Table of contents

1. Introduction 17
1.1 Overview 17
1.2 Purpose of the Environmental Plan 17
1.3 Environment Plan Summary 17
1.4 Structure of the Environment Plan 18
1.5 Description of the Titleholder 20
1.5.1 Details of Titleholder and nominated liaison person 20
1.5.1.1 Titleholder 20
1.5.1.2 Nominated liaison person 20
1.5.2 Arrangements for notifying change 20
1.6 Woodside Management System 21
1.6.1 Our Woodside Management System Purpose 21
1.6.2 Environment and Biodiversity Policy 23
1.7 Description of relevant requirements 23
1.7.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act) 23
1.7.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act) 24
1.7.2.1 Recovery plans and threat abatement plans 24
1.7.2.2 Australian Marine Parks 25
1.7.2.3 World Heritage Properties 26
2. EP process 28
2.1 Overview 28
2.2 Environment Plan process 28
2.2.1 Establish the context 30
2.2.2 Describe the activity 30
2.2.3 Describe the existing environment 30
2.2.4 Environmental legislation and other requirements 30
2.2.5 Impact and risk management 30
2.2.5.1 Impact and risk identification and analysis 30
2.2.5.2 Decision support framework 31
2.2.5.3 Decision support framework tools 32
2.2.5.4 Decision calibration 32
2.2.6 Control measures 33
2.2.7 Impact and risk classification 33
2.2.7.1 Impact classification 33
2.2.7.2 Risk classification 34
2.3 Impact and risk evaluation 35
2.3.1 Demonstration of ‘as low as reasonably practicable’ 35
2.3.2 Demonstration of acceptability 36
2.4 Recovery plan and threat abatement plan assessment 37
2.5 Environmental performance objectives/outcomes, standards and measurement criteria 37
2.6 Implement, monitor, review and report 38
2.7 Stakeholder consultation 38
3. Description of the activity 39
3.1 Overview 39

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.2 Project overview 39
3.3 Concordance with OPP 41
3.4 Location 44
3.4.1 Activities Outside Permit titles 46
3.5 Operational Area 46
3.6 Timing 46
3.7 Drilling activities 47
3.7.1 Underwater acoustic positioning 47
3.7.2 Top-hole section drilling 47
3.7.3 Blow out preventer and marine riser installation 47
3.7.4 Bottom-hole section drilling 47
3.7.5 Drilling fluids 48
3.7.5.1 Water-based Mud (WBM) system 48
3.7.5.2 Non-Water-Based Mud (NWBM) system 48
3.7.5.3 Mud pits 49
3.7.5.4 Drill cuttings 49
3.7.6 Cementing Operations 49
3.7.6.1 Cement unit test 49
3.7.6.2 Foam wipers 50
3.7.7 Formation evaluation 50
3.7.8 Wellbore clean-out 50
3.7.9 Xmas tree installation 50
3.7.10 Well completion 50
3.7.11 Well flowback 51
3.8 Subsea installation and pre-commissioning activities 51
3.8.1 Existing Subsea Infrastructure 53
3.8.2 Underwater acoustic positioning 53
3.8.3 Subsea installation 53
3.8.3.1 Pre-lay survey 53
3.8.3.2 Sediment mobilisation and relocation 53
3.8.3.3 Installation of subsea structures 53
3.8.3.4 Flowline initiation / initiation anchor deployment 53
3.8.3.5 General flexible flowline and EHU installation 54
3.8.3.6 General HFL, EFL and jumper installation 54
3.8.3.7 Span/scouring rectification and stabilisation 54
3.8.3.8 Infrastructure Crossing Supports 55
3.8.4 Pre-commissioning 55
3.8.4.1 Flooding 55
3.8.4.2 Leak testing 56
3.8.4.3 Dewatering 56
3.8.4.4 Tie-in to GWF subsea infrastructure 56
3.8.4.5 Cold commissioning of subsea infrastructure 56
3.8.5 Wet storage of equipment 56
3.8.6 Site surveys 57
3.8.7 Subsea IMR 57
3.9 Project fluids 57
3.10 Contingent activities 57

3.10.1 Respud 58
3.10.2 Sidetrack 58
3.10.3 Workover 58
3.10.4 Well intervention 58
3.10.5 Well suspension 58
3.10.6 Well abandonment 58
3.10.7 Sediment mobilisation and relocation 59
3.10.8 Venting 59
3.10.9 Emergency Disconnect Sequence 59
3.11 Vessels 59
3.11.1 MODU 60
3.11.2 IMMR vessels 60
3.11.3 Primary Installation vessel 61
3.11.4 Support vessels 61
3.11.4.1 Uncrewed Surface Vessel 61
3.11.5 Project vessel-based activities 62
3.11.5.1 Holding Station: Mooring Installation and Anchor Hold Testing/Soil Analysis 62
3.11.5.2 Holding Station: Rig Anchor Release MODU 62
3.11.5.3 Holding Station: Dynamic Positioning MODU 62
3.12 ROV 63
3.13 Helicopters 63
4. Description of the existing environment 64
4.1 Overview 64
4.2 Regional context 67
4.3 Matters of National Environmental Significance (EPBC ACT) 67
4.4 Physical environment 68
4.5 Habitats and biological communities 69
4.5.1 Offshore benthic habitats 71
4.5.1.1 Wilcox Shoal 74
4.5.1.2 Wilcox drill Centre and flowline route 74
4.5.1.3 Unnamed Shoal 74
4.5.1.4 Rankin bank 74
4.5.1.5 Glomar Shoal 75
4.6 Protected species 78
4.6.1 Fish, sharks and rays 78
4.6.1.1 Whale Shark 79
4.6.2 Marine reptiles 83
4.6.2.1 Flatback Turtle 83
4.6.3 Marine mammals 90
4.6.4 Seabirds and migratory shorebirds 94
4.6.4.1 Wedge-tailed shearwater 94
4.6.5 Seasonal sensitivities for protected species 102
4.7 Key ecological features (KEFs) 105
4.7.1 Ancient Coastline at 125 m Depth Contour 106
4.8 Protected places 106
4.8.1 Montebello Marine Park 108

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9 Socio-economic environment 109
4.9.1 Cultural values and heritage 109
4.9.1.1 Native Title 109
4.9.1.2 Coastally adjacent First Nations groups 109
4.9.1.3 Marine and National Parks 113
4.9.1.4 Indigenous protected areas 115
4.9.1.5 Sea Country values 115
4.9.1.6 Summary of cultural features and heritage values 162
4.9.1.7 Historic sites of significance 168
4.9.1.8 Historic underwater heritage 168
4.9.1.9 World, National and Commonwealth heritage listed places 168
4.9.2 Commercial Fisheries 169
4.9.3 Traditional and customary fishing 184
4.9.4 Tourism and recreation 184
4.9.5 Commercial shipping 184
4.9.6 Oil and gas facilities, infrastructure and other industries 186
4.9.7 Defence 187

5. Stakeholder consultation 189

5.1 Summary 189
5.2 Consultation – general context 190
5.3 Identification of relevant persons for consultation 193
5.3.1 Regulations 25(1)(a), (b) and (c) 193
5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c) 194
5.3.3 Regulation 25(1)(d) 194
5.3.4 Identification of relevant persons under Regulation 25(1)(d) 196
5.3.5 Regulation 25(1)(e) 202
5.3.6 Identification of relevant persons under Regulation 25(1)(e) 202
5.3.7 Persons or organisations Woodside chooses to contact 202
5.3.8 Assessment of relevant persons for the proposed activity 202
5.4 Consultation material and timing 202
5.4.1 Sufficient information 203
5.4.2 Reasonable period for consultation 205
5.4.3 Discharge of Regulation 25 207
5.5 Context of consultation approach with Traditional Custodians 207
5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal 207
5.5.2 Consultation method 208
5.5.3 Identification of relevant persons 210
5.5.4 Opportunity to self-identify and identifying other individuals 211
5.5.5 Sufficient information 211
5.5.6 Reasonable period for consultation 212
5.5.7 Discharge of Regulation 25 212
5.6 Providing feedback and assessment of merit of objections or claims 212
5.7 Ongoing consultation 213

6. Environmental impact and risk assessment, performance outcomes, standards and measurements criteria 214

6.1 Overview 214

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.2 Impacts and risks not deemed credible or outside the scope of this EP 218
6.2.1 Shallow/Near-shore Activities 218
6.2.2 Underwater Noise Emissions from Flaring, Helicopters and ROV 218
6.2.3 Loss of Containment from Abandoned Wellheads 218
6.3 Cumulative impacts 218
6.4 Indirect impacts from activities outside the Operational Area 218
6.5 Environmental performance outcomes, standards and measurement criteria 219
6.6 Presentation 219
6.7 Planned activities (routine and non-routine) 222
6.7.1 Physical Presence: Interaction with Other Marine Users 222
6.7.2 Physical Presence: Seabed Disturbance from Drilling Operations, Subsea Infrastructure, MODU Anchoring and ROV Operations 233
6.7.3 Routine Light Emissions: External Lighting on MODU and Project Vessels 245
6.7.4 Routine Acoustic Emissions: Generation of sound emissions from MODU and Project Vessels 255
6.7.5 Routine Emissions: Atmospheric and GHG emissions 271
6.7.6 Routine and Non-Routine Discharges: Hydrocarbons and Chemicals 281
6.7.7 Routine and Non-Routine Discharges: MODU and Project Vessels 289
6.7.8 Routine and Non-Routine Discharges: Drill Cuttings and Drilling Fluids 299
6.7.9 Routine and Non-Routine Discharges: Cement, Cementing Fluids, Subsea Well Fluids, Produced Water, Unused Bulk Product 318
6.8 Unplanned activities (accidents, incidents, emergency situations) 329
6.8.1 Quantitative spill risk assessment methodology 329
6.8.1.1 Worst case scenarios 329
6.8.1.2 Environment that May Be Affected and Hydrocarbon Contact Thresholds 330
6.8.1.3 Operational and scientific monitoring 333
6.8.1.4 Hydrocarbon Characteristics 333
6.8.2 Unplanned Hydrocarbon Release: Loss of Well Integrity 340
6.8.3 Unplanned Hydrocarbon Release: Vessel Collision 370
6.8.4 Unplanned Release: Hydrocarbon and Chemicals (Minor Loss of Containment) 387
6.8.5 Physical Presence (Unplanned): Interaction with Marine Fauna 399
6.8.6 Physical Prescence (Unplanned): Accidental Introduction and Establishment of Invasive Marine Species 407
6.8.7 Physical Presence (Unplanned): Seabed Disturbance from Dropped Objects and Loss of Station Keeping Leading to Anchor Drag 416
6.8.8 Physical Presence (Unplanned): Interaction with Live Infrastructure 424
6.8.9 Unplanned Release: Hazardous and Non-Hazardous Wastes 430
6.9 Recovery plan and threat abatement assessment 436
7. Implementation strategy 448
7.1 Overview 448
7.2 Systems, practices, and procedures 448
7.2.1 Assessment of project chemicals 448
7.2.1.1 Ecotoxicity 449
7.2.1.2 Biodegradation 449
7.2.1.3 Bioaccumulation 450
7.2.1.4 Alternatives 450
7.2.1.5 Decision 450

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.2 Woodside invasive marine species risk assessment process 450
7.2.2.1 Objective and scope 450
7.2.2.2 Risk assessment process 451
7.2.3 Offshore Seabird Management Plan 454
7.2.4 Unexpected finds procedure 454
7.3 Roles and responsibilities 455
7.4 Training and competency 461
7.4.1 Overview 461
7.4.2 Inductions 461
7.4.3 Petroleum Activity-specific environmental awareness 461
7.5 Monitoring, auditing, and managing non-conformance and review 461
7.5.1 Monitoring 461
7.5.1.1 Offshore Seabird Management Plan 462
7.5.1.2 Cetacean Adaptive Management 463
7.5.2 Auditing 463
7.5.2.1 MODU activities 463
7.5.2.2 Subsea scope activities 464
7.5.2.3 Marine assurance 464
7.5.2.4 Vessel risk assessment 465
7.5.3 Management of non-conformance 466
7.5.4 Review 466
7.5.4.1 Management review 466
7.5.4.2 Learning and knowledge sharing 466
7.5.4.3 Review of impacts, risks and controls across the life of the EP 467
7.6 Management of knowledge 467
7.7 Management of Newly Identified Impacts and Risks 467
7.8 Management of change and revision 467
7.8.1 EP management of change 467
7.8.2 OPEP management of change 468
7.9 Record keeping 468
7.10 Ongoing consultation 468
7.11 Reporting 470
7.11.1 Routine reporting (internal) 471
7.11.1.1 Regular health, safety and environment meetings 471
7.11.1.2 Performance reporting 471
7.11.2 Routine reporting (external) 471
7.11.2.1 Start and end notifications of the Petroleum Activity 471
7.11.2.2 Environmental performance review and reporting 471
7.11.2.3 End of the Environmental Plan 472
7.11.3 Incident reporting (internal) 472
7.11.4 Incident reporting (external) – Reportable and recordable 472
7.11.4.1 Reportable incidents 472
7.11.4.2 Recordable incidents 473
7.11.4.3 Other external incident reporting requirements 473
7.12 Emergency preparedness and response 477
7.12.1 Overview 477
7.12.2 Emergency response training 477

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.12.3 Emergency response preparation 478
7.12.4 Oil and other hazardous materials spill 479
7.12.5 Emergency and spill response 479
7.12.6 Emergency and spill response drills and exercises 479
7.12.7 Testing of hydrocarbon spill response arrangements 480
7.12.8 Testing of arrangements schedule 480
7.13 Cyclone and dangerous weather preparation 483
8. References 484
9. List of terms and acronyms 534
Appendix A Woodside environment and biodiversity, climate and risk management policies 537
Appendix B Relevant requirements 538
Appendix C Aboriginal cultural heritage search tool results 539
Appendix D EPBC Act Protected Matters Search Tool Results 540
Appendix E NOPSEMA Report Forms 541
Appendix F Stakeholder consultation 542
Appendix G Oil spill preparedness and response strategy selection and evaluation 543
Appendix H First strike plan 544

1. INTRODUCTION

1.1 Overview

On behalf of the North West Shelf Joint Venture (NWSJV), Woodside Energy Limited (Woodside), as Titleholder under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Commonwealth) (referred to as the Environment Regulations), proposes to undertake the following activities within Permit Areas WA-5-L, WA- 24 L, WA-7-R, WA-57-L:

- drilling and completions
- subsea installation and pre-commissioning

These activities will hereafter be collectively referred to as the Petroleum Activity and form the scope of this EP (EP). A detailed description of the activities is provided in Section 3. This EP has been prepared as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The Petroleum activity as defined in this EP is a part of the Goodwyn Area Infill Development Offshore Project Proposal (OPP) accepted by NOPSEMA on 27 August 2025.

1.2 Purpose of the Environmental Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- The potential environmental impacts and risks (planned [routine and non-routine] and unplanned) that may result from the Petroleum Activity are identified.
- Appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable.
- The Petroleum Activity is carried out in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in Section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* [EPBC Act]).

1.3 Environment Plan Summary

Table 1-1 summarises the content of this EP, as required by Regulation 35(7).

Table 1-1: EP summary

EP summary material requirement	Relevant section of this EP containing EP summary material
The location of the activity	**Section 3.4**
A description of the receiving environment	**Section 4**
A description of the activity	**Section 3**
Details of the environmental impacts and risks	**Section 6**
The control measures for the activity	**Section 6**
The arrangements for ongoing monitoring of the titleholder's environmental performance	**Section 7.5**
Response arrangements in the oil pollution emergency plan	**Appendix G** and **Appendix H**
Consultation already undertaken and plans for ongoing consultation	**Section 5**
Details of the titleholder's nominated liaison person for the activity	**Section 1.5.2**

1.4 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(a): Is appropriate for the nature and scale of the activity	Regulation 21: • Environmental assessment Regulation 22: • Implementation strategy for the EP Regulation 24: • Other information in the EP	The principle of 'nature and scale' is applicable throughout the EP	Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(b): Demonstrates that the environmental impacts and risks of the activity will be reduced to ALARP Regulation 34(c): Demonstrates that the environmental impacts and risks of the activity will be of an acceptable level	Regulations 21(1)–21(7): • 21(1) Description of the activity • 21(2) and (3) Description of the environment • 21(4) Requirements • 21(5) and (6) Evaluation of environmental impacts and risks • 21(7) Environmental Performance Outcomes and standards Regulations 24(a)–24(c): • A statement of the titleholder's corporate environmental policy • A report on all consultations between the titleholder and any relevant person	Set the context (activity and existing environment) Define 'acceptable' (the requirements, the corporate policy, relevant persons) Detail the impacts and risks Evaluate the nature and scale Detail the control measures – ALARP and acceptable	Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 34(d): Provides for appropriate Environmental Performance Outcomes, environmental performance standards and measurement criteria	Regulation 21(7): • Environmental Performance Outcomes and standards	Environmental Performance Outcomes (EPOs) Environmental performance standards (EPSs) Measurement criteria (MCs)	Section 6
Regulation 34(e): Includes an appropriate implementation strategy and monitoring, recording and reporting arrangements	Regulation 22: • Implementation strategy for the EP	Implementation strategy, including: Environmental Management System (EMS) Performance monitoring Oil Pollution Emergency Plan (OPEP – per Appendix G) and scientific monitoring Ongoing consultation	Section 7 Appendix G

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(f): Does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act.	Regulations 21(1)–21(3): • 21(1) Description of the activity • 21(2) Description of the environment • 21(3) Without limiting Regulation 21(2)(b), relevant values and sensitivities may include any of the following: – (a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act; – (b) the national heritage values of a National Heritage place within the meaning of that Act; – (c) the ecological character of a declared Ramsar wetland within the meaning of that Act; – (d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act; – (e) the presence of a listed migratory species within the meaning of that Act; – (f) any values and sensitivities that exist in, or in relation to, part or all of: ▪ (i) a Commonwealth marine area within the meaning of that Act; or ▪ (ii) Commonwealth land within the meaning of that Act.	No activity, or part of the activity, undertaken in any part of a declared World Heritage property	Section 3 Section 4 Section 6
Regulation 34(g): (i) the titleholder has carried out the consultations required by Regulation 25 (ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate	Regulation 25: • Consultation with relevant authorities, persons and organisations, etc. Regulation 24(b): • A report on all consultations between the titleholder and any relevant person	Consultation undertaken in the preparation of this EP.	Section 5

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(h): Complies with the Act and the regulations	Regulation 21(4)(a): • Describe the requirements, including legislative requirements, that apply to activity and are relevant to the environmental management of the activity Regulation 23: • Details of the Titleholder and liaison person Regulation 24(a): • A statement of the titleholder's corporate environmental policy Regulation 24(c): • Details of all reportable incidents in relation to the proposed activity	All contents of the EP must comply with the OPGGS Act and the Environment Regulations	Section 1.5 Section 7.11 Appendix A Appendix B

1.5 Description of the Titleholder

Woodside is the Titleholder for this activity, on behalf of the North West Shelf Joint Venture (NWSJV) comprising Woodside Energy Ltd, BP Developments Australia Pty Ltd, Woodside Energy (North West Shelf) Pty Ltd, Chevron Australia Pty Ltd, Japan Australia LNG (MIMI) Pty Ltd, CNOOC NWS Private Ltd, and Shell Developments (Australia) Pty Ltd.

1.5.1 Details of Titleholder and nominated liaison person

In accordance with Regulation 23 of the Environment Regulations, details of the titleholder, liaison person and arrangements for notifying changes are described below.

1.5.1.1 Titleholder

Woodside Energy Limited

11 Mount Street

Perth, Western Australia

T: 08 9348 4000

ACN: 63 005 482 986

1.5.1.2 Nominated liaison person

Nicolas Wirtz

Corporate Affairs Manager

11 Mount Street

Perth, Western Australia

Telephone: 08 9348 4000

Email: feedback@woodside.com

1.5.2 Arrangements for notifying change

If the titleholder, titleholder's nominated liaison person, or the contact details for either change, then NOPSEMA will be notified in writing within 2 weeks or as soon as practicable.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.6 Woodside Management System

The Woodside Management System (Our WMS) defines the core mandatory activities that support safeguarding the business and enabling its people to achieve objectives, manage uncertainty and meet obligations to deliver value for the company and its stakeholders.

1.6.1 Our Woodside Management System Purpose

Our WMS is a series of integrated business processes that contribute to value delivery. A process is defined as the core mandatory activities that are material to converting inputs to outputs for value delivery from the defined business area. A process must reflect relevant corporate drivers and may have associated tools that support its implementation. Our WMS activities are divided into two categories; Deliver Value Chain – for activities directly involved in value delivery and Enable Value Chain – for activities supporting the enterprise and value delivery (Figure 1-1). The Health, Safety and Environment sub-category is included in the Enable Value Chain category. Given this, there is interdependence between processes across these activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

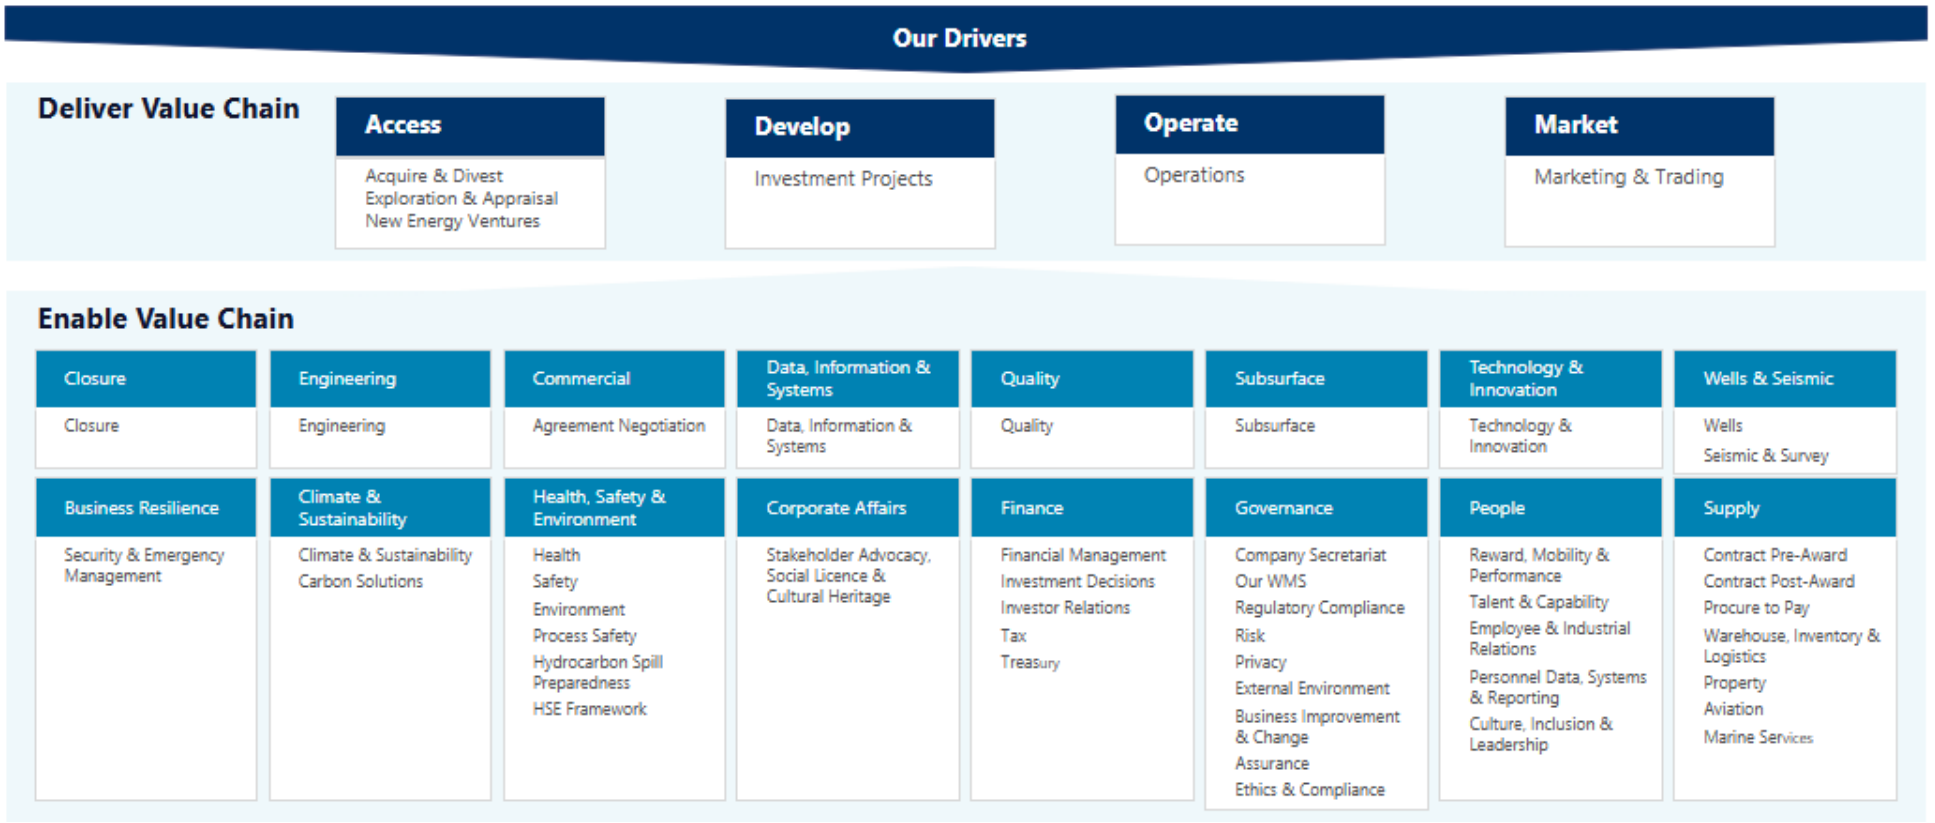

Figure 1-1: The Woodside Management System Structure

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Our WMS content is structured in a hierarchy as illustrated in Figure 1-2. This hierarchy begins with the "why" through Our Drivers, which are defined by the Board and Executive. It is followed by "The What" with Our Expectations, which establish mandatory requirements for executing process activities to deliver value in accordance with the relevant Our Drivers. Finally, it includes "The How" through Tools, which support the implementation, execution, or understanding of Our Expectations. Additionally, there is Non-WMS content that is subordinate to, but sits outside, Our WMS.

Adaptations of Our WMS tools may, as applicable and justified, be created for regional application.

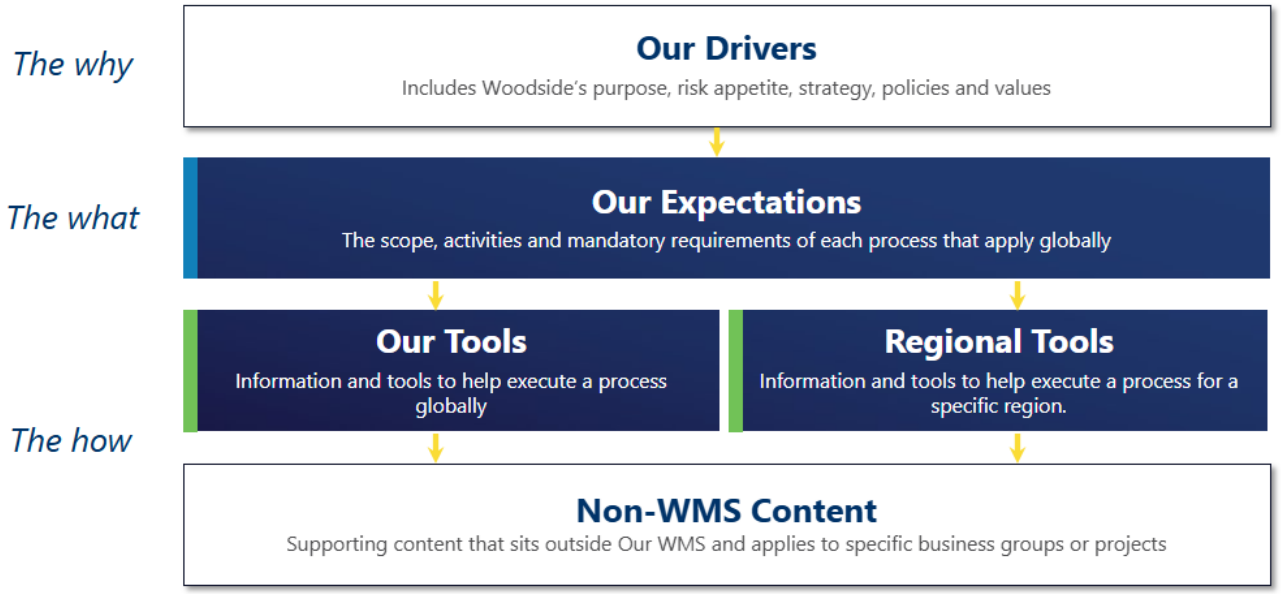

Figure 1-2: Our WMS information structure and document hierarchy

1.6.2 Environment and Biodiversity Policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside's Environment and Biodiversity Policy is provided in Appendix A of this EP.

Please note that the Environment and Biodiversity Policy is reviewed regularly and is updated as required. The Environment and Biodiversity Policy is made available on our website: https://www.woodside.com/who-we-are/corporate-governance-and-policies. This EP will be implemented in accordance with the current Environment and Biodiversity Policy as shown on our website.

1.7 Description of relevant requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and relevant to managing the risks and impacts of the Petroleum Activity are detailed in Appendix B and summarised in the following paragraphs.

1.7.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act)

The OPGGS Act legislates offshore petroleum activities beyond 3 nautical miles (nm) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 nm.

Under the OPGGS Act, the Environment Regulations apply to petroleum activities in Commonwealth Waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ESD
- by which the environmental impacts and risks of the activity will be reduced to ALARP; and
- by which the environmental impacts and risks of the activity will be of an acceptable level.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

This EP has been prepared in accordance with the relevant requirements of the OPGGS Act and the Environment Regulations.

Woodside submitted the Goodwyn Area Infill Development OPP to NOPSEMA for assessment in February 2024 and NOPSEMA accepted the Goodwyn Area Infill Development OPP in August 2025. This OPP provided the detail and evaluation of potential impacts and risks from the key components of the Goodwyn Area Infill Development. These key components include:

- drilling and completions
  - geotechnical sampling (if required to inform MODU mooring)
  - drilling operations (for up to 8 production wells)
  - formation evaluation
  - well completion
  - well unloading
- subsea installation and pre-commissioning
  - installing Xmas trees, flowlines, electrohydraulic umbilicals, and other infield infrastructure
  - pre-commissioning
- start-up and operations
  - initial start-up of wells and subsea infrastructure
  - subsea IMMR
- decommissioning
  - plugging and abandoning wells
  - removing property
- field support
  - operating MODUs, vessels, helicopters, and ROVs

In accordance with Regulation 56 of the Environment Regulations, references to the Goodwyn Area Infill Development OPP have been made throughout this EP. The approved Goodwyn Area Infill OPP is available on the NOPSEMA website: Goodwyn Area Infill Development Offshore Project Proposal >> NOPSEMA website.

1.7.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act)

The EPBC Act includes the objective to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the EPBC Act as ‘matters of national environmental significance’ (MNES). The EPBC Act sets a regime which aims to ensure that actions taken are on (or impacting upon) Commonwealth land or waters are consistent with the principles of ESD.

In relation to offshore petroleum activities in Commonwealth waters the requirements of the EPBC Act are administered by NOPSEMA. The Streamlining Offshore Petroleum Environmental Approvals Program Report (NOPSEMA 2014) requires any offshore petroleum activities, authorised by the OPGGS Act, to be conducted in accordance with an accepted EP whereby the definition of ‘environment’ covers all matters protected under Part 3 of the EPBC Act.

1.7.2.1 Recovery plans and threat abatement plans

Under Section 139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the Act. Similarly, under Section 268 of the EPBC Act:

> *‘A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.’*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

In respect to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA. Specifically:

- NOPSEMA will not accept an EP that proposes activities that will result in unacceptable impacts to a listed threatened species or ecological community.
- NOPSEMA will not accept an EP that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community.
- NOPSEMA will have regard to any approved conservation advice in relation to a threatened species or ecological community before accepting an EP.

An assessment of the Petroleum Activity against all relevant recovery plans and threat abatement plans is contained in Section 6.9.

1.7.2.2 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs) are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Under Section 362 of the EPBC Act, other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans. Therefore, NOPSEMA is required to consider potential impacts from petroleum activities on AMPs

Specific zones within AMPs have been allocated conservation objectives based on the Australian International Union for Conservation of Nature (IUCN) reserve management principles outlined in Schedule 8 of the EPBC Regulations 2000. The principles for each zone determine what activities are acceptable within a protected area under the EPBC Act. Section 4 provides a description of the AMPs that are overlapped by the Operational Area and environment that may be affected (EMBA) and the relevant zones that the Petroleum Activity is likely to interact with.

The proposed Petroleum activity may include works in the Montebello Marine Park Multiple Use Zone. In accordance with the North-west Marine Parks Network Management Plan (DNP, 2018a), offshore petroleum activities and oil spill response are permittable subject to approval in Multiple Use Zone (IUCN category VI) and Special Purpose Zone Trawl (IUCN category VI).

The DNP has issued class approvals that allow for petroleum activities in designated IUCN Category VI marine park zones. These approvals outline the specific zones where such activities are permitted and include various conditions. For the Petroleum Activity the conditions of the Class Approval that are considered relevant are detailed in Table 1-3.

Table 1-3: Conditions of Class Approval relevant to the Petroleum Activities

Number	Condition	Relevant section of EP
1	The Approved Actions must be conducted in accordance with: (a) an Environment Plan accepted under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009; - (b) the EPBC Act; (c) the EPBC Regulations (d) the North-west Network Management Plan; (e) any prohibitions, restrictions or determinations made under the EPBC Regulations by the Director of National Parks; and (f) all other applicable Commonwealth and state laws (to the extent those laws are capable of operating concurrently with the laws and instruments described in paragraphs (a) to (e)).	Conditions 1a, b, c and f are met by the submitted EP. Condition 1d - the impacts on the marine park values have been considered in Section 6. Condition 1e - consultation has been undertaken with the Director of National Parks and no prohibitions, restrictions or determinations have been made (see Section 5 of this EP)
2	If requested by the Director of National Parks, an Approved Person must notify the Director prior to	Section 7.10 of this EP describes requirements to notify the DNP prior to activities within the Montebello Multiple Use Zone.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Number	Condition	Relevant section of EP
	conducting Approved Actions within Approved Zones.	
3	If requested by the Director of National Parks, an Approved Person must provide the Director with information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones.	If requested by the Director of National Parks, information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones will be provided.

1.7.2.3 World Heritage Properties

Australian World Heritage Properties (WHP) are listed as MNES under the EPBC Act and are required to be assessed accordingly in EPs.

Schedule 5 of the EPBC Act establishes the Australian World Heritage management principles, which are designed to ensure that WHPs within Australia are managed in a way that maintains their values. Table 1-4 outlines the principles that are relevant to assessing impacts from the Petroleum Activity on WHPs within the EMBA, which are identified in Section 4 of this EP.

Table 1-4: Relevant management principles under Schedule 5 of the EPBC Act—Australian World Heritage management principles.

Number	Principle	Relevant section of the EP
3	**Environmental impact assessment and approval** 3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).	3.01 and 3.02: Three WHP are relevant to the Petroleum Activity (Murujuga Cultural Landscape, Shark Bay and Ningaloo Coast). The Petroleum Activity does not involve an action that is likely to have a significant impact on the World Heritage values of the WHP identified above. This EP includes an assessment of risks and impacts to WHP outlined in Section 6 These principles are met by the submitted EP.
	3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.	
	3.03 The assessment process should: (a) identify the World Heritage values of the property that are likely to be affected by the action; and (b) examine how the World Heritage values of the property might be affected; and (c) provide for adequate opportunity for public consultation.	3.03 (a) and (b): World Heritage values are identified in Section 4.9.1.9 of this EP. 3.03 (b): The World Heritage values that may be affected are considered in an assessment of impacts and risks for the Petroleum activity in Section 6 of this EP, specifically: - Unplanned risks applicable to WHP are assessed in Section 6.8 of this EP 3.03 (c): Relevant persons consultation and feedback received in relation to impacts and risks to WHP is included in Section 5 of this EP Woodside also facilitates ongoing consultation for the duration of the EP approval and life of the EP, as outlined in Section 7.10, Ongoing Consultation. These principles are met by the submitted EP.
	3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.	3.04, 3.05 and 3.06:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Number	Principle	Relevant section of the EP
	3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.	Relevant management plans give effect to the duties and obligations of Australia under the World Heritage Convention and facilitate the protection, conservation, presentation or transmission to future generations of the World Heritage values of the properties. For consideration of the protection, conservation, presentation or transmission to future generations of the World Heritage values of the properties, refer to: • Unplanned risks applicable to WHP are assessed in Section 6.8 of this EP These principles are met by acceptance and implementation of the EP.
	3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.	

Note: Sections 1 – General Principles and 2 – Management Planning of Schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2. EP PROCESS

2.1 Overview

This section outlines the process Woodside follows to prepare the EP once an activity has been defined as a Petroleum Activity. This includes a description of the environmental risk management methodology that is used to identify, analyse and evaluate risks to meet ALARP and acceptability requirements, and to develop EPOs and EPSs. This section also describes Woodside's risk management methodologies applicable to implementation strategies applied during the activity.

2.2 Environment Plan process

Figure 2-1 illustrates the EP development process. Each element of this process is discussed further in the next sections.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

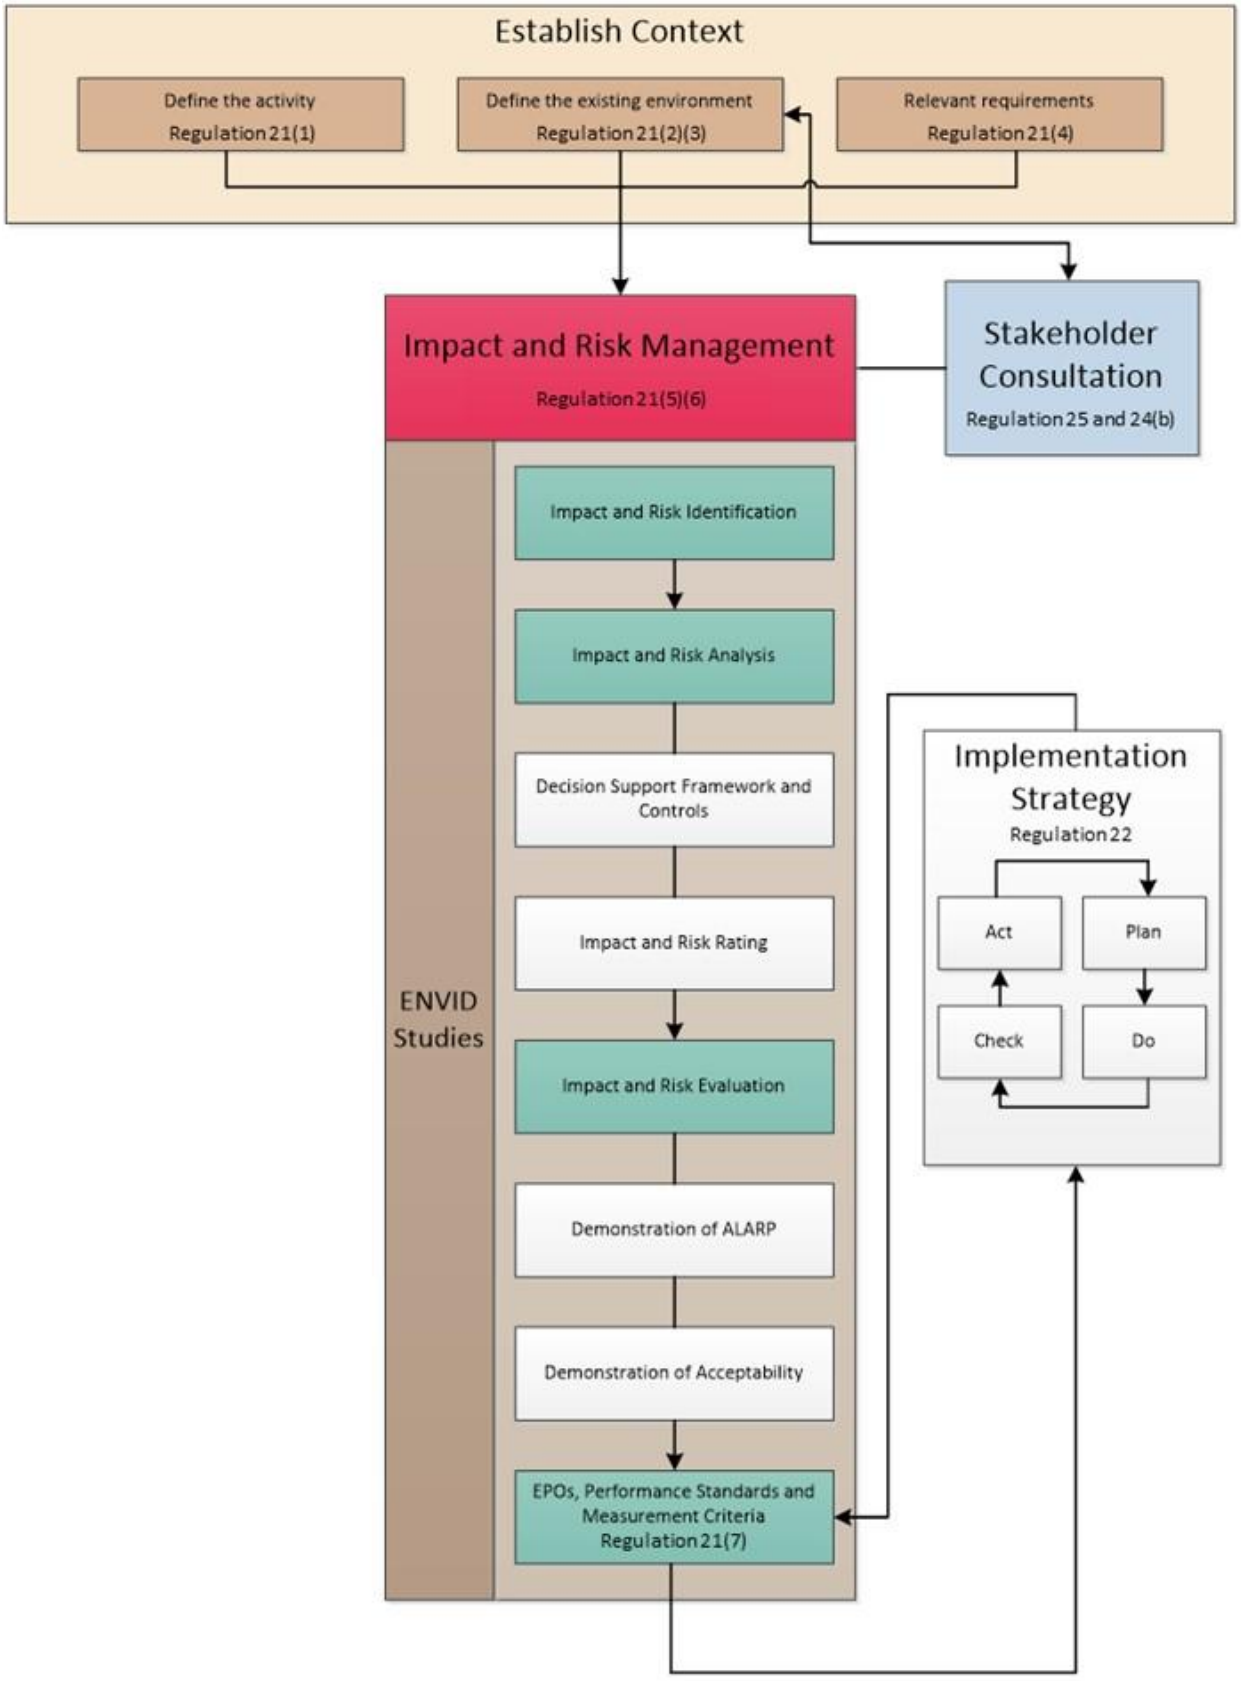

Figure 2-1: Environment Plan development process

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.2.1 Establish the context

Context is established by considering the proposed activities associated with a Petroleum Activity, and the environment in which the activities are planned to take place.

2.2.2 Describe the activity

Describing the activity involves evaluating whether the activity meets the definition of a 'Petroleum Activity' as defined in the Environment Regulations. The EP describes the activity, including:

- the location or locations of the activity; general details of the construction and layout of the facility used in undertaking the activity
- an outline of the activity and proposed timetables for undertaking the activity
- additional information relevant to considering environmental impacts and risks of the activity.

The 'what' and 'how' are described in the context of 'environmental aspects' to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents, incidents, emergency conditions) activities.

This activity is described in Section 3 and is referred to as the Petroleum Activity.

2.2.3 Describe the existing environment

The values and sensitivities relevant to environment where the Petroleum Activity is proposed to be undertaken have been identified in Section 4to the extent required to assess impacts and risks to environmental receptors from the Petroleum Activity.

The values and sensitivities relevant to the Petroleum Activity are fully described within the Master Existing Environment document. In accordance with Regulation 56(1) of the Environment Regulations, references to the Master Existing Environment within this EP refer to Appendix C of the accepted Julimar Operations EP, which is available on NOPSEMA's website using the following link: https://docs.nopsema.gov.au/A1225379.

2.2.4 Environmental legislation and other requirements

Legislation and other requirements that apply to the Petroleum Activity are presented in Section 1.7 and Appendix B. These requirements have been considered when developing this EP.

2.2.5 Impact and risk management

2.2.5.1 Impact and risk identification and analysis

The first step in managing impacts and risks is to identify all credible sources of environmental impacts and risks, including those directly and indirectly associated with the Petroleum Activity and potential emergency and accidental events. This may include environment impacts and risk that are a consequence of the proposed activity but are not within Woodside's control. In this EP:

- planned (routine and non-routine) activities, including contingent activities, that have the potential for inherent changes to the environment, are termed environmental 'impacts'
- unplanned events, including potential emergency and accidental events, that have the potential to result in a change to the environment, are termed environmental 'risks.'

An environmental impacts and risks identification and assessment workshop (ENVID) was undertaken by multidisciplinary teams comprising relevant operational, technical and environmental personnel with sufficient breadth of knowledge, training and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified during the ENVID for both planned (routine and non-routine) activities and unplanned (accidents, incidents, emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

During the ENVID, environmental impacts and risks were assessed, and controls were assigned to manage them. The ENVID also helped to identify relevant stakeholders to consult when developing this EP

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

(Section 5). The output of the ENVID, an environmental impacts and risk register, was then used as a basis to develop the risk and impact assessment section of this EP (Section 6).

2.2.5.2 Decision support framework

To support the impact and risk assessment process and Woodside's determination of acceptability, Woodside's HSE risk management procedures include using a decision support framework based on principles set out in the Guidance on Risk-Related Decision-Making (Oil and Gas UK 2014). The decision support framework is applied to confirm:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher-order environmental impacts are subject to further evaluation and assessment).

The framework allows a decision type (A, B, or C) to be selected for each impact and risk, based on several criteria; the decision type is documented in the environmental impacts and risk register. Figure 2-2 summarises the framework, criteria and resulting level of assessment for each decision type, discussed further below.

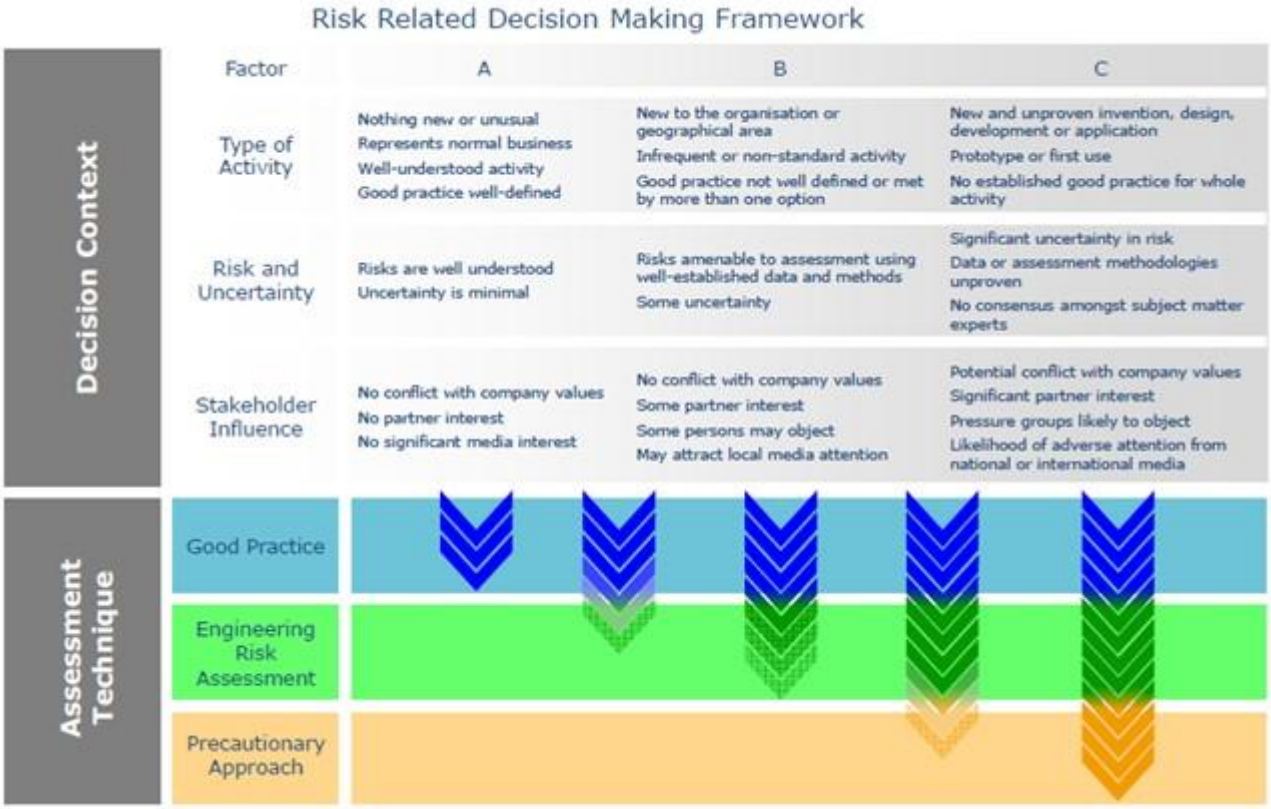

Figure 2-2: Risk-related decision-making framework

Source: Oil and Gas UK (Guidance on Risk-Related Decision-Making 2014)

2.2.5.2.1 Decision Type A

Decision Type A risks and impacts are well understood and established practice; they are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgement.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.2.5.2.2 Decision Type B

Decision Type B risks and impacts typically involve greater uncertainty and complexity and are considered higher-order impacts and risks. These impacts and risks may deviate from established practice or have some lifecycle implications, and therefore require further engineering risk assessment to support the decision and ensure the risk is ALARP.

2.2.5.2.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty, therefore requiring a precautionary approach. The risks may result in significant environmental impact, significant project risk or exposure, or may elicit negative stakeholder concerns. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external stakeholder consultation as part of the risk assessment process.

2.2.5.3 Decision support framework tools

The below framework tools were applied, as appropriate, when assessing each impact and risk to help identify control measures based on the selected decision type, described above:

- **Legislation, codes and standards (LCS):** identifies the requirements of legislation, codes and standards that are to be complied with for the activity.
- **Good industry practice (GP):** identifies further engineering control standards and guidelines Woodside may apply above that required to meet the LCS.
- **Professional judgement (PJ):** uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- **Risk-based analysis (RBA):** assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and cost-benefit analysis to help select control measures during the risk assessment process.
- **Company values (CV):** identifies values identified in Woodside's code of conduct, policies and Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- **Societal values (SV):** identifies and addresses the views, concerns and perceptions of relevant stakeholders.

2.2.5.4 Decision calibration

To determine that the decision type and the control measures are suitable, the following tools may be used for calibration (i.e. checking):

- **LCS/verification of predictions:** verification of compliance with applicable LCS and GP
- **peer review:** independent peer review of PJs, supported by RBA, where appropriate
- **benchmarking:** where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk
- **internal stakeholder consultation:** consultation within Woodside to inform the decision and verify CV are met
- **external stakeholder consultation:** consultation to inform the decision and verify SV are considered.

Where appropriate, additional calibration tools may be selected specific to the decision type and the activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.2.6 Control measures

Once impacts and risks have been identified, the potentially impacted receptors have been identified and understood, and the decision type has been selected, impact and risk reduction measures (i.e. controls) can be applied. Controls are prioritised and categorised in accordance with the hierarchy of controls listed below, where risk reduction measures at the top of the hierarchy take precedence over those further down:

- elimination of the impact or risk by removing the hazard[1]
- substitution of a hazard with a less hazardous one
- engineering controls, including design measures, to prevent or reduce the frequency, or detect or control, the impact or risk event (limiting the magnitude, intensity and duration), such as:
  - prevention: design measures that reduce the likelihood of a hazardous event occurring
  - detection: design measures that facilitate early detection of a hazardous event
  - control: design measures that limit the extent/escalation potential of a hazardous event
  - mitigation: design measures that protect the environment if a hazardous event occurs
  - response equipment: design measures or safeguards that enable cleanup/response after a hazardous event
- procedures and administration, including management systems and work instructions to prevent or mitigate environmental exposure to hazards
- emergency response and contingency planning, including methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

2.2.7 Impact and risk classification

Environmental impacts and risks are assessed to determine their potential impact consequence level or risk rating, which can then be evaluated, along with other criteria, against the ALARP and acceptability requirements under the Environment Regulations. The full process for classifying impacts and risks is described in the next subsections.

2.2.7.1 Impact classification

Using the Woodside Environment Risk and Impact Rating Tool as a guide, environmental impacts are assessed to determine the potential consequence level. The process for determining the consequence levels is described in Section 2.2.7.1.1.

2.2.7.1.1 Assign the consequence level

The consequence level (Severe, Major, Moderate, Minor, Localised and Low-Level, and No Lasting Effect) is determined through a classification framework that incorporates:

- significance[2] of the feature or area
- scale of the impact on the feature (e.g. species, population, habitat) or area (size)
- recoverability, defined as the ability of the feature or area to naturally recover from the impact within a nominal period.

2.2.7.1.2 Consequence level descriptions

Table 2-1 describes the possible environment, community and culture consequence levels for each identified impact and risk, assuming all controls (preventative and mitigative) are absent or have failed. Where multiple

[1] A hazard has the potential to cause harm to the environment.

[2] References to significance in Section 2.2.7, for the purposes of describing the Woodside Environment Risk and Impact Rating Tool, use significance as defined in the Woodside Environment Risk and Impact Rating Tool.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

receptors have the potential to be impacted, the worst-case consequence level is carried into the final impact and risk assessment and evaluation.

Table 2-1: Woodside impact and impact risk matrix (environment and community and culture) consequence descriptions

Environment	Community and culture	Consequence level	
Severe impact on a sensitive feature(s) or receiving environment, such as permanent impairment on a highly sensitive area or feature.	Severe, long-term impact to a community, social infrastructure or highly valued areas or items of international cultural and social significance.	**Severe**	***A***
Major impact on environmental feature(s) or area(s), such as impact on feature or area of national importance with limited ability to recover.	Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	**Major**	***B***
Moderate impact on environmental feature(s) or area(s), such as impact on feature or area of heightened sensitivity with limited ability to recover.	Moderate, medium-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	**Moderate**	***C***
Minor impact on environmental feature(s) or area(s) such as impact on feature of low significance with some ability to recover.	Minor, short-term impact to a community or areas or items of cultural significance.	**Minor**	***D***
Localised and low-level impact on environmental feature(s) or area(s) of low significance.	Slight, short-term impact to a community or areas or items of cultural significance.	**Localised and Low Level**	***E***
No lasting effect, localised impact not significant to environmental receptors.	Temporary localised impact not significant to areas or items of cultural significance.	**No Lasting Effect**	***F***

2.2.7.2 Risk classification

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence (Section 2.2.7.1.1) and likelihood (Section 2.2.7.2.1). The assigned risk rating is determined with controls in place; therefore, the risk rating is determined after identifying the decision type and appropriate control measures. The risk ratings are assigned using the Woodside risk matrix (refer to Table 2-3).

2.2.7.2.1 Assign the likelihood level

Likelihood is determined based on the chance of the selected worst-case consequence occurring, assuming reasonable effectiveness of preventative and mitigative controls (Table 2-2).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-2: Woodside risk matrix likelihood levels

	Likelihood description					
	Remote	***Highly unlikely***	***Unlikely***	***Possible***	***Likely***	***Highly likely***
Frequency	1 in 100,000–1,000,000 years	1 in 10,000–100,000 years	1 in 1,000–10,000 years	1 in 100–1,000 years	1 in 10–100 years	>1 in 10 years
Experience	Unheard of in the industry	Has occurred once or twice in the industry	Has occurred many times in the industry but not in the company	Has occurred once or twice in the company	Has occurred frequently in the company	Has occurred frequently in the location or activity
Likelihood level	***0***	***1***	***2***	***3***	***4***	***5***

2.2.7.2.2 Determine the risk rating

The risk rating is derived from the consequence and likelihood levels determined above, in accordance with the Woodside Risk Matrix summarised in Table 2-3. This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk in the environmental impacts and risk register for the EP (Section 2.3).

Table 2-3: Woodside risk matrix determination of risk rating

Consequence level	Likelihood level					
	0	***1***	***2***	***3***	***4***	***5***
A	A0	A1	A2	A3	A4	A5
B	B0	B1	B2	B3	B4	B5
C	C0	C1	C2	C3	C4	C5
D	D0	D1	D2	D3	D4	D5
E	E0	E1	E2	E3	E4	E5
F	F0	F1	F2	F3	F4	F5

Risk rating
Severe
Very High
High
Moderate
Low

Note: Very High and Severe risks based on HSE impacts are intolerable – action required.

2.3 Impact and risk evaluation

In accordance with Regulations 34(a), 34(b), 34(c) and 21(5)(b), Woodside applies the following process to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.3.1 Demonstration of ‘as low as reasonably practicable’

The descriptions in Table 2-4 articulate how Woodside demonstrates that each impact and risk identified within this EP are ALARP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-4: Summary of Woodside's criteria for 'as low as reasonably practicable' demonstration

Risk	Impact	Decision type
Low and Moderate (C, D, E or F level consequence)	***No Lasting Effect, Localised and Low-Level, or Minor (D, E or F)***	***A***
Woodside demonstrates these impacts, risks and decision types are reduced to ALARP if: • identified controls meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines, or • further effort towards impact and risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.		
High, very High or Severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are reduced to ALARP where it can be shown good industry practice and RBA have been employed, if legislative requirements are met, societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.		

2.3.2 Demonstration of acceptability

Acceptability of the Goodwyn Area Infill Development, including the Petroleum Activities described in this EP, was demonstrated in the Goodwyn Area Infill Development OPP (A1806RH000003, Rev 7) as required by Environment Regulation 13 (4) (d). The EPOs set in the Goodwyn Area Infill Development OPP demonstrate that the environment impacts and risks of the project will be managed to an acceptable level.

In this EP Woodside has demonstrated that the level of acceptability determined in the Goodwyn Area Infill Development OPP has been met through the following criteria:

- Adoption of relevant Goodwyn Area Infill Development OPP EPOs and controls
- Adoption of EP specific controls where required
- Impact consequence levels and risk rating are equal to or less than the acceptable level defined in the Goodwyn Area Infill Development OPP (A1806RH000003, Rev 7; Section .7; Table 4-3) and are therefore consistent with the EPOs and managed to an acceptable level of impact or risk,

The descriptions in Table 2-5 articulate how Woodside demonstrates how each impact and risk identified within this EP are acceptable.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-5: Summary of Woodside's criteria for acceptability

Risk	Impact	Decision type
Low and moderate (C, D, E or F level consequence)	***No Lasting Effect, Localised and Low Level or minor (D, E or F)***	***A***
Woodside demonstrates these lower order impacts, risks and decision types are 'broadly acceptable' if they meet the ALARP requirements for lower order risks and impacts described above (Table 2-4).		
High, very high or severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are of an 'acceptable' level if it can be demonstrated using GP and RBA, if legislative requirements are met and societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for moderate and high risks, Woodside evaluates: • the principles of ESD as defined under the EPBC Act • the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, procedures and standards • the external context – the environment consequence and stakeholder acceptability are considered • other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies and consider applicable plans for management and conservation advice, conventions and significant impact guidelines (e.g. MNES). Additionally, very high and severe risks require 'escalated investigation' and mitigation. If after further investigation the risk remains in the very high or severe category, the risk requires appropriate business engagement with increasing involvement of senior management to accept the risk, in accordance with Woodside's Risk Management Procedure. This includes due consideration of regulatory requirements.		

2.4 Recovery plan and threat abatement plan assessment

To demonstrate acceptability, a separate assessment is undertaken to demonstrate the EP is not inconsistent with any relevant recovery plans or threat abatement plans. This assessment follows the below process:

- Identify relevant listed threatened species and ecological communities.
- Identify relevant recovery plans and threat abatement plans.
- List all objectives and (where relevant) the action areas of these plans and assess whether these objectives and action areas apply to government, the titleholder, and the Petroleum Activity.
- For those objectives and action areas applicable to the Petroleum Activity, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action.

2.5 Environmental performance objectives/outcomes, standards and measurement criteria

The Environment Regulations define EPOs to mean "a measurable level of performance required for the management of environmental aspects of the activity to ensure environmental impacts and risks of the activity will be of an acceptable level". As such, the process of defining an appropriate EPO has relied on the required levels of performance, set either in:

- legislation (such as the OPGGS Act)
- regulator guidance notes such as the Matters of National Environmental Significance – Significant impact guidelines (Department of the Environment, Water, Heritage and the Arts 2013), or
- specific agreements with other relevant persons (e.g. fishers or other marine users).

For each evaluated impact and risk, controls adopted during the ENVID and when demonstrating ALARP are paired with activity-specific EPOs, EPSs and MC. EPOs, EPSs and MC form the basis for monitoring and

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

auditing. They allow Woodside's environmental performance to be measured when implementing this EP to ensure impacts and risks will be managed to a level that is ALARP and acceptable. EPOs, EPSs and MC are defined for each identified credible impact and risk in Section 6.

2.6 Implement, monitor, review and report

An implementation strategy for the Petroleum Activity describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the requirements of the Environment Regulations, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activity to ALARP and acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activity are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in Section 0.

2.7 Stakeholder consultation

Woodside undertakes consultation when preparing EPs. The consultation, along with the process for ongoing engagement and consultation throughout the activity, is presented in Section 5. The full text from correspondence is provided in Appendix F

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3. DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations and describes the activities to be undertaken as part of the Petroleum Activity under this EP.

3.2 Project overview

The GWF4 Project (Petroleum Activity) consists of a subsea tie-back to existing GWF subsea infrastructure to develop incremental volumes of gas and condensate to partially fill ullage at the GWA facility. The development consists of five wells: WCA01, WCA02, ESA01, YDA01 and TPA04 tied-in via existing manifolds (Figure 3-1).

- WCA01 and WCA02 will be connected to a new manifold using flexible jumpers. The manifold will then be connected to the existing GWF infrastructure via an ~ 25 km, 11-inch flexible flowline.
- YDA01 will be connected through a new manifold (EYA) using a 3 km long, 10-inch flexible flowline. The manifold will then be connected to the existing KDA manifold via a 3 km, 10-inch flexible flowline
- ESA01 will be connected through an 8-inch flexible jumper to the new EYA manifold
- TPA04 will be connected to the existing TPA manifold using an 8-inch flexible jumper

Wells will be drilled, completed and unloaded[3] using a hybrid (DP/moored) semi-submersible mobile offshore drilling unit (MODU). Typically, two or three support vessels will support the MODU during drilling activities, with at least one vessel in the vicinity to complete standby duties, if required. Supply vessels will frequent the MODU at regular intervals throughout operations.

Installation of the subsea infrastructure, including flowlines, umbilicals, manifolds, FLETs, mattresses, flying leads and pre-commissioning are undertaken using a primary installation vessel (PIV) (Refer to Section 3.11.3). Vessel activities are further described in Section 3.11.

An overview of the Petroleum Activity is provided in Table 3-1 and its location is provided in Figure 3-2.

[3] *Note that YDA01, ESA01 and TPA04 will be unloaded back to the GWA facility*

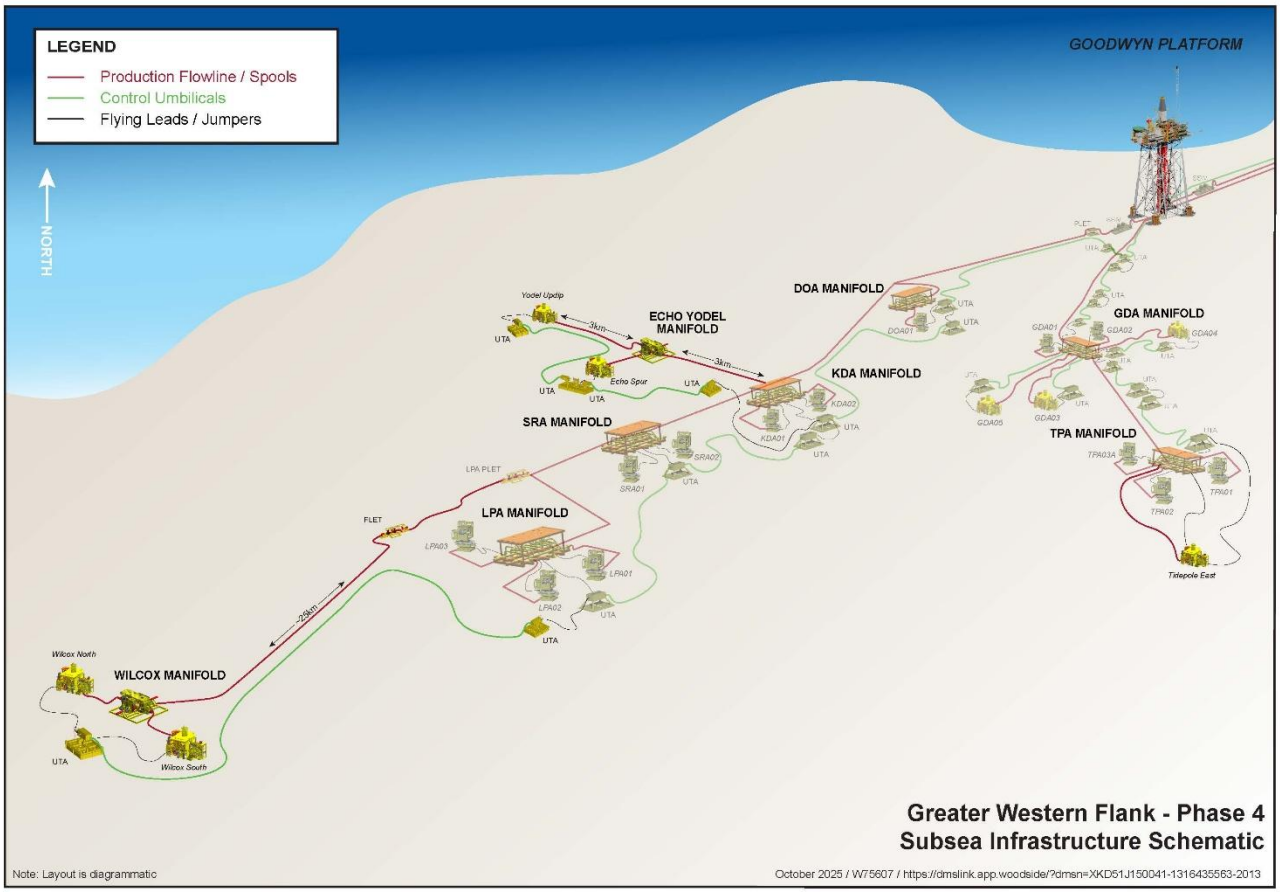

Figure 3-1: Generalised schematic of Greater Western Flank 4 Development

Table 3-1: Petroleum Activity overview

Item	Description
Permit Titles	WA-7-R, WA-57-L, WA-24-L, WA-5-L
Location	~140 km north-west of Karratha, WA
Water depth	~55 – 135 m for areas of proposed subsea infrastructure ~40 – 150 m in the Operational Area
Number of wells	Wilcox: two production wells (WCA01 and WCA02) Nearfield infill: three production wells (ESA01, YDA01 and TPA04)
Subsea infrastructure	Wilcox: • Xmas trees and wellheads, flowlines, electro-hydraulic umbilicals (EHUs), manifolds, flowline end termination (FLET), umbilical termination assemblies (UTAs), electrical flying leads (EFLs), hydraulic flying leads (HFLs), flexible pipe jumpers, subsea intensifiers Nearfield Infill: • Xmas trees and wellheads, flowlines, electro-hydraulic umbilicals (EHUs), manifolds, umbilical termination assemblies (UTAs), electrical flying leads (EFLs), hydraulic flying leads (HFLs), flexible pipe jumpers
MODU	Hybrid (moored and DP) MODU will be used

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Item	Description
Vessels	• PIV for installing the subsea infrastructure • inspection, monitoring, maintenance and repair (IMMR) vessel for Xmas tree installation, isolation testing, IMMR or contingent activities • support vessels including barge(s), heavy lift vessel(s) (HLVs), multi-service construction vessel(s), anchor handling vessel(s) and general supply/support vessels (including uncrewed surface vessels and PSVs).
Key activities	• mooring installation for the MODU (including piling) • development drilling and completions • pre and post- lay survey activities • installation of subsea infrastructure • IMMR • tie-in to existing subsea infrastructure • pre-commissioning testing.

3.3 Concordance with OPP

The Goodwyn Area Infill Development OPP describes the scope of the project and its component activities, at a level comprehensive enough to facilitate thorough evaluation of environmental impacts and risks and appropriate setting of EPOs. However, in accordance with NOPSEMA guidance, it is acknowledged that an OPP is prepared at an early stage in project development, before detailed planning of component activities has occurred. More detailed descriptions of the component activities are therefore expected in the subsequent EPs.

Refinement or modifications to methods or timing for individual project activities may occur after an OPP acceptance and before the submission of EPs. These refinements or modifications to the accepted project cannot be new activities and cannot significantly change the overall environmental impacts and risks of the project as described in the accepted OPP. Table 3-2 shows which scopes from the Goodwyn Area Infill Development OPP may have progressed in level of definition since the Goodwyn Area Infill Development OPP was authored, and as a result, may have changed.

Section 5 of the Goodwyn Area Infill Development OPP (A1806RH000003, Rev 7) provides a detailed description of the development.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 3-2: Concordance of activities described in the Goodwyn Area Infill Development OPP and those included in this EP

Goodwyn OPP Section	Scope or overview of the Activity	Relevance to this EP	Refinement or modification to methods	Refinement or modification to timing	Is this a new activity	Significance of change
Section 5.3 Drilling and Completions	Potential volume of drill cuttings were estimated in Goodwyn Area Infill Development OPP and used to undertake dispersion modelling. The estimated volumes of drill cuttings discharged from a typical well are in the order of ~108 m³ at the seabed, and ~474 m³ from the surface. While the estimated volumes of fluids (and solids) discharged from a typical well are in the order of ~7,057 bbl (~89.7 m³ solids) at the seabed, and ~30,461 bbl (~387.5 m³ solids) from the surface In addition, assumptions were made when modelling the discharge, such as a discharge location ~20 m below the surface.	Further planning and well design has progressed since the Goodwyn Area Infill Development OPP which has resulted in revised cutting and drilling fluid volumes The estimated volumes of drill cuttings discharged from a typical well are now in the order of ~237 m³ at the seabed, and ~490 m³ from the surface. While the estimated volumes of fluids (and solids) discharged from a typical well are in the order of ~19,834 bbl (~218 m³ solids) at the seabed, and ~33,541 bbl (~869 m³ solids) from the surface. In addition, the assumption for the discharge point from the MODU is now ~5m below the surface.	Yes – additional definition in engineering	No	No	This change does not significantly alter the overall environmental impacts and risks of the project as described in the accepted Goodwyn Area Infill Development OPP. The overall impact consequence level for disturbance to benthic habitat from trunkline installation and associated activities is Minor (D) based on a minor impact to the most sensitive receptors (benthic communities, AMPs and KEFs) (Section 6.7.2).
Section 9.3.6 Unplanned Hydrocarbon Release: Gas and Condensate	A release of ~745,012 m³ of condensate over a 77-day period from a well in the Wilcox reservoir was selected as the worst-case credible spill scenario for the Goodwyn Area Infill Development in the OPP.	A review of well control loss of containment scenarios has been undertaken since the Goodwyn Area Infill Development OPP which resulted in the identification of two worst case scenarios in terms of volume and location: Scenario 1: a 70-day release of 707,729 m^3 of condensate from the Wilcox well. Scenario 2: a 76-day release of 993,860 m^3 of condensate from the Yodel Updip well	Yes – additional definition in engineering	No	No	This change does not significantly alter the overall environmental impacts and risks of the project as described in the accepted Goodwyn Area Infill OPP. The overall risk rating for an unplanned hydrocarbon release: of gas and condensate remains as Moderate (Section 6.8.2 of this EP).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Goodwyn OPP Section	Scope or overview of the Activity	Relevance to this EP	Refinement or modification to methods	Refinement or modification to timing	Is this a new activity	Significance of change
		Modelling for the OPP in 2023 was based on a preliminary estimated relief well duration of 77 days resulting in a release of ~745,012 m^3. Contemporary studies estimate that a relief well could be executed within 70 days (including mobilisation of a MODU from South East Asia) releasing ~707,729 m^3. Given the decreased duration and volume, the existing modelling was deemed conservative and therefore additional modelling was not required. However contemporary studies also identified that the volume expected from Yodel Updip had increased to 993,860 m^3, this was based on updates to the subsurface model and an increase in the timing for a relief well, 18 days. Therefore additional modelling was undertaken for the Yodel Updip scenario. For this EP, the EMBA is the combined potential spatial extent of hydrocarbons at concentrations above ecological impact thresholds, in the event of a spill from both Scenario 1 and 2.

3.4 Location

The infrastructure associated with the Petroleum Activity is located in Commonwealth waters, ~140 km north-west of Karratha. The closest landfall to the Petroleum Activity is the Montebello islands ~35 km south. Approximate location details for the Petroleum Activity are provided in **Table 3-3**.

Table 3-3: Approximate location details for the Petroleum Activity including all relevant infrastructure

Infrastructure	Water depth (~m LAT)	Latitude (WGS84)	Longitude (WGS84)	Petroleum title(s)
New Wells and Manifolds				
WCA01 well	~73	19° 59’55.284”S	115° 29’55.973”E	WA-7-R
WCA02 well	~73	19° 59’53.658”S	115° 29’55.989”E	WA-7-R
YOD05 well	~131	19° 45’00.497”S	115° 43’49.734”E	WA-24-L
ESA01 well	~126	19° 45’15.456”S	115° 45’26.636”E	WA-24-L
TPA04 well	~112	19° 45’49.540”S	115° 53’26.051”E	WA-5-L
Wilcox manifold	~74	19°59'48.35"S	115°30'02.71"E	WA-7-R
Echo Yodel manifold	~128	19°45'16.62"S	115°45'30.89"E	WA-24-L
Existing Manifolds				
LPA manifold	~78	19°49'45.90"S	115°39'29.10"E	WA-57-L
KDA manifold	~123	19°45'28.12"S	115°47'07.62"E	WA-5-L
TPA manifold	~113	19°45'44.29"S	115°53'24.40"E	WA-5-L
Flowlines				
Wilcox (starting point)	~74	19°59'48.35"S	115°30'02.71"E	WA-7-R
Wilcox (end point)	~78	19°49'47.04"S	115°39'25.55"E	WA-57-L
Flowlines and flexibles	Flowlines / jumpers will connect wells to YOD and then to KDA and TPA. The exact location may vary during installation.

3.4.1 Activities Outside Permit titles

Woodside notes that the Operational Area may extend beyond the boundaries of the relevant Petroleum activity permit titles listed in Table 3-1. To the extent that mooring placement or subsea installation is carried out in parts of the Operational Area not included in the area of Woodside's existing permit titles, Woodside will obtain the relevant approval, permission, consent, authority or permit as required prior to undertaking any such activity, and will only carry out that activity in those areas in accordance with that approval, permission, consent, authority or permit. This EP considers potential impacts to environmental receptors and other marine users within the OA, including areas outside of the listed Petroleum activity permit titles.

3.5 Operational Area

The Operational Area (OA) defines the spatial boundary of the Petroleum activity, as described, risk assessed and managed by this EP, including vessel-related petroleum activities within the Operational Area The Operational Area applicable to the scope of this EP is shown in Figure 3-2 and includes:

- a radius of 4 km from each well to allow for MODU mooring
- 1.5 km radius (3.0 km corridor) around subsea installation locations in which subsea installation and pre-commissioning activities will occur, to allow for the movement and position of vessels.

Vessels supporting the Petroleum Activity when outside the Operational Area must adhere to applicable maritime regulations and other requirements. This EP applies to activities undertaken within the OA, as described in this section.

3.6 Timing

As detailed in Table 3-4, the Petroleum Activity is currently anticipated to commence from Q3 2026 with anchor installation activities to support drilling. Drilling and completions activities are planned to commence in Q2 2027, taking up to ~90 days per well including mobilisation, demobilisation and contingency activities. Subsea installation activities are planned to commence H2 2027 and the initial campaign for nearfield infill will take ~3 months, with a second campaigned planned for Wilcox subsea installation activities in Q4 2027 that is anticipated to take ~4 months. IMMR activities can occur at any time during the Petroleum Activity. Timing and duration of all activities is subject to change due to project schedule requirements, MODU/vessel availability, unforeseen circumstances and weather. Therefore, contingency has been included to allow both drilling and subsea installation activities to continue into 2029.

When underway, activities will be 24 hours per day, seven days per week. Simultaneous Operations (SIMOPS) activities may occur (e.g. subsea installation nearby drilling activities and installation activities nearby live operating infrastructure).

The EP has risk-assessed drilling activities, installation of subsea infrastructure, IMMR and support operations throughout the year (all seasons) to provide operational flexibility for requirements and schedule changes and MODU/vessel availability.

Table 3-4: Summary of the timing of the Petroleum Activity

Activity	Approximate timing (and cumulative duration in the field)	General information
Drilling and completions	Q3 2026 to Q2 2028 (~90 days per well, up to a total of 450 days)	• activities will be undertaken in WA-5-L, WA-7-R, WA-24-L • the MODU and up to three support vessels will be in the Operational Area at any time
Subsea Installation	Nearfield Infill: H2 2027 to Q1 2028 ~3 months Wilcox: Q4 2027 to Q2 2028 ~6 months	• activities will be undertaken in WA-5-L, WA-7-R, WA-24-L, WA-57-L • up to three vessels (PIV, IMMR and/or support vessels) will be in the Operational Area at any time

3.7 Drilling activities

3.7.1 Underwater acoustic positioning

Long base line (LBL) transponders are commonly used acoustic positioning methods and may be installed on the seabed as required by the MODU activities. The LBL array provides accurate positioning by measuring ranges to three or more transponders deployed at known locations on the seabed and structures.

A LBL array near each well may be in place for ~1–3 months. Acoustic transmissions are not continuous—they are short 'chirps' when active and do not emit any sound when on standby. If used, the LBL transponders are attached to clump weights and placed on the seabed. Both the transponders and clump weights are recovered after completion of MODU operations.

3.7.2 Top-hole section drilling

Drilling commences with the top-hole section of the well in this sequence:

1. the MODU arrives and establishes position over the well site
2. A pilot hole or holes may be drilled close to the intended well location:
   - Pilot holes are used when the geology and shallow hazards need to be confirmed or further understanding of the structural integrity of the rock is required.
   - Pilot holes are drilled riserless, as described below, generating additional cuttings and sweeps that may be deposited on the seabed
3. Top-hole sections are drilled riserless using seawater with pre-hydrated bentonite or guar gum, or similar sweeps or drilling fluids to circulate drill cuttings from the wellbore.
   - As a contingency, water-based muds (WBM) may be used (if required) based on shallow hazards
4. Once each top-hole section is drilled, steel casings are inserted into the wellbore to form the conductor, surface casings and wellheads; these casings are secured in place by pumping cement into the annulus above the casing shoe or to the surface (seabed), which may result in excess cement being discharged at the seabed.

Top-hole sections may be batch drilled, which involves drilling one (or more) hole sections for a group of wells before the subsequent sections are commenced. Cuttings generated during drilling of the top-hole sections are discharged at the seabed.

3.7.3 Blow out preventer and marine riser installation

After setting the surface casing, a marine riser and Blow out Preventer (BOP) are installed on the wellhead to physically connect the well and MODU. This creates a closed circulation system, where drilling fluids and drill cuttings can be circulated from the wellbore back to the MODU via the riser.

The BOP seals, controls, and monitors the well during drilling activities. The BOP components are operated using open hydraulic systems (using water-based BOP control fluids). Each time a pressure and function test schedule is undertaken approximately 3620 L of water-based fluid is released to the marine environment, of this approximately 4% is control fluid additive. BOP operation includes function and pressure testing approximately every 21 days, and a function test (approx. 2665 L) approximately every seven days, excluding the week a pressure test is conducted. BOP tethering may be required, where multiple gravity based anchors, typically 6 x 3 m, could be installed around a wellhead location to tether and tie down the BOP. The gravity based anchors would be removed following completion of the drilling activities.

3.7.4 Bottom-hole section drilling

Bottom-hole section drilling is executed after the marine riser and BOP have been installed. This drilling uses a closed circulation system to the planned wellbore total depth. Bottom-hole sections may be drilled using a combination of WBM and non-water based mud (NWBM), based on the technical requirements (Section 3.7.5.2).

Protective steel tubulars (casings and liners) are inserted as required. After installing a string of casings/liners and cementing them into the wellbore (Section 3.7.6), the casing/liner is pressure tested. Once

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the pressure testing is passed, drilling of the next section can resume with the riser in place to circulate drill cuttings and drilling fluids back to the MODU.

Cuttings in drilling fluids circulate back to the MODU and are separated from the drilling fluids by the solids control equipment (SCE). The SCE comprises shale shakers to remove coarse cuttings from the drilling fluid. After processing by the shale shakers, the recovered fluids from the cuttings may be directed to centrifuges, which are used to remove the finer solids. Water-based drill cuttings are typically discharged below the water line and the fluids are recirculated into the fluid system. If NWBM is required to drill a well section, the cuttings, which are separated from the NWBM via the shakers, will also pass through a cuttings dryer and associated SCE to reduce oil on cuttings.

3.7.5 Drilling fluids

Drilling fluids (also termed drilling muds) are used to lubricate the drill string and bit, maintain borehole stability and hydrostatic pressure, and aid in returning cuttings to surface. Drilling fluids comprise a base fluid, weighting agents, and chemical additives that are used to give the fluid the exact properties required to make drilling as efficient and safe as possible.

3.7.5.1 Water-based Mud (WBM) system

Typically, the top-hole sections will be drilled riserless using drilling fluid which is mainly comprised of water (salt or fresh), although some basic additives (such bentonite or guar gum) may be incorporated. All drilling fluid chemicals selected for use will be assessed under the Woodside Chemical Selection and Assessment Environment Guideline. The bottom-hole sections may be drilled using WBM in a closed circulation system which enables re-use of the WBM drilling fluids. WBMs contain a variety of chemicals, in addition to the water based fluid, to meet specific technical requirements (e.g. mud weight required to manage pressure or for borehole stability). WBM may not be able to be reused between drilling sections due to the drilling sequence, technical requirements of the mud (i.e. no tolerance for deterioration of mud during storage) and maintenance of productivity/injectivity. WBM drilling fluids that cannot be reused or are mixed in excess of required volumes, may be operationally discharged to the ocean under the MODU's Permit to Work (PTW) system at approximately 5 m below the waterline. Opportunities to reuse the WBM drilling fluids at the end of the Petroleum Activity are reviewed across current Woodside drilling activities.

3.7.5.2 Non-Water-Based Mud (NWBM) system

The decision to use NWBM drilling fluids for the bottom hole sections of a particular well is based on various technical factors relevant to wellbore conditions, such as: well temperature, well shape and depth, reactivity of the formation to water and well friction. The technical justification to use NWBM includes but is not limited to consideration of performance, environment, health, safety and waste management.

The use of NWBM drilling fluids is subject to a formal written technical justification. The main ingredient of NWBM is base oil and, similar to a WBM system, a range of standard solid and liquid additives may be added in the pits to alter specific mud properties for each section of the well. This depends on the conditions encountered while drilling. Where NWBM is used, the base oil will be a Group III synthetic oil (e.g. Saraline 185V), for all wells.

The NWBM drilling fluid will be primarily mixed onshore (new or re-use existing stock) and transferred to the MODU by a support vessel, where it is stored and maintained in the mud pits / reserve tanks. During drilling operations, the NWBM drilling fluid, like the WBM, is pumped by high pressure pumps down the drill string and out through the drill bit, returning via the annulus between the drill string and the casing back to the MODU via the riser.

The used NWBM pumped back to the MODU contains drill cuttings and is pumped to the SCE, where the drill cuttings are removed before being pumped back to the pits ready for re-use. The technical properties of the NWBM drilling fluids are maintained/altered (e.g. to increase weight) using additives as required when in the mud pits.

The NWBM drilling fluids that cannot be re-used (i.e. do not meet required drilling fluid properties or are mixed in excess of required volumes) are recovered from the mud pits and returned to the shore base for onshore processing, recycling and/or disposal. The mud pits and associated equipment/infrastructure are cleaned when NWBM is no longer required, with wash water treated onboard through SCE prior to discharge

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

with mud pit washings or returned to shore for disposal if discharge criteria cannot be achieved (refer Section 3.7.5.3).

3.7.5.3 Mud pits

There are typically a number of mud pits (tanks) on the MODU that provide a capacity to mix, maintain and store fluids required for drilling activities. The mud pits form part of the drilling fluid circulating system. As described above the mud pits are cleaned out when changing between drilling fluids and / or between different well sections. In addition, the mud pits and associated equipment/infrastructure are cleaned out at the end of drilling and completions operations. Mud pit wash residue is operationally discharged with less than 1% oil contamination by volume. Mud pit residue over 1% oil by volume is sent to shore for disposal.

3.7.5.4 Drill cuttings

Drill cuttings generated from the well are expected to range from very fine to very coarse (less than 1 cm) particle/sediment sizes. Cuttings generated during drilling of the top-hole sections are discharged at the seabed.

The bottom hole sections will be drilled with a marine riser that enables cuttings and drilling fluid to be circulated back to the MODU, where the cuttings are separated from the drilling fluids by the SCE. The SCE may comprise of, but is not limited to, shale shakers, cuttings dryers and centrifuges. The SCE uses shale shakers to remove coarse cuttings from the drilling mud. After being processed by the shale shakers, the recovered mud from the cuttings may be directed to centrifuges, which are used to remove fine solids (4.5 to 6 µm). The cuttings are usually discharged below the water line and the mud is recirculated into the fluid system.

If NWBM is required to drill a well section, the cuttings which are separated from the NWBM via the shakers will also pass through a cuttings dryer and associated SCE, to reduce the average oil on cuttings for the entire well (only sections using NWBM) to 6.9% weight/weight (wt/wt) or less on wet cuttings, prior to discharge.

Estimated volumes of drill cuttings that may be discharged during the Petroleum activity is presented in Section 6.7.8

3.7.6 Cementing Operations

In addition to cementing casing and liners into the place, cementing operations are also undertaken to:

- provide annular isolation between hole sections and structural support of the casing/liner as required
- sealing lost circulation zones
- set a plug in an existing well to side-track
- plug a well so it can be suspended/abandoned.

Support vessels transport cement, barite, and bentonite (as dry bulk) to the MODU. Cement is mixed as required by the cementing unit on the MODU and pumped by high-pressure pumps to the surface cementing head then directed down the well. During the cement jobs, some cement bulk could be discharged to the environment during the process of pumping cement downhole. In addition, contaminated liquid cement that cannot be used down hole cannot be returned to shore for disposal, as it may solidify in storage tanks. Cement will be mixed and pumped as required from a small mixing tank on the cement unit. This limits the volume of excess or contaminated cement that could potentially require discharge into the ocean.

Small amounts of dry cement may be vented and blown overboard during the pneumatic transfer process between support vessels and the MODU. After well operations are completed, excess cement, barite, and bentonite (dry bulk) are either held on board or may be discharged to the marine environment (refer to Section 6.7.9).

3.7.6.1 Cement unit test

The MODU may be required to perform a cement unit test, or ‘dummy cement job’ to test the functionality of the cement unit and the MODU’s bulk cement delivery system prior to performing an actual cement job. This operation is usually performed after a MODU has been out of operation for an amount of time (warm-stack),

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

or when equipment or materials need to be tested, if maintenance on the cement unit has been carried out, or if it is the first time a MODU is being used in-country and commissioning of the cement unit system is required.

A 'dummy cement job' involves mixing a sacrificial cement slurry at surface; the slurry is discharged through the usual cement unit discharge line (below the water line) or through drill pipe below sea level. The slurry is usually a mix of cement and mix water and cementing chemicals or chemical additives.

3.7.6.2 Foam wipers

As part of each cement job, foam wiper balls may be used for fluid separation between the cement slurry and displacement fluid and to mechanically clean the interior of the landing string or work string. These foam wiper balls are typically made of natural rubber or urethane.

During the top hole sections that will be drilled riserless and placement of an environmental cement plug in the event of non-routine activities (e.g. well abandonment in a dry hole scenario), the foam wiper balls will be discharged to sea from the drill string a few meters above the seabed. It is expected that up to three foam wiper balls will be used per well during top hole drilling and up to three foam wipers balls used during non-routine activities.

3.7.7 Formation evaluation

Formation evaluation interprets a combination of measurements taken inside a wellbore to detect and quantify hydrocarbon presence in the rock adjacent to the well once total depth is reached. Formation Evaluation While Drilling (FEWD) is the process by which the presence and quantity of hydrocarbon in a reservoir is measured according to its response to radioactive and electrical input. FEWD may include extracting small cores, wireline logging, full diameter cores and other downhole technologies, as required. FEWD tools will be incorporated into the drill string during development drilling; these tools may include gamma ray, directional deep resistivity, callipers, density-neutron, sonic and formation pressure measurement tools. Some FEWD tools contain radioactive sources; however, no radioactive material will be released to the environment. Generally, radiation fields are not detectable outside the tool if it is not energised; therefore, radiation does not present an environmental risk.

3.7.8 Wellbore clean-out

During drilling, wells are often displaced from one fluid system to another. A chemical cleanout fluids train will be circulated between the two fluids, then seawater or brine will be circulated until operational cleanliness specifications are met. Brine and seawater will be discharged during and/or after this operation. If clean-up brine is contaminated with base oil, it will be captured and stored on the MODU and discharged if oil concentration is < 1% by volume or returned to shore if discharge requirements cannot be met. Displacement pills and clean out trains are typically between 5 m^3 and 100 m^3, depending on application.

3.7.9 Xmas tree installation

Before the upper completion is installed into the wells, the Xmas tree will be installed from either an IMMR vessel or directly from the MODU. Due to the subsea well layout, if installation is planned to occur from the IMMR vessel, the MODU will be required to reposition away from the drill centre to allow the IMMR vessel to install the Xmas tree. Once the Xmas tree has been installed, it will be pressure tested to confirm integrity before the MODU BOP is reconnected to continue with drilling and completions activities.

The Xmas tree will be installed with a preservation mixture in the production and annulus bore. There will be a small discharge of preservation fluid associated with testing and connecting the subsea system (~100 to 150 L per well).

3.7.10 Well completion

Well completion activities to be undertaken after wellbore clean-out will include:

- installing lower completion equipment such as sand screens, reservoir isolation valve and gravel pack packer assembly

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- gravel packing the open hole, which involves circulation of a water based gravel pack gel carrying gravel/proppant into the open hole outside of the sand screens until the annular void is fully packed with gravel/proppant
- displacing a filtercake breaker fluid inside the sand screens after the gravel pack operation is completed, which contains chemicals such as acids or chelants designed to remove the filtercake from the inside of the open hole and improve well productivity
- installing upper completion equipment such as production packer, downhole gauge, downhole safety valve and tubing hanger
- base oil may be circulated into the tubing prior to setting of the production packer to allow the well to become underbalanced to the reservoir to allow the well to flow
- installing crown plugs in the tubing hanger (may be pre-installed in the tubing hanger)
- pressure testing plugs and Xmas tree valves to verify as suspension barriers
- opening the reservoir isolation valve
- shutting in the Xmas tree
- removing the BOP.

Following well completion activities, the wells may be left with subsea equipment (such as Xmas trees) installed, awaiting tie-back to the existing GWF infrastructure. All subsea equipment will contain preservation fluids to prevent corrosion and any other deterioration of the equipment before production flows commence. These preservation fluids will be produced to the production facility upon well startup.

3.7.11 Well flowback

Woodside may conduct well testing or well unloading activities after the production wells are drilled. Well testing and unloading tasks may include:

- reservoir gas flaring
- reservoir gas venting.

The nearfield wells (YDA01, ESA01, TPA04) are planned to be unloaded to host (i.e. the GWA platform) and will be managed in accordance with the NOPSEMA-accepted GWA Facility Operations EP. The Wilcox wells (WCA01, WCA02) are planned to be unloaded to the MODU, as described below.

Initial unloading of the well displaces the completion/suspension fluids, and these are captured in surge tanks. The base oil will be flared and the brine/produced water can be filtered (if required) prior to discharge. After the completion/suspension fluids are unloaded, the gas stream is sent to flare via the production separator. After the objectives of the well testing and flowback are achieved, the flow is stopped and the well will be suspended. Additional filter cake breaker chemicals may be bullheaded into the well after the well unload to further improve well productivity.

During well unloading to the MODU, completion and reservoir fluids may be flared or discharged to the environment via the temporary production system.

- the temporary production system water filtration treatment package may be used to treat produced/reservoir water before discharge. Prior to discharging, the fluids are cycled through an oil bond filtration system.
- gas, condensate, base oil, and methanol in the wellbore will be flared and efficiently burned. The flare may be extinguished due to water ingress, lack of pilot (propane), weather impact, or equipment failure resulting in cold venting of gas from the flare and/or discharge of small volumes of liquid hydrocarbon droplets for several minutes.

3.8 Subsea installation and pre-commissioning activities

The subsea installation scope of work will include installing and pre-commissioning the infrastructure identified in Table 3-5 Installation vessels will be used to install the subsea infrastructure. The installation vessel will operate in DP throughout the campaign. These vessels will typically be equipped with appropriate

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

equipment (e.g. cranes, submersible ROVs, etc.) which will aid in the installation, hook-up, and pre-commissioning processes.

During hook-up and pre-commissioning of the new and existing facilities there is potential for discharges associated with the testing and connection activities of the subsea systems. These discharges include:

- discharge of small volumes of flowline contents (inhibited seawater, MEG) during tie-in
- initial dissolving of chemical sticks prior to connectors being closed
- isolation testing resulting in small volumes of hydrocarbon gas being discharged.

Wet storage of infrastructure items may be required during installation (Refer to Section 3.8.4.4). During the wet storing period, the internal volumes of subsea equipment will be preserved and protected with inhibition fluids.

Once the subsea infrastructure is installed it will be tied into existing GWF subsea infrastructure.

The subsea installation scope of work is summarised in Table 3-5.

Table 3-5: Proposed subsea installation component summary

Description	Detail	Dimensions (~L × W × H)
Wilcox		
Wells	Two Xmas tree	4 x 6 x 4 m

Description	Detail	Dimensions (~L × W × H)
	Infrastructure crossings	

3.8.1 Existing Subsea Infrastructure

The proposed GWF4 subsea infrastructure will tie-in to three locations on the existing GWF subsea:

- LPA PLET
- KDA Manifold
- TPA Manifold

3.8.2 Underwater acoustic positioning

Long base line (LBL) transponders and/or ultrashort baseline transponders (USBL) are commonly used acoustic positioning methods and may be installed on the seabed as required by the installation activities. The USBL subsea transponder transmits an acoustic pulse back to the vessel receiver, hence providing an accurate positioning of the subsea transponder location. The LBL array provides accurate positioning by measuring ranges to three or more transponders deployed at known locations on the seabed and structures.

An LBL or USBL array near each well may be in place for ~1–6 months. Acoustic transmissions are not continuous—they are short ‘chirps’ when active and do not emit any sound when on standby. If used, the LBL transponders are installed in stands on the seabed. Both the transponders and stands are recovered after installation. The USBL transponders are mounted on the subsea infrastructure and removed post installation.

Transponders may also be installed in stands on the seabed for vessel positioning. Both transponders and stands will be removed post installation.

3.8.3 Subsea installation

3.8.3.1 Pre-lay survey

A pre-lay survey to identify debris and hazards (not a full geophysical survey) may be done before starting flowline installation and will be performed by the installation vessel, or alternatively, a uncrewed support vessel (USV).

The pre-lay survey may use various non-intrusive survey methods and techniques (such as side-scan sonar [SSS], multibeam echo sounder [MBES], or visual [e.g. via an ROV or autonomous underwater vehicle (AUV)]). Information is transferred to the vessel via an umbilical or downloaded when the instrument is recovered (if an AUV is used). Survey methods (e.g. SSS and MBES) use a technique of sound pulses to establish the profile of the seabed. Most systems work by transmitting a broad acoustic pulse from a hull or pole mounted transducer.

3.8.3.2 Sediment mobilisation and relocation

Sediment mobilisation and relocation techniques such as jetting, and mass flow excavation may be used to support subsea installation activities to meet design requirements.

3.8.3.3 Installation of subsea structures

Subsea structures (e.g. mud mats, fixed datum points, manifolds) will be installed by the PIV or IMMR vessel. Structures will be deployed using the PIV’s main crane to a pre-determined depth before engaging the ROV to guide it to the correct position. Underwater acoustic positioning, as described in Section 3.8.1, will be used to position the structure on the seabed.

3.8.3.4 Flowline initiation / initiation anchor deployment

Commencement of flowline installation may require using initiation anchor to pull against, in order to provide the required tension to the flowline as it transitions from the installation vessel to the seabed. The initiation anchors may consist of a suction pile, drag anchor or clump weight/dead-man anchor and will be recovered post installation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Installation aids such as sandbag markers or concrete mattresses may be used for positioning aids or wet storage as required. Where practicable these will be recovered.

3.8.3.5 General flexible flowline and EHU installation

The optimum flowline and umbilical routes are selected by considering seabed bathymetry, environmental data, preinstallation surveys and installation risk management, including dropped object risks and buckling/walking impacts.

The indicative installation methodology and principle applied when installing the flowlines and umbilicals is as follows:

- the flexible flowlines and umbilicals will be stored on reels or carousels
- a vertical lay system (VLS) on the vessel will be used
- during installation, a hydraulically driven centre reel drive will be engaged to the reel to rotate the reel in synchronised speed with the VLS
- installation sequence for flowline and umbilical is:
  - prepare connection system (flexible) or UTA (umbilical) and VLS onboard the vessel
  - perform tests and pre-deployment checks
  - deploy and land out the flowline or umbilical first end via VLS and crane wire, using ROV for observation, support activities and positioning as required
  - continue flexible flowline or umbilical lay as per lay route while monitoring touchdown with ROV until the total length of flowline/umbilical has been laid to (a) the second end connector for flexibles or (b) the second end UTA for umbilicals
  - land out the second end of the flowline or umbilical via the VLS and crane wire, using the ROV for observation, support activities and positioning as required.

The flexible flowline may be installed using a lighter installation spread on the installation vessel, via a deck mounted powered reel system in combination with a deployment chute mounted on the side of the installation vessel and temporary installation aids placed on the seabed. In the event the flexible flowline needs to make a turn, a temporary small bulkabag filled with sand are deployed to act as the turning bollard. Turning bollards (if required) would have their contents (sand locally sourced) left on the seabed and the bags recovered to the installation vessel.

3.8.3.6 General HFL, EFL and jumper installation

The Petroleum Activity includes installing several new subsea components that will tie in each well to the either existing or new production manifolds or to new UTAs. The FLs will be configured into deployment basket(s) or onto deployment frames and landed on the seabed using a crane. ROVs will complete the final subsea tie-in. Water jetting and/or acid injection may be used to clean the connections on the infrastructure prior to tie-in.

