

Pyrenees Facility Operations Environment Plan

Australian Operations Division

January 2026

Revision 23

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

Table of contents

1	Introduction.....	16
1.1	Overview	16
1.2	Purpose of the Environment Plan	16
1.3	Scope of the Environment Plan.....	17
1.4	Environment Plan summary	17
1.5	Structure of the Environment Plan	17
1.6	Description of the titleholder.....	20
1.7	Details of titleholder and nominated liaison person	20
1.7.1	Titleholder	20
1.7.2	Nominated liaison person	20
1.7.3	Arrangements for notifying change	20
1.8	Woodside/BHP Petroleum merger	20
1.9	Woodside (PetDW) Management System	21
1.9.1	Environment policy	21
1.10	Description of relevant requirements	21
1.10.1	<i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> (Cth).....	21
1.10.2	<i>Environment Protection and Biodiversity Conservation Act 1999</i> (EPBC Act) (Cth)	22
1.10.2.1	Recovery plans and threat abatement plans	23
1.10.2.2	Australian Marine Parks.....	24
1.10.2.3	World Heritage properties	24
2	Environment Plan process	25
2.1	Overview	25
2.2	Environmental risk management methodology	25
2.2.1	Woodside (PetDW) risk management process	25
2.2.2	Impact assessment process	25
2.3	Environment Plan development process.....	26
2.4	Establish the context	28
2.4.1	Define the activity	28
2.4.2	Define the existing environment	28
2.4.3	Relevant requirements	29
2.5	Impact and risk identification	29
2.6	Impact and risk analysis	30
2.6.1	Decision support framework	30
2.6.1.1	Decision Type A.....	30
2.6.1.2	Decision Type B.....	31
2.6.1.3	Decision Type C.....	31
2.6.1.4	Decision support framework tools.....	31
2.6.2	Control measures (hierarchy of controls)	32
2.6.3	Impact and risk classification.....	33
2.6.3.1	Risk rating process	34
2.7	Impact and risk evaluation	35
2.7.1	Demonstration of ‘as low as reasonably practicable’ (ALARP)	35
2.7.2	Demonstration of acceptability	36
2.8	Recovery plan and threat abatement plan assessment.....	36
2.9	Environmental performance outcomes, environmental performance standards, and measurement criteria.....	36

2.10	Implement, monitor, review and report.....	37
2.11	Consultation	37
3	Description of the activity	38
3.1	Overview	38
3.2	Petroleum Activity overview	38
3.3	Location	40
3.3.1	Operational Area	40
3.4	Timing.....	41
3.5	Subsea infrastructure layout and description	41
3.6	Suspended infrastructure	44
3.7	Exploration well with wellhead	44
3.8	Other property including exploration wellheads in the licence areas	45
3.9	Characteristics of target hydrocarbons	45
3.9.1	Production overview	45
3.10	Well control.....	45
3.11	Pyrenees Facility	45
3.11.1	Facility design conditions.....	46
3.11.2	Turret and mooring	47
3.11.3	Hull 51	
3.11.4	Topsides layout	51
3.12	Modes of operation.....	53
3.12.1	Connected mode	53
3.12.2	Disconnected mode	53
3.12.3	Transition from connected to disconnected mode.....	53
3.12.4	Floating production, storage and offtake facility (FPSO) personnel levels	53
3.13	Production process.....	54
3.13.1	Production system overview	54
3.13.2	Liquid processing overview	54
3.13.3	Flare system	60
3.13.3.1	Normal operations.....	60
3.13.3.2	Intermittent process upsets and activities	61
3.13.3.3	Emergency blowdown.....	61
3.13.3.4	Transient operations	61
3.13.4	Vent system.....	61
3.13.5	Production water treatment and injection system.....	61
3.13.6	Drainage system	66
3.13.6.1	Closed drains	66
3.13.6.2	Open drains	66
3.13.7	Seawater system	67
3.13.7.1	Cooling water system.....	67
3.13.7.2	Fresh water system.....	67
3.13.8	Cargo tanks	68
3.13.9	Ballast system.....	68
3.13.10	Offloading system and offtake tanker mooring	69
3.13.11	Inert gas system	69
3.13.12	Greenhouse gas emissions	70
3.14	Emergency blowdown, shutdown and safeguarding.....	70
3.14.1	Emergency blowdown	70

3.14.2	Shutdown and safeguarding control systems.....	70
3.14.3	Emergency shutdown valves.....	71
3.15	Utility systems	71
3.15.1	Power generation	71
3.15.1.1	Topside power generation	71
3.15.1.2	Essential (hull) generators	72
3.15.1.3	Emergency generators.....	72
3.15.1.4	Uninterruptable power supplies	72
3.15.2	Diesel fuel system	73
3.15.3	Hydraulic and lube oil	73
3.15.4	Instrument and plant air system	73
3.15.5	Nitrogen system.....	74
3.15.6	Steam systems	74
3.15.7	Sewage and putrescible wastes	74
3.15.8	Cranes and material handling.....	74
3.15.9	Passing vessel detection	74
3.15.10	Facility lighting	75
3.15.11	Chemical injection system	75
3.16	Hazardous substances and inventories	75
3.16.1	Process and non-process hydrocarbons	75
3.16.2	Process and non-process chemicals.....	76
3.16.3	Chemical selection, assessment and approval	80
3.16.3.1	Environmental selection criteria	80
3.16.3.2	Background overview of Offshore Chemical Notification Scheme	80
3.17	Support vessel operations.....	81
3.17.1	Facility support vessels	81
3.17.2	Other support vessels.....	81
3.18	Helicopter operations	82
3.19	Subsea inspection, monitoring, maintenance and repair (IMMR) activities	82
3.19.1	Inspections.....	82
3.19.2	Monitoring	83
3.19.3	Maintenance	83
3.19.4	Repair	83
3.19.5	Subsea chemical usage	84
3.19.6	Intervention isolations.....	84
3.19.7	Marine growth removal	85
3.19.8	Sediment relocation	85
3.20	Waste management	85
3.20.1	General non-hazardous wastes.....	85
3.20.2	Hazardous wastes	85
3.20.3	Naturally occurring radioactive materials and sand management	85
4	Description of the existing environment	87
4.1	Overview	87
4.2	Regional context.....	90
4.3	Matters of national environmental significance (EPBC Act).....	92
4.4	Physical environment	92
4.5	Habitats and biological communities.....	94
4.6	Protected species.....	95

4.6.1	Fish, sharks and rays	96
4.6.2	Marine reptiles	101
4.6.3	Marine mammals	110
4.6.4	Seabirds and migratory shorebirds	122
4.6.5	Seasonal sensitivities for protected species.....	135
4.7	Key ecological features	136
4.8	Protected places.....	138
4.9	Cultural features and heritage values	144
4.9.1	Background.....	144
4.9.2	First Nations peoples	144
4.9.2.1	Coastally adjacent First Nations groups	145
4.9.3	Marine and national parks	149
4.9.4	Sea Country values	151
4.9.4.1	Desktop assessment of Sea Country values.....	152
4.9.4.2	Studies of cultural features and heritage values.....	168
4.9.4.3	Consultation feedback to inform existing environment.....	168
4.9.4.4	Summary of cultural features and heritage values	182
4.9.4.5	Further context: intangible cultural heritage	186
4.9.4.6	Further context: marine ecosystems and species	187
4.9.5	Heritage listed places	188
4.9.5.1	Historic sites of significance.....	189
4.9.5.2	Underwater Heritage.....	189
4.9.5.3	World, National and Commonwealth Heritage listed places.....	190
4.10	Socio-cultural environment.....	192
4.10.1	Commercial fisheries	192
4.10.2	Traditional fisheries	204
4.10.3	Tourism and recreation.....	204
4.10.4	Commercial shipping	205
4.10.5	Oil and gas.....	207
4.10.6	Defence zones.....	209
5	Consultation.....	212
5.1	Summary	212
5.2	Consultation – general context.....	213
5.3	Identification of Relevant Persons for Consultation	216
5.3.1	Regulations 25(1)(a), (b) and (c)	216
5.3.2	Identification of relevant persons Under Regulations 25(1)(a), (b) and (c)	216
5.3.3	Regulation 25(1)(d).....	217
5.3.4	Identification of relevant persons Under Regulation 25(1)(d).....	219
5.3.5	Regulation 25(1)(e).....	224
5.3.6	Identification of relevant persons under Regulation 25(1)(e)	224
5.3.7	Persons or organisations Woodside chooses to contact	225
5.4	Assessment of relevant persons for the Proposed Activity	225
5.5	Consultation material and timing	225
5.5.1	Sufficient information	225
5.5.2	Reasonable period for consultation	228
5.5.3	Discharge of Regulation 25	229
5.5.4	Context of consultation approach with Traditional Custodians	230
5.5.5	Approach to methodology – Woodside’s interpretation of Tipakalippa	230

5.5.6	Consultation method.....	231
5.5.6.1	Identification of relevant persons	232
5.5.6.2	Opportunity to self-identify and identifying other individuals.....	233
5.5.6.3	Reasonable period for consultation	234
5.5.6.4	Discharge of Regulation 25	234
5.6	Providing feedback and assessment of merit of objections or claims	234
5.7	Ongoing consultation.....	235
6	Environmental impact and risk assessment, performance outcomes, standards and measurement criteria	236
6.1	Overview	236
6.2	Analysis and evaluation	236
6.3	Cumulative impacts	239
6.4	Environmental performance outcomes, standards and measurement criteria	239
6.5	Presentation	239
6.6	Environment risk/impacts not deemed credible	241
6.7	Planned activities (routine and non-routine)	242
6.7.1	Physical presence: disturbance to marine users.....	242
6.7.2	Physical presence: disturbance to the seabed	248
6.7.3	Routine light emissions: light emissions from FPSO lighting, vessel operations and operational flaring	254
6.7.4	Routine acoustic emissions: generation of noise during routine operations	264
6.7.5	Routine and non-routine atmospheric and greenhouse gas emissions	280
6.7.6	Routine and non-routine discharges: produced water	306
6.7.7	Routine and non-routine discharges: liquid wastes and subsea fluids.....	327
6.8	Unplanned activities (accidents, incidents, emergency situations)	338
6.8.1	Quantitative spill risk assessment methodology.....	338
6.8.1.1	Hydrocarbon characteristics – Pyrenees crude	338
6.8.1.2	Environment that may be affected and hydrocarbon contact thresholds	341
6.8.1.3	Operational and scientific monitoring.....	341
6.8.2	Unplanned hydrocarbon release: loss of well containment	342
6.8.3	Unplanned hydrocarbon release: loss of containment of bulk storage (crude)	371
6.8.4	Unplanned hydrocarbon release: subsea infrastructure	378
6.8.5	Unplanned hydrocarbon release: offtake operations	383
6.8.6	Unplanned hydrocarbon release: turret operations	387
6.8.7	Unplanned hydrocarbon release: diesel spill from bulk storage.....	391
6.8.8	Unplanned hydrocarbon or chemical release: transfer, storage and use	398
6.8.9	Unplanned discharges: hazardous and non-hazardous waste management	404
6.8.10	Physical presence: interaction with live infrastructure	409
6.8.11	Physical presence: vessel collision with marine fauna	412
6.8.12	Physical presence: introduction of invasive marine species	415
6.9	Recovery plan and threat abatement plan assessment.....	426
6.10	Cultural features and heritage values assessment	440
7	Implementation strategy	449
7.1	Overview	449
7.2	Systems, practice and procedures	449
7.3	Woodside (PetDW) Management System	449
7.4	Woodside invasive marine species risk assessment process	449
7.4.1	Objective and scope	449

7.4.2	Risk assessment process	450
7.5	Risk management	452
7.5.1	Management of risks – contracting and procurement	452
7.5.2	Management of risks – well integrity	453
7.5.3	Management of risks – marine services	453
7.5.4	Management of risks – direct greenhouse gas emissions management	453
7.5.4.1	Production optimisation and opportunity management	454
7.5.4.2	Fuel gas and flare target setting and monitoring	454
7.5.5	Management of risks – indirect greenhouse gas emissions management	455
7.5.5.1	Annual review	456
7.6	Change management	456
7.6.1	EP management of change and revision	456
7.6.2	Oil Pollution Emergency Plan management of change	456
7.7	Woodside decommissioning framework	457
7.7.1	Decommissioning in operations	457
7.7.2	Decommissioning planning	457
7.7.3	Inventory of property within Pyrenees asset	458
7.7.4	Pyrenees decommissioning strategy	460
7.7.5	Decommissioning planning activities	460
7.7.5.1	Offline production wells	460
7.7.5.2	Exploration wells	461
7.7.5.3	Suspended subsea infrastructure	461
7.7.5.4	Production infrastructure	461
7.7.5.5	Preparation for cessation of production	461
7.7.6	Title relinquishment	462
7.8	Organisation structure	462
7.8.1	Roles and responsibilities	462
7.9	Unexpected Finds Procedure	468
7.10	Training and competency	468
7.10.1	Inductions for offshore facility workers and visitors	469
7.10.2	Operations competency framework training	469
7.10.3	Permit to work system training	470
7.10.4	Emergency and hydrocarbon spill response training	470
7.10.5	Subsea IMMR activity environmental awareness	470
7.11	Monitoring, auditing, management of non-conformance and review	470
7.11.1	Monitoring	471
7.11.2	Management of knowledge	471
7.11.3	Management of newly identified impacts and risks	472
7.11.4	Auditing	474
7.11.4.1	Operations assurance	474
7.11.4.2	Annual offshore inspection/desktop review	474
7.11.4.3	Subsea support vessel environment inspection	474
7.11.4.4	Marine assurance	474
7.11.4.5	Risk assessment	475
7.11.5	Management of non-conformance	476
7.12	Review	476
7.12.1	Environmental risk review	476
7.12.2	Learning and knowledge sharing	477
7.12.3	Continuous improvement	477

7.13	Record keeping	477
7.14	Reporting	478
7.14.1	Overview	478
7.14.2	Routine reporting (internal)	478
7.14.2.1	Daily reports	478
7.14.2.2	Performance reporting	478
7.14.3	Routine reporting (external)	478
7.14.3.1	Cetacean and whale shark sightings reporting	478
7.14.3.2	Environmental performance review and reporting	478
7.14.4	End of the Petroleum Activity notification	479
7.14.4.1	End of the Environment Plan	479
7.14.5	Incident reporting (internal)	479
7.14.6	Incident reporting (external) – reportable and recordable	479
7.14.6.1	Reportable incidents	479
7.14.6.2	Recordable incidents	480
7.14.7	Other external reporting requirements and notifications	480
7.15	Ongoing consultation	481
7.16	Emergency preparedness and response	484
7.16.1	Overview	484
7.16.2	Emergency response training	484
7.16.3	Emergency response preparation	485
7.16.4	Initial response to facility incident	486
7.16.5	Oil and other hazardous materials spill	486
7.16.6	Emergency and spill response	486
7.16.7	Source control response capability	486
7.16.7.1	Source control Incident Management Team structure	486
7.16.7.2	Source Control Incident Management team personnel and resourcing	489
7.16.8	Emergency and spill response drills and exercises	490
7.16.9	Hydrocarbon spill response testing of arrangements	491
7.16.9.1	Testing of arrangements schedule	491
7.16.9.2	Source control testing and exercise arrangements	492
7.16.10	Cyclone and dangerous weather preparation	493
7.17	Offshore Marine Discharge Adaptive Management Plan	494
7.17.1	Overview	494
7.17.2	Routine monitoring and management	494
7.17.3	Further investigations	495
7.17.4	ALARP/acceptability study	496
7.17.5	Review and revision	496
8	References	497
9	List of terms and acronyms	511
	Appendix A: Woodside Environment and Biodiversity Policy	517
	Appendix B: Relevant requirements	518
	Appendix C: EPBC Act Protected Matters Search Tool results	521
	Appendix D: Cultural Heritage search results	522
	Appendix E: NOPSEMA reporting forms	523
	Appendix F: Consultation	524

Appendix G: Program of Ongoing Engagement with Traditional Owners	525
Appendix H: Oil spill preparedness and response mitigation assessment	526
Appendix I: First Strike Plan.....	527
Appendix J: Woodside master existing environment.....	528
Appendix K: Woodside's Climate Policy.....	529
Appendix L: Hydrocarbon Spill Australia Regulatory Framework	530

1 INTRODUCTION

1.1 Overview

Woodside Energy (Australia) Pty Ltd (Woodside), as titleholder under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (Cth) (referred to as the Environment Regulations), and as a participant in the Joint Venture detailed in Section 1.6, submits this Environment Plan as operator of the Pyrenees Facility. The Pyrenees Facility is located in production licences WA-42-L and WA-43-L and commenced operation in 2010. Crude oil is produced from the Ravensworth, Crosby, Stickle, Tanglehead, Wild Bull and Moondyne reservoirs (collectively referred to as 'the Pyrenees reservoirs') via a single stand-alone floating production, storage and offloading vessel (the Pyrenees Venture FPSO).

The operation of the Pyrenees Facility includes the following activities:

- routine production of crude oil and gas
- routine and non-routine operations of the Pyrenees Venture FPSO and associated subsea infrastructure
- routine injection and production of gas to the Macedon-6 injection well
- produced water (PW) overboarding and reinjection into water injection wells
- the use of support vessels and helicopter operations.
- routine and non-routine inspection, monitoring, maintenance and repair (IMMR) of the Pyrenees Venture FPSO and associated subsea infrastructure.
- routine offloading of crude oil to cargo tankers
- disconnection, reconnection and sail-away of the FPSO.

These activities will hereafter be referred to as the Petroleum Activity and form the scope of this Environment Plan (EP). A more detailed description of the activities is provided in Section 3.

This EP has been prepared in accordance with the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- the potential environmental impacts and risks (planned (routine and non-routine) and unplanned) that may result from the Petroleum Activity are identified
- appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable
- the Petroleum Activity is carried out in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act)).

This EP describes the process and resulting outputs of the risk assessment, whereby impacts and risks are managed accordingly.

The EP defines activity-specific environmental performance outcomes (EPOs), environmental performance standards (EPSs), and measurement criteria (MC). These form the basis for monitoring, auditing, and managing the Petroleum Activity to be undertaken by Woodside and its contractors. The implementation strategy (derived from the decision support framework tools) specified in this EP provides Woodside and NOPSEMA with the required level of assurance that impacts and risks associated with the Petroleum Activity are reduced to ALARP and are acceptable.

1.3 Scope of the Environment Plan

The scope of this EP covers the activities that define the Petroleum Activity, as described in Section 3, for a period of up to five years. The Operational Area, as defined in Section 3.3.1, defines the spatial boundary of the Petroleum Activity.

This EP addresses potential environmental impacts from planned activities and potential unplanned risks that originate from within the Operational Area. Transit to and from the Operational Area by project vessels, as well as port activities associated with these vessels, are not within the scope of this EP. Vessels supporting the Petroleum Activity operating outside the Operational Area (e.g. transiting to and from port) are subject to applicable maritime regulations and other requirements and are not managed by this EP.

1.4 Environment Plan summary

The EP summary in Table 1-1 is based on the material provided in this EP, as required by Regulation 35(4).

Table 1-1: Environment Plan (EP) summary

EP summary material requirement	Relevant section of this EP containing EP summary material
The location of the activity	Section 3
A description of the receiving environment	Section 4
A description of the activity	Section 3
Details of the environmental impacts and risks	Section 6
The control measures for the activity	Section 6
The arrangements for ongoing monitoring of the titleholder's environmental performance	Section 7
Response arrangements in the oil pollution emergency plan (OPEP)	Section 7
Consultation already undertaken and plans for ongoing consultation	Section 5
Details of the titleholder's nominated liaison person for the activity	Section 1.7.2

1.5 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(a): Is appropriate for the nature and scale of the activity	Regulation 21: Environmental Assessment Regulation 22: Implementation strategy for the environment plan Regulation 24: Other information in the environment plan	The principle of 'nature and scale' applies throughout the EP	Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(b): Demonstrates that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable	Regulations 21(1) to 21(7): 21(1) Description of the activity 21(2)(3) Description of the environment 21(4) Requirements 21(5)(6) Evaluation of environmental impacts and risks 21(7) Environmental performance outcomes and standards Regulations 24(a) to 24(c): A statement of the titleholder's corporate environmental policy A report on all consultations between the titleholder and any relevant person	Set the context (activity and existing environment) Define 'acceptable' (the requirements, the corporate policy, relevant persons) Detail the impacts and risks Evaluate the nature and scale Detail the control measures – ALARP and acceptable	Section 1 Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(c): Demonstrates that the environmental impacts and risks of the activity will be of an acceptable level			
Regulation 34(d): Provides for appropriate environmental performance outcomes, environmental performance standards and measurement criteria	Regulation 21(7): Environmental performance outcomes and standards	EPOs EPSs MC	Section 6
Regulation 34(e): Includes an appropriate implementation strategy and monitoring, recording and reporting arrangements	Regulation 22: Implementation strategy for the environment plan	Implementation strategy, including: • systems, practices and procedures • performance monitoring • OPEP and operational and scientific monitoring • ongoing consultation	Section 7

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(f): Does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act	Regulation 21 (1) to 21(3): 21(1) Description of the activity 21(2) Description of the environment 21(3) Without limiting [Regulation 21(2)(b)], particular relevant values and sensitivities may include any of the following: a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act b) the national heritage values of a National Heritage place within the meaning of that Act c) the ecological character of a declared Ramsar wetland within the meaning of that Act d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act e) the presence of a listed migratory species within the meaning of that Act f) any values and sensitivities that exist in, or in relation to, part or all of: i. a Commonwealth marine area within the meaning of that Act, or ii. Commonwealth land within the meaning of that Act.	No activity, or part of the activity, undertaken in any part of a declared World Heritage property	Section 3 Section 4 Section 6
Regulation 34(g): (i) the titleholder has carried out the consultations required by Division 2.2A (ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate	Regulation 25: Consultation with relevant authorities, persons and organisations, etc. Regulation 24(b): A report on all consultations between the titleholder and any relevant person	Consultation in preparation of the EP	Section 5
Regulation 34(h): Complies with the Act and the regulations	Regulation 23: Details of the titleholder and nominated liaison person Regulation 24(c): Details of all reportable incidents in relation to the proposed activity	All contents of the EP must comply with the Act and the regulations	Section 1.6 Section 7

1.6 Description of the titleholder

Woodside is the titleholder for this Petroleum Activity, operating on behalf of the Pyrenees Joint Venture (the Joint Venture).

For the Crosby, Stickle, Tanglehead, Wild Bull and Moondyne reservoirs located within production licence WA-42-L, the Joint Venture comprises of:

- Woodside Energy (Australia) Pty Ltd
- Santos WA PVG Pty Ltd.

For the Ravensworth reservoir split between production licence WA-42-L and the adjacent WA-43-L, the Joint Venture comprises of:

- Woodside Energy (Australia) Pty Ltd
- Santos WA PVG Pty Ltd
- INPEX Alpha Ltd.

1.7 Details of titleholder and nominated liaison person

In accordance with Regulation 23 of the Environment Regulations, details of the titleholder, nominated liaison person and arrangements for the notification of changes are described below.

1.7.1 Titleholder

Woodside Energy (Australia) Pty Ltd

11 Mount Street

Perth, Western Australia

T: 1800 442 977

Australian company number: 39 006 923 879

1.7.2 Nominated liaison person

Nicolas Wirtz

Corporate Affairs Manager

11 Mount Street

Perth, Western Australia (WA)

T: 1800 442 977

E: feedback@woodside.com

1.7.3 Arrangements for notifying change

If the titleholder, titleholder's nominated liaison person, or the contact details for the titleholder or the liaison person change, then NOPSEMA will be notified of the change in writing within two weeks or as soon as practicable.

1.8 Woodside/BHP Petroleum merger

BHP Group Ltd's petroleum assets (BHP Petroleum) and Woodside announced their intention to merge in 2021, which became effective on 1 June 2022. BHP Petroleum policies, standards, processes and procedures were included in the merger agreement and remain valid. Harmonisation of processes between BHP Petroleum and Woodside commenced upon the completion of the merger and will be conducted in a staged manner. The BHP Petroleum HSE Management system (herein referred to as the Woodside (Petroleum Deepwater (PetDW)) HSE Management System) will continue to be used by the Pyrenees Facility until potential changes have been assessed.

The titleholder name change from BHP Petroleum (Australia) Pty Ltd to Woodside Energy (Australia) Pty Ltd was made on 11 July 2022.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: PYHSE-E-001

Revision: 23

Page 20 of 530

Uncontrolled when printed. Refer to electronic version for most up to date information.

1.9 Woodside (PetDW) Management System

All Woodside controlled activities associated with the Petroleum Activity will be conducted in line with:

- Woodside 'Our Values'
- Woodside Environment and Biodiversity Policy
- Woodside (PetDW) Management System
- Woodside (PetDW) Health, Safety and Environment (HSE) Standard.

The Pyrenees Facility is required to maintain up-to-date practices that adhere to the requirements contained in the Woodside (PetDW) HSE Management System and Standard. Activity-specific environmental management measures specific to the Petroleum Activity are implemented through this EP.

1.9.1 Environment policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside's Environment and Biodiversity Policy is provided in Appendix A of this EP.

1.10 Description of relevant requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and are relevant to the management of risks and impacts of the Petroleum Activity are detailed in Appendix B. This EP will not be assessed under the *Environmental Protection Act 1986* (WA) as the activity does not occur on State land or within State waters.

1.10.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006 (Cth)

The *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGs Act) regulates exploration and production activities beyond three nautical miles (NM) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 NM.

This EP provides relevant information in relation to section 572 of the OPGGS Act, as detailed in Table 1-3.

Table 1-3: Relevant requirements of the Offshore Petroleum and Greenhouse Gas Storage Act

Section number	Relevant requirement	Relevant section of the EP
Section 572 – Maintenance and removal of property et. by titleholder		
2	A titleholder must maintain in good condition and repair all structures that are, and all equipment and other property that is: (a) in the title area, and (b) used in connection with the operations authorised by the permit, lease, licence or authority.	Section 3.19
3	A titleholder must remove from the title area all structures that are, and all equipment and other property that is, neither used nor to be used in connection with the operations: (a) in the title area, and (b) used in connection with the operations authorised by the permit, lease, licence or authority.	Section 7.7
7	This section has effect subject to: (a) any other provision of this Act, and (b) the regulations, and (c) a direction given by NOPSEMA or the responsible Commonwealth Minister under: (i) Chapter 3, or (ii) this Chapter, and (d) any other law.	Section 7.7

Under the OPGGS Act, the Environment Regulations apply to petroleum activities in Commonwealth Waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ecological sustainable development
- by which the environmental impacts and risks of the activity will be reduced to ALARP
- by which the environmental impacts and risks of the activity will be of an acceptable level.

1.10.2 **Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) (Cth)**

One of the objective of the EPBC Act is to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as 'matters of national environmental significance' (MNES). The EPBC Act sets a regime which aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ecological sustainable development. When a person proposes to take an action that they believe may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for the Environment and Water.

The Pyrenees Petroleum Field was referred for assessment under the EPBC Act in 2005 (EPBC 2005/2034) and was determined to be a Controlled Action as defined in Part 3 of the EPBC Act. The level of assessment was set at an Environmental Impact Statement, and the action was subsequently approved with conditions on 26 April 2006. Consolidated Approval Notice – Pyrenees Oil Field (EPBC 2005/2034) dated 8 September 2015 was issued to consolidate the approval conditions, and the approval conditions were subject to variation on the date of the notice. A key element to the variation relates to conditions requiring a plan for managing the impacts of the action. The previous conditions required the Minister's approval of such plans. The variation now automatically deems the plan to have been approved by the Minister if the measures are:

- included in an environment plan related to the action that was submitted to NOPSEMA after 27 February 2014
- in force under the Environment Regulations.

Conditions relating to the EPBC Act approval that are considered relevant to the scope of this EP are provided in Table 1-4.

Table 1-4: Conditions from Pyrenees Petroleum Field development (EPBC 2005/2034) relevant to the Petroleum Activity

Section number	Relevant requirement	Relevant section of the EP
1 (c)	The person taking the actions must submit, for the Minister's approval, a plan (or plans) for managing the offshore impacts of the action. The plan (or plans) must include measures for operations • trading tanker vetting procedures • produced formation water and naturally occurring radioactivity materials monitoring and management • interaction procedures for supply vessels and aircraft that are consistent with Part 8 of the Environment Protection and Biodiversity Conservation Regulations 2000 • monitoring of noise effects of operations on cetaceans, and • cetacean and whale shark sightings reporting. Individual offshore activities may not commence until the plan (or plans) for that specific activity has been approved. The approved plan (or plans) must be implemented.	Section 7.11.4.4 Sections 3.20.3, 6.7.6 and 6.8.9 Section 6.7.4 Section 6.7.4 Section 7.14.3.2

Section number	Relevant requirement	Relevant section of the EP
2.	The person taking the action must submit for the Minister's approval an oil spill contingency plan to mitigate the environmental effects of any hydrocarbon spills. The oil spill contingency plan must include: - the types of dispersants, protective booms, clean up gear, and related equipment to be used in the event of an oil spill and their storage arrangements - a demonstrated capacity to deploy oil spill response equipment within 12 hours - training of staff in oil spill response measures - identification of sensitive areas, in particular, Ningaloo Marine Park, and specific response measures for these areas - the reporting of oil spill incidents.	Appendix H Appendix I Section 7.16.2
3.	The person taking the action must submit a decommissioning plan for approval by the Minister that considers the removal of all structures and components above the sea floor, including floating production, storage and offtake vessels, subsea wells, flowlines, and any other associated infrastructure. Decommissioning may not commence until the plan is approved. The approved plan must be implemented.	Decommissioning is beyond the scope of the EP
10.	A plan required by condition 1, 2, 3 or 6 is automatically deemed to have been submitted to, and approved by, the Minister if the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) relating to the taking of the action that: - was submitted to NOPSEMA after 27 February 2014, and - either: - is in force under the OPGGS Environment Regulations, or - has ended in accordance with Regulation 25A of the OPGGS Environment Regulations.	The implementation of this EP is considered to meet this condition
10A.	Where a plan required by condition 1, 2 or 6 has been approved by the Minister and the measures (as specified in the relevant condition) are included in an environment plan (or environment plans) that: - was submitted to NOPSEMA after 27 February 2014, and - either: i. is in force under the OPGGS Environment Regulations; or ii. has ended in accordance with Regulation 25A of the OPGGS Environment Regulations the plan approved by the Minister no longer needs to be implemented.	The implementation of this EP is considered to meet this condition and supersedes previously approved plans
10B.	Where an environment plan, which includes measures specified in the conditions referred to in conditions 10 and 10A above, is in force under the OPGGS Environment Regulations that relates to the taking of the action, the person taking the action must comply with those measures as specified in that environment plan.	The implementation of this EP is considered to meet this condition

1.10.2.1 Recovery plans and threat abatement plans

Under section 139(1)(b) of the EPBC Act, the Minister for the Environment and Water must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the EPBC Act. Similarly, under section 268 of the EPBC Act:

a Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.

In relation to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA via the commitments in the EP. Relevant recovery plans or threat abatement plans relevant to the scope of this EP have been identified as described and assessed in Section 6.9.

1.10.2.2 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs), formally known as Commonwealth Marine Reserves, are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans (section 362 of the EPBC Act). Relevant AMPs are listed in Section 4.8 and described in Appendix J. The North-west Marine Parks Network Management Plan describes the requirements for management.

1.10.2.3 World Heritage properties

Australian World Heritage management principles are prescribed in Schedule 5 of the EPBC Regulations 2000. Management principles that are considered relevant to the scope of this EP are provided in Table 1-5.

Table 1-5: Relevant management principles under Schedule 5 – Australian World Heritage management principles of the EPBC Act

Number	Principle	Relevant section of the EP
3	Environmental impact assessment and approval 3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not). 3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process. 3.03 The assessment process should: - identify the World Heritage values of the property that are likely to be affected by the action, and - examine how the World Heritage values of the property might be affected, and - provide for adequate opportunity for public consultation. 3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property. 3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property. 3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.	3.01 and 3.02: Assessment of significant impact on World Heritage values is included in Section 6. Principles are met by the submitted EP. 3.03 (a) and (b): World Heritage values are identified in Section 4 and considered in the assessment of impacts and risks for the Petroleum Activity assessed in Section 6. 3.03 (c): 3.03 (c): Relevant stakeholder consultation and feedback received in relation to impacts and risks to the Shark Bay World Heritage property, Ningaloo Coast World Heritage property, and Murujuga Cultural Landscape World Heritage property are outlined in Section 4 and Appendix F. 3.04, 3.05 and 3.06: Principles are considered to be met by the acceptance of this EP. For consideration of the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property, refer to Section 6.

Note that Section 1 – General Principles and 2 – Management Planning of Schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.

2 ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process taken by Woodside to prepare this EP. This process describes the activity, the existing environment, followed by the environmental risk management methodology used to identify, analyse and evaluate risks to meet ALARP levels and acceptability requirements, and develop EPOs and EPSs. This section also describes Woodside's risk management methodologies as applied to implementation strategies for the activity. The process described is repeated in full with each five-year revision of the EP, having regard for changes to operational requirements as well as ensuring the environmental management practice applied is contemporary and good industry practice.

Regulation 21(5) of the Environment Regulations requires the EP to include details of the environmental impacts and risks of the Petroleum Activity, and an evaluation of all the environmental impacts and risks, appropriate to the nature and scale of each impact or risk. The objective of the risk assessment process described in this section is to identify risks and associated impacts of an activity, so they can be assessed, and appropriate control measures applied to eliminate, control or mitigate the impact/risk to ALARP, and to determine if the impact or risk level is acceptable.

Environmental impacts and risks include those directly and indirectly associated with the Petroleum Activity, and include potential emergency and accidental events:

- Planned activities have the inherent potential to cause environmental impacts.
- Environmental risks are unplanned events with the potential for environmental impact (termed risk 'consequence').

Herein, potential impacts from planned activities are termed 'impacts', whereas 'risks' are associated with unplanned events with the potential for environmental impact (should the risk be realised), with such impacts termed potential 'consequences'.

2.2 Environmental risk management methodology

2.2.1 Woodside (PetDW) risk management process

Woodside recognises that risk is inherent to its business and that effective management of risk is vital to delivering on company objectives, success and continued growth. Woodside is committed to managing risk proactively and effectively. The objective of Woodside's PetDW risk management system is to provide a consistent process for recognising and managing risks across Woodside's PetDW business. Achieving this objective includes ensuring risks consider impacts across these key areas of exposure: health and safety, environment, finance, reputation and brand, legal and compliance, and social and cultural.

The environmental risk management methodology used in this EP is based on Woodside's PetDW Risk Management Procedure. This procedure aligns to industry standards, such as International Organization for Standardization (ISO) 31000.

The risk management methodology provides a framework to demonstrate that risks and impacts are continually identified, reduced to ALARP and assessed to be at an acceptable level, as required by the Environment Regulations. A description of each step and how it is applied to the scopes of this activity is provided in Section 2.2 to Section 2.11.

2.2.2 Impact assessment process

To support effective environmental risk assessment, the impact assessment process illustrated in Figure 2-1 is used. This provides the steps undertaken to meet the required environment, health and social standards by ensuring impact assessments are undertaken appropriate to the nature and scale of the activity, the regulatory context, the receiving environment, interests, concerns and rights of relevant persons, and the applicable framework of standards and practices.

Figure 2-1: Impact assessment process

2.3 Environment Plan development process

The EP development process is illustrated in Figure 2-2. Each element of this process is discussed further in Section 2.4 to Section 2.10.

Figure 2-2: EP development process

2.4 Establish the context

2.4.1 Define the activity

This first stage involves evaluating whether the activity meets the definition of a 'petroleum activity' as defined in the Environment Regulations.

The activity is then described in relation to:

- the location
- what is to be undertaken
- how it is planned to be undertaken, including outlining operational details of the activity and proposed timeframes.

The 'what' and 'how' are described in the context of 'environmental aspects'¹ to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents, incidents, emergency conditions) activities.

The activity is described in Section 3 and is referred to as the Petroleum Activity.

2.4.2 Define the existing environment

The existing environment that may be affected by the Petroleum Activity is defined by considering the nature and scale of the activity (size, type, timing, duration, complexity, and intensity of the activity), as described in Section 3. The purpose is to describe the existing environment that may be impacted by the activity, directly or indirectly, by planned or unplanned events.

A description of values and sensitivities relevant to Woodside's North West Shelf Operations is contained within the Master Existing Environment document. The Master Existing Environment is provided in Appendix J and is revised in accordance with Woodside's management of knowledge process as information contained within is superseded or new information arises (Section 7.11.2).

The Master Existing Environment (Section 4) is structured into subsections defining the physical, biological, socio-economic and cultural attributes as relevant to the activity, in accordance with the definition of 'environment' in Regulation 5 of the Environment Regulations. These subsections make particular reference to:

- the environmental, and social and cultural consequences as defined by Woodside (refer to Table 2-3), which address key physical and biological attributes, as well as social and cultural values of the existing environment – these consequence definitions are applied to the impact and risk analysis (refer Section 2.6) and rated for planned and unplanned activities; additional detail is provided for unplanned hydrocarbon spill risk evaluation
- EPBC Act MNES, including listed threatened species and ecological communities and listed migratory species – defining the spatial extent of the existing environment is guided by the nature and scale of the Petroleum Activity (and associated sources of environmental risk); this considers the Operational Area and wider environment that may be affected (EMBA), as determined by the hydrocarbon spill risk assessments presented in Section 6.8; MNES, as defined under the EPBC Act, are addressed through Woodside's PetDW impact and risk assessment (Section 6)
- relevant values and sensitivities, which may include world or national heritage listed areas, listed threatened species or ecological communities, listed migratory species, or sensitive values.

By grouping potentially impacted environmental values by aspect (as presented in Table 2-1), the presentation of information about the receiving environment is standardised. This information is then consistently applied to the risk evaluation section to provide a robust approach to the overall environmental risk evaluation and its documentation in the EP.

¹ An environmental aspect is an element of the activity that can interact with the environment.

Table 2-1: Example of the environment values potentially impacted that are assessed within the EP

Environmental value potentially impacted Regulations 21(2)(3)						
Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/ habitats	Species	Socio-economic

2.4.3 Relevant requirements

The relevant requirements in the context of legislation, other environmental approval requirements, conditions and standards that apply to the Petroleum Activity are identified and reviewed and are presented in Appendix B.

The Woodside Environment and Biodiversity Policy is presented in Appendix A.

2.5 Impact and risk identification

Relevant environmental aspects and hazards have been identified that support the process to define environmental impacts and risks associated with an activity.

The environmental impact and risk assessment presented in this EP has been informed by recent and historic hazard and environmental risk identification studies (e.g. HAZID/ENVID) and consequence modelling studies for high consequence, low probability environmental risks. These studies have been reviewed and revalidated, as required, with the five-year revision of this EP. Woodside also considers environmental performance and compliance information gathered during the implementation phase of the in-force EP. Further, ongoing feedback from NOPSEMA to Woodside across its portfolio of environment plans has been considered and integrated, where relevant.

Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of Woodside's consultation process (Section 5). The environmental outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

An environmental impacts and risks identification and assessment workshop was undertaken by multidisciplinary teams comprising relevant operational and environmental personnel with sufficient breadth of knowledge, training and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents, incidents, emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned events respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the risk assessment and form the basis of EPOs, EPSs, and MC. This information is presented in Section 6, following the format presented in Table 2-2.

Table 2-2: Example of layout of identification of risks and impacts in relation to risk sources

Impacts and risks evaluation summary														
Source of impact/risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-economic	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Summary of source of impact/risk														

2.6 Impact and risk analysis

Risk analysis further develops the understanding of a risk by defining the impacts and assessing appropriate controls, as well as considering previous risk assessments for similar activities, relevant studies, past performance, relevant persons feedback, and the existing environment.

These key steps were undertaken for each identified risk during the risk assessment:

- Identify the decision type in accordance with the decision support framework.
- Identify appropriate control measures (preventive and mitigation) aligned with the decision type.
- Assess the risk rating.

2.6.1 Decision support framework

To support the risk assessment process and the determination of acceptability (Section 2.7.2), Woodside's PetDW environmental risk management process includes the use of a decision support framework based on principles set out in the Guidance on Risk-Related Decision-Making (Oil and Gas UK, 2014) (Figure 2-3). This concept is integrated into the environmental impacts and risks identification and assessment workshop to determine the level of supporting evidence that may be required to draw sound conclusions regarding risk level and whether the risk is acceptable and ALARP. Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher order environmental impacts are subject to further evaluation/assessment).

The framework provides appropriate tools commensurate to the level of uncertainty or novelty associated with the risk/impact (referred to as the Decision Type A, B, or C). The decision type is selected based on an informed discussion around the uncertainty of the risk/impact and is documented in impact and risk register worksheets.

This framework enables Woodside to appropriately understand a risk and determine if the risk or impact is acceptable and can be demonstrated to be ALARP.

2.6.1.1 Decision Type A

Decision Type A risks and impacts are well understood and established practice. They are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgment.

2.6.1.2 Decision Type B

Decision Type B risks and impacts typically involve greater uncertainty and complexity; and can include potential higher-order impacts/risks. These risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure the risk is ALARP. Engineering risk assessment tools may include:

- risk-based tools such as cost-based analysis or modelling
- consequence modelling
- reliability analysis
- company values.

2.6.1.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, significant project risk/exposure, or may elicit relevant persons' concern. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external consultation as part of the risk assessment process.

Figure 2-3: Risk-related Decision-making Framework (Oil and Gas UK, 2014)

2.6.1.4 Decision support framework tools

These framework tools are applied, as appropriate, to help identify control measures based on the decision type described above:

- Legislation, codes and standards (LCS) – identifies the requirements of legislation, codes and standards that are to be complied with for the activity.
- Good industry practice (GP) – identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.

- Professional judgement (PJ) – uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- Risk-based analysis (RBA) – assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- Company values (CV) – identifies values identified in Woodside’s code of conduct, policies and the Woodside Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- Societal values (SV) – identifies the views, concerns, and perceptions of relevant persons and addresses those views, concerns and perceptions.

2.6.1.4.1 Decision calibration

To determine that the alternatives selected and control measures applied are suitable, these tools may be used for calibration (i.e. checking) where required:

- LCS/verification of predictions – Verification of compliance with applicable LCS and/or good industry practice.
- Peer review – Independent peer review of PJ, supported by RBA, where appropriate.
- Benchmarking – Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- Internal consultation – Consultation undertaken within Woodside to inform the decision and verify company values are met.
- External consultation – Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the decision type and the activity.

2.6.2 Control measures (hierarchy of controls)

Risk reduction measures are prioritised and categorised in accordance with the hierarchy of controls, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- **Elimination** of the risk by removing the hazard.
- **Substitution** of a hazard with a less hazardous one.
- **Engineering controls** include design measures to prevent or reduce the frequency of the risk event, or detect or control the risk event (limiting the magnitude, intensity and duration) such as:
 - prevention: design measures that reduce the likelihood of a hazardous event occurring
 - detection: design measures that facilitate early detection of a hazardous event
 - control: design measures that limit the extent/escalation potential of a hazardous event
 - mitigation: design measures that protect the environment if a hazardous event occurs
 - response equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.
- **Procedures and administration** includes management systems and work instructions used to prevent or mitigate environmental exposure to hazards.
- **Emergency response and contingency planning** includes methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

2.6.3 Impact and risk classification

Environmental impacts and risks are assessed to determine the potential impact severity/consequence using the process shown in Figure 2-4.

Impacts are classified in accordance with the consequence severity (Table 2-3). The assigned severity level is determined after identifying the decision type and appropriate control measures.

Risks are assessed qualitatively and/or quantitatively in terms of both likelihood and consequence severity in accordance with the Woodside PetDW Risk Matrix (see Figure 2-5).

Figure 2-4: Environmental risk and impact analysis

Table 2-3: Woodside Petroleum Deepwater (PetDW) Risk Matrix (environment and social and cultural) consequence severity descriptions, severity levels and severity factors

Environment	Social and cultural	Severity level	Severity factor
Severe impact to the environment and where recovery of ecosystem function takes 10 years or more.	Severe impact on community lasting more than 12 months or a substantiated human rights violation impacting six or more people.	5 – Severe	1,000
Serious impact to the environment and where recovery of ecosystem function takes between three years and up to 10 years.	Serious impact on community lasting six to 12 months or a substantiated human rights violation impacting one to five people.	4 – Serious	300
Substantial impact to the environment and where recovery of ecosystem function takes between one year and up to three years.	Substantial impact on community lasting two to six months.	3 – Substantial	100
Measurable but limited impact to the environment, where recovery of ecosystem functions takes less than one year.	Measurable but limited impact on community lasting less than one month.	2 – Measurable	30
Minor temporary impact to the environment, where the ecosystem functions recover with little intervention.	Minor temporary community impact that recovers with little intervention.	1 – Minor	10

The impact and risk information, including classification and evaluation information as shown in the example (Table 2-2), are tabulated for each planned activity and unplanned event.

2.6.3.1 Risk rating process

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence severity and likelihood. The assigned risk rating is determined with controls in place; therefore, the risk rating is determined after identifying the decision type and appropriate control measures. This is also commonly called residual risk.

The risk rating process considers the potential environmental consequences severity and, where applicable, the social and cultural consequences severity of the risk. The risk ratings are assigned using the Woodside PetDW Risk Matrix (refer to Figure 2-5). The risk matrix delivers a risk rating, which is a score for prioritisation purposes.

The risk rating process is undertaken using the steps described in the subsections below.

2.6.3.1.1 Select the severity level

Determine the worst-case credible consequence severity (Table 2-3) associated with the selected event, assuming all controls (preventive and mitigative) are absent or have failed. If more than one potential consequence severity applies, select the highest severity consequence level.

2.6.3.1.2 Select the likelihood level

Determine the description that best fits the chance of the selected consequence severity occurring, assuming reasonable effectiveness of the prevention and mitigation controls (Table 2-4).

Table 2-4: Woodside PetDW Risk Matrix likelihood level definitions

Description	Frequency	Likelihood factor
Highly Likely	Likely to occur within a one year period	3
Likely	Likely to occur within a one to five year period	1
Possible	Likely to occur within a five to 20 year period	0.3
Unlikely	Likely to occur within a 20 to 50 year period	0.1
Highly Unlikely	Not likely to occur within a 50 year period	0.03

2.6.3.1.3 Calculate the risk rating

The risk rating is derived from the consequence severity factor and likelihood level factors above, in accordance with the Woodside PetDW Risk Matrix shown in Figure 2-5. Risk ratings in the green zone are considered 'Tolerable' and require no further treatment to reach ALARP. Risk ratings in the red zone are considered higher-order risks, which must be considered further.

A likelihood and risk rating are only applied to environmental risks, not environmental impacts from planned activities.

This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk as an output of the ENVID studies.

Likelihood	Severity Level				
	1	2	3	4	5
Highly Likely	30	90	300	900	3000
Likely	10	30	100	300	1000
Possible	3	9	30	90	300
Unlikely	1	3	10	30	100
Highly Unlikely	0.3	0.9	3	9	30

2.7 Impact and risk evaluation

Environmental impacts and risks cover a wider range of issues, differing species, persistence, reversibility, resilience, cumulative effects, and variability in severity than safety risks. Determining the degree of environmental risk, and the corresponding threshold for whether a risk/impact has been reduced to ALARP and is acceptable, is evaluated to a level appropriate to the nature and scale of each impact or risk. Evaluation includes considering the:

- decision type
- principles of ecological sustainable development – as defined under the EPBC Act
- internal context – ensuring the proposed controls and risk level are consistent with Woodside policies, procedures and standards
- external context – the environment consequence (Section 6) and stakeholder acceptability (Section 5)
- other requirements – ensuring the proposed controls and risk level are consistent with national and international standards, laws and policies.

In accordance with Environment Regulations 34(a), 34(b), 34(c) and 13(5)(b), Woodside applies the process described in the subsections below to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.7.1 Demonstration of ‘as low as reasonably practicable’ (ALARP)

The descriptions in Table 2-5 articulate how Woodside demonstrates that different risks, impacts and decision types identified within the EP are ALARP.

Table 2-5: Summary of Woodside’s PetDW criteria for ALARP demonstration

Decision type	Demonstration of ALARP
Decision Type A	Demonstrating ALARP for lower-order (‘Type A’) impacts or risks. Identified regulatory, corporate and industry good practice controls are implemented, Woodside considers the impact or risk to be managed to ALARP and no further detailed engineering evaluation of controls is required. The application of feasible and readily implementable alternate, additional or improved controls may be adopted opportunistically when demonstrated to further reduce potential environmental impacts or risks.
Decision Type B	Demonstrating ALARP for higher-order (‘Type B’) impacts or risks/ In addition to relevant regulatory, corporate and industry good practice controls being implemented, alternate, additional or improved controls should be proposed and evaluated according to their feasibility, reasonableness and practicability to implement to further reduce the potential for impacts and risks associated with the activities. Woodside applies a cost and benefit analysis when evaluating additional controls and applies those that are both feasible and where the cost (safety, time, effort and financial) are not grossly disproportionate to the potential reduction in environmental impact or risk afforded by the control.
Decision Type C	Demonstrating ALARP for highest-order (‘Type C’) impacts or risks Alternate, additional, or improved controls over and above relevant regulatory, corporate and industry good practice must be proposed and evaluated based upon a precautionary approach. Woodside ensures feasible controls that have the potential to reduce environmental impacts and risks are implemented, when safe to do so and irrespective of the additional effort, time or financial cost associated with implementing the control.

2.7.2 Demonstration of acceptability

The descriptions in Table 2-6 articulate how Woodside demonstrates how different risks, impacts and decision types identified within the EP are acceptable.

Table 2-6: Summary of Woodside's PetDW criteria for acceptability

Decision type	Demonstration of acceptability
Decision Type A	Woodside demonstrates these risks, impacts and decision types are 'Broadly Acceptable' if they meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines. Further effort towards risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.
Decision Type B	Woodside demonstrates these higher order risks, impacts and decision types are 'Acceptable if ALARP' if it can be demonstrated using GP and RBA, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for Moderate and High risks, Woodside evaluates: - the principles of ecological sustainable development as defined under the EPBC Act - the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, PetDW procedures and standards - the external context – consideration of the environment consequence and relevant persons consultation acceptability are considered - other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies and consideration of applicable plans for management and conservation advices, conventions and significant impact guidelines (e.g. MNES).
Decision Type C	When an impact or risk has been evaluated as 'highest-order', the potential environmental impact or risk can only be deemed acceptable once the criteria for 'Type B' demonstration of acceptability detailed above has been met and: any alternate, additional or improved controls adopted via implementing a precautionary approach (consistent with the 'Precautionary Principle' as defined within section 3A of the EPBC Act), can demonstrate residual impacts have been lowered, such that a severity level of '4' becomes 'Unlikely' or the severity level of '5' becomes 'Highly Unlikely' based upon the Woodside PetDW Risk Matrix.

2.8 Recovery plan and threat abatement plan assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (refer Section 1.10.2.1). The steps in this process are:

1. Identify relevant listed threatened species and ecological communities (Section 4.6).
2. Identify relevant recovery plans and threat abatement plans (Section 6.9).
3. List objectives and (where relevant) the action areas of these plans and assess whether these objectives/action areas apply to government, the titleholder and the Petroleum Activity (Section 6.9).
4. For those objectives/action areas applicable to the Petroleum Activity, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (Section 6.9).

2.9 Environmental performance outcomes, environmental performance standards, and measurement criteria

EPOs, EPSs and MC are defined to address the potential environmental impacts and risks. These are explored in Section 6.

2.10 Implement, monitor, review and report

An implementation strategy for the Petroleum Activity describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the principles of Australian Standard/New Zealand Standard ISO 14001 Environmental Management Systems, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activity to ALARP and acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activity are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the Petroleum Activity.

The implementation strategy is presented in Section 7.

2.11 Consultation

Woodside consults relevant persons in the course of preparing an EP in accordance with Regulation 25 of the Environment Regulations. Woodside's consultation methodology is presented in Section 5. Woodside's consultation record is at Appendix F.

3 DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations and describes the activities to be undertaken as part of the Petroleum Activity under this EP. It includes the location of the activity, general details of the facility's layout, the operational details of the activity, and additional information relevant to consideration of environmental risks and impacts.

3.2 Petroleum Activity overview

The Pyrenees Facility produces crude oil from six separate oil fields (Ravensworth, Crosby, Stickle, Tanglehead, Wild Bull [Upper Pyrenees] and Moondyne) via a standalone floating production, storage and offtake facility (FPSO) in production licences WA-42-L and WA-43-L.

Production commenced in February 2010, with an annual current production rate (correct as of end 2023) from the Pyrenees Facility of 13,000 bbl/day. Production has been declining since about 2011 (Section 3.9.1) and is expected to continue to decline over the life of this EP, until end of field life, which is currently predicted to be around 2035, based on the fields and wells that are currently tied back to the facility. In addition to the production of hydrocarbons from subsea wells, the associated activities conducted over the life of the EP include:

- routine production of crude oil and gas
- routine and non-routine operations of the Pyrenees Venture FPSO and associated subsea infrastructure
- routine injection and production of gas to the Macedon-6 injection well
- PW overboarding and reinjection
- routine offloading of crude oil to cargo tankers
- the use of support vessels and helicopter operations
- routine and non-routine IMMR of the Pyrenees Venture FPSO and associated subsea infrastructure
- disconnection, reconnection and sail-away of the FPSO.

There is also one exploration well with wellhead attached (West Muiron-5) inside the Operational Area. IMMR of the wellhead is part of the Petroleum Activity.

Any future decommissioning, well plug and abandonment, drilling, installation or tie-back activities are subject to future, separate EPs.

This EP is intended to remain in force for up to five years from EP acceptance by the regulator.

Figure 3-1: Overview of subsea infrastructure layout associated with the Pyrenees Venture FPSO (not to scale)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

A summary of the Petroleum Activity is presented in Table 3-1.

Table 3-1: Petroleum Activity overview

Item	Description
Production licence areas	WA-42-L and WA-43-L
FPSO location	201298 E, 7615199 N
Water depth (lowest astronomical tide) at FPSO location	200 m
End of field life (EOFL) (approx.)	2035
Key components of Pyrenees Venture FPSO facilities	FPSO hull, disconnectable turret and mooring, topside processing equipment and utilities
Key components of subsea infrastructure	26 wells with Xmas trees (including production wells, gas injection wells and water injection wells), manifolds, flowlines/pipelines and umbilicals
Exploration wells with wellheads	West Muiron-5
Vessels	FPSO support vessels, IMMR support vessels, and others appropriate to the nature of petroleum activities
Key activities	• Routine production of crude oil and gas • Routine and non-routine operations of the Pyrenees Venture FPSO and associated subsea infrastructure • Routine injection and production of gas to the Macedon-6 injection well • PW overboarding and reinjection • Routine offloading of crude oil to cargo tankers • The use of support vessels and helicopter operations • Routine and non-routine IMMR of the Pyrenees Venture FPSO and associated subsea infrastructure • Disconnection, reconnection and sail-away of the FPSO

3.3 Location

The Pyrenees Facility is located in Commonwealth waters approximately 45 km northwest of Exmouth, 14 km from the northern boundary of the Ningaloo Marine Park (Commonwealth waters) and 27 km north-northwest and northwest of the North West Cape, in WA (Figure 3-2).

3.3.1 Operational Area

The Operational Area defines the geographical boundary of the Petroleum Activity. The Operational Area is shown in Figure 3-2 and includes:

- the Pyrenees Venture FPSO and an area extending out to 1500 m to allow for offtake activities
- Pyrenees subsea infrastructure, including wells, flowlines, and associated infrastructure, and an area within 1500 m around the infrastructure.

The West Muiron-5 exploration well with wellhead is not connected to the Pyrenees subsea infrastructure and is stand-alone. The location of the wellhead is within the Operational Area.

There is also a Petroleum Safety Zone (PSZ) surrounding the FPSO, which is gazetted under the OPGGS Act (Part 6.6 Safety zones and the area to be avoided) and marked on navigation charts. The PSZ comprises the FPSO 260 m plus 500 m safety zone and extends to a 760 m radius from the internal turret of the Pyrenees Venture FPSO.

Vessels are not permitted to enter the PSZ without the consent of the Pyrenees Facility Offshore Installation Manager (OIM). An additional Cautionary Zone of 5 NM is also in place around the Pyrenees Venture FPSO within which contracted vessels must notify the Pyrenees Facility OIM before entering.

3.4 Timing

The Pyrenees Facility commenced production in 2010. The facility operates 24 hours a day, 365 days a year.

Planned IMMR activities are typically one to two weeks in duration and occur annually, although this is dependent on weather conditions, operational specifics, timing dependent monitoring, previous results and/or downtime. Non-routine IMMR activities could occur at any time during this EP to respond to unforeseen maintenance and/or production requirements. For example, a new water injection manifold to support existing water rejection is anticipated to be installed in 2026, currently anticipated to occur by end August 2026 aligned with scheduled FPSO dry dock.

The Pyrenees Venture FPSO has retained its functionality as a self-propelled seagoing vessel. As a result, it can disconnect from its turret mooring, and sail to a shipyard to complete maintenance. This is typically once every five years, and the FPSO is off station for around two to three months. The FPSO can also disconnect to avoid a cyclone, and is typically off station for a few days to around a week, depending on the cyclone track.

End of field life is informed by the production rates of the facility. Production rates at the facility are expected to continually decline, predicting an end of field life around 2035, based on the fields and wells that are currently tied back to the facility. This EP is intended to remain in force for up to five years from EP acceptance by the regulator.

Figure 3-2: Pyrenees Facility location, Operational Area and field layout

3.5 Subsea infrastructure layout and description

This section provides an overview of the subsea infrastructure associated with the Pyrenees Facility as relevant to consideration of the environmental risks and impacts of the Petroleum Activity.

The subsea production system includes production, gas injection and water injection wells connected to the Pyrenees Facility via flexible flowlines and risers via a series of subsea manifolds.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Controlled Ref No: PYHSE-E-001

Revision: 23

Page 41 of 530

Uncontrolled when printed. Refer to electronic version for most up to date information.

Production and gas lift jumpers connect each production well to its manifold. The manifolds are configured to allow the well fluids to be directed via switching valves to either a production flowline or a production/test flowline. Separate production flowlines and production/test flowlines transport the well fluids from the manifolds to the Pyrenees Facility. Choke valves to control well rates and gas lift rates are also located on the manifolds.

Multi-phase flow meters and gas lift meters are located on incoming production and outgoing gas lift pipework on each manifold. Dedicated gas lift flowlines distribute dehydrated lift gas, however, can also be used to convey well service fluids to allow flowline flushing and well kill operations. Water injection is provided through a single riser and flowline to a manifold, which allows distribution of injection water between the four water injection wells by way of surface-controlled choke valves. Gas injection to the Macedon injection well is via a single riser and flowline terminating at a pipeline end manifold with jumper connection the injection wellhead.

The subsea infrastructure associated with the Pyrenees Facility comprises:

- four mid water arches
- eight riser bases
- subsea manifolds (eight production, one gas, one water injector)
- dynamic flexible risers and dynamic umbilicals
- static flexible flowlines and static umbilicals
- subsea distribution unit and umbilical tension assembly installed with umbilicals
- hydraulic and electrical jumpers
- subsea trees (19 production trees, two suspended production wells, four water injection trees, one gas injection/production).

The subsea infrastructure associated with the Pyrenees Facility is designed to allow the tie-in of additional wells. The mooring and riser system have allowance for further production riser and umbilical systems. Subsea tie-in points are provided at manifolds for future production, test, and gas lift lines. Future water and/or gas injection wells have the capacity to be connected via a manifold. Controls and chemical injection facilities can be provided from umbilical distribution units or termination assemblies. All the process monitoring and instrumented control across the subsea infrastructure associated with the Pyrenees Facility are managed by the central control room on the FPSO.

The layout of the subsea infrastructure associated with the Pyrenees Facility is shown in Figure 3-1 and the coordinates of the production, gas injection/production and water injection wells are provided in Table 3-2 with their location, and that of other key infrastructure. An additional manifold adjacent to existing water injection manifold is to be installed and connected to support continued rejection of water from the existing manifold.

Table 3-2: Approximate location of the FPSO and associated subsea wells¹

Infrastructure	Water depth (approx. m lowest astronomical tide)	Block/ licence area	Well centre	Latitude/ Easting	Latitude/ Northing

3.6 Suspended infrastructure

Table 3-3 outlines the status of suspended subsea infrastructure associated with offline production wells (not currently producing) within WA-42-L and WA-43-L. The Petroleum Activity includes operation of this infrastructure as and when required by Operations. See Section 7.7 for further information.

3.7 Exploration well with wellhead

The scope of the Petroleum Activity includes the ongoing management of one exploration well with a wellhead (West Muiron-5) that is not tied back to the Pyrenees Facility and has no associated infrastructure (i.e. no Xmas tree) (Table 3-4). The well is managed under an accepted Well Operations Management Plan (WOMP). The wellhead will continue to be inspected in accordance with the WOMP based on the assessed risk for the well (Section 3.19). Planning for decommissioning is included in Section 7.7.

Table 3-4: Status of West Muiron-5 exploration well

Well	Block (surface location)	Type	Status	Latitude (degrees, minutes, seconds)/ Easting	Latitude (degrees, minutes, seconds)/ Northing
West Muiron-5	WA-42-L	Exploration	Plugged and suspended	21° 32' 52.836" S E: 204627	114° 08' 53.732" E N: 7614499

3.8 Other property including exploration wellheads in the licence areas

The Macedon Gas Development, also operated by Woodside, is located approximately 6 km to the southeast of the FPSO, in the same production licence (WA-42-L). The infrastructure is covered under the approved Macedon Operations EP (Commonwealth) (NOPSEMA Document ID: A1156357, accepted 24 December 2024), including two exploration wells with wellheads associated with the Macedon field (Macedon-4 and West Muiron-4) (Section 1.10.1). All other wells in the WA-42-L and WA-43-L licence areas have been permanently plugged and abandoned and wellheads removed.

3.9 Characteristics of target hydrocarbons

Generally, the crude oil produced from the Pyrenees reservoirs has very similar properties, which is a heavy crude (American Petroleum Institute (API) 19) with some dissolved methane (25 to 30 mol%, ~2 %wt). There are very small quantities of lighter hydrocarbons and no hydrogen sulphide within the well streams. However, there is minor potential for reservoir souring to occur over time as PW injection volumes increase. Up to 2.2 mol% carbon dioxide is present in the well streams.

All Pyrenees crude oils can be classified as Group III oils under the International Tanker Owners Pollution Federation (ITOPF) classification system, with the crude oil from the Moondyne reservoir considered the most persistent.

The relevant characteristics of the crude oils from each reservoir are provided in Table 6-18.

3.9.1 Production overview

The Pyrenees production forecast (amount of oil that is expected to be produced) is developed using an agreed set of assumptions for the reservoirs, wells, subsea equipment, and facility over the remaining field life. Production is limited by facility water handling capacity. As the reservoirs mature, the water-cut continues to rise while oil rate declines until the end of facility life. Forecast annual production varies due to planned maintenance shutdowns, shipyard maintenance of the FPSO and unplanned downtime (e.g. during cyclones in summer months). While oil rates reduce over time, the operation of the facility is predicted to remain steady, with fuel consumption, and corresponding emissions from production predicted to also remain fairly consistent year to year.

3.10 Well control

The subsea wells are remotely controlled from the central control room (CCR) located on the Pyrenees Venture FPSO, via the subsea umbilical system. Well control will involve intermittent discharges of small amounts of water-based hydraulic fluid (<3 m³ per year) when actuating the various tree valves on the twenty-one subsea production wells. This will be the only planned operational discharge to the marine environment from the offshore infrastructure.

3.11 Pyrenees Facility

Production fluids from the Pyrenees reservoirs are produced to the Pyrenees Venture FPSO, a double hulled standalone FPSO (Figure 3-3). Crude oil, formation water and gas are produced with aid of gas lift to the Pyrenees Venture FPSO where they are processed to stabilise the crude oil and store before being offloaded to offtake tankers direct for export.

The Pyrenees Venture FPSO is a conventional double hulled converted Suezmax trading tanker with an overall length of 274 m and a cargo storage capacity of approximately 881,000 barrels of oil. The original basis of design of the process was 96,000 bbl/day of oil, 150,000 bbl/day of water and 60 MMSCFD gas through the compression facilities.

Crude oil is exported directly from the Pyrenees Venture FPSO onto trading tankers. There were 53 offtakes from the Pyrenees Venture FPSO in the first year of production. In 2023, the cargo offtakes had reduced to approximately eight offtakes per year. Each offtake takes approximately 24 hours to complete.

The Pyrenees Venture FPSO design rates are detailed in Table 3-5.

Figure 3-3: Pyrenees Venture FPSO

The Pyrenees Venture FPSO design rates are detailed in Table 3-5.

Table 3-5: Pyrenees Facility design rates

Fluid/stream	Units	Design rate
Oil	STB/D	96,000
Total PW	STB/D	150,000
PW injection	STB/D	≥135,000
Gas compression	MMSCFD	60
Gas lift	MMSCFD	55
Gas injection	MMSCFD	55
Gas injection backflow	MMSCFD	15

3.11.1 Facility design conditions

The Pyrenees Venture FPSO has been designed in accordance with American Bureau of Shipping (ABS) Classification requirements. All FPSO facilities including subsea components, risers, process facilities, and the floater hull and mooring system have been designed to continue operation uninterrupted in a 1-in-100-year non-cyclonic storm and a 1-in-10-year cyclonic storm when disconnected. The subsea mooring system (spider buoy) is designed to a 1-in-1,000-year non-cyclonic storm. Table 3-6 shows the metocean design conditions for the Pyrenees Venture FPSO.

Table 3-6: Pyrenees Facility metocean design conditions

Parameter	Non-cyclonic (year)			Cyclonic (year)		
	1	10	100	10	100	10,000
Wind						
Gust speed (3 sec) (m/s)	19.9	22.2	23.9	57	75.1	81.8
Mean speed (1 min) (m/s)	17.6	19.7	21.2	46	52.3	68
Mean speed (10 min) (m/s)	15.9	17.8	19.1	42	47.4	61.7
Mean speed (60 min) (m/s)	14.7	16.4	17.6	-	43.69	56.87
Waves						
Significant wave height (m)	4.7	5.7	6.6	9.5	12.6	17.3
Peak spectral period (s)	15.6	16.1	16.3	12.9	14.2	16.5
Spectral mean wave period (s)	12.2	13.1	13.4	10.5	11.2	12.9
Average zero up-crossing period	10.5	11.3	11.6	9.9	10.5	12.1
Maximum single wave height (m)	8.6	9.9	10.4	16.3	21.3	30.1
Period of maximum wave (s)	14	15.1	15.4	11.4	12.9	14.8

3.11.2 Turret and mooring

The Pyrenees Venture FPSO is equipped with a disconnectable turret mooring (DTM) and its own propulsion system to allow evasion of tropical cyclones and to enable sail-away for maintenance.

The Pyrenees Venture FPSO is moored to the seafloor using an internal DTM system located near the bow of the vessel. All main flanges and valves of the turret are located above deck. The DTM system provides for passive weather vaning via bearings incorporated into the turret structure, which allows the vessel to freely pivot according to prevailing winds, waves, and currents. Well fluids flow from the flowlines to the production swivels located in the turret and onto the Pyrenees Venture FPSO for processing. The general arrangement of the turret mooring system is shown in Figure 3-4.

The mooring system consists of a turret mooring spider buoy (see Figure 3-5) which is anchored to the seabed via nine anchor legs comprising chain and wire rope (Table 3-7). The lower end of each anchor leg is connected to a drag anchor embedded into the seabed. The spider buoy and associated turret structure are integrated into structure of the hull.

The design of the spider buoy has ensured there is sufficient redundancy, which includes:

- The spider buoy can lose one of its anchor legs without loss of station.
- A single compartment of the spider buoy can be flooded without losing buoyancy.

Disconnection of the flexible risers is achieved by manual intervention of the mechanical connections on the structure and can generally be completed within 12 hours including time for blowdown. After disconnection, the spider buoy submerges to a depth of approximately 30 m. Once disconnected, the Pyrenees Venture FPSO steams away using its own propulsion as a fully classed vessel. Reconnection to the DTM is the opposite of a disconnect. There are no waste streams when restarting suspended wells and subsea infrastructure.

Tropical cyclone sail-away activities have a minimum lead time of over 21 hours with the Pyrenees Venture FPSO typically staying within Australian waters for the duration of a cyclonic event.

Dry dock activities occur on a scheduled basis, informed by maintenance and operational requirements, with a sail away to, and anchorage in, Singapore for extended periods of time to complete major works. All re-entries into Australian waters are planned in accordance with border security requirements, biosecurity requirements and Woodside procedures including Woodside's invasive marine species (IMS) risk assessment process.

Table 3-7: Pyrenees Venture FPSO mooring system

#	Anchor leg component	Diameter (mm)	Type	Deployed length (m) *
1	Top chain	100	Studless	10 + 5
2	Spiral strand wire	63	Sheathed	225
3	Bottom chain	85	Studless	633
4	Drag anchor	-	StevShark	

* Total chain length: 5,787 m; Total wire length: 2,025 m.

Figure 3-4: Pyrenees Venture FPSO disconnectable internal turret (upper section)

Figure 3-5: Pyrenees Venture FPSO lower turret and spider buoy

3.11.3 Hull

The Pyrenees Venture FPSO hull has been designed to Classification Society requirements and can store up to 881,000 bbls of 19 API crude oil, with an export parcel size of up to 550,000 bbls.

Figure 3-6 and Figure 3-7 show the Pyrenees Venture FPSO hull layout. The cargo holding area comprises six pairs of cargo tanks. There are also two slops tanks (port and starboard) and six pairs of wing and double bottom/sided dedicated ballast tanks, which are dedicated ballast tanks. These tanks provide a 3 m buffer at the vessel side and a 2.5 m buffer on the hull bottom to prevent cargo tank penetration damage. Diesel fuel tanks located in the hull are also provided with a cofferdam between the tank and the vessel's side shell.

The underwater hull and appendages are protected by an automatically controlled impressed current cathodic protection system. The propeller shaft and rudder post are grounded to the hull. Aluminium anodes are fitted in the sea chest on the rudder and propeller aperture and moonpool. Sacrificial zinc anodes (bolting type) have been provided for the water ballast tanks and slop tanks.

In compliance with International Maritime Organization's (IMO) AFS Convention and *Protection of the Sea (Harmful Anti-fouling Systems) Act 2006*, the Pyrenees Venture FPSO hull is coated in a tributyltin-free, self-polishing antifouling coating (AFC), which was reapplied in May 2024 during drydock. The expected coating lifetime being five years, the AFC is typically reapplied during dry docking every five years. The coating is designed to prevent marine growth buildup on the hull.

3.11.4 Topsides layout

The topsides equipment on the Pyrenees Venture FPSO is located on a number of pre-assembled modules:

- an internal riser mooring near the bow
- accommodation at the stern containing temporary refuge, which can accommodate the maximum persons on board (60 personnel); the key areas of the temporary refuge are the emergency control centre/CCR and the helicopter administration room/muster area
- gas compression equipment towards the bow (portside)
- lower pressure process equipment (i.e. hydrocarbon separation) in the middle of the Pyrenees Venture FPSO (i.e. midships)
- utilities and PW facilities between the accommodation and process area
- main power generation located towards the stern starboard side
- chemical laydown area located on a dedicated bunded deck above the chemical injection skids next to the crane
- laydown areas adjacent to the crane
- helideck
- inclined flare tower.

The FPSO layout is shown in Figure 3-6, Figure 3-7 and Figure 3-8.

Figure 3-6: Pyrenees Venture FPSO hull layout – profile

Figure 3-7: Pyrenees Venture FPSO hull layout – tank top plan

Figure 3-8: Pyrenees Venture FPSO layout – modules

3.12 Modes of operation

As described in Section 3.11 the Pyrenees Venture FPSO has the ability to move off station. The Pyrenees Venture FPSO operates in two modes: connected mode and disconnected mode; these are described below.

3.12.1 Connected mode

In connected mode and upon commencement of reconnection activity after cyclone disconnects, the Pyrenees Venture FPSO is subject to the jurisdiction of the NOPSEMA and operates in accordance with this EP. Routine activities during connected mode include:

- operation of the subsea production system
- operation of topsides processing and utilities
- operation of marine utilities
- crude oil storage and offloading operations
- helicopter and supply vessel operations
- CCR operations
- general services, including accommodation
- IMMR activities, including those undertaken subsea
- shutdown/disconnect and reconnect/start-up for tropical cyclone response.

3.12.2 Disconnected mode

In disconnected mode, i.e. when the Pyrenees Venture FPSO has completed the disconnection activity and sailed away from the 500 m PSZ, the Pyrenees Venture FPSO falls under the jurisdiction of the Australian Maritime Safety Authority (AMSA) while in Australian waters. The Australian flagged Pyrenees Venture FPSO (registered in Fremantle) is also subject to Class requirements.

During potential periods of extended Pyrenees Venture FPSO sail-away (e.g. when the Pyrenees Venture FPSO is disconnected and sailed away to the shipyard) normal well monitoring from the FPSO is unavailable. During these periods wells are shut-in and managed in accordance with the accepted Pyrenees WOMP. Woodside can demonstrate alignment with current industry good practice with respect to managing well integrity, through confirming that the well barriers are verified, wells are left in a safe state, and the risk of loss of containment is reduced to ALARP.

During disconnected mode some subsea IMMR activities may occur within the Operational Area.

3.12.3 Transition from connected to disconnected mode

The regulatory body governing the operation of the vessel transitions from NOPSEMA to AMSA when the facility transitions from production to ship mode. As part of the disconnection process, Woodside communicate to the recognised organisation (Classification Society), requesting the required certificates in accordance with the process described in the disconnect procedure.

3.12.4 Floating production, storage and offtake facility (FPSO) personnel levels

The total overnight persons-on-board capacity for the Pyrenees Venture FPSO is 60, however actual personnel levels may fluctuate below this. Personnel levels are influenced by a number of activities, including but not limited to:

- crew change
- campaign maintenance
- inspections/audits
- planned facility shutdowns.

3.13 Production process

3.13.1 Production system overview

The Pyrenees Venture FPSO topsides processing system receives well fluids (crude oil, reservoir or PW and associated natural gas) from the production wells, processes it in three stages to separate the crude oil, stores it in the Pyrenees Venture FPSO cargo tanks then offloads cargo to offtake tankers direct for export. Processed gas is used as the source of gas for fuel, gas lift, and minor amounts may be flared for process safety. Excess processed gas is reinjected into the Macedon Field via the Macedon-6 bi-directional well. The well is bi-directional, as gas for fuel can also be sourced from the Macedon-6 well.

The overall process flow diagram schematic is shown in Figure 3-9 (the blue lines represent water, the green lines represent gas and the black lines represent oil).

The Pyrenees topsides facilities include the following process functions:

- production and test separation
- oil stabilisation and dewatering
- PW treatment system
- water injection facilities
- gas de-hydration, compression and reinjection
- fuel gas generation and treatment
- flaring/blowdown facilities.

The processing system is designed to meet crude specifications of 0.5% basic sediment and water and Reid vapour pressure of less than 10 psia, as well as achieving all other environmental discharge limits, as established in the Pyrenees Basis of Design (BHP Petroleum, 2007).

Further details of the processing system are detailed in the sections below.

3.13.2 Liquid processing overview

The crude oil processing system receives the well production fluids via the production manifold and the test manifold. The production manifold sends fluids to the three-phase first stage separator and the test manifold routes fluids to the test separator. Alternatively, the test manifold can route fluids from the subsea test flowlines into the first stage separator (refer to Figure 3-9).

Gas from the first stage and test separation vessels is combined and sent to the suction of the high-pressure compression system. Oil or stable emulsions are sent to the crude heating system and any separated PW is routed to either the PW treatment system (refer Section 3.13.5) or closed drains (refer Section 3.13.6) (if the rate is below the minimum turndown to the PW treatment system).

The crude heating (interstage) system consists of a crude/crude exchanger that recovers heat from the hot crude streams originating from the electrostatic coalescer. The warmed crude/emulsion stream from the cross exchanger is then heated by low-pressure saturated steam to approximately 95°C in the crude heaters.

The hot crude/emulsion stream is then flashed in the three-phase, horizontal second stage separator. The main purpose of the second stage separator is to remove dissolved gases and supply low pressure (LP) fuel gas before the crude is sent to the electrostatic coalescer for dehydration. Hot PW can be recycled back to the inlet of the first stage separator to aid separation.

The hot crude/emulsion from the second stage separator is routed to a two-phase horizontal third stage separator (located above an electrostatic coalescer) with flash gas routed to the LP flare (refer Section 3.13.3). The liquid from the third stage separator is sent to the electrostatic coalescer.

The electrostatic coalescer further separates the oil and water using electric fields to facilitate the coalescence and separation of water droplets from the bulk oil phase. The separated oil stream is then sent to the oil storage system via the crude/crude exchanger. The PW can be recycled to the inlet of the first stage separator.

PW from the first stage separator and test separator is routed to the de-oiling hydrocyclones. Oil from the de-oiling hydrocyclones is routed to the recovered oil collection drum. Water from the de-oiling hydrocyclones is routed to the dissolved gas flotation unit (DGF). The DGF separates any remaining gas from the PW, where the gas is routed to the LP flare for safe disposal.

The PW is then either routed to the booster and injection pumps for re-injection in the water injection wells, routed to the slops tanks or is discharged overboard to the marine environment (refer Section 3.13.5 for further details on the PW treatment system).

Final crude rundown cooling to 45°C occurs after the crude/crude cross exchanger in the rundown cooler by exchanging heat with seawater.

Uncontrolled when printed. Refer to electronic version for most up to date information.

The compact floatation unit (CFU), DGF and slops water is discharged out of a DN350 pipe and the cooling water is discharged through the larger DN700 pipe. The pipes are located in close proximity (<2 m distant) on the port side, at C module, approximately 120 m from the rear/stern of the Pyrenees Venture FPSO. The discharges depth ranges from 3 m to 11 m, depending on ships draft with discharge pipe configuration shown in Table 3-8.

Table 3-8: Discharge pipe configuration

Component	Details	
	PW and slops pipes	Cooling water pipes
Pipe diameter	350 mm (DN350)	700 mm (DN700)
Pipe orientation	Outlet perpendicular to ship hull	Outlet perpendicular to ship hull
Discharge depth	Discharge depth – depends on ship's draft (i.e. ships height in water – depends on cargo onboard): 11 m (max cargo onboard) 7 m ('average' cargo onboard) 3 m (min cargo onboard)	Discharge depth – depends on ship's draft (i.e. ships height in water – depends on cargo onboard): 11 m (max cargo onboard) 7 m ('average' cargo onboard) 3 m (min cargo onboard)
Distance between pipes	1.363 m	

During routine operation, all gas from the first stage and test separators is compressed, dehydrated and used for either fuel gas, gas lift and the surplus injected into the Macedon reservoir via the Macedon-6 bi-directional well. An integrated gas compression and treatment system is provided. Artificial lift is provided via gas lift and surplus formation gas is disposed of via injection into the Macedon reservoir. The gas lift/injection specification is determined by corrosion and hydrate management requirements. Gas flows to subsea are measured using differential pressure (V-cone) instruments. Process gas measurement uses Vortex type flow meters, and ultrasonic gas flow meters are used for flare gas. No direct flow measurement is present on the Macedon reservoir but as all other gas producers and consumers on Pyrenees are metered, flow to Macedon can be determined via mass balance.

The gas compression equipment comprises two Solar 50% gas turbines direct driven three stage centrifugal compressors (with dual fuel capacity). Each of the compressors has a capacity of 30 MMSCFD (or total capacity of 60 MMSCFD). The offgas from the test and first stage separators commingle upstream of the offgas cooler, controlling the suction temperature to the gas compression trains to 45°C to ensure efficient compression. Gas compression is split into two trains, with each train capable of independent isolation. This design arrangement enables improved availability and reliability, with a reduction in unplanned process upsets due to additional redundancy. The fundamental process for the centrifugal compression is outlined in Figure 3-10 (with green indicating gas flow). The compressors are equipped with tandem dry gas seals for shaft sealing. Primary seal leakage gas consisting primarily of natural gas is collected to the LP flare system for safe disposal. Process gas flows are typically measured using Vortex-type flow meters.

Gas entering a compression train is scrubbed to remove any entrained liquid prior to compression to approximately 25 barg in the first stage of the centrifugal compressor. This gas is then cooled to approximately 40°C by a closed loop tempered water cooling system (refer Section 3.13.7.1) prior to entering a gas scrubber to remove and liquid dropout as a result of the compression and cooling process. The cool dry gas is then compressed to approximately 67 barg in the second stage of compression. The gas is again cooled to approximately 40°C prior to commingling with the cool second stage discharges of the other compression trains.

Liquids knocked out in the first stage suction scrubbers are returned back to the oil processing train upstream of the crude heater. Liquids knocked out in the second stage suction scrubbers are returned to the inlet of the first stage separator. Liquids recovered in the third stage suction scrubbers are returned to the gas dehydration glycol regeneration unit.

Gas from the dehydration system is used to feed the facility high pressure (HP) fuel gas system. This gas is used as the normal fuel source for the gas turbine generators and gas turbine driven compressors. Shortfalls in facility gas balance for fuel and gas lift are made up by producing gas from the Macedon field using the bi-directional gas injection/production well.

The co-mingled second stage compressor discharge flows through a filter coalescer vessel designed to remove any condensed liquids. To provide dry fuel gas, lift gas, and gas for re-injection, the water saturated gas is then passed through a glycol (triethylene glycol (TEG)) dehydration column to remove water to achieve a dewpoint of approximately minus 4°C. The HP fuel gas is taken from the discharge of the glycol dehydration column prior to the dehydrated gas splitting into each train of third stage compression.

The gas entering each third stage train is scrubbed to remove any glycol carryover and other liquids prior to compression to approximately 170 barg in the third stage of compression. The gas is then cooled prior to commingling with the cool third stage discharge of the other compression train.

The HP gas is then distributed between the gas lift and gas re-injection headers. The gas lift rate is set by the required gas lift flows to each of the production wells. The balance of the HP gas is directed to the gas re-injection header for injection into the Macedon reservoir. This situation only occurs when there is surplus gas being produced, i.e. during the early years as the reservoir gas caps are blown down.

When gas from the wells is insufficient to meet the HP fuel gas demand, the gas from the Macedon well is imported by reverse flowing through the injection swivel. This gas is directed to the Macedon scrubber where liquids from the flowline and well are knocked out before the gas is heated enroute to its tie-in upstream of the glycol contactor filter coalescer, where it combines with the second stage compressor discharge gas. This imported Macedon gas is used for HP fuel gas during start-ups and for process pressurisation following blowdown. The design allows for injected gas to be back-flowed to the facility for start-up and to meet fuel gas consumption requirements.

Injection into and back-flow of gas from the Macedon well is continuously adjusted to meet the fuel gas demand of the facility.

Figure 3-10: Pyrenees Facility gas processing schematic

3.13.3 Flare system

The flare system consists of two completely independent HP and LP systems to safely dispose of hydrocarbons.

Their main purposes are to safely discharge gas streams during an emergency depressurisation, or when the compression systems are unavailable. However, there are some process streams which continuously pass gas to the flare. Other streams intermittently flow to the flare, such as during process upsets, maintenance activities and when storage vessels are depressurised.

The Pyrenees Facility system was designed to facilitate minimal flaring with exceptions during process upset or maintenance. Although reinjection of surplus gas will avoid significant flaring of gas, a small quantity of gas will be continuously burning at the flare tip for safety reasons and there will be short periods that lead to more significant flaring of gas, such as:

- transient operations such as start-up and process upset conditions (i.e. failure of the gas injection compressor)
- emergency flaring caused by emergency depressurisation (blowdown) of equipment
- emergency relief flows to prevent overpressure (i.e. gas blowby or blocked outlet scenarios)
- manual depressurisation of topsides equipment
- venting of topsides equipment for maintenance.

During normal operations, only emissions from low pressure process sources are collected and routed to the LP flare system. Relieving/blowdown devices are provided throughout the process plant to protect the equipment against overpressure during an emergency situation.

The flare system is equipped with liquid knock-out (KO) drums to remove liquids, with self-draining flare headers to the drums. All flare headers have a continuous purge of LP fuel gas to maintain positive pressure and prevent the ingress of air. Nitrogen is used as an alternative purging medium in instances when LP fuel gas is not available.

Vapours from the LP and HP flare scrubbers are purged to the LP and HP flare tips mounted on the flare tower and integrated with the pilot. The LP and HP flares are designed smokeless, however, under some scenarios uncombusted hydrocarbons may generate dark smoke. All vapours discharged via the flare system are metered using continuous ultrasonic flow meters with pressure and temperature instruments. Liquids recovered from the flare KO drum(s) are routed back to the process plant upstream of the crude heater or to the slops tank.

The flare system was supplied by John Zinc. The LP flare system is a utility flare tip (EEF-U-16) with two pilots (model EEP-W2). The HP flare system is a Hydra-14B high pressure flare tip with two pilots (model EEP-W2). Flare pilots are kept on fuel gas backed up by propane bottles, and an ignition panel is provided to ignite pilot burners using spark ignition method. There is an infrared flame monitor located on the starboard side module B stairway pointed at the flare tip zone to detect if the flare flame or pilot goes out. A flame out activates a process control system alarm in the control room, which the operator will investigate.

The flare tower is at the bow of the FPSO and has a total height of 90 m above sea level.

3.13.3.1 Normal operations

During normal operations, a relatively small quantity of gas must be continuously flared for safety, associated with purge and pilot of the flare system and disposal of waste gas streams which are not recovered to the process.

The continuous flows to the LP flare include:

- flare pilot
- LP flare header and storage tank purges
- dry gas seals
- glycol regeneration process, including still column overheads
- DGF or CFU injected gas for PW treatment (when in use, refer to Section 3.13.5).

The continuous flows to the HP flare include:

- flare pilot
- HP flare header purges.

Leakage past pressure safety valves, pressure control valves, manual valves and blowdown valves may also result in a continuous flow; however, this is usually minor.

3.13.3.2 Intermittent process upsets and activities

During planned process upsets and activities, the process control valves on the main process equipment are designed to open to relieve excess pressure to flare. Sources include emergency shutdown testing, compressor outage, strainer changeout and cyclone disconnect interruptions.

3.13.3.3 Emergency blowdown

The topsides equipment and piping are divided into isolatable sections, each with a dedicated fail open actuated blowdown valve, which allow blowdown of the entire facility inventory. During an emergency shutdown, each section is separately depressurised to the HP or LP flare.

3.13.3.4 Transient operations

During process upsets, the pressure control valves on the main process equipment are designed to open to relieve excess pressure to the HP flare.

During start-up operations, the pressure control valves on the main process equipment can open to manage pressure.

3.13.4 Vent system

While it is preferable to flare rather than vent, there are some instances where venting may be required. An atmospheric vent system is installed to collect vapours from not normally venting vessels, with discharge to a vent outlet on a dedicated mast riser.

The following tanks on the Pyrenees Venture FPSO are vented:

- tanks storing non-volatile fluids such as lube oil and non-volatile chemicals, with minimal expected vapour vented during incidental tank filling only
- cargo tank blanket inert gas (boiler flue gas) during tank level change, which is vented through the breather valve on the inert gas main header, routed to vent at the flare tower (see Section 3.13.11)
- slops tank, which is vented via the breather valve on the vent header, with the outlet located on the flare tower.

Blanket gas from chemical storage vessels which contain potentially flammable and/or hazardous products (e.g. methanol) are not vented and are instead routed to the LP flare system.

3.13.5 Production water treatment and injection system

PW is brought to the surface from the reservoir and put through the PW treatment system. The PW treatment system is designed to separate oil and water and polish PW that is brought to the surface with reservoir fluid. The PW treatment system uses several techniques to stabilise the fluid and separate oil in water (OIW) prior to returning any oil sent back to the process. Polished PW can then be reinjected back into the reservoir, diverted to the slops tank or discharged overboard.

The PW system is designed to process a maximum of 23,848 m³/day (150,000 bbl/day). The primary separation system involves gas/oil water separator units and hydrocyclone separation before dividing into two systems – DGF and CFU (Figure 3-11).

The DGF is used for additional oil removal with the reject oily water from the hydrocyclones sent to the process for re-processing and polished water sent to the reinjection skid, diverted to the slops tanks or discharged overboard. The DGF has been in place since the Pyrenees Venture FPSO begun production in 2009 and in 2024, the design and performance of the DGF was reviewed and improvements to the design were completed to improve PW quality.

The CFU was installed in July 2018 in order to allow for improved PFW treatment and increased water handling. The CFU incorporates residual flotation gas in a secondary separation stage to increase OIW removal efficiency while fully degassing the clean water outlet. It is used for additional re-processing after the hydrocyclones or DGF processes and sent to the slops tanks or discharged overboard. A tie-in spool was also modified into the process design to allow for the parallel operations of the DGF and CFU to increase the capabilities and further improve PW quality.

After exiting the DGF and/or CFU, there are three available routes for PFW disposal, which are:

- reinjection into the reservoirs (target >90% reinjection)
- discharge to the marine environment via:
- routine operations – continuous side stream 1,589 m³/day (10,000 bbl/day) discharged overboard from the CFU (not currently utilised) (Figure 3-12)
- non-routine overboard discharge – during upset conditions, 9,062 m³/day (57,000 bbl/day) discharged overboard from the DGF and CFU (or temporary polishing skid) (Figure 3-13); will not exceed the total annual discharge overboard volume and for no longer than 10 consecutive days per event
- contingency overboard discharge – if the water injection system becomes unavailable prior to repairs of the system being complete (currently estimated by end August 2026), possible overboard discharge at 9,062 m³/day (57,000 bbl/day) until repairs can be completed; for environmental assessment purposes it has been assumed that the discharge could occur for up to 300 days
- automatic routing to the slops water tanks or fully coated cargo tank (alternate slops tank) for additional settlement and treatment, which occurs when reinjection or overboard discharge criteria cannot be achieved or when the OIW analysers after the DGF or CFU fail.

The FPSO has two dedicated slops tanks – the port slops tank (or the ‘dirty’ slop tank) and the starboard slops tank (or ‘clean’ slops tank). Oil recovered from the slops tank is routed to the cargo storage tanks. The port slops tank receives both PFW during upset of the reinjection or treatment system, and contaminated slop water from a variety of sources. Liquids in the port slops tank undergo a settling process, with less dense oily liquids floating on top of cleaner slop water at the bottom.

A balance pipe connects the port slop tank to the starboard slop tank. The inlet of the balance pipe in the port slop tank is located 3 m from the bottom of the tank and the outlet of the balance pipe is located 11 m above the bottom of the starboard slop tank. Relatively clean separated slop water from the bottom of the port slop tank flows through this arrangement to the starboard slop tank.

Once further settling occurs in the starboard slop tank, the discharge/return valve arrangement permits either a return of the water to the port (dirty) slop tank, to the topsides process (upstream of the reinjection pumps) for disposal via reinjection, or the CFU for further treatment to be overboard discharged as part of the PW stream.

Discharge overboard is via the PW stream from a caisson from the side of the ship at 3 m below the surface (discharge depth with an empty facility load, 11 m at full load; the exact depth varies with ballast/loading).

If overboard discharge criteria cannot be achieved a temporary polishing skid may be installed to facilitate overboard discharge during contingency conditions.

Figure 3-11: Pyrenees Facility produced water system schematic

Figure 3-12: Pyrenees Facility routine operations schematic

Figure 3-13: Pyrenees Facility upset conditions schematic

All water exiting the DGF or CFU passes through OIW measurement analysers prior to reinjection into the reservoir, diversion to the slops tank or discharge overboard. Both meters are *International Convention for Prevention of Pollution from Ships 1973* (MARPOL) certified. As an automated fail safe, if any of the meters fail to confirm OIW readings in the overboard discharge stream, inconsistent readings are observed between the CCR and the OIW analysers and/or the verification tests, or the OIW concentrations do not meet the specifications, then PW is diverted to the slops tank, alternative slops tank (Cargo Oil Tank No 4) or other specified storage tank.

In the event OIW analyser readings become unstable or vary substantially over a 24-hour period, manual sampling at six-hour intervals of OIW are completed to verify OIW specifications are being achieved while PW is being directed overboard. The manual sampling occurs until online analysers are brought back into calibration and the results are recorded and readings are entered in the daily Pyrenees Facility Production Report and the Enterprise Upstream database as per the Monitoring and Management of Produced Water and Slops Discharge Procedure.

3.13.6 Drainage system

3.13.6.1 Closed drains

All pressure vessels and equipment in hydrocarbon service or containing hazardous fluids on the Pyrenees Venture FPSO are provided with a hard-piped drain connection to the closed drains system. The system is generally used to drain liquids from process vessels and equipment prior to maintenance and therefore these sources are normally isolated and only drained after depressurisation. The closed drain system also collects liquids during normal operations.

The collection vessel for the closed drain system is the LP flare KO drum (Section 3.13). Liquids collecting in the LP flare KO drum are normally pumped back to the process upstream of the crude heater; however, it is also possible to route the liquids to the slops system in case the process train is unavailable or it is not desirable to return the fluid back to the process (i.e. well clean up fluids). The route to the slop systems is isolated and only used under controlled circumstances.

3.13.6.2 Open drains

The Pyrenees Venture FPSO open drain system consists of the following sub-systems:

- hazardous open drains, which collect liquids from open drain sumps, tundishes and equipment drip trays in areas classified as hazardous
- non-hazardous open drains, which collect liquids from open drain sumps, tundishes and equipment drip trays in areas classified as non-hazardous
- chemical drains from bunded containment areas, which allow collection or disposal of chemicals from the chemical injection facilities.

These are discussed in further detail below.

3.13.6.2.1 Hazardous and non-hazardous open drains

The open drain systems are designed to handle rainwater, deluge/firewater, wash down water and any spillage of liquids which may also contain solids from process plant deck areas and equipment drip trays. The hazardous and non-hazardous areas on the Pyrenees Venture FPSO have separate open drains collection systems. The hazardous drains in the hydrocarbon modules have dedicated routing to the slops tank, separate from non-hazardous open drains. The hazardous and non-hazardous open drain headers can be routed either to the port slops tank or the four-port slops tank.

Liquid spills are contained and recovered by routing the open drains system to a series of segregated sumps located in the floors of areas with plated decks to either hazardous or non-hazardous open drains, depending on the area classification. These sumps have their outlet protected by a strainer screen to prevent solids from entering the system and creating blockages. The overflow system for these sumps is designed to minimise the risk of overboard discharge of hydrocarbons (in the case of a spill). Liquid captured in these sumps then flows to a common header, either hazardous or non-hazardous depending on area classification, via gravity to the slops tank system. Water is decanted in the slops system before being treated in the water treatment package (refer Section 3.13.5). Recovered oil is routed to the cargo storage tanks.

A liquid seal is provided at the slop tank inlet connection to prevent inert gas migration from slops tank to plant areas via the open drains system.

All equipment that is likely to have small and/or unpredictable leaks of hydrocarbons or chemicals (such as pump seals) have dedicated drip trays.

Excess flows experienced during deluge or heavy rainfall is managed using two offtakes from the drain sumps – one at a low level routed to the open drains system, the other at a higher level routed to the ships deck. The overflow offtake is designed such that it minimises overflow of hydrocarbon.

3.13.6.2.2 Chemical storage area open drains

The open drains in the chemical storage areas have the following design features to minimise the risk of release of any spillage to the marine environment.

The chemical storage area consists of two levels – a chemical loading/unloading/handling area at the top level and the chemical storage and injection area, beneath the chemical handling area. Both areas are individually bunded and have drain sumps with segregation according to chemical compatibility.

All chemicals collected on the open drain sump at the top level are piped to the appropriate drain sumps provided in the chemical storage and injection area.

Level switches are provided for the chemical storage and injection area drain sumps that alarm on high level.

The collected drainage from the chemical storage and injection area drain sumps are pumped to a transportable waste collection tote tank in the event of a spill, or to the open drain system during normal operations.

3.13.7 Seawater system

Seawater is pumped onboard the Pyrenees Venture FPSO for use as cooling water and to produce potable and fresh/distilled water. These systems are discussed further below.

3.13.7.1 Cooling water system

The purpose of the Pyrenees Venture FPSO seawater systems is to provide process and heating, ventilation and air conditioning cooling. Seawater is delivered to the system from the ship's hull via three seawater lift pumps.

The process cooling water system consists of two sub-systems:

- the tempered water cooling system, which is a closed loop system that provides cooling to process heat exchangers and topsides machinery
- the seawater cooling system, which provides cooling to the closed loop process cooling water and to process coolers.

The tempered water cooling system is a closed loop system which provides cooling for the HP compressors, PW injection pumps, LP fuel gas cooler, steam condensate cooler and sample coolers. There is provision for chemical injection into the system as required (pH buffer, oxygen scavenger, scale/corrosion inhibitor and biocide).

The seawater cooling system is a single pass system used primarily to cool the seawater/tempered water cross exchanger, offgas cooler, crude rundown cooler and PW injection cooler. The seawater is filtered at the intake through the seawater coarse filters to prevent intake of a sudden influx of microalgae, seaweed, etc. After use in the cooling water system, the heated seawater is discharged overboard to discharge specifications.

Marine growth is prevented from growing in the seawater cooling system by a sodium hypochlorite copper chlorine system. Antifoam is also injected at the inlet of the seawater deaeration tower to control seawater foaming to reduce deaeration.

The daily seawater cooling flow rate expected during operations is 33,600 to 38,400 m³/day. The design return temperature is 46.3°C at the maximum expected surface ambient seawater temperature of 31°C. Cooling water flow rates and temperature are recorded in PI Process Book as per the below specifications (Table 3-9).

Table 3-9: Cooling water discharge specifications

Cooling water	Unit	Quantity
Cooling water discharge temperature max. ¹	°C	50
Daily flow rate	m ³ /day	48,000

¹ Limit to comply with environmental requirements and to reduce scaling potential in seawater cooling system.

3.13.7.2 Fresh water system

Fresh and distilled water is produced on the facility by a 'fresh water' generator, which uses heat from the auxiliary boiler steam system or main engine jacket cooling water to evaporate seawater in a vacuum. The vacuum is applied to the separator vessel by the brine ejector and seawater from the ejector pump is used to condense the vapour. The distillate water pump removes the PW from the condenser and delivers it to either the distilled or potable water tanks.

The fresh water generator consists of heat exchangers, separator shell and condenser, water ejector, the ejector pump, steam injector, distillate pump, salinometer, solenoid valve, deflector, mesh separator, water meter and feed water chemical injection unit.

The fresh water is stored in tanks and distributed by hydrophore units with electric driven pumps. Facilities for transfer of potable water from supply boats to the Pyrenees Facility freshwater storage tanks are also provided.

Fresh water is used for accommodation potable and hot water services, machinery space drinking fountains, topside utilities and safety showers and eye wash stations.

3.13.8 Cargo tanks

The Pyrenees Venture FPSO is divided into sealed compartments by a series of longitudinal and transverse bulkheads. There are six port cargo tanks and six starboard. The Pyrenees Venture FPSO features a double skinned hull (sides and bottom) around the cargo tanks.

The cargo tanks are blanketed with inert gas and maintained at a slight positive pressure, up to 14 kPa(g).

Stabilised crude oil is offloaded to tankers (up to 125,000 dead weight tonnage) moored at the stern of the Pyrenees Venture FPSO in a tandem configuration, using a floating hose (260 m by 16-inch) connected from the stern of the Pyrenees Venture FPSO to the mid-ship manifold of the receiving tanker. A mooring hawser connects the two vessels during crude transfer operations, with the distance between the two vessels approximately 60 m, maintained by an operations support vessel providing static tow on the offtake tanker.

The cargo system is designed to offload 87,430 m³ (550,000 bbl) in less than 30 hours. Cargo pumping is via electric submerged deep well pumps located in the cargo tanks. The dual carcass floating hose is stored on a hose-reel at the stern of the Pyrenees Facility while not in use. This reduces the likelihood of damage to the hose during handling or impact by vessels (and their propellers) and subsequent oil releases and enables the Pyrenees Venture FPSO to steam away from an incoming cyclone at a higher speed (as the floating hose is not being towed behind).

The offloading system includes an emergency shut off valve at the Pyrenees Venture FPSO stern and an emergency disconnection system. Both are capable of being remotely operated from the CCR. The floating hose has a quick release as part of the hose reel for emergency release. The design of the unit is such that minimal oil is lost in the event of a release (approximately 40 L).

3.13.9 Ballast system

The Pyrenees Venture FPSO ballasting system comprises six pairs of wing double bottom ballast tanks and the fore peak tank which surround the cargo tanks, providing a double hull arrangement. The ballast tanks and ballast system maintain stability of the Pyrenees Venture FPSO and manage stress conditions during cargo loading and discharge operations. Control of the ballast system is operated in the CCR, in conjunction with the 'Shipmanager' system, which monitors the load forces (e.g. shear forces and bending moments) and to ensure they remain within the acceptable stability envelopes.

The Pyrenees Venture FPSO ballast system complies with ABS Classification Rules and IMO (*Ballast Water Management Convention*) requirements. The system consists of:

- ballast tanks and pumps
- hydraulic power unit and supply lines
- ballast valves and piping
- vessel monitoring system/ballast panel (and associated software).

Ballast tanks and cargo tanks are segregated to minimise potential contamination with oil.

Two single stage centrifugal ballast pumps are provided, which take water from the ballast tanks or the sea (via a sea chest) via the ballast ringmain. The port and starboard ballast systems are cross connected via ringmain piping, allowing pumping from tanks on one side to the other and de-ballasting of any through either pump. Backup power is provided for the loading computer and cargo control panel via the emergency switchboard (i.e. emergency generator).

3.13.10 Offloading system and offtake tanker mooring

The Pyrenees Venture FPSO facility has a tandem offloading system, providing handling facilities to non-dedicated tankers of up to Suezmax (150,000 T) size, in accordance with Oil Companies International Marine Forum (OCIMF) requirements.

Before gaining Woodside's acceptance for offloading from the Pyrenees Venture FPSO facility, export tankers are assessed for their performance, quality (historic performance or incidents, documentation, systems and procedures) and operational compatibility with the facility.

Once accepted for offloading, the tanker must comply with requirements under the Pyrenees Venture Berthing & Terminal Handbook, which contains rules, information and operations guidelines. The manual also describes the operations and approach to the PSZ and cautionary zone, and the rules that apply in each area. Approach to the facility is approved by the facility OIM, then occurs under supervision of a Woodside pilot in accordance with the IMO and International Maritime Pilots Association Guidelines.

While the offtake tanker is making its approach to the Pyrenees Venture FPSO facility, a support vessel runs the messenger rope to the stern-mounted mooring hawser, then assists in the berthing operation as directed by the pilot, including transferring the hose to the offtake tanker connection. After the hose is connected, line-up for cargo operations begins under the direction of the pilot, with communications continuously maintained between the offtake tanker, the Pyrenees FPSO facility and facility support vessel. Separation between the FPSO and the offtake tanker is maintained by the support vessel on static tow at the stern of the offtake tanker, which also controls movement of the tanker.

Crude oil is offloaded to the offtake tanker via a 16-inch diameter, 279 m long floating offtake hose. It comprises a heavily reinforced material in sections approximately 11.8 m long, with flanged and bolted connections between sections. This allows each section to be independently tested and replaced if necessary. A double dry-break coupling is fitted approximately 30 m from the offtake rail end of the hose, which will release at a predetermined tension. Minor oil spillage may occur into drip trays on the tankers when the hoses are separated; spillage is minimised by closing the valves in each half of the parted dry-break coupling and all oil is retained within the drip trays.

Offloading operations from the Pyrenees Venture FPSO facility take place as required, based on production rates. Offtakes are currently every six weeks and will decline in frequency as production rates drop over time. Trading tankers have an oil storage capacity of up to 120,000 m³; a full loading operation is expected to take up to 30 hours. Initial loading rates are approximately 700 m³/hr; however, once safety and override checks are satisfactory, the rate is increased to suit offtake tanker requirements, to a maximum loading rate of 4000 m³/hour.

Offloading to tankers is monitored by the Pyrenees Venture FPSO facility's approved stress and stability program, which continuously calculates the stresses in the hull, based on measured liquid levels and densities within the tanks, and provides alarms if hull stresses exceed the allowable envelope.

The offtake hose is stored on a stern-mounted hose reel when not in use. This reduces the likelihood of hose damage during handling or impact by vessel.

3.13.11 Inert gas system

The inert gas system ensures the atmosphere in the Pyrenees Venture FPSO cargo storage and slop tanks is maintained at a positive pressure to prevent the formation of flammable mixtures during crude oil washing and purging operations and cargo offloading.

The system on the Pyrenees Venture FPSO is a standard inert gas system which uses boiler flue gas as the inert gas, sourced from the exhaust gas duct of the auxiliary boilers. The inert gas has an oxygen content of below 5% by volume. The inert gas plant is located in the engine room. The plant consists of a scrubber and demister, two inert gas blowers, a deck water seal unit, pressure/vacuum breaker, ducting and necessary fittings. The inert gas system is a standalone system with on-line monitoring of the inert gas oxygen content via a control panel in the CCR. On-line monitoring of the inert gas oxygen content is provided at the CCR. At high oxygen levels (above 5%), the deck supply valve will close automatically and the inert gas is vented to the atmosphere. Continuous monitoring of the inert gas pressure is also provided in the CCR and the bridge.

3.13.12 Greenhouse gas emissions

The sources of greenhouse gas (GHG) emissions associated with the Petroleum Activity are shown in Table 3-10. GHG sources that are not part of the Pyrenees Facility (e.g. transport, refining of oil) are included for completeness. In the context of this EP, the emissions are classified as direct and indirect emissions.

