# Sample Receipt Notification

**Attention** : Adrian Cukovski

**Client** : Beach Energy Limited
Level 15, 150 Lonsdale Street
Melbourne VIC 3000

**Email** : Adrian.Cukovski@beachenergy.com.au
**Telephone** : 08 8433 2325
**Facsimile** :

**Date** : 5/03/2021

**Re** : Receipt of Samples **Pages : 2**

**ESA Project** : PR1978 ☑ For Review ☐ Additional Documentation Required - Please Respond

## *Sample Delivery Details*

**Completed Chain of Custody accompanied samples: YES**
**Samples received in apparent good condition and correctly bottled: YES**
**Security seals on sample bottles and esky intact: YES**

**Date samples received** : 4/03/2021
**Time samples received** : 19:05
**No. of samples received** : 1
**Sample matrix** : Aqueous
**Sample temperature** : 11-15°C

**Comments** : 4 x 2.5L sample received at 12oC in apparent good condition

## *Contact Details*

Projects Manager : Dr Rick Krassoi
Telephone : 61 2 9420 9481
Facsimile : 61 2 9420 9484
Email : rkrassoi@ecotox.com.au

Please contact customer services officer for all queries or issues regarding samples

**Note that the chain-of-custody provides definitive information on the tests to be performed**

**Ecotox Services Australia**

# Toxicity Test Report: TR2029/1

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15 150 Lonsdale Street<br>Melbourne Vic 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2029<br>28 July 2021<br>29 July 2021 |
| **Attention:** | Adrian Cukovski | **Sampled By:** | Client |
| **Client Ref:** | Not Supplied | **ESA Quote #:** | PL2029_q01 |

| Lab ID No.: | Sample Name: | Sample Description: |
|---|---|---|
| 10165 | MI-5327 | Aqueous sample, pH 6.0*, salinity 16.1‰*, total ammonia 24.0mg/L*. Sample received at 12ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 30 July 2021 at 1615h |

| Sample 10165*: MI-5327* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Fertilised Eggs (Mean ± SD)** | | |
| FSW Control 92.3 ± 2.2 | | |
| ASW Control 91.5 ± 2.4 | | |
| 1.6 92.8 ± 1.5 | | |
| 3.1 60.0 ± 11.1 * | | |
| 6.3 0.0 ± 0.0 | | |

# Toxicity Test Report: TR2029/10

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15 150 Lonsdale Street<br>Melbourne Vic 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2029<br>03 August 2021<br>05 August 2021 |
| **Attention:** | Adrian Cukovski | **Sampled By:** | Client |
| **Client Ref:** | Not Supplied | **ESA Quote #:** | PL2029_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 10167 | Y003082021 | Aqueous sample, pH 6.1*, salinity 15.7‰*, total ammonia 29.0mg/L*. Sample received at 10ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 72-hr sea urchin larval development test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 105 (ESA 2016), based on APHA (1998), Simon and Laginestra (1996) and Doyle *et al*. (2003) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 06 August 2021 at 1500h |

| Sample 10167*: Y003082021* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Normal larvae (Mean ± SD)** | | |
| FSW Control 95.0 ± 1.6 | | |
| ASW Control 94.5 ± 2.7 | | |
| 1.6 95.5 ± 2.1 | | |
| 3.1 94.0 ± 1.8 | | |
| 6.3 42.5 ± 3.4 * | | |
| 12.5 0.0 ± 0.0 | | |
| 25 0.0 ± 0.0 | | |
| 50 0.0 ± 0.0 | | |
| 100 0.0 ± 0.0 | | |
| **72-hr EC10 = 3.9 (3.59-4.14)%**<br>**72-hr EC50 = 6.0 (5.79-6.21)%**<br>**NOEC = 3.1%**<br>**LOEC = 6.3%** | | |

*Significantly lower percentage of normally developed larvae compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)

| **Attention:** | Adrian Cukovski | **Sampled By:** | Client |
| **Client Ref:** | Not Supplied | **ESA Quote #:** | PL2029_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 10167 | Y003082021 | Aqueous sample, pH 6.1, salinity 15.7‰, total ammonia 29.0mg/L. Sample received at 10ºC in apparent good condition. |

| | |
|---|---|
| **Test Performed:** | 7-day fish imbalance and biomass toxicity test using barramundi *Lates calcarifer* |
| **Test Protocol:** | ESA SOP 122 (ESA 2017), based on USEPA (2002) |
| **Test Temperature:** | The test was performed at 25±2°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing. The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Hatchery reared, SA |
| **Size of Test Organisms:** | 12mm |
| **Test Initiated:** | 06 August 2021 at 1800h |

# Toxicity Test Report: TR2029/22

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15 150 Lonsdale Street<br>Melbourne Vic 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2029<br>18 August 2021<br>19 August 2021 |
| **Attention:** | Adrian Cukovski | **Sampled By:** | Client |
| **Client Ref:** | Not Supplied | **ESA Quote #:** | PL2029_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 10178 | A1-5327 | Aqueous sample, pH 6.5, salinity 15.9‰, total ammonia 15.6mg/L. Sample received at 10ºC in apparent good condition. |

| | |
|---|---|
| **Test Performed:** | 72-hr marine algal growth test using *Nitzschia closterium* |
| **Test Protocol:** | ESA SOP 110 (ESA 2016), based on Stauber *et al*. (1994) |
| **Test Temperature:** | The test was performed at 21±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was filtered to 0.45µm and serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | In-house culture, originally sourced from CSIRO Microalgae Supply Service, TAS |
| **Test Initiated:** | 20 August 2021 at 1800h |

Sample 10178*: A1-5327*

| **Concentration (%)** | **Cell Yield (Mean number of cells/mL x$10^4$ ± SD)** |
|---|---|
| FSW Control | 17.7 ± 0.6 |
| ASW Control | 17.5 ± 0.8 |
| 1.6 | 17.5 ± 0.5 |
| 3.1 | 17.9 ± 0.8 |
| 6.3 | 12.5 ± 1.1 * |
| 12.5 | 3.0 ± 2.0 * |
| 25 | 0.0 ± 0.0 |
| 50 | 0.0 ± 0.0 |
| 100 | 0.0 ± 0.0 |

**72-hr IC10 = 4.2 (3.64-4.50)%**
**72-hr IC50 = 8.7 (7.87-9.91)%**
**NOEC = 3.1%**
**LOEC = 6.3%**

*Significantly lower cell yield compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)

| **QA/QC Parameter** | **Criterion** | **This Test** | **Criterion met?** |
|---|---|---|---|
| Control mean cell density | ≥16.0x$10^4$ cells/mL | 18.7x$10^4$ cells/mL | Yes |
| Control coefficient of variation | <20% | 3.4% | Yes |
| Reference Toxicant within cusum chart limits | 3.5-8.2µg Cu/L | 4.6µg Cu/L | Yes |

# Toxicity Assessment of Produced Formation Water from the BASGAS Yolla Facility

## Beach Energy Ltd

## Test Report

**September 2022**

T +61 2 9420 9481
Unit 27, 2 Chaplin Drive
Lane Cove NSW 2066 Australia
www.ecotox.com.au
ECOTOX SERVICES AUSTRALIA PTY LIMITED
ABN 95 619 426 201

# Toxicity Test Report: TR2113/1

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15, 150 Lonsdale Street<br>Melbourne VIC 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2113<br>31 August 2022<br>01 September 2022 |
| **Attention:** | Adrian Cukovski | **Sampled By:** | Client |
| **Client Ref:** | BE00060922 | **ESA Quote #:** | PL2113_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 10677 | Y03/0822-1 | Aqueous sample, pH 8.3*, salinity 12.9‰*, total ammonia 12.9mg/L*. Sample received at 9ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 21.2±0.2°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 02 October 2022 at 1720h |

| Sample 10677*: Y03/0822-1* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Fertilised Eggs (Mean ± SD)** | | |
| FSW Control 92.8 ± 1.7<br>ASW Control 93.5 ± 2.7<br>1.6 92.8 ± 1.7<br>3.1 53.8 ± 14.8 *<br>6.3 5.5 ± 1.5 *<br>12.5 0.0 ± 0.0<br>25 0.0 ± 0.0<br>50 0.0 ± 0.0<br>100 0.0 ± 0.0 | | |
| **IC10 = 2.0 (1.86-2.22)%**<br>**EC50 = 3.4 (3.21-3.52)%**<br>**NOEC = 1.6%**<br>**LOEC = 3.1%** | | |

*Significantly lower percentage fertilised eggs compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)

# Toxicity Test Report: TR2187/1

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15, 150 Lonsdale Street<br>Melbourne VIC 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2187<br>23 August 2023<br>24 August 2023 |
| **Attention:** | Adrian Cukovski / Phil Wemyss | **Sampled By:** | Client |
| **Client Ref:** | PO: BE00076590 | **ESA Quote #:** | PL2187_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 11237 | Y0230823 | Aqueous sample, pH 6.0*, salinity 17.1‰*, total ammonia 25.5mg/L*. Sample received at 12ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20.0±1.0°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 25 August 2023 at 1850h |

| Sample 11237: Y0230823<br>**Concentration (%)** | **% Fertilised Eggs (Mean ± SD)** | *Vacant* | *Vacant* |

# Toxicity Test Report: TR2234/1_R01

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Limited<br>Level 15, 150 Lonsdale Street<br>Melbourne VIC 3000 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR2234<br>11 September 2024<br>12 September 2024 |
| **Attention:** | Ronie Magcamit | **Sampled By:** | Client |
| **Client Ref:** | PO: BE00089994 | **ESA Quote #:** | PL2234_q02 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 11710 | Y0110924 | Aqueous sample, pH 5.9*, salinity 10.0‰*, total ammonia 21.4mg/L*. Sample received at 12ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20.0±1.0°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 13 September 2024 at 1840h |

| Sample 11710*: Y0110924* | | *Vacant* | *Vacant* |
|---|---|---|---|
| **Concentration (%)** | **% Fertilised Eggs (Mean ± SD)** | | |
| FSW Control | 93.0 ± 1.8 | | |
| ASW Control | 91.5 ± 2.4 | | |
| 1.6 | 92.0 ± 1.8 | | |
| 3.1 | 92.0 ± 2.2 | | |
| 6.3 | 57.8 ± 9.2 * | | |
| 12.5 | 0.0 ± 0.0 | | |
| 25 | 0.0 ± 0.0 | | |
| 50 | 0.0 ± 0.0 | | |
| 100 | 0.0 ± 0.0 | | |
| **IC10 = 4.2 (3.77-4.46)%** | | | |
| **EC50 = 6.9 (6.62-7.09)%** | | | |
| **NOEC = 3.1%** | | | |
| **LOEC = 6.3%** | | | |

*Significantly lower percentage fertilised eggs compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)

|---|---|---|
| 11798 | Y0071124 | Aqueous sample, pH 6.3*, salinity 20.4‰*, total ammonia 14.6mg/L*. Sample received at 9ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20.0±1.0°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 20 November 2024 at 1810h |

| Sample 11798*: Y0071124* | *Vacant* | *Vacant* |
|---|---|---|

| **Client Ref:** | PO: BE00091633 | **ESA Quote #:** | PL2293_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 11798 | Y0071124 | Aqueous sample, pH 6.3, salinity 20.4‰, total ammonia 14.6mg/L. Sample received at 9ºC* in apparent good condition. |

| | |
|---|---|
| **Test Performed:** | 72-hr marine algal growth test using *Nitzschia closterium* |
| **Test Protocol:** | ESA SOP 110 (ESA 2016), based on Stauber *et al*. (1994) |
| **Test Temperature:** | The test was performed at 21±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was filtered to 0.45µm and serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | In-house culture, originally sourced from CSIRO Microalgae Supply Service, TAS |
| **Test Initiated:** | 20 November 2024 at 1900h |

| Sample 11798*: Y0071124* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** | **Cell Yield (Mean number of cells/mL x10⁴ ± SD)** | |
| FSW Control | 17.5 ± 1.0 | |

# Chain-of-Custody Documentation

Datasheet ID: 601.2
Last Revised: 21 September 2018

# Sample Receipt Notification

**Attention** : Ronie Magcamit

**Client** : Beach Energy Limited
Level 15, 150 Lonsdale Street
Melbourne VIC 3000

**Email** : ronie.magcamit@beachenergy.com.au
**Telephone** :
**Facsimile** :

**Date** : 15/11/2024

**Re** : Receipt of Samples **Pages : 2**

**ESA Project** : PR2293 ☑ For Review ☐ Additional Documentation Required - Please Respond

## *Sample Delivery Details*

**Completed Chain of Custody accompanied samples: YES**
**Samples received in apparent good condition and correctly bottled: YES**
**Security seals on sample bottles and esky intact: YES**

**Date samples received** : 14/11/2024
**Time samples received** : 9:40
**No. of samples received** : 1
**Sample matrix** : Aqueous
**Sample temperature** : 6-10°C

**Comments** : 4 x 2.5L sample received at 9 degrees C in apparent good condition

## *Contact Details*

Projects Manager : Dr Rick Krassoi
Telephone : 61 2 9420 9481
Facsimile : 61 2 9420 9484
Email : rkrassoi@ecotox.com.au

Please contact customer services officer for all queries or issues regarding samples

**Note that the chain-of-custody provides definitive information on the tests to be performed**

Purchase Order:

Ship To: Ecotox Services Australia
Attention: Dr Rick Krassoi
(please provide an email address for sample receipt notification)

Samples taken during descale unload on Y4.

*Toxicity Testing per PL2293

| Sample Date (day/month /year) | Sample Time | Sample Name (exactly as written on the sample vessel) | Sample Method (eg. Grab, composite etc.) | Number and Volume of Containers (eg 2 x 1L) | Tests Requested (See reverse for guidance) | Comments / Instructions |
|---|---|---|---|---|---|---|
| 07/11/24 | 11:00 | Y0071124-1 | Grab | 4 x 2.5lts | Toxicity Testing per PL2293 | |
| | | Y0071124-2 | | | | |
| | | Y0071124-3 | | | | |
| | | Y0071124-4 | | | | |

Comments / Instructions

**Note that testing will be delayed if an incomplete chain of custody is received**

- Additional treatment of samples (i.e. spiking)
- Sub-contracted services (i.e. chemical analyses)
- Dilutions required (if different than 100% down to 6.25%)
- Sample holding time restriction (if applicable)
- Sample used for litigation (if applicable)

*Note: An MSDS must be attached if Available*

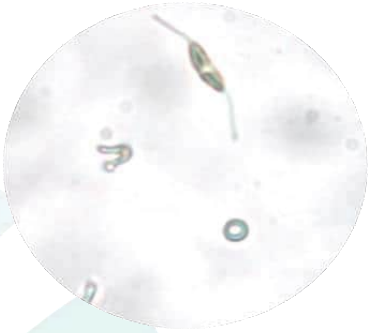
# Appendix C

## ESA Toxicity Test Factsheets

# TOXICITY TEST FACT SHEET #3 – Freshwater & Marine



## Chronic Toxicity Test With Algae

The chronic toxicity test using the micro alga measures the effect of test materials on growth over a 72 hour period. The test can be run using the freshwater green algae Selenastrum capricornutum, the marine diatom Nitzschia closterium or the marine flagellate Isochrysis aff. Galbana

Algae are primary producers of organic matter upon which animals depend either directly or indirectly through the food chain. In Australia, the test using the freshwater S. capricornutum has been widely used in toxicity assessment of sewage treatment plant effluents discharging into freshwater streams and rivers. The tests using the marine algae have been widely used along side invertebrate toxicity tests.

In summary, this test involves exposing laboratory cultured algae to the test material for 72 hours. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, algae cell yield is determined.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% inhibition in algal cell yield in the test population (IC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment.

The algae growth test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

If toxicity is detected using the chronic algae test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

# TOXICITY TEST FACT SHEET #5 – Marine

## Chronic Toxicity Test With Sea Urchin fertilisation test

Sea urchins and other echinoderms constitute a diverse and widely distributed group of marine animals. and are both ecologically and economically important. Toxicity tests utilising the short-term exposure of gametes are of comparable or greater sensitivity to many contaminants than other marine test species and life stages.

This test is commonly used throughout North America using USEPA protocols and is an important test in US effluent discharge licensing programme. In Australia, gametes of the sea urchin Heliocidaris tuberculata has also become widely used in toxicity assessment programs.

In summary, this test involves exposing urchin gametes (both sperm and eggs) to the test material for 1hour 20min. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the percentage of fertilised egg is determined.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% inhibition fertilisation rate in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment.

The Urchin Fertilisation test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

If toxicity is detected using the chronic Urchin Fertilisation test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

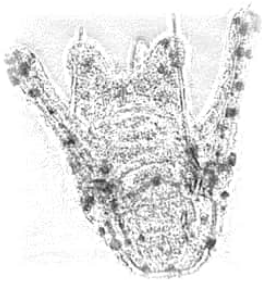
## Chronic Toxicity Test With Sea Urchin Larval Development Test



Sea urchins and other echinoderms constitute a diverse and widely distributed group of marine animals. and are both ecologically and economically important. Toxicity tests utilising the short-term exposure of embryos are of comparable or greater sensitivity to many contaminants than other marine test species and life stages.

This test is commonly used throughout North America using APHA and ASTM protocols. In Australia, embryos of the sea urchin Heliocidaris tuberculata have been increasingly used in toxicity assessment programs.

In summary, this test involves exposing developing urchin embryos to the test material for 72hours. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the number of normally developed and abnormal larvae are counted.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% inhibition in larval development in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment.

The Urchin Larval Development test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

If toxicity is detected using the chronic Urchin Larval Development test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

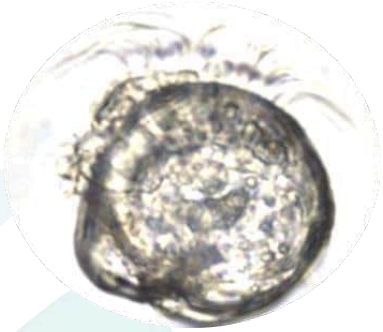
# TOXICITY TEST FACT SHEET #7 – Marine

## Chronic Toxicity Test Using Bivalve Larval Development



Bivalve molluscs such as oysters, scallops, mussels and clams constitute a diverse and widely distributed group of marine animals which are both ecologically and economically important. Toxicity tests utilising the short-term exposure of embryos are of comparable or greater sensitivity to many contaminants than other marine test species and life stages

This test is commonly used throughout North America using APHA and ASTM protocols. In Australia, embryos of the rock oyster Saccostrea glomerata, the milky oyster Saccostrea echinata the pacific oyster Crassostrea gigas, the doughboy scallop Mimachlamys asperrima and the mussel Mytilus edulis galloprovincialis have been increasingly used in toxicity assessment programs.

In summary, this test involves exposing developing bivalve embryos to the test item for 48 hours (or up to 72 hours). For an effluent sample, the test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3%. At the end of the exposure period, the number of normally developed and abnormal larvae are counted.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% inhibition in larval development in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment.

The Bivalve Larval Development test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

If toxicity is detected using the chronic Bivalve Larval Development test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

# TOXICITY TEST FACT SHEET #9 – Marine

## Acute Toxicity Test With Amphipods

The acute toxicity test using amphipods is used for the assessment of potential harm posed by contaminant to aquatic ecosystems. A number of species of epifaunal amphipods have been used for toxicity assessments, however the most commonly used species in Australia is Melita plumulosa and Allorchestes compressa

Marine amphipods are a diverse and widely distributed group of animals are an important food source for other invertebrates, fish and birds as well as being re-workers of seagrasses and seaweeds. The acute toxicity test uses mainly laboratory reared juvenile amphipods and is based on USEPA test method for mysid shrimp and USEPA OPPTS850.1020 guideline for gammarid amphipods.

In summary, this test involves exposing juvenile amphipods to the test material and assessing survival over a 96 hour period. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the number of surviving amhipod is recorded.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% reduction in amphipods survival in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause acute toxicity in the environment.

The Acute Amphipod Test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

If toxicity is detected using the Acute Amphipod Test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

# TOXICITY TEST FACT SHEET #11 – Freshwater & Marine

## Acute Toxicity Test with Fish larvae

A number of species of fish have been used for toxicity assessments. The species commonly used in our laboratory are the Rainbowfish (*Melanotaenia splendida*) and the zebra fish (*Zebra danio*). The most commonly used marine species in Australia are the Barramundi (*Lates calcarifer*), the Bass (*Macquaria novemaculeata*) , the australasian snapper (*Pagrus auratus*) and the Kingfish (*Seriola lalandis lalandis*).

Fish are both ecologically and economically important. The acute toxicity test uses externally sourced and laboratory reared fish larvae and is based on USEPA test method for measuring the acute toxicity of effluents and receiving waters to freshwater and marine organisms (2002).

In summary, this test involves exposing fish larvae to the test material for 96 hours. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the number of balanced and the number of un-balanced fish larvae are recorded.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% reduction in unbalanced fish in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause acute toxicity in the environment.

The Acute Fish Test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

The Acute Fish test exposure period can be extended to 7 days. If toxicity is detected using the Acute Fish Test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

# TOXICITY TEST FACT SHEET #12 – Marine

## Chronic Toxicity Test with Macroalgae

Two species of macroalgae, sometimes known as seaweed, are commonly used for toxicity assessments: The Neptune Necklace (*Hormosira banksii*) and the Brown Kelp (*Ecklonia radiata*). They play an important role in aquatic ecosystem by providing food to a wide range of marine organisms.

The macroalgae are sourced externally and spawned in the laboratory the day of testing following techniques described by Kevekordes and Clayton (1996), Bidwell (1998) and Burridge (1999).

In summary, this test involves exposing macroalgae zygotes or zoospores to the test material for 72 hours. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the number of germinated individuals are recorded.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% reduction in germinated macroalgae in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment.

The Chronic Macroalgae Test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

The Macroalgae test can also be extended to 14 days. The solutions are renewed every week and the length of the germinated individuals is determined by digital analysis at the end of the exposure period.

If toxicity is detected using the Macroalgae Test, a Toxicity Identification Evaluation (TIE) programme can be initiated to identify the cause of the observed toxicity.

| Chronic Toxicity Test Using Macroalgae | |

# TOXICITY TEST FACT SHEET #14 – Marine

## 7-d Imbalance & Growth Toxicity Test with Marine Fish

A number of species of fish have been used for toxicity assessments. The 7-day fish imbalance and growth test ues either the spiny damselfish (*Acanthochromis polyacanthus*), which are bred in house, or the barramundi (*Lates calcarifer*), which are purchased from a commercial hatchery.

Fish are both ecologically and economically important. The 7-day imbalance and growth test is similar to USEPA test Method USEPA (2002) *Sheepshead minnow*, *Cyprinodon variegatus*, larval survival and growth test. Method 1004.0, but with some modifications.

In summary, this test involves exposing fish fry or fingerlings to the test material for 7 days. The test is usually undertaken on a range of concentrations of a test material, eg 100, 50, 25, 12.5 and 6.3% effluent. At the end of the exposure period, the number of balanced and the number of un-balanced fish larvae are recorded. The weight of the fish is also recorded in order to determine the biomass.

Statistical analyses are then applied to the test data to determine for example, the concentration of the test material causing 50% reduction in unbalanced fish or reduction in biomass (reduction in growth) in the test population (EC50 estimate). The test data can then be used to estimate concentrations of the test material likely to cause chronic toxicity in the environment and for SSD calulations without the need for an acute:chronic application factor

The fish imbalance and growth test may be used to assess the toxicity of:

- Chemicals
- Effluents
- Leachates and groundwater
- Sediments

**Notes:**

ppt - parts per thousand
FSW - Filtered seawater
ASW - Artificial seawater
CV - coefficient of variation
* Variability presented in parentheses are 95% confidence limits
1 - These parameters for the September 2023 PFW Sample were not reported in the ecotoxicology laboratory report for this WET test, however are assumed to be the same as for other tests upon Sample 11237
2 - Recorded from the 'Statistical Printout' report for this test for the for the September 2023 PFW Sample. Refer Appendix B
3 - The laboratory was unable to report an EC/IC10 value for the November 2024 7-day fish imbalance test, although IC50 and NOEC values were reported. The NOEC was adopted for further data assessment in the SSD calculation (as per Warne et al. 2018 guidance on preferred hierarchy of estimates of toxicity).

# Appendix E

## Ecotoxicity Data Quality Scores

| Sample & Test ID | Questions | Was the duration of the exposure stated? | Was the biological endpoint stated and defined? | Was the biological effect stated (e.g. LC or NOEC)? | Was the biological effect quantified (e.g. 50% effect)? | Were appropriate controls used? | Were each control and contaminant concentration at least duplicated? | Were the test acceptability criteria stated? OR, Were test acceptability criteria inferred? Note: Data that fail the acceptability criteria are automatically deemed to be of unacceptable quality and must not be used. | Were the characteristics of the test organism (e.g. length, mass, age) stated? | Was the type of test media used stated? | Was the type of exposure (e.g. static, flow-through) stated? | Were contaminant concentrations measured at the beginning and end of the exposure? Note: If concentrations were not measured then automatically the data cannot be high quality. | Were parallell reference toxicity tests conducted? | Was there a concentration- response relationship either observalble or stated? | Was an appropriate statistical method or model used to determine the toxicity? | For the LC/ EC/ BEC data, was an estimate of variability provided? OR, For NOEC/ LOEC data was the significance level 0.05 or less? | Was the Conductivity / Salinity measured and stated? | Was the Dissolved Oxygen measured and stated? | Was the pH measured and stated? | Was the temperature measured and stated? Award 1 mark if the temperature was measured but not stated, or if only the temperature of the room or chamber are stated. | Were test solutions, blanks and/ or controls tested for contamination OR were analytical reagent grade or the highest possible purity chemicals used? | Total Max Possible Score (91 for plants, 94 for non-plants) | Total score | Quality Score (%) | Overall Data Quality |

*Notes*

*1 - although receiving a 'high' quality score of ≥ 80%, this datapoint was deemed 'unacceptable' as the WET test did not pass the QA/QC criterion of >20% fish growth in controls (Warne et al, 2018)*

*2 - although receiving a 'high' quality score of ≥ 80%, these datapoints were deemed only as 'acceptable' as this is the maximum quality score that can be applied to a test for which contaminant concentrations are not measured (Warne et al, 2018)*

*3 - although receiving an 'acceptable' quality score of ≥50 to <80%, this datapoint was deemed 'unacceptable' as the complete laboratory test report was not available (i.e. missing pages), thus it could be determined whether the QA/QC criterion was met.*

^ - The laboratory was unable to report an EC/IC10 value for the November 2024 (Sample and Test ID 11798, Y0071124, TR2293/5) 7-day fish imbalance test, although IC50 and NOEC values were reported. The NOEC was adopted for further data assessment in the SSD calculation (as per Warne et al. 2018 guidance on preferred hierarchy of estimates of toxicity).

# Appendix F

## Selection of Input Toxicity Data for Burrlioz 2.0

**PFW Samples (September 2019 - November 2024)**

| Test Species | Toxicity Endpoint | Exposure Duration | Period | Toxicity Estimate | Toxicty Value: PFW Concentration (%) and Variability (95% Confidence Intervals)^ | Toxicty Value (only): PFW Concentration (%) | Acute / Chronic classification in accordance with Warne et al. (2018) | Acute-to-Chronic Conversion Ratio | Geometric Mean for each combination of Species + Endpoint + Duration | Lowest toxicity value for each combination of Species + Endpoint | Burrlioz Input Toxicity Value, i.e. Lowest toxicity value for each Species |

DRAFT

# 1.0 PROJECT BACKGROUND

Beach Energy Limited (Beach) is the operator the Yolla Platform which is located within the production license T/L1 approximately 100 km offshore from mainland Victoria in the Bass Strait (Table 1.1 and Figure 1.1). The water depth in the vicinity of the platform is approximately 80 m.

In 2017, RPS was commissioned to undertake a near-field produced water (PW) dispersion modelling study (MAQ0573) for the Yolla Platform based on the following three cases: Case 1- Design (100 $m^3$/day); Case 2 - Typical (200 $m^3$/day; and Case 3- Worst Case (300 $m^3$/day). The cases and in turn discharge rates are based on the original PW design flow rate, expected operation post-debottlenecking and end of field life, respectively. The study findings revealed that the furthest distance travelled by the plume was 70 m and achieved a 1:1,000 dilution for Case 3 under high current speeds. (RPS, 2017).

Subsequently, Beach has requested modelling to assess the zones of dilution for the average (1:3,482) and maximum (1:5,400) total recoverable hydrocarbons (TRH) based on ANZECC guidelines. As well as reporting the distance to achieve the 1:62.5 dilution for the three cases.

**Table 1.1 Yolla Platform used as the release location for the produced formation water dispersion modelling study.**

| Release location | Latitude | Longitude | Water Depth (m) |
|---|---|---|---|
| Yolla Platform | 39° 50' 39.5" S | 145° 49' 5.9" E | 80 |

DRAFT

# 2.0 SCOPE OF WORK

The physical mixing of the PW stream can be separated into two distinct zones: (a) near-field; and (b) far-field. The limits of the near-field zone are defined by the area where the levels of mixing and dilution are controlled by the plume's initial jet momentum and the buoyancy flux, resulting from the density difference. When the plume encounters a boundary such as the water surface, or loses its buoyancy, the near-field mixing is complete, and the far-field mixing begins.

This study utilises the findings from the previously completed near-field modelling to accurately assess the predicted far-field plume dynamics. Therefore, the scope of work included the following components:

1. Generate a 5-year 3-dimensional current data set (2008-2012) that included the combined influence of ocean and tidal currents;

2. Determine the least energetic month and lower current speeds for input into the far-field three-dimensional dispersion model. This approach provides a conservative approach in estimating the level of mixing and dispersion.

3. Generate vertical profiles of salinity and water temperature for the identified period;

4. Model the far-field mixing of the PW discharge based on each of the three operational discharge rates (i.e., 100 $m^3$/day, 200 $m^3$/day and 300 $m^3$/day) over a 31-day period using time-varying current data;

5. Generate plots illustrating the predicted zones of dilution for the whole PW stream for each discharge rate based on dilutions of 1:62.5, 1:3,482.4 dilutions (TRH average) and 1:5,400 dilutions (TRH maximum); and

6. Generate a summary table presenting the maximum horizontal distance from the discharge point to predicted PW plume dilutions.

DRAFT

# 3.0 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area off the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are driven by tides, winds, incident continental shelf waves and density driven flows. High winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3.1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kampf 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional data set.

DRAFT

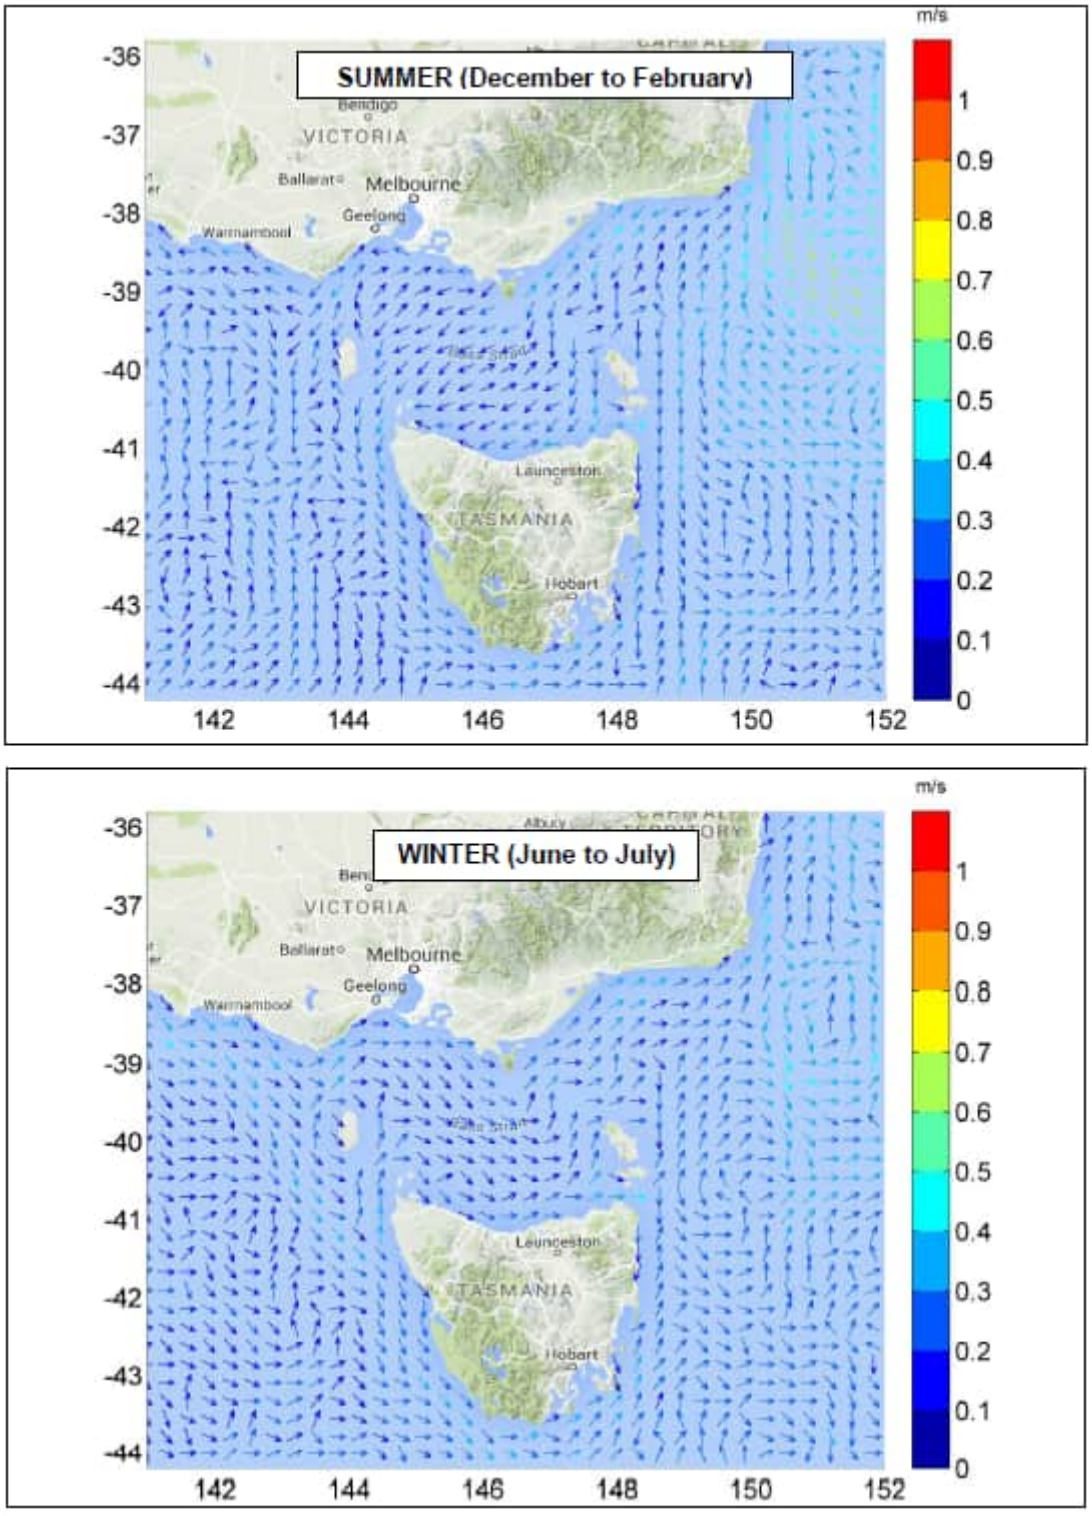

**Figure 3.1 Example HYCOM averaged seasonal surface drift currents during summer and winter.**

## 3.1 Tidal currents – HYDROMAP

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for over 30 years (Isaji and Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003). In fact, HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) oil spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a, 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

### 3.1.1 Grid Setup

The model is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

DRAFT

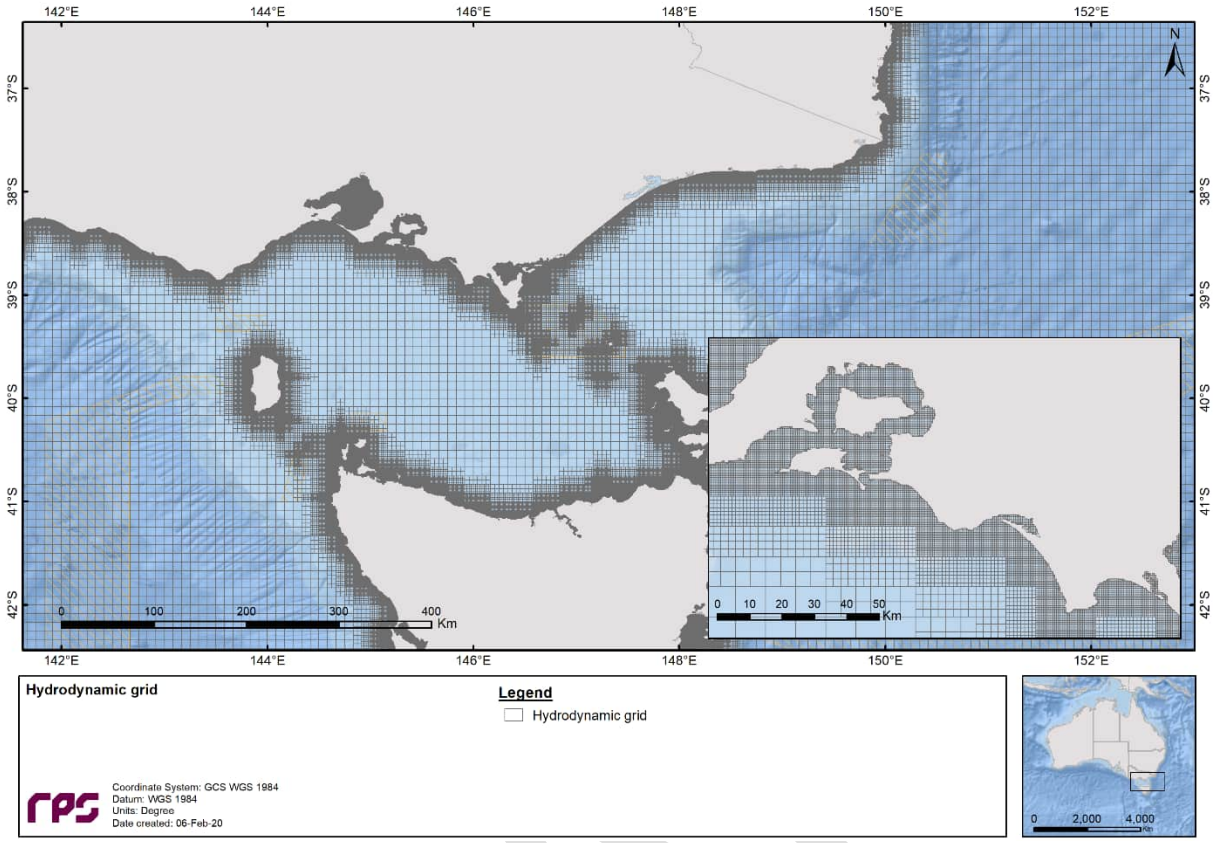

**Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.**

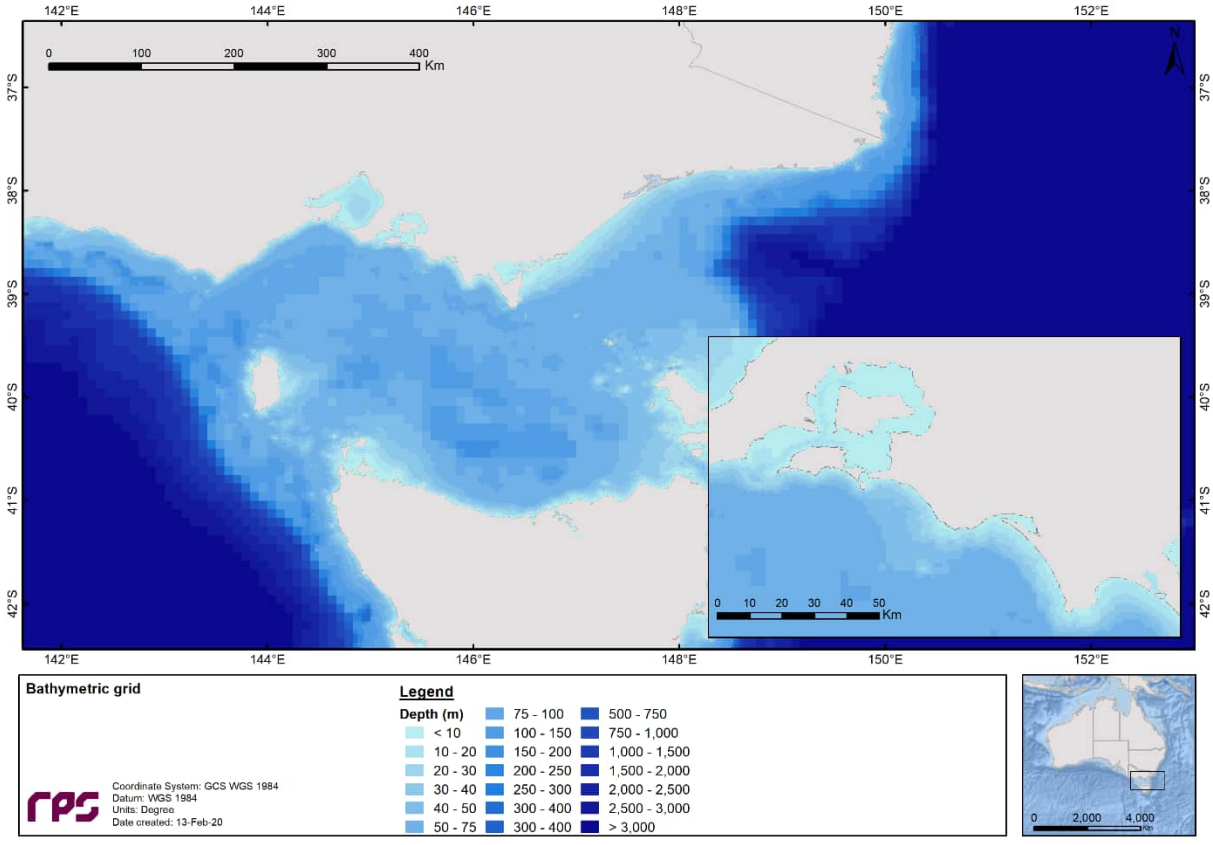

**Figure 3.3 Bathymetry defined throughout the tidal model domain.**

### 3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were $K_2$, $S_2$, $M_2$, $N_2$, $K_1$, $P_1$, $O_1$ and $Q_1$. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex-Poseidon tidal data has been widely used amongst the oceanographic community, being included in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

### 3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: $N$ = Number of observations

$P_i$ = Model predicted surface elevation

$O_i$ = Observed surface elevation

The Index of Agreement (IOA; Eq. 2) in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: $X_{model}$ = Model predicted surface elevation

$X_{obs}$ = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

DRAFT

Figure 3.5 and Figure 3.6 illustrate a comparison of the predicted and observed surface elevations in February 2017. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

**Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.**

| Tide Station | IOA | MAE (m) |
|---|---|---|
| Gabo Island | 0.98 | 0.08 |
| Port MacDonnell | 0.98 | 0.05 |
| Port Welshpool | 0.92 | 0.30 |
| Portland | 0.97 | 0.07 |
| Stack Island | 0.96 | 0.22 |

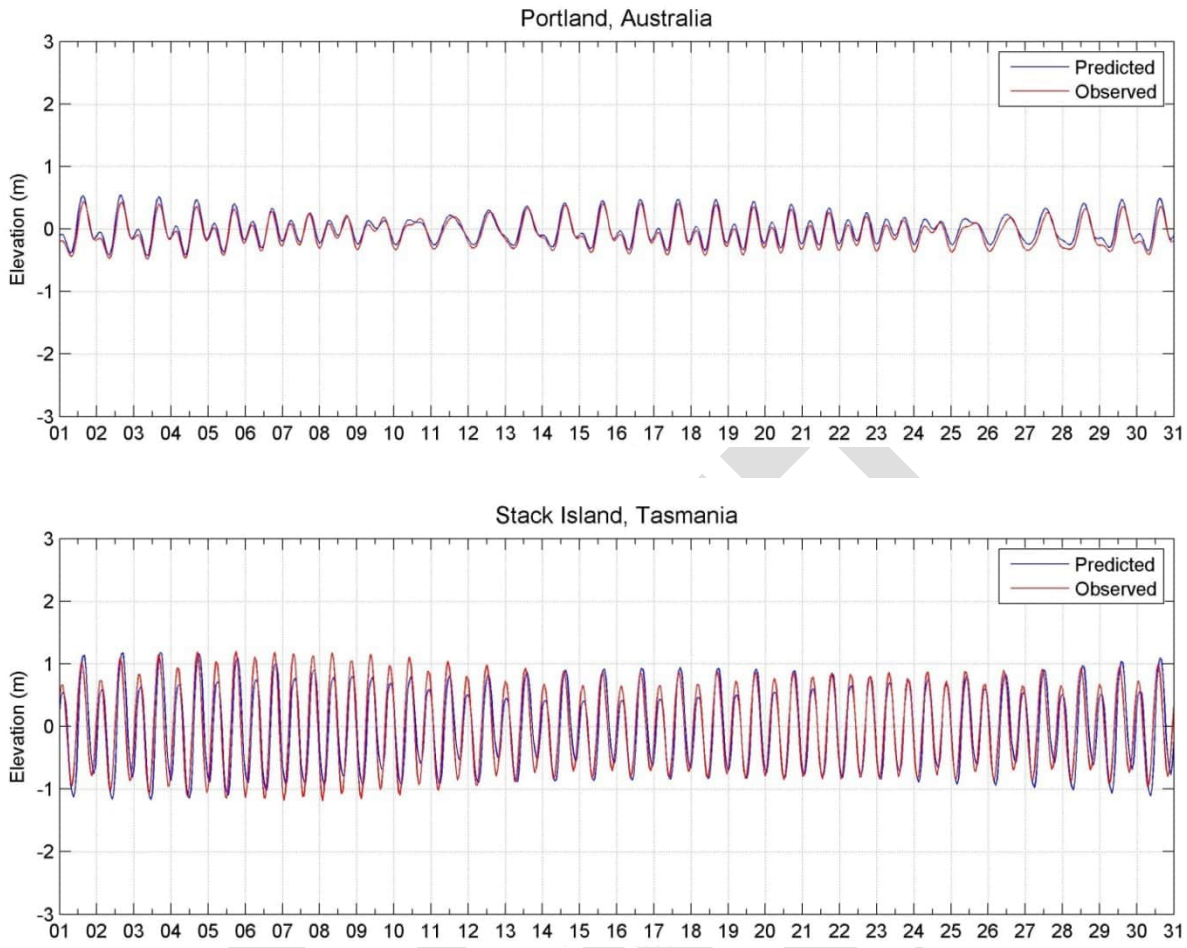

**Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).**

## 3.2 Ocean currents – HYCOM

The ocean currents (non-tidal) were represented by the output from a third-party three-dimensional ocean model, HYCOM (HYbrid Coordinate Ocean Model) (Wallcraft et al. 2003; Chassignet et al. 2007, 2009). HYCOM is operated by the HYCOM Consortium and sponsored by the Global Ocean Data Assimilation Experiment (GODAE). It uses an array of measured data as input to understand the current state of the water body, including time-varying observations of sea-surface height, sea-surface temperature and *in situ* temperature and salinity measurements (Chassignet et al. 2009). Numerical modelling is then employed to determine how the sea-state evolves between the measurement points. The HYCOM predictions are three-dimensional with a horizontal resolution of approximately 8.25 km and are recorded once per day. Hence, the data provides estimates of meso-scale ocean circulation, with horizontal resolution suitable to resolve eddies of approximately 20 kilometres in diameter, as well as connecting stream currents of similar spatial scale. HYCOM provides a comprehensive dataset spanning decades, with increasing data quality over more recent years through the increased availability of ocean observations from satellite and sensor data.

For this study, the HYCOM hindcast currents were obtained for the years 2008 to 2012 (inclusive). The ocean current data was retrieved at 10 m depth layers (0 – 80 m).

## 3.3 Current Speeds at the Release Site

Figure 3.7 presents the monthly current rose distributions resulting from the combination of HYCOM ocean current data and HYDROMAP tidal data nearby the Yolla release site.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

Table 3.2 presents the average and maximum net current speeds from combined HYCOM and tidal currents nearby the Yolla release site. Monthly current spends varied throughout the years ranging between 0.16 m/s (January) and 0.22 m/s (August). The dominant direction of surface currents was predominantly eastward.

The least energetic month of the current data was May 2011, which had an average monthly surface current speed of 0.13 m/s.

