"We are able to move that freight on a timely basis and that is one of the great benefits of having a curfew-free operation ... those markets are not impacted," APA spokesman Justin Portelli said.

"Each 24 hours that gets delayed has about a 20 per cent value impact on that produce."

Esso

An ExxonMobil Brand

Esso's decommissioning of platforms in Bass Strait

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its' Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Session and Drop-in

If you'd like to know more about activity plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting a community information session and drop-in at the following locations:

Wednesday 25 September 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool
10.00 am – 1.00 pm

Wednesday, 25 September 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
3.00 pm – 7.00 pm

Thursday, 26 September 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
3.00 pm – 7.00 pm

A presentation about decommissioning activities will be provided at 11.00 am for the AM sessions and 3.30 pm and 5.30 pm for the PM sessions.
We encourage you to come along and ask questions or to raise any concerns you may have.

To **register your attendance**, please email us at: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Bass Strait Decommissioning
- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project
- Bream Greenhouse Gas Appraisal Environment Plan (SEA CCS)

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

Letter to the Editor
Better Councillors demanded

Its time to evaluate the old crop of Councillors and assess what we need from a new crop. Councils matter. They not only provide the basic infrastructure of roads, footpaths. bridges and parks; but they also provide a range of community services and important advocacy for the area. They also have the power to set rates, which in our case are exceptionally high.

Anecdotal evidence suggests that Councils that exceed people's expectations (certainly not ours) have the characteristics of high levels of cooperation between Councillors, Council staff and the community with open transparent and healthy debate. Unfortunately for the community there's been little, if any, leadership and holding of Council staff to account. Most of the key initiatives of the current Council were determined by the previous one. Three years ago, the scene was meant to be set with a Citizens Assembly developing a vision for the Shire, which Council basically proceeded to ignore significant aspects of it. After three years it remains unclear what the current crop of Councillors has achieved.

Under their watch there's been a further erosion of democracy with the limitations on people being able to come in and ask questions uncensored. The elimination of the public from most non-commercial or staff briefings is a retrograde step. As ratepayer we might be paying full fees for our Councillors, but they are increasingly just a rubber stamp for staff recommendations for decisions of Council. Our Councillors are not informing us of their opinions nor holding staff to account. When you take out the monthly report of Councillors activities many meetings are lasting less than an hour vs 2-3 hours of the previous Council. Contrary to good governance and legal requirements, it appears that decisions have been made behind closed doors in briefing sessions with little if any public debate in the Council proper.

At a time when according to the State Government Whelan Report on Small Rural Council Finance rates should be falling as the asset load per assessment decreases with population 30,000 plus, our rates are one of the most expensive for our category of shires and indeed rising. Councillors have allowed a 100% increasing in capital works to $36m or an increase of 28% percent of our rates. The only ones benefiting are the favoured contractors. Farmers are disproportionately bearing the high cost of this largess though too high rate rises of nearly 10% vs 2.75% generally an unaffordable and unexplainable tax on our economy by our current crop of Councillors.

Without any fanfare it appears the $30m has been added to the forward budget unannounced for work at the municipal precinct without Councillors questioning it. Staff have allowed Coal Creek costs to blow out by nearly 400% to a $1m loss with a recent fake plan strangely with no budget allocation or performance targets endorsed by our Councillors. And appallingly there is little if any marketing.

There are serious allegations of failure to lawfully manage contracting. Two separate independent audits which have been leaked by internal whistle-blowers have allegedly raised serious of concerns requiring urgent remedial action. Council's senior staff have refused to release them, and our lame duck Councillors don't take any action to hold them to account or even demand that they are released after being advised that they exist. We are not sure if any of the over 40 recommendations have been implemented.

We need Councillors who are not passive lame duck ones. Ones who really set the direction. Ones who genuinely value democracy and partnership with the community. They must commit to reintroducing open question time not subject to staff censorship; reopen most briefings to the public and like Mornington Shire broadcast them as well as Council meetings and make decision through proper debate in Council not behind door illegal decision making in briefings. The new Councillors need to demand that Council process fair FOI requests and stop the stonewalling and delaying of them on sensitive matters,

The new Council needs to call for an urgent independent review of decision-making processes in compliance with the Local Government Act and the efficacy and compliance of contracting. It needs to release the two independent audit reports. They need to cut the capital works budget back to the long-term average and pass on zero rate rises for at least three years.

Council needs to stop being afraid of the community and act on the community vison developed through the Citizens Assembly that they actually implement in its new 4-year Council plan. We need Councillors who genuinely listen to and work for the community and not for Council staff. We don't want or need seat warmers, but real Councillors who have opinions and ideas, who listen to and respond on behalf of the community and who are active farsighted and democratic in their approach.

Andrew McEwen
Korumburra

Andrew McEwen says we need real Councillors not rubber stampers

Letter to the editor
Nuclear energy a risk to farming

The Liberal and National Parties recognise the need to cut carbon emissions by 2050 and have a policy which includes generation of electricity through the building of small modular reactors (SMR), a type of nuclear reactor.

Land within an 80km radius of a nuclear reactor is classified as an "ingestion exposure pathway", under international standards. This means that people may be exposed to radiation if they eat, or drink, food produced within the 80km radius after a leak. Internationally, farms within such a radius routinely test produce for radiation. Despite best intentions, leaks occur. Forty of the fifty-seven nuclear power stations in the US have leaked at some stage.

According to the International Atomic Energy Agency, there are NO small modular reactors currently in operation anywhere in the world.

Gippsland farms produce significant quantities of Australia's food. Unfortunately, many of these farms are within 80km of the planned site (Loy Yang) for the untested, small modular reactors.

Do we really want to risk large scale contamination of our dairy, beef, vegetables and water for the sake of nuclear reactors, which may leak and have not been tested anywhere in the world?

People in Gippsland have too much to lose to vote for nuclear power.

Seniors Week

Celebrate Seniors Week at South Gippsland.

South Gippsland Shire Council is thrilled to be supporting a number of events happening around our region.

Seniors Lunch at the Mirboo North Hotel: Saturday 28 October from 12.00pm

Seniors Week Entertainment at the Leongatha Senior Citizens Centre: Friday 11 October from 1.00pm

Seniors U3A Prom Coast Performing Arts Concert Singalong at the Foster War Memorial Arts Centre: Wednesday 23 October from 10.00am

Letter to the editor
Party hacks keep out

The heading of your recent article by Australian National University academics "Beyond roads and rubbish: Australians now expect local councils to act on bigger issues, including climate change" is certainly misleading.

The article gives responses from 1350 survey respondents (in Canberra?) claiming over 90% of respondents agree with "motherhood" sentiments saying local councils should support the needs, values and health of local communities but does not expand on the results of the question whether councils "should focus on providing only basic services (roads, rates and rubbish.) To this question the article claims 70% agree and 30% disagree. Surely this should be the main takeaway from the survey, forget the green, woke and international issues.

I suppose unsurprisingly, for a survey conducted by a university in Canberra, a result of 69% agree with the question " Political parties should play a greater role in local government. We can do without poitical aspirants, party hacks and division along party lines here in South Gippsland.

Wander through restored wetlands

Erika Allen

THE Heyfield Wetlands will host a bird-spotting and conservation appreciation day on Saturday, October 12, offering nature enthusiasts a chance to explore ecological restoration efforts in the area.

For a $10 fee, participants can join a guided tour led by Callam Reynolds, who consults on environmental projects including wetland restoration.

People can learn how to identify plant species and understand the importance of restoring wetland ecosystems. Funds raised will go towards maintaining the wetlands.

Heyfield Wetlands committee member Mike Kube said 15,000 shrubs, grasses, and aquatic species have been planted over the past 18 months, made possible by a two-year Gippsland Lakes Coordinating Committee community grant.

The $90,000 grant meant the committee could appoint an expert in wetland restoration to manage the revegetation project.

Some plants are still establishing – 240 were planted earlier this month by first-year Monash medical students who were undertaking their community-based placement in Heyfield - but the event will highlight the role these plants play in supporting the ecosystem, such as improving water quality, as visitors explore the lagoons and ponds.

The wetlands have not always been a paradise. Mr Kube said he'd seen photographs from 1999 depicting scarce plant life.

"People used to say when it flooded, it just stank. The water would stay there, and it would become quite unpleasant," he said.

Rain washes water from roads, carrying dirt and pollutants, while heavier downpours bring run-off from nearby farmland to the southwest, bringing compounds like phosphates into the wetlands.

Mr Kube explained the primary goal of revegetating the wetlands was to improve water quality before it flowed into the Thompson River and Gippsland Lakes.

Mr Kube said past revegetation projects have focused on terrestrial species rather than aquatic plants. This time, they have been planting below the water line and around the ponds' fringes that sometimes flood. This is called the ephemeral zone.

Species are planted strategically according to their optimal aquatic environment – what depth they can survive in.

A 1.8-metre wide, 25m-long jute mat made from organic material is laid over the ground, with plants inserted directly into it.

"You lay that right along the high water mark, and then you plant in that jute mat. The whole idea is that the jute mat hopefully suppresses weeds and lets the plants (grow), and the jute mat rots away after a couple of years," Mr Kube said.

He said school groups commonly volunteered time to planting, with one metropolitan school consistently contributing over 15 years.

Peninsula Grammar School students have travelled to the Heyfield Wetlands as part of their outdoor education program, planting over 20,000 trees, shrubs, grasses and aquatic plants throughout the years.

Mr Kube said students recently assisted the current revegetation project, planting up to 750 plants in one and a half hours.

The revegetation project is set to conclude at the end of December, but the nature walk in October is a chance to showcase the work done so far.

Mr Kube said the guided nature walk is the first of many recreational activities developed by the Tourism Innovation Working Group, a new community-led group that has been formed as part of the Future of Heyfield Timber Transition project.

"(The wetland) certainly is a recreation resource. When you're down there working, there's heaps of people that seem to be walking around any time of the day, so from that point of view, it's really good," Mr Kube said.

The nature walk begins at 10am and will wrap up at noon on October 12. Heyfield Lions Club are catering a barbeque lunch.

Anyone interested in the event is advised to make a booking via this website **https://www.trybooking.com/events/landing/1288326**

Eisteddfod win for Sale City Band

SALE City Band tasted success at the Latrobe Valley Eisteddfod in Traralgon on September 8.

Competing in the D grade section, the Sale band won the competition against Aberfeldie, Stonnington (both from Melbourne) and Warragul.

Bands played three contrasting pieces with the adjudicator awarding Sale first place for its performance of *Poppies For Fallen Soldiers*, a hymn style tribute; *Road To Run*, a piece in the style of the classic big band song *Birdland*, featuring solos from within the band; and the concert march *Punchinello*.

The result was greeted with cheers and fist pumps from players who worked hard and played well under first year musical director Tom Cousin.

There will be an opportunity to hear the band perform these pieces at their annual concert at The Wedge on Sunday, October 13, from 2pm.

The concert is a culmination of brass band tradition with a big band sound, local talent and vibrant themes based on the events of 2024. There are featured artists Izzie Wicks and Jonathon Kendall performing vocals and instrumental solos, backed by the full sound of the versatile 25-piece brass band.

Singers Izzie Wicks and Jonathon Kendall with Musical Director Tom Cousin and the cornet section of the Sale City Band rehearsing for their upcoming October concert. Photo: Contributed

JA22604

Director Yashmita Mahindra is expanding the C-Bay General Store and opening a café due to popular demand within the growing community of Coronet Bay. Z01_3924

New café opening in Coronet Bay this summer

THE C-Bay General Store re-opened its doors under new management in June last year. Since taking over – now operating as a family business, director Yashmita Mahindra and her husband Harmeet Singh Sidhu have prioritised expanding the store's grocery variety and all-day menu, moving beyond its initial limited offerings.

Customers can now enjoy a broader selection of alcohol, groceries, and diverse food options, including country fried chicken, homemade Indian cuisine and beloved pub-style dishes like the classic chicken parmigiana. Operating from breakfast through to dinner, the store caters to both the local community and tourists flocking to the area.

To meet the growing demand for dining options, Yashmita and Harmeet saw the opportunity to make efficient use of their space and open a new on-site café with plans to welcome indoor dining with a new breakfast menu.

"We're planning a place for locals and visitors to enjoy their coffee and a café style meal," Yashmita explained.

The management and staff are excited about the store's potential and look forward to becoming a staple in the community, with plans for the café's official opening this summer.

"We've also expanded our variety in-store with a large range in the grocery and confectionery aisle."

Yashmita has ambitious plans for the future, including the re-opening of the fuel station. In a discussion with the Sentinel-Times Yashmita highlighted the importance of the general stores' central location, which is just 100 metres from the Coronet Bay Foreshore Reserve, the Bronze Yarns Sculpture Walk and Coronet Bay Launching Facility. This prime spot makes it an ideal hub for locals and visitors alike.

Stay tuned for more updates as C-Bay General Store & Café continues to evolve and serve the needs of its patrons. Visit the friendly staff at 100 Cutty Sark Road, Coronet Bay from 8am until 8pm.

Milestone success for mouse matchmakers

PRECIOUS Pookila pups have been spotted in Wilsons Promontory National Park, signalling an early success for a genetic rescue mission.

In September 2023, six female Pookilas were released to the Prom in the hopes that they would couple up with local males. This flagship cohort were bred as part of a conservation breeding program at Melbourne Zoo and Moonlit Sanctuary.

Pookila pups at Wilsons Promontory National Park.

Now, a year later, six pups have been seen frequenting burrows near the release sites.

The small burrowing mouse is native to south-eastern Australia and inhabits open heathland and coastal areas.

Habitat destruction and predation by cats and foxes has caused the species to become extinct in seven of its known 12 Victorian locations. The remaining wild populations are fragmented and susceptible to inbreeding and further decline with the effects of climate change.

Small tissue samples taken from the wild-born pups will help researchers monitor the genetic health of the remaining wild populations, with the hopes of documenting an increase in diversity with each new generation.

This month, a further four female Pookilas have been released to the Prom to continue the mouse matchmaking initiative.

Shy and nocturnal, Pookilas are soil engineers who build complex multi-generational burrow systems, which aerates the soil and contributes to the spread of seeds and fungal spores. They can be distinguished from the house mouse by their bicoloured tail, large eyes, soft, thick fur, and a lack of 'mousey' odour.

The five remaining Victorian sites, believed to contain fewer than 3000 Pookilas, are in Gippsland – including at Wilsons Promontory and Loch Sport. An additional population was established in Royal Botanic Gardens Cranbourne in May.

The Victorian Pookila Conservation Breeding and Reintroduction Program is a joint project between the Department of Energy, Environment and Climate Action, Gippsland Water, Moonlit Sanctuary Wildlife Conservation Park, Parks Victoria, Royal Botanic Gardens Victoria, Zoos Victoria, and partners in Gunaikurnai Land and Waters Aboriginal Corporation and Bunurong Land Council Aboriginal Corporation.

The Victorian Government has committed $690,000 to the protection of Pookila through its Nature Fund, along with Zoos Victoria's Bushfire Emergency Wildlife Fund donations and generous philanthropic contributions in safeguarding our native species. We are proud to contribute to the recovery of this endangered mouse and look forward to continued success as more Pookilas are released into their natural habitat.

ExxonMobil

Esso's decommissioning of platforms in Bass Strait

Esso — An ExxonMobil Brand

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its' Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Session and Drop-in

If you'd like to know more about activity plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting a community information session and drop-in at the following locations:

Wednesday 25 September 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool
10.00 am – 1.00 pm

Wednesday 25 September 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
3.00 pm – 7.00 pm

Wednesday 25 September 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
3.00 pm – 7.00 pm

A presentation about decommissioning activities will be provided at 11.00 am for the AM sessions and 3.30 pm and 5.30 pm for the PM sessions. We encourage you to come along and ask questions or to raise any concerns you may have.

To register your attendance, please email us at: **consultation@exxonmobil.com**

If these dates and times don't suit, please contact us at **consultation@exxonmobil.com** or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:
- Bass Strait Decommissioning
- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project
  Bream Greenhouse Gas Appraisal Environment Plan (SEA CCS)

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.*

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Paramedic Immogen Nolan and MICA parameic Duncan Roney were guiding locals on how to perform CPR effectively. Ns16_4124

Saving one heart at a time

ONE of the most dire medical episodes someone can experience is cardiac arrest but thanks to the efforts of local paramedics an automated external defibrillator (AED) is now located outside the Wooli Express.

Cowes paramedics held a community session to not only inform locals about the AED, but showcase how to use it and how to help save a life during a cardiac emergency by performing CPR.

High praise was also given to the Rotary Club of Wonthaggi, who donated the AED and supported the initiative.

Speaking at the Wooli Tavern on Saturday, October 6, senior MICA team manager, Duncan Roney said an AED was invaluable as the earlier someone can shock the heart the better chances it has of recovering.

Paramedic Immogen Nolan also highlighted that every minute CPR is delayed, the survival rate is decreased by 10 per cent.

"So if 10 minutes goes by without CPR being initiated, you don't have much chance of surviving," she said.

"It's really important we get a bystander performing CPR, particularly in areas that are quiet or very isolated.

MICA paramedic Duncan Roney was presented with a Paul Harris Fellow award from the Rotary Club of Wonthaggi. He is pictured with past District Governor Linda Humphries. Ns19_4124

"We rely on communities to do CPR effectively."

She noted when performing CPR, aim for a five-centimetre depth compression, or a third of the chest, and it should be hard enough to potentially crack ribs.

"You want to be able to get a full recoil as well, when you're pressing down, you want to come up to allow the blood to fill up again and pump it around."

It is also important to check for a pulse or if the patient is breathing.

"We just want bystanders to get onto the chest compressions straight away and make sure you're prioritising CPR over the AED," she said.

"If you're by yourself and someone has gone into cardiac arrest, we'd rather you call for help and start compressions, don't worry about the AED, get someone else onto that."

And much to Duncan's surprise, Wonthaggi Rotary presented him with the prestigious Paul Harris Fellow award in recognition of his contributions to the community for the activities and programs he's led.

Paramedics also urged locals to sign up to become a GoodSAM responder by downloading the app, where you will be alerted if someone is in cardiac arrest nearby.

For more information, visit ambulance.vic.gov.au/call-push-shock.

Paramedic Immogen showcases how to use an AED. Ns18_4124

Victoria on the international stage for offshore wind energy

The Allan Labor Government is cementing Victoria as an international leader in renewable energy with Melbourne set to host the Global Wind Energy Council's Asia Pacific Wind Energy Summit.

Minister for Tourism Sport and Major Events Steve Dimopoulos and Minister for Energy and Resources Lily D'Ambrosio announced the APAC Wind Energy Summit will be held at the Melbourne Convention and Exhibition Centre in July 2025.

The three day summit brings international industry leaders, policymakers and global investors to Victoria – the home of Australia's first offshore wind generation industry. Following a successful inaugural event in Melbourne in 2023 and a second edition this year in South Korea, the third conference will provide a platform to drive discussion regarding the growth of wind energy across the Asia Pacific.

Businesses will play a strong role in supporting the delivery of the offshore wind industry which will be key to the state's renewable energy transition and meeting the legislated targets of at least 2 gigawatts (GW) of offshore wind energy generation by 2032, 4 GW by 2035 and 9 GW by 2040. The state is also leading the way in accelerating the deployment of offshore wind power – announcing at the 2023 summit that Victoria was the first subnational government in the world to join the Global Offshore Wind Alliance.

Offshore wind is critical to helping Victoria reach net zero emissions by 2045 and is expected to create over 6,000 jobs and generate billions in investment. Victoria will release an Expression of Interest for the state's first offshore wind energy auction by the end of the year, an important next step in building the first offshore wind farm in the country.

The conference will also boost the state's economy, with 1500 delegates staying at local hotels and enjoying the best of Victoria's hospitality sector, delivering an estimated economic contribution of $5.8 million.

Business events like the summit continue to make a significant contribution to the Victoria's economy - in the last financial year, Melbourne Convention Bureau delivered 213 business events and secured 215 future business events which are forecast to deliver $252 million in economic benefit.

Minister for Energy and Resources Lily D'Ambrosio said:
"Victoria has some of the best offshore wind resources in the world and we've done the groundwork to become the home of the country's first offshore wind industry which is attracting significant investment from all over the world."

Minister for Tourism Sport and Major Events Steve Dimopoulos said:
"We are proud to support this summit which plays a strong role in boosting our economy and bringing together people who share our vision for taking strong action against climate change."

New public facilities for Stony Creek Racecourse

Thanks to support from the Allan Labor Government, visitors are set to benefit from new facilities at Stony Creek Racecourse that will enhance race days and local events.

Minister for Racing Anthony Carbines visited the Stony Creek Racing Club to announce funding for a major upgrade to customer facilities and outdoor dining area.

The refurbishment will include upgrades to the public bar, the TAB area which will include a new customer service hub, the race day office as well as a new alfresco deck and shade sail outside.

Construction on the customer service hub and race day office has begun and is expected to be completed this month, while other works are expected to start later this year.

The Labor Government has tipped in $100,000 towards the refurbishment as part of its Regional Customer Facilities Program grant, with the club also providing more than $128,000. This announcement follows the clubs recent unveiling of a new automated irrigation system at the racecourse which the Labor Government contributed $319,000 towards.

Completed in April this year, the new system enables consistent watering across the track while reducing the risk of leaks, overwatering and pooling.

The watering system will be of immense benefit to trainers and jockeys, improving the track condition for the club's five annual race meetings and up to four official trials and jump out meetings.

Since 2014, the Labor Government has provided more than $840,00 to support six racing events and 12 infrastructure projects at the Stony Creek Racecourse.

Minister for Racing Anthony Carbines said:
"These upgrades to Stony Creek Racecourse reflect our commitment to ensuring regional racing clubs get the support they deserve. I look forward to seeing how these new upgrades benefit the club now and into the future"

Member for Eastern Victoria for Tom McIntosh said:
"The thoroughbred racing industry in the Latrobe-Gippsland region generates more than $89 million for the Victorian economy and helps sustain over 700 full-time equivalent jobs in the region."

Stony Creek Racing Club Chief Executive Officer Jason Benbow said:

"We would like to thank the Victorian Government for awarding our club with significant grants to help improve our racecourse and customer facilities."

Worms – what's the spring risk?

The reduced pasture heights for much of Victoria are increasing the susceptibility of sheep (and cattle) to internal parasites.

Grazing below a pasture height of 4cm will increase the ingestion of infective larvae. While most egg contamination occurs in the summer-autumn period, up to 40% can come from eggs deposited during late spring and early summer.

Typically, in spring there is an abundance of quality pasture which allows your sheep to cope with the worms they have.

However, given the challenging season this may not be the case. Farmers who are early weaning due to low feed availability need to prioritise worm control as weaners are the most susceptible livestock class to internal parasites.

Livestock that are in poorer condition and potentially on restricted nutrition can have a reduced resistance and resilience to internal parasites.

It's crucial to assess worm burdens during high-risk conditions, which in the current seasonal conditions could include lighter stock grazing shorter and highly contaminated pastures.

It's also important to have worm-free paddocks set up for weaners. Ideally, paddocks that weaners are put into will have only been grazed by sheep who received an effective summer drench.

The best paddocks to put weaners into may be ones that have been hay paddocks, are new pastures or paddocks that have been grazed by mature cattle.

Sheep that are infected with worms may show signs of scours, weight loss or event death. It is essential to monitor worm burdens using Wormtest 4-6 weeks after the weaning and treat based on results.

Summer drenching is the key to minimising this worm carryover into next year - by making sure there are few worms in your sheep getting a free ride to autumn.

Management of internal parasites is essential for animal production and welfare, especially during high-risk times when stock are in light condition.

Seek advice from your animal health professional such as a veterinarian or consultant to assist with developing a worm management strategy.

For more information about managing in dry seasonal conditions visit agriculture.vic.gov.au or call 136 186.

Council – has told The Australian elders from the Orange Local Aboriginal Land Council believed the songlines of the blue-banded bee Dreaming "had never previously existed".

Significant surveys in 2021, including the Philip Clarke Aboriginal Cultural Values Mapping Report, the Lance and Kamminga report and the Sneddon cultural surveys, did not mention the Dreaming.

In her detailed reasons, Ms Plibersek said six members of the OLALC, including five Wiradyuri elders, had disputed the veracity of the blue-banded bee Dreaming in a February submission.

"Information about a public artwork by Wiradjuri artist Baranga Wiradjuri (Birrunga Wiradyuri), named the Blue Banded Bee Creation Story, was also submitted to support the validity of the Dreaming as an Aboriginal tradition," she said in her report. "Whilst not identical, the description of the artist's interpretation of the Dreaming is largely consistent with WTOCWAC's explanation."

Additional details on the Dreaming story were provided to Ms Plibersek by an unnamed Wiradyuri elder whose submission was delayed due to medical issues.

The blue-banded bee mural at Bathurst Post Office

Mr Wiradyuri began painting in the 2010s, later opening his own gallery in Spring Hill, Brisbane.

He was born Robert Henderson and presented his art under that name until at least August 2018, before going by Birrunga Wiradyuri.

Originally from rural NSW, he has lived in Queensland since primary school, primarily around the Sunshine Coast.

Created in collaboration with Indigenous artists Kane Brunjes and Stevie O'Chin, the artwork's portrayal and placement on a songline is detailed on Mr Wiradyuri's gallery website.

"Our sacred mountain is Wahluu (Mount Panorama). There is a sacred songline that runs from Wahluu to Bubay Wahluu (Mount Stewart) and it is this songline that is portrayed in the work," the caption reads.

"We Wiradyuri, with the counsel and guidance of our Elders, performed a healing ceremony that healed this Songline in 2018. In 2022 the production of the work was housed in Bathurst Memorial Entertainment Centre which is on that Songline."

In an interview with Bathurst radio station 2BS from February 2022, Wiradyuri said the work "very much sticks to that story (of the blue-banded bee); it's very close to us Wiradyuri".

WTOCWAC was contacted for comment and Ms Plibersek declined to elaborate on her detailed reasoning.

Twin breaks silence in brother's murder trial

EMMA KIRK

The twin sister of a man who allegedly killed his mother to gain money from life insurance policies has given evidence in his trial, telling the court of a phone call with her mother's psychologist, who shared concerns about her brother.

Monique Rebelo described the day her mother died as "one of the worst days of my life".

Her brother Andre Zachary Rebelo is on trial for the murder of their mother Colleen who was found dead at her Bicton home in Perth's southwest on May 25, 2020. He has pleaded not guilty.

Last week, the WA Supreme Court was told Mr Rebelo had taken out three life insurance policies against his mother in the week before her death.

Prosecutor Brett Tooker told the court three days after Ms Rebelo died, Mr Rebelo started the claims process to access the insurance premiums.

The jury heard he also submitted forged documents to one of the insurers, including false medical information about his mother, a coroner's report and her last will and testament.

He pleaded guilty to four charges of fraud in relation to the forged documents.

Ms Rebelo's cause of death has never been established.

The court was told while her death was unexpected it was not treated as suspicious by first responders who were called to Ms Rebelo's home when she died.

The jury also heard police reopened the case when one of the insurers reported the matter suspecting an insurance claim against her life was fraudulent.

Mr Rebelo's twin sister Monique Rebelo told the WA Supreme Court that sometime after her mother's death she was contacted by a psychologist she shared with her mum.

Monique said the psychologist, Narina Sidhu, told her she had concerns about Andre and that he had tried to use her name to find out information about her mum's insurance.

Community Consultation- decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting a community information and drop-in session at the following locations:

Tuesday 22 October 2024 - Yarram
Yarram Hub
156 Grant Street, Yarram
5.00 pm – 7.00 pm

Wednesday, 23 October 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
5.00 pm – 7.00 pm

Thursday, 24 October 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
5.00 pm – 7.00 pm

A **presentation** about decommissioning activities will be provided at **5.30 pm** for the above locations.

Please **register your attendance** by emailing: consultation@exxonmobil.com

We encourage you to come along and ask questions or to raise any concerns you may have.

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Treasurer falls on his sword ahead of vote

MATTHEW DENHOLM
TASMANIA CORRESPONDENT

Tasmania's Liberal government must find a new treasurer – just as the state budget is debated in parliament – with incumbent Michael Ferguson quitting to avoid a parliamentary political execution on Tuesday.

Premier Jeremy Rockliff on Monday effectively cut his Treasurer and Deputy Premier loose, indicating Mr Ferguson would resign if, as expected, MPs voted no confidence in him on Tuesday.

Mr Ferguson hours later pre-empted that vote by announcing his resignation, accepting responsibility for a bungled wharf development and the late, over-budget delivery of two ferries.

"I recognise there have been some really significant failures and problems with the delivery of, in particular, the infrastructure to support the new ships at Devonport," Mr Ferguson said.

"I own that. I take responsibility for that."

He said there were no new facts to justify his departure from the Treasurer's role, having already quit as infrastructure minister, but that it appeared a majority of MPs would vote no confidence in him.

"We can all count and we need to be able to sustain a vote on the floor of the parliament," he said.

"I can see that and I want to offer to do the right thing, the honourable thing I hope, to save the parliament the waste of time and delays to the budget that would occur were the debate to go ahead tomorrow."

He thanked his wife Julie for her "incredible" support during his 20-year political career, which began with two terms in the House of Representatives from 2004, before switching to state politics in 2010.

Mr Ferguson said he was one of the "very few" ministers to serve as a minister for a decade in Tasmania and thanked his wife and children for "tolerating" the impact of his heavy workload.

"They're going to have to tolerate it for a bit longer, because I'm not going anywhere – I'm going to continue to serve the wonderful people of northern Tasmania in the electorate of Bass," he said.

Mr Rockliff defended his Treasurer as "diligent" but set the scene for his resignation earlier in the day by rejecting a push by some conservatives to ignore the pending no confidence vote.

"We will always accept the will of the parliament and should there be a no confidence passed in Mr Ferguson, then Mr Ferguson will be resigning as minister and going to the backbench," Mr Rockliff said.

The stance was a contrast to the approach advocated by senior minister Eric Abetz, who on Sunday urged Mr Ferguson to refuse to resign in the face of a successful no confidence motion.

"Even if a motion of no-confidence were to be passed in him ... there will be no need for Mr Ferguson to resign and I would encourage him not to resign," Mr Abetz said.

Labor had the required 18 votes for a majority of MPs to express no confidence in Mr Ferguson, 50, plunging the Liberal minority government into turmoil. Opposition Leader Dean Winter said Mr Rockliff's refusal to sack Mr Ferguson was "a failure of leadership" and Labor would "do his job for him" by moving no confidence.

"Minister Ferguson is responsible for the biggest infrastructure stuff-up in Tasmanian history," Mr Winter said. "The new Spirits (ferries) project is five years delayed, $500m over budget – and when the ships eventually arrive, they will have nowhere to berth."

Mr Ferguson had accepted some responsibility for the ferries fiasco but had also blamed state-owned businesses, particularly ferry operator TT-Line.

The Premier, a party moderate, may decide to take responsibility for Treasury himself in any reshuffle or to elevate an existing minister.

Promoting a conservative, such as Mr Abetz, a former senator and Howard era federal minister, or a younger conservative, such as Felix Ellis, could aid party unity. However, Mr Abetz and Mr Rockliff have clashed on several occasions.

Mr Rockliff also reassured Tasmanians of passage of the budget, which controversially increases state debt – non-existent for much of the 2010s – from $3.5bn in 2023-24 to $8.59bn in 2027-28.

Public concern about the debt has further eroded support for the minority Liberal government.

'Pontius Pilate' Rockliff washes his hands of deputy

MATTHEW DENHOLM
COMMENT

There was an air of Pontius Pilate to Jeremy Rockliff on Monday, as he washed his hands of his beleaguered deputy and Treasurer, Michael Ferguson.

Yes, there was praise – "diligent" and "full confidence" – but essentially the Premier was sending to the wolves a colleague of 14 years, while blaming others for his pending execution.

It was a confronting demonstration of the brutality of politics that left Ferguson no choice but to quit, which he did late in the day.

Some in the party may accuse Rockliff of treachery. Indeed, arch conservative Eric Abetz went public on Sunday with advice to Ferguson – a fellow conservative – not to resign, even if a no-confidence motion passed. Rockliff clearly felt this concept had to be slapped down, and quickly.

Abetz, a former Howard era-minister and leading candidate to replace Ferguson as treasurer, was technically correct: such a vote is not legally binding. However, to flout the will of parliament would have been an assault on longstanding convention and the Westminster system itself.

It would have even further destabilised the government, which relies on independents for its very existence. MPs could have rightly refused to deal with Ferguson as a minister lacking the confidence of the Assembly.

Such belligerence could have precipitated a far more serious crisis, potentially even an early election. Rockliff's stance was pragmatic and responsible.

Even so, it is extraordinary: a Treasurer having to exit stage left in the very week parliament is due to pass his third budget.

It remains to be seen if Ferguson, from the backbench, will repay the favour by joining other conservatives in undermining the moderate Premier and his weakened minority government.

"Rocky" could try to reduce that risk by appointing another conservative, such as Abetz or Felix Ellis, to Treasury, but will be tempted to take the key portfolio into his own hands.

The government has lost one of its most experienced operatives but one who has presided over a monumental stuff-up – the ferries fiasco – and set Tasmania on a deep debt trajectory.

Tasmanians can only hope whoever succeeds Ferguson reverses the debt spiral, and has more of a stomach for the kind of structural reform long ignored but so badly needed.

Rockliff

Ferguson

Bat with bite puts end to ore plan

PAUL GARVEY

Australia's largest predatory bat has sunk plans for a new iron ore mine in the Pilbara.

Mining giant Rio Tinto and its partner in the Rhodes Ridge joint venture have informed federal environmental regulators that they will no longer push ahead with a long-awaited proposal to mine the Giles Mini deposit near Newman due to its impact on potential roosting sites for the vulnerable ghost bat.

The variation request lodged by the partners with the Department of Climate Change, Energy, the Environment and Water also noted that scrapping Giles Mini would "reduce resource demands" on traditional owner groups, given it would reduce the number of native title holders involved in the project from two to one.

Giles Mini was part of a broader plan to develop a major new iron mines at the Rhodes Ridge project.

The Rhodes Ridge mine, which sits just to the north of Giles Mini, will still go ahead despite also being home to a sub-population of the ghost bat.

The partners said the decision would give them more time to consider developing mitigating strategies that could allow it to mine the deposit in the future.

"In the first instance, removal of Giles Mini from the proposed action avoids all direct impacts to the southern sub-population through retaining two adits and ten caves, which provide roosting habitat, and retains surrounding foraging habitat," the joint venture partners said.

"Additionally, the removal of the Giles Mini allows the proponent to investigate artificial roost potential to support potential future development in the Giles Mini area.

> 'Removal of Giles Mini from the proposed action avoids all direct impacts to the (bats)'
>
> JOINT VENTURE STATEMENT

"The removal of this deposit allows for further regional-based survey of the population and surrounding area to better understand the significance of the population, potential impacts and develop appropriate mitigation and management measures."

The original application lodged with the federal regulators this year had warned that the mines "may result in a potential significant impact to ghost bat individuals".

The Giles Mini deposit also straddles a native title boundary, with the western portion falling on the lands of the Ngarla-wangga people and the eastern half held by the Nyiyaparli Traditional Owner Group. The Nyiyaparli area also includes Rhodes Ridge.

The Rhodes Ridge and Giles Mini deposits were first identified decades ago and have been subject to fierce and protracted legal disputes between the pioneering Hancock and Wright families.

The fight went all the way to the High Court, with Wright Prospecting ultimately emerging victorious over Gina Rinehart's Hancock Prospecting.

Wright Prospecting and Rio Tinto in 2022 locked in a 50-50 joint venture over the project.

The iron ore at Rhodes Ridge is particularly valuable given its high grade, and Rio Tinto has described it as "one of the biggest and best undeveloped iron ore deposits on the planet".

The ghost bat is described as Australia's only carnivorous bat, and eats larger prey including frogs, birds, lizards and small mammals including other bats.

Esso's West Tuna platform in Bass Strait.

Kipper gas compression project complete

Esso Australia has successfully delivered the crucial Bass Strait project to extend Australia's crucial natural gas supplies for the domestic market.

The safe completion of the Kipper gas-field compression project will help the Gippsland Basin Joint Venture maintain its ongoing supply of natural gas to Melbourne and beyond.

One million work hours were put into the project ensuring gas will flow from the Gippsland Basin and Longford Plants well into the next decade.

Esso Australia is a subsidiary of ExxonMobil Australia, and operator of the Gippsland Basin Joint Venture a fifty-fifty joint venture between Esso Australia Resources and Woodside Energy.

The Kipper project required the installation of compression facilities on the West Tuna platform in order to maintain production from the Kipper field which has experienced decreasing reservoir pressure as gas reserves are depleted.

"The successful completion of the Kipper Compression Project enables the Gippsland Basin Joint Venture to maintain production of critical natural gas supplies from the Kipper field which is an integral part of our production system," said ExxonMobil Australia Chair, Simon Younger.

"Accessing new gas supplies or maintaining gas production is not simply a matter of flicking a switch.

"Operations teams put in more than one million hours to ensure the project's safe completion and on schedule."

Esso Australia said natural gas remains a crucial part of the energy grid as a vital backup to renewables for industries such as glass, bricks, steel, fertiliser, recycling and critical minerals.

"These industries don't have alternative energy or feedstock sources," added Younger.

"Over the past six decades, Esso and its joint venture partners have made significant investments in Bass Strait to help meet Australia's energy security and this project is another prime example of Esso's efforts to power Australian homes and businesses.

"We have invested hundreds of millions of dollars into the Gippsland Basin, including projects such as the Kipper Compression Project which will help supply as much gas alone as is consumed in all of Victoria in one year.

"These assets have generated significant economic benefit for the nation, the state, and importantly also for the local communities where we live and work."

Students looking after the local environment

MIRBOO North Secondary College has been named as one of the 103 groups to share in more than $409,000 provided through the Victorian Junior Landcare and Biodiversity grants program.

Member for Eastern Victoria Tom McIntosh last week welcomed the news that Mirboo North Secondary College was successful in receiving $5000, the maximum amount available, to enhance and restore the environment that was damaged by storms earlier this year.

"I was on the ground to see the storm damage in Mirboo North in February, and it's wonderful to see students are helping in the work to rebuild the environment," Member for Eastern Victoria Tom McIntosh said.

"As the Secretary of the recently established Parliamentary Friends of Landcare, I'm very excited to see our government supporting Junior Landcarers to do this work."

Grants of up to $5000 were awarded for educational activities that engage children in conservation and projects that improve and expand habitat for native plants, insects and wildlife.

Mirboo North Secondary School has been successful in receiving $5000 to enhance and restore the environment after February's storm.

"We are incredibly thrilled to receive this grant. During the storm in Mirboo North in February, the school lost over 60 mature trees," Mirboo North Secondary College Principal Vaya Dauphin said.

"The opportunity to support our community in the future through supplying trees we have grown ourselves will go a long way towards revegetating our beautiful natural environment."

Since 2018, $3 million has been invested to support more than 47,000 young people undertake on-ground conservation projects and activities.

Since then, these initiatives have achieved incredible results – including 99,000 new indigenous plantings and more than 1000 student excursions to wildlife sanctuaries.

For more information on the Victorian Junior Landcare and Biodiversity Grants program, visit environment.vic.gov.au/grants/victorian-junior-landcare-and-biodiversity-grants.

Excellence award for CGH

CENTRAL Gippsland Health is among seven hospitals in Victoria to have been recognised for their excellence in caring for and treating patients with stroke.

Announced at the Asia-Pacific Stroke Conference in Adelaide, the hospital accepted an Australian Stroke Coalition Quality Stroke Service Excellence Award.

The awards recognised hospitals which achieved best-practice stroke clinical care across several indicators, including treatment with thrombolysis within 60 minutes of hospital arrival, the provision of stroke unit care, and the provision of a discharge care plan.

Royal Melbourne and Box Hill hospital also among the other winners.

Australian Stroke Coalition co-chairman, Professor Tim Kleinig, congratulated the winning hospitals.

"It's inspiring to see these hospitals and their staff dedicated to providing the best possible care and treatment for survivors of stroke to ensure they're in the best position to recover well," he said.

Stroke Foundation chief executive Dr Lisa Murphy said the winning hospitals were leading the way in treatment and care.

"This is an exceptional achievement that should be celebrated and used as the benchmark for others to work towards in future," she said.

"These hospitals demonstrate the impact of multidisciplinary teams working together to improve outcomes for patients with stroke."

In 2023, more than 45,700 Australians had a stroke (including 34,793 for the first time) and there are more than 440,000 people living with the effects of stroke in the community.

Dr Murphy said receiving specialist treatment was critical to stroke recovery and gives survivors the best chance of living well after stroke and returning to doing the things they love.

"We know that patients with stroke who get to hospital quickly and receive timely treatment will have the best chance of survival, recovery and prevention of secondary stroke," she said.

Covering all bases to protect drinking water

GIPPSLAND Water is making steady progress in a significant program of works to protect drinking water supplies across its service area.

The organisation has finished replacing covers and liners at nine water storages, with just five more to go.

Covers and liners are used to maintain treated water quality and prevent foreign matter entering water storages, providing protection for around 25 years.

Managing director Sarah Cumming said work wrapped up at Sale's second storage basin in early October and progress was being made at another water storage in Coongulla.

"These upgrades are just one example of how we are upgrading our infrastructure so we can continue to deliver safe and reliable water for our customers," she said.

"By replacing ageing covers and liners, we're not only ensuring the supply of safe, clean drinking water but also enhancing the resilience of our entire network."

Completed upgrades include two storage basins at the Sale water treatment plant, as well as works at Warragul, Churchill, Morwell, Newborough and Neerim South.

Further cover and liner replacements will be completed at Moe, Seaspray, Heyfield and Tyers water treatment plants in the coming years.

For more information about Gippsland Water's coming works visit **www.gippswater.com.au/current-works**

The upgraded cover on a basin at Sale water treatment plant storage will maintain water quality and prevent foreign matter from entering. **Photo: Contributed**

Save tax, add more to super

Mark DiPietro, senior financial advisor at Shadforth,

If you make super contributions from your after-tax income or bank account savings, you may be able to claim a personal tax deduction and reduce your taxable income, while boosting your super.

The contribution is taxed in your super fund, generally at only 15% (or up to 30% for higher income earners). But this compares favourably to paying tax at your marginal tax rate which could be as high as 47%. Therefore, this strategy could result in a tax saving of up to 32% – and help you retire with more.

You can make a deductible contribution up to age 66 regardless of your working status, and you can claim up to the concessional contribution cap, which is $30,000 in 2024/25.

However, you may be able to contribute more than this if you didn't fully use up your concessional cap since 1 July 2018, by making some additional 'catchup' contributions.

But make sure you don't contribute more than you are allowed, as penalties may apply.

Add some certainty to your financial life.
Call me for a free wealth discussion today at Shadforth on 5152 5044 or 0409 521 921.
We have just moved to Shop 10 – 63 Macalister St. Sale.

AusNet

Have your say on upgrades to the local electricity network.

AusNet is currently seeking feedback on funding to maintain and upgrade its electricity distribution network over the next five years.

This funding will support:

- a safe, reliable and more resilient network
- keeping up with customers moving to all-electric homes and electric vehicles
- customer service improvements
- more renewables, including large and small renewables like rooftop solar.

To view a copy of the draft proposal and provide your feedback, scan the QR code or visit:

Fighting cancer at own pace

Cyclist Bernie Wright and walker Sharon Reardon are going the distance to help raise money for cancer research at the Peter Mac. Picture: David Caird

Robyn Riley

A marathon-loving mum and a dad who clocks up the cash riding his bike will join hundreds of Victorians to help fight cancer.

They are taking part in the Peter MacCallum Cancer Foundation's annual major fundraiser, Unite to Fight Cancer.

About 1000 people, sponsored by thousands more, will walk or cycle at their own pace across 10 days from Thursday.

They are united in their efforts to help raise about $550,000 for cancer research.

It will help fund the work of research scientists like Kylie Gorringe. The goal for her laboratory, she says, is to find novel therapies to treat ovarian cancer using patient-derived models.

It is music to Sharon Reardon's ears.

The mum of two started walking to raise money for the event after friends were diagnosed with cancer.

Little did Mrs Reardon know that when she turned 50 last year she would face her own ovarian cancer diagnosis.

"Everyone I know has been touched by cancer in some way," she said. "Whether it's through a loved one, friend, family member or it's much more personal, a cancer diagnosis is devastating."

Mrs Reardon will have a round of chemotherapy at Peter Mac the day she starts her 75km walk.

Bernie Wright, 43, will be on his bike and hoping to clock up about 350km. He started doing the event five years ago, when he didn't have a strong personal connection to the hospital.

He does now. His wife Sarah, 38, was diagnosed with breast cancer last year.

He hopes to raise about $4000, his way of thanking the Peter Mac team.

Pharaoh proves a treasure

Samantha Landy

Pharaoh was the NGV's most popular Melbourne Winter Masterpieces exhibition since the onset of the pandemic, attracting more than 336,000 local, interstate and international visitors in less than four months.

The showcase of more than 500 ancient Egyptian artefacts, which spanned 3000 years of history, ranked sixth for attendance in the series' 20-year history.

Van Gogh and the Seasons drew more than 462,000 people in 2017 to be the gallery's most successful Melbourne Winter Masterpieces exhibition. Pharaoh drew the biggest crowds since Terracotta Warriors & Cai Guo-Qiang's 377,105 attendees in 2019.

A fifth of Pharaoh's visitors were from interstate, and accompanying exhibit Ancient Egypt attracted more than 87,000 children.

Minister for Creative Industries Colin Brooks said: "These powerhouse attendance figures demonstrate why the NGV is Australia's most popular gallery."

The NGV's upcoming exhibitions include Cats & Dogs, from November 1, and Yayoi Kusama, from December 15.

Super, I don't need loads

Comfortable retirement well within reach

Anthony Keane

Pre-retirees think they need a nest egg above $850,000 but a study shows they can live comfortably on much less than that.

Research by investment service Generation Life has found nine out of 10 people feel under financial pressure and many believe their financial dreams are out of reach.

The report, Not Tomorrow's Problem, says most pre-retirees – aged 51 to 65 – pay little attention to their superannuation, leading to a lack of knowledge and fear of the unknown.

The average amount they think they need to retire is $856,209, it says, and three-quarters feel unable to achieve a happy retirement.

However, finance specialists say many set their sights unnecessarily high and may end up working years longer than they need to because of incorrect expectations.

The Association of Superannuation Funds of Australia's widely recognised ASFA Retirement Standard says a single person needs $595,000 at age 67 for a comfortable retirement delivering $52,085 a year, while a couple needs a combined $690,000 – or $345,000 each – to provide $73,337 annually.

Generation Life chief executive Grant Hackett said many people saw the ASFA calculations as minimal living standards rather than comfortable.

"Most Australians – we're an aspiring population, that's why we always punch above our weight – want to live above that, but they've probably gone too far," he said.

Mr Hackett said the $850,000-plus figure was "probably driven by the last couple of years when inflation's gone bananas post-Covid".

"A lot of people think they need a much larger amount because of the sustained price increases that we have seen for everyday items," he said.

"It's pretty phenomenal when you think we have got the fourth-biggest pension pool in the world, for a country of 28 million people, yet three-quarters of us going into retirement are really concerned about it and think they're not prepared for it."

MBA Financial Strategists director Darren James said the high $850,000 figure could put people off retirement planning.

"I think that's probably basing it on them not getting any age pension, whereas obviously a lot of people can," he said.

"Some people get scared, throw their hands up in the air and say it's all too hard. We're seeing people able to set up retirement quite well on far less than that."

Mr James said some people mistakenly believed they would need their current pre-tax earnings in retirement, but most retirees paid no tax, had no dependent children and low or no debt.

"The other misconception out there is people think retirement age is 67, the age pension age, when it's not," he said.

People can access their superannuation from age 60.

"To be honest, retirement is when you want it to be, as long as you have financing to do it."

Esso™

An ExxonMobil Brand

Community Consultation- decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting a community information and drop-in session at the following locations:

Tuesday 22 October 2024 - Yarram
Yarram Hub
156 Grant Street, Yarram
5.00 pm – 7.00 pm

Wednesday, 23 October 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
5.00 pm – 7.00 pm

Thursday, 24 October 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
5.00 pm – 7.00 pm

A **presentation** about decommissioning activities will be provided at **5.30 pm** for the above locations.

Please **register your attendance** by emailing: consultation@exxonmobil.com

We encourage you to come along and ask questions or to raise any concerns you may have.

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Education Matters

Lyn Kerrison, Yarram Secondary College Principal

DETERMINED, dogged, fixed, steady. These are great words to describe our theme for this term, persistence.

Each term our School Captains set a direction for the student body to aspire to.

Author and advocate for youth financial literacy, Lucas Remmerswaal, sums up persistence perfectly: "Nothing in the world can take the place of persistence. Wishing will not; Genius will not; education will not; perseverance is like a genie that creates a magical force in your life."

So, what have you done recently that involves determination or persistence? I have challenged our school community to set a goal, a challenging goal for the term. Setting goals are personal things. They could be goals relating to school and studies, or they could be goals relating to a sporting pursuit or a team. Some goals relate to bucket list items and to personal challenges.

Over the September holiday break I set a goal for myself to walk the Great Southern Rail trail from Yarram to Nyora covering over 145km. There were times when the skies opened up, and we walked for hours in the rain, but we kept going. Being persistent opened up the joy of this incredible walk, to the abundance of bird life and art on the trail. Persistence enabled us to set small daily goals and walk to our destination towns; Toora, Fish Creek, Meeniyan, Leongatha, Loch. Persistence meant we celebrated each night for reaching our daily goal. By breaking up a large task into bite size bits it enabled us to achieve a bucket list goal. Daily destinations kept us on the track, persistence got up to the end of the walk.

My recent rail trail experience reinforces the importance of persistence in achieving all you want in life. Persistence can open up rich possibilities and turn opportunities and dreams into reality. It is indeed a magical force.

Persistence is the Aladdin's lamp of our life. By guiding, talking and teaching about how to break up large tasks into achievable pieces, it sets our children up to believe that they can achieve their own life goals. Rather than feeling overwhelmed and daunted by study and life, suddenly it all becomes achievable. I like to think that persistence can be taught and practiced, and I encourage you all to start developing this essential life skill.

As our year 12s head into the last two weeks of formal education, we will celebrate as a community and reflect on all the small daily goals that enable our youth each year to achieve their VCE.

Yarram Secondary College year 12 students have just two weeks of formal education left before they commence their final exams, commencing with English on October 29.

Thursday, 24 October 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGSLSTC)
75 Ogilvy Street, Leongatha

All of the above sessions will run from **5.30 - 7.30pm** with a **presentation** about decommissioning activities provided at **5.30pm**.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 5351 8000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Jack-Up Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Tuna Area Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons (stakeholders) whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (v1.pdf) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Council Beat with David Braithwaite

Final council meeting before election

From page 1

The largest infrastructure project ever undertaken in shire history – the $23 million redevelopment of Aqua Energy Leisure Centre in Sale, is on track to be completed mid-next year.

With funding from the state government, council installed LED lighting and redeveloped the social club room at the Stratford Recreation Reserve. Additionally, it upgraded the multi-purpose court at the Nambrok Recreation Reserve.

Council has been upgrading, widening and enhancing the safety of streets and pathways. In Maffra, Nordens Lane was widened to six metres and Carpenter St was upgraded with a new footpath.

In Rosedale, a new pedestrian crossing and footpath was installed on Mackay St, a shared pathway added on Hood St and a new footpath on Duke St constructed.

The reconstruction of Bennison Drive, Wurruk, features curb and channel replacement and new asphalt, while Hodges Rd, Coongulla, and Park St, Cowwarr, were sealed as part of council's street scheme construction program.

Council completed the footpath and bridge over Riley Creek in Dargo. The 32.5m footbridge now links the the town's hotel, general store, hall, recreation reserve, bush nursing centre and town centre.

The long-awaited new toilet block was opened at the Port Albert Water Tower, along with new public toilets in Stratford.

The federal government's grant for the Sale Revitalisation Project has been completed, with the amenity of York St significantly improved with updated accessibility, lighting, and landscaping.

A new roundabout was installed at the intersection of Desailly and Macarthur Sts in Sale.

The expansion of the Great Southern Rail Trail from Alberton to Welshpool was completed after unexpected rainfall derailed the project for months.

Cr Scott Rossetti commended the report to the community.

"It's actually a great way of finding out what council is doing and what they do right through the whole shire," he said.

Seven of the nine councillors attended the final Wellington Shire Council meeting before the election. Photo: Stefan Bradley

Performance report

COUNCIL is on track to meet its targets for the 2024-25 financial year, after adopting its performance report for the three months to September 30.

Council income was $93 million, $16 million more than budgeted, mainly due to the late receipt of government grants. Expenditure was $29 million, in line with the budget, giving council a $64 million surplus.

Council has forecast a $15.6 million surplus for 2024-25.

Five capital works projects reached practical completion, including the Port of Sale mooring access project and improvements at the Gippsland Regional Livestock Exchange. Work is underway on 14 projects, 25 have had contracts awarded but not yet commenced, while 52 projects are in pre-planning stages.

Cr Stephens said most key performance indicators pointed to the budget being "well on track for the 2024-2025 year".

"The only thing that really stood out to me was the number of cyber threats that we've received in the last quarter. Something like 11.6 million, up from 5.1 million," he said.

"I think it just proves we need to be eternally on vigil for any threats to our IT systems. It's obviously becoming a bigger problem as time goes on.

"We recently had a business continuity exercise, which indicated that our systems are very stable and are meeting these threats, but we can't let our guard down because it's an ongoing issue."

Strategic land use

A REPORT on progress of strategic land use planning projects was also handed down.

Technical reports for the development of industrial land around West Sale Airport have been completed and will inform the preparation of the detail development plan for the site, which is anticipated to be prepared by the end of the year.

Work continuing on costings of key infrastructure items to support future growth areas outlined in the Maffra Structure Plan. Costings are expected to be finalised by the end of the year.

A draft contribution plan as part of the Wurruk Development Plan is currently with proponents for finalisation following council feedback.

Council has applied for federal government funding to implement elements of the study which determined the readiness of key towns in the southern part of the shire to service and support renewable energy projects, and economic opportunities associated with them. The application focused on advancing strategic planning to provide additional residential and industrial land in Yarram.

State government funding has already been obtained for an initial drainage assessment of potential growth areas in Yarram.

Volunteers thanked

CR Carmel Ripper acknowledged the efforts of volunteer members of five committees.

In receiving the annual reports for the Briagolong, Maffra, Newry and Gordon Street (Heyfield) recreation reserves as well as the Cameron Sporting Complex, Maffra, Cr Ripper said the volunteers were "absolutely integral".

"They just work for the community, so I would like to congratulate each and every one of these volunteer committees, that without them we would be lost," she said.

"I'd also like to thank their families, who don't have them at home for a certain amount of time. The families are allowing them to volunteer for the greater community."

Cr Maher added that volunteers were "the backbone of our community".

Voting closes next Friday

THE Victorian Electoral Commission is reminding voters in Wellington Shire they have until next Friday to vote in the Wellington Shire Council election.

Electoral Commissioner Sven Bluemmel said completed ballot packs need to be posted before 6pm on Friday, October 25, noting local clearance times may vary.

"You can also drop your ballot pack off at the election office located at Former Fulham TAFE, 19 Lyon Crescent, Fulham, before 6pm on Friday, October 25."

Any voter who still hasn't received their ballot pack should go to **vec.vic.gov.au** to complete an online replacement ballot pack form.

Extended hours for voters to hand deliver their completed ballot pack apply from 9am to 8pm on Thursday, October 24, and 9am to 6pm on Friday, October 25.

Voting is compulsory for voters who were on the state or council roll for this election on August 7. Enrolled voters who don't vote may be fined.

Steam train rolls through Gippsland

LOCAL train enthusiasts and the general public were treated to the sight of a stream train travelling through the region on Sunday.

Steamrail Victoria ran the steam excursion train on a day return trip between Melbourne and Bairnsdale.

The journey was advertised as the first ever "R class" day trip to Bairnsdale. R class locomotives could previously only travel as far as Sale because of the now replaced bridge over the Avon River at Stratford.

It was also the first time two R class locomotives have been at Bairnsdale, with one having run down the night before with the service vehicles.

An ExxonMobil Brand

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for Decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team will be hosting a community information and drop-in session at the following locations:

Tuesday 22 October 2024 - Yarram
Yarram Hub
156 Grant Street, Yarram
5.00 pm – 7.00 pm

Wednesday, 23 October 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
5.00 pm – 7.00 pm

Thursday, 24 October 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
5.00 pm – 7.00 pm

A **presentation** about decommissioning activities will be provided at **5.30 pm** for the above locations.

Please register your attendance by emailing: consultation@exxonmobil.com

We encourage you to come along and ask questions or to raise any concerns you may have.

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project

MPs fear backlash on private health reform

EXCLUSIVE

JOHN FERGUSON
ASSOCIATE EDITOR

The 47 federal NSW MPs are being warned of a looming backlash from voters over state government plans to increase costs on private health insurers.

A Private Healthcare Australia analysis of NSW federal seats has broken down the regions with the most number of people to be affected by the planned overhaul of the state's Health Insurance Levy. The NSW government last week introduced draft legislation to increase the levy from $1.77 per week per person with health insurance to $3.27 per week per person.

The Australian has seen Private Healthcare Australia data showing the electorates that will be hardest hit, affecting an estimated four million people.

The state government has blasted the PHA, but the PHA says NSW is the only state that taxes health insurance. If implemented, it would mean NSW voters would pay the highest health insurance costs in the country.

Federal NSW MPs have been warned of a backlash over the increases, which could lift premiums by about 4.5 per cent on average.

The seats analysis shows the increased levy could affect more than 120,000 people in nine seats – not all of whom would be voters – with more than $8m in extra costs.

This includes the key seats of Bennelong and Greenway.

Between 110,000 and 120,000 people in a further 14 seats would be affected, including in the Prime Minister's seat of Grayndler and the teal-held seat of Wentworth.

A further 20 seats with 80,000 to 100,000 affected voters – most in Labor electorates – also would be affected, according to the data.

But the NSW government has blasted the insurers' campaign, arguing they are reneging on their public hospital bills.

The government wants insurers to pay a higher rate when their customers get a private room in public hospitals.

"Premiums didn't go down when the big insurers stopped paying their bills," a government spokesman said.

"For every day private health insurers refuse to pay, public hospitals lose $383,561.

"We urge them to put patients and public hospitals before super profits and executive bonuses.

"Given their record profits, this is nothing but another scare campaign from the big four billion-dollar private insurance conglomerates."

Nick Coatsworth, the Australian Patients Association ambassador, said people taking out insurance wanted to support the concept of choice to back a strong health system.

This took the pressure off public health.

He said it was a negative choice for the NSW government to take this route. "I'm surprised," Dr Coatsworth said.

The PHA estimates the NSW strategy could cause about 75,200 people to drop their insurance. It argues that this would put additional pressure on public hospitals and emergency departments across the state, and increase waiting times for elective surgery. The row comes amid intense pressure on insurers and public and private health systems.

Private hospitals and medical device companies are ramping up pressure for reform to the way health insurance premiums are set – including an independent umpire to oversee the process – amid ongoing warnings the sector continues to face unsustainable challenges.

The Australian reported last week that key stakeholders have written to federal Health Minister Mark Butler calling for reforms to the health insurance premium round process.

The letter calls for an independent body "to oversee insurer behaviours that are threatening the viability of the system and the value of private health insurers for consumers", a cap on capital requirements to compel insurers to free up "excessive reserves" of capital to support the struggling private system, and reform to incorporate the cost of delivering care in premium round processes.

BCA seeks $10bn housing reform fund

NOAH YIM

The Business Council of Australia is calling for major policy interventions by state and federal governments to boost housing supply, including a national reform fund worth at least $10bn to overhaul stamp duty and streamline planning and approval processes.

As battle lines on housing take shape ahead of the federal election, the Coalition is demanding home construction jobs be prioritised on the immigration skills list.

Deputy Liberal leader Sussan Ley said the Albanese government should prioritise professions like bricklayers, painters and roof tilers under the skilled migration program.

"Under the current draft Core Skills Occupations List, developed and signed off by (former immigration minister) Andrew Giles, (former home affairs minister) Clare O'Neil and (former skills minister) Brendan O'Connor, many key construction tradies including bricklayers, painters, roof tilers and stonemasons are not in line to be prioritised," she said. "Instead, wushu martial arts and yoga instructors are.

"That must change. Labor must guarantee today that they will list all construction trades on the Core Skills Occupations List and ensure they are prioritised for visas under the skilled migration program. Industry sources suggest that the brief is sitting on (Home Affairs Minister Tony) Burke's desk for decision."

Mr Burke acknowledged a "skills shortage is one of the many challenges we face after the previous government neglected housing supply for a decade".

"Jobs and Skills Australia was established to help overcome those years of neglect," he said.

"If the Dutton opposition cared at all about housing supply, it should stop voting with the Greens party to prevent new homes being built."

The BCA will ask federal and state governments to enact "serious changes" to meet the Albanese government's target of building 1.2 million more homes in the next five years. Key among the proposals is a national reform fund that would have to be "at least $10bn" to tackle stamp duty reform across the country.

A report to be published on Monday by the business peak body will focus on the need to streamline planning and approval processes through a government-funded national reform fund.

BCA chief executive Bran Black said Australia's housing supply crisis needed "urgent action from all levels of government ... Our prosperity is being held back because many Australians can't buy a home or are paying too much rent; fixing this issue means putting hard but important policy changes on the table.

> 'If the Dutton opposition cared at all about housing supply, it should stop voting with the Greens'
>
> TONY BURKE
> HOME AFFAIRS MINISTER

"We want the federal government to create a national reform fund, like that created in the 1990s, that incentivises states to fix regulation and planning bottlenecks that hold back homes being built.

"Governments at all levels have recognised the importance of supply as the real solution to our housing challenge. We back many of the measures already being rolled out, but the scale of the task ... remains immense."

Murray Watt on Sunday again failed to rule out changes to negative gearing and the capital gains tax discount amid continued speculation about housing tax arrangements.

The Employment and Workplace Relations Minister said negative gearing had been "the established position in Australian politics for some time" and the government had not "received advice to change that".

He and Finance Minister Katy Gallagher also criticised the Coalition's pre-election pledge unveiled at the weekend to use a $5bn infrastructure fund to unlock up to 500,000 new homes as one already being rolled out by the Albanese government.

"(Peter Dutton is) kind of picking up one of our policies, so we've already got one about enabling infrastructure," Senator Gallagher told Sky News.

"We've already got a program that does that. So it looks like it's essentially copying that."

'Let's get Dutton': ALP ready to play the man

NEWSWIRE/TERTIUS PICKARD

Peter Dutton: 'He's arrogant, aggressive and reckless,' says Labor

Continued from Page 1

"He's a weak leader who's not really in control of events. The last few weeks have shown he's not particularly good under sustained pressure – whether it's his Tourette's remarks or snapping at journalists. And partly it's because he doesn't really have much of an agenda – the government's drifting."

With the prospect of a hung parliament making this election unique, both sides agree cost of living will be the top issue.

Labor's campaign strategy will be in two parts. Firstly, on the government's record and its second-term agenda and, secondly, on Mr Dutton. "We will confidently campaign on our record and our promises for a second term," the Labor source said.

"The cost-of-living pressure facing households would have been worse under the Coalition who opposed all this relief and Australians know that. Now that we are through the worst of the worldwide inflation surge we can build for the future and that's what our ambitious second-term agenda will be all about."

RedBridge strategy and analytics director Kos Samaras, a former deputy campaign director for Labor in Victoria, said the government's plan to go negative on Mr Dutton was "going to be very, very risky because the electorate is waiting to see significant nation-building solutions" to address the economic issues facing the country.

Noting Labor's two-part strategy, Mr Samaras said: "Many will tell you that voters don't like negative campaigns, but, at the end of the day, they do work. They work at times of economic prosperity. If you're an incumbent government and you've been in power during an unprecedented economic event, going negative is full of risk for that reason. People want to see a solution.

"It's a lot easier to make it a referendum on the government because ... elections are referendums on governments. It's a lot easier for Dutton to say 'this is where he's failed ... you, the Australian voter'. If he doesn't play the man but plays the policies, it'll grip like Velcro."

Labor is taking the same view of the electoral map as it did in 2022, which is that no state is more important than the other, though the party concedes it has more to gain in Queensland than anywhere else because of its poor record in the state over the last few electoral cycles.

"It's a challenging map for both sides, who have risks and opportunities everywhere. No one should approach the next election thinking the contest will be decided in one state. We certainly aren't," the Labor source said. While inner-city voters are moving away from the Coalition, the Liberal Party considers them just as crucial as outer-suburban and regional Australians.

The Liberals believe NSW, Victoria and Western Australia will be particularly crucial to a Dutton win given the number of seats in the most populous states and the party's under performance in WA last time.

"We're certainly going to run very strong campaigns in those inner-city seats, particularly those seats we lost to the teals. In the medium term, outer-suburb seats, regional seats, provincial seats are where the political centre of gravity for the Coalition is moving towards but by no means are we giving up on those inner-city seats," the Liberal source said.

The Coalition – whose campaign has turned from defensive in 2022 to offensive – must retain its 55 lower house electorates and pick up 21 seats to win majority government.

It has its sights on the Labor seats of Blair in Queensland, Bennelong, Robertson and Gilmore in NSW, Aston and McEwen in Victoria, Lyons in Tasmania, Boothby in South Australia, Tangney and Bullwinkel in WA and Solomon in the Northern Territory.

While election trends suggests it'll be difficult for the Coalition to win power after one term of the Albanese government, the opposition believes it is highly competitive as it starts to inch ahead in a few polls.

There are extremely tough fights ahead for the Liberal Party – including in the five teal seats it lost at the last election (the sixth, North Sydney, has been abolished after a redistribution).

Also difficult will be retaining Menzies and Deakin in Victoria after they became more marginal following a redistribution and holding onto seats where sitting Liberal MPs are retiring – Braddon in Tasmania and Leichhardt in Queensland.

Labor, on the other hand, has to lose a net total of three of its 78 seats to be plunged into minority.

The party is confident of its chances in several Coalition-held seats: Leichhardt, Bonner and Longman in Queensland, Bass and Braddon in Tasmania, Deakin and Menzies in Victoria and Sturt in South Australia.

It'll also target the one-time Labor stronghold of Fowler, which was won by independent Dai Le against star ALP candidate Kristina Keneally in 2022.

Party sources predicted the Greens' vote would go backwards in Brisbane and Griffith because voters were disappointed in the minor party's "grandstanding tactics".

Labor ditches inflation doctrine

GREG BROWN
CANBERRA BUREAU CHIEF

Workplace Relations Minister Murray Watt says the government is "having to reconsider some of the economic orthodoxy" as it battles cost-of-living pressures, arguing unemployment does not need to rise for inflation to come down.

With many economists arguing the unemployment rate of 4.1 per cent was too low for the Reserve Bank to consider cutting interest rates, Senator Watt said it was fair to describe the labour market as "tight".

But while he expected unemployment to rise further, he denied job losses were necessary to see underlying inflation fall from 3.4 per cent to the RBA's target band of 2-3 per cent.

"Under our government we have been able to more than halve inflation from the rate that we inherited when we came to office, while also delivering record numbers of jobs," he told the ABC's Insiders program.

"So, I think that we're having to reconsider some of the economic orthodoxy, which has traditionally been that you have to choose between lower inflation or unemployment rates.

"We've been able to do both at the same time.

"I'm not going to suggest that unemployment won't rise ... the economy is quite weak in terms of economic growth. But it's a real tribute to Australian employers and workers that we continue creating these numbers of jobs despite all of the barriers."

Some economists warned a rate cut would not come until the second half of next year after official figures released last week showed 64,100 jobs were created in September – more than 2.5 times above market expectations.

Independent economist Saul Eslake predicted the strong jobs growth would ensure an interest-rate cut this year was very unlikely. Mr Eslake said the government should have moved earlier to say inflation could come down without affecting employment, rather than Jim Chalmers accusing the RBA of "smashing the economy".

"I was surprised Chalmers was saying that, first of all because it is not true, the economy has not been smashed," Mr Eslake said. "Secondly because, I would have thought, a good argument for him to make is the Reserve Bank has consciously chosen to tolerate inflation being above its target for longer ... in order to preserve (employment) as much as possible."

Mr Eslake said interest rates had begun dropping in the US, where unemployment is at the same level as Australia.

"In Australia, and in the US, it seems to have been possible to bring inflation down without sacrificing jobs," he said.

AMP Capital chief economist Shane Oliver said unemployment had to increase a "little bit" but not dramatically to help bring inflation down. "We don't need to have a recession, all we need is some of the heat to come out of the jobs market," he said.

Opposition finance spokeswoman Jane Hume said public sector growth outstripping private sector growth was "unsustainable". "When you dig a little deeper you see that the public sector growth is much faster than private sector growth and that's an unsustainable phenomenon," she told Sky News.

"We want to see growth in jobs in the private sector and the only way we're going to be able to do that is to create a sense of opportunity and productivity in the private sector."

This young eastern barred bandicoot, found abandoned in a Cape Woolamai backyard, is fighting fit and has been released back into its colony. Picture: Phillip Island Nature Parks

This bandicoot's not so miserable

What this baby bandicoot lacks in size she sure makes up in heart – ready to enter the wild after narrowly cheating death in August.

The tiny eastern barred bandicoot was found abandoned in a Cape Woolamai backyard by a local resident, before being rescued by rangers from Phillip Island Nature Parks.

Just a few weeks old, the female joey was weak and in desperate need of food and milk, lacking a mother to provide such provisions.

Wildlife rehabilitation rangers housed the bandicoot in a small enclosure with heat and hydration, handfeeding the joey special milk alongside kibble, vegetables and live insects, and teaching it crucial wildlife skills such as digging for food.

Phillip Island Nature Parks ranger Kim Noy said the rescued bandicoot was ready to be released back into the wild after clocking in at 300g during a final health check.

"We want to keep our animals in the wild," she said. "The best outcome is when we can release these animals back into their home to thrive."

Charges laid over '88 rape

Liam Beatty

A man has been charged over an alleged "horrific" historical rape of teenager who was allegedly abducted and sexually assaulted in Melbourne more than three decades ago.

Victorian Police arrested the 57-year-old Queenslander this week following a reopened investigation into the alleged incident in St Kilda in 1988.

The man arrived in Melbourne on Saturday, when he was charged with two counts of aggravated rape, two counts of rape, abduction by force, kidnapping and false imprisonment.

Police allege the woman, then 19, was grabbed while walking home along Carlisle St, St Kilda, on January 23, 1988. She was allegedly driven to Elwood Beach and sexually assaulted.

Despite an investigation, no charges were laid. The case was reopened in 2021 after "more information came to light", police said.

Sexual Crime Squad Detective Acting Senior Sergeant Brett Robinson said police had not given up on the hope of bringing justice for the alleged "horrific" crime.

The man was remanded in custody and will appear in court in January.

Cleaner's top of the mops

But is Dyson's latest gadget worth $1000?

Jared Lynch

It's a $1000 mop, but Dyson insists it's much more than that.

The British consumer electronics giant is best known for reinventing the vacuum, and now it's gone full circle to disrupt the humble mop, with the release of the WashG1.

It promises the WashG1 will vaccuum as well as mop.

Before using the new supercleaner, Dyson told me I'd be surprised at the amount of dirt on my floors, even if they looked clean.

The WashG1 claims to remove wet spills, stains and dry dirt simultaneously, using more than two dozen pulse water jets backed by two counter-directional rollers.

It separates dirty water from clean water in the cleaning head, with the used water immediately being directed into a removable, see-through, tank.

I was impressed at the level of clean after a few weeks of use.

The rollers pull the mop along, making it feel like it also has grunt.

It has a built-in screen that alerts you if the mop needs urgent maintenance, and shows you an animation of how to fix the problem. Need to change the dust tray? It stops working and tells you to do it. Need to clean the rollers? The same thing happens.

The Dyson WashG1 in action.

There is no guesswork or reaching for the manual, it tells you how to do it.

Initially, the battery life seemed a bit short – up to 35 minutes or 290sq m coverage – but I was able to clean my entire top floor on one charge.

The verdict?

Dyson has achieved its aim in making a posh yet useful mop.

Can it be perfected? Sure.

The dust tray could be made bigger, given it can fill up quickly.

It is hard to manoeuvre under tight spaces such as beds and couches.

The rollers could also be smaller so it could fit under couches.

But I suspect this would compromise the performance of the device.

It's easy to use and maintain, provides an effective clean and has a good battery life.

Community Consultation- decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively.

After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting a community information and drop-in session at the following locations:

Tuesday 22 October 2024 - Yarram
Yarram Hub
156 Grant Street, Yarram
5.00 pm – 7.00 pm

Wednesday, 23 October 2024 - Foster
Manna Gum Community House
33 Station Street, Foster
5.00 pm – 7.00 pm

Thursday, 24 October 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy St., Leongatha
5.00 pm – 7.00 pm

A **presentation** about decommissioning activities will be provided at **5.30 pm** for the above locations.

Please **register your attendance** by emailing: consultation@exxonmobil.com

We encourage you to come along and ask questions or to raise any concerns you may have.

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Jack-Up-Rig Well Plug and Abandonment
- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South East Australia Carbon Capture & Storage (SEA CCS) Project

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023*

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Centre celebrations

Erika Allen

AN ANNIVERSARY 40 years in the making took place in the Gippsland Centre Sale last week.

The $21.6 million Gippsland Centre shopping complex was officially opened on October 29, 1984, by Treasurer of Victoria Robert Jolly with 1000 guests in attendance.

The following day, City of Sale mayor Geoff Rossetti and 1983 Miss Victoria Jeanine Clarke were on hand to welcome shoppers into the complex, featuring four chain stores, including Safeway and Target, and 49 specialty shops.

Over 30 people attended last week's celebration, listening to guest speakers, watching a film about the centre's history, browsing newspapers and photos, and eating cake.

Gippsland Centre Sale's management team compiled a visual retrospective of the centre's construction. The retrospective displays photographs from 1984 as the centre was being built, plus newspaper clippings highlighting its milestones and controversies.

Tied in with the centre's construction was a decade-long battle to have the old Sale railway station relocated from the north side of the Desailly and Cunningham Sts intersection to Pettit St. At last week's celebrations, former Sale City engineer Alan Lewis spoke about these challenges.

Former City of Sale mayor and local historian Peter Synan, who was mayor throughout the centre's construction, was also in attendance.

Incumbent Wellington Shire councillor Scott Rossetti, whose father Geoff was mayor when the centre opened, addressed the small crowd about conversations with his father and his memory of the opening day.

More about the centre's history, page 31.

Peter Synan, former City of Sale Mayor, cuts the 40th birthday cake on Wednesday.

Former Sale City engineer Alan Lewis, with Gippsland Centre Sale administration manager Tamara Williams, centre receptionist Diane van den Broek and incumbent Wellington Shire councillor Scott Rossetti. **Photos: Erika Allen**

Rental reforms unveiled

THE state government has announced reforms to give more rights to renters.

Among the reforms are preventing landlords from evicting a tenant at the end of their fixed-term lease without cause and capping lease break fees to no more than four weeks.

Consumer Affairs Minister Gabrielle Williams announced the government would do six things to make renting fairer:

Stop landlords making dubious bond claims without evidence;

Ban 'no fault' evictions, so renters can't be kicked out of a home for no reason;

Ban the extra fees that get charged;

Ban charging for 'background check' fees for rental applications;

Cap the cost of breaking a lease, and;

If a renter needs an extra key or fob for their apartment, they get one.

These reforms will be introduced to parliament in stages over the next 12 months, with some – including the ban on no reason notices – before the end of the year.

The reforms build on the work the government is already doing to protect renters – including launching Rental Dispute Resolution Victoria, creating a portable bonds scheme, and establishing the renting taskforce to crack down on dodgy landlords and agents.

"Renters' rights are all about respect – that's the principle that we are trying to bring to the rental market through more than 130 reforms, and that's why we are leading the nation on it," Minister Williams said.

"By banning fees and charges on rental payments and applications, and cracking down on unfair bond claims, we're putting more money back in the pockets of renters."

Tenants Victoria welcomed the measures to better protect the rights of renters, who make up almost 30 per cent of Victorians, in their homes. Its chief executive Jennifer Beveridge said "housing is an essential service and a human right".

"Extending the ban on no-reason evictions gives renters more security. It puts them on a more even footing to request repairs, for example, in the knowledge that rental providers cannot ask them to leave without a reason under the law," Ms Beveridge said.

Member for Gippsland South Danny O'Brien said while he supported protecting the rights of renters, there would be little benefit to Gippsland renters when they are not able to find a home to rent in the first place.

"There is a perception the government seems to embrace that landlords are rich and greedy with multiple rental properties in their portfolio, but the reality is that most of the landlords in Gippsland and across the state are mum and dad-type investors who have used their savings or superannuation to invest in and help keep our rental market afloat," Mr O'Brien said.

"According to the Australian Tax Office, the top rental provider occupations are registered nurses, office administrators and primary or secondary school teachers.

"These reforms, in addition to a suite of new land taxes are going to leave landlords questioning their investment and risk them leaving the market in favour of short-term rentals like Airbnb.

"A quick search online will show that many towns in my electorate are already being impacted by this growing trend as property owners understandably seek maximum return on their investment."

Mr O'Brien said that at the time of writing there were more than 20 full-houses listed on AirBnB in Sale alone.

"Under the Allan Labor government there have been no incentives for landlords to offer their homes to long term renters. We need a state government that can find the balance and ensure both renters and landlords are protected."

Data released by the Department of Families, Fairness and Housing earlier this year showed social housing stock across Gippsland decreased from 4874 in 2015, to 4834 as of June 30, 2023.

"These figures are particularly alarming when you consider that the social housing waitlist has also doubled in this time," Mr O'Brien said.

"These reforms will likely drive landlords away from investing in rentals in Victoria and only serve to exacerbate the issue."

NT senator suffers early blow in defamation suit

NORTHERN Territory senator Jacinta Nampijinpa Price has been ordered to pay up by the Federal Court, before a defamation suit against her has properly begun.

The shadow Indigenous Australians minister is being sued by Central Land Council chief executive Lesley Turner over a media release which he claims defamed him.

A Federal Court justice last week ordered Senator Nampijinpa Price pay $1,500 after her legal team failed to file a defence to present at the hearing as required.

According to a statement of claim filed with the court, a media release published by Senator Nampijinpa Price in July wrongly suggested Mr Turner no longer had the support of the majority of Central Land Council members due to alleged "unprofessional behaviour".

The media release implied Mr Turner had "behaved so unprofessionally that it warranted his dismissal" and was "unfit to continue to occupy the role of CEO", according to the document.

Jacinta Nampijinpa Price.

Representing Mr Turner, high-profile defamation lawyer Sue Chrysanthou SC told Wednesday's hearing the defendants were asking for a four-week adjournment in which to lodge their defence.

"We understand that there's a personal matter that's caused the delay," she said.

"We understand that some time might be needed."

Justice Michael Wheelahan said regardless of the reasons, the delay placed Senator Nampijinpa Price in default and ordered she pay the costs for Mr Turner's legal team appearing at the hearing.

"There's an expectation that by the first case management a defence will be filed," Justice Wheelahan told the senator's barrister Barry Dean.

"It appears on the evidence that is before me, your instructing solicitor does not respond to courteous requests for information.

"That's not acceptable in my court. That's not acceptable behaviour by a legal practitioner."

According to the statement of claim, Senator Nampijinpa Price's assertions were published by the *NT News* in an article titled, "No confidence motion against Lesley Turner defeated". The newspaper later publicly apologised to Mr Turner and retracted the article.

In a statement released on his behalf, Mr Turner's lawyers said he is keen for the matter to move forward.

"Mr Turner has brought these proceedings to seek vindication for the unjustified allegations published about him and looks forward to the proceedings moving forward as expeditiously as possible and in accordance with the Court's procedures and expectations."

The court ordered the Country Liberal senator's legal team file their defence by November 20, before the next hearing on December 4.

NSW GOVERNMENT

Community consultation on the draft Water Sharing Plans 2025

The NSW Government has developed the draft Water Sharing Plans for the following catchments:

- Macquarie/Wambuul Bogan Unregulated Rivers Water Sources
- Gwydir Unregulated River Water Sources
- Murrumbidgee Unregulated River Water Sources
- Namoi and Peel Unregulated Rivers Water Sources

The draft plans and supporting documentation are available for viewing on the Department of Climate Change, Energy, the Environment and Water website from Monday 4 November to Friday 13 December 2024.

Online webinars and face to face drop-in sessions will be held in November across the catchments.

Join us to learn more about:

- the draft plan
- how to make a submission.

From 11 November to 6 December 2024 staff from the department will also be available for 30 minute booked phone interviews.

To find out more information and to register for the webinars and drop-in sessions, please visit: water.nsw.gov.au/water-sharing-plans or email water.enquiries@dpie.nsw.gov.au

Submissions close at 11.59 pm on Friday 13 December 2024.

NS0045

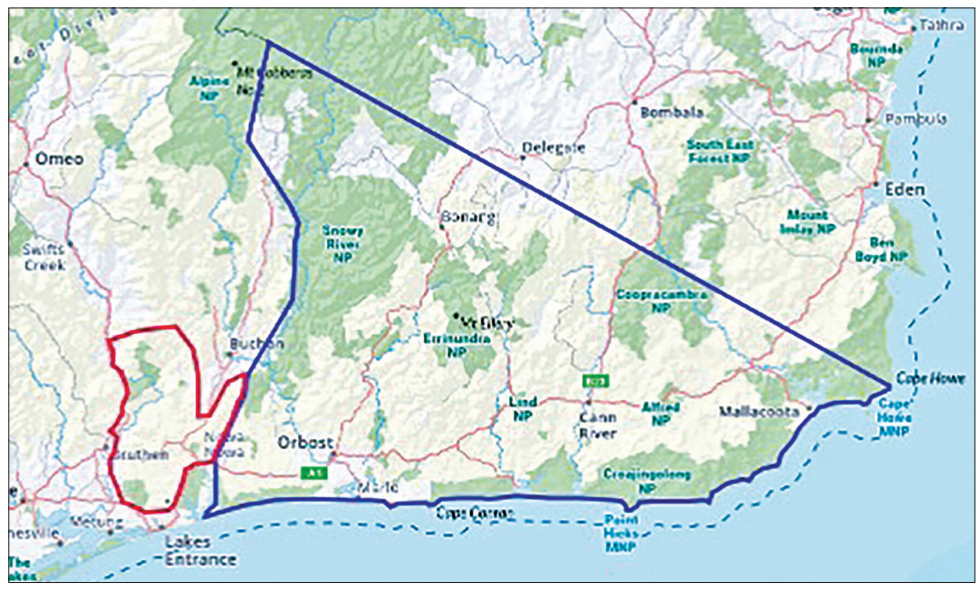
Fox baiting program

The Department of Environment, Energy and Climate Action (DEECA) will be undertaking an ongoing baiting program on all public land in the Snowy District, the Colquhoun and Kenny Forests in the Tambo District and in the Red Bluff section of the Lakes Entrance-Lake Tyers Coastal Reserve to control foxes.

Foxoff baits containing the toxin 1080 (sodium fluoroacetate) or Foxecute baits containing the toxin PAPP (Para-aminopropiophenone) will be used for these programs and they will be buried at a depth of 15cm below the ground in pre-constructed and maintained bait stations.

Fox control on all public land (State Forests and National Parks) in the Snowy District is continuous from November 6 until May 6, 2025.

There is no known antidote for 1080 and baits should not be handled by unauthorised people.



There is an antidote for PAPP but must be administered by a veterinarian within 30 minutes of bait consumption.

Unrestrained pets may be at risk. Please heed all warning signs and keep pets under control to ensure they do not consume baits.

The use of the 1080 and/or PAPP baits will comply with the product label and the Directions for the Use of 1080 and PAPP Pest Animal Bait Products in Victoria.

When used in accordance with these documents, the risk of humans or animals being poisoned by 1080 or PAPP baits can effectively be managed.

Further information concerning this poisoning program can be obtained by contacting DEECA in Orbost via email.

An ongoing fox baiting program carried out by the Department of Environment, Energy and Climate Action kicked off yesterday in all public land in the Snowy District, running until May 6, 2025.

Project welcomes Bobbi McKinnin

The Future of Orbost and District (FoOD) project is pleased to announce that Bobbi McKinnin will be an online guest speaker at the project's Collective Action Through Collective Leadership and Strategic Doing forum on November 13.

Growing up in the picturesque town of Yackandandah, Bobbi discovered her passion for renewable energy and energy efficiency.

Since 2009, she has been a dedicated small business owner and a partner at Solar Integrity, located in Albury Wodonga on the Victorian and New South Wales border.

Solar Integrity specialises in empowering communities, organisations and individuals to achieve energy independence.

The company has received multiple awards for its collaborations with Totally Renewable Yackandandah, highlighting their impactful work in the community.

Additionally, Bobbi is a co-founder of Renewable Albury Wodonga Energy, further highlighting her commitment to sustainable community energy solutions.

As an introduction to the forum, Bobbi will share valuable insights from her community energy projects and discuss broader strategies for fostering resilience within communities.

Liz Mitchell, chair of the FoOD project's governance group, emphasised the importance of learning from other communities.

"We don't need to reinvent the wheel here in Orbost and district," she said.

"This is a great opportunity to tap into the knowledge and experiences of other communities that have embarked on their own transformation journeys.

"Bobbi's insights will provide valuable inspiration for fostering collective action across our community.

"We look forward to community members joining this forum to explore how we can work together towards a more sustainable and prosperous future for Orbost and district."

The forum will be held between 4pm and 6.30pm on November 13.

There is no charge for the forum, however registrations are essential.

Registrations can made via the Future of Orbost and District website.

***Bobbi McKinnin**

HISTORY'S MYSTERIES

Can you identify the people in this photo (above) from the East Gippsland Historical Society collection?

The photo is of Bairnsdale West Primary School Grade 2A class circa 1972.

If you have any information, please contact the *Advertiser*. A new mystery will appear in next week's edition.

No information was received for last week's photo (below) of a debutante and her partner at the Lakes Entrance Ball held at the Lakes Entrance Mechanics Hall circa 1958.

Shining a light on wellbeing

Members of the Bairnsdale and District Diabetes Support Group will join the global push to put wellbeing at the heart of diabetes care on World Diabetes Day this November 14.

This World Diabetes Day, Diabetes Victoria is shining a light on support programs and resources to help people focus on their wellbeing as a part of their diabetes management.

"Our peer support groups offer a welcoming space to share experiences, gain insights from others and create connections," Giovanna Taverna, Diabetes Victoria peer support lead, said.

"These groups are led by community members or healthcare professionals who are dedicated to creating inclusive environments for connecting with others.

"I encourage people living with diabetes or supporting someone with diabetes to join a peer support group or start your own in your local area. If you would like support to do so, you can head to the Diabetes Victoria website."

Diabetes Victoria also offer camps for children with type 1, advocacy services and prevention programs. The Diabetes Victoria Clinic also offers appointments with a health psychologist who can assist with coping strategies for stress, anxiety, depression, diabetes burnout and diabetes distress.

The Bairnsdale and District Diabetes Support Group was established in 1987 to connect people living with all types of diabetes across Bairnsdale and surrounding district to support their quality of life and wellbeing through mutual support and education.

Bairnsdale and District Diabetes Support Group provides a safe and friendly environment to meet and support other community members living with diabetes. People living with diabetes are incredibly resilient, as diabetes impacts both physical and mental wellbeing.

The group meets every second month of the year at the Bairnsdale RSL.

Please contact the group convenor for further information (details available at the *Advertiser* office).

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions
If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 18 November 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool

Monday 18 November 2024 – Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 19 November 2024 - Sale
The Criterion Hotel
90 Macalister Street, Sale

Tuesday 19 November 2024 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 20 November 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about decommissioning.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South-East Australia Carbon Capture & Storage (SEA CCS) Project.

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

Shining a spotlight on violence against women

Contributed by YDHS

YARRAM and District Health Service (YDHS) is proud to be shining a spotlight on violence against women by participating in the 16 Days of Activism Against Gender-Based Violence.

The annual campaign, which runs from 25 November to 10 December, encourages all Victorians to work together to prevent and end gendered violence.

In Australia, more than one in three women has experienced men's violence and on average, a woman is killed by a man she knows every 10 days.

The Wellington Shire ranked within the top five Victorian municipalities for family violence incidents in 2022-23 and this year's local campaign is focussed on raising awareness of the impacts within Yarram and surrounding districts.

According to YDHS Manager Community Health Alison Payne, campaigns like the 16 Days of Activism help in highlighting this important issue and the role we all have to play in ending gendered violence.

"Unfortunately, safety for women is not a given in any community, and neither is respect," Ms Payne said.

"But it doesn't have to be this way; violence against women is preventable and we must work together towards a future where all women are safe, equal and respected".

A key element in addressing this issue is combatting ingrained attitudes and behaviours in men.

"We need to really address the harmful attitudes and behaviours that fuel violence and we all have a role to play in doing that," Ms Payne said.

"That means that if you hear a comment or a see a behaviour from a friend, a colleague or someone you know that's demeaning or sexist, you should call it out".

Yarram and District Health Service will once again participating in the 16 Days of Activism Against Gender-Based Violence.

A series of events are planned across Yarram throughout the 16 Days organised by a Committee comprising representatives from Yarram Neighbourhood House, Yarram Anglican and Uniting Churches, Rotary, Yarram Red Cross, the Yarram Progress Association, Yarram Secondary College and Gippsland Women's Health.

The events include a screening of the film Battle of the Sexes (the Billie Jean King Story), a men's breakfast, a women's morning tea, a photo exhibition and a community walk and barbecue.

The Walk for Respect will begin at 5.15pm on Monday 25 November 2024 at Yarram Secondary College. It will include a tour of the photo exhibition and end at the Yarram Memorial Park at 6pm with a smoking ceremony, a free barbecue and a candlelight vigil to remember those lives lost to family violence.

Ms Payne is encouraging locals to attend the events being hosted over the 16 Days and to engage with the issue of gendered violence.

"Campaigns like this are an important opportunity for us all to reflect on what we can do to contribute towards a world where all women are safe, equal and respected," she said.

Statistic around Family Violence

From June 23 – June 24 Wellington Shire had the 8th highest rates of family violence in the state.

679 Incidents of serious assault due to family violence were reported according to Crime Stats Agency Data Base.

Family and domestic violence

Family and domestic violence can affect anyone in all types of relationships. It can occur in:

past or current intimate relationships, including relationships where you are dating or living together, regardless of gender or sexuality

relationships involving carers of people with a disability or a medical condition, or elders

relationships with relatives and guardians

culturally recognised family groups.

Family and domestic violence isn't always physical. It can happen to anyone, no matter their age, gender or sexual orientation.

It can continue even when you've left a violent relationship.

Family and domestic violence is always the fault of the person causing the abuse. Its never the fault of the person experiencing abusive behaviour.

Landslip works continue

CONSTRUCTION works to repair the Hyland Highway started in July 2024 .

Estimated completion of works was stated as November weather permitting.

The damaged lane remains closed with temporary traffic signals installed to manage flow of traffic and a 40km/h speed limit in place.

Pre-construction and site access works, including geotechnical investigations, design and excavation works, were conducted back in February this year prior to the commencement of the reconstruction works.

The repair works include:

• the construction of a 50-metre long retaining wall to stabilise the road

• installation of ground anchors to increase the load bearing capacity of the retaining wall

• road reconstruction, resurfacing and linemarking, and

• installation of safety barriers.

Police stand firm on brawl

Regan Hodge

Police officers responding to the shooting death of Pal Bidong have been slammed for failing to break up an ugly brawl on the streets of North Melbourne at the weekend.

Up to a dozen youths waged war on each other just metres from police guarding the crime scene where the young rapper known as Peezy was shot and killed.

They were filmed punching and kicking each other while officers stood and watched.

Former homicide detective Charlie Bezzina said the officers should have intervened as it "sends the completely wrong message".

Mr Bezzina, who was a homicide squad investigator for 17 years, said police's top priority should be to prevent crime which they failed to do.

"It's not good optics, absolutely shocking optics for the general public, and sends the completely wrong message," he told 3AW on Tuesday. "They would be saying 'how good is this? The coppers are going to do nothing, we just go on our merry way'.

"They could have managed that, but you've got to go in there and show that we're not going to put up with this.

"It should have been stopped... It's a bad, bad look for Victoria Police."

Commander Mark Galliott defended police actions as their role was to protect the crime scene.

He said several alcohol-fuelled people had attempted to enter and "damage" the crime scene which forced police to form a line. He said those members were given a single direction of not allowing anyone to enter that area as the murder investigation overrules an incident of affray.

He said arrests were made after more police arrived, which is not shown in the footage.

"This is where a murder had just occurred, so the main objective for police attending was to secure that crime scene and preserve the evidence," he said.

Police are still hunting the gunman who fired the shots on Langford St about 3.15am on Saturday following a Halloween rave nearby.

The scene of the deadly shooting in North Melbourne. Picture: 7News

Schoolgirl shaken at vile slurs

One of the Jewish schoolgirls targeted in an anti-Semitic verbal attack by male teenagers has spoken of her fears after the incident.

"You don't expect this on a tram," she told the Herald Sun.

The year 11 girl was one of five female students from Beth Rivka College approached by two boys aged 16 or 17 on a tram on Monday in Caulfield North. The boys, who the girls had never seen before, made eye contact and screamed "Heil Hitler" at them after alighting.

The student said she and the others were left shaken and shocked, and neither the tram driver nor other passengers intervened or tried to comfort them.

The girl said the group is now more cautious and more aware of the growing risks of repeat incidents. Despite their concerns, they are not worried about returning to school.

Police are investigating the incident and have asked any witnesses who saw the attack, which occurred about 12.30pm on the corner of Balaclava and Orrong roads to contact Crime Stoppers on 1800 333 000 or submit a confidential report at www.crimestoppers.com.au.

In a statement, police said they were investigating a report of "racially motivated offensive behaviour".

'We apologise for audio clip'

No intention to mislead public: ABC

Sophie Elsworth
James Madden

The ABC has apologised for "inadvertently" including additional audio of gunshots in a series of stories about an Australian military operation in Afghanistan in 2012.

ABC news director Justin Stevens told a Senate estimates hearing on Tuesday that the issues with the audio "shouldn't have occurred" but he refused to name any employees involved in the stories that ran on the 7.30 program and on the public broadcaster's website.

In September, Channel 7's Spotlight program revealed additional gunshots – purportedly fired by an Australian soldier from a helicopter – had been inserted into stories about the military operation, thus giving a false impression of the circumstances of the skirmish.

ABC managing director David Anderson subsequently launched a review into the matter, to be conducted by the organisation's former editorial chief Alan Sunderland.

In commissioning the review, Mr Anderson said he was, to that point, unaware the ABC's legal department had received a letter raising concerns about the audio editing but it was not passed on to the organisation's news division.

Mr Sunderland's interim report, tabled on Tuesday, found there was "no evidence of any intention to mislead by any ABC employee", and cleared the broadcaster and the journalists involved in the stories of having "deliberately doctored, falsified, manipulated or distorted information, material or evidence in order to mislead audiences".

"I have found no evidence to support the conclusion that any of this was done at the direction of the journalists involved or on the initiative of the video editor in order to doctor or deliberately distort the depiction of the events that occurred," the review states.

"On the contrary, what evidence there is suggests it was not a deliberate editorial decision to include additional gunshot audio in order to mislead or deceive."

In a statement posted on the ABC's website on Tuesday, Mr Stevens said: "The ABC sincerely regrets and apologises for the editing errors in the video clips, including to members of the 2nd Commando Regiment. The video has been removed."

Last year, one of the soldiers involved in the 2012 military operation in Afghanistan, Special Forces commando Heston Russell, successfully sued the ABC for defamation over the stories, which were led by reporter Mark Willacy. Mr Russell was awarded $390,000 in damages, plus legal costs.

During the Senate hearing on Tuesday, Liberal Senator Sarah Henderson asked ABC acting managing director Melanie Kleyn: "On what basis did the ABC not respond (to the letter) and correct these terrible injustices that we now know about? Did ABC lawyers inform anyone else at the ABC? Who was instructing ABC lawyers?"

Ms Kleyn said she "didn't know" if anyone in the organisation's news division had received the letter that had been sent by Mr Russell's lawyers.

The hearing continues.

Israel awards highest civilian honour to Lowy, Leibler

STEPHEN RICE
NSW EDITOR

Retail magnate Frank Lowy and lawyer Mark Leibler have been awarded Israel's Presidential Medal of Honour, the first Australians ever to be granted the Jewish state's highest civilian honour.

The pair were among eight Jewish and non-Jewish leaders from around the world to receive the award, in recognition of their extraordinary contributions to the state of Israel and the Jewish people.

Announcing the awards, Israel's President Isaac Herzog said he had chosen the recipients for their unwavering commitment to Israel, particularly since the Hamas atrocities of October 7 last year.

"The past year, the most difficult since the founding of the state, tested our resilience as a nation and as the Jewish people," Mr Herzog said. "It showcased the diverse and beautiful face of Israeli society and proved, as we have always known and believed, that all of Israel is responsible for one another, that the Jewish communities worldwide and the state of Israel share a common destiny."

Sir Frank and Mr Leibler had fought against anti-Semitism, defended Israel's name in the media, and had long fought for Israel's place among nations, he said.

"Your work and dedication embody this great bond, and the Jewish people and the state of Israel will remain deeply grateful for all that you have done and continue to do," he said.

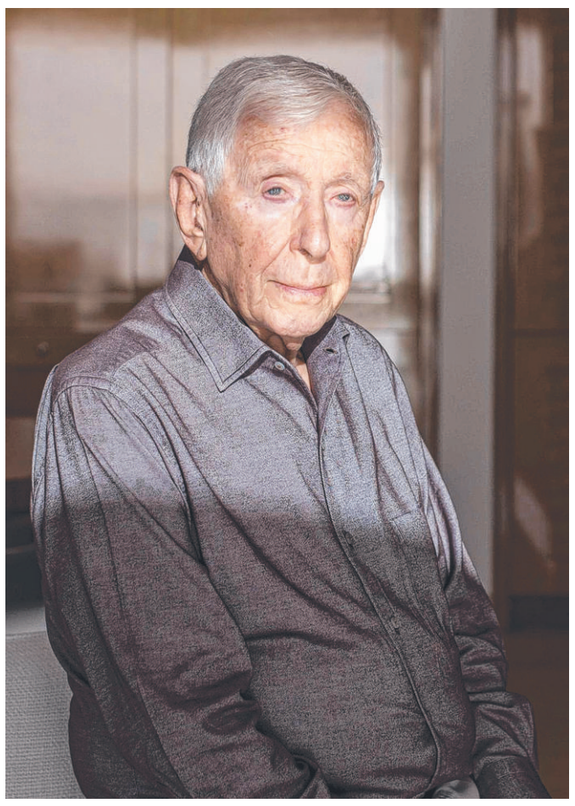
Mr Herzog said Sir Frank, a holocaust survivor, philanthropist and founder of the Westfield shopping empire, had supported the Jewish community in Australia and promoted the wellbeing of Israeli society, particularly in the fields of health, education, and social welfare.

"His influence is also evident in fostering Israeli-Australian relations and supporting vital Israeli initiatives, most recently the National Library in Jerusalem," the President said.

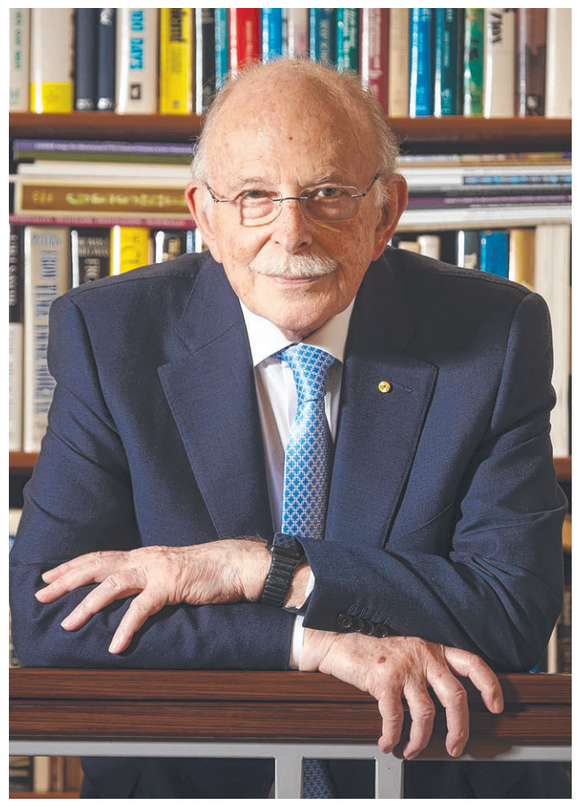
Mr Leibler, a prominent lawyer and Jewish community leader, had worked extensively for human rights, Israel, and the Jewish community in the country.

"For decades, he has been a central figure on the Board of Governors of the Jewish Agency for Israel and Keren Hayesod, working to promote the Australia-Israel friendship, combat anti-Semitism and anti-Israel sentiments, defend Israel's reputation, fight against boycotts, and support the Jewish community in Australia," President Herzog said.

The Arnold Bloch Leibler senior partner said he was thrilled to be recognised alongside his friend Sir Frank.



"Sitting around the dinner table on a Tuesday evening, you don't expect to receive a call from the President of Israel," Mr Leibler said. "I am astonished and deeply moved to have received this extraordinary honour, which I'll treasure for the rest of my life.



"Israel has always been central to my identity as a proud Australian Jew. Working in support of Israel, the Australian Jewish community, and the relationship between the two nations has been a passion and a privilege."

The medals will be presented to recipients in a ceremony at the President's Residence in Jerusalem next month.

The medal was established in 2012 by former president Shimon Peres and has been awarded to fewer than 50 individuals, the vast majority of them Israelis. Past non-Israeli recipients include US presidents Bill Clinton, Barack Obama and Joe Biden, German chancellor Angela Merkel and film director Steven Spielberg.

Soccer star loses bid to return home to NZ

NATHAN SCHMIDT

A Sydney soccer star embroiled in the A-League corruption scandal has lost his bid to travel freely to his native New Zealand amid fears he may not return.

Clayton Rhys Lewis appeared before Downing Centre Local Court on Tuesday facing charges of corrupting betting results and participating in a criminal group.

The 27-year-old midfielder was the third Macarthur Bulls A-League player charged over the scandal, alongside Ulises Davila and midfielder Kearyn Baccus.

Police allege Lewis was among players who deliberately obtained yellow cards during an A-League match between the Bulls and Sydney FC last December 9.

It is alleged the players deliberately affected the result of the betting market and were paid $10,000 by Davila, who was directed by a South American syndicate.

Appearing before the court, Lewis's lawyer Zemarai Khatiz applied for an amendment to Lewis's bail conditions to allow him to travel to his New Zealand.

Mr Khatiz put forward two possible amendments: in one, conditions prohibiting travel overseas and entering international departure points would be deleted. In the other, Lewis would be able to leave the country but would be allowed to do so only after providing seven days to 72-hours notice to NSW Police.

Mr Khatiz said repeated applications to return to New Zealand from western Sydney where he currently lives would result in costly legal fees.

The court was told the officer in charge of the investigation did not oppose the second option, but it had been objected to by the police prosecutor.

"The prosecution submits the primary variation is quite unusual in the sense that it's simply unknown how and when travel will take place," he said.

Magistrate Susan Horan ultimately denied the application, citing that the conditions did not adequately mitigate risks of failure to appear in court.

Push to give nurses, physios bigger roles

NATASHA ROBINSON
HEALTH EDITOR

Nurse practitioners, pharmacists and allied health professionals should be funded to carry out a greater array of healthcare including maternity care in GP clinics under calls for major reforms to health workers' scope of practice.

A federal government-commissioned independent review has recommended a suite of reforms that if implemented will break down legislative and regulatory barriers to these health workers taking over more frontline care in GP clinics, in line with the government's push to encourage greater multidisciplinary teamwork within primary care amid widespread difficulties by patients to access appointments with doctors and rising rates of chronic disease.

The recommendations were met with jubilation by nurses and allied healthcare groups, but peak doctors' groups are warning of a move towards an "NHS-style system" that may pose risks.

The key recommendation of the review by business consultant and former senior bureaucrat in the department of Prime Minister and Cabinet, Mark Cormack, is the implementation of a new blended payment model to enable patient access to multidisciplinary healthcare delivered by health professionals working to their full scope of practice.

Such a model represents a shift away from outdated fee-for-service funding rules which restrict Medicare payments to patients to subsidising individual consultations with GPs.

"The new payment would be supported by a growth in investment in primary care, shifting the ratio of Australian government payments for primary care ... fee-for-service (towards) blended payments ... over time," the report says.

"This recommendation addresses and supports the growth of new and innovative primary care models, the sustainability of which have ... been limited due to challenges accessing Medicare Benefits Scheme funding."

> 'The government must resist implementing Band-Aid solutions that will make the situation worse'
>
> DANIELLE McMULLEN
> AMA PRESIDENT

A bundled payment for maternity care is also proposed, "thereby providing women and families with a range of affordable, accessible and integrated maternity care options in primary care and hospital settings" amid spiralling out-of-pocket costs in the private sector.

Allied health professionals, midwives, nurse practitioners and remote area nurses would also be able to issue referrals in line with their scope of practice.

The reforms are in harmony with the government's policy agenda to modernise Medicare and gradually overhaul the fee-for-service funding model.

Another major recommendation that will attract the ire of doctors' groups is the conferral of authority over registration and accreditation of health professionals to health ministers, eroding medical colleges' authority over that process.

The Australian Medical Association was scathing of the planned reforms, saying the government "must resist leading Australia down the same failed path followed by the UK, where the primary care system is in tatters". AMA president Danielle McMullen said the suggested reforms would fragment patient care and undermine the key role of GPs in delivering high-quality care for patients.

"The federal government has acknowledged there is a GP workforce shortage, but it must resist implementing Band-Aid solutions that will only make the situation worse, as seen in the UK," Dr McMullen said.

"Turning this shortage around requires comprehensive reform, involving greater investment in support measures for Australia's highly valued GPs."

The AMA said decisions about standards of training and clinical practice must be made by independent, profession-led bodies, not politicians.

The Royal Australian College of GPs also warned the reforms "may make seeing a GP harder for some patients" and result in a costlier health system, more delays to care, and higher out-of-pocket costs for patients.

RACGP president Nicole Higgins said the report's recommendations "will raid Medicare and set us up for a two-tiered health system where those who can afford to see a GP will, and those who can't, don't".

"This isn't gatekeeping, it's coordination of a patient's care by a GP who knows them, their context, and their history ..."

No PBS service, but a $200k fee

JAMES DOWLING

Companies whose medicines have been deferred under an unprecedented decision to hold back on Pharmaceutical Benefits Scheme assessments are still being charged upwards of $200,000 per application, despite no services being provided.

Patient advisory groups left in the dark over 45 medicines left off the agenda of the next Pharmaceutical Benefits Advisory Committee meeting have demanded the Albanese government intervene. Cancer treatments and chronic-disease medications are among the drugs deferred in the surprise decision, with delays of at least four months expected to their potential PBS listing.

In letters seen by The Australian, Health Department staff alerted sponsors of PBS applications to the invoice fee despite their submissions being held back. "Submissions held over from March 2025 will be considered at the PBAC's July 2025 meeting subject to submission volume and capacity for that meeting," an October 22 letter reads. "Invoices will be issued for all notices of intent proposing a submission be considered by PBAC at the March 2025 meeting. This will also include submissions that are required to be considered at a future meeting."

An invoice dated October 23 charged one sponsor a $206,435 fee for a category 2 submission, meaning a drug deemed to have major potential impact.

"The department has received notification that over 50 major submissions are planned to be lodged for consideration at the March meeting," the October 22 letter reads. "This is an unprecedented number and exceeds the current capacity of the contracted Health Technology Assessment workforce for evaluation, as well as what PBAC can consider in one meeting. The department has contacted existing and additional providers of HTA evaluation services but there is not enough capacity available to consider all the submissions at the March meeting. It will therefore be necessary to consider some ... at a later meeting."

Despite Health Minister Mark Butler calling on staff to "urgently engage with (pharmaceutical advocate) Medicines Australia to examine all potential solutions" on Monday, the Health Department previously backed the PBAC decision.

The correspondence provided to PBS application sponsors said "the department considered it important for the independent expert PBAC to determine how to manage its March 2025 agenda". "In selecting submissions for the March 2025 agenda, the PBAC used its clinical judgment and experience," it reads.

Chief Justice told to butt out

EXCLUSIVE

ELLIE DUDLEY
LEGAL AFFAIRS CORRESPONDENT

A Federal Court judge has rebuked the NSW Chief Justice for creating "legal uncertainty" and flexing a "supervisory power" over judges outside his jurisdiction – the latest missile launched in a long-running dispute over the drafting of evidence.

Ian Jackman handed down a judgment last week criticising NSW Chief Justice Andrew Bell for seeking "to impose limitations" on judges outside the state Supreme Court, and for endorsing an "artificial, strained, misleading and fanciful" practice relating to written affidavits.

The comments mark a climax in the long debate, which centres on whether it is appropriate for a witness's memory to be converted into direct speech in a sworn affidavit. In other words, the two judges are split over whether a witness's recollection of a conversation should be written down as a verbatim quote.

This practice, Justice Jackman has argued, gives the "false appearance of verbatim memory". But Chief Justice Bell has said there was "no meaningful difference" between a witness offering their "best recollection" of events while giving verbal evidence, and that recollection being written as direct speech.

The disagreement began last year with a judgment by Justice Jackman – the brother of actor Hugh Jackman – in which he said he wanted to end a "longstanding practice" in NSW where affidavits quoting a witness's memory as direct speech are prefaced with the "confusing formula" of "in words to the following effect".

In a separate judgment in July, he found a witness's evidence was "drafted and approved by her as a matter which is adverse to her credibility" because it quoted her memory as direct speech. He said the practice was "logically, ethically and grammatically wrong".

"I regard it as adverse to a witness's credibility for the witness to convey the false impression in an affidavit of a verbatim recollection of a conversation by using direct speech, when all the witness remembers is the gist of something which was said," Justice Jackman said.

But in an appeal judgment for a succession matter in September, Chief Justice Bell said it was "unorthodox and undesirable" for Justice Jackman to "arrogate" to himself the "ending of a longstanding practice in NSW".

"There is no meaningful difference between a witness being asked in the witness box to give his or her 'best recollection' and that 'best recollection' being set out in direct speech in an affidavit or witness statement, qualified by 'words to the following effect' where the witness cannot recall the actual words used," the Chief Justice said. "Many a witness has suffered by reason of the absence of any genuine recall even of the gist of a conversation, exposed under cross examination. Experienced judges are alive to imperfection of memory and artificially precise recollections."

Responding to these comments last week, Justice Jackman accused Chief Justice Bell of seeking "to impose limitations" of judges outside of his jurisdiction. "Bell CJ's statement, read in context, was directed to judges of the Federal Court, but would apply equally to judges of the High Court," he said.

"I do not express any view as to whether his Honour's statement is appropriate to be applied to judges of the Supreme Court of NSW, that being a matter for the judges of that court to resolve in light of the intrusion on judicial independence which Bell CJ's view represents.

"However, to the extent that Bell CJ's view is intended to apply to judges of other courts, with great respect, his Honour is asserting a supervisory power that his Honour does not have."

He said the Federal Court had a "particular responsibility to foster consistent national practice".

"Its responsibilities thus differ from those of the Supreme Court of NSW," he said. "The Chief Justice of a state Supreme Court cannot insist that judges of the Federal Court exercise those responsibilities in a particular way."

ExxonMobil

Esso

An ExxonMobil Brand

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 18 November 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool

Monday 18 November 2024 - Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 19 November 2024 - Sale
The Criterion Hotel
90 Macalister Street, Sale

Tuesday 19 November 2024 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 20 November 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about decommissioning.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South-East Australia Carbon Capture & Storage (SEA CCS) Project.

So much value for money at Lake Bunga

Out of sight, but not out of the way, is this spectacular property located at the end of a no-through grove meaning passing cars are almost nonexistent.

This well designed and well-built home is every bit as good as it looks, with its clean, fresh looks and colour scheme both inside and out, making it a breeze to coordinate your décor within the spaciousness of each and every room.

Built in 2019, the vendors engaged Aspire Homes to produce this amazing three bedroom, two bathroom, two living area home with double garage providing internal access directly into the home.

It's quality all the way where the wide and welcoming entry sets the scene of what lays ahead. A roomy main bedroom that easily accommodates a king-size bed has a walk-in-robe and huge en suite also.

A well-appointed kitchen is complimented with a large walk-in pantry and food prep area (every home should have one). The spacious main living area has an abundance of natural light and leads directly onto a large alfresco area that can accommodate everyone.

Perhaps the biggest surprise is the stand-alone DPU (dependent persons unit). This building isn't just a converted room – it's a purpose-built unit designed for dependent persons – or perhaps large and extended families, hobbies or craft area – the possibilities go on and on.

An 8kw solar system (22 panels) plus solar hot water to each building all adds up to good economic sense. A separate, stand-alone garage/workshop will provide all the storage and work area you'll ever need.

Turkish White Bean Salad (Piyaz)

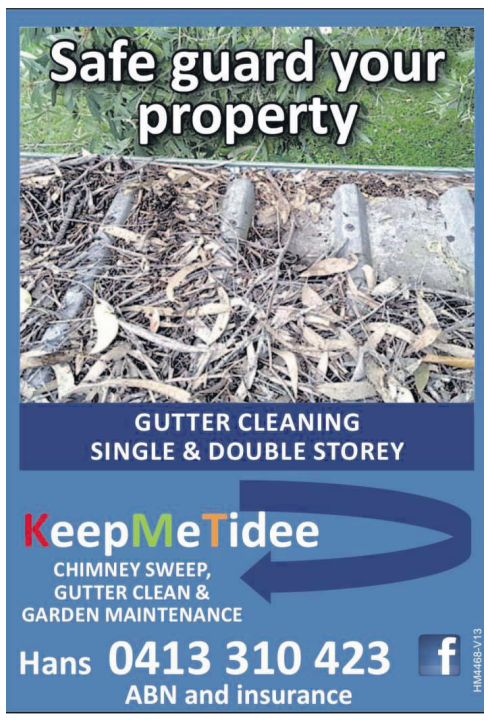
Andrew McEwen

This is a simple and easy accompaniment to a range of meat and other dishes. It is quick to make the Turkish white bean salad. It has a light and bright lemon vinaigrette - it's very tasty.!

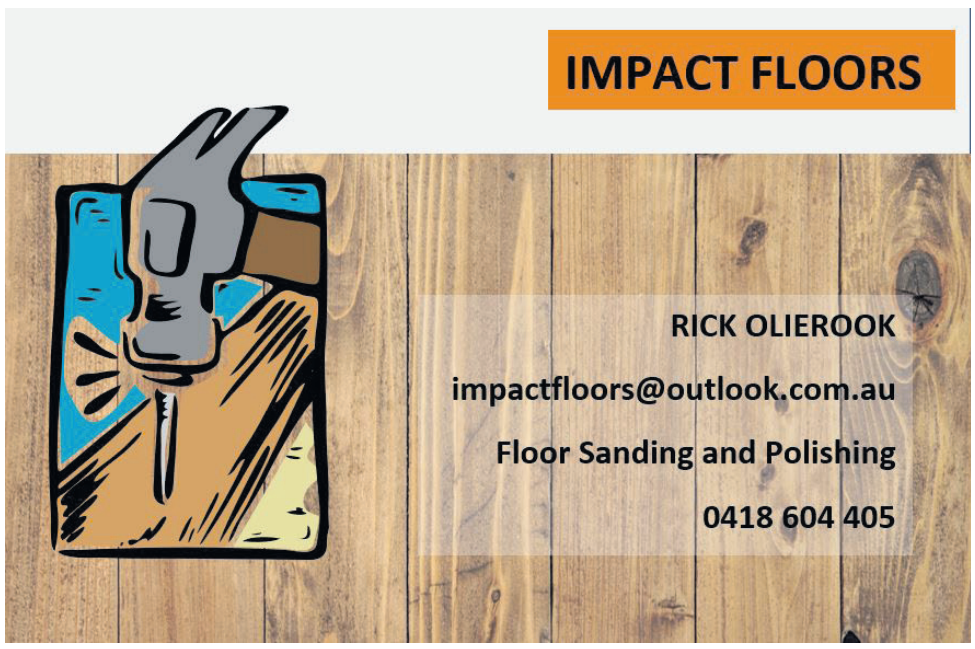
Ingredients
1 red onion, halved and thinly sliced
2 garlic cloves, minced
5 tablespoons red wine vinegar
1 large lemon, juiced
Salt and black pepper
2 cans of cannellini beans, drained and rinsed
2 teaspoons sumac
¼ cup extra virgin olive oil
3 Roma tomatoes, cut into wedges
½ cup packed chopped fresh parsley

Method
In a large bowl, add the onions, garlic, vinegar, and lemon juice and let stand for 10 minutes,
Add the beans, tomato wedges, and parsley.
Add the sumac, salt, and black pepper.
Drizzle with the olive oil and toss to combine.
Taste and adjust seasoning

Time 15 mins **Cost $12**
Serves 6 **Cost per serve $2**



Tarwin Valley Ward 3rd spot forecast to be Brad Snell



First round voting had Schelling and Williams way ahead of the pack with around 65% of all votes cast to those two candidates.

This gave around 600 preference votes to be passed on and most of those went to Brad Snell but interestingly, a large share also went to Rosemary Cousins who was above Brad on the ballot paper after an enormous number of 'donkey' votes with 1-7 from top to bottom - going to Cousins initially.... but starting behind Cousins, Snell overtook her as he scored preferences originally from Schelling and Williams as Kathleen Murray and Aaron-Taylor dropped out of the race.

With 3 remaining, Hill was leading by around 100 votes, with Snell 2nd and Cousins having fallen to 3rd around 100 votes behind Snell, she was next to exit the race. The 'donkeys' then flowed through to Snell as he was listed above Hill on the paper and a win of around 100 votes was expected from scrutineer observations.

Labor accused of 'hiding' huge Games blowout

MACKENZIE SCOTT

A blowout in costs in delivering the 2032 Brisbane Olympic and Paralympic Games could climb to $681m, with a major infrastructure project expected to run over budget by half a billion dollars.

The revelation came as Queensland Premier David Crisafulli promoted former senator Amanda Stoker to his "next-gen" assistant ministry alongside six other newly elected MPs.

Necessary upgrades to link Brisbane's Roma St train station to the federal government's $2.5bn Brisbane Live arena project are expected to run over by up to $500m.

Deputy Premier and State Development and Infrastructure Minister Jarrod Bleijie labelled the blowout "extraordinary", and said the department had been advised the cost analysis of Brisbane Live shows likely blowouts in the federal government's outlay.

"This is an extraordinary amount of blowouts the Labor Party have hid from the people of Queensland," Mr Bleijie said.

"(Opposition Leader) Steven Miles needs to apologise for hiding these cost blowouts ... no one knew about it. The Labor Party knew about it, and they hid it from the people of Queensland."

Last week, the new Liberal National government announced three minor venues for the Games – Chandler Indoor Sports Centre, Sunshine Coast Indoor Sports Centre and Sunshine Coast Stadium – had already blown out by $181m before a builder was appointed.

Crisafulli

The LNP government has committed to a review of Olympic Games venues in its first 100 days, which Mr Crisafulli was confident will deliver what Queenslanders want.

"We're going to make sure that the state has world-class Games, and that involves world-class venues," Mr Crisafulli said. "They'll get that, and they will also get generational infrastructure."

The Premier announced his assistant ministry on Sunday, but failed to deliver on his promise of having a dedicated local government minister or assistant minister.

Longserving member for Condamine Pat Weir was nominated as parliamentary Speaker.

"The assistant ministry today we are announcing is young and hungry to serve," Mr Crisafulli said.

"I've seen the roles of assistant ministry cheapened in recent years and it is our intention that this assistant ministry will go to work.

"That means dealing with stakeholders, that means policy formulation, that means working hand in glove with the ministry and the parliament to drive policy change."

Ms Stoker, elected to the bayside seat of Oodgeroo, took on the assistant finance, trade, employment and training portfolio. She said she would work "bloody hard" for Queenslanders.

"I'm looking forward to drawing on my federal experience to help build a stronger economy, to make Queensland the best place to work," she said.

"I'm absolutely determined to build the prosperity of Queenslanders and help them build their aspirations for their best possible lives."

Redlands MP Rebecca Young will oversee the promised Better Regulation assistant portfolio alongside planning, housing and supporting Mr Bleijie.

Former Gold Coast councillor and Burleigh MP Hermann Vorster has been appointed Assistant Minister for Multicultural Affairs and International Student Attraction.

Pro-life MP Donna Kirkland, who endured a trainwreck press conference on abortion during the campaign, will be the Assistant Minister for Mental Health, Drug and Alcohol Treatment, Families and Seniors and Central Queensland.

Question: Are you satisfied or dissatisfied with the way Anthony Albanese is doing his job as Prime Minister?

DUTTON'S PERFORMANCE

%	June 24-28	July 15-19	Aug 5-9	Aug 26-30	Sept 16-20	Oct 7-11	Nov 4-8
Satisfied	38	41	40	39	37	38	40
Dissatisfied	54	49	50	52	52	52	51
Uncommitted	8	10	10	9	11	10	9

Question: Are you satisfied or dissatisfied with the way Peter Dutton is doing his job as Leader of the Opposition?

BETTER PRIME MINISTER

%	June 24-28	July 15-19	Aug 5-9	Aug 26-30	Sept 16-20	Oct 7-11	Nov 4-8
Albanese	46	46	46	45	46	45	45
Dutton	38	39	39	37	37	37	41
Uncommitted	16	15	15	18	17	18	14

Question: Who do you think would make the better prime minister?

This survey was conducted by Pyxis Polling & Insights between November 4 and November 8 with 1261 voters throughout Australia interviewed online. The theoretical margin of error is ± 3.4. It is compliant with the Australian Polling Council Code and a methodology statement will be available within two days at https://www.pyxispolling.com/apc/. Copyright at all times remains with The Australian.

Prime Minister Anthony Albanese

Opposition Leader Peter Dutton

SIMON BENSON
ANALYSIS

PM's new personal low, Dutton on rise

Continued from Page 1

two leaders since the last election.

Mr Albanese's met approval ratings have dipped to a new low since becoming Prime Minister.

While his approval ratings remained unchanged at 40 per cent, those dissatisfied with the Prime Minister rose one point to 55 per cent. This gives the Labor leader a net approval rating of minus-15 – his worst result.