3.8.3.7 Span/scouring rectification and stabilisation

Spans are undulations in the seabed that do not provide sufficient support to the flowline. Spans are generally mitigated by installing structures, such as concrete mattresses or grout bags, before installing the flowline. Engineering will determine if span rectification is needed. The dimensions for each concrete mattress are typically 6 m x 3 m x 0.3 m.

Post-lay span rectification may also be required after subsea installation. This process typically involves placing grout bags under the span section. The empty bag is moved into position using ROV, then filled with grout supplied from a mixing and pumping spread on the vessel via a downline. Typical pumped grout volumes depend on the size of the span and may vary from about 200 kg to 2,000 kg per span.

If grout bags are used, the downline recovery time risks exceeding the grout curing time. If grout cures within the downline and pump, the equipment is likely to be rendered unserviceable, as well as the downline not being safely recoverable in the normal way. Therefore, after grouting activities at each span site, the downline and pump will need to be purged using seawater. This results in an amount of grout, equivalent to

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the downline volume (~5 m^3), being discharged to the ocean. This flushing is required once per grout site. The actual number is not known until the line is laid and need for span rectification determined, if any.

Scouring is the movement of seabed sediment (e.g. silt, sand and gravel) from around the base of a subsea structure to further afield due to prevailing hydrodynamic conditions, compromising the integrity of the structure. If scouring is a risk, then it is typically mitigated by installing concrete mattresses along the perimeter of the installed structure.

If concrete mattresses are used, the process for installation is likely to be similar to those described above for prelay span rectification. The concrete mattresses will be lifted off the installation vessel and lowered to the seabed by the vessel's main crane. The ROV from the installation vessel will assist with positioning the mattresses during installation.

Stabilisation is a post lay activity to ensure that the affected items, such as FLs, flexible flowlines and flexible jumpers, remain at their installed positions (i.e. not being shifted due to strong seabed current). Stabilisation of FLs is generally mitigated by installing sand bags on top at a predetermined distance apart. Sand bags generally come in a standard size with 20 to 25 kg weight. Concrete mattresses may be used to stabilise the flexible jumper. Sandbags or concrete mattresses may also be used to provide temporary stability of wet stored items if wet storage proves necessary.

3.8.3.8 Infrastructure Crossing Supports

The Wilcox flowline route crosses existing fibre optic cables which will require the installation of crossing supports (Table 3-6). The design and specifications of the crossing supports are specific to each crossing. Crossing supports are designed to be concrete mattresses. Concrete mattress will be installed in close proximity on either side of the existing subsea infrastructure. To ensure the correct height is achieved, the design allows for a layering of multiple mattresses to create sufficient bearing capacity. The installation and size of concrete mattresses is as described in Section 3.8.3.7. In addition sediment mobilisation and relocation may be used to create a short corridor to submerge flowlines and umbilicals for crossings in order to achieve design requirements.

Table 3-6: Commonwealth waters subsea infrastructure crossings

Crossing	KP	Water Depth (m)	Method
Fibre Optic Cable 1 (Telstra)	Wilcox - 4.7	~ 73 m	Mattresses
Fibre Optic Cable 2 (Telstra)	Wilcox - 9.5	~ 75 m	Mattresses
GWF2 Flowline	Flowline to KDA manifold	~ 124 m	Mattresses

3.8.4 Pre-commissioning

Pressure testing is performed to test the integrity of subsea infrastructure, test isolations and identify any leaks. Pressure is typically applied via a downline from the installation vessel or via ROV. Failure of testing equipment or integrity of the tested infrastructure may lead to a loss of leak test fluids to the marine environment. After the testing is completed, the system pressurisation volume may be released to the environment to mitigate the risk of hydrocarbons returning to the installation vessel.

During tie-in and pre-commissioning activities, any subsea connection break-outs will be preserved with chemical sticks. A small amount of chemically treated MEG/water may be discharged to the environment from the structure and tie-in flexible prior to final make-up of the connection. All chemicals used in pre-commissioning activities will be subject to the chemical selection assessment process described in Section 7.2.1

3.8.4.1 Flooding

The flexible jumpers and production flowlines will be installed filled with chemically treated, up to ~85 wt% MEG/water. While the Wilcox flowline will be installed with a ~30 wt% MEG/water. MEG is used to prevent formation of hydrates during start-up.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.8.4.2 Leak testing

Leak test/system pressure tests are performed to confirm the integrity of subsea connections and jumper. During leak testing there may be small volumes of test fluids discharged to environment during connection and disconnection of hot stabs.

3.8.4.3 Dewatering

The Wilcox flexible flowline will be dewatered and purged with nitrogen following installation and leak testing. Dewatering is accomplished by launching a dewatering pig train to remove as much line-fill medium from the piggable flexible flowline system as possible. The pig will be propelled by nitrogen gas to displace the fluid. The volume of pre-filled ~35 wt% MEG/water medium is expected to be approximately 1600 m^3.

After the pigging is completed, the flowline is left filled with nitrogen, at a pressure of at least 55 bar, in preparation for hot-commissioning (introduction of hydrocarbons). Hot commissioning is outside of scope of this EP.

The contents of the jumpers and the nearfield flowlines will be produced to the GWA Platforms, outside of the scope of this EP.

3.8.4.4 Tie-in to GWF subsea infrastructure

Prior to tie-in of the proposed infrastructure to the GWF infrastructure, verification testing of any leakage from the manifold isolation valves may be undertaken. This testing will verify that suitable isolations for safe tie-in are available, thereby preventing a major hydrocarbon release during tie-in. This verification may result in the release of hydrocarbons to the environment. The hydrocarbons are predominantly gas with a small quantity of condensate.

Additionally, when the flowline tie-ins take place, a quantity of hydrocarbons may be released. A conservative estimate of hydrocarbons that may be released during the flowline tie-in at a manifold is up to 400 L of condensate and residual gas over a 48 hour period. Water jetting and/or acid injection may be used to clean the connections on the infrastructure prior to tie-in.

3.8.4.5 Cold commissioning of subsea infrastructure

The commissioning associated with subsea infrastructure prior to the introduction of hydrocarbons (referred to as cold commissioning) generally includes subsea control systems verification and function testing of valves to verify that the HFLs and EFLs are ready for entry into the start-up phase.

During cold commissioning, an ROV is deployed from the installation vessel (or similar support vessel) to provide visual confirmation of Xmas tree valve actuation. This activity is typically less than 12 hours in duration per well.

3.8.5 Wet storage of equipment

Wet storage of infrastructure may be required intermittently throughout the duration of subsea installation activities as part of the Petroleum Activity There are three categories of equipment that may require wet storage as part of the Petroleum Activity and are summarised in Table 3-7.

Table 3-7: Wet storage that may be required as part of the Petroleum Activity

Wet storage category	Reason for wet storage	Typical equipment	Retrieval method
Installation aids	To facilitate safe installation of infrastructure	Predominantly installation aids (ROV baskets, clump weights, etc.)	Retrieval will be undertaken using project vessels and associated equipment such as cranes, ROV, etc.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Wet storage category	Reason for wet storage	Typical equipment	Retrieval method
Subsea infrastructure	Prior to connection of infrastructure, wet storage may be necessary to optimise project schedule and support SIMOPs	Items may include jumpers, flying leads and wet parking/deployment frames, etc.	Retrieval is not required, as infrastructure will be used for production operations and once connected is no longer considered wet stored
Mooring	BOP tethers (if required), mooring chains and anchors may be wet stored for ~ 60 days pre/post MODU connection/disconnection	Mooring chains and anchors, BOP tether systems	Retrieval will be undertaken using project vessels and associated equipment such as cranes, ROV, etc.

Any installation aids and mooring equipment placed on the seabed will be removed at the completion of activities (i.e. no wet stored equipment will remain on the seabed). Noting that some installation aids may remain attached to installed subsea infrastructure.

3.8.6 Site surveys

Site surveys may be undertaken at various stages during the installation of subsea infrastructure. An initial flowline pre-lay survey will be undertaken (Section 3.8.3.1), with additional surveys carried out with an ROV, as required. These surveys will identify the location of all items placed on the seabed (including wet stored items and installed infrastructure).

An as-built survey will be conducted by ROV at the completion of the installation campaign to ensure equipment is installed in the designed location. This data will be used to update the ‘survey screen’ to develop the as-built report, which is considered the inventory of items remaining on the seabed (and in the petroleum title). In addition, any material items dropped to the marine environment and not recovered will be added to the inventory for the title.

3.8.7 Subsea IMR

Following installation of subsea infrastructure and flowlines, items will remain installed or wet-stored in a preserved state on the seabed, prior to commissioning, start-up and operations. During this non-production phase, Inspection, Monitoring, Maintenance and Repair (IMMR) activities may be carried out as required any time throughout the life of this EP, post-infrastructure installation. This may include cleaning of marine growth (e.g. ROV water jet), sediment relocation, ROV inspections, infrastructure repair.

All subsea structures installed during the Petroleum Activity have been designed to be removed above the mudline. The subsea infrastructure is designed not to require regular intervention; however, an IMR process will be in place to maintain the subsea infrastructure to acceptable standards while this EP is in force.

IMMR activities may occur at any time during the Petroleum Activity in the unlikely event that they are required. IMMR activities are typically undertaken from a support vessel and may use an ROV with transponders to inspect equipment.

3.9 Project fluids

All chemicals that may be operationally released or discharged to the marine environment by the Petroleum Activity are evaluated using a defined framework and set of tools to ensure the potential impacts are acceptable, ALARP and meet Woodside’s expectation for environmental performance. This is detailed in Section 7.2.1

3.10 Contingent activities

The next sections present contingencies that may be required, if operational or technical issues occur during the Petroleum Activity. These contingencies have been considered within the relevant impact assessment sections and do not represent significant additional risks or impacts, but may generate additional volumes of discharges and emissions being operationally discharged.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.10.1 Respud

A respud may be required for a number of reasons, such as if the conductor or well head slumps or fails installation criteria (typically during top hole drilling) or after drilling the reservoir section. Respudding involves moving the MODU to a suitably close location (e.g. about 25 m - 250 m from the original location, within the OA) to recommence drilling. A respud activity would result in repeating top-hole drilling.

The environmental aspects of respudding are the same as those for drilling and are considered to be adequately addressed by this EP, with no significant changes to existing environmental risks or any additional environmental risks likely. The net environmental effect would be limited to an increase in the volume of cuttings (similar to those identified in Section 3.7) generated and discharged at the seabed, from the repeat drilling of the top-hole section, plus an increase in the quantity of cement discharged at seabed from cementing the conductor and surface casing strings.

3.10.2 Sidetrack

Drilling of a sidetrack may be required if operational issues are encountered. The environmental aspects of a sidetrack well are the same as those for routine drilling activities, which are considered to be adequately addressed by this EP, with no significant changes to existing environmental risks or any additional environmental risks likely. The net environmental effect would be limited to an increase in the volume of cuttings generated (including potential swarf), potential increase in the use of cements, drilling fluids, and the additional emissions (atmospheric and waste) associated with an extended drilling program.

3.10.3 Workover

The proposed development wells may be worked over to monitor and maintain well integrity as required. A workover may be completed using either a MODU or a vessel. The environmental aspects of a workover operation are the same as those for undertaking well completion activities and are considered to be adequately addressed by this EP, with no significant changes to existing environmental risks or any additional environmental risks likely.

3.10.4 Well intervention

An intervention may be performed on any of the Petroleum Activity wells. Interventions may be performed due to down-hole equipment failure or to address underperformance of a well. Key well intervention methods include wire-line and coiled tubing. Potential environmental impacts from intervention activities have been included in this EP, including discharge of suspension fluids and brines and small volume gas releases subsea due to removal of a tree cap which may be in place if the well was previously suspended.

3.10.5 Well suspension

During drilling activities, a well may need to be temporarily suspended. Suspension involves establishing suitable barriers, removing the riser and disconnecting the MODU from the well. The BOP may be left in place to act as a barrier. Suspension may be short term (e.g. in the case of a cyclone) or longer term (more than one year). On return to a well after suspension, the MODU reconnects to the well via the riser, and with BOP in place, barriers are removed and drilling and completions activity resumes.

3.10.6 Well abandonment

The Petroleum Activity covers the drilling of development wells, which are not envisaged to be abandoned until the end of the production field life. For technical reasons, it may be required to abandon the lower section of a well, prior to sidetracking, or in the event that a respud is required or in the event of a dry hole scenario.

Well abandonment activities are conducted in accordance with Woodside's internal standards. Base oil may be used for inflow testing prior to abandonment; to verify barrier integrity (base oil is also used for well cleanup/test activities and as such has been risk assessed in this EP). Base oil would be pumped down the drill string and reverse circulated back to the rig, with fluids collected for disposal onshore or flared if equipment / facilities are available. If stored in a mud pit, the base oil and other fluids associated with the test may result in pit wash water contaminated with hydrocarbons. If this is the case, mud pit wash water would be discharged in accordance with requirements in this EP; with a hydrocarbon content <1% by volume.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

If required, wells would be abandoned with abandonment cement plugs, including verification of the cement plug in accordance with Woodside Standard -Well Barrier Standard. A lower section of a well may also be abandoned prior to sidetracking.

Following abandonment activity, the marine riser and BOP will be removed and every reasonable attempt for retrieval of the wellhead will be made. Wellheads are removed by deploying a cutting device on drill pipe that then cuts through the surface casing and conductor, allowing the wellhead to be retrieved to the surface. Backup cutting equipment is sent offshore as a contingency should the primary set of equipment fail. The cutting equipment is very reliable with a high success rate of cutting wellheads. If these recognised removal techniques are ineffective, the wellhead may be left in-situ. The integrity of the wellbore is not affected by the wellhead assembly remaining in-situ.

3.10.7 Sediment mobilisation and relocation

If required, an ROV-mounted suction pump/dredging unit may be used to relocate sediment/cuttings around the wellhead or other infrastructure, to keep the area clear and safe for operations and equipment. This activity has the potential to generate plumes of suspended sediment during pumping.

3.10.8 Venting

During drilling or completion of the well, a well kick may occur. A kick is an undesirable influx of formation fluid into the wellbore. To maintain well integrity in this situation, a small volume of greenhouse gases is released to the atmosphere via the degasser, in a well control operation known as ‘venting’.

3.10.9 Emergency Disconnect Sequence

An Emergency Disconnect Sequence (EDS) may be implemented if the intervention vessel/MODU is required to rapidly disengage from the well. The EDS closes the BOP (i.e. shutting in the well) and disconnects the riser to break the conduit between the BOP and MODU. Common examples of when this system may be initiated include when the MODU moves outside of its operating circle (e.g. failure of one or more of the moorings) or moves to avoid a vessel collision (e.g. third-party vessel on collision course with the MODU). The EDS aims to leave the well in a secure condition but will result in the loss of the fluids/cuttings in the riser after disconnection.

3.11 Vessels

Several vessel types will be required to complete the activities associated with the Petroleum Activity (Table 3-3). Up to three vessels may be on site within the Operational Area at any time, noting that vessel presence may vary during different stages of the activity. Vessels are discussed in further detail in the following section and include:

- MODU, the term MODU refers to a hybrid mobile offshore drilling unit; with both moorings and DP systems
- IMMR vessels may be used for cold commissioning, installing the Xmas tree and IMMR activities
- installation vessels for flowlines, umbilicals, flying leads, jumpers, manifold and other subsea infrastructure and hardware. May also support cold commissioning prior to start up
- support vessels, including:
  - anchor handling vessels (AHVs) (if required) to set anchors and support the MODU during operations
  - offshore support vessels and heavy lift vessels for:
    - transporting hardware from port/staging area to the Operational Area and installation vessels
    - general re-supply activities
    - support for the MODU and installation vessel(s).

Vessels may mobilise from the nearest Australian port or directly from international waters to the Operational Area. All project vessels are subject to the Marine Offshore Assurance process and review of the Offshore Vessel Inspection Database (OVID). All required audits and inspections will assess compliance with the laws

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

of the international shipping industry, which includes safety and environmental management requirements, and maritime legislation including International Convention for the Prevention of Pollution from Ships 1973 as modified by the Protocol of 1978 (MARPOL) and other International Maritime Organization (IMO) standards.

For power generation, vessels may use diesel-powered generators and/or LNG. All vessels will display navigational lighting and external lighting, as required for safe operations. Lighting levels will be determined primarily by operational safety and navigational requirements under relevant legislation, specifically the *Navigation Act 2012.* The MODU and project vessels will be lit to maintain operational safety on a 24-hour basis. Note: Vessel activities outside the Operational Area are not part of the Petroleum Activity, and are not within scope of this Petroleum Activity (Section 3.2).

3.11.1 MODU

Wells will be drilled, completed and unloaded using a hybrid MODU (moored/DP). The type of MODU mooring system used will vary depending on the location and seabed conditions, and may include conventional or pre-lay anchors, or pile moorings.

Typical specifications for a hybrid MODU types are provided in Table 3-8. These are collectively referred to as the MODU for the remainder of the document unless specific risks for different MODU types have been identified. Due to variabilities, such as contractual and operational matters, the MODU used may be subject to change.

Table 3-8: Typical MODU specification ranges

Component	Specification Range
Rig type/design/class	Semi-submersible MODU
Accommodation	120 to 200 personnel (maximum persons on board)
Station keeping	Minimum eight-point mooring system and thrusters for Dynamic Positioning (DP3)
Bulk mud and cement storage capacity	283 to 1,360 m^3
Liquid mud storage capacity	576 to 3,000 m^3
Fuel oil storage capacity	966 to 4,000 m^3
Drill water storage capacity	3,500 m^3

3.11.2 IMMR vessels

It is anticipated that IMMR vessels will be involved no more than one to two weeks. Noting that an IMMR type vessel is an option for subsea installation (e.g. subsea xmas trees), ROV surveys, isolation testing and other activities. However, timing may vary depending on operational requirements, capability and availability. Size of the vessel may also vary depending on the scope of work. The specifications of the Fugro Etive are presented in Table 3-9 as an example and represent the typical specifications of a IMMR vessels.

Table 3-9: Typical IMMR vessel

Component	Specification Range
Vessel type	Operations support vessel
Length overall	92.95 m
Breadth	19.70 m
Depth	7.7 m
Gross tonnage	4,926 t
Accommodation	100 people
Dynamic positioning system	DP2
Fuel Capacity	2,225 m^3 (241 m^3 largest isolated diesel tank)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.11.3 Primary Installation vessel

The subsea installation scopes of work may require a vessel, with sufficient capacity to accommodate subsea infrastructure and hardware such as flowlines, umbilicals, FLs and jumpers.

A typical installation vessel for subsea and flowline installation would be a DP vessel (usually DP2 class) equipped with a primary differential global surface positioning system (DGPS) and an independent secondary DGPS backup. The specification of a typical subsea installation vessel is provided in Table 3-10.

Installation vessels are typically equipped with various material handling equipment, which includes cranes, winches, ROVs and ROV launch and recovery systems, vertical lay system (VLS) with either vertical reel drive or horizontal reel drive (carousel) and pre-commissioning spread.

Lifting operations may involve loading and unloading equipment from support and supply vessels onto the installation vessel and subsequently onto the seabed. Cranes are typically equipped with active heave compensation and auto tension, modes and have lifting capacities in excess of lifting loads expected to be encountered during operations.

Table 3-10: Typical DP2 Class subsea installation vessel

Component	Specification Range
Vessel type	DP2 Class as a minimum
Crane capacity	250 T active heave compensation crane as minimum
ROVs	Work Class ROVs
Deck space	~1,900 m^2
Deck strength	~15 T/m^2
Accommodation	~120 people
Fuel oil	~2,200 m^3 [total across multiple tanks]
Potable water	~800 m^3

3.11.4 Support vessels

The MODU and installation vessels will be supported by other vessels, such as general support vessel(s), cargo vessel(s), AHVs, barges and multiservice construction vessels. These vessels are expected to be in the Operational Area intermittently for short periods of time, as required.

Support vessels are used to transport equipment and materials between the MODU/installation vessel and port (e.g. Dampier, Onslow). If required, one of the vessels may remain at the MODU to perform standby duties, while others will make regular trips between the Operational Area and port for routine, non-routine, and emergency operations. These vessels may also be used to provide ROV operations to support both drilling and subsea installation activities.

Typical support vessels use a DP (Dynamic Positioning) system to allow manoeuvrability and avoid anchoring when undertaking work, due to the proximity of subsea infrastructure. However, these vessels are equipped with anchors that may be deployed in an emergency.

3.11.4.1 Uncrewed Surface Vessel

An Uncrewed Surface Vessel (USV) may be utilised to undertake ROV operations. The USV will be remotely controlled from an onshore remote operations centre (ROC) in Australia which is staffed 24 hours a day whilst the vessel is in transit or undertaking activities. Key roles in the ROC mirror those on a usual vessel management team and include a Vessel Master, First Officer, Offshore Manager and ROV Supervisor. The vessels are designed with multiple forms of high speed and reliable communication systems to allow connection to the ROC and provide redundancy in the case of disconnection during operations, including an independent emergency low bandwidth satellite communications system.

The USV will be assessed by Woodside Marine to review compliance with marine laws, flag requirements, vessel class and Woodside's safety and environment requirements.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Because there are no facilities to support human occupancy on USV's, emissions and discharges are typically limited to cooling water and combustion of marine diesel. The vessel is equipped with bilge monitoring systems to monitor the bilge tanks for hydrocarbons (such as leaks from engine machinery spaces or from marine diesel tanks), and where detected the bilge pumps will auto disable and the vessel will be required to immediately return to port.

The USV may be equipped with a built-in work class ROV with the ability to deploy and retrieve equipment from the seabed.

3.11.5 Project vessel-based activities

3.11.5.1 Holding Station: Mooring Installation and Anchor Hold Testing/Soil Analysis

Mooring uses a system of chains/ropes and anchors, which may be pre-laid before the MODU arrives at the location, to maintain position when drilling. If moorings are used, a mooring analysis will be performed to determine the appropriate mooring system for the Petroleum Activity. The mooring analysis will identify whether the mooring system will be pre-laid or set by the rig, proof tension values, or if using synthetic fibre mooring ropes is required. A pre-laid system can generally withstand higher sea states compared to a system that only uses the rig's mooring chain/equipment.

Installation and proof tensioning of anchors involves some disturbance to the seabed. Anchor handling vessels are used to deploy and recover the mooring system.

As part of mooring preparations, anchor hold may be tested around the well locations. Anchor hold testing would be performed if Woodside determines that further assurance is required to ensure a robust mooring design.

Anchor hold testing may consist of an AHV or similar vessel dropping an anchor at a potential mooring location. The AHV would then tension the anchor to determine its ability to hold, embed and not drag at the location. This may have to be repeated several times at each location. A ROV may also be used to judge how deep the anchor has embedded and independently verify the seabed condition. Anchor hold testing activities would occur before the MODU arrives on location.

Soil analysis may also be necessary to provide data on composition and rock/substrate strength as input into the mooring design – and verify seabed conditions for anchor holding. Soil analysis could include taking a physical sample of the seabed using ROV or other tools, or using measuring devices such as a cone penetrometer. These tests would be performed up to several months before the MODU arrives on location, and may occur from a support vessel or anchor handling vessel.

Suction piling may be required as a contingent activity, and will be reviewed with the MODU contractor.

3.11.5.2 Holding Station: Rig Anchor Release MODU

The hybrid MODU scenario is such that the MODU is DP capable though predominantly holds station via pre-laid mooring system. If a hybrid MODU is used to conduct drilling, it will likely have a rig anchor release (RAR) system integrated. The moorings are typically pre-laid, though a RAR device couples the MODU mooring components with the anchor mooring components. The RAR is an acoustic release connecting link that can be installed in a mooring line to enable a rapid disconnection of a MODU from the mooring system. Each mooring leg would have one RAR installed in the mooring line. The acoustic release process is instigated from a command unit on the MODU that, when activated, transmits a low frequency signal (9 – 11 kHz) that is received by the RAR transducer in the mooring line and activates the primary hydraulic actuator. The hydraulic cylinder then releases the RAR and the mooring line is disconnected. The MODU then recovers the wire/chain ready for transit (on DP) and the subsea mooring leg remains in place, which may be buoyed off to reduce interaction with infrastructure if required.

To reconnect the MODU with the mooring system, the AHV will recover the mooring line from the MODU with RAR and the trigger sleeve before connecting to the pre-laid line, which is recovered from the water column by the AHV with assistance from a ROV.

3.11.5.3 Holding Station: Dynamic Positioning MODU

DP uses satellite navigation and radio transponders in conjunction with thrusters to maintain the position of the MODU, PIV and OSVs at the required location. Information about the position of the MODU is provided

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

via a number of seabed transponders, which emit signals that are detected by receivers on the MODU and used to calculate position. The transponders and associated clump weights are typically deployed in an array on the seabed for the duration of the drilling at each well, and are recovered at the end, generally by ROV.

3.12 ROV

The MODU and project vessels may be equipped with an ROV system that is maintained and operated by a specialised contractor aboard the vessel. ROVs may be used during drilling operations and subsea installation, for activities such as:

- visual observations or surveys
- anchor hold testing
- anchor installation and connection of mooring systems
- BOP tether installation and connection (if required)
- positioning of subsea infrastructure
- supporting contingency activities
- subsea Xmas tree control systems hook-up and contingency control
- removal of sediments on or around subsea infrastructure
- installing, testing and pre-commissioning subsea infrastructure.
- contingency remote operation of BOP

An ROV may be fitted with various tools or camera systems as required. Specifically, during installation, the ROV is fitted with hydraulically driven tools to facilitate flowline tie-in. Temporary disturbance to a small area of the seabed (<25 m^2) may occur due to wet parking.

3.13 Helicopters

Helicopters are typically the primary means used to transport crew and/or urgent freight to and from the Operational Area They are also the preferred means of evacuating personnel in an emergency. Helicopter support will likely be sourced from Karratha or Exmouth airports.

Helicopter operations within the Operational Area are limited to helicopter take-off and landing on the helideck. Helicopters may be refuelled on the helideck of the MODU. Note: Helicopter activities outside the Operational Area are not part of, or within scope of, the Petroleum Activity (Section 3.2).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4. DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulations 21 (2) and 21 (3) of the Environment Regulations, this section describes the existing environment that may be affected (EMBA) by the activity (planned and unplanned, as described in Section 2.1), including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The EMBA is the largest spatial extent where unplanned events could have an environmental and/or socio-cultural consequence on the surrounding environment. For this EP, the EMBA is the combined potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds (as defined in Section 0). The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations. The worst-case credible spill scenario for this EP (Section 6.8.1) is a loss of well integrity resulting in the release of hydrocarbons to the environment. The EMBA for this EP is based on the EMBA of spill following scenarios.

- Scenario 1 – Well blow-out event from the Wilcox development well
- Scenario 2 – Well-blow out event from the Yodel Updip development well

Woodside recognises that hydrocarbons may be visible beyond the EMBA at lower concentrations than the ecological impact thresholds defined in Section 0. These visible hydrocarbons have the potential to cause socio-cultural impacts. These visible hydrocarbons are not expected to cause ecological impacts. In respect of this, an additional socio-cultural EMBA is defined, as the potential spatial extent within which social-cultural impacts may occur from changes to the visual amenity of the marine environment. Receptors relevant to the socio-cultural EMBA include cultural values and heritage, Commonwealth and State marine protected areas (MPAs), National and Commonwealth Heritage Listed places, areas of tourism and recreation, and commercial and traditional fisheries. For this EP, the socio-cultural EMBA based on surface hydrocarbons encompasses an area fully within the boundaries of the EMBA for ecological impacts. The EMBA and socio-cultural thresholds EMBA are shown in Figure 4-1 and described in Table 4-1.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill nor a depiction of a slick or plume at any particular point in time. Rather, the EMBA represents a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define EMBA for surface and in-water hydrocarbons

Hydrocarbon type	Ecological hydrocarbon thresholds [1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for operational and scientific monitoring
Surface	10 g/m^2 This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m^2 This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for operational and scientific monitoring.	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Hydrocarbon type	Ecological hydrocarbon thresholds [1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for operational and scientific monitoring
Dissolved	10 ppb The biological effects of hydrocarbons are driven by the fraction of hydrocarbons that are dissolved and therefore bioavailable to aquatic organisms. Toxicity studies show 10 ppb is protective of more than 95% of species for acute exposures, while still capturing the onset of effects in the most sensitive species and life stages (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. See Section 6.8.1.		10 ppb This low concentration value establishes the planning area for scientific monitoring within which further analysis can be undertaken to inform monitoring priorities. In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold (Table 7-7).
Entrained	1000 ppb Entrained hydrocarbons have limited bioavailability as toxic effects are driven by the small soluble fraction (typically less than 1% of the oil mass) that dissolves into the water column (French-McCay 2026). As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. See Section 6.8.1.		
Shoreline	100 g/m^2 This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m^2 This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for scientific monitoring.	

[1] Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 0.

4.2 Regional context

The Operational Area is located in Commonwealth waters (~40 – 150 m depth) off the north-west coast of Western Australia, located within the North West Marine Region (NWMR). Within the NWMR the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Commonwealth of Australia, 2006) places the Operational Area within the Northwest shelf Province (Figure 4-2). Additionally, the EMBA extends into the Northwest Transition, Central Western Transition, Central Western Shelf Transition, and South-West Marine Region provincial bioregions. Additional information on relevant marine bioregions is described in Section 3 of the Master Existing Environment.

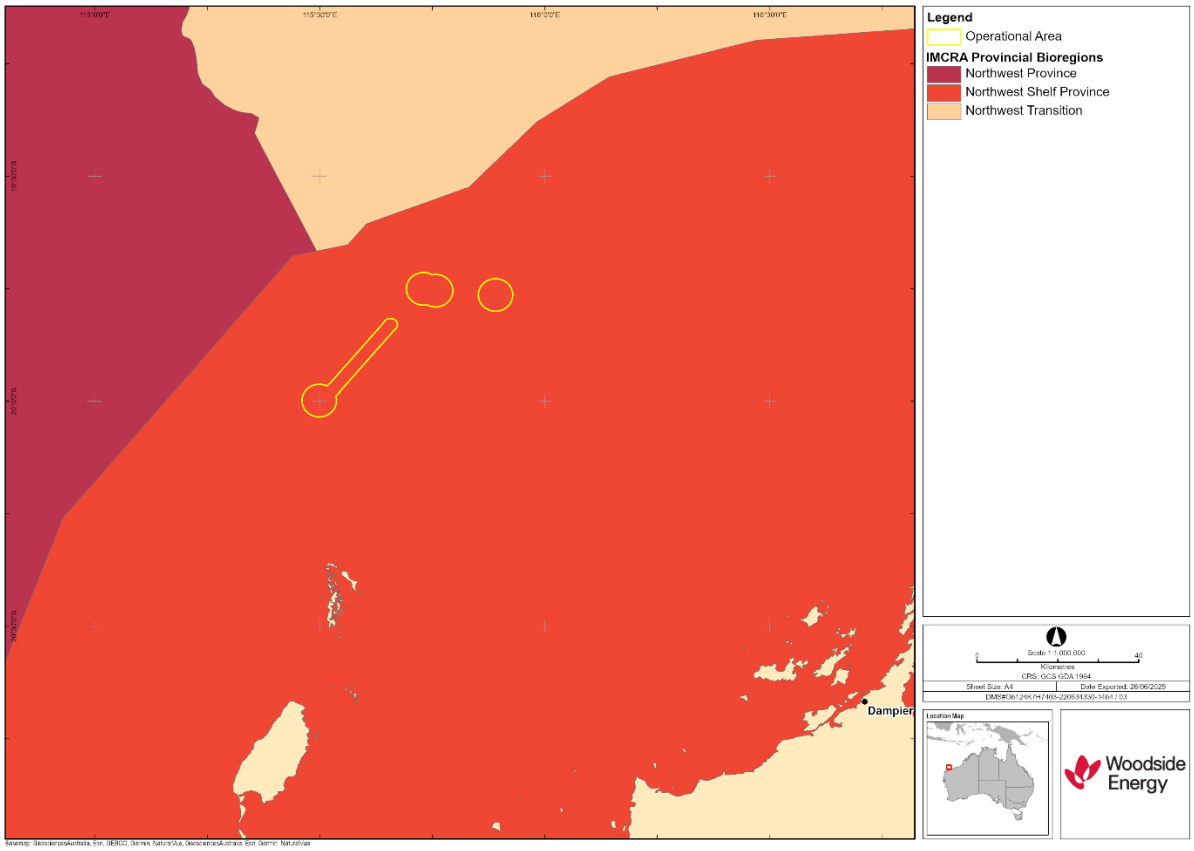

Figure 4-2: Location of the Operational Area and relevant marine bio-regions

4.3 Matters of National Environmental Significance (EPBC ACT)

Table 4-2 summarises the matters of national environmental significance (MNES) overlapping the Operational Area and EMBA, according to Protected Matters Search Tool (PMST) results (Appendix D). It should be noted that the EPBC Act PMST is a general database that identifies areas in which protected species have the potential to occur. The PMST conducts searches to determine the presence/absence of MNES based on a conservative grid-based search function. Marine areas (>30 km) from the coast use 32 km × 32 km grid cells to determine the spatial overlap with listed MNES. Accordingly, the PMST report (Appendix D) can indicate the presence of MNES that do not actually intersect with the Operational Area or EMBA. To ensure the accurate consideration of any impacts from the Petroleum Activity on MNES, shapefiles (provided by DCCEEW) have been assessed using Geographic Information System software to determine the actual presence and distance to MNES.

Additional information on these MNES is provided in the subsequent sections of this chapter and described in detail in the Master Existing Environment.

Commonwealth Marine Area	1	1	Section 4.8
Listed Threatened Ecological Communities	0	0	Section 4.8
Listed Threatened Species	27	79	Section 4.6
Listed Migratory Species	43	87	Section 4.6

4.4 Physical environment

A summary of the physical characteristics identified within the Operational Area and EMBA is described in Table 4-3 and further described in the Master Existing Environment.

Table 4-3: Summary of physical characteristics within the Operational Area and EMBA

Physical Characteristics	Description
Climate	The Operational Area offshore conditions (as reported for the Pluto Offshore Basic Design Data (Woodside 2014) show air temperatures range from highest mean record of 28.71 ºC in March to lowest mean record of 22.89 ºC in July (as derived from North Rankin records (excluding tropical cyclones). The broader NWMR experiences a tropical or monsoon climate (in northern Australia areas), exhibiting a hot summer season from October to April and a milder winter season between May and September (BoM 2024).
Winds	Seasonal variability derived from Pluto Offshore Basic Design Data (Woodside 2014) predicted the highest mean wind speed for June and July (7.63 m/s) and the lowest mean wind speed for November and December (7.15 m/s) based on hindcast modelling of wind speed. Winds within the EMBA are expected to follow this pattern.
Currents and tides	The dominant annual current directions at the Pluto offshore facility, in close proximity of the OA, are west or north-west and maximum current speeds between 2 and 3 m/s (Woodside 2014). Geophysical surveys undertaken within the Operational Area indicate that prevailing seafloor currents in this area are orientated east-north east / west-south west (Fugro 2011, Neptune Geomatics 2010). The broader NWMR is primarily influenced by the Indonesian Through Flow (ITF) current and the Leeuwin Current, internal tides and cyclones. The ITF brings warm waters from the Indonesian Archipelago into the NWMR and the Leeuwin Current flows southward along the edge of the continental shelf and is primarily a surface flow (up to 300 m deep). The ITF and Leeuwin Current are strongest during late summer and winter (Holloway and Nye 1985).
Water temperature	Measured seawater temperature (September 2005 and December 2007) in the Pluto offshore facility Basic Design Data shows the mean seawater temperatures at surface and through the water column in the upper 100 m depth range from 26.5 ºC at surface to 24 ºC at 100 m depth (Woodside 2014). The mean seawater temperature declines rapidly with mean temperatures of 17°C and 15°C at 200 m and 220 m, respectively (Woodside 2014). Within the NWMR the currents contribute to variability in seawater temperature and salinity throughout the water column. The water temperatures ranging between 30 ºC in summer and 22 ºC in winter (Pearce, et al. 2003). Water temperatures near the seabed have low interannual variability (±1.5°C at depths of 150 m) and become more stable with increasing water depth (Pearce, et al. 2003).

Physical Characteristics	Description
Seabed features and marine sediments	Based on Geoscience Australia's geomorphic classification of seabed (Harris, et al. 2005), the geomorphic features present within the EMBA are 'canyon', 'deep/hole/valley', 'pinnacle', 'plateau', 'reef', 'shelf', 'slope', 'terrace', and trench/trough. Wilcox shoal is located ~2.8 km east of the Operational Area (Figure 3-2) Rankin Bank is located ~1 km north of the Operational Area and Glomar Shoal is located ~90 km east, north-east of the OA, respectively, where identified within the EMBA. There is an unnamed shoal within the Operational Area boundary and adjacent to nominal flowline route. Sediments in the NWMR generally become finer with increasing water depth, ranging from sand and gravels on the continental shelf to mud on the continental slope and abyssal plain (Brewer, et al. 2007). The predominant seafloor sediment type within the EMBA are 'calcareous gravel, sand and silt', 'calcareous ooze', and 'mud and calcareous clay' (CSIRO 2015).
Air quality	Due to the extent of the open ocean area, the ambient air quality in the Operational Area and wider offshore region is considered to be of high quality.

4.5 Habitats and biological communities

Key habitats and ecological communities within the Operational Area and EMBA are identified in Table 4-4 and described in Section 4 and 5 of the Master Existing Environment. There are no threatened ecological communities identified within the Operational Area

Table 4-4: Habitats and Communities within the EMBA

Habitat / Community	Description
Marine primary producers	
Coral	Coral reef habitats typically have a high diversity of corals with associated fish communities and support numerous flora and fauna species; many of which are of both commercial and conservation importance. Coral reef habitats are an integral part of the marine environment within the NWMR. Coral was identified at the unnamed shoal ~2.5 km from the Wilcox drill centre and within the Operational Area (See Section 4.5.1). Additional coral reef habitat occurs at Rankin Bank (1 km from the OA) and Wilcox Shoal (2.8 km from the OA). Other coral reef habitats in the EMBA include those within the Montebello and Barrow Island protected areas, the Muiron Islands and Ningaloo Coast.
Seagrass beds and macroalgae	Seagrass beds and macroalgae habitats represent a food source for many marine species and may also provide key habitats and nursery grounds to species (DoF 2011). WA's clear coastal waters allow seagrasses to inhabit depths of >40 m; in contrast, in many estuaries, light penetration is poor, so seagrasses are limited to two m in depth (DoF 2011). The nearest seagrass is located at the Montebello and Barrow Islands, ~38 km and 80 km south of OA, respectively, within the EMBA. Seagrass beds and macroalgae habitat can also be found within the EMBA at some islands in the Pilbara Island Groups, the Muiron Islands and along the Ningaloo Coast.
Mangroves	Mangrove systems provide complex structural habitats that act as nurseries for many marine species as well as nesting and feeding sites. Mangroves also maintain sediment, nutrient and water quality within habitats and minimise coastal erosion (Nagelkerken, et al. 2008). The closest mangrove habitats to the Operational Area are located at the Montebello and Barrow Islands~35 km and 70 km south of the OA, respectively, within the EMBA. Other mangrove habitats associated with the EMBA include those located along the Ningaloo Coast.
Sandy beaches	Given the location of the OA, there are no sandy beaches within this area. Sandy beaches, within the broader EMBA, can be found around mainland and some Pilbara islands.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat / Community	Description
Salt marshes	Given the location of the OA, there are no salt marshes within this area. The closest salt marshes habitats to the Operational Area are located at the Barrow Islands ~70 km south of the OA, within the EMBA. Other salt marshes habitats associated with the EMBA include those located along the Ningaloo Coast.
Other communities and habitats	
Plankton	Primary productivity of the NWMR appears to be largely driven by offshore influences (Brewer, et al. 2007), with periodic upwelling events and cyclonic influences driving coastal productivity with nutrient recycling and advection. There is a tendency for offshore phytoplankton communities in the NWMR to be characterised by smaller taxa (e.g. bacteria), whereas shelf waters are dominated by larger taxa such as diatoms (Hanson, et al. 2007). Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR. Within the wider EMBA, peak primary productivity occurs in late summer / early autumn, along the shelf edge of the Ningaloo Reef. It also links to a larger biologically productive period in the area that includes mass coral spawning events, peaks in zooplankton and fish larvae abundance (MPRA 2005) with periodic upwelling throughout the year.
Pelagic and demersal fish populations	Demersal fish are associated with a wide range of habitats, including coastal and estuarine ecosystems, macroalgal and seagrass communities, and coral reefs (Hutchins 2001, Blaber, Young and Dunning 1985). Abundance and species richness of demersal fish species and communities (those that live and feed on or near the seabed) typically increase with increasing marine habitat complexity (Gratwicke and Speight 2005). Benthic habitats of the Operational Area are not expected to support a high diversity of demersal fish species. However, the nearest location identified as supporting high demersal fish richness and abundance is located at Rankin Bank, which overlaps the northern Operational Area The Continental slope demersal fish communities KEF (see Section 4.8) which features high levels of demersal fish endemism has also been identified within the EMBA (~25 km north of the OA). Pelagic fish species within the NWMR include both small and large species; small pelagic fish inhabit a range of marine habitats, including inshore and continental shelf waters. They feed on pelagic plankton and represent a food source for a wide variety of predators including larger pelagic fish, sharks, seabirds and marine mammals (Mackie, et al. 2007). Large pelagic fish in the NWMR include commercially targeted species such as mackerel, barracuda, billfishes and tunas (Lewis 2020). Large pelagic fish are typically widespread, found mainly in offshore waters (occasionally on the shelf) and often travel extensively (Hobday, Griffiths and Ward 2009). Pelagic fish species may be present within the OA, although there are no habitats considered important to these species within the Operational Area
Epifauna and infauna	The predominant habitat within the vicinity of the nearfield wells is expected to be soft sediment with infauna communities, supported by available geophysical data (Section 4.4) and previous studies (RPS 2011; BMT 2021). Benthic communities inhabiting the predominantly soft, fine sediments of the offshore habitats are characterised by infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, sea cucumbers). This is supported by surveys undertaken around the GWA Facility, which is predominantly comprised of sparse benthic infauna communities dominated by polychaetes and crustaceans (BMT 2021). Within the OA, in proximity to the LPA manifold and Wilcox drill centre, hard substrate has been identified which has the potential to support epifauna and filter feeder communities. Filter-feeding epifauna (e.g. sponges, ascidians, soft corals and gorgonians) are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures. Surveys have identified filter feeder communities within the Operational Area as detailed in the following sections (Refer to Section 4.5.1) The benthic infauna and epifauna found within the Operational Area are representative of the wider NWMR (and EMBA) (Brewer, et al. 2007, Rainer 1991).

4.5.1 Offshore benthic habitats

Shallow submerged bathymetry features in and near the Operational Area have been identified; those that occur at ≤50 m depth are shown in Figure 4-3 with only the Unnamed Shoal occurring within the Operational Area. These shallower areas (<40 m water depth) have the potential to support diverse coral reef ecosystems (both Rankin bank and Wilcox Shoal near the Operational Area) while the deeper surrounding area supports a mesophotic coral reef ecosystem characterised by a gradient of declining light availability and a gradual transition from phototrophic to mixotrophic and heterotrophic communities (Abdul Wahad et al 2018). To further understand the potential habitats a study was undertaken using geophysical and ROV data to characterise the benthic habitats and communities in the Wilcox field (Worley, 2025; Figure 4-4), this expanded on the AIMS study which mapped Rankin bank and the surrounding environment. A total of approximately 260 km^2 of seabed in this area has been mapped (Figure 4-5).

4.5.1.1 Wilcox Shoal

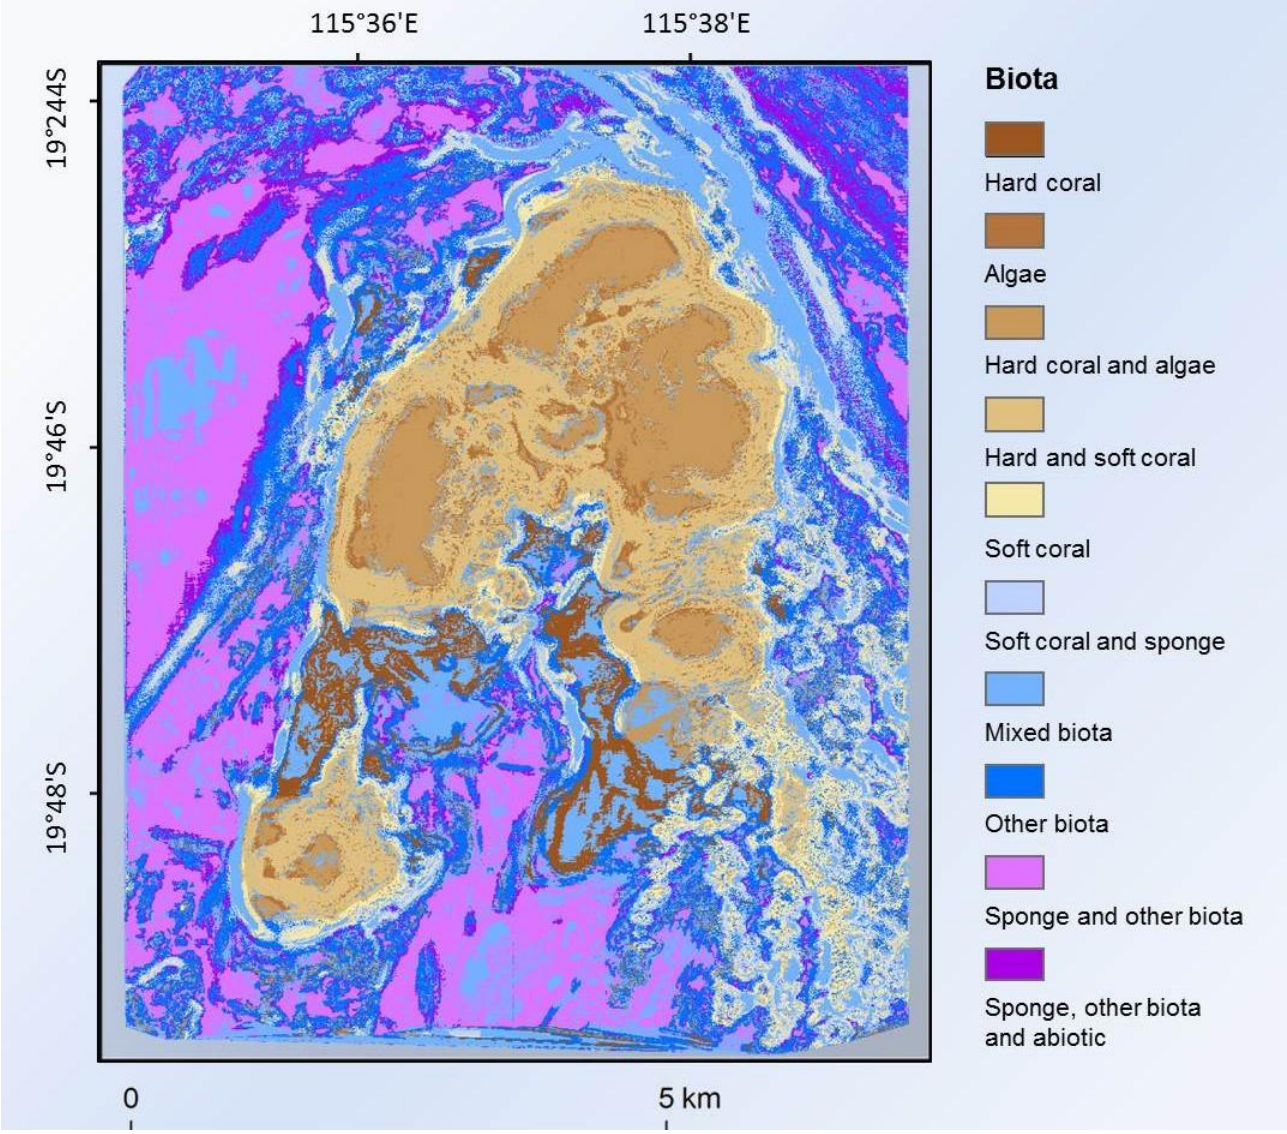
Wilcox Shoal is an isolated submerged oceanic shoal, rising from 80 m depth and reaching 26 m depth at its shallowest point (Worley, 2025). The top of the shoal has high structural complexity owing to the presence of shallow (<30 m) surface reef communities dominated by hard corals. The north and north-eastern sides of the shoal have steep slopes that drop from 40 m to 75 m, whereas the southern side has a gentle depth gradient and a long plateau out to the 70 m contour (Worley, 2025). In general, the habitat transitions from coral-dominated within the reef top into consolidated cobbles (coral rubble) and unconsolidated (soft) sand with sparsely distributed hard corals and other invertebrates including octocorals and porifera (e.g. gorgonians, sea whips, soft corals, sponges, and sea fans) along the shoal slope at ~30 m to 60 m depth (Worley, 2025). The seabed surrounding the base of the shoal was characterised as unconsolidated sand with intermittent octocorals and porifera in deep (70–80 m) waters (Worley, 2025).

The range of habitat types recorded at Wilcox Shoal were similar to those recorded at other shoals along the Western Australian coastline, including Rankin Bank (18 km north of Wilcox Shoal) (Worley, 2025).

4.5.1.2 Wilcox drill Centre and flowline route

The Pipeline Route area was dominated by unconsolidated sand with an intermittent and patchy distribution of octocorals and porifera to the south. There was a series of low ridges in the centre of the route orientated northwest-southeast. The area to the north of the ridges was dominated by unconsolidated gravel mostly bare. This area ended at the proposed Wilcox drill centre in in 60-70 m depth of water. Substrate type was mostly rock and veneer or unconsolidated sand. There were areas of rock veneer with mostly low cover of biota consisting of octocorals and porifera. Seabed habitats at the Wilcox drill centre and the pipeline route were characterised by low benthic cover (less than 11 % cover), low richness and similar community composition. These deep benthic assemblages were dominated by sponges (including crustose, erect, and massive morphotypes) and octocorals, with smaller contributions from bryozoans, hydroids, and ascidians. This pattern is typical of the North West Shelf (DSEWPaC, 2012; Wilson, 2013)

4.5.1.3 Unnamed Shoal



Unnamed Shoal is within the Operational Area and approximately 3 km north west of the Wilcox well locations. It is a small shoal around ~1 km^2 in water depths between 40 and 50 m. The reef top has moderate to high relief rock with stony corals (~40 m water depth) with ~30% cover and then transitioning to mixed biota on the reef slopes in depths 50 to 60 m. Unnamed Shoal supports some high relief coral reef but lacks the extent and structural complexity of the coral habitat on Wilcox Shoal (Worley, 2025). Deeper water habitats surrounding Unnamed Shoal are very similar to Wilcox Shoal consisting of sparsely distributed gorgonians, sea whips, soft corals, sponges, and sea fans (Worley, 2025). To the southwest there are areas of rock veneer that were mostly bare, and to the north there are areas of sand veneer, unconsolidated gravel, and unconsolidated sand, similar to Wilcox Shoal (Worley, 2025).

4.5.1.4 Rankin bank

Rankin Bank is on the continental shelf, ~5 km north-west of the proposed tie-in point at LPA. Although it is not a KEF, Rankin Bank, along with Glomar Shoal, are large and complex bathymetric features on the outer western shelf of the Pilbara and represents habitats that are likely to play an important role in the productivity of the Pilbara region (AIMS 2014a). Rankin Bank comprises three submerged shoals delineated by the 50 m depth contour, with water depths of ~18–30.5 m (AIMS 2014a).

Rankin Bank has a diverse marine environment, predominantly comprising consolidated reef and algae habitat (~55% cover at depths of <40 m), followed by hard corals (~25% cover at depths of <40 m), unconsolidated sand/silt habitat (~16% cover with increasing prevalence at depth), and benthic communities comprising macroalgae, soft corals, sponges and other invertebrates (~3% cover) (AIMS 2014a; Figure 4-6) Hydrocarbon and trace metal concentrations in sediments indicate the bank has not been affected by anthropogenic pollution (AIMS 2014a). Hard corals are a significant component of the benthic community of some parts of the bank, with abundance in the upper end of the range observed elsewhere on the submerged shoals and banks of north-west Australia (Heyward et al. 2012).

Source: North West Atlas; https://maps.northwestatlas.org

Figure 4-6: Rankin bank benthic habitats

The habitat surrounding Rankin Bank (<50 m) was mapped by AIMS on behalf of Woodside (AIMS 2014b) and hosts filter-feeding communities in areas of consolidated substrate interspersed by sand. Further surveys in 2017 in water depths greater than 70 m, at the LPA manifold location, found that epibenthic taxa were very sparse but typically clumped and comprised of mixed filter feeders such as sea whips, sea fans (gorgonians) other soft corals, sponges and hydroids (Jones et al 2021). It is expected that these filter feeder communities may be sparsely distributed in the south-west section of the Operational Area.

4.5.1.5 Glomar Shoal

Glomar Shoal is a large (~215 km^2) and complex bathymetric feature situated on the outer continental shelf off the Pilbara coast. Glomar Shoal is ~8.5 times wider than Rankin Bank at the 60 m contour. Glomar Shoal is a shallow sedimentary bank comprising coarser biogenic material than the surrounding seabed. The shoal is ~26–70 m below the sea surface (Falkner et al. 2009b) and is ~90 km east of the Operational Area. Glomar Shoal has been identified as a KEF for its high productivity and aggregations of marine life (Falkner et al. 2009b). This KEF encompasses a wider area than the shoal feature itself. Together with Rankin Bank, these remote shallow-water shoals represent regionally significant habitats and are considered likely to play an important role in the productivity of the Pilbara region (AIMS 2014a; Abdul Wahab et al. 2018).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Glomar Shoal has a high percentage of marine-derived sediments with high carbonate content and gravels of weathered coralline algae and shells (McLoughlin and Young 1985) The area's higher concentrations of coarse material compared to surrounding areas are indicative of a high-energy environment subject to strong seafloor currents (Falkner et al. 2009b). Cyclones are also frequent in this area and stimulate periodic bursts of productivity because of increased vertical mixing (Abdul Wahab et al. 2018). Studies by Abdul Wahab et al. (2018) found several hard coral and sponge species in water depths <40 m.

.Montebello Marine Park

The southern extent of the Operational Area partially extends into the northern extent of the Montebello Marine Park (See Figure 4-3).

An ROV survey within the northern extent of the Montebello Marine Park was undertaken in 2019 to characterise the benthic habitats and communities (Advisian 2019). Video imagery was collected from transects, and the habitat was classified in accordance with the Collaborative and Automated Tools for the Analysis of Marine Imagery (CATAMI) classification system. Five areas within the Montebello Marine Park were surveyed, of which three (Area 2, Area 3, Area 4) are near the Operational Area (Figure 4-7). Water depths in the three areas were very similar, with the midpoints depth of transects ranging from ~70–78 m. The survey findings are summarised in Table 4-5.

Table 4-5: Summary of benthic habitat and communities in the northern Montebello Marine Park

Area	Summary description[1]	Example ROV footage
2	• The seafloor was relatively flat and sandy with a light to high cover of unconsolidated biologenic gravel and/or organic material. Small undulations of the seabed were seen but no other regular bedforms such as sand ripples or sand waves were apparent. • No significant high relief habitat features, or areas of consolidated hard substrate, were observed in any transect. • Some areas of seafloor were relatively bare while others included a low (~5%) to high (~80%) density cover of benthic organisms. This benthic cover changed continually and often (within metres) over each transect. Benthic fauna comprised a diverse array of sponges and corals with varying forms, sizes and colours. Hydroids and cnidarians were also apparent on occasion. • Bioturbation of the seafloor in the form of small cones, craters, burrows, small and large trails was also apparent. Mobile organisms including fish, echinoderms and jellyfish, were also noted on the videos.	
3	• The seafloor in Area 3 was relatively flat and sandy with a light to high cover of biologenic gravel and/or organic material over its entire length (continually changing). Small undulations of the seabed and some small sand waves were present on occasion, but no other regular bedforms such as sand ripples or sand waves were apparent. • No significant moderate or high relief habitat features were observed on the video or can be seen on the transect maps with detailed bathymetry. Any features seen are ~1 m high and occur over relatively large scales. • The seabed was a mosaic of bare substrate and low (~5%) to high (~75%) density cover of benthic organisms (e.g. sponges, corals). Benthic fauna

Area	Summary description[1]	Example ROV footage
	comprised a diverse array of sponges and corals with varying forms, sizes and colours. Hydroids and cnidarians were also apparent on occasion along the transect length. • Bioturbation of the seafloor in the form of small cones, craters, burrows and small and large trails was apparent. Mobile organisms including fish, echinoderms and jellyfish were also noted on the videos. Fish fauna diversity was quite high, and varying sizes of fish were seen amongst the aggregations of corals and sponges and also over bare sandy seafloor.	
4	• The seafloor within Area 4 was typically flat sand with a high level of biologenic gravel of unknown origin. Small mounds, waves and undulations all <50 cm high were seen on occasion, mainly around aggregations of benthic epifauna (i.e. sponges and corals). • No significant moderate or high relief features or significant areas of consolidated hard substrate were present in Area 4 that could be seen on the video or transect maps. • The seafloor was scattered with sponges and corals of varying forms and sizes; these occurred as individuals with a low-density cover (~5%) up to more dense clusters (~50%). Other benthic epifauna included echinoderms and cnidaria. Mobile fauna (mainly small bony fishes) were most common around the larger clusters of sponges and corals. • Areas of bare sand occurred amongst the patches of epifauna. The switch between bare sand and benthic cover changed constantly and over short distances. • Bioturbation of the seafloor in the form of small mounds and craters was evident along the entire transect length.

4.6 Protected species

A total of 126 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 50 species were identified as potentially occurring within the Operational Area The full list of marine species identified from the PMST report(s) is provided in Appendix D including several MNES that are not considered to be credibly impacted (e.g. terrestrial species within the EMBA). Criteria for determining species to be considered for impact assessment is outlined in Section 3.2 of the Master Existing Environment. Two conservation dependent species have also been identified with a potential to occur within the Operational Area and EMBA. These species, the scalloped hammerhead and little gulper shark, are listed on the Species Profile and Threats Database (DCCEEW n.d.).

Species identified as potentially occurring within the Operational Area and EMBA and biologically important areas (BIAs) or habitat critical to their survival (habitat critical) which overlap the Operational Area and EMBA are listed in Table 4-6 to Table 4-15. Figure 4-8 to Figure 4-11 show the spatial overlap between relevant BIAs and habitat critical areas and the Operational Area and EMBA. Species that have been identified as having ecologically significant interactions in the Operational Area are described in further detail in this section. Key threatened and migratory species and associated biologically important behaviours in the EMBA are further described in the Master Existing Environment.

4.6.1 Fish, sharks and rays

A total of 15 EPBC Act listed threatened and migratory fish species have been identified to potentially occur within the EMBA, of which 13 occur in the Operational Area. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

Further description of BIAs and species is provided in the Master Existing Environment.

4.6.1.1 Whale Shark

The whale shark, *Rhincodon typus*, is a planktivorous shark and feeds on a variety of planktonic organisms including krill, jellyfish, and crab larvae (Last and Stevens 2009).

Whale sharks form seasonal aggregations at Ningaloo Reef between March and July (TSSC 2015c). However, seasonal aggregation can be variable, with individual whale sharks recorded at other times of the year.

This species undergoes an annual migration along the 200 m isobath of the WA coast between July and November (TSSC 2015c). Timing of the whale shark migration to and from Ningaloo coincides with the coral mass spawning period when there is an abundance of food (krill, planktonic larvae and schools of small fish) in the waters adjacent to Ningaloo Reef (DCCEEW 2024a). At Ningaloo Reef, whale sharks stay within a few kilometres of the shore and in waters about 30–50 m deep (Wilson, et al. 2005). After the aggregation period, the distribution of the whale sharks is largely unknown. Satellite tracking has shown that the sharks may follow three migration routes from Ningaloo (Meekan and Radford 2010):

- north-west, into the Indian Ocean
- directly north, towards Sumatra and Java
- north-east, passing through the NWS and travelling along the shelf break and continental slope.

Anecdotal evidence from sightings data collected from the Woodside offshore facilities on the NWS indicate whale sharks are present on the NWS in the months of April, July, August, September and October, corresponding with the whale shark's seasonal migration to and from the Ningaloo Reef. However, the numbers of individual whale sharks that transit through the Operational Area is expected to be low, based on the number of whale sharks aggregating at Ningaloo and on the different migration paths that the sharks may follow.

It is expected that whale sharks may traverse the vicinity of the Operational Area during their migrations to and from Ningaloo Reef. However, presence of the whale shark within the area would be of a relatively short duration and not in significant numbers, given the main aggregations are recorded in coastal waters, particularly the Ningaloo Reef edge (DPW 2013, MPRA 2005)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-6: Threatened and migratory fish, shark and ray species predicted to occur within the Operational Area and EMBA

Species name	Common name	Environment Protection and Biodiversity Conservation Act 1999 (as per PMST report Appendix D)			Potential for interaction	
		Threatened status	***Migratory status***	***Listed***	***OA***	***EMBA***
Sphyrna lewini	Scalloped Hammerhead	Conservation Dependent	N/A	N/A	Species or species habitat known to occur within area	Species or species habitat known to occur within area
Carcharodon carcharias	White Shark	Vulnerable	Migratory	N/A	Species or species habitat may occur within area	Species or species habitat may occur within area

4.6.2 Marine reptiles

A total of nine EPBC Act listed threatened and migratory marine reptile species have been identified to potentially occur within the EMBA, of which eight occur in the Operational Area (Table 4-8). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D

Further description of BIAs is provided in the Master Existing Environment.

4.6.2.1 Flatback Turtle

Flatback turtle nesting on Barrow Island occurs between October and March, with peak nesting activity occurring between November and January (Commonwealth of Australia 2017a). On Barrow Island, nesting activity is concentrated on the east coast on sandy, low-sloped, low-energy beaches with wide, shallow intertidal zones (K. Pendoley 2005, Pendoley, et al. 2014).

The Montebello Islands and Barrow Island are identified as nesting habitat critical to the survival of the species, as is the 60 km internesting buffer (Figure 4-10) around the Montebello Islands (Commonwealth of Australia 2017a).

Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia 2017a). However, the foraging ecology of post-hatchling Flatback turtles is currently unknown. Limited observations suggest they feed on small animals living in the water column (Commonwealth of Australia 2017a). During internesting turtles remain close to the nesting beach or rookery (Commonwealth of Australia 2017a).

A habitat suitability modelling study for internesting Flatback turtles in the NWS region of WA (Whittock, Pendoley and Hamann 2016) was conducted to identify areas of suitable Flatback turtle internesting habitat and determine overlap with identified industrial hazards. The study used a turtle tracking dataset of 47 nesting female turtles from five important rookeries in the NWS study area, including Barrow Island. The results showed internesting Flatback turtles from all rookeries remained within water depths of <44 m, with a mean depth of <10 m (Whittock, Pendoley and Hamann 2016). Results also showed internesting turtles from all rookeries remained within <28 km of the nearest coast, with a mean distance from the coast of <6.1 km. The habitat suitability modelling study defined suitable Flatback turtle internesting habitat as water depths of 0–16 m within 5–10 km of the coast. Unsuitable Flatback turtle internesting habitat was defined as waters >25 m deep and >27 km from the coast (Whittock, Pendoley and Hamann 2016). The Operational Area is therefore, classified as unsuitable for internesting Flatback turtles.

Another recent study involving satellite tracking data for 11 Flatback turtles following nesting on the Lacepede Islands (Thums, Waayers and Pattiaratchi 2017) found that Flatback turtles remained at an average distance of 15.75±12.25 km from the nesting beach in water depths of <20 m.

Other previous studies (Dobbs 2007, Guinea, Sperling and Whiting 2006, Pendoley Environmental 2010) have also presented findings that internesting behaviour was only observed in water depths of <40 m. One of these studies (Pendoley Environmental 2010) further indicates that internesting Flatback turtles have relatively shallow dives, with 85% of the time during spent in ≤20 m water depth, of which most was spent in 5–10 m (27±2.7%) and 10–15 m (22.3±3.5%) water depths.

Although individuals may transit through and forage within the Operational Area, habitat typically associated with species aggregations is not present due to the distance offshore (135 km from mainland), and to nesting beaches (~27 km).

4.6.4 Seabirds and migratory shorebirds

A total of 67 EPBC Act listed threatened seabirds and migratory shorebird species have been identified to potentially occur within the EMBA, of which 16 occur in the Operational Area (Table 4-14). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix C.

Detailed descriptions of seabirds and migratory shorebirds in the EMBA are provided in the Master Existing Environment.

4.6.4.1 Wedge-tailed shearwater

The Wedge-tailed shearwater (*Arena pacifica*) is a pelagic, marine seabird known from tropical and subtropical waters (DCCEEW 2024). Its distribution is widespread across the Indian and Pacific oceans with a global population of 2.6 million pairs. Of this, approximately one million pairs breed in Australia, most of which do so on islands in WA between Rottnest Island in the south to Ashmore Reef in the north (DCCEEW 2024).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late June onwards to re-excavate their burrows (Pendoley Environmental 2019). This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period (Pendoley Environmental 2019). Once hatched, adults leave the burrows to forage locally during the day returning at night to feed chicks until they are ready to fledge (Nicholson 2002). Due to the high synchronicity in egg laying, fledging is restricted to the first two weeks of April (Nicholson 2002).

This species is seen in North West WA from June to April (DBCA 2017). The breeding season in the Pilbara region occurs between November and April (DBCA 2017). Breeding behaviours are typically nocturnal in Wedge-tailed shearwaters.

Breeding behaviours are nocturnal in wedge tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead up to fledging, chicks also leave their burrows to exercise their wings outside burrows. Known breeding locations in the NWMR include Forestier Island (Sable Island), Bedout Island, Dampier Archipelago, Passage Island, Lowendal Island, islands off Barrow Island (Mushroom, Double and Boodie islands), islands in the Onslow area (including Airlie, Bessieres, Serrurier, North and South Muiron and Locker islands), islands in Freycinet Estuary, and south Shark Bay (Slope, Friday, Lefebre, Charlie, Freycinet, Double and Baudin islands (DSEWPC 2012). This species forages relatively close to breeding islands and its diet consists of squid, fish and crustaceans (DSEWPC 2012), tracking studies found that foraging activities at sea were more frequent during the day compared with at night (Catry, et al. 2009, Weimerskirch, de Grissac, et al. 2020).

Wedge-tailed shearwaters breeding on the Muiron Island (north) undertook extensive foraging trips during the incubation period (1,200 – 1,400 km) and shorter trips during chick rearing (<300 km, (Cannell, Hamilton and Driessen 2019)). Longer foraging trips took individuals in a NW direction offshore towards oceanic seamounts. Conversely, the shorter tended to include waters to the west and NW of the Muiron Islands (Cannell, Hamilton and Driessen 2019). In addition to the Muiron Islands, this dual foraging strategy, whereby parents alternate or mix short and long trips, have been recorded in Wedge-tailed shearwaters breeding in the east of Australia (Peck and Congdon 2005), and New Caledonia (Weimerskirch, Le Corre, et al. 2005). However, divergent foraging strategies have been detected between colonies, which is linked to the proximity of colonies to high productivity waters (Peck and Congdon 2005, Weimerskirch, Le Corre, et al. 2005).

The Breeding BIA of the Wedge-tailed shearwater overlaps the Operational Area.

4.6.5 Seasonal sensitivities for protected species

Seasonal sensitivities for protected migratory species identified as potentially occurring within the Operational Area are identified in. Movement patterns of all protected species identified in Section 4.6 are described in Section 5 of the Master Existing Environment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-16: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Fish, sharks and rays												
Whale shark – foraging/ aggregation (Ningaloo Coast) (TSSC 2015f)												
Whale shark – northern and southern migration (NWMR) (TSSC 2015f)												
Mammals												
Fin whale												
Humpback whale – northern migration (TSSC 2015d; Double et al. 2010)												
Humpback whale – southern migration (TSSC 2015d; Double et al. 2010)												
Sei whale - migration (DEH 2005)												
East Indian Ocean (EIO) pygmy blue whale – northern migration (Double et al. 2012; 2014)												
East Indian Ocean (EIO) pygmy blue whale – southern migration (Double et al. 2012; 2014)												
Marine reptiles												
Flatback Turtle												
Pilbara Coast genetic stock - nesting												
Pilbara Coast genetic stock -												
Green Turtle												
Northwest Shelf genetic stock - nesting												
Northwest Shelf genetic stock - foraging

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Hawksbill Turtle												
Western Australia genetic stock - nesting												
Western Australia genetic stock - foraging												
Loggerhead Turtle												
Nesting												
Foraging												
Seabirds and shorebirds												
Wedge-tailed shearwater – various breeding sites (DSEWPaC 2012e)												
	Species may be present in the OA											
	Peak period. Presence of animals is reliable and predictable each year											

1.Information regarding seasonal occurrence of marine turtles has been taken from the Recovery Plan for Marine Turtles in Australia 2017–2027 (CoA 2017b).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.7 Key ecological features (KEFs)

KEFs within the Operational Area and EMBA are identified in Table 4-17 and described in Section 9 of the Master Existing Environment. Further information of the KEFs within the Operational Area is provided in the following subsections.

Figure 4-12 shows the spatial overlap with KEFs and the Operational Area and EMBA.

Table 4-17: KEFs within the Operational Area and EMBA

Key ecological feature	Distance and direction from Operational Area to KEF (km)
Ancient coastline at 125 m depth contour	Overlaps Operation Area
Continental Slope demersal fish communities	25 km north
Glomar Shoals	70 km east
Exmouth Plateau	120 km west
Canyons linking the Cuvier Abyssal Plain and the ape Range Peninsula	180 km south west
Commonwealth waters adjacent to Ningaloo Reef	225 km south west
Mermaid Reef and commonwealth waters surrounding Rowley Shoals	375 km north east
Wallaby Saddle	720 km south west
Canyons linking the Argo Abyssal plain with the Scott Plateau	690 km north east
Western Rock lobster	870 km south west
Western Demersal slope and associated fish communities	690 km south west
Ancient coastline at 90 – 120 m depth	875 km south west
Commonwealth marine environment surrounding the Houtman Abrolhos Island	910 km south west
Perth Canyon and adjacent shelf break, and other west coast canyons	910 km south west

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

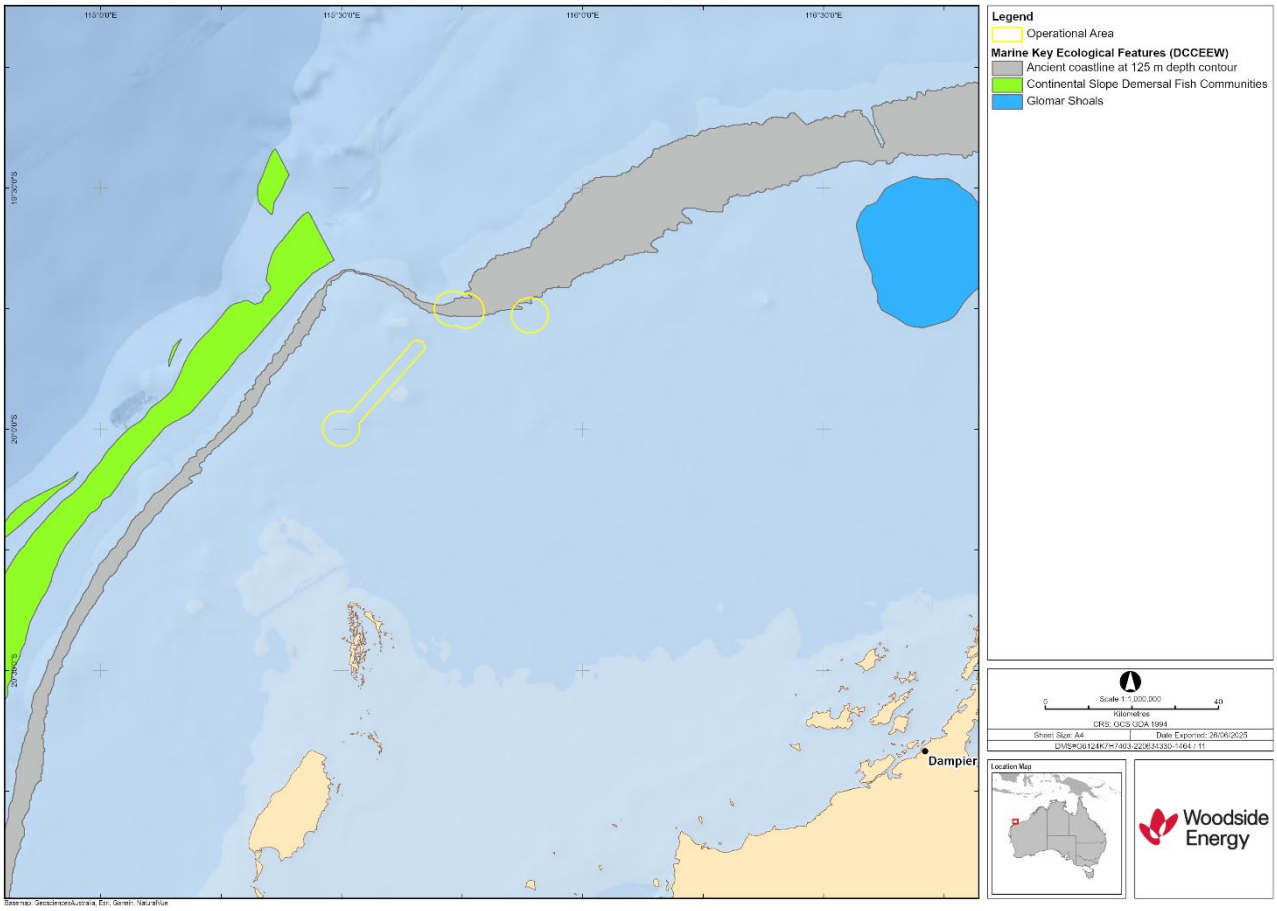

Figure 4-12: KEFs overlapping the Operational Area

4.7.1 Ancient Coastline at 125 m Depth Contour

The Ancient Coastline at 125 m depth contour KEF is recognised for its biodiversity values (unique sea-floor feature with ecological properties of regional significance), which apply to both the benthic and pelagic habitats within the feature (DSEWPC 2012).

Parts of the Ancient Coastline, particularly where it exists as a rocky escarpment, are thought to provide biologically important habitats in areas otherwise dominated by soft sediments (DSEWPC 2012). The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient rich environment. Little is known about fauna associated with the hard substrate of the escarpment, but it is likely to include sponges, corals, crinoids, molluscs, echinoderms and other benthic invertebrates' representative of hard substrate fauna in the North West Shelf bioregion (DSEWPC 2012).

Although the Ancient Coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner, et al. 2009).

4.8 Protected places

The Montebello Australian Marine park overlaps the Operational Area. No other protected places overlap the Operational Area. The Montebello Marine Park is located offshore of Barrow Island and 80 km west of Dampier extending from the Western Australian State water boundary and is adjacent to the Western Australian Barrow Island and Montebello Islands Marine Parks. This Marine Park covers an area of 3413 km² and water depths from less than 15 m to 150 m. Further information on the Montebello Australian Marine Park within the Operational Area is provided in Section 4.8.1.

Protected places within the Operational Area and EMBA are identified in Table 4-18 and presented in Figure 4-13. The Master Existing Environment outlines the values and sensitivities of protected places and other sensitive areas in the Operational Area and EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

IV: Habitat/Species Management Area

V: Protected Landscape

VI: Protected area with sustainable use of natural resources – allow human use but prohibits large scale development.

IUCN categories for the marine park are provided and, in brackets, the IUCN categories for specific zones within each Marine Park as assigned under the North-west Marine Parks Network Management Plan 2018 and South-west Marine Parks Network Management Plan 2018.

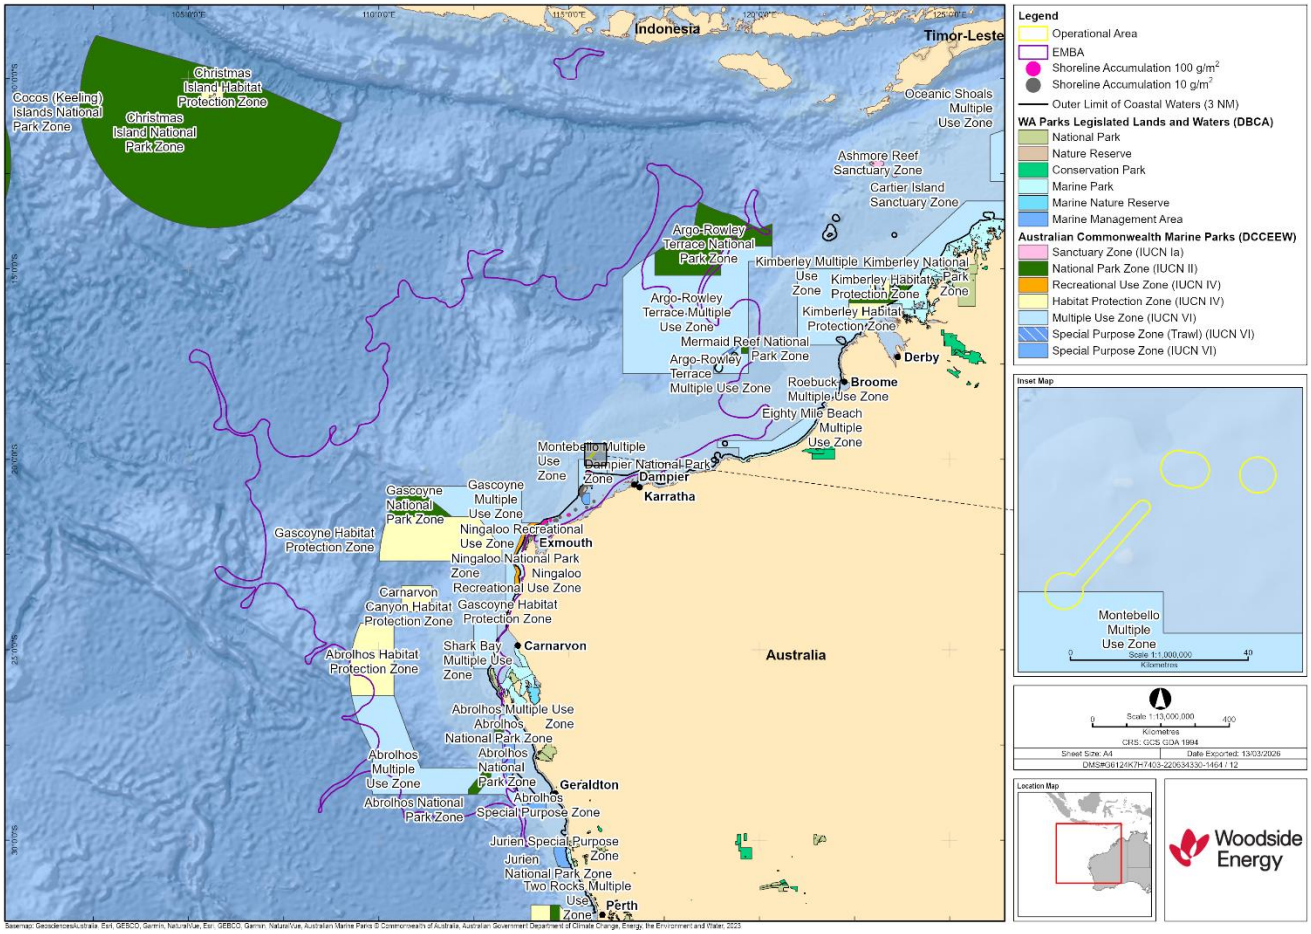

Figure 4-13: Protected areas overlapping the Operational Area and EMBA

4.8.1 Montebello Marine Park

The Montebello Marine Park includes shallow shelf environments and provides protection for shelf and slope habitats, as well as pinnacle and terrace seabed features. The North-west Marine Parks Network Management Plan (DNP 2018) identifies the following values for the Montebello Marine Park:

- **Natural Values**: the Marine Park includes examples of ecosystems representative of the Northwest Shelf Province - a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities. A key ecological feature of the Marine Park is the Ancient Coastline at the 125 m depth contour. The Marine Park supports a range of species listed under the EPBC Act. Biologically important areas within the Marine Park include breeding habitat for seabirds, internesting, foraging, mating, and nesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks.
- **Cultural Values**: the Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara region. Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years.

- **Heritage Values**: no international, Commonwealth or national listings apply to the Marine Park, however the Marine Park is adjacent to the Western Australia Barrow Island and the Montebello– Barrow Island Marine Conservation Reserves which have been nominated for national heritage listing. The Marine Park contains two known shipwrecks listed under the *Historic Shipwrecks Act 1976*: Trial (wrecked in 1622), the earliest known shipwreck in Australian waters and Tanami (unknown date).
- **Social and Economic Values**: tourism, commercial fishing, mining and recreation are important activities in the Marine Park.

4.9 Socio-economic environment

4.9.1 Cultural values and heritage

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of these areas are described. Description of cultural values and heritage as they relate to the wider North-west Marine Region (NWMR) are described in the Master Existing Environment.

4.9.1.1 Native Title

For the activity in this EP, there are no native title claims or determinations, and no ILUAs overlapping the Operational Area. There are eight Native Title claims that interact with the EMBA (Table 4-19). Claims and determinations have not been differentiated in this table, as it is acknowledged that rights and interest may exist within either of these. Figure 4-14 shows the spatial overlap with native title claims and ILUAs.

Further description of how Woodside considers native title rights and interest is provided in the Master Existing Environment.

4.9.1.2 Coastally adjacent First Nations groups

To identify cultural features and heritage values which may exist outside of a native title claim, determination, and ILUA areas, Woodside considers Native Title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (see Section 5).

Further description of how Woodside engages with coastally adjacent first nations groups is provided in the Master Existing Environment.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in Table 4-19 and shown in Figure 4-14.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.1.3 Marine and National Parks

Woodside undertakes an assessment of cultural values within Marine Park Management Plans where the Operational Area or EMBA overlaps a Marine Park.

Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified Traditional Custodians or representative bodies referenced to contact regarding potential cultural features and heritage values. For completeness, Woodside considers cultural features and heritage values identified in the management plans, where EP relevant Traditional Custodians or representative bodies are represented. These values are outlined in Table 4-21.

The Operational Area overlaps the Montebello AMP. The EMBA overlaps a further ten AMPs under the South-West Marine Parks Network Management Plan 2018 (DNP 2018) and North West Marine Parks Network Management Plan 2018 (DNP 2018). The Operational Area does not overlap any State Marine protected areas, however the EMBA overlaps a further 12 State marine protected areas. Where these plans specify identifiable representative bodies who may hold knowledge of heritage values or cultural features – including but not limited to Registered Native Title Bodies Corporate – these bodies are consulted (Section 5). Consultation with these group[s] may identify heritage values and cultural features beyond those

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

addressed in the marine park management plans. Eight identifiable representative bodies were specified for the marine parks overlapped by the EMBA (Table 4-20).

Management plans for the AMPs note shipwrecks within the AMPs and overlap with World, National and Commonwealth heritage lists. These are addressed in Sections 4.9.1.8 and 4.9.1.9.

The Management Plan for the Ningaloo Marine Park and Muiron Islands Marine Management Area 2005–2015: Management Plan Number 52 (Marine Parks and Reserves Authority and Department of Conservation and Land Management, 2005) (relating to the Muiron Islands Marine Management Area and Ningaloo Marine Park) notes the aesthetic values of the seascape as a cultural value and that "Panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves." In particular the plan notes that "Inappropriate structures along the coastline, on the islands and in the surrounding waters have the potential to degrade the aesthetic values of the reserves. Coastal developments and maritime infrastructure projects must therefore be planned with careful consideration of this issue." As the activity described in this EP does not include the addition of any structures within these parks, no impacts on the aesthetic values of these parks are anticipated.

Table 4-20: Summary of the Operational Area and EMBA overlap with Commonwealth and State Marine Park Management Plan areas

Marine Park Management Plan	Operational Area Overlap	EMBA Overlap	Specified bodies
Commonwealth Marine Park Management Plan			
Abrolhos AMP	No	Yes	Yamatji Marlpa Aboriginal Corporation

4.9.1.4 Indigenous protected areas

Indigenous Protected Areas (IPAs) are areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation through voluntary agreements with the Australian Government.

No IPAs were identified within the Operational Area One IPA was identified within the EMBA—the Nyangumarta Warrarn IPA (Unassigned [IUCN VI]) (Table 4-18).

This IPA is described in the Master Existing Environment.

4.9.1.5 Sea Country values

Sea Country can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. Sea Ccountry values of marine ecosystems are further described in the Master Existing Environment.

Woodside initiates consultation on cultural values of Sea Country where Traditional Custodians or representative institutions are identified, or self-identify, as relevant persons.

Cultural features or heritage values related to marine species within the Operational Area or EMBA were identified through publically available literature (Table 4-21) and through consultation in the course of preparing this EP and other Woodside EPs (Table 4-22)

4.9.1.5.1 Desktop assessment of Sea Country values

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the EMBA or Operational Area. Where cultural features or Sea Country values were identified these are summarised in Table 4-21 according to the First Nations groups (where identified or inferable) who hold these values.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	Feature: Potential for UCH in bonaparte basin (Kimberly and Arnhem Land)	Norman et al. (2024)	No	No
	Value: Sea Country *The terms 'Sea Country' or 'Saltwater Country' refer to coastal, island and marine environments that together make up the traditional estates of maritime Indigenous groups in Australia (Smyth 1997):* *The ocean, or saltwater country, is not additional to a clan estate on land, it is inseparable from it. As on land, saltwater country contains evidence of the Dreamtime events by which all geographic features, animals, plants and people were created. It contains sacred sites, often related to these creation events, and it contains tracks, or Songlines along which mythological beings travelled during the Dreamtime or creation period. The sea, like the land, is integral to the identity of each clan, and clan members have a kin relationship to the important marine animals, plants, tides and currents.*	Dermot (2008)	Yes	Yes
	Value: Responsibility for managing Sea Country	Australian Marine Parks (2018)	Possible (unspecified)	Possible (unspecified)
	Value: Management of Sea Country *Aboriginal people of north-western Australia have been sustainably using and managing their sea country for tens of thousands of years, in some cases since before rising sea levels created these marine environments.*		Possible (unspecified)	Possible (unspecified)
	Value: Traditional Fishing and Hunting *Fishing, hunting and the maintenance of culture and heritage*		No	Possible (unspecified)

4.9.1.5.2 First Nations archaeological heritage assessment

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the ATSIHP Act, UCH Act, or EPBC Act. Woodside is not aware of any registered or recorded First Nations archaeology within Commonwealth waters.

There are 44 registered sites and 55 lodged sites identified by the DPLH Aboriginal Cultural Heritage inquiry system (2026) overlapping the EMBA.

The WA Department of Planning, Lands and Heritage (DPLH) maintains a register of registered sites and heritage places including middens, burial, ceremonial [sites], artefacts, rock shelters, mythological [sites] and engraving sites. A search of DPLH's Aboriginal Cultural Heritage Inquiry System was undertaken, which showed 44 registered sites in the EMBA (Appendix C). These included sites along the coast of the North West Cape, Murujuga (Burrup Peninsula), and other mainland coastal areas, registered for artefacts, ceremonial, mythological, middens, and rock shelters.

No specific sites of significance within the Operational Area or EMBA were identified by Traditional Custodians during consultation in the course of preparing the EP.

4.9.1.5.3 Underwater Cultural Heritage

Further information regarding First Nations archaeological heritage in relation to the Ancient Landscape in the North-west Marine Region (NWMR) is described in the Master Existing Environment.

Archaeological material on the Ancient Landscape is a relevant matter for the GWF-4 development as there is overlap between the Operational Area and the Ancient Landscape.

To understand the potential for submerged archaeological material to be present Woodside engages a consultant to undertake a desktop review based on geophysical and bathymetric data.

A preliminary assessment associated with a broader area that encompasses the Operational Area was undertaken (Comber Consultants, 2023). The review did not identify any archaeological sites or values in Commonwealth waters that may be impacted. Certain areas were identified as having the potential to contain submerged archaeological features, and it was recommended that further assessment be undertaken once additional high-resolution data is obtained. Consistent with a staged and risk-based approach, further desktop assessment is planned prior to the Petroleum Activity.

Management controls and further assessment of the potential impacts on archaeological material by the proposed activity is discussed in Section 6.7.2.

4.9.1.5.4 Feedback received via consultation to inform Existing Environment Description

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that "Aboriginal and Torres Strait Islander heritage is managed... according to community ownership" (Heritage Chairs of Australia and New Zealand 2021). Dhawura Ngilan also specifically notes that "Aboriginal and Torres Strait Islander...intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community..." Through consultation with relevant persons, Registered Native Title Bodies Corporate have identified or raised topics relating to environmental values of cultural interest. These include a broad interest in the marine fauna, including whales and turtles (Table 1 in Appendix F).

Feedback received on potential cultural features and heritage values during consultation on Woodside EPs are described in Table 4-22.

Woodside has committed to ongoing engagement to further understand these values. Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-22: Summary of feedback received via consultation to inform Existing Environment Description

Relevant First Nations group / individuals	Consultation context	Description of value / feature / interest	Potential for overlap	
			Operational Area	EMBA
Bardi and Jawi Niimidiman Aboriginal Corporation	Consultation for this EP	*No values raised*	-	-
Bundi Yamatji Aboriginal Corporation (BYAC)	Raised during the course of consultation for another EP	Value: Migratory marine animals *"I draw your attention to the possibility that migrating marine life are part of the life inhabiting or traversing through the SCIPA area (Hutt River coastline to the Abrolhos Houtman Islands) may be impacted by the proposed activities."*	Possible	Possible
		Value: Sea Country Management	Possible (unspecified)	Possible (unspecified)
Buurabalayji Thalanyji Aboriginal Corporation	Raised during the course of consultation for another EP	Value: Connection to Sea Country *Enduring deep connection to sea country north of Onslow, extending out to Islands off the Pilbara coast such as the Montebello islands, Barrow Island and the Mackerel Islands*	Possible (unspecified)	Possible (unspecified)
Gogolayngor Aboriginal Corporation	Consultation for this EP	*No values raised*	-	-
Karajarri Traditional Lands Association	Consultation for this EP	*No values raised*	-	-
Kariyarra Aboriginal Corporation	Raised during the course of consultation for another EP	Value: Turtles	Possible	Possible
		Value: Access to Sea Country (1) Accessing Sea Country for fishing, trapping, crabbing catching turtle, hunting dugong, using stingray barbs for spears and collecting shellfish. (2) Visiting offshore islands at low tide	No (all)	Possible (all)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Relevant First Nations group / individuals	Consultation context	Description of value / feature / interest	Potential for overlap	
			Operational Area	EMBA
		Value: Marine species resources Resource species of cultural interest to Kariyarra people include marine mammals, fish, molloscs including bivalves, gastropods and cephalopods.	Possible	Possible
		Value: The existence of intangible cultural heritage including the Yinta (associated with Sea Country). From Kariyarra Native Title documents it is clear that Yinta are significant cultural/spiritual sites, often a pool or water source but possibly a hill or other feature. These are, at least generally, associated with creation beings and are a core part of cultural rights to land in determining who can use or speak for an area.	Possible (unspecified)	Possible (unspecified)
		Interest: Coastal Landforms (Cultural interest)	No	Possible
		Interest: Coastal Native Vegetation (Cultural interest)	No	Possible
		Feature: Cultural interest in cultural heritage sites associated with the coast and the ocean.	Possible (unspecified)	Possible (unspecified)
		Value: Traditional fishing and gathering rights in the ocean	Possible (unspecified)	Possible (unspecified)
		Value: Cultural interest in intangible cultural heritage associated with the coast and the ocean. (1) Presence of mythic snakes	Possible (unspecified)	Possible (unspecified)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Relevant First Nations group / individuals	Consultation context	Description of value / feature / interest	Potential for overlap	
			Operational Area	EMBA
		Value: Intergenerational Knowledge *In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these communities may be impacted where there is an impact at the species/population level. Impacts to resource collection would be limited to temporary exclusion in areas where there are hydrocarbons present, including shoreline accumulation. Relevant cultural authorities will be engaged in the event of a spill that may affect them...*	Possible (unspecified)	Possible (unspecified)
		Value: Cultural obligations to care for Country, including Sea Country. Value: Secret Habitat Totems associated with Sea Country	Possible (unspecified)	Possible (unspecified)
		Interest: Assertion of sea rights in native title claim area Interpreted as general connection to country, assertion of rights to access country and cultural obligation to care for environmental values of sea country (1) Having duties to look after and protect all KACs Sea Country.	No (based on distance to NT determined area)	Possible
		Value: Marine resources Concern raised about the potential for diseases due to adverse event [hydrocarbon spill]	Possible (unspecified)	Possible (unspecified)
		Value: Responsibility to care for Sea Country Value Marine Resources Kariyarra explained the most important thing is the preservation of sea life and coastal areas. The ocean provides critical food sources to their community and Kariyarra Traditional Owners are coastal people so they have a strong connection to the area and a responsibility to preserve the area for future generations.	Possible (unspecified)	Possible (unspecified)
		Value: Nearshore Islands Islands off Port Hedland - Little Turtle, North turtle and Bedou	No (location specific)	No (location specific)

4.9.1.6 Summary of cultural features and heritage values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under regulation 25 of the Environment Regulations.

The cultural features and heritage values identified in Sections 4.9.1.1 to 4.9.1.7 confirms whether there is any potential for these to exist within the Operational Area or EMBA. As previously described, topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Sections 6.7.2, 6.7.3, 6.7.4 and 6.7.5.

A summary of cultural features and heritage values identified through both consultation and desktop assessment is provided in Table 4-23.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-23: Summary of cultural features and heritage values

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	OA	EMBA
Archaeological heritage and landscapes					
Coastal/ island archaeological sites	Coastal archaeological sites include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources.	✓	✓	No	Possible (shoreline accumulation areas)
Petroglyphs	Petroglyphs are a form of rock art. Petroglyphs are a prominent feature particularly at Murujuga where it is found on hard, volcanic rock.	✓	x	Possible (submerged)	Possible
Fish traps	Stone arrangements constructed in intertidal areas which fill with fish at high tide and trap them at low tide	✓	✓	Possible (submerged)	Possible
Submerged archaeological sites	The Ancient Landscape extends between 12 m and 130 m below current sea level. Ancient occupation of this area may have left traces through now submerged archaeological sites.	✓	✓	Possible	Possible
Rivers, waterholes, tidal channels and seeps	Water sources on the Ancient Landscape which may be culturally significant or archeologically prospective. Traditional knowledge retains knowledge of some water sources on the Ancient landscape and some submerged waterholes are related to a Kangaroo songline.	✓	✓	Possible	Known to occur
Submerged calcarenite ridges/ paleo beach barrier systems	Calcarenite ridges that have formed at former coastal sand dunes have the potential to encase and preserve artefacts from disturbance during inundation where these formed following human occupation.	x	✓	Possible	Known to occur

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	OA	EMBA
Submerged hills	Hills on the Ancient Landscape which may be culturally significant or archeologically prospective. As sea level rose these hills would have become islands and eventually submerged.	x	✓	Possible	Known to occur
Madeleine Shoals	Archaeologically prospective location on the submerged landscape, including igneous geology which has the potential to include rock art.	x	x	No	Known to occur
Karst depressions/ Ravines and valleys between submerged ridges	Natural depressions with the potential to contain artefacts displaced during inundation.	x	x	Possible	Possible
Intangible values					
Songlines	Publicly available literature has noted songlines continue beyond the coast and across the submerged landscape	✓	✓	Possible (unspecified)	Possible (unspecified)
Creation / dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to creation/dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally.	✓	✓	Possible (unspecified)	Possible (unspecified)
Ceremonial sites	Places where ceremony (e.g. Thalu ceremonies) are performed. All identified ceremonial sites are located onshore.	✓	✓	No	Possible (unspecified)
Cultural obligations to care for Country	Cultural obligation to care for the environmental values of Sea Country. Exclusion of Traditional Custodians from Sea Country or decision making processes may inhibit ability to care for Country.	✓	✓	Possible (unspecified)	Possible (unspecified)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	OA	EMBA
Knowledge of Country / customary law and transfer of knowledge	The preservation and transmission of knowledge is dependent on the preservation of the environment generally. Exclusion of Traditional Custodians from Sea Country may inhibit the transfer of knowledge.	✓	✓	Possible (unspecified)	Possible (unspecified)
Connection to Country	Connection to Country is described in publicly available literature as “important to the Traditional owners’ spirituality and religion”. Connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge	✓	✓	Possible (unspecified)	Possible (unspecified)
Access to Country	Limitations on Traditional Custodians accessing or enjoying areas of Sea Country	✓	✓	Possible (unspecified)	No (no limitations on access beyond the OA)
Kinship systems and totemic species	Traditional Custodians have connection to species through kinship and totemic systems.	✓	✓	Possible (unspecified)	Possible (unspecified)
Resource collection	An individual may have obligation to care for or not consume a species to which they are kin.	✓	✓	Possible (unspecified)	Possible (unspecified)
Marine ecosystems and species					
Marine species	Generally raised in engagement with First Nations and literature	✓	✓	Possible	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	OA	EMBA
Marine mammals: Whales	• Generally raised in in engagement with First Nations • Thalu species of totemic importance • Linked to songlines and dreaming stories • Humpback whales in particular	✓	✓	Possible	Possible
Marine mammals: Dolphins	Culturally important species	✓	✓	Possible	Possible
Marine mammals: Dugongs	• Culturally important species • Used as a resource	✓	✓	No	Possible
Marine reptiles: Marine turtles	• Culturally important species and migration • There are Thalu ceremonies associated with turtles • Turtles and turtle eggs as a resource	✓	✓	Possible	Possible
Marine reptiles: Sea snakes	Culturally important species	✓	✓	Possible	Possible
Fish: Fish, sharks and rays	• Culturally important species • Used as a resource • There are Thalu ceremonies associated with increasing fish stocks • Fish, including bream and sting rays are totemic species • Fish, including sharks and rays raised as a natural environment interest	✓	✓	Possible	Possible
Cephalopods: Squid and Octopus	• Thalu species of totemic importance • Resource	✓	✓	Possible	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	OA	EMBA
Seabirds	• Culturally important species • Birds (including shags, seagulls and osprey) and bird eggs as a resource	✓	✓	Possible	Possible
Benthic habitats: Coral	Culturally important with regard to connection to habitats and use of reefs for resources	✓	✓	No	Yes
Benthic habitats: Seagrass	• Culturally important species • Protection of animals.	✓	✓	No	Yes
Benthic habitats: Macroalgal communities	Interest only, raised as a natural environment interest.	✓	✓	Yes	Yes
Benthic habitats: Epifauna and infauna	Interest only, subtidal soft bottom communities raised as a natural environment interest.	✓	✓	Yes	Yes
Shoreline habitats: Mangroves	• Mangrove seeds as resource • Critical breeding ground for marine and terrestrial wildlife. • Mangroves would have provided shelter, crabbing, digging for shellfish, could be turtle nurseries	✓	✓	No	Possible
Shoreline habitats: Intertidal sand/ mudflat communities	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Shoreline habitats: Rocky shores	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Shorelines	Interest only, raised as a natural environment interest.	✓	✓	No	Possible
Marine Parks or Coastal Reserves	Interest and responsibility to manage	✓	✓	Yes	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.1.7 Historic sites of significance

There are no known sites of Historic cultural heritage significance within the Operational Area. Sites within the EMBA are identified in the following sections and described in the Master Existing Environment.

4.9.1.8 Historic underwater heritage

The protection of historic underwater heritage under Commonwealth and State legislation is described in the Master Existing Environment.

The Australasian Underwater Cultural Heritage database records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters. The Australian National Shipwreck Database lists all known shipwrecks in Australian waters. A search of these databases indicated that there are no sites within the Operational Area, however, a number of sites (shipwrecks) exist within the EMBA.

Table 4-24 lists sites identified within 50 km of the Operational Area. Shipwreck locations in the wider NWMR and descriptions of National heritage listed shipwrecks are provided in the Master Existing Environment.