**Table 3.2 Predicted monthly average and maximum surface current speeds nearby the Yolla release site. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2008–2012 (inclusive).**

| Month | Average current speed (m/s) | Maximum current speed (m/s) | General direction |
|---|---|---|---|
| January | 0.16 | 0.48 | Variable |
| February | 0.18 | 0.66 | Variable |
| March | 0.18 | 0.68 | East-northeast |
| April | 0.17 | 0.98 | East |
| May | 0.16 | 0.73 | East |
| June | 0.19 | 0.85 | East-southeast |
| July | 0.20 | 1.02 | East-southeast |
| August | 0.22 | 0.99 | East-southeast |
| September | 0.21 | 0.73 | East-southeast |
| October | 0.16 | 0.54 | East-northeast |
| November | 0.17 | 0.61 | East |
| December | 0.18 | 0.48 | East |
| **Minimum** | **0.16** | **0.48** | |
| **Maximum** | **0.22** | **1.02** | |

DRAFT

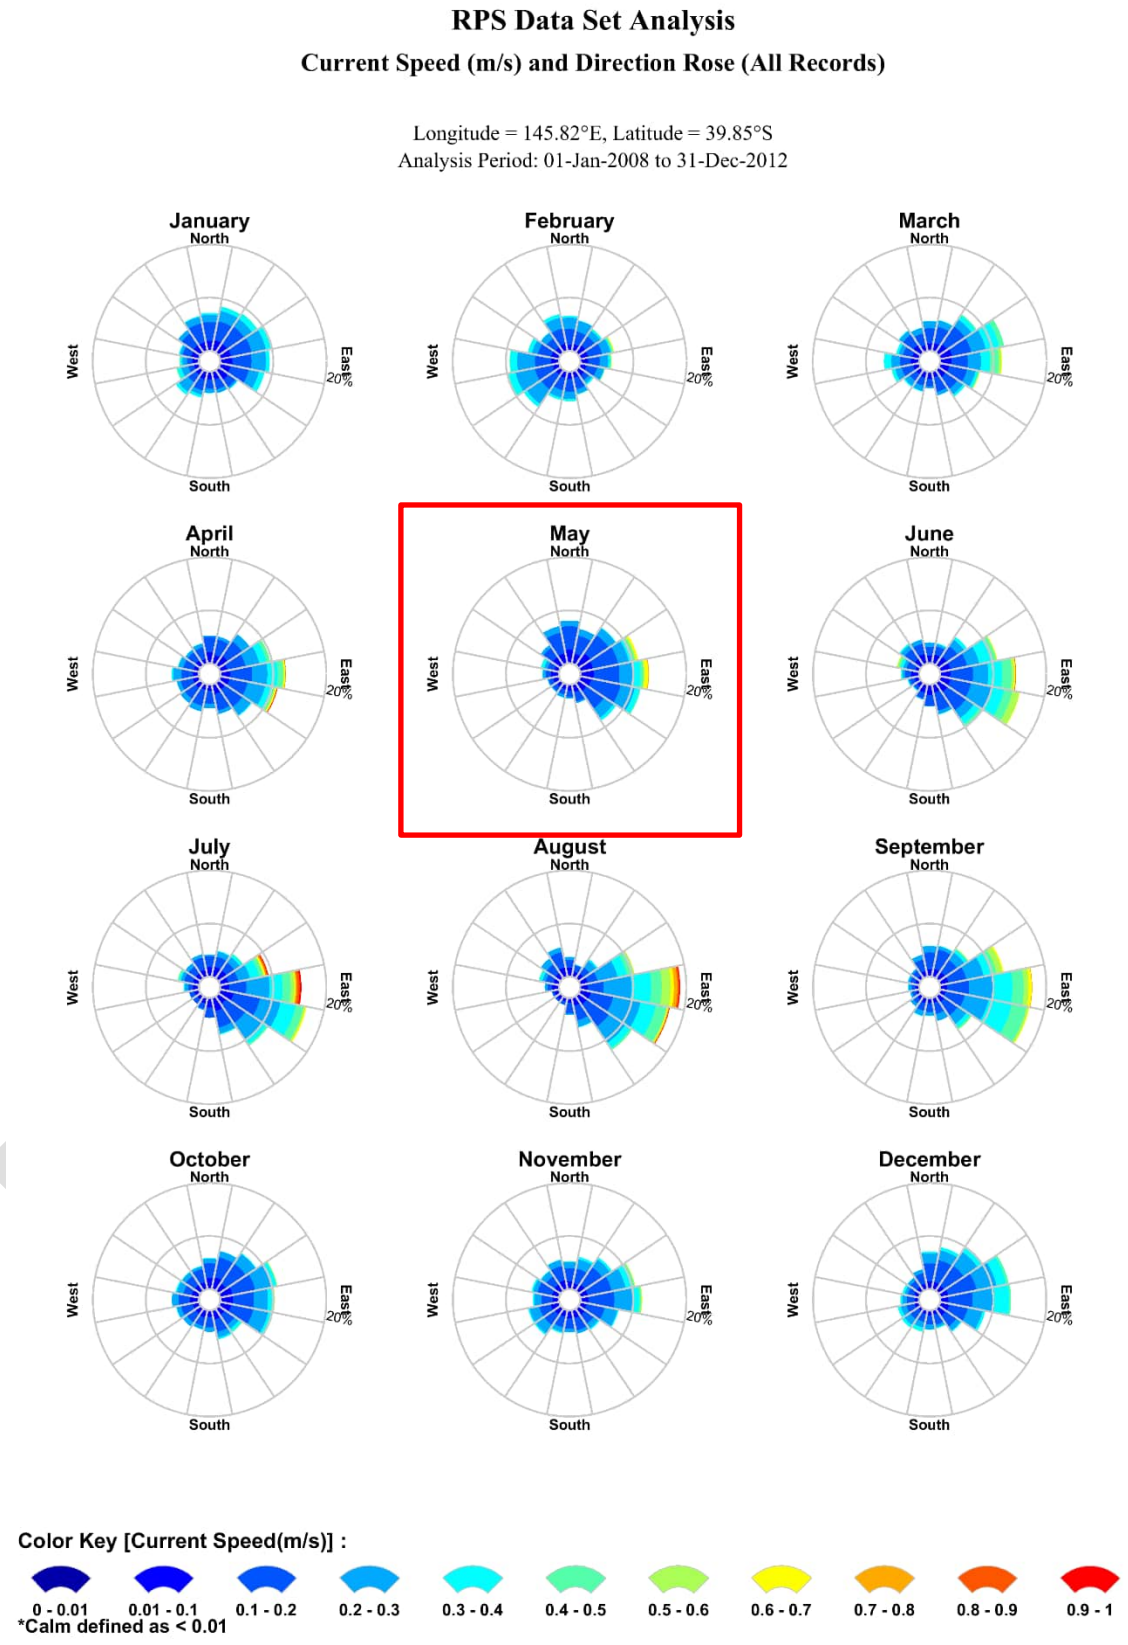

**Figure 3.7 Monthly surface current rose plots nearby the Yolla release site (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2008–2012 (inclusive). The month of May used as model input for the far-field dispersion modelling is indicated for ease of reference**

# 4.0 WATER TEMPERATURE AND SALINITY

To account for depth-varying sea temperature and salinity, data was obtained from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013).

Table 4.1 presents the sea temperature and salinity of the surface layer nearby the release sites.

The monthly average sea surface temperatures ranged between 12.7°C and 18.1°C, while the salinity values remain relatively consistent ranging between 24.9 and 35.5 psu. Water temperature and salinity during May conditions was 17ºC and 35.4 PSU, respectively.

Figure 4.1 illustrates the vertical profile of sea temperature and salinity.

**Table 4.1 Monthly average sea surface temperature and salinity nearby the release location.**

| | Jan | Feb | Mar | Apr | May* | Jun | Jul | Aug | Sep | Oct | Nov | Dec |
|---|---|---|---|---|---|---|---|---|---|---|---|---|

# 5.0 REPORTING CRITERIA

The area of exposure was determined based on dilutions of the whole PW discharge stream. Reported dilutions are based on the predicted instantaneous maximum concentrations and thus represent the predicted minimum dilution within any given grid cell over the duration of the 31-day model simulation.

A list of measured contaminant levels and trigger values for 99% species protection is shown in (Table 5.1), which were adopted as part of the near-field modelling study (RPS, 2017). As shown, the majority of the contaminants require a dilution factor of less than 1:75. Furthermore, as part of the near-field modelling study maximum dilutions of 1:1,000 were reported.

In line with ANZECC requirements, this modelling assessment reports the predicted zones of dilutions for 1:3,482.4 (TRH average) and 1:5,400 (TRH maximum).

The following dilutions (1:x) were also presented for completeness; 60, 62.5, 70, 80, 90, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 3482.4 and 5400.

DRAFT

**Table 5.1 Summary of produced water contaminants and trigger values (source: RPS, 2017).**

| Component | Max recorded produced water concentration (µg/L) | 99% Species protection trigger value (µg/L) | Required dilution factor to achieve 99% trigger value |
|---|---|---|---|
| Aluminium | 3,200 | 27* | 119 |
| Arsenic | BD | 1 | - |
| Boron | 3,400 | 90* | 38 |
| Barium | 13,000 | NL | - |
| Chromium | 1 | 0.14 | 7.1 |

| Lead | BD | 1 | - |
| Mercury | 29 | 0.1 | 290 |
| Manganese | 30 | 1200* | NR (<1) |
| Molydenum | 1 | ID | - |
| Nickel | 10 | 7 | 1.4 |
| Selenium | 1 | 5* | NR (<1) |
| Strontium | 810 | NL | - |
| Zinc | 90 | 7 | 12.9 |
| Benzene | 12,000 | 500 | 24 |
| Toluene | 14,000 | 110* | 127 |
| Ethylbenzene | 450 | 50* | 90 |
| o-Xylene | 1,600 | 200* | 8 |
| m&p-Xylene | 5,200 | 50* | 104 |
| Napthalene | 1,000 | 50 | 20 |
| Phenol | 64,000 | 270 | 237 |
| Cresols | 75,000 | NL | - |
| 2,4-Dimethyl Phenol | 8,700 | NL | - |
| Oil & Petroleum Hydrocarbons | <30,000 (current discharge limit) | 70 | 428 |
| Glycol | 2 vol% (20,000,000 µg/L) | 50,000^ | 400 |

^ = Guideline for working limits only, insufficient data to determine level of species protection
* = Taken from data for 99% species protection in fresh water systems ANZECC
BD = Historical testing shows these contaminants are below the limit of detection of 0.001 mg/L
ID = Insufficient data to determine a trigger value for marine or freshwater environment
NL = Component not listed in ANZECC guidelines
NR = Dilution not required, below ANZECC guideline concentration at point of discharge

DRAFT

# 6.0 DISPERSION MODELLING

## 6.1 Model Description

The MUDMAP model is an industry standard computerised modelling system, which has been applied throughout the world to predict the dispersion of sediment (cuttings and muds) and liquid (produced water) discharges since 1994 (Spaulding, 1994). The model is a development of the Offshore Operators Committee (OOC) model and like the OOC model calculates the fates of discharges through three known distinct integrated stages (Koh and Chang, 1973; Khondaker, 2000; Brandsma and Sauer, 1983a, 1983b).

The produced formation water release is represented by placing a fixed number of “particles” at the release location on each time-step. These particles are moved on each subsequent time-step according to the horizontal and vertical components from the hydrodynamic model. The plume spread is dependent on the horizontal and vertical mixing coefficients.

The MUDMAP system is based on a conservative tracer (no reaction or decay), constituting a “worst case” scenario, to examine the mixing and dilution of effluent plumes. The concentration distribution of the constituent in water is estimated using a counting grid. The number of particles in a grid square over a depth interval from the water surface down to a specified depth is counted, giving the mass of the constituent in a known volume, and therefore concentration.

The system has been extensively validated and applied for discharge operations in Australian waters (e.g. Burns et. al., 1999; King and McAllister, 1998, 1997).

## 6.2 Discharge Input Data

The detailed input data used in the far-field discharge model setup included:

- The relative temperatures and salinities of the PFW plume and receiving waters;
- The PFW rate of discharge;
- The height of the discharge point relative to mean sea level; and
- Current data to represent local physical forcing.

The PW stream, consists of both PW and water of condensation, is discharged vertically downwards through a discharge caisson at a depth of 45 meters below mean sea level (MSL) from a 0.73 m diameter outlet. The depth of the surrounding water is approximately 80 m.

The PW discharge properties are summarised in Table 6.1. The PW plume is slightly hotter (1°C above ambient at 45 m below MSL) and less saline than the receiving waters, resulting in a positively buoyant plume.

DRAFT

**Table 6.1 Summary of the far-field model inputs used to simulate the PW discharges at the Yolla platform.**

| Parameter | Design Operation | Typical Operation | Worst Case Operation |
|---|---|---|---|
| **Month and year simulated** | | May conditions 2011 | |
| **PW discharge flow rate ($m^3$/day)** | 100 | 200 | 300 |
| **Discharge type** | Continuous | Continuous | Continuous |
| **Period of discharge (days)** | 31 | 31 | 31 |
| **Discharge water temperature (ºC)** | 13.8 – 16.8 | 13.8 – 16.8 | 13.8 – 16.8 |
| **Discharge water salinity (PSU)** | 0.14 | 11.9 | 14.7 |
| **Depth of discharge (m)** | 45 | 45 | 45 |

## 6.3 MUDMAP Mixing Parameters

The horizontal and vertical dispersion coefficients represent the mixing and diffusion caused by turbulence, both of which are sub-grid processes. Both of these coefficients are expressed in units of rate of area change (i.e. $m^2$/s). Increasing the horizontal dispersion coefficient will increase the horizontal spread of the discharge plume and decrease the centreline concentrations. Increasing the vertical dispersion coefficient spreads the discharge across the vertical layers.

Spatially constant, conservative horizontal and vertical dispersion coefficients of 0.2 $m^2$/s and 0.0001 $m^2$/s were used to control the exchange of the PW in the horizontal and vertical directions respectively. Each of the mixing parameters was selected following an extensive sensitivity testing to recreate plume characteristics with respect to the near-field plume behaviour (see RPS, 2017).

## 6.4 MUDMAP Grid Configuration

MUDMAP uses a three-dimensional grid to represent the water depth and bathymetric profiles of the study area. Due to the rapid mixing and small-scale influences of the discharge, it was necessary to use a very fine grid with a resolution of 5 m x 5 m x 2 m (x, y and z) to track the movement and fate of the plume. The extent of the grid region measured 5 km (longitude or x-axis) x 5 km (latitude or y-axis).

DRAFT

# 7.0 MODELLING RESULTS

## 7.1 Predicted Zones of Dilution

Figure 7.1 to Figure 7.3 present the predicted zones of dilution for the whole PFW stream up to a 1:5,400 for each of the three cases over the 31 day simulation period:

- Case 1: Design operation: 100 $m^3$/day
- Case 2: Typical operation: 200 $m^3$/day
- Case 3: Worst case operation: 300 $m^3$/day

Table 7.1 presents the maximum horizontal distance from the discharge point to varying dilutions (1:x) for each for design (i.e. Cases 1, 2 and 3). Dilutions achieved at horizontal distance sub-grid cell size (i.e. 5 m) are denoted < 5m.

The 1:62.5 dilution was achieved within <5 m from the release location for all three cases. Dilutions of 1:3,482.4 (TRH average) and 1:5,400 (TRH maximum), were achieved at maximum horizontal distances from the release location of 133 m to 485 m and 292 m to 693 m, respectively (Figure 7.1 to Figure 7.3 and **Error! Reference source not found.**).

The 1:500 dilution was achieved within 70 m of the release location for all three cases. While the 1:1,000 dilution was reached 69 m, 73 m and 121 m from the release location under Case 1 (100 $m^3$/day), Case 2 (200 $m^3$/day) and Case 3 (300 $m^3$/day) operational rates, respectively.

DRAFT

**Table 7.1 Maximum horizontal distance from the discharge point to varying dilutions (1:x) for each case.**

| Dilution (1:x) | Maximum horizontal distance (m) | | |
|---|---|---|---|
| | Case 1 Design Operation | Case 2 Typical Operation | Case 3 Worst Case Operation |
| 60 | <5 m | <5 m | <5 m |
| 62.5 | <5 m | <5 m | <5 m |
| 70 | <5 m | <5 m | 26 |
| 80 | <5 m | <5 m | 26 |
| 90 | <5 m | <5 m | 26 |
| 100 | <5 m | 26 | 26 |

# EXECUTIVE SUMMARY

Beach Energy (Beach) is updating their Environment Plan (EP) for operations in the Yolla field. This field is situated within production licence T/L1, located 147 km south of Kilcunda (Victoria) in Bass Strait.

As part of their operations Beach is discharging produced formation water (PFW) continuously into the ocean. The PFW is water from the reservoir that is intimately mixed with oil and various organic and inorganic compounds such as heavy metals and minerals from the geological formations. Additionally, Beach will be periodically injecting a descaling agent (GLDA) into the reservoir to reduce resistance in the flowlines.

Whole effluent toxicity testing was carried for the PFW stream both with and without the presence of the GLDA, and the 99% species protection dilution thresholds were determined to be 1,961 and 19,608 dilutions, respectively. In order to achieve 95% species protection dilution thresholds decreased to 526 and 7,143 respectively.

RPS was commissioned to conduct a dispersion modelling study considering both the base case (200 $m^3$/day) and future case (300 $m^3$/day) discharge of PFW at a depth of 45 m below mean sea level.

To accurately determine the dilution of the PFW discharge and the total potential area of influence the effect of initial mixing generated by the discharge jet and buoyancy effects (near-field mixing) must be considered first. Subsequent dispersion of the remnant plume by ambient currents and turbulent forces in the water column (far-field dispersion) must then be considered where near-field mixing is inadequate to meet required dilutions. Different modelling approaches are required for calculating near-field and far-field dilutions due to the differing time and space scales that are involved. Rates of both near-field mixing and far-field dispersion will vary with prevailing currents. Hence, calculations must assess for variability in prevailing currents around the discharge site.

The potential area that may be influenced by the PFW discharge stream was assessed on an annual basis. The following details summarise the findings of this study.

## Near-Field Modelling

- Under strong currents, the distance where the lower dilution threshold of 526 was reached ranged from 55 m to 62 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 850 m to 1,230 m.
- Under moderate currents, the distance where the lower dilution threshold of 526 was reached ranged from 27 m to 30 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 475 m to 1,400 m.
- Under low currents, the distance where the lower dilution threshold of 526 was reached ranged from 11 m to 12 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 580 m to 1,600 m.

## Far-Field Modelling

- The lower dilution threshold (526) was observed within approximately 10 m and 12 m for the Base Case and Future Case, respectively.
- The dilution threshold of 7,143 was observed within approximately 29 m and 37 m for the Base Case and Future Case, respectively.
- The dilution threshold of 1,961 was observed within approximately 41 m and 61 m for the Base Case and Future Case, respectively.
- The upper dilution threshold (19,608) was observed within approximately 163 m and 247 m for the Base Case and Future Case, respectively.

# 1 INTRODUCTION

## 1.1 Background

Beach Energy (Beach) is updating their Environment Plan (EP) for operations in the Yolla field. This field is situated within production licence T/L1, located 147 km south of Kilcunda (Victoria) in Bass Strait.

As part of their operations Beach is discharging produced formation water (PFW) continuously into the ocean. The PFW is water from the reservoir that is intimately mixed with oil and various organic and inorganic compounds such as heavy metals and minerals from the geological formations. Additionally, Beach will be periodically injecting a descaling agent (GLDA) into the reservoir to reduce resistance in the flowlines.

Whole effluent toxicity testing was carried for the PFW stream both with and without the presence of the GLDA, and the 99% species protection dilution thresholds were determined to be 1,961 and 19,608 dilutions, respectively. In order to achieve 95% species protection dilution thresholds decreased to 526 and 7,143 respectively.

RPS was commissioned to conduct a dispersion modelling study considering both the base case (200 $m^3$/day) and future case (300 $m^3$/day) discharge of PFW at a depth of 45 m below mean sea level.

**Table 1-1 Location of the Yolla Platform used as the release site for the PFW dispersion modelling assessment.**

| Release Site | Latitude (S) | Longitude (E) | Water Depth (m) |
|---|---|---|---|
| Yolla Platform | 39° 50’ 39.5” | 145° 49’ 5.9” | 80 |

# 2 SCOPE OF WORK

The physical mixing and dilution of PFW with receiving waters occur through a series of processes. Initial mixing is generated during what is referred to as the “near-field” mixing zone, which occurs within metres of the discharge and within seconds to minutes. The near-field mixing is strongly affected by characteristics of the discharge configuration. Initial mixing is generated by turbulence generated as the discharge, ejected vertically and downwards, plunges due to momentum. As the plume descends, momentum will be lost due to the energy required to displace receiving water. If there is a lateral current, the centreline of the plume will bend in the direction of the current flow. Once downward momentum is lost, the fate of the plume will depend upon the plume density. If the plume remains buoyant relative to receiving water (i.e. warmer and/or at lower salinity than the receiving water), the plume will rise, undergoing further mixing by entrainment of ambient water, until either neutral density is reached or the plume collapses into a layer below the water surface. At this point, the plume is considered to enter the far-field mixing zone, where subsequent mixing is generated by water currents and turbulence in the water column.

The following scope of work was completed to assess dilution through near-field and far-field dilution phases:

- Collation of three-dimensional, spatially varying, current data for the waters surrounding the release location. Data spanning ten-years (2010-2019) was compiled by combining a hindcast from an ocean circulation model (HYCOM) with a high-resolution tidal model (HYDROMAP). The current dataset included the combined influence of drift and tidal currents and was suitably long as to be indicative of interannual variability in ocean currents.

- Derivation of statistical distributions for the current speed and directions for use in the near-field modelling. Analyses included percentile distributions and development of current roses. This analysis was important to ensure that current data samples applied in the dispersion model were statistically representative.

- Collation of vertical water density profiles at the Yolla Platform location for use as input to the dispersion models.

- Near-field modelling conducted for each unique discharge to assess the initial mixing of the discharge due to turbulence and subsequent entrainment of ambient water. This modelling was conducted at high spatial and temporal resolution (scales of metres and seconds, respectively).

- Outcomes from the near-field modelling included estimates of the width, shape and orientation of the plumes, and resulting contaminant concentrations and dilutions, for each discharge at a range of incident current speeds.

- Establishment of a far-field dispersion model to calculate dispersive mixing and dilution under currents and turbulence.

- Calculations for the transport and dispersive mixing of the remnant plume (remaining beyond the near-field zone) under a wide range of local current conditions by stochastic modelling (i.e. repeated simulations with each simulation using a unique time-sequence of current flow, chosen at random from the 10-year time series of current data).

- Analysis and mapping of areas that might be exposed to different levels of dilution.

# 3 DESCALING ACTIVITIES DISCHARGE IMPACT

Descaling involves the use of a chemical for the removal of scale deposits that accumulate in the wellbore and production equipment and pipelines due to the high mineral content of the PFW. Whilst the flowback of descaling activities is an isolated non-continuous discharge, contrasting with the PFW discharge, its impact on the surrounding waters was initially assessed through in-situ measurements taken at the PFW outlet. Even though the descaling chemical is not a hydrocarbon, it has a fluorescence which triggers the oil in water (OIW) instrumentation.

Measurements taken during activities conducted in November 2024 revealed changes in both density and OIW measurements, which were validated by samples of the stream. Density and OIW time-series showed a peak occurring immediately after the discharge, followed by a decay back to baseline readings approximately 13 hours later. WET tests performed to the samples collected in the same period also align with the peak OIW and density in-situ measurements. The density and OIW time-series are depicted in Figure 3-1.

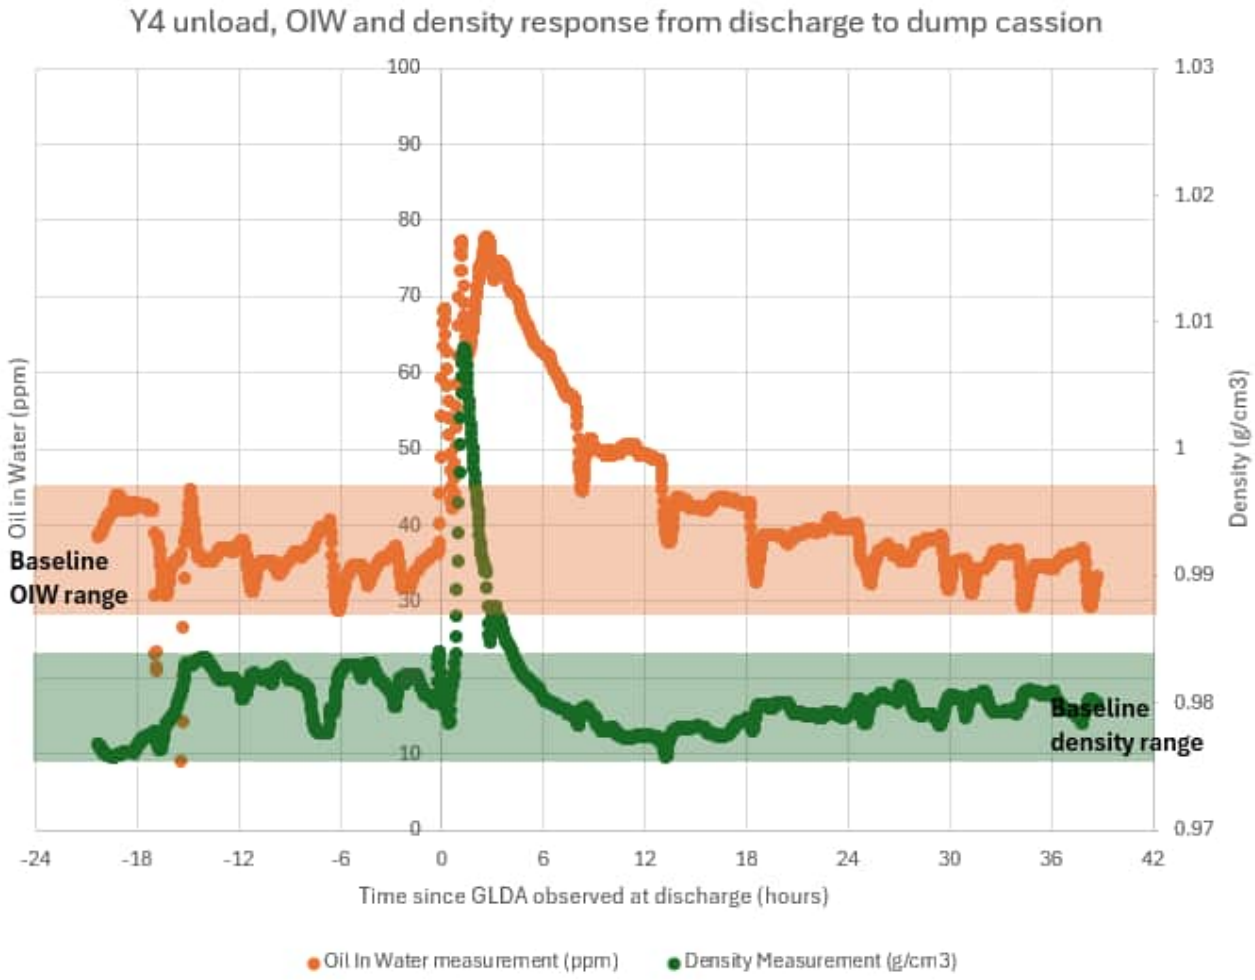

**Figure 3-1 Time-series of density and oil in water measurements taken in the PFW outlet during normal and descaling activities. Image provided by Beach.**

# 4 MODELLING METHODOLOGY

## 4.1 Near-Field Modelling

### 4.1.1 Overview

Numerical modelling was applied to quantify the area of influence of PFW discharges, in terms of the distribution of the minimum dilutions that might occur with distance from the source given defined discharge configurations, source concentrations, and the range of metocean conditions that affect the discharge location.

The dispersion of the PFW discharge will depend, initially, on the geometry and hydrodynamics of the discharges themselves, where the induced momentum and buoyancy effects dominate over background processes. This region is generally referred to as the near-field zone and is characterised by variations over short time and space scales. As the discharges mix with the ambient waters, the momentum and buoyancy signatures are eroded, and the background – or ambient – processes become dominant.

The shape and orientation of the discharged water plumes, and hence the distribution and dilution rate of the plume, will vary significantly with natural variation in prevailing water currents. Therefore, to best calculate the likely outcomes of the discharges, it is necessary to simulate discharge under a range of current speeds statistically representative of the Yolla Platform location.

### 4.1.2 Description of Near-Field Model: CORMIX

The near-field mixing and dispersion of the outfall was simulated using the three-dimensional flow model, CORMIX. CORMIX is a mixing zone model and decision support system for environmental impact assessment of regulatory mixing zones. CORMIX contains a series of elements for the analysis and design of single or multi-port discharges. Discharges may be submerged or above surface, buoyant or denser than receiving water and the receiving water may be stratified or unstratified. The emphasis of the model is the influence of the geometry and dilution characteristics on the initial mixing zone (Doneker and Jirka, 1990; Jirka et al., 1991). CORMIX is widely applied worldwide and has been validated in many independent studies (http://www.cormix.info/validations.php).

CORMIX is a collection of analytic solutions to simplified forms of the mathematical equations describing transport and dispersion of water borne constituents. The simplifications come about through a range of assumptions about the source configuration, source characteristics (discharge and buoyancy) and the ambient environment. These assumptions effectively limit the domain within which the analytic solutions apply. For the typical outfall source flow, two main zones can be defined as described in Table 4-1.

Although CORMIX does calculate far-field dispersion, the assumptions of the algorithms limit application to homogeneous environments with no eddies in the ambient flow and little recirculation. For this reason, the CORMIX component of the calculations for this study were limited to the near-field zone.

**Table 4-1 CORMIX mixing zones.**

| Zone | Description |
|---|---|
| Near-field | Jet characteristics, momentum flux, buoyancy flux and outfall geometry influence the plume's trajectory and mixing. |
| Far-field | Ambient conditions control the plume's trajectory and dilution due to density current buoyant spreading and ambient turbulence. |

CORMIX specifies the average dilution or bulk dilution (flux averaged) as 1.7 times the centreline dilution. The centreline is defined by the points of maximum concentration (maximum temperature, minimum dilution etc) at each vertical section along the longitudinal axis. Accordingly, centreline depth is defined as the depth of the maximum concentration point (maximum temperature, minimum dilution) along the longitudinal axis.

Figure 4-1 shows a conceptual diagram of the dispersion and fates of a positively buoyant discharge and the idealised representation of the discharge phases.

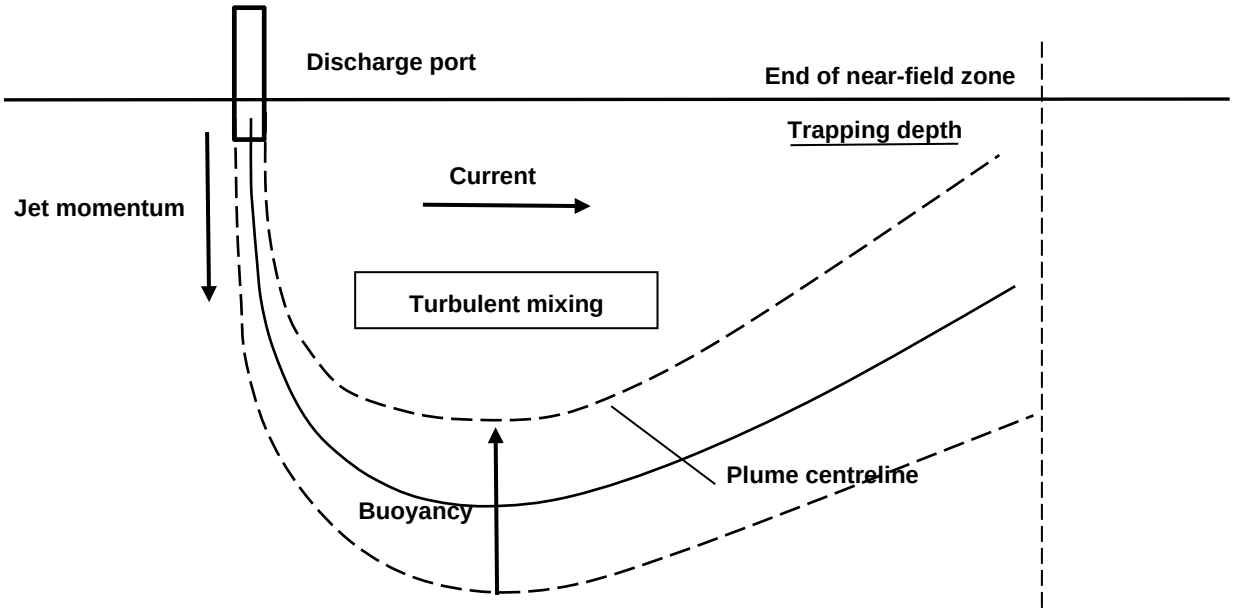

**Figure 4-1 Conceptual diagram showing the general behaviour of a positively buoyant discharge discharged vertically into receiving water moving due to current.**

### 4.1.3 Setup of Near-Field Model

#### 4.1.3.1 Discharge Characteristics

The PFW discharge characteristics for the discharge case are summarised in Table 4-2. The discharge is assumed to occur from the Yolla Platform at a discharge rate of either 200 $m^3$/day or 300 $m^3$/day. The PFW is discharged from a 0.73 m diameter pipe pointed vertically downwards and ending 45 m below the water surface. The discharge was assumed to have an average temperature and salinity of 15.3°C and 14.7 parts per thousand (ppt), respectively.

**Table 4-2 Summary of the PFW discharge characteristics.**

| Parameter | Base Case | Maximum Case |
|---|---|---|
| Flow rate ($m^3/d$) | 200 | 300 |
| Location | Yolla Platform | Yolla Platform |
| Duration (min) | Continuous | Continuous |
| Outlet pipe internal diameter (m) | 0.73 | 0.73 |
| Number of Ports | 1 | 1 |
| Outlet pipe orientation | Vertical (downwards) | Vertical (downwards) |
| Discharge Depth (m) | 45 (below MSL) | 45 (below MSL) |
| Discharge salinity (ppt) | 14.7 | 14.7 |
| Discharge temperature (°C) | 15.3 (average) | 15.3 (average) |

### 4.1.3.2 Ambient Environmental Conditions

Inputs of ambient environmental conditions to the CORMIX model included vertical profiles of temperature and salinity for winter (April to October) and summer (November to March) seasons, along with constant current speeds and general direction (per simulation). The temperature and salinity profiles are required to accurately account for the relative buoyancy of the diluting plume, while the current speeds control the intensity of initial mixing and the deflection of the PFW plume. These inputs are described in the following sections.

#### 4.1.3.2.1 Ambient Temperature and Salinity

Temperature and salinity data applied to the near-field modelling were sourced from the World Ocean Atlas 2018 (WOA18) database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration, NOAA) and its co-located World Data Center for Oceanography (Levitus *et al.*, 2013).

Figure 4-2 shows the vertical profiles of temperature and salinity for each month at Yolla Platform. Table 4-3 shows the average water temperature and salinity near surface and seabed at the Yolla Platform location for summer and winter.

**Table 4-3 Average seasonal temperature and salinity levels adjacent to the Yolla Platform location.**

| Season | Depth | Temperature (°C) | Salinity (PSU) |
|---|---|---|---|
| Summer | Near surface | 17.3 | 35.4 |
| | Near seabed | 15.8 | 35.3 |
| Winter | Near surface | 14.4 | 35.4 |
| | Near seabed | 14.4 | 35.4 |

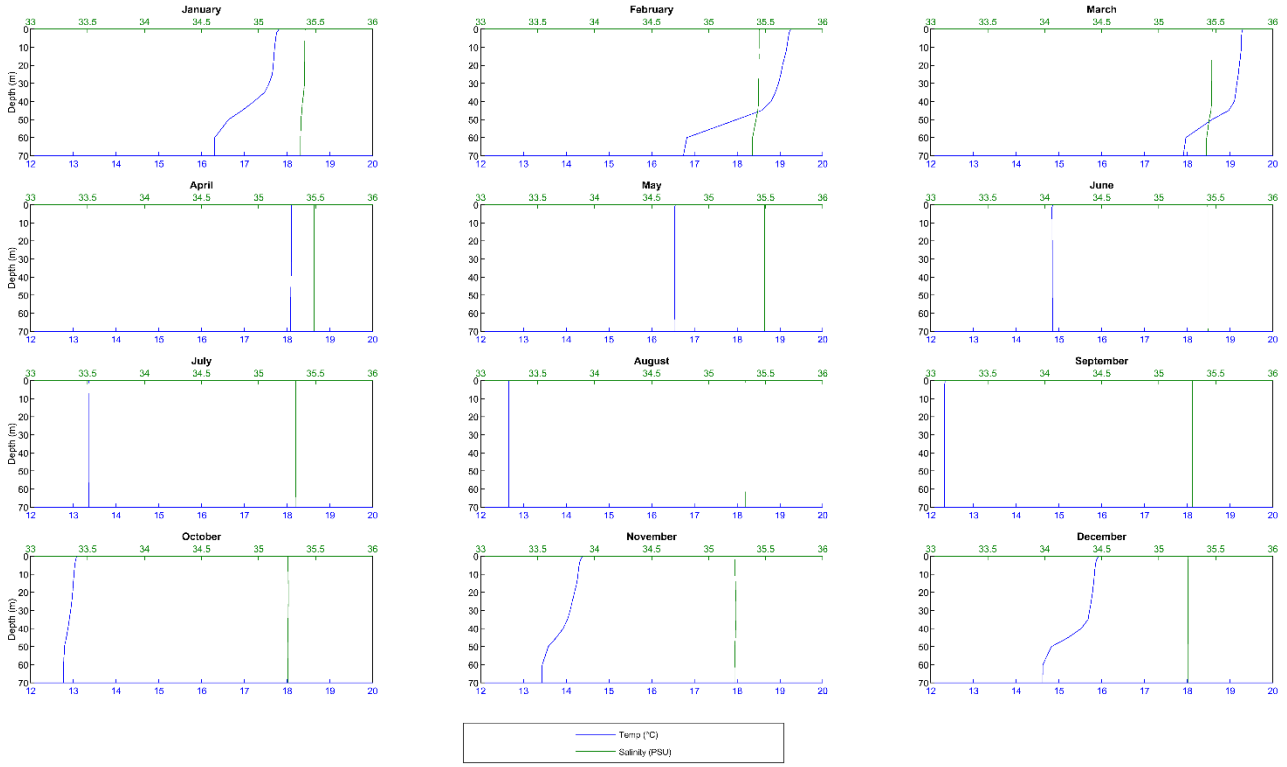

**Figure 4-2 Monthly salinity and temperature profiles at the Yolla Platform**

### 4.1.3.2.2 Ambient Current

Ocean current data was sourced from a ten-year hindcast data set of combined large-scale ocean (HYCOM) and tidal currents. The data was statistically analysed to determine the 5$^{th}$, 50$^{th}$ and 95$^{th}$ percentile current speeds. These statistical current speeds can be considered representative of annual conditions at the location as current speeds did not reveal to be substantially sensitive to seasonality.

Table 4-4 presents the annual steady-state, unidirectional, current speeds at varying depths used as input to the near-field model as forcing for each discharge case:

- 5$^{th}$ percentile current speed: weak currents, low dilution and slow advection.
- 50$^{th}$ percentile (median) current speed: average currents, moderate dilution and advection.
- 95$^{th}$ percentile current speed: strong currents, high dilution and rapid advection to nearby areas.

The 5$^{th}$, 50$^{th}$ and 95$^{th}$ percentile values are referenced as weak, medium and strong current speeds, respectively.

**Table 4-4 Adopted ambient current conditions adjacent to the Yolla Platform location.**

| Season | 5$^{th}$ Percentile (Weak) Current Speed (m/s) | 50$^{th}$ Percentile (Medium) Current Speed (m/s) | 95$^{th}$ Percentile (Strong) Current Speed (m/s) |
|---|---|---|---|
| Annual | 0.04 | 0.17 | 0.42 |

## 4.2 Far-Field Modelling

### 4.2.1 Overview

The far-field modelling expands on the near-field work by allowing the time-varying nature of currents to be included, with the potential for localised build-up when current speeds are low (e.g. at the turning of the tide) and recirculation of the plume back to the discharge location might occur. In this case, concentrations near the discharge point can be increased due to the discharge plume mixing with the remnant plume from an earlier time. This may be a potential source of episodic increases in pollutant concentrations in the receiving waters.

### 4.2.2 Description of Far-Field Model: MUDMAP

The mixing and dispersion of the produced formation water discharges beyond the near-field zone was predicted using the three-dimensional discharge and plume behaviour model, MUDMAP (Koh & Chang, 1973; Khondaker, 2000). MUDMAP predicts the transport and passive dispersion of the discharged material due to the local currents and dispersive forces in the water column. Dispersion of the discharged material will be enhanced with increased current speeds, greater variation in current direction over time and increased wave energy.

The passive dispersion stage employs a particle-based, random walk, procedure. Constituents within the discharge stream are represented by a sample of Lagrangian particles. These particles are moved in three dimensions over each subsequent time step according to the prevailing local current data as well as horizontal and vertical mixing coefficients. Seabed deposition patterns are calculated for particulate sinking material, with sinking rates varying by particle size.

MUDMAP treats the Lagrangian particles as conservative tracers (i.e. they are not removed over time to account for chemical interactions, decay or precipitation). Predicted concentrations will therefore be conservative overestimates where these processes do occur. Each particle represents a proportion of the discharge, by mass, and particles are released at a given rate to represent the rate of the discharge (mass per unit time). Concentrations of constituents are predicted over time by counting the number of particles that occur within a given depth level and grid square and converting this value to mass per unit volume.

The system has been extensively validated and applied for discharge operations in Australian waters for other PFW discharges (e.g. Burns et al., 1999; King & McAllister, 1997, 1998).

### 4.2.3 Stochastic Modelling

A stochastic modelling procedure was applied in the far-field modelling to sample a representative set of conditions that could affect the distribution of constituents. This approach involves 100 simulations of a given discharge, with each simulation representing discharge for 5 days under a different, randomly selected, sequence of current speed and direction data. These sequences were selected at random from the 10-year database of current data for the site. The initial dilution and shape of the discharge was set by the results of the near-field results described in Section 4.1. This methodology ensures that the calculated movement and fate of each discharge is representative of the passive dispersive forces for the range of prevailing currents that occur at the discharge location. Assumed PFW characteristics are summarised in Table 4-5.

Once the stochastic modelling was complete, all simulations were statistically analysed to map distributions of possible outcomes based on likelihood. The stochastic simulations were jointly processed annually (100 replicate simulations). The analysis calculated the frequency of occurrence of a given dilution level, by horizontal location, at surrounding locations. Results were summarised for the 95$^{th}$ percentile dilution over time.

The 95$^{th}$ percentile dilution values do not represent the instantaneous spatial extent of the plume at any single point in time. Instead, they provide a spatially aggregated statistical summary across all model simulations. Specifically, the 95$^{th}$ percentile dilution map shows the minimum dilution level that is met or exceeded 95% of the time during the simulations. In other words, dilution is lower than the mapped values for only 5% of the simulation periods.

This percentile-based approach is particularly relevant for environmental impact assessments. Instantaneous worst-case dilution values can be misleading, as they capture only brief (i.e. less than 1 hr), potentially rare events that are not representative of sustained environmental conditions. Since ecotoxicological studies—such as those used to establish safe concentration thresholds—are based on time-averaged exposure scenarios, a

percentile-based metric like the 95th percentile provides a more meaningful and conservative estimate of potential environmental harm. It aligns more closely with chronic exposure levels rather than transient extremes, making it more suitable for regulatory comparison and ecological risk evaluation.

### 4.2.4 Setup of Far-Field Model

#### 4.2.4.1 Discharge Characteristics

The MUDMAP model simulated the discharge into a time-varying current field with the initial dilution and shape of the discharge set by the near-field results described in Section 4.1. The PFW discharge scenario was modelled as a continuous discharge under time-varying current assuming the initial dilution and density change imposed by the near-field mixing (detailed in Section 5.1).

Table 4-5 presents a summary of the far-field model inputs used to calculate the transport and mixing of the chemical treatment by the ambient currents. As previously mentioned, 100 simulations were run as a representation on annual conditions and each simulation had a different start time, which ensured a range of current conditions were sampled.

**Table 4-5 Summary of PFW discharge modelling assumed for far-field modelling.**

| Parameter | Base Case | Future Case |
|---|---|---|
| Hindcast modelling period | 2010-2019 | 2010-2019 |
| Seasons | Annual | Annual |
| Flow rate ($m^3/d$) | 200 | 300 |
| Initial depth of centreline (m) | 45 | 45 |
| Number of simulations | 100 | 100 |
| Simulated discharge type | Continuous | Continuous |
| Simulated discharge period (days) | 5 | 5 |

### 4.2.4.2 Mixing Parameters

Horizontal and vertical dispersion coefficients in dispersion modelling represent turbulence-driven mixing and diffusion, which occur at sub-grid scales relative to the model's hydrodynamics. These coefficients, expressed in m²/s, govern the rate of area change per second. Increasing the horizontal dispersion coefficient enhances lateral plume spread, reducing centreline concentrations, while increasing the vertical coefficient accelerates downward mixing into the water column.

Horizontal turbulent diffusion depends on metocean conditions (wind, waves and currents) and the plume's scale relative to oceanic dispersion processes. For plumes 10–100 m wide, small-scale swirling motions and vertical mixing dominate, with horizontal dispersion rates near 0.1 m²/s. As the plume's width expands to 1–10 km, mesoscale eddies drive dispersion rates of a few to tens of m²/s. At scales exceeding mesoscale eddies, eddy mixing dominates with dispersion rates of 100–1,000 m²/s.

A spatially uniform and conservative dispersion coefficient of 0.2 m²/s (horizontal) and 0.0001 m²/s (vertical) was applied to control produced water plume spreading. These values were selected through extensive sensitivity testing, ensuring conservative concentration estimates, as in-situ mixing under average and high-energy conditions is expected to be at least an order of magnitude greater (King & McAllister, 1997, 1998).

### 4.2.4.3 Grid Configuration

MUDMAP uses a three-dimensional grid to represent the geographic region under study (water depth and bathymetric profiles). The model was setup, and analysed and mapped on two grid scales, representing the aqueous and particulates components, respectively. Due to the rapid mixing and small-scale effect of the effluent discharge, it was necessary to use a fine grid with a resolution of 5 m x 5 m to track the movement and fate of the aqueous PFW discharge plume. The extent of the grid region measured approximately 5 km (longitude or x-axis) by 5 km (latitude or y-axis), which was subdivided horizontally into approximately 1,000 x 1,000 cells. The vertical resolution was set to 5 m.

## 4.2.5 Regional Ocean Currents

### 4.2.5.1 Background

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area off the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the strait are driven by tides, winds, incident continental shelf waves and density driven flows. High winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 4-3 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kampf 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional data set.