Table 3-10: Direct and indirect greenhouse gas (GHG) emissions sources associated with Pyrenees production

Emission type	Source	Location	Jurisdiction	Process
Direct	Pyrenees Facility process	Offshore	Commonwealth	GHG emissions associated with fuel, flares, fugitives and process vents
Indirect	Support operations	Offshore	Commonwealth	GHG emissions associated with engines and fugitives on vessels and helicopters
	Transport	Transit	Subject to consumer location	GHG emissions associated with transport of products to market
	Refining of oil Regassification of gas Distribution and combustion of oil and gas by third-party user	Market	Subject to consumer location	GHG emissions associated with combustion of products as part of power generation and other energy products within the final market

3.14 Emergency blowdown, shutdown and safeguarding

3.14.1 Emergency blowdown

All hydrocarbon inventories on the Pyrenees Venture FPSO are provided with facilities to enable them to be depressurised via the blowdown system. The blowdown system comprises:

- fail open blowdown valves on various process equipment
- control instrumentation, power supply and instrument air.

The status of the blowdown valves is indicated in the CCR. Blowdown can be initiated manually from the CCR or automatically via the fire and gas system.

The blowdown design philosophy is based on blowdown of vessels from maximum operating pressure to 6.9 barg or 50% of maximum operating pressure within 15 minutes, whichever is lesser.

The actual blowdown has been conservatively based on blowdown from high pressure trips instead of normal operating pressure. This means blowdown from the normal operating pressure can be achieved in less than 15 minutes in most cases.

3.14.2 Shutdown and safeguarding control systems

The Pyrenees Venture FPSO has shutdown and safeguarding systems to automatically sense any abnormal process condition, alert the operator at the operator interface in the CCR and execute actions (such as isolate process inventories, initiate blowdown and shutdown equipment).

The process control system continuously monitors and controls the Pyrenees Venture FPSO process and utility systems, including equipment packages and associated facilities. Subsea wells are controlled by a standalone master control station. The process control system is the main data collection point for the information management (e.g. including hydrocarbon accounting for emission reporting).

The alarm monitoring system comprises the cargo and ballast control/stress systems, tanker loading facilities, certain utilities and services (e.g. diesel, potable water) and electrical power management for the emergency/essential generators. The system is also monitored and controlled in the CCR.

The subsea control system includes all electronic components and facilities for full control and monitoring of the subsea facilities and the associated hydraulic power on the vessel deck. The complete subsea installation is normally operated from the subsea master control station remote terminal in the CCR.

3.14.3 Emergency shutdown valves

Emergency shutdown valves (ESDVs) are provided throughout the topsides hydrocarbon processing plant and in the fuel gas and methanol systems. The ESDVs are designed and installed in accordance with ABS Classification and API standards.

The valves are pneumatically actuated, except the riser ESDVs which are hydraulically operated. The ESDVs are fail safe design, sprung to close with hydraulic/pneumatic actuation to open (i.e. they fail closed on loss of air/hydraulics or control signal). The valve position is indicated locally and in the CCR.

The topsides ESDVs are fire rated and are protected against long duration riser fires. Emergency shutdown of all isolation valves including the riser ESDVs will occur automatically upon confirmed fire or gas detection or as a result of process upset. ESDVs can also be initiated manually from the CCR and various pushbuttons around the Pyrenees Venture FPSO.

3.15 Utility systems

3.15.1 Power generation

The Pyrenees Facility power generation is derived from the following systems:

- topside main generators – three dual-fuel turbine generators each providing 7,000 kW
- essential (hull) generators – three sets of diesel generators each providing 950 kW
- emergency generator – one set diesel generator producing 300 kW
- uninterruptible power supply (UPS).

The primary source of electrical power for the Pyrenees Facility is three (dual fuel gas/diesel) turbine-driven power generators (located topside) and associated distribution system. Production equipment is predominantly electric motor driven, except the gas compressors which, like the main power generators, are also gas turbine driven. The power generation system is designed to be used in both production and ship's navigation requirements.

The Pyrenees Facility power systems are discussed in further detail below.

3.15.1.1 Topside power generation

Topside power generation is provided to meet all power requirements for the Pyrenees Facility when connected to the spider buoy and in normal production and offloading mode. This includes all process, utility and marine electrical loads. The topside main generators are also used for connection and reconnection of the Pyrenees Venture FPSO with the turret if it is necessary to use the thruster during the connection process.

The three gas turbine generator sets are 7,000 kW gas/diesel Solar Taurus 70 units. Two are usually in operation at any time with one remaining on standby. This design arrangement enables improved availability and reliability for sparing and redundancy. The generators normally run on fuel gas, with diesel fuel used only during periods when gas is unavailable, such as black start, turret connection and disconnection.

The main generator fuel system is capable of automatically switching from fuel gas to diesel fuel without interruption to the power supply, initiated either by a specific shutdown signal or upon loss of fuel gas pressure. Alternatively, the system may be manually switched from diesel to fuel gas without interruption to the power supply. Dual fuel capability improves the availability and reliability of power, helping to prevent facility shutdown or blowdowns and in turn reducing additional flaring from such unplanned events.

Fuel gas consumption of the gas turbine generators is not metered individually, however, this can be indirectly determined from power generated (kW), which is metered on each turbine.

3.15.1.2 Essential (hull) generators

Diesel generators in the shipside engine room are retained as a standby for marine utility and emergency systems and as the main generator for ship navigation. They additionally allow 'black start' of the main gas turbine generator. The system consists of three diesel engine driven generators of 950 kW each.

In the event of topside generation failure, the shipside generators will supply power to shipside utilities and topside emergency power. Start of shipside main generators (essential generators) is controlled both manually and locally. Power supply change over from topside gas turbine generators to shipside generator is performed with non-blackout power changeover (a short period parallel running of shipside and topside generators for power transfer with sync-check will be catered for as part of the system design).

3.15.1.3 Emergency generators

A diesel engine driven emergency generator is installed within a dedicated machinery room located on the hull's main deck, along with its dedicated diesel day tank (with 18 hours running time). The generator is 300 kW.

The emergency generator satisfies all regulation and class requirements and has sufficient installed capacity to satisfy all hull and topside systems emergency loads, including:

- emergency and helideck lighting
- UPS and battery systems
- fire and gas detection and prevention
- all emergency response telecommunication systems
- navigation systems and aids
- emergency equipment
- control power for subsea system
- UPS for the control systems.

3.15.1.4 Uninterruptable power supplies

Standalone UPSs provide secure power to the Pyrenees Venture FPSO critical loads for control, communication, safe shutdown and evacuation of the facility. Critical loads are defined as those required to maintain safe condition, equipment, or prevent loss inventory.

The systems are 100% redundant with exception of existing marine battery supplies and are configured to provide automatic and uninterruptible back-up on loss of normal, essential and emergency power. All systems have sufficient storage battery capacity to provide power in accordance with Classification Society requirements for marine and offshore installations. Redundant systems may be supplied from both emergency and normal power supply.

These power supplies also provide clean power services to sensitive instrumentation and telecommunication equipment where close tolerance voltage and frequency conditions are needed and supply disturbances minimised.

The critical loads have minimum battery autonomy periods. The critical loads include:

- process control and safety systems
- fuel gas system and supporting process control system equipment
- navigation aid systems
- electrical system
- topside unit control panel and mechanical packages
- critical control and alarm equipment.

Battery autonomy periods are also provided for telecoms essential loads, telecoms normal loads and instrumentation.

3.15.2 Diesel fuel system

Marine diesel oil is used for all sail-aways, initial mobilisation voyage and initial start-up and emergency operations, or to cover periods of disruption to production activities in the absence of fuel gas.

Diesel is required as the primary fuel for the following systems:

- secondary fuel for the topside power generation and marine steam boilers
- FPSO main engine
- essential generators and the emergency generator
- firewater pumps (main and standby)
- lifeboat.

Diesel fuel is bunkered onboard the facility from offshore support vessels (OSVs) and stored in the diesel storage tanks (approximately 2,935 m³ capacity) located within the aft hull of the Pyrenees Venture FPSO. Approximately 10 L per month of biocide/corrosion inhibitor is added on an as-required basis once diesel is stored onboard the Pyrenees Venture FPSO.

3.15.3 Hydraulic and lube oil

The hydraulic power units provide clean hydraulic fluids at various flow rates and pressures to accommodate the requirements of:

- mooring/topsides:
 - well subsurface safety valves and Xmas tree valves
 - riser and fluid transfer path ESDVs
 - topsides hydraulic ESDVs
 - ancillary topsides and hull systems hydraulically activated valves
 - mooring buoy structural connector
- marine:
 - cargo, ballast and slops tank valves
 - hull systems mooring and hawser winches.

Hydraulic fluid for the subsea control system is water based to minimise flammable hazards. Hydraulic fluid is replenished via tote tanks. The lube oil is used both for the power generation turbines and for major topsides rotating equipment. A lube oil purification system is also provided.

Sealed bulk bins are used to transfer large quantities of lube oil and chemicals offshore. The bins are located topsides at an elevated position with a gravity distribution piping to main oil consuming packages and the oil storage tanks.

3.15.4 Instrument and plant air system

Instrument air and utility air generation systems are provided via 'control' air compressor/drier/receiver (three by 50%). This supplies the instrument air header and nitrogen generation system. The instrument air users include:

- instruments and pneumatic tools
- gas turbine power generators
- process packages.

The 'start' air compressor/receiver supplies the utility air header.

3.15.5 Nitrogen system

The Pyrenees Venture FPSO process plant is equipped with a 155 m³/hr LP nitrogen generation system (i.e. compressed air powered membrane system), with a nitrogen purity of 97.5%. The nitrogen system is used to purge equipment and piping and is used as back up to the flare header purge gas.

3.15.6 Steam systems

Six-barg steam is supplied from the ship's hull for use as the heating medium for crude heater after depressurising and desuperheating to 1.0 barg saturated steam. Steam is also supplied to the topsides utility stations from desuperheater downstream. Steam condensate exiting the crude heaters is collected in the condensate collection drum and returned under gravity to the hull via steam condensate cooler.

3.15.7 Sewage and putrescible wastes

There are two sewage treatment units installed on the Pyrenees Venture FPSO. Sewage treatment unit U_4151 is the primary unit, sized for a maximum of 60 persons on board. This unit was installed during the Pyrenees Venture FPSO conversion. A second unit, sewage treatment unit U-4152, is sized for 32 persons on board and pre-existed the Pyrenees Venture FPSO conversion. This unit is retained as a standby (emergency) unit.

Both units are combined treatment systems manufactured by EVAC. Each unit comprises an integrated vacuum generator and a biological sewage treatment system. The system uses an aerobic process whereby activated sludge converts organic substances in waste water to carbon dioxide and water without danger of methane gas production. The units are fully automatic in normal operation and require low maintenance.

Both units are designed to meet the requirements of the *International Convention for Prevention of Pollution from Ships 1973*, as modified by the *Protocol of 1978* (referred to as MARPOL 73/78) Annex IV and the US Coast Guard Code of Federal Regulations Title 33 part 159, which specifies the discharge effluent quality as follows:

- biochemical oxygen demand <50 ppm
- suspended solids 100 ppm
- faecal coliforms <250 pcs/100 ml most probably number.

Sewage and greywater is discharged from the units to the marine environment in accordance with Annex IV of MARPOL 73/78.

Putrescible waste (food waste) is macerated to a size of <25 mm before discharge to the marine environment.

3.15.8 Cranes and material handling

The Pyrenees Venture FPSO is equipped with material handling equipment to enable maintenance of all major equipment on the Pyrenees Venture FPSO, efficient movement of materials around the Pyrenees Venture FPSO, and transfer of materials to and from OSVs.

3.15.9 Passing vessel detection

Management controls are in place to reduce the likelihood of unplanned interactions between the Pyrenees Venture FPSO and other vessels. These include features that allow detection of vessels approaching or passing near the Pyrenees Venture FPSO:

- facility personnel to observe approaching vessels and raise the alarm
- automatic identification system (AIS)
- automatic radar plotting aid
- closed circuit television.

Communication systems to notify other vessels of the Pyrenees Venture FPSO's location include:

- navigation aids, bridge wing searchlights and lights/deck illumination
- fog signal in restricted visibility

- radio communications.

The turret also has a radar reflector and navigation lights, which are activated when the Pyrenees Venture FPSO is disconnected.

3.15.10 Facility lighting

Artificial lighting on the Pyrenees Venture FPSO and support vessels at night is at levels required for safe conduct of operations and for various navigational sea and air safety requirements.

The main criterion for lighting design is to ensure that there is effective lighting to maintain a safe working area, and safe movement around the vessel to enable start-up, inspection and testing. All access ways to emergency pathways are also required to have sufficient light for successful evacuation from the ship in the event of an incident. As a result, the illumination levels on the Pyrenees Venture FPSO have been selected to balance the functional requirements whilst minimising spill illumination from the Pyrenees Venture FPSO. For safe working practices, the current specification requires lighting levels to be 150 lux at one metre above the deck of the FPSO, being 24 m above sea level with a deck height of approximately 23 m.

The main areas that require direct sea lighting are the emergency departure and muster area on the aft of the ship adjacent to the emergency escape vessel area. This is generally illuminated in the event of an emergency on board and is not classified as normal lighting for the vessel. Additional lighting is required periodically on cranes and around the stern of the Pyrenees Venture FPSO to allow safe lifting and loading and unloading of support vessels and trading tankers.

3.15.11 Chemical injection system

A chemical injection system is provided for the chemical treatment of production fluids (both subsea and topsides) and to protect piping and equipment. This includes a single chemical injection package, methanol injection package and acetic acid injection package. A separate distribution panel is located on the geostationary component of the DTM to facilitate distribution of subsea chemicals.

The system accommodates both continuous and intermittent chemical injection and is designed for minimal manual handling and mainly uses large but standard sized re-usable tanks (tote bins or isotainers for large consumption chemicals) which are filled onshore, shipped offshore, and placed in prearranged dedicated locations to be piped directly into the chemical distribution system. Variable flow positive displacement pumps are used to deliver the chemicals to the required injection points.

Normal loading is from tote/transportable tanks by gravity feed/or pumped to dedicated storage tanks (refer Table 3-11 and Table 3-12 for indicative inventory volumes). Flexible hoses with quick connectors are used to connect the tanks to the hard piped storage tank feed lines. The connectors and flexible hoses are unique for each chemical, used to avoid cross contamination of chemicals.

Individual storage for each chemical is provided and incompatible chemicals are stored in separate bunded areas. The acetic acid and methanol tanks (the largest inventory within the chemical injection area) are individually bunded and drain to the slops tank. The chemical storage area has its own open drains systems, which are described in Section 3.13.6.2.

Indicative chemicals in use and inventories on the Pyrenees Venture FPSO are outlined in Section 3.16.2. Chemicals used in the process and subsea system are recovered onboard the Pyrenees Venture FPSO (normally via the PW system) and reinjected or are alternatively collected and disposed through the slops discharge system.

3.16 Hazardous substances and inventories

This section provides information on the hazardous substances stored and used on the Pyrenees Venture FPSO and is divided into process and non-process hydrocarbons, and process and non-process chemicals.

3.16.1 Process and non-process hydrocarbons

The main indicative process hydrocarbon inventories on the Pyrenees Venture FPSO are summarised in Table 3-11. In addition to the process inventories, the following non-process hydrocarbon inventories are associated with the Pyrenees Venture FPSO:

- crude oil in the cargo tanks – maximum storage capacity 881,000 bbl
- crude oil in the offloading hose (temporarily during offtake, 260 m long and 400 mm diameter)

Controlled Ref No: PYHSE-E-001

Revision: 23

Page 75 of 530

Uncontrolled when printed. Refer to electronic version for most up to date information.

- diesel oil in the bulk storage tanks and various day tanks – approximately 2,452 m³ (with small quantities stored topsides in the emergency generator and lifeboat).

The hydraulic power units also provide clean hydraulic fluids at various flow rates and pressures to accommodate the requirements of the mooring/topsides and marine users.

Table 3-11: Indicative topsides process hydrocarbon inventories on the Pyrenees Venture FPSO

Inventory	Operating pressure (bar)	Operating temp (°C)	Gas volume (m ³)	Liquid volume (m ³)
First-stage separator V-0101	9	39 to 61	99.3	210
Test separator V-0105	9	14 to 47	35.7	73.2
Second stage separator V-0102	4	95 to 100	54.7	187.9
HP1 suction scrubber V-0301	8.5	45	4.3	1.212
HP2 suction scrubber V-0302	23.7	39	2.5	0.54
HP2 compressor C-0312	67.7	39	1.5	Negligible
Glycol contactor T-0351	65	39	13.3	Negligible
HP3 suction scrubber V-0303	64.6	41	1.2	0.6
HP3 compressor C-0313	169	153	1.5	Negligible
Macedon gas scrubber V-0305	72 to 170	14	4.6	0.78
HP fuel gas filter/separator F-6451	64.5	41	4.6	Negligible
HP fuel gas KO drum F-6401	3.5	46	0.7	0.4
HP flare gas KO V-6401	0.1 to 5	27 to 100	63.8	15.79
LP flare gas KO V-6401	0.1 to 0.5	40 to 132	11.6	16.56
Gas lift and gas injection swivel piping	167.7	60	0.1	Negligible
Offgas cooler E-0131	9	39	16.1	Negligible
Fuel gas system piping	27.6	58.4	1.1	Negligible
Production turret/spider buoy	9	29	2.4	0.33
Gas lift turret/spider buoy	167.7	60	1.7	Negligible
Gas injection turret/spider buoy	167.7	60	1.7	Negligible
Crude export	13	60	Negligible	155.6
Well clean-up package	3.5	60	Negligible	53

3.16.2 Process and non-process chemicals

Table 3-12 provides an indicative list of process chemicals and their indicative storage inventories onboard the Pyrenees Venture FPSO. Table 3-12 also lists the dosing point in the process, their purpose, typical dose rate, chemical type/classification and chemical risk assessment undertaken.

The chemicals with the largest inventories on the Pyrenees Venture FPSO are discussed in further detail below:

- Methanol is used when required in low dose rates to prevent hydrate formation in the production and gas manifolds in the event the glycol dehydration unit is out of service or off specification, or for chemical line flushing. Pyrenees hydrate management under normal steady state operation is achieved through environmental conditions (e.g. ambient temperature is 21°C). Wells may require methanol injection in the event of a protracted shutdown. For long-term shutdowns (e.g. cyclone disconnect), the flowlines are depressurised and do need to be inhibited with methanol.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Demulsifier is injected continuously into the wells. The Pyrenees crude is categorised as a heavy oil with an API gravity of 19. Heavy oil development wellstreams are characterised by water dispersions/emulsions. The point at which the water-in-oil emulsion inverts and the water becomes the continuous phase is referred to as the 'inversion point' or 'critical water-cut'. The Pyrenees crude emulsion inversion point is at approximately 90% water cut.

Maintenance chemicals include chemicals which are required for general maintenance or 'housekeeping' activities and are critical for overall maintenance of the facility and its equipment. These may include paints, degreasers, greases, lubricants, and domestic cleaning products. They may also include chemicals required for specialty tasks, such as laboratory testing and analysis.

Maintenance chemicals generally present negligible risk to the environment as they are not discharged as a result of their use (e.g. paint) or are used intermittently and discharged in low volumes (e.g. domestic cleaning products).

Table 3-12: Indicative process chemical types and storage quantities

Chemical	Chemical name (indicative only)	Dosing point and purpose	Tank capacity	Estimated daily use	Dosage concentration (ppm v/v)	Discharge concentration (ppm v/v)
Hydrate inhibitor (methanol)	Methanol	Subsea wellhead – controls hydrate formation	30 m ³	As required	As required	Variable
Topsides demulsifier	FLOW18280F	Topside process – facilitates separation of oil and water	20 m ³	Not currently used	0 to 50	<30
Water clarifier	CHP917407.32H (Cleartron IZB-172)	Topside process – facilitates separation of oil and water	9.2 m ³	150 L	0 to 10	<30
Scale inhibitor	SCAL16484F2	Topside process and subsea wellheads – controls inorganic scale due to mixing of seawater and PW	11 m ³	250 L	13	<40
Corrosion inhibitor	CORR11447A	Topsides process – controls corrosion	9.2 m ³	650 L	30	<10
Biocide	EC6297A	Slops tank and topside process – controls bacterial count	5.2 m ³	450 L and batch dosed every five and seven days	300	The distributed control system logic prevents PW discharge overboard during process biociding and for four hours post dosing
TEG antifoam	AFMR19029A	Controls foaming on tower	70 L	As required	As required	Variable
Process antifoam	AFMR19242A	Topsides process – controls foam	14.4 m ³	108 L	As required	Variable
TEG pH adjuster	CORR11005A	Adjusts/maintains pH	70 L	As required	As required	Variable
Oxygen scavenger	Nalco 7408	Topsides process – reduces dissolved oxygen concentration to <10 ppb	5.2 m ³	As required	As required	Variable
TEG	TEG	Gas dehydration	11 m ³	As required	As required	Variable

Chemical	Chemical name (indicative only)	Dosing point and purpose	Tank capacity	Estimated daily use	Dosage concentration (ppm v/v)	Discharge concentration (ppm v/v)
Subsea demulsifier	Baker Hughes DMO83409AP	Subsea wellhead – facilitates separation of oil and water	20 m ³	480 L	0 to 250	<26
Subsea control fluid	Transaqua HT2 (Castrol)	Subsea wellhead – hydraulic fluid	5 m ³	As required	As required	Variable

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.16.3 Chemical selection, assessment and approval

As part of Woodside's chemical approval process, operational chemicals are selected and approved in accordance with the Woodside Chemical Selection and Assessment Environment Guideline. This guideline is used to demonstrate that the potential impacts of the chemicals selected are acceptable and ALARP, in line with Woodside's Environmental Performance Procedure. The procedure requires chemicals to be selected with the lowest practicable environmental impacts and risks, subject to technical constraints.

The Woodside Chemical Selection and Assessment Environment Guideline includes the requirements set out by the Australian Government under the Industrial Chemicals Environmental Standard. This framework is a key component of several national reforms to improve approaches to how industrial chemicals are used, produced, imported and managed.

3.16.3.1 Environmental selection criteria

Woodside's process for selecting and assessing chemicals follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS) which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands (background on the OCNS scheme is provided below):

- Where operational chemicals with an OCNS rating of Gold/Silver/E/D and no OCNS substitution or product warning are selected, or a substance is considered to pose little or no risk to the environment, no further control is required. Such chemicals do not represent a significant impact on the environment under standard use scenarios and therefore are considered ALARP and acceptable.
- If other non-rated chemicals are required, or rated chemicals with a substitution warning, chemical selection process and ALARP justifications are undertaken where required.

The ALARP assessment may consider chemical toxicity, biodegradation, and bioaccumulation potential, using industry standard classification criteria. If a product has no specific ecotoxicity, biodegradation, or bioaccumulation data available, these options are considered:

- environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical, or
- environmental data may be referenced for each separate chemical ingredient (if known) within the product.

3.16.3.2 Background overview of Offshore Chemical Notification Scheme

The OCNS Scheme applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances listed on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters such as biodegradation, and bioaccumulation, in accordance with one of two schemes (as shown in Figure 3-14).

- Hazard Quotient Colour Band: Gold, Silver, White, Blue, Orange and Purple (listed in order of increasing environmental hazard), or
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard). Applied to inorganic substances, hydraulic fluids and pipeline chemicals only.

Hazard Quotient Colour Band	Gold	Silver	White	Blue	Orange	Purple
OCNS Grouping	E	D	C	B	A	
	Lowest Hazard Highest Hazard					

Figure 3-14: Offshore Chemical Notification Scheme ranking

3.17 Support vessel operations

Vessels, powered by either liquefied natural gas (LNG) or diesel, are used in a support capacity for transferring personnel in emergency scenarios, material and equipment to and from the facility. Vessels are also used for project field work. All support vessels are required to undergo a Woodside marine assurance inspection to review compliance with marine laws and Woodside safety and environment requirements.

3.17.1 Facility support vessels

Specifications of the Go Provider vessel (Figure 3-15) are presented in Table 3-13 as a representative example of typical specifications of a vessel that supports the Pyrenees operations. Vessels supporting the facility vary depending on vessel schedules and availability. While in the field, the vessel also backloads materials and segregated waste for transport back to the King Bay Supply Facility in Karratha.

Figure 3-15: Typical facility support vessel (Go Provider)

Table 3-13: Indicative facility support vessel specifications (Go Provider)

Attribute	Details
Type	Facility support vessel
Length overall	62.0 m
Breadth	17.0 m
Draft	4.5 m
Dead weight tonnage	1,250 tonnes
Accommodation	Berthing for 34 personnel

3.17.2 Other support vessels

Other support vessels such as crew transfer vessels, subsea support vessels (crewed or remotely operated) are used for field work, including cargo operations and subsea IMMR activities. Vessels supporting the activities may vary depending on operational requirements, vessel schedules, capability and availability.

Typical support vessels use a dynamic positioning (DP) system to allow manoeuvrability and avoid anchoring when undertaking works, due to the close proximity of subsea infrastructure. However, vessels are equipped with anchors which may be deployed in an emergency or during non-routine activities.

Vessels used to support IMMR activities may range in length from 50 m to 120 m and include multi-purpose support vessels and dive support vessels. Typically, only a single vessel would be required to implement IMMR activities. Inspections are typically for one to two weeks and occur once or twice a year. Infrequently,

there may be a requirement (e.g. a minor repair) for more than one vessel. These activities are still typically only one to two weeks. Repairs may also take longer, up to around four weeks, and if occur, typically only occur once every several years.

Vessels operate 24 hours a day. It is anticipated that vessel time for routine inspection will involve no more than one to two weeks per year, depending upon operational requirements. Maintenance and repair activities may result in additional vessel time, depending on the scale and complexity of the work scope. This would be for around four weeks.

Vessels will use DP to maintain position. All vessels will use marine diesel oil or marine gas oil and will be provisioned in port. There will be no refuelling of IMMR vessels in the Operational Area. It is expected that all vessels sourced for IMMR activities will have been previously operating in the North West bioregion, but may be sourced from within Australian waters or internationally if required.

3.18 Helicopter operations

Helicopters are the primary means of transporting passengers and/or urgent freight to and from the Pyrenees Venture FPSO and support vessels. They are also the preferred means of evacuating personnel in an emergency. Helicopter support is principally supplied from Learmonth Airport.

3.19 Subsea inspection, monitoring, maintenance and repair (IMMR) activities

Subsea infrastructure is designed not to require significant intervention. Inspection and maintenance are undertaken to ensure the integrity of the infrastructure and identify problems before they present a risk of loss of containment. Maintaining infrastructure integrity also supports decommissioning planning. Intervention may be required to repair identified problems.

To manage subsea threats (risks) the IMMR process requires an appropriate response to be selected to manage specific equipment risks. This is typically one of: inspection, maintenance, monitoring or repair.

The IMMR process for subsea infrastructure, including suspended equipment, maintains equipment in good condition and repair, for production and to enable future removal.

Subsea activities are typically undertaken from a subsea support vessel or uncrewed surface vessel and may use a remotely operated vehicle (ROV) or autonomous underwater vehicle (AUV) with transponders to inspect equipment, or divers. For some activities, ROVs or AUVs may also be deployed from the Pyrenees Venture FPSO. It is possible that non-routine repair or replacement activities could require up to two IMMR vessels in the Operational Area at the same time, for approximately two weeks.

Maintenance and repair activities may require the deployment of frames/baskets which are temporarily placed on the seabed. These typically have a perforated base with a seabed footprint of about 15 m². This temporary equipment is removed from field via recovery to vessels at the completion of IMMR activities.

Typical IMMR activities are described below.

3.19.1 Inspections

Inspection of subsea infrastructure is the process of physical verification and assessment of components in order to detect changes to the as-installed location and condition by comparison to initial state following installation and previous inspections. Details of typical subsea infrastructure inspections/surveys are provided in Table 3-14. Inspection of the exploration well with wellhead is determined by the WOMP. Scope and frequency of subsea equipment (operational and suspended) are determined using a risk-based inspection (RBI) methodology and associated plans.

RBI is commonly used within the industry as a method for determining inspection frequencies (Energy Institute, 2009; DNV, 2019). RBI for subsea systems that have reached the end of their useful life inherently pose less risk to the environment and may drive a less frequent inspection frequency.

Typical IMMR activities that may occur over the duration of this EP are outlined in Table 3-14.

Typically, total inspection activities are expected to be no more than one to two weeks per campaign with typically no more than two campaigns per year, depending on work task requirements.

3.19.2 Monitoring

Monitoring of subsea infrastructure refers to the process of surveillance of the physical and chemical environment that a subsea system or component is exposed to in order to determine if and when damage may occur, and (where relevant) predict the rate or extent of that damage. Monitoring activities may include process composition testing, corrosion probes, corrosion mitigation checks, metocean and seismic monitoring, and cathodic protection testing. Other monitoring activities include process monitoring (temperature, pressure, etc), cyclone weather monitoring, and hydraulic fluid usage.

3.19.3 Maintenance

Maintenance activities on subsea infrastructure are those required at regular or planned intervals to prevent deterioration or failure of infrastructure. Typical maintenance activities are described in Table 3-14.

3.19.4 Repair

Repair activities are those required when a subsea system or component is degraded, damaged or has deteriorated to a level outside of acceptance limits. Damage sustained may not necessarily pose an immediate threat to continued system integrity but may present an elevated level of risk to environment or production reliability. Due to the design of subsea infrastructure and materials used, repairs are undertaken on an as needs basis. The requirements and frequency of these repairs are dictated by the outcome of the inspection and maintenance regimes described above. Typical subsea repair activities are presented in Table 3-14.

Repair activities can result in minor volumes of fluids released to the marine environment associated with disconnection of the component that is being repaired or replaced. This could result in releases of up to approximately 10 m³ of fluids such as (but not limited to) PW, hydraulic fluids and/or reservoir hydrocarbons.

When equipment is replaced, the redundant equipment may remain in-situ or be removed from the field. The location of redundant subsea infrastructure items is recorded as part of the ROV as left survey and included in a database for the Pyrenees subsea inventory.

Table 3-14: IMMR activities with the potential to occur

IMMR activity	Actions
Inspections	- Visual inspections of subsea components, looking for damage, degradation, debris etc., requires ROVs or AUVs deployed from a vessel or facility - Multi-beam echo sounder (MBES) survey – involves high frequency, echo sounder along the flowlines and/or umbilical - Side scan sonar (SSS) surveys – involves the use of high frequency along the flowlines and/or umbilical
Monitoring	Cathodic potential readings, to confirm corrosion protection is working – involves ROVs taking cathodic protection measurements
Maintenance	- Cathodic protection maintenance – replacement/new cathodic protection sacrificial anodes may be installed on or adjacent (within the Operational Area) to infrastructure using a vessel and ROV - Burial or deburial of flowlines and/or umbilicals - Removal or relocation of foreign objects – such as boulders, debris - Valve/choke/subsea control module replacement (e.g. on subsea trees and manifolds) - Control lead replacement installation (e.g. hydraulic, electrical and fibre optic flying leads) - Marine growth/scale removal from subsea structures using ROVs to water blast and/or acid chemical wash (if required to facilitate removal)
Repair	- Removal, replacement or repair of manifold (water injection, control and production) (up to 32 m² seabed disturbance footprint for a new manifold) - Removal and/or replacement of anode assembly skid(s) - Removal and/or replacement of umbilical – typically 'like for like' replacement undertaken using ROV from a vessel

IMMR activity	Actions
	Flowline/umbilical repairs – could involve the installation of structural clamps or HP repair clamps; these activities are typically undertaken from a single vessel using ROV lifting equipment

3.19.5 Subsea chemical usage

Planned chemical discharges may occur during a range of subsea system operation and IMMR activities. However, these are either small volumes, or discharged intermittently. Operational chemicals to be used in the Pyrenees subsea infrastructure are selected and assessed using Woodside's chemical selection and assessment guideline, as described in Section 6.7.7. Typical chemicals that are used at the subsea infrastructure and may be released during IMMR activities include, but are not limited to:

- Control fluid – The subsea control fluid presently used in the Pyrenees subsea control systems is HT2 (a water glycol mix). Control fluid may be dosed with dye to enable leak location detection.
- Hydrate control – as ambient temperature is approximately 21°C, hydrate mitigation is not typically required. Methanol is used if hydrate management is required.
- Corrosion inhibitor – Corrosion inhibitor may be used to manage and prevent corrosion within flowlines. It is not currently used in Pyrenees.
- Biocide – Biocides are generally used to prevent the bacterial growth in flowlines that may cause corrosion. It is not currently used in Pyrenees, except for discrete use when performing operations that require breaking hydrocarbon containment such as choke change outs, where a biocide stick is inserted into the cavity prior to make up.
- Acid – Where removal of scale deposits is required an acid solution such as sulphamic acid or Magwash (or an equivalent) is used.
- Oxygen scavenger – Oxygen scavenger may be used to reduce/de-oxygenate the flowlines and prevent corrosion and aerobic bacterial growth. It is not currently used in Pyrenees.
- Grout – The material used in grout, mattresses and rock is typically concrete-based.
- Staurolite products – Used for abrasive/sand blasting to clean and remove marine growth, the main component is staurolite, which is a naturally forming mineral.

3.19.6 Intervention isolations

There may be environmental discharges during subsea IMMR activities, for example during pressure/leak testing or flushing. Where practicable, flushing is performed prior to disconnection of a subsea component to reduce residual hydrocarbon or chemical releases to the subsea environment upon disconnection. The flushing chemicals used for this Petroleum Activity may be supplied from either the Pyrenees Venture FPSO or a chemical package via a downline from a support vessel. Where possible, flushed fluids are returned to the Pyrenees Venture FPSO and processed and treated through the production system. Table 3-15 below shows typical discharge volumes during different IMMR activities.

Table 3-15: Typical discharge volumes during different IMMR and subsea activities

Activity	Description
Pressure/leak testing	Chemical dye estimates <10 L
Flushing	Residual hydrocarbon or chemical release volume is dependent upon component geometry and pumping rates
Hot stab changeout	Hydrocarbons or control fluid estimated <10 L
Subsea control module changeout	A typical release of diluted acid is up to 4,000 L and of control fluid estimated to be 10 L
Hydraulic flying lead and umbilical replacement	Typical releases of hydraulic fluid and chemicals is estimated to be <1 L each
Choke changeout	Release of hydrocarbons ~<10 L and a typical acid release of ~<1,000 L
Manifold replacement	Release of small volumes of PW, approximately 10 m ³

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.19.7 Marine growth removal

Due to the relatively high rate of marine growth on the North West Shelf (NWS), it is necessary to remove excess growth prior to undertaking many subsea IMMR activities. Marine growth removal is undertaken by ROV. The different techniques that may be used for the Petroleum Activity are described in Table 3-16.

Table 3-16: Marine growth removal techniques

Activity/equipment	Description
Water jetting	Uses HP water to remove marine growth
Brush systems	Uses brushes attached to a ROV to remove marine growth
Acid	Chemically dissolves scale deposits
Sand/abrasive blasting	Additional cleaning to allow close visual inspections (rare, not typical)

3.19.8 Sediment relocation

If sediment builds up around a flowline or other subsea infrastructure, an ROV-mounted suction pump/dredging unit may be used to relocate the sediment to allow inspection/works to be undertaken. This Petroleum Activity is limited to the relocation of small amounts of sediment material in the immediate vicinity of the subsea infrastructure (i.e. within the existing footprint). Sediment relocation typically results in minor seabed disturbance and some localised turbidity.

3.20 Waste management

Waste is segregated onboard the Pyrenees Venture FPSO and support vessels and stored in designated skips and waste containers for disposal at appropriate facilities onshore. Wastes are segregated into:

- non-hazardous waste (or general waste)
- hazardous waste
- recyclables.

3.20.1 General non-hazardous wastes

General non-hazardous wastes include domestic and galley waste, scrap materials, packaging, wood and paper and empty containers. Non-hazardous waste materials are stored on board the Pyrenees Venture FPSO and support vessels in suitable containers (segregated from hazardous waste materials) ahead of transport back to shore for disposal/recycling in accordance with regulations.

3.20.2 Hazardous wastes

Hazardous wastes are defined as waste materials that are or contain ingredients harmful to health or the environment. Hazardous wastes generated during the Pyrenees Facility operations include recovered solvents, excess or spent chemicals, oil contaminated materials (e.g. sorbents, filters and rags), batteries and used lubricating oils. The volumes of hazardous wastes expected to be generated at the Pyrenees Facility are relatively small.

3.20.3 Naturally occurring radioactive materials and sand management

Naturally occurring radioactive materials (NORMs) may be brought up from the reservoirs and accumulate in some pipes and vessels on the Pyrenees Venture FPSO. Three main types of material which may contain NORMs have reported to be found on the facility:

- Scale may be found in upper parts of well completion strings, where it may precipitate out from PW of high salinity and may contain sulphates and carbonates. The most common scale is barium sulphate. Scale-forming material may also precipitate on sand and sludge particles and scale debris may be mixed with sludge and sand inside process vessels.
- Sludge may be found in the slops tanks. The main components of sludge are fine particles of scale, sand, corrosion products, flakes of paint.
- Coarse sand and scale particles, usually retained in separators and sand traps and removed from separators by sparging.

NORMs emit gamma radiation and are a cause of external gamma radiation exposures. Pyrenees facility NORMs are likely to be in the category of low specific activity radioactive materials. Low specific activity radioactive materials can emit only a limited amount of radiation which is unlikely to deliver a high radiation dose similar to 'strong' radiography or radiotherapy radioactive sources. Due to this fact, radiation exposures and the radiological impact on marine life due to discharges of small volumes of NORMs are likely to be negligible.

A small amount of material from investigations of the process fluids piping systems have yielded low level NORMs. To reduce the accumulation of sand that may contain NORMs, the Pyrenees Facility include the following sand management measures:

- Sand screens are in place on the wells.
- Sand detection/monitoring is included on the subsea manifolds and on the commingled production and test headers located on the turret to enable early detection of screen failure.
- The topside process vessels are equipped with on-line sand removal and sand washing facilities for removal of accumulated sand.

NORMs that are detected on the Pyrenees Facility are managed in accordance with PYHSE-H-0010 – Managing Naturally Occurring Radioactive Materials, which includes the following controls:

- Routinely monitor radiation around the Pyrenees Venture FPSO and on opening of process vessels using a hand-held meter (such as the Rotem DA-3 or Automess 6150), which indicates the radiation levels in uSv/h. All monitoring is to be conducted by the on-board Radiation Officer. Trigger values for scale and sludge are an external dose rate of >0.7 uSv/h and pipework and valves is an external dose rate of >0.5 uSv/h.
- In the event trigger values are exceeded, collect, store and transport the material for onshore disposal in accordance with legislative requirements (*Radiation Protection Act 2004*).
- Restricted access to areas where NORMs may be present.
- Apply guidelines for working within vessels that may be contaminated with NORMs.
- Sample scale, sand and sludge as required.
- Implement procedures for storage, handling and transport and disposal of NORMs-contaminated material.

In the event that meter readings indicate an increased risk of NORMs on the Pyrenees Venture FPSO, the treated PW and slops water will be tested for NORMs (Radium 226 and 228). NORMs have been included as a parameter in the surface water quality monitoring program historically with concentrations in receiving water being below the limits of reporting (Advisian, 2022).

4 DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulations 21(2) and 21(3) of the Environment Regulations, this section describes the existing environment that may be affected by the Petroleum Activity (planned and unplanned), as described in Section 3, including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The EMBA is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the combined potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the following scenario:

- Scenario 1: An uncontrolled subsea loss of well control for a duration of 69 days.

The ecological impact thresholds used to delineate the EMBA are defined in Table 4-1. The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations. The EMBA is shown in Figure 4-1.

A second EMBA has also been defined based on the thresholds for potential socio-cultural impact, as defined in Table 4-1. This EMBA is referred to as the 'socio-cultural EMBA' and is used to identify social, cultural and economic receptors that could be impacted during a credible hydrocarbon spill scenario.

Collectively the EMBA and socio-cultural EMBA are referred to as 'the combined EMBA'.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any particular point in time. Rather, the areas are a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define the environment that may be affected (EMBA) for surface and in-water hydrocarbons

Hydrocarbon type	EMBA ¹	Socio-cultural EMBA ¹	Planning area for operational and scientific monitoring
Surface	10 g/m ² This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m ² This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for operational and scientific monitoring (NOPSEMA guidance note: A652993, April 2019).	
Dissolved	50 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		10 ppb This low exposure value establishes the planning area for operational and scientific monitoring (based on potential for exceedance of water quality triggers) (NOPSEMA guidance note: A652993, April 2019). In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold.
Entrained	100 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		

Hydrocarbon type	EMBA ¹	Socio-cultural EMBA ¹	Planning area for operational and scientific monitoring
Shoreline	100 g/m ² This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m ² This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	N/A

¹ Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 6.8.1

4.2 Regional context

The Operational Area is located in Commonwealth waters within the North-west Marine Region (NWMR) as defined under the Integrated Marine and Coastal Regionalisation of Australia (v4.0) (Commonwealth of Australia, 2006), in water depths of approximately 190 to 215 m. Within the NWMR, the Operational Area lies within the NWS Province, the Northwest Province and the Central Western Shelf Transition (Figure 4-2).

Woodside's Master Existing Environment document (Appendix J) summarises the characteristics of the relevant marine provincial bioregions.

Figure 4-2: Location of the Operational Area and relevant marine provincial bioregions

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.3 Matters of national environmental significance (EPBC Act)

Table 4-2 summarises the MNES overlapping the Operational Area and EMBA, respectively, according to the Protected Matters Search Tool (PMST) results (Appendix C). It should be noted that the EPBC Act PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Additional information on these MNES is provided in subsequent sections of this chapter and described in detail in Appendix J.

Table 4-2: Summary of matters of national environmental significance identified by the EPBC Act Protected Matters Search Tool as potentially occurring within the Operational Area and EMBA

MNES	Operational Area	EMBA	Relevant Section
World Heritage properties	0	2	Section 4.9.5
National Heritage places	0	4	Section 4.9.5
Wetlands of international importance (Ramsar)	0	0	Section 4.8
Commonwealth Marine Area	2	6	Section 4.8
Listed threatened ecological communities	0	0	Section 4.8
Listed threatened species	26	88	Section 4.6
Listed migratory species	40	98	Section 4.6

4.4 Physical environment

The Operational Area lies on the outer continental shelf in water depths of approximately 190 to 215 m (Figure 4-3). The Operational Area is located on the shelf break, the transition from continental shelf to slope, and is generally flat and featureless with some minor depressions.

The physical environment consistent with the NWMR is described in detail in Appendix J.

Figure 4-3: Bathymetry of the Operational Area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.5 Habitats and biological communities

Sediments in the Operational Area are comprised primarily of soft sediment, i.e. mud and calcareous clay which is consistent with the wider North West Province, NWS Province and the Central Western Shelf Transition. In 2005, 2015 and 2021 sediment characteristics at the Pyrenees Facility were surveyed (Advisian, 2015; 2021). Results showed the western portion of the seabed in the area (190 to 260 m depth) are characterised by gravely fine to coarse carbonate sands, while the seabed sediments in the eastern part of the area (190 to 200 m depth) are soft, fine sediments, mainly carbonate silts and clays (BHP, 2022). Further, video footage from 2002 of a sled towed across parts of the Operational Area showed rippled sediment, with rocky nodules and sparse but reasonably even distribution of sponges and soft corals. Typically, soft corals or sponges were seen attached to these small patches of hard substrate, with fish and other invertebrates gathered around (Australian Institute of Marine Science, 2002).

Hard substrates will occur more broadly in the region and can host more diverse benthic communities. Hard substrate may be associated with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula key ecological feature (KEF) (Section 4.7), which overlaps the Operational Area.

Key habitats and ecological communities within the EMBA are identified in Table 4-3 and described below.

Table 4-3: Habitats and communities within the EMBA

Habitat/ community	Key locations within the EMBA and approximate distance from the Operational Area where relevant
Marine primary producers	
Coral	Ningaloo Coast (9.3 km south) Muiron Islands (19 km south-east) Barrow Island (138 km north-east) Montebello Islands (179 km north-east) Shark Bay (359.4 km south) Rowley Shoals (641.1 km north-east) Houtman Abrolhos islands (745.9 km south) Rottnest Island (1,159.4 km south) Christmas Island (1,518.6 km north-west)
Seagrass beds and macroalgae	Ningaloo Coast (9.3 km south) Muiron Islands (19 km south-east) Exmouth Gulf (39 km south-east) Barrow Island (138 km north-east) Montebello Islands (179 km north-east) Shark Bay (359.4 km south) Jurien Bay (972.8 km south) Busselton (1,345.6 km south)
Mangroves	Ningaloo Coast (9.3 km south) Exmouth Gulf (39 km south-east) Montebello Islands (179 km north-east) Dampier (281.4 km north-east) Carnarvon (369.7 km south) Port Headland (477.9 km north-east) Broome (933.2 km north-east)

Habitat/ community	Key locations within the EMBA and approximate distance from the Operational Area where relevant
Other communities and habitats	
Plankton	Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR, as detailed in Appendix J. Peak primary productivity within the EMBA occurs in late summer/early autumn, along the shelf edge of the Ningaloo Reef. It also links to a larger biologically productive period in the area that includes mass coral spawning events, peaks in zooplankton and fish larvae abundance (Department of Conservation and Land Management, 2005), with periodic upwelling throughout the year. Further detail regarding productivity at other notable locations within the EMBA (e.g. North West Cape) is provided in Appendix J.
Pelagic and demersal fish populations	Pelagic and demersal fish populations within the Operational Area and EMBA are expected to be representative of the NWMR (described in Appendix J). Particular features overlapping the Operational Area that are known to support pelagic and demersal fish populations include the Continental Slope Demersal Fish Communities KEF. Features within the EMBA which support fish populations include the Ancient Coastline at 125 m Depth Contour KEF, Commonwealth Waters Adjacent to Ningaloo Reef, Western Demersal Slope and Associated Fish Communities, Glomar Shoals, Mermaid Reef and Commonwealth waters surrounding Rowley Shoals, etc. These features are described in Appendix J. Notably, the presence of subsea infrastructure associated with the Pyrenees Facility has resulted in the development of demersal fish communities that would otherwise not occur in the Operational Area due to the generally featureless, soft substrate that is present (McLean et al., 2017).
Epifauna and infauna	Filter feeders such as sponges, ascidians, soft corals, and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (Department of the Environment, Water, Heritage and the Arts, 2008). Filter feeders within the EMBA are expected to be representative of the NWMR, with notable areas of high sponge diversity occurring in the Commonwealth waters of Ningaloo Marine Park (see Appendix J). Discrete areas of hard substrate hosting sessile filter feeding communities may also be associated within the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula, which overlaps the Operational Area. Filter feeder communities within the Operational Area are present on the subsea infrastructure, which provides hard substrate for attachment in an otherwise generally featureless, soft and sandy substrate.

4.6 Protected species

A total of 130 EPBC Act listed threatened or migratory species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 36 species was identified as potentially occurring within the Operational Area. Species identified in the PMST that do not have a marine or migratory listing, are not considered to inhabit shorelines, or rely on the marine environment for their diet or survival were not considered in this section. These species were identified by the PMST search method, which applies a grid block system that conservatively identifies areas in which protected species have the potential to occur. A full list of species is provided in Appendix J. These results inform the assessment of impacts from planned and unplanned events (Section 6.7 and Section 6.8).

Biologically important areas (BIAs) are defined by the Marine Bioregional Plan for the North-west Marine Region as areas of spatial aggregation of individuals within a species known to demonstrate biologically important behaviour (Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC), 2012a). Examples of such behaviours include breeding, foraging, resting or migration.

Threatened and/or migratory species identified as potentially occurring within the Operational Area and EMBA, and BIAs or habitat critical to their survival (habitat critical) that overlap the Operational Area and EMBA, are listed in Table 4-4 to Table 4-12. A description of species is included in Appendix J.

Figure 4-4 to Figure 4-14 show the spatial overlap with relevant BIAs and habitat critical areas and the Operational Area and EMBA.

4.6.1 Fish, sharks and rays

A total of 23 EPBC-listed threatened and/or migratory fish species have been identified to potentially occur within the Operational Area or EMBA. Sixteen of these species are listed as threatened and 13 listed as migratory (Table 4-4). There are also 63 EPBC-listed marine species in the EMBA, which do not have a threatened or migratory status and include a variety of pipefish and sea dragons. These species are described in Appendix J.

The Operational Area overlaps the foraging (high density prey) BIA for the whale shark as outlined in Figure 4-4. Four other fish and shark species have BIAs within the EMBA and are outlined in Table 4-5 and detailed further in Appendix J.

Table 4-4: Threatened and migratory fish, shark and ray species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Carcharias taurus</i> (west coast population)	Grey nurse shark (west coast population)	Vulnerable	N/A	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Sphyrna lewini</i>	Scalloped hammerhead	Conservation Dependent	N/A	Species or species habitat likely to occur within area	Species or species habitat known to occur within area
<i>Thunnus maccoyii</i>	Southern bluefin tuna	Conservation Dependent	N/A	Species or species habitat likely to occur within area	Breeding known to occur within area
<i>Anoxypristis cuspidata</i>	Narrow sawfish	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Carcharhinus longimanus</i>	Oceanic whitetip shark	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat may occur within area
<i>Isurus oxyrinchus</i>	Shortfin mako	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
<i>Isurus paucus</i>	Longfin mako	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
<i>Manta alfredi</i>	Reef manta ray	N/A	Migratory	Species or species habitat known to occur within area	Species or species habitat known to occur within area
<i>Manta birostris</i>	Giant manta ray	N/A	Migratory	Species or species habitat known to occur within area	Species or species habitat may occur within area
<i>Galaxiella nigrostriata</i>	Blackstriped dwarf galaxias	Endangered	N/A	N/A	Species or species habitat known to occur within area
<i>Glyphis garricki</i>	Northern river shark	Endangered	N/A	N/A	Species or species habitat may occur within area
<i>Milyeringa veritas</i>	Cape Range cave blind gudgeon	Vulnerable	N/A	N/A	Species or species habitat known to occur within area
<i>Nannatherina balstoni</i>	Balston's pygmy perch	Vulnerable	N/A	N/A	Species or species habitat known to occur within area
<i>Ophisternon candidum</i>	Blind cave eel	Vulnerable	N/A	N/A	Species or species habitat known to occur within area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Carcharodon carcharias</i>	White shark, great white shark	Vulnerable	Migratory	N/A	Species or species habitat likely to occur within area
<i>Pristis clavata</i>	Dwarf sawfish, queensland sawfish	Vulnerable	Migratory	N/A	Breeding known to occur within area
<i>Pristis pristis</i>	Freshwater sawfish	Vulnerable	Migratory	N/A	Species or species habitat known to occur within area
<i>Pristis zijsron</i>	Green sawfish, dindagubba	Vulnerable	Migratory	N/A	Species or species habitat known to occur within area
<i>Rhincodon typus</i>	Whale shark	Vulnerable	Migratory	N/A	Species or species habitat may occur within area
<i>Centrophorus uyato</i>	Little gulper shark	Conservation Dependent	N/A	N/A	Species or species habitat likely to occur within area
<i>Galeorhinus galeus</i>	School shark	Conservation Dependent	N/A	N/A	Species or species habitat likely to occur within area
<i>Hoplostethus atlanticus</i>	Orange roughy	Conservation Dependent	N/A	N/A	Species or species habitat likely to occur within area
<i>Lamna nasus</i>	Porbeagle, mackerel shark	N/A	Migratory	N/A	Species or species habitat likely to occur within area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-5: Fish, shark and ray biologically important areas (BIAs) within the Operational Area and EMBA

Species	BIAs ¹ within the EMBA and approximate distance to the Operational Area			
	Foraging	Migration	Pupping	Nursing
Whale shark	Northward from Ningaloo along 200 m isobath (overlaps) Ningaloo Marine Park and adjacent Commonwealth waters (high abundance) (12.2 km south-west)	No migration BIA identified within the EMBA	No pupping BIA identified within the EMBA	No nursing BIA identified within the EMBA
White shark	Waters off pinniped colonies through the South-west Marine Region (757 km south-west)	No migration BIA identified within the EMBA	No pupping BIA identified within the EMBA	No nursing BIA identified within the EMBA
Dwarf sawfish	Eighty Mile Beach (611 km north-east)	No migration BIA identified within the EMBA	Eighty Mile Beach (611 km north-east)	Eighty Mile Beach (611 km north-east)
Green sawfish	Cape Keraudren (604 km north-east)	No migration BIA identified within the EMBA	Cape Keraudren (604 km north-east) Eighty Mile Beach (611 km north-east) Willie Creek (937.7 km north-east)	Cape Keraudren (604 km north-east) Eighty Mile Beach (611 km north-east)
Freshwater sawfish	Eighty Mile Beach (611 km north-east)	No migration BIA identified within the EMBA	Eighty Mile Beach (611 km north-east)	No nursing BIA identified within the EMBA

BIA locations are described in the National Conservation Values Atlas.

4.6.2 Marine reptiles

A total of nine EPBC listed threatened and/or migratory reptile species have been identified to potentially occur within the Operational Area or EMBA. Eight of these are threatened species and seven are listed as migratory species, as outlined in Table 4-6.

BIAs for the flatback turtle, green turtle, hawksbill turtle and loggerhead turtle overlap the Operational Area as described in Table 4-6 and shown in Figure 4-5.

Habitat critical for the green turtle, loggerhead turtle, flatback turtle and the hawksbill turtle is overlapped by, or adjacent to, the Operational Area as shown in Figure 4-6 and described in Table 4-6.

BIAs and critical habitat for these four species, and the olive ridley turtle, associated with the EMBA are shown in Figure 4-7 and Figure 4-8 and described in Table 4-7.

An additional 21 EPBC-listed marine reptile species occur in the EMBA, which do not have threatened or migratory status. The majority of these are sea snake species. These listed marine species are described in Appendix J.

Table 4-6: Threatened and migratory marine reptile species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Caretta caretta</i>	Loggerhead turtle	Endangered	Migratory	Congregation or aggregation known to occur within area	Breeding, foraging, feeding or related behaviour known to occur within area
<i>Dermochelys coriacea</i>	Leatherback turtle	Endangered	Migratory	Species or species habitat known to occur within are.	Breeding likely to occur within area Foraging, feeding or related behaviour known to occur within area
<i>Chelonia mydas</i>	Green turtle	Vulnerable	Migratory	Species or species habitat known to occur within are.	Breeding known to occur within area
<i>Eretmochelys imbricata</i>	Hawksbill turtle	Vulnerable	Migratory	Congregation or aggregation known to occur within are.	Breeding, foraging, feeding or related behaviour known to occur within area
<i>Natator depressus</i>	Flatback turtle	Vulnerable	Migratory	Congregation or aggregation known to occur within are.	Breeding, foraging, feeding or related behaviour known to occur within area
<i>Aipysurus apraefrontalis</i>	Short-nosed seasnake	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area
<i>Aipysurus foliosquama</i>	Leaf-scaled seasnake	Critically Endangered	N/A	N/A	Species or species habitat known to occur within area
<i>Lepidochelys olivacea</i>	Olive ridley turtle	Endangered	Migratory	N/A	Species or species habitat likely to occur within area Foraging, feeding or related behaviour likely to occur within area
<i>Crocodylus porosus</i>	Salt-water crocodile	N/A	Migratory	N/A	Species or species habitat likely to occur within area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.6.3 Marine mammals

A total of 17 EPBC Listed threatened and/or migratory marine mammal species have been identified to potentially occur within the Operational Area or EMBA. Six of these species are listed as threatened, and 13 listed migratory species. A further 26 mammal species were identified by the PMST. However, as they do not have a marine or migratory listing and they are not considered to inhabit shorelines, nor rely on the marine environment for their diet, they are not included in Table 4-9.

The Operational Area overlaps with the migration BIA for the humpback whale. The migration and foraging BIAs for the pygmy blue whale are further offshore (Figure 4-9), and the resting BIA for the humpback whale is located nearby in Exmouth Gulf (Figure 4-10). Four other species of marine mammal species have BIAs within the wider EMBA and are described in Table 4-10 including the southern right whale migration BIA and dugong BIA, both approximately 18 km from the Operational Area (Figure 4-10 and Figure 4-11). The southern right whale also has a gazetted habitat critical to survival relating to breeding which is 18 km from the Operational Area.

Table 4-9: Threatened and migratory marine mammal species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Balaenoptera musculus</i>	Blue whale ¹	Endangered	Migratory	Species or species habitat likely to occur within area	Migration route known to occur Foraging, feeding or related behaviour known to occur within area
<i>Eubalaena australis</i>	Southern right whale	Endangered	Migratory	Species or species habitat likely to occur within area	Breeding known to occur within area
<i>Balaenoptera borealis</i>	Sei whale	Vulnerable	Migratory	Species or species habitat likely to occur within area	Foraging, feeding or related behaviour likely to occur within area
<i>Balaenoptera physalus</i>	Fin whale	Vulnerable	Migratory	Species or species habitat likely to occur within area	Foraging, feeding or related behaviour likely to occur within area
<i>Balaenoptera edeni</i>	Bryde's whale	N/A	Migratory	Species or species habitat likely occur within area	Species or species habitat likely occur within area
<i>Megaptera novaeangliae</i>	Humpback whale	N/A	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area Foraging, feeding or related behaviour known to occur within area
<i>Orcinus orca</i>	Killer whale	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Physeter macrocephalus</i>	Sperm whale	N/A	Migratory	Species or species habitat may occur within area	Foraging, feeding or related behaviour known to occur within area
<i>Tursiops aduncus</i> (Arafura/ Timor Sea populations)	Spotted bottlenose dolphin	N/A	Migratory	Species or species habitat known to occur within area	Species or species habitat known to occur within area
<i>Neophoca cinerea</i>	Australian sea-lion	Endangered	N/A	N/A	Breeding known to occur within area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Xeromys myoides</i>	Water Mouse, Yirrkoo	Vulnerable	N/A	N/A	Species or species habitat may occur within area
<i>Balaenoptera bonaerensis</i>	Antarctic minke whale	N/A	Migratory	N/A	Species or species habitat likely occur within area
<i>Caperea marginata</i>	Pygmy right whale	N/A	Migratory	N/A	Foraging, feeding or related behaviour likely to occur within area
<i>Dugong dugon</i>	Dugong	N/A	Migratory	N/A	Breeding known to occur within area
<i>Lagenorhynchus obscurus</i>	Dusky dolphin	N/A	Migratory	N/A	Species or species habitat likely occur within area
<i>Orcaella heinsohni</i>	Australian snubfin dolphin	Vulnerable	Migratory	N/A	Species or species habitat known to occur within area
<i>Sousa sahulensis</i>	Australian humpback dolphin	Vulnerable	Migratory	N/A	Species or species habitat known to occur within area

¹ Pygmy blue whale is the blue whale subspecies typically found in the NWS.

4.6.4 Seabirds and migratory shorebirds

A total of 81 EPBC Listed threatened and/or migratory or seabird and shorebird species have been identified to potentially occur within the Operational Area or EMBA. 28 of these species are listed as threatened and 74 are listed as migratory species (Table 4-11).

The Operational Area overlaps the BIA (breeding) for the wedge-tailed shearwater, as shown in Figure 4-13. There are an additional 24 species with BIAs that are overlapped by the EMBA which are outlined in Table 4-12 and Figure 4-13.

Table 4-11: Threatened and migratory seabird and shorebird species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Calidris ferruginea</i>	Curlew sandpiper	Critically Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Numenius madagascariensis</i>	Eastern curlew	Critically Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Calidris canutus</i>	Red knot	Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Macronectes giganteus</i>	Southern-giant petrel	Endangered	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
<i>Thalassarche carteri</i>	Indian yellow-nosed albatross	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat likely to occur within area
<i>Actitis hypoleucos</i>	Common sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Anous stolidus</i>	Common noddy	N/A	Migratory	Species or species habitat may occur within area	Breeding known to occur within area
<i>Ardenna carneipes</i>	Flesh-footed shearwater	N/A	Migratory	Species or species habitat may occur within area	Breeding known to occur within area
<i>Calidris acuminata</i>	Sharp-tailed sandpiper	N/A	Migratory	Species or species habitat may occur within area	Roosting known to occur within area
<i>Calidris melanotos</i>	Pectoral sandpiper	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
<i>Calonectris leucomelas</i>	Streaked shearwater	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat known to occur within area
<i>Fregata ariel</i>	Lesser frigatebird	N/A	Migratory	Species or species habitat likely to occur within area	Breeding known to occur within area
<i>Phaethon lepturus</i>	White-tailed tropicbird	N/A	Migratory	Species or species habitat known to occur within area	Breeding known to occur within area
<i>Calidris tenuirostris</i>	Great knot	Critically Endangered	Migratory	N/A	Roosting known to occur within area

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Xenus cinereus</i>	Terek sandpiper	N/A	Migratory	N/A	Roosting known to occur within area

Table 4-12: Seabird and shorebird BIAs within the Operational Area and EMBA

Species	BIAs ¹ and approximate distance to the Operational Area			
	Resting	Foraging	Breeding	Aggregation
Australian lesser noddy	No resting BIA identified within the EMBA	Houtman Abrolhos Islands (747 km south-west) (provisioning young)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Bridled tern	No resting BIA identified within the EMBA	West coast of WA and around to Recherche Archipelago including offshore waters (476 km south-west) (provisioning young)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Brown booby	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	Kimberley and northern Pilbara coasts and islands also Ashmore Reef (507 km north-east)	No aggregation BIA identified within the EMBA
Caspian tern	No resting BIA identified within the EMBA	In WA found on most coasts, mainly islands (as far offshore as Adele, Bedout, Trimouille and the Houtman Abrolhos) and at Lake Argyle, Lake Gregory and Lake MacLeod; accidental elsewhere in the interior (679 km south-west) (provisioning young)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Common noddy	No resting BIA identified within the EMBA	Around Lancelin Islands (971 km south-east) Around Houtman Abrolhos Islands (provisioning young) (722 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIAs ¹ and approximate distance to the Operational Area			
	Resting	Foraging	Breeding	Aggregation
Fairy tern	No resting BIA identified within the EMBA	Lower north-west coast (north to Dampier Archipelago), west coast (south to Peel Inlet) and south coast (from Flinders Bay east to Israelite Bay), including islands (as far offshore as Trimouille Island and Houtman Abrolhos Island) (714 km south-west)	Pilbara and Gascoyne coasts and islands (27 km south-west)	No aggregation BIA identified within the EMBA
Flesh-footed shearwater	No resting BIA identified within the EMBA	Cape Naturaliste to Eyre, 1 to 150 km offshore (1,330 km south-east (high abundance))	No breeding BIA identified within the EMBA	Cape Naturaliste to Eyre, 1 to 150 km offshore (1,159 km south-east)
Greater frigatebird	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	Kimberley and Ashmore Reef (1,049 km north-east)	No aggregation BIA identified within the EMBA
Great-winged petrel	No resting BIA identified within the EMBA	Offshore south of Shark Bay, extending around south-west corner of WA and east past Kangaroo Island (1,302 km south-east) (provisioning young)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Indian yellow-nosed albatross	No resting BIA identified within the EMBA	Offshore waters of south-west marine region, north to Shark Bay and extending east into Bass Strait (1,417 km south-east) (provisioning young)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Lesser crested tern	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (57 km north-east)	No aggregation BIA identified within the EMBA
Lesser frigatebird	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	Kimberley and Pilbara coasts and islands also Ashmore Reef (451 km north-east)	No aggregation BIA identified within the EMBA
Little penguin	No resting BIA identified within the EMBA	Perth to Bunbury (1,160 km south-east) (provisioning young) South-west WA from Augusta to Twilight Cove (provisioning young) (1,414 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIAs ¹ and approximate distance to the Operational Area			
	Resting	Foraging	Breeding	Aggregation
Little shearwater	No resting BIA identified within the EMBA	From Kalbarri to Eucla including offshore waters (629 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Little tern	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (646 km north-east) Roebuck Bay Ramsar site (906 km north-east)	No foraging BIA identified within the EMBA	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (633 km north-east)	No aggregation BIA identified within the EMBA
Pacific gull	No resting BIA identified within the EMBA	West coast and islands from Point Quobba south to Wedge Island (688 km south-east) South coast and islands, west to Cape Leeuwin; common around Albany and Esperance and in the Recherche Archipelago (1,415 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Red-footed booby	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	North-west Kimberley and Ashmore Reef (1,049 km north-east)	No aggregation BIA identified within the EMBA
Roseate tern	Eighty Mile Beach (northern end) (801 km north-east)	North-western and west coasts and islands from Sir Graham Moore Island, south to Mandurah and as far offshore as Ashmore Reef, Bedout Island and the Houtman Abrolhos (717 km south-west) (provisioning young)	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (83 km north-east) North-east and North-west Twin Islets near the mouth of King Sound (1,074 km north-east) Low Rocks and Stern Island in Admiralty Gulf (1,464 km north-east)	No aggregation BIA identified within the EMBA
Short-tailed shearwater	No resting BIA identified within the EMBA	Found in the Recherche Archipelago and ranging west to the lower west coast north to 33°40'S (1,680 km south-east) (high abundance)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Soft-plumage petrel	No resting BIA identified within the EMBA	In WA found in seas north to 21°30'S (943 km south-east) (high abundance)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIAs ¹ and approximate distance to the Operational Area			
	Resting	Foraging	Breeding	Aggregation
Sooty tern	No resting BIA identified within the EMBA	Timor Sea south to 14°30', off north-west coast from Lacepede Island south-west to 117°E including Abrolhos, Fisherman and Lancelin islands (499 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
Wedge-tailed shearwater	No resting BIA identified within the EMBA	Ranging in western seas between 12°00'S and 33°20' (476 km south-west) (high abundance)	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (overlaps)	No aggregation BIA identified within the EMBA
White-faced storm petrel	No resting BIA identified within the EMBA	Offshore areas of the south-west marine region and into the adjacent south-east marine region and the north-west marine region to the north of Shark Bay (623 km south-west)	No breeding BIA identified within the EMBA	No aggregation BIA identified within the EMBA
White-tailed-tropic bird	No resting BIA identified within the EMBA	No foraging BIA identified within the EMBA	Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef (551 km north-east)	No aggregation BIA identified within the EMBA

¹ BIA locations are described in the National Conservation Values Atlas.

4.6.5 Seasonal sensitivities for protected species

Seasonal sensitivities for EPBC listed threatened migratory species identified as potentially occurring within and around the Operational Area are identified in Table 4-13. Movement patterns of all protected species identified in Section 4.6 are described in Appendix J.

Table 4-13: Key seasonal sensitivities for EPBC listed threatened migratory species identified as occurring in or near the Operational Area

Species	January	February	March	April	May	June	July	August	September	October	November	December
Fish, sharks and rays												
Great white shark – northern migration (to North West Cape) (DSEWPac, 2013a)												
Whale shark – foraging (northward from Ningaloo)												
Whale shark – foraging (high-density prey, Ningaloo Reef)												
Marine reptiles¹												
Flatback turtle, Pilbara Coast genetic stock – nesting												
Flatback turtle, Pilbara Coast genetic stock – hatching												
Green turtle, NWS genetic stock – nesting												
Green turtle, NWS genetic stock – hatching												
Hawksbill turtle, WA genetic stock – nesting												
Hawksbill turtle, WA genetic stock – hatching												
Leatherback turtle – nesting												
Leatherback turtle – hatching												
Mammals												
East Indian Ocean pygmy blue whale – northern migration (Double et al., 2012; 2014)												
East Indian Ocean pygmy blue whale – southern migration (Double et al., 2012; 2014)												
Humpback whale – northern migration (Double et al., 2010; Threatened Species Scientific Committee (TSSC), 2015a)												
Humpback whale – southern migration (Double et al., 2010; TSSC, 2015a)												
Southern right whale – migration (Department of the Environment (DoE), 2023a)												
Southern right whale – breeding												
Seabirds and shorebirds												
Christmas Island frigatebird – nesting (Hill & Dunn, 2004)												
Curlew sandpiper – non-breeding season (NWMR) (DoE, 2015)												

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Eastern curlew – non-breeding (NWMR) (DoE, 2015d)												
Fairy tern – breeding (Commonwealth of Australia, 2020a)												
Indian yellow-nosed albatross – non-breeding season (Australia) (Agreement on the Conservation of Albatrosses and Petrels, 2012)												
Red knot – non-breeding season (NWMR) (TSSC, 2016a)												
Roseate tern – breeding (Commonwealth of Australia, 2012b)												
Southern giant petrel – non-breeding season (Australia) (DoE, 2023b)												
Wedge-tailed shearwater – breeding (Commonwealth of Australia, 2020d)												
	Species may be present in the Operational Area											
	Peak period. Presence of animals is reliable and predictable each year											

Information regarding seasonal occurrence of marine turtles has been taken from the Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017).

4.7 Key ecological features

Two KEFs overlap the Operational Area (Figure 4-15). KEFs within the Operational Area and EMBA are identified in Table 4-14 and described in Appendix J.

Table 4-14: Key ecological features within the Operational Area and EMBA

Key ecological feature	Approximate distance and direction from Operational Area (km)
Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula	Overlaps
Continental slope demersal fish communities	Overlaps
Ancient Coastline at 125 m depth contour	2.5 km south-east
Commonwealth waters adjacent to Ningaloo Reef	9.3 km south
Exmouth Plateau	81.7 km north-west
Glomar Shoals	321.1 km north-west
Western demersal slope and associated fish communities	476.2 km south-west
Wallaby Saddle	500.1 km south-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	641.1 km north-east
Western Rock Lobster	679.3 km south
Ancient Coastline at 90 to 120 m depth	680.5 km south
Perth Canyon and adjacent shelf break, and other west coast canyons	707.4 km south
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	719 km south
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	721.2 km south
Canyons linking the Argo Abyssal Plain with the Scott Plateau	954.4 km north-east
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	1,135.2 km north-east
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	1,383.9 km north-east

4.9 Cultural features and heritage values

4.9.1 Background

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of the Operational Area and EMBA are described.

In line with The Burra Charter: The Australia International Council on Monuments and Sites (ICOMOS) Charter for Places of Cultural Significance (ICOMOS, 2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual or group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term "fabric" and refer to a place's elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible and intangible dimensions (ICOMOS, 2013).

Woodside has undertaken heritage assessment to identify potential cultural values or features that may be impacted by the Petroleum Activity. This assessment has not identified heritage places, objects or values which will be impacted by the activities planned under this EP (discussed in Section 6.10). However, through consultation with relevant persons, Woodside recognises the spiritual and cultural connection to the environment² that First Nations people hold.

4.9.2 First Nations peoples

As a starting point for understanding cultural features of the environment for First Nations groups, Woodside uses the existing systems, such as native title, to identify First Nations groups that may have functions, interests or activities that may be affected. Woodside identifies native title representative bodies and nominated representative entities (defined in Section 5.3.2) as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. While acknowledging that cultural features and heritage values may exist outside of the native title framework, Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the *Native Title Act 1993* (Cth) for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area (Native Title Tribunal).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of *Mabo v Queensland (No 2)* [1992] HCA 23; (1992) 175 CLR 1 ('Mabo'). Justice Toohey had the following to say (at 187):

it is inconceivable that Indigenous inhabitants in occupation of land did not have a system by which land was utilised in a way determined by that society. There must, of course, be a society sufficiently organised to create and sustain rights and duties...

² 'Environment' in Regulation 5 of the Environment Regulations is defined as:

- ecosystems and their constituent parts, including people and communities
- natural and physical resources
- the qualities and characteristics of locations, places and areas
- the heritage values of places, and includes
- the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d).

Therefore, Woodside understands that native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist, they will be held by a Registered Native Title Body Corporate (section 57, *Native Title Act*) in trust or as agent for native title holders.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area, or
- a native title claim has been made, or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders (Native Title Tribunal).

The *Native Title Act* also provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the *Native Title Act* within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

For the activity in this EP, there are no native title claims or determinations and no ILUAs overlapping the Operational Area; however, 26 native title claims and 44 ILUAs overlap the EMBA (see Figure 4-17). A summary of native title claims, determinations and ILUAs which are coastally adjacent to the EMBA is set out in Table 4-16. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

4.9.2.1 Coastally adjacent First Nations groups

Woodside understands that First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth, 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (see Table 4-16).

Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for First Nations groups and individuals. This may also, over time, build expectations in the broader First Nations community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge. Woodside also acknowledges that a First Nations group's relative proximity to the Operational Area or EMBA is not necessarily a meaningful indicator of the connection of First Nations groups to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in Table 4-16. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

4.9.3 Marine and national parks

Woodside acknowledges that Commonwealth and State marine park management plans have sought to recognise cultural values of First Nations groups. AMPs describe this framework in the following way: “*when making decisions about what can occur in marine parks and what action we will take to protect marine parks, we take values into account*”. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values.

Woodside undertakes an assessment of cultural values within marine park management plans where the Operational Area or EMBA overlaps an AMP. Woodside considers the management plans of marine parks that overlap the Operational Area and EMBA to determine whether cultural features and heritage values have been identified and whether there are specified representative bodies referenced to contact regarding potential cultural features and heritage values:

- The Operational Area does not overlap any Commonwealth Marine Parks.
- The Operational Area does not overlap any State Marine Parks.

- The EMBA overlaps 17 AMPs managed under the South-West Marine Parks Network Management Plan 2018, North-West Marine Parks Network Management Plan 2018 and North Marine Parks Network Management Plan 2018.
- The EMBA overlaps 12 State Marine Parks.
- The EMBA overlaps the Christmas Island AMP for which management plans are still being developed. No First Nations groups or cultural values are identified for this AMPs in the respective values statements (DNP, 2022a; 2022b).

Where the plans for these marine parks specify identifiable representative bodies who may hold knowledge of heritage values or cultural features – including but not limited to Registered Native Title Bodies Corporate – these bodies are consulted. Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Where specified identifiable representative bodies for the AMPs overlapped by the EMBA are expressed in Table 4-17.

The marine park management plans did note across the various AMPs that Yamatji Marlpa Aboriginal Corporation (YMAC), Kimberley Land Council, South West Aboriginal Land and Sea Council (SWALSC) are the relevant Native Title Representative Bodies or Native Title Service Providers. YMAC and Kimberley Land Council were requested to identify Traditional Custodians who may hold knowledge of heritage values or cultural features (see Table 4-17). Woodside consults with relevant Regional Corporations formed under the South West Native Title Settlement (see Appendix F).

4.9.4 Sea Country values

'Sea Country' can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that *"the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as 'Saltwater Country' or 'Sea Country'. 'Country' refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area."* (Smyth, 2007). "Sea Country is valued for Indigenous cultural identity, health and wellbeing" (DNP, 2018b). Cultural identity is understood to refer to the fact that *"essence of being a 'Saltwater' person is ontological rather than merely technological. That is, it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people"* (McDonald & Phillips, 2021).

In terms of seascape extent, McNiven (2004) suggests that *"For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20 to 30 km out to sea, out to the horizon and the limit of human visibility...However, in some coastal places, clouds that can be seen well over 100 km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon."* While there is some evidence of traditional watercraft in Australia's North-West, the recorded evidence is limited to travel across inland rivers (e.g. Barber & Jackson, 2011) or travel between coastal islands (Paterson et al., 2019).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government's Indigenous Protected Areas (IPAs) Program. The IPAs Program provides for *"areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their Country for future generations..."* (Department of Climate Change, Energy, the Environment and Water (DCCEEW), 2023). This intrinsic link concept is also described by MACas it relates to the values of the marine environment that are of cultural importance to MAC based on engagement with their Elders and Murujuga Land and Sea Unit Rangers. Elders were clear that all living

things in Mermaid Sound are connected and that Mermaid Sound and Dampier Archipelago (Murujuga) are considered one place where the entire environment and all ecosystems hold both cultural and environmental value, with these types of values (cultural and environmental) intrinsically linked (MAC, 2021 as cited in Woodside 2023a).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple First Nations language groups. Some species may travel as far as 5,000 km from Antarctica to the Kimberley region of WA (Double et al., 2010; 2012), passing First Nations language groups along the entire west coast of Australia. Distribution and migratory patterns of migratory species are described in Section 4.6 and Appendix J.

Sea Country values have been defined using multiple lines of evidence, including:

- desktop assessment of Sea Country values from publicly available sources
- specific studies including ethnographic surveys and archaeological heritage assessments
- consultation with First Nations groups and individuals.

The process for identifying First Nations groups who may have interests and connection in Sea Country are set out in Section 4.9.2.1 and Section 5. The scope of advice Traditional Custodians were encouraged to provide through project consultation was not limited by reference to any particular boundaries or limits of Sea Country.

4.9.4.1 Desktop assessment of Sea Country values

4.9.4.1.1 Cultural features and heritage values identified in publicly available literature

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the EMBA or Operational Area. Where cultural features or Sea Country values were identified these are summarised in Table 4-18 according to the First Nations groups (where identified or inferable) who hold these values. Except where specific references are made to cultural values, these are considered to be addressed through the management of environmental values and are not summarised in this section.

Table 4-18: Cultural features and heritage values identified in publicly available literature

First Nations group	Features and values	Source	Potential for Overlap	
			Operational Area	EMBA
Bardi and Jawi	Feature: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya, which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.	Sampi on behalf of the Bardi and Jawi People v State of Western Australia [2010] FCAFC 26	No	Possible (unspecified)
	Feature: Mythologically important places.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including dugong, turtle and trochus shell.		No	Possible
	Value: Activities of mythological beings in the sea area.		Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge of the sea and the features within.		Possible (unspecified)	Possible (unspecified)

First Nations group	Features and values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: The lands and seas and cultural forms and practices making up the body of customary Law were created and bequeathed via generations of human forebears by supernatural beings, inamunonjin, who had occupied and/or traversed the Dampier Peninsula-Buccaneer Archipelago region prior to direct human experience of the world.		Possible (unspecified)	Possible (unspecified)
	Value: The inamunonjin shaped features of the physical environment and imbued them with their eternal numinal essence. They named sites and set the boundaries of traditional territories and introduced the religious resources such as songs, dances, designs, objects, myths and rituals through which their activities would continue to be celebrated and affirmed. They instituted the basic rules of customs regulating social order.		No	Possible (unspecified)
	Value: The offspring of Bardi and Jawi men inhabit the phenomenal world as incarnations of pre-existent spirit beings called ray or raya which live in specific locations throughout Bardi and Jawi territory including waterholes, springs, trees and rocks on the land or in the sea.		No	Possible (unspecified)
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for hunting and fishing.		No	Possible
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for travelling.		No	Possible
	Value: Nobody may access Alarm Shoals as this includes a very significant sacred site and is a very dangerous spiritual place.		No	Possible
	Value: Lalariny, a rock feature in the vicinity of Thomas Bay, has a close association with a particular spiritual being and " <i>nobody should go there</i> "; people who do may be afflicted by a form of physical discomfort.		No	Possible
	Interest: Environmental characteristics of the sea.		Possible (unspecified)	Possible (unspecified)

First Nations group	Features and values	Source	Potential for Overlap	
			Operational Area	EMBA
Gnulli (Baiyungu, Thalanyji, Yinggarda)	Feature: Resources including marine animals.	Peck on behalf of the Gnulli Native Title Claim Group v State of Western Australia [2019] FCA 2090	Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge holds that ancestors live on the land and in the water. Therefore, people have obligations to access and care for these places (e.g. keeping them clean).		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including mangrove crabs, gastropods, shellfish, dugong, turtle).	Morse, 1993	Possible (turtle; Section 4.6.3) No (other resources)	Possible (turtle; Section 4.6.3) No (other resources)
Jabirr Jabirr and Ngumbarl	Feature: Dreaming stories relating to inland areas associated with the headwaters of creeks running west through Jabirr Jabirr Country.	National Native Title Tribunal. Registration Test Decision. Rita Augustine & Ors v State of Western Australia (Jabirr Jabirr). NNTT number WC2013/007	No	No
	Feature: During Bugarrlgarra (the Dreaming), a snake travelled from Nurrugun (Carnot Bay) in Jabirr Jabirr Country down to Ngumbarl Country and across into Yawuru Country. When this snake crossed Willie Creek, he changed his name and his kinship group ("skin").		No	Possible
	Value: Sites along the coast point to protracted economic and spiritual use of the land and include artefact scatters, middens, burials and/or ceremonial sites, sites of mythological and historical significance, fish traps and gender-restricted sites.		No	Possible (unspecified)
	Value: Coastal areas used for hunting, fishing and camping.		No	Possible (unspecified)
	Value: Traditional knowledge of the 'changes in seasons which rests on the relationships between the living things within a particular area'.		No	Possible (unspecified)
Kariyarra	Value: Traditional knowledge recalls that a salt water serpent lives in the sea and brings fish to shore.	Zaunmayr, 2016	Possible (unspecified)	Possible (unspecified)
Malgana	Feature: Resources including bobtail, long-tail, kangaroo, emu, pinkgrey galah, mull-hawk, bird eggs (shags [cormorants], seagull, divers), turtle eggs, dugongs, turtle, mullet, bluebone, whiting, snapper, oysters, mussels, crabs, prawns, scallops, cockles, little 'redies', black snapper and mallee fowl.	Oxenham on behalf of the Malgana People v State of Western Australia [2018] FCA 1929	Possible (unspecified)	Possible (unspecified)

First Nations group	Features and values	Source	Potential for Overlap	
			Operational Area	EMBA
	Value: Access to Country.		No	Possible (unspecified)
	Feature: Resources including dugong, green and loggerhead turtles and sharks.	Statton et al., 2021	Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge maintains records of freshwater seeps in the submerged landscape.		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including fish, shellfish, turtles and dugong.	Briggs & Green, 2008	Possible (unspecified)	Possible (unspecified)
	Feature: Archaeological sites.		No	Possible
	Feature: Green sea turtles, dugongs, shags and bottlenose dolphins are species of cultural significance.	Malgana Land and Sea Management et al., 2021	No	Possible
	Value: Sharing and controlling the sharing of knowledge.	Lyons et al., 2021	Possible (unspecified)	Possible (unspecified)
Nanda	Value: Access to Country resulting in physical and mental health.	Drury on behalf of the Nanda People v State of Western Australia [2018] FCA 1849	No	Possible (unspecified)
	Value: Water serpents must not be disturbed in pools.		No	No
	Value: Traditional knowledge recalls that a water serpent swam down the Murchison River towards the sound of the ocean's waves and created a tunnel to the sea. Scared by the waves, the serpent swam back up the Murchison.	Kalbarri Visitor Centre, 2023	No	No
	Value: Traditional knowledge recalls that the turtle used to live on the land, but became trapped in the sea due to its greed for berries in the water.	Capewell, 2020	Possible	Possible
	Value: Traditional knowledge recalls that creation ancestors danced at the mouth of the river at Kalbarri and established the Law.	Murdock, 2010	No	Possible (unspecified)
Ngarda-Ngarli (Mardudhunera, Ngarluma, Wong-Goo-Tt-Oo, Yaburara and/or Yindjibarndi)	Feature: Archaeological sites on Murujuga.	Department of the Environment and Heritage, 2006	No	Possible (submerged)
	Feature: Ceremonial sites.		No	No
	Feature: Dreaming sites.		Possible (unspecified)	Possible (unspecified)
	Value: Traditional knowledge recalls that the sea is a source of creation for flying foxes.	Department of Environment and Conservation, 2013	Possible (unspecified)	Possible (unspecified)
	Value: Petroglyphs are understood as permanent signs left by ancestral beings.		No	Possible (submerged)

4.9.4.2 Studies of cultural features and heritage values

4.9.4.2.1 First Nations archaeological heritage assessment

Woodside understands that communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al., 2017) and in many places maintain a strong continuing connection that is said to extend back in First Nations cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of First Nations occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al., 2019; University of Western Australia (UWA), 2021). Woodside also understands that, at its lowest level during First Nations occupation, sea level was between 125 m (O'Leary et al., 2020; Veth et al., 2019; Williams et al., 2018) and 130 m below current levels (Benjamin et al., 2020; Benjamin et al., 2023; UWA, 2021). Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al., 2019; UWA, 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited and can retain archaeological material from this time (Benjamin et al., 2020; Benjamin et al., 2023; see Ward et al., 2021 for an opposing view).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (see Section 4.7) as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible First Nations occupation. The Operational Area does not overlap the Ancient Landscape; however, the EMBA does.

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or *EPBC Act 1999*. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no First Nations archaeology known to exist anywhere within Commonwealth waters, and no areas subject to declarations or prescriptions under these Acts are located within the EMBA.

For this EP, a search of Department of Planning, Lands and Heritage's Aboriginal Cultural Heritage Inquiry System was undertaken, which showed 315 registered Aboriginal sites in the EMBA (see Appendix D).

If First Nations archaeological material is identified within the Operational Area, Woodside will discuss the management of this material with appropriate Traditional Custodian group(s), starting with any adjacent Native Title Body Corporate.

4.9.4.3 Consultation feedback to inform existing environment

4.9.4.3.1 Summary of values raised during consultation

A summary of the topics/interests and values raised by First Nations groups through consultations on this Petroleum Activity, or raised in the context of general project activities or other activities are provided in Table 4-19.

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that *“Aboriginal and Torres Strait Islander heritage is managed...according to community ownership”* (Heritage Chairs of Australia and New Zealand, 2020). Dhawura Ngilan also specifically notes that *“Aboriginal and Torres Strait Islander...intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community...”* Through consultation Registered Native Title Bodies Corporate and nominated representative corporations have identified or raised topics relating to environmental values of cultural interest. Woodside recognises the deep spiritual and cultural connection to the environment³ that First Nations people hold.

The Program of Ongoing Engagement with Traditional Custodians (Appendix G) provides a mechanism for ongoing dialogue between Woodside and Traditional Custodians, beyond that required by Regulation 25. The program enables Woodside to manage the potential impacts and risks to cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians. As an example, Woodside is developing a framework for ongoing consultation with BTAC and other groups (Appendix G). Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its management of change and revision process (see Section 7.6).

³ Definition of 'Environment' in Regulation 5 of the OPGGS (Environment) Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities
- b) natural and physical resources
- c) the qualities and characteristics of locations, places and areas
- d) the heritage values of places, and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d).

Table 4-19: Feedback received via consultation to inform existing environment description

Relevant First Nations group/ individuals	Consultation context	Description of feature and value/interest	Potential for overlap	
			Operational Area	EMBA
BTAC representing some of the Gnulli native title claimants (Baiyungu and Thalanyji people)	Raised in context of consultation on activities subject to other EPs	Value: Cultural obligation to care for the environmental values of Sea Country. Sea Country extends “out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands”.	Possible (unspecified)	Possible (unspecified)
Kariyarra Aboriginal Corporation	Raised in context of consultation across various EPs	Feature: Intangible cultural heritage sites including Yinta (ancestral sites underpinning Law and connection to Country).	Possible (highly unlikely due to distance)	Possible (unspecified)
		Feature: Coastal landforms.	No	Possible (unspecified)
		Feature: Coastal native vegetation.	No	Possible (unspecified)
		Feature: Tangible cultural heritage sites.	No (feature restricted to Ancient Landscape)	Possible
		Value: resource collection including fishing; trapping; crabbing; catching turtles, dugong and stingray; and collecting shellfish.	No	Possible
		Value: Access to Country including visiting offshore islands at low tide.	No	Possible (unspecified)
		Value: Intergenerational knowledge transfer.	Possible (highly unlikely due to distance)	Possible (unspecified)
		Value: Cultural obligations to care for Country, including Sea Country.	Possible	Possible
		Value: Marine resources – in relation to adverse event [hydrocarbon spill].	Possible	Possible

Relevant First Nations group/ individuals	Consultation context	Description of feature and value/interest	Potential for overlap	
			Operational Area	EMBA
		Value: Responsibility to care for Sea Country. Value: Marine resources. Kariyarra explained the most important thing is the preservation of sea life and coastal areas. The ocean provides critical food sources to their community and Kariyarra Traditional Owners are coastal people so they have a strong connection to the area and a responsibility to preserve the area for future generations.	Possible (unspecified) Possible	Possible (unspecified) Possible
		Value: River systems are important to the food chain.	No	No
		Value: Marine resources: • shellfish • cockles • oysters • clam shells • con shells • mullets • sea cow (dugong).	Possible (all) No (dugong)	Possible (all)
Murujuga Aboriginal Corporation representing Ngarda-Ngarli people (Mardudhunera, Ngarluma, Wong-Goo-Tt-Oo, Yaburara and Yindjibarndi)	Raised in context of consultation on activities subject to other EPs	Value: Mermaid Sound – ecosystem health.	No	Possible
		Feature: Whale. Value: A whale thalu is an increase at a totemic site that brings whales into beach. Value: Whales and other species of totemic importance need to be protected, including their populations, biodiversity and migration patterns. Value: Whales are culturally important species that migrate through Mermaid Sound. Humpback whales in particular.	Possible (Section 4.6.3) Possible (unspecified) Possible Possible	Possible (Section 4.6.3) Possible (unspecified) Possible Possible
		Feature: Dolphins. Value: There are cultural ceremonies associated with communicating with dolphins.	Possible Possible (unspecified)	Possible Possible (unspecified)

Relevant First Nations group/ individuals	Consultation context	Description of feature and value/interest	Potential for overlap	
			Operational Area	EMBA
		Feature: Dugongs. Value: Dugongs are a food source associated with seagrasses near Gidley Island.	No No	No No
		Feature: Fish. Value: There are thalu ceremonies associated with increasing fish stocks.	Possible Possible (unspecified)	Possible Possible (unspecified)
		Feature: Sea snakes. Specifically mentioned as culturally important species.	Possible	Possible
		Feature: Flatback, green, hawksbill, loggerhead and leatherback turtles. Turtles are culturally important species that moves through Mermaid Sound. Turtles are most often seen in shallower areas and where there are seagrasses. Most beaches are nesting sites for turtles, including those on Gidley and Legendre Islands. Value: The songline associated with the turtle comes from Fortescue to Withnell Bay. This song is sung by four or five tribes for day and night without consuming food or water.	Possible (turtle; Section 4.6.2) No No	Possible (turtle; Section 4.6.2) Possible Possible
		Interest: Coral. Fish are attracted to areas with coral. Concerned about coral bleaching because corals are important. Beautiful colours. They also attract a lot of other things. Fish carry coral spawn like bees pollinate flowers. If fish were looked after, the corals would get brighter and brighter (by transmitting nutrients and performing other ecosystem services, fish can be symbiotic with corals). Spawning events should be avoided (associated with full moon). Locations identified during consultation include Withnell Bay; Conzinc Bay; south-west of Legendre Island.	No (Section 4.5)	Possible (Section 4.5)

4.9.4.3.2 Further information regarding Buurabalayji Thalanyji Aboriginal Corporation's Sea Country values

During consultation, BTAC, on behalf of the Thalanyji People, advised it has a cultural obligation to care for the environmental values of Sea Country (refer to Appendix F, Table 1).

In correspondence from 20 February 2023 relating to another Woodside project, BTAC advised that:

BTAC seeks support from Woodside to enable BTAC to define and articulate its values on Sea Country in a manner that could be more clearly understood by the offshore sector, government, and the community. This would enable BTAC and Woodside to collaborate to develop effective management plans that can provide adequate protection to Sea Country values; and BTAC seeks support from Woodside to obtain technical support to review the information and provide BTAC and its members with feedback on the project risks to Sea Country and help BTAC contemplate the potential management controls that could be developed to protect its values and interests.

These requests do not constitute a request for an ethnographic survey. Woodside has agreed to BTAC's request, and the resulting offer of technical support is detailed in Appendix F, Table 1. However, Woodside's offer for technical support has not yet been accepted.

BTAC noted that this Sea Country extends "out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands." In the absence of further advice from BTAC, Woodside understands from this description that BTAC's interests extend to the Montebello Marine Park Multiple Use Zone in the vicinity of the islands.

While an ethnographic survey has not been requested, a review of publicly available literature has been undertaken to seek clarity on the extent of Sea Country for Thalanyji people. This review identified a number of heritage research projects undertaken for the Montebello and Barrow Islands which acknowledge the support of BTAC (e.g. Manne & Veth, 2015; Veth et al., 2017), though no information regarding Sea Country values, or the extent of Sea Country, were identified.

Publicly available heritage assessment reports elsewhere on Thalanyji Country tend to rely on established native title boundaries (e.g. Chisholm, 2013) or draw on historic maps, particularly those compiled by Norman Tindale and published in 1947 (e.g. Archae-aus, 2020). An early 1940s map by Tindale shows "Talaandji" (Thalanyji) Country as exclusively terrestrial and further west than areas typically recognised today as Thalanyji Country (Tindale 1940). This map also shows the Noala people as custodians of the Onslow area and defines Barrow and the Montebello Islands as "Mardudhunera" (Mardudhunera) Country – it is unclear from the map if the boundary of Mardudhunera is proposed to represent an extent of Sea Country, or merely note that these islands are part of Mardudhunera Country. A further refined version of this map was produced in 1974 which shows "Talandji" in a location more closely aligned with contemporary understanding of Thalanyji Country and removes the apparent extent of Mardudhunera over Barrow and the Montebello Islands" (Tindale, 1947). This definition of Thalanyji Country is still confined to the mainland in this map. A more contemporary attempt at mapping traditional Country is shown in the Australian Institute of Aboriginal and Torres Strait Islander Studies Map of Indigenous Australia (Horton, 1996). This map similarly confines Thalanyji Country to terrestrial areas west of Onslow and leaves Barrow and the Montebello Islands unmarked as an area with "No published information available". It is also noted that "This map is based on data collected up to 1994 and is not intended to show precise areas or boundaries" (Horton, 1996).

Collective assessments of Sea Country in the Pilbara (Lincoln & Hedge, 2019; YMAC et al., 2010) were also found to rely on existing native title boundaries. It is noted in the Pilbara Sea Country Plan (YMAC et al., 2010) that:

Although some differences remain, between and among native title groups, there is now a general sense that most groups have coalesced into final forms that will, in future, be the groups that exercise rights and interests in their respective areas. many of these rights and interests will relate directly to native title. however, there is also a more broadly based appreciation of the need to accept and discharge responsibilities for land and marine management within native title areas regardless of whether native title per se is affected. (YMAC et al., 2010, emphasis added).

The office of the Registrar of Indigenous Corporations records four corporations using the name Thalanyji:

- Buurabalayji Thalanyji Aboriginal Corporation
- Buurabalayji Thalanyji Aboriginal Corporation Registered Native Title Body Corporate

- Onslow Thalanyji Aboriginal Corporation
- Wurrumalu Thalanyji Aboriginal Corporation.

The only currently operative organisation, and the only organisation with an identifiable website, is BTAC Registered Native Title Body Corporate. This website states that "*Thalanyji Country spreads out across the Ashburton River coastal plain south to Tubridji Point, then across to Yannarie River and upstream to Emu Creek, across the range hills of southwest Pilbara to Henry River and Cane River in the north*" (BTAC, 2021). This description includes coastal areas but provides no description of the extent of Sea Country.

A search of the National Native Title Tribunal register of applications and determinations identified four historic native title claims with the name Thalanyji:

- Thalanyji People (WC1995/002)
- Thalanyji People #2 (WC1996/082)
- Thalanyji (WC1999/045)
- Thalanyji 2 (WC2010/004).

Most of these claims were dismissed, and Woodside makes no assessment of the merits of these claims.

The area of WC1995/002, as defined in the map forming Attachment 1 to the Native Title Application⁴, does not include any areas of Sea Country. WC1996/082 does not include a publicly available map on the National Native Title Tribunal website. The Native Title Application⁵ does describe the area covered by the claim, including "*This country extends from the Tubridji Point on the coast south west of Onslow and tracking south to Yanarrie River.*" and "*The area also includes the waters and associated islands between Tubridji point and Cane River. These islands were visited by Thalanyji People.*" The extent of this Sea Country from the coast is unclear, but would presumably include islands as distant as Airlie Island, approximately 30 km from the shore.

The area of WC1999/045, as defined in the map forming Attachment C to the Native Title Application⁶, includes an area of water extending approximately 30 km from the mainland coast in encompassing a number of islands, including Airlie Island, Ashburton Island, Bessieres Island, Direction Island, Flat Island, Locker Island, Round Island, Serrurier Island, Table Island, Thevenard Island, Tortoise Island and the Twin Islands. The area also includes the south-most of the Mangrove Islands, but does not include the other Mangrove Islands.

The area of WC2010/004, as defined in the map forming Attachment C to the Native Title Application⁷ includes localised areas of sea up to approximately 5 km beyond the coast.

In none of these applications do the extent of asserted interests extend to Barrow, Mackerel or the Montebello Islands. The furthest extent of a claim is the approximate 30 km margin extended from the mainland coast for WC1999/045. If this margin is precautionarily applied to the coasts of the Montebello Islands (as the closest islands to the Operational Area which were identified by BTAC in defining their Sea Country) this would not exceed beyond the Montebello Multiple Use Zone within the vicinity of the islands.

In summary, the publicly available information considered in this section does not record any instances of Thalanyji Sea Country extending beyond the Montebello Multiple Use Zone within the vicinity of the islands. The Montebello Islands, Barrow Island or the Mackerel Islands or the Montebello Marine Park Multiple Use Zone, or the islands indicated in WC1999/045 are outside of the Operational Area and EMBA for the activity.

Woodside has developed a robust understanding of Thalanyji Sea Country cultural values and heritage features through publicly available information (Section 4.9.4.1) and consultation with BTAC under Regulation 25. Woodside considers that it has taken all reasonable steps to identify cultural features and heritage values of Thalanyji people in the EMBA.

⁷ http://www.nntt.gov.au/searchReqApps/NativeTitleClaims/NTDA%20Extracts/WC2010_004/WC2010_004%202.%20Map%20of%20Application%20Area.pdf

If further guidance from BTAC is received as part of ongoing consultation which changes Woodside's understanding of the extent of Thalanyji Sea Country, Woodside's management of change and management of knowledge processes within EPO 22 will be applied to manage potential impact to newly identified cultural values or features to ALARP and acceptable levels. This estimation does not limit the extent of consultation with BTAC or the features and values they are encouraged to identify and communicate.

4.9.4.4 Summary of cultural features and heritage values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under Regulation 25.

Table 4-20 consolidates the cultural features and heritage values identified in Section 4.9.4 and confirms whether there is any potential for these to exist within the Operational Area or EMBA. It also includes topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Sections 6.6, 6.7 and 6.8.

As cultural features are physical elements of a place, these can generally be assessed for impacts; where a feature is avoided, it is not impacted. Heritage values relate less to what is significant and more to why something is significant; interaction between heritage values and the Operational Area can only be reliably informed by consultation with Traditional Custodians where they are willing to share the necessary knowledge. Assessment of heritage values beyond cultural features alone is addressed in Section 6.10 subject to these caveats.

Table 4-20 Summary of cultural features and heritage values

Identified cultural features and heritage values (incl. interests)	Context	EP source			Potential for overlap	
		Consultation Feedback	First Nations archaeological heritage assessment	Desktop literature assessment	Operational Area	EMBA
Archaeological heritage						
None identified – refer to Section 4.9.4.5.						
No archaeological sites have been identified beyond terrestrial or intertidal areas, except for two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al., 2020; Benjamin et al., 2023). It is recognised that there is the potential for submerged archaeological sites on the Ancient Landscape as noted in Table 4-19.						
Intangible values						
Songlines	Consultation and desktop literature noted Dreaming tracks from locations onshore and to islands outside of the EMBA, and through the sea generally, but was not able to determine the routes of any Dreaming tracks that may extend across the submerged landscape within the Operational Area.	✓	X	✓	Possible (unspecified)	Possible (unspecified)
Creation/Dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to Creation/Dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally, but cannot be confirmed to relate to features within the EMBA.	✓	X	✓	Possible (unspecified)	Possible (unspecified)
Cultural obligations to care for Country	Cultural obligation to care for the environmental values of Sea Country. Exclusion of Traditional Custodians from Sea Country or decision making processes may inhibit ability to care for Country.	✓	X	✓	Possible (unspecified)	Possible (unspecified)
Knowledge of Country/customary Law and transfer of knowledge	The preservation and transmission of knowledge is dependent on the preservation of the environment generally. Exclusion of Traditional Custodians from Sea Country may inhibit the transfer of knowledge.	✓	X	✓	Possible (unspecified)	Possible (unspecified)

4.9.4.5 Further context: intangible cultural heritage

Intangible cultural heritage has been identified through consultation with First Nations people as culturally important. Cultural knowledge, as expressed through songlines, Dreaming, dance and other cultural practices, can be associated with tangible objects and physical sites that are culturally important to First Nations people (Adler, 2021; Bursill et al., 2007). Intangible cultural heritage can also be embodied in the practices, representations, expressions, knowledge, uses and skills associated with physical sites (United Nations Educational, Scientific and Cultural Organization (UNESCO), 2003). As a result, physical features may have intangible dimensions (ICOMOS, 2013).

4.9.4.5.1 Songlines

Oral songlines are often described by First Nations people as the Law of the land and make up part of the Dreaming (Neale & Kelly, 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes across the landscape that mark significant sites for First Nations people (Higgins, 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts, 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins, 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale & Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge.

In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale & Kelly, 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country – for example connections to nearby islands that they once inhabited in their songlines (Smyth & Isherwood, 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins, 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale & Kelly, 2020:83–84).

The routes of any songlines in the EMBA have not been provided by Traditional Custodians through consultation.

4.9.4.5.2 Creation/Dreaming sites, sacred sites and ancestral beings

The only sources located by Woodside with detailed descriptions of the location ancestral beings or Creation, Dreaming or other sacred sites placed these on land or within inland water sources such as rivers or pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in First Nations cosmology.

4.9.4.5.3 Cultural obligations to care for Country

Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature reviewed by Woodside, caring for Country was noted to include, but is not limited to, maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions such as caring for ancestral beings or ensuring cultural safety. Thalu are places where increase ceremonies are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where e.g. a thalu relates to marine species populations.

4.9.4.5.4 Knowledge of Country/customary Law and transfer of knowledge

Knowledge of and familiarity with the features of Sea Country is itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. Further, connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald & Phillips, 2021).

Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003).

4.9.4.5.5 Connection to Country

Connection to Country describes the multi-faceted relationship between First nations people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many First nations people. In the case of Sea Country this can mean identifying as a Saltwater person, where *“essence of being a ‘Saltwater’ person is ontological... it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people”* (McDonald & Phillips, 2021).

4.9.4.5.6 Access to Country

Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet, n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.

4.9.4.5.7 Kinship systems and totemic species

Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). Kinship arises from totemic associations within First Nations “skin group” systems. It is forbidden for an individual to kill or eat a species who is from the same “skin group” (Juluwarlu, 2004). They may also have certain obligations linked to the discussion of caring for Country below. It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu, 2004).

4.9.4.5.8 Resource collection

A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

4.9.4.6 Further context: marine ecosystems and species

4.9.4.6.1 Marine mammals

Whales, and in particular humpback whales, have been identified through consultation with First Nations people as culturally important species, with totemic importance including their populations, biodiversity, and migration patterns. Cultural ceremonies associated with communicating with dolphins have also been raised by MAC through consultation.

Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler, 2023; Bursill et al., 2007; Cressey, 1998). Whales also speak to a broader connection that exists between First Nation people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to First Nations people (Fijn, 2021:47).

Details pertaining to whales and dolphins, their distribution, migration patterns and populations are described in Section 4.6.3, with further details in Appendix J (Master Existing Environment).

4.9.4.6.2 Marine reptiles

Turtles and sea snakes have been identified through consultation with First Nations people as culturally important species, with turtles identified as a resource. First Nations people that identify marine reptiles as species of totemic importance or integral to songlines may place high cultural value on their protection. No marine reptiles -related songlines have been identified as per Section 4.9.4.5 that have the potential to interact with the Operational Area or EMBA. Note the only songline related to marine reptiles (turtles) was shared by MAC, and was geographically restricted from Fortescue to Withnell Bay, in Mermaid Sound (MAC, 2021).

Turtle symbology expressed through stories, music, and dance can reflect an individual or group's connections with the sea, as well as marine fauna, and comprise First Nations' cultural values (Ardler, 2023; Bursill et al., 2007). Beyond mythology and symbolism, turtles can be connected with various economic and social functions associated with everyday life including hunting and settlement location. Turtles speak to a broader connection that exists between First Nation people and their surrounding environment, including cultural values associated with food security (Delisle et al., 2018:250).

Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to First Nations people (Fijn, 2021:47; Delisle et al., 2018). Details pertaining to marine reptiles, their distribution, and populations are described in Section 4.6.2, with further details in Appendix J (Master Existing Environment).

4.9.4.6.3 Fish

Fish have been identified through consultation with First Nations people as a culturally important species, with fish generally being identified as a resource.

First Nations may identify cultural values associated with fish species as important to maintaining both tangible (physical cultural sites) and intangible (cultural knowledge) cultural heritage. Tangible cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. Traditional fish traps require traditional knowledge of the surrounding environment and may involve specialised techniques which have been developed in adaptation to location conditions over time (Fijn, 2021:63).

Intangible cultural heritage associated with fish include songlines, Dreaming, art, song and dance. Cultural values relating to fish, and other marine fauna, can collectively capture 'Sea Country' which refers to a seascape that Traditional Custodians view, interact with or hold knowledge of. As a result, fish may be culturally value in relationship with broader marine environmental values that are of cultural importance to First Nations people (Smyth, 2007).

Details pertaining to fish, sharks and rays are described in Section 4.6.1, with further details in Appendix J (Master Existing Environment).

4.9.4.6.4 Natural environment interests

First Nations people have advised through consultation that they have a general interest in environmental management and ecosystem health, including understanding changes in water quality as a result of the Petroleum Activity and potential resultant effects on marine species and benthic communities in the Operational Area and EMBA. This includes marine mammals, marine reptiles, fish, seabirds, plankton and subtidal soft bottom communities, which are described in context of their distribution and populations in Section 4.6, with further details in Appendix J (Master Existing Environment).

4.9.5 Heritage listed places

No listed World, National or Commonwealth Heritage places overlap the Operational Area.

A search of the Australasian Underwater Cultural Heritage (UCH) database, which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other UCH) in Australian waters indicated that there are no underwater heritage sites or shipwrecks within the Operational Area.

Within the EMBA there are three World Heritage properties, 11 National Heritage places and 16 Commonwealth Heritage places; these are all listed in Table 4-22. There are also 25 recorded shipwrecks within the EMBA, listed in Table 4-21.