Mr Dutton's approval rating rose two points to 40 per cent to equal that of Mr Albanese.

Disapproval of Mr Dutton's performance, however, is lower than that of his rival at 51 per cent, giving the Opposition Leader a more favourable net approval rating of minus-9.

This is the first time in Newspoll that Mr Dutton has been in a superior position on this overall measure.

The latest Newspoll survey was conducted between Monday and Friday, and polled 1261 voters nationally. The previous Newspoll was conducted over the period of October 7-11.

Two significant shifts have occurred in Newspoll that should be of deepening concern for Labor.

The Coalition's primary vote of 40 per cent is the first time since June 2021 that it has had a four in front of what is the critical number.

It has now broken through a psychological barrier that has eluded the conservative parties since Scott Morrison's decline.

Peter Dutton can claim this as a personal victory, as the question of his whether he is electable appears also to have been answered.

With only four points between the two leaders on the question of preferred prime minister, this puts Dutton in a highly competitive position should Labor seek to make leadership the defining question of the election campaign.

If you consider the fact that on this question there is a built-in premium for the incumbent, on the question of Dutton being electable the answer has to be: you bet.

There is a caveat, however, which favours Labor.

Labor's primary vote has also lifted – two points to 33 per cent. The Coalition's gain comes with a corresponding failure to suppress this.

And Labor has won an election from this position before – moreover most recently.

So, if you're Anthony Albanese, and you're looking at these numbers in the context of a political debate that has focused on his snout in the trough, you'd be saying 'thank God, it could have been worse'.

Whatever the merits of his HECS debt policy, it has worked politically, by clawing back young voters from the Greens into Labor's column.

And this goes to the heart of what the opinion polls are saying.

There is a continuing transference of votes between the right and left at the margins.

The Greens go down, Labor goes up. One Nation goes down, the Coalition goes up.

Those who decide the election in the middle appear to be unmoved. And largely because neither party is talking to their primary concerns.

Yet, on balance, this is a bad poll for Labor.

And it would surely put paid to the most recent rumours in Canberra that Albanese is gearing up to call a snap election in the new year.

How could it entertain going to an election on these numbers unless it knows something magical that the rest of us don't on how it claws back three points on a two party preferred basis to sneak over the line?

On these numbers, applying the uniform method, Labor loses seven seats, and possibly eight, which reduces it to minority government.

In a tight election, it always comes down to the seat-by-seat contest.

But a three-point swing against Labor, as this poll suggests, is starting to get closer to the 6 per cent swing that the Coalition would need to change the outcome.

And it is the macro story of Newspoll that is the most instructive for both major parties. There is a trend that is hard to ignore.

In both the June and July Newspolls, Labor was ahead in two party preferred terms 51/49.

In August and September, this narrowed to 50/50, in three subsequent polls.

The swing in favour of the Coalition began in October and now appears to be continuing. The last two polls have had the Coalition in front 51/49.

The margin of error notwithstanding, the movement toward the Coalition is evident, even if it remains within a band that on balance has the two parties virtually neck and neck.

What is significant is that the erosion of Labor's support has been slow but it has been steady.

Newspoll has not seen wild fluctuations that you often get in polls.

Instead, it has been tracking a constant yet subtle drift away from Labor over the past six months.

If this trajectory were to continue at its current pace, by the time of the election the Coalition could well be in a position to be highly competitive.

On the issue of Dutton as leader, this now comes into play as a negative for Labor if its strategy is to go hard negative.

If Trump's resurrection proved anything, this might well be the great folly.

Family funeral for 'champion' son, 11

Loved ones gathered on Sunday for the private funeral of schoolboy Jack Davey, who was killed when a car crashed through the fence of his primary school in Melbourne's east.

Emergency services were called to Auburn South Primary School in Hawthorn East on October 29 after reports of the crash.

Jack was reportedly sitting at a table in the schoolyard with other students when a car crashed into the fence. The 11-year-old was rushed to hospital with critical injuries, however he later died.

Three girls – two 11-year-olds and one 10-year-old – as well as a 10-year-old boy were also taken to hospital with serious injuries.

Jack's father, Michael Davey, previously told 7 News his son would remain "very much alive in our hearts".

"We find comfort in reading the many messages and memories of Jack and how his life and energy was a positive influence on so many in the community at just 11 years old," Mr Davey said.

"Personally, he is our champion. He is our beloved son and brother who remains very much alive in our hearts ..."

The 40-year-old female driver of the SUV was arrested and interviewed by police and was released pending further inquiries.

NCA NEWSWIRE

Subsidy delays hit drug sponsors

EXCLUSIVE

JAMES DOWLING

Labor has failed to plan for the consequences of delaying drug subsidies and left hundreds of patients waiting on treatments, the pharmaceutical industry's top body warns.

Medicines Australia, which negotiates on behalf of drug companies, had a key role in dealing with the government's independent drug subsidy assessor after an unprecedented announcement it would limit and defer submissions.

Announced in late October, the delays threatened to keep up to 45 new drugs inaccessible to all but a small portion of patients.

Advocate groups claim the drug delays have left cancer treatments and chronic-disease medication in funding limbo.

In a timeline of the departmental response to the Pharmaceutical Benefits Advisory Committee capacity crisis released on Thursday, Health Minister Mark Butler was said to have asked his department to "advise Medicines Australia about the evaluation capacity shortfall" on October 9, the same date he was officially informed of the excess of submissions that left PBAC seeking to offset its workload.

Two days later the Health Department reports it contacted its independent evaluators to determine how many submissions they could take on.

Despite the October 9 mandate, MA is resolute it was not engaged by the Health Department until weeks later.

Chief executive Liz de Somer said MA was not made aware until October 22, when drug subsidy sponsors were also alerted that their submissions faced an indefinite delay.

"It became evident in estimates ... that the ministers' office first asked the department to consult with Medicines Australia on this issue on 9 October. It's very disappointing this didn't happen," Ms de Somer said.

"Had we been properly consulted at this time, our recommendation to hold an additional PBAC meeting could have been in place as an acceptable interim solution and mitigated the grief that has followed for patients and sponsors. Instead, the minister has had to step in.

"This situation is a failure in contingency planning. Sponsors pay significant cost recovery fees for submissions to be considered. If there are more submissions than one meeting can handle, additional days should be added to existing meetings. Additional meetings should be a secondary contingency."

Mr Butler was contacted for comment.

The PBAC meets three times a year, in March, July and November.

Finance Minister Katy Gallagher said on Thursday the PBAC would continue to grapple with "finite resources and time" despite recent intervention.

"I think you also need to accept the reality of the fact that there is only so much that one PBAC meeting can do," Senator Gallagher said.

MA has repeatedly argued that, given drug subsidy applicants pay fees that cover the cost of evaluation for each medicine they submit, the current resourcing struggle is a product of failing scalability, rather than funding woes.

"MA has not discussed evaluator funding with the department. However, the evaluator costs are fully recovered through fees," Ms de Somer said. "The department is responsible for managing evaluators, and should have a scalable, sustainable workforce in place."

Of the 45 submissions delayed, 24 were deemed "major" medicines. Many sponsors have since removed their submissions, reducing the overall workload from 77 drugs to 63 across the March and May meetings.

A March PBAC meeting had 65 drugs upon its agenda, while a March 2022 meeting considered 69 in a single sitting.

The Albanese government has tried to speed up its HTA system, setting up a working group to enact 50 reforms tipped to reduce wait times by 16 months.

Health officials say there is no intention to defer future submissions, despite introducing a "maximum total number" of drugs considered at meetings.

Esso

An ExxonMobil Brand

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 18 November 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool

Monday 18 November 2024 - Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 19 November 2024 - Sale
The Criterion Hotel
90 Macalister Street, Sale

Tuesday 19 November 2024 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 20 November 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about decommissioning.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South-East Australia Carbon Capture & Storage (SEA CCS) Project.

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Venus Bay Caravan Park leaseholder Tony Holgate. B27_4624

Venus Bay Caravan Park facing Christmas shutdown

'SHUT it down' the EPA has told Venus Bay Caravan Park unless they can make their septic system fully compliant by Christmas.

"We just don't have the money," said park operator Tony Holgate.

With the peak summer season just over a month away, Tony says his park is fully booked from Christmas Eve with only a few sites left for Easter. The Venus Bay Caravan Park has a total of 124 sites including annual sites, cabins, powered sites and unpowered sites accommodating up to 500 holidaymakers over January.

The EPA was first notified of a problem with the park's septic system two years ago.

"A complaint was made to the EPA after a blockage during the busy January period," said Tony.

"The blockage was fixed within an hour, but the EPA had already been notified."

The EPA found the caravan park had 'slipped through the gap' and its septic system was non-compliant.

'We were not aware there was a caravan park at Venus Bay with a septic system' claimed the EPA.

The caravan park was told it needed to comply with current standards.

"They tested the water table," said Tony.

The water table beneath the caravan park and the water table beneath the whole of Venus Bay were found to be contaminated by non-compliant septic systems. The cost of making the caravan park septic system compliant has been estimated to be at least $600,000.

"It is not something a lessee could afford," said Tony.

Holgate is in dispute with the property owner and EPA over who should pay for the compliance works producing a sheaf of paperwork centimetres thick.

"The EPA wants the issue resolved between the lessee and landlord," said Tony.

"Who's going to pay? The EPA argues that it is a new system, not an upgrade. There is no evidence it ever complied with Council regulations. The current system has been in place since the late seventies."

The EPA is yet to give Tony Holgate a timetable for the remedial works.

"It is very frustrating," said Tony.

"They want the caravan park to truck out the waste every day. That's fifty-thousand litres, costing $50,000 a day."

"Otherwise, we will have to shut down and the deadline is December. We can't possibly comply by December."

Tony Holgate says he will keep plugging away, but the park is fully booked.

According to Tony, the EPA told him if he couldn't get a truck to cart away the waste, he would have to shut down the park without notice. The nearest caravan parks are at Sandy Point and Inverloch, and they would also be fully booked according to Tony.

"The effect on the town would be devastating.

"Council has a plan for Venus Bay, but it would cost $2 million," said Tony.

"They don't have the budget, so the plan is on hold."

Located in the heart of Venus Bay, the caravan park is just 600 metres from the surf beach and survives on bore water over summer.

"It's a good little park," said Tony. "We have a pool, tennis court and games room."

Tony Holgate has managed the park for thirteen years spending $400,000 over that time on maintenance and improvements.

"People come back year after year. Parents with children stay at the park for the Nippers program at the lifesaving club."

Tony says he needs more time to settle the issue with the landlord.

"The time to resolve this is June next year. The work needs to be done during winter."

The EPA confirmed Venus Bay Caravan Park has been issued with an EPA Improvement Notice requiring it to apply for the appropriate permission for the wastewater management system on its premises by December 20, 2024. Failure to comply with an Improvement Notice may lead to a fine' according to the EPA.

For anyone operating or installing a wastewater management system the EPA recommends going to epa.vic.gov.au/about-epa/publications/onsite-wastewater-management-guidance.

Free camping leaves caravan parks in cold

A STATE Government plan to make camping free in National Parks including Wilson's Promontory has angered caravan park owners.

Regional small business owners claim they have been abandoned by the Premier who has refused to acknowledge the impact free camping in national parks will have on camping and caravan park operators.

Raising her concerns in State Parliament, Nationals' MP Melina Bath said caravan parks located near national parks will undoubtedly lose vital income.

"Listening to caravan park owners and managers from Orbost to Foster and Waratah Bay, I know Labor's decision is already causing distress for businesses who rely on tourism to survive. Campers in our caravan parks are a vital part of our regional economy helping to sustain jobs and generate much-needed income.

"Potential tourists have already asked licensees if they can match the State Government's free camping offer.

"They simply can't compete and pay wages and operating costs," said Ms Bath.

"These small businesses have been hit hard, suffering years of COVID lockdowns, higher taxes and sky-rocketing electricity bills.

"In her response to my request for support for regional businesses, the Premier arrogantly but unsurprisingly dismissed their plight."

Speaking in Parliament, Ms Bath highlighted the Victorian Caravan Park Association's fairer alternative of introducing a voucher program that could be used at all campgrounds, which was rejected by the Government.

"National park camping fees were already low so there was no need for the Allan Government to make them free," said Ms Bath.

"The $25.7 million derived statewide from camping fees in National Parks subsidises the cost of repairs to infrastructure.

"Our public spaces are suffering, so removing this revenue stream is negligent," claimed Ms Bath.

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 18 November 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool

Monday 18 November 2024 – Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 19 November 2024 - Sale
The Criterion Hotel
90 Macalister Street, Sale

Tuesday 19 November 2024 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday, 20 November 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

All the above sessions will run from **5.00pm - 7.00pm** with a presentation about decommissioning.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South-East Australia Carbon Capture & Storage (SEA CCS) Project

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

To find out more information

Latrobe Valley Express PARTNERSHIP

Seaspray Primary to remain closed

Stefan Bradley

SEASPRAY Primary School will not open for for the second-year running in 2025 after a high profile push to find enough enrolments was not successful.

In response to having just three enrolments for 2024, the school entered 'non-operational' status last year.

At the time, senior education improvement leader in the Wellington Shire, Craig Felstead stressed that the school's 'non-operational' status was temporary, and the school was not "closed".

A meeting on October 11 led to the community inviting families to enrol their kids in the school, with paperwork available for interested parents at the Seaspray General Store.

All those expressing interest were contacted, but ultimately there were not enough students for the Department of Education (DoE) to re-open the school, and thus a second community meeting scheduled for October 28, was abandoned.

"We are currently confirming possible enrolments at Seaspray Primary School. At this stage there does not appear to be sufficient interest to reopen the school for 2025," a DoE spokesperson told the *Gippsland Times* at the end of October.

The DoE mentioned the October 11 meeting which they described as a commitment to meet with families with school-aged children in relation to the status of the school. Seaspray Primary School remains non-operational pending a decision on its future.

Karen Smyth technically remains the principal of the school, although she is currently working elsewhere. She confirmed the follow-up meeting didn't go ahead due to a lack of interest, and previous students are at other schools in Sale and Longford.

"Each of the prospective enrolments was contacted. (There) wasn't enough interest to warrant the meeting," she said.

The DoE also did not provide a specific or range of numbers required for the school to open in the future.

The DoE did not address if the school faced potential permanent closure if it doesn't re-open in the next few years.

However, former Seaspray Primary School principal Heather Harrington noted that Neerim District Rural Primary School will exit non-operational status when it re-opens next year. The school had been non-operational since the end of 2019 due to having no enrolments. In 2025, 17 potential enrolments are on the table for Neerim.

Seaspray Primary School may just be going through a lull at the moment.

"It's just a natural change of demographics which happens everywhere all the time. It's a bit low at the moment. It's a different generation of people coming into the town," Ms Harrington said.

"Like a lot of rural areas, demographics change over time. It ebbs and flows. Both Seaspray and the school are hidden gems. But it's close to Sale, so it is not remote.

After entering non-operational status in 2024, there are not enough enrolments to re-open Seaspray Primary School in 2025. **Photo: File**

"The community is still hopeful the school will open in the future. It's such a vital part of the community and they haven't given up hope."

Changes to pool opening hours

GUARANTEED opening hours for all outdoor pools will be among changes being introduced by Wellington Shire Council this summer.

The changes also include a longer summer season at the Yarram pool and the launch of Free Swim Fridays at all sites.

Following community consultation where council heard feedback from over 500 local people, these improvements aim to provide more opportunities for everyone to enjoy the water and make the most of the summer season in Wellington.

The biggest change is guaranteed opening hours at all outdoor pools, which will be open every day, regardless of temperature. The update means the pools no longer rely on the old 25-degree temperature rule, a change based directly on community feedback.

With the exception of Yarram, outdoor pools will open daily and stay open longer on days when the temperature reaches 24deg.

The Yarram pool will have a different schedule, staying open later on specific days but closing on Tuesdays, Thursdays, and Sundays outside of school holidays when fewer people use the pool. During school holidays, the Yarram pool will open every day and offer Free Swim Fridays, just like other pools.

For the first time, the Yarram pool will extend its season to 19 weeks, from Monday, November 25, to Sunday, April 6 — four weeks longer than usual. Guaranteed opening hours and Free Swim Fridays will be offered all season.

Rosedale's season will run for 10 and a half weeks, from Friday, December 13, to Friday, February 28, with daily guaranteed hours, Free Swim Fridays, and extended hours on days over 24deg.

The Sale (Aqua Energy), Maffra, Heyfield, and Stratford outdoor pools will have a 15-week season from Friday, December 13 to Sunday, March 30, with daily guaranteed hours, Free Swim Fridays, and extended hours on days over 24deg.

Lap swimming will remain available at Sale and Maffra outdoor pools during designated hours.

Council chief executive David Morcom said knowing it needed to make changes this season, council listened to the community and made meaningful adjustments to suit.

"By engaging with the community early on, we gave ourselves time to consult, prepare, and update our services," he said.

"Our communities biggest requests were to remove the unpopular temperature trigger, and to offer guaranteed opening hours. We are happy that we can offer that across every pool this season.

"Last summer, over 27,000 people enjoyed Wellington's outdoor pools, and with 20 new lifeguards now on board, this year is shaping up to be even bigger.

"Our regional pools are the perfect place to cool off and have fun, and we can't wait to welcome residents and visitors back this summer."

All outdoor pools will be closed on Christmas Day.

For operating hours, visit **www.wellington.vic.gov.au/pools** or phone Wellington Shire Council's leisure services team on 5142 3700.

Stratford will be among four outdoor pools which will have a 15-week summer swim season, beginning December 13. **Photo: Contributed**

Bairnsdale Bearings will swing open its doors on Thursday, November 21, for its Milwaukee Powered-Up event.

Powered-Up event

Bairnsdale Bearings will hold a Milwaukee Powered-Up event on Thursday, November 21.

The one-day event will see discounted prices on Milwaukee products, merchandise giveaways, tool test drives and bonus products.

There will also be a "Tools or Travel" summer giveaway, where customers can spend $300 on Milwaukee products or purchase specially marked Milwaukee products to go into the draw to win one of three prizes.

The Powered-Up event will be held at the Bairnsdale Bearings site at 1 Rovan Place, Bairnsdale, and will run from 8am to 5pm.

Retiring East Gippsland Marketing executive officer, Liz Whitehill, chairman of the past five years, Pat Carson, incoming chairman Andrea Brown, and newly appointed executive officer Merrin Curnow. (PS)

Fresh faces at EGMI

Last week saw a changing of the guard at East Gippsland Marketing (EGMI) with Pat Carson stepping down as chairman after five years in the position, but he will remain on the board as an ordinary member.

According to his peers at EGMI, Pat has served the organisation well and in a quiet, firm and professional manner. Stepping into the chair at EGMI is tourism industry professional Andrea Brown. Andrea been deputy chair for the past two years.

Her practical business experience in the high end of tourism will shine a new light on leadership at EGMI.

New board members include Belinda Stewart, Darren Beggs and Jaco Van Deventer and retiring board members include Tim Biles, Paul Scrambler, Vanessa Medling and EGMI veteran Courtney Campbell.

The current EGMI executive officer was pleased to announce the appointment of Merrin Curnow as the new executive officer.

Merrin has recently moved to the region from Brisbane and has a wealth of experience in marketing in the financial sector, not-for-profit, manufacturing, community and health sector.

Merrin is pleased with her new appointment and keen to unwind her experience and skills to support the development of the region.

Merrin said she is looking forward to meeting the people involved in EGMI in the coming weeks and the broader community to see what they have to offer.

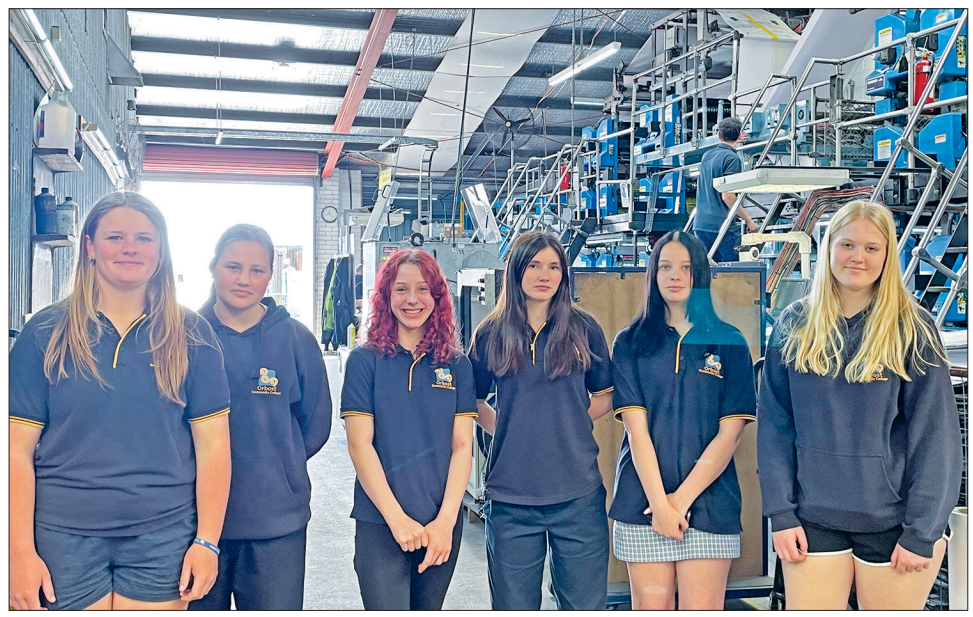
Students learn about printing

Orbost Community College's school magazine group was treated to a tour of James Yeates Printing and Communications in Bairnsdale recently, where the *Snowy River Mail*, *Bairnsdale Advertiser* and *Lakes Post* are printed.

They went to see the printing process and explore different apprenticeship careers and options for work experience.

They met community news reporter Rylee Pardew who went to Orbost Secondary College.

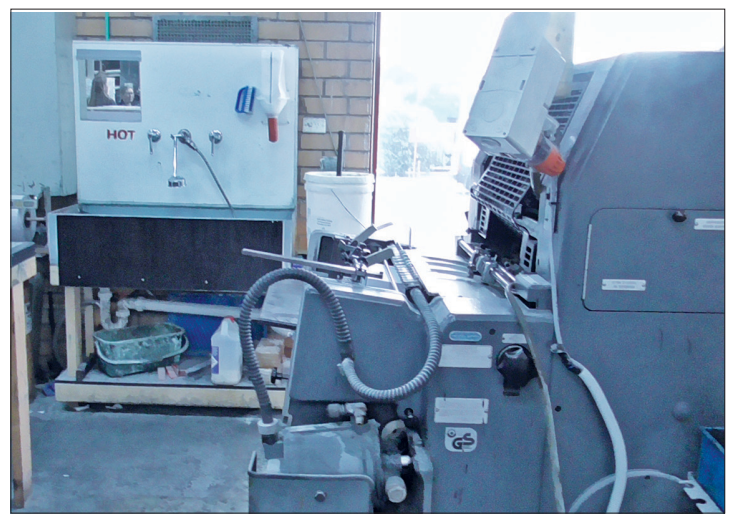
The students said they enjoyed seeing the different machines, the process of printing newspapers and how they are then collated to be delivered around the region.



"I enjoyed seeing the different machines and how huge they seemed in person," Rose McDowall said.

"I liked seeing the workers put the aluminium printing plates in the printer," Laura Light said.

"I liked watching the printing machines," Alyssa McDonald said.



"I liked watching the newspapers get printed," Allaura Grenfell said.

"I enjoyed watching the newspapers get put together," Charlie McKerlie said.

Orbost Community College students were recently given a tour of James Yeates Printing and Communications in Bairnsdale as part of their school magazine project. The students were able to see first-hand how local newspapers are printed and collated before being distributed around the region. (PS)

THUMBS UP / THUMBS DOWN

THUMBS UP: Thanks to Chris and Gab from Sailors Grave Brewing for putting together a tradies thank you afternoon at the newly completed Dunetown. Your generosity is much appreciated

THUMBS DOWN: To all the nimbies in this area against renewables, particularly the proposed Solar Farm, no backyard has a future without them.

THUMBS UP: To Bairnsdale Production Line Theatre for their recent presentation of Arthur Miller's *Death of a Salesman.* It was a brilliant production performed by very talented actors. Well done to everyone involved.

THUMBS DOWN: To those responsible for the Brookfield Lakes playground development. almost a year now with temporary fencing around the barbecue and the water fountain is still not working properly. Plenty of water is getting wasted as kids have to drink from the tap that fills the pet water bowl.

THUMBS UP: To the local residents beautifying Palm Ave in Paynesville. Thank you. But -
THUMBS DOWN to the responsible authority for leaving it up to residents to maintain roadside and park edges.

If submitting a Thumbs Up/Down

All items submitted for consideration for publication in Thumbs Up, Thumbs Down, must be signed and include the address and telephone number of the writer. (This information is not for publication but is required under the Newspaper Act.) Items should be limited to 30 words, and writers should note that due to the numbers received, only a selection can be published. No specific business names will be mentioned in Thumbs Up/Thumbs Down. **Write to 'Tom', c/- 'The News'**

Submit your thumbs up or thumbs down thumbs@eastvicmedia.com.au or online at www.bairnsdaleadvertiser.com.au

Workers at four major woolworths distribution centres took a stop work

Workers at four major woolworths distribution centres had a stop work last week on November 12th.

More than 1500 warehouse workers stopped work for 1-hour tomorrow across different shifts at three distribution centres in Victoria and one in NSW.

Workers are taking protected industrial action after negotiations for a new workplace agreement have ground to a halt in the face of the ongoing cost of living crisis, which is pushing workers to their limits.

Workers want everyone brought up to at least $38 per hour in the first year, with percentage wage increases in following years and a national agreement so that workers are paid the same pay for the same work.

Workers are calling to permanently scrap Woolworths' "Framework", which the union says is a high-risk management approach pushing workers to work faster, which could undermine safety in a very dangerous industry.

UWU National Secretary Tim Kennedy said:

"Workers all over Australia are struggling to survive in the face of more than a decade of wage stagnation compounded by ever rising prices. Wages are lower today than they were a decade ago.

"Meanwhile, big corporations like Woolworths have accrued ever increasing profits in this period contributing to growing wealth inequality in Australia. Workers at Woolworths need a proportionate wage increase to deal with the cost pressures they face.

"Woolworths workers want to be paid equally across the country. They want to be paid the same rate for doing the same work under a national agreement.

"It is crucial that Woolworths 'Framework' is shut down once and for all. This management approach has the potential to increase risk in an already very dangerous industry pushing people to work faster for fear of losing their jobs.

"Workers have voted in very large numbers to take indefinite strike action and will be deciding this week what their next steps will be in the lead up to Christmas if Woolworths does not come to the table with an improved offer."

ExxonMobil

Esso

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 18 November 2024 - Welshpool
Welshpool Memorial Hall
49 Main Street, Welshpool

Monday 18 November 2024 – Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 19 November 2024 - Sale
The Criterion Hotel
90 Macalister Street, Sale

Tuesday 19 November 2024 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday, 20 November 2024 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about decommissioning.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, please contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Consultation Team will also be available to discuss all current activities, including:

- Gippsland Basin Geophysical and Geotechnical Investigations
- Kipper - Sub-Sea Drilling
- Turrum Phase 3 Drilling
- South-East Australia Carbon Capture & Storage (SEA CCS) Project.

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Please fill in the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Please refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

AFL greats Josh Kennedy and Campbell Brown will play in a kabaddi tournament next month. Picture: Wayne Taylor

Catch this if you can

Peter Rolfe

An Indian sport never before played professionally on Australian soil is coming to Melbourne.

The first ever Pro Kabaddi League exhibition match will be played at John Cain Arena in December, in a series expected to attract fans from outside Victoria as well as Melbourne's vast ex-pat Indian community.

Pro Kabaddi Melbourne Raid will be held on December 28, after day three of the Boxing Day cricket Test between Australia and India at the MCG.

Fans are expected to attend the MCG blockbuster then watch a sport second only to cricket in popularity in India.

A curtain-raiser will pit a team of Australian athletes, including former AFL premiership stars Josh Kennedy and Campbell Brown, against an Indian team of Pro Kabaddi players.

The main event will be a Pro Kabaddi All Stars game between two PKL teams.

Premier Jacinta Allan will announce the series on Monday, along with Indian Consul General Dr Sushil Kumar.

"India's number one and number two sports will be side by side in the sporting capital of the world," Ms Allan said.

Tickets will go on sale from 10am Monday, starting from $10 for children and $55 for adults.

New Brazil green goal

SAO PAULO: Brazil plans to cut greenhouse gas emissions more dramatically than had been planned, the government of Luiz Inacio Lula da Silva has announced.

Instead of the earlier target of reducing emissions by 59 per cent from 2005 levels by 2035, it will aim for a 67 per cent cut.

The shift is intended to align Brazil's emissions goal with the terms of the 2016 Paris Accord.

Signatories to the accord have until February to announce their goals, but Brazil will present its target at the COP29 climate conference in Azerbaijan beginning Monday.

Workers lost to landslide

YAOUNDÉ: Workers have recovered 12 bodies following landslides that engulfed a road in the west of Cameroon, a regional official said Saturday, adding there was no hope of finding survivors.

State television CRTV reported the comments by the governor of Ouest region, Augustine Awa Fonka.

Only 12 bodies had been recovered from the site, he said. Dozens more people were still missing. Two landslides hit the Dschang cliff road on Tuesday – the second as emergency workers were trying to clear the road.

Debt axe plan aids wealthy

Students in city seats biggest winners

Jade Gailberger

Young voters in inner-city Greens and Labor seats would be the biggest beneficiaries of the Albanese government's pledge to wipe 20 per cent from student loans.

But the Greens have upped the ante, pledging to axe all student debt under an eye-watering $74bn promise to make it easier for people to save money, buy their first homes and start families.

Analysis of taxation office data shows the federal electorates of Melbourne, Wills, Brisbane, Griffith and Cooper have the most voters – more than 30,000 each – that will benefit from Labor's election policy.

Anthony Albanese's own electorate of Grayndler also makes the top 10, alongside the affluent suburb of Kooyong in Melbourne.

Experts say the cost-of-living measure will help young voters in the wealthiest, most educated electorates who have the greatest access to social and economic capital including financial support from family.

People in the seat of Melbourne have racked up average debts almost $8000 higher than the national average of $27,641, which means they'll get a $7000 cut, compared to the average $5520 saving.

Opposition Leader Peter Dutton rejected Labor's plan to slash $16bn from the HECS, TAFE and apprenticeship loans of three million Australians from June 1, 2025, arguing it was inflationary.

RedBridge pollster Kos Samaras said the policy was indicative of Labor always trying to fix problems that were "closer to their social class", rather than the voters it should be worried about.

"The younger voters that should keep this Labor government awake at night are those that are living in Camden, Ipswich, Rockhampton, Nelson – outer suburbs, regions," he said.

"They are the ones who are more likely to be extremely volatile, who expressed to us huge levels of dissatisfaction towards party politics full stop, and obviously these young people do not have a university degree.

"That grievance is fuelled by a sense of being economically abandoned, politically abandoned ... and I think all this will do is reinforce that prejudice."

But Education Minister Jason Clare said three million people across the cities, suburbs and regions would benefit.

He said the percentage of the cost of degrees that students paid had risen from 24 per cent when HECS was created to almost 45 per cent under the Morrison government.

"This is an important measure that will provide a bit of relief to a lot of young Australians starting out who might be trying to start a family or get into the housing market," Mr Clare said.

Meanwhile, the Greens plan to wipe all student debt is expected to cost $74bn over the decade, which it says it would pay for by taxing the big corporations that have profited from price gouging during the cost-of-living crisis.

Future leaders converge

VIC

THE CareerTrackers community reunited for the first time in person last week since 2020 at Naarm's Marvel Stadium at their annual Leadership Development Institute conference.

The conference brought together 400 CareerTrackers students, alumni, partners and staff in three days of learning and networking.

The CareerTrackers internship program was started in 2009 with a vision to create First Nations leaders, particularly in the corporate space. With an alumni cohort of more than 1,300, many of whom are keen to give back and support current interns, the program is the largest community of First Nations students and professionals in Australia.

CEO Taryn Marks said that spending three days with the CareerTrackers community has been an amazing experience.

"Seeing everyone in one room, and spending time with them over this three-day period, it's really obvious the power of our incredible community, which is why the theme this year is "Connecting for Impact – because together we can achieve so much more," Ms Marks said.

Quandamooka woman Scarlett Smith-Perkins, who is studying computer science at the University of Queensland, said that she appreciated the opportunity to meet other students and Mob in person. Scarlett said she enjoyed connecting with other computer science students from all over Australia at the STEM workshop.

Interns attended sessions on presentation, goal setting, STEM and study skills; and alumni attended sessions on Indigenous governance, leadership and managing cultural load.

Travis Cardona, Director First Nations and Outreach at NIDA who delivered a session for interns on presenting with confidence said: "It was truly inspiring to witness the enthusiasm of so many First Nations university students at the CareerTrackers event. Our brief NIDA presenting skills workshop aimed to equip them with tools to confidently navigate future presentations. CareerTrackers deserves commendation for their exceptional efforts in paving career pathways for our young Mob."

One of the most engaged sessions was run by Drew Patten and Layla Quartermaine of the Koorie Youth Council, with the theme 'The Gift of Responsibility', which included audience discussion of topics such as wellbeing and experiences in the workplace.

Alumni Manager Bek Lasky, who programmed the alumni workshops, said her highlights included seeing everyone together, meeting new people and getting the chance to have deep conversations.

"It was important for us to be together in person, so many alumni are on such great career paths and trajectories, so it was good seeing where they are now."

On the last day of the LDI, Andy Krakouer gave an inspirational speech about his incredible life from prison to playing for Collingwood Football Club to presenting *Yokayi Footy* on NITV. He spoke to the students about learning to be accountable for his actions, and the importance of culture, finding strength in community and resilience.

It's almost time to get along to the next Toora Pear Party, which is on 25 February.

There ain't no party like a Toora Pear Party

It will soon be harvest time at Toora's very own Heritage Pear Orchard, with organisers of the annual Pear Party set for what promises to be another great celebration on 25 February 2025.

The orchard really is a hidden gem off Mill Street in the town. Set in a small pocket of parkland, Muddy Creek burbles away at the side of the orchard itself, which provides plenty of space for tranquil, shaded picnics. For one day each year though, the park comes to life for the Pear Party, which has seen as many as 600 visitors over the course of the day in recent years.

Visitors can purchase a bag from organisers for $6, and pick their own choice of pears from the many varieties on offer, or bring along a supermarket shopping bag of their own and fill it for $10.

As well as the fruit picking, local bands will be performing throughout the day with market stall holders selling locally produced goods, children's games and activities, a baked pear competition on the day, and trash and treasure. The Lions BBQ will also be serving up its famous sausage sizzle.

Unfortunately, local horticulturalist Neil Barraclough will not be attending the party this year to offer grafting advice. But fear not, prospective students of this fine ancient art will be able to attend a workshop planned for late July at the Toora Hall, where participants will learn skills about the production of many different fruit varieties.

The orchard's upkeep is dealt with by a small band of volunteers, with working bees regularly dealing with pruning, mowing and fertilising across the year. Tony Adams, President of the Friends of Toora Heritage Pear Orchard said, "We're really looking forward to this year's Pear Party but as ever, we could do with help, year round if possible but if anyone can volunteer for some light duties on the day, please don't hesitate to get in touch."

Tony can be contacted at tony_adams@icloud.com or on 0490 352 600

Book Sale bonanza!

Readers from near and far converged on the Foster Hall over Friday and Saturday to pick up some bargain books, CDs, DVDs, records and more at the Friends of Corner Inlet Library Book Sale. They were delighted to see tables brimming with novels, thrillers, non-fiction books of all types and many, many children's books. Book sale organiser Liz Kindellan was very happy with the steady stream of buyers who attended the sale and snapped up loads of bargain books. "We took over $4,200 in sales, which is huge considering that most of the books are 50 cents each, and kids' books are three for a dollar."

Liz also thanked the volunteers who were responsible for setting up the hall and putting the books out prior to the sale as well as assisting shoppers over the two sale days. "Without the volunteers none of this would happen. As well as our always reliable regulars we had some new people helping, which certainly made a difference!"

The money raised goes towards purchasing new items for the library, and this year the focus is on supporting the 'Library of Things', which enables library members to borrow items such as a Thermomix, a surfboard, an induction cooktop, an overlocker, a cake tin kit, a GoPro and many more interesting things.

The next book sale will be held on the first weekend in July, and any donations of books or other items can be taken to the Foster Library. For any other information call Liz Kindellan on 0448 256 193.

Volunteers at the Foster Book Sale on 11 January. Keep your diary free in July for the next big sale!

Local bartender recognised

Whether it's the head on a pint, the crema on an espresso, or the pour of your Mr Whippy, you can tell whether the person making it takes pride in their role.

And that's certainly the case with local woman Megan Shellcot, who was recently placed third in the *Herald Sun's* Regional Victoria best bartender competition. She was voted for by regulars at Toora's Royal Standard and the RSL in Foster where she works part time.

Megan said she had been serving regulars and visitors for the past fourteen years and had wanted to work behind the bar since her teens.

"It really is satisfying to pour that perfect pot, even after all these years". She continued, "It's not just that though, it's really all about people skills, making people comfortable whether a regular or casual visitor. I get to socialise after a long day on the farm and the banter is always good".

Megan is a fifth generation cattle farmer, who lives and works with her family on their farm outside Foster and says, "I'm used to working with older people and love the conversations you can have with them, you always want them to go home having had a positive experience".

Regular at the RSL, Wolfgang 'Wolfy' Fiedler said, "Megan's always got a welcoming smile and is a great person to have a chat with. That's why she got the recognition after all".

Megan told the *Sun* she felt "very humbled" and "grateful" to everyone who voted for her.

Megan Shellcot - officially one of regional Victoria's finest bartenders

Magic Beach is now showing in cinemas nationwide.

Prom Coast hits the big screens in *Magic Beach*

South Gippsland's stunning coastline is set to reach national audiences through *Magic Beach*, the new film adaptation of Alison Lester's beloved children's book, with key scenes filmed at Walkerville South.

Director Robert Connolly, known for *The Dry* and *Force of Nature*, chose the region's coastal landscapes as the backdrop for this summer holiday release, which is showing on 230 screens across Australia.

"Filming in South Gippsland brought our cast and crew to this incredible region, employed locals and their businesses, and we were at all times welcomed by the wonderful communities in the region," Connolly said. "Cinema is such a wonderful way to showcase parts of Australia and Victoria to the world."

The production, supported by the Victorian Government through VicScreen, continues Connolly's commitment to regional Victorian filming locations, following his work in the Wimmera, Mallee, and Otways regions for previous films.

Magic Beach is now showing at Stadium 4 Cinema in Leongatha.

CropFest 2025 coming into bloom

Once described as South Gippsland's quirkiest film festival, CropFest 2025 provides the opportunity for local gardeners and lovers of nature to gather together to share their stories and celebrate.

Following the enthusiasm and excitement of last year's celebration, a date in mid March will soon be announced. Whether you're a green-thumbed film maker or just love a good homegrown story, it's time to grab your camera or phone and show off how your garden grows. Landscape mode is best to take advantage of the big screen at Toora Hall where the finished films will be shown.

CropFest invites short, two to three minute films to be sent to bryanwatterson202@gmail.com featuring anything to do with growing things in your garden, or someone else's if that's what you've been doing, it really doesn't matter.

We suggest using wetransfer.com which allows video of up to 2GB to be sent for free and really is the easiest platform for uploading and transferring data of this kind for free.

PROM COAST News

Join our team at Prom Coast News!

Are you a community minded local who likes connecting with the businesses and community groups across the Prom Coast?

We are looking for a volunteer to assist with advertising and editorial contributions. This role involves 2 - 3 hours per week, working with our teams to secure advertising and content for our fortnightly editions.
Whether you are transitioning into, or out of employment, this is a fantastic opportunity to use and develop your skills while supporting a valued community organisation.

For further detail:
E: hello@promcost.news

Proudly local and Independent

Mayor's message

South Gippsland Shire Council

John Schelling

Hello South Gippsland.

It was great to be out-and-about on the weekend seeing the wonderful celebrations for Australia Day. These events are run by volunteer groups who spend months planning so we can all enjoy some unique activities. Thank you to everyone who was involved in pulling these events together this year.

It was sad to see an event not go ahead in Leongatha, despite the organisers trying hard to get someone to take over the event. This highlights the very real issue we may be facing in the future if more of us don't put our hands up to volunteer and spread the workload. However, I have my fingers crossed that this event can come back next year.

Shaping South Gippsland engagement
Councillors are now back on deck, with briefings recommencing and a Council Meeting set for 19 February at 2.00pm. We all look forward to catching up with our community throughout the engagement for Shaping South Gippsland.

As I mentioned last week, we are seeking feedback from our community that will inform the development of the Council Plan 2025 – 2029 and help us understand if we need to make any changes to the Community Vision 2040.

Councillors will be out every weekend from now until the end of February at a range of events and at pop-ups in towns across South Gippsland to ensure we hear from as many people as possible.
To find an event near you or complete the survey, please visit: www.shapingsouthgippsland.com.au

Coal Creek Summer Session
Are you looking for a family-friendly event in South Gippsland? Look no further than Summer Session at Coal Creek.
Happening on Saturday 1 February from 4.00pm to 8.00pm, enjoy a night of music, dancing, food, drinks, and kids' entertainment in this beautiful heritage setting.

Summer Session is a free event, so go along and simply enjoy the atmosphere. To book your ticket, please visit: www.trybooking.com/CYAJU

ArtCubes
The colourful ArtCubes were on the move last week, making the trip from Foster to Venus Bay.

The Cubes have a jam-packed three months ahead, with an impressive line-up of groups taking their opportunity to showcase their work in one of the Cubes.
For a full program and for more information, please visit: www.visitsouthgippsland.com.au/artcubes

Grand Ridge Rail Trail Closure
The Grand Ridge Rail Trail will be closed between Darlimurla and Boolarra for track works from Tuesday 28 January until Friday 31 January.

If you are looking to get out on one of our fantastic trails during that time, why not pick a spot on the Great Southern Rail Trail? You can canvas your adventure on the new website: www.gsrt.com.au

New Project for Leongatha Community Garden
Community gardens are a terrific space for green thumbs to come together and make something beautiful.

The Leongatha Community Garden is currently planning for a new project – The Commons. It will be a horticulture farm with spaces for workshops, social gatherings and education programs.

If you would like to find out more about the project, please follow Leongatha Community Garden on social media or visit their website: www.gathacg.com

Take care,
Cr John Schelling – Mayor

Council launches community consultation campaign

South Gippsland Shire Council is embarking on an extensive community engagement initiative called 'Shaping South Gippsland' to help guide the region's future development.

The campaign, running from January 26 until the end of February, will review the priorities outlined in the 2040 Community Vision and gather input for the next Council Plan, which will set the direction for the next four years.

Mayor John Schelling emphasised the importance of community participation. "We want to hear from as many people as possible. I encourage everyone to get involved by coming along to one of the events that we will be attending, or to complete a survey online," he said.

The comprehensive engagement program includes Councillor attendance at 18 community events and dedicated 'pop-up' sessions. Additionally, Councillors will meet with key stakeholders, including the South Gippsland Youth Council, business groups, and the Access and Inclusion Committee, ensuring diverse community representation.

Residents can participate through both online and hard copy surveys, with all feedback contributing to the development of key planning documents that will shape the region's future. Community members can access the survey and find more information at www.shapingsouthgippsland.com.au. *Cara Schultz*

What's the right direction for South Gippsland? Have your say at www.shapingsouthgippsland.com.au

Fish Creek to soak up community grant

South Gippsland Water has announced a $10,000 Community Resilience Grant for Fish Creek, following a precautionary Boil Water Advisory issued in July 2024 after a water main was damaged by an external contractor.

Managing Director Robert Murphy said the grant aims to support community resilience and emergency preparedness. "We feel strongly that a grant that supports the community or builds the capacity to face future incidents or emergencies is something we can do in the wake of these events," he said.

The grant is specifically designed to support vulnerable community members experiencing financial or social disadvantage, or to enhance the community's preparedness for future emergencies.

Open to non-profit Fish Creek based community groups and organisations, the funding may be awarded as a single grant or divided into multiple smaller grants, depending on applications received. The Community Advisory Committee will assist South Gippsland Water in reviewing applications. Interested organisations have until 5pm on February 28, 2025, to submit their applications through South Gippsland Water's website.

Monitor for blue-green algae in stock water

Livestock owners should look for signs of blue-green algae when inspecting farm dams, troughs and other water sources, particularly during the warmer months, when algal blooms are more likely to occur.

Blue-green algae, also known as cyanobacteria, are bacteria that can multiply rapidly under certain conditions.

Blue-green algae is more likely to occur when the water is warm and enriched with nutrients like phosphorus or nitrogen.

While blue-green algal blooms typically appear as green paint-like surface scum in water, they can also be reddish-purple or brown in colour. It can be difficult to tell blue-green algae from other less toxic algal species.

Blue-green algae may contain toxins that damage the liver or nervous system. Drinking contaminated water can kill livestock quickly and a number of livestock may be affected at the same time.

Animals exposed to affected water supplies may continue to die over a prolonged period. In milder cases, productivity losses may occur, which in dairy cattle may be seen as decreased milk yield.

If a suspicious bloom is found, farmers should move their stock to an area on the property with a safe alternative water source.

Farmers should plan for managing water availability in the event that a blue-green algal bloom impacts their primary livestock drinking water supply.

The plan should include calculating how much water livestock would require if the primary water supply was unsafe to drink and identifying additional alternative on-farm water supplies that could be utilised quickly.

In the medium-term, your plan could include improving water reticulation systems, considering options for treating blue-green algae affected water, or agisting your stock elsewhere until your farm water is safe again.

A range of useful information such as the Blue-green algae: options for livestock drinking water factsheet is available from the Blue-green algae page on our website:

https://agriculture.vic.gov.au/farm-management/water/blue-green-algae-in-water

Alison Lee, Principal Veterinary Officer – Small Ruminants

Plenty Of Fish Thanks To Record Stocking

Victorian fishers are in for a bumper season, with more chances to hook, line and sinker a Murray cod thanks to 10 years of record fish stocking by the Allan Labor Government.

Minister for Outdoor Recreation Steve Dimopoulos visited Karkarook Lake last month to release 6,000 Murray cod fingerlings for fishers and to celebrate the Labor Government's continued investment in Victorian fishing.

Since 2014, more than 66 million fish have been released across Victoria including golden perch, Australian bass, estuary perch, trout, salmon and dusky flathead – that is more stocking than all other Australian states and territories combined.

The fingerlings released today were produced at the Arcadia Native Fish Hatchery, near Shepparton, which is being upgraded to triple its size and will see it produce up to six million native fish each year, part of a $15 million investment.

Since 2014, more than 22 million Murray cod have been stocked into Victorian waters at more than 60 locations across the state.

Several Victorian lakes are open year-round so fishers can wet a line and reel in a Murray cod including Lake Eppalock, Rocklands Reservoir and Lake Eildon.

Since 2014, Lake Eppalock alone has scored 2.4 million cod, with locals and visitors now catching increasing numbers of fish – which are likely upward of 3-4 years old.

Near the Grampians, Rocklands Reservoir has been stocked with millions of Murray cod since 2017, plenty of which are now being caught by freshwater anglers.

Several other waterways are flourishing thanks to record stocking and delivering benefits for nearby communities like Melton Reservoir, Cairn Curran, Taylors Lake near Horsham, Eildon and Lake Nillahcootie.

To find out more about some of the state's top fishing locations, head to vfa.vic.gov.au/fishingdestinations.

Minister for Outdoor Recreation Steve Dimopoulos said:

"We want Victorians to get out and enjoy our great outdoors and there's no better time to wet a line, with 66 million fish stocked in the last decade – more than all other Australian states and territories combined."

"There are millions of reasons Victorian families should get out and drop a line this year – with dozens of lakes and rivers stocked across the state."

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso

An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 17 February 2025 - Yanakie
Yanakie Hall
Millar Road, Yanakie

Tuesday 18 February 2025 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 19 February 2025 - Leongatha
South Gippsland Trade Skills Alliance (SGBLLEN)
71 Ogilvy Street, Leongatha

Monday 24 February 2025 – Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 25 February 2025 – Yarram
The Yarram Country Club
322-340 Commercial Road, Yarram

Wednesday 26 February 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Operations Environment Plan
- Gippsland Basin Geophysical and Geotechnical Investigations Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Complete the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

To find out more information

For more information about Esso's activities and other projects, go to the Esso Consultation Hub at:
https://corporate.exxonmobil.com/locations/australia/our-approach

GP Workforce Grows As Graduate Doctors Take Up Grants

The Allan Labor Government is again stepping in to fill gaps in the primary care system with the next round of a generous program to recruit more GPs and improve health outcomes for Victorians, now open.

Minister for Health Mary-Anne Thomas today visited Harp Family Clinic in Kew East to announce the first 400 grants, worth up to $40,000 – have now been awarded to medical graduates who take up a career in general practice.

A further 400 grants are available in 2025 for those commencing a GP training program in Victoria. Doctors who commenced their training this year and who had applied, enrolled and were accepted on or after 27 November 2022 are also eligible.

This $32 million program addresses some of the disincentives that stop young doctors from pursuing a career in general practice, such as the higher remuneration typically on offer in other medical specialties.

The grants are already making a difference to primary care in Victoria, with a survey of applicants showing:

•59 per cent of recipients are now doing their placement in regional Victoria

•13 per cent said they moved to Victoria from overseas or interstate because of the program

•64 per cent said it had some influence on their decision to enrol in GP training in Victoria

•44 per cent said they would have pursued a different career path in medicine if they program did not exist.

Graduates can apply for a grant directly through the Australian College of Rural and Remote Medicine (ACRRM) or the Royal Australian College of General Practitioners (RACGP) once they have been successfully accepted and enrolled into one of the relevant GP training programs.

Applicants are assessed against an eligibility framework and preference is given to applicants who are Australian medical graduates and doctors training in rural locations and areas of workforce need.

It comes as 2023/2024 marked Victoria's biggest ever yearly workforce growth, with a massive 6.7 per cent jump in new roles, that saw 7,664 nurses, doctors, allied health professionals and other frontline positions filled.

While primary care is the responsibility of the Federal Government, a decade of inaction from successive Coalition Governments that destroyed Medicare has made it harder than it has ever been to access a GP.

That's why the Labor Government has stepped in to ensure Victorians get the care they need, also delivering 29 Urgent Care Clinics, the Victorian Virtual Emergency Department, Nurse-on-Call, and the Community Pharmacist Statewide Pilot.
For more information please visit, health.vic.gov.au/general-practitioners-grant-program.

Youth drama stepping on stage

GIPPSLAND Youth Drama Workshop (GYDW) is set to begin its first production group for 2025, writing and rehearsing for a June show, with young performers traveling from across the region to be involved in the original production.

After the hit performance of the original comedy *Alice in Down-Under-Land* last December, the young performers were presented with production awards in recognition of their dedication and enthusiasm for the performing arts.

The group is now setting themselves for a new production, and invites new members to get involved.

Director Phillip A Mayer said "Drama builds resilience, self esteem and engagement, and participation gives young people essential life skills like resilience, which helps them cope with challenges.

"There is nothing but positives, and it's a privilege being a part of instilling an appreciation, and providing opportunities for the performing arts in our region. It's a special program, a positive for the community and the kids love it".

Established in 1993, the theatre program is unique in that every production is original and conceived by the participants.

GYDW has produced more than 100 original shows, involving over 2200 regional performers. The workshop sessions focus on building performance skills, as well as confidence, team work, vocabulary, communication, responsibility and many other attributes transferable to life.

The main aim is to enhance the young performer's natural talents, and provide a positive educational theatre experience in a supportive environment.

"Young performers build plot, characters, themes and humorous scenes which they find interesting and valuable in expressing their ideas. It's a great creative outlet," Mr Mayer said.

"We incorporate improvisations, theatre sports games, writer's workshop sessions, the rehearsal process, stage craft, voice projection and a final production open to the public.

"All the participants are given good sized roles commensurate with their experience and ability, and they buzz with excitement at performing in front of a large audience."

The group is enhanced by members of the award-winning Here There and Everywhere Theatre Co.

"We have an amazing team helping to produce theatre with our dedicated young people from across Latrobe," Mr Mayer added.

"Theatre is all about expressing yourself and viewing the world in unique ways so you can try and make sense of it. It's also a lot of fun.

"Taking part is one of the best ways to develop the imagination and support creative expression, especially for young people. Collaborating with peers, discussing big ideas and learning the skills of live performance can help prepare kids for real-world challenges. Our curriculum is designed and delivered by experienced performers with a passion for making a difference in young people's lives."

The workshop's new production start with rehearsals on Wednesday, February 12, and welcomes new young stars to join.

Running from 5.15pm until 6.45pm, weekly rehearsals are conducted in Traralgon, and are open to young participants from upper-primary age through to 17 years-of-age.

Final applications for the new show close soon, with bookings essential as places are limited.

For further information, phone the director on 0409 878 688.

Back in action: Gippsland Youth Drama Workshop are now accepting applications.

Improving digital skills

YOUNG people in regional and remote areas score lower in digital skills and wellbeing compared to their urban based peers, according to The Telstra Foundation's Youth Digital Index.

In response, Telstra Foundation is investing $1.5 million in an innovative three year partnership with PROJECT ROCKIT to offer schools across 33 regional communities free access to an impactful, youth-centred digital wellbeing program.

The program includes in person student workshops as well as tools and resources for schools, students and parents/carers.

From February 2025, schools located in the first round of targeted regional locations will receive an offer to participate in the free digital safety and wellbeing program.

"Our Index has shown that youth digital wellbeing is an area where there is much work to do, especially in regional areas. Using these insights from young regional people, we're taking action to empower them to have healthy lives online," Telstra Foundation Chief Executive, Jackie Coats said.

"This program supports young people in regional Australia to be agents of positive change in their schools and communities and takes a "whole of community" approach by also upskilling parents, carers and teachers to tackle their online safety concerns regarding young people.

"We know that bullying, in all its forms, takes a devastating toll on the lives of young people and those who care for them. Feeling unsafe as a young person has profound and long-lasting effects, impacting mental, emotional, and physical well-being. At PROJECT ROCKIT we're passionate about working with young people to create safety and a genuine, lasting change in schools and beyond."

Over the next three years, this new program will deliver in person digital citizenship workshops to 30,000 students in regional communities across Australia, provide online digital citizenship resources to reach an additional 250,000 young people and will improve community digital citizenship literacy by engaging 900 parents and those in the community through online seminars.

As part of their ongoing partnership with PROJECT ROCKIT, Telstra Foundation will subsidise this program so there is no cost to the schools selected to participate.

For more information about the program and how to get involved, visit https://www.projectrockit.com.au

Star of the South begins survey

Philip Hopkins

OFFSHORE wind farm developers aiming to establish projects in Gippsland have begun early survey works as they prepare for a scheduled auction, *The Australian* newspaper has reported.

The Star of the South offshore wind project, Australia's most advanced offshore wind project, had been undertaking early stage works such as undersea surveys for some time, *The Australian* said last week.

The project is backed by Copenhagen Infrastructure Partners and CBUS.

The Australian believes Corio, owned by Macquarie, Parkwinds, and the AGL Energy-backed Gippsland Skies project, have all recently begun new stages of work.

"Each project will need to ascertain the feasibility of their projects before bidding in the state auction scheduled for this year," the newspaper reported.

"Such auctions set the minimum and maximum return a developer would receive once generation electricity. Projects typically are only viable once they have secured an agreement."

Under the scheme, if the wholesale electricity price falls below an agreed threshold, taxpayers will compensate the renewable energy project. "Should the wholesale electricity price price exceed a metric, developers pay the government," said *The Australian*.

The scheme design eliminates revenue risk for developers.

If the auction is delayed, *The Australian* said this could allow more time for prospective developers to prepare for bidding, which could increase competition and reduce risks for taxpayers.

The first auction is for two gigawatts (GW) or 2000 megawatts (MW).

The government in 2022 set a target of generating about 20 per cent of its energy needs from offshore wind within a decade. The target doubles to 4GW by 2025 and 9GW by 2040. By 2050, Victoria believes there is capacity for 13GW of offshore wind.

As well, the state government last year gazetted a policy to fast-track planning approvals for solar, wind farm, battery storage and transmission line proposals.

"New rules leave it up to the minister to notify potential objectors," *The Australian* said.

The government claims in the document that it will "help to unlock the current $90 billion worth of investment value in renewable projects that are in the pipeline" and create about 15,000 jobs.

The moves come as talks are set to resume between the state government and landowners potentially affected by the big transmission lines planned to take electricity from the offshore wind farms to connect to the grid in the Latrobe Valley.

VicGrid, which is responsible for planning the transmission routes, has refined the study area for the transmission infrastructure needed. The study area starts about six kilometres from the coast at Giffard and extends north-west past Stradbroke West to Willung, across to Flynns Creek to the Loy Yang power station.

The Victorian Farmers Federation, in a report released before Christmas, said strategically important agricultural land in central and southern Gippsland should be safeguarded from transmission lines and renewable energy projects as the energy transition unfolds.

The VFF issued a 'red light warning' over the potential impacts on dairy, horticulture, beef and soil in general in Gippsland, in its submission into the inquiry into guidelines for the Victorian Transmission Plan. It identified 'red areas' where renewable energy and transmission should be avoided.

Award for Phillip Island centre

Philip Hopkins

BERNINNEIT, the Cowes cultural centre, whose internal design is dominated by Gippsland native hardwood timber, has won yet another award – the Public Building category in the 2024 Sustainability Awards.

The building defeated entries from the City of Sydney, upgrades to Redfern station, the Northcote Aquatics and Recreation Centre and an animal rehoming centre in Blacktown.

The Sustainability Awards are described as Australia's longest running and most prestigious award program dedicated to acknowledging and celebrating excellence in sustainable design and architecture.

'Berninneit' - 'gathering together' in the Boon Wurrung indigenous language – encompasses a 260-seat performing arts theatre, a cinema, gallery, library, historical museum, events spaces and community meeting rooms.

Sitting at the heart of it is glue-laminated timber (Masslam) – huge beams 5.9 metres long and columns 4.2m high, all 42 centimetres wide - from Australian Sustainable Hardwoods at Heyfield.

There were more than 250 entries submitted to the 2024 awards from all across Australia.

This was the fifth award for the building, following:

- The 2024 National Architecture Award for Public Architecture;
- The William Wardell Award for Public Architecture Awards at the 2024 Victorian Architecture Awards and was shortlisted in three other categories: regional architecture, sustainable architecture and interior architecture;
- An Excellence in Geographic Place Naming award at the 2024 Victorian Geospatial Excellence awards, given to Bass Coast Shire Council and the Bunurong Land Council Aboriginal Corporation, and;
- The Australian Interior Design Award for Public Design.

Masslam 45 is the proprietary strength of ASH's uniquely strong hardwood glulam.

"Vic ash glulam timber is the essential structural element for the building," Thom McCarthy, an interior designer with Jackson Clements Burrows, the project architects and designers, told the *Gippsland Times* last year.

"They formed the Grand Hall, the spine of the building connected to all the rooms – the artistic and library at each end, and the function rooms in the centre. They were the three major tenants of the community facility.

"Glulam columns are very striking; we have had tremendous experience with them in student residential projects. We were keen to express them as much as possible. They formed a lot of the internal pallet, and at the library end."

The award for Berninneit was one of three won by Jackson Clements Burrows, who won 'Best of the Best' and the award for commercial architecture for its T3 commercial building in Collingwood.

ASH's Masslam was also extensively used in the T3 building.

Design work on Berninneit began in 2015. Several schemes followed before JCB took on the job in 2020.

US aid retreat a boon for Xi debt trap

AMANDA HODGE
ASIA-PACIFIC CORRESPONDENT

As Pakistan and China toasted the first aeroplane to land at the new Gwadar International Airport – the mother of all Belt and Road Initiative white elephants – late last month, US development assistance was in full flight from the region under the Trump administration's aid freeze.

The symbolism was hard to ignore, notwithstanding deep concerns Pakistan is the latest victim of China's debt-trap diplomacy in which poor nations unable to meet unsustainable debt loads become captive to coercive leverage.

Islamabad's debt to China has spiralled from $US4bn to $US30bn ($47.9bn) in a decade under the China Pakistan Economic Corridor, a flagship BRI project that aims to connect China's Xinjiang to the markets of the Middle East, Africa and central Asia through Pakistan's insurgency-racked Balochistan on the Arabian Sea. Gwadar airport now is – preposterously – the largest in the country despite the heightened security risks in Balochistan posed by domestic separatist insurgents and ISIS terrorists.

"It makes no sense from Pakistan's perspective and raises questions as to why China would need or want this," says Michael Kugelman, a South Asia security analyst with Washington's Woodrow Wilson Centre. "For Pakistan it would be better to strengthen existing infrastructure. But Beijing would not be willing to invest this much capital in a project if it was not going to serve its most critical national and security interests."

The International Monetary Fund estimates at least 30 per cent of Pakistan's external debt is owed to China at commercial interest rates averaging 3.7 per cent, much of it sunk into infrastructure projects, including a deep sea port on the Arabian Sea in Balochistan's capital of Gwadar that sits largely idle, but which China's rivals fear could one day host warships.

Cash-strapped Pakistan should be the latest cautionary tale for neighbouring countries about the perils of Chinese investment, after the experience of similarly China debt-burdened Sri Lanka.

Yet with US soft power in retreat, and thousands of development programs across the region thrown into chaos by its catastrophic 90-day foreign aid pause, Beijing is looking more like a feasible alternative for Pakistan's neighbours.

> WOODROW WILSON CENTRE

Bangladesh is the latest to cosy up to Beijing as it seeks alternatives to Washington, now looking increasingly like an unreliable backer. Only last September, the outgoing Biden administration announced a fresh $US202m in USAid funding for Bangladesh to promote good governance and economic opportunity.

The pledge came soon after the country's authoritarian former prime minister, Sheikh Hasina, was ousted in a popular uprising and one of Bangladesh's most beloved figures, Nobel Peace laureate Muhammad Yunus, agreed to lead an interim government and institute widespread reforms.

With US aid now under a cloud, Mr Yunus is tipped to head to Beijing to negotiate a series of new financial agreements.

"Yunus has been aggressive in recruiting new Chinese aid and investment. He is also seeking loan forgiveness from China and lower interest rates on new Chinese projects in Bangladesh," Joshua Kurlantzick, a senior fellow for Southeast and South Asia at the US-based Council on Foreign Relations, said this week.

If the US is unperturbed by the effect of its aggressive foreign posture on allies and friends, Dhaka's growing alignment with Chinese development models and the BRI is being watched with increasing alarm in New Delhi, whose influence in Bangladesh has been waning amid tensions due to India's inertia over Dhaka's request for Mr Hashina's extradition.

Nepal too is moving closer to Beijing, setting aside previous concerns over the BRI and China's strategic intentions. In December new Prime Minister KP Sharma Oli snubbed New Delhi – traditionally the first port of call for all new Nepali leaders – in favour of Beijing, where he signed on for 10 new BRI infrastructure projects, two of which will be located in his own electorate.

Beijing first proposed the China Pakistan Economic Corridor in 2013, two years after the US Navy SEALS raid on the secret northwest Pakistan compound of Osama bin Laden.

China's accelerated push into nuclear-armed Pakistan aligns neatly with the precipitous decline in the US-Pakistan relationship. Analysts are now warning more countries are likely to follow Islamabad's lead as the Trump 2.0 administration's more transactional, combative foreign posture pushes even traditionally neutral countries into China's orbit.

"There will be a lot more interest in countries going to China and instances of Beijing approaching them," said Genevieve Donnellon-May, an Asia researcher with the Oxford Global Society.

"I think we will see a lot more activity from China in coming weeks and months, in terms of climate financing, economic development and commercial projects that could be considered a broader part of the BRI."

An ExxonMobil Brand

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait,** the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 17 February 2025 - Yanakie
Yanakie Hall
Millar Road, Yanakie

Tuesday 18 February 2025 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 19 February 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St, Leongatha

Monday 24 February 2025 - Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 25 February 2025 - Yarram
The Yarram Country Club
322-340 Commercial Road, Yarram

Wednesday 26 February 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Operations Environment Plan
- Gippsland Basin Geophysical and Geotechnical Investigations Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Starmer vows to power past NIMBYs to build nuke stations

STEVEN SWINFORD

British Prime Minister Keir Starmer says he will "push past NIMBYism" to ensure a new generation of mini nuclear power stations are built in the UK.

Mr Starmer announced he was changing planning rules to allow small modular reactors (SMRs) to be built for the first time in Britain.

At present, rules state that only the government may designate sites for potential nuclear power stations, severely limiting where they can be built. There are only eight designated locations in Britain. The government will drop that requirement and hopes the first small reactor will be built in Britain by 2032.

Mr Starmer wants them to power the energy-hungry data centres needed for artificial intelligence. He said: "If we get this right, I think people will genuinely look back in years to come and say that made a massive difference to the economy, to growth and just to the way in which we've been able to move forward.

"We do have to push past the NIMBYism. It does open up areas that weren't capable of being considered nuclear sites before. And that means that it will be in some areas where people hadn't even thought there's going to be anything nuclear near me. And yes, we're going to have to push it through."

Mr Starmer said he also expected Labour MPs to back small nuclear reactors in their constituencies along with new housing and other infrastructure.

"Everybody puts their hand up for infrastructure for change, taking the country forward, and then again when they're asked to object to it being in your area," he said. "We've got to break through that."

He said Labour's large majority presented an opportunity, adding: "We haven't had a big working majority in parliament for a long time now, which has meant that all those trade-offs were more muscular than they are at the moment."

Britain's five nuclear power stations, which generate about 6GW in total, powering 13 million homes, are all nearing the end of their lives. Two new nuclear power plants have been approved: Hinkley Point C in Somerset, which is being built; and Sizewell C in Suffolk, which is still at the development stage.

Advocates of nuclear power say more stations will be needed to meet the government's net-zero target and they see SMRs as a low-cost alternative to conventional plants. They are potentially much cheaper and faster to build and can be deployed in areas unsuitable for traditional nuclear power stations.

To date, no commercially operational small modular reactors have been built. The government is running a competition to develop the technology.

Mr Starmer said: "The UK is being left behind in the global race on nuclear energy. Other countries are sprinting ahead, yet it was the UK that was one of the first to start the firing gun."

THE TIMES

Sweden mourns after massacre

NIOUCHA ZAKAVATI
STOCKHOLM

Sweden on Thursday (AEDT) mourned the victims of its worst mass killing as police indicated that the gunman probably shot himself after killing 10 people at an adult education centre.

Mourners left candles, flowers and notes in front of the cordoned-off Campus Risbergska, a school for young adults in Orebro, as residents joined members of the royal family in paying respects.

Police have yet to give details about the gunman or his motives but they confirmed that 11 people, "including the killer", died in Tuesday's shooting in the town west of Stockholm. Swedish media reports suggested the killer was a 35-year-old local man who had been living as a recluse and suffering from psychological problems.

"We are very shocked," King Carl XVI Gustaf said after he and Queen Silvia laid flowers near the school. "All of Sweden is mourning today."

Prime Minister Ulf Kristersson, who also visited the site on Wednesday, described the massacre as "the worst mass shooting in Swedish history".

The royal couple, Mr Kristersson and several government ministers joined hundreds at a service at Orebro's Nikolai Church. The church observed a minute of silence before dignitaries and representatives from Muslim, Buddhists and other faith groups lit candles.

"We looked at each other and we did not really understand what was happening," said 19-year-old student Isabella Hatidou, who lit a candle at the memorial. "There was a lot of crying and panicking but we did our best to stay quiet."

Asked about reports that the gunman turned his gun on himself, police chief Roberto Eid Forest said: "There is a lot to indicate that." The suspect was dead when police reached him, he said, adding that there was no indication of an "ideological motive".

The man had been enrolled at the school in the past but had not attended classes there since 2021, according to Aftonbladet newspaper. At the time of the attack around 12pm local time (10pm AEDT) Tuesday, he was carrying three rifles and a knife. One was a hunting rifle and there were reports of another being a shotgun. He reportedly hid his weapons in a guitar case and changed into military style garb before the shooting began. Authorities said six people were being treated in hospital.

NZ fury as Cook Is partners with China

The Cook Islands Prime Minister will agree on a plan for a strategic partnership with China on a state visit starting on Monday, his office has confirmed, despite a public rebuke from close partner New Zealand.

Prime Minister Mark Brown will lead a delegation to China on a five-day visit during which the two sides will seal a Joint Action Plan for Comprehensive Strategic Partnership, his office said.

The trip is going ahead in defiance of a warning from New Zealand it should be consulted on international agreements that have significant strategic and security implications.

China is vying for diplomatic, economic and military influence in the strategically important Pacific region, challenging the historic sway of the US, Australia and New Zealand.

"This visit is about expanding economic opportunities while ensuring our sovereignty and national interests remain at the forefront," the Cook Islands Prime Minister said. "Our approach to foreign policy is clear – we engage openly and transparently to secure the best outcomes for our people."

The Cook Islands, a self-governing South Pacific nation of about 17,000 people, has a "free association" agreement with New Zealand, which provides it with budgetary support and help on foreign affairs and defence.

Under the agreement with New Zealand, of which it was once a dependent territory, the Cook Islands' people are New Zealand citizens.

Though Cook Islanders are "integral members of the New Zealand family", a spokesperson for New Zealand Foreign Minister Winston Peters cited a list of concerns including a proposal for a Cook Islands passport and a Cook Islands shipping registry.

The spokesperson said his country did not "see eye to eye" with the Cook Islands government on a range of issues.

New Zealand cited in particular "the lack of transparency by the Cook Islands in respect of policies and partnerships with other countries which could have significant security implications for the Cook Islands, New Zealand and the wider Pacific family".

Without directly mentioning China, it said Wellington "would expect the New Zealand government to be fully consulted on any major international agreements that the Cook Islands plans to enter into that have major strategic and security implications".

Scroll 'digitally unrolled' after 2000 years

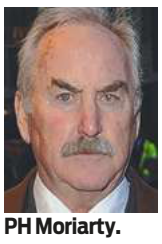
RHYS BLAKELY

The chief librarian of Oxford University has hailed an "incredible moment in history" after a charred Roman papyrus scroll was "digitally unrolled", providing the first glimpse inside it for nearly 2000 years.

The roll of papyrus, which resembles a lump of charcoal, was found in a lavish villa in the Roman town of Herculaneum. It was buried under metres of volcanic ash and mud during the eruption of Mount Vesuvius in 79AD and is too brittle to ever be physically opened. However, scientists have used a combination of X-ray imaging and computer software to virtually unfurl it.

Several columns of text are already visible from the X-rays, but more work will be done using artificial intelligence to distinguish the ink and make the writing more legible.

Efforts are under way at Oxford, where the scroll has been kept since the 19th century, to interpret them, with early hints suggesting it is a work of philosophy. One of the first words to be translated was a word meaning "confusion, agitation or disgust", which appeared twice within a few columns of text. Hopes are building that AI can be used to read the scroll's previously inaccessible texts and that the villa could contain other works. Richard Ovenden, from Oxford's Bodleian Libraries, said: "The astonishing strides forward made with imaging and AI are enabling us to look inside scrolls that have not been read for almost 2000 years."



THE TIMES

Veteran actor's final call

British actor P.H. Moriarty has died at the age of 86.

"Gentleman Paul" was best known for starring as Razors in 1980s gangster film The Long Good Friday.

Appearing alongside Helen Mirren and Bob Hoskins, the former boxer highlighted the movie as the one that "made all the difference" and kick-started his acting career.

PH Moriarty.

He later featured in movies such as Jaws 3 and Patriot Games with Harrison Ford.

In 1998, he went on to play another violent character, Hatchet Harry, in Guy Ritchie's award-winning crime movie Lock, Stock And Two Smoking Barrels.

Moriarty was born in Deptford, London in 1938 and originally worked as a boxer and docker before finding acting in his 50s.

He was discovered by a film crew who shot a scene at his workplace – the Surrey Commercial Docks.

When starting his acting career, he decided to go by the stage name P. H. Moriarty in order to distinguish himself from the actor Paul Moriarty.

A healthy passion

Chloe Bott

Art works will be auctioned off for a good cause this weekend.

All proceeds from the biennial New Directions Art Auction, which relies on donated pieces, will go to the Australian Prostate Centre (APC).

"My father's prostate cancer was treated by APC's Professor Tony Costello," contributor Julian Twigg said.

"He recovered well with no after-effects and continued to be in remission for the rest of his life.

"I am grateful to be able to support this wonderful cause with my artwork at each auction," he said.

Painter and auction curator Mary Schepisi, whose film director husband Fred Schepisi AO is a prostate cancer survivor, said this year's artists had again shown extraordinary generosity.

"I am proud of and grateful to the incredible artists that support us at each auction," she said.

The art works will go under the hammer at South Yarra's Artvisory at 5pm on Sunday.

Psych access pledge flops

Fewer use Medicare scheme for help

Clare Armstrong

Fewer Australians are accessing Medicare psychology appointments than before Labor halved the number of subsidised sessions for each patient on the premise it would allow more people to get support.

The number of new patients accessing the sessions was 700,840 in 2023-24 – a drop of about 8000 people compared with the previous financial year – while the rate of Australians getting appointments went backwards slightly to 2.71 million people, according to the Productivity Commission.

The slide in access comes amid expert warnings of soaring demand for services, and debunks the Albanese government's claims that its policy decisions would increase the overall number of new patients getting at least some subsidised psychology support.

The new figures show there has been no uptick in availability of sessions for new patients since Labor opted not to extend the Coalition's Covid-era policy of granting all Australians up to 20 subsidised psychology sessions a year, letting access drop to 10 sessions at the end of 2022.

It can also be revealed the Department of Health gave Labor a "fail" mark for its goal of increasing access to Medicare-subsidised mental health supports in its annual report for 2023-24.

The department found the number of sessions accessed fell by 2984 places per 100,000 people in the year to June 2024.

Coalition health spokeswomen Anne Ruston said it was "really concerning" to see access to Medicare mental health support "hit the lowest point in at least 10 years" when demand was "skyrocketing".

"Clearly, the government's bizarre explanation they cut the initiative to improve access for more patients was not only disingenuous but it was wrong," she said.

Ms Ruston said it was more important than ever before to ensure people had access to mental health support.

"We know that affordable access to primary care support, particularly for more complex mental health conditions, is critical to preventing worse outcomes," she said.

Health Minister Mark Butler said doubling the number of subsidised sessions without doubling the number of psychologists would create a "bottleneck" in the system.

"Mental health experts warned that would happen, and that's exactly what did happen; tens of thousands of Australians were locked out of getting any help at all," he said.

"That's why our government is investing in training more psychologists, with hundreds more scholarships, internships and expanded psychology courses."

Mr Butler said even after Medicare subsidies, costs could still be a "barrier" to people seeing psychologists, so the government was rolling out 61 free walk-in Medicare mental health centres nationally.

"We have also made record investment in creating a new National Early Intervention Service which should be operational by 2026," he said.

Summer survival guide: top tips to beat the heat

As South Gippslanders stare down the end of a hot (and often muggy) summer, there are a few essential strategies to help you and your loved ones stay safe and comfortable during extreme heat events, whether it's a killer 39 degree day with ripping northerlies, or a long string of sticky, sunny mid-thirties swelterers and oppressive nights. Try these tips to help beat the heat at home and protect your loved ones.

Home preparation is crucial, with simple modifications like sealing gaps around doors and windows, installing external shading, and using blackout curtains making a significant difference. External window shading alone can block up to 90% of unwanted heat gain.

For immediate relief, experts recommend staying hydrated, avoiding sun exposure during peak hours, and seeking air-conditioned spaces like libraries or even supermarkets if home cooling isn't available. Cold showers, spray bottles, and wet washcloths can provide quick cooling solutions.

Pet owners are advised to walk dogs during cooler hours, ensure constant access to water and shade, and never leave animals in parked cars. Setting up small paddling pools for pets and leaving water out for local wildlife will also help protect our animal friends.

Those most vulnerable to heat-related illness include the elderly, young children, pregnant women, and people with existing medical conditions. Residents are encouraged to check on neighbors and vulnerable community members during heatwaves and call triple zero (000) in emergencies.

Cash Savage at Meeniyan Hall

One of Australia's most beloved live acts brought her bruising raw sound and emotionally charged rock n' roll to Meeniyan on Saturday night, as Cash Savage played to over 200 people at the town hall, revealing her deep personal connections to South Gippsland along the way.

Jess Ribeiro set the tone perfectly for the night, comfortably winning over the crowd with her wry observations and self-deprecating wit during a stripped back solo show. Much of Ribeiro's music contains a sombre lyricism that seems to hint at the edges of darkness, but a darkness that, when it appears, Ribeiro isn't going to take too seriously herself. And from her descriptions of the sax solos and breakdowns that we were missing out on in her solo show, if the good people at Lyrebird can get her whole band down, we'll all be in for a treat..

With the success of the acclaimed 2023 album 'So This Is Love' still close in the rearview mirror, Savage demonstrated why she's earned a reputation as one of the nation's finest songwriters since forming The Last Drinks in 2008. In only her fourth ever solo show, Savage took the audience on a musical and storytelling journey as she wound her way through the Last Drinks back catalogue. She also brought along her long time drummer, Rene Mancuso (because she gets bored), to drive up the tempo on a few numbers, and we got a glimpse into the driving energy of a full

Cash Savage wowed audiences at Meeniyan. Colin U'Ren

Last Drinks show. Songs and stories about life, grief, loss, love, and Deniliquin had the audience hanging every word.

Early on in the evening, Cash had warned us that there may be singing required later in the show, but that the euphoric feeling would more than make up for any discomfort we might have. When it did come to audience participation time, it felt like magic was rippling through the warm summer air as the crowd provided support during an beautiful rendition of "I'm in Love".

It's an incredible feeling to see an artist at the absolute top of their game, and as Savage's face lit up and her body swayed to the lilting harmony of the crowd, it felt that we were witnessing a performer experiencing the unbridled joy of completely capturing the audience with their art. A captivating presence, she'd shared a lot throughout much of the night, through her stories (including spurious claims that she doesn't know how to write songs) and songs, but in this moment we truly got to share in her music - not just to listen to it, but to be part of her experience, to share in the euphoria. I don't think that a Cash Savage show would ever be just another tour stop, but tonight shows why Savage continues to be one of Australia's most compelling live acts (with or without band), particularly when playing to an audience that feels a little bit like home.

Good eats

With John Picpus

With its primo position on Foster's main street, Ando's Bakery has long been a beloved cornerstone of the town's landscape, offering both traditional favorites and unexpected delights. The bakery cafe stands out from the crowd with its consistent opening hours and welcoming atmosphere, dog-friendly outdoor seating, enormous plate glass windows for people watching, and a generous selection of newspapers to spread over the big tables inside.

Owners Lyn and Jamie Chea took over the bakery in 2020, just a day after COVID attacked the town and the state. Lyn reckons it was a challenging and depressing start, but that they never thought of giving up thanks to all their cheering customers around the town - Lyn's favourite thing about running the bakery is that Foster is a community town with lovely people.

Fortunately for us, Ando's continues to open its doors, rain, hail or shine, and like so many other country bakeries of its ilk, excels at the tried-and-true Aussie favorites. The homemade wagonwheels recreate a childhood classic with generous layers of jam and marshmallow sandwiched between two substantial biscuits, all encased in crisp chocolate. The lamingtons showcase perfect proportions: bouncy fresh sponge, ideal jam ratio, and delectable chocolate and moist coconut coating. For early risers, the combination of a fresh cinnamon donut and hot coffee provides the perfect start to the day.

The bakery's innovation also shines through in its award-winning pies, and the team has collected multiple medals at the Aussie Pie Council Awards over the last few years. Their Tom Yum pie earned silver in the 2021 gourmet category, while offerings like the Thai Green Curry and Ned Kelly pies secured bronze medals in 2022.

But that's not the only reason why Ando's is a must visit cafe for me. I adore their Banh mi (available weekdays only). These generously filled rolls rival those found in Melbourne's Vietnamese enclaves, featuring succulent roast pork, crunchy crackle, pickled carrot, fresh cucumber, creamy pate, and a subtle chili kick, all nestled in a perfectly crispy roll. Lyn came to Australia from Cambodia in 2014, and Jamie has a Vietnamese and Cambodian background, so it's no wonder they bring such a delectable taste of South East Asia to South Gippsland. But get in early, these babies sell out fast!

Ando's Bakery, 28 Main Street, Foster
Monday to Friday: 6:30am - 4:30pm
Saturday to Sunday: 8am - 2pm

Ando's famous Banh mi.

Homegrown literary talent on display in Foster

The Stockyard Gallery in Foster was filled with literary enthusiasts last week as local author Alison Shields launched her new collection of short stories, *Pickings*. Forty-five guests attended the celebration, which featured an introduction to Shields' work by Jan Bull and included refreshments. The short story collection is now available for purchase at the Stockyard Gallery.

Local author Alison Shields recently launched her new collection of short stories, *Pickings*, at Foster's Stockyard Gallery.

Rainfall totals

It's been a dry old January in Foster, with 24mm over three days and the least rain to start the year since 2013. The town received well below the January average of 61mm.

ExxonMobil

Esso

An ExxonMobil Brand

Community Consultation - decommissioning

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about plans for **Decommissioning of platforms and pipelines in Bass Strait**, the Esso Consultation Team will be hosting community information sessions at the following locations:

Monday 17 February 2025 - Yanakie
Yanakie Hall
Millar Road, Yanakie

Tuesday 18 February 2025 - Foster
Foster War Memorial Arts Centre
Main Street, Foster

Wednesday 19 February 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St, Leongatha

Monday 24 February 2025 – Lakes Entrance
On the Wharf Café, Bullock Island
Lakes Entrance

Tuesday 25 February 2025 – Yarram
The Yarram Country Club
322-340 Commercial Road, Yarram

Wednesday 26 February 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.
We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Operations Environment Plan
- Gippsland Basin Geophysical and Geotechnical Investigations Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Labor urged to act swiftly on judicial body

EXCLUSIVE

STEPHEN RICE
NSW EDITOR

The Albanese government is under mounting pressure to honour its longstanding pledge to set up a federal judicial commission in the wake of a High Court decision that gives judges absolute immunity from lawsuits.

The decision, handed down on Wednesday, stripped a Queensland father of the $300,000 in damages he was awarded after being wrongly jailed for contempt by Federal Circuit Court judge Salvatore Vasta.

The judgment left "Mr Stradford" (a pseudonym) without redress, with the High Court acknowledging that an ex gratia, or "act of grace", payment by the federal government – at the sole discretion of the Finance Minister – was his only hope of compensation for the six terrifying days he spent in jail.

Both the Law Council of Australia and senior barristers have called upon Labor to make good its commitment to a judicial commission, to ensure judges can be held to account for their conduct.

Leading Sydney silk Arthur Moses told The Australian there was "not a moment to linger" in establishing such a body.

"The need for a federal judicial commission is only heightened by the outcome of this decision, and it is rather concerning that despite longstanding calls by the profession nationally that there should be a federal judicial commission, we do not have one in place in 2025," Mr Moses said.

Most states already have independent judicial commissions to examine complaints about serving judges.

In September 2022, federal Attorney-General Mark Dreyfus agreed in principle to the Australian Law Reform Commission's recommendation to establish a federal judicial commission, and in January 2023 a taskforce in his department released a discussion paper to guide debate.

> 'It's important that the public has confidence in the judicial process'
>
> JULIANA WARNER
> PRESIDENT OF THE LAW COUNCIL OF AUSTRALIA

But more than two years later, little seems to have been achieved.

A spokesperson for Mr Dreyfus declined to answer questions about what progress had been made on the proposal and whether the government would provide funding for such a body.

In a one-sentence statement, they said: "The design and timing of the establishment of a federal judicial commission continues to be under consideration by the Australian government."

The Law Council of Australia will make the push for a commission part of its call to parties in the upcoming federal election, noting "with some concern" in a pre-budget submission to the government that the Judicial Commission Taskforce no longer appears in the Attorney-General's Department's Organisational Chart.

Law Council president Juliana Warner said the High Court's decision in the Vasta case was appropriate "but there must still be accountability", noting that the council had been urging a federal judicial commission since 2006.

"It would be a really positive development because it's important that the public has confidence in the judicial process," she said.

Mr Moses SC, a former president of both the Law Council and the NSW Bar Association, said the absence of a federal judicial commission was "unacceptable in an age of transparency and accountability".

"It is important for maintaining public confidence in the judiciary because members of the judiciary are not above the law, and they, of course, must be accountable for their conduct."

Mr Moses favours a model similar to the NSW judicial commission, but he said some form of statutory scheme to give affected parties a right to redress and a means to obtain compensation should also be considered.

"Parliament may need to consider ... whether there needs to be some form of statutory scheme for compensation that could be accessed by individuals who in essence are wrongfully imprisoned as a result of an action taken by a judicial officer," he said.

Clockwise from main: Geoff Outerbridge at the memorial wall where his sister Bev Brooker's ashes are kept; the late resident of Skennars Head; Jon Winfield, long-time suspect in the disappearance of his wife, Bronwyn; and the house that Ms Brooker left to Mr Winfield in her will, to the surprise of her family

Recluse's fortune and a windfall

Continued from Page 1

her death and since. When Geoff Outerbridge, was contacted by The Australian's national chief correspondent Hedley Thomas, he confirmed the dismay and confusion that still surrounds her last will and testament.

Mr Winfield, 70, emphatically denies any involvement in Bronwyn's disappearance, and there is no suggestion he harmed Ms Brooker. But relatives of Bronwyn and Ms Brooker are questioning what the situation says about his motives and character.

Thomas says in the podcast: "Was he the ultimate good Samaritan, looking after another introvert because he cared deeply for Bev – so much that he was there for her during her darkest months, weeks and days as the end neared? A selfless volunteer, a shoulder to cry on, a pillar of support. Or was Jon always playing a long game with a watchful eye on the spoils – the beachside house, the savings in Bev's bank accounts, new cars, and other items of monetary value? Are those two contrasting agendas mutually exclusive?"

Although she was close to and remained in regular contact with her brothers, Ms Brooker in her prior will from 2011 left everything to a cousin she was fond of.

But on March 23, 2022, Ms Brooker changed her will and left everything to Mr Winfield, apart from $200,000 bequeathed to the cousin who was previously the only beneficiary. On the same day, she signed over joint enduring power of attorney to Mr Winfield and her brother Geoff to manage her legal and financial affairs. She also appointed the two men as her guardians, authorising them to decide where she lived, the health care she received, and even to effectively decide if she received treatment to live or die. Additionally, Mr Winfield was made executor of her will.

Geoff Outerbridge says the first he heard of Mr Winfield was in May 2022, two months after his sister changed her will, when she was already gravely ill.

At the time, he had gone to see Ms Brooker's solicitor to sign the power-of-attorney paperwork.

The solicitor brought up Mr Winfield's name and said: "He is Bev's partner."

It was a "total shock ... because Bev never mentioned anything about anybody in her life," Mr Outerbridge said. "His name was never brought up in conversation at any of our gatherings. It was just a bolt out of the blue."

When Ms Brooker died in September 2022, Mr Outerbridge had to hire lawyers to get a copy of her will, and only then discovered where the proceeds were going.

Mr Outerbridge, 65, said he had no problem with his sister originally planning to leave everything to a cousin. "If that's what my sister wanted to do, that was okay by me," he said. "She (the cousin) was family. But this other guy, he's a total blow-in. It was a real surprise and shock to think that he would inherit everything that my sister owned, virtually."

Work on the downstairs bathroom, toilet and laundry was followed by a new kitchen, floating timber flooring and other work upstairs.

"By the time my sister passed away, there was still furniture being delivered to the house that she didn't even get to benefit by using," he said. "Jon was organising all the trades."

Mr Outerbridge saw his sister every second week and spoke to her about every five days.

"I could see her health going downhill," he said. "And she was making some really strange decisions. She was very strange in the last, probably, 12 months of her life. She became more and more reclusive."

Just before Ms Brooker died, Mr Winfield phoned Geoff Outerbridge and introduced himself.

"He rang me out of the blue ... and said 'Look, I've got some information about your sister. She's in hospital at the moment and she's very seriously ill. Can I come around to your house and have a talk to you about your sister's health?'"

After Mr Winfield arrived, he said he had met Bev years earlier when she was in her garden.

"He introduced himself to Bev and said that he is a builder, does maintenance work," Mr Outerbridge said.

"And she must have been happy with his work and that's when he eventually did more and more."

Mr Winfield had a diary with him at the meeting and used it to cite times Ms Brooker had fallen, was taken to hospital, saw specialists and nurses and the treatment she received.

"He had everything written down, the dates and the times and everything," Mr Outerbridge said.

"I said, 'Jon, look, that's not important'. I said 'I want to go and see my sister. Where is she?' And he said, 'No, no, no, you can't do that. You can't go there now. I'll make arrangements for you to visit her tomorrow.'"

The next day Mr Outerbridge visited his sister at St Vincent's. Mr Winfield was there, and had a cot beside Bev's bed.

Mr Outerbridge said he was told by Mr Winfield that his brother Paul was not allowed to know she was about to die.

"I had to wait until Bev had passed away," Mr Outerbridge said. "And then I went out and saw my brother and I broke down because I said, 'Mate, I'm sorry, but I wasn't allowed to tell you about Bev's health and her passing. I had to keep it a secret, apparently. This guy said it was Bev's wish'. My brother was devastated. He was gutted. He didn't get to see his sister. He didn't get to say goodbye."

The Outerbridge brothers both looked at legally challenging their sister's will, believing she was not of sound mind when she changed it. But they weren't in a financial position to do so, Mr Outerbridge said.

Bronwyn had been entitled to as much as half the assets she shared with Mr Winfield, including a house in Sandstone Crescent at Lennox Head. They had separated and were on the cusp of divorcing when she disappeared.

For members of Bronwyn's family including her cousin Madi Walsh, a forensic science graduate assisting the podcast, Ms Brooker's will has stirred deep emotions.

"There is something seriously wrong. He got everything. Just like he did when Bronwyn died," Ms Walsh said.

Labor loses ground but set to retain Werribee

MOHAMMAD ALFARES

Labor appears set to retain the Victorian seat of Werribee, despite a significant decline in voter support in its traditional stronghold in Saturday's by-election.

ALP candidate John Lister has a slim lead over Liberal contender Steve Murphy, as the Victorian Electoral Commission continues tallying postal votes.

As of the latest count, Mr Lister has secured 21,323 votes (50.71 per cent). Mr Murphy trails closely with 20,730 votes (49.29 per cent).

With about 79 per cent of the votes counted, the seat remains too close to call. Labor leads the Liberals by just 593 votes on a two-party-preferred basis.

The Liberal Party has yet to concede but the results suggest Labor will retain the seat it has held since 1979, despite a collapse of support in the west that translated to an estimated 17 per cent decrease in its primary vote share.

The swing against Labor in Werribee has raised concerns among federal Labor MPs about potential repercussions in the upcoming federal election.

Following the by-election, triggered by the retirement of former treasurer Tim Pallas, Premier Jacinta Allan acknowledged that the government must take stronger action to tackle cost-of-living pressures, rising crime and the lack of infrastructure in Melbourne's west.

The latest results came after Ms Allan struggled to provide clear answers regarding the timeline for the first home construction linked to the contentious Suburban Rail Loop project.

Ms Allan was in Broadmeadows in Melbourne's north yesterday for a TAFE announcement, but quickly found herself on the receiving end of a barrage of questions about the mega-project.

The state government's decision to double down on the project has reportedly stirred tensions in the party. Some MPs, speaking on the condition of anonymity, accused Labor of having the wrong priorities.

Ms Allan was unable to specify when the state's 'value capture' plan would commence to help finance the initial phase of the $34.5 billion rail loop from Cheltenham to Box Hill.

Ms Allan abruptly ended the discussion. "No, I'm done on the SRL. No, we're done," she said.

The Albanese government announced on Wednesday night that it had officially released the $2.2bn in funding pledged during the last federal election.

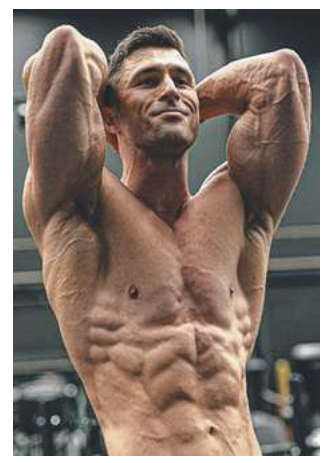
Cop charged with assault

Woman allegedly hurt at pub bucks party

Oscar Jaeger

A muscle-bound off-duty police officer allegedly assaulted a woman at a bucks party that kicked on at a popular Melbourne pub.



Senior Constable Christopher Barnden, 31 – who also coaches bodybuilders – appeared at Melbourne Magistrates Court on Thursday charged with recklessly causing injury and reckless conduct endangering serious injury.

The alleged incident occurred at a bucks party that ended up at the Garden State Hotel on Flinders Lane, where it's alleged the woman was assaulted by Mr Barnden.

The court heard that Mr Barnden allegedly left a woman with a glass injury to her thigh, with his lawyer telling the court it has been "unfairly characterised as a glassing".

"We may all have instances where a glass shatters and cuts occur," he said.

The woman who was allegedly assaulted will be cross-examined to determine whether she is a "reliable and credible" witness.

Christopher Barnden

The court heard she was unable to leave her home due to the injury and anxiety from the alleged incident.

However, this was contested, with another witness claiming the alleged victim messaged them a week later asking to "go out drinking and dancing".

Magistrate Donna Bakos granted both the prosecution and defence leave to cross-examine the woman, saying "she's the only witness who gives evidence as to who caused her injury to her".

Mr Barnden is highly regarded in Melbourne's elite fitness community and coaches men and women to compete on the international bodybuilding stage.

His professional Instagram account, followed by more than 2500 users, also promotes his work as a nutritionist and shows off his muscular physique.

"Nothing worth having comes easy. Putting in the work every day with no regrets," his latest post reads.

Ms Bakos adjourned the matter for a committal hearing on August 11.

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about **labour and logistics,** or any other topics related to the decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team along with **presentations from CMA Contracting (Dismantling and Recycling Contractor) and Qube (Operators of Barry Beach Marine Terminal),** will be hosting community information sessions at the following locations:

Monday 19 May 2025 - Welshpool
Welshpool Memorial Hall
49 Main St

Tuesday 20 May 2025 - Foster
Foster War Memorial Arts Centre
79 Main Street, Foster

Wednesday 21 May 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St

Monday 26 May 2025 – Yarram
The Yarram Hub
156 Grant Street

Tuesday 27 May 2025 – Lakes Entrance

Education Excellence Awards Nominations Open

The Victorian Education Excellence Awards recognise the inspirational teachers, principals, assistant principals, business managers and education support staff who support Victorian kids to get the skills they need to succeed.

Nominations are now being called for as part of the 2025 Victorian Education Excellence Awards.

The awards recognise individuals and school teams that have made a significant contribution to education across the state.

The awards also support the continued professional development of staff, with professional learning grants of $20,000 available for each individual award winner, and $25,000 for each team award.

The winner of the Lindsay Thompson Award for Excellence receives a further professional learning grant of $20,000.

Last year's winners include Cranbourne West Secondary College who boosted student wellbeing and engagement through the production of a Pasifika cultural performance that featured in the Victorian State Schools Spectacular.

Glen Eira College was recognised for its Japanese Immersion initiative empowering students to learn subjects through the lens of Japanese language and culture.

Churchill Primary School principal Jacquie Burrows was awarded the coveted Lindsay Thompson Excellence in Education Award for 2024, for her leadership which produced significant leaning and wellbeing improvements and strong NAPLAN results.

Nominations are made at a school level and are open until Monday 31 May 2025, with winners to be announced on Friday 24 October.

For more information on the awards, and to find out about last year's inspiring winners, visit vic.gov.au/VEEA.

Minister for Education Ben Carroll said:
"These awards recognise the outstanding work being done by teachers and staff in Victorian government schools, who provide world-class education for students every day."
"I encourage all schools to nominate innovative teachers, principals, support staff and teams making a real difference for the next generation."

Growing A Skilled And Diverse Wind Energy Workforce

The Allan Labor Government is making sure Victoria has the workforce it needs to build the state's renewable energy future, which will deliver lower power bills for all Victorians.

Minister for Energy and Resources Lily D'Ambrosio opened tenders for a delivery partner for Victoria's Wind Worker Training Centre – backed by $4.9 million investment that will make sure Victoria has a strong pipeline of skilled workers in renewable energy for the future.

The centre will deliver training for the onshore and offshore wind sectors and the provider must work closely with industry and unions to make sure the training responds directly to the skills needed on the job.

The training will be inclusive of all skill and career levels, making sure there is opportunity for existing workers to retrain and upskill, including Gippsland coal station workers that want to transition to our nation-leading offshore wind industry.

As well as specialist energy roles, the onshore and offshore wind sectors will provide job opportunities in other fields that support the delivery of projects such as accounting, information technology and community engagement.

Victoria's energy workforce is projected to grow to over 67,000 workers in 2040, more than doubling the current size of the industry – with a peak of 4,269 workers in onshore wind and 2,370 in offshore wind during construction.

This investment in wind energy training is essential to building up the skilled workforce needed to support the planning, construction, and operations of new renewable energy projects and meet Victoria's ambitious renewable energy targets.

Victoria is on track to deliver its renewable energy generation target of 95 percent by 2035 – onshore and offshore wind are a key part of this.

Last week the Government released Offshore Wind Energy Implementation Statement 4, which updated the community on the Victoria's progress to deliver the legislated targets of 2 gigawatts (GW) of offshore wind energy by 2032, 4 GW by 2035 and 9 GW by 2040.

Applications for the Wind Worker Training Centre tender is now open and will close 5pm Wednesday, 16 July.
For more information on how to apply, visit energy.vic.gov.au/grants/wind-worker-training-centre-grant.

Minister for Energy and Resources Lily D'Ambrosio said:
"Because of renewable energy, Victoria has the lowest energy prices in the market and building more will make sure we can continue to drive them down – whilst creating thousands of lifelong jobs for Victorians"
"This wind worker training centre will help future proof our energy workforce, so that Victorian workers can continue to access the training they need to deliver cheaper, cleaner renewable energy for Victoria."

'Life-Changing' Pay Rises Boost Lowest-Paid Workers

Pay rises of up to 27.8 per cent recommended by the Fair Work Commission for low-paid workers in early childhood education and care, alongside other female-dominated sectors, are the latest sign of Labor fulfilling its promise to get wages moving again*, United Workers Union said today.

Last month's ruling supported United Workers Union's arguments for a 23 per cent increase to a Cert III-qualified educators' pay level because early childhood educators had not been fairly rewarded due to historical gender undervaluation.
"Life-changing pay rises for low-paid workers recommended by the Commission are a further sign Labor is successfully addressing years of historical undervaluation based on gender," United Workers Union National President Jo Schofield said today.

"These recommendations show current annual above-inflation wage growth of more than 4 per cent a year is due to Labor's deliberate policy settings that encourage wage growth for those who need it most.
"Compare today's recommendations to the Coalition's paltry wage growth of 2 per cent a year during its 9-year tenure, when real wages were in decline amid massive inflation.
"No wonder workers say they can't afford to see a Peter Dutton-led Government – he would be a train wreck for wage growth because he wants to reverse laws that support pay rises.
"In relation to Indigenous health workers, I can think of no other cohort that deserves a pay rise more than these often-overlooked professionals.
"In relation to home-care disability support workers, today's finding imposes a bare minimum for disability support work in caring roles, meaning a substantial increase for many.
"In relation to health support workers in female-dominated sectors, today's findings represent wage justice that acknowledges years of being undervalued.
"In relation to our thousands of early childhood education and care members, today is cause for celebration.
"About 150,000 hard-working educators, more than 90 per cent of them women, can now lock in their 15 per cent pay rise delivered by the Albanese Labor Government, and expect more to come.
"After years of campaigning for recognition, educators should be proud of what they have achieved today.
"A high-quality early education sector gives children their best start in life, and gives families the support they need to return to the workforce.
"Labor's commitment to lifting workers' wages is unquestioned. It's on Mr Dutton to say whether he will honour these pay rises, or whether the Coalition will once again target low-paid workers and stiff them on the pay rises they deserve."

* Background:
Today's recommendations stem from the 2022 Better Jobs, Secure Pay reforms introduced by the Federal Labor Government that gave the Fair Work Commission the specific remit to examine gender undervaluation:
•It was the imposition of new objectives in the Fair Work Commission Act to consider access to secure jobs and gender equity that gave the basis for a stand-alone gender undervaluation review.
•It was Fair Work Commission research announced alongside the formation of expert pay equity and care and community sector panels, established under the Better Jobs, Secure Pay reforms, that provided the framework for the review.

Successful union-led cases for work-value pay rises of up to 28.5 per cent in aged care also gave a basis for the review; new aged care pay levels were specifically referenced in the review's issues to be considered.

For clarity, given today's ruling is above the 15 per cent pay rise implemented through the ground-breaking Multi-Employer Agreement for early childhood educators, United Workers Union sees the 15 per cent as a downpayment on the total gender undervaluation ruling.

An innovative model of healthcare for patients

ATTICUS Health is a social enterprise set up by doctors who are passionate about helping every patient maximise their experience of life.

Running the Korumburra Medical Centre, Atticus Health uses a an innovative, patient centred approach through the SEAM model – Simple, Emotive, Aged Care; which combines both health and social care.

Through case conferencing and training, clinicians and other healthcare professionals work together to deliver targeted, integrated and individualised health and home care.

This model helps to prevent the isolation often experienced by housebound patients, enabling them to receive comprehensive care in their own homes.

Atticus Health uses an innovative model to deliver comprehensive, targeted and integrated health and home care - Nathan (gardener), Rebecca (care manager), Jean, Kim (carer), with founder, Dr Floyd Gomes (GP).

"We're trying to bridge that gap with patients, elderly people, who are struggling to come to the clinic because they're getting more housebound, and that's what's sort of led me on this journey," said Dr Floyd Gomes, founder of Atticus Health.

Dr Gomes explained that through attending GP conferences over the years, he discovered Denmark have an outstanding healthcare model.

By leveraging off this model and using the opportunities in Australia's own healthcare system, he seeks to drive the synergy of this, to create a powerful, collaborative and innovative approach to healthcare.

"The people who do this truly, really well, often will go to places in Denmark. The Danish communities have these municipalities, and one of them is called Varde, and I just think it's worthwhile saying, we've got all the tools there now to achieve that, and to truly do something really special, leveraging off what's done in a place like Denmark."

A key element of the SEAM model is that the whole person or organisation, and their goals and aspirations are considered first.

A deep understanding of that allows for the best decisions and outcomes to be reached in partnership with the patient, their carer and the health and social care team, or organisation.

Doug was one of Atticus Health's first patients. He suffered severe COPD, which affected most aspects of his life and led to multiple hospital admissions.

To help Doug avoid so many hospital admissions, Atticus Health held a case conference with his GP, carer, case manager and physiotherapist, to create an action plan for when he becomes unwell at home.

The plan included using a nebuliser, checking the colour of his sputum if he was coughing more than usual, and sending a sample to check for bacterial growth – under the guidance of the care manager and GP.

The action plan was put into place on many occasions and getting on top of it quickly with a change of antibiotics, meant that Doug was able to avoid a hospital admission for an entire 12 months.

This is just one example of the innovative, holistic and patient-centred care that Atticus Health offers.

HM12501

20-year milestone and $280,000 raised

THE Mirboo North Lions Club celebrated their 20th anniversary by holding a dinner for nearly 100 community members at the Grand Ridge Brewery recently.

The night was emceed by Korumburra Lions Club member Roger Powell, while founding member Liz Morris, spoke about how the club got started.

It was the Strzelecki Lions Club who initially acted as the supporting club for the Mirboo North Lions, with Peter Ryan, previous MP, also helping to get things underway.

Chris McKay, another founding member, and one of only three charter members that remain in the club today, was presented with the Melvin Jones Fellowship Award, Lions Club International, on the night.

"We announced the Melvin Jones award to Chris McKay, which is the highest award you can award from the Lions – for general community work," said Judy Jackson, secretary of Mirboo North Lions Club.

He's one of those people who you ask him to help, and he's already got it done. He's just a quiet achiever.

$280,000 has been raised by the Lions over two decades, mostly from barbecues, raffles, the Mirboo North Op-shop and a few Show n' Shines thrown in.

Charter members of Mirboo North Lions Club were presented with plaques at the clubs recent 20th anniversary celebrations. Aaron Wilson, Leatha Peters, and Chris McKay, in addition, Chris was presented with the prestigious Melvin Jones Award, named after the organisation's founder. *Photo: Rob Waycott.*

"It just all adds up," said Judy.

The money raised by the club is donated to individuals, organisations and causes of their choosing.

The majority of funds go to the local community, while some goes to the Australian Lions Foundation, who distribute it for natural disasters nationwide, and some goes overseas towards international disasters.

The most memorable donation the club made, as recalled by Judy, was to a local boy who had cerebral palsy.

Equipment was purchased so the boy and his family could manage better at home.

"It really, really, gave us a buzz because we were helping someone, one single person, physically. It's mostly groups that we were helping, but this was a real one-on-one thing that made a huge difference," recounted Judy.

The Mirboo North Lions Club seek to continue their efforts for at least another 20 years and are always keen to welcome new members to join them.

For more information about Mirboo North Lions Club, contact Judy Jackson on 0419 370 770.

'POLICING IS IN MY BLOOD,' SAYS INCOMING POLICE CHIEF

Kiwi takes reins as state's top cop

MOHAMMAD ALFARES

Victoria's incoming police chief, Mike Bush, has vowed to usher in a new era of crime prevention, drawing on Sir Robert Peel's 18th-century principles of community-focused policing.

In his first public comments since being appointed to lead Victoria Police, the former New Zealand top cop said his policing philosophy was rooted in one of the most foundational concepts of modern law enforcement – the principles established in 1829 by former British home secretary Robert Peel, who formed the London Metropolitan Police and is widely regarded as the "father of modern policing".

Sir Robert's vision was centred around community trust, prevention over punishment, and accountability, and the principles still inform police forces around the world today.

Mr Bush, who was approached to apply for the role through a global executive search, arrived as an outsider at a time of significant upheaval within Victoria Police. His appointment follows the controversial exit of predecessor Shane Patton and amid tensions between the force and government over bail laws and youth crime.

The 65-year-old led the police response to the 2019 Christchurch massacre by far-right Australian terrorist Brenton Tarrant, who killed 51 Muslim people at two separate mosques, and the Whakaari White Island volcano eruption.

In taking the job in Victoria, Mr Bush will lead a force battling a range of issues including an exodus of experienced officers and spiralling crime rates.

It is the first time someone who has not worked at Victoria Police has been appointed to the role since 2001, when former NSW police assistant commissioner Christine Nixon was given the job. Mr Bush is expected to start his five-year contract on June 27.

He said his top priorities for Victoria included cracking down on organised crime, youth crime, community tensions and domestic violence, as well as getting more frontline officers on the beat.

"There's a very simple proverb, that culture is a consequence of leadership," he said. "So one of my first focuses will be ensuring that we have a leadership team that drives a really healthy, positive, open culture within our police.

"We'll also be quite sophisticated about how we bring in the intelligence and deploy people to get in front of crime issues.

"It's not good enough just to turn up after the act. It's really important we respond well, we investigate, we resolve. But you have to do more. You have to get in front of these things ... having a prevention mindset, a prevention focus at the front is really important.

"Some of you will be familiar with Sir Robert Peel. That is the No.1 principle of policing. We actually exist to prevent crime and harm."

Asked if he were willing to push back against the state government, Mr Bush said "absolutely".

He was approached to apply for the position by a recruitment agency and described the selection process as "far more robust" than those he had encountered previously, including with Britain's Metropolitan Police.

"Policing is in my blood," he said. "I've committed most of my adult life to ensuring communities are safe. It's an honour to now serve Victoria."

Premier Jacinta Allan said Mr Bush was the right person for the role. "He will bring new leadership to Victoria Police. Mr Bush made the community safer in New Zealand and he will do the same here in Victoria," she said.

IAN CURRIE/NEWSWIRE

Victoria Police's incoming Chief Commissioner, Mike Bush, in Melbourne on Tuesday

Fake nurse 'became SES superintendent'

EXCLUSIVE

WILL SEITAM
LIAM MENDES

A man convicted of working as a fake cosmetic nurse in Western Australia showed a "blatant disregard for the law" before becoming a high-ranking officer at a NSW government disaster emergency service.

NSW State Emergency Service Superintendent Scott McLennan moved across state lines in a bid to hide his notoriety as a cosmetic cowboy in Perth, posing "a significant risk to the public" after injecting unwitting patients with cosmetics while never being a registered nurse.

According to court documents obtained by The Australian, McLennan – who referred to himself as "Mr Sister Scott" – administered injectable treatments to patients, including Botox and fillers, and also supervised and provided training to nurses between 2015 and 2018.

In a March 2019 phone interview with investigators working for Australian Health Practitioner Regulation Agency, the nation's health regulator, the SES employee admitted to authorities he had studied nursing but did not complete a qualification.

The court heard the 52-year-old abused his rapport with a longtime friend who hired him as a general manager at her Fremantle practice, misleadingly claiming he had "been in the nursing industry for 20 to 30 years".

In one example, Mr McLennan told a patient he was a nurse and had trained in the army before specialising in cosmetics.

At his sentencing hearing in November 2019, prosecutor Solene Yiklong, acting for AHPRA, said Mr McLennan, who failed to appear in court, showed "a blatant disregard" for the nursing accreditation process imposed under law.

"The accused we submit has shown a lack of remorse; he has not demonstrated any insight into the impact on his offending," Ms Yiklong said.

"He has also avoided any attempts to be contacted about this matter and he was notified that if he did not appear today, the court could deal with the matter in his absence," she said.

According to LinkedIn, Mr McLennan had commenced work at an aged-care facility in Bathurst two months before his court date.

Ms Yiklong said it was not a "case of inadvertence or accidental oversight" but instead Mr McLennan deceived numerous staff and patients over an extended period of time.

"The accused told patients and other nurses and staff at the clinic that he was a nurse, or he did not correct anyone who introduced him as a nurse or registered nurse," she said. "He knowingly held himself out to be a registered nurse in a way which indicated that he was authorised to be a nurse, when in fact he was not."

The court also heard he had previously been convicted and fined $2500 for a similar offence in NSW over a decade before.

Mr McLennan was fined $15,000 and issued a $4000 costs order by magistrate Mark Millington. "When people go to get treatment, they put their health and, more importantly, their life in people's hands," Mr Millington said.

On Tuesday when contacted by The Australian, Mr McLennan said he had disclosed his convictions to the NSW SES. "I think the outputs that I have demonstrated over the last several years in this role both as a volunteer and as staff have demonstrated my commitment to the community to ensure the community remains safe," he said.

Minns pursues Obeid millions

ALEXI DEMETRIADI
NSW POLITICAL CORRESPONDENT

NSW Premier Chris Minns has promised the state's Crime Commission his government will empower it with resources, funding and even legislative changes to ensure it goes after Eddie Obeid's $30m made from a corrupt coal licence deal.

The Premier's Tuesday vow follows NSW Crime Commissioner Michael Barnes's statement in April that a decision not to confiscate the money was one he did not want to make and was due to a web of complexity.

But Mr Minns told Sydney radio 2GB on Tuesday his government not only disagreed with that decision but would back Mr Barnes and his organisation to pursue the $30m.

"The Crime Commission made a decision during the federal election campaign ... The government and the commission were criticised for it, and I think that criticism was actually legitimate," Mr Minns said. "(Obeid's haul and conduct) is the greatest and largest example of public corruption ... synonymous with public distrust in officials and with the Labor Party. And there needs to be a reckoning here."

Obeid, 81, son Moses, and former mining minister Ian Macdonald were jailed in 2021 over the deal after a judge-alone trial found the three men guilty of conspiring to commit misconduct in public office.

Eddie Obeid

The state's corruption watchdog conducted an explosive inquiry in 2013 into the coal exploration licence granted for the Obeid family farm, Cherrydale Park, in the Bylong Valley in the NSW Hunter region.

Obeid made $30m from a rigged licence tender and stood to make another $30m until the state government cancelled the licence.

Mr Minns said the Crime Commission had "extraordinary powers" it should use.

"In other words, if it's been proved or even suspected that criminal activity has taken place and there's been a windfall gain, it's incumbent upon the crook to prove that that's not the case," he said. "And I've made it clear to the Crime Commission and commissioner ... that we will provide the resourcing, the funding or changes to the law if necessary.

"Because not only does justice need to be done, it needs to be seen to be done, and the public needs to have faith in the public institution."

Mr Barnes said of the $30m in April: "The money went into a complex web of corporate discretionary trusts and was distributed along with lawfully obtained money.

"It was lent between a large number of beneficiaries and layered multiple times."

He also said that on top of trying to identify where the money ended up, some records were no longer available, and that "no stone" had been left "unturned".

Mr Minns said he had sought advice from the commission on what the government could provide to help it better pursue Obeid's corrupt gains.

"If the message goes out that if you've got deep enough pockets you can run (cases) through the courts, and the government will eventually drop off – what kind of message will that send to future corrupt officials or criminals in the state?" he said, adding that a lengthy court process to reclaim the funds may be required.

NSW parliament resumed on Tuesday.

Nurses' pay deal 'nation-leading'

MACKENZIE SCOTT

Queensland Health Minister Tim Nicholls has insisted the pay rise sweetener offered to nurses on Friday would keep them the best-paid in the country as negotiations with the powerful nurses union heat up.

The state government proposed nurses receive a 3 per cent increase in the final four months of the new agreement on top of the public service's base offer, which Mr Nicholls said would keep them the best-paid health workforce in the country.

Under the base offer put to the public service unions, Queensland nurses' pay would lead the nation for two years and eight months of the three-year agreement, before being overtaken by their Victorian counterparts, who last month accepted an annual rise of 7.1 per cent over four years.

"It's very difficult to compare Queensland directly with Victoria ... it's not a direct comparison, but to the best extent possible for the vast majority of people, our offer, which includes the government election commitment to the last four months, will maintain nation-leading wages and important conditions for nurses and midwives," Mr Nicholls said

> 'For the majority of Queensland Health nurses and midwives, this offer is not nation-leading'
>
> SARAH BEAMAN
> NURSES UNION SECRETARY

The affirmation comes after the Queensland Nurses and Midwives Union publicly rejected the offer it received last week.

The Health Minister said he would not comment on parity with Victoria until the government received a formal request from the union.

Union secretary Sarah Beaman said the offer would be taken to members from this week. "For the majority of Queensland Health nurses and midwives, this offer is not nation-leading," she said. "We also hold significant concerns that the Queensland Health offer includes many reductions in existing conditions that would currently see hundreds of members' pay go backwards over the life of the agreement."

Mr Nicholls ruled out using changes to patient-nurse ratios as leverage in negotiations. The state government is in the midst of pay negotiations with the public sector, which has broadly rejected the opening offer of a 3 per cent wage increase in 2025, followed by 2.5 per cent annually over the following two years.

The police union recently entered a two-week pause in negotiations after submitting its latest list of claims. Meanwhile, Queensland Teachers Union president Cresta Richardson said she would "not compromise" on getting teachers pay increases that "respect their vital work".

Aussie dad in Bali brawl faces prison term

DIAN SEPTIARI
AMANDA HODGE

A Sydney father faces up to six months in jail in Bali for allegedly punching and slapping a German woman in the face after her toddler was pushed down a water slide at one of the Indonesian tourist island's most luxurious hotels.

Ali Shahrouk, 38, was staying at the upscale Apurva Kempinski hotel in Nusa Dua on January 29 with his family when an altercation erupted between German tourist Christin Steinrode Tiller and another tourist, Samer Beckdache, whose older child was accused of pushing her three-year-old from the slide.

According to Denpasar court documents, Ms Tiller confronted Mr Beckdache after being told of the incident by another guest.

The altercation soon became physical with Ms Tiller pushing him into the pool and Mr Beckdache grabbing her hair, pulling her in with him.

Bali prosecutors have alleged Mr Shahrouk then approached Ms Tiller and another argument ensued which also turned physical, leading to the Sydney man allegedly slapping and punching the woman in the face.

Mr Shahrouk has been in custody since and charged with assault which, under Indonesian law, attracts a maximum penalty of two years, eight months' jail.

His Bali lawyer told The Australian Mr Shahrouk had been in the pool with his child at the time Ms Tiller and Mr Beckdache fell into the water and had confronted her out of concern over the danger she had posed. "She almost hit the child ... when they fell in the pool and because of that he told them off, like 'Hey, you almost hit my child'," Sabam Antonius told The Australian.

"Our client was then insulted and spat on. He backed away and the woman started yelling. Then she scratched our client and as a reflex he slapped her."

He said Mr Shahrouk, who admitted slapping Ms Tiller but denied punching her, had sought reconciliation. Prosecutors noted his co-operative behaviour at trial and asked the Denpasar District Court to sentence him to six months in jail, reduced by time served in detention. The sentence will be read on May 20.

Helping More Cats And Dogs Find Their Furever Home

The Allan Labor Government is helping Victorian pet rescue and rehoming groups find homes for vulnerable pets through the latest round of the Individual Pet Rehoming Grants.

Minister for Agriculture Ros Spence announced that a further $1.27 million has been awarded to organisations that provides vital rehoming services for cats and dogs.

Sixty organisations are involved in the program, they will be reimbursed $500 per dog and $200 per cat to help cover the costs of rehoming, including desexing, microchipping, vaccinations, the purchase of crates, bedding and leads, and training or rehabilitation.

As part of this round of funding, Forever Friends Animal Rescue in Gladysdale has received grants totaling $75,000, while Victorian Animal Aid in Coldstream has been awarded grants also totaling $75,000.

Second Chance Animal Rescue Inc. – an organisation in Craigieburn that has previously been supported by the grants program – has received grants totaling $56,700.

The program helps to reduce the costs for animal shelters and community foster care networks, so that they can continue caring for our state's furry friends.

To date the program has invested $5 million across 90 organisations, supporting the rehoming more than 6,000 dogs and 12,000 cats.

Delivered as part of the Animal Welfare Fund (AWF) Grants Program, these grants recognise and support the important role animal shelters and rehoming organisations play in caring for and rehabilitating our cats and dogs, offering vulnerable animals a second chance at finding a home.

Since 2014, the AWF Grants Program has awarded more than $13 million in funding to not-for-profit animal shelters, foster care organisations and community vet clinics to directly improve companion animal welfare in Victoria.

For more information about the AWF Grants Program, visit animalwelfare.vic.gov.au.

Minister for Agriculture Ros Spence said:
"These funds will help more rescue cats and dog find their forever home by making sure they receive the veterinary work and training they need to make their adoption as successful as possible."
"Our rehoming and rescue organisations do an incredible job caring for vulnerable animals, we're making sure they have the support they need to continue this great work."

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso
An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about **labour and logistics,** or any other topics related to the decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team along with **presentations from CMA Contracting (Dismantling and Recycling Contractor) and Qube (Operators of Barry Beach Marine Terminal),** will be hosting community information sessions at the following locations:

Monday 19 May 2025 - Welshpool
Welshpool Memorial Hall
49 Main St
Tuesday 20 May 2025 - Foster
Foster War Memorial Arts Centre
79 Main Street, Foster
Wednesday 21 May 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St
Monday 26 May 2025 – Yarram
The Yarram Hub
156 Grant Street
Tuesday 27 May 2025 – Lakes Entrance
The Bellevue Hotel,
201 The Esplanade
Wednesday 28 May 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan
- Decommissioning Planning Campaign 1A

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Complete the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

To find out more information

For more information about Esso's activities and other projects, go to the Esso Consultation Hub at:

Study To Drive Increase In RSV Protection

The Allan Labor Government is backing a new study to boost the number of expectant mothers having the Respiratory Syncytial Virus (RSV) immunisation and investigate the impact of RSV infections in pregnancy.

Minister for Economic Growth and Jobs Danny Pearson announced up to $685,000 for Murdoch Children's Research Institute (MCRI) to explore the barriers surrounding the uptake of the RSV immunisation in pregnant women, aiming to boost trust and increase uptake – which will improve the health of our youngest Victorians.

The new MCRI RSVChoice study will complement MCRI's current investigation into the health outcomes for mothers and their babies associated with COVID-19 vaccinations during pregnancy.

RSV is a common, highly contagious virus that infects up to 90 per cent of children within the first two years of life. It is the most common cause of hospitalisation in infants – eight times higher than the number of influenza hospitalisations – because it can often progress to pneumonia or bronchiolitis in very young children.

RSV immunisation during pregnancy significantly reduces the risk of severe RSV illness in infants, with studies showing a reduction of around 70 per cent. Maternal RSV vaccination is safe for both the mother and baby and is recommended as a single dose during weeks 32-36 of pregnancy.

The Labor Government recently announced a free RSV immunisation program to protect around 40,000 Victorian babies born this RSV season – free for eligible families until 30 September. Infants aged two years and under are eligible if their mother hasn't been immunised during pregnancy.

The Government's record investment of more than $1 billion in medical research has cemented Victoria as a global hub for medical research, driving incredible breakthroughs in treatment and patient care, this includes $35 million to establish the Children's Cancer CoLab - supporting our youngest Victorians to get the best cancer care.

Minister for Economic Growth and Jobs Danny Pearson said:
"We're supporting life-saving research to help us understand barriers in the uptake of RSV immunisation, boosting trust and supporting better coverage to protect babies, families, and communities."

Minister for Health Mary-Anne Thomas said:
"We know that RSV is the leading cause of hospitalisation in infants, that's why studies like these - along with our RSV mothers and babies immunisation protection program - are so important to keep our littlest Victorians healthy and safe."

MCRI Group Leader Vaccine Trials and UptakeProfessor Margie Danchin said:
"The MCRI RSVChoice study will help us to understand what factors impact parents' choice, including how well immunisations work to prevent their baby getting sick from RSV at home. It will improve immunisation acceptance, uptake and protection of Victorian babies and their families."

Have Your Say On Victoria's Multicultural Review

The Allan Labor Government is inviting multicultural and multifaith communities, organisations and leaders to have their say in shaping Victoria's multicultural policies and institutions.

Minister for Multicultural Affairs Ingrid Stitt announced the start of community consultations for Victoria's Multicultural Review, with an advisory group set to engage multicultural communities across ten regional and metropolitan local government areas.

The advisory group will lead discussions and workshops to hear directly from multicultural Victorians about how the Labor Government can tackle discrimination, build social cohesion and foster a more inclusive Victoria.