Table 4-24: Underwater heritage sites within 50 km of the Operational Area

Vessel name	Year wrecked	Wreck location*	Distance and direction from Operational Area (km)
Trial	1622	Montebello Marine Park	~30 km south
Vianen	1628	Barrow Island Area	~30 km west
Wild Wave (China)	1873	Monte Bello Island	
Marietta	1905	Barrow Island	
Curlew	1911	Monte Bello Island	

4.9.1.9 World, National and Commonwealth heritage listed places

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in Table 4-25. Section 11.2 of the Master Existing Environment describes the values and sensitivities of these places.

Table 4-25: World, National and Commonwealth heritage listed places within the EMBA

Listed Place	Distance and direction from Operational Area to Listed Place (km)
World Heritage Places (WHP)	
The Ningaloo Coast	~205 km south west
Shark Bay	~575 km south west
Murujuga Cultural Landscape	~105 km south east
National Heritage Places (NHP)	
The Ningaloo Coast	~205 km south west
Dampier Archipelago (including Burrup Peninsula)	~100 km south east
Shark Bay	~575 km south west
Dirk Hartog Landing Site 1616 - Cape Inscription Area	~656 km south west
HMAS Sydney II and HSK Kormoran Shipwreck Sites	~810 km south west

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Listed Place	Distance and direction from Operational Area to Listed Place (km)
Commonwealth Heritage Places (CHP)	
Ningaloo Marine Area - Commonwealth Waters	~225 km south west
Mermaid Reef – Rowley Shoals	~475 km north east
HMAS Sydney II and HSK Kormoran Shipwreck Sites	~810 km south west

4.9.2 Commercial Fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. Data from the Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES) were used to identify if Commonwealth managed fisheries have fished within the Operational Area and EMBA in the most recently available ten-year period of catch and effort data (2014- 2024). FishCube data was also requested from the WA Department of Primary Industries and Regional Development (DPIRD) for the most recently available five-year period of fishery catch and effort data (2019-2024) to analyse the potential for interaction of fisheries with the Operational Area. Data was reviewed from the last five years as a subset of past fishing effort. This was deemed an appropriate period to represent potential future fishing effort over the lifecycle of this EP.

This information was used to determine relevant fisheries for consultation who may be impacted by the proposed petroleum activities. Table 4-26 provides an assessment of the potential interaction and the Master Existing Environment provides further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5). There were no Commonwealth managed fisheries were identified as having being active with the Operational Area and three within the EMBA (Figure 4-17). Six State managed fisheries were identified as being active with the Operational Area and 27 within the EMBA (Figure 4-16).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-26: Commonwealth and State commercial fishery management areas overlapping the Operational Area and EMBA

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
Commonwealth managed fisheries			
Southern Bluefin Tuna Fishery	✓	✓	The SBTF management area covers the entire EEZ around Australia, out to 200 nm from the coast. The fishery targets southern bluefin tuna (*Thunnus maccoyii*) using longline and purse-seine fishing methods. No recent fishing effort has been recorded within the Operational Area or EMBA (ABARES 2024), therefore no interaction is expected.
Western Skipjack Fishery	✓	✓	The combined western and eastern skipjack tuna fisheries management area encompass the entire Australian EEZ. The WSTF extends westward from the SA / Victorian border across the Great Australian Bight and around the west coast of WA to the Cape York Peninsula in Queensland. The fishery targets Western skipjack tuna (*Katsuwonus pelamis*) using purse-seine gear and occasional pole and line fishing methods within water depths of 260 m (AFMA 2023). The WSTF has not been actively fished since the 2008-2009 fishing season.
Western Tuna and Billfish Fishery	✓	✓	The WTBF extends to the Australian EEZ boundary in the Indian Ocean. The fishery targets bigeye tuna (*Thunnus obesus*), Yellowfin tuna (*Thunnus albacares*), swordfish (Xiphias gladius) albacore (*Thunnus alalonga*), and striped marlin (*Kajikia audax*) using pelagic longline fishing gear to catch the targeted species. Minor line (including handline, troll, rod and reel) can be used. These species have a broad distribution and so water depths range between 150 – 600 m water depths. No recent fishing effort has been recorded within the Operational Area (ABARES 2024), therefore no interaction is expected. Recent active fishing effort intersects with the EMBA (ABARES 2024).

[7] *x indicates no spatial overlap with management area and therefore no potential for interaction with planned activities.*

✓indicates spatial overlap with management area.

✓with shading indicates spatial overlap with management area and potential for interaction with planned activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
North West Slope Trawl Fishery NWSTF	x	✓	The NWSTF management area operates off north-western Australia from 114°E to 125°E, and from ~200 m isobath to the outer limit of the AFZ. The fishery targets Australian scampi (*Metanephrops australiensis*), with smaller quantities of velvet scampi (*M. velutinus*) and Boschma's scampi (*M. boschmai*). A quantity of prawns is also harvested each season, and squid is becoming an increasingly significant component of the catch. Mixed snappers (*Lutjanidae*) and redspot emperor (*Lethrinus lentjan*) have historically been an important component of the NWSTF catch. The fishery uses demersal trawl fishing methods typically in waters between 350 – 600 m deep. There is no potential for interaction with this fishery in the Operational Area as it is not within the management area. There has been recent fishing effort recorded in the EMBA (ABARES 2024).
Western Deepwater Trawl Fishery WDWTF	x	✓	The Western Deepwater Trawl Fishery (WDTF) is located in deep water off WA, from the line approximating the 200 m isobath to the edge of the Australian Fishing Zone (AFZ). The fishery targets More than 50 species, historically dominated by six commercial finfish species or species groups: • Orange roughy (*Hoplostethus atlanticus*) • Oreos (*Oreosomatidae*) • Boarfish (P*entacerotidae*) • Eteline snapper (*Lutjanidae: Etelinae*) • Apsiline snapper (*Lutjanidae: Apsilin*ae) • Sea bream (*Lethrinidae)* Demersal trawling is the fishing method used in water deeper than 200 m. There is no potential for interaction with this fishery in the Operational Area as it is not within the management area. There has been recent fishing effort recorded in the EMBA (ABARES 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
State managed fisheries			
Abalone Management Plan 1994	✓	✓	The Abalone Managed Fishery includes all coastal waters from the WA/SA border to the WA/NT border. The fishery is concentrated on the south coast and the west coast. The fishery targets greenlip abalone (Haliotis laevigata), brownlip abalone (Haliotis rubra conicopora) and Roe's abalone (*Haliotis roei*) using diverse fishing methods between 5-40 m water depths. There was no fishing effort reported overlapping the Operational Area between 2019 and 2025 (DPIRD 2025), no interaction with this fishery is anticipated. Recent active fishing effort intersects with EMBA (DPIRD 2024).
Mackerel Managed Fishery Management Plan 2011	✓	✓	The commercial Mackerel Managed Fishery extends from the West Coast Bioregion to the WA/NT border. There are three managed fishing areas: Area 1: Kimberley (121° E to the WA/NT border); Area 2: Pilbara (114° E to 121° E) and Area 3: Gascoyne (27° S to 114° E) and West Coast (Cape Leeuwin to 27° S). The fishery targets: • Spanish mackerel (*Scomberomorus commerson*) • grey mackerel (S. *semifasciatus*) • other species from the genus *Scomberomorus* Using trolling, bait or lure cast, jigging methods. Recent active fishing effort intersects with the Operational Area (Figure 4-13). Recent active fishing effort intersects with EMBA (DPIRD 2024).
Marine Aquarium Fish Management Plan 2018	✓	✓	The Marine Aquarium Fish Managed Fishery can operate in all State waters. The fishery is typically active in the intertidal and nearshore waters, particularly between Esperance to Broome, Perth to Busselton, Karratha to Port Headland, the Gascoyne Region and around Albany (Smith, Newman, and Cliff 2010). The fishery targets Finfish, hard coral, soft coral, tridacnid clams, syngnathids (seahorses and pipefish), other invertebrates (including molluscs, crustaceans, echinoderms etc.), algae, seagrasses and 'live rock'. The resource potentially includes >1,500 species of marine aquarium fishes. The fishery is diver-based, which typically restricts effort to safe diving depths (<30 m). Recent active fishing effort intersects with the Operational Area and EMBA (Figure 4-16) (DPIRD 2024). The DPIRD fisheries data is recorded in 60 nm and 10 nm blocks and refers to how fishing activity is reported and monitored across different sized areas in Western Australia's waters. According to the data provided by DPIRD, fishing effort was recorded within the Operational Area within the 60 nm block.
North Coast Shark Fishing	✓	✓	North Coast shark fishery management area overlaps the Operational Area however no interaction is expected as there was no fishing effort reported within the Operational Area or EMBA between 2019 – 2024.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
(Professional) Notice 1993			
Onslow Prawn Limited Entry Fishery Notice 1991	✓	✓	The Onslow Prawn Managed Fishery encompasses a portion of the continental shelf off the Pilbara coast. The fishery targets: • western king prawns (*Penaeus esculentus*) • brown tiger prawns (*Penaeus esculentus*) • blue endeavour prawns (*Metapenaeus endeavouri*). Using low-opening, otter prawn trawl systems. Recent active fishing effort intersects with the Operational Area and EMBA (Figure 4-15) (DPIRD 2024). The DPIRD fisheries data is recorded in 60 nm and 10 nm blocks and refers to how fishing activity is reported and monitored across different sized areas in Western Australia's waters. According to the data provided by DPIRD, fishing effort was recorded within the Operational Area within the 60 nm block.
Pilbara Crab Managed Fishery Management Plan 2018	✓	✓	The Pilbara Crab Managed Fishery covers inshore waters from Onslow to Port Hedland (between longitudes 115° 5′ 60″ E and 120° E), with most activity around Nickol Bay. Areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management Plan for the Pilbara Crab Managed Fishery (DPIRD 2018). The fishery targets Blue swimmer crab (Portunus armatus) and uses hourglass trap fishing methods in up to 50 m deep waters (Johnston, Yeoh, and Fisher 2020) As the depths of the Operational Area are >50 m, and as there was no fishing effort reported overlapping the Operational Area between 2019 and 2024 (DPIRD 2024),no interaction with this fishery is anticipated. Recent active fishing effort intersects with EMBA (DPIRD 2024).
Pilbara Fish Trawl Interim Managed Fishery Management Plan 1997	✓	✓	The Pilbara Trawl (Interim) Managed Fishery, which is part of the Pilbara Demersal Scalefish Fisheries, is a high intensity fishery divided into two zones in an area governed by Schedule 5 (prohibited to trawling). In addition to the Prohibited Trawl Fishing area, no fish trawl units are allocated for use in Zone 1 or Areas 3 and 6 of Zone 2 (which comprises six management areas). The fishery targets more than 50 scalefish species. The main demersal scalefish species landed by the fishery in the Pilbara region are bluespotted emperor, red emperor and rankin cod. The key species caught by the fishery include crimson snapper, bluespotted emperor trevally and threadfin bream. Fishing methods include edemersel trawl in depths of 50-200 m. As there was no fishing effort reported overlapping the Operational Area between 2019 and 2024 (DPIRD 2024), no interaction with this fishery is anticipated. Recent active fishing effort intersects with EMBA (DPIRD 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
Pilbara Trap Limited Entry Fishery Notice 1992	✓	✓	The Pilbara Trap Managed Fishery, which is part of the Pilbara Demersal Scalefish Fisheries, covers the area from Exmouth northwards and eastwards to the 120°S line of longitude, and offshore as far as the 200 m isobath. The fishery targets: • bluespotted emperor (*Lethrinus punctulatus*) • red emperor (*Lutjanus sebae*) • rankin cod (*Epinephelus multinotatus*). Using demersal fish traps in depths of ~30-200 m isobath. Recent active fishing effort intersects with the Operational Area (Figure 4-13). Recent active fishing effort intersects with EMBA (DPIRD 2024).
Prohibition on Fishing by Line From Fishing Boats (Pilbara Waters) Order 2006	✓	✓	The Pilbara Line Fishery is part of the Pilbara Demersal Scalefish Fisheries. Boat licences are permitted to operate anywhere within 'Pilbara waters', bounded by a line commencing at the intersection of 21° 56′ S latitude and the high-water mark on the western side of the North West Cape on the mainland of WA; west along the parallel to the intersection of 21° 56′ S latitude and the boundary of the AFZ, and north to longitude 120°E. The fishery's catch comprises ~45–50 different fish species. The fishery targets similar demersal species to the Pilbara Trap and Trawl fisheries, as well as some deeper offshore species such as ruby snapper and eightbar grouper. Fishing methods include demersal long line. Recent active fishing effort intersects with the Operational Area (Figure 4-15). Recent active fishing effort intersects with EMBA (DPIRD 2024).
Specimen Shell Management Plan 1995	✓	✓	The Specimen Shell Managed Fishery encompasses the entire WA coastline, but effort is concentrated in areas adjacent to population centres such as Broome, Exmouth, Shark Bay, Geraldton, Perth, Mandurah, and Albany. There are several closed areas where the fishery is not permitted to operate, including various marine parks and aquatic reserves, such as Ningaloo Marine Park. The Perth metropolitan area is also important because of its populations of two rare cowrie species. The fishery targets collection of specimen shells for display, collection, cataloguing and sale. There is some focus of effort on mollusc families that are most popular with shell collectors, such as cowries, cones, murexes and volutes. The fishery uses collection by hand, (diver-based) this typically restricts effort to safe diving depths (<30 m) and ROV collection could enable depths up to 300 m (Hart et al. 2017). There was no fishing effort reported overlapping the Operational Area between 2019 and 2024 (DPIRD 2024), however in fishing effort in the 60 NM block, which overalps the Operational Area was reported in 2025. In addition, recent active fishing effort intersects with the EMBA (DPIRD 2025).

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
The South-West Coast Salmon Fishery	✓	✓	The South-west Coast Salmon Managed Fishery operates on various beaches south of the Perth metropolitan area and includes all WA waters north of Cape Beaufort (on the south coast of WA) except Geographe Bay. The fishery targets: • Western Australian salmon (*Arripis truttaceus*) Using beach seine nets. As there was no fishing effort reported overlapping the Operational Area between 2019 and 2024 (DPIRD 2024), no interaction with this fishery is anticipated. There has been no recent active fishing effort within the EMBA (DPIRD 2024).
West Coast Deep Sea Crustacean Managed Fishery Management Plan 2012	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery extends north from Cape Leeuwin to the WA/NT border in water depths >150 m within the AFZ. The fishery targets deepwater crustaceans: • crystal (snow) crab (*Chaceon albus*) • giant (king) crab (*Pseudocarcinus gigas*) • champagne (spiny) crab (*Hypothalassia acerba*) Catches are dominated by crystal crabs, of which 99% of their total allowable catch was landed in 2020. The fishery uses Baited pots, or traps, are operated in long-lines in depths of >150 m (mostly 500-800 m (WAFIC 2024d)). The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Broome Prawn Managed Fishery Management Plan 1999	x	✓	The Broome Prawn Managed Fishery operates off Broome and forms part of the North Coast Prawn Fishery. The fishery targets: • western king prawn (*Penaeus latisulcatus*) • coral prawns (*Metapenaeopsis sp.*) Using trawling methods typically between 30-60 m but can occur up to 100 m water depths (DEH 2004). The Operational Area does not overlap the fishery management area. There has been no recent active fishing effort within the EMBA (DPIRD 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
Exmouth Gulf Prawn Limited Entry Fishery Notice 1989	x	✓	The Exmouth Gulf Prawn Managed Fishery operates within the sheltered waters of Exmouth Gulf. The fishery occupies a total area of 4,000 km², with only half of this area being trawled (Fletcher and Santoro 2015, 20) The fishery targets: • western king prawn (*Penaeus latisulcatus*) • brown tiger prawn (*Penaeus esculentus*) • blue endeavour prawn (*Metapenaeus endeavouri*) • banana prawn (*Penaeus merguiensis*) using low opening, otter prawn trawl systems. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Gascoyne Demersal Scalefish Management Plan 2010	x	✓	The Gascoyne Demersal Scalefish Managed Fishery is located between the southern Ningaloo Coast to south of Shark Bay, with a closure area from Point Maud to Tantabiddi (WAFIC 2024a). The fishery targets: • pink snapper (*Chrysophrys auratus*) • goldband snapper (*Pristipomoides multidens*) • red emperor (*Lutjanus sebae*) • cod (*Gadus morhua*) • emperor (*Lethrinus miniatus*) using mechanised handlines in depths of >20 m. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Kimberley Crab Managed Fishery	x	✓	The Kimberley Crab Managed Fishery is one of two small trap-based crab fisheries that operate in the North Coast Bioregion between Cambridge Gulf and Broome. The fishery targets: • brown mud crab (*Scylla olivacea*) • green mud crab (*Scylla serrata*). Using Trap fishing methods.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
			The Operational Area does not overlap the fishery management area. There has been no recent active fishing effort within the EMBA (DPIRD 2024).
Nickol Bay Prawn Limited Entry Fishery Notice 1991	x	✓	The Nickol Bay Prawn Managed Fishery operates in nearshore and offshore waters of the Pilbara region along the NWS. Trawling has been reported to occur at several locations along the Pilbara coast east of the Burrup Peninsula, including within Nickol Bay. The fishery targets: • banana prawn *(Penaeus merguiensis*) • western king prawn (*Penaeus latisulcatus*) • brown tiger prawn (*Penaeus esculentus*) • blue endeavour prawn (*Metapenaeus endeavouri*) Using Trawling fishing methods. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Northern Demersal Scalefish Fishery Management Plan 2000	x	✓	The Northern Demersal Scalefish Managed Fishery is part of the North Coast Demersal Resource. The Northern Demersal Scalefish Managed Fishery is divided into two fishing areas: Area 1 (inshore) and Area 2 (offshore). Area 1 permits line fishing only, between the high-water mark and the 30 m isobath. Area 2 permits handline, dropline and fish trap fishing methods and is further divided into zones. Zone A is an inshore area, Zone B comprises the area with most historical fishing activity, and Zone C is an offshore deep slope area representing waters >200 m deep. The fishery targets: • goldband snapper (*Pristipomoides multidens*) • bluespotted emperor (*Lethrinus punctulatus*) • red emperor (*Lutjanus sebae*) • rankin cod (*Epinephelus multinotatus*) using line fishing, handline, dropline and fish trap fishing methods. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Octopus Interim Managed Fishery	x	✓	The Octopus Interim Management Fishery operates from Kalbarri Cliffs in the north to Esperance in the south. The fishery targets Octopus djinda, which is closely related to Octopus tetricus, using passive shelter pots and active traps in waters of up to 70 m.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
Management Plan 2015			The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
West Coast Rock Lobster Managed Fishery Management Plan 2012	x	✓	The West Coast Rock Lobster Managed Fishery operates from Shark Bay south to Cape Leeuwin. The fishery is managed using zones, seasons and total allowable catch. The fishery targets the Western rock lobster (*panullrus cygnus)* using baited pots and by hand. Operational Area does not overlap with fishery management area. No recent active fishing effort intersects with EMBA (DPIRD 2024).
Shark Bay Beach Seine and Mesh Net Management Plan 1992	x	✓	The Shark Bay Beach Seine and Mesh Net Managed Fishery operates from Denham. The fishery targets: • Whiting (yellowfin Sillago schomburgkii and goldenline S. analis), • Sea mullet (*Mugil cephalus*) • Tailor (*Pomatomus saltatrix*) • Western yellowfin bream (*Acanthopagrus australis*) Using Beach seine and mesh net methods. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Shark Bay Crab Managed Fishery Management Plan 2015	x	✓	The Shark Bay Crab Managed Fishery operates within the NWMR. It is based primarily in Carnarvon but operates throughout the waters of Shark Bay. The fishery targets blue swimmer crabs using trap and trawl fishing methods. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Shark Bay Prawn Limited Entry Fishery Notice 1993	x	✓	The Shark Bay Prawn Managed Fishery operates within inner Shark Bay. The fishery targets western king prawns (*Penaeus latisulcatus*), brown tiger prawns (*Penaeus esculentus*), endeavour (*Metapenaeus endeavouri*), coral prawns (*Metapenaeopsis s*p.) using Low-opening, otter prawn trawl systems. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Shark Bay Scallop	x	✓	The Shark Bay Scallop Managed Fishery operates within inner Shark Bay.

Fishery	Potential for interaction during activity[7]		Description
	Operational Area	EMBA	
Management Plan 1994			The fishery targets Saucer scallops (Ylistrum balloti) using low-opening, otter prawn trawl systems. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
West Coast Demersal Gillnet & Demersal Longline Interim Managed Fishery Management Plan 1997	x	✓	The West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery is part of the Temperate Demersal Gillnet and Demersal Longline Fishery, which operates between 26° and 33° S, and the Joint Authority Southern Demersal Gillnet and Demersal Longline Managed Fishery, which operates from 33° S to the WA/SA border. The fishery targets gummy shark (Mustelus antarcticus), dusky shark (Carcharhinus obscurus), whiskery shark (Furgaleus macki), sandbar shark (C. plumbeus) using gillnet and longline fishing methods. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
West Coast Demersal Scalefish (Interim) Management Plan 2007	x	✓	The West Coast Demersal Scalefish Interim Managed Fishery is the main commercial fishery that targets demersal species in the West Coast Bioregion. It encompasses the waters from just south of Shark Bay down to just east of Augusta and extends seaward to the 200 nm boundary. The fishery is divided into four inshore management areas and one offshore management area. The fishery targets over 100 species including Baldchin groper, Dhufish and pink snapper by lines. The Operational Area does not overlap the fishery management area. Recent active fishing effort intersects with the EMBA (DPIRD 2024).
Pearling (Declaration of Zones) Notice 1995 Item 1	✓	✓	Located in shallow coastal waters with the pearl oyster managed fishery designated by four zones extending from Exmouth to Kununurra and the seaward boundary demarcated by the 200 nm EEZ. The fishery targets Pearl oysters (Pinctada maxima) using drift diving methods. As there was no fishing effort reported overlapping the Operational Area between 2019 and 2024 (DPIRD 2024), no interaction with this fishery is anticipated. Recent active fishing effort does intersects with the EMBA (DPIRD 2025).
Pearling (Declaration of Zones) Notice 1995 Item 2	x	✓	
Pearling (Declaration of Zones) Notice 1995 Item 3	x	✓

4.9.3 Traditional and customary fishing

Traditional or customary fishing is typically carried out in shallow coastal waters and/or areas with structures such as reef. The Western Australia Recreational Fishing Guide (2024) states that First Nations people do not need a recreational fishing licence, in any waters, if it is in accordance with continuing tradition, for individual or familial consumption, and not for a commercial purpose.

Due to the offshore location of the Operational Area, there are no traditional or customary fisheries anticipated within the Operational Area

Refer to Section 4.9.1.2 for coastally adjacent first nations groups which may undertake traditional fishing within the EMBA.

Traditional fishing methods in the NWMR are further described in the Master Existing Environment.

4.9.4 Tourism and recreation

A survey report conducted for the 2020–2021 season by the WA DPIRD (Ryan, Lai and Smallwood 2022) identified that most boat-based recreational fishing effort occurred in nearshore habitat (46% and 54% for North Coast and Gascoyne Coast respectively), followed by inshore demersal habitats (32% and 39% for North Coast and Gascoyne Coast respectively). Most fishing effort was attributed to line fishing (87% and 91% for North-Coast and Gascoyne Coast respectively).

Tour operator fishing efforts recorded over a 10-year period (2013–2023) (DPIRD 2023) identified three vessels' operations within the Operational Area. Recreational fisheries in the wider EMBA are expected in shallow coastal waters.

The recreation and tourism industries in the Pilbara are of high social value with approximately 965,000 visitors over the last five years (Tourism Western Australia 2023). Tourism continued to grow in 2022, with over 1 million visitors (Tourism Western Australia 2023).

The Operational Area is located offshore of the North West tourism region which includes parts of the Gascoyne and Pilbara, region. Tourism is a key economic driver for the Pilbara with more than one million visitors to the region every year.

The main marine nature-based tourist activities in the Gascoyne region are concentrated around and within the Ningaloo World Heritage Area (~168 km southwest of the Operational Area). Ningaloo's economic contribution to WA is attributed to four key types of economic activity, tourism expenditure by international, interstate and WA visitors to the Ningaloo region, commercial fishing in the Exmouth Gulf, recreation activity involving the Reef by residents of the Ningaloo region and management and research relating to the Reef (DBCA 2020).

Tourism and recreation in the context of the wider NWMR is described in the Master Existing Environment.

4.9.5 Commercial shipping

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR to reduce the risk of vessel collisions with offshore infrastructure. It is noted that one of these fairways intersect with the Operational Area

The fairway overlaps the eastern side of the Operational Area (Figure 4-18), vessel traffic within the Operational Area is relatively low. Vessel tracking data suggest vessel traffic is higher to immediately to the west and north-east, likely associated with existing oil and gas facilities (e.g. GWA, NRC, Pluto, and Wheatstone platforms). Vessel traffic is also higher further south of the Operational Area, where the increased traffic is likely associated with servicing the resource industry and ports at Barrow Island, Onslow and Dampier.

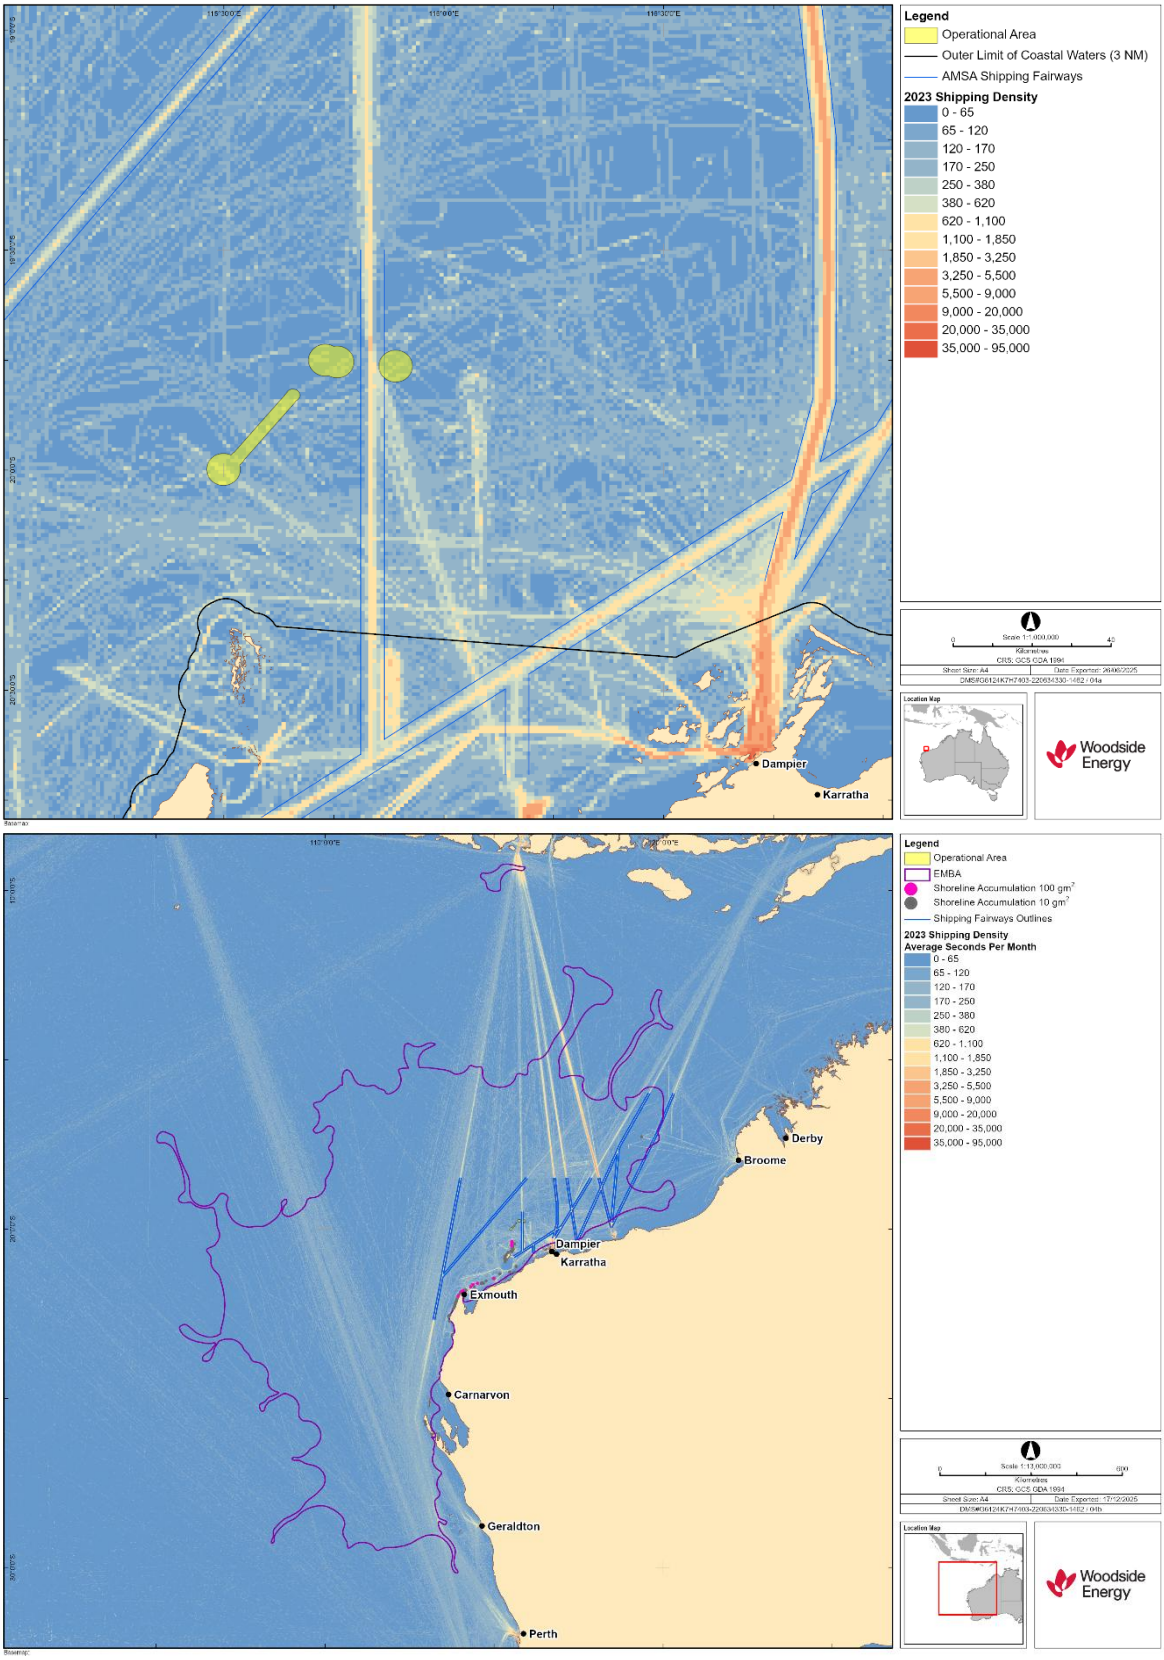

Figure 4-18: Vessel density map for the Operational Area and EMBA

Data derived from AMSA satellite tracking system data (vessels include cargo, LNG tanker, passenger vessels, support vessels, and others/unnamed

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.6 Oil and gas facilities, infrastructure and other industries

Table 4-27 details other facilities, assets and infrastructure located within 50 km of the Operational Area

The Master Existing Environment describes current oil and gas development within the EMBA, also shown in Figure 4-19.

Table 4-27: Other oil and gas facilities, infrastructure and other industries within 50 km of the Operational Area

Facility or asset	Operator	Distance and direction from Operational Area (km)
Facilities		
GWA platform	Woodside	~8 km north-east
Wheatstone platform	Chevron	~9 km west
Pluto platform	Woodside	~10 km west
North Rankin Complex	Woodside	~30 km north-east
Reindeer	Santos	~50 km south-east
Subsea Infrastructure		
GWF subsea infrastructure	Woodside	Overlaps
Pluto export trunkline	Woodside	~1 km south
Two fibre-optic cables	Telstra	The Wilcox flowline will cross both fibre-optic cables[8]

[8] As part of the consultation process for this EP woodside engaged with Telstra with, a Pipeline Crossing Contract between Telstra and Woodside currently being negotiated, noting that the flowline will be installed in accordance with the Agreement.

5. STAKEHOLDER CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations. (In this Section, references to 'regulations' are to the Environment Regulations, unless otherwise stated).

The consultation process is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to assess the merits of objections or claims about the adverse impact of each activity to which the EP relates that are received from relevant persons and for Woodside to adopt appropriate measures (if any) in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP) and will be of an acceptable level.

Consultation is informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa [2022*] FCAFC 193 *(Tipakalippa Appeal)* (see Section 5.2 and 5.5.1) and *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024]* FCA 9 *(Munkara Case*).

For this EP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- the first section (Section 5.2 to 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 25(1) to identify relevant persons
- the second section (Section 5.6 to 5.7) details Woodside's approach to accepting feedback and assessment of the merits of each objection or claim about the adverse impact of each activity to which the EP relates, and engaging in ongoing consultation for this EP.

Woodside's consultation record is in Appendix F and includes a summary of the following:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other stakeholders Woodside chose to consult
- engagement with persons or organisations that Woodside chose to contact who are 'not relevant' persons for the purposes of regulation 25(1) (see Section 5.3.4)
- opportunities provided to persons or organisations to participate in consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

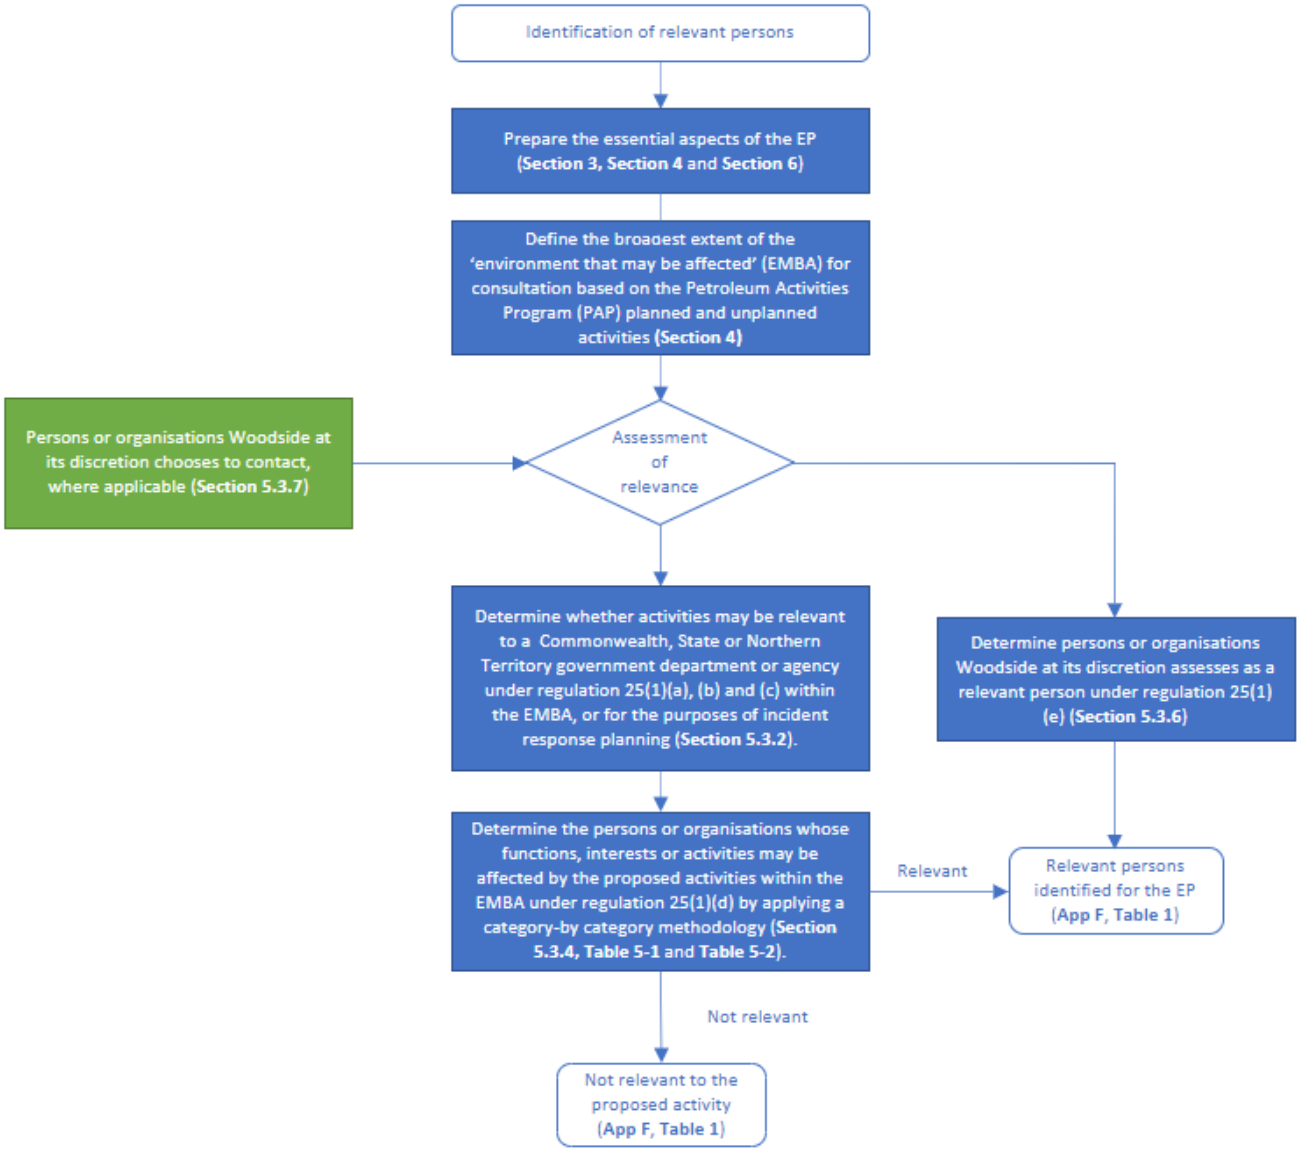

Figure 5-1: Overview of Woodside's methodology to identify relevant persons

5.2 Consultation – general context

Woodside has a portfolio of quality oil and gas assets and more than 40 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential risks and impacts associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations, enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult but, rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a petroleum activity. The information in the consultation list has been captured from years of experience; it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside acknowledges NOPSEMA's GL2086 – *Consultation in the course of preparing an environment plan guideline* (May 2023) as well as judicial guidance in the *Tipakalippa Appeal* on the intent of consultation, as follows:

- At paragraph 54 of the appeal decision: … *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: …*its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The *Tipakalippa Appeal* and *Munkara Case* have also been further considered in the context of specific methods for consultation with First Nations' relevant persons (Section 5.5.1).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons in accordance with regulation 25(1) (Section 5.3). This methodology is consistent with NOPSEMA's Guideline and demonstrates that, to meet the requirements of regulation 34 (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.4)
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 6.8).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 25, which requires a Titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
    - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant
    - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister
    - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister
    - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP
    - any other person or organisation that the Titleholder considers relevant (regulation 25(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 25(2))
- allow a relevant person a reasonable period for the consultation (regulation 25(3))
- tell each relevant person that the Titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the EPBC Act – see Section 2

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (regulation 4)
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity
- is collaborative. Woodside respects that, for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.10).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

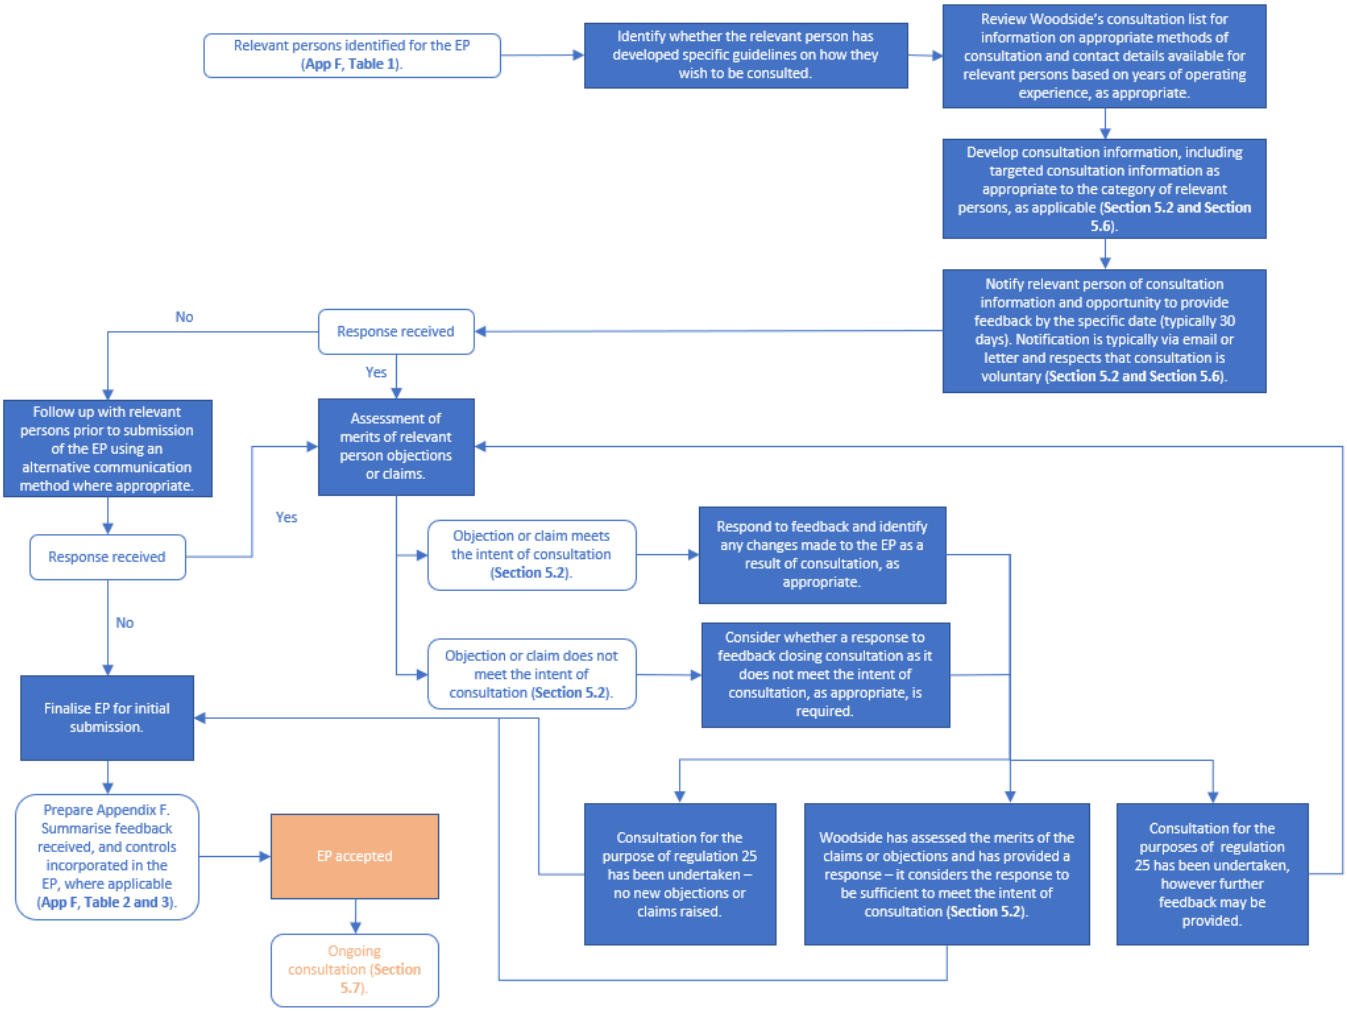

Figure 5-2: Overview of Woodside's consultation approach

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

5.3 Identification of relevant persons for consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons under regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with regulation 25(1)(b), Woodside consults with the Department of the relevant State Minister.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments, as set out on their websites, in NOPSEMA's *GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline* (January 2024), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.
- Woodside has categorised government department or agency groups as follows:

Table 5-1: Government department or agency categorisation

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies, determining whether those responsibilities overlap with potential risks and impacts specific to the Priority Protection Area (PPA) in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry; and AHO is responsible for maritime safety and Notices to Mariners. To undertake proposed activities in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Operational Area. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- The list of government departments and agencies assessed as relevant is set out in Appendix F, Table 1.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the Petroleum Activity in the EMBA or would not be involved in incident response planning.

5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of regulation 25(1)(d), the meaning of "*functions, interests or activities*" needs to be understood. In regulation 25(1)(d), the phrase "*functions, interests or activities*" should be construed broadly and consistently with the objects of the Environment Regulations (regulation 4) and the objects of the *EPBC Act* (Section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance below from NOPSEMA's *GL2086 – Consultation in the course of preparing an environment plan guideline* (May 2023):

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 5-2: Woodside's relevant persons identification methodology

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of 'interest' in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of 'activity' in regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside's methodology for determining 'relevant persons' for the purpose of regulation 25(1)(d) includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.

On the topic of consulting outside of Australia's jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters (Section 4) specifically Indonesian waters. Consideration has been given to the functions, interests or activities that may be affected by the activities to be carried out, should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on there being no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans would be in place or will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,[9] and capable of being discharged within a reasonable time.[10] The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Regulations require relevant persons, and their interests, to be readily ascertainable to the Titleholder[11].In the case of Indonesia, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records which allow for the identification of potential functions, interests or activities e.g. fisheries, tourism licences and permits.

For example, there are no known licencing requirements either in Australia or in Indonesia for traditional Indonesian fishers, therefore, no publicly available information to identify and make contact with persons for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational Area of this activity makes international consultation impractical to discharge from a reasonable time and efforts perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required for the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans provide a mechanism for consultation in international waters that will be complied with at the appropriate

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

time, if an incident occurs. In such circumstances, consultation with the DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult the DFAT for proposed activities outside of Australia's jurisdiction including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the Oil Pollution Emergency Plan –Appendix G of this EP. The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the Oil Pollution Emergency Plan – Appendix G of this EP.

5.3.4 Identification of relevant persons under Regulation 25(1)(d)

Relevant persons under regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 2.1)
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within regulation 25(1)(d), Woodside adopts the following methodology, and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions, interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities to be carried out under the EP. The broad categories are identified in Table 5-3 below and identification methodology applied as set out in Table 5-4.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-2, as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as 'not relevant' but whom Woodside chose to contact, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 3.

Table 5-3: Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the *Commonwealth Fisheries Management Act 1991* (Cth) and the *Western Australian Fish Resources Management Act 1994* (WA), which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Explanation
Titleholders and Operators	Registered holder of an offshore petroleum title or greenhouse gas (GHG) title under the OPGGS Act and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians with cultural rights and interests or cultural functions or who perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and asserts cultural rights, functions, interests or activities they will be considered under the definition of Traditional Custodian for the purpose of this EP (as appropriate).
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the *Native Title Act 1993 (Cth)* by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the *Native Title Act 1993* with prescribed functions, set out in Part 11 of the *Native Title Act 1993*, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Local government and elected Parliamentary representatives and recognised local community reference/liaison groups or organisations	Local government body formed under the *Local Government Act 1995 (WA)* and elected Parliamentary representatives which are responsible for representing the local community. Recognised local community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-4: Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category

Category	Relevant person identification methodology
Commercial fisheries (Commonwealth and State) and peak representative bodies	Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology: • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Confirming whether the EMBA overlaps with the fisheries management area (i.e., the spatial area the fishery is legally permitted to fish in) (see Section **4.9.2**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	• Woodside acknowledges WAFIC's consultation guidance[12], that Titleholders develop separate consultation strategies for significant unplanned events (for example an oil spill) where Titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC's guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs • For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA, ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.9.2). Assessment of relevance: • State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.2) are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC's guidance, Woodside only consults individual licence holders based on WAFIC's advice. Woodside also utilises WAFIC's consultation service whereby WAFIC: – directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area – consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario. • Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.2) are assessed as relevant to the proposed activity. • Based on advice from AFMA, a Commonwealth fishery's representative body is assessed as relevant where the EMBA overlaps the fishery's management area, even if the fishery itself has been assessed as not relevant based on potential for interaction. This approach recognises the representative body's role in representing fishing entitlements within the management area and the use of that area for stock assessment, management strategies and other fisheries management purposes. Recognised Commonwealth fishery representative bodies are identified by AFMA through information published on its website. For State fisheries, representative bodies are assessed as relevant where the fishery they represent is assessed as relevant. WAFIC is the only recognised State fishery representative body.
Recreational marine users and peak representative bodies	Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology: • Using Woodside knowledge and operating experience, applying knowledge of recreational marine users in the area. This assessment is both activity and location based. • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years. Assessment of relevance: • Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. • If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers.

[12] Consultation Approach for Unplanned Events - WAFIC

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	These representative bodies are identified via Woodside's existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.
Titleholders and Operators	Woodside assesses relevance for other Titleholders and Operators using the following steps in its methodology: • Using GPInfo to determine overlap with other Titleholders' or Operators' permit areas within the EMBA. • Using Woodside knowledge and operating experience, applying knowledge of other operators in the area. • Woodside produces a map showing the outcome of this assessment. Assessment of relevance: • Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.
Peak industry representative bodies	Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology: • Review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside's proposed activities within the EMBA. • Review of Woodside's existing consultation list. • Website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. Assessment of relevance: • Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed activities within the EMBA are assessed as relevant.
Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations	Consistent with its understanding of the matters discussed in Section 4.9.1, to identify Traditional Custodian groups or individuals, Woodside: • Uses existing systems of recognition to identify Traditional Owner groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under Native Title or cultural heritage legislation, or marine park management plans, or identification by other Traditional Owner groups or entities) • Notifies and invites consultation with Indigenous Peoples through their nominated representative corporation (for example Prescribed Bodies Corporate (PBCs)); or, in the case of Native Title and where appropriate, the Native Title Representative Body • Requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders) • Requests advice as to other Traditional Owner groups or individuals that should be consulted • Advertises widely so as to invite self-identification and consultation by Traditional Owner groups and individuals. Further detail to Woodside's methodology is as follows. Woodside uses the databases of the National Native Title Tribunal: • To understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA • To understand whether there are any relevant Indigenous Land Use Agreements (ILUAs), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. Where there is a positive determination of Native Title, contacting the PBC or, where their representative is a Native Title Representative Body, contacting the Native Title Representative Body.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	Where appropriate, contacting the relevant Native Title Representative Body to request a list of any Traditional Owner groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA. Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. In Victoria, using the Victorian Aboriginal Heritage Council data to determine whether there are any Registered Aboriginal Parties (RAP) appointed under the *Aboriginal Heritage Act 2006 (Vic)*, that overlap or are adjacent to the EMBA. Traditional Owner groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body. Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means. Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self-identify. Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means that an individual/s functions, interests and activities may be affected by other activities where EMBAs overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess risks and impacts to their values, and enable individuals to self-identify. Assessment of relevance: • Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.
Native Title Representative Bodies	Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology: • A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the *Native Title Act 1993* with prescribed functions set out in Part 11 of the *Native Title Act 1993*, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. • Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA. Assessment of relevance: • Where the area for which a Native Title Representative Body is recognised under the *Native Title Act 1993*, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Historical heritage groups or organisations	Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following steps in its methodology: • Using the Australasian Underwater Cultural Heritage Database to assess known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9.1). Assessment of relevance: • Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.
Local government and recognised local community reference/liaison groups or organisations	Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following steps in its methodology: • Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries 'My Council' database and WA Local Government Association (WALGA) Local Government Directory maps to assess

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	overlap between the local government's defined area of responsibility and the EMBA. • Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. • Woodside reviews the community reference/liaison group's terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e., onshore). Assessment of relevance: • The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant. • The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups, organisations or individuals	Woodside assesses relevance for other non-government groups, organisations or individuals using the following steps in its methodology: • Review of Woodside's existing consultation list. • Website search of registered non-government groups or organisations (i.e., registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website and/or social media material specific to the proposed activity at the time of development of the EP. • Organisation has a publicly available statement (or purpose) that clearly describes their collective functions, interests or activities. • Review of current website and/or social media material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities associated with the EMBA. • Review of an organisation's/individual's feedback to consider whether their functions, interests or activities within the EMBA may be affected by the activities to be carried out under the EP. Considering interests outside the EMBA would be considered too remote and contrary to the purpose of EP consultation. Assessment of relevance: • Registered non-government groups or organisations with current targeted public material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant. • Individual demonstrates their functions, interests or activities may be impacted will be assessed as relevant.
Research institutes and local conservation groups or organisations	Woodside assesses relevance for research institutes and local conservation groups or organisations using the following steps in its methodology: • Review of Woodside's existing consultation list. • Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based. • Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	Assessment of relevance: • Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant. • Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.

5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under regulation 25(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 25(1)(e).

5.3.6 Identification of relevant persons under Regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 25(1)(e).

5.3.7 Persons or organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under regulation 25(1), from time to time there are persons or organisations that Woodside chooses to contact in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 25(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to regulation 25(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisation's relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside's assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

5.3.8 Assessment of relevant persons for the proposed activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as 'not relevant' but chose to contact at its discretion in accordance with Section 5.3.4, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 1 and Appendix F, Table 3.

5.4 Consultation material and timing

Regulation 25(2) provides that a Titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) provides that the Titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons of the proposed activities, respecting that consultation is voluntary, and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Operational Area. Woodside acknowledges published guidance for good practice consultation, relevant to different sectors and

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.4.1 Sufficient information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes:

- a description of the proposed petroleum activity
- the Operational Area
- where the activity will take place
- the timing and duration of the activity
- a location map of the Operational Area and EMBA
- a description of the EMBA
- relevant exclusion zones
- a summary of relevant risks and mitigation and management control measures relevant to the proposed petroleum activity.

It also sets out contact details to provide feedback to Woodside.

The level of information necessary for a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person have not been provided. Woodside acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises persons being consulted that they may inform Titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the *Native Title Act 1993* for Native Title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- phone calls
- face-to-face meetings (virtual or in-person) with presentation slides or handouts as appropriate
- Let's Talk newsletter – digital and hard copy
- maps outlining a person or organisation's defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate
- attendance at on-the-ground community events or planned regional roadshows
- broader awareness campaigns on the how to be involved in the EP consultation process.

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that, as part of genuine two-way dialogue, these forms of communication may evolve including, for example due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

Table 5-5: Typical forms of communications for categories of relevant persons

Category of relevant person	Typically accepted form of communication
Government departments / agencies – marine	Woodside applies NOPSEMA's guideline for engagement with Commonwealth government departments or agencies GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023 by using email for its consultation unless another form of communication is requested. Other forms of communication, such as phone calls, meetings and/or presentation briefings are used on request.
Government departments / agencies – environment	
Government departments / agencies – industry	
Commercial fisheries and peak representative bodies	**Commonwealth commercial fisheries**: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **State commercial fisheries and recreational marine users**: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the *Fish Resources Management Act 1994* and *Aquatic Resources Management Act 2016*, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder's discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **Peak representative bodies**: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Recreational marine users and peak representative bodies	
Titleholders and Operators	Email is used as the primary form of communication between Titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category of relevant person	Typically accepted form of communication
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Historical heritage groups or organisations	NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with government departments or agencies is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Local government and recognised local community reference/liaison groups or organisations	**Local government:** NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023) for engagement with local government is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. **Community reference/liaison groups and chambers of commerce**: Email and presentations are used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Other non-government groups or organisations	Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 2.

Appendix F, Table 3 sets out the information which is provided to persons or organisations that are 'not relevant' for the purposes of regulation 25 but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 25(4), the relevant person may request that the Titleholder notifies NOPSEMA that particular information the person or organisation provides in the consultation not be published, and that information subject to that request will not be published under the Environment Regulations.

5.4.2 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside's methodology allows relevant persons a reasonable period for consultation (regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 sets out a public consultation period of 30 days.
- The Department of Mines, Petroleum and Exploration (DMPE) *Guidelines for Consultation with Indigenous People by Mineral Explorers* directs a period of 21-30 days of consultation with traditional owners.
- While repealed, guidance taken from the *Aboriginal Cultural Heritage Act 2021—Consultation Guidelines* (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period to allow identification, contact and response from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This period of consultation demonstrates that Woodside has provided a "*reasonable period*" for relevant persons to consult in accordance with regulation 25(3). Commentary in the *Tipakalippa Appeal* judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

"*it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time*..."[13]

Woodside seeks feedback in order to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- advertising in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected
- providing consultation materials directly to identified relevant persons as well as persons who are 'not relevant' but Woodside chose to contact and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided.

Woodside considers that consultation for this EP has closed.

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all stages of the life of the EP as per Woodside's ongoing consultation approach described in Section 5.7.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.4.3 Discharge of Regulation 25

The Full Federal Court made clear in the *Tipakalippa Appeal* that consultation should be approached in a "*reasonable", "pragmatic" and "not so literal"* way, so that consultation obligations were capable of being met by Titleholders (Section 5.5.1).[14] Consultation is a "*real world activity*" and must be capable of reasonable discharge.[15] The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.[16]

When the Titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, then regulation 25 consultation requirements are met.[17] Meeting these obligations requires evaluative judgement to determine reasonable satisfaction of the consultation obligation and, as such, the Regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.[18]

While a Titleholder is required to provide an opportunity to consult, the Titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a "*reasonable opportunity*" for consultation must be afforded to relevant persons.[19] A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities; and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under regulation 25 and considers that it is complete.

Appendix F, Table 2 and Table 3 of this EP set out the history of consultation under regulation 25. To the extent a relevant person says that they have further information to share or claims that consultation under regulation 25 has not been completed, Appendix F, Table 2 and Table 3 provide reasons why Woodside considers consultation under regulation 25 has been met, in relation to that relevant person.

5.5 Context of consultation approach with Traditional Custodians

To comply with regulation 25, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal

Woodside has implemented a consultation methodology consistent with regulation 25 and guidance provided in the *Tipakalippa Appeal* (Section 5.2). Woodside's consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Section 5.5.3 to 5.5.7).

Woodside notes the Full Federal Court discussed several *Native Title Act 1993 (Cth*) cases in response to a submission made in that case that a requirement under regulation 25 to consult *"each and every*" relevant person would be "*unworkable*". The reference to Native Title cases dealt with how decision-making processes under the *Native Title Act 1993 (Cth*) requiring "*all*" members of a group to be contacted for

[18] *Explanatory Statement, Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023, page 30 and Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].*

[19] *Cooper v National Offshore Petroleum Safety and Environmental Management Authority (No 2) [2023] FCA 1158 at paragraph [11]; Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at [153].*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

communal approval are interpreted by courts in a "*reasonable*", "*pragmatic*" and "*not so literal*" way,[20] and how obligations to consult "*each and every*" person under regulation 25 should be interpreted in a similarly pragmatic way, so that consultation is workable. The reference to *Native Title Act 1993 (Cth*) vauthorities was made by analogy:

"It can be seen that the terms of [the native title legislation] are somewhat absolute – "all". However, [the native title legislation] has consistently been construed in a way that is not so literal … The cases concerning [the native title legislation] … have reiterated … that [the native title legislation] does not require that "all" of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting." [21]

"We consider the authorities in relation to processes under the NTA to be illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner"[22] (emphasis added).

"…there is no definition of what constitutes "consultation for the purpose of Reg11A [now regulation 25] ... A titleholder will need to "demonstrate" to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons" [23] (emphasis added).

The Judgment in the Tipakalippa Appeal makes it clear that a Titleholder will have some decisional choice in identifying which person(s) are to be approached, how the information will be given to allow the "*relevant person*" to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.[24] Consultation is not fixed to a rigid process and will be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 25 requirements through its consultation methodology (Section 5.5.2).

Consistent with the *Tipakalippa Appeal*, Woodside considers *Native Title Act 1993 (Cth*) -style "*full group*" meetings are not required for there to be compliance with regulation 25. Nominated representative corporations (such as PBCs established under the *Native Title Act 1993 (Cth*)) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. It is not appropriate for Titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation method

Woodside's Indigenous Affairs team has experience in engaging and working with Traditional Custodian organisations and individuals, including within the Commonwealth Native Title and cultural heritage systems, and state and territory cultural heritage and land rights systems. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with Traditional Custodian groups' established channels of communication and methods of consultation. Woodside's Indigenous Affairs team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with Traditional Custodian groups. The Indigenous Affairs team's approach is also informed by the established systems of recognition for Traditional Custodian groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with Traditional Custodian groups in the Northern Territory ('not relevant' for this EP) tends to centre around engagement through Aboriginal land councils (under the

[20] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95], [98], [103]-[104] and [109].*

[21] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [98].*

[22] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [96].*

[23] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [104].*

[24] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [47] and [48].*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aboriginal Land Rights (Northern Territory) Act 1976 (*Cth*)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them.

By contrast, recognition for Traditional Custodian groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993 (Cth*) because the vast majority of the Western Australian coastline is settled under the Native Title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to, Native Title Representative Bodies and PBCs.

Native Title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA and help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgment in the *Tipakalippa Appeal* endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.[25] Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective Traditional Custodian communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (Section 5.5.4), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- advertising in relevant Indigenous and non-Indigenous newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian.
- creating carefully considered Summary Consultation Information Sheets with content developed by Woodside's Indigenous Affairs team to remove jargon and present information in a simplified format.
- directing contact through nominated representative corporations.
- using social media (i.e. Facebook/Instagram), texts, phone calls and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and, on that basis, used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. Indigenous woman, Professor Bronwyn Castle, through 10 years of research found *"Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations*" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- carrying out ongoing consultation post regulation 25 consultation, where Woodside supports ongoing engagement with Traditional Custodians. Woodside is committed to ongoing engagement and support to manage country, including Sea Country.
- basing members of its Indigenous Affairs team in Karratha and Roebourne who serve as on-Country points of contact for Traditional Custodian organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including distributing information and providing notice to the community to support Traditional Custodian attendance and involvement at Woodside's information sessions and community roadshows.
- ensuring that from the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as Elders).

[25] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193 at paragraph [95].[104].[153].*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- holding meetings on Country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate).
- providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The Indigenous Affairs team approach to consultation is also consistent with the Federal Court's decision in the *Munkara Case*. The *Munkara Case* notes that the word "*culture*" (and hence the word "*cultural*") has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people *as a people*. For values, features or beliefs that are expressed by an individual to be "*cultural*" they cannot simply be an individual's belief - the belief must have a communal aspect too, and demonstrate that the "*individual beliefs are broadly representative of the beliefs of other members of the group*"[26]. The phrase "*cultural features*", when applied to "*people*" as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual[27]. When the Indigenous Affairs team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

5.5.3 Identification of relevant persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) (Section 5.2 and 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation, where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.7). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporation. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate, including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.7 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993 (Cth*), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and Native Title/compensation claims under the *Native Title Act 1993* (*Cth*)[28].

[26] *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]*

[27] *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]*

[28] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193, at [104]*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.4 Opportunity to self-identify and identifying other individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section 5.5.3). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Custodians authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so, nor seek to audit the representative entities for compliance with any request.
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.5 Sufficient information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which is provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.4.1). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities. These methods are specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet is developed and reviewed by Woodside's Indigenous Affairs team to ensure that content is appropriate to the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

intended recipients, which is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face-to-face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians location of choice (where practicable) and with their nominated attendees. Along with members of Woodside's Indigenous Affairs Engagement team, key project personnel and environmental experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a Titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.6 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.4.2).

5.5.7 Discharge of Regulation 25

Woodside's consideration and approach to discharging regulation 25 for relevant persons is discussed in Section 5.4.3. In addition to this, Woodside has considered the application of regulation 25 specific to Traditional Custodians based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 is complete (Section 5.4.3).

5.6 Providing feedback and assessment of merit of objections or claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information* for the community, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the EP and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under regulation 34(g), there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Sections 5.3.4 and 5.3.7). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 26(8), sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

5.7 Ongoing consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7.10), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its Management of Change and Review process as appropriate (see Section 7.8).

6. ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENTS CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the Petroleum Activity, using the methodology described in Section 2 of this EP. Impacts and risks associated with the Petroleum Activity are summarised in Table 6-1 and evaluated throughout this chapter.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-1: Environmental impact analysis summary of planned and unplanned activities

Aspect	EP section	Risk rating				Acceptability of impact/risk
		Impact/ consequence	Potential impact/consequence level	Likelihood	Current risk rating	
Planned activities (routine and non-routine)						
Physical Presence Interaction with other marine users	Section 6.7.1	F	No lasting effect. localised impact not significant to environmental receptors	-	-	Broadly acceptable (see Section 2.3.2)
Physical Presence Seabed Disturbance from Drilling Operations, Subsea Infrastructure, MODU Anchoring and ROV Operations	Section 6.7.2	D	Minor impact on environmental feature/s or area/s such as impact on feature of low significance with some ability to recover	-	-	Broadly acceptable (see Section 2.3.2)
Routine Light Emissions: External Lighting on MODU and Project Vessels	Section 6.7.3	F	No lasting effect. localised impact not significant to environmental receptors	-	-	Broadly acceptable (see Section 2.3.2)
Routine Acoustic Emissions: sound emissions from MODU and Project Vessels	Section 6.7.4	E	Slight and low-level impact on environmental feature/s or area/s of low significance attributes.	-	-	Broadly acceptable (see Section 2.3.2)
Routine Emissions: Atmospheric and GHG emissions	Section 6.7.5	F	No lasting effect. localised impact not significant to environmental receptors	-	-	Broadly acceptable (see Section 2.3.2)
Routine and Non-Routine Discharges: Hydrocarbons and Chemicals	Section 6.7.6	F	No lasting effect. localised impact not significant to environmental receptors	-	-	Broadly acceptable (see Section 2.3.2)

6.2 Impacts and risks not deemed credible or outside the scope of this EP

The ENVID identified environmental risks that were assessed as not being applicable within or outside the Operational Area as a result of the Petroleum Activity and, therefore, were determined to not form part of this EP. These are described in the next sections for information only:

6.2.1 Shallow/Near-shore Activities

The Petroleum Activity is located in water depths typically greater than 70 m, noting that water depths at the unnamed shoal are ~40 m, and at a distance of about 30 km to the nearest landfall (Montebello Islands). Consequently, risks associated with shallow/ near-shore activities such as heavy lift activities, vessel anchoring, and risks of grounding were assessed as not credible.

6.2.2 Underwater Noise Emissions from Flaring, Helicopters and ROV

It is not credible that airborne noise from helicopter transfers and flaring would add to levels of underwater noise emanating from the MODU, project vessels and positioning equipment. Similarly, it is not credible that noise from ROV operations at the seabed in 55 – 130 m water depth would add to levels of noise emanating from the MODU and project vessels just below the sea surface, or noise emissions from transponders on the seabed. Noise emissions from these other sources would not add to cumulative sound fields from MODU, project vessel and transponders to any discernible extent. As such noise emissions from these sources has not been considered in Section 6.7.4.

6.2.3 Loss of Containment from Abandoned Wellheads

Several existing wellheads occur in the Operational Area for this EP that have been plugged and abandoned in accordance with applicable legislation at the time of the activity. Barriers are in place down the wells, so if a wellhead was inadvertently damaged or removed through dropped objects or anchor drag, no loss of containment would occur. Therefore, the scenario of loss of containment from existing wellheads on abandoned wells is not considered credible and is not assessed further.

6.3 Cumulative impacts

Woodside has assessed the cumulative impacts of the Petroleum Activity in relation to other relevant development activities which could potentially result in overlapping temporal and spatial extents. In particular, IMR work at existing GWF operating subsea infrastructure may occur while the Petroleum Activity is underway. Additionally, where relevant the cumulative impacts of activities associated with undertaking multiple concurrent or parallel activities associated with this Petroleum Activity have been assessed for cumulative impacts as relevant. Cumulative impacts are addressed where relevant in Sections 6.7 and 6.8.

Given that unplanned activities are not intended to occur during the life of the infrastructure, no reasonable estimate of the frequency, intensity or duration of such activities can be made. If these activities are undertaken, they will be discrete events and any impacts will be localised. As such, Woodside has reasonably assessed unplanned events are not credible, with no consideration of cumulative impacts of repeated unplanned events from the Petroleum Activity or compounding impacts from other petroleum facilities within the region.

6.4 Indirect impacts from activities outside the Operational Area

For the Petroleum Activity, the potential 'indirect' environmental impacts and risks evaluated are those associated with mobilisation/demobilisation of the MODU and project vessels to the Operational Area, such as those considered in the environmental impact assessment in Sections 6.7.1, 6.7.3, 6.7.5 and 6.7.7.

Due to the nature and scale of these potential indirect environmental impacts and risks (such as fuel usage, interaction with other marine users and usual vessel discharges), and the regulatory frameworks and applicable maritime regulations in place to manage them, Woodside considers the potential impacts and risks from mobilisation and demobilisation of the MODU and project vessels to be inherently ALARP. Therefore, Woodside considers that standard vessel and MODU operations are appropriate to manage the potential impacts and risks from mobilisation and demobilisation of the MODU and project vessels to a level that is acceptable.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

GWF-4 well fluids will be processed on the Goodwyn A Platform; all activity, environmental impacts and risks associated with the processing of GWF-4 well fluids are excluded from the scope of this EP and are described in the Goodwyn A Operations EP.

Normal operational discharges from the Goodwyn A Platform arising from production of hydrocarbons from the Petroleum Activity commingled with other production wells are included in the scope of the Goodwyn A Operations EP.

6.5 Environmental performance outcomes, standards and measurement criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes EPOs, EPSs and MC that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and acceptable levels.

The EPOs, EPSs and MC specified in this EP are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the codes and standards, good industry practice and professional judgement outlined in Section 0 as part of the acceptability and ALARP justification process.

As defined in Regulation 5 of the Environment Regulations, an EPO 'for an activity, means a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level'.

EPOs are set so that they are consistent with the principles of ESD as defined in section 3A of the EPBC Act and demonstrated through the acceptability process (described in Section 2.3.2), which is applied to the aspects in Section 6, taking into consideration the principles of ESD. The EPOs have been set at a level of environmental performance that is proportionate to the identified environmental impact or risk.

Impact based EPOs, where qualitative terms (e.g. 'prevent', 'limit') are used in EPOs, are supported by detailed impact assessment in Section 6 such that they can be interpreted as meaning 'impact and risk greater than that predicted in this EP'.

A risk-based EPO ties in with Woodside's risk management processes so that risk is maintained within a level that has been evaluated as being appropriate to the nature and scale of the risk. WMS and relevant controls are used to identify and treat potential step-outs (resulting in an increased likelihood) from expected controls performance or integrity envelopes.

EPSs and MC are defined to measure environmental performance against the EPOs. EPSs are statements of performance required of a control so as to manage risk and/or impacts to ALARP and to an acceptable level. EPSs are used as the basis for environmental performance reporting and demonstrate compliance against the EPO.

MC are outlined defining how environmental performance is measured and they set the criteria to determine whether the EPOs and EPSs have been met during the activity.

For planned activities, where the activity is undertaken as described and the relevant EPS are implemented, it confirms that the EPOs are being met. A breach of the EPOs or EPSs constitutes a 'recordable incident' under the Environment Regulations.

6.6 Presentation

The environmental impact and risk analysis and evaluation, demonstration of ALARP and acceptability, EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the example below. Italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Regulations and/or this EP.

Presence of subsea infrastructure interfering with or displacing third party vessels (commercial fishing)						X							

Description of source of impact

MODU and Vessel Operations

Drilling, subsea installation and contingency activities

Woodside proposes to drill up to five new production wells and may also intervene any of the new production wells, if required. The MODU will be present for up to approximately 90 days per new production well, including mobilisation and demobilisation activities. Therefore, a MODU and support vessels may be present within the Operational Area for up to 15 months. When underway, activities will be 24 hours per day, seven days per week. SIMOPS activities may occur.

An IMR vessel may be used to install Xmas trees if the MODU is unavailable or not deemed suitable. Installation of the Xmas trees by IMR vessel will be up to 3 days per Xmas tree per well (1 day for installation, 2 days for weather standby if required), with no consecutive days occurring as the IMR vessel will be required to return to port following each installation.

The PIV, IMR and support vessels will be used to install and pre-commission the flowlines and subsea infrastructure. The initial campaign for nearfield infill will take ~3 months with a second campaign planned for Wilcox subsea installation activities which is anticipated to take ~4 months. IMR activities can occur at any time during the Petroleum Activities.

The MODU and relevant vessels will have a 500 m safety exclusion zones within the Operational Area for the duration of the Petroleum Activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
Other vessels are also required during the Petroleum Activities, including an anchor handling tugs and support vessels (Table 3-3). Some vessels will need to transit in and out of the Operational Area to port for routine, non routine and emergency operations. The Petroleum Activities is not planned to be executed in a single campaign or in a consecutive sequence. Therefore, the presence of the MODU, subsea installation vessels and other support vessels may occur at any time in the three to four year period for the EP. ***Physical presence of subsea infrastructure*** All installed subsea infrastructure will be located within the Operational Area and will remain for the duration of field life. Wellheads and Xmas trees take up a small area of the seabed (~0.005 km^2) and will rise several meters above the seabed. Subsea infrastructure may take up to approximately 0.023 km^2 of the seabed. For technical reasons, the lower section of the wells may be abandoned, prior to sidetracking, or in the event that a re-spud is required (Section 3.10.1). This is considered a contingent activity and if a well is abandoned due to re-spud, every reasonable attempt to remove the wellhead will be made. However, the wellhead assembly may be left in situ if routine removal techniques are unsuccessful (Section 3.10.6). If a wellhead is left in situ, it could potentially interfere with third party activities (particularly fishing activities).

Impact assessment
Environmental value(s) potentially impacted
MODU and Vessel Operations **Commercial Fisheries** No Commonwealth and only five State-managed fisheries are considered to have limited potential for interaction with project activities (within 10 nm grid blocks) in the Operational Area (Table 4-26). Potential impacts to commercial fishers depends on the use of the area by fishers, and the temporal and spatial extent of the presence of vessels. Potential impacts to commercial fisheries include loss of commercial catch due to displacement from fishing grounds. Fishing effort in the Operational Area is typically low—during the last five seasons (2019–2024), the Pilbara Line Fishery had <3–6 vessels within the 60 nm fishery grid blocks that intersect with the Operational Area, and the Mackerel Managed Fishery recorded ≤6 vessels present within the 10 nm fishery grid blocks that intersect with the Operational Area. Fisheries that target pelagic species (e.g. Pilbara Line Fishery) use lines and fishing effort is focused in the upper part of the water column and therefore are highly unlikely to be impacted by additional seabed infrastructure. Fisheries that target demersal species (e.g. Pilbara Trap Managed Fishery) use long lines and seabed traps which may be impacted by additional seabed infrastructure, however, given the low number of vessels, and if required, only minor deviation around MODU or project vessels, the physical presence of the MODU and support vessels is not expected to substantially affect the functions, interests, or activities of the commercial fisheries. In addition, while the Specimen Shell fishery was identified as being active in the Operational Area, this was based on the 60 nm grid block which also covers the Montebello Islands, Barrow Island and is within 10 km of the mainland. Based on the unlikely presence of the fishery within the Operational Area and the fact that drilling and subsea installation activities will typically be in water depths of greater than 90 m (expect around unnamed shoal) only minor deviation around MODU or project vessels is expected, if required and the physical presence of the MODU and support vessels is not expected to substantially affect the functions, interests, or activities of the commercial fisheries. ***Cultural values and heritage*** In line with Woodside's First Nations Communities Policy (Woodside, 2022), Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage). If avoidance is not possible, Woodside will seek to minimise and mitigate impacts by consulting with First Nations communities and Traditional Custodians. Sea Country includes marine ecosystems and species (refer to following sub sections for specific impact assessments relevant to marine fauna) which may hold both cultural and environmental value, with cultural and environmental values intrinsically linked (DCCEEW 2023, MAC 2022 as cited in Woodside 2023a). The Petroleum activity may impact rights and obligations to care for Sea Country. Excluding Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation) is another potential source of impact. While operational safety exclusion zones will apply, these are spatially limited and temporary, and therefore not expected to prevent Traditional Custodians from maintaining cultural connections to Sea Country or fulfilling obligations to care for Country. Ongoing consultation is intended to facilitate access arrangements where feasibly safe to do so, and to support appropriately informed decision-making processes. Intangible values associated with Sea Country may potentially be impacted where they are physically interrupted by disturbance activities. Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale & Kelly, 2020). Physical sites that have been identified as comprising a component of a songline are important to protect, to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas activities exist in many areas of the NWS, and songlines are still acknowledged

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
and recognised. It is inferred that if there were to be any impacts to surviving songlines, these would be significantly more likely to be described as qualitative (i.e. 'weaken' a songline) rather than binary or absolute (i.e. destroy a songline). Ongoing connection to Sea Country is maintained by Traditional Custodians through living cultural traditions, including the use of resources and the practice of cultural activities such as ceremonies and Dreaming stories. Woodside invites ongoing engagement with relevant Traditional Custodian stakeholders to ensure this connection is uninterrupted by the Petroleum Activity. Any potential impacts to cultural values (both tangible and intangible) associated with Sea Country are not expected. ***Tourism and Recreation*** Tourism and recreational activities are expected to be limited in the Operational Area by the distance offshore and water depths (generally >70 m, except around the unnamed shoal). Some fishing tour operators may be active within the Operational Area, but recent effort is low (typically <3 active licences; Section 4.9.4). Charter fishing that did occur was within the southern part of the Operational Area in the vicinity of the Montebello Marine Park and within fishery grid blocks known to contain shallow bathymetric features (such as banks and shoals). Given the limited tourism and recreation activities, and if required, only minor deviation around MODU or project vessels, the physical presence of the MODU and other project vessels would likely be a minor interference (i.e. navigational hazard) and temporary, localised displacement and/ or avoidance. ***Commercial Shipping*** The potential for interactions with commercial shipping may occur from the physical presence of MODUs and vessels. The number of vessels in the Operational Area will vary depending on activity (e.g. drilling or installation). Although the vessels will move within the Operational Area, the MODU will be stationary during active drilling operations (~90 days per well). A 500 m safety exclusion zone around the MODU and installation vessel may result in minor course deviation for commercial shipping vessels. One of the NWS shipping fairways intersects with the eastern part of the Operational Area, commercial shipping vessel activity within the remainder of the Operational Area is relatively low compared to elsewhere on the NWS (Section 4.9.5). There are higher densities of vessel activities just to the east and west of the Operational Area, where the GWA and Pluto platforms are located. Given the number of commercial shipping vessels, and if required, only minor deviation around MODU or project vessels, the physical presence of the MODU and/or project vessels is not expected to substantially affect the functions, interests, or activities of these commercial shipping vessels. Therefore, the physical presence of the MODU and vessels within the Operational Area is only expected to result in a small interference ((i.e., navigational hazard) with localised displacement and / or avoidance by shipping. ***Oil and Gas and other Industries*** As discussed in Section 4.9.6, the Wilcox flowline and umbilical with cross two telecommunication fiber optic cables. Mattresses installed over existing infrastructure will be placed in a controlled manner, with positioning guidance from an ROV. The trunkline touchdown point will be continually monitored during installation over third party asset crossings to ensure correct instalment and no damage to infrastructure. Activities associated with the physical presence of vessels may result in localised, temporary interference to industry vessels requiring minor course alteration or readjustment in asset management while the Petroleum activity is active in the area. However, impacts are not expected to have lasting effect. ***Physical presence of subsea infrastructure*** Of the active State-managed commercial fisheries within the Operational Area, only one (Pilbara Trap Managed Fishery) uses a fishing method that would interact with the seafloor. Subsea infrastructure has been in place within the Operational Area since the 1990s when production for the GWA Facility commenced. Consequently, the addition of new subsea infrastructure within a similar area is not expected to result in an impact to commercial trap fishing operations (e.g. via loss of catches or damage to fishing equipment). Any deviation required for trap deployment around the subsea infrastructure is not expected to substantially affect to the functions, interests, or activities of the commercial fishery.
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that physical presence of the MODU, project vessels and subsea infrastructure will not result in an impact greater than localised, temporary displacement of shipping and commercial/recreational fishing interests with no lasting effect (i.e. Socio - Economic Impact – F).

Impact assessment				
Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)31***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
Vessels to adhere to the navigation safety requirements including the *Navigation Act 2012* and any subsequent Marine Orders.	F: Yes. CS: Minimal cost. Standard practice.	The Navigation Act regulates ship related activities and invokes certain requirements of MARPOL. Vessels (relevant to class) will adhere to requirements.	Benefits outweigh cost/sacrifice. Control is also Standard Practice.	Yes C 1.1
Establishment of a 500 m safety exclusion zone around MODU and relevant vessels and communicated to marine users.	F: Yes. CS: Minimal cost. Standard practice.	Establishment of a 500 m safety exclusion zone around MODU and relevant vessels reduces the likelihood of interaction with other marine users.	Benefits outweigh cost/sacrifice. Control is also Standard Practice	Yes C 1.2
Mooring systems (chains/wires and anchors) will be removed.	F: Yes CS: Additional cost. Standard Practice.	In accordance with OPGGS Act Section 572.	Benefits outweigh cost/sacrifice.	Yes C 1.3
Reasonable attempts at removal of wellhead(s) will be made in the event of a respud.	F: Yes. CS: Additional cost. Standard practice	In accordance with OPGGS Act Section 572	Benefits outweigh cost/ sacrifice. Control is also standard practice.	Yes C 1.4
Good practice				
Australian Hydrographic Office (AHO) will be notified of activities and movements no less than four working weeks prior to commencement of the Petroleum Activity.	F: Yes. CS: Minimal cost. Standard practice.	Notification of AHO will enable them to update maritime charts thereby reducing the likelihood of interaction with other marine users.	Benefits outweigh cost/sacrifice. Control is also Standard Practice.	Yes C 1.5
Notify relevant government departments, fishing industry representative bodies and licence holders of activities prior to commencement and upon completion of activities.	F: Yes. CS: Minimal cost. Standard practice.	Communication of the Petroleum Activity to other marine users ensures they are informed and aware, thereby reducing the likelihood of interference with other marine users.	Benefits outweigh cost/sacrifice. Control is also Standard Practice.	Yes C 1.6
Notify AMSA Joint Rescue Coordination Centre (ARC) of activities and movements 24 to 48 hours before operations commence.	F: Yes. CS: Minimal cost. Standard practice.	Communicating the Petroleum activity to other marine users ensures they are informed and aware should emergency response be required.	Benefits outweigh cost/sacrifice. Control is also Standard Practice.	Yes C 1.7

Impact assessment				
Apply a 'living heritage[32]' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 2.1
The environmental impacts and risks of the activity will continue to be managed to as low as reasonably practicable and an acceptable level for cultural features and heritage values.	F: Yes CS: Substantial costs	Implementation of activities and associated controls to ALARP and acceptable levels supports the maintenance of cultural features and heritage values	Benefits outweigh cost/sacrifice	Yes C 2.2
Use of cultural heritage monitors on vessels to oversee implementation of controls protecting cultural values	F: No CS: Not feasible	Primary Installation Vessels are POB constrained with no ability to facilitate additional personnel	Not considered – control not feasible.	No
Project inductions to all relevant marine crew, prior to the individual commencing the activity, will include information on cultural features and heritage values, including tangible and intangible cultural heritage.	F: Yes CS: Minimal	Ensures workforce is suitably aware of cultural features and heritage values in the area they are operating.	Benefits outweigh cost/sacrifice.	Yes C2.3
The Petroleum activity will be carried out in accordance with protection declarations relevant to the PAA, under Sections 9,10,12 of the ATSIHP Act.	F: Yes CS: Minimal	Ensures workforce is suitably aware of cultural features and heritage values in the area they are operating.	Benefits outweigh cost/sacrifice.	Yes C2.4

[32] *Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.*

Impact assessment				
Professional judgement – Eliminate				
Limit the Petroleum Activity to avoid peak shipping and commercial fishing activities.	F: No. Shipping occurs year-round and cannot be avoided. SIMOPS with fishing seasons cannot be eliminated as exact timings for all activities are not confirmed. CS: Not considered – control not feasible	Not considered – control not feasible.	Not considered – control not feasible.	No
Professional judgement – Substitute				
No additional controls identified				
Professional judgement – Engineered Solution				
Over-trawl protection on subsea infrastructure.	F: Yes. Over-trawl protection could mitigate against the potential for commercial fishing trawl gear to damage subsea infrastructure and/or result in loss of trawl gear. CS: Significant additional cost	Reduce the potential for snagging of trawl nets if a wellhead is left in situ following abandonment during drilling. However, given there is no currently active trawling fisheries occurring in the Operational Area the benefit is low	Disproportionate. Significant additional costs.	No
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of the physical presence of the MODU/PIV, project vessels and subsea infrastructure on other users, such as commercial fisheries and shipping. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, physical presence of the Petroleum Activity on other users is unlikely to result potential impact greater than no Lasting Effect to commercial fishing and shipping. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet requirements of Australian Marine Orders, and expectations of AMSA and AHS provided during consultation. In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to the interaction with other users have been adopted. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.2.5.2) and Woodside's criteria for demonstrating acceptability (Section 2.3.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of Source of Impact
Subsea Installation Activities Subsea installation of the infrastructure components described in Table 3-5 will result in temporary disturbance and suspension of sediment causing increased turbidity and impacts to benthic habitats during the installation process. The installation of subsea infrastructure (including wellheads, flowlines, umbilicals, flowline and umbilical termination assemblies, flying leads, manifold), supporting structures (e.g. concrete mattresses) and installation aids (clump weights, concrete mattresses, sandbags, bulkabags and rigging) will result in disturbance to benthic habitats where the infrastructure is laid and over time it may be disturbed in the immediate vicinity due to scour and/or build up around the infrastructure. Commencement of the flowline, jumper and umbilical installation generally requires tension to be maintained as it transitions from the installation vessel to the seabed. Therefore, the commencement of installation may start with landing the end of flowline / jumper / umbilical termination head either on the manifold or on the seabed attached to an initiation anchor (suction pile, drag anchor or clump weight/dead anchor). This will cause localised and temporary impacts to water quality in the vicinity of flowline landout. **Span rectification** Optimum flowline and umbilical routes will be selected by considering seabed bathymetry, preinstallation surveys and installation risk management, including dropped object risks and buckling/walking impacts. This reduces the potential for spanning and therefore the need for span rectification, while avoiding potential hard substrate habitats where practicable. Where span rectification is required concrete mattresses or grout bags may be positioned at the identified free span location by the use of the vessel crane and ROV. The dimensions for each concrete mattress are expected to be 6 m x 3 m x 0.3 m. Post-lay span rectification may involve placing grout bags (multiple ~25 kg) or concrete mattresses on the seabed, with the extent of any impact limited to the footprint of the installed flowline. **Stabilisation** Stabilisation is a post lay activity to ensure light items, such as flying leads, remain at their installed positions, i.e., not being shifted due to strong seabed current, by installing sand bags on top at a predetermined spacing. Sand bags generally come in a standard size with 20 kg to 40 kg weight. Concrete mattresses at regular spacings may also be used for stabilisation of some sections of the flexible jumpers, flowlines or umbilicals, subject to detailed design. ***Drilling and MODU Operations*** Drilling activities may result in intermittent or discontinuous direct physical or mechanical disturbance to the seabed up to an approximate 100 m radial distance around each well location due to the installation of the BOP and conductor. The generation and discharge of cuttings and drilling fluids are not considered in this section; refer to Section 6.7.8 for an assessment of drill cuttings and drilling fluids and Section 6.7.9 for an assessment of cement and cementing fluids. ***Mooring Installation and Anchor Hold Testing*** Seabed disturbance may result from the MODU anchor mooring system (for either a moored or hybrid MODU) including placement of anchors and chain/wire on the seabed, potential dragging during tensioning, and recovery of anchors. Mooring may require a 12-point pre-laid mooring system, depending on the time of year; however, for drilling activities outside of cyclone season, a standard eight-point mooring system is more likely. Suction piling may be required for installing the anchors. A hybrid MODU will have either an eight- or 12-point anchoring system which results in seabed disturbance between ~13,000 m² (0.013 km²) and ~19,000 m² (0.019 km²), including allowances for the anchor footprint and disturbance from anchor chains. In addition, there could be a further ~1,000 m² if the anchor does not embed as required and another attempt is required. The seabed disturbance footprint associated with a moored MODU may occur up to ~4 km from the proposed drilling location. At the Wilcox drill centre the anchor installation mooring systems will only be installed once and the MODU will kedge between WCA01 and WCA02. ***ROV Operations*** The use of a ROV during drilling and subsea installation activities as described in Section 3.11.5 may result in temporary seabed disturbance and suspension of sediment as a result of working close to, or occasionally on, the seabed. ROV use close to or on the seabed is limited to that required for effective and safe subsea activities. The footprint of a typical ROV is about 2.5 m × 1.7 m (4.25 m²). Additionally, the ROV may be used to relocate small amounts of sediment material (Section 4.5), for example to create a stable, level surface or to reduce the potential for scouring from subsea equipment (e.g. BOP). This will cause localised and temporary impacts to water quality from increased turbidity and may cause localised and temporary impacts to benthic habitats. ***Marine Growth Removal*** Excess marine growth and calcareous deposits may need to be removed following return to well after a period of suspended drilling. Removing marine growth and calcareous deposits is undertaken via a high-pressure water and/or brushes or acid, by ROV.

Description of Source of Impact

Underwater Acoustic Positioning

Accurate positioning of mattresses, rock berms or structures on the seabed is required as well as for DP station keeping for the MODU and therefore long base line (LBL) and/or ultra short baseline (USBL) acoustic positioning may be required in some instances. Transponders may be moored to the seabed either by a clump weight or mounted on a seabed frame. The standard clump weights used, made of cement or steel, will likely weigh about 80 kilogram (kg). A typical seabed frame is 1.5 m × 1.5 m × 1.5 m in dimension and weighs about 40 kg. On completion of the positioning operation, the array transponders moored by clump weight will be recovered by means of an acoustic release and the clump weights removed from the seabed. The transponders mounted on seabed frames will be removed by ROV.

Contingency Activities – Wet Parking

In the event that mud mats are required to be deployed to allow infrastructure to be temporarily wet parked (Section 3.8.5), an additional temporary seabed disturbance of 3.5 m by 3.5 m per mud mat near the location of the well would occur. Mud mats would be recovered following recovery of infrastructure.

Contingency Activities

Woodside may need to intervene or workover wells within the Operational Area. Any seabed disturbance would be the same as those described for drilling operations and MODU operations. In addition, in the event of a respud of a well the base case would be to remove the wellhead. However, if reasonable attempts at wellhead removal are unsuccessful, a wellhead may remain in situ until the end of field life. If a wellhead is left in-situ, there would be localised seabed disturbance at the wellhead location.

A BOP tether system may be required. This system may consist of clump weights approximately 6 m x 3 m, weighing up to about 75 tonnes each. There would be around four to eight clump weights used, though this may change once seabed and current conditions are better understood. The clump weights would be placed about 20 to 40 m from the wellhead, then the tether would be connected and tensioned using an ROV. The BOP tether system will result in localised seabed disturbance.

Seabed Disturbance Summary

Table 6-2 provides details on the expected total seabed disturbance from the installation of the flowline and subsea infrastructure for this petroleum activity. As detailed within Section 5.2.1 of the Goodwyn Area Infill Development OPP (A1806RH0000003, Rev 7), the estimated infrastructure footprint is ~0.05 km^2 with an estimated infrastructure disturbance of ~2.2 km^2 based on the development of eight wells. This disturbance area takes into consideration that displacement of the flowlines and/or EHUs may occur over time (no displacement of other infrastructure is expected to occur). The proposed disturbance from this activity is well within the estimated disturbance footprint in the Goodwyn Area Infill Development OPP.

The total expected disturbance from the installation of the anchor mooring system is expected to be 0.078 km^2 noting that additional disturbance may occur if more than one attempt is required to embed the anchor. Up to six anchors may be installed in the Montebello Marine Park equating to approximately 0.02 km^2. As detailed in Section 9.2.2.4 of the Goodwyn Area Infill Development OPP (A1806RH0000003, Rev 7) seabed disturbance is limited to 0.11 km^2 in the Montebello AMP.

Table 6-2: Estimated subsea infrastructure footprint and infrastructure disturbance area

Description	***Expected Footprint (km^2)***	***Expected Disturbance Area (km^2)***
Flowlines, EHUs and associated structures (e.g. UTA, FLET)	0.016	1.320
Manifold and associated connections/equipment (e.g. universal connection system termination head, EFLs, HFLs, rigid spools, pressure protection systems)	0.002	0.002
Wellheads, Xmas trees, and associated connections/equipment (e.g. universal connection system termination heads, EFLs, HFLs, well jumpers)	0.005	0.005
Total	**0.023**	**1.327**

Impact Assessment

Potential impacts to environmental values

Water and Sediment Quality

Seabed disturbance has the potential to result in a localised and temporary decline in water quality due to an increase in suspended sediment. After a period, suspended sediments settle and the turbidity in the water column returns to pre-disturbance levels. Any reduction in water quality will be temporary and will be limited to the waters close to the seabed immediately surrounding the disturbance area.

Epifauna and Infauna

Seabed disturbance and potential impacts to epifauna and infauna can occur as a result of the mobilisation and/or displacement of sediments along the flowline and through the placement of the subsea infrastructure. Disturbance to the seabed can alter the physical seabed habitat conditions, resulting in epifauna and infauna community changes (Newell et al., 1998). Potential impacts include:

- Direct impacts, including physical removal and loss of benthic communities and habitat and temporary alteration of the existing hydrodynamic regime within the direct footprint of activities.
- Indirect impacts caused by reduced water quality or increased sedimentation, including indirect effects on filter feeder-sponge habitat through reduced light availability for photosynthesis of the sponges' symbionts and reduced filtering and feeding (Abdul Wahab et al., 2019).

Subsea infrastructure

The installation of the subsea infrastructure will result in the localised loss of epifauna and infauna within the infrastructure footprint.

As detailed in Section 4, the Operational Area includes a variety of benthic communities depending on the substrate type. An assessment of the Operational Area determined that the substrate around the nearfield wells is comprised of soft sediments which are associated with infauna benthic communities. Typically, these communities are characterised by burrowing infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, sea cucumbers). These infauna communities are representative of the Northwest Shelf Province—low abundance and dominated by polychaetes and crustaceans (RPS 2012b). For the nearfields wells seabed disturbance is estimated to be 0.01 km^2 for subsea infrastructure. This estimated extent of direct seabed disturbance is considered small in relation to the extent of the soft sediment benthic communities in the Operational Area and the NWMR. Furthermore over time, sessile benthic biota (e.g. sponges, gorgonians) are expected to colonise this hard substrate, which may then support higher biodiversity benthic fauna than soft sediment habitats. Therefore, the presence of subsea infrastructure may lead to ecological communities establishing in this area that would not have existed here otherwise. For example, pipeline infrastructure has been shown to support more diverse fish assemblages and benthic biota (McLean et al. 2017); these communities are relatively diverse compared to the open water and soft sediment habitats.

At the Wilcox field (in the south-west) consolidated pavement occurs which provides habitat for patchy filter feeder communities. As described in Section 4, environmental surveys have been undertaken by AIMS to characterise the seabed habitats around Rankin bank and the Lady Nora Permberton (LNP) manifold (AIMS 2014) and the characterisation of the seabed habitats was extended in 2024 through surveys for GWF4 to include areas around the Wilcox drill centre and also along the flowline corridor (Worley 2025[33]). The installation of the Wilcox flowline and umbilical is expected to result in the direct loss of ~1 km^2 of benthic habitat and communities. Based on the habitat mapping undertaken in 2024, It is predicted that the footprint of the flowline and umbilical will intercept with bare substrate (sand, gravel etc; ~47%) and filter feeder communities (octocorals and porifera; ~53%), and avoid mapped stony coral habitat. . The filter feeder communities mapped as part of the 2024 survey had a patchy distribution with low cover (typically less than 10% biotic cover) in the flowline corridor route where water depths were greater than 55m.

Conservatively assuming direct loss of benthic communities within the footprint will also occur either side of the flowline and umbilical due to displacement throughout operations, these habitats are well represented throughout the area (See Table 6-3). In addition, as the subsea infrastructure provides hard substrate it is expected that the adjacent benthic biota (e.g. sponges, gorgonians) would recolonise the flowline and umbilical, which would allow the filter feeders communities to re-establish.

Table 6-3: Mapped habitat types and the percentage of disturbance from the installation of the Wilcox flowline and umbilical (Worley 2025)

Habitat Types	Mapped Habitat Types(km^2)	Percentage of habitat lost (%)
Filter feeder communities	56.42	1.25

[33] *Habitats were mapped using a predictive model based on geophysical data and ROV imagery.*

Impact Assessment		
Bare substrate (rock veneer, unconsolidated gravel and sand)	37.63	0.94
Coral habitats	5.27	0

MODU Mooring

Mooring installation activities are likely to result in localised physical modification to a small area of the seabed and disturbance to soft sediment and hard substrates, where present. Impacts from mooring activities (including anchor hold testing) for the nearfield wells are expected to be confined to sediment burrowing infauna and surface epifauna invertebrates, particularly filter feeders, inhabiting the seabed directly around the anchor test location (Hughes et al., 2010; Gates and Jones, 2012). Impacts to these broadly represented communities are expected to be highly localised with no significant impact to environment receptors. Literature suggests recovery from physical disturbance can range from weeks to over five years (Kraus and Carter 2018). The recovery of the physical environment is variable and dependent on a number of factors, including sediment supply, wave and current activity, and water depth. It is expected that benthic communities will recover at rates similar to physical restoration.

The proposed mooring pattern for the wells is still unknown however there will only be one mooring installation systems installed for the WCA01 and WCA02 wells and therefore it is expected that approximately up to 0.03 km^2 of seabed may be disturbed. The area around the drill centre is in water depths of 60-75 m and is mostly characterised by bare sand. There are areas of rock veneer with scattered biota consisting of filter feeder communities (e.g. octocorals and porifera) though biotic cover was generally low (2.73 to 13.9%) (Worley 2025). Assuming that the installation of the mooring system resulted in the direct loss of these community types this would represent less than 0.07% of mapped filter feeder communities.

Therefore, seabed disturbance within the Operational Area is not expected to result in a consequence greater than minor disturbance to habitats or biological communities, or affect ecosystem function, and thus the consequence level is ranked as D.

Key Ecological Features

The potential for changes to a KEF may occur from either temporary seabed disturbance (e.g. sampling or positioning) or the physical presence of subsea infrastructure. The nearfield wells overlap the ancient coastline at 125 m depth contour KEF. Therefore, seabed disturbance in this area is expected to be limited to 0.07 km^2 which is a negligible area for the KEF, which is 16,190 km^2.

As described in Section 4.7, the values of this KEF include providing areas of hard substrate that may result in higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment. However, assessment of the geophysical data did not identify any hard substrate. Furthermore, while physical habitat modification is listed as a pressure within the Marine Bioregional Plan for the NWMR, but has not been identified a pressure of concern for this KEF (DSEWPaC 2012b).

Therefore, seabed disturbance within the KEF is not expected to result in a consequence greater than minor disturbance to habitats or biological communities, or affect ecosystem function.

Cultural heritage values

The Operational Area partially overlaps the ancient landscape, which is defined as the area from the WA coast to the Ancient Coastline at 125 m Depth Contour KEF. This area has been identified as having the potential for First Nations archaeological heritage material to exist on the seabed. Therefore, seabed disturbance from subsea installation and mooring activities has the potential to impact on underwater Cultural Heritage Values, if present, that could include either First Nations cultural material or unidentified shipwrecks.

Known Indigenous heritage places, including archaeological sites, may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or EPBC Act 1999. Woodside understands there is no Indigenous archaeology known to exist within the Operational Area and no areas subject to declarations or prescriptions under these Acts are located within the Operational Area.

No sites of significance were identified by Traditional Custodians during consultation while preparing this EP. Controls (See Control 2.5) have been adopted to help further understand the potential for underwater cultural heritage before seabed is disturbed.

Australian Marine Parks

No top-hole sections for production wells or other subsea infrastructure will occur within the boundary of the marine park, but it is possible that the MODU mooring system may extend within the marine park boundary for activities at the Wilcox drill centre. Therefore, while the Operational Area partially overlaps the Montebello Marine Park (Figure 4-13) seabed disturbance, from MODU anchoring, is predicted to be 0.02 km^2, which represents less than 0.0006% of the marine park.