Also, within the EMBA, Ningaloo Reef, Exmouth and the adjacent coastline have a long history of occupancy by Aboriginal communities. The longstanding relationship between Aboriginal people and the land and sea is prevalent in Indigenous culture today and Indigenous heritage places, including archaeological sites, are protected under the *Aboriginal Heritage Act 1972* (WA) or EPBC Act.

For this EP, a Department of Planning, Lands and Heritage search was undertaken, which indicated a number of registered Indigenous heritage places in the EMBA (Appendix D). The exact location, access, and traditional practices for a number of these sites are not disclosed and if required, such as in the event of a major oil spill, would involve prioritising further consultation with key contacts within WA Department of Aboriginal Affairs and relevant local Aboriginal communities.

Woodside understands that there is no Indigenous archaeology known to exist anywhere within Commonwealth waters.

4.9.5.1 Historic sites of significance

There are no known sites of historic heritage significance within the Operational Area. Appendix J describes cultural heritage sites within the EMBA.

4.9.5.2 Underwater Heritage

A search of the Australian National Shipwreck Database which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other UCH) in Australian waters indicated that there are no sites within the Operational Area. However, numerous shipwrecks exist within the EMBA. Table 4-21 lists shipwrecks within 50 km of the Operational Area.

Table 4-21: Recorded shipwrecks within the EMBA

Vessel name (ID number)	Year wrecked	Latitude	Longitude

Florence (4111)	1893	-21.750000	114.083333

4.9.5.3 World, National and Commonwealth Heritage listed places

No listed heritage places overlap the Operational Area. World, National and Commonwealth Heritage places within the EMBA are identified in Table 4-22. Appendix J outlines the values and sensitivities of these places. Credible risks and impacts as a result of unplanned events from the Petroleum Activity are considered in Section 6.8.

Table 4-22: World Heritage properties and National/Commonwealth Heritage listed places within the EMBA

Listed place	Distance and direction from Operational Area to listed place (km)
World Heritage properties	
Ningaloo Coast	8.6 km south-east
Shark Bay, WA	357 km south-west
Murujuga Cultural Landscape	254 km north-east
National Heritage places	
Ningaloo Coast	8.6 km south-east
Barrow Island and the Montebello-Barrow Islands Marine Conservation Reserves	128.2 km north-east
Dampier Archipelago (including Burrup Peninsula)	256.9 km north-east
Shark Bay, WA	357.4 km south-west
Dirk Hartog Landing Site 1616 – Cape Inscription Area	445.3 km south-west
His Majesty's Australian Ship Sydney II and HSK Kormoran Shipwreck Sites	578.1.2 km south-west
Batavia Shipwreck Site and Survivor Camps Area 1629 – Houtman Abrolhos	761.4 km south-west
The West Kimberley	855.4 km north-east
Christmas Island Natural Areas	1,503.1 km north-west
Cape Riche	1,517.1 km south-east
Great Western Woodlands of WA	1,641.9 km south-east
Commonwealth Heritage places	
Ningaloo Marine Area – Commonwealth waters	8.5 km south-east
Learmouth Air Weapons Range Facility	92.6 km south-west
His Majesty's Australian Ship Sydney II and HSK Kormoran Shipwreck Sites	578.1 km south-west
Mermaid Reef – Rowley Shoals	746 km north-east
Lancelin Defence Training Area	1,030.2 km south-east
Scott Reef and Surrounds – Commonwealth Area	1146 km north-east
Ashmore Reef National Nature Reserve	1,384.4 km north-east
Cape Leeuwin Lighthouse	1,420.5 km south-east

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Listed place	Distance and direction from Operational Area to listed place (km)
Christmas Island Natural Areas	1,505.2 km north-west
Phosphate Hill Historic Area	1,514.1 km north-west
Bungalow 702	1,515.1 km north-west
Drumsite Industrial Area	1,515.1 km north-west
Industrial and Administrative Group	1,515.3 km north-west
Settlement Christmas Island; Malay Kampong Precinct; Malay Kampong Group; Poon Saan Group	1,515.5 km north-west
Administrators House Precinct	1,515.5 km north-west
South Point Settlement Remains	1,520.7 km north-west

4.9.5.3.1 Murujuga Cultural Landscape

The Murujuga Cultural Landscape (MCL) World Heritage property, located approximately 254 km north-east of the Operational Area on the Burrup Peninsula in WA, was officially inscribed on the UNESCO World Heritage List in July 2025. The MCL holds immense cultural and spiritual significance to Traditional Owners and is relevant to heritage values in the broader region. The World Heritage property encompasses approximately 100,000 hectares and includes 42 islands, islets, and rocky outcrops within the Dampier Archipelago, as well as parts of the adjacent mainland (DCCEEW, 2025). Murujuga is internationally recognised for its outstanding cultural heritage, particularly as home to the most extensive and dense concentration of petroglyphs (rock engravings) known globally.

The MCL is inscribed under Cultural Criterion i, iii and v which are reflective of the outstanding universal values (OUVs). The OUVs of the Murujuga Cultural Landscape World Heritage property include:

- Petroglyphs demonstrate artistic achievement assembled over 50,000 years. The petroglyphs are visually outstanding, demonstrate technical skill, and represent multiple phases in the development of regional and local styles.
- The MCL bears testimony to the living cultural traditions of Ngarda-Ngarli and the spiritual relationship between people and landscape that is at least 50,000 years old.
- The MCL is an outstanding example of human interaction with the environment over at least 50,000 years. The landscape is patterned by this long-term presence persisting through irreversible environmental and climatic changes.

Estimates suggest there are up to two million individual petroglyphs across the landscape, many of which are believed to be tens of thousands of years old, representing one of the world's longest continuous records of human artistic and cultural expression (DBCA, 2025). The petroglyphs depict a wide range of subjects, including human figures, animals, marine life, and symbolic motifs. Murujuga is also deeply significant to the Traditional Owners, including the Ngarda-Ngarli peoples, and forms part of an ongoing cultural connection to Country through language, Law, ceremony and custodianship.

Further information on the MCL can be found on the publicly available UNESCO World Heritage listing⁸.

Woodside supports the ongoing management of heritage values under listings including Murujuga Cultural Landscape World Heritage listing, Murujuga National Park and Dampier Archipelago (Including Burrup Peninsula) National Heritage place.

Safeguarding the MCL and its relevant outstanding universal values are considered under a number of relevant management plans, including:

- Murujuga National Park Management Plan (2013, as amended in 2023)
- The Murujuga Cultural Management Plan (2016)
- Murujuga Cultural Landscape Strategic Management Framework (2022).

⁸ <https://whc.unesco.org/en/list/1709>.

As part of its commitment to supporting World Heritage, where relevant, Woodside provides the necessary research and support information required by MAC and the State to ensure the protection and conversation of the OUV of MCL. Additionally, Woodside actively provides funding to the Murujuga Land and Sea Unit to assist in its ongoing management of Country and Sea Country associated with the MCL.

Woodside recognises that the management plans give effect to the duties and obligations of Australia under the World Heritage Convention and help facilitate the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property. Consequently, by being not inconsistent with the management plans Woodside demonstrates that its action is not inconsistent with Australian World Heritage management principles and therefore the World Heritage Convention.

4.10 Socio-cultural environment

4.10.1 Commercial fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. Fish Cube data were requested to analyse the potential for interaction of fisheries with the Operational Area, which was used to determine consultation with WA State-managed fisheries that may be impacted by proposed petroleum activities (Department of Primary Industries and Regional Development (DPIRD), 2020).

Table 4-23 provides an assessment of the potential interaction and Appendix J provides further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5).

Figure 4-18 to Figure 4-20 show fisheries identified as having a potential interaction with the Petroleum Activity.

Table 4-23: Commonwealth and State managed commercial fisheries overlapping the Operational Area and/or EMBA

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Commonwealth managed fisheries			
North West Slope Trawl Fishery	✓	✓	The North West Slope Trawl Fishery management area overlaps the Operational Area and the EMBA. Between one to six vessels have been active in the fishery since 2005. Fishery Status Reports indicate most recent activity inside the EMBA occurred in the 2020–2021 season (Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES), 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Western Deepwater Trawl Fishery	✗	✓	The Western Deepwater Trawl Fishery management area overlaps the EMBA. Based on Fishery Status Reports the fishery may be active within the EMBA with recent activity during the 2020–2021 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the combined EMBA.
Western Tuna and Billfish Fishery	✓	✓	The Western Tuna and Billfish Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. However, in the last five years (2016 to 2021), fishing effort has concentrated south of Carnarvon (ABARES, 2021). Accordingly, Woodside considers it a possibility that interaction with this fishery and the Petroleum Activity.
Northern Prawn Fishery	✗	✓	The Northern Prawn Fishery extends from Cape York, across the Gulf of Carpentaria to Cape Londondern, past the border between WA and Northern Territory. The majority of the fishing during the 2020–2021 season takes place around the coast of Northern Territory (ABARES, 2021).
Southern Bluefin Tuna Fishery	✓	✓	The Southern Bluefin Tuna Fishery management area overlaps the Operational Area and EMBA, spanning the entire Australian Fishing Zone. Since 1992, the vast majority of Australian catch effort have been concentrated in south-eastern Australian waters (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity.
Western Skipjack Fishery	✓	✓	The Western Skipjack Tuna Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The fishery is not currently active and no fishing has occurred since 2009 (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity.
Small Pelagic Fishery	✗	✓	The Small Pelagic extends from the QLD/NSW border around to the 31° south latitude line near Lancelin, Perth. The management area is split into western, eastern and sardine subareas. Fishery Status Reports indicate the maximum area fished between 2020 and 2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity
Christmas Island Line Fishery	✗	✓	The Christmas Island Line Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Southern and Eastern Scalefish and Shark Fishery Great Australian Bight Trawl Sector	✖	✓	The Southern and Eastern Scalefish and Shark Fishery: Great Australian Bight Trawl Sector extends along the south coast of WA and SA to Kangaroo Island. Fishery Status Reports indicate the maximum area fished between 2020 and 2021 occurred outside of the EMBA (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity.
State managed fisheries			
Abalone Managed Fishery (Area 3-8)	✓	✓	The Abalone Managed Fishery management area overlaps the Operational Area (Area 8) and EMBA (Area 3-8). The fishery is only active within the EMBA, with 60NM Catch and Effort System (CAES) block reporting three to 15 registered vessels for Greenlip and Brownlip Abalone Fishery. More recently, active vessel numbers were three to 10 across the 2021–2022 seasons (Strain et al., 2023a). Due to the water depths of the Operational Area at 200m, there is no potential for interaction with the fishery in the Operational Area, given the fishery method. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Abrolhos Islands and Mid-West Trawl Managed Fishery	✖	✓	The Abrolhos Islands and Mid-West Trawl Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting between three and six vessels across the 2017 to 2022 seasons (Kangas et al., 2023b), with no active vessels in the 2021–2022 financial year. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Cockburn Sound Managed Fishery	✖	✓	The Cockburn Sound (Crab) Fishery management area overlaps the EMBA. The Cockburn Sound Crab Managed Fishery has been closed since 2014 (Johnston et al., 2020). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.
	✖	✓	The Cockburn Sound (Fish Net) Fishery management area overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
	✖	✓	The Cockburn Sound (Line and Pot) Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting between six and eight, consistently active vessels across the 2017–2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
	✖	✓	The Cockburn Sound (Mussel) Fishery management area overlaps the EMBA. There has been no reported catch in the period between 2014 and 2022 (DPIRD, 2023). If the fishery were to resume, Woodside only considers it a possibility that interactions with the fishery would occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Exmouth Gulf Beach Seine and Mesh Net Managed Fishery	✖	✓	The Exmouth Gulf Beach Seine and Mesh Net Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Exmouth Gulf Prawn Managed Fishery	✖	✓	The Exmouth Gulf Prawn Managed Fishery management area overlaps the EMBA. The fishery is only active within the EMBA, with 60 NM CAES block reporting 6 consistently active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The CAES reporting block overlaps the Operational Area (indicating fishing effort within the Operational Area), the fishery is limited to the spatial extent within the Exmouth Gulf and Muiron Islands. Therefore, Woodside only considers it a possibility that interactions with the fishery may occur only in the EMBA.
Gascoyne Demersal Scalefish Fishery	✖	✓	The Gascoyne Demersal Scalefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and 12 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers there to be potential for interaction with the fishery within the EMBA.
Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery	✖	✓	The Joint Authority Southern Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three to 11 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Kimberley Crab Managed Fishery	✖	✓	The Kimberly Crab Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with an allocation of 1,200 units (600 traps) to licence holders and an equivalent allocation of 600 traps to Traditional Owner groups, with seven people employed in the 2021–2022 season (Johnston et al., 2023). Accordingly, Woodside considers there to be a potential for interaction with this fishery in the EMBA.
Kimberley Gillnet and Barramundi Fishery	✖	✓	The Kimberley Gillnet and Barramundi Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Kimberley Prawn Managed Fishery	✖	✓	The Kimberley Prawn Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting three to 14 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the EMBA.
Mackerel Managed Fishery	✓	✓	The Mackerel Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Mackerel Managed Fishery is not provided at the 10 NM scale; however, effort reported in the 60 NM CAES block reporting between three and seven active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2012. Woodside considers there may be potential for interaction with the fishery in the Operational Area and EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Marine Aquarium Fish Managed Fishery	✓	✓	The Marine Aquarium Fish Managed Fishery overlaps the Operational Area and EMBA. FishCube data for the Marine Aquarium Fish Managed Fishery is not provided at the 10 NM scale; however, effort reported in the 60 NM CAES block reporting between three and five active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent in the years since 2017. The Marine Aquarium Fish Managed Fishery generally collects fish for display in water depths <30 m. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Nickol Bay Prawn Limited Entry Fishery	✗	✓	The Nickol Bay Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active in the EMBA, with 60 NM CAES block reporting between three and eight active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
North Coast Shark Fishing	✓	✓	The North Coast Shark Fishing area overlaps the Operational Area and the EMBA. The northern shark fisheries comprise of the North Coast Shark Fishery in the Pilbara and Western Kimberly (closed since 1998), and the Joint Authority of Northern Shark Fishery in the eastern Kimberley, which has not been active since the 2008–2009 season (Australian Fisheries Management Authority (AFMA), 2021). Therefore, Woodside considers there to be no interaction with the fishery and the Petroleum Activity.
Northern Demersal Scalefish Managed Fishery	✗	✓	The Northern Demersal Scalefish Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and seven active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Octopus Interim Managed Fishery	✗	✓	The Octopus Interim Managed Fishery management area overlaps the EMBA. The fishery is active within the EMBA, 60 NM CAES block reporting between three and nine active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Onslow Prawn Limited Entry	✗	✓	The Onslow Prawn Limited Entry Fishery management area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The CAES reporting block for the fishery overlaps the Operational Area (indicating fishing effort within the Operational Area); however, the fishery is limited to the spatial extent and boundaries of the fishery. At the nearest point the fishery could only be active at a distance >45 km from the Operational Area. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Open Access in the North Coast	✗	✓	The Open Access in the North Coast Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and seven active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Pearl Oyster Managed Fishery	✓	✓	The Pearl Oyster Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and six active vessels across the 2017 to 2022 seasons (DPIRD, 2023). At the nearest point the fishery could only be active at a distance >45km from the Operational Area. The Pearl Oyster Managed Fishery fishing effort is mostly focused in coastal waters (10 to 15 m depth) with a maximum depth of 35 m (Lulofs et al., 2002). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Crab Managed Fishery	✓	✓	The Pilbara Crab Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The Pilbara Crab Managed Fishery covers inshore waters (<50 m) from Onslow to Port Headland, with most activity around Nickol Bay (Johnston et al., 2020). However, areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management Plan for the Pilbara Crab Managed Fishery (DPIRD, 2018b). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Fish Trawl (Interim) Managed Fishery	✓	✓	The Pilbara Fish Trawl (Interim) Managed Fishery area overlaps the Operational Area and EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between three and four active vessels across the 2017 to 2022 seasons (DPIRD, 2023). The Pilbara Fish Trawl (Interim) Managed Fishery is divided into 2 zones and an area governed by Schedule 5 (prohibited to trawling) (Newman et al., 2020). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Pilbara Line Fishery	✓	✓	The Pilbara Line Fishery licencees are permitted to operate anywhere within Pilbara waters (Newman et al., 2021), overlapping the Operational Area and EMBA. The fishery is active in the EMBA, with one 60 NM CAES block reporting up to five licences across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Line Fishery is not provided at the 10 NM scale. Therefore, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and/or EMBA.
Pilbara Trap Fishery	✓	✓	The Pilbara Trap Fishery management area overlaps the Operational Area and EMBA. The fishery is active with the overlapping 60 NM CAES block reporting up <three vessels across the 2017 to 2022 seasons (DPIRD, 2023). FishCube data for the Pilbara Trap Fishery is not provided at the 10 NM scale. Fishing effort at this level has been consistent over the previous 10-year catch report. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and/or EMBA.
Shark Bay Crab Managed Fishery	✗	✓	The Shark Bay Crab Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 17 and 23 consistently active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
Shark Bay Prawn Managed Fishery	✗	✓	The Shark Bay Prawn Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting between 16 and 18 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Shark Bay Scallop Managed Fishery	✖	✓	The Shark Bay Scallop Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 24 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Crustacean Managed Fishery	✖	✓	The South Coast Crustacean Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to five active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Estuarine Managed Fishery	✖	✓	The South Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 13 active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Line and Fish Trap Managed Fishery	✖	✓	The South Coast Line and Fish Trap Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 19 active vessels across the 2021–2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Nearshore Net Managed Fishery	✖	✓	The South Coast Nearshore Net Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to 10 active vessels across the 2021–2022 season (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Purse-Seine Managed Fishery	✖	✓	The South Coast Purse-Seine Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to six active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South Coast Salmon Managed Fishery	✖	✓	The South Coast Salmon Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to four active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Beach Net Fishery	✖	✓	The South West Coast Net Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to nine active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Coast Salmon Managed Fishery	✓	✓	The South West Coast Salmon Fishery management area overlaps the Operational Area and the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting up to three active vessels across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
South West Trawl Fishery	✖	✓	The South West Trawl Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Specimen Shell Managed Fishery	✓	✓	The Specimen Shell Managed Fishery management area overlaps the Operational Area and EMBA. The fishery is active within 60 NM CAES block overlapping the Operational Area, with <three licences active during the 2019 to 2022 seasons. FishCube data reported <three licences at the 10 NM CAES block overlapping the Operational Area (DPIRD, 2023), with the only activity occurring for a duration of four months in the 2017–2018 season. Although there is overlap with the Operational Area and the CAES reporting block, given the depth and offshore location of the Operational Area and the collection methods of the fishery, it is highly unlikely interactions would occur. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast (Beach Bait Fish Net) Managed Fishery	✖	✓	The West Coast (Beach Bait Fish Net) Managed Fishery area overlaps the EMBA. The fishery is active within the EMBA, with 60 NM CAES block reporting <three active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Blue Swimmer Crab Fishery	✖	✓	The West Coast Blue Swimmer Crab Fishery overlaps the EMBA. There have been no reported active vessels for the fishery across the 2017 to 2022 seasons (DPIRD, 2023). Therefore, Woodside considers it a possibility that if any interactions occur with the fishery, they would only occur within the EMBA.
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery is permitted to fish in waters deeper than the 150 m isobath, overlapping the Operational Area and EMBA. The fishery may be active in the Operational Area with one 60 NM CAES block reporting less than three vessels in the 2021–2022 season (DPIRD, 2023). FishCube data reported no fishing effort at 10 NM CAES blocks in the last five years overlapping the Operational Area (DPIRD, 2023). Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.
West Coast Demersal Gillnet and Demersal Longline	✖	✓	The West Coast Demersal Gillnet and Demersal Longline Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to four active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Demersal Scalefish (Interim) Managed Fishery	✖	✓	The West Coast Demersal Scalefish (Interim) Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 16 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort consistent during this time. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Estuarine Managed Fishery	✖	✓	The West Coast Estuarine Managed Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to 11 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort reducing to seven vessels in the 2020-2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
West Coast Purse Seine Fishery	x	✓	The West Coast Purse Seine Fishery area overlaps the EMBA. The fishery is active in the EMBA with 60 NM CAES block with up to four active vessels across the 2017 to 2022 seasons (DPIRD, 2023), with fishing effort reducing to <3 vessels in the 2018-2022 seasons. Therefore, Woodside considers it a possibility that interactions with the fishery may occur only in the EMBA.
West Coast Rock Lobster Fishery	x	✓	The Western Rock Lobster Fishery management area overlaps the EMBA (DPIRD 2023). The fishery is active in the EMBA with 60 NM CAES block with up to 94 active vessels across the 2017 to 2022 seasons (DPIRD, 2023), Vessel numbers in the fishery have steadily declined over the five-year period with up to 80 and 74 vessels active during the 2020 and 2022 seasons respectively. Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity.
Other			
Tour operators	✓	✓	Fishing tour operators are permitted to operate across WA state waters and are required to report monthly logbook records of client fish catches. FishCube data reports consistent fishing effort across the 60 NM CAES block that overlaps the EMBA (DPIRD, 2023). Fishing effort was reported by a maximum of 12 licence holder during the 2018–2019 season, with licence numbers varying between <three and 12 overall during the 2017 to 2022 seasons (DPIRD, 2023). FishCube data reported <three active tour operators at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2023), which were only active during the 2020–2021 period. FishCube data indicate tour operator fishing effort was highest around Ningaloo and Muiron Islands and at Barrow Island and the Montebello Islands, east of the EMBA. Woodside considers there to be potential for interaction with the fishery in the Operational Area or EMBA.

✓ = overlap with fishery; blue shading = possibility for interaction.

Figure 4-20: State-managed commercial fisheries overlapping the Operational Area with the potential for interaction with the Petroleum Activity (continued from Figure 4-19)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.2 Traditional fisheries

A key feature of the NWMR is the large tidal range in this part of the Australian coast with daily fluctuations up to 12 m, resulting in vast areas of intertidal land and reef flats available for marine resource harvesting (Smyth, 2007). Further, the tidal range also results in strong tidal currents, especially between islands and at the entrance to embayments that First Nations people used to travel long distance on rafts and canoes between mainland and the reefs and islands (Smyth, 2007). There are no traditional or customary fisheries within the Operational Area, as these are typically restricted to shallow coastal waters and/or areas with structures such as reefs. However, it is recognised that Barrow Island, Montebello Islands and Ningaloo Reef, all within the wider EMBA, have a known history of fishing when areas were occupied (as from historical records) (Department of Conservation and Land Management, 2005).

A Memorandum of Understanding was established with Indonesian fisheries for parts of the Australia Fishing Zone and Continental Shelf (MoU 74). Currently, Scott Reef is the principal reef in the MoU 74 box. This MoU allows Indonesian fishers to participate in traditional fishing activities using traditional methods and is used seasonally. The Operational Area is located outside of the MoU 74 box; however, it is overlapped by the EMBA (Appendix J).

4.10.3 Tourism and recreation

Year end March 2023 WA saw 11.7 million overnight (domestic and international) visitors who contributed \$15.9 billion into the economy, \$7.3 billion of which was spent in regional WA (Tourism Research Australia, 2023):

- Australia's South West accounted for approximately \$3.1 billion
- Australia's Coral Coast accounted for approximately \$1.1 billion
- Australia's North West accounted for approximately \$1.9 billion
- Australia's Golden Outback accounted for approximately \$1.1 billion (Tourism WA, 2023).

The Operational Area is located offshore of the North West tourism region which includes parts of the Gascoyne region, the Pilbara region, the Kimberley region. Tourism is concentrated in the vicinity of population centres such as Broome, Dampier, Exmouth, Coral Bay and Shark Bay. Population centres closest to the Operational Area are the towns of Onslow (~97 km east) and Exmouth (~45 km south). Onslow is a coastal town offering easy access to tourists, vacationers and recreational fishers to the Mackerel Islands, a group of 10 islands at 22 km offshore. Exmouth has become a significant tourist centre with Cape Range National Park, Ningaloo Marine Park and adjacent inshore waters. In 2018–2019, the Ningaloo region (Ningaloo Reef and the surrounding coastal region Exmouth Gulf, communities of Exmouth and Coral Bay, and adjacent proposed southern coastal reserves and pastoral leases) contributed an estimated \$110 million in value added to the WA economy (DCBA, 2020).

Peak tourism in the North West occurs from April to October coinciding with winter or the dry season. Marine-based activities are typically concentrated around infrastructure such as boat ramps and camping areas (Smallwood, 2009). Marine facilities, including boat launching ramps, jetties, marinas, etc, near the Operational Area are limited, with most located along the Exmouth Gulf side of the peninsula, including:

- Port of Onslow, Beadon Creek
- Point Murat naval supply jetty (restricted access)
- Bundegi – facilities include a concrete launching ramp, car park and public toilets
- Exmouth Marina – provides launching, mooring, fuelling and supply facilities for commercial fishing, charter fishing, tourist and commercial/private vessels.

Boat ramps on the Ningaloo side are located at:

- Tantabiddi Creek – facilities include a concrete launching ramp, car park and public toilets
- Coral Bay – concrete launching ramp.

Recreational fisheries and charter boat operators are managed by the WA DPIRD. With an estimated 753,000 people fishing recreationally in WA, it makes a significant contribution to the economy and attracts vast numbers of visitors to the region each year (DPIRD, 2025). The Ningaloo Marine Park (~9 km from the

Operational Area) also provides high-quality fishing for species such as spangled emperor, Spanish mackerel and coral trout. The Muiron Islands are ~19 km from the Operational Area and are used recreationally for swimming, snorkelling and scuba diving. Further, the Montebello Islands are ~197 km from the Operational Area and are used for similar recreational activities including camping, fishing, diving and boating.

4.10.4 Commercial shipping

AMSA has introduced a network of marine fairways across the NWMR off WA to reduce the risk of vessel collisions with offshore infrastructure. The Pyrenees Venture FPSO Operational Area within petroleum licences WA-42-L and WA-43-L lies outside of these declared and charted shipping fairways.

Refer to Appendix J for shipping information in the EMBA and Figure 4-21 for vessel density within the Operational Area and EMBA.

Figure 4-21: Vessel density map for the Operational Area and EMBA, derived from Australian Maritime Safety Authority satellite tracking system data (vessels include cargo, liquefied natural gas tanker, passenger vessels, support vessels and others/unnamed vessels)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.5 Oil and gas

The Operational Area is located within an area of established oil and gas operations within the NWMR. Table 4-24 and Figure 4-22 detail other oil and gas facilities located within 50 km of the Operational Area. Appendix J describes current oil and gas development within the EMBA.

Table 4-24: Other oil and gas facilities located within 50 km of the Operational Area

Facility name and operator	Approximate distance and direction from Operational Area (km)
Woodside Macedon Subsea Gas Field	Macedon Operational Area overlaps the Pyrenees Operational Area
Woodside Ngujima-Yin FPSO (Vincent Development)	6.6 km south-east
Woodside Stybarrow Field (in the process of being decommissioned ⁹)	27 km north-west
Santos Van Gogh/Coniston/Novara Development (Ningaloo Vision FPSO)	9.4 km south

⁹ Decommissioning of the Stybarrow field is managed under two accepted Environment Plans: 1) Stybarrow Decommissioning and Field Management Plan, accepted 8 Jan 2024; 2) Stybarrow End State Decommissioning Environment Plan, accepted 23 May 2024.

Figure 4-22: Oil and gas infrastructure within and near the Operational Area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.6 Defence zones

Department of Defence areas, facilities and unexploded ordnances (UXOs) overlapping the Operational Area and EMBA are outlined in Table 4-25 and presented in Figure 4-23. Appendix J describes key Department of Defence areas and facilities.

Table 4-25: Defence areas, facilities and unexploded ordnances overlapping the Operational Area and/or EMBA

Defence area/facility	Presence	
	Operational Area	EMBA
Learmonth Air Weapons Range Facility		✓
Learmonth air training area (associated with the Learmonth Air Weapons Range Facility)	✓	✓
Naval Communications Station Harold E. Holt		✓
UXO SDG096 Sea Dumping: Anchor Island. This site is an area used for the dumping at sea of ordnance and other items.		✓
Potential Depth Charge UXO DEP022: Northwest of Bessieres Island. This site was an area where depth charges were used in World War II and where some depth charges failed to function.		✓
UXO 793 and 794: Exmouth Gulf: Prior to World War II, Royal Australian Navy bombarded both land and sea targets on and near the peninsula		✓
UXO 1018: Exmouth Gulf: Allied World War II base high explosive ordnances were stored and fired		✓
UXO 1019: Exmouth Gulf: Aerial bombing in the Rough Range area during World War II. Two depth charges were lost overboard in the Bay of Rest area. Artillery fired on land and sea targets.		✓
UXO 940: Onslow. Anti-aircraft artillery live firing practices using high explosive ammunition during WWII. Aerial bombing also highly likely.		✓
Potential Depth Charge UXO DEP027: East of Montebello Islands. This site was an area where depth charges were used in World War II and where some depth charges failed to function.		✓
UXO SDG082: Sea Dumping – Ningaloo. This site is an area used for the dumping at sea of ordnance and other items.		✓
UXO SDG129 Sea Dumping – Indian Ocean. This site is an area used for the dumping at sea of ordnance and other items.		✓
Geraldton Seaward – artillery fired seaward during World War II and small quantities of high explosive ammunition were dumped at sea off Geraldton during the 1950s		✓
Oakajee Air Gunnery Range Geraldton – danger area shown seaward of coast. Probable ordnance impacted on land.		✓
Rangeway – live fire anti-armour exercises.		✓
Narngulu – areas most likely to contain UXO are the sand dunes to the west, south west and south of Meru		✓
Separation Point – artillery unit fired from vicinity of Wonthella to beach area of Separation Point in 1942		✓
Mouth of Greenough River and Southgate Dunes – artillery and anti-armour firings into sand dunes		✓
Jurien Bay Bombing Range – high explosive aerial bombing and strafing		✓
UXO SDG097 Sea Dumping – Coastal WA – Nambung. Area used for the dumping at sea of ordnance and other items.		✓
Flat Rock – area used since 1940 as a high explosive bombing target		✓

5 CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with Regulation 25 of the Environment Regulations.

The consultation process is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to assess the merits of objections or claims about the adverse impact of each activity to which the EP relates that are received from relevant persons and for Woodside to adopt appropriate measures (if any) in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to ALARP and will be of an acceptable level.

Consultation is informed by both the Environment Regulations and the findings of relevant Courts, including the Federal Court of Australia (FCA) – Full Court (FCAFC) in the Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 (Tipakalippa Appeal) (see Section 5.2 and 5.5.5) and Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 (Munkara Case).

For this EP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- The first section (Section 5.2 to 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply Regulation 25(1) of the Environment Regulations to identify relevant persons.
- The second section (Section 5.6 to Section 5.7) details Woodside's approach to accepting feedback and assessment of the merits of each objection and claim about the adverse impact of each activity to which the EP relates, and engaging in ongoing consultation for this EP.

Woodside's consultation record is at Appendix F and includes a summary of the:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other stakeholders Woodside chose to consult
- engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of Regulation 25(1) of the Environment Regulations (see Section 5.3.7)
- opportunities provided to persons or organisations to participate in consultation.

Figure 5-1: Overview of Woodside’s methodology to identify relevant persons

5.2 Consultation – general context

Woodside has a portfolio of quality oil and gas assets and more than 40 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential risks and impacts associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult, but rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a Petroleum Activity. The information in the consultation list has been captured from years of experience – it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's Guideline on Consultation in the course of preparing an environment plan (May 2023) as well as judicial guidance in the Tipakalippa Appeal on the intent of consultation as follows:

- At paragraph 54 of the appeal decision: *...provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: *...its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The Tipakalippa Appeal and Munkara Case have also been further considered in the context of specific methods for consultation with First Nations relevant persons (Section 5.5.5).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with Regulation 25(1) of the Environment Regulations (Section 5.3). This methodology is consistent with NOPSEMA's guideline and demonstrates that, to meet the requirements of Regulation 34 of the Environment Regulations (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.3.1)
- the geographical extent to which the environment may be affected by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 6).

Woodside has undertaken consultation in the course of preparing this EP in compliance with Regulation 25 of the Environment Regulations, which requires a titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
 - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant
 - if the plan relates to activities in the offshore area of a state – the department of the responsible State Minister
 - if the plan relates to activities in the principal Northern Territory offshore area – the department of the responsible Northern Territory Minister
 - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP
 - any other person or organisation that the titleholder considers relevant (Regulation 25(1) of the Environment Regulations)
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (Regulation 25(2))
- allow a relevant person a reasonable period for the consultation (Regulation 25(3))
- tell each relevant person that the titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (Regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ESD set out in section 3A of the EPBC Act – see Section 2
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (Regulation 4 of the Environment Regulations)
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the Petroleum Activity
- is collaborative – Woodside respects that for a relevant person, consultation is voluntary; where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.15).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

Figure 5-2: Overview of Woodside's consultation approach

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

5.3 Identification of Relevant Persons for Consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons within the description of Regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with Regulation 25(1)(b) of the Environment Regulations, Woodside consults with the department of the relevant State Minister.

5.3.2 Identification of relevant persons Under Regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under Regulations 25(1)(a), (b) and (c) is as follows:

Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments as set out on their

websites, in NOPSEMA's GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline (January 2024), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.

Woodside has categorised relevant authorities as government department or agency groups, as in Table 5-1.

Table 5-1: Relevant government departments and agencies

Government departments/ agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments/ agencies – environment	Agencies with legislated responsibilities for the protection of the marine environment.
Government departments/ agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

Woodside considers each of the responsibilities of the departments and agencies and determines whether those responsibilities overlap with potential risks and impacts specific to the Petroleum Activity in the EMBA. The assessment is both activity and location based.

Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry and Australian Hydrographic Office (AHO) is responsible for maritime safety and Notices to Mariners. To undertake the Petroleum Activity in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Petroleum Activity. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.

The list of government departments and agencies assessed as relevant is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the Petroleum Activity in the EMBA or would not be involved in incident response planning.

5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of Regulation 25(1)(d), the meaning of 'functions, interests or activities' needs to be understood. In Regulation 25(1)(d), the phrase 'functions, interests or activities' should be construed broadly and consistently with the objects of the Environment Regulations (Regulation 4) and the objects of the EPBC Act (section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance below from NOPSEMA's GL2086 – Consultation in the course of preparing an environment plan guideline (May 2023):

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of 'interest' in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of 'activity' in Regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside's methodology for determining 'relevant persons' for the purpose of Regulation 25(1)(d) of the Environment Regulations includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.

On the topic of consulting outside of Australia's jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters (Section 6.8), specifically Indonesian and Timor-Leste waters. Consideration has been given to the functions, interests or activities that may be affected by the activities to be carried out, should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on there being no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside's oil spill preparedness and response mitigation assessment and oil pollution first strike plans would be in place or will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,¹⁰ and capable of being discharged within a reasonable time.¹¹ The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Environment Regulations require relevant persons, and their interests, to be readily ascertainable to the titleholder.¹² In the case of Indonesia, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records that allow for the identification of potential functions, interests or activities, e.g. fisheries, tourism licences and permits.

For example, there are no known licencing requirements either in Australia or in Indonesia or Timor Leste for traditional fishers, therefore, no publicly available information to identify and make contact with persons for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational Area of this activity of over 1,300 km makes international consultation impractical to discharge from a reasonable time and effort perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required for the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside's oil spill preparedness and response mitigation assessment and oil pollution first strike plans provide a mechanism for consultation in international waters that will be complied with at the appropriate time, if an incident occurs. In such circumstances, consultation with the DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult the DFAT for proposed activities outside of Australia's jurisdiction, including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the OPEP – Appendix H of this EP. The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the OPEP – Appendix H of this EP.

¹¹ *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 [136].

¹² *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 [136], [147], [153].

5.3.4 Identification of relevant persons Under Regulation 25(1)(d)

Relevant persons under Regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 3)
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within Regulation 25(1)(d) of the Environment Regulations, Woodside adopts the following methodology, then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities proposed to be carried out under the EP. The broad categories are identified in Table 5-2 and identification methodology applied as set out in Table 5-3.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-3 as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as not relevant but whom Woodside chose to contact or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 3.

Table 5-2: Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State commercial fishery with a fishery management plan recognised under the <i>Fisheries Management Act 1991</i> (Cth) and <i>Fish Resources Management Act 1994</i> (WA), which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in WA.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and operators	Registered holder of an offshore petroleum title or GHG title under the OPGGS Act and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians with cultural rights and interests, or cultural functions or who perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and asserts cultural rights, functions, interests or activities, they will be included in the definition of Traditional Custodian for the purpose of this EP.
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians' nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the <i>Native Title Act</i> (Cth) by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Body is a regional organisation appointed under the <i>Native Title Act</i> with prescribed functions, set out in Part 11 of the <i>Native Title Act</i> , which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Historical heritage groups or organisations	Legislated or government enlisted groups or organisations responsible for the management of marine heritage.
Local government and elected Parliamentary representatives and recognised local community reference/liaison groups or organisations	Local government body formed under the <i>Local Government Act 1995</i> (WA) and elected Parliamentary representatives who are responsible for representing the local community. Recognised local community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations, or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-3: Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category

Category	Relevant person identification methodology
Commercial fisheries (Commonwealth and State) and peak representative bodies	Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following steps in its methodology: - Define the parameters, having regard to timing, location and duration of the proposed Petroleum Activity. - Confirm whether the EMBA overlaps with the fisheries management area (i.e. the spatial area the fishery is legally permitted to fish in) (see Section 4.10.1). - Follow WAFIC's consultation guidance¹³, that titleholders develop separate consultation strategies for significant unplanned events (for example, an oil spill) where titleholders can demonstrate the likelihood of such events is extremely low. WAFIC's guidance is that consultation about unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs (see Appendix F). - For Commonwealth and State commercial fisheries, assess the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA, ABARES and DPIRD FishCube data within the Operational Area and EMBA (see Section 4.10.1). Assessment of relevance: - State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.1) are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC's guidance, Woodside only consults individual licence holders based on WAFIC's advice. Woodside also utilises WAFIC's consultation service whereby WAFIC: - directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area - consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario. - Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.1) are assessed as relevant to the proposed activity. - If Woodside has identified that a Commonwealth or State fishery is a relevant person, then Woodside also consults the fisheries relevant representative body. For example, WAFIC represents the interests of State fisheries in WA. If a State fishery is identified as relevant, Woodside would also identify WAFIC as relevant. Recognised Commonwealth fishery representative bodies are identified by AFMA via its website. WAFIC is the only recognised State fishery representative body.
Recreational marine users and peak representative bodies	Woodside assesses relevance for recreational marine users and peak representative bodies using the following steps in its methodology: - Use Woodside knowledge and operating experience, apply knowledge of recreational marine users in the area. This assessment is both activity- and location-based. - Define the parameters, having regard to timing, location and duration of the proposed Petroleum Activity. - Assess the potential spatial and temporal extent for interacting with recreational marine users by reviewing DPIRD FishCube data to assess whether there has been activity within the EMBA in the past five years. Assessment of relevance: - Recreational marine users that have been active in the past five years within the EMBA are assessed as relevant to the proposed activity. DPIRD provides Woodside with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA to consult with the relevant persons. - If Woodside has identified recreational marine users as relevant, Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside's existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.

¹³ [Consultation Approach for Unplanned Events - WAFIC](#).

Category	Relevant person identification methodology
Titleholders and operators	Woodside assesses relevance for other titleholders and operators using the following steps in its methodology: • Use WA Petroleum Titles (DEMIRS-011) to determine overlap with other titleholders' or operators' permit areas within the EMBA. • From Woodside knowledge and operating experience, apply knowledge of other operators in the area. • Produce a map showing the outcome of this assessment. Assessment of relevance: • Titleholders and operators whose permit areas are identified as having an overlap with the EMBA are assessed as relevant.
Peak industry representative bodies	Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology: • Review peak industry representative bodies' responsibilities that Woodside actively participates in, considering overlap between industry focus area and Woodside's proposed activities within the EMBA. • Review Woodside's existing stakeholder consultation list. • Search websites to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. Assessment of relevance: • Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed planned activities in the Operational Area are assessed as relevant.
Traditional Custodians (individuals and/or groups/entity and Nominated Representative Corporations	Woodside assesses relevance for Traditional Custodian groups or individuals, using the following steps in its methodology: • Use existing systems of recognition to identify First Nations groups who overlap the EMBA (for example, recognition provided under Native Title or Cultural Heritage legislation, or marine park management plans, or identification by other First Nations groups or entities). • Notify and invite consultation with First Nations people through their nominated representative corporation (for example, PBCs) or, in the case of native title and where appropriate, the Native Title Representative Body. • Request the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders). • Request advice as to other First Nations groups or individuals that should be consulted. • Advertise widely to invite self-identification and consultation by First Nations groups and individuals. Further detail to Woodside's methodology is as follows: • Use the databases of the National Native Title Tribunal to: – understand whether there are any Native Title claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA – understand whether there are any relevant ILUAs registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. • Where there is a positive determination of Native Title, contact the PBC or, where their representative is a Native Title Representative Body, contact the Native Title Representative Body. • Where appropriate, contact the relevant Native Title Representative Body to request a list of First Nations groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA. • Review Commonwealth and State Marine Park management plans that overlap the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.

Category	Relevant person identification methodology
	- Identify First Nations groups or individuals identified by a Traditional Custodian, nominated representative corporation or Native Title Representative Body. - Request the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means. - Use one of Woodside's public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self-identify. - Provide individuals that consider themselves to be relevant interested persons an opportunity to self-identify for each EP. Woodside does not presume self-identification for an activity covered by another EP automatically means an individual is a relevant person. This decision is for the individual to make. The public notification, information sharing and consultation processes Woodside puts in place enable Traditional Custodians to become aware of proposed activities, assess risks and impacts to their values, and enable individuals to self-identify. Assessment of relevance: - Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA, are assessed as relevant.
Native Title Representative Bodies	Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology: - Review National Native Title Tribunal Aboriginal/Torres Strait Islander Body areas that overlap or are coastally adjacent to the EMBA. Assessment of relevance: - Where the area for which a Native Title Representative Body is recognised under the <i>Native Title Act</i>, overlaps with the EMBA, or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Historical heritage groups or organisations	Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following next steps in its methodology: - Use the Australasian UCH Database to assess any known records of Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9). Assessment of relevance: - Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.
Local government and elected Parliamentary representatives and recognised local community reference/ liaison groups or organisations	Woodside assesses relevance for local government and recognised local community reference/ liaison groups or organisations using the following steps in its methodology: - Review Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries 'My Council' database and WA Local Government Association Local Government Directory maps) to assess overlap between the local government's defined area of responsibility and the EMBA. - Host regular community reference/ liaison group meetings. Members represent a cross-section of the community and local towns' interests. Representatives are from community and industry and generally include Woodside, state government (for instance, relevant regional development commissions), local government, Indigenous groups, industry representative bodies, community and industry organisations. Woodside considers these reference/ liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. - Review the community reference/ liaison group's terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Reference Group's area of responsibility in relation to Woodside's operational, development and planning activities is defined in the terms of reference as the Exmouth Sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e. onshore). Assessment of relevance:

Category	Relevant person identification methodology
	- The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant. - The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups, organisations or individuals	Woodside assesses relevance for other non-government groups or organisations or individuals using the following steps in its methodology: - Review Woodside's existing consultation list. - Search websites of registered non-government groups or organisations (i.e. registered with an Australian business number or publicly available contact information) that may have public website material specific to the proposed activity when developing the EP. - Review organisations' publicly available mission statement (or purpose) where it clearly describes their collective functions, interests or activities. - Review current website material to identify targeted information that demonstrates functions, interests and activities relevant to the potential risks and impacts associated with planned activities. - Review an individual's feedback to consider whether their functions, interests and activities could be impacted. Assessment of relevance: - Registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and demonstrated functions, interests and activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2) will be assessed as relevant. - Individual demonstrates their functions, interests and activities could be impacted are assessed as relevant.
Research institutes and local conservation groups or organisations	Woodside assesses relevance for research institutes and local conservation groups or organisations using the following steps in its methodology: - Review Woodside's existing stakeholder consultation list. - Search websites of research institutes that may operate within the EMBA. This assessment is both activity- and location-based. - Search websites of local conservation groups or organisations that regularly conduct conservation activities within the EMBA. Assessment of relevance: - Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant. - Local environmental conservation groups who regularly conduct conservation activities within the EMBA assessed as relevant. This assessment is both activity and location based.

5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under Regulation 25(1)(d) of the Environment Regulations, Woodside has discretion to categorise any other person or organisation as a relevant person under Regulation 25(1)(e) of the Environment Regulations.

5.3.6 Identification of relevant persons under Regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under Regulation 25(1)(e) of the Environment Regulations.

5.3.7 Persons or organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under Regulation 25(1) of the Environment Regulations, there are persons or organisations that Woodside chooses to contact, from time to time, in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to Regulation 25(1) of the Environment Regulations but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to Regulation 25(1) of the Environment Regulations but have been contacted as a result of consultation requirements changing or updated guidance from the regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisations relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside's assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

5.4 Assessment of relevant persons for the Proposed Activity

The result of Woodside's assessment of relevant persons in accordance with Regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as not relevant but chose to contact at its discretion in accordance with Section 5.3.4 or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 1 and Appendix F, Table 3.

5.5 Consultation material and timing

Regulation 25(2) of the Environment Regulations provides that a titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) of the Environment Regulations provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons, of the proposed activities, respecting that consultation is voluntary and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Operational Area. Woodside acknowledges published guidance for good practice consultation relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.5.1 Sufficient information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes a description of the proposed petroleum activity, the Operational Area or Operational Area depending on the EP, where the activity will take place, the timing and duration of the activity, a location map of the Operational Area or Operational Area and EMBA, a description of the EMBA, relevant exclusion zones and a summary of relevant risks and mitigation and management control measures relevant to the proposed petroleum activity. It also sets out contact details to provide feedback to Woodside.

The level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person

have not been provided. Woodside acknowledges NOPSEMA's brochure entitled 'Consultation on offshore petroleum environment plans information for the community', which advises persons being consulted that they may inform titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the *Native Title Act* for Native Title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters
- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate
- Let's Talk newsletter – digital and hard copy
- maps outlining a persons or organisations defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate
- attendance at community events or planned regional roadshows
- broader awareness campaigns on how to be involved in the EP consultation process.

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that as part of genuine two-way dialogue, these forms of communication may evolve, including, for example, due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Typical forms of communication for categories of relevant persons are in Table 5-4.

Table 5-4: Typical forms of communication for categories of relevant persons

Category of relevant person	Typically accepted form of communication
Government departments/ agencies – marine	Woodside applies NOPSEMA's guideline for engagement with Commonwealth government departments or agencies GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023 by using email for its consultation unless another form of communication is requested. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Government departments/ agencies – environment	
Government departments/ agencies – industry	
Commercial fisheries and peak representative bodies	Commonwealth commercial fisheries: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. State commercial fisheries and recreational marine users: The WA DPIRD has responsibility for managing the <i>Fish Resources Management Act 1994</i> and <i>Aquatic Resources Management Act 2016</i> , which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder's discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. Peak representative bodies: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Recreational marine users and peak representative bodies	
Titleholders and operators	Email is used as the primary form of communication between titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Historical heritage groups or organisations	NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with government departments or agencies is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Local government and recognised local community reference/liaison groups or organisations	Local government: NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with local government is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Community reference/liaison groups and chambers of commerce: Email and presentations are used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Other non-government groups or organisations	Email is used as the primary form of communication with other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Category of relevant person	Typically accepted form of communication
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 2.

Appendix F, Table 3 sets out the information which is provided to persons or organisations that are not relevant for the purposes of Regulation 25 but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with Regulation 25(4), the relevant person may request that the titleholder notifies NOPSEMA that particular information the person or organisation provides in the consultation not be published and that information subject to that request will not be published under the Environment Regulations.

5.5.2 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside's methodology allows relevant persons a reasonable period for consultation (Regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 of the Environment Regulations sets out a public consultation period of 30 days.
- The Department of Mines and Petroleum Guidelines for Consultation with Indigenous People by Mineral Explorers directs a period of 21 to 30 days of consultation with Traditional Owners.
- While repealed, guidance taken from the *Aboriginal Cultural Heritage Act 2021* – Consultation Guidelines (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period to allow identification, contact and response from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This period of consultation demonstrates that Woodside has provided a "reasonable period" for relevant persons to consult in accordance with Regulation 25(3). Commentary in the Tipakalippa Appeal judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

*it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time...*¹⁴

Woodside seeks feedback to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- Advertise in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected.

¹⁴ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [136].

- Provide consultation materials directly to identified relevant persons as well as persons who are not relevant but Woodside chose to contact, and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date.
- Acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation, and may depend on the degree to which a relevant person or organisation is affected, apply different consultation processes if required for relevant persons and organisations depending on the information requirements.
- Follow up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person.
- Engage in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided for each relevant person.

Woodside considers that consultation for this EP has closed.

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all stages of the life of the EP as per Woodside's ongoing consultation approach as described in Section 5.7.

5.5.3 Discharge of Regulation 25

The Full Federal Court made clear in the Tipakalippa Appeal that consultation should be approached in a “reasonable”, “pragmatic” and “not so literal” way, so that consultation obligations were capable of being met by titleholders (Section 5.5.5).¹⁵ Consultation is a “real world activity” and must be capable of reasonable discharge.¹⁶ The Full Federal Court referred to native title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.¹⁷

When the titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, the Regulation 25 consultation requirements are met.¹⁸ Meeting these obligations requires evaluative judgment to determine reasonable satisfaction of the consultation obligation, and as such, the regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted, and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.¹⁹

While a titleholder is required to provide an opportunity to consult, the titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a “reasonable opportunity” for consultation must be afforded to relevant persons.²⁰ A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities, and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under Regulation 25 of the Environment Regulations. Woodside considers that consultation under Regulation 25 of the Environment Regulations is complete.

¹⁸ Explanatory Statement, Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023, page 29.

¹⁹ Explanatory Statement, Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023, page 30 and Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].

¹⁹ Explanatory Statement, Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023, page 30 and Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].

²⁰ Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2) [2023] FCA 1158 at paragraph [11]; Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].

Appendix F, Table 2 and Table 3 of this EP sets out the history of consultation under Regulation 25. To the extent a relevant person says they have further information to share or claims that consultation under Regulation 25 has not been completed, Appendix F, Table 2 and Table 3 provides reasons why Woodside considers consultation under Regulation 25 has been met in relation to that relevant person.

5.5.4 Context of consultation approach with Traditional Custodians

To comply with Regulation 25 of the Environment Regulations, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

5.5.5 Approach to methodology – Woodside’s interpretation of Tipakalippa

Woodside has implemented a consultation methodology consistent with Regulation 25 and guidance provided in the Tipakalippa Appeal (Section 5.2). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Sections 5.5.6.1 to 5.5.6.4).

Woodside notes the Full Federal Court discussed several *Native Title Act* (Cth) cases in response to a submission made in that case that a requirement under Regulation 25 to consult “each and every” relevant person would be “unworkable”. The reference to native title cases dealt with how decision-making processes under the *Native Title Act* requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way,²¹ and how obligations to consult “each and every” person under Regulation 25 should be interpreted in a similarly pragmatic way so that consultation is workable. The reference to *Native Title Act* authorities was made by analogy:

It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal...The cases concerning [the native title legislation]...have reiterated...that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting.²²

We consider the authorities in relation to processes under the Native Title Act to be illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner²³ (emphasis added).

...there is no definition of what constitutes “consultation for the purpose of ref 11A [now Regulation 25]... A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons²⁴ (emphasis added).

The Judgement in the Tipakalippa Appeal makes it clear that a titleholder will have some decisional choice in identifying which natural person(s) are to be approached, how the information will be given to allow the ‘relevant person’ to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.²⁵ Consultation is not fixed to a rigid process, and will be adapted so that it is informed by the relevant person or group. Woodside has met its Regulation 25 requirements through its consultation methodology (Section 5.2).

Consistent with the Tipakalippa Appeal, Woodside considers *Native Title Act*-style “full group” meetings are not required for there to be compliance with Regulation 25. Nominated representative corporations (such as PBCs established under the *Native Title Act*) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested

²¹ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95], [98], [103]-[104] and [109].

²² Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].

²³ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].

²⁴ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].

²⁵ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].

engagement of members via full group meetings. It is not appropriate for titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.6 Consultation method

Woodside's First Nations team has experience in engaging and working with First Nations organisations and individuals, including within the Commonwealth native title and cultural heritage systems and state and territory cultural heritage and land rights systems, for several decades. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups' established channels of communication and methods of consultation. The First Nations team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team's approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory (not relevant for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (Cth)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them. By contrast, recognition for First Nations groups and their nominated representative corporations in WA falls under the *Native Title Act* (Cth) because the vast majority of the WA coastline is settled under the native title regime. This means that the methodology and process for consultation in WA places greater emphasis on, but is not limited to Native Title Representative Bodies and PBCs. Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for Country adjacent to the EMBA, and help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgement in the Tipakalippa Appeal endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.²⁶ Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in WA.

In WA (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (Section 5.5.6.2), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- Advertising in relevant Indigenous and non-Indigenous newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e. Koori Mail, National Indigenous Times, The West Australian.
- Creating carefully considered Summary Information Sheets with content developed by Woodside's First Nations Team to remove jargon and present information in a simplified format.
- Directing contact through nominated representative corporations.
- Using social media (i.e. Facebook/Instagram), texts, phone calls and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout WA and on that basis used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle through 10 years of research found "*Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations*" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- Carrying out ongoing consultation post Regulation 25 of the Environment Regulations consultation, where Woodside has a Program of Ongoing Engagement with Traditional Custodians. This program

²⁶ Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95].[104].[153].

sets out Woodside's commitment to ongoing engagement and support to care for and manage Country, including Sea Country. The program was developed in response to Traditional Custodian feedback.

- Basing members of its First Nations team in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including distributing information and providing notice to the community to support Traditional Custodian attendance and involvement at Woodside's information sessions and Community roadshows.
- Ensuring that from the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as Elders).
- Holding meetings on Country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate).
- Providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The First Nations team approach to consultation is also consistent with the Federal Court's decision in the Munkara Case. The Munkara Case notes that the word 'culture' (and hence the word 'cultural') has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people as a people. For values, features or beliefs that are expressed by an individual to be "cultural" they cannot simply be an individual's belief – the belief must have a communal aspect too, and demonstrate that the "individual beliefs are broadly representative of the beliefs of other members of the group"²⁷. The phrase "cultural features", when applied to "people" as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual.²⁷ When the First Nations team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

5.5.6.1 Identification of relevant persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with Regulation 25(1) of the Environment Regulations (Section 5.2 and Section 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.6). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporations. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate including members of the nominated representative corporations who are communal rights holders.

²⁷ *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]*.

Having said this, as set out in further detail in Section 5.5.6.4, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act* (Cth), such as under the future Act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and Native Title/compensation claims under the *Native Title Act* (Cth)²⁸.

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.6.2 Opportunity to self-identify and identifying other individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section 5.5.6.1). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Custodians' authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so nor seek to audit the representative entities for compliance with any request.
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practices rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable

²⁸ *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193, at [104].

opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.6.2.1 Sufficient information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which are provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.5). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities. These methods are specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet is developed and reviewed by Woodside's First Nations team to ensure content is appropriate to the intended recipients, is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face to face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians' location of choice (where practicable) and with their nominated attendees. Along with members of Woodside's First Nations team, key project personnel and environmental experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.6.3 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.5)

5.5.6.4 Discharge of Regulation 25

Woodside's consideration and approach to discharging Regulation 25 for relevant persons is discussed in Section 5.5.3. In addition to this, Woodside has considered the application of Regulation 25 specifically to First Nations based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under Regulation 25. Woodside considers that consultation under Regulation 25 is complete (Section 5.5.3).

5.6 Providing feedback and assessment of merit of objections or claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. While Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled Consultation on offshore petroleum environment plans information for the community, which states that relevant persons are free to respond on any matter and raise any concern. However, this may not be able to be considered if it is outside the scope or purpose of the EP and approval process; for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under Regulation 34(g) of the Environment Regulations, there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

During consultation relevant persons may seek to introduce other issues (such as agreements) not specific to EP consultation. Concepts of agreements associated with broader consultation nevertheless consultation to specific EPs can occur.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.4). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with Regulation 26(8) of the Environment Regulations, sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under Regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

5.7 Ongoing consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its management of change and revision process as appropriate (see Section 7.6.1).

6 ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the Petroleum Activity, using the methodology described in Section 2.

6.2 Analysis and evaluation

As required by Regulations 21(5) and 21(6) of the Environment Regulations, the following analysis and evaluation demonstrates that the identified risks and impacts associated with the Petroleum Activity are reduced to ALARP, are of an acceptable level and considers all operations of the Petroleum Activity, including potential emergency conditions.

Impacts and risks identified during the ENVID (including decision type, current risk level, acceptability of risk and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

- planned (routine and non-routine) activities
- unplanned events (accidents, incidents or emergency situations).

Within these categories, impact and risk assessment groupings are based on environmental aspect²⁹ (e.g. emissions, physical presence). For all hazardous events considered, the worst credible consequence was assumed.

The ENVID identified seven impacts and 11 risks associated with the Petroleum Activity. Planned activities and unplanned events are summarised in Table 6-1 and

Table 6-2. The assigned risk ratings were determined with controls in place as described in Section 2.5.

The analysis and evaluation for the Petroleum Activity indicate that current environmental risks and impacts associated with the Petroleum Activity are reduced to ALARP and are of an acceptable level, as discussed further in Section 6.7 to Section 6.8.

²⁹ An environmental aspect is an element of the activity that can interact with the environment.

Table 6-1: Environmental impact and risk analysis summary table – planned activities

Aspect	EP section	Source of impact	Key potential environmental impacts (refer to relevant EP section for details)	Severity level	Acceptability
Physical presence: disturbance to marine users	6.7.1	Pyrenees Facility, turret mooring system, subsea infrastructure, offtake tanker, OSV and IMMR operations	Potential isolated social impact potentially resulting from interference with other sea users (e.g. commercial and recreational fishing, and shipping)	1 – Minor	Tolerable
		Presence of subsea infrastructure including mid-depth buoy while Pyrenees Venture FPSO sail-away for maintenance, modification or repairs (~two to three months, contingency)	Interference with commercial shipping, fishing and/or other third-party vessels	1 – Minor	Tolerable
Physical presence: disturbance to the seabed	6.7.2	Presence of Pyrenees Facility, wells and subsea infrastructure modifying marine habitats	Localised modification of seabed habitat (formation of artificial reef) within Operational Area	1 – Minor	Tolerable
		Subsea operations, inspection, maintenance, and repair activities resulting in disturbance to seabed	Potential minor, localised modification and/or small area of damage to seabed habitat within Operational Area and smothering of benthic habitats.	1 – Minor	Tolerable
Routine light emissions: light emissions from FPSO lighting, vessel operations and operational flaring	6.7.3	Light emissions from Pyrenees Facility, vessels (including IMMR) and ROVs	Potential for short-term, localised behavioural disturbance of phototactic species in close proximity to Pyrenees Venture FPSO and vessels	1 – Minor	Tolerable
		Light emissions from Pyrenees Facility during flaring	Minor alterations to marine fauna behaviour in close proximity to the Pyrenees Venture FPSO	1 – Minor	Tolerable
Routine acoustic emissions: generation of noise during routine operations	6.7.4	Noise generated within the Operational Area from: - Pyrenees Venture FPSO and associated infrastructure - vessels including IMMR activities (e.g. ROVs, AUVs, side scan sonar, multibeam echo sounder, vessels on DP) and helicopters	Potential localised physical or behavioural impacts to marine fauna	1 – Minor	Tolerable
Routine and non-routine atmospheric and greenhouse gas emissions	6.7.5	Routine emissions from diesel driven machinery, gas-powered turbines and heaters, venting, and operational flaring onboard the Pyrenees Venture FPSO	Impacts to regional air-shed	1 – Minor	Tolerable
		Consideration of indirect emissions associated with third party transportation, oil refining and combustion by end users	GHG emissions and climate change	1 – Minor	Tolerable
Routine and non-routine discharges: marine discharges – PW	6.7.6	Discharge of PW and slops from Pyrenees Venture FPSO	Overboard discharges causing changes in water quality (hydrocarbon, chemical, temperature) leading to environmental impacts to biota within the Operations Area	1 – Minor	Tolerable
Routine and non-routine discharges: liquid waste and subsea fluids	6.7.7	Release of subsea chemicals or hydrocarbons by actuation of valves or during subsea operations and activities	Potential for toxic effect to fauna in close association with release point causing changes in water quality (hydrocarbon, chemical, temperature) leading to environmental impacts to biota within the Operations Area	1 – Minor	Tolerable
		Marine discharges of liquid wastes from Pyrenees Venture FPSO and vessel utility systems and drains (sewage, greywater, RO brine reject, cooling water, food waste, rainfall/deck washdown water, firewater deluge testing)	Changes in water quality and biota due to: - minor localised nutrient increase from surfactants (soaps and detergents) and chemicals to water column - minor increase in salinity - localised nutrient increase from food waste discharge - detergent, oil and grease discharge to the marine environment during rainfall or washdown activities	1 – Minor	Tolerable

Table 6-2: Environmental impact and risk analysis summary table – unplanned events

Aspect	EP section	Source of risk	Key potential environmental impacts (refer to relevant EP section for details)	Severity level	Likelihood	Risk level	Acceptability
Unplanned hydrocarbon release: loss of well containment	6.8.2	Release of hydrocarbons resulting from loss of well containment	Contamination/pollution of water column	5 – Severe	Highly Unlikely	30	Tolerable
		Pyrenees Venture FPSO off station (up to THREE months), leaks or weeps from wells will be left undetected until return	Contamination/pollution of water column	1 – Minor	Unlikely	1	Tolerable
Unplanned hydrocarbon release: loss of containment of bulk storage (crude)	6.8.3	Large release of Pyrenees crude oil from bulk storage on Pyrenees Venture FPSO	Acute/ chronic toxic effect on marine organisms from hydrocarbons	4 – Serious	Highly Unlikely	9	Tolerable
Unplanned hydrocarbon release: subsea infrastructure	6.8.4	Accidental releases/leaks of crude oil from subsea infrastructure	Contamination/pollution of water column	2 – Measurable	Unlikely	3	Tolerable
Unplanned hydrocarbon release: offtake operations	6.8.5	Release of crude from equipment failure or processes (offloading, transferring)	Acute/ chronic toxic effect on marine organisms from hydrocarbons	3 – Substantial	Highly Unlikely	3	Tolerable
Unplanned hydrocarbon release: turret operations	6.8.6	Hydrocarbon spill from failure during turret operations	Contamination/pollution of water column	1 – Minor	Unlikely	1	Tolerable

Aspect	EP section	Source of risk	Key potential environmental impacts (refer to relevant EP section for details)	Severity level	Likelihood	Risk level	Acceptability
Unplanned hydrocarbon release: diesel spill from bulk storage	6.8.7	Diesel spill from ruptured fuel tank due to vessel collision	Contamination/pollution of water column	2 – Measurable	Highly Unlikely	0.9	Tolerable
Unplanned hydrocarbon or chemical release	6.8.8	Hydrocarbon spills/hazardous chemicals or liquid waste, accidental leaks from storage or equipment, including ROVs	Contamination/pollution of water column	1 – Minor	Possible	3	Tolerable
		Spills from bulk transfer of chemical from support vessels to Pyrenees Venture FPSO (bulk contents up to 2,000 L)	Contamination/pollution of water column	2 – Measurable	Unlikely	3	Tolerable
		Diesel spill due to human error/equipment failure during bunkering	Contamination/pollution of water column	1 – Minor	Unlikely	1	Tolerable
Unplanned discharges: hazardous and non-hazardous waste management	6.8.9	Incorrect disposal or accidental discharge of non-hazardous and hazardous waste to the marine environment	Impacts to marine fauna and/or water quality	1 – Minor	Highly Unlikely	0.3	Tolerable
		Dropped objects from support/logistical operations – vessel to vessel lifting (e.g. containers and materials)	Impacts to marine fauna and/or water quality	1 – Minor	Unlikely	1	Tolerable
Physical presence (unplanned): interaction with live infrastructure	6.8.10	Dropped objects from support/logistical operations – interaction with live infrastructure causing loss of containment	Contamination/pollution of water column	2 – Measurable	Unlikely	3	Tolerable
Physical presence: vessel collision with marine fauna	6.8.11	Physical presence of vessels resulting in collision with marine fauna	Potential injury or death of marine fauna (single animal), including protected species	1 – Minor	Unlikely	1	Tolerable
Physical presence: introduction of invasive marine species	6.8.12	Movement of vessels from known high IMS risk areas	Potential introduction of IMS possibly resulting in an alteration of the localised environment and major impact to native species	3 – Substantial	Unlikely	10	Tolerable

6.3 Cumulative impacts

In this EP Woodside has assessed the potential cumulative impacts of the Petroleum Activity in relation to other relevant activities which could realistically result in overlapping temporal and spatial extents. Other facilities located in close proximity to the Pyrenees Facility consist of the Woodside Ngujima-Yin FPSO, Woodside Macedon Field, and the Santos Ningaloo Vision FPSO (Table 4-24 and Figure 4-21). The Macedon Field Operational Area overlaps the Pyrenees Operational Area in proximity to one well (Macedon-6) (Figure 3-1 and Figure 4-22). Where relevant this EP considers cumulative impacts from the Petroleum Activity alongside potential impacts from other nearby oil and gas activities.

Given the sources of environmental risks and impacts from the Petroleum Activity are concentrated around the Pyrenees Venture FPSO, the potential for cumulative impacts is considered to be low. Cumulative impacts are discussed for sources of risk and impacts where such impacts were deemed to be credible.

6.4 Environmental performance outcomes, standards and measurement criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes EPOs, EPSs and MC that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and Acceptable levels.

The EPOs, EPSs and MC specified are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the LCS, GP and PJ, as part of the acceptability and ALARP justification process.

As defined in Regulation 5 of the Environment Regulations, an EPO *"for an activity, means a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level"*.

EPOs are set to ensure they are consistent with the principles of ESD as defined in section 3A of the EPBC Act and demonstrated through the acceptability process, which is applied to each aspect in Section 6, taking into consideration the principles of ESD. The EPOs have been set at a level of environmental performance that is equal to the identified environmental impact or risk.

Impact based EPOs, where qualitative terms (e.g. prevent, limit) are used in EPOs, they are supported by detailed impact assessment in Section 6 such that they can be interpreted as meaning *"impact and risk greater than that predicted in this EP"*.

A risk-based EPO ties in with Woodside's risk management processes so that risk is maintained within a level that has been evaluated as being appropriate to the nature and scale of the risk. Relevant controls are used to identify and treat potential step-outs (resulting in an increased likelihood) from expected controls performance or integrity envelopes.

EPSs and MC are defined to measure environment performance against the EPOs:

- EPS are statements of performance required of a control measure in order to manage risk and/or impacts to ALARP and acceptable level. EPS are used as a basis for environmental performance reporting and demonstrates compliance against the EPO.
- MCs are outlined defining how environmental performance is measured and sets the criteria to determine whether the EPO and EPS have been met during the Petroleum Activity.

For planned activities, where the activity is undertaken as described and the relevant EPSs are implemented it confirms that the EPOs are being met.

The EPOs, EPSs and MC are presented throughout Sections 6.7 and 6.8 and Appendix H (oil spill preparedness and response mitigation assessment). A breach of these EPOs or standards constitutes a 'Recordable Incident' under the Environment Regulations (refer to Section 7.14.6).

6.5 Presentation

The analysis and evaluation (ALARP and acceptability), EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the sample below. Italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Environment Regulations and/or this EP.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁰	Benefit in impact/risk reduction	Proportionality	Control adopted
ALARP/hierarchy of control tools used – Section 2.6.2				
Summary of control considered to ensure the impacts and risks are continuously reduced to ALARP. Regulation 21(5)(c).	Technical/logistical feasibility of the control. Cost/sacrifice required to implement the control (qualitative measure).	Qualitative commentary of impact/risk that could be averted/ environmental benefit gained if the cost/sacrifice is made and the control is adopted.	Proportionality of cost/sacrifice vs environmental benefit. If proportionate (benefits outweigh costs), the control will be adopted. If disproportionate (costs outweigh benefits), the control will not be adopted.	If control is adopted, reference to Control No. provided.
ALARP is demonstrated through controls being analysed for selection, based on their independence, and prioritised in accordance with hierarchy of controls, and further analysed to consider the type of effect the control provides.				

³⁰ Qualitative measure.

Demonstration of ALARP**ALARP statement:**

Made on the basis of the environmental risk/impact assessment outcomes, use of the relevant tools appropriate to the Decision Type (Section 2.7.1) and a proportionality assessment. Regulation 34(b).

Demonstration of acceptability**Acceptability statement:**

Made on the basis of applying the process described in Section 2.7.2 and taking into account internal and external expectations, risk/impact to environmental thresholds and use of environment decision principles. Regulation 34(c)

EPOs, EPSs and MC

Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
EPO No. <i>S: Specific performance that addresses the legislative and other controls that manage the activity, and against which performance by Woodside in protecting the environment will be measured.</i> <i>M: Performance against the outcome will be measured through implementation of the controls via the MC.</i> <i>A: Achievability/feasibility of the outcome demonstrated via discussion of feasibility of controls in ALARP demonstration. Controls are directly linked to the outcome.</i> <i>R: The outcome will be relevant to the source of risk/impact and the potentially impacted environmental value³¹.</i> <i>T: The outcome will state the timeframe during which the outcome will apply or by which it will be achieved.</i>	C No. <i>Identified control adopted to ensure that the impacts and risks are continuously reduced to ALARP.</i> <i>Regulation 21(5)(c).</i>	PS No. <i>Statement of the performance required of a control measure.</i> <i>Regulation 21(7)(a).</i>	MC No. <i>MC for determining whether the outcomes and standards have been met. Regulation 21(7)(c).</i>

6.6 Environment risk/impacts not deemed credible

The ENVID identified one source of environmental risk/impact that was assessed as not being applicable (not credible) within or outside the Operational Area as a result of the Petroleum Activity, and therefore is described here for information only:

- Shallow/nearshore activities: The Petroleum Activity is located in water depths of between 180 m and 200 m and at a distance approximately 16 km from nearest landfall (Muiron Islands). Consequently, risks and impacts associated with shallow-water or near-shore activities such as anchoring and vessel grounding were assessed as not credible.

³¹ Where impact/consequence descriptors are capitalised and presented within EPOs in Section 6; performance levels correspond with those aligned with the Woodside PetDW Risk Matrix (refer Section 2.6).

6.7 Planned activities (routine and non-routine)

6.7.1 Physical presence: disturbance to marine users

Context														
Facility layout and description – Section 3.5 Support services – Section 3.17 Subsea IMMR activities – Section 3.19				Socio-cultural environment – Section 4.9.5.3.110				Consultation – Section 5						
Impacts evaluation summary														
Source of impact	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Pyrenees Venture FPSO, turret mooring system, subsea infrastructure, offtake tanker, OSV and IMMR operations							x	A	1 – Minor	-	-	LCS GP PJ	Tolerable	EPO 1
Presence of subsea infrastructure including mid-depth buoy while Pyrenees Venture FPSO sail away for maintenance, modification or repairs (~two to three months, contingency)							x	A	1 – Minor	-	-			
Source of impact														
The Pyrenees Facility commenced operation in 2010 and has been marked on nautical charts since that time. The Pyrenees Venture FPSO and subsea equipment are surrounded by a 500 m radius PSZ, which non project vessels are prohibited from entering, unless authorised by Woodside. The PSZ is a critical safety control intended to reduce the likelihood of interactions between vessels and the Pyrenees Venture FPSO, subsequently increasing safety for both vessels and the Pyrenees Facility. Implementation of the PSZ excludes other users from a small area of the sea (approximately 0.79 km²). The presence of the Pyrenees Facility (FPSO, subsea infrastructure) and supporting vessels, may be a potential obstacle (exclusion from area) or collision risk/navigational hazard to other marine users (fisheries and/or shipping vessels) in the area. The Pyrenees Venture FPSO and supporting vessels are clearly visible under most conditions and are well lit according to navigational and safety requirements. The nature of the Pyrenees Venture FPSO (e.g. a large steel structure) also ensures a clear radar return to alert ships fitted with anti-collision radars. There are approximately 8 offtakes from the FPSO annually and offtake vessels will enter the Operational Area accordingly. Routine and non-routine vessel activities associated with the Petroleum Activity are generally concentrated within the PSZ (e.g. activities performed by support vessels at the Pyrenees Venture FPSO) but can occur anywhere within the Operational Area. Subsea support vessels will undertake activities, such as IMMR activities within the Operational Area at any time. The duration and location of these activities varies depending on the Petroleum Activity being undertaken. Routine IMMR activities typically require one vessel with 24hr operations, for no more than one or two weeks per year. Non-routine IMMR activities typically require one IMMR vessel, but may require up to two, with 24-hour operations for approximately two weeks per activity. All infrastructure within the scope of this EP is marked on navigation charts.

Impact assessment

The Petroleum Activity has the potential to exclude or displace other marine users. In some instances exclusion or displacement may be temporary, i.e. from vessel presence during IMMR activities, or permanent, i.e. from the ongoing presence of subsea infrastructure. The following paragraphs describe how specific other marine users may be impacted during the Petroleum Activity.

Commercial fishing

A number of commercial fisheries overlap the Operational Area with only four having potential for interactions with the Petroleum Activity (Section 4.9.5.3.1). The State-managed Pilbara Line Fishery, Pilbara Trap Fishery, Mackerel Managed Fishery and West Coast Deep Sea Crustacean Managed Fishery are considered to have some limited potential for interaction with project activities in the Operational Area (Section 4.9.5.3.1).

Commercial fishing vessels in the vicinity of the Operational Area are most likely to be licenced under the Pilbara Line Fishery and may employ several gear types (including trap and line) (Table 4-23). The Pilbara Line Fishery (condition) is active in the EMBA, with the 60 NM CAES block reporting up to five licences across the 2017 to 2022 seasons. The Pilbara Line Fishery licencees target 45 to 50 catch species and are permitted to operate anywhere in Pilbara waters, overlapping the Operational Area and EMBA. A small area of the Operational Area lies within Zone 2 of the fishery, which allows Pilbara trap fishing only. The Zone 2 fishery has a total area of approximately 24,580 km²; the portion of this zone that overlaps the Operational Area is approximately 90 km², which is less than 0.4% of the total Zone 2 fishery area. As such, impacts from the physical presence of the Pyrenees Facility and subsea infrastructure to this fishery are expected to be confined to localised displacement of fishing effort from the Operational Area.

The Mackerel Managed Fishery reported three to seven active fishers between the 2017 to 2022 seasons, with consistent fishing effort since 2012. Previous fishing effort indicates fishing concentrated in coastal Pilbara reefs north-east of the Operational Area. The managed fishery boundary entirely overlaps the Operational Area.

The West Coast Deep Sea Crustacean Managed Fishery reported three active vessels, in the 60 NM CAES block overlapping the Operational Area.

Based on historic catch data, there are no other commercial fisheries known to use the Operational Area.

Tourism and recreation

Tourism and recreation activity in the Operational Area is expected to be infrequent, with recreational and charter fishing from vessels the only tourism and recreation activities identified as potentially occurring in the Operational Area. Any recreational and charter fishing from vessels is largely undertaken using lines.

Fishing effort for tourism charter operators were reported at the 10NM reporting blocks overlapping the Operational Area, with up to three vessels active during the 2020-2021 season.

The annual GAMEX fishing tournament (usually run in March by the Exmouth Game Fishing Club) may result in increased offshore recreational fishing. Operational experience to date has not indicated adverse interactions with recreational fishers occurs during GAMEX. Woodside's experience gained from operating the Nganhurra and Pyrenees Venture FPSOs has shown that very little recreational (including charter) fishing takes place in the vicinity of the Operational Area. Consultation outcomes did not indicate any recreational fishing occurs within the Operational Area (Section 5).

Given the distance from boating facilities (nearest established boat ramps and marina are at Tantabiddi, approximately 42 km from the Operational Area), lack of natural attractions and water depth of the Operational Area, very little interaction with tourism and recreational activities is expected to occur during the Petroleum Activity. As such, impacts to recreational and charter fishing are expected to be localised and of no lasting effect.

Shipping

Significant commercial shipping occurs in the broader region where the Operational Area is located, with commercial shipping traffic comprising vessels such as:

- bulk carriers (e.g. mineral ore, salt) from Port Hedland and Dampier
- offtake tankers
- support vessels for offshore oil and gas activities
- LNG carriers from Dampier, Barrow Island and Ashburton North.

To reduce the likelihood of interactions between commercial vessels and offshore facilities, AMSA have introduced a series of shipping fairways within which commercial vessels are advised to navigate. The fairways are not mandatory; however, AMSA strongly recommends commercial vessels remain within the fairway when transiting the region. The use of shipping fairways is considered to be good seafaring practice, with AUSREP data from AMSA indicating cargo ships and tankers routinely navigate within the established fairways.

The fairway intended to direct north-/south-bound vessel traffic from Barrow Island and the southern Montebello Islands does not overlap the Operational Area.

The presence of the Pyrenees Facility, vessels and subsea infrastructure will not result in impacts to commercial shipping beyond a localised exclusion of shipping traffic from the PSZ and the temporary displacement of commercial shipping due to the presence of subsea support vessels undertaking activities in the Operational Area.

Oil and gas

The Macedon Subsea Gas Field is 5 km east and Ngujima-Yin FPSO is 6.6 km south-east. The nearest facility not operated by Woodside is the Ningaloo Vision FPSO, which lies approximately 9.4 km south of the Operational Area (Section 4.10.5). Given the distance between the Operational Area and petroleum activities undertaken by other operators, no impacts to other operators will occur as a result of the presence of the Pyrenees Venture FPSO, subsea infrastructure or project vessels.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
Contract vessels compliant with Marine Orders for safe vessel operations: - Marine Order 21 (Safety and emergency procedures) 2016 - Marine Order 27 (Safety of navigation and radio equipment) 2016 - Marine Order 30 (Prevention of collisions) 2016.	F: Yes. CS: Minimal cost. Standard practice.	Marine Orders 21, 27 and 30 are required under Australian regulations; implementation is standard practice for commercial vessels as applicable to vessel size, type and class. Compliance with Marine Orders 21, 27 and 30 reduces the likelihood of adverse interaction of vessels with other marine users.	Control based on legislative requirement – must be adopted.	Yes C 1.1
Implementation of a 500 m PSZ around the Pyrenees Venture FPSO to reduce the likelihood of interaction of vessels with the Pyrenees Venture FPSO.	F: Yes. CS: Minimal cost. Standard practice.	The PSZ is a requirement under Australian regulations and reduces the likelihood of interaction of vessels with the Pyrenees Venture FPSO.	Control based on legislative requirement – must be adopted.	Yes C 1.2
Good practice				
Permanent infrastructure is shown on AHO marine charts.	F: Yes. CS: Minimal cost. Standard practice.	Notification of AHO will enable them to update maritime charts, thereby reducing the likelihood of interactions with Pyrenees infrastructure.	Benefits outweigh cost/sacrifice.	Yes C 1.3
Consultation undertaken in support of the Petroleum Activity to ensure marine users are informed and aware of the Petroleum Activity.	F: Yes. CS: Minimal cost. Standard practice.	Consultation keeps marine users ensures they are informed and aware, thereby reducing the likelihood of interactions with Pyrenees infrastructure.	Benefits outweigh cost/sacrifice.	Yes C 1.4
Notify AHO of activities where vessels will be in the Operational Area, but outside of the PSZ >three weeks, no less than four working weeks prior to scheduled activity commencement date.	F: Yes. CS: Minimal cost. Standard practice.	Notification of AHO will enable them to issue a Maritime Safety Information Notification and Notice to Mariners, thereby reducing the likelihood of unplanned interactions with other vessels.	Benefits outweigh cost/sacrifice.	Yes C 1.5

Professional judgement – Procedures and administration				
The Pyrenees Venture FPSO's NAVAIDS Critical Equipment Performance Standard is implemented to alert marine vessels of the facility location.	F: Yes. CS: Minimal cost. Standard practice.	The Pyrenees Venture FPSO's NAVAIDS equipment can alert marine vessels of the facility location, which reduces the likelihood of adverse interaction with other marine users.	Control is a company management system requirement – must be adopted.	Yes C 1.7
Install over-trawl protection on subsea infrastructure.	F: Yes. Ove-trawl protection on subsea infrastructure could be fitted to Pyrenees subsea infrastructure. CS: Significant additional cost associated with the design and installation of trawl protection on subsea infrastructure.	Overtrawl protection on subsea infrastructure could mitigate against the potential for commercial fishing trawl gear to damage infrastructure or result in gear loss. However, trawl fishing is unlikely to happen within the Operational Area.	Given the limited portion of the Operational Area that lies within the area open to trawl fishing, the cost of installing overtrawl protection is grossly disproportionate to the environmental benefit.	No
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the potential impacts of the physical presence of the Pyrenees Facility, subsea infrastructure and vessels on other users. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability

Acceptability statement:

The impact assessment has determined that, given the adopted controls, the physical presence of the Pyrenees Venture FPSO, subsea infrastructure and vessels represent a minor impact that is unlikely to result in a potential impact greater than an isolated social impact to commercial fishing, recreational fishing and/or shipping. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders, and expectations of AMSA and AHO provided in consultation with relevant persons. Further opportunities to reduce the impacts and risks have been investigated above.

The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of physical presence of the Pyrenees Facility and support vessels to a level that is tolerable and demonstrate the EPOs are met.

EPOs, EPSs and MC

<i>Environmental performance outcomes</i>	<i>Controls</i>	<i>Environmental performance standards</i>	<i>Measurement criteria</i>
EPO 1 Impacts to relevant stakeholders from the planned activities will be limited through the provision of appropriate information/ notification.	C 1.1 Vessels compliant with Marine Orders for safe vessel operations: - Marine Orders 21 (Safety of navigation and emergency procedures) 2016 - Marine Order 27 (Safety of navigation and radio equipment) 2016 - Marine Orders 30 (Prevention of collisions) 2016.	PS 1.1 Vessels comply with Marine Orders as applicable to vessel size, type and class.	MC 1.1 Marine verification records demonstrate compliance with standard maritime safety procedures (Marine Orders 21, 27 and 30).
	C 1.2 Maintenance of 500 m PSZ around Pyrenees Venture FPSO.	PS 1.2 PSZ maintained and monitored for incursions.	MC 1.2 Records of unauthorised interactions in 500 m PSZ with other marine users are entered into Incident database.
	C 1.3 Permanent infrastructure is shown on AHO marine charts.	PS 1.3 Woodside will notify AHO of location of new permanent Pyrenees infrastructure.	MC 1.3 Records demonstrate AHO has been notified of location of new permanent Pyrenees infrastructure.
	C 1.4 Undertake consultation program to advise relevant persons of the Petroleum Activity and provide opportunity to raise objections or claims.	PS 1.4 Implement a consultation process that conforms to the requirements of the Environment Regulations	MC 1.4 Records demonstrate a consultation program that conforms to the requirements of the Environment Regulations has been undertaken (refer to Section 5).
	C 1.5 Notify AHO of activities where vessels will be in the Operational Area (but outside of the PSZ) for >three weeks, no less than four working weeks prior to scheduled Petroleum Activity commencement date.	PS 1.5 Woodside to notify AHO of activities where vessels will be in the Operational Area (but outside of the PSZ) >three weeks, to allow generation of navigation warnings.	MC 1.5 Records demonstrate that AHO notifications complete.

	C 1.7 The Pyrenees NAVAIDS Critical Equipment Performance Standard is implemented to alert marine vessels of the facility location, which reduces the likelihood of adverse interaction with other marine users.	PS 1.7 NAVAID critical equipment is managed in accordance with the Pyrenees NAVAIDS Critical Equipment Performance Standard to prevent environment risk by: • alerting facility of a potential collision with marine vessels • alerting marine vessels of facility location so they may take timely action to avoid the facility and hence reduce the likelihood of collision.	MC 1.7 Records demonstrate compliance with Performance Standard requirements.

6.7.2 Physical presence: disturbance to the seabed

Context														
Subsea infrastructure and layout description – Section 3.5 Pyrenees Facility – Section 3.11 Subsea IMMR activities – Section 3.19				Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5						
Impacts evaluation summary														
Source of impact	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Presence of Pyrenees Facility subsea infrastructure modifying marine habitats		x	x		x			A	1 – Minor	-	-	LCS GP PJ	Tolerable	EPO 2, 3
Subsea operations, inspection, maintenance and repair activities resulting in disturbance to the seabed		x	x		x			A	1 – Minor	-	-			
Source of impact														
Seabed disturbance or modification associated with the Petroleum Activity can occur during operations and other activities, including from: - physical presence of the Pyrenees Venture FPSO and subsea infrastructure (operational and suspended) - scour, spans and flowline movement inherent in design - subsea IMMR activities (Section 3.19).														
Presence of infrastructure The presence of subsea infrastructure may result in localised scouring around the infrastructure due to currents, subsurface waves, and seabed sediment fluid dynamics. Scour around subsea infrastructure may necessitate IMMR activities as part of integrity management practices. Flowline movement may occur as per design and within integrity margins along the flowline corridor. Normal flowline operational movement occurs due to factors such as flowline buckling, walking and varying metocean conditions. Lateral movement can occur within the flowline corridor. The extent of any flowline buckling and walking would be restricted to the Operational Area, and for safety reasons, Woodside will manage buckling and walking to within design limits.														
IMMR activities In order to maintain the integrity of subsea infrastructure, Woodside undertakes routine subsea IMMR activities, as described in Section 3.19. Activities that constitute IMMR may impact upon the benthic environment in the vicinity of the Petroleum Activity. IMMR activities identified as impacting the benthic environment include: - inspections – minor, localised sediment resuspension by ROV - scale and marine growth removal – minor, localised resuspension of sediment; removal of marine biota from subsea infrastructure - sediment relocation – minor, localised modification of benthic habitat and sediment resuspension - span rectification - jumper and umbilical replacement – minor, localised modification of benthic habitat in the vicinity of the jumper/umbilical														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- temporary laying of tools on seabed (e.g. seabed baskets) – minor, localised modification of benthic habitat in the vicinity of the basket
- laying of infrastructure during non-routine repair and/or replacement activities.

The area of benthic habitat predicted to be impacted varies depending on the nature and scale of the IMMR activity. Span rectification activities are IMMR activities with the greatest potential to modify benthic habitats, due to the alteration of the existing soft sediment habitat to hard substrate. Woodside's operational experience on the NWS indicates these activities are typically restricted to relatively short (tens of metres) linear sections of flowlines, with areas of up to approximately 100 m² impacted.

Under routine operations, anchoring of vessels undertaking IMMR is avoided in the Operational Area but there may be non-routine activities that require anchoring for safety reasons.

Impact assessment

Water and sediment quality

Seabed disturbance may include localised and temporary decline in water quality due to an increase in suspended sediment concentrations and sediment deposition caused by IMMR activities. However, sediment loads are not expected to be significant due to the relatively small footprint for each Petroleum Activity (IMMR activities described above, and in Section 3.19).

Each discrete IMMR activity near the seabed is likely to cause a single brief disturbance resulting in a transient plume of suspended sediment. This plume will subsequently be deposited down current as particles resettle. Such localised and short-term events may affect small areas of the seabed and consequently, impact the associated biota (typically sparsely distributed infauna and sessile epifauna). Such impacts are expected to be minor (e.g. ingestion of suspended sediment); impacts such as smothering of sessile biota are not expected to occur.

Benthic habitats

The benthic habitat within the Operational Area is predominantly soft sediment with sparsely associated epifauna which is broadly represented throughout the NWS Province and wider NWS (Section 4.5). Benthic communities of the soft sediment seabed are characterised by burrowing infauna such as polychaetes, with biota such as sessile filter feeders occurring on areas of hard substrate (such as subsea infrastructure).

The infauna communities are also representative of the NWS province; being of low abundance and dominated by polychaetes and crustaceans (RPS Environment and Planning, 2012).

IMMR activities may result in potential impacts that may be categorised as:

- direct physical disturbance of benthic habitat
- indirect disturbance to benthic habitats from activities such as sediment relocation.

As mentioned, flowline movement is limited to within design and integrity envelopes and may result in minor, localised impact to soft sediment benthic habitats, typically on the scales varying between metres to tens of metres laterally along the flowline corridors.

Direct seabed disturbance, including permanent modification of benthic communities, may result as a consequence of IMMR activities such as span rectification, flowline protection and stabilisation. These activities will typically disturb a small area (typically <100 m²) of soft sediment habitat, which is broadly represented in the Operational Area and wider NWS region. This habitat will be replaced by hard substrate (e.g. concrete mattresses, rocks), which is generally uncommon in the middle and outer NWS region.

Over time, this hard substrate is expected to be colonised by sessile benthic biota (e.g. sponges, gorgonians), which may support higher biodiversity benthic fauna (such as fish assemblages) than soft sediment habitats. The estimated overall extent of such direct seabed disturbance is extremely small in relation to the extent of the soft sediment habitats which are broadly represented within the Operational Area and the wider NWS Province.

Artificial habitat

Subsea infrastructure provides hard substrate for the settlement of marine organisms; the availability of hard substrate is often a limiting factor in benthic communities. As such, the presence of infrastructure has led to the development of ecological communities which would not have existed otherwise. For example, pipeline infrastructure has been shown to support more diverse fish assemblages and benthic biota (McLean et al., 2017; Bond, 2018). These communities are relatively diverse compared to the open water and soft sediment habitats in the broader Operational Area.

Key ecological features

Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula

The KEF is recognised for the unique physical structure of the seafloor and the biodiversity it supports. Studies published by Post et al. (2021) indicate the range of characteristics of the region to include near vertical cliffs, and sediment covered slopes on the upper continental slopes. The canyons are associated with upwelling as they channel deep nutrient-rich waters onto the continental shelf (Brewer et al., 2007), interacting with the Leeuwin Current at the canyon heads (Sleeman et al., 2007). Hard substrates dominate the canyons and provide repositories for particulate matter deposited from the shelf and sides of the canyons and provide habitats for deepwater snappers and other species (Brewer et al., 2007).

The few sediment samples that have been collected from the region indicate sandy to gravelly sediments on the upper shelf and typically muddy sediments on the Exmouth Plateau (Geoscience Australia, 2017). These studies are supported by Thomson & Heimann (2014), concluding the diverse presence of sediment types, including fine-grained silts, sands, and occasional gravels are the key contributing factor to the overall biodiversity and ecological functioning of the seabed.

Given the relatively small overlap of the Operational Area with the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula, the distance from the key Canyon features of the KEF, and nature of the IMMR activities, impacts to the KEF are likely to be minor.

Continental Slope Demersal Fish Communities

The Continental Slope Demersal Fish Communities KEF supports a high diversity of demersal fish assemblages, including 76 species across the KEF that are considered endemic (Last et al., 2005). Like the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula, the substrate comprising the Continental Slope Demersal Fish Communities KEF is characterised by a diverse range of sediment types, such as fine, muddy and gravelly sands (Thomson & Heimann, 2014). These diverse sediment compositions and associated seabed habitats contribute to the high biodiversity and productivity of the region. Any direct seabed disturbance from the Petroleum Activity will be localised and of a short duration, without compromise of the values and key features of the KEF due to the small portion of the KEF that could be impacted and the nature of the activities that are likely to occur associated with the Petroleum Activity.

³⁴ *Permit for Entry into a Protected Zone or to Impact Underwater Cultural Heritage would be acquired under the Underwater Cultural Heritage Act.*

6.7.3 Routine light emissions: light emissions from FPSO lighting, vessel operations and operational flaring

Context														
Pyrenees Facility – Section 3.11 Production processes – Section 3.13 Subsea IMMR activities – Section 3.19							Biological environment – Section 4.5				Consultation – Section 5			
Impacts evaluation summary														
Source of impact	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Light emissions from Pyrenees Facility, vessels (including IMMR) and ROVs						x		A	1 – Minor	-	-	LCS GP PJ	Tolerable	EPO 4, 5
Light emissions from Pyrenees Facility during flaring						x		A	1 – Minor	-	-			
Source of impact														
Routine light emissions include light sources that alter the ambient light conditions in an environment. The sources associated with the Petroleum Activity are operational lighting of the FPSO and support vessels and flaring from the FPSO. FPSO (operational lighting and flaring) Operational lighting on the FPSO is used to ensure a safe working environment to support 24-hour operations and to communicate the presence of the Pyrenees Venture FPSO to other marine users (i.e. navigation lights). This allows the Pyrenees Venture FPSO to meet sea and air safety safe working and navigational requirements. This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. As lighting is required for the safe operation of the facility it cannot reasonably be eliminated. A relatively small quantity of gas is required to be continuously flared associated with purge and pilot of the flare system and disposal of waste streams which are not recovered to the process. Intermittent flaring may occur for short periods during routine and non-routine operational activities, including depressurisation of the system and/or emergency shutdowns. Continuous flaring produces less intense light when compared to some non-routine flaring events such as emergency shutdowns and process upsets. The distance to the horizon at which components of the FPSO or support vessels are directly visible can be estimated using this formula: $\text{horizon distance} = 3.57 \times \sqrt{\text{height}}$ In this formula “horizon distance” is the distance to the horizon at sea level in kilometres, and “height” is the height above sea level of the light source in metres. Using this formula, with the top of the flare tower (the highest point of the facility) at 90 m above sea level and deck lighting at 24 m, the maximum distance to the horizon at which the flare tower and deck lighting is directly visible at sea level is approximately 34 km and 17.5 km respectively. Light emissions associated with the Dorado FPSO were modelled as part of the Dorado Offshore Project Proposal (Pendoley Environmental, 2020a) to consider both visibility and radiance, as well as worst-case flaring events. This assessment is considered a suitable and conservative surrogate for the light emissions of the Pyrenees Venture FPSO for the following reasons: • The deck height for operational lighting is similar.														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- The flaring tower height of the Dorado FPSO (110 m) is approximately 20 m higher than Pyrenees and so has slightly more visibility than the Pyrenees flare tower.
- The receiving environment for the Pyrenees Venture FPSO has a minor elevation equivalent to that of the Dorado FPSO receiving environment.

The Dorado light assessment used satellite data of known maintenance (i.e. worst case) flaring events at existing LNG facilities to obtain a base radiance value for a flare before applying it to the model, which is considered a more reliable and conservative approach than flare gas rate.

Two scenarios were modelled for the Dorado FPSO:

- operational lighting with no flaring
- operational lighting including flaring.

The Dorado FPSO lighting design and luminaire specifications were applied to the ILLUMINA artificial light at night model (Aubé et al., 2005). The ILLUMINA model is a 3D model that predicts the extent of visible light and radiance (light received in a specific area). In this assessment, light was described in terms of radiance which describes the light received in a specific area and is provided in the units $W/m^2/sr$, where W = watts, m^2 = metres squared and sr = steradian (unit of solid angle, equal to the angle at the centre of a sphere subtended by a part of the surface equal in area to the square of the radius).

In the absence of any published or generally accepted units or scale for measuring the impact of artificial light on wildlife, moonlight was selected as a proxy (considered representative of ambient light levels marine fauna are adapted to). The light model output was converted to units of full moon equivalents in an attempt to give the radiance output some biological relevance and to aid interpretation in an environmental impact assessment context. The light emissions are considered to have reduced to ambient when radiance is less than the equivalent of 0.01 (1/100th) of one full moon.

In the non-flaring scenario for the Dorado FPSO, the model results show that radiance reduced to ambient (less than 0.01 full moon equivalent) at 17.7 km from the source. In the flaring scenario, the flare is no longer directly visible at 42.4 km, when the flare drops below the horizon. At this distance, the radiance is equivalent to 0.25 full moons. As the flare drops below the horizon, radiance declines rapidly and is no longer visible.

Given the height of the Pyrenees flare and the nature of flaring that will take place during the Petroleum Activity is similar to what was modelled for the Dorado FPSO, it is also expected that lighting from the Pyrenees Venture FPSO (flare and navigational lighting) will be visible for up to 42.4 km from the Pyrenees Venture FPSO.

Support vessel lighting

Support vessels will routinely use external lighting to navigate and conduct safe operations at night for the duration of the Petroleum Activity. Vessel lighting will also be used to communicate the vessels' presence to other marine users (i.e. navigation/warning lights). This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. Lighting is required for safely operating the vessels and cannot reasonably be eliminated.

Spot lighting may also be used on an as-needed basis such as during ROV deployment and retrieval. During IMMR activities, lighting is generated over short periods of time while ROVs are in use, as well as from deck lighting. Given the typical intensity of ROV lights and the attenuation of light in seawater, light from ROVs will be localised to the vicinity of the ROV and vessels.

For lighting on a support vessel ~20 m above sea level, the distance to the visible horizon is approximately 16 km. Any lighting beyond this distance is below the horizon and direct light will not be visible. To also consider radiance, the Dorado FPSO modelling of the non-flaring (operational lighting) scenario can be used as a suitable surrogate given the increased lighting associated with an FPSO and greater deck height compared to standard support vessels. The model results show that radiance reduced to ambient (less than 0.01 full moon equivalent) at 17.7 km from the source.

Impact assessment

Lighting from the FPSO and support vessels may appear from direct unshielded light sources or through skyglow. Where direct light falls upon the ocean, this area of light is referred to as light spill. Skyglow is the diffuse glow caused by light that is screened from view, but through reflection and refraction creates a glow in the atmosphere. The distance at which direct light and skyglow may be visible from the source is dependent on the lighting on the facility/vessel and environmental conditions as described above as directly visible and radiance light.

Receptors that have important habitat present within a 20 km buffer of the Operational Area were considered as having potential for interaction, based on recommendations of the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds. The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings (15 to 18 km) and fledgling seabirds grounded in response to artificial light 15 km away (Commonwealth of Australia, 2020).

The Operational Area overlaps the following seabird and turtle BIAs:

- hawksbill turtle internesting
- flatback turtle internesting

- green turtle interesting
- loggerhead turtle interesting
- wedge-tailed shearwater breeding.

Habitat critical to the survival of the flatback turtle (nesting buffer) also overlaps the Operational Area.

Turtle and seabird receptors that have important habitat within a 20 km buffer extent around the Operational Area were considered for the impact assessment for FPSO and support vessel operational lighting, based on light emissions being visible up to 17.7 km away.

- green turtle nesting habitat critical (2.6 km and 14 km from the Operational Area)
- loggerhead turtle nesting habitat critical (2.6 km from the Operational Area)
- hawksbill turtle nesting habitat critical (14 km from the Operational Area)
- hawksbill turtle nesting BIA (19 km from the Operational Area)
- green turtle nesting BIA (18 km from the Operational Area).

Given that lighting from flaring may be visible up to 42.4 km from the FPSO, species with BIAs outside of 20 km and within 42.4 km were also identified. Although the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds suggest that impact is unlikely beyond 20 km from the source, an assessment of these species has been included for completeness:

- fairy tern breeding (27 km from the Operational Area).

Light emissions have the potential to disrupt ecological processes that rely on natural light for visual cues. Light emissions can affect fauna in two main ways:

- Behaviour – many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle as well as the phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- Orientation – species such as marine turtles and birds may use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may override natural cues, leading to disorientation.

The majority of fauna expected within the Operational Area is predominantly pelagic fish and zooplankton, with a low abundance of transient species primarily associated with the BIAs listed above.

Seabirds

High levels of marine lighting can attract and disorient seabird species resulting in behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source (e.g. Longcore & Rich, 2004; 2006; Gaston et al., 2014). All seabird species active at night are vulnerable to artificial light as it can disrupt their ability to orient towards the sea (Commonwealth of Australia, 2020). The potential for bird interactions is dependent upon their ability to perceive the dominant wavelengths in the spectral composition of a light source (Pendoley Environmental, 2023). Species with a nocturnal component to their behaviour and life history, such as procellariiforms (including wedge-tailed shearwaters), are at greater risk of negative impacts from artificial light sources at night. The bulk of the literature concerning impacts of lighting upon procellariiforms relates to the synchronised mass exodus of fledgling seabirds from their nesting sites (Deppe et al., 2017; Raine et al., 2007; Rodriguez et al., 2017a; 2017b), with fewer investigating the impacts of light at sea. Diurnal seabird species, such as terns, noddies and boobies, in contrast to procellariiforms, are less vulnerable to impacts resulting from nocturnal behaviours. However, the presence of lit facilities can result in localised alteration of foraging behaviours such as extended foraging durations.

Seabirds and shorebirds interacting with bright light sources could also alter migratory pathways and/or nocturnal roosting behaviours (Pendoley Environmental, 2023). The Operational Area may be occasionally visited by seabirds and migratory shorebirds; however, there is no emergent land that could be used for roosting or nesting habitat within the Operational Area. In a study of offshore oil platforms in the North Sea, Poot et al. (2008) observed that migrating seabirds can be attracted to the lights and flares of offshore oil platforms, particularly on cloudy nights and in between the hours of midnight and dawn. Migratory shorebirds travelling the East Asian-Australasian Flyway may transit through the Operational Area in the vicinity of the Pyrenees Venture FPSO and vessels enroute to staging areas, before moving onto the mainland south in the spring or Indonesia in the north in the autumn. It is possible that many of the birds on migration may also take advantage of ships and offshore facilities in the area to rest. Migrating birds in the region are at, or near, the end of their migration (or staging area), and if attracted will not be facing long-distance journeys directly upon leaving the facility. Although the migratory diversion is not expected to impact negatively on the birds, if there are identified maintenance, safety and health risks associated with guano from the birds it may be necessary to deter them from resting on the FPSO. No lasting effect is anticipated from seabirds attracted to the light and diverted from their migratory pathway.

The life stages most vulnerable for seabirds and migratory shorebirds are nesting adults or fledglings (Marangoni et al., 2022). Adult wedge-tailed shearwaters are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late June onwards to re-excavate their burrows. Adult shearwaters are vulnerable to artificial lighting in the breeding cycle, when returning to and leaving the nesting colony to maintain nesting sites or forage. The breeding period for the wedge-tailed shearwater is from August to March, with peak incubation and chick rearing during November (Cannel et al., 2019). During this period, adults were

observed taking a combination of short (one to four days) or long (six to 30 days) foraging trips from the Muiron Islands towards the north-west (Cannel et al., 2019). During the breeding period, foraging adult wedge-tailed shearwaters were observed travelling up to around 1,000 km from the breeding colony (Cannell et al., 2019). Foraging wedge-tailed shearwaters may be attracted to sources of light emissions to feed on fish drawn to the light; however, the species reportedly feeds predominantly during the day (Catry et al., 2009). Artificial light can also impact behaviour and adult nest attendance, or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al., 2018; Rodriguez et al., 2017a; 2017b).

Fledglings of burrow-nesting seabirds, and to a lesser extent adults, are attracted to and then grounded (i.e. forced to land) by lights when they fly at night with the most affected seabirds being petrels and shearwaters (Procellariiformes) (Rodriguez et al., 2017). Shearwater fledglings are predominantly impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mitkus et al., 2016; Telfer et al., 1987). Fledglings leave the nesting colony for the sea at night and the main fledgling period for shearwaters in WA is reportedly April (Advisian, 2022). Reported mass groundings and mortalities are associated with formerly uninhabited islands and the risk of light pollution from tourism and urban sprawl, and generally occur during adverse weather conditions. This is probably because of the potential for clouds, mist and rain to increase light pollution levels (Kyba et al., 2011), however recent research is revealing added complexity including moon phase, wind strength and direction (see Commonwealth of Australia, 2020b for review).

Wedge-tailed shearwaters are highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period. Due to the high synchronicity in egg laying, exodus of fledglings from burrows is also highly synchronised, restricted to the first two weeks of April (Nicholson, 2002). Only one record of a shearwater species interacting with an offshore facility has been recorded. This occurred in December 2016, and therefore is assumed to be an adult rather than a fledgling.

The potential extent of lighting emissions from the Operational Area overlaps a foraging and breeding BIA for the wedge-tailed shearwater and the Operational Area is also located approximately 19 km from the Muiron Islands, which is a significant breeding site for this species (Cannel et al., 2019). While the Petroleum Activity will occur during the wedge-tailed shearwater breeding period, the potential extent of lighting emissions does not represent a significant portion of the known wider breeding and foraging area for wedge-tailed shearwaters. Artificial lighting offshore is not considered to be sufficient to attract significant numbers of individuals to the Pyrenees Venture FPSO or support vessels. Grounding of fledglings during the synchronised exodus in April may occur as a result of onshore lighting in proximity of their burrows. There is, however, no evidence (anecdotal or otherwise) that lighting offshore contributes to groundings or displacement of fledglings onshore, or on facilities or vessels offshore. Impacts to wedge-tailed shearwaters from a change in ambient light offshore are therefore considered to be limited to negligible behavioural disturbance to isolated transient individuals, and are not significant to the population's presence in important breeding and foraging habitat.

The potential extent of lighting emissions from the Operational Area overlaps a foraging and breeding BIA for the fairy tern located on the northern end of the North West Cape, with the Operational Area approximately 27 km from nesting beaches (outside the 20 km threshold for impact assessment recommended by the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds). The WA breeding population (approximately 5,000 to 6,000 mature individuals) is dispersed over approximately 2,500 km of coastline (Greenwell, 2021). Within WA, the subspecies comprises a sedentary Pilbara population and a partially migratory population extending from Exmouth to Point Malcolm. The partially migratory population is widely distributed and winters primarily around the northern Houtman Abrolhos Islands (Greenwell, 2021). These birds migrate to breeding areas as far south as Point Malcolm on the eastern south coast and as far north as the Ningaloo coast, while others remain within the Houtman Abrolhos Archipelago (Greenwell, 2021). Within the North-west region, breeding occurs in small colonies between June and September on offshore islands, including Simpson Island, Barrow Island, the Montebello Islands, the Lowendal Islands, Thevenard Island, Serrurier Island, the islands in the Dampier Archipelago, Maryanne Shoals and Egret Island (Dunlop, 2018; Johnstone et al., 2013; Surman pers. obs.). Colonies tend to occupy areas rather than fixed sites, and nest sites can be abandoned after one or more years, even if they have been successful (Saunders & de Rebeira, 1985). While information regarding foraging ecology of this species within the North-west region is lacking, the Australian fairy tern has been studied in South Australia. Here, species typically forages in inshore waters and has been reported to rarely travel beyond 2 km during the breeding season in South Australia (Paton & Rogers, 2009). The potential extent of lighting emissions does not represent a significant portion of the known wider breeding and foraging area for fairy terns. Terns are a diurnal seabird species, which in contrast to procellariiforms, are less vulnerable to impacts resulting from nocturnal behaviours (Pendoley Environmental, 2023).