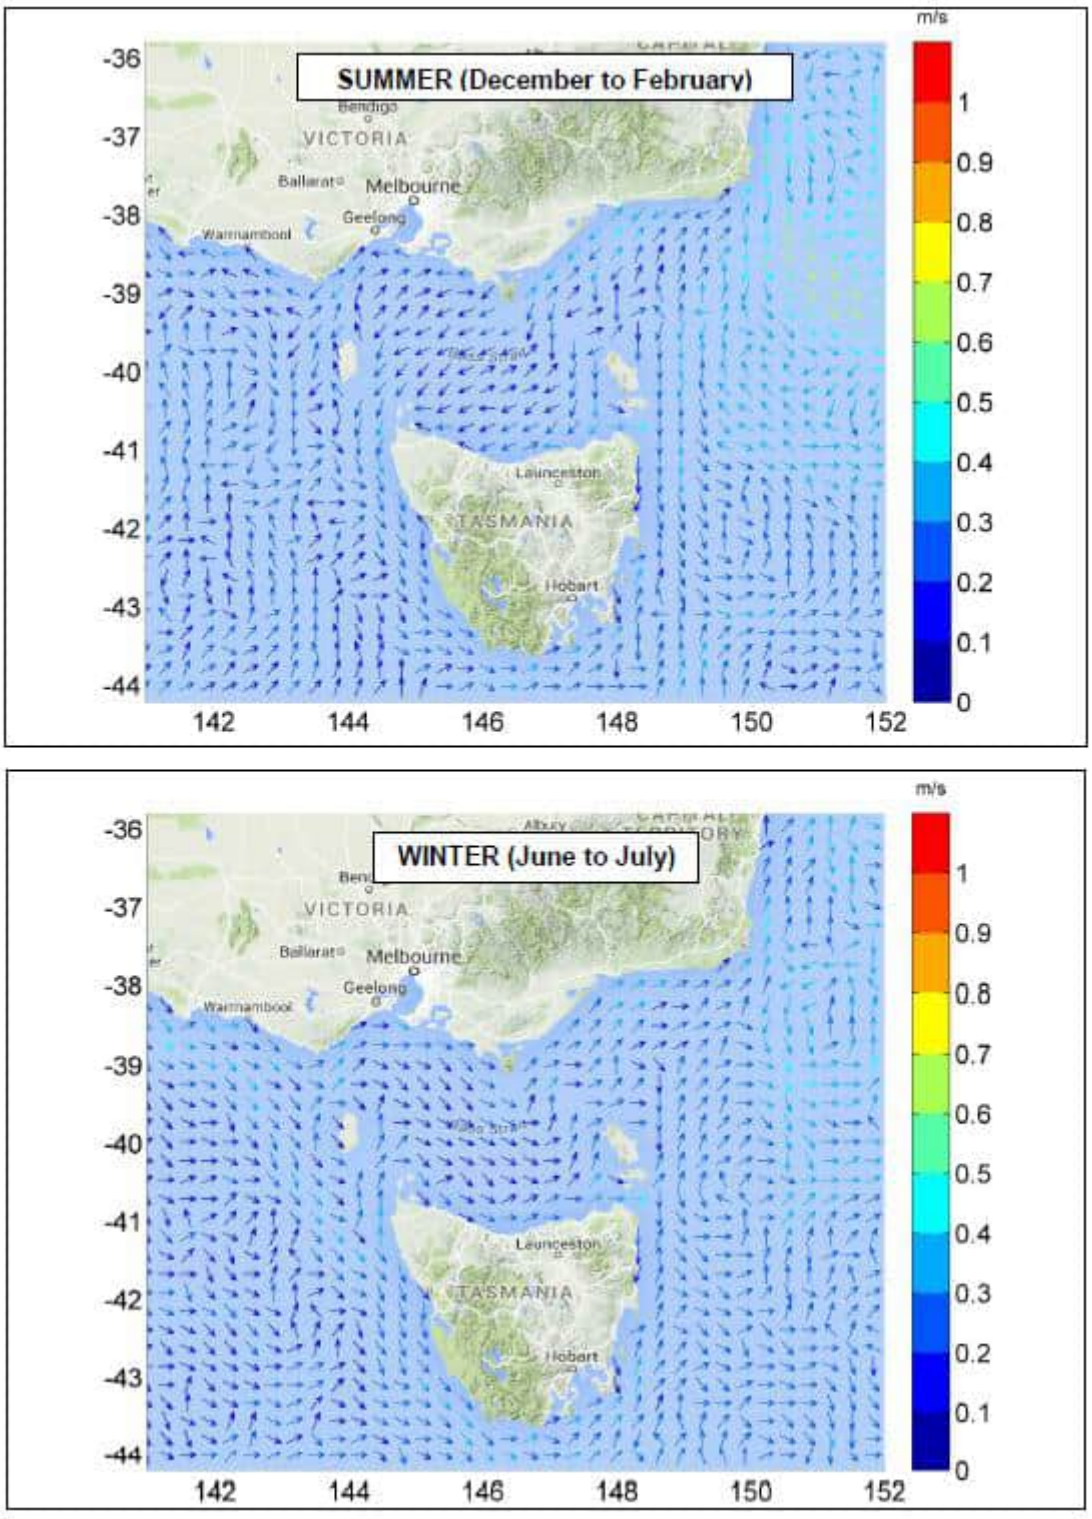

**Figure 4-3 Example HYCOM averaged seasonal surface drift currents during summer (top) and winter (bottom).**

### 4.2.5.1 Tidal Currents

Tidal current data were generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world over the past 38 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data have been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

### 4.2.5.2 Grid Setup

The tidal model domain has been sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids were allocated in a step-wise fashion to resolve flows more accurately along the coastline, around islands and over regions with more complex bathymetry. Figure 4-4 shows the tidal model grid resolutions.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 4-5). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

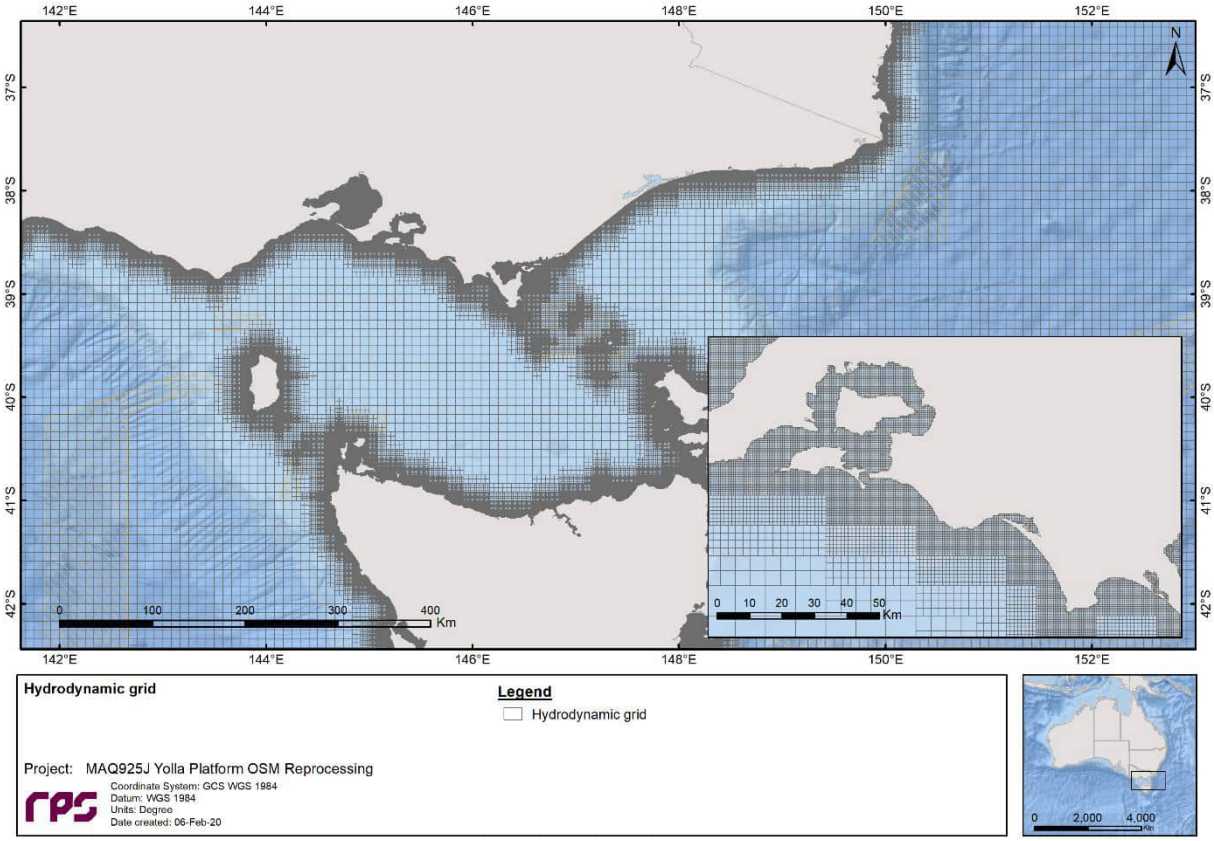

**Figure 4-4 Zoomed in view of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.**

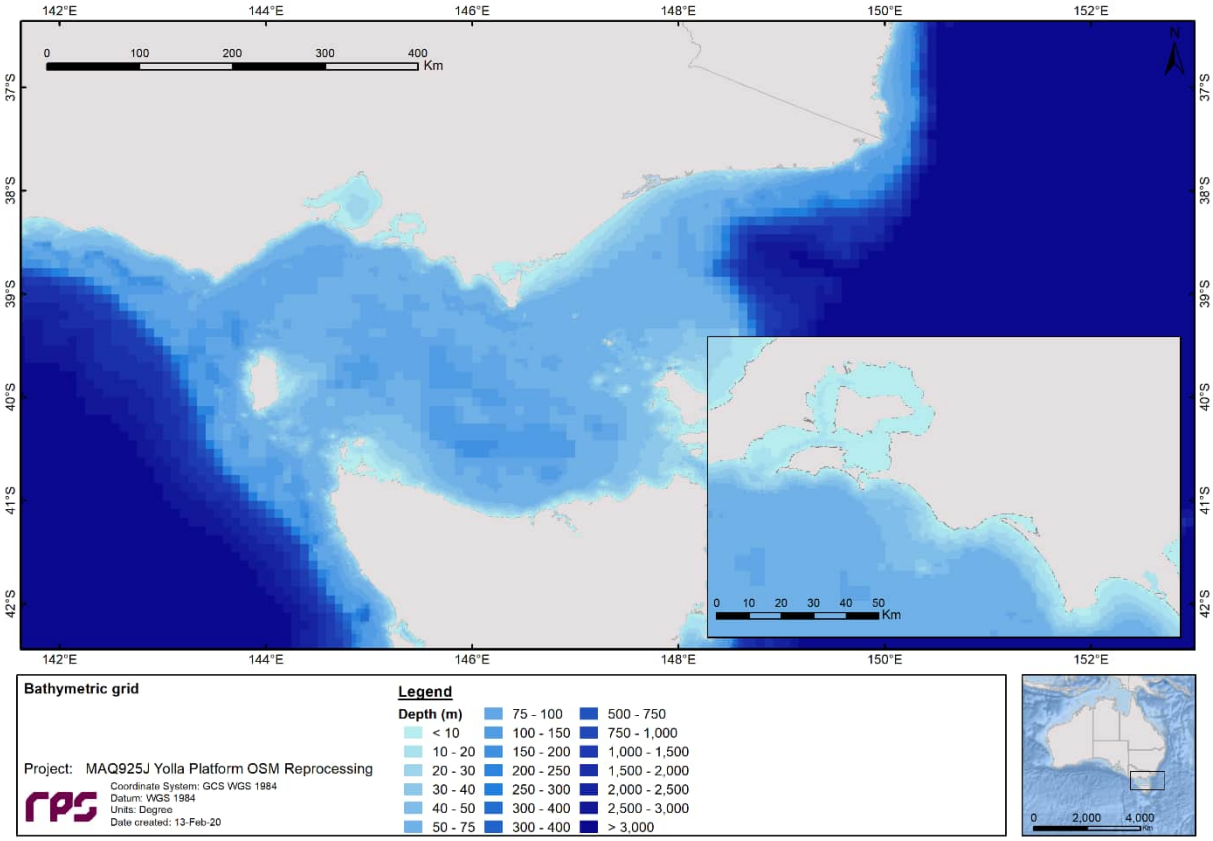

**Figure 4-5 Bathymetry defined throughout the tidal model domain.**

### 4.2.5.3 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 7.2) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were $K_2$, $S_2$, $M_2$, $N_2$, $K_1$, $P_1$, $O_1$ and $Q_1$. Using the tidal data, surface heights were firstly calculated along the open boundaries, at each time step in the model.

The TOPEX/Poseidon satellite data have a global resolution of 0.25 degrees and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The satellites equipped with two highly accurate altimeters and capable of taking sea level measurements with an accuracy of ± 5 cm measured oceanic surface elevations (and the resultant tides) for over 13 years (1992–2005). In total, these satellites carried out 62,000 orbits of the planet.

The TOPEX/Poseidon tidal data has been widely used amongst the oceanographic community, being included in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk and Tangdong, 2004; Qiu and Chen 2010). As such the TOPEX/Poseidon tidal data is considered suitably accurate for this study.

### 4.2.5.4 Ocean Currents

Data describing the flow of ocean currents was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the National Ocean Partnership Program (NOPP), as part of the U.S. Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12$^{th}$ of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

For this study, the HYCOM hindcast currents were obtained for the years 2010 to 2019 (inclusive).

Note the convention for defining current direction throughout this report is the direction the current flows towards. Each branch of the current rose distribution represents the currents flowing to that direction, with north to the top of the diagram. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of 0.1 m/s are typically used in these current roses. The length of each coloured segment within a branch is proportional to the frequency of currents flowing within the corresponding speed and direction.

### 4.2.5.5 Surface Currents

Table 4-6 presents the predicted average and maximum monthly surface current speeds at the release location.

Current speeds near the Yolla Platform varied throughout the year with monthly maximum current speeds ranging between 0.61 m/s (January) and 0.98 m/s (July). The dominant surface current directions throughout the year were identified as (towards) the east and east-southeast.

Figure 4-6 and Figure 4-7 present the monthly and total current rose distributions, respectively.

**Table 4-6 Predicted monthly average and maximum surface current speeds close to the release location. Data derived by combining the HYCOM ocean data and HYDROMAP high resolution tidal data from 2010-2019.**

| Month | Average current speed (m/s) | Maximum current speed (m/s) | General direction (towards) |
|---|---|---|---|
| January | 0.18 | 0.61 | Varied |
| February | 0.18 | 0.65 | East-west axis |
| March | 0.17 | 0.75 | East |
| April | 0.17 | 0.75 | East-southeast |
| May | 0.20 | 0.96 | East |
| June | 0.19 | 0.80 | East-southeast |
| July | 0.23 | 0.98 | East-southeast |
| August | 0.21 | 0.91 | East |
| September | 0.20 | 0.78 | East |
| October | 0.18 | 0.70 | East |
| November | 0.18 | 0.67 | East-northeast |
| December | 0.19 | 0.63 | East-northeast |
| **Minimum** | **0.17** | **0.61** | - |
| **Maximum** | **0.23** | **0.98** | - |

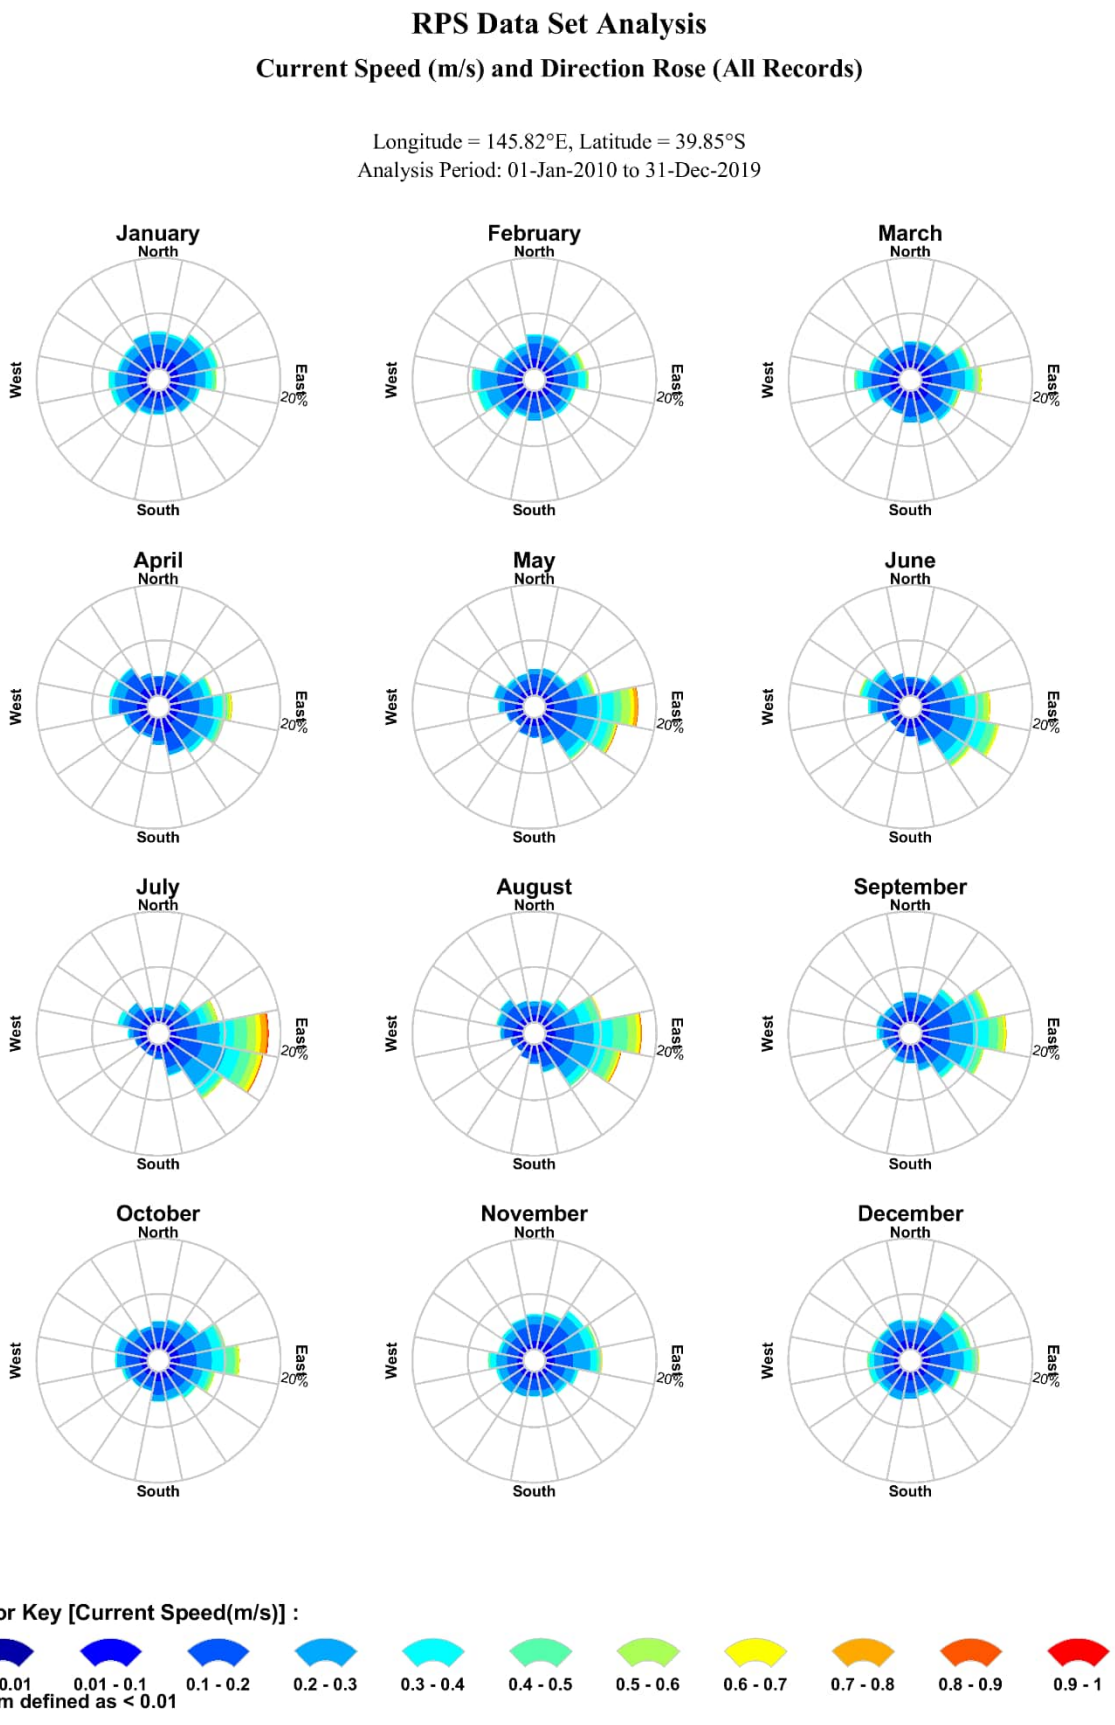

**Figure 4-6 Monthly surface current rose distributions at the release location derived from the 2010 to 2019 modelled dataset.**

# 5 MODELLING RESULTS

## 5.1 Near-Field Modelling

### 5.1.1 Overview

Figure 5-1 to Figure 5-12show the change in minimum dilution of the plume under varying seasons and current speeds (weak, medium and strong). The figures show the predicted horizontal distance travelled by the plume before the trapping depth is reached (i.e. before the plume becomes neutrally buoyant). Please note the differing x-axis and y-axis aspect ratios between the cases to best highlight details for each case.

The plots show the general shape expected for the plume given the discharge characteristics and different current speeds. The downward directed jet is forecasted to briefly plunge and rapidly dilute due to the initial momentum of the discharge, then rise to the water surface.

The plots also show the expected bending of the plume to align with the current direction over the plunge and rise phase. Faster currents speeds are forecasted to result in the plume aligning to the current direction more quickly, commencing during the plunge phase and continuing during the buoyant rise phase.

Under strong currents, the distance where the lower dilution threshold of 526 was reached ranged from 55 m to 62 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 850 m to 1,230 m.

Under moderate currents, the distance where the lower dilution threshold of 526 was reached ranged from 27 m to 30 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 475 m to 1,400 m.

Under low currents, the distance where the lower dilution threshold of 526 was reached ranged from 11 m to 12 m across the different seasons and flow rates, while the higher dilution threshold (19,608) was reached within 580 m to 1,600 m.

Table 5-1 and Table 5-2 summarise the distances from the release location for the threshold dilutions to be reached under high, medium and low currents for each season and flow case.

**Table 5-1 Distances from release location to reach threshold dilutions for the 200 $m^3$/day base case.**

| Current speed condition | Summer | | | | Winter | | | |
|---|---|---|---|---|---|---|---|---|
| | 526 dilutions | 1,961 dilutions | 7,143 dilutions | 19,608 dilutions | 526 dilutions | 1,961 dilutions | 7,143 dilutions | 19,608 dilutions |
| High | 55 | 161 | 400 | 1,230 | 55 | 145 | 400 | 900 |
| Medium | 28 | 83 | 400 | 1,100 | 27 | 73 | 198 | 475 |
| Low | 11 | 27 | 500 | 1,220 | 11 | 27 | 65 | 580 |

**Table 5-2 Distances from release location to reach threshold dilutions for the 300 $m^3$/day future case.**

| Current speed condition | Summer | | | | Winter | | | |
|---|---|---|---|---|---|---|---|---|
| | 526 dilutions | 1,961 dilutions | 7,143 dilutions | 19,608 dilutions | 526 dilutions | 1,961 dilutions | 7,143 dilutions | 19,608 dilutions |
| High | 62 | 182 | 410 | 850 | 58 | 162 | 446 | 1.030 |
| Medium | 30 | 95 | 560 | 1,400 | 29 | 80 | 220 | 503 |
| Low | 12 | 32 | 675 | 1,600 | 12 | 30 | 100 | 981 |

## 5.2 Far-Field Modelling

### 5.2.1 Overview

Near-field and far-field modelling describe different processes at different scales, so their results may not always align where the two overlap near the discharge location. Far-field modelling accounts for time-varying currents, which can sometimes lead to plume pooling at the release site under weak currents. When this pooled plume is later carried away, it can result in lower dilutions (higher concentrations) migrating farther from the discharge point.

### 5.2.2 Stochastic Analysis

The model outputs over the ten-year hindcast period (2010-2019) were combined and analysed on an annual basis.

Table 5-3 summarises the maximum distances from the discharge location to achieve various dilution levels, ranging between 500 and 20,000 dilutions, for the 95$^{th}$ percentile.

The lower dilution threshold (526) was observed within approximately 10 m and 12 m for the Base Case and Future Case, respectively.

The dilution threshold of 7,143 was observed within approximately 29 m and 37 m for the Base Case and Future Case, respectively.

The dilution threshold of 1,961 was observed within approximately 41 m and 61 m for the Base Case and Future Case, respectively.

The upper dilution threshold (19,608) was observed within approximately 163 m and 247 m for the Base Case and Future Case, respectively.

The dilution maps for the 95$^{th}$ percentile for each discharge case is depicted in Figure 5-13 and Figure 5-14, along with contours illustrating the lower and upper dilution thresholds.

**Table 5-3 Maximum distance from the PFW discharge location to achieve threshold dilutions.**

| Statistic | Dilutions (1:X) | Maximum distance (m) from discharge location to achieve given dilution for the Base Case (200 m$^3$/day) | Maximum distance (m) from discharge location to achieve given dilution for the Future Case (300 m$^3$/day) |
|---|---|---|---|
| 95$^{th}$ Percentile | 500 | 10 | 12 |
| | **526** | **10** | **12** |
| | **1,961** | **29** | **37** |
| | 2,000 | 29 | 36 |
| | 4,000 | 30 | 38 |
| | **7,143** | **41** | **61** |
| | 8,000 | 43 | 74 |
| | 10,000 | 64 | 125 |
| | 12,500 | 100 | 152 |
| | 15,000 | 126 | 182 |
| | 17,500 | 160 | 232 |
| | **19,608** | **163** | **247** |
| | 20,000 | 165 | 253 |

## About AECOM

AECOM is the world's trusted infrastructure consulting firm, delivering professional services throughout the project lifecycle – from advisory, planning, design and engineering to program and construction management. On projects spanning transportation, buildings, water, new energy and the environment, our public- and private-sector clients trust us to solve their most complex challenges. Our teams are driven by a common purpose to deliver a better world through our unrivaled technical and digital expertise, a culture of equity, diversity and inclusion, and a commitment to environmental, social and governance priorities. AECOM is a Fortune 500 firm and its Professional Services business had revenue of $14.1 billion in fiscal year 2024. See how we are delivering sustainable legacies for generations to come at aecom.com and @AECOM.

# 1.0 Introduction

Beach Energy Ltd (Beach) has commissioned AECOM Australia Pty Ltd (AECOM) to undertake an assessment of the proposed use of descaling chemical glutamic acid-N,N-diacetate (GLDA) at the Yolla-A facility, to redress falling production flow rates of gas. The objective of the assessment is to demonstrate that any potential impacts to the receiving marine environment from the use of GLDA have been reduced to as low as reasonably practicable (ALARP).

The assessment was led by Ian Baxter, CEnvP, of SEAPEN Marine Environmental Services and was prepared in collaboration with Dr Bryant Gagliardi (Principal Ecological Risk Assessor, Environment) and Dr Supriya Lath (Senior Environmental Scientist) from AECOM. Technical review was undertaken by Tania Liaghati (Technical Director, Environment), and the project was managed by Dr Jason Crisp (Principal Marine Scientist, Environment), both of AECOM.

## 1.1 Background

The BassGas Development facility is an offshore gas facility located in Bass Strait operated by Beach, which produces natural gas and condensate from the Yolla gas field in the Bass Strait. The gas field is serviced by the Yolla-A offshore platform, and an approximately 147 km subsea pipeline that transports the gas and liquids from the platform to the Victorian mainland. The location of the Yolla-A platform and pipeline is presented in Figure 1 below.

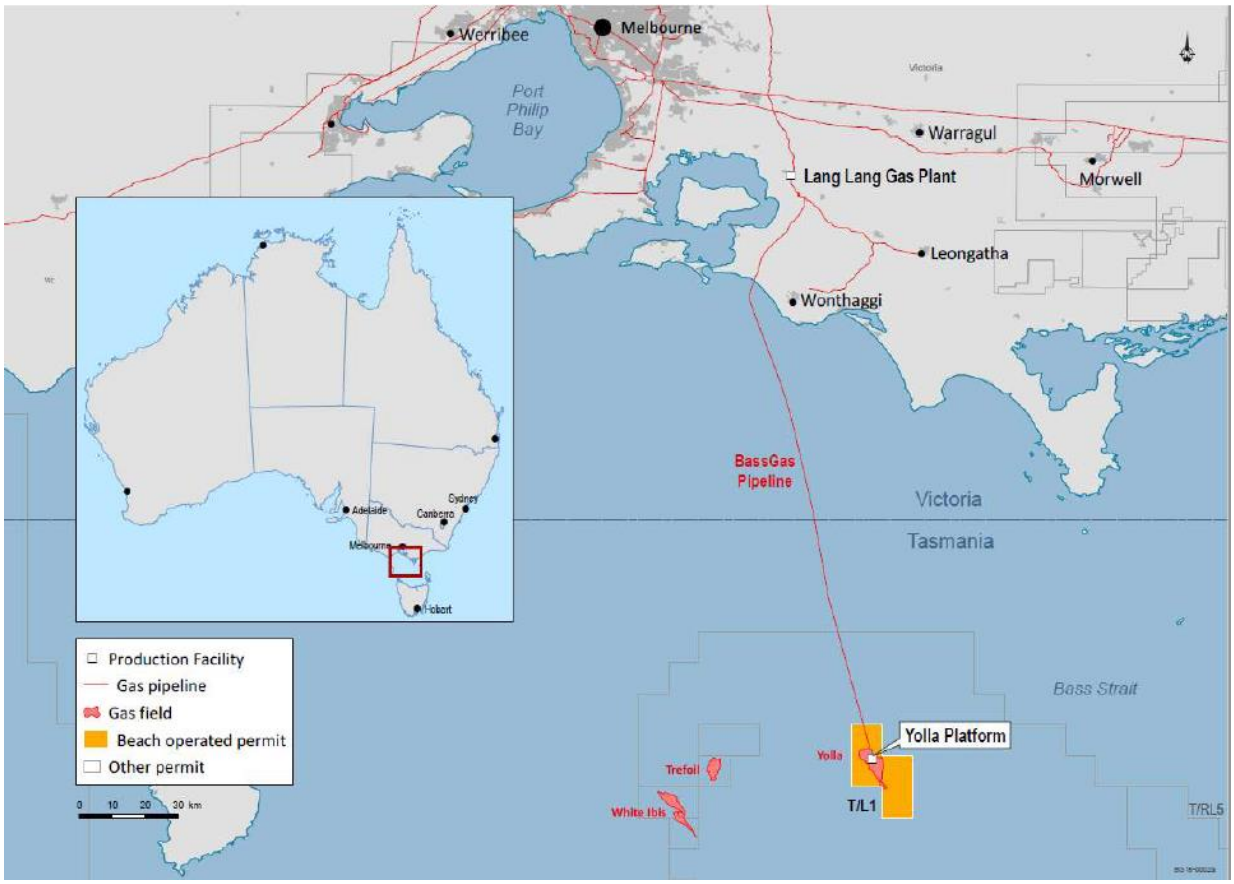

**Figure 1 Yolla-A Platform location at the BassGas Development facility.**

Yolla-A Platform is fed by four separate production wells (Y3, Y4, Y5 and Y6) via umbilicals laid over the seabed, from which gas is processed onboard Yolla-A and exported via the BassGas pipeline to shore. Treated Produced Formation Water (PFW) is released to the sea at the platform.

## 1.2 Selection of GLDA as the Preferred Descaling Chemical

In 2023, Beach observed a significant decline in well performance at Yolla-A, with export rates declining to 5-6Tj/d, approaching non-commercial levels (Beach pers comms). This prompted an investigation

into the source(s) of the loss of net well productivity, which identified Y-4 and Y-6 wells as being particularly impacted. A wireline intervention in Y-6 identified a downhole obstruction, which was subsequently sampled and analysed for constituents. This sample was found to primarily consist of calcite scale. Additionally, produced formation water (PFW) samples were collected from the field (at surface facilities) and analysed to determine chemical constituent profiles and concentrations.

A specialist production chemist was engaged by Beach, and a scale study was completed and found that the current downhole conditions at Y-6 well had resulted in calcite scale forming in the downhole completion and near wellbore of the wells (Gunn and Hobbs, 2024). A project was initiated to identify a suitable treatment method for the downhole scale removal, with industry experts and service companies engaged. Hydrochloric Acid (HCl) and a specialist chelating agent, GLDA, were both assessed as treatments for the calcite scale. However, HCl was found to be unsuitable due to its corrosive impact on metallurgy and seals, particularly under high temperature conditions. Additionally, any increase in pH during flow back can result in the redeposition of the scale, as calcium and iron scales solubility are pH dependent. HCl use also poses the risk of mobilising fines in the reservoir, leading to production impairment. Given these concerns, GLDA was selected as the lowest risk option for effectively treating the scale (Gunn and Hobbs, 2024). This synthetic product, derived from a naturally occurring amino acid (L-glutamic acid), has been used in the North Sea to treat scale and is known to be less corrosive on well and facilities metallurgy (as opposed to harsh acids) compared to strong acids. Furthermore, GLDA holds a GOLD rating under the OSPAR/CHARM framework, the highest classification on the CEFAS register, based on its favourable toxicity, biodegradability, and bioaccumulation characteristics (Backus, 2024; Backus, 2025; Nouryon, 2019).

## 1.3 Objectives and Scope

This report presents an assessment of the proposed removal of calcite scale from the BassGas Production system, with the objective of demonstrating that the potential environmental impacts within the receiving marine environment associated with the use of GLDA have been reduced to a level that is As Low As Reasonably Practicable (ALARP).

In order to assist Beach in developing a suitable ALARP case for consideration by the regulator, AECOM has undertaken the following scope of work:

- Reviewed the previous ALARP assessment (AECOM, 2019) undertaken in 2019.
- Evaluated learnings from the 2025 SSDF and Mixing Zone report (AECOM 2025), Whole Effluent Toxicity (WET) testing, available ecotoxicology data reports for GLDA use at Yolla-A.
- Considered technical information provided by Beach engineers to better understand intended use of GLDA at the Yolla-A production wells.
- Prepared this updated ALARP assessment report to consider the inclusion of GLDA in the production process.

# 2.0 Site Setting and Operations

## 2.1 Environment Plan

The BassGas Offshore Operations Environment Plan (henceforth EP) is being implemented to manage potential environmental impacts and risks associated with the operation of the BassGas Development facility, which includes Yolla-A as a key offshore production and processing asset. In accordance with the *Commonwealth Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (OPGGS(E))*, and the Victorian *Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Regulations 2011*, which have since been updated, Beach previously submitted a five-yearly update of the EP (Aventus, 2020) to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for assessment on 20 September 2019. The EP was accepted by NOPSEMA on 23 December 2020 (Beach, 2020; NOPSEMA 2020).

In accordance with current regulations, EPs for long-term offshore activities must be revised every five years. This obligation is set out under the following Regulations:

- Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Australian Government, 2023)
- Offshore Petroleum and Greenhouse Gas Storage Regulations 2021 (Victorian Government, 2021)

Beach is currently undertaking another five-year review of the Bass Gas Offshore Operations EP to cover ongoing production operations, with public consultation open until 10 October 2025. The revised EP will be re-submitted to NOPSEMA for approval. The revised EP's scope is intended to include the operation of the offshore wells, Yolla Platform and pipeline, and the ongoing maintenance and inspections to ensure safe ongoing field operations (Beach, 2025). The EP will also detail control measures to reduce and manage environmental impacts and potential risks to ALARP and acceptable levels (Beach, 2025).

## 2.2 Environmental Setting

The Yolla-A platform stands in approximately 80 m water depth and is located some 93 km south-west of Wilson's Promontory in Victoria and 109 km north-west of the Tasmanian mainland. The facility was installed in 2004 and has been in production since 2006. Product is transported from the platform via a 147 km subsea pipeline extending from the platform to the mainland shore crossing near Kilcunda, Victoria.

The following marine environmental receptors are considered likely to be present, or have the potential to be present, in the general vicinity of the PFW discharge:

- Benthic assemblages – surveys of the seabed near the Yolla-A platform prior to drilling and construction identified sparsely scattered clumps of solitary sponges, sea cucumbers, sea squirts and predatory snails (whelks).
- Plankton - both phytoplankton (e.g. diatoms, flagellates and cyanobacteria) and zooplankton (e.g. krill, polychaetes, fish eggs and fish larvae) are commonly found throughout Bass Strait.
- Marine flora – Due to the depth of the seabed in the vicinity of Yolla-A, marine plant life is likely confined to the shallower areas of the platform structure. These communities are expected to consist primarily of various species of brown, red, and green algae.
- Seabirds – a search of the *Environment Protection and Biodiversity Conservation Act 1999* protected matters database ('EPBC database') in October 2025 identified 29 species of seabirds whose habitat may occur within the general vicinity of the PFW discharge. Of these, three are listed as critically endangered, five as endangered and 21 as vulnerable. However, the critically endangered species are a curlew, a sandpiper and a parrot; none of these species are at risk of impacts from the PFW discharge, which does not have the potential to impact upon their habitats or to have effects upon their trophic chain. Each of the endangered species (three albatross and two petrels) has the potential to be exposed to effects from the PFW plume, either by direct contact (e.g during feeding or resting on the sea surface) or via trophic chain effects. Similarly, 19 of the

vulnerable species have the potential to be exposed to effects from the PFW plume (12 albatross, four petrels, a prion, a shearwater and a tern).

- Cetaceans – the EPBC database search identified two endangered whale species (blue [*Balaenoptera musculus]* and southern right *[Eubalena australis]*) and two vulnerable whale species (fin [*Balaenoptera physalus*] and sei [*Balaenoptera borealis*]) that may have the potential to occur within the general vicinity of the Yolla field. There are no records in the Victorian Biodiversity Atlas (VBA) or the Atlas of Living Australia (ALA) of observations of these species within hundreds of kilometres of the Yolla field, there may be the potential for them to occur in the area at certain times of the year, or to transit through the area during annual migrations. The non-threatened cetacean species protected under the EPBC Act that were identified in the database search as potentially occurring in the vicinity of the Yolla field comprised six whale species and four dolphin species.
- Pinnipeds – two pinniped species (the Australian fur seal [*Arctocephalus pusillus*] and the long-nosed fur seal [*Arctocephalus forsteri]*) were identified in the EPBC database as potentially occurring in the vicinity of the Yolla field; both of these species are listed as marine, not threatened, species. The VBA and the ALA only contain records of the former species within 100 km of the Yolla field, though the potential for the latter species to also be present cannot be discounted.
- Fish – it is estimated that there are over 500 species of fish found in the waters of Bass Strait, including a number of species of importance to commercial and recreational fisheries. One vulnerable shark species (great white [*Carcharodon carcharias*]) and two conservation dependent fish species (a trevally [blue warehou, *Seriolella brama]* and the eastern school shark [*Galeorhinus galeus*]) were identified in the EPBC database as potentially occurring in the vicinity of the Yolla field. All three species are included in the ALA as having been recorded in the vicinity of the Yolla field.
- Reptiles – two endangered species of marine turtle (leatherback [*Dermochelys coriacea*] and loggerhead [*Caretta caretta*] and one vulnerable species (green [*Chelonia mydas*]) are identified in the EPBC database as potentially being present in the vicinity of the Yolla field. While the VBA and ALA have records of only the leatherback occurring within hundreds of kilometres of the field, the potential for the other two species to occur cannot be discounted.
- Individuals of the these cetacean, pinniped, fish and reptile species that may be present, even seasonally, within the vicinity of the Yolla field will have the potential to be exposed to the PFW plume, or for the PFW discharge to affect their trophic chains.
- Introduced Marine Species – several introduced species are known to occur in Bass Strait, include the Pacific oyster (*Magallana gigas*), northern Pacific sea star (*Asterias amurensis*), New Zealand screw shell (*Maoricolpus roseus*), European shore crab (*Carcinus maenas*), and the alga ‘dead man’s fingers’ (*Codium fragile*). It is not known if any of these species are present in the vicinity of the Yolla field.

## 2.3 Environmental Risks

The key risks to the receiving marine environment arising from the use of GLDA and its discharge within the PFW stream relate to potential toxic effects on marine biota from:

- Residual GLDA and/or degraded constituents of GLDA.
- Byproducts generated during the descaling process (indicated from initial field tests as primarily metals).

These two sources of potential impact are inherently mixed within the PFW stream and may interact in either synergistic or antagonistic ways.

Modelling indicates that, upon discharge into the marine environment, the PFW forms a buoyant plume which is carried away from the platform in the direction of the prevailing current (AECOM 2025). The PFW is progressively diluted within the plume as it moves away from the platform until the constituents reach concentrations that are considered to no longer have the potential to impact upon marine receptors (i.e. the ‘edge of the mixing zone’).

As part of this ALARP assessment, it is important to demonstrate that all feasible control measures aimed at minimising the dimensions of the mixing zone have been evaluated, therefore, supporting the conclusion that the mixing zone itself meets ALARP criteria. However, the precise determination of actual mixing zone dimensions falls outside the scope of this ALARP assessment. This aspect was addressed separately through direct toxicity assessments (DTAs) of PFW containing GLDA and its associated byproducts, as documented in the SSDF and mixing zone report (AECOM 2025).

# 3.0 Existing PFW management

## 3.1 Routine PFW Characterisation

Beach undertakes the following PFW monitoring:

- Weekly sampling: Samples are collected and analysed for dispersed oil (un-dissolved oil) and BTEX. These analyses are performed using OSPAR approved methods in a non-NATA accredited laboratory.
- Biannual Comprehensive Analysis: In accordance with the approved EP, Beach undertakes twice yearly sampling for comprehensive chemical analysis at a NATA accredited laboratory.
- Sampling Locations: All samples are collected via the two in-line oil-in-water analysers (AIT 5327 & 5328), positioned upstream of the Dump Caisson. This location is critical, as the PFW discharged from the Dump Caisson represents the actual discharge point into the mixing zone surrounding the Yolla platform.

### 3.1.1 PFW processing

A schematic of the Yolla-A PFW treatment system is shown in Figure 2.

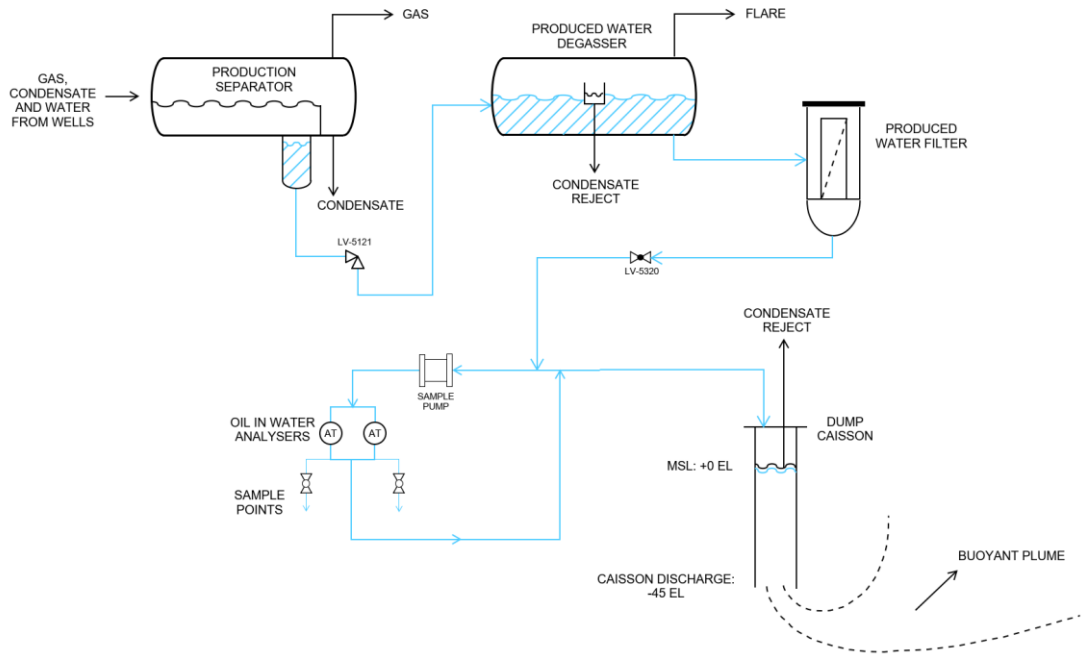

**Figure 2** Schematic of Yolla-A PFW processing system

The production fluids from the wells are passed through the Production Separator where gas is separated from the oil and water mixture. Dissolved gas is then removed in the Degasser, with the discharged water passing through a filter to remove any solid particulates remaining in the stream. The water is then discharged to the Dump Caisson via a liquid leg.

The Dump Caisson is constructed as part of the Platform jacket. It allows recovery of hydrocarbon liquid that may be present in the feed stream from the open drains system, PFW, or a spill. The hydrocarbon liquid is captured via gravity separation and accumulates at the top of the Caisson and can be pumped to the Flare Knock Out Drum. Water flows from the bottom of the Caisson at a depth of 45 m below sea level.

The segregated open drain and PFW feed to the Caisson are routed below the minimum sea water depth to ensure a liquid seal is achieved, which enables effective containment of vapours. These vapours are safely vented via the designated atmospheric outlets. Additionally, the Caisson is equipped with a vent line to a safe location, fitted with a flame arrestor to mitigate ignition risks.

The Dump Caisson is provided with a pneumatically operated Dump Caisson Pump to recover oil and condensate. Level indication, spared for redundancy, and alarms are also provided to assist with the operation of the Dump Caisson Pump and to provide an indication of the liquid hydrocarbon level within the Caisson. The pump has flexible connections and can deliver a nominal flow rate of 1 $m^3$/h from the liquid surface of the water within the Dump Caisson and pump the fluid into the Flare Knock Out Drum for reprocessing. The pump is operated by fuel gas and can be operated remotely from the Lang Lang Gas Plant onshore.

### 3.1.2 Oil in Water Analysers

Beach has attempted to develop correlations between the OIW analysers and dispersed oil, as shown in Figure 3 (OIW analysers) (BassGasLIMS Rev3). The correlation is difficult to establish.

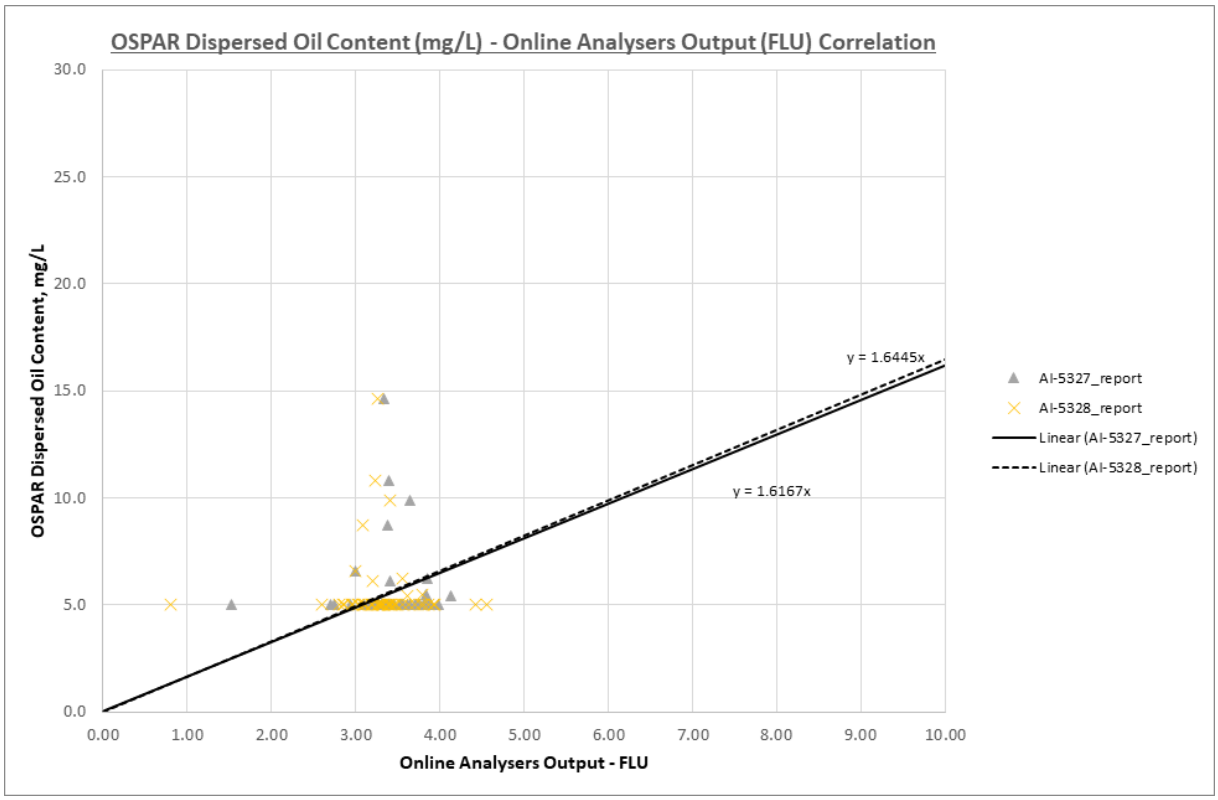

**Figure 3 Correlation between OSPAR dispersed Oil and OIW analyser outputs**

### 3.1.3 Weekly Dispersed Oil and BTEX monitoring

The following summary presents analytical data collected over the 12 month period (BassGasLIMS Rev3). (11 July 2024 - 31 August 2025)

**Table 1 PFW Characterisation (ACS Laboratories non-NATA)**

| | BTEX (GCMS) mg/L | Dispersed Oil (C7-C40 Aliphatic) mg/L | Total Oil (Mixed) mg/L |
|---|---|---|---|
| Average | 82 | 18 | 100 |
| Max | 163 | 75 | 197 |
| Min | 27.2 | 0.6 | 38 |

Note: 75 test results; 5 results >30ppm, 1 result>50ppm

The data demonstrate that the existing system is effective at removing the dispersed oil, with at least 93% of the test results consistently meeting the adopted criteria of 30 mg/L, and 98.7% within the 50ppm maximum concentration. . Total Oil refers to the combined concentration of dispersed oil and BTEX compounds. The results also show that BTEX constitutes the dominant fraction of the Total Oil measurement.

Figure 4 below shows physicochemical water quality readings for Yolla PFW samples, measured before and after GLDA injection, for the two trials (5/7/2025 for Y4, 4/8/2025 for Y6).

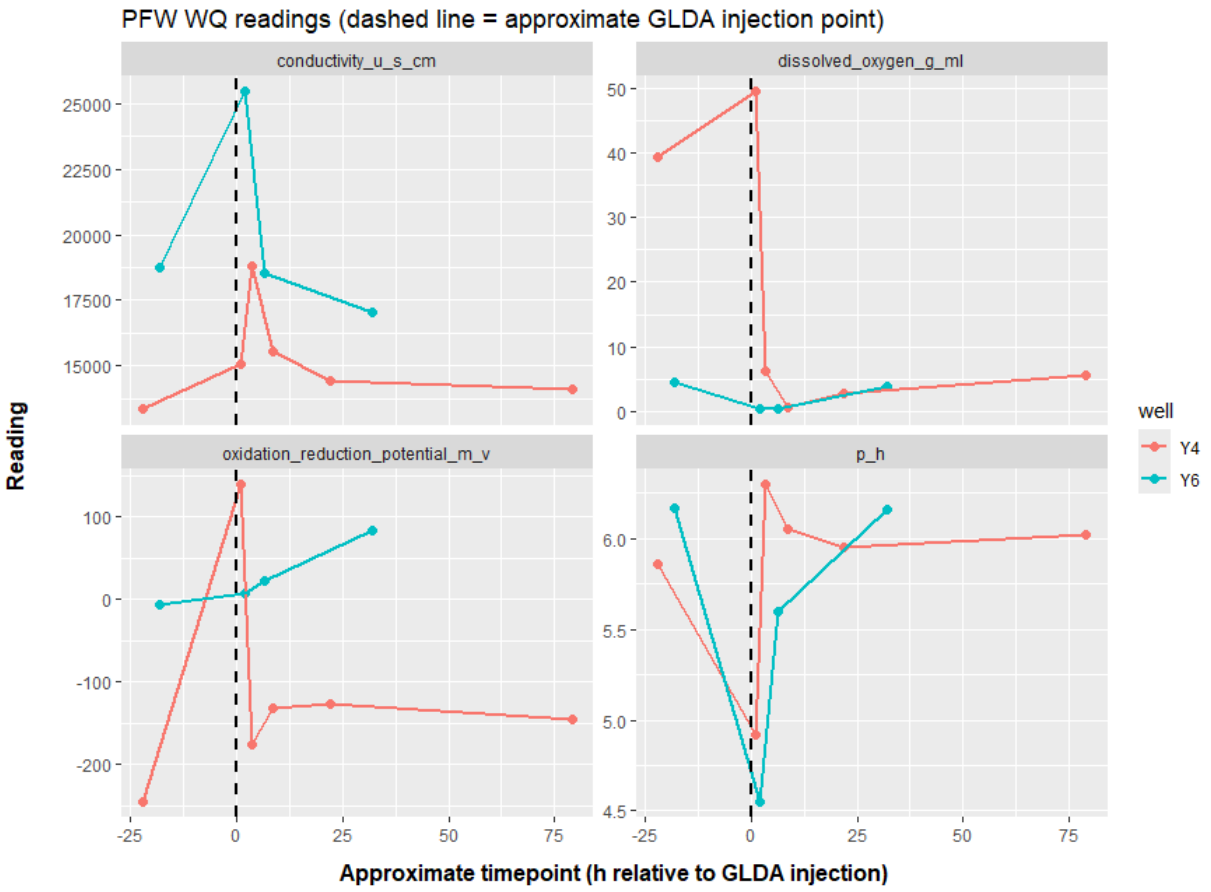

**Figure 4 PFW Water Quality readings for Y4 and Y6 wells treated in June and July 2025 respectively**

Figure 4 indicates that for conductivity and pH for both wells' injections, an initial shift associated with GLDA injection but a relatively rapid return to background levels, within approximately 2-3 hours. This also is the case for DO levels associated with the Y6 trial. For the other parameters / trials, there appears to be a longer shift in water quality, which may or may not be associated with GLDA injections.

Overall, the OIW/TPH/BTEX trends from July 2024 (GLDA first trial) to latest descaling (Y6 in Aug 2025) are summarised in Figure 5 below.

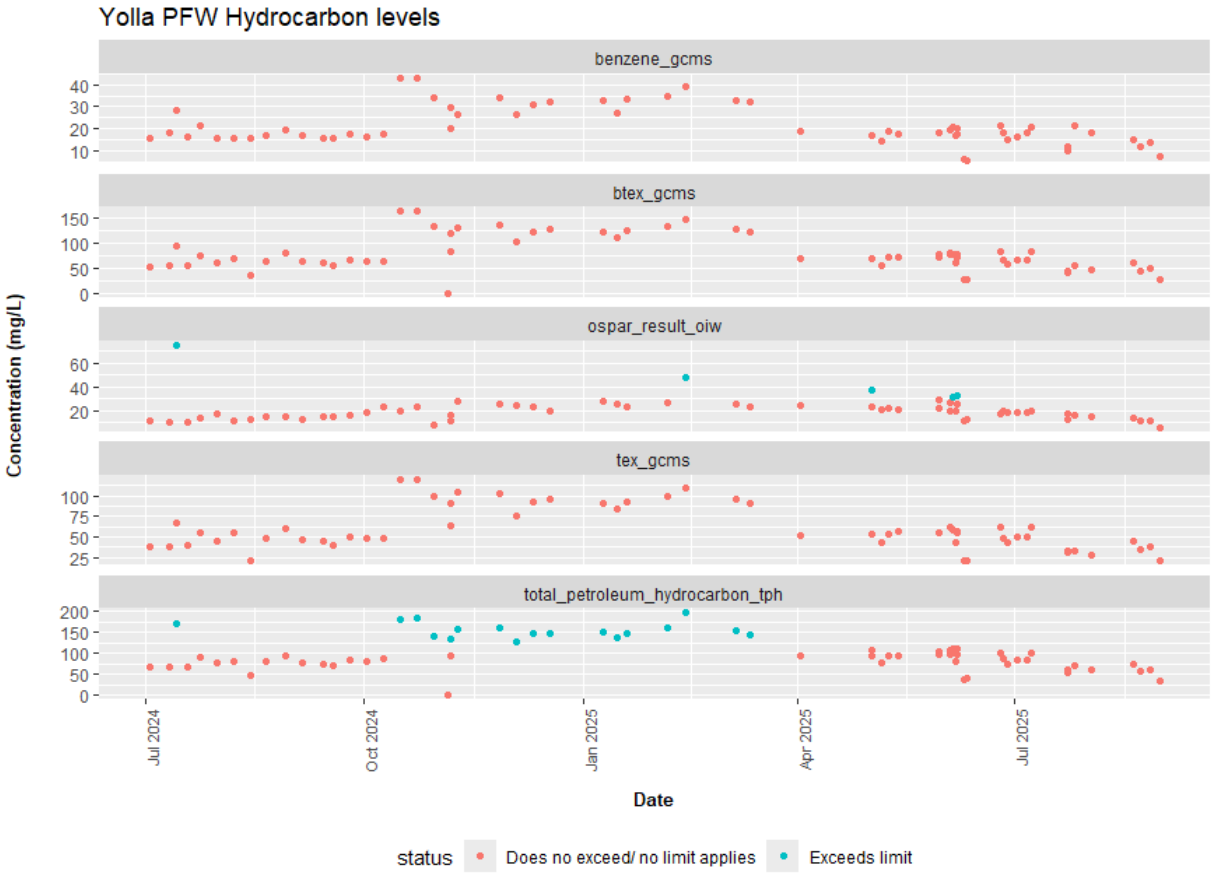

**Figure 5 PFW hydrocarbon levels between June 2024 to August 2025**

Figure 5 above shows a potential elevation in some hydrocarbon results from approximately late 2024 to approximately early 2025, however this potential elevation does not to appear to temporally coincide with GLDA trials, and readings appear to have since restored to approximately background levels.