The values of the Montebello Marine Park (as described in Section 4.8.1) include ecosystems representative of the Northwest Shelf Province, including areas of ancient coastline. Benthic habitats and potential impacts would be as described above for the Wilcox wells. Therefore, seabed disturbance within the Montebello Marine Park is not

shoals within the Operational Area		potential sensitive benthic habitats (e.g. coral reef tops).		
Top hole locations will not occur within 500 m of identified shoals within the Operational Area.	F: Yes. CS: Minimal costs	Ensuring that activities of the Petroleum Activity are spatially removed from shoals to avoid impacts to potential sensitive benthic habitats (e.g. coral reef tops).	Benefits outweigh cost/sacrifice.	Adopted See top hole locations in Table 3-3 and Figure 4-3 C 3.4
Seabed Disturbance from anchor infrastructure within the Montebello Marine Park will be limited to less than 0.11 km^2.	F: Yes. CS: Minimal costs	Minimize the seabed disturbance to will in turn minimize the impact on Montebello Marine Park.	Benefits outweigh cost/sacrifice.	Yes C 3.5
Apply a 'living heritage[34]' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 2.1
The environmental impacts and risks of the activity will continue to be managed to as low as reasonably practicable and an acceptable level for cultural features and heritage values.	F: Yes CS: Substantial costs	Implementation of activities and associated controls to ALARP and acceptable levels supports the maintenance of cultural features and heritage values	Benefits outweigh cost/sacrifice	Yes C 2.2

[34] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

Demonstration of ALARP				
Control Considered	***Control Feasibility (F) and Cost/Sacrifice (CS)[26]***	***Benefit in Impact/Risk Reduction***	***Proportionality***	***Control Adopted***
Undertake an ALARP demonstration for identified filter feeder communities that will be adversely impacted by subsea infrastructure. The ALARP demonstration shall assess the options in consideration of factors such as the technical feasibility, costs and health/safety, in the context of the mitigation hierarchy.	F: Yes CS: Substantial; more than $ 4M USD	See below	Control grossly disproportionate.	Yes, the adopted Wilcox flowline route results in no direct impacts to mapped stony coral benthic communities.
Hard substrate was identified in the vicinity of the Wilcox well locations and extended intermittently to the LPA tie-in point for the Wilcox flowline. Therefore, to understand the seabed and potential benthic communities a study was undertaken using geophysical and ROV data to characterise and map the benthic habitats and communities in the Wilcox field (Worley, 2025; Section 4.5.1.1). The proposed Wilcox flowline route was then overlaid on the habitat map to identify the potential disturbance to the different mapped habitats. During this assessment it was noted that the planned route included moderate-high rock with stony corals and mixed biota. As it was considered that these coral habitats have potentially longer recovery time the flowline route was rerouted, extending the proposed length of the route by 10s of metres, to avoid these mapped sensitive stony coral habitats. Avoidance of all mapped filter feeder habitat is not possible due to its intermittent and widespread distribution along the Wilcox flowline route. However, further assessment was undertaken to consider additional optimisation of the route to reduce overlap of the flowline corridor with filter feeder communities, octocorals and porifera. The environmental surveys (Worley 2025) identified that in water depths of 60-70 m the substrate type was mostly rock and sand veneer with a low cover of biota. Therefore, an assessment was undertaken to consider a flowline route that remained within water depths greater than 70 m, resulting in the flowline extending directly west of the Wilcox drill centre before turning north to connect to the LPA PLET. This route was as per the nominal flowline route presented in Figure 5-2 of the Goodwyn Area Infill Development OPP, however extending the route an additional 1.3 km in length to the east only resulted in reduction of 0.02 km^2 of filter feeder habitat. Furthermore, the distribution of filter feeders within this area is patchy with low biotic cover (Worley 2025; Jones et al 2021) and considered to be well represented in the area (Table 6-3; Worley 2025). Therefore, the increased length of a flowline route (~1.3 km) that avoids these habitats is not considered proportionate to the benefits as it results in additional installation time, increasing H&S exposure hours and increased emissions from vessel use and results in a substantial increase in costs.				
Professional Judgement – Eliminate				
Do not use ROV close to, or on, the seabed.	F: No. The use of ROVs (including work close to or occasionally landed on the seabed) is critical as the ROV is the main tool used to guide and manipulate equipment during drilling. ROV usage is already limited to only that required to conduct the work effectively and safely. Due to visibility and operational issues ROV work on or close to the seabed is	Not assessed, control not feasible.	Not assessed, control not feasible.	No

	avoided unless necessary. CS: Not assessed, control not feasible			
Professional Judgement – Substitute				
No additional controls identified.				
Professional Judgement – Engineered Solution				
No additional controls identified.				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of benthic habitat disturbance from MODU station holding, drilling and subsea installation activities and ROV operations. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of Acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, disturbance to benthic habitats within the Operational Area is not expected to result in a consequence greater than minor disturbance to habitats or biological communities, or affect ecosystem function. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet the requirements of Woodside's relevant systems and procedures. In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill Development OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to potential seabed disturbance have been adopted. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of seabed disturbance to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

External light emissions on board MODU and project vessels						X	A	F	-	-	GP	Broadly Acceptable	EPO 3c, 4, 2a°, 2b
Flaring						X							

Description of source of impact

MODU and Vessel Operations

The MODU and project vessels will have external lighting to support safe navigation and safe operations at night. This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. The spectral signatures associated with MODU lighting are estimated as 530 to 620 nanometres (SKM and ERM 2008). Lighting is required for the safe operation of the MODU and project vessels and cannot be reasonably eliminated.

During drilling and completion activities, artificial light will be emitted from flaring during well unloading to the MODU. Noting that nearfield wells are planned to be unloaded to host (i.e. to the GWA platform outside the scope of this EP) and the Wilcox wells to the MODU. Flaring during well unloading at the MODU will be of short duration (typically occurs for about one to two days per well), with a maximum flow rate of 75 MMscfd.

Measurements of natural gas flares have shown peak spectral signatures typically within the invisible infrared range (750 to 900 nanometres), with lower levels of light emitted within the lower (and visible) wavelength ranges (Hick 1995; Pendoley 2000). Flow rates did not appear to change the spectral signature of gas flares (Hick 1995; Pendoley 2000).

Cumulative light sources

Cumulative light impacts have the potential to occur from multiple vessels in the Operational Area, if an IMR vessel is being utilised for Xmas tree installation or subsea installation activities occur concurrently during drilling activities. This scenario would include the MODU, the IMR or subsea installation vessel and two OSVs on standby and resupplying the rig resulting in slightly elevated ambient light levels. Cumulative impacts from light during this scenario would be limited to a short duration. Light emissions from the adjacent vessels/MODU sources would result in a slightly greater overall spatial area being exposed, as well as cumulative emissions in the area between the MODU/vessels (noting that light intensity is inversely proportional to the distance from the source, and therefore the overlap in emissions is typically not occurring for the highest light intensities).

Additionally, IMMR activities on the subsea infrastructure associated with the Goodwyn A Operations EP may occur which may result in slightly elevated ambient light levels.

Impact assessment

Environmental value(s) potentially impacted

Light modelling

The largest sources of artificial light (MODU and installation vessel operation) were selected for modelling because they represent the greatest spatial extent of potential impacts. Based on Woodside's previous modelling and monitoring campaigns for similar activities on the NWS, these lighting analogues were selected to inform the impact assessment of light emissions from the GWF4 drilling and installation activities:

- a drilling rig during drilling activities at the Torosa field (Pendoley Environmental 2022)
- a pipelay vessel associated with the Scarborough trunkline (Pendoley Environmental 2020b; Woodside 2020b).

The ILLUMINA model was used for both studies and is a well-documented, open-source model selected for its ability to represent light across large areas and distances and equally across the entire visible spectrum, including biologically meaningful light from 350 nm to 700 nm. The model is a three dimensional (3D) model and accounts for both line of sight and atmospheric scattering, allowing light attenuation over distance and light glow extent to be modelled. The following scenarios were included

Drilling Scenarios

- Light modelling from the MODU included two scenarios one included operational light and the other also included flaring. Specifics of the MODUs light inventories were input into the ILLUMINA model.

Vessel Scenarios

- The study included two scenarios for the pipelay vessel, both near the Dampier Archipelago. Specifics of the vessels' light inventories were input into the ILLUMINA model.

In the absence of any published or generally accepted units of measurement, or scale, for measuring the impact of artificial light on marine fauna, moonlight was selected as a proxy and the light model output (radiance, in units of W/m²/sr) was converted to units of full moon equivalents (Pendoley Environmental 2020b). Table 6-4 lists the potential impact criteria for marine turtles based on radiance thresholds relative to moon radiance.

Table 6-4: Potential impact criteria for marine turtles to artificial light emissions

Proportion of Radiance of a Full Moon[1]	Impact to potential to Marine Turtles
1 to 10	Light or light glow visible and impact likely; represents a very bright light equivalent to up to 10 times the radiance of one moon. This light radiance will override the moderating influence of the ambient full moon at the time of exposure.
0.1 to 1	Light or light glow visible and behavioural impact possible, depending on ambient moon phase at the time of exposure, which will influence the visibility of the artificial light sources. Artificial lights will be more visible to marine turtles under a first quarter moon than under a full moon.
0.01 to 0.1	Light or light glow visible but behavioural impact unlikely (i.e. not biologically relevant). Equivalent to the light output from the first quarter moon to new moon.
<0.01	Light or light glow is considered ambient and no impact expected; equivalent to a new moon.

1. Where 10 equals the radiance of ten full moons and 0.01 equals a 100th the radiance of one full moon

MODU light modelling results

Modelling predicted that illuminance levels from the MODU were:

- 0.001 x full moon for operational lighting at 20 km from the MODU
- 0.020 x full moon for well clean up flaring at 23 km from the MODU

The results show that at 20 km from the MODU, radiance from operational light is reduced to ambient conditions and at 23 km from the MODU, radiance from flaring is visible but behavioural impacts are unlikely.

Vessel light modelling results

Modelling for the pipelay vessel predicted the following illuminance levels

- 10 × full moon ~0.2 km from the vessel
- 1 × full moon ~0.6 km from the vessel
- 0.1 × full moon ~1.8 km from the vessel
- 0.01 × full moon ~5.7 km from the vessel.

The results show that ~5.7 km from the pipelay vessel, radiance has reduced to ambient conditions. At distances ~1.8 to 5.7 km from the pipelay vessel, light may be visible, but is not expected to be biologically relevant and result in

Impact assessment

behavioural impacts. At distances of less than ~1.8 km from the pipelay vessel, the level of radiance is considered biologically important and behaviour impacts may occur (Pendoley Environmental 2020b).

Artificial Light Exposure Areas

A conservative approach has been adopted regarding consequence evaluation, with a 23 km buffer applied around the Operational Area for use in the impact assessment for turtles. This same approach has been taken to inform the impact assessment for seabirds; however, the buffer around the Operational Area is 20 km, which is based on the recommendations of the National Light Pollution Guideline (DCCEEW, 2023k).

Light emissions can affect fauna in two main ways:

- Behaviour: Many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle, as well as the night time phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- Orientation: Species such as marine turtles and birds may also use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may act to override natural cues leading to disorientation.

The fauna within the Operational Area are predominantly pelagic fish and zooplankton, with a low abundance of transient species such as marine turtles, whale sharks, whales and migratory seabirds. The Operational Area overlaps with Habitat critical for survival of flatback turtles as well as BIAs for flatback turtle internesting, whale shark foraging, and wedge-tailed shearwater breeding (Section 4.6).

Marine Turtles

Artificial light may result in behavioural changes to marine turtles, particularly around nesting beaches—adult females and emerging hatchlings use different light cues to orient to nesting and/or ocean locations (CoA 2017b; DCCEEW 2023k; Marangoni et al. 2022).

The Recovery Plan for Marine Turtles in Australia (CoA 2017b) identifies light emissions as a key threat to marine turtles because it can disrupt critical behaviours, such as nesting, hatchling orientation, sea finding, and dispersal behaviour. The Recovery Plan (CoA 2017b) defines the habitat critical to the survival of a species for nesting for each species at a stock level. The closest nesting habitat critical to the survival of flatback turtles is the Montebello Islands—at its closest, the Operational Area is ~30 km from these islands. Because the predicted light exposure area from the MODU and vessels is expected to range from ~1.8 to 23 km, no coastal areas (and therefore no adult nesting turtles or turtle hatchlings) are expected to be exposed. In addition, the predicted light exposure would only extend to the worst-case distance of 23 km for one to two days per well while flaring from the MODU.

While studies have indicated it is unlikely flatback turtles would aggregate within the Project Area during their internesting period, the Recovery Plan (CoA 2017b) defines the habitat critical to the survival of a species for internesting as a distance 60 km seaward from nesting habitat critical to the survival of flatback turtles. This means internesting habitat associated with nesting at the Montebello Islands may result in an overlap with the Operational Area and exposure to artificial light. However, Pendoley Environmental (2020a) found no published or anecdotal evidence to suggest internesting turtles are impacted by light from offshore vessels. Therefore, no changes to internesting behaviour due to light emissions from the MODU and vessels are expected.

Additionally, peak spectral emissions from MODU or vessel lighting and flaring from the Petroleum Activity are not within the most sensitive range for turtle species.

Seabirds

High levels of marine lighting can attract and disorient seabird species resulting in species behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source (e.g. Longcore and Rich, 2004; Gaston et al., 2014; Rich and Longcore, 2006; Commonwealth of Australia, 2022). As the Operational Area is offshore and away from islands or other emergent features, any presence of seabirds or shorebirds is considered likely to be of a transient nature only. A breeding BIA for the wedge-tailed shearwater does overlaps the Operational Area and the nearest emergent land that could be used for roosting or nesting habitat is the Montebello Islands (about 30 km from the Operational Area).

The most vulnerable life stages for seabirds and migratory shorebirds are nesting adults or fledglings. Nesting or fledgling seabirds and migratory shorebirds are vulnerable to artificial lighting within 20 km of the nesting location (Commonwealth of Australia, 2020a, 2020b, 2020c). For shearwater species, fledglings are predominantly impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mitkus et al., 2018; Telfer et al., 1987). Artificial light can also impact important behaviour of nesting adults (e.g. adult nest attendance, maintaining nest sites) or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al., 2018; Rodriguez et al., 2017). As the Operational Area is about 30 km from the nearest emergent land and noting that modelling predicts light or light glow is likely to be ambient at 20 km (unless the MODU is flaring which would be limited to two to four days) artificial light from the MODU or project vessels is not predicted to disrupt critical breeding behaviours within important nesting habitat or displace seabirds from nesting habitat.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment

Wedge-tailed shearwaters forage either relatively close to breeding islands or over a large area, depending on prey availability. Therefore, foraging wedge-tailed shearwaters may be present in the Operational Area and exposed to artificial light from the MODU and vessels. While foraging wedge-tailed shearwaters may be attracted to sources of light emissions to feed on fish drawn to the light, the species reportedly feeds predominantly during the day (Catry et al. 2009; Ravache et al 2020). Most foraging trips are short, with single-day foraging trips significantly more common than any other length, with birds returning to nesting/roosting sites between trips. The number of wedge-tailed shearwaters present in the Operational Area at night is expected to be low, given the primarily diurnal foraging behaviour, and behavioural impacts to the species are considered to be highly unlikely. Given the foraging behaviours of roosting shearwaters, artificial light from the Operational Area is not predicted to disrupt critical breeding behaviours within important nesting habitat or displace seabirds from nesting habitat.

Migratory shorebirds may be present in or fly through the region between July and December, and again between March and April as they complete migrations between Australia and offshore locations (Department of Environment, 2015). The risk associated with collision from seabirds and shorebirds attracted to the light (Commonwealth of Australia, 2022) is considered to be low, based on the localised nature of the activities in the Operational Area, as well as the distance offshore. However it is recognised that nocturnally active migratory shorebirds may be affected by light spill and alter their normal behaviour as a result. How birds are attracted to light is not proven, but it is proposed that artificial lighting may override the internal magnetic compass of migratory shorebirds or nocturnal seabirds (Gauthreaux and Belser 2006). However, Marquenie et al. (2013) estimated that a change in migratory behaviour of birds was limited to <5 km from the source. Therefore, this type of impact is expected to be spatially restricted to the immediate vicinity of the MODU and vessels and affect only individuals, not populations. Impacts are expected to be limited to temporary behavioural disturbance to isolated individuals and is not expected to disrupt important migration patterns of migratory seabirds.

Fish, Sharks and Rays

Artificial light may result in varied ecological changes to fish, including:

- changing predatory behaviour and abundance (Bolton et al. 2017; Marangoni et al. 2022)
- altering hatching success (Fobert, Burke da Silva, and Swearer 2019)
- acting as an attractant for plankton (Keenan, Benfield, and Blackburn 2007)
- altering circadian behavioural rhythms (Marangoni et al. 2022).

As identified above, the Operational Area overlaps with a foraging BIA for whale sharks. Whale sharks are known to aggregate at Ningaloo between March and July. Following this aggregation period, they migrate. Three potential migration routes have been identified, including one passing through the NWS along the shelf break and continental slope (Meekan and Radford 2010). This route corresponds to the foraging BIA and an expected seasonal presence during spring (DCCEEW 2016). Light is not identified as a key threat for the whale shark (TSSC 2015f).

Commercially targeted species that may occur within the Operational Area include pelagic (e.g. mackerel) and demersal species (e.g. emperors) (Section 4.9.2). Because the source of artificial light is above the surface and the waters are relatively deep, where drilling and subsea activities are planned to occur (generally >70 m, except around unnamed), demersal fish species are not expected to be exposed to artificial light sources.

Artificial light within the Operational Area is not expected to affect whale shark or pelagic fish (including mackerel) species in significant numbers because no known aggregation areas occur within the Operational Area and the presence of these species would be seasonal, transitory, and/or of a short duration. Lighting from a MODU or vessel may result in aggregations of fish, but these aggregations are localised and temporary, and no long-term changes to fish species composition or abundance are expected to occur.

Marine Protected Areas

The southern extent of the Operational Area intersects the Montebello AMP. The values of the Montebello AMP include species listed as threatened, migratory, marine, or cetacean under the EPBC Act, as well as any identified BIAs for regionally significant marine fauna.

The potential for changes to the values of the marine park from artificial light emissions within the Operational Area may occur as an indirect consequence of an impact to the marine fauna identified as a value of the Montebello Marine Park. However, as described in the consequence evaluations for the marine fauna groups above, artificial light emissions within the Operational Area are not expected to result in a lasting effect to marine fauna. Therefore, the consequence of potential changes to the values of the Montebello Marine Park has been ranked as F.

Cultural Values and Heritage

Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by light emissions, such as turtles, are culturally important to Traditional Custodians. Recognising that First Nations communities do not distinguish environment from culture, Woodside manages environmentally based cultural values by using the environmental management measures outlined in Section 6.7.

Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities, as this can limit access to cultural sites or deplete hunting areas and threaten local food security (Delisle *et al*., 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained. ***Concurrent Activities*** As detailed in Section 2.1, there is the potential for concurrent MODU and vessel operations within the Operational Area For concurrent MODU/vessel activities not occurring within proximity of each other, multiple individual (i.e. not overlapping) light exposure areas may occur. However, given the offshore location of the Operational Area (~30 km north of the Montebello Islands) and the seasonal and transitory nature of the presence of marine fauna within the Operational Area, the cumulative impact of multiple light exposure areas is not expected to adversely affect the biological behaviours of marine fauna within the Operational Area to an extent greater than already assessed above. For concurrent MODU/vessel activities occurring within proximity of each other, a slightly larger overall light exposure area may occur for the duration of the activity. For example, if single installation vessel has a ~3.6 km diameter (i.e. 1.8 km radius) biologically relevant light exposure area, then two vessels within ~0.5 km of each other, could create up to a ~4.1 km diameter exposure area. Within the area of overlap light intensity would also be slightly higher (noting that light intensity is inversely proportional to the distance from the source). Concurrent activities within proximity of each other (and therefore the overlapping light exposure areas) would only occur for a short duration. Given the offshore location of the Operational Area (~30 km north of the Montebello Islands) the seasonal and transitory nature of the presence of marine fauna within the Operational Area, and the limited duration of concurrent activities within close proximity, the cumulative impact of slightly larger light exposure areas and/or areas of increased light intensity is not expected to adversely affect the biological behaviours of marine fauna within the Operational Area to an extent greater than already assessed above.
Summary of Potential Impacts to environmental values(s)
Artificial light emissions from the MODU and vessels within the Operational Area is expected to be limited to temporary behavioural disturbance with no lasting effect on marine turtles, seabirds, migratory shorebirds or fish (i.e. Environment Impact – F).

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)35***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
No additional controls identified				
Good practice				
Lighting will be limited to the minimum required for navigational and safety requirements, with the exception of emergency events.	F. Yes. Lighting is typically appropriate for navigation and safety.	Given the potential impacts to turtles during this activity is insignificant, implementation of this control would not result in a reduction in consequence.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 4.1

[36] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)35***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of acoustic light. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine light emissions from external lighting on the MODU and project vessels will not result in impacts greater than localised and temporary behavioural disturbance to species within the Operational Area, with no lasting effect. BIAs within the Operational Area include the flatback turtle internesting, whale shark foraging, and wedge-tailed shearwater breeding areas. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts and the NLPG were taken into consideration during the impact evaluation. The Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (Section 6.9). In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to light emissions have been adopted. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of light emissions to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of impact

MODU and Vessel Operations

All activities of the Petroleum Activity (drilling, installation, contingency activities) will be supported by various vessels and/or a MODU. Vessels used for the Petroleum Activity are detailed in Section 3.11, and include a number of DP capable vessels. The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Vessels produce low frequency sound (i.e. below 1 kHz) from the operation of machinery, hydrodynamic flow sound around the hull and from propeller cavitation, which is typically the dominant source of sound (Ross, 1987, 1993). These noise sources will contribute to and have the potential to exceed ambient noise levels which range from around 90 dB re 1 µPa (root square mean sound pressure level [rms SPL]) under very calm, low wind conditions, to 120 dB re 1µPa (rms SPL) under windy conditions (McCauley, 2005).

The vessels and MODU will operate on DP, and therefore will generate underwater sound from using propellors and thrusters, which is expected to be the largest noise source.

Vessels in the 50-100 m size class (e.g. supply ships, crew boats, research vessels) produce broadband source levels in the 165–180 dB re 1 µPa SPL range (Gotz et al., 2009). While in comparison, underwater sound levels generated by large ships can produce levels exceeding 190 dB re 1 µPa (Gotz et al., 2009), and small vessels up to the 20 m size class typically produce sound at source levels of 151 to 156 dB re 1µPa (Richardson et al., 1995). A typical broadband source level for a stationary MODU using DP has been estimated at ~187 dB re 1 µPa while McCauley (1998) measured underwater broadband noise equivalent to about 182 dB re 1 µPa at 1 m (RMS SPL) from a support vessel holding station in the Timor Sea; it is expected that similar noise levels will be generated by support and IMR vessels used for this Petroleum Activity.

Sound Transmission Loss Modelling

Woodside commissioned JASCO (JASCO 2025) to undertake sound transmission loss modelling for the GWF4 activities to consider cumulative noise emissions from drilling and subsea installation activities. The scenarios

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact

considered included several permutations of support vessels and the MODU undertaking drilling activities, there are used to inform the typical credible noise propagation scenarios (including concurrent activities).

Additionally, Woodside commissioned JASCO (Muellenmeister, et al, 2023) to undertake sound transmission loss modelling at the Wilcox well location for a construction vessel operating under DP. This provides an indication of noise emissions for when the subsea installation activities occur without concurrent (e.g. MODU) activities.

Source levels representative of drilling and subsea installation scenarios

Source levels for relevant vessels that were used to inform the sound transmission loss modelling are presented in Table 6-5. The source sound levels were applied to the modelling scenarios for drilling and subsea installation activities.

Table 6-5: Vessel source levels used in the acoustic modelling for the Petroleum Activity

Vessel	**Sound** Level (dB re 1 µPa².m².s)
Hybrid MODU on DP	186.7
Hybrid MODU moored	170.6
OSV stationary under DP (resupply scenario)[1]	187.6
Anchor Handling tug	194.1
Installation Vessel under DP	181.0
Large Installation Vessel under DP	193.2

Sound Transmission Loss Modelling Scenarios

The acoustic modelling scenarios used in this assessment are presented in Table 6-6 and Table 6-7.

Table 6-6: Summary of modelled scenarios (JASCO 2025)

Scenario Number	Location	Description
1	Yodel	A MODU drilling under DP at Yodel, being supplied by an OSV, with a second OSV on stand-by in the field and an installation vessel conducting subsea installation ~3km away.
2	Wilcox	A moored MODU drilling at Wilcox, being supplied by an AHT vessel, with a second OSV on stand-by in the field and an installation vessel conducting subsea installation in close proximity (500m away).

Table 6-7: Modelled scenario at Willcox for a construction vessel (source: Muellenmeister, et al, 2023)

Scenario Number	Description
3	Large installation vessel under DP (24 hr)

The acoustic modelling studies assessed distances from operations where underwater sound levels were predicted to drop below thresholds corresponding to behavioural response and injury (temporary reduction in hearing sensitivity or TTS and permanent threshold shift or PTS) for marine fauna. The marine fauna considered included marine mammals, turtles, and fish. Due to the variety of species considered, several different thresholds were used for evaluating effects.

The modelling methodologies considered scenario specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources presented as sound pressure levels (SPL, Lp), and as accumulated sound exposure levels (SEL, LE) as appropriate for different noise effect criteria, behavioural response and injury (TTS and TPS), respectively. In this report, the duration of the SEL accumulation is defined as integrated over a 24-hour period.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as pelagic fish and turtles) would not stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with injury (TTS or PTS) if it remained in that location for 24 hours. ***Contingency Activities (Respud, Sidetrack, Intervention, Well Removal)*** Contingency activities include a well respud or sidetrack and well intervention, which will involve the use of a MODU and vessels, plus drilling operations. Any acoustic emissions generated will be the same as those expected from the planned activities described above. In the event a wellhead is removed under this EP scope, additional noise from the cutting of the surface casing and conductors is likely to be generated. Underwater noise associated with cutting (diamond wire) of subsea infrastructure is generally indistinguishable above background noise levels at lower frequencies, primarily detected at noise frequencies above 5 kHz (Pangerc et al., 2016). Quijano and McPherson (2021) estimated the source level of a diamond wire saw cutter at 169 dB re 1 µPa at 1 m. The casings and conductors will be cut below the mudline to enable wellhead recovery using either abrasive water jet cutting method, or mechanical cutting method. ***Helicopters*** Helicopters will likely be used during the Petroleum Activity (Section 3.13). These will generate sound within the atmosphere, which may penetrate into the ocean. Sound emitted from helicopter operations is typically <500 Hz (Richardson et al. 1995). Richardson et al. (1995) report that helicopter sound is audible in air for four minutes before it passed over underwater hydrophones, but detectable underwater for only 38 seconds at 3 m depth and 11 seconds at 18 m depth. Estimates of SPL for helicopters range from 149–162 dB re 1 µPa @ 1 m (Richardson et al. 1995; WDCS 2004). ***Generation of Underwater Noise from Positioning Equipment*** An array of long baseline (LBL) and/or ultra-short baseline (USBL) transponders may be installed on the seabed for metrology and positioning. An array of transponders is proposed within a radius of 500 m from the proposed location of the wells for the duration of the activity. During xmas tree installation activities ultra-short baseline transponders (USBL) may be installed on the seabed or mounted to the wellhead as required by the subsea installation activities. Transmissions from USBL transponders are similar to LBL transponders. Transponders typically emit pulses (impulsive noise) of medium frequency sound, generally within the range 21 to 31 kHz. The estimated SPL would be 180 to 206 dB re 1 µPa at 1 m (Jiménez-Arranz et al., 2017). Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby and are planned to only actively emit sound for about six hours per well. When required for general positioning they will emit one chirp every five seconds (estimated to be required for four hours at a time). When required for precise positioning they will emit one chirp every second (estimated to be required for two hours at a time). An array of transponders will be active whilst a DP MODU is on location. ***Rig Anchor Release system*** A hybrid MODU ustilises Rig Anchor Release (RAR) moorings which are installed to allow the DP capable rig to rapidly disengage from a mooring system. An RAR device will couple each of the moorings to the MODU (8 – 12 devices depending on mooring spread). RAR devices typically emit pulses (impulsive noise) of low frequency, in the range of 9-11 kHz. Transmissions are expected to be limited to short pulses with a duration of minutes, during weekly testing. When activated to release moorings, they are expected to emit pulses of ~two minutes duration for each RAR. ***Suction Piling*** Suction piling may be required as a contingent activity for mooring installation. Unlike driven piles, suction piles greatly reduce noise generation, which is expected to be similar to continuous operational noise of a MODU when not actively drilling due to the noise only being generated from high rate pumps on the ROV conducting the suction piling. ROVs may also be used for other operations during the petroleum activity (e.g. localised sediment removal around infrastructure and cleaning of infrastructure) resulting in lower levels of noise emissions, which are also temporary in nature. ***Concurrent Activities*** During routine drilling operations, a MODU, two support vessels (one standby vessel, and another resupply vessel) and the installation vessel may be present in-field. The vessel undertaking resupply is only present for a short duration (e.g. ~8 hours) and intermittent (e.g. 1–2 times per week, depending on the frequency of resupply required). Non-routine combinations of project vessels together with a MODU may occur in the Operational Area concurrently for relatively short durations from time to time. The underwater sound emissions from these concurrent activities are described below. The indicative schedule for the Petroleum Activity may have drilling and subsea installation activities occurring concurrently (Section 3.7.11). When there is MODU mooring connection/disconnection, both drilling and subsea

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
installation activities occurring within the Operational Area, the MODU (and support vessels) may not always be in close proximity to the installation vessel (i.e. the ensonified areas from sound emissions from the vessels would not overlap), or where they are in close proximity, the activity overlap would only occur for a short duration. For example, during connection/disconnection of MODU moorings an additional support vessel may be required, or if an installation vessel (rather than the MODU) was used to install the Xmas tree, these concurrent mooring, drilling and installation activities are expected to take ~2–3 days where vessels may be in close proximity of each other. Underwater sound emissions from the adjacent MODU and project vessels would result in a slightly greater overall spatial area being ensonified, as well as cumulative emissions in the area of overlap.

Impact assessment
Environmental value(s) potentially impacted
Receptors The Operational Area is located in water depths of approximately 74 – 150 m with depths decreasing to <40m surrounding the unnamed (refer to Section 3.3, Section 4.5.1). Anthropogenic noise interference is a key threat to a number of migratory and threatened cetaceans, marine turtles and whale sharks identified as potentially occurring within the Operational Area, including the pygmy blue whale. Relevant actions included in recovery plans for these species are outlined in Section 6. One marine protected area is located within the area where noise is expected to be above thresholds for behavioural impact and TTS impact to low-frequency cetaceans, this is the Montebello AMP. No other marine protected areas are expected to overlap areas where impact thresholds would be exceeded. ***Potential Impact of Noise*** Elevated underwater noise can affect marine fauna, including cetaceans, marine turtles, fish, sharks and rays, in three main ways (Richardson et al., 1995; Simmonds et al., 2004): • by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift [TTS]; referred to as auditory fatigue), or permanent threshold shift (PTS; injury); • by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey); and • through disturbance leading to behavioural changes or displacement from important areas (e.g. BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation. ***Sound Propagation*** Increasing the distance from the noise source results in the level of noise reducing, due primarily to the spreading of the sound energy with distance. The way that the noise spreads (geometrical divergence) will depend upon several factors such as water column depth, pressure, temperature gradients, and salinity, as well as surface and bottom conditions. ***Cetaceans*** <u>Species Sensitivity and Thresholds</u> Marine mammals and especially cetaceans rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart, 2007; Erbe et al., 2015; Erbe et al., 2018). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold (PTS and TTS) and physical damage and stress (Erbe, 2012; Rolland et al., 2012). The thresholds that could result in a behavioural response, TTS and PTS for cetaceans as a result of continuous and impulsive noise sources are presented in Table 6-8. These thresholds have been adopted by the United States National Oceanic and Atmospheric Administration (NOAA) (National Marine Fisheries Service [NMFS], 2014, 2018; Southall et al., 2019; NOAA, 2024). The adopted thresholds are based on best data available and published in peer-reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds. The Muellenmeister et al. (2023) study was undertaken prior to the NOAA (2024) revised thresholds being published. The revised thresholds related to changes for low-frequency (LF) and high-frequency (HF) cetaceans, PTS (auditory injury) and TTS onset thresholds, while behavioural response thresholds remaining the same.

Predicted Underwater Noise Impacts to Cetaceans

Results – Modelling of MODU and Project Vessels

A sound transmission loss modelling study was conducted by JASCO for representative scenarios (JASCO, 2025). The modelling study indicated that exceedances of PTS and TTS thresholds for low frequency (LF) cetaceans may occur out to a maximum of 0.17 km and 4.33 km, respectively, for activities at Yodel and 0.68 km and 5.17 km, respectively, for activities at Wilcox (Table 6-9). For HF and VHF cetaceans, the maximum distances at which sound levels dropped below PTS and TTS thresholds were 0.10 km and 1.49 km respectively (Table 6-9).

These scenarios are representative of concurrent activities with the MODU, support vessels and subsea installation activities (see Table 6-6).

As described above, the PTS and TTS thresholds are based on a cumulative metric that that reflects the dosimetric impact of noise levels over a 24 hour period based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. It is not expected that individual LF and HF cetaceans that may pass through the Operational Area during these would experience PTS or TTS, given individuals would need to remain within 680 m (PTS) and 5.17 km (TTS) for a period of 24 hours. Similarly, it is highly unlikely that any VHF cetaceans would experience PTS or TTS.

The study indicates that the behavioural response threshold for cetaceans may be exceeded to a distance of 14.9 km (Table 6-9).

Table 6-9: Modelled horizontal distances (R_{max}) from Yodel and Wilcox drill locations

Hearing group	Scenario 1 – Yodel	Scenario 2 - Wilcox
	R_{max} (km)	
PTS		
Low-Frequency (LF) cetaceans	0.17	0.68
High-frequency (HF) cetaceans	0.04	0.06
Very High- frequency (VHF) cetaceans	0.10	0.06
Marine Turtles	0.14	0.16
TTS		
Low-Frequency (LF) cetaceans	4.33	5.17

Results – Modelling of a Construction Vessel under DP at Wilcox

The sound transmission loss modelling study by JASCO for an installation vessel under DP (Muellenmeister, et al, 2023) is a conservative application as the noise levels from the planned installation vessel are substantially quieter

37

Impact assessment

than from the large installation vessel (Table 6-5). The modelling indicated that the PTS and TTS thresholds for low frequency (LF) cetaceans may be exceeded out to a maximum of 0.17 km and 3.89 km, respectively (Table 6-10). For HF cetaceans, PTS threshold was not exceeded and TTS thresholds was exceeded at 0.09 km, while for VHF cetaceans, PTS and TTS thresholds were exceed at maximum distances of 0.1 km and 1.19 km respectively

As described above, the radii that represent potential for PTS and TTS onset are based on a 24 hour period of exposure and therefore represent an unlikely worst-case scenario since, more realistically, cetaceans would not stay in the same location or at the same range for 24-hours. It is not expected that individual LF, HF and VHF cetaceans that may pass through the Operational Area during subsea installation, would experience PTS, given individuals would need to remain within 170 m of the drilling activity for a period of 24 hours. TTS onset is also considered highly unlikely given the known movement behaviour of cetaceans including key migrating LF whale species such as the pygmy blue whale and humpback whale transiting through the Operational Area The Operational Area is not known to represent significant foraging/aggregation habitat for cetaceans and individuals are not expected to linger within the Operational Area for extended periods.

Note that the modelling results in Muellenmeister et al. (2023) used thresholds from NOAA (2018), with PTS and TTS thresholds for HF and VHF cetaceans being revised. The new thresholds for LF cetaceans predict TTS onset at 177 dB re 1 µPa².s, previously this value was 179 dB re 1 µPa².s. The distance from source to TTS/PTS SEL24h noise effect criteria for the updated thresholds cannot be extrapolated from the acoustic modelling however it can be assumed to marginally increase. This means that there is a greater area over which LF cetaceans could be exposed to PTS/TTS associated with continuous noise emissions. However, it continues to remain unlikely that cetaceans will spend 24hrs in close proximity to noise generating activities within the Operational Area, as any cetacean activity in the Operational Area, or vicinity, would be migratory in nature therefore the conclusion of the impact assessment conducted based on results of the original modelling remain valid for all scenarios

The study indicates that the behavioural response threshold for cetaceans may be exceeded to a distance of 10.4 km Table 6-10).

Table 6-10: Modelled horizontal distances (R_{max}) from the construction vessel to reach noise effect criteria for cetaceans and marine turtles for continuous sound

Hearing group	Scenario 3

Impact Assessment – Behavioural

Acoustic modelling indicated that the R_{max} from the source to SPL noise effect criteria for all marine mammals was predicted to be 14.9 km during drilling and subsea installation activities (or conservatively 10.4 km during installation activities only).

As identified in Section 4.6.3, several marine mammal species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area The threatened and/or migratory cetaceans that may be present within the Operational Area are low-frequency and high-frequency cetaceans. Very-high-frequency cetaceans (e.g. *Kogia* spp.) were identified as species or species habitat that may occur within the Operational Area but are not listed as threatened and/or migratory under the EPBC Act (Section 4.6.3).

Impact assessment

- the pygmy blue whale migration BIA is ~25 km (at its closest) from the Operational Area and therefore the predicted ensonified area is not expected to extend into the pygmy blue whale BIA
- the humpback whale migration BIA is ~15 km (at its closest) from the Operational Area and the predicted ensonified area (at its closest ~11.5 km) is not expected to extend into the BIA

All cetacean species (for all hearing groups) transit through the area; however no areas of known aggregation within or around the ensonified area have been identified. Migrating pygmy blue whales are likely to occur in the Exmouth to Montebello Islands region from April to August (northern migration) and November to December (southern migration); humpback whales are typically present from June to October. Opportunistic cetacean sighting data from Woodside's facilities on the NWS indicate that humpback whales are the most commonly observed cetacean species.

Marine mammal presence within the Operational Area are not expected to comprise significant numbers because no known aggregation areas occur there, and their presence would be seasonal, transitory, and of a short duration. There are no constraints (e.g. shallow embayments or shorelines) that prevent marine mammals from moving away from MODUs or vessels, including within the BIAs. Because continuous sound emissions will only occur during specific activities (e.g. drilling and installation) they are not a continual or prolonged sound, and no significant change to marine mammal behaviours is expected within the Operational Area or BIAs.

Transponders used for positioning have the potential to cause some temporary behavioural disturbance to cetaceans; however, noise levels will be well below injury thresholds. Based on empirical spreading loss estimates measured by Warner and McCrodan (2011), received levels from USBL transponders are expected to exceed the cetacean behavioural response threshold for impulsive sources out to about 42 m. Given the short-duration chirps and the mid frequencies used by positioning equipment, the acoustic noise from a single transponder is unlikely to have any substantial effect on the behavioural patterns of marine fauna. Therefore, potential impacts from transponder noise are likely to be restricted to temporary and localised avoidance behaviour of individuals transiting through the Operational Area, and therefore are considered localised with no lasting effect.

Therefore, sound emissions within the Operational Area are not expected to result in a consequence greater than temporary changes in behaviour to individuals or a small proportion of the population.

Impact Assessment – Auditory impairment (TTS) or injury (PTS)

LF cetaceans

Acoustic modelling indicated that the R_{max} from the source to TTS and PTS SEL_{24h} noise effect criteria during concurrent activities for low-frequency cetaceans was 4.33-5.17 km and 0.17-0.68 km respectively (Table 6-9).

As identified in Section 4.6.3, several marine mammal species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area No BIAs for regionally significant marine mammals intersect with the Operational Area, however, two migration BIAs occur nearby—humpback whale (south) and pygmy blue whale (north-west). The pygmy blue whale migration BIA is ~25 km (at its closest) from the Operational Area; exposure of this BIA to continuous sound emissions at levels associated with TTS or PTS is not predicted to occur during drilling or installation activities. Similarly, the humpback whale migration BIA is ~15 km (at its closest); exposure of this BIA to continuous sound emissions at levels associated with TTS or PTS is not predicted to occur during drilling or installation activities.

Marine Turtles

Species Sensitivity and Thresholds

There is a paucity of data regarding responses of marine turtles to underwater noise. However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100–700 Hz (Bartol and Musick, 2003). Lenhardt (1994) observed marine turtles avoiding low-frequency sound.

Acute noise, or temporary exposure to loud noise, may result in the avoidance of important habitats and in some situations physical damage to marine turtles. The thresholds that could result in a behavioural response, TTS and PTS for marine turtles as a result of continuous and impulsive noise sources are presented in Table 6-11. These thresholds are based on best data available and published in peer- reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds (Accomando etl al 2025). No numerical thresholds have been developed for behavioural impacts of continuous sources (e.g. vessel noise) on marine turtles. A Popper et al. (2014) review assessed thresholds for marine turtles and found qualitative results that the risk of behavioural disturbance was high for near field exposure, moderate for intermediate exposure and low for far field exposure (Popper et al., 2014).

Sound exposure thresholds and criteria for continuous sound sources applicable to marine turtles are summarised in Table 6-11.

Table 6-11: Thresholds for PTS, TTS and behavioural response onset for marine turtles for continuous noise

	PTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)	TTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)	Behavioural response (dB re 1 µPa)#
Marine Turtles	178	198	(N) High (I) Moderate (F) Low

Source: PTS and TTS thresholds (Accomando et al., 2025), # behavioural response threshold (continuous) (Popper et al. 2014),

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al. 2014).

Impact Assessment

The Recovery Plan for Marine Turtles (Commonwealth of Australia, 2017) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, given the thresholds outlined in Table 6-11, it is reasonable to expect that marine turtles may demonstrate avoidance or attraction behaviour to the noise generated by the Petroleum Activity. Sound transmission loss modelling indicated that the potential for PTS and TTS onset would be limited to within hundreds of meters for PTS and up to 3.89 km (TTS). However, marine turtles within the Operational Area are expected to be transient, and unlikely to remain within this vicinity 24- hours, and therefore PTS and TTS thresholds are not expected to be reached. Behavioural impacts to marine turtles from continuous noise sources generated by the Petroleum Activity are expected to be short-term and localised.

Given the offshore distance from shore, the Operational Area does not represent suitable internesting habitat. The Operational Area overlaps a flatback turtle internesting Habitat Critical, which is also designated a BIA. However, it is noted that the defined BIA and Habitat Critical are considered very conservative as they are based on the maximum range of internesting females rather than direct studies that show marine turtles are more likely to remain near their nesting beaches. For example, tracking studies at Barrow and Thevenard islands suggest internesting flatback turtles remain in shallow water, close (< 3 km) to nesting beaches (Whittock et al., 2014). There is no available data to indicate flatback turtles swim out into deep offshore waters during the internesting period. Hence it is considered highly unlikely that the Operational Area is utilised by internesting flatback turtles.

Marine turtle presence in general is expected to be infrequent, and potential impacts from predicted noise levels from the project vessels (including MODU and support vessels) are expected to be short-term, intermittent and localised, if they occur and are not considered to be ecologically significant at a population level.

Fish, Sharks and Rays

Species Sensitivity and Thresholds

Fish perceive sound through the ears and the lateral line, which are sensitive to vibration. Some species of teleost or bony fish (e.g. herring) have a structure linking the gas-filled swim bladder and ear, and these species usually have increased hearing sensitivity. These species are considered to be more sensitive to anthropogenic underwater noise sources than species such as cod (Gadus sp.), which do not possess a structure linking the swim bladder and inner ear. Fish species that either do not have a swim bladder (e.g. elasmobranchs (sharks and rays) and scombrid fish (mackerel and tunas)) or have a much-reduced swim bladder (e.g. flat fish) tend to have a relatively low auditory sensitivity.

Considering these differences in fish physiology, Popper et al. (2014) developed sound exposure guidelines for fish; these are presented in Table 6-12 and are considered appropriate to assess continuous acoustic discharges to fish from the Petroleum Activity.

Table 6-12: Impact thresholds to fish, sharks and rays for continuous noise.

Hearing Group	Mortality and potential mortal injury	PTS	TTS	Masking	Behaviour
Fish: no swim bladder	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not involved in hearing	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder involving hearing	(N) Low (I) Low (F) Low	170 dB rms SPL for 48- hours	158 dB rms SPL for 12- hours	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low

Impact assessment					
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Note: The sound units provided in the table above include relative risk (high, medium and low) is given for fish (all types) at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al. 2014).

Impact Assessment

Given the thresholds outlined in Table 6-12 it is reasonable to expect that fish, sharks and rays may demonstrate avoidance or attraction behaviour to the noise generated by the Petroleum Activity. However, potential impacts from predicted noise levels from the project vessels (including MODU and support vessels) are not considered to be ecologically significant at a population level.

Maximum-over-depth horizontal distances to PTS and TTS thresholds for fish with a swim bladder involved in hearing as a result of underwater noise from a support vessel are approximately 40 and 80 m, respectively, from the source based on modelling (Warner et al. 2026). For fish with a swim bladder not involved in hearing, and fish without a swim bladder (including whale sharks) the likelihood of PTS or TTS is low. It is expected that potential impact to demersal and pelagic fish and sharks/rays will be limited to a behavioural response. Behavioural responses are expected to be short-lived, with duration of effect less than or equal to the duration of exposure.

Whale sharks do frequent the wider NWS outside their seasonal aggregation period (peak: April and May) within the high density prey foraging BIA at Ningaloo. The Operational Area overlaps a foraging BIA for whale sharks (Section 4.6.1.1), however it is over 250 km from the Ningaloo high density prey foraging BIA and therefore whale shark encounters are likely to be limited to individuals. Acoustic detections of tagged whale sharks at the North Rankin A and Goodwyn A platforms during two periods—June to July and October to January were recorded (Thomson et al. 2021) and supported anecdotal evidence of whale shark presence on NWS. Behavioural disturbance to whale sharks as a result of vessel noise may result in a temporary deviation on their migration route, however given the wide bounds of the route and its open nature, this should not result in altered movement patterns outside of the norm.

Given the thresholds outlined in Table 6 12, it is reasonable to expect that fish, sharks and rays may demonstrate avoidance or attraction behaviour to the noise generated by the Petroleum Activity. However, potential impacts from predicted noise levels from the project vessels (including MODU and support vessels) are not considered to be ecologically significant at a population level.

Rankin Bank and Wilcox shoal are known to support diverse fish assemblages (Section 4.5.1). While the Unnamed shoal does occur within the Operational Area; given the bathymetry of this shoal and its known benthic communities, it is expected to also support site attached fish communities. Noting the location of subsea infrastructure is off the shoals (where water depths are shallower) and because the risk of behavioural changes is expected to occur up to hundreds (not thousands) of metres from the sound source, the site-attached fish assemblages at these features are not predicted to be exposed.

Marine Protected Areas

Sound modelling showed that acoustic emissions from the Petroleum Activity could be above impact thresholds as far as 14.9 km from the source. Within 14.9 km of the noise source there is one marine protected area, the Montebello AMP. The values of the Montebello AMP are listed in the North-west Marine Parks Management Plan and those that are relevant to impacts from acoustic emissions are:

- Natural Values:
  - Humpback whale migration BIA
  - internesting, foraging, mating and nesting for marine turtle (flatback turtles)
  - whale shark foraging BIA
  - diverse fish communities.
- Cultural Values
  - none specifically relevant to acoustic emissions, beyond cultural values associated with the species listed under “Natural Values”.
- Heritage Values
  - None specifically relevant to acoustic emissions.
- Social and Economic Values
  - - None specifically relevant to light emissions.

Each of the relevant natural values of the Montebello AMP have been assessed in the sections above. For the reasons outlined above, it is expected that there will be localised impacts with no lasting effects on cetaceans from the Petroleum Activity and therefore the Petroleum Activity is not inconsistent with the values of the Montebello AMP

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
Cultural Values and Heritage Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by noise emissions, such as marine mammals and turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle, et al., 2018). Whale species are subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these Thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community. Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage. As described, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to ecologically significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that continuous noise emissions is unlikely to result in an impact greater temporary changes in marine fauna behaviour with no lasting effect (F).

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)38***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures[35:] • Project vessels will not travel greater than 6 knots within 300 m of a cetacean (caution zone) and not approach closer than 100 m from a whale. • Project vessels will not approach closer than 50 m for a dolphin and/or 100 m for a whale (with	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around cetaceans can potentially reduce the underwater noise footprint of a vessel and lower the likelihood of interaction above significant thresholds	Controls based on legislative requirements – must be adopted.	Yes C 5.1

[38] *Qualitative measure*

Control considered	***Control feasibility (F) and cost/sacrifice (CS)38***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
the exception of animals bow riding). • If the cetacean shows signs of being disturbed, project vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.				
Good practice				
Project vessels will not travel greater than 6 knots within 300m of a turtle (caution zone). If the turtle shows signs of being disturbed, vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots.	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around cetaceans can potentially reduce the underwater noise footprint of a vessel and lower the likelihood of interaction above significant thresholds	Benefits outweigh cost/ sacrifice.	Yes C 5.2
Project vessels will not travel greater than 6 knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around cetaceans can potentially reduce the underwater noise footprint of a vessel and lower the likelihood of interaction above significant thresholds	Benefits outweigh cost/ sacrifice.	Yes C 5.3
Implement adaptive management procedure during the pygmy blue whale southbound migration period.	F: Yes. CS: Time/ Cost associated with person used for observations. Schedule delays associated with waiting on pygmy blue whale activity to cease/ move on.	Implementation of adaptive management where pygmy blue whales (or large unidentified whales) are observed means a new noise source (vessel) is not introduced while pygmy blue whales are sighted. Restricting the introduction of new noise sources when pygmy blue whale presence is detected could lower likelihood of disturbance to pygmy blue whales so as to not be inconsistent with the Blue Whale Conservation Management Plan.	Benefits outweigh cost/ sacrifice.	Yes C 5.4

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)38***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
During the EP stage, review the acoustic modelling included in the Goodwyn Area Infill Development OPP, to confirm the assumptions continue to be valid and the outputs are appropriate to inform management actions, relative to the nature and scale of the potential impacts	F: Yes. CS: Minimal cost / sacrifice.	Ensure that continuous noise emissions associated with the Petroleum Activity described in this EP does not result in a larger environmental impact than described in the OPP	Benefits outweigh cost/ sacrifice.	Yes Additional modelling was undertaken and is presented in this EP
Use of additional detection controls (e.g., drones for aerial observations, Passive Acoustic Monitoring for use at night, thermal imaging for use at night) to Identify cetacean presence.	F: Yes CS: Time / cost associated with additional personnel and technology onboard vessels. Due to Operational Area distance offshore actual observation times are limited by fuel availability - larger fuel capacity associated with larger aircraft increases cost of the exercise	May increase likelihood of detection of whales, particularly during periods of poor visibility. Additional detection technologies can be degraded by metocean conditions (e.g., sea state). Additional detection methods would not result in a reduction in the potential consequence level. However the Operational Area and the predicted ensonified area does not extend into any cetacean BIA and therefore it is expected that the presence of ceteceans would be limited reducing the requirements for detection.	Disproportionate. The cost/ sacrifice outweighs the benefit gained. Adequate observations are able to be made from the MODU bridge due to the height and surveillance by trained crew and expected frequency of cetaceans in the Operational Area It is not expected that additional technologies would add significantly more value than this to warrant deployment.	No
The use of dedicated Marine Fauna Observers (MFOs) on project vessels for the duration of the Petroleum Activity to watch for whales and provide direction on and monitor compliance with Part 8 of the EPBC Regulations.	F: Yes. However, support vessel bridge crews already maintain a constant watch during operations. CS: Additional cost of MFOs.	Given that support vessel bridge crews already maintain a constant watch during operations and trained crew as MFOs will monitor for pygmy blue whale presence prior to resupply/support vessel moves alongside the MODU and PIV, additional MFOs would not further reduce the likelihood of an individual being within close proximity of the acoustic source during introduction of sounds	Disproportionate. The cost/sacrifice outweighs the benefit gained.	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)38***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Use professional MFOs in lieu of trained crew to observe for pygmy blue whales.	F: Yes CS: The cost of implementing dedicated MFOs during vessel activities would be tens of thousands of dollars and expose additional personnel to the health and safety risks of working at sea. The cost is grossly disproportionate to the environmental benefit.	The environmental benefit of having dedicated professional MFOs is a potential increase in the likelihood of detecting pygmy blue whales at the species level, which then permits actions to maintain separation as per the adaptive management procedure. Trained crew will watch for marine fauna during the Petroleum Activity. Trained crew will implement adaptive management measures if a pygmy blue whale or large unidentified whale is observed. Therefore whilst there is an increased likelihood for professional MFO's to detect pygmy blue whales from other large whale species, the ability to identify marine fauna in comparison with trained crew is negligible.	Disproportionate. The cost/ sacrifice outweighs the benefit gained.	No
Professional judgement – Substitute				
Management of vessel noise by varying the timing of the Petroleum Activity to avoid migration periods.	F: Yes. Migration periods for cetaceans that may occur in the Operational Area (pygmy blue and humpback whales) are well known. CS: Significant cost and schedule impacts if activities avoid specific timeframes	Avoiding migration periods would reduce the likelihood of impacts to cetaceans. However, given that the predicted impacts from noise sources associated with the Petroleum Activity are considered to be localised with no lasting effect, the overall benefit is minimal.	Disproportionate. The cost/sacrifice outweighs the benefit gained.	No
Professional judgement – Engineered Solution				
No additional controls identified				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of continuous noise emissions. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that the generation of noise from the MODU, project vessels and positioning equipment is unlikely to result in an impact greater than no lasting effect. Relevant recovery plans and conservation advice have been considered during the impact assessment. The Conservation Management Plan for the Blue Whale (Commonwealth of Australia 2015a) Interim Recovery Objective is that 'Anthropogenic threats are demonstrably minimised' with the following Action Area A.2.3: "Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area". While the Operational Area is close to the PBW migration BIA, modelling predicted that the ensonified area is not expected to extend into the BIA (Warner et al 2026). In addition, with the adoption of adaptive management controls (C 5.4), the activity will be managed to prevent unacceptable impacts of underwater anthropogenic noise on pygmy blue whales such that they will not be prevented from displaying biologically important behaviours and is therefore not inconsistent with the Interim Recovery Objective. In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill Development OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to acoustic emissionshave been adopted. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of continuous noise emissions to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Flaring (well test non-routine) during well unloading for pressure test and clean up			X										
Contingent venting of gas during drilling (e.g. well kick)			X										

Description of source of impact

Atmospheric emissions assessed in this Environment Plan (EP) are classified as either atmospheric pollutants (non-greenhouse gas emissions) or greenhouse gas (GHG) emissions.

- Atmospheric pollutants are gases and particulates emitted from activities or equipment that may adversely affect human health and/or flora and fauna. Key pollutants associated with the Petroleum Activity include carbon monoxide (CO), oxides of nitrogen (NO_x), sulphur oxides (SO_x), particulate matter less than 10 microns (PM_{10}), non-methane volatile organic compounds (VOCs), and BTEX compounds (benzene, toluene, ethylbenzene and xylenes).
- GHG emissions are atmospheric gases that absorb long-wave radiation and contribute to the greenhouse effect. The primary GHGs relevant to the Petroleum Activity are carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O). Other greenhouse gases, including perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF_6), may be emitted in trace quantities and are not expected to be material contributors.

MODU, Vessel and Helicopter Operations

Atmospheric emissions will be generated during the Petroleum Activity from the operation of MODUs, project vessels and helicopters. Emission sources include internal combustion engines (including propulsion, generators and auxiliary equipment) and onboard incineration systems associated with routine operations.

Atmospheric pollutants emitted during these activities are expected to include NO_x, SO_x, particulate matter and VOCs. Emission profiles are influenced by fuel type and sulphur content, with marine gas oil (MGO) typically producing lower SO_x and particulate emissions than marine diesel oil (MDO) or heavy fuel oil (HFO).

Total GHG emissions associated with MODU, vessel and helicopter operations for the Petroleum Activity are estimated to be approximately 126,900t CO_2-e.

A hybrid MODU may be utilised for the drilling campaign, which would reduce fuel consumption associated with station keeping where the MODU is primarily moored. However, dynamic positioning (DP) may be required due to water depth

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact

or adverse weather conditions. Other project vessels (e.g. pipelay, installation and intervention vessels) will utilise DP during installation or intervention activities.

Based on fuel consumption data from the DPS-1 MODU used during previous Woodside drilling campaigns, and the anticipated activity duration including mobilisation, a DP MODU is estimated to consume approximately 44 t/day of fuel. Over an estimated 90 days per well, total fuel consumption for MODU activities is expected to be up to 20,000 tonnes. This DP-based estimate is conservative and intended to bound potential emissions for impact assessment purposes. Actual emissions would be lower if a hybrid or moored MODU is used.

Based on fuel consumption data from comparable DP construction and intervention vessels used during previous Woodside offshore campaigns, the Installation Vessel is expected to operate for approximately 154 days, with total fuel consumption of up to 11,550 tonnes. The IMR vessel is expected to operate for approximately 35 days, with total fuel consumption of up to 525 tonnes, while a dedicated intervention vessel may be utilised for contingent activities for approximately 21 days, with total fuel consumption of up to 630 tonnes.

Support vessels and helicopters will also be required; however, their emissions are expected to be substantially lower than those generated by the MODU and primary installation vessels. Estimated fuel consumption for support vessels is up to 2,250 t for drilling activities, 3,850 t for subsea installation activities, and approximately 210 t for a contingent well intervention activity. Helicopter operations may consume up to 0.6 m³ of aviation fuel per hour, with multiple flights conservatively accounted for in the GHG estimates.

Well Kick, Flaring and Venting

Total GHG emissions associated with potential well kick events and MODU flaring and venting are estimated to be approximately 31,600 t CO_2-e.

During drilling or contingent well intervention activities, a well kick may occur, defined as an unplanned influx of formation fluids into the wellbore. During well control operations, small volumes of gas may be vented via the degasser to maintain well integrity and prevent escalation to an emergency condition. For conservative assessment purposes, up to two well kick events have been included in the GHG inventory and represent a very small proportion of total emissions. Well unloading to the MODU is not routinely required; however, for the purpose of the GWF4 assessment, the unloading of both Wilcox wells has been included. During unloading, gas, condensate, base oil and methanol present in the wellbore would be directed to the flare and are expected to be efficiently combusted.

In the event of flare extinguishment (e.g. due to water ingress, loss of pilot flame, adverse weather or equipment malfunction), short-duration cold venting may occur. Following completion of well testing and flowback objectives, the well may be cleaned using brine solutions containing chemicals such as biocides and surfactants. A worst-case conservative approach has been applied, with maximum flowback volumes of approximately 150 MMSCF of gas, 10,500 bbl of condensate, and 250 bbl of base oil.

Table 6-13: GHG emissions and sources associated with the Petroleum Activity

Source	**GHG** Emissions (CO_2-e t)
MODU Activities[1]	
MODU Operations[2]	63,900
Support vessel Operations	7,400
Helicopter operations	600
Pipelay, Installation and Commissioning[3]	
Support Vessel Operations	12,600
IMR vessel	1,800
Primary installation vessel	37,600
Helicopters Operations	200
Intervention / Contingency Scenarios (Including Unload to MODU)[4]	
Intervention Vessel	2,100
Support vessel Operations	700
Vented (MODU unload)	700
Flow back (MODU unload)	30,900
Well kick - Drilling Ops (60bbl Cold vent)	1

Description of source of impact
1. *MODU activities estimates cover activities described in Section 3.7.* 2. *MODU emissions are based off the use of a MODU operating on DP while actively drilling. This is considered a conservative volume of GHG emissions to inform impact assessment. GHG emissions from hybrid and moored MODUs would be less due to reduced fuel burn from station keeping.* 3. *Pipelay, installation and commissioning estimates cover all activities described in Section 3.8.* 4. *Intervention/contingency scenario estimates cover activities described in Section 3.10 and are based on a potential two events occurring. The actual number of intervention/contingency events are unknown and will depend on circumstances encountered during the Petroleum Activity.*

Impact assessment
Environmental value(s) potentially impacted
Air Quality Atmospheric emissions may result in a localised, temporary decline in local air quality, within the immediate vicinity of the emissions source. As described above, produced atmospheric and GHG emissions associated with the petroleum activity may include SO_2, NO_x, ozone depleting substances, CO_2, particulates and VOCs. Emissions from engines, generators and deck equipment may be toxic, odoriferous or aesthetically unpleasing, and will result in a localised, temporary reduction in air quality. Given the offshore location of the Operational Area, the rapid dispersion and the low volumes of atmospheric emissions which will be generated the potential impacts are expected to be localised with no lasting effect. ***Aesthetic Value*** Atmospheric emissions have the potential to introduce localised, temporary odour and visual amenity issues which can result in changes to the aesthetic value of an area. Given the distance from shore of the Operational Area (~ 35 km) and the short duration of the activities, the potential for a change in air quality from atmospheric emissions resulting in a change to aesthetic value for tourism/recreation or settlements is not considered to be credible and will have no lasting effect. Therefore, the impact of a change in aesthetic value from atmospheric emissions associated with the Petroleum Activity is of no lasting effect.
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that routine atmospheric and GHG emissions will not result in a potential impact greater than no lasting effect (e.g. Environment Impact – F) based on a localised effect to air quality of the regional airshed.

Demonstration of ALARP

Contracting strategy and evaluation for hire of vessels includes consideration of vessel emissions parameters and low carbon/alternate fuels	F: Yes CS: Minimal cost.	Reduce the GHG emissions associated with the Petroleum Activity	Benefits outweigh cost/ sacrifice.	Yes C 6.10
Professional judgement – Engineered Solution				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of fuel combustion, incineration and venting. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine atmospheric emissions from fuel combustion, incineration, and venting are unlikely to result in an impact significance greater than no lasting effect. The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and meet the requirements of Australian Marine Orders. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to atmospheric and GHG emissions have been adopted. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of atmospheric emissions to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of impact

Subsea installation and pre-commissioning

Planned (routine and non-routine) hydrocarbon and chemical discharges may occur during a range of subsea installation and pre-commissioning activities, including:

- connection of new and/or existing subsea infrastructure
- pressure and leak testing to check system integrity
- dewatering of the Wilcox flowline
- barrier testing and tie-in to existing GWF infrastructure.

Types of discharges may include preservation fluids, control fluids, MEG, hydrocarbon, or other chemicals. It should be noted that the discharges during the subsea installation and pre-commissioning phase are typically small volumes and are intermittent. The exception is pre-filled test fluids from flowlines, as depending on the length of flowline and location of discharge, these may be higher volumes.

Pre-filled test fluids may comprise biocide, corrosion inhibitor, oxygen scavenger, scale inhibitor, MEG, and fluorescein dye. Any hydrotest fluids will typically be discharged to the GWA platform, and these discharges will be managed in accordance with the NOPSEMA-accepted GWA Facility Operations EP; this does not form part of this impact assessment. However, due to distance to GWA platform hydrotest discharge from the Wilcox flowline may need to be discharged in situ.

Barrier Testing

Prior to tie-ins to existing GWF infrastructure testing of the isolation valves over a short period of time (<1 hour) will be undertaken. Releases associated with valve testing are expected to be very small (up to approximately 50 L condensate and 150 kg gas per test). This will provide an understanding of the potential manifold isolation valve pass rates during flowline tie-in. When the flowline tie-ins take place, hydrocarbons may be released at the manifold isolation valves.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
Dewatering Following leak testing the Wilcox flowline will be dewatered with the discharge occurring either the Wilcox or LPA end of the flowline, and has been estimated to be ~1610 m^3. This will be undertaken with a dewatering pig train propelled by nitrogen resulting in the discharge of MEG, treated water and nitrogen (See Section 3.8.4.3). **Dewatering Modelling** Woodside commissioned RPS to undertake a marine dispersion modelling study for a hydrotest discharge (RPS 2023b). The principal aim of the study was to predict the extent of the near-field and far-field mixing zones, based on the required dilution levels for biocide in the hydrotest discharge. The modelling conservatively used a discharge volume of 2000 m^3 and adopted the exposure criteria as the median concentration of fluid is not to exceed 0.06 mg/L over a 48-hour period (based on previously undertaken whole effluent toxicity (WET) testing of a hydrotest fluid (which contained the biocide Hydrosure 0-3670R) (CAPL 2015). Based on an expected dose concentration of hydrotest fluid (containing biocide), the required dilution factor to meet the above exposure criteria is 10,000.

Impact assessment
Environmental value(s) potentially impacted
Water Quality Subsea planned (routine and non-routine) discharges of hydrocarbons and chemicals will result in localised and temporary changes to water quality. Changes in water quality will depend on the discharge volume, rate and chemical composition. During installation activities, the subsea discharges are intermittent and small volumes, which are expected to rapidly mix and disperse in the open ocean. The small quantities of hydrocarbons (liquid and gas) that may be released will be buoyant and float upwards towards the surface. However, given the water depth, pressure, and the small volumes released, these hydrocarbons are not expected to reach the sea surface. Rather, the release will disperse and dissolve within the water column. A typical acid–water mix discharge may would be expected to quickly dilute and neutralise as it reacts with the calcareous material being removed from the subsea infrastructure. The aquatic toxicity of MEG is very low, it is listed as an 'E' category fluid under the Offshore Chemical Notification Scheme (OCNS), and is on the OSPAR list of substances that are considered to pose little or no risk to the environment once released (PLONOR). MEG is biodegradable and water soluble and dilutes rapidly in the marine environment to low concentrations. Given the relatively small volumes, intermittent discharges, and rapid mixing expected to occur within an open ocean environment, only localised and temporary changes in water quality are predicted. Hydrotest fluid discharge is likely to be the largest routine discharge. Modelling of hydrotest discharge indicate that dilution is expected rapidly upon release, with an average of between 896–1,214 dilutions occurring within ~282 m of the discharge location (RPS 2023b). The modelling also indicated that the distance to reach an instantaneous concentration of 0.06 ppm of the hydrotest fluid was estimated to be up to ~3 km from the discharge location (RPS 2023b); however this instantaneous exposure is not associated with any predicted ecotoxicological affects. In fact the modelling study showed that 48-hour median the exposure criteria was not predicted to be exceeded at any distance from the discharge location, during any season. Though the discharge location has not been selected both options are more than 500 m from either the unnamed shoal or Rankin bank. Therefore, the routine and non-routine discharge of hydrocarbons and chemicals within the Operational Area is expected to have no lasting effect on water quality. ***Marine Sediments*** Accumulation of contaminants in sediments depends primarily on the volume and concentration of particulates in discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the resuspension, bioturbation, and microbial decay of those particulates in the water column and on the seabed. However, given the subsea discharges are expected to rapidly mix in the water column and become diluted, accumulation in sediments at a measurable level is not expected to occur. ***Planktonic Communities*** A change in water quality as a result of routine and non-routine hydrocarbon and chemical discharges has the potential to change planktonic communities within the water column through toxicity effects. Any effects to plankton have to be assessed in the context of natural mortality rates, which are generally considered high and variable. Plankton have a patchy distribution linked to localised and seasonal productivity that produces sporadic bursts in populations (DEWHA 2008b). As described in the consequence evaluation above, the discharge of hydrocarbons and chemicals within the Operational Area is not expected to result in a lasting effect to water quality. Given the patchy and variable plankton

Impact assessment
communities, these discharges are not expected to cause a change in planktonic communities at a measurable level and will not change the viability of the population or ecosystem. ***Key Ecological Features*** A change in water quality as a result of routine and non-routine hydrocarbon and chemical discharges has the potential to change benthic habitats and communities through toxicity effects. As described in the consequence evaluation above, the discharge of hydrocarbons and chemicals within the Operational Area is not expected to result in a lasting effect to water quality, and no change in sediment quality is predicted. Therefore these discharges are unlikely to cause a change in habitats or communities at a measurable level and will not change the viability of the population or ecosystem. ***Australian Marine Parks*** The Operational Area overlaps ~23 km^2 of the 3,413 km^2 Montebello Marine Park (i.e. ~0.67% of the marine park). The values of the Montebello Marine Park (as described in section 4.8.1) include ecosystems representative of the Northwest Shelf Province, including areas of ancient coastline. Benthic habitat surveys within the northern section of the marine park indicate that it has a relatively flat and sandy seabed with variable coverage of benthic epifauna (e.g. sponges, corals) (Advisian 2019). This is not dissimilar to the benthic habitats and communities expected to occur throughout most of the Operational Area, which are broadly represented throughout the NWMR). Noting that subsea infrastructure will not be installed within the Marine Park and that while the hydrotest plume may extend into the marine park (if released at the Wilcox manifold) there is no ecological effect. Therefore, the routine and non-routine discharge of hydrocarbons and chemicals within the Operational Area is expected to have no lasting effect on the values of the Montebello Marine Park.
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that routine and non-routine discharges of hydrocarbons and chemicals associated with the Petroleum Activity will not result in a potential impact greater than no lasting effect (e.g. Environment Impact – F)

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts of routine and non-routine hydrocarbon and chemical discharges additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine and non-routine hydrocarbon and chemical discharges are unlikely to result in an impact significance greater than no lasting effect. The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and meet the requirements of Australian Marine Orders. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to routine and non-routine hydrocarbon and chemical discharges have been adopted. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of atmospheric emissions to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Routine discharge of brine or cooling water to the marine environment from MODU, installation vessel and support vessels	X	X		X	X								

Description of source of impact

Vessel and MODU Operations

Sewage, grey water and putrescible wastes

The MODU, installation vessel and support vessels routinely generate/discharge small volumes of treated sewage, putrescible wastes and grey water to the marine environment (impact assessment based on approximate discharge of 15 m^3 per vessel/MODU per day), using an average volume of 75 L/person/day and a maximum of 200 persons on board. However, it is noted that vessels such as the installation vessels, AHV and support vessels will have considerably fewer persons on board.

Deck and bilge water

The MODU/PIV and support vessels routinely generate/discharge:

- Routine/periodic discharge of relatively small volumes of bilge water. Bilge tanks receive fluids from many parts of the project vessels or MODU/PIV. Bilge water can contain water, oil, detergents, solvents, chemicals, particles, biocides and other liquids, solids or chemicals
- Variable water discharge from MODU/PIV/vessel decks directly overboard or via deck drainage systems. Sources could include rainfall events and/or deck activities such as cleaning/wash-down of equipment/decks.

Brine

Reverse osmosis (RO), distillation or desalination plants on board vessels and the MODU use seawater to produce potable and demineralised water; resulting in reject brine (i.e. hypersaline water) that is discharged to the marine environment. The potable water produced is stored in tanks on board.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
During the desalination process, relatively small volumes of reject brine is produced and discharged. Reject brine discharge is typically 20 to 50 percent higher in salinity than the intake seawater (depending on the desalination process used) and may contain low concentrations of scale inhibitors and biocides, which are used to avoid fouling of pipework (Woodside, 2014). Models developed by the US EPA (Frick et al., 2001) for temporary brine discharges from vessels assuming no ocean current (i.e. 0 m/s) found that brine discharges from the surface dilute 40–fold at 4 m from the source. This modelling can be used as an indicator for predicting horizontal attenuation and diffusion of reject brine; and suggests that the salinity concentration drops below environmental impact thresholds within 4 m of the discharge point. **Cooling Water** Seawater is used as a heat exchange medium for cooling machinery engines and other equipment. Seawater is drawn up from the ocean, where it is subsequently de-oxygenated and sterilised by electrolysis (by release of chlorine from the salt solution) and then circulated as coolant for various equipment through the heat exchangers (in the process transferring heat from the machinery), prior to discharge to the ocean. Upon discharge, it will be warmer than the ambient water temperature. Cooling water is often treated with additives including scale inhibitors and biocide to avoid fouling of pipework. In some instances, fresh water or central cooling systems may be fitted. In these systems, fresh water is used in a closed circuit to cool down the engine room machinery, and then further cooled by sea water in a seawater cooler. Seawater used for cooling purposes will be routinely discharged at a temperature expected to be less than 70°C and rates ~50 m³/d. Environmental risks relating to the unplanned disposal/discharges are addressed in Section 6.8.6.

Impact assessment
Environmental value(s) potentially impacted
Water Quality **Sewage, grey water and putrescible wastes** The principal environmental impact associated with ocean disposal of sewage and other organic wastes (i.e. putrescible waste) is eutrophication. Eutrophication occurs when the addition of nutrients, such as nitrates and phosphates, causes adverse changes to the ecosystem, such as oxygen depletion and phytoplankton blooms. Other contaminants of concern occurring in these discharges may include ammonia, E. coli, faecal coliform, volatile and semi-volatile organic compounds, phenol, hydrogen sulphide, metals, surfactants and phthalates. Woodside conducted monitoring of sewage discharges at its Torosa-4 Appraisal Drilling campaign which demonstrated that a 10 m³ sewage discharge reduced to about 1% of its original concentration within 50 m of the discharge location. In addition to this, monitoring at distances 50 m, 100 m and 200 m downstream of the platform and at five different water depths confirmed that discharges were rapidly diluted; no elevations in water quality monitoring parameters (e.g. total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station (Woodside, 2011). Mixing and dispersion would be further facilitated in offshore waters, consistent with the location of the Operational Area, through regional wind and large scale current patterns resulting in the rapid mixing of surface and near surface waters where sewage discharges may occur. Studies investigating the effects of nutrient enrichment from offshore sewage discharges indicate that the influence of nutrients in open marine areas is much less significant than that experienced in enclosed areas (McIntyre and Johnston, 1975). Activities associated with the Petroleum Activity will occur over a period of three and a half years, however actual project activities will occur as separate campaigns over the entire Petroleum Activity (refer Section 3.6 for timing). Vessels will also be moving (i.e. not in a single location for an extended period of time) and these routine discharges are expected to be intermittent in nature for the duration of the Petroleum Activity. Therefore, impacts to water quality from discharge of sewage, grey water and putrescible wastes within the Operational Area are expected to be localised with no lasting effect **Deck and bilge water** Deck drainage and treated bilge may contain a range of chemicals, oil, grease and solid material. This particulate matter can cause an increase in the turbidity of the receiving waters close to the point of discharge. The addition of these substances into the marine environment will result in a change to ambient water quality; however, these discharges are expected to rapidly dilute in the water column (Shell, 2010). Discharges will disperse and dilute rapidly, with concentrations significantly dropping with distance from the discharge point. Bilge water and deck drainage discharges, which may include non-organic contaminants, will rapidly dilute. As such, no significant impacts from the planned routine discharges are anticipated, because of the small quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment

Based on the detailed evaluation, the magnitude of potential impact of a change in water quality is no lasting effects.

Brine and cooling water

The key physicochemical stressors that are associated with reject brine and cooling water discharge include salinity, pH, temperature and chemical toxicity.

The potential impacts on water quality due to cooling water discharge include chlorine toxicity and increased water temperatures. Woodside undertook modelling of continuous wastewater discharges (including cooling water) for its Torosa South-1 drilling program in the Scott Reef complex (Woodside, 2014). This study predicted that discharge water temperature decreases quickly as it mixes with the receiving waters, with the discharge water temperature being <1 °C above ambient within 100 m (horizontally) of the discharge point, and 10 m vertically (Woodside, 2014). As such, any potential impacts to water quality are expected to be limited to 100 m of the source of the discharge where concentrations are highest.

Reject brine water is typically 20 to 50% higher in salinity to the surrounding water and, based on models developed by the US EPA (Frick et al., 2001), discharges of brine water will sink through the water column where it will be rapidly mixed with receiving waters and dispersed by ocean currents, with salinity rapidly returning to background concentrations in the near field.

Water quality of the surrounding environment may be altered through the addition of chemicals and an increase in salinity. Scale inhibitors and biocides are commonly used within the systems described above to prevent fouling. Scale inhibitors are typically low molecular weight phosphorous compounds that are water-soluble, and only have acute toxicity to marine organisms about two orders of magnitude higher than typically used in the water phase (Black et al., 1994). The biocides typically used in the industry are highly reactive and degrade rapidly (Black et al., 1994).

Generally, reject brine and cooling water containing chemical additives are inherently safe at the low dosages used. They are usually consumed in the inhibition process, so there is little or no residual chemical concentration remaining upon discharge.

Based on the detailed risk evaluation, the magnitude of the potential impact of a change in water quality from routine and non-routine brine and cooling water discharges is assessed as no lasting effect.

Seabirds and Migratory Shorebirds, Fish, Marine Reptiles and Marine Mammals

It is possible that marine fauna transiting the localised area may come into contact with these discharges (e.g. marine turtles, humpback whales, whale sharks; Section 4.6) as they traverse the Operational Area. However, given the localised extent of even from multiple vessel discharges and limited exposure within the Operational Area, significant impacts to marine fauna are not expected. In particular, whilst a flatback turtle internesting buffer BIA and an internesting Habitat Critical overlap the Operational Area, no impacts to flatback turtles are expected, given the offshore location and distance to nesting beaches (> 35 km).

Planktonic Communities

Research suggests that zooplankton composition and distribution are not affected in areas associated with sewage dumping grounds (McIntyre and Johnston, 1975). Plankton communities are expected to rapidly recover from any such short term, localised impact, as they are known to have naturally high levels of mortality and a rapid replacement rate.

Discharged brine sinks through the water column where it is rapidly mixed with receiving waters and dispersed by ocean currents. As such, any potential impacts are expected to be limited to the source of the discharge where concentrations are highest. Studies indicate that effects from increased salinity on planktonic communities in areas of high mixing and dispersion are generally limited to the point of discharge (Azis et al., 2003).

Planktonic productivity in the NWMR is low. No significant impacts from the planned routine discharges are expected, because of the minor quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area

Based on the impact assessment, the magnitude of the potential impacts on plankton from routine and non-routine brine and cooling water discharges is assessed as no lasting effect.

Cumulative Impacts

Routine and non-routine utility discharges from a MODU/PIV and supporting vessels may occur simultaneously, but will dilute rapidly and have negligible cumulative impacts. These discharges may also occur simultaneously with other discharges from the MODU, such as drill cuttings and fluids. Given the rapid dilution of these discharges in the open water environment, the potential for cumulative impacts to water quality is expected to occur within approximately 100 m of the discharge location hence, cumulative impacts will have a no lasting effect

Summary of Potential Impacts to environmental values(s)

Given the adopted controls, it is considered that routine or non-routine discharges described will not result in a potential impact greater than localised contamination not significant to environmental receptors, with no lasting effect (i.e. Environment Impact – F).

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)42***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of planned routine and non-routine discharges from MODU/vessels. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine and non-routine discharges from the MODU and project vessels are unlikely to result in an impact significance level greater than no lasting effect. BIAs within the Operational Area include the flatback turtle internesting, whale shark foraging, and distribution, and wedge-tailed shearwater breeding and foraging areas. The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and meet the requirements of Australian Marine Orders. In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to routine and non-routine discharges from the MODU and project vessel have been adopted. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of these discharges to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of impact

Drilling Operations

The Petroleum Activity will involve the drilling of up to five wells as described in Section 3.7. Drilling activities generate drill cuttings, require cementing of the casing, gravel packing of the open hole and require the use of a range of fluids. Throughout the drilling program several different fluids are to be run through the closed circulation system including, but not limited to, drilling fluids (water-based muds and non water-based muds), sea water, and kill-weight brine.

- Routine drilling discharges will include:
  - drill cuttings
  - drilling fluids direct to seabed (WBMs only), retained on cuttings and bulk discharge of mud pits (WBMs only)
- Non-routine drilling discharges may include:
  - drill cuttings and fluids generated due to respud or side tracking
  - well abandonment and use of fluids (subsea control, completions and well annular fluids).

The well will be drilled as a series of sections, as detailed in Table 6-14. The top-hole section of the well will be drilled without a riser in place (i.e. riserless drilling) with drill cuttings and unrecoverable WBMs are discharged at the seabed for the top-hole sections. This results in a localised area of sediment deposition (known as a cuttings pile) around and in proximity to the well site influenced by prevailing seabed currents.

Upon drilling of the top hole section, conductor and surface casing will be cemented in place, a BOP installed and a riser put in place between the BOP and the MODU. The riser remains in place during drilling of the bottom hole sections and facilitates the circulation of drilling fluids and cuttings between the well bore and the MODU. This enables cuttings and drilling fluids to be circulated back to the MODU, where the cuttings are separated from the drilling fluids by the solids control equipment (SCE) and typically re-used in the closed loop system between the well bore and the MODU. The cuttings (with adhered residual fluids) are, in typical circumstances, discharged below the water line, with their fate and dispersion determined by cuttings particle size and the density of the unrecoverable fluids.

In contrast, fluids are recirculated into the fluid system where there are a number of mud pits (tanks) on the MODU that provide a capacity to mix, maintain and store fluids required for drilling activities. The mud pits form part of the drilling fluid circulating system and may be discharged at the end of specific well sections, where there is a requirement to change the drilling fluid system or the drilling fluid cannot be re-used (due to deterioration/ contamination). Bulk discharge of this type is only permitted for WBMs.

Base oil may be used for inflow testing prior to abandonment of the well, to verify barrier integrity. Base oil would be pumped down the drill string and reverse circulated back to the rig, with fluids collected for disposal onshore. If stored in a mud pit, the base oil and other fluids associated with the test may result in pit wash water contaminated with hydrocarbons. If this is the case, mud pit wash water would be discharged in accordance with requirements in this EP; with a hydrocarbon content <1% by volume. Well abandonment activities are conducted in accordance with Woodside's internal standards

Drill Cuttings and Fluids

As described above, the primary discharges used as the basis of the impact assessment for this Petroleum Activity are as follows:

- Drill cuttings: drilling generates drill cuttings due to the breakup of solid material from within the borehole. The resultant drill cuttings are basically rock particles of various shapes, with sizes typically ranging from very fine to very coarse.
- Drilling fluids: serve many purposes including maintaining borehole stability and hydrostatic pressure, reducing friction and cleaning/ cooling of the drill bit, in addition to acting as a medium to carry cuttings from the well bore and return them to the surface at seabed or on the MODU. There are two main types of drilling fluids as follows:
  - WBMs consists mainly of fresh water or seawater with the addition of chemical and mineral additives to aid in its function. Drilling additives typically used may include chlorides (e.g. sodium, potassium), bentonite (clay), cellulose polymers, guar gum, barite or calcium carbonate. These additives are either completely inert in the marine environment, naturally occurring benign materials, or readily biodegradable organic polymers with a very fast rate of biodegradation in the marine environment. Bentonite and guar gum are listed as 'E' category fluids under the OCNS and is included on the Oslo Paris (OSPAR) Commission PLONOR (chemicals that 'pose little or no risk to the environment') list (OSPAR Commission, 2021). WBMs can be discharged to sea as fluids retained on cuttings and as bulk discharge from mud pits.
  - NWBMs refers to drill fluids that are hydrocarbon rather than water based fluid. NWBM may contain a range of synthetic hydrocarbons, such as paraffins and olefins; however, such additives are designed to be low in toxicity and biodegradable, as well as not being readily bioavailable or likely to bioaccumulate, particularly in deeper water areas. No bulk discharge of NWBMs will occur offshore, only NWBMs retained on cuttings can be discharged from the MODU. If a NWBM system is required to drill a well section, the cuttings from the NWBM drilling fluid system will pass through the SCE (centrifuge and dryers) to reduce the average residual oil on cuttings (OOC). An OOC discharge limit of 6.9% wt/wt or less on wet cuttings will be averaged over well sections drilled with NWBM for the well. It is noted that microbial biodegradation can result in oxygen

Description of source of impact

reduction within sediments, however Nedwed et al. (2006) found that depth is an important factor for residual concentrations of NWBF once they reach the seabed, suggesting that loss of base fluid during settling acted to significantly reduce chemical effects from discharges. It is also noted that NWBM cuttings tend to clump and settle to the seabed rapidly adding to the cuttings pile in proximity to the well site.

For the purposes of this impact assessment, the indicative dimensions, discharge locations and approximate drill cuttings and drilling fluid volumes provided in Table 6-14 represent the typical volumes for a single well section.

Table 6-14: Indicative drill cuttings and fluid volumes for a single well section

Well section width (inches)	Cuttings volume (~m³)	Drilling fluid type	Drilling fluid volume (~bbl)	Drilling fluid volume (~m³)	Discharge point
Planned activities					
42" conductor hole	78	Seawater with pre-hydrated bentonite (PHB) sweeps/XC polymer/WBM	4,251	675.8	Seabed
26" surface hole	237	Seawater with PHB sweeps/XC polymer/WBM	15,583	2,477.5	Seabed

12.25" production hole	165	WBM /NWBM	12,727	2,023.3	Surface
8.5" open hole	19	WBM	6,747	1,072.7	Surface
Total	***805***	**—**	***53,375***	***8,485.9***	**—**
If NWBM is required					
12.25"	165	NWBM	Retained fluid on cuttings		Surface
Indicative Contingent Activities – one top-hole respud					
42" + 26" + 17.5" sections	621	Seawater with PHB sweeps/XC polymer for 42" and 26" hole sections. WBM for 17.5" section	33,901	5,389.8	As above for each section
Indicative Contingent Activities – sidetrack one section					
~12.25" section	165 (formation rock) 2 (swarf) 3 (cement)	WBM	12,727	2,023.3	Surface
~12.25" section	165 (formation rock) 2 (swarf) 3 (cement)	NWBM	Retained fluid on cuttings		Surface

If NWBM required these volumes replace WBM volumes for equivalent production hole

Subsea – Displacement, Completion and Well-bore Cleanout Fluids

Reservoir drilling and completion fluids are usually brines (i.e. a mixture of seawater or formation water) with additives that can include:

- chlorides (often sodium, potassium or calcium)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
• bromides • hydrate inhibitor (mono-ethylene glycol (MEG)) • biocide • oxygen scavenger • formates (potassium). • filtercake breakers (such as acids or chelants) They are designed to have the proper density and flow characteristics to be compatible with the reservoir formation. Completion fluids are used to run well completions, and during wellbore clean up and flowback during drilling. Wellbore and casing clean-up are required at various stages of the drilling operations to ensure the contents of the well are free of contaminants before the next stage of drilling. A chemical wellbore cleanout fluid train may be used to remove residual fluids from the wellbore. The wellbore cleanout fluid is usually brine (similar to completion fluid) that can include several chemicals, such as biocide and surfactant. During the clean-up process, fluids are circulated back to the MODU. Cleanout fluids and completion brine will be captured and stored on the MODU and discharged if oil concentration is less than 1% by volume or returned to shore if discharge requirements cannot be met. Discharge volume would be~400 m³. Base oil may also be displaced into the tubing after the upper completion is installed in order to underbalance the well to allow the well to flow for well unloading activities. ***Contingent Drilling Activities*** **Respud** It is unlikely that a well would be required to respud. If required, the most likely scenario is that the decision to respud is made during drilling of the top hole section of a well; therefore, the incremental increase in cuttings and fluids discharges is associated with the repeat drilling of the same top hole sections for the respudded well with the same associated discharges. A respud once drilling of the bottom hole sections has commenced is far less likely, given the time and effort already committed to the well. However, if this was to occur, the associated discharges would also be a repeat of the discharges as per Table 6-14 to re-drill the same sections of the respudded well. **Sidetrack** The option of a sidetrack instead of a respud may be determined, if operational issues are encountered. Should a sidetrack be required, it will result in an increase in the volume of cuttings generated and a potential increase in the use of NWBM. Additional drill cuttings, swarf and cement volumes are estimated in Table 6-14. **Permanent Plugging Program and Removal of Well Infrastructure** If required as a contingency activity, the base case for permanently plugging the wells includes the use of WBM and wet cement and will produce well annulus fluids (residual hydrocarbons and residual produced formation water). These fluids/cuttings will be generated during the well bore clean-out, drilling of existing cement barriers, installation of permanent abandonment barriers, circulation of the annulus and washing out of the mud pit. Potential additional activities that may be required as part of the Petroleum Activity includes milling, which will produce metal swarf, drilled cement and formation rock. All of the downhole plugging for permanent abandonment activities are conducted through the marine riser. This is a closed system, meaning there are no planned discharges directly to sea during these activities. Planned discharges of the above fluids are only planned to occur after they have been received on the MODU.

Impact assessment
Environmental value(s) potentially impacted

Drill Cuttings Discharge and Dispersion Modelling

As the volumes of cuttings and fluids have been updated based on additional project definition (See Table 6-14) and the assumptions on the discharge location, now approximately 5 m below the water line, Woodside commissioned RPS to undertake a sediment dispersion modelling study that considered discharges of drill cuttings and drilling fluids to the marine environment during drilling activities (RPS 2026). Based on the modelled fate of discharged drill cuttings and drilling fluids, predictions of the levels of suspended sediments within the water column and bottom deposition (thickness and accumulated load) were quantified.

Given the proximity to sensitive receptors, modelling was undertaken for a nominal well location in the Wilcox field, outside the Montebello Marine Park.

- The modelling takes into account these discharge sources:
  - continuous discharge of drill cuttings and retained fluids as drilling proceeds
  - bulk discharge of drilling fluids at the end of each hole section
  - routine (approximately daily) discharge of a single mud pit

Stochastic modelling from the RPS (2026) drill cuttings and drilling fluids dispersion modelling showed:

- most of the sediment released by continuous discharges will settle out over an elliptical area with a long axis aligned with the tidal currents (typically west-north-west to east-south-east)
- the potential for thin (0.1 mm) deposits of sediment to settle out at distances ~1.2 km is very low (<5%) for all seasons (RPS 2026)
- TSS distribution calculations indicate that concentrations >10 mg/L may extend up to ~220-440 m from the source up to 5% of the time, (RPS 2026)
- TSS concentrations >1 mg/L were calculated to extend ~7.7–9.5 km from the source up to 5% of the time (RPS 2026)

Water Quality

Surface and subsea discharges of drill cuttings and drilling fluids will result in temporary changes to water quality. A reduction in water quality may occur via a change in suspended sediment within the water column, or from a change to the chemical content in the water column.

The discharge of cuttings and drilling fluids at the surface (associated with bottom-hole drilling), is expected to result in a larger spatial change to water quality because there is a greater possibility for wider dispersal (e.g. due to surface currents and waves) than discharging at the seabed (associated with top-hole drilling).

Hinwood et al. (1994) explain that when cuttings are discharged to the ocean from the surface, the larger particles (which represent ~90% of the mass of the solids) form a plume that settles quickly to the seabed close to the release point. A similar finding was observed by Jones et al. (2021) over 95% of the cuttings were greater than 1 mm (and >35% >2 mm) and the settling time to the seabed was minutes to tens of minutes. The remaining solids form a plume in the upper water column that drifts with prevailing currents away from the platform and is diluted rapidly in the receiving waters (Neff 2005; 2010). Neff (2005) state that in well-mixed oceanic waters, the drilling cuttings and fluid plume from a surface discharge is diluted by more than 100-fold within 10 m of the discharge.

Marine dispersion modelling for the Petroleum Activity indicated that the area of influence of TSS (1–3 mg/L) ranges between ~2.6–9.5 km for 95th percentile exposurey (RPS 2026). Modelling also indicated that the distance to ecological impact threshold (10 mg/L) is up to ~0.440 km for 95th percentile exposures (RPS 2026). Note that these results represent distances that would only be reached 5% of the time, and are based on instantaneous predictions for TSS.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

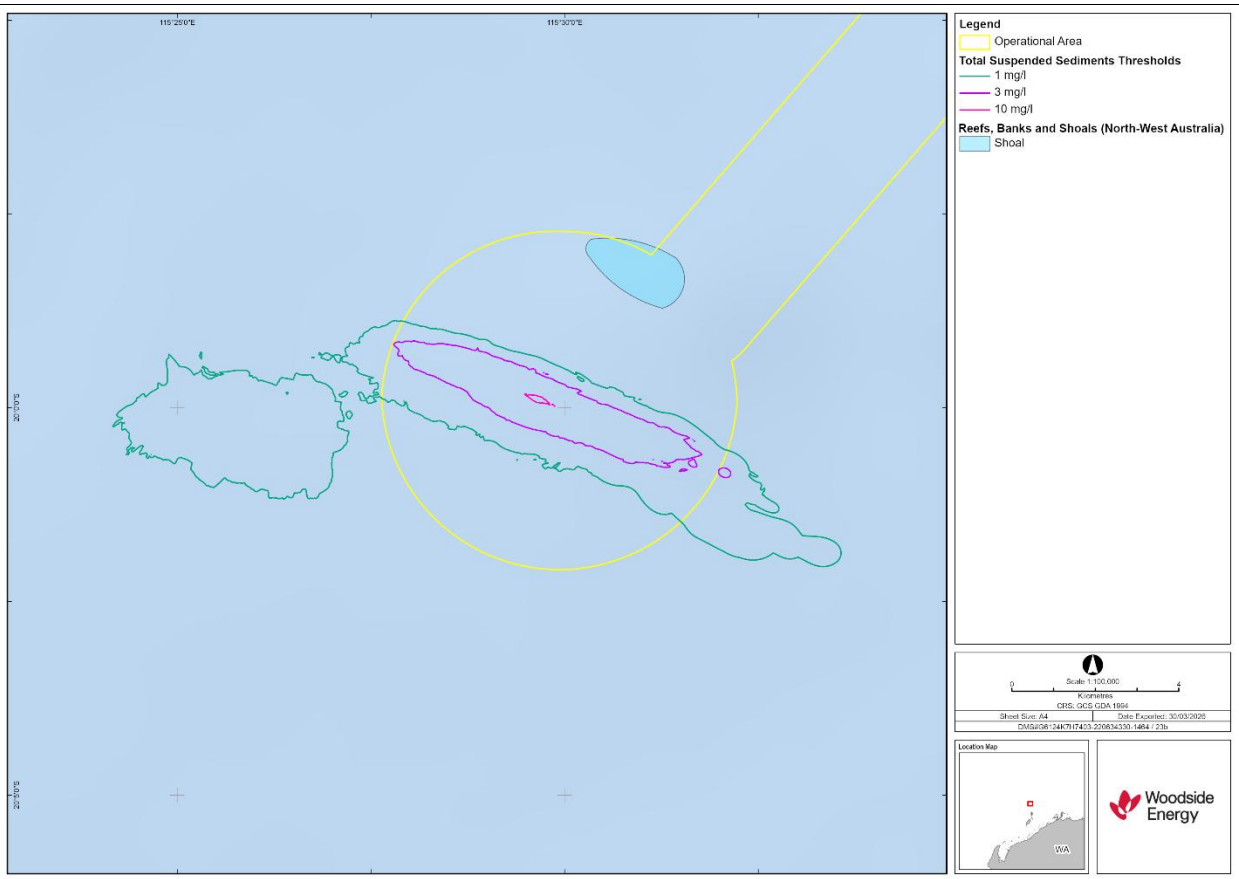

Figure 6-1: Predicted 95th percentile water column total suspended sediment concentrations under annualised enivornmetal conditions

Monitoring and modelling undertaken by Jones et al. (2021) of a drilling campaign at LPA, indicated that TSS concentrations up to 10 mg/L were possible ~1 km away from the discharge point, but these concentrations only remained for periods of minutes due to the intermittent nature of drilling discharges from the MODU. As context, Jones et al. (2021) also noted that transient peaks in TSS levels of tens or hundreds of mg/L for a few hours are common during cyclones and storms in tropical shallow water reef environments.

Drilling fluid discharges are mixtures of crushed rock (drill cuttings) and drilling fluid particles; these particles contain adsorbed organic components from the WBM or NWBM. When discharged, they form a plume in the water column. Dissolved components of the plume (particularly salts and water soluble drilling fluid additives) dilute rapidly by mixing in the water column (IOGP 2016).

Fluid components of WBM are predominantly ‘non-toxic’ or ‘almost non-toxic’ (Hinwood et al. 1994). Typical additives to WBMs are either completely inert in the marine environment, naturally occurring benign materials, or rapidly biodegradable organic polymers. Bentonite and guar gum are listed as ‘E’ category fluids under the OCNS and are included on the Oslo Paris (OSPAR) Commission PLONOR list (chemicals that ‘pose little or no risk to the environment’) (OSPAR Commission 2009). Given their typically inert nature, adverse impacts to water quality from additives to WBMs are not predicted to occur.

NWBM use a non-aqueous base fluid, with water and chemical additives. The environmental effects of NWBM are determined by the base fluid used; however the additives typically adsorb to particles in the cuttings (IOGP 2016). NWBM cuttings are hydrophobic and do not disperse or dissolve in the water column (IOGP 2016). As such, they are not expected to dissolve into the water column.

Due to the intermittent nature of drill cuttings and drilling fluid discharges, the short (~50 days per well) drilling campaign, and that peaks in TSS are expected to only remain for periods of minutes following a discharge, the routine and non-routine discharge of drill cuttings and drilling fluids within the Operational Area is expected to have no lasting effect on water quality.

Marine Sediments

Surface and subsea discharges of drill cuttings and drilling fluids could result in particles accumulating on the seabed, which may result in a localised and temporary change in sediment quality (e.g. physicochemical or composition), depending on the volume and type of contaminants.

Impact assessment

Marine dispersion modelling predicted that local sedimentation would occur as a mound around the well site, and that the thickness of the deposits generated by the particles settling on the seabed decreases exponentially with distance from the drilling location (RPS 2026). Modelling indicated that the distance to ecological impact threshold (6.5 mm) is up to ~0.26 km for 95th percentile exposure (RPS 2026). The modelling also indicated that there is no potential for thin (0.1 mm) deposits of sediment to settle out at distances greater than 1.2 km (RPS 2026).

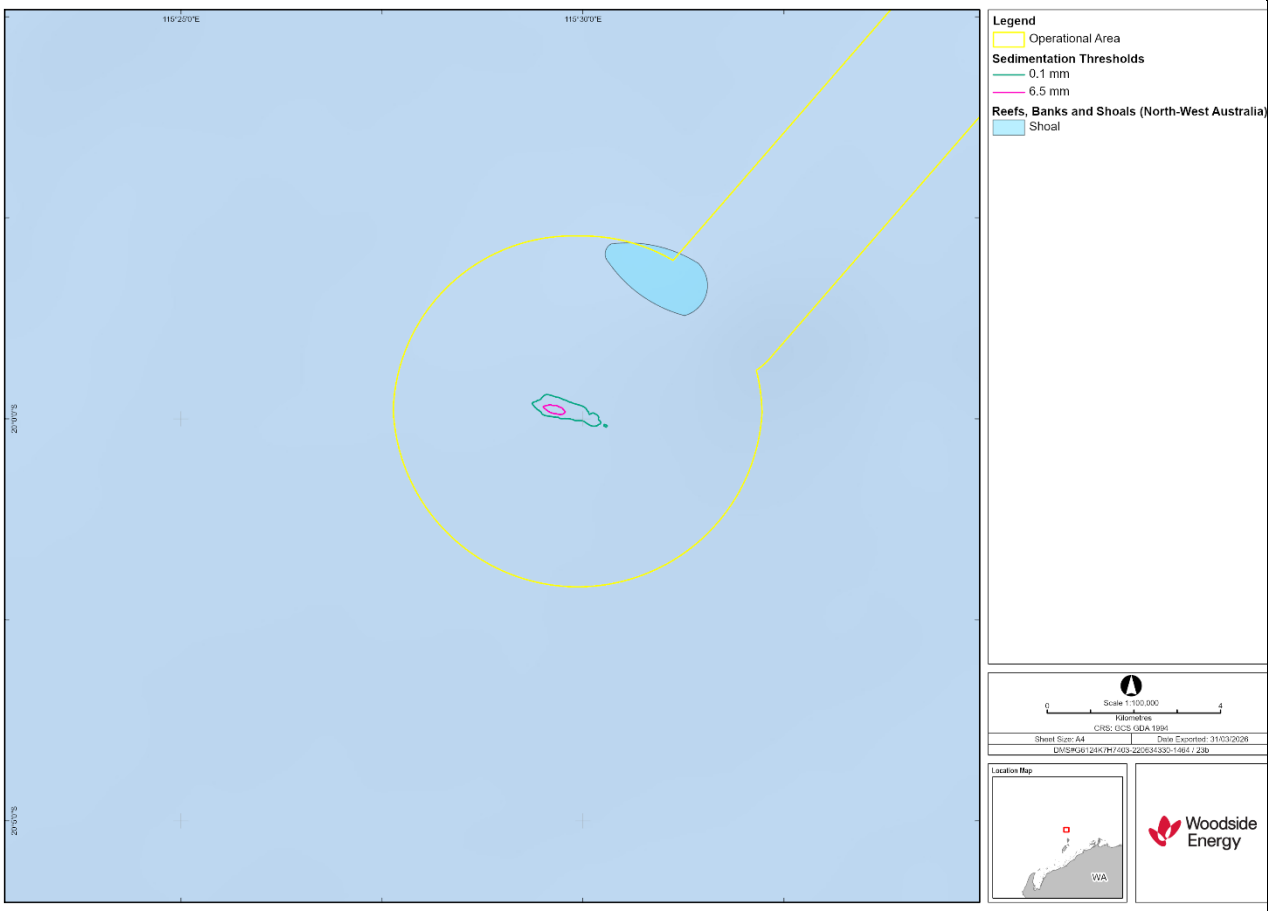

Figure 6-2: Predicted 95th percentile sediment thickness under annualised environmental conditions

Monitoring and modelling undertaken by Jones et al. (2021) of a drilling campaign at LPA, indicated that an area up to ~50 m from the drilling site showed a build-up of cuttings and muds. Beyond this distance, the build-up decreased and gradually thinned to a veneer of fine sediments.