Impacts to Fairy Terns from a change in ambient light are therefore considered to be limited to negligible behavioural disturbance to isolated transient individuals, not significant to the population's presence in important breeding and foraging habitat. The National Recovery Plan for the Australian Fairy Tern (*Sternula nereis nereis*) (Commonwealth of Australia, 2020a) does not list artificial light as a threat.

The Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020b) lists light pollution as a threat with minor consequence (individuals affected but no population level impacts expected).

On this basis the potential impact from light emissions from the Petroleum Activity on seabirds, including for constant routine low level flaring and intermittent short term more intense flaring is expected to be minor and temporary.

Marine turtles

Light pollution reaching turtle nesting beaches is widely considered detrimental owing to its ability to alter important nocturnal activities, including choice of nesting sites and orientation/navigation to the sea by hatchlings (Witherington & Martin, 2003). The most significant risk posed to marine turtles from artificial lighting is the potential disorientation of hatchlings following their emergence from nests, although the behaviour of breeding adult turtles can also be affected (Rich & Longcore, 2006, in EPA, 2010). The relevant recovery plan considers light pollution a threat to hatchling orientation, survivability/predation, and sea-finding behaviours and can disrupt nesting behaviours of mature females.

Given the nature of the light emitted from the Pyrenees Venture FPSO and vessels, its direction and distance, the potential for hatchling turtles to become disoriented by, or be exposed to increased predation risk due to, artificial lighting associated with the Petroleum Activity is considered to be limited to possible short-term impacts to isolated individual hatchlings offshore, with no lasting effect to the species. For adult and pelagic juveniles, light emissions from the facility and vessels are unlikely to result in displacement of, or behavioural changes to individuals. This is described in further detail below for hatchlings and adult turtles, respectively.

Hatchlings

The nearest potential nesting beaches in relation to the Pyrenees Venture FPSO are the Muiron Islands (19 km south-east), and the North West Cape (27 km south-west). Lighting from the tip of the flare tower onboard the Pyrenees Venture FPSO may be visible from these areas.

Turtle hatchlings emerge from the nest and orient towards the sea. Hatchlings generally show a preference of moving towards horizons which are low and bright, and moving away from horizons that are dark and elevated, using these cues to navigate towards the shoreline (Limpus & Kamrowski, 2013). After entering the water, hatchlings use a combination of cues (wave direction and currents) to orient and travel into offshore waters. Impacts to the sea-finding behaviour of hatchlings are more common for light sources behind a beach, as lighting offshore will orient emerging hatchlings towards the sea.

Artificial light at close distances can also impact hatchling dispersal once they are in the water. Light spill may 'entrap' hatchling swimming behaviour, reducing the success of their seaward dispersion and potentially increasing their exposure to predators via silhouetting (Salmon et al., 1992). However, modelling of light emissions from larger vessels in the Dampier Archipelago (e.g. trailer suction hopper dredge and pipelay vessel) indicated that the actual zone within which behavioural responses in hatchlings could occur is <2 km (Pendoley, 2020). Given that hatchlings distribution is likely to be governed by currents at this early life history stage, any hatchlings dispersed by water currents to within 2 km of vessels risking entrapment by lighting would be very limited.

Sky glow, particularly from flaring is also unlikely to cause behavioural impacts as the light source is located directly offshore in the same direction that emerging hatchlings would be heading in during normal sea-finding behaviour, meaning that no significant disorientation would occur. Studies reported by Witherington (1992) on hatchling orientation relative to spectrally controlled light sources indicated that most disruptive wavelengths were in the range of 300 to 500 nm. In contrast, the light emitted from natural gas flares has peak spectral intensity between 750 to 900 nm (Western Australian Petroleum, 1995) and so is highly unlikely to cause disturbance to nesting or hatching turtles. Pendoley (2000) showed that the intensity of two flares (a tower flare and a pit flare) at Thevenard Island, WA, peaked at between 650 and 700 nm. This result is similar to three other flares measured in Australia (Pendoley Environmental, unpublished data). Pendoley (2000) found no significant spectral difference between the two flare types, or when varying flow rates.

The anticipated light spill on nesting beaches where hatchlings emerge from nests is considered to be insignificant given: 1) vessel lighting is not visible at nesting beaches when within the Operational Area; and 2) the distance to and associated exponential decrease of any visible light from flaring.

Adults

Artificial lighting may affect the location that turtles emerge to the beach, the success of nest construction, whether nesting is abandoned, and even the seaward return of adults (Salmon et al., 1995a; 1995b; Salmon & Witherington, 1995). However, such lighting impacts typically arise from residential and industrial development overlapping the coastline, rather than offshore from nesting beaches.

The interesting period is the duration between each successive clutch during that season. The females remain close to rookeries or beaches, and therefore designated and defined buffer zones have been gazetted immediately seaward from nesting beaches. There are internesting buffers within 20 km of the Operational Area. Marine turtles do not use light cues to guide internesting behaviours (Pendoley Environmental, 2020). Further, Pendoley Environmental (2000) found no evidence, published or anecdotal, to suggest that foraging or migrating turtles are impacted by light from offshore facilities and vessels. As such, light emissions from the facility and vessels are unlikely to result in displacement of, or behavioural changes to individuals in these life stages (Pendoley Environmental, 2020).

It is acknowledged that the Operational Area overlaps the outer portion of a habitat critical for the survival for flatback turtles, as defined in the Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017). Given the water depth and preferred foraging habitat, this species is expected to be present in very low numbers only. Light is not thought to be an important cue for individuals that may move through the offshore area around the Pyrenees Venture FPSO. Adult turtles migrating through the Operational Area may temporarily alter their normal behaviour if attracted to the light spill from the Pyrenees Venture FPSO. However, since water has a higher albedo than land, navigation is expected to be influenced by wave motion, currents and earth magnetic field, rather

than artificial light. The probability of any light from the FPSO being detected by turtles when in the water and this light having any impact is negligible.

For nesting females, the presence of lighting among other factors is a key factor for site selection when laying clutches (Windle et al., 2018), preferring more dimly lit areas. The distance from the Pyrenees Venture FPSO to the Muiron Island and Ningaloo coast is 19 km and 27 km, respectively. Nesting turtles on the beaches are potentially exposed to lighting from the flare which may be directly visible on the horizon. The WA Environmental Protection Authority (EPA) conservatively estimates there is only a small influence on marine turtles if the light source is within 1.5 km of the nesting beach (EPA, 2010). As such, flaring directly visible on the horizon is not considered sufficient to induce changes to nesting behaviour.

Light emissions generated by IMMR activities within the Operational Area does not have the potential to be directly visible at nesting beaches, the closest of which is 19 km away from the perimeter of the Operational Area (Muiron Islands). IMMR activities are short-term and temporary. Given the distance to potential nesting locations, vessel lighting intensity and temporary duration of lighting, it is considered unlikely that IMMR activities will have any impact to turtle species.

Fish

Lighting from the presence of a vessel may result in the localised aggregation of fish below the vessel. These aggregations of fish are considered localised and temporary and any long-term changes to fish species composition or abundance is considered highly unlikely. This localised increase in fish extends to those comprising the whale shark's diet. However, given that a large proportion of the diet comprises krill and other planktonic larvae, it is unlikely that a light source will lead to a significant increase in whale shark abundance in the vicinity of the vessels. Similarly, any localised impacts to marine fish are not expected to impact on any commercial fishers in the area. No significant cumulative impacts over the life of the Petroleum Activity or in relation to other operations and activities in the region (e.g. Ngujima-Yin, Ningaloo Vision) are expected.

Values and sensitivities

The following values and sensitivities of Australian Marine Parks, the Ningaloo Coast World Heritage property and the North West Marine Park Management Plan as relevant to light emissions, are presented below.

The Ningaloo Marine Park stretches approximately 300 km along the west coast of the Cape Range Peninsula. This Marine Park covers an area of 2,435 km² and a water depth range of 30 m to more than 500 m. This Marine Park provides connectivity between deeper offshore waters of the shelf break and coastal waters. It includes some of the most diverse continental slope habitats in Australia, including the continental slope area between North West Cape and the Montebello Trough. This Marine Park supports a range of species listed under the EPBC Act and supports breeding and/or foraging habitat for seabirds, interesting habitat for marine turtles, and foraging habitat for whale sharks.

The Ningaloo Coast World Heritage property is approximately 710,000 ha and lies within the Ningaloo AMP. Universal values of the Ningaloo Coast World Heritage property include high marine species diversity and abundance; in particular, Ningaloo Reef supports both tropical and temperate marine reptiles.

The Gascoyne Marine Park is located ~20 km off the west coast of the Cape Range Peninsula, adjacent to the Ningaloo Marine Park and extends to the limit of Australia's exclusive economic zone. This Marine Park covers an area of 81,766 km² and water depth varies between 15 m and 6,000 m. The park is characterised by diverse and endemic fish communities and supports a range of species listed under the EPBC Act and their habitat. This includes breeding habitat for seabirds and interesting habitat for marine turtles.

The North-west Marine Parks Management Plan includes the following values relevant to impacts from light emissions:

- interesting, foraging, mating and nesting for marine turtle (flatback and green turtles)
- whale shark foraging BIA
- wedge-tailed shearwater breeding BIA
- diverse fish communities.

Seabirds, fish and reptiles present in these areas or listed as values within management plans may be impacted by light emissions; refer to the section above for an assessment of the potential impacts of artificial light on marine fauna. Given the distance from the Operational Area to these gazetted areas, light from the FPSO flare and support vessels is not considered to result in impacts other than minor.

Cumulative assessment

Woodside have considered the potential light emitting activities that could overlap with the Petroleum Activity temporally and spatially. This includes assessing the operation of supply/IMMR vessels, FPSO facility lighting and flaring occurring simultaneously.

This EP also acknowledges the proximity of Woodside's Ngujima-Yin, Macedon and Stybarrow operations, as well as Santos' Ningaloo Vision operations. Some of these (Ngujima-Yin and Ningaloo Vision operations) involve continuous light emissions from the associated FPSOs that are within 10 km of the Pyrenees Operational Area, whilst others involve temporary vessel activity only (Macedon and Stybarrow). Further, there is an overlap between the Pyrenees Operational Area and the Macedon Operational Area in proximity to the Macedon-6 well, however, it is not expected that any more than two supply/IMMR vessels would be present in the Pyrenees Operational Area with one IMMR

vessel used to complete tasks required for both fields sequentially. Only for non-routine repair or replacement activities would two IMMR vessels be present in the Operational Area at the same time for approximately two weeks.

The maximum distance of direct visibility for vessel lighting 17.7 km will not increase by the presence of multiple vessels. However, presence of additional vessels will make a small incremental contribution to the overall skyglow visible on the horizon. Given the distance from the perimeter of the Operational Area to the nearest nesting beaches (~19 km to Muiron Islands) and the short duration of IMMR vessel activities, it is unlikely that cumulative impact from vessel lighting associated with petroleum activities in the region would occur.

Artificial light monitoring conducted for the proposed Ningaloo Lighthouse Resort Development as well as direct observations from Hunters Beach in Cape Range National Park found that flaring from the three FPSOs currently operating off North West Cape (Ngujima-Yin, Pyrenees and Ningaloo Vision) may be visible at turtle nesting beaches on the tip of North West Cape (NOPSEMA correspondence and Pendoley Environmental, 2021). Flaring may also be visible at nesting beaches at the Muiron Islands, given its closer proximity to the Pyrenees Venture FPSO than the North West Cape.

For turtle hatchlings the lighting impact assessment for the Ningaloo Lighthouse Resort Development concluded that *“Sea finding by turtle hatchlings emerging from regional nesting beaches was consistent across the monitored beaches with most hatchling fans successfully orienting seaward and appeared unaffected by the current levels of visible regional skyglow.”* (Pendoley Environmental, 2021). Any cumulative impacts to marine turtle hatchlings from artificial light will therefore be limited to possible minor behavioural impacts to isolated individuals offshore, that are temporary in nature. For nesting turtles, the WA EPA conservatively estimates there is only a light influence if the light source is within 1.5 km of the nesting beach (EPA, 2010). As such, flaring is not considered sufficient to prevent significant biological behaviours to continue.

³⁵ Qualitative measure

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁵	Benefit in impact/risk reduction	Proportionality	Control adopted
Professional judgement – Eliminate				
No external lighting during the Petroleum Activity.	F: No. Light management is consistent with that required to provide a safe working environment onboard the FPSO and support vessels. CS: Not considered, control not feasible.	Not considered, control not feasible.	Not considered, control not feasible.	No
Do not flare.	F: No. Flaring is required for the safe operation of the Pyrenees Venture FPSO. CS: Not considered, control not feasible.	Not considered, control not feasible.	Not considered, control not feasible.	No
When gas production exceeds fuel gas demand, surplus gas will be re-injected during routine operations and therefore reducing flaring of surplus gas during routine production operations.	F: Yes. CS: Minor.	Given the potential impacts to turtles during this Petroleum Activity, implementation of this control would not result in a reduction in consequence.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 4.3
Professional judgement – Substitute				
Substitute external lighting with light sources designed to minimise impacts to seabirds, shorebirds and marine turtles: - use flashing/intermittent lights instead of fixed beam - use motion sensors to turn lights on only when needed - use luminaires with spectral content appropriate for the species present - avoid high intensity light of any colour.	F: Yes. Replacement of external lighting with lighting appropriate for turtles and seabirds is technically feasible, although is not considered to be practicable. CS: Significant cost sacrifice. The retrofitting of all external lighting on the FPSO, etc, would result in considerable cost and time expenditure. Considerable logistical effort to source sufficient inventory of the range of light types onboard the FPSO.	Given the potential impacts to turtles, nesting seabirds and fledglings during this activity are insignificant, implementation of this control would not result in a reduction in consequence. Potential for minor reduction in impact to individual foraging seabirds that may transit the Operational Area, as outlined in the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds.	Grossly disproportionate. Implementation of the control requires considerable cost sacrifice for minimal and provides minimal environmental benefit. The cost/sacrifice outweighs the benefit gained.	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁵	Benefit in impact/risk reduction	Proportionality	Control adopted
ALARP statement: On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the potential impacts from routine light emissions from the Pyrenees Facility and Petroleum Activity to be ALARP, as no reasonable additional/ alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, in its current state, operational light emissions from the Pyrenees Facility and Petroleum Activity represent a minor disturbance to fauna within the Operational Area. Further opportunities to reduce the impacts have been investigated above. The potential impacts are consistent with good oil-field practice/industry best practice and are considered to be broadly acceptable in its current state. Therefore, Woodside considers standard operations appropriate to manage the impacts of light emissions to a level that is tolerable and demonstrate that the EPOs are met.

EPOs, EPSs and MC			
Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
EPO 4 No impacts to marine fauna greater than that caused by minimum required light emissions for safe work and navigation. EPO 5 No displacement of marine turtles from habitat critical during nesting and interesting periods and marine turtles' biologically important behaviour can continue in biologically important areas.	C 4.1	Implement a Seabird Management Plan. PS 4.1 Implement a Seabird Management Plan on the Pyrenees Venture FPSO that includes: • standardisation and maintenance of record keeping and reporting of seabird interactions • procedures on seabird intervention, care and management • regulatory reporting requirements for seabirds (unintentional death of or injury to seabirds that constitute MNES) • a scalable adaptive management process, should negative light impacts to nocturnal seabirds be detected.	MC 4.1
	C 4.2	Lighting will be limited to the minimum required for navigational and safety requirements, except for emergency events. PS 4.2 Lighting will be limited to that required for safe work/navigation.	MC 4.2

Source of impact														
The Pyrenees Venture FPSO operations including subsea infrastructure, offtake tankers, IMMR vessels, support vessels, IMMR activities and helicopter operations all generate noise both in the air and/or underwater. For vessels equipped with DP systems, the primary source of underwater noise typically originates from thrusters operating to maintain position with cavitation being the main contributor. These noise emissions contribute to, and at times may exceed ambient noise levels, which range from around 90 dB re 1 µPa (root square mean sound pressure level [rms SPL]) under very calm, low wind conditions, to 120 dB re 1µPa under windy conditions (McCauley, 2005). FPSO The Pyrenees Venture FPSO does not have a DP system and is instead equipped with a single thruster which is in operation for approximately six hours per day. During these periods, the thruster is the dominant source of underwater noise emissions from the FPSO. Other sources of noise include onboard machinery, production equipment, including that associated with flaring, as well as subsea infrastructure. A source level of 173.9 dB re 1 µPa²m² was used in the modelling study to inform the impact assessment (Li et al., 2024), representing underwater noise emissions mainly associated with the vessel's truster operation. While this modelled value provides a reasonable basis for impact assessment particularly during the period when the FPSO's thruster is not in operation, empirical measurements indicate that actual source levels may be slightly higher. Specifically, measurements show that the Pyrenees Venture FPSO generates broadband sound pressure levels of approximately 178 dB re 1 µPa²m², suggesting that the modelled value may underestimate true noise emissions. This reinforces the need to adopt a conservative approach when assessing maximum noise propagation distances (see further below). In addition to vessel noise, the HP and LP flare systems generate noise from combustion. Noise from flaring is emitted at the top of the flare tower, which is approximately 90 m above sea level. Noise from the tip of the flare is not constrained and propagates spherically in all directions. Received levels from airborne propagation modelling were used to ascertain the underwater received levels during flaring activities for the WA-34-L Pyxis Drilling and Subsea Installation EP. Only a very small fraction of the acoustic energy produced from flaring transmits through the air/water

boundary due to the surface of water acting as a reflective plane, causing most acoustic energy to reflect back into the air. While received sound pressure level during flaring is estimated to be 136 dB re 1 μ Pa at 1 m below the sea surface, it is estimated to attenuate to ambient levels within a very short distance (e.g. a few metres) and therefore is not considered further in the impact assessment.

Offtake tankers and IMMR vessels

Production rates from the Pyrenees Venture FPSO have declined over time, with current offtake operations reduced to approximately eight campaigns per year. Each campaign involves a tanker entering the Operational Area and mooring alongside the FPSO for approximately 24 hours to transfer cargo. During approach and departure, the offtake tanker may use its thrusters for dynamic positioning, typically for up to two hours in each phase to maintain safe vessel control.

Similarly, IMMR activities may be supported by DP-operated vessels such as the Fugro Etive, which has an installed thruster capacity of 7,040 kW and has been measured to produce mean broadband source levels of approximately 187.6 dB re 1 μ Pa²m². (Li et al., 2024).

While the specific vessel type and operational profile differ between offtake tankers and IMMR vessels, both operate under similar DP conditions in close proximity to offshore infrastructure and rely on comparable thruster systems for station-keeping. As such, a vessel like the Fugro Etive provides a reasonable acoustic analogue for assessing underwater noise emissions from offtake operations.

Although the Pyrenees Operational Area overlaps with the Macedon Operational Area near the Macedon-6 well, it is not anticipated that more than one IMMR vessel will be present at any given time. A single vessel would likely complete its tasks sequentially across both fields, reducing the likelihood of cumulative noise exposure from multiple DP sources operating concurrently.

Support vessels

Support vessels are used for transporting goods and equipment to and from the FPSO and for supporting offtake.

The Siem Thiima is representative of support vessels used at the Pyrenees Facility, namely the Go Provider (refer to Section 3.17.1). The Siem Thiima has an installed thruster power of 7,230 kW which is slightly higher than the Go Provider's 6,550 kW. Based on modelling by Li et al. (2024), vessels of this type using DP systems generate mean broadband sound power levels of approximately 189 dB re 1 μ Pa²m².

During offtake and resupply activities, the DP-enabled support vessel is the dominant underwater noise source, exceeding that of the FPSO and offtake tanker (both of which do not use thrusters for the majority of time they are present in the Operational Area and generate noise below ~181 dB re 1 μ Pa²m²).

Subsea infrastructure

Subsea infrastructure, primarily wellhead choke valves and flowlines, will generate continuous underwater noise. These are expected to generate noise well within the extent of noise emissions that have been modelled for vessel operations.

JASCO Applied Sciences performed a modelling study of underwater sound levels associated with noise from Woodside's seabed wells along the NWS about 25 to 40 km off the North West Cape, directly adjacent to the Macedon Operational Area (Li, 2024). A broadband source level of 161.5 dB re 1 μ Pa²m² for noise from wellheads was utilised based on the proposed Browse to North West Shelf Project 2022 (Woodside, 2022).

The wellhead noise was modelled at two locations: one at site of Ngujima-Yin FPSO (15 km from Macedon) in water depth of 316 m, and at the Pyrenees Venture FPSO location (4 km from Macedon) in 196 m water depth.

For either location, the maximum distances from the noise source to where the marine mammal behavioural response criterion of 120 dB re 1 μ Pa was not exceeded was predicted to be less than 200 m. The noise is not predicted to ensonify the entire water column at or above 120 dB re 1 μ Pa, extending upwards to reach a depth of at least approximately 70 m below the water surface.

Based on the work of McCauley (2002) noise produced along a flowline is similar to that described for wellheads, with the radiated noise field falling to ambient levels within a hundred metres of the flowline.

IMMR activities (impulsive noise sources)

Noise from IMMR activities is for discrete work packages and will typically be intermittent and of short duration, with routine activities occurring approximately one week per year.

During IMMR activities, ROVs, AUVs, SSSs and/or MBESs may be deployed. The noise generated by these sources will typically be of considerably lower intensity than vessel noise, or, in the case of SSS, predominantly at frequencies (>180 kHz) that are outside the hearing thresholds of cetaceans and well above the hearing level of other mammals and fish (Department of Energy and Climate Change (DECC), 2011).

SSS devices operate at frequencies similar to those used in commercial fish-finding equipment, typically transmitting high frequency sound pulses typically between 100 and 500 kHz with higher frequencies providing greater imaging resolution (DECC, 2011). SSS used for imaging subsea infrastructure is highly directional and operates at frequencies that attenuate rapidly in the water column, limiting propagation to short distances.

MBESs are another form of sonar that typically operate at frequencies of 200 to 400 kHz for high resolution surveys in shallower waters. These frequencies fall outside the hearing range of most marine mammals and fish (DECC, 2011).

Given the short duration and infrequent use of these devices, as well as the rapid attenuation and intermittent nature

of high frequency sonar signals, potential effects on marine fauna are expected to reduce rapidly with distance from the source and are unlikely to cause significant impacts to any marine populations.

As overall sound levels are governed by the dominant (noisiest) source rather than being strictly additive, and as all such sonar activities require vessel support, their contribution to total underwater noise emissions during IMMR activities will be minimal compared to that generated by vessel operations.

A summary of all primary underwater noise sources associated with the Petroleum Activity are provided in Table 6-3.

Table 6-3: Summary of noise sources associated with the Petroleum Activity

Noise source	Estimated mean source level (dB re 1 $\mu\text{Pa}^2\text{m}^2$)	Frequency range (kHz)
Continuous noise		
Pyrenees Venture FPSO	178 $\pm$ 2	Broadband
Offtake tanker or IMMR vessel using DP	187.6	Broadband
Support vessel using DP	189	Broadband
Subsea infrastructure (Wellhead/choke valve)	161.5	Broadband
Impulsive noise		
Multibeam echo sounder	214	200-300
Side scan sonar	226	120 to 410
Sub-bottom profiler (chirp)	205	1 to 12
Sub-bottom profiler (pinger)	214	2 to 12
Sub-bottom profiler (boomer)	212	0.5 to 5

Helicopters

Helicopter engines and rotor blades are recognised as a source of noise emissions. Activities relevant to the Operational Area will relate to the landing and take-off of helicopters on the Pyrenees Venture FPSO and potentially on support vessels. During these critical stages of helicopter operations, safety is the highest priority. Helicopter noise is emitted to the atmosphere during routine helicopter flights. Noise levels for typical helicopters used in offshore operations (Eurocopter Super Puma AS332) at a 150 m separation distance has been measured at a maximum of 90.6 dB re 1 μPa (BMT Asia Pacific, 2005). Helicopter flights are at their lowest (i.e. closest point to the sea surface) during periods of take-off and landing from helidecks, which constitutes a relatively short phase of routine flight operations.

Water has a very high acoustic impedance contrast compared to air, and the sea surface is a strong reflector of noise energy (i.e. very little noise energy generated above the sea surface crosses into and propagates below the sea surface (and vice versa). The angle at which the sound path meets the surface influences the transmission of noise energy from the atmosphere through the sea surface, angles greater than 13° from vertical being almost entirely reflected (Richardson et al., 1995). Helicopter noise it is estimated to attenuate to ambient levels within a very short distance (e.g. metres) and therefore is not considered further in the impact assessment.

Impact assessment

Water depths in the Operational Area range from approximately 190 m to 215 m. The fauna present is predominantly pelagic species of fish, with migratory species such as turtles, birds, whale sharks and cetaceans as well as seabirds present in the area seasonally. These fauna species may include those associated with Traditional Custodians values.

Noise interference is a key threat to a number of migratory and threatened cetaceans and marine turtles identified as potentially occurring within the Operational Area. Relevant actions included in recovery plans for these species are outlined in Section 6.9.

Potential impacts of noise

Elevated underwater noise can affect marine fauna in three main ways (Richardson et al., 1995; Simmonds et al., 2004):

- by causing direct physical effects on hearing or other organs; hearing loss may be temporary (temporary threshold shift (TTS) referred to as auditory fatigue), or permanent threshold shift (PTS) (injury)

- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)
- through disturbance leading to behavioural changes or displacement from important areas (i.e. BIAs); the occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

The marine fauna considered was based on a review of receptors that may be impacted by underwater sound. These were marine mammals, turtles and fish.

Conservation management plans and conservation advice for sea turtles of Australia and the southern right, pygmy blue, sei and fin whales list noise interference as a threat to the survival of the species.

Impact thresholds

To inform the impact assessment, the impact thresholds provided in this section were considered in relation to the credible sources of acoustic emissions.

Marine mammals

Marine mammals and especially cetaceans rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart, 2007; Erbe et al., 2015; Erbe et al., 2018). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold (PTS and TTS), physical damage and stress (Erbe, 2012; Rolland et al., 2012). There is little information available regarding call masking in whales (Richardson et al., 1995), although it has been suggested that an observed lengthening of calls in response to low-frequency noise in humpback whales and orcas may be a response to auditory masking (Fristrup et al., 2003; Foote et al., 2004).

The noise thresholds above which a behavioural response, TTS and PTS for cetaceans could occur are presented in Table 6-4. These thresholds have been adopted by the US National Oceanic and Atmospheric Administration (NOAA) (US National Marine Fisheries Service (NMFS), 2014; 2018; Southall et al., 2019; NOAA, 2019). In October 2024, the NMFS issued Technical Memorandum NMFS-OPR-71, which was an update to Technical Guidance for Assessing the Effects of Anthropogenic Sound on Marine Mammal Hearing (V 3.0). The memo contains updated underwater and in-air criteria for onset of auditory injury and TTS for some cetacean hearing groups relevant to the noise modelling used in this EP. These updates, which do not apply to behavioural response thresholds, are shown in Table 6-4. Specifically, the update included slightly increased PTS and TTS thresholds for high frequency (HF) cetaceans exposed to impulsive and continuous noise (non-impulsive). For low frequency cetaceans, TTS and PTS thresholds are unchanged (impulsive noise) or slightly reduced (continuous noise).

Table 6-4: Impact thresholds for low and high frequency cetaceans for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)	PTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)
LF cetaceans	183	168	160	199 (197*)	179 (177*)	120
HF cetaceans	185 (193*)	170 (178*)		198 (201*)	178 (181*)	

Source: NMFS (2014; 2018); Southall et al. (2019); NOAA (2019).

* Source: Updated thresholds: NMFS (2024).

To better understand any effect of the new lower thresholds, updates to the assessment process of PTS and TTS impacts on key low-frequency (LF) cetacean receptors, Woodside commissioned Jasco Applied Sciences (to re-model two of the conservative scenarios associated with the Scarborough Operations EP using the new threshold criteria (Connell et al., 2025). For this re-analysis, Scenario 4 was chosen to represent the credible worst-case noise scenario for FPU hookup and installation while Scenario 7 was chosen to represent worst-case noise during commissioning.

The updates to the PTS and TTS thresholds were not considered sufficiently significant to warrant re-modelling all scenarios, and investigation of the worst-case noise scenarios was considered adequate to understand impact of the threshold change.

Results for Scenario 4 and 7 using the new thresholds for continuous noise are summarised as follows:

- Remodelling of Scenario 4 using the updated thresholds showed the distance to reach the LF cetacean TTS threshold increased from 7.4 km to 11.7 km (60%), while the distance to reach the LF PTS threshold increased from 21 m to 59 m (180%).
- Remodelling of Scenario 7 using the updated thresholds showed the distance to reach the LF cetacean TTS threshold increased from 740 m to 940 m (27%), while the distance to reach the LF PTS threshold increased from 50 m to 70 m (40%).

These outcomes were considered indicative of the relative change that could be realised if lower thresholds were applied to predicted outcomes for LF cetaceans from other modelling studies. A conservative approach was applied to the Exmouth study (Li et al., 2024) outcomes used in this EP whereby the highest percentage increases from the Scarborough Operations EP's re-modelled scenarios (60% for TTS and 180% for PTS) were applied. The maximum predicted distances for a range of sound exposure level (SEL) within a 24-hour period (SEL_{24h}) threshold criteria, including the updated threshold for continuous noise for LF cetaceans, are presented in Table 6-8 and Table 6-10.

Marine reptiles

The Recovery Plan for Marine Turtles (Commonwealth of Australia, 2017) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100 to 700 Hz (Bartol & Musick, 2003).

McCauley et al. (2000) observed the behavioural response of caged green and loggerhead turtles to impulsive sound (an approaching seismic airgun). For received levels above 166 dB re 1 μ Pa SPL, the turtles increased their swimming activity and above 175 dB re 1 μ Pa they began to behave erratically, which was interpreted as an agitated state as described in the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017). In addition, Popper et al. (2014) proposed qualitative impact criteria for behavioural responses to near-field, intermediate and far-field exposures of continuous noise sources (Popper et al., 2014).

Finneran et al. (2017) presented auditory PTS and TTS thresholds for turtles for both impulsive and continuous sound exposures, which have since been updated in Accomando et al. (2025). These revised thresholds were not available for the JASCO (Li et al., 2024) noise modelling; however, the modelling outputs have been re-interrogated with the new thresholds (Connell et al., 2025).

Relevant threshold criteria for marine turtles are summarised in Table 6-5.

Table 6-5: Impact thresholds for marine turtles for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	Behavioural response (dB re 1 μ Pa)	PTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 μ Pa ² .s)	Behavioural response (dB re 1 μ Pa)
Marine turtles	204 (184) [^]	189 (169) [^]	166* 175 ⁺	220 (198) [^]	200 (178) [^]	(N) High (I) Moderate (F) Low#

Source: PTS and TTS thresholds (Finneran et al., 2017); * behavioural response threshold (impulsive) (National Science Foundation, 2011), + behavioural disturbance threshold (impulsive) (McCauley et al., 2000); # behavioural response threshold (continuous) (Popper et al., 2014).

[^] Revised thresholds (Accomando et al., 2025).

Note: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Fish, sharks and rays

The majority of fish species detect sounds from <50 Hz up to 500 to 1,500 Hz (Popper & Hawkins, 2019). A smaller number of species can detect sounds over 3 kHz, while very few species can detect ultrasound over 100 kHz (Ladich & Fay, 2013). The critical issue for understanding whether an anthropogenic sound will affect the hearing of a fish is whether it is within the hearing frequency range of the fish and loud enough to be detectable above background ambient noise.

Fish perceive sound through the ears and the lateral line, which are sensitive to vibration. Some species of teleost or bony fish (e.g. herring) have a structure linking the gas-filled swim bladder and ear, and these species usually have increased hearing sensitivity. These species are considered to be more sensitive to anthropogenic underwater noise sources than species such as cod (*Gadus* sp.), which do not possess a structure linking the swim bladder and inner ear. Fish species that either do not have a swim bladder (e.g. elasmobranchs (sharks and rays) and scombrid fish (mackerel and tunas) or have a much-reduced swim bladder (e.g. flat fish) tend to have a relatively low auditory sensitivity.

Considering these differences in fish physiology, Popper et al. (2014) developed sound exposure guidelines for fish; these are presented in Table 6-6 and are considered appropriate to assess continuous acoustic discharges to fish from the Petroleum Activity.

Table 6-6: Impact thresholds for fish, sharks and rays for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)	PTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: <i>SEL_{24h}</i> (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)
Fish: no swim bladder	216	186	(N) High (I) Moderate (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not involved in hearing	203	186	(N) High (I) Moderate (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder involving hearing	203	186	(N) High (I) High (F) Moderate	170 dB rms SPL for 48-hours	158 dB rms SPL for 12-hours	(N) High (I) Moderate (F) Low

Impulsive noise: All criteria are presented as sound pressure, even for fish without swim bladders, since no data for particle motion exist.

Continuous noise: rms SPL: root mean square of time-series pressure level, useful for quantifying continuous noise sources.

Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I) and far (F). The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Modelling

To assess impacts of noise from Pyrenees Facility operations, an estimate of the ensonified area was conservatively derived from a modelling study of broader operations across the Exmouth Region configured to include close-proximity operations (Li et al., 2024). The modelling simulation involved five vessels, including three FPSOs, an OSV and an IMMR vessel (refer Figure 6-1). The noise sources and their source levels used in the modelling study included:

- Woodside Pyrenees Venture (PYR) FPSO – 173.9 dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$
- Woodside Ngujima-Yin (NY) FPSO – 173.9 dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$
- Santos Ningaloo Vision (NV) FPSO – 173.9 dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$
- *Siem Thiima* – OSV – 189 dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$
- IMMR vessel – *Fugro Etime* – 187.6 dB re 1 $\mu\text{Pa}^2\text{m}^2\text{s}$.

While the simulation is designed to reflect cumulative underwater noise exposure from FPSOs across the region, it is also considered to be a conservative analogue to peak operational conditions for the Pyrenees Facility representing concurrent offtake as well as IMMR or resupply activities.

The DP-enabled support vessel remains the dominant underwater noise source, with thruster use generating broadband source levels up to ~189 dB re 1 μPa @ 1 m. In comparison, the FPSO and offtake tankers, which are typically moored, produce lower noise levels, generally below ~181 dB re 1 μPa @ 1 m. The offtake tanker contribution is considered negligible as they remain in the Operational Area for less than two days for each of eight campaigns annually.

The conservative application of the modelling to peak operational conditions for the Pyrenees Facility is appropriate to account for potential underestimation of the Pyrenees Venture FPSO sound pressure level, and to recognise that scenario-specific configurations can influence noise propagation.

The predicted maximum distances for a range of SPL thresholds are provided in Table 6-7. The behavioural response threshold of 120 dB re 1 μPa was modelled to be exceeded up to 18.9 km of the dominant noise sources (16.9 km for 95% of the time), and this is also illustrated by sound level contours in Figure 6-1.

Table 6-7: Maximum distances for a range of sound pressure levels for vessel operations (Li et al., 2024)

SPL (Lp; dB re 1 μPa)	FPSO (NY), OSV, Santos FPSO (Ningaloo Vision), FPSO (Pyrenees Venture) and IMMR vessel

Figure 6-1: Sound pressure level contour map (Li et al., 2024)

The predicted maximum distance for a range of SEL_{24h} thresholds are provided in Table 6-8. The modelling of vessel operations indicates that PTS and TTS thresholds for LF cetaceans may be exceeded within a maximum distance of approximately 280 m (PTS) and 2.85 km (TTS). For marine turtles, the PTS threshold may be exceeded within 130 m and the TTS threshold may be exceeded within 2.86 km.

Table 6-8: Maximum distances for a range of sound exposure levels over 24 hrs for vessel operations (Li et al., 2024)

Hearing group	FPSO (NY), OSV, Santos FPSO (Ningaloo Vision),

Sea turtles	200	0.08
Sea turtles (<i>updated threshold from Accomando, 2025</i>)	178	2.86

The PTS and TTS thresholds are frequency-weighted cumulative sound exposure levels calculated over a continuous 24 hour period. Using these criteria, it is conservatively assumed that an animal remains within the sound field for the entire duration of exposure. Given that vessels operating DP systems are largely stationary, marine fauna would need to actively approach the vessel and remain in close proximity for 24 hours to experience harmful exposure levels. However, fauna such as cetaceans, fish and turtles are capable of moving away from potential noise sources, and there are no constraints to the movement of this fauna within the Operational Area. Consequently, the potential for noise-induced mortality, PTS, or TTS in marine mammals, fish and sea turtles is considered not credible.

In summary, impacts from Pyrenees Facility operations are conservatively considered to be:

- Cetaceans: behavioural disturbance may occur approximately 18.9 km from vessel operations within the Operational Area (16.9 km for 95% of the time).
- Fish: potential masking and behavioural disturbance at near and intermediate range; likelihood of TTS is considered not to be credible given fish would move away from the source – demersal fish are not expected to be exposed to underwater noise above impact thresholds.
- Turtles: potential masking and behavioural disturbance at intermediate and far range.

All support vessels are required to comply with EPBC Regulation 2000 – Part 8 Interacting with cetaceans to reduce the likelihood of collisions with cetaceans (refer to Section 6.8.11). Implementing this control may also reduce the noise generated by vessels in proximity to cetaceans, as vessels are travelling slower; slower vessel speeds may reduce underwater noise from machinery (main engines) and propeller cavitation.

Impulsive noise from IMMR activities

IMMR activities may generate a range of acoustic emissions; however, the most significant is expected to be from the use of underwater survey equipment. Therefore, this impact assessment is based on the use of MBES and SSS; all other routine IMMR activities are expected to cause lower impacts than those discussed herein.

Underwater noise from MBES and SSS will attenuate rapidly in the water column due to the relatively high frequency of noise emissions from these sources. The operating frequencies of MBES (12 to 700 kHz) and SSS (75 to 900 kHz) are well above the hearing range of turtles (1 to 2 kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2 to 30 kHz) may be audible to turtles, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Modelling of impulsive sub-bottom profiler sound emissions by Mathews & Zikov (2013) and McPherson et al. (2017) indicates the 166 dB re 1 µPa (SPL) behavioural disturbance threshold for turtles may only be exceeded within metres or tens of metres of the survey instruments. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

energy is produced at frequencies outside the peak hearing frequency range of turtles. No significant impacts to sensitive fauna are expected to occur as a result of these sources.

Sub-bottom profilers are typically lower frequency than multibeam echo sounders or side scan sonar, and acoustic emissions from sub-bottom profilers may propagate further in the water column. Based on typical source levels and frequencies for sub-bottom profilers and the geometric spreading equation present in vessel noise above, received levels from a sub-bottom profiler will attenuate to 160 dB re 1 μ Pa rms SPL within approximately 250 m of the source. This is comparable to the noise potentially produced by thrusters (refer to vessel noise section above for a discussion of potential impacts), although sub-bottom profiler emissions are impulsive rather than continuous. Potential impacts to cetaceans from MBES, SSS and sub-bottom profiler may, therefore, include behavioural disturbance if in close proximity to the survey instruments, but ranges to disturbance are less than or equivalent to disturbance ranges for the IMMR vessel itself. PTS or TTS are not considered credible, given individuals would need to be directly next to the noise sources for prolonged duration.

Subsea infrastructure

Given the low levels of noise emitted by subsea infrastructure such as wellheads, choke valves and flowlines, no impacts to marine fauna from these noise sources are expected. Measurements of noise generated by choke valves indicated it is relatively high frequency (>1 kHz) and hence will attenuate over relatively short distances in the water column; significant impacts to marine fauna are not considered credible.

The predicted maximum distance for a range of SPL thresholds are provided in Table 6-9. The behavioural response threshold of 120 dB re 1 μ Pa was modelled to be exceeded up to 170 m of a wellhead (160 m for 95% of the time).

Table 6-9: Maximum distances for a range of sound pressure levels for subsea infrastructure (Li et al., 2024)

SPL (Lp; dB re 1 μ Pa)	Scenario 1: Wellhead 1		Scenario 2: Wellhead 2		Scenario 3: Wellheads 1 and 2

110	0.63	0.58	0.71	0.64	0.71	0.65

The predicted maximum distance for a range of SEL_{24h} thresholds are provided in Table 6-10. The modelling of subsea infrastructure indicates that PTS and TTS thresholds for LF cetaceans may be exceeded within a maximum distance of approximately 30 m (PTS) and 70 m (TTS). The maximum distance for the revised PTS and TTS thresholds for sea turtles (Accomando, 2025) was not available at the time of the modelling, however, are not expected to be above these minor extents of 30 m and 70 m, respectively.

Table 6-10: Maximum distances and area for a range of sound exposure levels over 24 hrs for subsea infrastructure (Li et al., 2024)

Species-specific impact assessment

Cetaceans

As the migration BIA for humpback whales overlaps the Operational Area and the migration BIA for pygmy blue whales is within 5 km (Table 4-10), there is the potential for these species to be exposed to underwater noise levels from vessel activities that may alter their behaviour when they are present in the region during seasonal migrations. Tagging studies of pygmy blue whales (PBW) have shown the migratory pathway appears to be in deeper water to the west of the Operational Area. Any PBW presence in the vicinity of the Pyrenees Venture FPSO are likely to be migratory in nature.

Aerial surveys of humpback whales off North West Cape did not observe any apparent displacement of humpback whales from the area around the nearby NY FPSO (RPS Environment and Planning, 2010a). The majority of humpback whales observed during these surveys were east of the NY FPSO, which is consistent with other surveys showing that the majority of humpback whales migrate within continental shelf waters along WA (Double et al., 2010; 2012a).

Humpback whales are regularly observed in close proximity to the Pyrenees Venture FPSO. Maximum emitted noise levels are below the PTS threshold criteria and are expected to reach TTS thresholds within a short distance.

Avoidance behaviour has not been observed. Given that the overlap of the potentially ensonified area with the BIA is a minor proportion of the overall BIA and the location is not confined, it is considered unlikely that humpback whales are adversely impacted by noise from vessel operations.

The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015a) and associated guidance on key terms requires that pygmy blue whales not be displaced from a foraging area. The nearest recognised foraging BIA for pygmy blue whales is approximately 32 km from the Operational Area at the closest point (Table 4-10). Underwater noise from the Petroleum Activity is therefore unlikely to exceed the behavioural impact threshold within the pygmy blue whale foraging BIA.

The National Recovery Plan for the Southern Right Whale (DCCEEW, 2024a) also identified anthropogenic noise as a threat, and requires that actions within and adjacent to the southern right whale BIA and habitat critical should demonstrate that it does not prevent any southern right whale from utilising the area or cause auditory impairment and should also demonstrate that the risk of behavioural disturbance is minimised.

In 2024, trained crew observed four southern right whales near the Nguijima-Yin FPSO and the North Rankin Complex. The three individuals observed at the Nguijima-Yin FPSO were resting at the surface showing no sign of behavioural avoidance.

The maximum predicted extent of underwater noise exceeding the behavioural threshold is 18.9 km. This remains outside the boundaries of the southern right whale BIA and habitat critical, which are at least 19 km from the nearest Pyrenees subsea infrastructure and approximately 22 km from the Pyrenees FPSO (refer Figure 4-11, Figure 6-1 and Table 4-10).

The activity is therefore not considered likely to prevent southern right whales from accessing and using the BIA and habitat critical, cause auditory impairment, or present a high risk of behavioural disturbance. Key factors supporting this conclusion include:

- The predicted area over which the cetacean behavioural threshold may be exceeded could approach the southern boundary of the southern right whale BIA and habitat critical during periods of vessel activity near the closest subsea infrastructure. However, the noise levels at the perimeter of these sensitive areas would be near threshold levels. Importantly, IMMR activities that involve dynamic positioning are intermittent and of short duration (typically lasting hours to days), further reducing the likelihood of prolonged exposure or significant behavioural disturbance.
- The predicted footprint is 16.9 km for 95% of the time allowing at least a 2 km corridor between the ensonified area and the southern right whale BIA and habitat critical.
- The Operational Area is located in open ocean with no physical barriers (e.g. shallow waters, embayments) that could restrict whale movement or avoidance behaviours.

- Any potential deviation in migratory routes of individuals transiting outside the BIA is considered unlikely and insignificant given the whales' extensive migration range and high mobility.

Mid- and high-frequency cetaceans (e.g. dolphins) are known to show behavioural disturbance to increased underwater noise, including short-term avoidance or attraction (Southall et al., 2007). However, cetaceans regularly exposed to vessel noise may also habituate and adapt to these sounds (Richardson et al., 1995; NRCC, 2003), as may be the case for the humpback whales that regularly pass through areas of significant shipping traffic during migration.

Fish

Demersal and pelagic fish species are present in the Operational Area, including fish communities associated with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities KEFs. Vessels holding station using DP are expected to produce sound equivalent to about 182 dB re 1 μ Pa SPL at 1 m. Modelling undertaken by McPherson et al. (2019) of sound produced by facility and vessel operations found that recoverable injury to some types of fish would only be possible if they remained within a distance of less than 10 m for 48 hours, and TTS if fishes remained within 10 m for at least 12 hours. Pelagic fish are highly mobile and the types of demersal fishes known to occur in the vicinity of the Pyrenees Venture FPSO (e.g. snappers, emperors, cods and groupers) will exhibit some fidelity to the area but are still relatively free-swimming and are not constrained to such close ranges (i.e. 10 m). Therefore, free-swimming fish remaining in close range to sound sources for periods that subject themselves to TTS and injury is not considered to be a credible scenario.

Potential noise impacts to fish (including whale sharks) are expected to be restricted to masking and behavioural disturbance. Fish may temporarily be displaced from the immediate vicinity of a noise source; however, they would be expected to behave normally once the noise emissions ceased. Benthic species with site fidelity are not likely to be affected by the activity due to the depths to likely habitats and noise attenuation.

A foraging BIA for whale sharks overlaps the Operational Area and this species may be seasonally present (particularly between March and July) during their annual migration to, and from, the aggregation area off Ningaloo Reef. Whale sharks are not considered to be particularly vulnerable to underwater noise, as they do not have a swim bladder (considered to increase the vulnerability of a fish to noise related impacts). Received noise levels are expected to reduce to 103 dB re 1 μ Pa within 5 km of the Operational Area (McCauley, 1998). Currently, there are no quantitative sound exposure thresholds relevant to whale sharks. It is expected that the potential effects of noise on whale sharks are the same as for other fish species, resulting in minor, localised and temporary behavioural change such as avoidance. Noise attributed to the activity is not likely to interfere with the movement of whale sharks to and from the foraging area at the Ningaloo Reef, given the location is not confined and would not prevent the species from passing through. Therefore, impacts to whale sharks from the Pyrenees Venture FPSO or support vessels are expected to have no lasting effect on the species.

Turtles

Turtles may occur in the Operational Area as the area contains internesting BIAs and defined habitat critical. The Operational Area has minor overlap with hawksbill, green and loggerhead turtle internesting BIA and complete overlap with flatback turtle internesting BIA. The Operational Area also overlaps the habitat critical to the survival of the flatback turtle.

The relative risk of behavioural responses to continuous sound sources is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source. Typical noise levels generated by the FPSO and a support vessel using DP would not exceed these levels and prolonged exposure at close range is not considered a credible scenario.

Using the threshold criteria from Finneran et al. (2017) and Accomando (2025) to assess PTS and TTS for sea turtles the maximum distances to the thresholds were 2.86 km for TTS and 130 m for PTS.

The PTS and TTS thresholds are based on cumulative sound exposure levels calculated over a 24-hour period and it is conservatively assumed that an animal remains within the sound field for the entire duration of exposure. Given that vessels operating DP systems are largely stationary, marine fauna would need to actively approach the vessel and remain in close proximity for 24 hours to experience harmful exposure levels.

Prolonged exposure (≥ 24 hours) of marine turtles within this limited range is not considered credible with turtles capable of avoiding noise sources, and there are no barriers to movement within the Operational Area. The extent of overlap of the internesting areas by noise levels above the PTS or TTS thresholds is limited to less than 1% of the flatback turtle internesting BIA and habitat critical to survival and even less than this for the three other turtle species BIAs with minor overlaps with the Operational Area.

In addition, the DP enabled support vessel is the dominant underwater noise source for the activity during offtakes, resupply or IMMR. Activities that involve DP are intermittent and of short duration (typically lasting hours to days), further reducing the likelihood of prolonged exposure or significant behavioural disturbance.

Based on the above, no significant or lasting impacts to marine turtles from underwater noise is expected.

Cumulative impacts

Woodside have considered the potential noise emitting activities that could overlap with the Petroleum Activity both temporally and spatially. This includes consideration of the proximity of Woodside's Ngujima-Yin FPSO, Pyrenees Venture FPSO and Stybarrow operations, as well as Santos' Ningaloo Vision FPSO operations. There is an overlap between the Pyrenees Facility Operational Area and the Macedon Operational Area in proximity to the Macedon-6

well; however, it is not expected that any more than one IMMR vessel would be present in the Pyrenees Operational Area, with this vessel likely used to complete tasks required for both fields sequentially.

The modelling study of broader operations across the Exmouth region involved five vessels, including three FPSOs, an OSV and an IMMR vessel (refer Figure 6-1) designed to reflect cumulative underwater noise exposure from FPSOs across the region and relevant current vessel activities (offtake, IMMR/support).

The regional cumulative impact assessment predicts outcomes similar to those presented for Pyrenees Facility operations as it uses the same modelling approach and conservative operational assumptions. The predicted noise footprint above behavioural thresholds may approach the southern boundary of the southern right whale BIA and habitat critical during vessel activities at the nearest subsea infrastructure within the Pyrenees Facility Operational Area, but exposure would be of short duration (hours to days). Given the open-ocean setting, absence of natural barriers, and the high mobility of cetaceans, any behavioural responses are expected to be minor, temporary and unlikely to cause displacement, alteration of migration routes, or biologically significant impacts.

Overall, Woodside considers that the management of potential cumulative noise impacts to the pygmy blue whale is not inconsistent with the Blue Whale Conservation Management Plan (DCCEEW, 2021) or the National Recovery Plan for the Southern Right Whale (DCCEEW, 2024a).

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/ risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures ³⁶ : - Support vessels will not travel greater than 6 knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale. - Support vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (except animals bow riding). - If the cetacean shows signs of being disturbed, support vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.	F: Yes. CS: Minimal cost. Standard practice.	Implementation of these controls will reduce the likelihood of a collision between a cetacean, whale shark or turtle occurring.	Controls based on legislative requirements – must be adopted.	Yes C 5.1

³⁶ For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited manoeuvrability e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

Vessels will comply with <i>Biodiversity Conservation Regulations (WA) 2018</i> for whale shark speed control and separation distances: Vessels will not travel greater than 6 knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around whale sharks can potentially reduce the underwater noise footprint of a vessel.	Benefits outweigh cost/sacrifice. Good practice.	Yes C 5.2
Good practice				
Vary the timing of the Petroleum Activity to avoid migration, interesting or sensitive periods.	F: No. The Petroleum Activity occurs continuously over a five-year period and modifying the timing of the Petroleum Activity is not feasible. CS: Not considered, control not feasible.	Not considered, control not feasible.	Not considered, control not feasible.	No
Vessels will not travel greater than 6 knots within 300 m of a turtle (caution zone). If the turtle shows signs of being disturbed, vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around turtles can potentially reduce the underwater noise footprint of a vessel.	Benefits outweigh cost/sacrifice. Good practice.	Yes C 5.3
Implementing a shutdown zone around MBES for the following fauna: - whales - marine turtles - whale sharks.	F: Yes. However, as equipment is underwater, effective implementation of zones is challenging from topside observation. CS: Moderate. Requires the provision of a dedicated suitably trained crew member to undertake marine fauna observations.	Limited. The areas of disturbance for these devices are limited to within about 290 m of the source. In addition, it is noted that for MBES, the frequency range of these devices are outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks).	The source levels and frequency range of these devices are outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks), so costs are considered disproportionate to benefits.	No
Have a dedicated experienced and trained Marine Fauna Observer (MFO) onboard vessels to undertake marine fauna observations.	F: Yes, however additional cost for dedicated and experienced MFO to be present during IMMR CS: Moderate, requires the provision of a dedicated experienced MFO to undertake marine fauna observations.	Use of an MFO may detect fauna in the area, however control provides limited benefit when managing impacts associated with vessel noise alone.	Given limited benefit associated with the management of vessel noise impacts and costs associated with control implementation an experienced MFO is not considered necessary.	No

Professional judgement – Eliminate				
Eliminate the use of DP on vessels during the Petroleum Activity.	F: No. Vessels are required to reliably hold station during the Petroleum Activity. Failure to do so may lead to loss of separation between vessels and infrastructure. This would result in unacceptable safety and environmental risk (loss of vessel separation has been identified in Section 6.8). CS: Not considered, control not feasible.	Not considered, control not feasible.	Not considered, control not feasible.	No
Avoid, where practicable, planned IMMR vessel activities, during humpback whale migration (Jun to Sep, Jul to Nov), southern right whale migration (May to Sep) and southern right whale breeding (Apr to Oct).	F: Yes CS: Significant increased cost for logistics and restriction of vessel availability due to extensive period (eight months).	Planning to avoid, where practicable, planned IMMR activities during humpback whale and southern right whale migration and breeding will reduce underwater noise emissions in the humpback whale migration BIA and reduce noise in close proximity to the southern right whale BIA. However, given the infrequent noise emissions from IMMR vessel(s), for a limited duration (up to two weeks per year), the size and extent of the migration BIAs, the extensive period that the whales may be present, and the behaviour of the whales being transitory during migration, it is expected that this would have a very limited benefit, if any, on the migration behaviour of humpback and southern right whales.	The cost sacrifice is disproportionate to the benefit gained.	No
Professional judgement – Substitute				
None identified.				
Professional judgement – Engineered solution				
Application of bubble curtains to reduce noise propagation.	F: No, Bubble curtain installation and operation in offshore open water not feasible due to technical operation constraints i.e. water depth/current.	Not considered, control not feasible.	Not considered, control not feasible.	No

Manage support vessel speed in the Operational Area during humpback whale migration (Jun to Sep, Jul to Nov), southern right whale migration (May to Sep) and southern right whale breeding (Apr to Oct).	F: Yes. It is possible to carry out for vessels transiting within the Operational Area. CS: Longer transit times for vessels.	Vessel speeds can reduce vessel underwater noise emissions and increase the likelihood that fauna will be seen by vessels (and have more time to react) thereby reducing possibility of vessel strike.	Benefits outweigh cost/sacrifice.	Yes C 5.4
---	--	--	-----------------------------------	--------------

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the impacts from routine acoustic emissions from Pyrenees Facility operations to be ALARP. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

Demonstration of acceptability

Acceptability statement:

The impact assessment has determined that, in its current state, impacts from routine acoustic emissions from Pyrenees Facility operations represent a minor impact /disturbance to marine fauna. Further opportunities to reduce the impacts and risks have been investigated above. The impacts are consistent with good oil-field practice/industry best practice and are considered to be broadly acceptable in its current state. Therefore, Woodside considers standard operations appropriate to manage the impacts of acoustic emissions to a level that is tolerable and demonstrate that the EPOs are met.

EPOs, EPSs and MC

Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
EPO 6 No injury of, or mortality to, EPBC Act 1999 listed marine fauna as a result of noise generated by the Petroleum Activity.	C 5.1 Vessels will comply with the EPBC Regulations 2000 – Part 8 Division 8.1 and 8.3.	PS 5.1 Vessels will comply with EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, which include the following measures:	MC 5.1.1 Records demonstrate no breaches with EPBC Regulations 2000 – Part 8 Division 8.1 and 8.3
EPO 7 No displacement of marine turtles or southern right whales from habitat critical during nesting/breeding (inc. internesting periods for turtles) and ensure biologically important behaviour can continue in BIAs (e.g. humpback and southern right whale migration BIAs).		- Vessels will not travel greater than 6 knots within 300 m of a cetacean or turtle (caution zone) and not approach closer than 100 m from a whale. - Vessels will not approach closer than 50 m for a dolphin or turtle and/or 100 m for a whale (except animals bow riding). - If the cetacean shows signs of being disturbed, activity support vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.	MC 5.1.2 Records demonstrate reporting cetacean ship strike incidents to the DCCEEW.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPOs, EPSs and MC			
	C 5.2 Vessels will comply with Biodiversity Conservation Regulations (WA) 2018 for whale shark speed control and separation distances: Vessels will not travel greater than 6 knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.	PS 5.2 When within 250 m of a whale shark, vessels do not travel faster than 6 knots nor approach within 30 m.	MC 5.2 Incident reports are raised for breaching speed or distance requirements in relation to whale sharks.
	C 5.3 Vessels will not travel greater than 6 knots within 300 m of a turtle (caution zone). If the turtle shows signs of being disturbed, vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.	PS 5.3 When within 300 m of a turtle, vessels will not travel greater than 6 knots.	MC 5.3 Records demonstrate no breaches of speed requirements when within 300 m of a turtle.
	C 5.4 Manage support vessel speed in the Operational Area during humpback whale migration (Jun to Sep, Jul to Nov), southern right whale migration (May to Sep) and southern right whale breeding (Apr to Oct).	PS 5.4 Vessel speeds in the Operational Area are restricted ≤ 10 knots during humpback whale migration (Jun to Sep, Jul to Nov), southern right whale migration (May to Sep) and southern right whale breeding (Apr to Oct).	MC 5.4 Records demonstrate vessel speeds in the Operational Area were ≤ 10 knots during humpback whale migration (Jun to Sep, Jul to Nov), southern right whale migration (May to Sep) and southern right whale breeding (Apr to Oct).

6.7.5 Routine and non-routine atmospheric and greenhouse gas emissions

Source of impact														
Air emissions generated during the Petroleum Activity can be classified into two categories:														
- Atmospheric pollutants (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or the environment. The main emissions responsible for these effects include carbon monoxide, oxides of nitrogen, sulphur dioxide, particulate matter less than 10 microns, and non-methane volatile organic compounds (VOCs) including benzene, toluene, ethylbenzene and xylenes (BTEX). - Greenhouse gas (GHG) emissions. GHG refers to those gases within the atmosphere that absorb long-wave radiation, and thus trap heat reflected from the Earth’s surface. The main gases associated with this effect include carbon dioxide (CO₂), methane and nitrous oxide (N₂O). Other GHGs include perfluorocarbons, hydrofluorocarbons and sulphur hexafluoride.														
In this section, atmospheric emissions estimates are developed in line with the National Pollutant Inventory (NPI) emission estimation techniques. GHG emissions are estimated using the <i>National Greenhouse and Energy Reporting (NGER) Measurement Determination 2008</i> (Cth) and reported as required under the NGER Scheme.														
The following section has been separated into direct emissions (Scope 1) and indirect emissions (Scope 3), aligned with the definitions of the GHG Protocol Corporate Standard (GHG Protocol 2015) and NGER. As the Pyrenees Venture FPSO generates its own power, there are no Scope 2 emissions associated with the activity.														
The main source of GHG emissions associated with the Petroleum Activity are from fuel gas consumption, as shown in Table 6-11. Emissions from flaring are stable during routine operations, but may increase during non-routine operations, such as during maintenance campaigns as well as disconnection and re-connection for cyclone avoidance or sail away and return from shipyard maintenance.														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

GHG emissions sources that are not part of the direct Petroleum Activity such as GHG emissions from third party transportation, oil refining and combustion by end-users of the oil product, are included for consideration as indirect emissions. In the context of this EP, GHG emissions are classified as either direct and indirect emissions, as shown in Table 6-14 and consistent with the GHG Protocol 2015.

The GHG Protocol 2015 defines indirect GHG emissions as “*emissions that are a consequence of the activities of the reporting entity but occur at sources owned or controlled by another entity*”. For the purposes of this EP, the ‘reporting entity’ is the Pyrenees Facility and therefore, third-party transportation, oil refining and combustion of the oil product by end-users, as well as third-party contracted support vessel/helicopter operations, are considered indirect emissions sources.

Direct atmospheric and GHG emissions

Direct emissions generated from the Pyrenees Venture FPSO during the Petroleum Activity include emissions from gas turbines (that can also run on diesel), flares, fugitives and process vents. Direct emissions and combustion products include CO₂, water vapour, oxides of nitrogen, sulphur dioxide, particulates and VOCs.

A historical four-year emissions summary of GHG emissions from the Pyrenees Venture FPSO is provided in Table 6-11. Estimates for GHG emissions are derived from a review of NGER Scheme reporting for all relevant direct emissions streams since financial year FY21.

Table 6-11: Four-year Pyrenees Venture FPSO GHG (National Greenhouse and Energy Reporting) emissions summary

Emissions	FY21	FY22	FY23	FY24
Fuel gas				
m ³	73,133,640	75,728,220	70,570,520	42,062,749
CO ₂ (t)	147,731	152,973	142,554	84,968
Methane tonnes of CO ₂ equivalent (tCO ₂ e)	287	298	277	165
N ₂ O (tCO ₂ e)	86	89	83	50
Diesel				
m ³	984	197	1,027	2,612
CO ₂ (t)	2,654	532	2,771	7,048
Methane (tCO ₂ e)	4	1	4	10
N ₂ O (tCO ₂ e)	8	2	8	28
Fuel gas and diesel emissions: total emissions (%)	79.9	85.4	82.5	79.2
Flared gas				
Tonnes	9,726	6,640	5,797	4,906
CO ₂ (t)	27,234	18,593	16,231	13,736
Methane (tCO ₂ e)	9,075	6,195	5,408	4,577
N ₂ O (tCO ₂ e)	253	173	151	128
Flared gas emissions: Total emissions (%)	19.4	13.9	12.3	15.8
Fugitives				
Fugitives (tCO ₂ e)	1,477	1,366	9,167	5,841
Total				
Total (tCO ₂ e)	188,808	180,219	176,654	116,550
Total (MtCO ₂ e)	0.19	0.18	0.18	0.12

Inter-annual variation in realised air emissions is due to a number of factors such as reservoir and production system performance, planned activities (e.g. shutdowns and maintenance) and unplanned disconnection and reconnection for cyclone avoidance, or reliability events.

For example, FY24 recorded the lowest annual total emissions to date, primarily due to the FPSO being off-station for an extended shipyard maintenance period. This sail-away event significantly reduced fuel gas consumption and flaring due to being off-station for approximately three months. Steaming to and from the shipyard (in Australian waters, outside the Operational Area) contributed to the increased diesel use in FY24. Further, fugitive emissions reporting in FY21 and FY22 were limited in scope, as emissions from PW systems were not included during those years.

FY23 provides the most complete and representative picture of routine operations. It reflects a full year of production without significant unplanned interruptions and includes more comprehensive fugitive emissions reporting. Total GHG emissions in FY23 of 176,654 tCO₂e is considered the most representative annual value to achieve on average over the next five-year period under this EP. Throughout the life of this EP, absolute and relative annual emissions from individual streams are expected to fluctuate. These variations are primarily driven by operational changes, e.g. sail away for maintenance, as well as unplanned events, including increased cyclonic activity that may require facility disconnection and reconnection. Such fluctuations are inherent to the nature of offshore activities and are not indicative of abnormal performance.

Over the last four years (FY21 to FY24), the relative contribution to total emissions from fuel consumption (fuel gas and diesel) to total emissions has ranged between 79.2% to 85.4%. Similarly, flaring has contributed between 12.3% and 19.4%. These figures reflect standard operational variability and highlight the dynamic nature of emissions profiles in offshore operations.

Fluctuations across emissions streams are anticipated to balance out, enabling total GHG emissions to be limited to below FY23 levels annually on average over the life of the EP as a realistic target, continuing through to EOFL (2035). Ongoing efforts to optimise operations and implement emissions reduction measures are aimed to mitigate any overall increase in emissions, as far as practicable.

Fuel gas and diesel consumption

Fuel gas consumption for compression and power generation is the predominant source of combustion emissions from the Pyrenees Venture FPSO, primarily from the three 7,000 kW gas turbine generators and steam generating boilers. The turbines may run on fuel gas or diesel. Emergency diesel generators may also be used when required. Diesel is used for firewater pumps, emergency generators, cranes and back-up fuel for the turbine generators.

FY23 provides the most complete and representative picture of routine fuel gas consumption. Total fuel gas use in FY23 was 70,570,520 m³ and associated GHG emissions were approximately 142,914 tCO₂e, and this is the annual value expected to be achieved annually over the next five-year period under this EP, and until EOFL, for the reasons provided in the section above.

Total diesel consumption in FY23 was 1,027 m³ and associated GHG emissions were approximately 2,783 tCO₂e. Diesel consumption from routine operations should remain stable with any material variance in a typical operational year driven by unplanned shutdown activity (e.g. disconnection and reconnection from cyclones) or reliability events. Diesel consumption is forecast to increase up to 2,612 m³ in a year in which the FPSO sails away for shipyard maintenance e.g. as shown for FY24. Total emissions for the year is, nevertheless, anticipated to remain within the annual level reported for FY23 due to the reduction in fuel gas use due to the FPSO being off station for an extended period.

Estimated annual emissions from fuel gas and diesel combustion at the Pyrenees Venture FPSO are summarised in Table 6-12. The emissions values include exhaust gas from the steam boilers, which is used to blanket tanks storing non-volatile fluids and chemicals, the cargo tanks and slops tanks. This exhaust gas is released when it is displaced by the tanks being filled. The estimated annual emissions from fuel gas and diesel combustion have been estimated using emissions factors (as per National Greenhouse and Energy Reporting (NGER) (Measurement) Determination 2008 and National Pollutant Inventory (NPI) Emission Estimation Techniques (EET)).

Table 6-12: Estimated annual emissions from fuel gas and diesel combusted onboard the Pyrenees Venture FPSO

Component	Emissions from fuel gas combustion	Emissions from diesel combustion	
		Normal year	Sail away year ¹
Volume (m ³)	70,570,520	1,027	2,612
CO ₂ (t)	142,554	2,771	7,048
Methane tonnes of CO ₂ equivalent (tCO ₂ e)	277	4	10
N ₂ O (tCO ₂ e)	83	8	28

Total tCO₂e	142,914	2,783	7,086
Oxides of nitrogen (t)	571	54	138
Carbon monoxide (t)	146	14	37

¹ Sail away for maintenance is planned for 2026 and typically undertaken approximately every 5 years. Total emissions from fuel gas and diesel combusted for a sail away year is anticipated to remain within the total annual amount reported for FY23 even though diesel use is expected to increase. This is due to the reduction in fuel gas use in that year due to the FPSO being off station for an extended period.

Flaring

During normal operations, injection into and back-flow of gas from the Macedon well is continuously adjusted to meet the fuel gas demand of the Pyrenees Facility, which minimises potential flaring and associated GHG emissions from the hydrocarbon production system.

Flaring of hydrocarbon gas may occur via the HP and LP flare systems under various scenarios. The average combustion efficiency of the Pyrenees Facility flare is estimated to be approximately 98%. The HP and LP systems are maintained to ensure availability and efficient combustion of hydrocarbons, including maintenance of the flare tip flare ignition system (C 6.9). In addition, a plan is in place to develop a new performance standard to capture key requirements for environmental emissions monitoring equipment (C 6.6).

Gas flaring emits greenhouse gases to the atmosphere from combustion of natural gas, a non-renewable resource. Emissions and combustion products include CO₂, oxides of nitrogen, sulphur dioxide, methane, particulates, and VOCs. Incomplete combustion under certain scenarios may also generate dark smoke.

In 2017, Woodside became signatory to the World Bank's Zero Routine Flaring Initiative, applicable to all oil assets. Woodside's implementation of the initiative involves reporting on flaring according to the following definitions:

- **Routine flaring:** Routine flaring of gas is flaring during normal oil production operations in the absence of sufficient facilities or amenable geology to re-inject the produced gas, utilise it on-site or dispatch it to a market. This includes e.g. flaring from oil/gas separators. Routine flaring does not include safety flaring, even when continuous.
- **Safety flaring:** Safety flaring of gas is flaring to ensure safe operation of the facility (e.g. flaring of gas from an incident that jeopardises safe operation, blowdown gas, flare maintenance gas [purge/make-up/fuel gas]), pilot gas, gas flared due to safety-related operations such as emergency shutdown and leak tests, dry gas seals, gas containing hydrogen sulphide, including dispersant/assist gas and gas that contains high levels of VOCs).
- **Non-routine flaring:** Non-routine flaring is all flaring other than routine and safety flaring (typically intermittent and of short duration and can either be planned or unplanned). It includes flaring resulting from temporary failure of equipment that handles the gas during normal operations until its repair or replacement, temporary failure of customer facilities that prevents the receipt of gas, start-up, scheduled preventative maintenance and inspections, process upsets, reservoir/well maintenance activities and well testing/clean-up).

The flaring volume is impacted by the availability, reliability, and efficiency of the compressors. During compressor outages, flaring may occur because of gas lift instability leading to slugging in the production flowlines. Slugging can result in temporarily exceeding the gas compressor capacity and flaring is required to manage the pressure cycles. Performance degradation of the compressors can similarly lead to flaring as compressor capacity is reduced.

To minimise flaring associated with compressor service outages and performance deterioration, the condition of the compressors and its utility systems are monitored by both Solar (compressor and gas turbine vendor) and Woodside. Solar provides a condition monitoring service of the gas turbine generators and high-pressure compressors and will inform if the predicted performance deviates too much from observed. During maintenance activities, gas turbines and compressors undergo an internal inspection via borescope to confirm the condition of the equipment. Scheduled water washes are also typically performed to ensure optimum efficiency and power capacity of the turbines.

The compressor and gas turbine utility systems are monitored to optimise operating conditions and performance efficiency. This includes fuel and seal gas filtration to minimise wear and tear and lube oil varnish removal which could otherwise lead to increased friction and increased maintenance duration.

In 2024, the first and second stage compressor suction scrubbers were modified to minimise liquid carry over which can lead to a buildup of corrosion products on the compressor impellers. As a result of these activities, the compressor performance and availability has been improved and running time between maintenance activities increased from 30,000 to 40,000 hours.

FY23 provides the most complete and representative picture of annual flaring from operations. In FY23, 5,797 tonnes of gas were flared, generating GHG emissions of approximately 21,790 tCO₂e (Table 6-11). Flaring volumes can vary with production rates and non-routine activities including any outages and shutdowns, as can be seen in Table 6-11. Estimated annual emissions from flaring from the Pyrenees Facility are summarised in Table 6-13 and based on realised values reported for FY23. These annual flaring values are expected to be achieved annually over the next five-year period, and until EOFL. The values have been calculated using the NGER measurement determination and NPI emission estimation techniques and include water vapour, inert gas and hydrocarbon gas. Under normal and continuous operations flaring is expected to vary, and it is anticipated that safety flaring would contribute approximately 3,500 to 5,000 tonnes of gas per year of the total estimated 5,797 tonnes. In FY23 ~66% of flaring was

reported as safety flaring and ~34% of flaring was reported as non-routine flaring. Noting that this changes year on year, controls are focused on reducing and minimising total flaring.

Table 6-13: Estimated annual emissions from flaring onboard the Pyrenees Venture FPSO

Component	Estimated Annual Emissions ¹
Flared gas (t)	5,797
CO ₂ (t)	16,231
Methane (tCO ₂ e)	5,408
N ₂ O (tCO ₂ e)	151
Total tCO₂e	21,790
Oxides of nitrogen (t)	9
Carbon monoxide (t)	50

¹ Estimate only from historical performance from FY23. Future performance may differ due to variety of reasons such as upset conditions, change in field production, etc.

Fugitive emissions

Fugitive emissions can occur from pressurised equipment, and are inherent in design, required for infrequent operational activities, or can be caused by unintentional equipment leaks. Sources can include valves, flanges, pump seals, compressor seals, relief valves, vents, sampling connections, process drains, open-ended lines, casing, tanks and other potential leakage sources from pressurised equipment.

Discrete, relatively small volumes of packed gases and charged systems including refrigerant gases are used across the Pyrenees Venture FPSO and vessels, which have potential for small volume leaks (typically less than 100 kg per isolatable inventory). Such gases are used in the heating, ventilation and air conditioning and refrigerant systems onboard the Pyrenees Venture FPSO and vessels.

As much of the safe operation of the Pyrenees Facility relies on the effective containment of hydrocarbons, the volumes of routine and non-routine fugitive emissions are considered small. Fugitive emissions are, by their nature, difficult to quantify and are estimated by application of methods under the *National Greenhouse and Energy Reporting (Measurement) Determination*. Using this estimation technique, the Pyrenees Venture FPSO reported 9,167 tCO₂e lost through fugitive emissions during FY23 and this remains the expected level of fugitive emissions for the EP period (next five years).

There is a risk of venting of process hydrocarbons via the flare system. Flaring systems are maintained to effectively combust hydrocarbons as a critical component for the safe operation of the Pyrenees Facility. There is a risk that the flares could be extinguished (for example, during high winds during a tropical cyclone) or unavailable (such as following a major shutdown prior to system ramp-up). In this event the hydrocarbon gas discharged via the flare system may initially not be combusted during the period required to purge the flare system and re-establish flare ignition. This may result in the short-term (minutes) low-rate release of uncombusted hydrocarbon gas to the atmosphere. This has not happened at the facility and controls are in place to prevent and limit the volume, if this were to occur.

Emissions Reduction Opportunities at Pyrenees

Pyrenees Facility operations applies a structured process to identify and implement initiatives that aim to improve production efficiency and reduce air emissions (Section 7.5.4). The focus is on maintaining high baseline reliability, which directly supports operational efficiency and contributes to emissions reductions e.g. through reduced flaring. These efficiencies are incorporated into both existing emission performance reporting and future emissions estimates.

Operational workflows including proactive maintenance, performance monitoring and vulnerability management, are implemented to enhance reliability and, where applicable, reduce emissions. Maintenance and operational planning consider opportunities to reduce emissions such as minimising blowdown requirements by aligning work scopes with scheduled shutdowns and optimising maintenance of rotating equipment.

This approach ensures focus on efficiency and reliability improvements which contribute to ongoing emissions reduction outcomes. These processes will be formally incorporated into and align with the Woodside Production Optimisation and Opportunity Management Framework (POOMP) in 2027.

Indirect emissions

Emissions from vessels and helicopters

GHG and atmospheric emissions are generated by vessels and helicopters supporting Pyrenees activities. Vessel emissions include those from internal combustion engines and fugitives. Atmospheric and GHG emissions from support vessels vary depending on the nature of activities being undertaken; for example, travelling or 'steaming' to a destination at low speed uses less fuel and generates lower atmospheric and GHG emissions than high speed steaming. Emissions generated during safety related vessel standby activities, holding station using DP during loading and unloading of materials to the facility or undertaking subsea IMMR work also vary.

Expected annual emissions for vessel and helicopter activities have been estimated to be:

- 4,000 tCO₂e for support vessels in 2023, which is considered a high support vessel activity year
- 300 tCO₂e for helicopters, based on helicopter flights in 2022, considered a typical helicopter use year.

Indirect emissions relating to support vessels and helicopter operations is a small contribution to the total emissions profile of the Petroleum Activity and are not expected to vary materially for the duration of the EP.

Emissions from shipping, refining and end-use attributable to Pyrenees

Indirect emissions attributed to Pyrenees results from shipping, refining and combustion/end use of hydrocarbons. Indirect GHG emissions attributed to Pyrenees operations were estimated using historical and forecasted production rates (Table 6-14). Key influences impacting indirect GHG emissions from Pyrenees include:

- total production – indirect emissions are proportional to total production, which varies with shutdown activity, new field tiebacks or gradual reservoir decline.

The forecast direct and indirect GHG emissions are presented in Table 6-14. Forecast emissions estimates are sensitive to production rate and non-routine events, which are subject to uncertainty associated with reservoir performance and will change over the life of the facility. Indirect emissions from support vessel and helicopter operations as well as product end-use are estimated to be approximately 1.72 MtCO₂e per year, totalling up to 8.61 MtCO₂e for the duration of the EP.

Table 6-14: Forecast direct and indirect GHG emissions

Source of impact	Annual estimated emissions (MtCO ₂ e)	Total estimated emissions for EOFL ² (MtCO ₂ e)
Direct emissions		
Fuel, flaring and fugitives	0.177	1.943
Indirect emissions		
Support vessels and helicopter operations	0.004	0.047
Third party transport of products, refining and combustion ¹	1.717	18.888

¹ Source: Transport and refining based on Oil-Climate Index factors for Australia Cossack. Combustion factors aligned with United Nations' 2006 Intergovernmental Panel on Climate Change (IPCC) Guidelines for National Greenhouse Gas Inventories. Emissions factors used are the default values as product customer's destination and use of the products are unknown.

² EOFL is predicted to be 2035, subject to reservoir performance and life extension studies. Annual emissions are expected to remain fairly consistent until EOFL.

Impact assessment

Global efforts to reduce greenhouse gas emissions in order to meet climate goals are changing the way the world produces and consumes energy. This energy transition is uncertain and there is a wide range of potential demand for oil, gas and new energy including in pathways consistent with limiting global temperature rise. Today, Woodside has a portfolio of oil and gas assets. We are also developing a portfolio of new energy products and lower carbon services. Across our portfolio we seek to match the pace, scale and needs of our customers as they determine their own decarbonisation pathways.

Air quality

Facility and vessel routine and non-routine emissions, predominantly from fuel combustion and flaring, have the potential to result in localised, temporary reduction in air quality, generation of dark smoke if incomplete combustion occurs and contribution to GHG emissions. Potential impacts of emissions depend on the nature of the emissions, as well as the location and nature of the receiving environment. The quantities of atmospheric emissions generated by the Pyrenees Facility are relatively small and will, under normal circumstances, be quickly dissipated into the surrounding atmosphere.

The Operational Area is in a remote offshore location, with no expected adverse interaction with populated areas or sensitive environmental receptors associated with air emissions.

A wedge-tailed shearwater breeding BIA overlaps the Operational Area and several other threatened and migratory seabird species could occur in the Operational Area or nearby. Individual birds would be transiting the offshore area as roosting and nesting habitats occur on land. The nearest potential seabird roosting habitat, the Muiron Islands, lies approximately 19 km south-east of the Operational Area. Given the highly dispersed nature of facility air emissions, no adverse air quality impacts to birds are anticipated due to air emissions.

Potential impacts are expected to be short-term and limited to the airshed local to the Operational Area. Air emission impacts are not expected to have direct or cumulative impacts on sensitive environmental receptors, or above *National Environmental Protection (Ambient Air Quality) Measures* and are expected to disperse well before reaching the nearest populated area (Exmouth).

The flare and potential dark smoke resulting from incomplete combustion may impact visual amenity, however, this is unlikely to be the case at the Muiron Islands and the North West Cape located 10 and 27 km from the FPSO, respectively. It has been reported that flaring during upset conditions may be visible on the horizon from shore during night-time; however, upset conditions are uncommon and dark smoke from any incomplete combustion is not expected to be visible at these distances at any time. Impacts to residential communities in Exmouth 45 km away from flaring or any dark smoke are not considered credible. Impacts to tourism activities from night-time observations of flaring on the horizon at the North West Cape is considered negligible.

GHG emissions

Climate change is caused by the net global concentration of greenhouse gases in the atmosphere. Human-caused climate change is a consequence of more than a century of net GHG emissions from energy use, land use change, lifestyle patterns of consumption, and production (IPCC, 2023). The IPCC has stated that observed increases in GHG concentrations since 1750 leading to climate change are unequivocally caused by human activities and that there is a near linear relationship between cumulative anthropogenic CO₂ emissions and the global warming they cause (IPCC, 2023).

The energy transition precise shape and pace is expected to vary across countries because they have different starting points, development requirements, resources and capabilities. However, the scale of the transition is clearer, it will take many trillions of dollars, invested over decades.

Woodside is working to diversify its portfolio by adding new lower-carbon products and services alongside our existing products, where we believe we have a competitive advantage to supply them successfully through the energy transition. However, demand in petrochemical and heavy transport is likely to be resilient for longer. Woodside sees a demand for oil expected across a range of pathways through the energy transition. The Pyrenees Facility will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life. Woodside sees a role for oil from the Pyrenees Facility to meet customer demand.

Climate change impacts upon Australian receptors cannot be directly causally linked to any one activity or one project, including the operation of the Pyrenees Facility, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. The accumulation of greenhouse gas emissions in the atmosphere is, in turn, influenced by global energy demand and the composition of the global energy mix. The following contextual evaluation is provided. This contextual evaluation assessment considers the potential impacts of climate change on sensitive receptors, including MNES within Australian jurisdictions.

GHG emissions – global and Australian context

Climate science is a rapidly evolving field in which new observations continue to deepen understanding of the current and potential impacts of global warming, and the possible pathways for mitigation and adaptation.

The IPCC is the United Nations body for assessing the science related to climate change and finalised the Sixth Assessment Report (AR6) in 2023. This consists of three Working Group contributions and a Synthesis Report. A summary of outcomes of the working group's contributions comprises a range of matters, which among others include:

- The AR6 Working Group I report stated that it is unequivocal that there is human-induced warming. It also stated that increased atmospheric CO₂ levels, generated by human activity, are the largest driver of warming over the longer term, and that there are a range of factors, including emissions of methane, which increase warming in the short-term.
- The AR6 Working Group II report stated that human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. It stated that global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans. The report noted that societal choices and actions implemented in the next decade will determine the extent to which medium- and long-term pathways will deliver climate resilient development.
- The AR6 Working Group III report provided an updated global assessment of climate change mitigation progress and pledges and examined the sources of global emissions. It explained developments in emissions reduction and mitigation efforts and assessed the impact of national climate pledges in relation to long-term emissions goals. More than 2,000 quantitative emissions pathways were submitted to the IPCC, of which 1,202 scenarios included sufficient information for assessing the associated warming. The report found that there are many pathways in the literature that likely limit global warming to 2°C with no overshoot, or to 1.5°C with limited overshoot. These variations occur because, while climate science is able to calculate a 'carbon budget' of net emissions before any particular temperature outcome is reached, the allocation of this budget between different human activities requires additional judgements about for example technology, economics, consumer preferences and policy choices.

- The AR6 Working Group I report stated that climate change is a global phenomenon, but manifests differently in different regions (IPCC, 2021). IPCC projections for climate change in Australia from the AR6 Working Group II report include:
 - further climate change is inevitable, with the rate and magnitude largely dependent on the emission pathway (very high confidence)³⁷
 - ongoing warming is projected, with more hot days and fewer cold days (very high confidence)
 - further sea level rise, ocean warming, and ocean acidification are projected (very high confidence)
 - less winter and spring rainfall is projected in southern Australia, with more winter rainfall in Tasmania, less autumn rainfall in southwestern Victoria and less summer rainfall in western Tasmania (medium confidence), with uncertain rainfall changes in northern Australia.
 - more extreme fire weather is projected in southern and eastern Australia (high confidence)
 - increased drought frequency is projected for southern and eastern Australia (medium confidence)
 - increased heavy rainfall intensity is projected, with fewer tropical cyclones and a greater proportion of severe cyclones (medium confidence) (Lawrence et al. 2022).
- The AR6 Working Group II report identified nine key climate risks for the Australasian region:
 - loss and degradation of coral reefs and associated biodiversity and ecosystem service values in Australia due to ocean warming and marine heatwaves (very high confidence)
 - loss of alpine biodiversity in Australia due to less snow (high confidence)
 - transition or collapse of alpine ash, snowgum woodland, pencil pine and northern jarrah forests in southern Australia due to hotter and drier conditions with more fires (high confidence)
 - loss of kelp forests in southern Australia due to ocean warming, marine heatwaves, and overgrazing by climate-driven range extensions of herbivore fish and urchins (high confidence)
 - loss of natural and human systems in low-lying coastal areas due to sea level rise (high confidence)
 - disruption and decline in agricultural production and increased stress in rural communities in south-western, southern and eastern mainland Australia due to hotter and drier conditions (high confidence)
 - increase in heat-related mortality and morbidity for people and wildlife in Australia due to heatwaves (high confidence)
 - cascading, compounding and aggregate impacts on cities, settlements, infrastructure, supply-chains and services due to wildfires, floods, droughts, heatwaves, storms and sea level rise (high confidence)
 - inability of institutions and governance systems to manage climate risks (high confidence) (Lawrence et al., 2022).

An earlier report by Australia's Biodiversity and Climate Change Advisory Group summarised the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al., 2009). The 2009 report identified examples of observed changes in Australia's biota that were considered consistent with the emerging climate change 'signal', as genetic constitution, geographic ranges, life cycles, populations, ecotonal boundaries, ecosystems, and disturbance regimes (Steffen et al., 2009). The report also stated:

- *"Biodiversity is one of the most vulnerable sectors to climate change".*
- *"Australia's biodiversity is not distributed evenly over the continent but is clustered in a small number of hotspots with exceptionally rich biodiversity", and that these "include the Great Barrier Reef, south-west Western Australia, the Australian Alps, the Queensland Wet Tropics and the Kakadu wetlands".*

Further, it was stated that *"many of the most important impacts of climate change on biodiversity will be the indirect ones at the community and ecosystem levels, together with the interactive effects with existing stressors"* (Steffen et al., 2009). Future climate change (e.g. increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian mediterranean ecosystem (Commonwealth Scientific and Industrial Research Organisation (CSIRO), 2017).

Extensive modelling and monitoring studies over the last twenty years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al., 2018) however these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life-history events) (Dunlop et al., 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex ratios (Steffen et al., 2009).

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across all terrestrial ecosystems within Australia (Dunlop et al., 2012; Steffen et al., 2009). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat

³⁷ A level of confidence is expressed using five qualifiers: very low, low, medium, high, and very high. For a given evidence and agreement statement, different confidence levels can be assigned, but increasing levels of evidence and degrees of agreement are correlated with increasing confidence (Lawrence et al., 2022).

heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both endemic and invasive species (Dunlop et al., 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al., 2018).

The 'loss of climatic habitat caused by anthropogenic emissions of greenhouse gases' has been listed as a key threatening process under the EPBC Act (DCCEEW, 2021). The threatening process consists of reductions in the bioclimatic range within which a given species or ecological community exists due to emissions induced by human activities of greenhouse gases (DCCEEW, 2021). The process is considered to have a continental distribution, including both terrestrial and marine areas. Ecosystems in which the process occurs include alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests, and arid and semi-arid environments (DCCEEW, 2021).

Coral reefs were recognised by both IPCC and the Australian Government as being at risk of climate change (Lawrence et al., 2022; DCCEEW, 2021). Protected coral reef areas in Australia include those within World Heritage listed sites, such as Ningaloo Coast, Shark Bay, or the Great Barrier Reef. Climate change has been identified as a threat for each of these World Heritage areas, with potential risks to coral reef as well as other environmental values (such as marine fauna) within these ecosystems (IUCN, 2020b; 2020c; 2020a).

Climate variability and change have been identified as threats to some EPBC Act protected species, including marine turtles, whales, seabirds and migratory shorebirds:

- The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) states that "*climate change is of particular concern to marine turtles because it is likely to have impacts across their entire range and at all life stages. Climate change is expected to cause changes in dispersal patterns, food webs, species range, primary sex ratios, habitat availability, reproductive success and survivorship*".
- The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015a) states that "*climate change is expected to cause changes in migratory timing and destinations, population range, breeding schedule, reproductive success and survival of baleen whales, including blue whale species and subspecies*".
- The Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2022b) states that "*consequences to seabirds could include negative impacts from an increase in extreme weather events, reduced or changed prey abundance and distribution, and decrease in nesting habitat*".
- the Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australia, 2015) states that "*such changes have the potential to affect migratory shorebirds and their habitats by reducing the extent of coastal and inland wetlands or through a poleward shift in the range of many species*".

The North-west Marine Parks Network Management Plan 2018 (DNP, 2018) identifies climate change as a pressure that may impact marine park values. The management plan states that "*the impacts of climate change on the marine environment are complex and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity, species range extensions or local extinctions, all of which have the potential to impact on marine park values*" (DNP, 2018).

Within the Marine Bioregional Plan for the NWMR (DSEWPac, 2012a), pressures related to climate change are assessed as 'of potential concern' for species of marine turtle, inshore dolphins, sawfish, sea snakes, whale shark, dugong, and seabird and shorebird, as well as the KEFs and shipwrecks known to occur in the NWMR.

		per OGMP framework. Evaluate methane emissions identified in inventory and put in place actions to remediate sources where practicable.		
Forecast, measure, monitor and/or estimate facility fuel and flare emissions (in accordance with NGERS/NPI) to inform optimisation management practices and minimise environmental impact of emissions.	F: Yes. CS: Moderate cost. Standard practice.	Minimises environmental impact of emissions through planning, ongoing review, governance and optimisation. It combines with good operating practice to maximise production, reduce fuel gas use and emissions to manage cost, which reduces emissions (e.g. cleaner production), optimising emissions from the Petroleum Activity. Annual fuel and flare target setting followed by tracking enables review of performance, investigation of trends and insights to improve overall emissions reductions. Emissions reductions opportunities and workshops also identify further opportunities to reduce emissions. A new performance standard for environmental emissions monitoring equipment will enhance compliance assurance and support risk reduction. It outlines how environmental releases and emissions will be detected and monitored to meet reporting requirements. This includes monitoring of flared and fuel gas, maintaining functionality of key systems such as the flare re-ignition panel, and ensuring metering equipment is maintained.	Benefits outweigh cost/sacrifice.	Yes C 6.6

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Report on an emissions intensity target for Pyrenees crude.	F: Yes. CS: Additional reporting burden without providing improved environmental outcome.	Woodside already reports Scope 1 and 2 gross emissions intensity as a measure of production efficiency before application of offsets, and this is published annually through corporate disclosures. For the FPSO, fuel gas combustion requirements are relatively fixed to maintain safe and continuous operation. Now that the facility is operating off plateau with lower production volumes, emissions intensity has increased as a function of reduced output. As a result, emissions intensity is no longer a meaningful indicator of environmental performance. Woodside's focus is now on delivering absolute emission reductions, which more accurately reflect environmental outcomes.	Control does not improve environmental risk management relative to existing controls. Cost grossly disproportionate to benefit gained. Not adopted.	No
Woodside supports customers ³⁹ to reduce their emissions via the investment in new energy products and lower carbon services, including the progression of corporate Scope 3 targets that apply across Woodside's portfolio, including the following: Scope 3 Investment Target ⁴⁰ : Woodside has a Scope 3 investment target aiming to invest \$5 billion in new energy products and lower carbon	F: Yes. CS: Cost as reflected in target.	Supports customers to reduce their Scope 1 and 2 GHG emissions.	Proportional at a Woodside corporate level.	Yes C.7.1

³⁹ The customers for these products and services may be the same as the customers of our oil and gas business, directly substituting their energy for new products or directly abating the associated emissions. They may also be customers of the new products and services, without also being customers of oil and gas.

⁴⁰ Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment. Timing refers to financial investment decision, not start-up/operations.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
services (non LNG) by 2030⁴¹. Scope 3 Emissions Abatement Target⁴⁰: Woodside has a Scope 3 emissions abatement target, to indicate the potential abatement impact of these products and services upon customer Scope 1 or 2 emissions. This target is to take final investment decisions on new energy products and lower carbon services by 2030, with total abatement capacity of 5 Mtpa CO₂e.⁴²				
Through its portfolio, Woodside will work with the natural gas value chain to reduce emissions in third party systems (e.g. regasification and distribution), such as through: - the adoption and promotion of the Methane Guiding Principles - sharing knowledge of methane reduction via Australian industry forums and other companies in the natural gas value chain - advocacy for stable policy frameworks that reduce carbon emissions - annual review of the implementation and outcomes of these measures.	F: Yes. CS: Minimal cost associated with collaboration and advocacy.	Supports customers to reduce their Scope 1 and 2 GHG emissions.	Proportional at a Woodside corporate level.	Yes C 7.2
Continue to implement the Pyrenees Flare and Vent	F: Yes.	To align the Pyrenees facility processes for	Disproportionate relative to outcome	No

⁴¹ Includes pre-RFSU spend on new energy products and lower carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 emissions which are managed separately through asset decarbonisation plans.

⁴² Includes binding and non-binding opportunities in the portfolio, subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Management Plan that includes annual tracking of emissions intensity and benchmarking against other facilities.	CS: Adds complexity without improving environmental outcomes; benchmarking data is not always comparable due to facility-specific variables.	flaring and venting with other Woodside assets, it is proposed to no longer use the Flare and Vent Management Plan. The controls will implemented through alternative processes, to achieve the same outcome. These are • C 4.3 & C 6.10 - operational procedures • C 6.6 (PS 6.6.1 & PS 6.6.3) - internal monitoring • C 6.3 & C 6.4 - compliance with regulatory requirements. Benchmarking and intensity tracking has been completed annually and has provided limited actionable insight due to variability across facility types and operating contexts. As a result, benchmarking and intensity tracking is to cease. Instead, additional new controls are proposed: • C 6.5 - methane management; and • C 6.6 (PS 6.6.2, PS 6.6.4) for flaring management.	and not considered ALARP – environmental outcomes are adequately managed through other controls; additional measures of benchmarking and intensity tracking would result in disproportionate administrative burden.	
Professional judgement – Eliminate				
Fuel for energy generation on facility is selected for lowest emissions generation where practicable: Fuel gas derived from subsea wells will be used in preference to diesel for power generation.	F: Yes, fuel gas is the primary fuel source on Pyrenees. CS: Cost effective.	Diesel substitution reduces CO ₂ emissions for a given unit of power and reduces spill risk associated with fuel bunkering activities.	Cost effective. Opportunities minimise fuel bunkering transfer risks.	Yes. C 6.7
Eliminate flaring by venting un-combusted hydrocarbons.	F: No. Routine hydrocarbon venting is not considered good industry practice; as unburnt hydrocarbons pose potential for greater environment impact	Not assessed, control not feasible.	Not assessed, control not feasible.	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
	compared to combustion emissions. The ability to flare hydrocarbons is a key safety feature on the facility. Removing the ability to flare hydrocarbons may result in unacceptable safety risks on the Pyrenees Facility. CS: Not assessed, control not feasible.			
When gas production exceeds fuel gas demand, surplus gas will be re-injected during routine operations and therefore reducing flaring of surplus gas during routine production operations.	F: Yes. CS: Minimal cost.	Minimises emissions from flaring and reduces any additional impacts attributed to flaring (e.g. lighting).	Control based on Woodside requirements, is feasible, standard practice with minimal cost. Benefits outweigh any cost/sacrifice.	Yes C 4.3
When surplus gas is available under the Macedon back-flow arrangement, gas intake will be reduced to avoid excess supply and minimise the potential for flaring.	F: Yes. CS: Minimal cost.	Balancing gas demand and availability maximises efficiency and reduces the volume of gas needed from the reservoir, thereby reducing GHG emissions and saving gas volumes for future.	Control based on Woodside requirements, is feasible, standard practice with minimal cost. Benefits outweigh any cost/sacrifice.	Yes C 6.8
Professional judgement – Substitute				
No additional controls identified.				
Professional judgement – Engineered solution				
Maintain flare to maximise efficiency of combustion and minimise venting, incomplete combustion waste products and smoke emissions.	F: Yes. CS: Minimal cost, Standard practice.	Flare tip integrity and ignition system functionality minimises potential for venting, incomplete combustion waste products and smoke emissions.	Control is company requirement – must be adopted.	Yes C 6.9
Maintain gas compression system to maximise reinjection of excess fuel gas.	F: Yes. CS: Standard practice.	Maintenance of gas compression system minimises unplanned flaring by helping to prevent unplanned outages of equipment.	Standard practice. Control adopted.	Yes C 6.10
Installation of flare gas recovery systems to reduce emissions entering the atmosphere from flaring.	F: Yes. CS: Significant additional cost associated with the design and installation of flare gas recovery	Small to negligible environmental benefit from reducing atmospheric emissions from flaring. The environmental benefit gained from the recovery	Given the increased safety risk and the very low, if any, environmental benefit provided when increased power generation emissions	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
	systems, including significant retrofitting of multiple stages of compression systems, coupled with associated ancillaries, valving and piping, facility modification and weight considerations. The safe addition of the required rotating equipment also poses significant production sacrifice, and potential domestic gas supply impacts due to the initial design layout and space safety constraints.	of flaring emissions would be limited to only a portion of flare system flows due to process safety constraints and flare system operation over a wide design envelope (associated with flow variations). Furthermore, required retrofitting of multiple stages of compression (e.g. for LP/HP streams) would offset any environmental benefits through increased power generation emissions. The retrofitting interaction with the safety critical flare system and continued operation of gas compression would also increase facility safety risks.	are taken into consideration, the installation of flare gas recovery systems is considered grossly disproportionate to the environmental benefit it would provide.	
Redesign facility to redirect all non-safety flaring streams to reinject the gas.	F: Yes CS: Significant additional cost associated with the re-design and installation of associated equipment and pipework to allow for the reinjection of streams which are currently flared.	Small environmental benefit from reducing atmospheric emissions from flaring. The current contribution from these streams are low and reinjection of excess fuel gas is in place, and the facility has redundancy (two) reinjection compressors for rejecting excess fuel gas, as well as other controls in place to minimise flaring.	Given the small environmental benefit, the significant cost in re-designing and installing associated equipment and pipework, and the other controls already in place to minimise flaring, it is grossly disproportionate to the environmental benefit that it would provide.	No
Maintaining closed circuit television monitoring systems to prevent/respond to unplanned venting.	F: Yes. CS: Increase in cost to maintain high reliability/availability of system, which is not necessary given facility is crewed and panel operator can see flare from operator panel.	Closed circuit television provides very little to no benefit given facility is crewed and superior controls are in place to monitor the flare and unplanned venting. Closed circuit television may have a benefit for an uncrewed facility but has little to no benefit for a crewed facility such as Pyrenees.	Cost/sacrifice is grossly disproportionate to benefit gained.	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ³⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Discussion of ALARP Atmospheric emissions Given the adopted controls appropriate to manage the impacts of atmospheric emissions. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP. GHG emissions Risk-based analysis Application of Woodside's PetDW risk management procedures and other PetDW procedures reduces GHG emissions risk to ALARP. This includes a system of continual review and improvement of key emissions sources from the Pyrenees Venture FPSO. Societal values Consultation was undertaken for this program to identify the views and concerns of relevant stakeholders, as described in Section 5. No specific concerns around air emissions, resulting in changes to air quality and greenhouse gas emissions, were identified through this process. ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision type A and B for direct and indirect emissions respectively), Woodside considers the adopted controls appropriate to manage the impacts from GHG emissions from the Pyrenees Facility and indirect emissions sources that Woodside can practicably influence, including support vessels, during the five year term of this EP. The adopted controls meet legislative requirements, including: • Marine Order 97 for support vessels • NGER Scheme and NPI reporting for direct emissions attributed to the Pyrenees Venture FPSO • <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015.</i> Woodside has elected to focus emissions performance reporting in this EP on absolute emissions reductions to inform environmental outcomes, and that are more directly aligned with national climate policy targets and the company's own decarbonisation objectives. While a specific emissions intensity target is no longer included in this EP, Woodside continues to monitor and report gross Scope 1 and 2 emissions intensity through its corporate sustainability disclosures and under the Safeguard Mechanism framework. The adopted controls include flare minimisation, energy efficiency improvements, equipment optimisation, and fugitive emissions management. These have been selected based on their technical feasibility and proven ability to reduce emissions. These controls are quantified and monitored through Woodside's internal emissions management systems, and performance is reviewed regularly in accordance with PetDW continual improvement processes. Woodside considers that the adopted approach achieves an equivalent or better level of environmental performance than inclusion of a standalone emissions intensity target or emission intensity tracking and benchmarking. No further controls were identified that would reduce GHG emissions without grossly disproportionate cost or impact to operations. Therefore, GHG emissions impacts and risks are considered to be reduced to ALARP.				

Demonstration of acceptability
Acceptability statement: atmospheric emissions Given the adopted controls, atmospheric emissions represent a negligible impact that is unlikely to result in greater than isolated impacts within close proximity of the Operational Area. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders and National Pollutant Inventory reporting. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of atmospheric emissions from the Pyrenees Facility to a level that is broadly acceptable. Acceptability statement: GHG emissions To assess and determine that impacts from GHG emissions will be of an acceptable level, Woodside considered corporate commitments, principles of ESD, company values and societal values.

Principles of ecologically sustainable development

Giving considerations to economic development that safeguards the welfare of future generations, Pyrenees is considered to align with the following core objectives of ESD by:

- committing to management and mitigation measures for GHG emissions within operational control of the facility, given the uncertainty about future climate change trajectories
- committing to mitigation measures for indirect GHG emissions that are controlled or influenced by operator and connected to the operations of the Pyrenees Facility
- continuing to provide fuel for global markets and pursue the development of lower carbon energy sources with reference to the United Nations Sustainable Development Goal 7, Affordable and Clean Energy.

Internal context

The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and EPOs, including:

- Woodside Health, Safety, Environment Policy
- Woodside PetDW Risk Management Policy
- Woodside Climate Policy (Appendix K).

Woodside's climate strategy

The management of emissions from the Pyrenees Facility is aligned with Woodside's climate strategy. Woodside's climate strategy is to thrive through the energy transition with a low-cost and lower-carbon, profitable, resilient and diversified portfolio, which contains two key elements:

- Reduce our net equity Scope 1 and 2 GHG emissions:
 - Woodside is targeting a reduction of net equity Scope 1 and 2 GHG emissions of 15% by 2025 and 30% by 2030, with an aspiration of net zero by 2050 or sooner.⁴³
 - Reducing our net equity Scope 1 and 2 GHG emissions is supported by three levers: avoiding emissions in design, reducing emissions in operations, and offsetting the remainder through our portfolio of carbon credits.
- Invest in products and services for the energy transition.

Woodside has two Scope 3 targets⁴⁴ to help reduce customer⁴⁵ emissions:

- Invest in new energy products and lower carbon services by 2030 of \$5 billion.⁴⁶
- Take FID on new energy products and lower carbon services by 2030 with total abatement capacity of 5 Mtpa CO₂e.⁴⁷

Progress against targets is reported annually in Woodside's annual disclosures. Reduction targets are not set for individual assets, including Pyrenees, but are assessed corporately.

External context

GHG emissions are a global concern as such Woodside has undertaken an impact assessment of GHG associated with the Pyrenees operations and identified key measures to address this issue.

The global consensus on climate change led to the implementation of the Paris Agreement. The aim of the Paris Agreement, as stated in the Article 2.1(a), is to hold the increase in global average temperature to well below 2°C above pre-industrial levels. The Agreement also aims to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change.

Paris Agreement text extract⁴⁸:

"Article 2

1. This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:

(a) Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change".

This was reaffirmed in December 2023 in the Conference of Parties 28 decision text on the first global stocktake.⁴⁹ The text further recognised that the transition away from fossil fuels in energy systems is to be done in a just, orderly and equitable manner accelerating action in this critical decade, so as to achieve net zero by 2050 in keeping with the science.⁵⁰ It also recognises that transitional fuels can play a role in facilitating the energy transition while ensuring energy security⁵¹.

The Paris Agreement establishes a framework where countries make nationally determined contributions to manage and reduce their own emissions.

Australia has ratified the Paris Agreement and has set a target to reduce emissions by 43% below 2005 levels by 2030 and to reach net-zero emissions by 2050. Australia's emissions projections under a 'with additional measures' scenario is projected to be 43% below 2005 levels by 2030 and to reach net zero emissions by 2050 (Department of Industry, Science, Energy and Resources, 2022).

Woodside considers that a stable energy transition will be one in which energy is affordable and reliable, as well as lower carbon. The Pyrenees Venture FPSO Facility will provide an incremental volume of hydrocarbons to international markets during its estimated remaining field life. Woodside considers that this development is aligned with their goals for supporting the energy transition and is compatible with the Paris Agreement goal to limit global warming to below 2°C.

Woodside's support of customers to reduce their GHG emission through our corporate Scope 3 targets focus on the natural gas value chain as this is an area we believe we have greatest influence with our customers. Additionally, our global hydrogen and ammonia opportunities are intended to bring lower carbon new energy alternatives, which our customers may use to displace oil (e.g. marine fuel).

Through these corporate Scope 3 targets, Woodside is implementing programs at a corporate level to manage indirect emissions associated with customer use of oil from the Pyrenees Facility.

Alongside our corporate scope 3 targets, Woodside also supports initiatives to reduce methane emissions. Woodside is a signatory to several global initiatives which are complementary to our corporate approach to methane emissions management, which include OGMP 2.0 (2024), Oil and Gas Climate Initiative Aiming for Zero Methane Emissions (OGCI Near-Zero) and the Methane Guiding Principles (2022), which are voluntary, international multi-stakeholder partnerships between industry and non-industry organisations. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate cost/sacrifice, GHG emissions from the Pyrenees Facility and indirect emissions sources that Woodside may practicably influence are considered ALARP and acceptable.

Other requirements (includes laws, polices, standards and conventions)

Legislation and other requirements considered relevant for this aspect, and a demonstration of how these requirements are met, are described below.

Requirement	Requirement demonstration
Marine Order 97: Gives effect to Annex VI of MARPOL 73/78	The requirements of Marine Order 97 are incorporated into the key control measures.
National Greenhouse and Energy Reporting Scheme: Annual GHG reporting for facilities	The requirements of NGER scheme are incorporated into the key control measures.
<i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015:</i> Emission intensity for reservoir carbon from new gas fields	The requirements of NGER Safeguard Mechanism are incorporated into the key control measures.
National Pollutant Inventory Reporting: Annual air pollutant reporting	The requirements of annual NPI reporting are incorporated into the key control measures.

⁴³ The net equity Scope 1 and 2 emissions reduction targets are relative to a starting base of 6.32 MtCO₂e which is representative of the gross annual average equity Scope 1 and 2 GHG emissions over 2016-2020. The starting base may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets.

⁴⁴ Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment. Timing refers to financial investment decision, not start-up/operations.