# 4.0 GLDA Field Trials

## 4.1 GLDA Field Trials (2024-2025)

In July 2024, Beach conducted an initial field trial involving the application of GLDA in a batch soak treatment at the Y-6 well, which had been identified as experiencing severe scaling. GLDA, diluted with produced water, was introduced into the well and allowed to soak for at least 24 hours before being unloaded. Following the treatment, the well was brought back online, and a significant improvement in rates was observed, indicating that near-wellbore productivity impairment had been largely resolved (Beach, pers. comms). Subsequently, further trials were executed in November 2024 on other wells in the field (Y-4, Y-5, Y-3), with WET testing and sample screening completed during the Y-4 descaling only. Trials were repeated in July and August 2025 with further WET testing and repeated-sample water quality screening conducted for the tests.

WET Testing includes chronic and acute toxicity tests. Chronic toxicity testing includes: 1-hr sea urchin fertilisation success, 72-hr sea urchin larval development, 72-hr marine algal growth, 48-hr larval development, 72-hr macroalgal germination success. Acute toxicity testing includes 96-hr fish imbalance toxicity and 96-hr acute toxicity test using amphipod. Samples are shipped to Ecotox for analysis.

The PFW Water Quality analysis (analysed by Eurofins) includes:

- Physical screening for Conductivity, ph, total phosphate (as P), total Nitrogen (as N), Total Suspended Solids (TSS),
- Heavy Metals such as Arsenic (As), Cadmium (Cd), Chromium (Cr), Copper (Cu), Lead (Pb), Mercury (Hg), Nickel (Ni), Zinc (Zn), In 2025 screening additional metals such as Aluminium (Al), Barium (Ba), Cobalt (Co), Iron (Fe), Manganese (Mn), Selenium (Se), Silver (Ag), Vanadium (Va) were also analysed.
- Potassium (K),
- Total Petroleum Hydrocarbons (1999 & 2013 NEPM).
- Benzene, Toluene, Ethylbenzene and Xylenes (BTEX),
- Plycyclic Aromatic Hydrcarbons (PAH).
- Phenols (Halogenated and non-Halogenated).

During GLDA trials, the OIW/TPH readings were recorded by the OIW analysers and samples were collected during the GLDA treatment in July 2024 (Y-4) and Aug 2025 (Y-6). Samples were collected prior and post GLDA unloading at different time intervals. These samples are sent to ACS (main laboratory) and SGS (as secondary laboratory). Results were recorded in the LIMS.

Based on the performance of GLDA treatments to date and the requirement to maintain production rates at commercial levels, timing of future treatments to each production well have been predicted to be repeated every ~2-6 months per well (Beach pers comms). Currently only Y-4 and Y-6 are receiving treatments on this frequency. Based on the scale modelling completed and inherent high tendency of the reservoir to scale, scale treatments are expected to be required on all operational wells for the remaining field life.

**The enhancement of well productivity is essential for prolonging the productive life of the Yolla field.**

Current management practices for analysing well performance, including monitoring by real time surveillance of well head and downhole pressures, temperatures and flow will be included as part of the review process for determining treatment frequency.

## 4.2 Toxicant screening

Analysis of the toxicant profiles and WET test results from three descaling events was conducted to determine whether the characteristics of PFW are changed as a result of treatment. Results showed that the treatment process may cause a temporary increase in PFW toxicity, potentially altering the extent of the mixing zone from the PFW only measures. It should also be noted that although no end point was established during these trials, dispersion modelling shown in the SSDF report highlighted that an initial spike in toxicity resulting from unloading of descalant by-products may then be sufficiently diluted over a time period < 5 days, to a point where the mixing zone boundary is maintained (AECOM 2025).

In terms of WET test results to date, Table 2 below demonstrates potential variability in the toxicity of PFW due to the treatments. Each test event sampled the PFW approximately 1 hr after unloading commenced, representing the peak toxicity of the PFW-GLDA. Toxicity values in Table 2 below show the most toxicity occurs with the lowest values. These results indicate two potential outcomes of the GLDA use:

1. Repeated treatment of the Y4 well over an ~8 month period may substantially decrease overall toxicity of well toxicants.
2. Subsequent treatment of the Y6 well after the repeated treatment of the Y4 well also produced lower toxicity than the first Y4 well treatment.

These results are caveated by the fact that even minor changes to the sampling regime of the PFW and flow rates of PFW mixes that was subsequently used for WET testing can produce differing net toxicities of PFW. However, of all three WET test results profiles, the first test in November 2024, which was used as part of the SSDF calculations, appears the most conservative to date.

**Table 2 GLDA-PFW Samples collected post-descaling events (Nov 2024 - Aug 2025)**

| Test Species | Toxicity Endpoint | Exposure Duration | Sample Date | Well descaled | Toxicity Estimate | Toxicty Value: PFW Concentration (%) and Variability (95% Confidence Intervals)^ | Toxicty Value (only): PFW Concentration (%) |
|---|---|---|---|---|---|---|---|
| Allorchestes compressa (amphipod) | Survival | 96 hr | 7-Nov-24 | Y4 | IC10 | 0.3 (0.22-0.38)% | 0.3 |
| | | | 5-Jul-25 | Y4 | IC10 | 5.1 (4.93-5.31)% | 5.1 |
| | | | 4-Aug-25 | Y6 | EC10 | 0.2 (0.14-0.24)% | 0.2 |
| Heliocidaris tuberculata (sea urchin) | Fertilisation | 1 hr | 7-Nov-24 | Y4 | IC10 | 0.1 (0.09-0.11)% | 0.1 |
| | | | 5-Jul-25 | Y4 | IC10 | 1.1 (0.97-1.27)% | 1.1 |
| | | | 4-Aug-25 | Y6 | EC10 | 0.4 (0.34-0.40)% | 0.4 |
| | Larval development | 72 hr | 7-Nov-24 | Y4 | EC10 | 0.1 (0.11-0.14)% | 0.1 |
| | | | 5-Jul-25 | Y4 | IC10 | 1.1 (0.87-1.29)% | 1.1 |
| | | | 4-Aug-25 | Y6 | EC10 | 0.2 (0.22-0.26)% | 0.2 |
| *Hormosira banksii* (macroalgae seaweed) | Macroalgal germination | 72 hr | 7-Nov-24 | Y4 | IC10 | 0.3 (0.15-0.46)% | 0.3 |
| | | | 5-Jul-25 | Y4 | EC10 | 1.6 (0.99-2.13)% | 1.6 |
| | | | 4-Aug-25 | Y6 | EC10 | 0.6 (0.33-0.77)% | 0.6 |
| *Lates calcarifer* (fish, Barramundi) | Biomass | 7 day * | 7-Nov-24 | Y4 | IC10 | 0.3 (0.00-0.35)% | 0.3 |
| | | | 5-Jul-25 | Y4 | IC10 | 3.4 (1.02-3.42)% | 3.4 |
| | | | 4-Aug-25 | Y6 | - | - | - |
| | Fish imbalance | 96 hr | 7-Nov-24 | Y4 | IC10 | 1.3 (1.32-1.36)% | 1.3 |
| | | | 5-Jul-25 | Y4 | IC10 | 5.3 (5.21-5.50)% | 5.3 |
| | | | 4-Aug-25 | Y6 | - | - | - |

| Test Species | Toxicity Endpoint | Exposure Duration | Sample Date | Well descaled | Toxicity Estimate | Toxicty Value: PFW Concentration (%) and Variability (95% Confidence Intervals)^ | Toxicty Value (only): PFW Concentration (%) |
|---|---|---|---|---|---|---|---|
| | | 7 day * | 7-Nov-24 | Y4 | NOEC ^ | 0.2% (* 95% CL are not determinable) | 0.2 |
| | | | 5-Jul-25 | Y4 | IC10 | 2.9 (2.91-2.91)% | 2.9 |
| | | | 4-Aug-25 | Y6 | - | - | - |
| Macquaria novemaculeata (fish, Bass) | Fish imbalance & Larval dvlpt (only 1 end point calculated for 4-Aug-25) | 7 day # | 7-Nov-24 | Y4 | - | - | - |
| | | | 5-Jul-25 | Y4 | - | - | - |
| | | | 4-Aug-25 | Y6 | IC10 | 0.2 (0.02-0.28)% | 0.2 |
| | Fish imbalance | 96 hr | 7-Nov-24 | Y4 | - | - | - |
| | | | 5-Jul-25 | Y4 | - | - | - |
| | | | 4-Aug-25 | Y6 | IC10 | 0.2 (0.02-0.25)% | 0.2 |
| Mytilus galloprovincialis (mussel) | Larval development | 72 hr | 7-Nov-24 | Y4 | IC10 | 0.1 (0.10-0.15)% | 0.1 |
| | | | 5-Jul-25 | Y4 | IC10 | 1.0 (0.91-1.34)% | 1 |
| | | | 4-Aug-25 | Y6 | EC10 | 0.2 (0.17-0.21)% | 0.2 |
| *Nitzschia closterium* (marine microalgae) | Algal growth | 72 hr | 7-Nov-24 | Y4 | IC10 | 0.3 (0.11-0.32)% | 0.3 |
| | | | 5-Jul-25 | Y4 | IC10 | 1.6 (1.17-1.91)% | 1.6 |
| | | | 4-Aug-25 | Y6 | IC10 | 0.2 (1.16-0.24)% | 0.2 |

* - The 7-day fish biomass and imbalance tests were considered as chronic tests by ESA in accordance with the ESA test factsheets, however, these tests have been conservatively classified by AECOM as acute tests on the basis of Warne et al. (2018) which recommends that all tests conducted on juvenile or adult fish for durations less than 21 days are considered as acute tests

^ - The laboratory was unable to report an EC/IC10 value for the November 2024 7-day fish imbalance test on *Lates calcarifer* (fish, Barramundi), although IC50 and NOEC values were reported. The NOEC was adopted as the toxicity estimate herein, based on Warne et al. 2018 guidance on preferred hierarchy of estimates of toxicity.

# - The laboratory was unable to report two end points for an EC/IC10 value for the August 2025 7-day fish imbalance test, as *Lates calcarifer* (fish, Barramundi) were unavailable for use and were substituted with Australian Bass (*Percalates novemaculeata*). This impacted the ability to calculate biomass effects, as the Bass tested were newly hatched larvae, which were too small to determine biomass at Day 7.

# 5.0 Updated SSDF plume models

The objective of the most recent SSDF report produced by AECOM (2025b), was to assess WET and analytical chemistry PFW data, using samples obtained before and immediately after (during the unloading process) GLDA treatment. Samples were taken from PFW in September 2024, then again during unloading of GLDA during the first Y4 well treatment in November 2024. The GLDA toxicity was reviewed as part of an update to the mixing zone boundaries previously assessed in 2021. In summary:

- WET testing data were considered to be of suitable quality and quantity to derive the SSDFs in accordance with the ANZG (2018) species sensitivity distribution (SSD) statistical method on the basis of the following:
  - The minimum WET data requirements to derive the SSDF using SSD modelling techniques were exceeded, and the dataset was classified as 'adequate', including measurement of both chronic and acute endpoints.
  - Data quality complied with the conditions for test characteristics set out in Warne et al. (2018) relating to experimental design, duration of exposure and toxicological endpoints.
  - Data quality scores for 114 of 116 WET tests exceeded the requisite score of 80% to classified as 'acceptable' to 'high' quality. Data from the remaining two tests were excluded from the SSDF derivation due to them not passing internal laboratory quality assurance / quality control criteria.
- For PFW, a concentration (strength) of 0.051% based on an SSDF of 1:1,961 is estimated to be required to achieve 99% species protection (spp.) in the receiving environment. However, for GLDA-PFW, a concentration (strength) of 0.0051% based on an SSDF of 1:19,608 is estimated to be required to achieve 99% spp. Based on the available data, the SSDF of GLDA-PFW is 10 times greater than the SSDF of PFW. In other words, operational injection of GLDA at the volume used in this sample enhances effluent toxicity by approximately 10-fold. These SSDFs are considered to be of 'moderate reliability', and hence suitable for application in environmental protection, in accordance with the classification process outlined in Batley et al. (2018).

In addition, this study also incorporated a mixing zone update from the previous SSDF assessment, and based on modelling outputs provided by RPS 2025:

- Under the maximum and 'worst case' PFW discharge scenario of 300 $m^3$ per day, modelling identified a 'mixing zone' boundary of 37 m for PFW alone, and 247 m for PFW+GLDA. Beyond these distances from the discharge point, 99% of marine species are expected to be protected from chronic toxicity effects.
- Previous models that did not incorporate stochastic methods for deriving metocean conditions used to assess plume dispersion, produced significantly larger mixing zone boundaries compared to earlier, more rudimentary models that employed single-speed current inputs. The stochastic approach was considered more representative of natural variability in oceanographic conditions and was applied to simulate dispersion over a five-day period, the timeframe during which GLDA was predicted to influence the specific gravity of the PFW.

# 6.0 Regulatory Context

## 6.1 NOPSEMA Guidance

In its guideline document *Environment Plan decision making* (document N-04750-GL1721 A524696 10/1/2024), NOPSEMA outlines its expectation under Criterion (34b) for ALARP, which provides the following:

*Reducing impacts and risks to ALARP is based on the concept of reasonable practicability; the weighing up of the magnitude of impact or risk reduction against the cost of that reduction. The 'cost' in this context means the sacrifice associated with implementing a control measure which includes an evaluation of the benefits versus the impost such as money, time and/or effort required to implement a particular control measure. The titleholder must adopt additional control measures or increase effectiveness of existing control measures if the cost of doing so is not grossly disproportionate to the environmental benefit gained.*

Therefore, ALARP can be defined as a level of risk that is not intolerable, and cannot be further reduced without the incurring costs that are grossly disproportionate to the benefit gained from the reduction.

When making a decision regarding whether an Environment Plan (EP) demonstrates that the environmental impacts and risks of the activity will be reduced to ALARP, the guideline indicates that NOPSEMA will consider the following:

- Whether all control measures that could reasonably be considered are evaluated, particularly for higher order impacts and risks. For higher order impacts and risks the exploration of alternative, additional, or improved control measures should be evident.
- Whether the evaluation of impacts and risks has informed the selection of suitable control measures to either reduce the consequence/severity or likelihood of impacts and risks.
- Whether enough detail of the control measure is provided to demonstrate that the control measure will be effective in reducing impacts and/or risks for the duration of the EP. The control measure should be evaluated for its functionality, availability, reliability, survivability, independence and compatibility with other control measures.
- The method of evaluating whether or not a control measure is adopted is based on environmental benefit versus costs of implementing that control measure.
- The method of evaluation is systematic, applied thoroughly, defensible and reproducible.
- That information provided during relevant person consultation is incorporated, considered and evaluated where applicable.

In this ALARP assessment, the specific subject is the release of all byproducts as a result of descaling treatment in PFW discharged from the Yolla-A Platform.

## 6.2 Approach

The ALARP assessment steps through a classic 'hierarchy of controls' for reducing the risk of impacts associated with the use of GLDA to the receiving marine environment. The hierarchy, ranked from most to least effective, includes:

- Elimination – design processes to remove the source of the risk.
- Substitution – use alternative measures in place of the source of the risk.
- Engineering controls – reduce exposure of the environment to the risk through additional equipment, treatment, etc.
- Administrative controls – implement additional procedures, monitoring and training associated with management of the source of the risk.

# 7.0 ALARP Assessment

In its guideline document *Environment plan decision making* (GL1721-Rev5 June 2018), in discussing the ALARP criterion, NOPSEMA provides the following:

*Sub-regulation 10A(b) requires that an EP demonstrate that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP). The question that needs to be answered to meet this criterion is 'has the titleholder done enough to reduce the impacts and risks of the activity?' Reducing impacts and risks to ALARP is based on the concept of reasonable practicability; the weighing up of the magnitude of impact or risk reduction against the cost of that reduction[4]. In this context, a titleholder is required to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure*.

In this ALARP assessment, the subject is the discharge of PFW+GLDA from the Yolla-A Platform.

NOPSEMA (Article published in the Regulator, Issue 3: 2014) has provided further commentary in relation to ALARP and PFW as a whole.

*The repeal of regulations 29 and 29A is a notable change brought about through the 28 February 2014 amendments to the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Environment Regulations). The Regulations previously set a limit of 30 mg/L of petroleum (averaged over 24 hours) in any produced formation water (PFW) discharged to the sea, and also outlined associated testing requirements for equipment used to monitor oil-in-water (OIW).*

*The 30 mg/L limit was a legacy of the former 'Schedule of Specific Requirements as to Offshore Petroleum Exploration and Production 1995', and stemmed from an engineering specification used in the Gulf of Mexico in the 1970s. This was considered to be the limit at which a visible sheen could not be observed and was as low as the available water treatment and analysis technology of the day could achieve.*

*Regulations 29 and 29A were prescriptive within the wider 'objective-based' context of the Environment Regulations, and were inconsistent with the principles of risk management as found in ISO 31000, especially given OIW is only one class of contaminants associated with PFW mixtures discharged to the sea.*

*Under the amended Environment Regulations, discharges of PFW are to be assessed and managed in the same way as other emissions and discharges from offshore petroleum facilities. That is, it needs to be demonstrated that the impacts and risks will be of an acceptable level and reduced to as low as reasonably practicable (ALARP). It should be noted that while OIW limits may remain a valid control, the risk assessment process must address all impacts and risks. It may therefore be necessary to consider a range of other factors, including the PFW discharge regime, chemical composition, toxicity, extent of dispersion and fate (including potential for accumulation in sediments and biota).*

*Further, the Environment Regulations also require an appropriate implementation strategy with provisions for the monitoring of emissions and discharges, and reporting arrangements to facilitate assessment of whether environmental performance outcomes and standards are being met and control measures are effective. Together, these elements of the implementation strategy aim to ensure that all reasonable action is being taken to keep the impacts and risks from the discharge of PFW acceptable and ALARP.*

Therefore, this proposed calcite removal method should include a risk assessment of the environmental impacts. Each assessment should assess the likelihood of an impact occurring and the severity of the impact as part of the risk assessment, including the capacity of the environment to recover from the activity. Management of these environmental risks are conventionally assessed by a combination of risk levels, feasibility in delivery and cost effectiveness. Potential methods are assessed primarily as a waste hierarchy (see Appendix A and sections 7.2-7.4), which include cascading steps from elimination, to substitution and finally engineering controls.

## 7.1 Environmental risks

A risk assessment was completed by Beach ahead of the trial on the Y4 well in 2024; this covered all risks, including the potential environmental impact of the discharge of GLDA in PFW. Subsequent to the trial, a study was initiated in 2024 to review the impact of the batch dosing of the wells and flowing this back along with PFW to the Yolla-A discharge point (dump caisson). Field samples were taken and evaluated as per EP requirements (whole effluent toxicity [WET] testing and PFW quality parameters); this information was interpreted and modelled with supporting consultants. Further field samples were taken in mid-2025 (July and August) in accordance with Beach's adaptive management framework (refer to current EP) and were used to better inform the initial risk assessment undertaken prior to the commencement of descaling trials. An updated interpretation of the risk assessment incorporating this assessment is presented below:

## 7.2 Elimination

Various potential options were assessed for eliminating the discharge of PFW containing residual GLDA and well cleaning byproducts into the marine environment. These options are listed below:

- A 'No Treatment' option has been considered; however, severely scaled wells as had been observed prior to the first treatment will lead to early cessation of production within 12-24 months of ceasing current descaling operations.
- Primary PFW treatment methods, such as reverse osmosis, were ruled out due to lack of a viable disposal route for the concentrated waste stream and prohibitive costs.
- The Installation of a separate export pipeline to transport PFW to shore was also economically unfeasible and posed a high corrosion risk.
- Reinjection was considered but would require drilling new well(s), which is similarly uneconomical.

### 7.2.1 Primary PFW treatment prior to discharge

Options for removing GLDA from the PFW, including reverse osmosis treatment, were evaluated. These were ultimately ruled out due to the lack of a practical and economically viable method for disposing of the resulting supernatant.

### 7.2.2 Reinjection

PFW injection into either a capped well that is abandoned, or a new well was considered. All wells feeding back to the Yolla-A platform are required for production, thus a new well would be required to receive the PFW with GLDA and byproducts. An evaluation of sub-surface geological structures would be necessary, at an approximate cost in the order of $A120-150M, this is not economically viable.

A re-injection well has other complications and associated risks. There would need to be space on the Yolla-A platform to service the additional well, which would also require a conductor (i.e. pipe in casings that goes from deck level to below seabed), a hydraulic control system, injection pumps and a Xmas tree.

There is a potential risk that the reinjection well will also scale if it is targeting similar reservoirs/conditions to the production wells in the Yolla field.

### 7.2.3 Discharge through a pipeline for onshore management

This option involves no separation of PFW on the platform, but discharge to the onshore BassGas facility. There would be the need for substantial chemical injection (Mono Ethylene Glycol - MEG) and corrosion inhibitors. The supply of MEG to the platform would require either a pipeline or routine delivery by boat. The PFW would be separated at the onshore facility and would require on land management potentially through evaporation ponds. It would be necessary to obtain an EPA works approval as well as other approvals. This option would have high capital and operating costs (e.g. MEG Pipeline: $116M capital, $0.2M annual operating cost; MEG Boat delivery: $55M, capital $9.5M annual operating cost).

## 7.3 Substitution

### 7.3.1 Alternative chemicals

The substitution of GLDA with acid treatment could significantly increase the risk of corrosion to well and facilities metallurgy, thereby elevating the likelihood of containment loss and associated environmental impacts. Additionally, acid use would pose greater health and safety risks to personnel due to its hazardous nature.

### 7.3.2 Wireline drift runs

An alternative method of removing scale from the wellbore would be to conduct regular wireline drift runs and re-perforations, with runs required approximately every three months on wells with scale. Due to the high frequency, the practical application would involve permanent installation of an offshore wireline unit on Yolla-A. The efficacy of this solution has not been tested and may not be as effective at scale removal as using GLDA. This wireline work would also introduce a number of additional risks, including:

- Temporary well barriers, with increased risk of loss of well containment.
- Personnel exposure to risks associated with wireline work.
- Potential for stuck tools during each wireline run, with subsequent risk of damage to the asset and loss of the well.

Regular wireline drift runs would require Yolla-A to be permanently manned, introducing significant additional operational cost to the asset. Under Beach's risk assessment matrix, this would be ranked as "Major" cost impact (estimated between $10-$100M). Similarly, the installation of permanent wireline infrastructure, tools and associated crew mobilisation, would also be considered "Major" under the matrix ($10-$100M). Given these financial and logistical implications, regular wireline drift runs are not considered ALARP when compared to chemical descaling methods.

## 7.4 Engineering controls

The following potential engineering control measures (additional to those implemented during existing operations) were considered during the ALARP assessment.

### 7.4.1 Reduction of GLDA concentration applied

Guidance from the chemical supplier is that the optimum concentration of GLDA in the wellbore is 40% - 50% of their product and trials to date have aligned with this guidance. Typically, the chemical is batch delivered into the well in a diluted form, with the intent of achieving concentrations of ~40% GLDA/Water mix in the wellbore. Beach has completed one trial with lower concentrations of GLDA (20%) in the wellbore and noted poorer performance of the descaling, as observed via well behaviour post treatment.

Beach will continue to optimise the dosing strategy, with the aim of treating the wellbore scale effectively, and minimising any impacts on the produced water.

### 7.4.2 Reduction of GLDA and well cleaning byproduct concentrations discharged

#### 7.4.2.1 Steam stripper

The steam stripper was previously assessed as part of the 2019 ALARP assessment for PFW management. The proposed system included a demineralised water package, steam stripper unit and associated pumps, tie ins and demolition of some elements on the platform. The screening level estimated capital cost is $18.2M, operating cost has not been estimated. The power consumption estimate is equivalent to 400 kW using fuel gas. Despite these considerations, steam stripping has been assessed as a non-viable option, given available space, safety risks onboard the platform and need to transport supernatant off the platform to shore.

#### 7.4.2.2 MPPE

The MPPE system was previously assessed for the PFW ALARP in 2019 and comprises of a demineralised water package and ion exchange beds, pumps, the MPPE unit, tie ins and demolition. The estimated capital cost is $15.4M, operating cost has not been estimated. The power consumption estimate is 75 kW. Despite these, MPPE has been assessed as a non-viable option, given available space, safety risks onboard the platform and need to transport supernatant off the platform to shore.

#### 7.4.2.3 Increased pumping of raw seawater mix

This is considered a potentially viable option to reduce concentrations at the point of discharge, by introducing additional raw seawater into the PFW just prior to discharge. Options for obtaining seawater supply for dilution of PFW were assessed by Beach engineers, who concluded that only the firefighting line was in a suitable location on the platform to provide the quantities of raw seawater required. Given the risks to safety on board the platform though, this option was deemed unsuitable and would not meet thresholds for Safety Case approval.

# 8.0 Risk Assessment

Risk assessment of the descaling process have been compared to the previously approved ALARP for the PFW discharge on the Yolla-A platform (see Appendix B). These risk (and impact) assessments were also included as part of the existing EP (see table 7.26 of the EP for details).

We have identified further risks to the environment from the proposed action above those for PFW, which include:

- Changes in PFW characteristics resulting from increased scale minerals (metals and metalloids) and GDLA reagent constituents during unloading.
- Changes to buoyancy and dispersion characteristics of PFW in receiving waters resulting in increased mixing zone boundaries.
- Changes to toxicity of PFW as whole effluent toxicity (WET) resulting in increased toxicity.

A more recent assessment incorporating GLDA into the site-specific dilution factor and updated mixing zone boundaries (AECOM 2025) found:

- No changes to the buoyancy characteristics of the PFW discharge with the inclusion of GLDA. This has been modelled to an extent that no change in mixing zone boundaries is expected to occur as a result of buoyancy changes and is therefore not further considered in the risk assessment.
- Minor adjustments to the mixing zone boundaries using updated calculation methods and inputs, resulting in a mixing zone boundary that remains broadly consistent with historical delineations.

Based on the risk assessment, the key additional mitigating measures involve implementing appropriate online and/or routine total hydrocarbon monitoring systems. AECOM (2019) found that the ongoing discharge of PFW continues to have effects on the receiving environment and concluded that:

- "*Due to the small zone of impact associated with the PFW mixing zone, it is concluded that there is a negligible risk of the PFW having a significant impact upon the marine ecosystem within the receiving environment. It is reasonable to conclude that any impacts that may occur would be localised to those biological communities present in those habitats with long-term exposure to the PFW plume, which represent only a very small proportion of the total available similar habitat (i.e. other platform legs or subsea infrastructure). Any indirect impacts would be localised to those species that forage on the biota within the habitats that experience long-term exposure to the PFW plume*."

The risk analysis, evaluation and treatment are presented in Table 3. Key outcomes include:

- Given the expected changes to PFW profiles, it is expected that existing monitoring controls and implementation of Beach's adaptive management framework will likely maintain environmental quality of the receiving environment without significant changes to existing conditions.
- It is also important to note that GLDA is a gold CHARM rated chemical. Gold CHARM chemicals are currently approved for use in the existing EP (see table 7.26 of the EP for details), therefore the impacts from toxicant dispersion into receiving waters and subsequent changes to mixing zone boundaries from changes to PFW profiles remain the primary risk to existing approved activities.

**Table 3 Environmental Risk Assessment of Descaling Activity**

| Objective(s) | Potential Impact | Current Controls | Effectiveness of Controls | Current Risk | Additional Mitigation Measures | Residual Risk |
|---|---|---|---|---|---|---|
| To maintain the quality of water, sediment and biota so that environmental values are protected. | Acute adverse impact on the marine environment from PFW during unloading of descaling treatment above current accepted levels. Acute changes to mixing zone toxicity were modelled to occur within a 5-day period RPS 2025). Impacts included increase in the size of the mixing zone and higher concentrations of toxicant constituents in the mixing zone during the unloading phase. Ongoing impacts due to persistent elevated toxicant levels not expected after 5 days, when sufficient dilution is expected to occur. | Routine monitoring of the PFW on a weekly basis (BTEX and dispersed oil) and six-monthly comprehensive analysis. Implementation of the Adaptive Management Framework (AMF). | Currently effective in managing PFW discharge. Review of this data using the adaptive management framework should result in a response if necessary. e.g. re-evaluation of impact assessment and development of mitigating measures. | Potential adverse impact on the marine environment beyond accepted levels, potential non-compliance to EP conditions and NOPSEMA consents. Moderate / Unlikely **MEDIUM RISK** | Use GLDA at lowest effective concentration. Incorporate additional PFW sampling and analysis program in accordance with the Adaptive Management Framework to continue to assess possible changes in PFW toxicity. | Highly Unlikely / Moderate **LOW RISK** |

# 9.0 Synthesis

NOPSEMA (2024) provides guidance on the application of the ALARP principle in environmental impact and risk management, highlighting the importance of reasonable practicability in decision-making:

- Reducing impacts and risks to ALARP is based on the concept of reasonable practicability; the weighing up of the magnitude of impact or risk reduction against the cost of that reduction.
- The titleholder must adopt additional control measures or increase effectiveness of existing control measures if the cost of doing so is not grossly disproportionate to the environmental benefit gained.

**Based on the assessments undertaken on PFW toxicity changes from descaling activities, and in comparison to existing management frameworks, it is likely that existing control measures will be appropriate to manage risks to the receiving marine environment from the presence of residual GLDA and well cleaning byproducts within the PFW discharge to a level that is ALARP.**

It is considered that the costs and risks of implementing any measures to further reduce the risk of impacts to the receiving marine environment would be grossly disproportionate to any potential environmental benefit. The rationale supporting this conclusion, summarised in Table 4, is based upon the following considerations:

- The reinjection and onshore discharge via pipeline would eliminate discharge to the marine environment and rank highly on the hierarchy of controls. However, the pipeline option introduces land-based PFW disposal challenges, and both options would increase energy consumption, though not significantly, except for ship-based MEG supply.
- The substitution of GLDA with acid or increasing the frequency of wireline drift runs could introduce significant risks, including potential loss of well containment, that are disproportionately high relative to the potential reduction in risk of environmental impacts attendant to the inclusion of GLDA and well cleaning byproducts within the existing PFW discharge.
- Reducing the concentration of GLDA applied to the wells would compromise cleaning effectiveness, requiring more frequent application of GLDA to maintain well performance. This could result in annual discharge loads of GLDA and cleaning byproducts into the marine environment to greater than those under the existing cleaning regime.
- Diluting PFW with additional raw seawater prior to discharge would reduce constituent concentrations but would not eliminate the discharge itself.
- Technologies such as filtration, steam stripping, and MPPE are deemed unviable due to a combination of safety risks and prohibitive costs.
- Many alternative options would increase operational complexity, elevating health and safety risks and maintenance demands. While these could be managed within existing systems, they still represent a notable increase in operational burden.
- Capital costs for these alternatives are considered disproportionately high relative to the potential environmental gains, and substantial operating costs, many of which remain undefined, would also be incurred.

**Table 4 ALARP Assessment Synthesis**

| Control Measure | Hierarchy | Reduced Net Risk? | Cost Effective? | Adopted? | Justification |
|---|---|---|---|---|---|
| Reinjection of PFW containing GLDA | Elimination | No | No | No | The costs and environmental risks and impacts associated with drilling of a reinjection well, and with the reinjection process, would be grossly disproportionate to the environmental benefit potentially gained. |
| PFW containing GLDA transferred to shore via pipeline for onshore treatment and disposal | Elimination | No | No | No | Transfers increase the risks of spills and leaks. The costs and environmental impacts associated with construction of a pipeline to shore, and construction and operation of an onshore treatment facility, would be grossly disproportionate to the environmental benefit potentially gained. |
| PFW containing GLDA treated using Reverse Osmosis (RO) filtration | Elimination | No | No | No | Creates large amounts of supernatant that cannot be viably transferred to shore, hence would require dumping at sea. This negates all benefits of the treatment. Limited space aboard the Yolla-A platform may inhibit installation and safe use of an RO plant. |
| Use alternative chemical to GLDA | Substitution | No | Potentially | No | Chemical treatments with harsh acids (i.e. Hydrochloric Acid) are less desirable due to the increased risk to personnel (exposure), increased risk of corrosion of wells and facilities (with an attendant increased potential for loss of containment) and increased potential for environmental impact. |
| Implement wireline drift runs | Substitution | No | No | No | Frequent wireline drift runs would introduce additional risks, including increased potential for loss of well containment, personnel exposure, asset damage and well loss. The costs associated with the establishment and operation of a wireline unit would be grossly disproportionate to the environmental benefit potentially gained. |
| Reduction of GLDA concentration applied to the lowest effective level | Engineering | Yes | Yes | Yes | Use of Beach adaptive management framework including assessment of well performance after treatment and PFW toxicity profiles from existing screening procedures. |
| Reduction of GLDA and well cleaning products in PFW stream through re-engineering equipment. | Engineering | Yes | No | No | Costs associated with re-engineering of equipment would be grossly disproportionate to the environmental benefit potentially gained.<br>Use of existing equipment (i.e. fire water system) ruled out due to Safety Case considerations. |
| PFW toxicant monitoring | Administrative | N/A | N/A | Retained existing system | There is an existing PFW management system and monitoring plan, using certified equipment and standard processes, which demonstrates that the ongoing PFW discharge meets accepted toxicant thresholds. |

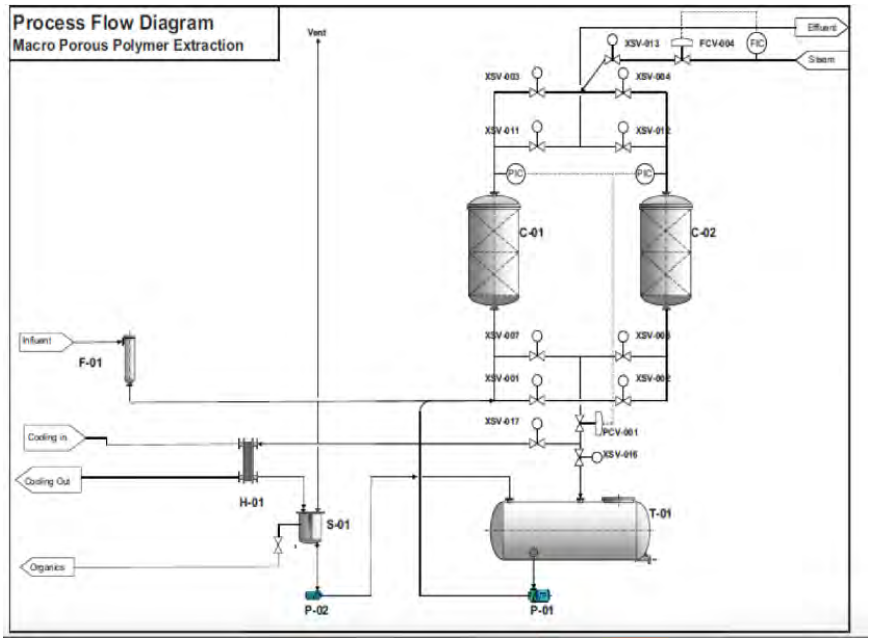
**Removal of dissolved and dispersed hydrocarbons from oil and gas produced water with Macro Porous Polymer Extraction (MPPE) to reduce toxicity and allow water reuse** (Dick Meijer and Chris Madin APPEA Journal 2010).

This technology (supplied by Veolia Water Solutions) has been used off shore at a number of locations. It is reported to remove (recover) dissolved hydrocarbons and BTEX to in excess of 99%. These hydrocarbons are recovered and can be re-injected with the gas/condensate stream sent on shore.

### 3.2.1.1 Conclusion – overseas technology review

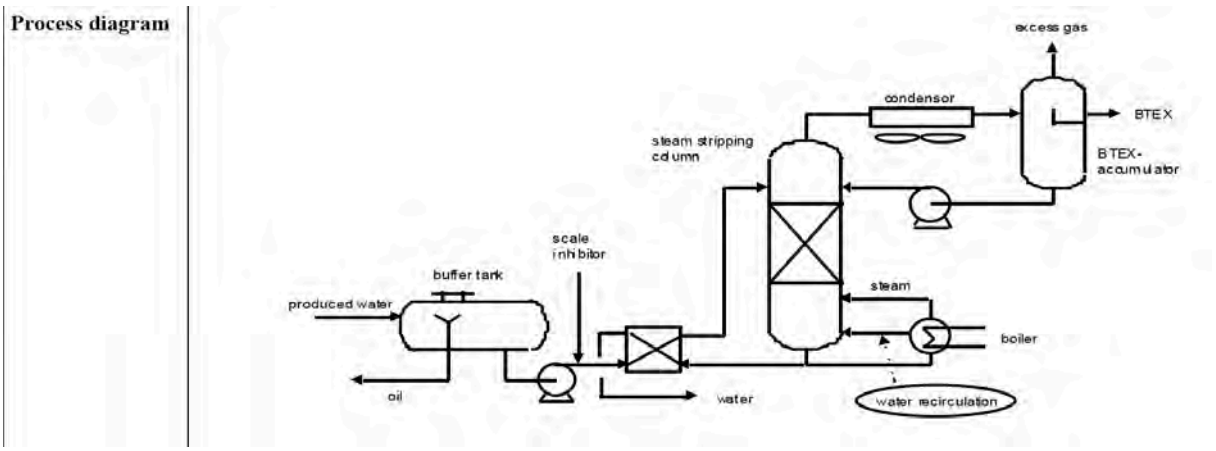
Based on the review of overseas experience, the suitable technologies that would be considered BAT and that could enhance the removal of the dissolved hydrocarbons and BTEX are steam stripping and MPPE. OSPAR (2012) provided the following process descriptions for these options.

#### 3.2.1.1.1 MPPE Information (OSPAR 2012)



| | Per Unit | Minimum | Maximum |
|---|---|---|---|
| **Technical details** | Treatment capacity ($m^3$ PW per hour) | 0.3-15 | 150 |
| | Gross Package volume (LxWxH) | 6.2 x 4 x 3 m | 10 x 6 x 12 m |
| | Operating weight | 10 ton | 250 ton |
| **Critical operational parameters** | | The main critical parameter is the measured outlet concentration vs. discharge limit. If this comes close to the discharge limit the MPPE material needs to be replaced. This is a very slow process (years) and can be done say on a weekly basis. The reduction performance is very stable and does not change overnight. | |
| **Operational reliability including information on downtime** | | The MPPE unit is fully automatic and remote controlled and has been in operation on an unmanned platform. | |

#### 3.2.1.1.2 Steam Stripper Information (OSPAR 2012)



| | Platform | Gas 1 (small) | Gas 2 (large) | Oil 1 |
|---|---|---|---|---|
| **Technical details** | PW volume (design) | 1 $m^3/h$ | 6 $m^3/h$ | N/A |
| | Required area (LxWxH) | 3 x 2 x 5 m | 6 x 3 x 5 m | |
| | Mass (filled) | 12 tonnes | 20 tonnes | |
| **Critical operational parameters** | | Since PW usually contains salts and solid particles, problems with depositions (scale) may occur in the boiler and the heat exchanger. In order to prevent concentration of salts in the boiler, it is recommended to create a slight throughput by means of a re-circulation line from the boiler to the column. The steam line must be large enough in order to allow for equal levels in boiler and column (and above the bundle of the boiler). In order to guarantee a constant | | |

| | Platform | Gas 1 (small) | Gas 2 (large) | Oil 1 |
|---|---|---|---|---|
| | | throughput, a buffer tank is required. This also provides the possibility to skim off oil, avoiding disruption of the process in the column. | | |
| **Operational reliability** | | When the PW contains large amounts of salts,<br>the installation will need to be shut down regularly to enable removal of salt depositions. | | |

The expected removal efficiency for BTEX is high: reduction from 50 mg/L to < 6 mg/L, aliphatic hydrocarbons from 30 mg/L to <3 mg/L. Removal efficiencies of >90% for dissolved oil, BTEX, benzene and PAHs.

### 3.2.2 PFW Management on Platforms in Australian waters

Current PFW treatment systems used on Oil and Gas platforms in Australian waters are summarised in Table 8. This is based on a review of publicly available documents provided on the NOPSEMA web site.

Two of the systems use injection wells, the others use subsurface marine discharges similar to Yolla. Most of the sites use simple oil water separation systems; e.g. degasser with additional treatment with flotation units. Two of the sites, in addition, use MPPE.

Where nominated, the PFW discharge rates are much higher than from the Yolla platform, resulting in larger plumes.

The systems used on the Yolla platform to treat the PFW (see section 2.0) are generally similar to most of the other platforms used in Australian Waters (Table 8). The monitoring results demonstrate that the Yolla system is effective in removing dispersed oil (Section 2.2). None of the other platforms report using a BTEX stripper, while two platforms use MPPE (refer Section 3.2.1.1.1 for process details).

Based on local experience it can be concluded that further consideration should be given to the options of injection wells and MPPE for management of PFW from the Yolla platform.

### 3.2.3 Best Practice Review Conclusion

Based on the review of overseas and local experience the following best practice options should be considered for the ALARP assessment:

- Reinjection Wells
- A steam Stripper
- MPPE.

**Table 8 PFW treatment and disposal on Oil and Gas Industry platforms in Australian waters.**

| Platform | Treatment | Discharge | Reference |
|---|---|---|---|
| Ngujima-Yin (NY) Floating Production Storage and Offloading Facility | PW treatment begins in one of two HP separators, with chemical injection, then enters a coagulation vessel and through to a hydro-cyclone unit. From the hydro-cyclone, the PW is directed through one of the PW filters continues on through to the PW degasser. The degasser is fitted with an internal oil skimming facility to remove residual oil build-up in the degasser vessel. | Injection Wells | Ngujima-Yin Floating Production Storage and Offloading Facility Operations Environment Plan Summary. Woodside, December 2018 |
| Angel Operations | The PW system is designed to direct streams from the process areas to the PW degasser to remove dissolved gas and condensate before disposal overboard above the water line at +8 m LAT. | Marine subsurface | Angel Operations Environment Plan Summary. Woodside, December 2018 |
| Goodwyn Alpha (GWA) Facility | The PW system directs all PW streams from the process areas to the PW degasser. Adsorbent hydrocarbon filters to remove dispersed oil from the PW stream are installed on GWA. The system is used sparingly and primarily to manage OIW upsets. | Marine subsurface | Goodwyn Alpha (GWA) Facility Operations Environment Plan Summary. Woodside, October 2018 |
| Ichthys Project Offshore Facility | Use primary PW treatment system to reduce OIW concentrations. Use MPPE as a secondary PW treatment system. During normal operations, use of primary and secondary PW treatment systems to achieve OIW discharge, to meet ≤30 mg/L, on a rolling 24-hour average. Whether this was total hydrocarbons was not specified. | Marine subsurface | Ichthys Project Offshore Facility (Operation) Environment Plan Summary |
| Esso Bass Strait | PFW is separated from crude oil and then treated by dissolved gas flotation and/or hydro-cyclones to remove oil to below 30 mg/L before discharge to the ocean. Whether this was total hydrocarbons was not specified. | Marine subsurface | Esso Bass Strait Operations EMP |
| Prelude FLNG | Oil Water Separation and MPPE. | Marine subsurface | Prelude FLNG Environment Plan Summary. Shell |
| Pyrenees Operations | PFW and slops water is discharge to the sea from the Compact Flotation Unit (CFU) and Dissolved Gas Flotation unit (DGF) if not greater than an average of 30 mg/L over any rolling period of 24 hours. | Under normal operating conditions, 90% of PFW will be re-injected. | Pyrenees Operations Environment Plan (Commonwealth Summary) BHP 2019 |
| *North Rankin Complex* | The PW system directs all PW streams from the process to the PW degasser to remove dissolved gas. The degasser allows mixing and provides a hold-up volume for the control of a uniform feed to the PW centrifuge(s), thus ensuring efficiency of the centrifuge is not affected by gas breakout. The system also returns water to the degasser. | Marine subsurface | North Rankin Complex Operations Environment Plan Summary. Woodside, September 2019 |

## 3.3 ALARP Assessment

Based on the best practice review discussed in Section 3.2 and an assessment of land management undertaken by Beach (BassGas Raw Gas Pipeline Feasibility Study, Worley Parsons May 2009), the below options were identified for the ALARP assessment. Two approaches were then taken to ALARP assessment, one based on the waste hierarchy and the second based on selected criteria.

- **Reinjection**

In consideration of PFW injection into a well, all four wells on Yolla are required for production. Therefore, it would require a new well. It would be necessary to evaluate a sub-surface structure that could accept the PFW, but may require a new well (roughly circa $A40 million excluding rig mobilisation/demobilisation cost), injection pumps and Xmas tree.

A re-injection well has other complications. There would need to be space on the platform for the additional well, which would also require a conductor (i.e. pipe in casings that goes from deck level to below seabed), hydraulic control system etc. The Xmas tree should be a fair bit smaller than the existing trees given the PFW volumes involved.

- **Discharge through the pipeline for on shore management**

This option involves no separation of PFW on the platform, but discharge to the on shore BassGass facility. There would be the need for substantial chemical injection (Mono Ethylene Glycol - MEG) and corrosion inhibitors. The supply of MEG to the platform would require either a pipeline or routine delivery by boat. The PFW would be separated at the LLGP and would require on land management potentially through evaporation ponds. It would be necessary to obtain an EPA works approval as well as other approvals. This option was rejected in 2009 due to the high capital and operating cost (MEG Pipeline: $116M capital, $0.2M annual operating cost; MEG Boat delivery: $55M, capital $9.5M annual operating cost).

- **Steam stripper**

Two stripping options were considered by Advisian (Yolla Produced Water Improvement TIC estimated Dec 2019 included in **Appendix D**) - a gas stripper and a steam stripper. More details are provided in that report. The gas stripper utilises the fuel gas produced in the platform to strip volatiles from the PFW. This system was available for use from 2006-2009 but was removed due to its inefficiency for removal of BTEX. This option was not considered further in this assessment. The steam stripper comprises of a demineralised water package, a steam stripper and associated pumps, tie ins and demolition of some elements on the platform. The screening level estimated capital cost is $18.2 M, operating cost has not been estimated. The power consumption estimate is equivalent to 400 kW using fuel gas.

- **MPPE**

The MPPE system comprises of a demineralised water package and ion exchange beds, pumps, the MPPE unit, tie ins and demolition (see **Appendix D**). The screening level estimated capital cost is $15.4 M, operating cost has not been estimated. The power consumption estimate is 75 kW.

### 3.3.1 ALARP Assessment based on the Waste Hierarchy

The comparison of the four options based on the waste hierarchy is presented in Table 9.

Avoidance is generally considered to mean eliminating the source. In this case avoidance of discharging to the marine environment is addressed through a change in the processing/ discharge regime.

The outcome of the comparison is that, based on the waste hierarchy, reinjection would be preferable, although a new injection well would be required, with an associated high cost (estimated at more the $40M for the drilling and up to an additional $40M for mobilisation/demobilisation). The suitability of the geological strata is yet to be confirmed.

**Table 9 Assessment of the Options using the Waste Hierarchy**

| Criteria | Option 1 Reinjection | Option 2 Pipeline discharge | Option 3 Steam Stripping | Option 4 MPPE | Current System |
|---|---|---|---|---|---|
| Avoidance | This avoids discharge to the sea. However, it will require additional treatment and use of chemicals. It may be necessary to drill a new injection bore | This avoids discharge to the sea but requires significant additional chemical usage in terms of corrosion inhibiters. It moves management of the PFW to a land-based system | This does not avoid discharges but allows recovery of hydrocarbons | This does not avoid discharges but allows recovery of hydrocarbons | This does not avoid discharges |
| Reuse/Recycling | N/A | Given the saline nature of the PFW, reuse and recycling are not feasible | This does not facilitate reuse of water but recovery of some hydrocarbons | This does not facilitate reuse of water but recovery of some hydrocarbons | This does not facilitate reuse of water or recovery of some hydrocarbons |
| Recovery of Energy | This will require energy for pumped reinjection, and an additional injection well | N/A | This requires additional energy for steam production and pumping | This requires additional energy for steam production and pumping | N/A |
| Treatment | Additional treatment is required | Land based treatment and disposal would need to occur | This is a treatment option | This is a treatment option | This is a treatment option |
| Containment | This involves containment in the geological substrata. | N/A | N/A | N/A | N/A |

### 3.3.2 ALARP Assessment based on Selected Criteria

The assessment of the four options against the base case (current situation) for the selected criteria is presented in Table 10.

The proposed option of reinjection and pipeline discharge would result in no discharge to the marine environment and hence is high on the waste hierarchy. The pipeline option would result in PFW disposal issues on land. The four options will increase energy consumption but are not major contributors (other than a ship-based supply of MEG to the platform in the case of the pipeline option and the steam stripping). The four options produce some minor waste streams.

The increased complexity relating to the operations increases the health and safety risk profile and increased operations and maintenance requirements. Both of these aspects should be manageable under existing systems.

Implementation timeframes are estimated in the range up to 2.5 years with possible additional time for government approvals.

In all cases, including the base case, an update of the EP will be required as well as other approvals for modifications to the platform, an injection well or EPA Works Approval for land-based modification for the pipeline option.

The capital costs are in the range of $15.4M - $55M+; operating costs have not been defined for all options.

The capacity of the platform with respect to weight and area has not been assessed for the MPPE and steam stripper options.

As noted in Table 10,the options would eliminate the impacts or reduce the mixing zone from 7 m to less than 3.5 m. Eliminating the mixing zone would cost between $55M capital and $9.5M annual for the pipeline options, and more than $40M for the reinjection option, if found to be feasible.