Victoria's Multicultural Review is led by longstanding multicultural leader George Lekakis AO, with support from a targeted advisory group comprising of Hass Dellal AO, Carmel Guerra OAM, Miriam Suss OAM and Mark Duckworth PSM.

The Review will recommend how the Labor Government can strengthen systems, organisations and policies to better resolve conflict, foster connection and celebrate the rich diversity of our multicultural and multifaith communities.

As important steps are undertaken through Victoria's new Anti-Racism Strategy and the Anti-Vilification and Social Cohesion Bill now enshrined in law, it's critical that multicultural organisations have the support they need to strengthen inclusion and unity across all communities, especially those that are new and emerging.

For more information on where and when consultations will take place and how to participate, please visit vic.gov.au/victorias-multicultural-review.

Minister for Multicultural Affairs Ingrid Stitt said:
"Victoria's multiculturalism is one of the most precious parts of our state – and it's essential that our systems actively support inclusion, tackle discrimination and bring communities together."
"We encourage all multicultural and multifaith communities to take part in this consultation process – your voices are integral in shaping the future of Victoria's multicultural policies and programs."

George Lekakis AO said:
"As someone who has dedicated my life to advocating for the rights and inclusion of multicultural communities, leading Victoria's Multicultural Review is not just a responsibility – it's a deeply personal mission."
"This work is about ensuring every Victorian is included, valued, and can access government services. It's about building a future where our diversity is not just acknowledged but celebrated as a strength."

Defence, business on trip agenda

BEN PACKHAM
FOREIGN AFFAIRS AND DEFENCE CORRESPONDENT

Anthony Albanese will look to ramp-up joint military exercises with Indonesia and turbocharge the nations' trade and investment ties when he sits down with the country's President, Prabowo Subianto, in Jakarta on Thursday.

Amid heightened concerns over Indonesia's expanding ties with Russia and China, the Prime Minister is said to be determined to strengthen his already close personal relationship with Mr Prabowo, who will be in office for the entirety of Mr Albanese's second term.

Mr Albanese will be accompanied on his first overseas trip since his election win by two of his most trusted lieutenants – Foreign Minister Penny Wong and Home Affairs Minister Tony Burke.

Bedding down the Australia-Indonesia defence co-operation agreement, signed last August, will be a top priority for the visit, along with strengthening business ties with the emerging economic giant.

Donald Trump's tariff blitz will also be on the agenda as both nations look to negotiate carve-outs from the punishing trade measures that have dealt a blow to the US's standing in Southeast Asia.

Mr Albanese, who will then fly from Jakarta to Rome for the Pope's inaugural mass on Sunday, underscored the importance of the Australia-Indonesia relationship when Mr Prabowo phoned him last week to congratulate him on his election win.

"I have a request for you, and I want you to say yes," Mr Albanese asked his counterpart.

"I want Indonesia to be my first visit. Not Washington, not Beijing, not anywhere else."

The trip comes after it was revealed during the election campaign that Moscow issued a formal request to operate long-range military aircraft from an Indonesian air base just 1300km from Darwin.

Lowy Institute international security program director Sam Roggeveen said Jakarta's "flirtation" with Russia underscored its longstanding commitment to its non-aligned status. But he said Australia's goal should be an ANZUS-style agreement with Indonesia committing both countries to consult on security threats.

"You're up against Indonesia's non-aligned status and the Indonesians would never jeopardise that. But you can do an awful lot without calling it a treaty," Mr Roggeveen said.

At the same time, he said Australia needed to be wary of Indonesia's concerns over the AUKUS submarine pact and the US's growing strategic presence in Australia, which threatened to turn Southeast Asia into "a theatre for great power competition".

He said Australia should also encourage Jakarta to step up as the natural leader of the ASEAN bloc as a counterbalance to China's strategic heft. "Given China's ambitions in Southeast Asia, anything Australia can do to nudge Indonesia towards that kind of leadership position is welcome," Mr Roggeveen said.

The Albanese's government's 2022 Southeast Asia Economic Strategy, developed by former Macquarie Bank boss Nicholas Moore, urged Australian investors to take a fresh look at Indonesia, which is on track to become the world's fifth-largest economy by 2040.

University of Western Sydney chancellor Jennifer Westacott, who was appointed by the government as a "business champion" for the Indonesia relationship, said the investment opportunities in the country were "staggering".

"This is an economy that's going to be one of the biggest in the world. Why would we not want to be a part of that?" she said, adding resources companies, food producers, education providers and health companies were among those that stood to cash in.

Jakarta visit a test of our two nations' 'unbreakable bond'

AMANDA HODGE
ANALYSIS

The first time Anthony Albanese visited Indonesia as prime minister his wobbly circuit of the presidential palace on a bamboo bicycle was an irresistible metaphor for an Australian leader on foreign policy training wheels.

In the wake of his stunning electoral victory last week, the second-term PM exuded confidence when he told Indonesia's new president Prabowo Subianto by phone that the two countries share an "unbreakable bond".

His choice of words resonated strongly in Jakarta, just days after an Australian election campaign stoush over Russia's ambit claim to house military aircraft on south Papua's Biak air base raised eyebrows in non-aligned Indonesia.

Prabowo will have well understood how such a prospect would hit a central nerve in Canberra, even if the Australian political debate misrepresented Indonesia's commitment to a constitutionally enshrined "free and independent" foreign policy.

No foreign power has a military base in Indonesia, nor permanent access to an Indonesian base, though that hasn't stopped Moscow trying for the past half a century.

Still, six months after skipping Prabowo's inauguration ceremony, Albanese's visit this week is an opportunity to smooth any ruffled feathers. More importantly, it is a chance to underscore Jakarta's importance to Australia with concrete commitments at a time of fluctuating global geopolitical alignments.

"To say Indonesia and Australia have an unbreakable bond – that was a big statement," says George Iwan Marantika, a Jakarta-based Indonesia-Australia business champion and chair of the Australian bilateral committee within Indonesia's Chamber of Commerce and Industry.

"If that's the case that means our conversation will go beyond what we have now," he says, adding "2025 is the new baseline".

"How do we take the relationship further, building defence industry alliances together, critical minerals together, raise capital together for Danantara (Indonesia's new sovereign wealth fund)?"

Prabowo came to power last October promising to slash Indonesia's child stunting rates through a free school meals program, build new hospitals, improve schools, shore up food security, construct three million new homes a year, and deliver annual economic growth of 8 per cent.

Since then, the Trump administration has up-ended the economic and geopolitical order with punitive tariffs that have sent global markets on a giddying rollercoaster, while Prabowo's own austerity measures designed to free up capital for policy priorities have hurt investor sentiment.

This week, Indonesia's first-quarter growth rate came in below expectations at 4.87 per cent – far below what the country needs to become one of the world's top five largest economies by 2045.

Prabowo needs and wants options to ensure Indonesia does not become overly dependent on China to help it achieve its aim.

As the former defence minister who signed off on the bilateral landmark Defence Co-operation Agreement last year, Prabowo will also be looking to add meat to its bones through closer engagement with Australia in defence and defence technologies, as well as build partnerships in the critical minerals sector, and expand co-operation in education and training.

These are not one-way deals.

Monash and Western Sydney universities are the only two foreign universities to have been granted full Indonesian operating licences so far.

More broadly, Albanese's visit is a potential opener for a new conversation on how the two countries can help weatherproof each other from Washington's tariffs.

It is to Canberra that Jakarta has recently turned again to support its membership to the Comprehensive and Progressive Agreement for trans-Pacific Partnership, a move that has grown in importance in light of Indonesia's admission to the Chinese-led BRICS grouping.

With the US in isolation mode, and Russia and China both vying for more influence in Jakarta, adding economic depth to Australia's relationship with Indonesia has never been more important.

AFP

Anthony Albanese and former president Joko Widodo

No rush to strike a tariff deal with volatile Trump

CAMERON STEWART
ANALYSIS

The Albanese government plans not to rush negotiations with Washington over tariffs but will instead watch and wait to see how other deals fall as Donald Trump veers wildly on tariff policy.

Trump's vaguely worded inaugural trade deal with Britain and his head-snapping reversal on tariffs on China have led senior government figures to believe it's better for Australia to not be at the front of the queue on tariff negotiations.

Australia is one of more than 50 countries seeking to negotiate lower tariffs with the President after he slapped them with higher tariffs on his so-called "Liberation Day", before then suspending the rises for 90 days.

Australia faces across-the-board tariffs of 10 per cent in addition to 25 per cent tariffs on steel and aluminium exports to the US, despite being one of the few countries to have a trade surplus with America. Anthony Albanese, who says the tariffs are "not the act of a friend", is expected to make the case for scrapping all of these new tariffs when he next speaks with the President.

But the dramatic backflip on Trump's tariffs with China this week is further proof that the President's tariff policy remains in flux, and at the whim of market forces and the mood of a deeply unpredictable leader.

The risk for Australia is that an early negotiation of lower tariffs could result in a worse outcome than it would later on if Trump continues his recent backtracking from his initial tariff regime.

Trump's so-called trade deal with the UK last week was not nearly as advantageous to London as British leader Keir Starmer claimed at the time. The UK deal failed to remove the 10 per cent baseline tariffs for British imports although it did remove the tariffs on British steel and aluminium. Much of the agreement was vaguely worded and amounted to little more than a framework for further negotiations. The kicker was that it allows the US to change course at any time on tariffs – something that cannot be ruled out with Trump as President.

Trump's spectacular backflip with China, in which tariffs on Chinese imports to the US will fall from 145 per cent to 30 per cent for 90 days – a move roughly reciprocated by China – was driven by economic reality and Trump's desire to avoid a collapse on Wall Street, a recession or both.

It comes on top of similar earlier announcements and backflips on tariffs including on Canada and Mexico and then on the broad-brush "Liberation Day" tariff announcements.

Trump is vacillating on tariff policy because he is trapped between his conviction that they are good for the US and the weight of evidence from other countries, economists, the Federal Reserve and global markets that they are hugely damaging.

Trump's tariff regime is also losing support from voters, including many who voted for him last November. A Gallup poll released last week revealed that 89 per cent of Americans believe that tariffs will drive up prices on products. Seventy per cent believe the levies will, in the short term, cost the US more money than they make.

Trump's tariff policy is utterly unpredictable right now. It is untethered to logic and entwined with the President's emotions. He has shown he is willing to reverse it overnight if the markets spook him or if a recession beckons.

In this climate, it makes sense for Australia to go slow and not be first in line to strike a tariff deal with Trump until the dust settles and some form of policy coherence emerges.

WORLD P9
EDITORIAL P10

NSW GOVERNMENT

EXHIBITION OF AMENDED STATE SIGNIFICANT INFRASTRUCTURE APPLICATION

Cowarra Water Supply Scheme – Amended Proposal

Application No.	SSI-57056461
Location	DP 0754403, Cowarra Access Road and associated pipe alignments within Port-Macquarie-Hastings local government area
Proponent	Port Macquarie-Hastings Council
Council Area	Port Macquarie-Hastings
Approval Authority	Minister for Planning and Public Spaces

Description of first proposal

Construction and operation of a new water treatment plant, clear water tank, dewatering plant, and pipeline for supply of potable water for Port Macquarie-Hastings customers. The water treatment plant is proposed to be located 400 metres southeast of Cowarra Dam, which is 15 km southwest of the Port Macquarie central business district. The water supply pipeline traverses Burrawan Forest Drive, Oxley Highway and to Clearwater Crescent in Port Macquarie.

The new water supply scheme includes operation of:

- Water treatment plant (WTP), clear water tank, dewatering plant
- Northern Arm Trunk Main (NATM) pipeline for water supply from Cowarra to Rosendahl Reservoir
- Access road upgrades and electricity supply.

Description of amended proposal

The amended proposal includes the original project described above with design and construction changes:

- Amending extent of asset protection zone (APZ) at the proposed WTP site and an extended APZ area
- Amending alignment of NATM pipeline
- Amending construction method at two NATM creek crossings
- Amending NATM underbore locations
- Amending NATM end point arrangement at Clearwater Crescent.

About the exhibition

An exhibition process allows any individual or organisation to have their say about a proposed development.

The Department of Planning, Housing and Infrastructure is exhibiting an amended State Significant Infrastructure (SSI) application, Environmental Impact Statement (EIS), Amendment Report and accompanying documents from **Wednesday 14 May 2025** until **Tuesday 27 May 2025**.

You can view these documents online at planningportal.nsw.gov.au/major-projects/projects/cowarra-water-supply-scheme

At the time of publishing this advertisement, the Minister for Planning and Public Spaces has not directed that a public hearing should be held.

Controlled Action under *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act)

The Commonwealth Minister for the Environment and Water has determined that the proposed development for the Cowarra Water Supply Scheme is a "controlled action" under the EPBC Act.

The EPBC Act Part 3, Division 1 controlled provisions are:

- Sections 18 and 18A (Listed threatened species and communities).

The proposed development EPBC 2023/09581 will be assessed under Part 5 of the *Environmental Planning and Assessment Act 1979*. The assessment will be in accordance with the Bilateral Agreement between NSW and the Commonwealth, made under the EPBC Act. The assessment will be done in the manner specified in Schedule 1 of the Bilateral Agreement. This means the project will be assessed against the requirements of both acts. The public notice for the project may be found at: epbcpublicportal.environment.gov.au/all-referrals/

Have your say

To have your say on this project, you must lodge a submission online through the NSW Planning Portal before the close of exhibition.

To do this, search for this project at planningportal.nsw.gov.au/major-projects and click on 'Make a submission'. You will need to log in or create a user account.

Resources to help you use the NSW Planning Portal are available at planningportal.nsw.gov.au/major-projects/help including a step-by-step guide on how to make a submission. If you require further assistance, please contact Service NSW on 1300 305 695.

If you think you'll need help making a submission using the portal, it's a good idea to contact Service NSW sooner rather than later. Ensure you give yourself plenty of time to make a submission before the project's exhibition end date.

Before making your submission: You should read the department's:

- Disclaimer and declaration at planningportal.nsw.gov.au/major-projects/help/disclaimer-and-declaration, and
- Privacy statement at planning.nsw.gov.au/privacy.

Your submission will be published on the NSW Planning Portal in accordance with our privacy statement and disclaimer and declaration. You can elect to have your name withheld from the published list of submitters. If you choose this option, do not include personal information in the body of your submission or in any attachments as your submission will be published in full.

When making a submission you will be required to include:

- your name and address
- the name of the application and the application number
- a statement on whether you 'support' or 'object' to the proposal or if you are simply providing comment
- the reasons why you support or object to the proposal
- a declaration of any reportable political donations you have made in the last two years (visit planning.nsw.gov.au/Assess-and-Regulate/Development-Assessment/Planning-Approval-Pathways/Donations-and-Gift-Disclosure or phone 1300 305 695 to find out more)
- an acknowledgement that you accept the department's disclaimer and declaration.

For more information, including the department's submissions policy, please go to planningportal.nsw.gov.au/major-projects/have-your-say.

For more information about the project: Contact Chris Fraser, Senior Planning Officer on (02) 9995 6321
If you require assistance to use the NSW Planning Portal or you are having difficulty making a submission online, please call Service NSW on 1300 305 695.

Domestic violence funding boost

Recent support for families experiencing domestic violence has received a welcome boost, according to Member for Gippsland Darren Chester.

The much-needed $3 million funding under the Crisis and Transitional Accommodation Program (CTAP) will support Quantum Support Services in providing new accommodation for women and children experiencing family violence.

"Gippsland continues to experience an increasing rate of family violence and we need to do more to support victims and prevent crime in the first place," Mr Chester said.

"Data from the Crime Statistics Agency shows an increase in family violence incidents across all Gippsland local government areas (LGAs) for the year ending September 2024.

"Family violence incidents rose by 30.9 per cent in East Gippsland, 20.2 per cent in Latrobe and 7.9 per cent in the Wellington Shire, with East Gippsland and Latrobe recording the first and second highest rate of family violence in the state.

"This $3 million funding announcement will see Quantum Support Services purchase four dwellings to deliver new critical crisis and transitional housing for women and children experiencing family and domestic violence, supporting some of the most vulnerable within the Gippsland community and contributing to much-needed housing solutions across Latrobe City."

While housing is fundamental to breaking the cycle of violence, Mr Chester has challenged Gippslanders to do more to put an end to this violent epidemic.

"We all need to do more to end the violence against women and children in our community," Mr Chester said.

"I have spoken many times in Parliament about the need to eliminate violence in our community and I'm passionate about assisting in whatever way possible.

"Preventing violence against women should be above party politics, and I support efforts from all levels of government to work in partnership with our communities to keep women safe.

"It remains our enduring challenge to achieve equality and ensure all women can feel safe and secure as they go about their public lives and in their own homes.

"As men, we need to demonstrate our respect for the women in our lives on a daily basis and accept responsibility for the changes that need to occur."

Mr Chester has also thanked men and women who are already working to improve the situation in Gippsland and urged them to keep working together to fight the problem.

"I want to live in a community where girls and women are safe, and they are treated with respect in their homes and in public," Mr Chester said.

"I support a shared vision where all Gippslanders are safe, thriving, and living free of family violence."

Federal MP Darren Chester says support for families experiencing domestic violence has received a welcome boost, with much-needed funding to deliver new critical crisis and transitional housing for women and children.

Research shows most road deaths happen close to home

New research reveals that most deaths on regional Victorian roads over the past five years involved local residents, showing that the unexpected can happen even on the most familiar roads.

Transport Accident Commission (TAC) analysis of road fatalities from 2020 to 2024 shows that more than 70 per cent of people killed on country roads died within a 30km radius of their home address.

The research follows a tragic start to the year on Victoria's roads, with 74 lives lost compared with 75 at the same time last year. January this year was the deadliest month on Victoria's roads since March 2008, and the worst start to a year since 2001.

The majority of fatalities so far this year have also happened on regional roads where there have been 43 lives lost, compared with 31 in metropolitan Melbourne.

In regional areas, road users typically travel longer distances in high-speed zones, and the consequences are more severe if something goes wrong.

Importantly, the new TAC data analysis dispels the myth that people dying in fatal crashes in regional Victoria are predominantly visitors or people unfamiliar with the roads they're traveling on – just four per cent of deaths were people travelling from outside of Victoria or Australia.

Around 70 per cent of the regional fatalities analysed happened on high-speed roads, most of which had low traffic volumes and gravel shoulders and involved either a vehicle running off the road or into an oncoming vehicle or crashing at an intersection.

The findings have prompted the TAC to remind drivers to slow down on low-volume, high-speed country roads, come to a complete stop at intersections and ensure they are distraction free - even on roads they know like the 'back of their hand'.

"The evidence is clear – crashes often happen close to home, on familiar roads that we know like the back our hand," Transport Accident Commission chief executive officer Tracey Slatter said.

"Our new insights reinforce the need for us all to be aware of risks on local roads, not to be complacent, and to give our undivided attention to driving until we reach our destination safely.

"We can all a play in part in keeping ourselves and others safe on the road by obeying the law, avoiding risky behaviours and being 100 per cent focused very time we get behind the wheel."

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about **labour and logistics,** or any other topics related to the decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team along with **presentations from CMA Contracting (Dismantling and Recycling Contractor) and Qube (Operators of Barry Beach Marine Terminal),** will be hosting community information sessions at the following locations:

Monday 19 May 2025 - Welshpool
Welshpool Memorial Hall
49 Main St

Tuesday 20 May 2025 - Foster
Foster War Memorial Arts Centre
79 Main Street, Foster

Wednesday 21 May 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St

Monday 26 May 2025 – Yarram
The Yarram Hub
156 Grant Street

Tuesday 27 May 2025 – Lakes Entrance
The Bellevue Hotel,
201 The Esplanade

Wednesday 28 May 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan
- Decommissioning Planning Campaign 1A

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Complete the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

THUMBS UP / THUMBS DOWN

THUMBS UP: To the person who handed in my engagement ring at the BARC. My husband died recently and the ring was very precious to me. Thank you so much for your honesty.

THUMBS DOWN: To the water temperature at the BARC main pool. Twenty-seven degrees is too cold for the little kids and the citizens who are frequent users of the facility.

THUMBS UP: To all the polling station workers and AEC staff, for a job well done. We are so very lucky, to live in a country where elections are fair, free and transparent - and where the losers are gracious and accepting of the outcomes.

THUMBS DOWN: To the motorists who find it extremely difficult to use indicators at the roundabout near the United on the eastern side of Bairnsdale. How are fellow motorists expected to know which direction you're heading. An accident waiting to happen.

THUMBS UP: To all the Orbost hospital staff who looked after me so well recently. Also, a big thank you to the nurses from New Zealand for your contribution to the running of our healthcare system.

THUMBS UP: To Jim from the Orbost SES for organising a crew to cut off a tree on the Errinundra Road.

If submitting a Thumbs Up/Down

All items submitted for consideration for publication in Thumbs Up, Thumbs Down, must be signed and include the address and telephone number of the writer. (This information is not for publication but is required under the Newspaper Act.) Items should be limited to 30 words, and writers should note that due to the numbers received, only a selection can be published. No specific business names will be mentioned in Thumbs Up/Thumbs Down. **Write to 'Tom', c/- 'The News'**

Submit your thumbs up or thumbs down
thumbs@eastvicmedia.com.au or online at

Heart health a top priority

Orbost Regional Health (ORH) celebrated 2025 Heart Week between May 5 and 11 by encouraging the community to prioritise their heart health.

Heart disease is the leading cause of death in Australia.

Many heart attacks and strokes can be prevented through healthy eating, exercising regularly, maintaining a healthy weight and by not smoking or vaping.

Heart Health Checks are important because people cannot tell when they have high blood pressure or high blood cholesterol, and these invisible factors increase our risk of developing heart disease.

Jade Macdonald is a highly experienced cardiology nurse who joined ORH in 2024 as the clinical nurse educator. Jade said "Heart Health Checks aim to lower your risk of heart attack or stroke".

These checks usually involve:

- Identifying heart-healthy lifestyle changes
- Referring you to other health professionals for more support
- Assessing whether you would benefit from blood pressure or cholesterol lowering medicines.

Jade encourages our community members to book a Heart Health Check with a nurse at Orbost Medical Clinic if they are:

- Aboriginal and / or Torres Strait Islander and aged over 30 years;
- A person with diabetes aged over 35 years; or
- Older than 45 years.

Heart specialist, Dr David Bertovic visits the Medical Clinic regularly.

"It is so important for patients to fully understand the reasons behind the treatments for their heart conditions," Dr Bertovic said.

ORH thanked Jade and David for their unwavering commitment to keeping local hearts healthy.

Orbost Medical Clinic's Natalie McEntee, Dr Nadira Anis and Jade McDonald.

Please call Orbost Medical Clinic to organise a Heart Health Check with one of the friendly nurses.

SURVEY

Residents are being invited to complete a survey on your healthcare experience to help improve how hospitals work together across the state. The survey is open from April 22 to June 8 and will take about 10 minutes to complete and will be available in 10 other languages.

All responses will be anonymous and confidential.

Complete the survey here via the Engage Victoria website.

Visualising a potential future in hemp

As native timber harvesting ends, Orbost & District is at a turning point. A new identity is emerging—one rooted in our land, heritage, community and future potential. Can industrial hemp play a role in this next chapter?

Together let's create the picture of a bold, community-led vision—one that turns transition into opportunity and positions Orbost as a leader in sustainable innovation.

This workshop will showcase emerging hemp innovations—sustainable construction, climate-smart farming, and bioproducts—while faciliating a bold post-forestry visualisation to help our district redefine its identity, inspire action, and attract support.

Bookings essential by 18th May

The Lakes' spectacular migratory birds: Bar-tailed Godwit pulling a worm out of wet sand; Far Eastern Curlew; and Latham's snipe. (PS)

A bird friendly community

Each autumn, the Gippsland Lakes' incredible migratory birds prepare for takeoff to fly over 10,000 kilometres to their northern hemisphere breeding grounds – some do it non-stop. On World Migratory Bird Day last Saturday, May 10, these birds were celebrated and the community was thanked for the part it plays in protecting them.

The Gippsland Lakes Ramsar Site is known to support more than 90 species of waterbird including critically endangered migratory species such as Bar-tailed Godwit, Common Greenshank, Latham's Snipe and Sharp-tailed Sandpiper. They visit the Gippsland Lakes each year arriving in spring and, as the weather turns colder, they head north to breed in the northern hemisphere.

Most of the birds travel to north east Asia and Alaska along what is known as the East Asian Australasian Flyway setting incredible flight records along the way. Bar-tailed Godwits – a large migratory bird that visits the Lakes - have been recorded making the 11,000-kilometre journey to Alaska non-stop in nine days.

"The Lakes' fabulous migratory birds are a key reason for them being recognised internationally as a Ramsar wetland. Many species are endangered, some critically, so working together to help protect them and their habitat is crucial," Bec Hemming, chief executive officer of East Gippsland CMA, said.

"This year's theme of Shared Spaces is about creating bird-friendly communities and is especially relevant as migratory birds rely on healthy wetlands to survive - and this takes a community effort.

"We are proud of what we have achieved to date working with Traditional Owners, BirdLife Australia, Greening Australia, West Gippsland CMA, partners and community to protect wetlands and fringing habitat and conduct ongoing bird monitoring.

"Over the past year, we launched the new Gippsland Lakes Ramsar Site Plan which guides our understanding of the management of the Lakes' wetland birds. The recently released Gippsland Lakes Environment Report noted waterbird abundance and diversity as 'good' with over 20,000 feeding and roosting in the Lakes each year. We are looking forward to continuing to work together to enhance our bird-friendly community to protect and support the Gippsland Lakes Ramsar Wetland and the birds that rely on it to survive."

In preparation for takeoff, the birds are busy preening their feathers into top condition and feeding to build up body fat to ensure they have enough fuel for the long journey ahead.

"This is a crucial time for the birds, so as a community, we can help by not disturbing them and keeping dogs on a leash where signed. It's a simple way we can all play our part in being a bird-friendly community," Ms Hemming said.

Weekly Book Review

Always Home, Always Homesick

by Hannah Kent

In a land of ethereal beauty, within a culture soaked in myth, a young woman discovers the story that will change her life. In 2003, seventeen-year-old Australian exchange student Hannah Kent arrives at Keflavík Airport in the middle of the Icelandic winter.That night she sleeps off her jet lag and bewilderment in the National Archives of Iceland, unaware that, years later, she will return to the same building to write Burial Rites, the haunting story of Agnes Magnúsdóttir, the last woman executed in Iceland. The novel will go on to launch the author's stellar literary career and capture the hearts of readers across the globe.Always Home, Always Homesick is Hannah Kent's exquisite love letter to a land that has forged a nation of storytellers, her ode to the transcendent power of creativity, and her invitation to us all to join her in the realms of mystery, spirit and wonder.

Data shows price rise

By STEFAN BRADLEY

HOME prices have risen in Gippsland by half-a-percent in the past few months, with Australia's median home price up 0.20 per cent, reaching a record high of $805,000 in April, according to new PropTrack data.

Elections often introduce "a degree of uncertainty that can see some buyers and sellers adopt a wait-and-see approach", particularly in the lead-up to polling day, according to Senior REA Group economist, Eleanor Creagh.

"Home prices (all dwellings combined) in the Latrobe-Gippsland region have risen 0.5 per cent over the past quarter," Ms Creagh told the *Express*. The price of units in Gippsland was actually down 0.68 per cent over the past quarter, with houses up 0.60 per cent.

The median value of homes in Gippsland is $543,000 for all dwellings, $372,000 for units and $568,000 for houses. Year-on-year growth for all dwellings was down 2.17 per cent.

Despite rising over April, regional Victorian home prices fell annually, according to the PropTrack Home Price Index, released on May 1.

Compared to 12 months ago, capital city prices are sitting 3.35 per cent higher, with regional areas 4.61 per cent higher.

The report found that regional Victoria was the only regional market to see home prices fall in the past 12 months, down 0.8 per cent, despite growing 0.2 per cent over April.

Since the onset of the pandemic in March 2020, regional Victoria home prices have risen 40.5 per cent.

"With the election now behind us and a decisive result delivered, the path is clear for buyers and sellers to re-engage, though the typically quieter winter period is approaching," Ms Creagh said.

Home prices in Melbourne rose 0.3 per cent, marking the fourth consecutive increase this year. Melbourne has been the weakest performing capital city for home price growth over the past five years.

"While national home prices rose in April, the rate of growth has slowed compared to the first three months of the year," said Anne Flaherty, a senior economist at REA Group.

"Should interest rates fall in May, we may see the rate of growth pick up again as borrowing capacities increase and mortgage repayments decline."

Compared to April 2024, home prices in Melbourne are down 1.7 per cent, making it the only capital to record an annual decline. Prices are also 4.0 per cent below 2022's peak levels.

Prices in the city are expected to recover further this year, off the back of lower interest rates and increased first home buyer incentives.

IN other real estate news, the state government's renting taskforce is cracking down on offences with inspectors out across the state conducting property inspections.The taskforce will be inspecting properties across the CBD and regional Victoria to ensure rentals are being advertised fairly and meet the mandatory minimum standards for safety and livability.

The taskforce has the power to conduct targeted inspections and take enforcement action, including issuing official warnings, fines, disciplinary proceedings against estate agents, and court actions for the most serious breaches.

If a property does not meet the minimum standards, the taskforce works with the property manager to ensure repairs are made before a renter moves in.

If a property isn't fixed and a renter moves in, this is an offence and penalties may apply.

The taskforce has issued more than 70 fines totalling more than $620,000 for key rental offences since it was established in 2024.

In addition to minimum standards, the taskforce's priorities include ensuring bonds are being lodged with the Residential Tenancies Bond Authority and condition reports are provided.

The taskforce is also cracking down on rental bidding, which means rentals must be advertised with a fixed price.

To date, the taskforce has received more than 500 reports from the public via the online complaint form.

These reports have helped the taskforce engage with estate agents to request properties be upgraded and repaired to meet the minimum standards, prior to a rental agreement being signed.

Victorians who suspect rental properties are being falsely advertised or do not meet minimum standards can reach Consumer Affairs Victoria directly through: forms.consumer.vic.gov.au/riarp

LATROBE CITY COUNCIL

GP1681707

Council Beat with Erika Allen

Roads, rates and reports

IN addition to releasing its draft budget for public comment, Wellington Shire Council met on Tuesday night last week to discuss a road project for Manns Beach, its plan for raising revenue through rates, and a report on last year's council election.

Councillors also acknowledged recent events like Yarram's Tarra Festival and local Anzac Day services.

All councillors attended the meeting, which wrapped up in 26 minutes before moving into a closed session.

Manns Beach upgrades

RESPONDING to a petition to seal and upgrade roads in Manns Beach, council will write to the head petitioner, outlining that a special charge scheme will be required for the project to proceed.

While council would contribute funding toward the upgrades, the scheme relies on partial payment from residents. Therefore, under the scheme, residents living on the affected roads would each pay a fixed charge of $3600.

In 2019, council surveyed residents on Fisher, Wight, David and Fry Sts. At the time, 28 of the 63 residents supported the proposal, while 25 opposed it, falling short of the support needed to proceed.

Coastal Ward councillor Garry Stephens said to proceed with a special charge scheme, at least 60 per cent of affected residents would need to support it.

A petition, tabled at the April 1 council meeting, included 49 signatures supporting the road upgrade project.

Cr Stephens briefly commented that many projects have been completed using special charge scheme, and hoped Manns Beach residents would support the scheme.

"They're never going to get their streets constructed cheaper than through our current policy," he said.

Mayor Scott Rossetti said special charge schemes were "heavily subsidised" by rates and federal funding from programs like Roads to Recovery.

"Hopefully people say 'yes' and we get a good outcome," Cr Rossetti said.

Shaping council's Revenue and Rating Plan

RESIDENTS will be able to review council's draft Revenue and Rating Plan 2025-29 and submit feedback.

Council has endorsed a community engagement process to gather public feedback on its draft plan. Residents can review it through the 'Your Wellington, Your Say' website.

After the engagement period, council will consider all submissions before deciding whether to formally adopt the finalised plan at its June 17 meeting.

The plan outlines how the council raises revenue via rates and service charges.

The draft plan includes several changes, including removing rates and waste charges on undevelopable Ninety Mile Beach lots, which have been part of a compulsory acquisition program managed by the Department of Energy, Environment and Climate Action. These lots, subdivided into 11,800 parcels between 1955 and 1969 before planning controls existed, are unsuitable for development due to flooding and a lack of essential services.

The new rating strategy, which the state Local Government Act dictates must be done following a council election, proposes no substantive changes to the current rating strategy and rating differentials.

Residential, commercial and industrial rates are proposed to remain at 100 per cent of the rate set annually by council, and the differential for farms is at 80 per cent.

The plan explains how council determines which valuations to use and the advantages and disadvantages of these.

Council election report

VOTER turn-out at last year's Wellington Shire Council election was up just over three per cent compared to 2020, according to a report by the Victorian Electoral Commission (VEC).

At certification, the voter roll for Wellington's 2024 general election included 34,651 enrolled voters.

As far as results are concerned, the successful candidates in the Central Ward were Scott Rossetti, who received over 39 per cent of Central Ward votes, followed by Liz Foat (32 per cent), and Geoff Wells (17 per cent). Jacob Veldhuizen was the fourth candidate.

Garry Stephens was the most popular Central Ward candidate with 27 per cent of the votes. Current deputy mayor Cindy Madeley received 22 per cent, while Catherine Bannerman received nearly 16 per cent. Robin Sidebotham, Marcus McKenzie and Paul Mayer were the unsuccessful Coastal Ward candidates.

Edward Lowe was an overwhelming winner in the Northern Ward, receiving 33 per cent of the votes. Carmel Ripper was second home with 17 per cent, while John Tatterson returned to council, narrowly beating Kevin Christensen by less than one per cent. Jamie Hogan and Christos Iliopoulos were the other unsuccessful candidates.

The VEC received seven written complaints relating to Wellington's election. However, the report did not provide details other than the brief nature of the complaint. A few regarded the amount and frequency of advertising, the location of signage, and overseas and interstate voting.

Land 'unreserved'

COUNCIL will begin removing a public acquisition overlay (PAO) from land in Rosedale and Heyfield after determining the road accesses originally planned were no longer needed.

A PAO allows land to be 'reserved' for public purposes. The overlays discussed were intended for rear access to commercial properties along Prince St, Rosedale, and Temple St, Heyfield, for truck loading and unloading. However, investigations found most impacted properties couldn't accommodate the required laneways, and alternative solutions, like loading bays in Rosedale, have rendered the overlay redundant.

Council's built environment division has endorsed the removal, which will proceed through a formal amendment in the Wellington Planning Scheme.

Acknowledgements

DEPUTY mayor Cindy Madeley said she attended "deeply moving" Anzac Day services in Sale and Seaspray.

She said the services across Wellington showed how important the date is and said they were "well attended".

Cr Madeley thanked RSLs, volunteers and community groups for organising the commemorations.

"Their efforts ensure the ANZAC Spirit continues to live on in every part of our shire."

Central Ward Councillor Liz Foat acknowledged a tour at the Longford Gas Plant, which gave councillors a perspective on the role of the site in the broader energy landscape.

"In particular, I know I really appreciated the discussion about the planned decommissioning to begin in 2027…. It gave us a great appreciation for the complexity and importance of this transition," she said.

Cr Foat also attended a citizenship ceremony held at The Wedge.

"We proudly welcomed 36 new Australian citizens from 12 different countries at our ceremony," she said.

Cr Foat said the ceremony was "moving" and a reminder of the "strength and richness diversity brings to our community".

Cr Foat wished the new citizens all the best.

Cr Stephens attended the Yarram Tarra Festival and congratulated the coordinating committee on its success, particularly thanking Sarah Janssen (president), Holly Jonston (secretary) and Ian Jaggard-Hawkins (treasurer) for their leadership. He highlighted a Good Friday event in the Yarram Memorial Gardens and the street procession on Easter Saturday.

"I must admit that I didn't think the street procession would come back after it stopped after 2019 - it was obviously killed by covid along with a lot of other things in the community and (the committee) did an outstanding job… the community got behind them and it was a great morning," Cr Stephens said.

Cr Madeley said she took her family and is making plans to return next year - "dragging other people with us as well because it was just so good for kids and families".

Northern Ward councillor Carmel Ripper stayed in Yarram for five nights for the Tarra Festival. She said she couldn't see everything the festival offered, but her highlight was the lantern parade in Port Albert.

Cr Ripper also attended the launch of Bobbin Aspland's book *Little Bites - My Domestic Violence Roadmap to Safety and Peace*.

"I commend this book to those who may want to find out more about domestic violence in the area," she said.

Following this topic, Cr Ripper commented on the candlelight vigil took place the day after the council meeting. Cr Ripper encouraged people to "come together to remember those we've lost, support those affected and commit to ending family violence in our communities."

Dangerous concrete

VERONICA Barnes of Rosedale attended the council meeting to inform councillors of a dangerous footpath at the Sale Memorial Hall where she fell two weeks ago.

Ms Barnes said she was handing out how to vote cards during early voting for the election when the incident occurred.

"I've since found out that it's not really (council's) jurisdiction, but what I'll do is, after the meeting, I will get someone to help me send an email with the photos of the area. Once I had the fall, some witches' hats were put down, altering people of the hazard. But I believe some correspondence will be able to rectify the matter."

Cr Rossetti thanked Ms Barnes and said council would help put her in touch with the trust which runs the Memorial Hall.

Closed session

THE meeting moved into a closed session to discuss two matters.

The first related to a contract for glass and mixed recycling. The second is about expressions of interest regarding the West Sale Airport, which the council opened last year, calling for businesses to invest in the airport and use its facilities like the former TAFE campus and land with direct runway access.

The next Wellington Shire Council will be held next Tuesday, May 20, from 5pm, in the Wellington Centre, Port of Sale. Proceedings can be viewed live via council's YouTube page.

ExxonMobil

Esso An ExxonMobil Brand

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about **labour and logistics,** or any other topics related to the decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team along with **presentations from CMA Contracting (Dismantling and Recycling Contractor) and Qube (Operators of Barry Beach Marine Terminal),** will be hosting community information sessions at the following locations:

Monday 19 May 2025 - Welshpool
Welshpool Memorial Hall
49 Main St
Tuesday 20 May 2025 - Foster
Foster War Memorial Arts Centre
79 Main Street, Foster
Wednesday 21 May 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St
Monday 26 May 2025 – Yarram
The Yarram Hub
156 Grant Street
Tuesday 27 May 2025 – Lakes Entrance
The Bellevue Hotel,
201 The Esplanade
Wednesday 28 May 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan
- Decommissioning Planning Campaign 1A

Community projects benefit from fund

Member for Eastern Victoria Tom McIntosh with Gippsland Vehicle Collection operations manager Sue Lawrence. **Photo: Contributed**

THE state government says it is making some of Wellington Shire's towns better places to live, work, stay and play, by investing in new community-building projects through the Tiny Towns Fund.

Member for Eastern Victoria Tom McIntosh announced six projects in Wellington were being delivered through the second round of the fund.

The grants of between $5000 and $50,000 will help local communities across Victoria flourish, and in many cases, support local workers during project development.

The Gippsland Vehicle Collection, Maffra, will receive $50,000 through the fund – which will contribute towards the replacement of the collection's roof.

The Maffra-Sale Motorcycle Club will also receive $50,000 for toilet block refurbishments at Newry, and the Dargo Bush Nursing Centre has been gifted $20,480 for an upgrade to the Dargo Community House's facilities.

Other local investments include $16,375 to the Heyfield War Memorial Hall, for the installation of new aluminium windows, $18,400 to the Gippsland Plains Rail Trail through Heyfield, and $18,000 to the Yarram Scout Group for a child-safe rear fence.

"I grew up in a tiny regional Victorian town, and you see just how hard volunteers work to make these such incredible places - and I'm pleased to see them supported," Mr McIntosh said.

Gippsland Vehicle Collection operations manager Sue Lawrence said the committee was surprised and delighted to have been awarded $50,000.

"Our sincere thanks go to the managers of the fund for selecting our project," she said.

"The funds will assist us in our quest to raise over $1 million to replace our ageing asbestos roof.

"The Gippsland Vehicle Collection has been in operation for over 20 years and plays an important part in the lives of many people whether they be members, volunteers and/or visitors."

Regional Development Minister Jaclyn Symes said regional Victoria had so much to offer, with the government continuing to support projects that enhance the tiniest towns, strengthen community connections and encouraged more visitors to all corners of the state.

"The Tiny Towns Fund is refreshing community halls, creating new walking tracks, upgrading local sporting facilities and boosting the regional art scene, making our smallest towns are great places to live, work, stay and play," she said.

ORCHESTRA VICTORIA

An *evening* with
Jacinta Parsons *and*
Orchestra Victoria

The vivacious and thoughtful **Jacinta Parsons** (host of *Friday Revue* and *Saturday Mornings* on ABC Radio Melbourne) will guide you through the music and introduce you to the people and stories behind the music you hear.

Ultimate spreadsheet

THE Victorian State Budget was handed down yesterday (Tuesday, May 22).

Details from the budget were not known at the time the Express went to press (The Express goes to press early Tuesday mornings).

Express reporters Stefan Bradley and Liam Durkin were in Melbourne for the budget lockup, as state treasurer Jaclyn Symes delivered her first budget.

The state government did however release a number of details before the budget was officially handed down.

The government has included $152.3 million to increase the Camps Sports and Excursions Fund, and $15 million to deliver Get Active Kids vouchers for another two years.

Currently, eligible primary school students receive $154 per year, while eligible secondary students receive $256.

With an investment of $152.3 million, all payments will be increased to $400 from Term 1, 2026.

The government says this support will help around 200,000 kids from families with a Health Care or concession card every year, and has supported more than two million students since it was introduced in 2015.

Families with multiple children at the same school can pool their allocated funding to use on one child or for one specific activity – helping in situations where the costs for activities in a certain year level are higher than others.

The state government also says the budget will deliver more support for sports, activities and equipment through the $200 Get Active Kids vouchers.

The vouchers will help more than 65,000 kids who need it, and help cover the cost of memberships, registration fees, equipment and uniforms for sports and popular activities, and is available to families with a Health Care or concession card.

The program covers more than 70 sports and more than 2100 activity providers across the state, making sure every child across Victoria has the chance to take part.

"We're focused on what matters most – real help with cost-of-living for families, and real support for every child," Premier Jacinta Allan said.

"The cost of camps, sports, excursions and activities add up. We're making sure no kid misses out, because every child deserves every chance to learn and play alongside their classmates."

Books: State Treasurer Jaclyn Symes. File pic

Locally, the Opposition pointed to investment in country roads as a main budget priority.

"At the risk of re-stating the bleedingly obvious and repeating what we all know, the state of Victoria's country roads is the worst in recent history," Nationals Member for Gippsland East, Tim Bull said.Speaking in Parliament recently, Mr Bull said 'traffic hazard ahead' signs had in some cases been a constant in the one location for four years without any proper fix being applied."When you have both the roads' resealing budget and general maintenance budget slashed over recent years, there is only ever going to be one outcome and that is what we are seeing," he said."When we raise this, the Minister (Minister for Roads, Melissa Horne) blames the weather and floods, but Bureau of Meteorology data tells us our weather patterns in Gippsland have been incredibly normal over recent years with no major events."It is an attempt to deflect the cuts that are clearly stated in the government's own Budget papers and is a direct result of their inability to manage money."Unfortunately, we have arrived at a point in time where their own figures indicate a debt of $187 billion with interest payments alone of more than $1 million per hour, or $1 billion every six weeks."The result is we see cuts in funding programs (like roads) and services (like fisheries officers), but it is just a case of Labor being unable to manage money and country Victorians paying the price.

"I am aware we won't get all we need, but it is about time we started knocking a few of these projects off the list," he said.

A full wrap from the budget, including what it means for Gippsland, will feature in next week's issue.

End in sight for rail upgrade

From Page 1

AFTER the budget was delivered in May last year, Member for Gippsland South, Danny O'Brien, said Gippslanders had suffered long enough from construction-related delays and were wondering if there would ever be any benefits from this project.

"This is yet another blow for Gippsland commuters who are sick of delays and underperformance of the Gippsland V/Line service," he said.

The 2024/25 budget papers indicated an additional $31 million has been added to the $562 million cost of the Gippsland Line Upgrade. The lack of a completion date at the time was justified by the state government due to "signalling design work and co-ordination with the pipeline of projects underway across the program".

GP1681067

The Mallacoota-Genoa Road is continuing to deteriorate, with the State Government refusing to provide a timeline for construction to start with $10 million in Federal Government funding.

Road wait continues

Four years after securing funding for a $10 million upgrade of the Mallacoota-Genoa Road, local MP Darren Chester says he's 'angry and frustrated' that nothing has been done to actually fix the road.

Mr Chester secured the $10 million from the previous Coalition Government to improve the safety and resilience of the road, which was closed for six weeks after the Black Summer bushfires in 2019-20.

Four years later, no construction work has occurred on the road despite repeated requests from Mr Chester for the State Government to fast track the project and he's written to the Prime Minister, seeking an explanation.

"This is not a happy anniversary because it's been four years since the money was secured in the budget with 100 per cent of the funding coming from the previous Federal Government," Mr Chester said.

"The world can hold the Olympics every four years, you can finish a university degree in four years, but the Labor Government in Victoria can't fix the Mallacoota-Genoa Road in four years, even when it's not costing them a cent.

"Even though constructing a more resilient and safer transport route was identified as a high-priority project by the local community after the bushfires, there is no sense of urgency in Minister Melissa Horne's office or amongst the bureaucracy to get the work started.

"It's become a complete farce, and we can't get a straight answer about when work will actually start to improve road safety."

Mr Chester said he had received no updates on the project since the Minister for Roads and Road Safety Melissa Horne confirmed in January that $500,000 of the original funding had been spent on studies and consultation.

"I am advised that technical studies, including preliminary designs and environmental and cultural heritage investigations, have been completed," Ms Horne wrote at the time.

"These investigations and evaluations are essential to ensure the Department of Transport and Planning meets the planning and environment legislative requirements and understand the associated approval pathways, timeframes, and costs.

"Now that these details have been confirmed, DTP has lodged a detailed submission to the Australian Government for the release of the remaining $9.5 million funding to construct this project."

Mr Chester has now written to the Prime Minister seeking an urgent meeting to discuss the project and other road transport priorities across Gippsland.

"Surely it is time to prioritise human life over a few gum trees in Gippsland when we already have an extensive network of National Parks and reserves across our state?" Mr Chester wrote.

"It's well-known that regional motorists are disproportionately represented in road trauma statistics, and the majority of crashes occur on roads with limited safety features. Commonwealth-funded rural and regional road safety projects are life-saving endeavours that should be pursued with a sense of urgency in partnership with other levels of government.

"The entire Infrastructure Investment Program should have an increased focus on saving lives in our regions, not just saving minutes for city commuters."

Probus club has a whale of a time

Orbost Probus Club's monthly guest speaker for May was Mike Irvine from the Parks Victoria Orbost branch.

Mike's exciting talk was about the whale disentanglement offshore between Lakes Entrance and Marlo on June 28 and 29 2024.

An offshore helicopter pilot reported the entangled whale off loch sport on Monday, June 24, the whale was caught up in ropes wrapped around its belly, towing approximately 100 metres of rope and a mass of red fishing buoys.

A team of six-eight people comprising of Parks Victoria, water police and fisheries compiled a plan of rescue to release the ropes and buoys the whale was towing, a tracker was attached to follow the whale's movements.

The whale was distressed after towing a tonne of weight and being entangled.

By Friday, June 28 it was offshore between Lakes Entrance and Marlo.

It was decided to attempt the rescue by cutting the ropes halfway between the whales tail and the buoys it was towing.

To add to the drama a five metre shark was spotted under the whale, suspected to be a white pointer.

It took two days, the Friday and Saturday, to cut through the four ropes, believed to come off a commercial fishing boat from Antarctica.

Mike's talk together with a slide presentation was compelling and had members captivated.

He has agreed to visit again with the stunning photos of Beware Reef.

Members thanked Mike and all the team involved in this mighty rescue.

Orbost Probus Club's Ros Berns thanked guest speaker, Mike Irvine, for his presentation at the club's recent meeting. Mr Irvine spoke about the whale disentanglement offshore between Lakes Entrance and Marlo last year. (PS)

May has been a very interesting month for the Probus group with a day trip to Sale which included a historical boat trip on the *Rubeena* up the Port of Sale to the swinging bridge which is still operational. Members then had lunch at the library café and a guided tour of the Sale Art Gallery.

The guest speaker for the month of June will be Andrew French from Corringle Samphire Producer.

All are welcome to attend at the senior citizens rooms on June 19 at 10am.

ExxonMobil

Community Consultation - decommissioning of oil & gas infrastructure in Bass Strait

An ExxonMobil Brand

Esso Australia Resources Pty Ltd (Esso), a wholly owned subsidiary of ExxonMobil Australia Pty Ltd, is committed to operating and decommissioning its Gippsland and Bass Strait facilities safely and effectively. After delivering energy to Australia for over 50 years, many of the Bass Strait oil and gas fields are now reaching the end of their productive life. As planning for decommissioning progresses, Esso is focused on safely shutting-down non-producing facilities and ensuring they stay safe throughout the entire decommissioning process.

Community Information Sessions

If you'd like to know more about **labour and logistics,** or any other topics related to the decommissioning of platforms and pipelines in Bass Strait, the Esso Consultation Team along with **presentations from CMA Contracting (Dismantling and Recycling Contractor) and Qube (Operators of Barry Beach Marine Terminal),** will be hosting community information sessions at the following locations:

Monday 19 May 2025 - Welshpool
Welshpool Memorial Hall
49 Main St

Tuesday 20 May 2025 - Foster
Foster War Memorial Arts Centre
79 Main Street, Foster

Wednesday 21 May 2025 - Leongatha
Leongatha Memorial Hall
6-8 McCartin St

Monday 26 May 2025 – Yarram
The Yarram Hub
156 Grant Street

Tuesday 27 May 2025 – Lakes Entrance
The Bellevue Hotel,
201 The Esplanade

Wednesday 28 May 2025 - Sale
The Criterion Hotel
90 Macalister Street, Sale

All the above sessions will run from **5.00pm - 7.00pm** with a **presentation** about Esso's operations with a focus on decommissioning projects.

We encourage you to come along and ask questions or to raise any concerns you may have. Please **register your attendance** by emailing: consultation@exxonmobil.com

If these dates and times don't suit, contact us at consultation@exxonmobil.com or by phone on 03 9261 0000.

The Esso Team will also be available to discuss all current activities, including:

- Bass Strait State Waters Environment Plan
- Bass Strait Environment Plan
- Jack-Up-Rig Plug & Abandonment Revision 1 Environment Plan
- Turrum Phase 3 Drilling Environment Plan
- Decommissioning Planning Campaign 1A

Like to be consulted about these activities?

Esso is working to identify and consult with relevant persons [stakeholders] whose functions, interests, or activities may be affected by one or more of Esso's proposed activities.

Complete the Esso Consultation Questionnaire (sli.do) in the Esso Consultation Hub to let us know if you'd like to be consulted or have any questions or feedback.

Refer to the NOPSEMA brochure Consultation on offshore petroleum environment plans brochure.pdf (nopsema.gov.au) to understand more about consultation on offshore petroleum environment plans assessed under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023.

Your feedback and our response will be included in the relevant regulatory application documentation and submitted to the regulator.

Please connect us with other interested people

If there is anyone you know who may be interested in our activities, we encourage you to share this information with them.

Metung Lions Club members busy at work transforming the entry to the club's shed. (PS)

John Butler-Cole, Richard English, Malcolm Reed, Andrew Bell and Tony Foot were part of the working crew at Metung Lions Club shed. (PS)

Lions get busy

Metung Lions Club has been busy with a new project over the past week at its home base.

The club's shed surroundings have undergone a transformation as the entry to and exit from the site had become rough and dangerous for small vehicles. Over time storm water from a nearby road washed a deep gutter inside the concrete kerbing along Metung Road.

With the donated assistance of screenings and machinery from local operators, plus manual labour from the Lions members, the site has been transformed into an all-weather location.

The area is used mainly by the community to drop off 10 cent bottles and cans raising money for the Metung CFA and Lions projects.

In addition, a small retaining wall constructed along the front of the shed will be planted with small shrubs to beautify the site.

Metung Lions Club secretary Malcolm Reed thanked all those involved in the project.

Local companies pitched in with donated materials and machinery. (PS)

Weekly Book Review

Great Big Beautiful Life

by Emily Henry

When Margaret Ives, the famously reclusive heiress, invites eternal optimist Alice Scott to the balmy Little Crescent Island, Alice knows this is it- her big break. And even more rare- a chance to impress her family with a Serious Publication. The catch? Pulitzer-prize winning human thundercloud, Hayden Anderson, is sure of the same thing. The proposal? A one-month trial period to unearth the truth behind one of the most scandalous families of the 20th Century, after which she'll choose who'll tell her story. The problem? Margaret is only giving each of them tantalising pieces. Pieces they can't put together because of an ironclad NDA and an inconvenient yearning pulsing between them every time they're in the same room. And it's becoming abundantly clear that their story - just like the tale Margaret's spinning - could be a mystery, tragedy, or love ballad ... depending on who's telling it.

EXECUTIVE SUMMARY 1
Background 1
Methodology 1
Marine Gas Oil Properties 2
Results 2
Scenario 1: A 1,165 m³ surface release of MGO over 12 hours at Dolphin 2
Scenario 2: A 1,165 m³ surface release of MGO over 12 hours at Whiting 2
Scenario 3: A 1,165 m³ surface release of MGO over 12 hours at Fortescue 3
Scenario 4: A 1,165 m³ surface release of MGO over 12 hours at Kingfish A 3
Scenario 5: A 1,165 m³ surface release of MGO over 12 hours at Flounder 4

1 INTRODUCTION 5
1.1 Background 5
1.2 What is Oil Spill Modelling? 7
1.2.1 Stochastic Modelling (Multiple Spill Simulations) 7
1.2.2 Deterministic Modelling (Single Spill Simulation) 8

2 SCOPE OF WORK 9

3 REGIONAL CURRENTS 9
3.1 Tidal currents 11
3.1.1 Grid Setup 11
3.1.2 Tidal Conditions 13
3.1.3 Surface Elevation Validation 13
3.2 Ocean Currents 17
3.3 Surface Currents 17
3.3.1 Dolphin 17
3.3.2 Whiting 20
3.3.3 Fortescue 23
3.3.4 Kingfish A 26
3.3.5 Flounder 29

4 WIND DATA 32
4.1 Offshore Locations 33
4.2 Nearshore Location 36

5 WATER TEMPERATURE AND SALINITY 39

6 OIL SPILL MODEL – SIMAP 42
6.1 Stochastic Modelling 42
6.2 Floating, Shoreline and In-Water Thresholds 42
6.2.1 Floating Oil Exposure Thresholds 43
6.2.2 Shoreline Accumulation Thresholds 44
6.2.3 In-water Exposure Thresholds 45

7 HYDROCARBON PROPERTIES 47
7.1 Physical Properties 47
7.2 Weathering Properties 48

8 MODEL SETTINGS 50

9 PRESENTATION AND INTERPRETATION OF MODEL RESULTS 51
9.1 Annual Analysis 51
9.2 Deterministic Trajectories 51
9.3 Receptors Assessed 52

10 RESULTS – SCENARIO 1 – A 1,165 M³ SURFACE RELEASE OF MGO AT DOLPHIN 66

10.1 Stochastic Analysis 66
10.1.1 Floating Oil Exposure 66
10.1.2 Shoreline Accumulation 74
10.1.3 In-water exposure 77

11 RESULTS – SCENARIO 2 – A 1,165 M³ SURFACE RELEASE OF MGO AT WHITING 111
11.1 Stochastic Analysis 111
11.1.1 Floating Oil Exposure 111
11.1.2 Shoreline Accumulation 118
11.1.3 In-water exposure 121

12 RESULTS – SCENARIO 3 – A 1,165 M³ SURFACE RELEASE OF MGO AT FORTESCUE 150
12.1 Stochastic Analysis 150
12.1.1 Floating Oil Exposure 150
12.1.2 Shoreline Accumulation 157
12.1.3 In-water exposure 160

13 RESULTS – SCENARIO 4 – A 1,165 M³ SURFACE RELEASE OF MGO AT KINGFISH A 190
13.1 Stochastic Analysis 190
13.1.1 Floating Oil Exposure 190
13.1.2 Shoreline Accumulation 197
13.1.3 In-water exposure 200

14 RESULTS – SCENARIO 5 – A 1,165 M³ SURFACE RELEASE OF MGO AT FLOUNDER 231
14.1 Stochastic Analysis 231
14.1.1 Floating Oil Exposure 231
14.1.2 Shoreline Accumulation 238
14.1.3 In-water exposure 241

Table 16.3 Probability of entrained hydrocarbons exposure above 1,000 ppb to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Forstescue. The results reflect annual conditions. 284
Table 16.4 Probability of entrained hydrocarbons exposure above 1,000 ppb to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions. 287
Table 16.5 Probability of entrained hydrocarbons exposure above 1,000 ppb to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions. 290

Figures

Figure 1.1 Map of the release locations. 6
Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability. 7
Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration. 8

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
BIA	Biologically Important Area
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
CFSR	Climate Forecast System Reanalysis
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated marine and coastal regionalisation areas
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
LGA	Local Government Areas
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park

MP	Marine Park
NASA	National Aeronautics and Space Administration (USA)
NCEP	National Centres for Environmental Prediction (USA)
NOAA	National Oceanic and Atmospheric Administration (USA)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NR	Nature Reserve
PAH	Polynuclear Aromatic Hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
ppb	Parts per billion (concentration)
psu	Practical salinity units
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, Shoals and Banks
Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
SRTM	Shuttle Radar Topography Mission
State Waters	Low water mark seaward for three nautical miles
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area of hydrocarbon exposure and indicates which locations are more likely to be exposed (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be exposed in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment
Sub-LGA	Sub-Local Government Areas
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
US EPA	United States Environmental Protection Agency
World Ocean Atlas	A collection of physicochemical parameters (e.g. temperature, salinity, oxygen, phosphate, silicate, and nitrate) based on profile data from the World Ocean Database (NCEI, 2021) established by NOAA's National Centers for Environmental Information (NCEI)
WGS 1984	World Geodetic System 1984 (WGS84); reference coordinate system

EXECUTIVE SUMMARY

Background

Esso Australia Pty Ltd (Esso) is planning and preparing to decommission some of the non-producing platforms located in the Gippsland Basin, as part of the first Bass Strait decommissioning campaign (Campaign 1).

To support offshore environmental impact and risk assessments, Esso engaged RPS to perform a comprehensive oil spill modelling study. This study evaluated a hypothetical vessel collision scenario at 5 different locations as follows:

- **Scenario 1**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Dolphin (DPA).
- **Scenario 2**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Whiting (WTA).
- **Scenario 3**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Fortescue (FTA).
- **Scenario 4**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Kingfish A (KFA).
- **Scenario 5**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Flounder (FLA).

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a 10-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations, with each simulation having the same spill information (location, spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.

The SIMAP system, the methods and analysis presented herein use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-22 "*Standard Practice for Development and Use of Oil-Spill Trajectory Models*".

Marine Gas Oil Properties

MGO has an API of 37.6, density of 829.1 kg/m^3 (at 25ºC), with low viscosity (4 cP at 25ºC) classifying it as a Group II (light-persistent) oil according to ITOPF (2020) and US EPA/USCG classifications. The oil comprises a significant portion of volatiles and semi- to low volatiles (~95% total) with 5% residual components. This means most of the hydrocarbons will evaporate when on the water surface, with the persistent components to remain on the water surface over a longer period.

Results

Scenario 1: A 1,165 m³ surface release of MGO over 12 hours at Dolphin

- The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 200.0 km (east-northeast), 31.4 km (northeast) and 20.2 km (southwest), respectively. With the exception of the receptors the release location is within, the Upwelling East of Eden (KEF) recorded the highest probability of exposure at 8% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach Victoria State Waters the quickest at 1.42 days (34.08 hours) following the spill commencement.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 76% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 1.83 days. The maximum total volume ashore for a single spill trajectory was 83.3 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 99 km, 13 km and 3 km, respectively. The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for East Gippsland (LGA) (58%).
- Excluding the receptors that the release location is within, the probability of dissolved hydrocarbon exposure at concentrations equal to, or greater than, 10 ppb (low threshold) is greatest at Upwelling East of Eden (KEF) (7%). The maximum dissolved hydrocarbon concentration at any given receptor(s), including the receptors the release location lies within was shown to be 162.6 ppb, followed by the Upwelling East of Eden (KEF) at 75.1 ppb.
- Except for the receptors the release location is within, the highest probability of low (10 ppb) entrained hydrocarbon exposure was 72% recorded for the Upwelling East of Eden (KEF). The quickest time for exposure at the same threshold was 0.88 days (21.12 hours) for the same receptor. The highest entrained hydrocarbon concentration was predicted to be 10,680.6 ppb, including the receptors the release location lies within, followed by 776.7 ppb at Upwelling East of Eden (KEF).

Scenario 2: A 1,165 m³ surface release of MGO over 12 hours at Whiting

- The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 240.0 km (east-northeast), 31.5 km (northeast) and 19.1 km (northeast), respectively. With the exception of the receptors the release location is within, the Upwelling East of Eden (KEF) recorded the highest probability of exposure at 36% to concentrations exceeding 1 g/m^2.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 56% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 3.21 days. The maximum total volume ashore for a single spill trajectory was 54.8 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds were 54 km, and 11 km, respectively. No shoreline contact was predicted above the high threshold.
- The shoreline segment of East Gippsland (LGA) revealed the highest probability of accumulation above the low (41%) and moderate (20%) thresholds.
- Excluding the receptors that the release location is within, the probability of dissolved hydrocarbon exposure at concentrations equal to, or greater than, 10 ppb (low threshold) is greatest at the Upwelling East of Eden (KEF) (17%). The maximum dissolved hydrocarbon concentration at any

given receptor(s) was shown to be 151.5 ppb, including the receptors the release location lies within, followed by the Upwelling East of Eden (KEF) at 145.8 ppb.

- Except for the receptors the release location is within, the highest probability of low (10 ppb) entrained hydrocarbon exposure was 78% recorded for the Upwelling East of Eden (KEF). The quickest time for exposure at the same threshold was 0.17 days (4.08 hours) at White Shark - Breeding (BIA). The highest entrained hydrocarbon concentration was predicted to be 14,461.7 ppb, including the receptors the release location lies within, followed by 3,167.8 ppb at the White Shark – Breeding (BIA).

Scenario 3: A 1,165 m³ surface release of MGO over 12 hours at Fortescue

- The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 107.6 km (east-northeast), 46.0 km (southwest) and approximately 16.4 km (south), respectively. With the exception of the receptors the release location is within, the Upwelling East of Eden (KEF) recorded the highest probability of exposure at 21% to concentrations exceeding 1 g/m^2.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 23% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 5.33 days. The maximum total volume ashore for a single spill trajectory was 13.2 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds was 31 km and 2 km, respectively. No shoreline contact was recorded for the high threshold. The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Bega Valley (Sub-LGA) (13%).
- Excluding the receptors that the release location is within, the probability of dissolved hydrocarbon exposure at concentrations equal to, or greater than, 10 ppb (low threshold) is greatest at Upwelling East of Eden (KEF) (19%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 182.3 ppb, including the receptors the release location lies within, followed by the Upwelling East of Eden (KEF) at 115.5 ppb.
- Except for the receptors the release location is within, the highest probability of low (10 ppb) entrained hydrocarbon exposure was 71% recorded for the Upwelling East of Eden (KEF). The quickest time for exposure at the same threshold was 0.13 days (3.12 hours) for the same receptor. The highest entrained hydrocarbon concentration was predicted to be 16,850.7 ppb, including the receptors the release location lies within, followed by 3,516 ppb at Upwelling East of Eden (KEF).

Scenario 4: A 1,165 m³ surface release of MGO over 12 hours at Kingfish A

- The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 70.9 km (northeast), 48.9 km (southwest) and 16.6 km (southwest), respectively. With the exception of the receptors the release location is within, the White-faced Storm-petrel - Foraging (BIA) recorded the highest probability of exposure at 6% to concentrations exceeding 1 g/m^2.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 18% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 6.04 days. The maximum total volume ashore for a single spill trajectory was 21 m^3, and the maximum length of shoreline with accumulation above the low and moderate and high thresholds were 45 km and 5, respectively. No shoreline contact was predicted at the high threshold. The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Montague Island (LGA) (7%).
- Excluding the receptors that the release location is within, the probability of dissolved hydrocarbon exposure at concentrations equal to, or greater than, 10 ppb (low threshold) is greatest at Upwelling East of Eden (KEF) (8%). The maximum dissolved hydrocarbon concentration at any given

receptor(s) was shown to be 145 ppb, including the receptors the release location lies within, followed by the White-faced Storm-petrel – Foraging (BIA) at 83.8 ppb.

- Except for the receptors the release location is within, the highest probability of low (10 ppb) entrained hydrocarbon exposure was 56% recorded for the White-faced Storm-petrel – Foraging (BIA). The quickest time for exposure at the same threshold was 0.29 days (6.96 hours) for the White-faced Storm-petrel – Foraging (BIA). The highest entrained hydrocarbon concentration was predicted to be 11,353 ppb, including the receptors the release location lies within, followed by 1,427 ppb at White-faced Storm-petrel – Foraging (BIA).

Scenario 5: A 1,165 m³ surface release of MGO over 12 hours at Flounder

- The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 179.5 km (east-northeast), 39.2 km (south-southwest) and 18.5 km (south-southwest), respectively. With the exception of the receptors the release location is within, Antipodean Albatross – Foraging (BIA) recorded the highest probability of exposure at 18% to concentrations exceeding 1 g/m^2.
- The probability of accumulation to any shoreline at, or above, the low (10 g/m2) threshold was 17% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 5.08 days. The maximum total volume ashore for a single spill trajectory was 25.9 m3, and the maximum length of shoreline with accumulation above the low and moderate thresholds were 41 km and 9 km, respectively. No shoreline contact was predicted at the high threshold. The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Bega Valley (LGA and sub-LGA) (8%).
- Excluding the receptors that the release location is within, the probability of dissolved hydrocarbon exposure at concentrations equal to, or greater than, 10 ppb (low threshold) is greatest at the Antipodean Albatross - Foraging (BIA) (13%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 197.3 ppb, including the receptors the release location lies within, followed by the Antipodean Albatross - Foraging (BIA) at 129.8 ppb.
- Except for the receptors the release location is within, the highest probability of low (10 ppb) entrained hydrocarbon exposure was 59% recorded for the Antipodean Albatross – Foraging (BIA). The quickest time for exposure at the same threshold was 0.17 days (4.08 hours) for the Antipodean Albatross – Foraging (BIA). The highest entrained hydrocarbon concentration was predicted to be 18,716.1 ppb, including the receptors the release location lies within, followed by 2,987.4 ppb at Antipodean Albatross – Foraging (BIA).

1 INTRODUCTION

1.1 Background

Esso Australia Pty Ltd (Esso) is planning and preparing to decommission some of the non-producing platforms located in the Gippsland Basin, as part of the first Bass Strait decommissioning campaign (Campaign 1).

To support offshore environmental impact and risk assessments, Esso engaged RPS to perform a comprehensive oil spill modelling study. This study evaluated a hypothetical vessel collision scenario at 5 different locations as follows:

- **Scenario 1**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Dolphin (DPA).
- **Scenario 2**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Whiting (WTA).
- **Scenario 3**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Fortescue (FTA).
- **Scenario 4**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Kingfish A (KFA).
- **Scenario 5**: A 1,165 m^3 surface release of MGO over 12 hours following a vessel collision at Flounder (FLA).

The coordinates for the release locations used for the above mentioned scenarios are presented in Table 1.1 and are illustrated in Figure 1.1.

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions as well as the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein use modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-22 "*Standard Practice for Development and Use of Oil-Spill Trajectory Models*".

Table 1.1 Coordinates and water depth of the release locations.

Location	Latitude	Longitude	Water Depth (m)
Dolphin (DPA)	38° 29' 14.3" S	147° 22' 39" E	38
Whiting (WTA)	38° 14' 24" S	147° 52' 25" E	46
Fortescue (FTA)	38° 24' 26" S	148° 16' 41" E	69
Kingfish A (KFA)	38° 35' 47" S	148° 08' 41" E	77
Flounder (FLA)	38° 18' 40" S	148° 26' 22" E	93

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic (Section 1.2.1) and deterministic (Section 1.2.2) modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic oil spill modelling is created by overlaying a great number (often hundreds) of individual, computer-simulated hypothetical spills (NOPSEMA, 2018; Figure 1.2).

Stochastic modelling is a common means of assessing the potential risks from oil spills related to new projects and facilities. Stochastic modelling typically utilises hydrodynamic data for the location in combination with historic wind data. Typically, 100 iterations of the model will be run utilising the data that is most relevant to the season or timing of the project.

The outcomes are often presented as a probability of exposure and is primarily used for risk assessment purposes in view to understand the range of environments that may be affected or impacted by a spill. Elements of the stochastic modelling can also be used in oil spill preparedness and planning.

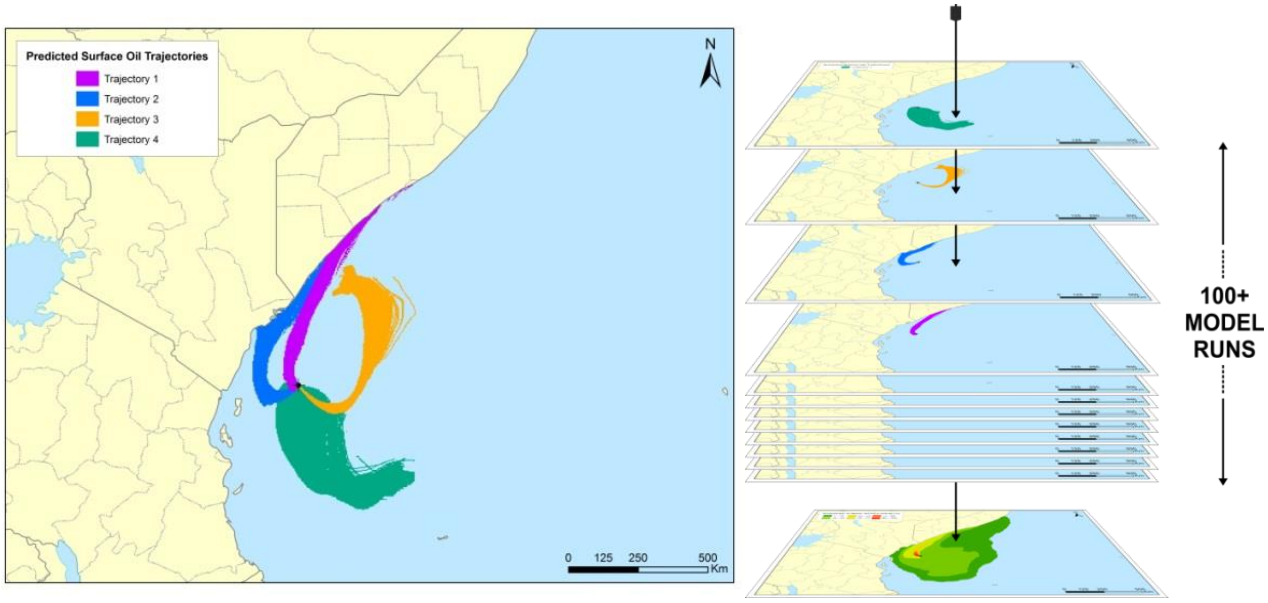

Figure 1.2 Examples of four individual spill trajectories (four replicate simulations) predicted by SIMAP for a spill scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response. Deterministic spills can be selected on several basis such as minimum time to shoreline, largest swept area, maximum volume ashore, longest length of shoreline contacted by oil or largest area of entrained or dissolved hydrocarbons.

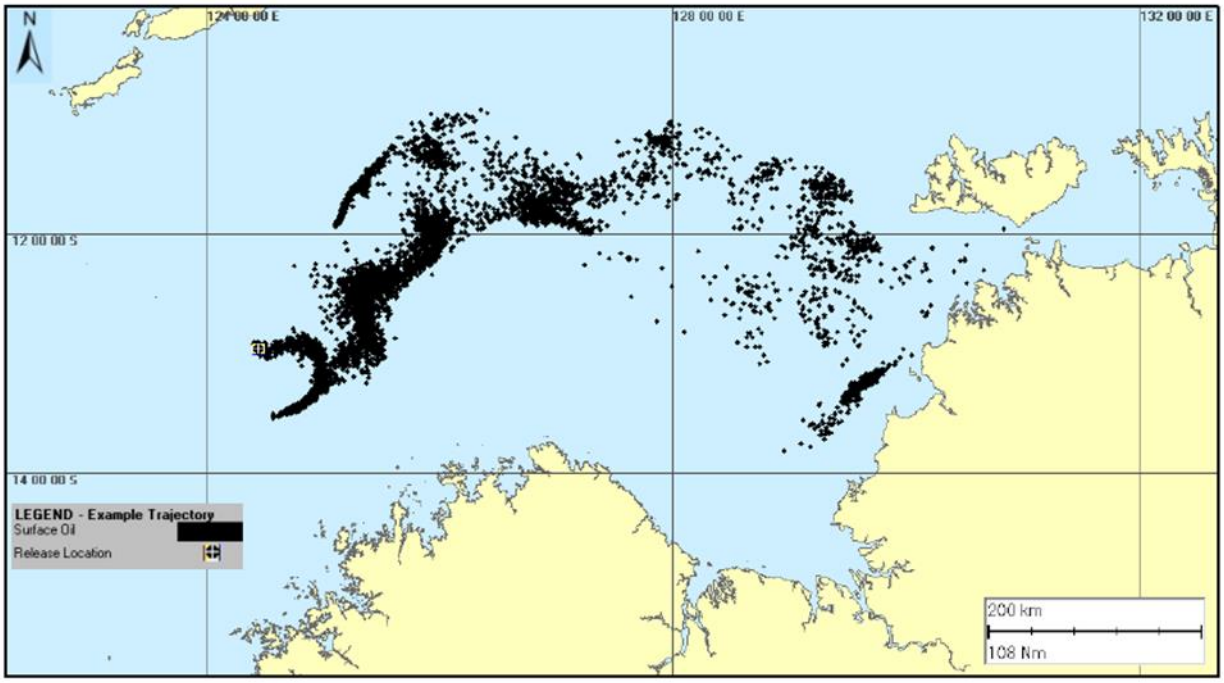

Figure 1.3 Example of an individual spill trajectory predicted by SIMAP for a spill scenario. Note, this image represents surface oil as spillets and do not take any thresholds into consideration.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents;
- Include the wind and current data and characteristics of the oil type as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time;
- Use SIMAP's stochastic model (also known as a probability model) to calculate exposure to surrounding waters and shorelines. This involved running 100 randomly selected single trajectory simulations per scenario, with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions;
- Results were assessed to determine the exposure to surrounding waters and contact to shorelines based upon the thresholds outlined in the NOPSEMA Oil Spill Modelling Bulletin (NOPSEMA, 2019)[1]; and
- The stochastic modelling results were reviewed, and the "worst case" deterministic runs were identified and presented based on the following criteria (if applicable):
    a. Largest swept area for surface oil above 10 g/m^2;
    b. Largest volume of oil ashore;
    c. Longest length of shoreline with oil accumulation above 100 g/m^2;
    d. Largest area of entrained hydrocarbon exposure above 100 ppb; and
    e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3.1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling westward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

[1] Results for entrained hydrocarbon exposure at, or above, 1,000 ppb, in alignment with French-McCay (2023), are provided in Appendix A.

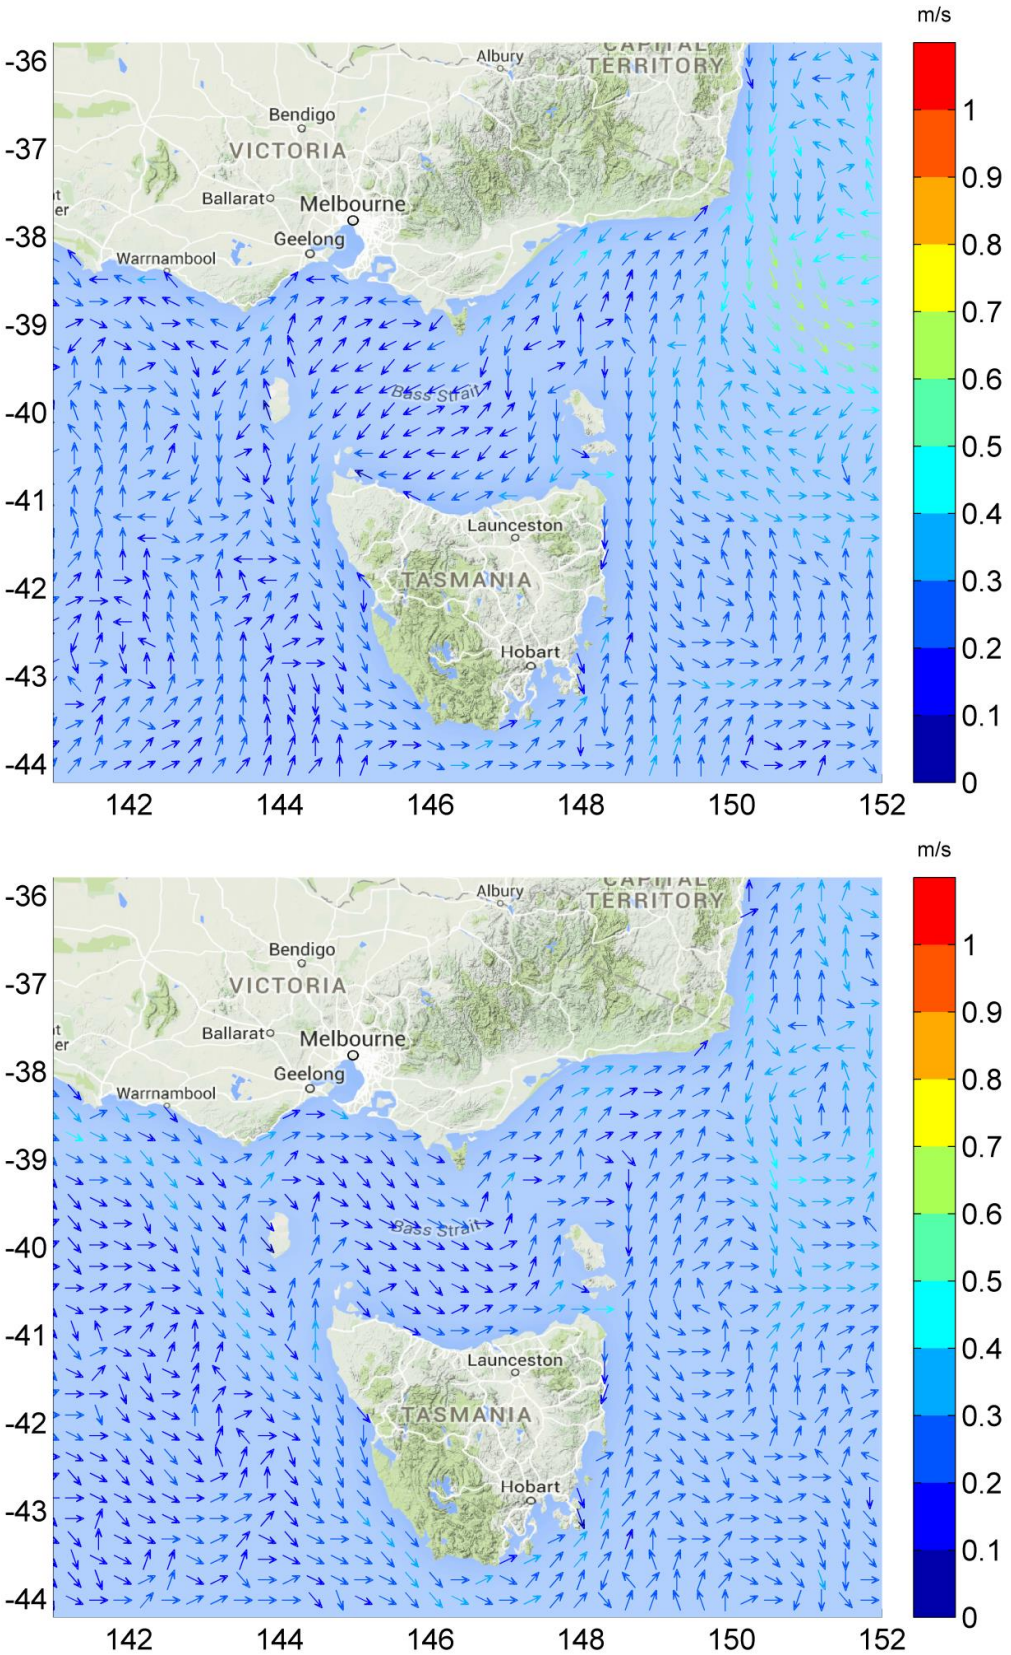

Figure 3.1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal currents

The effects of tides were generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for over 35 years (Isaji and Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003; Makarynskyy et al., 2010), whilst being used for a wide variety of disciplines within marine environments (e.g. Zigic et al., 2003, 2009; Talouli et al., 2009; Zigic et al., 2009; King et al., 2010; Makarynskyy et al., 2010, 2015). In fact, HYDROMAP tidal current data have been used as input for the OILMAP hydrocarbon spill modelling system, which forms part of the Incident Management System (IMS) operated by Maritime New Zealand (MNZ), Australian Maritime Safety Authority (AMSA) and the United Kingdom Maritime and Coastguard Agency, as well as several major oil and gas companies.

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

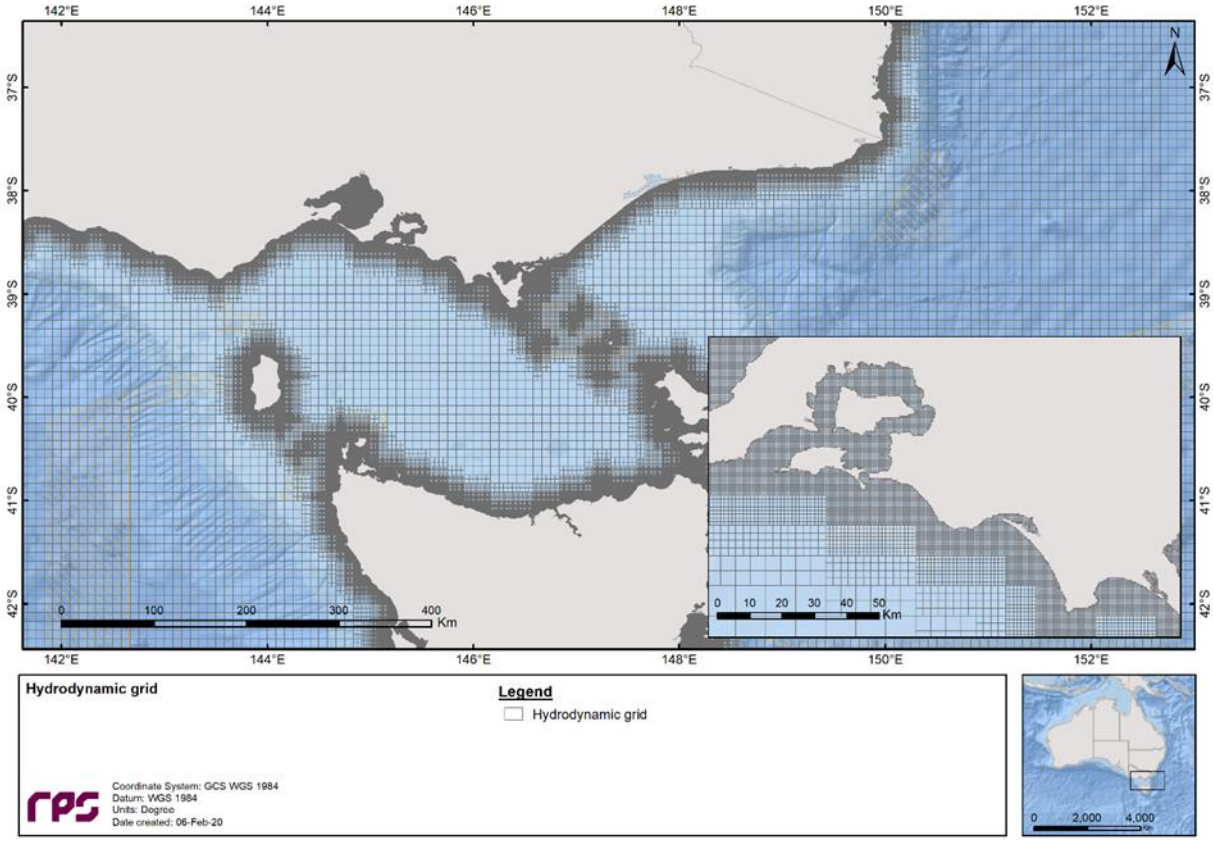

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

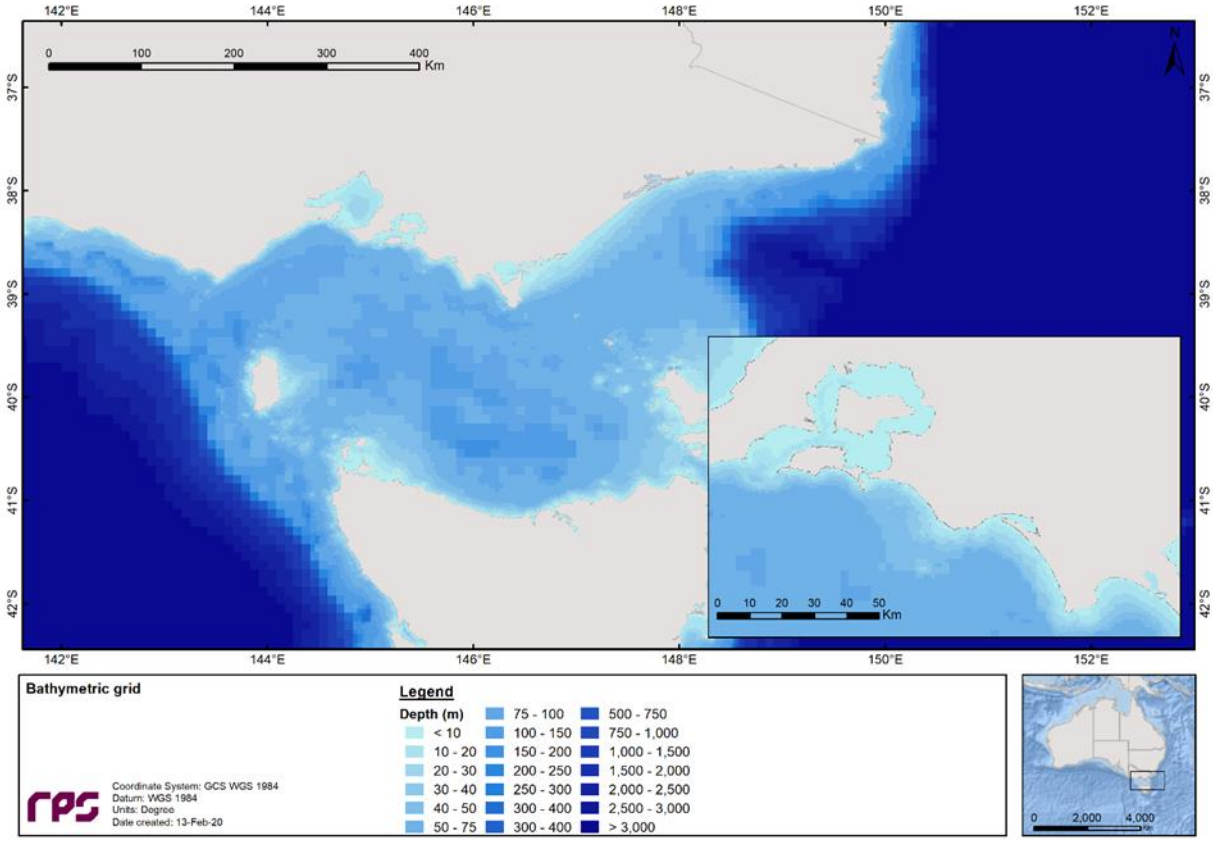

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The TOPEX/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total, these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data have been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010; Amores et al., 2019; Sagnieres et al., 2020; Veng et al., 2021; Zeitlhöfler et al., 2023). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott & Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2), in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6 illustrate a comparison of the predicted and observed surface elevations in February 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

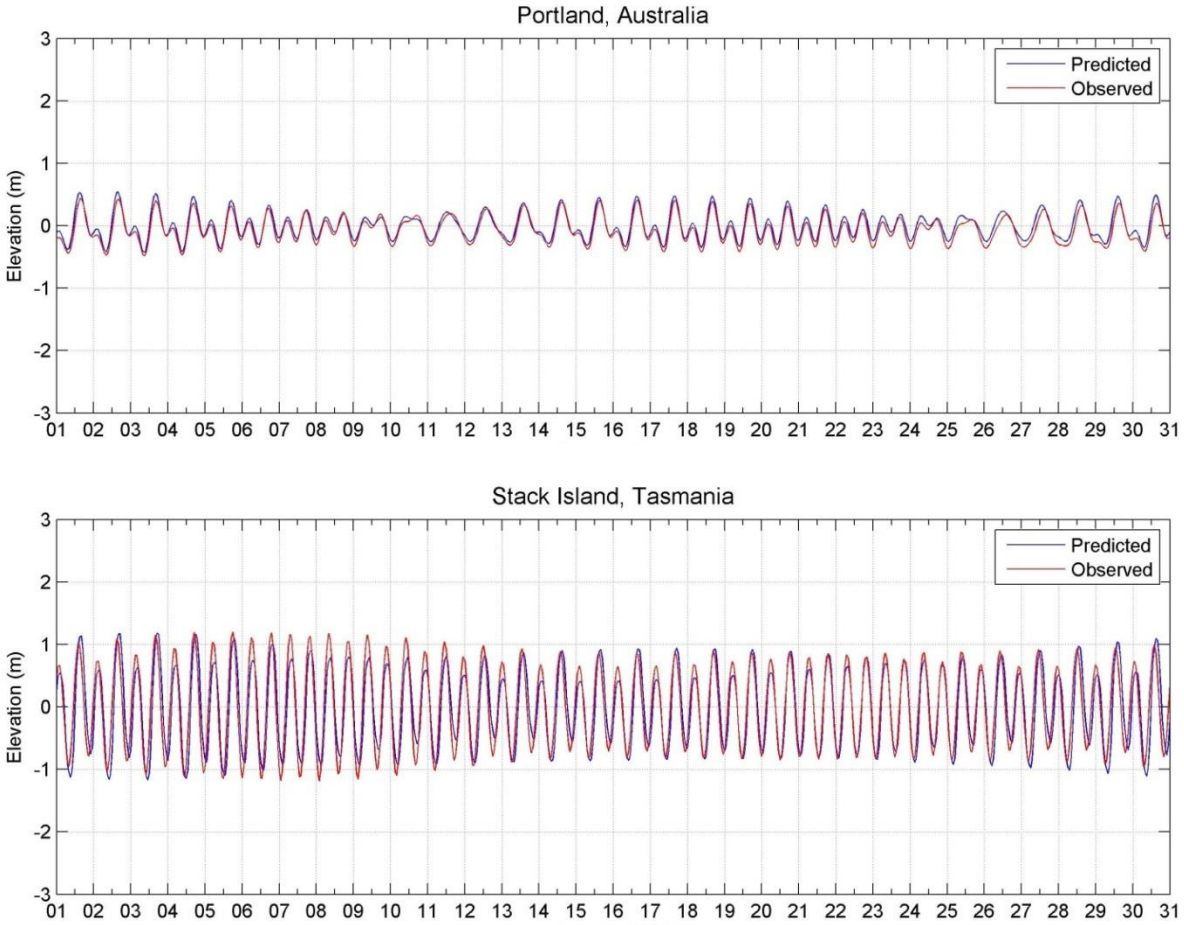

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) were obtained from HYCOM (Hybrid Coordinate Ocean Model, Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

The sections below present the monthly and total surface current data extracted from the closest node to each release location (or Scenario) used in this study.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing towards that direction, with north to the top of the diagram. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

3.3.1 Dolphin

Table 3.2 presents the average and maximum surface current speeds nearby the Dolphin release location by combining the ocean and tidal currents.

The predicted current speed and direction at the Dolphin release location is strongly dominated by the tides. The average surface current speed was shown to be consistent throughout the year at approximately 0.42 m/s, while the monthly maximum current speeds varied between 1.57 m/s (October) and 1.97 m/s (July). The dominant surface current direction followed that of the flooding and ebbing tides, northeast and southwest, respectively.

Figure 3.7 and Figure 3.8 show the monthly and total surface current rose distributions for the selected location.

Table 3.2 Predicted monthly average and maximum surface current speeds nearby Dolphin. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.42	1.69	Tidally dominated from a predominant southwest and northeast direction
February	0.41	1.50	
March	0.41	1.67	
April	**0.40**	1.63	
May	0.42	1.85	
June	0.41	1.75	
July	0.43	**1.97**	
August	0.42	1.79	
September	**0.44**	1.81	
October	0.42	**1.57**	
November	0.43	1.74	
December	0.42	1.82	
Minimum	**0.40**	**1.57**	
Maximum	**0.44**	**1.97**

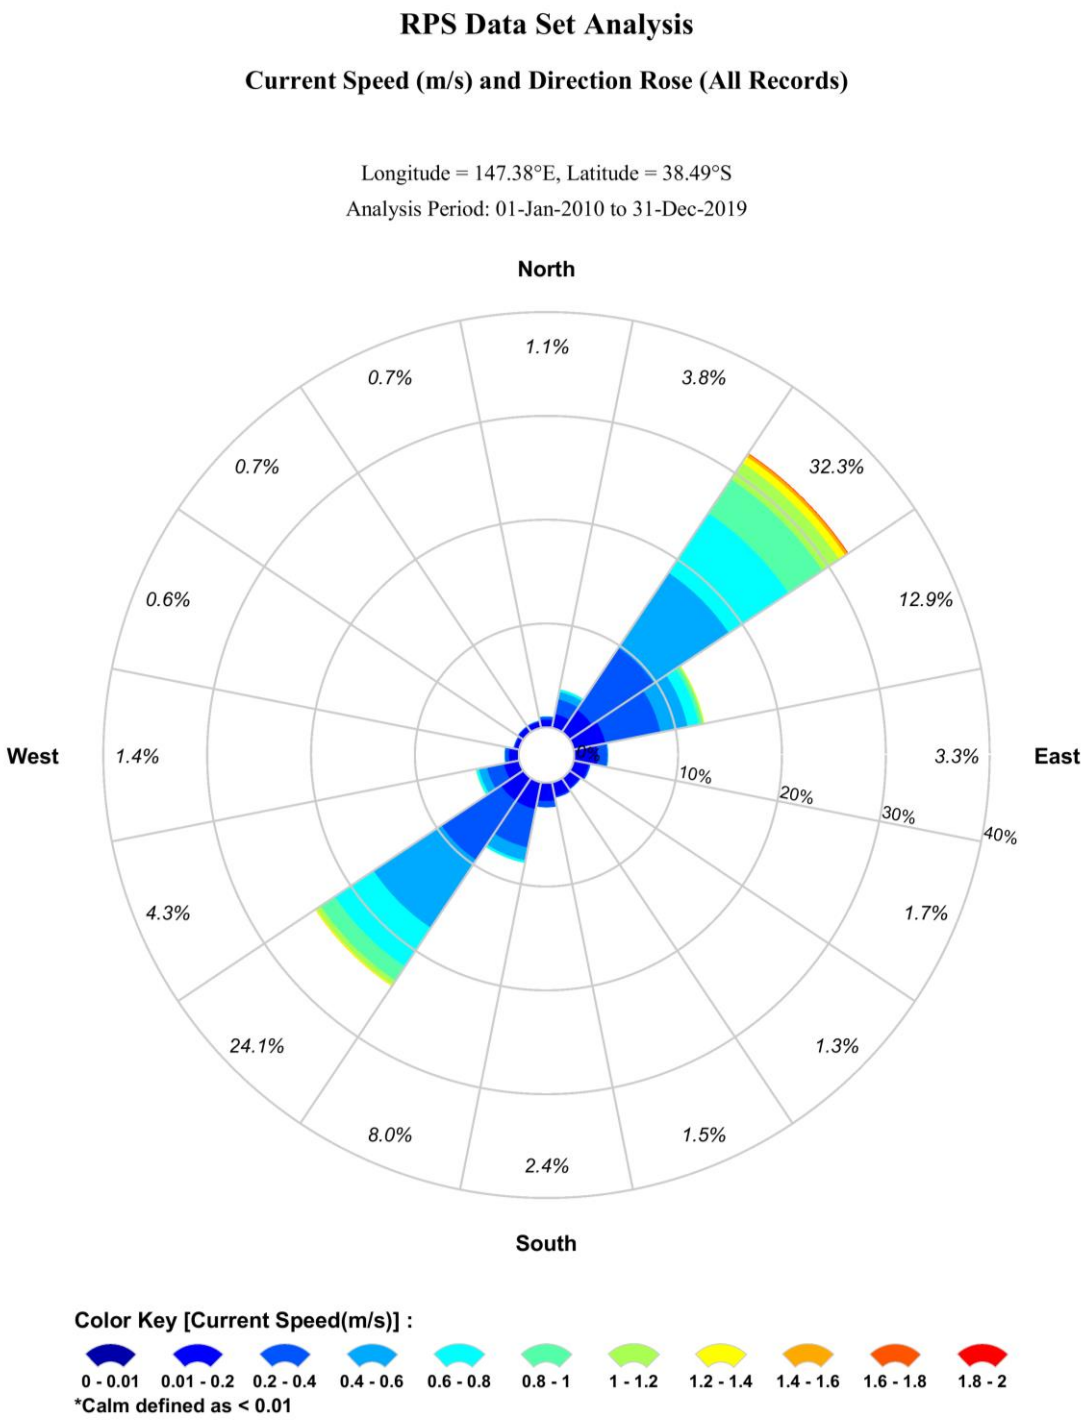

Figure 3.8 Total surface current rose plot nearby Dolphin platform derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

3.3.2 Whiting

Table 3.3 presents the average and maximum surface current speeds nearby the Whiting release location by combining the ocean and tidal currents.

Predicted surface current speeds near the Whiting release location varied throughout the year with monthly maximum speeds ranging between approximately 1.16 m/s (February) and 1.77 m/s (July). The dominant surface current direction was mostly aligned with the southwest-northeast axis during the whole year, with a dominant northeast direction in winter.

Figure 3.9 and Figure 3.10 show the monthly and total surface current rose distributions for the selected location.

Table 3.3 Predicted monthly average and maximum surface current speeds nearby Whiting. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.31	1.32	Southwest and northeast
February	0.31	**1.16**	Southwest and northeast
March	0.31	1.37	Southwest and northeast
April	**0.28**	1.18	Northeast
May	0.33	1.64	Northeast

3.3.3 Fortescue

Table 3.4 presents the average and maximum surface current speeds nearby the Fortescue release location by combining the ocean and tidal currents.

Predicted surface current speeds near the Fortescue release location varied throughout the year with monthly maximum speeds ranging between approximately 1.31 m/s (February) and 2.00 m/s (July). The dominant surface current direction was predominantly aligned with the southwest-northeast axis during the whole year, with a dominant northeast direction in winter and southwest direction in summer.

Figure 3.11 and Figure 3.12 show the monthly and total surface current rose distributions for the selected location.

Table 3.4 Predicted monthly average and maximum surface current speeds nearby Fortescue. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.32	1.35	Southwest
February	0.35	**1.31**	Southwest
March	0.34	1.38	Southwest
April	**0.29**	1.42	Varied
May	0.36	1.69	Northeast

3.3.4 Kingfish A

Table 3.5 presents the average and maximum surface current speeds nearby the Kingfish A release location by combining the ocean and tidal currents.

Predicted surface current speeds near the Kingfish A release location varied throughout the year with monthly maximum speeds ranging between approximately 1.34 m/s (November) and 2.02 m/s (July). The dominant surface current direction was predominantly aligned with the east-west axis during the whole year, with a dominant east-northeast direction in winter and west-southwest direction in summer.

Figure 3.13 and Figure 3.14 show the monthly and total surface current rose distributions for the selected location.

Table 3.5 Predicted monthly average and maximum surface current speeds nearby Kingfish A. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.36	1.44	West-southwest and East-northeast
February	0.37	1.40	West-southwest
March	0.36	1.41	West-southwest

3.3.5 Flounder

Table 3.6 presents the average and maximum surface current speeds nearby the Flounder release location by combining the ocean and tidal currents.

Predicted surface current speeds near the Flounder release location varied throughout the year with monthly maximum speeds ranging between 1.06 m/s (February) and 1.94 m/s (July). The dominant surface current direction was mostly aligned with the southwest-northeast axis during the whole year, with a dominant northeast direction in winter and southwest direction in summer.

Figure 3.15 and Figure 3.16 show the monthly and total surface current rose distributions for the selected location.

Table 3.6 Predicted monthly average and maximum surface current speeds nearby Flounder. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.27	1.24	Southwest and northeast
February	0.28	**1.06**	Southwest and northeast
March	0.28	1.30	Southwest and northeast

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) were sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land, and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model.

Due to the uniformity of the wind field over long distances without coastal interference, a detailed wind analysis is provided for the offshore and nearshore regions. The offshore region encompasses WTA, FTA, KFA and FLA, while the nearshore region is a representation of DPA.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

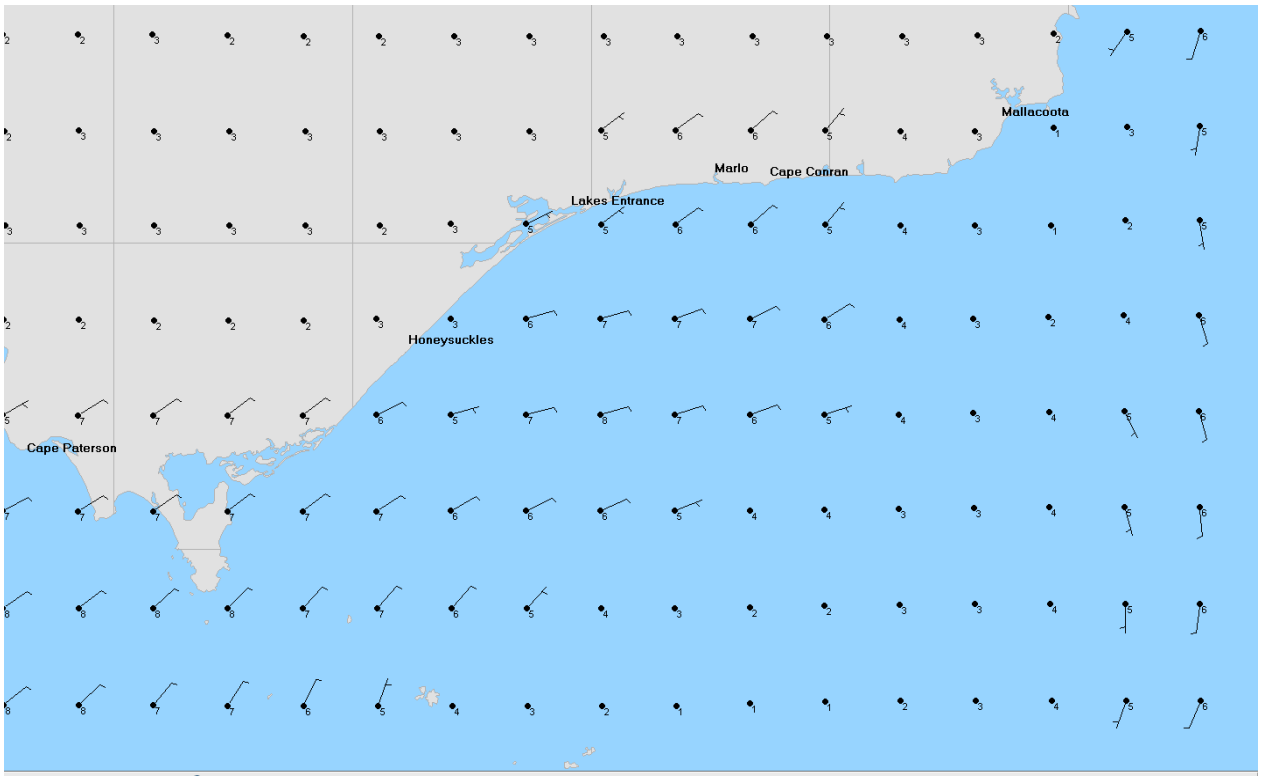

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model.

4.1 Offshore Locations

Note, the offshore locations refer to the WTA, FTA, KFA and FLA release locations.

Table 4.1 presents the monthly average and maximum winds derived from a CFSR wind node nearby the offshore release locations. The wind data demonstrated average monthly wind speeds ranging from 14.0 knots (April) to 17.4 knots (July). The dominant wind direction varied throughout the year, though westerly and south-westerly winds tend to be the dominant direction at the offshore locations.

Figure 4.2 and Figure 4.3 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the offshore release locations.

Table 4.1 Predicted average and maximum winds representative for the selected node nearby the offshore release locations (WTA, FTA, KFA and FLA). Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (From)
January	15.2	45.5	West-southwest and east-northeast
February	15.1	44.6	West-southwest and east-northeast
March	14.8	46.6	West-southwest and east-northeast
April	**14.0**	40.7	West-southwest
May	16.7	44.6	West-southwest
June	16.3	48.9	West
July	**17.4**	47.1	West
August	16.8	46.1	West
September	17.0	48.2	West-southwest
October	15.9	**40.4**	West-southwest
November	15.7	**49.5**	West-southwest
December	15.4	43.5	West-southwest
Minimum	**14.0**	**40.4**	
Maximum	**17.4**	**49.5**	

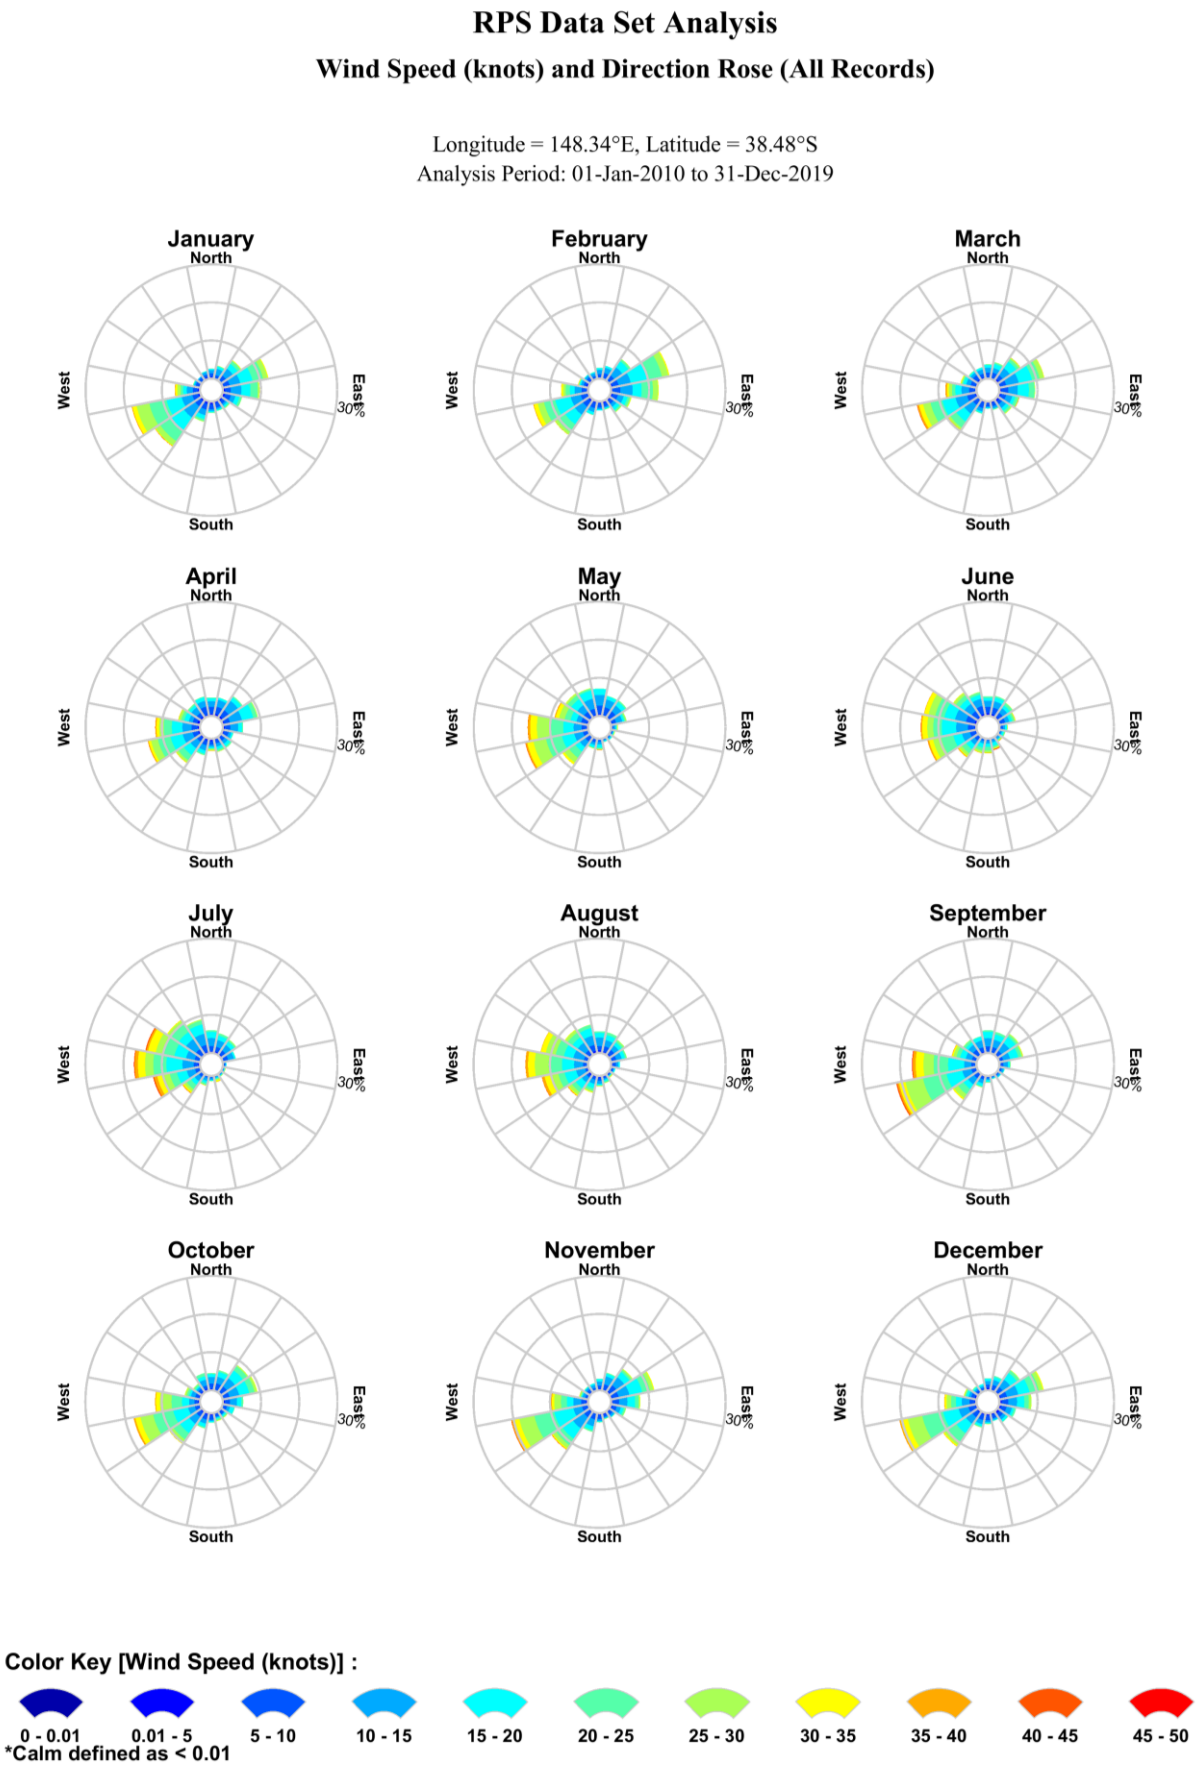

Figure 4.2 Modelled monthly wind rose distributions from 2010–2019 (inclusive) for the node nearby the offshore release locations (WTA, FTA, KFA and FLA).

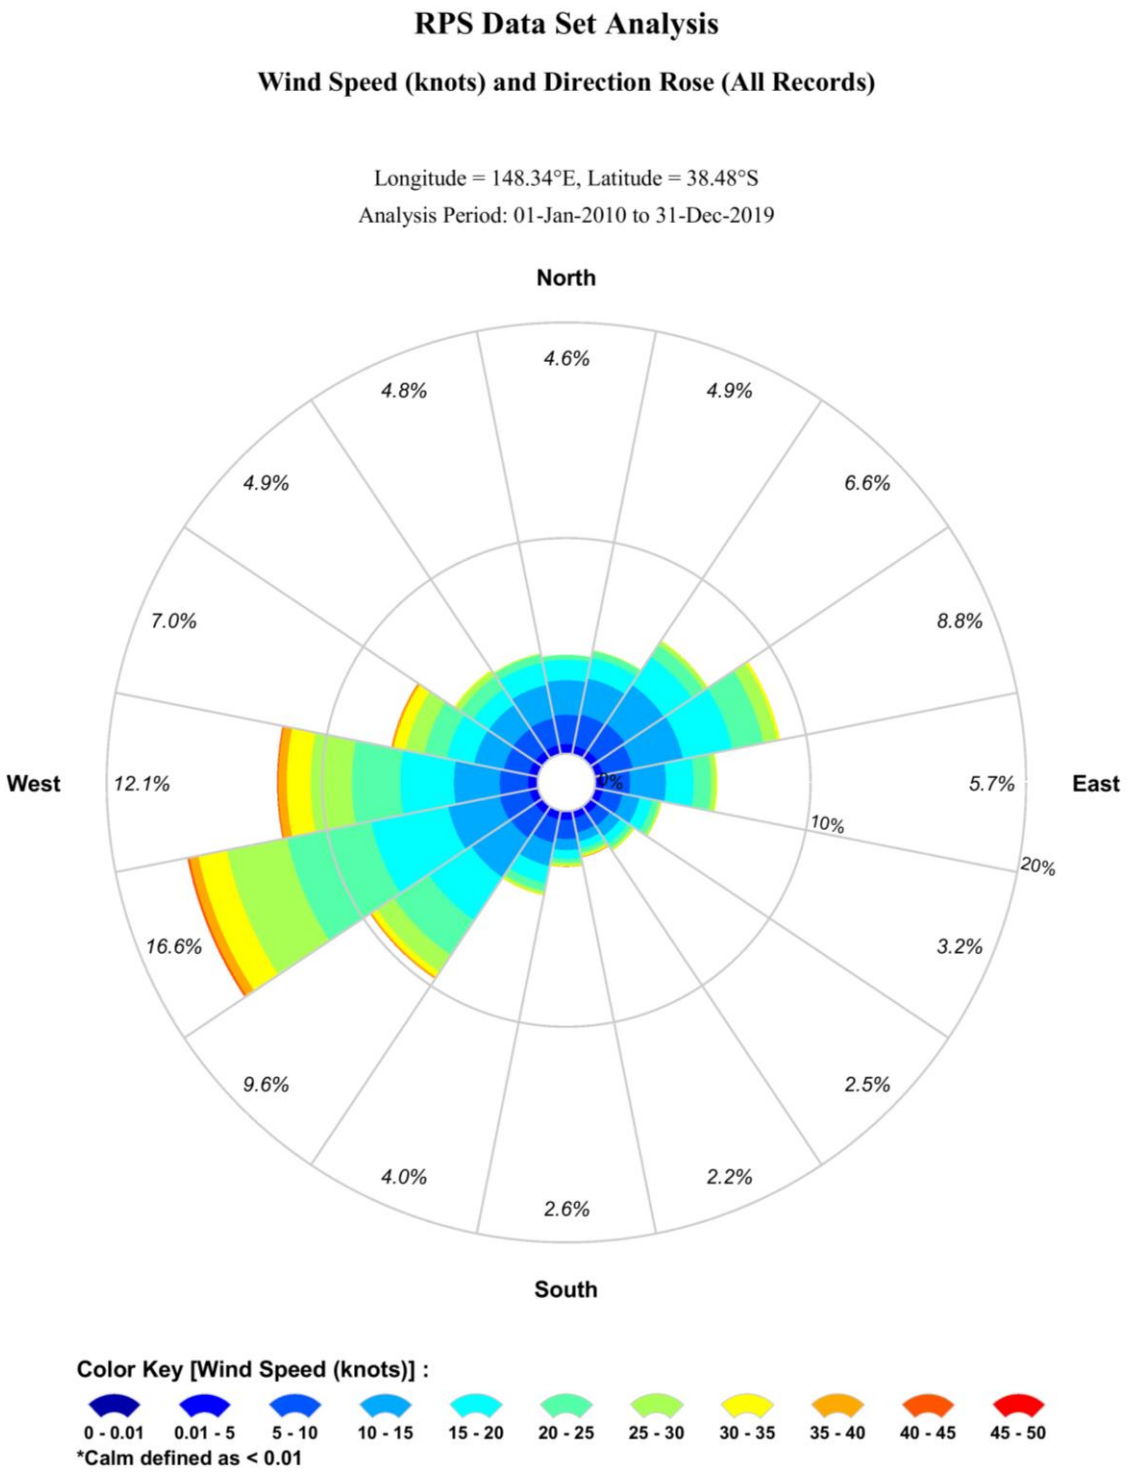

Figure 4.3 Modelled total wind rose distributions from 2010–2019 (inclusive) for the node nearby the offshore release locations (WTA, FTA, KFA and FLA).

4.2 Nearshore Location

Note, the nearshore location refers to the DPA release location.

Table 4.2 presents the monthly average and maximum winds derived from the CFSR wind node nearby the nearshore release location. The wind data demonstrated average monthly wind speeds ranging from 9.5 knots (April) to 11.8 knots (July). The dominant wind direction varied throughout the year, though westerly and south-westerly winds tend to be the dominant direction nearby the nearshore release location.

Figure 4.4 and Figure 4.5 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the nearshore release location.

Table 4.2 Predicted average and maximum winds representative for the selected node nearby the nearshore release location (DPA). Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (From)
January	10.5	29.0	West-southwest and east-northeast
February	10.6	33.7	West-southwest and east-northeast
March	10.2	34.3	West-southwest and east-northeast
April	**9.5**	33.0	West-southwest and east-northeast
May	11.2	34.2	West
June	10.8	36.6	West-northwest
July	**11.8**	**33.6**	West-northwest
August	11.5	32.3	West-northwest
September	11.4	34.2	West-southwest
October	10.9	**28.5**	West-southwest
November	10.8	33.9	West-southwest and east
December	10.7	31.9	West-southwest and east
Minimum	**9.5**	**28.5**	
Maximum	**11.8**	**36.6**

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study were obtained from the World Ocean Atlas 2018 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (see Levitus et al., 2013). These parameters were used as factors to inform the weathering, movement, and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Table 5.1 presents the water temperature and salinity of the surface layer at the representative offshore location. The monthly average sea surface temperatures ranged between 13.0°C (September) and 20.9°C (March). The monthly average surface salinity values remained consistent between 35.4 psu and 35.5 psu.

Figure 5.1 illustrates the vertical profile of sea temperature and salinity nearby the offshore release locations.

Table 5.1 Monthly average sea surface temperature and salinity in the offshore region (WTA, FTA, KFA and FLA).

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	19.2	20.8	20.9	18.8	16.7	15.2	14.2	13.6	13.0	13.8	16.0	16.8
Salinity (psu)	35.5	35.5	35.5	35.5	35.5	35.5	35.5	35.4	35.4	35.4	35.4	35.4

Additionally, Table 5.2 presents the water temperature and salinity of the surface layer at the representative nearshore location. The monthly average sea surface temperatures ranged between 12.4°C (September) and 19.9°C (February). The monthly average surface salinity values remained relatively consistent ranging between 35.4 psu and 35.6 psu.

Figure 5.2 illustrates the vertical profile of sea temperature and salinity nearby the nearshore location.

Table 5.2 Monthly average sea surface temperature and salinity in the nearshore region (DPA).

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	19.6	19.9	19.7	18.3	16.0	14.6	13.2	12.5	12.4	13.4	15.6	17.2
Salinity (psu)	35.5	35.5	35.5	35.5	35.6	35.6	35.5	35.4	35.4	35.4	35.4	35.4

6 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and surface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004; 2021; 2022a; 2022b).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and surface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

6.1 Stochastic Modelling

For the stochastic modelling presented herein, 100 oil spills were modelled for each scenario using the same spill information (release location, spill volume, duration and oil type) but with varied start dates. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Maximum residence time of exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may accumulate on shorelines from any single simulation;
- Concentration that might occur on sections of individual shorelines;
- Exposure to dissolved hydrocarbons in the water column; and
- Exposure to entrained hydrocarbons in the water column.

6.2 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 6.2.1 to 6.2.3. Supporting justifications of the

adopted thresholds applied during the study and additional context relating to the area of potential exposure are also provided. It is important to note that the thresholds herein are based on (NOPSEMA, 2019)[2].

6.2.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2009; AMSA, 2014) (see Table 6.1). Figure 6.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 6.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 6.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 6.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

[2] Results for entrained hydrocarbon exposure at, or above, 1,000 ppb, in alignment with French-McCay (2023), are provided in Appendix A.

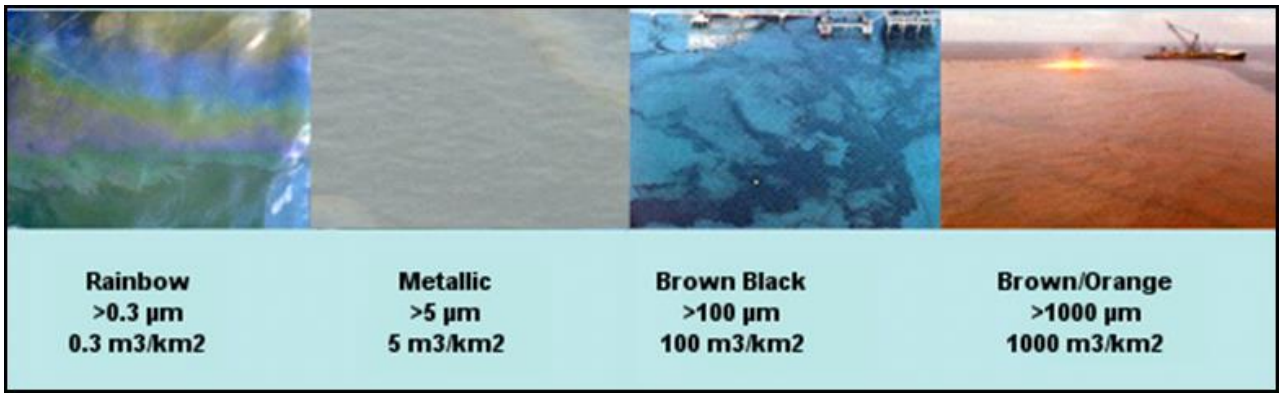

Figure 6.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 6.2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

6.2.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2023) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996) demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high

shoreline accumulation". It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 6.3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 6.3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

6.2.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

6.2.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed "bioavailable".

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 6.4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

6.2.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZECC & ARMCANZ (2000) water quality guidelines. Due to the requirement for relatively long exposure times (>24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 6.4), to cover the range of thresholds outlined in ANZECC & ARMCANZ (2000) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 6.4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Oil Phase	Exposure level	In-water threshold (ppb)	Description
Dissolved hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	50	Approximates potential toxic effects, particularly sublethal effects to sensitive species
	High	400	Approximates toxic effects including lethal effects to sensitive species
Entrained hydrocarbons*	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	High	100	As appropriate given oil characteristics for informing risk evaluation
	n/a	1,000	Additional threshold presented in Appendix

*Additional threshold of 1,000 ppb presented in Appendix but not part of NOPSEMA (2019).

7 HYDROCARBON PROPERTIES

7.1 Physical Properties

Marine gas oil (MGO) was used for the scenario modelled in this assessment. Table 7.1 and Table 7.2 present the physical properties and boiling point ranges of the MGO used in this study.

MGO has an API of 37.6, density of 829.1 kg/m^3 (at 25ºC), with low viscosity (4 cP at 25ºC) classifying it as a Group II (light-persistent) oil according to ITOPF (2020) and US EPA/USCG classifications. The oil comprises a significant portion of volatiles and semi- to low volatiles (~95 % total) with 5.0% residual components. This means most of the hydrocarbons will evaporate when on the water surface, with the persistent components to remain on the water surface over a longer period.

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 12 hours for the C_4 to C_{10} compounds (BP <180°C);
- Up to 24 hours for the C_{11} to C_{15} compounds (BP 180-265°C);
- Several days for the C_{16} to C_{20} compounds (BP 265-380°C); and
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

Table 7.1 Physical properties.

Characteristic	MGO
Density (kg/m^3)	829.1
API	37.6
Dynamic viscosity (cP)	4 (at 25°C)
Pour point (°C)	-14.0
Wax Content (%)	1
Hydrocarbon property category	Group II
Hydrocarbon property classification	Light-persistent

Table 7.2 Boiling point ranges.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 >C_{20}
MGO	% of total	6.0	34.6	54.4	5.0

7.2 Weathering Properties

A series of model weathering tests were conducted to illustrate the potential behaviour of the hydrocarbons when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (15 °C) and ambient tidal and drift currents; and
- A 50 m^3 surface release over 1-hour under variable wind conditions (1-23 knots, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

Note, a surface release is used in the weathering test to solely focus on the weathering and fates of the hydrocarbons when exposed to atmospheric conditions.

The first case is indicative of conditions that would not generate entrainment, while the second case represents conditions that would likely cause entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil is on the sea surface.

The mass balance for the oil under the constant 5 knot wind case (Figure 7.1) shows that 39.3% is expected to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the less volatile, longer-chain compounds. Evaporation shall cease when only the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 7.2), where the winds are of greater strength on average, entrainment of hydrocarbons into the water column is shown to increase. Approximately 24 hours after the spill, 78.1% of the mass is shown to have entrained and a further 17.4% has evaporated, leaving only a small proportion floating on the water surface (<1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of ~2.7% per day with 19.1% after 7 days, compared to 0.2% per day and a total of 1.4% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

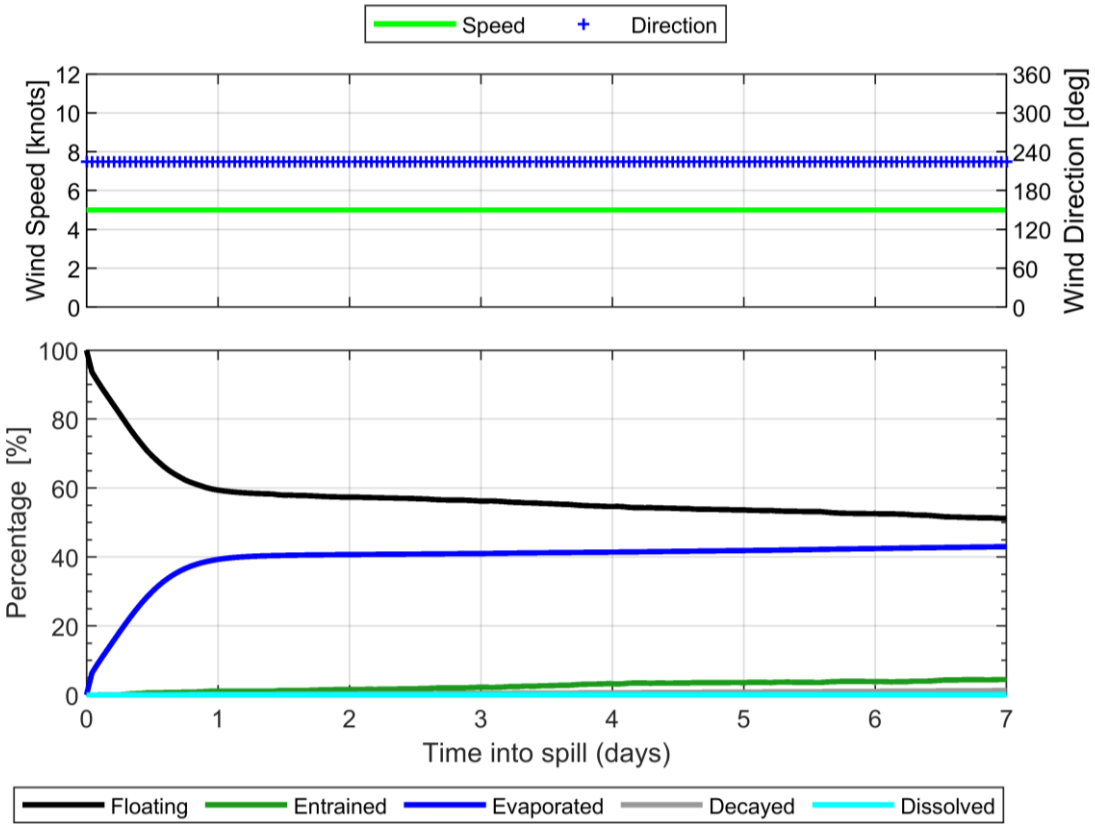

Figure 7.1 Proportional mass balance plot representing the weathering of MGO spilled onto the water surface over 1-hour and subject to a constant 5 knots wind speed at 15°C water temperature.

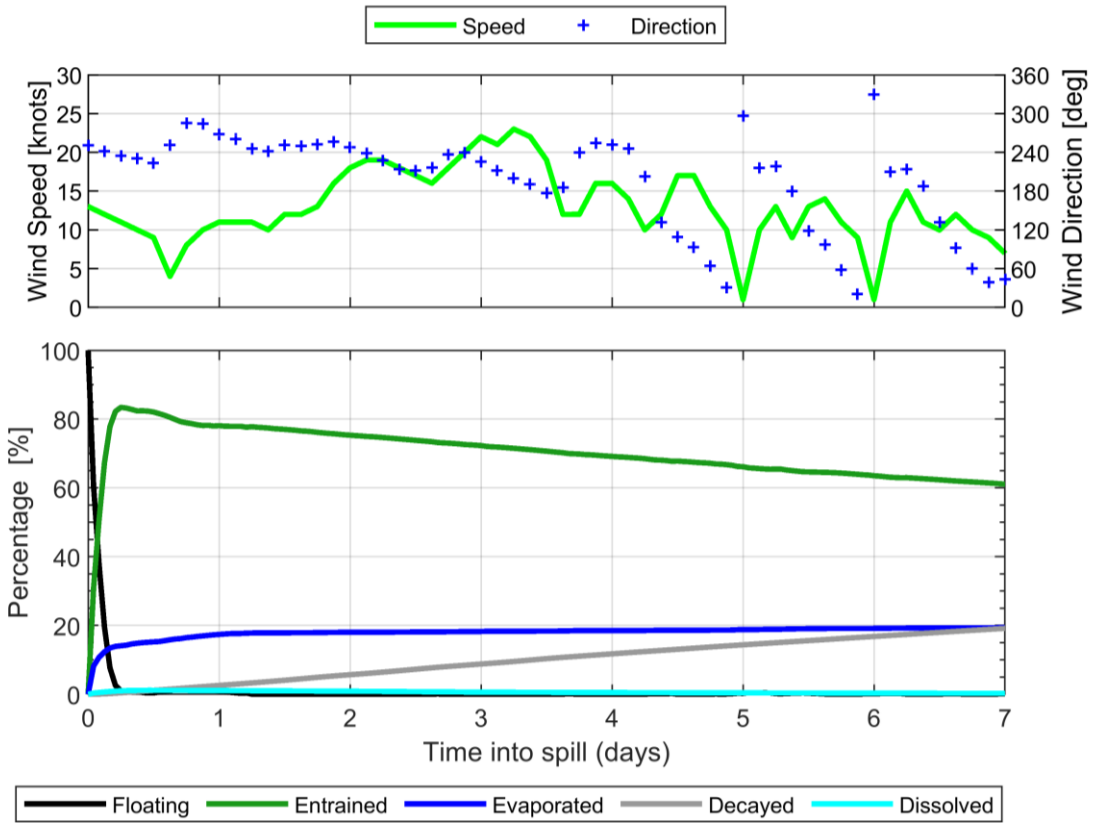

Figure 7.2 Proportional mass balance plot representing the weathering of MGO spilled onto the water over 1-hour and subject to variable wind speeds (1-23 knots) at 15°C water temperature.

8 MODEL SETTINGS

Table 8.1 provides a summary of the oil spill model settings.

Table 8.1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5
Description	Vessel collision - release from rupture of single largest vessel fuel tank				
Location	Dolphin (DPA)	Whiting (WTA)	Fortescue (FTA)	Kingfish A (KFA)	Flounder (FLA)
Number of randomly selected spill start times	100				
Model period	Annual				
Hydrocarbon type	Marine Gas Oil (MGO)				
Spill volume	1,165 m^3				
Release type (surface, depth (m))	Surface				
Release duration	12 hours				
Simulation length	30 days				
Surface oil concentration thresholds (g/m^2) ^	1 (low); 10 (moderate); 50 (high)				
Shoreline oil accumulation thresholds (g/m^2) ^	10 (low); 100 (moderate); 1,000 (high)				
Dissolved hydrocarbon concentrations (ppb) ^	10 (low); 50 (moderate); 400 (high)				
Entrained hydrocarbon concentrations (ppb) ^*	10 (low); 100 (high)				

^Thresholds based on NOPSEMA (2019);

9 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of potential sea-surface and water column exposure and shoreline accumulation.

9.1 Annual Analysis

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by a) recording the maximum and b) second greatest distance travelled (or 99th percentile) by a single trajectory, within a scenario, from the release location to the identified exposure thresholds;
- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario;
- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value;
- The ***maximum residence time for oil exposure within a receptor*** – is determined by recording the longest continuous length of time a grid cell is exposed to either floating, entrained or dissolved hydrocarbon above each threshold, within a receptor.
- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario;
- The ***maximum potential oil loading within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario;
- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell.
- ***Maximum total volume*** ashore (found in shoreline statistics table) – Is the total volume of oil stranded on the shorelines throughout the duration of the simulation. This volume does not take into account any weathering of the stranded oil.
- ***Maximum instantaneous peak volume ashore*** (found in the deterministic analysis section and derived from the histogram) - Is the peak volume of oil accumulated on shorelines at a single point in time. This peak value does not include oil that came ashore earlier in the simulation and was subsequently lost through evaporation or other weathering processes.

9.2 Deterministic Trajectories

The stochastic modelling results were assessed for each scenario, and the deterministic runs were identified and are presented in the result section based on the following criteria.

a. Largest swept area for surface oil above 10 g/m^2;

b. Largest instantaneous peak volume of oil ashore;

c. Longest length of shoreline with oil accumulation above 100 g/m^2;

d. Largest area of entrained hydrocarbon exposure above 100 ppb; and

e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

9.3 Receptors Assessed

A range of environmental receptors and shorelines were assessed for floating oil exposure, shoreline accumulation and water column exposure as part of the study (see Figure 9.1 to Figure 9.11). Receptor categories (see Table 9.1) include sections of shorelines which are defined by local government areas (LGAs), sub-LGAs and offshore islands. All other sensitive receptors other than submerged reefs, shoals and banks (RSB) were sourced from Australian Government Department of Climate Change, Energy, the Environment and Water (https://www.dcceew.gov.au/).

Note that the receptor dataset used in this assessment is reviewed on an annual basis to ensure that it is always considered up to date.

Risks of exposure were separately calculated for each sensitive receptor area and have been tabulated.

Table 9.2 summarises the receptors that the release locations reside within.

Table 9.1 Summary of receptors used to assess floating oil, shoreline and in-water exposure to hydrocarbons.

10 RESULTS – SCENARIO 1 – A 1,165 M^3 SURFACE RELEASE OF MGO AT DOLPHIN

This scenario examined a 1,165 m^3 surface release of MGO over 12 hours at Dolphin. A total of 100 spill simulations were run and each simulation was tracked for 30 days. The results are presented on an annual basis.

Sections 10.1 and 10.2 present the annual stochastic analysis and deterministic analysis results, respectively.

10.1 Stochastic Analysis

10.1.1 Floating Oil Exposure

Table 10.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 200 km (east-northeast), 31.4 km (northeast) and 20.2 km (southwest), respectively.

Table 10.2 summarises the potential floating oil exposure, minimum time and maximum residence time of floating oil exposure to individual receptors.

With the exception of the receptors the release location is within (see

Table 9.2), the Upwelling East of Eden KEF recorded the highest probability of exposure at 8% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach Victoria State Waters the quickest at 1.42 days (34.08 hours) following the spill commencement.

Figure 10.1 presents the zones of potential floating oil exposure for all thresholds, while Figure 10.2 to Figure 10.4 present the maximum residence time of floating oil exposure for all thresholds assessed under annual conditions.

Table 10.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

Distance and direction travelled	Zones of potential floating oil exposure		
	Annual		
	Low	Moderate	High
Maximum distance (km) from release location	200.0	31.4	20.2
Maximum distance (km) from release location (99th percentile)	85.2	30.1	19.3
Direction	ENE	NE	SW

Table 10.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

10.1.2 Shoreline Accumulation

Table 10.3 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 76% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 1.83 days. The maximum total volume ashore for a single spill trajectory was 83.3 m^3, and the maximum length of shoreline with accumulation above the low, moderate and high thresholds were 99 km, 13 km and 3 km, respectively.

Table 10.4 summarises the shoreline accumulation statistics for individual receptors.

The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for East Gippsland (LGA) (58%). The maximum volume of oil ashore was 74.3 m^3 for East Gippsland. Wellington (LGA) and Golden Beach (sub-LGA) shorelines were forecast to record the quickest time before oil accumulation at the 10 g/m^2 threshold at 1.83 days (43.92 hours).

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 10.5.

Table 10.3 Summary of oil accumulation across all shorelines. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	76
Absolute minimum time for visible oil to shore (days)	1.83
Maximum total volume of hydrocarbons ashore (m^3) ^	83.3
Average total volume of hydrocarbons ashore (m^3) ^	13.5
Maximum length of the shoreline at **10 g/m^2** (km)	99
Average shoreline length (km) at **10 g/m^2** (km)	19.6
Maximum length of the shoreline at **100 g/m^2** (km)	13
Average shoreline length (km) at **100 g/m^2** (km)	4.1
Maximum length of the shoreline at **1,000 g/m^2** (km)	3
Average shoreline length (km) at **1,000 g/m^2** (km)	2

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

Table 10.4 Summary of oil accumulation on individual shoreline receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

10.1.3 In-water exposure

10.1.3.1 Dissolved Hydrocarbons

Table 10.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure, for all thresholds assessed.

Excluding the receptors that the release location is within (see

Table 9.2), the probability of exposure at concentrations equal to, or greater than, 10 ppb is greatest at Upwelling East of Eden (KEF) (7%). The maximum dissolved hydrocarbon concentration at any given receptor(s), including the receptors the release location lies within was shown to be 162.6 ppb, followed by the Upwelling East of Eden (KEF) at 75.1 ppb.

Figure 10.6 presents the zones of potential dissolved hydrocarbon exposure for 0-10 m depth layer.

Figure 10.7 to Figure 10.8 present the maximum residence time of dissolved hydrocarbon exposure for the low and moderate thresholds, respectively.

Table 10.5 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

10.1.3.2 Entrained Hydrocarbons

Table 10.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure for all thresholds assessed.

Except for the receptors the release location is within (see

Table 9.2), the highest probability of low entrained hydrocarbon exposure was 72% recorded for the Upwelling East of Eden (KEF). The quickest time for exposure at the same threshold was 0.88 days (21.12 hours) for the same receptor. The highest entrained hydrocarbon concentration was predicted to be 10,680.6 ppb, including the receptors the release location lies within, followed by 776.7 ppb at Upwelling East of Eden (KEF).

Figure 10.9 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer.

Figure 10.10 and Figure 10.11 present the maximum residence time of entrained hydrocarbon exposure for 10 ppb and 100 ppb.

Table 10.6 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

10.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2; (Section 10.2.1)
b. Largest (total) volume of oil ashore (Section 10.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m^2 (Section 10.2.3)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 10.2.4)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 10.2.5)

Table 10.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 10.7 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore	Longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb

Start Date		19th August 2014 1am	7th May 2012 2am	15th June 2013 10pm	23rd July 2015 11pm	30th May 2019 2am

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

10.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 88, which started on the 19th of August 2014.

Figure 10.12 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 10.13 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 10.14 presents the fates and weathering graph for the corresponding single spill trajectory and Table 10.8 summarises the mass balance peaks and at the end of the simulation.

Table 10.8 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	737	0.5	0
Entrained (m^3)	675	2.5	241
Dissolved (m^3)	1	4.6	0
Evaporation (m^3)	532	30.0	532
Decay (m^3)	420	30.0	420

11 RESULTS – SCENARIO 2 – A 1,165 M^3 SURFACE RELEASE OF MGO AT WHITING

This scenario examined a 1,165 m^3 surface release of MGO over 12 hours at Whiting. A total of 100 spill simulations were run and each simulation was tracked for 30 days. The results are presented on an annual basis.

Sections 11.1 and 11.2 present the annual stochastic analysis and deterministic analysis results, respectively.

11.1 Stochastic Analysis

11.1.1 Floating Oil Exposure

Table 11.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 240.0 km (east-northeast), 31.5 km (northeast) and 19.1 km (northeast), respectively.

Table 11.2 summarises the potential floating oil exposure, minimum time and maximum residence time of floating oil exposure to individual receptors.

With the exception of the receptors the release location is within (see

Table 9.2), the Upwelling East of Eden KEF recorded the highest probability of exposure at 36% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach the same receptor the quickest at 0.54 day following the spill commencement.

Figure 11.1 presents the zones of potential floating oil exposure for all thresholds, while Figure 11.2 to Figure 11.4 present the maximum residence time of floating oil exposure for all thresholds assessed under annual conditions.

Table 11.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

Distance and direction travelled	Zones of potential floating oil exposure		
	Annual		
	Low	Moderate	High
Maximum distance (km) from release location	240.0	31.5	19.1
Maximum distance (km) from release location (99th percentile)	139.2	27.7	18.2
Direction	ENE	NE	NE

Table 11.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

	Receptor	Annual

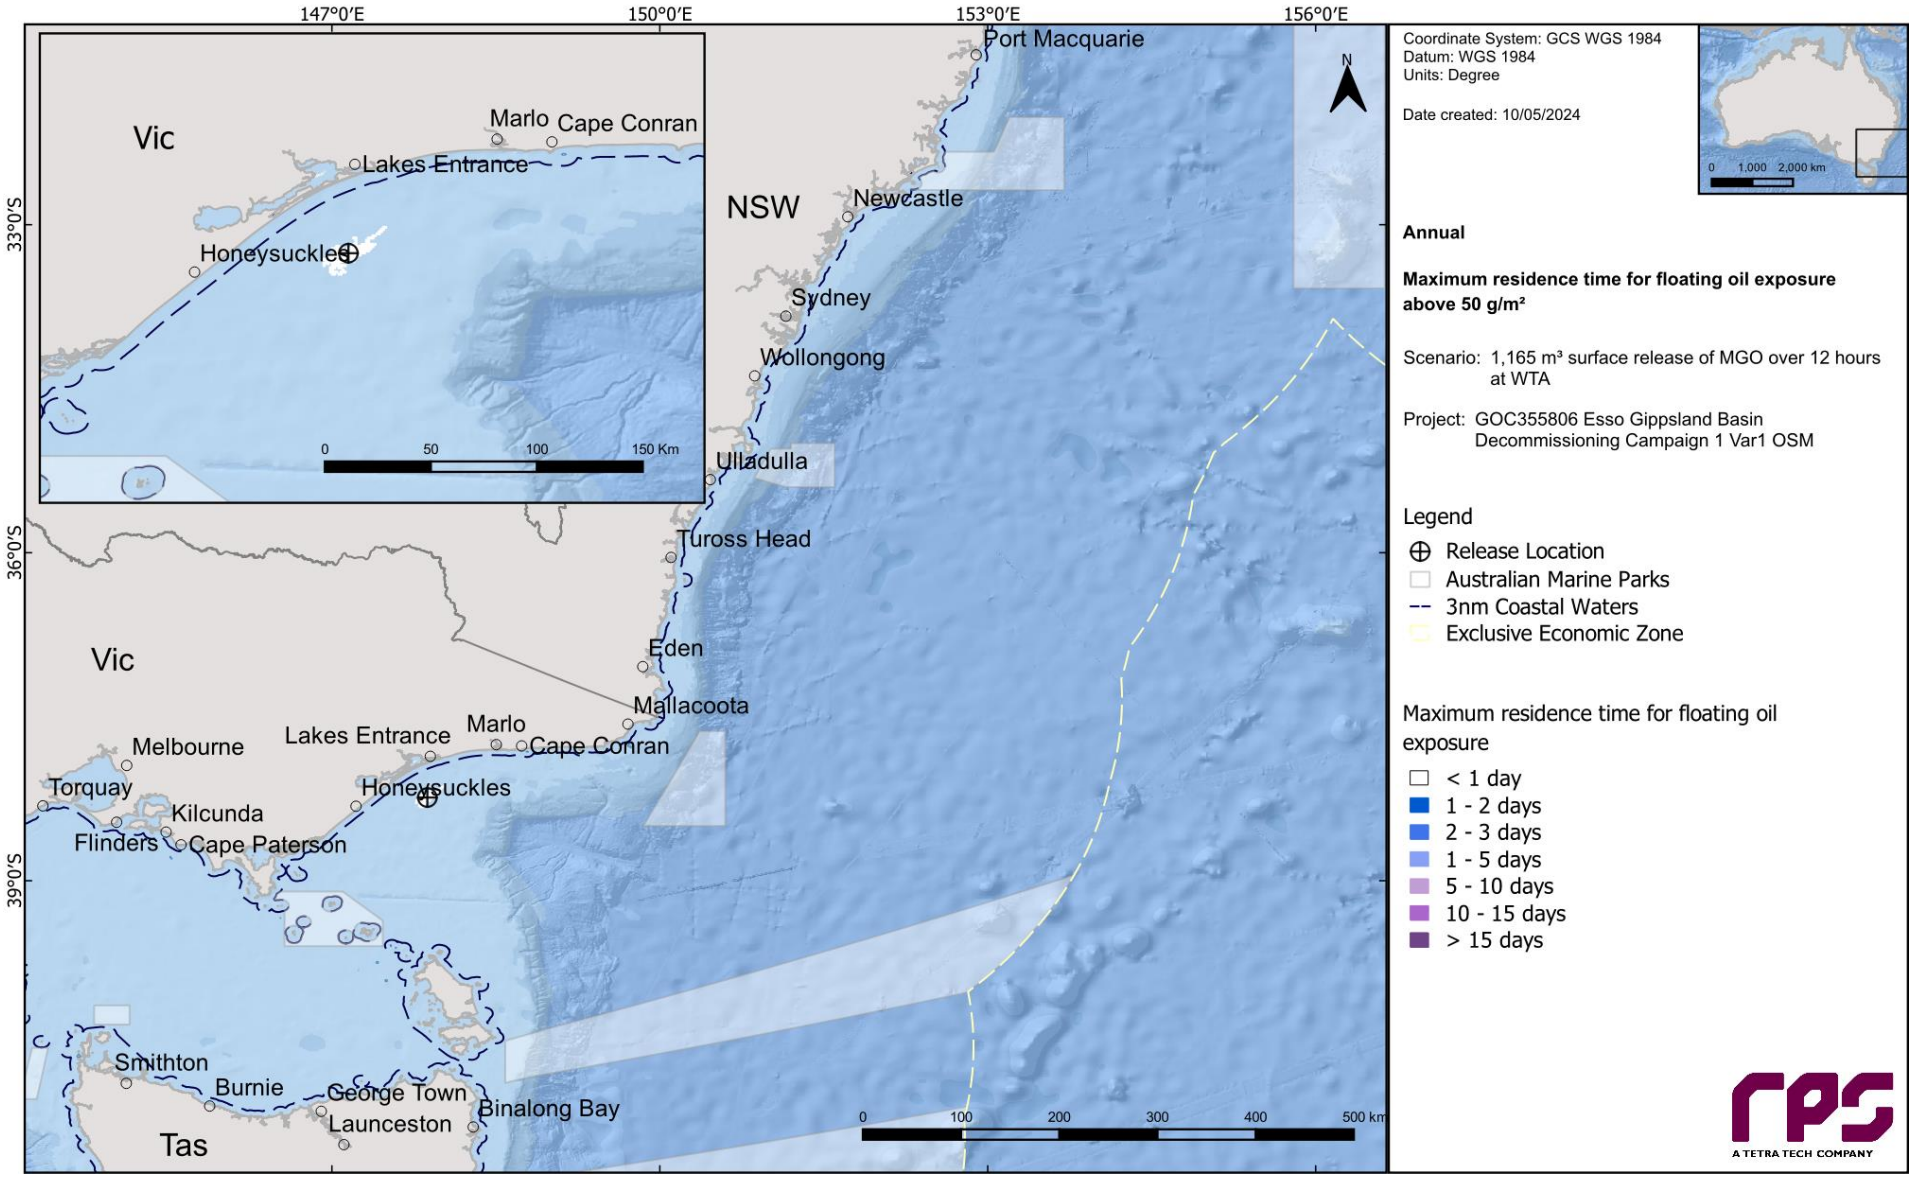

Figure 11.4 Maximum residence time of floating oil exposure above 50 g/m^2, in the event of a 1,165 m^3 surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

11.1.2 Shoreline Accumulation

Table 11.3 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 56% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 3.21 days. The maximum total volume ashore for a single spill trajectory was 54.8 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds were 54 km and 11 km, respectively. No shoreline contact was predicted above the high threshold.

Table 11.4 summarises the shoreline accumulation statistics for individual receptors.

The shoreline segment of East Gippsland (LGA) revealed the highest probability of accumulation above the low (41%) and moderate (20%) thresholds.

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 11.5.

Table 11.3 Summary of oil accumulation across all shorelines. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	56
Absolute minimum time for visible oil to shore (days)	3.21
Maximum total volume of hydrocarbons ashore (m^3) ^	54.8
Average total volume of hydrocarbons ashore (m^3) ^	7.2
Maximum length of the shoreline at **10 g/m^2** (km)	54
Average shoreline length (km) at **10 g/m^2** (km)	15.1
Maximum length of the shoreline at **100 g/m^2** (km)	11
Average shoreline length (km) at **100 g/m^2** (km)	4
Maximum length of the shoreline at **1,000 g/m^2** (km)	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

Table 11.4 Summary of oil accumulation on individual shoreline receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

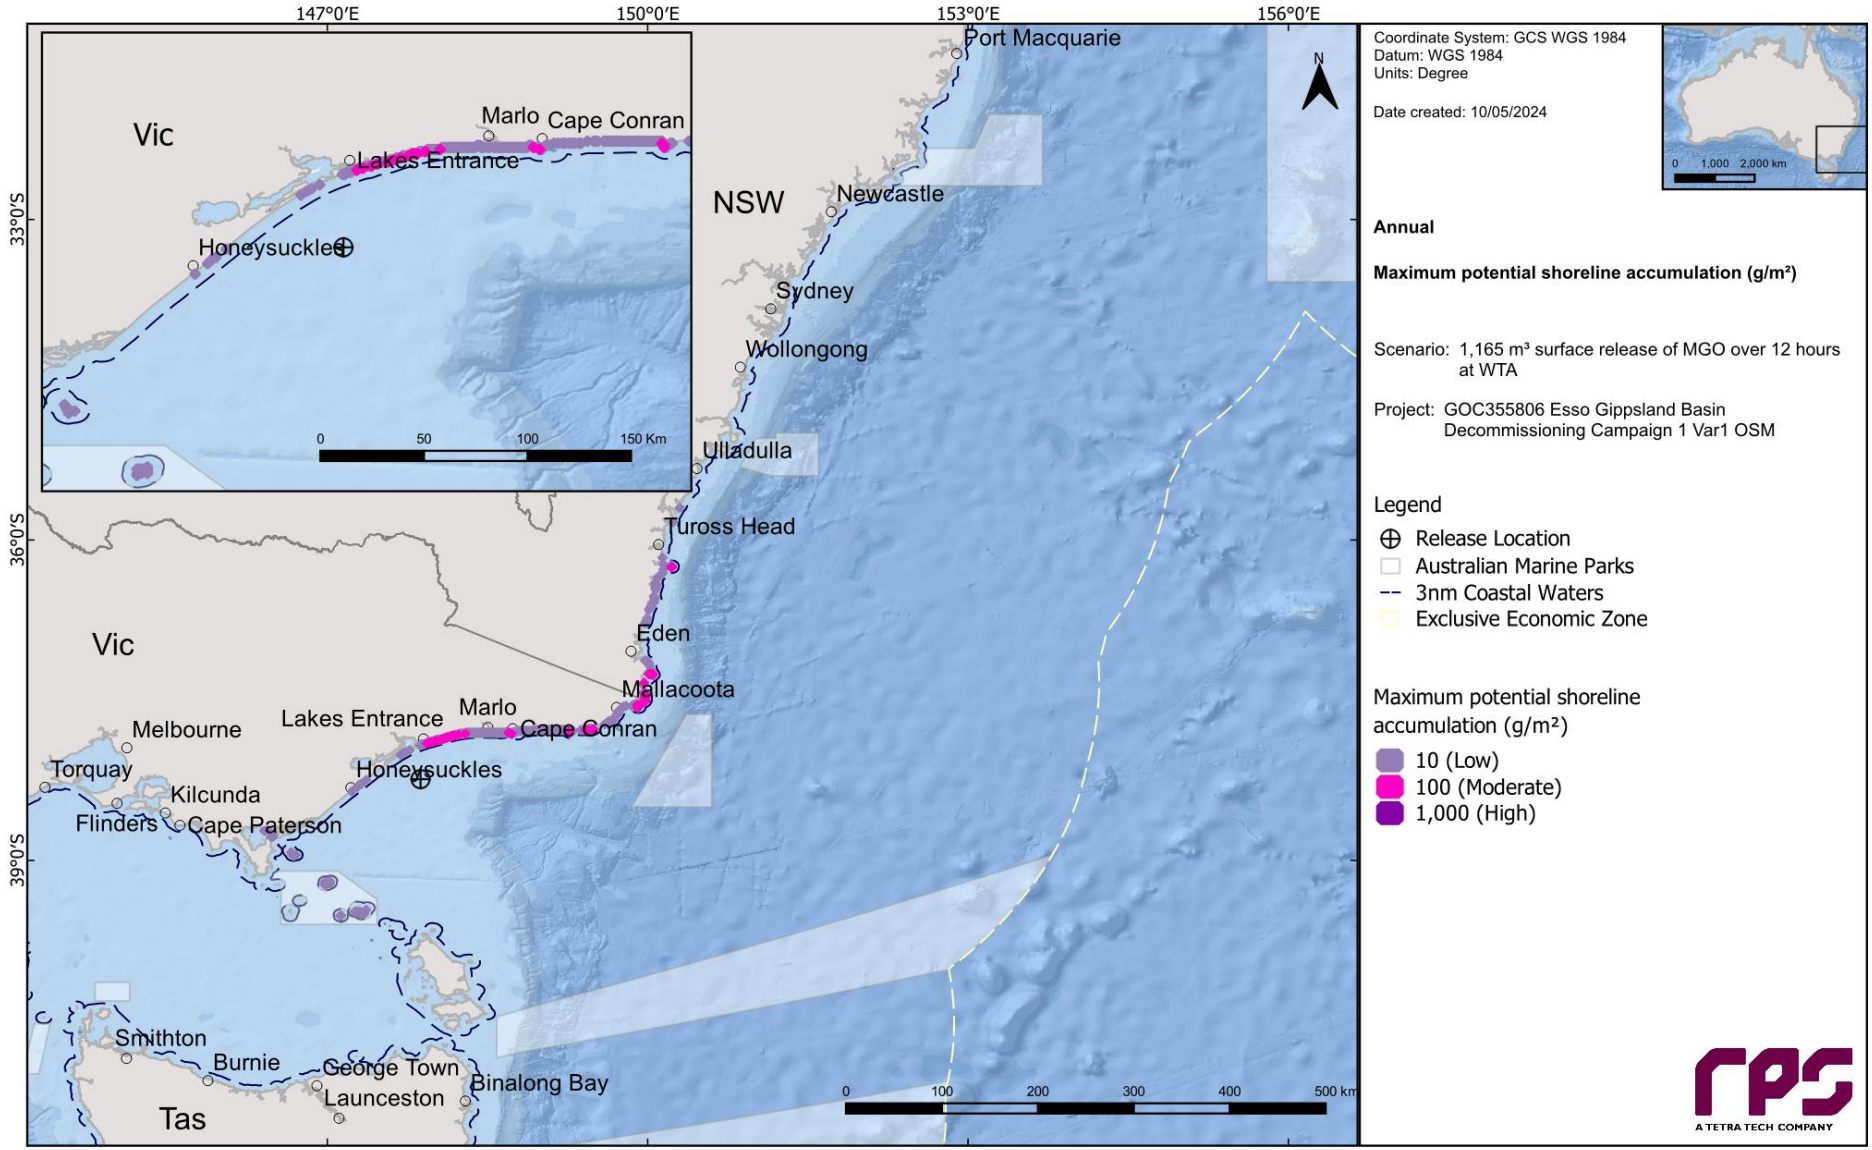

Figure 11.5 Maximum potential shoreline loading in the event of a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

11.1.3 In-water exposure

11.1.3.1 Dissolved Hydrocarbons

Table 11.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure, for all thresholds assessed.

Excluding the receptors that the release location is within, the probability of exposure at concentrations equal to, or greater than, 10 ppb is greatest at the Upwelling East of Eden (KEF) (17%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 151.5 ppb, including the receptors the release location lies within, followed by the Upwelling East of Eden (KEF) at 145.8 ppb.

Figure 11.6 present the zones of potential dissolved hydrocarbon exposure for 0-10 m depth layer.

Figure 11.7 and Figure 11.8 presents the maximum residence time of dissolved hydrocarbon exposure for the low and moderate thresholds, respectively.

Table 11.5 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

11.1.3.2 Entrained Hydrocarbons

Table 11.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure for all thresholds assessed.

Except for the receptors the release location is within, the highest probability of low entrained hydrocarbon exposure was 78% recorded for the Upwelling East of Eden (KEF).

The quickest time for exposure at the same threshold was 0.17 days (4.08 hours) at White Shark - Breeding (BIA). The highest entrained hydrocarbon concentration was predicted to be 14,462 ppb, including the receptors the release location lies within, followed by 3,168 ppb at the White Shark – Breeding BIA.

Figure 11.9 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer.

Figure 11.10 and Figure 11.11 present the maximum residence time of entrained hydrocarbon exposure for 10 ppb and 100 ppb.

Table 11.6 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Whiting. The results reflect annual conditions.

11.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2; (Section 11.2.1)
b. Largest (total) volume of oil ashore (Section 11.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m^2 (Section 11.2.2)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 11.2.3)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 11.2.4)

Table 11.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 11.7 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria			
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore and longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Run Number		45	2	87	94
Total area of floating Oil exposure (km²)	1 g/m²	269	253	88	22
	10 g/m²	**178**	37	57	5
	50 g/m²	15	-	10	1
Total length of shoreline accumulation (km)	10 g/m²	-	32	4	-
	100 g/m²	-	**10**	-	-
	1,000 g/m²	-	-	-	-
Minimum time before accumulation on any shoreline (hours)	10 g/m²	-	83	204	-
	100 g/m²	-	109	-	-
	1,000 g/m²	-	-	-	**-**
Peak volume of oil ashore (m³)		-	**40 (Total volume 54.8 m³)^**	-	-
Total area of entrained hydrocarbon exposure (km²)	10 ppb	10,170	5,339	14,621	6,160
	100 ppb	660	1,502	**3,606**	672
	1,000 ppb	-	25	25	21
Total area of dissolved hydrocarbon exposure (km²)	10 ppb	-	16	-	223
	50 ppb	-	-	-	**35**
	400 ppb	-	-	-	-
Start Date		12th April 2012 9pm	7th September 2011 1am	1st September 2017 5pm	12th April 2011 12pm

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

11.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 45, which started on the 12th of April 2012.

Figure 11.12 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 11.13 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 11.14 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.8 summarises the mass balance peaks and at the end of the simulation.

Table 11.8 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	739	0.5	0
Entrained (m^3)	688	2.0	213
Dissolved (m^3)	1	6.5	0
Evaporation (m^3)	572	30.0	572
Decay (m^3)	408	30.0	408
Ashore (m^3)	0	21.7	0

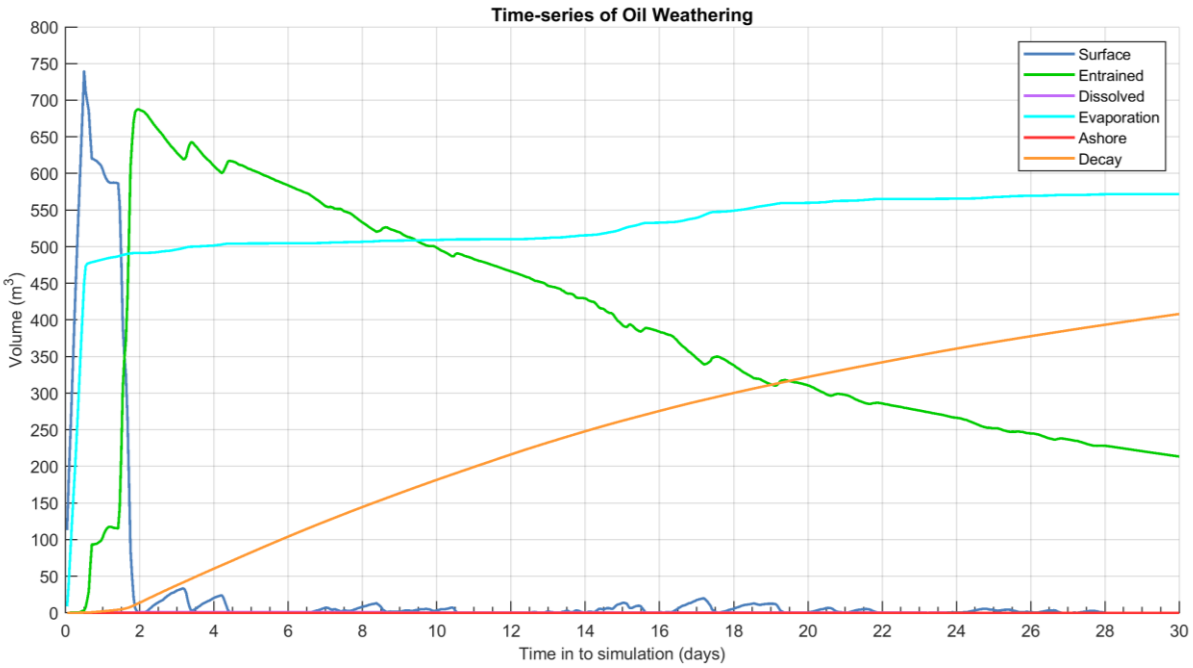

Figure 11.14 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 10 g/m^2.

11.2.2 Deterministic Case: Largest volume of oil ashore and longest length of shoreline contacted by oil above 100 g/m^2

The deterministic trajectory that resulted in the largest volume of oil ashore also resulted in the longest length of shoreline contacted by oil above 100 g/m^2. This simulation was identified as run number 2, which started on the 7th of September 2011.

Figure 11.15 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 11.16 and Figure 11.17 display the time series of the volume of shoreline oil and the length of shoreline oil accumulation above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation respectively.

Figure 11.18 presents the fates and weathering graph for the corresponding single spill trajectory and Table 11.9 summarises the mass balance peaks and at the end of the simulation.

Table 11.9 Summary of the mass balance for the trajectory with the largest volume of oil ashore and the longest length of shoreline contacted by oil above 100 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30

11.2.3 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as run number 87, which started on the 1st of September 2017.

Figure 11.19 illustrates the zones of potential entrained hydrocarbon exposure over the 30-day simulation.

Figure 11.20 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 30-day simulation.

12 RESULTS – SCENARIO 3 – A 1,165 M^3 SURFACE RELEASE OF MGO AT FORTESCUE

This scenario examined a 1,165 m^3 surface release of MGO over 12 hours at Fortescue. A total of 100 spill simulations were run and each simulation was tracked for 30 days. The results are presented on an annual basis.

Sections 12.1 and 12.2 present the annual stochastic analysis and deterministic analysis results, respectively.

12.1 Stochastic Analysis

12.1.1 Floating Oil Exposure

Table 12.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 107.6 km (east-northeast), 46.0 km (southwest) and approximately 16.4 km (south), respectively.

Table 12.2 summarises the potential floating oil exposure, minimum time and maximum residence time of floating oil exposure to individual receptors.

With the exception of the receptors the release location is within (see

Table 9.2), the Upwelling East of Eden (KEF) recorded the highest probability of exposure at 21% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach the same receptor the quickest at 0.17 days (4.08 hours) following the spill commencement.

Figure 12.1 presents the zones of potential floating oil exposure for all thresholds, while Figure 12.2 to Figure 12.4 present the maximum residence time of floating oil exposure for all thresholds assessed under annual conditions.

Table 12.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Fortescue. The results reflect annual conditions.

Distance and direction travelled	Zones of potential floating oil exposure		
	Annual		
	Low	Moderate	High
Maximum distance (km) from release location	107.6	46.0	16.4
Maximum distance (km) from release location (99th percentile)	55.9	41.2	16.3
Direction	ENE	SW	S

12.1.2 Shoreline Accumulation

Table 12.3 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 23% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 5.33 days. The maximum total volume ashore for a single spill trajectory was 13.2 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds was 31 km and 2 km, respectively. No shoreline contact was recorded for the high threshold.

Table 12.4 summarises the shoreline accumulation statistics for individual receptors.

The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Bega Valley (Sub-LGA) (13%). The maximum volume of oil ashore was 12.6 m^3 for the same receptor. Montague Island (LGA) was forecast to record the quickest time before oil accumulation at the 10 g/m^2 threshold at 5.33 days (127.92 hours).

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 12.5.

Table 12.3 Summary of oil accumulation across all shorelines. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Fortescue. The results reflect annual conditions.

Shoreline Statistics	Annual

12.1.3 In-water exposure

12.1.3.1 Dissolved Hydrocarbons

Table 12.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure, for all thresholds assessed.

Excluding the receptors that the release location is within (see

Table 9.2), the probability of exposure at concentrations equal to, or greater than, 10 ppb is greatest at Upwelling East of Eden (KEF) (19%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 182.3 ppb, including the receptors the release location lies within, followed by the Upwelling East of Eden (KEF) at 115.5 ppb.

Figure 12.6 present the zones of potential dissolved hydrocarbon exposure for 0-10 m depth layer.

Figure 12.7 and Figure 12.8 presents the maximum residence time of dissolved hydrocarbon exposure for the low and moderate thresholds, respectively.

Table 12.5 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Fortescue. The results reflect annual conditions.

Receptor		Annual

12.1.3.2 Entrained Hydrocarbons

Table 12.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure for all thresholds assessed.

Except for the receptors the release location is within (see

Table 9.2), the highest probability of low entrained hydrocarbon exposure was 71% recorded for the Upwelling East of Eden (KEF). The quickest time for exposure at the same threshold was 0.13 days (3.12 hours) for the same receptor. The highest entrained hydrocarbon concentration was predicted to be 16,850.7 ppb, including the receptors the release location lies within, followed by 3,516 ppb at Upwelling East of Eden (KEF).

Figure 12.9 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer.

Figure 12.10 and Figure 12.11 present the maximum residence time of entrained hydrocarbon exposure for 10 ppb and 100 ppb.

Table 12.6 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Fortescue. The results reflect annual conditions.

12.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2; (Section 12.2.1)
b. Largest (total) volume of oil ashore (Section 12.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m^2 (Section 12.2.2)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 12.2.3)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 12.2.4)

Table 12.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 12.7 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria			
		Largest swept area of floating oil >10 g/m^2	Largest volume of oil ashore and longest length of shoreline with accumulation >100 g/m^2	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Run Number		92	33	69	51
Total area of floating Oil exposure (km^2)	1 g/m^2	449	8	5	7
	10 g/m^2	**208**	2	1	3
	50 g/m^2	2	-	-	-

	100 g/m^2	-	**2**	-	-
	1,000 g/m^2	-	-	-	-
Minimum time before accumulation on any shoreline (hours)	10 g/m^2	318	263	128	-
	100 g/m^2	-	274	-	-
	1,000 g/m^2	-	-	-	**-**
Peak volume of oil ashore (m^3)		1	**10 (Total volume 13.2 m^3)^**	-	-
Total area of entrained hydrocarbon exposure (km^2)	10 ppb	7,387	9,033	7,353	3,842
	100 ppb	1,173	748	**2,509**	716
	1,000 ppb	-	113	113	73
Total area of dissolved hydrocarbon exposure (km^2)	10 ppb	-	382	363	407
	50 ppb	-	4	0	**67**
	400 ppb	-	-	-	-
Start Date		16th February 2010 12pm	28th July 2012 11am	9th May 2015 6pm	23rd September 2017 7pm

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

12.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 92, which started on the 16th of February 2010.

Figure 12.12 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 12.13 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 12.14 presents the fates and weathering graph for the corresponding single spill trajectory and Table 12.8 summarises the mass balance peaks and at the end of the simulation.

Table 12.8 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	650	0.5	2
Entrained (m^3)	624	2.0	195
Dissolved (m^3)	1	3.4	0
Evaporation (m^3)	605	30.0	605
Decay (m^3)	369	30.0	369
Ashore (m^3)	2	18.5	1

12.2.2 Deterministic Case: Largest volume of oil ashore and longest length of shoreline contacted by oil above 100 g/m^2.

The deterministic trajectory that resulted in the largest volume of oil ashore also resulted in the longest length of shoreline contacted by oil above 100 g/m^2. This simulation was identified as run number 33, which started on the 28th of July 2012.

Figure 12.15 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 12.16 and Figure 12.17 display the time series of the volume of shoreline oil and the length of shoreline oil accumulation above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation respectively.

Figure 12.18 presents the fates and weathering graph for the corresponding single spill trajectory and Table 12.9 summarises the mass balance peaks and at the end of the simulation.

Table 12.9 Summary of the mass balance for the trajectory with the largest volume of oil ashore and the longest length of shoreline contacted by oil above 100 g/m^2.

12.2.3 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as run number 69, which started on the 9th of May 2015.

Figure 12.19 illustrates the zones of potential entrained hydrocarbon exposure over the 30-day simulation.

Figure 12.20 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 30-day simulation.

13 RESULTS – SCENARIO 4 – A 1,165 M^3 SURFACE RELEASE OF MGO AT KINGFISH A

This scenario examined a 1,165 m^3 surface release of MGO over 12 hours at Kingfish A. A total of 100 spill simulations were run and each simulation was tracked for 30 days. The results are presented on an annual basis.

Sections 13.1 and 13.2 present the annual stochastic analysis and deterministic analysis results, respectively.

13.1 Stochastic Analysis

13.1.1 Floating Oil Exposure

Table 13.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 70.9 km (northeast), 48.9 km (southwest) and 16.6 km (southwest), respectively.

Table 13.2 summarises the potential floating oil exposure, minimum time and maximum residence time of floating oil exposure to individual receptors.

With the exception of the receptors the release location is within (see

Table 9.2), the White-faced Storm-petrel - Foraging (BIA) recorded the highest probability of exposure at 6% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach the same receptor the quickest at 0.71 days (17.04 hours) following the spill commencement.

Figure 13.1 presents the zones of potential floating oil exposure for all thresholds, while Figure 13.2 to Figure 13.4 present the maximum residence time of floating oil exposure for all thresholds assessed under annual conditions.

Table 13.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

Distance and direction travelled	Zones of potential floating oil exposure		
	Annual		
	Low	Moderate	High
Maximum distance (km) from release location	70.9	48.9	16.6
Maximum distance (km) from release location (99th percentile)	54.9	42.7	16.6
Direction	NE	SW	SW

Table 13.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

	Receptor	Annual

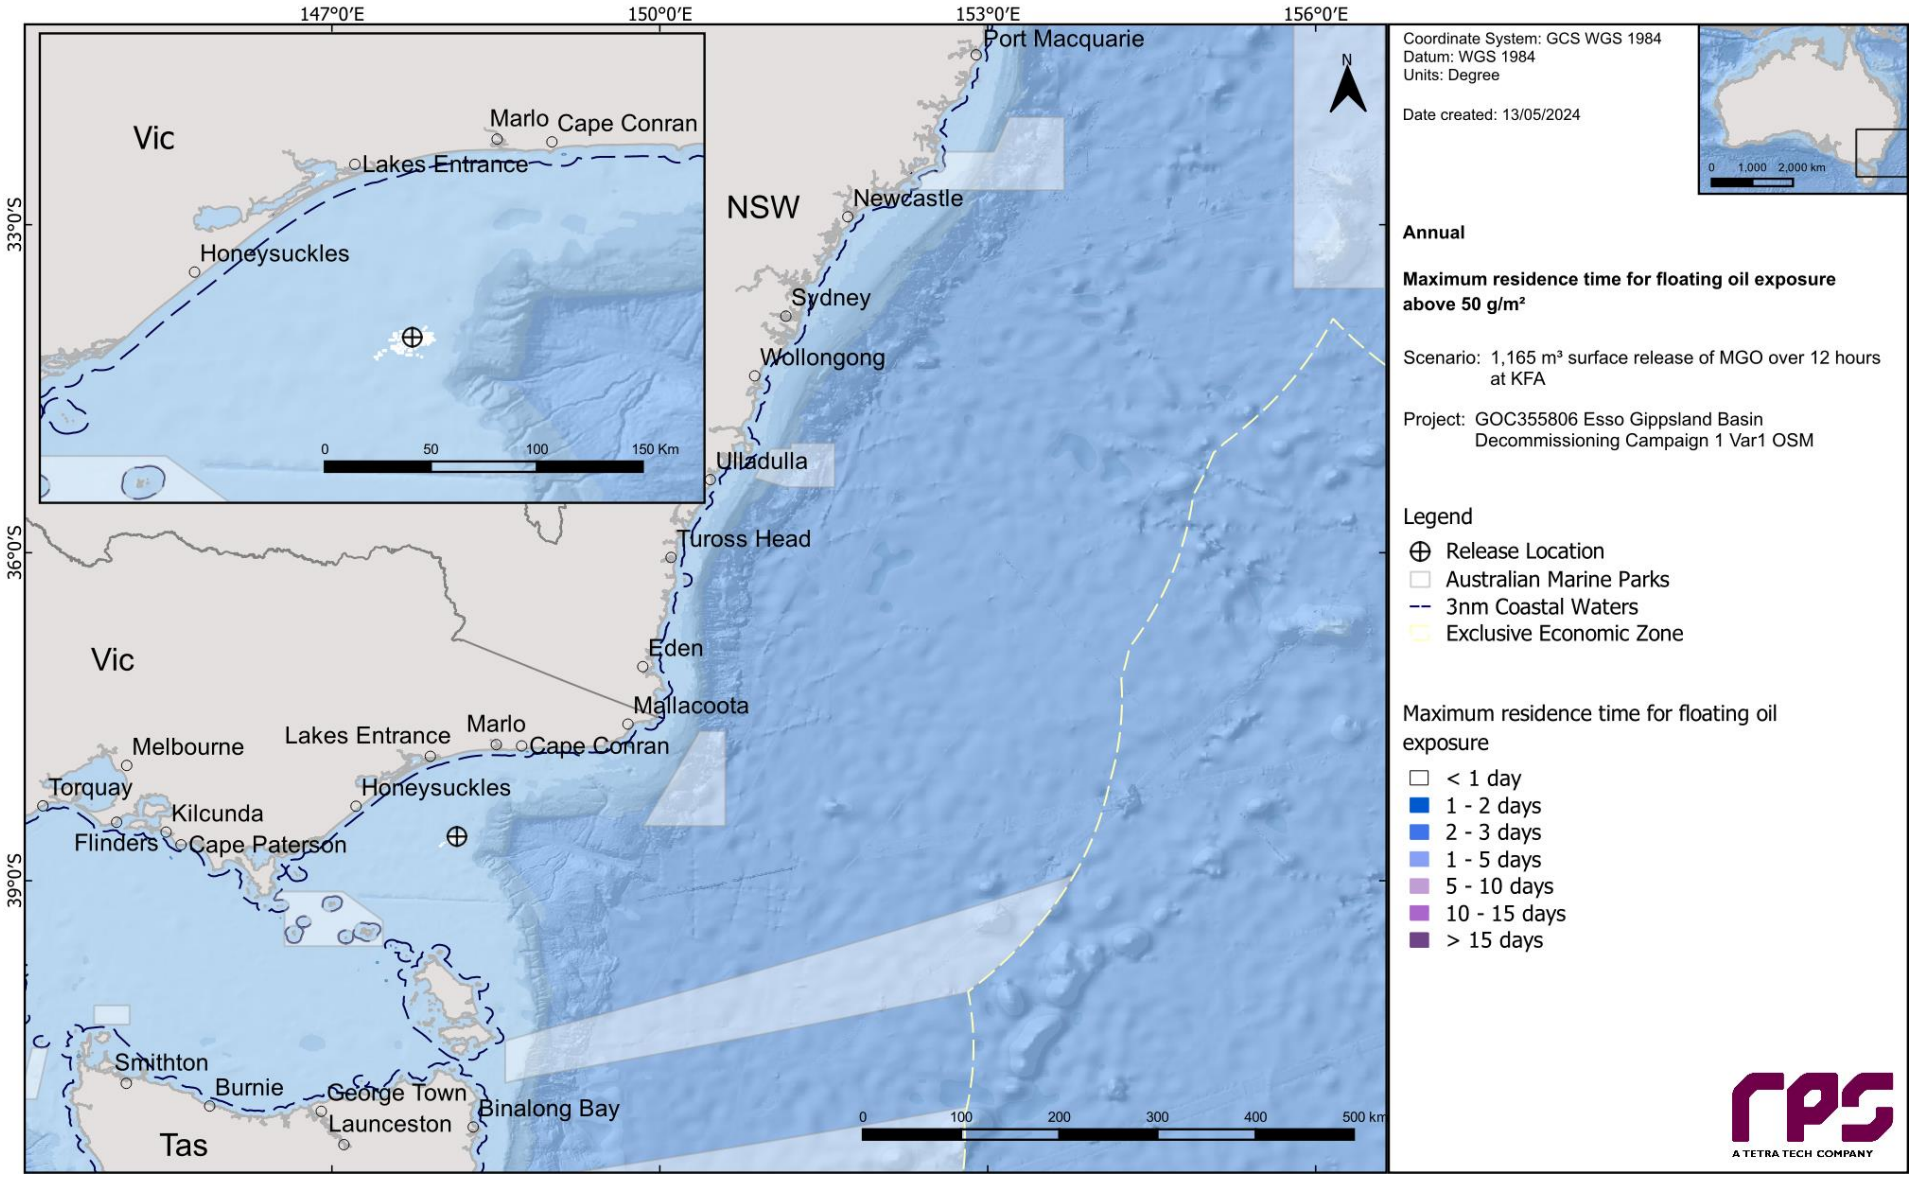

Figure 13.4 Maximum residence time of floating oil exposure above 50 g/m^2, in the event of a 1,165 m^3 surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

13.1.2 Shoreline Accumulation

Table 13.3 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 18% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 6.04 days. The maximum total volume ashore for a single spill trajectory was 21 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds were 45 km and 5 km, respectively. No shoreline contact was predicted at the high threshold.

Table 13.4 summarises the shoreline accumulation statistics for individual receptors.

The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Montague Island (LGA) (7%). The maximum volume of oil ashore was 14.3 m^3 for the same receptor. Montague Island (LGA) was also forecast to record the quickest time before oil accumulation at the 10 g/m^2 threshold at 6.04 days (144.96 hours).

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 13.5.

Table 13.3 Summary of oil accumulation across all shorelines. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	18
Absolute minimum time for visible oil to shore (days)	6.04
Maximum total volume of hydrocarbons ashore (m^3) ^	21
Average total volume of hydrocarbons ashore (m^3) ^	1.6
Maximum length of the shoreline at **10 g/m^2** (km)	45
Average shoreline length (km) at **10 g/m^2** (km)	8.6
Maximum length of the shoreline at **100 g/m^2** (km)	5
Average shoreline length (km) at **100 g/m^2** (km)	3.5
Maximum length of the shoreline at **1,000 g/m^2** (km)	-
Average shoreline length (km) at **1,000 g/m^2** (km)	-

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

Table 13.4 Summary of oil accumulation on individual shoreline receptors. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

13.1.3 In-water exposure

13.1.3.1 Dissolved Hydrocarbons

Table 13.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure, for all thresholds assessed.

Excluding the receptors that the release location is within (see

Table 9.2), the probability of exposure at concentrations equal to, or greater than, 10 ppb is greatest at Upwelling East of Eden (KEF) (8%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 145 ppb, including the receptors the release location lies within, followed by the White-faced Storm-petrel – Foraging (BIA) at 83.8 ppb.

Figure 13.6 presents the zones of potential dissolved hydrocarbon exposure for 0-10 m depth layer.

Figure 13.7 and Figure 13.8 present the maximum residence time of dissolved hydrocarbon exposure for the low and moderate thresholds, respectively.

Table 13.5 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

13.1.3.2 Entrained Hydrocarbons

Table 13.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure for all thresholds assessed.

Except for the receptors the release location is within (see

Table 9.2), the highest probability of low entrained hydrocarbon exposure was 56% recorded for the White-faced Storm-petrel – Foraging (BIA). The quickest time for exposure at the same threshold was 0.29 days (6.96 hours) for the White-faced Storm-petrel – Foraging (BIA). Additionally, the highest entrained hydrocarbon concentration was predicted to be 11,353 ppb, including the receptors the release location lies within, followed by 1,427 ppb at White-faced Storm-petrel – Foraging (BIA).

Figure 13.9 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer.

Figure 13.10 and Figure 13.11 present the maximum residence time of entrained hydrocarbon exposure for 10 ppb and 100 ppb.

Table 13.6 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Kingfish A. The results reflect annual conditions.

13.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2; (Section 13.2.1)
b. Largest (total) volume of oil ashore (Section 13.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m^2 (Section 13.2.2)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 13.2.3)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 13.2.4)

Table 13.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 13.7 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria			
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore and longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Run Number		62	29	68	94
Total area of floating Oil exposure (km²)	1 g/m²	620	203	10	11
	10 g/m²	**277**	25	3	2
	50 g/m²	4	1	0	1
Total length of shoreline accumulation (km)	10 g/m²	5	41	5	-

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

13.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 62, which started on the 16th of February 2010.

Figure 13.12 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 13.13 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 13.14 presents the fates and weathering graph for the corresponding single spill trajectory and Table 13.8 summarises the mass balance peaks and at the end of the simulation.

Table 13.8 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	655	0.5	2
Entrained (m^3)	645	2.1	200
Dissolved (m^3)	1	4.5	0
Evaporation (m^3)	596	30.0	596
Decay (m^3)	374	30.0	374
Ashore (m^3)	2	18.9	1

13.2.2 Deterministic Case: Largest volume of oil ashore and longest length of shoreline contacted by oil above 100 g/m^2.

The deterministic trajectory that resulted in the largest volume of oil ashore also resulted in the longest length of shoreline contacted by oil above 100 g/m^2. This simulation was identified as run number 29, which started on the 13th of September 2010.

Figure 13.15 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 13.16 and Figure 13.17 display the time series of the volume of shoreline oil and the length of shoreline oil accumulation above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation, respectively.

Figure 13.18 presents the fates and weathering graph for the corresponding single spill trajectory and Table 13.9 summarises the mass balance peaks and at the end of the simulation.

13.2.3 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as run number 68, which started on the 9th of October 2018.

Figure 13.19 illustrates the zones of potential entrained hydrocarbon exposure over the 30-day simulation.

Figure 13.20 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 30-day simulation.

14 RESULTS – SCENARIO 5 – A 1,165 M^3 SURFACE RELEASE OF MGO AT FLOUNDER

This scenario examined a 1,165 m^3 surface release of MGO over 12 hours at Flounder. A total of 100 spill simulations were run and each simulation was tracked for 30 days. The results are presented on an annual basis.

Sections 14.1 and 14.2 present the annual stochastic analysis and deterministic analysis results, respectively.

14.1 Stochastic Analysis

14.1.1 Floating Oil Exposure

Table 14.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distances and corresponding directions from the release location to the low (1–10 g/m^2), moderate (10–50 g/m^2) and high (>50 g/m^2) exposure zones were 179.5 km (east-northeast), 39.2 km (south-southwest) and 18.5 km (south-southwest), respectively.

Table 14.2 summarises the potential floating oil exposure, minimum time and maximum residence time of floating oil exposure to individual receptors.

With the exception of the receptors the release location is within (see

Table 9.2), Antipodean Albatross – Foraging (BIA) recorded the highest probability of exposure at 18% to concentrations exceeding 1 g/m^2. Floating oil at the 1 g/m^2 threshold was predicted to reach the same receptor (Antipodean Albatross – Foraging (BIA)) the quickest at 0.38 days (9.12 hours) following the spill commencement.

Figure 14.1 presents the zones of potential floating oil exposure for all thresholds, while Figure 14.2 to Figure 14.4 present the maximum residence time of floating oil exposure for all thresholds assessed under annual conditions.

Table 14.1 Maximum distance and direction from the release location to the edge of floating oil exposure. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

Distance and direction travelled	Zones of potential floating oil exposure		
	Annual		
	Low	Moderate	High
Maximum distance (km) from release location	179.5	39.2	18.5
Maximum distance (km) from release location (99th percentile)	69.8	36.3	17.2
Direction	ENE	SSW	SSW

14.1.2 Shoreline Accumulation

Table 14.3 presents a summary of the potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low (10 g/m^2) threshold was 17% throughout the year. The minimum time before oil accumulation at, or above, the low threshold was 5.08 days. The maximum total volume ashore for a single spill trajectory was 25.9 m^3, and the maximum length of shoreline with accumulation above the low and moderate thresholds were 41 km and 9 km, respectively. No shoreline contact was predicted at the high threshold.

Table 14.4 summarises the shoreline accumulation statistics for individual receptors.

The highest probability of shoreline oil accumulation at the 10 g/m^2 threshold was forecast for Bega Valley shoreline (LGA and Sub-LGA) (8%). The maximum volume of oil ashore was 18.1 m^3 for the same receptors. Montague Island (LGA) was forecast to record the quickest time before oil accumulation at the 10 g/m^2 threshold at 5.08 days (121.92 hours).

The maximum potential shoreline loadings above each shoreline thresholds are presented in Figure 14.5.

Table 14.3 Summary of oil accumulation across all shorelines. Results are based on a 1,165 m^3 surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	17

14.1.3 In-water exposure

14.1.3.1 Dissolved Hydrocarbons

Table 14.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure, for all thresholds assessed.

Excluding the receptors that the release location is within (see

Table 9.2), the probability of exposure at concentrations equal to, or greater than, 10 ppb is greatest at the Antipodean Albatross - Foraging (BIA) (13%). The maximum dissolved hydrocarbon concentration at any given receptor(s) was shown to be 197.3 ppb, including the receptors the release location lies within, followed by the Antipodean Albatross - Foraging (BIA) with a concentration of 129.8 ppb.

Figure 14.6 present the zones of potential dissolved hydrocarbon exposure for 0-10 m depth layer.

Figure 14.7 and Figure 14.8 presents the maximum residence time of dissolved hydrocarbon exposure for the low and moderate thresholds, respectively.

Table 14.5 Probability of dissolved hydrocarbons exposure to marine based receptors in the 0–10 m depth. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

14.1.3.2 Entrained Hydrocarbons

Table 14.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure for all thresholds assessed.

Except for the receptors the release location is within (see

Table 9.2), the highest probability of low entrained hydrocarbon exposure was 59% recorded for the Antipodean Albatross – Foraging (BIA). The quickest time for exposure at the same threshold was 0.17 days (4.08 hours) for the Antipodean Albatross – Foraging (BIA). The highest entrained hydrocarbon concentration was predicted to be 18,716.1 ppb, including the receptors the release location lies within, followed by 2,987.4 ppb at Antipodean Albatross – Foraging (BIA).

Figure 14.9 presents the zones of potential entrained hydrocarbon exposure for the 0-10 m depth layer.

Figure 14.10 and Figure 14.11 present the maximum residence time of entrained hydrocarbon exposure for 10 ppb and 100 ppb.

Table 14.6 Probability of entrained hydrocarbons exposure to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

*The release location resides within the receptor boundaries.

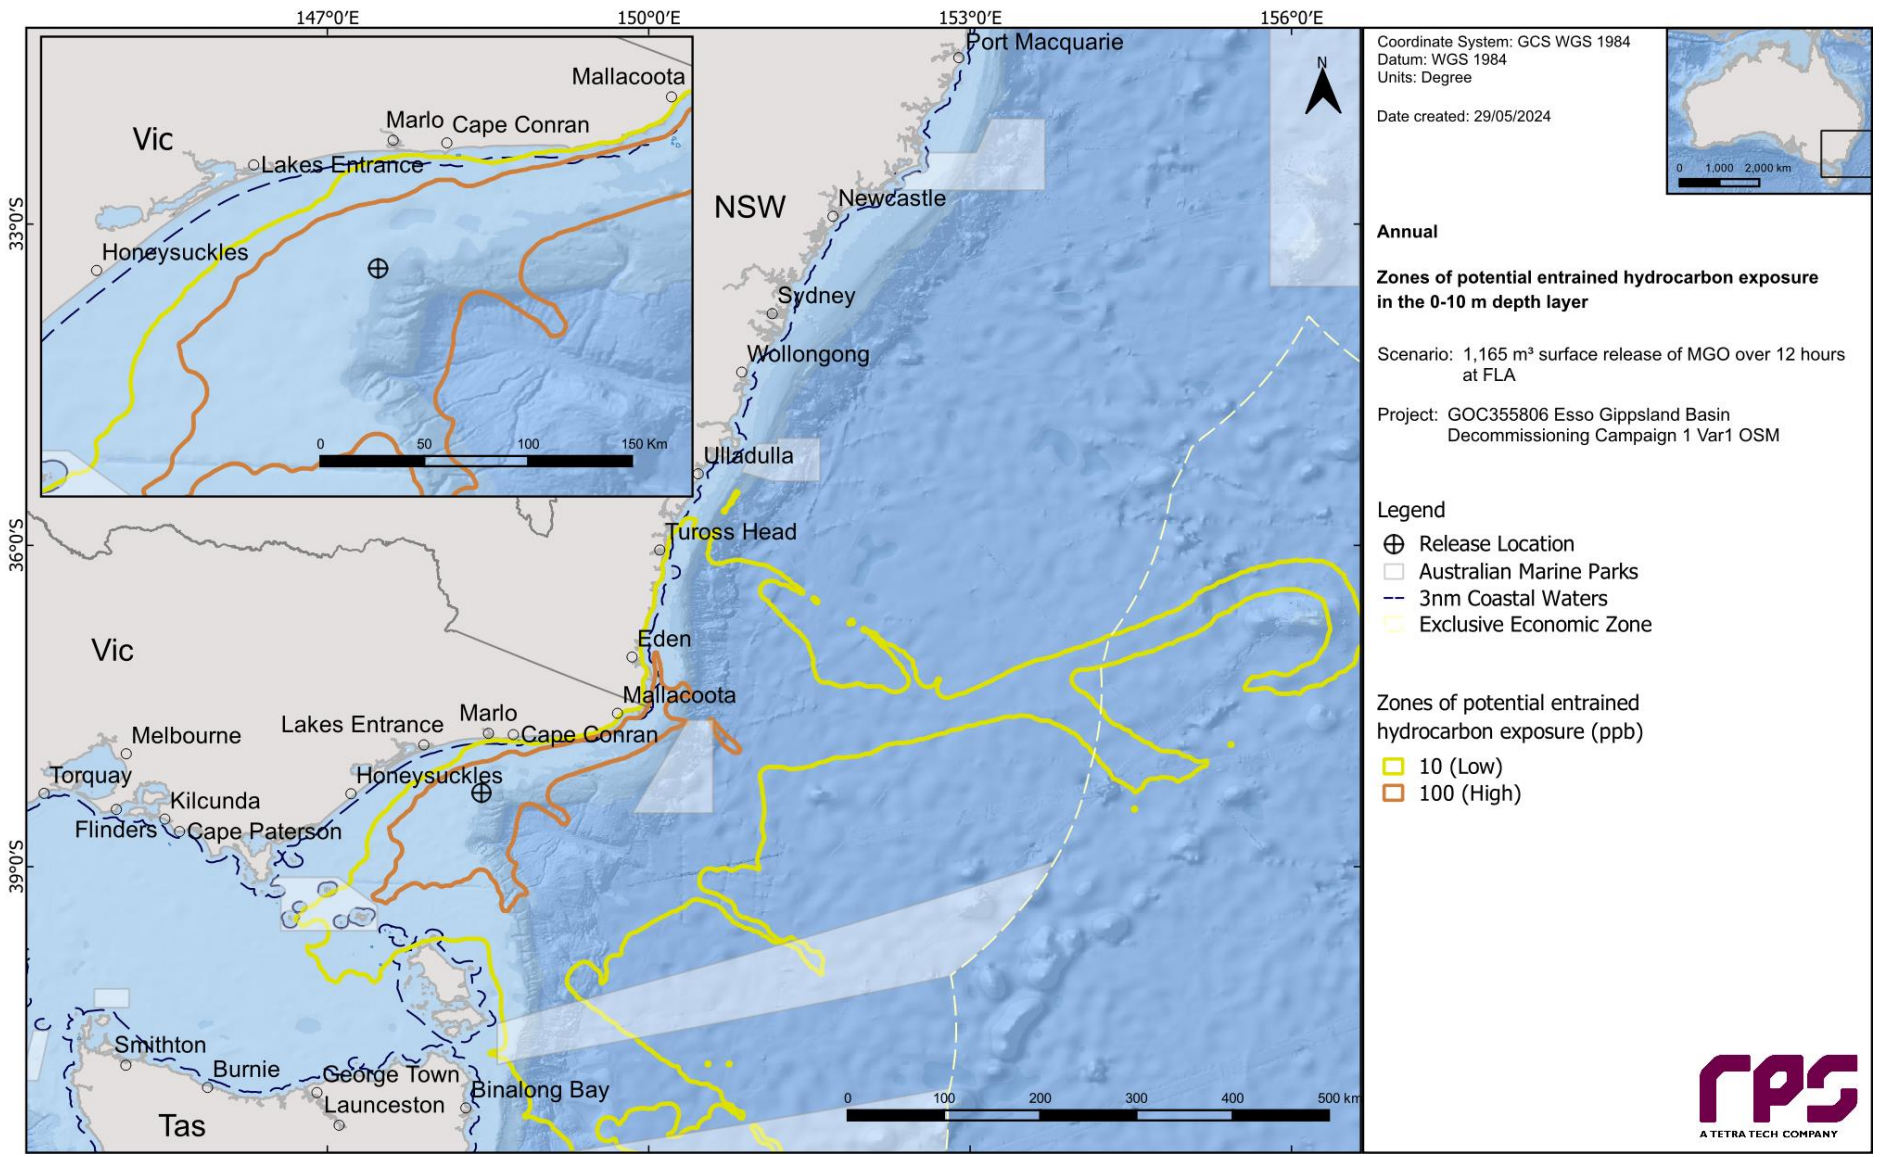

Figure 14.9 Zones of potential entrained hydrocarbon exposure at 0-10 m below the sea surface in the event of a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

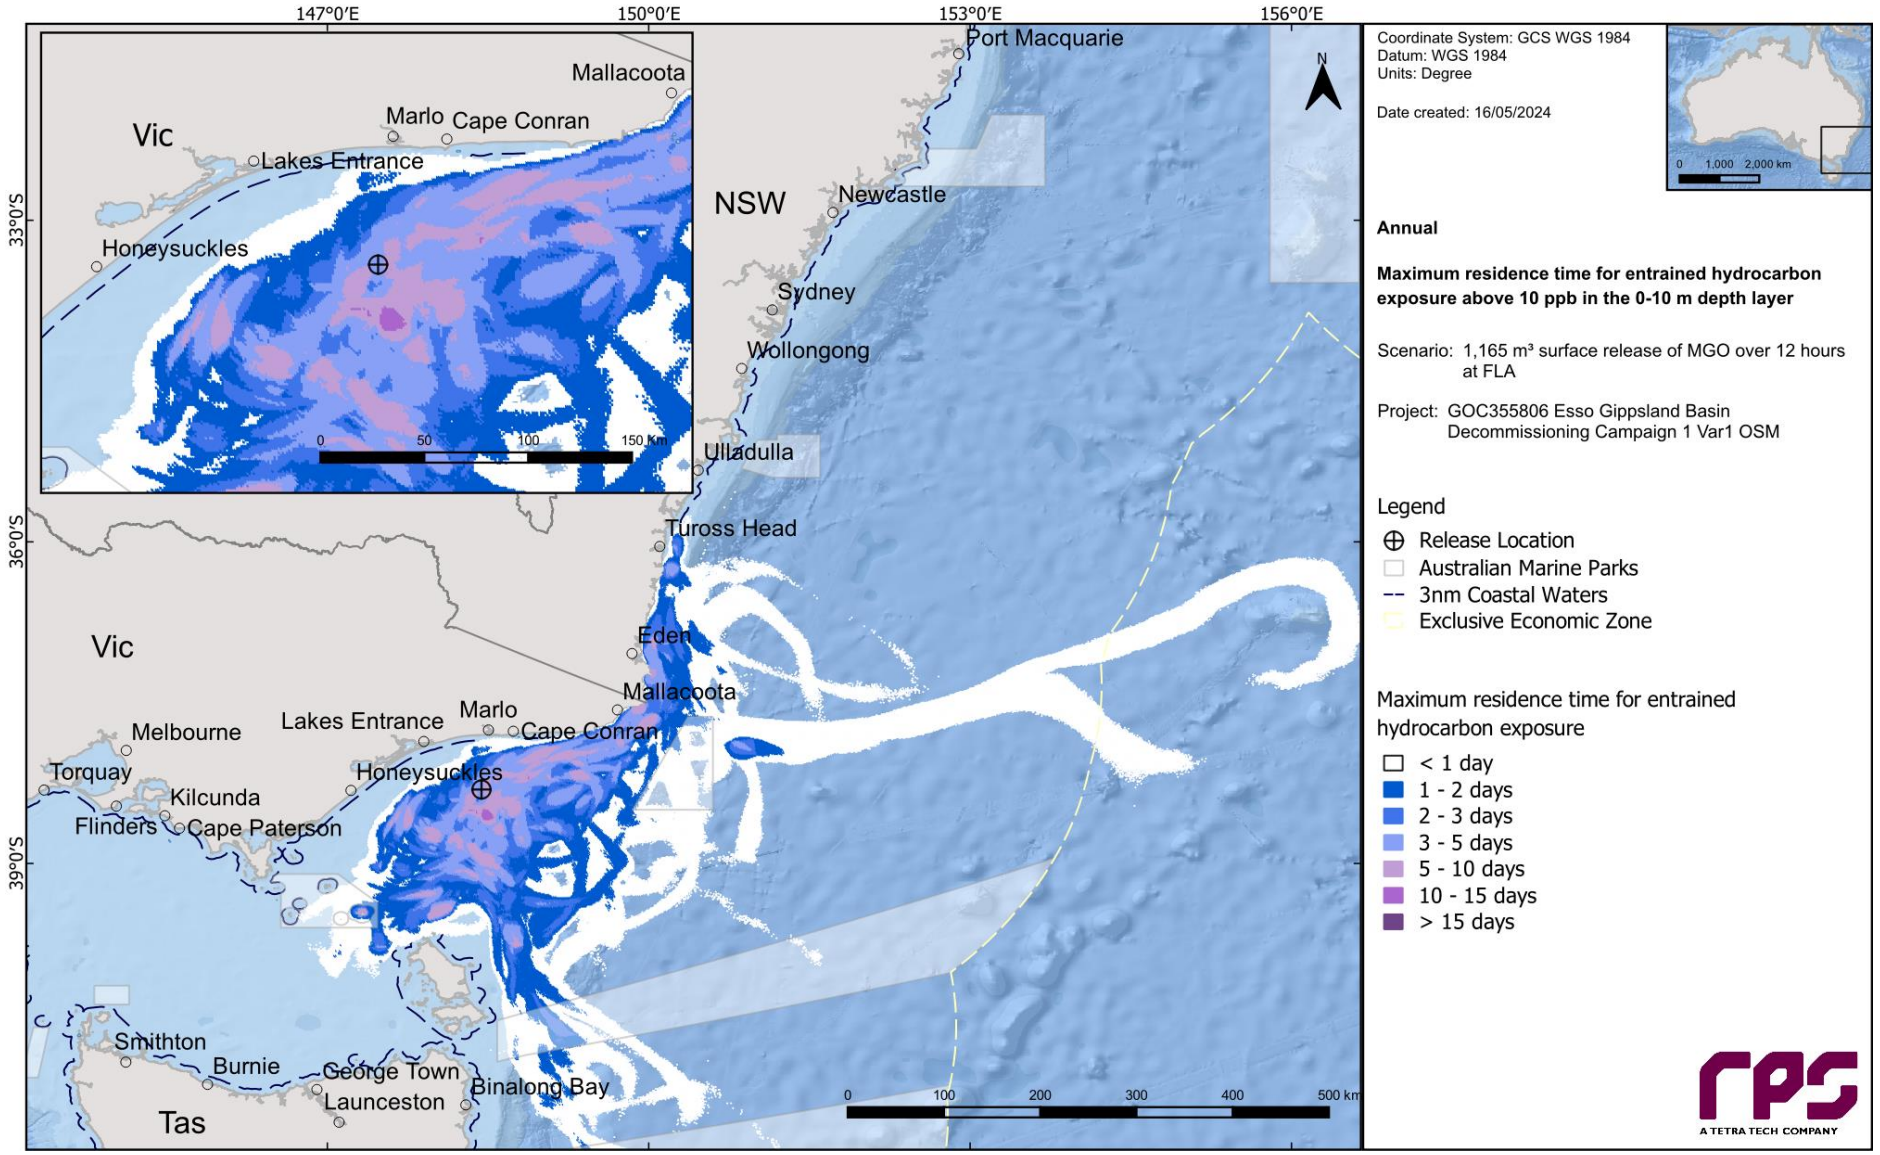

Figure 14.10 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

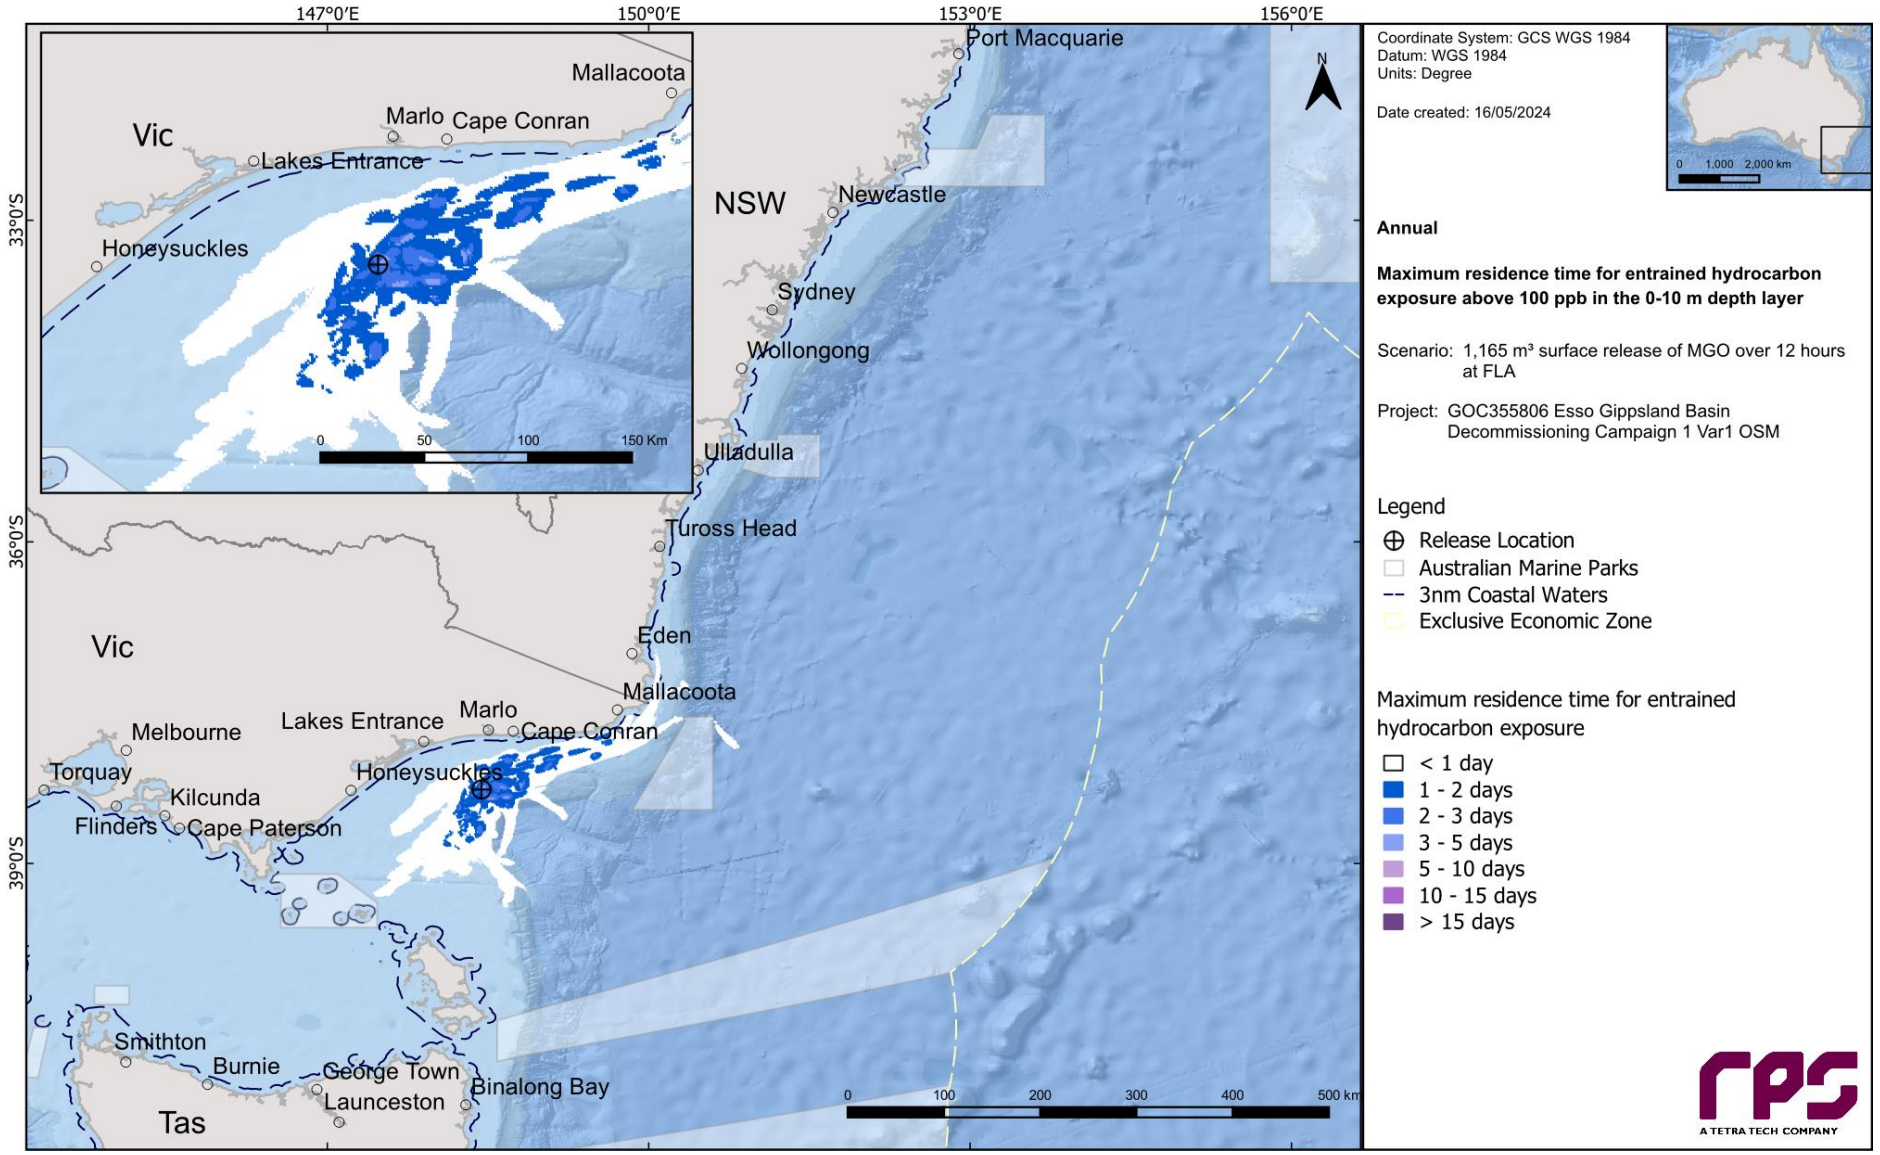

Figure 14.11 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 1,165 m³ surface release of MGO over 12 hours at Flounder. The results reflect annual conditions.

14.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m^2; (Section 14.2.1)
b. Largest (total) volume of oil ashore (Section 14.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m^2 (Section 14.2.2)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 14.2.3)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 14.2.4)

Table 14.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 14.7 Summary of the worst-case deterministic analysis based on the scenario presented in the stochastic analysis section.

Variable	Threshold	Deterministic Analysis Criteria			
		Largest swept area of floating oil >10 g/m²	Largest volume of oil ashore and longest length of shoreline with accumulation >100 g/m²	Largest area of entrained hydrocarbon exposure >100 ppb	Largest area of dissolved hydrocarbon exposure >50 ppb
Run Number		62	72	97	58
Total area of floating Oil exposure (km²)	1 g/m²	314	8	327	28
	10 g/m²	**195**	1	185	1
	50 g/m²	7	-	9	-
Total length of shoreline accumulation (km)	10 g/m²	3	23	1	2
	100 g/m²	-	**8**	-	-
	1,000 g/m²	-	-	-	-
Minimum time before accumulation on any shoreline (hours)	10 g/m²	234	180	268	552
	100 g/m²	-	187	-	-
	1,000 g/m²	-	-	-	-
Peak volume of oil ashore (m³)		-	**16 (Total volume 25.9 m³)^**	-	-
Total area of entrained hydrocarbon exposure (km²)	10 ppb	9,651	6,292	9,966	8,705
	100 ppb	1,951	1,423	**2,173**	1,478
	1,000 ppb	-	80	33	54
Total area of dissolved hydrocarbon exposure (km²)	10 ppb	-	166	-	520
	50 ppb	-	-	-	**56**
	400 ppb	-	-	-	-
Start Date		11th March 2016 5am	17th September 2010 6pm	10th March 2016 11pm	13th November 2015 3am

^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay.

14.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m^2

The deterministic trajectory that resulted in the largest swept area of floating oil above 10 g/m^2 was identified as run number 62, which started on the 11th of March 2016.

Figure 14.12 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 14.13 displays the time series of the area of sea surface exposure above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation.

Figure 14.14 presents the fates and weathering graph for the corresponding single spill trajectory and Table 14.8 summarises the mass balance peaks and at the end of the simulation.

Table 14.8 Summary of the mass balance for the trajectory with the largest swept area of floating oil above 10 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	701	0.5	0
Entrained (m^3)	600	1.8	220
Dissolved (m^3)	1	6.6	0
Evaporation (m^3)	569	30.0	569
Decay (m^3)	383	30.0	383
Ashore (m^3)	1	11.1	0

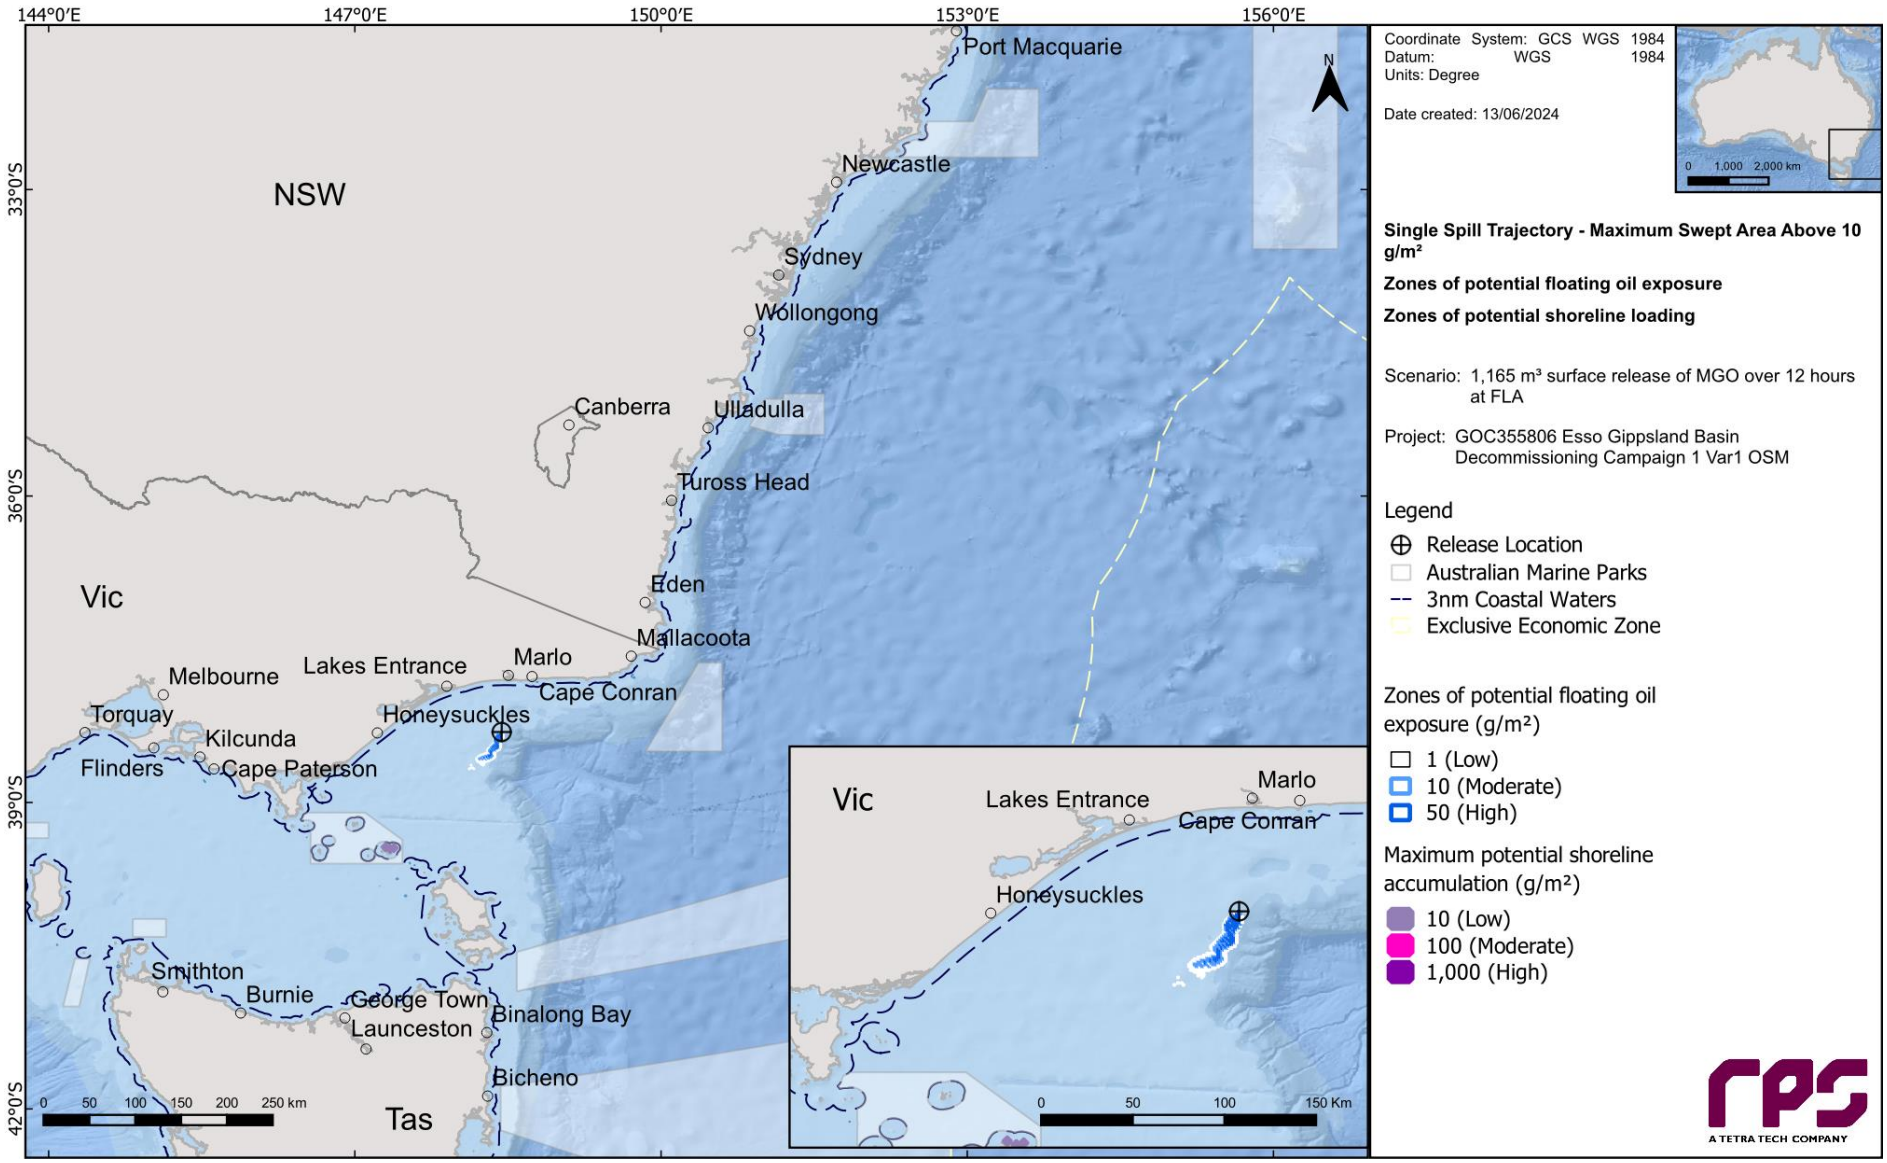

Figure 14.12 Zones of potential floating oil exposure and shoreline accumulation, for the trajectory with the largest swept area of floating oil above 10 g/m².

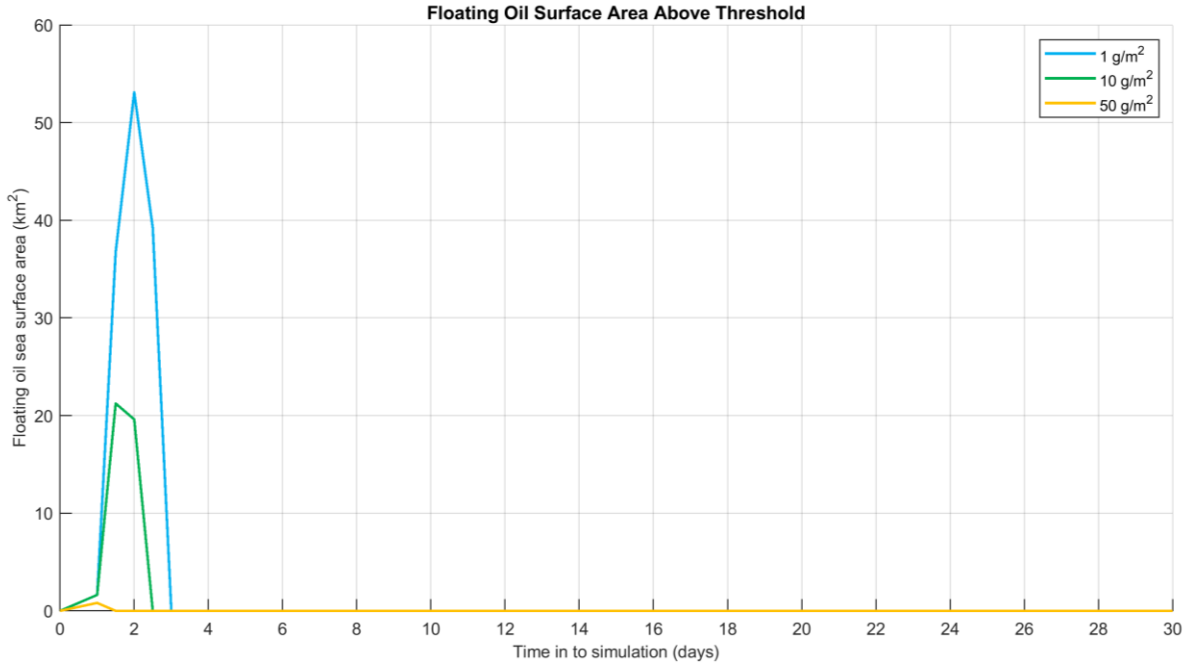

Figure 14.13 Time series of floating oil exposure above each threshold for the trajectory with the largest swept area of floating oil above 10 g/m^2.

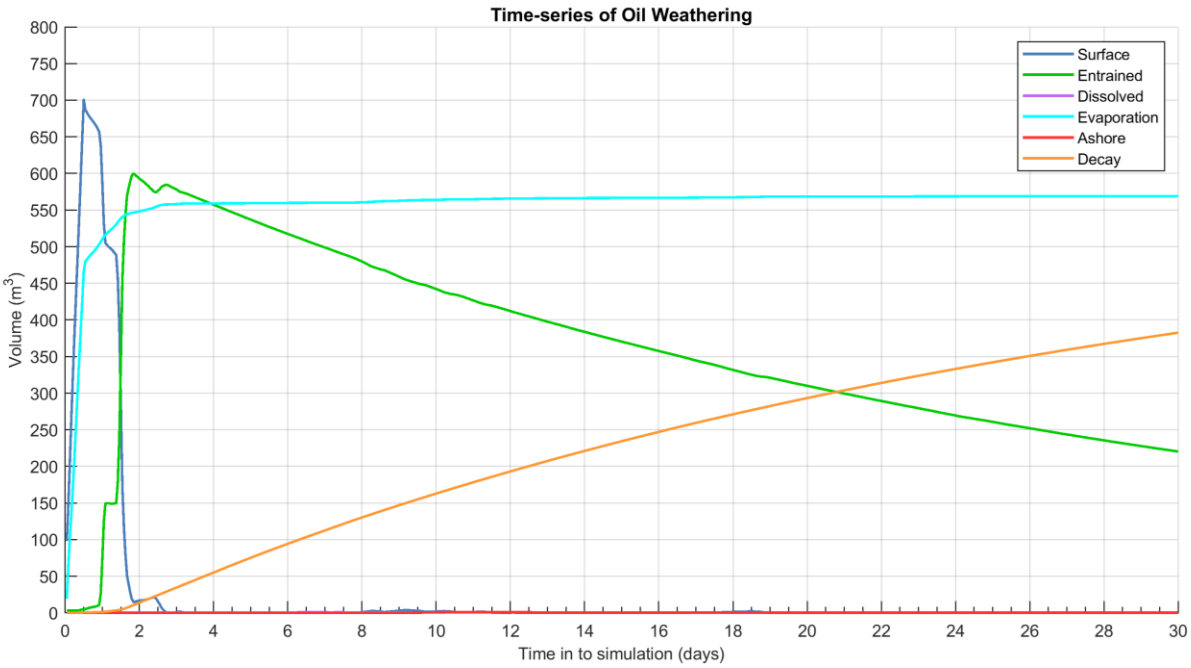

Figure 14.14 Predicted weathering and fates graph for the trajectory with the largest swept area of floating oil above 10 g/m^2.

14.2.2 Deterministic Case: Largest volume of oil ashore and longest length of shoreline contacted by oil above 100 g/m^2.

The deterministic trajectory that resulted in the largest volume of oil ashore also resulted in the longest length of shoreline contacted by oil above 100 g/m^2. This simulation was identified as run number 72, which started on the 17th of September 2010.

Figure 14.15 illustrates the floating oil exposure and shoreline accumulation over the 30-day simulation.

Figure 14.16 and Figure 14.17 display the time series of the volume of shoreline oil and the length of shoreline oil accumulation above the low (1 g/m^2), moderate (10 g/m^2) and high (50 g/m^2) thresholds over the 30-day simulation, respectively.

Figure 14.18 presents the fates and weathering graph for the corresponding single spill trajectory and Table 14.9 summarises the mass balance peaks and at the end of the simulation.

Table 14.9 Summary of the mass balance for the trajectory with the largest volume of oil ashore and the longest length of shoreline contacted by oil above 100 g/m^2.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	56	4.1	0
Entrained (m^3)	993	0.5	181
Dissolved (m^3)	10	0.9	0
Evaporation (m^3)	518	30.0	518
Decay (m^3)	464	30.0	464
Ashore (m^3)	22	14.4	16

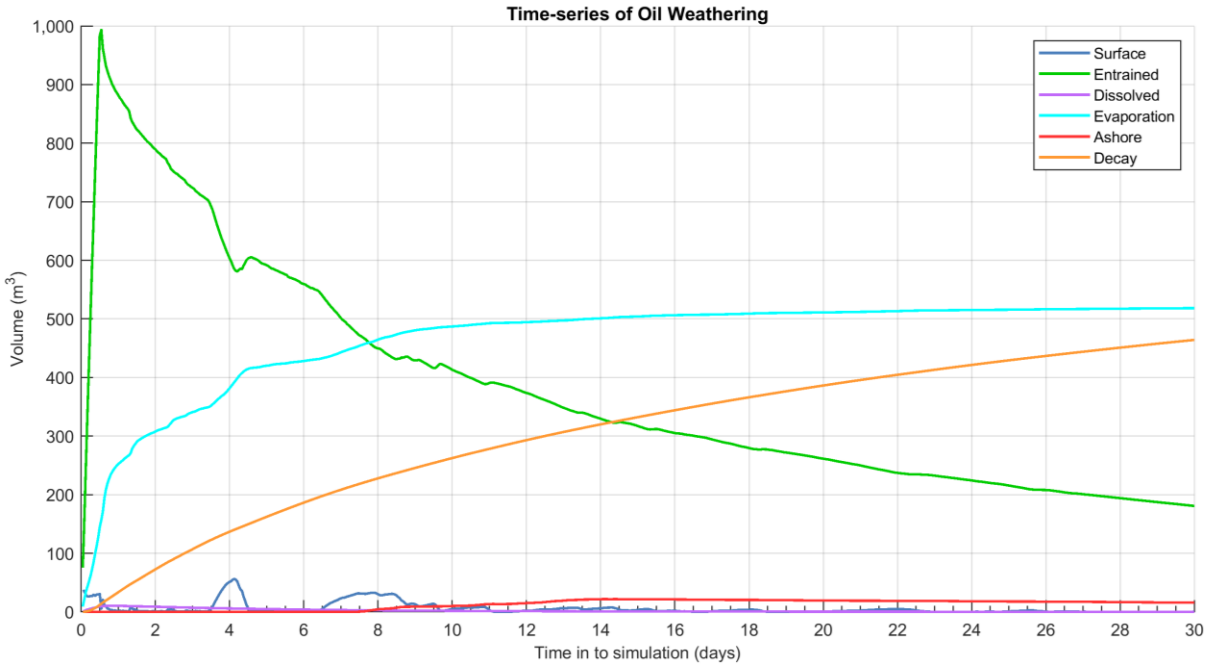

Figure 14.18 Predicted weathering and fates graph for the trajectory with the largest volume of oil ashore and the longest length of shoreline contacted by oil above 100 g/m^2.

14.2.3 Deterministic Case: Largest area of entrained hydrocarbon exposure above 100 ppb

The deterministic trajectory that resulted in the largest area of entrained hydrocarbon exposure above 100 ppb was identified as run number 97, which started on the 10th of March 2016.

Figure 14.19 illustrates the zones of potential entrained hydrocarbon exposure over the 30-day simulation.

Figure 14.20 displays the time series of the area of entrained hydrocarbon exposure at the low (10 ppb) and high (100 ppb) thresholds over the 30-day simulation.

Figure 14.21 presents the fates and weathering graph for the corresponding single spill trajectory and Table 14.10 summarises the mass balance peaks and at the end of the simulation.

Table 14.10 Summary of the mass balance for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	493	0.5	0
Entrained (m^3)	597	2.1	220
Dissolved (m^3)	1	6.6	0
Evaporation (m^3)	557	30.0	557
Decay (m^3)	394	30.0	394
Ashore (m^3)	1	11.2	0

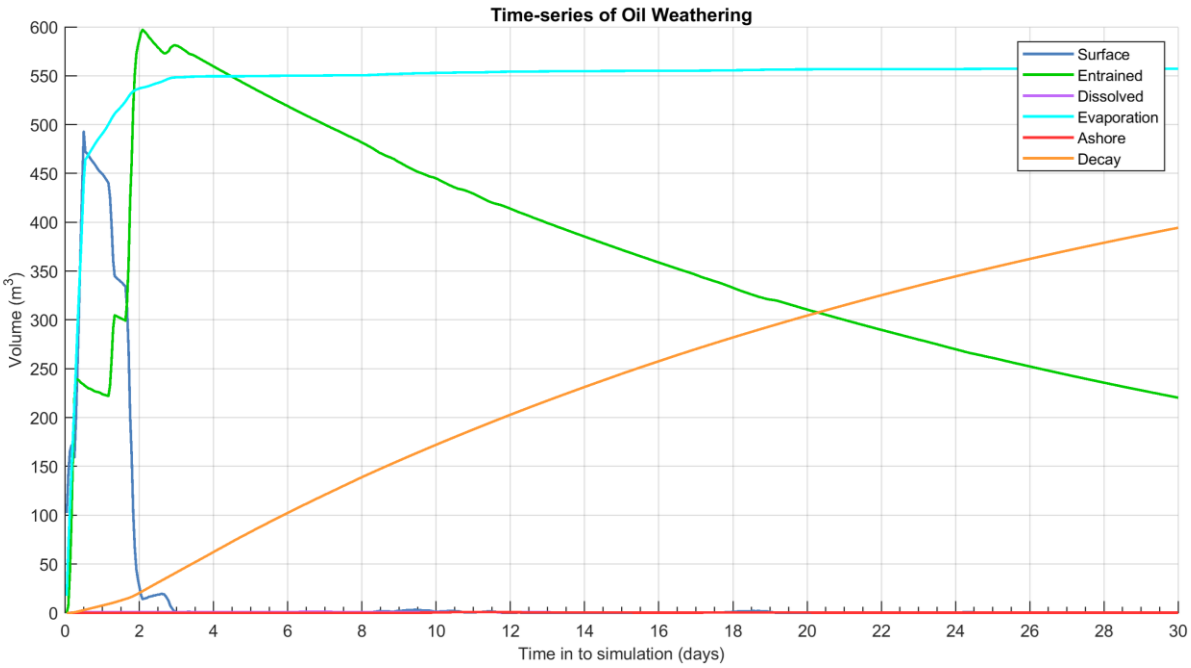

Figure 14.21 Predicted weathering and fates graph for the trajectory with the largest area of entrained hydrocarbon exposure above 100 ppb.

14.2.4 Deterministic Case: Largest area of dissolved hydrocarbon exposure above 50 ppb

The deterministic trajectory that resulted in the largest area of dissolved hydrocarbon exposure above 50 ppb was identified as run number 58, which started on the 13th of November 2015.

Figure 14.22 illustrates the zones of potential dissolved hydrocarbon exposure over the 30-day simulation.

Figure 14.23 displays the time series of the area of dissolved hydrocarbon exposure at the low (10 ppb), moderate (50 ppb) and high (400 ppb) thresholds over the 30-day simulation.

Figure 14.24 presents the fates and weathering graph for the corresponding single spill trajectory and Table 14.11 summarises the mass balance peaks and at the end of the simulation.

Table 14.11 Summary of the mass balance for the trajectory with the largest area of dissolved hydrocarbon exposure above 50 ppb.

Exposure Metrics	Peak Volume	Day of occurrence	Volume at day 30
Surface (m^3)	54	0.3	2
Entrained (m^3)	969	0.5	206
Dissolved (m^3)	12	0.8	0

16 APPENDIX A - MODELLING RESULTS BASED ON 1,000 PPB ENTRAINED HYDROCARBON THRESHOLD

The assessment also considered exposure from entrained hydrocarbon concentrations at, or above, 1,000 ppb, based on the study by French-McCay (2023). Consequently, the entrained exposure areas outlined in Sections 10 to 14 were recalculated to account for the proposed exposure threshold.

16.1 Scenario 1 – A 1,165 m^3 surface release of MGO at Dolphin

Table 16.1 Probability of entrained hydrocarbons exposure above 1,000 ppb to marine based receptors in the 0–10 m depth layer. Results are based on a 1,165 m³ surface release of MGO over 12 hours at Dolphin. The results reflect annual conditions.

Receptors		Maximum entrained hydrocarbon exposure (ppb)	Probability of entrained hydrocarbon exposure (%)	Minimum time before entrained hydrocarbon exposure (days)	Maximum residence time for entrained hydrocarbon exposure (days)
			1,000 ppb	1,000 ppb	1,000 ppb
BIA	Black-browed Albatross - Foraging	10,680.60	62	0.04	0.63

Marine Gas Oil Properties xii
Key Findings xiii

1 INTRODUCTION **1**
1.1 Background 1

2 SCOPE OF WORK **3**

3 REGIONAL CURRENTS **3**
3.1 Tidal currents 5
3.1.1 Grid Setup 5
3.1.2 Tidal Conditions 7
3.1.3 Surface Elevation Validation 7
3.2 Ocean Currents 11
3.3 Surface Currents 11
3.3.1 Transfer Location A 11
3.3.2 Transfer Location B 14

4 WIND DATA **17**
4.1 Transfer Location A 18
4.2 Transfer Location B 21

5 WATER TEMPERATURE AND SALINITY **24**

6 OIL SPILL MODEL – SIMAP **26**
6.1 Stochastic Modelling 26
6.2 Deterministic Modelling 26
6.3 Floating, Shoreline and In-Water Thresholds 27
6.3.1 Floating Oil Exposure Thresholds 27
6.3.2 Shoreline Accumulation Thresholds 28
6.3.3 In-water Exposure Thresholds 29

7 HYDROCARBON PROPERTIES **31**
7.1 Physical Properties 31
7.2 Weathering Properties 32

8 RECEPTORS **34**

9 MODEL SETTINGS **36**

10 PRESENTATION AND INTERPRETATION OF MODEL RESULTS **37**
10.1 Annual Analysis 37

11 RESULTS: SCENARIO 1 – A 280 M^3 SURFACE RELEASE OF MGO AT TRANSFER LOCATION A **38**
11.1 Stochastic Analysis 38
11.1.1 Floating Oil Exposure 38
11.1.2 Shoreline Accumulation 44
11.1.3 Water Column Exposure 47
11.2 Deterministic Analysis 59
11.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m² 61
11.2.2 Deterministic Case: Largest volume of oil ashore 65
11.2.3 Deterministic Case: Longest length of shoreline with accumulation above 100 g/m² 69
11.2.4 Deterministic Case: Largest area of entrained hydrocarbons above 100 ppb 73

11.2.5 Deterministic Case: Largest area of dissolved hydrocarbons above 50 ppb 76

12 RESULTS: SCENARIO 2 – A 280 M³ SURFACE RELEASE OF MGO AT TRANSFER LOCATION B 77

12.1 Stochastic Analysis 77
12.1.1 Floating Oil Exposure 77
12.1.2 Shoreline Accumulation 83
12.1.3 Water Column Exposure 86
12.2 Deterministic Analysis 98
12.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m² 100
12.2.2 Deterministic Case: Largest volume ashore and longest length of shoreline with accumulation above 100 g/m² 104
12.2.3 Deterministic Case: Largest area of entrained hydrocarbons above 100 ppb 108
12.2.4 Deterministic Case: Largest area of dissolved hydrocarbons above 50 ppb 111

The stochastic results were calculated from 100 spill trajectories. 126

TERMS AND ABBREVIATIONS

AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZG	Australian and New Zealand Governments
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
AQR	Aquatic Reserve
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
ASTM	American Society for Testing and Materials
BAs	Bioregional Assessments
BIA	Biologically Important Area
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
BP	Boiling point. The temperature at which the vapor pressure of the liquid is equal to the pressure exerted on it by the surrounding atmosphere
BTEX	Benzene, Toluene, Ethylbenzene, and Xylenes
CA	Conservation Area
CFSR	Climate Forecast System Reanalysis
CHPI	Commonwealth Heritage Place Indigenous
CHPN	Commonwealth Heritage Place Natural
CP	Conservation Park
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
Deterministic oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as “deterministic modelling” provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of ‘worst-case’ oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2017). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
Floating oil exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors
GODAE	Global Ocean Data Assimilation Experiment
HR	Heritage River
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model

HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IBRA	Interim Biogeographic Regionalisation for Australia
IMCRA	Integrated marine and coastal regionalisation areas
IOA	Index of Agreement
ITOPF	International Tanker Owners Pollution Federation Limited
KEF	Key Ecological Feature
LGA	Local Government Areas
MAE	Mean Absolute Error
MAHs	Monoaromatic Hydrocarbons
MNP	Marine National Park
MP	Marine Park
MR	Marine Reserve
MS	Marine Sanctuary
NASA	National Aeronautics and Space Administration (USA)
NCA	Natural Catchment Area
NCEP	National Centres for Environmental Prediction (USA)
NFR	Natural Features Reserve
NHPH	National Heritage Place Historic
NHPI	National Heritage Place Indigenous
NHPN	National Heritage Place Natural
NIW	Nationally Important Wetland
NOAA	National Oceanic and Atmospheric Administration (USA)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NPC	National Park (Commonwealth)
NPS4	National Parks Act Schedule 4 Park or Reserve
NR	Nature Reserve
NRMR	Natural Resource Management Regions
PAH	Polycyclic aromatic hydrocarbons
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics
ppb	Parts per billion (concentration)
psu	Practical salinity units
RA	Reference Area
Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RNAS6	Remote and Natural Area - Schedule 6, National Parks Act
RSB	Reefs, Shoals and Banks

Shoreline accumulation	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 2 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Mapping Analysis Program. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
SRTM	Shuttle Radar Topography Mission
SCA	State Conservation Area
SP	State Park
SPZ	Special Purpose Zone
SR	State Reserve
State Waters	Low water mark seaward for three nautical miles
Stochastic oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area of hydrocarbon exposure and indicates which locations are more likely to be exposed (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations will encompass a much larger area than could be exposed in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the region derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2017) Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment

EXECUTIVE SUMMARY

Background

Esso Australia Pty Ltd (Esso) is planning and preparing to decommission some of the non-producing platforms located in the Gippsland Basin, as part of the first Bass Strait decommissioning campaign (Campaign 1).

To support offshore environmental impact and risk assessments, Esso engaged RPS to perform a comprehensive oil spill modelling study. This study evaluated a hypothetical vessel collision scenario at two different locations as follows:

- **Scenario 1**: A 280 m^3 surface release of marine gas oil (MGO) over 6 hours following a vessel collision at Transfer Location A.
- **Scenario 2**: A 280 m^3 surface release of MGO over 6 hours following a vessel collision at Transfer Location B.

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Mapping Analysis Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Methodology

The modelling study was carried out in several stages. Firstly, a 10-year wind and current dataset (2010–2019) was generated and the currents included the combined influence of three-dimensional large-scale ocean currents and tidal currents. Secondly, the currents, winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, modelling was conducted using a stochastic (random or non-deterministic) approach, which involved running 100 randomly selected single trajectory simulations, with each simulation having the same spill information (location, spill volume, duration and composition of hydrocarbons) but varying start times. This ensured that each spill simulation was subject to a unique set of wind and current conditions.

The SIMAP system, the methods and analysis presented herein use modelling algorithms which have been anonymously peer reviewed and published in international journals. Further, RPS warrants that this work meets and exceeds the ASTM Standard F2067-22 "*Standard Practice for Development and Use of Oil-Spill Trajectory Models*".

Marine Gas Oil Properties

Marine gas oil (MGO) was used for the scenario modelled in this assessment. MGO has an API of 37.6, density of 829.1 kg/m^3 (at 25ºC), with low viscosity (4 cP at 25ºC) classifying it as a Group 2 oil according to ITOPF (2024) and is described as a light-persistent oil according to AMSA (2023) classifications. The oil comprises a significant portion of volatiles and semi- to low volatiles (~95 % total) with 5 % residual components. This means most of the hydrocarbons will evaporate when on the water surface, with the persistent components to remain on the water surface over a longer period.

Key Findings

A detailed summary of the results for all modelled scenarios is provided in the table below.

Summary of key results

Scenario description		Scenario 1 Transfer Location A	Scenario 2 Transfer Location B
Spill volume		280 m^3	280 m^3
Oil type		MGO	MGO
Release depth		Surface	Surface
Release duration		6 hours	6 hours
Simulation length		30 days	30 days
Floating Oil Exposure	Maximum distances from the release location to floating oil exposure thresholds	The maximum distance from the release location to the low (1 g/m²) threshold was 21.22 km. For the moderate (10 g/m²) high (≥ 50 g/m²) thresholds the maximum distances from the release location reduced to 10.76 and 4.38 km, respectively.	The maximum distance from the release location to the low (1 g/m²) threshold was 14.95 km. For the moderate (10 g/m²) high (≥ 50 g/m²) thresholds the maximum distances from the release location reduced to 9.98 and 5.69 km, respectively.
	Highest probability of floating oil exposure to a receptor at, or above, 1 g/m^2	West Gippsland (VIC) NRMR and Victoria State Waters, 67%	West Gippsland (VIC) NRMR and Victoria State Waters, 33%
	Quickest time before exposure to a receptor at, or above, 1 g/m^2	West Gippsland (VIC) NRMR and Victoria State Waters, 0.03 day	West Gippsland (VIC) NRMR and Victoria State Waters, 0.1 day
Shoreline Oil Accumulation	Probability of oil accumulation on **any** shoreline at, or above, 10 g/m^2	82%	88%
	Absolute minimum time for oil to accumulate on shoreline cells at, or above, 10 g/m^2	0.18 day	0.36 day
	Maximum volume of oil ashore from a single spill simulation at, or above, 10 g/m^2	88.2 m^3	30.8 m^3
	Highest probability of oil accumulation for a specific shoreline cell at, or above, 10 g/m^2	Seal Islands, 47%	Seal Islands, 68%
	Maximum volume of oil ashore from a single spill simulation for a specific shoreline cell at, or above, 10 g/m^2	Point Hicks, 18.43 m^3	Wilsons Promontory - East, with, 28.41 m^3
Dissolved Hydrocarbons	Highest probability of dissolved hydrocarbon exposure to a receptor at, or above, 10 ppb	West Gippsland (VIC) NRMR and Victoria State Waters, 7%	West Gippsland (VIC) NRMR and Victoria State Waters, 2%
	Quickest time before exposure to a receptor at, or above, 10 ppb	West Gippsland (VIC) NRMR and Victoria State Waters, 0.21 day	West Gippsland (VIC) NRMR and Victoria State Waters, 0.23 day
Entrained Hydrocarbons	Highest probability of entrained hydrocarbon exposure to a receptor at, or above, 10 ppb	Victoria State Waters, 100%	Victoria State Waters, 100%
	Quickest time before exposure to a receptor at, or above, 10 ppb	West Gippsland (VIC) NRMR and Victoria State Waters, 0.02 day	Victoria State Waters, 0.05 day

1 INTRODUCTION

1.1 Background

Esso Australia Pty Ltd (Esso) is planning and preparing to decommission some of the non-producing platforms located in the Gippsland Basin, as part of the first Bass Strait decommissioning campaign (Campaign 1).

To support offshore environmental impact and risk assessments, Esso engaged RPS to perform a comprehensive oil spill modelling study. This study evaluated a hypothetical vessel collision scenario at two different locations as follows:

- **Scenario 1**: A 280 m^3 surface release of marine gas oil (MGO) over 6 hours following a vessel collision at Transfer Location A.
- **Scenario 2**: A 280 m^3 surface release of MGO over 6 hours following a vessel collision at Transfer Location B.

The coordinates for the release locations used for the above mentioned scenarios are presented in Table 1.1 and are illustrated in Figure 1.1.