⁴⁵ The customers for these products and services may be the same as the customers of our oil and gas business, directly substituting their energy for new products or directly abating the associated emissions. They may also be customers of the new products and services, without also being customers of oil and gas.

⁴⁶ Includes pre-ready-for-startup spend on new energy products and lower carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 emissions which are managed separately through asset decarbonisation plans.

⁴⁷ Includes binding and non-binding opportunities in the portfolio, subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance.

Acceptability statement: GHG emissions

As per Section 2.7.2 decision type B are acceptable if ALARP, demonstrated using good industry practice and RBA, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion). Indirect GHG emissions associated with the Pyrenees Facility are managed to an acceptable level by meeting (where they exist) legislative requirements, industry codes and standards, applicable company requirements, and industry guidelines, and these have been adopted as key controls.

The adopted controls are considered good oil-field practice/industry best practice and are consistent with Woodside's internal requirements. The potential impacts are considered acceptable if ALARP is demonstrated. As described above, the predicted GHG emissions associated with the Pyrenees Facility are considered de minimis and as such, below the acceptable levels and will not materially or substantially contribute to Australia's net GHG emissions or net global GHG emissions levels.

EPOs, EPSs and MC			
Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
EPO 8 Minimise GHG emissions from vessels through efficient fuel usage and consideration of fuel types utilised. EPO 9 Net FPSO GHG emissions shall achieve GHG reductions under reformed Safeguard Mechanism (inclusive of legislated net zero emissions by 2050).	C 6.1 Vessels compliant with Marine Order 97 (Marine pollution prevention – air pollution) and International Air Pollution Prevention certification.	PS 6.1 Vessels compliant with Marine Orders as applicable to vessel size, type and class.	MC 6.1 Marine verification records.
	C 6.2 NGER Scheme and NPI reporting – estimation of greenhouse gas, energy and criteria pollutants.	PS 6.2 Pyrenees emissions reported annually in accordance with NGER Scheme and NPI.	MC 6.2 NGER Scheme and NPI reporting records.
	C 6.3 Apply for and manage net direct and indirect GHG emissions to within the relevant baseline under the <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</i> .	PS 6.3 Manage net direct and indirect GHG emissions to within the accepted baseline, under the <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</i> .	MC 6.3 Records demonstrate implementation.
	C 6.4 Contracting strategy and evaluation for hire of support vessels includes consideration of vessel emissions parameters and low carbon/alternative fuels.	PS 6.4 Evaluation of tenders for support vessels considers emissions parameters.	MC 6.4 Records demonstrate that emissions were considered in tender evaluations.
	C 6.5 Implement relevant methane management measures at Pyrenees.	PS 6.5 Implement relevant methane management measures, including: - Pyrenees methane inventory developed by 2025 to identify and evaluate methane sources. - Safety-driven leak detection and repair – start-up leaks checks reduce methane emissions. - Operational gas detection fixed and mobile, to identify methane sources. - Annual methane leak survey implemented in 2026 and results included in Pyrenees Venture FPSO inventory. - Routine annual facility methane survey at Pyrenees Venture FPSO commencing in	MC 6.5 Records demonstrate relevant methane management measures are identified, assessed and implemented.

Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
	incomplete combustion waste products and smoke emissions.	PS 6.9.2 Flare ignition system to be functioning.	MC 6.9 Records demonstrate inspection of flare ignition system as per Maintenance Plan.
	C 6.10 Maintain gas compression system to maximise reinjection of excess fuel gas.	PS 6.10 Compression system maintained in accordance with good industry practice.	MC 6.10 Records demonstrate maintenance undertaken in accordance with maintenance plan.
EPO 10 Woodside will support customers to reduce their GHG emissions.	C 7.1 Woodside supports customers ⁵³ to reduce their emissions via the investment in new energy products and lower carbon services, including corporate targets that apply across Woodside's portfolio including the following: Scope 3 Investment Target: ⁵⁴ - Invest \$5 billion in new energy products and lower carbon services (non-LNG) by 2030⁵⁵. Scope 3 Emissions Abatement Target: ⁵⁴ - Take final investment decisions on new energy products and lower carbon services by 2030, with total abatement capacity of 5 Mtpa CO₂e.⁵⁶	PS 7.1 Woodside will progress its Scope 3 investment and emissions targets, aligned with stated timeframes.	MC 7.1 Progress against targets reported in the relevant annual Woodside disclosures to relevant industry standards and/or requirements. This includes an estimate of abated emissions from currently sanctioned projects.

⁵³ The customers for these products and services may be the same as the customers of our oil and gas business, directly substituting their energy for new products or directly abating the associated emissions. They may also be customers of the new products and services, without also being customers of oil and gas.

⁵⁴ Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment. Timing refers to financial investment decision, not start-up/operations.

⁵⁵ Includes pre-RFSU spend on new energy products and lower carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 emissions which are managed separately through asset decarbonisation plans.

⁵⁶ Includes binding and non-binding opportunities in the portfolio, subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance.

	C 7.2 Through its portfolio, Woodside will work with the natural gas value chain to reduce emissions in third party systems (e.g. regasification and distribution).	PS 7.2 Woodside to implement the following: sharing knowledge via Australian industry forums and other companies in the natural gas value chain through: - the adoption and promotion of global methane frameworks such as the Methane Guiding Principles and Oil and Gas Decarbonisation Charter - advocacy for stable policy frameworks that reduce carbon emissions - annual review of the implementation and outcomes of these measures, this includes consideration of current or new industry forums, initiatives and natural gas value chain participants.	M 7.2 Records demonstrate that listed actions have been undertaken and are effective.

6.7.6 Routine and non-routine discharges: produced water

Context														
Pyrenees Facility – Section 3.11 Production processes – Section 3.13				Physical environment – Section 4.4 Habitats and biological communities – Section 4.5				Consultation – Section 5						
Impacts evaluation summary														
Source of impact	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Discharge of PW from the Pyrenees Venture FPSO	-	x	x	-	x	x	-	B	1 – Minor	-	-	LCS GP PJ RBA	Broadly Acceptable	EPO 11

Source of impact

PW is either formation water (derived from a water reservoir below the hydrocarbon formation) or condensed water (water vapour present within gas/condensate that condenses when brought to the surface), or a combination of both. Separation of water from reservoir fluids is not 100% effective and separated PW often contains small amounts of contaminants, including:

- organic compounds: dispersed oil, dissolved aliphatic and aromatic hydrocarbons, organic acids, phenols
- inorganic compounds: soluble salts, metals
- residual process chemicals used during production and treatment.

These contaminants vary depending on reservoir characteristics, production history, and operational processes (Table 6-15).

Table 6-15: Contaminant characterisation and variability

Contaminant	Typical range	Monitoring method
OIW	<30 mg/L under normal operations	Online analyser/manual sampling
Hydrocarbons (BTEX, polycyclic aromatic hydrocarbons (PAHs), total petroleum hydrocarbons (TPH), total recoverable hydrocarbons (TRH))	Low ppm levels, varies with reservoir and process	End-of-pipe chemical and ecotoxicity analysis
Metals	Detectable at low concentrations (near limits of laboratory reporting or guideline values). Low risk non conservative tracers (e.g. barium, strontium) at higher concentrations and able to be traced after dilution. Vary with reservoir	End-of-pipe chemical and ecotoxicity analysis
Organic acids, phenols	Low concentrations, present in formation water	End-of-pipe chemical and ecotoxicity analysis

Process chemicals	Minor, dependent on operational use	Individual chemical assessments End-of-pipe chemical and ecotoxicity analysis
-------------------	-------------------------------------	--

PW is expected to be routinely reinjected although temporary decreases in reinjection capacity may occur, resulting in overboard discharge from the facility to the marine environment. Such discharges may occur during short term upset production conditions (non-routine) or during a once-off contingency period to enable significant repairs to the reinjection system, if required.

Routine, non-routine and contingency PW processing scenarios include:

- Current Routine Operations – Full reinjection of PW with no overboard discharge representing the primary processing scenario for the majority of the facility's operational life.
- Future Routine Operations – As the reservoir matures and water production increases, routine overboard discharge may become necessary. It is expected that the majority of PW will continue to be reinjected (>90%) with a continuous overboard stream of up to 1,589 m³/day discharged overboard from the CFU or DGF.
- Non-routine Overboard Discharge – During upset conditions, up to 9,062 m³/day of PW may be discharged overboard from the DGF and CFU or a temporary treatment skid. Such discharge will be managed to ensure the total annual discharge volume does not exceed 870,456 m³/year (approximately 5,475,000 bbl/year) and will be limited to a maximum of 10 consecutive days per event.
- Contingency Overboard Discharge – The PW reinjection system is scheduled for maintenance and repair, with work currently scheduled for completion by end August 2026. If the system becomes unavailable prior to completion of this scope, routine reinjection may not be possible, and overboard PW discharge of up to 9,062 m³/day may be required. This represents a scenario where production would continue, however at reduced rates as a control to limit volume of PW discharged overboard and associated potential impact. This scenario may last for up to 300 days but upon completion of repairs, the facility would return to routine operations with no/the majority of PW reinjected.

When the facility operates under current routine operations with no PW discharged overboard, no monitoring requirements are triggered.

Historical discharges

A summary of PW production and reinjection since FY11 is presented in Figure 6-2. Historically, approximately 95 to 100% of PW has been reinjected into the reservoir. Annual PW volumes (thousand m³ (km³)) discharged overboard from the PW discharge point and the slops discharge are presented in Figure 6-3.

Figure 6-2: Produced water production and reinjection summary

Historically, PW discharged overboard (including slops water) has been a small proportion of total PW produced, ranging from 0% to approximately 5.5% between 2011 and 2023 (Figure 6-3). Slops water is diverted to the slops

tank for further processing and has generally been reinjected into the reservoir (100% since FY16), with only small volumes discharged overboard prior to 2016 (0% to 3.4%). Slops water is no longer discharged directly overboard but is recycled into the process and treated within the PW system.

Figure 6-3: Summary of produced water and slops water discharged overboard

PW treatment

A description of the existing PW treatment system is provided in Section 3.13.5. The system is designed to remove hydrocarbons and other contaminants to ensure that PW is suitable for reinjection or controlled overboard discharge. OIW concentrations are continuously monitored using online analysers located downstream of the CFU and DGF, providing real-time feedback on treatment performance. If OIW concentrations exceed operational limits, PW is automatically diverted to the slops tanks for additional treatment before it can be reinjected or discharged after additional processing through the PW system. In instances where the online analysers are unavailable, manual sampling is undertaken to verify OIW levels and confirm compliance with operational limits.

Monitoring and management framework

This section describes the framework Woodside has developed to support the management of PW overboard discharges from offshore assets. Further details are provided in Woodside's Offshore Marine Discharge Adaptive Management Plan (OMDAMP), refer Section 7.17. The framework includes:

- operational monitoring of OIW
- monitoring of PW during operations involving overboard discharge.

Monitoring and management will be implemented in accordance with the OMDAMP, which adheres to water and sediment quality monitoring requirements consistent with the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018). Monitoring requirements include chemical assessments (metals, BTEX, PAH, phenols, organic acids, TPH and TRH) and ecotoxicity (whole effluent toxicity (WET)) testing of any overboard discharge. If extended (more than 10 days) contingency overboard discharge is required, a precipitation/sedimentation study will be completed during initial sampling to ensure sediment quality remains within the impact assessment limits.

Operational monitoring of OIW

OIW concentrations are monitored via two online analysers located downstream of the CFU and/or DGF, providing a key measure of operational performance of the PW system. If elevated OIW concentrations are detected, PW is diverted to the slops tanks for further processing. PW is then either reinjected or routed back through the PW system prior to being discharged overboard, provided it meets the OIW discharge limit. If both online OIW analysers are unavailable, manual sampling is undertaken to confirm compliance.

Online analyser data are transmitted to the distributed control system and stored in the process database for analysis and trending. The distributed control system provides control room visibility, enables manual or automated process

adjustments, and/or trigger alarms (e.g. high OIW). Results from manual sampling if online analysers are not available are reported in the daily Pyrenees Facility Production Report and the Enterprise Upstream database.

Operational monitoring of PW

The OMDAMP details monitoring, assessment against guideline values, analytical methods and actions to be taken if a trigger value is exceeded. Monitoring of PW under the OMDAMP includes annual chemical characterisation of end-of-pipe samples, WET testing to assess toxicity every three years or on commencement of contingency overboard discharge, and tracking of overboard discharge volumes to ensure PW contamination remain within modelled parameters and impact assessment limits (Table 6-16).

Trigger values are applied through a risk-based approach using multiple lines of evidence, capturing uncertainty and staging monitoring and management responses according to the degree of risk of environmental impact. Early detection of changes in discharge contaminants, volume or PW toxicity allows timely management before impacts occur. WET testing assesses potential effects on biota, while chemical characterisation identifies the toxicants driving WET results and indicates whether the discharge has changed significantly since the last WET test.

Results of chemical characterisation and WET testing are assessed against trigger values defined in the OMDAMP (refer Table 6-16), and any exceedances are investigated to determine the potential for an impact. If a trigger value has been exceeded, a single species toxicity test is conducted⁵⁷ and operational management actions will be implemented (e.g. reduce discharge volume to ensure dilutions are being achieved at the mixing zone boundary) as appropriate to reduce risk and additional WET testing may be completed, as required. If it is determined that there are potential risks of environmental impact outside the mixing zone, in situ field sampling may be initiated in accordance with the OMDAMP response actions. Monitoring will be conducted in line with the OMDAMP, applying established monitoring guidelines, sampling methods and appropriate scientific standards (e.g. requirement for WET testing) to ensure consistency and comparability of data.

Table 6-16: Monitoring parameter, trigger value and frequency

Monitoring parameter	Trigger value	Frequency
Review of continuous operational monitoring results	Increases in the average monthly OIW concentration by 5 mg/L total over six consecutive months or by 10 mg/L total over two consecutive months.	Monthly
Chemical characterisation: end-of-pipe	Results that are predicted to be higher than the 99% default guideline values (DGV) at the approved mixing zone boundary and are above the results from the earlier toxicity year ¹ .	Annually during future routine or non-routine overboard discharge operations or at initiation of contingency overboard discharge
WET testing	The 99% species protection safe dilutions derived from earlier toxicity year are not predicted to be achieved at boundary of the approved mixing zone.	Three yearly or at initiation of contingency overboard discharge
Discharge volume – future routine operations	Mean discharge volume (m ³ /day) above modelled flow rates used to define approved mixing zone based on earlier toxicity year ¹ .	Daily
Discharge volume – non-routine overboard discharge	Discharge volume (m ³ /day) above modelled flow rates used to define approved mixing zone based on updated toxicity data ¹ . This will not exceed the total annual discharge overboard volume of 870,456 m ³ /year (5,475,000 bbl/year) and for no longer than 10 consecutive days per event.	Daily
Discharge volume – contingency overboard discharge	Mean discharge volume (m ³ /day) is above modelled flow rates used to define approved mixing zone based on updated toxicity data and not to exceed 300 days of discharge.	Daily

¹ 'Earlier toxicity year' means the year in which the most recent WET test occurred.

⁵⁷ Single species testing is conducted in parallel to chemical characterisation to support further investigations (see Section 7.17).

Ecological protection level and triggers

PW dispersion modelling has established a 200 m mixing zone around the discharge point, with 99% of species predicted to be protected at the edge of the zone (RPS, 2018; 2025), as calculated using the ANZG (2018) statistical distribution method applied to direct toxicity assessment results. This ensures that the ecological and conservation values at the edge of the mixing zone are maintained, and that there is no significant environmental impact outside the approved mixing zone.

To assess the potential impact of PW overboard discharges, near field (CORMIX) and far field (CHEMMAP) coupled modelling was conducted. These models predict the distance required to achieve minimum safe dilutions under various discharge rates (RPS, 2018; 2025).

Ecotoxicity data from 2017 were used as model inputs representing the worst-case measured toxicity scenario to date. This data indicates that 139 dilutions are required to achieve the predicted no effect concentration (NOEC) (GHD, 2018). Multiple discharge scenarios were modelled including continuous PW discharge rates (1,589 m³/day, 2,000 m³/day, 5,500 m³/day and 9,062 m³/day) across different seasonal conditions to assess the movement and fate of PW, the influence of seasonal metocean conditions and potential exposure risks to environmental sensitivities.

Each replicate model simulation was conducted to encompass both neap and spring tidal cycle. This simulated duration was sufficient to demonstrate the dispersal of PW reaching equilibrium without further accumulation of contaminants within the simulation. Stochastic modelling results under worst-case contingency overboard discharge rates of 9,062 m³/day show, further, that within two days of discharge, the plume would disperse and residual contaminants would not persist beyond the mixing zone. The minimum dilution at 200 m from the outlet in any season was 239 (Figure 6-4), which is well within the predicted NOEC requirement. This output from the contingency overboard discharge simulations were used to conservatively inform the impact assessment covering all overboard discharge scenarios.

Figure 6-4: Produced water dilution contours at the 9,062 m³/day continuous discharge rate (contingency operations)

Plume tracking and verification of modelled dilutions

Water quality monitoring surveys around the Pyrenees Venture FPSO were conducted annually between 2011 and 2017 and again in 2020 and 2021 resulting in 129 historic water quality samples (Advisian, 2022). The monitoring survey design included fixed distance sites within, at and beyond the mixing zone boundary as well as reference sites. A gradient design was included into some of the sampling campaigns. Field sampling of water quality in 2016 and 2020 also included using rhodamine dye to track the plume to ensure samples were collected in the PW plume (Advisian, 2016; 2020). These surveys found no exceedances of DGVs beyond 50 m from the PW discharge point.

In the 2020 survey, the plume was visually confirmed using rhodamine dye injection and drone footage and found to extend approximately 0.5 km in the direction of the prevailing current from the Pyrenees Venture FPSO. These observations were made under extremely calm conditions with small, long-period swell and light winds (Advisian, 2020). Under these low-energy conditions, although 99% species protection would have been achieved by 200 m (as per modelled predictions) the visual plume depicted by the dye likely represents its worst case maximum potential extent. During period of larger swells and stronger winds, surface mixing would increase, resulting in a smaller plume. Dilution performance was further assessed in 2020 using multivariate statistics on conductivity, temperature, depth profiles and toxicant concentrations and found no significant relationships with conservative tracers (i.e. salinity) and non-conservative tracers (i.e. barium and strontium) outside of 50 m from the discharge point. The statistical analysis of water quality showed no evidence of a gradient effect with distance from the discharge point. Barium and strontium concentrations at the end-of-pipe were sufficiently high to remain detectable in water samples even at dilutions up to 2,300 (Advisian, 2020), yet no spatial trend was observed and concentrations in water samples were near background levels within 50 m. This confirms that PW dispersion modelling is conservative and supports the approved mixing zone delineation, which predicts a minimum of 153 dilutions at 50 m during 1,589 m³/day of overboard discharge during future routine operations. Based on the conservative assumptions applied in the dispersion modelling, it is reasonable to also conclude that the predicted dilution factor of approximately 1:239 at a discharge rate of 9,062 m³/day would be achieved at 200 m under all seasonal metocean conditions.

Water temperature

Near-field modelling indicates that the 3°C temperature increase above ambient marine water from PW and cooling water discharge is confined to within 4 m of the discharge location (RPS, 2025). Thermal impacts on marine biota are not expected beyond this immediate area.

Impact assessment

PW discharges have the potential to influence local marine environments due to residual hydrocarbons, process chemicals, and naturally occurring particulates. These effects are typically confined to the vicinity of the discharge due to rapid subsurface dilution and the buoyant nature of the PW plume, which initially plunges below the surface and then rises toward the water column.

Potential environmental impacts from PW overboard discharge include:

- changes to water and sediment quality
- toxicity effects on biota, including species listed under the EPBC Act
- changes to the values of relevant KEFs, namely the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula, and the Continental Slope Demersal Fish Communities.

To understand these potential impacts, Woodside has conducted a comprehensive historical program of in-situ sampling and testing across its offshore production facilities. Data from Pyrenees-specific surveys, combined with this cumulative knowledge, provide a robust foundation for evaluating environmental outcomes associated with PW discharges.

Impacts from PW overboard discharge have been assessed based on a worst-case scenario of 9,062 m³/day continuous discharge, representing the maximum potential impact from a contingency discharge during system repair. Routine and lower-volume non-routine discharges (1,589 m³/day continuous or 9,062 m³/day for a 10-day period) would result in proportionally lower impacts but are assessed conservatively using the worst-case scenario to ensure environmental protection.

Potential Impacts to Water Quality

Potential impacts to water quality from PW have been assessed through chemical characterisation, ecotoxicity testing, and dispersion modelling of discharge volumes. A review of historical monitoring at the Pyrenees Venture FPSO indicates the approved mixing zone has not been exceeded and provides high confidence that impacts from PW discharge are highly localised and pose negligible effects to environmental receptors (Advisian, 2022).

Chemical characterisation of PW

End-of-pipe chemical analyses conducted annually since 2011 (except during FPSO downtime in 2018 to 2019 and 2022 to 2024) indicate that most analytes are below guideline values or at low concentrations, achieving the 99% species protection guideline value well within the approved 200 m mixing zone.

Since 2013, nitrogen, copper, and zinc have occasionally exceeded the ANZG (2018) 99% DGVs at end-of-pipe concentrations. These exceedances were minor, requiring minimal dilution to meet the 99% species protection level. Elevated copper concentrations have been observed at some in-situ monitoring sites, including reference sites, during historic Pyrenees surveys and at other Woodside assets. These measurements are not attributed to end-of-pipe PW concentrations or active discharges.

In situ water quality

Annual surface water monitoring of the receiving environment has been conducted since 2011, measuring metals, metalloids, hydrocarbons (TPH, BTEX, PAH), nutrients and NORMs. Since 2016, monitoring coincides with end-of-pipe characterisations.

Results confirm that the 99% dilution is achieved at or before the mixing zone boundary, consistent with conservative dispersion modelling. Concentrations of TPH, TRH, BTEX, PAH, phenol and NORMs were below limits of reporting at all sites. Metals were below 99% DGVs, except for occasional minor copper exceedances including at reference sites, consistent with historical patterns and demonstrating negligible environmental risk.

Residual process chemicals

Residual process chemicals in PW may include scale inhibitors, biocides, corrosion inhibitors, and other production chemicals. Dosages are determined according to production requirements and are monitored in line with the Pyrenees Chemical Application Manual. Ecotoxicity risks are assessed through individual chemical risk assessments and WET testing, which consistently demonstrates that concentrations of residual chemicals do not pose measurable toxicity to local marine organisms.

Naturally occurring radioactive materials

PW may contain low levels of radionuclides, including uranium-238 and thorium-232 decay chains, as well as longer-lived isotopes such as lead-210, polonium-210, radium-226 (Ra-226), and radium-228 (Ra-228) (Coleman & West, 2000). These radionuclides preferentially adsorb to suspended particles and fine sediments, ultimately settling in low-energy seabed areas where they are isolated from the biosphere (Valeur & Peterson, 2013).

Measurements of Ra-226 and Ra-228 in Pyrenees PW range from below detection to approximately 6 Bq/L, which is below the average concentration of natural radioactivity in surface seawater (~13.6 Bq/L from K-40) (Walker & Rose, 1990). Field water quality surveys confirm that NORMs concentrations are below detection limits in the receiving environment, indicating negligible radiological risk to marine biota (Advisian, 2017; 2020; 2021).

Impact summary

The assessment of impacts is underpinned by the primary disposal mechanism for all/the majority of PW generated from the activity being re-injection and therefore avoiding or significantly reducing overboard discharge and any associated impact.

In overboard discharge scenarios, the potential impact of PW discharges on water quality is expected to be Minor due to:

- low anticipated routine discharge volumes
- controlled short duration (both in the context of field life and duration of the EP) of non-routine or contingency discharges
- conservative worst-case dispersion modelling demonstrating localised impact zone
- historical in-situ verification being appropriate and suitable based on level of risk, and demonstrating rapid dilution.
- additional PW plume field verification to be performed during contingency overboard discharge should it be required.

Any effects are temporary and confined to the immediate mixing zone, with no measurable impact on environmental receptors beyond this area.

Potential impacts to biota

Water depths in the Operational Area range from approximately 190 m to 215 m. The fauna present is predominantly pelagic species of fish, with migratory species such as turtles, birds, whale sharks and cetaceans as well as seabirds present in the area seasonally. These fauna species may include those associated with Traditional Custodians values.

A number of EPBC-listed marine species have BIAs which overlap the Operational Area, including:

- humpback whale migration BIA
- interinteresting buffer BIAs for flatback, green and loggerhead turtle
- whale shark foraging BIA.
- wedge-tailed shearwater breeding BIA.

In addition, habitat critical to the survival of the flatback turtle overlaps the Operational Area.

Two KEFs also intersect the Operational Area:

- Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula
- Continental Slope Demersal Fish Communities overlap.

Fauna associated with these KEFs, such as demersal fish, may be exposed to PW overboard discharges.

PW characteristics and toxicity

Most treated PW has low to moderate toxicity (Neff et al., 2011), with actual toxicity dependent on its chemical constituents and any added process chemicals, the level of treatment and dilution with condensed water prior to release, and the dilution achieved as the discharge mixes with seawater. Hydrocarbons in PW are considered non-specific narcotic toxins with additive toxicities; therefore, toxicity largely depends on the total concentration and range of bioavailable hydrocarbons (Neff, 2002).

Potential impacts of PW to biota have been assessed through WET testing and dispersion modelling to verify required dilutions are being achieved within the approved mixing zone.

WET testing

WET testing accounts for interactions between toxicants and effects that cannot be readily measured. Eight toxicity tests are conducted on a PW sample using taxa of ecological relevance which are primarily tropical Australian marine species (Warne et al., 2025). Tests are selected based on ecological relevance, sensitivity to contaminants, robust protocols and reproducibility. Safe dilution factors to achieve predicted no effect concentration were determined from WET tests conducted in 2017 and 2021 (Table 6-17). WET testing has not occurred since 2021 due to reinjection but will be completed if overboard discharge resumes.

Table 6-17: Guideline values and required dilutions to achieve 99% and 95% species protection

Species protection level	Guideline value and safe dilutions to achieve predicted no effect concentration	
Year	2017	2021
99%	0.72 (1:139)	1.90 (1:53)
95%	1.8 (1:56)	3.00 (1:34)

A 'moderate' reliability DGV for a 99% species protection level was calculated as 0.72% PW in ambient seawater on a volume basis from the species sensitivity distribution method, which is equivalent to a safe dilution factor of 1:139 to achieve the predicted no effect concentration. These results were confirmed again in 2021 by full suite WET testing which resulted in a guideline value of 1.90% PW with a corresponding safe dilution factor of 1:53. The DGV safe dilutions (139) for a 99% species protection level from the 2017 sample is considered to be representative of the facility's PW.

Dispersion modelling showed that at least 153 dilutions would be achieved at 50 m and approximately 284 dilutions at 200 m from the discharge point during future routine operations discharge volume of 1,589 m³/day. Under the contingency discharge of 9,062 m³/day, modelling predicts 239 dilutions at 200 m, ensuring that adequate plume dispersion and mixing occur within the approved mixing zone boundary. WET testing will be completed upon initiation of overboard discharge and then every three years if overboard discharge is occurring to verify the toxicity profile of the PW.

Bioaccumulation

Bioaccumulation refers to the uptake of substances through water, diet, or direct contact. PW may contain BTEX, metals, NORMs, PAH and phenols, which could potentially bioaccumulate in biota.

The most comprehensive field study assessing bioaccumulation of hydrocarbons and metals from PW discharged into offshore waters was undertaken by Neff et al. (2011). At the request of the US Environmental Protection Agency (US EPA), the Gulf of Mexico Offshore Operators Committee sponsored a large-scale investigation into the bioconcentration of PW constituents in marine invertebrates and fish around several offshore production facilities discharging more than 731 m³/d of PW to outer continental shelf waters. The study targeted five metals (As, Cd, Hg, Ra-226 and Ra-228); three volatile monocyclic aromatic hydrocarbons (benzene, toluene, and ethylbenzene), and four semi-volatile organic chemicals (phenol, fluorene, benzo(a)pyrene, and di(2-ethylhexyl)phthalate). Additional analytes including xylenes and a comprehensive suite of 40 parent and alkylated PAHs and dibenzothiophenes, were also analysed in PW, ambient water and tissues.

Neff et al. (2011) found that concentrations of monocyclic aromatic hydrocarbons, PAH and phenol were several orders of magnitude higher in PW than in ambient seawater. There was no evidence, however, that these compounds were bioconcentrated in marine organisms. They were either undetected (>95% of tissue samples) or present only at trace levels in invertebrate and fish tissue. Slight, but statistically significant, increases in certain petrogenic PAHs' (e.g. alkyl naphthalenes, alkyl dibenzothiophenes) were observed, in some bivalve molluscs near discharging facilities, though not in fish. Concentrations remained well below levels that could cause harm to marine fauna or pose risks to humans consuming seafood collected near offshore facilities.

End-of-pipe PW samples from the Pyrenees Venture FPSO indicate that PAH concentrations are below laboratory reporting limits, and BTEX concentrations are very low (Advisian, 2020; 2021). While laboratory studies (Berry 1980) demonstrate that BTEX can bioaccumulate under extremely high, artificial exposure concentrations, such conditions do not occur around the FPSO. Field-based water quality sampling around the Pyrenees Venture FPSO confirms that BTEX, PAH, NORMs, phenols, and bioaccumulating metals (As, Cd, Hg) are below analytical detection limits in all receiving water samples (Advisian, 2022).

In the marine environment, mercury is typically present as complexes of mercury (II) or as organomercurials (Hart, 1982). Bacterial methylation can transform inorganic mercury into more bioavailable and toxic forms (e.g. methylmercury), although Neff et al. (2011) found no differences in metal concentrations (As, Ba, Cd, Hg) between molluscs and fish collected near discharging and non-discharging platforms in the Gulf of Mexico. This finding suggests that potential impacts from metals are limited to the immediate vicinity of discharge points and are unlikely to affect mobile species. Mercury has never been detected above laboratory reporting limits at the Pyrenees Venture FPSO; therefore, impacts from this pathway are not expected.

The potential for environmental impacts associated with bioaccumulation of PW constituents is very low. Any effects would be localised to individual organisms in close proximity to the FPSO and would not affect populations of protected or commercially significant species. The risk to fisheries is further reduced to ALARP by the PSZ, which prohibits fishing activities near the FPSO. Given the low contaminant concentrations, rapid plume dilution, and conservative dispersion modelling results, the potential for bioaccumulation is assessed as Minor, and restricted primarily to sessile organisms growing on the hull or adjacent structures.

Potential impacts to EPBC listed species

There are 26 listed threatened species and 40 listed migratory species which may occur within the project area, including whales, whale sharks, sharks, rays, dolphins, sea snakes, turtles and seabirds (Appendix C). Key threats identified in species recovery plans and threat abatement assessment are outlined in Section 6.9.

Cetaceans

The humpback whale migration BIA overlaps the FPSO. Short-term exposure may occur for individuals during transit through the Operational Area in the vicinity of the FPSO.

During PW overboard discharge, marine mammals, including humpback whales, may be exposed to elevated contaminant concentrations primarily through contact with the water column while transiting the Operational Area. Humpback whales undertake seasonal migrations that overlap with the Operational Area, creating the potential for short-term exposure to PW potentially discharged.

Direct exposure may occur through ingestion of water or prey containing contaminants, while indirect effects could arise from temporary changes in prey availability or water quality within the mixing zone. Modelling, however, indicates that contaminant concentrations decline rapidly beyond the immediate discharge area and remain below ANZG (2018) guideline values, and the exposure risk is further reduced by management of the contingency overboard discharge under the OMDAMP and the return to routine reinjection operations once repairs are completed.

Marine turtles

The internesting buffer for the green and loggerhead turtles are more than 3 km from the FPSO and, at this distance, are unlikely to be affected by PW contaminants. The internesting buffer BIA and habitat critical to the survival of the flatback turtle, however, overlap the FPSO.

The shortest distance from the FPSO to the nearest nesting site (the Muiron Islands) is approximately 26 km, and the water depth at the facility is around 200 m. While these sensitive areas for the flatback turtle extend offshore, they primarily encompass foraging and internesting ranges of turtles that use adjacent coastal and island nesting beaches. The deep offshore environment of the Operational Area does not provide suitable nesting or benthic foraging habitat (i.e. no emergent islands, reefs, or shallow shoals), and therefore only low numbers of transient turtles are expected to occur near the facility.

The Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017) identifies chemical discharges as a potential threat to turtles. However, any exposure of transient individuals to PW discharge would be limited to brief, surface contact within the approved 200 m mixing zone. Modelling indicates that contaminant concentrations rapidly dilute below ANZG (2018) guideline values at this boundary. Consequently, potential for acute or chronic toxicity is negligible, and contact durations are expected to be very short given turtle movement behaviour.

Although the outer extent of flatback turtle habitat critical to survival overlaps the FPSO, turtles are unlikely to utilise this deepwater area during nesting or internesting phases, which are typically associated with shallow coastal waters around Barrow Island and the adjacent mainland (Chevron Australia, 2015; Whittock et al., 2014). Therefore, potential exposure of turtles is expected to be infrequent and transient.

Overall, any interaction between PW discharge and marine turtles is predicted to result in no measurable impact at the individual or population level. The activity will be managed under the OMDAMP to ensure ongoing compliance with water quality criteria and maintenance of ecological values within and beyond the mixing zone.

Whale shark

The Pyrenees Venture FPSO is located within the known seasonal (July to November) foraging area (BIA) for the whale shark.

Whale sharks typically migrate through the area during March to July and tend to travel as single individuals. As filter feeders, whale sharks primarily consume plankton. Therefore, there is a low probability of incidental feeding within highly diluted PW. Although the plume associated with PW discharge is confined to surface waters, whale sharks in oceanic environments exhibit frequent deep-diving behaviour (Bignell et al., 2025), reducing the likelihood of sustained contact with surface discharges.

Modelling indicates that PW concentrations reach steady-state within two days of continuous discharge, after which plume size and contaminant levels remain stable and limited to within approximately 200 m of the facility. At this approved mixing zone boundary, PW quality will meet 99% species protection criteria consistent with ANZG (2018) guidelines. Given the dispersive open-water environment, rapid dilution, and transient nature of whale sharks and other megafauna (including cetaceans, rays, and marine turtles), potential exposure durations are expected to be brief, and contaminant concentrations are well below levels that could cause acute or sub-lethal effects.

While the extended duration of contingency overboard discharge could increase the number of individuals who momentarily come into contact with the plume while transiting through the area, no measurable impact to individuals or populations is expected due to short contact times and low contaminant concentrations. Fish communities and

other fauna associated with the facility may experience minor, intermittent changes in local water quality as plume vectors shift, but effects are predicted to be localized and non-persistent. Overall, the activity is assessed as having no lasting or ecologically significant impact on whale sharks or other transient marine fauna, with discharges managed under the OMDAMP to ensure compliance with relevant environmental performance standards.

Fish

During PW overboard discharge, fish in the Operational Area may be exposed to elevated contaminant concentrations through both direct and indirect pathways. Direct exposure occurs when fish swim through the discharge mixing zone, resulting in uptake of contaminants across the gills or ingestion during normal feeding, and when benthic or demersal species come into contact with contaminants settling on the seafloor.

Indirect exposure may occur via dietary uptake of contaminated prey (e.g. zooplankton or benthic invertebrates) or through temporary alterations to habitat quality, including changes in water chemistry or prey availability. Although a contingency overboard discharge may persist for up to 300 days, predicted contaminant concentrations rapidly dilute beyond the mixing zone and remain below ANZG (2018) guideline values, limiting potential sub-lethal or population-level effects. Exposure is further mitigated through management of the discharge under the OMDAMP and a return to routine reinjection once repairs are complete.

Seabirds

The FPSO is located within the breeding BIA for the Wedge-tailed shearwater, which supports colonies on nearby islands and associated offshore foraging habitat. Adult shearwaters forage widely over open waters, often tens of kilometres from nesting colonies, and may occasionally occur near the FPSO. During overboard discharge of PW, potential exposure of foraging birds to PW contaminants would be limited to short-term contact with surface waters in the immediate vicinity of the discharge. Modelling indicates that PW rapidly dilutes below ANZG (2018) guideline values within a short distance of the FPSO, and surface sheens are not expected under managed discharge conditions. Consequently, the likelihood of direct exposure through surface contact or ingestion is low.

Indirect exposure through consumption of contaminated prey is also unlikely, as contaminant concentrations in the water column and biota are predicted to remain below levels that could cause sub-lethal or population-level effects. No disturbance to nesting or breeding behaviour is expected given the distance of colonies from the discharge point and the absence of light, noise, or physical presence impacts associated with the activity. Overall, PW overboard discharges within the Wedge-tailed Shearwater breeding BIA is predicted to have negligible impact on individual birds or the breeding population, with discharge quality and environmental performance managed under the OMDAMP consistent with ANZG (2018) guidelines.

Plankton

A change in water quality as a result of comingled PW and cooling water discharges has the potential to result in the injury or death of planktonic species within the water column through toxicity effects. Early life stages of fish (embryos, larvae) and other plankton would be the most susceptible organisms to exposure from hydrocarbons and chemicals in the discharges, as they have limited mobility and are therefore likely to be exposed to the plume, if present. Modelling indicates that any toxicity effects would be confined to within approximately 200 m of the discharge location, with concentrations rapidly diluting below ANZG (2018) guideline values beyond this distance. Given the naturally high mortality rates and rapid turnover of planktonic species (UNEP, 1985), as well as the abundance and continuous replenishment of plankton through reproduction and advection from surrounding waters (Volkman et al., 2004), population-level effects are not expected. The predicted spatial extent of potential impacts is small relative to the regional distribution of plankton, and any localised effects would be short-lived. The discharge will be managed under the OMDAMP to verify that water quality remains within acceptable limits. Therefore, the overall impact on plankton and early life stages of fish is predicted to be negligible.

Potential impacts to KEFs and AMPs

Values and sensitivities of the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula (overlaps the FPSO) and Continental Slope Demersal Fish Communities KEFs (more than 4 km from the FPSO) are described in Section 4.7.

These features represent important benthic and demersal habitats that support diverse fish assemblages and ecological processes. During PW discharging, potential impacts to these KEFs could occur through the deposition of fine particulates from the discharge plume or exposure of pelagic and demersal biota to dissolved contaminants within the water column. Modelling predicts that any increase in contaminant concentration or particulate deposition will be confined to within approximately 200 m of the discharge point, with rapid dilution below ANZG (2018) guideline values beyond this zone. Given the localized nature of the discharge, the natural variability of sediment and water quality at this depth, and the mobility of demersal species, measurable or long-term impacts on the structure or function of these KEFs are not expected. Sediment quality considerations are discussed further below.

No Australian or State Marine Parks occur within the 200 m approved mixing zone. The nearest protected areas from the Operational Area are the Gascoyne Marine Park (7.7 km) and the Ningaloo Marine Park and World Heritage Area (8.6 km). As these parks are well beyond the mixing zone, no impacts to their ecological or conservation values are expected, and they are therefore not considered further.

Impact summary

Overall, PW overboard discharge, managed under the OMDAMP and within the approved mixing zone, is predicted to have negligible to minor environmental impacts. Effects are localised, temporary, and below guideline values, with no

expected population-level or long-term ecological consequences for EPBC-listed species, KEFs, or nearest marine parks.

Potential impacts to sediment quality

The accumulation of PW contaminants in sediments is primarily influenced by the volume and concentration of particulates in discharged PW, the tendency of constituents to adsorb onto suspended matter and settle, the area of potential deposition (controlled by current speeds and water depths), and subsequent processes such as resuspension, bioturbation, and microbial degradation in the water column and on the seabed.

Contaminants in PW may be introduced into sediments through the precipitation of soluble contaminants and the flocculation and sedimentation of particulate matter within the discharge plume. Studies at Woodside facilities indicate that PW contains very small amounts of solid material, with limited potential for settling or flocculation due to small particle sizes (Jacobs 2016). Based on oceanographic analysis and settling rate calculations, particles sized 1 to 5 µm are unlikely to permanently settle, while particles sized 5 to 40 µm would only settle in very deep water (>5,000 m) or under very weak hydrodynamic conditions (SKM, 2013). Samples of processed PW will be collected to assess particle size distributions and potential sedimentation near the Pyrenees Venture FPSO if discharge occurs.

Sediment quality surveys were completed in 2015 and 2021 at both reference sites and within the mixing zone (Advisian, 2015; 2021). In 2015, all metals were below Australian and New Zealand Environment Conservation Council/Agriculture and Resource Management Council of Australia and New Zealand (2000) trigger levels, and concentrations of hydrocarbons (BTEX, TPH, PAHs) and phenols were below laboratory limits of reporting or relevant guideline values. In 2021, concentrations of BTEX, TPH, PAH, and phenols were all below limits of reporting, and metal concentrations were below ANZG (2018) DGVs. No impacts to sediment quality were identified in either survey.

The buoyant nature of the PW plume, with lower salinity (30.7 psu) and higher temperature (~55°C) than ambient seawater, confines potential toxicity effects to near-surface waters. Chronic toxicity assessments and dispersion modelling indicate that any effects within the mixing zone are highly localised, with negligible risk to sediment quality.

Impact summary

Considering the low particulate load of PW, rapid near-field dilution, relatively deep and well-mixed receiving waters (~200 m depth; median current 0.2 to 0.3 m/s), and consistent monitoring results, the potential effect of PW overboard discharge on sediment quality is assessed as Minor. Sediment surveys in 2015 and 2021 found no differences between reference and impact sites attributable to PW discharges, reinforcing the conclusion that any effects are temporary, localised, and unlikely to result in long-term sediment degradation.

Demonstration of ALARP

Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
None identified.				
Good practice				
Chemicals will be selected with the lowest practicable environmental impacts and risks subject to technical constraints.	F: Yes. Routinely implemented to the chemical selection process for Woodside facilities. CS: Minimal cost. Standard practice.	Selection and assessment of chemicals in accordance with the process, reduces environmental impacts associated with residual chemicals in PW discharge.	Benefits outweigh cost/sacrifice.	Yes C 8.1
Manage OIW concentrations to a threshold lower than the 30mg/l adopted control C 8.2.	F: Not feasible with existing PW treatment system. CS: Design and implementation costs including retrofitting of existing equipment or additional treatment equipment installed	Minimal additional benefit, as re-injection is the primary management measure and overboard discharge scenarios are limited in duration and/or volume. Dispersal modelling shows the 200 m mixing zone remains protective of 99% of species and the discharge	Disproportionate given the limited incremental risk reduction relative to operational complexity and the normally low volume of overboard discharge during routine and non-routine operations.	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
	to suitable design specification. Additional equipment (CFU) has been installed to maximise potential reduction of OIW concentrations, but performance is unknown as it has not been operated and does not guarantee a reduction.	point is more than 13 km from the Ningaloo World Heritage Area.		
Monitor and manage OIW concentrations limiting average PW OIW to less than 30 mg/L (over a rolling 24-hour period).	F: Yes. CS: Monitoring and implementation costs. Standard practice. The 30 mg/L limit proposed is a legacy of the former OPGGS Environment Regulations 29 and 29A repealed in 2014. Averaging over a 24-hour rolling period allows for short-term variability while ensuring sustained compliance.	Maintains discharge quality while ensuring average conditions are representative of real exposure potential. Effectively controls risk at the point of discharge.	Benefits outweigh cost/sacrifice. The facility can continue to operate efficiently while maintaining environmental protection. Allows adaptive management during transient conditions (e.g. start-ups or well slugs) without unnecessary production interruptions.	Yes C 8.2
Implement monitoring and management framework for PW discharges, including: • monitoring of PW discharge volume • chemical characterisation (including BTEX, PAHs, organic acids, metals) • WET testing timing of triennial sampling to be representative aiming to detect change • sedimentation and precipitation study.	F: Yes. CS: Monitoring costs. Standard practice.	The OMDAMP provides for detection of significant changes to the PW discharge characteristics (i.e. volumes, OIW concentration, chemical characterisation) that may cause an increased impact or risk to the marine environment. Monitoring is designed to detect if 99% species protection is achieved at the approved mixing zone boundary. Through the implementation of the OMDAMP, potential risks to the environment are reduced.	Woodside has developed the OMDAMP based on operational experience from relevant offshore assets. The OMDAMP considers risk-based adaptive management measures.	Yes C 8.3

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Online monitoring and/or procedural controls in place to monitor and control PW OIW concentrations and prevent discharge of PW with high OIW concentrations. Process performance monitored by OIW analyser. Conduct manual sampling on a six-hourly basis if online analyser is unavailable, where safe and practicable to do so.	F: Yes. CS: Minimal cost. Standard practice.	The OIW analyser provides optimal process control and safeguarding to monitor, control and prevent discharge of PW with high OIW concentration to the environment. High OIW PW is inboarded for further separation then a second OIW analyser is installed to monitor, control and prevent discharge of PW with high OIW concentration to the environment. Manual monitoring of OIW concentrations when online analyser unavailable when safe and practicable to do so.	Control is Procedural requirement – must be adopted	Yes C 8.4
Professional judgement – Eliminate				
Reinjection of PW into reservoirs.	F: Yes. CS: Maintenance and implementation costs.	Reinjection results in no impact. Target >90% reinjection over the life of the facility reduces impact in over boarding scenarios.	Benefits outweigh cost/sacrifice.	Yes C 8.7
Cease production to avoid overboard discharge of PW if reinjection is not available.	F: Possible. CS: Ceasing production to avoid overboard discharge of PW during periods when reinjection is unavailable would result in a complete shutdown of the Pyrenees Venture FPSO's oil production operations. This would lead to significant loss of production revenue, potentially in the order of several million dollars per day, depending on prevailing oil prices and production rates.	Ceasing production results in no environmental impact from PW discharge.	Cost/sacrifice outweighs benefits because potential impacts from overboard discharge can be managed to ALARP and an acceptable level if production is reduced to limit PW overboard discharge. Given the negligible incremental environmental benefit compared to the existing controlled and monitored discharge regime, the level of economic and operational sacrifice is considered grossly disproportionate to the additional risk reduction achieved.	No
Avoid reinjection system repair to prevent potential	F: Technically feasible but results in ongoing system degradation.	Avoids short-term contingency overboard discharge but increases likelihood of significant	Not proportionate. Short-term avoidance of contingency overboard discharges	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
	environmental monitoring program, such as vessel activities, logistics, manual labour, analytical laboratory and service provider costs.	good application of the hierarchy of controls and results in disproportionate sacrifice with regard to execution risks and costs for limited gain.	outlined in the OMDAMP as effective controls do not require routine monitoring of water and sediment. If initial PW monitoring indicates an increased risk to sediment quality that is likely to be detectable by <i>in situ</i> monitoring (elevated contaminant loads, increased particles size) non-routine monitoring may be undertaken. PW separation process design, optimisation, monitoring and surveillance offer the primary controls, with discharge OIW analysis in place to detect performance variations. Further, Woodside maintains a routine OIW monitoring program for the PW stream (including adaptive management via the OMDAMP, which assesses the need for in-situ monitoring). The initial monitoring and increased frequency of end of pipe sampling are proposed to verify assumptions and demonstrate compliance at end of pipe. If triggers are not met end of pipe non-routine in-situ monitoring would be considered. The work undertaken to date provides Woodside with a sound understanding of the nature and scale of the environmental impacts from PW discharge, which would not be further improved by increasing the frequency of routine in-situ monitoring. The execution risks and cost of implementing

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
			this control is grossly disproportionate to the environmental benefit.	
On an annual basis, review PW routine or contingency monitoring results and determine if non routine sediment quality monitoring should be undertaken as per OMDAMP.	F: Yes. CS: Monitoring and implementation costs. Standard practice.	Reviewing the monitoring results to determine if additional monitoring is required does not reduce environmental impact but does provide assurance impact is being appropriately defined.	Additional monitoring on a risk-based basis is proportional to the additional cost of implementation and part of the OMDAMP.	Yes C 8.8
In-situ plume measurement and analysis of plume dilution and mixing characteristics, including water quality monitoring at approved mixing zone boundary to inform an updated impact assessment.	F: Yes, once a contingency overboard discharge is confirmed as required, a plume verification survey will be commissioned and completed as soon as practicable following initiation of contingency overboard discharge.. CS: Monitoring and implementation costs. Incrementally increases vessel activities within the 500 m PSZ adjacent to the facility with applicable SIMOPS management requirements.	In-situ plume studies validate the predicted mixing zone and dilution performance in the modelling. This provides assurance that model outputs remain reliable for understanding PW dilution. Incorporation of measured WET testing results, chemical characterisation data, verified model dilutions, and water quality monitoring at the approved mixing zone boundary confirms that the EPO has been met.	Additional cost is proportionate to the environmental benefit gained from validating the conservative assumptions used in the impact assessment.	Yes C 8.9

Demonstration of ALARP
Risk-based analysis
Application of Woodside's Risk Management Procedures and implementation of the adaptive management framework provides for assessment of potential PW impacts, identification of changes to discharges, systematic assessment of risks and ongoing assessment/monitoring of discharge streams to reduce risk to ALARP, which includes: - ongoing hazard identification, risk assessment and the identification of control measures - ongoing PW discharge monitoring.
Company values
Corporate values require all personnel at Woodside to comply with appropriate policies, standards, procedures and processes while being accountable for their actions and holding others to account in line with the Woodside Values. As detailed above, the Petroleum Activity will be undertaken in line with these policies, standards and procedures, which include suitable controls to manage PW discharge.

Societal values

Due to the Petroleum Activity's proximity to sensitive receptors and potential uncertainty around PW discharges, the PW discharge consequence rating presents a Decision Type B in accordance with the decision support framework described in Section 2.6.1. Consultation was undertaken for this program to identify the views and concerns of relevant persons, as described in Section 5.

Woodside has sent a Consultation Information Sheet to all identified relevant stakeholders regarding the Petroleum Activity (Section 5), no specific concerns around PW discharge were identified through this process.

ALARP statement

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of PW discharge. Woodside has completed additional PW treatment studies, treatment trials, upgrades to PW system vessel internals, potential use of a temporary OIW skid, OIW and discharge volume monitoring, and risk-based analysis (PW discharge modelling) to inform the evaluation and assessment of environmental impacts and risks. Woodside also implements a risk-based adaptive management framework, which includes annual end-of-pipe monitoring. The outcomes of both the modelling studies and long-term monitoring have been considered in determining the ALARP position. Historic in-situ water quality and sediment sampling has demonstrated no impact outside of the approved mixing zone. An in-situ plume verification study will be conducted if contingency overboard discharge is confirmed as required.

As no reasonable additional/alternative controls are currently identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts are considered ALARP.

Demonstration of acceptability

To assess and determine the acceptable limits of impacts from PW discharges, Woodside has considered appropriate guidelines, principles of ESD, company values and societal values.

Other requirements (includes laws, policies, standards and conventions)

The adopted controls and acceptability assessment has considered regulatory guidance, in particular the ANZG (2018) guidelines and WA EPA (2016) Technical Guidance: Protecting the Quality of Western Australia's Marine Environment. Both sources of regulatory guidance state that environmental values should be identified, and levels of ecological protection should then be set. To ensure ecosystem health is maintained overall, the cumulative size of the areas where lower levels of ecological protection apply should be proportionally small compared to the areas designated high and maximum.

The Monitoring and Management Framework aligns to the levels of protection described by both WA EPA (2016) and the ANZG (2018) guidelines through the acceptable limits of change. The level of ecological protection provided to sensitive receptors is consistent with the North-west Network Management Plan (2018). By monitoring and managing to the 99% species protection safe dilutions at boundary of the approved mixing zone at 200 m from the discharge point, there can be high confidence that potential impacts are managed via the OMDAMP.

The Minamata Convention 2013 (ratified by Australia in 2021) requires measures to be in place to control releases containing mercury or mercury compounds. Each of these measures, with information on how each measure is met for discharges of PW from the facility is provided below:

- *Release limit values to control, and where feasible, reduce releases.* Guideline values related to mercury are in place and described above.
- *The use of best available techniques and best environmental practices to control releases.* Monitoring via the annual chemical characterisation at end-of-pipe and OMDAMP provides adaptive management to ensure best environmental practices.
- *A multi-pollutant control strategy for mercury releases.* The monitoring framework implemented includes full chemical characterisation and WET testing at end-of-pipe, which allows understanding of holistic toxicity of the effluent considering all contaminants.

Species recovery plans, approved conservation advice and threat abatement plans

Woodside has considered information contained in recovery plans, approved conservation advice and threat abatement plans published by DCCEEW. This includes the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017). The overarching objective of the Recovery Plan for Marine Turtles in Australia is to reduce detrimental impacts on Australian populations of marine turtles and hence promote their recovery in the wild. Three species of turtle have BIAs that intercept the Operational Area. The FPSO is within the flatback turtle BIA and the habitat critical to the survival of the species. The Recovery Plan identifies chemical discharge as a relevant threat to marine turtles and lists the following relevant priority action: 'Manage anthropogenic activities to ensure marine turtles are not displaced from identified habitat critical to the survival.'

With controls in place, Woodside considers the potential impacts and risk to marine turtles from changes in water quality from PW discharges are low and consistent with the Recovery Plan for Marine Turtles.

Principles of ecologically sustainable development

Woodside has established several research projects to understand the marine environments in which we operate, notably in the Exmouth region and the Kimberley region, including Rankin Bank, Glomar Shoal, Enfield Canyon and Scott Reef. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions. These principles of ESD were considered for this aspect:

- Integration Principle:
 - The existing environment (Section 4) has been described consistent with the definition within Regulation 5 of the Environment Regulations (i.e. includes ecological, socioeconomic, and cultural features), and any relevant values and sensitivities have been included within this impact analysis; therefore, the impact assessment process inherently includes economic, environmental and social considerations.
 - Feedback, objections and claims from relevant persons were considered, see Appendix F.
- Precautionary Principle:
 - The impact consequence rating for this aspect is Minor, therefore, potential for serious or irreversible environmental damage is not expected.
 - Although serious or irreversible environmental damage is not predicted to occur, there is some scientific uncertainty associated with the PW composition however it is not expected to change the consequence level and PW will be monitored and managed as per the adopted control measures.
- Intergenerational Principle:
 - The acceptable levels were developed consistent with the principles of ESD, including that the environmental impacts and risks of the offshore project will not forego the health, diversity, or productivity of the environment for future generations.
 - As described above, the predicted environmental impact spatially limited to an area around the facility which is not considered as having the potential to affect ecological integrity. By maintaining ecological integrity, the discharge of PW is not considered to have the potential to affect intergenerational equity.
- Biodiversity Principle:
 - The existing environment (Section 4) identifies and describes relevant MNES, as defined in Regulation 7(3) of the Environment Regulations; any relevant values and sensitivities are included within this impact analysis.
 - As described above, the predicted environmental impacts are spatially limited to an area around the facility, which is not considered as having the potential to affect ecological integrity. By maintaining ecological integrity, discharge of PW is not considered to have the potential to affect biological diversity.

Woodside looks after the communities and environments where we operate. Risks are inherent in petroleum activities; however, through sound management, systematic application of policies, standards, procedures and processes, Woodside considers that the predicted impact from PW discharge is acceptable.

Internal context

The Petroleum Activity is consistent with Woodside corporate policies, standards, procedures and processes as outlined in the Demonstration of ALARP (above) and EPOs (below), including:

- Woodside Environment and Biodiversity Policy
- Woodside Environmental Performance Procedure (which specifies maximum mixing zones and minimum sampling requirements).

Given that the 99% species protection level approved mixing zone has been established (200 m from discharge), the proposed limits of acceptable change meet the requirements of the Environmental Performance Procedure.

Woodside corporate values include working sustainably, with respect to the environment and communities in which it operates, listening to internal stakeholders, relevant persons, and considering HSE when making decisions. Consultation has been undertaken prior to the Petroleum Activity, as described below.

External context

Woodside recognises that its licence to operate from a regulator and societal perspective is to some extent, based on historical performance, complying with appropriate policies, standards and procedures, and perception of the expectations of external stakeholders. External stakeholder consultation (Section 5) was undertaken prior to the Petroleum Activity and stakeholder feedback (Section 5 and Appendix F) was incorporated into this EP where appropriate.

By providing PW monitoring and control measures that are commensurate with the risk rating, location, and sensitivity of the receiving environment (including social and aesthetic values), Woodside considers that societal concerns are addressed to an acceptable level.

Acceptability statement:

Routine, non-routine and contingency overboard discharges of PW have been evaluated as representing potential minor, localised, short-term impacts to water quality, marine sediment, marine fauna and ecosystem/habitat. As per Section 2.6, Woodside considers 'high order impacts' (Decision Type B impacts such as PW discharge) as acceptable if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk based

Demonstration of acceptability

analysis. Acceptability is further supported where legislative requirements are met and societal concerns are accounted for, and alternative control measures are grossly disproportionate to the benefit gained. In addition, acceptability is assessed against the above criteria. Further opportunities to reduce the impacts have been investigated (refer ALARP demonstration discussion). The adopted controls are considered good oil-field practice/industry best practice, are consistent with ANZG (2018) and Woodside's internal requirements. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of PW discharge to a level that is broadly acceptable and demonstrate that the EPO is met.

EPOs, EPSs and MC

Environmental performance outcomes	Controls	Environmental performance standards	Measurement criteria
EPO 11 No impact to the environment outside of the Approved Mixing Zone from planned discharge of PW.	C 8.1 Implement Woodside's Chemical Selection and Assessment Environment Guideline: - Where Gold, Silver, E or D OCNS rating (and no OCNS substitution or product warning), chemicals are selected – no further control required. - If chemicals with a different OCNS rating, sub warning or non-OCNS rated chemicals are required, chemicals will be assessed in accordance with the guideline prior to use.	PS 8.1 All chemicals intended or likely to be discharged to the marine environment will be assessed and approved prior to use in accordance with the Chemical Selection and Assessment Environment Guideline (described in Section 3.16.3) to ensure the impacts associated with use are ALARP and acceptable.	MC 8.1 Records demonstrate the chemical selection, assessment and approval process for operational chemicals is followed.
	C 8.2 Monitor and manage OIW concentrations in accordance with PARCOM 1997/16 Annex 3 methodology limiting average PW OIW to less than 30 mg/L (over a rolling 24-hour period).	PS 8.2 For routine and non-routine operations, OIW is limited to a 30 mg/L concentration 24-hour rolling average.	MC 8.2 Records of OIW concentrations (during normal operations) in PW discharge overboard maintained at all times. Records demonstrate that the OIW rolling average limits are not exceeded.
	C 8.3 Implementation of the Adaptive Monitoring and Management Framework for Produced Water, including: - monitoring of PW discharge volume - chemical characterisation (including mercury) - WET testing timing of annual/ triennial sampling to be representative aiming to detect change.	PS 8.3 No potential to impact environment outside the approved mixing zone based on multiple lines of evidence.	MC 8.3 Records show routine monitoring has been conducted. Further investigations have identified no potential to impact the environment from PW.

<i>Environmental performance outcomes</i>	<i>Controls</i>	<i>Environmental performance standards</i>	<i>Measurement criteria</i>
	C 8.7 Reinjection of PW into reservoirs.	PS 8.7 Facilities Basis of Design 6.4 Environmental Requirements: Under normal operating conditions (routine and non-routine operations), 90% of PW will be reinjected. The allowable period for discharge overboard will be based on assuming a 90% water reinjection system uptime including topsides, subsea and wells.	MC 8.7 Records of PW re-injection volumes indicate that >90% of PW has been reinjected over the life of the project.
	C 8.8 On an annual basis, review routine monitoring results and determine if non-routine sediment quality monitoring should be undertaken as per the OMDAMP.	PS 8.8 Complete review of routine monitoring results and determine contaminant load and/or contaminants with the potential to impact sediments have increased and whether non-routine sediment quality monitoring should be undertaken to determine extent of impacts.	MC 8.8 Records show annual review has been conducted as described.
	C 8.9 In-situ plume measurement and analysis of plume dilution and mixing characteristics, including monitoring at approved mixing zone boundary to inform an updated impact assessment.	PS 8.9 Commission a plume verification survey once contingency overboard discharge is confirmed as required, and complete survey as soon as practicable following initiation of contingency overboard discharge. Scope to include: - Obtain background measurements of surface and sub surface temperature and salinity levels surrounding facility - Tracking the plume (using a dye or similar) to quantify the horizontal and vertical plume dilutions achieved. - Conducting water quality sampling at the approved mixing zone boundary to measure potential contaminant concentrations.	MC 8.9 Technical report comparing in-situ dilution results with predicted model outputs consistent with the impact assessment, ALARP principles and an environmentally acceptable outcome.

6.7.7 Routine and non-routine discharges: liquid wastes and subsea fluids

Context														
Pyrenees Facility – Section 3.11 Production processes – Section 3.13 Subsea IMMR activities – Section 3.19				Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5						
Impacts evaluation summary														
Source of impact	Environmental value potentially impacted								Evaluation					
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Release of subsea chemicals or hydrocarbons by actuation of valves or during subsea operations and activities		x	x					A	1 – Minor	-	-	LCS GP PJ	Tolerable	EPO 12
Marine discharges of liquid wastes from Pyrenees Venture FPSO and vessel utility systems and drains (sewage, greywater, reverse osmosis brine reject, cooling water, putrescible waste, rainfall/deck washdown water, firewater deluge testing)		x	x					A	1 – Minor	-	-			
Source of impact														
Hydrocarbons, chemicals and liquids that may be discharged as a result of planned routine and non-routine operations and activities, as follows:														
- operational discharge of control fluids, including but not limited to: - discharge of subsea control fluids – subsea control fluid is used to control valves remotely from the facility. It is an open-loop system, designed to release control fluid from the control system during valve operations (e.g. up to about 1 L per valve actuation) - potential non-routine hydraulic fluid discharge associated with umbilical system losses/leaks - discharge of minor fugitive hydrocarbon from wells and subsea equipment (e.g. weeps/seeps/bubbles) - discharge of chemicals introduced into subsea infrastructure and the production stream, either as process or non-process chemicals (e.g. corrosion inhibitors, biocides, scale inhibitors); chemicals flow through the production process, with residual chemicals produced as a component of the PW discharged overboard - IMMR activities (nominal discharges from liquid waste, described below), including but not limited to: - discharge of residual hydrocarbons in subsea lines and equipment and small gas releases associated with isolation testing and breaking containment - discharge of residual chemicals in subsea lines and equipment, or the use of chemicals (including pigging); these chemicals are used and discharged intermittently in small volumes; small quantities of chemicals may remain in the flushed infrastructure, which may be released to the environment after disconnection - discharge of residual fluids during non-routine repair and replacement works, including (but not limited to), small volumes of produced formation water (Section 6.7.6), hydraulic fluids and/or reservoir hydrocarbons - during non-routine repairs to the reinjection system there may also be small volumes (approximately 10 m³) of PW discharged at the seabed														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- liquid waste, including but not limited to:
 - sewage, grey water and putrescible waste from all vessels: the volume of waste from these sources generated by a typical FPSO is estimated to be in the order of 8 to 9 m³ per day
 - deck drainage from all vessels: rainfall and wash down activities on the deck may result in minor quantities of chemical residues, such as detergent, oil and grease entering the deck drainage system and being possibly discharged overboard
 - cooling water and brine from all vessels: seawater is brought onboard and used throughout the facility for the production of potable water via the flash evaporation water makers and to cool process equipment; marine discharges from these processes include brine from the creation of potable water and heated seawater; the heated seawater may include sodium hypochlorite, which is used to suppress growth of fouling organisms in the internal seawater systems
 - firewater deluge testing: testing of fire pump system using water from seawater lift system; discharge of firewater to marine environment via a pipe over the side of the Pyrenees Venture FPSO, thus avoiding full deck deluge and potential deck contaminants entering the marine environment; the discharge specification of firewater is similar to that of the cooling water discharge, i.e. chlorine from the Marine Growth Prevention System
 - subsea fluids: subsea valves are controlled hydraulically using fluid under pressure to adjust the position of the valve; the subsea control valves operate on an open circuit that leads to loss of subsea control fluid when the valve is activated; residual hydrocarbons or chemicals remaining in subsea lines and equipment may also be released to the marine environment as a result of subsea intervention works or subsea inspection, maintenance and repair activities.

Impact assessment

Subsea fluids

Subsea control fluid is the main planned routine subsea chemical discharge. An industry standard water-based subsea control fluid is used to control wellhead valves remotely from the Pyrenees Venture FPSO. This is an open loop system, with approximately 1 L of control fluid discharged from the wellhead valves on the seabed when they are operated, which generally only occurs on restart of the process after a shutdown.

Open loop systems are the most commonly used system because of their superior safety performance and reliability. Use of a closed loop system was considered during design of the facility, which recycles control fluids. However, this was not considered feasible due to the limitations of closed loop systems on the speed of valve operation and hence a greater potential for escalation of risks.

Open loop subsea control systems are an industry standard. Given the low volumes discharged during each event, and the limited number of release events, the potential impacts of this discharge are expected to be very localised, with only a slight impact on the marine environment. Consequently, the overall environmental impact is considered to be low.

Minor quantities of other subsea chemicals or hydrocarbons may be released during subsea intervention works or subsea inspection, maintenance and repair activities (refer Table 3-14 for example activities). An indicative list of chemicals used in the Pyrenees Facility subsea systems are listed in Section 3, all of which have an OCNS colour banding of Gold. Due to the water depth, small quantities of release and short duration of release, these chemicals and hydrocarbons will rapidly disperse into the water column (refer Table 3-15).

In summary, the Pyrenees Facility surface water quality monitoring program is designed to measure the effect of marine discharges on the environment to ensure the controls (described below) are effective. Analysis of the water samples includes metals and hydrocarbon contaminants as well as nutrients to examine the potential effects, if any, discharges such as sewage and putrescible waste. The approach for management of marine discharges follows the framework for environmental management outlined in ANZG (2018) and described previously in Section 6.7.6.

There is potential for slight, localised decrease in water quality at planned discharge locations and potential impacts on marine biota. Within the mixing zone, impacts to pelagic fish are expected to be limited to avoidance of the localised area of the discharge and short-term, localised decline in planktonic organisms in the immediate vicinity of any discharge plume.

Produced formation water that is released subsea during non-routine maintenance and/or repair works is expected to have no more than minor impacts to water quality and species. Given the release would be a once off and the PW is expected to rapidly disperse in the water column with potential impacts being minor, temporary and in close proximity to the release site.

Liquid waste**Nutrient enrichment**

Discharged macerated food scraps to the marine environment are expected to be rapidly diluted, dispersed and assimilated. No measurable impact to surrounding water quality, outside of a very small, localised mixing zone is expected based on the low volumes of discharge within an open ocean environment.

Some fish and oceanic seabirds may be attracted to the Pyrenees Facility and support vessels by the discharge of food scraps. This attraction may be either direct in response to increased food availability or secondary as a result of prey species being attracted to the facilities. However, because the waste is macerated prior to discharge and the discharge volumes involved are small, the impact is expected to be low.

The most significant environmental impact associated with ocean disposal of sewage is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. The loading of total nitrogen (TN) and total phosphorus (TP) from sewage discharge from the Pyrenees Facility is estimated as follows:

- TN load: 0.16 to 0.50 kg/day
- TP load: 0.02 to 0.05 kg/day.

Food waste, a solid waste, is also a source of nutrient enrichment and is addressed in this section for the purpose of addressing cumulative effect. Studies on food waste on ships (Polglaze, 2003) have indicated average dry weight nutrient content of 2.4% TN and 0.4% TP. The total TN and TP loading from food waste discharge from the Pyrenees Facility is estimated as follows:

- TN load: 0.94 kg/day
- TP load: 0.16 kg/day.

The total nutrient load from sewage, grey-water and food waste from the Pyrenees Facility is estimated as follows:

- TN load: 1.10 to 1.44 kg/day
- TP load: 0.18 to 0.21 kg/day.

Although the North West Shelf is characterised as a low nutrient environment (Department of the Environment, Water, Heritage and the Arts, 2008) studies of adjacent waters have found the area to be "...a *highly productive ecosystem in which nutrients and organic matter are rapidly recycled*" (Furnas & Mitchell, 1999). The estimated daily loading is inconsequential in comparison to the daily turnover of nutrients in the area. The impact of nutrients associated with discharge of sewage, grey-water and putrescible waste is considered to be low because of the small mass relative to daily turnover, and the assimilative capacity of the receiving environment (open ocean).

Brine

Desalination brine has a greater density than seawater and is expected to sink and disperse in the currents when discharged. The brine is predicted to have a concentration of around 60 ppt. On this basis, the largest increase of salinity experienced would be approximately 10% in the immediate vicinity of the discharge point. Most species are able to tolerate short-term fluctuations in salinity in the order of 20 to 30% (Walker & McComb, 1990) and it is expected that most pelagic species in the area would be able to tolerate short-term exposure to the slight increase in salinity caused by discharge of the brine.

Deck drainage

Rainfall and wash down activities on the deck may result in minor quantities of chemical residues, such as detergent, oil and grease entering the deck drainage system and being possibly discharged overboard.

Firewater deluge testing and cooling water

Seawater is used for testing of the fire pump system. Seawater is directed through the firewater pumps and discharged overboard to the marine environment at a similar specification to that of cooling water.

Seawater is also used as a heat exchange medium for the cooling of machinery engines. Seawater is pumped on board then through heat exchangers and subsequently discharged with a temperature elevation in the order of 25°C above ambient. Approximately 48,000 m³/day of heated seawater is discharged from the system. When discharged to sea, the cooling water is subject to mixing and loss of heat to the surrounding waters.

The trajectory and dispersion of cooling water discharge have been modelled for a nominal discharge of 100,000 m³/day (and hence a conservative estimate of the estimated actual rate of 48,000 m³/day) at a water temperature of 46.3°C. The results indicate that at a flow of 100,000 m³/day there is a 50% probability of the temperature of surface water within 25 to 50 m of the discharge point exceeding ambient temperature by more than 2°C. The probability of surface water temperature exceeding the ambient temperature by more than 2°C decreases to 1% within about 60 to 85 m of the discharge point, depending on seasonal variations in the surface currents (Figure 6-5).

The area of detectable increase in seawater temperature is likely to be less than 10 m radius and as such the overall environmental impact of cooling water discharge considered to be low.

The residual copper in the cooling water discharged to the marine environment is estimated to be between 0.52 and 0.69 ppb (as estimated during studies of similar system undertaken by the US Uniform National Discharge Standards Program (US EPA, 1999)). At these low concentrations, the copper will rapidly dilute to ambient background levels on

discharge to the marine environment, and the discharge of copper is not expected to result in bioaccumulation. Copper is included as a parameter in the water quality monitoring program.

Figure 6-5: Predicted dispersion and temperature of cooling water discharge trajectory and dispersion of cooling water modelled for a nominal discharge of 100,000 m³ at a water temperature of 25°C above surrounding seawater

There is potential for slight, localised decrease in water quality at planned discharge locations and potential impacts on marine biota. Within the mixing zone impacts to pelagic fish are expected to be limited to avoidance of the localised area of the discharge and short-term, localised decline in planktonic organisms in the immediate vicinity of the discharge plume.

Sediment quality

Accumulation of contaminants in sediments (from subsea chemicals or hydrocarbon release), depends primarily on the volume/concentration of particulates in discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the resuspension, bioturbation and microbial decay of those particulates in the water column and on the seabed. Valve actuation discharges are frequent but low in volume (typically <1 L per actuation). The subsea control fluid used in the open loop system (HT2) is water-based and has an OCNS rating of D with a substitution warning. The substitution warning is for the fluorescein dye which is approximately 150 ppm within the product, due to its low biodegradability. However, the product is non-toxic and does not have a potential to bioaccumulate. Once released the control fluid is expected to mix rapidly in the water column and become diluted, accumulation in sediments is not considered likely.

Given the frequency and volume of hydrocarbon releases and its buoyancy, accumulation in sediments is not considered likely.

Ecosystem/habitats

Sediments in the Operational Area are expected to be broadly consistent with those in the NWS Province such as sparsely populated silty/sandy sediment habitats (as described in Section 4.5), with filter feeders such as sponges, ascidians, soft corals and gorgonians associated with areas of hard substrate. The only areas of hard substrate expected in the vicinity are artificial habitat associated with subsea infrastructure. Impacts to ecosystems are not expected due to the localised nature of discharge plumes and potential for sediment quality impacts. Given the nature and scale of planned discharges, potential impacts are considered to be localised and negligible.

KEFs

The Operational Area of the Petroleum Activity overlaps two KEFs, namely the Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula and the Continental Slope Demersal Fish Communities. Treated sewage, grey water, macerated food waste, deck wash, brine and cooling water and subsea fluids generated during operations, will be managed consistently with MARPOL standards. This will result in volumes and quality of discharge being at a level

that is unlikely to result in any impacts to the ecosystem function of the KEFs with any impact being minor and temporary in nature.

Discharges from subsea control fluids may be discharged during wellhead values, which is limited to operational restart or shutdown of the wellheads. Given the small volume and infrequent discharge of subsea chemicals, any impact is likely to be highly localised and not have any impacts to the ecosystem function of the KEFs.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/ sacrifice (CS) ⁵⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
Contract vessels compliant with Marine Orders for safe vessel operations: - Marine Orders 91 (Marine pollution prevention – oil) - Marine Orders 95 (Marine pollution prevention – garbage) - Marine Orders 96 – (Marine pollution prevention – sewage).	F: Yes. CS: Minimal cost. Standard practice.	Marine Orders required under Australian regulations; implementation is standard practice for commercial vessels as applicable to vessel size, type and class. Marine Orders 91, 95 and 96 (pollution prevention) reduces the potential impact of marine wastewater discharges on water quality.	Controls based on legislative requirements – must be adopted.	Yes C 9.1
Good practice				
All operational chemicals intended or likely to be discharged to the marine environment will be assessed and approved through the Woodside chemical assessment process.	F: Yes. Routinely implemented to the chemical selection process for Woodside facilities. CS: Minimal cost. Standard practice.	Selection and assessment of chemicals in accordance with the Woodside process, reduces environmental impacts associated with planned chemical discharge.	Benefits outweigh cost/sacrifice.	Yes C 8.1
Subsea infrastructure flushed where practicable during IMMR intervention activities to reduce volume/concentration of residual hydrocarbons/ chemicals released to the environment.	F: Yes. CS Minimal cost. Standard practice.	Maintaining and testing the ability to isolate wells and pipelines will ensure barriers are in place and verified limiting the volume of hydrocarbon released.	Benefit outweighs cost/sacrifice.	Yes C 9.2
Limit volume of subsea control fluid discharged to the marine environment through monitoring subsea control fluid use and investigating material discrepancies.	F: Yes. The use of control fluid is monitored to maintain adequate fluid in the system. CS: Minimal cost.	Limits the volumes of subsea control fluid discharge to the marine environment.	Benefit outweighs cost/sacrifice.	Yes C 9.3

⁵⁸ Qualitative measure.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/ sacrifice (CS) ⁵⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Professional judgement – Eliminate				
Storage, transport and treatment/disposal onshore of sewage, greywater, putrescible and bilge wastes.	F: No. Long term transport of waste onshore would present additional safety and hygiene hazards resulting from the storage, loading and transport of the waste material. CS: Not considered – control not feasible.	Not considered – control not feasible.	Not considered – control not feasible.	No
Professional judgement – Substitute				
Install closed-loop subsea valve control system.	F: Yes. Closed-loop subsea valve control systems can be installed, however, they may not perform as quickly/reliably as open-loop systems. CS: Significant. The design, procurement and retrofitting of a closed-loop valve control system would result in considerable offshore logistics, exposure to safety hazards during installation, and significant financial burden through direct costs and lost production.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and avoiding the discharges would provide little or no environmental benefit.	When considering the negligible effect from the release of control fluids, the risk and costs of retrofitting a closed-loop subsea valve control system is considered to be grossly disproportionate to the environmental benefit.	No
Professional judgement – Engineered solution				
Open and closed drainage systems will be maintained in accordance with system requirements.	F: Yes. CS: Minimal cost. Standard practice.	The open hazardous drain system will be maintained to support appropriate disposal of environmentally hazardous liquids.	Benefits outweigh cost /sacrifice.	Yes C 9.4
Sewage treatment and discharge equipment onboard to treat sewage and reduce impact to the environment and maintained in good working order.	F: Yes. CS: Minimal cost. Standard practice.	The treatment and discharge equipment will be maintained to support the appropriate disposal of sewage.	Benefits outweigh cost/sacrifice.	Yes C 9.5

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/ sacrifice (CS) ⁵⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Route hydrocarbons to vessel during disconnection of subsea infrastructure.	F: Yes. However, to do so would introduce significant safety risks to the vessel crew (fire, explosion, asphyxiation). CS: Significant. Equipping and training crew onboard subsea support vessels to safely route hydrocarbons to the vessel would result in significant additional costs (in addition to the increased safety risk identified above).	Small environmental benefit from preventing low concentration hydrocarbon discharge.	Given the increased safety risk and the very low environmental impact from hydrocarbon releases during subsea IMMR activities, the cost of routing hydrocarbons to the vessel is grossly disproportionate to the environmental benefit.	No
Decrease frequency of valve actuation.	F: Yes. However, decreasing the frequency of valve may adversely impact the safe functionality and reliability of valves. Reducing the performance of subsea valves may introduce operability impacts, and increased safety and environmental risk associated with loss of containment events. CS: Minimal cost.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and reducing the number of discharges would provide little or no environmental benefit.	Decreasing the frequency of valve actuations would lead to a potential decrease in safe functionality and reliability of valves. When considering the potential safety and environmental risks from such a performance degradation, along with the minor impact from the release of control fluids, the cost of decreasing the frequency of valve actuations is considered to be grossly disproportionate to the environmental benefit.	No
Professional judgement – Procedures and administration				
Current International Sewage Prevention Pollution Certificate onboard Pyrenees Facility, OSV and IMMR vessels.	F: Yes. CS: Minimal cost. Standard practice.	Certification demonstrates vessel compliance with legislative requirements.	Controls based on legislative requirements – must be adopted.	Yes C 9.6
No contaminated deck drainage from the Pyrenees Facility directly to the environment unless authorised by the OIM.	F: Yes. CS: Minimal cost. Standard practice.	Supports implementation of Marine Orders.	Benefits outweigh and cost/sacrifice.	Yes C 9.7

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/ sacrifice (CS) ⁵⁸	Benefit in impact/risk reduction	Proportionality	Control adopted
Storage, handling and transport of wastes in accordance with the Waste Management Plan.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of a release of waste to the environment by providing guidance on storage, handling and transport of wastes.	Benefit outweighs cost/sacrifice.	Yes C 9.8
Environment awareness induction provided to all vessel crew to advise waste management requirements.	F: Yes. CS: Minimal cost. Standard practice.	Crew are aware of activities that are required to meet environmental obligations and therefore increasing the likelihood of waste being managed appropriately.	Benefits outweigh and cost/sacrifice.	Yes C 9.9
Cooling water flow rates and temperatures monitored at all times to ensure discharge specifications are met.	F: Yes. CS: Minimal cost. Standard practice.	Minimises any potential impacts from discharges of cooling water above flow rates and temperatures that are appropriate for the receiving environment.	Benefits outweigh and cost/sacrifice.	Yes C 9.10
Scupper plugs or equivalent deck drainage control measures available where chemicals and hydrocarbons are stored and frequently handled.	F: Yes. CS: Minimal cost. Standard practice.	Minimises any potential impacts from any unplanned releases.	Benefits outweigh and cost/sacrifice.	Yes C 9.11
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine liquid waste and subsea chemical discharges. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, planned routine and non-routine hydrocarbon and chemical discharges represents a localised, minor impact that is unlikely to result in a lasting potential impact on water quality, marine sediment or ecosystem habitat. Further opportunities to reduce the impacts have been investigated above. Fluid discharges from the subsea system during operations and IMMR activities are routine in the oil and gas industry. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of planned routine and non-routine hydrocarbon and chemical discharges to a level that is tolerable and demonstrate that the EPOs are met.

* Defined as "Minor, temporary impact", as in Section 2.6.3.

6.8 Unplanned activities (accidents, incidents, emergency situations)

6.8.1 Quantitative spill risk assessment methodology

Quantitative hydrocarbon spill modelling was undertaken by RPS and GHD, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form OIW emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each of the particles (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

All hydrocarbon spill modelling assessments undertaken by RPS and GHD undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.8.1.1 Hydrocarbon characteristics – Pyrenees crude

The relevant characteristics of the crude oils from the Pyrenees reservoirs are listed within Table 6-18.

Based on the ITOPI classification system, Pyrenees crude can be classified as a Group III oil. Group III oils can lose up to 40% by volume through evaporation. As a general rule, the higher the API of the oil (and the lower the specific gravity), the less persistent it will be after a spill.

The data collected on the well fluids suggest that, like the Ravensworth, Crosby and Stickle crude, each reservoir hydrocarbons were expelled from mature sediments that were deposited under sub-oxic (probably marine) conditions and contain a mixed marine and land-plant-influenced organic matter suite. Steranes based maturity parameters calculated from the branched-cyclics data indicate that all reservoir oil is essentially the same as Ravensworth, Crosby and Stickle crude. Therefore it is considered that the characteristics of all hydrocarbons returned to the Pyrenees Venture FPSO, processed, and stored in the cargo tanks are very similar and therefore considered to have the same characteristics (including weathering).

Based on the ITOPF classification and data analysis of the reservoir hydrocarbons, the characteristics of the most persistent reservoir crudes, hereafter referred to as 'Pyrenees crude' was used in the modelling and spill risk assessment for the crude spill scenarios (see the characteristics in Table 6-18).

Table 6-18: Characteristics of Pyrenees crude

Hydrocarbon type	Initial density (g/cm ³ at 15°C)	Viscosity (cP at 40°C)	Component	Volatiles <180°C	Semi- volatiles 180 to 265°C	Low volatility 265 to 380°C	Residual >380°C	Aromatic of whole product <380°C (boiling point)
			Boiling point (°C)	Non-persistent			Persistent	
Pyrenees crude	0.9378	55.5	% of total	0.6	8.5	36.13	54.4	14.18
			% aromatics	0.015	0.11	14.05	-	-

Weathering characteristics

The mass balance forecast for the constant-wind case (Figure 6-6) for Pyrenees crude shows that approximately 9.3% of the oil is predicted to evaporate within 24 hours. Under these calm conditions, most of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 6-7), where the winds are of greater strength, entrainment of Pyrenees crude into the water column is indicated to be greater than the constant wind case. Approximately 24 hours after the spill, around 38.1% of the oil mass is forecast to have entrained and a further 8.9% is forecast to have evaporated. Due to the large proportions of heavy hydrocarbons that are persistent, 45.4% will remain on the surface after 24 hours. The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately > 6 m/s).

The increased level of entrainment in the variable-wind case will result in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 2.5% per day with an accumulated total of ~17.2% after seven days, in comparison to a rate of ~1.8% per day and an accumulated total of 11.5% after seven days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration will extend the area of potential effect, requiring the break-up and dispersion of the slicks and droplets to reduce concentrations below the thresholds considered.

6.8.1.2 Environment that may be affected and hydrocarbon contact thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels exceeding selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurred. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA. The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for a variety of weather and metocean conditions, and the EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each hydrocarbon fate. Together, these EMBA have defined the spatial extent for the existing environment described in Section 4.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill concentrations are expressed as grams per square metre (g/m²), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb). A conservative approach to selecting thresholds was taken by adopting the guideline impact thresholds (NOPSEMA, 2019) for surface, entrained, dissolved and accumulated hydrocarbons to define the EMBA for condensate spills from a loss of well control and loss of marine diesel. An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m²) impacting on the visual amenity of the marine environment and is described below. Each of these hydrocarbon thresholds are presented in Table 6-19.

Table 6-19: Summary of thresholds applied to the quantitative hydrocarbon spill risk modelling results

Hydrocarbon type	Surface hydrocarbon (g/m ²)	Dissolved hydrocarbon (ppb)	Entrained hydrocarbon (ppb)	Accumulated hydrocarbon (g/m ²)	Operational and scientific monitoring (g/m ²)
Crude oil	10	50	100	100	1
Marine diesel	10	50	100	100	1

6.8.1.3 Operational and scientific monitoring

A planning area for operational and scientific monitoring is also described in the oil spill preparedness and response mitigation assessment (Appendix H). This planning area has been set with reference to the low exposure entrained value of 10 ppb detailed in the NOPSEMA (2019) oil spill modelling bulletin.

An operational and scientific monitoring program may be activated following a Level 2 or 3 unplanned hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) for the entire EMBA and in particular, any identified first-strike monitoring priorities for the worst-case credible spill scenario(s) or other identified unplanned hydrocarbon releases associated with the operational activities.

6.8.2 Unplanned hydrocarbon release: loss of well containment

Context														
Subsea infrastructure layout and description – Section 3.5 FPSO disconnected mode – Section 3.12.2							Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5			
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Release of hydrocarbons resulting from loss of well containment		x	x	x	x	x	x	B	5 – Severe	Highly Unlikely	30	LCS GP RBA SV	Tolerable	EPO 13
Source of risk														
A loss of well containment can lead to an uncontrolled release of reservoir hydrocarbons or other well fluids to the environment. Woodside has identified a loss of well containment as the scenario with the worst-case credible environmental outcome as a result of this event. The causes of a loss of well containment may include, but are not limited to: - internal corrosion - external corrosion - erosion - overpressure of the annuli - fatigue - loss of control of suspended load from vessel (operating near subsea wells). Loss of well containment – credible scenario The Petroleum Activity includes production from a series of subsea wells. The worst-case credible hydrocarbon spill scenario involves a long-term (69-day) uncontrolled subsea release of 29,618 m³ of Pyrenees crude. The loss of well containment scenario was assumed to have a duration of 69 days. This duration is based on the estimated time required to successfully drill an intervention well. Quantitative spill risk assessment Spill modelling of the worst-case credible loss of well containment spill scenario was undertaken by RPS (2024), to determine the fate of hydrocarbons released based on the assumptions in Section 6.8.1. Modelling was undertaken over all seasons to address year-round operations. This is considered to provide a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volumes for all loss of well containment scenarios. Hydrocarbon characteristics Hydrocarbon characteristics are provided in described in more detail in Section 6.8.1.1. Subsea plume dynamics The loss of well containment scenarios will result in a buoyant plume of hydrocarbons, which has been modelled using the OILMAP-Deep numerical model. Likelihood In accordance with the Woodside PetDW Risk Matrix, a worst-case loss of well containment has been defined as a 'highly unlikely' event. Information to support this likelihood determination is outlined below. This assessment considers the likelihood of the worst-case credible scenario occurring.														

A review of industry statistics indicates that the probability of a loss of well containment for production wells is low (10.6% of 292 recorded blowouts), relative to other activities in other hydrocarbon provinces (Gulf of Mexico and the North Sea), such as exploration drilling (31.5% of blowouts), development drilling (23.6% of blowouts) and well workovers (20.5% of blowouts) (SINTEF, 2017). Separate analysis of blowout data collected between 1991 and 2010 in the North Sea and the US Gulf of Mexico shows that only ten blowouts occurred during the production phase at a frequency of 1.36×10^{-5} blowouts per well year, with all these events occurring in the US Gulf of Mexico and none occurring in the North Sea (Scandpower, 2013). North Sea standards of well design and operation are considered to be aligned with those applied by Woodside, as outlined in the Pyrenees WOMP. This data quantitatively supports the likelihood ranking as described above.

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbons were considered during the impact assessment for the identified worst-case loss of well containment scenario (presented in the following section). These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by GHD, available information on environmental sensitivities that may credibly be impacted in the event of either worst-case spill event, and relevant literature and studies considering the effects of hydrocarbon exposure. The consequence was considered to be Severe (5).

Consequence assessment

Environment that may be affected

Surface hydrocarbons

The stochastic modelled floating hydrocarbon EMBA from both loss of well containment is forecast to drift in all directions, reflecting the competing influence of both surface currents and winds across the wide area in which a large and persistent slick could travel over the long duration of the release. At the surface threshold of 10 g/m², floating oil is forecast to potentially occur up to approximately 130 km from the release site. The potential contact above impact thresholds at a number of receptors.

Entrained hydrocarbons

Stochastic modelling indicated entrained hydrocarbons are forecast to potentially drift in all directions, with the most likely directions of travel being to the south-west of the release site, due to the influence of the NWMR seasonal currents. The modelling indicated that the entrained hydrocarbon EMBA above the 100 ppb threshold concentrations could potentially occur up to 300 km for the loss of well containment scenario; contact above impact thresholds was forecast at a range of receptors.

Dissolved hydrocarbons

Dissolved hydrocarbons at the moderate threshold (50 ppb) were predicted to occur within up to ~400 km from the spill site, contact above impact thresholds was forecast at a range of receptors.

Accumulated hydrocarbons

Shoreline loading above the low threshold (>10 g/m²) was predicted to occur between the Walpole-Albany coastline to the south and Cox-Finnis coastline in Northern Territory to the north.

Summary of potential impacts to environmental value(s)

Table 6-20 presents the full extent of the EMBA for loss of well containment (within which all other credible hydrocarbon spill EMBA's are contained), i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons (surface, entrained, dissolved and accumulated) at or above the set threshold concentrations in the unlikely event of a loss of well containment during the Petroleum Activity. Details of these receptors are outlined in Section 4. The potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of well containment during the Petroleum Activity are discussed in the following sections.

Table 6-20: Key receptor locations and sensitivities potentially contacted above impact thresholds by the loss of well containment scenario with summary hydrocarbon spill contact ≥1% probability

Summary of potential impacts to environmental value(s)**Open water environment (near spill area)****Air quality**

A hydrocarbon release during a loss of containment has the potential to result in localised, temporary reduction in air quality and contribution of greenhouse gases to the global concentration of these gases in the atmosphere. Potential impacts from reduced air quality are expected to be minor, short-term and predominantly localised.

There is potential for human health effects for workers in the immediate vicinity of atmospheric emissions. The ambient concentrations of methane and VOCs released from diffuse sources is difficult to accurately quantify, although the behaviour and fate is predictable in open offshore environments as it is dispersed rapidly by meteorological factors such as wind and temperature. Methane and VOC emissions from a hydrocarbon release in such environments are rapidly degraded in the atmosphere by reaction with photo chemically-produced hydroxyl radicals.

Due to the unlikely occurrence of a loss of containment; the temporary nature of any methane or VOC emissions (from the weathering of liquid hydrocarbons from a loss of containment); the predicted behaviour and fate of methane and VOCs in open offshore environments; and the significant distance from the Operational Area to the nearest sensitive air shed (town of Exmouth approximately 40 km away), the potential impacts are expected to be minor and short-term.

Water quality

Water quality would be affected in the offshore environment within the EMBA due to hydrocarbon contamination from entrained, dissolved and surface hydrocarbons. Due to the weathering processes of the hydrocarbons, impacts to water quality are anticipated to be minor long term and/or significant short term as a result of hydrocarbon contamination above background levels.

Marine sediment quality

Floating, entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Hydrocarbons may accumulate (at or above the ecological threshold) at a range of nearshore receptors. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Studies of hydrocarbon concentrations in deep sea sediments in the vicinity of a catastrophic well blowout indicated hydrocarbon from the blowouts can be incorporated into sediments (Romero et al., 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero et al., 2015).

In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, the extent of potential impacts to the seabed area at and surrounding the release site would be largely confined to a localised footprint. Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a long to medium term, as hydrocarbons in sediments typically undergo slower weathering and degradation (Diercks et al., 2010; Liu et al., 2012).

There is the potential for floating and entrained hydrocarbons to sink following extensive weathering and adsorption of sediment particles, which may result in the deposition of hydrocarbons to the seabed in areas distant from the release location. Such hydrocarbons are expected to be less toxic due to the weathering process.

Benthic fauna communities

In the event of a major release at the seabed, the stochastic spill model predicted hydrocarbons droplets would be entrained, rapidly transporting them to the sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat and any epifauna (filter feeders) associated with the Canyon KEFs, and the Continental Slope Demersal Fish Communities KEF, refer to Section 4.7) within and outside the Operational Area are not expected to have widespread exposure to released hydrocarbons. Impacts are expected to be restricted to a localised area relating to the hydrocarbon plume at the point of release, which would result in a small area of seabed and associated epifauna and infauna exposed to hydrocarbons.

Heterotrophic, filter feeding organisms, such as sponges and gorgonians, have been identified as potentially occurring in the canyon features located within the wider EMBA. In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, hydrocarbon exposure to these deep-water filter-feeding communities is unlikely, and exposure at concentrations of ecological consequence is not expected to occur where these heterotrophic communities exist.

Evidence from the Deepwater Horizon spill in the Gulf of Mexico recorded low taxa richness and high nematode/harpacticoid-copepod ratios within 3 km of the release location and moderate impacts up to 17 km away (Montagna et al., 2013). The communities were likely exposed to dispersed hydrocarbons as the response included subsea dispersant application. A loss in benthic biodiversity has been correlated to a decline in deep-water ecosystem

functioning (Danovaro et al., 2008). The location of the petroleum activity and the EMBA largely affect continental shelf waters, which are shallower than the Deepwater Horizon spill, and as such may host more diverse infauna communities, although the impacts are considered to be similar. Therefore, a loss of well containment may result in localised but long-term effects on community structure.

Demersal and pelagic fish populations

Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (ITOPF, 2011b). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water, so individuals exposed to a spill are likely to recover (King et al., 1996). Where fish mortalities have been recorded, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays.

Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann et al., 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high concentrations of hydrocarbons. However, sub-lethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to PAH concentrations (Hjermann et al., 2007), which are typically the most toxic components of hydrocarbons. Light molecular weight aromatic hydrocarbons (i.e. one- and two-ring molecules) are generally soluble in water, which increases bioavailability to gill-breathing organisms such as fish. While modelling of the loss of well containment indicates the potential EMBA for dissolved hydrocarbons is extensive, no time-integrated exposure metrics were modelled; given the oceanographic environment within the wider EMBA, PAH exposures in the order of weeks for pelagic fish are not considered credible.

The effects of exposure to oil on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and, to a lesser extent, affects fish consuming contaminated food (Cohen et al., 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to facilitate the elimination of ingested oil from the fish (Cohen et al., 2005).

Fish are perhaps most susceptible to the effects of spilled oil in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can mechanically damage feeding and breathing apparatus of embryos and larvae (Fodrie & Heck, 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie & Heck, 2011). More subtle, chronic effects on the life history of fish as a result of exposure in early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann et al., 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression, and allows expression of viral diseases (Hjermann et al., 2007).

PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al., 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

The Continental Slope Demersal Fish Communities and the Canyons linking the Cuvier Abyssal Plain and the Cape Range KEF overlap the Operational Area. Species found on the continental slopes of these key ecological features been shown to host high levels of endemism (BMT Oceanica, 2016). Additionally, demersal species are associated with the Ancient Coastline KEF (~0.6 km from the Operational Area).

Mortality and sub lethal effects may impact populations located close to the well blow out and within the EMBA for entrained/dissolved aromatic hydrocarbons (≥ 100 and >50 ppb, respectively). Additionally, if prey (infauna and epifauna) surrounding the well location and within the EMBA is contaminated, this can result in the absorption of toxic components of the hydrocarbons (PAHs), potentially impacting fish populations that feed on these. These impacts may result in localised medium/long term impacts on demersal fish habitat (e.g. seafloor).

Hydrocarbons above ecological thresholds may subsequently impact populations located near to the release location for the worst-case spill scenario, with lethal impacts not considered likely in this offshore environment.

Protected places

Receptors

The Australian Marine Parks (AMPs) listed in Section 4.8 may be affected by a worst-case spill scenario. The AMPs were predicted to potentially be contacted by hydrocarbons in the event of a worst-case spill scenario include Ningaloo AMP, Gascoyne AMP, Montebello AMP, Dampier AMP, Shark Bay AMP, etc.

Impacts

The Gascoyne Marine Park is the closest AMP to the Operational Area (4 km) predicted to be contacted by hydrocarbons. Impacts to this AMP are discussed below. Impacts to the natural, cultural, heritage and socio-economic values of the other AMPs predicted to be contacted by hydrocarbons in a worst-case spill scenario are expected to be similar, however, of varying severity and duration due to their varying distances from the Operational Area (see Section 4.8).

Gascoyne Marine Park

The Gascoyne Marine Park comprises an area about 81,766 km². The Marine Park is assigned IUCN category IV and includes three zones assigned under this plan: National Park Zone (II), Habitat Protection Zone (IV) and Multiple Use Zone (VI). The AMP ranges in water depths from less than 15 m up to 6000 m.

The Gascoyne Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Transition, Central Western Transition, and Northwest Province. It overlaps with the Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF, Commonwealth waters adjacent to Ningaloo Reef KEF, continental slope demersal fish communities KEF, and the Exmouth Plateau KEF (see 'Key Ecological Features' above for a discussion of impacts to KEFs).

The AMP includes some of the most diverse continental slope habitats in Australia, in particular the continental slope area between North West Cape and the Montebello Trough. Canyons in the Marine Park link the Cuvier Abyssal Plain to the Cape Range Peninsula and are important for their role in sustaining the nutrient conditions that support the high diversity of Ningaloo Reef. The specific values of the AMP and associated impacts are summarised here.

Natural values – The AMP includes diverse benthic and pelagic fish communities and ancient coastline thought to be an important seafloor feature (KEF) and a migratory pathway for humpback whales (BIAs). The AMP supports a range of species including species listed as threatened, migratory, marine or cetacean under the EPBC Act. BIAs within the AMP include breeding habitat for seabirds, interesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat and migratory pathway for pygmy blue whales.

Cultural values – There is limited information about the cultural significance of this AMP, however, it is noted that Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. Potential impacts to cultural values of the AMP will closely tie in with the impacts to the natural values of the Marine Park, as addressed above and below; and range from moderate mid-term potential impacts to major long-term potential impacts.

Heritage values – There are no World, National or Commonwealth heritage listings within the AMP. However, the Ningaloo Coast World Heritage Property, the Ningaloo Marine Area (Commonwealth waters), and the Ningaloo Coast National Heritage areas are located adjacent to the Gascoyne AMP. Five historic shipwrecks are located within the Marine Park. Impacts to shipwrecks are discussed below under 'Cultural Heritage'.

Social and economic values – Commercial fishing, mining and recreation are important activities in the AMP. These activities contribute to the wellbeing of regional communities and the prosperity of the nation. A worst-case hydrocarbon spill scenario has the potential to result in impacts to these AMPs that range from moderate, medium-term to major, long-term, with the consequence severity dependent on the actual timing, duration and extent of a spill.

Key ecological features

KEFs potentially impacted by the hydrocarbon spill from a loss of well containment event are provided in Section 4.7. Although these KEFs are primarily defined by seabed geomorphological features, they are described to identify the potential for increased biological productivity and, therefore, ecological significance.

The consequences of a hydrocarbon spill from a loss of well containment event are predicted to result in moderate impacts to values of the KEFs affected (for the values of each KEF, see Section 4.7).

Potential impacts include contamination of sediments, impacts to benthic sediment fauna and associated impacts to demersal fish populations, and reduced biodiversity as described above and below. Most of the KEFs within the EMBA have relatively broad-scale distributions and are unlikely to be significantly impacted. KEFs within the EMBA that are not associated with broad-scale distributions are not expected to be impacted by floating hydrocarbons and contact with entrained and dissolved fractions is predicted to be very low/no contact. Hence, the environmental values of these KEFs are not expected to be impacted.

Protected species

Cetaceans

A range of cetaceans were identified as potentially occurring within the Operational Area and wider EMBA (Section 4.6.3). In the event of a loss of well containment, surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for oceanic cetacean species and the migratory routes and BIAs of cetaceans considered to be MNES, including humpback whales, southern right whales, sperm whales, pygmy blue whales (northbound and southbound migrations), Australian snubfin dolphins, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins.

Cetaceans that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and

inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts and organs, impairment of the immune system, neurological damage (Helm et al., 2015), reproductive failure, adverse health effects (e.g. lung disease, poor body condition) and potentially mortality (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016).

Given the relatively low volatile fractions of the hydrocarbons, the area where potential impacts from inhalation may occur is expected to be localised around the release location. In a review of cetacean observations in relation to large scale hydrocarbon spills, it was concluded that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (Deepwater Horizon Natural Resource Damage Assessment Trustees, 2016). Long-term population level impacts to killer whales have been linked to the Exxon Valdez tanker spill (Matkin et al., 2008). Geraci (1988) has identified behavioural disturbance (i.e. avoiding spilled hydrocarbons) in some instances for several species of cetacean, suggesting that cetaceans have the ability to detect and avoid surface slicks.

However, observations during spills have recorded larger whales (both mysticetes and odontocetes) and smaller delphinids travelling through and feeding in oil slicks. During the Deepwater Horizon spill, cetaceans were routinely seen swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al., 2017).

Cetacean populations that are resident within the EMBA may be susceptible to impacts from spilled hydrocarbons if they interact with an area affected by a spill. Such species are more likely to occupy coastal waters (refer to the Mainland and Islands section below for additional information). Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins (e.g. spinner dolphin) is broadly distributed throughout the region and as such, however impacts are unlikely to affect an entire population. Other species identified in Section 4.6.3 may also have possible transient interactions with the EMBA.

Pygmy blue whale and humpback whale

Pygmy blue whales and humpback whales are known to migrate seasonally through the wider EMBA, and the migration BIAs in the region for both species overlap the Operational Area. A major spill in May to November would coincide with humpback whale migration through the waters off the Pilbara, North West Cape and Shark Bay. A major spill in April to August or October to January would coincide with pygmy blue whale migration. Both pygmy blue and humpback whales are baleen whales, so are most likely to be significantly impacted by toxic effects when feeding. However, feeding during migrations is low level and opportunistic, with most feeding for both species in the Southern Ocean.

The entrained hydrocarbon EMBA includes pygmy blue whale foraging BIAs (closest being the Ningaloo Coast (approximately 14 km from Operational Area), humpback whale resting BIA at Exmouth Gulf (approximately 23 km away), southern right whale calving BIA at Perth coast (approximately 1108 km away), and sperm whale foraging BIA at Perth Canyon (approximately 1120 km away). Furthermore, the foraging, breeding and calving BIAs for the Australian snubfin dolphin, Indo-Pacific humpback dolphin and Indo-Pacific/spotted bottlenose dolphins (closest being Roebuck Bay for all, approximately 910 km) were identified within the entrained hydrocarbon EMBA. Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the risk of ingestion of hydrocarbons is low. Migrations of both pygmy blue whales and humpback whales are protracted through time and space (i.e. the whole population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population). The humpback whale resting area in Exmouth Gulf and the calving area in Camden Sound are not predicted to be contacted by surface, entrained or dissolved hydrocarbons above threshold concentrations.

A loss of well containment resulting in a well blowout could disrupt a significant portion of the humpback or pygmy blue whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sublethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact the overall population viability of cetaceans, given the global distribution of these species.

Physical contact with hydrocarbons to these species is likely to have biological consequences, however, it is unlikely to affect an entire population and not predicted to impact on the overall population viability. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Entrained hydrocarbons may also be ingested, particularly by baleen whales which feed by filtering large volumes of water.

Dugongs

The following BIAs are present within the EMBA for the dugong in proximity to the North West Cape: calving, breeding, foraging (high density seagrass beds) and nursing.

Summary

A worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to offshore cetacean species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Pinnipeds

Australian sea lions are found on and around the Abrolhos Islands, distant from the Operational Area, but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the time for floating and entrained hydrocarbons to contact (35 and 32 days respectively), entrained and floating hydrocarbons that do reach this area are likely to be weathered. There is the potential for sea lions to interact with floating and stranded hydrocarbons. This may result in diminished ability to thermoregulate due to the loss of insulation, potentially resulting in mortality. Potential impacts are expected to be minor and temporary at a population scale.

Marine turtles

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (NOAA, 2010). Contact with surface slicks, or entrained hydrocarbon, can therefore result in hydrocarbon adherence to body surfaces (Gagnon & Rawson, 2010) causing irritation of mucous membranes in the nose, throat and eyes, leading to inflammation and infection (NOAA, 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al., 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of their salt gland (Lutcavage et al., 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton & Lutz, 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (NOAA, 2010). Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon & Rawson, 2010).

Due to the absence of potential nesting habitat and location offshore, the Operational Area is unlikely to represent important habitat for marine turtles.

It is acknowledged that foraging marine turtles may be present foraging within the EMBA, and the EMBA would overlap with the BIAs identified in Section 4 and Appendix F, in particular the internesting BIAs and critical habitats for flatback turtles which extend for ~80 km from known nesting locations. It is noted by Woodside that the Petroleum Activity will overlap nesting seasons for marine turtles in the region.

In the event of a well blowout, there is potential that surface, entrained and dissolved hydrocarbons exceeding threshold concentrations will be present in offshore waters extending up to 950 km, 1,550 km and 1,250 km, respectively, from the release site. Therefore, a hydrocarbon spill may disrupt a portion of the population; however, there is no anticipated threat to overall population viability.

Potential impacts to nesting and inter-nesting marine turtles are discussed in the Mainland and Islands (nearshore) impacts discussion.

Summary

In the event of a loss of well containment, there is potential that surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations will be present in offshore waters. Therefore, a hydrocarbon spill may disrupt a portion of marine turtle populations for the green, flatback, hawksbill, loggerhead and/or leatherback turtle. However, there is considered to be no threat to overall population viability given the non-persistent nature of predicted hydrocarbons.

Seasnakes

Impacts to seasnakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles. They may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (ITOPF, 2011a). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, seasnakes frequent the waters of the continental shelf area around offshore islands and potentially submerged shoals (water depths <100 m; see Submerged Shoals below). It is acknowledged that seasnakes may be present in the Operational Area and are present in the wider EMBA; however, their abundance is not expected to be high in the deep water and offshore environment. Therefore, a hydrocarbon spill may disrupt a portion of seasnake populations, but there is no threat to overall population viability given their widespread distribution in tropical waters.

Sharks and rays

Hydrocarbon contact may affect whale sharks through ingestion (entrained/dissolved hydrocarbons), particularly if feeding. Whale sharks may transit offshore open waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July (see Mainland and islands (nearshore waters) below).