## 3.4 ALARP Conclusion

Given the discussion of ALARP presented by NOPSEMA:

*Reducing impacts and risks to ALARP is based on the concept of reasonable practicability; the weighing up of the magnitude of impact or risk reduction against the cost of that reduction[4]. In this context, a titleholder is required to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure.*

It is concluded that the cost of implementing any of the four options is grossly disproportionate to the environmental benefit of implementing any of four options. This is because:

- the PFW flow is relatively low (compared to other platforms)
- the toxicity (as measured by the WET testing) can be managed with low dilutions
- the extent of the mixing zone is very small (less than 7.3 m based on the WET testing and plume modelling).

Therefore, it is concluded that it has been demonstrated that the current system represents an ALARP solution. The risk of impacts on the environment can be considered minimal and, therefore, acceptable.

**Table 10 Options Assessment**

| Criteria | Option 1 Reinjection | Option 2 Pipeline Discharge | Option 3 Steam Stripping | Option 4 MPPE | Current System (base case) |
|---|---|---|---|---|---|
| Marine Emissions | No discharges to the marine environment | No discharges to the marine environment | Extent of mixing zone reduced by 50% or more to less than 3.5 m | Extent of mixing zone reduced by 50% or more to less than 3.5 m | Mixing zone impact (NOEC) less than 7.3 m from discharge. |
| Air impacts | No impact | No impact | No impact | No impact | No impact |
| Energy/Greenhouse Gas | Additional energy consumption/greenhouse gas emissions through drilling and additional treatment and pumping to well | Additional energy consumption/greenhouse gas emissions due to chemical dosing on platform and additional PFW management on shore (overall energy consumption not estimated in the Worley 2009 study) | Additional energy/greenhouse gas emissions (400 kW equivalent from gas usage) for treatment and steam production | Additional energy/greenhouse gas emissions (75 kW gas/electricity usage) for treatment and steam production | No additional energy/greenhouse gas emissions |
| Other Waste streams | Minor waste streams from additional treatment | Minor waste streams from additional treatment, plus management of MEG | No additional waste streams other than steam related blowdown | No additional waste streams other than steam related blowdown | No additional waste streams |
| Waste hierarchy | Eliminates/Avoids discharge to the marine environment | Eliminates/Avoids discharge to the marine environment | Enhanced Treatment of the PFW with recovery of hydrocarbons | Enhanced Treatment of the PFW with recovery of hydrocarbons | Treatment with no recovery of hydrocarbons |
| Health and Safety | Some additional complexity of operation unlikely to significantly change the H&S risk profile | Some additional complexity of operation unlikely to significantly change the H&S risk profile | Additional complexity with added PFW processing, including steam generation, likely to increase the H&S risk profile | Additional complexity with added PFW processing, including steam generation, likely increase the H&S risk profile | No change in risk profile. |

| Criteria | Option 1 Reinjection | Option 2 Pipeline Discharge | Option 3 Steam Stripping | Option 4 MPPE | Current System (base case) |
|---|---|---|---|---|---|
| Capital cost | $40M+ (2019$), plus up to $40M for movilisation/demobilisation | $55-116M (2009$) depending on the MEG supply option. | $18.2M (2019$) | $15.4M (2019$) | No increase |
| Operating cost | Not assessed | $9.5-$0.2M (2009$) depending on the MEG supply option | Not assessed | Not assessed | No increase |
| Operations and Maintenance Availability | Increased operations and maintenance due to additional treatment, pumping pipeline and well | Increased operations and maintenance due to additional treatment, MEG management and on shore PFW management | Increased operations and maintenance due to additional treatment including steam generation | Increased operations and maintenance due to additional treatment including steam generation | No change in O&M activities |
| Licencing/approvals | Additional approvals would be required for an injection well | The EP would need to be updated and approvals for new processes required. An EPA works approval for the onshore activities would be required. | The EP would need to be updated and approvals for new processes required. | The EP would need to be updated and approvals for new processes required | No change |

# 4.0 Risk Assessment

## 4.1 Methodology

The risk assessment methodology is consistent with the proposed methodology included in NOPSEMA documentation (e.g. Oil Pollution Risk Management Guidance Note Feb 2018 Doc. A382148; Environment plan content requirements Guidance note N-04750-GN1344 Revision 4 - 17 April 2019 Doc. A339814) and Beach risk management procedures (see **Appendix E**).

## 4.2 Establish the Context

The context of the assessment is the response to the NOPSEMA EIN issued on the 27th August 2019 and the need to update the EP. The scope of the assessment is the discharge of hydrocarbons in the PFW into the marine environment. The marine environment is described in detail in Section 5 (Existing Environment) of the EP. The current system for managing PFW is described in Section 2.0 of this report. The characteristics of the PFW are described in Sections 2.1 and 2.2 of this report. The assessment of the current PFW treatment system, and of the risk of impacts from which it is concluded that it represents an ALARP solution, is presented in Section 3.3. In a recent meeting NOPSEMA raised the issue of impact on marine life e.g. seals. In response AECOM prepared the memo Potential Impact of Yolla Platform PFW Discharge on Marine Life which is included as **Appendix F** (AECOM 2019).

## 4.3 Risk Identification

The identified risks in relation to the impact of hydrocarbons discharged with the PFW were:

- Failure of oil water separation resulting in the increased discharge of dispersed oil.

The monitoring data indicate that the oil water separation system is effective in removing dispersed oil. The current on-line monitors appear to be adequate for assessing peak and daily average results relative to criteria. Failure of the separation systems would result in increased impact on the marine environment.

- Changes in PFW characteristics resulting in increased hydrocarbons, particularly dissolved hydrocarbons including BTEX.

In comparing historical data with data from the past 2-3 years there has been an increase in some constituents. These have the potential to change impacts on the marine environment. Current on-line monitoring does not provide this data while routine monitoring does.

- Failure of existing OIW monitoring systems to adequately monitor dispersed oil.

The current on-line monitors appear to be adequate for assessing peak and daily average results relative to criteria. If they were to fail then discharges exceeding criteria would not be identified.

- Inadequate total hydrocarbon monitoring.

Currently no routine total hydrocarbon monitoring occurs other than the six-monthly comprehensive analysis. The current assessment concludes that the PFW systems are at ALARP and the risks of impacts are minimal and acceptable. Should the characteristics of the PFW increase suddenly (which is not considered likely) there is potential for increased impacts (i.e. greater plume size).

## 4.4 Risk Analysis, Evaluation and Treatment

The risk analysis, evaluation and treatment are presented in Table 11.

Based on the risk assessment, the key additional mitigating measures are implementing suitable on line and/or routine total hydrocarbon monitoring systems. In addition, incorporation of annual WET testing of the PFW to confirm the findings to date. With respect to impacts on marine life AECOM (2019) concluded

*Due to the small zone of impact associated with the PFW mixing zone, it is concluded that there is a negligible risk of the PFW having a significant impact upon the marine ecosystem within the receiving environment. It is reasonable to conclude that any impacts that may occur would be localised to those biological communities present in those habitats with long-term exposure to the PFW plume, which represent only a very small proportion of the total available similar habitat (i.e. other platform legs or subsea infrastructure). Any indirect impacts would be localised to those species that forage on the biota within the habitats that experience long-term exposure to the PFW plume.*

As the risk was considered negligible the impact was not considered further.

**Table 11 Risk Analysis, Evaluation and treatment**

| Risk Issue | Impact | Current Controls | Effectiveness of Controls | Consequence | Likeli-hood | Risk | Additional Mitigation Measures | Residual Risk |
|---|---|---|---|---|---|---|---|---|
| Failure of oil water separation resulting in the increased discharge of dispersed oil. | Adverse impact on the marine environment through increase in the size of the mixing zone and higher concentrations of hydrocarbons in the mixing zone. Non-compliance with the EP and regulations | Routine system maintenance, monitoring and alarms from OIW monitoring system, should the OIW monitoring exceed 20 mg/L daily sampling of PFW discharges is commenced. | Maintenance systems are considered effective, the OIW monitoring systems are problematic. There are two monitors such that redundancy is provided. The OIW systems may be adequate for monitoring dispersed oil but are not effective for total hydrocarbons. Based on the weekly monitoring data (e.g. Table 2) there have been no exceedances of 30/50 mg/L dispersed oil historically | Potential adverse impact on the marine environment, NOPSEMA Notice or Fine<br>**Consequence: Moderate- Serious** | Unlikely | Medium | Improved Monitoring of dispersed oil | Highly unlikely/ Moderate:<br>**Low Risk** |
| Changes in PFW characteristics resulting in increased hydrocarbons particularly dissolved hydrocarbons including BTEX | Adverse impact on the marine environment through the increase in the size of the mixing zone and higher concentrations of hydrocarbons in the mixing zone if not detected and addressed. Non-compliance with the EP and regulations. The review included in this report indicates that characteristics have | Routine monitoring of the PFW on a weekly basis (BTEX and Dispersed oil) and six-monthly comprehensive analysis | It is not a control as such. The review of this data should result in a response if necessary. e.g. re-evaluation of impact assessment and development of mitigating measures. | It is likely that dissolved hydrocarbons and BTEX increases would occur gradually rather than suddenly unless there was a significant change in operations e.g. an additional well. This type of event would be addressed through Management of Change procedures. Potential adverse impact on the marine environment, NOPSEMA Notice or Fine<br>**Consequence:** | Possible | Medium | Implementation of suitable on-line total hydrocarbon monitoring, weekly monitoring for total hydrocarbons (as well as BTEX and dispersed oil), annual WET testing | Highly unlikely/ Moderate<br>**Low risk** |

| Risk Issue | Impact | Current Controls | Effectiveness of Controls | Consequence | Likeli-hood | Risk | Additional Mitigation Measures | Residual Risk |
|---|---|---|---|---|---|---|---|---|
| | changed with increases in BTEX in particular. However, the assessment of the impact found that it is small (mixing zone of <7.3 m) | | | **Moderate** | | | | |
| Failure of existing OIW monitoring systems to adequately monitor dispersed oil | Adverse impact on the marine environment through increase in the size of the mixing zone and higher concentrations of hydrocarbons in the mixing zone if not detected and addressed. Non-compliance with the EP and regulations. | Routine system maintenance, monitoring and alarms from OIW monitoring system, should the OIW monitoring exceed 20 mg/L daily sampling of PFW discharges is commenced. | The inline monitoring is maintained and are routinely calibrated. There are two monitors such that redundancy is provided. The OIW systems may be adequate for monitoring dispersed oil but are not effective for total hydrocarbons. Based on the weekly monitoring data (e.g. Table 2) there have been no exceedances of 30/50 mg/L dispersed oil historically | The lack of reliable data means that operators do not know whether the discharge complies with the requirements. Potential adverse impact on the marine environment, NOPSEMA Notice or Fine **Consequence: Moderate- Serious** | Possible | Medium | Reassessment of the suitability of the on-line monitors - if requiring replacement, implement the recommended actions | Highly unlikely/ Moderate **Low risk** |
| Inadequate total hydrocarbon monitoring | Adverse impact on the marine environment through increase in the size of the mixing zone and higher concentrations of hydrocarbons in the mixing zone if not detected and addressed. Non- | Routine monitoring of the PFW on a weekly basis (BTEX and Dispersed oil) and six-monthly comprehensive analysis) | It is not a control as such. The review of this data should result in a response if necessary. e.g. re-evaluation of impact assessment. Development of mitigating measures. | The lack of reliable data means that operators do not know whether the discharge complies with the requirements potential adverse impact on the marine environment, NOPSEMA Notice or Fine **Consequence: Moderate** | Likely | Medium | Implementation of suitable on-line total Hydrocarbon Monitoring, weekly monitoring for total hydrocarbons (as well as BTEX and dispersed oil), annual WET testing | Highly unlikely /Moderate **Low risk** |

| Risk Issue | Impact | Current Controls | Effectiveness of Controls | Consequence | Likeli-hood | Risk | Additional Mitigation Measures | Residual Risk |
|---|---|---|---|---|---|---|---|---|
| | compliance with the EP and regulations. The review included in this report indicates that characteristics have changed with increases in BTEX in particular. However, the assessment of the impact found that it is small (mixing zone of <7.3 m). | | | | | | | |

# 5.0 Discussion, conclusions and recommendations

## 5.1 Introduction

The NOPSEMA EIN indicates:

*The following action must be taken by the titleholder within the period specified above:*

*5.1. Implement produced water treatment and monitoring measures to ensure that levels of total petroleum hydrocarbons are not greater than 50 mg/L at any time, and that there is an average of less than 30 mg/L over any period of 24 hours as described in the Bass Gas Offshore Environment Plan; or*

*5.2. Comply with regulation 7 by any other suitable means as required to remove the threat, such as demonstrate that impacts and risks from the discharge of produced water will be reduced to a level that is acceptable and as low as reasonably practicable (ALARP).*

The following discussion, conclusions and recommendations address both clauses 5.1 and 5.2 of the NOPSEMA EIN. It is noted that the notice advises that clause 5.1 or 5.2 could be addressed to demonstrate compliance. Based on this report, clause 5.2 has been addressed fully and demonstrates compliance. In relation to clause 5.1, see the discussion below.

## 5.2 Response to Clause 5.1

As noted in this report and documentation for NOPSEMA, the 30 mg/L and 50 mg/L criteria derive from dispersed oil criteria ("Oil in Water"). This was then adopted as *30 mg/L and 50 mg/L of petroleum using an oil in water monitor*. The NOPSEMA notice and inspection report interpret this as being total hydrocarbons. The EP describes OIW as *including soluble and insoluble hydrocarbons.* NOPSEMA has also indicated (see clause 5.2 above) that ALARP needs to be demonstrated (see section 5.3 below) and *OIW may remain a valid control*. To date, the weekly monitoring includes BTEX and dispersed oil and the six-monthly comprehensive monitoring includes all hydrocarbons (as total petroleum hydrocarbons).

The recent results are summarised in the following Table 12.These results demonstrate the effectiveness of the PFW treatment system for removing dispersed oil. They also indicate that total hydrocarbons have been found at up to 140 mg/L.

The WET testing found that for 110-120 mg/L hydrocarbons (Sept -Oct 2019), 1.6% dilution provides a NOEC for all species tested. Plume modelling has found that this results in an impacted mixing zone of up to 7.3 m from the discharge point.

The approach used is consistent with ANZG guidelines for site-specific development of compliance criteria and with the OSPAR approach (OSPAR Commission 2012, OSPAR Recommendation 2012/5) to impact assessment. It is not currently proposed to undertake field testing of the plume as two different dispersion models were used giving similar results and this is a valid validation mechanism.

In relation to impact on marine life, due to the small zone of impact associated with the PFW mixing zone, it is concluded that there is a negligible risk of the PFW having a significant impact upon the marine ecosystem within the receiving environment.

In relation to OIW as a valid control, AECOM proposes the following to be incorporated into the EP:

- The 30 mg/L and 50 mg/L remain as a control point as currently monitored.
- Beach to implement enhanced monitoring of total hydrocarbons, either on line and/or routinely (e.g. weekly).
- The data should be reviewed in line with monthly reporting requirements.
- Total produced water discharge not to exceed 300$m^3$ per day.

In the context of the existing systems being ALARP, as discussed in Section 5.3 below, the proposed control points can address the potential risks and impacts and provide an expanded monitoring program.

**Table 12 Comparison of weekly analyses and comprehensive analysis.**

## 5.3 Response to clause 5.2

The discussion of ALARP presented by NOPSEMA is as follows:

*Reducing impacts and risks to ALARP is based on the concept of reasonable practicability; the weighing up of the magnitude of impact or risk reduction against the cost of that reduction[4]. In this context, a titleholder is required to implement all available control measures where the cost is not grossly disproportionate to the environmental benefit gained from implementing the control measure.*

It was concluded that the cost of implementing any of the four options is grossly disproportionate to the environmental benefit of implementing any of four options. This is because:

- the PFW flow is relatively low (compared to other platforms)
- the toxicity (as measured by the WET testing) can be managed with low dilutions
- the extent of the mixing zone is very small (less than 7.3 m based on the WET testing and plume modelling.

Therefore, it is concluded that it has been demonstrated that the current system represents an ALARP solution. The risk of impacts on the environment can be considered as minimal and, therefore, acceptable.

Additional monitoring has been recommended to provide the operator with information on the total hydrocarbons being discharged to ensure the PW discharge properties are still valid to the ALARP assessment.

# 7.0 Limitations

AECOM Australia Pty Limited (AECOM) has prepared this report in accordance with the usual care and thoroughness of the consulting profession for the use of Beach Energy Ltd (Beach) and only those third parties who have been authorised in writing by AECOM to rely on this Report.

It is based on generally accepted practices and standards at the time it was prepared. No other warranty, expressed or implied, is made as to the professional advice included in this Report.

It is prepared in accordance with the scope of work and for the purpose outlined in the proposal dated 9 August 2019.

Where this Report indicates that information has been provided to AECOM by third parties, AECOM has made no independent verification of this information except as expressly stated in the Report. AECOM assumes no liability for any inaccuracies in or omissions to that information.

This Report was prepared between August and December 2019 and is based on the conditions encountered and information reviewed at the time of preparation. AECOM disclaims responsibility for any changes that may have occurred after this time.

This Report should be read in full. No responsibility is accepted for use of any part of this report in any other context or for any other purpose or by third parties. This Report does not purport to give legal advice. Legal advice can only be given by qualified legal practitioners.

Except as required by law, no third party may use or rely on this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

Except as specifically stated in this section, AECOM does not authorise the use of this Report by any third party.

It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the site.

Any estimates of potential costs which have been provided are presented as estimates only as at the date of the Report. Any cost estimates that have been provided may therefore vary from actual costs at the time of expenditure.

## Wet Test Chemical Analyses Reports

**Beach Energy Limited**
**5775 South Gippsland Highway**
**Lang Lang**
**VIC 3984**

**NATA Accredited**
**Accreditation Number 1261**
**Site Number 18217**

Accredited for compliance with ISO/IEC 17025 – Testing
The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

## Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description | Testing Site | Extracted | Holding Time |

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

| | |
|---|---|
| **Dry** | Where a moisture has been determined on a solid sample the result is expressed on a dry basis. |
| **LOR** | Limit of Reporting. |
| **SPIKE** | Addition of the analyte to the sample and reported as percentage recovery. |
| **RPD** | Relative Percent Difference between two Duplicate pieces of analysis. |
| **LCS** | Laboratory Control Sample - reported as percent recovery. |
| **CRM** | Certified Reference Material - reported as percent recovery. |
| **Method Blank** | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water. |
| **Surr - Surrogate** | The addition of a like compound to the analyte target and reported as percentage recovery. |
| **Duplicate** | A second piece of analysis from the same sample and reported in the same units as the result to show comparison. |
| **USEPA** | United States Environmental Protection Agency |
| **APHA** | American Public Health Association |
| **TCLP** | Toxicity Characteristic Leaching Procedure |
| **COC** | Chain of Custody |
| **SRA** | Sample Receipt Advice |
| **QSM** | US Department of Defense Quality Systems Manual Version 5.3 |
| **CP** | Client Parent - QC was performed on samples pertaining to this report |
| **NCP** | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| **TEQ** | Toxic Equivalency Quotient |

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

**Quality Control Results**

| Test | Units | Result 1 | | | Acceptance Limits | Pass Limits | Qualifying Code |
|---|---|---|---|---|---|---|---|

## Comments

## Sample Integrity

| | |
|---|---|
| Custody Seals Intact (if used) | N/A |
| Attempt to Chill was evident | Yes |
| Sample correctly preserved | Yes |
| Appropriate sample containers have been used | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime | Yes |
| Some samples have been subcontracted | No |

## Qualifier Codes/Comments

| Code | Description |
|---|---|
| N01 | F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis). |
| N02 | Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid. |
| N04 | F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes. |
| N07 | Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs |

## Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

| | |
|---|---|
| **Dry** | Where a moisture has been determined on a solid sample the result is expressed on a dry basis. |
| **LOR** | Limit of Reporting. |
| **SPIKE** | Addition of the analyte to the sample and reported as percentage recovery. |
| **RPD** | Relative Percent Difference between two Duplicate pieces of analysis. |
| **LCS** | Laboratory Control Sample - reported as percent recovery. |
| **CRM** | Certified Reference Material - reported as percent recovery. |
| **Method Blank** | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water. |
| **Surr - Surrogate** | The addition of a like compound to the analyte target and reported as percentage recovery. |
| **Duplicate** | A second piece of analysis from the same sample and reported in the same units as the result to show comparison. |
| **USEPA** | United States Environmental Protection Agency |
| **APHA** | American Public Health Association |
| **TCLP** | Toxicity Characteristic Leaching Procedure |
| **COC** | Chain of Custody |
| **SRA** | Sample Receipt Advice |
| **QSM** | US Department of Defense Quality Systems Manual Version 5.3 |
| **CP** | Client Parent - QC was performed on samples pertaining to this report |
| **NCP** | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| **TEQ** | Toxic Equivalency Quotient |

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

**Quality Control Results**

| Test | Units | Result 1 | | | Acceptance Limits | Pass Limits | Qualifying Code |

## Comments

## Sample Integrity

| | |
|---|---|
| Custody Seals Intact (if used) | N/A |
| Attempt to Chill was evident | Yes |
| Sample correctly preserved | Yes |
| Appropriate sample containers have been used | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime | Yes |
| Some samples have been subcontracted | No |

## Qualifier Codes/Comments

| Code | Description |
|---|---|
| N01 | F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis). |
| N02 | Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid. |
| N04 | F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes. |
| N07 | Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs |

## Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

| | |
|---|---|
| **Dry** | Where a moisture has been determined on a solid sample the result is expressed on a dry basis. |
| **LOR** | Limit of Reporting. |
| **SPIKE** | Addition of the analyte to the sample and reported as percentage recovery. |
| **RPD** | Relative Percent Difference between two Duplicate pieces of analysis. |
| **LCS** | Laboratory Control Sample - reported as percent recovery. |
| **CRM** | Certified Reference Material - reported as percent recovery. |
| **Method Blank** | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water. |
| **Surr - Surrogate** | The addition of a like compound to the analyte target and reported as percentage recovery. |
| **Duplicate** | A second piece of analysis from the same sample and reported in the same units as the result to show comparison. |
| **USEPA** | United States Environmental Protection Agency |
| **APHA** | American Public Health Association |
| **TCLP** | Toxicity Characteristic Leaching Procedure |
| **COC** | Chain of Custody |
| **SRA** | Sample Receipt Advice |
| **QSM** | US Department of Defense Quality Systems Manual Version 5.3 |
| **CP** | Client Parent - QC was performed on samples pertaining to this report |
| **NCP** | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| **TEQ** | Toxic Equivalency Quotient |

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling.Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

**Quality Control Results**

| Test | Units | Result 1 | | | Acceptance Limits | Pass Limits | Qualifying Code |

## Comments

## Sample Integrity

| | |
|---|---|
| Custody Seals Intact (if used) | N/A |
| Attempt to Chill was evident | Yes |
| Sample correctly preserved | Yes |
| Appropriate sample containers have been used | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime | Yes |
| Some samples have been subcontracted | No |

## Qualifier Codes/Comments

| Code | Description |
|---|---|
| N01 | F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis). |
| N02 | Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid. |
| N04 | F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes. |
| N07 | Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs |
| Q08 | The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference. |

# Toxicity Test Report: TR1858/1

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Ltd<br>GPO Box 175<br>Adelaide SA 5002 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR1858<br>25 September 2019<br>26 September 2019 |
| **Attention:** | Adrian Cukovski / John Peel | **Sampled By:** | Client |
| **Client Ref:** | BE00020689 | **ESA Quote #:** | PR1858_q01 |

| Lab ID No.: | Sample Name: | Sample Description: |
|---|---|---|
| 9252 | Y0250919 | Produced Formation Water, pH 6.3*, salinity 17.3 ‰*, total ammonia 32.0mg/L*. Sample received at 12ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 27 September 2019 at 1810h |

| Sample 9252*: Y0250919* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Fertilised Eggs (Mean ± SD)** | | |
| FSW Control 92.0 ± 1.8 | | |
| ASW Control 92.5 ± 1.7 | | |
| 1.6 87.8 ± 5.6 | | |
| 3.1 12.8 ± 9.5 * | | |
| 6.3 2.0 ± 1.4 * | | |
| 12.5 0.0 ± 0.0 | | |
| 25 0.0 ± 0.0 | | |
| 50 0.0 ± 0.0 | | |
| 100 0.0 ± 0.0 | | |
| **EC10 = 1.6%**** | | |
| **EC50 = 2.4% **** | | |
| **NOEC = 1.6%** | | |
| **LOEC = 3.1%** | | |

*Significantly lower percentage fertilised eggs compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)
** The 95% Confidence limits are not reliable.

# Toxicity Test Report: TR1858/7

Performed in compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Ltd<br>GPO Box 175<br>Adelaide SA 5002 | **ESA Job #:** | PR1858 |
| | | **Date Sampled:** | 25 September 2019 |
| | | **Date Received:** | 26 September 2019 |
| **Attention:** | Adrian Cukovski / John Peel | **Sampled By:** | Client |
| **Client Ref:** | BE00020689 | **ESA Quote #:** | PR1858_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 9252 | Y0250919 | Produced Formation Water, pH 6.3, salinity 17.3‰, total ammonia 32.0mg/L. Sample received at 12ºC in apparent good condition. |

| | |
|---|---|
| **Test Performed:** | 96-hr fish imbalance toxicity test using the Bass *Macqauria novemaculeata.* |
| **Test Protocol:** | ESA SOP 117 (ESA 2016), based on USEPA (2002) |
| **Test Temperature:** | The test was performed at 25±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample |
| **Source of Test Organisms:** | In-house cultures |
| **Test Initiated:** | 27 September 2019 at 1900h |

| Sample 9252: *Y0250919* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Unaffected (Mean ± SD)** | | |
| FSW Control — 90.0 ± 11.6 | | |
| ASW Control — 90.0 ± 11.6 | | |
| 1.6 — 90.0 ± 11.6 | | |
| 3.1 — 60.0 ± 16.3 * | | |
| 6.3 — 0.0 ± 0.0 | | |
| 12.5 — 0.0 ± 0.0 | | |
| 25 — 0.0 ± 0.0 | | |
| 50 — 0.0 ± 0.0 | | |
| 100 — 0.0 ± 0.0 | | |
| **96-hr IC10 = 2.1%**** | | |
| **96-hr EC50 = 3.5 (3.04-4.06)%** | | |
| **NOEC = 1.6%** | | |
| **LOEC = 3.1%** | | |

*Significantly lower percentage of unaffected larval fish compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)
** The 95% Confidence Limits are not reliable.

# Toxicity Test Report: TR1858/9

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Ltd<br>GPO Box 175<br>Adelaide SA 5002 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR1858<br>2 October 2019<br>3 October 2019 |
| **Attention:** | Adrian Cukovski / John Peel | **Sampled By:** | Client |
| **Client Ref:** | BE00020689 | **ESA Quote #:** | PR1858_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 9259 | Y0021019 | Produced Formation Water, pH 6.5*, salinity 17.7 ‰*, total ammonia 32.6mg/L*. Sample received at 12ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 08 October 2019 at 1420h |

| Sample 9259*: Y0021019* | *Vacant* | *Vacant* |

| **Test Performed:** | 48-hr larval development test using the mussel *Mytilus galloprovincialis* |
| **Test Protocol:** | ESA SOP 106 (ESA 2016), based on APHA (1998) and USEPA (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | The test was extended to 72hr |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Farm-reared, Mercury Passage, TAS |
| **Test Initiated:** | 04 October 2019 at 1600 h |

# Chain-of-Custody / Service Request Form

Datasheet ID: 601.1
Last Revised: 20 September 2018

ecotox SERVICES AUSTRALIA

Customer: Beach Energy
Contact Name: Adrian Cukrowski
Phone:
Email: Adrian.cukrowski@beachenergy.com.au (please provide an email address for sample receipt notification)
X Sampled by: D. MCLACHLAN

Ship To: Ecotox Services Aust
Attention: Ruth Krassoi

# Toxicity Test Report: TR1858/17 (Page 1 of 2)

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Ltd<br>GPO Box 175<br>Adelaide SA 5002 | **ESA Job #:** | PR1858 |
| | | **Date Sampled:** | 9 October 2019 |
| | | **Date Received:** | 10 October 2019 |
| **Attention:** | Adrian Cukovski / John Peel | **Sampled By:** | Client |
| **Client Ref:** | BE00020689 | **ESA Quote #:** | PR1858_q01 |

| Lab ID No.: | Sample Name: | Sample Description: |
|---|---|---|
| 9262 | A1-5327 | Produced Formation Water, pH 6.9*, salinity 18.5 ‰*, total ammonia 31.4 mg/L*. Sample received at 14ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 1-hr sea urchin fertilisation success test using *Heliocidaris tuberculata* |
| **Test Protocol:** | ESA SOP 104 (ESA 2014), based on USEPA (2002) and Simon and Laginestra (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | Nil |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Field collected from South Maroubra, NSW. |
| **Test Initiated:** | 10 October 2019 at 1010h |

| Sample 9262*: A1-5327* | | *Vacant* | *Vacant* |
|---|---|---|---|
| **Concentration (%)** | **% Fertilised Eggs (Mean ± SD)** | | |
| FSW Control | 94.5 ± 1.3 | | |
| ASW Control | 92.3 ± 2.6 | | |
| 1.6 | 94.8 ± 1.7 | | |
| 3.1 | 95.3 ± 1.7 | | |
| 6.3 | 35.3 ± 8.5 * | | |

# Toxicity Test Report: TR1858/19 (Page 1 of 2)

Accredited for compliance with ISO/IEC 17025 - Testing

| | | | |
|---|---|---|---|
| **Client:** | Beach Energy Ltd<br>GPO Box 175<br>Adelaide SA 5002 | **ESA Job #:**<br>**Date Sampled:**<br>**Date Received:** | PR1858<br>9 October 2019<br>10 October 2019 |
| **Attention:** | Adrian Cukovski / John Peel | **Sampled By:** | Client |
| **Client Ref:** | BE00020689 | **ESA Quote #:** | PR1858_q01 |

| **Lab ID No.:** | **Sample Name:** | **Sample Description:** |
|---|---|---|
| 9262 | A1-5327 | Produced Formation Water, pH 6.9*, salinity 18.5 ‰*, total ammonia 31.4 mg/L *. Sample received at 14ºC* in apparent good condition. |

*NATA accreditation does not cover the performance of this service

| | |
|---|---|
| **Test Performed:** | 48-hr larval development test using the mussel *Mytilus galloprovincialis* |
| **Test Protocol:** | ESA SOP 106 (ESA 2016), based on APHA (1998) and USEPA (1996) |
| **Test Temperature:** | The test was performed at 20±1°C. |
| **Deviations from Protocol:** | The test was extended to 72hr |
| **Comments on Solution Preparation:** | The sample was adjusted to a salinity of 35±1‰ with modified GP2 artificial sea salts prior to testing.<br>The sample was serially diluted with filtered seawater (FSW) to achieve the test concentrations. A FSW control and an artificial seawater (ASW) control were tested concurrently with the sample. |
| **Source of Test Organisms:** | Farm-reared, Mercury Passage, TAS |
| **Test Initiated:** | 10 October 2019 at 1230 h |

| Sample 9262*: A1-5327* | *Vacant* | *Vacant* |
|---|---|---|
| **Concentration (%)** / **% Normal larvae (Mean ± SD)** | | |
| FSW Control: 76.8 ± 3.3 | | |
| ASW Control: 74.3 ± 3.0 | | |
| 1.6: 79.3 ± 3.4 | | |
| 3.1: 78.0 ± 2.6 | | |
| 6.3: 77.5 ± 2.7 | | |
| 12.5: 37.0 ± 9.4 * | | |
| 25: 0.0 ± 0.0 | | |
| 50: 0.0 ± 0.0 | | |
| 100: 0.0 ± 0.0 | | |
| **72-hr EC10 =7.4 (6.85-7.80)%**<br>**72-hr EC50 =12.3 (11.93-12.78)%**<br>**NOEC = 6.3%**<br>**LOEC = 12.5%** | | |

*Significantly lower percentage of normally developed larvae compared with the ASW Control (Dunnett's Test, 1-tailed, P=0.05)

# Chain-of-Custody Documentation

Datasheet ID: 601.2
Last Revised: 21 September 2018

# Sample Receipt Notification

**Attention** : Peter Young

**Client** : AECOM Australia Pty Ltd
Level 6, 3 Forrest Place
Perth WA 6849

**Email** : peter.young@aecom.com
**Telephone** : 08 6208 0000
**Facsimile** :

**Date** : 10/10/2019

**Re** : Receipt of Samples **Pages :** **2**

**ESA Project** : PR1858 ☑ For Review ☐ Additional Documentation Required - Please Respond

## *Sample Delivery Details*

**Completed Chain of Custody accompanied samples:** **YES**
**Samples received in apparent good condition and correctly bottled:** **YES**
**Security seals on sample bottles and esky intact:** **YES**

**Date samples received** : 10/10/2019
**Time samples received** : 8:30
**No. of samples received** : 1
**Sample matrix** : Aqueous
**Sample temperature** : 11-15°C

**Comments** : 4 x 2.5L sample received at 14oC in apparent good condition

## *Contact Details*

Projects Manager : Dr Rick Krassoi
Telephone : 61 2 9420 9481
Facsimile : 61 2 9420 9484
Email : rkrassoi@ecotox.com.au

Please contact customer services officer for all queries or issues regarding samples

**Note that the chain-of-custody provides definitive information on the tests to be performed**

# Important Note

**DISCLAIMER**:

Apart from fair dealing for the purposes of private study, research, criticism, or review as permitted under the Copyright Act, no part of this report, its attachments or appendices may be reproduced by any process without the written consent of RPS ("RPS" or "we"). All enquiries should be directed to RPS.

We have prepared this report for Lattice Energy ("Client") for the specific purpose for which it is supplied ("Purpose"). This report is strictly limited to the Purpose including the facts and matters stated within it and is not to be used, directly or indirectly, for any other application, purpose, use or matter.

In preparing this report RPS has made certain assumptions. We have assumed that all information and documents provided to us by the Client or as a result of a specific request or enquiry were complete, accurate and up-to-date. Where we have obtained information from a government register or database, we have assumed that the information is accurate. Where an assumption has been made, we have not made any independent investigations with respect to the matters the subject of that assumption. As such we would not be aware of any reason if any of the assumptions were incorrect.

This report is presented without the assumption of a duty of care to any other person ("Third Party") (other than the Client). The report may not contain sufficient information for the purposes of a Third Party or for other uses. Without the prior written consent of RPS:

(a) this report may not be relied on by a Third Party; and

(b) RPS will not be liable to a Third Party for any loss, damage, liability or claim arising out of or incidental to a Third-Party publishing, using or relying on the facts, content, opinions or subject matter contained in this report.

If a Third Party uses or relies on the facts, content, opinions or subject matter contained in this report with or without the consent of RPS, RPS disclaims all risk from any loss, damage, claim or liability arising directly or indirectly, and incurred by any third party, from the use of or reliance on this report.

This report has been issued to the client under the agreed schedule and budgetary requirements and contains confidential information that is intended only for use by the client and is not for public circulation, publication, nor any third-party use without the approval of the client.

Readers should understand that modelling is predictive in nature and while this report is based on information from sources that RPS considers reliable, the accuracy and completeness of said information cannot be guaranteed. Therefore, RPS, its directors, and employees accept no liability for the result of any action taken or not taken on the basis of the information given in this report, nor for any negligent misstatements, errors, and omissions. This report was compiled with consideration for the specified client's objectives, situation, and needs. Those acting upon such information without first consulting RPS do so entirely at their own risk.

# Executive Summary

## Background

Lattice Energy Pty Ltd (Lattice) operates the Yolla Platform which is located within the production license T/L1 and is approximately 100 km offshore from mainland Victoria in the Bass Strait.

As part of Lattice's due diligence, they have commissioned RPS to assess the fate of produced water (PW) being operationally discharged from the Yolla Platform. Recent debottlenecking upgrades to the produced water system has increase the maximum discharge rate, therefore Lattice requested RPS to assess a range of operational states; i) Design, ii) Typical and iii) Worst Case.

The rates of discharge for these three cases were 100 $m^3$/day, 200 $m^3$/day and 300 $m^3$/day, which represented the original PW design flow rate, expected operation post-debottlenecking, and worst-case (end of field life, large amounts of PW production) operation scenarios, respectively. All scenarios were modelled as single port discharge through the bottom of the discharge caisson.

## Methodology

The modelling study was carried out by firstly generating a high resolution vertical current profile for the study area, which included the combined influence of ocean and tidal currents. Secondly, the vertical profiles for typical seasonal salinity and temperature profiles were obtained from the World Ocean Atlas. Finally, a near-field discharge model (CORMIX) was used to assess the rate of dilution (defined as the ratio of the initial concentration (at the discharge port) to the concentration at a given location based on the centreline of the plume) of the plume under static low and high current speeds for each of the three model scenarios under summer and winter conditions.

## Key Findings

### Near-field Modelling

- The furthest distance for any plume to reach 1000:1 dilution was 70 m, for Case 3 – Worst Case Operation scenario (300 $m^3$/day) under summer conditions with high current speeds.
- Plumes released during summer conditions required a greater distance before reaching 1,000:1 dilution, in comparison to plumes released during winter.
- Plumes released during low current speed conditions rose higher in the water column and travelled less horizontally than plumes released in high current speed conditions for all three flow rates modelled under summer and winter conditions.

# 1.0 Introduction

Lattice Energy Pty Ltd (Lattice) operates the Yolla Platform which is located within the production license T/L1 and is approximately 100 km offshore from mainland Victoria in the Bass Strait.

As part of Lattice's due diligence, they have commissioned RPS to assess the fate of produced water (PW) being operationally discharged from the Yolla Platform. Recent debottlenecking upgrades to the produced water system has increase the maximum discharge rate, therefore Lattice requested RPS to assess a range of operational states; i) Design, ii) Typical and iii) Worst Case.

The rates of discharge for these three cases were 100 $m^3$/day, 200 $m^3$/day and 300 $m^3$/day, which represented the original PW design flow rate, expected operation post-debottlenecking, and worst-case (end of field life, large amounts of PW production) operation scenarios, respectively. All scenarios were modelled as single port discharge through the bottom of the discharge caisson.

**Table 1 Location of the release site used for the dispersion modelling assessment.**

| Release Site | Latitude | Longitude | Water Depth (m) |
|---|---|---|---|
| Yolla Platform | 39° 50' 39.5" S | 145° 49' 5.9" E | 80 |

## 1.1 Scope of work

The physical mixing of the PW stream can be separated into two distinct zones: (a) near-field; and (b) far-field. The limits of the near-field zone are defined by the area where the levels of mixing and dilution are controlled by the plume's initial jet momentum and the buoyancy flux, resulting from the density difference. When the plume encounters a boundary such as the water surface, or loses its buoyancy, the near-field mixing is complete, and the far-field mixing begins.

Therefore, to accurately determine the dilution of the discharge and the mixing zones, the effect of near-field dynamics need to be considered first.

The scope of work included the following components:

1. Generate a 5-year 3-dimensional current data set (2012-2016) that included the combined influence of ocean and tidal currents;
2. Generate seasonal vertical profiles of salinity and water temperature at the release site; and
3. Simulate the near field-mixing and dilution zone using the three-dimensional near-field model (CORMIX) under static low and high current speeds for each of the three model scenarios under summer and winter conditions.

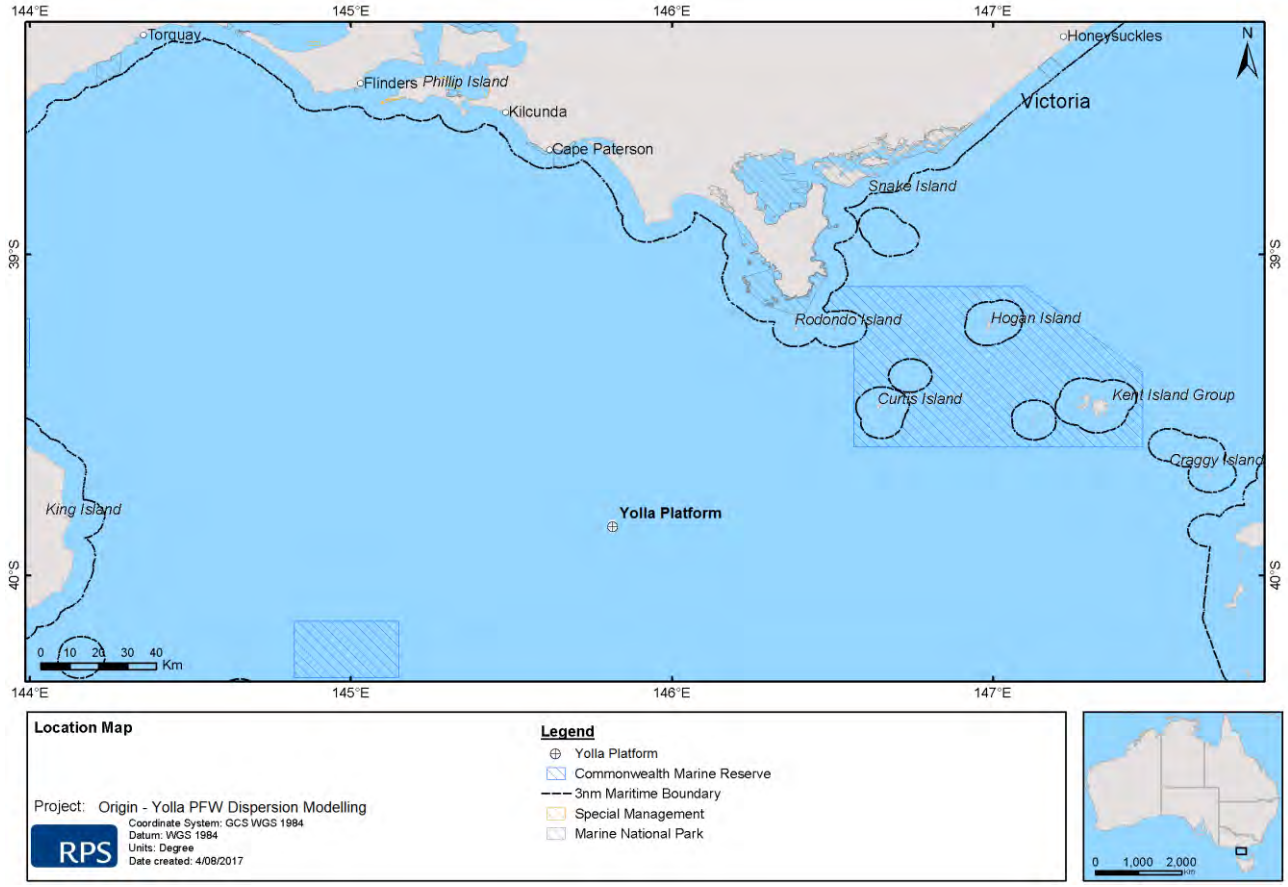

**Figure 1 Location of the Yolla Platform used in the dispersion modelling study.**

# 2.0 Discharge Characteristics

The PW stream, consists of both PW and water of condensation, is discharged vertically downwards through a discharge caisson at a depth of 45 meters below mean sea level (MSL). The depth of the surrounding water is approximately 80 m.

The PW discharge properties, are summarised in Table 2. The PW plume is slightly hotter (1°C above ambient at 45 m below MSL) and less saline than the receiving waters, resulting in a positively buoyant plume.

**Table 2 Summary of the modelled discharge parameters used to simulate the discharges at Yolla.**

| Component | Design Operation | Typical Operation | Worst Case Operation |
|---|---|---|---|
| Flow rate ($m^3/d$) | 100 | 200 | 300 |
| Temperature (°C) | 13.784 – 16.760 | 13.784 – 16.760 | 13.784 – 16.760 |
| Salinity (PSU) | 0.14 | 11.9 | 14.7 |
| Diameter of discharge pipe (m) | 0.73 | | |
| Depth of discharge (m) | 45 | | |
| Pipe orientation | Downward | | |

## 2.1 Produced Water Contaminants Assessed

Lattice has provided a list of measured contaminant levels and trigger values for 99% species protection (Table 3), which were adopted as part of this study.

As shown, the majority of the contaminants require a dilution factor of less than 75.

Contaminants of concern include mercury, phenol, glycol and oil and petroleum hydrocarbons, all of which require dilutions greater than 100 to reach the 99% species protection.

For conservatism the discharge was assessed to a maximum dilution of 1000:1.

**Table 3 Summary of produced water contaminants and trigger values**

| Component | Max recorded produced water concentration (µg/L) | 99% Species protection trigger value (µg/L) | Required dilution factor to achieve 99% trigger value |
|---|---|---|---|
| Aluminium | 3,200 | 27* | 119 |
| Arsenic | BD | 1 | - |
| Boron | 3,400 | 90* | 38 |
| Barium | 13,000 | NL | - |
| Chromium | 1 | 0.14 | 7.1 |
| Iron | 4,300 | ID | - |
| Lead | BD | 1 | - |
| Mercury | 29 | 0.1 | 290 |
| Manganese | 30 | 1200* | NR (<1) |
| Molydenum | 1 | ID | - |
| Nickel | 10 | 7 | 1.4 |
| Selenium | 1 | 5* | NR (<1) |
| Strontium | 810 | NL | - |
| Zinc | 90 | 7 | 12.9 |
| Benzene | 12,000 | 500 | 24 |
| Toluene | 14,000 | 110* | 127 |
| Ethylbenzene | 450 | 50* | 90 |
| o-Xylene | 1,600 | 200* | 8 |
| m&p-Xylene | 5,200 | 50* | 104 |
| Napthalene | 1,000 | 50 | 20 |
| Phenol | 64,000 | 270 | 237 |
| Cresols | 75,000 | NL | - |
| 2,4-Dimethyl Phenol | 8,700 | NL | - |
| Oil & Petroleum Hydrocarbons | <30,000 (current discharge limit) | 70 | 428 |
| Glycol | 2 vol% (20,000,000 µg/L) | 50,000^ | 400 |

^ = Guideline for working limits only, insufficient data to determine level of species protection
* = Taken from data for 99% species protection in fresh water systems ANZECC
BD = Historical testing shows these contaminants are below the limit of detection of 0.001 mg/L
ID = Insufficient data to determine a trigger value for marine or freshwater environment
NL = Component not listed in ANZECC guidelines
NR = Dilution not required, below ANZECC guideline concentration at point of discharge

# 3.0 Currents

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area off the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are driven by tides, winds, incident continental shelf waves and density driven flows. High winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 2 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kampf 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling eastward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining deep ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional data set.

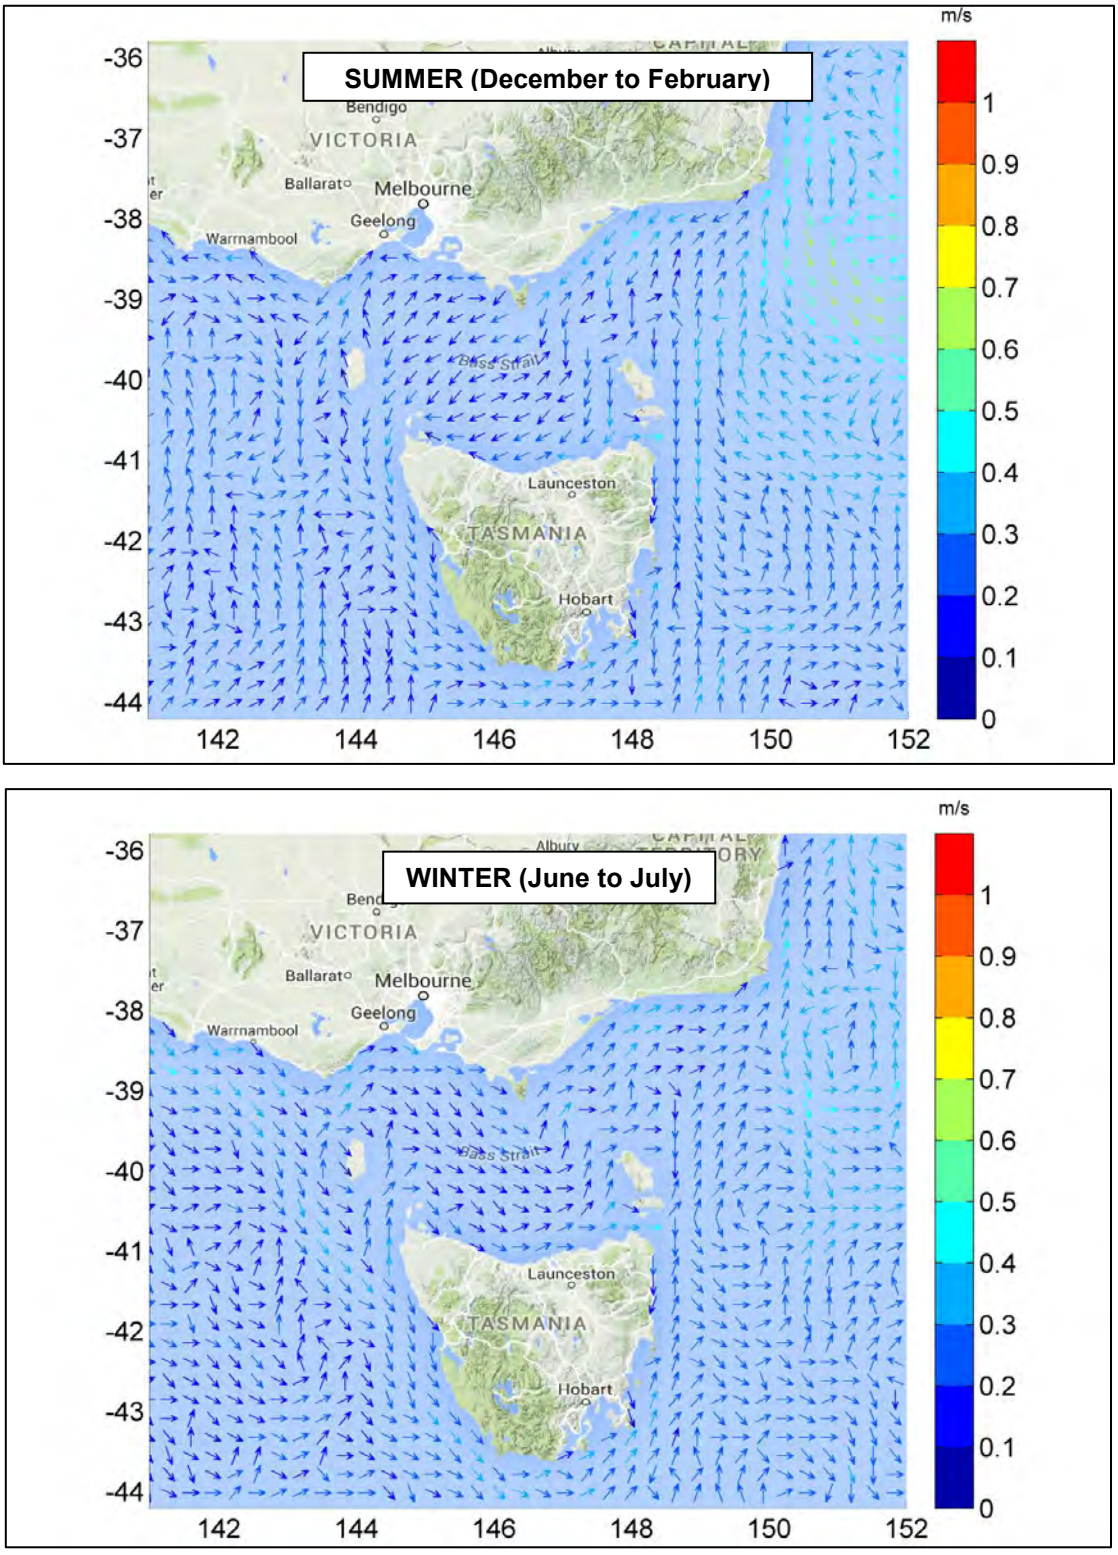

**Figure 2 HYCOM averaged seasonal surface drift currents during summer and winter.**

## 3.1 Tidal Currents

Tidal current data was generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified by comparison to field measurements throughout the world over the past 32 years (Isaji & Spaulding, 1984; Isaji, et al., 2001; Zigic, et al., 2003). HYDROMAP tidal current data has been used as input to forecast (in the future) and hindcast (in the past) pollutant spills in Australian waters and forms part of the Australian National Oil Spill Emergency Response System operated by AMSA (Australian Maritime Safety Authority).