The modelling assessment was undertaken on an annual basis.

The purpose of the modelling is to provide an understanding of a conservative 'outer envelope' of the potential area of exposure in the unlikely event of hydrocarbon spill. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent of hydrocarbon exposure.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Mapping Analysis Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions as well as the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein use modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-22 "*Standard Practice for Development and Use of Oil-Spill Trajectory Models*".

Table 1.1 Coordinates and water depth of the release locations.

Location	Latitude	Longitude	Water Depth (m)
Transfer Location A	38° 52' 46" S	146° 44' 38"E	~20
Transfer Location B	39° 1' 49" S	146° 35' 15" E	~45

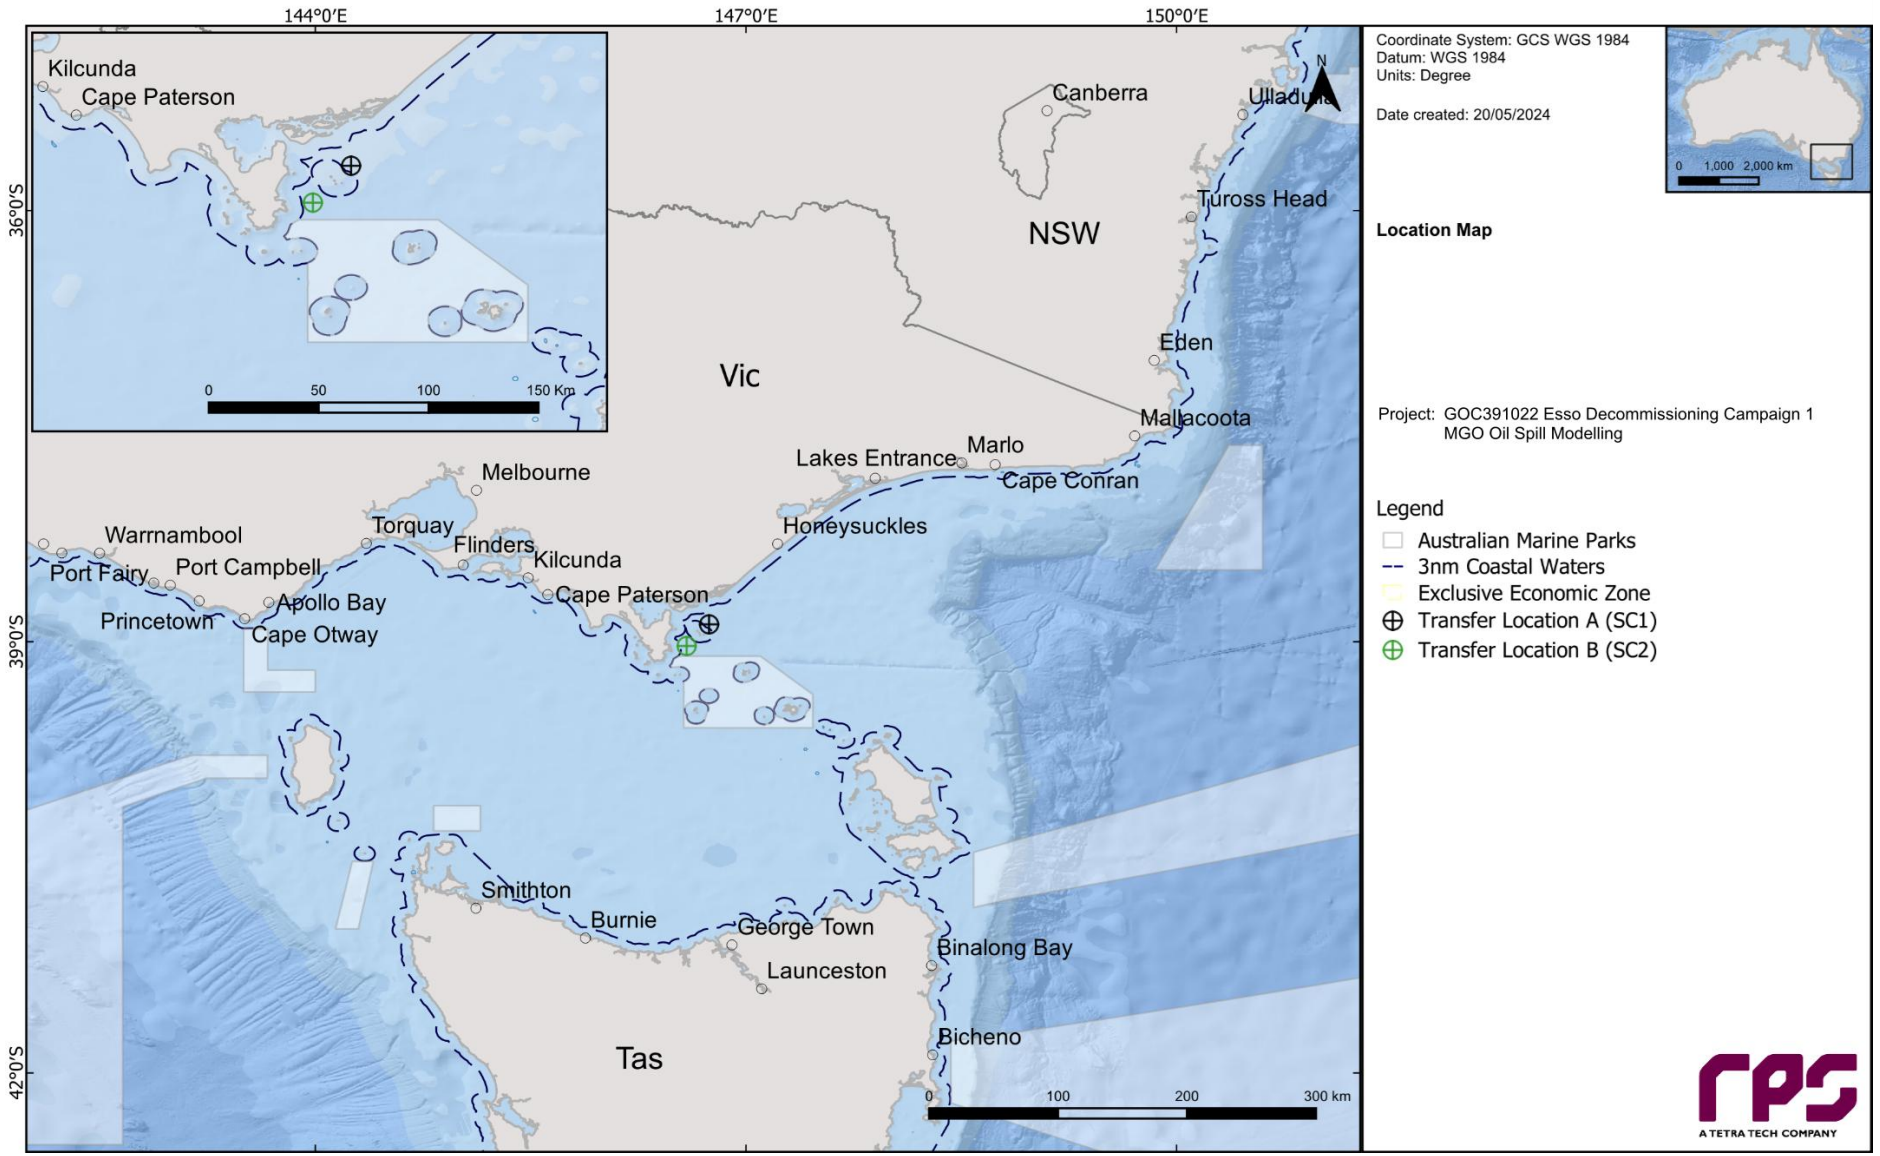

Figure 1.1 Map of the release locations.

2 SCOPE OF WORK

The scope of work included the following components:

- Generate 10 years of winds and three-dimensional currents from 2010 to 2019 (inclusive). The currents included the combined influence of tidal and ocean currents.
- Include the wind and current data and characteristics of the oil type as input into the three-dimensional oil spill model (SIMAP), to model the movement, spreading, weathering and shoreline contact by hydrocarbons over time.
- Run 100 simulations per scenario, with each simulation having the same spill information (location, volume, duration, and oil properties) but randomly varying start times. This ensured that each spill simulation was subjected to unique wind and current conditions.
- Combine the results from the 100 spill simulations per scenario to assess the exposure to waters and shoreline accumulation based upon the NOPSEMA thresholds as well as a threshold of 1,000 ppb for entrained hydrocarbons; and
- From the 100 simulations modelled per scenario, identify, and present the “worst case” deterministic runs, which can be used to inform response planning based on the following criteria:
  a. Largest swept area for surface oil above 10 g/m^2;
  b. Largest volume of oil ashore;
  c. Longest length of shoreline with oil accumulation above 100 g/m^2;
  d. Largest area of entrained hydrocarbon exposure above 100 ppb; and
  e. Largest area of dissolved hydrocarbon exposure above 50 ppb.

3 REGIONAL CURRENTS

Bass Strait is a body of water separating Tasmania from the southern Australian mainland, specifically the state of Victoria. The strait is a relatively shallow area of the continental shelf, connecting the southeast Indian Ocean with the Tasman Sea. Currents within the straight are primarily driven by tides, winds, incident continental shelf waves and density driven flows; high winds and strong tidal currents are frequent within the area (Jones, 1980).

The varied geography and bathymetry of the region, in addition to the forcing of the south-eastern Indian Ocean and local meteorology lead to complex shelf and slope circulation patterns (Middleton & Bye, 2007). Figure 3.1 displays seasonal current trends within the Bass Strait. During winter there is a strong eastward water flow due to the strengthening of the South Australian Current (fed by the Leeuwin Current in the Northwest Shelf), which bifurcates with one extension moving though the Bass Strait, and another forming the Zeehan Current off western Tasmania (Sandery & Kämpf, 2007). During summer, water flow reverses off Tasmania, King Island and the Otway Basin travelling westward, as the coastal current develops due to south-easterly winds.

To accurately describe the variability in currents between the inshore and offshore region, a hybrid regional dataset was developed by combining ocean predictions obtained from HYCOM (Hybrid Coordinate Ocean Model) with surface tidal currents developed by RPS. The following sections provide a summary of the hybrid regional dataset.

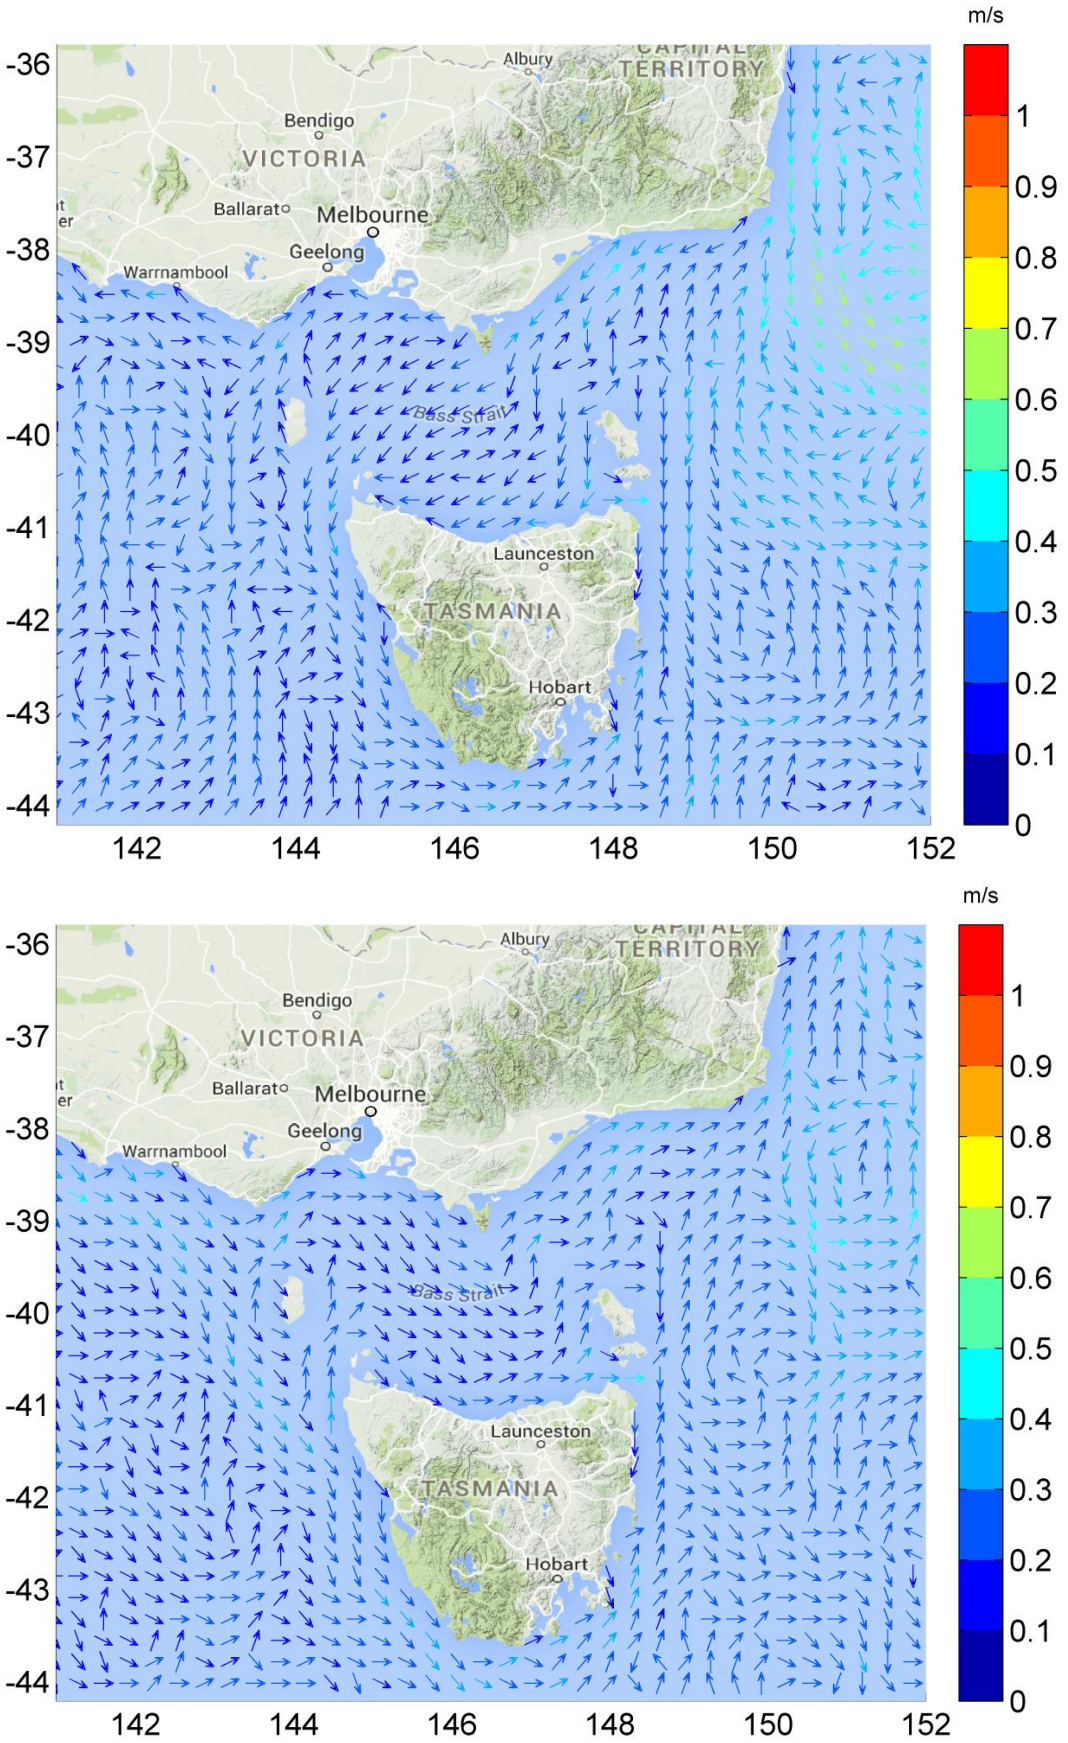

Figure 3.1 HYCOM averaged seasonal surface drift currents during summer (upper image) and winter (lower image).

3.1 Tidal currents

The effects of tides were generated using RPS's advanced ocean/coastal model, HYDROMAP. The HYDROMAP model has been thoroughly tested and verified through field measurements throughout the world for over 35 years (Isaji and Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003; Makarynskyy et al., 2010), whilst being used for a wide variety of disciplines within marine environments (e.g. Zigic et al., 2003, 2009; Talouli et al., 2009; Zigic et al., 2009; King et al., 2010; Makarynskyy et al., 2010, 2015). In fact, HYDROMAP tidal current data have been used as input for the OILMAP hydrocarbon spill modelling system, which forms part of the Incident Management System (IMS) operated by Maritime New Zealand (MNZ), Australian Maritime Safety Authority (AMSA) and the United Kingdom Maritime and Coastguard Agency, as well as several major oil and gas companies.

HYDROMAP employs a sophisticated sub-gridding strategy, which supports up to six levels of spatial resolution, halving the grid cell size as each level of resolution is employed. The sub-gridding allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, and/or of particular interest to a study.

The numerical solution methodology follows that of Davies (1977a and 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji and Spaulding (1984) and Isaji et al. (2001).

3.1.1 Grid Setup

The tidal model domain is sub-gridded to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids are progressively allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over regions with more complex bathymetry. Figure 3.2 shows the tidal model grid covering the study domain.

A combination of datasets was used and merged to describe the shape of the seabed within the grid domain (Figure 3.3). These included spot depths and contours which were digitised from nautical charts released by the hydrographic offices as well as Geoscience Australia database and depths extracted from the Shuttle Radar Topography Mission (SRTM30_PLUS) Plus dataset (see Becker et al., 2009).

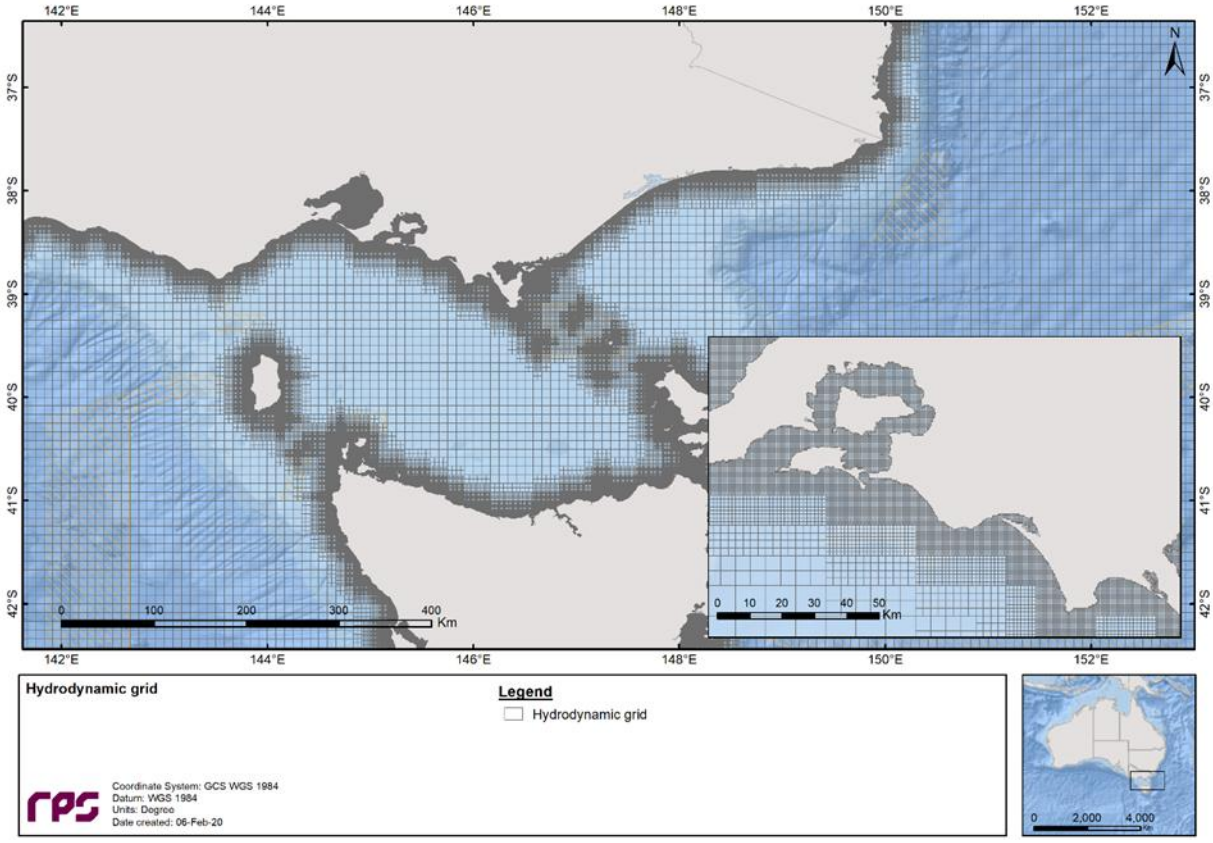

Figure 3.2 Sample of the model grid used to generate the tidal currents for the study region. Higher resolution areas are shown by the denser mesh.

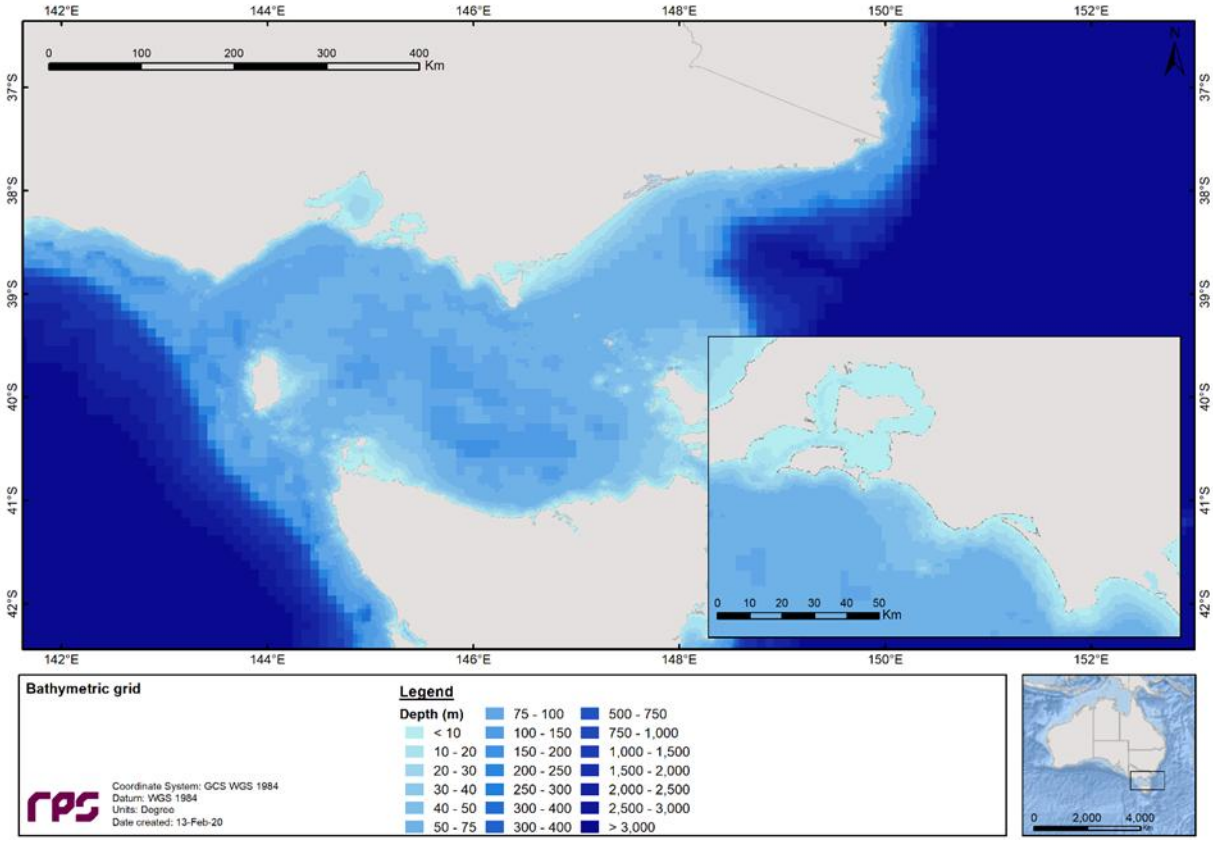

Figure 3.3 Bathymetry defined throughout the tidal model domain.

3.1.2 Tidal Conditions

The ocean boundary data for the regional model was obtained from satellite measured altimetry data (TOPEX/Poseidon 8.0) which provided estimates of the eight dominant tidal constituents at a horizontal scale of approximately 0.25 degrees. The eight major tidal constituents used were K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1. Using the tidal data, time series surface heights were calculated along the open boundaries for the simulation period.

The TOPEX/Poseidon satellite data has a resolution of 0.25 degrees globally, with higher resolution in coastal regions, and is produced and quality controlled by NASA (National Aeronautics and Space Administration). The data capturing satellites, equipped with two altimeters capable of taking sea level measurements accurate to less than ± 5 cm, measured oceanic surface elevations (and the resultant tides) for the period 1992–2005. In total, these satellites carried out 62,000 orbits of the planet. The Topex/Poseidon tidal data have been widely used amongst the oceanographic community, being referenced in more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen 2010; Amores et al., 2019; Sagnieres et al., 2020; Veng et al., 2021; Zeitlhöfler et al., 2023). The Topex/Poseidon tidal data is considered suitably accurate for this study.

3.1.3 Surface Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at a location situated within the study area (Figure 3.4).

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott & Matsuura, 2005) were used.

The MAE (Eq.1) is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott & Matsuura, 2005) and more readily understood. The MAE is determined by:

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i| \qquad \text{Eq.1}$$

Where: N = Number of observations

P_i = Model predicted surface elevation

O_i = Observed surface elevation

The Index of Agreement (IOA; Eq. 2), in contrast, gives a non-dimensional measure of model accuracy or performance. A perfect agreement between the model predicted and observed surface elevations exists if the index gives an agreement value of 1, and complete disagreement between model and observed surface elevations will produce an index measure of 0 (Wilmott, 1981). Willmott et al. (1985) also suggests that values larger than 0.5 may represent good model performance. The IOA is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2} \qquad \text{Eq.2}$$

Where: X_{model} = Model predicted surface elevation

X_{obs} = Observed surface elevation

Clearly, a greater IOA and lower MAE represent a better model performance.

Figure 3.5 and Figure 3.6 illustrate a comparison of the predicted and observed surface elevations in January 2014. As shown on the graph, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

Table 3.1 shows the IOA and MAE values for the selected tide station locations indicating that the model is performing well.

Table 3.1 Statistical comparison between the observed and HYDROMAP predicted surface elevations.

Tide Station	IOA	MAE (m)
Gabo Island	0.98	0.08
Port MacDonnell	0.98	0.05
Port Welshpool	0.92	0.30
Portland	0.97	0.07
Stack Island	0.96	0.22

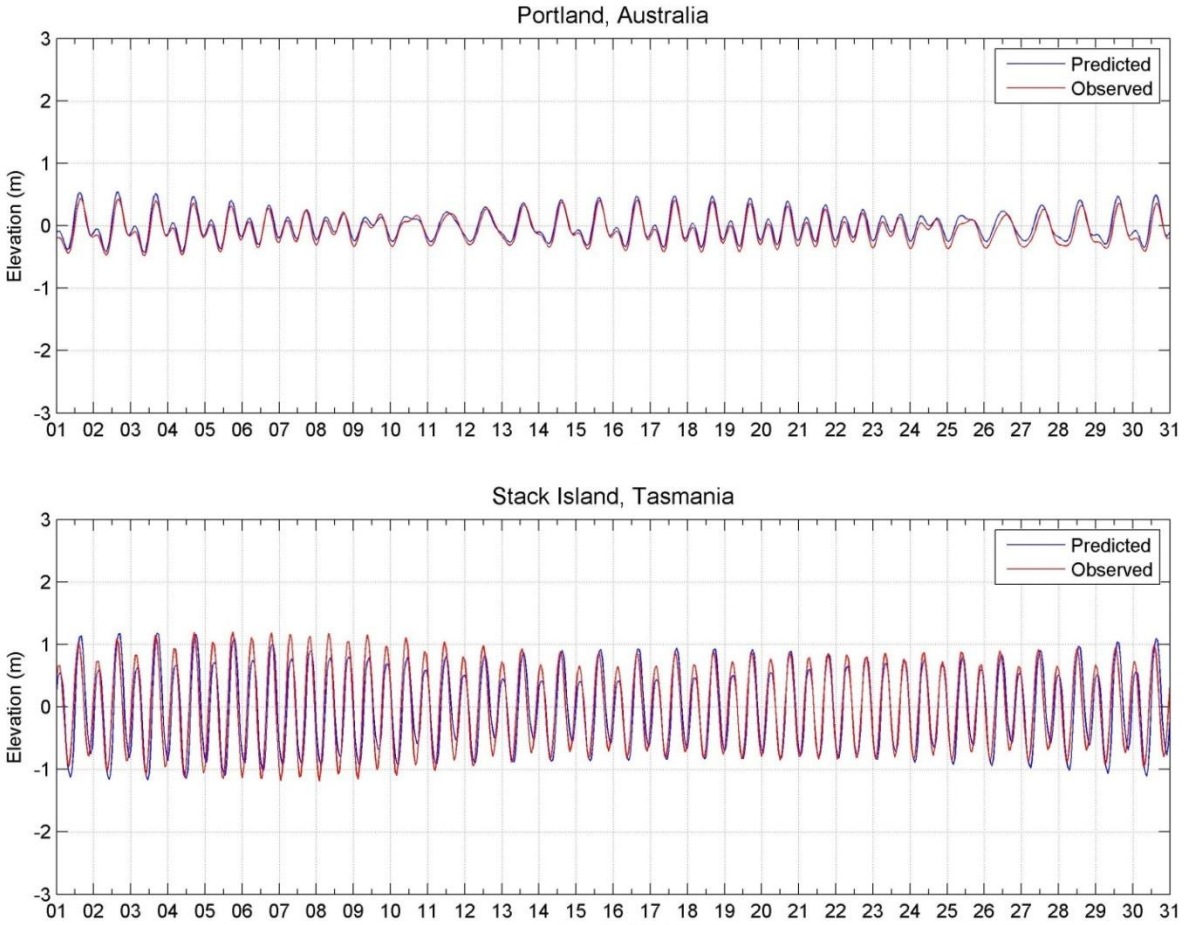

Figure 3.6 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation at tidal stations Portland (upper image) and Stack Island (lower image).

3.2 Ocean Currents

Data describing the flow of ocean currents for the years 2010 to 2019 (inclusive) were obtained from HYCOM (Hybrid Coordinate Ocean Model, Chassignet et al., 2007), which is operated by the HYCOM Consortium, sponsored by the Global Ocean Data Assimilation Experiment (GODAE). HYCOM is a data-assimilative, three-dimensional ocean model that is run as a hindcast (for a past period), assimilating time-varying observations of sea surface height, sea surface temperature and in-situ temperature and salinity measurements (Chassignet et al., 2009). The HYCOM predictions for drift currents are produced at a horizontal spatial resolution of approximately 8.25 km (1/12th of a degree) over the region, at a frequency of every 3 hours. HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas.

3.3 Surface Currents

The sections below present the monthly and total surface current data extracted from the closest node to each release location (or Scenario) used in this study.

Note the convention for defining current direction is the direction the current flows towards, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing towards that direction, with north to the top of the diagram. The branches are divided into segments of different colour, which represent the current speed ranges for each direction. The length of each coloured segment is relative to the proportion of currents flowing within the corresponding speed and direction.

3.3.1 Transfer Location A

Table 3.2 presents the average and maximum surface current speeds nearby the Transfer Location A by combining the ocean and tidal currents.

Predicted surface current speeds near the Transfer Location A varied throughout the year with monthly maximum speeds varying from 1.21 m/s (October) to 1.42 m/s (March, April and August). The surface current direction was mostly aligned with the east-northeast and west-southwest axis during the whole year.

Figure 3.7 and Figure 3.8 show the monthly and total surface current rose distributions for the selected location.

Table 3.2 Predicted monthly average and maximum surface current speeds nearby Transfer Location A. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	0.37	1.37	Tidally dominated from a predominant west-southwest and east-northeast direction
February	0.37	1.22	
March	0.37	**1.42**	
April	**0.36**	**1.42**	
May	**0.36**	1.37	
June	**0.36**	1.22	
July	0.37	1.36	
August	0.37	**1.42**	
September	**0.38**	1.29	
October	0.37	**1.21**	
November	0.37	1.33	
December	0.36	1.23	
Minimum	**0.36**	**1.21**	
Maximum	**0.38**	**1.42**

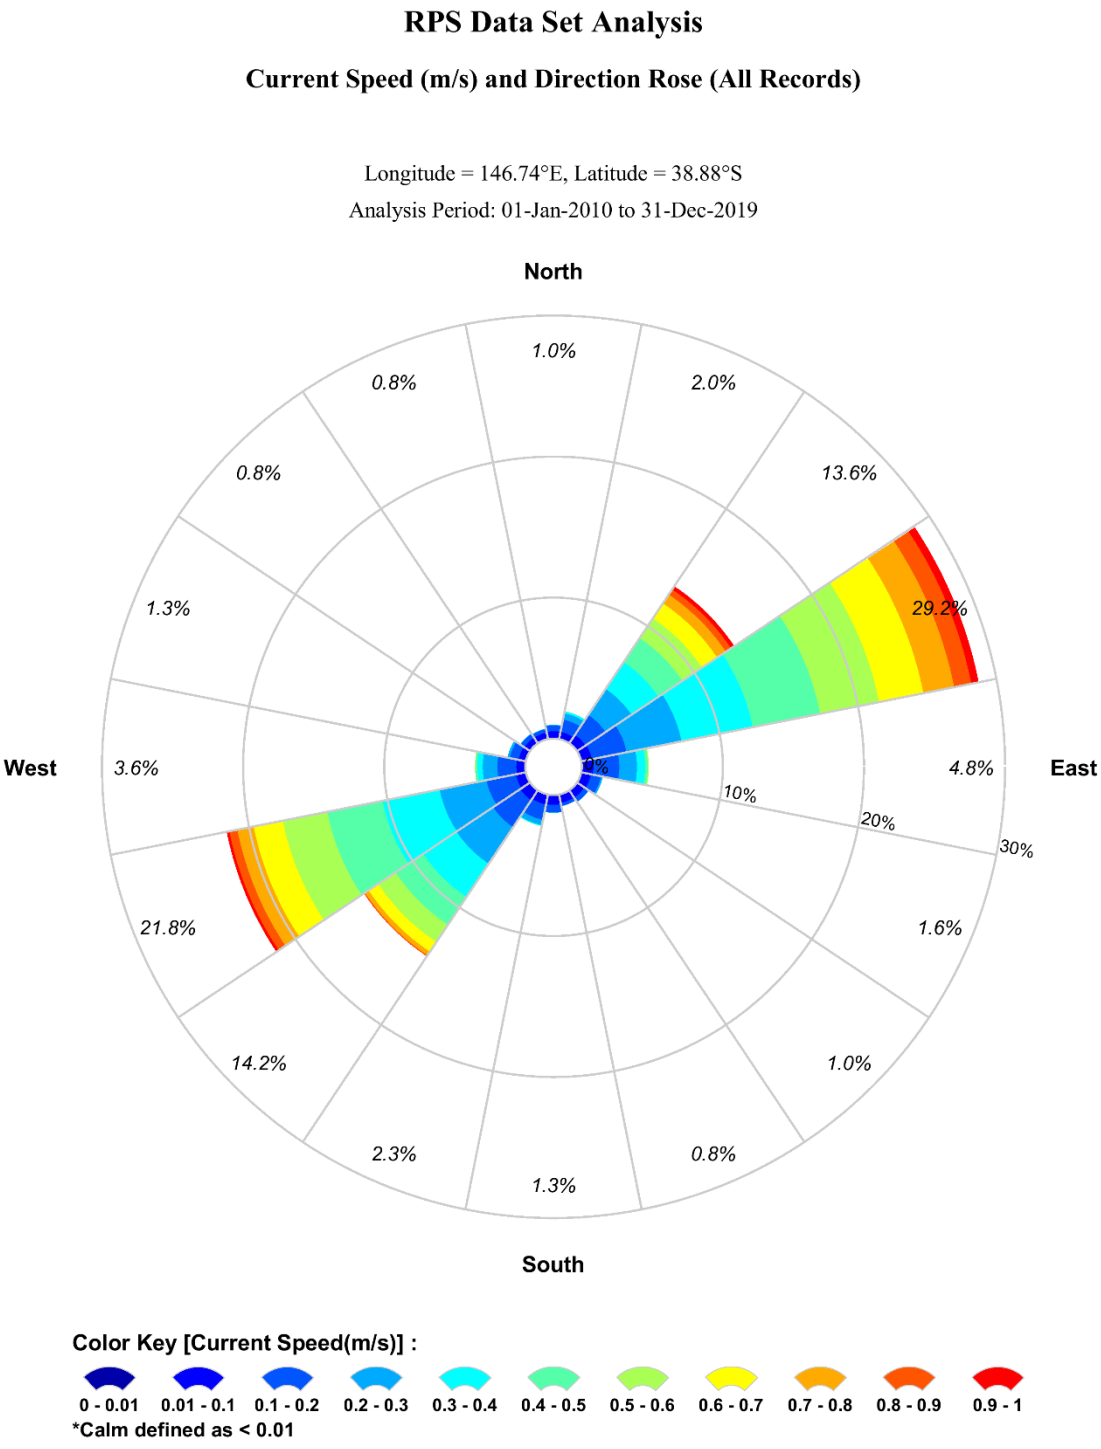

Figure 3.8 Total surface current rose plot nearby Transfer Location A platform derived by combining the HYDROMAP tidal currents and HYCOM ocean currents for 2010–2019 (inclusive).

3.3.2 Transfer Location B

Table 3.3 presents the average and maximum surface current speeds nearby the Transfer Location B by combining the ocean and tidal currents.

Predicted surface current speeds near the Transfer Location B varied throughout the year with monthly maximum speeds ranging between 0.89 m/s (February) and 1.01 m/s (August and November). The dominant surface current direction was mostly aligned with the southwest-northeast axis during the whole year.

Figure 3.9 and Figure 3.10 show the monthly and total surface current rose distributions for the selected location.

Table 3.3 Predicted monthly average and maximum surface current speeds nearby Transfer Location B. The data was derived by combining the HYCOM ocean data and HYDROMAP tidal data from 2010–2019 (inclusive).

Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction(s) (Towards)
January	**0.29**	0.91	Tidally dominated from a predominant southwest and northeast direction
February	**0.29**	**0.89**	
March	**0.29**	0.96	
April	0.28	1.00	
May	0.28	0.95	
June	**0.27**	0.92	
July	0.28	0.92	
August	**0.29**	**1.01**

4 WIND DATA

High resolution wind data for the years 2010 to 2019 (inclusive) were sourced from the National Centre for Environmental Prediction (NCEP) Climate Forecast System Reanalysis dataset (CFSR; see Saha et al., 2010). The CFSR wind model is a fully coupled, data-assimilative hindcast model representing the interaction between the earth's oceans, land, and atmosphere. The gridded wind data output is available at ¼ of a degree resolution (~33 km) and 1-hourly time intervals. Figure 4.1 shows the spatial resolution of the wind field used as input into the oil spill model.

Section 4.1 and 4.2 present the monthly and total wind rose distribution at the closest wind node to Transfer Location A and Transfer Location B, respectively.

Note that the atmospheric convention for defining wind direction, that is, the direction the wind blows from, is used to reference wind direction throughout this report. Each branch of the rose represents wind coming from that direction, with north to the top of the diagram. Sixteen directions are used. The branches are divided into segments of different colour, which represent wind speed ranges from that direction. The length of each segment within a branch is proportional to the frequency of winds blowing within the corresponding range of speeds from that direction.

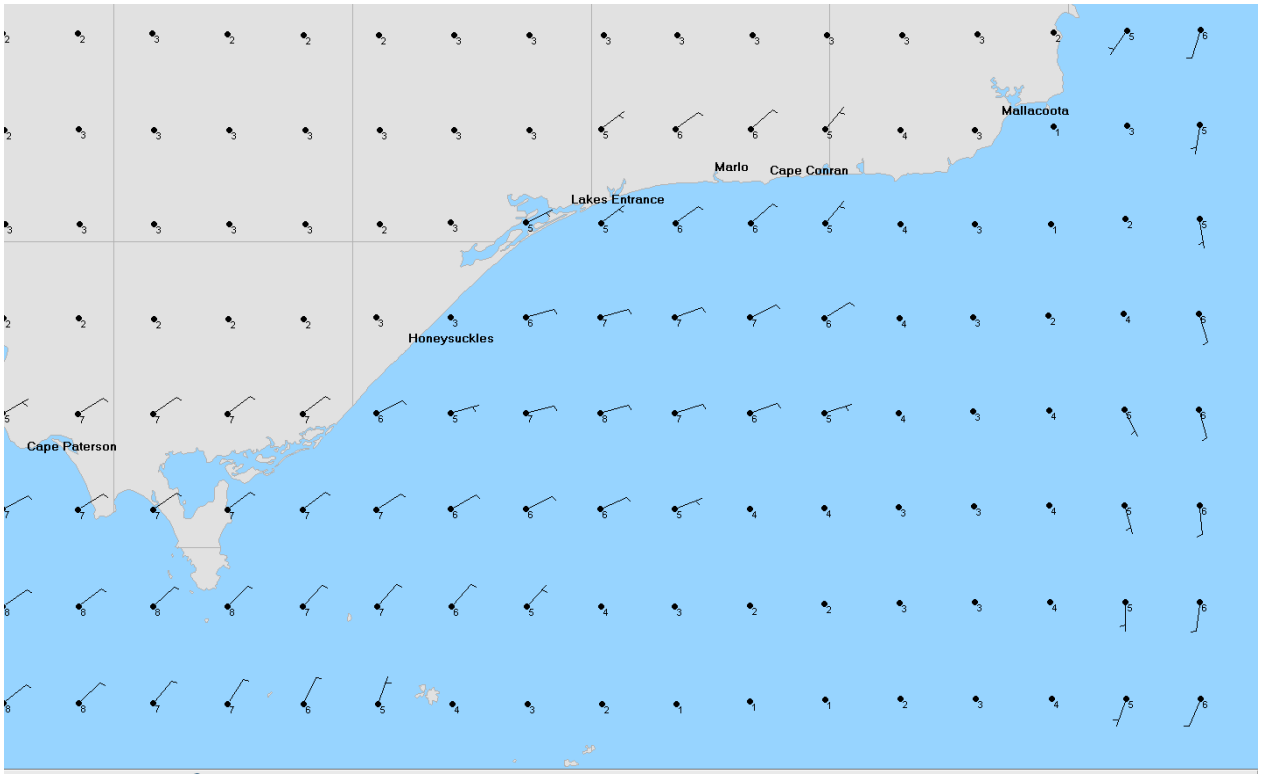

Figure 4.1 Spatial resolution of the CFSR modelled wind data used as input into the oil spill model. Note, for ease viewing only every second wind vector is displayed on the map.

4.1 Transfer Location A

Table 4.1 presents the monthly average and maximum winds derived from a CFSR wind node nearby the Transfer Location A release location. The wind data demonstrated monthly average wind speeds ranging from 12.2 knots (April) to 15.4 knots (July). Wind direction varied throughout the year, though westerly winds revealed to be prevailing nearby Transfer Location A.

Figure 4.2 and Figure 4.3 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the nearshore release location.

Table 4.1 Predicted average and maximum winds representative for the selected node nearby the Transfer Location A release location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (From)
January	12.8	**35.3**	West-southwest
February	13.2	38.5	West-southwest and east
March	12.8	39.3	West-southwest
April	**12.2**	37.1	West
May	14.4	39.6	West
June	13.9	37.5	West-northwest
July	**15.4**	**43.7**	West-northwest
August	14.8	40.6	West-northwest
September	14.4	43.2	West-southwest
October	13.5	35.8	West-southwest
November	13.4	37.7	West-southwest
December	13.2	40.5	West-southwest
Minimum	**12.2**	**35.3**	-
Maximum	**15.4**	**43.7**	

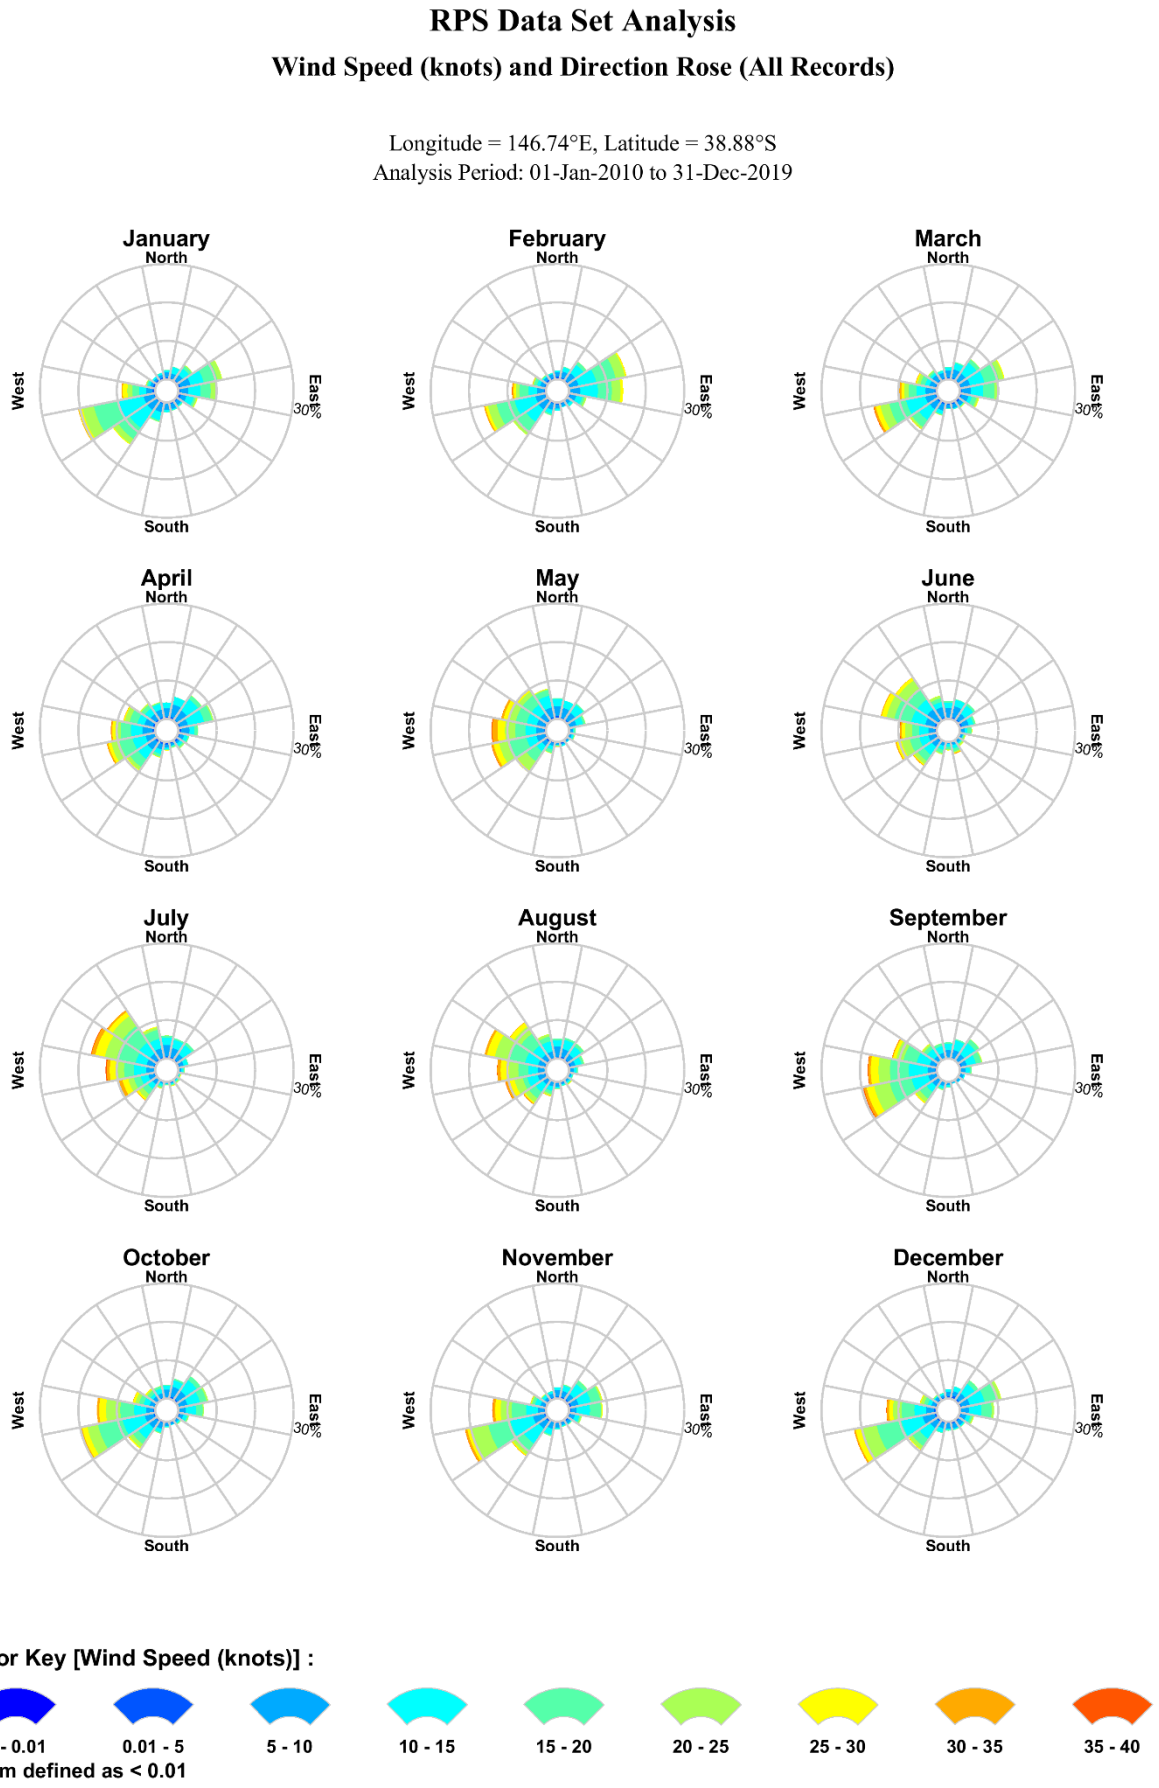

Figure 4.2 Modelled monthly wind rose distributions from 2010–2019 (inclusive) for the node nearby the Transfer Location A release location.

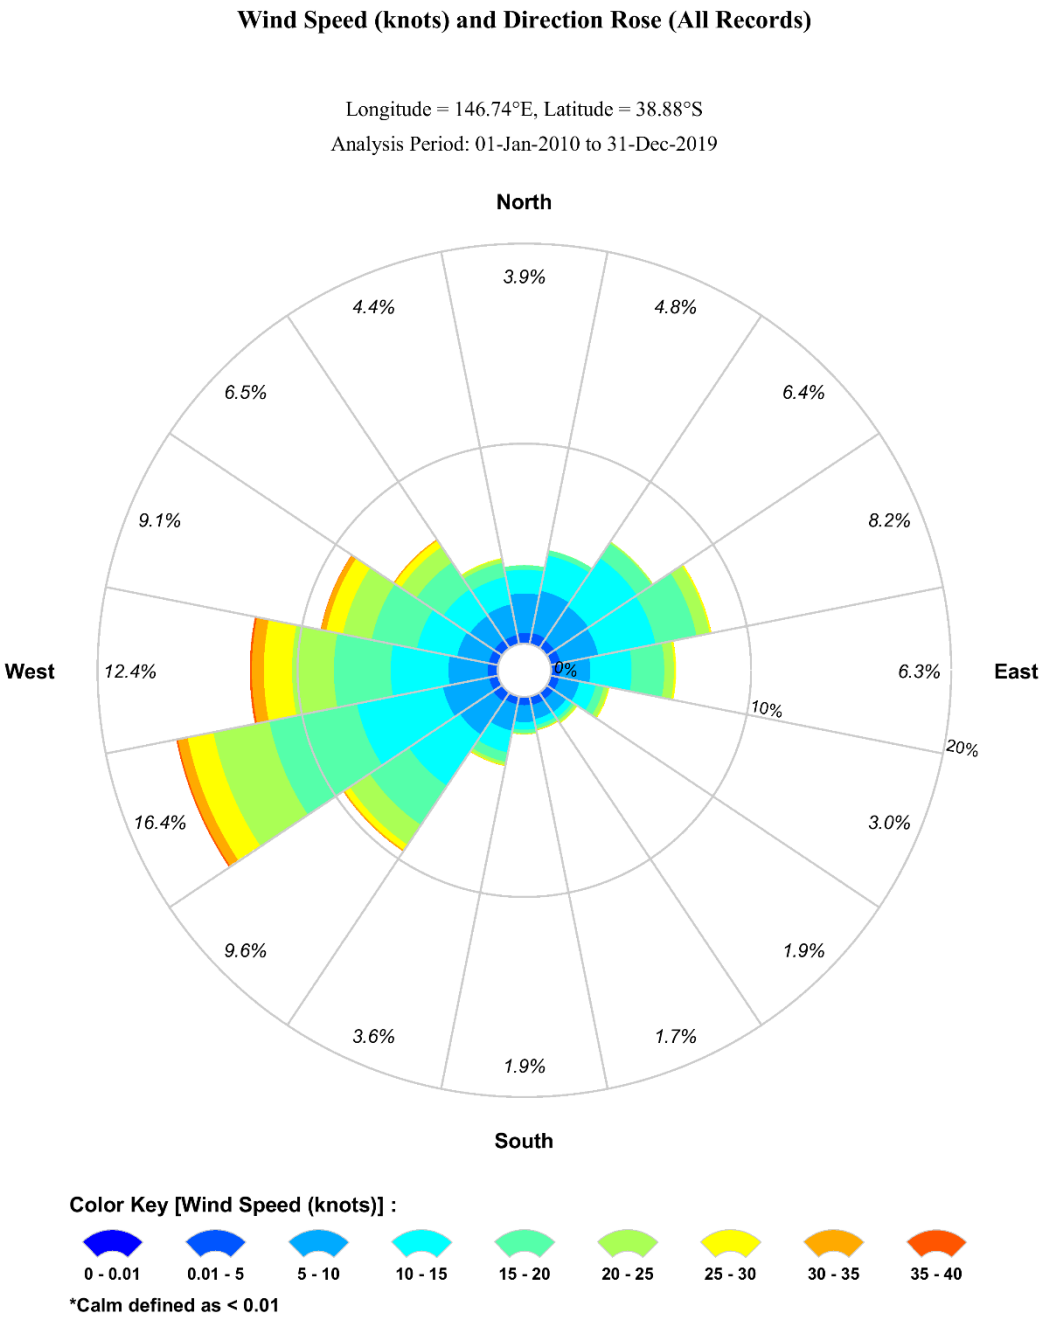

Figure 4.3 Modelled total wind rose distributions from 2010–2019 (inclusive) for the node nearby the Transfer Location A release location.

4.2 Transfer Location B

Table 4.2 presents the monthly average and maximum winds derived from a CFSR wind node nearby the Transfer Location B release location. The wind data demonstrated average monthly wind speeds ranging from 14.3 knots (April) to 18.4 knots (July). The dominant wind direction at the release location varied throughout the year, but westerly winds have shown to be dominant.

Figure 4.4 and Figure 4.5 show the monthly and total wind rose distributions derived from the CFSR data for the selected node nearby the Transfer Location B release location.

Table 4.2 Predicted average and maximum winds representative for the selected node nearby the Transfer B release location. Data derived from CFSR hindcast model from 2010–2019 (inclusive).

Month	Average wind speed (knots)	Maximum wind speed (knots)	General direction(s) (From)
January	14.7	41.8	West-southwest
February	15.2	42.8	West-southwest and east
March	14.8	43.5	West-southwest and east
April	**14.3**	43.6	West-southwest
May	16.9	43.7	West
June	16.4	42.7	Northwest
July	**18.4**	**53.4**	Northwest
August	17.6	44.2	West-northwest
September	16.9	49.5	West-southwest
October	15.7	**40.3**	West-southwest
November	15.4	42.1	West-southwest
December	15.3	42.6	West-southwest
Minimum	**14.3**	**40.3**	-
Maximum	**18.4**	**53.4**	

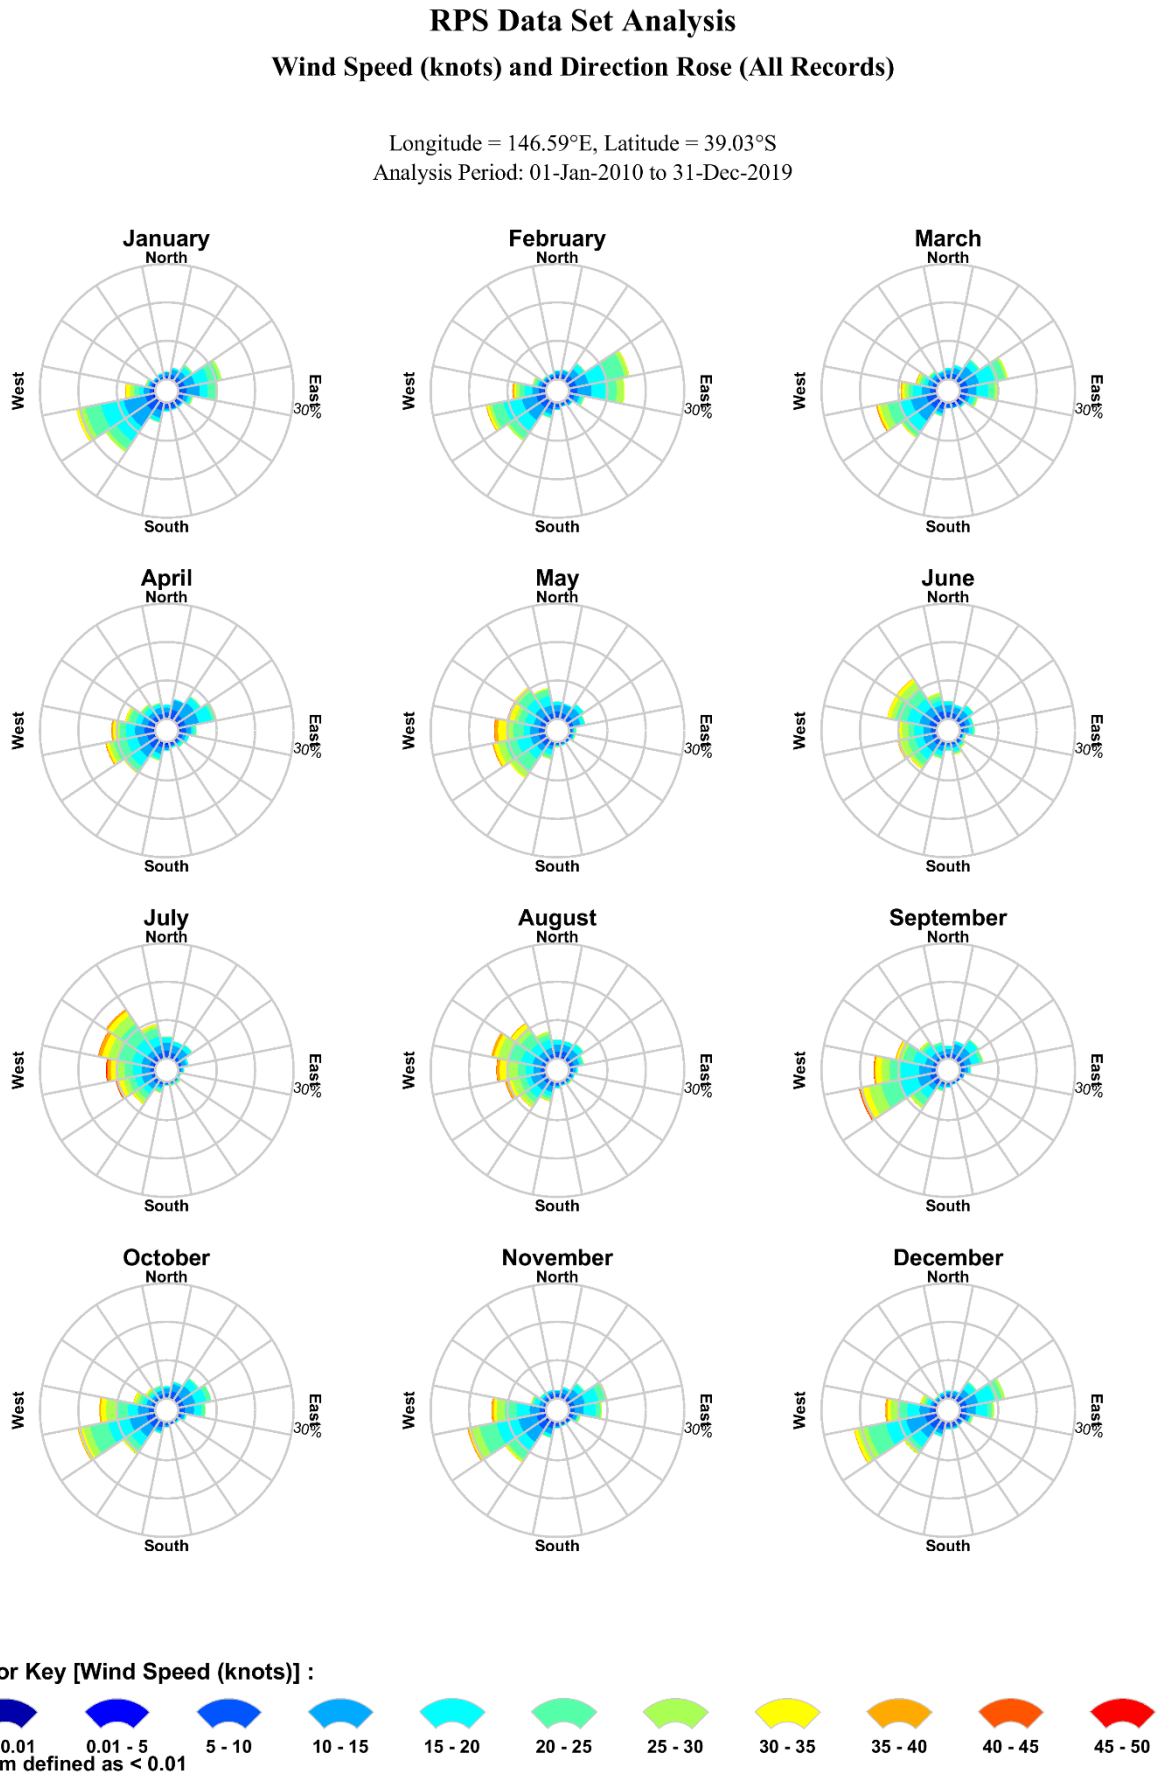

Figure 4.4 Modelled monthly wind rose distributions from 2010–2019 (inclusive) for the node nearby the Transfer Location B release location.

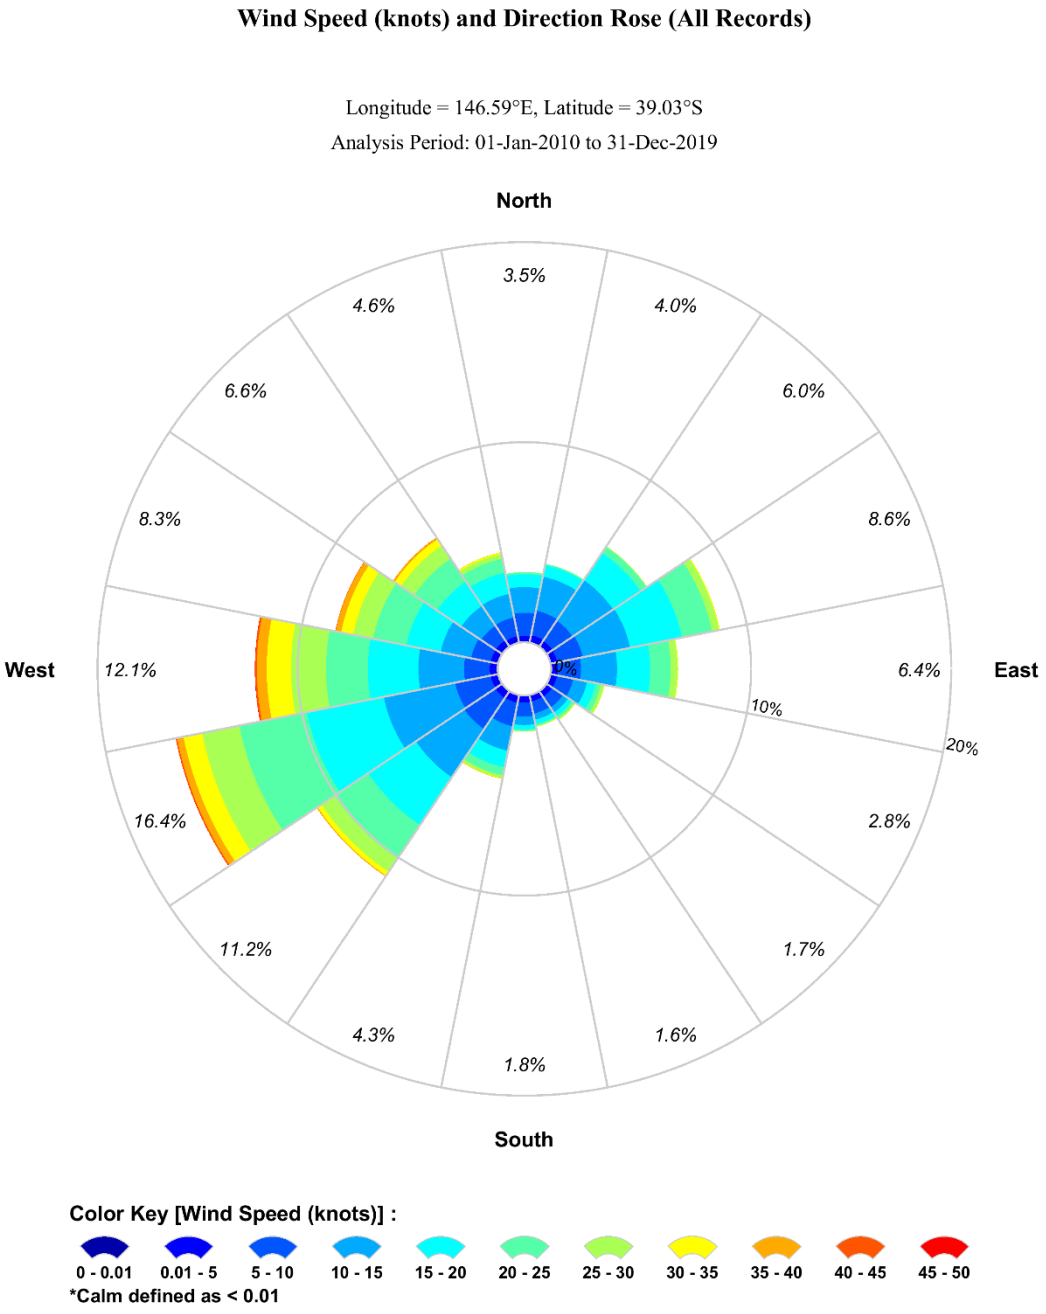

Figure 4.5 Modelled total wind rose distributions from 2010–2019 (inclusive) for the node nearby the Transfer Location B release location.

5 WATER TEMPERATURE AND SALINITY

The monthly sea temperature and salinity profiles of the water column within the study was obtained from the World Ocean Atlas 2018 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Centre for Oceanography (see Levitus et al., 2013). These parameters were used as factors to inform the weathering, movement, and evaporative loss of hydrocarbon spills in the surface and sub-surface layers.

Table 5.1 presents the water temperature and salinity of the surface layer the vicinity of Transfer Location A and B release locations. The monthly average sea surface temperatures ranged between 12.4°C (August) and 20.4°C (December and January). The monthly average surface salinity values remained relatively consistent ranging between 35.4 psu and 35.6 psu.

Figure 5.1 illustrates the vertical profile of sea temperature and salinity in the vicinity of Transfer Location A and B release locations.

Table 5.1 Monthly average sea surface temperature and salinity at the representative location.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (ºC)	20.4	19.6	18.1	16.0	14.6	13.2	12.5	12.4	13.4	15.4	17.1	20.4

6 OIL SPILL MODEL – SIMAP

Modelling of the fate of oil was performed using the Spill Impact Mapping Analysis Program (SIMAP). SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for both the surface and surface releases (Spaulding et al., 1994; French et al., 1999; French-McCay, 2003, 2004; French-McCay et al., 2004; 2021; 2022a; 2022b).

SIMAP has been used to predict the weathering and fate of oil spills during and after major incidents including: Montara (Australia) well blowout August 2009 in the Timor Sea (Asia-Pacific ASA, 2010); Macondo (USA) well blowout April 2010 in the Gulf of Mexico; Bohai Bay (China) oil spill August 2011; and the pipeline oil spill July 2013 in the Gulf of Thailand.

The SIMAP model calculates the transport, spreading, entrainment, evaporation and decay of surface hydrocarbon slicks as well as the entrained and dissolved oil components in the water column, either from surface slicks or from oil discharged subsea. The movement and weathering of the spilled oil is calculated for specific oil types. Input specifications for oil mixtures include the density, viscosity, pour point, distillation curve (volume lost versus temperature) and the aromatic/aliphatic component ratios within given boiling point (BP) ranges.

SIMAP is a three-dimensional model that allows for various response actions to be modelled including oil removal from skimming, burning, or collection booms, and surface and surface dispersant application.

The SIMAP oil spill model includes advanced weathering algorithms, specifically focussed on unique oils that tend to form emulsions and/or tar balls. The weathering algorithms are based on 5 years of extensive research conducted in response to the Deepwater Horizon oil spill in the Gulf of Mexico (French-McCay et al., 2015).

Biodegradation is included in the oil spill model. In the model, SIMAP, degradation is calculated for the surface slick, deposited oil on the shore, the entrained oil and dissolved constituents in the water column, and oil in the sediments. For surface oil, water column oil and sedimented oil a first order degradation rate is specified. Biodegradation rates are relatively high for hydrocarbons in dissolved state or in dispersed small droplets.

6.1 Stochastic Modelling

For the stochastic modelling presented herein, 100 oil spills were modelled for each scenario using the same spill information (release location, spill volume, duration and oil type) but with varied start dates. During each simulation, the model records whether any grid cells are exposed to any oil concentrations, the concentrations involved and the elapsed time before exposure. The results of all 100 oil spill simulations were analysed to determine the following statistics for every grid cell:

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Maximum residence time of exposure;
- Probability of contact above defined concentrations;
- Volume of oil that may accumulate on shorelines from any single simulation;
- Concentration that might occur on sections of individual shorelines;
- Exposure to dissolved hydrocarbons in the water column; and
- Exposure to entrained hydrocarbons in the water column.

6.2 Deterministic Modelling

While stochastic modelling is crucial for assessing potential risks to sensitive receptors in the event of an oil spill, deterministic modelling is equally important for refining response strategies. A deterministic scenario is typically selected from stochastic results based on key metrics such as the largest volume of oil ashore or the longest affected shoreline exceeding a contamination threshold (e.g., >100 g/m^2).

By simulating the detailed trajectory and fate of oil under specific conditions, deterministic modelling enables planners to identify the most vulnerable receptors, estimate arrival times and accumulation rates, and

evaluate environmental and socio-economic impacts with greater precision. This level of detail enhances preparedness, optimizes resource deployment, and supports more effective decision-making in oil spill response and mitigation planning.

6.3 Floating, Shoreline and In-Water Thresholds

The thresholds and their relationship to exposure for the sea surface, shoreline and water column (entrained and dissolved hydrocarbons) are presented in Sections 6.3.1 to 6.3.3. Supporting justifications of the adopted thresholds applied during the study and additional context relating to the area of potential exposure are also provided. It is important to note that the thresholds herein are based on (NOPSEMA, 2019)[1].

6.3.1 Floating Oil Exposure Thresholds

The modelling results can be presented to any levels; therefore, thresholds have been specified (based on scientific literature) to record floating oil exposure to the sea-surface at meaningful levels only, described in the following paragraphs.

The low threshold to assess the potential for floating oil exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement, 2016; AMSA, 2014) (see Table 6.1). Figure 6.1 shows photographs highlighting the difference in appearance between a silvery sheen, rainbow sheen and metallic sheen. This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 6.1 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of floating oil exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2016).

Scholten et al. (1996) and Koops et al. (2004) indicated that at oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2016). For this study the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019). This threshold can also be used to inform response planning.

Table 6.2 defines the thresholds used to classify the zones of floating oil exposure reported herein.

Table 6.1 The Bonn Agreement Oil Appearance Code.

Code	Description Appearance	Layer Thickness Interval (g/m^2 or µm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

[1] Results for entrained hydrocarbon exposure at, or above, 1,000 ppb, in alignment with French-McCay (2023), are provided in Appendix A.

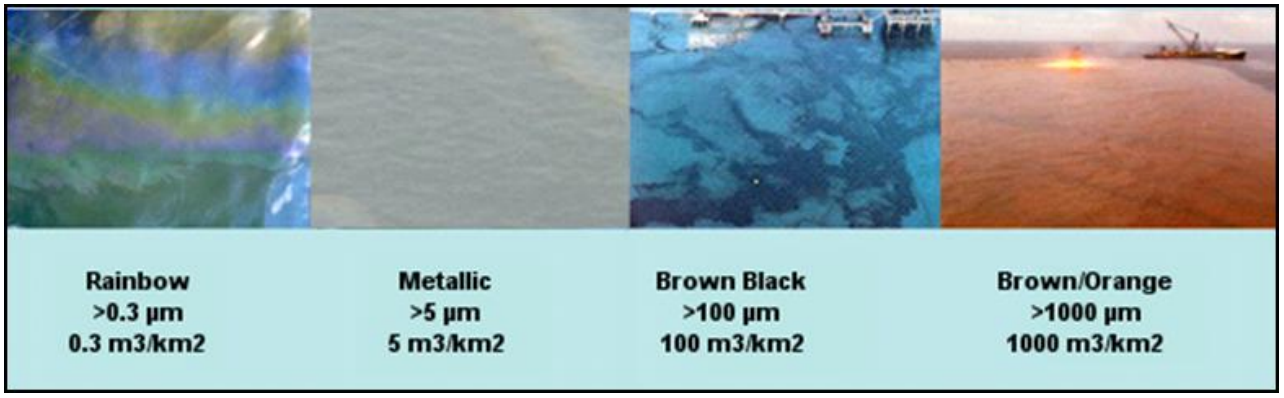

Figure 6.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions, 2015).

Table 6.2 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA (2019)).

Threshold level	Floating oil (g/m^2)	Description
Low	1	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

6.3.2 Shoreline Accumulation Thresholds

There are many different types of shorelines, ranging from cliffs, rocky beaches, sandy beaches, mud flats and mangroves, and each of these influences the volume of oil that can remain stranded ashore and its thickness before the shoreline saturation point occurs. For instance, a sandy beach may allow oil to percolate through the sand, thus increasing its ability to hold more oil ashore over tidal cycles and various wave actions than an equivalent area of water; hence oil can increase in thickness onshore over time. A sandy beach shoreline was assumed as the default shoreline type for the modelling herein, as it allows for the highest carrying capacity of oil (of the available open/exposed shoreline types). Hence the results contained herein would be indicative of a worst-case scenario, where the highest volume of oil may be stranded on the shoreline (when compared to other shoreline types, such as exposed rocky shores).

In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2 to assess the potential for shoreline accumulation. This is a conservative threshold used to define regions of socio-economic impact, such as triggering temporary closures of adjoining fisheries or the need for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). It would equate to approximately 2 teaspoons of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a stain/film. On that basis, the 10 g/m^2 shoreline accumulation threshold has been selected to define the zone of potential “low shoreline accumulation”.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according to the AMSA (2023) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline accumulation. The appearance is described as a thin oil coat. Therefore, 100 g/m^2 has been selected to define the zone of potential “moderate shoreline accumulation”.

Observations by Lin & Mendelssohn (1996) demonstrated that loadings of more than 1,000 g/m^2 of hydrocarbon during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing hydrocarbon impacts on mangroves (Grant et al., 1993;

Suprayogi & Murray, 1999). Hence, 1,000 g/m^2 has been selected to define the zone of potential “high shoreline accumulation”. It equates to approximately 1 litre of hydrocarbon per square meter of shoreline accumulation. The appearance is described as a hydrocarbon cover.

It is worth noting that the shoreline accumulation thresholds derived from extensive literature review (outlined in Table 6.3) agree with the commonly used threshold values for oil spill modelling specified in NOPSEMA (2019).

Table 6.3 Thresholds used to assess shoreline accumulation.

Threshold level	Shoreline loading (g/m^2)	Description
Low (socioeconomic/sublethal)	10	Predicts potential for some socio-economic impact
Moderate	100	Loading predicts area likely to require clean-up effort
High	> 1,000	Loading predicts area likely to require intensive clean-up effort

6.3.3 In-water Exposure Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

6.3.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath and Di Toro, 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polycyclic aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NASEM, 2022). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50% population mortality (LC_{50}) between 6 and 400 ppb total PAH concentration after 96 hrs exposure, with an average of 50 ppb. Hence, concentrations lower than 6 ppb total PAH value should be protective of 97.5% of species and life stages even with exposure periods of days (at least 96 hours). Early life-history stages of fish appear to be more sensitive than older fish stages and invertebrates.

Exceedances of 10, 50 or 400 ppb over a 1 hour timestep (see Table 6.4) was applied to indicate increasing potential for sub-lethal to lethal toxic effects (or low to high), based on NOPSEMA (2019).

6.3.3.2 Entrained Hydrocarbons

Entrained hydrocarbons consist of oil droplets that are suspended in the water column and insoluble. As such, insoluble compounds in oil cannot be absorbed from the water column by aquatic organisms, hence are not bioavailable through absorption of compounds from the water. Exposure to these compounds would require routes of uptake other than absorption of soluble compounds. The route of exposure of organisms to whole oil alone include direct contact with tissues of organisms and uptake of oil by direct consumption, with potential for biomagnification through the food chain (NRC, 2005).

The 10 ppb threshold represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in the ANZG (2018) water quality guidelines. Due to the requirement for relatively long exposure times (>24 hours) for these concentrations to be significant, they are likely to be more meaningful for juvenile fish, larvae and planktonic organisms that might be entrained (or otherwise moving) within the entrained plumes, or when entrained hydrocarbons adhere to organisms or trapped against a shoreline for periods of several days or more.

This exposure zone is not considered to be of significant biological impact and is therefore outside the adverse exposure zone. This exposure zone represents the area contacted by the spill. This area does not define the area of influence as it is considered that the environment will not be affected by the entrained hydrocarbon at this level.

Thresholds of 10 ppb and 100 ppb were applied over a 1-hour time exposure (Table 6.4), to cover the range of thresholds outlined in ANZG (2018) water quality guidelines, the incremental change for greater potential effect and is per NOPSEMA (2019).

A complicating factor that should be considered when assessing the consequence of dissolved and entrained oil distributions is that there will be some areas where both physically entrained oil droplets and dissolved hydrocarbons co-exist. Higher concentrations of each will tend to occur close to the source where sea conditions can force mixing of relatively unweathered oil into the water column, resulting in more rapid dissolution of soluble compounds.

Table 6.4 Dissolved and entrained hydrocarbon exposure values assessed over a 1-hour time step, as per NOPSEMA (2019).

Oil Phase	Exposure level	In-water threshold (ppb)	Description
Dissolved hydrocarbons	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	Moderate	50	Approximates potential toxic effects, particularly sublethal effects to sensitive species
	High	400	Approximates toxic effects including lethal effects to sensitive species
Entrained hydrocarbons*	Low	10	Establishes planning area for scientific monitoring based on potential for exceedance of water quality triggers
	High	100	As appropriate given oil characteristics for informing risk evaluation
	n/a	1,000	Additional threshold presented in Appendix A.1

*Additional threshold of 1,000 ppb presented in Appendix A.1 but not part of NOPSEMA (2019).

7 HYDROCARBON PROPERTIES

7.1 Physical Properties

Marine gas oil (MGO) was used for the scenario modelled in this assessment. Table 7.1 and Table 7.2 present the physical properties and boiling point ranges of the MGO used in this study.

MGO has an API of 37.6, density of 829.1 kg/m^3 (at 25ºC), with low viscosity (4 cP at 25ºC) classifying it as a Group 2 oil according to ITOPF (2024) and is described as a light-persistent oil according to AMSA (2023) classifications. The oil comprises a significant portion of volatiles and semi- to low volatiles (~95 % total) with 5 % residual components. This means most of the hydrocarbons will evaporate when on the water surface, with the persistent components to remain on the water surface over a longer period.

The boiling points (BP) are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate. Typical evaporation times once the hydrocarbons reach the surface and are exposed to the atmosphere are:

- Up to 6 hours for the C_4 to C_{10} compounds (BP <180°C);
- Up to 24 hours for the C_{11} to C_{15} compounds (BP 180-265°C);
- Several days for the C_{16} to C_{20} compounds (BP 265-380°C); and
- Not applicable for the residual compounds (BP >380°C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

Table 7.1 Physical properties.

Characteristic	MGO
Density (kg/m^3)	829.1
API	37.6
Dynamic viscosity (cP)	4 (at 25°C)
Pour point (°C)	-14.0
Wax Content (%)	1
Hydrocarbon property category	Group 2
Hydrocarbon property classification	Light-persistent

Table 7.2 Boiling point ranges.

Oil Type	Component	Volatile (%)	Semi-volatile (%)	Low-volatility (%)	Residual (%)
	Boiling point (°C)	<180 C_4 to C_{10}	180-265 C_{11} to C_{15}	265-380 C_{16} to C_{20}	>380 >C_{20}
MGO	% of total	6.0	34.6	54.4	5.0

7.2 Weathering Properties

A series of model weathering tests were conducted to illustrate the potential behaviour of the hydrocarbons when exposed to idealised and representative environmental conditions:

- A 50 m^3 surface release over 1-hour under calm wind conditions (constant 5 knots), assuming low seasonal water temperature (15 °C) and ambient tidal and drift currents; and
- A 50 m^3 surface release over 1-hour under variable wind conditions (1-23 knots, drawn from representative data files), assuming low seasonal water temperature (15°C) and ambient tidal and drift currents.

Note, a surface release is used in the weathering test to solely focus on the weathering and fates of the hydrocarbons when exposed to atmospheric conditions.

The first case is indicative of conditions that would not generate entrainment, while the second case represents conditions that would likely cause entrainment. Both scenarios provide examples of potential behaviour during a spill once the oil is on the sea surface.

The mass balance for the oil under the constant 5 knot wind case (Figure 7.1) shows that 39.3% is expected to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the less volatile, longer-chain compounds. Evaporation shall cease when only the residual compounds remain, and they will be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 7.2), where the winds are of greater strength on average, entrainment of hydrocarbons into the water column is shown to increase. Approximately 24 hours after the spill, 78.1% of the mass is shown to have entrained and a further 17.4% has evaporated, leaving only a small proportion floating on the water surface (<1%).

The increased level of entrainment in the variable-wind case result in a higher percentage decaying at an approximate rate of ~2.7% per day with 19.1% after 7 days, compared to 0.2% per day and a total of 1.4% after 7 days for the constant-wind case. Given the proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons will decay over time scales of several weeks.

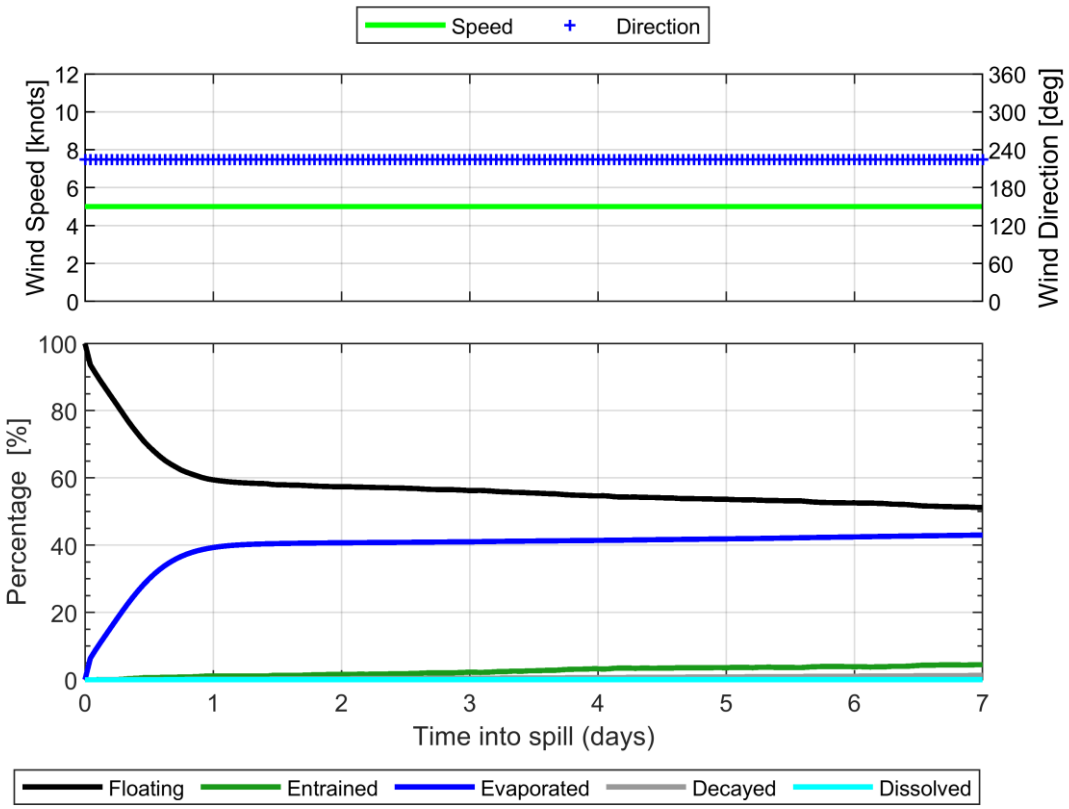

Figure 7.1 Proportional mass balance plot representing the weathering of MGO spilled onto the water surface over 1-hour and subject to a constant 5 knots wind speed at 15°C water temperature.

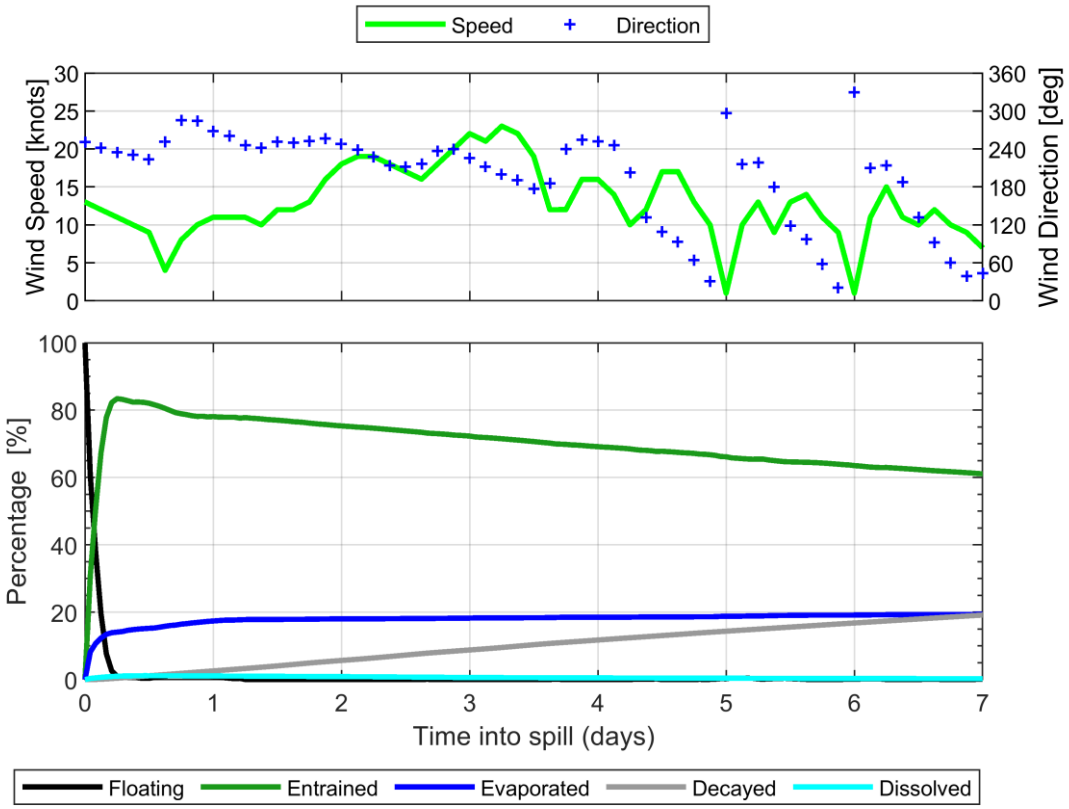

Figure 7.2 Proportional mass balance plot representing the weathering of MGO spilled onto the water over 1-hour and subject to variable wind speeds (1-23 knots) at 15°C water temperature.

8 RECEPTORS

A comprehensive receptor database was compiled from multiple sources to evaluate floating oil exposure, in-water column exposure (entrained and dissolved hydrocarbons), and shoreline oil accumulation. These sources include:

- Protected Matters Search Tool (PMST) from Department of Climate Change, Energy, the Environment and Water (https://pmst.environment.gov.au).
- Shoreline cells Local Government Areas (https://data.gov.au); and
- Additional receptors, such as Biologically Important Areas of Regionally Significant Marine Species from Department of Climate Change, Energy, the Environment and Water (https://fed.dcceew.gov.au).

Table 8.1 summarises the receptors assessed for hydrocarbon exposure as part of the study. Exposure risks were calculated separately for each receptor, and results are presented only for those receptors predicted to be exposed at, or above, the minimum thresholds.

Table 8.1 Summary of receptors assessed for floating oil exposure, in-water column exposure (entrained and dissolved hydrocarbons), and shoreline oil accumulation.

9 MODEL SETTINGS

Table 9.1 provides a summary of the oil spill model settings.

Table 9.1 Summary of the oil spill model settings and thresholds used in this assessment.

Parameter	Scenario 1	Scenario 2
Description	Vessel collision- release from rupture of single largest vessel fuel tank	
Location	Transfer Location A	Transfer Location B
Number of randomly selected spill start times	100	
Model period	Annual	
Hydrocarbon type	Marine gas oil (MGO)	
Spill volume	280 m^3	
Release type (surface, depth (m))	Surface	
Release duration	6 hours	
Simulation length	30 days	
Surface oil concentration thresholds (g/m^2) ^	1 (low); 10 (moderate); 50 (high)	
Shoreline oil accumulation thresholds (g/m^2) ^	10 (low); 100 (moderate); 1,000 (high)	
Dissolved hydrocarbon concentrations (ppb) ^	10 (low); 50 (moderate); 400 (high)	
Entrained hydrocarbon concentrations (ppb) ^*	10 (low); 100 (high)	

^Thresholds based on NOPSEMA (2019);
*additional 1,000 ppb entrained hydrocarbon threshold assessed and presented in Appendix A.

10 PRESENTATION AND INTERPRETATION OF MODEL RESULTS

The results from the modelling study are presented in a number of tables and figures, which aim to provide an understanding of potential sea-surface and water column exposure and shoreline accumulation.

10.1 Annual Analysis

The statistics are based on the following principles:

- The ***greatest distance travelled by a spill trajectory*** – is determined by recording the maximum by a single trajectory, within a scenario, from the release location to the identified exposure thresholds.
- The ***probability of oil exposure to a receptor*** – is determined by recording the number of spill trajectories to reach a specified sea surface or subsea threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***minimum time before oil exposure to a receptor*** – is determined by ranking the elapsed time before sea surface exposure, at a specified threshold, to grid cells within a receptor polygon and recording the minimum value.
- The ***probability of oil accumulation at a receptor*** – is determined by recording the number of spill trajectories to reach a specified shoreline accumulation threshold within a receptor polygon, divided by the total number of spill trajectories within that scenario.
- The ***maximum potential oil accumulation within a receptor*** – is determined by identifying the maximum loading to any grid cell within a receptor polygon, for a scenario.
- The ***dissolved and entrained hydrocarbon exposure*** – is determined by recording the maximum instantaneous concentrations at each grid cell assessed over a 1-hour time step.
- ***Maximum total volume ashore*** (found in stochastic shoreline statistics table) – Is the total volume of oil stranded on the shorelines throughout the duration of the simulation. This volume does not account for natural removal processes such as evaporation and decay.
- ***Total volume ashore above threshold*** (found in stochastic shoreline statistics table) – Is the volume of oil above the specified threshold stranded on the shorelines throughout the duration of the simulation. This volume does account for natural removal processes such as evaporation and decay.
- ***Peak volume ashore*** (found in the deterministic mass balance tables) – Is the peak volume of oil accumulated on shorelines at a single point in time, regardless of any thresholds.

11 RESULTS: SCENARIO 1 – A 280 m³ SURFACE RELEASE OF MGO AT TRANSFER LOCATION A

This scenario examined a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. A total of 100 spill simulations were run for each of the three seasons and each simulation was tracked for 30 days.

Section 11.1 presents the seasonal (or stochastic) analysis results, while Section 11.2 presents the deterministic results.

11.1 Stochastic Analysis

11.1.1 Floating Oil Exposure

Table 11.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1 g/m²) threshold was 21.22 km. For the moderate (10 g/m²) high (≥ 50 g/m²) thresholds the maximum distances from the release location reduced to 10.76 and 4.38 km, respectively.

Table 11.2 summarises the potential floating oil exposure and minimum time of floating oil exposure to individual receptors.

Apart from the receptors the release location lies within, the West Gippsland (VIC) NRMR and Victoria State Waters revealed the highest probability of reaching the lowest threshold for floating oil at 67%, followed by the Twofold Shelf IMCRA at 2%. The earliest floating oil exposure above the low threshold was 0.03 days (0.7 hour) for West Gippsland (VIC) NRMR and Victoria State Waters.

Figure 11.1 presents the annualized zones of floating oil exposure, while Figure 11.2 to Figure 11.4 present the minimum time before floating oil exposure.

Table 11.1 Summary of swept areas, maximum distances and directions travelled from the release location to floating oil exposure for each season and threshold. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

Distance and direction	Zones of potential floating oil exposure		
	Low	Moderate	High
Total stochastic sea surface swept area (km²)	406.57	143.08	7.82
Maximum deterministic sea surface swept area (km²)	151.74	51.61	3.13
Maximum distance from release site (km)	21.22	10.76	4.38
Direction	Southwest	East-northeast	Southwest

Table 11.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The results were calculated from 100 spill trajectories and represent annual conditions.

**The release location resides within the receptor boundaries.

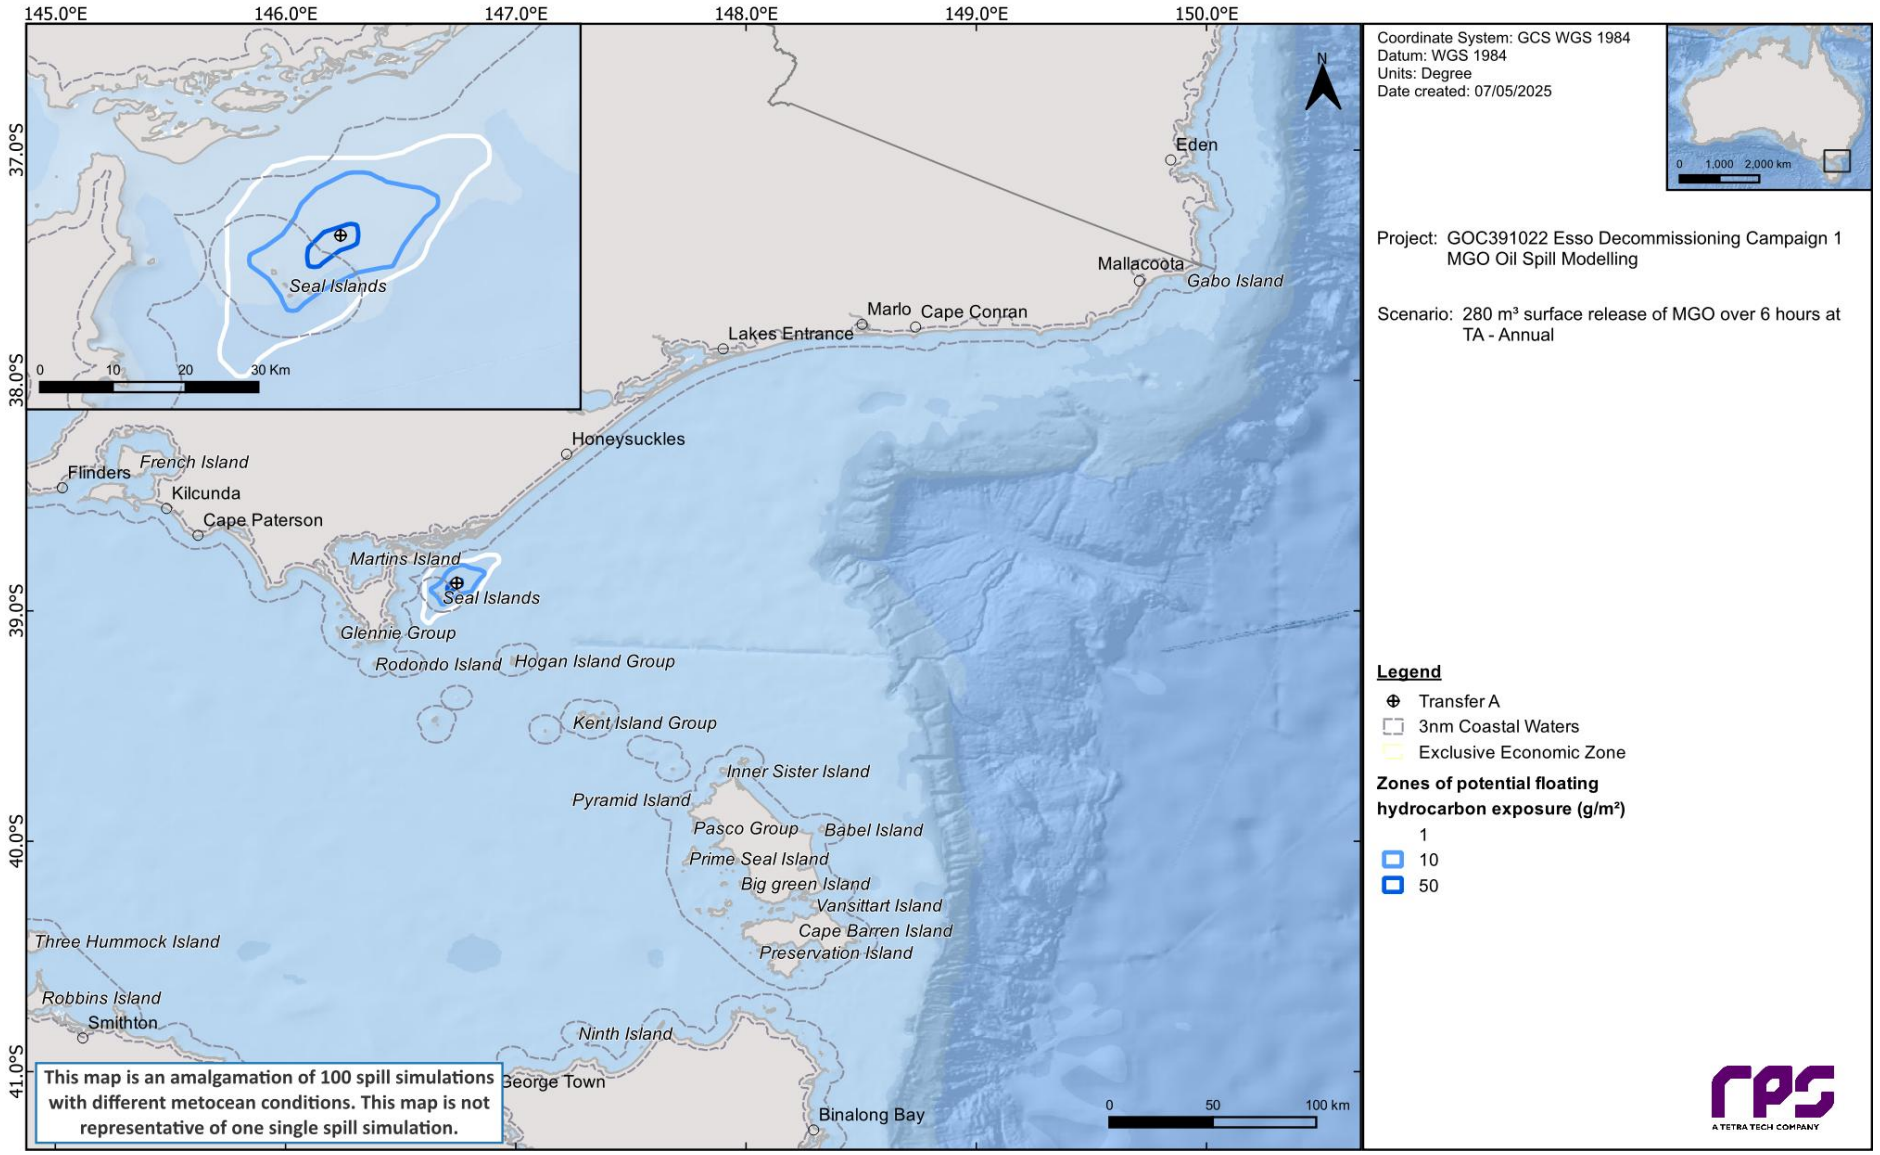

Figure 11.1 Zones of potential floating oil exposure in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The results were calculated from 100 spill trajectories and represent annual conditions.

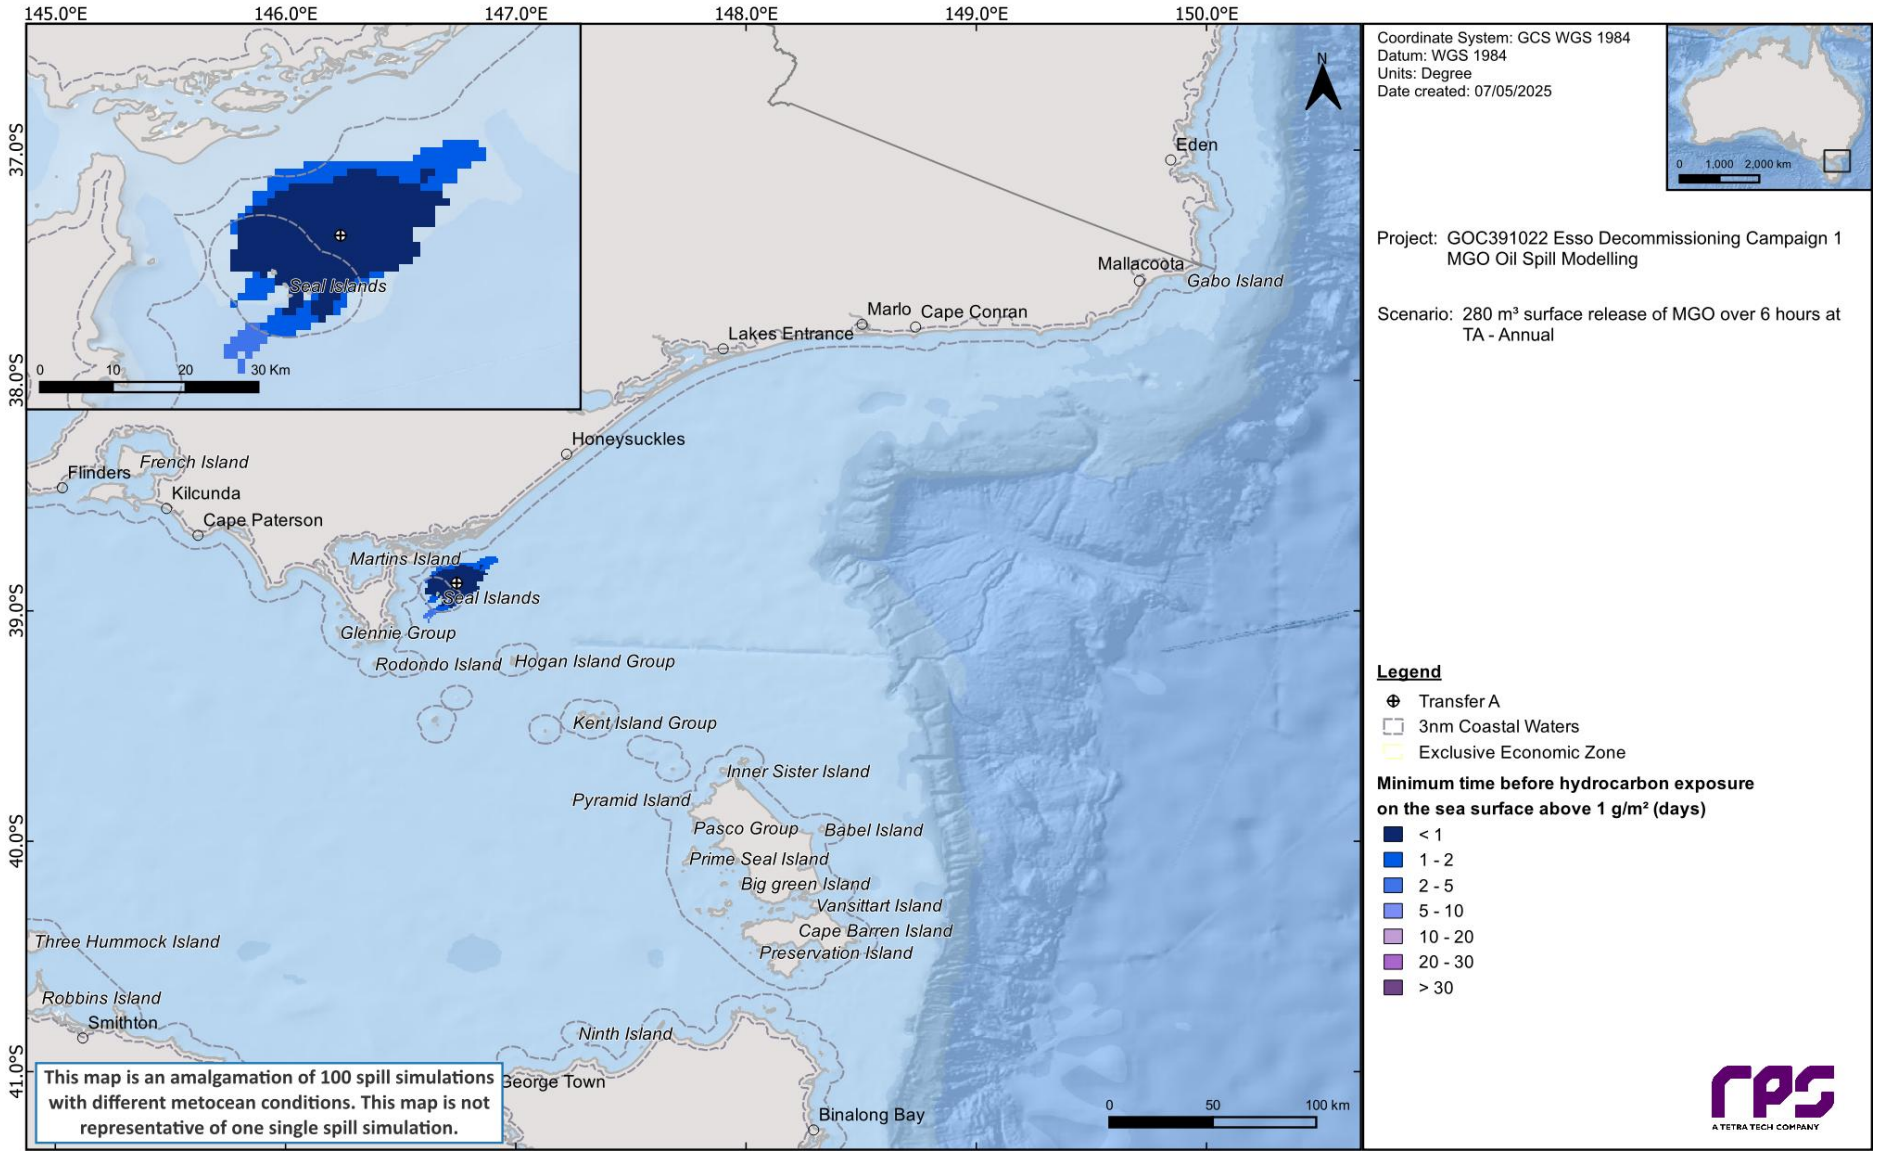

Figure 11.2 Minimum time before floating oil exposure above 1 g/m² in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The results were calculated from 100 spill trajectories and represent annual conditions.

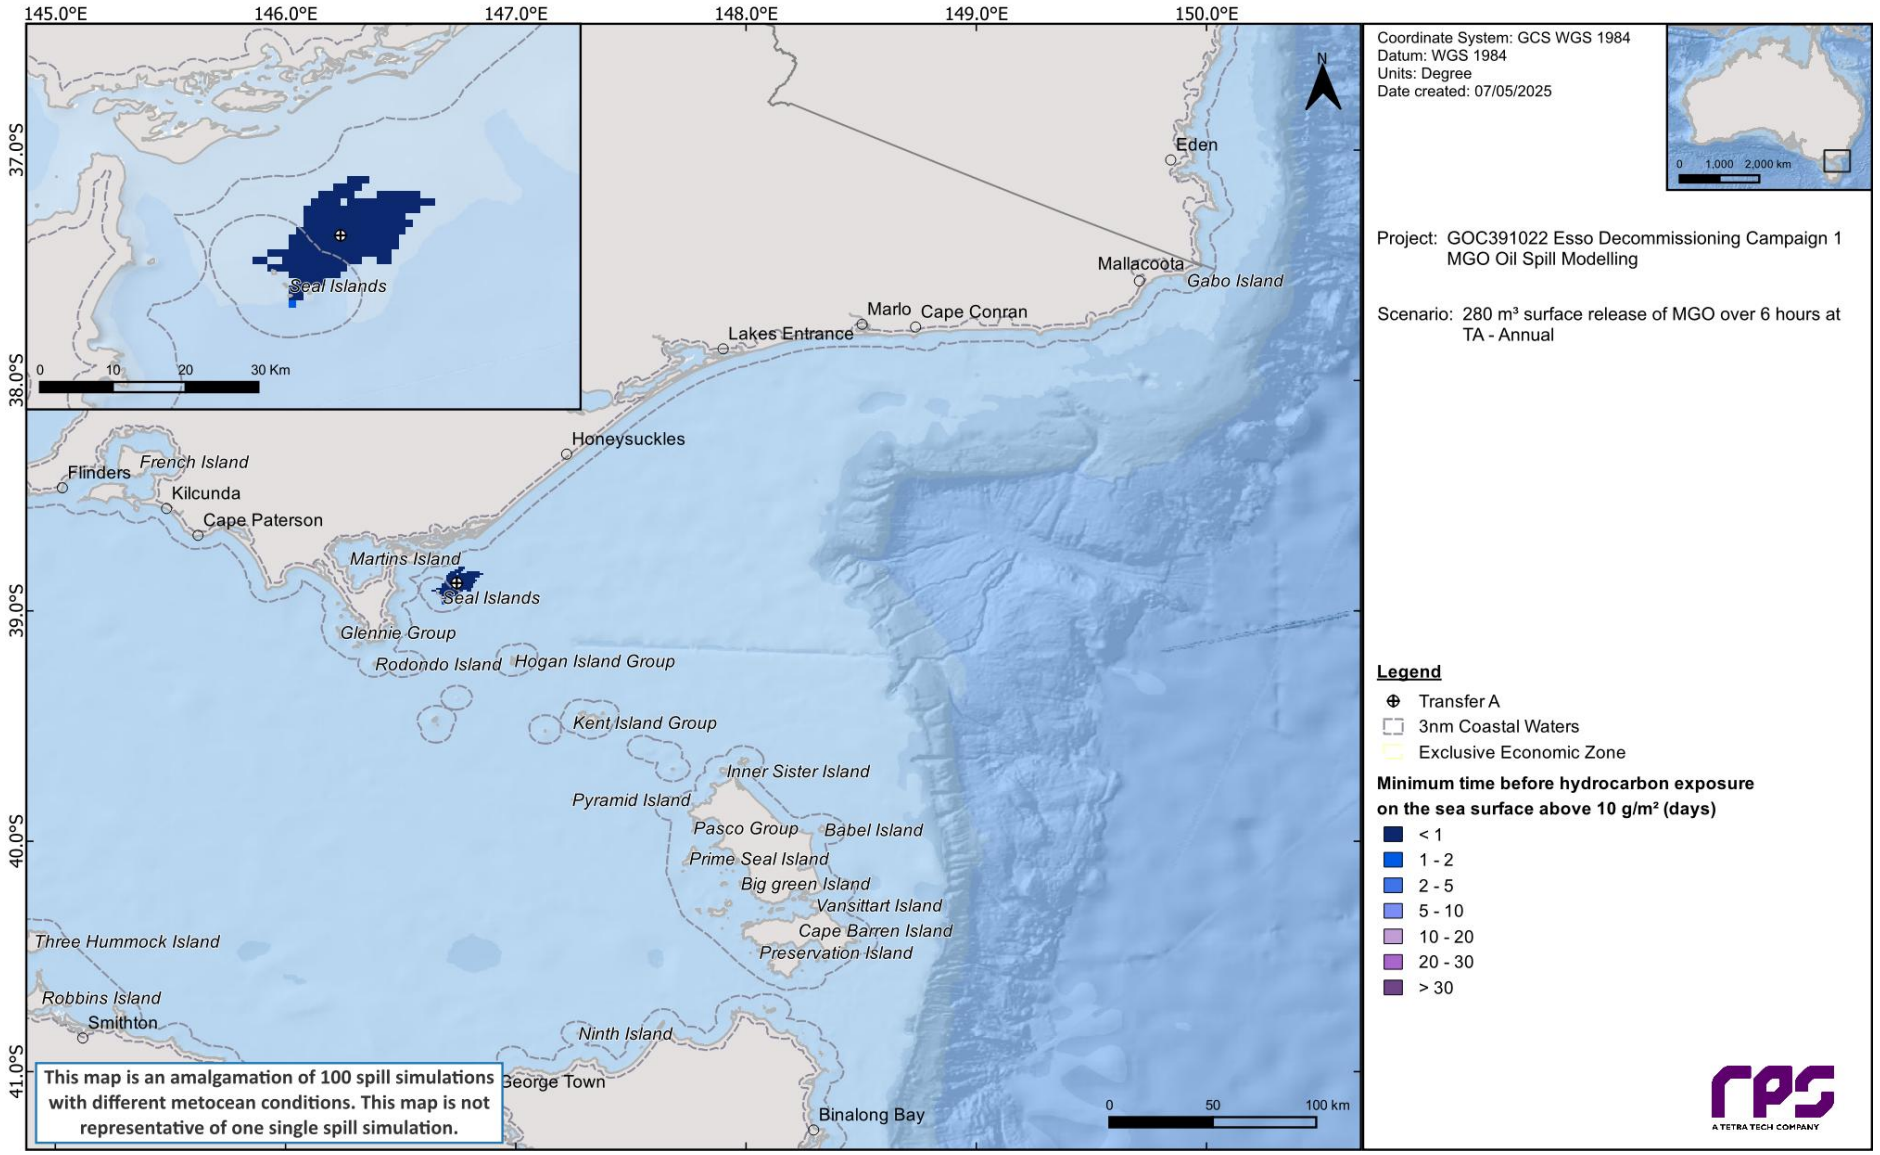

Figure 11.3 Minimum time before floating oil exposure above 10 g/m² in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The results were calculated from 100 spill trajectories and represent annual conditions.

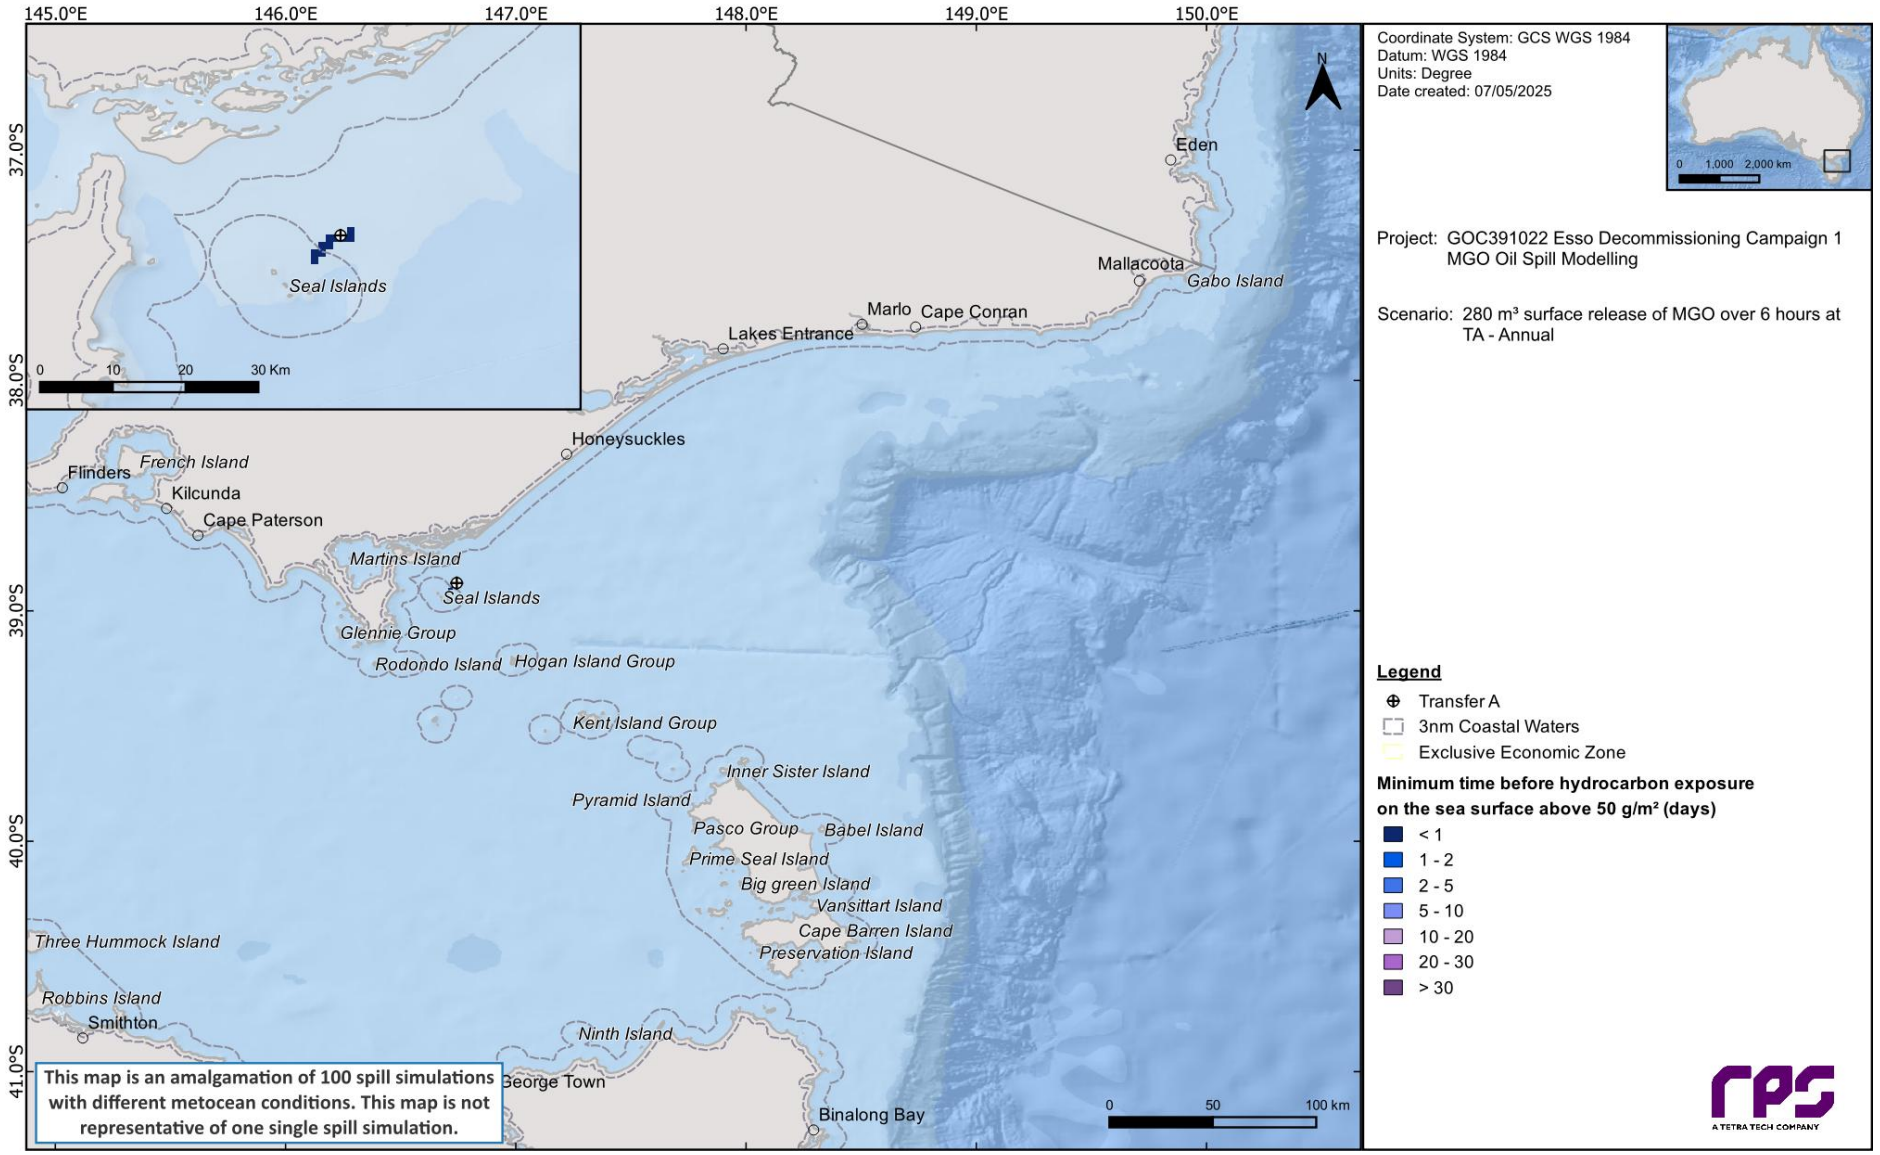

Figure 11.4 Minimum time before floating oil exposure above 50 g/m² in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The results were calculated from 100 spill trajectories and represent annual conditions.

11.1.2 Shoreline Accumulation

Table 11.3 presents a summary of the predicted potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 82% and the minimum time before oil accumulation at, or above, the low threshold was 0.18 days. The maximum total volume ashore for a single spill trajectory was 88.2 m^{3*}, whilst the maximum length of shoreline accumulation at the low threshold was 30.3 km.

Table 11.4 summarises the shoreline accumulation on individual receptors. Seal Islands recorded the highest probability of shoreline accumulation at the low threshold, being 47% and the minimum time before shoreline accumulation above the low threshold with 0.18 days. Additionally, the maximum total volume ashore for the single spill trajectory was predicted for Seal Island, with volumes of 86.6 m^3 above the low and moderate thresholds and 82.2 m^3 above the high threshold.

The maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 11.5.

Table 11.3 Summary of oil accumulation across all shorelines. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	82
Absolute minimum time for visible oil to shore (days)	0.18
Total volume of hydrocarbons ashore (m^3)*	88.2
Total volume of oil on the shoreline ≥10 g/m² (m³)	87.9
Total volume of oil on the shoreline ≥100 g/m² (m³)	86.6
Total volume of oil on the shoreline ≥1,000 g/m² (m³)	82.3
Maximum length of the shoreline at 10 g/m^2 (km)	30.3
Average shoreline length (km) at 10 g/m^2 (km)	4.7
Maximum length of the shoreline at 100 g/m^2 (km)	5.3
Average shoreline length (km) at 100 g/m^2 (km)	0.8
Maximum length of the shoreline at 1,000 g/m^2 (km)	1.5
Average shoreline length (km) at 1,000 g/m^2 (km)	0.1

*Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay

Table 11.4 Summary of oil accumulation on individual shoreline receptors. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

Shoreline Receptor		Maximum probability of shoreline loading (%)			Minimum time before shoreline accumulation (days)			Load on shoreline (g/m²)		Maximum total volume of oil arriving ashore (m³)			Average total volume of oil arriving ashore (m³)			Maximum total length of shoreline contacted (km)			Average total length of shoreline contacted (km)

11.1.3 Water Column Exposure

11.1.3.1 Dissolved Hydrocarbons

Table 11.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure and maximum residence time for all thresholds assessed, respectively.

In the surface (0-10 m) depth layer, with the exception of the receptors that the release location resides within, the highest probability to dissolved hydrocarbon above the low threshold was 7% at West Gippsland (VIC) NRMR and Victoria State Waters, which also presented the shortest time before exposure (0.21 days).

Figure 11.6 presents the extent of the predicted dissolved hydrocarbon exposure in the 0-10 m depth layer, whilst Figure 11.7 present the maximum residence time of dissolved hydrocarbon exposure for the low thresholds.

Table 11.5 Predicted probability and maximum dissolved hydrocarbon exposure to marine-based receptors in the 0-10 m depth. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

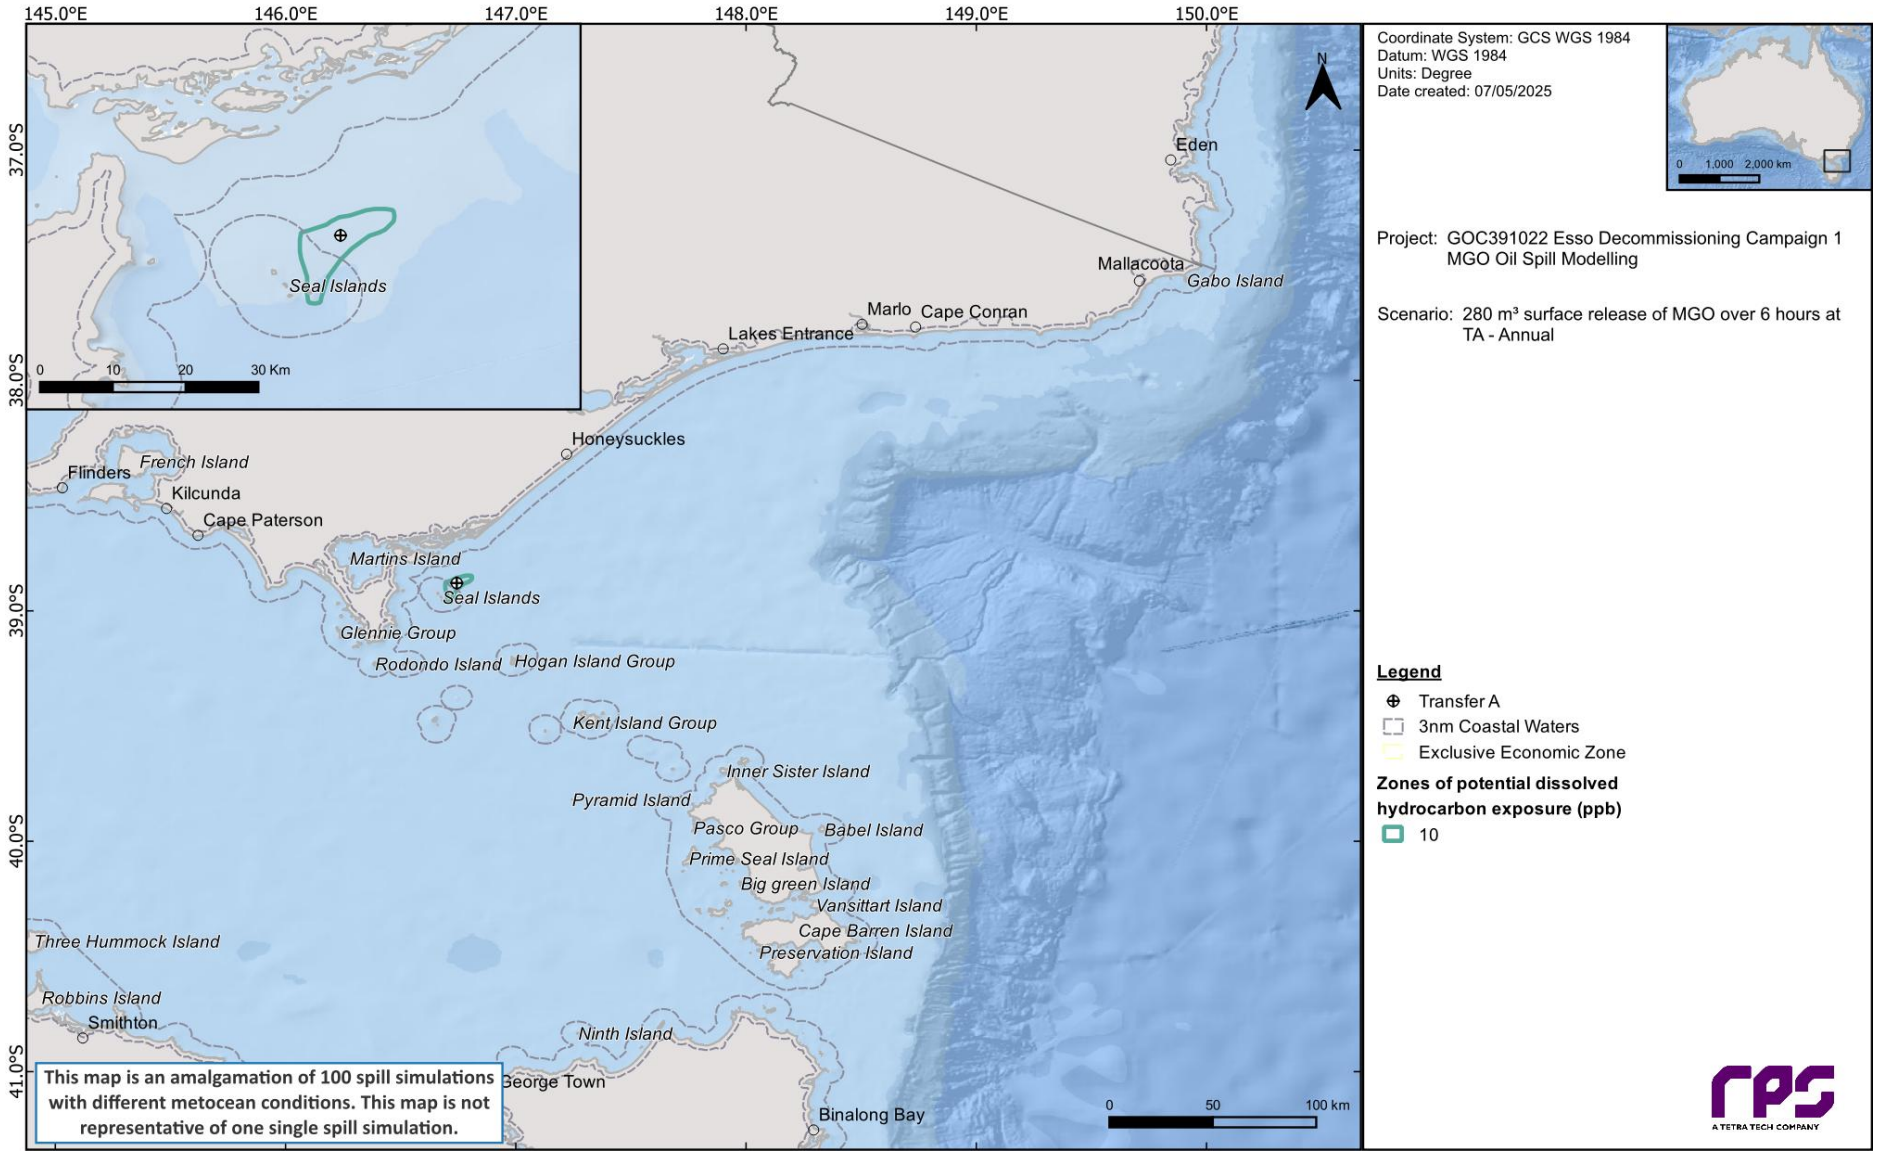

Figure 11.6 Zones of potential dissolved hydrocarbon exposure at 0-10 m, in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

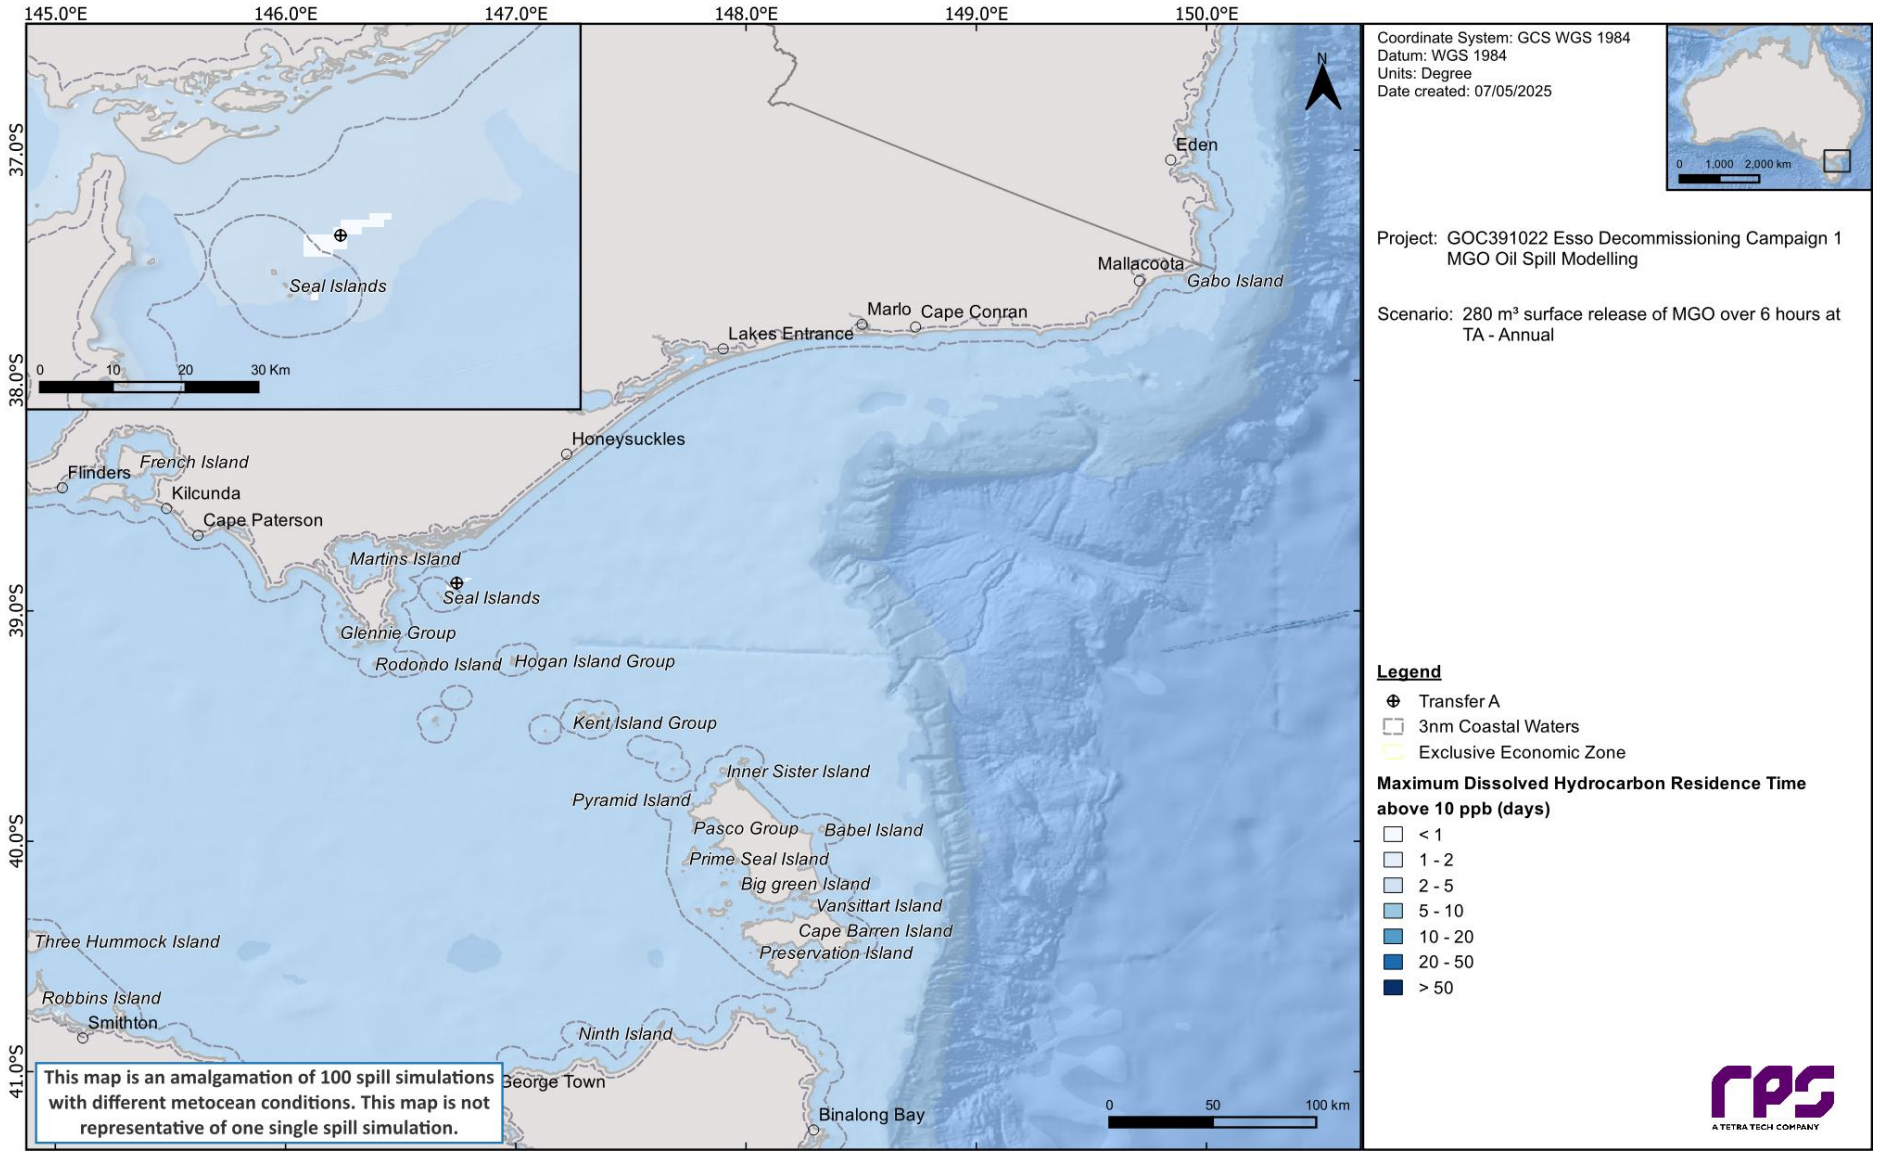

Figure 11.7 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface, in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

11.1.3.2 Entrained Hydrocarbons

Table 11.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure and maximum residence time for all thresholds assessed.

Except for the receptors the release location resides within, the highest probability of low entrained hydrocarbon exposure was recorded as 100% for Victoria State Waters, followed by 97% for Twofold Shelf and West Gippsland (VIC). The quickest time for exposure at the same threshold was 0.02 days for the Victoria State Waters and West Gippsland (VIC).

Figure 11.8 presents the extent of the predicted entrained hydrocarbon exposure for the low and high thresholds in the 0-10 m depth layer.

Figure 11.9 presents the maximum residence time of entrained hydrocarbon exposure for 10 ppb.

Table 11.6 Predicted probability and maximum entrained hydrocarbon exposure to individual receptors in the 0-10 m depth. **The release location resides within the receptor boundaries.

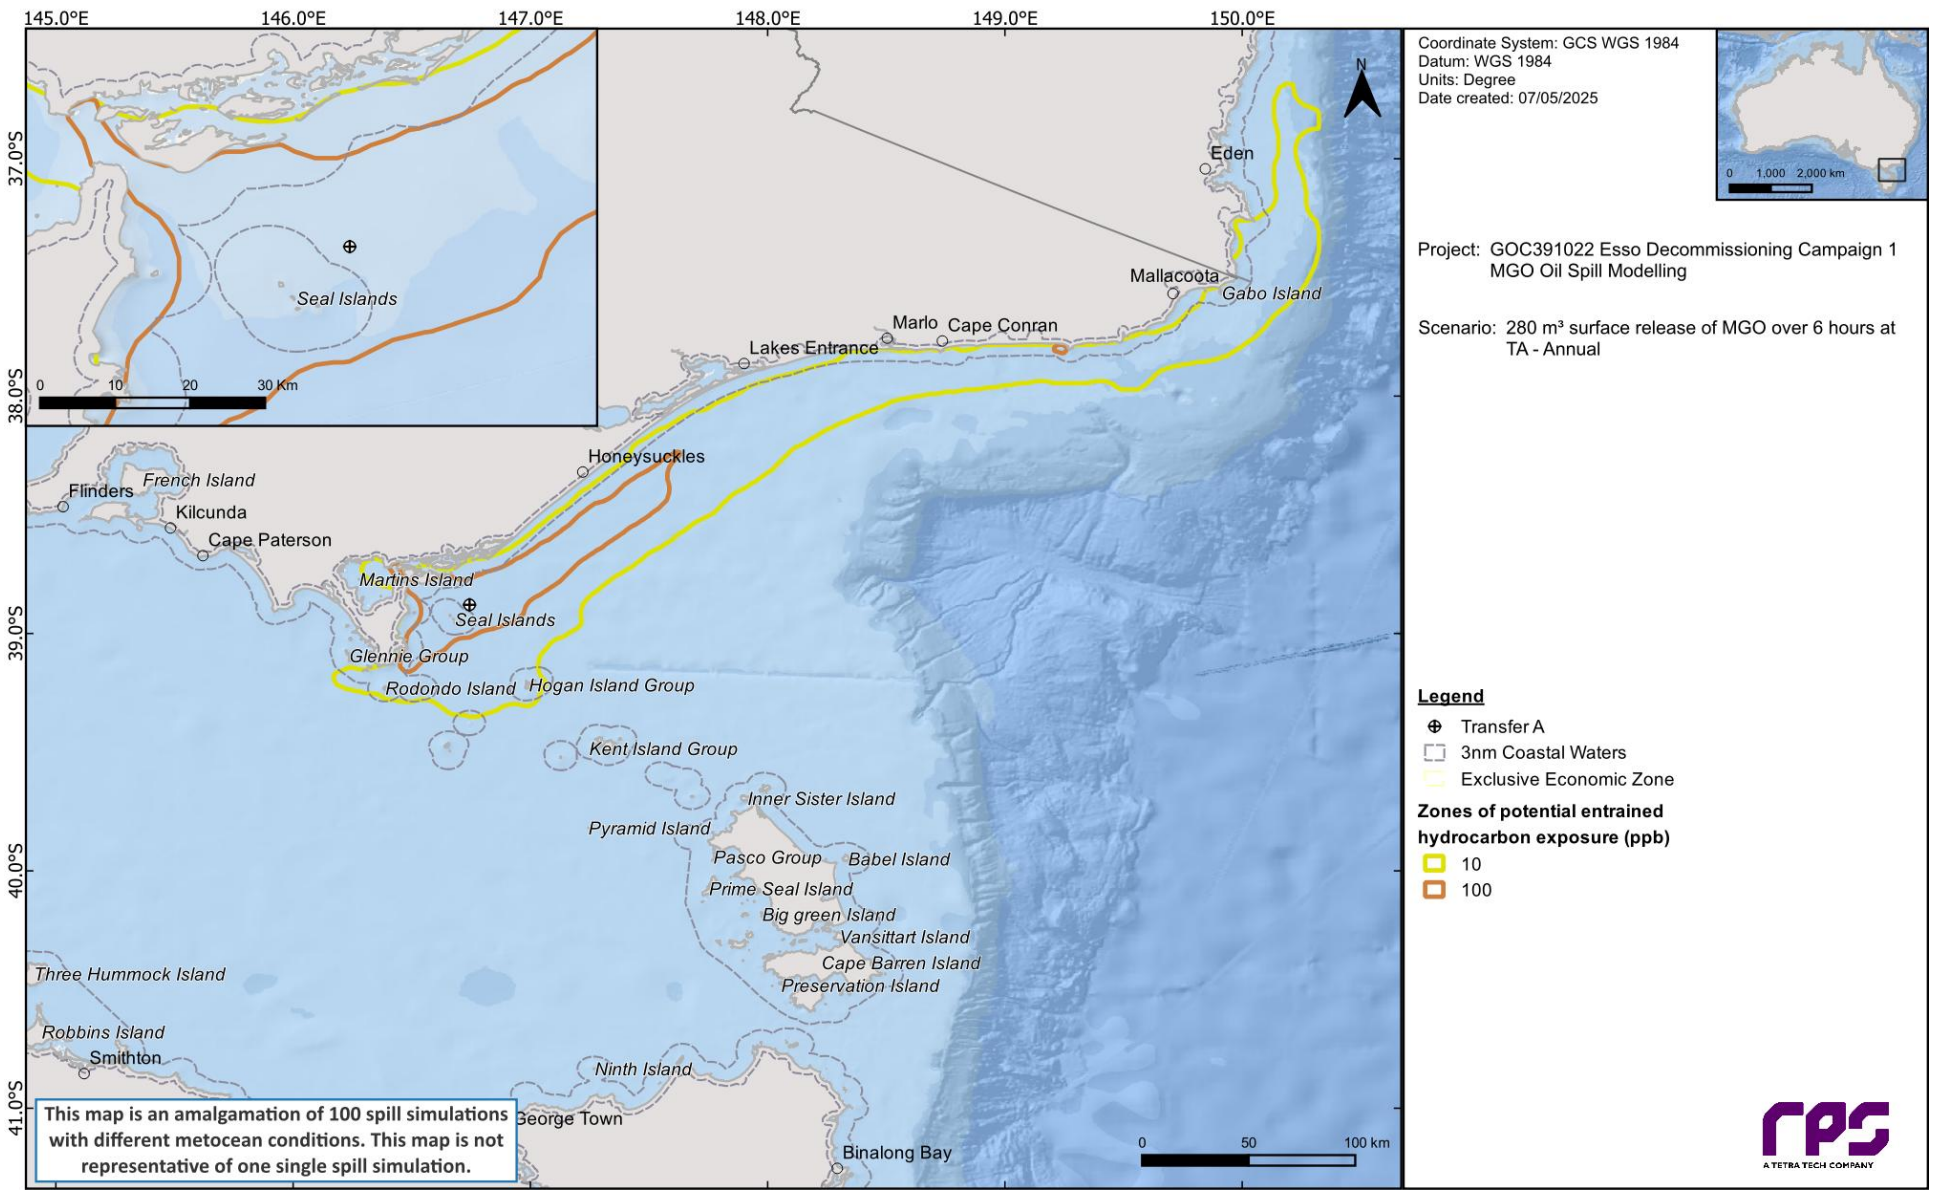

Figure 11.8 Zones of potential entrained hydrocarbon exposure at 0-10 m in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

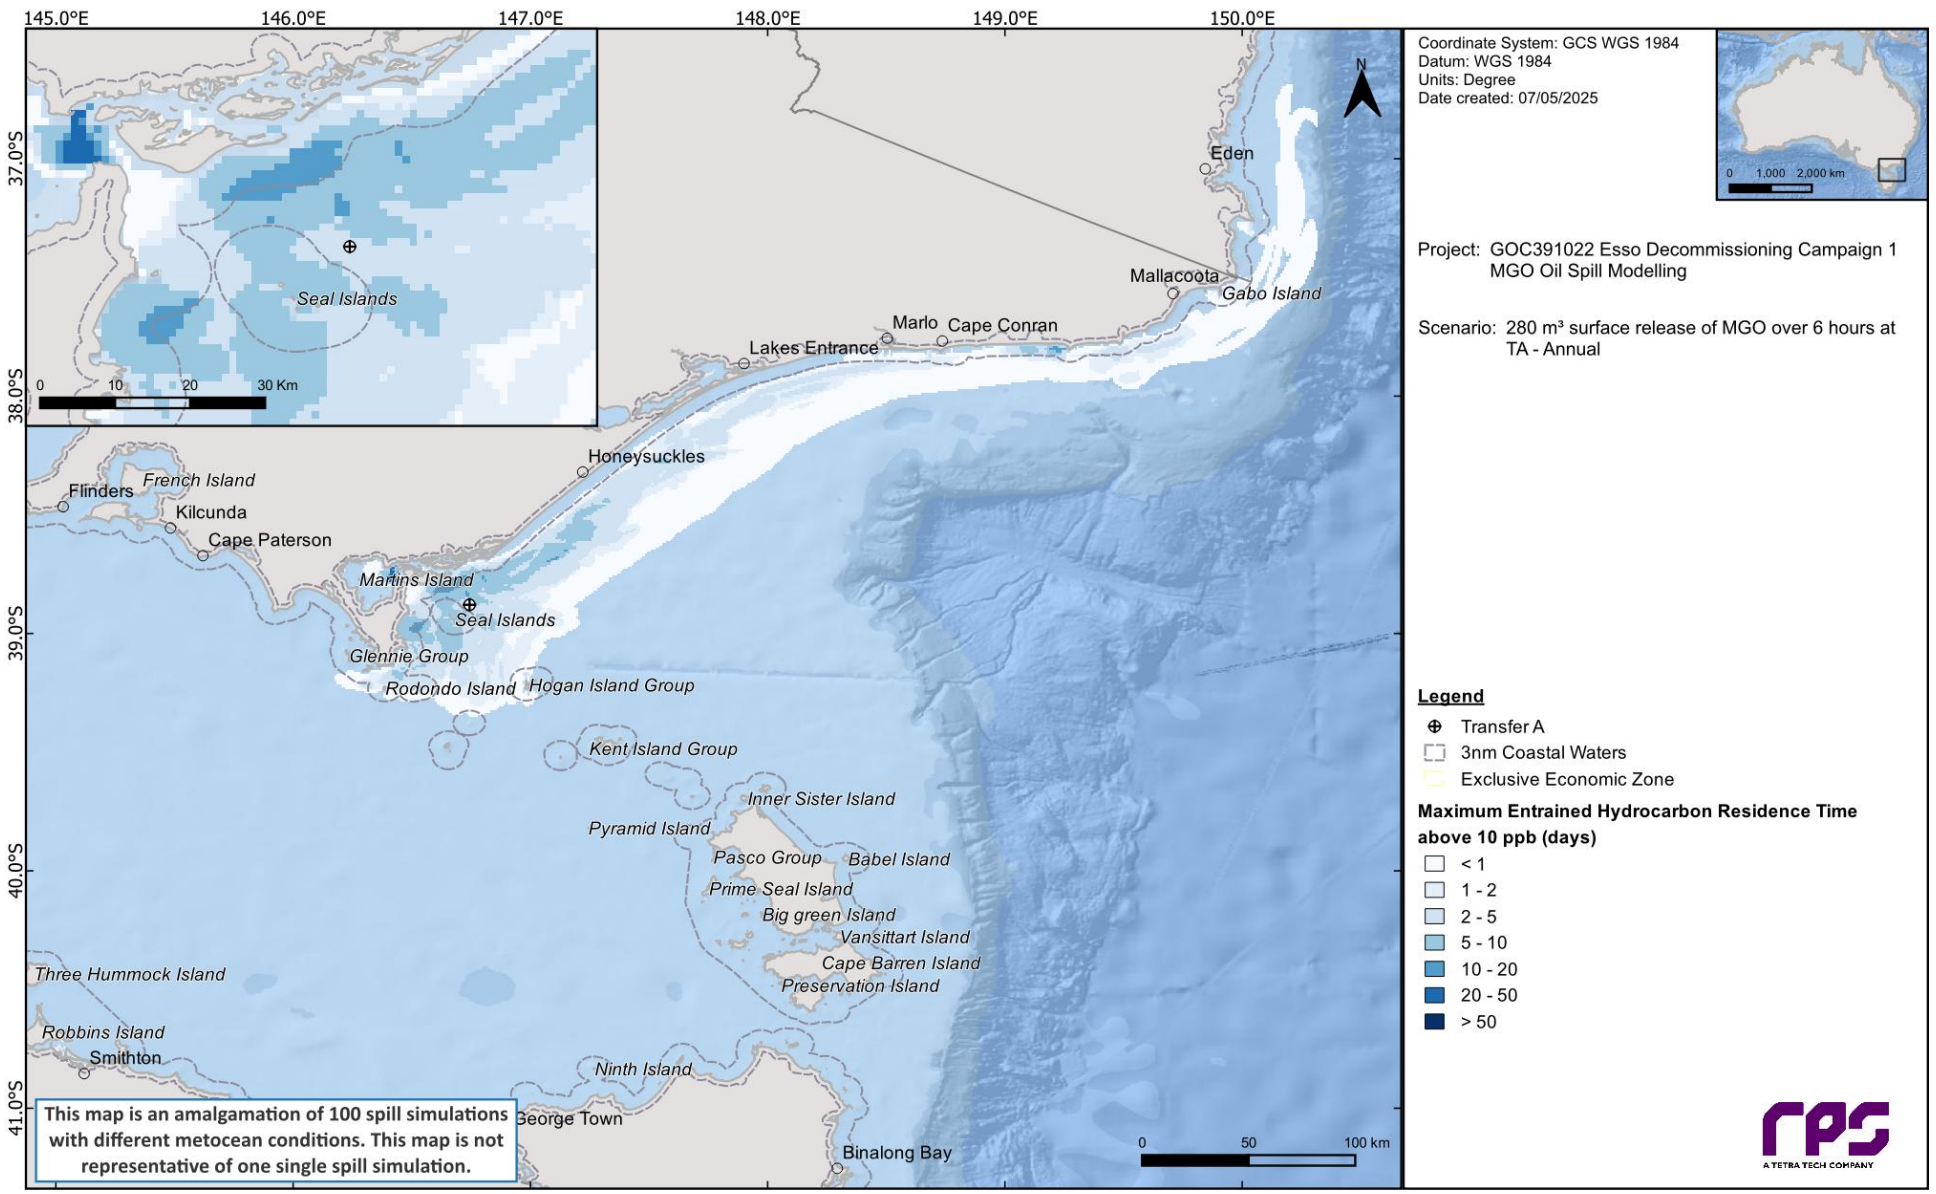

Figure 11.9 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

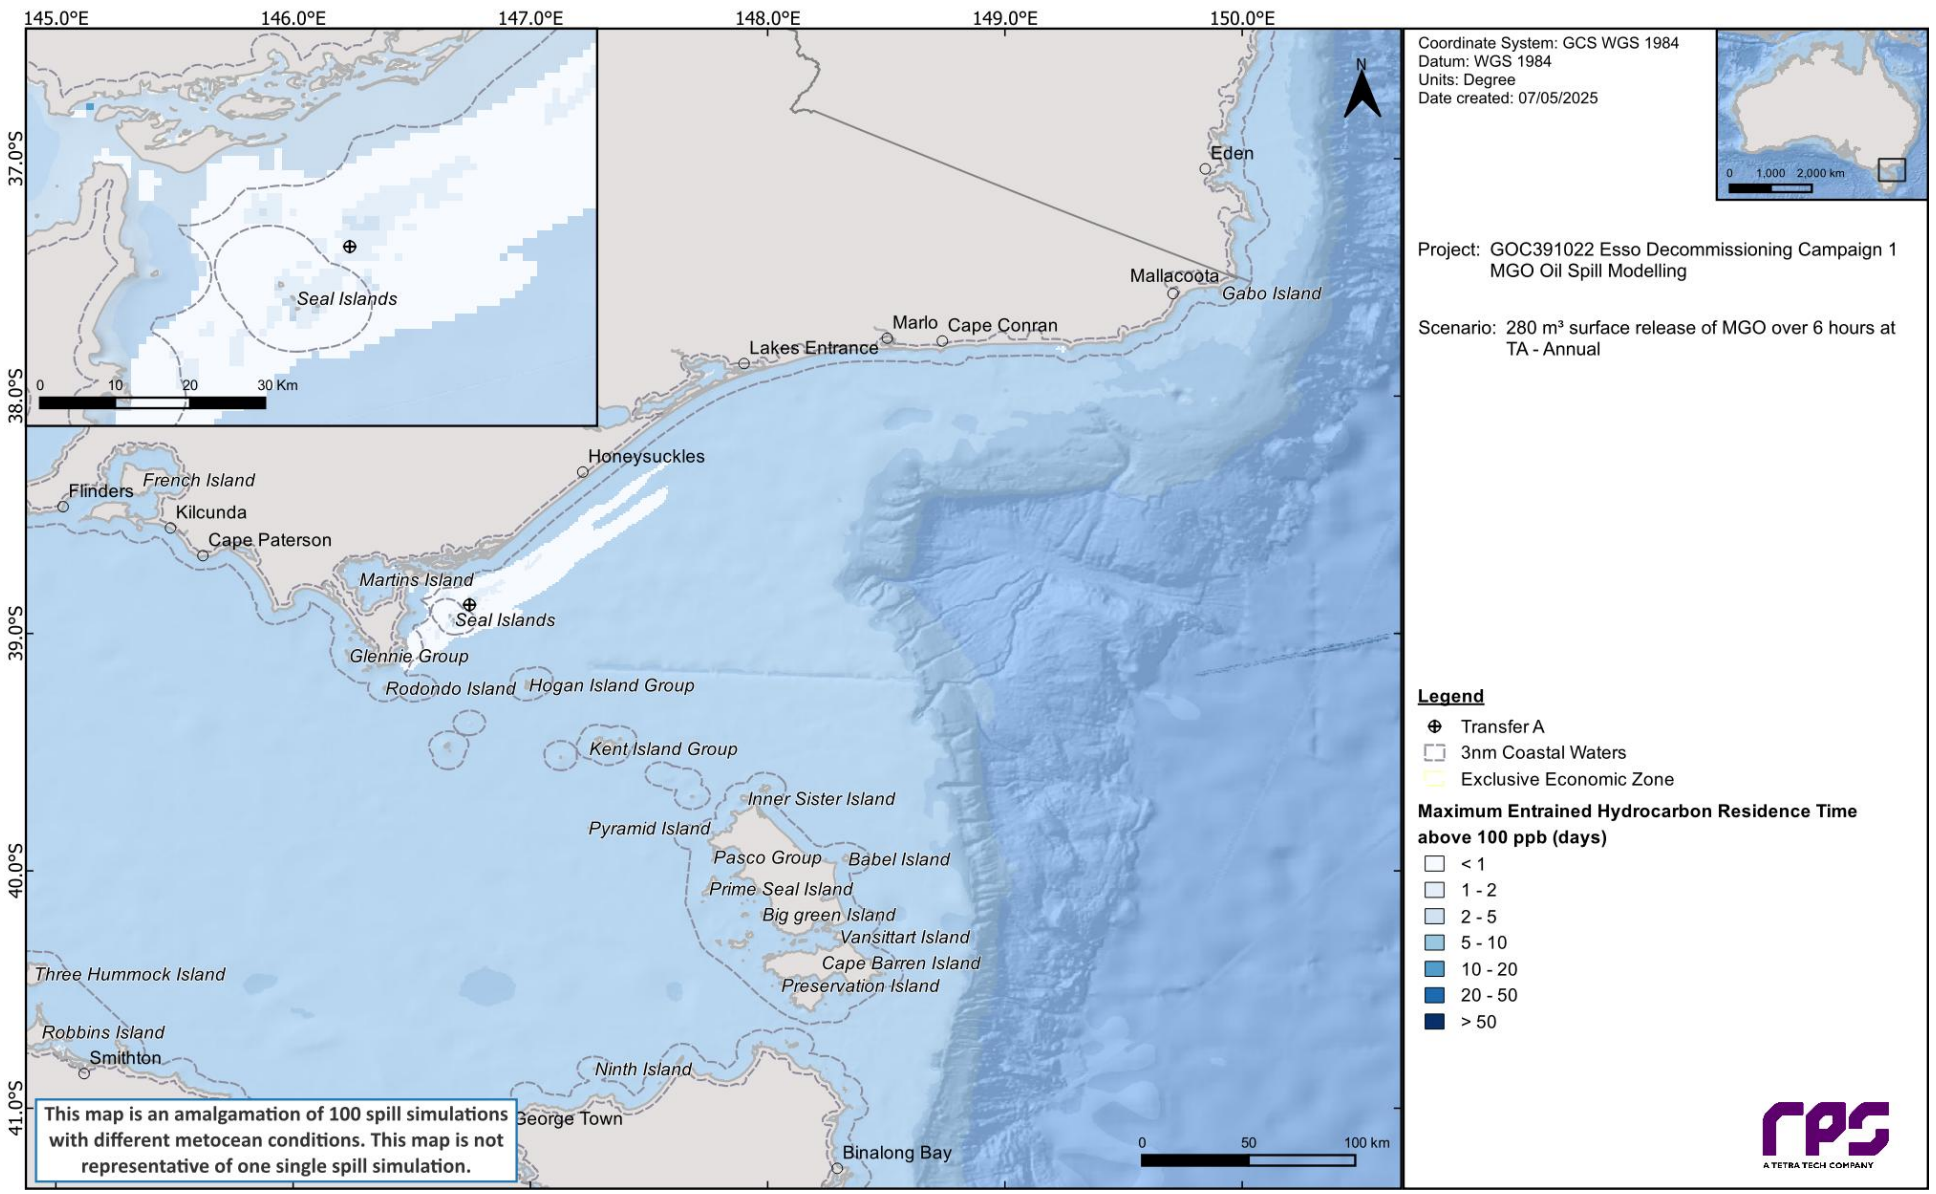

Figure 11.10 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

11.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m²; (Section 11.2.1)
b. Largest (total) volume of oil ashore (Section 11.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m² (Section 11.2.3)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 11.2.4)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 11.2.5)

Table 11.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 11.7 Summary of the deterministic analysis following a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil above 10 g/m²	Largest volume of oil ashore	Longest length of shoreline accumulation above 100 g/m²	Largest area of entrained hydrocarbons above 100 ppb	Maximum area of dissolved hydrocarbons above 50 ppb
Run Number		57	55	1	26	NC
Floating Oil (km²)	1 g/m²	82.1	118.0	3.9	1.6

	400 ppb	-	-	-	-	
Start Date		21st May 2010, 3:00 am	25th June 2018, 11:00 am	23rd February 2019, 10:00 pm	12th November 2013, 8:00 pm	

NC represents no contact to shoreline at, or above, low threshold (i.e., no shoreline accumulation).
^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay

11.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m²

The deterministic simulation that resulted in the largest swept area of floating oil above 10 g/m² (moderate threshold) was identified as run number 57, commencing 21st May 2010, 3:00 am.

Figure 11.11 presents the extent of the predicted floating oil exposure and shoreline oil accumulation over the entire 30-day simulation.

Figure 11.12 and Figure 11.13 display the time series of the predicted oil surface area and volume of floating oil above each threshold over the 30-day simulation.

Figure 11.14 presents the fates and weathering for the corresponding simulation and Table 11.8 summarises the peak volumes and times of occurrence for each oil phase and volumes at the end of the 30-day simulation.

Table 11.8 Summary of peak volumes and times of occurrence for each oil phase and the volumes at the conclusion of the simulation (day 30), for the simulation that resulted in the largest swept area of floating oil above 10 g/m².

Exposure Metrics	Peak Volume	Day of Occurrence	Volume at day 30
Surface (m³)	178.2	1	0.2
Entrained (m³)	158.4	2	50.0
Dissolved (m³)	0.4	2	0.0
Evaporation (m³)	129.7	30	129.7
Ashore (m³)	4.2	15	3.0
Decay (m³)	101.2	30	101.2

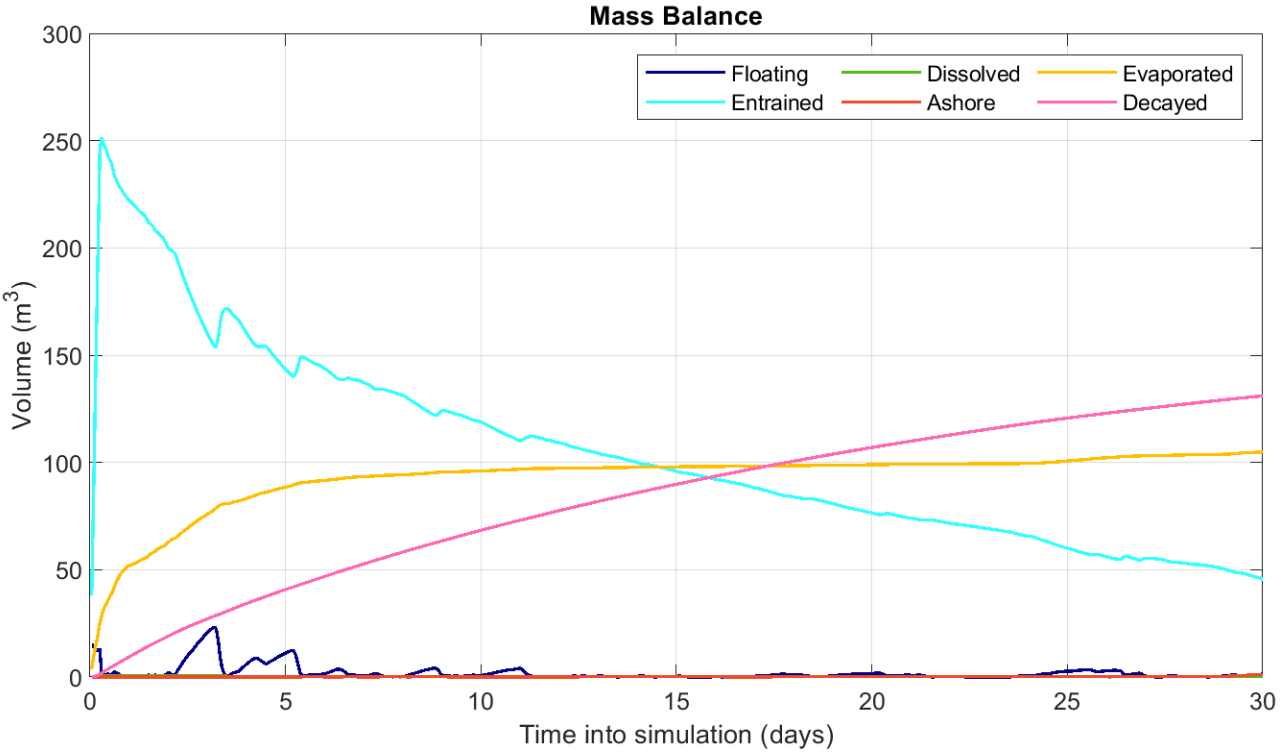

Figure 11.25 Predicted weathering and fates graph for the simulation with the largest area of entrained hydrocarbons above 100 ppb.

11.2.5 Deterministic Case: Largest area of dissolved hydrocarbons above 50 ppb

No dissolved hydrocarbon exposure above 50 ppb was recorded. Hence, no results are presented.

12 RESULTS: SCENARIO 2 – A 280 m³ SURFACE RELEASE OF MGO AT TRANSFER LOCATION B

This scenario examined a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. A total of 100 spill simulations were run for each of the three seasons and each simulation was tracked for 30 days.

Section 12.1 presents the seasonal (or stochastic) analysis results, while Section 12.2 presents the deterministic results.

12.1 Stochastic Analysis

12.1.1 Floating Oil Exposure

Table 12.1 summarises the maximum distance travelled by floating oil on the sea surface at each threshold. The maximum distance from the release location to the low (1 g/m²) threshold was 14.95 km. For the moderate (10 g/m²) high (≥ 50 g/m²) thresholds the maximum distances from the release location reduced to 9.98 and 5.69 km, respectively.

Table 12.2 summarises the potential floating oil exposure and minimum time of floating oil exposure to individual receptors.

Apart from the receptors the release location lies within, the Victoria State Waters and West Gippsland (VIC) revealed the highest probability of reaching the lowest threshold for floating oil (33%). The earliest floating oil exposure threshold recorded above the low was 0.1 days (~2.4 hours) for the same two receptors.

Figure 12.1 presents the zones of floating oil exposure for each season, while Figure 12.2 and Figure 12.4 present the minimum time before floating oil exposure.

Table 12.1 Summary of swept areas, maximum distances and directions travelled from the release location to floating oil exposure for each season and threshold. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

Distance and direction	Zones of potential floating oil exposure		
	Low	Moderate	High
Total stochastic sea surface swept area (km²)	283.20	137.31	17.94
Maximum deterministic sea surface swept area (km²)	126.33	46.03	5.46
Maximum distance from release site (km)	14.95	9.98	5.69
Direction	Southwest	Southwest	Southwest

Table 12.2 Summary of the potential floating oil exposure to individual receptors. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The results were calculated from 100 spill trajectories and represent annual conditions.

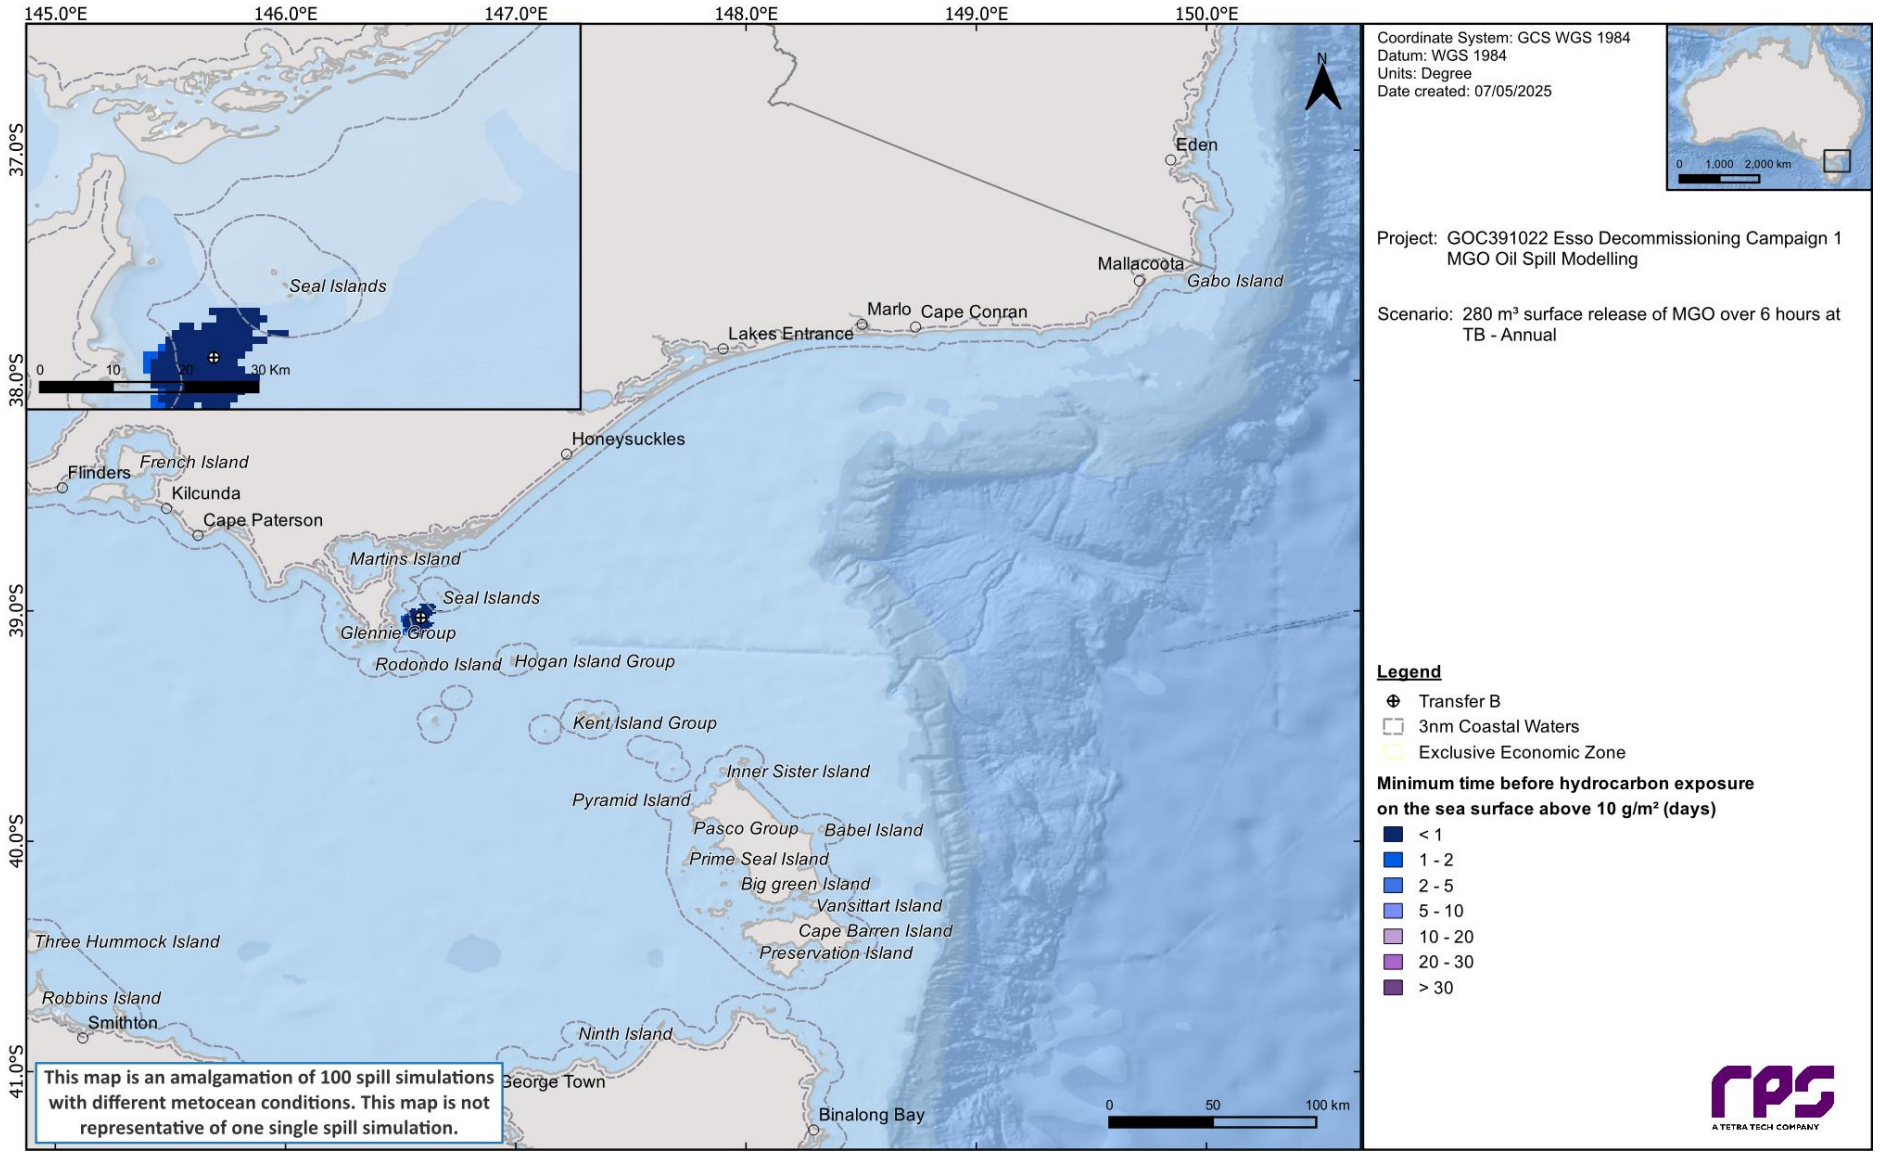

Figure 12.3 Minimum time before floating oil exposure above 10 g/m² in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The results were calculated from 100 spill trajectories and represent annual conditions.

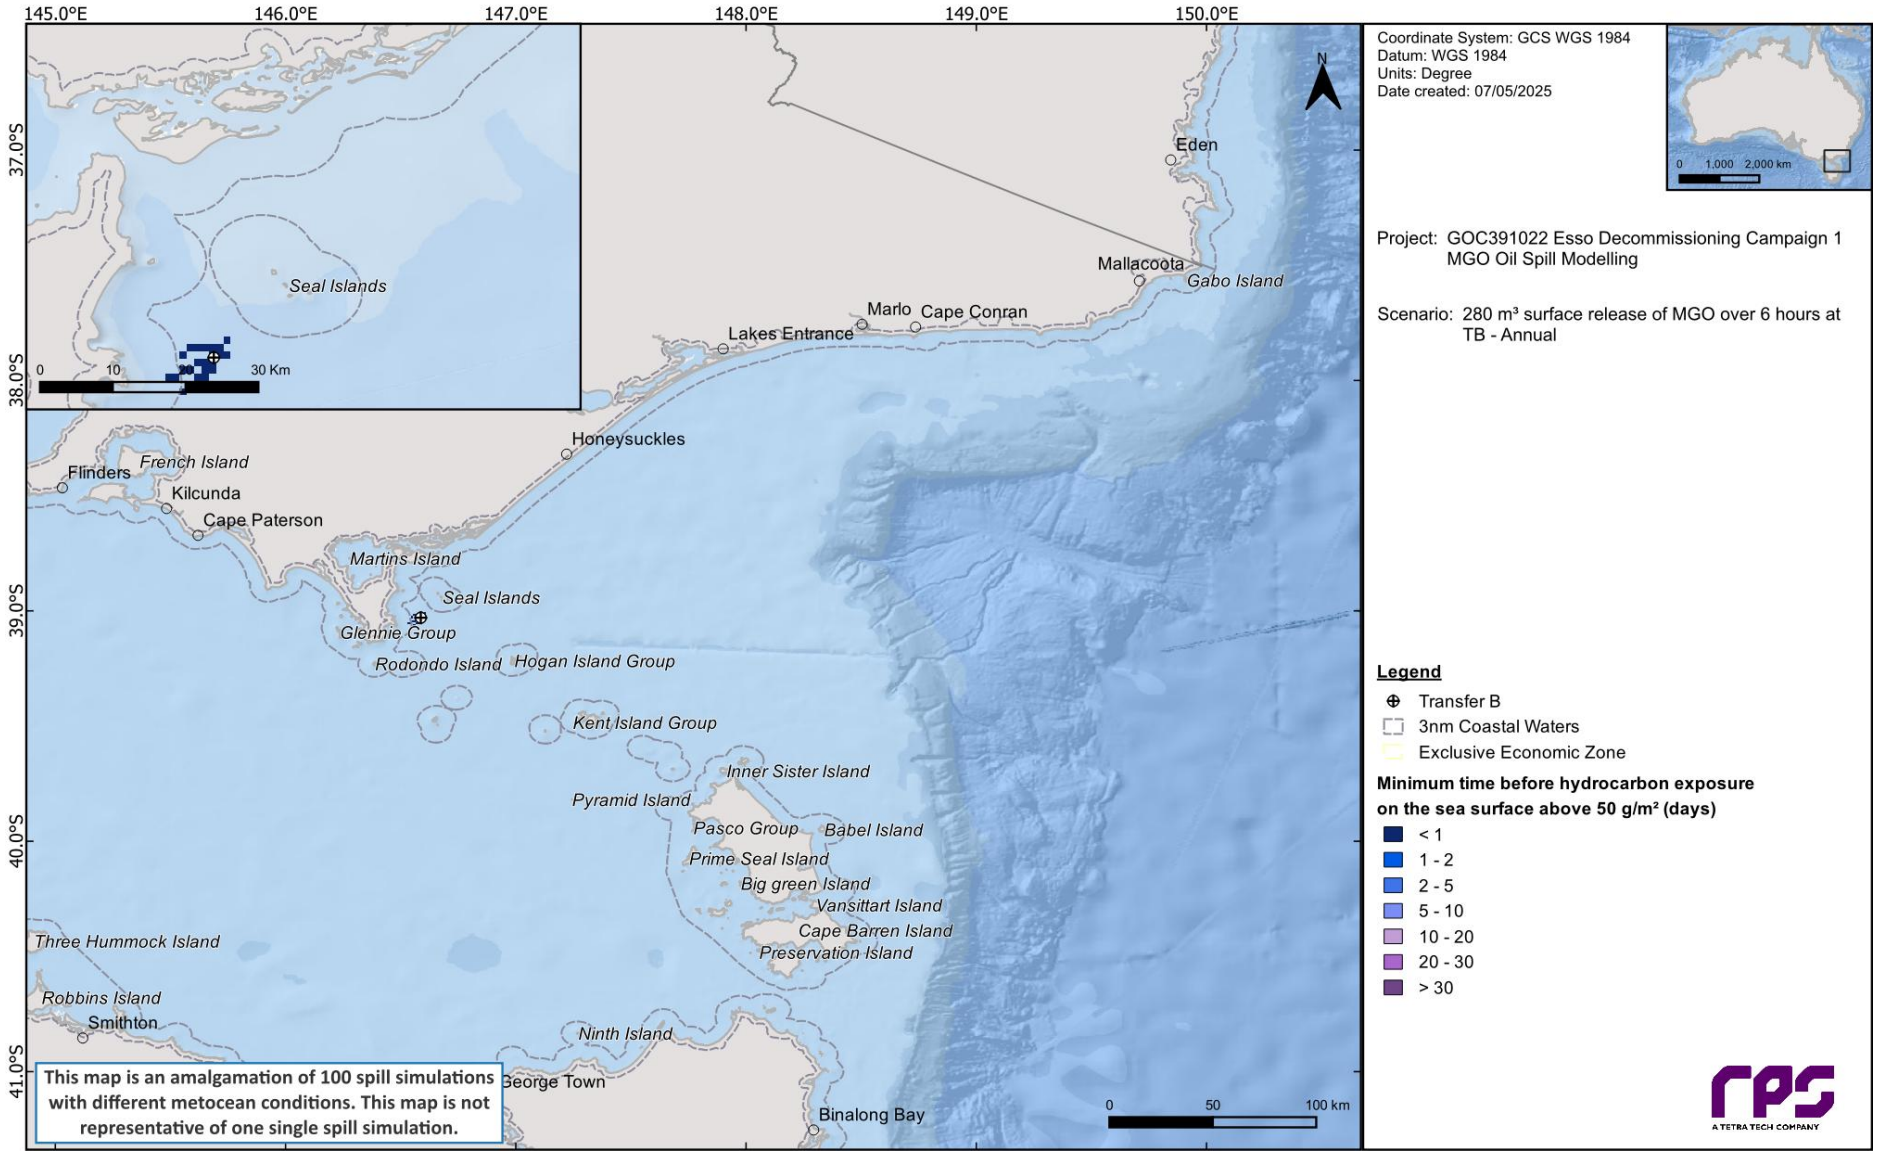

Figure 12.4 Minimum time before floating oil exposure above 50 g/m² in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The results were calculated from 100 spill trajectories and represent annual conditions.

12.1.2 Shoreline Accumulation

Table 12.3 presents a summary of the predicted potential shoreline accumulation. The probability of accumulation to any shoreline at, or above, the low level (10 g/m^2) threshold was 88% and the minimum time before oil accumulation at, or above, the low threshold was 0.36 days. The maximum volume ashore for a single spill trajectory was 30.8 m^3*, whilst the maximum length of shoreline accumulation at the low threshold was 30.9 km.

Table 12.4 summarises the shoreline accumulation on individual receptors. Seal Islands recorded the highest probability of shoreline accumulation at the low threshold, being 68% and the minimum time before shoreline accumulation above the low threshold with 0.36 days. Additionally, the maximum total volume ashore for the single spill trajectory was predicted for South Gippsland, with volumes of 28.5 m^3 and 21.7 m^3 being predicted above the low and moderate thresholds, respectively.

The maximum potential shoreline loading above the low, moderate and high shoreline thresholds are presented in Figure 12.5.

Table 12.3 Summary of oil accumulation across all shorelines. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

Shoreline Statistics	Annual
Probability of accumulation on any shoreline (%)	88
Absolute minimum time for visible oil to shore (days)	0.36
Maximum total volume of hydrocarbons ashore (m^3)*	30.8
Maximum total volume of oil on the shoreline ≥10 g/m² (m³)	30.8
Maximum total volume of oil on the shoreline ≥100 g/m² (m³)	21.8
Maximum total volume of oil on the shoreline ≥1,000 g/m² (m³)	-
Maximum length of the shoreline at 10 g/m^2 (km)	30.9
Average shoreline length (km) at 10 g/m^2 (km)	4.9
Maximum length of the shoreline at 100 g/m^2 (km)	7.1
Average shoreline length (km) at 100 g/m^2 (km)	0.8
Maximum length of the shoreline at 1,000 g/m^2 (km)	-
Average shoreline length (km) at 1,000 g/m^2 (km)	-

*Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay

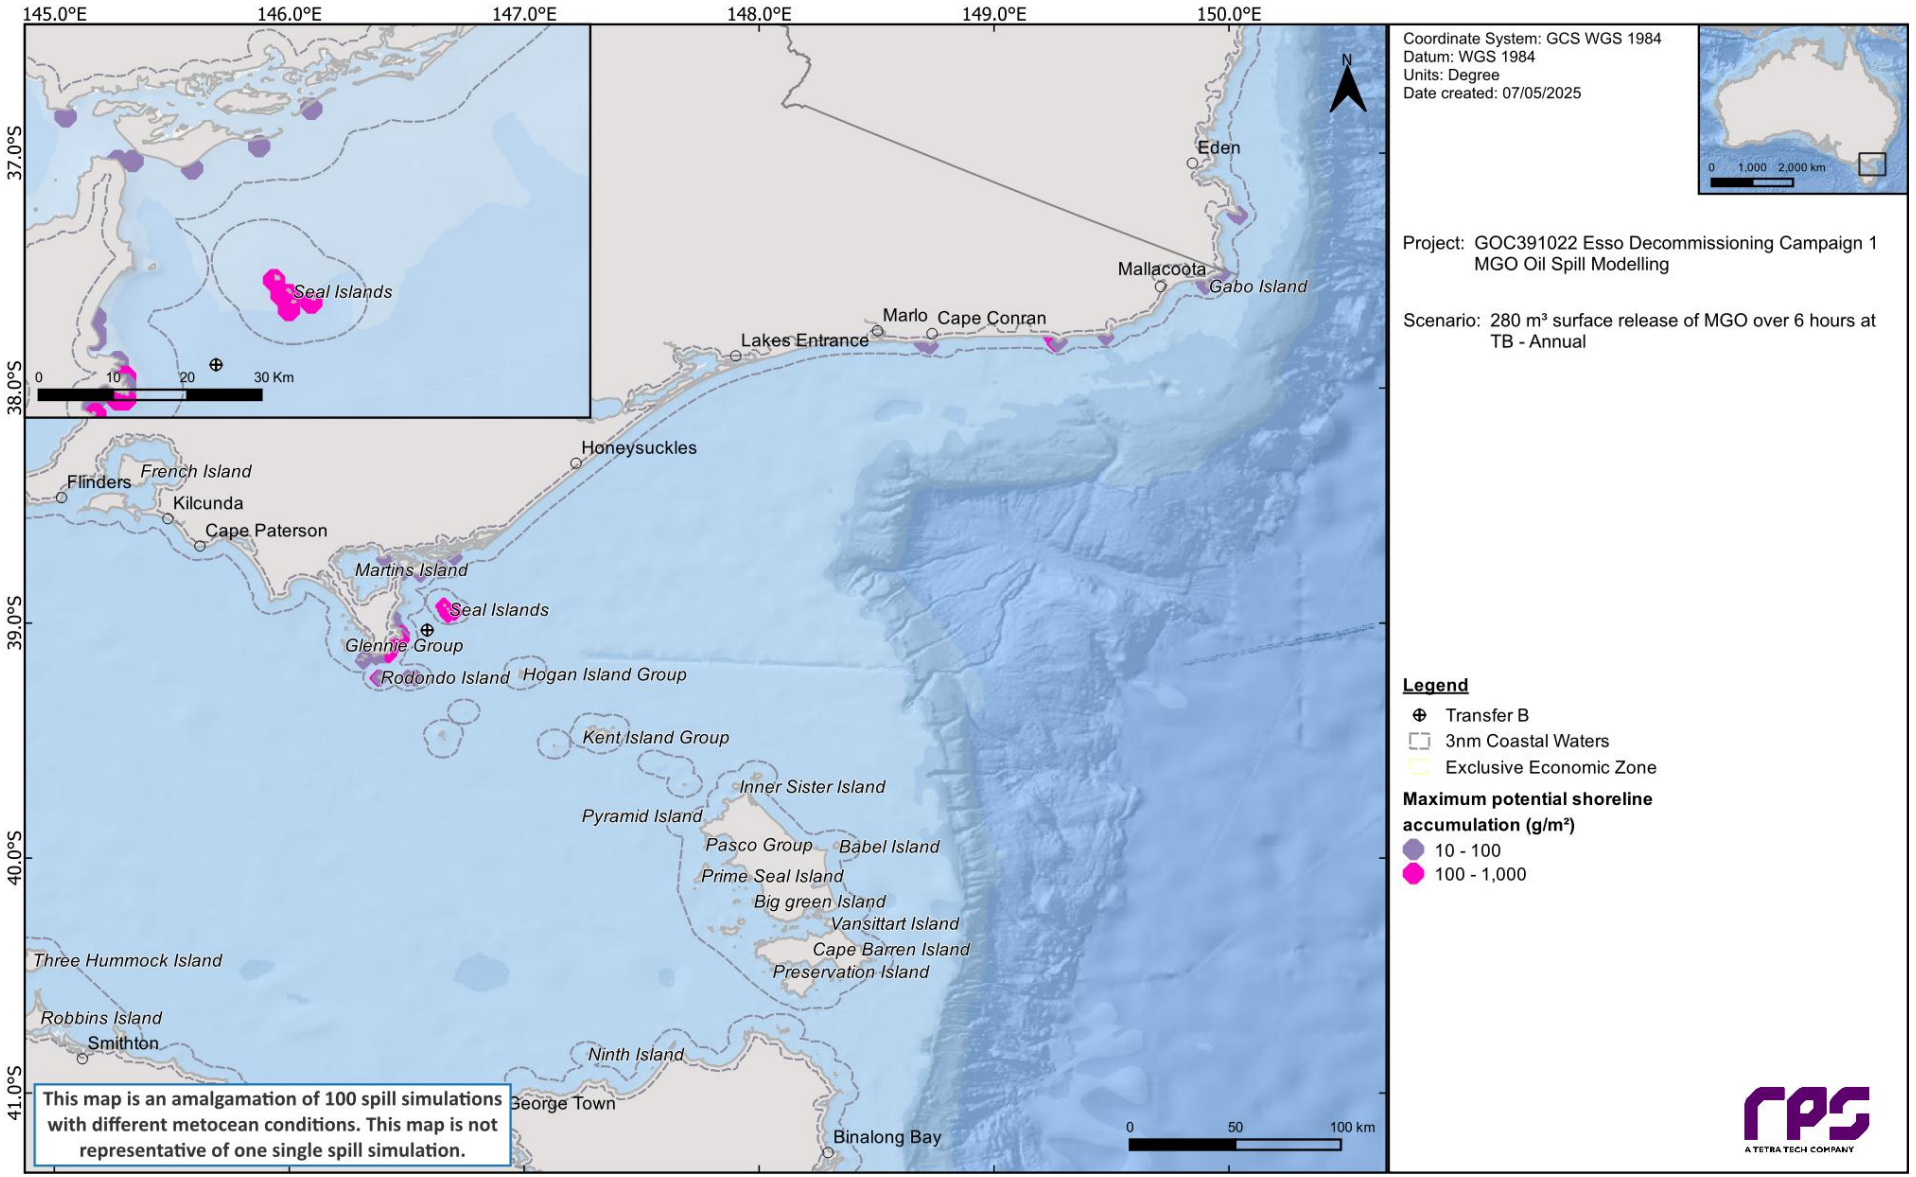

Figure 12.5 Maximum potential shoreline loading in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

12.1.3 Water Column Exposure

12.1.3.1 Dissolved Hydrocarbons

Table 12.5 summarises the potential in-water exposure to individual receptors from dissolved hydrocarbons in the 0-10 m layer as well as the minimum time before exposure and maximum residence time for all thresholds assessed.

In the surface (0-10 m) depth layer, with the exception of the receptors that the release location resides within, the highest probability to dissolved hydrocarbon above the low threshold was 2% at West Gippsland (VIC) NRMR and Victoria State Waters, which also presented the shortest time before exposure (0.23 days).

Figure 12.6 illustrates the extent of the predicted dissolved hydrocarbon exposure in the 0-10 m depth layer.

Figure 12.7 presents the maximum residence time of dissolved hydrocarbon exposure for the low threshold.

Table 12.5 Predicted probability and maximum dissolved hydrocarbon exposure to marine-based receptors in the 0-10 m depth. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

Receptor		Maximum dissolved hydrocarbon exposure (ppb)	Probability of dissolved hydrocarbon exposure (%)			Minimum time before dissolved hydrocarbon exposure (days)			Maximum residence time for dissolved hydrocarbon exposure (days)

**The release location resides within the receptor boundaries.

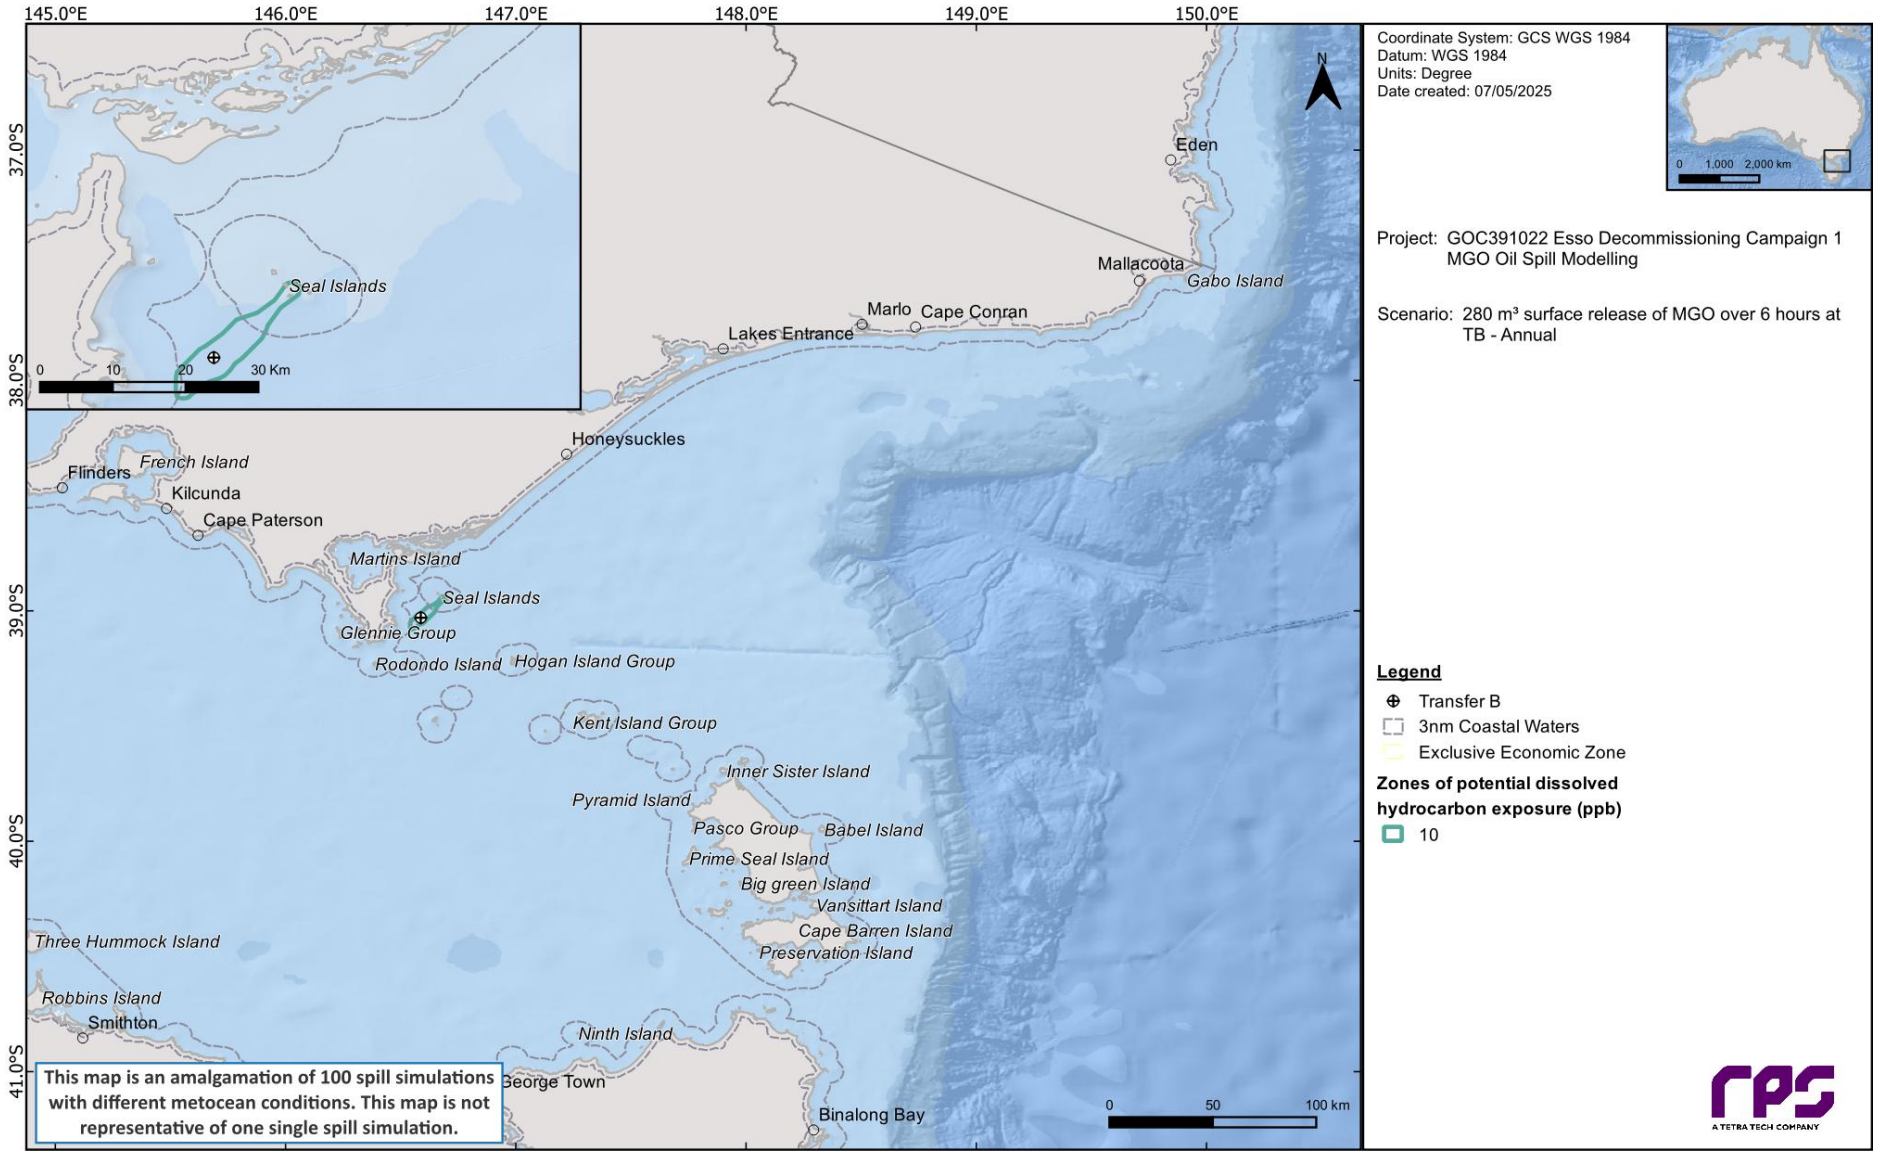

Figure 12.6 Zones of potential dissolved hydrocarbon exposure at 0-10 m, in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

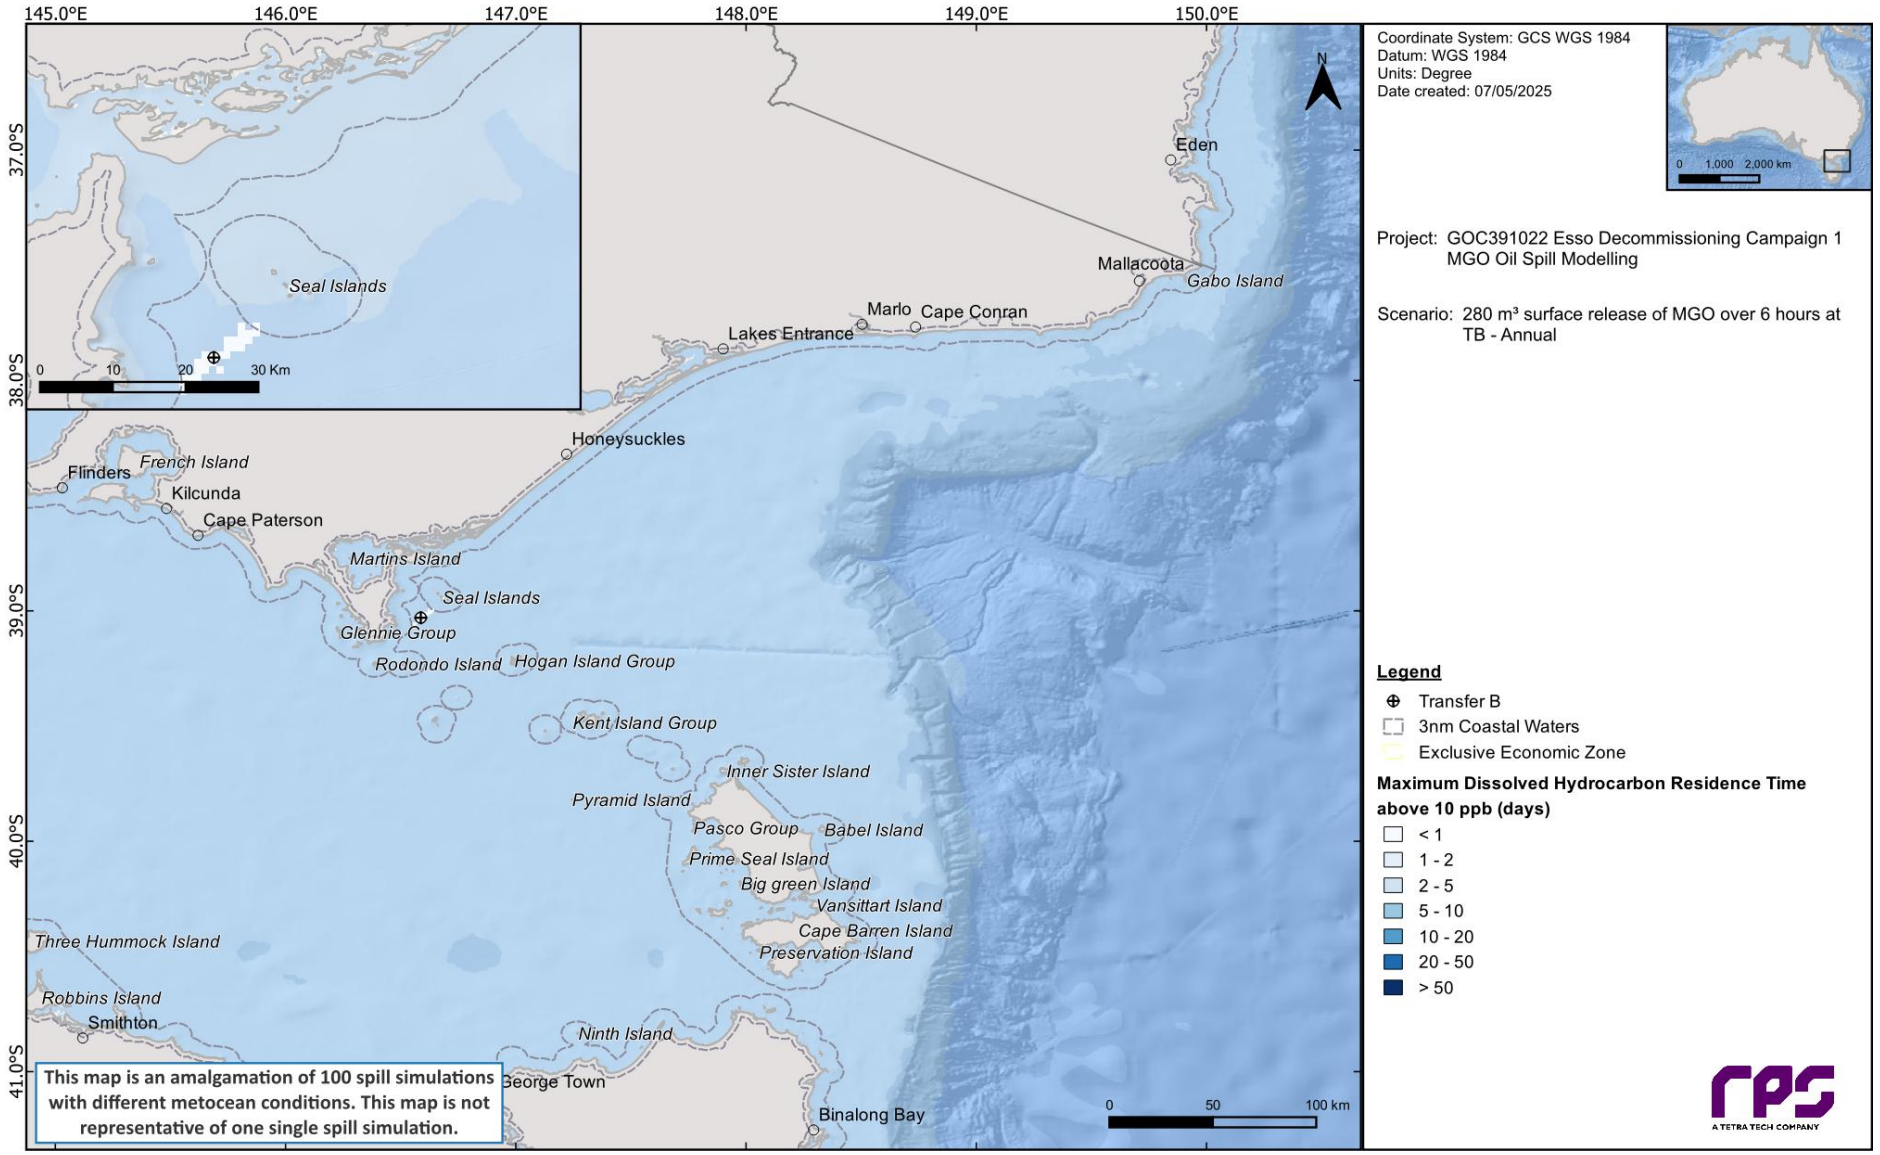

Figure 12.7 Maximum residence time for dissolved hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface, in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

12.1.3.2 Entrained Hydrocarbons

Table 12.6 summarises the potential in-water exposure to individual receptors from entrained hydrocarbons in the 0-10 m depth layer, as well as the minimum time before exposure and maximum residence time for all thresholds assessed.

Except for the receptors the release location resides within, the highest probability of low entrained hydrocarbon exposure was recorded as 100% for the Victoria State Waters. The quickest time for exposure at the same threshold was 0.05 day for the same receptor.

Figure 12.8 illustrates the extent of the predicted entrained hydrocarbon exposure for the low and high thresholds in the 0-10 m depth layer.

Figure 12.9 and Figure 12.10Figure 11.9 present the maximum residence time of entrained hydrocarbon exposure for 10 and 100 ppb.

Table 12.6 Predicted probability and maximum entrained hydrocarbon exposure to individual receptors in the 0-10 m depth. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

**The release location resides within the receptor boundaries.

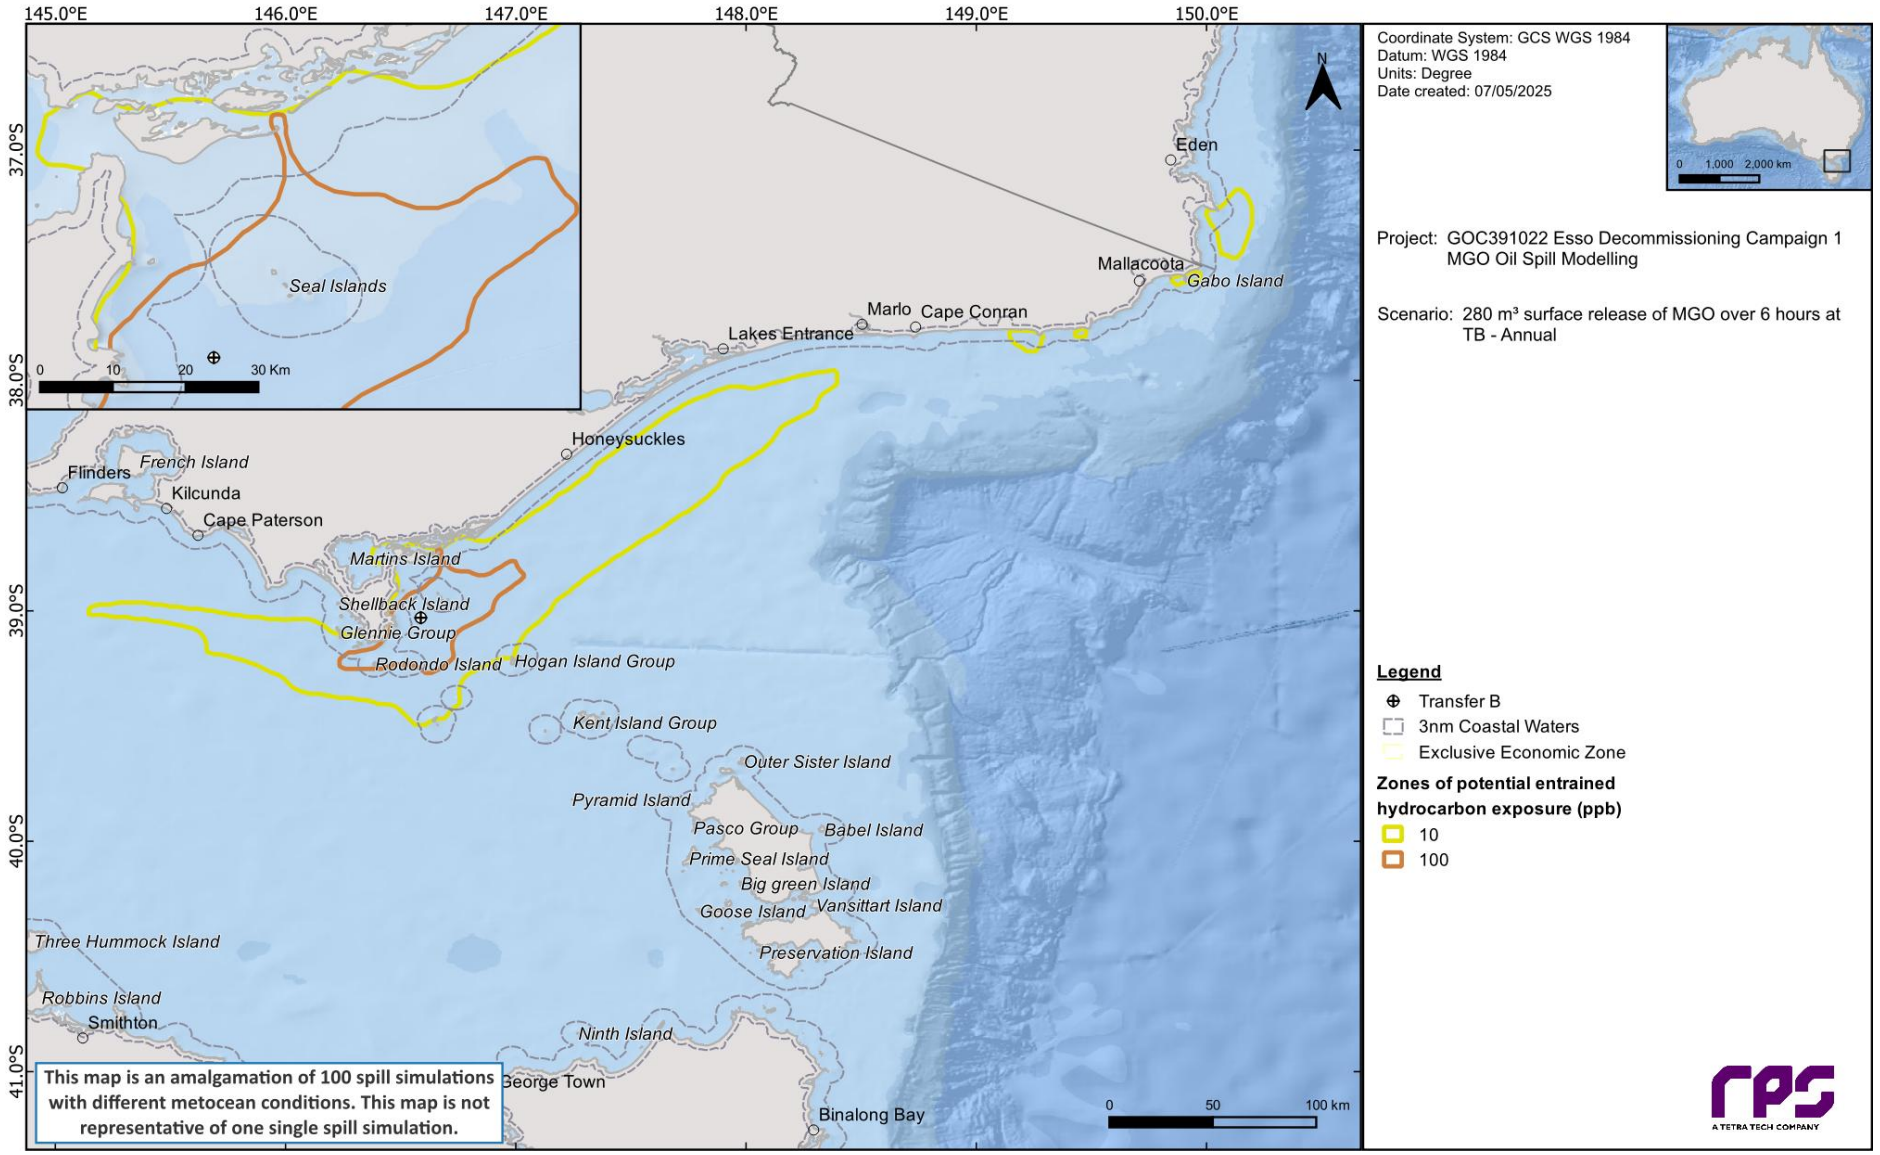

Figure 12.8 Zones of potential entrained hydrocarbon exposure at 0-10 m in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

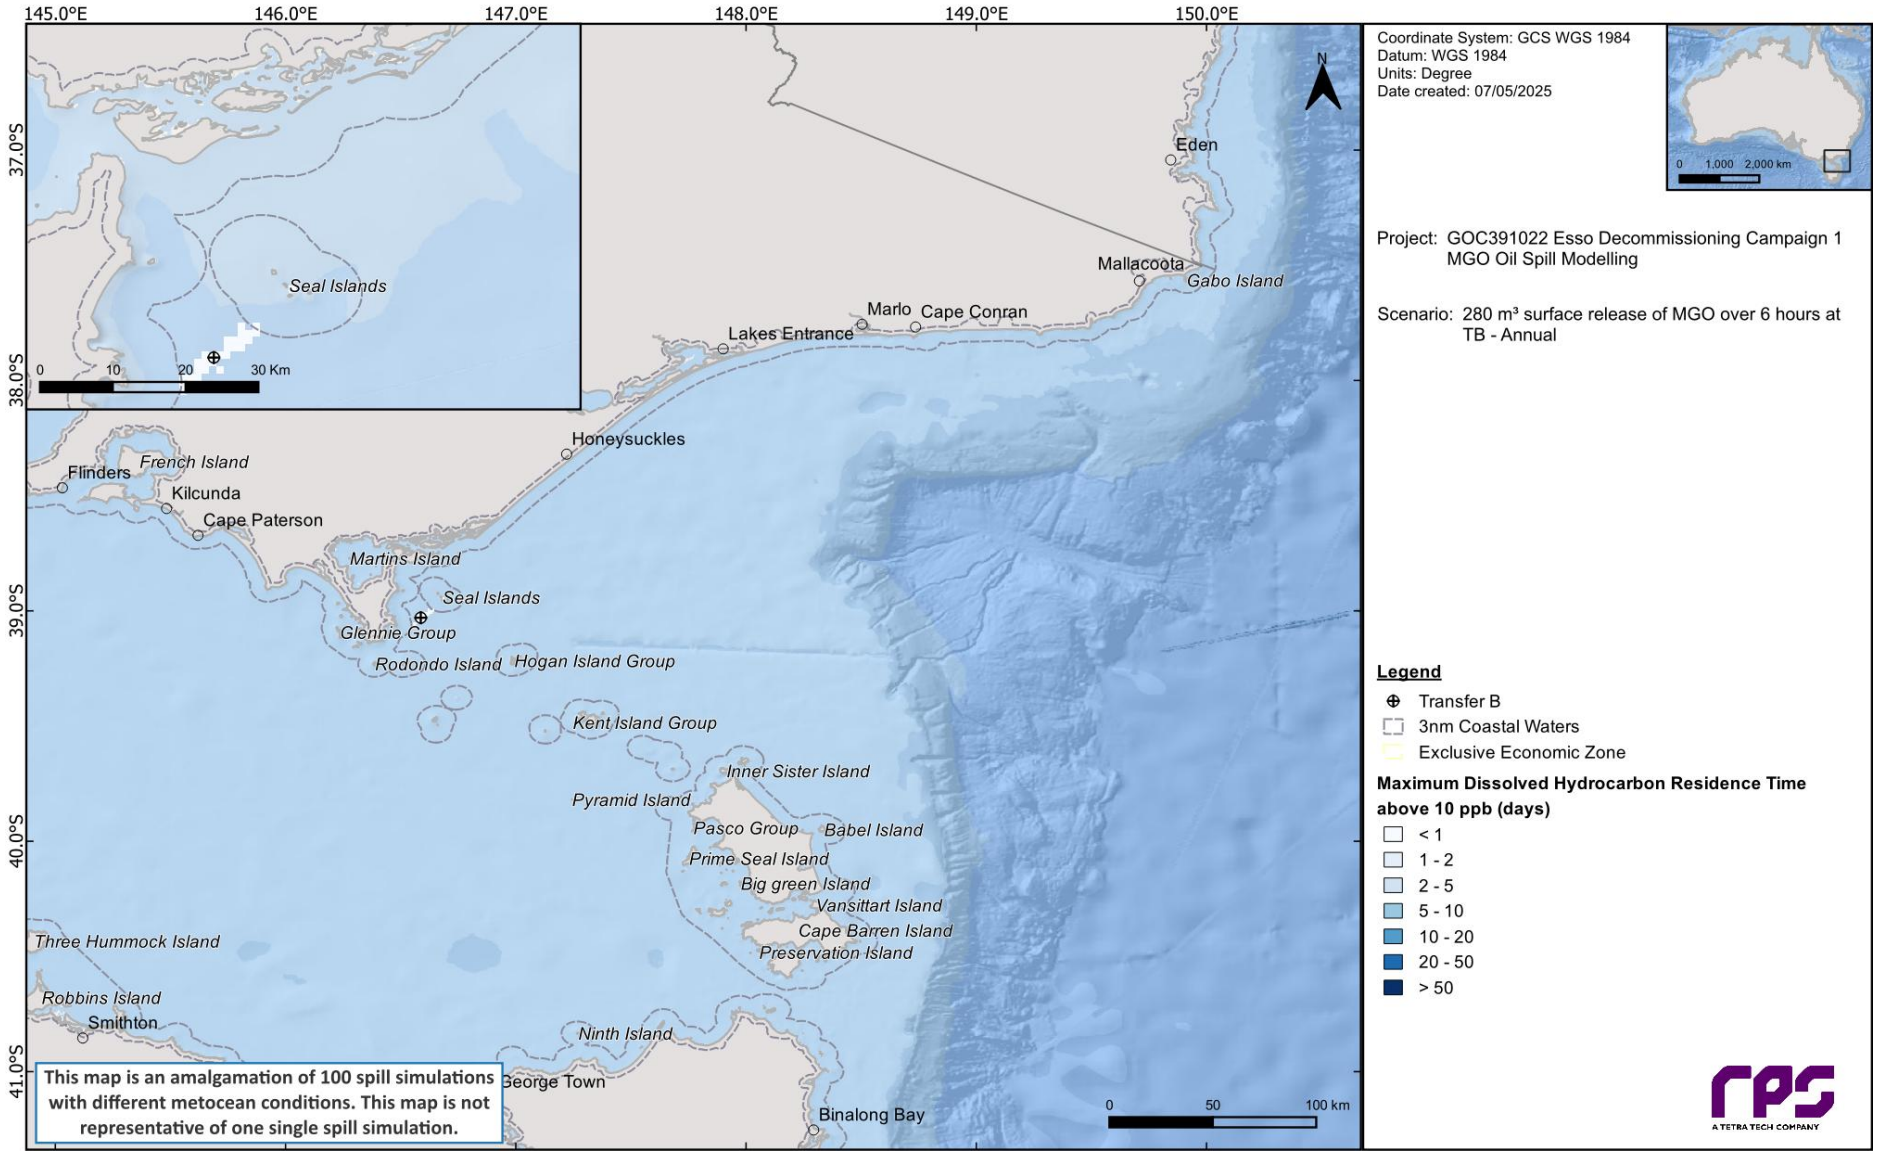

Figure 12.9 Maximum residence time for entrained hydrocarbon exposure above 10 ppb, at 0-10 m below the sea surface in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

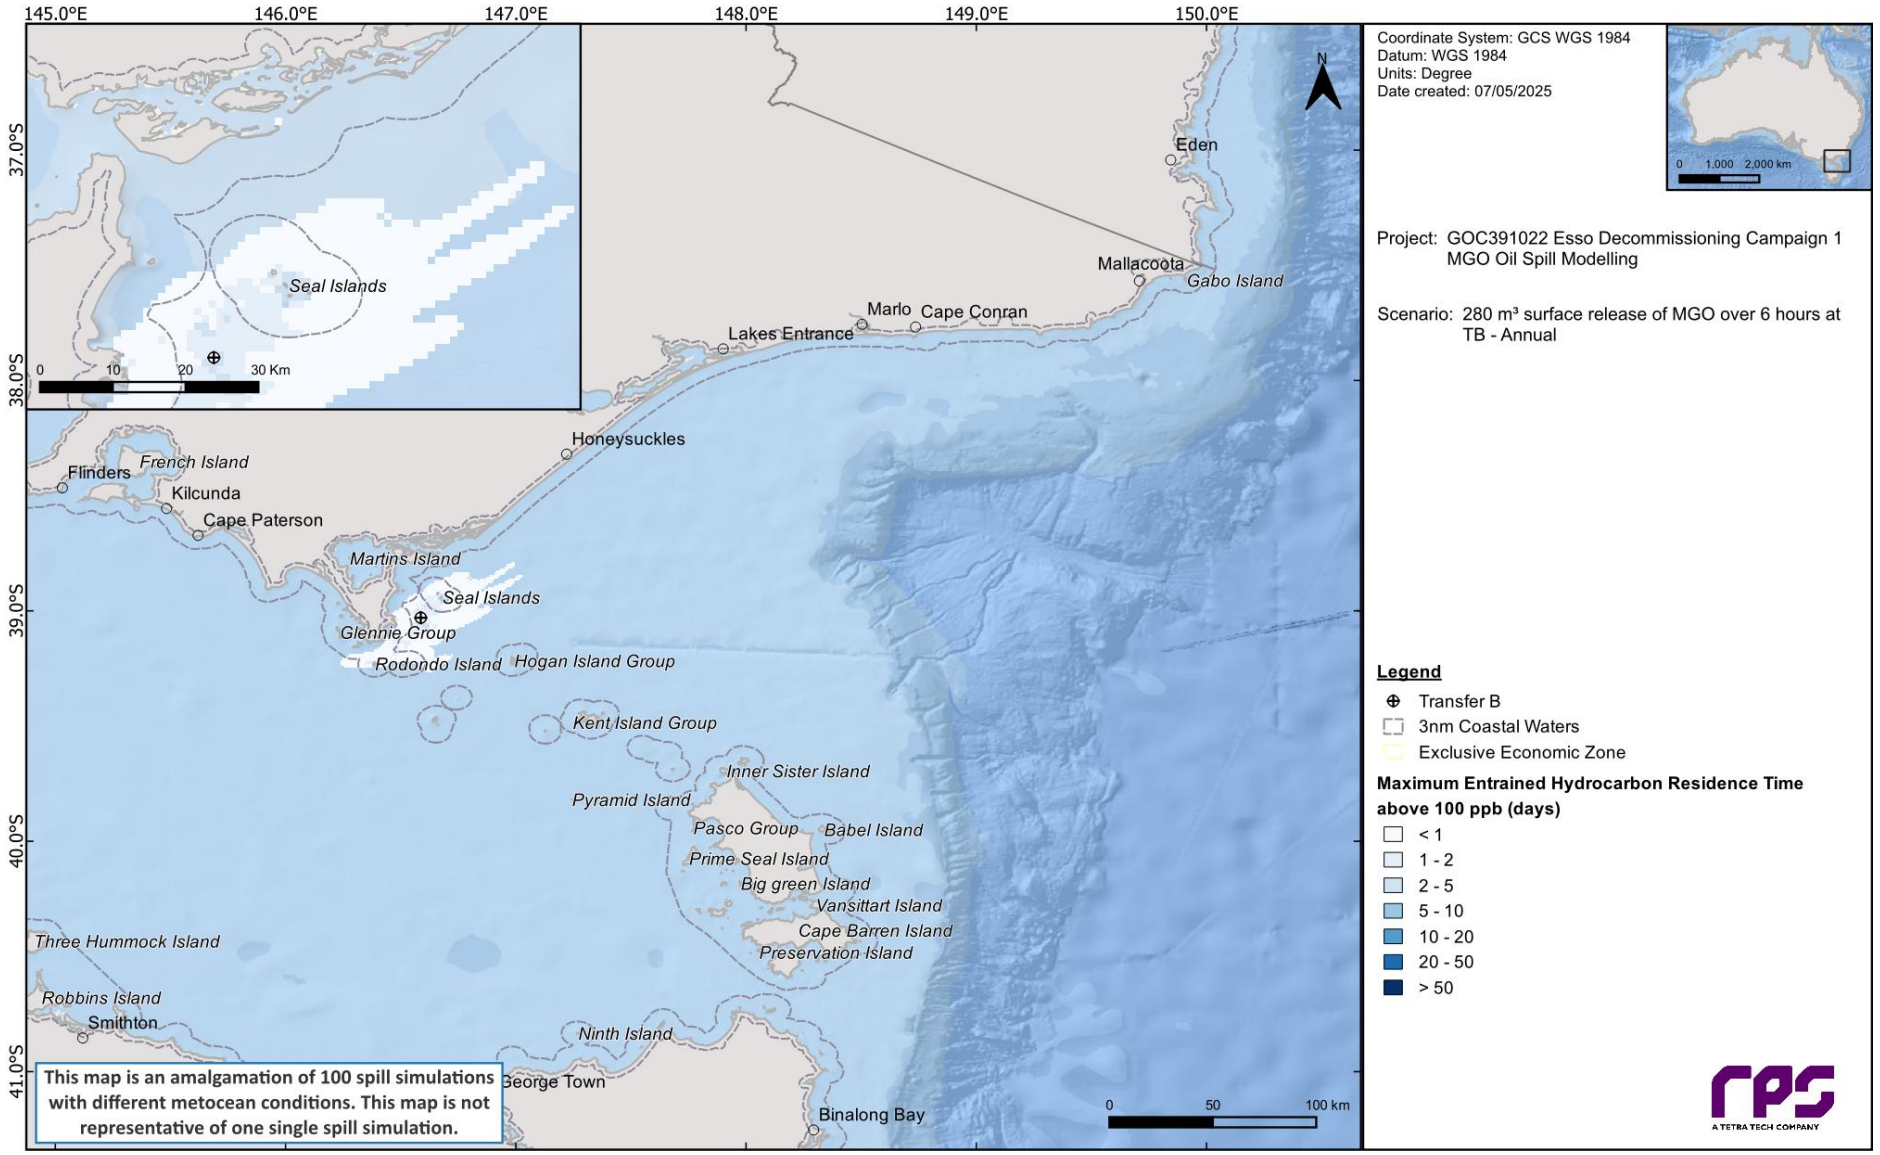

Figure 12.10 Maximum residence time for entrained hydrocarbon exposure above 100 ppb, at 0-10 m below the sea surface in the event of a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B. The stochastic results were calculated from 100 spill trajectories.

12.2 Deterministic Analysis

The stochastic modelling results were assessed, and the “worst case” deterministic runs were identified and are presented below for the following criteria:

a. Largest swept area for surface oil above 10 g/m²; (Section 12.2.1)
b. Largest (total) volume of oil ashore (Section 12.2.2)
c. Longest length of shoreline with oil accumulation above 100 g/m² (Section 12.2.2)
d. Largest area of entrained hydrocarbon exposure above 100 ppb (Section 12.2.3)
e. Largest area of dissolved hydrocarbon exposure above 50 ppb (Section 12.2.4)

Table 12.7 presents a summary of sea surface and in-water exposure and shoreline accumulation at the assessed thresholds for the identified deterministic simulations.

Table 12.7 Summary of the deterministic analysis following a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location B.

Variable	Threshold	Deterministic Analysis Criteria				
		Largest swept area of floating oil above 10 g/m²	Largest volume of oil ashore	Longest length of shoreline accumulation above 100 g/m²	Largest area of entrained hydrocarbons above 100 ppb	Maximum area of dissolved hydrocarbons above 50 ppb
Run Number		65	74	74	29	NC
Floating Oil (km²)	1 g/m²	126.3	3.1	3.1	1.6

Dissolved Area (km²)	10 ppb	-	-	-	-	
	50 ppb	-	-	-	-	
	400 ppb	-	-	-	-	
Start Date		5th March 2013, 5:00 am	8th June 2011, 8:00 pm	8th June 2011, 8:00 pm	8th August 2018, 3:00 am	

NC represents no contact to shoreline at, or above, low threshold (i.e., no shoreline accumulation).
^Total volume of oil stranded on shorelines over the entire simulation, not accounting for natural removal processes such as evaporation and decay

12.2.1 Deterministic Case: Largest swept area of floating oil above 10 g/m²

The deterministic simulation that resulted in the largest swept area of floating oil above 10 g/m² (moderate threshold) was identified as run number 65, commencing 5th March 2013, 5:00 am.

Figure 12.11 presents the extent of the predicted floating oil exposure and shoreline oil accumulation over the entire 30-day simulation.

Figure 12.12 and Figure 12.13 display the time series of the predicted oil surface area and volume of floating oil above each threshold over the 30-day simulation.

Figure 12.14 presents the fates and weathering for the corresponding simulation and Table 12.8 summarises the peak volumes and times of occurrence for each oil phase and volumes at the end of the 30-day simulation.

Table 12.8 Summary of peak volumes and times of occurrence for each oil phase and the volumes at the conclusion of the simulation (day 30), for the simulation that resulted in the largest swept area of floating oil above 10 g/m².

Exposure Metrics	Peak Volume	Day of Occurrence	Volume at day 30
Surface (m³)	176.5	1	2.6
Entrained (m³)	146.9	3	43.3
Dissolved (m³)	0.5	3	0.0
Evaporation (m³)	137.1	30	137.1
Ashore (m³)	0.9	8	0.2
Decay (m³)	100.9	30	100.9

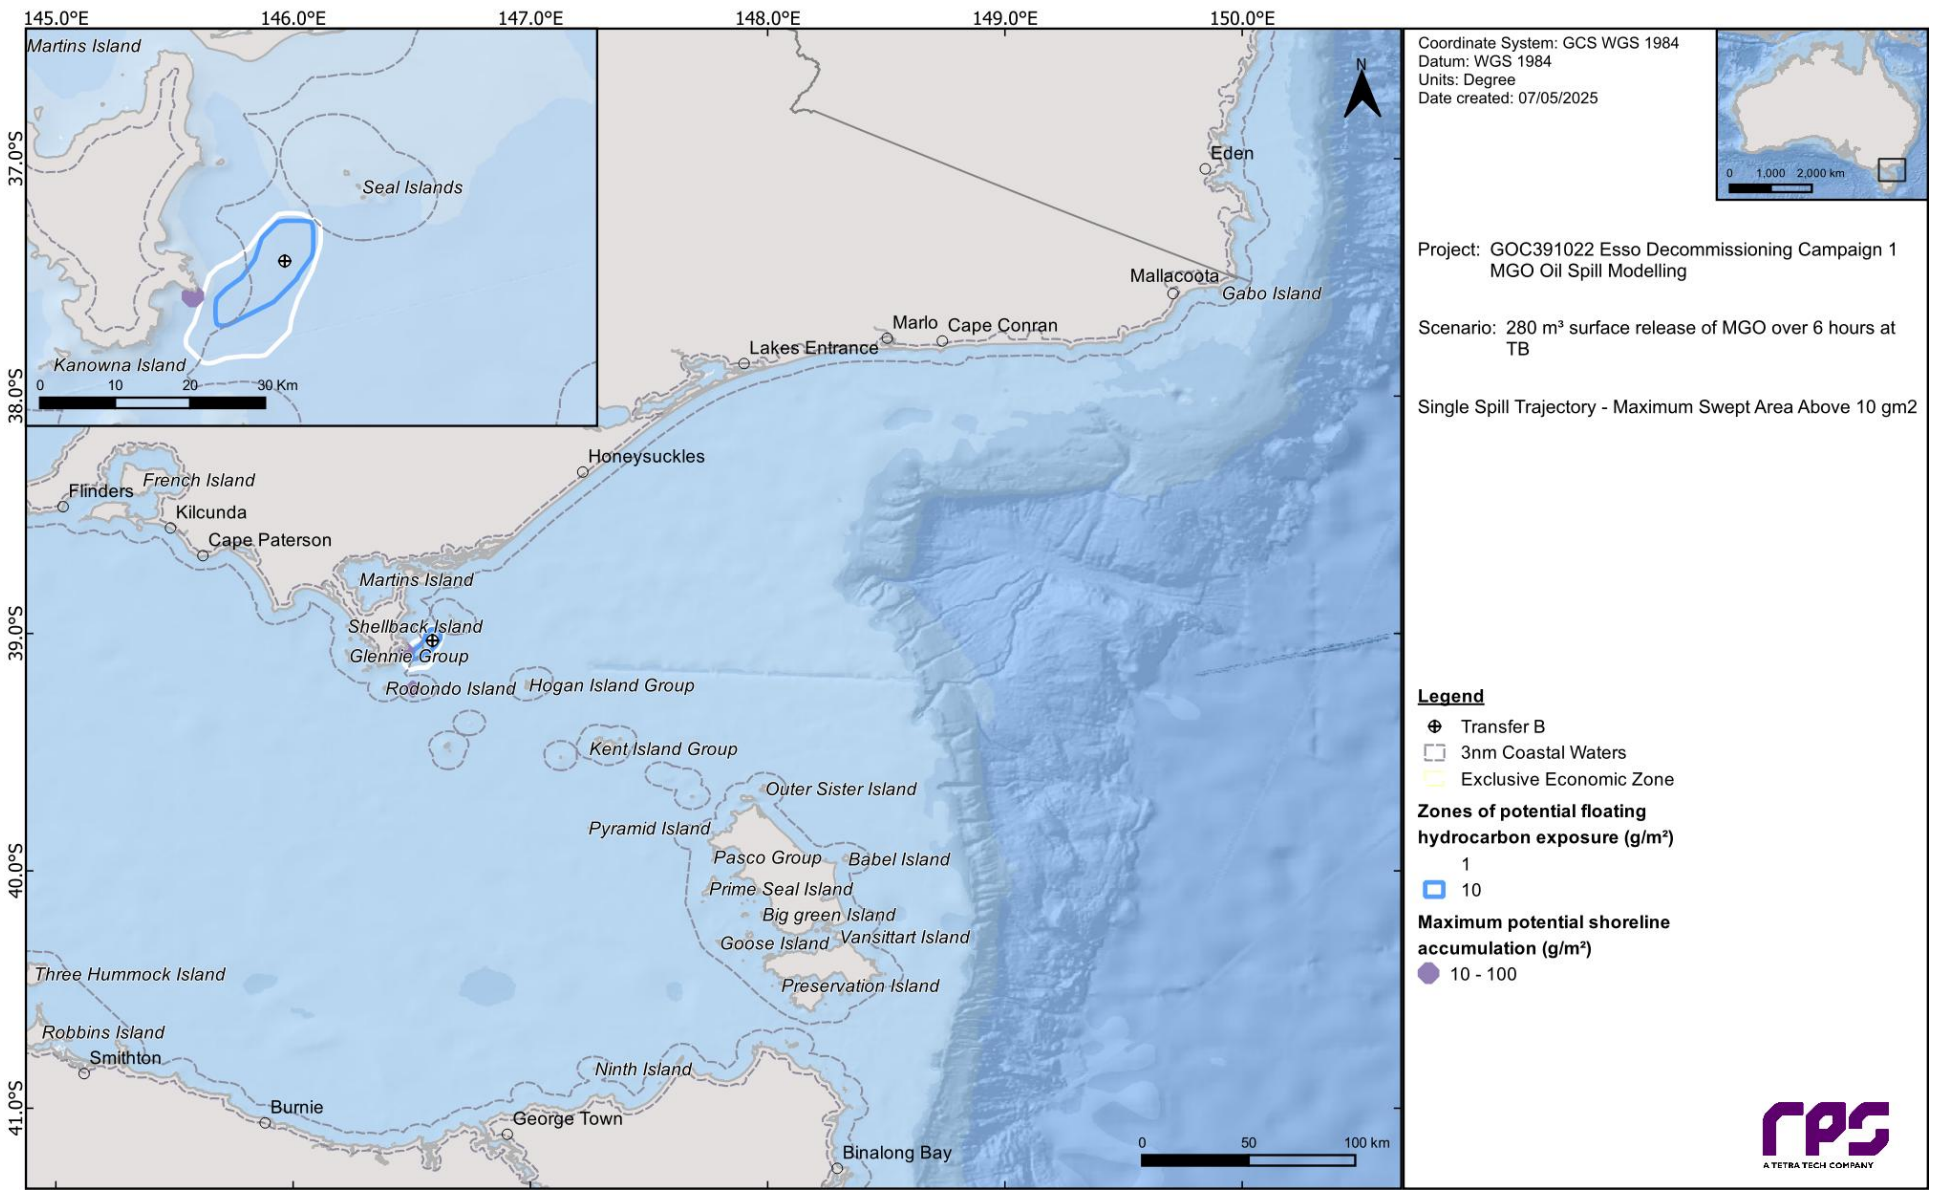

Figure 12.11 Zones of potential floating oil exposure and shoreline accumulation over the entire 30 days, for the simulation with the largest swept area of floating oil above 10 g/m².

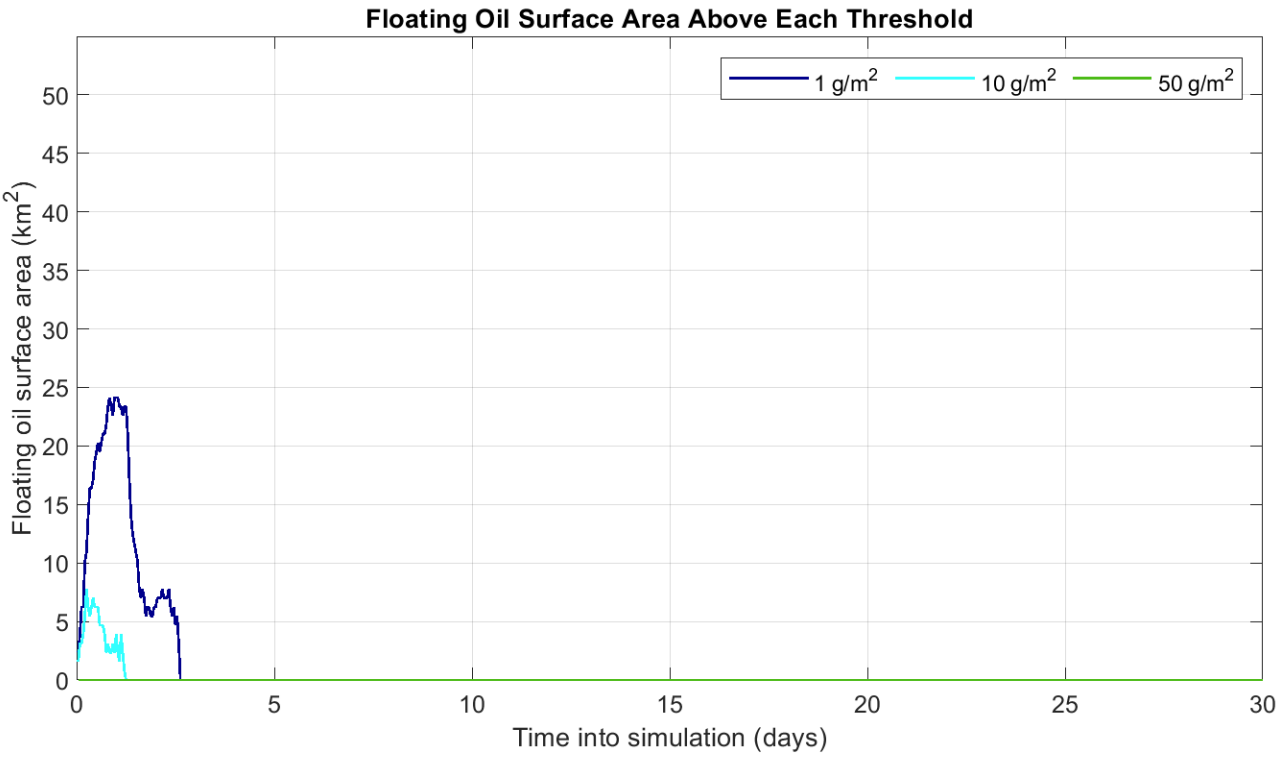

Figure 12.12 Predicted floating oil surface area above each threshold, for the simulation with the largest swept area of floating oil above 10 g/m².

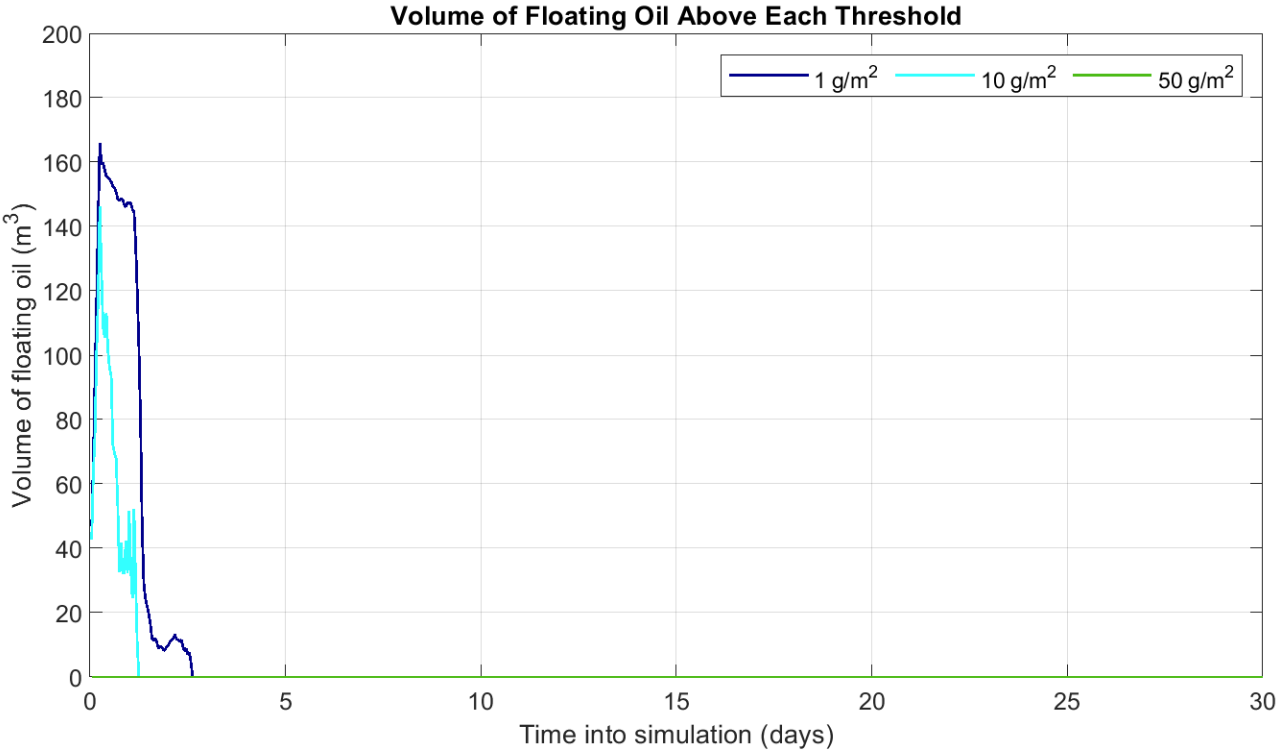

Figure 12.13 Predicted volume of floating oil above each threshold, for the simulation with the largest swept area of floating oil above 10 g/m².

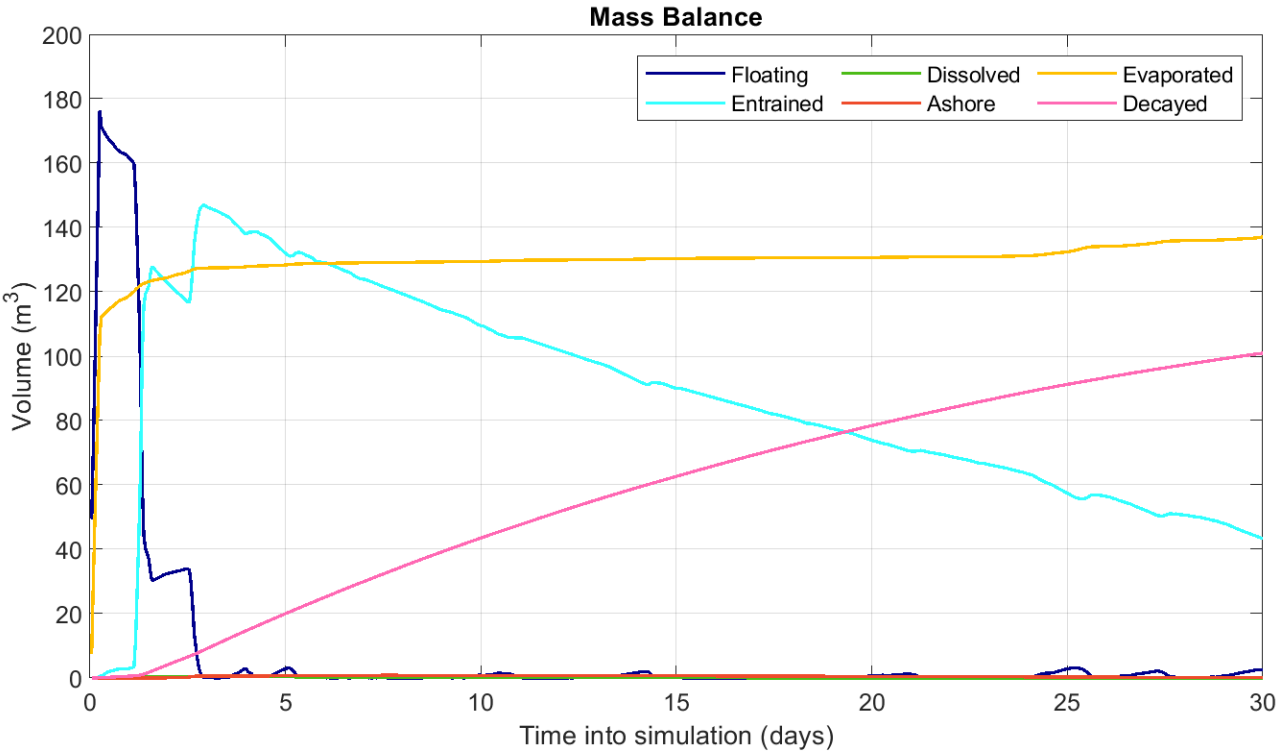

Figure 12.14 Predicted weathering and fates for the simulation with the largest swept area of floating oil above 10 g/m².

12.2.2 Deterministic Case: Largest volume ashore and longest length of shoreline with accumulation above 100 g/m²

The deterministic simulation that resulted in the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m^2 was identified as run number 74, commencing 8th June 2011, 8:00 pm.

Figure 12.15 presents the extent of the predicted floating oil exposure and shoreline oil accumulation over the entire 30-day simulation.

Figure 12.16 and Figure 12.17 display the time series of the predicted oil surface area and volume of floating oil above each threshold over the 30-day simulation.

Figure 12.18 presents the fates and weathering for the corresponding simulation and Table 12.9 summarises the peak volumes and times of occurrence for each oil phase and volumes at the end of the 30-day simulation.

Table 12.9 Summary of peak volumes and times of occurrence for each oil phase and the volumes at the conclusion of the simulation (day 30), for the simulation that resulted in the largest volume ashore and longest length of shoreline with accumulation above 100 g/m^2.

Exposure Metrics	Peak Volume	Day of Occurrence	Volume at day 30
Surface (m³)	29.3	1	0.4
Entrained (m³)	218.7	1	35.3
Dissolved (m³)	0.4	1	0.1
Evaporation (m³)	114.1	30	114.1
Ashore (m³)	27.5	7	20.9
Decay (m³)	113.5	30	113.5

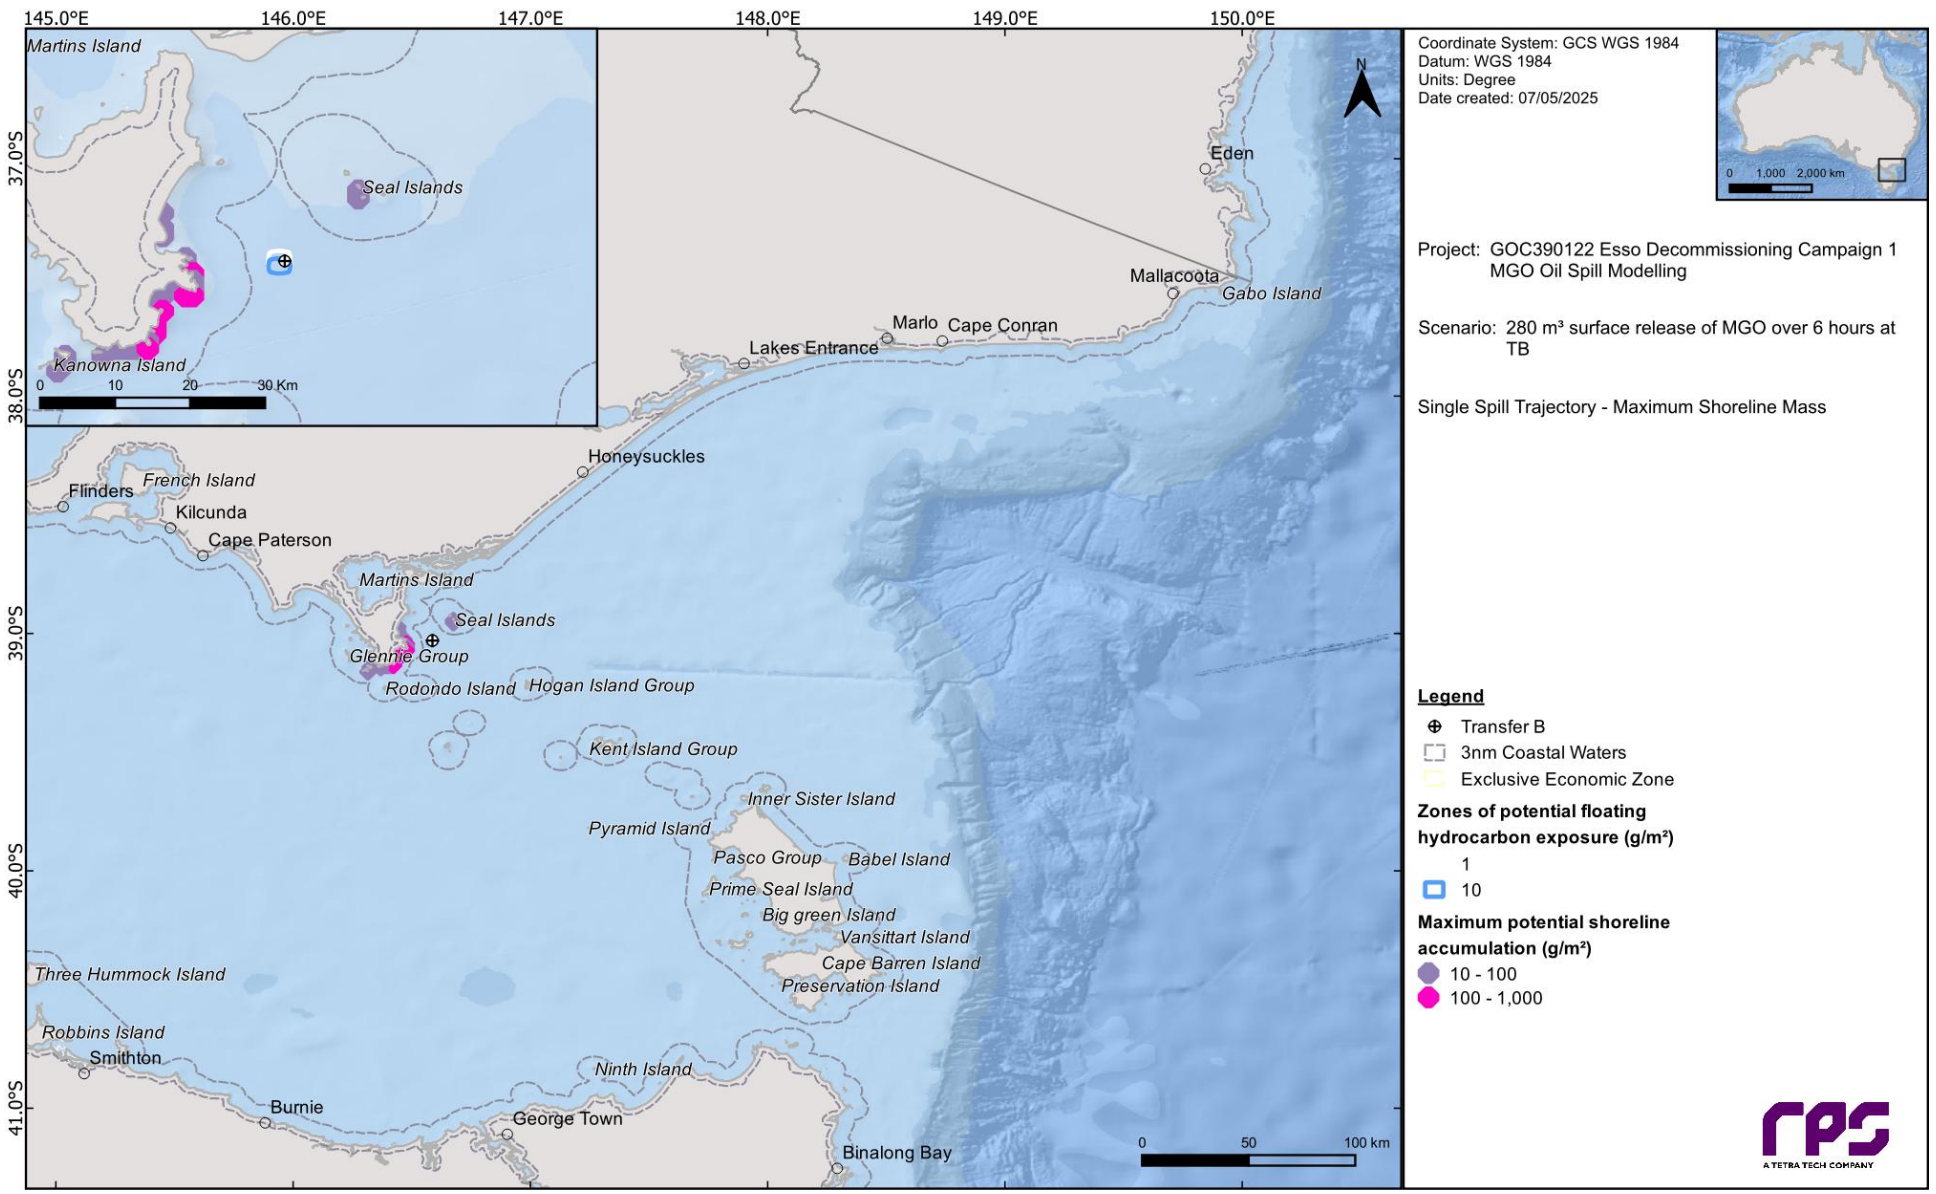

Figure 12.15 Zones of potential floating oil exposure and shoreline accumulation over the entire 30 days, for the simulation with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m².

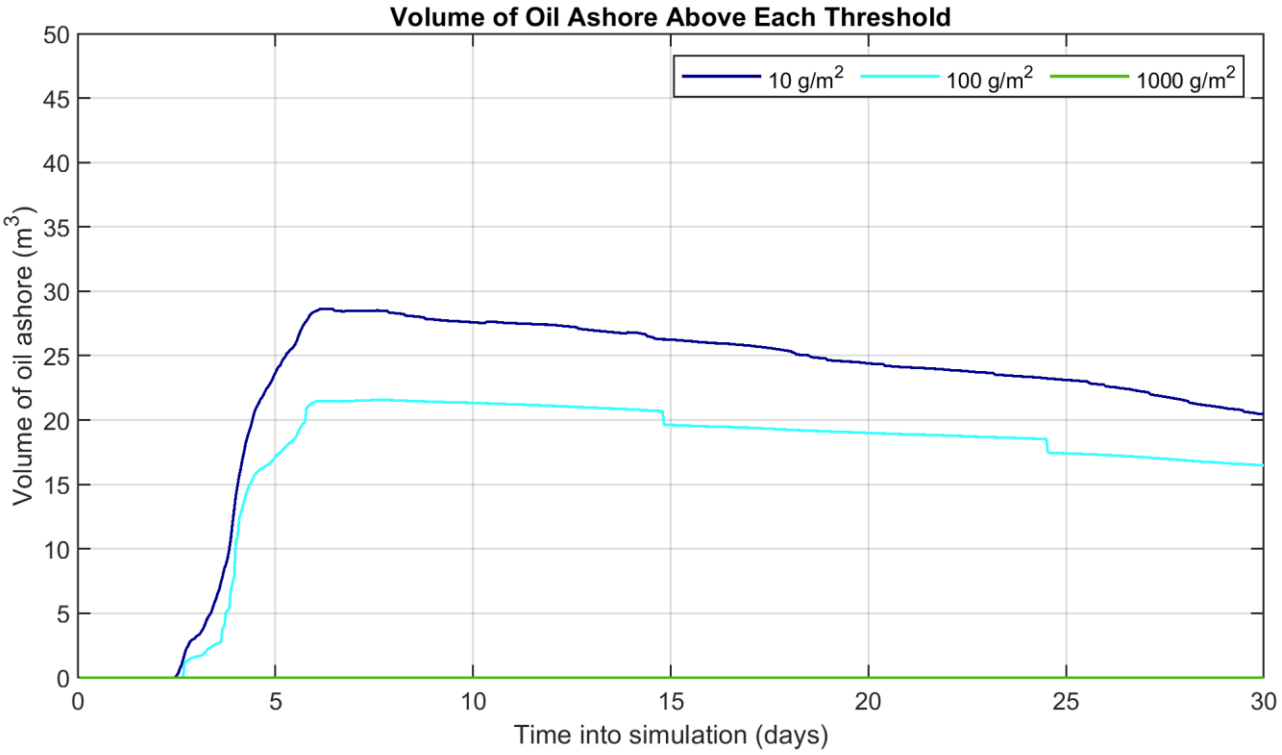

Figure 12.16 Predicted volume of oil ashore above each threshold for the simulation with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m^2.

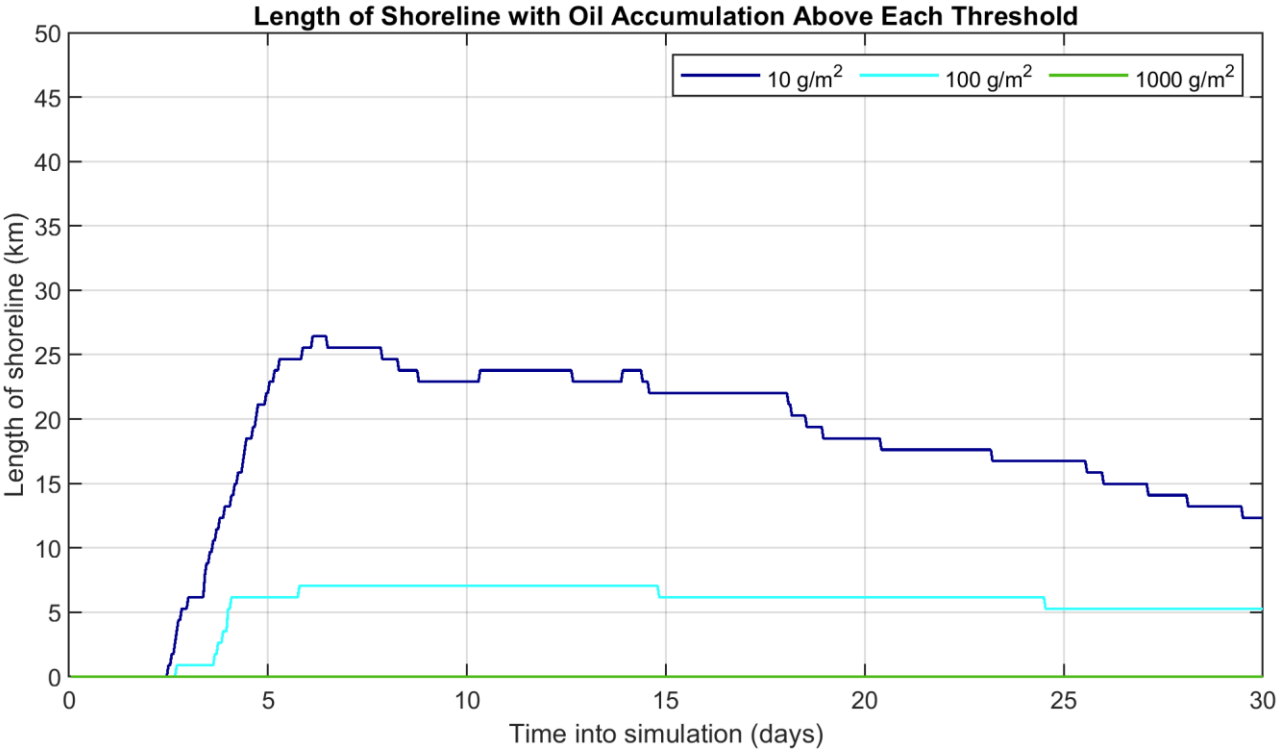

Figure 12.17 Predicted length of shoreline accumulation for the simulation with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m^2.

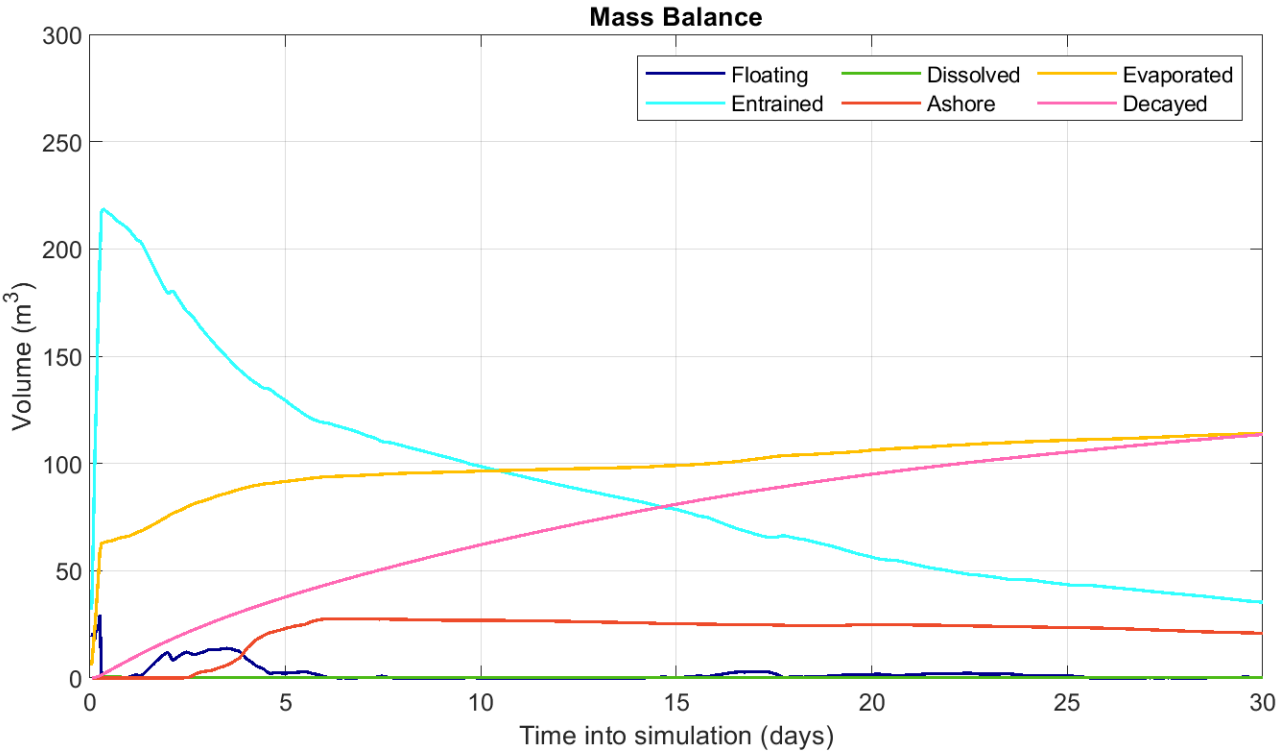

Figure 12.18 Predicted weathering and fates for the simulation with the largest volume ashore and the longest length of shoreline with accumulation above 100 g/m².

12.2.3 Deterministic Case: Largest area of entrained hydrocarbons above 100 ppb

The deterministic simulation that resulted in the largest area of entrained hydrocarbons above 100 ppb was identified as run number 29, commencing 8th August 2018, 3:00 am.

Figure 12.19 presents the extent of the predicted entrained hydrocarbon exposure zones over the entire 30-day simulation.

Figure 12.20 displays the time series of the area of entrained hydrocarbons above each threshold over the 30-day simulation.

Figure 12.21 presents the fates and weathering for the corresponding single spill trajectory and Table 12.10 summarises the peak volumes and times of occurrence for each oil phase and volumes at the end of the 30-day simulation.

Table 12.10 Summary of the peak volumes and times of occurrence for each oil phase and the volumes at day 30, for the trajectory with the largest area of entrained hydrocarbons above 100 ppb.

Exposure Metrics	Peak Volume	Day of Occurrence	Volume at day 30
Surface (m³)	17.0	1	<0.1
Entrained (m³)	250.0	1	42.6
Dissolved (m³)	0.3	9	0.1
Evaporation (m³)	110.1	30	110.1
Ashore (m³)	0.4	18	0.1
Decay (m³)	131.2	30	131.2

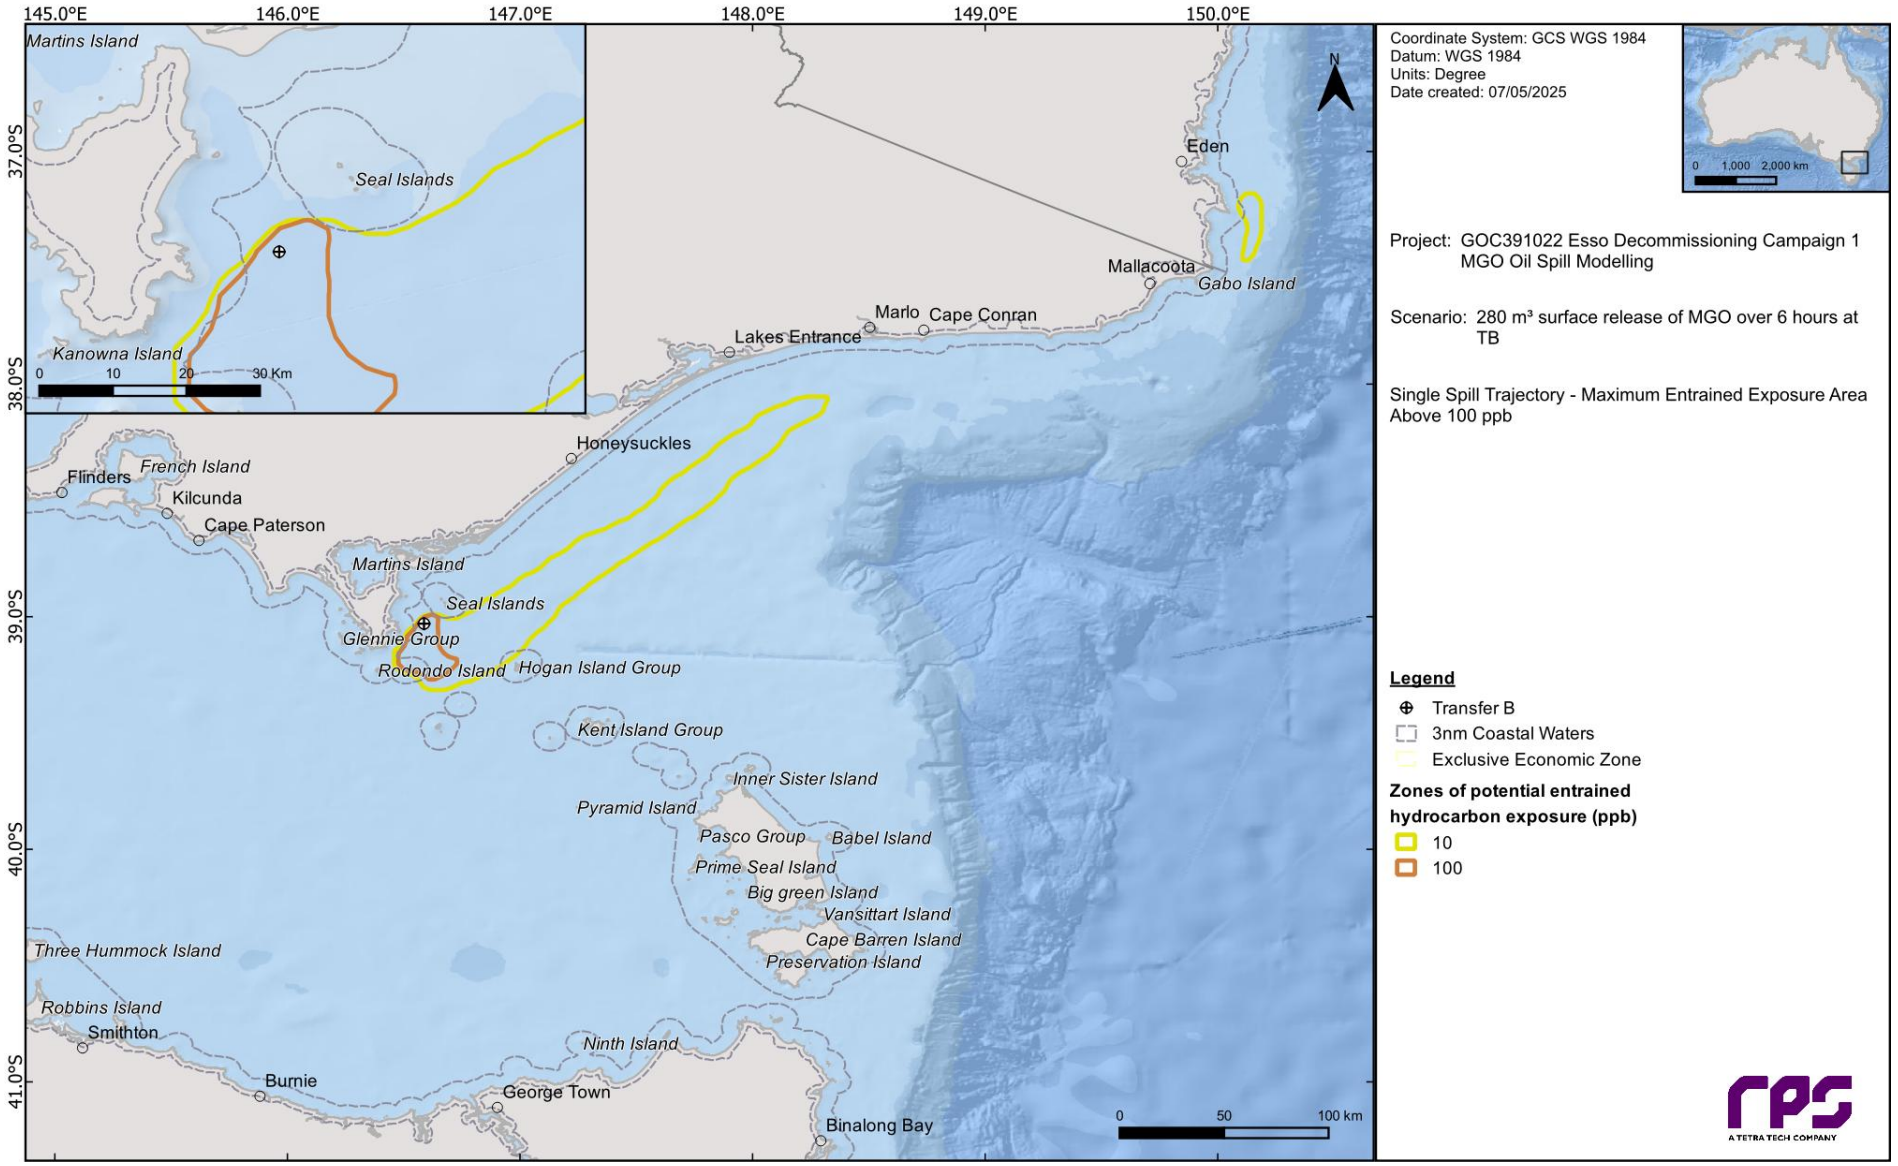

Figure 12.19 Zones of potential entrained hydrocarbon exposure over the entire 30 days, for the simulation with the largest area of entrained hydrocarbons above 100 ppb.

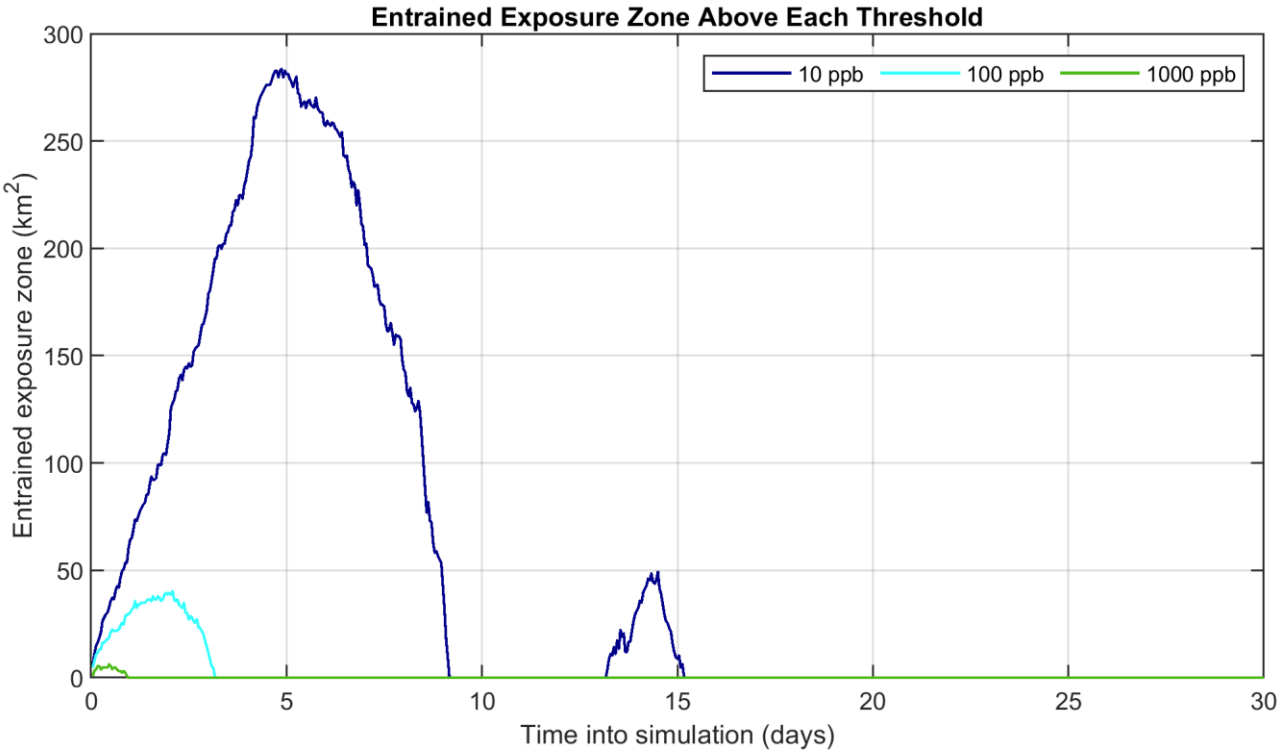

Figure 12.20 Time series of the area of entrained hydrocarbons for each threshold for the simulation with the largest area of entrained hydrocarbons above 100 ppb.

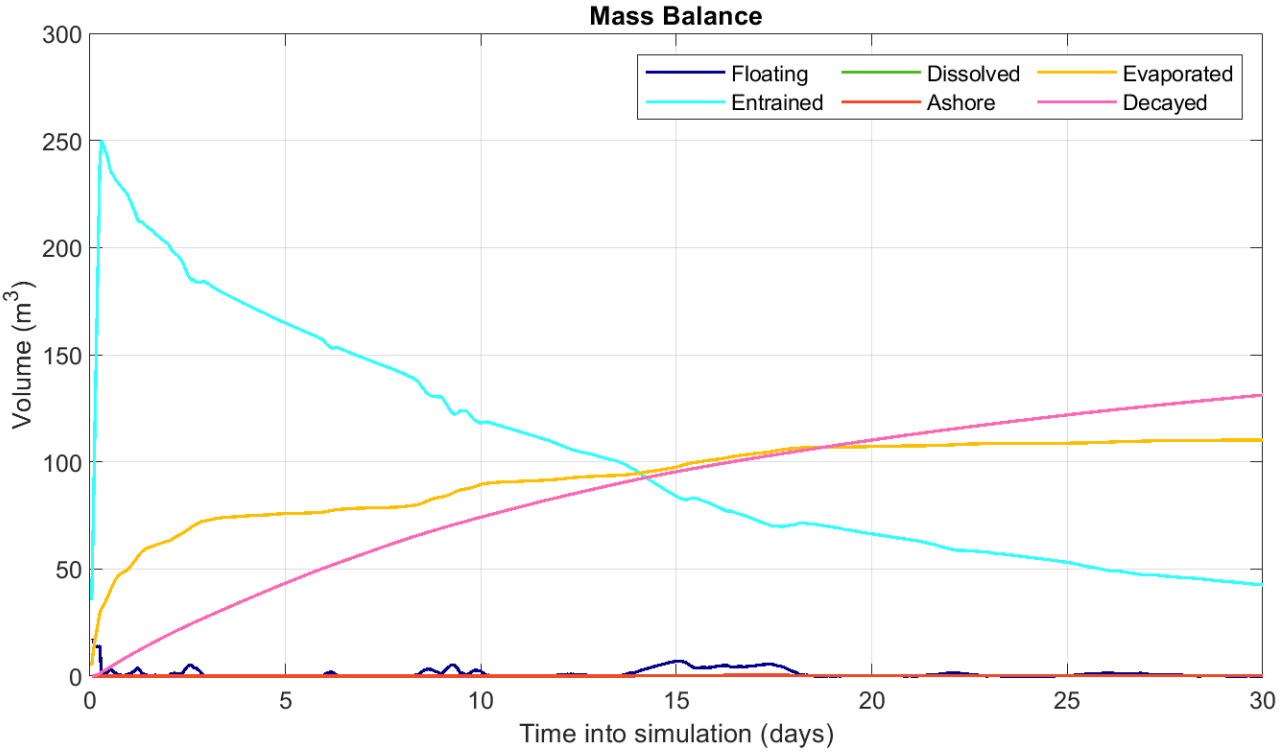

Figure 12.21 Predicted weathering and fates graph for the simulation with the largest area of entrained hydrocarbons above 100 ppb.

12.2.4 Deterministic Case: Largest area of dissolved hydrocarbons above 50 ppb

No dissolved hydrocarbon exposure above 50 ppb was recorded. Hence, no results are presented.

A.1 Appendix A - Modelling Results Based on 1,000 ppb Entrained Hydrocarbon Threshold

The assessment also considered exposure from entrained hydrocarbon concentrations at, or above, 1,000 ppb, based on the study by French-McCay (2023). Consequently, the entrained exposure areas outlined in Sections 11.1 and 12.1 were recalculated to account for the proposed exposure threshold.

13.1 Scenario 1 – A 280 m^3 surface release of MGO at Transfer Location A

Table 13.1 Predicted probability and maximum entrained hydrocarbon exposure to individual receptors in the 0-10 m depth. Results are based on a 280 m³ surface release of MGO over 6 hours following an accidental release incident at Transfer Location A. The stochastic results were calculated from 100 spill trajectories.

Receptor		Maximum entrained hydrocarbon exposure (ppb)	Probability of entrained hydrocarbon exposure (%)	Minimum time before entrained hydrocarbon exposure (days)	Maximum residence time for entrained hydrocarbon exposure (days)
			1,000 ppb	1,000 ppb	1,000 ppb

Executive Summary

JASCO Applied Sciences (JASCO) performed a modelling study of underwater sound levels associated with the decommissioning campaign in the Gippsland Basin proposed by Esso Australia Pty Ltd (Esso). This modelling study considers the activities involved with the decommissioning operations. These include a heavy lift vessel (HLV) under dynamic positioning (DP) and in transit, a construction support vessel (CSV) under DP, a platform support vessel (PSV), a tug/towed barge combination and a remotely operated vehicle (ROV) equipped with cutting tools. *Allseas Pioneering Spirit* and *Fortitude* are planned to be used as the HLV and CSV respectively, whilst the *Allseas Alegria*, *MMA Mermaid Cove* and the *Cashman Equipment Corp. Miss Hannah* were chosen for modelling the PSV, tug and barge respectively. The vessels were modelled in 9 scenarios across 4 different areas: the Dolphin Facility, the Kingfish A Facility, and two transfer locations near the shore west of the facilities.

The modelling study specifically assessed distances from operations where underwater sound levels reached thresholds corresponding to behavioural response, impairment (temporary reduction in hearing sensitivity or TTS) and injury (permanent threshold shift or PTS). The animals considered here included low-, high-, and very high-frequency cetaceans, phocid and otariid seals, fish (including fish larvae and eggs), and sea turtles.

The modelling methodology considered scenario-specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels for non-impulsive (continuous) noise sources presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as appropriate for different noise effect criteria.

The SPL metric is the root-mean-square pressure level over a stated frequency band over a specified time window. In this study, for continuous noise, a time window of 1 s was used.

In this report, to evaluate the potential for accumulated sound exposure levels (SEL), the duration of the SEL accumulation was defined as integrated over a 24-hour period. The SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} radii represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 hours.

The key results of this acoustic modelling study are summarised in the marine mammal, sea turtle and fish sections below. Maps are provided in the report to assist with contextualising tabulated distances.

Marine mammals

The maximum distances to the NOAA (2019) marine mammal behavioural response criterion of 120 dB re 1 µPa (SPL) ranged between 5.71 km (Scenario 1) and 25.1 km (Scenario 7) (Table 1). Low-frequency cetaceans (LFC) is the marine mammal group whose TTS and PTS ranges are the farthest in all scenarios (except for its PTS range in Scenario 1, where very-high-frequency cetaceans had the farthest PTS range at 0.07 km). For TTS, the maximum distances for accumulated SEL_{24h} criteria for low-frequency cetaceans were between 0.02 km (Scenarios 8 and 9) and 6.1 km (Scenario 6). For PTS, the maximum distances for accumulated SEL_{24h} criteria from Southall et al. (2019) varied between distances less than 20 m (Scenario 8 and 9) and 0.31 km (in Scenario 4).

Table 1. Summary of maximum (R_{max}) horizontal distances (in km), from all scenarios considered, to the marine mammal behavioural response criterion of 120 dB re 1 µPa (SPL) and frequency-weighted LF-cetacean SEL_{24h} TTS and PTS thresholds (179 and 199 dB re 1 µPa²·s, respectively) based on Southall et al. (2019). Ensonified areas are also provided for TTS and PTS thresholds.

Scenario Number	Description	Marine Mammal Behavioural Response - SPL [a] R_{max} (km)	LF-cetacean TTS - SEL_{24h} [b]		LF-cetacean PTS - SEL_{24h} [b]	
			R_{max} (km)	Area (km²)	R_{max} (km)	Area (km²)
1	CSV and ROV cutter at Dolphin	5.71	1.54	7.01	0.05	0.01
2	HLV at Kingfish A	19.6	3.97	46.4	0.14	0.05
3	HLV, CSV and ROV cutter at Kingfish A	20.6	4.45	56.5	0.24	0.08
4	HLV, CSV and PSV at Transfer Location A	20.9	4.78	64.2	0.31	0.20
5	HLV, CSV and PSV at Transfer Location B	23.4	4.71	65.1	0.28	0.11
6	HLV and Tug/Towed Barge at Transfer Location A	25.0	6.08	93.2	0.41	0.45
7	HLV and Tug/Towed Barge at Transfer Location B	25.1	6.01	103	0.31	0.25
8	HLV transiting from Kingfish A to Transfer Location A	9.23	0.02	4.52	–	–
9	HLV transiting from Kingfish A to Transfer Location B	8.34	0.02	4.98	–	–

Noise exposure criteria: [a] NOAA (2019) and [b] Southall et al. (2019).
A dash indicates the level was not reached within the limits of the modelled resolution (20 m).

Sea turtles

The threshold criteria from Finneran et al. (2017) were used to assess PTS and TTS for sea turtles. Across all scenarios, the maximum distances to threshold were 20 m for PTS and 380 m for TTS.

Fish

Sound produced by the HLV and support vessels reached the sound levels associated with recoverable injury and TTS for fish species with a swim bladder involved in hearing that are in close proximity to the sound sources (Table 2). But in order for the thresholds to be exceeded, the fish must remain within those distances for either 48 h or 12 h, respectively.

Table 2. Summary: Maximum (R_{max}) horizontal distances (in km), from all scenarios considered, to sound pressure level (SPL) criteria based on Popper et al. (2014).

Scenario Number	Description	Maximum (R_{max}) distance to threshold (km)	
		Recoverable injury (48 h)	TTS (12 h)
1	CSV and ROV cutter at Dolphin	0.02	0.02
2	HLV at Kingfish A	0.02	0.05
3	HLV, CSV and ROV cutter at Kingfish A	0.02	0.06
4	HLV, CSV and PSV at Transfer Location A	0.02	0.08
5	HLV, CSV and PSV at Transfer Location B	–	0.05

A dash indicates the level was not reached within the limits of the modelled resolution (20 m).

1. Introduction

JASCO Applied Sciences (JASCO) performed a modelling study of underwater acoustic source levels associated with Esso Australia's (Esso) decommissioning operations in the Gippsland Basin. The modelling study specifically predicted the distances from the operating vessels at which underwater sound levels reached noise effect thresholds and criteria. The marine mammal thresholds include levels associated with behavioural response, permanent threshold shift (PTS) and temporary threshold shift (TTS). The marine mammal functional hearing groups considered were low-, high-, and very high-frequency cetaceans, and phocid and otariid seals. Thresholds for fish include recoverable injury and TTS, and the thresholds for sea turtles include PTS and TTS. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and accumulated sound exposure levels (over 24 hours) (SEL_{24h}, $L_{E,24h}$), as appropriate for non-impulsive (continuous) noise sources.

SEL_{24h} is a cumulative metric that reflects the dosimetric effect of noise levels within 24 hours, based on the assumption that a receiver (e.g., an animal) is consistently exposed to such noise levels at a fixed position. More realistically, marine mammals, fish, and sea turtles would not stay in the same location for 24 hours (especially in the absence of location-specific habitat) but rather a shorter period, depending on the animal's behaviour and the source's proximity and movements. Therefore, a reported radius for the SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the source will be impaired, but rather that an animal could be exposed to the sound level associated with impairment (either permanent threshold shift (PTS) or temporary threshold shift (TTS)) if it remained within the ensonified area for 24 hours.

This report is further structured as follows. The remainder of Section 1 provides details on the scenarios considered for modelling. Section 2 explains the metrics used to represent underwater acoustic fields and the effect criteria considered. Section 3 details the methodology for predicting the source levels and modelling the sound propagation, including the specifications of the considered sound sources and the environmental parameters. Section 4.1 presents the acoustic results as tabulated ranges to thresholds, Section 4.2 provides sound level contour maps. The acoustic modelling results are then discussed in Section 5.

1.1. Modelling Scenarios

For modelling, we considered the Dolphin Facility, the Kingfish A Facility and two transfer locations near the shore west of the facilities. Figure 1 displays an overview of the modelling area showing modelling locations, Biologically Important Areas (BIAs) for southern right whales (*Eubalaena australis*) and pygmy blue whales (*Balaenoptera musculus brevicauda*), and the regional bathymetry. This study considered the following sound-producing activities associated with the decommissioning works:

- *Allseas Pioneering Spirit* as a Heavy Lift Vessel (HLV) under DP and in transit,
- *Allseas Fortitude* as a Construction Support Vessel (CSV) under DP,
- Vessel noise from platform support vessel (PSV) – similar to *Allseas Alegria*,
- Vessel noise from tug/towed barge under DP – similar to *MMA Mermaid Cove* and *Cashman Equipment Corp. Miss Hannah*, and
- Cutting tool noise from a remotely operated vehicle (ROV) performing underwater cutting of subsea infrastructure.

The exact position and orientation of the vessels in modelled scenarios is not known and will likely vary due to operational conditions and requirements. Therefore, for scenarios involving multiple adjacent sources in simultaneous operation, the best estimates of the relative geographic positions of the vessels were used, which considers the dimensions of each vessel.

Figure 1 displays an overview of the modelling area showing the modelled sites, the southern right whale BIAs, the pygmy blue whale BIA, and the regional bathymetry. Figures 2 and 3 show the individual modelled sites for all scenarios and Tables 3 and 4 outline the modelling locations and scenarios.

2. Noise Effect Criteria

To assess the potential effects of a sound-producing activity, it is necessary to first establish exposure criteria (thresholds) for which sound levels may be expected to have an adverse effect on animals. Whether acoustic levels might injure or disturb marine fauna is an active research topic. Since 2007, several expert groups have developed SEL-based assessment approaches for evaluating auditory injury, with key works including Southall et al. (2007), Finneran and Jenkins (2012), Popper et al. (2014), United States National Marine Fisheries Service (NMFS 2018) and Southall et al. (2019). The number of studies that investigate the level of behavioural disturbance to marine fauna by anthropogenic sound has also increased substantially.

Two sound level metrics, SPL and SEL, are commonly used to evaluate non-impulsive noise and its effects on marine life. In this report, the duration of the SEL accumulation is defined as integrated over a 24-hour period. Appropriate subscripts indicate any frequency weighting applied (see Appendix A.4). The acoustic metrics in this report reflect the ANSI and ISO standards for acoustic terminology, ANSI S1.1 (S1.1-2013) and ISO 18405:2017 (2017).

The following thresholds and guidelines for this study were chosen because they represent the best available science:

1. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Southall et al. (2019) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals for non-impulsive sound sources.
2. Marine mammal behavioural threshold based on the current interim US National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.
3. Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014).
4. Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Finneran et al. (2017) for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in sea turtles.

Section 2.1, along with Appendix A.3 and A.4, expand on the thresholds, guidelines, and sound levels for marine mammals. Section 2.2 expands on the guidelines for fish and sea turtles.

2.1. Marine Mammals

The criteria applied in this study to assess possible effects of non-impulsive noise sources on marine mammals are summarised in Table 5. Cetaceans, phocids, and otariid seals were identified as the marine mammals requiring assessment. Details on thresholds related to auditory threshold shifts or hearing loss and behavioural response are provided in Appendix A.3, with frequency weighting explained in detail in Appendix A.4.

Table 5. Criteria for effects of non-impulsive noise exposure, including vessel noise, for marine mammals: unweighted SPL and weighted SEL_{24h} thresholds.

Hearing group	NOAA (2019)	Southall et al. (2019)	
	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)
Low-frequency (LF) cetaceans	120	199	179
High-frequency (HF) cetaceans		198	178
Very High-frequency (VHF) cetaceans		173	153
Phocid Seals		201	181
Otariid Seals		219	199

L_p denotes sound pressure level and has a reference value of 1 µPa.
L_E denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa²·s.

2.1.1. Behavioural Response

The NOAA continuous noise criterion was selected for this assessment because it represents the most commonly applied behavioural response criterion by regulators. The distances at which behavioural responses could occur are therefore determined by areas ensonified above an unweighted SPL of 120 dB re 1 µPa (NMFS 2014, NOAA 2019). Appendix A.3 provides more information about the development of this criteria. Whilst newer research by Southall et al. (2021) provides recommendations and discusses the nuances of assessing behavioural response, the authors do not recommend new numerical thresholds for onset of behavioural responses for marine mammals.

2.1.2. Injury and Hearing Sensitivity Changes

There are two categories of auditory threshold shifts or hearing loss: permanent threshold shift (PTS), a physical injury to an animal's hearing organs; and temporary threshold shift (TTS), a temporary reduction in an animal's hearing sensitivity as the result of receptor hair cells in the cochlea becoming fatigued.

To assist in assessing the potential for effect on marine mammals, this report applies the criteria recommended by Southall et al. (2019), considering both PTS and TTS (see Table 5). Appendix A.3 provides more information about the Southall et al. (2019) criteria.

2.2. Fish, Sea Turtles, Fish Eggs, and Fish Larvae

In 2006, the Working Group on the Effects of Sound on Fish and Turtles was formed to continue developing noise exposure criteria for fish and sea turtles based on work began by a NOAA panel two years earlier. The Working Group developed guidelines with specific thresholds for different levels of effects for several species groups (Popper et al. 2014). The guidelines define quantitative thresholds for three types of immediate effects:

- Mortality, including injury leading to death;
- Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma;

- TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds. However, as these depend upon activity-based subjective ranges, these effects are not addressed in this report, and are included in Table 6 for completeness only. Because the presence or absence of a swim bladder has a role in hearing, fish susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Sea turtles, fish eggs, and fish larvae are considered separately.

Table 6 lists the relevant effects thresholds from Popper et al. (2014) for shipping and continuous noise. Some evidence suggests that fish sensitive to acoustic pressure show a recoverable loss in hearing sensitivity, or injury when exposed to high levels of noise (Scholik and Yan 2002, Amoser and Ladich 2003, Smith et al. 2006); this is reflected in the SPL thresholds for fish with a swim bladder involved in hearing (shaded cells in Table 6). Finneran et al. (2017) presented revised thresholds for sea turtle PTS and TTS onset from continuous noise sources, considering frequency weighted SEL, which have been applied in this study (Table 7).

Table 6. Criteria for vessel noise exposure for fish and sea turtles , adapted from Popper et al. (2014).

Type of animal	Mortality and Potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Sea Turtles	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1 µPa.
Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N) – tens of metres, intermediate (I) – hundreds of metres, and far (F) – thousands of metres.

Table 7. Acoustic effects of continuous noise on sea turtles, weighted SEL_{24h}, Finneran et al. (2017).

PTS onset thresholds (received level)	TTS onset thresholds (received level)
Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^{2}s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa^{2}s)
220	200

$L_{E,24h}$ denotes cumulative sound exposure over a 24 h period and has a reference value of 1 µPa^{2}s.

3. Methods and Parameters

The modelled sites for the activities considered in this study were located on the continental shelf off the coast of Gippsland near the shelf break (refer to wide regional bathymetry in Appendix B.1.1). The modelled sites were situated in water depths of approximately 25 – 71 m and are considered representative of the vessel activity locations.

To allow for operational flexibility, the sound speed profile considered for the modelling was selected through a sensitivity analysis considering all months of the year. The month of June was found to be the most favourable for sound propagation, resulting in the longest ranges to considered isopleth criteria. As such, June was selected as a conservative choice for modelling. Additional detail can be found in Appendix B.1.2.

The seabed beneath the modelled sites will likely consist of medium/fine sand, marl, and limestone. The geologic and geoacoustic profiles of the seabed were generated using borehole analysis from Holdgate et al. (2003) and Mitchell et al. (2007). Further details on the associated geoacoustic properties used in this modelling study are provided in Appendix B.1.3.

The following sections provide a description of the inputs used for this underwater noise modelling study. The sections are divided into subsections detailing the source inputs for the *Pioneering Spirit*, *Fortitude*, PSV vessel, tug/towed barge, and ROV cutter (Section 3.1) with Sections 3.2–3.3 providing details on the applied modelling techniques and model configuration information.

3.1. Vessel Noise Sources

Underwater sound that radiates from vessels is produced mainly by propeller and thruster cavitation, with a smaller fraction of noise produced by sound transmitted through the hull, such as by engines, gearing, and other mechanical systems. Sound levels tend to be the highest when thrusters are used to position the vessel and when the vessel is transiting at high speeds. A vessel's sound signature depends on the vessel's size, power output, propulsion system (e.g., conventional propellers vs. Voith Schneider propulsion), and the design characteristics of the given system (e.g., blade shape and size). A vessel produces broadband acoustic energy with most of the energy emitted below a few kilohertz. Sound from onboard machinery, particularly sound below 200 Hz, dominates the sound spectrum before cavitation begins (Spence et al. 2007).

Figure 4 presents a summary plot of all considered source spectra for comparison purposes. The source spectra plot shows the distribution of sound across the decidecade frequency bands that the modelling considers. Additional detail on the sources is provided in Sections 3.1.1, 3.1.2, 3.1.3.

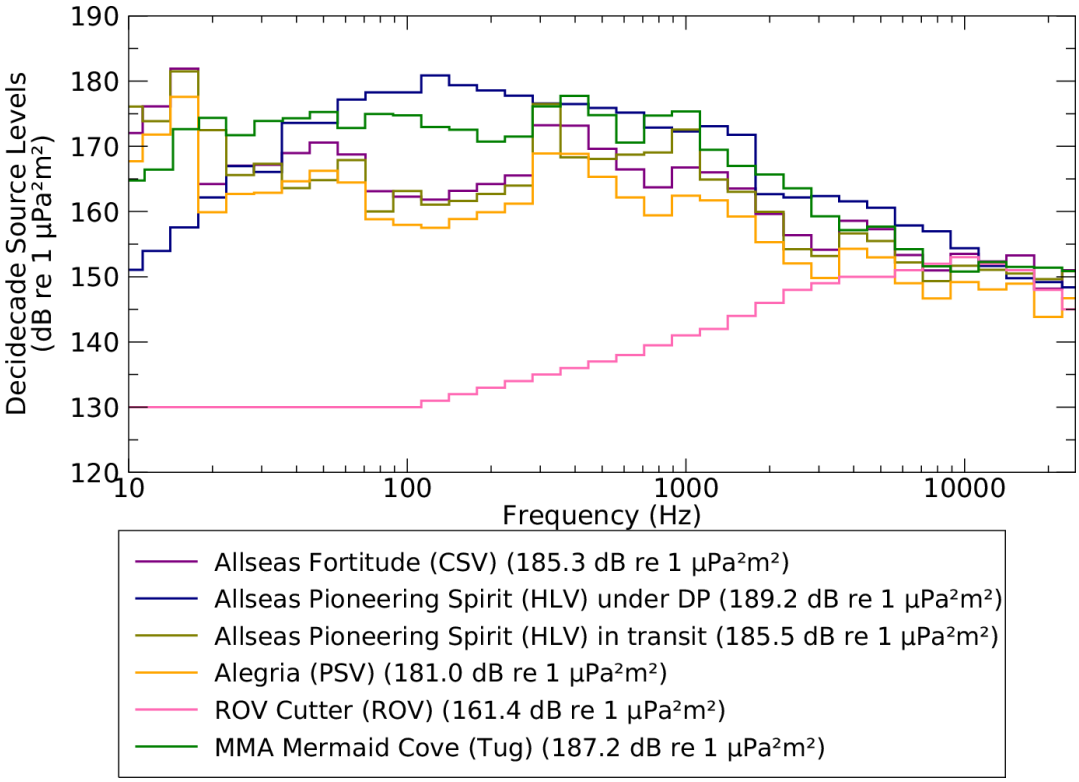

Figure 4. Source level spectra (in decidecade frequency-band) for all sound sources.

3.1.1. Heavy Lift Vessel (HLV)

The HLV considered for the Esso Gippsland Decommissioning Campaign is the *Allseas Pioneering Spirit*. The *Allseas Pioneering Spirit* is currently the largest offshore construction vessel, with a lifting capacity of 48,000 t. It has 72,600 kW of installed thruster power and dimensions 382 m length, 124 m width, max 27 m draft when in operation and max 17 m draft when transporting. While in operation, it will hold position using thrusters under DP. The source depth is modelled as 0.7× draft, which aligns with current international standards, ISO 17208-1 (2016). Therefore, the Pioneering Spirit was modelled with a source depth of 18.9 m while under DP and 11.9 m while in transit.

As there is no publicly available measurements of the source level of the *Pioneering Spirit*, the source levels of the *Allseas Pioneering Spirit* under DP had been estimated using the source levels associated with the *Allseas Solitaire*. The *Solitaire's* source level and spectrum was previously measured during the installation of the *Nord Stream 2* pipeline as part of a monitoring study presented in Tougaard and Griffiths (2020). The *Solitaire* has a maximum installed thruster power of 55,500 kW, and the median broadband source level from several measurements for the *Solitaire* was 188.0 dB re 1 µPa²m²s.

To account for the difference in thruster power, the source levels of the *Solitaire* was scaled by the difference in maximum installed thruster power following Equation (1).

$$\mathrm{SL} = \mathrm{SL}_{\mathrm{ref}} + 10\log_{10}\left(\frac{P}{P_{surrogate}}\right) \quad (1)$$

Hence, the broadband (10 Hz to 25 kHz) source level (BBSL) of the *Pioneering Spirit* while under DP was modelled as 189.2 dB re 1 µPa²m²s. The final source spectrum is shown below in Figure 5.

Publicly available noise measurements of *Pioneering Spirit* whilst in transit were not available at the time of this report; therefore, to estimate the source level of the while in transit a surrogate vessel was considered. Two approaches were considered.

Source levels for transiting cargo/container ships were considered in selecting a surrogate level for the transiting *Pioneering Spirit*. Measurements and noise correlation curves from MacGillivray et al. (2022) were considered as potentially applicable to the *Pioneering Spiri.* However, the propulsion system of the majority these container vessels measured in this study consist of single or twin screw propellers, which differ from the thruster pods of the *Pioneering Spirit*.

The *Skandi Feistein* was considered a potential surrogate, primarily because its propulsion system is composed of thruster pods which are similar to the *Pioneering Spirit.* The source levels of the *Feistein* while in transit were previously measured during a monitoring report conducted by JASCO for Esso (McPherson et al. 2022), which contained source level measurements for the *Feistein* transiting at about 10 knots. 10 knots also aligns with the modelled transit speed for the HLV in Scenarios 8 and 9 (see Table 4). Whilst a smaller vessel, the *Skandi Feistein* was consider a potential useful surrogate, because its thruster pod propulsion system, as opposed to single/twin screw propellers, and because the source level measurements of the *Feistein* were acquired at similar transit speeds.

The average source level for the *Feistein* while in transit, was 174.1 dB re 1 μPa^2m^2s. The *Feistein's* propulsion system contains a single 880 kW bow thruster, a single 880 kW azimuth thruster, and two 2200 kW stern thrusters. While in transit the bow thruster is not operational, a total thrust power of 5280 kW was considered. To account for the difference in thruster power, the source levels of the *Feistein* were scaled following Equation (1). Hence, the broadband (10 Hz to 25 kHz) source level (BBSL) of the *Pioneering Spirit* while transiting was modelled as 185.5 dB re 1 μPa^2m^2s. The source spectrum is shown below in Figure 5.

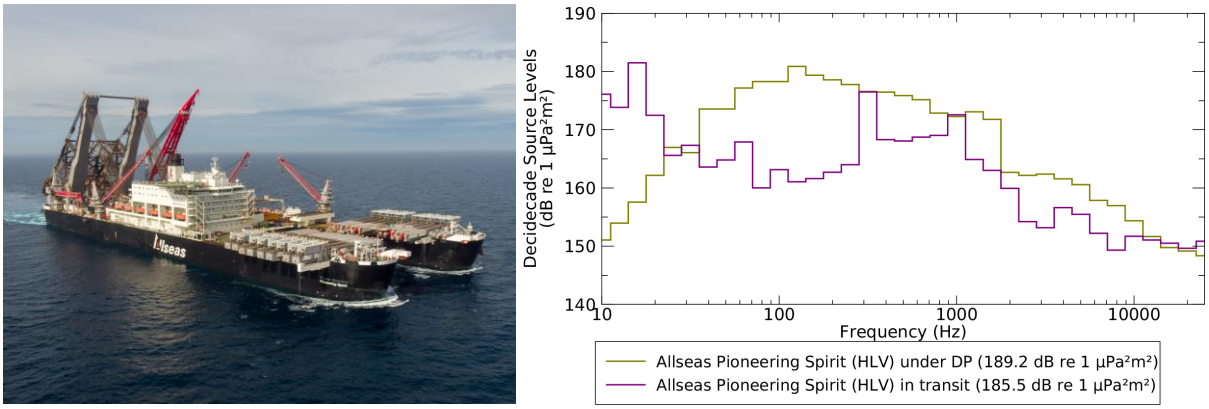

Figure 5. Photo of the *Pioneering Spirit* (left) and the source level spectra (right) (Photo source: Allseas 2024).

3.1.2. Remotely Operated Vehicle (ROV)

The model analysed the operation of an ROV undertaking cutting activities. The source levels were previously used for Cooper Energy in Connell et al. (2021). Published literature available to quantify the underwater sound fields from cutting technologies is very limited.

Pangerc et al. (2016) described the underwater sound measurement data during an underwater diamond wire cutting of a 32" conductor (10 m above seabed in approximately 80 m depth) and found that at lower frequencies, the operation was generally indistinguishable above the background noise; however, the sound that could be associated with the diamond wire cutting was primarily detectable above the background noise at the higher acoustic frequencies (above around 5 kHz). The background noise levels were substantially higher at lower frequencies; therefore, it is likely that the spectra of the noise peaks at lower frequencies, which has been approximated between 2.5 and 20 kHz.

In another study, the US Navy measured underwater sound levels when the diamond saw was cutting caissons for replacing piles at an old fuel pier at Naval Base Point Loma and reported an average SPL for a single cutter at 136.1-141.4 dB re 1 µPa²m²s at 10 m, as reported in Fairweather Science (2018).

In the absence of other information, the information provided in Pangerc et al. (2016) was used to estimate a representative decidecade-band spectra for the diamond wire saw underwater, which was scaled to have a level of 141.4 dB re 1 µPa²m²s at 10 m and then backpropagated using spherical spreading ($20\,log_{10}(R)$) to determine an ESL spectra (in decidecade frequency bands). This was estimated to be the most appropriate approach given the limited information available. Figure 4 shows the representative decidecade-band ESL spectra, with a broadband ESL for the cutter being 161.4 dB re 1 µPa²m²s.

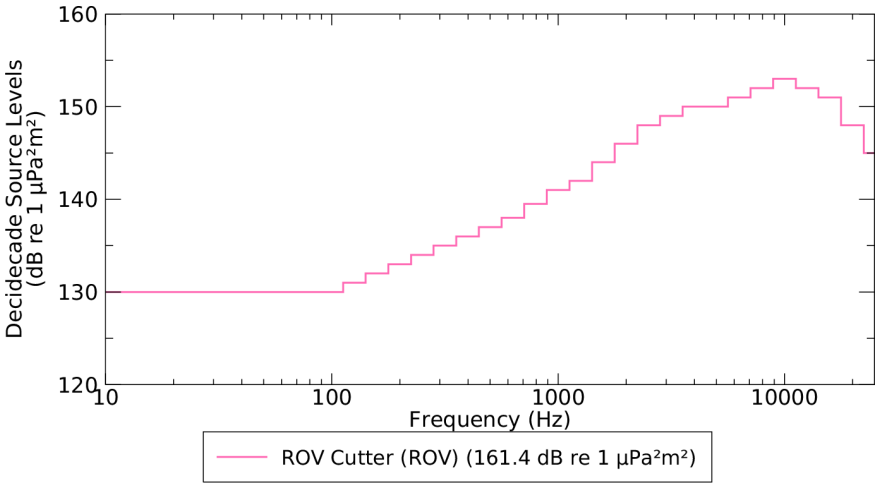

Figure 6. Energy source level (ESL) spectra for the diamond cutter, operated by the ROV.

3.1.3. Support Vessels

There are no publicly available measurements of the source levels of the listed support vessels at the time of this study. As such, the Skandi *Feistein* and the *Siem Sapphire* were used as the surrogate vessels for the support vessels considered in this modelling study of this campaign.

3.1.3.1. Construction Support Vessel (CSV)

The CSV considered for the Esso Gippsland Decommissioning Campaign is the *Allseas Fortitude*. The vessel has dimensions 150 m length, 32 m width and 8 m draft. Like the HLV, it will hold its position using DP while under operation. The source depth is modelled as 0.7× draft, thus the *Fortitude* has been modelled with a source depth of 4.4 m.

The *Allseas Fortitude* has a total of 21,750 kW installed power comprising two 2500 kW bow thrusters, two 3350 kW retractable azimuth thrusters, and three 3350 kW main propulsion thrusters. The *Feistein* was used previously as a surrogate vessel for the *Allseas Fortitude* as described in Warren et al. (2024). The authors in Warren et al. (2024) estimated the source levels of the *Allseas Fortitude* by considering the engineering field data and source levels for *Feistein* as reported *in* (McPherson et al. 2021). A regression analysis of source level vs actual thruster engine power was conducted, resulting in a regression relationship between the two variables. Using this relationship and a total power usage of 45%, the source level (BBSL) of the *Allseas Fortitude* while under DP was modelled as 185.3 dB re 1 µPa²m²s. A total power usage of 45% represents typical operational thrust combinations, within the upper bound range during normal DP field operations. The source spectrum is shown below in Figure 7.

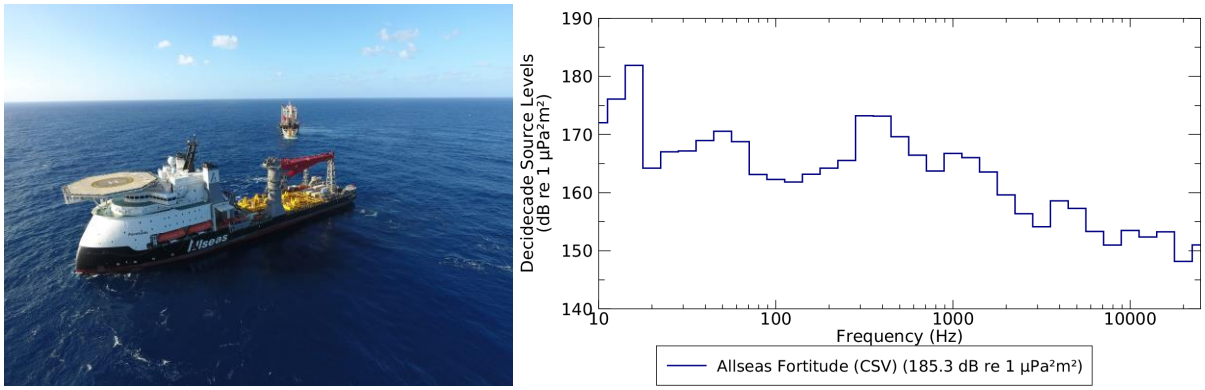

Figure 7. Photo of the *Allseas Fortitude* (left) and the source spectrum (right) (Photo source: Allseas 2024)

3.1.3.2. Platform Support Vessel (PSV)

The PSV modelled in this study is the *Allseas Alegria*. The Alegria is considered a vessel representative of potential PSVs that may be used within the decommissioning campaign. It has 8053 kW of installed thruster power and dimensions 82.88 m length, 19.3 m width and 6.31 m draft. The source depth is modelled as 0.7× draft, and so the *Alegria* has been modelled with a source depth of 5.6 m. Following the same procedure described above in Section 3.1.3.1 and Warren et al. (2024) regression curve between source level vs actual thruster engine power was used to estimate the source level of the *Allseas Alegria* while on DP. Using regression correlation with a total power usage of 45%, the source level (BBSL) of the *Allseas Alegria* while under DP was modelled as 181.0 dB re 1 µPa^{2}m^{2}s. A total power usage of 45% represents typical operational thrust combinations, within the upper bound range during normal DP field operations. The source spectrum is shown below in Figure 8.

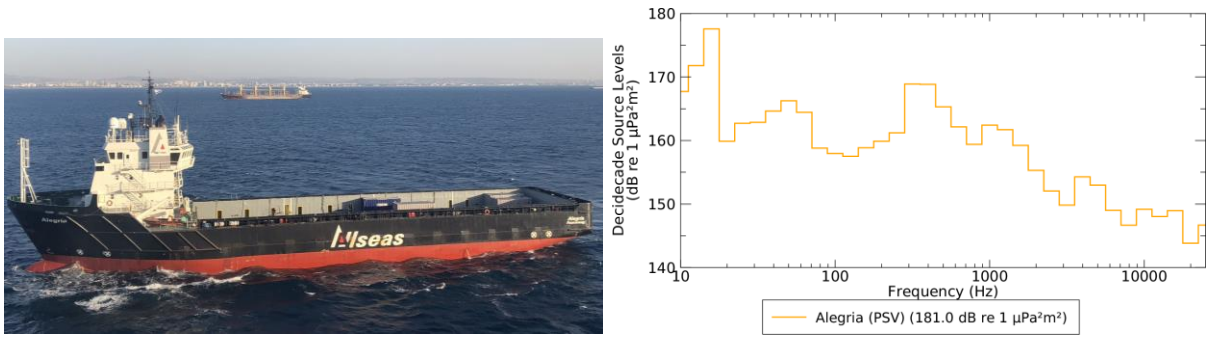

Figure 8. Photo of the *Allseas Alegria* (left) and source spectrum (right) (Photo source: Allseas 2020)

3.1.3.3. Tug/Towed Barge

The modelled scenarios which consider off-take operations (see Table 4) consists of two tugs, the HLV and a Barge (considered to be noiseless). The scenarios considered the tugs conducting '*pushing/maneuvering*' operations with the barge to set it in position with the HLV. These activities potentially involve higher power DP operations to hold the barge in position until transfer of structures from HLV to the barge has been completed and barge can then be towed away. A representative tug has been identified as *MMA Mermaid Cove*, or of equivalent a similar design.

The Mermaid Cove was purpose built to be an offtake support vessel with 4700 kW of maximum installed thruster power and 70.3 t bollard pull with an overall length, beam, and draft of 52.35 m,

14.6 m, and 4.9 m. The source depth was modelled as 0.7× draft, and so the *Mermaid Cove* has been modelled with a source depth of 3.43 m.

Estimates of the source levels for the Mermaid Cove were based on a surrogate vessel, the *Siem Sapphire* (Siem VS491 CD design AHTS) and its specifications were used to form a basis for vessel source level estimation for acoustic modelling purposes. The *Siem Sapphire* is an Anchor Handling Tug Supply vessel (AHTS) with an overall length, beam, and draft of 91 m, 22 m, and 7.98 m and has a total installed thruster power of 23,020 kW. The *Siem Sapphire* was selected as a surrogate because it may better represent noise generated from the considered tug operations, as opposed to the *Skandi Feistein* considered in other sections of this report. The measurements of the *Skandi Feistein* were primarily conducted to represent platform resupply activities, see McPherson et al. 2022, and might not be suitable to represent '*pushing/maneuvering*' operations.

The monopole source levels (MSLs) and spectra for the surrogate vessel were measured by JASCO in McPherson et al. (2021) and scaled to the Mermaid Cove based on the ratio of maximum installed thruster power following Equation (1). The broadband (10 Hz to 25 kHz) source level of the Mermaid Cove under DP was modelled as 187.2 dB re 1 μPa^2m^2. The source spectrum is shown below in Figure 9. This resultant source level is consistent with similar tug source levels that JASCO has measured for tugs berthing container vessels and is considered more suitable to represent tug '*pushing/maneuvering*' operations.

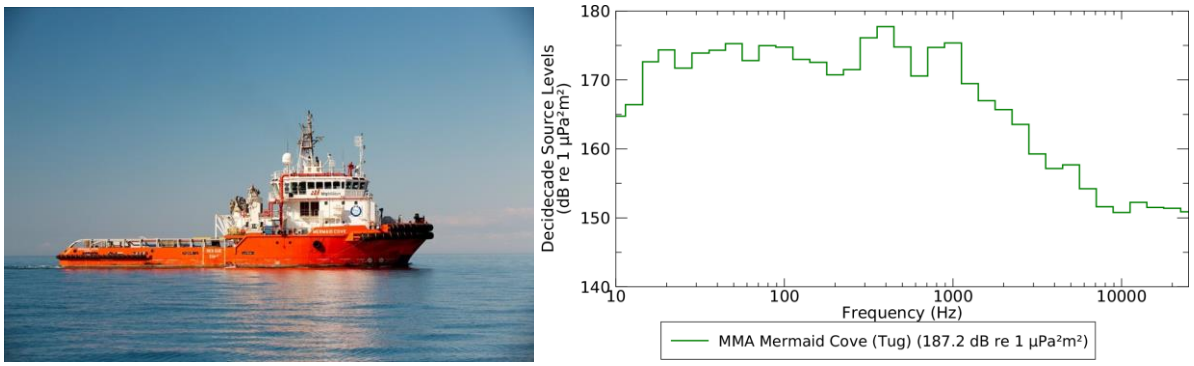

Figure 9. Photo of MMA Mermaid Cove (left) and source spectrum (right) (Photo source: MMA Offshore)

3.2. Geometry and Modelled Regions

JASCO's Marine Operations Noise Model (MONM-BELLHOP; see Appendix B.2.2) was used to predict the acoustic field at frequencies of 10 Hz to 25 kHz for all vessels. To supplement the MONM results (10 Hz to 1 kHz), high-frequency results for propagation loss were modelled using BELLHOP (Porter and Liu 1994) for frequencies from 1.26 to 25 kHz. The MONM and BELLHOP results were combined to produce results for the full frequency range of interest.

The sound field modelling calculated propagation losses up to 100 km from the source, with a horizontal separation of 20 m between receiver points along the modelled radials. The sound fields were modelled with a horizontal angular resolution of $\Delta\theta = 2.5$ for a total of N = 144 radial planes. Receiver depths were chosen to span the entire water column over the modelled areas, from 2 m to a maximum of 4250 m.

To produce the maps of received sound level isopleths, and to calculate distances to specified sound level thresholds, the maximum-over-depth level was calculated at each sampling point within the modelled region. The radial grids of maximum-over-depth levels were then resampled (by linear triangulation) to produce a regular Cartesian grid. The contours and threshold ranges were calculated from these grids of the modelled acoustic fields.

3.3. Accumulated SEL

In this study, the sound sources were considered to be continuously operating with new sound energy constantly being introduced to the environment. The reported source levels are usually in terms of sound pressure levels (SPL), representing the average instantaneous acoustic level of a considered source. The evaluation of the cumulative sound field (i.e., in terms of SEL_{24h}) depends on the number of seconds of operation during the accumulation period.

The SPL modelling results were converted to SEL by the duration of the measurement, which is appropriate for a non-impulsive noise source. For scenarios where the vessels are stationary, SEL was assessed over 24 h. For scenarios where the vessel is in transit, the SEL was assessed over the duration of the transit (see Table 4). For a stationary vessel, the conversion from SPL was obtained by increasing the levels by $10*\log_{10}(T)$, where T is 86,400 (the number of seconds in 24 h). For scenarios where a vessel was transiting along a track, a similar adjustment to the SPL was applied, however the time factor was determined based on the step size along the track and the vessel's speed. See Appendix B.4 for detail.

4. Results

The maximum-over-depth sound fields for the modelled scenarios are presented below in two formats: as tables of distances to sound levels and, where the distances are long enough, as contour maps showing the directivity and range to various sound levels.

For the results below, the distances to isopleths/thresholds were reported from either the centroid of several sources or from the most dominant single source. When an isopleth completely envelopes multiple sources the centroid was used. When several closed isopleths exist the most dominant source was used. Maps are provided in Section 4.2 to assist with contextualising tabulated distances.

4.1. Tabulated Results

Tables 8 and 9 present the maximum and 95% horizontal distances to specific SPL contours. The SPL sound footprints represent instantaneous sound fields and do not depend on time accumulation.

Tables 11 and 12 present the maximum distances to frequency-weighted SEL_{24h} thresholds, as well as total ensonified area.

Table 8. *Dolphin and Kingfish A Facility, SPL*: Maximum (R_{max}) and 95% ($R_{95\%}$) horizontal distances (in km) to sound pressure level (SPL) from most appropriate location for considered sources per scenario.

4.2.2. Accumulated SEL_{24h} Sound level Contour Maps

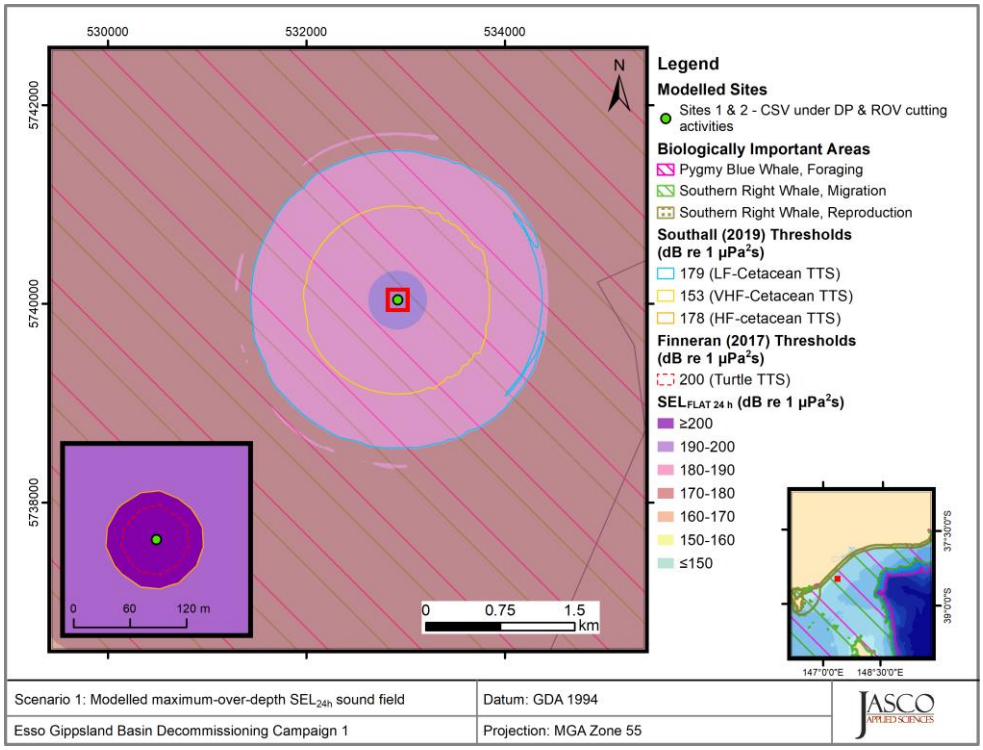

Figure 19. *Scenario 1, CSV and ROV cutter at Dolphin, accumulated SEL_{24h}*: Sound level contour map showing maximum-over-depth SEL_{24h} results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

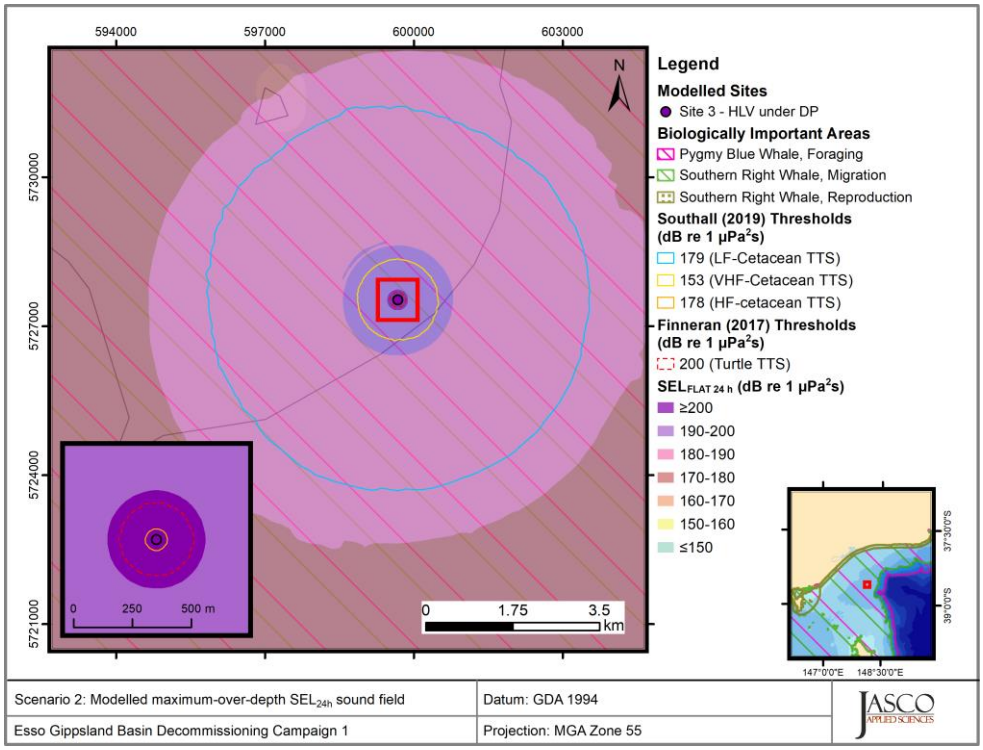

Figure 20. *Scenario 2, HLV at Kingfish A, accumulated SEL$_{24h}$*: Sound level contour map showing maximum-over-depth SEL$_{24h}$ results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

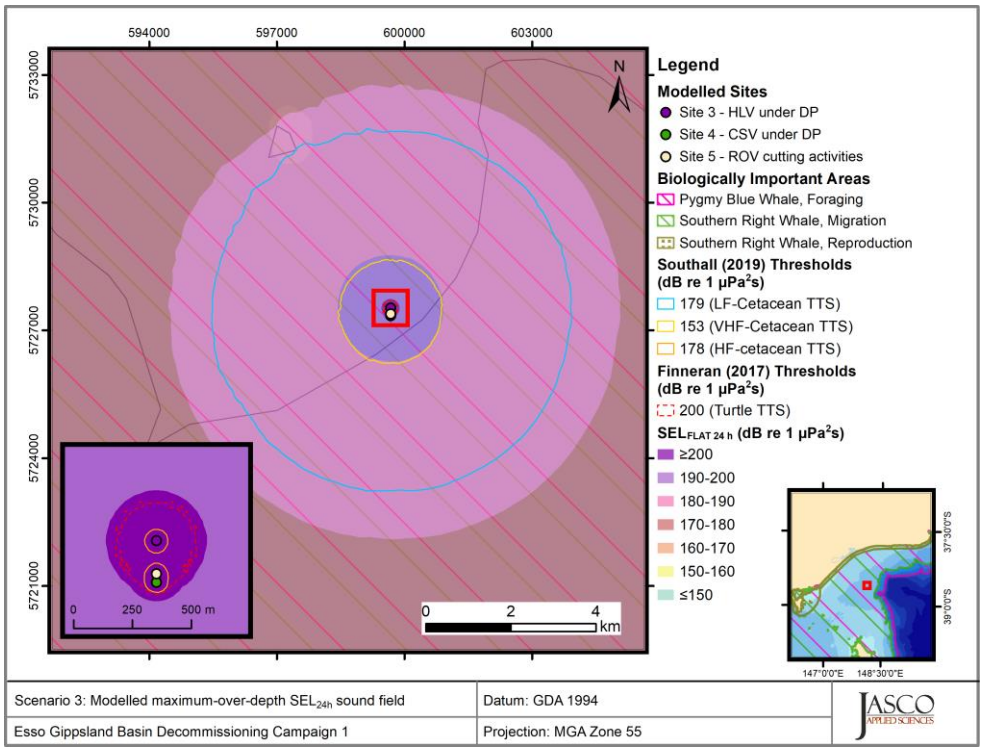

Figure 21. *Scenario 3, HLV, CSV and ROV cutter at Kingfish A, accumulated SEL$_{24h}$*: Sound level contour map showing maximum-over-depth SEL$_{24h}$ results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

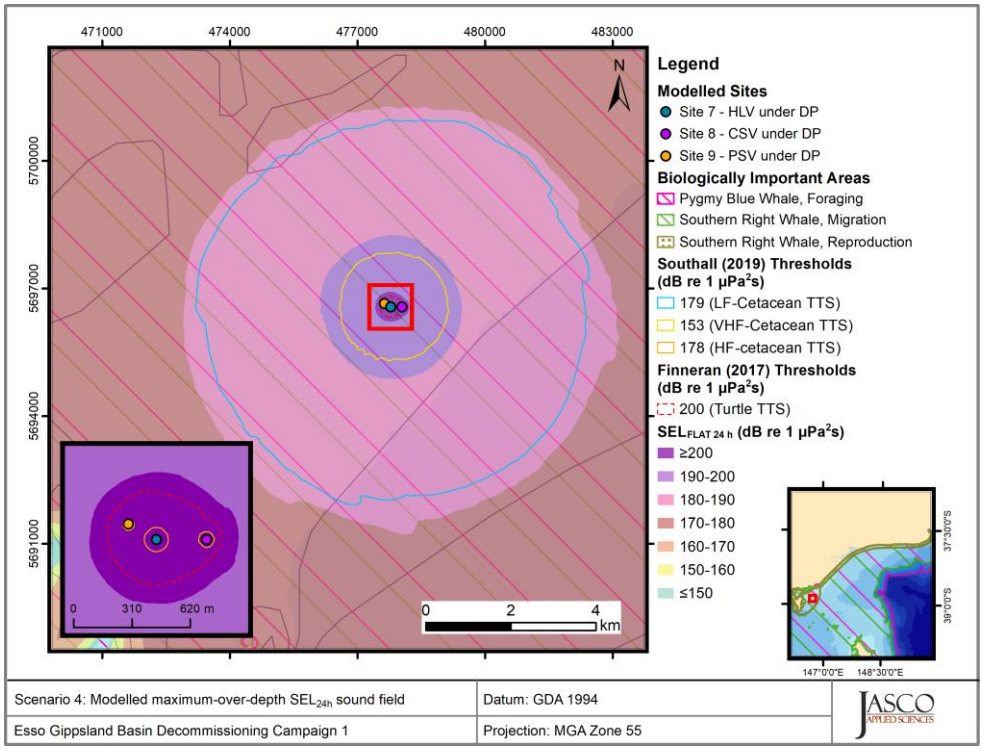

Figure 22. *Scenario 4, HLV, CSV and PSV at Transfer Location A, accumulated SEL_{24h}*: Sound level contour map showing maximum-over-depth SEL_{24h} results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

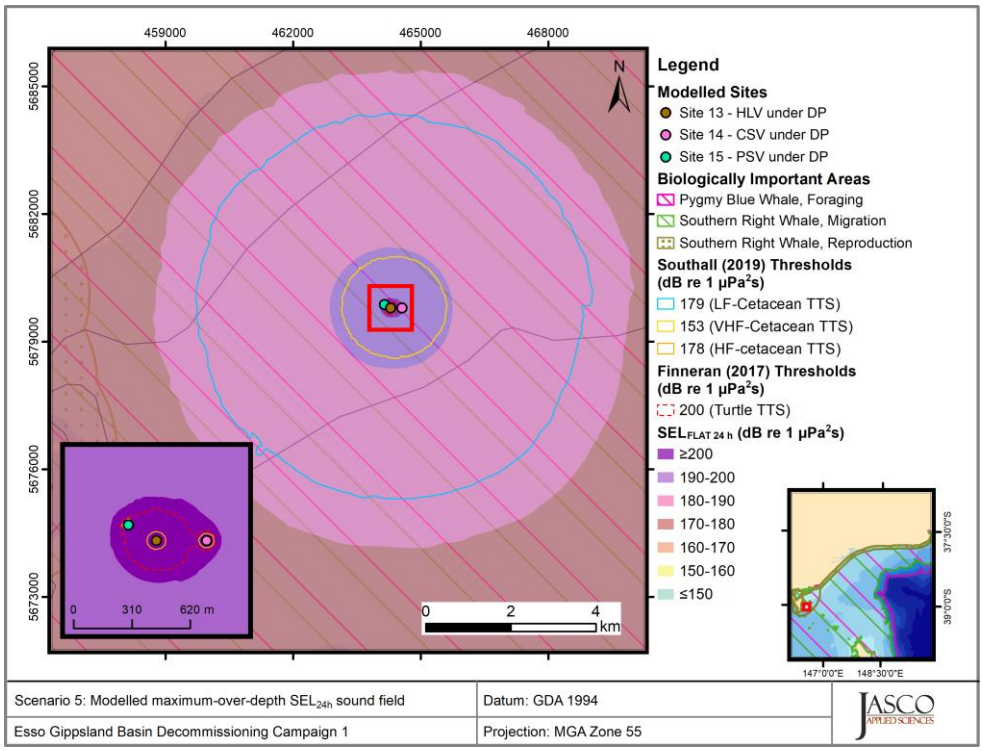

Figure 23. *Scenario 5, HLV, CSV and PSV at Transfer Location B, accumulated SEL_{24h}*: Sound level contour map showing maximum-over-depth SEL_{24h} results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

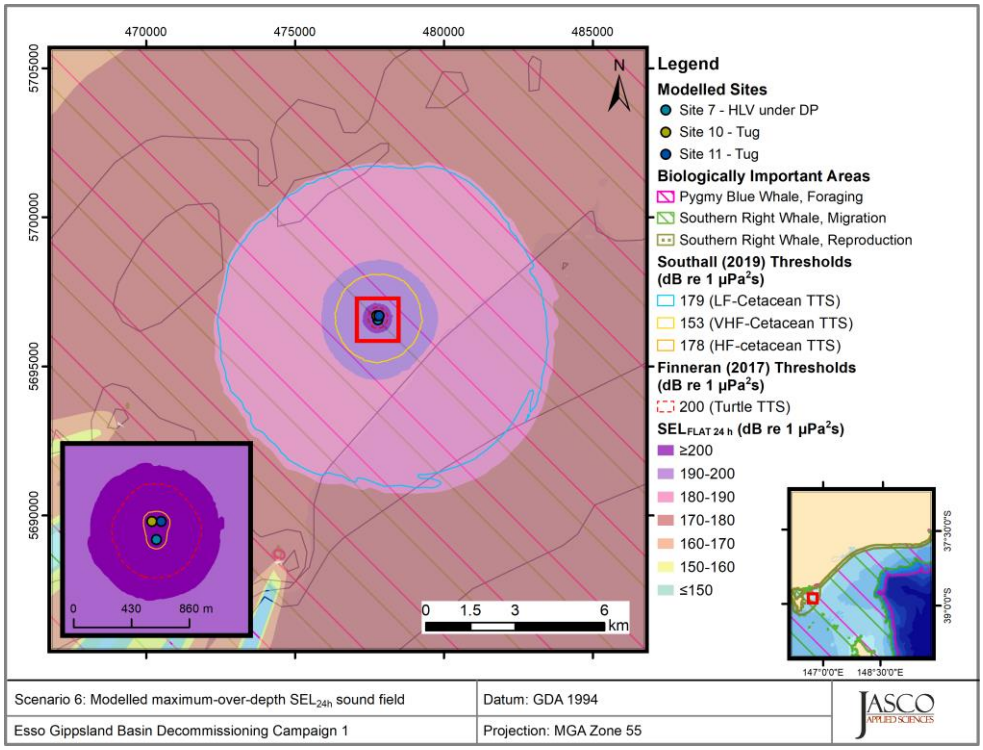

Figure 24. *Scenario 6, HLV and Tug/Towed Barge at Transfer Location A, accumulated SEL$_{24h}$*: Sound level contour map showing maximum-over-depth SEL$_{24h}$ results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

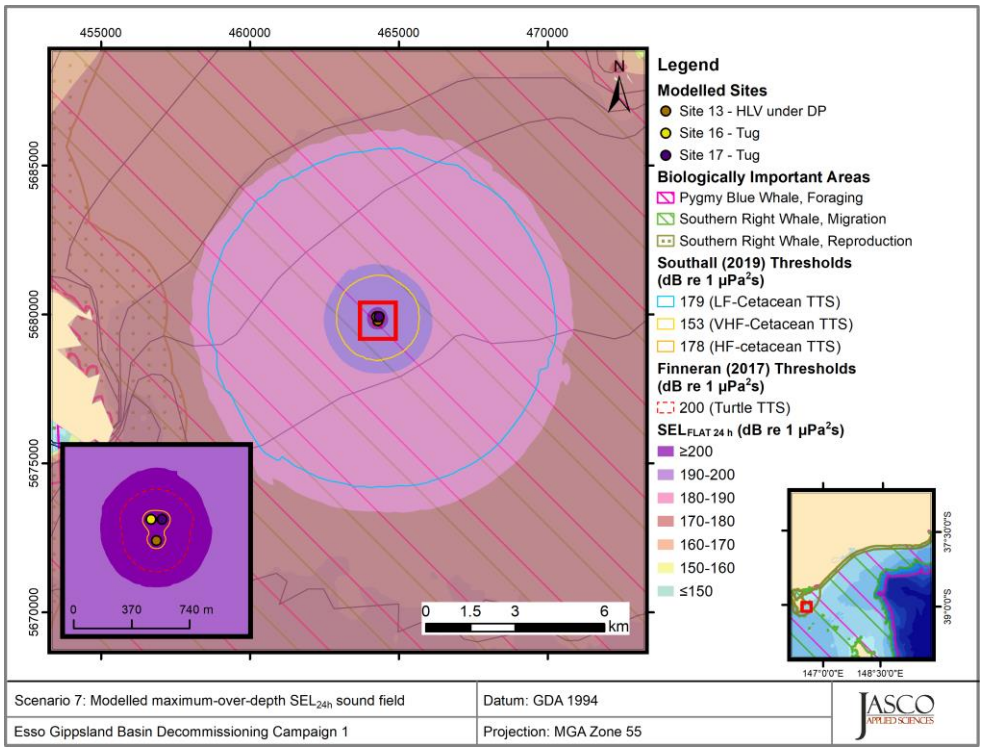

Figure 25. *Scenario 7, HLV and Tug/Towed Barge at Transfer Location B, accumulated SEL$_{24h}$*: Sound level contour map showing maximum-over-depth SEL$_{24h}$ results (unweighted/flat), along with frequency weighted isopleths for TTS in low, high, and very-high-frequency cetaceans, and turtles. Thresholds omitted here were not reached or not long enough to display graphically.

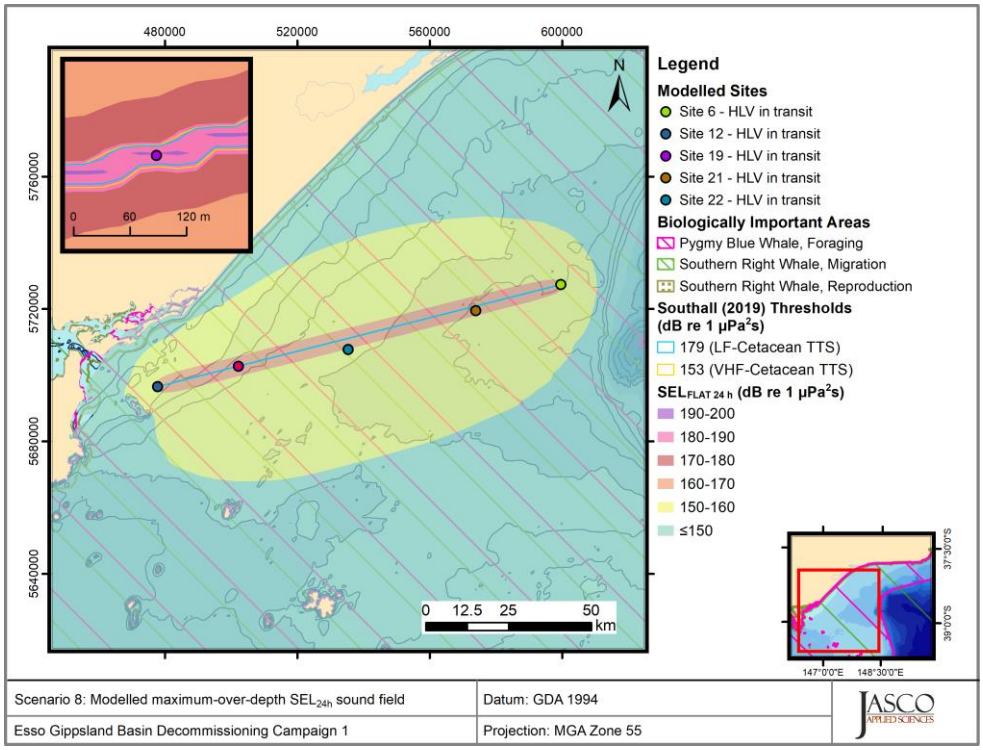

Figure 26. *Scenario 8, HLV in transit from Kingfish A to Transfer Location A, accumulated SEL_{24h}*: Sound level contour map showing maximum-over-depth SEL_{24h} results (unweighted/flat), along with frequency weighted isopleths for TTS in low and very-high-frequency cetaceans. Thresholds omitted here were not reached or not long enough to display graphically.

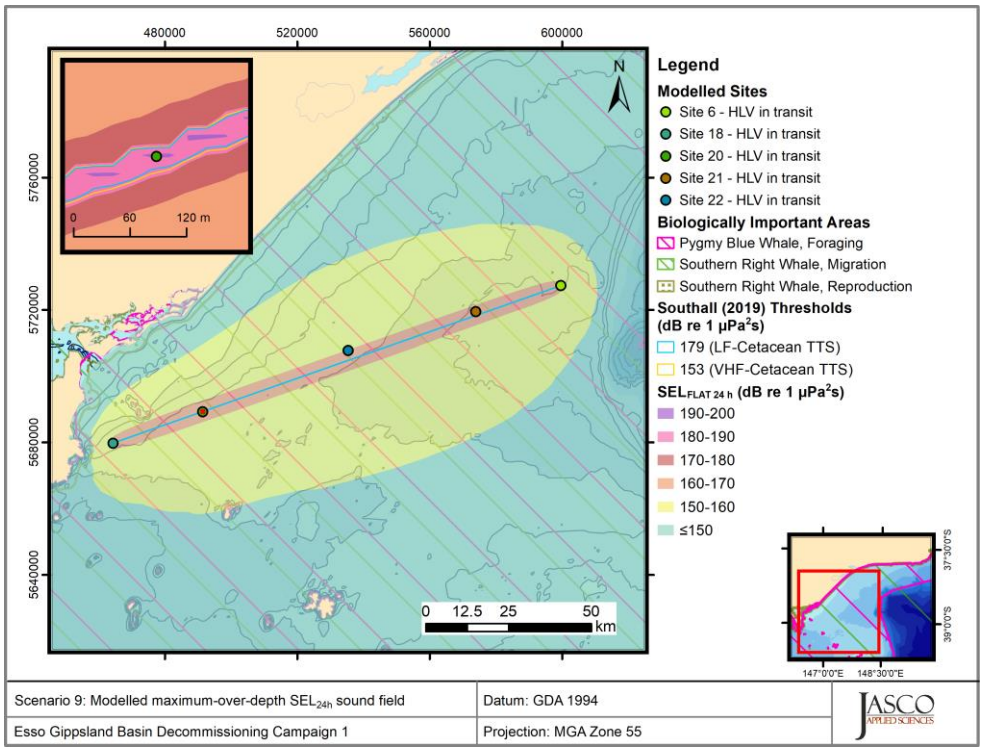

Figure 27. *Scenario 9, HLV in transit from Kingfish A to Transfer Location B, accumulated SEL_{24h}*: Sound level contour map showing maximum-over-depth SEL_{24h} results (unweighted/flat), along with frequency weighted isopleths for TTS in low and very-high-frequency cetaceans. Thresholds omitted here were not reached or not long enough to display graphically.

5. Discussion

The sound speed profile was derived from data from the U.S. Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). An analysis of monthly sound speed profiles was conducted to select the month corresponding to the longest sound propagation, to allow for operational flexibility and conservative estimation of distances. It was determined that June was the most conducive to sound propagation and likely the most conservative choice over the entire year. The final profile consisted of a combination of three representative profiles within the modelled area to capture the propagation effects associated with shallow and deep-water regimes (Appendix B.1.2).

The June sound speed profile was primarily upward refracting between the sea surface and 90 m water depth. The upward refracting sound speed profile has the potential trap frequencies above 219.6 Hz based on the thickness of this layer (Jensen et al. 2011), which corresponds to a significant portion of the source spectra detailed in Section 3.1, which can further enhance large distances to isopleths and criteria compared to other months.

The modelled scenarios were in water depths ranging from 25.2 to 74.3 m.

The Dolphin facility is located on the continental shelf about 20 km offshore the Gippsland coastline, and the bathymetry varies gradually, becoming deeper at distances further offshore. The isopleth contours corresponding to PTS and TTS thresholds and behavioural response threshold generally manifested as axially symmetric sound field footprints. The Kingfish A facility is nearer the continental slope where the bathymetry becomes deeper quickly, heading south-east. The influence of the bathymetry on sound propagation results in isopleth ranges that are shorter offshore and longer towards the coast.

The two transfer locations are located near the coast east of Wilsons Promontory, surrounded by sparse archipelagos. The irregular bathymetry in this area causes a large degree of asymmetry in the isopleth contours, with certain radials being impeded by the islands surrounding the transfer locations.

In the transit scenarios, the vessels travelled from Kingfish A to one of the two transfer locations, with Transfer Location B being the farthest one from Kingfish A. The isopleth contours corresponding to PTS and TTS thresholds are within about 25 m of the vessel paths. Compared to the stationary scenarios, these sound field contours have a much shorter range, as the vessel is travelling fast enough that very little loud sound is accumulated at any point near the vessel paths. There is little variation in radii as the bathymetry changes very gradually across the greater-than-120 km paths, from 69.5 m at Dolphin to 25.8 m at Transfer Location A and 47.3 m at Transfer Location B. This can be seen in Figure 26 and Figure 27. The behavioural response threshold has a comparatively longer range, consistently propagating up to 10 km, with the sound contour also remaining generally symmetrical. This can be seen in Figure 17 and Figure 18.

For the results tables presented in Section 4.1, where a dash is used in place of a horizontal distance, these thresholds may or may not be reached. Due to the discretely sampled 20 m calculation grids of the modelled sound fields, distances to these levels could not be estimated for practicable computational purposes. It is likely that SPL isopleths could be reached at distances between the source and the modelled horizontal resolution (20 m); however, distances to injurious accumulated SEL thresholds may not be reached at any range greater than the source due the species-specific frequency weighing functions. Additionally, if close-to-source radii are comparable to the dimensions of the modelled vessel (especially the HLV, which is many times larger than the modelling resolution) then they may only be reached within the dimensions of the vessel, if at all.

5.1. Conclusion

The tables presented below summarise the maximum horizontal distances to criteria and thresholds over all scenarios considered in this study. Results for individual scenarios can be found in Section 4.1. The distances presented below are related to sound level contours presented in Section 4.2. Appendix B.3 gives a detailed interpretation of how distances are related to contours, particularly in the context of R_{max}. These tabulated values can be interpreted as being the longest possible distance from an activity to where a criterion and/or threshold may be reached; however, they should be considered together with the sound field footprints in Section 4.2, as the contours may not be symmetric around a source or activity.

For the criteria associated with SPL metrics (e.g. marine mammal behavioural response), they are associated with an average instantaneous acoustic received level from a source and do not depend on an accumulation period.

On the other hand, SEL_{24h} is a cumulative metric that reflects the dosimetric impact of noise levels within a 24-hour accumulation time. The distances and contours based on this metric assume that an animal is consistently exposed to such noise levels at a fixed position. The corresponding SEL_{24h} distances represent an unlikely worst-case scenario. More realistically, marine mammals (as well as fish and turtles) would not stay in the same location for 24 hours. Therefore, a reported radius for SEL_{24h} criteria does not mean that marine fauna travelling within this radius of the noise source will be injured, but rather that an animal could be exposed to the sound level associated with impairment if it remained in that location for 24 hours.

Marine Mammals

Table 14 summarises the maximum horizontal distances to behavioural (unweighted SPL) and physiological effects (PTS and TTS) thresholds across all modelled scenarios.

Table 14. Summary of maximum (R_{max}) horizontal distances (in km) from the respective scenario centres to the behavioural response threshold, temporary threshold shift (TTS) and permanent threshold shift (PTS) for marine mammals. The maximum within each scenario type is reported here.

Hearing group	Modelled distance to effect threshold (R_{max})								
	Behavioural response[a] (km)	TTS[b] (km)	PTS[b] (km)	Behavioural response[a] (km)	TTS[b] (km)	PTS[b] (km)	Behavioural response[a] (km)	TTS[b] (km)	PTS[b] (km)
	Facilities Scenarios (1-3)			Transfer Scenarios (4-7)			Transit Scenarios (8-9)		
Low-frequency (LF) cetaceans	20.6	4.45	0.24	25.1	6.08	0.41	9.23	0.02	–
High-frequency (HF) cetaceans		0.06	0.03		0.15	0.02		–	–
Very High-frequency (VHF) cetaceans		1.24	0.15		1.53	0.17		0.02	–
Phocids		0.58	0.03		1.57	0.06		–	–
Otariid Seals		0.03	–		0.12	–		–	–

Noise exposure criteria: [a] NOAA (2019) and [b] Southall et al. (2019)
A dash indicates the level was not reached within the limits of the modelled resolution (20 m).

Sea turtles

The threshold criteria from Finneran et al. (2017) was used to assess PTS and TTS for sea turtles. PTS is predicted to occur within 0.02 km at the farthest. TTS is predicted to occur between 0.04 and 0.28 km in the facilities scenarios (scenarios 1-3), between 0.27 and 0.38 km in the transfer scenarios (scenarios 4-7), and not occur within the modelling resolution in the transit scenarios (scenarios 8-9).

Fish

The 12 h threshold for TTS for fish with a swim bladder involved in hearing (158 dB re 1 µPa (Popper et al. 2014)) was reached between ranges of 20 m and 190 m across all of the modelled scenarios. The 48 h threshold for recoverable injury for fish with a swim bladder involved in hearing (170 dB re 1 µPa (Popper et al. 2014)) was reached at a range of 20 m across all of the modelled scenarios.

Glossary

Unless otherwise stated in an entry, these definitions are consistent with ISO 18405 (2017).

Light blue text indicates related terms that might be in this glossary. Dark blue text indicates clickable links to related terms in this glossary

1/3-octave

One third of an octave. A 1/3-octave is approximately equal to one decidecade (1/3 oct ≈ 1.003 ddec).

1/3-octave-band

Frequency band whose bandwidth is one 1/3 octave. The bandwidth of a 1/3-octave-band increases with increasing centre frequency.

absorption

The conversion of sound energy to heat energy. Specifically, the reduction of sound pressure amplitude due to particle motion energy converting to heat in the propagation medium.

Acoustic impedance

The ratio of the sound pressure in a medium to the volume flow rate of the medium through a specified surface due to the sound wave. It is a measure of how well sound propagates through a particular medium.

acoustic noise

Sound that interferes with an acoustic process.

ambient sound

Sound that would be present in the absence of a specified activity (ISO 18405:2017). It is usually a composite of sound from many sources near and far, e.g., shipping vessels, seismic activity, precipitation, sea ice movement, wave action, and biological activity.

attenuation

The gradual loss of acoustic energy from absorption and scattering as sound propagates through a medium. Attenuation depends on frequency—higher frequency sounds are attenuated faster than lower frequency sounds.

audiogram

A graph or table of hearing threshold as a function of frequency that describes the hearing sensitivity of an animal over its hearing range.

auditory frequency weighting

The process of applying an auditory frequency-weighting function. An example for marine mammals are the auditory frequency-weighting functions published by Southall et al. (2007).

auditory frequency-weighting function

Frequency-weighting function describing a compensatory approach accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.

azimuth

A horizontal angle relative to a reference direction, which is often magnetic north or the direction of travel. In navigation it is also known as bearing.

background noise

Combination of ambient sound, acoustic self-noise, and, where applicable, sonar reverberation (ISO 18405:2017) that is detected, measured, or recorded with a signal.

bandwidth

A range within a continuous band of frequencies. Unit: hertz (Hz).

broadband level

The total level measured over a specified frequency range. If the frequency range is unspecified, the term refers to the entire measured frequency range.

cavitation

A rapid formation and collapse of vapor cavities (i.e., bubbles or voids) in water, most often caused by a rapid change in pressure. Fast-spinning vessel propellers typically cause cavitation, which creates a lot of noise.

cetacean

Member of the order Cetacea. Cetaceans are aquatic mammals and include whales, dolphins, and porpoises.

compressional wave

A mechanical vibration wave in which the direction of particle motion is parallel to the direction of propagation. Also called a longitudinal wave. In seismology/geophysics, it's called a primary wave or P-wave. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

conductivity-temperature-depth (CTD)

Measurement data of the ocean's conductivity, temperature, and depth; used to compute sound speed profiles and salinity.

continuous sound

A sound whose sound pressure level remains above the background noise during the observation period and may gradually vary in intensity with time, e.g., sound from a marine vessel.

decade

Logarithmic frequency interval whose upper bound is ten times larger than its lower bound (ISO 80000-3:2006). For example, one decade up from 1000 Hz is 10,000 Hz, and one decade down is 100 Hz.

decibel (dB)

Unit of level used to express the ratio of one value of a power quantity to another on a logarithmic scale. Especially suited to quantify variables with a large dynamic range.

decidecade

One tenth of a decade. Approximately equal to one third of an octave (1 ddec ≈ 0.3322 oct), and for this reason sometimes referred to as a 1/3 octave.

decidecade band

Frequency band whose bandwidth is one decidecade. The bandwidth of a decidecade band increases with increasing centre frequency.

delphinid

Member of the family of oceanic dolphins (Delphinidae), composed of approximately 35 extant species, including dolphins, porpoises, and killer whales.

energy source level

A property of a sound source equal to the sound exposure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2 s.

energy spectral density

Ratio of energy (time-integrated square of a specified field variable) to bandwidth in a specified frequency band from f_1 to f_2. In equation form, the energy spectral density E_f is given by: $E_f = 2\int_{f_1}^{f_2} |X(f)|^2 \, \mathrm{d}f / (f_2 - f_1)$ where $X(f)$ is the Fourier transform of the field variable $x(t)$: $X(f) = \int_{-\infty}^{+\infty} x(t) \exp(-2\pi i f t) \, \mathrm{d}t$.

The field variable $x(t)$ is a scalar quantity, such as sound pressure. It can also be the magnitude or a specified component of a vector quantity such as sound particle displacement, velocity, or acceleration. The unit of energy spectral density depends on the nature of x, as follows:

- If x = sound pressure: Pa^2 s/Hz
- If x = sound particle displacement: m^2 s/Hz
- If x = sound particle velocity: (m/s)^2 s/Hz
- If x = sound particle acceleration: (m/s^2)^2 s/Hz

The factor of two on the right side of the equation for E_f is needed to express a spectrum that is symmetric about f = 0, in terms of positive frequencies only. See entry 3.1.3.9 of ISO 18405 (2017).

energy spectral density level

The level ($L_{E,f}$) of the energy spectral density (E_f) in a stated frequency band and time window. Defined as: $L_{E,f} = 10\log_{10}(E_f/E_{f,0})$. Unit: decibel (dB). As with energy spectral density, energy spectral density level can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement). The reference value ($E_{f,0}$) for energy spectral density level depends on the nature of the field variable.

energy spectral density source level

A property of a sound source equal to the energy spectral density level of the sound pressure measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2 s/Hz.

ensonified

Exposed to sound.

equal-loudness-level contour

Curve that shows, as a function of frequency, the sound pressure level required to produce a given loudness for a listener having normal hearing, listening to a specified kind of sound in a specified manner (ANSI S1.1-2013).

far field

The zone where, to an observer, sound originating from an array of sources (or a spatially distributed source) appears to radiate from a single point.

Fourier transform, Fourier synthesis

A mathematical technique which, although it has varied applications, is referenced in a physical data acquisition context as a method used in the process of deriving a spectrum estimate from time-series data (or the reverse process, termed the inverse Fourier transform). A computationally efficient numerical algorithm for computing the Fourier transform is known as the fast Fourier transform (FFT).

frequency

The rate of oscillation of a periodic function measured in cycles per unit time. The reciprocal of the period. Unit: hertz (Hz). Symbol: *f*. 1 Hz is equal to 1 cycle per second.

frequency weighting

The process of applying a frequency-weighting function.

frequency-weighting function

The squared magnitude of the sound pressure transfer function (ISO 18405:2017). For sound of a given frequency, the frequency-weighting function is the ratio of output power to input power of a specified filter, sometimes expressed in decibels. Examples include the following:

- *Auditory frequency-weighting function*: compensatory frequency-weighting function accounting for a species' (or functional hearing group's) frequency-specific hearing sensitivity.
- *System frequency-weighting function*: frequency-weighting function describing the sensitivity of an acoustic recording system, which typically consists of a hydrophone, one or more amplifiers, and an analog-to-digital converter.

functional hearing group

Category of animal species when classified according to their hearing sensitivity, hearing anatomy, and susceptibility to sound. For marine mammals, initial groupings were proposed by Southall et al. (2007), and revised groupings are developed as new research/data becomes available. Revised groupings proposed by Southall et al. (2019) include low-frequency cetaceans, high-frequency cetaceans, very high-frequency cetaceans, phocid carnivores in water, other carnivores in water, and sirenians. Example hearing groups for fish include species for which the swim bladder is involved in hearing, species for which the swim bladder is not involved in hearing, and species without a swim bladder (Popper et al. 2014). See also auditory frequency-weighting functions, which are often applied to these groups.

geoacoustic

Relating to the acoustic properties of the seabed.

hearing threshold

For a given species or functional hearing group, the sound level for a given signal that is barely audible (i.e., that would be barely audible for a given individual in the presence of specified background noise during a specific percentage of experimental trials).

hertz (Hz)

Unit of frequency defined as one cycle per second. Often expressed in multiples such as kilohertz (1 kHz = 1000 Hz).

high-frequency (HF) cetaceans

See functional hearing group. The mid- and high-frequency cetaceans groups proposed by Southall et al. (2007) were renamed high- and very-high-frequency cetaceans, respectively, by Southall et al. (2019).

hydrophone

An underwater sound pressure transducer. A passive electronic device for recording or listening to underwater sound.

hydrostatic pressure

The pressure at any given depth in a static liquid that is the result of the weight of the liquid acting on a unit area at that depth, plus any pressure acting on the surface of the liquid. Unit: pascal (Pa).

impulsive sound

Qualitative term meaning sounds that are typically transient, brief (less than 1 s), broadband, with rapid rise time and rapid decay. They can occur in repetition or as a single event. Sources of impulsive sound include, among others, explosives, seismic airguns, and impact pile drivers.

isopleth

A line drawn on a map through all points having the same value of some specified quantity (e.g., sound pressure level isopleth).

knot (kn)

Unit of vessel speed equal to 1 nautical mile per hour.

level

A measure of a quantity expressed as the logarithm of the ratio of the quantity to a specified reference value of that quantity. For example, a value of sound pressure level with reference to 1 μPa^2 can be written in the form *x* dB re 1 μPa^2.

low-frequency (LF) cetaceans

See functional hearing group.

masking

Obscuring of sounds of interest by other sounds at similar frequencies.

median

The 50th percentile of a statistical distribution.

mid-frequency (MF) cetaceans

See functional hearing group. The mid-frequency cetaceans group proposed by Southall et al. (2007) was renamed high-frequency cetaceans by Southall et al. (2019).

monopole source level (MSL)

A source level that has been calculated using an acoustic model that accounts for the effect of the sea-surface and seabed on sound propagation, assuming a point source (monopole). Often used to quantify source levels of vessels or industrial operations from measurements. See also radiated noise level.

M-weighting

A set of auditory frequency-weighting functions proposed by Southall et al. (2007).

mysticete

Member of the Mysticeti, a suborder of cetaceans. Also known as baleen whales, mysticetes have baleen plates (rather than teeth) that they use to filter food from water (or from sediment as for grey

whales). This group includes rorquals (Balaenopteridae, such as blue, fin, humpback, and minke whales), right and bowhead whales (Balaenidae), and grey whales (*Eschrichtius robustus*).

non-impulsive sound

Sound that is not an impulsive sound. Not necessarily a continuous sound.

octave

The interval between a sound and another sound with double or half the frequency. For example, one octave above 200 Hz is 400 Hz, and one octave below 200 Hz is 100 Hz.

odontocete

Member of Odontoceti, a suborder of cetaceans. These whales, dolphins, and porpoises have teeth (rather than baleen plates). Their skulls are mostly asymmetric, an adaptation for their echolocation. This group includes sperm whales, killer whales, belugas, narwhals, dolphins, and porpoises.

otariid

Member of the family Otariidae, one of the three groupings of pinnipeds (along with phocids and walrus). These eared seals, commonly called fur seals and sea lions, are adapted to semi-aquatic life; they use their large fore flippers for propulsion underwater and can walk on all four limbs on land.

otariid pinnipeds underwater (OW)

See functional hearing group.

other marine carnivores in water (OCW)

See functional hearing group.

parabolic equation method

A computationally efficient solution to the acoustic wave equation that is used to model propagation loss. The parabolic equation approximation omits effects of backscattered sound (which are negligible for most ocean-acoustic propagation problems), simplifying the computation of propagation loss.

particle acceleration, particle displacement, particle motion, particle velocity

See sound particle acceleration, sound particle displacement, sound particle motion, and sound particle velocity.

peak sound pressure level (PK), zero-to-peak sound pressure level

The level (L_{pk}) of the squared maximum magnitude of the sound pressure (p_{pk}^2) in a stated frequency band and time window. Defined as $L_{pk} = 10\log_{10}(p_{\mathrm{pk}}^2/p_0^2) = 20\log_{10}(p_{\mathrm{pk}}/p_0)$. Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 µPa^2.

percentile level

The sound level not exceeded *N* % of the time during a specified time interval. The *N*th percentile level is equal to the (100−*N*) % exceedance level.

permanent threshold shift (PTS)

An irreversible loss of hearing sensitivity caused by excessive noise exposure. Considered auditory injury. Compare with temporary threshold shift.

phocid

Member of the family Phocidae, one of the three groupings of pinnipeds (along with otariids and walrus). These true/earless seals are more adapted to in-water life than are otariids, which have more terrestrial adaptations. Phocids use their hind flippers to propel themselves underwater.

phocid pinnipeds underwater (PW), phocid carnivores in water (PCW)

See functional hearing group.

pinniped

Member of the superfamily Pinnipedia, which is composed of phocids (true seals or earless seals), otariids (eared seals or fur seals and sea lions), and walrus.

point source

A source that radiates sound as if from a single point.

power spectral density

Generic term, formally defined as power in a unit frequency band. Unit: watt per hertz (W/Hz). The term is sometimes loosely used to refer to the spectral density of other parameters such as squared sound pressure. Ratio of energy spectral density, E_f, to time duration, Δt, in a specified temporal observation window. In equation form, the power spectral density P_f is given by $P_f = E_f / \Delta t$. Power spectral density can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement).

power spectral density level

The level ($L_{P,f}$) of the power spectral density (P_f) in a stated frequency band and time window. Defined as: $L_{P,f} = 10\log_{10}(P_f / P_{f,0})$. Unit: decibel (dB).

As with power spectral density, power spectral density level can be expressed in terms of various field variables (e.g., sound pressure, sound particle displacement). The reference value ($P_{f,0}$) for power spectral density level depends on the nature of the field variable.

power spectral density source level

A property of a sound source equal to the power spectral density level of the sound pressure measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 $\mu Pa^2\,m^2/Hz$.

propagation loss (PL)

Difference between a source level (SL) and the level at a specified location, $PL(x) = SL - L(x)$. Unit: decibel (dB). See also transmission loss.

radiated noise level (RNL)

A source level that has been calculated assuming sound pressure decays geometrically with distance from the source, with no influence of the sea-surface or seabed. Often used to quantify source levels of vessels or industrial operations from measurements. See also monopole source level.

received level

The level of a given field variable measured (or that would be measured) at a given location.

reference value

Standard value of a quantity used for calculating underwater sound level. The reference value depends on the quantity for which the level is being calculated:

Quantity	Reference value
Sound pressure	p_0^2 = 1 μPa² or p_0 = 1 μPa
Sound exposure	E_0 = 1 μPa² s
Sound particle displacement	δ_0^2 = 1 pm²
Sound particle velocity	u_0^2 = 1 nm²/s²
Sound particle acceleration	a_0^2 = 1 μm²/s⁴

shear wave

A mechanical vibration wave in which the direction of particle motion is perpendicular to the direction of propagation. Also called a secondary wave or S-wave. Shear waves propagate only in solid media, such as sediments or rock. Shear waves in the seabed can be converted to compressional waves in water at the water-seabed interface.

sound

A time-varying disturbance in the pressure, stress, or material displacement of a medium propagated by local compression and expansion of the medium. In common meaning, a form of energy that propagates through media (e.g., water, air, ground) as pressure waves.

sound exposure

Time integral of squared sound pressure over a stated time interval in a stated frequency band. The time interval can be a specified time duration (e.g., 24 h) or from start to end of a specified event (e.g., a pile strike, an airgun pulse, a construction operation). Unit: pascal squared second (Pa² s). Symbol: E.

sound exposure level (SEL)

The level (L_E) of the sound exposure (E) in a stated frequency band and time window: $L_E = 10\log_{10}(E/E_0)$ (ISO 18405:2017). Unit: decibel (dB). Reference value (E_0) for sound in water: 1 μPa² s.

sound exposure spectral density

Distribution as a function of frequency of the time-integrated squared sound pressure per unit bandwidth of a sound having a continuous spectrum (ISO 18405:2017). Unit: pascal squared second per hertz (Pa² s/Hz).

sound field

Region containing sound waves.

sound intensity

Product of the sound pressure and the sound particle velocity (ISO 18405:2017). The magnitude of the sound intensity is the sound energy flowing through a unit area perpendicular to the direction of propagation per unit time. Unit: watt per meter squared (W/m²). Symbol: I.

sound particle acceleration

The rate of change of sound particle velocity. Unit: meter per second squared (m/s²). Symbol: a.

sound particle motion

Movement caused by the action of sound of the smallest volume of a medium that represents its mean physical properties. Important for determining effects of underwater noise on fishes and invertebrates because their hearing organs sense particle motion rather than sound pressure.

sound particle displacement

Displacement of a material element caused by the action of sound, where a material element is the smallest element of the medium that represents the medium's mean density (ISO 18405:2017). Unit: meter (m). Symbol: δ.

sound particle velocity

The velocity of a particle in a material moving back and forth in the direction of the pressure wave. Unit: meter per second (m/s). Symbol: u.

sound pressure

The contribution to total pressure caused by the action of sound (ISO 18405:2017). Unit: pascal (Pa). Symbol: p.

sound pressure level (SPL), rms sound pressure level

The level (L_p) of the time-mean-square sound pressure (p_{rms}^2) in a stated frequency band and time window: $L_p = 10\log_{10}(p_{\mathrm{rms}}^2/p_0^2) = 20\log_{10}(p_{\mathrm{rms}}/p_0)$, where rms is the abbreviation for root-mean-square. Unit: decibel (dB). Reference value (p_0^2) for sound in water: 1 μPa^2. SPL can also be expressed in terms of the root-mean-square (rms) with a reference value of p_0 = 1 μPa. The two definitions are equivalent.

sound speed profile

The speed of sound in the water column as a function of depth below the water surface.

source level (SL)

A property of a sound source equal to the sound pressure level measured in the far field plus the propagation loss from the acoustic centre of the source to the receiver position. Unit: decibel (dB). Reference value: 1 μPa^2 m^2.

spectrum

Distribution of acoustic signal content over frequency, where the signal's content is represented by its power, energy, mean-square sound pressure, or sound exposure.

surface duct

The upper portion of a water column within which the gradient of the sound speed profile causes sound to refract upward and therefore reflect repeatedly off the surface resulting in relatively long-range sound propagation with little loss.

temporary threshold shift (TTS)

Reversible loss of hearing sensitivity caused by noise exposure. Compare with permanent threshold shift.

thermocline

A depth interval near the ocean surface that experiences larger temperature gradients than the layers above and below it due to warming or cooling by heat conduction from the atmosphere and by warming from the sun.

transmission loss (TL)

The difference between a specified level at one location and that at a different location: TL(x_1,x_2) = $L(x_1) - L(x_{2)}$ (ISO 18405:2017). Unit: decibel (dB). See also propagation loss.

unweighted

Term indicating that no frequency-weighting function is applied.

very high-frequency (VHF) cetaceans

See functional hearing group.

wavelength

Distance over which a wave completes one cycle of oscillation. Unit: meter (m). Symbol: λ.

Appendix A. Acoustic Metrics

This section describes in detail the acoustic metrics, impact criteria, and frequency weighting relevant to the modelling study.

A.1. Pressure Related Acoustic Metrics

Underwater sound pressure amplitude is measured in decibels (dB) relative to a fixed reference pressure of p_0 = 1 µPa. Because the perceived loudness of sound, especially pulsed sound such as from seismic airguns, pile driving, and sonar, is not generally proportional to the instantaneous acoustic pressure, several sound level metrics are commonly used to evaluate sound and its effects on marine life. Here we provide specific definitions of relevant metrics used in the accompanying report. Where possible, we follow International Organization for Standardization definitions and symbols for sound metrics (e.g., ISO 2017, ANSI S1.1-2013).

The sound pressure level (SPL or L_p; dB re 1 µPa) is the root-mean-square (rms) pressure level in a stated frequency band over a specified time window (T; s). It is important to note that SPL always refers to an rms pressure level and therefore not instantaneous pressure:

$$L_p = 10 \log_{10} \left(\frac{1}{T} \int_T g(t)\, p^2(t)\, dt / p_0^2 \right) \text{ dB} \tag{A-1}$$

where $g(t)$ is an optional time weighting function. In many cases, the start time of the integration is marched forward in small time steps to produce a time-varying SPL function.

The sound exposure level (SEL or L_E; dB re 1 µPa^2·s) is the time-integral of the squared acoustic pressure over a duration (T):

$$L_E = 10 \log_{10} \left(\int_T p^2(t)\, dt / T_0 p_0^2 \right) \text{ dB} \tag{A-2}$$

where T_0 is a reference time interval of 1 s. SEL continues to increase with time when non-zero pressure signals are present. It is a dose-type measurement, so the integration time applied must be carefully considered for its relevance to impact to the exposed recipients.

SEL can be calculated over a fixed duration, such as the time of a single event or a period with multiple acoustic events. When applied to pulsed sounds, SEL can be calculated by summing the SEL of the N individual events. For a fixed duration, the square pressure is integrated over the duration of interest. For multiple events, the SEL can be computed by summing (in linear units) the SEL of the N individual events:

$$L_{E,N} = 10 \log_{10} \left(\sum_{i=1}^{N} 10^{\frac{L_{E,i}}{10}} \right) \text{ dB}\,. \tag{A-3}$$

If applied, the frequency weighting of an acoustic event should be specified, as in the case of weighted SEL (e.g., $L_{E,LFC,24h}$; Appendix A.4). The use of fast, slow, or impulse exponential-time-averaging or other time-related characteristics should also be specified.

A.2. Decidecade Band Analysis

The distribution of a sound's power with frequency is described by the sound's spectrum. The sound spectrum can be split into a series of adjacent frequency bands. Splitting a spectrum into 1 Hz wide bands, called passbands, yields the power spectral density of the sound. This splitting of the spectrum into passbands of a constant width of 1 Hz, however, does not represent how animals perceive sound.

Because animals perceive exponential increases in frequency rather than linear increases, analysing a sound spectrum with passbands that increase exponentially in size better approximates real-world scenarios. In underwater acoustics, a spectrum is commonly split into decidecade bands, which are one tenth of a decade wide. A decidecade is sometimes referred to as a "1/3 octave" because one tenth of a decade is approximately equal to one third of an octave. Each decade represents a factor 10 in sound frequency. Each octave represents a factor 2 in sound frequency. The centre frequency of the ith band, $f_c(i)$, is defined as:

$$f_c(i) = 10^{\frac{i}{10}} \text{ kHz} \tag{A-4}$$

and the low (f_{lo}) and high (f_{hi}) frequency limits of the ith decade band are defined as:

$$f_{lo,i} = 10^{\frac{-1}{20}} f_c(i) \quad \text{and} \quad f_{hi,i} = 10^{\frac{1}{20}} f_c(i). \tag{A-5}$$

The decidecade bands become wider with increasing frequency, and on a logarithmic scale the bands appear equally spaced (Figure A-1). The acoustic modelling spans from band 10 (f_c (10) = 10 Hz) to band 44 ($f_c(44)$ = 25 kHz).

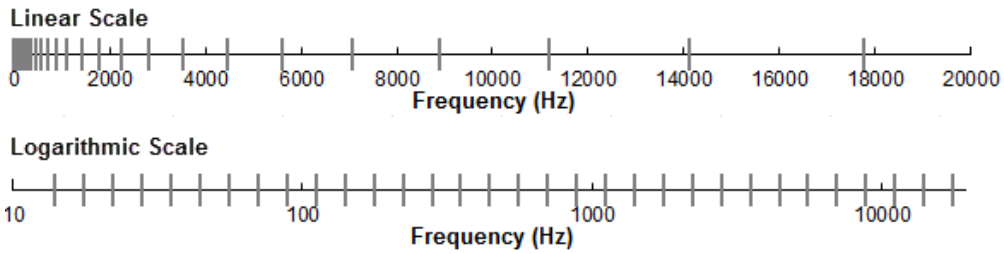

Figure A-1. Decidecade frequency bands (vertical lines) shown on a linear frequency scale and a logarithmic scale.

The sound pressure level in the ith band ($L_{p,i}$) is computed from the spectrum $S(f)$ between $f_{lo,i}$ and $f_{hi,i}$:

$$L_{p,i} = 10\, log_{10} \int_{f_{lo,i}}^{f_{hi,i}} S(f)\, df \text{ dB}. \tag{A-6}$$

Summing the sound pressure level of all the bands yields the broadband sound pressure level:

$$\text{Broadband SPL} = 10 \log_{10} \sum_i 10^{\frac{L_{p,i}}{10}} \text{ dB}. \tag{A-7}$$

Figure A-2 shows an example of how the decidecade band sound pressure levels compare to the sound pressure spectral density levels of an ambient sound signal. Because the decidecade bands are wider than 1 Hz, the decidecade band SPL is higher than the spectral levels at higher frequencies. Acoustic modelling of decidecade bands requires less computation time than 1 Hz bands and still resolves the frequency-dependence of the sound source and the propagation environment.

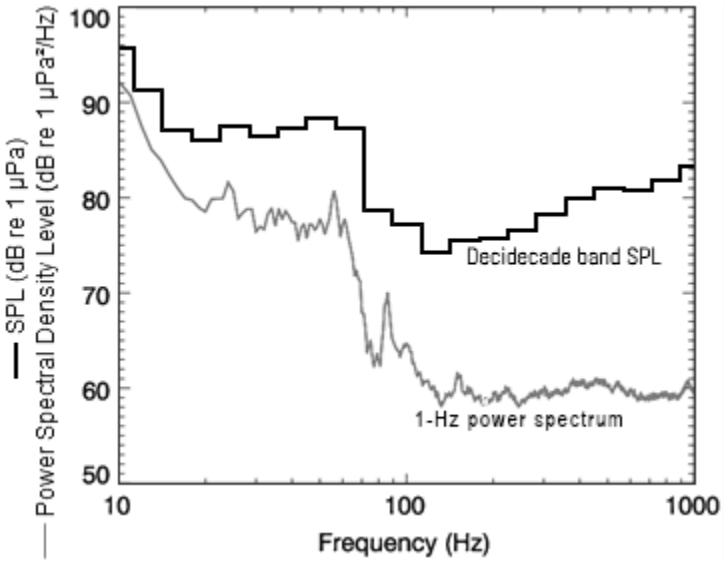

Figure A-2. Sound pressure spectral density levels and the corresponding decidecade band sound pressure levels of example ambient noise shown on a logarithmic frequency scale.Because the decidecade bands are wider with increasing frequency, the decidecade band SPL is higher than the power spectrum.

A.3. Marine Mammal Noise Effect Criteria

It has been long recognised that marine mammals can be adversely affected by underwater anthropogenic noise. For example, Payne and Webb (1971) suggest that communication distances of fin whales are reduced by shipping sounds. Subsequently, similar concerns arose regarding effects of other underwater noise sources and the possibility that impulsive sources—primarily airguns used in seismic surveys—could cause auditory injury. This led to a series of workshops held in the late 1990s, conducted to address acoustic mitigation requirements for seismic surveys and other underwater noise sources (NMFS 1998, ONR 1998, Nedwell and Turnpenny 1998, HESS 1999, Ellison and Stein 1999). In the years since these early workshops, a variety of thresholds have been proposed for auditory injury, impairment, and disturbance. The following sections summarise the recent development of thresholds; however, this field remains an active research topic.

A.3.1. Injury and Hearing Sensitivity Changes

In recognition of shortcomings of the SPL-only based auditory injury criteria, in 2005 NMFS sponsored the Noise Criteria Group to review literature on marine mammal hearing to propose new noise exposure criteria. Some members of this expert group published a landmark paper (Southall et al. 2007) that suggested assessment methods similar to those applied for humans. The resulting recommendations introduced dual auditory injury criteria for impulsive sounds that included peak pressure level thresholds and SEL_{24h} thresholds, where the subscripted 24h refers to the accumulation period for calculating SEL. The peak pressure level criterion is not frequency weighted whereas SEL_{24h} is frequency weighted according to one of four marine mammal species hearing groups: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively) and Pinnipeds in Water (PINN). These weighting functions are referred to as M-weighting filters (analogous to the A-weighting filter for humans; see Appendix A.4). The SEL_{24h} thresholds were obtained by extrapolating measurements of onset levels of Temporary Threshold Shift (TTS) in belugas by the amount of TTS required to produce Permanent Threshold Shift (PTS) in chinchillas. The Southall et al. (2007) recommendations do not specify an exchange rate, which suggests that the thresholds are the same regardless of the duration of exposure (i.e., it implies a 3 dB exchange rate).

Wood et al. (2012) refined Southall et al.'s (2007) thresholds, suggesting lower PTS and TTS values for LF and HF cetaceans while retaining the filter shapes. Their revised thresholds were based on TTS-onset levels in harbour porpoises from Lucke et al. (2009), which led to a revised impulsive sound PTS threshold for HF cetaceans of 179 dB re 1 $\mu Pa^2 \cdot s$. Because there were no data available for baleen whales, Wood et al. (2012) based their recommendations for LF cetaceans on results obtained from MF cetacean studies. In particular they referenced the Finneran and Schlundt (2010) research, which found mid-frequency cetaceans are more sensitive to non-impulsive sound exposure than Southall et al. (2007) assumed. Wood et al. (2012) thus recommended a more conservative TTS-onset level for LF cetaceans of 192 dB re 1 $\mu Pa^2 \cdot s$.

As of present, a definitive approach is still not apparent. There is consensus in the research community that an SEL-based method is preferable, either separately or in addition to an SPL-based approach to assess the potential for injuries. In August 2016, after substantial public and expert input into three draft versions and based largely on the above-mentioned literature (NOAA 2013, 2015, 2016), NMFS finalised technical guidance for assessing the effect of anthropogenic sound on marine mammal hearing (NMFS 2016). The guidance describes auditory injury criteria with new thresholds and frequency weighting functions for the five hearing groups described by Finneran and Jenkins (2012). The latest revision to this work was published in 2018 (NMFS 2018). Southall et al. (2019) revisited the interim criteria published in 2007. All noise exposure criteria in NMFS (2018) and Southall et al. (2019) are identical (for impulsive and non-impulsive sounds); however, the mid-frequency cetaceans from NMFS (2018) are classified as high-frequency cetaceans in Southall et al. (2019), and high-frequency cetaceans from NMFS (2018) are classified as very-high-frequency cetaceans in Southall et al. (2019).

A.3.2. Behavioural Response

Numerous studies on marine mammal behavioural responses to sound exposure have not resulted in consensus in the scientific community regarding the appropriate metric for assessing behavioural reactions. However, it is recognised that the context in which the sound is received affects the nature and extent of responses to a stimulus (Southall et al. 2007, Ellison and Frankel 2012, Southall et al. 2016).

NMFS currently uses a step function (all-or-none) threshold of 120 dB re 1 µPa SPL (unweighted) for non-impulsive sounds to assess and regulate noise-induced behavioural impacts on marine mammals (NOAA 2019). The 120 dB re 1 µPa threshold is associated with continuous sources and was derived based on studies examining behavioural responses to drilling and dredging (NOAA 2018), referring to Malme et al. (1983), Malme et al. (1984), and Malme et al. (1986), which were considered in Southall et al. (2007). Malme et al. (1986) found that playback of drillship noise did not produce clear evidence of disturbance or avoidance for levels below 110 dB re 1 µPa (SPL), possible avoidance occurred for exposure levels approaching 119 dB re 1 µPa. Malme et al. (1984) determined that measurable reactions usually consisted of rather subtle short-term changes in speed and/or heading of the whale(s) under observation. It has been shown that both received level and proximity of the sound source is a contributing factor in eliciting behavioural reactions in humpback whales (Dunlop et al. 2017, Dunlop et al. 2018).

A.4. Marine Mammal Frequency Weighting

The potential for noise to affect animals depends on how well the animals can hear it. Noises are less likely to disturb or injure an animal if they are at frequencies that the animal cannot hear well. An exception occurs when the sound pressure is so high that it can physically injure an animal by non-auditory means (i.e., barotrauma). For sound levels below such extremes, the importance of sound

components at particular frequencies can be scaled by frequency weighting relevant to an animal's sensitivity to those frequencies (Nedwell and Turnpenny 1998, Nedwell et al. 2007).

A.4.1. Marine Mammal Frequency Weighting Functions

In 2015, a US Navy technical report by Finneran (2015) recommended new auditory weighting functions. The overall shape of the auditory weighting functions is similar to human A-weighting functions, which follows the sensitivity of the human ear at low sound levels. The new frequency-weighting function is expressed as:

$$G(f) = K + 10\log_{10}\left[\left(\frac{(f/f_{lo})^{2a}}{\left[1+(f/f_{lo})^{2}\right]^{a}\left[1+(f/f_{hi})^{2}\right]^{b}}\right)\right]. \quad \text{(A-8)}$$

Finneran (2015) proposed five functional hearing groups for marine mammals in water: low-, mid- and high-frequency cetaceans (LF, MF, and HF cetaceans, respectively), phocid pinnipeds, and otariid pinnipeds. The parameters for these frequency-weighting functions were further modified the following year (Finneran 2016) and were adopted in NOAA's technical guidance that assesses acoustic impacts on marine mammals (NMFS 2018), and in the latest guidance by Southall (2019). The updates did not affect the content related to either the definitions of frequency-weighting functions or the threshold values, however, the terminology for mid- and high-frequency cetaceans was changed to high- and very high-frequency cetaceans. Table A-1. lists the frequency-weighting parameters for each hearing group relevant to this assessment, and Figure A-3 shows the resulting frequency-weighting curves.

Table A-1. Parameters for the auditory weighting functions used in this project as recommended by Southall et al. (2019).

Hearing group	a	b	flo (Hz)	fhi (Hz)	C (dB)
Low-frequency cetaceans (baleen whales)	1.0	2	200	19,000	0.13
High-frequency cetaceans (most dolphins, plus sperm, beaked, and bottlenose whales)	1.6	2	8,800	110,000	1.20
Very-high-frequency cetaceans (true porpoises, *Kogia*, river dolphins, *Cephalorhynchus* spp., *Lagenorhynchus cruciger* and *L. australis*)	1.8	2	12,000	140,000	1.36
Phocid Seals in water	1.0	2	1,900	30,000	0.75
Otariid Seals in water	2.0	2	940	25,000	0.64

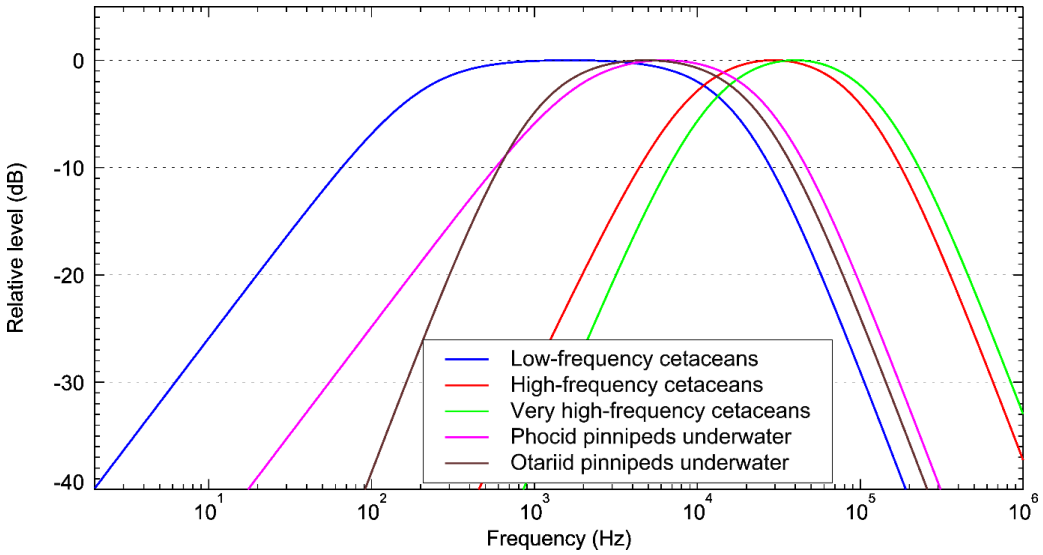

Figure A-3. Auditory weighting functions for functional marine mammal hearing groups used in this project as recommended by Southall et al. (2019).

Appendix B. Methods and Parameters

B.1. Environmental Parameters

B.1.1. Bathymetry

Bathymetry throughout the modelled area was extracted from the High-resolution depth model for the Bass Strait (Beaman 2022), a 0.0003 arc-degree (about 30 m) grid rendered for the Bass Strait. Bathymetry data were re-gridded and combined onto a Map Grid of Australia (MGA) coordinate projection (Zone 55) with a regular grid spacing of 200 × 200 m (Figure B-1).

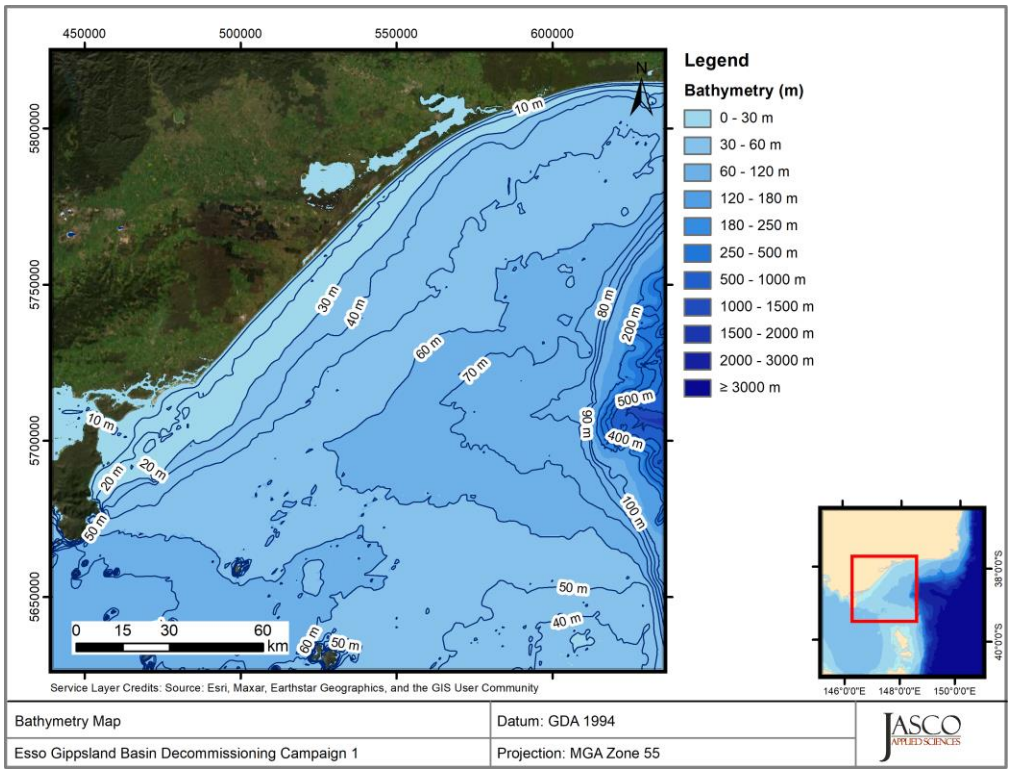

Figure B-1. Bathymetry in the modelled area.

B.1.2. Sound Speed Profile

The sound speed profile in the area was derived from temperature and salinity profiles from the U.S. Naval Oceanographic Office's Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009). GDEM provides an ocean climatology of temperature and salinity for the world's oceans on a latitude-longitude grid with 0.25° resolution, with a temporal resolution of one month, based on global historical observations from the U.S. Navy's Master Oceanographic Observational Data Set (MOODS). The climatology profiles include 78 fixed depth points to a maximum depth of 6800 m (where the ocean is that deep). The GDEM temperature-salinity profiles were converted to sound speed profiles according to Coppens (1981).

Mean monthly sound speed profiles were derived from the GDEM profiles in the locality of the modelled sites. Following a sensitivity analysis, the June sound speed profile was found to be most favourable to longer-range sound propagation. As such, June was selected for sound propagation

modelling to ensure precautionary estimates of distances to received sound level thresholds. Figure B-2 shows the resulting profile, which was used as input to the sound propagation modelling.

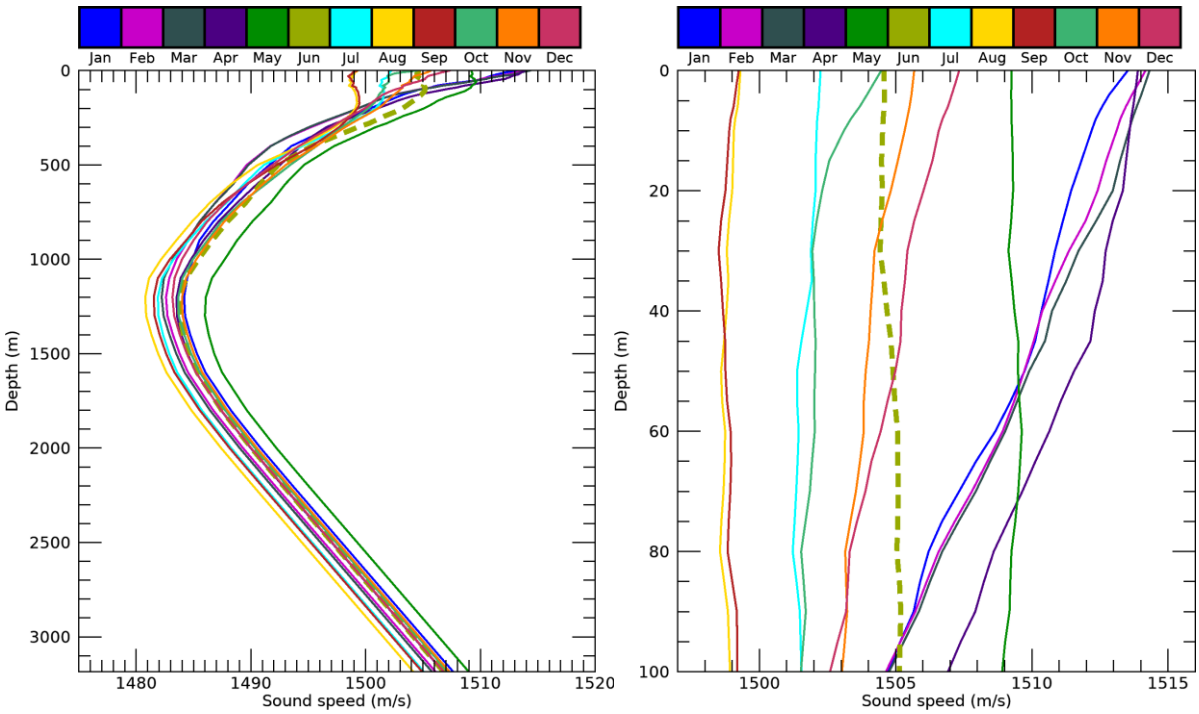

Figure B-2. Sound speed profiles for all months, with the applied month (June) displayed as a dotted line: full profile (left) and top 100 m (right) Profiles are calculated from temperature and salinity profiles from Generalized Digital Environmental Model V 3.0 (GDEM; Teague et al. 1990, Carnes 2009).

B.1.3. Geoacoustics

The propagation model used in this considered two geoacoustic profiles within the modelling area. These profiles determine how sound is reflected from the seabed, as well as how it is transmitted, reflected, and absorbed into the seabed. The modelled geoacoustics are based on a study by Mitchell et al. (2007), which conducted geological studies of the area via borehole analysis. The borehole nearest to the Dolphin facility is Barracouta-1 (Mitchell et al. 2007). The geology here consists of unconsolidated sediment (alternating fine to medium-fine quartz-carbonate sand) underlain by marl. For sediment layers, representative grain sizes and porosities were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters as input to sound propagation models. The marl and limestone parameters are estimate based on Duncan et al. (2013).

The borehole nearest Kingfish A is Kingfish B (Mitchell et al. 2007). The geology here consists of a shallow layer of unconsolidated sediment (alternating coarse shelly quartz-carbonate sand and muddy fine quartz-carbonate sand) underlain by limestone. For sediment layers, representative grain sizes and porosities were used in the grain-shearing model proposed by Buckingham (2005) to estimate the geoacoustic parameters required by the sound propagation models.

Table B-1 presents the Barracouta-1 geoacoustic profile, and Table B-2 presents the Kingfish B geoacoustic profile. For the transfer locations and transit sites, due to the proximity of the Barracouta-1 borehole to these sites (Mitchell et al. 2007) the same data as shown in Table B-1 were used.

Table B-1. Geoacoustic profile for Barracouta Facility modelled site. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm³)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0-4	Fine quartz-carbonate sand	2.06	1625-1763	0.08-0.62	357	3.65
4-8	Medium-fine quartz-carbonate sand	2.07	1790-1844	0.69-0.86		
8-10	Fine quartz-carbonate sand	2.06	1810-1828	0.78-0.84		
10-15	Medium-fine quartz-carbonate sand	2.07	1865-1908	0.92-1.05		
15-38	Fine to medium-fine quartz-carbonate sand	2.06	1886-2008	1.00-1.31		
38-40	Medium-fine quartz-carbonate sand intermixed with limestone	2.07	2039-2048	1.37-1.39		
40-68	Micaceous, carbonaceous muddy fine quartz-carbonate sand	2.06	1987-2076	1.27-1.47		
68-90	Medium-fine quartz-carbonate sand	2.07	2151-2216	1.60-1.72		
90-102	Muddy fine quartz-carbonate sand	2.06	2132-2159	1.58-1.63		
> 102	Marl	2.7	2600	0.5		

Table B-2. Geoacoustic profile for Kingfish B Facility modelled site. Each parameter varies linearly within the stated range.

Depth below seafloor (m)	Predicted lithology	Density (g/cm³)	Compressional wave		Shear wave	
			Speed (m/s)	Attenuation (dB/λ)	Speed (m/s)	Attenuation (dB/λ)
0-3	Coarse shelly quartz-carbonate sand	2.08	1637-1859	0.06-0.87	357	3.65
3-10	Fine quartz-carbonate sand	2.06	1747-1828	0.57-0.83		
10-13	Coarse shelly quartz-carbonate sand	2.08	2000-2042	1.25-1.35		
> 13	Limestone	2.7	2600	0.5		

B.2. Sound Propagation Models

B.2.1. Propagation Loss

The propagation of sound through the environment was modelled by predicting the acoustic propagation loss—a measure, in decibels, of the decrease in sound level between a source and a receiver some distance away. Geometric spreading of acoustic waves is the predominant way by which propagation loss occurs. Propagation loss also happens when the sound is absorbed and scattered by the seawater, and absorbed scattered, and reflected at the water surface and within the seabed. Propagation loss depends on the acoustic properties of the ocean and seabed; its value changes with frequency.

If the acoustic energy source level (ESL), expressed in dB re 1 $\mu Pa^2 \cdot s\ m^2$, and propagation loss (PL), in units of dB, at a given frequency are known, then the received level (RL) at a receiver location can be calculated in dB re 1 $\mu Pa^2 \cdot s$ by:

$$RL = SL - PL. \quad \text{(B-1)}$$

B.2.2. MONM-BELLHOP

Long-range sound fields were computed using JASCO's Marine Operations Noise Model (MONM). While other models may be more accurate for steep-angle propagation in high-shear environment, MONM is well suited for effective longer-range estimation. This model computes sound propagation at frequencies of 10 Hz to 1.6 kHz via a wide-angle parabolic equation solution to the acoustic wave equation (Collins 1993) based on a version of the U.S. Naval Research Laboratory's Range-dependent Acoustic Model (RAM), which has been modified to account for a solid seabed (Zhang and Tindle 1995). MONM computes sound propagation at frequencies > 1.6 kHz via the BELLHOP Gaussian beam acoustic ray-trace model (Porter and Liu 1994).

The parabolic equation method has been extensively benchmarked and is widely employed in the underwater acoustics community (Collins et al. 1996). MONM accounts for the additional reflection loss at the seabed, which results from partial conversion of incident compressional waves to shear waves at the seabed and sub-bottom interfaces, and it includes wave attenuations in all layers. MONM incorporates the following site-specific environmental properties: a bathymetric grid of the modelled area, underwater sound speed as a function of depth, and a geoacoustic profile based on the overall stratified composition of the seafloor.

MONM computes acoustic fields in three dimensions by modelling propagation loss within two-dimensional (2-D) vertical planes aligned along radials covering a 360° swath from the source, an approach commonly referred to as N×2-D. These vertical radial planes are separated by an angular step size of $\Delta\theta$, yielding N = 360°/$\Delta\theta$ number of planes (Figure B-3).

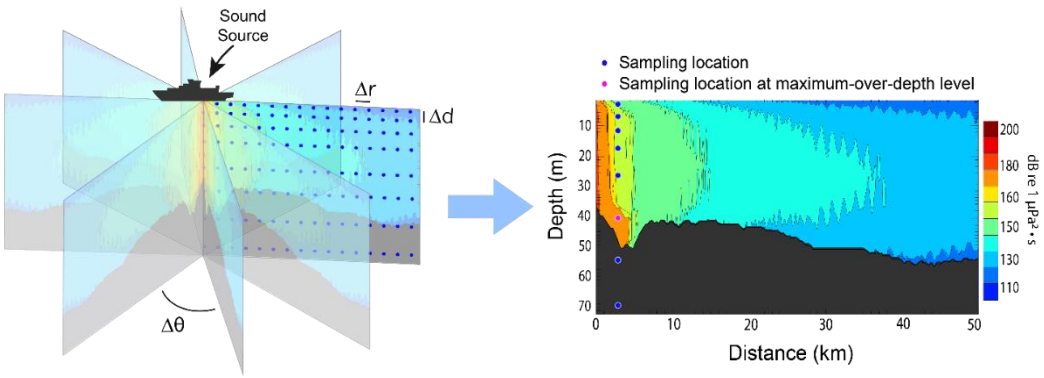

Figure B-3. The N×2-D and maximum-over-depth modelling approach used by MONM.

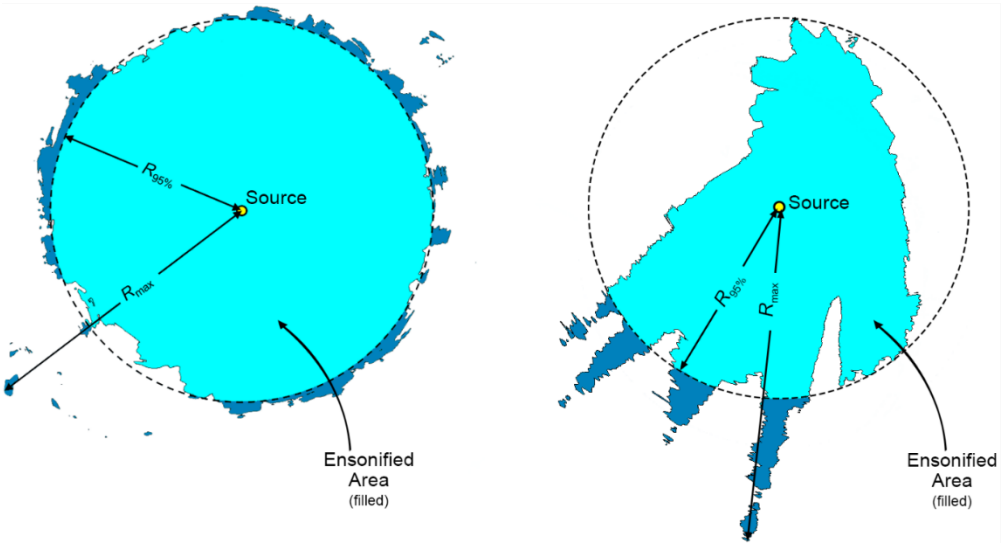
MONM treats frequency dependence by computing acoustic propagation loss at the centre frequencies of decidecade bands. Sufficiently many decidecade frequency-bands, starting at 10 Hz, are modelled to include most of the acoustic energy emitted by the source. At each centre frequency, the propagation loss is modelled within each of the N vertical planes as a function of depth and range from the source. The decidecade received per-second SEL are computed by subtracting the band propagation loss values from the directional source level in that frequency band. Composite broadband received per-second SEL are then computed by summing the received decidecade levels.



The received 1-s SEL sound field within each vertical radial plane is sampled at various ranges from the source, generally with a fixed radial step size. At each sampling range along the surface, the sound field is sampled at various depths, with the step size between samples increasing with depth below the surface. The step sizes are chosen to provide increased coverage near the depth of the source and at depths of interest in terms of the sound speed profile. For areas with deep water, sampling is not performed at depths beyond those reachable by marine mammals. The received per-second SEL at a surface sampling location is taken as the maximum value that occurs over all

samples within the water column, i.e., the maximum-over-depth received per-second SEL. These maximum-over-depth per-second SEL are presented as colour contours around the source.

B.3. Estimating Range to Thresholds Levels

Sound level contours were calculated based on the underwater sound fields predicted by the propagation models, sampled by taking the maximum value over all modelled depths above the sea floor for each location in the modelled region. The predicted distances to specific levels were computed from these contours. Two distances relative to the source are reported for each sound level: 1) R_{max}, the maximum range to the given sound level over all azimuths, and 2) $R_{95\%}$, the range to the given sound level after the 5% farthest points were excluded (see examples in Figure B-4).

The $R_{95\%}$ is used because sound field footprints are often irregular in shape. In some cases, a sound level contour might have small protrusions or anomalous isolated fringes. This is demonstrated in the image in Figure B-4(a). In cases such as this, where relatively few points are excluded in any given direction, R_{max} can misrepresent the area of the region exposed to such effects, and $R_{95\%}$ is considered more representative. In strongly asymmetric cases such as shown in Figure B-4(b), on the other hand, $R_{95\%}$ neglects to account for significant protrusions in the footprint. In such cases R_{max} might better represent the region of effect in specific directions. Cases such as this are usually associated with bathymetric features affecting propagation. The difference between R_{max} and $R_{95\%}$ depends on the source directivity and the non-uniformity of the acoustic environment.

(a) (b)

Figure B-4. Sample areas ensonified to an arbitrary sound level with R_{max} and $R_{95\%}$ ranges shown for two different scenarios. (a) Largely symmetric sound level contour with small protrusions. (b) Strongly asymmetric sound level contour with long protrusions. Light blue indicates the ensonified areas bounded by $R_{95\%}$; darker blue indicates the areas outside this boundary which determine R_{max}.

B.4. Estimating Sound Fields from Moving Vessels

During vessel transit, new sound energy is constantly being introduced to the environment. The noise footprint for the transiting vessels considered in this report were estimated by modelling the 1-s maximum over depth SEL footprints for the vessel at one location, and by translating and summing these footprints along the vessel transit routes. The vessel locations along the tracks were spaced uniformly, with an approximate step of $\Delta s \approx 5$ m for this study.

The SEL sound field at any given point along the path is dependent upon the duration of exposure, which with a fixed footprint spacing depends upon the speed of the vessel during each segment of the transit. The 1-s SEL footprint at each vessel location (i) were therefore scaled based on the speed of the vessel following:

$$\mathrm{SEL}_i = \mathrm{SEL}_{1s} + 10\log_{10}\left(\frac{\Delta s}{v}\right), \quad \text{(B-2)}$$

where v represents the vessel speed in m/s.

The cumulative SEL_{24h} field over the transit period can be calculated using the formulae in Appendix A.1. This method acceptably reflects large-scale sound propagation features, primarily dependent on water depth, which dominate the cumulative field and is thus considered to provide a meaningful estimate of the SEL_{24h} field for moving vessels.

B.5. Model Validation Information

Predictions from JASCO's propagation models (MONM, FWRAM, and VSTACK) have been validated against experimental data from a number of underwater acoustic measurement programs conducted by JASCO globally, including the United States and Canadian Arctic, Canadian and southern United States waters, Greenland, Russia and Australia (Hannay and Racca 2005, Aerts et al. 2008, Funk et al. 2008, Ireland et al. 2009, O'Neill et al. 2010, Warner et al. 2010, Racca et al. 2012a, Racca et al. 2012b, Matthews and MacGillivray 2013, Martin et al. 2015, Racca et al. 2015, Martin et al. 2017a, Martin et al. 2017b, Warner et al. 2017, MacGillivray 2018, McPherson et al. 2018, McPherson and Martin 2018).

In addition, JASCO has conducted measurement programs associated with a significant number of anthropogenic activities that have included internal validation of the modelling (including McCrodan et al. 2011, Austin and Warner 2012, McPherson and Warner 2012, Austin and Bailey 2013, Austin et al. 2013, Zykov and MacDonnell 2013, Austin 2014, Austin et al. 2015, Austin and Li 2016, Martin and Popper 2016, Austin et al. 2018, Beach Energy Limited 2020).

Appendix J: Sediment screening levels

Table J - 1 Summary table of levels of potential concern against which analytical results from sediment samples in the Gippsland Basin were compared.

Contaminant	Regulatory screening level mg/kg dry weight	Literature screening level mg/kg dry weight (except for NORM[c])
Oil constituents		
Total polycyclic aromatic hydrocarbons (TPAH)	4	0.1[a]
Total recoverable hydrocarbons	280	-
Acenaphthene	0.016	-
Acenaphthalene	0.044	-
Anthracene	0.085	-
Fluorene	0.019	-
Naphthalene	0.16	-
Phenanthrene	0.24	-
Benzo(a)anthracene	0.261	-
Benzo(a)pyrene	0.43	-
Dibenzo (a,h) anthracene	0.063	-
Chrysene	0.384	-
Fluoranthene	0.6	-
Pyrene	0.665	-
Metals and metalloids		
Aluminum	26,625	-
Antimony	2	-
Arsenic	20*	-
Barium	200	-
Cadmium	1.5	-
Chromium	80	-

Contaminant	Regulatory screening level mg/kg dry weight	Literature screening level mg/kg dry weight (except for NORM[c])
Cobalt	10	-
Copper	34	-
Iron	73,700	-
Lead	30	4[b]
Manganese	260	-
Mercury	0.15	0.05[b]
Nickel	21	-
Selenium	1	-
Silver	1	-
Vanadium	57	-
Zinc	200	-
NORMs (gross Alpha and Beta emitters)		1000 Bq/kg DW[c]

* Denotes low confidence in using a screening value approach with this contaminant.

a. Lower screening level is based on the potential for adverse outcomes measured as changes in benthic community structure.

b. Lower screening level is based on the potential for bioaccumulation and contamination of seafood resources.

c. Value was chosen based on the Australian Radiation Protection and Nuclear Safety Agency regulatory exemption limit for individual NORM radionuclides, as discussed in Hook S. E., et al. (2021). It is also twice the LOR. Units are Bq/kg dry weight (DW)

Appendix K: Environmental Performance Outcomes, Environmental Performance Standards, controls and measurement criteria

Table K - 1 Environmental Performance Outcomes, Environmental Performance Standards, controls and measurement criteria - Impacts

Aspect	EPO	Control measure	EPS	Measurement criteria
Physical presence – Seabed displacement	IMP1-EPO1: No adverse impact to unexpected finds of Underwater Cultural Heritage without a permit .	IMP1-CM1: Unexpected finds of potential UCH sites/ features, including First Nations UCH, are managed in accordance with an Unexpected Finds Protocol.	IMP1-EPS1.1: In the event potential UCH is discovered, management of the find will be undertaken in accordance with an Unexpected Finds Protocol. This Protocol will meet the requirements of the *Guidelines to assessing and managing impacts to Underwater Cultural Heritage in Australian waters* (DCCEEW, 2024f).	IMP1-MC1.1.1: No non-compliance with the Unexpected Finds Protocol.
	IMP1-EPO2: Seabed displacement is limited to planned activities and defined removal locations.	IMP1-CM2: No planned anchoring of vessels.	IMP1-EPS2.1: No planned anchoring by vessels undertaking Campaign #1 activities within the OA. Any anchoring during Campaign #1 will be recorded as an environmental incident.	IMP1-MC2.1.1: Removal procedures confirm no planned anchoring by vessels. IMP1-MC2.1.2: Records confirm incident reporting requirements have been communicated to appropriate vessel crew via Campaign #1 inductions.
		IMP1-CM3: Utilise internal cutting methods in preference to external cutting methods where jacket piles are to be cut below seabed.	IMP1-EPS3.1: Internal cutting methods are used where possible in preference to external cutting methods where jacket piles are cut below seabed.	IMP1-MC3.1.1: Removal procedures for each facility which documents planned cutting location and methods. IMP1-MC3.1.2: As removed survey report will document final removal heights above seabed or each facility.
	IMP1-EPO3: Temporarily stored equipment is removed as soon as reasonably practicable in accordance with the requirements of Section 572(3)	IMP1-CM4: Remove temporarily stored infrastructure prior to the end of the Campaign #1 activities, or document for future removal	IMP1-EPS4.1: Temporarily stored equipment is removed prior to the end of Campaign #1. If any items are not removed during Campaign #1 these are documented for future removal.	IMP1-MC4.1.1: The Campaign #1 temporary storage register confirms temporarily stored items are recorded and removed. IMP1-MC4.1.2: Esso Subsea Material Register is updated following Campaign #1 for items that have not been removed.
Physical presence – Interference with other marine users	IMP2-EPO1: Limit interference with other marine users to the extent necessary for the reasonable exercise of the right conferred by the titles granted.	IMP2-CM1: Temporary storage of removed items is restricted to within the facility 500m PSZ.	IMP2-EPS1.1: Temporary storage is undertaken within the 500m PSZ of a facility.	IMP2-MC1.1.1: The Campaign #1 temporary storage register confirms the locations of temporarily stored items are within the 500m PSZ of a facility.
	IMP2-EPO2: Marine users are informed prior to the commencement of the Campaign #1 activities such that they can plan their activities and avoid unexpected interference.	IMP2-CM2: Notify AMSA Joint Rescue Coordination Centre prior to commencing removal activities.	IMP2-EPS2.1: AMSA Joint Rescue Coordination Centre (JRCC) notified before removal, and removal preparation, activities commence to enable AMSA to distribute an AUSCOAST warning.	IMP2-MC2.1.1: Records confirm that information to distribute an AUSCOAST warning was provided to the JRCC before removal operations commenced. IMP2-MC2.1.2: Issued AUSCOAST warning dated prior to, or on the date activities commenced.
		IMP2-CM3: Notify AHO prior to commencing removal and removal preparation activities.	IMP2-EPS3.1: AHO notified before removal, and removal preparation, activities commence to allow generation of navigation warnings (including Notice to Mariners).	IMP2-MC3.1.1: Issued Notice to Mariners dated prior to, or on the date removal operations, or removal preparation activities commenced.
		IMP2-CM4: Provide updates to other marine users with activities in the OA, as requested.	IMP2-EPS4.1: Other marine users with activities in the OA are provided with updates on the removal activities and the removal preparation activities, if requested during consultation for this EP.	IMP2-MC4.1.1: Relevant person consultation records confirm that relevant persons were provided with updates in the manner and form as agreed during consultation.
		IMP2-CM5: Distribution of SMS text message updates to the eastern fishing fleet advising of vessel movements or	IMP2-EPS5.1: Distribution of SMS text message updates to the eastern fishing fleet advising of vessel movements and Campaign #1 activities	IMP2-MC5.1.1: Records of SMS text message communications held by Esso, confirming when and to whom updates were sent.

Aspect	EPO	Control measure	EPS	Measurement criteria
		activities being performed outside the PSZ.	being performed outside the PSZ of facilities. Messages may be sent as often as daily during an activity, if appropriate.	
		IMP2-CM6: Utilise a rolling map to provide updated information on removal activities throughout Campaign #1.	IMP2-EPS6.1: SETFIA notified prior to removal and removal preparation activities and provided with the required information to allow the rolling chart administered by SETFIA to be updated.	IMP2-MC6.1.1: Record of required information sent to the SETFIA Project Manager within the requested timeframes.
	IMP2-EPO3: Marine users are aware of the ongoing presence of infrastructure following Campaign #1 activities.	IMP2-CM7: Notify AHO of the location of infrastructure remaining following the completion of Campaign #1 so navigational charts can be updated if required.	IMP2-EPS7.1: AHO notified of the location of infrastructure remaining following completion of Campaign #1, so these can continue to be marked on navigational charts.	IMP2-MC7.1.1: Records show that the AHO has been notified of the locations of infrastructure remaining following the completion of Campaign #1.
Planned discharge – Sewage and food waste	IMP3-EPO1: Impacts as a result of sewage and food waste from vessels are limited to localised, temporary changes in water and habitat quality.	IMP3-CM1: Compliance with MARPOL Annex IV and MARPOL Annex V and associated Marine Order 96 (Marine pollution prevention — sewage) and Marine Order 95 (Marine pollution prevention — garbage) (as appropriate to vessel class).	IMP3-EPS1.1: Campaign #1 vessels are compliant with Marine Order 96 (Marine pollution prevention — sewage) requirements as appropriate to vessel class.	IMP3-MC1.1.1: Records demonstrate vessel maintains an International Sewage Pollution Prevention certificate. IMP3-MC1.1.2: Preventative maintenance system records demonstrate sewage treatment plant is maintained as required.
			IMP3-EPS1.2: Campaign #1 vessels are compliant with Marine Order 95 (Marine pollution prevention — garbage) requirements as appropriate to vessel class.	IMP3-MC1.2.1: Vessel maintains a Garbage Record Book. IMP3-MC1.2.2: Garbage Management Plan current and implemented. IMP3-MC1.2.3: Preventative maintenance system records demonstrate macerator/s are maintained as required.
Planned discharge – Cooling waters and reverse osmosis system	Not applicable.			
Planned discharge – Bilge water/deck drainage (vessel discharges)	IMP5-EPO1: Impacts as a result of the discharge of bilge water or deck drainage are limited to localised, temporary changes in water and habitat quality.	IMP5-CM1: Compliance with MARPOL Annex I and MARPOL Annex V and associated Marine Orders.	IMP5-EPS1.1: Campaign #1 vessels are compliant with Marine Order 91 (Marine Pollution Prevention – Oil) requirements as applicable to vessel class.	IMP5-MC1.1.1: Vessel maintains an International Oil Pollution Prevention Certificate. IMP5-MC1.1.2: Vessel is equipped with an approved oil discharge monitoring and control system which ensures that the oil-in-water content of treated bilge water is <15ppm. IMP5-MC1.1.3: Vessel maintains an Oil Record Book.
			IMP5-EPS1.2: Campaign #1 vessels are compliant with Marine Order 95 (Marine pollution prevention — garbage) requirements as appropriate to vessel class.	IMP5-MC1.2.1: Vessel maintains a garbage record book. IMP5-MC1.2.2: Garbage management plan current and implemented.
Planned discharge – Grout	IMP6-EPO1: Impacts from grout discharges are limited to localised, temporary changes in water and habitat quality.	IMP6-CM1: All grout planned for discharge will be evaluated as acceptable.	IMP6-EPS1.1: All grout planned for discharge will be evaluated as acceptable in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013).	IMP6-MC1.1.1: Documentation in accordance with the Environmental Chemical Discharge Assessment Process (AUGO-EV-PCE-013) (refer to Section

Aspect	EPO	Control measure	EPS	Measurement criteria
				8.11.2.1) confirms proposed grout and additives were evaluated as acceptable prior to discharge.
		IMP6-CM2: Grout will be selected to ensure a mercury concentration of <1mg/kg (1ppm) as outlined in the API standards.	IMP6-EPS2.1: Grout will not be discharged unless it has been confirmed as containing a mercury concentration of <1mg/kg.	IMP6-MC2.1.1: Documentation in accordance with the Environmental Chemical Discharge Assessment Process (AUGO-EV-PCE-013) (refer to Section 8.11.2.1) confirms proposed grout and additives were evaluated as acceptable prior to discharge.
		IMP6-CM3: Grouting procedures will be in place and include the requirement of no discharge of bulk grout to the environment (mixed or unmixed).	IMP6-EPS3.1: Contractor will develop and implement a grouting procedure for grouting operations. The procedure will include the requirement not to discharge bulk grout to the environment (mixed or unmixed).	IMP6-MC3.1.1: Grouting procedure developed. IMP6-MC3.1.2: Training records confirm procedure requirements and discharge limitations have been communicated to crew/subcontractors. IMP6-MC3.1.3: Grout pumping logs developed to track waste and unused grout returned onshore for appropriate management.
Planned discharges – Umbilicals	IMP7-EPO1: Impacts from planned discharges from umbilicals are limited to localised, temporary changes in water. No injury or mortality of marine fauna.	IMP7-CM1: Residual chemicals to be discharged during cutting and lifting of umbilicals are evaluated as acceptable for discharge.	IMP7-EPS1.1: Residual chemicals to be discharged during cutting and lifting of umbilicals have been evaluated as acceptable in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013).	IMP7-MC1.1.1: Documentation in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013) (refer to Section 8.11.2.1) confirms residual chemicals have been evaluated as acceptable.
		IMP7-CM2: Capping or plugging of umbilicals following cutting – where this is deemed technically feasible.	IMP7-EPS2.1: Umbilicals are capped or plugged when it is determined technically feasible and practicable during the detailed execution planning and execution stage.	IMP7-MC2.1.1: Evidence of feasibility assessment. IMP7-MC2.1.2: Records confirming capping or plugging of umbilicals was completed following cutting, if technically feasible.
		IMP7-CM3: Completion of flushing of umbilical cores as per facility preparation works scope are verified.	IMP7-EPS3.1: Verification is undertaken that flushing of umbilicals that are part of facility preparations activities (covered under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012) have been completed prior to commencement of umbilical cutting activities where practicable.	IMP7-MC3.1.1: Digital Decommissioning Management Tool provides evidence that umbilical cores were flushed as part of facilities preparation works (where practicable).
Planned discharges – Pipeline and risers fluids	IMP8-EPO1: Impacts as a result of planned discharges from pipelines and risers are limited to localised, temporary changes in water. No injury or mortality of marine fauna.	IMP8-CM1: Residual chemicals to be discharged during cutting and lifting of pipelines have been evaluated as acceptable.	IMP8-EPS1.1: Residual chemicals to be discharged during cutting of pipelines and risers have previously been evaluated as acceptable in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013).	IMP8-MC1.1.1: Documentation in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013) (refer to Section 8.11.2.1) confirms residual chemicals have previously been evaluated as acceptable.
		IMP8-CM2: Capping or plugging of all pipelines post cutting.	IMP8-EPS2.1: All pipelines are capped or plugged after cutting at a distance of up to 5m outboard from the jacket or pipeline connector.	IMP8-MC2.1.1: Records confirming capping or plugging of pipelines was completed following cutting, and location of the cut.
		IMP8-CM3: Completion of pipelines flushing and cleaning works as per facility preparation works scope have been verified.	IMP8-EPS3.1: Verification that planned flushing of pipelines and risers that are part of facility preparations activities (covered under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012) have been completed prior to commencement of pipeline/riser cutting activities.	IMP8-MC3.1.1: Digital Decommissioning Management Tool records provide evidence that: • pipelines and risers were flushed and cleaned • the residual OIW concentration remaining in the pipeline is within the cleanliness targets or demonstrated diminishing returns as outlined in Section 6.8.2.

Aspect	EPO	Control measure	EPS	Measurement criteria
Planned discharges – ODSPs and CDSPs	IMP9-EPO1: Impacts as a result of planned discharges from ODSPs and CDSPs are limited to localised, temporary changes in water. No injury or mortality of marine fauna.	IMP9-CM1: Verification that de-inventory and cleaning activities have been completed as per facility preparation scope of works.	IMP9-EPS1.1: Verification that planned de-inventory and cleaning of ODSPs and CDSPs that are part of the facility preparations activities (covered under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012) have been completed prior to the commencement of HLV operations covered under this Campaign #1 EP	IMP9-MC1.1.1: Digital Decommissioning Management Tool records provide *evidence*: • that ODSP and CDSPs were de-inventoried and cleaned • of the residual OIW concentration remaining in the ODSP/CDSP
Planned discharges – Jacket structure internal fluids	IMP10-EPO1: Impacts as a result of planned discharges from JLSTs are limited to localised, temporary changes in water. No injury or mortality of marine fauna.	IMP10-CM1: Verification of completion of de-inventory and cleaning works were completed as per facility preparation scope of works.	IMP10-EPS1.1: Verification that planned de-inventory and cleaning of JLSTs that are part of the facility preparations activities (covered under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012)) have been completed prior to commencement of HLV operations covered under this Campaign #1 EP.	IMP10-MC1.1.1: Digital Decommissioning Management Tool records provide evidence that JLSTs were de-inventoried and cleaned
Planned discharges – Solids	IMP11-EPO1: Impacts from planned discharges - solids are limited to localised, temporary changes in water and habitat quality.	IMP11-CM1: Garnet to be used during cutting activities evaluated as acceptable for discharge.	IMP11-EPS1.1: All garnet used during cutting activities will be evaluated prior to its use as acceptable in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013).	IMP11-MC1.1.1: Documentation in accordance with the Environmental Chemical Discharge Assessment Process (AUGO-EV-PCE-013) (refer to Section 8.11.2.1) confirms proposed garnet has been evaluated as acceptable prior to use and discharge.
Planned discharge – Marine growth	IMP12-EPO1: Impacts as a result of the planned discharge of marine growth are limited to localised, temporary changes in water quality and habitat.	IMP12-CM1: Marine growth that falls during transport aboard the HLV will be returned to the sea as close as practicable to the next jacket removal location.	IMP12-EPS1.1: Marine growth that falls on the HLV vessel deck in accessible areas will be aggregated and held onboard prior to returning to sea as close as practicable to the next removal location. Marine growth originating from the PCA/DPA monopods will only be returned to the PCA/DPA removal location or will be transferred onshore for disposal. No marine growth originating from other facilities will be returned to the PCA/DPA locations.	IMP12-MC1.1.1: Standard Operating Procedure as referenced within Allseas EMP and PCA and DPA lift plan. IMP12-MC1.1.2: Marine growth management/discharge log.
		IMP12-CM2: Marine growth will not be transferred from a primary vessel transporting a jacket structure to a different vessel and allowed to fall or be pushed off.	IMP12-EPS2.1: Aggregated marine growth will not be transferred from a primary vessel to a different vessel and then be allowed to fall or be pushed off – except when this is unavoidable as part of normal safe operation of the vessel.	IMP12-MC2.1.1: Marine growth management/discharge log.
		IMP12-CM3: Jacket structures will either be fully inboard or placed onto HTVs or barges longitudinally (lengthways) to ensure there is minimal overhang of the structures outside of the vessel.	IMP12-EPS 3.1: Inboarding or longitudinal placement of removed jacket sections on HTVs/barges has been undertaken to minimise the potential for marine growth to drop to the marine environment during transit from the transfer location to BBMT.	IMP12-MC3.1.1: Transfer procedures include the requirement for jacket structures to be placed longitudinally. IMP12-MC3.1.2: Jacket grillage on HTVs/barges installed (as built) for inboarding or longitudinal placement.
		IMP12-CM4: Marine growth that falls on HTV/barges during transit from the transfer area will be collected, where safe to do so, and taken onshore.	IMP12-EPS 4.1: Marine growth that falls on the deck of the barges/HTV during transit from the transfer area has been collected, where safe to do so, and taken onshore for composting or disposal in accordance with EPA Victoria regulations. Residual marine growth that cannot be collected will be washed off the deck to ensure a safe working environment for vessel crew.	IMP12 -MC4.1.1: Marine growth management/discharge log IMP12-MC4.1.2: Waste disposal records demonstrate waste was transferred onshore and disposed of in accordance with regulatory requirements
Sound emissions	IMP13-EPO1: There is no auditory injury (including PTS) or TTS to cetaceans from sound emissions, and whales (PBWs and SRWs) are not displaced from BIAs or	IMP13-CM1: Application of the Australian National Guidelines for Whale and Dolphin Watching 2017 (Commonwealth of Australia, 2017a).	IMP13-EPS1.1: Vessel and aircraft operations within the OA will comply with requirements established in Part 8 Division 8.1 of the EPBC Regulations, and align with the Australian National Guidelines for	IMP13-MC1.1.1: Roles and responsibilities as described in the Allseas EMP and related vessel subcontractors appropriate management plan.

Aspect	EPO	Control measure	EPS	Measurement criteria
	prevented from accessing and utilising these areas to conduct important behaviours such as foraging, breeding or migrating during Campaign #1 operations		Whale and Dolphin Watching 2017 (Commonwealth of Australia, 2017a), specifically with: • identification and training of personnel who will hold responsibilities for ensuring compliance with legal requirements established in Part 8 Division 8.1 of the EPBC Regulations and the Australian National Guidelines for Whale and Dolphin Watching 2017 (Commonwealth of Australia, 2017a), prior commencement of operations covered under the scope of works for decommissioning activities • helicopters will not fly lower than 500m when within 500m horizontal distance of a cetacean except when landing or taking off and will not approach a cetacean from head on • other aircraft (drones, fixed-wing aircraft) will not fly lower than 300m when within 500m horizontal distance of a cetacean except if landing or taking off from a project vessel is required. Other aircraft will not approach a cetacean from head on • caution zone: vessels will not approach closer than 150m from a dolphin and/or 300m from a whale • vessels will not travel at a speed of more than 6kn when a dolphin or whale is sighted within 300m from the vessel. Vessels must also move away from the dolphin/whale at a constant speed of <6kn.	IMP13-MC1.1.2: Induction records of vessel crew members and aircraft operator(s) on the requirements from, and how to comply with, Part 8 Division 8.1 of the EPBC Regulations and the Australian National Guidelines for Whale and Dolphin Watching 2017 (Commonwealth of Australia, 2017a). IMP13-MC1.1.3: Training records of relevant vessel crew and aircraft operator(s) members on marine fauna observations engaged. IMP13-MC1.1.4: Daily vessel or aircraft reports including actions implemented during vessel operations if/when whales and dolphins were sighted within the distances established under Part 8 Division 8.1 of the EPBC Regulations.
		IMP13-CM2: Preventative maintenance program.	IMP13-EPS2.1: All vessels taking part in Campaign #1 operations will have a maintenance program in place that includes plant and equipment that generates noise and/or vibration. The maintenance program is executed as per planned schedule.	IMP13-MC2.1.1: Maintenance program for key underwater noise-generating equipment (i.e. thrusters). IMP13-MC2.1.2: Records of maintenance completed for key underwater noise-generating equipment (i.e. thrusters).
		IMP13-CM3: Marine fauna observations by trained vessel crew.	IMP13-EPS3.1: Implementation of continuous daylight hours marine fauna observations by trained vessel crew during completion of Campaign #1 activities as follows: • prior to commencement of vessel operations, covered under the Campaign #1 scope, identify vessel crew that will hold responsibilities for fauna observations as part of their role description/watchkeeping duties • prior to commencement of vessel operations covered under the Campaign #1 scope, the relevant vessel crew must be trained on marine fauna observations (focusing on sensitive marine fauna that may be present within the area where removal activities will be conducted) • continuous daylight hours marine fauna observations by relevant vessel crew takes place during vessel operations.	IMP13-MC3.1.1: Roles and responsibilities as described in the Allseas EMP and related vessel subcontractors appropriate management plan. IMP13-MC3.1.2: Training records of relevant vessel crew members on marine fauna observations, inclusive of awareness of the adaptive whale management plan engaged. IMP13-MC3.1.3: Records demonstrating vessel crew assigned with marine fauna observation responsibilities undertake this task. IMP13-MC3.1.4: Daily vessel reports and actions (refer to adaptive whale management) implemented during vessel operations based on recommendations/reports from the vessel crew that is conducting fauna observations. IMP13-MC3.1.5: Inspection records demonstrate compliance with AMSA Marine Order 28.

Aspect	EPO	Control measure	EPS	Measurement criteria
		IMP13-CM4: Avoid HLV operations during the indicative peak PBW season, estimated to occur between April and June in the Bass Strait area.	IMP13-EPS4.1: HLV operations will avoid key periods where PBWs may be present within the OA, These key periods are estimated to be between April and June - while HLV operations are planned to take place between September and February.	IMP13-MC4.1.1: HLV operations schedule (planned and executed).
		IMP13-CM5: Limit vessel thruster power to maximum 75% on main Campaign #1 vessels (HLV and CSVs).	IMP13-EPS5.1: Set a maximum limit for thruster operation by the HLV and CSVs of 75% of the total installed capacity, subject to safety considerations.	IMP13-MC5.1.1: Vessel DP logs of thruster operation during vessel activities.
		IMP13-CM6: Marine mammal observations by trained MMOs from the HLV.	IMP13-EPS6.1: For HLV operations, specialised personnel (MMOs) will be engaged to conduct continuous daylight hours HLV-based marine mammal observations. Considerations include: • prior to commencement of HLV vessel operations covered under the Campaign #1 scope, engage specialised MMOs for HLV-based vessel operations • MMOs must have relevant training and experience in marine mammal observations • ensure continuous daylight hours marine mammal observations by MMOs during HLV operations.	IMP13-MC6.1.1: Record of engagement of MMOs and roles and responsibilities. IMP13-MC6.1.2: Training records and/or training certificates and/or curriculum vitae of MMOs engaged that demonstrate suitable qualifications. IMP13-MC6.1.3: Daily MMOs report. IMP13-MC6.1.4: Daily HLV reports and actions implemented during vessel operations based on recommendations/reports from MMOs. IMP13-MC6.1.5: Inspection records demonstrate compliance with AMSA Marine Order 28.
		IMP13-CM7: Pre-activity aerial survey prior to commencement of vessel safety-critical operations when distances at which behavioural threshold on SRWs or PBWs could be triggered is estimated to be greater than approximately 9.5km from the sound source. *Refer to Section 2.8.4 of this EP for definition of vessel safety-critical operations Note: this control is subject to consideration of vessel safety-critical operations.	IMP13-EPS7.1: Implement pre-activity aerial surveys for marine mammal observations before the start of vessel safety-critical operations when estimated distance at which behavioural threshold for LFC could be triggered is >9.5km from the sound source, as follows: • prior to commencement of vessel operations covered under the Campaign #1 scope, engage aircraft/drone/helicopter service provider for daytime pre-activity aerial surveys. • prior* to commencement of vessel safety-critical operations, and if distance estimated for triggering of behavioural response on SRWs or PBWs is >9.5km, conduct pre-activity aerial survey of the area where removal operations will take place. This action is planned to be undertaken for each vessel safety-critical operation when distance criteria of >9.5km is met and when weather conditions and light make it safe to execute. • A trained/competent MMO must be engaged to support the pre-activity aerial survey	IMP13-MC7.1.1: Contract/agreement of services with providers, including type of aircraft to be used for the pre-activity aerial surveys. IMP13-MC7.1.2: Record of engagement of MMOs and roles and responsibilities. IMP13-MC7.1.3: Training records and/or training certificates and/or curriculum vitae of MMOs engaged that demonstrate suitable qualifications. IMP13-MC7.1.4: Records with evidence (date and time) of pre-activity aerial surveys completed during Campaign #1 operations. IMP13-MC7.1.5: Records with evidence (date and time) of HLV operations prior to commencing vessel safety-critical operations. IMP13-MC7.1.6: MMO pre-activity aerial survey reports.
			IMP13-EPS7.2: Implement pre-activity aerial survey for marine mammal observations before subsea cutting activities when use of a ripper tool is expected.	IMP13-MC7.2.1: Contract/agreement of services with provider, including type of aircraft to be used for the pre-activity aerial surveys. IMP13-MC7.2.2: Record of engagement of MMOs and roles and responsibilities. IMP13-MC7.2.3: Training records and/or training certificates and/or curriculum vitae of MMOs engaged that demonstrate suitable qualifications.

Aspect	EPO	Control measure	EPS	Measurement criteria
				IMP13-MC7.2.4: Records with evidence (date and time) of pre-activity aerial surveys completed during Campaign #1 operations. IMP13-MC7.2.5: Records with evidence (date and time) of CSV operations prior to commencing subsea cutting operations when use of the ripper tool was expected. IMP13-MC7.2.6: MMO pre-activity aerial survey reports.
		IMP13-CM8: Adaptive management: Adaptive whale management plan for PBWs and SRWs.	IMP13-EPS8.1: Implementation of a whale adaptive management plan that includes specific actions to prevent or reduce potential impact to PBWs and SRW, including: • Delay supply vessel operations as follows: - when PBWs or SRWs have been sighted from a Campaign #1 vessel within the 30 minutes prior supply operations commence, supply vessel will not be allowed to come alongside the Campaign #1 vessel. - based on the visual observations made of the PBW or SRW, select the most suitable transit route for the supply vessel that allows avoidance of the likely/predicted path of the whale that was observed. - authorisation for supply vessel to resume approach towards the Campaign #1 vessel will only be granted when no PBW or SRW sightings have been made for a period of 30 minutes, or before this time if there is visual confirmation that PBWs or SRWs have exited the area in which behavioural response may be triggered. • If PBWs or SRWs are observed while the supply vessel is alongside the Campaign #1 vessel, suspend supply operations if safe to do so as follows: - supply vessel is to stop supply operations and move away from the project vessel, in the opposite direction of where the whale was sighted and then reduce DP operation. - authorisation for supply vessel to resume supply operations will only be granted when no PBW or SRW sightings have been made for a period of 30 minutes, or before this time if there is visual confirmation that PBWs or SRWs have exited the area in which behavioural response may be triggered. • If a PBW or SRW is sighted within the area in which behavioural response may be triggered before the HLV (and CSV as applicable) commence vessel safety-critical operations, adapt operations to reduce potential impact to whales as follows: - Safety critical operations may only commence when:	IMP13-MC8.1.1: Whale sighting records (trained vessel crew and/or MMOs daily reports). IMP13-MC8.1.2: Schedule or records of vessel supply activities (planned and executed). IMP13-MC8.1.3: Records (i.e. vessel master logs) of actions implemented by the vessels prior or during supply operations if/when PBWs or SRWs are sighted. IMP13-MC8.1.4: Record (i.e. vessel master logs) of actions implemented by HLV or CSV prior to the start of vessel safety-critical operations if/when PBW or SRW are sighted during the pre-activity aerial survey.

Aspect	EPO	Control measure	EPS	Measurement criteria
			▪ HLV thruster utilization required for the specific operation is less than 50% of its installed thruster capacity, or ▪ 30 minutes have passed since the last PBW or SRW sighting within the area in which behavioural response may be triggered, or ▪ There is visual confirmation that PBWs or SRWs have exited the area in which behavioural response may be triggered - avoid approaching the direction in which the whale was located until 30 minutes have passed after the last sighting, or before this time if there is visual confirmation that PBWs or SRWs have exited the area in which behavioural response may be triggered. - Where/if required, adjust vessel transit route to avoid the predicted path of the whales (based on the visual observations). Note that this measure is not applicable to the HLV and CSV when the vessels have commenced safety-critical operations at the time of the sighting. The area in which behavioural response from PBWs and SRWs may be triggered is defined by the distance up to which the 120 dB threshold may extend from the location of the noise source, as estimated for the activity.	
		IMP13-CM9: Adaptive management: Night-time and low visibility procedure for PBWs and SRWs.	IMP13-EPS9.1: Implementation of a whale adaptive management plan that includes a night-time and low visibility procedure with specific actions to prevent or reduce potential impact to PBWs and SRW, including: • Adapt vessel operations when PBWs or SRWs have been observed within the area in which behavioural response may be triggered prior to night-time or before low visibility conditions occur before the HLV (and CSV as applicable) commence vessel safety-critical operations, if the following criteria is met: - There have been three or more sightings of PBWs or SRWs reported during the 3-hour period preceding night-time and/or low visibility occurring, within the area in which behavioural response may be triggered, and/or: - There has been a sighting of a PBW or SRW within the 30 minutes period prior to night-time and/or low visibility occurring, within the area in which behavioural response may be triggered. • When either of these criteria are met, vessel safety-critical operations will not commence unless the following criteria are achieved: - HLV thruster utilization required for the specific operation is less than 50% of its installed thruster capacity, or	IMP13-MC9.1.1: Whale sighting records (marine fauna observers and/or MMOs daily reports). IMP13-MC9.1.2: Schedule or records of vessel operations (planned and executed). IMP13-MC9.1.3: Record of actions implemented by Campaign #1 vessels if criteria 1 and/or 2, were met.

Aspect	EPO	Control measure	EPS	Measurement criteria
			Additional actions include: - avoid approaching the direction in which the whale was located - where/if required, adjust vessel transit route to avoid the predicted path of the whale(s) (based on the visual observations). When night-time or low visibility conditions end, vessel operations will observe the controls established for day-time operations, (refer to IMP13-CM8 - 'Adaptive management: Adaptive whale management plan for PBWs and SRWs'). Note that this measure is not applicable to HLV and CSV when these specific vessels have commenced vessel safety-critical operations at the time of the sighting. The area in which behavioural response from PBWs and SRWs may be triggered is defined by the distance up to which the 120 dB threshold may extend from the location of the noise source, as estimated for the activity.	
Light emissions	IMP14-EPO1: No injury/ mortality, or significant change in behaviour of fauna, resulting from artificial light emissions from vessels operations during Campaign #1 activities.	IMP14-CM1: Application of the NLPGW.	IMP14-EPS1.1: Implementation of light emissions management measures that are consistent with advice from the NLPGW.	IMP14-MC1.1.1: Evidence of measures implemented and consistency with the NLPGW.
		IMP14-CM2: Do not undertake vessel crew change activities during night-time (except when required in the event of an emergency).	IMP14-EPS2.1: Vessel crew change is only conducted during daytime hours.	IMP14-MC2.1.1: Evidence of crew change operations: • helicopter schedule (planned versus executed) for crew change operations • vessel records for crew change operations (planned versus executed).
		IMP14-CM3: Implement a dark zone between nocturnal foraging and roosting habitats (when operationally feasible, by means of reducing number of vessels during SIMOPS, or increasing the distance to these habitats when safe to do so).	IMP14-EPS3.1: Only essential support vessels for transfer or HLV mode change operations may approach the HLV during night-time.	IMP14-MC3.1.1: Planning records (i.e.: SIMOPS plan) for transfer and HLV mode change operations, with description of vessels required to complete these operations.
		IMP14-CM4: Limit external lighting to that required for safe works operations and navigation.	IMP14-EPS4.1: Vessel crew change is only conducted during daytime hours (except when required in the event of an emergency).	IMP14-MC4.1.1: Evidence of crew change operations: • helicopter schedule (planned versus executed) for crew change operations • vessel records for crew change operations (planned versus executed).
			IMP14-EPS4.2: Only essential support vessels for transfer or HLV mode change operations may approach the HLV during night-time.	IMP14-MC4.2.1: Planning records (i.e.: SIMOPS plan) for transfer and HLV mode change operations, with description of vessels required to complete these operations.
			IMP14-EPS4.3: Lights are oriented towards the work areas.	IMP14-MC4.3.1: Records of lighting inspections.

Aspect	EPO	Control measure	EPS	Measurement criteria
		IMP14-CM5: For transfer operations and during the HLV mode change operation, limit presence of Campaign #1 support vessels in proximity to the HLV to only those required to complete these operations in a safe manner.	IMP14-EPS5.1: Only essential support vessels for transfer or HLV mode change operations may approach the HLV during night-time.	IMP14-MC5.1.1: Planning records (i.e.: SIMOPS plan) for transfer and HLV mode change operations, with description of vessels required to complete these operations.
		IMP14-CM6: Manage light spill from internal light sources.	IMP14-EPS6.1: Blinds/curtains are installed in the HLV and CSVs, and are used during night-time operations when the cabin light is on.	IMP14-MC6.1.1: Evidence of blinds installed/available at each cabin. IMP14-MC6.1.2: Training/induction records of all vessel crew that includes awareness of the requirement to have cabin blinds closed at night time.
		IMP14-CM7: Shielding and/or orienting of vessel light, where practicable (subject to safety considerations).	IMP14-EPS7.1: Lights are oriented towards the work areas.	IMP14-MC7.1.1: Records of lighting inspections.
		IMP14-CM8: Trained vessel crew on management of artificial lighting.	IMP14-EPS8.1: All vessel crew is trained on management of light emissions.	IMP14-MC8.1.1: Training records of vessel crew members on management of light emissions, inclusive of awareness of the Seabird Management Plan.
			IMP14-EPS8.2: Relevant vessel crew is trained on the Seabird Management Plan.	IMP14-MC8.2.1: Roles and responsibilities as described in the Allseas EMP and related vessel subcontractors appropriate management plan. IMP14-MC8.2.2: Training records of relevant vessel crew members on the Seabird Management Plan. IMP14-MC8.2.3: Reports on implementation of the Seabird Management Plan.
		IMP14-CM9: Seabird Management Plan.	IMP14-EPS9.1: Development and implementation of a Seabird Management Plan.	IMP14-MC9.1.1: Seabird Management Plan IMP14-MC9.1.2: Evidence of implementation of actions established in the Seabird Management Plan.
Emissions to air	IMP15-EPO1: Impacts from air emissions during Campaign #1 activities are limited to localised, short term effects in the immediate area of operations.	IMP15-CM1: Comply with MARPOL Annex VI.	IMP15-EPS1.1: Campaign #1 vessels are compliant with MARPOL Annex VI.	IMP15-MC1.1.1: Vessel International Air Pollution Prevention certificate. IMP15-MC1.1.2: Vessel International Energy Efficiency certificate. IMP15-MC1.1.3: Vessel statement of compliance for fuel consumption.
		IMP15-CM2: Preventative maintenance program.	IMP15-EPS2.1: All vessels taking part in Campaign #1 operations will have a maintenance program in place that includes plant and equipment that generates emissions to air. The maintenance program is executed as per planned schedule.	IMP15-MC2.1.1: Maintenance program in place for key air emission-generating equipment (i.e. generators). IMP15-MC2.1.2: Records of maintenance completed for key air emission-generating equipment (i.e. generators).

Aspect	EPO	Control measure	EPS	Measurement criteria
Waste generation and management	IMP16-EPO1: Impacts as a result of waste from vessels are limited to localised, temporary changes in water and habitat quality.	IMP16-CM1: Compliance with MARPOL Annex V and associated Marine Order 96 (Marine pollution prevention — sewage) and Marine Order 95 (Marine pollution prevention — garbage) (as appropriate to vessel class).	IMP16-EPS1.1: Campaign #1 vessels are compliant with MARPOL Annex V and associated Marine Order 95 (Marine pollution prevention — garbage) requirements as appropriate to vessel class.	IMP16-MC1.1.1: Vessel maintains a Garbage Record Book. IMP16-MC1.1.2: Garbage Management Plan current and implemented. IMP16-MC1.1.3: Preventative maintenance system records demonstrate macerator/s are maintained as required.
	IMP16-EPO2: Campaign #1 waste is managed in compliance with regulatory requirements.	IMP16-CM2: Waste practices will comply with relevant provisions of applicable international, State and Commonwealth legislation.	IMP16-EPS2.1: All waste streams will be managed and disposed of in accordance with applicable regulatory requirements, including but not limited to: • *Environment* Protection Act 2017 (Vic) • Environment Prote*ction Regulations* 2021 (Vic).	IMP16-MC2.1.1: Waste management plan documentation. IMP16-MC2.1.2: Vessel waste disposal records demonstrate disposal of waste was compliant with relevant Commonwealth and State legislation.
	IMP16-EPO3: Campaign #1 waste to landfill is minimised.	IMP16-CM3: Removals and onshore dismantling contractors waste management plans.	IMP16-EPS3.1: The development of waste management plans will include consideration of the waste hierarchy principles to minimise disposal of waste to landfill where practicable.	IMP16-MC3.1.1: Waste management plan documentation.

Table K - 2 Environmental Performance Outcomes, Environmental Performance Standards, controls and measurement criteria - Risks

Aspect	EPO	Control measure	EPS	Measurement criteria
Physical interaction – Other users of the sea	RSK1-EPO1: No adverse interactions with other marine users during removal and transfer operations.	RSK1-CM1: PSZs are in place around the facilities to be removed.	RSK1-EPS1.1: PSZs are in place around the Campaign #1 facility removal locations and prevent unauthorised access during removal activities.	RSK1-MC1.1.1: PSZs are gazetted and published on the NOPSEMA website. RSK1-MC1.1.2: Any incursions by unauthorised vessels into the PSZs during removal operations are recorded as an incident and investigated.
		RSK1-CM2: Safety exclusion zones around Campaign #1 vessels for activities undertaken outside a PSZ.	RSK1-EPS2.1: A 500m radius safety exclusion zone is in place around the HLV and other Campaign #1 vessels during transfer operations, which is enforced by the HLV.	RSK1-MC2.1.1: Notice to Mariners issued to communicate safety exclusion zone during removal and transfer operations. RSK1-MC2.1.2: Any incursions by unauthorised vessels into the safety exclusion zones during removal or transfer operations are recorded as an incident and investigated.
		RSK1-CM3: Notify AMSA Joint Rescue Coordination Centre prior to commencing removal activities.	RSK1-EPS3.1: AMSA Joint Rescue Coordination Centre (JRCC) notified before removal activities commence to enable AMSA to distribute an AUSCOAST warning.	RSK1-MC3.1.1: Records confirm that information to distribute AUSCOAST warning/s was provided to the JRCC before removal operations commenced. RSK1-MC3.1.2: Issued AUSCOAST warning/s dated prior to, or on the date activities commenced.
		RSK1-CM4: Notify AHO prior to commencing removal activities.	RSK1-EPS4.1: AHO notified before removal activities commence to allow generation of navigation warnings (including Notice to Mariners).	RSK1-MC4.1.1: Issued Notice to Mariners dated prior to, or on the date removal preparation activities (with the CSV) and removal operations (with the HLV and CSV/s) commenced.
		RSK1-CM5: Campaign #1 vessels are compliant with relevant navigational safety requirements.	RSK1-EPS5.1: Campaign #1 vessels are compliant with relevant navigation safety requirements under the *Navigation Act 2012* (Cth) and subsidiary Marine Orders.	RSK1-MC5.1.1: Inspection records demonstrate compliance with relevant navigation safety requirements under the *Navigation Act 2012* (Cth) and subsidiary Marine Orders.
	RSK1-EPO2: No adverse interactions with other marine users and partially removed infrastructure.	RSK1-CM6: Operation of permanent navigation aids on partially removed facilities - where infrastructure remains above the sea surface	RSK1-EPS6.1: A remotely monitored navigation aid will be in place on the BMB concrete substructure to provide ongoing visual identification of the structure following removal of the topsides.	RSK1-MC6.1.1: Remote monitoring records demonstrate correct operation of the navigation aid.
		RSK1-CM7: The locations of partially removed infrastructure which remains on the seabed following Campaign #1 will continue to be marked on navigational charts administered by the AHO.	RSK1-EPS7.1: The locations of partially removed infrastructure which remains on the seabed following Campaign #1 will continue to be marked on navigational charts administered by the AHO to advise marine users of their presence.	RSK1-MC7.1.1: Records show that: • the AHO has been notified of the locations of the partially removed infrastructure.
		RSK1-CM8: Ongoing consultation (via quarterly stakeholder forums) with commercial fisheries with licences in the ATBA to ensure licence holders are aware of changes to facility status after Campaign #1.	RSK1-EPS8.1: Commercial fisheries with licences in the ATBA will be notified of the changes to facility status via ongoing quarterly stakeholder forums.	RSK1-MC8.1.1: Minutes of quarterly stakeholder forums confirm the locations and particulars (i.e. height above seabed) of the partially removed infrastructure are communicated to commercial fishing stakeholders.
	RSK1-EPO3: Mitigate the impacts of adverse interactions with commercial fishing vessels and partially removed infrastructure, in the event that an interaction occurs.	RSK1-CM9: Existing Esso processes (the Fisherman's Tribunal) are in place to mitigate the impact of an interaction with a commercial fishing vessel, if this occurs.	RSK1-EPS9.1: The current model for compensation for claims of equipment damage as a result of interaction with Esso facilities, the Fisherman's Tribunal, will remain in place, until such time as all Bass Strait operations are decommissioned.	RSK1-MC9.1.1: Records of Fisherman's Tribunal meetings verify this process remains in place.

Aspect	EPO	Control measure	EPS	Measurement criteria
Physical interaction – Marine fauna and seabirds	RSK2-EPO1: No vessel strike injury is caused to whales or dolphins as a result of vessel operations during Campaign #1 activities.	RSK2-CM1: Operations within the OA will comply with requirements established in Part 8 Division 8.1 of the EPBC Regulations, and align with the *Australian National Guidelines for Whale and Dolphin Watching 2017* (Commonwealth of Australia, 2017a)	RSK2-EPS1.1: Operations within the OA will comply with requirements established in Part 8 Division 8.1 of the EPBC Regulations, and align with the *Australian National Guidelines for Whale and Dolphin Watching 2017* (Commonwealth of Australia, 2017a), specifically with: • identification and training of personnel that will hold responsibilities on ensuring compliance with legal requirements established in Part 8 Division 8.1 of the EPBC Regulations and the *Australian National Guidelines for Whale and Dolphin Watching 2017* (Commonwealth of Australia, 2017a), prior to commencement of operations covered under the scope of works for decommissioning activities • caution zone: vessels will not approach closer than 150m from a dolphin and/or 300m from a whale. vessels will not travel at a speed of more than 6kn when a dolphin or whale is sighted within 300m from the vessel. Vessel must also move away from the dolphin/whale at a constant speed of <6kn.	RSK2-MC1.1.1: Roles and responsibilities as described in the Allseas EMP and related vessel subcontractors appropriate management plan RSK2-MC1.1.2: Induction records of vessel crew members and aircraft operator(s) on the requirements from, and how to comply with, Part 8 Division 8.1 of the EPBC Regulations and the *Australian National Guidelines for Whale and Dolphin Watching 2017* (Commonwealth of Australia, 2017a). RSK2-MC1.1.3: Training records of relevant vessel crew and aircraft operator(s) members on marine fauna observations engaged. RSK2-MC1.1.4: Daily reports including actions implemented during vessel operations if/when whales and dolphins were sighted within the distances established under Part 8 Division 8.1 of the EPBC Regulations.
	RSK2-EPO2: No physical contact interaction with hauled out fur seals if present on structures or vessels at the time of operations.	RSK2-CM2: Seals to be encouraged back into the water on as needed basis using non-contact methods (e.g. arm waving, clapping, tapping handrails).	RSK2-EPS2.1: Crew will receive training (during environmental inductions) on the requirement to use non-contact methods (arm waving, sound, tapping handrails etc.) to encourage hauled out seals into the water when needed to facilitate access to or lifting of a structure.	RSK2-MC2.1.1: Induction records of vessel crew members.
	RSK2-EPO3: No injury/mortality of seabirds from interaction with vessel that is caused by their attraction to the presence of marine growth.	RSK2-CM3: Vessel contractor waste management procedure.	RSK2-EPS3.1: Development and implementation of a waste management procedure.	RSK2-MC3.1.1: Waste management procedure documentation.
		RSK2-CM4: Seabird Management Plan.	RSK2-EPS4.1: Development and implementation of a Seabird Management Plan.	RSK2-MC4.1.1: Seabird Management Plan. RSK2-MC4.1.2: Evidence of implementation of actions established in the Seabird Management Plan.
Translocation of native species	RSK3-EPO1: No translocation of native species within the OA or to adjacent areas.	RSK3-CM1: Marine growth which falls on the deck of the HLV will be returned to the sea as close as practicable to the next removal location.	RSK3-EPS1.1: Marine growth that falls on the HLV vessel deck in accessible areas will be aggregated and held onboard prior to returning to sea as close as practicable to the next removal location. Marine growth originating from the PCA/DPA monopods will only be returned to the PCA/DPA removal location, or will be transferred onshore for disposal. No marine growth originating from other facilities will be returned to the PCA/DPA locations.	RSK3-MC1.1.1: Standard Operating Procedure as referenced within Allseas EMP and PCA and DPA lift plan. RSK3-MC1.1.2: Marine growth management/discharge log.
		RSK3-CM2: Jacket structures will either be fully inboard or placed onto HTVs or barges longitudinally (lengthways) to ensure there is minimal overhang of the structures outside of the vessel.	RSK3-EPS2.1: Inboarding or longitudinal placement of removed jacket sections will be undertaken to minimise the potential for marine growth to drop to the marine environment during transit from the transfer location to BBMT.	RSK3-MC2.1.1: Transfer procedures include the requirement for jacket structures to be inboard or placed longitudinally. RSK3-MC2.1.2: Jacket grillage on HTVs/barges installed (as built) for inboarding or longitudinal placement.
		RSK3-CM3: Marine growth that falls on HTVs/barges during transit from the transfer area to BBMT will be collected, where safe to do so, and taken onshore.	RSK3-EPS3.1:Marine growth that collects on the deck of HTVs/barges during transit from the transfer area to BBMT will be collected, where safe to do so, and taken onshore for composting or disposal in accordance with EPA Victoria regulations.	RSK3 -MC3.1.1: Marine growth management/discharge log. RSK4 -MC3.1.2: Waste disposal records demonstrate waste was transferred onshore and disposed of in accordance with regulatory requirements.

Aspect	EPO	Control measure	EPS	Measurement criteria
			Residual marine growth that cannot be collected will be washed off the deck to ensure a safe working environment for vessel crew	
Introduction or spread of Invasive Marine Species	RSK4-EPO1: No introduction to, or spread of, IMS within the OA as a result of Campaign #1 activities.	RSK4-CM1: Ballast uptake and discharge during Campaign #1 activities is managed in accordance with Australian ballast water management requirements.	RSK4-EPS1.1: Campaign #1 vessel ballast water to be managed in accordance with the requirements of the *Australian Ballast Water Management Requirements Version 8* (DAWE, 2020a).	RSK4-MC1.1.1: Valid Ballast Water Management Plan present on the vessel. RSK4-MC1.1.2: Valid International Ballast Water Management Certificate present on the vessel. RSK4-MC1.1.3: Complete and accurate vessel ballast water record system is in place on the vessel. RSK4-MC1.1.4: Biosecurity Status Document (issued via the Maritime and Aircraft Reporting System) showing an approved ballast status (for vessels arriving from beyond Australia or a low risk exemption or evidence of compliant ballast water management through a domestic ballast water risk assessment (for domestic trading vessels).
		RSK4-CM2: Vessel biofouling risk is managed in accordance with Australian biofouling requirements.	RSK4-EPS2.1: Campaign #1 vessels sourced from international waters which enter Australian Territorial seas (12nm limit) prior to entering the OA will apply the Australian biofouling management requirements Version 2 (DAFF, 2023), including: • implementation of an effective biofouling management plan and record book • vessel cleaned of all biofouling within 30 days prior to arriving in Australian Territory, or implementation of an alternative biofouling management method pre-approved by the department.	RSK4-MC2.1.1: Biosecurity Status Document (issued via the Maritime and Aircraft Reporting System) showing a low risk or approved biofouling/biosecurity status.
		RSK4-CM3: A risk based management approach is applied for vessels being mobilised to the OA.	RSK4-EPS3.1: Campaign #1 vessels from international locations or sourced from Australian domestic locations, will comply with the Australian National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (Marine Pest Sectoral Committee, 2009), including: • completion of an IMS risk assessment, which includes evidence that demonstrates the vessel has a current biofouling management plan and biofouling record book and/or implementation of mitigation measures to reduce risk • only vessels classified as a low-level risk can enter the OA.	RSK4-MC3.1.1: Documented IMS risk assessment confirms vessel poses low risk of introducing IMS prior to commencing work in the OA.
		RSK4-CM4: All immersible retrievable equipment cleaned and/or inspected prior to commencement of removal activities.	RSK4-EPS4.1: All immersible retrievable equipment has been cleaned and/or inspected in accordance with *National biofouling management guidelines for the petroleum production and exploration industry* (Marine Pest Sectoral Committee, 2009) prior to commencement of removal activities.	RSK4-MC4.1.1: Records document cleaning and/or inspection of immersible retrievable equipment.
		RSK4-CM5: Marine growth which falls on the deck of the HLV will be returned to the sea as close as practicable to the next removal location.	RSK4-EPS5.1: Marine growth that falls on the HLV vessel deck in accessible areas is aggregated and held onboard prior to returning to sea as close as practicable to the next removal location. Marine growth originating from the PCA/DPA monopods is only returned to	RSK4-MC5.1.1: Standard Operating Procedure as referenced within Allseas EMP and PCA and DPA lift plan. RSK-MC5.1.2: Marine growth management/discharge log.

Aspect	EPO	Control measure	EPS	Measurement criteria
			the PCA/DPA removal location or will be transferred onshore for disposal. No marine growth originating from other facilities is returned to the PCA/DPA locations.	
		RSK4-CM6: Jacket structures will either be fully inboard or placed onto HTVs or barges longitudinally (lengthways) to ensure there is minimal overhang of the structures outside of the vessel.	RSK4-EPS6.1: Inboarding or longitudinal placement of removed jacket sections on HTVs/barges has been undertaken to minimise the potential for marine growth to drop to the marine environment during transit from the transfer location to BBMT.	RSK4-MC6.1.1: Transfer procedures include the requirement for jacket structures to be placed longitudinally. RSK4-MC6.1.2: Jacket grillage on HTVs/barges installed (as built) for inboarding or longitudinal placement.
		RSK4-CM7: Marine growth that falls on HTVs/barges during transit from the transfer area to BBMT will be collected, where safe to do so, and taken onshore	RSK4-EPS7.1: Marine growth that collects on the deck of the barges/HTV during transit from the transfer area to BBMT will be collected, where safe to do so, and taken onshore for composting or disposal in accordance with EPA Victoria regulations. Residual marine growth that cannot be collected will be washed off the deck to ensure a safe working environment for vessel crew.	RSK4 -MC7.1.1: Marine growth management/discharge log RSK4 -MC7.1.2: Waste disposal records demonstrate waste was transferred onshore and disposed of in accordance with regulatory requirements.
	RSK4-EPO2: In the event an IMS is identified, or suspected, notifications to the appropriate external parties are undertaken.	RSK4-CM8: Photographs of any potential IMS will be taken and provided to an IMS subject matter expert for review. Specimens will be collected to assist with identification (where it is safe, accessible and practicable to do so).	RSK4-EPS8.1: Photographs are taken of any potential IMS observed on or within marine growth which falls or is aggregated in accessible areas of the HLV or HTV or within one month of the jacket structure being loaded in at BBMT (if safe and accessible). Photographs are provided to an IMS subject matter expert for review. RSK4-EPS8.2: If a specimen of the photographed potential IMS can safely and practically be collected, the specimen is preserved and transported onshore for further identification. RSK4-EPS8.3: If identification cannot be achieved by morphological/anatomical analysis by a taxonomic expert, further techniques such as molecular, DNA-based analysis may be undertaken to assist with identification of the specimen, if required following consultation with an IMS subject matter expert. RSK4-EPS8.4: In the event an IMS is positively identified, or suspected, following review by an IMS subject matter expert, reporting to the appropriate external parties will be undertaken in accordance with the processes outlined in Table 8 7.	RSK4-MC8.1.1: Marine growth management/discharge log includes the requirement to take photographs/collect specimens of suspected IMS (if this safe, accessible and practical). RSK4-MC8.1.2: Training records of relevant crew members, which demonstrate training was provided in the identification of potential IMS and the requirement to obtain photographs/specimens if observed and safe, accessible and practical. RSK4–MC8.1.3: Records of any photographs taken/specimens collected/molecular analysis undertaken (if required) and results reviewed by an IMS subject matter expert. RSK4-MC8.1.4: In the event an IMS is positively identified, or suspected, records of reporting to relevant parties in accordance with Table 8 7.
Accidental release – Dropped objects	RSK5-EPO1: No dropped objects as a result of facility removal, transport or transfer operations.	RSK5-CM1: Specific lifting plans and procedures developed and implemented.	RSK5-EPS1.1: A specific lifting procedure/plan is developed and implemented for critical lifting and transfer operations.	RSK5-MC1.1.1: Lift Procedure/Plan for each critical lift and transfer undertaken, including verification sign offs at critical steps.
		RSK5-CM2: Visual inspection of lifting gear is undertaken regularly in line with the PMS.	RSK5-EPS2.1: Visual inspection of lifting gear is undertaken regularly in line with the PMS by a qualified competent person. Lifting gear is also inspected in accordance with class survey requirements, ensuring compliance with statutory and classification society standards.	RSK5-MC2.1.1: Inspection of PMS records and equipment register verifies that inspections have been conducted to schedule.
		RSK5-CM3: Sea fastening requirements for structures accepted as fit for purpose.	RSK5-EPS3.1: Securing requirements for removed structures (topsides, jackets and struts) are accepted as fit for purpose by the Campaign 1 Marine Warranty Surveyor prior to transport to the transfer area, and prior to departure from the transfer area.	RSK5-MC3.1.1: Approval of sea fastening design by Marine Warranty Surveyor. RSK5-MC3.1.2: Confirmation that a competent person has verified that the installed sea fastening complies with the Marine Warranty approved design.

Aspect	EPO	Control measure	EPS	Measurement criteria
		RSK5-CM4: Dead weight support.	RSK5-EPS4.1: Dead weight supports are in place to ensure structures on facilities are kept in place during lifting and transit and do not become dropped objects.	RSK5-MC4.1.1: Where required, design reports available for dead weight supports. RSK5-MC4.1.2: Confirmation that a competent person has verified that the installed support complies with the approved design.
		RSK5-CM5: All cargo securely fastened or stored during transport.	RSK5-EPS5.1: All cargo securely fastened or stored during transport in accordance with approved Cargo Securing Manual to prevent loss to sea.	RSK5-MC5.1.1: A completed pre-departure inspection checklist verifies that cargo is securely sea-fastened.
		RSK5-CM6: Crane handling and transfer procedures are in place.	RSK5-EPS6.1: A crane handling and transfer manual is in place and implemented by competent crane operators.	RSK5-MC6.1.1: Verification of training records of crane operators. RSK5-MC6.1.2: Approved crane handling and transfer manual.
	RSK5-EPO2: In the event of a dropped object, no adverse impacts to shipwrecks protected under the *Underwater Cultural Heritage Act 2018* (Cth)	RSK5-CM7: Transfer operations will not be undertaken within a 100m radius of a shipwreck protected under the Underwater Cultural Heritage Act 2018 (Cth).	RSK5-EPS7.1: Transfer operations are not undertaken within a 100m radius of a shipwreck protected under the *Underwater Cultural Heritage Act 2018* (Cth).	RSK5-MC7.1.1: Transfer location selection decision criteria (refer to Section 2.8.2) includes avoidance of known shipwreck locations. RSK5-MC7.1.2: Records show transfers were not made within a 100m radius of a shipwreck protected under the *Underwater Cultural Heritage Act 2018* (Cth).
		RSK5–CM8: The HLV or CSV, when transporting a jacket or topsides, will not transit within 100m of a shipwreck protected under the *Underwater Cultural Heritage Act 2018* (Cth).	RSK5- EPS 8.1: Transit operations are not undertaken within a 100m radius of a shipwreck protected under the *Underwater Cultural Heritage Act 2018* (Cth).	RSK-MC 8.1.1: Helmsman display as updated with the locations of shipwrecks protected under the *Underwater Cultural Heritage Act 2018* (Cth).
	RSK5-EPO3: In the event of a dropped object, no impact to underwater infrastructure that results in an environmental incident.	RSK5-CM9: Transfer operations will not be undertaken over underwater infrastructure marked on navigational charts such as cables, pipelines, wellheads etc.	RSK5-EPS9.1: Transfer operations are undertaken in accordance with transfer location decision criteria, which stipulates the transfer area must be clear of underwater infrastructure as marked on navigational charts.	RSK5-MC9.1.1: Transfer location selection decision criteria (refer to Section 2.8.2) includes avoidance of underwater infrastructure as marked on navigational maps. RSK5-MC9.1.2: Records show transfer location decision criteria was followed and transfers were not undertaken over underwater infrastructure as marked on navigational charts.
	RSK5-EPO4: In the event of a dropped object, mitigation measures and recovery are undertaken as soon as practicable.	RSK5-CM10: OPEP is in place to mitigate any impacts to the environment as a result of a dropped object.	RSK5-EPS10.1: OPEP is in place to response to an incident such as a dropped structure (topsides) that may result in a release of residual fluids to sea or the requirement for cleanup activities.	RSK5-MC10.1.1: Test records confirm that emergency response capability has been maintained in accordance with that described in the ERP and the OPEP. RSK5-MC10.1.2: Records confirm that emergency response activities have been implemented in accordance with the OPEP. RSK5-MC10.1.3: Records or other documented evidence of implementation and maintenance of OPEP, including training/drills where required.
		RSK5-CM11: Dropped objects will be recovered during Campaign #1 or recorded	RSK5-EPS11.1: Dropped objects are removed prior to the end of Campaign #1.	RSK5-MC11.1.1: The Campaign #1 temporary storage register confirms dropped objects are recorded and removed.

Aspect	EPO	Control measure	EPS	Measurement criteria
		for removal as part of the wider Bass Strait decommissioning program.	RSK5-EPS11.2: If any dropped objects are not removed during Campaign #1 these are documented for future removal.	RSK5-MC11.2.1: Esso Subsea Material Register is updated following Campaign #1 for dropped objects that have not been removed.
		RSK5-CM12: If a removed structure (topside, jacket section or strut) is dropped and cannot be recovered during Campaign #1, a recovery plan will be developed.	RSK5-EPS12.1: If a large dropped object such as a removed structure (topside, jacket section or strut) cannot be recovered during Campaign #1, a recovery plan will be developed, including a timeframe for recovering the structure as soon as practicable.	RSK5-MC12.1.1: Recovery plan which includes: • methodology for removal • timeframe for removal • any required controls for the interim period prior to removal to reduce environmental impacts to ALARP and acceptable.
Accidental release – Solid waste	RSK6-EPO1: No unplanned release of solid waste to the marine environment.	RSK6-CM1: Compliance with MARPOL Annex V and associated Marine Order 95 (Marine pollution prevention — garbage)	RSK6-EPS1.1: Campaign #1 vessels are compliant with MARPOL Annex V and associated Marine Order 95 (Marine pollution prevention — garbage) requirements as appropriate to vessel class.	RSK6-MC1.1.1: Vessel maintains a garbage record book. RSK6-MC1.1.2: Garbage management plan current and implemented.
Accidental release – Accidental release of hazardous or non-hazardous substances	RSK7-EPO1: No unplanned release of hazardous or non-hazardous substances.	RSK7-CM1: Compliance with IMO/Industrial Chemicals Environmental Management Standard.	RSK7-EPS1.1: Campaign #1 vessels are compliant with IMO/IChEMS.	RSK7-MC1.1.1: Evidence of alert (raised for each vessel) related to prohibitions applicable to firefighting foams. RSK7-MC1.1.2: Vessel specific chemicals register that includes firefighting equipment present onboard. RSK7-MC1.1.3: Records of inspection/audit of firefighting equipment onboard the vessels.
		RSK7-CM2: Class certificate – oil pollution.	RSK7-EPS2.1: Campaign #1 vessels are compliant with MARPOL Annex I and MARPOL Annex V and associated Marine Order 91 (Marine Pollution Prevention – Oil) as applicable to vessel class.	RSK7-MC2.1.1: Vessel maintains an International Oil Pollution Prevention Certificate.
		RSK7-CM3: Job Safety Analysis and Permit to Work.	RSK7-EPS3.1: Application of relevant Esso and contractor procedures.	RSK7-MC3.1.1: Records of application of work safety procedures (JSAs, last minute checks). RSK7-MC3.1.2: Records of third-party performance compliance checks/inspections by Esso.
		RSK7-CM4: Design and certification of hoses.	RSK7-EPS4.1: Only hoses that are certified will be used during transfer operations of hazardous/non-hazardous substances.	RSK7-MC4.1.1: Hose certification and assessment of working ratings in line with operational parameters and manufacturers specifications.
		RSK7-CM5: Preventative maintenance program.	RSK7-EPS5.1: Maintenance program in place for plant and equipment to be used for Campaign #1 operations.	RSK7-MC5.1.1: Maintenance program for key plant and equipment (i.e. generators, pumps). RSK7-MC5.1.2: Records of maintenance completed for key plant and equipment (i.e. generators, pumps).
		RSK7-CM6: International Marine Contractors Association (IMCA) audit – ROV.	RSK7-EPS6.1: ROVs are inspected prior to use in removal operations.	RSK7-MC6.1.1: Evidence of visual inspections and checks of ROVs prior to dives. RSK7-MC6.1.2: Evidence of regular planned maintenance and inspections of ROVs.
		RSK7-CM7: SOPEP	RSK7-EPS7.1: Campaign #1 vessels comply with MARPOL Annex I – Chapter 5.	RSK7-MC7.1.1: SOPEP developed for each vessel that takes part of Campaign #1 activities.

Aspect	EPO	Control measure	EPS	Measurement criteria
				RSK7-MC7.1.2: Records of implementation of SOPEP (i.e. records of planned and executed emergency drills).
		RSK7-CM8: EMP – Vessel contractor.	RSK7-EPS8.1: Contractor has an EMP in place for Campaign #1 operations.	RSK7-MC8.1.1: Contractor EMP and auditing/inspection records.
		RSK7-CM9: Procedures for grouting operations.	RSK7-EPS9.1: Contractor will develop and implement a grouting procedure for grouting operations.	RSK7-MC9.1.1: Grouting procedure developed. RSK7-MC9.1.2: Training records confirm procedure requirements have been communicated to crew/subcontractors.
		RSK7-CM10: Verification of completion of de-inventory and cleaning works were completed per facility preparation works scope under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012).	RSK7-EPS10.1: Verification that planned de-inventory and cleaning of ODSPs and CDSPs that are part of the facility preparations activities (covered under the *Bass Strait Environment Plan* (AUGO-EV-EMM-012) have been completed prior to the commencement of HLV operations covered under this Campaign #1 EP.	RSK7-MC10.1.1: Digital Decommissioning Management Tool records provide evidence that ODSP and CDSPs were de-inventoried and cleaned
	RSK7-EPO2: Minimise and control hazardous or non-hazardous substances accidentally released from vessels.	RSK7-CM11: Class certificate – oil pollution.	RSK7-EPS11.1: Campaign #1 vessels are compliant with MARPOL Annex I and MARPOL Annex V and associated Marine Order 91 (Marine Pollution Prevention – Oil) as applicable to vessel class.	RSK7-MC11.1.1: Vessel maintains an International Oil Pollution Prevention Certificate.
		RSK7-CM12: SOPEP.	RSK7-EPS12.1: Campaign #1vessels comply with MARPOL Annex I – Chapter 5.	RSK7-MC12.1.1: SOPEP developed for each vessel that takes part of Campaign #1 activities RSK7-MC12.1.2: Records of implementation of SOPEP (i.e. records of planned and executed emergency drills).
		RSK7-CM13: EMP – Vessel contractor.	RSK7-EPS13.1: Contractor has an EMP in place for Campaign #1 operations.	RSK7-MC13.1.1: Contractor EMP and auditing/inspection records.
		RSK7-CM14: Procedures for grouting operations.	RSK7-EPS14.1: Contractor will develop and implement a grouting procedure for grouting operations.	RSK7-MC14.1.1: Grouting procedure developed. RSK7-MC14.1.2: Training records confirm procedure requirements have been communicated to crew/subcontractors.
		RSK7-CM15: Environmental Chemical Discharge Assessment Process (AUGO-EV-PCE-013).	RSK7-EPS15.1: All grout to be used during Campaign#1 activities will be evaluated as acceptable in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013).	RSK7-MC15.1.1: Documentation in accordance with the *Environmental Chemical Discharge Assessment Process* (AUGO-EV-PCE-013) (refer to Section 8.11.2.1) confirms proposed grout and additives were evaluated as acceptable for discharge.
Accidental release – Loss of containment refined oils (marine gas oil)	RSK8-EPO1: No unplanned release of refined oils from rupture of vessel fuel tanks.	RSK8-CM1: Class certificate – oil pollution.	RSK8-EPS1.1: Campaign #1 vessels are compliant with MARPOL Annex I and MARPOL Annex V and associated Marine Order 91 (Marine Pollution Prevention – Oil) as applicable to vessel class.	RSK8-MC1.1.1: Vessel maintains an International Oil Pollution Prevention Certificate. RSK8-MC1.1.2: Classed approved Shipboard Oil Pollution Emergency Plan.
		RSK8-CM2: OPEP and OSMP.	RSK8-EPS2.1: An OPEP, inclusive of an OSMP, is in place for Campaign #1 operations.	RSK8-MC2.1.1: OPEP developed for Campaign #1 activities. RSK8-MC2.1.2: Implementation of OPEP (i.e. records of planned and executed emergency drills).

Aspect	EPO	Control measure	EPS	Measurement criteria
		RSK8-CM3: SOPEP.	RSK8-EPS3.1: Campaign #1 vessels comply with MARPOL Annex I – Chapter 5.	RSK8-MC3.1.1: SOPEP developed for each vessel that takes part of Campaign #1 activities. RSK8-MC3.1.2: Implementation of SOPEP (i.e. records of planned and executed emergency drills).
		RSK8-CM4: Implementation of ASOG and Critical Activity Mode Operation for Campaign #1 operations.	RSK8-EPS4.1: ASOG/Critical Activity Mode Operation risk management is applied during Campaign #1 activities.	RSK8-MC4.1.1: Records/evidence of ASOG and Critical Activity Mode Operation.
		RSK8-CM5: Implementation of a safety case for each facility * *For Campaign #1 purposes, facility refers to the Pioneering Spirit HLV and the Fortitude CSV	RSK8-EPS5.1: Safety case in place for the HLV (*Pioneering Spirit*) and the CSV (*Fortitude*).	RSK8-MC5.1.1: NOPSEMA approved Safety Cases for the HLV and the CSV. RSK8-MC5.1.2: Record of Safety Case implementation checks undertaken prior to mobilisation.
		RSK8-CM6: CSV and HLV approach protocols.	RSK8-EPS6.1: Approach protocols to platforms in place for the CSV and HLV.	RSK8-MC6.1.1: Approach protocols to platforms developed for Campaign #1 activities. RSK8-MC6.1.2: Implementation of approach protocols (i.e. PSZ entry).
		RSK8-CM7: Lifting and transfer operations procedures.	RSK8-EPS7.1: Lifting and transfer operations procedures in place for the CSV and HLV.	RSK8-MC7.1.1: Records/evidence of: • procedures for lifting and transfer operations developed for Campaign #1 activities. • implementation of lifting and transfer operations procedures.
		RSK8-CM8: Support/supply vessel approach protocols.	RSK8-EPS8.1: Support/supply vessel approach protocols.	RSK8-MC8.1.1: Records/evidence of: • approach protocols for support and supply vessel operations developed for Campaign #1 activities implementation of approach protocols (i.e. PSZ entry)
		RSK8-CM9: CSVs and HLV must be DP Class 2 or 3.	RSK8-EPS9.1: CSVs are certified as DP Class 2 or Class 3.	RSK8-MC9.1.1: Current DP class certificate. RSK8-MC9.1.2: Failure Modes and Effects Analysis.
			RSK8-EPS9.2: HLV is certified as DP class 3.	RSK8-MC9.2.1: Current DP class certificate. RSK8-MC9.2.2: Failure Modes and Effects Analysis.
	RSK8-EPO2: Minimise and control oil spilled from vessels in the event of an unplanned release of oil due to rupture of a vessel fuel tank.	RSK8-CM10: Class certificate – oil pollution.	RSK8-EPS10.1: Campaign #1 vessels are compliant with MARPOL Annex I and MARPOL Annex V and associated Marine Order 91 (Marine Pollution Prevention – Oil) as applicable to vessel class.	RSK8-MC10.1.1: Vessel maintains an International Oil Pollution Prevention Certificate. RSK8-MC10.1.2: Classed approved Shipboard Oil Pollution Emergency Plan.
		RSK8-CM11: OPEP and OSMP.	RSK8-EPS11.1: An OPEP, inclusive of an OSMP, is in place for Campaign #1 operations.	RSK8-MC11.1.1: OPEP developed for Campaign #1 activities. RSK8-MC11.1.2: Implementation of OPEP (i.e. records of planned and executed emergency drills).
		RSK8-CM12: SOPEP.	RSK8-EPS12.1: Campaign #1 vessels comply with MARPOL Annex I – Chapter 5.	RSK8-MC12.1.1: SOPEP developed for each vessel that takes part of Campaign #1 activities.

Aspect	EPO	Control measure	EPS	Measurement criteria
				RSK8-MC12.1.2: Implementation of SOPEP (i.e. records of planned and executed emergency drills).

Table K - 3 Environmental Performance Outcomes, Environmental Performance Standards, controls and measurement criteria - Emergency response capability

EPO	Control	EPS	Measurement criteria
EPR1-EPO1: IMT is available to respond as required to coordinate spill response operations in a timely manner to minimise impact to the environment	EPR1-CM1: IMT (per Esso/Allseas emergency preparedness and response bridging document).	EPR1-EPS1.1: Trained personnel are available to fulfil Incident Commander, Operations Section Chief, Planning Section Chief, Logistics Section Chief, Safety Officer and Environmental Unit Lead roles with one hour of IMT activation.	EPR1-MC1.1.1: Training records.
		EPR1-EPS1.2: Support is available for a Tier III response in: • <12 hours from notification for remote support <72 hours for in country support.	EPR1-MC1.2.1: Capability is demonstrated and documented during test/drill, or through list of assigned personnel for emergency response and relevant training records.
		EPR1-EPS1.3: Emergency response capability is maintained for the duration of the activities.	EPR1-MC1.3.1: IMT call out tests conducted and recorded per test schedule.
EPR2-EPO1: Source control equipment is available when required to prevent further uncontrolled release of hydrocarbons into the marine environment.	EPR2-CM1: Equipment required for internal and/or external emergency transfer of fuel is available in the vessel(s).	EPR2-EPS1.1: Suitable equipment for transfer of fuel and their location within the vessel(s) is identified and confirmed prior commencement of decommissioning activities.	EPR2-MC1.1.1: Resource availability is demonstrated and documented (i.e.: inspections, check of vessel drawings with location of transfer pumps).
	EPR2-CM2: Support vessel identification process.	EPR2-EPS2.1: Suitable support vessels and their location during the activity will be identified prior to decommissioning activities.	EPR-MC2.1.1: Completed register in the Tier II/III EPR.
EPR3-EPO1: Equipment and third-party services are available to complete oil spill surveillance and monitoring when required to gather information on the extent, severity and persistence of the oil and potential sensitivities at risk.	EPR3-CM1: Helicopter fleet.	EPR3-EPS1.1: A helicopter is available to complete surveillance and monitoring in <4 hours of request, subject to safe flying conditions. (Note: Assumes good visibility, daylight hours and suitable flying conditions).	EPR3-MC1.1.1: Agreement document with service provider.
	EPR3-CM2:Arrangement with third-party for provision of fixed wing aircraft.	EPR3-EPS2.1: Third-party fixed wing aircraft will be available <24 hours from request of service.	EPR3-MC2.1.1: Agreement document with service provider.
	EPR3-CM3:Support vessel.	EPR3-EPS3.1: Support vessel is available to complete surveillance and monitoring in <24 hours from request of service.	EPR3-MC3.1.1: Agreement document with service provider.
	EPR3-CM4: Agreement with third-party suppliers for provision of additional vessels.	EPR3-EPS4.1: Agreement states additional vessels will be available when requested.	EPR4-MC4.1.1: Agreement document with service provider.
	EPR3-CM5: Agreement with AMOSC for trajectory modelling.	EPR3-EPS5.1: Trajectory modelling is through AMOSC within <4 hours of service request.	EPR5-MC5.1.1: Agreement document with service provider.
	EPR3-CM6: Tracking buoys.	EPR3-EPS6.1: Tracking buoy is available to complete surveillance and monitoring within 12 hours of spill occurring subject to safe conditions.	EPR5-MC6.1.1: Agreement document when equipment provided by third-party. EPR5-MC6.1.2: Equipment information sheet with location and scheduled maintenance reports where required when equipment is sourced in-house.
	EPR3-CM7: Contract with satellite imagery provider.	EPR3-EPS7.1: Agreement with satellite imagery provides 24/7 emergency response support.	EPR5-MC7.1.1: Agreement document with service provider.
	EPR3-CM8: Initial response sampling kits.	EPR3-EPS8.1: Initial response sampling kit with required equipment is available when required.	EPR3-MC8.1.1: Inspection records of sampling kits.

EPO	Control	EPS	Measurement criteria
		Samples obtained <24 hours of spill occurring subject to safe conditions.	EPR3-MC8.1.2: Evidence of notification of emergency (with date and time) EPR3-MC8.1.3: Copy of Chain of Custody of samples
	EPR3-CM9: Agreement with service provider for monitoring and sampling.	EPR3-EPS9.1: Monitoring and sampling service provider has capability to implement the OSMP.	EPR3-MC9.1.1: Annual capability review.
EPR4-EPO1: Equipment and personnel available to support shoreline protection and clean-up when requested to reduce oil impact on shoreline environmental sensitivities.	EPR4-CM1: Agreement with third-party OSMP-implementation consultant.	EPR4-EPS1.1: Contract will be in place to enable access to personnel and resources required for implementation of the OSMP.	EPR4-MC1.1.1: Agreement in place for OSMP-implementation consultant. EPR-MC4.1.2: Capability testing conducted and recorded.
	EPR4-CM2: Review of agreement with third-party suppliers for provision of vessels.	EPR4-EPS2.1: Contracts in place to enable access to vessels needed for shoreline protection.	EPR4-MC2.1.1: Agreement in place for vessels which meets standard. EPR4-MC2.1.2: Capability testing conducted and recorded.
	EPR4-CM3: Response equipment.	EPR4-EPS3.1: Equipment is maintained in accordance with maintenance strategy. Equipment is available for deployment within 24 hours.	EPR4-MC3.1.1: Monthly reports (maintenance, inspection, and/or testing) with actions signed off by the appropriate level of operations management.
	EPR4-CM4: Agreement in place with AMOSC.	EPR4-EPS4.1: Contracts, agreements and memberships with AMOSC in place to provide oil spill response equipment and personnel.	EPR4-MC4.1.1: Contracts, agreements or membership certificates that demonstrate access to spill response equipment and personnel.
	EPR4-CM5: Annual assurance assessment of AMOSC capabilities.	EPR4-EPS5.1: Response capabilities maintained per AMOSC Service Level Statement.	EPR4-MC5.1.1: Annual assurance assessment report.
	EPR4-CM6: Personnel hiring agreements.	EPR4-EPS6.1: Agreements in place with labour hiring companies.	EPR4-MC6.1.1: Agreement documents with service provider.
	EPR4-CM7: Agreement with waste management contractor.	EPR4-EPS7.1: Contract in place for onshore waste management.	EPR4-MC7.1.1: Agreement documents with service provider.
	EPR4-CM8: Agreement with contractor for heavy plant equipment.	EPR4-EPS8.1: Agreement in place with contractor for heavy plant equipment. Equipment is available for deployment within 48 hours.	EPR4-MC8.1.1: Agreement documents with service provider. EPR4-MC8.1.2: Capability is demonstrated during test/drill and is documented in test/drill report.
EPR5-EPO1: Equipment and personnel to support oiled wildlife response are available when requested to monitor, evaluate and reduce environmental impact on fauna.	EPR5-CM1: Agreement in place with AMOSC.	EPR5-EPS1.1: Contracts, agreements and memberships with AMOSC in place to provide oiled wildlife response equipment and personnel.	EPR5-MC1.1.1: Contracts, agreements or membership certificates that demonstrate access to oiled wildlife response equipment and personnel.
	EPR5-CM2: Annual assurance assessment of AMOSC capabilities.	EPR5-EPS2.1: Response capabilities maintained per AMOSC Service Level Statement.	EPR5-MC2.1.1: Annual assurance assessment report.
	EPR5-CM3: Agreement in place with Oil Spill Response Limited.	EPR5-EPS3.1: Contracts, agreements and memberships with Oil Spill Response Limited in place to provide oiled wildlife response equipment for mobilisation to Melbourne within 72 hours.	EPR5-MC3.1.1: Contracts, agreements or membership certificates that demonstrate access to oiled wildlife response equipment and personnel.

EPO	Control	EPS	Measurement criteria
	EPR5-CM4: Esso/Allseas emergency preparedness and response (bridging document).	EPR5-EPS4.1: Team personnel are available for remote support within 12 hours and in country support within 72 hours.	EPR5-MC4.1.1: Capability is demonstrated and documented during test/drill or through list of assigned personnel for emergency response and relevant training records.
	EPR5-CM5: Agreement with waste management contractor.	EPR5-EPS5.1: Contract in place for onshore waste management. Equipment is available for deployment within 48 hours.	EPR5-MC5.1.1: Contract agreement with service provider.
EPR6-EPO1: Equipment and personnel to manage waste are available when requested to reduce secondary contamination impacts on shoreline environmental sensitivities	EPR6-CM1: Review of agreement with third-party suppliers for provision of vessels.	EPR6-EPS1.1: Contracts in place to enable access to vessels needed for waste management.	EPR6-MC1.1.1: Current agreement in place for vessels which meets standard. EPR6-MC1.1.2: Capability testing conducted and recorded.
	EPR6-CM2: Agreement in place with AMOSC.	EPR6-EPS2.1: Contracts, agreements and memberships with AMOSC in place to provide oil spill response equipment and personnel, and waste management resources.	EPR6-MC2.1.1: Contracts, agreements or membership certificates that demonstrate access to spill response equipment and personnel.
	EPR6-CM3: Assurance assessment of AMOSC capabilities.	EPR6-EPS3.1: Response capabilities maintained per AMOSC Service Level Statement.	EPR6-MC3.1.1: Annual assurance assessment report.
	EPR6-CM4: Agreement with waste management contractor.	EPR6-EPS4.1: Contract in place for onshore waste management.	EPR6-MC4.1.1: Agreement contract with service provider.
	EPR6-CM5: Personnel hiring agreements.	EPR6-EPS5.1: Agreements in place with labour hiring companies.	EPR6-MC5.1.1: Agreement documents with service provider.
	EPR6-CM6: Agreement with contractor for heavy plant equipment.	EPR6-EPS6.1: Agreement in place with contractor for heavy plant equipment. Equipment is available for deployment within 48 hours.	EPR6-MC6.1.1: Agreement documents with service provider.