All wells will be drilled with either seawater (with basic additives) or WBM for the top-hole sections (Section 3.7). As described above, additives to WBMs are typically either inert in the marine environment, naturally occurring benign materials, or rapidly biodegradable organic polymers.

Most of the metals detected in drilling muds are primarily trace impurities in barite, bentonite clay, or the sedimentary rocks (drill cuttings) in the formations penetrated by the drill bit (Neff 2008). Barite and bentonite have been referred to as practically inert from a toxicological perspective (Neff 1987; Smit et al. 2008). The metals of environmental concern (because of their potential toxicity and persistence) that may be present in some drilling mud barites include cadmium, chromium, copper, mercury, lead, and zinc, which are primarily insoluble mineralised sulfide salts in the barite (Neff 2008) and have limited environmental mobility. Laboratory testing on industrial barite samples indicates that mercury and other trace metals are not released in significant quantities into seawater or the pore water of marine sediment (Crecelius et al. 2007). Given the low concentrations of trace metals within the stock barite that would be within WBM, the overall volumes of heavy metals within the drilling fluid discharges are minimal.

IOGP (2016) summarised several field studies of cuttings and associated WBMs from top-hole drilling—they found that cuttings could be detected visually or as elevated barium concentrations in benthic sediments within 10–150 m of the discharge, with a greater spread down-current. This is consistent with measurements of barium in the sediment taken during a drilling campaign which showed elevated concentrations at 50 m from the drilling site, but decreased with increasing distance away (Jones et al. 2021). Jones et al. (2021) also detected some chromium around the wells, however this was well below Australian and New Zealand Guidelines for fresh & marine water quality (ANZG)

Impact assessment

sediment quality guidelines. As such, a change in sediment quality from top-hole drilling discharges is expected to be localised to within hundreds of metres of the drilling site, and limited to inert minerals (e.g. barite) and trace amounts of mineralised metal sulfides.

Bottom-hole drilling may be undertaken using either WBM or NWBM depending on the technical requirements for the well (Section 3.7.5). NWBM remain as non-dispersible clumps of particles if the amount of NWBM on the cuttings is high (IOGP 2016). These clumps tend to settle rapidly and accumulate on the seafloor over a small area near the discharge location (Neff 2010; IOGP 2016). NWBM discharges in water depths of <400 m are usually deposited within ~100–200 m of the discharge (IOGP 2016).

WBM discharged at the surface from a drilling rig tend to disperse more widely and settle more slowly than NWBM; estimated distances for deposition range from ~100 m to >1 km (IOGP 2016). Jones et al. (2021) detected slightly elevated barium levels >2 km from the drilling site. This is consistent with other monitoring that referenced elevated sediment barium concentrations in sediment samples up to 1000 m and 3000 m from the platforms before decreasing to background levels (Jones et al. 2021).

Due to the localised area of effect for sedimentation, and trace amounts of constituents of concern in drilling fluids, the routine and non-routine discharge of drill cuttings and drilling fluids within the Operational Area is expected to have no lasting effect on sediment quality

Planktonic Communities

Physicochemical changes in water quality as a result of routine and non-routine drill cuttings and drilling fluid discharges has the potential to change planktonic communities within the water column.

Plankton have a patchy distribution linked to localised and seasonal productivity that produces sporadic bursts in populations (DEWHA 2008b). Any effects to plankton have to be assessed in the context of natural mortality rates, which are generally considered high and variable.

As described above, predicted changes to water quality are a localised and temporary increase in suspended sediments. Adverse changes to the chemical water quality parameters are not expected to occur due to the inert nature of additives to WBMs. Therefore, this evaluation is focussed on potential suspended sediment impacts to planktonic communities.

Impacts to zooplankton from turbidity are associated with variations in predator–prey dynamics, which favour planktonic feeders over visual feeders (Gophen 2015). Smit et al. (2008) also suggests that impacts to zooplankton occur due to physical effects to filter-feeding and respiration organs. Impacts to phytoplankton occur with decreases in available light, which reduces productivity (Dokulil 1994). Concentrations at which impacts to phytoplankton may occur are highly localised and unlikely to occur >25 m from the discharge point (IOGP 2016; Smith, Brandsma, and Nedwed 2004).

Jenkins and McKinnon (2006) reported that levels of suspended sediments greater than 500 mg/L are likely to produce a measurable impact upon larvae of most fish species, and that levels of 100 mg/L will affect the larvae of some species if exposed for >96 hours. Jenkins and McKinnon (2006) also indicated that levels of 100 mg/L may affect the larvae of several marine invertebrate species, and that fish eggs and larvae are more vulnerable to suspended sediments than older life stages. Note: Any impact to fish larvae is expected to be limited due to high natural mortality rates (McGurk 1986), intermittent exposure, and the dispersive characteristics of the open water near the wells.

Previous dilution estimates (Hinwood et al. 1994; Neff 2005) suggest suspended sediment concentrations caused by the discharge of drill cuttings will be well below the levels required to cause an effect on fish or invertebrate larvae (i.e. predicted levels are well below a 96-hour exposure at 100 mg/L, or instantaneous 500 mg/L exposure). Modelling indicated a maximum TSS concentration in the water column of 126.6 mg/L for 95th percentile exposure (RPS 2026). Note that these results represent concentrations that would only be reached 5% of the time, and are based on instantaneous predictions for TSS. Further, the modelling indicated that the distance to ecological impact threshold for TSS (10 mg/L) is up to ~0.4 km for 95th percentile exposure (RPS (2026).

As described in the consequence evaluation above, the discharge of drill cuttings and drilling fluids within the Operational Area is not expected to result in a lasting effect to water quality. Given the patchy and variable plankton communities, these discharges are unlikely to cause a change in planktonic communities at a measurable level and will not change the viability of the population or ecosystem.

Offshore Habitats and Biological Communities

Sedimentation, and physicochemical changes sediment or water quality resulting from routine and non-routine drill cuttings and drilling fluid discharges has the potential to change benthic habitats and communities.

The main environmental disturbance from discharging drill cuttings and drilling fluids is associated with smothering and burying sessile benthic and epibenthic fauna (Hinwood et al. 1994; Jones et al. 2021). Elevated TSS levels are also a well-known hazard for filter feeder communities (Jones et al. 2021).

Modelling indicated that the distance to ecological impact threshold for sediment (6.5 mm) is up to ~0.26 km for 95th percentile exposure (RPS 2026). The largest area predicted to be exposed above this ecological threshold was

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment

~0.06 km^2 (RPS 2026). Further, the modelling indicated a maximum bottom thickness of 104.5 mm for 95th percentile exposure (RPS 2026).

This is supported by monitoring and modelling undertaken by Jones et al. (2021) of a drilling campaign at LPA, which indicated:

- a zone of high impact surrounding the drilling site up to 50–75 m
- an area of medium impact up to the ends of the 200 m transect lines.

The zone of high impact is due to a combination of riserless top-hole sections that discharged straight to the seabed, as well as surface discharges from the MODU (Jones et al. 2021). Effects to the sparse benthic filter feeder communities close to the wells were observed, but no effects were seen on the epibenthic or demersal fish assemblages across the nearby mesophotic reef, Rankin bank (Jones et al. 2021).

Although chemicals can usually be detected within the sediment surrounding the discharge site, impacts to benthic flora and fauna are generally subtle (Cranmer 1988; Neff et al. 1989; Hyland et al. 1994; Daan and Mulder 1996; Currie and Isaacs 2005; OSPAR Commission 2009; Bakke, Klungsøyr, and Sanni 2013). An increase in NWBM in sediments may deplete oxygen in surface layers; development of hypoxia in surface layers, accompanied by increased concentrations of ammonia and sulfide, often leads to a decrease in benthic community diversity (IOGP 2016). Terrens et al. (1998) found that NWBM was not detectable in sediments after 11 months. Although some components of WBM or NWBM are potentially bioaccumulative, organisms can oxidise and expel aromatics—i.e. aromatic hydrocarbons may be bioavailable but they are not expected to bioconcentrate (Melton et al. 2000). Mobile benthic fauna (e.g. crabs, shrimps, demersal fish) tend to avoid affected areas; therefore, no impacts to these fauna are expected (IOGP 2016).

Most of the metals detected in drilling muds are primarily trace impurities in barite, bentonite clay, or the sedimentary rocks (drill cuttings) in the formations penetrated by the drill bit (Neff 2008). Barite and bentonite have been referred to as practically inert from a toxicological perspective (Neff 1987; Smit et al. 2008). Trace metals within barite are primarily insoluble mineralised sulfide salts (Neff 2008). Laboratory testing on industrial barite samples indicates that mercury and other trace metals are not released in significant quantities into seawater or the pore water of marine sediment (Crecelius et al. 2007). As barite releases little of these metals to seawater or sediment pore-water, it is not likely that barite will cause environmental effects to organisms living on or near the seafloor. A study on the impacts of drilling in Bass Strait by Terrens et al. (1998) observed biological effects within 100 m of the drilling site shortly after drilling; recovery of seabed communities across the area were reported within 4 months. Neff (2010) found that recolonisation of NWBM cuttings piles in cold-water marine environments began within one to two years of ceasing discharges, after the hydrocarbon component of the cutting piles had biodegraded. Both Balcom et al. (2012) and IOGP (2016) indicate that impacts to benthic communities as a result of drill cuttings and drilling fluids discharges are minimal, resulting in highly localised impacts; benthic environments recover after drilling ceases. The studies reviewed in IOGP (2016) reported varying recovery times, but substantial recovery within one year post-drilling was common. Although recovery time may differ, species present in soft sediment are well adapted to changes in substrate, especially burrowing species (Kjeilen-Eilertsen et al. 2004), and they recover quickly.

The benthic habitat within the Operational Area is expected to be predominantly dominated by soft sediments with infauna (nearfield wells) and areas of sparse filter feeder communities (Wilcox wells); these habitats are broadly represented throughout the NWMR (Worley 2025) (Section 4.3). Benthic organisms (including benthic infauna and epifauna) below each cuttings pile may be smothered; however, this would be limited to a localised area. Ecological impacts to benthic biota as a result of smothering are predicted to occur when sediment deposition is equal to or greater than 6.5 mm in thickness (IOGP, 2016) which is expected to be ~250 m around the well.

The unnamed shoal is approximately 2 km north east of the Wilcox drilling centre and therefore ecological impacts are not expected. In addition, Rankin Bank and Wilcox Shoal are >8 km west and ~21 km west-south west of proposed drilling at the Yodel Updip, respectively. Wilcox Shoal is also ~12 km north-east of the proposed drilling at the Wilcox field. No sedimentation (at either the ecological threshold or as a low-level veneer) is predicted to occur at any of these shallow bathymetric features because of drill cuttings or drilling fluid discharges during the drilling Program.

Given the temporary and intermittent nature of the discharge, the predicted spatial extent of exposure, the predominantly soft sediment habitats within the Operational Area, and that habitats and communities are expected to recover, the routine and non-routine discharge of drill cuttings and drilling fluids is not expected to result in a consequence greater than minor short-term disturbance to localised areas but not affect ecosystem function.

Key Ecological Features

Sedimentation, and physicochemical changes sediment or water quality resulting from routine and non-routine drill cuttings and drilling fluid discharges has the potential to change benthic habitats and communities.

The largest area predicted to be exposed above this ecological threshold for sedimentation (6.5 mm) was ~0.06 km^2 (RPS 2026) for one well. Two of the nearfield wells are located on the KEF and therefore up to ~0.12 km^2 may be impacted however this represents a very small proportion (less than 0.001%) of the overall KEF.

As described in Section 4.7, the values of this KEF include providing areas of hard substrate that may result in higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment. However, it is predicted that the areas around the nearfield wells is soft sediments and no hard substrate was identified. The

Impact assessment
potential impacts to benthic habitats and communities from drill cuttings and drilling fluid discharges are described above. Physical habitat modification is listed as a pressure within the Marine Bioregional Plan for the NWMR, but has not been identified a pressure of concern for this KEF (DSEWPaC 2012b). Given the temporary and intermittent nature of the discharge, the predicted spatial extent of exposure, and the variable benthic habitat (sand interspersed with areas of rubble or pavement) within the KEF, the routine and non-routine discharge of drill cuttings and drilling fluids is not expected to result in a consequence greater than minor short-term disturbance to localised areas but not affect ecosystem function ***AMPs*** The potential for changes to the values of the Montebello Marine Park may occur from sedimentation or a change in suspended solids within the marine park resulting from the routine or non-routine discharge of drill cuttings or drilling fluids from drilling activities adjacent to the marine park associated with the Wilcox reservoir. No top holes for production wells will occur within the boundary of the marine park (Section 4.8.1). Modelling indicated that the distance to ecological impact threshold for sedimentation (6.5 mm) is up to ~0.26 km for 95th percentile exposure (RPS (2026). The modelling also indicated that there is no potential for thin (0.1 mm) deposits of sediment to settle out at distances ~1.2 km (RPS (2026). Therefore, depending on the exact location of the drilling activity, limited exposure above ecological sedimentation thresholds may occur within the marine park; and some deposition (<6.5 mm thick) may occur. Modelling indicated that the distance to ecological impact threshold for TSS (10 mg/L) is up to ~0.44 km for 95th percentile exposure (RPS 2026). Modelling also indicated that the area of influence of TSS (1–3 mg/L) ranges between ~2.6–9.5 km for 95th percentile exposure (RPS (2026)). As such, changes in suspended sediment loads are expected to occur within the marine park boundary, with concentrations depending on the exact location of the drilling activity. The values of the Montebello Marine Park (as described in Section 4.8.1) include ecosystems representative of the Northwest Shelf Province, including areas of ancient coastline. Benthic habitat surveys within the northern section of the marine park indicate that it is a relatively flat and sandy seabed with variable coverage of benthic epifauna (e.g. sponges, octocorals) (Section 4.5; (Advisian 2019; Worley 2025)), which is similar to the benthic habitats and communities expected to occur throughout most of the Operational Area, and which are broadly represented throughout the NWMR. However, as described above, predicted changes to water quality are a localised and temporary increase in suspended sediments. Adverse changes to the chemical water quality parameters are not expected to occur. Potential impacts to benthic habitats and communities are also highly localised (e.g. up to ~250 m) from a drilling location, and as such no or negligible change to benthic habitats and communities within the Montebello Marine Park is expected.
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that routine discharges of drill cuttings and drilling fluids described will not result in a potential impact greater than minor short-term disturbance to localised areas but not affect ecosystem function (i.e. Environment Impact – D).

Control considered	***Control feasibility (F) and cost/sacrifice (CS)43***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
		during the Petroleum Activity.		
No top hole locations within the Montebello Marine Park	F: Yes. CS: Minimal cost. Standard practice.	Mitigates the risk of sediment plumes generated during riserless drilling entering the AMP	Benefits outweigh cost/sacrifice.	Yes See adopted locations (Table 3-3)
Cuttings reinjection into formation. Cuttings are crushed, slurrified and pumped to a desired geological structure with a suitable seal, below the seabed through an annulus or tubing.	F: No. No concurrent drilling or direct sequential drilling planned which would require cuttings to be stored prior to re-injection.	Not considered – control not feasible.	Not considered – control not feasible.	No
Riserless Mud Recovery (RMR) system to return top-hole cuttings/mud from the riserless section of the well to the MODU prior to treatment onboard and discharge from the MODU (below the water line).	F: Yes CS: Additional costs associated with the installation of the RMR system	Has the potential to reduce the size of cuttings pile in the vicinity of the top hole however it may increase the area of ecological impact (>6.5mm) from sedimentation.	Disproportionate. Given the adopted controls and low current risk rating, the high cost/sacrifice outweighs the benefit gained over the duration of the Petroleum Activity.	No
Riserless Mud Recovery (RMR) system to return top hole cuttings from the riserless section of the well to the MODU prior to transport to an alternative discharge location or back to shore for disposal. OR Return riser-in-place cuttings for disposal at another marine location or onshore for processing and land disposal (skip and ship) for whole well to reduce risk of benthic disturbance. OR Return riser-in-place cuttings for all sections drilled with NWBM for disposal onshore (to reduce potential residual oil on cuttings to environment).	F: Yes. CS: Primary cost/sacrifice of this option is the additional handling required in transporting cuttings to alternative disposal location. Particularly the health and safety risks associated with high frequency of support vessel activity alongside the rig and the amount of crane lifting required if a cuttings skip/drilling waste container system were employed. Other cost/sacrifice elements which are considered include: • Further treatment of cuttings onshore is required to ensure a standard suitable for landfill. Class II disposed locally (e.g. Karratha).	Compared to adopted control, return riser in place cuttings would achieve a reduction in cuttings/mud discharged (although discharge would still occur during riserless drilling on the basis this control is not adopted) at each well location; however, given current impact assessment and controls adopted, this would not result in a significant reduction on consequence.	Disproportionate. Given the adopted controls and low current risk rating, the high cost/sacrifice outweighs the benefit gained over the duration of the Petroleum Activity. Impact assessment has determined a minor from overall cuttings/mud discharge to benthic communities which are broadly represented throughout the NWMR therefore benefit to be gained from cuttings/mud recovery is disproportionate to the risks introduced by cuttings relocation (including if an alternative system which doesn't use transport containers was implemented).	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)43***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Reduce total drill cuttings by implementing slim well design.	F: No. Slim well design is not considered feasible based on the following factors: The well design is optimised to minimise the size of hole drilled while still being able to reach the targets and meet development objectives safely. CS: Not considered – control not feasible.	Not considered – control not feasible.	Not considered – control not feasible.	No
Water quality and/or sediment monitoring of drill cuttings or drilling fluids to verify impact during activity.	F: Yes. CS: For in-water sampling utilising ROV - Time and logistics for tool change out from operational tools to specialised scientific sampling tools. Additional personnel on board to operate ROV and coordinate sampling program. Low ROV availability due to operations can limit time to perform environment monitoring. If additional ROV is required on the MODU, deck space and resources to run/store/service ROV. Resources for sample processing (space/ equipment/ personnel).	No environmental benefit would be gained by implementation of monitoring during the activity. Monitoring could be used to inform additional control measures in future drilling activities; however, there is a considerable body of existing scientific literature, including a study at LPA which is within the Operational Area (Jones et al 2021), on potential impacts of drill cuttings and impacts are generally well understood. Furthermore, it is not guaranteed that additional controls would be feasible, or if they would provide any environmental benefit.	Disproportionate Cost/sacrifice outweigh benefit to be gained in in reducing environmental impacts. Although adoption of this control could be used to verify EPOs associated with drilling mud and cutting discharge, current modelling is based on site specific information and alternative controls identified achieve an appropriate outcome.	No
Use SCE with secondary treatment for NWBM: Thermomechanical systems (to achieve <1% average oil on cuttings).	F: Yes – with associated infrastructure including vessels for offline storage and delivery to thermomechanical dryer.	A reduction in consequence would be achieved by reducing the average oil on cuttings discharged.	Disproportionate. Cost/sacrifice outweighs benefit to be gained in the context of existing environment and drilling campaign.	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)43***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
	CS: The primary cost/sacrifice of this option is the monetary outlay for acquisition and implementation which is estimated at $800,000 to mobilise, install and demobilise, along with a running cost of about $32,000/day. Other factors considered include: • It is estimated that it would take a minimum of seven months to mobilise, install and commission the system on to the MODU. • Complex and unfamiliar system to integrate with the rig systems. • Increased health and safety exposure due to: – crew of nine engineers and technicians required to run the plant. – multiple crane lifting operations, during installation, operations and demobilisation. – rotating machinery heat illness – deck congestion due to large footprint of the plant.			

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)43***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Time restricted discharge of WBM and/or cuttings to align with tide/current or other oceanographic events.	F: Yes. CS: Disruption to drilling operations in having to stop drilling at time when discharge of WBM and/or cuttings might not be permitted. Additional mud storage volume required.	Given the offshore location, oceanographic changes are unlikely to significantly affect the dispersion of cuttings and therefore no environmental benefit would be gained.	Disproportionate. The cost/sacrifice outweighs the benefit gained – No hard coral or other photo- sensitive benthic communities in the vicinity of the well to rationalise phased/ timed discharge.	No
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of drill cuttings and fluids discharges to the marine environment. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine discharges of drilling cuttings and fluids to the marine environment are unlikely to result in a potential impact greater than slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice. In addition, the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP, including revised modelling, that are relevant to the routine discharges of drilling cuttings and fluids have been adopted. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of these discharges to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of impact

Cementing Fluids, Cement and Grout

Cementing fluids, including cementing mix water, may require discharge to the marine environment under various scenarios.

Dry cement is pneumatically transferred between support vessels and the MODU. A small amount (typically 5% material loss) of dry cement may be vented and blown overboard during the pneumatic transfer process. At the commencement of the drilling campaign there may be a requirement to run a cement unit test to ensure the functionality of the cement unit and the cement bulk delivery system prior to performing an actual cement job. This test would result in a small volume (typically 10 m^3) of cement slurry being discharged at the sea surface. The slurry is usually a mix of cement and water however may contain stabilisers or chemical additives. There may also be infrequent, non-routine requirements to conduct cement unit tests throughout the drilling campaign. If required, this would result in an additional discharge of 10 m^3 per test.

When cementing the conductor and surface casings after top hole sections of a well have been drilled, cement must be circulated to the seabed to ensure structural integrity of the well. Excess cement is pumped to ensure structural integrity is achieved. If the hole is completely in-gauge and there are no downhole losses while pumping the cement, a maximum volume of 111 m^3 is estimated to be circulated to the seabed at each well location, which forms a thin concrete film on the seabed in close proximity to the well.

Wherever possible, the cement line flush volumes are included in the planned cement jobs. After each cement job, leftover cement slurry and/or cement spacer fluid in the cement pump unit and the surface lines is flushed and

Description of source of impact
discharged to the sea to prevent clogging of the lines and equipment. This is estimated at about 50 m³ (based on up to five cement jobs x 10 m³ discharged per job per well). In the unlikely event a respud event is required it would result in additional cement jobs. Also, in the rare event that the cement products become contaminated, the entire volume (~140 m³) may need to be discharged to sea. Cement spacers can be used as part of the cementing process, within the well casing, to assist with cleaning of the casing sections prior to cement flow through. The spacers may consist of either seawater/fresh water with weighting agents and other additives (e.g. surfactants, solvents, defoamers, viscosifiers) to aid with the cleaning of casing and cement placement, and dye. The dye is used to provide a pre-indicator of cement overflow to the seabed surface, to ensure adequate cement height. Foam wiper balls may be used as part of the cementing process, ensuring that the: • cement is not contaminated by the displacement fluid through fluid separation. • a contaminated cement slurry could result in a compromised structural integrity of the casing strings that are installed in the top hole sections. • these casing strings are designed to support the load of the subsequent tubulars that are installed in the well and other equipment that is installed on top of the well (ie. Wellhead, Christmas tree, BOP stack) • landing string or work string is clear of any residual cement that may have not been flushed. • if the landing string or work string is not adequately cleaned of any residual cement, a cement sheath will form in the internal diameter of the tubulars which could plug up subsequent drilling assemblies or cause a restriction for the passage of equipment that may be run internally (eg. Drill pipe darts, e-line tools) Foam wiper balls may vary in size and material composition depending on the required application. Typical sizes range from around 8 cm to 30 cm when the wiper ball is new and unused. Where practicable, foam wiper balls that are constructed from natural rubber will be used however the use of high performance urethane foam wiper balls may be required depending on particulars such as temperature, pressure and chemical compatibility with the fluids in use. If used during top-hole sections where there is no riser in place, recovery of the foam wiper balls to the MODU will not be possible and residual components will be released to the environment. In this case, it is expected that the residual foam wiper ball components would be covered in the respective fluids (i.e. cementing fluids) and would therefore settle to the seabed in the vicinity of the well, assimilating with cuttings piles and cement. ***Subsea Fluids – Blow Out Preventors (BOP) and Well Construction Activity Control Fluids*** Subsea fluids are likely to be released during drilling, including the release of BOP control fluids. Subsea control fluids are water-based hydraulic control fluids used in control systems on the subsea trees and BOPs. The BOP is required, by legislation, to be regularly function tested when subsea. Subsea control fluids will be discharged during function testing of the BOP on installation and pressure testing. The BOP is function tested during assembly and maintenance and during operation on the seabed as described in Section 3.7.3. As part of this testing, small volumes (up to 90 L) of BOP control fluid (generally consisting of water mixed with a glycol based detergent or equivalent water-based anti-corrosive additive) are released to the marine environment. Each time a pressure and function test is undertaken approximately 3620 L of water-based fluid is released to the marine environment, of this approximately 4% is control fluid additive. BOP operation includes function and pressure testing approximately every 21 days, and a function test (approx. 2665 L) approximately every seven days, excluding the week a pressure test is conducted. ***Subsea Fluids – Displacement Fluids*** As required throughout activities with the riser connected, the well will be displaced from one drilling fluid system to another. A chemical clean-out pill or fluids train will be circulated between the different fluids. This will result in a discharge of operational fluids in accordance with the Woodside internal guidelines. ***Produced / Reservoir Water (Well Unloading)*** Completion/suspension fluids, as well as produced/reservoir formation water will be captured at surface during MODU unloading operations. The temporary production system water filtration package may be used to treat produced fluids prior to discharge. ***Non-routine discharge of unused dry bulk products at the end of the drilling campaign:*** Adequate stocks of dry bulk product are required to be stored on the MODU for the duration of the drilling activity for safe operations and well control purposes, as defined in the Woodside Well Control Bridging Document. Approximate quantities typically required are as follows: • cement: approximately 100 tonnes • barite: approximately 120 tonnes • bentonite: approximately 120 tonnes. At the end of the drilling activity and prior to demobilisation, Woodside is contractually obliged to remove the dry bulk product from the MODU. A number of options for removing excess product from the MODU exist, with the last option

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
being to discharge to the marine environment. Woodside have developed a process to assess all safe and technically feasible options for the excess product before a decision is made to discharge overboard, this includes the considering the following options, as described below and illustrated in Figure 6-3 below: • Retaining products on the MODU to be used for subsequent Woodside drilling activities where the Petroleum Activity is not the last in the Woodside MODU sequence • Retaining products on the MODU to be used by the next titleholder who has the MODU on hire • Transferring to another Woodside-contracted MODU operating in the region • Transferring to another titleholder-contracted MODU operating in the region • Returning to shore for onshore storage and/or disposal if a facility is available that is both safe and technically feasible to transfer to • Discharged to the marine environment as a slurry if it is concluded that no other options outlined in Figure 6-3 (below) are feasible and that concentrations of mercury and cadmium in barite are <1 mg/kg and <3 mg/kg, respectively. Woodside's base plan is to retain dry bulk product on board the MODU at the end of the campaign, either for reuse by Woodside (if a subsequent Woodside drilling activity is contracted after the Petroleum Activity), or transfer the dry bulks to the next titleholder who has the MODU on hire. At the time this EP was written it was not yet confirmed whether Woodside would be contracting the MODU for subsequent petroleum activities or if there was another titleholder who planned to contract it. If there are no available options to leave the dry bulk products on the MODU, Woodside would look to transfer excess dry bulk product to another MODU operating in the region, either for Woodside use or for another titleholder. MODU schedules and regional activities are closely monitored to identify these transfer opportunities early, allowing sufficient time to coordinate transfer arrangements. At the time this EP was written it was not yet confirmed if there was another MODU to transfer dry bulk product to. The opportunity to transfer to another MODU would typically present toward the end of the drilling activity Woodside has a proven record of transferring dry bulk materials for reuse between operators and offshore facilities within these timeframes. The backload of dry bulks to shore at the end of the campaign has been explored with Woodside's fluids providers. However, current onshore infrastructure does not support the safe transfer of bulk product at high pressure. When the MODU receives bulk product from a shore base, it involves the pneumatic transfer of product from a lower pressure container/tank to the higher pressure MODU or supply vessel container/tank. However, transfer of bulk product from the MODU to shore would involve the transfer of that material, which is powder, from a high pressure to low pressure mobile tank. These high to low pressure transfers of dry powder carry safety risk as the pressure differential between the two systems can result in an uncontrolled, or rapid fluid flow causing pressure build up, beyond safe limits. Dry bulk products can be transported from shore when initially processed given the manufacturing locations have necessary infrastructure to package bulks in bags for transportation and sale, including bagging machines. These dry bulk products cannot be returned to shore in this same manner. Once the product is transported offshore, it is stored in tanks under high pressure conditions. To return product to shore in the same manner it is initially transported from manufacturing location, the product would need to be high-pressure transferred from the MODU or support vessel tanks to bags, which is not considered to be feasible. During the Petroleum Activity Woodside will continue exploring the feasibility of installing appropriate infrastructure including pressure release valves and other transfer equipment to enable safe transfer of dry bulk product to shore at the end of the drilling activities. If reuse of excess bulks for subsequent activities in the region is not possible and no feasible options for safe transfer of dry bulk product are identified by completion of the campaign, excess dry bulk will be discharged to the marine environment in the form of a slurry. This will only occur if it can be demonstrated that there are no other options identified in Figure 6-3. Use and discharge of all chemicals and products will be conducted in line with Woodside's internal guidelines (Section 7.2). Dry bulk materials generally pose little or no risk to the environment (PLONOR)[46], though barite may contain traces of heavy metals, such as mercury and cadmium. Woodside requires that concentrations of mercury and cadmium in barite be <1 mg/kg and <3 mg/kg, respectively. This conforms to the American Petroleum Institute (API) specification for drilling barite. Heavy metal analysis is conducted on individual batches of stock barite prior to mobilisation offshore. This sampling confirms that heavy metals of concern (cadmium and mercury) are within limits prescribed by API standards.

[46] *Barite (as barium sulphate) is on the OSPAR List of Substances Used and Discharged Offshore which are Considered to Pose Little or No Risk to the Environment (PLONOR). The List is available at: https://www.cefas.co.uk/media/p3sbu3bn/ospar-list-of-substances-used-and-discharged-offshore-which-are-considered-to-pose-little-or-no-risk-to-the-environment-plonor-update-2021.pdf*

Description of source of impact

Contingency Activities

BOP Tethering

For BOP tethering, the system may comprise of an initial tensioning unit (ITU) component of the Liner Rope Tensioner (LRT) that sits on top of the Gravity Based Anchor (GBA) and operates using hydraulic fluid. The ITU may hold ~3L of fluid and typically, no top ups are required. ROV hydraulic system(s) may be used to for various purposes including tensioning the LRT and various other tooling functions utilising hot stabs. During ROV hot stabbing, a very small volume of hydraulic fluid between the two seals (10 - 15 mL) is released each time the hot stab is engaged. However, greater releases of hydraulic fluid (typically <500mL) do occur from time to time.

Well Intervention

Woodside may need to intervene or workover wells within the Operational Area. These activities generally occur within the wellbore and may include well testing and flowback activities, as well as any other drilling activities described in Sections 3.7 and 3.10, which may including discharge of subsea control fluid (control of subsea tree), completions fluids and well annular fluids. Discharges are not expected to be different from those previously described. Kill weight brine may also be used during well suspension or well abandonment, which is a brine (e.g. sodium chloride) of adequate density to control formation pressure.

Well unload to MODU - PW

If required, a temporary production system water filtration treatment package will be used to treat produced/reservoir water before discharge. Prior to discharging, the fluids are cycled through an oilbond filtration system and gauge tank. Water filtration is standard practice for well unloading operations and the produced water will be treated to meet 30 ppm OIW. Fluids that cannot be treated or flared will be sent onshore in tanks for disposal. Approximately 500 bbls (80 m^3) of produced water is yielded per well, which may be discharged via the treatment package.

Impact assessment

Environmental value(s) potentially impacted

Water Quality

Surface and/or subsea discharges of cement, cementing fluids, subsea fluids, PW, or bulk product may result in temporary changes to water quality. A reduction in water quality may occur via a change in suspended sediment within the water column, or from a change to the chemical content in the water column.

Cement-related discharges may occur at the seafloor or at the surface. Cement discharges increase the volume of suspended material in the water column, which can temporarily reduce water quality in a localised area. A surface discharge is expected to result in a larger spatial change to water quality because there is a greater possibility for wider dispersal (e.g. due to surface currents and waves) than discharging at the seabed.

Modelling of cement wash out discharges for another offshore project (BP Azerbaijan 2013) was used as it provides a comparison of the potential extent of exposure from cementing activities during drilling. Two hours after the start of discharge, plume TSS concentrations were determined to be 5–50 mg/L, and the horizontal and vertical extents of the plume were ~150 m and 10 m, respectively. Four hours after ceasing the discharge, modelling indicates that the plume had dispersed to concentrations <5 mg/L (BP Azerbaijan 2013). Based on this modelling, it is conservatively estimated that changes to water quality from cement discharges will be limited to within hundreds of metres of the discharge source.

Cement mixtures have the potential for toxicity due to the chemical additives that may be added. Discharge of cement mixtures is limited to the subsea release of cement (i.e. not discharge of dry cement or slurry). However, once the cement has hardened, chemical additives are locked into the cement (Terrens, Gwyther, and Keough 1998) and not are expected to pose any toxicological risk to the marine environment. Therefore adverse impacts to water quality from additives to cement mixtures are not predicted to occur.

Completion fluids are generally brine with additives that may be toxic (e.g. biocides, oxygen scavengers). PW may contain metals, hydrocarbons, glycols, phenols, organic acids, naturally occurring radioactive materials, and residual process chemicals. Changes to water quality are expected to be localised as these fluids will rapidly disperse within the Operational Area. As these are intermittent discharges, any change in water quality will also be temporary and short term, due to rapid dilution from ocean currents.

Control fluids are typically biodegradable and are expected to readily disperse after discharge to the marine environment. Modelling by BP (2013) indicates that a release of control fluids during BOP function testing is expected to reach a dilution of 3,000 times within a maximum displacement plume of 98 m. As the discharge of control fluids are intermittent small volumes, the subsequent changes to water quality are expected to highly localised and temporary.

Approximately 500 bbls (80 m^3) of treated produced / reservoir water may be discharged to the marine environment, meeting the 30 ppm OIW. Given the minor volumes of produced / reservoir water discharges, short discharge

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment

durations and the low toxicity and high dispersion in the open, offshore environment, any impacts on the marine environment are expected to be slight and localised.

Therefore, routine and non-routine discharges of cement, cementing fluids, subsea fluids, PW, and bulk product within the Operational Area are expected to have no lasting effect on water quality.

Marine Sediments

Surface and/or subsea discharges of cement, cementing fluids, or bulk product could result in particles accumulating on the seabed, which may result in a localised and temporary change in sediment quality (e.g. physicochemical or composition), depending on the volume and type of contaminants.

Most cement discharges that will occur during the drilling activities will be at the seabed during cementing of the casing. Cement discharged at the seabed is not expected to disperse—it is designed to set in a marine environment and thus will set in situ, limiting its impact to the area directly around the well. BP (2013) modelled a 200 T subsurface cement discharge and determined that impacts would be limited to a radius of ~10–20 m (depending on the height of the discharge) from the well.

Once overspill from cementing activities hardens, the physical sediment properties of the area directly adjacent to the well (10–50 m) will be permanently altered (Terrens, Gwyther, and Keough 1998). As described above, once cement has hardened, any chemical additives (and potential source of toxicity) is locked into the cement (Terrens, Gwyther, and Keough 1998) and is not expected to pose any toxicological risk to the marine environment.

This estimated area for benthic habitat disturbance from cement discharges falls within the predicted exposure area for drill cuttings and drilling fluid discharges (Section 3.7.5). The highly localised (e.g. up to ~50 m) physical footprint at the well site is not expected to affect the overall sediment quality of the Operational Area, noting that sedimentation up to 6.5 mm is expected out to 260 m (Section 6.7.8).

Additional products such as barite and bentonite may be discharged in bulk during or at the end of the activity if they cannot be reused or taken back to shore. An overboard bulk discharge is expected to disperse over a wide area. Barite and bentonite have been referred to as practically inert from a toxicological perspective (Neff 1987; Smit et al. 2008). The metals of environmental concern (because of their potential toxicity and persistence) that may be present in some drilling mud barites include cadmium, chromium, copper, mercury, lead, and zinc, which are primarily insoluble mineralised sulfide salts in the barite (Neff 2008) and have limited environmental mobility. Laboratory testing on industrial barite samples indicates that mercury and other trace metals are not released in significant quantities into seawater or the pore water of marine sediment (Crecelius et al. 2007).Therefore, the routine and non-routine discharge of cement, cementing fluids, subsea fluids, PW, and bulk product within the Operational Area is expected to have no lasting effect on sediment quality.

Habitats and Biological Communities

Sedimentation, and physicochemical changes sediment or water quality resulting from routine and non-routine cement, cementing fluids, foam wiper balls, subsea fluids, PW, or bulk product has the potential to change benthic habitats and communities.

As described in the consequence evaluation above, the discharge of cement, cementing fluids, subsea fluids, PW, and bulk product within the Operational Area is not expected to result in a lasting effect to water or sediment is predicted to occur.

The area of sedimentation—and therefore potential smothering or burial of benthic habitats and communities—was predicted to be highly localised (up to ~50 m) around a well site. This estimated area for benthic habitat disturbance from cement discharges falls within the predicted exposure area for drill cuttings and drilling fluid discharges (Section 3.7.5).

An overboard bulk discharge of unused barite or bentonite is expected to disperse over a wide area. Barite and bentonite have been referred to as practically inert from a toxicological perspective (Neff 1987; Smit et al. 2008). Trace metals within barite are primarily insoluble mineralised sulfide salts (Neff 2008). Laboratory testing on industrial barite samples indicates that mercury and other trace metals are not released in significant quantities into seawater or the pore water of marine sediment (Crecelius et al. 2007). As barite releases little of these metals to seawater or sediment pore-water, it is not likely that barite will cause environmental effects to organisms living on or near the seafloor.

The benthic habitat within the Operational Area is expected to be predominantly dominated by sponges, soft corals with less coverage of bryozoans, hydroids, ascidians and soft sediment; this habitat is broadly represented throughout the NWMR (Worley 2025) (Section 4.5). The highly localised (i.e. up to ~50 m) physical footprint at the well site is not expected to affect the overall diversity or ecosystem function of the benthic communities of the Operational Area

Given the temporary and intermittent nature of the discharge, the predicted spatial extent of exposure, the routine and non-routine discharge of cement, cementing fluids, subsea fluids, PW, or bulk product is not expected to result in a consequence greater than slight short-term disturbance to localised areas but not affect ecosystem function.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
Key Ecological Features
Sedimentation, and physicochemical changes sediment or water quality resulting from routine and non-routine cement, cementing fluids, subsea fluids, PW, or bulk product has the potential to change benthic habitats and communities.
As described in Section 4.7.1, the values of this KEF include providing areas of hard substrate that may result in higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment. However, benthic habitat surveys within the KEF are characterised by soft sediment (Noting that only the nearfield wells are located on the KEF).
Physical habitat modification is listed as a pressure within the Marine Bioregional Plan for the NWMR, but has not been identified a pressure of concern for this KEF (DSEWPaC 2012b).
The potential impacts to benthic habitats and communities are described above.
Given the temporary and intermittent nature of the discharge, the predicted spatial extent of exposure, the routine and non-routine discharge of cement, cementing fluids, subsea fluids, PW, or bulk product is not expected to result in a consequence greater than slight short-term disturbance to localised areas but not affect ecosystem function.
AMPs
The potential for changes to the values of the Montebello Marine Park may occur from sedimentation or a change in suspended solids within the marine park resulting from the routine or non-routine discharge of cement, cementing fluids, subsea fluids, PW, or bulk product from drilling activities adjacent to the marine park associated with the Wilcox reservoir.
No top holes for production wells will occur within the boundary of the marine park (Section 3.7). Given the highly localised (i.e. up to ~50 m) physical footprint at the well site, exposure to the Montebello Marine Park from the routine or non-routine discharge of cement and wiper balls, cementing fluids, subsea fluids, PW, or bulk product is not predicted to occur. Therefore, potential changes to values of the Montebello Marine Park are not evaluated further.
Cumulative Impacts
Given the highly localised nature of these discharges and potential impacts, cumulative impacts to marine biota, water quality and sediments are expected to be slight and short-term.
Summary of Potential Impacts to environmental values(s)
The overall impact significance level for routine and non-routine discharges of cement, cementing fluids, subsea well fluids and unused bulk product is a slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes (e.g. Environment Impact – E).

No additional controls identified				
Professional judgement – Engineered Solution				
No top hole locations within the Montebello Marine Park	F: Yes. CS: Minimal cost. Standard practice.	Mitigates the discharges generated during drilling entering the AMP	Benefits outweigh cost/sacrifice.	Yes C 9.10
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of cement, cementing fluids, subsea well fluids and unused bulk products. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, cement, cementing fluids, subsea well fluids and unused bulk products discharges are likely to have no lasting effect. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered good practice. When considering the broader acceptability of the potential impacts consideration has been given to the legislative context, including international conventions such as the Minamata Convention on Mercury (Minamata Convention). While there are currently no specific legislative requirements relating to the Minamata Convention relevant to the management of mercury in this EP, Woodside has undertaken an assessment of the Petroleum Activity and the

Demonstration of acceptability
Minimata Convention (including the measures in Article 9(5)) and considers that the Petroleum Activity is not inconsistent with the Minamata Convention. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the impact consequence level is consistent with the level rated in the OPP and the EPOs and controls from the OPP that are relevant to routine and non-routine discharge of cement, cementing fluids, subsea well fluids and unused bulk products have been adopted. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of these discharges to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.8 Unplanned activities (accidents, incidents, emergency situations)

6.8.1 Quantitative spill risk assessment methodology

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur during the Petroleum Activity.

Quantitative hydrocarbon spill modelling was undertaken by RPS, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form oil-in-water emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each particle (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

Hydrocarbon spill modelling assessments undertaken by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.8.1.1 Worst case scenarios

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur from the petroleum activities. In assessing the potential impacts of an unplanned hydrocarbon release, representative worst-case scenarios (in terms of volume and location) were identified. They include:

- Scenario 1: a long term (70-day) uncontrolled surface/subsurface release of 707,729 m^3 of PYA-01 condensate from the Wilcox well, representing loss of containment after a loss of well control
- Scenario 2: a long term (76-day) uncontrolled surface/subsurface release of 993,860 m^3 of Yodel-3 condensate from the Yodel Updip well, representing loss of containment after a loss of well control

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Scenario 3: A short-term (instantaneous) surface release of 1000 m^3 of marine diesel near the furthest nearfield well, representing loss of fuel tank integrity after a vessel collision
- Scenario 4: A short-term (instantaneous) surface release of 1000 m^3 of marine diesel near the Wilcox wells, representing loss of fuel tank integrity after a vessel collision

These scenarios are considered appropriate to inform the risk assessment because:

- The volumes have been estimated based on a loss of well integrity resulting in a full well blowout. The estimates carry the worst-case assumption that blow out occurs once the well has been drilled to total depth and an unconstrained blow out occurs.
- The duration is based on Woodside's operational experience on the NWS and previous response time modelling for relief well drilling. Time frames have been informed based on vessel mobilisation, well intercept and kill estimations, and times to drill to total depth for a relief well. Redundancy has been included in this estimation for multiple attempts to kill the well.

Woodside identified analogous modelling that could be used to inform for scenarios 1, 3 and 4. These modelling studies were considered appropriate and conservative to inform the risk assessment. The modelled scenarios are summarised in Table 6-15.

Table 6-15: Summary of modelling credible hydrocarbon release scenarios

Scenario	Hydrocarbon type	Duration (days)	Maximum credible volume (m^3)	Locations
Scenario 1[1] Wilcox well loss of containment	PYA-01 Condensate	77	745,012	19˚59'53.8" S 115˚29'38.44"E (nominal Wilcox well location)
Scenario 2 Yodel Updip well loss of containment	Yodel-3 Condensate	76	993,860	19˚45'4.365" S 115˚43'38.44.79"E (Yodel Updip development well location)
Scenario 3 Vessel collision resulting in a fuel tank rupture at the nearfield wells	Marine Diesel	Instanteous	1000	
Scenario 4 Vessel collision resulting in a fuel tank rupture at the Wilcox wells	Marine Diesel	Instanteous	2000	20°03'1.4"S, 115°31'35.0"E (within Montebello Marine Park)

[1] modelling for a loss of well integrity in the Wilcox Prospect was originally undertaken in 2023 based on a preliminary estimated relief well duration of 77 days resulting in a release of circa 745,012 m^3. Contemporary studies estimate that a relief well could be executed within 70 days (including mobilisation of a MODU from South East Asia) releasing circa 707,729 m^3. Given the decreased duration and volume, the existing modelling is deemed conservative analogue.

6.8.1.2 Environment that May Be Affected and Hydrocarbon Contact Thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels that exceed selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurs. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA.

The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for various weather and metocean conditions. The EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. Furthermore, as the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

of the metocean mechanism of transportation, a different EMBA is presented for each hydrocarbon fate. Together, these EMBAs define the spatial extent for the existing environment described in Section 5.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill concentrations are expressed as grams per square metre (g/m^2), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb). An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m^2) impacting on the visual amenity of the marine environment. Each of these hydrocarbon thresholds are presented in Table 6-16 and described in the subsections below.

Table 6-16: Summary of environmental impact thresholds applied to the quantitative hydrocarbon spill risk modelling results

Hydrocarbon Type	Ecological hydrocarbon thresholds				Socio-cultural hydrocarbon thresholds	
	Surface Hydrocarbon (g/m^2)	***Entrained hydrocarbon (ppb)***	***Dissolved aromatic hydrocarbon (ppb)***	***Accumulated hydrocarbons (g/m^2)***	***Surface Hydrocarbon (g/m^2)***	***Accumulated hydrocarbons (g/m^2)***
Condensate	10	1,000	10	100	1	10
Diesel	10	1,000	10	100	1	10

6.8.1.2.1 Surface hydrocarbon threshold concentrations

The spill modelling outputs defined the EMBA for surface hydrocarbons resulting from a spill (contact on surface waters) using a threshold of ≥10 g/m^2 (dull metallic colours) based on the relationship between film thickness and appearance (Bonn Agreement 2015) (Table 6-17). This threshold concentration is used to define an area within which ecological impacts to the marine environment may occur from surface hydrocarbons. It represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.

Thresholds for registering biological impacts resulting from contact of surface slicks have been estimated by different researchers at about 10–25 g/m^2 (French et al. 1999; Koops et al. 2004; NOAA 1996). Potential impacts of surface slick concentrations in this range for floating hydrocarbons may include harm to seabirds through ingestion from preening of contaminated feathers, or the loss of the thermal protection of their feathers. The 10 g/m^2 threshold is the reported level of oiling to instigate impacts to seabirds and is also applied to other wildlife, though it is recognised that 'unfurred' animals, where hydrocarbon adherence is less, may be less vulnerable. 'Oiling' at this threshold is taken to be of a magnitude that can cause a response from the most vulnerable wildlife such as seabirds. Due to weathering processes, surface hydrocarbons will have a lower toxicity due to change in their composition over time. Potential impacts to shoreline sensitive receptors may be markedly reduced in instances where there is extended duration until shoreline contact.

Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA, at concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible surface oil (1 g/m^2) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur. This area is referred to as the socio-cultural EMBA. Potential impacts to socio-cultural values assessed within these EMBAs include:

- protected areas,
- national and Commonwealth Heritage Listed places,
- tourism and recreation, and
- fisheries.

Table 6-17: The Bonn Agreement oil appearance code

Appearance (following Bonn visibility descriptors)	Mass per area (g/m²)	Thickness (µm)	Volume per area (L/km²)
Discontinuous true oil colours	50 to 200	50 to 200	50,000 to 200,000
Dull metallic colours	5 to 50	5 to 50	5000 to 50,000
Rainbow sheen	0.30 to 5.00	0.30 to 5.00	300 to 5000
Silver sheen	0.04 to 0.30	0.04 to 0.30	40 to 300

6.8.1.2.2 Dissolved hydrocarbon thresholds concentrations

Dissolved hydrocarbons present a narcotic effect resulting from uptake into the tissues of marine organisms. This effect is additive, increasing with exposure concentration or with time of exposure (French-McCay 2002; NRC 2005). The dissolved aromatic threshold of 10 ppb has been selected as a threshold to approximate the potential toxic effects, particularly sublethal effects to sensitive species (French-McCay 2026).

Dissolved hydrocarbons represent the bioavailable fraction of oil in the water column and are therefore the most appropriate metric for assessing potential toxic effects to marine organisms. Toxicity studies consistently demonstrate that adverse biological effects are driven by exposure to dissolved oil components, rather than total oil mass or the physical presence of oil droplets, because only dissolved hydrocarbons can cross biological membranes and interact with target tissues. Acute toxicity datasets and species sensitivity distributions show that the majority of marine species experience no acute effects at dissolved hydrocarbon concentrations at or below 10 ppb, indicating that this concentration is protective of more than 95% of species for acute exposures (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017).

Experimental and modelling studies demonstrate that toxic effects may begin to occur in the most sensitive species and life stages at dissolved concentrations on the order of 10 ppb, including early biological and sub-lethal responses (French-McCay 2026; Bejarano et al. 2014; McGrath et al. 2018). As such, 10 ppb represents a lower-bound, biologically meaningful exposure value, rather than an arbitrary screening threshold. Use of this concentration is therefore appropriate for identifying ecological features that may be affected by dissolved oil and for assessing potential environmental consequences, while avoiding the implication that widespread or severe toxicity is expected. The 10 ppb dissolved hydrocarbon exposure value thus provides a conservative yet scientifically grounded basis for impact assessment of the dissolved-phase hydrocarbon fate.

As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 10 ppb is an instantaneous value while ecological studies are based on an exposure duration of typically 48 to 96 hours and therefore accounts for uncertainty in consequence from hydrocarbons spills on ecological, social, economic and cultural features of the environment.

6.8.1.2.3 Entrained hydrocarbon thresholds concentrations

Entrained hydrocarbons in the water column consist of oil droplets containing a mixture of soluble, semi-soluble and insoluble compounds. The toxicologically relevant fraction of entrained oil is limited to the proportion of hydrocarbons that are able to dissolve from droplets into the surrounding water, with multiple experimental and modelling studies demonstrating that toxicity is driven by the dissolved fraction, rather than by droplet mass, and that dissolved hydrocarbons typically represent a small proportion (on the order of ~1%) of fresh oil, with these soluble components lost rapidly as oil weathers (Forth et al. 2017; Redman & Parkerton 2015; French-McCay 2026). Consequently, entrained oil droplets increasingly comprise non-bioavailable material over time, and entrained hydrocarbon concentrations are therefore a poor proxy for toxicity at low concentrations (Forth et al. 2017; Parkerton et al. 2018).

Given this established relationship between oil composition, dissolution processes and weathering, entrained oil concentrations must be substantially higher than dissolved effect thresholds before biologically meaningful exposure is plausible. French-McCay et al. (2018) demonstrate a direct correlation between entrained oil mass and the dissolved fraction derived from it, indicating that entrained concentrations two orders of magnitude greater than dissolved concentrations are required to represent equivalent exposure potential. On this basis, an entrained hydrocarbon exposure value of 1,000 ppb represents a scientifically justified

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

lower-bound threshold for identifying ecological features that may be affected by entrained oil and for assessing potential environmental consequences. This threshold appropriately reflects the limited bioavailability and declining toxicity of entrained oil droplets, while remaining conservative for impact assessment purposes (French-McCay et al. 2018; Negri et al., 2024).

As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 1,000 ppb is an instantaneous value whereas laboratory-based ecological studies typically assess toxicity over exposure durations of 48 to 96 hours, such that use of an instantaneous exposure value provides a precautionary margin to account for uncertainty in the assessment of potential ecological, social, economic and cultural consequences of hydrocarbon spills.

6.8.1.2.4 Accumulated hydrocarbon threshold concentrations

Owens et al. (1994) define accumulated hydrocarbon <100 g/m² to have an appearance of a stain on shorelines. French-McCay (2009) defines accumulated hydrocarbons ≥100 g/m² to be the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. A threshold of ≥100 g/m² has been adopted as the threshold for shoreline accumulation and has been included in the EMBA.

As described above in Section 0 Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA at low concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible shoreline accumulation (10 g/m²) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur.

6.8.1.3 Operational and scientific monitoring

A planning area for operational and scientific monitoring is also described in Annex C of the Oil Spill Preparedness and Response Mitigation Assessment (OSPRMA) (Appendix G). This planning area has been set with reference to a low exposure values of 1 g/m^2 for surface hydrocarbons, 10 g/m^2 for accumulated hydrocarbons, and 10 ppb for both entrained and dissolved.

An operational scientific monitoring program may be activated following a release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) and any identified pre-emptive baseline areas for the worst-case credible spill scenario or other identified unplanned hydrocarbon releases associated with the operational activities.

6.8.1.4 Hydrocarbon Characteristics

Table 6-18 summarises the characteristics of the hydrocarbons used as the basis for the modelling studies and subsequently used to inform the assessment of credible hydrocarbon spills. Additional detail on the characteristics of these hydrocarbons is also provided in the sections below.

Table 6-18: Characteristics of the hydrocarbon types used for modelling and ecotoxicological studies

Hydrocarbon Type	Density (g/m3) at 25 °C	Viscosity (cP) at 25 °C	Component	Volatile (%)	Semi-volatile (%)	Low volatility (%)	Residual (%)	Aromatics (%)
			Boiling Point (°C)	<180	180–265	265–380	>380	Of whole oil <380
PYA-01 Condensate	0.801	1.39	% of total	48	19	30	3	21.1
			% of aromatics	10.1	4.0	6.3	0.7

Hydrocarbon Type	Density (g/m3) at 25 °C	Viscosity (cP) at 25 °C	Component	Volatile (%)	Semi-volatile (%)	Low volatility (%)	Residual (%)	Aromatics (%)
			Boiling Point (°C)	<180	180–265	265–380	>380	Of whole oil <380
Marine Diesel			% of aromatics	1.8	1.0	0.2		

6.8.1.4.1 PYA-01 Condensate

PYA-01 condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components (Table 6-18). In favourable evaporation conditions, ~48% by mass should evaporate within the first 12 hours; up to a further ~19% should evaporate within the first 24 hours; and a further ~30% should evaporate over several days. Around 3% of the hydrocarbon is shown to be persistent (Table 6-18).

The whole condensate has a low asphaltene content (<0.5%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle (RPS 2023c).

Soluble, aromatic hydrocarbons contribute ~21.1% by mass of the whole oil (RPS 2023c). Around 10.1% by mass is highly soluble and highly volatile. A further 4% by mass has semi-to-low volatility. These compounds dissolve more slowly but tend to persist in soluble form for longer. Discharge onto the water surface will favour the evaporation process over dissolution under calm sea conditions, but increased entrainment of oil and dissolution of soluble compounds can be expected under breaking wave conditions (RPS 2023c).

The mass balance forecast for the constant-wind case (Figure 6-4) for PYA-01 condensate shows that approximately 66% of the oil is predicted to evaporate within 12 hours. Under these calm conditions most of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

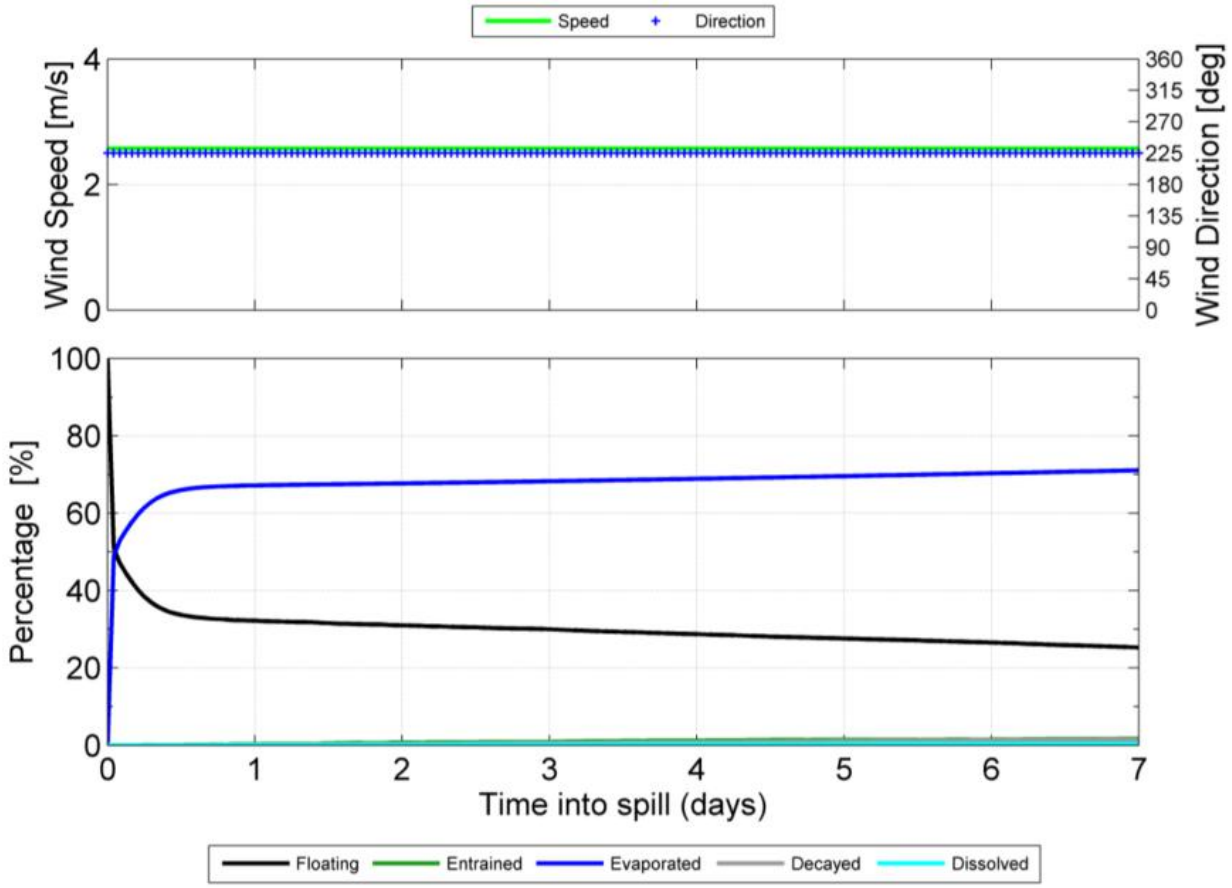

Figure 6-4: Proportional mass balance plot representing the weathering of PYA-01 condensate spilled onto the water surface as a one-off release (50 m^3) and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

Under the variable-wind case (Figure 6-5), where the winds are of greater strength, entrainment of the condensate into the water column is indicated to be significant. Approximately 12 hours after the spill, around 33.7% of the oil mass is forecast to have entrained and a further 58.2% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

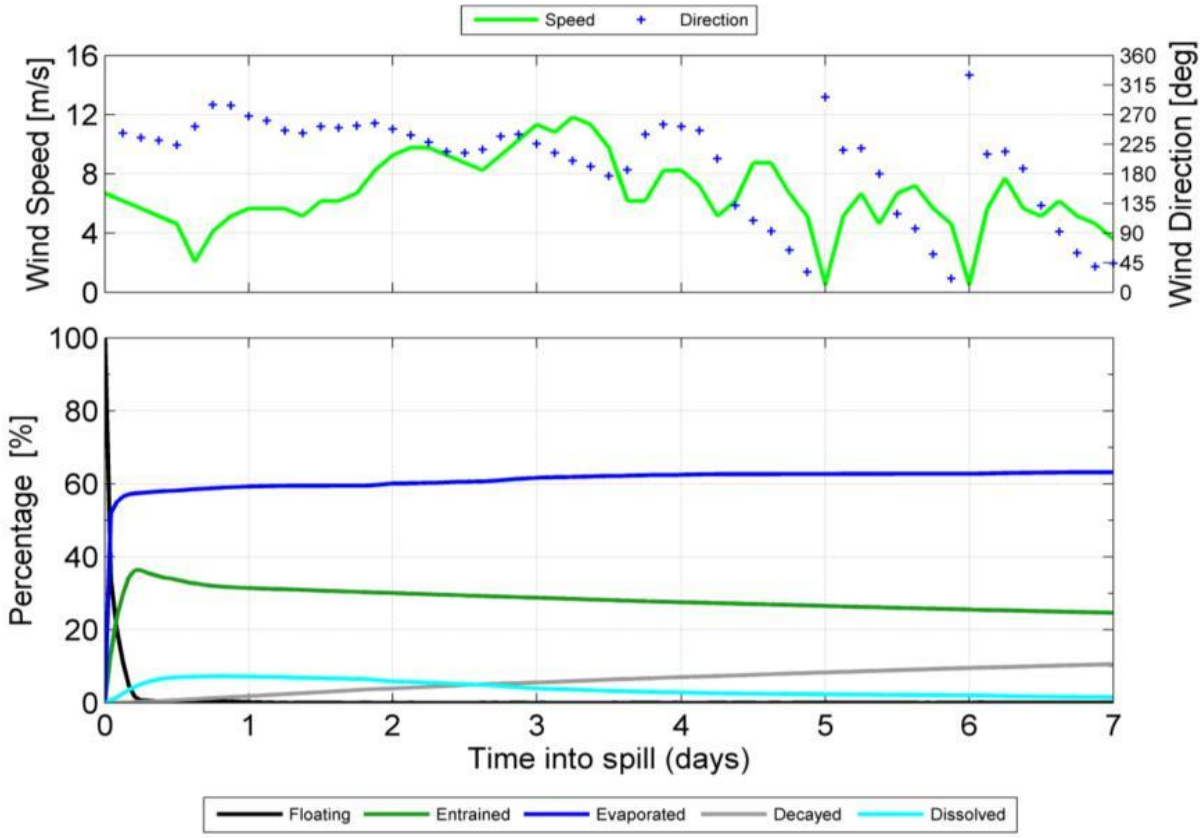

Figure 6-5: Proportional mass balance plot representing the weathering of PYA-01 condensate spilled onto the water surface as a one-off release (50 m^3) and subject to variable wind at 27 °C water temperature and 25 °C air temperature

6.8.1.4.2 Yodel 3 Condensate

Yodel 3 condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components (Table 6-18). In favourable evaporation conditions, ~63.1% by mass should evaporate within the first 12 hours; up to a further ~25.3% should evaporate within the first 24 hours; and a further ~9.1% should evaporate over several days. Around 2.5% of the hydrocarbon is shown to be persistent (Table 6-18).

The whole condensate has a low asphaltene content (<0.1%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle (RPS 2025).

Soluble, aromatic hydrocarbons contribute ~8.7% by mass of the whole oil (RPS 2025). Around 1.8% by mass is highly soluble and highly volatile. A further 6.9% by mass has semi-to-low volatility. These compounds dissolve more slowly but tend to persist in soluble form for longer. Discharge onto the water surface will favour the evaporation process over dissolution under calm sea conditions, but increased entrainment of oil and dissolution of soluble compounds can be expected under breaking wave conditions (RPS 2025).

The mass balance forecast for the constant-wind case (Figure 6-6) indicate that Yodel-3 Condensate will have a tendency to evaporate fairly rapidly, with 88% of the spilled volume predicted to evaporate and around 10% remaining on the water surface after the first 24 hours under light winds. Negligible levels of entrainment and dissolution are expected under these light wind conditions.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

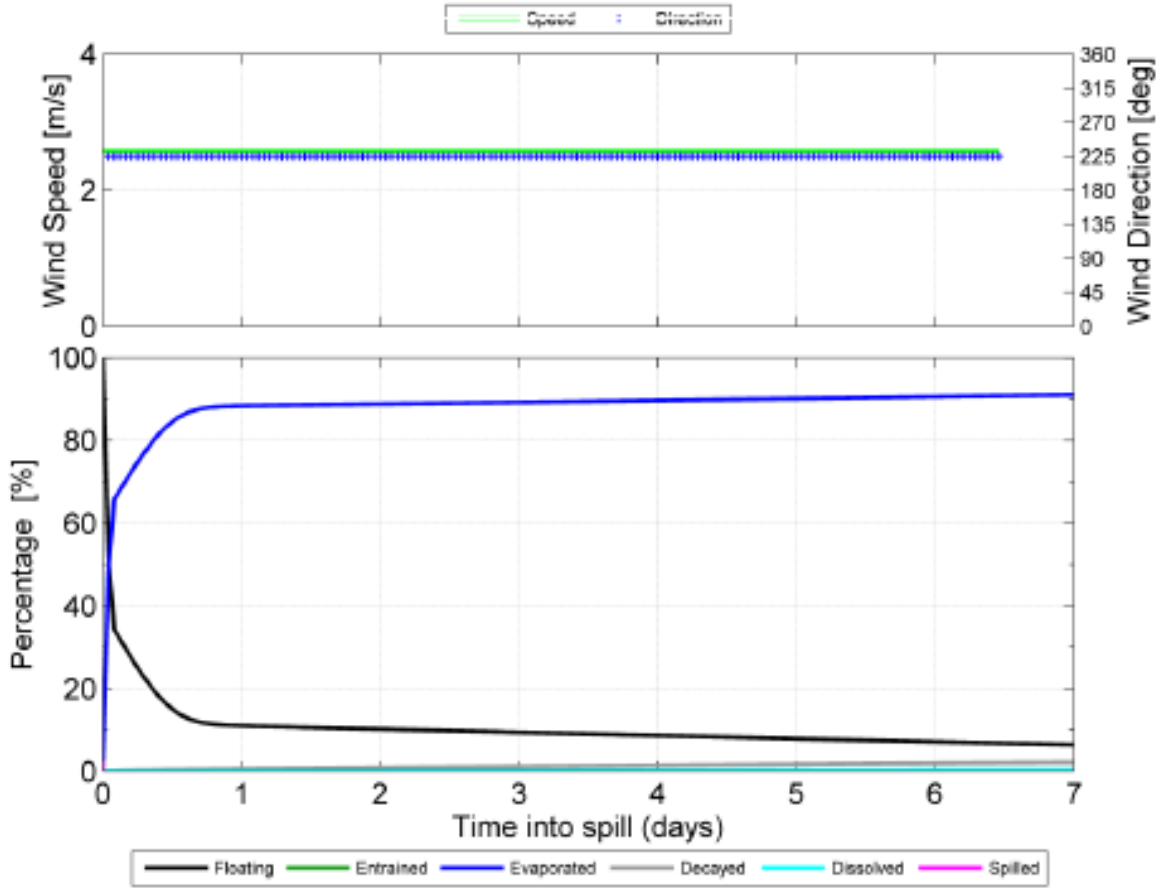

Figure 6-6: Proportional mass balance plot representing the weathering of Yodel 3 condensate spilled onto the water surface as a one-off release (50 m^3) and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

The mass balance forecast for the constant-wind case (Figure 6-7) indicate that Yodel-3 Condensate indicate increased entrainment and dissolution rate, with a corresponding decrease in the floating oil proportion to negligible levels. The variable-wind case also indicates that, once entrained, the oil tends to remain in the water column and may not resurface even during calm wind periods.

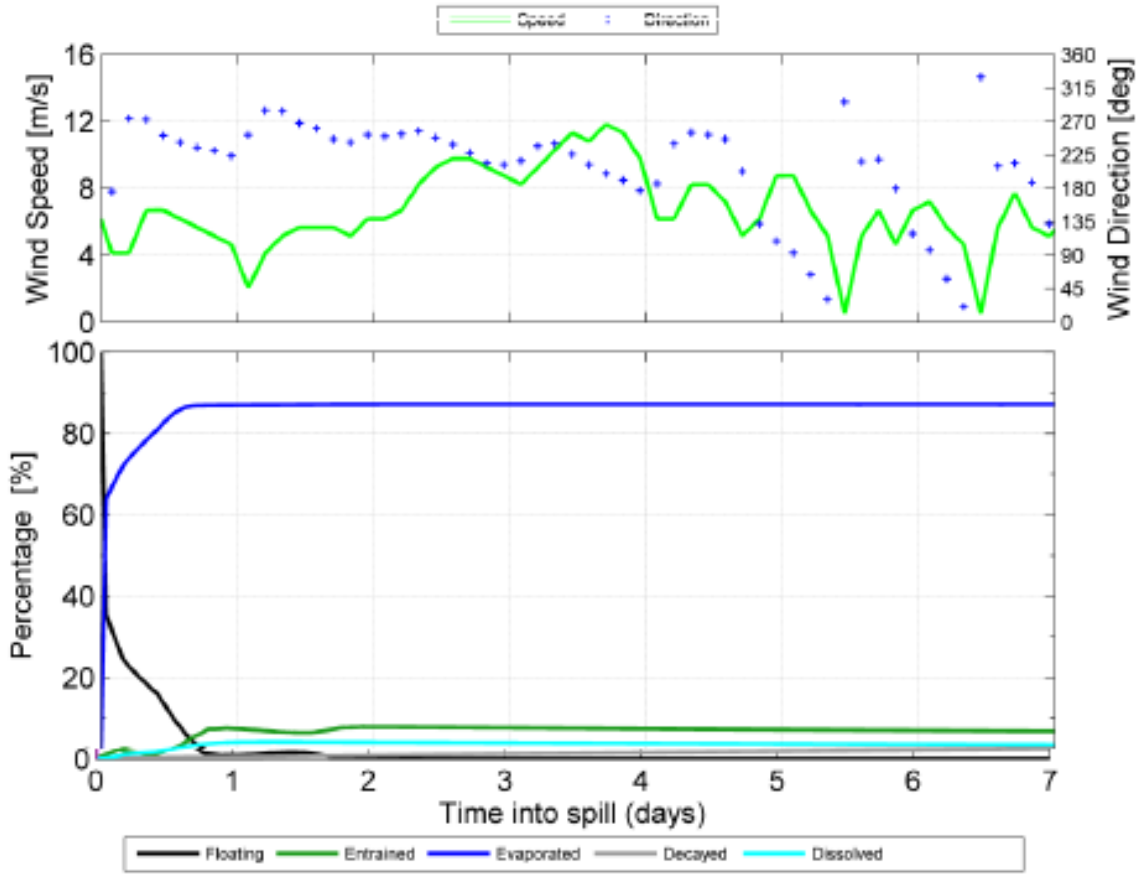

Figure 6-7: Proportional mass balance plot representing the weathering of Yodel 3 condensate spilled onto the water surface as a one-off release (50 m^3) and subject to variable wind at 27 °C water temperature and 25 °C air temperature

6.8.1.4.3 Marine diesel

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. In general, about 6% of the oil mass should evaporate within the first 12 hours (boiling point < 180°C); a further 35% should evaporate within the first 24 hours (180°C < boiling point < 265°C); and a further 54% should evaporate over several days (265°C < boiling point < 380°C). About 5% of the oil is shown to be persistent. The aromatic content of the oil is about 3%.

The mass balance forecast for the constant-wind case for marine diesel shows that about 41% of the oil is predicted to evaporate within 24 hours. Under these calm conditions the majority of the remaining oil on the water surface weathers at a slower rate due to comprising the longer-chain compounds with higher boiling points. Evaporation of the residual compounds slows significantly and is then subject to more gradual decay through biological and photochemical processes.

Under the more realistic variable-wind case (Figure 6-8), where the winds are of greater strength, entrainment of marine diesel into the water column is indicated to be significant. About 24 hours after the spill, around 72% of the oil mass is forecast to have entrained and a further 24% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds tend to remain entrained beneath the surface under conditions that generate wind waves (about >6 m/s).

Description of Source of Impact

Woodside has identified a loss of well containment as the scenario with the worst-case credible environmental outcome as a result of loss of well integrity. A loss of well containment is an uncontrolled release of reservoir hydrocarbon or other well fluids to the environment. A blowout is an incident where formation fluid flows out of the well or between formation layers after all the predefined technical well barriers (e.g. the BOP) or activation of the same has failed.

Industry Experience

Review of industry statistics indicates the probability of a loss of well containment occurring during the drilling phase of a well is 3.02×10^{-4}(SINTEF 2020) which gives a likelihood of 'unlikely' on the Woodside risk matrix.

An order of magnitude reduction has been applied to reduce the likelihood of significant environmental impacts to Level 1'highly Unlikely' for the following reasons;

- The SINTEF data set considered well integrity events from 1980-2018. There have been significant improvements in industry standards following the Macondo event in 2010, including more stringent API STD 53 BOP requirements in force. Woodside has a good history of implementing industry standard practice in well design and construction. In the company's 60 year history, it has not experienced any well containment events that have resulted in significant releases or significant environmental impacts.
- For the international blowout incidents analysed, these are expected to have resulted in varied release outcomes with varied flow and environmental consequence outcomes – not all are aligned with a worst case unconstrained full-bore blowout (which is the basis for this assessment)
- When considering likelihood from an 'experience' perspective, and considering the significant environmental consequence likelihood as the outcome of a blowout event; historical blowouts resulting in major impacts to the environment have not occurred "many times in industry". Hence, alignment with Highly Unlikely likelihood classification is deemed appropriate.

Description of Source of Impact
Credible Scenarios – Loss of Well Containment
The Petroleum Activity consists of drilling five production wells. A loss of well integrity could result in a loss of containment at any of these wells of which Woodside has identified two worst-case credible spill scenarios for consideration. These include: • Scenario 1 – an uncontrolled surface release for five days (during which time the MODU would provide a conduit to the surface for the uncontrolled flow) followed by a 65 uncontrolled seabed release from the Wilcox well • Scenario 2 - an uncontrolled surface release for five days (during which time the MODU would provide a conduit to the surface for the uncontrolled flow) followed by a 71 uncontrolled seabed release from the Yodel Updip well A number of Woodside procedures were followed to identify credible spill scenarios, calculate release rates and determine relief well drill timing. The duration of the model run is based on relief well drill times, which is comprised as mobilisation of a MODU to site, mooring and drilling to required depth and then intersect and kill of the well to cease the release of hydrocarbons. While the total volume release is estimated based on the release rates and time to drill a relief well, taking into account well characteristics.
Quantitative Hydrocarbon Spill Modelling
Modelling for a loss of well integrity in the Wilcox Prospect was originally undertaken in 2023 based on a preliminary estimated relief well duration of 77 days resulting in a release of circa 745,012 m^3. Contemporary studies estimate that a relief well could be executed within 70 days (including mobilisation of a MODU from South East Asia) releasing circa 707,729 m^3. Given the decreased duration and volume, the existing modelling is deemed conservative and therefore additional modelling was not required. Spill modelling was undertaken by RPS, on behalf of Woodside, to determine to determine the fate of hydrocarbon released from the Yodel Updip loss of well containment scenario, based on the condensate characteristics (Table Table 6-18). The modelled release rate provided assumes the worst case scenario for the largest oil volume release (Table 6-15). Modelling considered metocean conditions throughout the year; this was done to inform the determination of consequence of loss of well control during intervention at any time of the year.
Hydrocarbon characteristics

Impact Assessment
Potential Impacts Overview
EMBA
Quantitative hydrocarbon spill modelling results for surface, dissolved and entrained hydrocarbon fates for Scenarios 1 and 2 are described below. Individual receptors contacted, worst case of the two scenarios, are listed in Table 6 28. The individual hydrocarbon fates are described herein.
Surface Hydrocarbons
Scenario 1: Surface hydrocarbons above 1 g/m^2 are predicted to drift over Rankin Bank and reach Tryal Rocks, both at 47% probability. Floating oil concentrations above 10 g/m^2 are predicted to contact several receptors including Montebello Marine Park, which has a 100% probability of contact for all assessed thresholds. This is due to the hypothetical spill site being within the boundaries of the Montebello Marine Park. The worst-case for maximum local accumulation of oil on any surrounding shoreline was calculated at 3,133 g/m^2 on Hermite Island. Scenario 2: Surface hydrocarbons above 1 g/m^2 are predicted to drift over Rankin Bank but is not expected to reach Tryal Rocks. Floating oil concentrations above 10 g/m^2 are predicted to contact several receptors. The worst-case for maximum local accumulation of oil on any surrounding shoreline was calculated at 32 g/m^2 at Southern Pilbara Islands.
Entrained Hydrocarbons
Scenario 1: Entrained hydrocarbons at concentrations equal to or greater than the 1,000 ppb threshold are predicted to be found up to 1,206 km from the release site. Scenario 2: The greatest probability of contact for entrained oil above 1,000 ppb is calculated at 100% for Rankin Bank while Tryal Rocks (55%), Montebello Marine Park (98%), Ningaloo Marine Park (57%), Muiron Islands MMA (53%), Ningaloo Coast WH (57%), and Gascoyne Marine Park (65%), having more than 90% probability of contact. The worst-case entrained condensate concentration at any receptor is 6,602 ppb at Rankin Bank.
Dissolved Hydrocarbons
Scenario 1: The probability of contact by dissolved aromatic hydrocarbon concentrations above 10 ppb is predicted to be 100% at Montebello Marine Park and Tryal Rocks. The probability of contact above 10 ppb is more than 90% for

Impact Assessment
Gascoyne Marine Park, Ningaloo Marine Park, Barrow Islan and the, Southern Pilbara Islands. The maximum dissolved aromatic hydrocarbon concentration forecast at any receptor is 24,018 ppb at Montebello Marine Park. Scenario 2: The probability of contact by dissolved aromatic hydrocarbon concentrations above 10 ppb is predicted to be 100% at Montebello Marine Park and Rankin Bank. The probability of contact above 10 ppb is more than 50% for Tyral Rocks (60%), Murion Islands MMA (64%), Ningaloo Marine Park (68%), Gascoyne Marine Park (69%), and the Southern Pilbara Islands (55%). The maximum dissolved aromatic hydrocarbon concentration forecast at any receptor is 30 550 ppb at Montebello Marine Park.

Summary of Potential Impacts to environmental values
Summary of Potential Impacts to protected species
Receptor group
Offshore Cetaceans
A range of cetaceans were identified as potentially occurring within the Operational Area and wider EMBA (Section 4.6.3). In the event of a loss of well containment, surface, entrained, and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for cetacean species. Migratory routes and BIAs of cetaceans considered to be MNES may be affected, including humpback whales and pygmy blue whales (northbound and southbound migrations). Cetaceans that have direct physical contact with surface, entrained, or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (from prey, water and sediments), aspiration of oily water or droplets, and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees [DHNRDT] 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts, and organs. Other potential impacts include impairment of the immune system, neurological damage (Helm et al. 2015), reproductive failure, other adverse health effects (e.g. lung disease, poor body condition), and mortality (DHNRDT 2016). Physical contact with hydrocarbons is likely to have biological consequences for these species. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Hydrocarbons may also be ingested, particularly by baleen whales (e.g. pygmy blue whales and humpback whales), which feed by filtering large volumes of water. Geraci (1988) has identified behavioural disturbance through avoidance of spilled hydrocarbons in several species of cetacean, suggesting that cetaceans have the ability to detect surface slicks. However, observations during spills have recorded larger whales (both mysticetes and odontocetes) and smaller delphinids travelling through and feeding in oil slicks. During the Deepwater Horizon spill, cetaceans were routinely seen swimming in surface slicks offshore and nearshore (Aichinger Dias et al., 2017). In a review of the impacts of large scale hydrocarbon spills on cetaceans, it was found that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (DHNRDT., 2016), and long-term population level impacts to killer whales were linked to the Exxon Valdez tanker spill (Matkin et al., 2008). Pygmy blue whales and humpback whales are known to migrate seasonally through the wider EMBA. A major spill in May to November would coincide with humpback whale migration through the waters off the Pilbara and North West Cape (Section 4.6.3). A major spill in April–August or October would coincide with pygmy blue whale migration (Section 4.6.3). Both pygmy blue and humpback whales are baleen whales, so are most likely to be significantly impacted by toxic effects when feeding. However, feeding during migrations is low level and opportunistic, with most feeding for both species occurring in the Southern Ocean. Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the risk of ingestion of hydrocarbons is low. Pygmy blue whale and humpback whale migrations are protracted through time and space (i.e. the whole population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore cetacean species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions. ***Nearshore Cetaceans and Dugongs*** Coastal populations of small cetaceans and dugongs are known to reside or frequent nearshore waters, including the Ningaloo Coast, Muiron Islands, Montebello/Barrow/ Lowendal Islands Group and Pilbara Southern Island Group which may be potentially impacted by entrained hydrocarbons exceeding threshold concentrations in the event of a loss of well containment. The Exmouth Gulf is a known humpback whale aggregation area on the annual southern migration (September to December), as well as overlapping foraging, breeding, nursing and calving BIAs for dugongs (~215 km south of the Operational Area).; therefore, migratory humpbacks moving into the Gulf, or more residential dugongs, may be exposed to entrained hydrocarbons above thresholds levels. However, entrained hydrocarbons concentrations above the threshold are not expected within Exmouth Gulf itself. No hydrocarbon contact at or above threshold concentrations for the ecological EMBA is expected for Camden Sound, an important calving area for humpback whales. The potential impacts of exposure are discussed above. However, nearshore populations of cetaceans and dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning. Nearshore dolphin species (e.g. spotted bottlenose dolphins) may exhibit higher site fidelity than oceanic species, although Geraci (1988) observed relatively little impacts beyond behavioural disturbance. Additional potential environment impacts may also include the potential for dugongs to ingest hydrocarbons when feeding on oiled seagrass stands, or indirect impacts to dugongs due to loss of this food source due to dieback in worst-affected areas.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Summary of Potential Impacts to environmental values

Cetacean populations that are resident within the EMBA may be susceptible to impacts from spilled hydrocarbons if they interact with an area affected by a spill. Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins is broadly distributed throughout the region and as such, impacts are unlikely to affect an entire population. Other species identified in Section 4.6.3 may also have possible transient interactions with the EMBA.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to inshore cetacean species and dugongs, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Marine Turtles

Offshore

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (NOAA 2010). Therefore, contact with surface slicks or entrained hydrocarbon can result in hydrocarbons adhering to body surfaces (Gagnon and Rawson 2010) causing irritation of mucous membranes in the nose, throat and eyes, leading to inflammation and infection (NOAA 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al. 1995). A stress response associated with this exposure includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of the salt gland (Lutcavage et al. 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe as they may inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours, which are the most toxic component of the hydrocarbon spill (Milton and Lutz 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia, and neurological impairment (NOAA 2010). Contact with entrained hydrocarbons can result in hydrocarbons adhering to body surfaces, causing irritation of mucous membranes in the nose, throat and eyes and leading to inflammation and infection (Gagnon and Rawson 2010).

A flatback turtle internesting BIA and Habitat Critical overlaps the Operational Area (Figure 4-9). However, the Operational Area is unlikely to represent an important habitat for marine turtles as there is an absence of potential nesting or foraging habitat (i.e. no emergent islands, reef habitat or shallow shoals) and the water is deep (70 - 160 m). There are significant nesting and foraging sites along the mainland coast and islands of the region, including Dampier Archipelago and the Montebello Islands, and a number of BIAs and Habitat Criticals' overlap the EMBA (Section 4.6.2, Figure 4-9, Table 4-10)

In particular, the internesting BIAs and Habitat Critical areas for green, loggerhead and hawksbill turtles extend for ~20 km from known nesting locations, and for ~60 km for flatback turtles. Oil from an ongoing loss of containment could be present during nesting season depending on the timing of a spill.

There is the potential for marine turtles to be present at submerged shoals within the EMBA, such as Rankin Bank and Glomar Shoals, however these receptors are not expected to be contacted by entrained hydrocarbons above the threshold concentration. Submerged reefs and shoals of Barrow Island and southern Pilbara islands have the potential to be contacted by entrained hydrocarbons above the threshold concentrations. Marine turtles may be present at such reefs and shoals given the benthic communities associated with the areas.

In summary, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore foraging marine turtles, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Mainland and Islands

Several marine turtle species use nearshore waters and shorelines for foraging and breeding (including internesting), with significant nesting beaches along the mainland coast and islands in potentially impacted locations such as the Montebello/Barrow/Lowendal Islands Group, Pilbara Islands and Ningaloo Reef. A number of BIAs have been identified for marine turtles, including nesting, internesting and foraging areas as discussed above. There are distinct breeding seasons, as detailed in Section 4.6.2. The nearshore waters of these turtle habitat areas may be exposed to entrained hydrocarbons exceeding the threshold concentration. In addition, The potential for accumulation of oil on shoreline, occurring above thresholds concentrations (100 g/m^2), was predicted at the Montebello Islands and State Marine Park, Hermite Island and Barrow Island (Table 6-19). Shoreline oil from an ongoing loss of containment could be present at these receptors during nesting/hatching season depending on the timing of a spill.

The potential impacts of exposure are as discussed above. In the nearshore environment, turtles can ingest hydrocarbons when feeding (e.g. on oiled seagrass stands/macroalgae) or can be indirectly affected by loss of food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon and Rawson 2010). In addition, hydrocarbon exposure can impact turtles during the breeding season at nesting beaches. Contact with gravid adult females or hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact. If accumulated hydrocarbons

(Montebello/Hermite/Barrow Island and Montebello State Marine Park) or entrained hydrocarbons reach the shoreline or internesting coastal waters (refer to Table 6-19 for receptor locations), there is the potential for impacts to turtles using the affected area. Animals that lay eggs have been shown to pass metabolised oil related compounds into their offspring which has the potential to be toxic to the developing embryos. Similarly, adult female turtles can pass

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Summary of Potential Impacts to environmental values

metabolised oil and related products to their eggs, thereby potentially exposing developing embryos and impairing the development and survival of embryos (DWH Natural Resource Damage Assessment Trustees, 2016).

During the breeding season, turtle aggregations near nesting beaches within the EMBA are most vulnerable due to greater turtle densities and potential impacts may occur at the population level. Potential impacts on marine turtles may be major and long-term in the unlikely event of a loss of well control. However, based on the assessment above and given the volatile and non-persistent nature of the hydrocarbons and low levels of shoreline accumulation, the extent of impacts is not expected to result in a threat to the overall viability of marine turtle populations in the wider region.

A worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to foraging and nesting marine turtles, with consequence severity dependent on the actual timing, duration and extent of a spill.

Sea Snakes

Impacts to sea snakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles. This may include potential damage to the dermis and irritation to the mucus membranes of the eyes, nose and throat (ITOP, 2011a). They may also be impacts when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, sea snakes are found in continental shelf waters around offshore islands and potentially submerged shoals (water depths <100 m. Sea snakes may be present in the wider EMBA at the submerged shoals, Rankin Bank and Glomar Shoals, as well as the submerged reefs and shoals of Barrow Island and southern Pilbara islands. Sea snakes may also be present in nearshore waters of the mainland and islands which, along with submerged reefs and shoals, have the potential to be contacted by entrained hydrocarbons above the threshold concentrations. Their abundance is not expected to be high given the water depth and offshore environment. However, sea snake species in Australia generally show strong habitat preferences (Heatwole and Cogger, 1993); species that have preferred habitats associated with submerged shoals may be disproportionally affected by a hydrocarbon spill affecting such habitat.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to sea snakes, with consequence severity dependent on the duration and extent of a spill in relation to the distribution of sea snakes. Potential impacts to inshore and offshore reef associated sea snakes are discussed below.

Fish, Sharks and Rays

Offshore

Hydrocarbon contact may affect whale sharks through ingestion of entrained or dissolved hydrocarbons, particularly if feeding. Whale sharks may transit offshore open waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July (see Mainland and Islands (nearshore waters) below).

Whale sharks are known to feed in the Operational Area and EMBA, and both areas overlap the whale shark foraging BIA identified in Section 4.6.1.1, within which whale sharks are seasonally present between April and October (Section 4.6.1). Impacts to sharks and rays may occur through direct contact with hydrocarbons, or through contamination of the tissues and internal organs, either through direct contact or through consumption of prey. As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons entering the body via the gills, and entrained hydrocarbons via coating of the gills inhibiting gas exchange.

There is the potential for resident shark, ray and fish populations associated with offshore reefs and shoals to be impacted directly from hydrocarbon contact, or indirectly through contaminated prey, or loss of habitat. Spill model results indicate Rankin Bank and Glomar Shoals are not predicted to be contacted by entrained hydrocarbons above threshold concentrations). Submerged reefs and shoals of Barrow Island and southern Pilbara islands have the potential to be contacted by entrained hydrocarbons above the threshold concentrations. Shark and ray species that have associations with submerged shoals may be more susceptible to a reduction in habitat quality resulting from a hydrocarbon spill.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore shark, sawfish and ray species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Nearshore

Whale sharks and manta rays are known to frequent the Ningaloo Reef system and the Muiron Islands (forming feeding aggregations in late summer/autumn). Whale sharks and manta rays generally transit along the nearshore coastline and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding.

Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive subsurface ram-feeding and active surface feeding (Taylor 2007). Passive feeding involves swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (Taylor, 2007). Individuals that are present in worst affected spill areas would have the potential to ingest toxic amounts of entrained or dissolved

Summary of Potential Impacts to environmental values

aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect endocrine and immune systems in the longer term.

The presence of hydrocarbons may displace whale sharks from the area where they normally feed and rest, and potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by surface, entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are fish eggs and phytoplankton, which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If the spill event occurred during the spawning season, this important food supply (in worst spill-affected areas of the reef) may be diminished or contaminated. The contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long-term impacts as a result of bioaccumulation.

There is the potential for other resident shark and ray (e.g. manta ray species identified in Section 4.6.1) populations to be impacted directly from hydrocarbon contact or indirectly through contaminated prey or loss of habitat.

Spill modelling indicates the receptor locations predicted to be contacted by entrained hydrocarbons above the threshold concentration where impacts to the benthic communities of nearshore and subtidal communities could occur, potentially resulting in habitat loss. Therefore, the consequences to resident shark and ray populations (if present) from loss of habitat, may result in a disruption to a significant portion of the population; however, it is not expected to impact the overall viability of the population. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to inshore associated shark, sawfish and ray species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Seabirds and Migratory Shorebirds

Offshore waters of the Operational Area are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat (e.g. Ningaloo, Muiron Islands and the Barrow/Montebello/Lowendal Island Group). There are confirmed foraging grounds off Ningaloo and the Barrow/Montebello/ Lowendal Island Group. Foraging and breeding BIAs for a number of seabirds and migratory shorebirds overlap with the EMBA (Section 4.6.4). In particular, the EMBA overlaps a number of significant habitats for seabirds and migratory shorebirds such as the Dampier Archipelago and Pilbara Islands.

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation, and to ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed 2011).

Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons. Physical contact of seabirds with surface slicks is by several exposure pathways—primarily immersion, ingestion, and inhalation. Such contact with hydrocarbons may result in (AMSA 2013, International Petroleum Industry Environmental Conservation Association [IPIECA] 2004):

- plumage fouling and hypothermia (loss of thermoregulation)
- decreased buoyancy and consequent increased potential to drown
- inability to fly or feed
- anaemia
- pneumonia, and
- irritation of eyes, skin, nasal cavities and mouths.

Longer-term exposures may potentially impact seabird populations through loss of reproductive success, malformation of eggs or chicks (AMSA 2013), or mortality of individuals from oiling of feathers or the ingestion of hydrocarbons.

A hydrocarbon spill may result in surface slicks disrupting a significant portion of the foraging habitat for seabirds, including foraging BIAs, which are generally associated with breeding habitats. Seabird distributions are typically concentrated around islands, so hydrocarbons near nesting/roosting areas may result in increased numbers of seabirds being impacted, with many species of seabirds, such as the wedge-tailed shearwater and the various species of tern, foraging relatively close to breeding islands/colonies.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore seabirds and migratory shorebirds, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Nearshore

In the event of a major spill, there is the potential for seabirds, and resident, non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to entrained, dissolved, and accumulated hydrocarbons. This could result in lethal or sublethal effects. Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in waters near their breeding colony. This results in relatively higher seabird densities in these areas during the breeding season, making these areas particularly sensitive in the event of a spill.

Summary of Potential Impacts to environmental values
Pathways of biological exposure that can result in impact may occur through ingesting contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs). Ingestion can also lead to internal injury to sensitive membranes and organs (IPIECA, 2004). Whether the toxicity of ingested hydrocarbons is lethal or sub-lethal will depend on the weathering stage and its inherent toxicity (note: the shortest entrained hydrocarbon time to contact with a shoreline is seven days (North Ningaloo Coast)). Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds. Migratory shorebirds may be exposed to stranded hydrocarbon when foraging or resting in intertidal habitats, however, direct oiling is typically restricted to a relatively small portion of birds, and such oiling is typically restricted to the birds' feet. Modelling predicts that shoreline accumulation above impact thresholds are not expected at receptor groups; the potential for impacts to migratory shorebirds by accumulated hydrocarbons on shorelines is considered to be very low. Important areas for foraging seabirds and migratory shorebirds are identified in Section 4.6.4. Refer to Table 6-19 for locations within the predicted extent of the EMBA that are identified as habitat for seabirds/migratory shorebirds. Suitable habitat or seabirds and shorebirds are broadly distributed along the mainland and nearshore island coasts within the EMBA. Of note are important nesting and resting areas, including (refer to Section 4.6.4 for additional information, including BIAs within the wider EMBA): • Muiron Islands • Ningaloo Coast • Montebello/Barrow/Lowendal Islands Group (including known nesting habitats on Boodie, Double and Middle Islands) • Pilbara Islands South Island Group Therefore, a hydrocarbon spill may result in impacts on key feeding habitat and disruption to a significant portion of the habitat. Potential impacts on seabirds and shorebirds are expected to be major and long-term in the highly unlikely event of a loss of well control. However, based on the assessment above and given the volatile and non-persistent nature of the hydrocarbons and low levels of shoreline accumulation predicted, the extent of impacts is not expected to result in a threat to the overall viability of seabird or shorebird populations in the wider region.
Summary of potential impacts to other species
Receptor Group
Pelagic Fish Populations
Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (ITOPF 2011b). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water, so individuals exposed to a spill are likely to recover (King et al. 1996). Where fish mortalities have been recorded, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays. Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann et al. 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high concentrations of hydrocarbons. However, sublethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to polycyclic aromatic hydrocarbon (PAH) concentrations (Hjermann et al. 2007), which are typically the most toxic components of hydrocarbons. Light molecular weight aromatic hydrocarbons (i.e. one- and two-ring molecules) are generally soluble in water, which increases bioavailability to gill-breathing organisms such as fish. The effects of exposure to oil on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and, to a lesser extent, affects fish consuming contaminated food (Cohen et al. 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to help eliminate ingested oil from the fish (Cohen et al. 2005). Fish are perhaps most susceptible to the effects of spilled oil in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can damage feeding and breathing apparatus of embryos and larvae (Fodrie and Heck 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie and Heck 2011). Subtler, chronic effects on the life history of fish as a result of exposure in early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann et al. 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression and allows expression of viral diseases (Hjermann et al. 2007). PAHs have also been linked to increased mortality and

Summary of Potential Impacts to environmental values

stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al. 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

A number of additional KEFs that may host relatively diverse or abundant fish assemblages compared to relatively featureless continental shelf habitats occur within the wider EMBA (Table 4-17 and Figure 4-12). KEFs within 5200 km of the Operational Area include the:

- Continental Slope Demersal Fish Communities (~150 25 km west), an area of high biodiversity of demersal fish assemblages, including high levels of endemism.

Mortality and sublethal effects may impact populations located close to a well blowout and within the EMBA for entrained/dissolved aromatic hydrocarbons. Additionally, if prey (infauna and epifauna) surrounding the well location and within the EMBA is contaminated, this can result in the absorption of toxic components of the hydrocarbons (PAHs), potentially impacting fish populations that feed on these.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to pelagic fish species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Summary of Potential Impacts to Marine Primary Producers

Receptor Group

Submerged Shoals

The waters overlying the submerged Rankin Bank and / or Wilcox Shoal have the potential to be exposed to dissolved and entrained hydrocarbons above threshold concentrations (Table 6-19).

The permanently submerged habitats of these banks and shoals represents sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Given the water depth, it is likely the potential for biological impact is significantly reduced when compared to the upper water column layers. However, potential biological impacts could include sub-lethal stress and in some instances total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species.

The submerged shoals are areas associated with sporadic upwelling and associated primary productivity events. Impacts to plankton communities from exposure to entrained hydrocarbons above threshold concentrations may result in short-term changes in plankton community composition but recovery would occur. Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population but would not affect the longer term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be localised at the shoals and temporary.

Hydrocarbon exposure to offshore filter-feeding communities may occur depending on the depth of the entrained/dissolved hydrocarbons. Exposure to dissolved (aromatic) hydrocarbons (≥10 ppb) has potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al., 2012). Shoals that are exposed to entrained and/or dissolved hydrocarbons are expected to result in localised long-term effects, depending on the exposure concentrations and degree of weathering.

Coral Reef

The quantitative spill risk assessment indicates there would be potential for coral reef habitat to be exposed to entrained hydrocarbons at locations including the Montebello/Barrow Island reefs and shoals, and Ningaloo Reef.

Exposure to entrained hydrocarbons (≥1000 ppb) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column (top 20 m), including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities. Mortality in a number of coral species is possible, and this could result in the reduction of coral cover and change in the composition of coral communities.

Sublethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri and Heyward 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Barrow/Montebello/Lowendal Islands, Muiron Islands) and the mainland coast (i.e. Ningaloo Coast). With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor and Pearce 1999).

If a spill occurs at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward 2000). Such impacts are

Summary of Potential Impacts to environmental values
likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained hydrocarbons, resulting in sublethal impacts and in some cases mortality—particularly early life-stages of coral reef animals (reef-attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will depend on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities. Over the worst-affected sections of reef habitat, coral community live cover, structure and composition may reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al. 2013). Therefore, a worst-case hydrocarbon spill scenario has the potential to result in large scale impacts to coral populations within the EMBA, with long-term effects (recovery >10 years) likely. The consequence severity is predicted to be greatest at reefs closest to the potential release location (e.g. Montebello Islands). ***Seagrass Beds/Macroalgae and Mangroves*** Spill modelling has predicted that entrained hydrocarbons above threshold concentrations have the potential to contact a number of nearshore locations that support biologically diverse, shallow subtidal and intertidal communities. The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Depending on the trajectory of the entrained plume, macroalgal/seagrass communities including Barrow Island, Lowendal Islands, Muiron Islands, Pilbara Islands, Montebello Islands and Ningaloo Coast may have the potential to be exposed (see Table 6-19 for a full list of receptors within the EMBA). Exposure to entrained hydrocarbons may result in mortality, depending on actual entrained exposure concentrations received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sublethal stress, causing reduced growth rates and reduced tolerance to other stress factors (Zieman et al. 1984). Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al. 2010). However, the potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should lower the content of soluble aromatic components before contact occurs. Mangrove habitat at Ningaloo Coast, Pilbara islands, and Montebello Islands may be contacted by entrained hydrocarbons within the EMBA (see Table 6-19). Entrained hydrocarbons may adhere to the sediment particles and in low-energy environments such as in mangroves, deposited sediment bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (NOAA 2014). Hydrocarbons may persist in the sediment, potentially causing chronic sublethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from any impacts could be long-term (>10 years). Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to seagrass beds, macroalgae and mangrove communities within the EMBA, with consequence severity predicted to be greatest at receptors closest to the potential release location (e.g. Montebello Islands).
Summary of Potential Impacts to Other Habitats and Communities
Receptor Group
Benthic Fauna Communities
In the event of a major release at the seabed, the stochastic spill model predicted hydrocarbon droplets would be entrained, rapidly transporting them to the sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat and any epifauna (filter feeders) associated with KEFs within the wider EMBA are not expected to have widespread exposure to released hydrocarbons (Ancient Coastline, Continental Slope Demersal Fish Communities KEF, Canyons KEF, Exmouth Plateau KEF and Commonwealth Waters adjacent to Ningaloo Reef KEF (Section 4.7)). Therefore, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to seabed and associated epifauna and infauna within the EMBA, with impacts predicted to be greatest for habitats closest to the potential release location.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Open Water – Productivity/Upwelling

Primary production by plankton (triggered by sporadic upwelling events in the offshore waters) is an important component of the primary marine food web. Planktonic communities are generally mixed, including phytoplankton (cyanobacteria and other microalgae), secondary consuming zooplankton (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton). Exposure to hydrocarbons in the water column can result in changes in species composition, with declines or increases in one or more species or taxonomic groups (Batten et al. 1998).