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

### 3.1.1 Grid Setup

RPS has a global tidal model with global coverage. The model is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3 shows the tidal model grid covering the study domain.

A combination of datasets were used and merged to describe the shape of the seabed within the grid domain (Figure 4). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

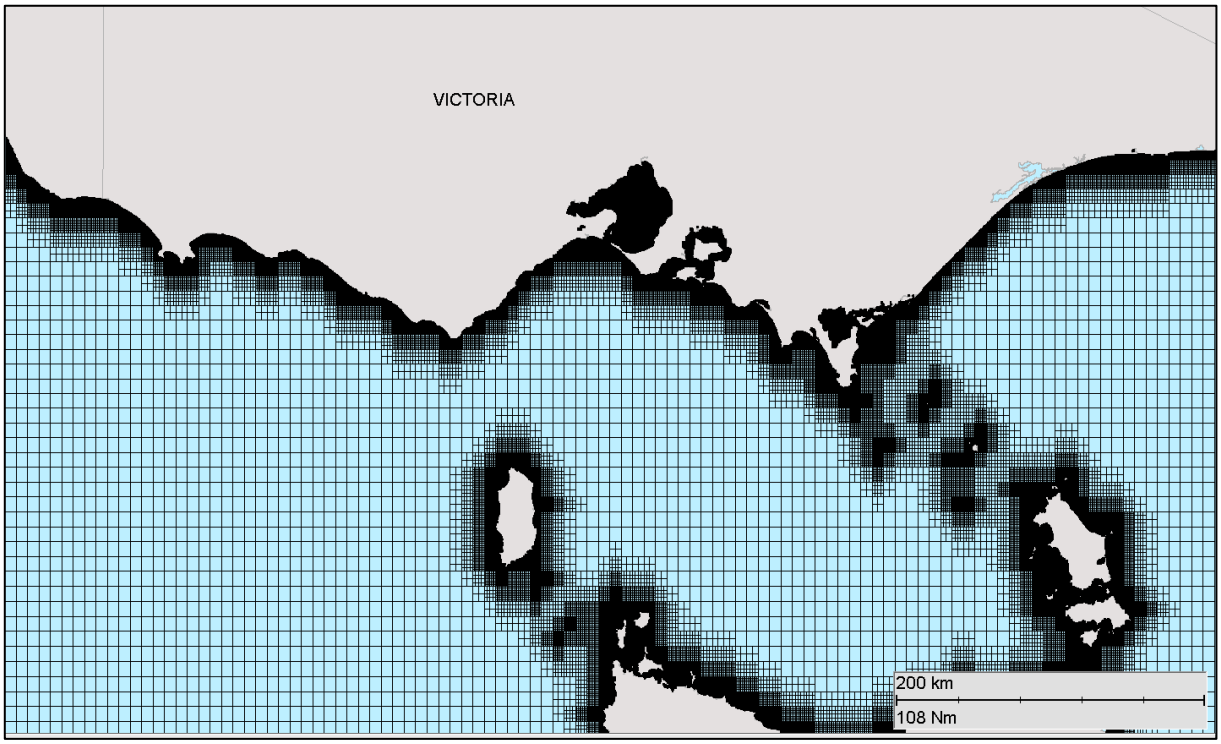

**Figure 3 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.**

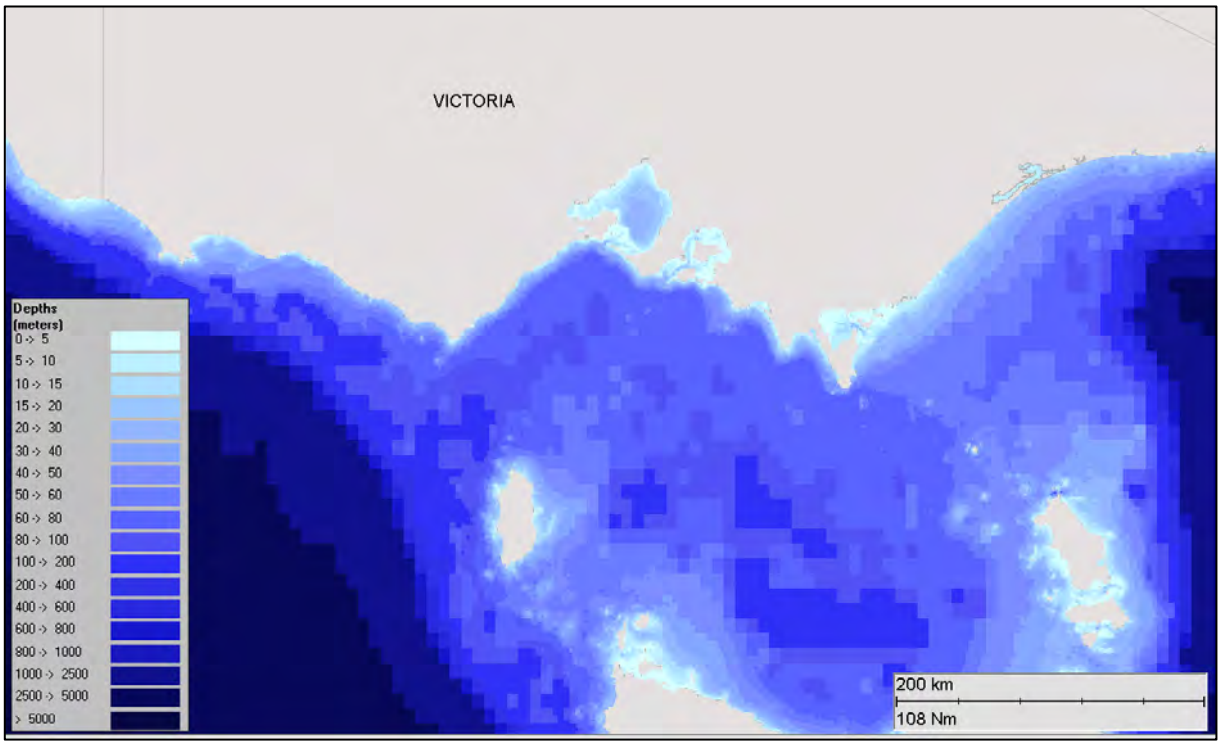

**Figure 4 Bathymetry defined throughout the tidal model domain.**

### 3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were $K_2$, $S_2$, $M_2$, $N_2$, $K_1$, $P_1$, $O_1$ and $Q_1$. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The Topex-Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total these satellites carried out 62,000 orbits of the planet. The Topex-Poseidon tidal data has been widely reported amongst the oceanographic community, being included in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010). The Topex/Poseidon tidal data is considered suitably accurate for this study.

### 3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data from five locations situated within the study area (Figure 5).

Figure 6 and Figure 7 illustrate comparisons of the predicted and observed surface elevations for each location for January 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

To provide a statistical measure of the model's performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE is the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error and more readily understood (Willmott & Matsuura, 2005).

$$MAE = N^{-1}\sum_{i=1}^{N}|P_i - O_i|$$

The Index of Agreement (IOA) is determined by:

$$IOA = 1 - \frac{\sum|X_{model} - X_{obs}|^2}{\sum(|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2}$$

Where: X represents the variable being compared and the time mean of that variable. A perfect agreement exists between the model and field observations if the index gives an agreement value of 1 and complete disagreement will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values meaningfully larger than 0.5 represent good model performance. Clearly, a greater IOA and lower MAE represent a better model performance.

Table 4 Statistical comparison between the observed and HYDROMAP predicted surface elevations. shows the IOA and MAE values for the selected locations.

Figure 8 shows a screenshot of the predicted tidal current vectors within the Otway Basin.

**Table 4 Statistical comparison between the observed and HYDROMAP predicted surface elevations.**

| Tide Station | IOA | MAE (m) |
|---|---|---|
| Gabo Island | 0.98 | 0.08 |
| Port MacDonnell | 0.98 | 0.05 |
| Port Welshpool | 0.92 | 0.30 |
| Portland | 0.97 | 0.07 |
| Stack Island | 0.96 | 0.22 |

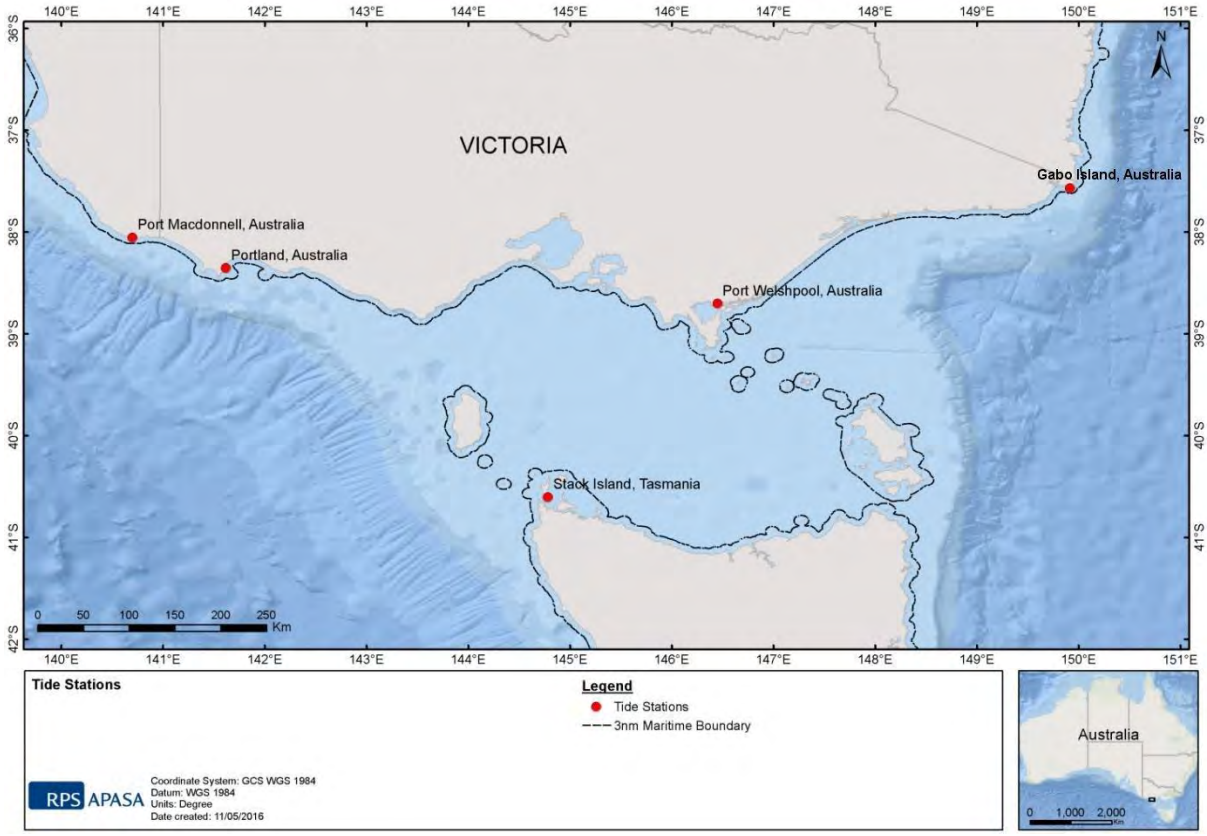

**Figure 5 Location of the tide stations used in the surface elevation validation.**

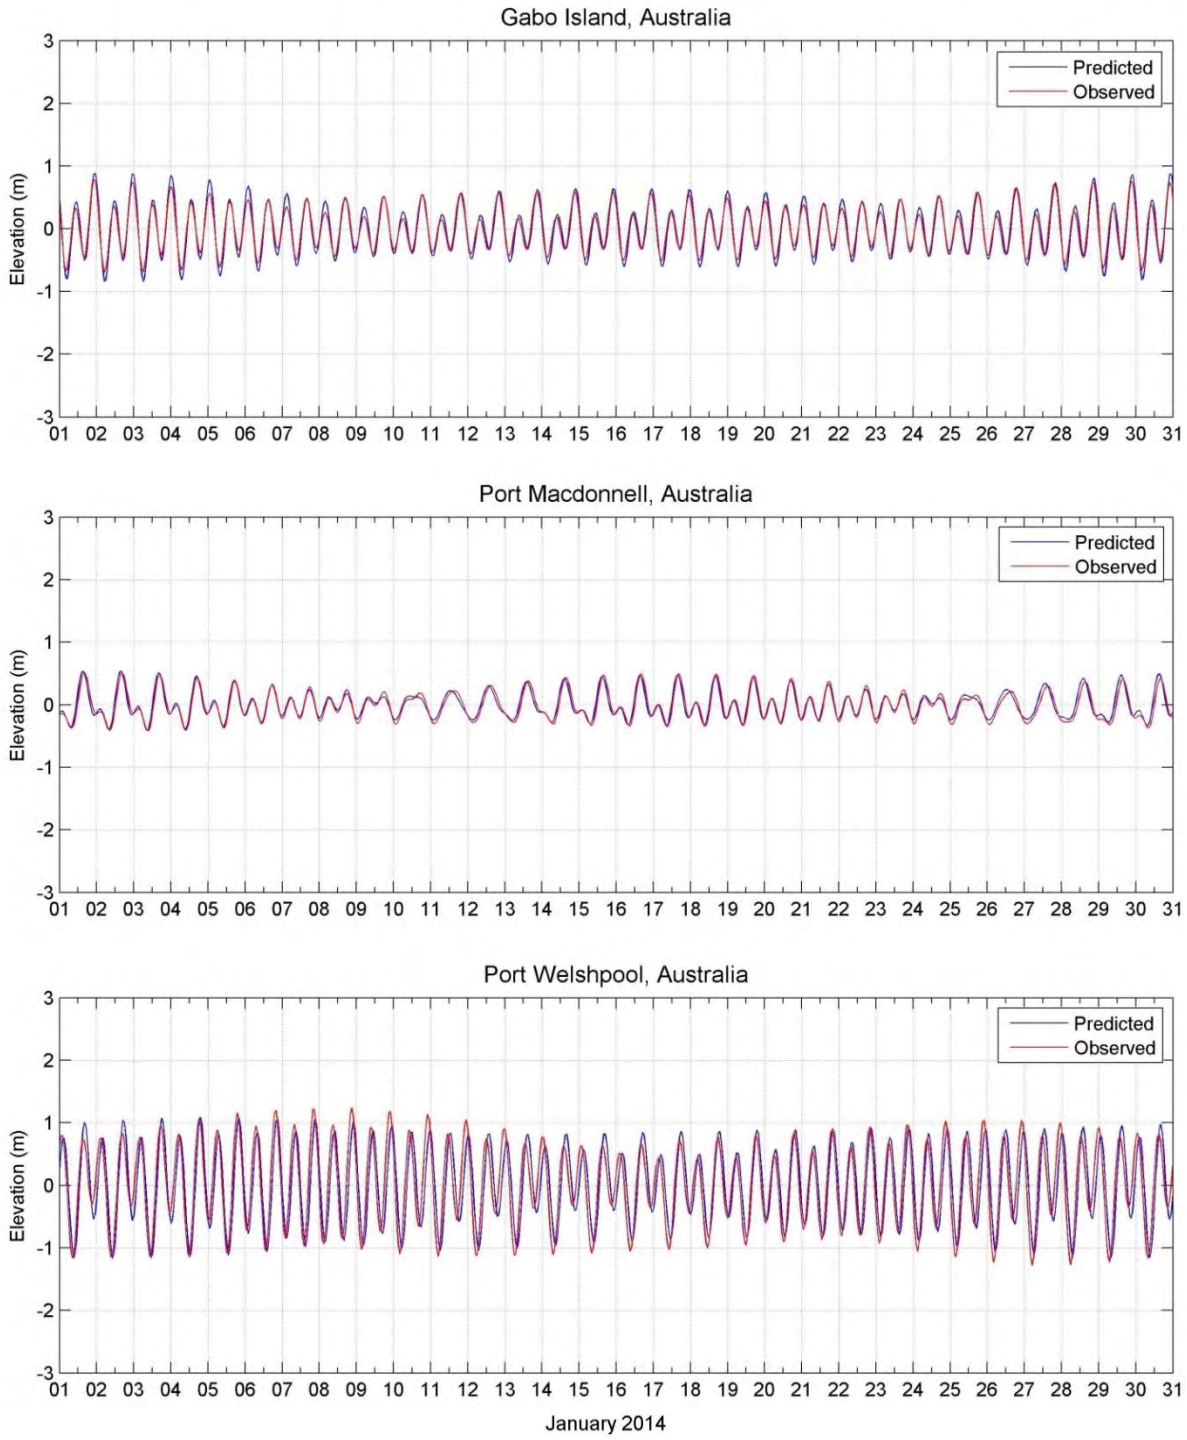

**Figure 6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Gabo Island (upper image), Port MacDonnell (middle image) and Port Welshpool (lower image).**

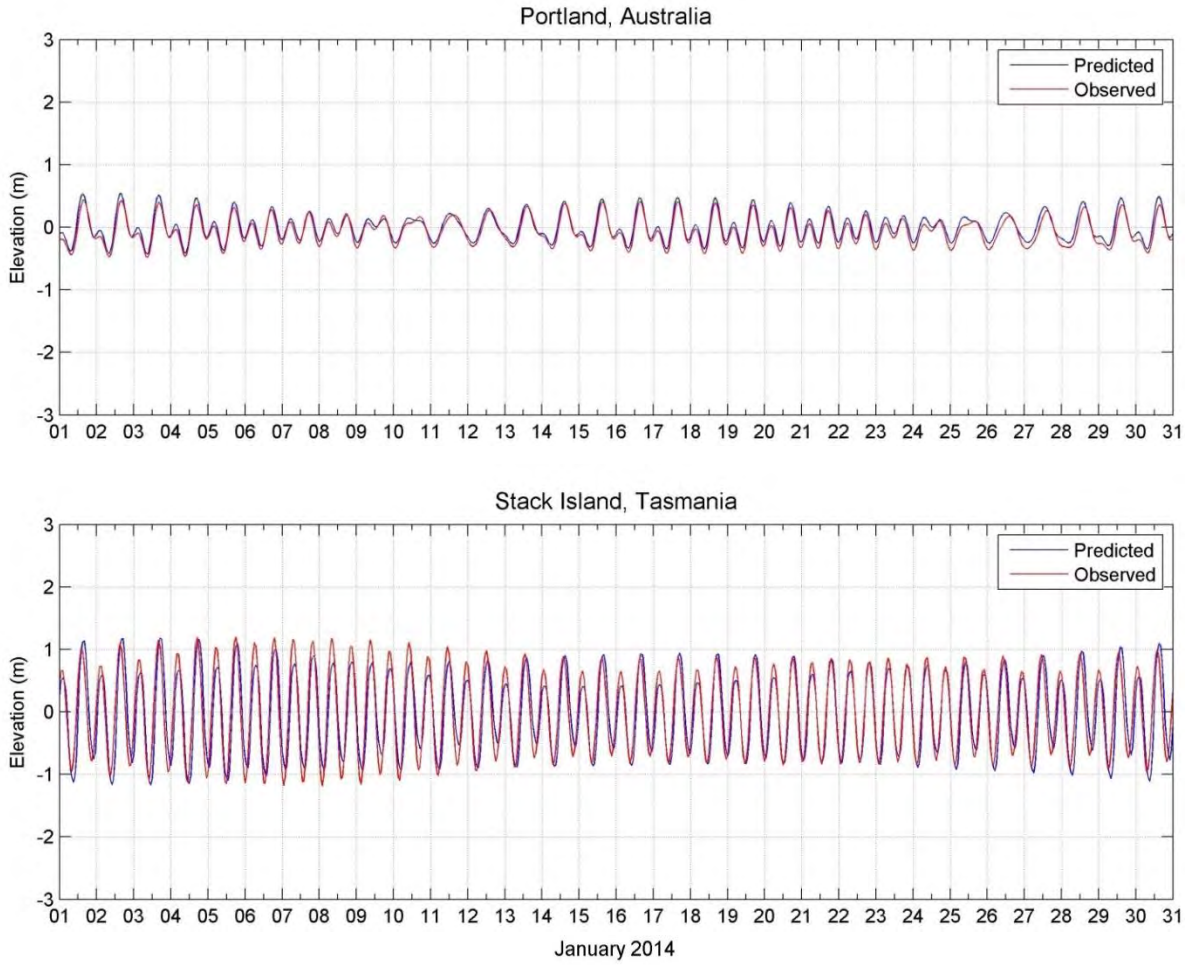

**Figure 7 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).**

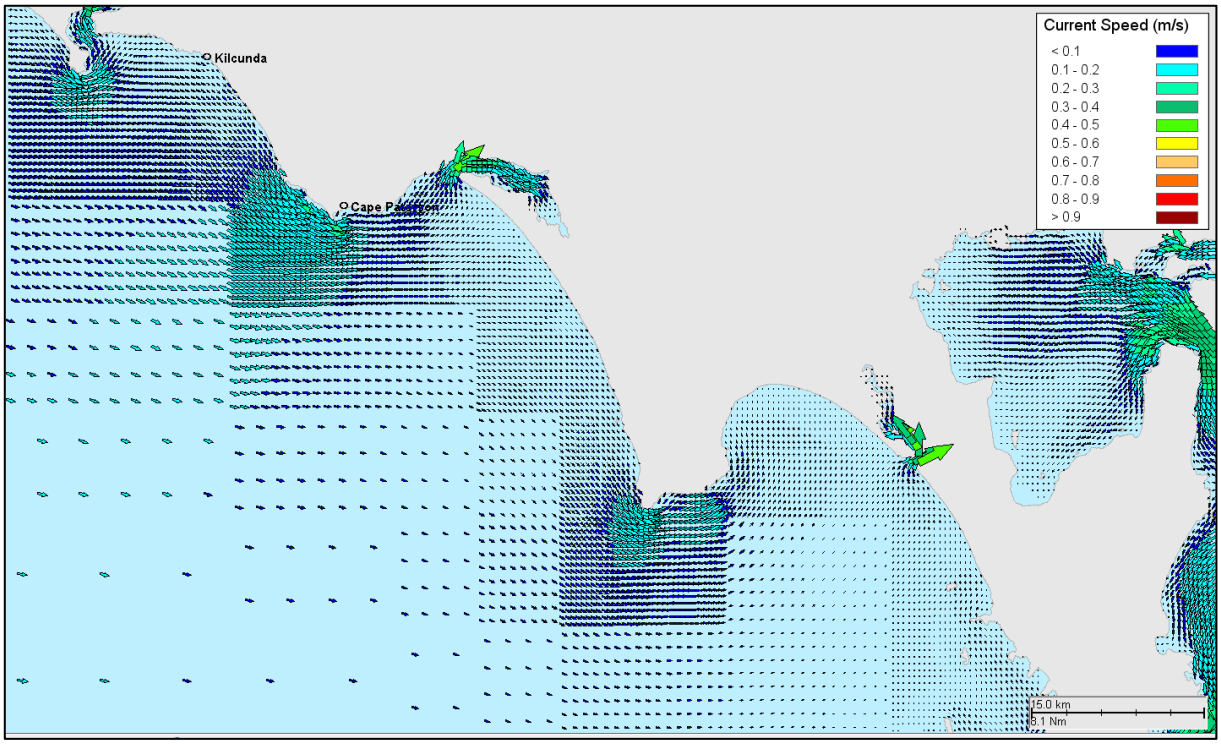

**Figure 8 Snapshot of the predicted tidal current vectors. Note the density of the tidal vectors vary with the grid resolution, particularly along the coastline and around the islands and sholas. Colourations of individual vectors indicate current speed.**

## 3.2 Ocean Currents

Data describing the flow of ocean currents was obtained from HYCOM (Hybrid Coordinate Ocean Model, (Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km ($1/12^{th}$ of a degree) over the region, at a frequency of once per day. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

For this study, the HYCOM hindcast currents were obtained used. Figure 9 shows an example modelled surface ocean currents (HYCOM) during the study period.

Figure 10 and Figure 11 show the monthly and total current rose distributions resulting from the combination of HYCOM ocean current data and HYDROMAP tidal data nearby the Yolla release site.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. Speed intervals of

0.1 m/s are predominantly used in these current roses. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

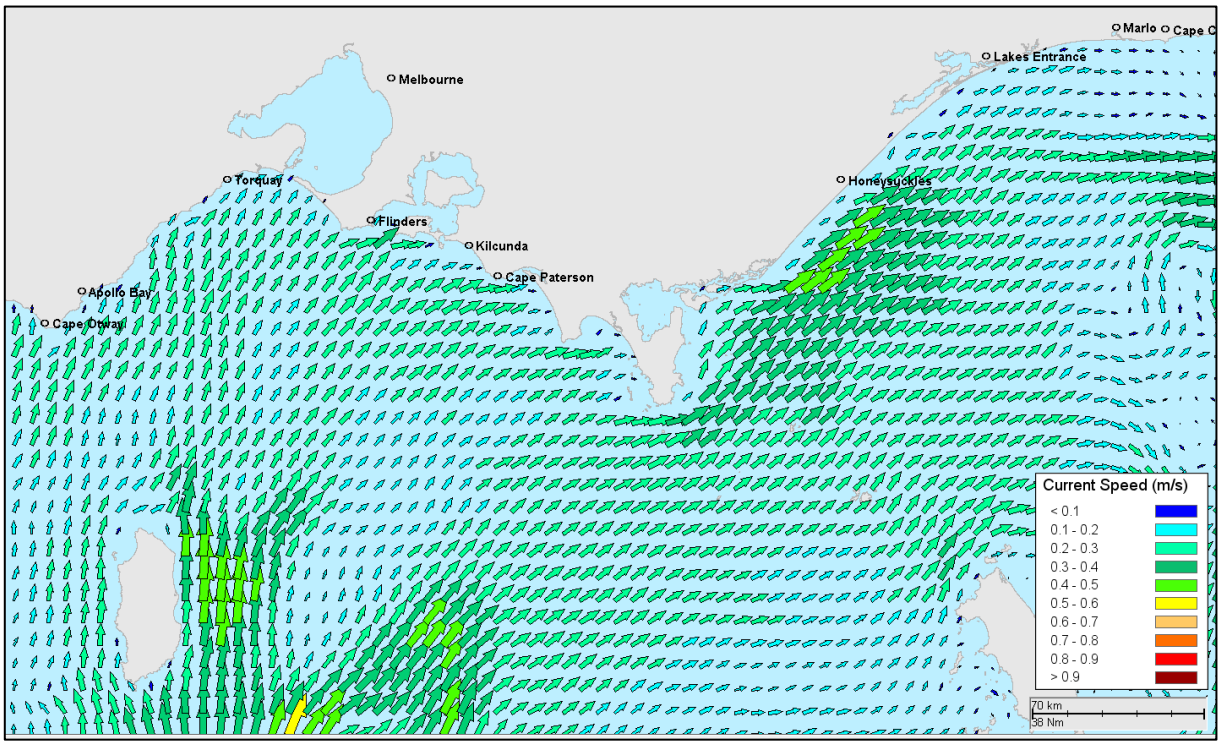

**Figure 9 Modelled surface ocean currents presented for the 1st May 2012. Derived from the HYCOM ocean hindcast model. The colours of the vectors indicate current speed in m/s.**

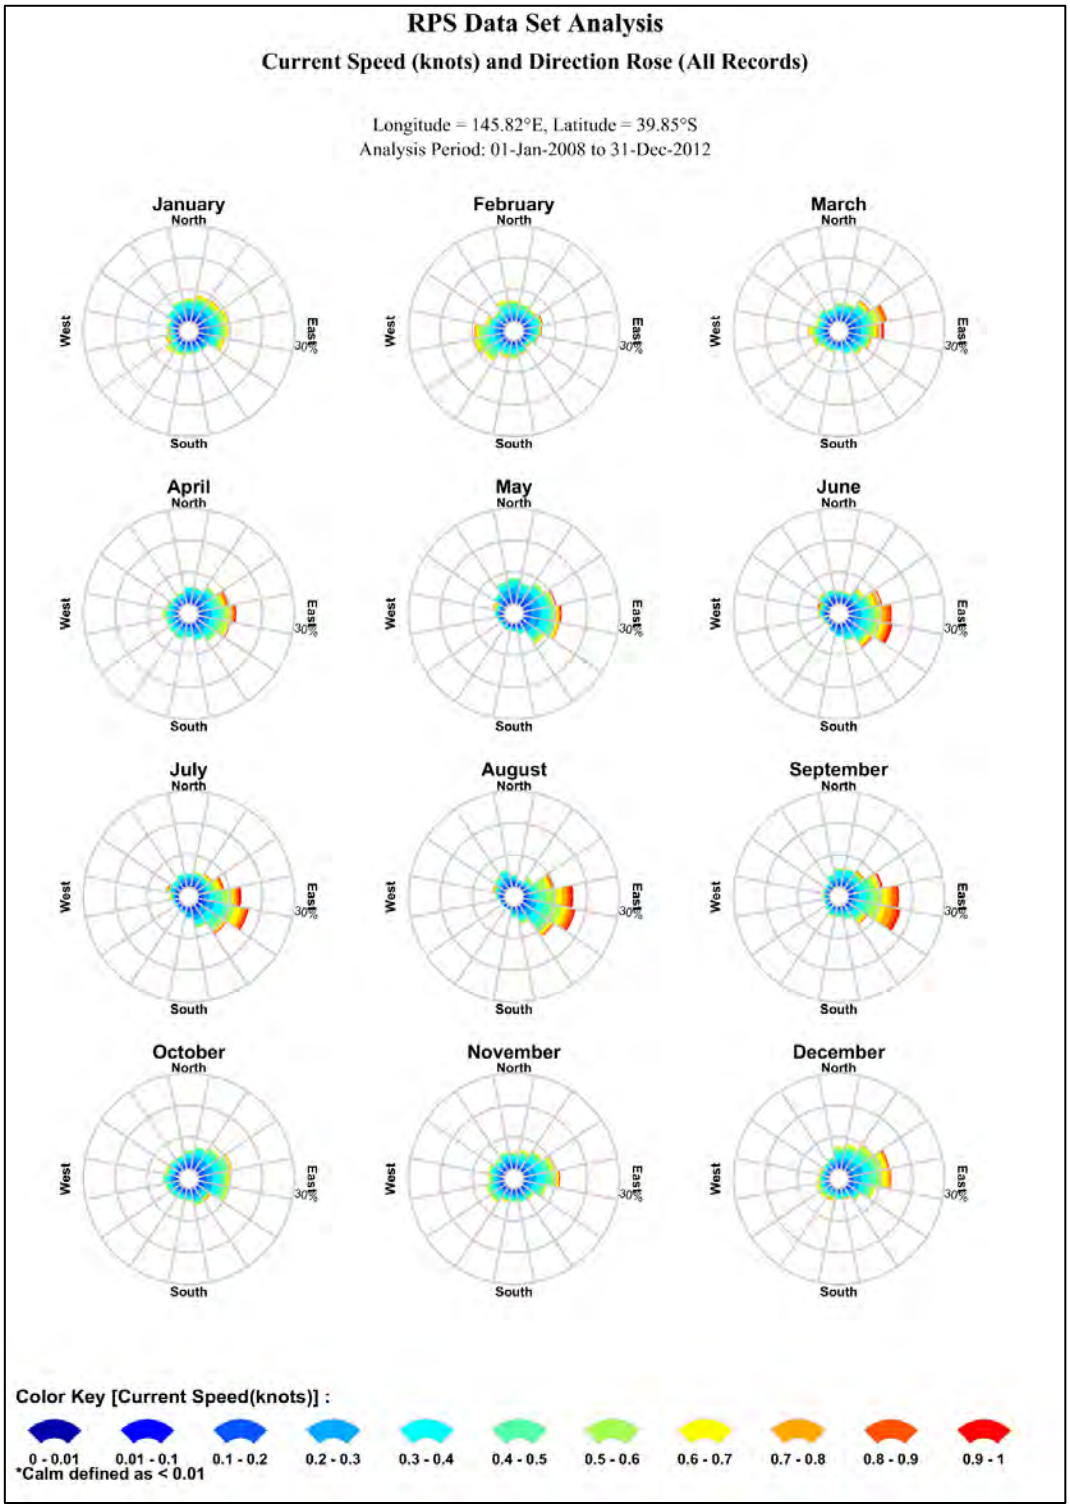

**Figure 10 Monthly surface current rose plots nearby the Yolla release site (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2008–2012 (inclusive). The colour key shows the current magnitude (m/s), the compass direction provides the current direction flowing TOWARDS and the length of the wedge gives the percentage of the record for a particular speed and direction combination.**

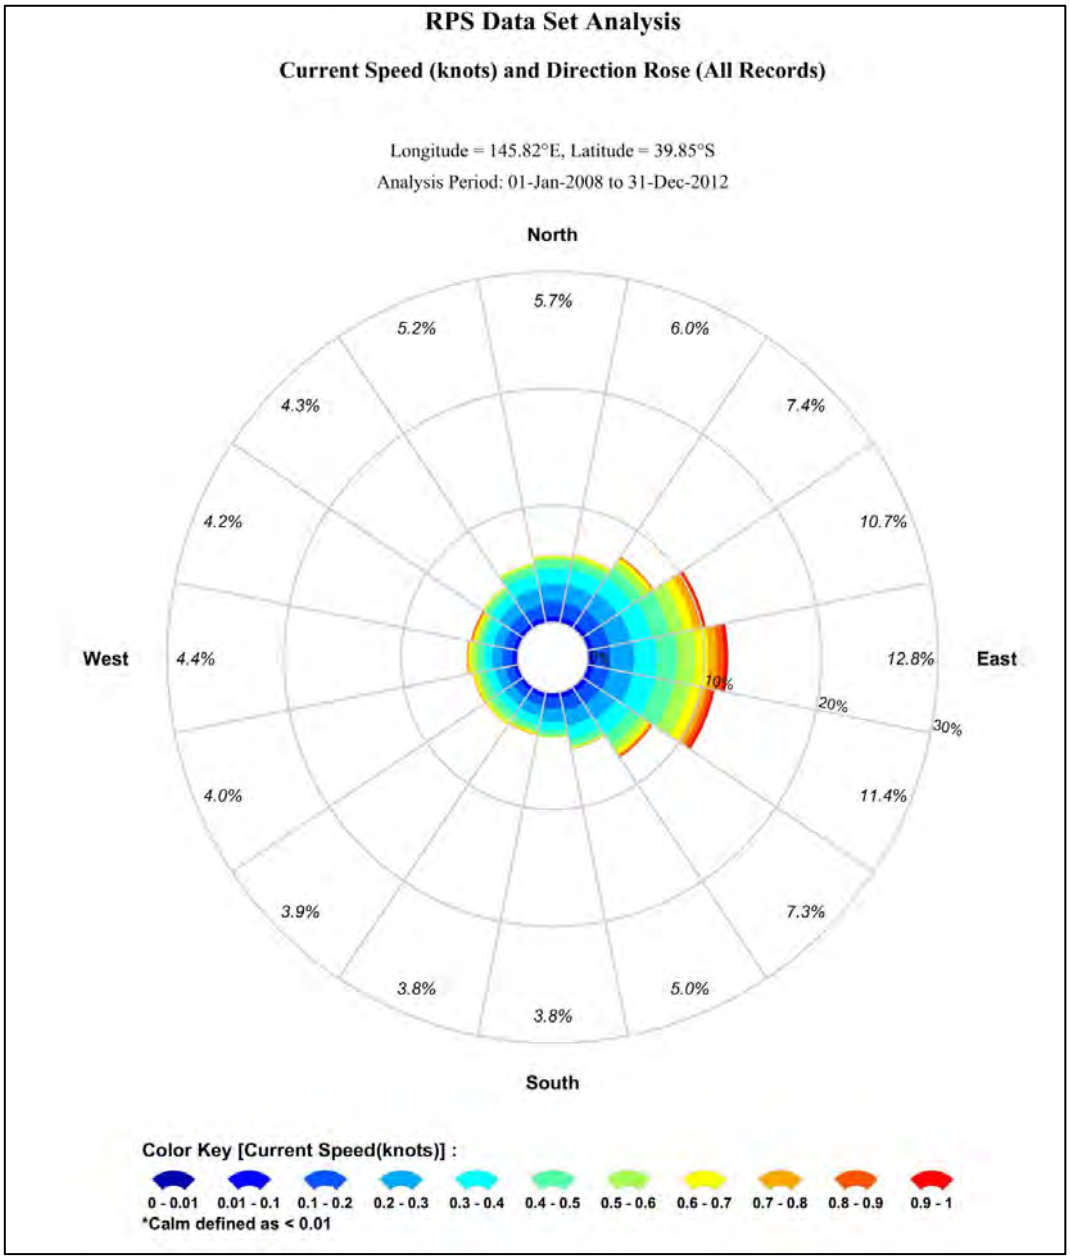

**Figure 11 Modelled total surface current rose plot nearby the Yolla release site (derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2008–2012 (inclusive). The colour key shows the current magnitude (m/s), the compass direction provides the current direction flowing TOWARDS and the length of the wedge gives the percentage of the record for a particular speed and direction combination.**

# 4.0 Modelling Methods

## 4.1 Description of Models

### 4.1.1 Near-Field Model

The near-field mixing and dispersion of the operational discharge was simulated using the fully three-dimensional flow model in CORMIX.

CORMIX is a mixing zone model and decision support system for environmental impact assessment of regulatory mixing zones.

CORMIX contains a series of elements for the analysis and design of conventional or toxic, single or multi-port, submerged or surface, buoyant or nonbuoyant, pollutant discharges into stratified or unstratified watercourses, with emphasis on the geometry and dilution characteristics on the initial mixing zone. (Doneker, 1990; Jirka & Doneker, 1991)

CORMIX has been validated in many independent studies over the years. A list of some of these studies is provided on the CORMIX website (http://www.cormix.info/validations.php).

## 4.2 Near-Field Model Setup

### 4.2.1 Ambient Environmental Conditions

Inputs for the ambient environmental conditions included a vertical profile of salinity and water temperature, along with static current speeds and general direction. The salinity and water temperature and profiles are important to accurately account for buoyancy of the diluting plume, whilst the current speeds influence the intensity of initial mixing and the deflection of the PW plume. These inputs are described below.

#### 4.2.1.1 Ambient Temperature and Salinity

Table 5 shows the seasonal water temperature and salinity levels at varying depths from 0 to 50 m at the release site. The data was sourced from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013).

Seasonal water temperature profiles show a 2–4 $^{o}$C difference between the summer and winter conditions. The temperature ranged from 14.74 to 17.79$^{o}$C during the summer season and 12.78 to 13.11$^{o}$C during the winter season. Alternatively, salinity values demonstrate greater consistency across the seasons and depth range. Salinity values during the summer season ranged from 35.36 to 35.52 PSU and 35.49 to 35.61 PSU during the winter season.

**Table 5 Seasonal temperature and salinity profile adjacent at the release site.**

| Season | Depth (m) | Temperature (°C) | Salinity (PSU) |
|---|---|---|---|
| Summer | 0 | 18.05 | 35.36 |
| | 10 | 17.79 | 35.41 |
| | 20 | 17.55 | 35.44 |
| | 30 | 17.36 | 35.44 |
| | 40 | 16.78 | 35.44 |
| | 50 | 14.74 | 35.52 |
| Winter | 0 | 13.11 | 35.49 |
| | 10 | 13.07 | 35.57 |
| | 20 | 13.02 | 35.58 |
| | 30 | 12.81 | 35.60 |
| | 40 | 12.79 | 35.61 |
| | 50 | 12.78 | 35.61 |

#### 4.2.1.2 Ambient Currents

The 5-year current dataset was analysed to determine the 5$^{th}$ and 95$^{th}$ percentile current speeds as input into the near-field model, representative of low and high current speeds, respectively.

Table 6 presents the 5$^{th}$ and 95$^{th}$ percentiles of current speeds through the water column, which produce contrasting dilution and advection cases:

- 5$^{th}$ percentile current speed: low current speed, low dilution and slow advection;
- 95$^{th}$ percentile current speed: high current speed, high dilution and rapid advection to nearby areas.

The 5$^{th}$ and 95$^{th}$ percentile values are referenced as low and high current speeds throughout the remainder of the report, respectively.

**Table 6 Adopted ambient current conditions.**

| Depth (m) | 5$^{th}$ Percentile or low current speed (m/s) | 95$^{th}$ Percentile or high current speed (m/s) |
|---|---|---|
| 0 | 0.042 | 0.390 |
| 10 | 0.030 | 0.254 |
| 20 | 0.028 | 0.227 |
| 30 | 0.027 | 0.224 |
| 40 | 0.026 | 0.218 |
| 50 | 0.026 | 0.212 |

# 5.0 Results

## 5.1 Near-Field Modelling Results

Table 7 presents a summary of the near-field plume results for each of the three cases for summer and winter conditions under low and high current speed conditions.

Figure 12 to Figure 14 show the trajectory of the plume through the water column as the current transport it away from the discharge point.

The furthest distance for any plume to reach 1000:1 dilution was 70 m, for the Case 3 – Worst Case Operation scenario (300 $m^3$/day) under summer conditions with high current speed.

Plumes released during summer conditions required a greater distance before reaching 1,000:1 dilution, in comparison to plumes released during winter.

Plumes released during low current speed conditions rose higher in the water column and travelled less horizontally than plumes released in high current speed conditions for all three flow rates modelled under summer and winter conditions.

**Table 7 Maximum horizontal distance from the discharge point that centreline dilution (X:1) was predicted to travel.**

| Case | Season | Current Speed (%ile) | Maximum Distance from Discharge Point to Centreline Dilution X:1 (m) | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | 100 | 200 | 300 | 400 | 500 | 600 | 700 | 800 | 900 | 1000 |
| Case 1 Design Operation | Summer | 5th | 0.2 | 0.4 | 0.6 | 0.7 | 0.9 | 1.0 | 1.1 | 1.3 | 1.4 | 1.5 | 2.7 | 3.7 | 4.6 | 5.4 | 6.2 | 7.0 | 7.8 | 8.5 | 9.2 |
| | | 95th | 1.2 | 2.2 | 3.0 | 3.6 | 4.2 | 4.8 | 5.3 | 5.8 | 6.3 | 6.7 | 11.0 | 14.9 | 18.4 | 21.8 | 25.1 | 28.4 | 31.6 | 34.8 | 38.0 |
| | Winter | 5th | 0.2 | 0.4 | 0.6 | 0.7 | 0.9 | 1.0 | 1.1 | 1.2 | 1.4 | 1.5 | 2.6 | 3.6 | 4.5 | 5.3 | 6.1 | 6.8 | 7.6 | 8.3 | 9.0 |
| | | 95th | 1.2 | 2.2 | 3.0 | 3.6 | 4.2 | 4.7 | 5.2 | 5.7 | 6.2 | 6.7 | 10.9 | 14.6 | 18.0 | 21.2 | 24.3 | 27.3 | 30.1 | 32.9 | 35.6 |
| Case 2 Typical Operation | Summer | 5th | 0.3 | 0.5 | 0.8 | 1.0 | 1.2 | 1.4 | 1.6 | 1.8 | 2.0 | 2.2 | 3.8 | 5.3 | 6.6 | 7.9 | 9.1 | 10.2 | 11.2 | 12.3 | 13.3 |
| | | 95th | 1.4 | 2.6 | 3.6 | 4.5 | 5.4 | 6.2 | 6.9 | 7.7 | 8.4 | 9.1 | 15.4 | 21.1 | 26.5 | 31.8 | 37.1 | 42.5 | 48.1 | 53.9 | 59.9 |

# Executive summary

Due to changes in legislation regarding the allowable oil-in-water content of water discharge overboard, Beach energy are reviewing options to improve the capability of the Produced Water (PW) Treatment system on the Yolla platform.

Beach energy identified 3 options and commissioned Advisian to perform a high level (+/- 50%) Total Installed Cost (TIC) estimated of these options. To generate the costs, assumptions had to be made regarding where equipment would be installed and the adequacy of existing utilities. These assumptions are critical to the cost estimate and given that the platform has limited spare weight, layout and utilities these assumptions have the potential to escalate the costs by +100% or more if invalid. A thorough review and validation of the assumptions should be conducted in the next project phase.

A cost comparison of the 3 options is shown in Figure 0-1 with further details below.

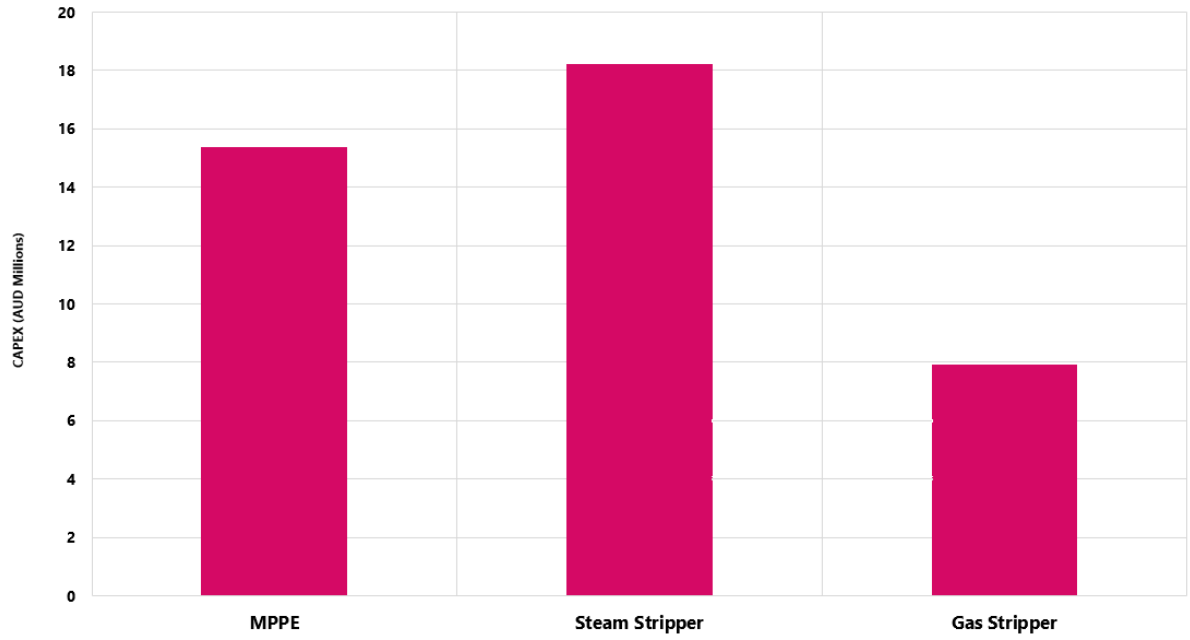

*Figure 0-1: Total Installed Cost Comparison of the 3 options*

**Mono Porous Polymer Extraction (MPPE) Unit**

The MPPE unit removes the hydrocarbons by running the produced water through a media filled extraction column. Two columns are installed in a duty/regeneration arrangement with steam being used to regenerate the offline column. The hydrocarbon laden steam is condensed, and the two liquid phases separated with the water recycled back into the produced water stream and the hydrocarbons sent to the flare drum.

The MPPE unit is provided as a single package containing the columns, condenser, separator, pumps and electric steam boiler. An offtake of Reverse Osmosis (RO) treated water (available on Yolla) will be passed through an Ion Exchange (IX) unit to create demineralised water to feed to the steam boiler.

It is envisaged that the MPPE will be installed where the current Produced Water Filters are located (with the filters demolished) and the IX unit installed near the existing RO units.

The total installed cost is **AUD$15.4M**

### Steam Stripping Unit

The Steam Stripping unit removes the hydrocarbons by contacting the produced water with steam inside a packed column. The hydrocarbon laden steam is condensed with the water recycled in the column and the hydrocarbon/BTEX vapour stream sent to flare.

The steam stripper package consists of a single package containing the column, buffer tank, condenser, BTEX accumulator, pumps and steam boiler. The steam rate required (~420 kg/h) is to too great for the existing RO units, therefore a new demineralised water package needs to be installed to produce the Boiler Feed Water (BFW). The duty of the steam boiler of 400 kW is too great for the existing Yolla power gen sets and hence a fired heater using fuel gas would be installed. The existing seawater lift pumps and fuel gas conditioning units are considered to have adequate capacity to not required modifications.

It is envisaged that the Steam Stripping Unit will be installed where the current Produced Water Filters are located (with the filters demolished) and the demineralised water package to be installed near the existing RO units or if too large to be located close to the steam boiler.

The total installed cost is **AUD $18.2M**

### Gas Stripping Unit

The Gas stripping unit option consists of reinstalling a  gas stripping column similar to what was originally installed on Yolla. In this option hydrocarbons are removed by contacting the produced water with fuel gas. The leaving fuel gas is sent to flare.

It is envisaged that the Gas Stripper will be installed next to the current Produced Water Filters i.e. filters not demolished in this case. This is similar to the original installation; however, the base of the column will need to be installed on the top deck.

The total installed cost is **AUD $7.9M**

## RECOMMENDATION

The gas stripping unit is the cheapest of the options but given the operating experience with the previous column underperforming there is the risk that the technology would not meet the more stringent specification. The MPPE option is cheaper than the steam stripper and has less impact on the water handling (RO units) due to the lower amount of steam required. The MPPE options therefore would be the preferred option at this stage. The issue with this option (and all options) is ensuring the equipment fits within existing constraints of the platform. This study has made the assumption that only minor brownfield work is required to locate and install the necessary package however if major

works such as jacket strengthening is required then the costs provided could escalate by 100% or more.

**FURTHER WORK**

There are several feasibility issues that have not been addressed in this preliminary study that must be investigated.