Whale sharks may also carry out opportunistic feeding in offshore waters and the Operational Area. The EMBA overlaps the whale shark migration and foraging BIA identified in Section 4.6.1 and Appendix F, within which whale sharks are seasonally present between April and October. Therefore, individual whale sharks that have direct contact with hydrocarbons within the spill-affected area may be impacted, but the consequences to migratory whale shark populations are likely to be minor. White sharks have foraging BIAs within the Southwest region that may be impacted by the hydrocarbon EMBA.

Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs, either through direct contact or via the food chain (consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Therefore, any impact on sharks and rays is predicted to be minor and only a temporary disruption.

Seabirds

Offshore waters are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat (e.g. Ningaloo, Muiron Islands and the Barrow/Montebello/Lowendal Island Group). There are confirmed foraging grounds off Ningaloo and the Barrow/Montebello/Lowendal Island Group. A BIA for the wedge-tailed shearwater (peak use August to April) overlaps with the Operational Area.

There are also a number of BIAs for seabirds and migratory shorebirds that overlap with the wider EMBA, as provided in Section 4.6.4 and Appendix F.

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan & Javed, 2011). Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons. Physical contact of seabirds with surface slicks is by several exposure pathways, primarily immersion, ingestion and inhalation. Such contact with hydrocarbons may result in plumage fouling and hypothermia (loss of thermoregulation), decreased buoyancy and potential to drown, inability to fly or feed, anaemia, pneumonia and irritation of eyes, skin, nasal cavities and mouths (AMSA, 2013; International Petroleum Industry Environmental Conservation Association (IPIECA), 2004), and result in mortality due to oiling of feathers or the ingestion of hydrocarbons. Longer term exposure effects that may potentially impact seabird populations include a loss of reproductive success (loss of breeding adults) and malformation of eggs or chicks (AMSA, 2013).

A hydrocarbon spill may result in surface slicks disrupting a significant portion of the foraging habitat for seabirds, including BIAs identified for foraging birds which are generally associated with breeding habitat, and seabirds foraging in waters in proximity to these sites. Seabird distributions are typically concentrated around islands, so hydrocarbons in proximity to nesting/roosting areas may result in increased numbers of seabirds being impacted, with many species of seabirds, such as the wedge-tailed shearwater and species of tern, forage relatively close to breeding islands/colonies. This may lead to impacts upon foraging seabirds in the offshore environment; however, this is not expected to result in a threat to the overall population viability, given the relatively broad distributions of the seabird species.

Nearshore waters (mainland and island)

Marine sediment quality

Entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Shoreline hydrocarbons may also reach a number of islands. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Protected species

Cetaceans

Coastal populations of small cetaceans are known to reside or frequent nearshore waters, including the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Island Groups, Shark Bay, and a number of other nearshore and coastal locations including coastal areas of the Indonesian archipelago which may be potentially impacted by surface, entrained and dissolved hydrocarbons exceeding threshold concentrations in the event of a loss of well containment.

The predicted EMBA for surface, entrained and dissolved hydrocarbons extends past Exmouth Gulf and Shark Bay. These areas are known humpback whale aggregation areas during their annual southern migration (September to December); therefore, humpbacks moving into these aggregation areas may be exposed to hydrocarbons above thresholds levels. However, surface, entrained and dissolved hydrocarbons concentrations above thresholds are not expected within Exmouth Gulf itself. No floating hydrocarbon contact at or above threshold concentrations is expected for Camden Sound, an important calving area for humpback whales.

The potential impacts of exposure are as discussed previously in Offshore – cetaceans. However, nearshore populations of cetaceans are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Nearshore dolphin species (e.g. spotted bottlenose dolphins) may exhibit higher site fidelity than oceanic species, although Geraci (1988) observed relatively little impacts beyond behavioural disturbance. Resident cetacean populations (e.g. numerous dolphin species) known to inhabit nearshore waters with the EMBA for surface hydrocarbons, such as the Laut Sawu Marine National Park, may experience impacts on feeding habitats that could disrupt a portion of the local population, but is not predicted to result in impacts on overall population viability of either dugongs or resident/coastal cetaceans.

A hydrocarbon spill may disrupt a portion of a migratory cetacean population in Indonesian waters, including blue whale and sperm whale populations. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation) and, in rare circumstances, death. However, such disruptions or impacts are not predicted to impact on the overall population viability of migratory cetaceans within Indonesian waters.

Dugongs

Potential environment impacts may include the potential for dugongs to ingest hydrocarbons when feeding on oiled seagrass stands, or indirect impacts to dugongs due to loss of this food source due to dieback in worse affected areas. Furthermore, nearshore populations of dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning.

Hydrocarbon spill modelling indicates that surface hydrocarbons exceeding threshold concentrations may extend into the Lesser Sunda and Southern Java ecoregions of Indonesia, potentially exposing migratory and resident dugongs.

Summary

A hydrocarbon spill may have an impact on feeding habitats and disrupt a significant portion of the local population, but it is not predicted to result in impacts on overall population viability of either dugongs or coastal cetaceans.

Pinnipeds

Australian sea lions are found in the Houtman Abrolhos Islands Nature Reserve and Ngari Capes Marine Park, distant from the Operational Area but within the wider EMBA. Given the considerable distance from the Operational Area to these receptors, and the lengthy time for surface and entrained hydrocarbons to contact (minimum 25 days for the Abrolhos Islands), surface or entrained hydrocarbons that do reach this area are likely to be weathered.

Hydrocarbons accumulating on shorelines at haul-out locations may result in oiling of sea lions. Oiling may inhibit the ability for sea lions to thermoregulate, potentially resulting in mortality through hypothermia. Oiled sealions may also ingest hydrocarbons when attempting to clean themselves, potentially resulting in toxic effects.

Marine turtles

Several marine turtle species utilise nearshore waters and shorelines for foraging and breeding (including inter-nesting), with significant nesting beaches along the mainland coast and islands in potentially impacted locations such as the Ningaloo Coast, Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Islands (Northern and Southern Island Groups), Shark Bay, Scott Reef, Ashmore Reef and the southern Indonesian archipelago. There are distinct breeding seasons as detailed in Section 4. The nearshore waters of these turtle habitat areas may be exposed to surface, entrained or dissolved hydrocarbons exceeding threshold concentrations, and accumulated hydrocarbons above threshold concentrations.

The behaviour and biology of marine turtles makes these species relatively vulnerable to population-scale impacts compared to other fauna, such as dugongs. All species of marine turtles exhibit high nesting site fidelity by females, with gene flow between populations primarily mediated by movements of male turtles (FitzSimmons et al., 1997). Additionally, marine turtles rely on nesting beaches to reproduce, which makes them vulnerable to impacts from spilled hydrocarbon accumulations on shorelines through oiling of nesting females and emergent hatchlings, and disturbance of nests from spill response activities (Lauritsen et al., 2017). A spill during nesting and hatching season poses an increased risk to marine turtle populations.

A number of BIAs have been identified for marine turtles, including aggregation, nesting, internesting, mating and foraging areas. A hydrocarbon spill above impact thresholds in these areas may result in impacts to biologically important behaviours. During the breeding season, turtle aggregations near nesting beaches within the wider EMBA are most vulnerable due to greater turtle densities, and potential impacts may occur at the population level of some marine turtle species.

The islands within the Lesser Sunda and Southern Java Ecoregions provide habitat for marine turtles, with the Laut Sawu Marine National Park in particular identified as providing habitat for five species of marine turtles – green, leatherback, olive ridley, loggerhead and flat back turtles. The potential impacts to marine turtles in Indonesian waters contacted by the surface hydrocarbon EMBA and those contacted by accumulated hydrocarbons on shorelines are likely to be similar to those described above for Offshore – marine turtles and Mainland and islands (nearshore waters) – marine turtles.

The potential impacts of exposure are as discussed previously in Offshore – marine turtles. In the nearshore environment, turtles can ingest hydrocarbons when feeding (e.g. on oiled seagrass stands/macroalgae), or can be indirectly affected by loss of food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon & Rawson, 2010). In addition, hydrocarbon exposure can impact turtles during the breeding season at nesting beaches. Contact with gravid adult females or hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact.

Results from studies of nesting beaches subject to extensive oil pollution from the Deepwater Horizon spill indicated a significant reduction (approximately 44%) in turtle nest density during the nesting season immediately following the spill (Lauritsen et al., 2017). Lauritsen et al. (2017) partially attributed this reduction to direct (e.g. direct mortality of adults due to oiling or toxicity) and indirect (e.g. shoreline disturbance from response activities) impacts from the spill. There was a significant increase in nesting density in the years immediately following the spill, with nesting density returning to levels comparable to pre-spill densities within two nesting seasons (Lauritsen et al., 2017). This indicates

that adult female turtles that avoided mortality may have deferred nesting during the spill until subsequent years. The significant decline in nesting density observed following the Deepwater Horizon spill represents a decline of approximately 36% of reproductive output of the turtle population in the study area (Lauritsen et al., 2017); given turtles may take over a decade to reach sexual maturity, the effects of such a reduction in reproductive output may take over a decade to appear in nesting related metrics (which are commonly used to monitor turtle populations).

Based on the deterministic modelling results and the potential for impact and recovery of turtles, a worst-case hydrocarbon spill from a loss of well containment may result in reduced turtle numbers and nesting density; however, it would not be expected to result in elimination of a population. Impacts and subsequent recovery may take decades to occur. To date, no oil spills have been demonstrated to have resulted in elimination of a turtle population at any scale (Yender & Mearns, 2010). Disastrous spills impacting important turtle habitat (including nesting areas) have not been shown to eliminate turtle populations, although direct and indirect impacts have been documented (e.g. Lauritsen et al., 2017; McDonald et al., 2017; Stacy et al., 2017; Vander Zanden et al., 2016). Turtle populations have been shown to be able to recover, even when populations have been reduced to small sizes after experiencing significant declines (Mazaris et al., 2017). As such, population scale impacts to marine turtles from a worst-case loss of well containment would be expected to exhibit recovery, although may take several decades to reach pre-impact population levels due to the relatively long lifespan and late sexual maturity of marine turtle species.

Seasnakes

Impacts to sea snakes for the mainland and island nearshore waters from direct contact with hydrocarbons may occur and may include potential damage to the dermis and irritation to mucous membranes of the eyes, nose and throat (ITOPF, 2011a).

Fish

Fish (and other commercially targeted taxa) in their early life stages (eggs, larvae and juveniles) are at their most vulnerable to lethal and sub-lethal impacts from exposure to hydrocarbons, particularly if a spill coincides with spawning seasons or reaches nursery areas close to the shore (e.g. seagrass and mangroves) (ITOPF, 2011a). Fish spawning (including for commercially targeted species such as snapper and mackerel) occurs in nearshore waters at certain times of the year, and nearshore waters are also inhabited by higher numbers of juvenile fishes than offshore waters.

Modelling indicated that, in the unlikely event of a major spill, there is potential for entrained or dissolved hydrocarbons to occur in the surface water layers above threshold concentrations in nearshore waters (e.g. Ningaloo Coast, the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern and Northern Islands Groups, Shark Bay and the Abrolhos Islands). This has the potential to result in lethal and sublethal impacts to a portion of fish larvae in areas contaminated above impact thresholds, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. Although there is the potential for spawning/nursery habitat to be impacted (e.g. mangroves and seagrass beds, discussed above), losses of fish larvae in worst affected areas are unlikely to be of major consequence to fish stocks compared with significantly larger losses through natural predation, and the likelihood that most nearshore areas would be exposed is low (i.e. not all areas in the region would be affected). This is supported by a recent study in the Gulf of Mexico which used juvenile abundance data, from shallow-water seagrass meadows, as indices of the acute, population-level responses of young fishes to the Deepwater Horizon spill. Results indicated that there was no change to the juvenile cohorts following the Deepwater Horizon spill. Additionally, there were no significant post-spill shifts in community composition and structure, nor were there changes in biodiversity measures (Fodrie & Heck, 2011). Any impacts to spawning and nursery areas are expected to be minor and short term, as would flow-on effects to adult fish stocks into which larvae are recruited.

Sharks and rays

Whale sharks and manta rays are known to frequent the Ningaloo Reef system and the Muiron Islands (forming feeding aggregations in late summer/autumn). The Indonesian islands of Komodo and Nusa Penida, Bali are also known to host significant manta ray populations.

Whale sharks and manta rays generally transit along the nearshore coastline and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding. Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman & Wilson, 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive sub-surface ram-feeding and active surface feeding (Taylor, 2007). Passive feeding consists of swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (Taylor, 2007). These feeding methods would result in the potential for individuals that are present in worst affected spill areas to ingest potentially toxic amounts of surface, entrained or dissolved aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect their endocrine and immune system in the longer term. The presence of hydrocarbons may displace whale sharks from the area where they normally feed and rest, and potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by surface, entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are fish eggs and phytoplankton which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If the spill event were to occur during the spawning season, this important food supply (in worse spill affected areas of the reef) may be diminished or contaminated. The

contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long term impacts as a result of bioaccumulation.

There is the potential for other resident shark and ray (e.g. sawfish species identified in Section 4.6.1) populations to be impacted directly from hydrocarbon contact or indirectly through contaminated prey or loss of habitat. However, it is probable that shark species will move away from the affected areas.

Shark populations displaced or no longer supported due to habitat loss would be expected to redistribute to other locations. Therefore, the consequences to resident shark and ray populations (if present) from loss of habitat, may result in a disruption to a significant portion of the population; however, it is not expected to impact the overall viability of the population.

Seabirds

There is the potential for seabirds, and resident, non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to surface, entrained and dissolved hydrocarbons. This could result in lethal or sublethal effects. Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in waters near their breeding colony. This results in relatively higher seabird densities in these areas during the breeding season, making these areas particularly sensitive in the event of a spill.

Pathways of biological exposure that can result in impact may occur through ingestion of contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs). Ingestion can also lead to internal injury to sensitive membranes and organs (IPIECA, 2004). Whether the toxicity of ingested hydrocarbons is lethal or sublethal will depend on the weathering stage and its inherent toxicity.

Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds.

Important areas for foraging seabirds and migratory shorebirds are identified in Section 4.6.4. Suitable habitat or seabirds and shorebirds are broadly distributed along the mainland and nearshore island coasts within the EMBA. Of note are important nesting and resting areas, including (refer to Section 4.6.4 for additional information, including BIAs within the wider EMBA):

- Muiron Islands
- Ningaloo Coast
- North West Cape
- Montebello/Barrow/Lowendal Islands Group (including known nesting habitats on Boodie, Double and Middle Islands)
- Pilbara Islands North and South Island Group
- Shark Bay
- Abrolhos Islands
- Ashmore Reef.

Therefore, a hydrocarbon spill may impact key feeding habitat and disrupt a significant portion of the habitat; however, this is not expected to threaten the overall population viability of seabirds or shorebirds.

Submerged shoals and banks

Protected species

Marine turtles

There is the potential for marine turtles to be present at submerged shoals such as Ningaloo Reef, Exmouth Reef Montebello Shoals, Barrow Island and Rowley Shoals. These shoals and banks may, at times, be foraging habitat for marine turtles, given the coral and filter feeding biota associated with these areas. Satellite tracking of individual green turtles in the nearshore environment of the NWS did not indicate any overlap of the tracked post-nesting migratory routes and the Operational Area. It is, however, acknowledged that individual marine turtles may be within the surrounding areas. Therefore, a hydrocarbon spill may have a minor disruption to a portion of the population (see offshore description above); however, there is no threat to overall population viability.

Seasnakes

There is the potential for seasnakes to be present at submerged shoals such as Exmouth Reef and Barrow Islands Reefs and Shoals. The potential impacts of exposure are as discussed previously in Offshore – seasnakes.

A hydrocarbon spill may disrupt a portion of the population but there is no threat to overall population viability. Seasnake species in Australia generally show strong habitat preferences (Heatwole & Cogger, 1993); species that have preferred habitats associated with submerged shoals and oceanic atolls may be disproportionately affected by a hydrocarbon spill affecting such habitat.

Sharks and rays

There is the potential for resident shark and ray populations to be impacted directly from hydrocarbon contact, or indirectly through contaminated prey or loss of habitat. Spill model results indicate potential impacts to the benthic communities of Barrow Islands Reefs and Shoals and Ningaloo Reef (modelling showed contact by entrained or dissolved hydrocarbons above threshold concentrations).

Pelagic sharks and rays are expected to move away from areas affected by spilled hydrocarbons. Impacts to such species are expected to be limited to behavioural responses/displacement. Shark and ray species that have associations with submerged shoals and oceanic atolls may not move in response to such habitat being contacted by spilled hydrocarbons. Such species may be more susceptible to a reduction in habitat quality resulting from a hydrocarbon spill. Impacts to sharks and rays are likely to be localised, as they are comparable to other Australian reefs and the NWMR submerged shoals and banks. It is expected that there will be no impacts at the population level.

All settings**Coral reefs****Receptors**

The quantitative spill risk assessment and EMBA indicate there would be potential for coral reef habitat to be exposed to surface, dissolved and entrained hydrocarbons. There would be potential for surface, entrained and dissolved hydrocarbons above threshold concentrations to reach reef habitat along the Ningaloo coast and at identified offshore islands such as the Muiron Islands, Montebello/Barrow/Lowendal Islands Group, Pilbara Southern Islands Group, Shark Bay, Abrolhos Islands, Ashmore Reef and southern Indonesian islands.

Impacts

The shallow coral habitats are most vulnerable to hydrocarbon coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are also known to cause high coral mortality via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species) (Shigenaka, 2001). The duration of surface slick contact with the reef flat may be reduced, as the slick will likely be lifted off the reef by the flooding tide; however, exposure will be prolonged where hydrocarbons adhere. There is significant potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. This particularly applies to branching corals, which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons (≥ 100 and >50 ppb, respectively) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column, including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities (with reference to Ningaloo Coast). Mortality in a number of coral species is possible, and this would result in the reduction of coral cover and change in the composition of coral communities. Sub-lethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri & Heyward, 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Muiron Islands, Barrow/Montebello/Lowendal Islands, Pilbara Southern and Northern Island Groups and Abrolhos Islands) and also the mainland coast (e.g. Ningaloo coast and Shark Bay).

With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained and dissolved hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor & Pearce, 1999).

Shoreline accumulation

As mentioned, shoreline accumulation was modelled to occur at a number of receptors. Shallow coral habitats (i.e. nearshore and intertidal waters) are most vulnerable to hydrocarbons through coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are known to cause high coral mortality (Shigenaka, 2001) via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species). There is, therefore, potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos by entrained hydrocarbons, with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. These impacts are particularly applicable to branching corals which are reported to be more sensitive than massive corals (Shigenaka, 2001).

Recruitment/spawning

In the unlikely event of a spill occurring at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri & Heyward, 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained and dissolved aromatic hydrocarbons, resulting in sub-lethal impacts and in some cases mortality. This is with particular reference to the early life-stages of

coral reef animals (reef attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide-ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will be entirely dependent on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities.

Over the worst affected sections of reef habitat, coral community live cover, structure and composition is predicted to reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood, 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al., 2013).

Therefore, a hydrocarbon spill may result in large-scale impacts to coral reefs, particularly Ningaloo Reef, with long-term effects (recovery >10 years) likely.

Submerged shoals

The waters overlying the submerged Ningaloo Reef, North West Reef and Tryal Rocks have medium to high probability to be exposed to entrained hydrocarbons above threshold concentrations (at or greater than 100 ppb). These permanently submerged habitats represent sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Potential biological impacts could include sub-lethal stress and, in some instances, total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species. Other submerged shoals and banks within the wider EMBA (e.g. Barrow Island reefs and shoals, Exmouth Reef, Montebello shoals) are also predicted to be exposed to entrained or dissolved hydrocarbons above threshold concentrations, just at a lower probability. These submerged shoals and banks are also likely to be exposed to floating hydrocarbons above impact thresholds. Although the waters above these shoals may be contacted by surface slicks, any entrainment of surface hydrocarbons is likely to be restricted to the first few metres of the water column and is considered to pose limited potential for impact to marine primary producer habitats at these locations.

Non-biogenic reefs

The reef communities fringing the Pilbara region (e.g. Pilbara islands) may be exposed to surface or entrained hydrocarbons (at or above threshold concentrations) and consequently exhibit lethal or sub-lethal impacts resulting in partial or total mortality of keystone sessile benthos, particularly hard corals; thus, potential community structural changes to these shallow, nearshore benthic communities may occur. If these reefs are exposed to entrained or dissolved hydrocarbons, impacts are expected to result in localised long-term effects.

Productivity

Primary production by plankton (triggered by sporadic upwelling events in the offshore waters) is an important component of the primary marine food web. Planktonic communities are generally mixed, including phytoplankton (cyanobacteria and other microalgae), secondary consuming zooplankton (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton).

Exposure to hydrocarbons in the water column can result in changes in species composition, with declines or increases in one or more species or taxonomic groups (Batten et al., 1998). Phytoplankton may also experience decreased rates of photosynthesis (Tomajka, 1985). For zooplankton, direct effects of contamination may include suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation. Impacts on plankton communities are likely to occur in areas where surface, entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover, with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (ITOPF, 2011a).

Nearshore waters and adjacent offshore waters surrounding the offshore islands (e.g. Muiron Islands, Montebello/Barrow/Lowendal Islands Group) and to the west of the Ningaloo Reef system are also known locations of seasonal upwelling events and productivity. The seasonal productivity events are critical to krill production, which supports megafauna aggregations such as whale sharks and manta rays in the region. This has the potential to result in lethal and sub-lethal impacts to a certain portion of plankton in affected areas, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. The submerged shoals of Ningaloo Reef and North West Reef are areas associated with sporadic upwelling and associated primary productivity events. Stochastic spill model results predict entrained hydrocarbons (at or above the 100 ppb threshold) may reach these shoals. However, recovery would occur. Therefore, any impacts are likely to be temporary and on exposed planktonic communities present in the EMBA.

Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population, but would not affect the longer-term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be temporary and localised at the shoals.

Filter feeders

Hydrocarbon exposure to filter-feeding communities (e.g. deepwater communities 20 THE 200 m) and nearshore filter feeders that are present (shallower water <20 m) may potentially be impacted by entrained/dissolved hydrocarbons.

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons (≥ 100 and ≥ 50 ppb, respectively) has the potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al., 2012). Any impacts may result in localised long-term effects to community structure and habitat.

Offshore filter-feeding communities, include such as communities around Ningaloo Reefs or on hard substrate associated with the Canyons linking the Cuvier Abyssal Plain and Continental Slope Demersal Fish Communities KEF or other locations may be impacted depending on the depth of exposure. Nearshore filter feeder communities identified within the Ningaloo Marine Park (approximately 8 km from the Operational Area) may be exposed to hydrocarbons. Such impacts may result in localised, long-term effects to community structure and habitat.

Seagrass beds, macroalgae and mangroves

Spill modelling has predicted that surface, entrained and dissolved hydrocarbons above threshold concentrations have the potential to contact a number of shoreline sensitive receptors, such as those supporting biologically diverse, shallow subtidal and intertidal communities. The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Depending on the trajectory of the surface and entrained/dissolved plume, macroalgal/seagrass communities including the Ningaloo Coast (patchy and low cover associated with the shallow limestone lagoonal platforms), Muiron Islands (associated with limestone pavements), the Barrow/Montebello/Lowendal Islands, Shark Bay, the Pilbara Southern Island Group (documented as low and patchy cover), the Northern Island Group, the Abrolhos Islands, the Kimberley Coast, Ashmore Reef and southern Indonesian islands have the potential to be exposed.

Seagrass in the subtidal and intertidal zones have different degrees of exposure to hydrocarbon spills. Subtidal seagrass is generally considered much less vulnerable to surface oil spills than intertidal seagrass, primarily because freshly spilled hydrocarbons, including crude oil, float under most circumstances. Dean et al. (1998) found that oil mainly affects flowering, therefore, species that are able to spread through apical meristem growth are not as affected (such as *Zostera*, *Halodule* and *Halophila* species).

Seagrass in the intertidal zone is particularly vulnerable, as it may come into direct contact with surface hydrocarbons, as well as entrained components, which can smother and kill seagrasses if it coats the leaves and stems (Taylor & Rasheed, 2011). This conclusion is supported by Howard et al. (1989) who noted that surface hydrocarbon spills which become stranded on the seagrass and smother it during the rise and fall of the tide can result in reduced growth rates, blackened leaves and mortality. Wilson & Ralph (2011) concluded that long-term impacts to seagrass are unlikely unless hydrocarbon is retained within the seagrass meadow for a sustained duration.

Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al., 2010). The potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should serve to lower the content of soluble aromatic components before contact occurs. Exposure to entrained/dissolved aromatic hydrocarbons may result in mortality, depending on actual entrained/dissolved aromatic hydrocarbon concentration received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sub-lethal stress, causing reduced growth rates and a reduction in tolerance to other stress factors (Zieman et al., 1984).

Mangrove habitat and associated mud flats and salt marsh at Ningaloo Coast (small habitat areas), the Pilbara islands, the Montebello Islands and southern Indonesian islands were identified within the EMBA. Hydrocarbons coating prop roots of mangroves can occur from surface hydrocarbons when hydrocarbons are deposited on the aerial roots. Hydrocarbons deposited on the aerial roots can block the pores used to breathe or interfere with the trees' salt balance, resulting in sub-lethal and potential lethal effects. Mangroves can also be impacted by entrained/dissolved aromatic hydrocarbons that may adhere to the sediment particles. In low energy environments such as in mangroves, deposited sediment-bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (NOAA, 2014). The hydrocarbons comprise a proportion of persistent residual fractions; therefore, deposited hydrocarbons are likely to persist in the sediment, potentially causing chronic sub-lethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from oil spills can take 20 to 30 years (NOAA, 2014); therefore, recovery from any impacts would be long-term (>10 years).

Sandy shores/estuaries/tributaries/creeks (including mudflats)/rocky shores

Shoreline exposure for the upper and lower areas differ. The upper shore has the potential to be exposed to surface slicks, while the lower shore is subjected to dissolved or entrained oil.

Potential impacts may occur due to surface hydrocarbon contact with intertidal areas, including sandy shores, mudflats and rocky shores. Hydrocarbons at sandy shores are incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores (IPIECA, 2000). Hydrocarbons in the intertidal zone can adhere to sand particles; however, high tide may remove some or most of the hydrocarbons back out of the sediments. Typically, hydrocarbons are only incorporated into the surface layers to a maximum of 10 cm (IPIECA, 2000). It is predicted that a number of sandy shores along the coastline may have accumulated hydrocarbons ≥ 100 g/m². As described earlier, accumulated hydrocarbons ≥ 100 g/m² could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. The persistence of the hydrocarbons will be dependent on the wave exposure, but can be months to years.

The impact of oil on rocky shores is largely dependent on the incline and energy environment. On steep/vertical rock faces on wave exposed coasts, there is likely to be no impact from a spill event. However, a gradually sloping boulder shore in calm water can potentially trap large amounts of oil (IPIECA, 2000). The impact of the spill on marine organisms along the rocky coast will be dependent on the toxicity and weathering of the hydrocarbon. Similar to sandy shores, accumulated hydrocarbons ≥ 100 g/m² could coat the epifauna along rocky coasts and impact the reproductive capacity and survival. Intertidal mudflats are susceptible to potential impacts from hydrocarbons, as they are typically low energy environments and therefore trap oils. Intertidal mudflats have been identified in the EMBA along the Ningaloo coast, Pilbara coastline and as far north as Indonesia. The extent of oiling is influenced by the neap and spring tidal cycle, and seasonal highs and lows affecting mean sea level. Potential impacts to tidal flats include heavy accumulations covering the flat at low tide; however, it is unlikely that oil will penetrate the water-saturated sediments. However, oil can penetrate fine sediments through animal burrows and root pores. It has been demonstrated that infaunal burrows allow hydrocarbons to enter subsurface sediments, where it can be retained for months.

The toxicity of stranded surface hydrocarbons and the in-water toxicity of the entrained or dissolved hydrocarbons reaching the shorelines will determine impacts to marine biota such as sessile barnacle species and/or mobile gastropods and crustaceans such as amphipods. Lethal and sub-lethal impacts may be expected where the entrained or dissolved hydrocarbon concentration threshold is >100 or >50 ppb, respectively. Impacts may result in localised changes to the community structure of these shoreline habitats, which would be expected to recover in the medium term (two to five years).

Indonesian waters – all settings**Coral reef**

The fringing coral reefs of the islands of the Lesser Sunda and Southern Java ecoregions may be impacted by surface and accumulated hydrocarbons at or above threshold levels in the event of loss of well containment. The potential impacts on shallow water coral reef systems are discussed above for Mainlands and islands (nearshore waters) – coral reef. There is the potential for lethal impacts due to the physical hydrocarbon coating of coral reef systems, with likely mortality of corals (adults, juveniles and established recruits) at areas contacted by surface hydrocarbons above threshold concentrations.

Seagrass beds/macroalgae and mangroves

Seagrass meadows, macroalgae and mangroves in the intertidal and subtidal habitats of the islands of the Lesser Sunda and Southern Java ecoregions all have the potential to be contacted by surface hydrocarbons exceeding threshold levels, in the unlikely event of a loss of well containment. The potential impacts on these habitats and communities are discussed above for Mainland and islands (nearshore waters).

Open water – productivity/upwelling

Floating hydrocarbons are the only fraction identified by stochastic modelling as potentially reaching Indonesian waters above impact thresholds. Given the distance between the release location and sensitivities in Indonesia, any hydrocarbons reaching Indonesian waters will be highly weathered. The majority of soluble and volatile components of the hydrocarbon will have been lost prior to reaching Indonesian waters.

The Lesser Sunda and Southern Java ecoregions of Indonesia experience seasonal upwellings that support megafauna such as migratory cetacean species. The potential impacts to cetaceans from surface hydrocarbons are discussed above in Offshore – cetaceans and Mainland and islands (nearshore waters) – cetaceans.

Mantra rays and whale sharks attracted to seasonal upwellings may experience indirect impacts if the spill was to coincide with a seasonal event such as plankton aggregations. However, surface slicks that have not entered the water column by entrainment or dissolution are unlikely to have a significant impact on plankton populations, as only a small proportion of the population will be close to the surface. The main pathways for direct exposure and contamination of plankton are digestion and transport of hydrocarbon particles through the gut (Gajbhiye et al., 1995), and exposure to OIW emulsions which adhere to the external body wall or gills. Both these pathways are unlikely to result from surface hydrocarbons. Therefore, significant impacts on open water productivity and upwelling in Indonesian waters are considered unlikely.

Spawning/nursery areas

As discussed for Indonesia – pelagic fish, there is the potential for intertidal nursery areas such as mangroves and seagrass meadows to be contacted by surface hydrocarbons at or above threshold concentrations, potentially leading to impacts such as smothering of mangroves and seagrasses. Impacts to mangroves and seagrasses may result in indirect impacts to early life stages of marine fauna species (such as fish species targeted by local fishers) using these habitats. Given the nature of the hydrocarbon (highly weathered, soluble and volatile components significantly diminished, etc) and the sporadic nature of shoreline/shallow water contact, impacts are expected to be localised, with no population- or ecosystem-scale impacts expected.

Nearshore filter feeders

Potential impacts to nearshore filter feeders in Indonesian waters are unlikely, given the lack of entrained or dissolved hydrocarbons, and the limited potential for surface slicks to entrain into the water column.

Sandy shores/estuaries/tributaries/creeks (including mudflats)/rocky shores

The islands of the Lesser Sunda and Southern Java ecoregions have the potential to be contacted by surface hydrocarbons and accumulated hydrocarbons above threshold levels. The potential impacts to shoreline habitats are discussed above for Mainland and islands (nearshore waters) – sandy shores/estuaries/tributaries/creeks (including mudflats)/rock shores.

Prolonged stranding of surface hydrocarbons, particularly for low energy environments such as mudflats, may lead to localised changes to the community structure of these shoreline habitats (ITOPF, 2011a) which would be expected to recover in the medium term (two to five years).

Summary of potential impacts to socio-economic values

Setting	Receptor group
All settings	Cultural heritage A number of historic shipwrecks have been identified in the vicinity of North West Cape. The spill results do not predict surface slicks contacting the identified wrecks. However, shipwrecks occurring in the subtidal zone will be exposed to entrained/dissolved hydrocarbons, and marine life that shelter and take refuge in and around these wrecks may be affected by in-water toxicity of dispersed hydrocarbons. The consequences of such hydrocarbon exposure may include large fish species moving away, and/or resident fish species and sessile benthos such as hard corals exhibiting sub-lethal and lethal impacts (which may range from physiological issues to mortality). The foreshore and hinterland of North West Cape and along the coastline to Shark Bay contain numerous Aboriginal sites such as burial grounds, middens and fish traps. Only sites that are located below the high-water mark are expected to be impacted from a spill. This could result in hydrocarbon contamination of the site, which may affect the cultural significance and traditional practices associated with the sites. Within the wider EMBA are a number of designated heritage places (Section 4.8). These places are also covered by other designations such as World Heritage Area, Marine Park and Listed Shipwreck. Potential impacts have therefore been discussed in the sections above.
Offshore waters	Fisheries – commercial The spill scenario that was modelled may cause significant direct impacts on the target species of Commonwealth and offshore State fisheries within the defined EMBA. Further details are provided within the ecological impact to fish above. Southern Bluefin Tuna, Western Skipjack Tuna, Small Pelagic, Southern and Eastern Scalefish and Shark fisheries The tuna and small pelagic fisheries target pelagic fish species. Adult fish are highly mobile and able to move away from the spill affected area or avoid the surface waters; however, hydrocarbon concentrations in the upper water column could lead to potential exposure through direct absorption of hydrocarbons, and indirectly by the consumption of contaminated prey (Merkel et al., 2012). Given these pelagic species are distributed over a wide geographical area, the impacts at the population or species level are considered minor in the unlikely event of a spill. A major loss of hydrocarbon from the Petroleum Activity may lead to an exclusion of fishing from the spill affected area for an extended period. North West Slope, Western Deepwater Trawl, and Western Tuna and Billfish fisheries The predicted EMBA resulting from an uncontrolled loss of hydrocarbon from a loss of well containment may result in direct impacts on the species fished by the North West Slope Trawl Fishery and Western Deep Trawl Fishery. These fisheries target benthic species (demersal finfish and crustaceans) in water greater than 200 m deep. The Northwest Slope Trawl Fishery targets scampi and deep-water prawns. These species are less mobile and will therefore not be able to easily move away from the location of a well blowout. Mortality/sub-lethal effects may impact

populations located close to the well blowout location. Mortality and sub-lethal effects may impact localised populations of targeted species close to the well blow out and within the EMBA for entrained/dissolved hydrocarbons (≥ 100 and ≥ 50 ppb, respectively). However, the entrained hydrocarbon is likely to be confined in the upper water column, therefore the demersal species are less likely to be exposed to hydrocarbons than pelagic species. This is particularly relevant, as the majority of the fishing effort for both these fisheries is located distant from the location of a potential well blowout. Exploited fish resources in these areas are less likely to be impacted significantly, as hydrocarbons at this distance are likely to be confined in the upper water column.

The Western Tuna and Billfish Fishery may also be impacted by the predicted EMBA. This fishery targets highly mobile, pelagic fish populations, which are able to move away from the spill affected area. However, as stated above, hydrocarbon concentrations in the upper water column could lead to potential direct and indirect exposure impacts. As these pelagic species are distributed over a wide geographical area, the impacts at the population or species level are considered minor in the unlikely event of a spill.

A major loss of hydrocarbons from the Petroleum Activity may lead to an exclusion of fishing from the spill affected area for an extended period.

State fisheries

Hydrocarbons from a major spill may impact on the area fished by multiple State fisheries within the EMBA. These fisheries generally use a range of gear types (trawl, trap and line), and operate from shallow inshore water to water depths up to 200 m, targeting demersal and pelagic finfish species and prawns. In the unlikely event of a major hydrocarbon spill, there is the potential for the targeted fish species to be exposed to entrained and/or dissolved aromatic hydrocarbons in the water column. However, the potential for direct impact would be reduced, as target species such as mackerel and snapper are likely to avoid the surface water layer underneath oil slicks. Demersal species (such as finfish and crustaceans) have limited mobility, and therefore will not be able to easily move away from a spill. Mortality/sub-lethal effects may impact populations located close to the well blowout location. The demersal and crustacean (prawn) fisheries are located over 20 km from the location of a potential well blowout. Populations in these areas are less likely to be impacted significantly, as hydrocarbons at this distance are likely to be entrained/dissolved or weathered and confined in the upper water column. A major loss of hydrocarbons from the Petroleum Activity may lead to an exclusion of fishing from the spill-affected area for an extended period.

A number of other State and Commonwealth fisheries, further afield in the EMBA, may also be affected by a major spill; however, the impacts to these far field fisheries will be similar to those described below for 'General fisheries' impacts.

Summary

Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration which removes hydrocarbons from tissues by metabolic processes, although it is dependent upon the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons, while crustaceans (such as prawns) have a reduced ability (Yender et al., 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential contamination of seafood can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al., 2002). A major spill would result in the establishment of an exclusion zone around the spill affected area. There would be a temporary prohibition on fishing activities for a period of time, and subsequent potential for economic impacts to affected commercial fishing operators.

Tourism and recreation

Recreational fishers predominantly target tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with the peak in activity between April and October (Smallwood et al., 2011) for the Exmouth region. Limited recreational fishing takes place in the offshore waters of the Operational Area. Impacts on species that are recreationally fished are described above under 'Summary of potential impacts to other species'.

A major loss of hydrocarbons from the Petroleum Activity may lead to exclusion of marine nature-based tourist activities, resulting in a loss of revenue for operators. Tourism is a major industry for the region, and visitor numbers would likely reduce if a hydrocarbon spill were to occur based on the perception of hydrocarbon spills and associated impacts resulting in moderate, medium term (five to 10 years) impacts to community and highly valued areas.

Offshore oil and gas infrastructure

In the unlikely event of a major spill, surface hydrocarbons may affect production from existing petroleum facilities (platforms and FPSOs), as well as activities such as drilling and seismic

	exploration. For example, facility water intakes for cooling and fire hydrants could be shut off, which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit activity support vessel access as well as offtake tankers approaching facilities off the North West Cape. The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and metocean conditions. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest production is the Nganhurra FPSO (operated by Woodside). Other nearby facilities include the Santos-operated Ningaloo Vision FPSO. Operation of these facilities is likely to be affected in the event of a well blowout spill.
Nearshore island and mainland coastal areas (nearshore waters)	Fisheries – commercial In the unlikely event of a loss of well containment, there is the possibility that target species in some areas utilised by a number of state fisheries could be affected, including pearl aquaculture in the North West Cape (including Exmouth Gulf) and wild oysters in the Pearl Oyster Managed Fishery that are within the nearfield EMBA, and further afield the Western Rock Lobster Fishery and a number of west coast and south coast fisheries (refer to for fisheries within the wider EMBA). Targeted fish, prawn, mollusc and lobster species and pearl oysters could experience sub-lethal stress, or in some instances mortality, depending on the concentration and duration of hydrocarbon exposure and its inherent toxicity. In addition, there is also the potential for commercial and artisanal Indonesian fisheries and aquaculture (e.g. seaweed farming) to be impacted (see above for potential impacts to seagrasses). Prawn managed fisheries In the event of a major spill, the modelling indicated the surface, entrained and dissolved EMBA may extend to nearshore waters closest to the mainland Pilbara and Gascoyne coasts, including the actively fished areas of the designated Onslow Prawn Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Broome Prawn Managed Fishery, Kimberley Prawn Managed Fishery, Nikol Bay Prawn Limited Entry Fishery and the Shark Bay Prawn and Scallop Managed Fishery, and managed prawn nursery areas. Note that the majority of the demarcated area for the prawn managed fishery in the Exmouth Gulf (proper) is outside the EMBA. Prawn habitat utilisation differs between species in the post-larval, juvenile and adult stages (Dall et al. 1990) and direct impacts to benthic habitat due to a major spill have the potential to impact prawn stocks. For example, juvenile banana prawns are found almost exclusively in mangrove-lined creeks (Rönnbäck et al., 2002), whereas juvenile tiger prawns are most abundant in areas of seagrass (Masel & Smallwood, 2000). Adult prawns also inhabit coastline areas, but tend to move to deeper waters to spawn. In the event of a major spill, a range of subtidal habitats that support juvenile prawns may be exposed to hydrocarbons above impact thresholds, including: • Muiron Islands • Montebello Islands • Barrow Island • Lowendal Islands • Pilbara Northern and Southern Island Groups • Shark Bay • Ningaloo Coast. Localised loss of juvenile prawns in worst spill affected areas is possible. Whether lethal or sub-lethal effects occur will depend on duration of exposure, hydrocarbon concentration and weathering stage of the hydrocarbon, and its inherent toxicity. Furthermore, seafood consumption safety concerns and a temporary prohibition on fishing activities may lead to subsequent potential for economic impacts to affected commercial fishing operators. Fisheries – traditional The wider EMBA intersects the formally recognised MoU Box covering Scott Reef and surrounds, Montebello Island and Ashmore Reef. Indonesian traditional fishers target trochus, sea cucumbers (holothurians), abalone, green snail, sponges, giant clams and finfish, including sharks. Impacts would be similar to those identified for commercial fishing, in the form of a potential exclusion zone and contamination/tainting of fish stocks. This may result in discarding of catch, or reduced fishing effort due to fishery closure.

	Tourism and recreation In the unlikely event of a major spill, the nearshore waters of the Ningaloo coast and shorelines further south and north (including Indonesia) could be reached by surface slicks, entrained hydrocarbons and dissolved hydrocarbons, depending on prevailing wind and current conditions. As these locations offer a number of amenities such as fishing, swimming and using beaches and surrounds, they have a recreational value for local residents and visitors (regional, national and international). If a well blowout event resulted in hydrocarbon contact, there could be restricted access to beaches for a period of days to weeks, until natural weathering, tides, currents or oil spill response (e.g. shoreline clean-up if safe to do so) removes the hydrocarbons. In the event of a well blowout, tourists and recreational users may also avoid areas due to perceived impacts, including after the oil spill has dispersed. Typically, a hydrocarbon spill that results in visible slicks in coastal waters and on shorelines will disrupt recreational activities, particularly tourism and its supporting services. In the unlikely event of a well blowout, hydrocarbons may accumulate on shorelines (at or above a set threshold), and there is potential for visible surface slicks ($<10 \text{ g/m}^2$) (i.e. a rainbow sheen) to reach sensitive receptor locations, for example, key tourist areas of the Ningaloo Coast (see Section 4.8) or the full list of receptors). As a result of surface slicks in nearshore waters and potential accumulation on beaches, it is expected that there will be a temporary cessation of all marine-based tourism activities on the spill-affected coast and wider coastal area for a period of weeks or longer, until natural weathering or tides and currents remove the hydrocarbons or clean-up operations remove beached oil. A temporary prohibition on charter boat recreational fishing trips and any other marine nature-based tourism trips to locations such as the Ningaloo Reef, Exmouth Reef Rowley Shoals, Montebello Islands may be put into effect, depending on the trajectory of the plume, resulting in a loss of revenue for operators. There is the potential for stakeholder perception that this environment will be contaminated over a large area and for the longer term, resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill related tourism impacts and found that, on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the spill, effectiveness of the spill clean-up, and change in any public misconceptions regarding the spill (Oxford Economics, 2010).
Indonesian waters	Fisheries – commercial Within the Lesser Sunda and Southern Java ecoregions, aquaculture, encompassing a variety of species and methods, contributes significantly to local employment and food production. The main species farmed are seaweed, prawns and fish. If surface hydrocarbons at or above threshold levels contact aquaculture operations, impacts are likely to include shutdown of production, contamination/tainting of product, and, in the case of seagrass potentially exposed at low tides, smothering and dieback. Indirect impacts are likely to include loss of income and economic impacts to coastal communities.
	Fisheries – traditional The Lesser Sunda and Southern Java ecoregions of Indonesia are a productive area for Indonesian artisanal fisheries. The potential impacts to these fisheries from surface hydrocarbons at or above threshold levels would be similar to those described above for Offshore and Mainland and Islands traditional and commercial fisheries and would be likely to include exclusion zones and the potential tainting/contamination of catch. Indirect impacts may include impacts to local economies of coastal communities.
	Tourism and recreation Tourism is a major industry within the Lesser Sunda and Southern Java ecoregions, with the islands of Bali, Flores, Lombok, Komodo and the Gili Islands particularly important popular tourist destinations, with beach and coastal activities primary attractions. Contact with surface or accumulated hydrocarbons above threshold levels with these areas is likely to result in similar impacts to those described above for Mainland and Islands (nearshore waters) – Tourism and Recreation and would include restricted access to beaches for a period of days to weeks or longer, and the potential for tourist perception that this environment will be contaminated over a large area and for the longer term. This could result in a potential prolonged period of tourism decline. Indirect impacts are likely to include loss of income and economic disruption to a portion of the Lesser Sunda and Southern Java ecoregions. There is also the potential for the following Indonesian Marine National Parks and National Parks to be contacted by surface and accumulated hydrocarbons at or above threshold levels:

	• Laut Sawu Marine National Park • Tanjung Tampa Nature Recreation Park. Impact on the protected areas is discussed in the sections above for ecological values and sensitivities. Additionally, such hydrocarbon contact may alter stakeholder understanding and/or perception of the protected marine environment, given these represent areas largely unaffected by anthropogenic influences and contain biologically diverse environments.

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release from loss of well containment. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: Acceptability is demonstrated with regard to the considerations below. Principles of ecologically sustainable development Woodside is a proud Australian company that is here for the long term. Woodside has a strong history of exploration and development of oil and gas reserves in the north west of WA, with an excellent environmental record while providing revenue to State and Commonwealth governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore, with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations. Woodside has established a number of research projects in order to understand the marine environments in which they operate, notably in the Exmouth region and the Kimberley region, including Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside assumes a pristine natural environment exists and therefore implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions. Woodside looks after the communities and environments in which it operates. Risks are inherent in petroleum activities; however, through sound management and systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable. Internal context The Petroleum Activity is consistent with Woodside corporate policies, standards, procedures, processes, and training requirements as outlined in the Demonstration of ALARP and EPOs, including: • Woodside Environment and Biodiversity Policy • the EPSs developed and implemented for the Pyrenees Facility • hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk, and associated impacts of the response are reduced to ALARP (Appendix H). Woodside corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions. Consultation, outlined below, has been undertaken prior to the Petroleum Activity.

External context – societal values

Woodside recognises that its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. Consultation, outlined below, has been undertaken prior to the Petroleum Activity:

Woodside has consulted with AMSA and WA DTMI on spill response strategies. A copy of the Oil Pollution First Strike Plan was provided to AMSA and DTMI.

Other relevant persons were consulted (Section 5) and their feedback incorporated into this EP where appropriate.

By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

Other requirements (includes laws, policies, standards and conventions)

The Petroleum Activity is consistent with laws, policies, standards and conventions, including:

- accepted Safety Case (as per the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009*)
- mutual aid MoU for relief well drilling is in place
- accepted WOMP as per the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011*
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with Section 7.11.

The Petroleum Activity is consistent with the objectives in the Ningaloo management plans (Management Plan for Ningaloo Marine Park and Muiron Islands Marine Management Areas, Ningaloo Marine Park Management Plan) in relation to water quality, coral, shoreline and intertidal, macroalgal, seagrass, mangroves, seabirds and social and economic values.

PS 10.8 Incident reports raised for unplanned releases, and Recordable Incidents notified for material unplanned liquid releases to sea, of: 80 L or more of hydrocarbons, or 1,000 L or more of environmentally hazardous chemical* in any 48-hour period. <i>* Chemicals that are not on the CEFAS OCNS Ranked List of Notified Chemicals or CEFAS OCNS listed chemicals which have a CEFAS OCNS substitution warning, a OCNS product warning or are OCNS Hazard Quotient white, blue, orange, purple, A, B or C.</i>	MC 10.8 Records demonstrate incident reports raised for unplanned releases, and applicable Recordable Incident notifications completed.
Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activity are presented in Appendix H.			

** Risk considers both likelihood and consequence as set out in Woodside's risk management process outlined in Section 2.6.3. Material releases are defined in PS 10.8.*

6.8.3 Unplanned hydrocarbon release: loss of containment of bulk storage (crude)

Context														
Cargo storage and offtake system – Section 3.13.8				Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5						
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Large release of Pyrenees crude oil from bulk storage on Pyrenees Venture FPSO			X	X	X	X	X	B	4 – Serious	Highly Unlikely	9	LCS GP RBA SV	Tolerable	EPO 14
Source of risk														
Several events could result in significant structural damage to the Pyrenees Venture FPSO hull, with potential for hydrocarbon release. This scenario identifies the release of hydrocarbons to the marine environment from a rupture of one of the crude storage tanks on the FPSO, which would require a severe accidental event. An incident that could result in loss of containment of the Pyrenees Facility cargo tanks is a collision by a support or OSV, offtake tanker or errant merchant vessel. The likelihood that such a collision could result in a structural damage to the hull of an extent that a loss of containment from a cargo tank could occur would depend on the speed, angle and location of collision, and the size/weight of the colliding vessel. A review of literature indicates that although collisions with FPSOs have occurred in the past by support vessels and offtake tankers, no collisions have occurred with errant vessels or merchant tankers. Further, although collisions with support vessels and offtake tankers have caused structural damage to both vessels, no loss of containment from the cargo tanks has occurred in the past (refer Metzger et al., 2010; Cavaye & Waibl, 2008). A Marine Transport assessment determined that due to radar controls and communication systems in place on both the FPSO and merchant vessels and the 25 km distance from shipping lanes, the possibility of collision by a powered merchant vessel with the Pyrenees Facility is not considered credible [8]. However, although very low in likelihood, the scenarios of collision of a vessel or offtake tanker are considered credible. Given the controls in place at the facility during offtake, literature indicates that collisions during offtake can successfully be avoided, and if a collision does occur, the impact will be reduced and not cause significant structural damage to either vessel (refer Pyrenees Marine Transport Assessment and Cavaye & Waibl, 2008). Such controls include tandem mooring with the tanker approaching downwind and static tow at the Pyrenees Venture FPSO stern, double hull structure, turret mooring rather than spread mooring, and control of size/weight of vessels offtaking and weather/sea state limits of operation. All these controls are in place at the Pyrenees Facility. Structural damage to the Pyrenees Facility hull from collision by a vessel is considered the most credible scenario of vessel collision resulting in loss of cargo tank containment. A review of literature indicates that a supply or support vessel would need to be travelling at greater than 15 knots and strike at a direct 90 degree angle to breach the hull of a double-skinned FPSO (Cavaye & Waibl, 2008). Support vessel speeds in the Pyrenees Operations Area are strictly controlled to less than 1 knot within the Operations Area, and the competence and operations of contracted vessels is ensured through the marine assurance process. Collision from a support vessel would also be cushioned by the impact protection at the bow of the vessel. On this basis, the loss of containment from the cargo tank as a result of a support vessel collision is considered a worst possible case scenario. However it should be noted that given the controls in place, collision of any vessel with the Pyrenees Venture FPSO, which could result in sufficient structural damage to cause a cargo tank loss of containment, is considered to be the lowest likelihood (although worst possible case scenario) of all unplanned events identified for the facility.														

The cargo tanks located along the sides of Pyrenees Facility have a capacity of 14,569 m³ of crude oil. The rupture of up to two tanks caused by a direct side impact of similar sized tanker with the beam of the impacting vessel being less than the width of the two tanks is considered plausible. A volume of up to 50% of the content of the two full tanks, a total of 14,600 m³, is considered the maximum plausible release in the event that two tanks are simultaneously ruptured based on vessel draft conditions and loss of inventory above the water line due to the hydrostatic head of the inventory. This is consistent with industry guidance which assumes 50% loss of a ruptured tank, the full loss of two tanks has been deemed as not credible.

This is a conservative volume given that loss of inventory would not be instantaneous, and inter-tank transfer would immediately be initiated to adjacent undamaged tanks via inter-tank valves to minimise the potential release volume. Furthermore, Woodside has a contract in place with ABS, which enables them to be available to provide immediate advice on optimal cargo transfer in the highly unlikely case of such an event.

Loss of containment from bulk storage

Modelling has been carried out for a cargo tank release of crude oil to the marine environment of 14,600 m³ to evaluate the potential environmental impacts that may occur. The results are detailed below.

Details of the modelling scenario used for a release of crude oil from a cargo tank rupture caused by a support vessel collision with the Pyrenees Facility are provided in Section 6.8.1. The characteristics of Pyrenees crude was used as the basis for modelling the for the loss of containment of bulk storage scenario; refer to Section 6.8.1 for additional information on modelling methods, hydrocarbon characteristics and environmental impact thresholds.

Table 6-21: Summary of worst-case loss of containment scenario

Scenario	Hydrocarbon	Spill duration (hours)	Model duration (days)	Depth (BMSL)	Latitude	Longitude	Total hydrocarbon release volume (m ³)
Surface release	Pyrenees crude	12	56	Surface	21° 32' 28.1" S	114° 06' 58.6" E	14,600

Consequence assessment

This section discusses the outcomes of spill trajectory modelling undertaken for a hydrocarbon release from the Pyrenees Facility cargo tank rupture scenario. It focusses on the likelihood of oil contact with specific sensitive locations at a particular threshold.

Summary of hydrocarbon spill modelling

To assess the potential fate and environmental impact of a 14,600 m³ crude oil release, modelling was undertaken to indicate the potential extent the oil may travel once released.

The detailed environmental risk assessment of this scenario indicates that the overall risk to sensitive environmental resources is low. This assessment has been aided by the use of spill modelling techniques that have been extensively tested and are based on real oil characteristics and measured local current and weather conditions.

Modelling undertaken for a 14,600 m³ release on the sea surface indicated that potential zones of surface exposure of >10 g/m³ were predicted to extend predominantly towards the northwest during all seasons. However, there would be some contact with the Ningaloo Marine Park and adjacent coastal and reef areas. The highest probability of surface contact at any threshold was 43% for the Gascoyne Marine Park, offshore from the Ningaloo coastline, with a minimum time of seven hours to arrive at this threshold.

Shoreline contact areas for a 14,600 m³ release of crude from the Pyrenees Facility (with no oil spill response intervention for 56 days) are shown to contact a number of receptors. The highest probability of any shoreline contact was 14.5% at Ningaloo State Marine Park, Ningaloo Coast and Exmouth (approximately 27 km away); with other shoreline contact probabilities ranging between <0.5 and 10%. As expected, the time to shoreline contact ranged from around 1.5 days (37 hours) for the shorelines of Ningaloo State Marine Park, Ningaloo Coast World Heritage Area and Exmouth, and between approximately two to five days for Cape Range, and the northern island groups; Muiron Island, Barrow Island, Middle Island, Boodie Island, Sunday Island, Peak Island and Flat Island.

AMSA guidance indicates that wave action alone is sufficient to clean shorelines with thickness <100 g/m². Therefore, when considering the probabilities and locations of shoreline thickness ≥100 g/m², there was a relatively low probability (ranging from <0.5 to 8%) of any shoreline contact exceeding this threshold at any location.

The most likely location (8% probability) for oil to come ashore at >100 g/m² was in proximity to Point Coates on North West Cape.

It is noteworthy that the environmental sensitivities of the Exmouth Gulf, including scattered mangroves along some of the small inlets on the western side, and areas of high priority mangroves and intertidal mudflats utilised as seabird and migratory shorebird habitat, are described in the oil spill preparedness and response mitigation assessment. However, the shoreline accumulation results indicated a no greater than 0.5% probability of concentrations >100 g/m² of oil accumulating on these important habitats.

The stochastic hydrocarbon spill modelling for entrained and dissolved hydrocarbons indicated that hydrocarbons are forecast to drift in a predominantly a south-west direction from the release site. The modelling indicated that the entrained hydrocarbons (>100 ppb) and dissolved hydrocarbons (>50 ppb) could occur at a number of receptors. Analysis of the stochastic modelling identified Gascoyne Marine Park to have the highest probability of entrained (48.5%) and dissolved (52.5%) hydrocarbons at or greater than 100 ppb or 50 ppb, respectively.

Summary of potential impacts

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from Pyrenees Venture FPSO cargo tank loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA (2024), available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from cargo tank loss of containment may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.2. The consequence was considered to be Serious (4).

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release from loss of containment of bulk stored crude. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability

Acceptability statement:

Loss of bulk storage containment has been evaluated as having a Serious consequence if it occurred. With controls in place the overall risk of this event is Tolerable. Acceptability is demonstrated with regard to the considerations below:

Principles of ecologically sustainable development

Woodside is a proud Australian company that is here for the long term. Woodside has a strong history of exploration and development of oil and gas reserves in the northwest of WA, with an excellent environmental record while providing revenue to State and Commonwealth governments, returns to shareholders, jobs and support to local communities. Titles for oil and gas exploration are released based on commitments to explore, with the aim of uncovering and developing resources. It is under the lease agreement that Woodside has determined the potential to develop the hydrocarbon fields for which acceptance of this EP is sought under the Environment Regulations.

Woodside has established a number of research projects in order to understand the marine environments in which they operate, notably in the Exmouth Region and the Kimberley Region, including Rankin Bank, Glomar Shoals, Enfield Canyon and Scott Reef. Where scientific data does not exist, Woodside assumes a pristine natural environment exists and therefore implements all practicable steps to prevent damage. Woodside's corporate values require that we consider the environment and communities in which we operate when making decisions.

Woodside looks after the communities and environments in which it operates. Risks are inherent in petroleum activities; however, through sound management and systematic application of policies, standards, procedures and processes, Woodside considers that despite this risk, the extremely low likelihood of loss of well containment is acceptable.

Internal context

The Petroleum Activity is consistent with Woodside corporate policies, standards, procedures, processes, and training requirements as outlined in the Demonstration of ALARP and EPOs, including:

- Woodside Environment and Biodiversity Policy
- the EPSs developed and implemented for the Pyrenees Facility
- hydrocarbon spill preparedness and response strategies are considered applicable to the nature and scale of the risk, and associated impacts of the response are reduced to ALARP (Appendix H).

Woodside corporate values include working sustainably, with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions.

Consultation, outlined below, has been undertaken prior to the Petroleum Activity.

External context – societal values

Woodside recognises that its licence to operate from a regulator and societal perspective is based on historical performance, complying with appropriate policies, standards and procedures, and understanding the expectations of external stakeholders. Consultation, outlined below, has been undertaken prior to the Petroleum Activity:

Woodside has consulted with AMSA and WA DTMI on spill response strategies. A copy of the Oil Pollution First Strike Plan was provided to AMSA and DTMI.

Other relevant persons were consulted (Section 5) and their feedback incorporated into this EP where appropriate.

By providing hydrocarbon spill response measures that are commensurate with the risk rating, location and sensitivity of the receiving environment (including social and aesthetic values), Woodside believes this addresses societal concerns to an acceptable level.

Other requirements (includes laws, policies, standards and conventions)

The Petroleum Activity is consistent with laws, policies, standards and conventions, including:

- accepted Safety Case (as per the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009*)
- mutual aid MoU for relief well drilling is in place
- accepted WOMP as per the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011*
- notification of reportable and recordable incidents to NOPSEMA, if required, in accordance with Section 7.14.6.

The Petroleum Activity is consistent with the objectives in the Ningaloo management plans (Management Plan for Ningaloo Marine Park and Muiron Islands Marine Management Areas, Ningaloo Marine Park Management Plan) in relation to water quality, coral, shoreline and intertidal, macroalgal, seagrass, mangroves, seabirds and social and economic values.

6.8.4 Unplanned hydrocarbon release: subsea infrastructure

Context														
Subsea infrastructure layout and description – Section 3.5							Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5			
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Accidental releases/ leaks of crude oil from subsea infrastructure		x	x		x	x	x	A	2 – Measurable	Unlikely	3	LCS GP	Tolerable	EPO 15
Pyrenees Venture FPSO off station (up to three months), leaks or weeps from wells will be left undetected until return		x	x	x	x	x	x	A	1 – Minor	Unlikely	1	LCS GP RBA SV	Tolerable	
Source of risk														
Consideration has been given to the potential sources of hydrocarbons from subsea infrastructure leak or failure events that could lead to potential environmental impacts. It was identified that the greatest loss of hydrocarbons from subsea infrastructure was from damage to (severing of) a production jumper or production flow line. The release rate for a severed production line would depend on the network lineup and number of wells flowing into the damaged section of the subsea network, and the response time to perform a production shut down and isolation. Individual well productivity and water cut would also influence the potential release volumes. It is noted that the average producing water cut of Pyrenees is around 92% (Q3 2023) and forecasted to increase further through to end of field life. Pyrenees wells require gas lift to flow and have been shown to be unable to self-lift (without the aid of gas lift) at water cut in excess of around 60 % to a back pressure equivalent to seabed (mudline) pressure. The current daily rate of the most productive wells in the Pyrenees field is approximately 2,500 m³/day total liquid (which is approximately 250 m³/day of oil) when producing to the production facility For a severing of a production line and release to the marine environment, the following has been assumed: • An initiating event within the field was caused by an event such as an anchor drag or dropped heavy object overboard. • The event does not disrupt gas lift to the online wells, remaining intact. • The Xmas tree remains intact with hydraulic controls normal and operative. • Those wells requiring gas lift continue to produce. • Wells within the impacted network section are able to flow to the sea bed (mudline) with approximately 20 bar back pressure in 200 m water depth. This assumption adopts a worst case simplification to neglect any pressure drop effects of the remaining subsea network. • A worst case operational response is proposed to be two hours before action taken to shut wells and gas lift in. • A worst case network lineup is assumed whereby up to four wells are online to either the Crosby, Ravensworth or Stickle networks, as well as a commingled manifold lineup allowing all four wells to crossflow through the impacted subsea network. Based on the SIMOPS monitoring procedures in place within the Pyrenees Operations Area, procedures and mitigation controls for heavy lifting activities, maintenance and design of subsea infrastructure and the emergency

response procedures that would be activated following an incident, it has been estimated that a credible time to become aware of a rupture to a production line, and then cascade shut down procedures and stop flow is two hours at a worst case. The reality is that the entire field would be closed down prior to the anticipated arrival of a dragging rig. Similarly, wells within the range of a dropped object with significant mass would be shut in immediately following reports to the OIM. However these realistic responses have been omitted for the purposes of creating this scenario.

A worst case estimate has been calculated using a proxy model for the most productive well in each of the Crosby, Stickle and Ravensworth networks flowing to mudline back pressure with 4 MMSCFD gas lift per well for four wells at 90% watercut. The total spill volumes over a 2 hr flow period from a severed production jumper would be:

- Crosby – 90 m³ oil (790 m³ formation water)
- Stickle – 110 m³ oil (1,110 m³ formation water)
- Ravensworth – 100 m³ oil (1,000 m³ formation water).

(Note, Moondyne considered to be significantly lower volume, as there are only 2 wells in this network).

Therefore, the worst case scenario for a production flowline failure is severing the Stickle production flowline (or production jumper), with an estimated worst case release of 110 m³ oil over two hours before the emergency response procedure would shut down production flow.

There is also an unlikely credible scenario for hydrocarbons to enter the marine environment when the FPSO is off station. This could be caused by slow leaks or weeps from the wells that are unable to be detected while the FPSO is disconnected. The Petroleum Activity includes scenarios for the FPSO to leave station for short periods of time associated with events such as cyclonic weather and for extended periods of time associated with dry docking.

Consequence assessment

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon from accidental leaks from subsea infrastructure and from undetected leaks or weeps during FPSO sail away, were considered during the impact assessment for a maximum credible spill scenario from subsea flowline and riser loss of containment. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from subsea flowline and riser loss of containment may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill, the impacts of hydrocarbons on those receptors have been fully assessed in Section 6.8.2. The consequence associated with the volumes from accidental leaks, weeps or spills from subsea wells and infrastructure was considered Measurable (2).

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release from subsea infrastructure. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability

Acceptability statement:

The proposed management controls for preventing and minimising the risk of release of hydrocarbons from subsea infrastructure are comprehensive and consistent with all relevant codes and standards and good oilfield practice. No reasonably practicable additional controls have been identified that would provide a significant net environmental benefit.

The magnitude of the spill is unlikely to be greater than an estimated worst case release of 110 m³ oil over two hours. The offshore oceanic location is such that any spills would be rapidly diluted and dispersed, with any environmental effects being temporary and localised, with significant impacts not expected owing to the short exposure timeframe.

In summary, all relevant controls were considered as part of the ALARP assessment, and as no other reasonable additional controls were identified that would further reduce the impacts and risks of an unplanned spill from subsea infrastructure without a gross disproportionate sacrifice, the impacts and risks are considered ALARP. Woodside undertakes regular consultation with relevant persons about its operations/ activities providing them with sufficient and reasonable opportunities to raise any new concerns or issues for the duration of this Petroleum Activity.

Woodside is satisfied that when the accepted controls are implemented that the impact and residual risk of an unplanned spill from subsea infrastructure to the environment is considered ALARP and that adherence to the performance standards will manage the impacts and risks to an acceptable level.

6.8.5 Unplanned hydrocarbon release: offtake operations

Context														
Cargo storage and offtake system – Section 3.13.8				Physical environment – Section 4.4 Biological environment – Section 4.5					Consultation – Section 5					
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Release of crude from equipment failure or processes (offtake, transferring)			x	x		x	x	B	3 – Substantial	Highly Unlikely	3	LCS PJ	Tolerable	EPO 16
Source of risk														
This spill risk scenario would involve disconnection or bursting of the offtake hose (total volume of hose string – 34.02 m³), a slow leak from valves or flanges during offtake and transfer operations or misalignment of valves or overflows. The maximum credible spill volume would include the hose volume plus pumping rate until shutdown (offtake pumping rate: 4,000 m³ per hour or 67 m³ per minute). AMSA guidelines indicate that 15 minutes at the transfer rate conducted under continuous supervision, or 1,000 m³ in this case.														
Consequence assessment														
The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from loss of hydrocarbons to the marine environment from a transfer/offtake operation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.														
The credible worst-case hydrocarbon spill scenario that may arise from loss of hydrocarbons to the marine environment from a transfer/offtake operation may impact upon a number of environmental receptors, with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.2. The consequence was considered to be Minor (1).

* Risk considers both likelihood and consequence as set out in Woodside's risk management process outlined in Section 2.6.3. Material releases are defined in PS 10.8.

6.8.6 Unplanned hydrocarbon release: turret operations

Context														
Utility system – Section 3.15				Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5						
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Hydrocarbon spill from failure during turret operations			x					A	1 – Minor	Unlikely	1	LCS GP	Tolerable	EPO 17
Source of risk														
Turret operations have the potential to result in a small amount of crude oil being spilt to the marine environment. Three credible scenarios for this have been identified and are described below. In all credible scenarios a spill would be expected to be no more than 1 m³. Failure to disconnect from turret The disconnect system includes a primary and backup set of collet ring drive cylinders, either of which can release (unlock) the DTM, which then drops away. These systems are subject to routine maintenance and hence inability to disconnect is considered unlikely. In combination, the robustness of the Pyrenees Venture FPSO/mooring system and the disconnect mechanism results in a negligible risk of a spill. Failure of mooring system A failure of the mooring system could result in a small release of crude oil. The mooring system is designed to remain intact with the loss of a single mooring line, therefore there would be no spill associated with the loss of a single line. Further, a mooring monitoring system has been implemented on the facility. The system monitors the Pyrenees Venture FPSO position relative to the mooring with an audible excursion alarm sounding in the bridge and CCR should the FPSO move outside an allowed maximum radius. Connect/disconnect turret The riser spool is disconnected only when the associated well is shut-in and/or the riser isolation valves are closed, sealing the spool off from upstream inventory. Downstream valves are also closed. Prior to splitting flanges, the spool is drained while still hooked up (a bypass valve is used). When the draining is complete, the flanges are split and a very small amount of hydrocarbon fluid may escape. This hydrocarbon fluid is contained with absorbent matting so the potential for an oil spill (estimated at less than 1 m³) to reach the sea is considered as negligible. Likelihood In accordance with the Woodside PetDW Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood has been determined as Unlikely.														
Consequence assessment														
The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from loss of hydrocarbons to the marine environment from a transfer/offtake operation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure. The credible worst-case hydrocarbon spill scenario that may arise from loss of hydrocarbons to the marine environment from a transfer/offtake operation may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.2 (loss of well containment). The consequence was considered to be Minor (1).

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of unplanned hydrocarbon release during turret operations. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

⁶³ Qualitative measure.

Demonstration of acceptability

Acceptability statement:

The consequence assessment has determined that, given the adopted controls, accidental releases of less than 1 m³ hydrocarbons from turret operations to the marine environment represents a minor risk rating that is unlikely to result in a consequence greater than minor short-term impacts. Further opportunities to reduce the risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders. Consultation with relevant persons has not indicated any concerns in relation to accidental spills of hydrocarbons during turret operations.

Woodside acknowledges that uncertainty on cultural values may remain, however, the Program of Ongoing Engagement with Traditional Custodians has been developed to enable Woodside to manage potential uncertainty on the impacts and risks to cultural values which may be identified at the time during Woodside's activities via ongoing dialogue with Traditional Custodians.

The potential risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of accidental spills of hydrocarbons during transfer, storage and use to a level that is broadly acceptable.

6.8.7 Unplanned hydrocarbon release: diesel spill from bulk storage

Context														
Utility system – Section 3.15				Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5						
Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Diesel spill from ruptured fuel tank due to vessel collision			X					A	2 – Measurable	Highly Unlikely	0.9	LCS GP	Tolerable	EPO 18
Source of risk														
Diesel is stored on board the Pyrenees Venture FPSO and OSV, as a fuel for vessel engines and generators. Rupture of one of the diesel oil fuel tanks on the Pyrenees Venture FPSO would require a severe accidental event, such as collision by errant ship. The potential for an accident of this type to occur was considered in the ENVID but discounted as ‘very rare’ due to the tanks being located centrally inboard towards the stern and is not considered further. Rupture of an OSVs fuel tanks would require direct collision from the side with enough force to rupture a wing tank. Direct stern and direct bow impacts to an OSV are unlikely to rupture a fuel tank because of the location tanks in these areas are protected by overhang of the deck. AMSA have analysed historical data (DNV, 2011) to identify the spill frequency per year for all ship types and accident types. The overall frequency of collision accidents leading to a spill event in Australian waters is 1.6×10^{-5}. The maximum volume likely to be released from a single OSV tank rupture is approximately 120 m³. Previously, a conservative assumption of two wing tanks being ruptured leading to a loss of 250 m³ has been modelled, however, reference to AMSA’s analysis of historical data (DNV, 2011) indicates that this is overly conservative and not representative the credible worst-case. It considered that a credible worst-case is rupture of a single wing tank. The theoretical capacity is 120 m³; however, it is normal practice not to fill more than 90% (i.e. 108 m³) and all OSVs have the capacity to transfer fuel between tanks, which would further reduce the volume released. Hence, modelling has been conducted for a 100 m³ diesel release (APASA, 2012). The estimated probability of a release of this quantity is approximately 2.7×10^{-6} (for comparison the risk of a 200 m³ spill is approximately 1.8×10^{-6}). Hydrocarbon characteristics and quantitative spill risk assessment Diesel fuel is a light petroleum distillate with a predominance of 12 carbon atoms to 14 carbon atoms (C12 to C14) hydrocarbon compounds. Diesel fuels may vary in their properties depending on their origin and particular additives but are generally comprised of moderate concentrations of BTEX and low concentrations of PAHs of low molecular weight such as naphthalene, fluorene and phenanthrene. The specific gravity of diesel ranges from 0.84 to 0.88 g/cm³ (30 to 32° API) and the pour point varies between -17°C and -30°C. Diesel fuels have a low viscosity of approximately 13 cSt (at 20°C) and are categorised, using the ITOF methods, as light persistent oils. Stochastic modelling predicated that the maximum distance that a 100 m³ spill of diesel above the 1 µm threshold was predicted to travel was approximately 15 km west of the surface release site, after which there was no diesel predicted to remain on the water surface above the selected threshold. A conservative EMBA is as follows for the 100 m³ diesel spill: • surface 1 µm – 15 km radius • entrained >960 ppb.hrs – 19.5 km (0 to 5 m); 11.6 km (5 to 10 m). If diesel is spilled to the sea surface, the more volatile BTEX components will evaporate or breakdown rapidly leaving behind the PAH components, which continually evaporate or breakdown more slowly over several days as it thins out														

on the water surface. For the environmental conditions experienced in the Pyrenees Facility area, diesel is expected to undergo rapid spreading and this (together with evaporative loss) will result in a relatively rapid slick break up.

The BTEX components in diesel are the main source of toxicity to marine organisms and hence it is generally observed that the toxicity of spilled diesel decreases as the diesel weathers, decreasing from about 8 to 12 ppm for fresh diesel (Neff et al., 2000). A spill of diesel in the Pyrenees Facility area will have an immediate acute impact on the water column biota in the vicinity of the spill origin. Given the water depth at the Pyrenees location, a surface spill of diesel will not impact directly on the seafloor benthos.

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. In general, about 6% of the oil mass should evaporate within the first 12 hours (boiling point < 180°C); a further 35% should evaporate within the first 24 hours (180°C < boiling point < 265°C); and a further 54% should evaporate over several days (265°C < boiling point < 380°C). About 5% of the oil is shown to be persistent. The aromatic content of the oil is about 3%.

The mass balance forecast for the constant-wind case for marine diesel shows that about 41% of the oil is predicted to evaporate within 24 hours. Under these calm conditions the majority of the remaining oil on the water surface weathers at a slower rate due to comprising the longer-chain compounds with higher boiling points. Evaporation of the residual compounds slows significantly and is then subject to more gradual decay through biological and photochemical processes.

Under the more realistic variable-wind case, where the winds are of greater strength, entrainment of marine diesel into the water column is indicated to be significant. About 24 hours after the spill, around 72% of the oil mass is forecast to have entrained and a further 24% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds tend to remain entrained beneath the surface under conditions that generate wind waves (about >6 m/s).

The increased level of entrainment in the variable-wind case results in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 2.4% per day with an accumulated total of ~16% after seven days, in comparison to a rate of ~0.2% per day and an accumulated total of 1.3% after seven days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration extends the area of potential effect.

Figure 6-8: Proportional mass balance plot representing the weathering of marine diesel spilled onto the water surface as a one-off release (50 m³ over one hour) and subject to variable wind at 27°C water temperature and 25°C air temperature

Likelihood

In accordance with the Woodside PetDW Risk Matrix, given prevention and mitigation measures in place, the likelihood has been determined as Highly Unlikely.

Consequence assessment

Stochastic modelling predicated that the maximum distance that a 100 m³ spill of diesel above the 1 µm threshold was predicted to travel was approximately 15 km west of the surface release site, after which there was no diesel predicted to remain on the water surface above the selected threshold.

A conservative EMBA is as follows for the 100 m³ diesel spill:

- surface 1 µm – 15 km radius
- entrained >960 ppb.hrs – 19.5 km (0 to 5 m); 11.6 km (5 to 10 m).

The BTEX components in diesel are the main source of toxicity to marine organisms and hence it is generally observed that the toxicity of spilled diesel decreases as the diesel weathers; decreasing from about 8 to 12 ppm for fresh diesel (Neff et al., 2000). A spill of diesel will have an immediate acute impact on the water column biota in the vicinity of the spill origin. Given the water depth throughout the Operational Area is generally greater than ~200 m, a surface spill of diesel would not impact directly on the seafloor benthos.

The diesel EMBA would include sensitive receptors within the water column (entrained), on the water surface including shallow water habitats adjacent to the shore, and effects on shorelines of the mainland and adjacent islands.

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon were considered during the impact assessment for a maximum credible spill scenario from a diesel spill from vessel collision. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS APASA, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill and relevant literature and studies considering the effects of hydrocarbon exposure.

The credible worst-case hydrocarbon spill scenario that may arise from loss of diesel to the marine environment from a vessel collision may impact upon a number of environmental receptors with potential impacts of a hydrocarbon spill to these receptors considered in Section 6.8.2. The consequence was considered to be Measurable (2).

ALARP statement:				
On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of accidental release of diesel from bulk storage. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: In the highly unlikely event of a vessel collision resulting in the loss of bulk storage marine diesel to the marine environment, the stochastic modelling undertaken predicts that no diesel at or above the minimum thickness threshold of 10 µm would contact any shoreline. In all seasons, surface waters to the northwest of the diesel release location would most likely to come into contact with diesel above 10 µm thickness threshold, with no diesel predicted to remain on the water surface past 8 hours. The potential sensitive receptors present in the immediate area of the diesel spill will include fish and marine mammals, marine reptiles and seabirds at the sea surface that become coated in diesel or through ingestion. The impact on these sensitive receptors would be negligible and is likely to be limited to a small number of transient individuals, given the distance from the nearest shoreline and as there are no important areas of habitat are present in the immediate vicinity. In summary, all relevant controls were considered as part of the ALARP assessment, and as no other reasonable additional controls were identified that would further reduce the impacts and risks of an unplanned diesel spill due to vessel collision without a gross disproportionate sacrifice, the impacts and risks are considered ALARP. Woodside undertakes regular consultation with relevant persons about its operations/ activities providing them with sufficient and reasonable opportunities to raise any new concerns or issues for the duration of this Petroleum Activity. Woodside is satisfied that when the accepted controls are implemented that the impact and residual risk of an unplanned diesel spill due to vessel collision is considered 'ALARP' and that adherence to the performance standards will manage the impacts and risks to an acceptable level and demonstrate that the EPOs are met.

6.8.8 Unplanned hydrocarbon or chemical release: transfer, storage and use

Context														
Utility systems – Section 3.15			Physical environment – Section 4.4 Biological environment – Section 4.5 Protected species – Section 4.6					Consultation – Section 5						
Risks evaluation summary														
Source of risk	Environmental value potentially impacted						Evaluation							
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Hydrocarbon spills/ hazardous chemicals or liquid waste, accidental leaks from storage or equipment, including ROVs			x			x		A	1 – Minor	Possible	3	LCS GP	Tolerable	EPO 19
Spills from bulk transfer of chemical from support vessels to Pyrenees Venture FPSO (bulk contents up to 2,000 L)			x			x		A	2 – Measurable	Unlikely	3			
Diesel spill due to human error/ equipment failure during bunkering			x					A	1 – Minor	Unlikely	1			
Source of risk														
Hydrocarbon and chemical use and storage Various hydrocarbons and chemicals are stored onboard the Pyrenees Facility and vessels, to power equipment. Such liquids include fuel, refined oil, lube oil, biocides, corrosion inhibitors, hydraulic oil, lubricating oils, cleaning and cooling agents, and methanol. Accidental loss of such liquids or liquid wastes to the marine environment could occur as a result of spillage during handling, inadequate bunding and/ or storage, inadequate method of securing or tank/pipework failure, leak from equipment or rupture or failure of hoses. The volume of chemical or refined oil likely to be accidentally released from a leak or spillage and be released into the marine environment, based on a review of past incidents and possible causes, is less than approximately 80 L.														
Bulk chemical transfer Chemicals are transferred to the Pyrenees Facility from support vessels by bulk transfer. The most likely spill volume of chemicals during bulk transfer is likely to be less than 200 L based on the volume of the transfer hose and the immediate shutoff of the pumps by personnel involved in the bulk transfer process. However, the worst-case credible spill scenario could result in up to 2,000 L of chemicals being discharged. The chemical used in the largest volume, and therefore the most likely to be discharges in this worst-case spill scenario, is methanol. This unlikely scenario represents a complete failure of the bulk transfer hose combined with a failure to follow procedures (which require transfer activities to be monitored), coupled with a failure to immediately shut off pumps.														

Marine diesel bunkering

Diesel is stored on board the Pyrenees Venture FPSO, off take tanker and OSV as fuel for vessel engines and generators. Diesel could potentially impact the marine environment if accidentally released during diesel transfer operations from Pyrenees Venture FPSO to offtake tanker or OSV to Pyrenees Venture FPSO.

Diesel transfer has the potential to result in an accidental spill to the marine environment. In a review of the risk of spills in the marine environment, the risk of spill of greater than 1 tonne from fuel transfer was found to be 0.18 spills per year from all transfer operations in Australian waters. There is very little data on the frequency of spills from ship to ship transfers. AMSA (DNV, 2011) noted that the UK experience of ship-to-ship transfer was estimated to be one spill over 1 tonne in 2,000 tanker offloading operations, giving a spill frequency of 5×10^{-4} per transfer operation.

The potential causes of such an event occurring has been identified as:

- Failure of the hoses during pumping. The maximum credible spill that would occur from total failure of a diesel transfer hose is approximately 450 L (volume of 100 m of 75 mm diameter hose) plus allowance for time to shut down the pump. The most credible response time is considered to be 15 seconds; the worst case is considered to be two minutes if the operator is absent or not vigilant. The calculated loss (assuming an average pumping rate of 225 m³ per hour) is 1.4 m³ diesel. If compounded by human error the volumes could potentially increase to 7.5 m³ for diesel (estimated probability of 0.028%). For conservativeness, a spill volume of 10 m³ was considered in the risk assessment.
- Failure of connections or valves at disconnection. Valves are dry break but if a valve was to fail at disconnection worst-case loss would result in contents of the hose, approximately 450 L, being released to sea.

Quantitative diesel spill risk assessment

For the environmental conditions experienced in the Pyrenees Facility Operations Area, diesel is expected to undergo rapid spreading and this, together with evaporative loss, will result in a relatively rapid slick break up. Numerical modelling completed as part of the Pyrenees Expansion was used to predict the trajectory and fate of 10 m³ of spilled diesel from the Pyrenees Facility. This volume represents worst case (7.5 m³) plus a further conservative additional volume. The model was set to provide data on final surface loading of 10 g/m². The selected thickness is equivalent to a concentration of approximately 10 ppm if the diesel was to be distributed throughout the top 1 m of water column. These concentrations were chosen as the end point because 10 ppm of diesel represents 24 hour LC50 for sensitive species (24-hour LC50 range for diesel is approximately 2 to 600 ppm depending on species and life cycle stage – US EPA Toxbase).

The maximum distance that diesel above the 10 g/m² threshold was predicted to travel was approximately 3.0 km west of the surface release site at the well location, after which there was no diesel predicted to remain on the water surface above the thickness threshold of 10 g/m².

The stochastic modelling demonstrated that visible hydrocarbons would be clear of the water surface within 25 hours. Under the annual conditions assessed, no contact with the shorelines was predicted.

Consequence assessment**Marine diesel**

Given the low viscosity of marine diesel, along with the high portion of volatile components, a spill of up to 7.5 m³ of marine diesel during transfer, storage or use would spread and weather rapidly. Environmental receptors at risk would be restricted to those in the immediate vicinity and may include:

- marine fauna, particularly fauna associated with the sea surface (e.g. seabirds, air breathing vertebrates)
- plankton.

Given the relatively small worst-case credible release volume, the non-persistent nature of marine diesel and the low sensitivity of the immediate receiving environment within the Operational Area (i.e. offshore open water environment, refer to Section 4) potential impacts are expected to be short term (< 1 year) and confined to less than 3 km from the release location. Such impacts may include:

- localised decrease in water quality
- acute toxic effects to planktonic organisms in the immediate area of the spill.

Impacts to plankton may include acute toxicity resulting in mortality of planktonic organisms. Given the rapid turn-over of plankton communities, these impacts would be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by a marine diesel spill. Impacts to larger fauna such as cetaceans and marine turtles are expected to be light fouling, potentially resulting in irritation of sensitive membranes such as the eyes, mouth, and digestive system (Helm et al., 2015). Mortality of larger fauna is not expected to occur. No impacts to ecosystem function are expected.

No impacts are predicted to the canyons linking the Cuvier Abyssal and the Cape Range Peninsula or the Continental Slope Demersal Fish Communities KEFs. Although, they do overlap the Operational Area (see Section 4), they are well outside the spill impact zone due to their depths.

Minor, short-term impacts may occur to other marine users (e.g. commercial fisheries); however, as the worst case marine diesel spill is only 7.5 m³, and there is already no fishing within the PSZ, it is unlikely there would be any significant impact to commercial fishers.

Chemicals and non-process hydrocarbons

Monoethylene glycol and TEG are miscible in water; both are rated OCNS Group E and monoethylene glycol is considered to pose little or no risk. A maximum credible spill of monoethylene glycol or TEG is expected to mix with the receiving environment with no lasting environmental impact. Accidental releases of chemicals (including corrosion inhibitor) or non-process hydrocarbons decrease the water quality in the immediate area of the release. The consequence is expected to be a minor short-term impact, given the open ocean mixing environment, distance from sensitive receptors and relatively low credible release volumes.

Depending on the chemical released, the toxicity and/or potential to bioaccumulate may potentially result in localised impacts to water quality, sediment quality, pelagic fish or other marine species in the vicinity of the discharge. Potential impacts to plankton from an accidental chemical spill may include acute toxicity, resulting in mortality of planktonic organisms. Given the rapid turnover of plankton communities and nature and scale of the credible releases, these impacts would be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by an accidental chemical spill. Impacts to air-breathing fauna such as cetaceans, birds and marine turtles are expected to be restricted to irritation of sensitive membranes, such as the eyes, mouth and digestive system.

Minor short-term impacts may occur to other marine users (e.g. commercial fisheries); however, as there is minimal fishing effort within the Operational Area, it is unlikely there would be any significant impact to commercial fishers.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)⁶⁵	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
Contract vessels compliant with Marine Order 91 (Marine pollution prevention – oil) for safe vessel operations.	F: Yes. CS: Minimal cost. Standard practice.	Legislative requirements to be followed reduce the likelihood of an unplanned release. The consequence is unchanged.	Control based on legislative requirement – must be adopted.	Yes C 16.1
Vessels will have current MARPOL compliant SOPEP and SMPEP – for noxious liquid – the latter may be combined with a SOPEP.	F: Yes. CS: Minimal cost. Standard practice.	Compliance with MARPOL Annex I, minimises any potential impacts from any unplanned releases.	Control based on legislative requirement – must be adopted.	Yes C 13.1
Good practice				
Chemicals will be selected with the lowest practicable environmental impacts and risks subject to technical constraints.	F: Yes. Routinely implemented to the chemical selection process for Woodside facilities. CS: Minimal cost. Standard practice.	Selection and assessment of chemicals in accordance with the Woodside process, reduces environmental impacts associated with accidental discharge.	Benefits outweigh cost/sacrifice.	Yes C 8.1
Diesel bunkering hoses to have dry break couplings and be pressure rated at purchase.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of a hose failure.	Benefits outweigh cost/sacrifice.	Yes C 16.2
Incident reports are raised for unplanned releases within event reporting system.	F: Yes. CS: Minimal cost. Standard practice.	Good practice that operators identify, report and learn from unplanned release events. Supports compliance with regulatory reporting requirements.	Control based on Woodside standard and regulatory requirements.	Yes C 10.8

⁶⁵ Qualitative measure.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ⁶⁵	Benefit in impact/risk reduction	Proportionality	Control adopted
Implementation of bunkering procedures.	F: Yes. CS: Minimal cost. Standard practice.	Implements a procedure to outline the methods and requirements for undertaking safe bunkering. This reduces the likelihood of a bunkering incident. Fuel and chemical handling and transfer procedures are required by EPBC Act 1999 Ministerial Approval Decision April 2006 (EPBC 2005/2034) Conditions.	Benefits outweigh cost/sacrifice.	Yes C 16.3
Professional judgement – Elimination				
Deadman's switch on fuel transfer hose.	F: No. Impractical as control has to be constantly operated for the duration of the transfer (for example, the handle on a petrol bowser that needs to be depressed). CS: Not assessed.	Not assessed as control not feasible.	Not assessed – control not feasible.	No
Professional judgement – Substitute				
None identified.				
Professional judgement – Engineered solution				
None identified.				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of accidental spills of hydrocarbons or chemicals from bunkering/refuelling and from storage, use and transfer. As no reasonable additional/alternative controls were identified that would further reduce the consequences and risks without grossly disproportionate sacrifice, the risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The consequence assessment has determined that, given the adopted controls, accidental spills during bunkering/refuelling, or spills from storage, transfer and use represent a moderate risk rating that is unlikely to result in a consequence greater than Minor temporary impact to the environment, where the ecosystem functions recover with little intervention. Further opportunities to reduce the risks have been investigated above. The magnitude of the worst-case spill is unlikely to be greater than 10 m ³ . Stochastic modelling undertaken for a spill of this magnitude predicts that no shoreline or coastal reef habitats will be contacted by hydrocarbons at the modelled thresholds. More than 50% of the diesel would be evaporated within eight hours of an accidental spill and the oceanic location is such that any spills would be rapidly diluted and dispersed, with any environmental effects being temporary and localised, with significant impacts not expected owing to the short exposure timeframe. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders. The potential risks are considered tolerable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of bunkering/refuelling, and storage, transfer and use to a level that is tolerable and demonstrate that the EPOs are met.

6.8.9 Unplanned discharges: hazardous and non-hazardous waste management

Context														
Waste management – Section 3.20			Physical environment – Section 4.4 Biological environment – Section 4.5				Consultation – Section 5							
Risks evaluation summary														
Source of risk	Environmental value potentially impacted						Evaluation							
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Incorrect disposal or accidental discharge of non-hazardous and hazardous waste to the marine environment		X	X			X		A	1 – Minor	Highly Unlikely	0.3	LCS GP	Tolerable	EPO 20
Dropped objects from support/logistical operations – vessel to vessel lifting (e.g. containers and materials)		X	X			X		A	1 – Minor	Unlikely	1			
Source of risk														
Normal operations on the Pyrenees Facility and vessels results in a variety of hazardous and non-hazardous wastes. These materials could potentially impact the marine environment if incorrectly disposed of, lost overboard, or accidentally discharged. Non-hazardous wastes include domestic and industrial wastes, such as aluminium cans, bottles, paper and cardboard, scrap steel. Hazardous wastes include recovered solvents, excess or spent chemicals, oil contaminated materials (e.g. sorbents, filters and rags), batteries, used lubricating oils and potentially material containing NORMs. Sand and sludges may also be periodically generated during well clean-up operations, de-sanding and vessel maintenance. Equipment (small hand-held tools) and personal protective equipment may be accidentally lost overboard. Equipment that has been recorded as being lost on other similar facilities and vessels has primarily been windblown or dropped overboard and has included things such as hardhats, gloves, safety glasses and small tools or materials. Equipment (small hand-held tools) and personal protective equipment are not classified as waste as per the Waste Management Plan and are not included any further in this risk assessment. Equipment (small hand-held tools) and personal protective equipment lost overboard are recorded, investigated and corrective actions tracked as per requirements in Section 7.11.5 and Section 7.14.5. Loss of hazardous and non-hazardous wastes have occurred during backloading activities, periods of adverse weather and incorrect waste storage. All waste materials not suitable for discharge to the environment that are generated on the Pyrenees Facility, including hazardous wastes (i.e. liquid and solid wastes), are transported to shore for disposal or recycling by Woodside's licenced waste contractor.														

Consequence assessment

The potential impacts of solid wastes accidentally discharged to the marine environment include direct pollution and contamination of the marine environment and secondary impacts relating to potential contact of marine fauna with wastes resulting in entanglement or ingestion and potentially leading to injury and death of individual animals. Solid material accidentally lost to the marine environment could potentially lead to slight localised contamination of benthic sediments. If NORMs are detected in the operations, NORMs will be managed in accordance with the relevant requirements, so that there are no impacts on the environment.

The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact based on the location of the Operational Area, the types, size and frequency of wastes that could occur, and the species present.

Demonstration of ALARP

Control considered	Control feasibility (F) and cost/sacrifice (CS)⁶⁶	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
Contract vessels compliant with Marine Orders for safe vessel operations: - Marine Order 94 (Marine pollution prevention – packaged harmful substances) 2014 - Marine Order 95 (Marine pollution prevention – garbage).	F: Yes. CS: Minimal cost. Standard practice.	Implementation of Marine Orders 94 and 95 reduces the likelihood of a harmful substance being released to the environment. Implementation is standard practice for commercial vessels as applicable to vessel size, type and class.	Controls based on legislative requirements – must be adopted.	Yes C 17.1
Management and handling of NORMs in accordance with Australian Radiation Protection and Nuclear Safety Agency guidelines.	F: Yes. CS: Minimal cost. Standard practice.	Australian Regulations require NORMs to be managed for appropriate classification, handling and disposal.	Controls based on legislative requirements – must be adopted.	Yes C 17.6
Good practice				
Implementation of waste management procedures.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of a release of waste to the environment by providing guidance on storage, handling and transport of wastes.	Benefit outweighs cost/sacrifice.	Yes C 17.2
Recovery of dropped objects where practical to do so and when recovery will provide a net environmental benefit.	F: Yes. CS: Minimal cost. Standard practice.	Reduced the impacts of extended disturbance to the seabed, or potential entanglement of fauna in surface or in-water waste.	Benefit outweighs cost/sacrifice.	Yes C 17.3

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of accidental discharge of non-hazardous and hazardous wastes. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The consequence assessment has determined that, given the adopted controls, the accidental discharge of non-hazardous waste and hazardous waste represent a moderate risk rating and is unlikely to result in a consequence greater than slight, short-term impacts to water quality, marine sediments and marine species. Woodside, across its operations (including the Pyrenees Facility) has a well-established waste management culture which underpins a strong performance and limits the potential for accidental releases to the marine environment. Opportunities to reduce waste management impact and risks are employed through standard practice such as job planning, implementation of the Waste Management Plan on Pyrenees Venture FPSO, and job hazard analysis practices. The adopted controls are considered good oil-field practice/industry best practice and meet relevant Commonwealth and WA State regulatory requirements. The potential impacts and risks are considered tolerable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of accidental discharge of non-hazardous and hazardous waste to a level that is tolerable and demonstrate that the EPOs are met.

	C 17.6 Management of NORMs in accordance with Australian Radiation Protection and Nuclear Safety Agency guidelines.	PS 17.6 In the event that waste materials are routinely identified as NORMS (above exempted levels) disposal will be coordinated in line with Management of NORMs guidelines (Radiation Health and Safety Advisory Council, 2005), and State waste management requirements for appropriate waste disposal.	MC 17.6 Waste management records demonstrate appropriate handling and disposal of NORMs classified material.

* Risk considers both likelihood and consequence as set out in Woodside's risk management process outlined in Section 2.6.3.

6.8.10 Physical presence: interaction with live infrastructure

Context													
Support vessel operations – Section 3.17 Subsea IMMR activities 3.19				Socio-economic environment – Section 4.9.5.3.110				Consultation – Section 5					
Risks evaluation summary													
Source of risk	Environmental value potentially impacted					Evaluation							
	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-economic	Decision type	Severity level	Likelihood	Risk rating	ALARP tools	Acceptability	Outcome
Interaction with live infrastructure from dropped objects						X	A	2 – Measurable	Unlikely	3	LCS GP	Tolerable	EPO 21
Source of risk													
As detailed in Section 4.10.5, the Operational Area overlaps the Operational Area associated with the operation of Woodside’s Macedon field. This area of overlap includes live infrastructure associated with the Macedon-6 well. During IMMR activities there is potential for IMMR vessels to be operating over and/or near the live Macedon infrastructure that is overlapped by the Operational Area. Dropped objects There is the potential for objects to be dropped overboard from the IMMR vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners), hardware fixtures (e.g. riser hose clamp). However, there is potential for larger equipment to be dropped during the activity depending on the nature of IMMR activities within the Operational Area. The spatial extent in which dropped objects can occur is restricted to the Operational Area.													
Consequence assessment													
Potential impacts to environmental values													
Interactions with other marine users													
In the unlikely event of an object being dropped on live infrastructure there is potential impacts to the infrastructure. Within the Operational Area, there is infrastructure associated with the Macedon Field Production System operated by Woodside. If interactions with live infrastructure were to occur, Woodside would notify the relevant operations team in accordance with the SIMOPS plan. This would trigger responses from the operator to assess and respond to any damage caused in accordance with the relevant operations EP for the live infrastructure. Under Regulation 56 of the Environment Regulations, a titleholder may refer NOPSEMA to information previously given to NOPSEMA for another purpose under the OPGGS Act, the Environment Regulations or any other regulations made under the Act, to comply with a requirement on the titleholder under the Environment Regulations to give NOPSEMA information or include information in a document. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EP⁶⁸ submitted by Woodside, and accepted by NOPSEMA, for the detail of the assessment and response in such a scenario. Potential impacts therefore include time and costs associated with inspecting the infrastructure and time and costs associated with any associated repair, which are expected to be slight and short-term in nature.													

⁶⁸ Macedon Operations EP (NOPSEMA Doc A680730, <https://docs.nopsema.gov.au/A680730>).

Potential subsequent loss of containment

In the unlikely event of an object being dropped on live infrastructure, and in the further unlikely event of a severe interaction with the infrastructure, there is a possibility that live infrastructure could be ruptured releasing hydrocarbons into the marine environment in such a scenario. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by Woodside for the operation of the live infrastructure associated with the Macedon field production system, and accepted by NOPSEMA, for the detail of potential impacts, receptors and the extent of the environment that may be affected in such a scenario, being:

- Macedon Operations EP (NOPSEMA Doc A680730, <https://docs.nopsema.gov.au/A680730>).

As detailed in this section above and below, this EP addresses the risks and impacts (interaction with live infrastructure) that arise from the activities under this EP (interaction from dropped objects). This EP also contains controls to prevent such an event from occurring that are within the operational control of this EP. As detailed in this Section, the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure is not within the operational control of this EP. As detailed below, the risks and impacts of the activities under this EP are managed to ALARP and an acceptable level by implementing the SIMOPS plan and notifying the relevant operators in the instance of an interaction with live infrastructure to allow the relevant operator's detailed response strategies under the relevant operations EPs to be triggered, if required. In the event of a loss of containment caused by an interaction with live infrastructure Woodside will follow direction from the Macedon operations team and will respond as per the relevant requirements. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EP submitted by Woodside for the live infrastructure associated Macedon field production system, and accepted by NOPSEMA, for the detail of the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure.⁶⁹

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS) ⁷⁰	Benefit in impact/risk reduction	Proportionality	Control adopted
Good practice				
Recovery of dropped objects where practical to do so and when recovery will provide a net environmental benefit.	F: Yes. CS: Minimal cost. Standard practice. Professional judgement – Engineered solution				
Lifting procedures applied by all vessels to minimise risk of dropped objects.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of failure resulting in dropped objects.	Benefit outweighs cost/sacrifice.	Yes C 17.5
ALARP statement:				
Woodside considers the adopted controls appropriate to manage the risks of a significant dropped object or anchor drag interacting with live infrastructure within the Operational Area. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without disproportionate sacrifice, the risks and consequences are considered ALARP.				

⁶⁹ Macedon Operations EP (NOPSEMA Doc A680730, <https://docs.nopsema.gov.au/A680730>).

⁷⁰ Qualitative measure.

Demonstration of acceptability**Acceptability statement:**

The impact assessment has determined that interaction with live infrastructure from dropped objects or a loss of station keeping of an IMMR vessel represents a low current risk rating and is unlikely to result in a risk consequence greater than slight. The adopted controls are considered industry good practice.

The potential risks and consequences are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of seabed disturbance from dropped objects/anchor drag to an acceptable level and demonstrate that the EPOs are met.

Environmental performance outcomes, standards and measurement criteria

Outcomes	Controls	Standards	Measurement Criteria
EPO 21 No interaction with live infrastructure.	C 17.3 Refer to Section 6.8.9.	PS 17.3.1 and 17.3.2 Refer to Section 6.8.9.	MC 17.3.1 and 17.3.2 Refer to Section 6.8.9.
	C 17.4 Refer to Section 6.8.9.	PS 17.4 Refer to Section 6.8.9.	MC 17.4 Refer to Section 6.8.9.

Risks evaluation summary														
Source of risk	Environmental value potentially impacted							Evaluation						
	Soil and groundwater	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/habitat	Species	Socio-cultural	Decision type	Severity level	Likelihood	Risk level	ALARP tool	Acceptability	Outcome
Physical presence of vessels resulting in collision with marine fauna						X		A	1 – Minor	Unlikely	1	LCs	Tolerable	22
Source of risk														
The vessels operating in the Operational Area may present a potential hazard to cetaceans and other protected marine fauna, such as whale sharks and marine reptiles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction), and mortality. The factors that contribute to the frequency and severity of impacts due to collisions include vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth) and the type of animal potentially present and their behaviours. There is a requirement that all vessels within the Operational Area move at low speeds, generally less than 8 knots, unless in an emergency.														
Consequence assessment														
The likelihood of vessel/whale collision being lethal is influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen & Silber, 2004; Laist et al., 2001). Vanderlaan & Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. According to the data of Vanderlaan & Taggart (2007), it is estimated that the risk is less than 10% at a speed of 4 knots. Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the US NOAA database (Jensen & Silber, 2004) there only two known instances of collisions when the vessel was travelling at less than 6 knots, both of these were from whale watching vessels that were deliberately placed among whales. Vessels undertaking the Petroleum Activity within the Operational Area are likely to be travelling less than 8 knots; much of the time vessels are holding station. Therefore, the risk of a vessel collision with protected species resulting in death is inherently low. The Operational Area overlaps the humpback whale migration BIA, where humpback whales are seasonally abundant during their annual migrations. Aerial surveys undertaken by Woodside indicate that the majority of humpback whales migrating in the region typically occur east of the Operational Area; the majority of the whales occurred in depths less than 500 m, with the greatest density of whales concentrated in water depths of 200 to 300 m (RPS Environment and Planning, 2010a). It is expected that humpback whales could occur within the Operational Area during their seasonal migration period; however, harmful interactions between vessels and humpback whales in the Operational Area are considered highly unlikely due to the slow speed of vessels in the Operational Area. A pygmy blue whale migration BIA also overlaps the Operational Area. Analysis of underwater noise logger data indicated pygmy blue whales are present in waters off North West Cape between October to December (northbound migration) and April to August (southbound migration) (McCauley & Jenner, 2010). Satellite tagging studies have shown pygmy blue whales migrating along the WA coast near the Operational Area in water depths between 200 m and 1,000 m, which includes the depth range of the Operational Area (approximately 340 to 849 m). Pygmy blue whales were not recorded in a series of whale monitoring flights between July and September (RPS Environment and														

Planning, 2010a), although these flights were intended to record humpback whales and did not extensively sample deeper waters preferred by pygmy blue whales.

Given the seasonality of humpback whales in the Operational Area, and seasonality and low density of pygmy blue whales recorded in the Operational Area, harmful interactions between vessels and whales during the Petroleum Activity are considered unlikely. Given the typical speeds of vessels within the Operational Area, any collision between vessels and whales is not expected to result in mortality.

The nearest BIAs and habitat critical for the southern right whale being 18 km from the Operational Areas therefore it is not expected that there is a risk of vessel strike.

Whale sharks are at risk from vessel strikes when feeding at the surface, or in shallow waters where there is limited option to dive. Whale sharks may traverse offshore waters, including the Operational Area, during their migrations to and from Ningaloo Reef, and a BIA for foraging whale sharks overlaps the Operational Area. However, it is not expected whale sharks would occur in large numbers within the Operational Area, given there is no main aggregation area within the vicinity of the Operational Area, and their presence would be transitory and of a short duration. There are no constraints preventing whale sharks from moving away from vessels (e.g. shallow water or shorelines).

The Operational Area overlaps or is adjacent to foraging and interbreeding BIAs and habitats critical to the survival of green turtle, loggerhead turtle, leatherback turtle and Hawksbill turtle. The nearest nesting habitat is 18 km for green turtle and loggerhead turtle nesting BIAs, at Muiron Island. Water depth within the Operational Area is approximately 200 m. With consideration of the absence of potential nesting or foraging habitat for turtles (i.e. no emergent islands, reef habitat or shallow shoals) and the water depth, it is considered that the Operational Area is unlikely to represent important habitat for marine turtles. Individual turtles may infrequently transit the area. It is acknowledged that there are significant nesting sites along the mainland coast and islands of the region.

The typical response from turtles on the surface to the presence of vessels is to dive (a potential “startle” response), which decreases the risk of collisions (Hazel et al., 2007). As with cetaceans, the risk of collisions between turtles and vessels increases with vessel speed (Hazel et al., 2007). Given the low speeds of vessels undertaking the Petroleum Activity, along with the expected low numbers of turtles within the Operational Area, interactions between vessels and turtles are considered highly unlikely. It is unlikely that vessel movement associated with the Petroleum Activity will have a significant impact on marine fauna populations, given:

- the low presence of transiting individuals
- avoidance behaviour commonly displayed by whales, whale sharks and turtles
- low operating speed of the Petroleum Activity support vessels (generally less than 8 knots or stationary, unless operating in an emergency).

Activities are considered unlikely to result in a consequence greater than minor short-term disruption to individuals or a small proportion of the population, and no impact on critical habitat or fauna activity.

Demonstration of ALARP				
<i>Control considered</i>	<i>Control feasibility (F) and cost/ sacrifice (CS)⁷¹</i>	<i>Benefit in impact/risk reduction</i>	<i>Proportionality</i>	<i>Control adopted</i>
Legislation, codes and standards				
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans will be implemented to reduce the likelihood of collision with marine fauna.	F: Yes. CS: Minimal cost. Standard practice.	Reductions in speed around protected fauna reduce the likelihood of collision.	Controls based on legislative requirements – must be adopted.	Yes C 5.1
Good practice				
None identified.				

⁷¹ Qualitative measure.

Demonstration of ALARP				
Professional judgement – Eliminate				
Prevent or reduce use of vessels during peak migration periods.	F: No. No alternative to the use of vessels during the Petroleum Activity was identified. Given that vessels must be used to undertake the Petroleum Activity. There is no feasible means to eliminate the source of risk. CS: Not assessed, control not feasible.	The use of vessels is essential to the Petroleum Activity. Reducing the numbers of the vessels in the vessel operations area would increase the duration of the activities and affect the safety of operations.	Costs are disproportionate to benefits in impact reduction.	No
Professional judgement – Substitute				
None identified.				
Professional judgement – Engineered solution				
Passive acoustic monitoring to detect cetaceans in the vicinity of the vessels.	F: Yes. CS: The cost of a PAM system has been estimated to be unacceptably high and would require several permanent mooring locations in the Operations Area with real time monitoring and analysis.	Identification of marine fauna might enable vessels to reduce speed or change direction to avoid interactions.	Given that support vessels in this area would be moving slowly (hence little chance of collision with whales) it is considered that the cost is grossly disproportionate to the benefit that may be gained.	No
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risk of vessel collision with marine fauna. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls, vessel collision with marine fauna represents a tolerable risk rating that is expected to result in no lasting effect to fauna populations and no impact on critical habitat or activity. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet the requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. The potential impacts and risks are considered tolerable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of vessel collision with marine fauna to a level that is tolerable and demonstrate that the EPOs are met.