Phytoplankton may also experience decreased rates of photosynthesis (Tomajka 1985). For zooplankton, direct effects of contamination may include suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation. Impacts on plankton communities are likely to occur in areas where surface, entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover, with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (ITOPF 2011a).

Nearshore waters and adjacent offshore waters surrounding the offshore islands (e.g. Montebello/Barrow/Lowendal Islands Group, Muiron Islands, Pilbara Islands), and west of the Ningaloo Reef system are known locations of seasonal upwelling events and productivity. The seasonal productivity events are critical to krill production, which supports megafauna aggregations such as whale sharks and manta rays in the region. This has the potential to result in lethal and sublethal impacts to a certain portion of plankton in affected areas, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. However, recovery would occur (see relevant section above).

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to plankton populations within the EMBA.

Filter Feeders

Entrained hydrocarbons above the 1000 ppb ecological thresholds will be limited to the top 20 m of the water column beyond the immediate source. Entrained hydrocarbons are therefore not expected to impact filter feeder habitats in deep offshore waters including filter feed communities associated with the Continental Slope Demersal Fish Communities KEF, Canyons KEF, Exmouth Plateau KEF and Commonwealth Waters adjacent to Ningaloo Reef KEF.

Hydrocarbon exposure to shallow nearshore filter feeding communities (< 20 m) (e.g. Montebello Islands, Barrow Island) may occur. Exposure to entrained aromatic hydrocarbons has the potential to result in lethal or sublethal toxic effects. Sublethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al. 2012). Any impacts may result in localised long-term effects to community structure and habitat.

Nearshore filter feeders that are present in shallower water (< 20 m) may potentially be impacted by entrained hydrocarbon through lethal/sublethal effects, although given the distance from source hydrocarbons are expected to be less toxic due to the weathering process. Such impacts may result in localised, long term effects to community structure and habitat.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in localised, long-term impacts to filter feeders within the EMBA.

Open Water – Physical Displacement of Fauna from Gas Plume

The effect of the physical extent of the gas plume in the environment is expected to have a limited and localised effect on identified receptors such as the physical barrier created by the gas plume, which may displace transient and/or mobile biota such as pelagic fish, megafauna species (migratory whales) and plankton. It is acknowledged that the physical extent of the plume may displace some open water species transiting the offshore waters of this area of the NWS. The extent of the plume is relatively small in comparison to the surrounding offshore environment but the overall impact to the in-water biota and the marine environment in general is expected to be slight to minor short-term impact to communities in the EMBA.

Spawning/Nursery Areas

Fish (and other commercially targeted taxa) in their early life stages (eggs, larvae and juveniles) are at their most vulnerable to lethal and sublethal impacts from exposure to hydrocarbons, particularly if a spill coincides with spawning seasons or reaches nursery areas close to the shore (e.g. seagrass and mangroves) (ITOPF 2011a). Fish spawning (including for commercially targeted species such as snapper and mackerel) occurs in nearshore waters at certain times of the year, and nearshore waters are also inhabited by higher numbers of juvenile fishes than offshore waters.

Modelling indicated that, in the event of a major spill, there is potential for entrained hydrocarbons to occur in the surface water layers above threshold concentrations in nearshore waters, including Montebello/Barrow/Lowendal Islands Group, Pilbara Southern Islands Groups, Ningaloo Coast, Exmouth Gulf West, and the Muiron Islands. This has the potential to result in lethal and sublethal impacts to a portion of fish larvae in areas contaminated above impact thresholds, depending on concentration and duration of exposure and the inherent toxicity of the hydrocarbon. Although there is the potential for spawning/nursery habitat to be impacted (e.g. mangroves and seagrass beds, discussed above), losses of fish larvae in worst-affected areas are unlikely to be of major consequence to fish stocks compared with significantly larger losses through natural predation, and the likelihood that most nearshore areas would be exposed is low (i.e. not all areas in the region would be affected). This is supported by a study in the Gulf of

Summary of Potential Impacts to environmental values
Mexico, which used juvenile abundance data from shallow-water seagrass meadows as indices of the acute, population-level responses of young fishes to the Deepwater Horizon spill. Results indicated that there was no change to the juvenile cohorts following the Deepwater Horizon spill. Additionally, there were no significant post-spill shifts in community composition and structure, nor were there changes in biodiversity measures (Fodrie and Heck 2011). Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to spawning fish and/or nursery areas within the EMBA, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to key spawning periods and locations. ***Non-biogenic Reefs*** The reef communities fringing the Pilbara region (e.g. Pilbara islands) may be exposed to entrained hydrocarbons (at or above the threshold concentration), and consequently exhibit lethal or sublethal impacts resulting in partial or total mortality of keystone sessile benthos, particularly hard corals; thus, potential community structural changes to these shallow, nearshore benthic communities may occur. If these reefs are exposed to entrained hydrocarbons, impacts are expected to result in localised long-term effects. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to non-biogenic reefs within the EMBA. ***Sandy Shores/Estuaries/Tributaries/Creeks (including Mudflats)/Rocky Shores*** Shoreline exposure for the upper and lower areas differ. The upper shore has the potential to be exposed to surface slicks, while the lower shore is potentially exposed to entrained hydrocarbon. Potential impacts may occur due to hydrocarbon contact with intertidal areas, including sandy shores, mudflats and rocky shores, listed in Table 6-19. Hydrocarbon at sandy shores is incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores. Hydrocarbon in the intertidal zone can adhere to sand particles; however, high tide may remove some or most of the hydrocarbon back of the sediments. Typically, hydrocarbon is only incorporated into the surface layers to a maximum of 10 cm (Etkin, 2003). As described earlier, accumulated hydrocarbons ≥100 g/m² could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat (French-McCay, 2009). Note that no shoreline accumulation above impact thresholds was identified by the stochastic modelling and long term impacts to shorelines is not expected. ***Key Ecological Features*** KEFs potentially impacted by the hydrocarbon spill from a loss of well containment event are detailed in Section 4.7. Although these KEFs are primarily defined by seabed geomorphological features, they can indicate a potential for increased biological productivity and, therefore, ecological significance. The consequences of a hydrocarbon spill from a loss of well containment event are predicted to result in minor impacts to values of the KEFs affected (for the values of each KEF, Refer Section 4.7). Impacts to benthic habitats are not predicted given the maximum depth of entrained hydrocarbons above 1000 ppb is predicted to be 20 m beyond the immediate source. Potential impacts to associated pelagic communities may occur as described above and below. The KEFs within the EMBA have relatively broad-scale distributions and are unlikely to be significantly impacted. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to the ecological values of KEFs within the EMBA, with impacts predicted to be greatest for habitats closest to the potential release location.

Summary of Potential Impacts to environmental values
Summary of Potential Impacts to Marine Primary Producers
Receptor Group
Submerged Shoals
The waters overlying the submerged Rankin Bank have the potential to be exposed to dissolved and entrained hydrocarbons above threshold concentrations (Table 6-19).
The permanently submerged habitats of Rankin Bank represents sensitive open water benthic community receptors, extending from deep depths to relatively shallow water. Given the water depth, it is likely the potential for biological impact is significantly reduced when compared to the upper water column layers. However, potential biological impacts could include sub-lethal stress and in some instances total or partial mortality of sensitive benthic organisms such as corals and the early life stages of resident fish and invertebrate species.
The submerged shoals are areas associated with sporadic upwelling and associated primary productivity events. Impacts to plankton communities from exposure to entrained hydrocarbons above threshold concentrations may result in short-term changes in plankton community composition but recovery would occur. Hydrocarbon contact during the spawning seasons for resident shoal community benthos and fish (meroplankton), particularly exposure to in-water toxicity effects to biota, may result in the loss of a discrete cohort population but would not affect the longer term viability of resident populations. Therefore, any impacts to resident shoal community benthos and fish (meroplankton) are likely to be localised at the shoals and temporary.
Hydrocarbon exposure to offshore filter-feeding communities may occur depending on the depth of the entrained/dissolved hydrocarbons. Exposure to dissolved (aromatic) hydrocarbons (≥10 ppb) has potential to result in lethal or sub-lethal toxic effects. Sub-lethal impacts, including mucus production and polyp retraction, have been recorded for gorgonians exposed to hydrocarbon (White et al., 2012). Shoals that are exposed to entrained and/or dissolved hydrocarbons are expected to result in localised long-term effects, depending on the exposure concentrations and degree of weathering.
Coral Reef
The quantitative spill risk assessment indicates there would be potential for coral reef habitat to be exposed to entrained hydrocarbons at locations including the Montebello/Barrow Island reefs and shoals, and Ningaloo Reef.
Exposure to entrained hydrocarbons (≥1000 ppb) has the potential to result in lethal or sublethal toxic effects to corals and other sensitive sessile benthos within the upper water column (top 20 m), including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities. Mortality in a number of coral species is possible, and this could result in the reduction of coral cover and change in the composition of coral communities.
Sublethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates, and impaired reproduction (Negri and Heyward 2000). This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Barrow/Montebello/Lowendal Islands, Muiron Islands) and the mainland coast (i.e. Ningaloo Coast). With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon, creating a pressure gradient that drives water in a strong outward flow through channels. These channels are across as much as 15% of the length of Ningaloo Reef (Taylor and Pearce 1999).
If a spill occurs at the time of coral spawning at potentially affected coral locations, or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained hydrocarbons, resulting in sublethal impacts and in some cases mortality—particularly early life-stages of coral reef animals (reef-attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon exposure. Coral reef fish are site-attached, have small home ranges, and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide ranging fish species.
The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo Reef system) will depend on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities.
Over the worst-affected sections of reef habitat, coral community live cover, structure and composition may reduce, manifested by loss of corals and associated sessile biota. Recovery of these impacted reef areas typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding, with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities (Underwood 2009). Recovery at other coral reef areas may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al. 2013).

Summary of Potential Impacts to environmental values
Therefore, a worst-case hydrocarbon spill scenario has the potential to result in large scale impacts to coral populations within the EMBA, with long-term effects (recovery >10 years) likely. The consequence severity is predicted to be greatest at reefs closest to the potential release location (e.g. Montebello Islands). ***Seagrass Beds/Macroalgae and Mangroves*** Spill modelling has predicted that entrained hydrocarbons above threshold concentrations have the potential to contact a number of nearshore locations that support biologically diverse, shallow subtidal and intertidal communities. The variety of habitat and community types, from the upper subtidal to the intertidal zones support a high diversity of marine life and are used as important foraging and nursery grounds by a range of invertebrate and vertebrate species. Depending on the trajectory of the entrained plume, macroalgal/seagrass communities including Barrow Island, Lowendal Islands, Muiron Islands, Pilbara Islands, Montebello Islands and Ningaloo Coast may have the potential to be exposed (see Table 6-19 for a full list of receptors within the EMBA). Exposure to entrained hydrocarbons may result in mortality, depending on actual entrained exposure concentrations received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sublethal stress, causing reduced growth rates and reduced tolerance to other stress factors (Zieman et al. 1984). Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al. 2010). However, the potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should lower the content of soluble aromatic components before contact occurs. Mangrove habitat at Ningaloo Coast, Pilbara islands, and Montebello Islands may be contacted by entrained hydrocarbons within the EMBA (see Table 6-19). Entrained hydrocarbons may adhere to the sediment particles and in low-energy environments such as in mangroves, deposited sediment bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (NOAA 2014). Hydrocarbons may persist in the sediment, potentially causing chronic sublethal toxicity impacts beyond immediate physical and acute effects, which may delay recovery in an affected area. Recovery of mangroves from any impacts could be long-term (>10 years). Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to seagrass beds, macroalgae and mangrove communities within the EMBA, with consequence severity predicted to be greatest at receptors closest to the potential release location (e.g. Montebello Islands).
Summary of Potential Impacts to Water Quality
Receptor Group
Open Water – Water Quality The highly-mixed, open water location will result in rapid evaporation and dispersion. Water quality would be reduced and is predicted to be at or above biological effect concentrations for the surrounding marine waters over the Montebello Marine Park. The submerged Tryal Rocks (30-40 m depth) within the Montebello Marine Park has the potential to be exposed to entrained hydrocarbons at or greater than 1000 ppb. The waters surrounding this submerged habitat would show a reduction in quality due to hydrocarbon contamination above background and/or national/international quality standards. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to water quality within the EMBA, with impacts predicted to be greatest for areas closest to the release location.

Summary of Potential Impacts to environmental values

Summary of Potential Impacts to Marine Sediment Quality

Receptor Group

Marine Sediment Quality

Studies of hydrocarbon concentrations in deep-sea sediments in the vicinity of a catastrophic well blowout indicated hydrocarbon from the blowouts can be incorporated into sediments (Romero et al. 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero et al. 2015). In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of hydrocarbon would form droplets that would be transported into the water column to the surface (i.e. transported away from the seabed). As a result, the extent of potential impacts to the seabed area at and surrounding the release site would be largely confined to a localised footprint.

Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a long to medium term, as hydrocarbons in sediments typically undergo slower weathering and degradation (Diercks et al. 2010, Liu et al. 2012). There is the potential for floating and entrained hydrocarbons to sink following extensive weathering and adsorption of sediment particles, which may result in the deposition of hydrocarbons to the seabed in areas distant from the release location. Such hydrocarbons are expected to be less toxic due to the weathering process.

Entrained and dissolved hydrocarbons (at or above the defined threshold) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines. Hydrocarbons may occur (at or above the ecological impact thresholds) at the Montebello Islands, islands along the Pilbara coast and near Exmouth Gulf and the Ningaloo Coast (refer to Table 6-19).

Such hydrocarbon contact may lead to reduced marine sediment quality through adherence to sediment. However, given the nature of the hydrocarbon and degree of weathering that is expected prior to contact with nearshore seabed habitats, contamination of sediments is expected to be limited and short term.

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in slight, short-term impacts to offshore sediment quality within a localised area of the Operational Area. For nearshore environments, a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to sediment quality within the EMBA, with impacts predicted to be greatest for areas closest to the potential release location.

Summary of Potential Impacts to Air Quality

A hydrocarbon release during a loss of well containment has the potential to result in short-term reduction in air quality. There is potential for human health effects on workers in the immediate vicinity of atmospheric emissions. The ambient concentrations of VOCs released from diffuse sources is difficult to accurately quantify, although their behaviour and fate is predictable in open offshore environments, as VOC emissions disperse rapidly by meteorological factors such as wind and temperature. VOC emissions from a hydrocarbon release in such environments are rapidly degraded in the atmosphere by reaction with photochemically produced hydroxyl radicals.

Given the remote likelihood of occurrence of a loss of well containment, the temporary nature of any VOC emissions (from either gas surfacing or weathering of liquid hydrocarbons from a loss of well containment), the predicted behaviour and fate of VOCs in open offshore environments, and the significant distance from the Operational Area to the nearest sensitive airshed (town of Dampier ~169 km away), a worst-case hydrocarbon spill scenario has the potential to result in minor, short-term impacts to air quality within the EMBA, with impacts predicted to be greatest for areas closest to the potential release location.

Summary of Potential Impacts to Protected Areas

The quantitative spill risk assessment results indicate that the open-water environment protected within a number of Commonwealth AMPs, State Marine Parks, World Heritage Areas and other protected places (refer to Table 6-19) may be affected by released hydrocarbons in the event of a loss of well containment. In the unlikely event of a major spill, entrained hydrocarbons and/or dissolved hydrocarbons may contact the identified key receptor locations of islands and mainland coastlines, resulting in the actual or perceived contamination of the protected areas, identified in Table 6-19.

The Montebello AMP has the greatest potential to be contacted by surface hydrocarbons, dissolved aromatic hydrocarbons and entrained hydrocarbons at or above the defined ecological effect concentrations. Hydrocarbons at or exceeding impact thresholds also have the potential to contact other protected areas, including the Argo-Rowley Terrace AMP, Gascoyne AMP, Ningaloo AMP and WHA and Shark Bay AMP. In most cases, the hydrocarbons that are predicted to reach these protected areas will be in an advanced state of weathering and at concentrations typically associated with lethal and sub-lethal impacts to only the most sensitive marine organisms. The potential (albeit low probability) of visible surface hydrocarbons exceeding 1 g/m^2 reaching these protected areas may result in a perception of more significant impacts than actually occur.

Summary of Potential Impacts to environmental values
Objectives in the management plans for protected areas within the EMBA, including AMPs require consideration of a number of physical, ecological, socio-economic and heritage values identified in these areas (Section 4.8). Impact on the values of these protected areas are discussed in the relevant sections above for ecological and physical values and below for socio-economic and heritage values. Additionally, such hydrocarbon contact may alter perception of the protected marine environment, given these represent areas largely unaffected by anthropogenic influences and contain biological diverse environments.
Summary of Potential Impacts to Socioeconomic Values
Receptor Group
Traditional Custodians Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned discharges of hydrocarbon/chemicals, such as marine mammals, whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these Thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO,2003). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained ***Fisheries – Commercial*** **Offshore** A hydrocarbon release during a loss of well containment event has the potential to result in direct impacts to target species of three Commonwealth and 24 State fisheries active within the defined EMBA (refer Section 4.9.2). Lethal and sublethal effects may impact localised populations of targeted species within the EMBA for entrained/dissolved hydrocarbons. However, entrained hydrocarbons are likely to be confined in the upper water column; therefore, demersal species are less likely to be exposed to hydrocarbons than pelagic species. A major loss of hydrocarbons from the Petroleum Activity may also lead to an exclusion of fishing from the spill-affected area for an extended period. Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration, which removes hydrocarbons from tissues by metabolic processes, although its efficacy depends on the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons, while crustaceans (such as prawns) have a reduced ability (Yender et al. 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential seafood contamination can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al. 2002). A major spill would result in the establishment of an exclusion zone around the spill-affected area. There would be a temporary prohibition on fishing activities for a period of time, and subsequent potential for minor economic impacts to affected commercial fishing operators. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major, long-term impacts to commercial fisheries within the EMBA, particularly for pelagic fisheries and fisheries with most of their effort focused within the EMBA. Potential impacts to inshore fisheries are discussed in the Mainland and Islands (nearshore) impacts discussion below, and the impact assessment relating to spawning is discussed above.

Summary of Potential Impacts to environmental values

Nearshore

In the highly unlikely event of a loss of well integrity, there is the possibility that target species in some areas used by a number of State fisheries, prawn fisheries, pearl oyster fisheries and aquarium, and land hermit crab fisheries in nearshore waters of the mainland coast and islands that are within the EMBA could be affected. Targeted fish, prawn, mollusc and lobster species could experience sub-lethal stress, or in some instances mortality, depending on the concentration and duration of hydrocarbon exposure and its inherent toxicity.

The hydrocarbons predicted to reach these nearshore water locations will be in an advanced state of weathering and at concentrations typically associated with lethal and sub-lethal impacts to only the most sensitive marine organisms. Therefore, direct impacts may be limited to sub-lethal impacts only. However, there is also the potential for tainting of target species and for negative public perception.

Prawn Managed Fisheries

In a major spill, the modelling indicated the entrained EMBA may extend to nearshore waters closest to the mainland Pilbara and Gascoyne coasts, including the actively fished areas of the designated Onslow Prawn Managed Fishery, Exmouth Gulf Prawn Managed Fishery, Nickol Bay Prawn Managed Fishery and the Shark Bay Prawn and Scallop Managed Fishery, and managed prawn nursery areas. Those fisheries that occur within the EMBA occur in shallow, nearshore waters where limited hydrocarbon exposures are predicted to occur.

Prawn habitat utilisation differs between species in the post-larval, juvenile and adult stages (Dall et al., 1990). Direct impacts to benthic habitat due to a major spill has the potential to impact prawn stocks. For example, juvenile banana prawns are found almost exclusively in mangrove-lined creeks (Rönnbäck et al., 2002), whereas juvenile tiger prawns are most abundant in areas of seagrass (Masel and Smallwood, 2000). Adult prawns also inhabit coastline areas but tend to move to deeper waters to spawn. In a major spill, the model predicted shallow subtidal and intertidal habitats at the Muiron Islands, Montebello Islands, Barrow Island, Lowendal Islands, Pilbara Southern Islands Group, and mangrove and seagrass habitats of the Ningaloo Coast are located within the EMBA and could be exposed to hydrocarbon concentrations above threshold concentrations, depending on the trajectory of the plume. Localised loss of juvenile prawns in worse spill affected areas is possible. Whether lethal or sub-lethal effects occur will depend on duration of exposure, hydrocarbon concentration, weathering stage of the hydrocarbon and its inherent toxicity.

Furthermore, seafood consumption safety concerns and a temporary prohibition on fishing activities may lead to subsequent potential for economic impacts to affected commercial fishing operators.

Therefore, a worst-case credible hydrocarbon spill scenario has the potential to result in displacement of fishing activities in the spill-affected area for an extended period, detrimental impacts to seafood quality, and stress/mortality affects to target species including prawn stocks through critical habitat destruction across commercial fisheries within the EMBA.

Tourism including Recreational Activities

In the event of a major spill, the nearshore waters of offshore islands and reefs (e.g. Barrow/Montebello/Lowendal Islands Group, Muiron Islands, Pilbara Islands etc.) as well as the Ningaloo coast could be reached by entrained and dissolved hydrocarbons depending on prevailing wind and current conditions. There is also a low probability of shoreline accumulation above the socio-cultural threshold at a number of receptor sites. As these locations offer a number of amenities such as fishing, swimming and using beaches and surrounds, they have a recreational value for local residents and visitors. If a well blowout event resulted in hydrocarbon contact, there could be restricted access to beaches for a period of days to weeks, until natural weathering, tides, currents or oil spill response (e.g. shoreline clean-up if safe to do so) removes the hydrocarbons. In the event of a well blowout, tourists and recreational users may also avoid areas due to perceived impacts, including after the oil spill has dispersed.

Recreational fishers predominantly target large tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with peak activity between April and October (Smallwood et al. 2011) for the Exmouth region. Limited recreational fishing takes place in the offshore waters of the Operational Area. Impacts on species that are recreationally fished are described above under Summary of Potential Impacts to Other Species.

A major loss of hydrocarbons from the Petroleum Activity may lead to exclusion of marine nature-based tourist activities, including charter based fishing and diving, resulting in a loss of revenue for operators. Tourism is a major industry for the region and visitor numbers would likely reduce if a hydrocarbon spill were to occur, based on the perception of hydrocarbon spills and associated impacts.

There is the potential for stakeholder perception that this environment will be contaminated over a large area and for the longer term, resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill-related tourism impacts and found that, on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the spill, effectiveness of the spill clean-up, and change in any public perceptions regarding the spill (Oxford Economics 2010).

Summary of Potential Impacts to environmental values

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to tourism and recreation within the EMBA.

Offshore Oil and Gas Infrastructure

A hydrocarbon release during a loss of well containment event has the potential to result in disruptions to production at existing petroleum facilities (platforms and FPSOs), as well as activities such as drilling and seismic exploration. For example, facility water intakes for cooling and fire hydrants could be shut off if contacted by floating hydrocarbons, which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit access for activity support vessels as well as offtake tankers approaching facilities off the North West Cape. The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and metocean conditions. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest production facilities to Yodel updip or Wilcox will sites are:

- Pluto platform (operated by Woodside): ~50 km south-west
- Wheatstone platform (operated by Chevron): ~40 km south-west
- Reindeer platform (operated by Santos): ~70 km south-east
- Goodwyn Alpha platform (operated by Woodside):~ 20 km north-east
- North Rankin Complex: ~45 km north-east

Operation of these facilities is likely to be affected in the event of a well blowout spill. Therefore, a worst-case hydrocarbon spill scenario has the potential to result in slight, short-term impacts to oil and gas industry within the EMBA.

Cultural Heritage

There are a number of historic shipwrecks identified within 50 km of the Operational Area (Table 4-24) with the closest at 30km distant. Within the wider EMBA there are a further 71 shipwrecks.

The modelling results do not predict surface slicks contacting the identified wrecks, and the majority of entrained hydrocarbons are expected to occur close to the surface. However, shipwrecks in the subtidal zone could be exposed to entrained and dissolved hydrocarbons. Marine life that shelter and take refuge in and around these wrecks may be affected by in-water toxicity of dispersed hydrocarbons. The consequences of such hydrocarbon exposure may include large fish species moving away and resident fish species and sessile benthos such as hard corals exhibiting sub-lethal and lethal impacts (which may range from physiological issues to mortality).

Entrained hydrocarbons above the threshold concentration are predicted at the Montebello/Barrow/Lowendal islands. There is also a low probability of shoreline accumulation above the ecological threshold at Barrow/Montebello Islands. However, artefacts, scatter and rock shelters are on land above the high water mark on Barrow and Montebello islands; therefore, no contact is predicted for these areas.

Within the wider EMBA are several designated heritage places (Section 4.9.1). These places are also covered by other designations such as World Heritage Area. Potential impacts are discussed in the sections above.

In the highly unlikely event of a major hydrocarbon spill due to a loss of well integrity, the EMBA includes the areas listed in Section 4. This incorporates AMPs as well as other sensitive marine environments and associated receptors of the Muiron Islands, Ningaloo Coast, Rankin Bank, Montebello/Barrow/Lowendal Islands Group, the Pilbara Southern and Northern Islands Group and Shark Bay. Long-term impacts may occur at these locations, including socio cultural effects as a result of a major spill of condensate from drilling activities within the Operational Area.

In summary, long-term impacts may occur at sensitive nearshore and shoreline habitats, particularly areas of the Barrow and Montebello Islands, as a result of a major spill of hydrocarbon from a loss of well control within the Operational Area The overall environmental consequence is defined as 'B – Major, long-term impact (ten to 50 years) on highly valued ecosystem, species, habitat, physical or biological attributes'.

Well specific barrier elements, and the specified verification requirements, are identified in accordance with the Well Acceptance Criteria Procedure.	F: Yes. CS: Minimal cost. Standard practice.	This procedure will reduce the likelihood of a spill occurring from a suspended well. Although changes in consequence would occur, the reduction in likelihood results in a reduction in overall risk.	Benefits outweigh cost/sacrifice.	Yes C 11.4
Good Practice				
Subsea BOP installed and function tested during permanent plugging operations. The BOP shall meet the Woodside Well Control Standard, and shall be subject to API Standard 53 BOP Risk Assessment.	F: Yes. CS: Standard practice. Required by Woodside standards.	Testing of the BOP will reduce the likelihood of a blowout resulting in release of hydrocarbons to the marine environment. In the event of a blowout, this control would not reduce the consequence, although the reduction in likelihood reduces the overall risk ranking.	Benefits outweigh cost/sacrifice.	Yes C 11.5
Project specific Mooring Design-Analysis.	F: Yes. CS: Standard practice. Required by Woodside standards.	Ensure adequate MODU station holding capacity to prevent loss of station keeping. This will reduce the likelihood of a blowout resulting in release of hydrocarbons to the marine environment.	Benefits outweigh cost/sacrifice.	Yes C 3.4
Apply a 'living heritage[52]' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 2.1

[52] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

No additional controls identified.				
Professional Judgement – Engineered Solution				
No additional controls identified.				
Risk Based Analysis				
A quantitative spill risk assessment was performed (refer Section 6.8.1).				
Company Values				
Corporate values require all personnel at Woodside to comply with appropriate policies, standards, procedures and processes while being accountable for their actions and holding others to account in line with the Woodside Compass. As detailed above, the Petroleum Activity will be performed in line with these policies, standards and procedures that include suitable controls to prevent loss of well integrity, and response should a loss of well integrity occur.				
Societal Values				
Due to the Petroleum Activity's potential extent of the EMBA, the loss of well integrity current risk rating presents a Decision Type B, in accordance with the decision support framework described in Section 0. Consultation was conducted for this program to identify the views and concerns of relevant persons and organisations, as described in Section 5. During consultation with relevant persons Woodside, AMSA and WA DTMI were consulted on the activity. DTMI was provided with a copy of the Oil Pollution First Strike Plan (Appendix H) detailing selected spill response strategies.				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type B, Section 0), Woodside considers the adopted controls appropriate to manage the risks and consequences of a highly unlikely unplanned hydrocarbon release as a result of a loss of well integrity. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
Loss of well integrity has been evaluated as having a moderate level of current risk rating due to the scale of potential environmental impacts. However, the likelihood of a loss of well integrity occurring is considered highly unlikely. As outlined in Section 0, Woodside considers the current risk ratings for a Decision Type B to be acceptable, if ALARP is demonstrated using good industry practice, consideration of company and societal values and risk based analysis, if legislative requirements are met and societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained. ***Principles of ESD*** The impact and risk evaluation has taken into account the following relevant principles of ESD: • decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations • the principle of inter-generational equity—that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations • the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Environment and Biodiversity Policy (Appendix A)

Demonstration of Acceptability
• Woodside Risk Management Policy (Appendix A) • Well Barrier Standard • Well Control Standard • Manage Campaign Operations Standard • Global Source Control Emergency Response Plan Oil spill preparedness and response strategies are considered applicable to the nature and scale of the risk and associated impacts of the response are reduced to ALARP (Appendix G). Monitoring and Evaluation (operational monitoring) as a key response in the unlikely event of a hydrocarbon release will assess and track the extent of the hydrocarbon contact and revise the predicted extent of impact. In addition, the Planning Area for scientific monitoring (refer to Annex C of the Oil Spill Preparedness and Response Mitigation Assessment – Appendix G) can be re-assessed in the highly unlikely event of hydrocarbon release with consideration of the conservation values and social-cultural values of state and commonwealth protected areas (including AMPs), National and Commonwealth Heritage Listed places; tourism and recreation; and fisheries. The post-response SMP will consider assessment and monitoring in line with the affected receptors such as habitat and species, AMPs and fisheries. Woodside corporate values include working sustainably with respect to the environment and communities in which we operate, listening to internal and external stakeholders, and considering HSE when making decisions. Consultation, outlined below, has been performed prior to the Petroleum Activity. ***External Context*** During consultation with relevant persons Woodside, AMSA and WA DTMI were consulted on the activity. DTMI was provided with a copy of the Oil Pollution First Strike Plan (Appendix H) detailing selected spill response strategies. Fish spawning and commercial fisheries in the event of an unplanned hydrocarbon released were raised during consultation however it was noted that the environmental performance outcome is to prevent any unplanned hydrocarbon release to the marine environment. ***Other Requirements*** Impact assessment has been informed by risk-based analysis, including hydrocarbon spill modelling. The proposed control measures are consistent with industry legislation, codes and standards, good practice and professional judgement including: • API Standard 53 for subsea BOP function testing • AEP Memorandum of Understanding: Mutual Assistance for relief well drilling is in place. Woodside develops an activity SCERP, including the Relief Well Plan, which is signed off by the Drilling Engineering Manager and maintains a list of rigs that are currently operating in Australia (refer also to Appendix G). • OPGGS (Resource Management and Administration) Regulations 2011 to have an accepted WOMP and application to permanently plug for abandonment of the wells. NOPSEMA will be notified of reportable and recordable incidents, if required, in accordance with Section 7.11. A mutual aid MoU for relief well drilling is in place and the Drilling Engineering Manager maintains a list of rigs that are currently operating in WA. The EMBA overlaps a number of BIAs for threatened and migratory species, as well as a number of State and Commonwealth MPAs and the Ningaloo Coast WHA. As demonstrated in Section 4.8 the residual risk of accidental hydrocarbon release from loss of well integrity is not inconsistent with the relevant objectives and actions of any applicable recovery plans or threat abatement plans. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. The Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (Section 4). ***Acceptability Statement*** The impact assessment has determined that an accidental hydrocarbon release as a result of a loss of well integrity represents a moderate current risk rating and may result in major, long-term impacts (10 - 50 years) on highly valued ecosystems, species, habitat or physical or biological attributes. A number of BIAs for protected species overlap with the EMBA. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for a loss of well integrity have been adopted. The likelihood of a loss of well integrity occurring is highly unlikely, given the adopted controls. The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and a risk-based assessment has been conducted to better understand the potential consequences and plan oil spill response. The adopted controls also meet the requirements and expectations of Australian Marine Orders, AMSA and AHO identified during impact assessment and consultation. As demonstrated in Section 6.9 the potential impacts of hydrocarbon

Demonstration of Acceptability
release from loss of well integrity is not inconsistent with the relevant objectives and actions of any applicable recovery plans or threat abatement plans. Regard has been given to relevant conservation advice during the assessment of potential risks. On the basis of the environmental impact assessment outcomes and Woodside's criteria for acceptability outlined in Section 2.2.7, this is considered an acceptable level of risk.

Loss of hydrocarbons to marine environment due to a vessel collision (e.g. project vessels or other marine users)		X		X	X	X	A	D	1	M	LCS GP	Broadly Acceptable	EPO 12

Description of Source of Impact

Background

The temporary presence of the MODU and project vessels in the Operational Area will result in a navigational hazard for commercial shipping within the immediate area. This navigational hazard could result in a third party vessel colliding with the MODU or a project vessel which could release hydrocarbons.

Spill scenarios involving the MODU are not considered likely for a hydrocarbon release given the collision points, vessel speeds and locations of the vessel tanks. MODU fuel tanks are located in the MODU pontoons, typically located on the inner sides of pontoons and can be over 10 m below the waterline.

The installation vessel may have multiple fuel tanks with the largest single tank capacity between 500 - 1000 m^3.

A typical project vessel (e.g. a support or survey vessel) is likely to have multiple isolated marine diesel tanks distributed throughout the hull of the vessel. The marine diesel storage capacity of a support vessel can be in the order of 1000 m^3 (total) that is distributed through multiple isolated tanks typically located mid-ships and can range in typical size from 22 to 105 m^3. Support vessels can have fuel tank sizes ranging from 111 m^3 – 247 m^3. The AHV is considered to have a maximum fuel tank size of 264 m^3, and the survey vessel a maximum of 275 m^3.

In the unlikely event of a vessel collision involving a project vessel during the Petroleum Activity, the vessel will have the capability to pump marine diesel from a ruptured tank to a tank with spare volume in order to reduce the potential volume of fuel released to the environment.

Industry Experience

Registered vessels or foreign flag vessels in Australian waters are required to report events to the Australian Transport Safety Bureau (ATSB), AMSA or Australian Search and Rescue (AusSAR).

From a review of the ATSB marine safety and investigation reports, one vessel collision occurred in 2011/12 that resulted in a spill of 25–30 L of oil into the marine environment as a result of a collision between a tug and support vessel off Barrow Island. Two other vessel collisions occurred in 2010, one in the port of Dampier, where a support

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of Source of Impact
vessel collided with a barge being towed. Minor damage was reported and no significant injury to personnel or pollution occurred. The second 2010 vessel collision involved a vessel under pilot control in port connecting with a vessel alongside a wharf, causing it to sink. No reported pollution resulted from the sunken vessel. These incidents demonstrate the likelihood of only minor volumes of hydrocarbons being released during the highly unlikely event of a vessel collision. From 2010 to 2011, the ATSB's annual publication defines the individual safety action factors identified in marine accidents and incidents: 42% related to navigation action (2011). Of those, 15% related to poor communication and 42% related to poor monitoring, checking and documentation (ATSB, 2011). The majority of these related to the grounding instances. ***Credible Scenario*** For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align as follows: • The identified causes of vessel interaction must result in a collision. • The collision must have enough force to penetrate the vessel hull. • The collision must be in the exact location of the fuel tank. • The fuel tank must be full, or at least of volume which is higher than the point of penetration. The environmental risk analysis and evaluation identified and assessed a range of potential scenarios that could result in a loss of vessel structural integrity, resulting in damage to fuel storage tank(s) and a loss of marine diesel to the marine environment. Spill scenarios involving the MODU are not considered likely for a hydrocarbon release given collision points, vessel speeds and locations of the vessel tanks. Instead, the most credible scenarios are associated with the collision of a PIV with a refuelling vessel in the event that one should be used within the field. In summary: • It is not a credible scenario that the total storage volume of the MODU would be lost, as fuel is stored in more than one tank. • It is not a credible scenario that a storage tank on the MODU would be damaged due to the location of the tanks within the hull, behind the bilge tanks, below the waterline. • It is highly unlikely that the full volume of the largest storage tank on a support vessel would be lost. The last scenario considered was a collision between a project vessel with a third-party vessel (i.e. commercial shipping, other petroleum related vessels and commercial fishing vessels). This was assessed as being credible but highly unlikely, given the standard vessel operations and equipment in place to prevent collision at sea, the standby role of a support vessel (low vessel speed) and its operation in close proximity to the MODU (exclusion areas), and the construction and placement of storage tanks. Potential spill volumes for these scenarios are summarised in Table 6-20. Given the offshore location of the Operational Area, vessel grounding is not considered a credible risk.

Table 6-20: Summary of credible hydrocarbon spill scenario as a result of vessel collision

Scenario	Hydrocarbon Volumes	Preventative and Mitigation Controls	Credibility
Loss of containment from MODU as a result of vessel collision	Submerged marine diesel tanks up to an individual capacity of 500 m^3.	Fuel tanks are located on the inside of pontoons and protected by location below water line, protection from other tanks, e.g. bilge tanks. The draught of vessel and location of tanks in terms of water line prevent the tanks from being breached.	Not credible due to location of tanks.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of Source of Impact			
Breach of support vessel fuel tanks due to support vessel – other vessel collision including commercial, shipping/fisheries.	Activity support vessel has multiple marine diesel tanks typically ranging between 22– 105 m³ each.	Typically, double wall, tanks which are located midship (not bow or stern). Vessels are not anchored and steam at low speeds when relocating within the Operational Area or providing stand-by cover. Normal maritime procedures would apply during such vessel movements.	Credible Activity support vessel – other vessel collision could potentially result in the release from a fuel tank.
Breach of PIV fuel tanks due to collision with another vessel including commercial shipping/fisheries.	The installation vessel has multiple isolated tanks; largest volume of a single tank is unlikely to exceed 500 to 1000 m³	Tank locations midship (not bow or stern). Installation vessel will be holding station during installation activities or steaming at low speeds when relocating within the Operational Area	Credible PIV – third party vessel collision could potentially result in the release from a fuel tank.
Breach of the largest single tank inventory of a fuel tanker due to collision with a primary installation vessel.	A fuel tanker will have a maximum single inventory tank of 1000 m³.	Refer to Section 6.7.4 for preventative and mitigation controls.	Credible –Worst case Installation vessel – fuel tanker collision could potentially result in the release from a fuel tank. It is noted that this scenario is only credible if refuelling of an installation vessel is required in the field.

Quantitative Hydrocarbon Risk Assessment

Two scenarios were identified:

- A short-term (instantaneous) surface release of 1000 m3 of marine diesel near the furthest nearfield well, representing loss of fuel tank integrity after a vessel collision
- A short-term (instantaneous) surface release of 1000 m3 of marine diesel near the Wilcox wells, representing loss of fuel tank integrity after a vessel collision

Modelling was performed by RPS, to determine the fate of marine diesel released from a collision within the Montebello Marine Park (20°03'1.4" S, 115°31'35.0" E) and at the GDA well site.

The modelling in the Montebello assessed the extent of a marine diesel spill volume of 2000 or 1000 m^3 (noting that 1000 m^3 was the credible scenario and that the 2000 m^3 was used as a conservative modelling analogue) for all seasons, using an historic sample of wind and current data for the region. A total of 200 replicate simulations were modelled over an annual period (50 per quarter).

Impact Assessment

Potential Impacts Overview

Environment that May Be Affected

Surface Hydrocarbons

Quantitative hydrocarbon spill modelling results for surface hydrocarbons are shown in Table 6-21. If this scenario occurred, a surface hydrocarbon slick would form down-current of the release location, with the trajectory dependent on prevailing wind and current conditions at the time. The modelling indicates that the EMBA would be largely confined to open water. A socio-cultural EMBA for surface hydrocarbons which includes the threshold for visible surface hydrocarbons of 1 g/m^2 may extend beyond the EMBA in which ecological impacts may occur.

Entrained Hydrocarbons

Quantitative hydrocarbon spill modelling results are shown in Table 6-21. If this vessel collision scenario occurred, a plume of entrained hydrocarbons would form down-current of the release location, with the trajectory dependent on prevailing current conditions at the time. Table 6-21 provides details of receptors potentially contacted by entrained diesel at 1000 ppb.

Dissolved Hydrocarbons

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 10 ppb threshold are predicted to be predominantly confined to open water. Table 6 22 provides details of receptors potentially contacted

Accumulated Hydrocarbons

Accumulated hydrocarbons above threshold concentrations (≥100 g/m^2) were not predicted by the modelling to occur at any location.

Taking into consideration the EMBA derived from hydrocarbon spill modelling for a marine diesel spill, the environment that may be affected will fall within the EMBA of the spill from a loss of well integrity outlined in Section 0.

Summary of Potential Impacts to environmental value(s)

In the event of a 2000 m³ release of marine diesel spill due to vessel collision, the modelling predicts a low probability of receptors being contacted by entrained hydrocarbons >1000 ppb or dissolved aromatic hydrocarbons >10 ppb. The greatest likelihood of contact is at the Montebello AMP). Further, entrained hydrocarbons reaching these environments will be highly weathered, with the volatile and water soluble (often the most toxic) components expected to have dissipated. Surface hydrocarbons above 10 g/m^2 are predicted to contact the Montebello AMP only and no shoreline oiling above 100 g/m^2 is predicted.

The potential impacts of spilled hydrocarbons to species (protected and otherwise), marine primary producers, other habitats and communities, water quality, marine sediment quality, air quality, protected areas and socio-economic values are described in Section 0. The hydrocarbon EMBA for the Petroleum Activity is based on both the loss of well containment EMBA the marine diesel EMBA, as at points, the marine diesel EMBA extends further than the loss of well containment EMBA. Therefore, the potential impacts of entrained hydrocarbons provided in Section 6.8.2, and the scale of impact described provides a suitable assessment for potential impacts of a 2000 m³ release of marine diesel. Impacts specific to a spill of marine diesel are summarised below. It is noted that the toxic components in marine diesel include alkylated naphthalenes which can be rapidly accumulated by marine biota including invertebrates such as marine oysters, clams, shrimp, as well as a range of vertebrates, such as finfish. Marine diesel also contains additives that contribute to its toxicity.

Given the localised area of the potential EMBA and the rapid dispersion, dilution and weathering of a marine diesel spill, it is expected that any potential impacts will be minor and short-term.

Protected Species

As identified in Section 4.6, protected species including migrating pygmy blue whales may be encountered near the Operational Area, and therefore could be impacted in close proximity to the marine diesel spill location, where the volatile, water soluble and most toxic components of the diesel may be present. However, the window for exposure to hydrocarbons with the potential for any toxicity effects in these waters would be limited to a few days following the spill. Potential impacts may include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, organ or neurological damage leading to death. Given the absence of critical habitats or aggregation areas, cetaceans in the area are expected to be transient, and impacts are expected to be limited to individuals or small groups of animals. Impact on the overall population viability of cetaceans are not predicted.

There is also the potential for migrating humpback whales, dugongs and coastal dolphin populations to be exposed in nearshore waters, however, the low concentrations and advanced degree of weathering of hydrocarbons in these nearshore waters is not expected to result in any discernible sublethal or lethal impacts to cetaceans.

The EMBA overlaps with BIAs for marine turtle internesting habitat, as identified in Section 4.6.2. Turtle internesting habitats, such as those in waters adjacent to Barrow Island and the Montebello Islands, are predicted to have very limited or no exposure to surface or dissolved hydrocarbons above their respective impact threshold concentrations. Some marine turtles in these areas may be exposed to patchy occurrences of entrained hydrocarbons, which would be in an advanced state of weathering with reduced toxicity. Low concentrations are only capable of causing sublethal impacts to the most sensitive marine organisms and no lethal or sub-lethal impacts to marine turtles are expected in the BIAs. The potential for lethal and sub-lethal impacts to marine turtles is limited to small numbers of transient individuals that may be present in offshore waters near the release location.

Seabirds may also be exposed to marine diesel on the sea surface or upper water column, if resting or foraging in waters near to the spill. Impacts may include mortality due to oiling of feathers or the ingestion of hydrocarbons. However, due to the limited spatial extent of a marine diesel spill and limited window for exposure, population level impacts are not expected.

Other protected species that may occasionally transit through the area and may potentially be exposed to a marine diesel spill, include shark and ray species such as whale sharks and manta rays. Should sharks or rays be present in offshore waters near the Operational Area during the spill, direct impacts may occur if foraging within surface slicks or in the upper 20 to 30 m of the water column containing entrained hydrocarbons and dissolved aromatics. Contamination of their food supply and the subsequent ingestion of this prey may also result in long term impacts as a result of bioaccumulation. Impacts are again predicted to be limited to a small number of animals given the absence of key habitat and the low numbers of animals that may transit through the area during the short period when spilled hydrocarbons are present.

Given the limited number of animals that may be impacted and the rapid dispersion of marine diesel, it is considered that any potential impacts will be minor.

Other Habitats, Species and Communities

Within the EMBA for a marine diesel spill resulting from a vessel collision, there is the potential for plankton communities to potentially be impacted where entrained hydrocarbon threshold concentrations are exceeded. A range of lethal and sublethal impacts may occur to plankton exposed to entrained or dissolved hydrocarbons within the EMBA. Communities are expected to recover quickly (weeks/months) due to high population turnover (ITOPF, 2011). It is therefore considered that any potential impacts would be low magnitude and temporary in nature.

Summary of Potential Impacts to environmental value(s)
Pelagic fish populations in the open water offshore environment of the EMBA are highly mobile and have the ability to move away from a marine diesel spill. The spill-affected area would be confined to the surface layer and upper 20 to 30 m of the water column. It is therefore unlikely that fish populations would be exposed to widespread hydrocarbon contamination. Pelagic fish populations are distributed over a wide geographical area so impacts on populations or species level are considered to be negligible. Combined with these factors and the rapid dispersion of marine diesel, it is considered that any potential impacts will be minor. Other communities (e.g. demersal fish, benthic infauna and epifauna) and key sensitivities (e.g. KEFs identified in Section 4.7) occur within the EMBA, however will not be directly exposed or impacted by a marine diesel spill as hydrocarbons are confined to the upper layers of the water column. ***Water Quality*** It is likely that water quality will be reduced at the release location of the spill; however, such impacts to water quality would be temporary and localised in nature due to the rapid dispersion and weathering of marine diesel. The potential impact is therefore expected to be minor. ***Protected Areas*** Entrained hydrocarbons at or exceeding the 1000 ppb threshold have a low probability of contacting the Gascoyne AMP and Ningaloo AMP and WHA. Entrained hydrocarbons are only predicted within the surface waters of the deep open waters of these protected areas, with no contact to seabed habitats or to shoreline contact. Potential impacts to water quality and the natural values (e.g. mobile protected species) in these areas would be minor and short-term in nature due to the rapid dispersion and weathering of the marine diesel, as described above. Dissolved and visible surface hydrocarbons (at or exceeding 1 g/m^2) are not predicted to reach any other protected areas. ***Commercial Fisheries*** A marine diesel spill is considered highly unlikely to cause significant direct impacts on the target species fished by three Commonwealth and 21 State active fisheries (refer Section 4.9.2) which overlap with the EMBA. The fisheries that operate within the EMBA predominantly target demersal fish species (demersal finfish and crustaceans) that inhabit waters in the range of >60–200 m depth, or pelagic species which are highly mobile. Therefore, a marine diesel spill is expected to only result in minor impacts, considering that hydrocarbons are confined to the upper layers of the water column. There is the potential that a fishing exclusion zone would be applied in the area of the spill, which would put a temporary ban on fishing activities and therefore potentially lead to subsequent economic impacts on commercial fishing operators if they were planning to fish within the area of the spill. Such measures would likely be in place for less than a week and would not result in widespread or long-term impacts to fishing activities. ***Cultural Values and Heritage*** Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned discharges of hydrocarbon/chemicals, such as marine mammals, whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these Thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community. (Fijn, 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained

Summary of Potential Impacts to environmental value(s)
Given the adopted controls, the overall risk rating for an unplanned hydrocarbon release resulting from a vessel collision is moderate based on a minor consequence (short term impact: 1-2 years), to the high value receptors (marine fauna, AMPs, KEFs and commercial fishing), and a highly unlikely likelihood.

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A), Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned loss of hydrocarbon as a result of a vessel collision. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability statement: The impact assessment has determined that an accidental hydrocarbon release as a result of a vessel collision represents a moderate current risk rating and a risk consequence of minor. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for a vessel collision have been adopted. The adopted controls are considered consistent with industry legislation, codes and standards, good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders, AMSA and AHO identified during impact assessment and consultation. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of a loss of vessel structural integrity to a level that is broadly acceptable.

Loss of hydrocarbons (diesel/jet fuel) to marine environment from bunkering/ refuelling		X		X	X	X							

Description of source of impact

MODU and vessel operations

An unplanned minor LOC of hydrocarbons or chemicals may occur during several activities, including:

- chemical use, transfer and storage
- hydraulic line failure from equipment
- marine diesel bunkering (refuelling)
- bulk chemical transfers between MODU and vessels.

Hydrocarbons and chemicals that may be used and accidentally released include non-process chemicals (e.g. those used for maintenance or cleaning), and non-process hydrocarbons (e.g. hydraulic fluids used in equipment or machinery, fuel).

A range of hydrocarbons and other chemicals are expected to be present on the vessels and/or MODU while within the Operational Area; however, the maximum credible volume associated with a single-point failure was estimated to be ~1 m^3 based on the loss of an entire intermediate bulk container due to rupture while handling. A hydraulic line failure on equipment is expected to result in a small volume only (i.e. <1 m^3).

AMSA (2015) suggests the maximum credible spill volume from a refuelling incident with continuous supervision is approximately the transfer rate × 15 minutes. Assuming failure of dry-break couplings and an assumed 200 m^3/h transfer rate, this equates to an instantaneous released volume of ~50 m^3.

For the bulk transfers of any bulk liquid (such as NWBM) between vessels and MODU, it is estimated that the worst-case credible spill could result in up to ~8 m^3 being discharged. This scenario represents a complete failure of the bulk transfer hose combined with a failure to follow procedures requiring transfer activities to be monitored, coupled with a

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact

failure to immediately shut off pumps (e.g. mud pumped through a failed transfer hose for a period of about five minutes).

Woodside's operational experience demonstrates that spills are most likely to originate from hydraulic hoses and have been less than 100 L, with an average volume <10 L (0.01 m^3).

Drilling Fluids - Slip Joint Packer Failure

The slip joint packer enables compensation for the dynamic movement of the MODU (heave) in relation to the static location of the BOP. A partial or total failure of the slip joint packer could result in a loss of mud to the marine environment. The likely causes of this failure include a loss of pressure in the pneumatic (primary) system combined with loss of pressure in the back up (hydraulic) system.

Catastrophic sequential failure of both slip joint packers (pneumatic and hydraulic) would trigger the alarm and result in a loss of the volume of fluid above the slip joint (conservatively 1.5 m^3) plus the volume of fluid lost in the one minute (maximum) taken to shut down the pumps. At a flow rate of 3,700 per minute this volume would equate to an additional 3.8 m^3. In total, it is expected that this catastrophic failure would result in a loss of 5.3 m^3.

Failure of either of the slip joint packers at a rate not large enough to trigger the alarms could result in an undetected loss of 20 bbl (3 m^3) maximum assuming a loss rate of 10 bbl/hr and that MODU personnel would likely walk past the moon pool at least every two hours.

Loss of a drilling chemical container or drum during transfer from the supply vessel to the MODU may occur due to crane operator error or machinery failure. The maximum container that could be lost is an intermediate Bulk Container IBC) which can hold 1 m^3 of chemicals. In the event that an IBC or drum is lost to the marine environment and cannot be recovered the contents will discharge, either immediately or over a period depending on the damage to the drum or container.

NWBM Drilling Fluid System

The selection of a NWBM drilling fluid system (if required) will be based on Woodside processes; however, for the purposes of this risk assessment, an example base oil (Saraline 185V) has been used. Saraline 185V is a mixture of volatile to low volatility hydrocarbons. Predicted weathering of base oil, based on typical conditions in the region, indicates that about 50% by mass is predicted to evaporate over the first day or two (refer Table 6-22). At this time, most of the remainder could be entrained into the water column. In calm conditions, entrained hydrocarbons are likely to resurface with up to 100% able to evaporate over time

Table 6-22: Characteristics of the non water-based mud base oil

Oil Type	Initial density (kg/m^3)	Viscosity (cP @ 20 °C)	Volatiles (%) < 180	Semi Volatiles (%) 180 -265	Low volatility (%) 265 -380	Residual (%) >380	Aromatic (%) of whole oil <380 °C BP
			Non-persistent		***Persistent***		
Base oil (Saraline 185V)	0.776	2.0 @ 40 °C	8.5	41.1	50.4	0	0

All chemicals that may be released or discharged to the marine environment during the Petroleum Activity are assessed as per Woodside Chemical Selection and Assessment. This procedure is used to demonstrate that the potential impacts of the chemicals that may be released are acceptable and ALARP.

Cement

Bulk cement is transferred as powder from the supply vessel to the MODU prior to being mixed into a slurry in the cement unit. Additives are required to form a cement slurry; these are transferred to the MODU in drums from the supply vessel to the MODU. Unplanned discharge to the marine environment may occur due to crane operator error or machinery failure resulting in loss of a drum of cement additive, which cannot be recovered. Cement additives are typically stored in drums <100 L.

Contingency Activities

Activation of the Emergency Disconnect Sequence

The EDS is an emergency system that provides a rapid means of shutting in the well (i.e. BOP closed) and disconnecting the MODU from the BOP. The EDS could be manually activated due to an identified threat to the safety of the MODU, including loss of MODU station keeping resulting from loss of multiple moorings, potential collision by a third-party vessel or a loss of well control. During operations, this could result in a subsurface release of a combination of WBM and/or NWBM and solids at the seabed and a release of base fluid. The volume of material released depends on the water depth and, hence, the length of the riser (i.e. the entire riser volume would be lost). The base oil of the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
NWBM would remain in an emulsion with the other components of the mud system. Approximately 103 m^3 of base oil could be released in the event of the riser being disconnected when drilling with NWBM

Impact assessment
Environmental value(s) potentially impacted
Water quality
An unplanned minor LOC of hydrocarbons and chemicals will result in localised and temporary changes to water quality. Changes in water quality will depend on the discharge volume, rate, and chemical composition.
Minor LOC releases would be infrequent and are typically small volumes (e.g. ~0.01 m^3 of hydraulic fluid, ~5 m^3 of drilling fluids), which are expected to rapidly mix and disperse in the open ocean.
The largest unplanned surface release that may occur is during vessel bunkering (estimated at ~50 m^3). A spill of marine fuel may have an acute impact on the water column within the immediate vicinity of the release. However, considering the hydrocarbon type, dispersion and weathering is expected to be rapid, and any effects on water quality would be localised and short term. Given the surface release, a sheen is expected to occur, however given the highly volatile nature of marine fuels, the hydrocarbon is expected to rapidly evaporate within days of release.
Therefore, an unplanned minor LOC of hydrocarbons or chemicals within the Operational Area is expected to have a slight, short-term effect on water quality.
Marine sediments
Accumulation of contaminants in sediments depends primarily on the volume and concentration of particulates in discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the resuspension, bioturbation, and microbial decay of those particulates in the water column and on the seabed.
However, given the subsea discharges are expected to rapidly mix in the water column and become diluted, accumulation in sediments at a measurable level is not expected to occur. Thus, any potential change to sediment quality has not evaluated further
Planktonic communities
Physicochemical changes in water quality resulting from an unplanned minor LOC of hydrocarbons or chemicals has the potential to change planktonic communities within the water column.
Plankton have a patchy distribution linked to localised and seasonal productivity that produces sporadic bursts in populations (DEWHA 2008b). Any effects to plankton have to be assessed in the context of natural mortality rates, which are generally considered high and variable.
As described in the consequence evaluation above, an unplanned minor LOC of hydrocarbons or chemicals within the Operational Area may result in slight, short-term changes to water quality. Given the patchy and variable plankton communities, these discharges are unlikely to cause a change in planktonic communities at a measurable level and will not change the viability of the population or ecosystem. Therefore, potential changes to planktonic communities from a minor LOC event are also expected to be slight.
Key Ecological Features
Physicochemical changes sediment or water quality resulting from an unplanned minor LOC of hydrocarbons or chemicals has the potential to change benthic habitats and communities. However, as described in the consequence evaluations above, an unplanned minor LOC of hydrocarbons or chemicals within the Operational Area is not expected to result in a lasting effect to water quality, and no change in sediment quality is predicted. Given the soft sediment and hard substrate, with sparse epifauna communities, within the Operational Area, these discharges are unlikely to cause a change in habitats or communities at a measurable level and will not change the viability of the population or ecosystem. Therefore, potential changes to offshore habitats and biological communities and KEFs are not evaluated further.
Marine Fauna
Physicochemical changes in water quality resulting from an unplanned minor LOC of hydrocarbons or chemicals has the potential to cause toxic effects to marine fauna within the water column. As described in the consequence evaluations above, an unplanned minor LOC of hydrocarbons or chemicals within the Operational Area is not expected to result in a lasting effect to water quality. If marine fauna did come into direct contact with a release some minor fouling, ingestion, tissue irritation, or inhalation may occur. However, sublethal or lethal effects from toxicity are considered unlikely given the typically small volume of an unplanned minor LOC release, and the rapid dilution and dispersion of the discharge once entering the marine environment.
Therefore, while transient marine fauna, which includes fish, marine reptiles and marine mammals, would have the potential to be exposed to these unplanned releases, the concentration and duration of exposure is expected to be

Impact assessment
below the levels required to cause toxicity effects. Therefore, an unplanned minor LOC of hydrocarbons or chemicals within the Operational Area is expected to have slight, short-term effects on marine fauna. ***Cultural Values and Heritage*** Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned discharges of hydrocarbon/chemicals, such as marine mammals, whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle, et al. 2018). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these Thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community. (Fijn 2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.
Summary of Potential Impacts to environmental value(s)
Given the adopted controls, it is considered that unplanned discharges of drilling fluids or cement to the marine environment will not result in a potential impact greater than slight and short-term impacts on species, habitat (but not affecting ecosystems function), physical and biological attributes (i.e. Environment Impact – E).

WBM. As such, there would be fewer bulk transfer movements.	capacity cannot be confirmed. CS: Significant cost and schedule delay would occur if the MODU was limited to greater storage capacity.			
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of unplanned release of project fluids. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that accidental discharge of project fluids represents a low current risk rating and a risk consequence of slight. BIAs within the Operational Area include the flatback turtle internesting, whale shark foraging, and wedge-tailed shearwater breeding areas. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are considered consistent with industry legislation, codes and standards, good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders identified during impact assessment. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for an unplanned release of hydrocarbons or chemicals have been adopted. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned discharge of chemicals /hydrocarbons to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of impact

Vessel Operations

Activities associated with the Petroleum Activity will require vessels for drilling activities, subsea installation, contingency activities, support operations and supply/transport. The type and number of vessels in the Operational Area at any one time, and the duration of presence, will differ depending on the activities being undertaken (Section 2.1,Table 3-3).

Project vessels operating in and around the Operational Area may present a potential hazard to protected marine fauna, including cetaceans (e.g. pygmy blue whales), whale sharks and marine turtles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction) and mortality. Factors that contribute to the frequency and severity of impacts due to collision vary greatly due to vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth), the type of animal potentially present and their behaviours.

Project vessels would typically be stationary or moving at low speeds when supporting the Petroleum Activity; support vessels typically transit to and from the Operational Area between two and four trips per week (e.g. to port).

Impact assessment

Environmental value(s) potentially impacted

Fish, Sharks, and Rays

The potential for unplanned interactions with marine fauna may occur from the physical presence and transit of the MODUs and vessels within the Operational Area. Any potential interaction with the MODU or vessels is limited to the surface waters where these activities occur.

Vessel or MODU movements can result in a vessel strike, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement, reproduction), or death.

Impacts resulting from vessel strike are highly influenced by vessel speed—the greater the speed at impact, the greater the risk of death (Jensen and Silber 2004; Laist et al. 2001). The fish species most vulnerable to unplanned interactions with moving MODUs or vessels include large sharks; because these species frequent the upper portions of the water column, they are the focus of this consequence evaluation.

As identified in Section 4.6, several fish species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area. One BIA—foraging BIA for whale sharks—intersects with the Operational Area

The Conservation Advice for Whale Sharks (TSSC 2015f) identifies boat strike from large vessels as a threat to the species in Australia. Similarly, the National Strategy for Reducing Vessel Strike on Cetaceans and other Marine Megafauna (CoA 2017a) identifies whale sharks as a species at risk.

Impact assessment
Whale sharks are known to aggregate at Ningaloo between March and July. Following this aggregation period, they migrate. Three potential migration routes have been identified, including one passing through the NWS along the shelf break and continental slope (Meekan and Radford 2010). This route corresponds to the foraging BIA and an expected seasonal presence during spring (DCCEEW 2016). The species is generally encountered close to or at the surface. Whale sharks tagged off WA spend ~25% of their time <2 m from the surface, and >40% of their time in the upper 15 m of the water column (Wilson et al. 2006; Gleiss et al. 2013). Whale shark presence within the Operational Area would not comprise significant numbers because no known aggregation areas occur there, and their presence would be seasonal, transitory, and of a short duration. There are no constraints (e.g. shallow water or shorelines) that prevent whale sharks from moving away from a moving MODU or vessels. If a vessel strike did occur, no significant impacts to populations are expected. ***Marine Reptiles*** The potential for unplanned interactions with marine fauna may occur from the physical presence and transit of the MODUs and vessels within the Operational Area. Any potential interaction with the MODU or vessels is limited to the surface waters where these activities occur. Marine reptile species most vulnerable to unplanned interactions with moving MODUs or vessels include marine turtles that frequent the upper portions of the water column while surfacing to rest or breathe; these are the focus of this consequence evaluation. However, it has been reported that turtles spend comparatively limited time (3–6%) at the surface, with dives generally lasting between 15 and 60 minutes (Milton and Lutz 2003). The typical response from turtles on the surface to the presence of vessels is to dive (a potential 'startle' response) (Hazel et al. 2007). As identified in Section 4.6.2, several marine reptile species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area. An internesting buffer BIA for the flatback turtle and internesting habitat critical to the survival of the flatback turtle, intersect with the Operational Area The Recovery Plan for Marine Turtles in Australia (CoA 2017b) identifies vessel disturbance as a key threat to the species. However, it also notes that this is particularly an issue in shallow coastal foraging habitats. The Operational Area is in waters generally >70 m deep, except around the unnamed shoal; and at its closest is ~35 km from a coast (Montebello Islands). An internesting BIA and habitat critical for the survival of flatback turtles overlap the Operational Area; these internesting buffers are associated with the Montebello Islands (Section 4.6.2.1). The Recovery Plan (CoA 2017b) defines the habitat critical to the survival of a species for internesting as a distance 60 km seaward from nesting habitat critical to the survival of flatback turtles. A study by Whittock et al. (2016a) indicates that the internesting behaviour of flatback turtles on the NWS appears more spatially restricted than the Recovery Plan suggests. This study reported that during their internesting periods flatback turtles prefer habitats closer to the coast (maximum 27.8 km; mean <6.1 km) and at relatively shallow depths (maximum <44 m, mean <10 m). The preference for shallow (<40 m water depth) internesting habitat is also supported by other studies (Dobbs 2007; Guinea, Sperling, and Whiting 2006; Pendoley Environmental 2010). This suggests that although the Operational Area does overlap with some internesting habitat critical to the survival of flatback turtles and an internesting buffer BIA, because it is offshore (~35 km from the Montebello Islands) it is considered unlikely that flatback turtles would aggregate within theOperational Areaduring their internesting period If flatback turtles (or other marine turtles) are present within the Operational Area, their presence would not comprise significant numbers because no known aggregation areas occur there, and their presence would be seasonal, transitory, and of a short duration. If a vessel strike did occur, no significant impacts to populations are expected. Therefore, the physical presence of the MODU and vessels within the Operational Area is not expected to result in a consequence greater than slight short-term disruption to individuals or a small proportion of the population ***Marine Mammals*** The potential for unplanned interactions with marine fauna may occur from the physical presence and transit of the MODUs and vessels within the Operational Area. Any potential interaction with the MODU or vessels is limited to the surface waters where these activities occur. Whales react in various ways to the approach of a vessel—some species remain motionless when near a vessel, while others are curious and often approach vessels that have stopped or are slow moving, although they generally do not approach, and sometimes avoid, faster-moving vessels (Richardson et al. 1995). Impacts resulting from vessel strikes are highly influenced by vessel speed—the greater the speed at impact, the greater the risk of death (Jensen and Silber 2004; Laist et al. 2001). Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from 10% at a speed of 4 knots, to 20% at 8.6 knots, and to 80% at 15 knots. Vessel–whale strikes at this speed are uncommon and, based on reported data contained in the US NOAA database (Jensen and Silber 2004), only two known instances of collisions have occurred when the vessel was travelling <6 knots—both were from whale-watching vessels that were deliberately placed amongst whales. As described above, project vessels typically travel at relatively slow speeds (e.g. <8 knots) or are holding station.

Impact assessment
As identified in Section 4.6.3, several marine mammal species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area No BIAs for regionally significant marine mammals intersect with the Operational Area; however, two migration BIAs occur nearby—humpback whale (~15 km south) and pygmy blue whale (~25 km north-west). The Conservation Management Plan for the Blue Whale (CoA 2015a) identifies vessel disturbance as a threat to this species. Vessel strike is also identified as a threat to fin and sei whales (TSSC 2015b; 2015a). Migrating pygmy blue whales are likely to occur in the Exmouth to Montebello Islands region from April to August (northern migration) and November to December (southern migration); humpback whales are typically present from June to October. The migratory patterns of fin and sei whales within Australian waters is not well defined (refer to the Master Existing Environment.). Opportunistic cetacean sighting data from Woodside's facilities on the NWS indicate that humpback whales are the most commonly observed cetacean species. Marine mammal presence within the Operational Area are not expected to comprise significant numbers because no known aggregation areas occur there, and their presence would be seasonal, transitory, and of a short duration. There are no constraints (e.g. shallow water or shorelines) that prevent marine mammals from moving away from MODUs or vessels. If a vessel strike did occur, no significant impacts to populations are expected. Therefore, the physical presence of the MODU and vessels within the Operational Area is not expected to result in a consequence greater than slight short-term disruption to individuals or a small proportion of the population ***Seabirds and Migratory Shorebirds*** As identified in Section 4.6.4, several bird species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area. Those present would predominately be migrating and foraging pelagic seabirds, noting that due to the distance to the Montebello Islands there also may be foraging nearshore seabirds. In addition, due to the overlap with the EAAF, shorebirds may migrate through the Operational Area. The physical presence of the vessels and MODU introduces a new emergent feature that may provide a temporary refuge for migratory / foraging seabirds and possibly shorebirds. Unlike nocturnal seabirds, which can be impacted by facility lighting through attraction or disorientated diurnal seabirds and shorebirds are attracted to vessels because of its presence and refuge potential. While there are reports of migratory shorebirds utilising ships as resting stopovers (e.g. Sara et al. 2023), reports of this behaviour within Australian waters are absent, reflecting either a lack of reporting or few such events. Occurrences of migratory shorebirds utilising offshore platforms of the NWMR would most likely be associated with a low number of individuals being blown off course during inclement weather events, rather than birds utilising facilities / vessels as a strategy to conserve energy during migration by large numbers of individuals. Considering behaviour and reports of seabird use of offshore platforms, noting that Woodside facilities located in the vicinity of the Operational Area such as Pluto (designed to be operated not-normally-attended or minimally attended) and Angel, have experienced bird roosting activities, species considered likely and possible to utilise vessels for resting and/or roosting include the brown booby, common noddy, crested tern, lesser crested tern and the roseate tern (Worley Consulting, 2024) It is noted that the two pelagic seabird species listed, have wide-ranging distributions but their designated BIAs do not overlap with Operational Area. The nearshore seabirds have been reported utilising not-normally-crewed offshore platforms on NWS however there is no overlap of designated BIAs. The use of the vessels may lead to a positive impact on these species by providing resting/roosting habitat. However, the increased presence of species may result in injury or death if individuals become entangled or trapped in topside infrastructure or as a result of collision with helicopters (Ronconi et al. 2015). The potential impacts of the vessel presence on seabird species considered likely to rest or roost on the vessels or MODU are considered negligible given that use of the FPU by seabirds is not expected to alter population size, habitat use or distribution at the NWMR level and will most likely result in a temporary behavioural change ***AMPs*** The Operational Area overlaps ~23 km^2 of the 3,413 km^2 Montebello Marine Park (i.e. ~0.67% of the marine park). The values of the Montebello Marine Park (as described in 4.8.1) include species listed as threatened, migratory, marine, or cetacean under the EPBC Act, as well as any identified BIAs for regionally significant marine fauna. The potential for changes to the values of the marine park from the physical presence of the MODUs and vessels within the Operational Area may occur as an indirect consequence of an impact to the marine megafauna identified as a value of the Montebello Marine Park. However, as described in the consequence evaluations for the marine fauna groups above, the physical presence of the MODU and vessels within the Operational Area is not expected to result in a consequence greater than slight short-term disruption to individuals or a small proportion of the population. Therefore, no significant long-term adverse impacts to the values of the Montebello Marine Park are expected to occur population, and no impact on critical habitat or fauna activity (E).

Impact assessment
Cultural Values and Heritage Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by a collision with a support vessel, such as marine mammals, whale sharks and marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Whale species may be subject of First Nations' increase ceremonies/rituals which are performed to enhance or maintain populations. As these Thalu ceremonies are performed to maintain and increase populations of marine species, it is considered that management applies at the species/population level and not to individuals. For example, it is anticipated the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn,2021). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO, 2003) As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.
Summary of Potential Impacts to environmental value(s)
Given the adopted controls, it is considered that a collision, were it to occur, will not result in a potential impact greater than slight, short term impact on species (i.e. Environment Impact – E).

Demonstration of ALARP

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)55***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
The use of dedicated MFOs on project vessels for the duration of the Petroleum Activity to watch for whales and provide direction on and monitor compliance with Part 8 of the EPBC Regulations.	F: Yes. However, support vessel bridge crews already maintain a constant watch during operations. CS: Additional cost of MFOs.	Given that support vessel bridge crews already maintain a constant watch during operations and trained crew as MFOs will monitor for pygmy blue whale presence prior to resupply/support vessel moves alongside the MODU and PIV, additional MFOs would not further reduce the likelihood of an individual being within close proximity of the acoustic source during introduction of sounds related to DP or during operations.	Disproportionate The cost/sacrifice outweighs the benefit gained.	No
Apply a 'living heritage[56]' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes C 2.1
The environmental impacts and risks of the activity will continue to be managed to as low as reasonably practicable and an acceptable level for cultural features and heritage values.	F: Yes CS: Substantial costs	Implementation of activities and associated controls to ALARP and acceptable levels supports the maintenance of cultural features and heritage values	Benefits outweigh cost/sacrifice	Yes C 2.2
Use of cultural heritage monitors on vessels to oversee implementation of controls protecting cultural values	F: No CS: Not feasible	Primary Installation Vessels are POB constrained with no ability to facilitate additional personnel	Not considered – control not feasible.	No

[56] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment.

No additional controls identified.				
Professional judgement – Engineered Solution				
No additional controls identified.				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of potential vessel collision with protected marine fauna. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				
Demonstration of acceptability				
Acceptability statement: The impact assessment has determined that, given the adopted controls, vessel collision with marine fauna represents a low current risk rating that is unlikely to result in significant localised impact with lasting effect. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet the requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for interactions with marine fauna have been adopted. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of vessel collision with marine fauna to a level that is broadly acceptable, and that compliance with those controls demonstrates that the EPOs are met.				

Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

Introduction and establishment of invasive marine species (IMS) within the Operational Area				X	X	X	A	E	0	L	LCS GP PJ	Broadly Acceptable	EPO 15

Description of source of impact

Installation of Subsea Infrastructure, and MODU and Vessel Operations

During the Petroleum Activity, vessels will be transiting to and from the Operational Area, potentially including vessels mobilising from beyond Australian waters. These project vessels may include the MODU, AHV, installation vessel or general support vessels (Section 3.11).

All vessels are subject to some level of marine fouling whereby organisms attach to the vessel hull. This could particularly occur in areas where organisms can find a good attachment surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc.). Organisms can also be drawn into ballast tanks during onboarding of ballast water as cargo is loaded or to balance vessels under load.

During the Petroleum Activity, project vessels have the potential to introduce IMS to the Operational Area through marine fouling (containing IMS) on vessels as well as within high risk ballast water discharge. Cross contamination between vessels can also occur (e.g. IMS translocated between project vessels) during times when vessels need to be alongside each other.

Impact assessment

Environmental value(s) potentially impacted

IMS are a subset of Non-Indigenous Marine Species (NIMS) that have been introduced into a region beyond their natural biogeographic range resulting in impacts to social/cultural, human health, economic and/or environmental values. NIMS may have the ability to survive, reproduce and establish founder populations. However, not all NIMS introduced into an area will thrive or cause demonstrable impacts; the majority of NIMS around the world are relatively benign and few have spread widely beyond sheltered ports and harbours. NIMS are only considered IMS when they result in impacts to environmental values and/or have social/cultural, economic and/or human health impacts.

IMS are considered a significant threat to Australia's marine environment and industries (Knight et al. 2007). Introducing IMS into the local marine environment may alter the ecosystem, as IMS have characteristics that make them superior (in a survival and/or reproductive sense) to non-endemic species. They may prey on local species (which had previously not been subject to this kind of predation and therefore not have evolved protective measures against the attack), they may outcompete non-endemic species for food, space or light, and can also interbreed with local species, creating hybrids such that the endemic species is lost. Other resulting impacts from changing

Impact assessment
ecosystems include altering local nutrient cycles, increasing predation pressure, or changing the community structure/dynamics. Impacts can be temporary or permanent, depending on the receiving environment and the number of individuals introduced. ***Offshore Habitats and Biological Communities*** Benthic habitats are most at risk from the introduction of an IMS. Establishment of IMS may change habitat composition, which leads to the creation of new habitats or fragmentation of existing habitats. A new habitat type may allow other endemic species to increase their distribution or range, thus influencing population processes of existing species. In species with limited dispersal, habitat fragmentation can isolate subpopulations, with secondary impacts to population genetics, population dynamics, species distribution, ecosystem processes, resource consumption and nutrient cycling processes. Once established, some IMS can be difficult to eradicate; therefore, there is the potential for a long-term change in habitat structure (DAWE 2018). IMS can spread outside the area where they were introduced, potentially having widespread impacts. IMS typically require hard substrate in the photic zone; therefore, requiring shallow waters to become established. Ecosystems that are particularly susceptible to IMS colonisation are highly disturbed shallow water and coastal marine environments (Dafforn, Glasby, and Johnston 2009; Dafforn, Johnston, and Glasby 2009). Whereas IMS are generally unable to successfully establish in deep water ecosystems (Geiling 2014). The Australian Government's Bureau of Resource Sciences estimates that the median risk of establishment[57]at 3 nm, 12 nm and 24 nm is ~40%, ~28%, and ~9% respectively (Knight et al. 2007), which indicates that offshore waters are less susceptible to impacts associated with introducing an IMS. At its closest, the Operational Area is ~140 km (~75 nm) north-west of Karratha, and within waters typically >70 m deep, except around unnamed. The benthic habitat within the Operational Area is expected to be a soft sediment in the vicinity of the nearfield wells and then a mixture of soft sediments and hard substrates in the vicinity of the Wilcox wells. Two main shallow bathymetric features are known to occur in or within proximity to the Operational Area (Section 4.5.1) Wilcox Shoal (<2.8 km south-east of the Operational Area) and Rankin Bank (~5 km north-west of the proposed tie-in at LPA). Rankin Bank is considered to represent habitats that likely play an important role in the productivity of the Pilbara region—it has diverse reef and algae habitats, which support a diverse fish assemblage (AIMS 2014a; Abdul Wahab et al. 2018). Activities for the Petroleum Activity will occur in an open ocean offshore location more than 12 nm from the mainland, concentrated in waters >70 m deep. Despite the potential high consequence if an IMS does establish, the deep offshore open waters are not conducive to the settlement and establishment of IMS due to the open-water environments where the rate of dilution and the degree of dispersal are high (Williamson and Fitter 1996; Paulay et al. 2002; Geiling 2014). Therefore, the introduction of an IMS within the Operational Area is not expected to result in a consequence greater than a slight disturbance to benthic habitats but not affecting ecosystem functions ***Traditional Custodians*** Through consultation and review of available literature (Section 4.9.1), Woodside understands that ecosystem health that may be affected by accidental introduction and establishment of IMS, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. Listening and talking with Country, which includes Sea Country, through stories, songlines, and other practices are ways Traditional Custodians care for, navigate, and connect with Country. Songlines rely on the continued health of Country, and people's continued access and connection to it. When Country is damaged or altered, so too are songlines and the knowledge they embody and enact. As described above, translocation to, and colonisation of IMS to the Operational Area is not considered credible, as such, no impact pathway to a change in access to Country from an accidental introduction and establishment of IMS within the Operational Area are anticipated. Cultural values and intangible cultural heritage associated with ecosystem health are expected to be maintained ***Commercial Fisheries*** The potential for changes to the functions, interest or activities of commercial fisheries within the Operational Area may occur as an indirect consequence of an impact to the benthic habitats and communities of the marine environment if IMS became established.

[57] *In this context, establishment refers to an organism being able to find suitable habitat and survive.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
The establishment of IMS may cause changes to targeted species' prey abundance, distribution, or behaviour, thus impacting commercial fishery activities. IMS can also change fisheries' stock levels and locations as a result of changes in the dynamics of in the surrounding ecosystem. As identified in Section 4.9.2 five state-managed commercial fisheries may be active within the Operational Area . Fishing effort is typically low; during the 5-year (2019 – 2024) period. As described in the consequence evaluation above, the introduction of an IMS within the Operational Area is only expected to result in slight disturbance to localised areas of benthic habitat. Given the low level of fishing effort within the Operational Area, and the unsuitability of the benthic habitats to support widespread IMS establishment, any impacts to commercial fisheries are not considered credible and are not evaluated further **Tourism and Recreation** The potential for changes to the functions, interest or activities of tourism and recreational users within the Operational Area may occur as an indirect consequence of an impact to the benthic habitats and communities of the marine environment if IMS became established. Due to the water depths (typically >70 m except around unnamed) and distance offshore, tourism and recreational activities are expected to be limited in the Operational Area. ome fishing tour operators may be active within the Operational Area, but recent effort is low (typically <3 active licences; Section 4.9.4). Where it does occur, charter fishing is active in the southern part of the Operational Area (in the vicinity of the Montebello Marine Park) and within grid blocks known to contain shallow bathymetric features (such as banks and shoals). As described in the consequence evaluation above, the introduction of an IMS within the Operational Area is only expected to result in slight disturbance to localised areas of benthic habitat. Given the low level of tourism and recreation occurring within the Operational Area, and the unsuitability of the benthic habitats to support widespread IMS establishment, any impacts to tourism and recreational users are not considered credible and are not evaluated further.
Summary of Potential Impacts to environmental value(s)
Given the adopted controls, it is considered that the introduction of IMS is only expected to result in slight impacts to benthic populations and a likelihood as Remote (0),

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)58***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
Project vessels will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transferring marine pests between survey vessels within the Operational Area No change in consequence would occur.	Controls based on legislative requirements under the Biosecurity Act 2015 – must be adopted.	Yes C15.1
Vessels must comply with legislative requirements, including *Protection of the Sea (Harmful Anti-fouling Systems) Act 2006* (Cth), *Biosecurity Act 2015* (Cth) and any subsequent marine	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transfer of marine pests between vessels within the Operational Area No change in consequence would occur.	Controls based on legislative requirements under the Biosecurity Act 2015 – must be adopted.	Yes C 15.2

orders, and any national best practice guidance				
Good practice				
Woodside's IMS risk assessment process[59] will be applied to the MODU, project vessels and relevant immersible equipment undertaking the Petroleum Activity. Assessment will consider these risk factors: • For vessels/ MODU: • vessel/MODU/ type • recent IMS inspection and cleaning history, including for internal niches • out-of-water period before mobilisation • age and suitability of antifouling coating at mobilisation date • internal treatment systems and history • origin and proposed area of operation • number of stationary/slow speed periods>7 days • region of stationary or slow periods • type of activity - contact with seafloor. • For immersible equipment: • region of deployment since last thorough clean, particularly coastal locations	F: Yes. CS: Minimal cost. Good practice implemented across all Woodside Operations.	Identifies potential risks and additional controls implemented accordingly. In doing so, the likelihood of transferring marine pests between project vessels within the Operational Area is reduced. No change in consequence would occur.	Benefits outweigh cost/sacrifice.	Yes C 15.3

[59] Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (IMO Guidelines, 2011).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)58***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
• duration of deployments • duration of time out of water since last deployment • transport conditions during mobilisation • post-retrieval maintenance regime. • Based on the outcomes of each IMS risk assessment, management measures commensurate with the risk (such as treating internal systems, IMS inspections or cleaning) will be implemented to minimise the likelihood of IMS being introduced.				
Professional judgement – Eliminate				
No discharge of ballast water during the Petroleum Activity.	F: No. Ballast water discharges are critical for maintaining vessel stability. Given the nature of the Petroleum Activity, the use of ballast (including the potential discharge of ballast water) is considered to be a safety critical requirement. CS: Not assessed, control not feasible	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Eliminate use of MODU/vessels.	F: No. Given that vessels must be used to implement project, there is no feasible means to eliminate the source of risk. CS: Loss of the project.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Professional judgement – Substitute				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)58***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Source project vessels based in Australia only.	F: Potentially. Limiting activities to only use local project vessels could potentially pose a significant risk in terms of time and duration of sourcing a vessel, as well as the ability of the local vessels to perform the required tasks. For example, there are limited installation vessels based in Australian waters. While the project will attempt to source project vessels locally it is not always possible. Availability cannot always be guaranteed when considered competing Oil and Gas activities in the region. In addition, sourcing Australian based vessels only will cause increases in cost due to pressures of vessel availability. CS: Significant cost and schedule impacts due to restrictions of vessel hire opportunities.	Sourcing vessels from within Australian will reduce the likelihood of IMS from outside Australian waters, however, it does not reduce the likelihood of introduction of species native to Australia but alien to the Operational Area and NWMR, or of IMS that have established elsewhere in Australia. The consequence is unchanged.	Disproportionate Sourcing vessels from Australian waters may result in a reduction in the likelihood of IMS introduction to the Operational Area; however, the potential cost of implementing this control is grossly disproportionate to the minor environmental gain (or reducing an already remote likelihood of IMS introduction) potentially achieved by using only Australian based vessels, consequently this risk is considered not reasonably practicable.	No
IMS inspection of all vessels.	F: Yes. Approach to inspect vessels could be a feasible option. CS: Significant cost and schedule impacts. In addition, Woodside's IMS risk assessment process (C 15.2) is seen to be more cost effective as this control allows Woodside to manage the introduction of marine pests through biofouling, while targeting its efforts to and resources to areas of greatest concern.	Inspection of all vessels for IMS would reduce the likelihood of IMS being introduced to the Operational Area However, this reduction is unlikely to be significant given the other control measures implemented. No change in consequence would occur.	Disproportionate . The cost/sacrifice outweighs the benefit gained, as other controls to be implement achieve an ALARP position.	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)58***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Professional judgement – Engineered Solution				
None identified				
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS introduction. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls, introduction of IMS represent a slight risk rating that has a remote likelihood to result in an environmental consequence greater than a slight, short-term impact on marine communities within the Operational Area Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet Australian legislative requirements, including the Biosecurity Act 2015. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for the introduction of invasive marine species have been adopted. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of invasive marine species to an acceptable level, and compliance with those controls demonstrates that the EPOs are met.

Loss of station keeping of the MODU leading to anchor drag and the disturbance of benthic habitat	X			X									

Description of source of impact

During MODU and project vessel operations, the primary cause for unplanned seabed disturbance is through dropped objects from the MODU or project vessels. Additional unplanned disturbance to the seabed may occur from a loss of station keeping and subsequent anchor drag during MODU operations if a moored MODU is used for the Petroleum Activity.

Dropped Objects

There is the potential for objects to be dropped overboard from the MODU and project vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners) hardware fixtures (e.g. riser hose clamp) and drill equipment (e.g. drill pipe); however, there is also potential for larger equipment to also be dropped during the activity, particularly during recovery of infrastructure from the seabed. The spatial extent in which dropped objects can occur is restricted to the Operational Area

Anchor Drag

A moored/ hybrid MODU may be used for drilling the wells, secured on station by an 8 to 12-point mooring system deployed to the seabed, as dictated by the mooring analysis. High energy weather events such as cyclones, occurring while the MODU is on station, can lead to excessive loads on the mooring lines, resulting in failure (either anchor(s) dragging or mooring lines parting). A failure of mooring integrity may lead to the mooring lines and anchors attached to the MODU being trailed across the seabed. If mooring failure is sufficient, the MODU may move off station, increasing the likelihood of anchor drag across the seafloor.

For a moored MODU, personnel on-board are typically evacuated during cyclones. Woodside implements a risk-based assessment process to aid in decision-making for cyclone evacuations, with the well suspended prior to MODU evacuation. Support vessels also demobilise from the Operational Area during the passage of a cyclone. While the MODU is temporarily abandoned, the position of the MODU is monitored remotely for any deviation. Support vessels and MODU personnel return to the Operational Area as soon as safe to do so after a cyclone evacuation. Operational experience indicates cyclone evacuations typically last for seven days

Industry statistics from the North Sea show that a single mooring line failure for MODUs is the most common failure mechanism (33 × 10-4 per line per year), followed by a double mooring line failure (11 × 10-4 per line per year) (Petroleumstilsynet, 2014). Note that single and double mooring line failures do not typically result in the loss of

Description of source of impact
station keeping. If partial or complete mooring failures are sufficient to result in a loss of station keeping, industry experience indicates that MODUs may drift considerable distances from their initial position (Offshore: Risk & Technology Consulting Inc., 2002). Partial mooring failures leading to a loss of station keeping resulted in smaller MODU displacements, due to the remaining anchors dragging along the seabed when compared to complete mooring failures; complete mooring failures resulted in a freely drifting MODU (Offshore: Risk & Technology Consulting Inc., 2002). NOPSEMA has recorded four cases of anchor drag due to loss of MODU holding station during cyclone activity between 2004 and 2015 (NOPSEMA 2015). Seabed disturbance area size from anchor drag will depend on the extent of the drag.

Impact assessment
Environmental value(s) potentially impacted
In the unlikely event of an object being dropped into the marine environment or failed mooring, potential environmental effects would be limited to minor physical impacts on benthic communities. In most cases, objects will be able to be recovered and therefore these impacts will also be temporary in nature. However, there may be instances where objects are unable to be recovered due to health and safety, operational constraints or other factors such as the difficulty of recovering dropped objects at depth. When dropped objects are unable to be recovered, the impact will continue to be minor but permanent. ***Water Quality*** Unplanned seabed disturbance has the potential to result in a localised and temporary decline in water quality due to an increase in suspended sediment. After a period, the suspended sediments settle and the turbidity in the water column returns to pre-disturbance levels. Each activity near the seabed is likely to cause a single brief disturbance resulting in a transient plume of suspended sediment, within an area of predominantly soft sand habitat. Therefore, unplanned seabed disturbance associated with activities within the Operational Area is expected to have no lasting effect on water quality ***Offshore Habitats and Biological Communities*** Unplanned seabed disturbance has the potential to change benthic habitats and communities within the Operational Area The benthic habitat within theOperational Areais expected to be comprised of soft sediment in proximity to the nearfield wells and a mixture of soft sediments and hard substrate in the vicinity of the Wilcox wells; this habitat is broadly represented throughout the NWMR (Worley 2025). Unplanned seabed disturbance footprints will typically range from ~15 m^2 (from tools or equipment) to ~150 m^2 (infrastructure). Note: Unplanned seabed disturbance from a mooring or anchor drag will vary, depending on the extent of the drag. This estimated extent of seabed disturbance is considered very small in relation to the extent of the soft sediment habitats, which are broadly represented within the Operational Area and the wider NWMR. Rankin Bank and Wilcox Shoal both occur within proximity to the Operational Area (Section 4.5.1). Wilcox Shoal is <2.8 km east Operational Area, and Rankin Bank is ~5 km north of the proposed tie-in at LPA. There is a smaller shoal feature (~2.5 km north-east of nominal Wilcox wells within the Operational Area and consequently could be at risk from unplanned seabed disturbance from dropped objects or mooring/anchor drag depending on the specific location and nature of any project activities. Dropped objects may result in a small permanent loss of habitat under the object however in most cases, these objects will be able to be recovered and the impacts will be temporary in nature. While the unplanned seabed disturbance from a mooring or anchor drag will vary, depending on the extent of the drag. This estimated extent of seabed disturbance is considered very small in relation to the extent of the soft sediment habitats, which are broadly represented within the Operational Area and the wider NWMR. Therefore, unplanned seabed disturbance within the Operational Area is not expected to result in a consequence greater than short-term disturbance to habitats or biological communities, or affect ecosystem function ***Key Ecological Features*** Unplanned seabed disturbance footprints will typically range from ~15 m^2 (from tools or equipment) to ~150 m^2 (infrastructure). Note: Unplanned seabed disturbance from a mooring or anchor drag will vary, depending on the extent of the drag. This unplanned seabed disturbance represents a very small proportion of the 16,190 km^2 area of the KEF. As described in Section 4.7, the values of this KEF include providing areas of hard substrate that may result in higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment. However, an assessment of the seabed (including within the ancient coastline at 125 m depth contour KEF) indicate that benthic habitats within the KEF are characterised by soft sediments. In addition, while physical habitat modification is listed as a pressure within the Marine Bioregional Plan for the NWMR, it has not been identified a pressure of concern for this KEF (DSEWPaC 2012b).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
Therefore, seabed disturbance within the KEF is not expected to result in a consequence greater than slight short-term disturbance to habitats or biological communities, or affect ecosystem function ***AMPs*** The potential for changes to the Montebello Marine Park may occur from an unplanned seabed disturbance within the marine park boundary as it is possible the MODU mooring system may extend within the marine park boundary, depending on the type of MODU selected for activities at Wilcox reservoir. The values of the Montebello Marine Park (as described in 4.8.1) include ecosystems representative of the Northwest Shelf Province, including areas of ancient coastline. Benthic habitat surveys within the northern section of the marine park indicate that it has a relatively flat and sandy seabed with variable coverage of benthic epifauna (e.g. sponges, corals) (Section 4.5; (Advisian 2019)). This is not dissimilar to the benthic habitats and communities expected to occur throughout most of the Operational Area, which are broadly represented throughout the NWMR (Section 4.3). Therefore, seabed disturbance within the Montebello Marine Park is not expected to result in a consequence greater than slight short-term disturbance to habitats or biological communities, or affect ecosystem function.
Summary of Potential Impacts to environmental value(s)
Given the adopted controls, the predicted small footprint of a dropped object, it is considered that unplanned seabed disturbance will result in slight impacts to a small area of the seabed and a small proportion of the benthic populations. However, no significant impact to environmental receptors and resulting in minor and short-term impacts (i.e. Environment Impact – E).

ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of unplanned seabed disturbance. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that disturbance to seabed from dropped represents or a loss of station keeping of the MODU a low current risk rating and is unlikely to result in a risk consequence greater than slight. The adopted controls are considered industry good practice. In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP for unplanned seabed disturbance have been adopted. The potential risks and consequences are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of seabed disturbance from dropped objects to an acceptable level, and compliance with those controls demonstrates that the EPOs are met.

Interaction with live infrastructure from anchor drag						X							

Description of source of impact

As detailed in Section 4.9.6 there is existing live subsea infrastructure in the Operational Area, which includes a number of tiebacks to the GWA Platform. During the Petroleum Activity, activities may be conducted that present a risk of dropped objects or anchor drag over the nearby live infrastructure.

During the Petroleum Activity, activities may be conducted that present a risk of dropped objects or anchor drag over the nearby live infrastructure. The purpose of the following assessment is to determine the risk associated with interaction between dropped objects and/ or anchor drag and existing live subsea infrastructure. This risk assessment does not consider risk of a spill from existing subsea infrastructure. For these events risk ratings are determined in the below approved EPs:

- Goodwyn Alpha (GWA) Facility Operations Environment Plan
- Pluto Facility Operations Environment Plan

Dropped Objects

There is the potential for objects to be dropped overboard from the MODU and project vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners), hardware fixtures (e.g. riser hose clamp) and drill equipment (e.g. drill pipe). However, there is potential for larger equipment to be dropped during the activity, particularly during recovery of infrastructure from the seabed. The spatial extent in which dropped objects can occur is restricted to the Operational Area

Anchor Drag

A hybrid MODU will be used for drilling the wells, secured on station by an 8 to 12-point mooring system deployed to the seabed, as dictated by the mooring analysis. High energy weather events such as cyclones, occurring while the MODU is on station, can lead to excessive loads on the mooring lines, resulting in failure (either anchor(s) dragging or mooring lines parting). A failure of mooring integrity may lead to the mooring lines and anchors attached to the MODU being trailed across the seabed and over live infrastructure.

For a moored MODU, personnel on-board are typically evacuated during cyclones. Woodside implements a risk-based assessment process to aid in decision making for cyclone evacuations, with the well suspended prior to evacuation. Support vessels also demobilise from the Operational Area during the passage of a cyclone. While the MODU is temporarily abandoned, the position of the MODU is monitored remotely for any deviation. Support vessels and MODU personnel return to the Operational Area as soon as safe to do so after a cyclone evacuation. Operational experience indicates cyclone evacuations typically last for seven days.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source of impact
Industry statistics from the North Sea show that a single mooring line failure for MODUs is the most common failure mechanism (33 × 10-4 per line per year), followed by a double mooring line failure (11 × 10-4 per line per year) (Petroleumstilsynet, 2014). Note that single and double mooring line failures do not typically result in the loss of station keeping. If partial or complete mooring failures are sufficient to result in a loss of station keeping, industry experience indicates that MODUs may drift considerable distances from their initial position (Offshore: Risk & Technology Consulting Inc., 2002). Partial mooring failures leading to a loss of station keeping resulted in smaller MODU displacements, due to the remaining anchors dragging along the seabed when compared to complete mooring failures; complete mooring failures resulted in a freely drifting MODU (Offshore: Risk & Technology Consulting Inc., 2002). NOPSEMA has recorded four cases of anchor drag due to loss of MODU holding station during cyclone activity between 2004 and 2015 (NOPSEMA 2015).

Impact assessment
Environmental value(s) potentially impacted
Interactions with other marine users In the unlikely event of an object being dropped on, or anchors dragging over, live infrastructure there is potential impacts to the infrastructure. Within the Operational Area, there is the infrastructure associated with the Goodwyn Alpha Platform Field Production System owned by Woodside. If interactions with live infrastructure were to occur, Woodside would notify the relevant operations team in accordance with the SIMOPS plan. This would trigger responses to assess and respond to any damage caused in accordance with the relevant operations EP for the live infrastructure. Under Regulation 56 of the Environment Regulations, a titleholder may refer NOPSEMA to information previously given to NOPSEMA for another purpose under the OPGGS Act, the Environment Regulations or any other regulations made under the Act, to comply with a requirement on the titleholder under the Environment Regulations to give NOPSEMA information or include information in a document. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs[72] submitted by the Operators of the live infrastructure, and accepted by NOPSEMA, for the detail of the Operators' assessment and response in such a scenario. Potential impacts therefore include time and costs associated with inspecting the infrastructure and time and costs associated with any associated repair, which are expected to be slight and short-term in nature. ***Potential subsequent loss of containment*** In the unlikely event of an object being dropped on, or anchors dragging over, live infrastructure, and in the further unlikely event of a severe interaction with the infrastructure, there is a possibility that live infrastructure could be ruptured releasing hydrocarbons into the marine environment in such a scenario. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by the Operators of the live infrastructure, and accepted by NOPSEMA, for the detail of potential impacts, receptors and the extent of the environment that may be affected in such a scenario, being: • Goodwyn Alpha (GWA) Facility Operations Environment Plan, Section 6.8.4 (NOPSEMA Doc A825979,https://docs.nopsema.gov.au/A825979) • Pluto Facility Operations Environment Plan, Section 6.9.11 (NOPSEMA Doc A1197328,docs.nopsema.gov.au/A1197328) As detailed in these Sections above and below, this EP addresses the risks and impacts (interaction with live infrastructure) that arise from the activities under this EP (interaction from dropped objects and interaction from anchor drag). This EP also contains controls to prevent such an event from occurring that are within the operational control of this EP. As detailed in this Section, the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure is not within the operational control of this EP. As detailed below, the risks and impacts of the activities under this EP are managed to ALARP and an acceptable level by implementing the SIMOPS plan and notifying the relevant Operators in the instance of an interaction with live infrastructure to allow the relevant Operator's detailed response strategies under the relevant operations EPs to be triggered, if required. In the event of a loss of containment caused by an interaction with live infrastructure Woodside will follow direction from the relevant Operator and will respond as per the relevant Operator's requirements. In accordance with Regulation 56, NOPSEMA is referred to the relevant operations EPs submitted by the Operators of. the live infrastructure, and accepted by NOPSEMA, for the detail of the operational control, maintenance and incident response associated with the live infrastructure and/or loss of containment from the live infrastructure
Summary of Potential Impacts to environmental values(s)
Given the adopted controls, it is considered that a interaction with live infrastructure due to a dropped object or anchor drag, were it to occur, will not result in a potential impact greater than slight, short term (i.e. Environment Impact – E).

6.8.9 Unplanned Release: Hazardous and Non-Hazardous Wastes

Context		
Relevant Activities Project Vessels - Section 3.11	***Existing*** Environment Regional Context – Section 4.2	***Consultation*** Consultation – Section 5

Impact evaluation summary

Source of impact	***Environmental value potentially impacted***						***Evaluation***						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Accidental loss of hazardous or non-hazardous solid wastes / equipment to the marine environment		X			X	X	A	F	2	L	LCS GP	Broadly Acceptable	EPO 18

Description of source of impact

The MODU and project vessels will generate a variety of solid wastes, including packaging and domestic wastes such as aluminium cans, bottles, paper and cardboard. Hence, there is the potential for solid wastes to be lost overboard to the marine environment.

Equipment may also be accidentally lost overboard. Equipment that has been recorded as being lost on previous campaigns has primarily been windblown or dropped overboard and has included things such as personal protective equipment and small tools or materials.

These events have occurred during backloading activities, periods of adverse weather and incorrect waste storage.

Impact assessment

Environmental value(s) potentially impacted

The potential impacts of hazardous or non-hazardous solid waste / equipment accidentally discharged to the marine environment include contamination of the environment as well as secondary impacts relating to potential contact of marine fauna with wastes. This could result in entanglement or ingestion and lead to injury and death of individual animals and changes to aesthetic values. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the location of the Operational Area, the types, size and frequency of wastes that could occur, and species present.

Water Quality

Change in Water Quality

Hazardous solid wastes such as paint cans, oily rags, etc., can cause localised contamination of the water through a release of toxins and chemicals. The level of impact to water quality will depend on the nature of the discharge, however volumes of the hazardous components are generally low (such as residual paint in cans or oily rags).

Modelling of small volumes of hydrocarbons such as this (e.g. Shell, 2010) indicate rapid dilution in the offshore marine environment, with impacts limited to the immediate vicinity of the contamination.

Given likely small volumes, and the occasional nature of the event, these would result in temporary and highly localised changes to the water quality.