- Weight limits for Yolla
- Constructability
    - Downtime e.g. while filters are demolished, tie-ins made
    - Manning limits
    - Brownfield works e.g. demolition work required.
- Utility limits / Capacity
    - Power – capacity of existing gen sets
    - Fuel gas requirements (supply to the steam boiler)
    - Water handling (seawater lift, RO units)
- Impact on operations including greater surveillance and operator intervention
- Chemical consumption e.g. MPPE media and chemicals for BFW generation
- Time to implement
    - Site surveys
    - Analysis and design
    - Procurement
    - Installation
    - Hook-up and commissioning

In the next project phase the following activities should occur;

- Confirm with MPPE vendor the impact on size, weight, cost of replacing the plate and frame condenser with an ACHE
- Confirm that based on operating experience and contacting the RO vendor that the existing units could operate without modification for the additional load required for steam generation for the MPPE option.
- Confirm details of the steam stripping package for the full produced water rate (300 $m^3/d$), including confirmation of steam rate and boiler duty required. If boiler duty is below 200 kW, there's the potential to use an electric boiler and stay within the existing capacity of the gen sets.

- Contact vendors to confirm details on the ion exchange for the MPPE option and demineralised water generation package for the Steam Stripper option
- More detailed analysis of layout and where equipment could be installed for all options.
- Develop a detailed project execution schedule for each of the options.

# 1 Introduction

The National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) has recently revised the allowable oil content in water specification for discharge overboard. This change in regulations means that the produced water treatment system on the Yolla platform will require upgrades.

The facility is to handle a maximum of 300 $m^3$/d (12.5 $m^3$/h) of produced water and remove all hydrocarbons (free and dissolved) to no more than 10 mg/L.

Beach Energy has performed an initial assessment and identified three (3) treatment options;

1. Macro Porous Polymer Extraction (MPPE) Unit
2. Stream Stripping Unit
3. Gas Stripping Unit

Beach Energy has commissioned Advisian to perform a high level Total Installed Cost (TIC) estimate of the three options.

The cost estimates have been developed based on the preliminary assessment information provided by Beach Energy for each option (Appendix A). The project is in pre-concept and Advisian has not performed any engineering design/analysis on the identified options other than to assess the necessary works associated with each option to determine the TIC.

As advised in the Beach Energy scope of work document, the following work is excluded;

1. No allowance for Owner's costs
2. No assessment for layout
3. No assessment of existing platform spare weight capacity
4. No estimate for duration of platform outage to install

Although layout is noted as an exclusion, Advisian has performed a brief look at potential locations for where the equipment could be installed at a high level to generate the construction costs associated with each option - Refer to section 5.

The costing has been prepared using in-house cost engineering experience and standard Advisian spreadsheets. The estimating sheets allow for material procurement and construction activities which are added to give the total direct cost. Allowances are added for engineering, project management, design growth and unknowns. These costs have then combined and summarised to build up costs for each option. These cost estimates are for screening purposes only with an estimate range of +/- 50%.

# 2 Macro Porous Polymer Extraction (MPPE)

Beach Energy has provided a quotation for the MPPE unit has from vendor Veolia (Appendix B).

Figure 2-1 shows a sketch of the proposed works associated with installing a MPPE package with further description below.

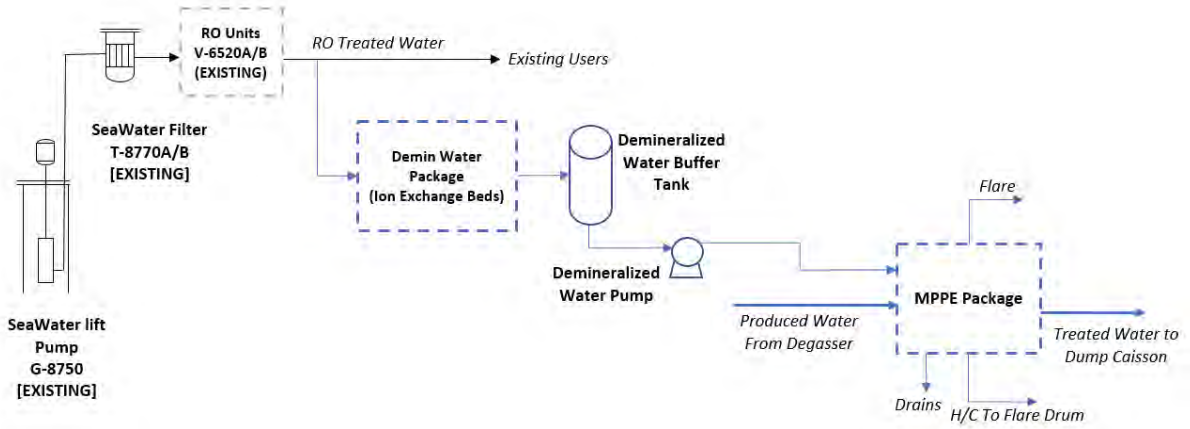

*Figure 2-1: Sketch for MPPE Option*

- MPPE Package
    - Veolia will provide a skid package that contains the processing equipment (cartridge filter, extraction/regeneration columns, stream generator, condenser, separator, water tank, return water pump and hydrocarbons pump).

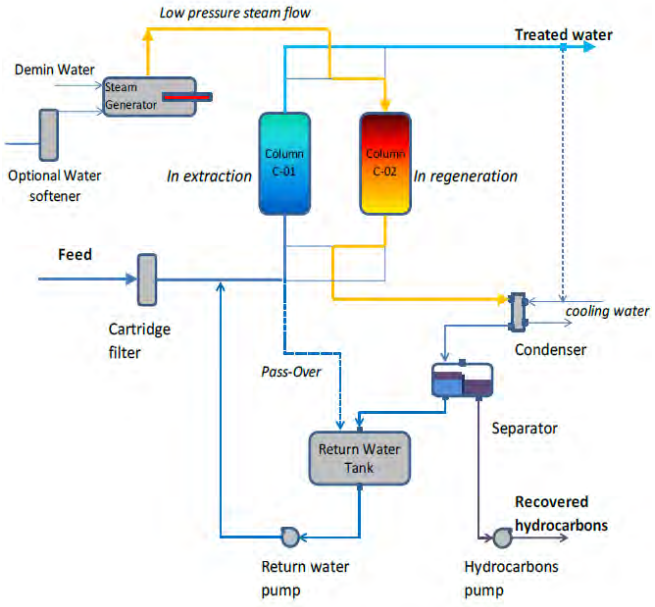

*Figure 2-2: MPPE Package*

- The MPPE package has dimensions and weight of:
  - L x W x H: 6.1m x 2.5m x 3.7m
  - Weight: 12 t
- It is recommended that the cooling medium for the steam condenser change from cooling water to air i.e. installation of an Air Cooled Heat Exchanger (ACHE) in place of the plate and frame exchanger proposed by Veolia. For Yolla the use of air is preferred to water for the following reasons;
  - If raw seawater is used (supply taken from downstream of the existing seawater filters, but upstream of the RO units) there is the high risk of the condenser scaling and fouling due to exchanger operating above 100°C and the water containing salts and minerals.
  - If treated utility water is used additional RO units would be required as the required cooling water rate is 1$m^3$/h whereas the RO units have a combined capacity of 0.76 $m^3$/h (0.38 $m^3$/h each).

  The condenser needs to achieve a temperature of approximately 40°C to condense all hydrocarbons and water which given the ambient temperature at Yolla would be feasible with an ACHE. The inclusion of the ACHE also removes the tie-in to the existing water system and associated new piping, valves, instruments and fittings.

  For the cost estimate no change has been made to the quote provided by Veolia, but NO allowance has been made for modifications necessary to provide cooling water.

- Demineralised water package / Ion exchange (IX) beds
  - Steam is required to regenerate and strip the extracted hydrocarbons from the MPPE columns. The steam generator is part of the MPPE package provided by Veolia but the water to the generator must come from the platform and must be of Boiler Feed Water (BFW) or demineralised water quality. Veolia advise that the steam generator requires 91 L/h [~2 $m^3$/d] of water at a specification of 0.5 German hardness (~9 ppm or mg/L $CaCO_3$).
  - The existing Yolla RO units (duty/standby) have a capacity of 760 L/h (0.38$m^3$/h each) and can produce water with a total hardness of <20mg/L $CaCO_3$. The required 91 L/h is about 12% of the total capacity of the units and hence no upgrade to the RO units is expected, but additional processing of the RO treated water is required. For this option it is assumed that an offtake of the RO treated water will flow through a set of ion exchanger (resin) chambers to generate demineralised water at the necessary hardness specification.
  - It has also been assumed that a small demineralised buffer tank (2$m^3$ i.e. 1 day reserve) and pump (2 $m^3$/d) will be installed (close to the MPPE package boiler) to ensure constant supply to the boiler.

- Hydrocarbon Return Pump
    - The Veolia quote states that the hydrocarbon return pump is an optional equipment item as they assume the oil can gravity flow to the drains. A cost allowance for a <1 kW pump to return hydrocarbon to flare KO drum has been made.
- Demolition
    - It is assumed that the existing Produced Water Filters will be demolished and the MPPE installed in its location. It is assumed that the ion exchange will be installed close to the existing RO units (Refer section 5). The Demin Water buffer tank will be located close to the MPPE.
- Piping Tie-ins include;
        - PW tie-in between PW filters and dump caisson (3") to install MPPE package
        - Tie-in to water system to install demineralised water package (1")
        - Tie-in to flare header (2")
        - Tie-in to Liquids return header to flare knock out drum (2")
        - Tie-ins to closed drains header (2")
- Power generation
    - The installed power for the steam boiler is 66 kW, the other electrical items i.e. pump, lighting, tracing & instruments is estimated at 3 kW, the addition of the ACHE fan motor would be < 5 kW and the hydrocarbon return pump would add <1 kW.
    - The demineralised water package (ion exchange beds) is assumed to have negligible power consumption. The demineralised water pump motor would be < 1kW.
    - Total additional power consumption for MPPE is estimated at ~75 kW. As advised by Beach energy there is approximately a spare 200 kW available to still fit comfortably within the existing rated gen sets.
- Control Systems
    - Works are required to the substations to incorporate and make provisions for the operating and control systems of the MPPE package into the DCS/ESD. Veolia have indicated 32 instruments as part of their package and it is estimated there will be another 8 for the BFW supply.
- Other utilities
    - It is assumed all other utilities e. nitrogen for purging and instrument air have adequate capacity and do not require upgrades other than allowing for the necessary tie-ins.

# 3 Steam Stripping Package

Preliminary information regarding the steam stripping option has been provided by Beach energy (Appendix A).

Figure 2-1 shows a sketch of the proposed works associated with installing a stream stripper unit with further description below.

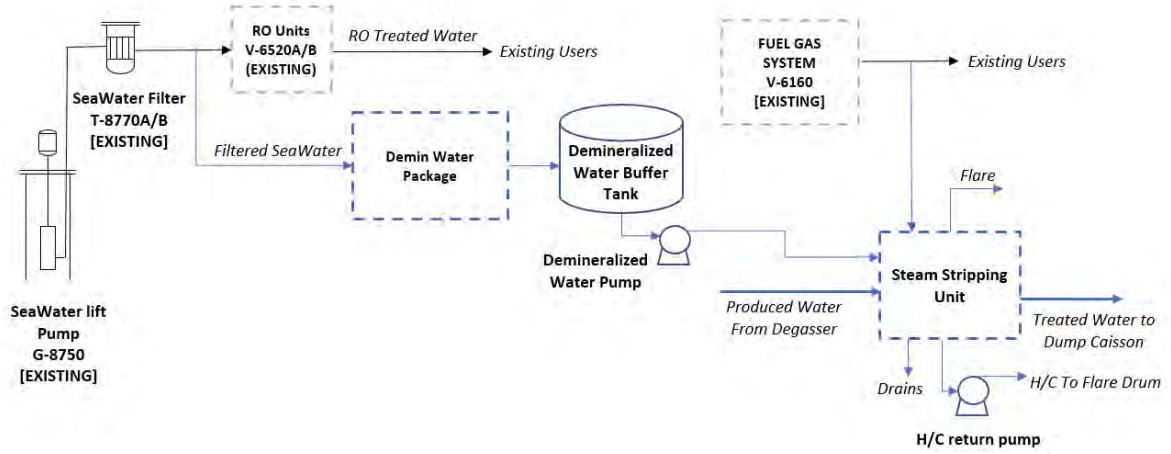

*Figure 3-1: Sketch for Steam Stripping option*

- Steam stripper package
    - The steam stripper package includes; buffer tank, PW booster pump, cross exchanger, stripping column, overheads condenser, BTEX accumulator, reflux pump and steam boiler.

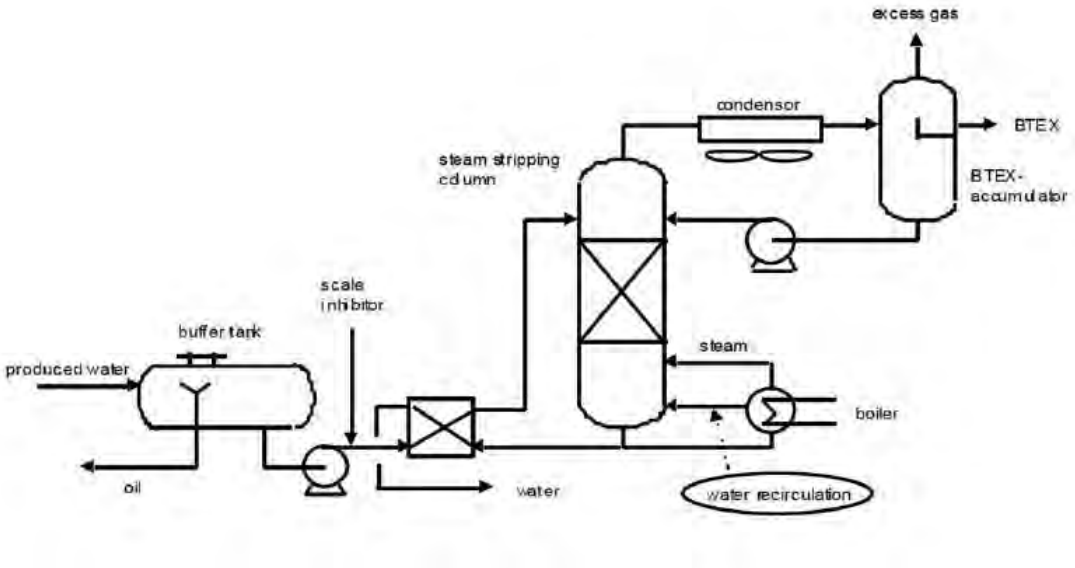

*Figure 3-2: Steam stripping unit*

  - Scaling from the available data provided the estimated dimensions and weight of the steam unit is
    - L x W x H: 7.2m x 3.3m x 5m
    - Weight: 23 t

- BFW / demineralised water package
  - Figure 3-2 indicates that some treated produced water flow is recirculated to the boiler to generate the steam. This study has assumed all the necessary steam is generated from demineralised water.
  - The required BFW rate is estimated on a ratio of 1:30 to produced water feed. At a design rate of 300$m^3$/d (12.5 $m^3$/h) his equates to 10$m^3$/d (0.42$m^3$/h) or ~420 kg/h of steam required.
  - Allowing a margin, a demineralised water package of 0.5$m^3$/h has been allowed. This would equate to about 55% of the existing RO unit's capacity. This has the potential to overload the units and risk the supply of potable water to the accommodation block. Therefore, a new demineralised water package would be installed upstream of the existing RO units / downstream of the Seawater filters.
  - The existing sealift pump has a capacity of 12$m^3$/h with a discharge pressure of 1000 kPag. It is assumed it has spare capacity to supply the additional 0.5$m^3$/h through the demineralised water package to the buffer tank without modification.
  - It has also been assumed that a demineralised buffer tank (~12$m^3$ i.e. 1 day reserve) and pump (0.5 $m^3$/h) will be installed (close to the MPPE package boiler) to ensure constant supply to the boiler.
  - The total installed electrical power required to generate this steam is estimated at 400 kW. This is too large for the existing gen sets to provided (only ~200 kW available) hence a fired (gas fuelled) boiler is required. The fuel gas required is approximately 50 kg/h which is considered within the capacity of the existing fuel gas system [capacity >3,000 kg/h] therefore no upgrade to the fuel gas system has been made.
- Hydrocarbon Return Pump
  - A cost allowance for a 1 kW pump to return hydrocarbon from the buffer tank to the flare KO drum has been made.
- Demolition
  - It is assumed that the existing Produced water filters will be demolished, and the steam stripper package installed in its location. It is assumed that the demineralised water package will be installed close to the existing RO units (Refer section 5), however if there is inadequate space it may need to be located next to the stripper unit. The Demin Water buffer tank will be located close to the Stripper package.

- Piping Tie-ins include;
    - PW tie-in between PW filters and dump caisson (3") to install steam stripper package
    - Tie-in to water system to install Demineralised water package (1")
    - Tie-in to Liquids return header to flare knock out drum (2")
    - Tie-in to the fuel gas supply system (2")
    - Tie-in to flare header (3")
    - Tie-ins to closed drains header (2")
- Power generation
    - As stated above the assumption is the steam boiler with be fired and not electric. The other power users i.e. water supply pump, condenser fan, reflux pump along with lighting, instruments etc is expected to be <10 kW.
    - The demineralised water package will have negligible power consumption. Associated chemical injection Pulsation pumps will likely be air driven. The demineralised water pump motor will be <1 kW.
    - Total additional power consumption for steam stripper is estimated at ~10 kW. As advised by Beach energy there is approximately a spare 200 kW available to still fit comfortably within the existing rated gen sets.
- Control Systems

  Works are required to the substations to incorporate and make provisions for the operating and control systems of the steam stripper package into the DCS/ESD. It is estimated that there will be about 25 instruments in total.
- Other utilities
    - It is assumed all other utilities e.g. nitrogen for purging and instrument air have adequate capacity and do not require upgrades other than allowing for the necessary tie-ins.

# 4 Gas Stripping Unit

For the gas stripping unit it is assumed that the previous gas stripping column arrangement will be re-instated. Works involved are:

- Installation of the gas stripping column
    - 0.4m ID x 10.6 F/F
    - Weight 1.6t [Column = 1.4t, internals 0.2t]

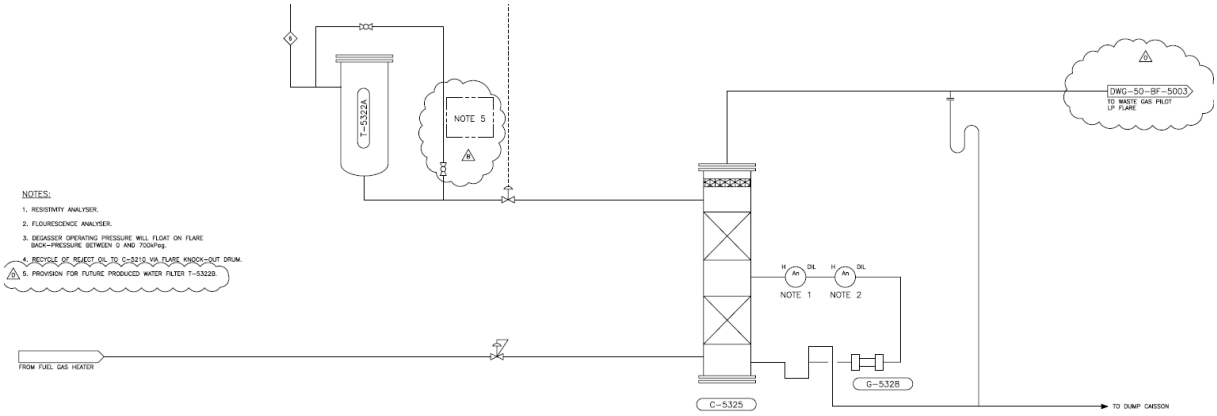

*Figure 4-1: Original PW Stripper (with fuel gas)*

- Fuel Gas System
    - As this is a re-instatement of the original design and an additional fuel gas conditioning unit has been installed to support the booster compressor, it is assumed there is adequate fuel gas supply capacity and no upgrade required.
- Tie-ins
    - Tie-in between PW filters and dump caisson (3")
        - PW sample show in Figure 4-1 is to remain in current position close to dump caisson and to not be reconnected to the column.
    - Tie-in to the fuel gas system (2")
    - Tie-in to the flare header (3")
    - Tie-in the drains header (2")
- Demolition
    - For this option is assumed that the existing Produced water filters will NOT be demolished and that the stripper column be installed next to the filters on the upper deck.

- Power generation
    - No additional power uses to be added as part of this option.
- Control Systems
    - Works are required to the substations to incorporate and make provisions for the operating and control systems of the steam stripper package into the DCS/ESD. It is estimated there'll be 8 instruments to connect.
- Other utilities
    - It is assumed all other utilities e.g. nitrogen for purging and instrument air have adequate capacity and do not require upgrades other than allowing for the necessary tie-ins.

# 5 Layout

Layout was listed as an exclusion in the Scope of Work and has not been investigated in any detail, however the location of the equipment does have a significant bearing on the cost of construction. Therefore, a brief review of the Yolla layout drawings and 3D model has been performed to make assumptions of where the equipment could be located. The locations proposed have been shown in Figure 5-1 and has formed the basis for the cost of construction. The feasibility of using these locations requires a more thorough investigation.

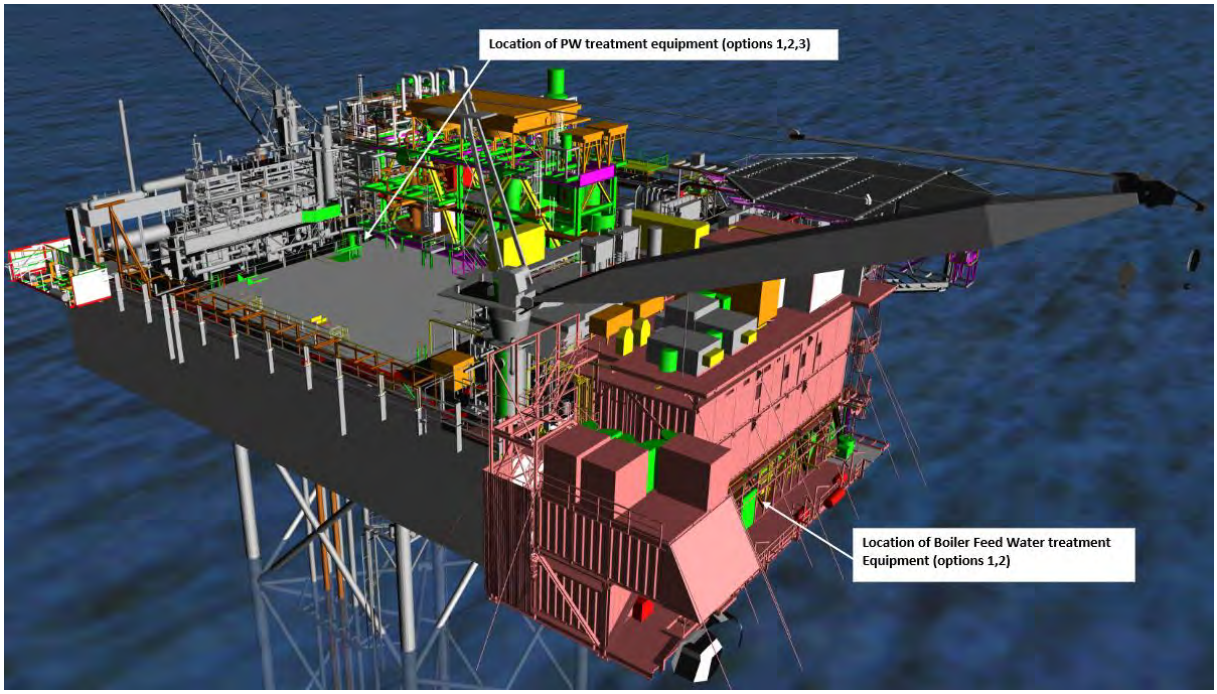

*Figure 5-1: Potential Equipment Locations*

## 5.1 Main processing equipment

For this assessment it has been assumed that for either of the 3 options the main equipment items i.e. MPPE package, the Steam stripper package or the gas stripper column would be installed on the main deck area where the current produced water filter and chemical injection skid are installed. These items would need to be removed/relocated as required.

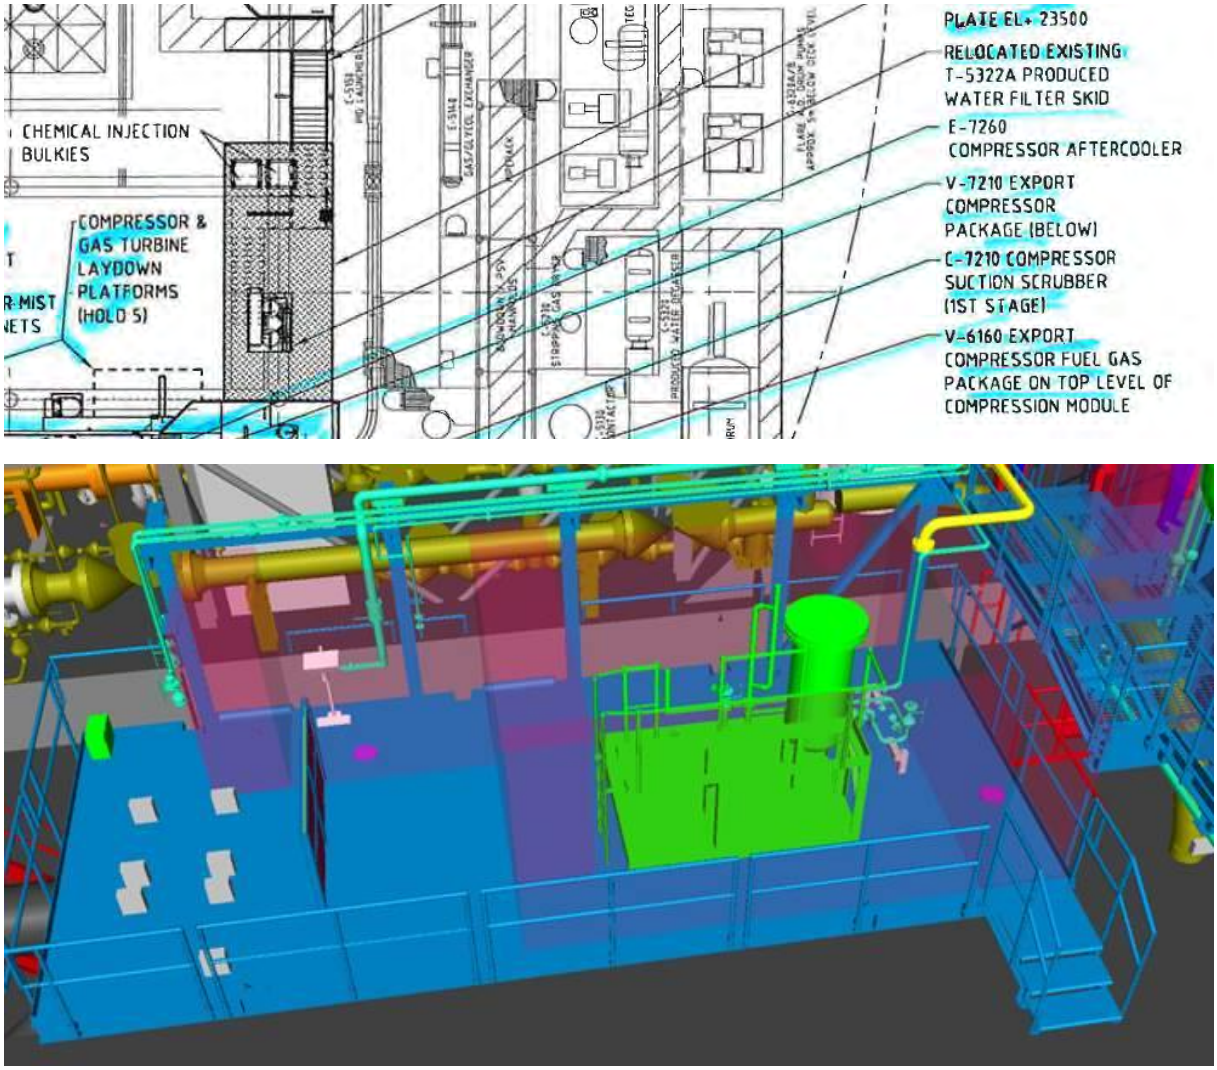

*Figure 5-2: Existing PW Filters*

## 5.2 Demineralised water generation equipment

For the options that require steam i.e. the MPPE and steam stripper option, the equipment required for pre-treating the boiler feed water is assumed to be installed on the accommodation utilities level where the existing water utilities (RO units, freshwater tanks, sea water filters etc.) are installed. It is assumed that relocation of some of these items may be required in order to fit the new equipment items in. For the steam stripping option, the demineralised water package may not fit into this location and alternatively it too would need on the upper deck close to the steam stripping package.

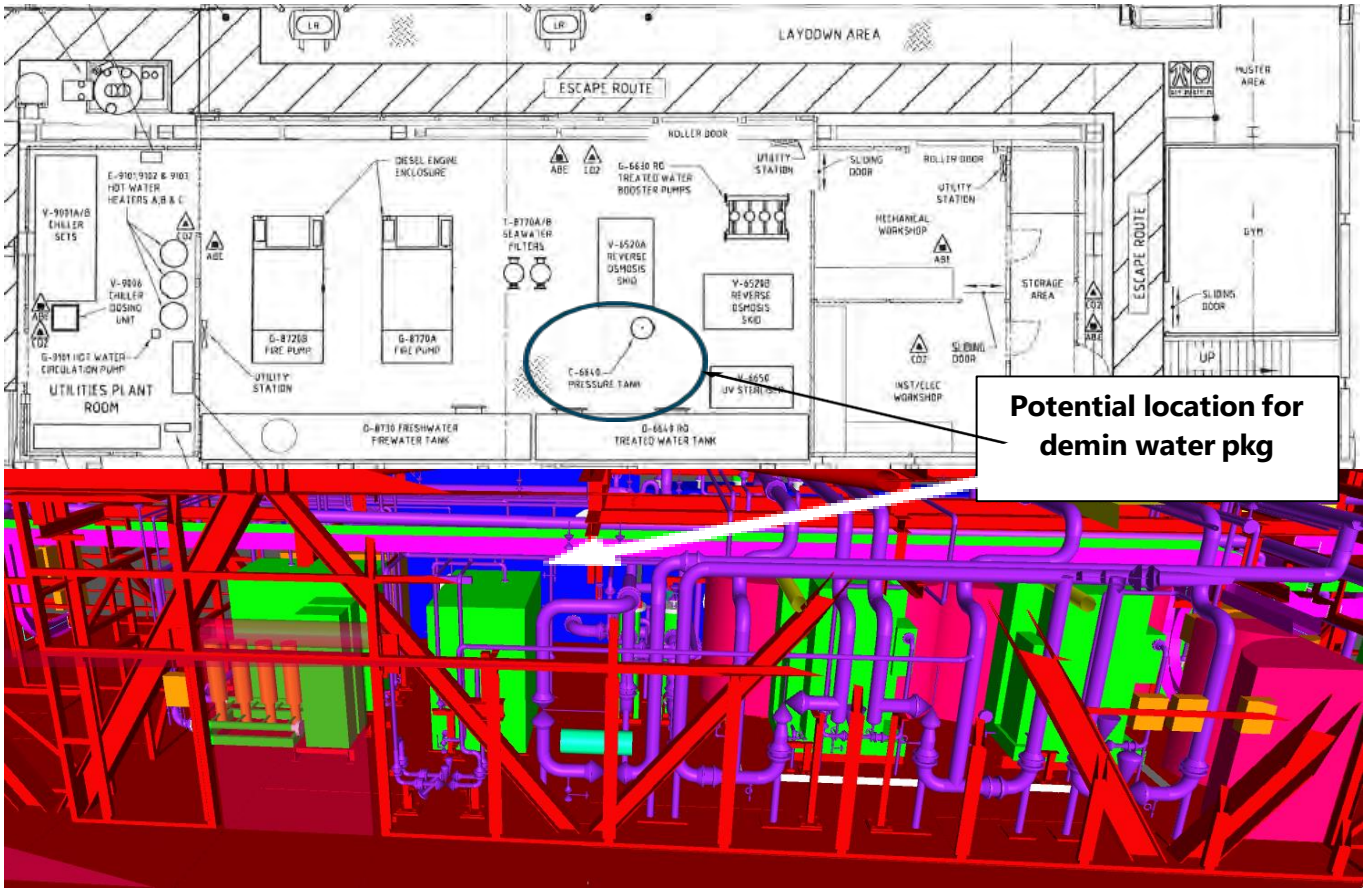

*Figure 5-3: Existing water handling facilities*

# 6 Cost Estimates

A summary of the cost estimates is provided in Table 6-1 with full costing spreadsheets provided in Appendix C. Estimates have been prepared for three cases:

- MPPE
- Steam Stripper
- Gas Stripper

The estimated CAPEX ranges from $18.2 million for the Steam stripper option to $7.9 million for the gas stripper option. These estimates are P50 estimates including a 30% to 40% contingency, the P50 cost is the most likely cost that has an equal probability of being underrun or overrun.

The estimate has been prepared using budget quotes from previous work for the MPPE and steam stripper equipment, other equipment is estimated using historical metrics escalated to todays costs. Bulks have been generated using bulk weight factors. All installation costs have been estimated by task allowing a crew size, duration and productivity factor for each activity. The procurement, fabrication and installation give the total direct costs.

Allowances have been added for design growth, engineering, project management and insurance as a percentage of direct costs. A 30% contingency is added to the bottom line to allow for unknowns.

*Table 6-1: Total Installed Cost (TIC) Summary*

| AUD ($Millions) | MPPE | STEAM STRIPPER | GAS STRIPPER |
|---|---|---|---|
| Equipment Costs | 1.92 | 2.42 | 0.19 |
| Bulks | 0.14 | 0.23 | 0.03 |
| Mobilisation / Demobilisation | 0.54 | 0.54 | 0.54 |
| Construction | 4.80 | 5.71 | 2.88 |
| Engineering / Project Management | 2.60 | 2.99 | 1.52 |
| Allowances | 0.52 | 0.64 | 0.16 |
| Contingency | 4.84 | 5.69 | 2.57 |
| TOTAL INSTALLED COST | **15.4** | **18.2** | **7.9** |

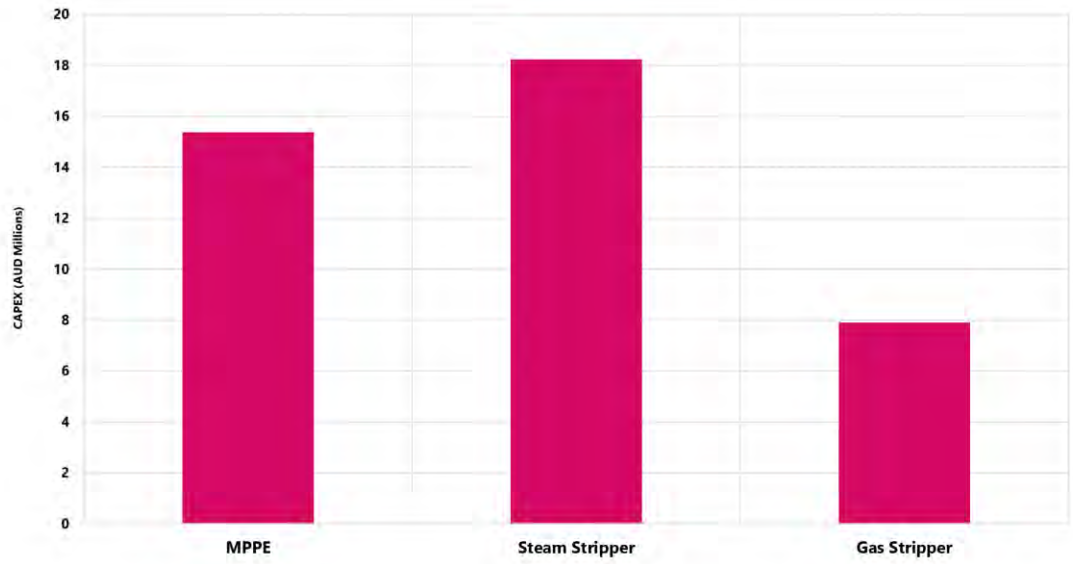

*Figure 6-1 CAPEX by option*

The Gas Stripper is the least expensive as it requires the least amount of equipment to install. However, as the original gas stripper was removed from Yolla, additional investigation is required to confirm that the new column would be able to meet the necessary specification.

The Steam Stripper is the most expensive due to the size and quantity of the processing equipment to install and requires the most steam. This option would have the most difficulty in finding the necessary layout, especially trying to fit the new demineralised water package close to the existing water handling facilities.

The MPPE option is less than the steam stripper however does make the assumption that condenser could be replaced with an air cooler. If cooling water is required, then modifications to the water handling system would be required i.e. installation of a demineralised water package which would make the costs fairly similar to the steam stripper option.

The following basis has been used for this study;

- All costs in 2019 AUD
- Exchange rate of 1 Euro = 1.62 AUD [spot rate at 6-December-2019]
- An all-inclusive Labour rate of $280 / hr consisting of overheads, transport, accommodation, food, tools and consumables.
- A productivity factor of 50% or 60% has been applied to offshore works.
- No owners' costs have been allowed
- Assumes the utilities are adequate except where specifically specified for each option.

- Assumes demolition work is minimal i.e. removal of filters and existing water handling equipment.
- Allowances have been added as a % of costs
    - Freight at 8% of equipment and bulks procurement
    - Spares at 5% of equipment procurement
    - Insurance and certification at 3% of total direct costs
    - Design growth at 3% of total direct costs
    - Engineering at 8% of fabrication costs and 20% of offshore costs
    - Project Management at 10% of fabrication costs and 25% of offshore costs
    - Contingency at 30% of fabrication costs and 40% of offshore costs

21 November 2019

**Project to Determine TIC of a Produced Water Treatment Facility on Yolla Platform**

## SCOPE OF WORK

Beach Energy require an indicative estimate to perform works associated with generating a total installed cost to modify Yolla platform with a facility to remediate the produced water system. The project is at pre-concept stage only and only requires indicative estimates against each option.

Use in-house cost engineering experience and/or industry cost estimating software for an offshore facility. Allowances to include engineering design, procurement, construction, construction management and commissioning.

**Design Basis**

Facility will handle up to design maximum of 300m3/day of produced water.

Target to reduce total hydrocarbons (free and dissolved) to no more than 10 mg/litre. Currently typically about 80 mg/litre comprising mostly dissolved BTEX.

Three treatment options have been identified:

(1) MPPE Unit
(2) Steam Stripping Unit
(3) Gas Stripping Unit

**Schedule**

Target by close of business Friday, 13th December 2019

**Deliverable**

Cover note and a spreadsheet outlining indicative costs for each option.

**OPTIONS:**

### (1) MPPE Unit

A quotation and sizing/weight for a Macro Porous Polymer Extraction (MPPE) unit has been requested from a vendor Veolia. Quote expected by start of week of 25-Nov which will include steam generation capacity. This estimate will be forwarded as soon as it is available.

Allowance for utility/process connections include power supply, treated water supply, cooling, flare/drains:

- Allow for some substation works, expect to have adequate capacity from existing gensets.
- Allow for cooling water mods from downstream of filters and return line to dump caisson. Assume existing seawater pump has adequate spare capacity.

- Allow for some upgrade to water supply ex RO units, and chemical injection eg BFW treatment Assume produced water can gravity flow from existing Degassing Vessel.
- Allow for pump to deliver recovered hydrocarbons to Flare KO Drum
- Allowance for integration into DCS/ESD systems.
- Scale up estimated weight from package estimate from vendor. Factor weight for piping and connections.

### (2) Steam Stripping Unit

Attached document provides 2012 estimates for a steam stripping unit. Consider a factored cost based on capacity, year and location, and for duplex vs carbon steel.

Allowance for utility/process connections include power supply, treated water supply, cooling, flare/drains:

- Allow for some substation works, expect to have adequate capacity from existing gensets.
- Assume doubling the size of the existing seawater pump.
- Allow for some upgrade to water supply ex RO units, and chemical injection eg BFW treatment Note: Indicative water/steam ratio of approx. 30-40:1. Assume 30:1, therefore steam rate from 10m3/hr of feed water. Allow for 8MW gas fired steam boiler. Allow for upgrade of fuel gas facility.
- Assume produced water can gravity flow from existing Degassing Vessel.
- Allow for pump to deliver recovered hydrocarbons to Flare KO Drum.
- Allowance for integration into DCS/ESD systems.
- Scale up estimated weight from package estimate from vendor. Factor weight for piping and connections.

Clarified in email with Richard Walls (03-Dec-19) that this should have been per day not hour making boiler duty ~400kW [Email attached at end of SoW]

### (3) Gas Stripping Unit

Assume a Gas Stripping Column similar to what was removed from Yolla a few years ago. Refer attached historical P&ID.

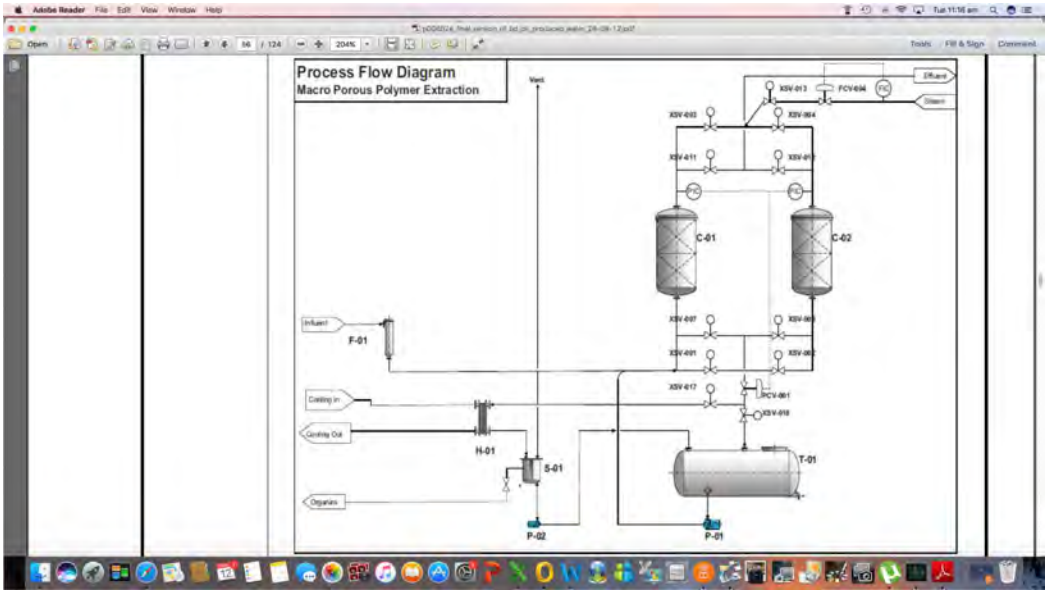
Allowance for utility/process connections include flare/drains:

- Allowance to have validation of the design and process guarantee.
- Allowance for integration into DCS/ESD systems.
- Use estimated package weight from previous design. Factor weight for piping and connections.

Exclusions:

1. No allowance for Owner's costs.
2. No assessment for layout
3. No assessment of existing platform spare weight capacity.
4. No estimate for duration of platform outage to install.

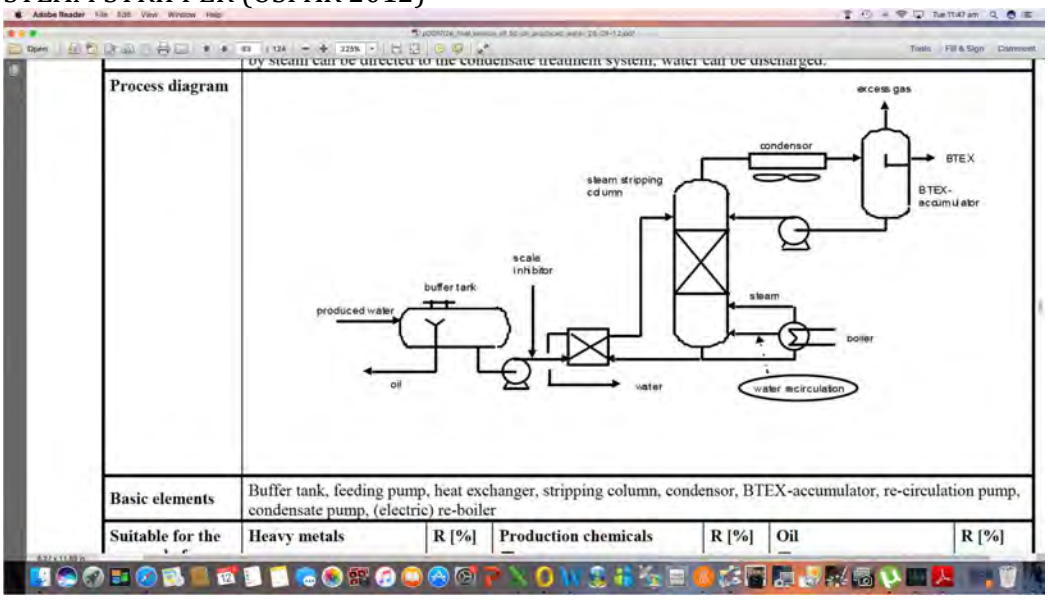
# MPPE Information (OSPAR 2012)



| | Per Unit | Minimum | Maximum |
|---|---|---|---|
| **Technical details** | Treatment capacity (m3 produced water per hour) | 0,3-15 | 150 |
| | Gross Package volume (LxWxH) | 6,2 x 4 x 3 m | 10 x 6 x 12 |
| | Operating weight | 10 ton | 250 ton |
| | CAPEX (€) | 1 000 000 (2012) | 10 000 000 |
| | OPEX (€/year) | 50 000 (2012) | 250 000 |
| | Cost per m3 produced water(€/m3) | 0,60 (2012) | 0,24 |

| | |
|---|---|
| **Critical operational parameters** | The main critical parameter is the measured outlet concentration vs. discharge limit. If this comes close to the discharge limit the MPPE material needs to be replaced. This is a very slow process (Years) and can be done say on a weekly basis. The reduction performance is very stable and does not change overnight. |
| **Operational reliability incl. information on downtime** | -The MPPE unit is fully automatic and remote controlled and has been in operation on an unmanned platform |

# STEAM STRIPPER (OSPAR 2012)



| | | | | |
|---|---|---|---|---|
| **Technical details** | Platform | Gas 1 (small) | Gas 2 (large) | Oil 1 |
| | Produced water volume (design) | 1 m3/h | 6 m3/h | n.a. |
| | Required area (LxWxH) | 3 x 2 x 5 m | 6 x 3 x 5 m | |
| | Mass (filled) | 12 tonnes | 20 tonnes | |

**Critical operational parameters**

Since produced water usually contains salts and solid particles, problems with depositions (scale) may occur in the boiler and the heat exchanger. In order to prevent concentration of salts in the boiler, it is recommended to create a slight throughput by means of a re-circulation line from the boiler to the column. The steam line must be large enough in order to allow for equal levels in boiler and column (and above the bundle of the boiler). In order to guarantee a constant throughput, a buffer tank is required. This also provides the possibility to skim off oil, avoiding disruption of the process in the column.

**Operational reliability**

When the produced water contains large amounts of salts, the installation will need to be shut down regularly to enable removal of salt depositions.

The expected removal efficiency for BTEX is high: reduction from 50 mg/l to < 6 mg/l, aliphatic hydrocarbons from 30 mg/l to < 3 mg/l . Removal efficiencies of >90% for Dissolved oil, BETX, benzene and PAHs.

| **Costs** | Investment costs (CAPEX) [€] 2012 | | Exploitation costs (OPEX) [€ / year] | |
|---|---|---|---|---|
| | present | new | present | new |
| gas platform, small | 670 000 | 560 000 | 238 000 | 169 200 |
| gas platform, large | 990 000 | 840 000 | 401 400 | 276 900 |
| oil platform | n.a. | n.a. | n.a. | n.a. |

**Subject:** RE: Request for quote to provide indicative cost estimate for works on Yolla

Hi Richard

Just a question regarding the basis for the steam stripping option;

In the SoW it's noted that an indicative water/steam ratio of 30:1 is to be assumed, giving steam rate generated from 10m3/h of BFW. Should this be 10m3/**d?** i.e. total produce water to column is 300 m3/d. At 10m3/d (0.42 m3/h) the steam to the column is closer to 420 kg/h and the boiler duty comes down to ~300 kW as opposed to the 8 MW given in the SoW.

This would still result in the boiler needing to be fired not electric, but probably within the existing margins of the fuel gas system and the seawater lift pump.

Regards

**Richard George**

**** [EXTERNAL SENDER] Do not click links or open attachments unless you recognize the sender. ****

Carolina/Arlette,
Follow-up item from the meeting:
Current power draw of Yolla is typically 900-1000 kW, spiking to 1050 kW. Several months ago, it was slightly higher, with spikes to nearly 1100 kW.
The rated power of the gensets is 1400 kW (P&ID BP-7101) each.
Guess we could allow additional power draw of up to 200 kW and stay comfortably within the genset capacity.

Richard

# 1. Executive Summary

***A proven safe, robust and one-step solution to efficiently remove dispersed & dissolved Hydrocarbons and Mercury from Produced Water.***

Beach Energy has requested Veolia Water Technologies Techno Center Netherlands B.V. to provide preliminary budget proposal including design, sizing and weight information for a MPPE unit treating Gas Produced Water from an existing Offshore Platform.
We have based our Technical proposal on the received website inquiry data and communication by phone.

The present Technical proposal accounts for general O&G specifications in terms of engineering, quality, inspection and documentation, but some deviations on HFE requirements with regards to spacing and accessibility might be applicable mainly due to the fact that the unit has been contained in a 20' Sea container.

We are investigating the option for long term rental of the unit through our local Australian office.

Veolia has been supplying on- and offshore MPPE units for Gas Produced Water since 1994. MPPE Technology treats the Gas Produced Water on for instance for Shell Prelude, Inpex Ichthys, Equinor Kollsnes, Shell Ormen Lange and Woodside Pluto.

## 1.1 Veolia's Solution to the Key Projects Requirements

| Key Project Requirement | Veolia's MPPE System Solution |
|---|---|
| Achieve the required Effluent quality | Yes |
| Treat a maximum inlet flow rate of 12.5 m3/h | Yes |
| Ability to maintain removal efficiency independent of Feed concentration | Yes |
| Ability to handle emulsions that maybe present | Yes |
| Ability to remove Mercury if present | Yes, removal rate 90% - 98% |
| Most compact solution possible | Yes, the Sea container version is the most compact and easy to install solution. However an open skid mounted unit may also be offered. |
| Value added benefits of Veolia's solution | • *Full recovery of hydrocarbons for sale*<br>• *Fully regenerable system providing certainty of OPEX costs & performance irrespective of influent hydrocarbon levels*<br>• *Proven performance to handle slugs of oil or increased BTEX levels as seen in LNG related wastewater as high as 2500 mg/l* |
| Performance impact due to motion | No impact |

**MPPE Features & Benefits**

| MPPE Features | Benefits to the Project |
|---|---|
| 1. Very High Separation Performance | • MPPE technology removes dissolved and dispersed hydrocarbons with high reduction factor (any removal rate from 80% to 99.99%).<br>• Reduction factor independent of inlet concentration. I.e. the design is made for a certain reduction rate. So when designed for 99% removal 100 ppm will be reduced to 1 ppm and 500 ppm to 5 ppm. |
| 2. Robust, No Fouling | • No interference from dissolved iron, heavy metals, surfactants, salt and polar compounds, and no scaling<br>• No biological fouling because of periodic in situ regeneration by steam |
| 3. Reliable and Easy Operation | • Fully automated operation. NO operator intervention required for adjusting of settings or on-site controls.<br>• No special equipment requiring dedicated maintenance. |
| 4. Flexible Operation | • Turndown ratio up to 10%.<br>• Higher Feed concentrations can be treated at lower flow rates. For example, if the feed concentration is 50% higher, effluent requirements can still be maintained with only a 10% lower flow.<br>At lower feed concentrations, higher flows can be treated while still meeting the effluent demand.<br>• Immediate performance at start up<br>• Batch wise operation possible |
| 5. Compact Equipment | • MPPE offers a Single unit treatment. Compared to existing technologies, the unit is compact with a small footprint. |
| 6. No Chemicals uses No Sludge produced | • NO Chemicals required, thus NO HSE issues, NO logistics, NO dosing tweaking required and NO Chemical sludge produced requiring storage and dewatering.<br>• Removed hydrocarbons are recovered almost 100% pure and may be reused (blended). Thus no waste. |
| 7. Performance Guarantee during Operational Life | • The MPPE media performance is guaranteed through the Performance Guarantee Service Contract |
| 8. Environmental Benefits | • Long lifetime of media. Normally 2-4 years.<br>Spent media are collected by Veolia, cleaned and refilled with extraction fluid to be reused.<br>• Low energy consumption<br>• Low noise<br>• No off-gas produced |

## 1.2 Conclusion & Next Steps

We trust that we have supplied you with sufficient information and look forward to discuss further possibilities with you in detail.

Veolia is available to answer any questions you may have regarding this proposal and are excited at the prospect of working with Beach Energy on this project.
If this budget proposal is of further commercial interest, we would welcome the opportunity to present this proposal through tele- or videoconferencing and discuss the next steps along with their timing.

We would like to inform you that Veolia Water is the Number 1 water treatment company in the world. Veolia Water Technologies as part of Veolia Water is able to deliver you the whole portfolio of

water treatment technologies to treat your wastewater, produced water, process water and groundwater.

## 1.3 Point of contact:

Sales Manager: Jan Bart Kok
Phone: Office +31 318 664010
Direct +31 318 664006
Mobile +31 6 51335419
Email: janbart.kok@veolia.com

# 2. Commercial

## 2.1 Budget Estimate (CAPEX)

The CAPEX price is given for the engineering, manufacturing, equipment delivery, tests and inspection, optional functional duration test and services for a MPPE unit as described in following paragraphs. The MPPE material is supplied through the PGS contract (see 2.3.1).

For the Base Case, i.e. **including** Return Tank and Return Pump:

**€ 1,000,000.- (One Million Euro)**

## 2.2 Operational expenditures

### 2.2.1 OPEX

The annual operating expenditures consist of:

- A fixed annual fee for a Performance Guarantee & related Service (PGS) Contract
- Utility costs
- Operation and maintenance costs

Note that the recovered Hydrocarbons have a market value (equivalent to condensates) and can be considered as a revenue.

### 2.2.2 Performance Guarantee & related Service Contract (PGS)

An MPPE unit is delivered with an operational lifetime Performance Guarantee with related services, meaning that VWT Techno Center Netherlands B.V guarantees the Intermediate and Hydrocarbons removal efficiency over the lifetime of the MPPE unit.
This removal efficiency guarantee is covered in the Performance Guarantee and related Services (PGS) Contract. The PGS contract includes supply, replacement and return of the MPPE material, operations support, service and periodic control, access to new developments (process, automation etc.).

The fixed annual PGS fee, is independent of the number of MPPE exchanges per year and the performance guarantee is valid for the total operational lifetime of the MPPE unit.
At lower influent concentrations it is possible to run the unit at higher capacity (higher flow) while still meeting effluent requirements.
At higher influent concentrations than design it is possible to meet the effluent criteria at lower flows.
These conditions are all within the performance guarantee at no higher operational costs.

The PGS contract will be closed with the End user (owner and operator) and includes the following:

- MPPE material supply / exchange / return
- Columns internals inspection
- Performance guarantee during lifetime operation
- Performance control and optimization (based on remote control facility)
- Operations support by remote control and local support
- Access to new developments / improvements

Annual Fee: **€ 45,000 (Forty Five Thousand Euro)**

## 2.3 Value recovered Hydrocarbons (profits)

The recovered Hydrocarbons have a market value (assumed 65 $/barrel). Based on design Feed conditions and design removal rates the annual recovery is approximately **150 barrels per year i.e. $10,000 per year.**

## 2.4 Price

The price is based on the complete and undivided delivery.
Value Added Tax or similar fiscal imposition, any taxes such as withholding taxes which are in force or which may be introduced by the government, is not included in any price indicated in this proposal.

## 2.5 Delivery conditions

### 2.5.1 Delivery type

The delivery is FCA Workshop according to Incoterms 2017. Workshop location may be The Netherlands, Middle East or Asia. Location can only be fixed in during EPC, after contract award.

### 2.5.2 Time of Delivery

Under normal conditions the expected delivery time FCA Workshop is 12 months from PO acceptance.

# 3. Process Design

The design has been based on Feed flow rate and concentrations of Dispersed & Dissolved HC's and BTEX as specified.

## 3.1 Design conditions and Separation performance

| FEED CONDITIONS | | | |
|---|---|---|---|
| **Parameter** | **Unit** | **Value** | **Remark** |
| Design Flow rate ~~max~~ for ~~separation~~ performance guarantee. | m3/h | 12,5 | Note 1 |
| Feed pressure at flow | barg | 1 - 5 | |
| Temperature | C | <40 | Note 2 |
| | | | |
| **Inlet composition** | | | |
| Dispersed Hydrocarbons | mg/l | <40 | Assumed to be present as C11-C16 |
| Dissolved Hydrocarbons (aliphatic) | mg/l | <100 | Assumed to be present as C6-C10 |
| BTEX | mg/l | <60 | |
| **Total** | mg/l | **<200** | |
| Hg | mg/l | N/A | Note 4 |
| PAHs | mg/l | N/A | No information provided, note 5 |
| NPDs | mg/l | N/A | |
| Corrosion & Scale Inhibitors | mg/l | N/A | |

| DISCHARGE DATA | | | |
|---|---|---|---|
| **Parameter** | **Unit** | **Value** | **Remark** |
| Dispersed Hydrocarbons | mg/l | <5 | |
| BTEX | mg/l | <5 | |
| **Total HC** | **mg/l** | **<10** | |
| PAHs removal rate | Removal | >99% | Expected removal |
| NPDs removal rate | Removal | >99% | Expected removal |
| Temperature increase | C | 2-3 | Estimate |
| Flow rate outlet | $m^3/h$ | 0- 112% | Every hour: 7 min zero flow<br>Remaining time at 112% inlet flow. |
| Pressure at flow (approx..) | mwc | 12 | |

Notes:

**1) Maximum flowrate**

Hydraulic flow rate limitations are set by the pipe sizes used. Veolia allows for a maximum velocity in the pipe of 2.5 m/s. In this offer a pipe size of 2" is used allowing a maximum Feed Flow rate of approximately 15 m3/h (but at reduced removal efficiency).

**2) Temperature**

For the technology to be efficient the Feed temperature needs to be below 50 degC and preferably below 40degC.

**3) Inlet concentration of hydrocarbons**

It should be noted that the values for BTEX are low compared to what we see in other references. We have assumed that the C11-C16 is predominantly present as dispersed phase. The C6-C10 will be partly dispersed and partly dissolved.

**4) Mercury removal**

No information has been provided on the Hg level in the produced water, nor information on maximum discharge level is given.

In benchmark studies of current MPPE units a structural removal of total Mercury content of 80-99% has been observed. This phenomenon has been studied and Hg removal can be guaranteed at 90% for dissolved Hg, either metallic or ionic. Particulate Hg or Hg chemically bound to organic molecules are excluded from this guarantee.

**5) Removal of other constituents**

This MPPE process design is based on the dissolved & dispersed aliphatics and BTEX. Other extractable compounds like PAHs, NPDs (and partly field chemicals like corrosion/scale inhibitors) will also be removed. In principle a Zero Harmful Discharge to the Environment will be achieved.

## 4. General Process Description

The extraction process itself is a batch process but by using two columns, one in extractioj mode and one in regeneration mode, the process can be made continuous. This however requires a process sequence that will create an internal recycle which can be dealt with in two ways: (i) include a Return Tank, or (ii) make use of a projected feed tank or off-spec tank. The latter reduces the number of equipment and decreases the size and the weight of the MPPE unit, but does require the MPPE unit to be above and close to the projected tank. The two options are described below:

### 4.1 Description including a Return Tank

A Macro Porous Polymer Extraction (MPPE) unit consists of two columns, containing a packed bed of MPPE material. One Column is in extraction mode, the other in regeneration (figure 1). The MPPE media contain an immobilized extraction fluid that enables the extraction of hydrocarbons from the Feed water.

A cartridge filter protects the media from incidental off-spec solids. The MPPE-column C-01 is in operation and fed in up flow direction (blue line) . Column C-02 is in regeneration (yellow) and is heated up with Low-pressure steam. The temperature of around 102 C in the Bed is maintained for approximately 30 minutes. The extracted hydrocarbons contained in the media are forced out into the steam vapor. The vapor condenses in two phases – a water and a hydrocarbon phase - in a water cooled condenser. Density differences between the condensed phases allow a final separation of hydrocarbons and water in the Separator.

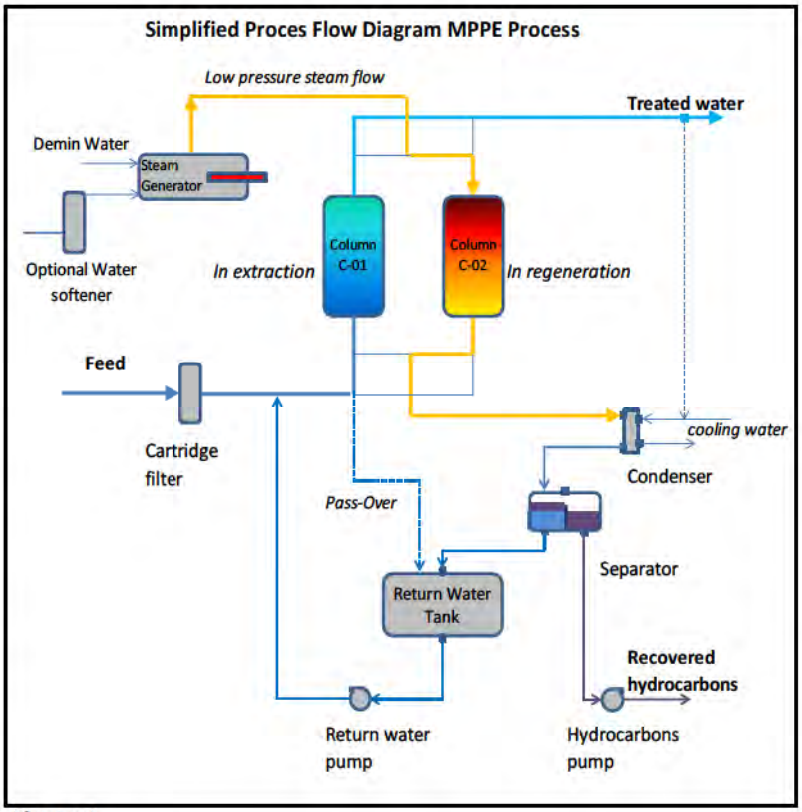

*Figure 1*

When the regeneration has completed (normally 1 hour) the operation of the Columns is switched. The hot regenerated Column C-02 is fed with Feed Water which is led to the Column C-01 to be regenerated. This so-called Pass-over enables cooling down of the regenerated Column and pre-heating of the Column to be regenerated. As the Pass-over Water coming from the Column is hot and containing elevated levels of hydrocarbons it cannot be discharged. The pass-over Water is led to the Water Return Tank and gradually fed back with the Feed Water over the next operational phase. The switching of Columns does not interrupt the Feed. The discharge of treated water is interrupted for several minutes during the Pass-over step.

The process is fully automated, flow rate adjusted and requires no Operator intervention. The process has a Turn-down ratio up to 10% of the design flow rate. The process operates at very low noise levels.

## Description of the No Return Tank option

The so-called Return water is required to buffer the drain (so-called Pass-over step) from the MPPE Columns during the Regeneration step. The buffered water is contaminated with HC from the Columns and is pumped by the Return Water Pump back to the Feed line of the MPPE Unit within one Regeneration cycle. The Return Water Tank (with related pumps and piping) can be deleted in case there is an external Buffer Tank available positioned below the MPPE unit (to allow gravity flow) and that has the option of pumping to the Feed of the MPPE unit. The Buffer Tank may either be an existing upstream Buffer Tank from which the Feed is pumped to the MPPE Unit or for instance Off-Spec Tank that has the option of pumping to the Feed line of the MPPE Unit (see figure 2).
The major advantage is the deletion of one floor (that holds the Return Tank and pumps) in the Base case unit resulting in a major weight, height and cost reduction.

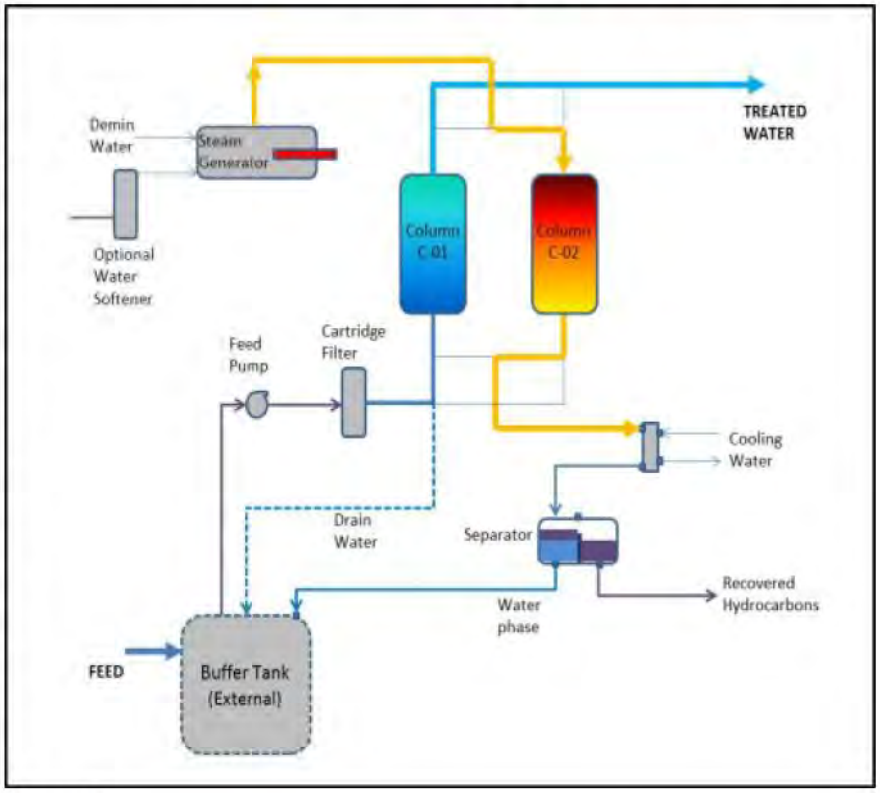

*Figure 2*

The following requirements apply for this option:

- Buffer Tank (upstream) Tank should be below and near to MPPE Unit to allow for gravity drain from MPPE Columns.
- Buffer Tank Feed pumps allow for approximately 4 m3/h additional flow rate on top of the design Feed Flow rate. Preferably VSD controlled to limit the Flow Control Valve pressure drop.

The following process consequences should be noted:

- The drain from the columns will be during approximately 3-15 minutes and has a temperature that is equivalent to the Feed temperature. However the last approximately 0.2 m3 will have a temperature of 95 C.
- The drain from the Columns may hold dispersed HC that may float in the Buffer tank. It is advised to have a skimming option in the Tank (something that is normally considered for this type of Tanks)

## 5. Design Assumptions and Considerations

The following assumptions and considerations have been used in the design:

1. **Build type**
   We have proposed a **containerized MPPE Unit**. The Unit will be supplied with all piping, electrical and I/O connections at battery limits. The on-site works for deck connection, connection of (external) piping, electrical and I/O cabling is by Client or third party local Contractor. Veolia will provide Supervisor for on-site support.

2. **Pre-treatment**
   A standard Cartridge type pre-filter is included for preventive reasons. As a default we assume that TSS content is low and particles are small in the Feed and that no continuous TSS removal is required. In existing MPPE units treating offshore Gas/Condensate produced water TSS is no issue and typical lifetime of the cartridges is 6-12 months.

3. **Material of construction**
   The material of construction for piping and vessels Duplex SS due to salt and sea environment and high design temperature of certain parts.

4. **Redundancy <u>OPTIONS</u>**
   - Cartridge Filters
     Cartridge Filters are supplied as 1 duty + 1 standby preventing a unit shutdown when filters are exchanged.

   - Condenser
     Condenser plates may foul depending on Feed and Cooling water composition. Generally the cleaning/inspection frequency is every 1-4 years. Redundant Condensers will allow for uninterrupted operations.

   - BTEX/Recovered Hydrocarbon pumps
     The BTEX/RHC pump discharges the Recovered Hydrocarbons from the Separator tank. The Separator Tank has a typical buffer capacity for Hydrocarbons of several days, allowing for repair/maintenance of the BTEX/RHC pump.

   - Water Return Pumps
     The Water Return Pump recycles the condensed steam and back-flow water into the Feed of the Unit. Discontinuation of operation can only be allowed for several minutes and does not allow for repair or maintenance works.

   - Redundant Extraction capacity
     Generally the efficiency loss of the MPPE media is very gradual. A required exchange of the media can be predicted months ahead. A media exchange requires a total stop of the operations. An additional set of 2 columns can be included as a warehouse (onshore/offshore) spare option for quick exchange (less than one working day). This however requires sufficient lay down area and access by crane with around 2 tons lifting capacity.

5. **Nitrogen/Fuel gas Blanketing option**
   Small volumes of "breathing" off-gas due to level variations in the Return Water Tank and the Separator are vented at a high point of the unit as default.
   Some environmental regulation may not allow breathing to the air. Connection to a venting, blanketing and/or flare system may be required and can be offered as an option.

6. **Specifications**
   We have accounted for typical O&G specifications in terms of required design & engineering, quality & inspection and documentation standards. However some specific Company requirements may lead to major design, lay-out or equipment changes that will impact price and supply time.

7. **Zoning**
   We have assumed that the Unit is placed in a Zone 2 area

8. **Control**
   The default supply consists of instrument cabling to Junction boxes on unit edge. Power cabling to be installed by client (separate cable trays are included in scope).
   Functional description as basis for programming of Client (central) control is included.

# 6. Unit properties and Utilities

## 6.1 Estimated Sizing & Weight

For typical GA please refer to Attachment 1, dimensions and weights are listed below

Base Case:
Estimated MPPE Unit sizing: 6.1 x 2.5 x 3.7 m (L x W x H) excluding external stairs and ladders
Estimated Weight: Empty 12 tons
Wet (max.) 15 tons

## 6.2 Estimated Utilities Consumption

Estimated Utilities Consumption below are based on Design conditions as listed in previous paragraph

| | | |
|---|---|---|
| Cooling water consumption Condenser (design conditions) | m3/y | 5.762 |
| *Assuming Cooling water temp. 25 C; max. temp. increase 15 C* | m3/h | 1 |
| Feed water Steam Boiler (design conditions) | m3/y | 494 |
| *Feed water quality should be better than 0.5 German hardness* | l/h | 91 |
| Annual steam consumption (LP: 110C; 1.5 bar abs.) | ton/y | 449 |
| Peak Steam flow rate | kg/h | 82 |
| Electrical consumption: eg. pumps, lighting, tracing, instruments | kWh/y | 25.448 |
| Electrical consumption Steam Generator | kWh/y | 203 |
| Installed Power Steam Boiler | kW | 66 |

# 7. Scope of Supply

## 7.1 Engineering services

Following major Engineering services are included:

| Item | Remark |
|---|---|
| Project Management and Detailed Engineering incl:<br>• Project Management<br>• Structural analysis and design,<br>• MPPE Process design<br>• Pipe stress analysis<br>• Thermal & Mechanical design of exchanger(s),<br>• Mechanical design of equipment<br>• Assembly of equipment, piping and MPPE skid (at Veolia Workshop)<br>• Inspections Equipment and at works Veolia workshop<br>• Packing | |
| Participation and technical support at<br>- Kick-Off meeting (1 meetings of 2 days)<br>- Progress meetings (max 2 meetings of 2 days),<br>- HAZOP (1 meeting of max 2 days),<br>- 30% 3D, 60% 3D and 90% 3D meetings (each meeting of max 2 days)<br>- Bi-weekly engineering conference (video or telephone) | |
| DCC and Documentation/certification as per Veolia standard | |
| MPPE Polymer first fill | Not included but part of the Performance Guarantee & Services Contract with End-user |
| Functional Test MPPE unit, incl software validation | Optional |
| Vendor assistance onshore and/or offshore, e.g. Pre-Commissioning, Commissioning, SAT and Ready For Start Up (RFSU) | Optional |
| Training for Company operations and maintenance personnel at Company Site or other nominated venue | Optional |

## 7.2 Functional duration test with water prior to shipment

Once completed, the MPPE unit will be fully functional tested including automatic extraction regeneration cycles. Apart from testing all equipment, this functional testing makes it also possible to "debug" the automation program (possibly made by client based on narratives supplied by MPP Systems). The functional test can be executed in the presence of End user/Contractor after which the MPPE unit is then "Plug and Play" ready for delivery.

## 7.3 Spare parts for commissioning and Start up

Commissioning and start up spare parts based on a standard list and included.

## 7.4 Referenced Documents and Standards

No Technical specifications and requirements have been forwarded by the Client at this stage.
We have assumed "general" Oil & Gas specifications for budget estimate purposes.

## 7.5 Equipment supply

All Equipment will be mounted in and on a 20' Sea container. The attached typical PFD (Attachment 2) shows the main Equipment, Valves and Instrumentation. Attachment 1 shows a typical layout.

| Item | MOC | # | Remark |
|---|---|---|---|
| **EQUIPMENT** | | | |
| Inlet Filter | Duplex | 1 | Atmospheric with lid |
| MPPE Columns | Duplex | 2 | FV-9 barg |
| Separator | Duplex | 1 | FV-9 barg |
| HC Pump | Duplex | - | Optional; assumed gravity flow from separator |
| Steam Generator | Duplex | 1 | electrical |
| Condenser | Duplex plates, | 1 | FV-9 barg, CS frame |
| Return Water Tank | Duplex | 1 | FV-9 barg<br>*(not in No Return Tank option)* |
| Return Water Pump | Duplex | 1 | Magnetic Type<br>*(not in No Return Tank option)* |
| **PIPING** | | | |
| Piping | Duplex | 1 | ASME |
| Insulation; certain part of piping + vessels | Mineral wool + alu cladding | 1 | CINI Guidelines |
| Overpressure safety on steam gen | Duplex | 1 | |
| Drains and vents | | 1 | Connected to main header prior TP |
| Positive isolation by MV only | | 1 | |
| Sample connections | Duplex | 2 | Feed Water, Effluent Water |
| **STRUCTURAL** | | | |
| Structural Steel | SS | 1 | steel base, support structures, platforms, stairs, ladders, walkways, handrails, pinned construction/ positioning |
| Grating | Galvanised CS | 1 | 20mm ball proof (by Hilti assembly) |
| **INSTRUMENTS** | | | |
| Temperature transmitters | | 4 | |
| Pressure transmitters | | 8 | |
| Level transmitters | | 3 | |
| Flow transmitters | | 2 | |
| Control Valves | | 2 | |
| Automated ON/OFF Valves | | 13 | |
| Instrumentation tubing | SS316 | incl. | |
| Manual Valves | | 34 | |
| E&I cabling | | incl. | Power & instrument cables segregated |
| Cable trays | | incl. | |
| Cables supports | | incl. | |
| Cables wired to junction boxes at package edge | | incl. | |
| Earthing system | Cu-cable | incl. | |
| **PROCESS CONTROL** | | | |
| Software Control MPPE process | | - | Base offer: control by Client control system. Optional PLC + HMI, incl software license |
| **MARKING** | | | |
| ATEX | | incl. | |
| CE Marking | | incl. | |
| Fluid tagging | | incl. | As per Client spec |
| Name plates for E&I | | incl. | As per Client spec |
| Name plates for equipment | | incl. | As per Client spec |
| Name plates for Vessels | | incl. | As per Client spec |

## 7.6 Preferred suppliers

| Item | Vendor |
|---|---|
| **Mechanical** | |
| Steel structure, vessels, piping, assembly | Yard in China, South East Asia, Middle East or Europe may be selected |
| | |
| **Valves** | |
| Automated Ball Valves | Pentair |
| Check valves | Pentair |
| Control Valves | Samson |
| Manual Valves | Eriks |
| | |
| **Pumps** | |
| Return Water Pump | Flowserve, Sulzer, Dickow |
| Hydrocarbon Transfer Pump | Axflow; SPX Flow, Dickow |
| | |
| **Condensor** | Alfa Laval, Tranter, Kelvion, ITM |
| | |
| **Safety relief Valves** | Tyco, Pentair |
| | |
| **Instruments** | Endress+Hauser or equivalent |

# 8. MPPE Process : Characterstics & Proven Experience

## 8.1 MPPE Flexibility and Robustness

- High reduction factor.
- Reduction factor independent of inlet concentration.
- Robust against water environment (salt, methanol, glycols, corrosion inhibitors, scale inhibitors, H2S scavengers, demulsifiers, defoamers and dissolved (heavy) metals).
- Predictable performance.
- Flow/inlet concentration flexibility:
  - 10% lower flow than design: 50% higher inlet concentration possible.
  - lower inlet concentration: higher flow possible.
- Capacity flexibility: turn up / down ratio e.g. 0 to 150% of design capacity (depending on hydraulic constraints).
- Batch wise operation possible, immediate performance after start up.
- Separated hydrocarbons are practically 100% pure ready for (re)use.
- No waste stream, no air emission, low noise.
- 100% water and hydrocarbon recovery.

## 8.2 MPPE Experience, Reliability and Performance
## (OIL & GAS, LNG, Chemical, Pharmaceutical, Coatings, Electronics Industry)

**Introduction**

The MPPE Technology is a relatively new Innovative Technology and therefore generally not described in text books and being taught at Schools and Universities. For potential new users, not familiar and experienced with this technology, it is often difficult to evaluate and predict the reliability, robustness, separation and operation performance. Therefore this summary has been prepared to get a quick impression. Further information/analyses can be received on request.

**General Performance predictability and experience**

MPPE is basically a liquid – liquid Extraction Technology where the extraction liquid is immobilized in an Macro Porous Polymer.
The MPPE separation performance for dissolved and dispersed hydrocarbons is independent of the influent concentration (law of physics) and therefore separation effectiveness is maintained at influent levels from ppb levels to thousands of ppm and higher.
The MPPE process is mathematically described, computer modeled and tested, so the performance predictability of any design is practically 100%.
All installed MPPE units (> 30) have reached their predicted performance.
Various business concepts (Design & Build, Operation and Maintenance or Design, Build, Finance and Maintenance) have been applied.

**Gas / Condensate / LNG Produced water (BTEX, PAHs, Aliphatics)**

- In Offshore Produced Water treatment of Gas/Condensate/LNG production a more than 50 years of accumulated experience (TOTAL, NAM (SHELL/EXXON), STATOIL) has been built up with good separation performance and operational experience.
- On 3 offshore platforms, MPPE units have been installed without prior testing and are operating successfully now since 2002 (99% removal of 600-900 ppm of dispersed and dissolved hydrocarbons, BTEX, PAHs, Aliphatics).
- The oldest MPPE unit (ELF/TOTAL/VERMILION in Harlingen) is operating successfully since 1994 on offshore produced water (gas/condensate) with a > 99.9% removal of 2,000 to 3,000 ppm dissolved and dispersed hydrocarbons.
- Environmental Impact Factor reductions of 95 to 99% (removal of toxic contents of produced water) were reported (HYDRO / STATOIL) for gas/condensate produced water.
- HYDRO/SHELL ORMEN LANGE Norway (NORSOK specifications) offshore gas/condensate field, aiming at zero harmful discharge (startup 2008).
- WOODSIDE PLUTO LNG Australia, (startup 2011).
- SHELL PRELUDE Australia, first Floating LNG (startup 2018).
- INPEX ICHTHYS LNG Australia, MPPE on FPSO (startup 2018)

**Waste water (CHCs, BTEX, PAHs, Aliphatics, THT)**

For waste water treatment a more than 45 years of accumulated experience has been built up in Europe and the USA (PHILIPS, DUPONT, TOTAL, ALBEMARLE, GAZ DE FRANCE, AKZO NOBEL) with removal at 99% levels or higher.

In five projects the MPPE units were installed without prior testing and have shown performances as predicted/designed.

VEOLIA

Veolia MPPE Technology — TOTAL F 15A Offshore - NL

## Offshore Gas Produced Water treatment- Unmanned Operation

**Operational since 2002**
- Robust against salt, surfactants, Corrosion inhibitors
- Fulfilling TOTAL's environmental goal beyond present legal requirements

## Challenge
- Unmanned operation
- Remote control
- Practically no space on existing platform
- Dissolved/dispersed toxic content removal for Zero Harmful Discharge

## Performance

**MPPE removes:**
- Dispersed oil (aliphatics) > 99%
- Dissolved and dispersed aromatics (BTEX) >99%
- Poly Aromatics (PAHs) >99.5%

**MPPE Unit capacity 5 m3/h**
- Built in container
- Hanging 50% outside platform
- Fully integrated including
  - steamboiler
  - water maker
- No waste stream

### The MPPE process

*MPPE stands for Macro Porous Polymer Extraction. Polymer beads contain a specific immobilized extraction liquid. Hydrocarbon contaminated water is passed through a column packed with MPPE particles. The hydrocarbons are extracted from the water at any designed efficiency up to 99.999%. The MPPE particles can simply be regenerated by heating with steam. The removed hydrocarbons are recovered as an almost 100% pure product. No other waste stream is created. No chemicals requires, no off gasses produced.*

## Beach Risk Assessment Guidance

# Risk Rating Toolkit

## Risk Matrix Instruction

**Step A**
Identify and describe the risk as follows: "(something happens) leading to outcomes expressed in terms of impact on objectives).

**Step B**
Assess the potential exposure (maximum credible impact on Lattice Energy arising from a risk without regards for controls).

**Step C**
Identify existing controls, and assess their effectiveness.

**Step D**
Identify the consequence rating (1-6) corresponding to the maximum credible impact across the Consequence Categories (may be more than one), given the existing controls and their effectiveness.

**Step E**
Identify the Likelihood of occurrence ("remote" through to "almost certain") of those consequences at that level, taking into account the current controls and their effectiveness.

**Step F**
Determine the Level of Risk (Low, medium, High, Severe, Extreme) based on the intersection of the Consequence rating and Likelihood.

**Step G**
Determine and action (e.g. Risk treatment) and escalation required based on the Level of Risk.

## Control Effectiveness

| Rating | Explanation |
|---|---|
| **Fully Effective** (100%) | Controls are well designed for the risk, largely prevent the risk from eventuating, and address the root causes. The controls are operating effectively and are reliable at all times. Nothing more to be done except review and monitor the existing controls. |
| **Substantially Effective** (75%) | Most controls are designed correctly and are in place and effective. Some more work needs to be done to improve operating effectiveness of the controls, or there are doubts about operational effectiveness and reliability. |
| **Partially Effective** (50%) | While the design of controls may be largely correct in that they treat most of the root causes of the risk, they are not currently very effective. There may be an over reliance on reactive controls. |
| **Largely ineffective** (25%) | Significant control gaps. Either controls do not treat root cause or they do not operate effectively at all. Controls, if they exist, are just reactive. |
| **None** (0%) | Virtually no credible control. There is little to no confidence that any degree of control is being achieved due to poor control design and/or very limited operational effectiveness of controls. |

## Risk Management Action

| Level of risk | Action required | Escalation and Approval of Treatment Plans | Acceptance authority |
|---|---|---|---|
| EXTREME | Risk treatment Plan must be in place immediately<br>Risk reviewed monthly by Risk owner | Exco for review and approval of the treatment plan | Exco |
| SEVERE | Risk treatment must be considered<br>Risk reviewed monthly by Risk owner | Exco for review and approval of associated treatment plan (if applicable) | Exco |
| HIGH | Risk treatment must be considered<br>Risk reviewed twice per year by Risk owner | Project / Operations Manager for review and approval of associated treatment plan (if applicable) | Exco direct report (Exco -1) |
| MEDIUM | Risk treatment may be considered<br>Risk reviewed annually by Risk owner | Project / Operations Manager | Exco direct report (Exco -1) |
| LOW | No risk treatment required<br>Risk reviewed annually by Risk owner | Facilities Manager / Operations Superintendent | Exco Direct report – reports (Exco -2) |

Based on the Origin Risk Matrix 2010

# Risk Matrix

| CONSEQUENCE CATEGORIES | Impact to Lattice or contracting personnel | Natural environment | Community damage/ impact/ social/ cultural heritage | Financial impact (e.g. due to loss of revenue, business | Damage to reputation, services interruption, customer interruption | Breach of law or criminal prosecution or civil action (e.g. OHS, environment, industrial relations, trade practices, industry acts) |
|---|---|---|---|---|---|---|
| 6 CATASTROPHIC | Multiple fatalities >4 or severe irreversible disability to large group of people (>10). | Long term destruction of highly significant ecosystem or very significant effects on endangered species or habitats. | Multiple community fatalities, complete breakdown of social order, irreparable damage of highly valued items or structures of great cultural significance. | EBIT: impact, loss or deterioration from expectation greater than $100m. CASH FLOW: severe cash flow crisis, unable to source funds. | Negative international or prolonged national media (e.g. 2 weeks). continued severe degradation of services to customers > 1 month or > 10,000 customer days. | Potential jail terms for executives and or very high fines for the company. Prolonged multiple litigations. |
| 5 CRITICAL | 1-3 fatalities or serious irreversible disability (>30%) to multiple persons (<10). | Major offsite release or spill, significant impact on highly valued species or habitats to the point of eradication or impairment of the ecosystem. Widespread long-term impact. | Community fatality. Significant breakdown of social order. Ongoing serious social issue. Major irreparable damage to highly valuable structures/ items of cultural significance. | EBIT: impact, loss or deterioration from expectation greater than $30m but less than $100m. CASH FLOW: severe cash flow crisis, difficulty to source funds. Probable credit rating downgrade. | Negative media national for 2 days or more. Significant public outcry. severe degradation of services to customers up to 1 month or >5,000 customer days | Very significant fines and prosecutions. Multiple prosecution and fines. |
| 4 MAJOR | Serious permanent injury/ illness or moderate irreversible disability (<30%) to one or more persons. | Offsite release contained or immediately reportable event with very serious Environmental effects, such as displacement of species and partial impairment of ecosystem. Widespread medium and some long-term impact. | Serious injury to member of the community, Widespread social impacts. Significant damage to items of cultural significance. | EBIT: impact, loss or deterioration from expectation greater than $3m but less than $30m. CASH FLOW: Loss of flexibility and/or increase in cost to source funds. Market explanation required. | Negative national media for 1 day. Individual customers or segments disadvantaged up to 1 week. Customer interruption >500 customer days. NGO adverse attention. | Major breach of regulation and significant prosecution including class actions. |
| 3 SERIOUS | Serious reversible/ temporary injury/illness (e.g. lost time >5 days or hospitalisation or alternate/Restricted Duties > 1 month). | Moderate effects on biological or physical environment and serious short term effect to ecosystem functions. | Media attention and heightened concerns by local community and criticism by NGOs. Ongoing social issues. Permanent damage to items of cultural significance. | EBIT: impact, loss or deterioration from expectation greater than $0.3m but less than $3m. CASH FLOW: Material impact to cash flow. | Negative state media. Heightened concern from local community. Service interruption up to 1 day or > 10 customer days. Criticism by NGOs. | Serious breach of law/regulation with investigation or report to authority with possible prosecution. Performance infringement notice (Pin). |
| 2 MODERATE | Reversible temporary injury/illness requiring Medical treatment (e.g. lost time <5 days or alternate/Restricted Duties for < 1 month). | Event contained within site. Minor short term damage to area of limited significance. Short term effects but not affecting ecosystem functions. | Medical treatment injury to a member of the community, Minor adverse local public or media attention and complaints. Minor medium term social impact on local population, mostly repairable. | EBIT: impact or loss greater than $30k but less than $0.3m. CASH FLOW: impact to project or business unit cash flow. | Public concern restricted to local complaints Negative local media. Internal escalation to senior management. Few hours service interruption. Adverse local public attention. | Breach of law/regulation or non-compliance. Minor legal issues, minor litigation possible. |
| 1 MINOR | Injury/illness requiring Medical treatment (no lost time, no alternate/ Restricted Duties), First aid, Report only. | Minor consequence, local response. No lasting effects. Low level impacts on biological and physical environment to an area of low significance. | Public concern restricted to local complaints, low level repairable damage to common place structures. | EBIT: impact or loss greater than $3k but less than $30k. CASH FLOW: no significant impact. | Public concern restricted to local complaints. | Local investigation, minor breach of regulation, on the spot fine or technical non-compliance. Prosecution unlikely. |

| LIKELIHOOD | 1 REMOTE | 2 HIGHLY UNLIKELY | 3 UNLIKELY | 4 POSSIBLE | 5 LIKELY | 6 ALMOST CERTAIN |
|---|---|---|---|---|---|---|
| | <1% chance of occurring within the next year. Occurrence requires exceptional circumstances exceptionally unlikely event in the long-term future only occur as a 100-year event. | >1% chance of occurring within the next year May occur but not anticipated could occur years to decades. | >5% chance of occurring within the next year May occur but not for a while could occur within a few years. | >10% chance of occurring within the next year May occur shortly but a distinct probability it wont could occur within months to years. | >50% chance of occurring within the next year Balance of probability will occur could occur within weeks to months. | 99% chance of occurring within the next year impact is occurring now could occur within days to weeks. |

# Memorandum

| | | | |
|---|---|---|---|
| To | Harry Grynberg | Page | 1 |
| CC | Ian Baxter, Peter Young | | |
| Subject | Potential Impact of Yolla Platform PFW Discharge on Marine Life | | |
| From | Abigail Ross | | |
| File/Ref No. | 60612990 | Date | 19-Dec-2019 |

This memo presents a high-level overview of the potential impacts of the Yolla PFW discharge on the marine environment to satisfy the following comment from Beach Energy (in response to their discussion with NOPSEMA):

- We need to ensure we have risk assessed and considered the potential effect on surrounding marine life. Please refer to our Existing Environment (Section 5) in particular Section 5.5 of the EP to get an understanding of what marine life we have that may frequent around the platform and what this means in connection to our WET results.

## PFW toxicants effects in the Marine Environment

A brief overview of the potential effects on the marine environment associated with each of the toxicants which exceed detection limits in the Yolla Platform PFW discharge (see Table 4.0 in Yolla Platform ALARP Assessment) for which the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZG 2018) provide default guideline values (DGVs, which are included in Table 4 of the ALARP assessment) is as follows:

- Naphthalene – The acute toxicity of naphthalene to marine organisms is considered by Bates, Young & Sutton (1997, in Nazir et al 2008) to be 'high to moderate'. Other toxicity effects include bioaccumulation, reproduction defects, and limited growth (Nazir et al 2008). It has been shown to biodegrade in water, with half-lives ranging from about 0.8 to 43 days (Toxnet 2017a).
- Benzene – The potential for benzene to bioconcentrate[1] in aquatic organisms is considered to be low (Toxnet 2017b). It also has a low tendency to bioaccumulate; hence it is not considered likely to biomagnify though food chains (ATSDR 2007). It has high volatility and relatively low water solubility and is rapidly lost to the atmosphere from water bodies (ANZG 2018). Biodegradation has been found to vary with season (e.g. Wakeham et al 1983), but is considered by ANZG (2018) to also be rapid.
- PAHs (phenanthrene, anthracene, fluoranthene and benzo(a)pyrene) - Concentrations of PAHs in marine ecosystems are generally highest in sediments, intermediate in biota and lowest in the water column (Neff 1979). Marine biota can take up PAHs via a number of routes, including dermal absorption, inhalation and consumption of contaminated prey or sediment (Meador et al. 1995). However, the persistence of these compounds in tissues and body fluids of exposed marine organisms varies depending upon the rates of uptake, metabolism and elimination (Krahn and Stein 1998, Rust et al 2004). Vertebrates, such as fish and marine mammals, quickly metabolise PAHs into more polar forms that are then excreted into urine or secreted into bile for rapid elimination via faeces (Roubal, Collier & Malins 1977, Krahn et al. 1984, Varanasi Stein & Nishimoto 1989). However, some of the PAH intermediates formed during metabolism can be more toxic, and may pose a greater health risk than the parent PAHs (Varanasi Stein & Nishimoto

[1] Bioconcentration is the intake and retention of a substance in an organism entirely by respiration from water in aquatic ecosystems. Bioaccumulation is the intake of a chemical and its concentration in an organism by all possible means, including contact, respiration and ingestion (Alexander 1999).

1989). Fish exposed to PAHs may exhibit an array of toxic effects including genetic damage, morphological deformities, altered growth and development, decreased body size, inhibited swimming abilities and mortality (e.g. White, Robitaille & Rasmussen 1999, Incardona et al 2005). Benzo(a)pyrene has a higher molecular weight than the other three PAHs, has a greater potential to bioaccumulate and has been found to cause tumours in fish (Hawkins et al. 1990).

- Toluene – Algae seem to be more resistant to the acute effects of toluene than fish and crustaceans (Jones and Zabel 1986). Bioaccumulation in marine organisms has been found to be low, and depuration rates high (Jones and Zabel 1986). Bioconcentration in aquatic organisms is considered to be low to moderate (Toxnet 2017c). Toluene has high volatility and relatively low water solubility and is rapidly lost to the atmosphere from water bodies (ANZG 2018). Complete degradation has been observed over periods of four days (summer) and 22 days (spring) in a marine mesocosm (Wakeham et al 1983).
- Ethylbenzene – The acute toxicity of ethylbenzene to marine algae, invertebrates and fish is rated by Toxnet (2017d) as 'moderate'; there are no data reported for chronic toxicity. The potential for bioconcentration in aquatic organisms is considered low and ethylbenzene is considered to be volatile and inherently biodegradable in water under aerobic conditions (OECD 2002).
- Xylenes - Meta-, para- and ortho-xylenes are chemical isomers, with similar physicochemical properties and moderate to low toxicity (OECD 2003, Toxnet 2017e). They are inherently biodegradable under aerobic conditions and their bioaccumulation and bioconcentration potentials are considered to be relatively low (OECD 2003, Ogata et al 1984).
- Copper – adsorbed strongly by suspended material (Florence & Batley 1980 in ANZG 2018). Copper is readily accumulated by plants and animals and bioconcentration has been recorded for various species of phytoplankton, zooplankton, macrophytes, macro-invertebrates and fish (Spear & Pierce 1979 in ANZG 2018). Toxic effects occur when the rate of uptake exceeds the rates of physiological or biochemical detoxification and excretion (Rainbow 1996). Some marine invertebrates, particularly crustaceans, corals, sea anemones and bivalve molluscs, are sensitive to copper (ANZG 2018), while gastropod molluscs are more tolerant and can accumulate quite high concentrations without toxic effects (Taylor & Anstiss 1999). Marine fish appear to be relatively tolerant of copper (e.g. Denton & Burdon-Jones 1986 in ANZG 2018). Copper toxicity in algae, invertebrates and fish generally increases as salinity decreases (e.g. Stauber 1995). Precipitation of copper hydroxide reaches a maximum around pH8 (Ayres, Davis & Gietka 1994) but there is no clear relationship between pH and toxicity (ANZG 2018).
- Silver - one of the most toxic metals to aquatic life in laboratory experiments, in particular silver nitrate and silver iodide (CCREM 1987). However, in the natural environment silver is often found in less bioavailable complexes with chloride, dissolved organic carbon and sulfur-containing ligands and hence laboratory data may overestimate the toxicity of silver (Gorsuch & Purcell 1999 in ANZG 2018). The acute toxicity of silver to marine fish is considerably lower than for freshwater fish, though toxicity to most marine species increases with decreasing salinity and with elevated ammonia concentrations (Hogstrand & Wood 1998).
- Zinc – commonly forms complexes with organic matter in marine waters (Florence & Batley 1977 in ANZG 2018, Bruland 1989). Zinc is adsorbed by certain metal hydroxides (Dzombak & Morel 1990) and by suspended material; bioavailability after adsorption is variable (e.g. Vercauteren & Blust 1996). Zinc toxicity generally decreases with decreasing pH, at least up to pH 8, above which trends are variable (e.g. Everall, Macfarlane & Sedgwick 1989, Roy & Campbell 1995). Zinc uptake and toxicity generally decreases as salinity increases (e.g. Hamilton & Buhl 1990).
- Ammonia – lost from water by volatilisation (Johnson et al 2007) and rapidly oxidised by bacteria (under aerobic conditions) into nitrite (Ward 1996). Ammonia is directly toxic to biota and can cause convulsions, coma and/or death in marine vertebrates such as fish (Randall & Tsui 2002). The toxicity of ammonia in water increases with increasing temperature and pH, but decreases with increasing salinity (ATSDR 2004). Exposure to sub-lethal ammonia stress can lead to adverse reproductive effects in fish (e.g. Armstrong et al 2015) and invertebrates (e.g. Lee et al 2013), changes in invertebrate behaviour (e.g. Montresor et al 2013, Alonso & Camargo 2014) and reduced growth in a wide range of aquatic organisms (Cheng et al 2015). Some fish species

have been found to adapt to long-term sublethal ammonia concentrations by increased excretion from the body and detoxification in the brain (e.g. Kolarevic et al 2012).

- Phenol - Readily soluble in, and not expected to volatilise from, water (ANZG 2018). Phenol is expected to adsorb to suspended solids (Toxnet 2017e) but there has been no indication that it accumulates in sediment (IHCP 2006). Depuration is rapid (half-life ≤12 hours, ANZG 2018) and it is considered unlikely to bioaccumulate (e.g. Crookes & Howe 1996 in ANZG 2018, Toxnet 2017e). Toxicity to fish is considered high (Toxnet 2017e) and has been shown to increase with decreasing pH (e.g. Dalela et al. 1980 and Verma et al. 1980 in ANZG 2018).

**Potential impacts of PFW discharge on marine life**

Indirect impacts of the PFW discharge on marine life may include potential bioaccumulation, bioconcentration and/or biomagnification (i.e. increasing concentrations with increasing trophic levels) of toxicants through trophic levels. These may potentially arise from the ingestion/foraging of prey species that have established on, or are associated with, the legs and subsea infrastructure of the Yolla platform, particularly those established habitats/species that have been present within the PFW mixing zone for an extended period of time (i.e. they are less likely to arise in those species whose presence is of a transitory nature and not related to foraging). The level of any indirect impact would likely be localised to:

- the predator-prey relationships of those species that have interacted with, or been directly associated with, the habitat present within the PFW mixing zone; or
- the species that have inhabited the area within the zone of influence, that are more likely to have long-term exposure to those toxicants (see Table 4.0 of the Yolla Platform ALARP assessment).

Arnould et al (2015) investigated the use of habitat created by offshore infrastructure in Bass Strait by marine mammals and the potential benefits this infrastructure may have to certain marine ecosystems. The Australian fur seal (*Arctocephalus puillus doriferus*), is a benthic forager that feeds exclusively on demersal fish and cephalopod species over the continental shelf, with all but one of the known breeding colonies occurring within Bass Strait (Arnould et al 2015). This region is considered to be of low primary productivity (Gibbs 1992), therefore the presence of subsea infrastructure can potentially provide valuable foraging habitat. The study conducted by Arnould et al (2015) concluded that offshore infrastructure in the Bass Strait was potentially important foraging habitat for Australian fur seals, due to creation of fish habitat etc, however the study indicated that pipelines and cable routes appeared to be the most influential structures (over wells and shipwrecks), potentially providing habitat connectivity for prey species. Fur seals are often observed below the Yolla platform, which indicates that the associated subsea infrastructure may support suitable foraging habitat.

There is a potential for pinnipeds (seals and sea lions), specifically the Australian fur seal, to forage on species that have had a direct association with habitat within the PFW mixing zone, e.g. seals eat fish that may have eaten algae/crustaceans/molluscs that inhabit the zone of influence of the PFW mixing zone. Therefore, there is a potential that bioaccumulation or bioconcentration of toxicants within fur seals may occur.

The principal diet of most seals and sea lions consist of cephalopod molluscs and fish; unlike bivalves and suspension feeders these prey are not likely to accumulate petroleum hydrocarbons. All seals and sea lion species are assumed to have the necessary enzymes available within their systems to metabolise some petroleum fractions, while others may be deposited into fat stores. To date, no evidence of deleterious effects related to bioaccumulation of petroleum hydrocarbons has been documented (NOAA 1992).

**Conclusion**

Due to the small zone of impact associated with the PFW mixing zone, it is concluded that there is a negligible risk of the PFW having a significant impact upon the marine ecosystem within the receiving environment. It is reasonable to conclude that any impacts that may occur would be localised to those biological communities present in those habitats with long-term exposure to the PFW plume, which represent only a very small proportion of the total available similar habitat (i.e. other platform legs or subsea infrastructure). Any indirect impacts would be localised to those species that forage on the biota within the habitats that experience long-term exposure to the PFW plume.

## About AECOM

AECOM is the world's trusted infrastructure consulting firm, delivering professional services throughout the project lifecycle – from advisory, planning, design and engineering to program and construction management. On projects spanning transportation, buildings, water, new energy and the environment, our public- and private-sector clients trust us to solve their most complex challenges. Our teams are driven by a common purpose to deliver a better world through our unrivaled technical and digital expertise, a culture of equity, diversity and inclusion, and a commitment to environmental, social and governance priorities. AECOM is a Fortune 500 firm and its Professional Services business had revenue of $14.1 billion in fiscal year 2024. See how we are delivering sustainable legacies for generations to come at aecom.com and @AECOM.