Movement of vessels and Pyrenees Venture FPSO from known high introduced marine species risk areas					X	X		A	3 – Substantial	Unlikely	10	LCS GP	Tolerable	EPO 23
Source of risk														
The Pyrenees Facility relies on vessels to service routine operations, offtake cargo, and undertake IMMR activities. Vessels are potential vectors for the introduction of IMS to the Operational Area during the Petroleum Activity, and include: - Facility support vessels: typically sourced from Australian waters and generally considered to be low risk, these vessels are the most commonly used vessels in the Operational Area. - Offtake tankers typically from international waters and generally considered to be low risk, these tankers may visit the Operational Area approximately eight times per year, with offtake frequency declining as production rates decline; offtake operations may take up to 30 hours to complete. - FPSO sail away: during the implementation of the Petroleum Activity, the Pyrenees Venture FPSO may sail away to an international location for modifications, maintenance or repair. - Subsea support vessels or uncrewed surface vessels – may be sourced from Australia or overseas, depending on requirements and vessel availability. IMS may be introduced to the Operational Area from these activities through: - the discharge of ballast water - release of IMS propagules/fragments from biofouling. Potential IMS can be drawn into ballast tanks during on-boarding of ballast water as cargo is unloaded or to balance vessels under load. Offtake tankers use ballast water to maintain vessel stability. This ballast is discharged when loading crude oil from the Pyrenees Venture FPSO during offtake operations. The Pyrenees Venture FPSO may require ballast water to operate safely when detached from the DTM. Ballast water taken on within the Operational Area (i.e. prior to detachment) is considered unlikely to host IMS due to the offshore location and deep water (approximately 200 m water depth). When returning from beyond Australian waters, the Pyrenees Venture FPSO routinely undertakes ballast water exchanges to achieve low risk ballast water. Ballast water exchanges are not typically required by facility support or subsea vessels. All support and subsea vessels are required to have low risk ballast water on-board prior to being contracted to Woodside. All vessels are subject to some level of marine fouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a good surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests). Biofouling organisms can become established in an area through the release of propagules (e.g. eggs or larvae), or by attaching to substrate after becoming detached from the host vessel. While the FPSO remains in position for extended periods, it may leave the Operational Area to avoid dangerous weather or sail away to undergo scheduled modifications, maintenance or repair. During the most recent sail away for maintenance, in Q2 2024, the FPSO was dry-docked and all seawater systems, hull areas, and niche environments were thoroughly inspected and cleaned. Antifouling coatings were reapplied, and no IMS were detected. The FPSO

was retained in-water post-dry dock for less than seven days before departing Singapore – consistent with DPIRD advice that IMS settlement risk significantly increases beyond this period.

Consequence assessment

Non-indigenous marine species (NIMS) are species introduced beyond their natural biogeographic ranges that can survive, reproduce and establish populations. Not all NIMS introduced into an area will thrive or cause demonstrable impacts. Indeed, the majority of NIMS around the world are relatively benign; few have spread widely beyond sheltered ports and harbours. Only a subset of NIMS that become abundant and impact social/cultural, human health, economic and/or environmental values can be considered IMS. IMS have historically been introduced and translocated around Australia by a variety of human means, including biofouling and ballast water.

Species of concern are those that are:

- not native to the region
- likely to survive and establish in the region
- able to spread by human mediated or natural means.

Species of concern vary from one region to another depending on various environmental factors such as water temperature, depth, salinity, nutrient levels and habitat type. These factors dictate their survival and invasive capabilities. IMS are typically species that occur in shallow water, and hence are unlikely to survive in the deep offshore Operational Area (approx. 200 m depth). The Pyrenees Venture FPSO hull, the mooring and sections of risers near the sea surface are the only substrates considered suitable for establishment of potential IMS.

Introducing IMS into the local marine environment may alter the ecosystem, as IMS have characteristics that make them superior (in a survival and/or reproductive sense) to indigenous species. They may prey upon local species which had previously not been subject to this kind of predation, and therefore not have evolved protective measures against the attack. They may outcompete indigenous species for food, space or light, and can also interbreed with local species, creating hybrids such that the endemic species is lost.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas, once established. If the introduction is captured early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Despite the potential high consequence of the establishment of a marine pest within a high value environment as a result of introduction, unlike coastal or sheltered nearshore waters, the deep offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS. The Petroleum Activity is undertaken in an open ocean, offshore location away from shorelines and/or critical habitat, more than 14 NM from a shore and in waters approximately 200 m deep. The impacts of introducing a marine pest in this offshore location would have a lower consequence than introduction within a nearshore location, as the introduction of IMS and associated establishment is considered highly unlikely.

When examining the potential impacts from translocation of marine pests to the Pyrenees Facility itself, interactions with the facility and any support vessels (most likely Australian sourced) and tankers are limited, with time within the 500 m PSZ around the facility limited to support vessel transfers/bunkering. However, the risk of this occurring is considered manageable, given the ballast water and biofouling controls which are implemented for the Petroleum Activity.

In 2022 a trial of emerging eDNA technology was undertaken to enhance invasive marine species detection and management. A third-party eDNA monitoring survey was conducted around the Pyrenees Venture FPSO using 18S and CO1 metabarcoding assays (BMT, 2022). Two taxa of interest were flagged, including the dinoflagellate *Gymnodinium catenatum* and a possible identification of a non-native oyster, *Crassostrea virginica*. The former is a planktonic species with no risk of hull colonisation, and the latter had low-confidence sequence matches that also align with native species such as *Saccostrea glomerata*. No biofouling-associated IMS were identified. The detection of *G. catenatum* is likely the result of natural current-driven dispersal (e.g. Leeuwin Current), not FPSO-related activities.

During the Pyrenees Venture FPSO's recent dry dock in Singapore in Q2 2024 the FPSO was hauled out, cleaned of marine growth, a new AFC applied, and prior to sail back, inspected for IMS. No IMS were detected.

Summary of potential impacts to environmental value(s)

In support of Woodside's assessment of the impacts and risks of IMS introduction associated with the Petroleum Activity, risk and impact evaluations of the different aspects of potential marine pest translocation are undertaken. The absence of IMS detections immediately prior to sail back following the dry-dock confirms the controls being implemented reduce the risk to ALARP.

Woodside has presented the highest potential severity level as 2 (Measurable) and likelihood as Highly Unlikely resulting in an overall Tolerable risk following the implementation of identified controls.

Table 6-22: Assessment of the impacts and risks of IMS introduction associated with the Petroleum Activity

IMS introduction aspect	Credibility of introduction	Consequence of introduction	Likelihood
Transfer of IMS from infected vessel to Operational Area and establishment on the seafloor or subsea infrastructure.	Not credible The deep offshore open waters of the Operational Area, away from shorelines and/or critical habitat, more than 12 NM from a shore and in waters 320 to 849 m deep are not conducive to the settlement and establishment of IMS.		
Transfer of IMS from infected vessel to and subsequent establishment on the Pyrenees Venture FPSO.	Credible There is potential for the transfer of marine pests to occur.	If IMS were to establish this would potentially result in fouling of intakes (depending on the pest introduced) and would likely result in the quarantine of the Pyrenees Venture FPSO until eradication could occur (through cleaning and treatment of infected areas), which would be costly to undertake. Substantial (3) – reputation and brand Such introduction would be expected to have Substantial (3) impact to Woodside's reputation and brand, and close scrutiny of asset level operations or future proposals. Measurable (2)– environment Environmental consequence of introduction of IMS to the Pyrenees Venture FPSO is considered Measurable (2), localised and would relate to habitat directly on the Pyrenees Venture FPSO.	Unlikely (0.1) Interactions between the Pyrenees Venture FPSO and support vessels will be limited during the Petroleum Activity, with a 500 m PSZ being adhered to. Offtake tankers are considered to present a low IMS risk do not directly contact the Pyrenees Venture FPSO and are within the Operational Area for short periods of time (typically <36 hours). Spread of marine pests via ballast water or spawning in these open ocean environments is considered Unlikely (0.1).
Transfer of IMS to Pyrenees Venture FPSO while disconnected and returning to Operational Area from shipyard.	Credible There is potential for the transfer of marine pests to occur.	If IMS were to return on the FPSO and establish, this would potentially result in fouling of intakes (depending on the pest introduced), and likely result in the quarantine of the Pyrenees Venture FPSO until eradication could occur (through cleaning and treatment of infected areas). This would be costly to undertake.	Unlikely (0.1) Interactions between the Pyrenees Venture FPSO and support vessels will be limited during the Petroleum Activity, with a 500 m PSZ being adhered to. In addition, controls will be implemented (refer to ALARP discussion below) on return of the Pyrenees Venture FPSO from the shipyard to limit likelihood of IMS translocation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		Measurable (2) – environment Environmental consequence of introduction of IMS to the Pyrenees Venture FPSO is considered measurable (2), localised, and would relate to habitat directly on the Pyrenees Venture FPSO. Substantial (3) – reputation and brand Such introduction would be expected to have a substantial (3) impact to Woodside's reputation and brand, and close scrutiny of asset level operations or future proposals.	Spread of marine pests via ballast water or spawning in these open ocean environments is considered Unlikely (0.1).
Transfer of IMS from infected vessel to a subsequent establishment on Pyrenees Venture FPSO, then transfer of IMS to a secondary vessel from the Pyrenees Venture FPSO.	Not credible Risk is considered so remote that it is not credible for the purposes of the Petroleum Activity. The transfer of a marine pest from an infected activity vessel to the Pyrenees Venture FPSO was already considered highly unlikely, given the offshore open ocean environment. Furthermore, if this was to happen controls would be implemented to respond to the transfer, before many other vessels had opportunities to interact with the FPSO. For a marine pest to then establish into a mature spawning population on the Pyrenees Venture FPSO and then transfer to another support vessel is not considered credible (i.e. beyond the Woodside PetDW Risk Matrix). The Pyrenees Venture FPSO is in an offshore, open ocean, deep environment. Support vessels only spend short periods of time alongside the Pyrenees Venture FPSO (i.e. during backloading or bunkering activities). There is also no direct contact (i.e. they are not tied up alongside) during these activities. It's also noted that Woodside has been conducting marine vessel movements between the FPSO and WA ports (such as Dampier) for a long period of time, and no IMS has been		

	detected in these ports (Department of Fisheries, 2017).

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Legislation, codes and standards				
All vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.	F: Yes. CS: Minimal cost. Standard practice.	The use of an approved ballast water treatment system will reduce the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the <i>Biosecurity Act 2015</i> – must be adopted.	Yes C 18.1
Internationally sourced vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the <i>Biosecurity Act</i> – must be adopted.	Yes C 18.2
Good practice				
Woodside's IMS risk assessment process will be applied to vessels and immersible equipment that enter the Operational Area, unless exempt (Section 7.4). Based on the outcomes of each IMS risk assessment, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced. Management options include IMS Inspection, clearing and treatment of internal systems depending on the IMS translocation risk identified.	F: Yes. CS: Minimal cost. Good practice implemented across all Woodside Operations.	Identifies potential risks and additional controls implemented accordingly. In doing so, the likelihood of transferring marine pests between FPSO and vessels within the Operational Area is reduced. No change in consequence would occur.	Benefits outweigh cost/sacrifice.	Yes C 18.3
Undertake diver-based monitoring of the Pyrenees Venture FPSO for IMS.	F: Potentially, diver-based surveys are technically feasible for the Pyrenees Venture FPSO but are not approved under the in-force Safety Case. CS: Significant. IMS inspections of in-water assets typically require vessel logistics and diver-based inspection teams to reliably detect IMS. This is a costly, time-consuming process	FPSO monitoring does not prevent the potential for translocation (i.e. only as a mitigation measure). Detection may facilitate subsequent development of options to manage IMS. Subsequent success may be limited due to structure complexity and hazardous environment.	Grossly disproportionate. Interactions between FPSO and support/ subsea vessels posing IMS translocation risk will be limited, and the vessels involved will have been managed through the implementation of Woodside's IMS risk assessment	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
	that would likely require facility simultaneous operational constraints, and invariably introduces a series of significant safety risks in a hazardous offshore environment. Monetary cost of IMS survey for Pyrenees Venture FPSO sized infrastructure would be comparable to safe diver campaign arrangements in the order of AUD\$200,000/day plus mob/demob costs. Costs of ROV to support survey are in the order of AUD\$150,000/day plus mob/demob costs (based on subsea ROV hire costs). Health and safety exposure includes those of personnel while conducting diver-based surveys – four days of two to three people (based on subsea ROV surveys of similar size), as well as offshore vessel and facility simultaneous operations hazards.		process (C 17.3 and Section 7.4). Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given material execution safety risks, and controls already adopted.	
Pyrenees Facility hull in-water inspections undertaken in line with Lloyds Register and AMSA requirements, <three yearly basis.	F: Yes, however, this requirement is established for a different purpose (ensuring hull integrity) than to monitor for IMS. CS: Any assessment of presence of IMS from in-water inspections would incur cost.	The control is good practice for the purpose of hull integrity inspection. FPSO hull integrity inspections do not prevent the potential for translocation (i.e. only as a mitigation measure).	Grossly disproportionate. Interactions between FPSO and support/ subsea vessels posing IMS translocation risk will be limited, and the vessels involved will have been managed through the implementation of Woodside's IMS risk assessment process (C 17.3 and Section 7.4). Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given controls already adopted.	No

Demonstration of ALARP				
Control considered	Control feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Opportunistic routine Class Society 'underwater inspection in lieu of drydocking' survey to occur in line with ROV IMR activities (three yearly). Closed circuit television footage and high resolution photos provided to suitably qualified IMS inspector for review of potential IMS.	F: Yes. CS: Any assessment of presence of IMS from 'underwater inspection in lieu of drydocking' inspections would incur cost.	FPSO monitoring does not prevent the potential for translocation (i.e. only as a mitigation measure). Detection may facilitate subsequent development of options to manage IMS.	Grossly disproportionate. Interactions between FPSO and support/ subsea vessels posing IMS translocation risk will be limited, and the vessels involved will have been managed through the implementation of Woodside's IMS risk assessment process (C 17.3 and Section 7.4). Further, the recent dry dock confirmed through direct visual inspection that there was no presence of IMS. This outcome supports the conclusion that Woodside' preventative control measures regime is effective in mitigating IMS translocation risk. Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given controls already adopted.	No
Woodside to provide to a suitably qualified IMS inspector a review most recent ROV footage of subsea equipment for evaluation for IMS.	F: Yes. CS: Any assessment of presence of IMS subsea equipment would incur cost.	FPSO monitoring does not prevent the potential for translocation (i.e. only as a mitigation measure). Detection may facilitate subsequent development of options to manage IMS.	Grossly disproportionate. Interactions between FPSO and support/ subsea vessels posing IMS translocation risk to subsea equipment will be limited, and the vessels involved will have been managed through implementation of Woodside's IMS risk assessment process (C 17.3 and Section 7.4). Further, the recent dry dock confirmed through direct visual	No

			inspection that there was no presence of IMS. This outcome supports the conclusion that Woodside's preventative control measures regime is effective in mitigating IMS translocation risk. Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given other controls already adopted.	
Use of genetic DNA sequencing for the detection of IMS associated with FPSO operations.	F: Yes. Approach to monitoring is feasible. CS: Potential for significant cost of studies and monitoring.	The implementation of this control during Revision 17 of the Pyrenees Facility Operations EP (2022) was undertaken as a feasibility study exploring the suitability of eDNA as a monitoring tool from an FPSO while in-situ. The conclusion of this study was that the method does not yet provide sound single-line of evidence for detection of IMS (BMT, 2022). Due to limitations with the reference sequence database as well as the current inability to confirm with 100% confidence the presence/absence of certain closely related taxa, eDNA is most useful and reliable as an add on during traditional surveillance methods at this time. The future applicability of eDNA for IMS detection on FPSOs is considered disproportionate and no further studies area proposed. Monitoring does not prevent the potential for translocation (i.e. only	Grossly disproportionate. Interactions between FPSO and support/subsea vessels posing IMS translocation risk will be limited, and the vessels involved will have been managed through Woodside' IMS risk assessment process (C 17.3 and Section 7.4). Consequently, any additional benefit gained through the implementation of this control is considered disproportionate given controls already adopted.	No

	CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS Inspector. This process incurs significant financial and schedule sacrifices.	Operational Area from international sail away.	considered disproportionate (rejected control above), considering the implementation of Woodside's IMS risk assessment process (C 17.3 and Section 7.4), the inspection of the Pyrenees Venture FPSO itself by an IMS Inspector is considered appropriate given the added level of confidence it provides.	
Professional judgement – Engineered solution				
None identified.				
ALARP statement: A suite of preventative controls has been adopted, targeting the most credible IMS introduction pathways – biofouling and ballast water. These include Woodside's IMS risk assessment process, ballast water management compliant with Australian requirements, and biofouling management consistent with national guidelines and international conventions. These controls are applied to all vessel types interacting with the Pyrenees Venture FPSO, including international vessels and offtake tankers. Woodside completed dry dock works on the Pyrenees Venture FPSO in Q2 2024, which included hull cleaning and recoating, and management of niche areas and ballast tanks. Comprehensive dry dock inspections conducted found no evidence of IMS immediately prior to sail back. Such direct visual inspections provide a definitive and highly reliable assessment that supersedes inconclusive outcomes of eDNA and 'underwater inspection in lieu of drydocking'/ROV survey methods. Given the potential for these methods to generate indicative IMS findings that could be misleading or false positives these methods are not considered to be necessary or appropriate as a standard requirement going forward. The risk assessment has determined that, given the adopted controls, introduction of IMS represent a tolerable risk. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of invasive marine species to an acceptable level.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls, introduction of IMS represents a tolerable risk to marine communities within the Operational Area. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS to an acceptable level and demonstrate that the EPOs are met.

EPOs, EPSs and MC			
<i>Environmental performance outcomes</i>	<i>Controls</i>	<i>Environmental performance standards</i>	<i>Measurement criteria</i>
EPO 23 No introduction and establishment of invasive marine species into the Operational Area.	C 18.1 All vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.	PS 18.1 Compliance with Australian Ballast Water Management Requirements (as defined under the <i>Biosecurity Act</i>) (aligned with the <i>International Convention for the Control and Management of Ships' Ballast Water and Sediments</i>) to prevent the introduction of IMS.	MC 18.1 Ballast water exchange records maintained by vessels which verifies compliance against Ballast Water Management requirements.
	C 18.2 Internationally sourced vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.	PS 18.2 Compliance with Australian Biofouling Management Requirements.	MC 18.2 Records of implementation of biofouling management measures and pre-arrival reporting.
	C 18.3 Woodside's IMS risk assessment process will be applied to vessels and immersible equipment that enter the Operational Area, unless exempt (Section 7.4). Based on the outcomes of each IMS risk assessment, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.	PS 18.3.1 Prior to entering the Operational Area, vessels and relevant immersible equipment are determined to be low risk ⁷² of introducing IMS of concern.	MC 18.3.1 Records of IMS risk assessments maintained for all vessels and relevant immersible equipment entering the Operational Area to undertake the Petroleum Activity.
		PS 18.3.2 IMS risk assessments undertaken by an authorised Environment Advisor who has completed relevant Woodside IMS training or by qualified and experienced IMS inspector.	MC 18.3.2 Records of Environment Advisor training and IMS inspector qualifications (as relevant).
	C 18.4 Inspection of Pyrenees Venture FPSO by IMS Inspector prior to arrival in Australian waters.	PS 18.4 IMS assessments undertaken by an authorised IMS Inspector.	MC 18.4 Records of IMS inspector assessment.

⁷² Low risk of introducing IMS of concerns is defined as either no additional management measures required or, management measures have been applied to reduce the risk.

6.9 Recovery plan and threat abatement plan assessment

This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activity is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017)
- Recovery Plan for the White Shark (*Carcharodon carcharias*) (Commonwealth of Australia, 2013a)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Commonwealth of Australia, 2014)
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b)
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018)
- Conservation Management Plan for the Blue Whale 2015–2025 (Commonwealth of Australia, 2015a)
- National Recovery Plan for the Southern Right Whale (DCCEEW, 2024a)
- Recovery Plan for the Australian Sea Lion (Commonwealth of Australia, 2013b)
- National Recovery Plan for albatrosses and petrels (Commonwealth of Australia, 2022)
- Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australia, 2015c)
- Wildlife Conservation Plan for Seabirds (Commonwealth of Australia, 2020b)
- National Recovery Plan for the Australian Fairy Tern (Commonwealth of Australia, 2020a)
- National Recovery Plan for the Christmas Island Frigatebird (Commonwealth of Australia, 2004).

Table 6-23 lists the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas are applicable to government, the titleholder, and/or the Petroleum Activity. For those objectives/action areas applicable to the Petroleum Activity, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the Petroleum Activity are not inconsistent with that action. The results of this assessment against relevant actions are presented in

Table 6-24 to Table 6-29.

Table 6-23: Identification of applicability of recovery plan and threat abatement plan objectives and action areas

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
Marine Turtle Recovery Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim recovery objectives			
Current levels of legal and management protection for marine turtle species are maintained or improved, both domestically and throughout the migratory range of Australia's marine turtles	Y		
The management of marine turtles is supported	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Trends in nesting numbers at index beaches and population demographics at important foraging grounds are described	Y	Y	
Action areas			
A. Assessing and addressing threats			
A1. Maintain and improve efficacy of legal and management protection	Y		
A2. Adaptively manage turtle stocks to reduce risk and build resilience to climate change and variability	Y		
A3. Reduce the impacts of marine debris	Y	Y	Y
A4. Minimise chemical and terrestrial discharge	Y	Y	Y
A5. Address international take within and outside Australia's jurisdiction	Y		
A6. Reduce impacts from terrestrial predation	Y		
A7. Reduce international and domestic fisheries bycatch	Y		
A8. Minimise light pollution	Y	Y	Y
A9. Address the impacts of coastal development/infrastructure and dredging and trawling	Y	Y	
A10. Maintain and improve sustainable Indigenous management of marine turtles	Y		
B. Enabling and measuring recovery			
B1. Determine trends in index beaches	Y	Y

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
B2. Understand population demographics at key foraging grounds	Y		
B3. Address information gaps to better facilitate the recovery of marine turtle stocks	Y	Y	Y
Blue Whale Conservation Management Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim recovery objectives			
The conservation status of blue whale populations is assessed using efficient and robust methodology	Y		
The spatial and temporal distribution, identification of BIAs, and population structure of blue whales in Australian waters is described	Y	Y	Y
Current levels of legal and management protection for blue whales are maintained or improved and an appropriate adaptive management regime is in place	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Action areas			
A. Assessing and addressing threats			
A.1: Maintain and improve existing legal and management protection	Y		
A.2: Assess and address anthropogenic noise	Y	Y	Y
A.3: Understand impacts of climate variability and change	Y		
A.4: Minimise vessel collisions	Y	Y	Y
B. Enabling and measuring recovery			
B.1: Measure and monitor population recovery	Y		
B.2: Investigate population structure	Y		
B.3: Describe spatial and temporal distribution and define biologically important habitat	Y	Y	Y

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
Southern Right Whale Recovery Plan			
Long-term vision: Increase population to a level that the conservation status has improved and the species no longer qualifies for listing as threatened under any of the EPBC Act listing criteria	Y	Y	Y
Interim recovery objectives			
Current levels of Commonwealth and State legislative and management protection for southern right whales are implemented, maintained, or improved, so threats continue to be managed and reduced over the life of the plan	Y		
Anthropogenic threats are managed consistent with ecologically sustainable principles to facilitate recovery of southern right whales	Y	Y	Y
Population dynamics, including demographics, distribution, residency, and coastal movement across the species range are monitored and quantified using robust, standardised, best-practice methodology to assess population recovery	Y		
The population structure in Australian waters is clearly characterised to evaluate the degree to which the western and eastern populations are separate populations and inform the degree of connectivity with other southern right whale populations	Y		
Capability of First Nation Australians, research, citizen science, and general community groups is improved to assist in addressing recovery actions of southern right whales in Australia	Y		
Action areas			
Assess and address key threats			
A1: Maintain, implement and improve efficacy of current legislative and management protection for southern right whales	Y		
A2: Address habitat degradation impacts from coastal and offshore marine infrastructure developments within the species' range	Y	Y	Y
A3: Understand impacts of climate variability and anthropogenic climate change on the species biology and population recovery	Y	Y	Y
A4: Manage and mitigate the threat of entanglements from commercial active or discarded fishing gear throughout the species' range in Australian waters	Y		
A5: Assess, manage and mitigate impacts from anthropogenic underwater noise	Y	Y	Y
A6: Manage, minimise and mitigate the threat of vessel strike	Y	Y	Y

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
Measure recovery			
B1: Measure and monitor population demographic and recovery	Y		
B2: Characterise population structure	Y		
B3: Determine migratory paths and offshore distribution	Y		
B4: Improve capability of First Nation Australians, research, citizen science, and general community groups to assist management of southern right whales	Y		
Grey Nurse Shark Recovery Plan			
Overarching objective			
To assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: - improving the population status, leading to future removal of the grey nurse shark from the threatened species list of the EPBC Act - ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific objectives			
Develop and apply quantitative monitoring of the population status (distribution and abundance) and potential recovery of the grey nurse shark in Australian waters	Y		
Quantify and reduce the impact of commercial fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Quantify and reduce the impact of recreational fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Where practicable, minimise the impact of shark control activities on the grey nurse shark	Y		
Investigate and manage the impact of ecotourism on the grey nurse shark	Y		
Manage the impact of aquarium collection on the grey nurse shark	Y		
Improve understanding of the threat of pollution and disease to the grey nurse shark	Y	Y	Y
Continue to identify and protect habitat critical to the survival of the grey nurse shark and reduce the impact of threatening processes within these areas	Y	Y	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
Continue to develop and implement research programs to support the conservation of the grey nurse shark	Y	Y	
Promote community education and awareness in relation to grey nurse shark conservation and management	Y		
Sawfish and River Sharks Recovery Plan			
Primary objective			
To assist the recovery of sawfish and river sharks in Australian waters with a view to: - improving the population status leading to the removal of the sawfish and river shark species from the threatened species list of the EPBC Act - ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific objectives			
Reduce and, where possible, eliminate adverse impacts of commercial fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of recreational fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of Indigenous fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate the impact of illegal, unregulated and unreported fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of collection for public aquaria on sawfish and river shark species	Y		
Improve the information base to allow the development of a quantitative framework to assess the recovery of, and inform management options for, sawfish and river shark species	Y		
Develop research programs to assist conservation of sawfish and river shark species	Y	Y	
Improve community understanding and awareness in relation to sawfish and river shark conservation and management	Y

EPBC Act Part 13 statutory instrument	Applicable to:		
	Government	Titleholder	Petroleum Activity
Marine Debris Threat Abatement Plan			
Objectives			
Contribute to long-term prevention of the incidence of marine debris	Y	Y	
Understand the scale of impacts from marine plastic and microplastic on key species, ecological communities and locations	Y	Y	Y
Remove existing marine debris	Y		
Monitor the quantities, origins, types and hazardous chemical contaminants of marine debris, and assess the effectiveness of management arrangements for reducing marine debris	Y		
Increase public understanding of the causes and impacts of harmful marine debris, including microplastic and hazardous chemical contaminants, to bring about behaviour change	Y		

Table 6-24: Assessment against relevant actions of the Marine Turtle Recovery Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
Marine Turtle Recovery Plan	Action Area A3: Reduce the impacts from marine debris	Action: Support the implementation of the Marine Debris Threat Abatement Plan <u>Priority actions at stock level:</u> Green turtle, NWS stock – Understand the threat posed to this stock by marine debris Loggerhead turtle, WA stock – Determine the extent to which marine debris is impacting loggerhead turtles Flatback turtle, Pilbara stock – No relevant actions	Refer Section 6.8.9 Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to marine turtles. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activity.	EPO 20 C 17.1 to C 17.4 PS 17.1 to PS 17.4

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
	Action Area A8: Minimise light pollution	Action: Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats <u>Priority actions at stock level:</u> Green turtle, NWS stock – As above Loggerhead turtle, WA stock – No relevant actions Flatback turtle, Pilbara stock – Manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue	Refer Section 6.7.3 Not inconsistent assessment: The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels. Based on the frequency and nature of IMMR activities, the impacts to adult turtles moving through the Operational Area from vessel lighting are expected to be localised and temporary with no lasting effect.	EPO 4, 5 C 4.1 to C 4.3 PS 4.1 to PS 4.3
	Action Area B1: Determine trends at index beaches	Action: Maintain or establish long-term monitoring programs at index beaches to collect standardised data critical for determining stock trends, including data on hatchling production <u>Priority actions at stock level:</u> Green turtle, NWS stock – Continue long-term monitoring of index beaches Loggerhead turtle, WA stock – Continue long-term monitoring of nesting and foraging populations Flatback turtle, Pilbara stock – No relevant actions	Not inconsistent assessment: Woodside contributes to Action Area B1 via its support of the Ningaloo Turtle Program.	N/A
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks	Action: Understand the impacts of anthropogenic noise on marine turtle behaviour and biology <u>Priority actions at stock level:</u> Green turtle, NWS stock – Given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise; investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the NWS stock to other stocks Loggerhead turtle, WA stock – No relevant actions Flatback turtle, Pilbara stock – No relevant actions	Refer Sections 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to marine turtles. IMMR related noise is not expected to result in behavioural response, injury or mortality of individuals, or any other lasting effect.	EPO 6, 7 C 5.1 to C 5.3 PS 5.1 to PS 5.3

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
Assessment summary The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-25: Assessment against relevant actions of the Blue Whale Conservation Management Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
Blue Whale Conservation Management Plan	Action Area A.2: Assess and address anthropogenic noise	Action 2: Assess the effect of anthropogenic noise on blue whale behaviour Action 3: Anthropogenic noise in BIAs will be managed such that any blue whale continues to use the area without injury and is not displaced from a foraging area	Refer Sections 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales. Acoustic emissions from project vessels will not cause injury to any pygmy blue whale. There are no known or possible foraging areas for pygmy blue whales within or adjacent to the Operational Area. If the Petroleum Activity within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration.	EPO 6, 7 C 5.1 to C 5.3 PS 5.1 to PS 5.3
	Action Area A.4: Minimise vessel collisions	Action 3: Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented	Refer Section 6.8.10 Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to pygmy blue whales. If the Petroleum Activity within the Operational Area overlaps with an individual northbound or southbound migration, they may deviate slightly from the migratory route, but will continue on their migration. Vessel collisions with pygmy blue whales are highly unlikely to occur, given the low operating speed of support vessels.	EPO 22 C 5.1 PS 5.1

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
	Action Area B.3: Describe spatial and temporal distribution and define biologically important habitat	Action 2: Identify migratory pathways between breeding and feeding grounds Action 3: Assess timing and residency within BIAs	Not inconsistent assessment: Woodside contributes to Action Area B.3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements).	N/A
Assessment summary The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-26: Assessment against relevant actions of the Grey Nurse Shark Recovery Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
Grey Nurse Shark Recovery Plan	Objective 7: Improve understanding of the threat of pollution and disease to the grey nurse shark	Action 7.1: Review and assess the potential threat of introduced species, pathogens and pollutants	Refer Section 6.8.1 Not inconsistent assessment: This EP includes an assessment of the impacts from accidental release of solid wastes as well as planned discharges of drilling waste on marine species.	N/A
			Not inconsistent assessment: The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to grey nurse sharks. Spill risk strategies and response program include management measures, as identified and required.	Refer Section 6.8 Detailed oil spill preparedness and response EPOs, EPSs and MC for the Petroleum Activity are presented in Appendix H
Assessment summary The Grey Nurse Shark Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-27: Assessment against relevant actions of the Southern Right Whale Recovery Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSSs
National Recovery Plan for the Southern Right Whale	Action Area A2: Address habitat degradation impacts from coastal and offshore marine infrastructure developments within the species' range	Action 1: Coastal and offshore development actions are assessed according to principles of ecological sustainable development to ensure the risk of injury, auditory impairment and/or disturbance to southern right whales is maintained Action 3: Current information on species' occurrence, particularly in habitat critical, BIAs and historic high use areas, are used to inform planning, assessment, and decision-making on marine infrastructure development actions	Not inconsistent assessment: This EP assesses the potential impacts of the petroleum activity do not result in the risk of injury, auditory impairment and/or disturbance to southern right whales, particularly within the habitat critical and BIAs that are located 18 km from the Operational Areas.	N/A
	Action Area A3: Understand impacts of climate variability and anthropogenic climate change on the species biology and population recovery	Action 1: Continue to meet Australia's international commitments to address causes of climate change, including greenhouse gas emissions	Refer Section 6.7.5 Not inconsistent assessment: This Petroleum Activity contributes to Australia meeting international commitments to address causes of climate change, including greenhouse gas emissions, primarily via compliance with Marine Order 97, the NGER Scheme and <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</i>.	EPO 8, EPO 9 C 6.2, C 6.3 PS 6.2, PS 6.3

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
	Action Area A5: Assess, manage, and mitigate impacts from anthropogenic underwater noise	Action 2: Actions within and adjacent to southern right whale BIAs and habitat critical should demonstrate that it does not prevent any southern right whale from utilising the area or cause auditory impairment Action 3: Actions within and adjacent to southern right whale BIAs and habitat critical should demonstrate that the risk of behavioural disturbance is minimised Action 4: Ensure environmental assessments associated with underwater noise generating activities include consideration of national policy (e.g. EPBC Act Policy Statement 2.1) and guidelines related to managing anthropogenic underwater noise and implement appropriate mitigation measures to reduce risks to southern right whales to the lowest possible level Action 5: Quantify risks of anthropogenic underwater noise to southern right whales, including studies aimed to measure physiological effects, behavioural disturbance, and changes to acoustic communication (e.g. masking of vocalisations) to whales	Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to southern right whales. The nearest BIAs and habitat critical for the southern right whale being 18 km from the Operational Areas therefore it is not expected that noise from the Petroleum Activity will impact the southern right whales.	N/A
	Action Area A6: Manage, minimise and mitigate the threat of vessel strike	Action 1: Assess risk of vessel strike to southern right whales in BIAs Action 3: Ensure environmental impact assessments and associated plans consider and quantify the risk of vessel strike and associated potential cumulative risks in BIAs and habitat critical	Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to southern right whales. The nearest BIAs and habitat critical for the southern right whale being 18 km from the Operational Areas therefore it is not expected that there is a risk of vessel strike.	N/A
Assessment summary The National Recovery Plan for the Southern Right Whale has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-28: Assessment against relevant actions of the Sawfish and River Shark Recovery Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSs
Sawfish and River Shark Recovery Plan	Objective 5: Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Action 5c: Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks	Refer Section 6.8 Not inconsistent assessment: The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to sawfish and river shark. Spill risk strategies and response program include management measures, as identified and required.	Refer Section 6.8 Detailed oil spill preparedness and response EPOs, EPSs and MC for the Petroleum Activity are presented in Appendix H
	Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Action 6a: Assess the impacts of marine debris including ghost nets, fishing gear and plastics on sawfish and river shark species	Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to sawfish. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activity.	N/A
Assessment summary The Sawfish and River Shark Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-29: Assessment against relevant actions of the Marine Debris Threat Abatement Plan

Part 13 statutory instrument	Relevant action areas/objectives	Relevant actions	Evaluation	EPOs, controls and EPSS
Marine Debris Threat Abatement Plan	Objective 2: Understand the scale of marine plastic and microplastic impact on key species, ecological communities and locations	Action 2.04: Build understanding related to plastic and microplastic pollution	Not inconsistent assessment: The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to the marine environment. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activity.	N/A
Assessment summary The Marine Debris Threat Abatement Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.10 Cultural features and heritage values assessment

As described in Section 4, the identification of cultural values associated with cultural heritage as well as the social, economic and cultural features important to First Nations people is integral to understanding the environment and any potential impacts and risks to the environment.

In line with Woodside's First Nations Communities Policy, Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage) and, if avoidance is not possible, minimise and mitigate the impacts, in consultation with First Nations communities and Traditional Custodians. Mitigation can include any measure or control aimed at ensuring the viability of the intangible cultural heritage and its intergenerational transmission. This can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO, 2003; ICOMOS, 2013).

It is important to note that not all topics raised by First Nations groups/individuals through consultation are considered values for the purpose of the cultural features and heritage values impact assessment below. A number of topics were raised as a general interest in environmental management and ecosystem health, where the group/individual was seeking further information about potential impacts and risks from the Petroleum Activity on the receptor. As these interests relate to the maintenance of the natural environment, these are adequately addressed through impact and risk assessments described in Sections 6.6, 6.7 and 6.8 respectively, and are not further assessed in this section.

Aspect	Cultural features and heritage values			
Description of source of impact/risk	The physical presence of the FPSO and vessels and associated movements in the Operational Area, as well as physical presence of subsea infrastructure, have the potential to impact or be a risk to cultural features and heritage values. The Pyrenees Venture FPSO and subsea infrastructure has been in operation since 2008 and has been marked on nautical charts since that time. Inspection, monitoring, maintenance and repair activities may also be conducted within the Operational Area. The Petroleum Activity includes production from a series of subsea wells. The worst-case credible hydrocarbon spill scenario involves a long-term (69-day) uncontrolled subsea release of 115,600 m³ of Pyrenees crude⁷³ and forms the basis of the EMBA.			
Receptor sensitivity	Cultural features and heritage values: High value Marine mammals: High value species Marine reptiles: High value species Fish: High value species			
Planned activities	The potential environmental impact to species that have a cultural feature or heritage value have been summarised below to provide the context of a potential impact significance level to those species to understand any cumulative impact on the cultural feature or heritage value.			
	Aspect	Impact significance level		
	Environmental impact assessment to marine species	Marine mammals	Marine reptiles	Fish
	6.7.3 Routine light emissions	N/A	Minor (1)	N/A
	6.7.4 Routine acoustic emissions	Minor (1)	Minor (1)	Minor (1)
	6.7.6 Routine and non-routine discharges: produced water	Minor (1)	Minor (1)	Minor (1)

⁷³ Existing modelling was undertaken in 2022 for a release of 156,774 m³ of Stickle crude at the Stickle 4H-1 well. Given that the available modelling is 41,174 m³ larger than then spill risk for this activity and is similar distance to the nearest shoreline, it is deemed representative and additional modelling for these areas was therefore not required.

Aspect	Cultural features and heritage values			
Unplanned activities	The potential environmental risks to species considered to have cultural value to Traditional Owners have been summarised below and attributed a risk rating to understand cumulative impacts on them as a cultural feature or heritage value.			
	Aspect	Risk rating		
	Environmental risk assessment to marine species	Marine mammals	Marine reptiles	Fish
	6.8.2 Unplanned hydrocarbon release: loss of well containment	30	30	30
	6.8.4 Unplanned hydrocarbon release: subsea infrastructure	3	3	3
	6.8.5 Unplanned hydrocarbon release: offtake operations	3	3	3
	6.8.3 Unplanned hydrocarbon release: loss of containment of bulk storage (crude)	9	9	9
Impact and risk assessment	The Petroleum Activity has the potential to impact cultural features and heritage values through the following ways: <u>Intangible Cultural Heritage</u> • Songlines: Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale & Kelly, 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. 'weaken' a songline) rather than binary or absolute (i.e. destroy a songline). • Creation/Dreaming sites; sacred sites; ancestral beings: Activities that physically alter landscape features may be assumed to potentially impact values of Creation/Dreaming sites, sacred sites or ancestral beings. • Cultural obligations to care for Country: Environmental impacts may be assumed to impact rights and obligations to care for Sea Country. Exclusion of Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation) are other potential sources of impact. • Knowledge of Country/customary Law and transfer of knowledge: Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population. Therefore, the transmission of these skills is expected to be impacted where there are impacts at the species/population level. Limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. • Connection to Country: Where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald & Phillips, 2021). • Access to Country: Impacts to access to Country may be classified as temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Impacts to access to Country can only occur in areas that were traditionally accessed by Traditional Custodians. As described in Section 4.9 this is anticipated to be focussed on areas adjacent to the coast. • Restrictions on Access to Country: Access to the Operational Area has not been identified as a cultural issue; however, some areas within the EMBA may not be culturally appropriate to access. Impacts to this value may occur where spill response access areas that are not appropriate, or in ways that are not consistent with traditional Law. • Kinship systems and totemic species: It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that "skin group" from hunting or eating that same species (Juluwarlu, 2004). It is therefore inferred that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals.			

Aspect	Cultural features and heritage values
	- Resource collection: Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level. <u>Marine ecosystems and species</u> - Marine ecosystems may hold both cultural and environmental value (see Section 4.9) with cultural and environmental values intrinsically linked (DCCEEW, 2023; MAC, 2021 as cited in Woodside, 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country – the seascape which Traditional Custodians view, interact with or hold knowledge of. <u>Coastal landforms</u> - Coastal landforms may have cultural values either through association with intangible values described above (e.g. as features of a songline, physical manifestations of ancestor beings) or as archaeologically prospective locations (e.g. water sources with increased habitation/use, dunes used for burials) <u>Intangible values</u> <u>Songlines</u> Management of intangible cultural heritage can include reducing impacts and risks to tangible features that are associated with intangible cultural heritage (UNESCO, 2003; ICOMOS, 2013). Impacts to marine plants, animals and other cultural features associated with songlines might impact the intergenerational transmission of knowledge of songlines when individuals can no longer witness or interact with the cultural features tied to songlines on Country. Therefore, managing songlines may require environmental controls to minimise potential impact to marine fauna at a population level, including migratory routes. Refer to species-specific assessment below for further information. Physical features comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. Songlines can become lost, fragmented, or broken when there is a loss of Country or impact to culturally important physical features (Neale & Kelly, 2020:30). No specific details of songlines within the EMBA have been provided by relevant persons during consultation for this Activity, and no landforms typical of songlines (e.g. rocks, mountains, rivers, caves and hills (Higgins, 2021:724)) are anticipated to be impacted by the Petroleum Activity. <u>Creation/Dreaming sites; sacred sites; ancestral beings</u> Woodside has undertaken all reasonable steps to identify Creation and Dreaming sites, sacred sites, and places associated with ancestral beings within the EMBA. No such sites have been identified. A review of relevant literature has been undertaken which has identified Creation, Dreaming and ancestral narratives related to the sea more broadly without confirming where (if anywhere) these overlap the EMBA. These references are of a general nature, and do not identify any features or values requiring specific protection or management from the proposed activities. In the literature reviewed, sea serpents or water serpents are common in Aboriginal creation narratives, and several references were identified. The majority of these refer to serpents residing within inland rivers or pools outside of the EMBA (Barber & Jackson, 2011, Hayes v Western Australia [2008] FCA 1487, Juluwarlu, 2004; Water Corporation, 2019). In some versions, the serpent originates from the sea or coast and creates the rivers as it heads inland. Areas of the current coastline and past coastlines at various points along the Ancient Landscape – where the Serpent would have emerged onto the land – are within the EMBA. Areas of the broader ocean where the serpent may have originally lived are not specified. Barber & Jackson (2011) also recount a story where a freshwater serpent pushes a sea serpent back into the ocean where it presumably continues to reside. This does not provide the specificity required to determine the location of sea serpents within the sea, and it is possible that the ocean as a whole (out to and beyond other continents) should be viewed generally as housing the sea serpent(s). Consultation with Traditional Custodians and ethnographic surveys have not identified impacts on sea serpents from the Petroleum Activity. However, by analogy to other water serpent narratives across Australia, possible impact pathways may include interruption of its path by blocking or reducing flows of water, damaging sacred sites such as thalu or rock art sites or depleting water sources. No impacts to water flows (either tidal movement or ocean currents) or depletion of water sources are anticipated from this Petroleum Activity. <u>Cultural obligations to care for Country</u> Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. Lack of access to coastally located cultural sites that carry songlines or remain ceremonially important can

Aspect	Cultural features and heritage values
	impact First Nations people's livelihoods and impact their ability to carry out cultural obligations on Country. <u>Knowledge of Country/customary Law and transfer of knowledge</u> Cultural knowledge about Sea Country/customary Law and the intergenerational transmission of knowledge are important values identified through consultation, assessments and the literature review. Transfer of knowledge includes continuing traditional practices to pass on practical skills. Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population – for example traditional fishing methods require the survival of traditional fish resources. Therefore, ensuring the transmission of cultural knowledge may require environmental controls protecting species and migratory pathways at a population level. Refer to species specific assessment below for further information. <u>Connection to Country</u> Connection to Country describes the multi-faceted relationship between First Nations people and the landscape, which is envisioned as having personhood and spirit. No impacts to connection to Country are anticipated as a result of exclusion or displacement of Aboriginal communities. Access to Country is discussed below. <u>Murujuga Cultural Landscape</u> There is no overlap between the Operational Area and the boundary of the Murujuga Cultural Landscape World Heritage Area. Intangible values associated with MCL are preserved through the ongoing connection the Traditional Owners maintain with the landscape. Woodside maintains an ongoing relationship with the cultural authority of the MCL (MAC), to ensure these values are uninterrupted by the Petroleum Activity. Additionally, Woodside actively provides funding to the Murujuga Land and Sea Unit to assist in its ongoing management of Country and Sea Country associated with the MCL. In the unlikely event of a spill that may affect the OUV of MCL, the appropriate cultural authority would be engaged as specified in Appendix H. As there are no planned impact pathways identified for the MCL, its OUVs are expected to be maintained. <u>Access to Country</u> Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Access is also a value in its own right, as a continuation of traditional Sea Country access and use. Access to areas within the Operational Area may be limited where exclusion zones are established around vessels for safety purposes. Further the exclusion zones around drilling activities are temporary and presence of subsea infrastructure are not anticipated to affect navigation, particularly given the water depth. Access to Country within the EMBA is also not expected to be affected in the highly unlikely event of an unplanned hydrocarbon release. However relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix H. <u>Restrictions on access to Country</u> No information was received which suggested any part of the Operational Area cannot be accessed in a culturally appropriate way. However, some areas of the EMBA may be subject to cultural restrictions on access or may be culturally dangerous to access in any respect. Access to these areas would only be required in response to an unplanned impact. <u>Kinship systems and totemic species</u> Individuals may have kinship to specific species (Smyth, 2008; Juluwarlu, 2004) and/or a responsibility to care for species (Muller, 2008). These relationships are understood to impose obligations on Traditional Custodians. It is understood that these obligations do not impose restrictions on other people generally, but it is considered that impacts to species at a population level may inhibit Traditional Custodians with kinship relationships' ability to perform their obligations where this results in reduced or displaced populations. It is therefore considered that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. As such, impacts to individual marine fauna is not expected to impact on the totemic or kinship cultural connection. Refer to species specific assessment below for further information. <u>Resource collection</u> A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

Aspect	Cultural features and heritage values
	Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these communities may be impacted where there is an impact at the species/population level. Refer to species specific assessment below for further information. Relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix H. <u>Marine species</u> <u>Marine mammals</u> There are increase ceremonies/rituals for species of animals and plants, important to First Nations, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals – for example, the thalu site on Murujuga which “brings in whales to beach” will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed interest about whale migratory routes and studies (Table 4-19). Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). As described in the relevant environmental impact and risk assessment, potential impacts to whales are limited to behavioural disturbance to transient individuals, which are not considered to be ecologically significant at a population level, and hence not expected to impact the value of marine mammals, including the transmission of cultural knowledge. The Operational Area does overlap the BIAs for migration for the pygmy blue whale and humpback whale. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained. <u>Marine reptiles</u> Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources (Table 4-19). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level. Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn, 2021). First Nations groups have expressed an interest regarding turtle monitoring programs and migration patterns (Table 4-19). Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al., 2018:251). Inter-generational transmission of cultural knowledge (including Songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). As described in the relevant environmental impact and risk section, potential impacts to marine reptiles are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts will not occur to significant proportions of the populations of the species, nor result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. Further, the Operational Area and EMBA do overlap marine turtle BIAs. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained. <u>Fish</u> Fish have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore,

Aspect	Cultural features and heritage values
	these species (as resources) will be impacted where there is an impact at the species/population level. During consultation, fish were identified as important agents in the management of the broader ecosystem in Mermaid Sound, and generally to marine environments. Inter-generational transmission of cultural knowledge relating to fish may be impacted where changes to population/behaviour results in reduced sightings (e.g. through population decline). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). Intangible cultural heritage associated with fish, including inter-generational knowledge regarding fishing techniques and migratory patterns, can be managed by reducing impacts to fish in nearshore marine environments to which this cultural knowledge is intrinsically connected. As described in the relevant environmental impact and risk sections, it is expected that fish, sharks and rays may demonstrate avoidance or attraction behaviour however, potential impacts are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained. <u>Benthic habitats (coral, seagrass)</u> Through consultation, First Nations groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important habitat for dugongs. Additionally, coral is valued by MAC for its aesthetic values. As described in the relevant environmental impact assessments in Sections 6.7 and 6.8, the potential impacts from the Petroleum Activity on benthic habitats is assessed to be no lasting effect. Potential environmental impacts to benthic communities have been assessed in Sections 6.7 and 6.8. In terms of risk, as described in Sections 6.7 and 6.8, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, short-term exposure, as well as the response strategies planned to be deployed, an unplanned release is not expected to result in a level of exposure to coral and seagrass that would cause an adverse impact on marine ecosystem functioning or integrity results. As such, cultural values and intangible cultural heritage associated with benthic habitats are expected to be maintained. <u>Shoreline habitats (coastal vegetation, mangroves)</u> Through consultation, First Nations groups identified shoreline habitats as valuable for their ecological values, including coastal vegetation such as mangroves which provide shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia, 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli. There is no overlap between the Operational Area and shoreline habitats, and no planned impacts to shoreline habitats from the Petroleum Activity. In terms of risk, as described in Sections 6.7 and 6.8, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, as well as the response strategies planned to be deployed, an unplanned release is not expected to have a substantial adverse impact on marine ecosystem functioning or integrity. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained. <u>Coastal landforms</u> There is no overlap between the Operational Area and coastal landforms, and no planned impacts to coastal landforms from the Petroleum Activity. For coastal landforms beyond the Operational Area, the EMBA is driven by an unplanned hydrocarbon release. There is no anticipated impact pathway from the presence of marine diesel on the physical existence of coastal landforms such as hills, waterways or dune systems. Access to Country within the EMBA is also not expected to be affected in the highly unlikely event of an unplanned hydrocarbon release. However relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix H. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.

Aspect	Cultural features and heritage values
	Conclusion The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than Minor (1) and unplanned activities are assessed to have a residual risk rating of 30 (or lower) which is considered “Tolerable” according to the Woodside PetDW Risk Matrix. Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.6 of this EP).

Demonstration of ALARP				
Control considered	Feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
Apply a ‘living heritage’ ⁷⁴ management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes. CS: Minimal.	Implementation of the ‘living heritage’ approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 19.1
C 3.1 EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures ⁷⁵ : - Project vessels will not travel greater than 6 knots within 300 m of a cetacean (caution zone) and not approach closer than 100 m from a whale. - Project vessels will not approach closer than 50 m for a dolphin and/or 100 m for a whale (with the exception of animals bow riding). - If the cetacean shows signs of being disturbed, project vessels will immediately withdraw from the caution zone at a	F: Yes. CS: Minimal.	Implementation of controls for reduced vessel speed around marine fauna can potentially reduce the underwater noise footprint of a vessel and reduces the likelihood of impact or influence on whale activity. Where this control prevents impacts to whales at a population level, it maintains a culturally significant resource to a level that results in no observable change to coastal communities (migratory pathways maintained).	Benefits outweigh cost/sacrifice.	Yes C3.1

⁷⁴ Living heritage supports community and individual identity. Intangible cultural heritage is ‘living heritage’ that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation, and evolves in response to the environment. Woodside applies a ‘living heritage’ approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness.

⁷⁵ For safety reasons, the distance requirements below are not applied for a vessel holding station or with limited manoeuvrability; e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

Demonstration of ALARP				
Control considered	Feasibility (F) and cost/sacrifice (CS)	Benefit in impact/risk reduction	Proportionality	Control adopted
constant speed of less than 6 knots.				
Should it be identified that relevant cultural authorities may be affected in the unlikely event of a spill, Woodside will engage with those parties as appropriate and in alignment with the oil spill preparedness and response mitigation assessment.	F: Yes. CS: Minimal.	Engaging with relevant cultural authorities that may be impacted by a spill will allow the Traditional Custodians to identify areas of concern. This will also allow Traditional Custodians to confirm areas where access is not culturally appropriate so these can be considered for avoidance, or advice of the necessary requirements to access such areas (such as the gender of respondents or necessary ceremonies).	Benefits outweigh cost/sacrifice.	Yes Adopted, see Appendix H
As marine ecosystems may hold both cultural and environmental value (see Section 4.9), with cultural and environmental values intrinsically linked, in addition to the above controls, the controls in Section 6.7 and Section 6.8 will reduce impacts to cultural features and heritage values.				
ALARP statement: On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A). Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact and risk assessment has determined that the planned activities are unlikely to result in an impact greater than Minor (1) and unplanned activities are assessed to have a residual risk rating of 30 (or lower) which is considered Tolerable according to the Woodside PetDW Risk Matrix. Woodside recognises and supports the ongoing management of heritage values under listings Murujuga Cultural Landscape World Heritage listing, Murujuga National Park and Dampier Archipelago (Including Burrup Peninsula) National Heritage place. Based on the relevant EPOs (13,14, 24) and the adopted controls, activities proposed under the Petroleum Activity are not inconsistent with relevant heritage legislation, management plans and agreements under which these values are protected and conserved. The Petroleum Activity and the EMBA do not overlap the Ancient Landscape and they are not anticipated to have a significant impact on MNES (Section 4) including marine fauna with a First Nations connection with, or traditional use in nearshore areas as defined in Section 4.9.4. Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable if ALARP.

Environmental Performance Outcomes, Standards and Measurement Criteria related to Cultural Features and Heritage Values ⁷⁶			
EPO	Adopted Control(s)	EPS	MC
EPO 24 No adverse impact to cultural features and heritage values without a permit.	C 19.1 Apply a 'living heritage' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledge across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	PS 19.1.1 Woodside will continue to give voice to Traditional Custodians to identify interests, transmit information and express concern.	MC 19.1.1 Records demonstrate change management and management of knowledge processes have been followed where new controls or management measures identified.
		PS 19.1.2 Woodside will assess and where deemed practicable will implement appropriate cultural protocols by Traditional Custodians.	MC 19.1.2 Records demonstrate Woodside implemented cultural protocols as requested.

⁷⁶ As marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in Sections 6.7 and 6.8 will reduce impacts to cultural features and heritage values.

7 IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the Petroleum Activity. The implementation strategy for the Petroleum Activity confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and EPSs outlined in this EP are achieved.

Woodside, as operator, is responsible for ensuring that the Petroleum Activity is managed in accordance with this implementation strategy.

7.2 Systems, practice and procedures

All operational activities are planned and carried out in accordance with relevant legislation and internal environment standards and procedures identified in this EP (Section 6).

Processes are implemented to verify controls to manage environmental impacts and risks to:

- a level that is ALARP and acceptable
- meet EPOs
- comply with EPSs defined in this EP.

The systems, practices and procedures that will be implemented are listed in the EPSs contained in this EP. Document names and reference numbers may be subject to change during the statutory duration of this EP; this is managed through a change register and management of change process (Section 7.6). Further information regarding some of the key systems, practices and procedures relevant to implementation of this EP is provided below.

7.3 Woodside (PetDW) Management System

The Woodside PetDW Management System defines the boundaries within which all activities are conducted. It provides a structured framework to set common requirements, boundaries, expectations, governance and assurance for all activities. It also supports accountabilities and responsibilities as defined in the organisational structure. The overarching objective of the Woodside PetDW Management System is to aspire to zero harm to people, communities and the environment, and achieve leading industry practice.

This EP has been designed to meet the environmental aspects of the Woodside PetDW Management System framework and establishes the foundation for continual improvement through the application, monitoring and auditing of consistent requirements across all aspects of the Petroleum Activity including;

- identification of statutory obligations and commitments to ensure maintenance of licence to operate
- implementation of petroleum risk management processes, including this EP
- scheduled monitoring and auditing of control implementation
- completion of reviews, and reporting outcomes of these reviews

7.4 Woodside invasive marine species risk assessment process

7.4.1 Objective and scope

To minimise the risk of introducing IMS, all applicable vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below).

The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

The IMS risk assessment process does not apply to:

- vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)⁷⁷
- 'new build' vessels or immersible equipment launched less than 14 days before mobilisation
- locally sourced vessels or immersible equipment from within the Western Locally Sourced Zone⁷⁸.
Vessels, or immersible equipment are defined as locally sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of AFC.

7.4.2 Risk assessment process

Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry (Marine Pest Sectoral Committee, 2018) and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (IMO, 2023).

To effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each project vessel, or immersible equipment planning to undertake activities within an IMSMA or operational area. The risk assessment process considers a range of factors, as listed in Table 7-1 and

Table 7-2.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A quality assurance and control process is implemented for all Woodside-conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

Table 7-1: Key factors considered as a part of the risk assessment process for vessels

Factors	Details
Vessel type	The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g. dredges) in comparison to simple vessels (e.g. crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, different risk ratings are applied depending on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past six months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e. proportion of time spent stationary or below 3 knots), and its main operational region (i.e. tropical, subtropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.
Internal treatment systems	A risk reduction factor applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.

⁷⁷ The IMSMA is defined as all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 NM from land ('Territorial Seas', and including Australian territorial islands). The IMSMA also includes: (i) all waters which are shallower than the 50-metre depth contour outside of the 12 NM boundary, thereby encompassing submerged reefs and atolls, and (ii) Operational Areas defined in environmental approvals. The IMSMA is based on current maritime boundary definitions, legal frameworks and requirements, IMS risk interpretations and existing management arrangements applied by Commonwealth and State/Territory regulatory agencies.

⁷⁸ The Western Locally Sourced Zone spans an area that includes the entire Western Australian coastline out to the Exclusive Economic Zone limit at 200 NM (excluding any government-declared Quarantine Areas).

Factors	Details
Vessel origin and proposed area of operation	Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the proposed climatic region of the proposed area of operation. Highest risk rating is applied to similar climatic regions.
Number of stationary/slow speed periods >seven days	A risk factor is calculated based on the number of seven-day periods that the vessel has operated at stationary or at low speed (<3 knots) in port or coastal waters, which is any waters <50 m deep outside 12 NM from land or any waters within 12 NM of land. The greater the number of periods, the higher the risk factor applied.
Region of stationary or slow periods	A further multiplier is applied depending on the location of the stationary/slow speed periods. The highest risk rating applied if the stationary or slow speed periods occurred within ports or coastal waters of the same climatic region.
Type of activity – contact with seafloor	The potential for the introduction of IMS varies on the planned vessel activity taking place. Those activities that come in contact with sediments and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs) are considered to have a greater risk of infection.

Table 7-2: Key factors considered as a part of the risk assessment process for immersible equipment

Factors	Details
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep and/or within 12 NM from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.
Duration of time out of water since last deployment	A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.
Transport conditions during mobilisation	If the equipment is stored in damp conditions, then a high risk factor is applied, while if equipment is stored in dry and well ventilated (low humidity) conditions, then a low risk factor is applied.
Post-retrieval maintenance regime	A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and/or disassembled between project sites, while a higher risk rating is applied where no routine cleaning occurs.
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep and/or within 12 NM from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.

Following implementation of the risk assessment process, vessels and/or immersible equipment are classified as one of three risk categories:

- 'Low' – Low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk
- 'Uncertain' – risk of introducing IMS is not apparent and as such the precautionary approach is adopted, and additional management options may be required
- 'High' – High risk of introducing IMS means additional management options are required before this vessel mobilises to the Operational Area.

Following the allocation of a 'low' risk rating for a vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed before mobilisation. For vessels or equipment classified as posing an Uncertain or High theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a Low risk status. These management options have been developed with the intention of reducing IMS risk to levels that are

ALARP. It is a flexible approach that allows for a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include:

- having a suitably qualified and experienced IMS inspector inspect (desktop, in-water or dry dock) to verify risk status; where practicable, the inspection shall occur within seven days (but not more than 14 days) before final departure to the Operational Area
- applying in-water or dry dock cleaning of the hull and other niche areas, typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports
- limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries); applicable for Uncertain risk vessels only
- rejecting the vessel.

In some circumstances, such as emergency scenarios or in the presence of serious logistic constraints or other factors outside of the control of Woodside, it may not be possible to effectively apply any of the IMS management measures available and described above. In the absence of regulatory conditions, commitments, or other legislative obligations that prescribe management measures for IMS, a risk assessed alternative process is available which must be approved by the relevant Business Vice President (VP), and HSE VP.

Before they enter the Operational Area, survey vessels and immersible equipment are required to be a low risk of introducing IMS.

7.5 Risk management

Risk management processes and practices are applied on an ongoing basis to design, production and maintenance activities for the Pyrenees Facility to manage risks to personnel, assets and the environment.

Potential environmental consequences and impacts of the Pyrenees Facility are assessed and controlled in accordance with the Woodside PetDW risk management processes described in Section 2.2 of this EP (environmental risk management methodology).

The results of the Pyrenees Facility ENVID are described in Section 6 and in the Environmental Impacts and Risk Register. This register, in conjunction with the EP, provides a demonstration that environmental impacts and risks have been identified, and that appropriate controls are in place to manage them to a level that is acceptable and ALARP throughout the life of the facility.

A number of other risk management tools and techniques are used to manage environmental and other risks on a routine basis during operational, maintenance and inspection tasks. Examples include:

- the processes outlined in Section 2
- risk management tools, including hazard identification and risk assessments and Level 2 risk assessments, operational risk assessments, the technical management of change system (Section 7.6), and Step Back 5×5
- integrity review studies, HAZIDs and hazard operability studies.

These tools, risk and integrity management practices are described further in the Pyrenees Facility Safety Case and the WOMP.

In addition, other risk sub-processes and practices are also applied within Woodside on an ongoing basis to manage different types of risk. A summary of those relevant to the Petroleum Activity is provided below. Woodside PetDW's risk management processes (refer to Section 2.2.1), along with the supporting risk sub-processes and practices discussed in this section, ensure the environmental impacts and risks of the Petroleum Activity continue to be identified and reduced to a level that is ALARP.

7.5.1 Management of risks – contracting and procurement

Suppliers and contractors play a significant role in meeting the resource needs of Woodside PetDW's operations. Effective management of environmental risks in contracts is achieved by setting clear expectations and managing environmental risks throughout the duration of the contract.

The Health, Safety and Environment in Contracts and Procurement Procedure establishes the HSE requirements to manage contractors performing tasks in relation to the plant and pipeline. The Health, Safety and Environment in Contracts and Procurement Procedure ensures contractors are informed of their requirement to comply with the requirements of the Woodside (PetDW) HSE Management system. Third parties are assessed under the process prior to being engaged. This process includes, but is not limited to, an assessment of HSE, management and maintenance systems.

7.5.2 Management of risks – well integrity

Wells are managed throughout their lifecycle in line with the Well Lifecycle Management Procedure. This procedure provides the basis for ensuring well integrity in accordance with the Process Safety Management Procedure.

In addition, wells are required to have a regulator accepted WOMP to demonstrate that well integrity risks are managed to ALARP levels. Wells tied back to the facility and 'exploration wells temporarily abandoned' are managed under a WOMP.

Management of operating wells can be formally transferred from Operations to the Global Wells and Seismic (GWS) team for activities such as well intervention and workover. Where activities are undertaken by GWS, the risks are managed under the GWS Risk Management Procedure, which specifically addresses the risk of loss of containment from a well or well related equipment. This procedure supplements the Woodside Risk Management Procedure.

7.5.3 Management of risks – marine services

Woodside's Marine Services Function provides a platform for the conduct of safe and efficient marine operations across Woodside through the Marine Services Management. A set of procedures that support vessel assurance and management (including HSE and quality management) are in place to ensure marine operations are conducted in a safe and efficient manner, and in accordance with regulatory requirements.

More details on vessel assurance and the communication of environment requirements to vessels are provided in Section 7.11.4.

Vessel masters are required to request clearance from the facility OIM or delegate prior to entering the 500 m PSZ.

7.5.4 Management of risks – direct greenhouse gas emissions management

Emissions generation and energy use is to be managed in accordance with the GHG Emissions and Energy Management Procedure (from 2027), which defines the minimum mandatory requirements to deliver continuous improvement in energy efficiency and reduce GHG emissions. This procedure supports the implementation of Woodside's Climate Policy, aligns with the Woodside Environmental Management Standard for assets in Operate phase and supports the 'operate out' component of limiting net emissions.

Implementation of the procedure assists in meeting external expectations, including Woodside's net equity Scope 1 and 2 GHG reduction targets of 15% by 2025 and 30% by 2030, and the aspiration for net zero by 2050 or sooner⁷⁹. These targets are applied across the portfolio, with progress reported in annual corporate disclosures. No specific reduction targets are set for individual assets. Achievement of corporate targets may require additional net voluntary abatement beyond the SGM requirements.

The procedure maintains consistency with the principles of current corporate initiatives, including the Zero Routine Flaring Initiative for oil assets, the OGMP 2.0, OGCI Near-Zero, and Methane Guiding Principles. Section 3 of the Climate Management Standard requires assets that emit material amounts of methane to continually reduce methane through leak detection and repair, annual routine monitoring, accountability and governance, improving methane emissions data and increasing transparency through reporting. Where emissions cannot be mitigated, appropriate controls consistent with the principles of the OGCI Near-Zero are applied.

The GHG Emissions and Energy Management Procedure links to the annual review of opportunities to improve energy performance through identification and evaluation as described in the Production

⁷⁹ Targets and aspiration are for net equity Scope 1 and 2 greenhouse gas emissions relative to a starting base of 6.32 Mt CO₂-e which is representative of the gross annual average equity Scope 1 and 2 GHG emissions over 2016–2020 and which may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets.

Optimisation and Opportunity Management Procedure. It also requires measurement, analysis and communication of energy performance across the Operations Division and consideration of actual or potential impacts to energy efficiency in Woodside decision-making, such as management of change, operational decisions, issue resolution options analysis and facility optimisation plans.

Opportunities to improve energy performance or reduce emissions are identified, captured, and evaluated as described in the Production Optimisation and Opportunity Management Procedure (see Section 7.5.4.1).

Identification considers a wide range of opportunities, including those that require formal allocation of budget and resources (longer term), as well as opportunities that can be executed as part of day-to-day operations. Opportunities identified are to be evaluated and implemented in a manner consistent with the Production Optimisation and Opportunity Management Procedure.

The Woodside Environmental Performance Procedure and Management Standard require that assets measure, monitor or estimate direct air and GHG emissions, and that such emissions and energy intensities are minimised to ALARP. The requirement to set, measure and track flare and emissions targets for assets, help to manage the emissions to meet the EPS requirements in Section 6.7.5 is outlined in Section 7.5.4.2 below.

7.5.4.1 Production optimisation and opportunity management

The Pyrenees Facility has the opportunity to contribute to emissions reduction by operating safely, reliably and efficiently, driven through operational improvements across activities including energy and operating efficiency, process optimisation and reducing flaring, venting and fugitives. Opportunities to reduce emissions are identified throughout the year in various meetings, forums and teams.

In addition, the Pyrenees Facility is planning to adopt a new process for the facility, Woodside's Production and Opportunity Management Procedure. The facility is looking to commence implementing the process in 2026 and anticipating that the transition will be completed in 2026, with the process being implemented from 2027. As this is a new process for the facility, it will take time to implement. It is anticipated that will take around a year to implement as this is an annual process.

The procedure outlines the process for identification, prioritisation and management of production opportunities that maximise production revenue or reduce emissions intensity across Woodside operated assets. Opportunities are identified throughout the year in various meetings, forums and teams. In addition, formal opportunity identification takes place through annual workshops, which complement the identification of improvement opportunities. These opportunities are to be prioritised and managed according to the workflow shown in Figure 7-1.

Figure 7-1: Emissions reduction opportunity management workflow

Emissions reductions opportunities are to be evaluated and progressed based on value and confidence of return, within the constraints of technical feasibility, cost and other factors. Implemented opportunities are to be validated and recorded before closeout.

7.5.4.2 Fuel gas and flare target setting and monitoring

To demonstrate the risks and impacts relating to fuel gas combustion and flaring have been reduced to ALARP, fuel gas and flare targets for the facility are set annually. Targets are currently set annually estimated based on operating experience (using historic realised data to validate assumptions related to the reservoirs, wells, subsea equipment, and facility) and forecast activities; e.g. planned maintenance and shutdowns. Consideration is also given to unplanned events such as disconnection and re-connection for cyclone avoidance. Annual development of targets also gives consideration to the fuel gas combustion and flaring estimates contained within this EP.

The fuel gas and flare targets are tracked against fuel gas combustion and flare performance through the year. Where achieving a flare target is in question, an internal flare target deviation is developed, which requires an ALARP justification. A flare target deviation considers EP flare estimates. If the estimate is likely

to be exceeded, an EP management of change assessment (see Section 7.6.1) is undertaken to determine if a revision and resubmission is required.

The facility has commenced aligning the PetDW fuel gas and flare target setting processes (previously outlined in the Pyrenees Flare and Vent Management Plan) to follow Woodside's Greenhouse Gas, Fuel and Flare Target Setting Guideline. It is anticipated that the transition will be completed in 2026, and the Greenhouse Gas, Fuel and Flare Target Setting Guideline used for targets set from 2027.

7.5.5 Management of risks – indirect greenhouse gas emissions management

As stated in the Climate Policy, Woodside's objective is to thrive in this energy transition as a low-cost, lower-carbon energy provider. To support this policy Woodside undertakes the following measures:

- Set science-based⁸⁰ near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned⁸¹ scenarios, covering equity Scope 1 and 2 emissions, both operated and non-operated.⁸²
- Develop and operate oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (design out), supporting efficient operations (operate out) and use of robust offsets (offset) as methods to reduce and offset greenhouse gas emissions.
- Invest in new energy products and lower-carbon services to reduce customers' emissions (part of Woodside's Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publish transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures or other recognised global reporting standards.
- Align our advocacy to the principles of this Climate Policy.

Woodside's Scope 3 targets include the introduction of new products and services into our portfolio, like hydrogen, ammonia and carbon capture, utilisation and storage. These products and services can help our customers avoid or reduce their Scope 1 or 2 emissions and therefore reduce the life cycle (Scopes 1, 2 and 3) emissions intensity of Woodside's portfolio.

Woodside's initial Scope 3 target was an investment target, to invest \$5 billion in new energy products and lower carbon services by 2030^{83,84}. In 2023, Woodside reviewed our approach to Scope 3 targets in response to investor feedback and supplemented the existing investment target with a new complementary emissions abatement target, to take final investment decisions on new energy products and lower carbon services by 2030, with total abatement capacity of 5 Mtpa CO₂e⁸⁵.

The investment target tracks Woodside's work at a corporate level to develop these projects and bring them to market. The emissions abatement target will track the potential impact of these projects on customer

⁸⁰ Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of 'science-based' (published 2021) which states "targets are considered 'science-based' if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement – limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf>.

⁸¹ Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of 'Paris-aligned scenarios' (published 2021) which states "scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See <https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures-prototype.pdf>.

⁸² Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside's ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside's ownership interest.

⁸³ Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment. Timing refers to financial investment decision, not start-up/operations.

⁸⁴ Includes pre-ready-for-startup spend on new energy products and lower carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 emissions which are managed separately through asset decarbonisation plans.

⁸⁵ Includes binding and non-binding opportunities in the portfolio, subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance.

emissions. The customers for these products and services may be the same as the customers of our oil and gas business, directly substituting their energy for new products or directly abating the associated emissions. They may also be customers of the new products and services, without also being customers of oil and gas. Progress against these targets is reported annually in Woodside's annual disclosures. Targets are not set for individual projects, including Pyrenees, but are assessed corporately.

7.5.5.1 Annual review

An annual review of the implementation and outcomes associated with Woodside working with the natural gas value chain to reduce emissions in third party systems via corporate activities will be undertaken. Additionally, progress against corporate Scope 3 investment and abatement targets will be reported annually in relevant Woodside annual disclosures. If they are deemed to be effective at a corporate implementation level, then it will also be deemed that specific impacts and risks at an asset contribution level (i.e. proportion attributable to Pyrenees production) are also being managed appropriately.

If the annual review deems the controls are not effective, an EP management of change assessment is undertaken to determine if a revision and resubmission is required.

7.6 Change management

Change management is used where there is no existing approved business baseline, such as a process, procedure or accepted practice, or where conformance with an approved baseline is not possible or intended; for example, due to equipment fault or failure or a recently discovered issue which will take time to rectify. Change management is also used when the baseline is changed (e.g. the process is modified). It applies to management of temporary, permanent, planned or unplanned change encompassing one or more of the following:

- plant (equipment, plant, technology, facilities, operations or materials)
- projects (budget, schedule)
- people (organisation structure, performance, roles)
- process (WMS content, processes, procedures, standards, legislation, information).

7.6.1 EP management of change and revision

Woodside's Environmental Approval Requirements Australia Commonwealth Guideline provides guidance on the Environment Regulations that may trigger a revision and resubmission of the EP to NOPSEMA. The document also provides guidance on what may constitute as new source-based or receptor-based impacts and risks, or a significant increase in an existing source of environmental risk (to provide context in determining if EP resubmission is required under Regulations 19 and 39 of the Environment Regulations).

Minor EP changes, where a review of the activity and the environmental risks and impacts of the activity shows the changes do not trigger regulatory requirements to resubmit the EP, will be considered a 'minor revision'.

Changes with potential to influence minor or technical changes to the EP text are tracked in management of change records, project records, or the EP Updates Register, and incorporated during internal updates of the EP or the five-yearly revision.

In accordance with the requirements of Regulation 41 of the Environment Regulations, Woodside will also submit to NOPSEMA a proposed revision to this EP at least 14-days before the end of each period of five years, commencing on the day on which the original and subsequent revisions of the EP are accepted under Regulation 35 of the Environment Regulations.

7.6.2 Oil Pollution Emergency Plan management of change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond

- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 39 to determine if EP, including OPEP, resubmission is required (see Section 7.6.1). Changes with potential to influence minor or technical changes to the OPEP are tracked in management of change records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

7.7 Woodside decommissioning framework

Decommissioning is a routine, planned activity for the offshore oil and gas industry. Current best practice is for decommissioning to include:

- designing for decommissioning during the development phase of projects / facilities
- removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging wells associated with a petroleum activity
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production
- selecting, developing and planning the selected decommissioning option
- executing decommissioning plans
- restoring the marine environment.

This assists with compliance with section 572(3) of the OPGGS Act, which requires titleholders to remove property from the title area when it is neither used, nor to be used, in connection with the operations. Under section 572(7) of the OPGGS Act, the property removal requirements under section 572(3) of the OPGGS Act have effect subject to any other provision of the OPGGS Act, the regulations, directions given by NOPSEMA or the responsible Commonwealth Minister, and any other law. Under section 270(3) of the OPGGS Act, before title surrender, all property brought into the surrender area must be removed to the satisfaction of NOPSEMA, or arrangements that are satisfactory to NOPSEMA must be made in relation to the property. Sections 572(7) and 270(3) of the OPGGS Act provide scope for in-situ decommissioning and other arrangements to be made where it can be demonstrated that the risks and impacts are ALARP and acceptable as well as comply with all other Acts and legislation.

7.7.1 Decommissioning in operations

Asset specific decommissioning plans are typically developed prior to cessation of production. Planning includes redundant infrastructure as well as structures coming to the end of production and decommissioning critical systems to enable removal. Appropriate maintenance plans are developed and implemented to ensure decommissioning critical systems meet the requirements to facilitate removal.

7.7.2 Decommissioning planning

Decommissioning planning generally commences two to 10 years prior to cessation of production (CoP) (Figure 7-2). The timeframe selected for decommissioning planning depends on the complexity of the facility and infrastructure requiring decommissioning.

End of Field Life / Cessation of Production (CoP) – Preparation for CoP and Facility Decommissioning / P&A -Existing Facilities

Asset/Project Lifecycle Process

Figure 7-2: Woodside's process for decommissioning planning

7.7.3 Inventory of property within Pyrenees asset

An inventory of property associated with the Pyrenees development located within WA-42-L and WA-43-L, covered under this EP, including its status, is provided in Table 7-3.

For a more detailed breakdown of key subsea infrastructure of the Pyrenees development see Section 3.5. Other infrastructure in the WA-42-L title area outside of the Pyrenees development are beyond the scope of this EP and are covered under the Macedon Operations (Commonwealth) Environment Plan (NOPSEMA Document ID: A1156357, accepted 24 December 2024). WA-42-L and WA-43-L also contain a number of exploration wells that have been abandoned with wellheads removed. As there is no remaining infrastructure associated with these, they have not been included in Table 7-3.

Table 7-3: Inventory of Woodside infrastructure within WA-42-L and WA-43-L covered by this EP

Item	Description	Status	Decom Phase
WA-42-L			
Pyrenees Venture FPSO and DTM	FPSO is self-propelled vessel. Overall length of ~274 m DTM is a turret mooring spider buoy, anchored to the seabed by nine anchor legs comprised of chain and wire rope	Operational	Not yet applicable
Subsea wells	17 production wells	14 online, three offline	Not yet applicable
	One gas injection well – one	Online	Not yet applicable
	Four water injection wells	Three online, one offline	Not yet applicable
	One exploration well (West Muiron-5)	Plugged and suspended	Technical assessment of the West Muiron-5 well has concluded that the well requires further well intervention to be considered permanently abandoned. The planning for this scope is outlined in the <i>WA-42-L Suspended Exploration Wells - Well Operations Management Plan (WOMP) (MACPN-SO-0023)</i> submitted to NOPSEMA on October 28 2025.
Subsea infrastructure	26 subsea trees	Operational	Not yet applicable
	27 wellheads	Operational	Not yet applicable
	10 manifolds	Operational	Not yet applicable
	24 umbilical termination assemblies	Operational	Not yet applicable
	12 risers + two electro-hydraulic umbilical risers	Operational	Not yet applicable
	Nine chain/wire mooring legs (with anchors)	Operational	Not yet applicable
	26 flowlines, totalling approximately 79 km	Operational	Not yet applicable
	13 umbilicals, totalling approximately 35 km	Operational	Not yet applicable
	117 flying leads (electrical and hydraulic)	Operational	Not yet applicable
Macedon subsea infrastructure and wells	Operated, managed and detailed within Macedon Operations EP (NOPSEMA Doc A680739)		
WA-43-L			
Subsea wells	Four production wells	Operational	Not yet applicable
Subsea infrastructure	Flowlines, electro-hydraulic umbilical, hydraulic jumpers (included above)	Operational	Not yet applicable

7.7.4 Pyrenees decommissioning strategy

CoP for the Pyrenees field is estimated to be 2035; however, the CoP could change based on production forecasting; thus, the CoP date will be continuously monitored, and the timing of the planned decommissioning activities will be adjusted accordingly.

The plan for decommissioning consists of:

- After flushing and cleaning of the subsea equipment to reduce associated potential impacts and risks to ALARP, the FPSO and the DTM system will be removed out of the field for disposal or divestment.
- The next phase will include permanent plugging and abandonment of wells, removal of trees, wellheads, flexible flowlines, and the other subsea equipment (e.g. manifolds, valve stations, umbilical).

In line with Woodside's decommissioning planning process outlined above, an Asset Closure Management Plan has been prepared for Pyrenees Asset.

Decommissioning of the Pyrenees infrastructure is being undertaken in two phases:

- plan for decommissioning
- execute decommissioning.

Woodside adopts a risk-based approach to the planning and execution of decommissioning of the property.

Timing of the main activities related to decommissioning planning and execution for the Pyrenees infrastructure are subject to change as plans develop and specific decommissioning requirements are defined; however, the current schedule is presented in Figure 7-3.

7.7.5 Decommissioning planning activities

Planning for decommissioning mostly includes desktop studies and engineering design, but it may also leverage data from inspections and other activities undertaken during IMMR within the scopes of the Petroleum Activity.

During the decommissioning planning phase all infrastructure will be managed and maintained within the scope of this EP to meet Woodside's obligations under section 572. The equipment associated with the Pyrenees development will be inspected, monitored and maintained in accordance with the Woodside asset maintenance and inspection regime for producing infrastructure.

As part of closure planning on all assets, periodic reviews are undertaken to identify any equipment that may, or has, recently become redundant since the last planning period. The equipment is reviewed to understanding the decommissioning approach, including scheduling based on risk, as well as methodology. This review is then updated in the closure management plans and sets the forward decommissioning strategy.

Decommissioning execution activities will adopt a risk-based approach, that considers the NOPSEMA Decommissioning Compliance Strategy 2024–2029 (NOPSEMA, 2023a).

7.7.5.1 Offline production wells

Four wells contained within the Pyrenees Field are currently offline. The wells are ROV surveyed on an RBI basis in accordance with the Pyrenees WOMP, and are being maintained in accordance with the process described in Section 3.19 of this EP. The wells are monitored and have adequate isolation barriers. The maintenance activities performed meet Woodside's obligations under section 572(2).

A comprehensive review of the offline wells has been conducted. This review has concluded that all wells have future utility and provision has been made for their return to service prior to EOFL. Timing for the return to service is triggered by individual relative production performance decline of other Pyrenees wells in most cases (typically when water cut exceeds 95% for production wells or loss of >30% injection capacity for water injector). As the offline wells are not redundant, no activities are currently required to comply with section 572(3). The wells will continue to be managed under the provisions and arrangements described in the Pyrenees WOMP. A WOMP Revision in Parts was submitted in July 2025 and accepted in August 2025 to provide further details of the management and future return to service plans for these wells.

All wells in the Pyrenees field are reviewed annually to identify wells approaching late life or redundant status. Wells identified as redundant will remain in the Operate phase until permanent abandonment and will continue to be managed under the provision and arrangements described in the Pyrenees WOMP.

7.7.5.2 Exploration wells

One exploration well with a wellhead that has been plugged is within the scope of this EP (West Muiron-5). This well has not yet been approved for abandonment by NOPSEMA.

Detailed technical assessment of the West Muiron-5 well to determine if the current state can be considered as permanently abandoned. This assessment has concluded that the well will require further well intervention to complete the P&A and be considered permanently abandoned. The planning for this scope is outlined in the *WA-42-L Suspended Exploration Wells - Well Operations Management Plan (WOMP) (MACPN-SO-0023)* submitted to NOPSEMA on October 28, 2025.

Decommissioning of the wellhead is to progress once the well has been accepted as permanently abandoned. Timing of these activities is subject to change and dependent on the assessments to be undertaken by Woodside and NOPSEMA. Any future plug and abandonment activities are not included within the scope of this EP.

Current planning for West Muiron-5 Wellhead decommissioning is premised upon removal, with consideration of the principles of ALARP and acceptability. Once a well has been accepted as permanently abandoned and the decommissioning activity is defined, a separate EP will be submitted for the wellhead decommissioning activity. This well with a wellhead is to continue to be maintained until it is decommissioned.

7.7.5.3 Suspended subsea infrastructure

A number of subsea items listed in Section 3.5 are suspended. These are being maintained in accordance with an RBI process described in Section 3.19 with removal of this property planned to occur at EOFL. Removal during operational life is not considered to be ALARP because it is incorporated within live infrastructure which introduces additional complexities and HSE risk that can be avoided during EOFL decommissioning.

7.7.5.4 Production infrastructure

As reflected in Figure 7-3, planning commences ahead of CoP and consists of desktop studies and engineering design, that leverages data from inspections and other activities undertaken during IMMR scopes within the scope of the Petroleum Activity.

During the decommissioning planning phase all infrastructure, including suspended infrastructure, will be managed and maintained within the scope of this EP to meet Woodside's obligations under section 572.

Decommissioning execution activities are expected to adopt a risk-based approach that is informed by NOPSEMA Decommissioning Compliance Strategy 2024–2029 (NOPSEMA, 2023).

7.7.5.5 Preparation for cessation of production

Flushing of the Pyrenees flowlines and the subsea infrastructure will occur following cessation of production and prior disconnection of the FPSO for its removal out of the field.

Figure 7-3: Pyrenees decommissioning target schedule

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7.6 Title relinquishment

Woodside proposes to collect the necessary data to inform future title surrender requirements through environmental monitoring campaigns. The environmental monitoring campaigns will assess any impact from emissions and discharges over the life of the activity. The results of the environmental monitoring will be assessed in a future subsea decommissioning EP and used to inform future title surrender requirements.

The final decommissioning EP for the Pyrenees field will outline any additional environmental monitoring required at the conclusion of all equipment removal activities. At title relinquishment, Woodside will submit a report to NOPSEMA demonstrating that the requirements of section 270 of the OPGGS Act have been met. This demonstration will consider a range of environmental information, including data collected following the completion of equipment decommissioning activities.

7.8 Organisation structure

The following Woodside organisational structure provides leadership and direction for operation of the Pyrenees Facility and environmental performance:

- the Executive VP Australian Operations reports to the Chief Executive Officer
- the FPSOs and Macedon VP report to the Executive VP
- the Pyrenees Asset Manager reports to the VP FPSOs and Macedon
- the Pyrenees OIM reports to the Asset Manager
- the Reliability & Integrity Manager reports to the VP FPSOs and Macedon
- the functional support teams report to the corresponding Business Unit VP.

Production facilities are supported by a team of environmental professionals who report to the Environment Manager. Facilities are supported by other Woodside functional teams, including:

- HSE – provides specific guidance and access to specialist HSE resources including assistance for governance and training, as well as guidance on Woodside HSE standards.
- Global Wells and Seismic – ensures the safe planning and execution of drilling (note, drilling is excluded from the scope of this EP), completion and work over operations.
- Projects – responsible for the engineering, construction and execution of the projects on operational facilities to ensure ongoing integrity and safe operation. The Closure Planning team and the Decommissioning Delivery team are part of Projects, and this ensures planning and execution of the asset's decommissioning activities are seamless.
- Marine Group – responsible for chartering vessels to support Woodside's offshore production facilities including vessels to aid emergency response.
- Aviation Group – provides personnel transport, material transport, emergency evacuation and search and rescue capabilities.

7.8.1 Roles and responsibilities

As required by Regulation 22(4), this section of the implementation strategy establishes a clear chain of command that sets out the roles and responsibilities of personnel in relation to the implementation, management and review of the EP, ranging from senior management to operational personnel.

Key roles and responsibilities for Woodside and contractor personnel in relation to the implementation, management and review of this EP are described below in Table 7-4. Roles and responsibilities for hydrocarbon spill preparation and response are outlined in Appendix I and the Woodside Incident Management Handbook. Roles and responsibilities for facility emergency response are outlined in the Pyrenees Facility Safety Case and are consistent with the Pyrenees ERP.

It is the responsibility of all Woodside employees and contractors to apply the Woodside Environment and Biodiversity Policy in their areas of responsibility.

Table 7-4: Roles and responsibilities

Title (role)	Environmental responsibilities
All personnel	
All facility based personnel and onshore support personnel	• Understand the Woodside standards and procedures that apply to their area of work. • Understand the environmental risks and control measures that apply to their area of work. • Carry out assigned activities in accordance with approved procedures and the EP. • Follow instructions from relevant supervisor with respect to environmental protection. • Cease operations which are deemed to present an unacceptable risk to the environment. • Participate in environmental assurance activities and inspections as required. • Prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation.
Office-based personnel	
Pyrenees Asset Manager	• Implement systems, practices and procedures. • Be accountable for ensuring all necessary regulatory approvals are in place to operate. • Approve (decide on) the content to be contained in the EP. • Be accountable for managing the asset throughout its operations in accordance with legislative/regulatory requirements (including this EP) and WMS requirements. • Be responsible for continuous improvement of operations of the facility, including environmental performance. • Decide on technical decisions where required based on assessed current level of risk. • Be accountable for aspects of integrity management. • Support monitoring, auditing, non-conformance and emergency response. • Decide on technical decisions where required based on assessed current level of risk. • Be accountable for incident notification, reporting and investigation in line with regulatory requirements, the WMS and EP requirements. • Communicate changes relevant to the EP to the Production Environment team. • Be accountable for conformance to production Operations processes.
Maintenance Engineering Team Leader	• Implement systems, practices and procedures. • Be responsible for safeguarding process safety with respect to the asset. • Ensure technical integrity risks are identified, managed and reduced to ALARP. • Recommend technical decisions where required based on assessed current level of risk.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
Integrity Authorities (Technical Integrity Custodians, Technical Authorities and Engineering Authorities)	• Implement systems, practices and procedures. • Agree technical integrity decision based on assessed current level of risk when discipline owner. • Undertake process safety responsibilities as defined under the Woodside process safety framework.
Production Environment Manager	• Implement systems, practices and procedures. • Facilitate operations environmental approval documentation and timely submission in accordance with regulatory requirements. • Develop and maintain appropriate Production environmental processes and procedures. • Support monitoring, auditing, non-conformance and emergency response. • Monitor and communicate to internal stakeholders all relevant changes to legislation, policies, regulator organisation that may impact the EP or business. • Facilitate review of the EP, including five-yearly revision and in relation to any technical decisions or proposed changes to operations.
Production Environment Adviser	• Implement systems, practices and procedures. • Manage change relevant to the EP in accordance with the Regulations and the EP. • Ensure resourcing, training and competencies. • Liaise with Woodside contractors and Subsea Support Bessel crew to communicate and ensure their understanding of IMMR related requirements under this EP. • Support monitoring, auditing, non-conformance and emergency response. • Ensure environmental monitoring, offshore inspections, and reporting is undertaken as per the requirements of this EP. • Coordinate and monitor closeout of corrective actions. • Ensure environmental inspections/audits are undertaken as per the requirements of the EP. • Ensure environmental incident reporting meets regulatory requirements (as described within the EP) and WMS requirements.
Subsea and Pipelines (IMMR) Activity Manager	• Implement systems, practices and procedures. • Ensure IMMR process undertaken in line with EP commitments. • Manage IMMR change requests for the activity and notify the Production Environment Adviser of any scope changes in a timely manner. • Be responsible for governance of IMMR related activities for subsea support vessels. • Ensure resourcing, training and competencies. • Provide sufficient resources to implement the EP requirements. • Support monitoring, auditing, non-conformance and emergency response. • Monitor and close out corrective actions raised from IMMR environmental inspections/audits or incidents.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
Corporate Affairs Adviser	• Implement systems, practices and procedures. • Be the relevant person identification and consultation. • Report on consultation. • Perform ongoing relevant person liaison as required.
Woodside Marine Services Function	• Be responsible for pre-charter assurance for all contracted vessels. • Conduct ongoing operational assurance of vessels contracted through Woodside Marine, to confirm vessels operate in compliance with relevant legislation, rules and Woodside Marine Charterers Instructions in order to be able to meet safety, navigation, operational and emergency response requirements.
Contractor Sponsors	• Implement systems, practices and procedures. • Ensure implementation of EP for the contractor's scope of work. • Ensure resourcing, training and competencies. • Ensure contractors have adequate environmental capability in order to execute their respective scopes of work. • Review contractor environmental performance as required.
Offshore-based personnel	
Offshore Installation Manager	• Implement systems, practices and procedures. • Be in charge of the facility and the field. • Be accountable for implementation of the EP at the facility. • Ensure offshore personnel comply with regulatory/legislative requirements (including the EP) and the WMS. • Be responsible for Area Operations compliance with technical integrity requirements, including management of change process, permit to work process and Manual of Permitted Operations and process safety requirements. • Be the single point responsible person for the coordination of simultaneous activities. • Implement relevant offshore environment initiatives and review environmental performance to drive continuous improvement. • Ensure effective communication with workforce on environmental performance. • Ensure incidents are reported and investigated in line with WMS and EP requirements, with appropriate actions initiated and closed out. • Decide on technical decisions where required based on assessed current level of risk. • Communicate changes relevant to the EP to the Production Environment team. • Ensure resourcing, training and competencies. • Be accountable for the performance and development of direct reports, ensuring operator capability and competency across all shifts and ensuring the skill requirements of the Production division are being met. • Support monitoring, auditing, non-conformance and emergency response.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	• Lead response efforts (as Incident Controller) in managing emergency or crisis scenarios. • Ensure exercises and drills are conducted in a manner to assure the facility's ability to respond effectively to an emergency.
Operations Supervisor/ Operations Team Leader/ Maintenance Team Leader/ Shift Supervisor	• Implement systems, practices and procedures. • Be accountable for the day-to-day operations of the facility including effective shift handover; completion and logging of operator routine. • Be responsible for operations shift compliance to all legislative and regulatory requirements as defined in the EP. • Be responsible for permitting and isolation for all frontline work activities. • Be responsible for leading and coordinating a multi-disciplined team performing specific duties required to support the facility, including helicopter operations, vessel movements and consumable controls. • Support monitoring, auditing, non-conformance and emergency response. • Be responsible for following emergency response protocols in accordance with the emergency response procedure and fulfilling allocated emergency response roles.
Operations and Maintenance Technicians	• Implement systems, practices and procedures • Be responsible for all daily operations on the facility within their operational control. • Undertake daily operational and maintenance tasks in accordance with approved standards and procedures to ensure compliance with the EP. • Manage day-to-day environmental risks through use of Permit to Work and other risk management tools. • Identify opportunities for continuous improvement and communicate these to their Supervisor. • Complete training requirements to maintain competence and knowledge in operating and maintaining equipment, and manage environmental risks and impacts. • Participate in environmental assurance activities and inspections as required. • Report all environmental hazards and incidents and assist in investigations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
Vessel-based personnel	
Vessel Master of Support Vessel (Facility and Subsea Support Vessels)	• Implement systems, practices and procedures. • Understand and manage HSE aspects of the vessel, including environmental requirements. • Communicate with OIM as required regarding potential environmental risks applicable to vessel activities. • Ensure vessel meets quarantine requirements. • Support monitoring, auditing, non-conformance and emergency response. • Notify AMSA and other authorities of any incidents as per maritime requirements. • Provide, as requested by Woodside, copies of documents, records, reports and certifications (i.e. fuel use, ballast exchanges, waste logs, etc.) in a timely manner to assist in compliance reporting. • Ensure the vessel's Emergency Response team has sufficient training to implement the vessel's SOPEP. • Ensure all emergency and SOPEP drills are conducted. • Ensure that vessel procedures are followed in the event of an emergency or spill. • Immediately notify the Woodside Representative of any environmental incidents.
Subsea and Pipelines Site Woodside Representative	• Implement systems, practices and procedures. • Ensure relevant management measures in this EP are implemented on the subsea support vessel. • Ensure resourcing, training and competencies. • Ensure Subsea Support Vessel induction attendance is recorded. • Support monitoring, auditing, non-conformance and emergency response. • Ensure periodic environmental inspections are completed. • Ensure environmental incidents or breaches of EPOs, EPSs or MCs are reported in accordance with Woodside and regulatory requirements.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.9 Unexpected Finds Procedure

In the event of the discovery of what appears to be UCH (defined as “*any trace of human existence that has a cultural, historical or archaeological character and is located under water*”), the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected UCH must cease immediately. Retain all records of the potential UCH, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside’s Global Heritage Manager.

Woodside will specify an appropriate buffer around the potential UCH, taking into consideration the nature and scale of the potential UCH and the activities to be managed.

No seabed disturbance may occur within the buffer area around the potential UCH until approved by Woodside’s Global Heritage Manager.

Woodside’s Global Heritage Manager must notify a qualified underwater archaeologist and provide all available documentation of the potential UCH.

If the potential UCH appears to be Aboriginal underwater cultural heritage, Woodside’s Global Heritage Manager must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.

If the potential UCH appears to be a shipwreck or aircraft that has been wrecked for more than 75 years or is otherwise reportable under section 40 of the *Underwater Cultural Heritage Act*, Woodside’s Global Heritage Manager must notify the Minister responsible for the *Underwater Cultural Heritage Act*, the DCCEEW underwater archaeology section through the Australasian UCH database, and the Western Australian Museum.

If the suspected heritage object includes human remains, Woodside’s Global Heritage Manager must also notify:

- the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
- the Office of the Minister for the Environment and Water in accordance with section 20 of the *Aboriginal and Torres Strait Islander Heritage Protection Act*.

Work must not recommence in the vicinity of the potential heritage object until Woodside’s Principal Heritage Adviser provides written approval. Woodside’s Global Heritage Manager must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential UCH is confirmed to not be UCH.

7.10 Training and competency

As required by Regulation 22(5), this section of the implementation strategy includes measures that ensure all personnel associated with operating the facility are aware of their EP-related responsibilities, and that all relevant personnel have appropriate competencies and training.

Environmental training is undertaken to ensure employees and contractors whose work may impact on the environment have the necessary awareness, knowledge and competence appropriate for their role.

Different levels of training are undertaken in relation to managing environmental risks and impacts for the production offshore facilities and associated subsea support vessel based IMMR activities, as follows:

- inductions for offshore facility workers and visitors
- operations competency framework training
- permit to work training
- production environmental leadership training and environment awareness training
- emergency and hydrocarbon spill response training

- inductions for subsea IMMR (vessel-based) personnel.

Records for Woodside production personnel, in relation to the above-listed training, are maintained in Woodside's learning management system. Contractor training records are also maintained.

Competence of operations personnel can be reviewed via online dashboards.

7.10.1 Inductions for offshore facility workers and visitors

A comprehensive induction process is in place for personnel working on or visiting Woodside's offshore production facilities. The induction process is designed to equip personnel with the HSE awareness and skills necessary for them to manage their own safety and environmental performance and contribute to others working around them. The induction process includes:

Common production induction – All employees and contractors who have not accessed a production facility within twelve months are required to undertake this induction prior to mobilisation. It includes Woodside's values, HSE and Process Safety, continuous improvement, risk management and Permit to Work.

Facility-specific induction – All employees and contractors that have not accessed the production facility within six months are required to undertake this induction on arrival at the facility. This induction covers the HSE and emergency response issues specific to each facility. For environment, this induction covers the facility EP, prevention of spills, waste management, fauna interactions, hazard identification and risk assessment, and incident reporting.

Production offshore environmental leadership training – Key operations leadership roles (as specified within the Operations Competency Framework) are required to complete this competency on commencement of the new role and three yearly thereafter. The training covers Woodside's policies and standards, environmental legislative requirements, the EP, key environmental risk and impacts, environmental reporting, environmental management tools (e.g. improvement planning, compliance reviews and audits), hydrocarbon spill response and environmental accountabilities.

Production offshore environmental awareness training – All new offshore operational personnel are required to undertake this online training on commencement of the new role and two-yearly thereafter. This training covers environmental legislative requirements, the facility EP, key environmental hazards and control measures (including waste management, spill prevention, chemical storage, wildlife interactions), environmental management tools, hazard and incident reporting, spill response, and environmental responsibilities.

7.10.2 Operations competency framework training

The Operations Competency Guideline defines a framework to make sure all personnel on operating facilities are competent to perform their work and that competency is managed. By doing this, the potential for unplanned (accident/incident) type events that could result in environmental impact is minimised.

Operational Area Licence to Operate (LTO) roles are those roles related to oil and gas processing, equipment maintenance, marine regulations, emergency response and any other roles involved with safeguarding the facility integrity, including all roles where high-risk work licences are required. Additionally, roles mandated by Woodside such as Medic and Helicopter Landing Officer are included in the LTO roles process.

The requisite competency and training for each LTO role has been defined. Competencies for these LTO roles are stipulated by the governance group for each respective position and are based on the relevant Australian or International standards which apply. In cases where no Australian or International standards are available or applicable, training is based on the relevant Woodside Standard as determined by the respective governance group.

Contractors working on Woodside facilities are required to verify the competency of their personnel through the contractor's own verification systems. Additionally, contractor personnel working on Woodside facilities are required to be registered in Woodside's Contractor Verification Service beforehand. Personnel registered in Contractor Verification Service have had their skills and qualifications independently verified on behalf of Woodside thereby confirming that contractor personnel hold the required competencies before mobilisation to the facility.

The LTO Roles Report (available online on the Woodside Competency Reporting Dashboard on the Production Academy Intranet page) provides the conformance status of the facility against the LTO roles requirements.

7.10.3 Permit to work system training

The permit to work system (see Section 7.3) is a key element in ensuring that all necessary steps are taken to ensure the safety of personnel, protection of the environment and technical integrity of the facility. The permit to work system takes a risk-based approach to all activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control.

All members of the workforce that are required to work with a Permit to Work receive training commensurate with the level of authority and responsibility they hold in the permit to work system.

7.10.4 Emergency and hydrocarbon spill response training

All operations personnel involved in crisis and emergency management are required to commit to ongoing training, process improvement and participation in emergency and crisis response (both real and simulated), including emergency drills specific to potential incidents at the facility. Training includes task specific training and role based training and 'on the job' experience (i.e. participation in crisis or emergency management exercises). Roles-based training is further described in Section 7.16.

An overview of Woodside's hydrocarbon spill response training and competency requirements are provided in dashboards for key responder roles. The roles are consistent with Woodside's crisis and emergency management incident control structure.

Woodside Hydrocarbon Spill Preparedness Adviser(s) are responsible for maintaining hydrocarbon spill preparedness competency. This includes the identification and development of approved competency and non-competency based courses, identification of relevant personnel required to undertake training and ensuring training records are maintained. Minimum Woodside capabilities will continue to be identified and documented.

7.10.5 Subsea IMMR activity environmental awareness

At the beginning of and during a new subsea IMMR activity, the Subsea Support Vessel crew including contractor crew, Woodside representatives and other relevant personnel are required to undertake a vessel induction before commencing work. This induction covers HSE requirements for the vessel and IMMR activities, and as required environmental information specific to the activity location. The induction may cover the following environmental information:

- adherence to standards and procedures, and the use of job safety analysis and permit to work hazard identification and management process
- spill management including prevention, response and clean-up, location of spill kits and reporting requirements
- waste management requirements and location of bins
- reporting of marine fauna, location of forms and charts
- chemical management requirements.

All personnel who undertake the project induction are required to sign an attendance sheet, which is retained.

Regular HSE meetings are held on subsea support vessels with crew. During these meetings, any environmental incidents are reviewed, and environmental awareness material presented.

7.11 Monitoring, auditing, management of non-conformance and review

Regulation 22(6) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the facility against the EPOs, EPSs and MC, with a view to continuous

improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

7.11.1 Monitoring

Woodside and its Contractors undertake a program of periodic monitoring during the Petroleum Activity. This information will be collected using the tools and systems outlined below based on the EPOs, controls, EPSs and MC in this EP. Environmental aspects are integrated into Woodside-wide functional and asset review and assurance processes, which deliver effective governance. This integration of environmental controls into appropriate parent systems and processes includes process safety management (Section 7.5.2), contractor management (Section 7.5) and marine assurance (Section 7.11.4.4), and provides multi-faceted assurance of routine implementation.

The tools and systems collect, as a minimum, the data (evidence) referred to in the MCs in Section 6.7 and Section 6.8. The collection of this data will form part of the record of compliance maintained by Woodside and form the basis for demonstrating that the EPOs and EPSs are met. Compliance is summarised in a series of routine reporting documents (refer to Section 7.14.3.2).

The following tools and systems to monitor environmental performance, (including collection of evidence of compliance with controls), where relevant, include:

- environmental emissions/discharge reporting systems that record volumes of planned discharges to ocean and atmosphere, e.g. via the Production Allocation System and process historian database – a summary of emissions and discharges monitoring that is undertaken during the Petroleum Activity is provided within Table 7-5
- routine internal reporting (as described in Section 7.14.2) and routine external annual compliance reporting (as described in Section 7.14.3)
- internal auditing and assurance program (as described in Section 7.11.4).

Collectively, these systems/tools involve collection of evidence of compliance with controls. Throughout the Petroleum Activity, Woodside continues to identify new source-based risks and impacts through the monitoring and auditing systems and tools described above and within Section 7.11.

Other examples of assurance tasks implemented through the EP include (as an example):

- start of shift operator walk arounds
- permit to work hazard, risk management checklist, area sign-on, and permit audits
- ongoing maintenance performance assurance (e.g. conformance dashboard)
- management system performance audits reviews (e.g. management system performance standards) (Section 7.11.4)
- data gathering and governance dashboard presentations (e.g. Woodside Integrated Risk and Compliance System).

7.11.2 Management of knowledge

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). Relevant knowledge is defined as:

- environmental science supporting the description of the existing environment
- socio-cultural environment and relevant persons information
- environmental legislation.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of management of change are documented in the WMS EP Guideline.

Under the Joint Industry Operational and Scientific Monitoring Framework, a Marine Environment Baseline Database has been developed to capture key baseline data within each titleholder's monitoring priority locations. The database is reviewed on an annual basis to determine the adequacy of the data in context of the joint industry operational monitoring programs and scientific monitoring programs.

7.11.3 Management of newly identified impacts and risks

New sources of receptor based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the management of change and revision process (Section 7.6).

Table 7-5: Summary of emissions and discharges monitoring for the Petroleum Activity

Category	Parameter to be monitored/reported	Monitoring frequency	Monitoring equipment/methodology	EP section
Planned emissions				
Atmospheric emissions	Greenhouse, energy and criteria pollutants	Normally continuous process metering/annual reporting	NGER Scheme and NPI reporting estimation methods (e.g. fuel/flare flow meters, throughput meters, process estimation)	6.7.5
	Fuel gas and flare emissions	Normally continuous process metering/monthly reviews	Fuel and flare flowmeters inform GHG and atmospheric emissions – tracked against optimisation targets	6.7.5
Planned discharges				
Discharge of subsea control fluids during well actuations	Subsea control fluid consumption	Normally continuous process indication/monthly review	Subsea control fluid consumption surveillance. Process indication for gross leaks/ruptures	6.7.7
Discharge of hydrocarbons and chemicals during subsea IMMR activities	Volumes of hydrocarbons and chemicals released subsea	As required, during IMMR activities (Petroleum Activity specific)	Estimates based on known volumes pumped and ROV observation	6.7.7
Discharge of PW	OIW concentration of discharged PW	Normally continuous process metering/monthly review	Normally continuous process metering/monthly review	6.7.6
		Up to six-hourly during non-routine operations	Manual sampling	
	PW chemical character	Annually	PW chemical characterisation	
	PW ecotoxicity	Three yearly	PW ecotoxicity testing	
Discharge of cooling water	Total residual chlorine	Periodically	Total residual chlorine testing	6.7.6
Waste recycling and disposal	Quantities of solid and liquid wastes disposed of onshore	Ongoing	Facility waste manifest	6.8.1
Unplanned emissions and discharges				
Unplanned emissions and discharges	Nature of release	As required	HSE Event Reporting System (First Priority)	6.8

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.11.4 Auditing

7.11.4.1 Operations assurance

To provide confidence, based on evidence commensurate with risk, that business objectives are met, business activities are performed and risks are managed, assurance is performed as described in the Provide Assurance Procedure and the Provide Assurance Guideline. The guideline aims to explain how the Operations Division Assurance Team implement WMS Assurance requirements, while concurrently satisfying the Operations Division's specific objectives.

Operations Assurance Assignments are contained within the Operations Division Integrated Assurance Assignment Plan.

Environmental assurance activities are conducted on a regular basis to help:

- verify environmental risks and potential impacts are being managed in accordance with the EPOs and EPSs detailed in this EP
- monitor, review and evaluate the effectiveness of the EPOs and EPSs detailed in this EP
- verify the effectiveness of the EP implementation strategy
- identify potential non-conformances.

The outputs of the assurance process are corrective actions that feed the improvement process. Therefore, assurance is a key driver of continuous improvement.

7.11.4.2 Annual offshore inspection/desktop review

An inspection/review of the facility is undertaken every calendar year by the Production Environment Team, via either an offshore inspection or desktop review. Selected risk areas/activities are inspected to review environmental performance against the EPOs and EPSs, and verify that control measures are effective in reducing the environmental risks and impacts of the Petroleum Activity to an ALARP and acceptable level.

The inspection/review also includes review of conformance with selected aspects of the EP implementation strategy. All risk sources/activities applicable to the offshore facility will be reviewed over a three-year rolling period. Records of findings and records of close-out of any corrective or improvement actions are maintained (closeout is tracked in Woodside's action tracking system).

7.11.4.3 Subsea support vessel environment inspection

Environmental inspections of subsea support vessels are undertaken. This involves annual and ongoing inspections of subsea support vessels to ensure that any subsea support vessel is compliant with both the EP and the approved Contractor Management system. Inspections are conducted in line with the Subsea and Pipelines contractor implementation package, however, may include additional requirements for project specific inspection items.

Vessel inspection findings are captured within a closeout report. Actions arising from subsea support vessel environmental audits are added to the relevant Environmental Commitments and Actions Register within the Subsea Construction, IMMR Environment Project Register. This Environmental Commitments and Actions Register is used to track support vessel compliance with EP commitments, including any findings and corrective actions.

7.11.4.4 Marine assurance

Woodside's marine assurance is managed by the Marine Assurance team within the Operations Function in accordance with Woodside's Marine Offshore Vessel Assurance Standard. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as OCIMF and International Maritime Contractors Association.

Woodside's marine offshore assurance process is mandatory for all vessels (other than tankers and FPSO vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e. <three months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel are seaworthy and meet the requirements for a defined scope of work.

The process is multi-faceted and encompasses:

- Offshore Vessel Safety Management System assessment (OVMSA)
- DP system verification
- vessel inspections.

Vessel inspections are used to verify compliance with the company's Safety Management System, the overall condition of the vessel and the status of planned maintenance system onboard. A Woodside Marine Assurance Specialist will conduct a risk assessment on each vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- OCIMF Offshore Vessel Inspection Database (OVID) Inspection
- OCIMF Ship Inspection Report (SIRE)
- International Maritime Contractors Association Common Marine Inspection Document Inspection
- Marine Warranty Survey.

The Woodside Marine Assurance team will issue the vessel a statement of approval upon completion of the marine assurance process if any identified concerns are addressed appropriately and any conditions imposed are managed.

Where an OVID vessel inspection and/or OVMSA Verification Review is not available and all reasonable efforts based on time and resource availability to complete an OVID inspection and/or OVMSA Verification Review are performed (i.e. short-term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternate means of inspection (Section 17.11.4.5).

Environmental requirements specific to support vessel contractors are communicated via Woodside marine charterers instructions. This document provides the Master of a vessel on hire to Woodside with a clearly defined set of requirements and procedures for operating the vessel in the vicinity of the Woodside's operating facilities. This includes the management of environmental risks and impacts from the facility. The document includes information on:

- applicable legislation and guidelines
- roles and responsibilities
- marine fauna interaction guidance
- incident reporting requirements.

Environmental requirements specific to subsea support vessels are communicated via the Subsea Environmental Compliance Package. This document outlines mandatory environmental management requirements for subsea support vessels and associated contractors.

7.11.4.5 Risk assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or an OVID vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The marine vessel risk assessment will be conducted by the Marine Assurance Specialist Superintendent, or the nominated deputy, where the vessel meets the short term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the Petroleum Activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

- management control factors

- company audit score (i.e. management system)
- vessel HSE incidents
- vessel Port State Control deficiencies
- instances of Port State Control vessel detainment
- years since previous satisfactory vessel inspection
- age of vessel
- contractors' prior experience operating for Woodside.
- activity risk factors:
 - people health and safety risks, a function of the nature of the work and the area of operation
 - environmental risks, a function of environmental sensitivity, Petroleum Activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario)
 - value risk, likely time and cost consequence to Woodside if the vessel becomes unusable
 - reputation risk
 - exposure (i.e. exposure to risk based on duration of project)
 - industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to Petroleum Activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

7.11.5 Management of non-conformance

Woodside employees and Contractors are required to internally report all environmental incidents and hazards, including potential non-conformances with EPOs and EPSs in this EP.

The HSE Event Reporting and Investigation Procedure defines how incidents and hazards are internally reported. Key requirements are set out through the use of an Event Report Form, which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence. An internal online database called First Priority is used for the recording and reporting of these events. Corrective actions are monitored using First Priority and closed out in a timely manner.

Detailed investigations are completed for incidents with an actual impact of A, B or C, and high potential environmental incidents and hazards. The classification, reporting, investigation and actioning of environmental incidents and hazards is undertaken in accordance with the HSE Event Reporting and Investigation Procedure supported by the HSE Event Reporting Guideline. Event bulletins may be used for communication of learnings from significant events.

Non-conformances with EPOs and EPSs are also internally reported and investigated in accordance with Regulatory Compliance Management Procedure, supported by the Regulatory Compliance Management Guideline.

External regulatory reporting requirements for this Petroleum Activity are outlined in Section 7.14 of this EP.

7.12 Review

7.12.1 Environmental risk review

Woodside PetDW risk management processes include risk review, are described in Sections 7.5 and 7.12 and are applied on a day-to-day basis. The Facility Environmental Impacts and Risk Register must be reviewed and updated every five years.

Monitoring (Section 7.11.1), assurance (Section 7.11.4) and review (Section 7.12) are also used to identify potential new information that may arise during the Petroleum Activity and ensure that performance

outcomes and standards are being met and EP environmental control measures are effective. While conducting these activities, qualified, experienced environment advisors, in consultation with experienced Operational and/or Engineering personnel use their professional judgement, to identify potential new control measures that have potential to improve environmental outcomes or reduce risk. As various monitoring, assurance and review processes are used, there is not an overarching procedure/checklist that is suitable to contain a prompt for consideration of new environmental controls.

In addition, Woodside's risk management practices and processes are systematically applied on an ongoing basis to activities provided for within the EP (as summarised within Section 7.5). Via these processes and practices, new risk controls for individual planned and unplanned events may be selected and implemented (proportional to risk levels). When such risk controls are identified by environmental advisors as being relevant to the overarching EP sources of risk, these may also be added as new EP control measures. Any new or improved EP environmental controls or specific measures (that have the potential to improve environmental outcomes or reduce risk), can be tracked within the production EP updates register for incorporation into the EP at its next revision. The EP may be internally revised to reflect these changes without resubmission.

Where review processes identify new or improved controls relevant to environmental risks identified in this EP (that have the potential to improve environmental outcomes or reduce risk), the EP may be internally revised to reflect these changes without resubmission.

7.12.2 Learning and knowledge sharing

Learning and knowledge sharing occurs via a number of different methods, including for example:

- operations learnings meetings
- event investigations
- event bulletins
- engineering and technical authorities discipline communications and sharing.

7.12.3 Continuous improvement

Continuous improvement projects to improve production or environmental performance that involve refurbishment, modification or major maintenance on the facility are typically managed by Brownfields Engineering and required to follow appraise and develop management procedures. The procedure requires that all projects be managed in accordance with the Opportunity Management Framework, which supports the progressive maturation of an opportunity through value creation in the Assess and Select phases and the maintenance of value in the Develop and Execute phases.

To support the accountable executive to make a decision on whether a continuous improvement project should proceed to the next phase in the Opportunity Management Framework, it is sometimes necessary to conduct a trial of the modification to determine the outcomes that can be expected if the modification is implemented. Due to prioritisation of resources, the phased progress of opportunities, competition between different solutions and long-term strategic and financial considerations, it is not possible to set quantitative success criteria to determine whether a modification will be implemented based on the results of trials. Instead, the results of a trial are used to inform a decision on whether to progress the continuous improvement project to the next phase in the Opportunity Management Framework. Decisions are typically made with two key considerations; whether the business is ready to proceed which has a technical/functional focus and whether there is a business case for progressing to the next phase. The business case may consider the ALARP position for the continuous improvement project, if relevant.

7.13 Record keeping

Compliance records (outlined in MCs in Section 6) are maintained. Record keeping is in accordance with Regulation 22(7) that addresses maintaining records of emissions and discharges such that the records can be used to assess whether EPOs and EPSs are being met (refer to Section 7.11.1 and Table 7-5 for a summary of records that are retained).

7.14 Reporting

7.14.1 Overview

To meet the EPOs and EPSs outlined in this EP, Woodside undertakes reporting at a number of levels. These reporting arrangements are outlined below.

7.14.2 Routine reporting (internal)

7.14.2.1 Daily reports

The following daily reports, containing environmental performance information are issued:

- Pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events.
- Subsea support vessel Daily Progress Report(s) – During subsea IMMR activities, daily reports are issued by the Woodside Site Representative. The reports provide performance information on HSE events, diesel use, together with equipment information, current and planned work activities.

7.14.2.2 Performance reporting

A number of routine performance reports are developed in support of the facility operational activities. These reports cover HSE, production and process safety performance. Information included in these reports, relevant to the EP, includes:

- summary of environment incidents
- current and planned work activities, significant events (e.g. shutdowns, failures)
- integrity status and process safety metrics
- status of subsea IMMR activities.

7.14.3 Routine reporting (external)

7.14.3.1 Cetacean and whale shark sightings reporting

In accordance with EPBC Act approval conditions for the activity (refer Section 1.10.2), Woodside will keep a record of any cetacean and whale shark sightings for the life of this EP. A sightings report will be submitted to the Australian Antarctic Division annually with the reporting period being by calendar year (see also Table 7-6).

7.14.3.2 Environmental performance review and reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information on environmental performance to the appropriate regulator.

Routine regulatory reporting requirements are summarised in Table 7-6. The requirements include that Woodside will develop and submit an annual Environmental Performance Report to NOPSEMA, with the first report submitted within 12 months of the commencement of activities covered by this EP (as per the requirements of Regulation 22(7), i.e. by 30 June the following year).

Table 7-6: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Report	NOPSEMA	Monthly, by 15 of each month	As required by Regulation 50, details of recordable incidents that have occurred under the EP for the previous month. Refer to Section 7.14.6 for more detail.
Annual EP Performance Report	NOPSEMA	Annual, by 30 June of the year following reporting period	As required by Regulation 22(2) and 26C the report will report compliance with the EPOs and EPSs outlined in Section 6 of this EP. The reporting period is 1 January to 31 December each year.
Regulation 54 start or end of activity notification form	NOPSEMA	At least 10 days before an activity (or stage of an activity) commences; and within 10 days after completion. This includes instances where production temporarily ceases associated with FPSO sail away.	As required by Regulation 54, Woodside must notify NOPSEMA that an activity (or stage of an activity) is to commence at least 10 days before the activity commences; and within 10 days after completion.
NPI Report	DCCEEW	Annual, by 30 September each year	Summary of the emissions to land, air and water including those from the facility. Reporting period 1 July to 30 June each year.
NGER Scheme	Clean Energy Regulator	Annual, by 31 October each year	Summary of energy use and GHG emissions, including those from the facility. Reporting period is 1 July to 30 June each year.
Cetacean and whale shark sightings	DCCEEW	Annual, by 31 January each year	Summary of cetacean and whale shark sightings. Reporting period is 1 January to 31 December.

7.14.4 End of the Petroleum Activity notification

In accordance with Regulation 54, Woodside will notify NOPSEMA within ten days of the completion of the Petroleum Activity. The Petroleum Activity is not expected to end within the five-year life of this EP.

7.14.4.1 End of the Environment Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activity has ended, all the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 46 of the Environment Regulations. As noted above, the Petroleum Activity is not expected to end within the five-year life of this EP.

7.14.5 Incident reporting (internal)

All Woodside employees and contractors are required to report environmental incidents and non-conformances with this EP. Incidents are reported using an Event Report Form which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence (for further details refer to Section 7.11.5).

7.14.6 Incident reporting (external) – reportable and recordable

Woodside's regulatory reporting requirements are outlined within the Regulator Event Reporting Procedure supported by the Regulator Event Reporting Guideline.

7.14.6.1 Reportable incidents

A reportable incident is defined under Regulation 5 of the Environment Regulations as “*an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage*”.

A reportable incident for the Petroleum Activity is:

- an incident that has caused environmental damage with a severity level of 3 – Moderate or above (as defined under Woodside's PetDW Risk Table; refer to Section 2.6).

- an incident that has the potential to cause environmental damage with a severity level of 3 – Moderate or above (as defined under Woodside's PetDW Risk Table – refer to Section 2.6).

The environmental risk assessment (Section 6) for the Petroleum Activity identifies those risks with a potential Severity Level of 3 for environment. The incidents that have the potential to cause this level of impact include hydrocarbon loss of containment events to ocean resulting from either subsea infrastructure, loss of well containment or a vessel collision.

Any such incidents represent potential events which would be reportable incidents. Reporting of incidents is undertaken with consideration of NOPSEMA (2014) guidance, stating "*if in doubt, notify NOPSEMA*", and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the regulations.

Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47 and 48 of the Environment Regulations. Woodside will:

- orally notify NOPSEMA of all reportable incidents to the regulator as soon as practicable, but within two hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator and the Department of the responsible State Minister as soon as practicable after the oral notification of the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0929 – Reportable Environment Incident, which must be submitted to NOPSEMA as soon as practicable, but within three days of the incident or of its detection by Woodside
- provide a copy of the written report to National Offshore Petroleum Titles Administrator and the Department of the responsible State Minister within seven days of the written report being provided to NOPSEMA.

In the unlikely event of a spill, Woodside must notify appropriate cultural authorities that may be affected; with the purpose of mitigating potential risks to cultural heritage values in accordance with its Oil Pollution First Strike Plan (see Appendix I).

7.14.6.2 Recordable incidents

A recordable incident is defined under Regulation 5 of the Environment Regulations as a "*breach of an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident*".

Any breach of the EPOs or EPSs (as presented within Section 6) will be raised as a recordable incident and managed as per the notification and reporting requirements outlined below and internal requirements outlined in Section 7.14.5.

Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50. Woodside will provide a written record not later than 15 days after the end of the calendar month using a format consistent with the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report.

7.14.7 Other external reporting requirements and notifications

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, the following incident reporting requirements also apply in the Operational Area if the spill originates from a vessel:

Any oil pollution incidents in Commonwealth Waters will be reported (by the vessel master) to AMSA Rescue Coordination Centre Australia as per Article 8 and Protocol I of MARPOL within two hours via the national emergency 24-hour notification contacts, and a written report within 24 hours of the request by AMSA. (This requirement is included in the Oil Pollution First Strike Plan).

If the ship is at sea, reports are to be made to:

Free call: 1800 641 792

Phone: 08 9430 2100 (Fremantle)

Any spills greater than ten tonnes in Commonwealth Waters must be reported (by the vessel master) to AMSA within one hour. (This requirement is detailed in the Oil Pollution First Strike Plan). Reports are to be made via the national 24-hour emergency notification contacts (AusSAR: Rescue Coordination Centre):

Rescue Coordination Centre Australia (RCC Australia)

Phone: 02 6230 6811

Facsimile: 02 6230 6868

Telex: 62349

Free call: 1800 641 792

AFTN: YSARYCYX.

A hydrocarbon spill incident with potential to significantly impact MNES must be reported to DCCEEW.

If the activity described within this EP results in the unintentional death of or injury to a fauna that constitute MNES (i.e. species listed as threatened or migratory under the EPBC Act), and the activity was not authorised by a permit, DCCEEW should be notified within seven days of becoming aware of the results of the activity:

The Secretary

DCCEW

Hotline: 1800 803 772

Email: protected.species@environment.gov.au

For hydrocarbon spill incidents, other agencies and organisations will be notified as appropriate to the nature and scale of the incident as per procedures and contacts in the Hydrocarbon Spill Australia Regulatory Framework ([Appendix L](#)) and the Oil Pollution First Strike Plan (Appendix I).

A hydrocarbon spill incident with the potential to significantly impact MNES must be reported to DCCEEW.

7.15 Ongoing consultation

In accordance with Regulation 22 (15) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside's approach to ongoing consultation is that feedback and comments received from relevant persons and additional persons continue to be assessed and responded to, as required, through the life of an EP, including during EP assessment and throughout the duration of the accepted EP, in accordance with the intended outcome of consultation (as set out in Section 5.2).

Woodside proposes to undertake the engagements with directly impacted relevant persons and additional persons listed in Table 7-7. Relevant new information identified during ongoing consultation will be assessed using the EP management of knowledge (refer to Section 7.11.2 and management of change and review process (refer to Section 7.6)).

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who present at those meetings are from community and industry and include Woodside, State Government (for instance relevant regional development commissions), local government, Indigenous groups, industry representative bodies, community and industry organisations.

Relevant persons, additional persons and those who are merely interested in the activities, can otherwise remain up to date on this activity through subscribing to the Woodside website, or by reading the publicly available version of the EP on NOPSEMA's website, where available.

Should consultation feedback be received following EP acceptance that identifies a measure or control that requires implementation or update to meet the intended outcome of consultation (see Section 5.2), Woodside will apply its EP management of knowledge (refer to Section 7.11.2 and management of change (refer to Section 7.6)) processes as appropriate.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians (Appendix G), directly informed by feedback from Traditional Custodians. It provides a mechanism for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the possible consequences of an activity to be carried out under an EP on their functions, interests and activities as they relate to cultural values. The program enables Woodside to manage uncertainty on the impacts and risks to cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians.

Any significant changes on this activity will be communicated to relevant persons.

Table 7-7: Ongoing consultation engagements

Report/ information	Recipient	Purpose	Frequency	Content
Program of Ongoing Engagement with Traditional Custodians (Appendix G)	Relevant cultural authorities	Identification, assessment and consideration of cultural values relevant to the Operational Area and EMBA	Ongoing	Assessment of cultural values Any relevant new information on cultural values will be assessed using the EP management of knowledge (Section 7.11.2) and management of change (refer to Section 7.6) processes
Notification (email)	Other relevant persons	Notification of significant change	As required	Notification of significant change
Emails/meetings	Persons or organisations who provide feedback to Woodside post EP submission	Identification, assessment and consideration of feedback, claims and objections	As appropriate	Assessment of claims and objections Relevant new information will be assessed using the EP management of knowledge (Section 7.11.2) and management of change (refer to Section 7.6) processes
Notification (email)	Australasian UCH database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.9)	Report any unexpected finds of potential Underwater Cultural Heritage	If triggered by Unexpected Finds Procedure (Section 7.9)	Refer to Unexpected Finds Procedure (Section 7.9)
Notification (email)	AHO	Notify AHO where vessels will be in the Operational Area (but outside the PSZ) for >three weeks, no less than four working weeks prior to scheduled activity commencement date	As required	Refer to PS 1.5
Notification (email)	AMSA	AMSA's Response Centre is notified 24 to 48 hours before mobilisation for activities where vessels will be in the Operational Area (but outside the PSZ) for >three weeks	As required	Refer to PS 1.6

7.16 Emergency preparedness and response

7.16.1 Overview

Under Regulation 22(8), the implementation strategy must contain an OPEP and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

A summary of how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements is shown in Table 7-8.

Table 7-8: Oil pollution preparedness and response overview

Content	Environment Regulations reference	Document/section reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulations 21(5), 21(6), 22(2)	Appendix H
Describes the OPEP	Regulation 22(8)	EP: Section 7.16. Woodside's OPEP has the following components: - Hydrocarbon Spill Australia Regulatory Framework (Appendix L) - Appendix I - Appendix H
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22(9)	Appendix H Appendix I
Details the arrangements for updating and testing the oil pollution response arrangements	Regulations 22(8), 22(12), 22(13), 22(14)	EP: Section 7.16.9.1 Appendix H
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Appendix H
Demonstrates that the response arrangements in the oil pollution emergency plan are consistent with the national system for oil pollution preparedness and response	Regulation 22(11)	Hydrocarbon Spill Australia Regulatory Framework (Appendix L)

7.16.2 Emergency response training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk based training needs analysis on positions required for effective emergency response.

Table 7-9: Emergency response training requirements

IMT position	Minimum competency
Corporate Incident Management team (CIMT) Incident Commander and Deputy Incident Commander	- Incident Management team (IMT) Fundamentals Course (internal course) or equivalent - ICS 100/200 - IMO3 or equivalent spill response specialist level with an oil spill response organisation - Participation in Level 2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	- IMT Fundamentals Course or equivalent - ICS 100/200 - Oil spill theory - Participation in Level 2 activation, exercise or skills maintenance
Environment Unit Leader	- IMT Fundamentals Course - ICS 100/200 - IMO2 or equivalent spill response specialist level with an oil spill response organisation - Participation in Level 2 activation, exercise or skills maintenance
Note on competency/equivalency	
In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for CIMT roles. The revised IMT Fundamentals training program aligns with the performance requirements of the PMAOMIR320 – Manage Incident Response Information and PMAOM0R418 – Coordinate Incident Response. In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such all rostered members of the Incident Management Team are trained up to ICS 200. In addition to baseline incident management training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) which involves the completion of two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training. Woodside Learning Services is responsible for collating and maintaining personnel training records. The Hydrocarbon Spills Preparedness Dashboard reflects the competencies required for each oil spill role (IMT/operational).	

7.16.3 Emergency response preparation

The Corporate Incident Management Team, based in the Emergency Operations Centre at Woodside's head office, is the onshore coordination point for an offshore emergency. The CIMT is staffed by a roster of appropriately skilled personnel available on call 24 hours a day. The CIMT, under the leadership of the CIMT Incident Commander, supports the site-based IMT by providing additional support in areas such as operations, logistics, planning, people management and public information (Corporate Affairs). Woodside's Incident Command structure is included in the Oil Pollution First Strike Plan (Appendix I) and response arrangements are further detailed in the Hydrocarbon Spill Australia Regulatory Framework ([Appendix L](#)). Roles and responsibilities for emergency response are detailed in the Woodside Incident Management Handbook.

Woodside will have a number of ERPs in place relevant to the Petroleum Activity. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident.

In addition, the Emergency Preparedness Management System Performance Standard (M06) is in place to assure that in the event of an incident, the organisation is appropriately prepared for all necessary actions which may be required for the protection of People, Environment, Asset, Reputation and Livelihood.

7.16.4 Initial response to facility incident

The facility is equipped with emergency shutdown systems designed to protect personnel, the facility and the environment from unsafe operating conditions and catastrophic situations.

Emergency shutdown systems are provided as a means of isolation in response to process upsets and facility conditions (including associated flowlines and risers) that could result in loss of hydrocarbon inventories, or to reduce the potential impact from a hydrocarbon loss of containment event on the facility. Provision has been made for process and facility alarm systems to provide early indication of any process upset conditions and potential hazardous events, including fire and gas alarms.

The ERP relevant to the facility and subsea infrastructure covers health, safety, asset and environmental risks (including fire, structural integrity, sabotage, etc.) to ensure the range of occupational, asset and environmental risk exposures from incidents have been considered and plans are in place for their management. The plan provides specific details on the initial response required during events with potential significant environmental consequences such as a hydrocarbon spill, subsea hydrocarbon leak or potential collision.

The Oil Pollution First Strike Plan provides immediate actions required to commence a response. Vessels have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activity, as detailed in Appendix H.

7.16.5 Oil and other hazardous materials spill

A significant hydrocarbon spill during the Petroleum Activity is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Woodside Hydrocarbon Spill Australia Regulatory Framework document ([Appendix L](#)) is supported by Appendix I, which provides tactical response guidance to the Petroleum Activity.

The Crisis and Emergency Management team manages Woodside's hydrocarbon spill response equipment stockpile. Woodside also maintains a suite of contracts for access to additional specialist response equipment and trained personnel as required via Australian and international spill response organisations and labour supply companies. In the event of a major spill, Woodside will enact first strike response actions, in liaison with the relevant Control Agency, as detailed in the activity-specific Oil Pollution First Strike Plan.

7.16.6 Emergency and spill response

Woodside categorises incidents in relation to response requirements as follows:

- **Level 1 Incident** – A Level 1 incident can be resolved through the use of existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site/regionally based teams using existing resources and functional support services.
- **Level 2 Incident** – A Level 2 incident is characterised by a response that requires external operational support to manage the incident. It is triggered in the event the capabilities of the tactical level response are exceeded. This support is provided to the activity via the activation of all, or part of, the responsible CIMT.
- **Level 3 Incident** – A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, or livelihood. At Woodside, the Crisis Management team manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation, etc). The CIMT may also be activated as required to manage the operational incident response requirements.

7.16.7 Source control response capability

7.16.7.1 Source control Incident Management Team structure

Woodside source control incident classification levels are defined in the Woodside Well Control Procedure. Level 1 and Level 2 Source Control events will be managed by GWS without activation of the CIMT.

A Level 3 Source Control incident requires the activation of the CIMT and Crisis Management team. The CIMT organisation includes a Source Control Section Chief position on the core roster reporting to the CIMT Incident Commander. Following activation, the Source Control Section Chief will assemble a Source Control Section comprising multiple functional support teams (FSTs) appropriate to the magnitude and complexity of the situation. The make-up of the Source Control Section may change as the well control incident progresses. An example Source Control Section showing FST structures is shown in Figure 7-4. For clarity, the Source Control Section can be considered a like for like replacement for the Well Control Incident Team, which is referred to in some legacy documentation.

Figure 7-4: Source Control Section organisation structure

For complex source control events, the Source Control Section may be required to be in existence for an extended period. Suitable arrangements must be made to establish shifts and duty roster cycles for Source Control Section members.

Table 7-10: Source Control Section roles and responsibilities

Role	Key responsibilities
Source Control Section Chief (SCSC)	The SCSC, a member of the CIMT, is responsible for managing, implementing, and coordinating operations and plans directly related to source control. The SCSC activates and supervises organizational elements per the Incident Action Plan and directs its execution. The SCSC directs dedicated source control equipment, requests or releases resources, approves group operational plans, approves source control changes to the Incident Action Plan, as necessary, and is aligned with the CIMT Operations Section Chief. The SCSC might have one or more Deputy SCSCs to coordinate Source Control Branch activities.
Deputy Source Control Section Chief	The Deputy Source Control Section Chief (Deputy SCSC) provides support and relief to the SCSC. The Deputy has the same training and expertise as the Section Chief. The Deputy SCSC serves as the delegate of authority for the SCSC when the SCSC is unavailable. The number of Deputy SCSCs varies as a function of proficiency and the support level required.
MODU Interface	The active Woodside Superintendent or delegate fulfills the role of MODU interface. The MODU interface assists the SCSC and Operations Section Chief in communications with the MODU and Associated Drilling Contractor. The MODU interface provides specialist knowledge of operations leading up to the event to the Source Control Section.
Subsea First Response Toolkit (SFRT) FST Lead	The SFRT FST Lead is responsible for planning, organizing, and conducting operations that utilise the SFRT. This includes site survey and assessment, debris removal and blowout preventer intervention. The SFRT FST Lead reports directly to the SCSC and coordinates with the Capping, Subsea Dispersant Injection and SIMOPS FST Leads.
Capping FST Lead	The Capping FST Lead is responsible for planning, organizing, mobilising and conducting Capping Stack Installation and operations to shut-in the well. The Capping Stack FST Lead reports to the SCSC and coordinates its operations with the SFRT and Relief Well FST Leads. After the well is capped, the Capping Stack FST Lead's team monitors the well and cap integrity.
Subsea Dispersant Injection FST Lead	The Subsea Dispersant FST Lead coordinates the use of subsea dispersant equipment at or near the incident source. The Subsea Dispersant FST Lead manages subsea dispersant operations, encompassing subsea dispersant equipment operations, including setup, determination of flow rates and application techniques. The Subsea Dispersant FST Lead also coordinates the procurement and transportation of dispersant materials and works with the surface spill team to ensure the proper dispersant resource allocation. The Subsea Dispersant FST Lead also coordinates with the SIMOPS FST Lead.
Relief Well FST Lead	The Relief Well FST Lead is responsible for managing and coordinating the relief well design, relief well operation, coordinating the development of the drilling plan and drilling procedures, securing resources, and managing relief well operations. The Relief Well FST Lead coordinates their operations with the SIMOPS FST Lead. The Relief Well FST Lead reports to the SCSC for source control matters and the GWS Drilling Engineering Manager for drilling matters.
Well Kill FST Lead	The Well Kill FST Lead is responsible for planning and coordinating the Well Kill operation. This includes providing the best estimate of well-discharge rates and evaluation of well integrity to support capping and relief well operations. The Well Kill FST Lead coordinates gathering current reservoir and geologic models, wellbore diagram and directional surveys, well fluid surveys, performance predictions, wellbore stability, and mechanical condition of the well. The Well Kill FST provides recommendations on chemical injection programs (hydrate inhibitors) and proposed subsea flow equipment. The Well Kill FST Lead reports directly to the SCSC and coordinates with the Relief Well, Capping, Subsea Dispersant Injection and SIMOPS FST Leads.
SIMOPS FST Lead	The SIMOPS Function Support Team Lead plans, organizes, and monitors subsea and surface operations within the designated SIMOPS area. The Supervisor manages the access to the subsea areas for all simultaneous activities, including ROV operations, relief well operations, debris removal operations, capping operations, subsea dispersant operations, and containment operations, including frequency management. The SIMOPS FST Lead ensures coordination of all Source Control operations with other associated Response Operations. The Lead also works with the SCSC to develop operational plans for the Incident Action Plan. The SIMOPS FST Lead reports directly to the SCSC.

The Source Control Section may include:

- GWS Head of Region
- GWS Engineering Manager/s
- GWS Superintendent/s
- Subsea Vessel Superintendent/s
- GWS Engineering support, as required
- Subsea Engineering support, as required
- Rig Contractor Representatives
- Service Company and Vendor Representatives
- Source Control Contractors
- HSE Adviser/s
- Logistics Coordinator/s
- Fluids Coordinator
- Subsurface Pore Pressure Prediction Focal Point
- Operations Geologists
- Geomatics Representative.

Woodside has a contract with Integrity Management and Response LLC, based in Houston, for the provision of source control emergency response services and personnel. This service can be called off on an as-required basis to supplement the Perth-based Source Control Response team.

7.16.7.2 Source Control Incident Management team personnel and resourcing

A source control response is managed by the SCSC. This is a rostered position with role specific training requirements. The SCSC will initially draw upon personnel within the GWS Australia organisation for form the necessary FSTs. To ensure the FSTs are staffed by the appropriate personnel, a map of FST positions against current role descriptions has been developed and can be found below in Table 7-11. For example, the Senior Drilling Engineer role is mapped as being a primary candidate to fill the Relief Well Unit Lead FST position. In this example the competencies required to drill a relief well are deemed to be analogous to the competences required to drill a development or exploration well. As such, any individual currently performing in the Senior Drilling Engineer role, and subject to the existing Woodside performance management process including the completion of annual performance reviews, is deemed to be competent to perform the mapped FST role.

Table 7-11: Role descriptions mapped to Source Control Section roles

Role description	Functional Support team

The Source Control IMT response structure indicated in Figure 7-4 is estimated to require from four to 14 personnel per shift, varying with the scale of response (eight to 28 personnel for 24-hour coverage). For a prolonged response, including resources to provide on/off weekly cycles, an additional 28 personnel may be required. These numbers are indicative and will vary, depending on scale and complexity of operations.

The current organisational review indicates Woodside has more than 80 internal staff members to support the Source Control IMT positions. In the event of a Level 3 incident, response activities will be given priority and other projects may be reduced or suspended, allowing reallocation of significant additional resources. Woodside would require access to external resources primarily for specialist services and expertise in source control and well control operations.

Additional personnel to support the Source Control FST will be filled through the following avenues:

- Source Control Specialists through existing contracts, for example Wild Well Control, AGR
- Secondment of personnel from other titleholders through Australian Energy Producers Industry MoU (2021)
- engineering support through call-off frame agreements.

7.16.8 Emergency and spill response drills and exercises

Testing of Woodside's capability to respond to incidents will be conducted in alignment with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in Figure 7-5. Woodside's emergency response testing regime is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are the reference point for emergency management and crisis management exercise schedule development. External participants may be invited to attend exercises, such as government agencies, specialist service providers, oil spill response organisations or industry members with which we have mutual aid arrangements.

The overall objective of exercising is to test procedures, skills and teamwork of the Emergency Response and Command teams in their ability to respond to major events. After each exercise, the team holds a debrief session, during which the exercise is reviewed. Any lessons learnt or areas for improvement are identified and incorporated into revised procedures where appropriate.

Table 7-12: Testing of response capability

Response category	Scope	Response testing frequency – operations	Response Testing Objective
Level 1 response	Exercises are project/activity specific	Two comprehensive Level 1 'First Strike' drills conducted per year, per asset. Additional Level 1 emergency drills routinely conducted (approximately one per fortnight).	Comprehensive exercises test elements of Appendix I Emergency drills are scheduled to test other aspects of the Emergency Response Plan
Level 2 response	Exercises are facility/vessel specific	A minimum of one Emergency Management exercise is conducted biennially.	Test both the facility IMT response and that of the CIMT following handover of incident control
Level 3 response	Exercises are relevant to all Woodside assets	The number of Crisis Management team exercises conducted each year is determined by the Chief Executive Officer, in consultation with the VP of Security and Emergency Management.	Test Woodside's ability to respond to and manage a crisis level incident

7.16.9 Hydrocarbon spill response testing of arrangements

There are a number of arrangements which, in the event of a spill, will underpin Woodside's ability to implement a response across its petroleum activities. To ensure these arrangements are adequately tested, the Crisis and Emergency Management team within Security and Emergency Management ensures tests are conducted in alignment with the Hydrocarbon Spill Testing of Arrangements Schedule.

Woodside's arrangements for spill response are common across its Australian operating assets and activities to ensure the controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- ensure relevant responders, contractors and key personnel understand and practice their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Figure 7-5, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.16.9.1 Testing of arrangements schedule

Woodside's 'testing of arrangements' schedule (Figure 7-5) aligns with international good practice for spill preparedness and response management; the testing is compatible with the IPIECA Good Practice Guide and the Australian Institute for Disaster Resilience Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

Figure 7-5: Indicative three-yearly testing of arrangements schedule

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g. capability, equipment and personnel). For example, an arrangement could be to test Woodside's personnel capability for conducting operational monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested, at a minimum, over the three-year rolling schedule. The sub-heading for the column describes the standard method of testing likely to be undertaken (e.g. discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises (e.g. critical arrangements) or via other 'additional assurance' methods outside the formal testing of arrangements schedule that also constitute sufficient evidence of testing of arrangements (e.g. audits, no-notice drills, internal exercises, assurance drills).

7.16.9.2 Source control testing and exercise arrangements

This section aims to present the testing and exercise arrangements for Source Control techniques as recommended in the recent industry guidelines such as the Australian Energy Producers Australian Offshore Titleholders Source Control Guideline (issued June 2021) and the NOPSEMA Information Paper: Source Control Planning and Procedures (issued June 2021)

The paragraphs below elaborate on the scope, testing frequency, objectives and close-out processes applicable to testing/exercises for Source Control techniques.

Scope, objectives and key performance indicators

The objective of tests/exercises is to verify the capability of Woodside and/or contractors to manage and deliver elements of the Source Control Plans presented in OPEP.

Tests may include specific elements of the response cycle for source control strategy, e.g. activation of arrangements, mobilisation of equipment and personnel and if relevant, testing of specific operational plans (e.g. SFRT, capping and relief well).

Objectives typically include testing of IMT capabilities, communications requirements, testing of source control response plans and evaluating specific aspects of source control arrangements, e.g. number of personnel, equipment, mobilisation plans and timeframes for response.

An example of test objectives from a recent exercise are presented below for reference:

- Objective 1 – Exercise the Source Control IMT against worst case credible loss of containment scenario.
- Objective 2 – Source a relief well MODU.
- Objective 3 – Verify key equipment and services are available to support relief well operations.
- Objective 4 – Deliver 'xx day' relief well specific to activity.

Key performance indicators are taken from the ALARP commitments as stated in the oil spill preparedness and response mitigation assessment (Appendix H).

The exercises are planned utilising Subject Matter Experts from the function with independent observers/agencies as available (e.g. Australian Marine Oil Spill Centre, Oil Spill Response Limited) along with Industry collaboration as available/permitted.

Formal exercise plans are produced prior to tests and exercises to document the scope, objectives, allocate resources and select relevant plans and previous lessons learnt for the test or exercise.

Table 7-12 provides indicative scope, testing frequency and objectives of the emergency and spill response drills and exercises which includes Source Control response techniques.

Frequency of tests

In addition to testing of arrangements for all responses listed in the schedule, Source Control techniques are tested on an annual basis; at least one technique per year. The schedule for testing Source Control techniques is described in Section 7.16.9.1.

Woodside has tested the below response techniques in last three years:

- capping stack deployment in 2021
- subsea well kill spool in 2022 (discussion exercise)
- SFRT, capping stack, relief well and well kill, and well intervention in 2023
- SFRT, relief well, capping stack, and well kill in 2024 during the Level 3 crisis management exercise.

In addition, Woodside Source Control team members participate in joint industry exercises on source control as available for continuous improvements to response plans.

Closeout processes

Post-exercise debriefs are held with the exercise team to identify gaps and capture learnings. The recommendations and actions are documented and assigned to the relevant function within the organisation and tracked until closeout. Close-out reports are distributed to relevant function leads and captured under Woodside's document management systems and relevant processes. Lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

7.16.10 Cyclone and dangerous weather preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Subsea support vessels receive regular forecasts from the Bureau of Meteorology. If a cyclone (or severe weather event) is forecast, the path and its development will be plotted and monitored using the Bureau of Meteorology data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activity, the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

7.17 Offshore Marine Discharge Adaptive Management Plan

7.17.1 Overview

The OMDAMP has been developed to manage routine discharges to the marine environment from applicable offshore production facilities.

The objectives of the OMDAMP are to:

- manage marine discharges in a way that reduces the environmental risks and potential environmental impacts to ALARP and an acceptable level
- define monitoring measures to determine whether routine marine discharges comply with regulatory requirements and Woodside's Environmental Performance Procedure
- detail verification assessment and non-routine monitoring to be undertaken when routine monitoring identifies a change in discharge characteristics which have the potential to alter existing compliance with the Environmental Performance Procedure or relevant facility Operations EPs.

The OMDAMP defines a process and rationale for management of routine discharges such as PW, cooling water and brine to the marine environment. The OMDAMP considers applicable technical guidance (including the Commonwealth ANZG for fresh and marine water quality, National Water Quality Management Strategy and Technical Guidance: Protecting the quality of WA's marine environment (EPA, 2016)), as well as relevant internal procedures and asset-specific EP commitments. In addition, the OMDAMP is based on Woodside's experience managing PW at multiple northwest shelf offshore facilities and considers monitoring data collected over 20 to 30 years, allowing the application of appropriate controls and any lessons learnt to ensure impacts are acceptable and reduced to ALARP.

7.17.2 Routine monitoring and management

Monitoring changes in water quality as well as investigating potential toxicity via WET testing and implementing management to maintain acceptable levels of changes is standard industry practice in Commonwealth and State waters. By limiting the changes to water quality and therefore the pathway to impact sediment quality and biota there is high confidence no environmental impact has occurred outside the approved mixing zone boundary.

The OMDAMP details guideline values, routine monitoring assessment against trigger values, analytical methods and actions when a trigger value is exceeded. The trigger values are applied through a risk-based approach that is intended to capture uncertainty around the level of impact by staging monitoring and management responses according to the degree of risk of environmental impact. This approach provides a level of confidence that management responses are not triggered too early (i.e. when there is no actual impact) or too late after significant or irreversible damage to the surrounding ecosystem (EPA, 2016). Changes in discharge contaminants and PW toxicity can be detected early and can indicate the potential for an impact prior to an impact occurring allowing for timely management. WET testing confirms if there is a potential for impact on biota.

PW samples should be representative of normal operations, hence timing of sampling coincides with a period of normal operating circumstances for a facility, as well as also considering when wells have begun to cut water, which formation water producing wells are online and chemicals that may be present in the discharge stream. Ensuring samples are representative of normal operations may require deferring sampling within the calendar year if required. Samples are analysed by a National Association of Testing Authorities accredited laboratory (where applicable) for key physio-chemical parameters and chemical analytes.

WET tests are undertaken on a broad range of taxa of ecological relevance for which accepted standard test protocols are well established. WET tests mainly focus on the early life stages of test organisms, when organisms are typically most sensitive to contaminants; the tests are designed to represent local trophic level receptors. For WET testing, a range of tropical and temperate Australian marine species were selected based on their ecological relevance, known sensitivity to contaminants, availability of robust test protocols, and known reproducibility and sensitivity as test species. The dilutions required to protect 99% and 95% of species are calculated using the Warne et al. (2025) methodology. If a trigger value is not met, it indicates uncertainty around whether the environmental value is being protected and further investigation is required (Figure 7-6).

Figure 7-6: Routine monitoring and adaptive management framework for produced water

7.17.3 Further investigations

Detectable exceedances in trigger values may occur without impacting the environment. To provide confidence that environmental impact has not occurred outside the approved mixing zone boundary, further investigation would be required (Figure 7-6) in the form of a data review desktop study to initially assess the exceedance in context of available data and confirm if there is potential for impact to the environment. Although a desktop assessment is necessary before undertaking additional in-field monitoring, operational management actions may be initiated to reduce the risk to the environment while the review is completed. This ensures monitoring programs are designed and implemented to provide robust findings based on good survey design.

A range of methods can be used to detect trigger value exceedances (e.g. relative percentage difference, control charts, multivariate analysis) depending on the dataset available. An appropriate method is selected as described in the OMDAMP due to the variable nature of environmental data. If critical data are not available, the desktop study identifies potential data gaps and may recommend additional non-routine studies and/or monitoring to ensure the assessment is appropriately undertaken. The purpose of the 'further investigations' step is to provide certainty that the EPO has been achieved if a trigger value has been exceeded. The key investigation steps are described below:

- **Confirm the trigger value has been exceeded** – Review quality assurance and quality control, methodology and possible sources of contamination to determine if the results are reliable, or if any factors have occurred that may compromise the integrity of the monitoring or data.
- **Desktop assessment to understand whether the EPO is at risk** – If a trigger value is confirmed to be exceeded, multiple lines of evidence are considered including historical and current data from routine and non-routine monitoring and studies. This assessment shall consider whether there is adequate evidence to demonstrate that acceptability criteria have been met (EPO not breached). If the desktop assessment determines that the existing body of evidence is insufficient, it shall outline what additional monitoring or studies are required. Potential additional monitoring/studies may include but is not limited to:
 - single species test (collected annually in parallel with routine chemical characterisation should further investigation be required)
 - dilution modelling and or studies

- flocculation, sedimentation, settling velocity and/or dispersion analysis
- metal bioavailability
- scanning electron microscopy and particle size distribution analyses
- in-situ monitoring (water quality and/or sediments).

Routine monitoring activities may be required ahead of schedule and additional monitoring not listed may be undertaken as appropriate. Field monitoring is undertaken in accordance with a plan that details timing, locations and objectives of monitoring.

- **Conduct additional studies to confirm the EPO is not at risk** – Monitoring results provide additional lines of evidence to determine whether there is a risk of environmental impact at the mixing zone boundary due to unacceptable changes in water quality resulting in changes to sediment, or biological indicators. Given the significant health, safety and technical risks, logistics and planning required, monitoring of the receiving environment is typically only considered when all other sources of evidence are insufficient to demonstrate that the EPO is not at risk. The OMDAMP provides detailed guidance on the steps and actions required to be undertaken if a trigger value is exceeded and this may include additional non-routine monitoring to verify that environmental impacts have not occurred outside the boundary of the mixing zone.

If triggers are being exceeded but no impact to the environment is predicted to occur, the desktop assessment may consider development of site-specific trigger values in line with ANZG. For example, if chemical characterisation identified copper as exceeding trigger – ANZG 99% DGV but further investigations concluded levels observed were consistent with baseline and naturally occurring in the region. If potential impacts to environment are identified, an ALARP/acceptability study is required to determine what additional controls can be implemented to ensure the impacts are not realised.

7.17.4 ALARP/acceptability study

An ALARP/Acceptability study is conducted once it has been determined, as a result of further investigations, that there is potential for an impact that exceeds the acceptable limits of change. The ALARP/acceptability study shall be conducted in accordance with the ALARP Demonstration Procedure, to determine additional controls that may be necessary to reduce the potential impacts. Additional management measures (controls) may include technology, process upgrades or reservoir management. Woodside will implement the additional controls identified in the ALARP/acceptability study that are required to give confidence that the acceptable limits of impact can be achieved.

7.17.5 Review and revision

This OMDAMP is typically reviewed annually to incorporate the following:

- completion of the annual OMDAMP compliance review – incorporating any recommendations for further assessment and/or updates to the monitoring framework
- recently accepted EPs – incorporating any new/amended monitoring commitments/triggers
- regulatory inspections – incorporating any relevant findings or recommendations

Updates to key guidelines, guideline values or changes to recommended sampling/methodologies.

9 LIST OF TERMS AND ACRONYMS

Acronym	Description
@	at
~	approximately
°C	degrees Celsius
<	less/fewer than
>	greater/more than
≤	less than or equal to
≥	greater than or equal to
µm	micrometre
3D	three-dimensional
ABARES	Australian Bureau of Agricultural and Resource Economics and Sciences
ABS	American Bureau of Shipping
AFC	antifouling coating
AFMA	Australian Fisheries Management Authority
AHO	Australian Hydrographic Office
AIS	Automatic Identification System
ALARP	as low as reasonably practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZG	Australian and New Zealand Guidelines for Fresh and Marine Water Quality
API	American Petroleum Institute
AR6	Sixth Assessment Report
AUV	autonomous underwater vehicle
bbl/d	barrels per day
BIA	biologically important area
Bq/L	becquerels per litre, used to measure the concentration of radioactive material in a liquid
BTAC	Buurabalayji Thalanyji Aboriginal Corporation
BTEX	benzene, toluene, ethylbenzene and xylenes
CAES	Catch and Effort System
CCR	central control room
CFU	compact floatation unit
CIMT	Corporate Incident Management team
cm	centimetre
cm ³	cubic centimetre
CO ₂	carbon dioxide
CoP	cessation of production
Cp	centipoise
CS	cost sacrifice

APPENDIX A: WOODSIDE ENVIRONMENT AND BIODIVERSITY POLICY

WOODSIDE POLICY

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new exploration or development of hydrocarbons within the boundaries of natural sites on the UNESCO World Heritage List (as specified at 1 December 2022). Existing activity may continue if compatible with maintenance of the listed outstanding universal values.
- Not undertaking new exploration or development of hydrocarbons within IUCN Protected Areas (as specified at 1 December 2022) unless compatible with management plans in place for the area. Existing activity may continue if compatible with management plans in place for the area.
- Achieving net zero deforestation¹ associated with new projects that take a Final Investment Decision (FID) after 1 December 2022.
- Developing Biodiversity Action Plans for all new major projects (CAPEX >USD\$2 billion) that take a FID after 1 December 2022.
- Supporting positive biodiversity outcomes in regions and areas in which we operate.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Approved by the Woodside Energy Group Ltd Board in December 2022.

¹ Definition of Forest: 'trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

APPENDIX B: RELEVANT REQUIREMENTS

The below table refers to Commonwealth legislation related to the project.

Commonwealth legislation	Legislation summary
<i>Air Navigation Act 1920</i> <i>Air Navigation Regulations 1947</i> <i>Air Navigation (Aerodrome Flight Corridors) Regulations 1994</i> <i>Air Navigation (Aircraft Engine Emissions) Regulations 1995</i> <i>Air Navigation (Aircraft Noise) Regulations 1984</i> <i>Air Navigation (Fuel Spillage) Regulations 1999</i>	This Act relates to the management of air navigation.
<i>Australian Maritime Safety Authority Act 1990</i>	This Act establishes a legal framework for the AMSA, which represents the Australian Government and international forums in the development, implementation and enforcement of international standards including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters.
<i>Australian Radiation Protection and Nuclear Safety Act 1998</i>	This Act relates to the protection of the health and safety of people, and the protection of the environment from the harmful effects of radiation.
<i>Biosecurity Act 2015</i> <i>Quarantine Regulations 2000</i> <i>Biosecurity Regulation 2016</i> <i>Australian Ballast Water Management Requirements 2017</i> <i>Biosecurity Amendment (Biofouling Management) Regulations 2021</i>	This Act provides the Commonwealth with powers to take measures of quarantine, and implement related programs as are necessary, to prevent the introduction of any plant, animal, organism or matter that could contain anything that could threaten Australia's native flora and fauna or natural environment. The Commonwealth's powers include powers of entry, seizure, detention and disposal. This Act includes mandatory controls on the use of seawater as ballast in ships and the declaration of sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers. The Biofouling Management Regulations requires ships to report information about biofouling management and the voyage history of the ship in the past 12 months through a pre-arrival report.
<i>Environment Protection and Biodiversity Conservation Act 1999</i> <i>Environment Protection and Biodiversity Conservation Regulations 2000</i>	This Act protects matters of national environmental significance (NES). It streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places. Under this Act, actions that may be likely to have a significant impact on matters of NES must be referred to the Minister for the Environment and Water
<i>Environment Protection (Sea Dumping) Act 1981</i> <i>Environment Protection (Sea Dumping) Regulations 1983</i>	This Act provides for the protection of the environment by regulating dumping matter into the sea, incineration of waste at sea and placement of artificial reefs.
<i>Industrial Chemicals (Notification and Assessment Act) 1989</i> <i>Industrial Chemicals (Notification and Assessment) Regulations 1990</i>	This Act creates a national register of industrial chemicals. The Act also provides for restrictions on the use of certain chemicals which could have harmful effects on the environment or health.

Commonwealth legislation	Legislation summary
<i>National Environment Protection Measures (Implementation) Act 1998</i> <i>National Environment Protection Measures (Implementation) Regulations 1999</i>	This Act and Regulations provide for the implementation of National Environment Protection Measures (NEPMs) to protect, restore and enhance the quality of the environment in Australia and ensure that the community has access to relevant and meaningful information about pollution. The National Environment Protection Council has made NEPMs relating to ambient air quality, the movement of controlled waste between states and territories, the national pollutant inventory, and used packaging materials.
<i>National Greenhouse and Energy Reporting Act 2007</i> <i>National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015</i>	This Act and associated Rule establishes the legislative framework for the NGER Scheme for reporting greenhouse gas emissions and energy consumption and production by corporations in Australia.
<i>Navigation Act 2012</i> Marine Order 12 – Construction – subdivision and stability, machinery and electrical installations Marine Order 30 – Prevention of collisions Marine Order 47 – Offshore Industry units Marine Order 57 – Helicopter operations Marine Order 91 – Marine pollution prevention – oil Marine Order 93 – Marine pollution prevention – noxious liquid substances Marine Order 94 – Marine pollution prevention – packaged harmful substances Marine Order 96 – Marine pollution prevention – sewage Marine Order 97 – Marine pollution prevention – air pollution	This Act regulates navigation and shipping including Safety of Life at Sea (SOLAS). The Act will apply to some activities of the MODU and project vessels. This Act is the primary legislation that regulates ship and seafarer safety, shipboard aspects of marine environment protection and pollution prevention.
<i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> <i>Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023</i> <i>Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011</i> <i>Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009</i>	This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the Regulations listed.
<i>Ozone Protection and Synthetic Greenhouse Gas Management Act 1989</i> <i>Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995</i>	This Act provides for measures to protect ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone depleting substances (ODS) and synthetic greenhouse gases, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone depleting substances.
<i>Protection of the Sea (Powers of Intervention) Act 1981</i>	This Act authorises the Commonwealth to take measures for the purpose of protecting the sea from pollution by oil and other noxious substances discharged from ships and provides legal immunity for persons acting under an AMSA direction.

Commonwealth legislation	Legislation summary
<i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> <i>Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994</i> Marine Order 91 – Marine pollution prevention – oil Marine Order 93 – Marine pollution prevention – noxious liquid substances Marine Order 94 – Marine pollution prevention – packaged harmful substances Marine Order 95 – Marine pollution prevention – garbage Marine Order 96 – Marine pollution prevention – sewage <i>Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007</i> MARPOL Convention	This Act relates to the protection of the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances. The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 nautical miles (nm) off the coast out to the end of the Australian Exclusive Economic Zone (200 NM). It also applies within the 3 NM of the coast where the State/Northern Territory does not have complementary legislation. All the Marine Orders listed, except for Marine Order 95, are enacted under both the Navigation Act 2012 and the Protection of the Sea (Prevention of Pollution from Ships) Act 1983. This Act is an amendment to the Protection of the Sea (Prevention of Pollution from Ships) Act 1983. This amended Act provides the protection of the sea from pollution by oil and other harmful substances discharged from ships.
Protection of the Sea (Harmful Antifouling Systems) Act 2006 Marine order 98—(Marine pollution—anti-fouling systems)	This Act relates to the protection of the sea from the effects of harmful anti-fouling systems. It prohibits the application or reapplication of harmful anti-fouling compounds on Australian ships or foreign ships that are in an Australian shipping facility.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Jun-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	26
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	61
Whales and Other Cetaceans:	26
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	22
Key Ecological Features (Marine):	3
Biologically Important Areas:	7
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area

[Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Congregation or aggregation known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat known to occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Congregation or aggregation known to occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahalensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Jun-2024

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	2
National Heritage Places:	7
Wetlands of International Importance (Ramsar	6
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	13
Listed Threatened Ecological Communities:	11
Listed Threatened Species:	203
Listed Migratory Species:	108

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	282
Commonwealth Heritage Places:	21
Listed Marine Species:	209
Whales and Other Cetaceans:	44
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	1
Australian Marine Parks:	65
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	139
Regional Forest Agreements:	1
Nationally Important Wetlands:	18
EPBC Act Referrals:	481
Key Ecological Features (Marine):	23
Biologically Important Areas:	102
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Listed Threatened Ecological Communities

[Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 1 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community in Caves of the Swan Coastal Plain	Endangered	Community known to occur within area
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area
Empodisma peatlands of southwestern Australia	Endangered	Community likely to occur within area
Honeymyrtle shrubland on limestone ridges of the Swan Coastal Plain Bioregion	Critically Endangered	Community likely to occur within area

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community may occur within area
Proteaceae Dominated Kwongan Shrublands of the Southeast Coastal Floristic Province of Western Australia	Endangered	Community likely to occur within area
Scott River Ironstone Association	Endangered	Community likely to occur within area
Sedgeland in Holocene dune swales of the southern Swan Coastal Plain	Endangered	Community known to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community likely to occur within area

Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Malurus leucopterus leucopterus White-winged Fairy-wren (Dirk Hartog Island), Dirk Hartog Black-and-White Fairy-wren [26004]	Vulnerable	Species or species habitat likely to occur within area
Ninox natalis Christmas Island Hawk-Owl, Christmas Boobook [66671]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Breeding known to occur within area
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Polytelis alexandrae Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat may occur within area
Psophodes nigrogularis nigrogularis Western Heath Whipbird [64449]	Endangered	Species or species habitat known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Turdus poliocephalus erythropleurus Christmas Island Thrush [67122]	Endangered	Species or species habitat likely to occur within area
Turnix varius scintillans Painted Button-quail (Houtman Abrolhos) [82451]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat may occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area
Zanda baudinii listed as Calyptorhynchus baudinii Baudin's Cockatoo, Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Breeding known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area
CRUSTACEAN		

Scientific Name	Threatened Category	Presence Text
Engaewa pseudoreducta Margaret River Burrowing Crayfish [82674]	Critically Endangered	Species or species habitat may occur within area
Kumonga exleyi Cape Range Remipede [86875]	Vulnerable	Species or species habitat likely to occur within area
FISH		
Galaxias truttaceus (Western Australian population) Western Trout Minnow [89857]	Endangered	Species or species habitat known to occur within area
Galaxiella nigrostriata Blackstriped Dwarf Galaxias, Black-stripe Minnow [88677]	Endangered	Species or species habitat known to occur within area
Hoplostethus atlanticus Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Milyeringa veritas Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Nannatherina balstoni Balston's Pygmy Perch [66698]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
Seriolella brama Blue Warehou [69374]	Conservation Dependent	Species or species habitat likely to occur within area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
INSECT		
Hesperocolletes douglasi Douglas' Broad-headed Bee, Rottnest Bee [66734]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trioza barrettae Banksia brownii plant louse [87805]	Endangered	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Bettongia lesueur lesueur Burrowing Bettong (Shark Bay), Boodie [66659]	Vulnerable	Species or species habitat known to occur within area
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat known to occur within area
Crocidura trichura Christmas Island Shrew [86568]	Critically Endangered	Species or species habitat likely to occur within area
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isoodon auratus barrowensis Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes conspicillatus conspicillatus Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus bernieri Rufous Hare-wallaby (Bernier Island) [66662]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus Central Australian subspecies Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Lagorchestes hirsutus dorreae Rufous Hare-wallaby (Dorre Island) [66663]	Vulnerable	Species or species habitat known to occur within area
Lagostrophus fasciatus fasciatus Banded Hare-wallaby, Merrnine, Marnine, Munning [66664]	Vulnerable	Species or species habitat known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Myrmecobius fasciatus Numbat [294]	Endangered	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Osphranter robustus isabellinus Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area

Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat known to occur within area
Perameles bougainville Shark Bay Bandicoot [278]	Endangered	Species or species habitat known to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Phascogale calura Red-tailed Phascogale, Red-tailed Wambenger, Kenngoor [316]	Vulnerable	Species or species habitat may occur within area
Potorous gilbertii Gilbert's Potoroo, Ngilkat [66642]	Critically Endangered	Species or species habitat known to occur within area
Pseudocheirus occidentalis Western Ringtail Possum, Ngwayir, Womp, Woder, Ngoor, Ngoolangit [25911]	Critically Endangered	Breeding known to occur within area
Pseudomys fieldi Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
Pseudomys shortridgei Heath Mouse, Dayang, Heath Rat [77]	Endangered	Species or species habitat likely to occur within area
Pteropus natalis Christmas Island Flying-fox, Christmas Island Fruit-bat [87611]	Critically Endangered	Species or species habitat known to occur within area
Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Setonix brachyurus Quokka [229]	Vulnerable	Species or species habitat known to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
OTHER		
Westralunio carteri Carter's Freshwater Mussel, Freshwater Mussel [86266]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area
Andersonia pinaster Two Peoples Bay Andersonia [67444]	Vulnerable	Species or species habitat may occur within area
Androcalva bivillosa Stragglng Androcalva [87807]	Critically Endangered	Species or species habitat likely to occur within area
Anigozanthos bicolor subsp. minor Little Kangaroo Paw, Two-coloured Kangaroo Paw, Small Two-colour Kangaroo Paw [21241]	Endangered	Species or species habitat known to occur within area
Asplenium listeri Christmas Island Spleenwort [65865]	Critically Endangered	Species or species habitat known to occur within area
Banksia brownii Brown's Banksia, Feather-leaved Banksia [8277]	Critically Endangered	Species or species habitat known to occur within area
Banksia mimica Summer Honeypot [82765]	Endangered	Species or species habitat may occur within area
Banksia nivea subsp. uliginosa Swamp Honeypot [82766]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Banksia squarrosa subsp. argillacea Whicher Range Dryandra [82769]	Vulnerable	Species or species habitat may occur within area
Banksia verticillata Granite Banksia, Albany Banksia, River Banksia [8333]	Vulnerable	Species or species habitat known to occur within area
Beyeria lepidopetala Small-petalled Beyeria, Short-petalled Beyeria [18362]	Endangered	Species or species habitat likely to occur within area
Caladenia barbarella Small Dragon Orchid, Common Dragon Orchid [68686]	Endangered	Species or species habitat may occur within area
Caladenia bryceana subsp. cracens Northern Dwarf Spider-orchid [64556]	Vulnerable	Species or species habitat known to occur within area
Caladenia elegans Elegant Spider-orchid [56775]	Endangered	Species or species habitat known to occur within area
Caladenia granitora [65292]	Endangered	Species or species habitat known to occur within area
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat likely to occur within area
Caladenia huegelii King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid [7309]	Endangered	Species or species habitat likely to occur within area
Caladenia lodgeana Lodge's Spider-orchid [68664]	Critically Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii Sandplain Duck Orchid [87944]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Calectasia cyanea Blue Tinsel Lily [7669]	Critically Endangered	Species or species habitat likely to occur within area
Chamelaucium sp. S coastal plain (R.D.Royce 4872) Royce's Waxflower [87814]	Vulnerable	Species or species habitat may occur within area
Chordifex abortivus Manypeaks Rush [64868]	Endangered	Species or species habitat likely to occur within area
Chorizema humile Prostrate Flame Pea [32573]	Endangered	Species or species habitat may occur within area
Chorizema varium Limestone Pea [16981]	Endangered	Species or species habitat known to occur within area
Conostylis micrantha Small-flowered Conostylis [17635]	Endangered	Species or species habitat may occur within area
Diuris drummondii Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat known to occur within area
Diuris micrantha Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat likely to occur within area
Diuris purdiei Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat may occur within area
Drakaea concolor Kneeling Hammer-orchid [56777]	Vulnerable	Species or species habitat known to occur within area
Drakaea elastica Glossy-leaved Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Drakaea micrantha Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat likely to occur within area
Drummondita ericoides Morseby Range Drummondita [9193]	Endangered	Species or species habitat likely to occur within area
Eucalyptus argutifolia Yanchep Mallee, Wabling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
Eucalyptus beardiana Beard's Mallee [18933]	Vulnerable	Species or species habitat may occur within area
Eucalyptus cuprea Mallee Box [56773]	Endangered	Species or species habitat may occur within area
Gastrolobium papilio Butterfly-leaved Gastrolobium [78415]	Endangered	Species or species habitat may occur within area
Hemiandra gardneri Red Snakebush [7945]	Endangered	Species or species habitat likely to occur within area
Isopogon uncinatus Albany Cone Bush, Hook-leaf Isopogon [20871]	Endangered	Species or species habitat likely to occur within area
Kennedia glabrata Northcliffe Kennedia [16452]	Vulnerable	Species or species habitat known to occur within area
Kennedia lateritia Augusta Kennedia [45985]	Endangered	Species or species habitat likely to occur within area
Lambertia echinata subsp. occidentalis Western Prickly Honeysuckle [64528]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lambertia orbifolia Roundleaf Honeysuckle [15725]	Endangered	Species or species habitat likely to occur within area
Lechenaultia chlorantha Kalbarri Leschenaultia [16763]	Vulnerable	Species or species habitat known to occur within area
Leptomeria dielsiana Diels' Currant Bush [5146]	Vulnerable	Species or species habitat likely to occur within area
Leucopogon marginatus Thick-margined Leucopogon [12527]	Endangered	Species or species habitat likely to occur within area
Leucopogon obtectus Hidden Beard-heath [19614]	Endangered	Species or species habitat may occur within area
Macarthuria keigheryi Keighery's Macarthuria [64930]	Endangered	Species or species habitat may occur within area
Marianthus paralius [83925]	Endangered	Species or species habitat known to occur within area
Minuria tridens Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
Morelotia australiensis listed as Tetraria australiensis Southern Tetraria [92784]	Vulnerable	Species or species habitat may occur within area
Petrophile latericola Laterite Petrophile [64532]	Endangered	Species or species habitat may occur within area
Phaius australis Lesser Swamp-orchid [5872]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pneumatopteris truncata fern [68812]	Critically Endangered	Species or species habitat known to occur within area
Pterostylis sinuata Northampton Midget Greenhood, Western Swan Greenhood [84991]	Endangered	Species or species habitat likely to occur within area
Reedia spathacea Reedia [2995]	Critically Endangered	Species or species habitat may occur within area
Ricinocarpos trichophorus Barrens Wedding Bush [19931]	Endangered	Species or species habitat may occur within area
Sphenotoma drummondii Mountain Paper-heath [21160]	Endangered	Species or species habitat likely to occur within area
Stachystemon nematophorus Three-flowered Stachystemon [81447]	Vulnerable	Species or species habitat known to occur within area
Synaphea sp. Fairbridge Farm (D.Papenfus 696) Selena's Synaphea [82881]	Critically Endangered	Species or species habitat likely to occur within area
Tectaria devexa Cave Fern [14767]	Endangered	Species or species habitat likely to occur within area
Thelymitra stellata Star Sun-orchid [7060]	Endangered	Species or species habitat may occur within area
Wurmbea tubulosa Long-flowered Nancy [12739]	Endangered	Species or species habitat may occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Cryptoblepharus egeriae Christmas Island Blue-tailed Skink, Blue-tailed Snake-eyed Skink [1526]	Critically Endangered	Species or species habitat likely to occur within area
Ctenotus lancelini Lancelin Island Skink [1482]	Vulnerable	Species or species habitat known to occur within area
Ctenotus zasticus Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Cyrtodactylus sadleiri Christmas Island Giant Gecko [86865]	Endangered	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Lepidodactylus listeri Christmas Island Gecko, Lister's Gecko [1711]	Critically Endangered	Species or species habitat known to occur within area
Lerista neviniae Nevin's Slider [85296]	Endangered	Species or species habitat known to occur within area
Liasis olivaceus barroni Pilbara Olive Python [66699]	Vulnerable	Species or species habitat known to occur within area
Liopholis pulchra longicauda Jurien Bay Skink, Jurien Bay Rock-skink [83162]	Vulnerable	Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Ramphotyphlops exocoeti Christmas Island Blind Snake, Christmas Island Pink Blind Snake [1262]	Vulnerable	Species or species habitat likely to occur within area
Tiliqua scincoides intermedia Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat known to occur within area
Varanus mertensi Mertens' Water Monitor, Mertens's Water Monitor [1568]	Endangered	Species or species habitat may occur within area
Varanus mitchelli Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat may occur within area
SHARK		
Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Congregation or aggregation known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Centrophorus uyato Little Gulper Shark [68446]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat likely to occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

SPIDER		
Idiosoma nigrum Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]	Vulnerable	Breeding known to occur within area
Ardenna grisea Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]	Endangered	Species or species habitat known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]		Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]		Foraging, feeding or related behaviour likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]		Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phoebastria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis as Balaena glacialis australis		
Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus		
Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus		
Longfin Mako [82947]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus		
Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus		
Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Megaptera novaeangliae		
Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi		
Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris		
Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahalensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Species or species habitat known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area

Commonwealth Lands

[Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Learmonth Air Weapons Range Facility	WA	Listed place
Mermaid Reef - Rowley Shoals	WA	Listed place
Ningaloo Marine Area - Commonwealth Waters	WA	Listed place
Scott Reef and Surrounds - Commonwealth Area	EXT	Listed place

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous minutus Black Noddy [824]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]	Vulnerable	Species or species habitat may occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Cereopsis novaehollandiae grisea Cape Barren Goose (south-western), Recherche Cape Barren Goose [25978]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Species or species habitat known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area
Puffinus huttoni Hutton's Shearwater [1025]		Foraging, feeding or related behaviour known to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius antarcticus as Catharacta skua Brown Skua [85039]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Species or species habitat known to occur within area overfly marine area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys sculptus Sculptured Pipefish [66197]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Cosmocampus maxweberi Maxweber's Pipefish [66209]		Species or species habitat may occur within area
Doryrhamphus baldwini Redstripe Pipefish [66718]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus macrorhynchus Whiskered Pipefish, Ornate Pipefish [66222]		Species or species habitat may occur within area
Halicampus mataafae Samoan Pipefish [66223]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys heptagonus Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippichthys spicifer Belly-barred Pipefish, Banded Freshwater Pipefish [66232]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Micrognathus brevirostris thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Breeding known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Reptile		
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus fuscus Dusky Sea Snake [1119]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Aipysurus pooleorum Shark Bay Sea Snake [66061]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Ginkgo-toothed Beaked Whale, Ginkgo-toothed Whale, Ginkgo Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahalensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Not controlled action (particular manner)		Manner)	
DAVROS MC 3D marine seismic survey northwaet of Dampier, WA	2013/7092	Not Controlled Action (Particular Manner)	Post-Approval
Decommissioning of the Legendre facilities	2010/5681	Not Controlled Action (Particular Manner)	Post-Approval
Deep Water Drilling Program	2010/5532	Not Controlled Action (Particular Manner)	Post-Approval
Deep Water Northwest Shelf 2D Seismic Survey	2007/3260	Not Controlled Action (Particular Manner)	Post-Approval
Demeter 3D Seismic Survey, off Dampier, WA	2002/900	Not Controlled Action (Particular Manner)	Post-Approval
develop and operate a new deepwater port	2010/5760	Not Controlled Action (Particular Manner)	Post-Approval
Diesel Fuel Bunker Operation	2012/6289	Not Controlled Action (Particular Manner)	Post-Approval
Draeck 3D Marine Seismic Survey, WA-205-P	2006/3067	Not Controlled Action (Particular Manner)	Post-Approval
Dredging of marine sediment to enable construction of eight berths and a turnin	2010/5678	Not Controlled Action (Particular Manner)	Post-Approval
Drilling 35-40 offshore exploration wells in deep water	2008/4461	Not Controlled Action (Particular Manner)	Post-Approval
Earthworks for kitchen/mess, cyclone refuge building & Compression Plant, Varanus Island	2013/6900	Not Controlled Action (Particular Manner)	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action (particular manner)			
Eendracht Multi-Client 3D Marine Seismic Survey	2009/4749	Not Controlled Action (Particular Manner)	Post-Approval
Effect of marine seismic sounds to demersal fish and pearl oysters, north-west WA	2018/8169	Not Controlled Action (Particular Manner)	Post-Approval
Endurance 3D Marine Seismic Data Acquisition Survey	2007/3667	Not Controlled Action (Particular Manner)	Post-Approval
Enfield M3 & Vincent 4D Marine Seismic Surveys	2008/3981	Not Controlled Action (Particular Manner)	Completed
Enfield M3 4D, Vincent 4D & 4D Line Test Marine Seismic Surveys	2008/4122	Not Controlled Action (Particular Manner)	Post-Approval
Enfield M4 4D Marine Seismic Survey	2008/4558	Not Controlled Action (Particular Manner)	Post-Approval
Enfield oilfield 3D Seismic Survey	2006/3132	Not Controlled Action (Particular Manner)	Post-Approval
Exmouth West 2D Marine Seismic Survey	2008/4132	Not Controlled Action (Particular Manner)	Post-Approval
Exploration Drilling Campaign	2011/6047	Not Controlled Action (Particular Manner)	Post-Approval
Exploration drilling of Zeus-1 well	2008/4351	Not Controlled Action (Particular Manner)	Post-Approval
Exploration Drilling Program - Permit areas - WA-314-P, WA-315-P, WA-398-P.	2008/4064	Not Controlled Action (Particular Manner)	Post-Approval
Fletcher-Finucane Development, WA26-L and WA191-P	2011/6123	Not Controlled Action (Particular	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action (particular manner)		Manner)	
Foxhound 3D Non-Exclusive Marine Seismic Survey	2009/4703	Not Controlled Action (Particular Manner)	Post-Approval
Gazelle 3D Marine Seismic Survey in WA-399-P and WA-42-L	2010/5570	Not Controlled Action (Particular Manner)	Post-Approval
Geco Eagle 3D Marine Seismic Survey	2008/3958	Not Controlled Action (Particular Manner)	Post-Approval
Geoscience Australia - Marine survey in Browse Basin to acquire data to assist assessment of CO2 sto	2013/6747	Not Controlled Action (Particular Manner)	Post-Approval
Gicea 3D Marine Seismic Survey	2008/4389	Not Controlled Action (Particular Manner)	Post-Approval
Gigas 2D Pilot Ocean Bottom Cable Marine Seismic Survey	2007/3839	Not Controlled Action (Particular Manner)	Post-Approval
Glencoe 3D Marine Seismic Survey WA-390-P	2007/3684	Not Controlled Action (Particular Manner)	Post-Approval
Grand Southern Margin 2D Marine Seismic Survey	2008/4599	Not Controlled Action (Particular Manner)	Post-Approval
Greater Western Flank Phase 1 gas Development	2011/5980	Not Controlled Action (Particular Manner)	Post-Approval
Grimalkin 3D Seismic Survey	2008/4523	Not Controlled Action (Particular Manner)	Post-Approval
Guacamole 2D Marine Seismic Survey	2008/4381	Not Controlled Action (Particular Manner)	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action (particular manner)			
Harmony 3D Marine Seismic Survey	2012/6699	Not Controlled Action (Particular Manner)	Post-Approval
Harpy 1 exploration well	2001/183	Not Controlled Action (Particular Manner)	Post-Approval
Helicopter baiting of exotic yellow crazy ant supercolonies, Christmas Island, Indian Ocean	2009/5016	Not Controlled Action (Particular Manner)	Post-Approval
Honeycombs MC3D Marine Seismic Survey	2012/6368	Not Controlled Action (Particular Manner)	Post-Approval
Huzzas MC3D Marine Seismic Survey (HZ-13) Carnarvon Basin, offshore WA	2013/7003	Not Controlled Action (Particular Manner)	Post-Approval
Huzzas phase 2 marine seismic survey, Exmouth Plateau, Northern Carnarvon Basin, WA	2013/7093	Not Controlled Action (Particular Manner)	Post-Approval
INDIGO Marine Cable Route Survey (INDIGO)	2017/7996	Not Controlled Action (Particular Manner)	Post-Approval
John Ross & Rosella Off Bottom Cable Seismic Exploration Program	2008/3966	Not Controlled Action (Particular Manner)	Post-Approval
Judo Marine 3D Seismic Survey within and adjacent to WA-412-P	2009/4801	Not Controlled Action (Particular Manner)	Post-Approval
Judo Marine 3D Seismic Survey within and adjacent to WA-412-P	2008/4630	Not Controlled Action (Particular Manner)	Post-Approval
Julimar Brunello Gas Development Project	2011/5936	Not Controlled Action (Particular Manner)	Post-Approval
Kingtree & Ironstone-1 Exploration Wells	2011/5935	Not Controlled Action (Particular	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action (particular manner)		Manner)	
Klimt 2D Marine Seismic Survey	2007/3856	Not Controlled Action (Particular Manner)	Post-Approval
Koolama 2D Seismic Survey Dampier Basin	2010/5420	Not Controlled Action (Particular Manner)	Post-Approval
Kraken, Lusca & Asperus 3D Marine Seismic Survey	2013/6730	Not Controlled Action (Particular Manner)	Post-Approval
Laverda 3D Marine Seismic Survey and Vincent M1 4D Marine Seismic Survey	2010/5415	Not Controlled Action (Particular Manner)	Post-Approval
Laying a submarine optical fibre telecommunications cable, Perth to Singapore and Jakarta	2014/7332	Not Controlled Action (Particular Manner)	Post-Approval
Leopard 2D marine seismic survey	2005/2290	Not Controlled Action (Particular Manner)	Post-Approval
Lion 2D Marine Seismic Survey	2007/3777	Not Controlled Action (Particular Manner)	Post-Approval
Macedon Gas Field Development	2008/4605	Not Controlled Action (Particular Manner)	Post-Approval
Marine Environmental Survey	2012/6275	Not Controlled Action (Particular Manner)	Post-Approval

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Albany Canyons group and adjacent shelf break	South-west
Ancient coastline at 125 m depth contour	North-west
Ancient coastline at 90-120m depth	South-west
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Cape Mentelle upwelling	South-west
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	South-west
Commonwealth marine environment surrounding the Recherche Archipelago	South-west

Name	Region
Commonwealth marine environment within and adjacent to Geographe Bay	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Diamantina Fracture Zone	South-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west
Naturaliste Plateau	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas	[Resource Information]	
Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon		
Dugong [28]	Breeding	Known to occur
Dugong dugon		
Dugong [28]	Calving	Known to occur
Dugong dugon		
Dugong [28]	Foraging	Known to occur
Dugong dugon		
Dugong [28]	Foraging	Likely to occur
Dugong dugon		
Dugong [28]	Foraging (high density	Known to occur

Scientific Name	Behaviour	Presence
	seagrass beds)	
Dugong dugon Dugong [28]	Migration likely	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Interneesting	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Interneesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Interneesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Interneesting	Known to occur
Chelonia mydas Green Turtle [1765]	Interneesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Interneesting buffer	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Likely to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Likely to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Largetooth Sawfish [60756]	Foraging	Known to occur
Pristis pristis Largetooth Sawfish [60756]	Pupping	Likely to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Nursing	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		

Scientific Name	Behaviour	Presence
Anous stolidus Common Noddy [825]	Foraging	Known to occur
Anous stolidus Common Noddy [825]	Foraging (provisioning young)	Known to occur
Anous tenuirorstris melanops Australian Lesser Noddy [26000]	Foraging (provisioning young)	Known to occur
Ardena carneipes Flesh-footed Shearwater [82404]	Aggregation	Known to occur
Ardena carneipes Flesh-footed Shearwater [82404]	Foraging (in high numbers)	Known to occur
Ardena pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardena pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Ardena tenuirostris Short-tailed Shearwater [82652]	Foraging (in high numbers)	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging (provisioning young)	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high	Known to occur

Scientific Name	Behaviour numbers)	Presence
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Former Range
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm-petrel [1016]	Foraging (in high numbers)	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Foraging	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging (provisioning young)	Known to occur

Scientific Name	Behaviour	Presence
Sterna dougallii Roseate Tern [817]	Resting	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging (in high numbers)	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (abundant food source)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (high density)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (on migration)	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Foraging Area (annual high use area)	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (south)	Known to occur

Scientific Name	Behaviour	Presence
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur
Physeter macrocephalus Sperm Whale [59]	Foraging (abundant food source)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

APPENDIX D: CULTURAL HERITAGE SEARCH RESULTS

Search Criteria

436 Aboriginal Cultural Heritage (ACH) Register in Shapefile - PyreneesConsultationEMBA. Warning: Search area complex so results may be inaccurate. Contact DPLH for assistance.

Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form> and we will make every effort to rectify it as soon as possible.

South West Settlement ILUA Disclaimer

Your heritage enquiry is on land **within or adjacent to** the following Indigenous Land Use Agreement(s): Wagyl Kaip & Southern Noongar Indigenous Land Use Agreement, Gnaala Karla Booja Indigenous Land Use Agreement, South West Boojarah #2 Indigenous Land Use Agreement, Yued Indigenous Land Use Agreement, Whadjuk People Indigenous Land Use Agreement.

On 8 June 2015, six identical Indigenous Land Use Agreements (ILUAs) were executed across the South West by the Western Australian Government and, respectively, the Yued, Whadjuk People, Gnaala Karla Booja, Ballardong People, South West Boojarah #2 and Wagyl Kaip & Southern Noongar groups, and the South West Aboriginal Land and Sea Council (SWALSC).

The ILUAs bind the parties (including 'the State', which encompasses all State Government Departments and certain State Government agencies) to enter into a Noongar Standard Heritage Agreement (NSHA) when conducting Aboriginal Heritage Surveys in the ILUA areas, unless they have an existing heritage agreement. It is also intended that other State agencies and instrumentalities enter into the NSHA when conducting Aboriginal Heritage Surveys in the ILUA areas. It is recommended a NSHA is entered into, and an 'Activity Notice' issued under the NSHA, if there is a risk that an activity will 'impact' (i.e. by excavating, damaging, destroying or altering in any way) an Aboriginal heritage site. The Aboriginal Heritage Due Diligence Guidelines, which are referenced by the NSHA, provide guidance on how to assess the potential risk to Aboriginal heritage.

Likewise, from 8 June 2015 the Department of Energy, Mines, Industry Regulation and Safety (DEMIRS) in granting Mineral, Petroleum and related Access Authority tenures within the South West Settlement ILUA areas, will place a condition on these tenures requiring a heritage agreement or a NSHA before any rights can be exercised.

If you are a State Government Department, Agency or Instrumentality, or have a heritage condition placed on your mineral or petroleum title by DEMIRS, you should seek advice as to the requirement to use the NSHA for your proposed activity. The full ILUA documents, maps of the ILUA areas and the NSHA template can be found at <https://www.wa.gov.au/organisation/departments/premier-and-cabinet/south-west-native-title-settlement>.

Further advice can also be sought from the Department of Planning, Lands and Heritage via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form>.

WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

List of Aboriginal Cultural Heritage (ACH) Register

Terminology

ID: ACH on the Register is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department..
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via <https://achknowledge.dplh.wa.gov.au/ach-enquiry-form>.
- **Culturally Sensitive Nature:**
 - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
 - **Men only:** Only *males* can view restricted information.
 - **Women only:** Only *females* can view restricted information.

Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972*.
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 94 Datum.

Consultation Approach

For the Pyrenees Facility Operations Environment Plan (EP), Woodside has taken a broad and proactive tiered consultation approach over a period of up to 28 months.

This approach was aimed at raising public awareness of the consultation opportunity and to enable self-identification. It included a social media campaign and advertising in national, state, regional and Indigenous newspapers.

The tiered consultation approach discharges regulation 25 of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth) (Environment Regulations) requirements. The approach is proactive, extended, has enabled self-identification, and has raised broad awareness of Woodside's activities related to this EP.

Consultation for this EP was also combined with another operations EP.

Tiered Consultation Approach

Regulation 25	Woodside's consultation approach assessed and identified relevant persons, enabled two-way dialogue and engagement, and included email and phone call follow up. The approach taken comfortably satisfies the requirements of regulation 25: to give relevant persons sufficient information and allow a reasonable period of time for consultation (see: Section 5).
Proactive	To raise awareness of the consultation process, and to enable grass-roots consultation, Woodside undertook advertised regional consultation roadshows and facilitated consultation at regional community events.
Extended	A reasonable consultation period was provided to enable an informed assessment of possible consequences on functions, interests or activities and associated supportive communication activities.
Self-Identification	Broad communication activities were undertaken to build awareness of consultation and enable self-identification, supported by targeted education materials.
Broad Understanding	Broad proactive communication activities were undertaken with the public to raise awareness of Woodside's activities.

Building on the Existing Consultation Approach

For this EP, Woodside has built on its consultation methodology and undertaken additional consultation activities throughout the consultation period to ensure a reasonable period of time and sufficient information has been provided to relevant persons so that they can make an informed assessment of the possible consequences of the activity on their functions, interests or activities.

The approach for this included:

- a consultation period of up to 28 months
- undertaking proactive consultation activities to provide sufficient information to relevant persons
- raising awareness of the consultation process and opportunity to provide feedback
- driving participation in the consultation process.

An overview of this approach is shown below:

CONSULTATION TIMELINE

Figure 1: Pyrenees Facility Operations Consultation Activity

Traditional Custodian Consultation Approach

Woodside has meaningful long-term relationships with relevant Traditional Custodians specifically tailored to provide for effective engagement which is continuous and is not confined to individual EPs, instead covering all EPs and other issues that are relevant at the time of engagement.

To this end, consultation on any particular EP, including the Pyrenees Facility Operations EP, happens before, during and after the designated consultation period in a more holistic manner allowing for an understanding of the bigger picture and accommodating cultural requirements. Ongoing consultation remains an important part of consulting with Traditional Custodians based on availability, cultural protocols and the preferred method of consultation for each relevant person.

Since as early as February 2024, where requested, Woodside has been working with nominated representative bodies to develop Consultation Agreement Frameworks which seek input from groups to outline their preferred method of consultation.

eNGO Consultation Approach

Woodside has an established history of consulting with environmental non-government organisations (eNGOs) as part of its EP consultation. In its methodology (Section 5.3.4, Table 5-2), eNGOs are considered “Other non-government groups or organisations” and “Research institutes and local conservation groups or organisations”. Relevant person identification for these categories is based on registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or

activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation.

So that eNGOs were given sufficient information and a reasonable period of time to consult, Woodside:

- advertised the consultation period (social and traditional media)
- directly consulted eNGOs
- participated in regional community events (which were advertised) in the Pilbara and Gascoyne, which could be attended by any eNGOs including local groups (if eNGOs attended these sessions, they did not identify themselves).

eNGO Response

For this EP, Woodside identified seven eNGOs as not relevant but which Woodside nevertheless chose to contact. None of the seven eNGOs provided feedback on this EP.

Relevancy Assessment

Assessment of Relevant Persons for the Proposed Activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25(1) of the Environment Regulations is outlined below at **Table 1** and **Table 2**.

Persons or organisations that Woodside assessed as not relevant but nonetheless chose to contact at its discretion in accordance with **Section 5.3.7** or self-identified and Woodside assessed as not relevant are summarised below at **Table 1** and **Table 3**.

As per Woodside's consultation methodology (set out in **Section 5**), Woodside considers both the Operational Area and the broader environment that may be affected (EMBA) as part of its identification of relevant persons. After initial consultation had been completed for this EP, Woodside undertook additional modelling which resulted in a revised EMBA (**Figure 2**). This has meant some stakeholders who were previously assessed as not relevant are now relevant persons (**Table 2**), while some persons and organisations previously assessed as relevant are now not relevant and chose to contact (**Table 3**). As a result of the revised modelling, a number of new relevant persons were identified and consulted. These relevant persons are included in **Table 1** and **Table 2**.

In addition, some persons and organisations in **Table 1** and **Table 3** were provided with consultation information on this EP as initial consultation for this EP was combined with another operations EP. While these stakeholders were not assessed as relevant for this EP, they were given the opportunity to provide feedback on both EPs.

Table 1: Assessment of Relevancy

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Commonwealth and State Government Departments or Agencies – Marine			
Australian Border Force (ABF)	Responsible for coordinating maritime security	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. ABF's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Department of Foreign Affairs and Trade (DFAT)	Responsible for promoting and protecting Australia's interests internationally and contributes to global stability and economic growth. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. DFAT has no direct role in the management of the Commonwealth marine area, but has an interest in ensuring that consultation with foreign entities, both private and government, is effective and is aligned with Australia's interests. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries. The proposed activity has the potential to impact DFAT's functions, interests or activities as the EMBA overlaps Indonesian waters.	Yes
Department of Infrastructure, Transport, Regional Development, Communications and the Arts (DITRDCA)	Responsible for managing fisheries within 12 nm of Christmas Island	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. The Christmas Island Line Fishery is active in the EMBA. DITRDCA's responsibilities may be relevant to the activity as the Christmas Island Line Fishery is active in the EMBA.	Yes
Australian Fisheries Management Authority (AFMA)	Responsible for managing Commonwealth fisheries	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. No Commonwealth fisheries are active in the Operational Area. The North West Slope Trawl Fishery, Western Deepwater Trawl Fishery,	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		Western Tuna and Billfish Fishery, Northern Prawn Fishery and Christmas Island Line Fishery are active in the EMBA. AFMA's responsibilities may be relevant to the activity as the North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery, Northern Prawn Fishery and Christmas Island Line Fishery are active in the EMBA.	
Australian Hydrographic Office (AHO)	Responsible for maritime safety and Notices to Mariners	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AHO's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Maritime Safety Authority (AMSA) – Marine Safety	Statutory agency for vessel safety and navigation	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AMSA – Marine Safety's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Maritime Safety Authority (AMSA) – Marine Pollution	Legislated responsibility for oil pollution response in Commonwealth waters	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AMSA – Marine Pollution's responsibilities may be relevant to the activity as the proposed activity has a hydrocarbon spill risk which may require AMSA response in Commonwealth waters.	Yes
Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries	Responsible for implementing Commonwealth policies and programs to support agriculture, fishery, food and forestry industries	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. No Commonwealth fisheries are active in the Operational Area. The North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery, Northern Prawn Fishery and Christmas Island Line Fishery are active in the revised EMBA. DAFF – Fisheries responsibilities may be relevant to the activity the North West Slope Trawl Fishery, Western Deepwater Trawl Fishery, Western Tuna and Billfish Fishery, Northern Prawn Fishery and Christmas Island Line Fishery are active in the revised EMBA.	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Department of Defence (DoD)	Responsible for defending Australia and its national interests.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. DoD's responsibilities may be relevant to the activity as defence training areas lie within the EMBA.	Yes
Department of Primary Industries and Regional Development (DPIRD)	Responsible for managing State fisheries	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The Mackerel Managed Fishery (Schedule 2 – Area 2), Pilbara Line Fishery (Condition), Pilbara Trap Managed Fishery and West Coast Deep Sea Crustacean Managed Fishery are active in the Operational Area. The Abalone Managed Fishery, Abrolhos Islands and Mid West Trawl Managed Fishery, Cockburn Sound (Line and Pot) Managed Fishery, Exmouth Gulf Beach Seine and Mesh Net Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Joint Authority Southern Demersal Gillnet and Demersal Fishery, Kimberley Crab Managed Fishery, Kimberley Gillnet and Barramundi Managed Fishery, Mackerel Managed Fishery (Schedule 2 – Area 1, 2, 3; Schedule 3), Marine Aquarium Fish Managed Fishery, Nickol Bay Prawn Managed Fishery, Northern Demersal Scalefish Managed Fishery, Octopus Interim Managed Fishery, Onslow Prawn Managed Fishery, Open Access in the North Coast, Gascoyne Coast, South Coast and West Coast Bioregions, Pearl Oyster Managed Fishery, Pilbara Crab Managed Fishery, Pilbara Fish Trawl (Interim) Managed Fishery, Pilbara Line Fishery (Condition), Pilbara Trap Managed Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, South Coast Crustacean Managed Fishery, South Coast Estuarine Managed Fishery, South Coast Line and Fish Trap Managed Fishery, South Coast Nearshore Net Managed Fishery, South Coast Purse-Seine Managed Fishery, South Coast Salmon Managed Fishery, South West Coast Beach Net Fishery (Order), South West Coast Salmon Managed Fishery, South West Trawl Fishery, Specimen Shell Managed Fishery, West Coast (Beach Bait Fish Net) Managed Fishery, West Coast Deep Sea Crustacean Managed Fishery, West Coast Demersal Gillnet and Demersal Longline, West Coast Demersal Scalefish (Interim) Managed Fishery,	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		West Coast Estuarine Managed Fishery, West Coast Purse Seine Fishery, West Coast Rock Lobster Managed Fishery, Cockburn Sound (Fish Net) Managed Fishery and Kimberley Prawn Managed Fishery have been active in the EMBA within the last 5 years. DPIRD's responsibilities may be relevant to the activity as the government department responsible for State fisheries.	
Department of Transport (DoT) / now Department of Transport and Major Infrastructure (DTMI)	Legislated responsibility for oil pollution response in State waters	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has a hydrocarbon spill risk, which may require DTMI response in State waters.	Yes
Department of Planning, Lands and Heritage (DPLH)	Responsible for state level land use planning and management, and oversight of Aboriginal cultural heritage and built heritage matters.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. There is known Maritime Cultural Heritage overlapping the EMBA.	Yes
Western Australian Museum	Manages 200 shipwreck sites of the 1,500 known to be located off the Western Australian coast.	Woodside has applied its methodology for 'Historical cultural heritage groups or organisations' under regulation 25(1)(b). There are known shipwrecks overlapping the EMBA which the Western Australian Museum may be responsible for.	Yes
Pilbara Ports	Responsible for the operation of the Port of Dampier and Port of Port Hedland.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Pilbara Ports's responsibilities as the EMBA overlaps the Pilbara Ports's area of responsibility.	Yes
Southern Ports	Responsible for the operation of the Port of Albany and Port of Bunbury.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The EMBA does not overlap Southern Ports' area of responsibility. Woodside contacted Southern Ports, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Kimberley Ports Authority	Responsible for the operation of the Port of Yampi Sound.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Kimberley Ports Authority's responsibilities as the EMBA overlaps Kimberley Ports Authority's area of responsibility, including Port of Yampi Sound (revised EMBA).	Yes
Mid West Ports Authority	Responsible for the operation of the Port of Geraldton.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Mid West Ports Authority's responsibilities as the EMBA overlaps Mid West Ports Authority's area of responsibility.	Yes
Fremantle Port Authority	Responsible for the operation of Port of Fremantle.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Fremantle Port Authority's responsibilities as the EMBA overlaps Fremantle Port Authority's area of responsibility.	Yes
Port of Christmas Island	Responsible for the operation of the Port of Christmas Island.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Port of Christmas Island's responsibilities as the EMBA overlaps Port of Christmas Island's area of responsibility.	Yes
Port of Cocos (Keeling) Island	Responsible for the operation of the Port of Cocos (Keeling) Island.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The EMBA does not overlap Port of Cocos (Keeling) Island's area of responsibility. Woodside contacted Port of Cocos (Keeling) Islands, in line with Section 5.3.7, as consultation was combined with consultation on a separate EP.	No

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Department of Agriculture, Fisheries and Forestry (DAFF) – Biosecurity (marine pests, vessels, aircraft and personnel)	DAFF administers, implements and enforces the Biosecurity Act 2015. The Department requests to be consulted where an activity has the potential to transfer marine pests. DAFF also has inspection and reporting requirements to ensure that all conveyances (vessels, installations and aircraft) arriving in Australian territory comply with international health regulations and that any biosecurity risk is managed. The Department requests to be consulted where an activity involves the movement of aircraft or vessels between Australia and offshore petroleum activities either inside or outside Australian territory.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DAFF – Biosecurity's responsibilities may be relevant to the proposed activities in the EMBA in the prevention of introduced marine species.	Yes
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	Responsible for implementing Commonwealth policies and programs to support climate change, sustainable energy use, water resources, the environment and our heritage. Administers the <i>Underwater Cultural Heritage Act 2018</i> in collaboration with the States, Northern Territory and Norfolk Island, which is responsible for the protection of shipwrecks, sunken aircraft and other types of underwater heritage and their associated artefacts in Commonwealth waters.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DCCEEW's responsibilities may be relevant to the proposed activities in the EMBA as there are potential environmental impacts from the proposed activity. There is known Maritime Cultural Heritage overlapping the EMBA.	Yes
Director of National Parks (DNP)	Responsible for the management of Commonwealth parks and conservation zones.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DNP's responsibilities may be relevant to the activity as DNP requires an awareness of activities that occur within AMPs, and an understanding of potential impacts and risks to the values of parks (NOPSEMA guidance note: N-04750-GN1785 A620236, June 2020). Titleholders are required to consult DNP on offshore petroleum and greenhouse gas exploration activities if they occur in, or may impact	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		on the values of marine parks, including where potential spill response activities may occur in the event of a spill (i.e. scientific monitoring).	
Ningaloo Coast World Heritage Advisory Committee (NCWHAC)	Supports the DBCA to manage the Ningaloo Coast World Heritage Area.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. The NCWHAC's responsibilities may be relevant to the activity as the EMBA overlaps the Ningaloo Marine Park.	Yes
Department of Biodiversity, Conservation and Attractions (DBCA)	Responsible for managing WA's parks, forests and reserves to achieve wildlife conservation and provide sustainable recreation and tourism opportunities.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. The DBCA's responsibilities may be relevant to the activity as EMBA overlaps WA parks, forests or reserves. Activities have the potential to impact marine tourism in the EMBA.	Yes
Northern Territory Department of Industry, Tourism and Trade (DITT) (Aquatic Biosecurity)	Monitors and manages the risk of new marine pests arriving in the Northern Territory.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. DITT (Aquatic Biosecurity)'s responsibilities may be relevant to the activity as the revised EMBA overlaps Northern Territory waters.	Yes
Department of Industry, Tourism and Trade (DITT) - NT Fisheries	Responsible for managing State fisheries in the Northern Territory	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. While no Northern Territory fisheries have been identified as relevant for this activity, the revised EMBA overlaps Northern Territory waters. Woodside contacted NT Fisheries at its discretion in line with Section 5.3.7.	No
Northern Territory Department of Environment, Parks and Water Security (DEPWS)	Responsible for managing the Northern Territory's policies to protect the environment and natural resources.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. DEPWS's responsibilities may be relevant to the activity as the revised EMBA overlaps Northern Territory waters.	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Northern Territory Environment Protection Agency (NTEPA)	Responsible for promoting the ecologically sustainable development of the Northern Territory	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. NTEPA's responsibilities may be relevant to the activity as the revised hydrocarbon spill risk associated with the proposed activity overlaps Northern Territory waters.	Yes
Northern Territory Department of Infrastructure, Planning and Logistics (DIPL) (Marine Safety)	Responsible for marine safety in Northern Territory waters.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. DIPL (Marine Safety)'s responsibilities may be relevant to the activity as the revised EMBA overlaps Northern Territory waters.	Yes
Commonwealth and State Government Departments or Agencies – Industry			
Department of Industry, Science and Resources (DISR)	Department of relevant Commonwealth Minister.	Required to be consulted under regulation 25(1)(a) of the Environment Regulations.	Yes
Department of Energy, Mines, Industry Regulation and Safety (DEMIRS) / now Department of Mines, Petroleum and Exploration (DMPE)	Department of relevant State Minister	Required to be consulted under regulation 25(1)(c) of the Environment Regulations.	Yes
Northern Territory Department of Industry, Tourism and Trade (DITT) (Mining and Energy)	Department of relevant State Minister	Required to be consulted under regulation 25(1)(c) of the Environment Regulations where the Northern Territory is relevant.	Yes
Commonwealth Commercial fisheries and representative bodies			
North West Slope and Trawl Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		Although the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area within the last 5 years. The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.	
Southern Bluefin Tuna Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment regulations. Woodside does not consider that the proposed activity will present a risk to licence holders, given since 1992, the majority of Australian catch has concentrated in south-eastern Australia. (Patterson et al., 2022). In addition, given fishing methods by licence holders for species fished in this fishery (Australia has a 35% share of total global allowable catch of Southern Bluefin Tuna, which is value-added through tuna ranching near Port Lincoln (South Australia), or fishing effort in New South Wales (Australian Southern Bluefin Tuna Industry Association).	No
Western Deepwater Trawl Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.	Yes
Western Skipjack Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Woodside does not consider that the activity will present a risk to licence holders, given the fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (Patterson et al., 2022). In addition, interactions are not expected given the species' pelagic distribution fishing methods for species fished by licence holders.	No
Western Tuna and Billfish Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		Tuna and Billfish Fishery, Northern Prawn Fishery and Christmas Island Line Fishery are active in the EMBA.	
Australian Southern Bluefin Tuna Industry Association (ASBTIA)	Represents the interests of the Southern Bluefin Tuna Fishery and Western Skipjack Fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Southern Bluefin Tuna Fishery has been assessed as not relevant to the proposed activity. As the peak representative body for the Southern Bluefin Tuna Fishery, the ASBTIA has also been assessed as not relevant. Woodside has provided information to the ASBTIA at its discretion in line with Section 5.3.7 on AFMA advice that it expects all Commonwealth fishers who have entitlements to fish within the proposed area to be consulted, which can be through the relevant fishing industry associations.	No
Tuna Australia	Represents the interests of the Western Tuna and Billfish Fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Western Tuna and Billfish Fishery is active within the EMBA. Tuna Australia's functions may be relevant to the activity as the Western Tuna and Billfish Fishery is active in the EMBA.	Yes
Pearl Producers Association	Peak representative organisation of The Australian South Sea Pearling Industry, with members in Western Australia and the Northern Territory	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Pearl Oyster Managed Fishery is active within the EMBA. Pearl Producers Association's functions may be relevant to the activity as the Pearl Oyster Managed Fishery is active in the EMBA.	Yes
Northern Prawn Fishery Industry Pty Ltd	Represents the interests of the Northern Prawn Fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Northern Prawn Fishery is active within the revised EMBA. Northern Prawn Fishery Industry Pty Ltd's functions may be relevant to the activity as the Northern Prawn Fishery is active within the revised EMBA.	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		(Fish Net) Managed Fishery and Kimberley Prawn Managed Fishery have been active in the EMBA within the last 5 years. WAFIC's functions may be relevant to the activity as the peak representative body for State fisheries. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting, via WAFIC, fisheries that are assessed as having a potential for interaction in the Operational Area. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario	
Marine Aquarium Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. While Woodside assessed the fishery as relevant in the Operational Area, under an agreement between WAFIC and Woodside, WAFIC has advised there is no need to consult this fishery given the proposed activities operate in depths ~180-850m which is outside the depth of the hand collection and diving methods used by this fishery. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario.	No
South West Coast Salmon Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area within the last 5 years. The fishery has been active in the EMBA within the past 5 years, however, based on WAFIC's advice, Woodside does not need to consult fisheries in the EMBA. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for	No

		Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario.	
Mackerel Managed Fishery (Area 1, 2 and 3)	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery Area 2 overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries, via WAFIC, that are assessed as having a potential for interaction in the Operational Area. The fishery Areas 1 and 3 do not overlap the Operational Area. The fishery areas overlap the EMBA and have been active in the EMBA within the past 5 years, however, based on WAFIC's advice, Woodside does not need to consult fisheries in the EMBA. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	Yes (Area 2)
Pilbara Crab Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area within the last 5 years. The fishery has been active in the EMBA within the past 5 years, however, based on WAFIC's advice, Woodside does not need to consult fisheries in the EMBA. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario.	No

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
West Coast Deep Sea Crustacean Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting, via WAFIC, fisheries that are assessed as having a potential for interaction in the Operational Area	Yes
Specimen Shell Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. While Woodside assessed the fishery as relevant in the Operational Area, under the fee-for-service agreement between WAFIC and Woodside, WAFIC has advised there is no need to consult this fishery given the proposed activities operate in depths ~180-850m which is outside the depth of the hand collection and diving methods used by this fishery. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario.	No
Abalone Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area within the last 5 years. The fishery has been active in the EMBA within the last 5 years, however, based on WAFIC's advice, Woodside does not need to consult fisheries in the EMBA. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		MAC is the Nominated Representative Corporation under the Burrup and Maitland Industrial Estates Agreement (BMIEA). The EMBA overlaps the Murujuga National Park. MAC was established to represent the members of competing Native Title claims over Murujuga, collectively known as the Ngarda Ngarli and comprising Mardudhunera, Ngarluma, Yaburara, Yindjibarndi and Wong-Goo-Tt-Oo people. The determination of the competing Native Title claims resulted in no native title being found over the lands subject to the BMIEA or below the low water mark. MAC also owns and co-manages the Murujuga National Park, is responsible for the Dampier Archipelago National Heritage Place and is progressing the World Heritage nomination of the Murujuga Cultural Landscape.	
Nganhurra Thanardi Garrbu Aboriginal Corporation (NTGAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People native title claim, the determination of which the Baiyungu, Thalanyji and Yinggarda people are party to, overlaps the EMBA. The NTGAC and Yi YAC are the Registered Native Title Body Corporates holding native title on behalf of the Baiyungu, Thalanyji and Yinggarda people. NTGAC is party, with the WA State Government, to the Ningaloo Conservation Estate Indigenous Land Use Agreement (ILUA), which overlaps the EMBA. NTGAC is also party to the Gnaraloo ILUA and Nganhurra Thanardi Garrbu Aboriginal Corporation Conservation Estate ILUA, which overlaps the EMBA. The NTGAC is responsible for the joint management of the Ningaloo Marine Park (State Waters), the Cape Range National Park and new conservation areas extending along the Ningaloo Coast, which runs in parallel to the outer Ningaloo Marine Park in Commonwealth waters. NTGAC's nominated representative is the Yamatji Marlpa Aboriginal Corporation (YMAC) and the NTGAC executive officer and contact officer pursuant to the <i>Corporations (Aboriginal and Torres Strait</i>	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		<i>Islander) Act 2006</i> is employed by YMAC. Woodside has therefore consulted the NTGAC, via YMAC.	
Buurabalayji Thalanyji Aboriginal Corporation (BTAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Thalanyji native title claim, which BTAC is the Registered Native Title Body Corporate for, overlaps the EMBA. BTAC is also party to the Ashburton Salt Project ILUA (Body Corporate Agreement) and Macedon ILUA, which overlaps the EMBA.	Yes
Yinggarda Aboriginal Corporation (YAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People native title claim, the determination of which the Baiyungu, Thalanyji and Yinggarda people are party to, overlaps the EMBA. YAC is party to the Quobba – Yinggarda Pastoral ILUA, which overlaps the EMBA, and the Brickhouse and Yinggarda Aboriginal Corporation ILUA, which is coastally adjacent to the EMBA. The Yinggarda Aboriginal Corporations nominated representative is Gumala Aboriginal Corporation.	Yes
Kariyarra Aboriginal Corporation (KAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Kariyarra native title claim, for which the KAC is the Registered Native Title Body Corporate, overlaps the EMBA. KAC is also party to the Kariyarra and State ILUA, which overlaps the EMBA.	Yes
Wirrawandi Aboriginal Corporation (WAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations.	Yes

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		The Yaburara & Mardudhunera People native title determination, for which WAC is the Registered Native Title Body Corporate, overlaps the EMBA. WAC is also party to the Cape Preston Project Deed (YM Mardie ILUA), Cape Preston West Export Facility, and KM & YM Indigenous Land Use Agreement 2018, which overlap the EMBA.	
Robe River Kuruma Aboriginal Corporation (RRKAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations.