Injury/Mortality to Fauna

The unplanned discharge of solid wastes can result in mortality to fauna, either through contamination or physical injury depending on the nature of the waste. Marine fauna, including fish, seabirds and shorebirds, marine mammals and marine reptiles may be impacted through ingestion or entanglement of waste or through exposure to toxic chemicals. Ingestion or entanglement of marine fauna has the potential for physical harm which may limit

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impact assessment
feeding/foraging behaviours and thus can result in mortalities. Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris was listed as a key threatening process under the EPBC Act in August 2003 (Department of the Environment and Energy (DoEE), 2018). The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (DoEE, 2018) identifies EPBC Act-listed species for which there are scientifically documented adverse impacts resulting from marine debris. Marine turtles and seabirds in particular may be at risk from plastics which may cause entanglement or be mistaken for food (e.g. DoEE, 2018; Commonwealth of Australia, 2017) and ingested causing damage to internal tissues and potentially preventing feeding activities. In the worst instance this could have a lethal affect to an individual. Marine debris has been identified as threat in the Recovery Plan for Marine Turtles in Australia (2017–2027). Impacts to species including fish, birds, marine mammals and marine reptiles from the unplanned discharge of solid waste is unlikely given low occurrence of unplanned discharges and the location of the activities at significant distance from sensitive habitats. Significant impacts are unlikely to occur at an individual level and will not occur at a population level, nor result in the decrease of the quality of the habitat such that the extent of these species is likely to decline. While the threat abatement plan for impacts of marine debris on vertebrate marine life does not list explicit management actions for non-related industries (Department of Environment, Water, Heritage and the Arts (DEWHA), 2009), management controls will reduce the risk of unplanned discharge of solid waste. ***Cultural Values and Heritage*** Through consultation and review of available literature (Section 4.9.1), Woodside understands that marine fauna that may be affected by unplanned loss of hazardous and non-hazardous waste/equipment, such as marine turtles, are culturally important to Traditional Custodians. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to songlines and dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country. For example, activities that impact marine turtle populations and their marine environment may have an indirect impact on some Indigenous communities if they deplete hunting areas and threaten local food security (Delisle et al. 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes results in reduced sightings (e.g., through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (Fijn,2021). As described above, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.
Summary of Potential Impacts to environmental value(s)
Given the adopted controls, it is considered that the accidental discharge of solid waste described will result in no significant localised impact, with no lasting effect on environmental receptors (i.e. Environment Impact – F).

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)63***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
ALARP statement: On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of accidental loss of hazardous or non-hazardous solid wastes/equipment to the marine environment. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, accidental discharge of solid waste represents a low current risk rating with no lasting effect of localised impacts. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good oil-field practice/industry best practice and meet legislative requirements (Marine Order 95). In addition the Petroleum Activity is within the acceptable level of impact determined through the Goodwyn Area Infill OPP as the risk rating is consistent with the level rated in the OPP and the EPOs and controls from the OPP the unplanned release of hazardous and non-hazardous waste have been adopted. The potential impacts and risks are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks of these discharges to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.9 Recovery plan and threat abatement assessment

As described in Section 1.7.2.1, an EP must not be inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community. This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activity is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017).
- Conservation Management Plan for the Blue Whale 2015–2025 (Commonwealth of Australia, 2015a).
- Recovery Plan for the Grey Nurse Shark (Carcharias taurus) 2014 (Commonwealth of Australia, 2014).
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b).
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018).

Table 6-23 lists the objectives and (where relevant) the action areas of these plans and also describes whether these objectives/action areas are applicable to government, the Titleholder and/or the Petroleum Activity. For those objectives/action areas applicable to the Petroleum Activity, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are clearly inconsistent with that action or not. The results of this assessment against relevant actions are presented in Table 6-23 to Table 6-28.

The assessment of potential impacts and risks to pygmy blue whales from underwater noise emissions in Section 6.7.4has taken into account the definitions of terminology in the CMP, as described in the DCCEEW and NOPSEMA guidance released in September 2021. Similarly, the assessment against relevant actions in the CMP in Table 6-25 has been undertaken in the context of the definitions included in the guidance note.

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	***Titleholder***	***Petroleum Activity***
Interim Recovery Objectives			
The conservation status of blue whale populations is assessed using efficient and robust methodology	Y		
The spatial and temporal distribution, identification of biologically important areas, and population structure of blue whales in Australian waters is described	Y	Y	Y
Current levels of legal and management protection for blue whales are maintained or improved and an appropriate adaptive management regime is in place	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Action Areas			
A. Assessing and addressing threats			
A.1: Maintain and improve existing legal and management protection	Y		
A.2: Assessing and addressing anthropogenic noise	Y	Y	Y
A.3: Understanding impacts of climate variability and change	Y		
A.4: Minimising vessel collisions	Y	Y	Y
B. Enabling and Measuring Recovery			
B.1: Measuring and monitoring population recovery	Y		
B.2: Investigating population structure	Y		
B.3: Describing spatial and temporal distribution and defining biologically important habitat	Y	Y	Y
Grey Nurse Shark Recovery Plan			
Overarching Objective			
To assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: • improving the population status, leading to future removal of the grey nurse shark from the threatened species list of the EPBC Act • ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objective			
Develop and apply quantitative monitoring of the population status (distribution and abundance) and potential recovery of the grey nurse shark in Australian waters	Y		
Quantify and reduce the impact of commercial fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Quantify and reduce the impact of recreational fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Where practicable, minimise the impact of shark control activities on the grey nurse shark	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	***Titleholder***	***Petroleum Activity***
Investigate and manage the impact of ecotourism on the grey nurse shark	Y		
Manage the impact of aquarium collection on the grey nurse shark	Y		
Improve understanding of the threat of pollution and disease to the grey nurse shark	Y	Y	Y
Continue to identify and protect habitat critical to the survival of the grey nurse shark and reduce the impact of threatening processes within these areas	Y	Y	
Continue to develop and implement research programs to support the conservation of the grey nurse shark	Y	Y	
Promote community education and awareness in relation to grey nurse shark conservation and management	Y		
Sawfish and River Sharks Recovery Plan			
Primary Objective			
To assist the recovery of sawfish and river sharks in Australian waters with a view to: • improving the population status leading to the removal of the sawfish and river shark species from the threatened species list of the EPBC Act • ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objectives			
Reduce and, where possible, eliminate adverse impacts of commercial fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of recreational fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of Indigenous fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate the impact of illegal, unregulated and unreported fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of collection for public aquaria on sawfish and river shark species	Y		
Improve the information base to allow the development of a quantitative framework to assess the recovery of, and inform management options for, sawfish and river shark species	Y		
Develop research programs to assist conservation of sawfish and river shark species	Y	Y

Table 6-24: Assessment against relevant actions of the Marine Turtle Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Marine Turtle Recovery Plan	Action Area A3: Reduce the impacts from marine debris	Action: Support the implementation of the Marine Debris Threat Abatement Plan (TAP) Priority actions at stock level: G-NWS – understand the threat posed to this stock by marine debris LH-WA – determine the extent to which marine debris is impacting loggerhead turtles F-Pil and H-WA – no relevant actions	Refer Section 6.8.9 Not inconsistent assessment: The assessment of accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to marine turtles.	EPO 18
	Action Area A4: Minimise chemical and terrestrial discharge	Action: Ensure spill risk strategies and response programs adequately include management for marine turtles and their habitats, particularly in reference to 'slow to recover habitats', e.g. nesting habitat, seagrass meadows or coral reefs Priority actions at stock level: G-NWS – ensure that spill risk strategies and response programs include management for turtles and their habitats LH-WA, F-Pil – ensure that spill risk strategies and response programs include management for turtles and their habitats, particularly in reference to slow to recover habitats, e.g. seagrass meadows or corals H-WA – no relevant actions	Refer Sections 6.8.2 6.8.3, 6.8.4, Appendix G. Not inconsistent assessment: The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to marine turtles. Spill risk strategies and response program include management measures for turtles and their nesting habitats.	Refer Sections 6.8.2 6.8.3, 6.8.4 Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activity are present in Appendix G.
		Action: Routine discharges from MODU and project vessels are managed such that marine turtles are not adversely affected by changes in water quality. Priority actions at stock level: G-NWS – as above LH-WA, F-Pil – as above	Refer Sections 6.7.6, 6.7.7 6.7.8 6.7.9 Not inconsistent assessment: The assessment of routine discharges of chemicals, deck drainage, treated sewerage, putrescible wastes and grey water has considered the potential risks to marine turtles. Individuals transiting the localised	EPO 7, 8, 9, 10

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
		H-WA – no relevant actions	area may come into contact with routine discharges, however these are sporadic and in small quantities, and are unlikely to pose a significant risk.	
	Action Area A8: Minimise light pollution	Action: Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats Priority actions at stock level: G-NWS – as above LH-WA – no relevant actions F-Pil and H-WA – manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue	Refer Section 6.7.3 Not inconsistent assessment: The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels. Vessel light emissions could cause localised and temporary behavioural disturbance to isolated transient individuals, which is unlikely to result in displacement of adult turtles from internesting or nesting Habitat Critical.	EPO 3, 4
	Action Area B1: Determine trends at index beaches	Action: Maintain or establish long-term monitoring programs at index beaches to collect standardised data critical for determining stock trends, including data on hatchling production Priority actions at stock level: G-NWS – continue long-term monitoring of index beaches LH-WA – continue long-term monitoring of nesting and foraging populations F-Pil and H-WA – no relevant actions	Not inconsistent assessment: Woodside contributes to Action Area B1 via its support of the Ningaloo Turtle Program[65]. Given the offshore location of the Operational Area, impacts to turtle nesting beaches will not occur.	N/A

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks	Action: Understand the impacts of anthropogenic noise on marine turtle behaviour and biology Priority actions at stock level: G-NWS – given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise – Investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the North-West Shelf stock to other stocks LH-WA, F-Pil - no relevant actions H-WA – investigate mixed stock genetics at foraging grounds	Refer Section 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to flatback and olive ridley turtles. Vessel and seismic acoustic emissions could cause localised and short-term behavioural disturbance to isolated transient individuals, which is unlikely to result in displacement of adult turtles from internesting or nesting Habitat Critical	EPO 4, 5
Assessment Summary The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-25: Blue Whale Conservation Management Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Blue Whale Conservation Management Plan	Action Area A.2: Assessing and addressing anthropogenic noise	Action 2: Assessing the effect of anthropogenic noise on blue whale behaviour Action 3: Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to use the area without injury, and is not displaced from a foraging area	Refer Section 6.7.4 Not inconsistent assessment: The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales.	EPO 4, 5
	Action Area A.4: Minimising vessel collisions	Action 3: Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented	Refer Section 6.8.5 Not inconsistent assessment: The assessment of vessel collision with marine fauna has considered the potential risks to pygmy blue whales. Vessel collisions with pygmy blue whales are highly unlikely to occur, given the very slow vessel speeds and presence of crew trained in marine fauna observations.	EPO 14
	Action Area B.3: Describing spatial and temporal distribution and defining biologically important habitat	Action 2: Identify migratory pathways between breeding and feeding grounds Action 3: Assess timing and residency within Biologically Important Areas	Not inconsistent assessment: Woodside contributes to Action Area B3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements[66]).	N/A
Assessment Summary The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.

7. IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the Petroleum Activity confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and EPS outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring that the Petroleum Activity is managed in accordance with this Implementation Strategy and the WMS (Section 1.6).

7.2 Systems, practices, and procedures

All operational activities are planned and performed in accordance with relevant legislation and standards, management measures identified in this EP, and internal environment standards and procedures (Section 6).

Processes are implemented to verify controls to manage environmental impacts and risks to:

- a level that is ALARP and acceptable
- meet EPOs
- comply with EPSs defined in this EP.

Document names and reference numbers may change during the statutory duration of this EP and will be managed through a Change Register and update process.

7.2.1 Assessment of project chemicals

As part of Woodside's chemical approval process, chemicals required by the Petroleum Activity are selected and approved in accordance with the Woodside Environment Chemical Selection and Assessment Guideline. This procedure is used to demonstrate the potential impacts of the chemicals selected are acceptable and ALARP, in line with Woodside's Environmental Management Standard. The procedure requires selecting chemicals that have the lowest practicable environmental impacts and risks, subject to technical constraints.

Woodside's Environment Chemical Selection and Assessment Guideline includes the requirements set out by the Australian Government under the Industrial Chemicals Environmental Standard. Chemicals proposed for this activity will be assessed against those listed in the Industrial Chemicals Environmental Standard Register under one of seven schedules according to their environmental risk. The selection and management of any chemical will adhere to the specific risk management measures, storage, use and handling requirements outlined in the corresponding schedule.

No chemical discharges are planned as part of this Petroleum Activity. AFFF may be discharged where project vessel helideck testing requirements (typically annual) fall within the on-hire period, or in an emergency.

The chemical assessment process follows the principles outlined in the OCNS, which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands. It applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for managing chemicals.

All chemical substances on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters, such as biodegradation and bioaccumulation, in accordance with one of two schemes (as shown in Figure 7-1):

- Hazard Quotient (HQ) Colour Band: Gold, Silver, White, Blue, Orange or Purple (listed in order of increasing environmental hazard)
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard); used for inorganic substances, hydraulic fluids and pipeline chemicals only.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

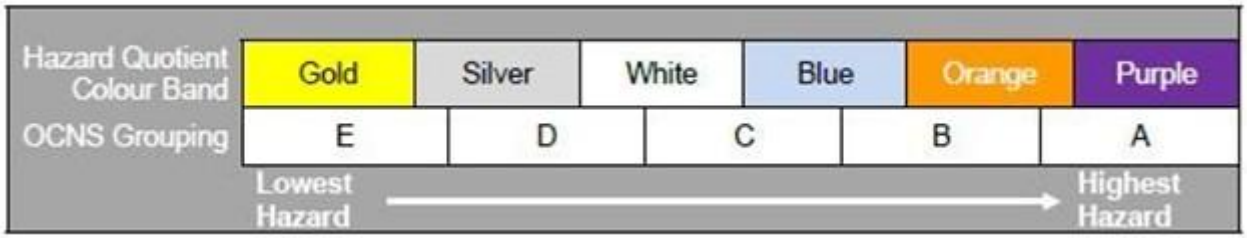

Figure 7-1: Offshore Chemical Notification Scheme ranking

Chemicals fall into the following assessment types:

- **No further assessment** – Chemicals with an HQ band of Gold or Silver or an OCNS ranking of E or D with no substitution or product warnings do not require further assessment. Such chemicals do not represent a significant impact on the environment under standard use scenarios and are therefore considered ALARP and acceptable.
- **Further assessment/ALARP justification required** – The following types of chemicals require further assessment to understand the environmental impacts of discharge into the marine environment:
  - chemicals with no OCNS ranking
  - chemicals with an HQ band of White, Blue, Orange or Purple or an OCNS ranking of A, B or C
  - chemicals with an OCNS product or substitution warning.

This includes assessing the ecotoxicity, biodegradation and bioaccumulation of the chemicals in the marine environment in accordance with the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) Hazard Assessment and the DMPE Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

7.2.1.1 Ecotoxicity

Chemical ecotoxicity is assessed using the criteria used by CEFAS to group chemicals based on ecotoxicity results (Table 7-1). If a chemical has an aquatic or sediment toxicity within the criteria for the OCNS grouping of D or E, this is considered acceptable in terms of ecotoxicity.

Table 7-1: Centre for Environment, Fisheries and Aquaculture Science's Offshore Chemical Notification Scheme grouping based on ecotoxicity results

Initial Grouping	A	B	C	D	E
Results of aquatic toxicity data (ppm)	<1	>1 to 10	>10 to 100	>100 to 1,000	>1,000
Results for sediment toxicity data (ppm)	<10	>10 to 100	>100 to 1,000	>1,000 to 10,000	>10,000

Note: Aquatic toxicity refers to the Skeletonema costatum EC50, Acartia tonsa LC50 and Scophthalmus maximus (juvenile turbot) LC50 toxicity tests; sediment toxicity refers to Corophium volutator LC50 test.

7.2.1.2 Biodegradation

Chemical biodegradation is assessed using the CEFAS criteria, which align with the categorisation outlined in the DMPE Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

CEFAS categorises biodegradation into three groups:

- readily biodegradable: results of >60% biodegradation in 28 days to an OSPAR harmonised offshore chemical notification format (HOCNF)-accepted ready biodegradation protocol
- inherently biodegradable: results >20% and <60% to an OSPAR HOCNF-accepted ready biodegradation protocol or result of >20% by OSPAR-accepted inherent biodegradation study

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- not biodegradable: results from OSPAR HOCNF-accepted ready biodegradation protocol or inherent biodegradation protocol of <20%, or half-life values derived from aquatic simulation test indicate persistence.

Chemicals with >60% biodegradation in 28 days to an OSPAR HOCNF-accepted ready biodegradation protocol are considered acceptable in terms of biodegradation:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

7.2.1.3 Bioaccumulation

The bioaccumulation of chemicals is assessed using the CEFAS bioaccumulation criteria, which align with the categorisation outlined in the DMPE Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

The following guidance is used by CEFAS:

- Non-bioaccumulative: Log Pow <3, or Bioconcentration Factor ≤100 and molecular weight is ≥700.
- Bioaccumulative: Log Pow ≥3 or Bioconcentration Factor >100 and molecular weight is <700.

Chemicals that meet the non-bioaccumulative criteria are considered acceptable. If a product has no specific ecotoxicity, biodegradation or bioaccumulation data available, the following options are considered:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

7.2.1.4 Alternatives

If no environmental data are available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical will be investigated, with preference for options with an HQ band of Gold or Silver, or OCNS Group E or D with no substitution or product warnings.

7.2.1.5 Decision

Once the further assessment/ALARP justification has been completed, the relevant environment adviser must concur that the environmental risk as a result of chemical use is ALARP and acceptable.

7.2.2 Woodside invasive marine species risk assessment process

7.2.2.1 Objective and scope

To minimise the risk of introducing IMS because of the Petroleum Activity, all applicable project vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below).

The objective of the process is to identify the level of threat a contracted project vessel, or immersible equipment, poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The IMS risk assessment process does not apply to:

- vessels or immersible equipment that do not plan to enter the IMS Management Area[67]
- 'new build' vessels or immersible equipment launched less than 14 days before mobilisation
- locally sourced vessels or immersible equipment from within the Western Locally Sourced Zone[68]. Vessels, or immersible equipment are defined as locally sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock, or application of antifouling coating (AFC).

7.2.2.2 Risk assessment process

Woodside's IMS risk assessment process was developed by considering the national biofouling management guidelines for the petroleum production and exploration industry, and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (IMO 2023).

To effectively evaluate the potential for project vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each project vessel, or immersible equipment planned to undertake activities within an IMS Management Area or Operational Area. The risk assessment process considers a range of factors, as listed in Table 7-2 and Table 7-3.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. Woodside implements a quality assurance and control process for all IMS risk assessments it conducts, where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the process.

[67] The IMS Management Area is defined as all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 NM from land ('Territorial Seas', and including Australian territorial islands). The IMS Management Area also includes: (i) all waters that are shallower than the 50 m depth contour outside of the 12 NM boundary, thereby encompassing submerged reefs and atolls, and (ii) Operational Areas defined in environmental approvals. The IMS Management Area is based on current maritime boundary definitions, legal frameworks and requirements, IMS risk interpretations, and existing management arrangements applied by Commonwealth and State/Territory regulatory agencies.

[68] The Western Locally Sourced Zone spans an area that includes the entire WA coastline out to the Exclusive Economic Zone limit at 200 NM, but it excludes any government-declared Quarantine Areas.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-2: Key factors considered as a part of the risk assessment process for project vessels

Factors	Details
Vessel type	The risk of IMS infection depends on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g. dredges) compared to simple vessels (e.g. crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, risk ratings depend on whether out-of-water or in-water inspections by qualified IMS inspectors and cleaning (if required) have been undertaken before the contract begins. If an IMS inspection (and clean if required) has not been undertaken in the past six months (from the time the contract begins), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out then mobilised as deck cargo or by road, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e. proportion of time spent stationary or below 3 knots), and its main operational region (i.e. tropical, subtropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable, the risk factor applied reduces with age since application.
Internal treatment systems	A risk reduction factor is applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.
Vessel origin and proposed area of operation	Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the climatic region of the proposed area of operation. The highest risk rating is applied to similar climatic regions.
Number of stationary/slow speed periods exceeding seven days	A risk factor is calculated based on the number of seven-day periods the vessel has been stationary or operated at low speed (<3 knots) in port or coastal waters, which is any waters <50 m deep outside 12 NM from land or any waters within 12 NM of land. The greater the number of periods, the higher the risk factor applied.
Region of stationary or slow periods	A further multiplier is applied depending on the location of the stationary and slow speed periods. The highest risk rating is applied if these periods occurred within ports or coastal waters of the same climatic region.
Type of activity – contact with seafloor	The potential for introducing IMS varies based on the planned vessel activity. Those activities that touch sediments, and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs), are considered to have a greater risk of infection.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-3: Key factors considered as a part of the risk assessment process for immersible equipment

Factors	Details
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep or within 12 NM of land) are given the highest risk rating.
Duration of deployment	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.
Duration of time out of water since last deployment	A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.
Transport conditions during mobilisation	If the equipment is stored in damp conditions, a high risk factor is applied, but if equipment is stored in dry and well ventilated (low humidity) conditions, a low risk factor is applied.
Post-retrieval maintenance regime	A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and dissembled between project sites, while a higher risk rating is applied where no routine cleaning occurs.

After the risk assessment process is implemented, project vessels and immersible equipment are classified as one of three risk categories:

- low – low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk
- uncertain – risk of introducing IMS is not apparent so the precautionary approach is adopted, and additional management options may be required
- high – high risk of introducing IMS, which means additional management options are required before this vessel mobilises to the Operational Area.

After allocating a ‘low’ risk rating for a project vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed before mobilisation. For project vessels or equipment classified as posing an ‘uncertain’ or ‘high’ theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a low risk status. These management options have been developed with the intention of reducing IMS risk to levels that are ALARP. It is a flexible approach that allows a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include:

- having a suitably qualified and experienced IMS inspector inspect (desktop, in-water or dry dock) to verify risk status; where practicable, the inspection shall occur within seven days (but not more than 14 days) before final departure to the Operational Area
- applying in-water or dry-dock cleaning of the hull and other niche areas, typically applied where the risk is ‘high’ and driven by the age of the AFC on the project vessel and its time spent in similar climatic region ports
- limiting the duration the vessel spends within the IMS Management Area to a maximum of 48 hours (cumulative entries); applicable for ‘uncertain’ risk project vessels only
- rejecting the vessel.

In some circumstances, such as emergency scenarios or in the presence of serious logistic constraints or other factors outside of Woodside’s control, it may not be possible to effectively apply any of the IMS management measures available and described above. In the absence of regulatory conditions, commitments, or other legislative obligations that prescribe management measures for IMS, a risk-assessed alternative process is available that must be approved by the relevant Business Vice President and HSE Vice President.

Before they enter the Operational Area, project vessels and immersible equipment are required to be a low risk of introducing IMS.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.3 Offshore Seabird Management Plan

Project vessels will implement Woodside's Offshore Seabird Management Plan, which aligns with recommendations in the National Light Pollution Guidelines for Wildlife (DCCEEW 2023). When implemented, the SBMP addresses seabird interaction reporting and management for offshore and inshore activities within the NWMR, specifically where the activity is located within a nocturnal seabird species BIA.

The SBMP is used to manage interactions with seabirds offshore to ensure any impacts and risks are reduced to ALARP and an acceptable level. The plan also provides frontline workers with guidance to manage seabird interactions and related potential impacts identified as caused by Woodside's activities.

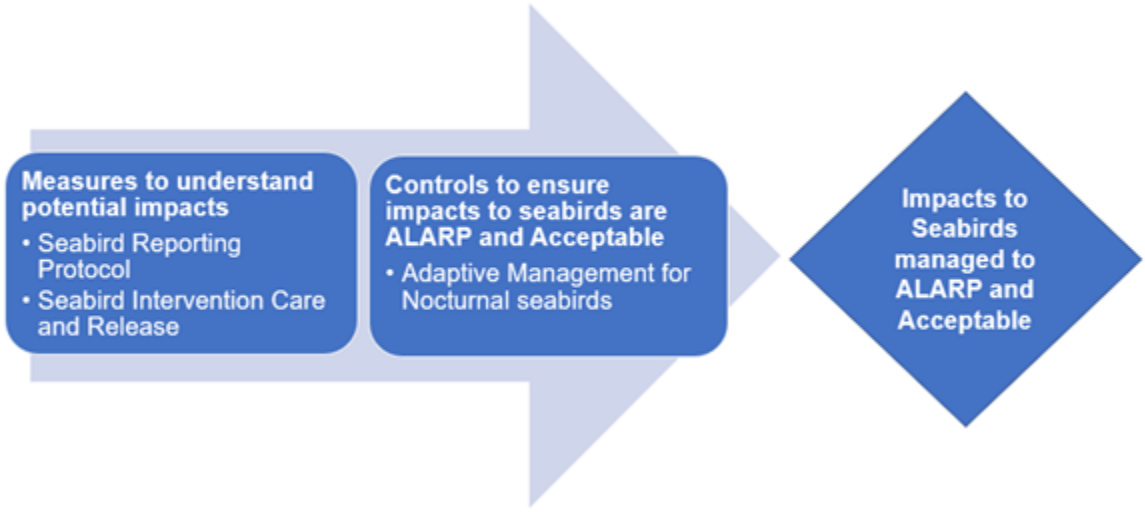

Figure 7-2: Schematic for Offshore Seabird Management Plan to manage seabird impacts to acceptable and as low as reasonably practicable levels

Woodside has established the SBMP adaptive management framework to manage the uncertainty of potential impacts of artificial night at light on nocturnal seabirds. It is applied when a project is within a nocturnal seabird BIA and more than 20 km from a known rookery. Where interactions with nocturnal seabirds are identified, adaptive management controls under the SBMP may be triggered in a tiered approach.

This may include an initial assessment of:

- seabird species' important habitat proximity, life cycle seasonality, and periods of heightened sensitivity such as fledgling exodus
- overlap of seabird interactions and inclement weather (for example, post-cyclonic metocean conditions are known to increase seabird groundings)

and the possible controls and mitigation actions, for example:

- extinguish outdoor/deck lights not necessary for but allowing safe operations and navigation at night.

The SBMP will be available aboard the project vessels during the Petroleum Activity. Vessel crew will be made aware of the SBMP through the environment induction. This induction will include the requirement to report seabird sightings to the offshore HSE advisers on the seismic survey vessel and the onshore Woodside Environment Adviser. The SBMP will be implemented by frontline personnel with support from Woodside activity-focused Environmental Advisers, the Science Team and a dedicated seabird subject matter expert.

7.2.4 Unexpected finds procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as 'any trace of human existence that has a cultural, historical or archaeological character and is located under water'); the following Unexpected Finds Procedure will apply:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside's Principal Heritage Adviser.
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
- No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside's Principal Heritage Adviser.
- Woodside's Principal Heritage Adviser must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
- If the potential Underwater Cultural Heritage appears to be Aboriginal underwater cultural heritage, Woodside's Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
- If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the *Underwater Cultural Heritage Act 2018* (UCH Act), Woodside's Principal Heritage Advisor must notify the Minister responsible for the UCH Act, the Department of Climate Change, Energy, Environment and Water (DCCEEW) underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.
- If the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
- the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
- the Office of the Federal Environment Minister in accordance with Section 20 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*.
- Work must not recommence in the vicinity of the potential heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

7.3 Roles and responsibilities

Key roles and responsibilities for Woodside and contractor personnel relating to implementing, managing and reviewing this EP are described in Table 7-4. Roles and responsibilities for oil spill preparation and response are outlined in the Oil Pollution First Strike Plan (Appendix H) and the Woodside Incident Management Handbook.

All Woodside employees and contractors are responsible for implementing the Environment and Biodiversity Policy (refer to Appendix A) in their areas of responsibility and must be suitably trained and competent in their respective roles.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-4: Roles and responsibilities

Title (role)	Environmental Responsibilities
All Personnel	
All offshore-based personnel and onshore support personnel	Understand the Woodside standards and procedures that apply to their area of work. Understand the environmental risks and control measures that apply to their area of work. Carry out assigned activities in accordance with approved procedures and the EP. Follow instructions from relevant supervisor with respect to environmental protection. Cease operations which are deemed to present an unacceptable risk to the environment. Participate in environmental assurance activities and inspections as required. Prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation. Attend HSE meetings, training and drills when required.
Office-based Personnel	
Woodside Project Manager	Monitor and manage the activity so it is undertaken as per the relevant standards and commitments in this EP. Notify the Woodside Environment Adviser of any scope changes in a timely manner. Liaise with regulatory authorities as required. Review this EP as necessary and manage change requests. Ensure all project and support vessel crew members complete an HSE induction. Verify that contractors meet environmental related contractual obligations. Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside's Health, Safety and Environment Reporting and Investigation Procedure. Monitor and close out corrective actions identified during environmental monitoring or audits.
Woodside Head of Projects/Region (Global Wells and Seismic)	Ensure drilling operations are undertaken as per this EP and approval conditions. Provide sufficient resources to implement the drilling-related management measures (i.e. controls, EPOs, PSs and MC) in this EP. Ensure MODU and project vessel personnel are given an Environmental Induction as per Section 7.4 of this EP at the start of the drilling programs. Confirms controls and performance standards in this EP are actioned, as required, before drilling commences. Ensures the MODU start-up meets the requirements of the Drilling and Managing Rig Operations Process.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
Subsea Delivery Lead	Ensure the subsea installation activities are undertaken as per this EP and approval conditions. Provide sufficient resources to implement the subsea installation-related management measures (i.e. controls, EPOs, PSs and MC) in this EP. Ensure installation vessel personnel are given an Environmental Induction as per Section 7.4 this EP at the start of the installation activities. Confirm controls and performance standards in this EP are actioned, as required, before installation activities commence. Ensure relevant vessels meet the requirements of Woodside's Marine Operations Operating Standard. Manage change requests for the activity and notify the Woodside Environment Adviser of any scope changes in a timely manner. Ensure all chemicals proposed to be discharged are assessed and approved as per the requirements of the EP.
Woodside Drilling Superintendent	Ensure the drilling program meets the requirements detailed in this EP. Ensure changes to the drilling program are communicated to the Woodside Environmental Adviser. Ensure the Woodside's Well Site Manager is provided with the resources required to ensure the management measures (i.e. controls, EPOs, EPs and MC) in this EP are undertaken. Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside's Health, Safety and Environment Reporting and Investigation Procedure. Monitor and close out corrective actions identified during environmental monitoring or audits.
Woodside Drilling Engineers	Ensure changes to the drilling program are communicated to the Woodside Environmental Adviser. Ensure all drill and completions fluid chemical components and other fluids that may be used downhole have been reviewed by the Global Wells and Seismic Environmental Adviser.
Woodside Environmental Adviser	Verify relevant Environmental Approvals for the activities exist prior to commencing activity. Track compliance with performance outcomes and performance standards as per the requirements of this EP. Prepare environmental component of relevant Induction Package. Assist with the review, investigation and reporting of environmental incidents. Ensure environmental monitoring and inspections/audits are undertaken as per the requirements of this EP. Liaise with relevant regulatory authorities as required. Assist in preparation of external regulatory reports required, in line with environmental approval requirements and Woodside incident reporting procedures. Monitor and close out corrective actions (Campaign Action Register (CAR)) identified during environmental monitoring or audits. Provide advice to relevant Woodside personnel and contractors to assist them to understand their environment responsibilities. Liaise with primary installation contractors to ensure communication and understanding of environment requirements as outlined in this EP and in line with Woodside's Compass values and management systems.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
Woodside Corporate Affairs Adviser	Prepare and implement the Consultation Plan for the Petroleum Activity. Report on consultation. Ongoing liaison and notification as required as per Section 7.10
Woodside Marine Assurance Superintendent	Conducts relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements to meet safety, navigation and emergency response requirements.
Woodside CIMT Duty Manager	On receiving notification of an incident, the Woodside CIMT Duty Manager shall: • establish and take control of the IMT and establish an appropriate command structure for the incident • assess situation, identify risks and actions to minimise the risk • communicate impact, risk and progress to the Crisis Management Team and stakeholders • develop the incident action plan (IAP) including setting objectives for action • approve, implement and Manage the IAP • communicate within and beyond the incident management structure • manage and review safety of responders • address the broader public safety considerations • conclude and review activities.
MODU-based Personnel	
MODU Offshore Installation Manager (OIM)	Ensure the MODU's management system and procedures are implemented. Ensure personnel starting work on the MODU receive an environmental induction that meets the requirements specified in this EP. Ensure personnel are competent to undertake the work they have been assigned. Verify that emergency drills are conducted as per the MODU's schedule. Ensure the MODU's Emergency Response Team has been given sufficient training to implement the MODU's SOPEP. Ensure any environmental incidents or breaches of outcomes or standards are reported immediately to the Well Site Manager. Ensure corrective actions for incidents or breaches are developed, communicated to the Well Site Manager, and tracked to close out in a timely manner. Close out of actions is communicated to the Well Site Manager.
Woodside Offshore HSE Adviser	Ensure periodic environmental inspections/reviews are completed. Corrective actions from inspections are developed, tracked and closed out in a timely manner.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
	Support the Well Site Manager to ensure the controls detailed in this EP relevant to offshore activities are implemented on the MODU and help collect and record evidence of implementation (other controls are implemented, and evidence collected onshore). Support the Well Site Manager to ensure the Environmental Performance Outcomes are met and the performance standards detailed in this EP are implemented on the MODU. Confirm actions in the Well Delivery HSE Improvement Plan are undertaken. Support the Well Site Manager to ensure environmental incidents or breaches of outcomes or standards outlined in this EP are reported, and corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. Ensure periodic environmental inspections/reviews are completed and corrective actions from inspections are developed, tracked and closed out in a timely manner. Review Contractors procedures, input into Toolbox talks and JSAs. Provide day to day environmental support for activities in consultation with the Woodside Environment Adviser.
Drilling Logistics Coordinator	Waste is managed on the MODU and sent to shore as per the Global Wells and Seismic Waste Management Plan.
Vessel-based Personnel	
Installation Vessel Master Activity Support Vessel Master	Ensure the vessel management system and procedures are implemented. Ensure personnel commencing work on the vessel receive an environmental induction that meets the relevant requirements specified in this EP. Ensure personnel are competent to undertake the work they have been assigned. Verify SOPEP drills are conducted as per the vessel's schedule. Ensure the vessel Emergency Response Team (ERT) has been given sufficient training to implement the SOPEP. Ensure any environmental incidents or breaches of relevant Environmental Performance Outcomes or performance standards detailed in this EP are reported immediately to the Woodside Representative. Ensure corrective actions for incidents or breaches are developed, communicated to the Woodside Representative, and tracked to close out in a timely manner. Close out of actions is communicated to the Woodside Representative.
Vessel Logistics Coordinators	Ensure waste is managed on the relevant support vessels or installation vessel and sent to shore as per the relevant Waste Management Plan.
Vessel HSE Advisers	Refer to Woodside HSE Offshore Adviser responsibilities detailed above under MODU-based personnel.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental Responsibilities
Contractor Project Manager	Confirm that activities are undertaken in accordance with this EP, as detailed in the Woodside approved Contactor Environmental Management Plan Ensure personnel commencing work on the project receive a relevant environmental induction that meets the requirements specified in this EP. Ensure personnel are competent to undertake the work they have been assigned. Ensure any environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported immediately to the Woodside Responsible Engineer or Vessel Master.
Woodside Site Representative/ Resident Engineer	Ensure activities are undertaken as detailed in this EP. Ensure the management measures made in this EP are implemented on the vessel. Ensure environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported as per the Woodside Corporate Event Notification Matrix. Verify HSE improvement actions identified during the project are implemented where practicable Ensure periodic environmental inspections are completed.
Woodside Well Site Manager	Ensure the drilling program is undertaken as detailed in this EP. Ensure the management measures (i.e. controls, EPOs, PSs and MC) detailed in this EP (relevant to offshore activities) are implemented on the MODU (other controls will be implemented onshore). Ensure environmental incidents or breaches of outcomes or standards are reported as per the Woodside Corporate Event Notification Matrix. Corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. Ensure actions in the Well Delivery HSE Improvement Plan are undertaken.

It is the responsibility of all Woodside employees and contractors to implement the Woodside's Corporate Environment and Biodiversity Policy (Appendix A) in their areas of responsibility and that the personnel are suitably trained and competent in their respective roles.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.4 Training and competency

7.4.1 Overview

Woodside as part of its contracting process assesses a proposed contractor's environmental management systems to determine the level of compliance with the standard AS/NZ ISO 14001. This assessment is performed for the Petroleum Activity as part of the pre-mobilisation process. The assessment determines whether there is a clearly defined organisational structure that sets out the roles and responsibilities for key positions. The assessment also assesses whether there is an up-to-date training matrix that defines any corporate and site/activity-specific environmental training and competency requirements.

As a minimum, environmental awareness training is required for all personnel, detailing awareness and compliance with the contractor's environmental policy and EMS.

7.4.2 Inductions

Inductions are provided to all relevant personnel (e.g. contractors and Company representatives) before mobilising to or on arrival at the activity location. The induction covers the HSE requirements and environmental information specific to the activity location. Attendance records will be maintained.

The induction may include, but is not limited to:

- description of the activity
- ecological and socio-economic values of the activity location
- regulations relevant to the activity
- Woodside's Environmental Management System – Health Safety and Environment Policy
- EP importance/structure/implementation/roles and responsibilities
- main environmental aspects/hazards and potential environmental impacts and related EPOs
- oil spill preparedness and response
- monitoring and reporting on EPOs and standards using measurement criteria
- incident reporting
- Unexpected Finds Procedure and reporting requirements (Section 7.2.1).

7.4.3 Petroleum Activity-specific environmental awareness

Before commencing the subsea campaigns associated with the Petroleum Activity, a pre-activity meeting will be held with all relevant personnel. The pre-activity meeting provides an opportunity to reiterate specific environmental sensitivities or commitments associated with the activity. Relevant sections of the pre-activity meeting will also be communicated to the support vessel personnel. Attendance lists are recorded and retained.

During operations, regular HSE meetings will be held. During these meetings, recent environmental incidents are reviewed and awareness material presented.

7.5 Monitoring, auditing, and managing non-conformance and review

7.5.1 Monitoring

Regulation 22(5) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the Petroleum Activity against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

A key tool that is used throughout the implementation of the EP is Woodside's environmental compliance and action register (ECAR). This is an internal tool that is developed at EP acceptance and is maintained until the EP is closed. The ECAR contains all the commitments, controls, performance standards and measurement criteria from the EP and tracks compliance against each of these items. Before a project vessel is mobilised, Woodside confirms the compliance systems in place on the vessel and identifies, and records in the ECAR, the specific records that will be provided by the vessel contractor during the offshore campaign. This provides Woodside with the opportunity to confirm the records provided during the activity are sufficient for demonstrating compliance against the EP. It also serves as a central depository for compliance information relevant to each activity under the Petroleum Activity.

7.5.1.1 Offshore Seabird Management Plan

Vessels will implement Woodside's Frontline Offshore Seabird Management Plan (SBMP), which aligns with recommendations in the National Light Pollution Guidelines for Wildlife (Commonwealth of Australia, 2023). When implemented, the SBMP addresses seabird interaction reporting and management for offshore/inshore activities within the Operational Area, specifically where the activity is located within a nocturnal seabird species BIA.

The purpose of the SBMP is to manage interactions with seabirds offshore to ensure any impacts and risks are reduced to ALARP and an acceptable level. The plan also provides frontline workers with guidance to manage seabird interactions and potential impacts resulting from these interactions identified as occurring as a result of Woodside's activities, as demonstrated in Figure 7-3.

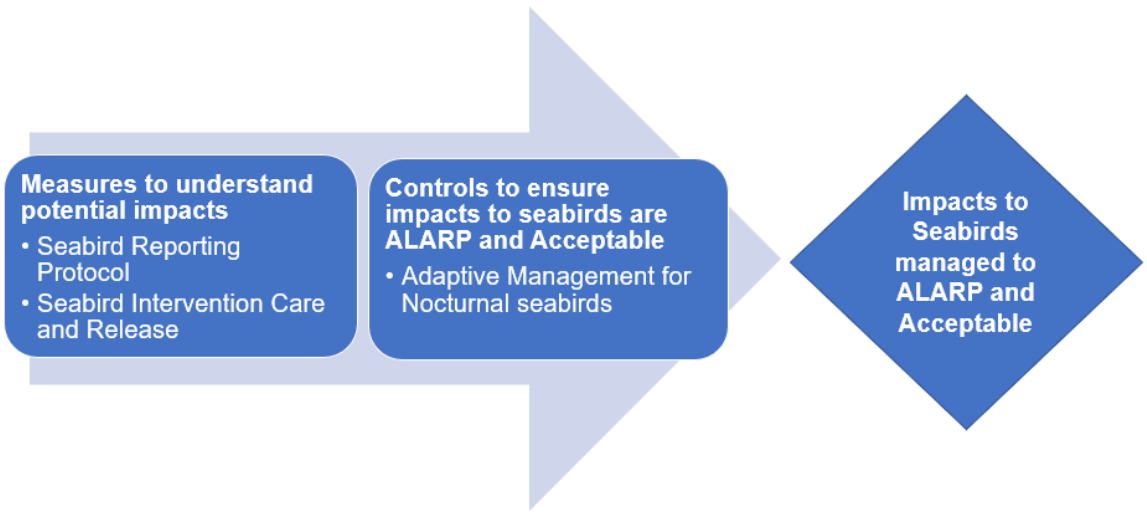

Figure 7-3: Schematic for SBMP to manage seabird impacts to ALARP and acceptable

The SBMP adaptive management framework has been established to manage the uncertainty of the potential impacts of artificial night at light on nocturnal seabirds and is applied when a Petroleum Activity is within a nocturnal seabird BIA and greater than 20 km from a known rookery. Where interactions[69] with nocturnal seabirds are identified, adaptive management controls under the SBMP may be triggered in a tiered approach.

This may include an initial assessment of:

- Seabird species important habitat proximity, life cycle seasonality and periods of heightened sensitivity such as fledgling exodus;
- Overlap of seabird interactions and inclement weather (for example, post-cyclonic metocean conditions are known to increase seabird groundings);

And the possible consideration of controls and mitigation actions, for example:

[69] *Interaction is defined as a death, injury, entanglement or impact to seabird; or a grounding of a nocturnal seabird.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Extinguish outdoor/deck lights not necessary for safety and navigation at night,
- Use of block-out-blinds on portholes and windows not necessary for safety and/or navigation.

7.5.1.2 Cetacean Adaptive Management

Acoustic emissions were identified as a potential impact to cetaceans and therefore adaptive management will be implemented to achieve the EPO 5 and manage impacts to an ALARP and acceptable level. The objective of the primary installation vessel and MODU adaptive management is to achieve EPO-3b, specifically the *Conservation Management Plan for the Blue Whale, Management Action A.2.3*: *Anthropogenic noise in BIAs will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area.* A risk-based approach to management actions will be applied so greatest risk reduction is implemented during migration season/BIA and then controls cascade commensurate with the level of risk (i.e. peak migration, distribution area etc.).

Evidence demonstrates that PBW on their north-bound migration are generally found within the pygmy blue whale migration BIA while there is more uncertainty on the southbound migration. Noting that modelling has indicated the effect zones (120 db) did not extend into either the pygmy blue whale migration biologically important area (BIA) or the humpback whale migration BIA. The following adaptive management will be implemented during daylight hours:

- Peak south-bound migration, *activity occurs within 50 km of the migration BIA*: trained crew as marine fauna observers monitor for pygmy blue whales for 30 minutes prior to resupply vessel moving alongside MODU or PIV, proceed with move only when no pygmy blue whales or large unidentified whales have been sighted, to the limits of visibility, over the 30-minute monitoring period.

7.5.2 Auditing

Environmental performance auditing will be performed to:

- identify potential new, or changes to existing environmental impacts and risk, and methods for reducing those to ALARP
- confirm that mitigation measures detailed in this EP are effectively reducing environmental impacts and risk, that mitigation measures proposed are practicable and provide appropriate information to verify compliance
- confirm compliance with the Performance Outcomes, Controls and Standards detailed in this EP.
- Internal auditing will be performed to cover each key project activity as summarised below.

7.5.2.1 MODU activities

Internal auditing is performed on a MODU specific schedule, rather than a schedule to align with the Petroleum Activity. This enables continuous review and improvement of environmental performance over the term of the vessel's contract. The following internal audits, inspections and reviews will be performed to review the environmental performance of the activities:

- Survey environment rig equipment for a newly contracted MODU (if not previously contracted to Woodside within the last 2 years). An environment rig equipment survey scope typically includes functional and technical requirements for mud and solids control systems, environmental discharge control (including drainage management), and loss of containment management.
  - Complete a minimum of monthly environmental inspection (conducted by offshore Woodside personnel or a delegate) which may include verifying:
  - bunkering/transfers between support vessels and MODU /project vessels
  - environment containment including chemical storage, spill response equipment and housekeeping
  - general MODU environment risks including waste management, drilling fluids oil/water separation, and inspection of subsea and moonpool areas.
- Perform environment audits during the Petroleum Activity, while the MODU is on location (by a Woodside Environment Adviser or delegate), which may include, but is not limited to:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- operational compliance audits relevant to environmental risk of activities which may include compliance with training commitments, discharge requirements, bunkering activities, verification of use of approved chemicals, and satisfactory close out of items from previous audits
- inspection of selected risk areas/activities (which may include shaker house, drill floor and mud management while commencing riser drilling or reservoir interception) during routine visits throughout the drilling campaign, determined by risk, previous incidents or operation specification requirements.
- audit findings relevant to continuous improvement of environmental performance will be tracked through the MODU or vessel compliance action register, a contractor register between the MODU operator or vessel contractor and Woodside.

7.5.2.2 Subsea scope activities

The following internal auditing will be performed for the subsea scope activities:

- Pre-mobilisation inspection/audit report will be conducted by a relevant person (before commencing). The scope of the audits are risk-based and specific to the relevant activity, but will generally focus on aspects relating to ensuring appropriate understanding of environmental commitments and the operational readiness of the activity scope, including appropriate environmental controls in place. The primary installation vessel will be audited by Woodside. Support or transport vessels will be assessed on a risk-based approach, but will be audited via the primary subsea installation contractor's process.
- At least one operational compliance audit relevant to applicable EP commitments will be conducted by a Woodside Environment Adviser for the subsea campaign. The audit may be conducted offshore or office-based, subject to the duration of the activity and logistics of performing the audit offshore for short duration scopes.
- Contractor-specific HSE audits will also be conducted of the associated support vessels. The audits will consider the implementation of HSE management, risk management, as well as pre-mobilisation and offshore readiness.
- Vessel-based HSE inspections will be conducted fortnightly by vessel HSE personnel. Each inspection will focus on a specific risk area relevant to the project activity and a formal report will be issued (e.g. bunkering controls, chemical and discharge management, cetacean reporting).

The internal audits and reviews, combined with the ongoing monitoring described in this EP, and collection of evidence for MC are used to assess EPOs and standards.

As part of Woodside's Environmental Management System (EMS) and/or assurances processes, activities may also be periodically selected for environmental audits as per Woodside's internal auditing process. Audit, inspection and review findings relevant to continuous improvement of environmental performance are tracked through the ECAR.

Non-conformances identified will be reported and/or tracked in accordance with this EP.

7.5.2.3 Marine assurance

Woodside's marine assurance is managed by the Marine Assurance Team of the Logistics Function in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

The process is mandatory for all vessels (other than tankers and floating production storage and offloading vessels) hired for Woodside operations, including for short-term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust safety management system.

The process is multi-faceted and encompasses the following marine assurance activities:

- offshore vessel management system assessment (OVMSA)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- dynamic positioning (DP) system verification
- vessel inspections
- offshore vessel inspection database (OVID) or condition and suitability assessment
- project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- Oil Companies International Marine Forum OVID Inspection
- International Marine Contractors Association Common Marine Inspection Document Inspection
- Marine Warranty Survey.

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

If a vessel inspection and/or OVMSA verification review is not available and all reasonable efforts based on time and resource availability have been made to complete this (e.g. short-term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternative means of inspection, known as a risk assessment.

7.5.2.4 Vessel risk assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short-term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

- Management control factors:
  - Company audit score (i.e. management system)
  - vessel HSE incidents
  - vessel Port State Control deficiencies
  - instances of Port State Control vessel detainment
  - years since previous satisfactory vessel inspection
  - age of vessel
  - contractors' prior experience operating for Woodside.
- Activity risk factors:
  - people health and safety risks (a function of the nature of the work and the area of operation)
  - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
- reputation risk
- exposure (i.e. exposure to risk based on duration of project)
- industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

7.5.3 Management of non-conformance

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per Woodside's HSE Event Reporting and Investigations Work Instruction which includes learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent recurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a consequence matrix for classification of environmental incidents, with the significant categories being A, B and C. Detailed investigations are completed for all categories A, B, C and high potential environmental incidents.

7.5.4 Review

7.5.4.1 Management review

Within the relevant Environment teams, regular reviews of the effectiveness of the EP Implementation Strategy are undertaken at a frequency commensurate with activity duration and risk. This review may consider:

- Well Delivery key performance indicators (KPIs)
- Effectiveness of tools and systems to monitor environmental performance
- Lessons learned from implementation during previous campaigns or activities
- Reviews of oil spill arrangements and testing performed in accordance with this EP.

Within each Asset, Project team or Business Unit, managers review environmental performance regularly, usually though incident and event reporting and monthly HSE reports. The outcome of such reviews will inform whether further action is required to address key or recurring environmental performance matters.

7.5.4.2 Learning and knowledge sharing

Learning and knowledge sharing occurs via several different methods including:

- event investigations
- event bulletins
- after action review conducted at the end of each well, including review of environmental incidents as relevant
- ongoing communication with MODU operators
- formal and informal industry benchmarking
- cross-asset learnings
- engineering and technical authorities discipline communications and sharing.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.5.4.3 Review of impacts, risks and controls across the life of the EP

In the unlikely case that activities described in this EP do not occur continuously or sequentially, before recommencing activities after a cessation period greater than 12 months, impacts, risks and controls will be reviewed.

The process will identify or review impacts and risks associated with the newly commencing activity and will identify or review controls to ensure impacts and risks remain/are reduced to ALARP and acceptable levels. Information learned from previous activities conducted under this EP will be considered. Controls which have previously been excluded on the basis of proportionality will be reconsidered. Any required changes will be managed by the MOC process outlined below.

7.6 Management of knowledge

Review of knowledge relevant to the existing environment is undertaken to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). New knowledge checks take place both routinely primarily via quarterly and annual knowledge reviews and ad hoc (as information is obtained), and encompasses the following topics:

- Environmental science – update checks conducted via desktop reviews: scientific literature, government publications and Woodside supported publications and studies relating to existing environment topics (including but not limited to species and habitats) as well as EPBC Act Matters of National Environmental Significance (Part 3) and Part 13 statutory instruments.
- Socio-economic environment and stakeholder information – update checks conducted via desktop reviews: scientific literature, government publications and Woodside consultation; and,
- Environmental legislation – monitoring of emerging regulatory changes and the subsequent management of regulatory change (as outlined in the Regulatory Compliance Our Expectations).

A management of knowledge tracker is maintained to record reviews and updates. Communication of relevant new knowledge is addressed at the EP Consolidation meetings where changes in knowledge prompt a consideration of MOC, this is actioned and documented appropriately.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of MOC are documented in the WMS EP Guideline.

Any relevant new information on cultural values and heritage will be assessed using the EP Management of Change Process.

Under the Oil Spill Operational and Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

7.7 Management of Newly Identified Impacts and Risks

New sources of receptor based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the Change Management Process.

7.8 Management of change and revision

7.8.1 EP management of change

Management of changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description described in this EP including: review of advances in technology at stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, EPBC Act listed threatened and migratory species status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

requirements for AMPs; and potential new advice from external stakeholders, will be managed in accordance with Regulation 39 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology detailed in this EP to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 39 of the Environment Regulations.

Minor changes where a review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a formal revision under Regulation 39 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental risks and impacts is not required (e.g. document references, phone numbers, etc.), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

7.8.2 OPEP management of change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 38 & 39 to determine if EP, including OPEP, resubmission is required. Changes with potential to influence minor or technical changes to the OPEP are tracked in MOC records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

7.9 Record keeping

Compliance records (outlined in MC in Section 6) will be maintained.

Compliance records referenced in the measurement criteria contained within this EP will be maintained. Many of the measurement criteria listed in this EP refers to 'records', in this context Woodside considers 'records' to mean any hard or soft copy of information such as data, observations, certifications or photographs that can show a point in time and can be duplicated such that they can be stored in compliance systems and/or provided to internal and external auditors (i.e. NOPSEMA) on request.

Record keeping will be in accordance with Regulation 22(6) that addresses maintaining records of emissions and discharges.

7.10 Ongoing consultation

Although consultation for the purpose of Regulation 25 is complete, in accordance with Regulation 22(9) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside proposes to undertake the engagements with relevant interested persons throughout the life of the EP. Recent new information identified during ongoing consultation will be assessed as appropriate using the EP Management of Knowledge system and Management of Change Process.

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who are present at those meetings are from community and industry and include Woodside, State Government (for instance relevant

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations.

Relevant persons and those who are simply interested in the activities, can otherwise remain up-to-date on this activity through subscribing to the Woodside website, or by reading the publicly available version of the EP on NOPSEMA's website, where available.

Should consultation feedback be received following EP acceptance that identifies relevant new information or a measure or control that requires implementation or update to meet the intended outcome of consultation, Woodside will apply its EP Management of Knowledge process and Management of Change Process as appropriate.

Woodside supports ongoing engagement with Traditional Custodians, which complies with Woodside policies, strategies and procedures and is directly informed by feedback from Traditional Custodians.

It provides a mechanism for ongoing dialogue so Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the Petroleum Activity and in relation to caring for and managing Country, including Sea Country. The approach will be tailored to each Traditional Custodian group and may include, as agreed with relevant Traditional Custodians:

- social investment to support Indigenous ranger programs
- support for Indigenous oil spill response capabilities
- support for recording Sea Country values
- support to Traditional Custodian groups to build capabilities and capacity with respect to ability to engage with Woodside and the broader oil and gas industry on activities
- development of ongoing relationships with Traditional Custodian groups
- any other initiatives proposed for protecting Country, including cultural values.

At the time of EP submission, activities as part of ongoing consultation regarding the Petroleum Activity are planned with Traditional Custodians. Where Traditional Custodian relevant persons have requested information or further engagement considered as ongoing consultation, but have not requested a framework agreement, these requests have been captured in Table 7-5. However, a framework agreement may still be initiated by these groups at any time.

Table 7-5: Ongoing consultation engagements

Report/information	Recipient	Purpose	Frequency	Content
Notification (email)	AHO	As requested by AMSA and AHO during consultation.	No less than 4 weeks prior to commencement	PS 1.5 (Section 6.7.1). Date of activity start and end.
Updates (email)			As required.	Changes to planned activities.
Notification (email)	AMSA	As requested by AMSA during consultation.	At least 24-48 hours before operations commence.	PS 1.7 (Section 6.7.1). Date of activity start.
Updates (email)			Provide updates to the AHO and ARC should there be changes to the activity.	Changes to planned activities.
Notification (email)	DoD	Standard practice (overlap with Defence Area).	No less than five weeks before the scheduled activity commencement date.	PS 1.10 (Section 6.7.1). Date of activity start.
Notification (email)	DMPE	Good practice.	At least 10 days prior to commencement and following the completion of activities.	Activity start and end date.
Notification (email)	NOPSEMA	Standard practice per regulation	At least 10 days prior to commencement and	As per Regulation 54

Notification (email)	Australasian Underwater Cultural Heritage Database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.2.1)	Report any unexpected finds of potential Underwater Cultural Heritage	If triggered by unexpected Finds Procedure	Details of the potential Underwater Cultural Heritage shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the *Underwater Cultural Heritage Act 2018* (Cth) (UCH Act),
Notification (email)	All relevant persons for the proposed activity.	Notification of significant change.	As appropriate.	Notification of significant change. Any relevant new information will be assessed using the EP Knowledge Management System (refer to Section 7.6) and Management of Change Process (refer to Section 7.8).
Emails/meetings	Persons or organisations who provide feedback to Woodside post EP submission.	Identification, assessment and consideration of feedback, claims and/or objections.	As appropriate.	Assessment of claims and/or objections. Relevant new information will be assessed be assessed using the EP Management of Knowledge (refer to Section 7.6) and Management of Change Process (refer to Section 7.8)

7.11 Reporting

To meet the EPOs and EPSs outlined in this EP, Woodside reports at a number of levels, as outlined in the next sections.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.11.1 Routine reporting (internal)

7.11.1.1 Regular health, safety and environment meetings

The project support vessel will hold regular HSE meetings which cover all crews. During these meetings, environmental incidents will be reviewed, and awareness material presented. All personnel are required to attend the HSE meetings and attendances sheets are retained by the project vessel contractor. Daily meetings held onboard the project support vessel will also serve to reinforce environmental awareness during the Petroleum Activity.

Dedicated HSE meetings will also be held with the offshore and Perth-based management to address targeted HSE incidents and initiatives.

7.11.1.2 Performance reporting

Monthly and quarterly performance reports are developed and reviewed by the Function and Business Unit Leadership Teams. These reports cover several subject matters, including:

- HSE incidents (including high potential incidents and those related to this EP) and recent activities
- corporate KPI targets, which include environmental metrics
- outstanding actions as a result of audits or incident investigations
- technical high and low lights.

7.11.2 Routine reporting (external)

7.11.2.1 Start and end notifications of the Petroleum Activity

In accordance with Regulation 54, Woodside will notify NOPSEMA of the start of the Petroleum Activity at least 10 days before the activity commences and will notify NOPSEMA within 10 days of completing the activity.

7.11.2.2 Environmental performance review and reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information about environmental performance to the appropriate regulator. Regulatory reporting requirements are summarised in Table 7-6.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-6: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Reports (Appendix E)	NOPSEMA	Monthly, by the 15th of each month	Details of recordable incidents that have occurred during the Petroleum Activity for previous month (if applicable)
Environmental Performance Report	NOPSEMA	Annually, with the first report submitted within 12 months of the commencement of the Petroleum Activity covered by this EP (as per the requirements of Regulation 22(7))	• Compliance with EPOs, controls and EPSs outlined in this EP, in accordance with the Environment Regulations • Decommissioning progress update

7.11.2.3 End of the Environmental Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activity has ended and all of the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 46 of the Environment Regulations.

7.11.3 Incident reporting (internal)

It is the responsibility of the Woodside Project Manager to ensure reporting of environmental incidents meets Woodside and regulatory reporting requirements as detailed in the Woodside HSE Event Reporting and Investigation Work Instruction and this section of this EP.

7.11.4 Incident reporting (external) – Reportable and recordable

7.11.4.1 Reportable incidents

Definition

A reportable incident is defined under Regulation 5 of the Environment Regulations as:

- ‘an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage’.

A reportable incident for the Petroleum Activity is:

- an incident that has caused environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table)
- an incident that has the potential to cause environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table).

The environmental risk assessment for the Petroleum Activity identifies those risks with a potential consequence level of C+ for environment. The incidents that have the potential to cause this level of impact include hydrocarbon loss of containment events to the marine environment resulting from a vessel fuel tank rupture.

Any such incidents represent potential events which would be reportable incidents. Incident reporting is performed with consideration of NOPSEMA (2014) guidance, stating ‘if in doubt, notify NOPSEMA’, and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the Environment Regulations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47, 48 and 49 of the Environment Regulations. Woodside will:

- report all reportable incidents to the regulator (orally) as soon as practicable, but within 2 hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator and the department of the responsible State Minister (DMPE) As soon as practicable after orally reporting the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0831 – Reportable Environmental Incident (Appendix E) which must be submitted to NOPSEMA as soon as possible (ASAP), but within 3 days of the incident or of its detection by Woodside
- provide a copy of the written report to the National Offshore Petroleum Titles Administrator and DMPE, within 7 days of the written report being provided to NOPSEMA.

Australian Maritime Safety Authority (AMSA) will be notified of oil spill incidents ASAP after their occurrence, and DCCEEW notified if MNES are to be affected by the oil spill incident.

7.11.4.2 Recordable incidents

Definition

A recordable incident as defined under Regulation 5 of the Environment Regulations is an incident arising from the activity that 'breaches an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident'.

Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50(4), no later than 15 days after the end of the calendar month using the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report (Appendix E), detailing:

- all recordable incidents that occurred during the calendar month
- all material facts and circumstances concerning the recordable incidents that the operator knows or is able, by reasonable search or enquiry, to find out
- any action taken to avoid or mitigate any adverse environment impacts of the recordable incidents
- the corrective action that has been taken, or is proposed to be taken, to prevent similar recordable incidents
- the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring.

7.11.4.3 Other external incident reporting requirements

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, Table 7-7 describes the incident reporting requirements that also apply in the Operational Areas.

The pollution activities that should also be reported to AMSA via RCC Australia by the Vessel Master are:

- any loss of plastic material
- garbage disposed of in the sea within 12 nm of land (garbage includes food, paper, bottles and such)
- any loss of hazardous materials.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

For oil spill incidents, other agencies and organisations will be notified as appropriate to the nature and scale of the incident as per procedures and contact lists in the Hydrocarbon Spill Australia Regulatory Framework[70] and the First Strike Plan (Appendix H).

External incident reporting requirements under the OPGGS (Safety) Regulations, including under Sub regulation 2.42, notices and reports of dangerous occurrences will be reported to NOPSEMA under the approved activity safety cases.

[70] *In accordance with Regulation 56 of the Environmental Regulations, references to the Woodside Hydrocarbon Spill Australia Regulatory Framework within this EP refer to Appendix K of the North West Shelf Phase 1 Plug and Abandonment and TPA03 Well Intervention Environment Plan, which is available on NOPSEMA's website using the following link: https://docs.nopsema.gov.au/A1282745*

7.12 Emergency preparedness and response

7.12.1 Overview

Under Regulation 22(8), the implementation strategy must contain an oil pollution emergency plan (OPEP) and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

Table 7-8 summarises how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements.

Table 7-8: Oil pollution preparedness and response overview

Content	Environment Regulations reference	Document/section reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21 (5), 21(6), 22 (2)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G)
Describes the oil pollution emergency plan	Regulation 22(8)	Woodside's oil pollution emergency plan has the following components: Hydrocarbon Spill Australia Regulatory Framework[70] Oil Pollution First Strike Plan (Appendix H) Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22(9)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G). Oil Pollution First Strike Plan (Appendix H).
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22(8), 22(12), 22(13), 22(14)	EP: Section 7.12.6 Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Demonstrates that the response arrangements in the oil pollution emergency plan are consistent with the national system for oil pollution preparedness and response	Regulation 22(16)	Hydrocarbon Spill Australia Regulatory Framework[70]

7.12.2 Emergency response training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response. Following the mapping of training to Woodside identified competencies, training was then mapped to positions based on their required competencies (Table 7-9).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-9: Emergency response training requirements

IMT position	Minimum competency
CIMT Incident Commander and Deputy Incident Commander	IMT Fundamentals (internal course) or equivalent Incident Command System 100/200 IMO3 or equivalent spill response specialist level with an oil spill response organisation Participation in Level 2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	IMT Fundamentals course or equivalent Incident Command System 100/200 Oil Spill theory Participation in Level 2 activation, exercise or skills maintenance
Environment Unit Lead	IMT Fundamentals course Incident Command System 100/200 IMO2 or equivalent spill response specialist level with an oil spill response organisation Participation in Level 2 activation, exercise or skills maintenance
Note on competency/equivalency	
In 2023 Woodside reviewed its incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the crisis and emergency management training and the oil spill response training requirements for IMT roles. The revised IMT Fundamentals training program aligns with the performance requirements of PMAOMIR320 – Manage Incident Response Information and PMAOM0R418 – Coordinate Incident Response. In 2023, Woodside decided to align its global incident command arrangements to the Incident Command System. As such, all rostered members of the IMT are trained up to Incident Command System 200. In addition to baseline incident management training, all rostered members of the IMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course, which involves completing two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training. Woodside Learning Services is responsible for collating and maintaining personnel training records. The Hydrocarbon Spills Preparedness Dashboard reflects the competencies required for each oil spill role (IMT/operational).	

7.12.3 Emergency response preparation

The Emergency Operations Centre, based in Woodside's head office in Perth, is the onshore coordination point for an offshore emergency, and the location for the CIMT during an incident. The Emergency Operations Centre is staffed by an appropriately skilled team available on call 24 hours a day. This team coordinates rescues, minimises damage to the environment and facilities, and liaises with external agencies. Woodside's incident command structure is included in the Oil Pollution First Strike Plan (Appendix H) and response arrangements are further detailed in the Hydrocarbon Spill Australia Regulatory Framework[70]. Roles and responsibilities for emergency response are detailed in Woodside's Incident Management Handbook. Woodside will have an Emergency Response Plan (ERP) in place relevant to the Petroleum Activity. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident.

In an emergency of any type:

- On the MODU the OIM will assume overall onsite command and act as the Incident Controller (IC). All persons aboard the MODU will be required to act under the IC's directions. The MODU/vessels will maintain communications with the onshore Drilling Superintendent and/or other emergency services in the event of an emergency. Emergency response support can be provided by the contractor's emergency centre or WCC if requested by the IC.
- Vessel Master (depending on the location of the emergency) will assume overall onsite command and act as the IC. All persons will be required to act under the IC's directions. The vessels will maintain communications with the onshore project manager and/or other emergency services in the event of an emergency. Emergency response support can be provided by the contractor's emergency centre or WCC if requested by the IC.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- The MODU and project vessels will have on-board equipment for responding to emergencies including medical equipment, fire-fighting equipment and oil spill response equipment.

7.12.4 Oil and other hazardous materials spill

A significant hydrocarbon spill during the Petroleum Activity is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Woodside Oil Pollution Emergency Arrangements (Australia) document, supported by the Petroleum Activity's Oil Pollution First Strike Plan which provides tactical response guidance to the activity/area (Appendix H), cover spill response for this Petroleum Activity.

The Crisis and Emergency Management Team manages Woodside's hydrocarbon spill response equipment stockpile. Woodside also maintains a suite of contracts for access to additional specialist response equipment and trained personnel as required via Australian and international spill response organisations and labour supply companies. In the event of a major spill, Woodside will enact first strike response actions, in liaison with the relevant Control Agency, as detailed in the activity-specific Oil Pollution First Strike Plan.

Vessels will have shipboard oil pollution emergency plans (SOPEPs) in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Petroleum Activity's Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activity, as detailed in Appendix G.

7.12.5 Emergency and spill response

Woodside categorises incidents in relation to response requirements:

- **Level 1** incidents are those that can be resolved using existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site- or regionally-based teams using existing resources and functional support services.
- **Level 2** incidents are characterised by a response that requires external operational support to manage the incident. It is triggered if the capabilities of the tactical level response are exceeded. This support is provided to the activity by activating all or part of the responsible CIMT.
- **Level 3** incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, or livelihood. At Woodside, the Crisis Management Team manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation and such). The CIMT may also be activated as required to manage the operational incident response

7.12.6 Emergency and spill response drills and exercises

Woodside's capability to respond to incidents will be tested periodically, in accordance with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in Table 7-10. Emergency response testing is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards and risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference points for developing and scheduling emergency and crisis management exercises. External participants may be invited to attend exercises (for example, government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements).

The overall objective of exercises is to test procedures, skills and the teamwork of the emergency response teams and IMTs in their ability to respond to major accident and major environment events. After each exercise, the team holds a debriefing session, during which the exercise is reviewed. Any lessons learned or areas for improvement are identified and incorporated into revised procedures, where appropriate.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-10: Testing of response capability

Response category	Scope	Response testing frequency	Response testing objective
Level 1 Response	Exercises are MODU/ vessel specific	One Level 1 'First Strike' drill conducted within two weeks of commencing activity. For campaigns with an operational duration of greater than one month this will occur within the first two weeks of commencing the activity and then at least every 6 month hire period thereafter	• Comprehensive exercises test elements of the Oil Pollution First Strike Plan (Appendix H). • Emergency drills are scheduled to test other aspects of the Emergency Response Plan
Level 2 Response	Exercises are MODU specific	A minimum of one Emergency Management exercise per MODU per campaign [Note: must be conducted within one month of campaign commencing and at least one Level 2 exercise per 6 month hire period].	Testing both the facility IMT response and/or that of the CIMT following handover of incident control. Exercises may include testing of Source Control Response Strategies.
Level 3 Response	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management.	Test Woodside's ability to respond to and manage a crisis level incident

7.12.7 Testing of hydrocarbon spill response arrangements

Woodside is required to test hydrocarbon spill response arrangements as per Regulations 22(12), 22(13) and 22(14) in the Environment Regulations. Woodside's arrangements for spill response are common across Australian operating assets and activities to ensure controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside processes and procedures and improvements made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Table 7-10, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.12.8 Testing of arrangements schedule

Woodside's Testing of Arrangements Schedule (Figure 7-4) aligns with international good practice for spill preparedness and response management; the testing is compatible with the International Petroleum Industry Environmental Conservation Association Good Practice Guide and the Australian Institute for Disaster Resilience Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

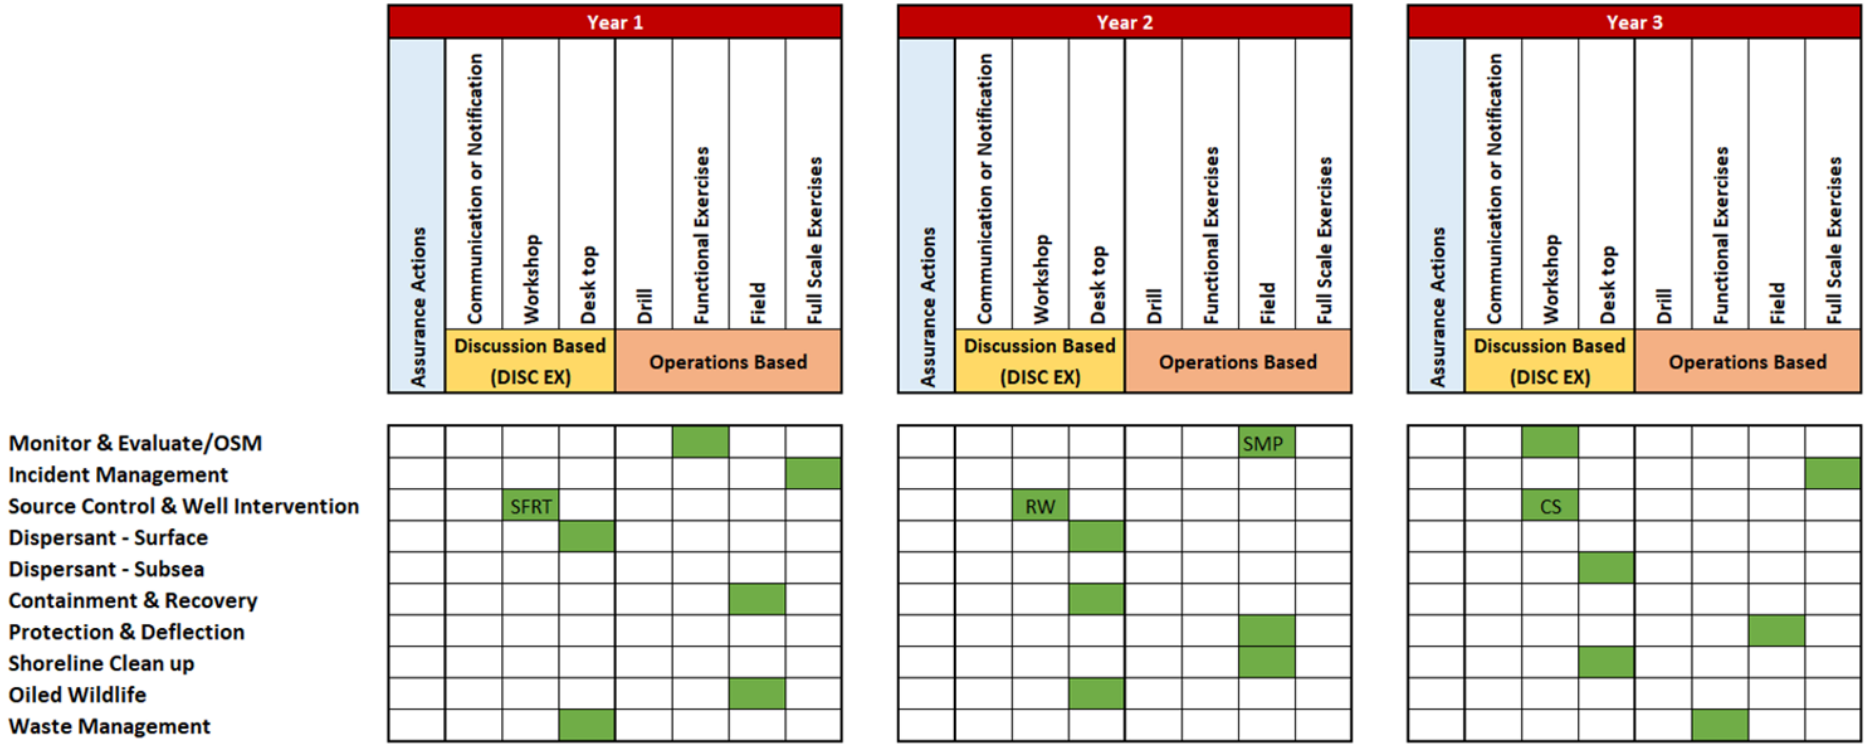

Figure 7-4: Indicative 3-yearly testing of arrangements schedule

Note: Schedule is subject to change, additional detail is included in live document

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g. capability, equipment and personnel). For example, an arrangement could be to test Woodside's personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the three-year rolling schedule. The subheading for the column describes the standard method of testing likely to be undertaken (e.g. discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises (e.g. critical arrangements) or via other 'additional assurance' methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g. audits, no-notice drills, internal exercises, assurance drills).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.13 Cyclone and dangerous weather preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Facilities and relevant support vessels on hire to Woodside receive regular forecasts from Woodside Meteorologists, who liaise closely with the Bureau of Meteorology (BOM). If a cyclone (or severe weather event) is forecast, the path and its development is plotted and monitored using the BOM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activity the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

9. LIST OF TERMS AND ACRONYMS

Table 9-1: List of terms and definitions

Term	Definition
ACN	Australian Company Number
AFC	Antifouling Coating
ALARP	As Low as Reasonably Practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
AS	Australian Standard
ASAP	As soon as possible
BCF	Bioconcentration Factor
BOM	Bureau of Meteorology
CEFAS	Centre for Environment, Fisheries and Aquaculture Science
CIMT	Corporate Incident Management Team
CMMS	Computerised Maintenance Management System
CS	Cost/sacrifice
CV	Company Values
DCCEEW	Commonwealth Department of Climate Change, Energy, Environment and Water
DMPE	Western Australian Department of Mines, Petroleum and Exploration (formerly Western Australian Department of Energy, Mining, Industry Regulation and Safety)
DNP	Director of National Parks
DTMI	Western Australian Department of Transport and Major Infrastructure (formerly Western Australian Department of Transport)
DP	Dynamic Positioning
ECAR	Environmental Compliance Action Register
EMBA	Environment that May be Affected
EMS	Environmental Management System
ENVID	Environment Identification
EOC	Emergency Operations Centre
EP	Environment Plan
EPBC Act	Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*
EPO	Environmental Performance Outcome
EPS	Environmental Performance Standards
ERP	Emergency Response Plan
ESD	Ecologically Sustainable Development
F	Feasibility
GHG	Greenhouse Gas
GP	Good Industry Practice
HOCNF	Harmonised Offshore Chemical Notification Format
HQ	Hazard Quotient

APPENDIX A WOODSIDE ENVIRONMENT AND BIODIVERSITY, CLIMATE AND RISK MANAGEMENT POLICIES

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision-making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new activities[1] within the boundaries of natural sites on the UNESCO World Heritage List.[2]
- Not undertaking new activities within IUCN Protected Areas[3] unless compatible with management plans in place for the area.
- Achieving net zero deforestation[4] for new activities.
- Developing Biodiversity Management Plans for all new major projects (CAPEX >US$2 billion).
- Supporting positive biodiversity outcomes in regions and areas in which we undertake activities.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Revised by the Woodside Energy Group Ltd Board in December 2024.

[1] Does not include non-industrial and existing activities that are compatible with maintenance of the listed outstanding universal values.
[2] New UNESCO World Heritage Listings that overlap existing activities will be assessed at the time of listing.
[3] New IUCN Protected Areas that overlap existing activities will be assessed at the time of listing.
[4] Definition of Forest: 'native trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

Climate Policy

BACKGROUND

The Intergovernmental Panel on Climate Change has stated that "it is unequivocal that human influence has warmed the atmosphere, ocean and land". An objective of the Paris Agreement is to hold "the increase in the global average temperature to well below 2ºC above pre-industrial levels" and to pursue "efforts to limit the temperature increase to 1.5ºC". Many countries have set targets to reduce greenhouse gas emissions, including by changing the way they produce and consume energy.

OBJECTIVE

Woodside's objective is to thrive in this energy transition as a low cost, lower carbon energy provider.

PRINCIPLES

Woodside aims to achieve the objective by:

- Setting science-based[1] near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned[2] scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.[3]
- Developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- Investing in new energy products and lower carbon services to reduce customers' emissions (part of Woodside's Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Aligning our advocacy to the principles of this Climate Policy.

[1] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "science-based" (published 2021) which states "targets are considered 'science-based' if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.". See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[2] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "Paris-aligned scenarios" (published 2021) which states "scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[3] Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside's ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside's ownership interest.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venture participants engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2024.

Risk Management Policy

OBJECTIVES

Woodside recognises that risk is inherent in our business and the effective management of risk is vital to deliver our strategic objectives, continued growth and success. We are committed to managing risks in a proactive and effective manner as a source of competitive advantage.

Our approach protects us against potential negative impacts, enables us to take risk for reward and improves our resilience against emerging risks. The objective of our risk management framework is to provide a single consolidated view of risks across the company to understand our full risk exposure and prioritise risk management and governance.

The success of our approach lies in the responsibility placed on everyone at all levels to proactively identify, assess and treat risks relating to the objectives they are accountable for delivering.

PRINCIPLES

Woodside achieves these objectives by:

- Applying a structured and comprehensive framework for the identification, assessment and treatment of current risks and response to emerging risks;
- Ensuring line of sight of financial and non-financial risks at appropriate levels of the organisation;
- Demonstrating leadership and commitment to integrating risk management into our business activities and governance practices;
- Recognising the value of stakeholder engagement, best available information and proactive identification of potential changes in external and internal context;
- Embedding risk management into our critical business processes and control framework;
- Understanding our exposure to risk and tolerance for uncertainty to inform our decision making and assure that Woodside is operating with due regard to the risk appetite endorsed by the Board; and
- Evaluating and improving the effectiveness and efficiency our approach.

APPLICABILITY

The Managing Director of Woodside is accountable to the Board of Directors for ensuring this Policy is effectively implemented.

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2024.

APPENDIX B RELEVANT REQUIREMENTS

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary
Aboriginal and Torres Strait Islander Heritage Protection Act 1984	This Act seeks "to preserve and protect places, areas and objects of particular significance" to Aboriginal people. Under the Section 9 and 10 provisions of the Act, the Minister for the Environment may declare significant Aboriginal areas temporarily or permanently protected if they are considered under threat. Similar declarations regarding Aboriginal objects can be made under Section 12. Under Section 22 of the Act, the contravention of any of these declarations is an offence. Additionally, the discovery of any Aboriginal remains must be reported to the Minister under Section 20. Damage or interference with Aboriginal objects or places is not an offence under the Act except within Victoria under Section 21U.
Air Navigation Act 1920 *Air Navigation Regulations 1947* *Air Navigation (Aerodrome Flight Corridors) Regulations 1994* *Air Navigation (Aircraft Engine Emissions) Regulations 1995* *Air Navigation (Aircraft Noise) Regulations 1984* *Air Navigation (Fuel Spillage) Regulations 1999*	This Act relates to managing air navigation.
Australian Maritime Safety Authority Act 1990	This Act establishes a legal framework for AMSA, which represents the Australian Government and international forums in the development, implementation and enforcement of international standards, including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters.
Aquatic Resources Management Act 2016	The *Aquatic Resources Management Act 2016* aims to conserve aquatic ecosystems, eimponsure sustainable development of fishing and aquaculture, and balance economic, social, and cultural benefits among fishery resource user groups.
Australian Radiation Protection and Nuclear Safety Act 1998	This Act relates to protecting the health and safety of people, and protecting the environment from the harmful effects of radiation.
Biosecurity Act 2015 *Quarantine Regulations 2000* *Biosecurity Regulation 2016* *Australian Ballast Water Management Requirements 2022* *Biosecurity Amendment (Biofouling Management) Regulations 2021*	This Act provides the Commonwealth with powers to take quarantine measures, and implement necessary related programs, to prevent introducing any plant, animal, organism or matter that could contain anything that could threaten Australia's native flora and fauna or natural environment. The Commonwealth's powers include entry, seizure, detention and disposal. This Act includes mandatory controls on using seawater as ballast in ships and declaring sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers. The *Biofouling Management Regulations* requires ships to report information about biofouling management and the voyage history of the ship in the past 12 months through a pre-arrival report.

Commonwealth legislation	Summary
Environment Protection and Biodiversity Conservation Act 1999 *Environment Protection and Biodiversity Conservation Regulations 2000*	This Act protects MNES. It streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places. Under this Act, actions that may be likely to have a significant impact on MNES must be referred to the Minister for the Environment and Water.
Environment Protection (Sea Dumping) Act 1981 *Environment Protection (Sea Dumping) Regulations 1983*	This Act provides for protecting the environment by regulating dumping of matter into the sea, incineration of waste at sea, and placement of artificial reefs.
Fisheries Management Act 1991	The *Fisheries Management Act 1991* is pursued by the Minister and Australian Fisheries Management Authority (AFMA). The Act objectives include the establishment of efficient, cost-effective fisheries management that ensure ecologically sustainable practice, maximin economic return, maintained accountability, and compliance to government cost-recovery targets.
Fish Resources Management Act 1994	The *Fish Resources Management Act 1994* relates to the management of fish resources, including the development and management of fisheries and aquaculture and the conservation of fish and other aquatic resources and their habitats, and for related purposes.
Hazardous Waste (Regulation of Exports and Imports) Act 1989 (Cth)	The Act regulates the export, import, and transit of hazardous waste to ensure it is managed in an environmentally sound manner, protecting human health and the environment both within and outside Australia. It implements Australia's obligations under the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal.
Industrial Chemicals Environment Management (Register) Act 2021	This Act provides for the Minister to make one or more scheduling decisions for a relevant industrial chemical and to vary or revoke such a decision.
Industrial Chemicals (Notification and Assessment Act) 1989 *Industrial Chemicals (Notification and Assessment) Regulations 1990*	This Act creates a national register of industrial chemicals. The Act also provides for restricting the use of certain chemicals that could have harmful effects on the environment or health.
National Environment Protection Measures (Implementation) Act 1998 *National Environment Protection Measures (Implementation) Regulations 1999*	This Act and Regulations provide for implementing National Environment Protection Measures to protect, restore and enhance the quality of the environment in Australia and ensure the community has access to relevant and meaningful information about pollution. The National Environment Protection Council has made National Environment Protection Measures relating to ambient air quality, movement of controlled waste between states and territories, the National Pollutant Inventory, and used packaging materials.
National Greenhouse and Energy Reporting Act 2007 *National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015*	This Act and associated Rule establishes the legislative framework for the National Greenhouse and Energy Reporting Scheme for reporting GHG emissions and energy consumption and production by corporations in Australia.
Native Title Act 1993	The *Native Title Act 1993* establishes processes to recognise and protect Native Title, and the rights afforded to Native Title holders and registered Native Title claimants in relation to thirdparty land use addresses Native Title rights and interests, which may include rights and interests in heritage. This Act does not apply where Native Title has not been determined to exist.

Commonwealth legislation	Summary
Navigation Act 2012 *Marine Order 12: Construction – subdivision and stability, machinery and electrical installations* *Marine Order 30: Prevention of collisions* *Marine Order 47: Offshore Industry units* *Marine Order 57: Helicopter operations* *Marine Order 91: Marine pollution prevention – oil* *Marine Order 93: Marine pollution prevention – noxious liquid substances* *Marine Order 94: Marine pollution prevention – packaged harmful substances* *Marine Order 96: Marine pollution prevention – sewage* *Marine Order 97: Marine pollution prevention – air pollution*	This Act regulates navigation and shipping, including SOLAS. This Act is the primary legislation that regulates ship and seafarer safety and shipboard aspects of marine environment protection and pollution prevention.
Offshore Petroleum and Greenhouse Gas Storage Act 2006 *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* *Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011* *Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2024*	This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the listed Regulations.
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989 *Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995*	This Act provides for protecting ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone-depleting substances and synthetic GHGs, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone-depleting substances.
Protection of the Sea (Powers of Intervention) Act 1981	This Act authorises the Commonwealth to take measures to protect the sea from pollution by oil and other noxious substances discharged from ships. It provides legal immunity for persons acting under an AMSA direction.
Protection of the Sea (Prevention of Pollution from Ships) Act 1983 *Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994* *Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances* *Marine Order 94: Marine pollution prevention – packaged harmful substances* *Marine Order 95: Marine pollution prevention – garbage* *Marine Order 96: Marine pollution prevention – sewage* *Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007* *MARPOL Convention*	This Act relates to protecting the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances. The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 NM off the coast out to the end of the Australian Exclusive Economic Zone (200 NM). It also applies within the 3 NM of the coast where the State/Northern Territory does not have complementary legislation. All the Marine Orders listed, except for Marine Order 95, are enacted under both the *Navigation Act* and the *Protection of the Sea (Prevention of Pollution from Ships) Act*. The *Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007* is an amendment to the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*. This amended Act provides for protecting the sea from pollution by oil and other harmful substances discharged from ships.

Commonwealth legislation	Summary
Protection of the Sea (Harmful Antifouling Systems) Act 2006 *Marine Order 98: Marine pollution – anti-fouling systems*	This Act relates to protecting the sea from the effects of harmful anti-fouling systems. It prohibits applying or reapplying harmful anti-fouling compounds on Australian ships or foreign ships that are in an Australian shipping facility.
Recycling and Waste Reduction (Mandatory Product Stewardship – Mercury-added Products) Rules 2021 (Minamata Convention on Mercury 2017)	This Convention is an agreement to protect human and environmental health from the effects of releases of mercury and mercury-containing compounds to the environment. The convention has been ratified by Australia and is implemented in Commonwealth law.
Underwater Cultural Heritage Act 2018 *Underwater Cultural Heritage Guidance for Offshore Developments* *Guidelines to Protect Underwater Cultural Heritage*	The Act prescribes penalties for damaging protected Underwater Cultural Heritage without a permit under Section 30 or in contravention of a permit under Section 28. Protected Underwater Cultural Heritage is prescribed in Section 16 to automatically include the remains and associated artefacts of any vessel or aircraft that has been in Australian waters for 75 years, whether known or unknown. This protection is also extended to Underwater Cultural Heritage in Commonwealth waters specified by the Environment Minister under Section 17. Without a declaration under this section, Aboriginal Underwater Cultural Heritage is not protected under the *Underwater Cultural Heritage Act*.

Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form and we will make every effort to rectify it as soon as possible.

Copyright

Copyright in the information contained herein is and shall remain the property of the State of Western Australia. All rights reserved. This includes, but is not limited to, information from the Register established and maintained under the *Aboriginal Heritage Act 1972*.

Location information data licensed from Western Australian Land Information Authority (WALIA) trading as Landgate. Copyright in the location information data remains with WALIA. WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

Terminology

ID: ACH on the Register is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department..
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.
- **Culturally Sensitive Nature:**
  - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
  - **Men only:** Only *males* can view restricted information.
  - **Women only:** Only *females* can view restricted information.

Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972.*
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 2020 Datum.

Disclaimer

Aboriginal heritage holds significant value to Aboriginal people for their social, spiritual, historical, scientific, or aesthetic importance within Aboriginal traditions, and provides an essential link for Aboriginal people to their past, present and future. In Western Australia Aboriginal heritage is protected under the *Aboriginal Heritage Act 1972*.

All Aboriginal cultural heritage in Western Australia is protected, whether or not the ACH has been reported or exists on the Register.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you provide the details to the Department via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form and we will make every effort to rectify it as soon as possible.

Copyright

Copyright in the information contained herein is and shall remain the property of the State of Western Australia. All rights reserved. This includes, but is not limited to, information from the Register established and maintained under the *Aboriginal Heritage Act 1972*.

Location information data licensed from Western Australian Land Information Authority (WALIA) trading as Landgate. Copyright in the location information data remains with WALIA. WALIA does not warrant the accuracy or completeness of the location information data or its suitability for any particular purpose.

Terminology

ID: ACH on the Register is assigned a unique ID by the Department of Planning, Lands and Heritage using the format: ACH-00000001. For ACH on the former Register the ID numbers remain unchanged and use the new format. For example the ACH ID of the place Swan River was previously '3536' and is now 'ACH-00003536'.

Access and Restrictions:

- **Boundary Reliable (Yes/No):** Indicates whether to the best knowledge of the Department, the location and extent of the ACH boundary is considered reliable.
- **Boundary Restricted = No:** Represents the actual location of the ACH as understood by the Department..
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the ACH is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Culturally Sensitive = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the ACH is not restricted in any way.
- **Culturally Sensitive = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the ACH is restricted if it is considered culturally sensitive information. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the people who provided the information. To request access please contact via https://achknowledge.dplh.wa.gov.au/ach-enquiry-form.
- **Culturally Sensitive Nature:**
  - **No Gender / Initiation Restrictions:** *Anyone* can view the information.
  - **Men only:** Only *males* can view restricted information.
  - **Women only:** Only *females* can view restricted information.

Status:

- **Register:** Aboriginal cultural heritage places that are assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972*.
- **Lodged:** Information which has been received in relation to an Aboriginal cultural heritage place, but is yet to be assessed under Section 5 of the *Aboriginal Heritage Act 1972.*
- **Historic:** Aboriginal heritage places assessed as not meeting the criteria of Section 5 of the *Aboriginal Heritage Act 1972*. Includes places that no longer exist as a result of land use activities with existing approvals.

Place Type: The type of Aboriginal cultural heritage place. For example an artefact scatter place or engravings place.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place.

Coordinates

Map coordinates are based on the GDA 2020 Datum.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	27
Listed Migratory Species:	43

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	72
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	43
Key Ecological Features (Marine):	2
Biologically Important Areas:	7
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Phaethon rubricauda westralis](#) Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Species or species habitat likely to occur within area
[Sternula nereis nereis](#) Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
MAMMAL		
[Balaenoptera borealis](#) Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
[Orcaella heinsohni](#) Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat may occur within area
[Sousa sahulensis](#) Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat may occur within area
REPTILE		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
[Chelonia mydas](#) Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat likely to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis		
Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
null		

Scientific Name	Threatened Category	Presence Text
Balaenoptera omurai		
Omura's Whale [87136]		Species or species habitat likely to occur within area
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat may occur within area
Calonectris leucomelas		
Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Macronectes giganteus		
Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda		
Red-tailed Tropicbird [994]		Species or species habitat likely to occur within area
Migratory Marine Species		
Anoxypristis cuspidata		
Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat may occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
[Carcharhinus longimanus](#) Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
[Carcharias taurus](#) Grey Nurse Shark [64469]		Species or species habitat likely to occur within area
[Carcharodon carcharias](#) White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
[Chelonia mydas](#) Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
[Crocodylus porosus](#) Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area
[Dermochelys coriacea](#) Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
[Eretmochelys imbricata](#) Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
[Isurus oxyrinchus](#) Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus		
Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pandion haliaetus		
Osprey [952]		Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Anous stolidus Common Noddy [825]		Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus		
Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Pandion haliaetus		
Osprey [952]		Species or species habitat may occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon lepturus fulvus		
Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda		
Red-tailed Tropicbird [994]		Species or species habitat likely to occur within area
Fish		
Acentronura larsonae		
Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni		
Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus		
Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma		
Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus		
Muiron Island Pipefish [66196]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Reptile		
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus duboisii Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis kingii as Disteira kingii		
Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli		
MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major		
Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus		
Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii		
Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus		
Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii		
Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata		
Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
[Balaenoptera edeni](#) Bryde's Whale [35]		Species or species habitat likely to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera omurai](#) Omura's Whale [87136]		Species or species habitat likely to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
[Delphinus delphis](#) Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
[Feresa attenuata](#) Pygmy Killer Whale [61]		Species or species habitat may occur within area
[Globicephala macrorhynchus](#) Short-finned Pilot Whale [62]		Species or species habitat may occur within area
[Grampus griseus](#) Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
[Kogia breviceps](#) Pygmy Sperm Whale [57]		Species or species habitat may occur within area
[Kogia sima](#) Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
[Lagenodelphis hosei](#) Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
[Megaptera novaeangliae](#) Humpback Whale [38]		Breeding known to occur within area
[Mesoplodon densirostris](#) Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
[Orcaella heinsohni](#) Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat may occur within area
[Orcinus orca](#) Killer Whale, Orca [46]		Species or species habitat may occur within area
[Peponocephala electra](#) Melon-headed Whale [47]		Species or species habitat may occur within area
[Physeter macrocephalus](#) Sperm Whale [59]		Species or species habitat may occur within area
[Pseudorca crassidens](#) False Killer Whale [48]		Species or species habitat likely to occur within area
[Sousa sahulensis](#) Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat may occur within area
[Stenella attenuata](#) Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
[Stenella coeruleoalba](#) Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
[Stenella longirostris](#) Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks	[Resource Information]
Park Name	Zone & IUCN Categories
Montebello	Multiple Use Zone (IUCN VI)

Habitat Critical to the Survival of Marine Turtles		[Resource Information]
Scientific Name	Behaviour	Presence
All year (Jun - Aug)		
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur

Extra Information

EPBC Act Referrals			[Resource Information]
Title of referral	Reference	Referral Outcome	Assessment Status
Browse to North West Shelf Development, Indian Ocean, WA	2018/8319		Approval
DAVROS MC 3D marine seismic survey northwaet of Dampier, WA	2013/7092		Completed
Deep Water Northwest Shelf 2D Seismic Survey	2007/3260		Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Construct and operate LNG & domestic gas plant including onshore and offshore facilities - Wheatston	2008/4469	Controlled Action	Post-Approval
Echo-Yodel Production Wells	2000/11	Controlled Action	Post-Approval
Equus Gas Fields Development Project, Carnarvon Basin	2012/6301	Controlled Action	Completed
Gorgon Gas Development 4th Train Proposal	2011/5942	Controlled Action	Post-Approval
Pluto Gas Project	2005/2258	Controlled Action	Completed
Pluto Gas Project Including Site B	2006/2968	Controlled Action	Post-Approval
Not controlled action			
'Goodwyn A' Low Pressure Train Project	2003/914	Not Controlled Action	Completed
Echo A Development WA-23-L, WA-24-L	2005/2042	Not Controlled Action	Completed
Exploration of appraisal wells	2006/3065	Not Controlled Action	Completed
Maia-Gaea Exploration wells	2000/17	Not Controlled Action	Completed
North Rankin B gas compression facility	2005/2500	Not Controlled Action	Completed
Pipeline System Modifications Project	2000/3	Not Controlled Action	Completed
Project Highclere Geophysical Survey	2021/9023	Not Controlled Action	Completed
Searipple gas and condensate field development	2000/89	Not Controlled Action	Completed
sub-sea tieback of Perseus field wells	2004/1326	Not Controlled Action	Completed
Telstra North Rankin Spur Fibre Optic Cable	2016/7836	Not Controlled Action	Completed
To construct and operate an offshore submarine fibre optic cable, WA	2014/7373	Not Controlled Action	Completed
Western Flank Gas Development	2005/2464	Not Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action			
Wheatstone 3D seismic survey, 70km north of Barrow Island	2004/1761	Not Controlled Action	Completed
Not controlled action (particular manner)			
'Tourmaline' 2D marine seismic survey, permit areas WA-323-P, WA-330-P and WA-32	2005/2282	Not Controlled Action (Particular Manner)	Post-Approval
"Leanne" offshore 3D seismic exploration, WA-356-P	2005/1938	Not Controlled Action (Particular Manner)	Post-Approval
3D Marine Seismic Survey in WA 457-P & WA 458-P, North West Shelf, offshore WA	2013/6862	Not Controlled Action (Particular Manner)	Post-Approval
Aperio 3D Marine Seismic Survey, WA	2012/6648	Not Controlled Action (Particular Manner)	Post-Approval
Balnaves Condensate Field Development	2011/6188	Not Controlled Action (Particular Manner)	Post-Approval
Cable Seismic Exploration Permit areas WA-323-P and WA-330-P	2008/4227	Not Controlled Action (Particular Manner)	Post-Approval
CGGVERITAS 2010 2D Seismic Survey	2010/5714	Not Controlled Action (Particular Manner)	Post-Approval
Cue Seismic Survey within WA-359-P, WA-361-P and WA-360-P	2007/3647	Not Controlled Action (Particular Manner)	Post-Approval
Demeter 3D Seismic Survey, off Dampier, WA	2002/900	Not Controlled Action (Particular Manner)	Post-Approval
Foxhound 3D Non-Exclusive Marine Seismic Survey	2009/4703	Not Controlled Action (Particular Manner)	Post-Approval
Greater Western Flank Phase 1 gas Development	2011/5980	Not Controlled Action (Particular Manner)	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action (particular manner)			
Harmony 3D Marine Seismic Survey	2012/6699	Not Controlled Action (Particular Manner)	Post-Approval
Julimar Brunello Gas Development Project	2011/5936	Not Controlled Action (Particular Manner)	Post-Approval
Moosehead 2D seismic survey within permit WA-192-P	2005/2167	Not Controlled Action (Particular Manner)	Post-Approval

Tidepole Maz 3D Seismic Survey Campaign	2007/3706	Not Controlled Action (Particular Manner)	Post-Approval
West Panaeus 3D seismic survey	2006/3141	Not Controlled Action (Particular Manner)	Post-Approval
Westralia SPAN Marine Seismic Survey, WA & NT	2012/6463	Not Controlled Action (Particular Manner)	Post-Approval
Wheatstone 3D MAZ Marine Seismic Survey	2011/6058	Not Controlled Action (Particular Manner)	Post-Approval
Wheatstone Iago Appraisal Well Drilling	2007/3941	Not Controlled Action (Particular Manner)	Post-Approval
Wheatstone Iago Appraisal Well Drilling	2008/4134	Not Controlled Action (Particular Manner)	Post-Approval

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region

Name	Region
Ancient coastline at 125 m depth contour	North-west
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

[Resource Information]

Scientific Name	Behaviour	Presence
Marine Turtles		
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Mar-2026

Summary
Details
- Matters of NES
- Other Matters Protected by the EPBC Act

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	2
National Heritage Places:	2
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	6
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	58
Listed Migratory Species:	67

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	16
Commonwealth Heritage Places:	2
Listed Marine Species:	113
Whales and Other Cetaceans:	33
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	14
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	37
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	224
Key Ecological Features (Marine):	8
Biologically Important Areas:	44
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Murujuga Cultural Landscape	WA	Declared property
Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Indigenous		
Dampier Archipelago (including Burrup Peninsula)	WA	Listed place
Natural		
The Ningaloo Coast	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name

Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pezoporus occidentalis Night Parrot [59350]	Critically Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		
Milyeringa justitia Barrow Cave Gudgeon [86867]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Milyeringa veritas		
Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum		
Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies		
Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus		
Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isoodon auratus barrowensis		
Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes conspicillatus conspicillatus		
Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Lagorchestes hirsutus Central Australian subspecies		
Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Macroderma gigas		
Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area
Osphranter robustus isabellinus		
Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area
Petrogale lateralis lateralis		
Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Sousa sahulensis		
Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Minuria tridens		
Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis		
Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama		
Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus zastictus Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Liasis olivaceus barroni Pilbara Olive Python [66699]	Vulnerable	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Congregation or aggregation known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
null		
Balaenoptera omurai Omura's Whale [87136]		Species or species habitat likely to occur within area
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharias taurus Grey Nurse Shark [64469]		Congregation or aggregation known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area

Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Breeding known to occur within area
Reptile		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus laevis](#) Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
[Aipysurus mosaicus as Aipysurus eydouxii](#) Mosaic Sea Snake [87261]		Species or species habitat may occur within area
[Aipysurus tenuis](#) Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
[Balaenoptera edeni](#) Bryde's Whale [35]		Species or species habitat likely to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera omurai](#) Omura's Whale [87136]		Species or species habitat likely to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Delphinus delphis](#) Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
[Eubalaena australis](#) Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
[Feresa attenuata](#) Pygmy Killer Whale [61]		Species or species habitat may occur within area
[Globicephala macrorhynchus](#) Short-finned Pilot Whale [62]		Species or species habitat may occur within area
[Grampus griseus](#) Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
[Indopacetus pacificus](#) Longman's Beaked Whale [72]		Species or species habitat may occur within area
[Kogia breviceps](#) Pygmy Sperm Whale [57]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west

Name	Region
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west

Biologically Important Areas		[Resource Information]
Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Eubalaena australis Southern Right Whale [40]	Migration	
Eubalaena australis Southern Right Whale [40]	Reproduction	
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 23-Mar-2026

Summary
Details
- Matters of NES
- Other Matters Protected by the EPBC Act
- Extra Information

Acknowledgements

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	2
National Heritage Places:	2
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	6
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	58
Listed Migratory Species:	67

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	16
Commonwealth Heritage Places:	2
Listed Marine Species:	113
Whales and Other Cetaceans:	33
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	14
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	37
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	224
Key Ecological Features (Marine):	8
Biologically Important Areas:	44
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Murujuga Cultural Landscape	WA	Declared property
Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Indigenous		
Dampier Archipelago (including Burrup Peninsula)	WA	Listed place
Natural		
The Ningaloo Coast	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pezoporus occidentalis Night Parrot [59350]	Critically Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda westralis Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
FISH		
Milyeringa justitia Barrow Cave Gudgeon [86867]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Milyeringa veritas		
Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum		
Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies		
Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus		
Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isoodon auratus barrowensis		
Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes conspicillatus conspicillatus		
Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Lagorchestes hirsutus Central Australian subspecies		
Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Macroderma gigas		
Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area
Osphranter robustus isabellinus		
Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area
Petrogale lateralis lateralis		
Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Sousa sahulensis		
Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Minuria tridens		
Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis		
Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama		
Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus zastictus Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Liasis olivaceus barroni Pilbara Olive Python [66699]	Vulnerable	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Congregation or aggregation known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
null		
Balaenoptera omurai Omura's Whale [87136]		Species or species habitat likely to occur within area
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharias taurus Grey Nurse Shark [64469]		Congregation or aggregation known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State
Bureau of Meteorology	
Lot 1102 P217148 [AGPR5866]	WA
Lot 819 P211578 [AGPR5865]	WA

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]	Vulnerable	Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Breeding known to occur within area
Reptile		
[Aipysurus apraefrontalis](#) Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus foliosquama](#) Leaf-scaled Sea Snake, Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
[Aipysurus laevis](#) Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
[Aipysurus mosaicus as Aipysurus eydouxii](#) Mosaic Sea Snake [87261]		Species or species habitat may occur within area
[Aipysurus tenuis](#) Brown-lined Sea Snake, Mjoberg's Sea Snake [1121]		Species or species habitat may occur within area
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Emydocephalus annulatus Eastern Turtle-headed Sea Snake [1125]		Species or species habitat may occur within area
Ephalophis greyae as Ephalophis greyi Mangrove Sea Snake [93738]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
[Balaenoptera edeni](#) Bryde's Whale [35]		Species or species habitat likely to occur within area
[Balaenoptera musculus](#) Blue Whale [36]	Endangered	Migration route known to occur within area
[Balaenoptera omurai](#) Omura's Whale [87136]		Species or species habitat likely to occur within area
[Balaenoptera physalus](#) Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
[Delphinus delphis](#) Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
[Eubalaena australis](#) Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
[Feresa attenuata](#) Pygmy Killer Whale [61]		Species or species habitat may occur within area
[Globicephala macrorhynchus](#) Short-finned Pilot Whale [62]		Species or species habitat may occur within area
[Grampus griseus](#) Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
[Indopacetus pacificus](#) Longman's Beaked Whale [72]		Species or species habitat may occur within area
[Kogia breviceps](#) Pygmy Sperm Whale [57]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Species or species habitat known to occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Habitat Critical to the Survival of Marine Turtles		[Resource Information]
Scientific Name	Behaviour	Presence
All year (Jun - Aug)		
Natator depressus		
Flatback Turtle [59257]	Nesting	Known to occur
Nov-Feb		
Caretta caretta		
Loggerhead Turtle [1763]	Nesting	Known to occur
Oct - Feb		
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Nesting	Known to occur
Oct - Mar		
Chelonia mydas		
Green Turtle [1765]	Nesting	Known to occur

EPBC Act Referrals

[Resource Information]

Title of referral	Reference	Referral Outcome	Assessment Status
3D Seismic Survey in the Carnarvon Bsin on the North West Shelf	2002/778		Completed
Babylon 3D Marine Seismic Survey, Commonwealth Waters, nr Exmouth WA	2013/7081		Completed
Browse to North West Shelf Development, Indian Ocean, WA	2018/8319		Approval
DAVROS MC 3D marine seismic survey northwaet of Dampier, WA	2013/7092		Completed
Deep Water Northwest Shelf 2D Seismic Survey	2007/3260		Completed
Development of Mutineer and Exeter petroleum fields for oil production, Permit	2003/1033		Completed
Gorgon Gas Development	2003/1294		Post-Approval
Marine Route Survey for Subsea Fibre Optic Data Cable System - Australia West	2024/09826		Completed
Ningaloo Lighthouse Development, 17km north west Exmouth, Western Australia	2020/8693		Post-Approval
North West Shelf Project Extension, Carnarvon Basin, WA	2018/8335		Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Offshore Dredge Spoil Disposal - Mardie Project	2024/10054		Referral Decision
Optimised Mardie Project ? Additional Triodia Grassland Habitat Clearing	2024/10094		Referral Decision
Optimised Mardie Solar Salt Project	2022/9169		Post-Approval
Project Highclere Cable Lay and Operation	2022/09203		Completed
Single Jetty Deep Water Port Renewable Hub, WA	2021/8942		Assessment
Action clearly unacceptable			
Highlands 3D Marine Seismic Survey	2012/6680	Action Clearly Unacceptable	Completed
Controlled action			
'Van Gogh' Petroleum Field Development	2007/3213	Controlled Action	Post-Approval
2-D seismic survey Scott Reef	2000/125	Controlled Action	Post-Approval
Anketell Point Iron Ore Processing & Export Port	2009/5120	Controlled Action	Post-Approval
Construct and operate LNG & domestic gas plant including onshore and offshore facilities - Wheatston	2008/4469	Controlled Action	Post-Approval
Construction and operation of a Solar Salt Project, SW Onslow, WA	2016/7793	Controlled Action	Assessment Approach
Develop Jansz-Io deepwater gas field in Permit Areas WA-18-R, WA-25-R and WA-26-	2005/2184	Controlled Action	Post-Approval
Development of Angel gas and condensate field, North West Shelf	2004/1805	Controlled Action	Post-Approval
Development of Browse Basin Gas Fields (Upstream)	2008/4111	Controlled Action	Completed
Development of Coniston/Novara fields within the Exmouth Sub-basin	2011/5995	Controlled Action	Post-Approval
Development of Stybarrow petroleum field incl drilling and facility installation	2004/1469	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Echo-Yodel Production Wells	2000/11	Controlled Action	Post-Approval
Enfield full field development	2001/257	Controlled Action	Post-Approval
Equus Gas Fields Development Project, Carnarvon Basin	2012/6301	Controlled Action	Completed
Eramurra Industrial Salt Project	2021/9027	Controlled Action	Assessment Approach
Eramurra Industrial Salt Project, near Karratha, WA	2019/8448	Controlled Action	Completed
Gorgon Gas Development 4th Train Proposal	2011/5942	Controlled Action	Post-Approval
Gorgon Gas Revised Development	2008/4178	Controlled Action	Post-Approval
Greater Enfield (Vincent) Development	2005/2110	Controlled Action	Post-Approval
Greater Gorgon Development - Optical Fibre Cable, Mainland to Barrow Island	2005/2141	Controlled Action	Completed
Light Crude Oil Production	2001/365	Controlled Action	Post-Approval
Mardie Project, 80 km south west of Karratha, WA	2018/8236	Controlled Action	Post-Approval
Pluto Gas Project	2005/2258	Controlled Action	Completed
Pluto Gas Project Including Site B	2006/2968	Controlled Action	Post-Approval
Pyrenees Oil Fields Development	2005/2034	Controlled Action	Post-Approval
Simpson Development	2000/59	Controlled Action	Completed
Simpson Oil Field Development	2001/227	Controlled Action	Post-Approval
The Scarborough Project - FLNG & assoc subsea infrastructure, Carnarvon Basin	2013/6811	Controlled Action	Post-Approval
Vincent Appraisal Well	2000/22	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Yardie Creek Road Realignment Project	2021/8967	Controlled Action	Assessment Approach
Not controlled action			
'Goodwyn A' Low Pressure Train Project	2003/914	Not Controlled Action	Completed
'Van Gogh' Oil Appraisal Drilling Program, Exploration Permit Area WA-155-P(1)	2006/3148	Not Controlled Action	Completed
Airlie Island soil and groundwater investigations, Exmouth Gulf, offshore Pilbara coast	2014/7250	Not Controlled Action	Completed
Baniyas-1 Exploration Well, EP-424, near Onslow	2007/3282	Not Controlled Action	Completed
Barrow Island 2D Seismic survey	2006/2667	Not Controlled Action	Completed
Bollinger 2D Seismic Survey 200km North of North West Cape WA	2004/1868	Not Controlled Action	Completed
Bultaco-2, Laverda-2, Laverda-3 and Montesa-2 Appraisal Wells	2000/103	Not Controlled Action	Completed
Carnarvon 3D Marine Seismic Survey	2004/1890	Not Controlled Action	Completed
Cazadores 2D seismic survey	2004/1720	Not Controlled Action	Completed
Construct 110km buried natural gas pipeline from Onslow, connecting to Dampier/Bunbury natural gas p	2013/7039	Not Controlled Action	Completed
Construction and operation of an unmanned sea platform and connecting pipeline to Varanus Island for	2004/1703	Not Controlled Action	Completed
Controlled Source Electromagnetic Survey	2007/3262	Not Controlled Action	Completed
Development of Halyard Field off the west coast of WA	2010/5611	Not Controlled Action	Completed
Differential Global Positioning System (DGPS)	2001/445	Not Controlled Action	Completed
Drilling of an exploration well Gats-1 in Permit Area WA-261-P	2004/1701	Not Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action			
Drilling of exploration wells, Permit areas WA-301-P to WA-305-P	2002/769	Not Controlled Action	Completed
Eagle-1 Exploration Drilling, North West Shelf, WA	2019/8578	Not Controlled Action	Completed
Echo A Development WA-23-L, WA-24-L	2005/2042	Not Controlled Action	Completed
Exploration drilling well WA-155-P(1)	2003/971	Not Controlled Action	Completed
Exploration of appraisal wells	2006/3065	Not Controlled Action	Completed
Exploration Well (Taunton-2)	2002/731	Not Controlled Action	Completed
Exploration Well in Permit Area WA-155-P(1)	2002/759	Not Controlled Action	Completed
Exploratory drilling in permit area WA-225-P	2001/490	Not Controlled Action	Completed
Extension of Simpson Oil Platforms & Wells	2002/685	Not Controlled Action	Completed
HCA05X Macedon Experimental Survey	2004/1926	Not Controlled Action	Completed
Hess Exploration Drilling Programme	2007/3566	Not Controlled Action	Completed
Huascaran-1 exploration well (WA-292-P)	2001/539	Not Controlled Action	Completed
Improving rabbit biocontrol: releasing another strain of RHDV, sthrn two thirds of Australia	2015/7522	Not Controlled Action	Completed
Infill Production Well (Griffin-9)	2001/417	Not Controlled Action	Completed
Jansz-2 and 3 Appraisal Wells	2002/754	Not Controlled Action	Completed
Klammer 2D Seismic Survey	2002/868	Not Controlled Action	Completed
Mahimahi Aquaculture Facility	2002/891	Not Controlled Action	Completed
Maia-Gaea Exploration wells	2000/17	Not Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Not controlled action			
Manaslu - 1 and Huascaran - 1 Offshore Exploration Wells	2001/235	Not Controlled Action	Completed
Mermaid Marine Australia Desalination Project	2011/5916	Not Controlled Action	Completed
Montesa-1 and Bultaco-1 Exploration Wells	2000/102	Not Controlled Action	Completed
Murujuga archaeological excavation, collection and sampling, Dampier Archipelago, WA	2014/7160	Not Controlled Action	Completed
North Rankin B gas compression facility	2005/2500	Not Controlled Action	Completed
Onslow Power Infrastructure Upgrade Project, Onslow, WA	2014/7314	Not Controlled Action	Completed
Onslow Water Supply Infrastructure Upgrade Project, Onslow, WA	2014/7329	Not Controlled Action	Completed
Pipeline System Modifications Project	2000/3	Not Controlled Action	Completed
Project Highclere Geophysical Survey	2021/9023	Not Controlled Action	Completed
Searipple gas and condensate field development	2000/89	Not Controlled Action	Completed
Spool Base Facility	2001/263	Not Controlled Action	Completed
Subsea Gas Pipeline From Stybarrow Field to Griffin Venture Gas Export Pipeline	2005/2033	Not Controlled Action	Completed
sub-sea tieback of Perseus field wells	2004/1326	Not Controlled Action	Completed
Telstra North Rankin Spur Fibre Optic Cable	2016/7836	Not Controlled Action	Completed
Thevenard Island Retirement Project	2015/7423	Not Controlled Action	Completed
To construct and operate an offshore submarine fibre optic cable, WA	2014/7373	Not Controlled Action	Completed
WA-295-P Kerr-McGee Exploration Wells	2001/152	Not Controlled Action	Completed

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west

Name	Region
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west

Biologically Important Areas		[Resource Information]
Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Eubalaena australis Southern Right Whale [40]	Migration	
Eubalaena australis Southern Right Whale [40]	Reproduction	
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

FORM

Monthly Environmental Incident Reports

Document No: N-03300-FM0928 A198750

Date: 12/06/2025

Report for the month is due no later than 15 days after the end of the calendar month.

Send completed form to: submissions@nopsema.gov.au or via secure file transfer at https://securefile.nopsema.gov.au/filedrop/submissions

Reference: Section 50

Final report for this activity: ☐					
Titleholder name:			**Title of environment plan for the activity**		
Activity type: (e.g. drilling, seismic, production)			**Month, Year:**		
Contact person:		**Email:**		**Phone:**	

Incident date	All material facts and circumstances (including release volumes to environment if applicable)	Performance outcome(s) and/or standard(s) breached	Action taken to avoid or mitigate any adverse environmental impacts of the incident	Corrective action taken, or proposed, to stop, control or remedy this incident	Action taken, or proposed, to prevent a similar incident occurring in future

Note 1: This form may be submitted in conjunction with the 'Operational Activities Monthly Report' Form available at www.nopsema.gov.au

Privacy Notice

NOPSEMA collects your personal information for the purpose of investigating accidents, environmental incidents and dangerous occurrences under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006.*

NOPSEMA will not use or disclose your personal information for any other purpose without your consent, unless it is required or authorised by law, or relates to NOPSEMA's enforcement activities. Your personal information may be disclosed to the following organisations, entities or individuals:

- individuals who make a request under the *Freedom of Information Act 1982*
- the Australian National Audit Office and other privately appointed auditors
- other law enforcement bodies (for example, the police or the coroner)
- NOPSEMA's legal advisors.

NOPSEMA may occasionally be required to disclose information to overseas recipients in order to discharge its functions or exercise its powers, or to perform its necessary business activities.

Information about how you can access, or seek correction to, your personal information is contained in NOPSEMA's APP Privacy Policy at www.nopsema.gov.au/privacy. If you have an enquiry or a complaint about your privacy, please contact NOPSEMA's Privacy Contact Officer on 08 6188 8700 or by email at privacy@nopsema.gov.au

FORM

Report of an Accident, Dangerous Occurrence, Well Integrity or Environmental Incident

Document No: N-03300-FM0831 A159980

Date: 31/03/2026

Accidents, dangerous occurrences, well and environmental reportable incidents can all be reported using this form.

Where an incident occurs, and the titleholder and operator are not the same organisation and have different reporting requirements under the OPGGS Act and regulations, each organisation must submit a separate report.

This form should be used in conjunction with NOPSEMA Guidance Note N-03300-GN2303 - Notification Reporting and Reporting Requirements for Incidents available on the NOPSEMA website.

Part 1 is required within 3 days of a notified incident.

Part 2 is required within 30 days of a notified accident or dangerous occurrence incident.

This form and any attachments are to be submitted by either:

- Email: **submissions@nopsema.gov.au** for documents less than 10 MB; or
- Secure file transfer: https://securefile.nopsema.gov.au/filedrop/submissions.

NOPSEMA considers that a full report will contain copies of documentary material referenced and/or relied on in the course of completing this form, which may include (but not be limited to) as appropriate: witness statements, management system documents, drawings, diagrams and photographs, third party reports (audit, inspection, material analysis etc.), internal records and correspondence.

Date and time of the initial verbal incident notification to NOPSEMA			
Date		**Time**	

Was NOPSEMA notified through the dedicated notification phone line?			
Yes/No		**If no, who was contacted at NOPSEMA**	

Notification Number provided by NOPSEMA for this incident	
Reference	

Date and time of this written incident report			
Date		**Time**	

Is this the initial incident report?	
Yes/No	

What type of incident is being reported?		***Tick all appropriate incident types***
Accident or dangerous occurrence	☐	Complete parts 1A, 1B, 1E, 1F & 2
Well incident	☐	Complete parts 1A, 1C, 1E, 1F
Environmental incident	☐	Complete parts 1A, 1D, 1E, 1F

What category of incident is being reported?	***Tick all appropriate category types***	
To use electronically: MS Word 2007-10 – click in check box		
Accidents	Death	☐
	Serious Injury	☐
	Lost time injury ≥3 days	☐
Dangerous occurrences	Could have caused death, serious injury or Lost time injury ≥3 days	☐
	Fire or explosion	☐
	Collision marine vessel and facility	☐
	Uncontrolled hydrocarbon release >1 kg or ≥80 L (gas or liquid)	☐
	Well kick >8 m^3 or 50 barrels	☐
	Damage, loss or removal of a technical or other control measure critical to safety	☐
	Pipeline incident	☐
	Unplanned event – implement ERP	☐
	Other _____	☐
Wells	Loss of integrity release >1 kg (gas)	☐
	Loss of integrity >80 L (liquid)	☐
	A build-up of pressure or a positive flow check and operation of the BOP or diversion system	☐
	Damage or failure of well-related equipment that has led or could lead to a loss of integrity of the well	☐
	Damage or failure to well-related equipment that is used to monitor the well	☐
	Other unplanned occurrence requiring measures to regain control of the well	☐
Environmental	Hydrocarbon release	☐
	Chemical release	☐
	Drilling fluid/mud release	☐
	Other substance release	☐
	Loss of waste/materials/equipment	☐
	EPBC list species death or injury/near miss	☐
	Detection of marine pest/invasive marine species	☐
	Displacement of other marine user	☐
	Underwater cultural heritage, including First Nations underwater cultural heritage	☐
	Other _____	☐

Part 1A – Information Required within 3 Days of a Reportable Incident

1. Where did the incident occur? *Fill in all information applicable to the incident location. Multiple facilities/wells may be included if appropriate.*	
Did the incident occur on a facility or Associated Offshore Place (AOP)?	
If yes what type of facility?	Facility or AOP name:
FPSO ☐	
MODU ☐	
Platform – manned ☐	
Platform – not normally manned ☐	
Vessel ☐	
Did the incident occur on a pipeline?	If yes, pipeline name:
Did the incident involve a well or wells?	If yes, well(s) name and title(s):
Incident location (Provide datum used i.e. GDA2020)	Latitude: Longitude:
Name of petroleum activity being undertaken?	
2. Who is the registered operator/titleholder or person that controls the works site or activity?	
Name	
Position	
Business address	
Business phone no.	
3. When did the incident occur?	
Date	
Time and time zone	
4. Details of person submitting this form	
Name	
Position	
Email	
Telephone no.	

5. Details of any witnesses *If more witnesses, copy and insert this section.*	
Full name	
Phone no. (Business hours)	
Phone no. (Home) (Mobile)	
Email (Business) (Private)	
Postal address	

6. Brief description of incident

7. Work or activity being undertaken at time of incident

8. What are the internal investigation arrangements?

9. Was there any loss of containment?	
Yes or No *If yes, provide details below*	
Type of loss	Hydrocarbon fluid ☐ Hydrocarbon gas ☐ Hydrocarbon gas and fluid ☐ Non-hydrocarbon gas ☐ Chemical ☐ Drilling fluid/mud ☐ Formation/Produced formation water ☐ Hydraulic oil ☐ Diesel/Fuel oil ☐ Waste ☐ Other ☐
Estimated quantity *Liquid (L), Gas (kg)*	

Estimation Type *Calculation or measurement*				
Composition *Percentage and description*				
Known toxicity to people and/or environment	Yes ☐ No ☐ If yes, provide Safety Data Sheet and ecotox, bioaccumulation and persistence data (if available).			
What equipment was involved in the release?				
Is the equipment critical to safety?				
How was the leak/spill detected?	Fire & gas detection CCTV Visual	☐ ☐ ☐	Other	☐
Did ignition occur?	No Yes	☐ ☐	Immediate Delayed	☐ ☐
If yes, what was the likely ignition source?	Hotwork Spark electrical source Spark metallic contact Hot surface	☐ ☐ ☐ ☐	Other	☐

10. Hydrocarbon release details

System of hydrocarbon release	Process Drilling Subsea / Pipeline	☐ ☐ ☐	Utilities Well related Marine	☐ ☐ ☐
Estimated inventory in the isolatable system *Liquid (L), Gas (kg)*				
System pressure and size of piping or vessel	Pressure *(MPag)*			
	Size *Piping diameter (mm)* *Piping length (mm)* *or Vessel volume (L)*			
Estimated equivalent hole diameter *(mm)*				

11. Has the release been stopped and/or contained?

Yes or No	
Duration of the release *hh:mm:ss*	
Estimated rate of release *Liquid (L), Gas (kg) per hour*	

Part 1B - Complete for accidents or dangerous occurrences

12. Action taken to make the work-site safe					
Was permission given by a NOPSEMA inspector to interfere with the site? OPGGS(S)R 2.49. Yes ☐ No ☐					
Action taken					
Details of any disturbance of the work site					
13. Was an emergency response initiated? Yes ☐ No ☐					
Type of response	Manual Automatic alarm	☐ ☐	Muster Evacuation	☐ ☐	
How effective was the emergency response?					
14. Was anyone killed or injured? *Provide details below* Yes ☐ No ☐					
Injured person (IP)					
If different from Part 1A. Employer name		Employer address			
Employer phone no.		Employer email			
IP full name					
IP date of birth		Gender	Male ☐	Female ☐	
			Indeterminate/Intersex/Unspecified ☐		
IP residential address					
IP phone no. (Work)		IP phone no. (Home) (Mobile)			
IP occupation/job title		Core employee or contractor			
Circumstances of injury					

Based on TOOCS (refer to References) Nature of injury	a. Intracranial injury b. Fractures c. Wounds, lacerations, amputations, internal organ damage d. Burn e. Injury to nerves and spinal cord f. Traumatic joint/ligament and muscle/tendon injury	☐ ☐ ☐ ☐ ☐ ☐	g. Other injuries h. Mental disease i. Skin and subcutaneous tissue diseases j. Respiratory system diseases k. Circulatory system diseases l. Other diseases Not provided	☐ ☐ ☐ ☐ ☐ ☐ ☐
Location (On body)	G1 - 11 Cranium G1 - 12 Eye G1 - 13 Ear G1 - 14 Mouth G1 - 15 Nose G1 - 16 Face - not elsewhere classified G1 - 18 Head - multiple locations G2 - 21 Neck G3 - 31 Back - upper and lower G3 - 33 Chest (thorax) G3 - 34/ 35 Abdomen and pelvic region G3 - 38 Trunk - multiple locations G3 - 39 Trunk - unspecified locations G4 - 41 Shoulder G4 - 42 Upper arm G4 - 43 Elbow G4 - 44 Forearm G4 - 45 Wrist G4 - 46 Hand fingers and thumb G4- 48 Upper limb - multiple locations G5 - 51 Hip G5 - 52 Upper leg	☐ ☐	G5 - 53 Knee G5 - 54 Lower leg G5 - 55 Ankle G5 - 56 Foot and toes G5 - 58 Lower limb - multiple locations G6 - 61 Neck and trunk G6 - 62 Head and neck G6 - 63 Head and other G6 - 64 Trunk and limbs G6 - 65 Upper and lower limbs G6 - 66 Neck and shoulder G6 - 68 Other specified multiple locations G7 - 71 Circulatory system G7 - 72 Respiratory system G7 - 74 Genitourinary system G7 - 75 Nervous system G7 - 78 Other and multiple systemic conditions G7 - 79 Unspecified systemic conditions G8 - 80 Psychological system G9 - 90 Unspecified locations Not provided	☐ ☐
Mechanism of injury	G0 - 01 Falls from a height G0 - 02 Falls on the same level G0 - 03 Stepping kneeling or sitting on objects G1 - 11 Hitting stationary objects G1 - 12 Hitting moving object G2 - 21 Being hit by falling objects G2 - 25 Being trapped by moving machinery or equipment G2 - 26 Being trapped between stationary and moving objects G2 - 27 Exposure to mechanical vibration G2 - 28 Being hit by moving objects G3 - 31 Exposure to single, sudden sound G3 - 32 Long-term exposure to sound G3 - 38 Explosion G4 - 41 Muscular stress while lifting, carrying or putting down objects G4 - 42 Muscular stress while handling objects other than lifting, carrying or putting down G4 - 43 Muscular stress with no objects being handled G4 - 44 Repetitive movement, low muscle loading G5 - 51 Contact with hot objects G5 - 52 Contact with cold objects	☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐	G5 - 53 Exposure to environmental heat G5 - 54 Exposure to environmental cold G5 - 57 Contact with electricity G5 - 59 Exposure to other and unspecified environmental factors G6 - 61 Single contact with chemical or substance G6 - 62 Long term contact with chemicals or substances G6 - 69 Other and unspecified contact with chemical or substance G8 - 81 Exposure to a traumatic event G8 - 82 Exposure to workplace or occupational violence G8 - 84 Work pressure G8 - 85 Suicide or attempted suicide G8 - 86 Other mental stress factors G8 - 87 Work related harassment and/or workplace bullying G8 - 88 Other harassment G9 - 98 Other and multiple mechanisms of incident G9 - 99 Unspecified mechanisms of incident Not provided'	☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐
Agency of injury	1. Machinery and (mainly) fixed plant 2. Mobile plant or transport 3. Powered equipment, tools and appliances 4. Non-power hand tools, appliances and equipment 5. Chemicals and chemical products	☐ ☐ ☐ ☐ ☐	6. Chemicals and chemical products 7. Material and substances 8. Environmental agencies 9. Animal, human and biological agencies 10. Other and unspecified agencies Not provided _____	☐ ☐ ☐ ☐ ☐ ☐

Details of job being undertaken				
Day and hour of shift	Day *e.g. 5th day of 7 (5 / 7)*		Hour *e.g. 3rd hour of 12 (3 / 12)*	
NB: Copy/paste this section for each additional injured person and insert here				

15. Was anyone incapacitated from performing work for three or more days (>3 day Loss Time Injury)
Yes ☐ No ☐

Has the worker been cleared to return to full duties?	Yes ☐ No ☐
If not yet returned to work when is the worker expected to be cleared to return to full time duties?	
Total number of workdays lost at time of this report being submitted?	
At the time of this report being submitted is the injury still classified as a LTI >3Days, and if not, what is the new injury classification?	
NB: The injury and workdays lost should be reported to NOPSEMA in the Monthly Operational Activities Report	

16. Was there any serious damage? *Provide details below.* Yes ☐ No ☐

Item 1	
Equipment damaged	
Extent of damage	
Will the equipment be shut down?	Yes ☐ No ☐
If yes, for how long?	
NB: Copy/paste this section for each additional item and insert here	

17. Will the facility be shut down? *Provide details below.* Yes ☐ No ☐

Facility shutdown	Date		dd/mm/yyyy
	Time		24-hour clock
	Duration		days / hours / minutes

18. What were the immediate causes of the incident?

Part 1C – Complete for Well Incidents

19. What is the WOMP relating to the well?	
WOMP Name Document number Version	
20. Well Phase or Activity	
Drilling Completions Interventions Production Other (please describe)	☐ ☐ ☐ ☐ ☐
21. Brief description of current well status and condition (e.g. Shut-in, Producing, Barrier status etc, Stabilised pressures etc)	
22. Details of all material facts and circumstances concerning the reportable incident that the titleholder knows or is able, by reasonable search or enquiry, to find out	

23. What were the causes of the incident? This section should include a detailed analysis of the failure mode, including demonstration that an appropriate internal investigation has been completed in line with the titleholder's management systems, and provide evidence of the internal assurance of the outcomes of the investigation. This section should also cover the risk of the same incident occurring in other wells operated by the titleholder (e.g. rule out a systemic issue) If this information is not available within the 3 days requirement contact NOPSEMA.

24. Requirement for ongoing reporting This section is required if the reportable incident has not been resolved at the time of submitting the initial 3-day report. A further written report is required every 30 days from the date of the issue of the initial report, until the incident has been resolved. This report should provide information including details of any temporary control measures put in place to minimise risks to well integrity to as low as practicable, and an estimate of when control measures set out in the WOMP for the well will be reinstated.

Part 1D – Complete for environmental incidents

25. What is the accepted environment plan for this incident?		
Environment plan name Document number Version		
26. Has the incident resulted in an impact to the environment? *Provide details below.* Yes ☐ No ☐		
Incident details *e.g. estimated area of impact, nature/significance of impact*		
Environmental Receptors	Open ocean ☐ Shoreline ☐ Population centre ☐ Stakeholders ☐ Other sensitivity ☐ *e.g. conservation area, nesting beach*	Macroalgae ☐ Coral Reef ☐ Benthic invertebrates ☐ Seagrass ☐ Mangrove ☐

Environment Receptor	
Environmental receptor	
Location of environment receptor	
Latitude (Provide datum used i.e. GDA2020)	
Longitude (Provide datum used i.e. GDA2020)	
Date and time of impact	
Action taken to minimise exposure	
Specify each matter protected under Part 3 of the EPBC Act impacted	
NB: Copy/paste this section for each additional environmental receptor and insert here	

27. Are any environments at risk of impact, including as a result of spill response measures? *Provide details below.* Yes ☐ No ☐		
Details *e.g. zone of potential impact*		
Environmental Receptors	Open ocean ☐ Shoreline ☐ Population centre ☐ Stakeholders ☐ Other sensitivity ☐ *e.g. conservation area, nesting beach*	Macroalgae ☐ Coral Reef ☐ Benthic invertebrates ☐ Seagrass ☐ Mangrove ☐

Environment Receptor	
Estimated location of 'at-risk' environments	
Estimated impact date & time	

Action required to minimise exposure	
Specify each matter protected under Part 3 of the EPBC Act at risk	
NB: Copy/paste this section for each additional environmental receptor and insert here	
28. Was an oil pollution emergency plan activated? *Provide details below.* Yes ☐ No ☐	
If yes, what action has been implemented /planned?	
If yes, how effective is/was the spill response?	
29. Was an environmental monitoring program initiated? *Provide details below.* Yes ☐ No ☐	
If yes, what actions have been implemented and/or planned?	
30. Did the incident result in the death or injury of any fauna? *Provide details below.* Yes ☐ No ☐	

Injured fauna	**Species 1**	**Species 2**	**Species 3**
Species name (common or scientific name)			
Number of individuals killed or injured	Killed: Injured:	Killed: Injured:	Killed: Injured:
NB: Copy/paste this section for each additional species and insert here			

Part 1E – Complete for actions

31. Actions taken to avoid or mitigate any adverse environmental impacts of the incident		
Action	**Responsible party**	**Completion date** *Actual or intended*
NB: Copy/paste this section for each additional actions and insert here		
32. Corrective actions taken, or proposed, to stop, control or remedy the incident		
Action	**Responsible party**	**Completion date** *Actual or intended*
NB: Copy/paste this section for each additional actions and insert here		
33. Actions taken, or proposed, to prevent a similar incident occurring in the future		
Action	**Responsible party**	**Completion date** *Actual or intended*
NB: Copy/paste this section for each additional actions and insert here		

Part 1F – Complete for attachments

34. Are you attaching any documents? *Provide details below.* **Yes ☐ No ☐**

No.	ID	Revision	Date	Title/description

NB: Copy/paste this section for each document and insert here

Part 2 – Information required within 30 days of accident or dangerous occurrence

NOPSEMA acknowledges that in many circumstances an operator may not have completed an investigation within 3 days of an accident or first detection of a dangerous occurrence and agrees that these items must be provided within 30 days unless otherwise agreed, in writing with NOPSEMA.

In circumstances where an investigation has been completed within 3 days, and these items are available (supplemented, as required by any attachments) this part should also be completed at that time.

35. Is there any change to the LTI information provided at section 15 *Provide details below.* Yes ☐ No ☐	
Details	
36. Has the investigation been completed? *Provide details below.* Yes ☐ No ☐	
Root cause 1	
Root cause 2	
Root cause 3	
Other root causes	
37. Full report. *Describe investigation in detail, including who conducted the investigation and in accordance with what standard/procedure with reference to attachments listed in the 'attachments table' as applicable*	

38. Actions to prevent recurrence of same or similar incident.		
Action	**Responsible party**	**Completion date** *Actual or intended*
NB: Copy/paste this section for each additional actions and insert here		

39. Are you attaching any documents? Yes ☐ No ☐ *If yes, add to Section 1F Complete for Attachments.*

1. CONSULTATION APPROACH

Consultation under regulation 25 of the OPGGS(E) Regulations provides that a titleholder must consult each relevant person (regulation 25(1)), must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person (regulation 25(2)), and must allow a relevant person a reasonable period for consultation (regulation 25(3)).

A titleholder must also give a relevant person a reasonable opportunity to consult – this means that a titleholder will need to demonstrate that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant person (see Tipakalippa Full Court paragraph 104). The EP must contain a report that contains an assessment of the merits of any objection or claim about the adverse impact of each activity to which the EP relates, and a statement of the titleholder's response, or proposed response, if any, to each objection or claim (regulation 24(b)).

The criteria for acceptance of an EP includes that the EP demonstrates that the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate (regulation 34(g)).

For the Greater Western Flank Phase 4 (GWF-4) Drilling and Subsea Installation Environment Plan (EP), Woodside has taken a broad and proactive tiered consultation approach over a period of 8 months.

This approach was aimed at raising public awareness of the consultation opportunity and to enable self-identification. It included a social media campaign and advertising in national, state, regional and Indigenous newspapers.

The tiered consultation approach discharges regulation 25 of the Environment Regulations' requirements. The approach is proactive, extended, has enabled self-identification, and has raised broad awareness of Woodside's activities related to this EP.

1.1 Tiered consultation approach

Regulation 25	Woodside's consultation approach assessed and identified relevant persons, enabled two-way dialogue and engagement, and included email and phone call follow-up. The approach taken comfortably satisfies the requirements of regulation 25: to give relevant persons sufficient information and allow a reasonable period of time for consultation (see Section 5 of the EP).
Proactive	To raise awareness of the consultation process, and to enable grass-roots consultation, Woodside undertook advertised regional consultation roadshows and facilitated consultation at regional community events.
Self-Identification	Broad communication activities were undertaken to build awareness of consultation and enable self-identification, supported by targeted education materials.
Broad Understanding	Broad proactive communication activities were undertaken with the public to raise awareness of Woodside's activities.

1.2 Building on the existing consultation approach

For this EP, Woodside has built on its consultation methodology and undertaken additional consultation activities throughout the consultation period to ensure a reasonable period of time and sufficient information has been provided to relevant persons so that they can make an informed assessment of the possible consequences of the activity on their functions, interests or activities.

The approach for this included:

- a consultation period of up to 8 months.
- undertaking proactive consultation activities to provide sufficient information to relevant persons.
- raising awareness of the consultation process and opportunity to provide feedback.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- driving participation in the consultation process.

An overview of this approach is shown below:

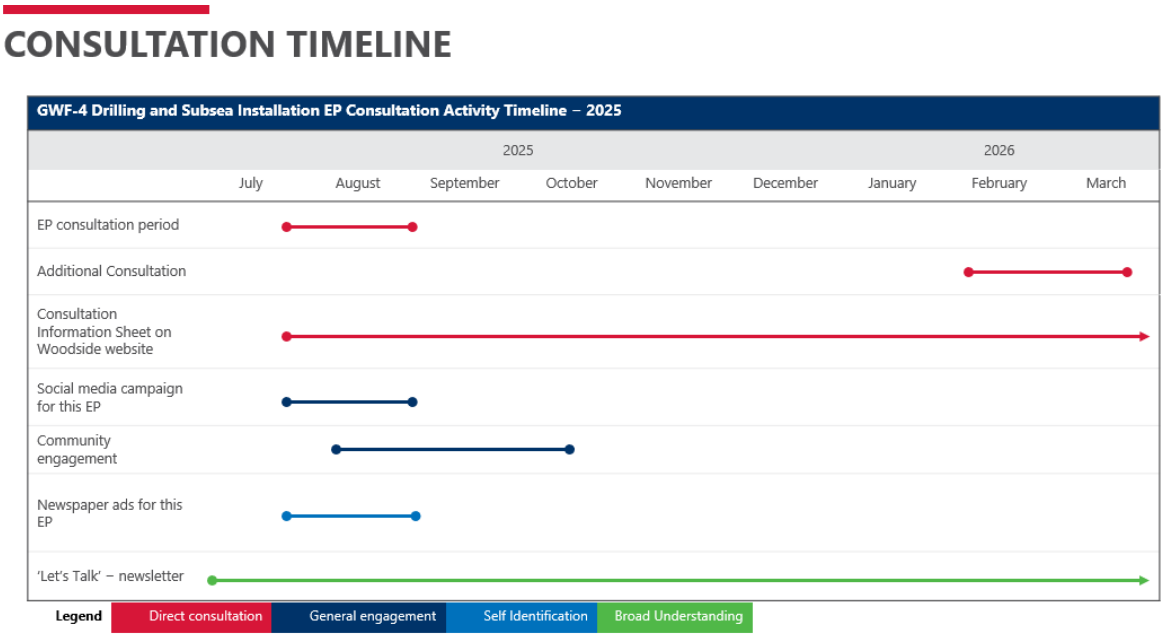

Figure 1-1: GWF-4 Drilling and Subsea Installation EP consultation activity

1.3 Goodwyn Area Infill Development Offshore Project Proposal (OPP)

The Petroleum Activity as defined in this EP is a part of the Goodwyn Area Infill Development Offshore Project Proposal (OPP) accepted by NOPSEMA on 27 August 2025.

1.4 Traditional Custodian consultation approach

Woodside has meaningful long-term relationships with relevant Traditional Custodians specifically tailored to provide for effective engagement which is continuous and is not confined to individual EPs, instead covering all EPs and other issues that are relevant at the time of engagement.

To this end, consultation on any particular EP, including the GWF-4 Drilling and Subsea Installation EP, happens before, during and after the designated consultation period in a more holistic manner allowing for an understanding of the bigger picture and accommodating cultural requirements. Ongoing consultation remains an important part of consulting with Traditional Custodians based on availability, cultural protocols and the preferred method of consultation for each relevant person.

1.5 NGO consultation approach

Woodside has an established history of consulting with environmental non-government organisations (NGOs) as part of its EP consultation. In its methodology (Section 5.3.4, Table 5-4), NGOs are considered “Other non-government groups or organisations” and “Research institutes and local conservation groups or organisations”. Relevant person identification for these categories is based on registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation.

So that NGOs were given sufficient information and a reasonable period of time to consult, Woodside:

- advertised the consultation period (social and traditional media)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- directly consulted NGOs
- participated in regional community events (which were advertised) in the Pilbara and Gascoyne which could be attended by any NGOs including local groups (if NGOs attended these sessions, they did not identify themselves).

1.6 NGO response

During consultation for the GWF-4 Drilling and Subsea Installation EP, Woodside contacted seven NGO's with one response being received from The Wilderness Society.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2. RELEVANCY ASSESSMENT

2.1 Assessment of relevant persons for the proposed activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25 (1) of the Environment Regulations is outlined below at Table 1 and Table 2.

Persons or organisations that Woodside assessed as not relevant but nonetheless chose to contact at its discretion in accordance with Section 5.3.4 in the EP or self-identified and Woodside assessed as not relevant are summarised below at Table 1 and Table 3.

As per Woodside's methodology (Section 5 in the EP), assessment of relevant persons is informed by the EMBA, shown in Figure 2-1.

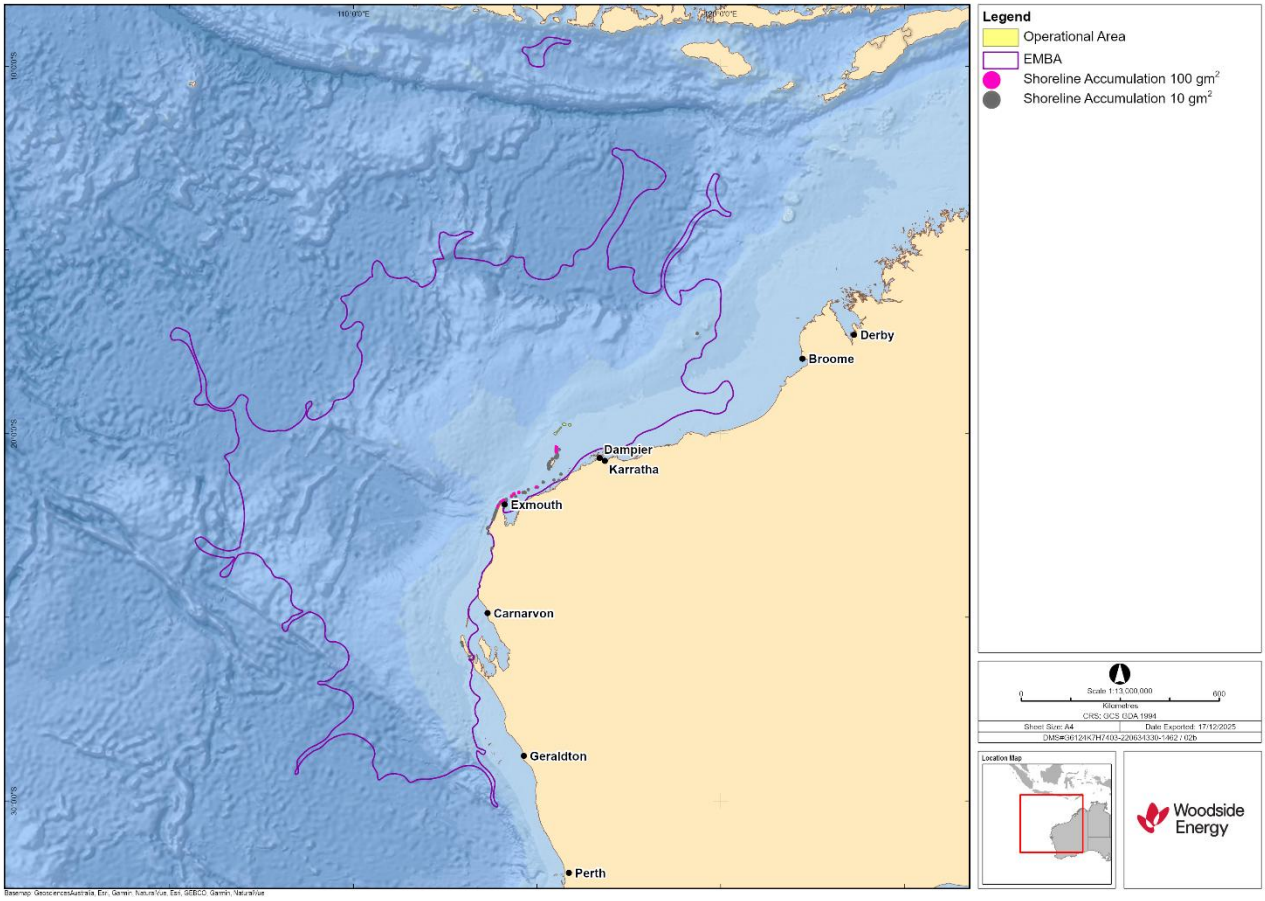

Figure 2-1: Operational Area and EMBA for the GWF-4 Drilling and Subsea Installation EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.2 Table 1: Assessment of relevance

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Commonwealth and WA State Government Departments or Agencies – Marine			
Australian Border Force (ABF)	Responsible for coordinating maritime security.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. ABF's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Communications and Media Authority (ACMA)	Regulator for communications and media.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. ACMA's responsibilities may be relevant to the activity as there maybe telecommunications lines that intersect the Operational Area.	Yes
Australian Fisheries Management Authority (AFMA)	Responsible for managing Commonwealth fisheries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. No Commonwealth fisheries are active in the Operational Area. The North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. AFMA's responsibilities may be relevant to the activity as the North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.	Yes
Australian Hydrographic Office (AHO)	Responsible for maritime safety and Notices to Mariners.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AHO's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Maritime Safety Authority (AMSA) – Marine Pollution	Legislated responsibility for oil pollution response in Commonwealth waters.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AMSA – Marine Pollution's responsibilities may be relevant to the activity as the proposed activity has a hydrocarbon spill risk which may require AMSA response in Commonwealth waters.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Australian Maritime Safety Authority (AMSA) – Marine Safety	Statutory agency for vessel safety and navigation.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. AMSA – Marine Safety's responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries	Responsible for implementing Commonwealth policies and programs to support agriculture, fishery, food and forestry industries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. No Commonwealth fisheries are active in the Operational Area. The North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. DAFF – Fisheries responsibilities may be relevant to the activity as the North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.	Yes
Department of Defence (DoD)	Responsible for defending Australia and its national interests.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. DoD's responsibilities may be relevant to the activity as defence training areas lie within the EMBA.	Yes
Department of Foreign Affairs and Trade (DFAT)	Responsible for promoting and protecting Australia's interests internationally and contributes to global stability and economic growth. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(a) of the Environment Regulations. DFAT has no direct role in the management of the Commonwealth marine area but has an interest in ensuring that consultation with foreign entities, both private and government, is effective and is aligned with Australia's interests. DFAT manages Australia's relationships and interaction with the governments of our neighbouring countries. The proposed activity has the potential to impact DFAT's functions, interests or activities as the EMBA overlaps Indonesian waters.	Yes
Department of Planning, Lands and Heritage (DPLH)	Responsible for state level land use planning and management, and oversight of Aboriginal cultural heritage and built heritage matters.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. There is known Maritime Cultural Heritage overlapping the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Department of Primary Industries and Regional Development (DPIRD)	Responsible for managing State fisheries.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The Mackerel Managed Fishery (Area 2), Marine Aquarium Fish Managed Fishery, Onslow Prawn Managed Fishery, Pilbara Trap Managed Fishery, Pilbara Line Fishery, and Specimen Shell Managed Fishery have been active in the Operational Area within the past 5 years. The West Coast Demersal Scalefish (Interim) Managed Fishery, West Australian Sea Cucumber Fishery, Exmouth Gulf Prawn Managed Fishery, Gascoyne Demersal Scalefish Managed Fishery, Mackerel Managed Fishery (Area 2), Marine Aquarium Fish Managed Fishery, Nickol Bay Prawn Managed Fishery, Northern Demersal Scalefish Managed Fishery, Octopus Interim Managed Fishery, Onslow Prawn Managed Fishery, West Coast Rock Lobster Managed Fishery, Pilbara Crab Managed Fishery, Pilbara Fish Trawl (Interim) Managed Fishery, Pilbara Trap Managed Fishery, Pilbara Line Fishery (Condition), Shark Bay Beach Seine and Mesh Net Managed Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, Pearl Oyster Managed Fishery, West Coast Deep Sea Crustacean Managed Fishery, Exmouth Gulf Beach Seine and Mesh Net Managed Fishery, Open Access in the North Coast and Gascoyne Coast have been active in the EMBA within the past 5 years. DPIRD's responsibilities may be relevant to the activity as the government department responsible for State fisheries.	Yes
Department of Transport and Major Infrastructure (DTMI)	Legislated responsibility for oil pollution response in State waters.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has a hydrocarbon spill risk, which may require DTMI response in State waters.	Yes
Pilbara Ports	Pilbara Ports encompasses the Ports of Ashburton, Dampier, Port Hedland and Varanus Island. Pilbara Ports oversees the operation of the greenfield ports of Anketell, Balla Balla,	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 25(1)(b) of the Environment Regulations. The proposed activity has the potential to impact Pilbara Ports responsibilities as the EMBA overlaps the Pilbara Ports area of responsibility.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
	Cape Preston East, Cape Preston West and Urala. Pilbara Ports oversees the Shipping and Pilotage Act 1967 (SPA) ports of Barrow Island, Cape Preston, Onslow and Port Walcott.		
Western Australian Museum (WAM)	Manages 200 shipwreck sites of the 1,500 known to be located off the Western Australian coast.	Woodside has applied its methodology for 'Historical cultural heritage groups or organisations' under regulation 25(1)(d) of the Environment Regulations. There is known shipwrecks overlapping the EMBA which the Western Australian Museum may be responsible for.	Yes
Commonwealth and WA State Government Departments or Agencies – Environment			
Clean Energy Regulator (CER)	The Clean Energy Regulator administers schemes legislated by the Australian Government for measuring, managing, reducing or offsetting Australia's carbon emissions.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. CER's responsibilities are not relevant to non-operational EPs.	No
Department of Agriculture, Fisheries and Forestry (DAFF) – Biosecurity (marine pests, vessels, aircraft and personnel)	DAFF administers, implements and enforces the Biosecurity Act 2015. DAFF requests to be consulted where an activity has the potential to transfer marine pests. DAFF also has inspection and reporting requirements to ensure that all conveyances (vessels, installations and aircraft) arriving in Australian territory comply with	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DAFF – Biosecurity's responsibilities may be relevant to the proposed activities in the EMBA in the prevention of introduced marine species.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
	international health regulations and that any biosecurity risk is managed. DAFF requests to be consulted where an activity involves the movement of aircraft or vessels between Australia and offshore petroleum activities either inside or outside Australian territory.		
Department of Biodiversity, Conservation and Attractions (DBCA)	Responsible for managing WA's parks, forests and reserves to achieve wildlife conservation and provide sustainable recreation and tourism opportunities.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(b) of the Environment Regulations. The DBCA's responsibilities may be relevant to the activity as the EMBA overlaps WA parks, forests or reserves. Activities have the potential to impact marine tourism in the EMBA.	Yes
Department of Climate Change, Energy, the Environment and Water (DCCEEW)	Responsible for implementing Commonwealth policies and programs to support climate change, sustainable energy use, water resources, the environment and our heritage. Administers the Underwater Cultural Heritage Act 2018 in collaboration with the States, Northern Territory and Norfolk Island, which is responsible for the protection of shipwrecks, sunken aircraft and other types of underwater heritage and their associated artefacts in Commonwealth waters.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DCCEEW's responsibilities may be relevant to the proposed activities in the EMBA as there are potential environmental impacts from the proposed activity. There is known Maritime Cultural Heritage overlapping the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Person or Organisation	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Director of National Parks (DNP)	Responsible for the management of Commonwealth parks and conservation zones.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. DNP's responsibilities may be relevant to the activity as DNP requires an awareness of activities that occur within Australian Marine Parks (AMPs), and an understanding of potential impacts and risks to the values of parks (NOPSEMA guidance note: N-04750-GN1785 A620236, June 2020). Titleholders are required to consult DNP on offshore petroleum and greenhouse gas exploration activities if they occur in, or may impact on, the values of marine parks, including where potential spill response activities may occur in the event of a spill (i.e. scientific monitoring).	Yes
Ningaloo Coast World Heritage Advisory Committee (NCWHAC)	Supports the DBCA to manage the Ningaloo Coast World Heritage Area.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 25(1)(a) of the Environment Regulations. The NCWHAC's responsibilities may be relevant to the activity as the EMBA overlaps the Ningaloo Marine Park.	Yes
Commonwealth and State Government Departments or Agencies – Industry			
Department of Mines, Petroleum and Exploration (DMPE)	Department of relevant State Minister.	Required to be consulted under regulation 25(1)(c) of the Environment Regulations.	Yes
Department of Industry, Science and Resources (DISR)	Department of relevant Commonwealth Minister.	Required to be consulted under regulation 25(1)(a) of the Environment Regulations.	Yes
Commonwealth commercial fisheries and peak representative bodies			
Australian Southern Bluefin Tuna Industry Association (ASBTIA)	Represents the interests of the Southern Bluefin Tuna Fishery and Western Skipjack Fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Southern Bluefin Tuna Fishery overlaps the Operational Area and EMBA, but it has not been active in the Operational Area or EMBA within the past 5 years. As the peak representative body for the Southern Bluefin Tuna Fishery, ASBTIA's functions may be relevant to the activity as the Southern Bluefin Tuna Fishery overlaps the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth Fisheries Association (CFA)	Represents the interests of commercial fishers with licences in Commonwealth waters.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. No fisheries are active in the Operational Area. The North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. CFA's functions may be relevant to the activity as the North-West Slope Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.	Yes
North West Slope Trawl Fishery	Commonwealth commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years.	Yes
Southern Bluefin Tuna Fishery	Commonwealth commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area and EMBA, it has not been active in the Operational Area or EMBA within the past 5 years. Woodside does not consider that the proposed activity will present a risk to licence holders, given since 1992, the majority of Australian catch has concentrated in south-eastern Australia. (Patterson et al., 2022). In addition, given fishing methods by licence holders for species fished in this fishery (Australia has a 35% share of total global allowable catch of Southern Bluefin Tuna, which is value-added through tuna ranching near Port Lincoln (South Australia), or fishing effort in New South Wales (Australian Southern Bluefin Tuna Industry Association). Woodside chose to contact Southern Bluefin Tuna Fishery at its discretion in line with Section 5.3.7 of the EP.	No
Tuna Australia	Represents the interests of the Western Tuna and Billfish Fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Western Tuna and Billfish Fishery overlap the EMBA and has been active in the EMBA within the past 5 years. As the peak representative body for the Western Tuna and Billfish Fishery Tuna Australia's	Yes

		functions may be relevant to the activity as the Western Tuna and Billfish Fishery is active in the EMBA.	
Western Deepwater Trawl Fishery	Commonwealth commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps EMBA and has been active in the EMBA within the past 5 years.	Yes
Western Skipjack Fishery	Commonwealth commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area and EMBA, it has not been active in the Operational Area or EMBA within the past 5 years. Woodside does not consider that the activity will present a risk to licence holders, given the fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (Patterson et al., 2022). In addition, interactions are not expected given the species' pelagic distribution fishing methods for species fished by licence holders.	No
Western Tuna and Billfish Fishery	Commonwealth commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area, it has not been active in the Operational Area within the past 5 years. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years.	Yes
State commercial fisheries and peak representative bodies			
Aquaculture Council of Western Australia (ACWA)	State peak body for WA's aquaculture industry.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. ACWA's members are active within the EMBA. As the peak body for WA's aquaculture industry, ACWA's functions may be relevant to the activity as ACWA members are active in the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Western Australian Fishing Industry Council (WAFIC)	Represents the interests of commercial fishers with licences in State waters.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The Mackerel Managed Fishery (Area 2), Marine Aquarium Fish Managed Fishery, Onslow Prawn Managed Fishery, Specimen Shell Managed Fishery, Pilbara Trap Managed Fishery and Pilbara Line Fishery have been active in the Operational Area within the past 5 years. The West Coast Demersal Scalefish (Interim) Managed Fishery, West Australian Sea Cucumber Fishery, Exmouth Gulf Prawn Managed Fishery, Gascoyne Demersal Scalefish Managed Fishery, Mackerel Managed Fishery (Area 2), Marine Aquarium Fish Managed Fishery, Nickol Bay Prawn Managed Fishery, Northern Demersal Scalefish Managed Fishery, Octopus Interim Managed Fishery, Onslow Prawn Managed Fishery, West Coast Rock Lobster Managed Fishery, Pilbara Crab Managed Fishery, Pilbara Fish Trawl (Interim) Managed Fishery, Pilbara Trap Managed Fishery, Pilbara Line Fishery (Condition), Shark Bay Beach Seine and Mesh Net Managed Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, Pearl Oyster Managed Fishery, West Coast Deep Sea Crustacean Managed Fishery, Exmouth Gulf Beach Seine and Mesh Net Managed Fishery, Open Access in the North Coast and Gascoyne Coast have been active in the EMBA within the past 5 years. WAFIC's functions may be relevant to the activity as the peak representative body for State fisheries. Under an agreement WAFIC issued consultation materials to relevant commercial fisheries licence holders. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting, via WAFIC, fisheries that are assessed as having a potential for interaction in the Operational Area. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would be undertaken only in the event of an unplanned emergency scenario.	Yes
Pearl Producers Association	Peak representative organisation of The Australian South Sea Pearling Industry, with members in Western Australia and the Northern Territory.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area but has not been active in the Operational Area within the past 5 years. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		As the peak representative body for the Pearl Oyster Managed Fishery, the PPA's functions may be relevant as the Pearl Oyster Managed Fishery has been active in the EMBA.	
Abalone Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area but has not been active in the Operational Area within the past 5 years. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Exmouth Gulf Beach Seine and Mesh Net Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Exmouth Gulf Prawn Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Gascoyne Demersal Scalefish Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	
Mackerel Managed Fishery (Area 2)	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
Marine Aquarium Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
Nickol Bay Prawn Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Northern Demersal Scalefish Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	
Onslow Prawn Managed Fishery (Area 1and 2)	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
Open Access in the North Coast, Gascoyne Coast and West Coast Bioregions	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Pilbara Crab Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. While the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area in the past 5 years. The fishery overlaps the EMBA and has been active in the EMBA in the past five years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demersal Scalefish Fishery: Pilbara Trawl Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. While the fishery overlaps the Operational Area, the fishery has not been active in the Operational Area in the past 5 years. The fishery overlaps the EMBA and has been active in the EMBA in the past five years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Demersal Scalefish Fishery: Pilbara Trap Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
Demersal Scalefish Fishery: Pilbara Line Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
Pearl Oyster Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the EMBA in the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries	No

		Woodside does not consider that the activity will present a risk to licence holders, given fishers are active south of Perth and from the beach (previous WAFIC advice). Further, no fishing occurs north of the Perth Metropolitan Area and therefore, no effort occurs within the Operational Area or EMBA.	
Specimen Shell Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA in the past 5 years. Woodside acknowledges WAFIC's consultation guidance and has applied this by consulting fisheries that are assessed as having a potential for interaction in the Operational Area via WAFIC.	Yes
West Coast Deep Sea Crustacean Managed Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. Although the fishery overlaps the Operational Area, the fishery has not been active within the Operational Area in the past five years. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
West Coast Demersal Scalefish Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
West Coast Rock Lobster Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years.	
Western Australian Sea Cucumber Fishery	State commercial fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The fishery does not overlap the Operational Area. The fishery overlaps the EMBA and has been active in the EMBA within the past 5 years. As per WAFIC's Commercial Fishing Consultation Framework for the Offshore Oil and Gas Sector and Consultation Approach for Unplanned Events, consultation with State fisheries relevant to the EMBA of the proposed activity would however be undertaken only in the event of an unplanned emergency scenario.	No
Western Rock Lobster Council	Represents the interests of the Western Rock Lobster Managed Fishery.	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 25(1)(d) of the Environment Regulations. The West Coast Rock Lobster Managed Fishery is active within the EMBA. The Western Rock Lobster Council's functions may be relevant to the activity as the West Coast Rock Lobster Managed Fishery is active in the EMBA.	Yes
Recreational marine users and peak representative bodies			
Gascoyne Recreational Marine Users	Gascoyne-based dive, tourism and charter operators. The Bindunbur Part B Native Title claim does not overlap the EMBA. The claim is coastally adjacent to the EMBA, for which Nimanburr Aboriginal Corporation and GAC are the Registered Native Title Body Corporates.	Yes
Nyangumarta Karajarri Aboriginal Corporation (NKAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Nyangumarta-Karajarri Overlap Proceeding (Yawinya) Native Title claim does not overlap the EMBA. The claim is coastally adjacent to the EMBA, for which NKAC is the Registered Native Title Body Corporate. NKAC is party to the NKAC KSCS Eighty Mile Beach ILUA, Nyangumarta Karajarri and Anna Plains Station ILUA, and Nyangumarta Karajarri and Mandora Station ILUA, which are coastally adjacent to the EMBA.	Yes
Nyangumarta Warrarn Aboriginal Corporation (NWAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Nyangumarta People (Part A) Native Title claim does not overlap the EMBA. The claim is coastally adjacent to the EMBA, for which NWAC is the Registered Native Title Body Corporate.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		NWAC is party to the Nyangumarta PBC KSCS ILUA, Nyangumarta Warrarn Aboriginal Corporation & Mandora Pastoral Lease ILUA, and Nyangumarta Warrarn Aboriginal Corporation & Wallal Downs Pastoral Lease ILUA, which are coastally adjacent to the EMBA.	
Nyul Nyul PBC Aboriginal Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Bindunbur and Bindunbur #2 Native Title claims do not overlap the EMBA. The claims are coastally adjacent to the EMBA, for which Nyul Nyul PBC Aboriginal Corporation, GAC and Nimanburr Aboriginal Corporation are the Registered Native Title Body Corporates.	Yes
Robe River Kuruma Aboriginal Corporation (RRKAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. RRKAC is party to the KM & YM Indigenous Land Use Agreement 2018 and RTIO Kuruma Marthudunera People ILUA, which overlap the EMBA.	Yes
Thalanyji/Nhuwala People	Native Title Claim Group	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Thalanyji/Nhuwala Peoples Native Title claim overlaps the EMBA. All notices to Thalanyji/Nhuwala Peoples, other than in relation to the claim application, are via BTAC.	Yes
Wanparta Aboriginal Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Ngarla and Ngarla #2 (Determination Area A), Ngarla Overlap Proceeding and Ngarla People (Mount Goldsworthy Lease Proceeding) Native Title claims are coastally adjacent to the EMBA, for which Wanparta Aboriginal Corporation is the Registered Native Title Body Corporate. The Wanparta Aboriginal Corporation is party to the Ngarla Pastoral ILUA and Ngarla PBC KSCS ILUA, which are coastally adjacent to the EMBA.	Yes
Wirrawandi Aboriginal Corporation (WAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Yaburara & Mardudhunera People Native Title claim, for which WAC is the Registered Native Title Body Corporate, overlaps the EMBA. WAC is also party to the Cape Preston Project Deed (YM Mardie ILUA) and KM & YM Indigenous Land Use Agreement 2018, which overlap the EMBA; and Cape Preston West Export Facility, which is coastally adjacent to the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Wunambal Gaambera Aboriginal Corporation (WGAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. When consultation first commenced, WGAC was a relevant person due to its interests with the Kimberley State Marine Park. However, a revision of the EMBA resulted in the marine park no longer overlapping the EMBA resulting in WGAC not being a relevant person, as determined by Woodside's methodology. For this reason, WGAC is not relevant but chosen to consult.	No – but chosen to consult
Yamatji Marlpa Barna Baba Maaja Aboriginal Corporation (Yamatji Land and Sea Council)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. Yamatji Marlpa Barna Baba Maaja Aboriginal Corporation is party to the Cape Range National Park, which overlaps the EMBA.	Yes
Yawuru Native Title Holders Aboriginal Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Rubibi Community Native Title claim does not overlap the EMBA. The claim is coastally adjacent to the EMBA, for which the Yawuru Native Title Holders Aboriginal Corporation is the Registered Native Title Body Corporate. The Yawuru Native Title Holders Aboriginal Corporation is party to the Eco Beach ILUA, Yawuru Area Agreement ILUA, Yawuru Nagulagun / Roebuck Bay Marine Park ILUA and Yawuru Prescribed Body Corporate ILUA – Broome, which are coastally adjacent to the EMBA.	Yes
Yindjibarndi Aboriginal Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Ngarluma/Yindjibarndi People Native Title claim, for which Yindjibarndi Aboriginal Corporation and NAC are the Registered Native Title Body Corporates, overlaps the EMBA. Yindjibarndi Aboriginal Corporation is also party to the Damper Marine Park, which overlaps the EMBA.	Yes
Yinggarda Aboriginal Corporation (YAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d). The Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People Native Title claim, which the Baiyungu, Thalanyji and Yinggarda people are party to, overlaps the EMBA. YAC and NTGAC are the Registered Native Title Body Corporates holding Native Title on behalf of the Baiyungu, Thalanyji and Yinggarda people. YAC is party to the Brickhouse and Yinggarda Aboriginal Corporation ILUA and Quobba –	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		Yinggarda Pastoral ILUA, which are coastally adjacent to the EMBA. All communications to YAC is via Gumala Aboriginal Corporation.	
Yued Aboriginal Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d). The Yued Indigenous Land Use Agreement is coastally adjacent to the EMBA, for which the Yued Aboriginal Corporation is the Registered Native Title Body Corporate.	Yes
Native Title Representative Bodies			
Kimberley Land Council (KLC)	Native Title Representative Body	Woodside has applied its methodology for 'Native Title Representative Bodies' under regulation 25(1)(d) of the Environment Regulations. KLC is party to the Yawuru Area Agreement ILUA, which is coastally adjacent to the EMBA. KLC is the Native Title Representative Body for the Kimberley region of Western Australia. As such, they are not a Prescribed or Registered Native Title Body Corporate but exist to assist native title claimants and holders. KLC's functions may be relevant to the proposed activity in relation to its facilitation and coordination function as a Native Title Representative Body under applicable federal legislation.	Yes
Yamatji Marlpa Aboriginal Corporation (YMAC)	Native Title Representative Body	Woodside has applied its methodology for 'Native Title Representative Bodies' under regulation 25(1)(d) of the Environment Regulations. The Thalanyji/Nhuwala People Native Title claim does not overlap the EMBA. The claim is coastally adjacent to the EMBA, for which YMAC is the Registered Native Title Body Corporate. YMAC is party to the KM & YM Indigenous Land Use Agreement 2018, which overlaps the EMBA; and Kariyarra and State ILUA, which is coastally adjacent to the EMBA. YMAC is also party to the following marine parks – Abrolhos, Dampier, Montebello, Ningaloo, Gascoyne, Shark Bay, Cape Range National Park, which overlap the EMBA. YMAC is the Native Title Representative Body for the Yamatji and Pilbara regions of Western Australia. As such, they are not a Prescribed or Registered Native Title Body Corporate but exist to assist native title claimants and holders. NTGAC, Thalanyji/Nhuwala People and Nanda Aboriginal Corporation nominated representative is YMAC. Woodside has therefore consulted NTGAC, Thalanyji/Nhuwala People and Nanda Aboriginal Corporation via YMAC. Woodside contacted YMAC to seek guidance with respect to the appropriate Traditional Custodian group(s) to engage with respect to the proposed activity where this was not	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		clear. YMAC's functions may be relevant to the proposed activity in relation to its facilitation and coordination function as a Native Title Representative Body under applicable federal legislation.	
Yamatji Southern Regional Corporation	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. Yamatji Southern Regional Corporation is party to the Yamatji Nation Agreement, which is coastally adjacent to the EMBA.	Yes
Self-identified First Nations groups			
Ngarluma Yindjibarndi Foundation Ltd (NYFL)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 25(1)(d) of the Environment Regulations. The Ngarluma and Yindjibarndi People, the NWS JVs and Woodside entered into an agreement on 22 December 1998 (Agreement). NYFL was subsequently incorporated under the terms of the Agreement to act as trustee for the trust established to benefit the Ngarluma and Yindjibarndi People and the Roebourne Aboriginal Community. Subsequent to that, the Ngarluma people settled their Native Title claim and established their nominated representative corporation, NAC, and the Yindjibarndi people settled their Native Title claim and established their nominated representative corporation, the Yindjibarndi Aboriginal Corporation. NAC and the Yindjibarndi Aboriginal Corporation are the appropriate representative bodies for consultation in relation to cultural interests. NYFL's functions may be relevant to the proposed activity in relation to its functions under the Agreement.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Other First Nations Groups			
Save Our Songlines (SOS) and/or [Individual 1]	Representatives of Non-Government Organisation SOS and/or [Individual 1]	Woodside has applied its methodology for 'Traditional Custodians and nominated representative corporations' and 'Other non-government groups or organisations' under regulation 25(1)(d) of the Environment Regulations to determine SOS (SOS) and/or [Individual 1] relevance for the proposed activity. SOS and/or [Individual 1] stated interest is to stop or pause Scarborough gas and to stop new industry on the Burrup; and oppose planned expansion of the Burrup Hub industry by Woodside, Perdaman and Yara. In addition, their stated interests also include the protection of Murujuga rock art. As SOS and/or [Individual 1] have raised concerns relating to the processing of greenhouse gases on Murujuga, Woodside considers that SOS and/or [Individual 1] are relevant for this activity.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3. CONSULTATION ACTIVITIES

3.1 GWF-4 Drilling and Subsea Installation EP consultation activities

Woodside has been conducting extensive consultation with relevant persons and other parties for this EP since July 2025 when consultation commenced with interested and affected stakeholders as part of a planned, integrated and consistent approach to stakeholder engagement for Woodside's proposed opportunities.

A broad consultation process has been undertaken with relevant persons for the GWF-4 Drilling and Subsea Installation EP. Consultation aims to be inclusive, transparent, voluntary, respectful and two-way. Consultation was undertaken by email, letter, phone call and/or meetings and through advertising.

3.2 Discharging Regulation 25 of the Environment Regulations

Woodside advertised the planned activities proposed for this EP in national, state and relevant local newspapers including (see Record of Consultation, reference 6.5).

No direct comments or feedback were received from the advertisements.

Newspaper	Coverage	Readership	Publication dates
The Australian	National	Weekly – 453,000	28 July 2025
The West Australian	Regional (WA)	Daily – 364,000	28 July 2025
Pilbara News	Local (WA)	Weekly – 17,611	30 July 2025
Midwest Times	Local (WA)	Weekly – 50,534	30 July 2025
North West Telegraph	Local (WA)	Weekly – 8,154	31 July 2025
Koori Mail	Indigenous	Monthly – 80,000	30 July 2025
National Indigenous Times	Indigenous	Monthly – 1,484,340	29 July 2025

A Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see Section 5.3.4 in the EP), which included details such as an activity overview, maps, a summary of key risks and/or impacts and management measures (Record of Consultation, reference 6.1 and 6.3).

Since the commencement of the initial consultation period (July 2025), the stakeholder Consultation Information Sheet has been available on Woodside's website, and the consultation update Consultation Information Sheet has been available since January 2026 ahead of the February 2026 activity update consultation period. Consultation Information Sheets include a toll-free 1800 phone number and Woodside's feedback email address consultation@feedback.woodside.com

The Woodside Consultation Activities webpage (accessible on the Consultation Information Sheet via a QR code, banners at community events and via social media content and advertisements) includes Consultation Information Sheets for the EPs on which Woodside is currently consulting, including this EP. The website page also features a subscribe field for EP-focussed communications from Woodside.

Additional targeted information was provided to select relevant persons based on their roles and responsibilities such as a vessel density map (Record of Consultation, reference 6.1.4 and 6.3.3), GIS shape files, shipwreck information (Record of Consultation, reference 6.1.5, 6.1.6, 6.3.5, 6.3.6), a submarine communication cable map (Record of Consultation, reference 6.1.7 and 6.3.6) and a defence zone map (Record of Consultation, reference 6.1.3 and 6.3.2).

Where appropriate, Woodside conducted phone calls and meetings with relevant persons.

Where appropriate, targeted follow-up emails were sent to relevant persons who had not provided a response prior to the close of the target feedback period.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside considered relevant person responses and assessed the merits and relevance of objections and claims about the potential adverse impact of the proposed activity set out in the EP, in accordance with the intended outcome of consultation (see Section 5.2 in the EP).

Consultation activities undertaken with relevant persons are summarised at Appendix F, Table 2.

Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact (see Section 5.3.4 in the EP) or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 3.

From August 2025, Woodside commenced a geotargeted sponsored social media campaign (Record of Consultation, reference 6.6) covering various local government authorities within, or coastally adjacent to, the EMBA for the proposed activities. The campaign brought the proposed activity to the attention of persons who may be interested and advised persons or organisations on how they can find out about Woodside's proposed activities by visiting Woodside's website.

Facebook	66 👍 23 ❤️ 7 😡 2 😳 7 shares	31	0

3.3 Proactive consultation

3.3.1 Community engagement

The Community Information Sessions or community events that Woodside has conducted or attended are outlined below (and captured in more detail in Record of Consultation, reference 6.7). To support attendance, Woodside published advertisements ahead of these sessions and events in relevant local newspapers and on social media.

Date	Location	Event (if applicable)
2-3 August 2025	Karratha	FeNaCING Festival
5 October 2025	Exmouth	Exmouth Community Markets
18 October 2025	Dampier	Dampier Beachside Markets

3.3.2 Community Liaison Group engagement

The Exmouth and Karratha Community Liaison Groups (CLGs) represent the interests of a range of local government, industry and community organisations in relation to oil and gas matters in the Exmouth and Karratha region. Woodside regularly meets with these two CLGs to discuss a range of issues including consultation of specific EPs. For this EP, see 4.9.6 for consultation with Exmouth CLG and 4.9.7 for Karratha CLG.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.3.3 Newsletters

Woodside's EP focussed newsletter *Let's Talk* is designed to reach existing and potential stakeholders and encourage self-identification about Woodside's EP-related activities. The newsletter provides quarterly updates about EP consultation activities, case studies on effective consultation with relevant persons and other EP related information such as forthcoming events where Woodside personnel will be consulting with the local community. *Let's Talk* is distributed in a variety of locations as well as across digital platforms including Woodside's website and social media channels. People can also subscribe to receive it on Woodside's website. (Record of Consultation, reference 6.8.1).

Woodside also publishes the *Karratha Community Update* newsletter quarterly which includes a QR code and encourages people to go to the Consultation Activities page on Woodside's website to subscribe and find information on EPs. (Record of Consultation, reference 6.8.2).

3.4 Traditional Custodian specific consultation

In addition to the approaches outlined above including community information sessions, additional activities were undertaken with relevant Traditional Custodians, which were specifically designed to provide for effective engagement with Traditional Custodians and so that information was provided in a form that was readily accessible and appropriate (Record of Consultation, reference 6.1.2).

Consultation undertaken specifically with Traditional Custodians for this EP includes direct engagement with nominated representative bodies via the contact listed on the Office of the Registrar of Indigenous Corporations (ORIC) website, requesting advice on how they would like to be engaged and asking whether other members and/or individuals should be consulted. This has resulted in:

- the EP's Summary Consultation Information Sheet, being provided to relevant Traditional Custodian groups (Record of Consultation, reference 6.1.2). The resource is developed and reviewed by subject matter experts with knowledge and experience in Indigenous Affairs, in collaboration with technical experts to ensure content is appropriate to the intended recipients
- meetings with directors, Elders and any nominated representatives, at a time and location nominated by them
- the exchange of written feedback and correspondence
- telephoning relevant persons to provide context, if requested and/or required
- invitations to and/or attendance at community monthly luncheons for Traditional Custodians.

Ongoing efforts were made to engage and develop relationships with these bodies via a variety of means such as email, phone calls, alternative contacts, texts, social media and, in some cases, physical visits.

Consultation meetings with attendees decided by Traditional Custodian groups and supported by senior Woodside representatives, subject matter experts and Indigenous Affairs advisers with skills and experience in community engagement. Meetings are developed through a two-way consultation process to ensure effective information sharing via:

- mutually agreed agenda avoiding time pressure
- encouraging Traditional Custodian attendees to control the pace of the meeting and pause at any time to ask questions, seek clarification or provide feedback
- visual aids such as posters, presentations, maps, simplified technical videos and real-world pictures and footage
- emphasis on potential planned and unplanned risks and impacts of the activity
- ample opportunity for questions and feedback
- discussion about ongoing relationship development and opportunities

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- distribution of hard-copy Consultation Information Sheets (Record of Consultation, reference 6.1.1) and Summary Consultation Information Sheets (Record of Consultation, reference 6.1.2) are available at in-person consultation
- meeting costs such as sitting fees, travel, legal support and executive support and other support required
- advertising in Indigenous publications such as the National Indigenous Times (29 July 2025) and Koori Mail (30 July 2025) (Record of Consultation, reference 6.5.1).

Newspaper	Coverage	Publication dates
Koori Mail	Indigenous	30 July 2025
National Indigenous Times	Indigenous	29 July 2025

Woodside also ran a geotargeted sponsored social media campaign (Record of Consultation, reference 6.6) to various communities that are coastally adjacent to the EMBA for the proposed activities.

Social media is a highly effective means to engage Indigenous audiences as outlined in Indigenous Digital Life: The Practice and Politics of Being Indigenous on Social Media (Bronwyn Carlson and Ryan Frazer, 2021).

The campaign brought the proposed activity to the attention of persons who may be interested and advised persons or organisations how they can learn more about Woodside's proposed activities by visiting Woodside's website. The advertisements linked to Woodside's website, which details the intent of consultation with relevant persons under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Cth)*.

Woodside uses a diverse range of techniques to reach relevant persons and build awareness of the proposed activity and how it may affect their functions, activities or interests, and to understand how to provide feedback. The combination of Prescribed Bodies Corporate (PBC) engagement meetings, traditional print media, social media and face-to face community interaction provides a wide-ranging opportunity to consult.

3.5 Consultation Update (February 2026)

As a result of revised modelling, the EMBA for this activity was revised.

Woodside identified a number of relevant persons who were potentially impacted by the change to the EMBA and provided a consultation update to these relevant persons which included:

- Government departments, where the changes to the EMBA were potentially relevant to their functions, interests or activities, including record keeping and emergency response preparedness.
- Stakeholders whose reason for relevancy changed as a result of the revised EMBA.

Stakeholders who were provided a consultation update were invited to provide any additional feedback during 2 week consultation period.

Based on the revised EMBA, Woodside also identified a number of persons and organisations who had not previously been consulted for this EP. Woodside has consulted these persons and organisations in accordance with regulation 25 of the Environment Regulations and the summary of that consultation is set out in **Appendix F, Table 2 and Table 3**. These stakeholders were provided 30 days for consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4. TABLE 2: CONSULTATION REPORT WITH RELEVANT PERSONS OR ORGANISATIONS

The black numbering **(N)** in the 'Summary of information provided and record of consultation for this EP' in Table 2 denotes an item raised by a stakeholder. The green numbering **(N)** in this section denotes Woodside's response to that issue.

4.1 Commonwealth and WA State Government departments or agencies – marine

4.1.1 Australian Border Force (ABF)

Summary of information provided and record of consultation for this EP:

- On 30 July 2025, Woodside emailed ABF advising of the proposed activity (Record of Consultation, reference 6.1.8), provided a Consultation Information Sheet, and a link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans: Information for the community*'.
- On 18 August 2025, as no response had been received, Woodside proactively sent a follow-up email (Record of Consultation, reference 6.2.1).
- On 10 February 2026, Woodside emailed ABF a consultation update on this EP (Record of Consultation, reference 6.3.10). Woodside advised that additional modelling during the EP development process had resulted in changes to the EMBA and based on those changes, Woodside was undertaking additional consultation with ABF. Woodside attached an updated Consultation Information Sheet which included a map of the revised EMBA.

Summary of Feedback, Objection or Claim	Woodside's Assessment of Merits of Feedback, Objection or Claim	Woodside's Statement of Response	Inclusion in Environment Plan
No feedback, objections or claims about the adverse impact of the activity received despite follow-up.		Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received after the EP has been accepted, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8).	No additional measures or controls are required.

Summary Report – Consultation Complete

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and considers consultation with ABF for the purpose of regulation 25 complete. Sufficient information, a reasonable period and a reasonable opportunity have been provided, as described in Section 5.4 of the EP and further summarised in the Consultation Approach above. Specifically:

Sufficient Information

Woodside has given ABF sufficient information to allow ABF to make an informed assessment of the possible consequences of the activity on its functions, interests or activities because:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- The Consultation Information Sheet for this EP has been publicly available on the Woodside website since July 2025 and updated Consultation Information Sheets since January 2026. Woodside gave this information to ABF on 30 July 2025, marking the commencement of consultation on this EP and provided a consultation update on 10 February 2026. The Consultation Information Sheet included:
  - The purpose of consultation and set out what was being sought through consultation.
  - A summary of the activity description, location of the activity, timing of the activity, receiving environment, impacts and risks associated with the PAP, and proposed mitigation and management measures.
  - A timeframe for consultation and the provision of feedback.
  - A link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans: Information for the community'*.
  - Advice that relevant persons can request that particular information provided during consultation not be published (to align with 25(4) of the Environment Regulations).

Reasonable Period

Woodside allowed ABF a reasonable period for consultation in the preparation of this EP because:

- A consultation period was stated in the initial correspondence and in the consultation update to ABF advising of consultation as well as when consultation closed for the purposes of the preparation of the EP. This enabled Woodside to assess feedback before EP submission.
- Woodside's methodology allows a 30-day consultation period and Woodside allowed ABF 30 days for the initial consultation and an additional 17 days for the consultation update in February 2026.
- Consultation for this EP commenced 8 months ago.
- In this context, Woodside allowed ABF a reasonable period for consultation in preparation of the EP.

Reasonable Opportunity

A reasonable opportunity to provide feedback has been provided because Woodside's approach to consultation with ABF is appropriate and adapted to the nature of interests of ABF:

- Woodside published advertisements in 7 national, state, and relevant local newspapers (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- Woodside ran a targeted social media campaign (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- In the absence of feedback following the initial consultation, Woodside sent a follow-up consultation email on 18 August 2025, reminding ABF of the opportunity to provide feedback.

Outcomes of Consultation

Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24. The measures (if any) that Woodside has adopted or proposes to adopt because of the consultation are appropriate because:

- No additional measures were considered as a result of consultation as ABF did not provide feedback for this EP.
- Woodside will continue to accept and assess feedback throughout the life of the EP and apply its Management of Change and Revision process when applicable.
- The measures and controls described in this EP address the potential impact from the proposed activity on ABF's functions, interests or activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.1.2 Australian Communications and Media Authority (ACMA)

Summary of information provided and record of consultation for this EP:

- On 29 July 2025, Woodside emailed ACMA advising of the proposed activity (Record of Consultation, reference 6.1.9), provided a Consultation Information Sheet, a link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans: Information for the community*', and a map of the submarine communication cables in the vicinity of the Operational Area.
- On 31 July 2025, ACMA responded to Woodside (SI Report A, reference 1.1) thanking them for the opportunity to comment and:
  - **(1)** Stated that the operational area described in Woodside's materials was not located near any existing submarine cable protection zones declared under Schedule 3A to the *Telecommunications Act 1997*.
  - **(2)** Recommended that Woodside engage with carriers responsible for submarine cables situated within the vicinity of the operational area, including those shown on the map provided by Woodside.
  - **(3)** Advised that for complete details on submarine cable locations potentially affected by the proposed activities, Woodside should contact the Australian Hydrographic Office (AHO), which develops and maintains charts showing active and out-of-service submarine cables.
  - **(4)** Indicated that, due to the general nature of ACMA's comments, no additional consultation would be required on environment plans associated with the GWF-4 Project.
- On 11 August 2025, Woodside replied to ACMA (SI Report A, reference 1.2) thanking them for their feedback and:
  - (1) Noted AMCA's confirmation that the Operational Area is not in the vicinity of any existing protection zones.
  - (2) Confirmed that Woodside was aware of cable infrastructure in the area owned by Telstra and Vocus and had contacted both parties regarding this EP.
  - (3) Noted that the AHO maintained records of geospatial coordinates for all active and out-of-service submarine cables and stated that AHO had also been contacted regarding this EP.
  - (4) Acknowledged ACMA's indication that no additional consultation was required for EPs associated with the GWF-4 Project but requested confirmation that ACMA would not require any consultation on any future EPs related to the GWF-4 Project.
- On 10 February 2026, Woodside emailed ACMA a consultation update on this EP (Record of Consultation, reference 6.3.14). Woodside advised that additional modelling during the EP development process had resulted in changes to the EMBA and based on those changes, Woodside was undertaking additional consultation with ACMA. Woodside attached an updated Consultation Information Sheet which included a map of the revised EMBA.

Summary of Feedback, Objection or Claim	Woodside's Assessment of Merits of Feedback, Objection or Claim	Woodside's Statement of Response	Inclusion in Environment Plan
(1) Stated that the Operational Area was not located near any existing submarine cable protection zones.	**(1)** Woodside notes ACMA's advice that the Operational Area was not located near any declared submarine cable protection zones.	**(1)** Woodside noted ACMA's advice that the Operational Area was not located near any declared submarine cable protection zones.	**(1)** No additional controls or measures are required.
(2)	**(2)**	**(2)**	**(2)**

Recommended that Woodside engage with carriers responsible for submarine cables near the Operational Area.	Woodside has identified that submarine cables are located in the proximity of the Operational Area and has provided consultation information to Telstra and Vocus.	Woodside confirmed it had provided consultation information to operators of submarine cables in the vicinity of the Operational Area.	No additional controls or measures are required, as Woodside had already provided consultation information to operators of submarine cables in the vicinity of the Operational Area as part of its consultation methodology, described in Section 5 and Appendix F of this EP.
(3) Advised that Woodside should contact AHO for details on submarine cable locations.	**(3)** Woodside provided consultation information to AHO.	**(3)** Woodside confirmed it had provided consultation information to the AHO.	**(3)** No additional controls or measures are required, as Woodside had provided consultation information to AHO as part of its standard consultation methodology, described in Section 5 and Appendix F of this EP.
(4) Confirmed that no further consultation would be required on EPs associated with the GWF-4 Project.	**(4)** Woodside notes ACMA's request regarding additional consultation on the GWF-4 Project but would like confirmation regarding any future consultation on EPs related to the GWF-4 Project.	**(4)** Woodside acknowledged ACMA's request regarding additional consultation for EPs associated with the GWF-4 Project but sought confirmation from ACMA regarding any future consultation on EPs related to the GWF-4 Project.	**(4)** No additional controls or measures are required.
While feedback has been received, there were no objections or claims.	Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24.	Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8).	No additional controls or measures are required.
Summary Report – Consultation Complete			
Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and considers consultation with ACMA for the purpose of regulation 25 complete. Sufficient information, a reasonable period and a reasonable opportunity have been provided, as described in Section 5.4 of the EP and further summarised in the Consultation Approach above. Specifically: **Sufficient Information** Woodside has given ACMA sufficient information to allow ACMA to make an informed assessment of the possible consequences of the activity on its functions, interests or activities because:			

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- The Consultation Information Sheet for this EP has been publicly available on the Woodside website since July 2025 and updated Consultation Information Sheets since January 2026. Woodside gave this information to ACMA on 29 July 2025, marking the commencement of consultation on this EP and provided an activity update on 10 February 2026. The Consultation Information Sheet included:
  - The purpose of consultation and set out what was being sought through consultation.
  - A summary of the activity description, location of the activity, timing of the activity, receiving environment, impacts and risks associated with the PAP, and proposed mitigation and management measures.
  - A timeframe for consultation and the provision of feedback.
  - A link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans*'.
  - Advice that relevant persons can request that particular information provided during consultation not be published (to align with 25(4) of the Environment Regulations).
- Woodside provided additional tailored information to AMCA including a map of submarine telecommunications cables relevant to the activity.
- On 31 July 2025, ACMA shared its feedback, claims or objections regarding this activity, indicating the information provided was sufficient to enable ACMA to make an informed assessment of the possible consequences of the activity on its functions, interests or activities.

Reasonable Period

Woodside allowed ACMA a reasonable period for consultation in the preparation of this EP because:

- A consultation period was stated in the initial correspondence and the consultation update to ACMA advising of consultation as well as when consultation closed for the purposes of the preparation of the EP. This enabled Woodside to assess feedback before EP submission.
- Woodside's methodology allows a 30-day consultation period and Woodside allowed ACMA 30 days for the initial consultation and an additional 17 days for the update in February 2026.
- Consultation for this EP commenced 8 months ago.
- In this context, Woodside allowed ACMA a reasonable period for consultation in preparation of the EP as evidenced by ACMA's response on 31 July 2025.

Reasonable Opportunity

Woodside allowed ACMA a reasonable opportunity for consultation in the preparation of this EP because:

- Woodside published advertisements in 7 national, state, and relevant local newspapers (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- Woodside ran a targeted social media campaign (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- Woodside considers a reasonable opportunity was provided to ACMA as evidenced by its response on 31 July 2025.

Outcomes of Consultation

Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24. The measures (if any) that Woodside has adopted or proposes to adopt because of the consultation are appropriate because:

- ACMA provided feedback but no objections or claims. In line with the intended outcome of consultation as set out in Section 5.2 and Regulations 24 and 34(g), Woodside has:
  - Responded to feedback from ACMA.
  - Made no changes or inclusions to the EP as a result of consultation with ACMA because appropriate measures are already included in the EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Woodside will continue to accept and assess feedback throughout the life of the EP and apply its Management of Change and Revision process when applicable.

4.1.3 Australian Fisheries Management Authority (AFMA)

Summary of information provided and record of consultation for this EP:

- On 29 July 2025, Woodside emailed AFMA advising of the proposed activity (Record of Consultation, reference 6.1.57), provided a Consultation Information Sheet, information on potential impacts to fisheries, and a link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans: Information for the community*'.
- On 30 July 2025, Woodside emailed AFMA to clarify that technical issues may have affected the display of the previous consultation email, Woodside re-issued the full consultation email, outlined that the Consultation Information Sheet is available on Woodside's website, and advised that the consultation period had been extended (Record of Consultation, reference 6.1.57.1)
- On 11 August 2025, AFMA responded to Woodside (SI Report A, reference 2.1) thanking them for the email and:
  - **(1)** Confirmed it had no direct comments to the EP.
  - **(2)** Requested that AFMA be included in future consultation on this matter.
  - **(3)** Confirmed that the fisheries listed by Woodside for the area of interest were correct and advised that Southern Bluefin Tuna Fishery should be included in the consultation, as fishery activity could occur within the EMBA.
- On 21 August 2025, Woodside replied to AFMA (SI Report A, reference 2.2) thanking them for their response and:
  - **(1)** Noted that AFMA had no comments on the EP.
  - **(2)** Confirmed it would include AFMA in future consultation related to the Greater Western Flank Phase 4 Project.
  - **(3)** Woodside confirmed that, as per AFMA's advice, Woodside had provided consultation materials to Southern Bluefin Tuna Fishery licence holders and the Australian Southern Bluefin Tuna Industry Association (ASBTIA) on 11 August 2025.
- On 10 February 2026, Woodside emailed AFMA a consultation update on this EP (Record of Consultation, reference 6.3.10). Woodside advised that additional modelling during the EP development process had resulted in changes to the EMBA and based on those changes, Woodside was undertaking additional consultation with AFMA. Woodside attached an updated Consultation Information Sheet which included a map of the revised EMBA.
- On 16 February 2026, AFMA responded to Woodside (SI Report A, reference 2.3) thanking them for their response and:
  - **(1)** Confirmed that it did not have any direct feedback on the Environment Plan.
  - **(2)** Requested to remain involved in any subsequent consultation relating to this matter.
  - **(4)** Confirmed that the fisheries list previously supplied by Woodside for the updated EMBA continued to be accurate.
- On 4 March 2026, Woodside replied to AFMA (SI Report A, reference 2.4) thanking them for their response and:
  - **(1)** Noted that AFMA had no comments on the EP.
  - **(2)** Confirmed it would include AFMA in future consultation related to the Greater Western Flank Phase 4 Project.
  - **(4)** Noted that the fisheries list previously supplied continued to be accurate.

Summary of Feedback, Objection or Claim	Woodside's Assessment of Merits of Feedback, Objection or Claim	Woodside's Statement of Response	Inclusion in Environment Plan
(1) AFMA confirmed it had no direct comments to the EP	**(1)** Woodside notes AFMA had no direct comments for this EP.	**(1)** Woodside thanked AFMA for its reply and for confirming it had no direct comments on the EP.	**(1)** No additional controls or measures are required.
(2) AFMA requested to be included in future consultation on this matter.	**(2)** Woodside understands that AFMA would like to be informed of future consultation opportunities and has committed to notifying AFMA prior to the commencement of activities.	**(2)** Woodside confirmed it would include AFMA in future consultation for the EP.	**(2)** No additional controls or measures are required. As per Woodside's standard notifications, AFMA will be notified 10 days prior to the commencement of activities and following completion of activities, as referenced as PS 1.6 and set out in Table 7-5, Section 7.10 of the EP.
(3) AFMA recommended that Woodside consult with specific Commonwealth fishery stakeholders.	**(3)** Woodside notes AFMA's advice that Southern Bluefin Tuna Fishery should be included in consultation for this EP and confirmed that in line with this advice Woodside provided consultation materials to Southern Bluefin Tuna Fishery licence holders and the Australian Southern Bluefin Tuna Industry Association (ASBTIA).	**(3)** Woodside confirmed that in line with the advice provided by AFMA, consultation materials were provided to Southern Bluefin Tuna Fishery licence holders and the Australian Southern Bluefin Tuna Industry Association (ASBTIA).	**(3)** No additional controls or measures are required, however based on advice from AFMA Woodside provided consultation information to Southern Bluefin Tuna Fishery licence holders and the Australian Southern Bluefin Tuna Industry Association (ASBTIA), as evidenced in Table 2 of Appendix F in this EP.
(4) AFMA confirmed that the fisheries list Woodside had previously provided continued to be accurate for the updated EMBA.	**(4)** Woodside notes that the fisheries list provided is still accurate following the EMBA revision.	**(4)** Woodside noted AFMA's confirmation that the list of fisheries previously provided remains accurate.	**(4)** No additional controls or measures are required.
While feedback has been received, there were no objections or claims.	Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24.	Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should further feedback be	No additional controls or measures are required.

		received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8).	

Summary Report – Consultation Complete

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and considers consultation with AFMA for the purpose of regulation 25 complete. Sufficient information, a reasonable period and a reasonable opportunity have been provided, as described in Section 5.4 of the EP and further summarised in the Consultation Approach above. Specifically:

Sufficient Information

Woodside has given AFMA sufficient information to allow AFMA to make an informed assessment of the possible consequences of the activity on its functions, interests or activities because:

- The Consultation Information Sheet for this EP has been publicly available on the Woodside website since July 2025. Woodside gave this information to AFMA on 29 July 2025, marking the commencement of consultation on this EP. The Consultation Information Sheet included:
  - The purpose of consultation and set out what was being sought through consultation.
  - A summary of the activity description, location of the activity, timing of the activity, receiving environment, impacts and risks associated with the PAP, and proposed mitigation and management measures.
  - A timeframe for consultation and the provision of feedback.
  - A link to NOPSEMA's brochure '*Consultation on offshore petroleum environment plans*'.
  - Advice that relevant persons can request that particular information provided during consultation not be published (to align with 25(4) of the Environment Regulations).
- On 11 August 2025 and 16 February 2026, AFMA shared its feedback, claims or objections regarding this activity, indicating the information provided was sufficient to enable AFMA to make an informed assessment of the possible consequences of the activity on its functions, interests or activities.
- In addition to the information in the Consultation Information Sheet, Woodside provided additional information to AFMA in response to AFMA's feedback (Woodside's email of 21 August 2025 and 4 March 2026).

Reasonable Period

Woodside allowed AFMA a reasonable period for consultation in the preparation of this EP because:

- A consultation period was stated in the initial correspondence to AFMA advising of consultation as well as when consultation closed for the purposes of the preparation of the EP. This enabled Woodside to assess feedback before EP submission.
- Woodside's methodology allows a 30-day consultation period and Woodside allowed AFMA 30 days for consultation.
- Consultation for this EP commenced 8 months ago.
- In this context, Woodside allowed AFMA a reasonable period for consultation in preparation of the EP as evidenced by AFMA's responses on 11 August 2025 and 16 February 2026.

Reasonable Opportunity

Woodside allowed AFMA a reasonable opportunity for consultation in the preparation of this EP because:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Woodside published advertisements in 7 national, state, and relevant local newspapers (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- Woodside ran a targeted social media campaign (see Consultation Activities). This allowed for broad awareness of the activity under the EP and also of consultation.
- Woodside considers a reasonable opportunity was provided to AFMA as evidenced by its responses on 11 August 2025 and 16 February 2026.

Outcomes of Consultation

Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24. The measures (if any) that Woodside has adopted or proposes to adopt because of the consultation are appropriate because:

- AFMA provided feedback but no objections or claims. In line with the intended outcome of consultation as set out in Section 5.2 and Regulations 24 and 34(g), Woodside has:
  - Responded to feedback from AFMA.
  - Made no changes or inclusions to the EP as a result of consultation with AFMA because appropriate measures are already included in the EP.
- Woodside will continue to accept and assess feedback throughout the life of the EP and apply its Management of Change and Revision process when applicable.

4.1.4 Australian Hydrographic Office (AHO)

Summary of information provided and record of consultation for this EP:

- On 29 July 2025, Woodside emailed AHO advising of the proposed activity (Record of Consultation, reference 6.1.10), provided a Consultation Information Sheet, a link to NOPSEMA's brochure *'Consultation on offshore petroleum environment plans: Information for the community',* a vessel density map and GIS Shape Files.
- On 29 July 2025, AHO responded to Woodside (SI Report A, reference 3.1) thanking them for the invitation to comment and:
  - **(1)** Confirmed that AHO had no concerns regarding any of the proposed activities.
  - **(2)** Outlined that AHO only required further updates when activity was due to commence.
- On 24 September 2025, Woodside replied to AHO (SI Report A, reference 3.2) thanking them for their response and:
  - **(1)** Noted that AHO had no concerns with the proposed activity.
  - **(2)** Confirmed that Woodside would notify AHO prior to the commencement of activities.
- On 10 February 2026, Woodside emailed AHO a consultation update on this EP (Record of Consultation, reference 6.3.16). Woodside advised that additional modelling during the EP development process had resulted in changes to the EMBA and based on those changes, Woodside was undertaking additional consultation with AHO. Woodside attached an updated Consultation Information Sheet which included a map of the revised EMBA.
- On 16 February 2026, AHO responded to Woodside (SI Report A, reference 3.3) thanking them for the invitation to comment and:
  - **(1)** Confirmed that AHO had no concerns regarding any of the proposed activities.
  - **(2)** Outlined that AHO only required further updates when activity was due to commence.
- On 4 March 2026, Woodside replied to AHO (SI Report A, reference 3.4) thanking them for their response and:
  - **(1)** Noted that AHO had no concerns with the proposed activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

– **(2)** Confirmed that Woodside would notify AHO prior to the commencement of activities.

Summary of Feedback, Objection or Claim	Woodside's Assessment of Merits of Feedback, Objection or Claim	Woodside's Statement of Response	Inclusion in Environment Plan
(1) No concerns with the activities.	**(1)** Woodside accepts AHO has no concerns regarding the activities.	**(1)** Woodside noted that AHO had no concerns and thanked AHO for its feedback.	**(1)** Not required
(2) No further updates required until activity beginning.	**(2)** Woodside will notify AHO prior to activity commencement	**(2)** Woodside confirmed it would notify AHO prior to the commencement of the activities.	**(2)** No additional controls or measures are required. As per Woodside's standard notifications, AHO will be notified no less than four working weeks prior to activity commencement, as referenced as PS 1.5 and set out in Table 7-5, Section 7.10 of the EP.
While feedback has been received, there were no objections or claims.	Woodside has assessed the merits of each objection or claim (if any) about the adverse impact of the activity to which the EP relates, as required under Regulation 24.	Woodside engages in ongoing consultation throughout the life of an EP. Woodside notes that further feedback may be received as part of ongoing consultation. Should further feedback be received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8).	No additional controls or measures are required.

Summary Report – Consultation Complete

Woodside has discharged its obligations for consultation under regulation 25 of the Environment Regulations and considers consultation with AHO for the purpose of regulation 25 complete. Sufficient information, a reasonable period and a reasonable opportunity have been provided, as described in Section 5.4 of the EP and further summarised in the Consultation Approach above. Specifically:

Sufficient Information

Woodside has given AHO sufficient information to allow AHO to make an informed assessment of the possible consequences of the activity on its functions, interests or activities because:
