PMST results were compiled for the Project area (**Figure 1-2)** and the EMBA (**Figure 3-1**). The PMST results for the EMBA were obtained using shapefiles covering the scenarios informing the EMBA. The search tool only allows for a bounding area of 1 million km^2, therefore the PMST search results for each scenario informing the EMBA are made up of multiple individual PMST search results reports.

The PMST results for the Dorado Project include:

- The Project Area PMST (**Attachment 1-1)** report is based on the Dorado Project area shown in **Figure 1-2**.
- The EMBA (described in **Section 3.1.1** and presented in **Figure 3-1**) PMST report is inclusive of PMST search results for the Dorado LOWC scenario and the Future Tieback LOWC scenario (**Attachment 1-2)** . Some listed threatened species identified from the EMBA PMST results are not expected to occur in significant numbers in the marine and coastal environments due to their terrestrial distributions. Species that may occur on shorelines include shorebirds, but terrestrial mammals, reptiles (such as pythons) and bird species that do not have habitats along shorelines have been excluded from consideration. These species will not come into contact with any unplanned hydrocarbon spills and therefore are not included in the Description of Environment section (**Section 3**) of the OPP.

Attachment 1-1 PMST – Project Area

Australian Government

Department of Climate Change, Energy, the Environment and Water

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	1
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	20
Listed Migratory Species:	40

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	73
Whales and Other Cetaceans:	25
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	1
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	6
Key Ecological Features (Marine):	1
Biologically Important Areas:	10
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti		
Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat may occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Migratory Marine Species		

Scientific Name	Threatened Category	Presence Text
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Dugong dugon Dugong [28]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat may occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Listed Marine Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat may occur within area
Anous stolidus Common Noddy [825]		Species or species habitat may occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat may occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phoxocampus belcheri		
Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii		
Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis		
Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus		
Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus		
Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus		
Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris		
Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon		
Dugong [28]		Species or species habitat may occur within area
Reptile		
Acalyptophis peronii		
Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat may occur within area
Aipysurus duboisii		
Dubois' Seasnake [1116]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Species or species habitat known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Species or species habitat known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Species or species habitat likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Species or species habitat known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Congregation or aggregation known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks [Resource Information]

Park Name	Zone & IUCN Categories
Eighty Mile Beach	Multiple Use Zone (IUCN VI)

Westralia SPAN Marine Seismic Survey, WA & NT	2012/6463	Not Controlled Action (Particular Manner)	Post-Approval

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region

Name	Region
Ancient coastline at 125 m depth contour	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Marine Turtles		
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

AREA 1

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	17
Listed Migratory Species:	28

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	18
Whales and Other Cetaceans:	25
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	2
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	5
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Natator depressus		
Flatback Turtle [59257]	Vulnerable	Species or species habitat likely to occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks	[Resource Information]
Park Name	Zone & IUCN Categories
Christmas Island	National Park Zone (IUCN II)
Cocos (Keeling) Islands	National Park Zone (IUCN II)

Controlled action			
Nava-1 Cable System	2001/510	Controlled Action	Completed
Not controlled action			
INDIGO West Submarine Telecommunications Cable, WA	2017/8126	Not Controlled Action	Completed
Not controlled action (particular manner)			
Australia to Singapore Fibre Optic Submarine Cable System	2011/6127	Not Controlled Action (Particular Manner)	Post-Approval
INDIGO Marine Cable Route Survey (INDIGO)	2017/7996	Not Controlled Action (Particular Manner)	Post-Approval
Laying a submarine optical fibre telecommunications cable, Perth to Singapore and Jakarta	2014/7332	Not Controlled Action (Particular Manner)	Post-Approval

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda		
Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii		
Roseate Tern [817]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons		
Little Tern [82849]		Congregation or aggregation known to occur within area
Sula dactylatra		
Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster		
Brown Booby [1022]		Breeding known to occur within area
Sula sula		
Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata		
Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Foraging, feeding or related behaviour known to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Congregation or aggregation known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys sculptus Sculptured Pipefish [66197]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Cosmocampus maxweberi Maxweber's Pipefish [66209]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus baldwini Redstripe Pipefish [66718]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus macrorhynchus Whiskered Pipefish, Ornate Pipefish [66222]		Species or species habitat may occur within area
Halicampus mataafae Samoan Pipefish [66223]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys heptagonus Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippichthys spicifer Belly-barred Pipefish, Banded Freshwater Pipefish [66232]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus brevirostris thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus fuscus Dusky Seasnake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Chitulia inornata as Hydrophis inornatus Plain Seasnake [87379]		Species or species habitat may occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrophis atriceps Black-headed Seasnake [1101]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat may occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Commonwealth Reserves Terrestrial [Resource Information]

Name	State	Type
Christmas Island	EXT	National Park (Commonwealth)
Pulu Keeling	EXT	National Park (Commonwealth)

Australian Marine Parks [Resource Information]

Park Name	Zone & IUCN Categories
Christmas Island	Habitat Protection Zone (IUCN IV)
Cocos (Keeling) Islands	Habitat Protection Zone (IUCN IV)
Oceanic Shoals	Multiple Use Zone (IUCN VI)
Christmas Island	National Park Zone (IUCN II)
Cocos (Keeling) Islands	National Park Zone (IUCN II)
Oceanic Shoals	Special Purpose Zone (Trawl) (IUCN VI)

Habitat Critical to the Survival of Marine Turtles

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Sahul Shelf	North-west
Carbonate bank and terrace system of the Van Diemen Rise	North
Continental Slope Demersal Fish Communities	North-west
Pinnacles of the Bonaparte Basin	North-west
Pinnacles of the Bonaparte Basin	North

Biologically Important Areas

Scientific Name	Behaviour	Presence
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur

Scientific Name	Behaviour	Presence
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur

Scientific Name	Behaviour	Presence
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

AREA 3

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	5
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	47
Listed Migratory Species:	65

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	23
Commonwealth Heritage Places:	21
Listed Marine Species:	112
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	12
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	6
Regional Forest Agreements:	None
Nationally Important Wetlands:	1
EPBC Act Referrals:	139
Key Ecological Features (Marine):	9
Biologically Important Areas:	47
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Ashmore reef national nature reserve	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
EEZ and Territorial Sea
EEZ and Territorial Sea
Extended Continental Shelf
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat likely to occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Hypotaenidia philippensis andrewsi Buff-banded Rail (Cocos (Keeling) Islands), Ayam Hutan [88994]	Endangered	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Pterodroma arminjoniana Round Island Petrel, Trinidade Petrel [89284]	Critically Endangered	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat may occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Mesembriomys gouldii gouldii Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat may occur within area
Petrogale concinna monastria Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat likely to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		

Scientific Name	Threatened Category	Presence Text
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Anous minutus Black Noddy [824]		Breeding known to occur within area
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calonectris leucomelas		
Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica		
Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans		
Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae		
Silver Gull [82326]		Breeding known to occur within area
Fregata andrewsi		
Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Glareola maldivarum		
Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster		
White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area overfly marine area
Fish		

Scientific Name	Threatened Category	Presence Text
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys sculptus Sculptured Pipefish [66197]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus brevirostris thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Breeding known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus fuscus Dusky Seasnake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia inornata as Hydrophis inornatus Plain Seasnake [87379]		Species or species habitat may occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Seasnake [1101]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		

Current Scientific Name	Status	Type of Presence
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Carbonate bank and terrace system of the Sahul Shelf	North-west
Carbonate bank and terrace system of the Van Diemen Rise	North
Continental Slope Demersal Fish Communities	North-west
Pinnacles of the Bonaparte Basin	North-west
Pinnacles of the Bonaparte Basin	North
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Internesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Mating	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Likely to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

AREA 4

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	4
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	47
Listed Migratory Species:	63

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	7
Commonwealth Heritage Places:	3
Listed Marine Species:	107
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	8
Habitat Critical to the Survival of Marine Turtles:	3

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	16
Regional Forest Agreements:	None
Nationally Important Wetlands:	2
EPBC Act Referrals:	54
Key Ecological Features (Marine):	5
Biologically Important Areas:	54
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
EEZ and Territorial Sea
Extended Continental Shelf
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat likely to occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Polytelis alexandrae Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat known to occur within area
Pterodroma arminjoniana Round Island Petrel, Trinidade Petrel [89284]	Critically Endangered	Species or species habitat may occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Petrogale concinna monastria Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat known to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding likely to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat likely to occur within area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis		
Oriental Reed-Warbler [59570]		Species or species habitat may occur within area
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat may occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat likely to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area overfly marine area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour likely to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus fuscus Dusky Seasnake [1119]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Continental Slope Demersal Fish Communities	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur

Scientific Name	Behaviour	Presence
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging likely	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Migration likely	Known to occur
Dugong		
Dugong dugon Dugong [28]	Foraging	Likely to occur
Marine Turtles		
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Juvenile	Known to occur

Scientific Name	Behaviour	Presence
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Likely to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia

AREA 5

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	2
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	49
Listed Migratory Species:	81

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	79
Commonwealth Heritage Places:	3
Listed Marine Species:	135
Whales and Other Cetaceans:	30
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	7
Habitat Critical to the Survival of Marine Turtles:	2

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	23
Regional Forest Agreements:	None
Nationally Important Wetlands:	5
EPBC Act Referrals:	82
Key Ecological Features (Marine):	5
Biologically Important Areas:	55
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places		[Resource Information]
Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands)	[Resource Information]
Ramsar Site Name	Proximity
Eighty-mile beach	Within Ramsar site
Roebuck bay	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Polytelis alexandrae Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Species or species habitat may occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat may occur within area
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat known to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
PLANT		
Seringia exastia Fringed Fire-bush [88920]	Critically Endangered	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Liopholis kintorei		
Great Desert Skink, Tjakura, Warrarna, Mulyamiji [83160]	Vulnerable	Species or species habitat may occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat likely to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding likely to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula birostris as Manta birostris		
Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chalcites osculans as Chrysococcyx osculans		
Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus		
Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus		
Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus		
Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae		
Silver Gull [82326]		Breeding known to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat known to occur within area
Gallinago megala		
Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura		
Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum		
Oriental Pratincole [840]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting known to occur within area overfly marine area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		

Scientific Name	Threatened Category	Presence Text
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis macdowelli as Hydrophis mcdowelli		
Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii		
Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi		
Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Lepidochelys olivacea		
Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus		
Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Breeding known to occur within area

Current Scientific Name	Status	Type of Presence
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging likely	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Migration likely	Known to occur
Dugong		
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Migration likely	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Juvenile	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Juvenile	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Likely to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Likely to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Known to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Nursing	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		

Scientific Name	Behaviour	Presence
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Resting	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur

Scientific Name	Behaviour	Presence
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

- -Office of Environment and Heritage, New South Wales

AREA 6

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	2
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	57
Listed Migratory Species:	86

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	197
Commonwealth Heritage Places:	2
Listed Marine Species:	131
Whales and Other Cetaceans:	32
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	11
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	57
Regional Forest Agreements:	None
Nationally Important Wetlands:	7
EPBC Act Referrals:	292
Key Ecological Features (Marine):	6
Biologically Important Areas:	52
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
The Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Indigenous		
Dampier Archipelago (including Burrup Peninsula)	WA	Listed place
Natural		
The Ningaloo Coast	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Eighty-mile beach	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Great Knot [862]	Critically Endangered	Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
CRUSTACEAN		
Kumonga exleyi Cape Range Remipede [86875]	Vulnerable	Species or species habitat known to occur within area
FISH		
Milyeringa veritas Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isoodon auratus barrowensis Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes conspicillatus conspicillatus Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus Central Australian subspecies Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Osphranter robustus isabellinus Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pseudomys fieldi		
Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Minuria tridens		
Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama		
Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus zastictus		
Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lerista nevinae		
Nevin's Slider [85296]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Liasis olivaceus barroni		
Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat known to occur within area
Liopholis kintorei		
Great Desert Skink, Tjakura, Warrarna, Mulyamiji [83160]	Vulnerable	Species or species habitat may occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area overfly marine area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting known to occur within area overfly marine area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Breeding known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Habitat Critical to the Survival of Marine Turtles

Scientific Name	Behaviour	Presence
Aug - Sep		
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
Dec - Jan		
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Nov-Feb		
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Nov - May		
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur

EPBC Act Referrals

[Resource Information]

Title of referral	Reference	Referral Outcome	Assessment Status
Ashburton Infrastructure Project	2021/9064		Post-Approval
Balla Balla Export Facilities ? Design Variation	2022/09254		Assessment
Browse to North West Shelf Development, Indian Ocean, WA	2018/8319		Approval
North West Shelf Project Extension, Carnarvon Basin, WA	2018/8335		Approval
Optimised Mardie Solar Salt Project	2022/9169		Assessment
Project Highclere Cable Lay and Operation	2022/09203		Completed
Action clearly unacceptable			
Asian Renewable Energy Hub Revised Proposal, WA	2021/8891	Action Clearly Unacceptable	Completed
Highlands 3D Marine Seismic Survey	2012/6680	Action Clearly Unacceptable	Completed
Controlled action			
'Van Gogh' Petroleum Field Development	2007/3213	Controlled Action	Post-Approval
Additional Rail Infrastructure between Herb Elliott Port Facility and Cloudbreak Mine Site	2010/5513	Controlled Action	Post-Approval
Ammonium Nitrate Project	2010/5423	Controlled Action	Completed
Anketell Point Iron Ore Processing & Export Port	2009/5120	Controlled Action	Post-Approval
Asian Renewable Energy Hub, 220 km east of Port Hedland, Western Australia	2017/8112	Controlled Action	Post-Approval
Balmoral South Iron Ore Mine	2008/4236	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Binowee Iron Ore Project	2001/366	Controlled Action	Proposed Decision
Burrup North East Sand Mining Project	2008/4611	Controlled Action	Completed
Cape Lambert Port B Development	2008/4032	Controlled Action	Post-Approval
Construct and operate LNG & domestic gas plant including onshore and offshore facilities - Wheatston	2008/4469	Controlled Action	Post-Approval
Construction and operation of a Solar Salt Project, SW Onslow, WA	2016/7793	Controlled Action	Assessment Approach
Develop Jansz-Io deepwater gas field in Permit Areas WA-18-R, WA-25-R and WA-26-	2005/2184	Controlled Action	Post-Approval
Development of Angel gas and condensate field, North West Shelf	2004/1805	Controlled Action	Post-Approval
Development of an iron ore mine and associated infrastructure	2010/5630	Controlled Action	Assessment Approach
Development of Browse Basin Gas Fields (Upstream)	2008/4111	Controlled Action	Completed
Development of Coniston/Novara fields within the Exmouth Sub-basin	2011/5995	Controlled Action	Post-Approval
Development of Stybarrow petroleum field incl drilling and facility installation	2004/1469	Controlled Action	Post-Approval
Duplication of the Dampier Highway Stages 2 & 6	2010/5419	Controlled Action	Post-Approval
Echo-Yodel Production Wells	2000/11	Controlled Action	Post-Approval
Enfield full field development	2001/257	Controlled Action	Post-Approval
Equus Gas Fields Development Project, Carnarvon Basin	2012/6301	Controlled Action	Completed
Eramurra Industrial Salt Project	2021/9027	Controlled Action	Assessment Approach
Eramurra Industrial Salt Project, near Karratha, WA	2019/8448	Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur

Scientific Name	Behaviour	Presence
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Likely to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Nursing	Known to occur

Scientific Name	Behaviour	Presence
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Scientific Name	Behaviour	Presence
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia
-Department of Land and Resource Management, Northern Territory

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	2
National Heritage Places:	4
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	62
Listed Migratory Species:	76

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	19
Commonwealth Heritage Places:	2
Listed Marine Species:	106
Whales and Other Cetaceans:	32
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	9
Habitat Critical to the Survival of Marine Turtles:	2

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	25
Regional Forest Agreements:	None
Nationally Important Wetlands:	4
EPBC Act Referrals:	38
Key Ecological Features (Marine):	3
Biologically Important Areas:	22
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Shark Bay, Western Australia	WA	Declared property
The Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
HMAS Sydney II and HSK Kormoran Shipwreck Sites	EXT	Listed place
Dirk Hartog Landing Site 1616 - Cape Inscription Area	WA	Listed place
Natural		
Shark Bay, Western Australia	WA	Listed place
The Ningaloo Coast	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Malurus leucopterus leucopterus White-winged Fairy-wren (Dirk Hartog Island), Dirk Hartog Black-and-White Fairy-wren [26004]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur lesueur		
Burrowing Bettong (Shark Bay), Boodie [66659]	Vulnerable	Species or species habitat known to occur within area
Bettongia penicillata ogilbyi		
Woylie [66844]	Endangered	Species or species habitat known to occur within area
Dasyurus geoffroii		
Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Lagorchestes hirsutus bernieri Rufous Hare-wallaby (Bernier Island) [66662]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus dorreae Rufous Hare-wallaby (Dorre Island) [66663]	Vulnerable	Species or species habitat known to occur within area
Lagostrophus fasciatus fasciatus Banded Hare-wallaby, Merrnine, Marnine, Munning [66664]	Vulnerable	Species or species habitat known to occur within area
Leporillus conditor Wopilkara, Greater Stick-nest Rat [137]	Vulnerable	Translocated population known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Translocated population known to occur within area
Perameles bougainville listed as Perameles bougainville bougainville Shark Bay Bandicoot [278]	Endangered	Species or species habitat known to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat likely to occur within area
Pseudomys fieldi Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form) Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat may occur within area
PLANT		

Scientific Name	Threatened Category	Presence Text
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat may occur within area
Eucalyptus beardiana Beard's Mallee [18933]	Vulnerable	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus zastictus Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		

Scientific Name	Threatened Category	Presence Text
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Centrophorus zeehaani		
Southern Dogfish, Endeavour Dogfish, Little Gulper Shark [82679]	Conservation Dependent	Species or species habitat likely to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area
SPIDER		
Idiosoma nigrum		
Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Congregation or aggregation known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula birostris as Manta birostris		
Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca		
Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus		
Sperm Whale [59]		Species or species habitat may occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris alba		
Sanderling [875]		Roosting known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis		
Red-necked Stint [860]		Roosting known to occur within area
Calidris tenuirostris		
Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State
Defence	
Defence - CARNARVON TRAINING DEPOT [50235]	WA

Ningaloo Marine Area - Commonwealth Waters	WA	Listed place

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Foraging, feeding or related behaviour known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius skua as Catharacta skua		
Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii		
Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis		
Fairy Tern [82949]		Breeding known to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis		
Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii		
Greater Crested Tern [83000]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solenostomus cyanopterus		
Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Stigmatopora argus		
Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Syngnathoides biaculeatus		
Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus		
Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris		
Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon		
Dugong [28]		Breeding known to occur within area
Reptile		
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama		
Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus laevis		
Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus pooleorum		
Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Congregation or aggregation known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks [Resource Information]

Park Name	Zone & IUCN Categories
Abrolhos	Habitat Protection Zone (IUCN IV)
Carnarvon Canyon	Habitat Protection Zone (IUCN IV)
Gascoyne	Habitat Protection Zone (IUCN IV)

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Commonwealth waters adjacent to Ningaloo Reef	North-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Migration	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Internesting	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

AREA 8

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	3
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	3
Listed Threatened Species:	82
Listed Migratory Species:	62

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	28
Commonwealth Heritage Places:	1
Listed Marine Species:	102
Whales and Other Cetaceans:	36
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	9
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	39
Regional Forest Agreements:	None
Nationally Important Wetlands:	3
EPBC Act Referrals:	52
Key Ecological Features (Marine):	6
Biologically Important Areas:	25
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Shark Bay, Western Australia	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos	WA	Listed place
Natural		
Lesueur National Park	WA	Listed place
Shark Bay, Western Australia	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community may occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Turnix varius scintillans		
Painted Button-quail (Houtman Abrolhos) [82451]	Vulnerable	Species or species habitat known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris		
Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Species or species habitat known to occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia penicillata ogilbyi		
Woylie [66844]	Endangered	Species or species habitat known to occur within area
Dasyurus geoffroii		
Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area
Eubalaena australis		
Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat known to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
PLANT		
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area
Androcalva bivillosa Straggling Androcalva [87807]	Critically Endangered	Species or species habitat likely to occur within area
Anigozanthos viridis subsp. terraspectans Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat may occur within area
Beyeria lepidopetala Small-petalled Beyeria, Short-petalled Beyeria [18362]	Endangered	Species or species habitat likely to occur within area
Caladenia barbarella Small Dragon Orchid, Common Dragon Orchid [68686]	Endangered	Species or species habitat may occur within area
Caladenia bryceana subsp. cracens Northern Dwarf Spider-orchid [64556]	Vulnerable	Species or species habitat known to occur within area
Caladenia elegans Elegant Spider-orchid [56775]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii Sandplain Duck Orchid [87944]	Endangered	Species or species habitat likely to occur within area
Chorizema humile Prostrate Flame Pea [32573]	Endangered	Species or species habitat likely to occur within area
Conostylis dielsii subsp. teres Irwin's Conostylis [3614]	Endangered	Species or species habitat may occur within area
Conostylis micrantha Small-flowered Conostylis [17635]	Endangered	Species or species habitat may occur within area
Diuris drummondii Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat may occur within area
Drakaea concolor Kneeling Hammer-orchid [56777]	Vulnerable	Species or species habitat known to occur within area
Drummondita ericoides Morseby Range Drummondita [9193]	Endangered	Species or species habitat known to occur within area
Eucalyptus argutifolia Yanchep Mallee, Wabling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
Eucalyptus beardiana Beard's Mallee [18933]	Vulnerable	Species or species habitat may occur within area
Eucalyptus cuprea Mallee Box [56773]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Grevillea batrachioides Mt Lesueur Grevillea [21735]	Endangered	Species or species habitat may occur within area
Grevillea bracteosa subsp. howatharra [85002]	Critically Endangered	Species or species habitat likely to occur within area
Grevillea humifusa Spreading Grevillea [61182]	Endangered	Species or species habitat may occur within area
Hemiandra gardneri Red Snakebush [7945]	Endangered	Species or species habitat likely to occur within area
Hypocalymma angustifolium subsp. Hutt River (S.Patrick 2982) [85023]	Endangered	Species or species habitat known to occur within area
Hypocalymma longifolium Long-leaved Myrtle [8081]	Vulnerable	Species or species habitat likely to occur within area
Lechenaultia chlorantha Kalbarri Leschenaultia [16763]	Vulnerable	Species or species habitat known to occur within area
Leucopogon marginatus Thick-margined Leucopogon [12527]	Endangered	Species or species habitat known to occur within area
Leucopogon obtectus Hidden Beard-heath [19614]	Endangered	Species or species habitat may occur within area
Pterostylis sinuata Northampton Midget Greenhood, Western Swan Greenhood [84991]	Endangered	Species or species habitat known to occur within area
Stachystemon nematophorus Three-flowered Stachystemon [81447]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Tetratheca nephelioides [83217]	Critically Endangered	Species or species habitat may occur within area
Thelymitra stellata Star Sun-orchid [7060]	Endangered	Species or species habitat likely to occur within area
Wurmbea tubulosa Long-flowered Nancy [12739]	Endangered	Species or species habitat known to occur within area
REPTILE		
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ctenotus lancelini Lancelin Island Skink [1482]	Vulnerable	Translocated population known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat may occur within area
Liopholis pulchra longicauda Jurien Bay Skink, Jurien Bay Rock-skink [83162]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus zeehaani		
Southern Dogfish, Endeavour Dogfish, Little Gulper Shark [82679]	Conservation Dependent	Species or species habitat likely to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area
SPIDER		
Idiosoma nigrum		
Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Species or species habitat may occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

Migratory Terrestrial Species

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris alba Sanderling [875]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area
Calidris ruficollis Red-necked Stint [860]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat may occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area
Pterodroma macroptera Great-winged Petrel [1035]		Foraging, feeding or related behaviour known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Puffinus huttoni Hutton's Shearwater [1025]		Foraging, feeding or related behaviour known to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius skua as Catharacta skua Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Mammal		

Scientific Name	Threatened Category	Presence Text
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Reptile		
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 90-120m depth	South-west
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Seabirds		
Anous stolidus Common Noddy [825]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Anous stolidus Common Noddy [825]	Foraging (provisioning young)	Known to occur
Anous tenuirorstris melanops Australian Lesser Noddy [26000]	Foraging (provisioning young)	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Known to occur
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sterna dougallii Roseate Tern [817]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging (provisioning young)	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

AREA 9

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	1
Wetlands of International Importance (Ramsar	4
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	15
Listed Threatened Species:	130
Listed Migratory Species:	81

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	327
Commonwealth Heritage Places:	6
Listed Marine Species:	117
Whales and Other Cetaceans:	39
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	23
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	141
Regional Forest Agreements:	1
Nationally Important Wetlands:	16
EPBC Act Referrals:	316
Key Ecological Features (Marine):	8
Biologically Important Areas:	33
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Australian Convict Sites (Fremantle Prison)	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Fremantle Prison (former)	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Becher point wetlands	Within Ramsar site
Forrestdale and thomsons lakes	Within 10km of Ramsar site
Peel-yalgorup system	Within Ramsar site
Vasse-wonnerup system	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 1 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community 2 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 3 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community 4 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community in Caves of the Swan Coastal Plain	Endangered	Community known to occur within area
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area
Clay Pans of the Swan Coastal Plain	Critically Endangered	Community likely to occur within area
Corymbia calophylla - Xanthorrhoea preissii woodlands and shrublands of the Swan Coastal Plain	Endangered	Community known to occur within area
Scott River Ironstone Association	Endangered	Community likely to occur within area
Sedgelands in Holocene dune swales of the southern Swan Coastal Plain	Endangered	Community known to occur within area
Shrublands on southern Swan Coastal Plain ironstones	Endangered	Community likely to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Thrombolite (microbial) community of coastal freshwater lakes of the Swan Coastal Plain (Lake Richmond)	Endangered	Community known to occur within area
Thrombolite (microbialite) Community of a Coastal Brackish Lake (Lake Clifton)	Critically Endangered	Community known to occur within area
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Calyptorhynchus banksii naso Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat may occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis		
Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Rostratula australis		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Sternula nereis nereis		
Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Zanda baudinii listed as Calyptorhynchus baudinii		
Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Breeding known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris		
Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area
CRUSTACEAN		
Cherax tenuimanus		
Hairy Marron, Margaret River Hairy Marron, Margaret River Marron [78931]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Engaewa pseudoreducta		
Margaret River Burrowing Crayfish [82674]	Critically Endangered	Species or species habitat known to occur within area
Engaewa reducta		
Dunsborough Burrowing Crayfish [82675]	Critically Endangered	Species or species habitat known to occur within area
FISH		
Galaxiella nigrostriata		
Blackstriped Dwarf Galaxias, Black-stripe Minnow [88677]	Endangered	Species or species habitat known to occur within area
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannatherina balstoni		
Balston's Pygmy Perch [66698]	Vulnerable	Species or species habitat known to occur within area
Nannoperca pygmaea		
Little Pygmy Perch [88315]	Endangered	Species or species habitat known to occur within area
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
FROG		
Anstisia alba listed as Geocrinia alba		
White-bellied Frog, Creek Frog [92544]	Critically Endangered	Species or species habitat known to occur within area
Anstisia vitellina listed as Geocrinia vitellina		
Orange-bellied Frog [92547]	Vulnerable	Species or species habitat likely to occur within area
INSECT		
Hesperocolletes douglasi		
Douglas' Broad-headed Bee, Rottnest Bee [66734]	Critically Endangered	Species or species habitat may occur within area
MAMMAL		

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat known to occur within area
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat may occur within area
Pseudocheirus occidentalis Western Ringtail Possum, Ngwayir, Womp, Woder, Ngoor, Ngoolangit [25911]	Critically Endangered	Breeding known to occur within area
Setonix brachyurus Quokka [229]	Vulnerable	Species or species habitat known to occur within area
OTHER		

Scientific Name	Threatened Category	Presence Text
Westralunio carteri Carter's Freshwater Mussel, Freshwater Mussel [86266]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat likely to occur within area
Anigozanthos viridis subsp. terraspectans Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat likely to occur within area
Austrostipa bronweniae listed as Austrostipa bronwenae [92773]	Endangered	Species or species habitat known to occur within area
Austrostipa jacobsiana [87809]	Critically Endangered	Species or species habitat known to occur within area
Banksia mimica Summer Honeypot [82765]	Endangered	Species or species habitat likely to occur within area
Banksia nivea subsp. uliginosa Swamp Honeypot [82766]	Endangered	Species or species habitat known to occur within area
Banksia squarrosa subsp. argillacea Whicher Range Dryandra [82769]	Vulnerable	Species or species habitat known to occur within area
Banksia verticillata Granite Banksia, Albany Banksia, River Banksia [8333]	Vulnerable	Species or species habitat likely to occur within area
Boronia exilis Scott River Boronia [64844]	Endangered	Species or species habitat known to occur within area
Brachyscias verecundus Ironstone Brachyscias [81321]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Caladenia busselliana Bussell's Spider-orchid [24369]	Endangered	Species or species habitat known to occur within area
Caladenia caesarea subsp. maritima Cape Spider-orchid [64856]	Endangered	Species or species habitat known to occur within area
Caladenia excelsa Giant Spider-orchid [56717]	Endangered	Species or species habitat likely to occur within area
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat likely to occur within area
Caladenia huegelii King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid [7309]	Endangered	Species or species habitat known to occur within area
Caladenia lodgeana Lodge's Spider-orchid [68664]	Critically Endangered	Species or species habitat known to occur within area
Caladenia procera Carbunup King Spider Orchid [68679]	Critically Endangered	Species or species habitat known to occur within area
Caladenia viridescens Dunsborough Spider-orchid [56776]	Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii Sandplain Duck Orchid [87944]	Endangered	Species or species habitat may occur within area
Calectasia cyanea Blue Tinsel Lily [7669]	Critically Endangered	Species or species habitat may occur within area
Chamelaucium lullfitzii listed as Chamelaucium sp. Gingin (N.G.Marchant 6) Gingin Wax [92777]	Endangered (listed as Chamelaucium sp. Gingin	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Chamelaucium sp. S coastal plain (R.D.Royce 4872)		
Royce's Waxflower [87814]	Vulnerable	Species or species habitat known to occur within area
Chorizema varium		
Limestone Pea [16981]	Endangered	Species or species habitat known to occur within area
Darwinia ferricola		
Scott River Darwinia [56706]	Endangered	Species or species habitat known to occur within area
Darwinia whicherensis		
Abba Bell [83193]	Endangered	Species or species habitat likely to occur within area
Daviesia elongata subsp. elongata		
Long-leaved Daviesia [64883]	Vulnerable	Species or species habitat known to occur within area
Diuris drummondii		
Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat known to occur within area
Diuris micrantha		
Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat known to occur within area
Diuris purdiei		
Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat known to occur within area
Drakaea elastica		
Glossy-leafed Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat known to occur within area
Drakaea micrantha		
Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat known to occur within area
Eleocharis keigheryi		
Keighery's Eleocharis [64893]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eucalyptus argutifolia Yanchep Mallee, Wabling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
Eucalyptus x phylacis Meelup Mallee [87817]	Endangered	Species or species habitat known to occur within area
Gastrolobium argyrotrichum Metricup Pea [89145]	Critically Endangered	Species or species habitat known to occur within area
Gastrolobium modestum Broad-leaved Gastrolobium [78361]	Vulnerable	Species or species habitat known to occur within area
Gastrolobium papilio Butterfly-leaved Gastrolobium [78415]	Endangered	Species or species habitat may occur within area
Grevillea brachystylis subsp. australis [55525]	Vulnerable	Species or species habitat likely to occur within area
Grevillea brachystylis subsp. grandis Large-flowered Short-styled Grevillea [85001]	Critically Endangered	Species or species habitat known to occur within area
Grevillea elongata Ironstone Grevillea [64578]	Vulnerable	Species or species habitat likely to occur within area
Grevillea maccutcheonii McCutcheon's Grevillea [64522]	Endangered	Species or species habitat known to occur within area
Hemiandra gardneri Red Snakebush [7945]	Endangered	Species or species habitat may occur within area
Kennedia glabrata Northcliffe Kennedia [16452]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Kennedia lateritia Augusta Kennedia [45985]	Endangered	Species or species habitat likely to occur within area
Lambertia echinata subsp. occidentalis Western Prickly Honeysuckle [64528]	Endangered	Species or species habitat likely to occur within area
Lambertia orbifolia Roundleaf Honeysuckle [15725]	Endangered	Species or species habitat known to occur within area
Leptomeria dielsiana Diels' Currant Bush [5146]	Vulnerable	Species or species habitat known to occur within area
Macarthuria keigheryi Keighery's Macarthuria [64930]	Endangered	Species or species habitat may occur within area
Marianthus paralius [83925]	Endangered	Species or species habitat known to occur within area
Melaleuca sp. Wanneroo (G.J. Keighery 16705) [89456]	Endangered	Species or species habitat known to occur within area
Morelotia australiensis listed as Tetraria australiensis Southern Tetraria [92784]	Vulnerable	Species or species habitat known to occur within area
Petrophile latericola Laterite Petrophile [64532]	Endangered	Species or species habitat likely to occur within area
Reedia spathacea Reedia [2995]	Critically Endangered	Species or species habitat known to occur within area
Synaphea sp. Fairbridge Farm (D. Papenfus 696) Selena's Synaphea [82881]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Synaphea sp. Pinjarra Plain (A.S. George 17182) [86878]	Endangered	Species or species habitat known to occur within area
Synaphea sp. Serpentine (G.R. Brand 103) [86879]	Critically Endangered	Species or species habitat known to occur within area
Synaphea stenoloba Dwellingup Synaphea [66311]	Endangered	Species or species habitat known to occur within area
Verticordia densiflora var. pedunculata Long-stalked Featherflower [55689]	Endangered	Species or species habitat known to occur within area
Verticordia plumosa var. ananeotes Tufted Plumed Featherflower [23871]	Endangered	Species or species habitat known to occur within area
Verticordia plumosa var. vassensis Vasse Featherflower [55804]	Endangered	Species or species habitat known to occur within area
Wurmbea calcicola Naturaliste Nancy [64691]	Endangered	Species or species habitat known to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ctenotus lancelini Lancelin Island Skink [1482]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia		
Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat may occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus zeehaani		
Southern Dogfish, Endeavour Dogfish, Little Gulper Shark [82679]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus		
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat may occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		

Scientific Name	Threatened Category	Presence Text
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardenna grisea Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area

Migratory Marine Species

Scientific Name	Threatened Category	Presence Text
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Foraging, feeding or related behaviour known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Migratory Terrestrial Species		
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba		
Sanderling [875]		Roosting known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis		
Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta		
Long-toed Stint [861]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Species or species habitat may occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area overfly marine area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius skua as Catharacta skua Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Reptile		
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Foraging, feeding or related behaviour known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 90-120m depth	South-west
Cape Mentelle upwelling	South-west
Commonwealth marine environment within and adjacent to Geographe Bay	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Naturaliste Plateau	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west

Name	Region
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Seabirds		
Anous stolidus Common Noddy [825]	Foraging	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Aggregation	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Foraging (in high numbers)	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging (provisioning young)	Known to occur
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Former Range
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Known to occur
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging (in high numbers)	Known to occur
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (abundant food source)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (high density)	Known to occur

Scientific Name	Behaviour	Presence
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (on migration)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging Area (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Eubalaena australis Southern Right Whale [40]	Calving buffer	Known to occur
Eubalaena australis Southern Right Whale [40]	Seasonal calving habitat	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (south)	Known to occur
Physeter macrocephalus Sperm Whale [59]	Foraging (abundant food source)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

- -Office of Environment and Heritage, New South Wales

AREA 1

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	3
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	5
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	38
Listed Migratory Species:	46

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	85
Commonwealth Heritage Places:	11
Listed Marine Species:	92
Whales and Other Cetaceans:	28
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	1
Australian Marine Parks:	3
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	2
EPBC Act Referrals:	102
Key Ecological Features (Marine):	2
Biologically Important Areas:	19
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Ashmore reef national nature reserve	Within 10km of Ramsar site
Hosnies spring	Within Ramsar site
The dales	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
EEZ and Territorial Sea
Extended Continental Shelf
Extended Continental Shelf
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Accipiter hiogaster natalis		
Christmas Island Goshawk [82408]	Endangered	Species or species habitat known to occur within area
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Chalcophaps indica natalis		
Christmas Island Emerald Dove, Emerald Dove (Christmas Island) [67030]	Endangered	Species or species habitat known to occur within area
Fregata andrewsi		
Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Ninox natalis		
Christmas Island Hawk-Owl, Christmas Boobook [66671]	Vulnerable	Species or species habitat known to occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area
Papasula abbotti		
Abbott's Booby [59297]	Endangered	Species or species habitat known to occur within area
Phaethon lepturus fulvus		
Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat known to occur within area
Turdus poliocephalus erythropleurus		
Christmas Island Thrush [67122]	Endangered	Species or species habitat likely to occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Crocidura trichura Christmas Island Shrew [86568]	Critically Endangered	Species or species habitat likely to occur within area
Pteropus natalis Christmas Island Flying-fox, Christmas Island Fruit-bat [87611]	Critically Endangered	Species or species habitat known to occur within area
PLANT		
Asplenium listeri Christmas Island Spleenwort [65865]	Critically Endangered	Species or species habitat known to occur within area
Pneumatopteris truncata fern [68812]	Critically Endangered	Species or species habitat known to occur within area
Tectaria devexa [14767]	Endangered	Species or species habitat likely to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Cryptoblepharus egeriae Christmas Island Blue-tailed Skink, Blue-tailed Snake-eyed Skink [1526]	Critically Endangered	Species or species habitat likely to occur within area
Cyrtodactylus sadleiri Christmas Island Giant Gecko [86865]	Endangered	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Lepidodactylus listeri Christmas Island Gecko, Lister's Gecko [1711]	Critically Endangered	Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ramphotyphlops exocoeti Christmas Island Blind Snake, Christmas Island Pink Blind Snake [1262]	Vulnerable	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Foraging, feeding or related behaviour known to occur within area
Calonectris leucomelas		
Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata andrewsi		
Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Breeding known to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Foraging, feeding or related behaviour likely to occur within area
Sternula albifrons Little Tern [82849]		Congregation or aggregation known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat may occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat may occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat may occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus macrorhynchus Whiskered Pipefish, Ornate Pipefish [66222]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus mataafae Samoan Pipefish [66223]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys heptagonus Madura Pipefish, Reticulated Freshwater Pipefish [66229]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippichthys spicifer Belly-barred Pipefish, Banded Freshwater Pipefish [66232]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Micrognathus brevirostris thorntail Pipefish, Thorn-tailed Pipefish [66254]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus fuscus Dusky Seasnake [1119]		Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrophis atriceps Black-headed Seasnake [1101]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat may occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat may occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Sahul Shelf	North-west
Continental Slope Demersal Fish Communities	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur

Scientific Name	Behaviour	Presence
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		

Scientific Name	Behaviour	Presence
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	4
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	45
Listed Migratory Species:	66

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	3
Commonwealth Heritage Places:	2
Listed Marine Species:	108
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	10
Habitat Critical to the Survival of Marine Turtles:	2

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	10
Regional Forest Agreements:	None
Nationally Important Wetlands:	1
EPBC Act Referrals:	113
Key Ecological Features (Marine):	6
Biologically Important Areas:	51
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places		[Resource Information]
Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands)	[Resource Information]
Ramsar Site Name	Proximity
Ashmore reef national nature reserve	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
EEZ and Territorial Sea
Extended Continental Shelf
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat likely to occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
FISH		
Thunnus maccoyii Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Mesembriomys gouldii gouldii		
Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat may occur within area
Petrogale concinna monastria		
Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis		
Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat likely to occur within area
Saccolaimus saccolaimus nudicluniatus		
Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Trichosurus vulpecula arnhemensis		
Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
Xeromys myoides		
Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
REPTILE		
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama		
Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		

Scientific Name	Threatened Category	Presence Text
Anous stolidus Common Noddy [825]		Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata andrewsi Christmas Island Frigatebird, Andrew's Frigatebird [1011]	Endangered	Foraging, feeding or related behaviour known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis		
Oriental Reed-Warbler [59570]		Species or species habitat known to occur within area
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State

Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus		
Bridled Tern [82845]		Breeding known to occur within area
Pandion haliaetus		
Osprey [952]		Breeding known to occur within area
Papasula abbotti		
Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus		
Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda		
Red-tailed Tropicbird [994]		Breeding known to occur within area
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area
Sterna dougallii		
Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]		Breeding known to occur within area
Sula dactylatra		
Masked Booby [1021]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area overfly marine area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trachyrhamphus bicoarctatus		
Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris		
Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon		
Dugong [28]		Breeding known to occur within area
Reptile		
Acalyptophis peronii		
Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii		
Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii		
Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama		
Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area
Aipysurus fuscus		
Dusky Seasnake [1119]		Species or species habitat known to occur within area
Aipysurus laevis		
Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis		
Brown-lined Seasnake [1121]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Seasnake [1101]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma coggeri as Hydrophis coggeri Black-headed Sea Snake, Slender-necked Seasnake [87373]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Foraging, feeding or related behaviour known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks [Resource Information]

Park Name	Zone & IUCN Categories
Kimberley	Habitat Protection Zone (IUCN IV)
Argo-Rowley Terrace	Multiple Use Zone (IUCN VI)
Kimberley	Multiple Use Zone (IUCN VI)
Oceanic Shoals	Multiple Use Zone (IUCN VI)
Argo-Rowley Terrace	National Park Zone (IUCN II)
Christmas Island	National Park Zone (IUCN II)
Kimberley	National Park Zone (IUCN II)

Key Ecological Features

[Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	North-west
Canyons linking the Argo Abyssal Plain with the Scott Plateau	North-west
Carbonate bank and terrace system of the Sahul Shelf	North-west
Continental Slope Demersal Fish Communities	North-west
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Significant habitat - unknown behaviour	Likely to occur
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density	Known to occur

Scientific Name	Behaviour	Presence
	seagrass beds)	
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Likely to occur
Chelonia mydas Green Turtle [1765]	Mating	Likely to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Likely to occur

Scientific Name	Behaviour	Presence
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

AREA 3

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	1
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	1
Listed Threatened Species:	50
Listed Migratory Species:	83

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	47
Commonwealth Heritage Places:	2
Listed Marine Species:	132
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	10
Habitat Critical to the Survival of Marine Turtles:	3

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	32
Regional Forest Agreements:	None
Nationally Important Wetlands:	5
EPBC Act Referrals:	61
Key Ecological Features (Marine):	4
Biologically Important Areas:	57
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

National Heritage Places [Resource Information]

Name	State	Legal Status
Natural		
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Roebuck bay	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	Endangered	Community likely to occur within area

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Erythrura gouldiae Gouldian Finch [413]	Endangered	Species or species habitat known to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii blaauwi Partridge Pigeon (western) [66501]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pezoporus occidentalis		
Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus		
Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Polytelis alexandrae		
Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat known to occur within area
Rostratula australis		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Tyto novaehollandiae kimberli		
Masked Owl (northern) [26048]	Vulnerable	Species or species habitat may occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Conilurus penicillatus		
Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus hallucatus		
Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Isoodon auratus auratus Golden Bandicoot (mainland) [66665]	Vulnerable	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Petrogale concinna monastria Nabarlek (Kimberley) [87607]	Endangered	Species or species habitat known to occur within area
Phascogale tapoatafa kimberleyensis Kimberley brush-tailed phascogale, Brush-tailed Phascogale (Kimberley) [88453]	Vulnerable	Species or species habitat likely to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat known to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat may occur within area
PLANT		
Seringia exastia Fringed Fire-bush [88920]	Critically Endangered	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Liopholis kintorei Great Desert Skink, Tjakura, Warrarna, Mulyamiji [83160]	Vulnerable	Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Breeding likely to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Sula sula Red-footed Booby [1023]		Breeding known to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Cecropis daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area
Cuculus optatus Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat may occur within area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat known to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat known to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Breeding known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Rhipidura rufifrons		
Rufous Fantail [592]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Sterna dougallii		
Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis		
Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella		
Australian Pratincole [818]		Species or species habitat known to occur within area overfly marine area
Sula dactylatra		
Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster		
Brown Booby [1022]		Breeding known to occur within area
Sula sula		
Red-footed Booby [1023]		Breeding known to occur within area
Thalasseus bengalensis as Sterna bengalensis		
Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii		
Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes		
Grey-tailed Tattler [851]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Foraging, feeding or related behaviour known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Aipysurus laevis		
Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis		
Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii		
Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus		
Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Crocodylus johnstoni		
Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus		
Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Disteira kingii		
Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major		
Olive-headed Seasnake [1124]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Enhydrina schistosa Beaked Seasnake [1126]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Congregation or aggregation known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Pelamis platurus		
Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis		
Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata		
Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus		
Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus		
Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus		
Longman's Beaked Whale [72]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Breeding known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Breeding known to occur within area

Current Scientific Name	Status	Type of Presence
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Breeding	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Calving	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging (high density prey)	Known to occur

Scientific Name	Behaviour	Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Foraging likely	Known to occur
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Resting	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Breeding	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Calving	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging	Likely to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Known to occur
Sousa chinensis Indo-Pacific Humpback Dolphin [50]	Foraging (high density prey)	Likely to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Breeding	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Calving	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Foraging likely	Known to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Migration likely	Known to occur
Dugong		

Scientific Name	Behaviour	Presence
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Migration likely	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Pristis clavata Dwarf Sawfish [68447]	Juvenile	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Juvenile	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Nursing	Likely to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Known to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Fregata minor Greater Frigatebird [1013]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sternula albifrons sinensis Little Tern [82850]	Resting	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Sula sula Red-footed Booby [1023]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Calving	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Nursing	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia
-Department of Land and Resource Management, Northern Territory

AREA 4

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	3
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	59
Listed Migratory Species:	86

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	110
Commonwealth Heritage Places:	2
Listed Marine Species:	132
Whales and Other Cetaceans:	32
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	12
Habitat Critical to the Survival of Marine Turtles:	4

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	58
Regional Forest Agreements:	None
Nationally Important Wetlands:	7
EPBC Act Referrals:	298
Key Ecological Features (Marine):	6
Biologically Important Areas:	55
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
The Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Indigenous		
Dampier Archipelago (including Burrup Peninsula)	WA	Listed place
Natural		
The Ningaloo Coast	WA	Listed place
The West Kimberley	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Eighty-mile beach	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Malurus leucopterus edouardi White-winged Fairy-wren (Barrow Island), Barrow Island Black-and-white Fairy-wren [26194]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Polytelis alexandrae		
Princess Parrot, Alexandra's Parrot [758]	Vulnerable	Species or species habitat known to occur within area
Pterodroma mollis		
Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis		
Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Sternula nereis nereis		
Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
CRUSTACEAN		
Kumonga exleyi		
Cape Range Remipede [86875]	Vulnerable	Species or species habitat known to occur within area
FISH		
Milyeringa veritas		
Cape Range Cave Gudgeon, Blind Gudgeon [66676]	Vulnerable	Species or species habitat known to occur within area
Ophisternon candidum		
Blind Cave Eel [66678]	Vulnerable	Species or species habitat known to occur within area
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Breeding known to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia lesueur Barrow and Boodie Islands subspecies Boodie, Burrowing Bettong (Barrow and Boodie Islands) [88021]	Vulnerable	Species or species habitat known to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isoodon auratus barrowensis Golden Bandicoot (Barrow Island) [66666]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes conspicillatus conspicillatus Spectacled Hare-wallaby (Barrow Island) [66661]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus Central Australian subspecies Mala, Rufous Hare-Wallaby (Central Australia) [88019]	Endangered	Translocated population known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat known to occur within area
Macrotis lagotis Greater Bilby [282]	Vulnerable	Species or species habitat known to occur within area
Osphranter robustus isabellinus Barrow Island Wallaroo, Barrow Island Euro [89262]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Petrogale lateralis lateralis		
Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat known to occur within area
Saccolaimus saccolaimus nudicluniatus		
Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat may occur within area
Trichosurus vulpecula arnhemensis		
Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat may occur within area
PLANT		
Minuria tridens		
Minnie Daisy [13753]	Vulnerable	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis		
Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus foliosquama		
Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta		
Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas		
Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Ctenotus zastictus		
Hamelin Ctenotus [25570]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea		
Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Lerista nevinae Nevin's Slider [85296]	Endangered	Species or species habitat known to occur within area
Liasis olivaceus barroni Olive Python (Pilbara subspecies) [66699]	Vulnerable	Species or species habitat known to occur within area
Liopholis kintorei Great Desert Skink, Tjakura, Warrarna, Mulyamiji [83160]	Vulnerable	Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
SHARK		
Carcharias taurus (west coast population) Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sternula albifrons Little Tern [82849]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat known to occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat known to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Migratory Terrestrial Species		
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat known to occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba		
Sanderling [875]		Roosting known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis		
Red-necked Stint [860]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Species or species habitat likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Breeding known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Roosting known to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat known to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting known to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Roosting known to occur within area overfly marine area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Breeding known to occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area

Fish

Scientific Name	Threatened Category	Presence Text
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Breeding known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lapemis curtus as Lapemis hardwickii Spine-bellied Seasnake [83554]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Australian Marine Parks [Resource Information]

Park Name	Zone & IUCN Categories
Carnarvon Canyon	Habitat Protection Zone (IUCN IV)
Dampier	Habitat Protection Zone (IUCN IV)
Gascoyne	Habitat Protection Zone (IUCN IV)
Dampier	Multiple Use Zone (IUCN VI)

Habitat Critical to the Survival of Marine Turtles

Scientific Name	Behaviour	Presence

Scientific Name	Behaviour	Presence
Aug - Sep		
Natator depressus		
Flatback Turtle [59257]	Nesting	Known to occur
Dec - Jan		
Chelonia mydas		
Green Turtle [1765]	Nesting	Known to occur
Nov-Feb		
Caretta caretta		
Loggerhead Turtle [1763]	Nesting	Known to occur
Nov - May		
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Nesting	Known to occur

EPBC Act Referrals [Resource Information]

Title of referral	Reference	Referral Outcome	Assessment Status
Ashburton Infrastructure Project	2021/9064		Post-Approval
Balla Balla Export Facilities ? Design Variation	2022/09254		Assessment
Browse to North West Shelf Development, Indian Ocean, WA	2018/8319		Approval
North West Shelf Project Extension, Carnarvon Basin, WA	2018/8335		Approval
Optimised Mardie Solar Salt Project	2022/9169		Assessment
Project Highclere Cable Lay and Operation	2022/09203		Completed
Action clearly unacceptable			
Asian Renewable Energy Hub Revised Proposal, WA	2021/8891	Action Clearly Unacceptable	Completed
Highlands 3D Marine Seismic Survey	2012/6680	Action Clearly Unacceptable	Completed
Controlled action			
'Van Gogh' Petroleum Field Development	2007/3213	Controlled Action	Post-Approval
Additional Rail Infrastructure between Herb Elliott Port Facility and Cloudbreak Mine Site	2010/5513	Controlled Action	Post-Approval
Ammonium Nitrate Project	2010/5423	Controlled Action	Completed
Anketell Point Iron Ore Processing & Export Port	2009/5120	Controlled Action	Post-Approval
Asian Renewable Energy Hub, 220 km east of Port Hedland, Western Australia	2017/8112	Controlled Action	Post-Approval
Balmoral South Iron Ore Mine	2008/4236	Controlled Action	Post-Approval
Binowee Iron Ore Project	2001/366	Controlled Action	Proposed Decision
Boating Facility	2002/830	Controlled Action	Completed

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Burrup North East Sand Mining Project	2008/4611	Controlled Action	Completed
Cape Lambert Port B Development	2008/4032	Controlled Action	Post-Approval
Construct and operate LNG & domestic gas plant including onshore and offshore facilities - Wheatston	2008/4469	Controlled Action	Post-Approval
Construction and operation of a Solar Salt Project, SW Onslow, WA	2016/7793	Controlled Action	Assessment Approach
Develop Jansz-Io deepwater gas field in Permit Areas WA-18-R, WA-25-R and WA-26-	2005/2184	Controlled Action	Post-Approval
Development of Angel gas and condensate field, North West Shelf	2004/1805	Controlled Action	Post-Approval
Development of an iron ore mine and associated infrastructure	2010/5630	Controlled Action	Assessment Approach
Development of Browse Basin Gas Fields (Upstream)	2008/4111	Controlled Action	Completed
Development of Coniston/Novara fields within the Exmouth Sub-basin	2011/5995	Controlled Action	Post-Approval
Development of Stybarrow petroleum field incl drilling and facility installation	2004/1469	Controlled Action	Post-Approval
Duplication of the Dampier Highway Stages 2 & 6	2010/5419	Controlled Action	Post-Approval
Echo-Yodel Production Wells	2000/11	Controlled Action	Post-Approval
Enfield full field development	2001/257	Controlled Action	Post-Approval
Equus Gas Fields Development Project, Carnarvon Basin	2012/6301	Controlled Action	Completed
Eramurra Industrial Salt Project	2021/9027	Controlled Action	Assessment Approach
Eramurra Industrial Salt Project, near Karratha, WA	2019/8448	Controlled Action	Completed
Gorgon Gas Development	2003/1294	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Gorgon Gas Development 4th Train Proposal	2011/5942	Controlled Action	Post-Approval
Gorgon Gas Revised Development	2008/4178	Controlled Action	Post-Approval
Greater Enfield (Vincent) Development	2005/2110	Controlled Action	Post-Approval
Greater Gorgon Development - Optical Fibre Cable, Mainland to Barrow Island	2005/2141	Controlled Action	Completed
Great Northern Pipeline - 630 km buried gas pipeline	2009/5257	Controlled Action	Completed
Light Crude Oil Production	2001/365	Controlled Action	Post-Approval
Mardie Project, 80 km south west of Karratha, WA	2018/8236	Controlled Action	Post-Approval
Mauds Landing Marina	2000/98	Controlled Action	Completed
Nava-1 Cable System	2001/510	Controlled Action	Completed
Ningaloo Lighthouse Development, 17km north west Exmouth, Western Australia	2020/8693	Controlled Action	Assessment Approach
North Star Magnetite Project	2012/6689	Controlled Action	Post-Approval
North West Shelf Gas Venture Phase VI Expansion	2007/3436	Controlled Action	Referral Decision
Perdaman Urea Project, near Karratha, WA	2018/8383	Controlled Action	Post-Approval
Pluto Gas Project	2005/2258	Controlled Action	Completed
Pluto Gas Project Including Site B	2006/2968	Controlled Action	Post-Approval
Port Hedland Outer Harbour Development and associated marine and terrestrial in	2008/4159	Controlled Action	Post-Approval
Port Hedland Spoilbank Marina, WA	2019/8520	Controlled Action	Post-Approval
Proposed technical ammonium nitrate production facility	2008/4546	Controlled Action	Post-Approval

Title of referral	Reference	Referral Outcome	Assessment Status
Controlled action			
Proposed West Pilbara Iron Ore Project	2009/4706	Controlled Action	Post-Approval
Pyrenees Oil Fields Development	2005/2034	Controlled Action	Post-Approval
Simpson Development	2000/59	Controlled Action	Completed
Simpson Oil Field Development	2001/227	Controlled Action	Post-Approval
Single Jetty Deep Water Port Renewable Hub, WA	2021/8942	Controlled Action	Proposed Decision
site preparations	2005/2391	Controlled Action	Post-Approval
The Scarborough Project - FLNG & assoc subsea infrastructure, Carnarvon Basin	2013/6811	Controlled Action	Post-Approval
Vincent Appraisal Well	2000/22	Controlled Action	Post-Approval
Widening and resurfacing two principal roads servicing the Dampier Port Authori	2010/5677	Controlled Action	Completed

Varanus Island Compression Project	2012/6698	Referral Decision	Completed

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Likely to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur

Scientific Name	Behaviour	Presence
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Likely to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Likely to occur

Scientific Name	Behaviour	Presence
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur
River shark		
Pristis clavata Dwarf Sawfish [68447]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Pristis clavata Dwarf Sawfish [68447]	Nursing	Known to occur
Pristis clavata Dwarf Sawfish [68447]	Pupping	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Foraging	Known to occur
Pristis pristis Freshwater Sawfish [60756]	Pupping	Likely to occur
Pristis zijsron Green Sawfish [68442]	Foraging	Known to occur
Pristis zijsron Green Sawfish [68442]	Nursing	Known to occur
Pristis zijsron Green Sawfish [68442]	Pupping	Known to occur
Seabirds		
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Phaethon lepturus White-tailed Tropicbird [1014]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Resting	Known to occur
Sternula albifrons sinensis Little Tern [82850]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia

AREA 5

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	2
National Heritage Places:	5
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	86
Listed Migratory Species:	80

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	6
Commonwealth Heritage Places:	2
Listed Marine Species:	128
Whales and Other Cetaceans:	37
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	14
Habitat Critical to the Survival of Marine Turtles:	1

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	22
Regional Forest Agreements:	None
Nationally Important Wetlands:	4
EPBC Act Referrals:	51
Key Ecological Features (Marine):	8
Biologically Important Areas:	35
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Shark Bay, Western Australia	WA	Declared property
The Ningaloo Coast	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
HMAS Sydney II and HSK Kormoran Shipwreck Sites	EXT	Listed place
Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos	WA	Listed place
Dirk Hartog Landing Site 1616 - Cape Inscription Area	WA	Listed place
Natural		
Shark Bay, Western Australia	WA	Listed place
The Ningaloo Coast	WA	Listed place

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Vulnerable	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Malurus leucopterus leucopterus White-winged Fairy-wren (Dirk Hartog Island), Dirk Hartog Black-and-White Fairy-wren [26004]	Vulnerable	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pezoporus occidentalis Night Parrot [59350]	Endangered	Species or species habitat may occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Turnix varius scintillans		
Painted Button-quail (Houtman Abrolhos) [82451]	Vulnerable	Species or species habitat known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris		
Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Species or species habitat known to occur within area
FISH		
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
MAMMAL		
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus		
Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Bettongia lesueur lesueur Burrowing Bettong (Shark Bay), Boodie [66659]	Vulnerable	Species or species habitat known to occur within area
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat known to occur within area
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Translocated population known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Lagorchestes hirsutus bernieri Rufous Hare-wallaby (Bernier Island) [66662]	Vulnerable	Species or species habitat known to occur within area
Lagorchestes hirsutus dorreae Rufous Hare-wallaby (Dorre Island) [66663]	Vulnerable	Species or species habitat known to occur within area
Lagostrophus fasciatus fasciatus Banded Hare-wallaby, Merrnine, Marnine, Munning [66664]	Vulnerable	Species or species habitat known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat may occur within area
Perameles bougainville listed as Perameles bougainville bougainville Shark Bay Bandicoot [278]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Petrogale lateralis lateralis		
Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Pseudomys fieldi		
Shark Bay Mouse, Djoongari, Alice Springs Mouse [113]	Vulnerable	Species or species habitat likely to occur within area
Rhinonicteris aurantia (Pilbara form)		
Pilbara Leaf-nosed Bat [82790]	Vulnerable	Species or species habitat may occur within area
PLANT		
Androcalva bivillosa		
Straggling Androcalva [87807]	Critically Endangered	Species or species habitat known to occur within area
Beyeria lepidopetala		
Small-petalled Beyeria, Short-petalled Beyeria [18362]	Endangered	Species or species habitat likely to occur within area
Caladenia barbarella		
Small Dragon Orchid, Common Dragon Orchid [68686]	Endangered	Species or species habitat may occur within area
Caladenia bryceana subsp. cracens		
Northern Dwarf Spider-orchid [64556]	Vulnerable	Species or species habitat known to occur within area
Caladenia elegans		
Elegant Spider-orchid [56775]	Endangered	Species or species habitat known to occur within area
Caladenia hoffmanii		
Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii		
Sandplain Duck Orchid [87944]	Endangered	Species or species habitat likely to occur within area
Chorizema humile		
Prostrate Flame Pea [32573]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Conostylis dielsii subsp. teres Irwin's Conostylis [3614]	Endangered	Species or species habitat likely to occur within area
Conostylis micrantha Small-flowered Conostylis [17635]	Endangered	Species or species habitat likely to occur within area
Diuris drummondii Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat may occur within area
Drakaea concolor Kneeling Hammer-orchid [56777]	Vulnerable	Species or species habitat known to occur within area
Drummondita ericoides Morseby Range Drummondita [9193]	Endangered	Species or species habitat known to occur within area
Eucalyptus beardiana Beard's Mallee [18933]	Vulnerable	Species or species habitat may occur within area
Eucalyptus cuprea Mallee Box [56773]	Endangered	Species or species habitat likely to occur within area
Grevillea bracteosa subsp. howatharra [85002]	Critically Endangered	Species or species habitat likely to occur within area
Hypocalymma angustifolium subsp. Hutt River (S.Patrick 2982) [85023]	Endangered	Species or species habitat known to occur within area
Hypocalymma longifolium Long-leaved Myrtle [8081]	Vulnerable	Species or species habitat likely to occur within area
Lechenaultia chlorantha Kalbarri Leschenaultia [16763]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Leucopogon marginatus Thick-margined Leucopogon [12527]	Endangered	Species or species habitat known to occur within area
Pterostylis sinuata Northampton Midget Greenhood, Western Swan Greenhood [84991]	Endangered	Species or species habitat known to occur within area
Stachystemon nematophorus Three-flowered Stachystemon [81447]	Vulnerable	Species or species habitat known to occur within area
Wurmbea tubulosa Long-flowered Nancy [12739]	Endangered	Species or species habitat known to occur within area
REPTILE		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus zeehaani		
Southern Dogfish, Endeavour Dogfish, Little Gulper Shark [82679]	Conservation Dependent	Species or species habitat likely to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area
SPIDER		
Idiosoma nigrum		
Shield-backed Trapdoor Spider, Black Rugose Trapdoor Spider [66798]	Vulnerable	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Sterna dougallii		
Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons		
Little Tern [82849]		Species or species habitat may occur within area
Thalassarche carteri		
Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche cauta		
Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida		
Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris		
Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Balaenoptera bonaerensis		
Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis		
Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni		
Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus		
Blue Whale [36]	Endangered	Migration route known to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Dugong dugon Dugong [28]		Breeding known to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Congregation or aggregation known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Hirundo rustica		
Barn Swallow [662]		Species or species habitat known to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres		
Ruddy Turnstone [872]		Species or species habitat known to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris alba		
Sanderling [875]		Species or species habitat known to occur within area
Calidris canutus		
Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos		
Pectoral Sandpiper [858]		Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ruficollis Red-necked Stint [860]		Species or species habitat known to occur within area
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius phaeopus Whimbrel [849]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area
Pluvialis squatarola Grey Plover [865]		Species or species habitat known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Species or species habitat known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Species or species habitat known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Species or species habitat known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Breeding known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Species or species habitat known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris alba Sanderling [875]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Species or species habitat known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Species or species habitat known to occur within area overfly marine area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat known to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Species or species habitat known to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius phaeopus Whimbrel [849]		Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Breeding likely to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Species or species habitat known to occur within area
Pluvialis squatarola Grey Plover [865]		Species or species habitat known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Foraging, feeding or related behaviour known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area
Puffinus huttoni Hutton's Shearwater [1025]		Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Recurvirostra novaehollandiae Red-necked Avocet [871]		Species or species habitat known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius skua as Catharacta skua Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Species or species habitat known to occur within area
Tringa glareola Wood Sandpiper [829]		Species or species habitat known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Species or species habitat known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Species or species habitat known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Dugong dugon Dugong [28]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Reptile		
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans

[Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Congregation or aggregation known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 90-120m depth	South-west
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon Dugong [28]	Breeding	Known to occur
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Internesting	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Seabirds		
Anous stolidus Common Noddy [825]	Foraging (provisioning young)	Known to occur
Anous tenuirorstris melanops Australian Lesser Noddy [26000]	Foraging (provisioning young)	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur

Scientific Name	Behaviour	Presence
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Known to occur
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging (provisioning young)	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Seals		

Scientific Name	Behaviour	Presence
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

-Office of Environment and Heritage, New South Wales
-Department of Environment and Primary Industries, Victoria
-Department of Primary Industries, Parks, Water and Environment, Tasmania
-Department of Environment, Water and Natural Resources, South Australia

AREA 6

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 16-Dec-2022

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	2
Wetlands of International Importance (Ramsar	3
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	14
Listed Threatened Species:	130
Listed Migratory Species:	86

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	494
Commonwealth Heritage Places:	7
Listed Marine Species:	123
Whales and Other Cetaceans:	40
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	33
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	119
Regional Forest Agreements:	1
Nationally Important Wetlands:	13
EPBC Act Referrals:	309
Key Ecological Features (Marine):	11
Biologically Important Areas:	39
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Australian Convict Sites (Fremantle Prison)	WA	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Historic		
Fremantle Prison (former)	WA	Listed place
Natural		
Lesueur National Park	WA	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Becher point wetlands	Within Ramsar site
Forrestdale and thomsons lakes	Within Ramsar site
Peel-yalgorup system	10 - 20km upstream from Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
EEZ and Territorial Sea
Extended Continental Shelf

Listed Threatened Ecological Communities [Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 2 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community 3 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area

Community Name	Threatened Category	Presence Text
Aquatic Root Mat Community 4 in Caves of the Leeuwin Naturaliste Ridge	Endangered	Community known to occur within area
Aquatic Root Mat Community in Caves of the Swan Coastal Plain	Endangered	Community known to occur within area
Assemblages of plants and invertebrate animals of tumulus (organic mound) springs of the Swan Coastal Plain	Endangered	Community known to occur within area
Banksia Woodlands of the Swan Coastal Plain ecological community	Endangered	Community likely to occur within area
Clay Pans of the Swan Coastal Plain	Critically Endangered	Community likely to occur within area
Corymbia calophylla - Kingia australis woodlands on heavy soils of the Swan Coastal Plain	Endangered	Community known to occur within area
Corymbia calophylla - Xanthorrhoea preissii woodlands and shrublands of the Swan Coastal Plain	Endangered	Community known to occur within area
Proteaceae Dominated Kwongkan Shrublands of the Southeast Coastal Floristic Province of Western Australia	Endangered	Community may occur within area
Sedgelands in Holocene dune swales of the southern Swan Coastal Plain	Endangered	Community known to occur within area
Subtropical and Temperate Coastal Saltmarsh	Vulnerable	Community likely to occur within area
Thrombolite (microbial) community of coastal freshwater lakes of the Swan Coastal Plain (Lake Richmond)	Endangered	Community known to occur within area
Tuart (Eucalyptus gomphocephala) Woodlands and Forests of the Swan Coastal Plain ecological community	Critically Endangered	Community likely to occur within area

Listed Threatened Species

[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Anous tenuirostris melanops		
Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Botaurus poiciloptilus Australasian Bittern [1001]	Endangered	Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Calyptorhynchus banksii naso Forest Red-tailed Black-Cockatoo, Karrak [67034]	Vulnerable	Species or species habitat known to occur within area
Cereopsis novaehollandiae grisea Cape Barren Goose (south-western), Recherche Cape Barren Goose [25978]	Vulnerable	Breeding known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Dasyornis longirostris Western Bristlebird [515]	Endangered	Species or species habitat likely to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area
Leipoa ocellata Malleefowl [934]	Vulnerable	Species or species habitat known to occur within area
Limosa lapponica menzbieri Northern Siberian Bar-tailed Godwit, Russkoye Bar-tailed Godwit [86432]	Critically Endangered	Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pachyptila turtur subantarctica Fairy Prion (southern) [64445]	Vulnerable	Species or species habitat known to occur within area
Pezoporus flaviventris Western Ground Parrot, Kyloring [84650]	Critically Endangered	Species or species habitat likely to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area
Sternula nereis nereis Australian Fairy Tern [82950]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche steadi		
White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Zanda baudinii listed as Calyptorhynchus baudinii		
Baudin's Black-Cockatoo, Long-billed Black-cockatoo [87736]	Endangered	Breeding known to occur within area
Zanda latirostris listed as Calyptorhynchus latirostris		
Carnaby's Black Cockatoo, Short-billed Black-cockatoo [87737]	Endangered	Breeding known to occur within area
CRUSTACEAN		
Cherax tenuimanus		
Hairy Marron, Margaret River Hairy Marron, Margaret River Marron [78931]	Critically Endangered	Species or species habitat may occur within area
Engaewa pseudoreducta		
Margaret River Burrowing Crayfish [82674]	Critically Endangered	Species or species habitat known to occur within area
FISH		
Galaxiella nigrostriata		
Blackstriped Dwarf Galaxias, Black-stripe Minnow [88677]	Endangered	Species or species habitat likely to occur within area
Hoplostethus atlanticus		
Orange Roughy, Deep-sea Perch, Red Roughy [68455]	Conservation Dependent	Species or species habitat likely to occur within area
Nannatherina balstoni		
Balston's Pygmy Perch [66698]	Vulnerable	Species or species habitat likely to occur within area
Seriolella brama		
Blue Warehou [69374]	Conservation Dependent	Species or species habitat known to occur within area
Thunnus maccoyii		
Southern Bluefin Tuna [69402]	Conservation Dependent	Species or species habitat likely to occur within area
FROG		
Anstisia alba listed as Geocrinia alba		
White-bellied Frog, Creek Frog [92544]	Critically Endangered	Species or species habitat known to occur within area
INSECT		

Scientific Name	Threatened Category	Presence Text
Hesperocolletes douglasi Douglas' Broad-headed Bee, Rottnest Bee [66734]	Critically Endangered	Species or species habitat known to occur within area
Leioproctus douglasiellus a short-tongued bee [66756]	Critically Endangered	Species or species habitat may occur within area
Neopasiphae simplicior A native bee [66821]	Critically Endangered	Species or species habitat likely to occur within area
MAMMAL		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Bettongia penicillata ogilbyi Woylie [66844]	Endangered	Species or species habitat known to occur within area
Dasyurus geoffroii Chuditch, Western Quoll [330]	Vulnerable	Species or species habitat known to occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat may occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Parantechinus apicalis Dibbler [313]	Endangered	Species or species habitat known to occur within area
Petrogale lateralis lateralis Black-flanked Rock-wallaby, Moororong, Black-footed Rock Wallaby [66647]	Endangered	Species or species habitat known to occur within area
Pseudocheirus occidentalis Western Ringtail Possum, Ngwayir, Womp, Woder, Ngoor, Ngoolangit [25911]	Critically Endangered	Species or species habitat known to occur within area
Setonix brachyurus Quokka [229]	Vulnerable	Species or species habitat known to occur within area
OTHER		
Westralunio carteri Carter's Freshwater Mussel, Freshwater Mussel [86266]	Vulnerable	Species or species habitat known to occur within area
PLANT		
Andersonia gracilis Slender Andersonia [14470]	Endangered	Species or species habitat known to occur within area
Anigozanthos viridis subsp. terraspectans Dwarf Green Kangaroo Paw [3435]	Vulnerable	Species or species habitat known to occur within area
Banksia brownii Brown's Banksia, Feather-leaved Banksia [8277]	Endangered	Species or species habitat likely to occur within area
Banksia goodii Good's Banksia [16727]	Vulnerable	Species or species habitat may occur within area
Banksia nivea subsp. uliginosa Swamp Honeypot [82766]	Endangered	Species or species habitat may occur within area
Banksia squarrosa subsp. argillacea Whicher Range Dryandra [82769]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Banksia verticillata Granite Banksia, Albany Banksia, River Banksia [8333]	Vulnerable	Species or species habitat likely to occur within area
Caladenia excelsa Giant Spider-orchid [56717]	Endangered	Species or species habitat likely to occur within area
Caladenia granitora [65292]	Endangered	Species or species habitat may occur within area
Caladenia harringtoniae Harrington's Spider-orchid, Pink Spider-orchid [56786]	Vulnerable	Species or species habitat may occur within area
Caladenia hoffmanii Hoffman's Spider-orchid [56719]	Endangered	Species or species habitat may occur within area
Caladenia huegelii King Spider-orchid, Grand Spider-orchid, Rusty Spider-orchid [7309]	Endangered	Species or species habitat known to occur within area
Caladenia lodgeana Lodge's Spider-orchid [68664]	Critically Endangered	Species or species habitat known to occur within area
Caleana dixonii listed as Paracaleana dixonii Sandplain Duck Orchid [87944]	Endangered	Species or species habitat likely to occur within area
Calectasia cyanea Blue Tinsel Lily [7669]	Critically Endangered	Species or species habitat likely to occur within area
Calytrix breviseta subsp. breviseta Swamp Starflower [23879]	Endangered	Species or species habitat likely to occur within area
Chamelaucium lullfitzii listed as Chamelaucium sp. Gingin (N.G.Marchant 6) Gingin Wax [92777]	Endangered (listed as Chamelaucium sp. Gingin	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Chorizema varium Limestone Pea [16981]	Endangered	Species or species habitat known to occur within area
Conospermum undulatum Wavy-leaved Smokebush [24435]	Vulnerable	Species or species habitat may occur within area
Conostylis dielsii subsp. teres Irwin's Conostylis [3614]	Endangered	Species or species habitat likely to occur within area
Conostylis micrantha Small-flowered Conostylis [17635]	Endangered	Species or species habitat likely to occur within area
Conostylis misera Grass Conostylis [21320]	Endangered	Species or species habitat may occur within area
Diuris drummondii Tall Donkey Orchid [4365]	Vulnerable	Species or species habitat known to occur within area
Diuris micrantha Dwarf Bee-orchid [55082]	Vulnerable	Species or species habitat known to occur within area
Diuris purdiei Purdie's Donkey-orchid [12950]	Endangered	Species or species habitat known to occur within area
Drakaea elastica Glossy-leafed Hammer Orchid, Glossy-leaved Hammer Orchid, Warty Hammer Orchid [16753]	Endangered	Species or species habitat known to occur within area
Drakaea micrantha Dwarf Hammer-orchid [56755]	Vulnerable	Species or species habitat known to occur within area
Eleocharis keigheryi Keighery's Eleocharis [64893]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Eremophila glabra subsp. chlorella [84927]	Endangered	Species or species habitat likely to occur within area
Eucalyptus argutifolia Yanchep Mallee, Wabling Hill Mallee [24263]	Vulnerable	Species or species habitat known to occur within area
Eucalyptus x balanites Cadda Road Mallee, Cadda Mallee [87816]	Endangered	Species or species habitat may occur within area
Gastrolobium papilio Butterfly-leaved Gastrolobium [78415]	Endangered	Species or species habitat may occur within area
Grevillea batrachioides Mt Lesueur Grevillea [21735]	Endangered	Species or species habitat may occur within area
Grevillea curviloba subsp. incurva Narrow curved-leaf Grevillea [64909]	Endangered	Species or species habitat may occur within area
Grevillea humifusa Spreading Grevillea [61182]	Endangered	Species or species habitat may occur within area
Hemiandra gardneri Red Snakebush [7945]	Endangered	Species or species habitat likely to occur within area
Isopogon uncinatus Albany Cone Bush, Hook-leaf Isopogon [20871]	Endangered	Species or species habitat likely to occur within area
Kennedia glabrata Northcliffe Kennedia [16452]	Vulnerable	Species or species habitat may occur within area
Lambertia echinata subsp. occidentalis Western Prickly Honeysuckle [64528]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Lepidosperma rostratum Beaked Lepidosperma [14152]	Endangered	Species or species habitat may occur within area
Leucopogon marginatus Thick-margined Leucopogon [12527]	Endangered	Species or species habitat may occur within area
Leucopogon obtectus Hidden Beard-heath [19614]	Endangered	Species or species habitat likely to occur within area
Macarthuria keigheryi Keighery's Macarthuria [64930]	Endangered	Species or species habitat known to occur within area
Marianthus paralius [83925]	Endangered	Species or species habitat known to occur within area
Melaleuca sp. Wanneroo (G.J. Keighery 16705) [89456]	Endangered	Species or species habitat known to occur within area
Morelotia australiensis listed as Tetraria australiensis Southern Tetraria [92784]	Vulnerable	Species or species habitat likely to occur within area
Reedia spathacea Reedia [2995]	Critically Endangered	Species or species habitat likely to occur within area
Sphenotoma drummondii Mountain Paper-heath [21160]	Endangered	Species or species habitat may occur within area
Synaphea sp. Fairbridge Farm (D. Papenfus 696) Selena's Synaphea [82881]	Critically Endangered	Species or species habitat likely to occur within area
Synaphea sp. Pinjarra Plain (A.S. George 17182) [86878]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Synaphea sp. Serpentine (G.R. Brand 103) [86879]	Critically Endangered	Species or species habitat known to occur within area
Tetratheca nephelioides [83217]	Critically Endangered	Species or species habitat may occur within area
Thelymitra stellata Star Sun-orchid [7060]	Endangered	Species or species habitat likely to occur within area
Verticordia apecta Hay River Featherflower, Scruffy Verticordia [65545]	Critically Endangered	Species or species habitat may occur within area
Wurmbea tubulosa Long-flowered Nancy [12739]	Endangered	Species or species habitat likely to occur within area
REPTILE		
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Ctenotus lancelini Lancelin Island Skink [1482]	Vulnerable	Species or species habitat known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Egernia stokesii badia Western Spiny-tailed Skink, Baudin Island Spiny-tailed Skink [64483]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Liopholis pulchra longicauda		
Jurien Bay Skink, Jurien Bay Rock-skink [83162]	Vulnerable	Species or species habitat known to occur within area
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Pseudemydura umbrina		
Western Swamp Tortoise [1760]	Critically Endangered	Species or species habitat may occur within area
SHARK		
Carcharias taurus (west coast population)		
Grey Nurse Shark (west coast population) [68752]	Vulnerable	Species or species habitat known to occur within area
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Centrophorus zeehaani		
Southern Dogfish, Endeavour Dogfish, Little Gulper Shark [82679]	Conservation Dependent	Species or species habitat likely to occur within area
Galeorhinus galeus		
School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark [68453]	Conservation Dependent	Species or species habitat likely to occur within area
Pristis pristis		
Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat known to occur within area

Listed Migratory Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Migratory Marine Birds		

Scientific Name	Threatened Category	Presence Text
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Ardenna carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area
Ardenna grisea Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Ardenna tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Hydroprogne caspia Caspian Tern [808]		Breeding known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Onychoprion anaethetus Bridled Tern [82845]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons Little Tern [82849]		Species or species habitat may occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Migratory Marine Species		
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Eubalaena australis as Balaena glacialis australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Foraging, feeding or related behaviour known to occur within area

Scientific Name	Threatened Category	Presence Text
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat may occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Migratory Terrestrial Species		
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area
Charadrius dubius Little Ringed Plover [896]		Species or species habitat known to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting known to occur within area

Scientific Name	Threatened Category	Presence Text
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Species or species habitat known to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Tringa brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anous tenuirostris melanops Australian Lesser Noddy [26000]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Ardenna grisea as Puffinus griseus Sooty Shearwater [82651]		Species or species habitat may occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Ardenna tenuirostris as Puffinus tenuirostris Short-tailed Shearwater [82652]		Breeding known to occur within area
Arenaria interpres Ruddy Turnstone [872]		Roosting known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Roosting known to occur within area
Calidris alba Sanderling [875]		Roosting known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat known to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris subminuta Long-toed Stint [861]		Roosting known to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Critically Endangered	Roosting known to occur within area overfly marine area
Cereopsis novaehollandiae grisea Cape Barren Goose (south-western), Recherche Cape Barren Goose [25978]	Vulnerable	Breeding known to occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius bicinctus Double-banded Plover [895]		Roosting known to occur within area overfly marine area
Charadrius dubius Little Ringed Plover [896]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting known to occur within area
Charadrius ruficapillus Red-capped Plover [881]		Roosting known to occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Diomedea antipodensis Antipodean Albatross [64458]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea dabbenena Tristan Albatross [66471]	Endangered	Species or species habitat likely to occur within area
Diomedea epomophora Southern Royal Albatross [89221]	Vulnerable	Species or species habitat may occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Diomedea sanfordi Northern Royal Albatross [64456]	Endangered	Species or species habitat may occur within area
Eudyptula minor Little Penguin [1085]		Breeding known to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura Pin-tailed Snipe [841]		Roosting known to occur within area overfly marine area
Glareola maldivarum Oriental Pratincole [840]		Roosting known to occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Halobaena caerulea Blue Petrel [1059]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting known to occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area
Limicola falcinellus Broad-billed Sandpiper [842]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Limosa limosa Black-tailed Godwit [845]		Roosting known to occur within area overfly marine area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pachyptila turtur Fairy Prion [1066]		Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Pelagodroma marina White-faced Storm-Petrel [1016]		Breeding known to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Breeding known to occur within area
Phalacrocorax fuscescens Black-faced Cormorant [59660]		Foraging, feeding or related behaviour likely to occur within area
Phalaropus lobatus Red-necked Phalarope [838]		Roosting known to occur within area
Philomachus pugnax Ruff (Reeve) [850]		Species or species habitat known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Phoebetria fusca Sooty Albatross [1075]	Vulnerable	Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting known to occur within area
Pluvialis squatarola Grey Plover [865]		Roosting known to occur within area overfly marine area
Pterodroma macroptera Great-winged Petrel [1035]		Breeding known to occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Puffinus assimilis Little Shearwater [59363]		Breeding known to occur within area
Recurvirostra novaehollandiae Red-necked Avocet [871]		Roosting known to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat known to occur within area overfly marine area
Stercorarius skua as Catharacta skua Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat likely to occur within area
Thalassarche cauta Shy Albatross [89224]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Thinornis cucullatus as Thinornis rubricollis Hooded Plover, Hooded Dotterel [87735]		Species or species habitat known to occur within area overfly marine area
Tringa brevipes as Heteroscelus brevipes Grey-tailed Tattler [851]		Roosting known to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting known to occur within area overfly marine area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat known to occur within area overfly marine area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting known to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa totanus Common Redshank, Redshank [835]		Roosting known to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]		Roosting known to occur within area overfly marine area
Fish		
Acentronura australe Southern Pygmy Pipehorse [66185]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Heraldia nocturna Upside-down Pipefish, Eastern Upside-down Pipefish, Eastern Upside-down Pipefish [66227]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus breviceps Short-head Seahorse, Short-snouted Seahorse [66235]		Species or species habitat may occur within area
Hippocampus subelongatus West Australian Seahorse [66722]		Species or species habitat may occur within area
Histiogamphelus cristatus Rhino Pipefish, Macleay's Crested Pipefish, Ring-back Pipefish [66243]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Leptoichthys fistularius Brushtail Pipefish [66248]		Species or species habitat may occur within area
Lissocampus caudalis Australian Smooth Pipefish, Smooth Pipefish [66249]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Lissocampus runa Javelin Pipefish [66251]		Species or species habitat may occur within area
Maroubra perserrata Sawtooth Pipefish [66252]		Species or species habitat may occur within area
Mitotichthys meraculus Western Crested Pipefish [66259]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Notiocampus ruber Red Pipefish [66265]		Species or species habitat may occur within area
Phycodurus eques Leafy Seadragon [66267]		Species or species habitat may occur within area
Phyllopteryx taeniolatus Common Seadragon, Weedy Seadragon [66268]		Species or species habitat may occur within area
Pugnaso curtirostris Pugnose Pipefish, Pug-nosed Pipefish [66269]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Stigmatopora nigra Widebody Pipefish, Wide-bodied Pipefish, Black Pipefish [66277]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Urocampus carinirostris Hairy Pipefish [66282]		Species or species habitat may occur within area
Vanacampus margaritifer Mother-of-pearl Pipefish [66283]		Species or species habitat may occur within area
Vanacampus phillipi Port Phillip Pipefish [66284]		Species or species habitat may occur within area
Vanacampus poecilolaemus Longsnout Pipefish, Australian Long-snout Pipefish, Long-snouted Pipefish [66285]		Species or species habitat may occur within area
Mammal		
Arctocephalus forsteri Long-nosed Fur-seal, New Zealand Fur-seal [20]		Breeding known to occur within area
Neophoca cinerea Australian Sea-lion, Australian Sea Lion [22]	Endangered	Breeding known to occur within area
Reptile		
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [Resource Information]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Foraging, feeding or related behaviour known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Berardius arnuxii Arnoux's Beaked Whale [70]		Species or species habitat may occur within area
Caperea marginata Pygmy Right Whale [39]		Foraging, feeding or related behaviour likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Breeding known to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Globicephala melas Long-finned Pilot Whale [59282]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Hyperoodon planifrons Southern Bottlenose Whale [71]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Lagenorhynchus obscurus Dusky Dolphin [43]		Species or species habitat likely to occur within area
Lissodelphis peronii Southern Right Whale Dolphin [44]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Foraging, feeding or related behaviour known to occur within area
Mesoplodon bowdoini Andrew's Beaked Whale [73]		Species or species habitat may occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense-beaked Whale [74]		Species or species habitat may occur within area
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon hectori Hector's Beaked Whale [76]		Species or species habitat may occur within area
Mesoplodon layardii Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale [25556]		Species or species habitat may occur within area
Mesoplodon mirus True's Beaked Whale [54]		Species or species habitat may occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Foraging, feeding or related behaviour known to occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Tasmacetus shepherdi Shepherd's Beaked Whale, Tasman Beaked Whale [55]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Albany Canyons group and adjacent shelf break	South-west
Ancient coastline at 90-120m depth	South-west
Cape Mentelle upwelling	South-west
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	South-west
Commonwealth marine environment surrounding the Recherche Archipelago	South-west
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	South-west
Diamantina Fracture Zone	South-west
Naturaliste Plateau	South-west
Perth Canyon and adjacent shelf break, and other west coast canyons	South-west
Western demersal slope and associated fish communities	South-west
Western rock lobster	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Seabirds		
Anous stolidus Common Noddy [825]	Foraging	Known to occur
Anous stolidus Common Noddy [825]	Foraging (provisioning young)	Known to occur

Scientific Name	Behaviour	Presence
Anous tenuirorstris melanops Australian Lesser Noddy [26000]	Foraging (provisioning young)	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Aggregation	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Foraging	Known to occur
Ardenna carneipes Flesh-footed Shearwater [82404]	Foraging (in high numbers)	Known to occur
Ardenna pacifica Wedge-tailed Shearwater [84292]	Foraging (in high numbers)	Known to occur
Ardenna tenuirostris Short-tailed Shearwater [82652]	Foraging (in high numbers)	Known to occur
Eudyptula minor Little Penguin [1085]	Foraging (provisioning young)	Known to occur
Hydroprogne caspia Caspian Tern [808]	Foraging (provisioning young)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Known to occur
Larus pacificus Pacific Gull [811]	Foraging (in high numbers)	Former Range
Onychoprion anaethetus Bridled Tern [82845]	Foraging (in high numbers)	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Pelagodroma marina White-faced Storm petrel [1016]	Foraging (in high numbers)	Known to occur
Phalacrocorax fuscescens Black-faced Cormorant [59660]	Foraging	Known to occur
Pterodroma macroptera macroptera Great-winged Petrel (macroptera race) [1035]	Foraging (provisioning young)	Known to occur
Pterodroma mollis Soft-plumaged Petrel [1036]	Foraging (in high numbers)	Known to occur
Puffinus assimilis tunneyi Little Shearwater [59363]	Foraging (in high numbers)	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Foraging (provisioning young)	Known to occur
Sternula nereis Fairy Tern [82949]	Foraging (in high numbers)	Known to occur
Thalassarche chlororhynchos bassi Indian Yellow-nosed Albatross [85249]	Foraging (in high numbers)	Known to occur
Seals		
Neophoca cinerea Australian Sea Lion [22]	Foraging (male)	Likely to occur
Neophoca cinerea Australian Sea Lion [22]	Foraging (male and female)	Known to occur
Sharks		
Carcharodon carcharias White Shark [64470]	Foraging	Known to occur

Scientific Name	Behaviour	Presence
Carcharodon carcharias White Shark [64470]	Known distribution	Known to occur
Whales		
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (abundant food source)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (high density)	Known to occur
Balaenoptera musculus Blue and Pygmy Blue Whale [36]	Foraging (on migration)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Foraging Area (annual high use area)	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Known Foraging Area	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Eubalaena australis Southern Right Whale [40]	Calving buffer	Known to occur
Eubalaena australis Southern Right Whale [40]	Seasonal calving habitat	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north)	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur
Physeter macrocephalus Sperm Whale [59]	Foraging (abundant food source)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

194 Registered Aboriginal Sites in Shapefile - Shoreline_100gm2_combined

Disclaimer

The *Aboriginal Heritage Act 1972* preserves all Aboriginal sites in Western Australia whether or not they are registered. Aboriginal sites exist that are not recorded on the Register of Aboriginal Sites, and some registered sites may no longer exist.

The information provided is made available in good faith and is predominately based on the information provided to the Department of Planning, Lands and Heritage by third parties. The information is provided solely on the basis that readers will be responsible for making their own assessment as to the accuracy of the information. If you find any errors or omissions in our records, including our maps, it would be appreciated if you email the details to the Department at AboriginalHeritage@dplh.wa.gov.au and we will make every effort to rectify it as soon as possible.

Coordinate Accuracy

Coordinates (Easting/Northing metres) are based on the GDA 94 Datum. Accuracy is shown as a code in brackets following the coordinates.

Terminology (NB that some terminology has varied over the life of the legislation)

Place ID/Site ID: This a unique ID assigned by the Department of Planning, Lands and Heritage to the place.

Status:

- **Registered Site**: The place has been assessed as meeting Section 5 of the *Aboriginal Heritage Act 1972.*
- **Other Heritage Place which includes:**
  - **Stored Data / Not a Site:** The place has been assessed as not meeting Section 5 of the *Aboriginal Heritage Act 1972.*
  - **Lodged:** Information has been received in relation to the place, but an assessment has not been completed at this *stage* to determine if it meets Section 5 of the *Aboriginal Heritage Act 1972.*

Access and Restrictions:

- **File Restricted = No:** Availability of information that the Department of Planning, Lands and Heritage holds in relation to the place is not restricted in any way.
- **File Restricted = Yes:** Some of the information that the Department of Planning, Lands and Heritage holds in relation to the place is restricted if it is considered culturally sensitive. This information will only be made available if the Department of Planning, Lands and Heritage receives written approval from the informants who provided the information. To request access please contact AboriginalHeritage@dplh.wa.gov.au.
- **Boundary Restricted = No:** Place location is shown as accurately as the information lodged with the Registrar allows.
- **Boundary Restricted = Yes:** To preserve confidentiality the exact location and extent of the place is not displayed on the map. However, the shaded region (generally with an area of at least 4km²) provides a general indication of where the place is located. If you are a landowner and wish to find out more about the exact location of the place, please contact the Department of Planning, Lands and Heritage.
- **Restrictions:**
  - **No Restrictions:** *Anyone* can view the information.
  - **Male Access Only:** Only *males* can view restricted information.
  - **Female Access Only:** *Only* females can view restricted information.

Legacy ID: This is the former unique number that the former Department of Aboriginal Sites assigned to the place. This has been replaced by the Place ID / Site ID.

ABBREVIATIONS AND TERMS

Abbreviation/term	Definition
Ancient coastline KEF	Ancient coastline at 125 m depth contour Key Ecological Feature
CSIRO	Commonwealth Scientific and Industrial Research Organisation
FPSO	Floating production storage and offloading vessel
ROV	Remotely operated vehicle
Tappity	Habitat characterisation software and hardware designed by CSIRO
USBL	Ultra-short baseline positioning system
WHP	Wellhead platform

EXECUTIVE SUMMARY

Santos is planning the Dorado development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 130 km north of Port Hedland. The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority.

The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project and this assessment requires an understanding of the status of the receiving environment. Santos identified uncertainty in the status of the marine environment in the vicinity of the development and commissioned ecological studies to provide environmental data to support appropriate assessment. A key component of the marine environmental characterisation studies was a benthic habitat survey.

RPS was commissioned to conduct a benthic habitat survey at the Dorado Project location between 18 and 22 December 2019. The objective of the study was to characterise existing benthic habitats and communities in the area.

Remotely operated vehicle (ROV) surveys were conducted to characterise benthic communities and habitats, and sediment grab sampling was conducted to describe infauna across the Survey Area. The survey revealed predominantly soft sediment habitats, with low sand waves and scattered rocky reef. The sediment habitats support low abundance of infauna and epifauna, and the rocky substrates support low to medium density filter-feeder communities and other fauna including fish at low densities. Infaunal taxa were characteristic of the sediments recorded at the sample sites (RPS 2020), and indicated where epibiota (e.g. hydroids, bryozoans and sponges) and consolidated/hard substrate may also be present. No high conservation significant ecological values, habitats, communities or species were identified. The benthic communities and habitats within the Dorado Survey Area are considered to be well represented in the local area and region.

1 INTRODUCTION

1.1 Background

Santos is planning the Dorado Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia, approximately 130 km north of Port Hedland. The Dorado Project will target the Dorado field, with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading (FPSO) facility. There is also potential for future development of surrounding fields within the Dorado Survey Area (Survey Area). Given some uncertainty in the precise location of seabed disturbing activities within the Survey Area, Santos has taken the approach of describing broad habitat types and associated communities such that development in any part of other Survey Area can be assessed accordingly when the locations are better defined.

The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority. The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk. The purpose of this study is to characterise existing benthic habitats within the survey area to assess potential impacts to benthic communities and habitats under the NOPSEMA regulatory requirements.

CSIRO has been assisting Santos in characterising regional-scale ecotypes (habitat types) that occur in the Survey Area, based on extensive data from the region over decades of offshore research (Keesing et al. 2020). From this work, Santos identified the need for a survey of benthic habitats, and macrofaunal and infaunal communities within the Survey Area. RPS was engaged to conduct benthic habitat surveys to feed into re-analysis of CSIRO's ecotype model for the area and to inform the OPP. The field survey was conducted in December 2019 and the outcomes of the survey and subsequent analyses are described herein.

1.2 Rationale

Seabed infrastructure will include elements of the WHP, FPSO, flowlines, drilling and cuttings discharges etc; however, facility and field layout are not finalised. Information on the benthic habitats and communities within the Dorado Survey Area is required to inform the assessment of environmental impacts and risks in the Dorado Development OPP. The benthic habitat survey reported herein was designed to characterise survey benthic habitats and communities to fulfill this requirement. The spatial extent of the survey extends well beyond the areas of the seabed that may be directly disturbed by Dorado Project activities and includes environmental features of interest, such as the Ancient Coastline at 125 m depth contour Key Ecological Feature ('Ancient coastline KEF'). The information collected was also used to inform revision of modelling of 'ecotypes' within the Dorado Survey Area (Keesing et al 2020).

The benthic habitat survey was designed by CSIRO, RPS and Santos to target the likely development locations (area encompassing nominal WHP and FPSO locations) and to representatively survey the range of habitat and community types in the Survey Area. Survey design focussed on representative ROV deployments within the five ecotypes identified by CSIRO in preliminary modelling, which lie within the Survey Area.

1.3 Objectives

- To characterise the benthic habitats, macrofaunal communities and infauna communities within the Survey Area, with a focus on sites and habitats that may be impacted by the Dorado Project.
- Describe the distribution of benthic habitats and communities in the Survey Area to support subsequent impact assessment.
- Assess the ecological value of the benthic habitats and communities and the likely representation in the broader region.

2 METHODS

2.1 Survey team

2.1.1 Marine ecology

The field team was led by suitably qualified and experienced RPS marine scientists who ensured that the remotely operated vehicle (ROV) transects were flown according to the survey plan, while recording live habitat and community data using CSIRO's Tappity benthic characterisation system (further detail on this system is described below).

A separate RPS team of marine scientists undertaking sediment and water quality sampling for the Dorado Project (covered in separate reports) conducted the benthic infauna sampling presented herein.

2.1.2 CSIRO collaboration

Santos engaged CSIRO directly to provide the habitat and community characterisation and assemblages described in Keesing (2020). CSIRO researchers provided the ecotype model outputs and used computer algorithms to generate representative survey sites, from which the final transect locations were selected (Figure 2-1). The site selection process aimed to representatively sample the environmental variability in the region, according to the importance of each environmental variable in the analyses undertaken to date. The CSIRO analyses included ecotype modelling based on historic datasets from the region comprising data on a variety of biotic and abiotic parameters.

CSIRO has reported on the re-analysis of the ecotype data incorporating the findings from the current study in a separate report (Keesing et al. 2020).

2.1.3 ROV operation

The ROV was operated by Intervention Engineering, under the direction of the RPS party chief. The ROV position was recorded throughout each deployment, using an ultra-short baseline (USBL) acoustic positioning system. The USBL transceiver was mounted and deployed via the survey vessel's moon pool.

A clump weight was attached to the end of the winch cable. The ROV tether was attached above the clump weight, leaving around 50 m of tether between the ROV and the clump weight. This configuration allows the ROV free range of movement around the clump weight, but also takes the drag of the cable between the clump weight and the surface off the ROV, mitigating impact to speed and manoeuvrability. This approach has the added benefit of removing vertical drag on the ROV potentially caused by the movement of the surface vessel over waves, resulting in much smoother video imagery.

2.2 Survey vessels

The survey vessel MV Warrego was supplied and operated by Gun Marine Services in Exmouth.

The vessel largely drifted along the transect lines to avoid pulling the ROV and clump weight too fast (i.e. >1.5 knots). The vessel master was able to estimate drift direction and speed and run the drift transects across the nominated survey sites.

Benthic infauna sampling was conducted from a separate vessel, the Jetwave Maddison.

2.3 Timing

Benthic video surveys were undertaken from 18 to 22 December 2019. Infauna sampling was undertaken at night, from 16 to 19 December 2019.

2.4 Quality control

All field surveys were conducted in accordance with the agreed Sampling Analysis and Quality Plan (SAQP) for the survey (RPS 2019). The SAQP was approved by Santos prior to mobilisation and covered the planned survey methods, sites schedule, data handling. The key elements for survey quality control relate to sample and data integrity.

2.4.1 Time synchronisation

Given the multiple data streams were recorded concurrently, it was important that the clocks associated with the various components of the video receiving, overlay, recording and analytical systems were synchronised during or after the survey.

Equipment connected to a GPS was synchronised to the GPS satellite time code; other devices without GPS were synchronised to the satellite time.

2.4.2 Data stream management

The ROV technicians recorded the video and positional data streams from the vessel bridge and navigation systems and saved them directly to a hard drive. The data were displayed as a live stream on a monitor during transects to show they were being received, and for quantitative analysis (using Tappity).

2.4.3 Data transport

All data were backed up to a hard drive and back-up drives daily to prevent data loss while at sea and during transport to the office.

2.4.4 Habitat and biota classification

To ensure consistency between RPS' classifications of seabed types and communities during the survey with CSIRO's broader survey database, RPS' personnel reviewed and conducted the survey in accordance with the CSIRO field guide - "CSIRO tow video real-time ("Tappity") data recording guide to substrate and biohabitat categories". This provided lists of habitat and biota categories and example photographs of each category.

2.4.5 Post-survey data checks

On return to the office and prior to analysis, the data were checked by CSIRO and any necessary time code adjustments were made. Random checks of biota identifications were run by CSIRO and the dataset declared suitable for analysis.

All transect start, middle and end points were transcribed from the videos and QA/QC checked against the Survey Area plot to confirm the tabulated coordinates were correct.

2.5 Sample collection

2.5.1 Benthic video transects

2.5.1.1 Transect locations

CSIRO developed a list of sampling sites based on their preliminary habitat model, drawing on extensive regional datasets on a range of bio-physico-chemical parameters. The CSIRO approach to ecotype characterisation is described in its separate report (Keesing et al. 2020). Importantly, the ecotype characterisation presented in the CSIRO report will differ to some degree from that presented in Figure 2-1 because their report will use the findings of this study to further refine the characteristics and spatial distribution of their ecotypes (Keesing et al. 2020).

The nominal survey sites were selected to represent the range of benthic habitats, including the Ancient coastline KEF, likely to occur in the Survey Area and was based around the ecotypes developed by CSIRO for this area (Figure 2-1; see Keesing et al. 2020). At least five transects were completed within each of the five main ecotypes that were well represented in the Survey Area (ecotypes 1 to 5); ecotype six was excluded because there is minimal overlap with the Survey Area. The water depths of the sites at which benthic habitats were surveyed ranged from 75 m to 138 m. Thirty-nine sites were surveyed within the Survey Area boundary (Figure 2-2).

CSIRO’s pre-defined target site coordinates were entered into the navigation software on the vessel with a 250 m radius circle drawn around each site. The vessel was allowed to drift across the survey circle and the ROV followed adjacent the drifting vessel. The ROV transects were approximately 500 m long with the centre point of the transect close to the nominal site location. The actual survey transect sites surveyed are shown in Figure 2-2; the three points at each site represent the start, middle and end points of each 500 m transect. These coordinates are listed in Appendix A.

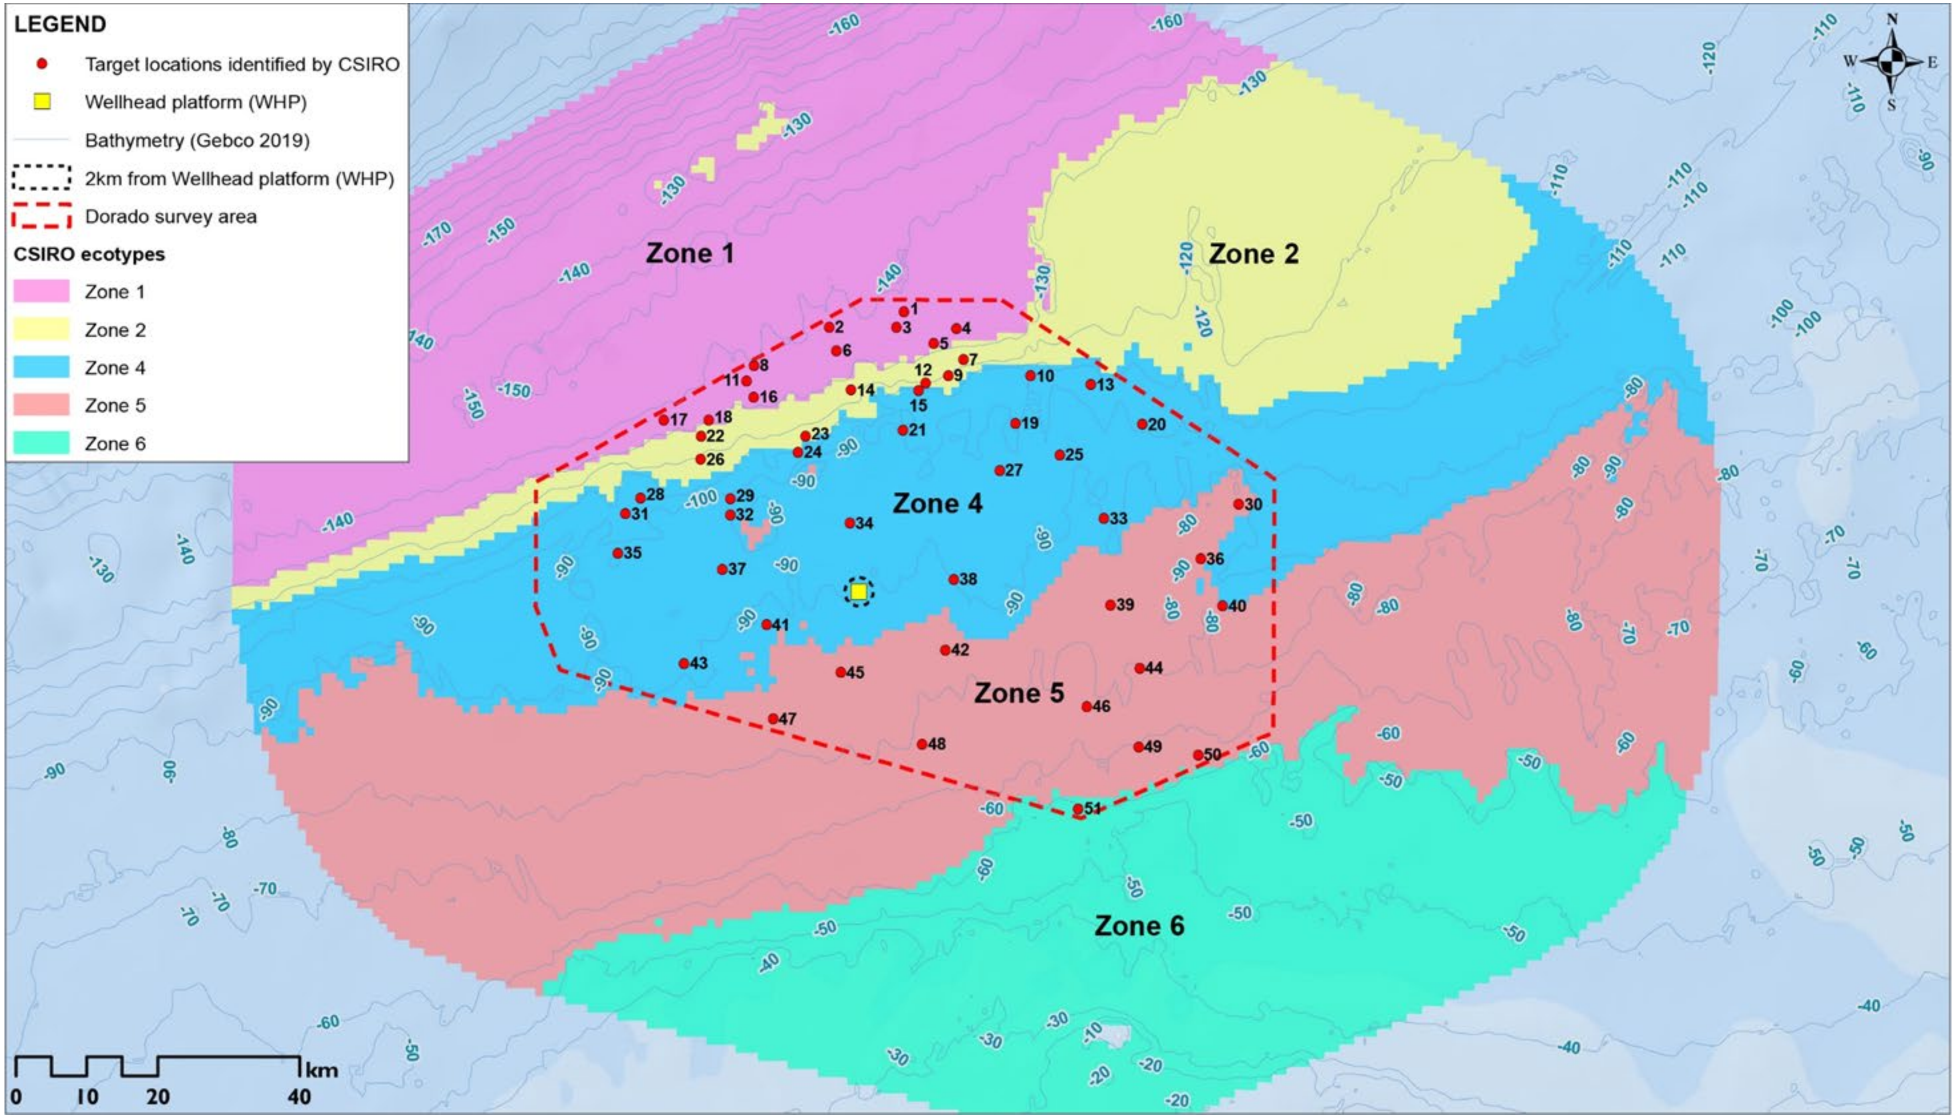

Figure 2-1: Nominal ecotype zones and sampling sites from CSIRO

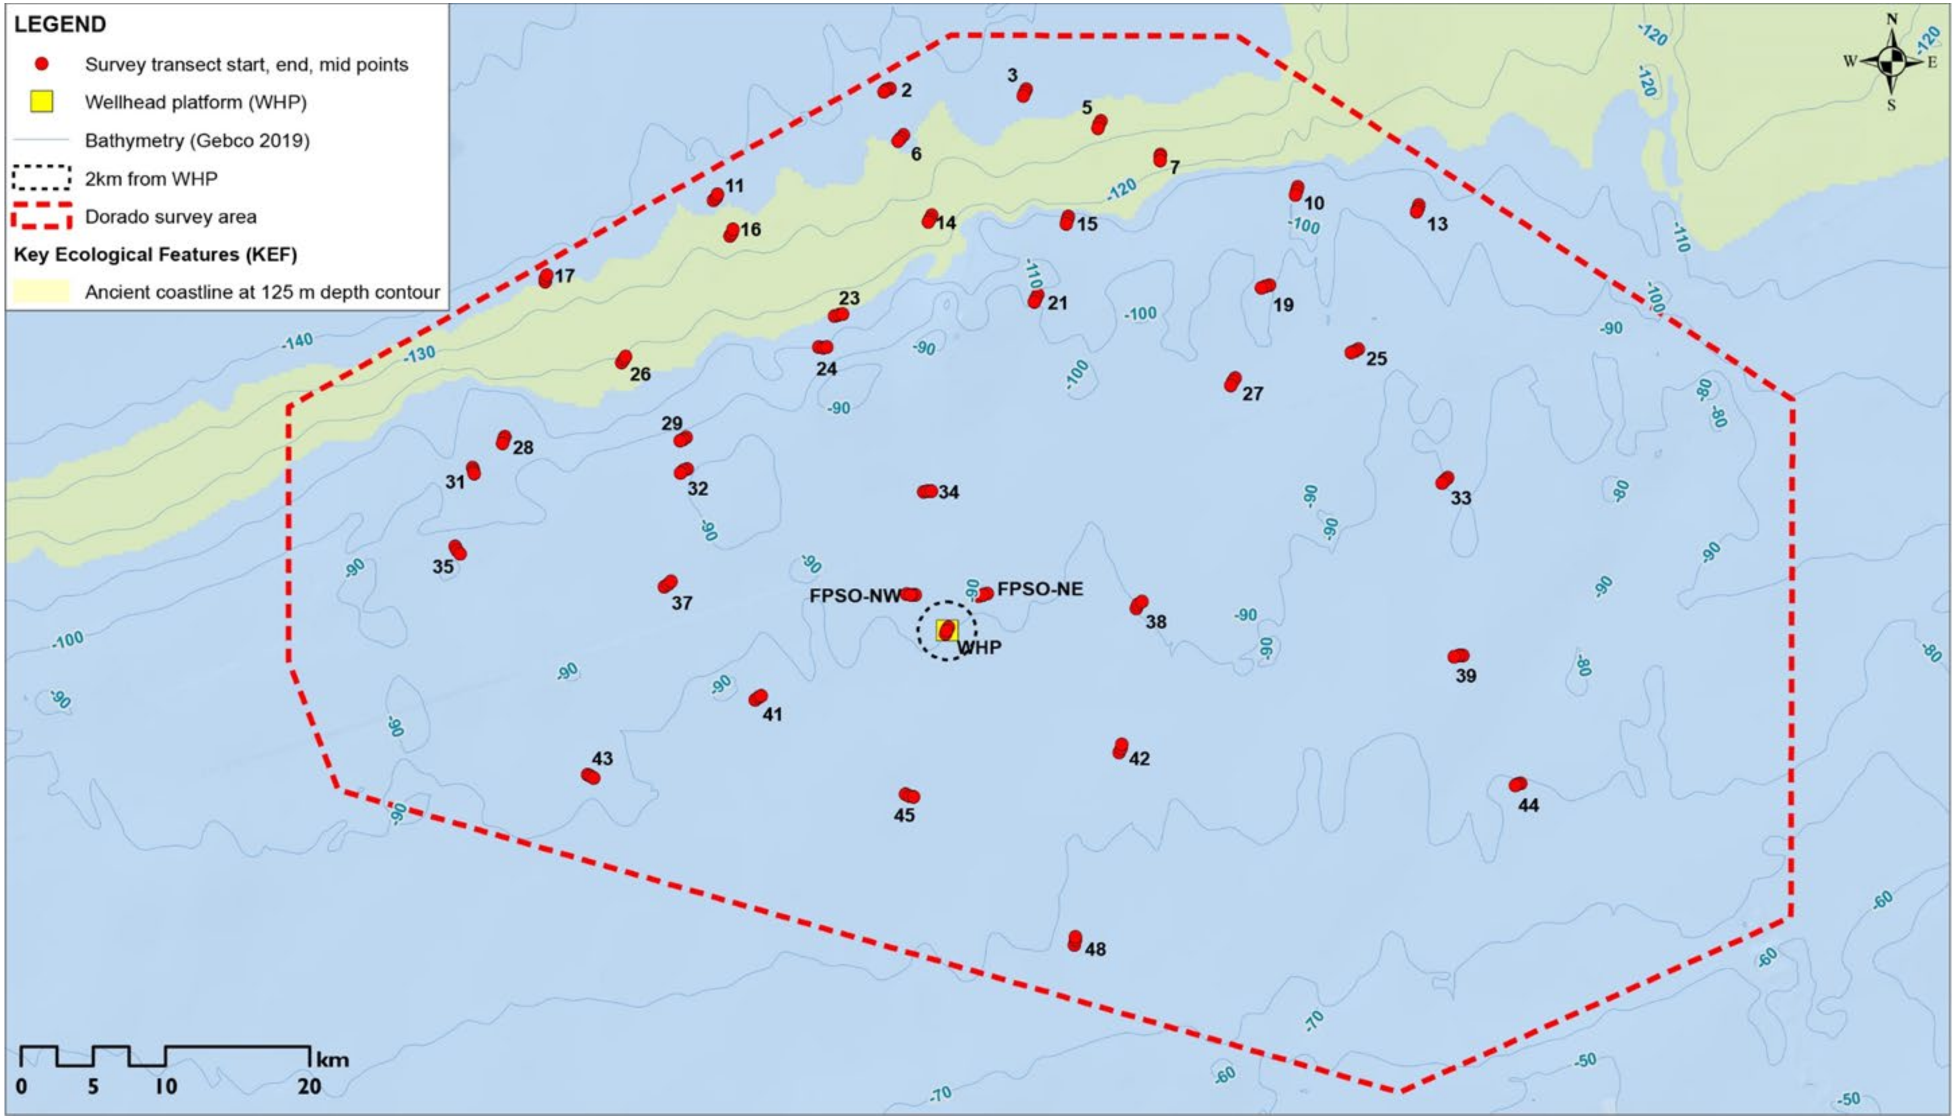

Figure 2-2: ROV benthic habitat and community transect locations

2.5.1.2 ROV survey

The ROV had on-board standard definition and a high definition, colour, zoom-capable video camera, lights, and paired, parallel lasers set 5 cm apart. A clump weight was lowered from the vessel to provide additional stability to the ROV during surveys by buffering vessel and sea surface movements. This allowed the ROV to fly at a constant height above the seabed of approximately 0.5 - 1 m and the cameras were set to face forward, to capture oblique imagery of the seabed suitable for qualitative habitat descriptions.

The vessel position was taken from the vessel GPS (using the geographic coordinate system WGS 1984) and the vessel's progress along the transect was monitored and recorded using a second GPS with external aerial on the bridge roof.

An USBL system was used to calculate the positional offset between the ROV and the vessel. This positional offset was then used to correct the positional overlays on the video image and in the survey software.

Seabed imagery was recorded to hard drive with overlays of USBL-corrected position, depth of vehicle, ROV heading along transect, time and date and site number. Positional data were also backed up to the hard drives at the end of every working day. Other data were collected to facilitate further analyses by CSIRO if required (e.g. ROV pitch and roll). The green laser points on the imagery are 5cm apart and provide scale for estimating the size of features and biota.

2.5.1.3 CSIRO Tappity software

During every ROV deployment, CSIRO's proprietary "Tappity" habitat characterisation software and hardware were used to record data on benthic substrates, habitats and biota. The data included a time code and positional code to allow its use in CSIRO's ecotype modelling. This analysis is not included in the current report but is reported separately by Keesing et al. (2020).

2.5.2 Infauna sampling

Infauna sampling was required to support characterisation of benthic habitats.

2.5.2.1 Infauna sampling sites

Infauna sampling was conducted on a separate vessel to the ROV survey (the Jetwave Maddison). Infauna sampling was undertaken as part of the sediment sampling scope as both aspects required the same sampling equipment (section 3.5.2.2). The results of infauna sampling are presented in this report and the results from the sediment sampling program are presented in Dorado Sediment Quality Survey Report (RPS, 2020).

Infaunal samples were successfully retrieved from five sites across the Survey Area (Figure 2-3). Insufficient sediment for infaunal analysis was collected from the other ten sediment sampling sites after five attempts; these are marked as "none" in Figure 2-3. Review of unsuccessful samples and the vessel sounder indicated that the substrates were likely hard within thin veneers of sediment, or highly compact sediments. Only scrapings were collected, which indicated that the grab had closed at the seabed, but did not collect sufficient sediment to meet the minimum quality control criteria for an infauna sample.

The Dorado Sediment Quality Survey Report (RPS 2020) provides further detail on the characteristics of sediments in the Survey Area.

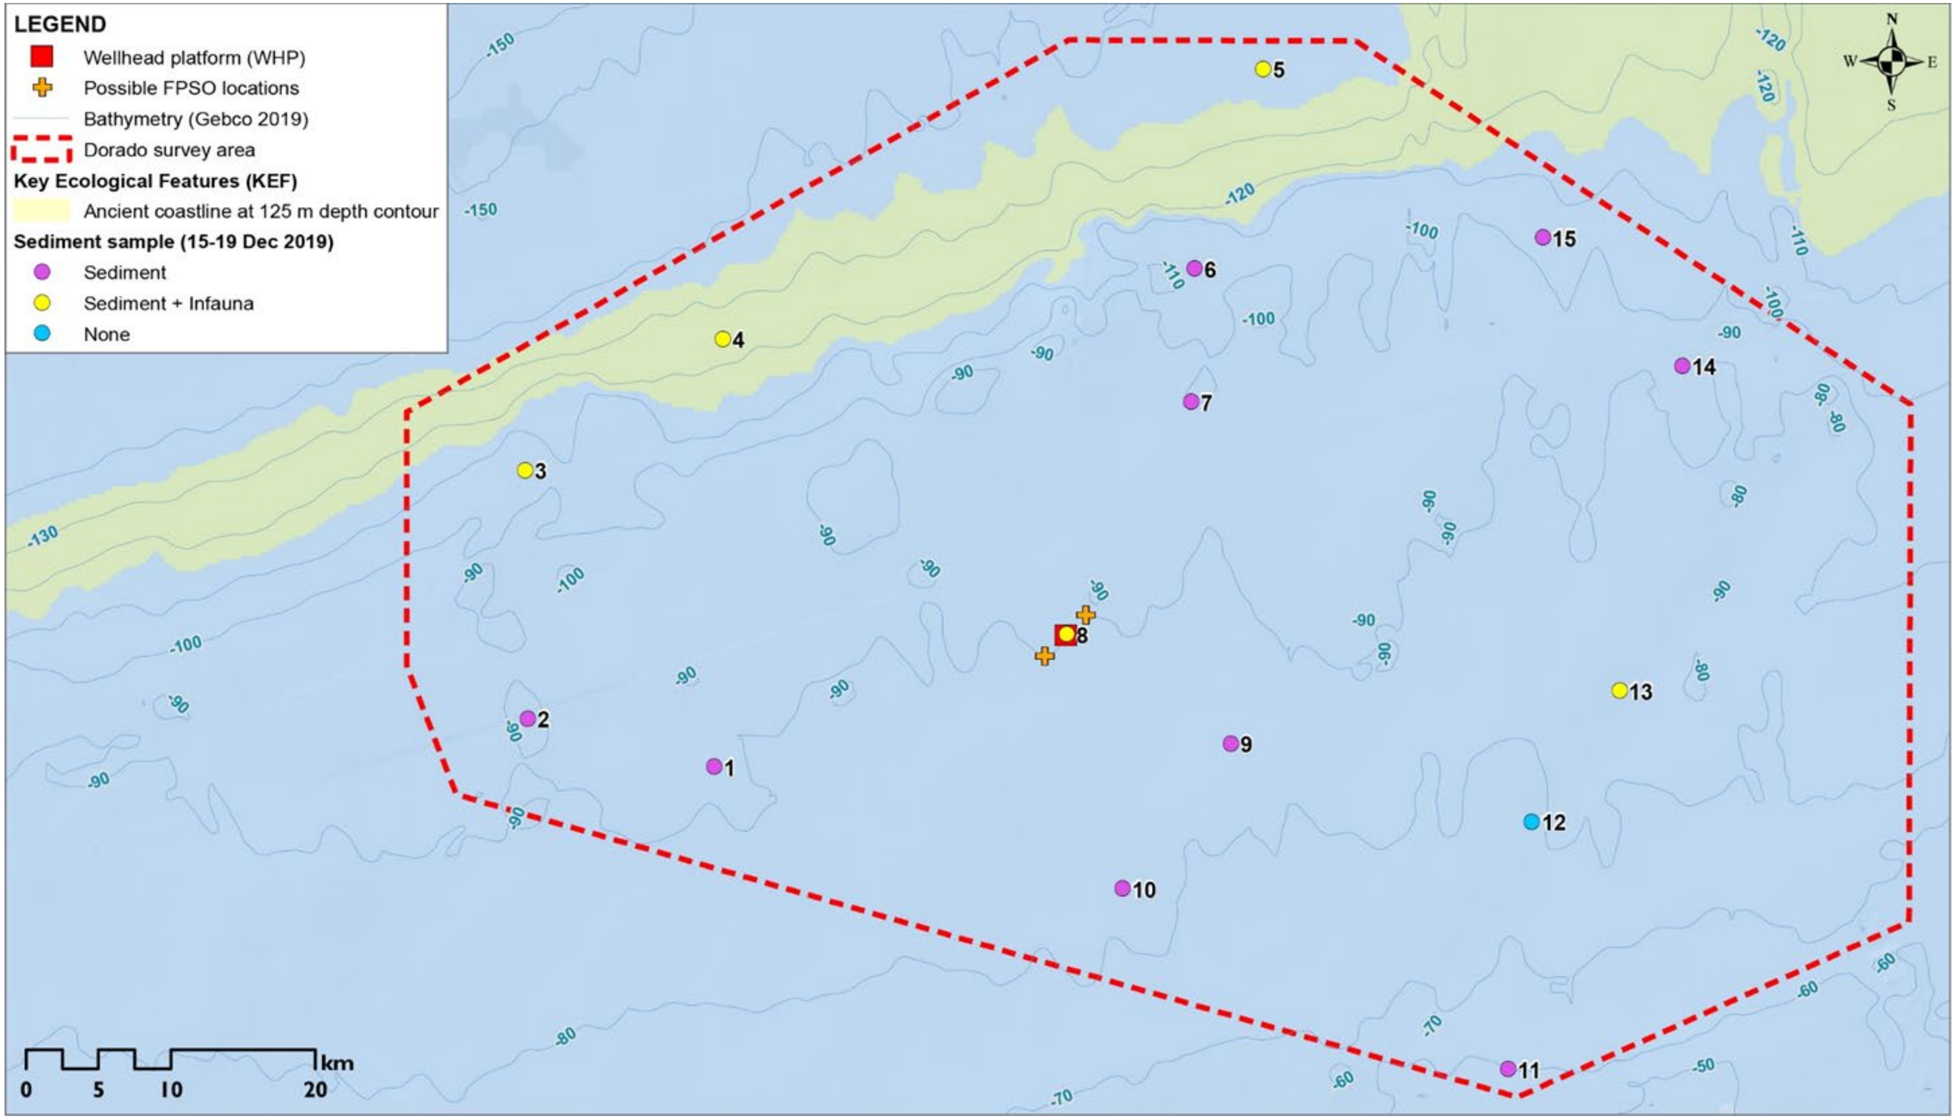

Figure 2-3: Sediment and infauna sampling sites

2.5.2.2 Infauna sampling

A 0.25 m^2 van Veen grab sampler was deployed from the stern of the survey vessel (Jetwave Maddison) using an A-frame (Plate 2-1), and lowered to the seabed at a rate of approximately 30 m per minute. A GPS position, time and water depth were recorded every time the grab hit the seabed. The grab was then recovered to the deck and lowered onto a pre-washed rubber mat.

The whole sample was removed from the grab onto the rubber mat and then sieved using a 1 mm mesh box sieve. Observations of the sample, including description of the sediment type and any conspicuous biota, were documented (see RPS 2020). The sediment and biota retained on the sieve were concentrated into one corner of the sieve and washed into a labelled sample bag with minimal sea water. To preserve the sample, 100% ethanol was added to the sample: diluting to a total concentration of approximately 80% ethanol in the seawater retained in the sample. The labelled sample bag was sealed, double-bagged, and transferred to a secure container for storage and transport.

The samples were transported to the Benthic Australia laboratory for sorting and taxonomic identification.

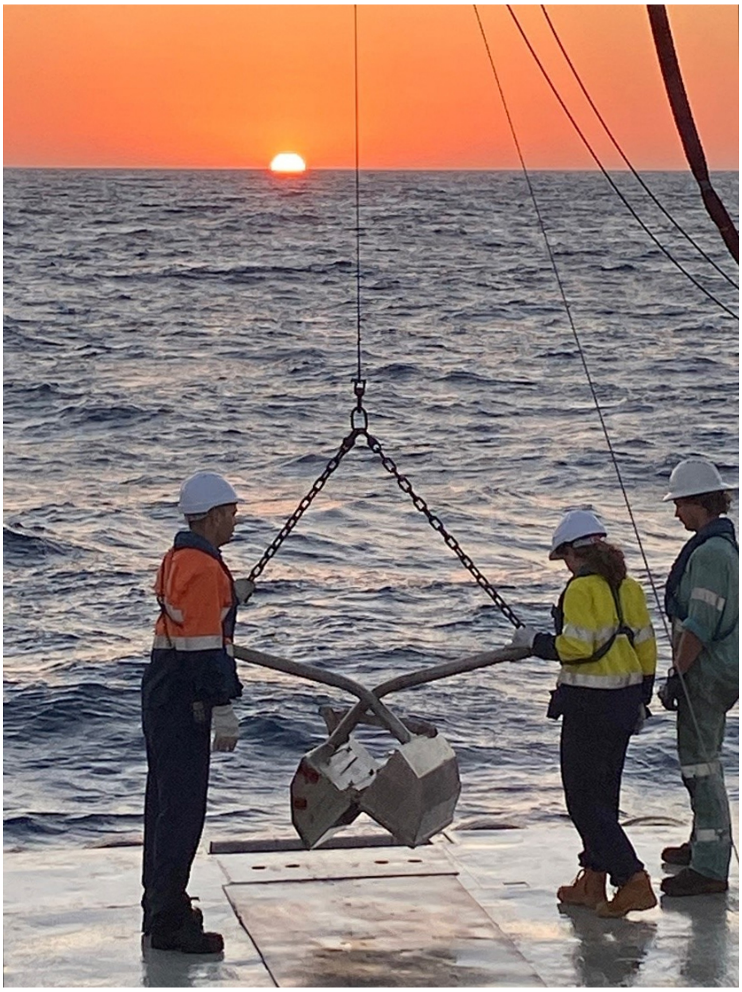

Plate 2-1: Deployment of van Veen grab sampler

2.6 Data analysis

2.6.1 Benthic habitats and macrofaunal communities

Benthic habitats were described by an experienced marine biologist during each transect, as described below. The high-level description of benthic habitats included water depth (ROV depth), seabed relief, substrate type and biotic habitats and epibiota (Appendix B).

Still images were extracted from the high resolution video imagery and used in descriptions of the main benthic habitats of the Survey Area.

2.6.2 Infauna identification

Infauna were picked from the sediment retained on the sieves by Benthic Australia. They were then analysed to the lowest practicable taxonomic level, with the abundance of each taxa recorded from each sample. A reference collection was prepared and provided to the Western Australian museum for curation.

2.7 Tappity habitat and biota classifications

The recording of bio-physical characteristics and densities of the benthic habitats and communities was largely based on the categorisation of Tappity because this was the primary data recording process during the survey. Other notes were also taken to provide more general habitat and biotic descriptions.

CSIRO's habitat classification scheme was followed when entering data on seabed habitat and biota types into the Tappity software. The Tappity classification scheme comprised pre-defined substrate and biohabitat descriptors, as listed below.

2.7.1 Substrate descriptors

- Soft mud
- Silt (sandy mud)
- Sand
- Coarse sand
- Sand waves/dunes
- Rubble (0.5 – 5 cm)
- Stones (5 – 25 cm)
- Rocks (>25 cm)
- Low relief reef
- High relief reef.

2.7.2 Biohabitat descriptors

- No biohabitat (no visible biological presence)
- Bioturbated sediment
- Tube polychaete beds (used by RPS in this case to capture the "biogenic turf"[1] commonly occurring in the Survey Area)
- Alcyonarians - dense
- Alcyonarians - medium
- Alcyonarians - sparse
- Bryozoans - dense
- Bryozoans - medium
- Bryozoans - sparse
- Seawhip garden - dense

[1] The specific composition of the biogenic turf could not be determined from the ROV imagery but is likely to comprise hydroids and other cnidarians, polychaete tubes and potentially bryozoans.

- Seawhip garden - medium
- Seawhip garden - sparse
- Gorgonian garden - dense
- Gorgonian garden - medium
- Gorgonian garden - sparse
- Sponge garden - dense
- Sponge garden - medium
- Sponge garden - sparse
- Hard coral garden - dense
- Hard coral garden - medium
- Hard coral garden - sparse
- Macroalgae - dense
- Macroalgae - sparse
- Rhodoliths
- Halimeda
- Caulerpa
- Sargassum.

2.7.3 Biota

- Solitary coral
- Mollusc
- Hydroid
- Crinoid
- Urchin
- Starfish
- Crab
- Holothurian
- Gastropod
- Ascidian
- Anemone
- Sea pen
- Commercial fish.

2.8 Additional descriptors

Hand-written field notes were also collected during the survey as a back-up for the digital dataset and to provide benthic habitat and community descriptions prior to CSIRO’s analyses. This allowed capture of biota and habitats not integrated into the automated Tappity system. These are listed below and used in the benthic habitat and community descriptions in Appendix B.

2.8.1 Seabed relief

- Flat
- Low relief reef
- Medium relief reef
- High relief reef
- Drop-off
- Sand ripples
- Dunes, sand ridges, sand waves.

2.8.2 Substrate type

- Silt
- Silty sand
- Sandy silt
- Sand
- Muddy sediment
- Sediment veneer (thin layer)
- Hard substrate (pavement reef)
- Rubble (<5 cm)
- Boulders (<25 cm).

2.8.3 Biotic habitats and epibiota

- Bare
- Biogenic turf
- Bioturbation
- Alcyonarians (soft corals)
- Sea pens
- Sponges (laminar, cup, branched)
- Sea whips
- Gorgonians (fans, branched)
- Hydroids
- Crinoids
- Others as described e.g. specific fish taxa.

3 RESULTS

3.1 Field observations

Field observations for each survey site are included in Appendix B. Appendix B also includes representative photographs from each site, and where more than one habitat type was observed on a transect, a photograph of each habitat type is included for that site.

The ROV followed the drift of the vessel and submerged clump which means the transect bearing tends to reflect the direction of seabed current in the area. The current directions were noted to change during the day probably due to tidal movements across the shelf.

3.2 Habitats

3.2.1 Soft sediment habitats

There were two main soft sediment habitat types, both of which were extensively represented across the Survey Area. These were:

- Flat, silty sand and silty mud with sparse epibiota dominated by biogenic turf and scattered sea pens, crinoids and anemones, bioturbated by small fish and invertebrates
- Low, probably mobile, sand waves supporting very little epibiota other than occasional sea pens and low density biogenic turf.

Sediments in the deeper offshore areas tended to comprise silty fine sand sediments (Plate 3-1). Over most of the Survey Area, however, the seabed sediments ranged from coarse to silty sand (Plate 3-2, Plate 3-3). A common feature observed across the Survey Area was biogenic turf (likely to comprise small hydroids, bryozoa and potentially worm tubes). In some areas, small sand waves (generally <0.2 m high but up to 0.5 m high) were scattered across the Survey Area (Plate 3-4). At several sites, coarse-sand waves were interspersed with patches of fine silty sediments in a semi-regular pattern of linear sand waves. Sand waves were generally composed of coarser sands, often with small-scale surface ripples (Plate 3-4).

Plate 3-1: Flat silty mud sediment with signs of bioturbation (e.g. fish burrows) and low density of biogenic turf

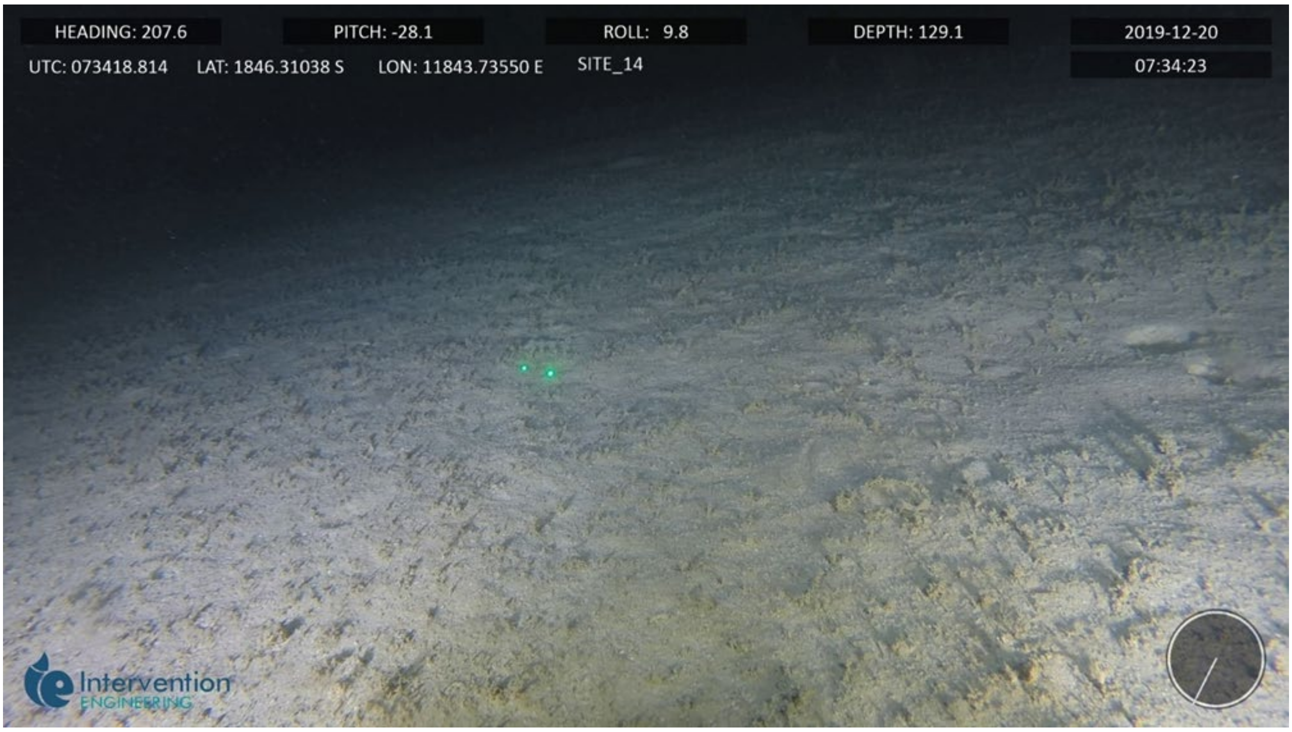

Plate 3-2: Flat, silty sediment with medium density of biogenic turf

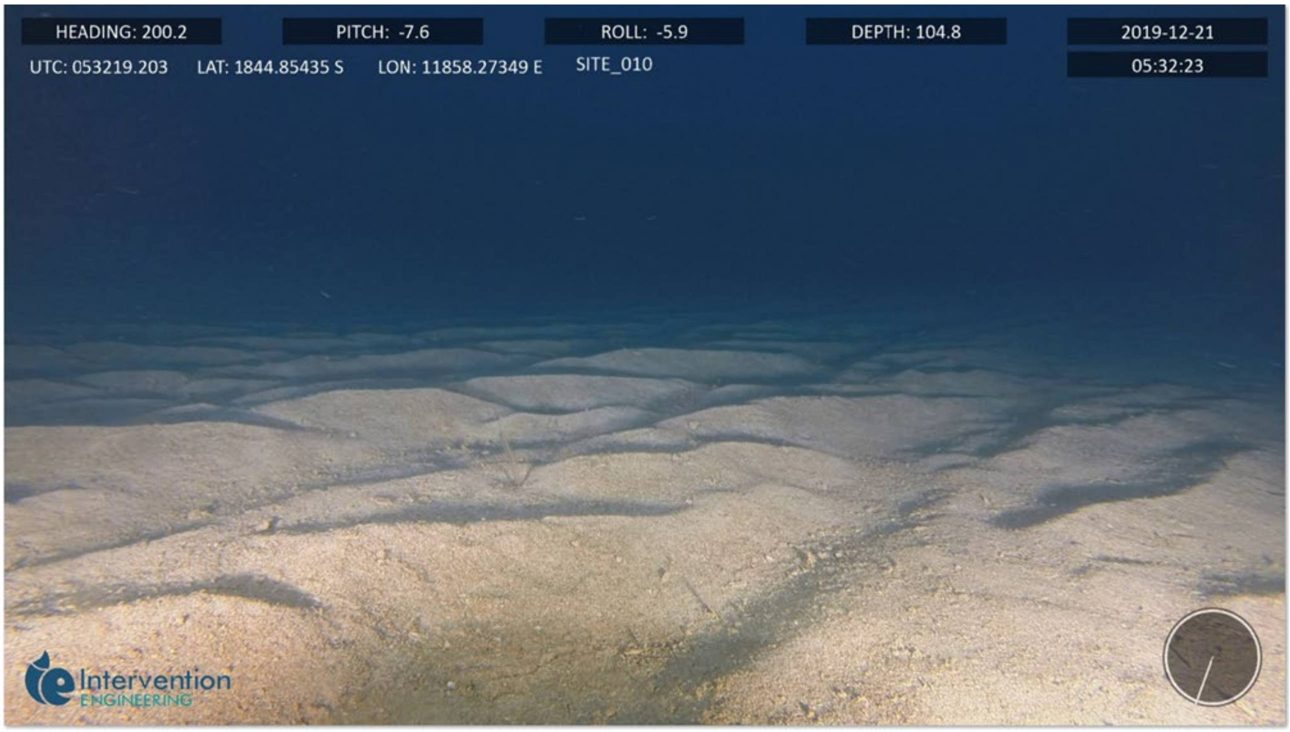

Plate 3-3: Coarse, rippled, flat, sandy sediment with very low density of biogenic turf and epibiota

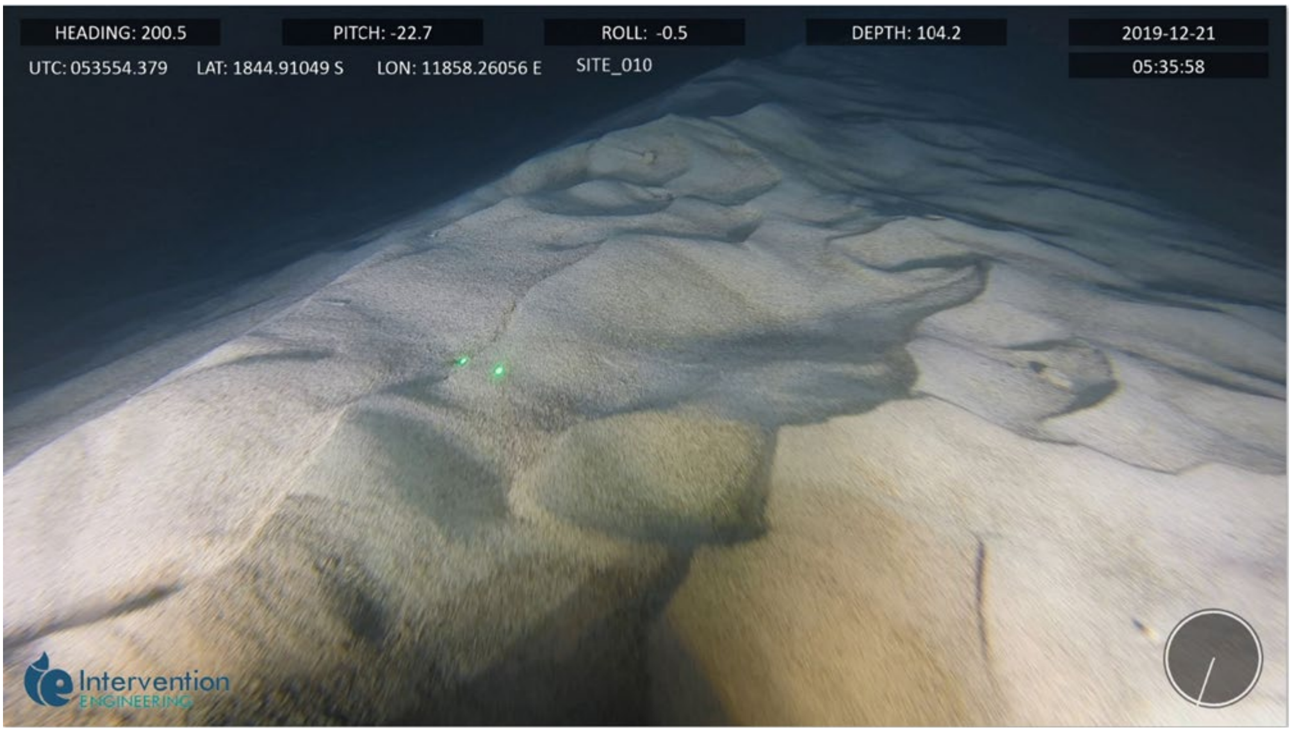

Plate 3-4: Coarse sand wave with surface ripples and very low density of biogenic turf and epibiota

3.2.2 Hard substrates

There were two main hard substrate habitat types, which were patchily distributed across the Survey Area. These were:

- Pavement reef with a veneer of sediment and scattered rubble and small boulders, which support filter-feeding assemblages including gorgonians, alcyonarians, sea whips, hydroids and sponges
- Low rocky ledges and reef substrates supporting abundant fish and generally supporting distinct communities of epibiota; however one of the sites surveyed had low densities of epibiota.

Large areas of seabed appeared to have an underlying pavement (low profile) reef, broken pavement or consolidated hard substrate with a variable thickness veneer of soft sediment on the surface. The presence of organisms which typically attach to hard substrates, for example gorgonians, protruding from the sediment veneer confirmed the presence of the underlying hard material for colonisation (e.g. Plate 3-5).

Another indicator of underlying hard substrate was the presence of scattered and partially buried boulders which were widespread across the Survey Area.

Low to medium relief reef was only observed at Site 25. The low rocky ledges at this site supported an abundant assemblage of mobile fish (*Lutjanus* spp.) and were covered with encrusting biota (e.g. bryozoans) but very sparse larger epibiota on the exposed rock (Plate 3-6, Plate 3-7). This reef was approached from the north-east and as the transect ran across the reef it changed from exposed rocky ledges to buried reef. The low densities of large epibiota suggests the reef is likely to have been recently exposed and is regularly buried and uncovered. The reef to the south-west comprised pavement reef with a thin veneer of sediment and sparse filter-feeding assemblage (Plate 3-8). While this assemblage was sparse it was more developed than the exposed low-medium profile reef to the north-east.

Plate 3-5: Pavement reef with thin veneer of sediment and emergent filter-feeding organisms attached to the rock

Plate 3-6: Low to medium relief reef with low rocky ledges and abundant Lutjanid fish

Plate 3-7: Low to medium relief reef with thin sediment veneer and very sparse epibiota

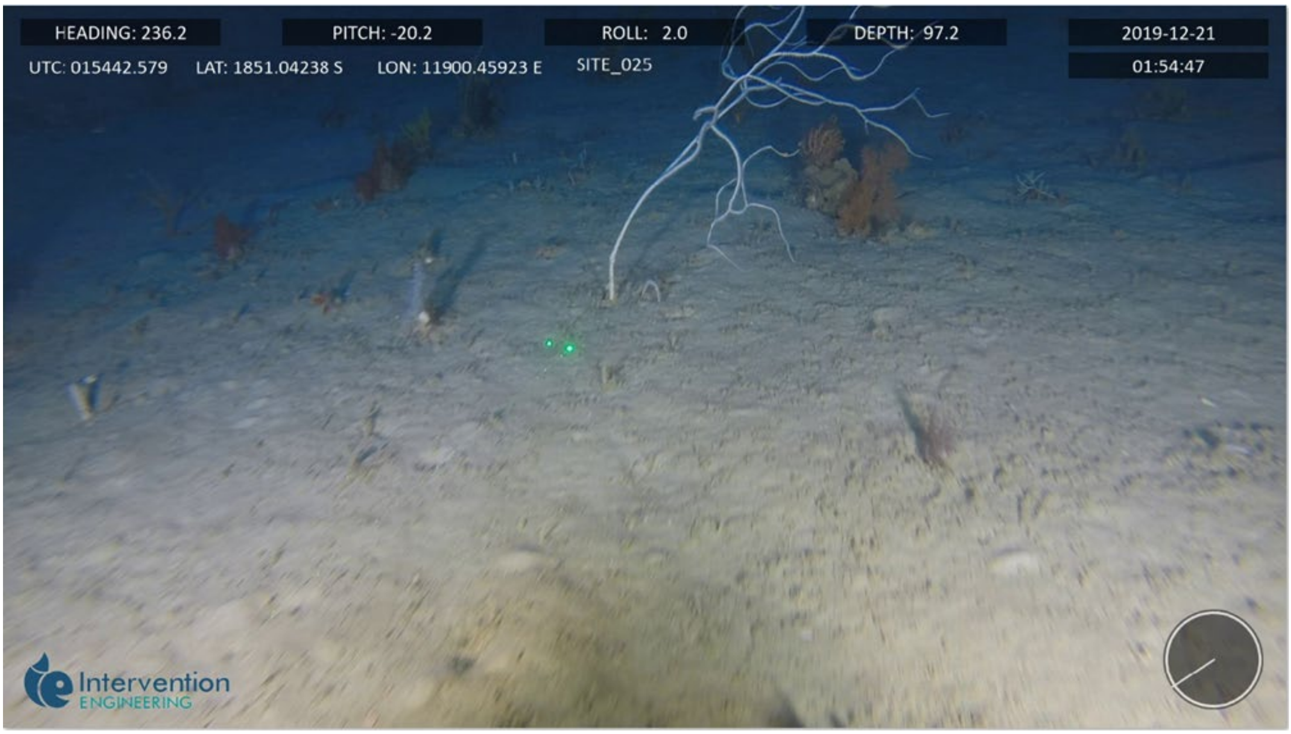

Plate 3-8: Low relief reef with thin sediment veneer and sparse epibiota

3.2.3 CSIRO ecotype model

CSIRO used the ROV survey data collected in this study to update their regional dataset and re-modelled the ecotypes in the area. The boundaries and definitions of the ecotypes varied slightly following this re-assessment, as described by Keesing et al. (2020).

3.3 Infauna

A total of 94 individuals, representing 49 taxa from 4 phyla, were recorded from the five samples collected. The full dataset can be found in Appendix C. Taxonomic nomenclature was checked using the World Register of Marine Species match taxa tool (WoRMS editorial board 2020). This tool provided the current accepted scientific name, the scientific authority, and taxonomic hierarchy for each taxa.

Descriptive statistics of infaunal community data describing the number of species (S), abundance (N), Margalef's species richness (d), Pielou's evenness (J'), Shannon-Weiner diversity (H') and Simpson's alpha diversity index (1-λ) are presented in Table 3-1. Species richness and abundance were lowest at site 5 (8 individuals from 5 taxa) and greatest at site 8 (39 individuals from 26 taxa). All other metrics were also lowest at site 5 and greatest at site 8, with the exception of Pielou's evenness, where the highest evenness score was recorded at site 4 (J' = 0.983).

Table 3-1: Infaunal community descriptive statistics

Site	S	N	d	J'	H' (log^e)	1-λ
Site 3	18	23	5.422	0.965	2.789	0.972
Site 4	8	9	3.186	0.983	2.043	0.972
Site 5	5	8	1.924	0.861	1.386	0.786
Site 8	26	39	6.824	0.959	3.126	0.974
Site 13	12	15	4.062	0.978	2.431	0.971

Key: S = species richness, N = abundance, d = Margalef's species richness, J' = Pielou's evenness, H' = Shannon-Weiner diversity, 1-λ = Simpson's alpha diversity index.

The infaunal composition analysed at the phylum level is presented in Table 3-2. Annelid worms were the most abundant phylum at sites 3 and 5, whereas arthropods (mainly crustaceans) were most abundant at sites 8 and 13. Both phyla were dominant at site 4. The greatest abundance of echinoderms and molluscs were recorded at site 8. Taxa recorded were representative of a range of trophic levels, from filter feeders, predators/scavengers and omnivores, deposit feeders, and taxa that are able to utilise a number of different feeding strategies to respond to living in harsh environments.

Table 3-2: Infaunal community composition (to phylum level) and abundance at each site

Phylum	Site 3	Site 4	Site 5	Site 8	Site 13
Annelida	11	4	5	9	2
Arthropoda	9	4	3	21	12
Echinodermata	1	0	0	5	0
Mollusca	2	1	0	4	1

The cumulative occurrence of taxa at the five sites provided an indication of the variability between sample sites across the Survey Area. Only one taxon (a representative of the amphipod crustacean family Phoxocephalidae) was recorded from all five sites. This family of amphipods comprises permanent burrowers, predators of a range of vertebrate and invertebrate larvae and juveniles, and inhabits a range of muddy and sandy sediments (Oliver et al. 1982).

A species accumulation curve was generated to estimate whether the five samples collected adequately represented the biodiversity in the Survey Area. The species accumulation curve was generated by recording the total number of taxa for each increasing level of sampling effort (i.e. 1, 2, 3, 4 or 5 grabs), with the order of sites randomised. This process repeated five times to prevent bias. The results were plotted and a trendline fitted to the data (Figure 3-1). The R^2 value indicated that a linear trendline was the best fit with the data, which indicated that:

- Approximately ten new taxa were recorded for each additional grab.
- Five samples were insufficient to identify a reduction in the slope of the accumulation curve.
- The asymptote had not been reached.

This is important information that can be used to inform the planning of any potential future monitoring studies in the Dorado area.

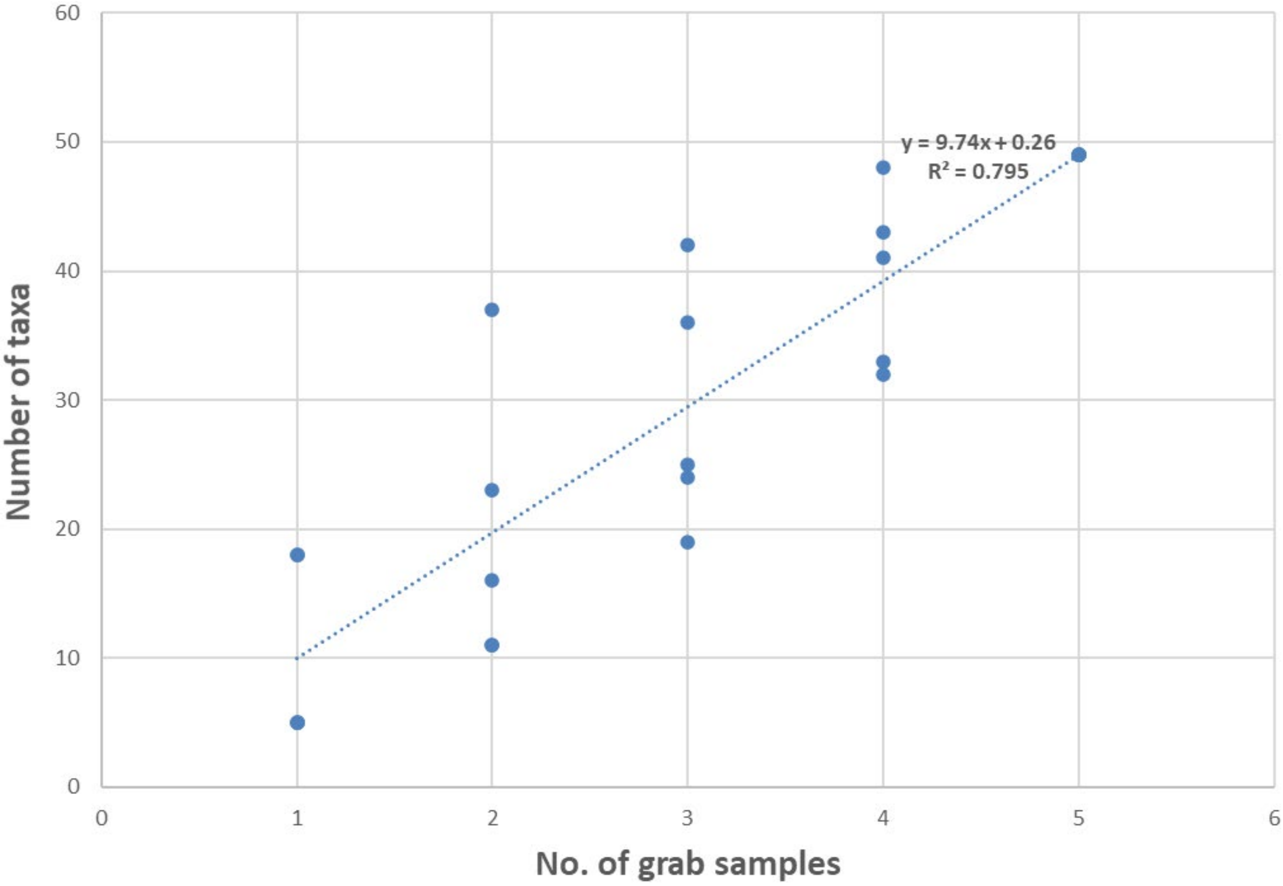

Figure 3-1: Best-fit species accumulation curve, showing R2 value and slope equation

The infaunal communities at each site can be summarised as follows:

- Site 3 (in water depth 98 m BSL; nearest to ROV site 31) was dominated by annelid worms, comprising around half of the total individuals recorded at this site (11 individuals from seven taxa). The arthropods comprised amphipods (Melitidae, *Ampelisca* spp. and Phoxocephalidae), an isopod (Anthuroidea), a mantis shrimp (Squillidae), a tanaid and a cumacean. Molluscs were represented by infaunal bivalves (*Tellina* spp.) and an aplacophoran. A single sea cucumber (Dendrochirotida) represented the echinoderms. Many of these taxa were tube-dwelling or burrowing biota, with most commonly found associated with finer muds and sands. This aligned with the sediment type found at this site, which was very poorly sorted gravelly muddy sand.
- Site 4 (water depth 118 m, nearest ROV site = site 17) was equally represented by arthropods (caprellids, a phoxocephalid amphipod and a goneplacid decapod) and annelids (*Magelona* sp., a sabellid fan worm, a syllid polychaete and *Echiura* sp. (spoon worms)). The molluscs were represented by a single aplacophoran. These taxa are generally characteristic of sands and muds. The sediment type at this site was characterised as poorly sorted, slightly gravelly, muddy sand. The caprellid amphipods also indicate the likely presence of hydroids or bryozoans. Caprellids have adapted to inhabit these epibiota, and their physiology is designed to cling on to and blend in with thin, branching structures. This camouflage is both for protection from predators (such as demersal fish), but also to ambush prey such as smaller crustaceans, small worms and protozoans. Although mainly predatory, caprellids are omnivorous, they also feed on detritus and are capable of filter feeding. Biogenic turf was observed at a range of densities across the Survey Area (e.g. see Section 4.6), and may provide habitat for these cryptic ambush predators.

- Site 5 (water depth 135 m; nearest ROV site = site 3) was found to have the lowest number of species and abundance, and was characterised by two annelid taxa (the spionid polychaete *Prionospio* spp. And catworm *Aglaophalamus* sp.) and three arthropod taxa (Caprellidae, the gammarid amphipod Phoxocephalidae, and the lyssianassid amphipod *Platyschinopus* sp.). These taxa are indicative of sandy habitats, with epibiota such as hydroids or bryozoa present. Particle size analysis identified that the sediment could be characterised as very poorly sorted gravelly muddy sand.
- Site 8 (water depth 85 m; nearest ROV site = wellhead platform site) was the most diverse site sampled, and dominated by arthropods (the amphipods *Ampelisca* sp., Aoridae, Melitidae, Corophiidae and Phoxocephalidae; the isopods Anthuroidea, Sphaeromatidae and Valvifera; Gonodactyloid mantis shrimps; decapod crustaceans represented by brachyurans and Rananidae (frog crabs); and copepods and Leptostracans). The annelid worms comprised *Lumbrineris* spp, spionids such as Prionospio spp., *Glycera* spp., the nephtyd polychaete *Aglaophalamus* spp., the eunicid *Rhamphobrachium* spp., and *Orbinia* spp Echinoid taxa present included infaunal urchins Echinoidea and *Echinocyamus* spp., and the brittlestar *Ophioplax* spp. The molluscs were represented by *Tellina* spp. and *Paphia* spp. (both infaunal bivalves), Mytilidae (mussels) and Skeneidae (small to very small gastropods). As would be expected in poorly sorted gravely sand (see sediment report), the infaunal assemblages were characterised by higher abundances of crustaceans, with several larger and more robust taxa capable of digging into coarser sediments (e.g. frog crabs), infaunal urchins that feed on organic material that accumulates in the pore spaces between the larger grains, and taxa that hunt for prey at and near the sediment surface (e.g. *Aglaophalamus* spp.).
- The infaunal assemblage at Site 13 (water depth 84 m; nearest ROV site = site 39) was dominated by arthropods (the amphipods Phoxocephalidae, Corophiidae, Oedicerotidae and Zobrachoidae; the isopods *Gnathiidae* spp. and Sphaeromatidae, and tanaids), with relatively low representation by annelids (*Glycera* spp. and *Syllidae* spp.) and molluscs (*Barbatia* sp., the bearded ark clam). Although the sediment in the grab samples was characterised as moderately sorted slightly gravelly sand, the taxa indicated that some consolidated or hard substrate is likely to occur in area. For example, Gnathiid isopods are often associated with sponges. Syllid polychaetes are active predators on rock and sandy substrate, hunting in crevices and on epibiota. The bearded ark clam is found at the sediment-water interface, securing itself to consolidated/hard substrate and other epibiota with byssus threads.

3.4 Epifauna

3.4.1 Soft sediment biota

Large expanses of the seabed were characterised by soft sediment habitats supporting low density epibiotic assemblages. In addition to the bioturbation by a range of biota from infaunal tube worms, crustaceans, bivalves and echinoderms, most sedimentary habitats were bioturbated by fish such as gurnards and gobies, to larger fauna, probably fish, which had left large feeding scars on the seabed. Some burrow-dwelling species of fish also adapt their burrow entrances to provide cover from predation. They achieve this by excavating a series of shallow trenches around their burrow in which they can prevent their body being silhouetted above the seabed, whilst being able to observe the sediment surface in the vicinity of their burrows as their eyes are high on their head (e.g. Plate 3-1).

The (visibly) dominant epibiota of the soft sediment habitats included attached or sessile organisms including anemones, sea pens, hydroids, crinoids and sponges, and mobile organisms including sea stars, sea urchins and small fish. Buried or partially-buried fauna including crinoids, sea urchins and molluscs were not reliably detected on the ROV transects. Biogenic turf was present in most areas of soft sediments, with turf densities very low in the more mobile coarse sandy sediments and higher in finer sediments (Plate 3-1, Plate 3-2).

Sand waves tended to support very sparse epibiotic assemblages. Sandy sediments with ripples had fewer signs of bioturbation by infauna, such as holes, burrows, scrapes and tracks.

3.4.2 Hard substrate biota

Exposed hard substrates supported low- to medium-density, filter-feeding assemblages which were generally dominated by small gorgonians, sea whips, soft corals and sponges (Plate 3-9, Plate 3-10). The focus of the survey was on habitat characterisation and areal coverage, so the transects were flown continuously and the ROV did not stop to identify organisms along the way. The identifications were therefore high-level but provide a good indication of the generic types of assemblages that occurred on the hard substrates.

The taxa which could be tentatively identified from the ROV footage included:

- Gorgonian fans (including Acanthogorgiidae, Plexauridaer)
- Soft corals (including Alcyoniidae, Nephtheidae)
- Sea whips (including Ellisellidae)
- Hydroids (including Plumulariidae, Aglaopheniidae)
- Sponges (including Raspailiidae).

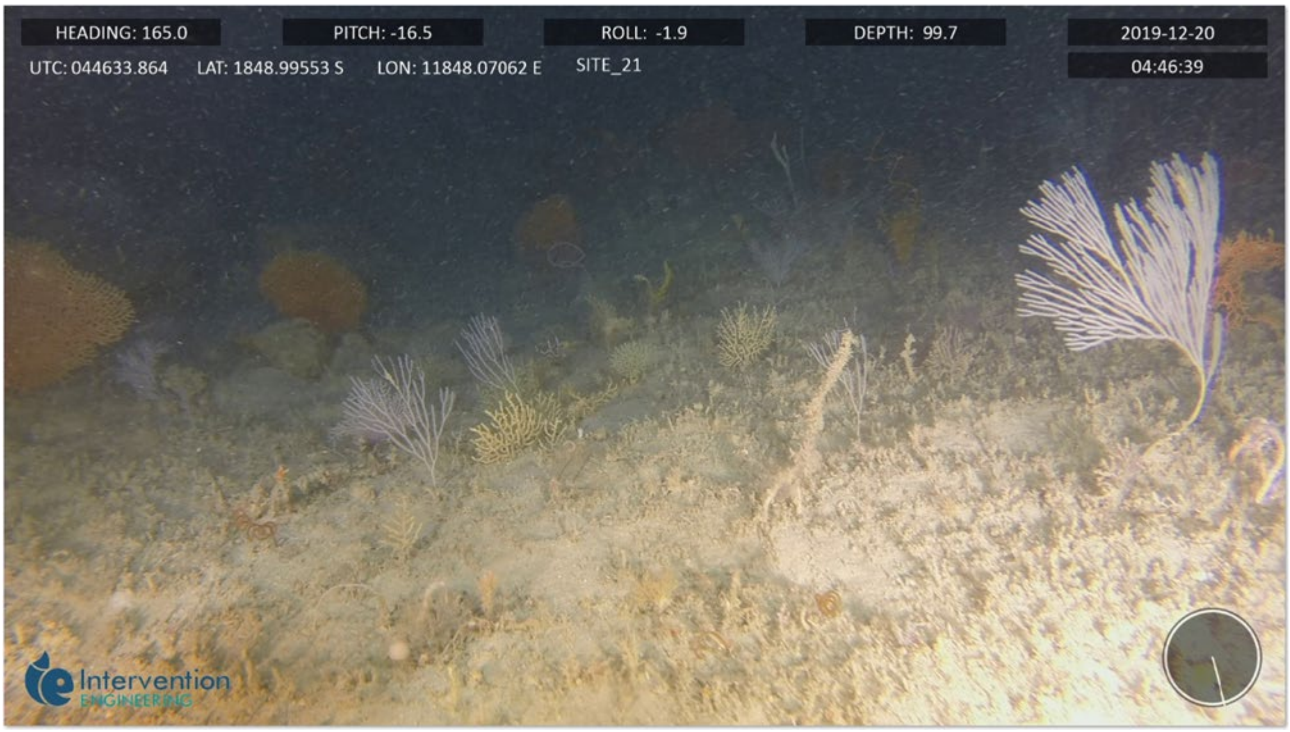

Plate 3-9: Medium-density, gorgonian-dominated, filter-feeding assemblage on pavement reef

Plate 3-10: Medium-density, filter-feeding assemblage of sponges, soft corals, sea whips and gorgonians on pavement reef

3.5 Demersal vertebrate fauna

Large, predatory mobile fish such as trevally were observed occasionally on or near the seabed (Plate 3-11).The ROV sampling technique is not suited to representative sampling of fish assemblages in open water and while some observations were recorded, these data are considered opportunistic sightings rather than community descriptors. The large trevally in Plate 3-11 are regular visitors to the demersal zone in the Survey Area. A recent baited remote underwater video systems survey in the Ancient coastline KEF adjacent to the Dorado Survey Area recorded two different species of trevally (the longnose trevally, *Carangoides chrysophrys*, and the giant trevally, *Caranx ignobilis*) in around half of the 45 deployments, which were commonly among the most abundant species recorded (RPS/UWA 2019).

The lutjanid snappers at Site 25 were aggregated around the reefal structure and tended to remain near the reef when the ROV approached. The shoal of snapper was dominated by brownstripe red snapper, *Lutjanus vitta* (Plate 3-12), but there was a mix of species in the shoal including other lutjanids (Plate 3-13).

Small fish were commonly associated with sediment habitats, where they were typically living on the seabed (e.g. flatfish), burrowing into the sediment (e.g. gurnards - Plate 3-13), or part of the mobile demersal ichthyofauna (e.g. trevally).

Elegant sea snakes (*Hydrophis elegans*) were observed on the seabed during the survey and appeared to be foraging undisturbed (Plate 3-14). They were observed in deep water (with one recorded at 134 m) and may occur across the area as they were commonly observed at the surface by survey personnel. However, they are typically found in shallower water (DAWE 2020).

3.6 Wellhead platform site

The WHP was surveyed with one 500 m transect running from 250 m south-west of the WHP site, through the site and 250 m to the north-east of the site. The seabed was very flat with a depth difference of less than 0.5 m across the transect (~88.5 m to 89 m). It was characterised by silty sand, with scattered pebbles (<5 cm rocks), very few larger cobbles or boulders and no exposed hard substrate. The silty seabed supported extensive mats of biogenic turf and a very sparse epibiota assemblage, including urchins, larger hydroids, and sea pens. No hard substrate filter-feeder assemblages were observed.

Representative photographs are provided below (Plate 3-15, Plate 3-16, Plate 3-17, Plate 3-18, Plate 3-19).

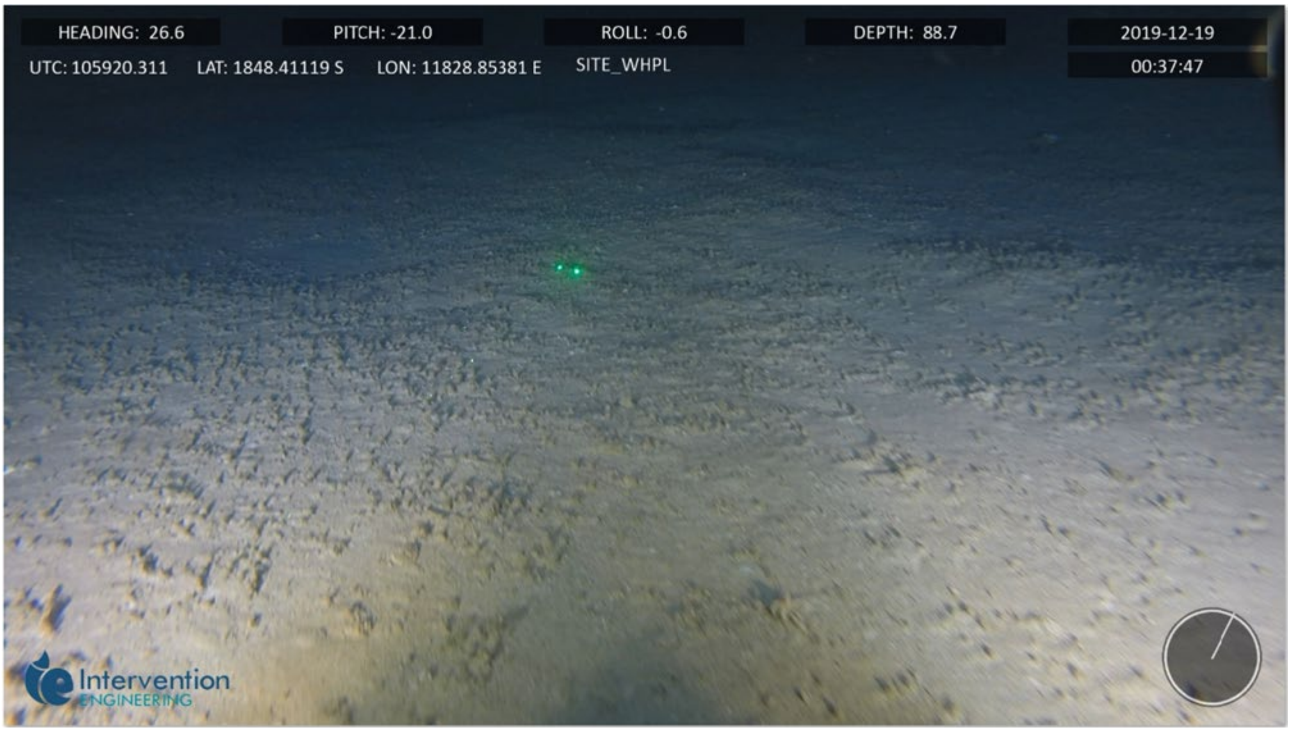

Plate 3-15: Start of transect to south-west of WHP site showing medium density biogenic turf on silty sand sediment habitat

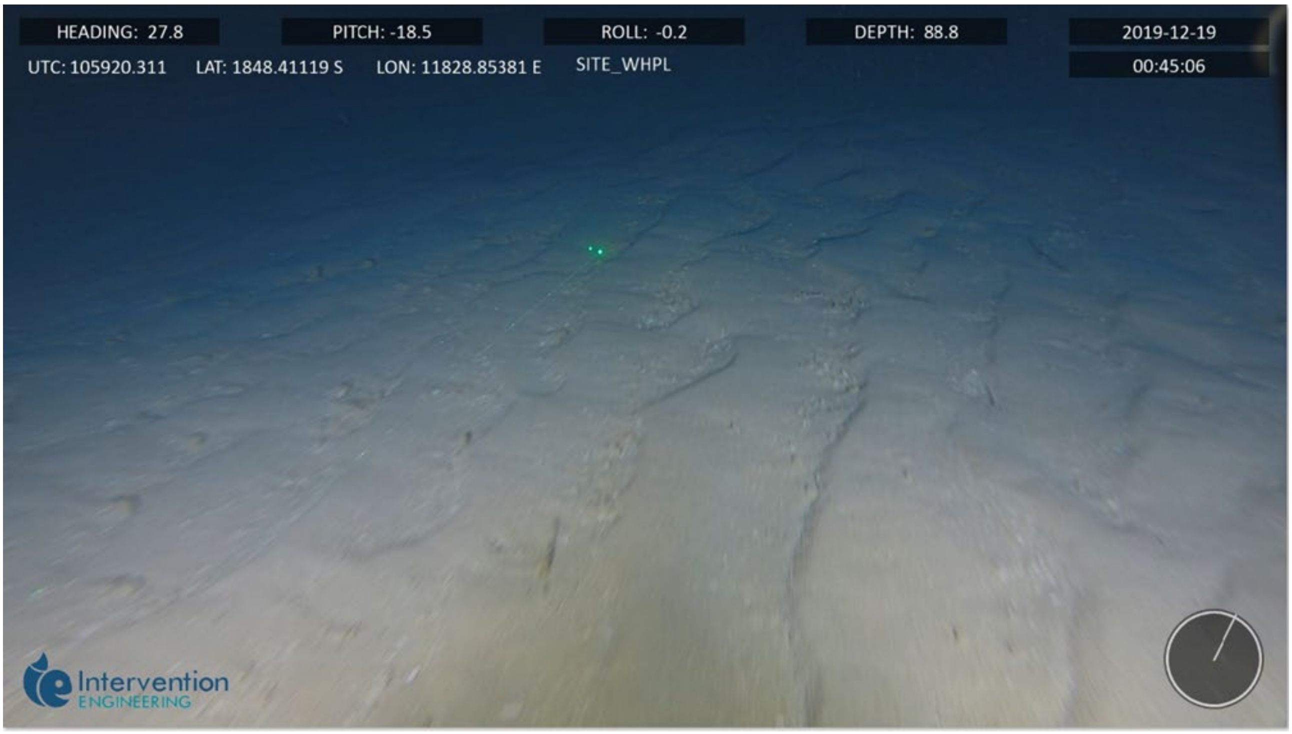

Plate 3-16: Small patch of bare rippled sand and rubble to south-west of WHP site with very low density biogenic turf

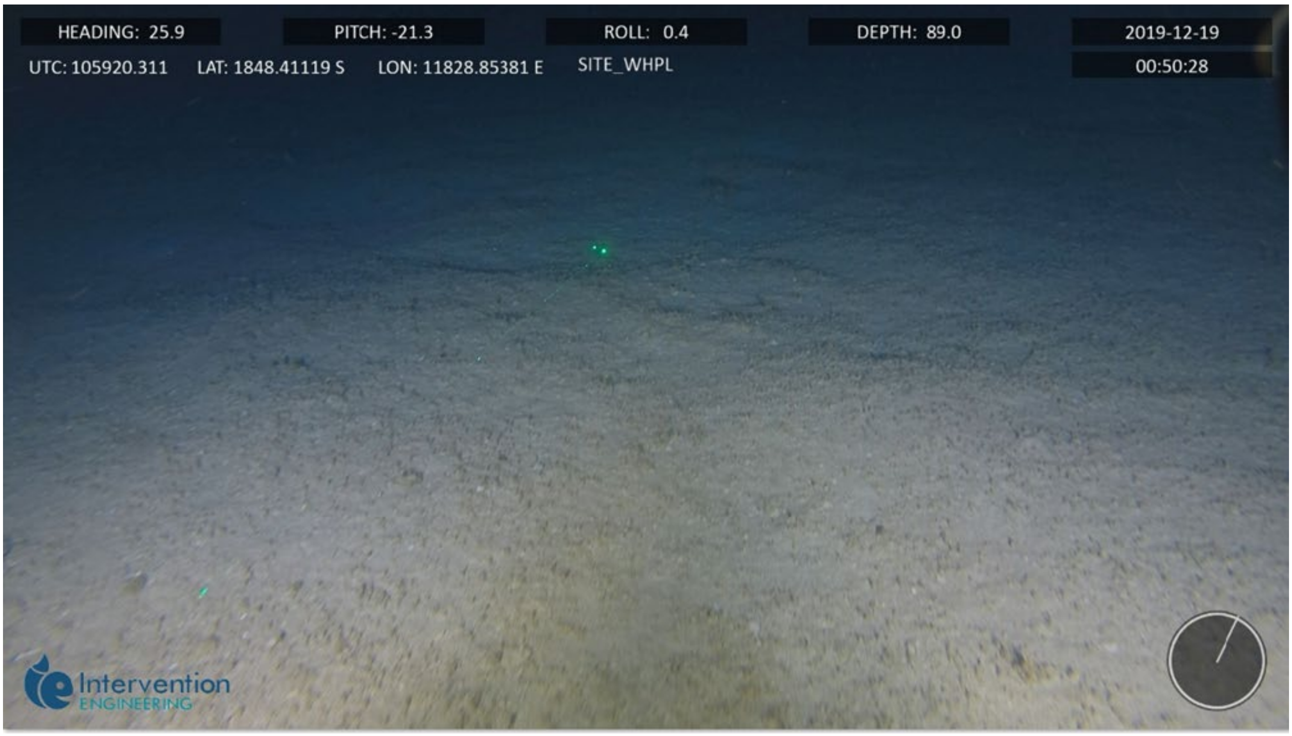

Plate 3-17: WHP site (mid-transect) with medium density biogenic turf on silty sand sediment habitat

Plate 3-18: Very sparse epibiota near WHP site (mid-transect) with sea urchin and sea star

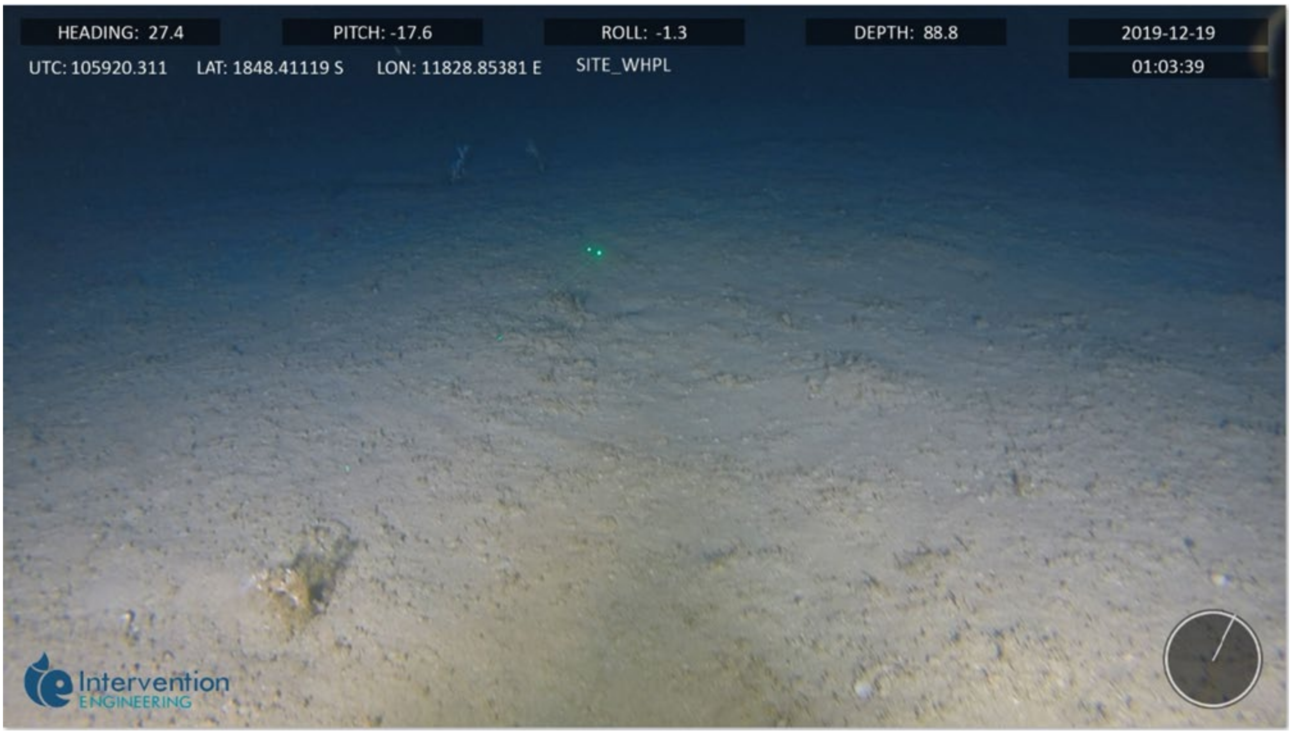

Plate 3-19: End of transect to north-east of WHP site with medium density biogenic turf on silty sand sediment habitat

3.7 Ancient coastline KEF

Five survey sites were inside the Ancient coastline KEF (Figure 3-2). These sites (5, 7, 14, 16, 26) are described in Appendix B. They were all soft sediment habitats with sparse epibiotic communities similar to many other parts of the Dorado Survey Area. There were no records of any significant benthic features; for example, no high profile reef with abundant fish, or any feature of particular conservation significance or importance to the ecology of the region were observed.

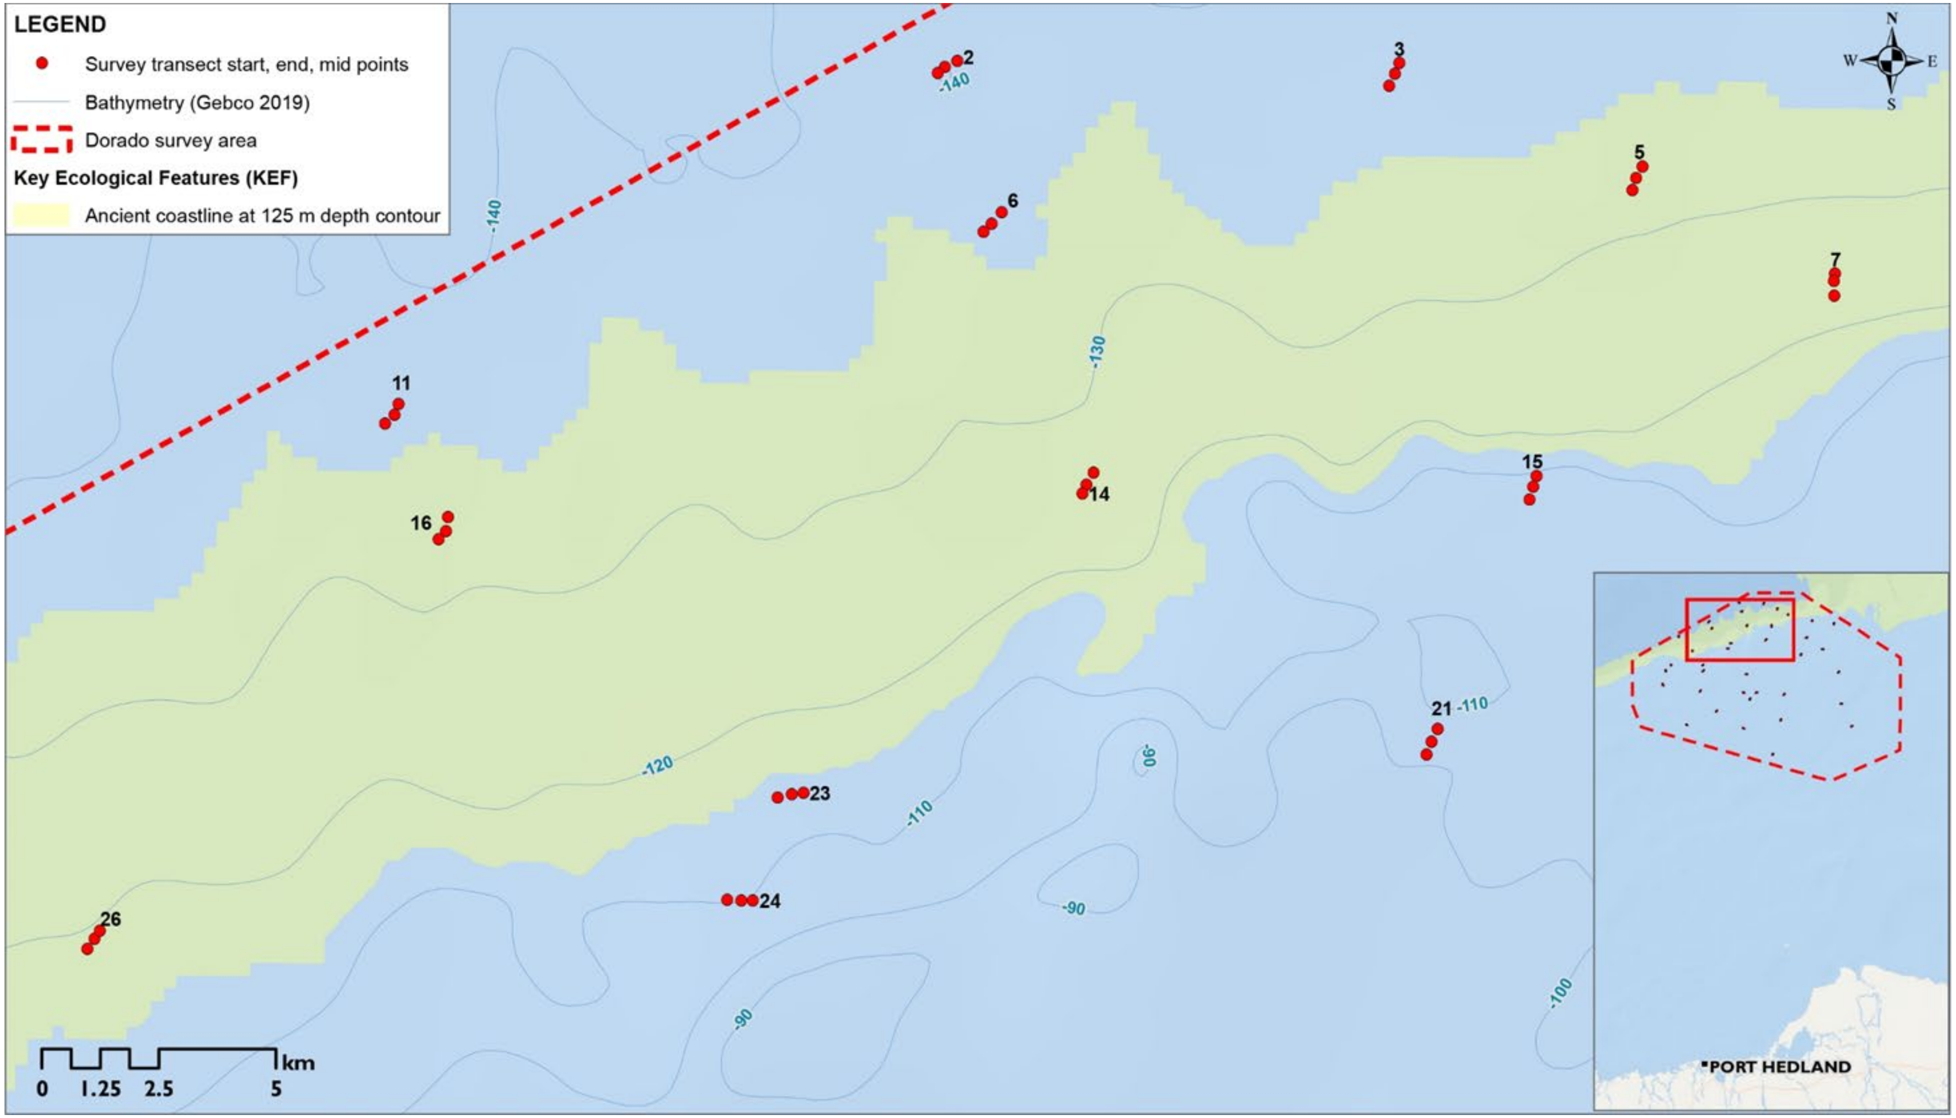

Figure 3-2: ROV transect sites over the ancient coastline KEF (green)

4 DISCUSSION

4.1 Benthic habitats and communities in the Survey Area

The benthic habitats of the Survey Area comprised two overarching sediment types – silty sand and coarser mobile sands. Low relief hard substrate habitats were also recorded across the Survey Area. These findings align with those found in recent geophysical surveys (e.g. Fugro 2015, Neptune 2019a), where two main seabed types were identified from side-scan sonar data. Particulate sediment habitats were more widespread and often supported sparse to medium density biogenic turf communities in areas where the sediments were finer and appeared more stable (i.e. not rippled by seabed currents, and/or with higher density biogenic turf). Areas of coarser bare sand were generally rippled, indicating they are being moved by seabed currents. These more mobile sediments tend to support less well-developed epibiotic assemblages, and may cause episodic inundation of finer sediments and hard substrate habitats.

It appears most of the area of soft sediment is underlain by a hard pavement reef, broken pavement or consolidated hard substrate. Where the reef was exposed, it had been colonised by epibiota. The epibiotic assemblages were dominated by filter-feeding organisms, which is typical of the North West Shelf.

It was apparent from the video transects that soft sediments throughout to area are bioturbated to varying extents. Infaunal communities were generally characteristic of sediment types, which were mainly found to be either muddy sand or sand (with shell/gravel) and indicated the presence of nearby epibiota (e.g. hydroids, bryozoans and sponges). A number of taxa recorded are capable of adopting several feeding strategies from different trophic levels (e.g. carnivores, scavengers able to filter feed), which is indicative of the harsh and changing environment often found in mobile sand wave habitats.

The distribution of the regional ecotypes across the Survey Area is described in the CSIRO report (Keesing et al. 2020) and the data from the current survey have been used to update the ecotype model with the main habitat types in the area. Refer to Keesing et al. (2020) for a map of ecotypes of the area and broader region.

4.1.1 Habitats in the Dorado Survey Area

The benthic habitats and communities were all well represented across the Survey Area. The habitats included areas of flat, silty sand sediments, with low to medium density biogenic turf, and areas of hard substrate with a veneer of sediment, supporting sparse to medium density filter-feeding assemblages.

The WHP site was flat and featureless and comprised soft sediment habitats and biota which were very well represented in the area. No features of high conservation significance or commercial fish habitat value were observed. The homogeneity of the transect indicates this seabed type is likely to continue well beyond the surveyed transect. This interpretation is supported by recent geophysical and geotechnical surveys (e.g. Fugro 2015, NGI 2017, Neptune 2019a, Neptune 2019b, Neptune 2019c).

The proposed FPSO sites had a combination of soft sediment and hard substrate habitats and communities. Both of these habitat types and the associated assemblages are well represented in the Survey Area. While the hard substrate assemblages have higher local environmental value, they are not significant in the broader area and there are equivalent or better examples at other sites, for example at Site 21, which had extensive low to medium density filter-feeder communities.

The biogenic turf recorded during the present study is worthy of note. It is likely to occur widely, but is often simply overlooked. This habitat component appears to stabilise sediments to some degree (especially at high densities), and is likely to be habitat for small epibiota, e.g. caprellid amphipods, annelid worms and molluscs, and it may provide a food source for demersal fish.

4.1.2 Vertebrates

Mobile demersal fish, including commercially important species, were uncommon. This may partly reflect their under-representation in the video transect data due to their active avoidance of the ROV and the absence of habitats that they may aggregate around, such as high profile reef. The one area of higher profile reef at Site 25 supported a high abundance of lutjanid snappers (cf. *Lutjanus vitta, Lutjanus* spp.) which were not observed in surrounding sediment habitats or on pavement reef habitats. This indicates they tend to aggregate in areas of higher habitat complexity and will be largely absent from, or transient visitors in, the greater proportion of the Survey Area which are characterised by flat seabed morphologies.

No aggregations of commercially-important fish species were observed on any transect other than Site 25 (~100 m water depth). The sites in the remodelled ecotype zone 2, which broadly represents the Ancient coastline KEF (Keesing et al. 2020), did not appear to have any habitat of any greater value to fish than any other site in the broader Survey Area. This probably reflects the absence of emergent or high relief reef habitat in the KEF area.

Small benthic fish associated with seabed habitats such as burrows and boulders, and small fish living on the sediment surface such as gurnards and flatfish, were observed at very low to low densities on most transects. Estimates of fish density should be considered as underestimates though, as the presence of the ROV (including lights) are known to disturb of startle fish, which may have either found refugia or left the area covered by the lights before they could be recorded or identified.

Large pelagic fish including marlin and several species of shark were observed at the sea surface (upper 40 m of water column) but not at the seabed. Previous studies have identified that the following sharks occur in the Survey Area:

- Greater hammerhead shark *Sphyrna mokarran*
- Scalloped hammerhead shark *S. lewini*
- Silvertip shark, *Carcharinus albimarginatus*
- Whitecheck shark, *C. coatesi*
- Sandbar shark, *C. plumbeus*
- School shark, *C. sorrah*
- Tiger shark, *Galeocerdo cuvier*
- Sliteye shark, *Loxodon macrorhinus* (RPS and UWA 2019).

Elegant sea snakes seemed unperturbed by the presence of the ROV and were probably represented at reliable densities in the footage. Only two sea snakes were observed on the seabed in approximately 20 km of transect survey, indicating a very low density on the seabed in the area. They are listed as a Marine species under the Environment Protection and Biodiversity Conservation Act 1999 and are broadly distributed from the Shark Bay to approximately Newcastle on the mid NSW coast and do not have a recovery plan in place (DAWE 2020). The Survey Area is unlikely to represent critical foraging habitat for the species but is part of their very broad range.

4.2 Habitat and community stability

The current study has shown that there are low sand waves throughout the area and the coarse, rippled nature of the sand waves suggests that they are being moved by seabed currents. Recent near seabed current measurements showed that internal tides are the dominant current driver (with a distinct spring-neap cycle). Tidal currents ebb to the north-west and flood to the south-east. Seabed drift currents are driven by the interactions of the ebb and flow tidal currents, and vary slightly between locations and seasons. Near seabed drift currents vary with location and season, but generally range from between west-north-west and north-east (RPS 2019). In summarising the available literature on the dynamics of soft sediments of the North West Shelf, Wilson (2013) describes dynamic benthic sediment movements associated with cyclonic activity, internal waves and tidal currents.

The north-west to south-east orientation of seabed features (e.g. sand ripples, sand waves, sand ribbons, ridges and mounds) identified in previous geophysical and geotechnical surveys of the area commissioned by Santos (e.g. Fugro 2015, Neptune 2019c) are likely to be primarily due to near seabed currents (RPS 2019), but are also likely to be influenced by underlying geology (NGI 2017). Several sea floor and subsea floor palaeochannels occur in the Survey Area, which run from south to north (e.g. the Roc channel), or south-south-east to north-north-west (e.g. the Dorado channel and the West Roc channel). These channels have been infilled by sandy material, acting as a pathway for modern sediment transport (NGI 2017).

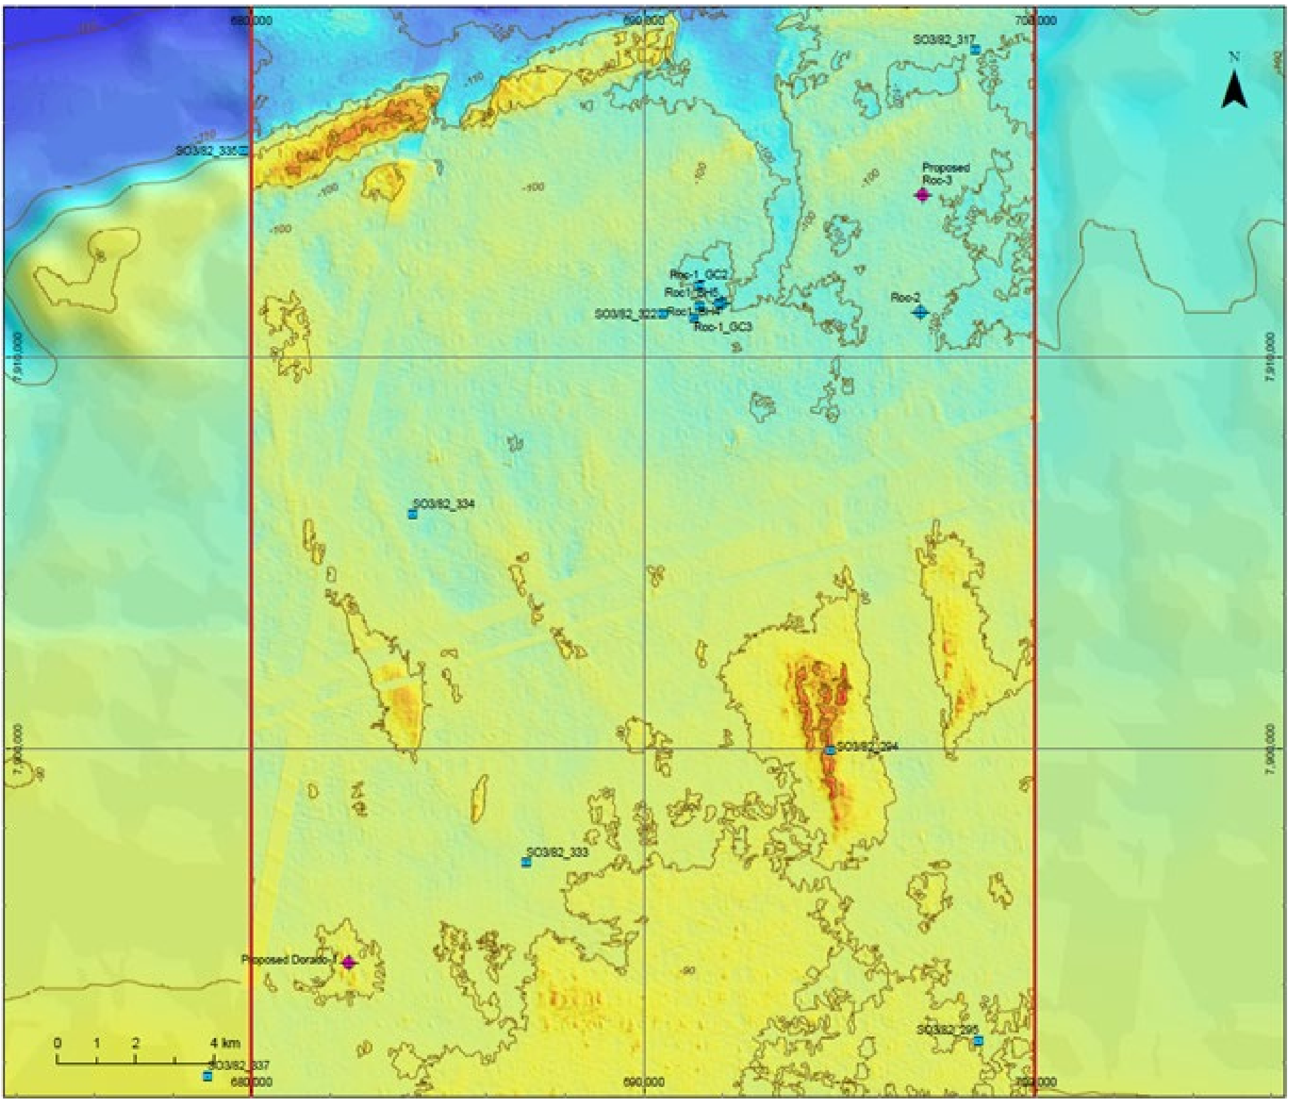
This indicates that benthic features observed in the Survey Area are dynamic in space and time, and are likely to periodically bury benthic communities or uncover new habitat as they migrate. The scales of the changes in the habitat and the associated communities are unknown. While the temporal stability of the sand waves is not known, the sparsity of epibiota on these features indicates that they are likely to be highly mobile

Few of the filter-feeder communities appeared to be well established because most individual organisms were relatively small. Sites such as Site 21 where the filter-feeder community was better developed and populated by large individuals, appear to be in areas of less frequent sediment movement. In other areas, the benthic communities may be stunted by periods of burial (and no growth) and erosion, or they may reflect more recent settlement and recruitment events.

This supports the hypotheses that the benthic communities are adapted to intermediate levels of perturbation due to sediment movement and this is reflected in the abundance/density and diversity of filter-feeding organisms on exposed hard substrates. It also indicates that the persistence of these communities in the region is dependent on their ability to recolonise exposed hard substrates as they become available.

4.3 Local and regional significance

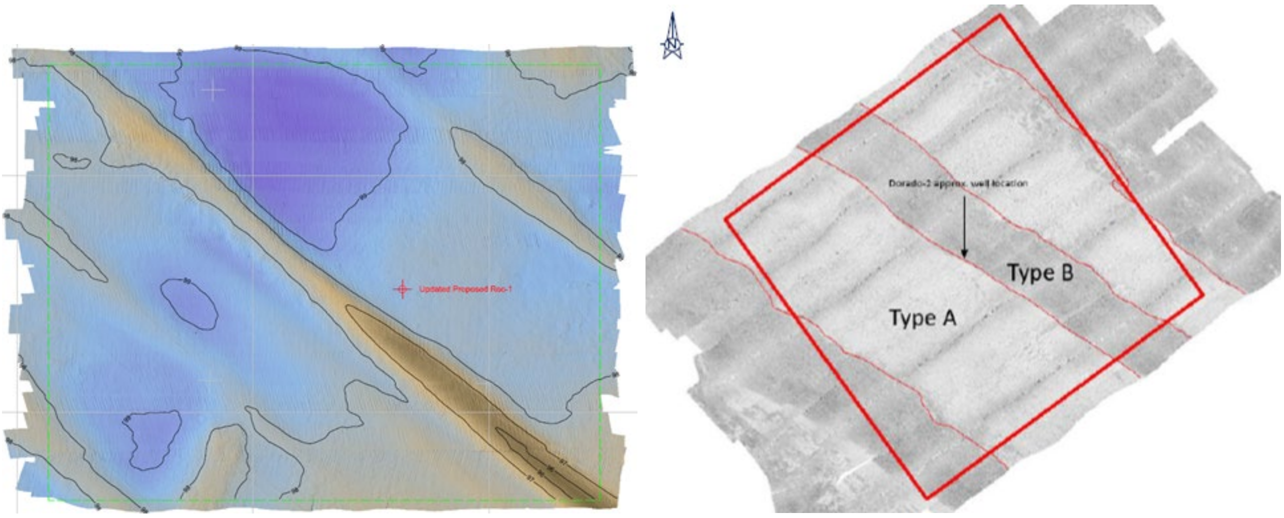
Santos geophysical reports from well site geophysical, debris clearance and bathymetric surveys within the Survey Area (Fugro 2015, Neptune 2018, Neptune 2019a, b, c, and NGI 2017) included collecting seabed imagery and mapping seabed features. These reports reveal broad patterns in surficial sediments, sediment features and geology that characterise the habitat types in the Survey Area. The findings of the present study are consistent with these reports, providing additional context on the biological assemblages that are associated with each type of habitat. The geophysical and geotechnical surveys encompasses most of the Survey Area and therefore provide valuable context for interpretation of the distribution of sediments and seabed types (Figure 4-1).This context indicates that the habitats and communities recorded in the ROV survey are likely to be representative of the broader Survey Area.



Source: NGI 2017

Figure 4-1: Extent of seabed surveys and reviews in geophysical reports (red polygon)

The geophysical reports have confirmed the seabed in the area broadly comprises very fine to coarse sandy sediment with shell fragments, with features such as sand ripples and ribbons occurring across the Survey Area. The sand ripples and ribbons show a predominant north-west to south-east orientation. Examples include linear sand ripple features at the Roc area (north-east of Dorado) and the similarly aligned seabed types at Dorado are shown in Figure 4-2.



Source: Neptune 2018; 2019

Figure 4-2: Patterns of sand waves in Roc area (left) and Dorado area (right)

The dynamic nature of the sandy seabed habitats was described by the NGI (2019) expert interpretation of the combined datasets from the Roc area. Neptune (2019) surveyed the seabed in the Dorado-1 area and confirmed that the seabed is generally flat across the area, and is likely sandy with low amplitude sand waves across most of the site. The sand waves have wavelengths between 5 and 8 m with amplitudes of mostly 15 – 20 cm up to 30 cm. No rocky outcrops were detected in the Dorado-1 site surveys.

The Geoscience Australia bathymetry and sub bottom profiling data confirm the regional nature of the seabed sand ripple features (NGI 2019).

The CSIRO ecotypes have been re-modelled for the region and are shown to extend well beyond the immediate area of interest (Figure 4-3). These ecotypes are described in more detail in the Keesing et al. (2020) report.

There are no known geographical barriers to larval dispersion between the Survey Area and adjacent areas, and no rare or restricted habitat values were recorded in the Survey Area. This indicates that there are no high conservation value areas or communities in the Survey Area.

5 CONCLUSIONS

The benthic habitat and communities survey revealed that the Dorado Survey Area is relatively flat, homogeneous soft sediment, with low sand waves (ripples) and scattered rocky reef. The sediment habitats support very sparse to sparse infauna and epifauna and the rocky substrates support low to medium density filter-feeder communities and other fauna including fish at low densities. Infaunal taxa were characteristic of the sediments recorded at the sample sites (RPS 2020), and indicated where epibiota (e.g. hydroids, bryozoans and sponges) and consolidated/hard substrate may also be present.

No high conservation significant ecological values, habitats, communities of species were identified and the habitats and communities within the Dorado Survey Area are very well represented in the region.

Appendix B
Transect descriptions

APPENDIX B: TRANSECT DESCRIPTIONS

Table B-1: Transect description – Site 002

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-20	9:24:34	224.4	140.5	-18.688798	118.702649
Midpoint		9:33:47	240.4	140.5	-18.689896	118.700121
End		9:43:01	166.1	140.4	-18.691107	118.698736

Benthic habitat and biota description

Flat, silty, bioturbated sediment with medium density tube worms and very sparse epifaunal assemblage. Epibiota include crinoids, sea stars, small fish (e.g. gurnards), alcyonarians, hydroids, anemones.

Representative photographs

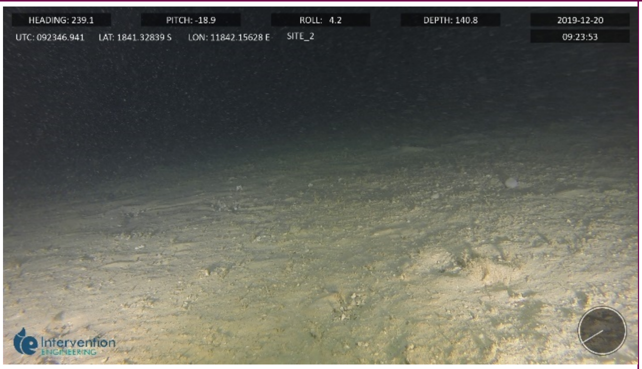

Plate B.1: Silty sediment with medium density of biogenic turf

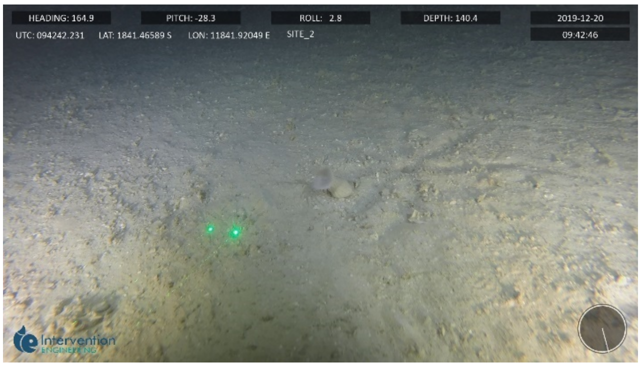

Plate B.2: Anemone on silty sediment and fish burrow

Plate B.3: Bioturbation by small fish

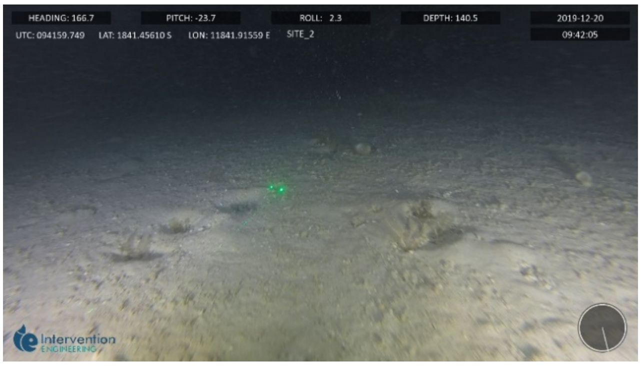

Plate B.4: Hydroids and anemones

Table B-2: Transect description – Site 003

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-21	9:07:07	218.7	138.6	-18.688246	118.792055
Midpoint		9:15:38	207.6	138.1	-18.690439	118.791232
End		9:24:09	209.9	138.3	-18.692757	118.790105

Benthic habitat and biota description

Mainly flat homogeneous silty to sandy sediment, with very sparse epibiota. Biogenic turf at up to medium density and moderate bioturbation in silty sediments. Occasional alcyonaceans, sponges, small fish.

Representative photographs

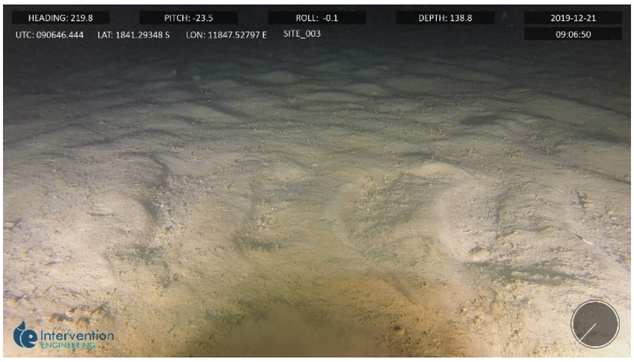

Plate B.5: Silty sand sediments with low density of biogenic turf and small ripples

Plate B.6: Alcyonacean on silty sand with small ripples

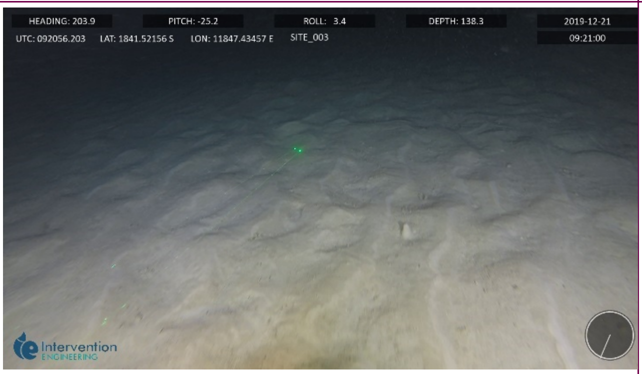

Plate B.7: Small sponge

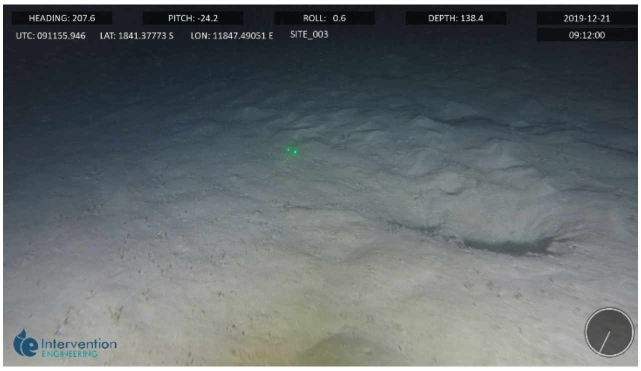

Plate B.8: Bioturbated silty sediment

Table B-3: Transect description – Site 005

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-21	8:01:46	102.2	134	-18.707814	118.84153
Midpoint		8:11:10	202.4	134.2	-18.710053	118.840167
End		8:20:34	201.3	133.6	-18.712349	118.839475

Benthic habitat and biota description

Mainly flat homogeneous with very sparse epibiota, biogenic turf in silty sediment up to medium density, occasional predatory fish (e.g. trevally), sea stars, small fish, anemones. Moderate bioturbation in silty areas. Low sand waves (< 0.5 m high).

Representative photographs

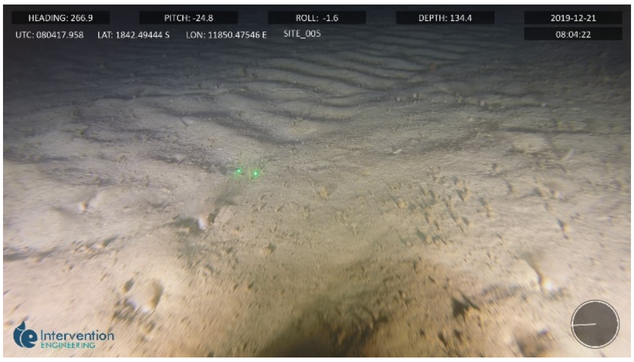

Plate B.9: Anemones on transition from silty sand to sand with ripples

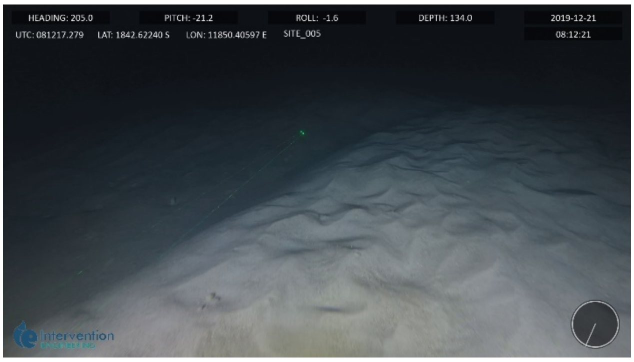

Plate B.10: Low sand wave with very sparse epibiota

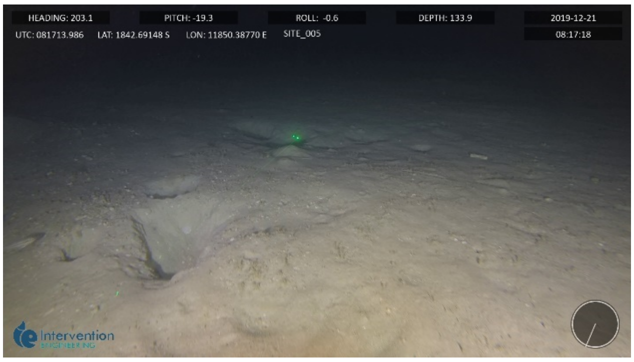

Plate B.11: Silty sediment with bioturbation by small fish

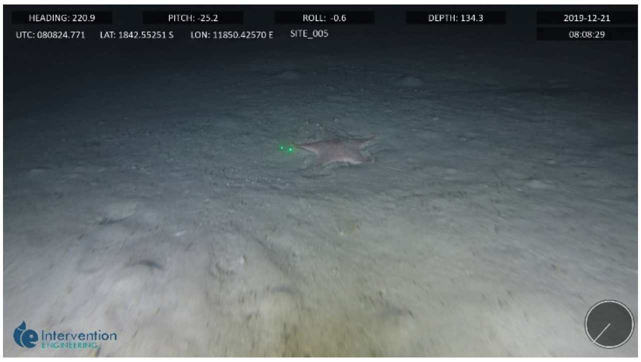

Plate B.12: Sea star and bioturbation

Table B-4: Transect description – Site 006

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-20	8:22:58	235	138.5	-18.717915	118.711915
Midpoint		8:33:08	221.6	138	-18.720055	118.709978
End		8:43:17	219.9	137.3	-18.721681	118.708281

Benthic habitat and biota description

Flat homogeneous silty to sandy sediment, with very sparse epibiota. Biogenic turf at low to medium density and moderate bioturbation in silty sediments. Very sparse epibiota including heart urchins, hydroids, sea pens, small sponges, anemones, small fish in burrows, crinoids, sea whips, occasional predatory fish (e.g. trevally).

Representative photographs

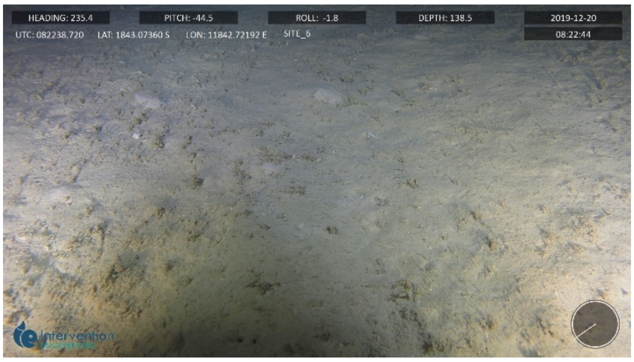

Plate B.13: Flat silty sediment with medium density of biogenic turf

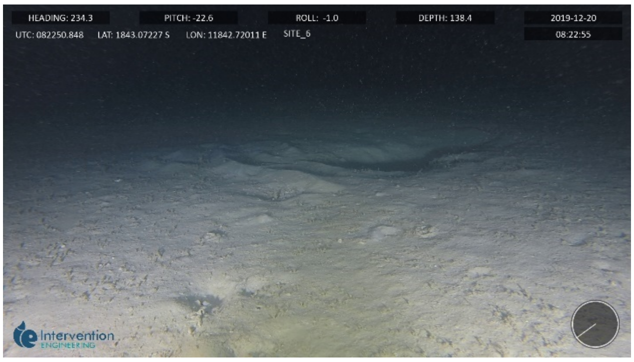

Plate B.14: Flat silty sediment with medium density of biogenic turf and large feeding scars

Table B-5: Transect description – Site 007

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-21	6:57:06	184.1	125.7	-18.7281	118.880594
Midpoint		7:06:49	179.3	125.7	-18.729459	118.880393
End		7:16:32	179.5	124.4	-18.732296	118.880532

Benthic habitat and biota description

Flat silty bottom with small boulders indicating sediment veneer over rock. Supporting low and open filter-feeding assemblage of gorgonians, alcyonarians, sea whips, small sponges, dead sponges (unburied in recent years?), zoanthids, hydroids. Moderate bioturbation, often with small fish in holes.

Representative photographs

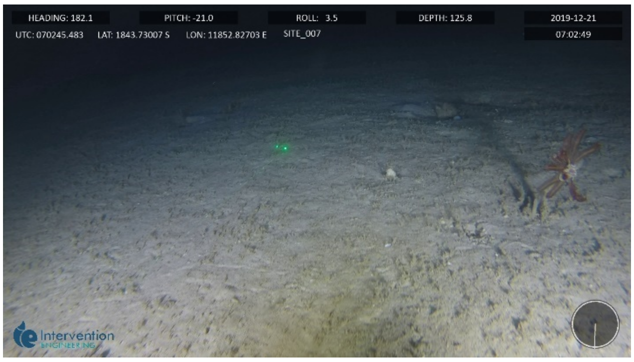

Plate B.15: Medium density biogenic turf on silty sediment with anemone and crinoid.

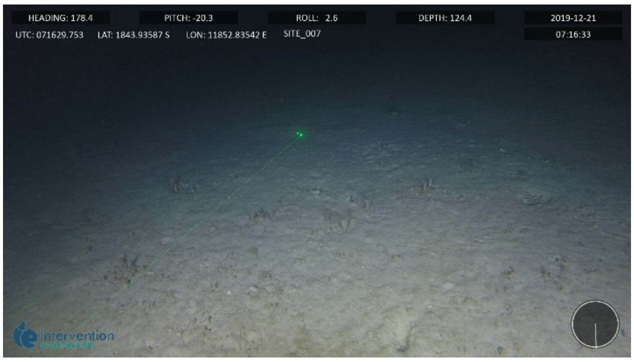

Plate B.16: Silty sediment over pavement with sparse epibiota including small sponges

Plate B.17: Alcyonacean on silty sediment

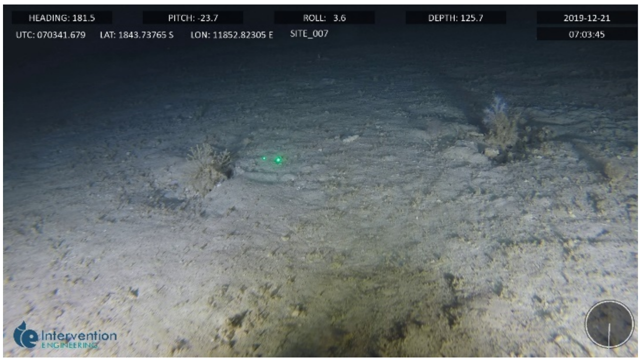

Plate B.18: Small boulders in silty sediment with small gorgonian and soft coral

Table B-6: Transect description – Site 010

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-21	5:32:37	205.8	104.8	-18.74762	118.971167
Midpoint		5:44:25	203.7	104.4	-18.749946	118.970508
End		5:56:13	204.9	105.6	-18.752515	118.969411

Benthic habitat and biota description

Sediments appear mobile and very little epibiota visible, occasional sea pens and biogenic turf present but at low densities throughout transect. Low sand waves with rippled sand on top, interspersed with silty sediments.

Representative photographs

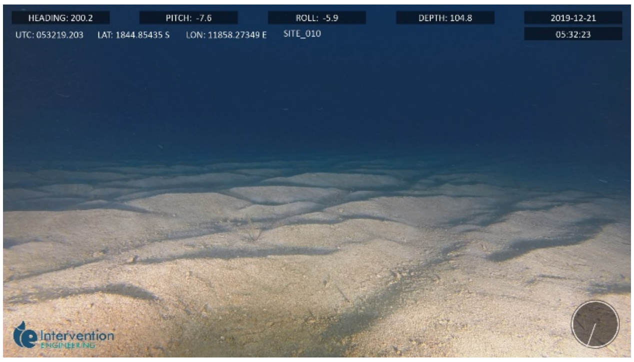

Plate B.19: Coarse sandy sediments

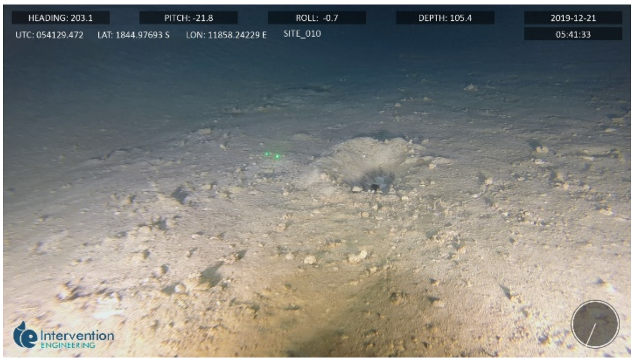

Plate B.20: Silty sediments

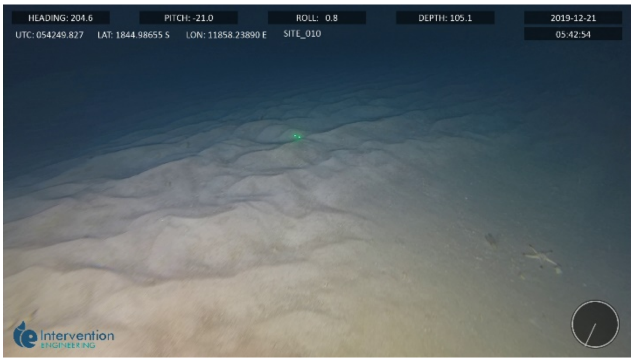

Plate B.21: Low sand wave with adjacent fine sediment and sea star

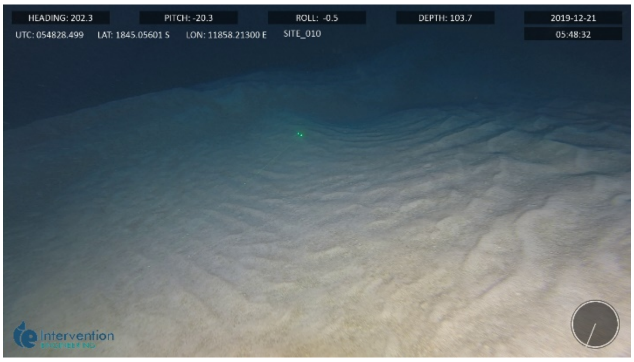

Plate B.22: Low sand waves with ripples

Table B-7: Transect description – Site 011

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-19	8:37:07	83.7	137.7	-18.759627	118.587622

End		4:27:30	203	112	-18.762266	119.049168

Benthic habitat and biota description

Flat, sandy sediment supporting very sparse epibiota, occasional sea pens, anemones, small sponges.

Representative photographs

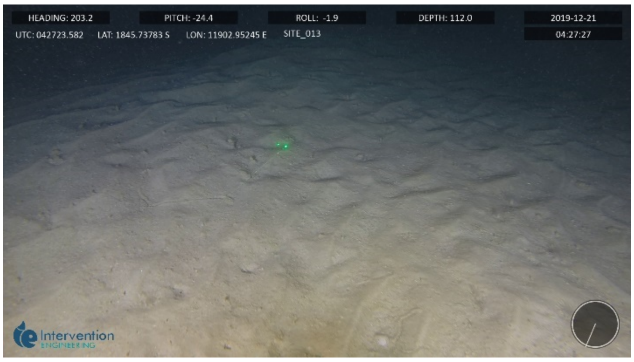

Plate B.27: Rippled sandy sediment with bioturbation

Plate B.28: Sandy silt with sponge and biogenic turf

Table B-9: Transect description – Site 014

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-20	7:13:49	210.1	129.3	-18.767865	118.731026
Midpoint		7:24:14	207.3	129	-18.770289	118.729643
End		7:34:39	207.1	129	-18.771953	118.728818

Benthic habitat and biota description

Flat, sandy silt sediment with occasional low sand waves. Silty sediments with medium to high density of tube worms, sandy sediments with very low worm tube densities. Very sparse epibiota including anemones, sea pens, bioturbation with small fish in the holes.

Representative photographs

Plate B.29: Silty sand sediment with bioturbation

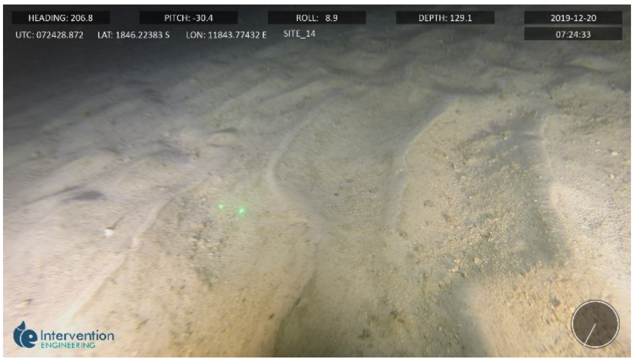

Plate B.30: Rippled sandy sediment in low wave

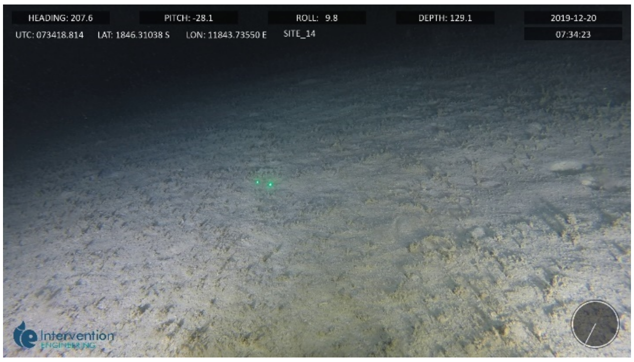

Plate B.31: Medium density biogenic turf in silty sediment

Plate B.32: Sea pen on silt with medium density biogenic turf

Table B-10: Transect description – Site 015

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-20	6:00:09	190.5	106.3	-18.767662	118.820681
Midpoint		6:08:30	206.6	107	-18.7697	118.819975
End		6:16:50	188.9	107.7	-18.772251	118.819314

Benthic habitat and biota description

Flat, silty sand sediments support low- medium density of biogenic turf and sparse epibiota including sea pens, small sponges, hydroids, crinoids and small fish in holes. Areas of hard substrate underlying thin veneer of sediment and scattered boulders supporting sparse epibiota including sea whips, hydroids, crinoids, gorgonians, sponges, few fish.

Representative photographs

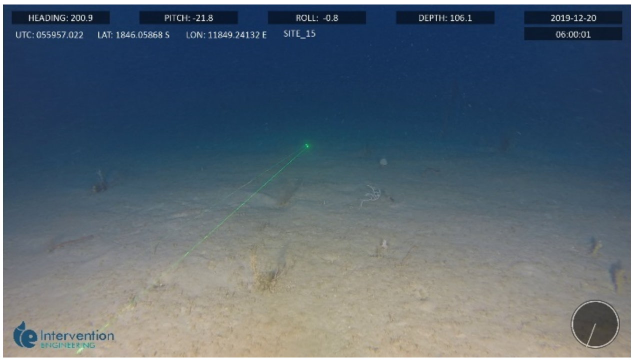

Plate B.33: Sparse epibiota over buried hard substrate

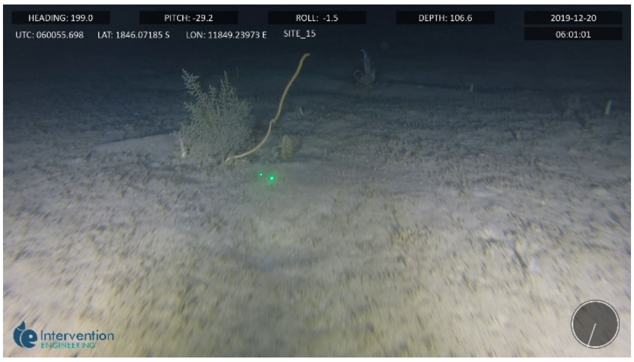

Plate B.34: Sea whip and gorgonian on buried rock

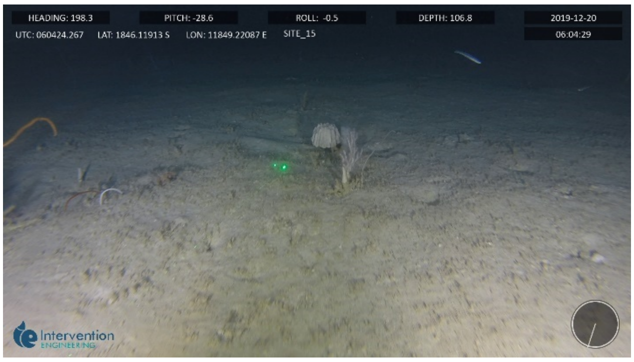

Plate B.35: Sea whips, sponges and gorgonians on buried rock

Plate B.36: Boulders with sponges and small epibiota

Table B-11: Transect description – Site 016

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-19	7:20:23	38.1	133.9	-18.78198	118.598657
Midpoint		7:34:23	44.4	133.9	-18.780361	118.600132
End		7:48:24	1.4	133.8	-18.777636	118.600525

Benthic habitat and biota description

Flat, sandy silt to mud sediments with abundant bioturbation (and associated small fish and crustaceans) and biogenic turf in soft sediments, very sparse epibiota including anemones. Areas of rippled coarse sand in low waves with very sparse epibiota.

One trevally.

Representative photographs

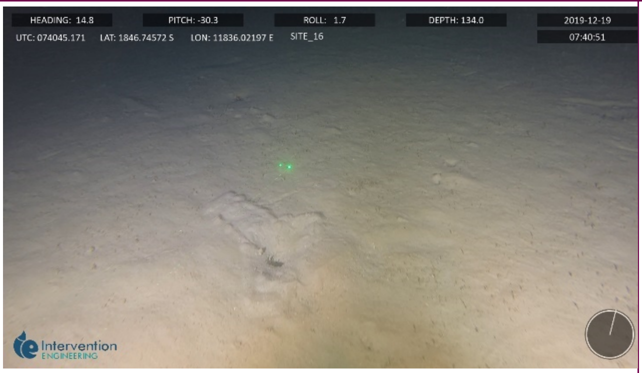

Plate B.37: Bioturbated muddy sediment with fish burrows

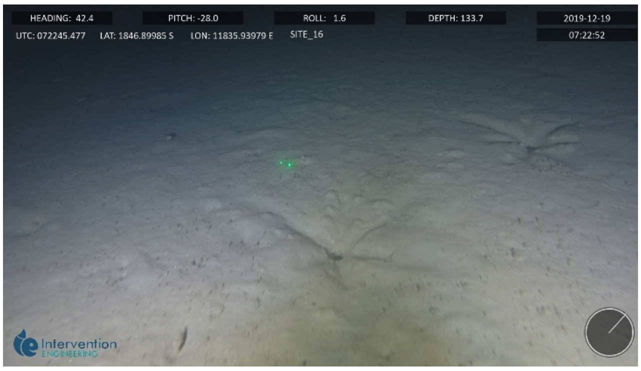

Plate B.38: Bioturbated muddy sediment with fish burrows

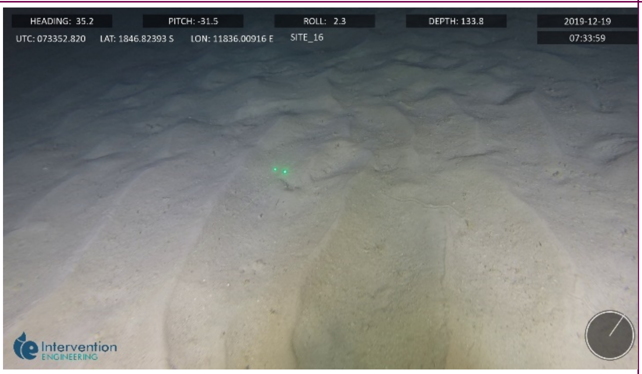

Plate B.39: Rippled sandy sediment

Plate B.40: Large trevally attracted to laser points from ROV

Table B-12: Transect description – Site 017

Position	Date	Time stamp	Heading (°)	Depth (m)	Coordinates in WGS84	
					Latitude	Longitude
Start	2019-12-18	10:12:31	49.9	135.3	-18.81138	118.477624
Midpoint		10:29:49	100.7	136	-18.809422	118.477768
End		10:47:07	47.8	136.2	-18.807349	118.47877

Benthic habitat and biota description

Transect was aborted due to inability to stay on transect line under strong currents. Sufficient coverage for benthic description.

Flat, silty sand with sparse epifauna, little bioturbation, few fish, patches of tube worms in troughs with rubble, occasional urchins and anemones. Areas of rippled bare sand with very sparse epibiota.

Representative photographs

Benthic habitat and biota description

Flat, silty sand, rubble with low to medium density tube worms and very sparse epibiota including urchins, hydroids, sea pens, crinoids, sea whips. Very few larger rocks or boulders.

Representative photographs

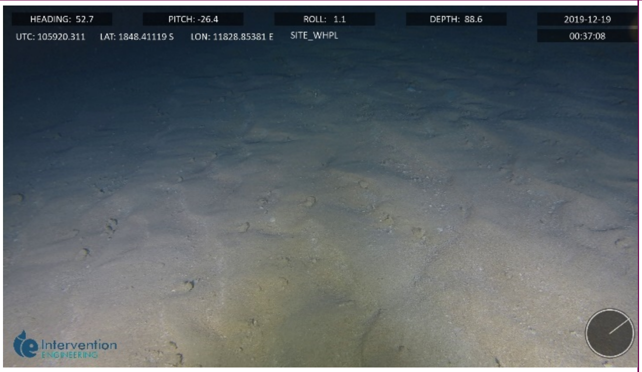

Plate B.135: Rippled sand, low density biogenic turf, very sparse epibiota

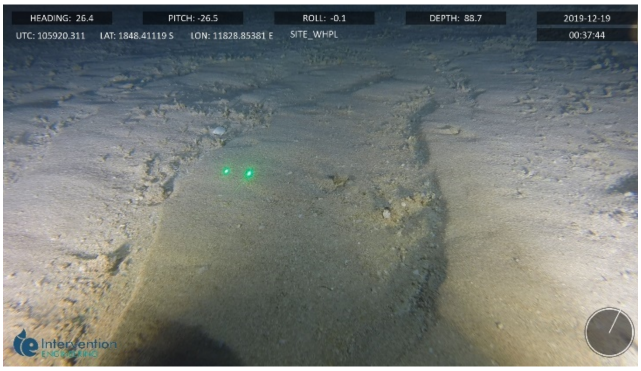

Plate B.136: Rippled sand, rubble and biogenic turf

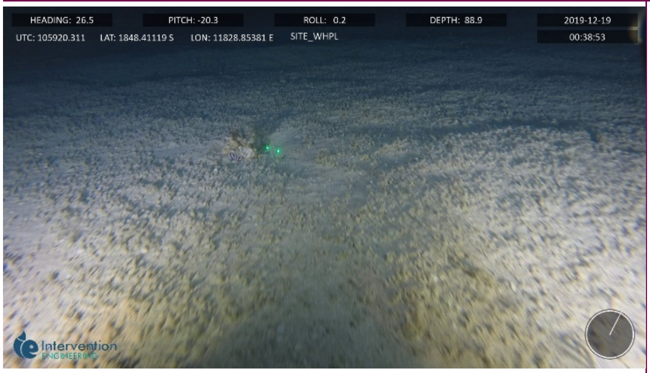

Plate B.137: Medium density biogenic turf, silty sand

Plate B.138: Sparse epibiota on scattered boulders and rocks

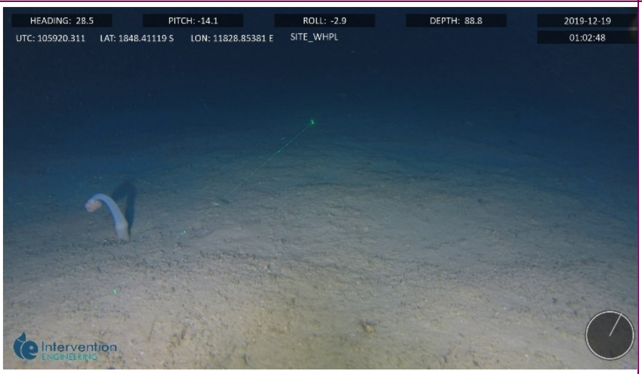

Plate B.139: Soft coral on silty sand

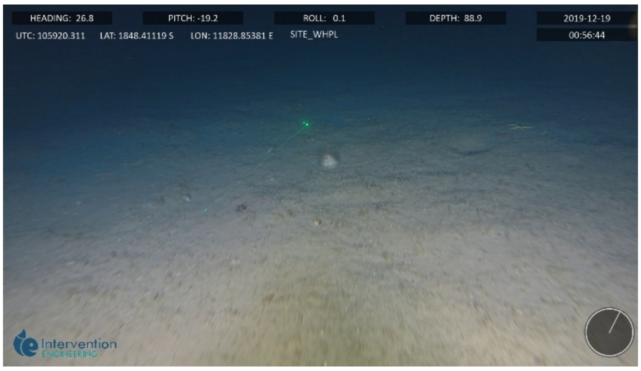

Plate B.140: Sea urchin and sea star on silty sand

End		2:20:52	66	90.5	-19.003958	118.769955

Benthic habitat and biota description

Flat silty sand with patches of boulders. Denser epibiota towards start of transect and end of transect; large stretch of tube worms in silty sediment in the middle. Boulders and smaller rocks supported low density assemblage of sponges (digitate, cup, branched), sea whips, gorgonians (fans and branched), hydroids on sand, alcyonarians. Few fish visible.

Representative photographs

Plate B.141: Gorgonians and soft coral. Sponge, crinoid of silty sand

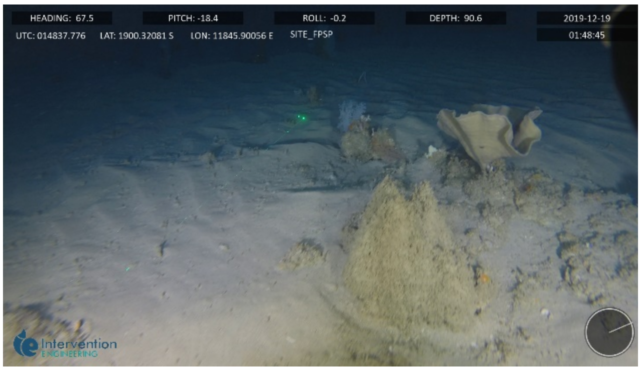

Plate B.142: Live and dead sponges on partly buried boulders

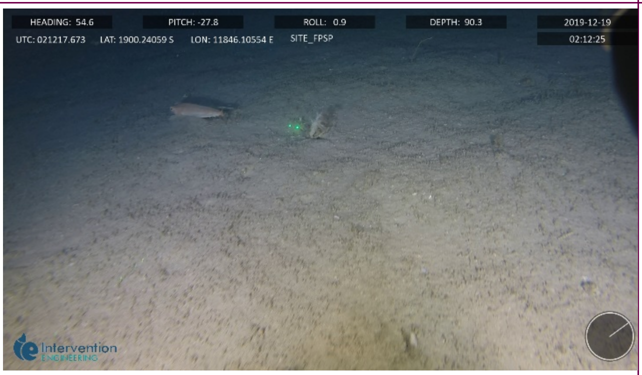

Plate B.143: Gurnard, small invertebrates, biogenic turf

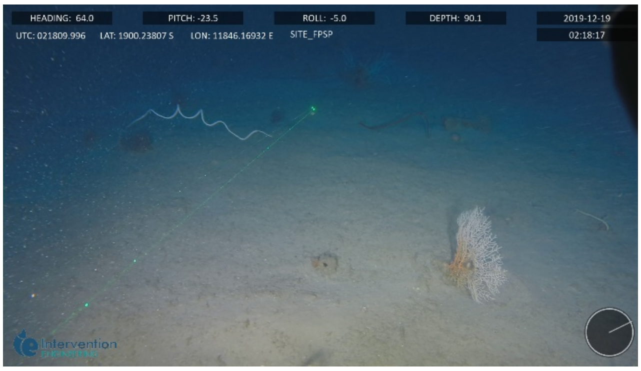

Plate B.144: Gorgonians, sea whips on partly buried boulders

Table B-38: Transect description –Site FPSPNW (062)

Benthic habitat and biota description

Flat, silty sediments with buried reef and boulders (5 – 25 cm), with low to medium density filter-feeding assemblage. Filter-feeding assemblage dominated by fan and branching gorgonians and sea whips and alcyonarians, sponges (laminar, cup, branched), occasional hydroids, sea stars and anemones with low densities of biogenic turf on soft sediments.

Representative photographs

Plate B.145: Gorgonians, sponges on buried hard substrate

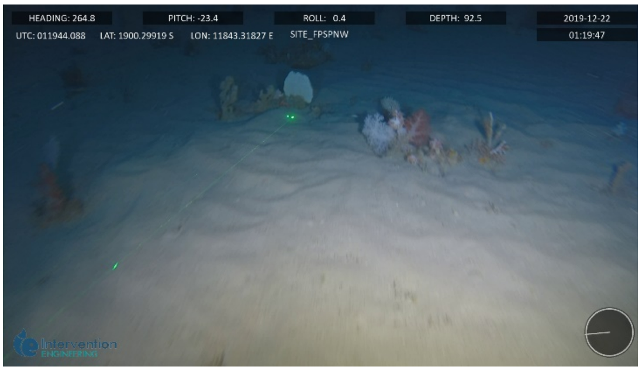

Plate B.146: Soft corals, sponges on exposed parts of boulders

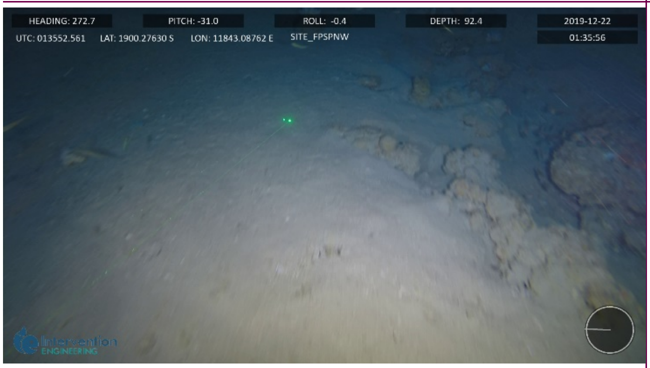

Plate B.147: Partly uncovered, low relief reef and boulders

Plate B.148: Low sand wave over hard substrate with filter-feeders

Plate B.149: Fish around gorgonian on buried rock

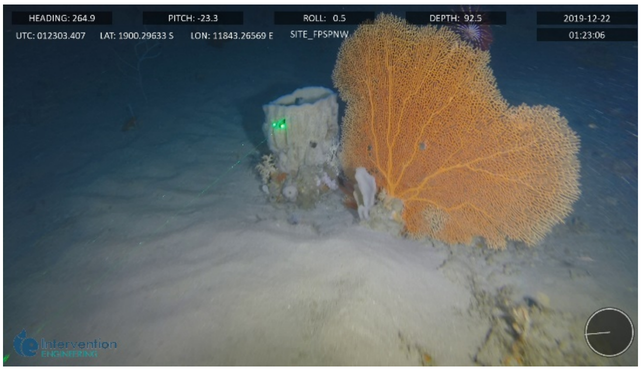

Plate B.150: Gorgonian, sponge on buried rock

List of acronyms and definitions

AFD – Australian Faunal Directory

ALA – Atlas of Living Australia

ANFC – CSIRO Australian National Fish Collection database

BRUV – Baited Remote Underwater Video

CAAB – Codes for Aquatic Australian Biota database

CARS – CSIRO Atlas of Regional Seas

CITES – Convention on International Trade in Endangered Species of Wild Fauna and Flora – international agreement between governments aiming to ensure that international trade in specimens of wild animals and plans does not threaten their survival

CSIRO – Commonwealth Scientific and Industrial Research Organisation

DEM – Digital Elevation Model – An array of regularly spaced elevation values that produce a 3D representation of a terrain's surface

DLI – Dufrene-Legendre Indicator – calculates the indicator value (fidelity and relative abundance) of species in clusters of types

Ecotype – Areas with characteristic biological assemblages and environmental properties

EPBC Act – Environment Protection and Biodiversity Conservation Act 1999 – Australian Government's key piece of environmental legislation providing a national scheme of environment and heritage protection and biodiversity conservation

FB – Frank and Bryce – type of trawl net design

FnB – Frank and Bryce – type of trawl net design

IMCRA – Integrated Marine and Coastal Regionalisation of Australia – Spatial framework for classifying Australia's marine environment into bioregions that make sense ecologically and are at a scale useful for regional planning

IUCN – International Union for Conservation of Nature

KEF – Key Ecological Feature – Geomorphic features or regionally important species or habitats. They are elements of the Commonwealth marine environment that are considered to be of regional importance for either a region's biodiversity or its ecosystem function and integrity.

MARS – Geosciences Australia Marine Sediments database

MRT – Multivariate regression tree – Statistical technique used to explore, describe and predict relationships between multispecies data and environmental characteristics

NASA – National Aeronautics and Space Administration

NO_3 – Nitrate

NOPSEMA – National Offshore Petroleum Safety and Environmental Management Authority – Australia's independent expert regulator for health and safety, environmental management, structural and well integrity for offshore petroleum facilities and activities in Commonwealth waters

NWS – North West Shelf – Region off the north-west Australian coast in the Pilbara region

OPP – Offshore Petroleum Proposal – A requirement of all offshore petroleum projects to prepare and submit a proposal for NOPSEMA assessment. This includes, but is not limited to, a description of the project and the environment including impacts and risks, environmental performance outcomes, feasible project alternatives, legislation pertaining to the project, and reflects a level of transparency and an opportunity for public comment

PAR – Photosynthetically Active Radiation – Light of wavelengths 400–700 nm and the portion of the light spectrum utilised by plants for photosynthesis.

PO_4 – Phosphate

ROV – Remotely Operated Vehicle

RPS – RPS Group – A global professional services firm working across property, energy, transport, water, resources, defence and government sectors

SBRUV – Stereo Baited Remote Underwater Video

TEPS – Threatened, Endangered or Protected Species

WHPL – Well Head/Platform Location

Executive summary

Background

Santos is planning to develop the Dorado field on the North West Shelf (NWS) and is developing an Offshore Petroleum Proposal (OPP) as required under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009. Santos is required to assess all environmental impacts and risks from the Dorado Project and, as such, requires information about the benthic habitats and assemblages to inform this assessment. In particular, those assemblages associated with the ancient coastline key ecological feature (KEF) are of importance in determining the extent of biologically rich marine habitats in the area.

This report provides an analysis of ecotypes, or areas with characteristic biological assemblages and environmental properties, spatial patterns and composition of these biological assemblages in and around the area of the proposed Dorado development. It gives detailed descriptions of the substratum, topography and benthic biohabitats, especially the composition of habitat forming filter feeder assemblages, and provides a description of the fish and invertebrate biodiversity of the Dorado Survey Area (herein referred as the survey area) placing this in the broader context of the NWS region as a whole.

Study description

The analysis draws on five historical datasets. These include primarily fish trawl catch and benthic imagery held by CSIRO (up to 1997) that extend through, or partly through the survey area, and more recent data including remote fish videos, ROV seabed imagery, and a high-resolution model of the bathymetry. Forty-one environmental variables, including bathymetry-derived, sedimentary, ocean colour and bottom water attributes (gridded at 0.01°) were also used to spatially stratify seabed habitats and assemblages. Additionally, detailed descriptions of the substrate and biota from seabed imagery from 67 historical and recently surveyed sites were undertaken and public databases of fish and marine invertebrate biodiversity were used to determine the level of representativeness and uniqueness of the recently surveyed sites within the Dorado Survey Area relative to the broader NWS region.

Summary of findings – spatial distribution of habitat and biotic assemblages

The mapping of ecotypes (areas with characteristic biological assemblages and environmental properties) in and around the area of the Dorado development identified seven ecotypes (Table 1) of which four comprise the majority of the survey area (Figure 1). The most important environmental influences on ecotypes include the seasonal range and annual average of bottom-water attributes such as oxygen, salinity, nutrients and temperature. Some of the ecotype boundaries align with depth because several of these important variables vary with depth, although in non-linear ways. So, although the distribution of the ecotypes is not explained by depth *per se*, it is convenient to classify the most offshore and inshore ecotypes (three in total) according to depth:

- Ecotype 1 – largely associated with waters 130 m and deeper, overlaps the survey area only at the northern margin;
- Ecotype 6 – associated with waters between approximately 40 and 60 m and intersects the survey area to very minor extent in the south;
- Ecotype 7 – located further inshore (< 40 m) and does not intersect the survey area at all.

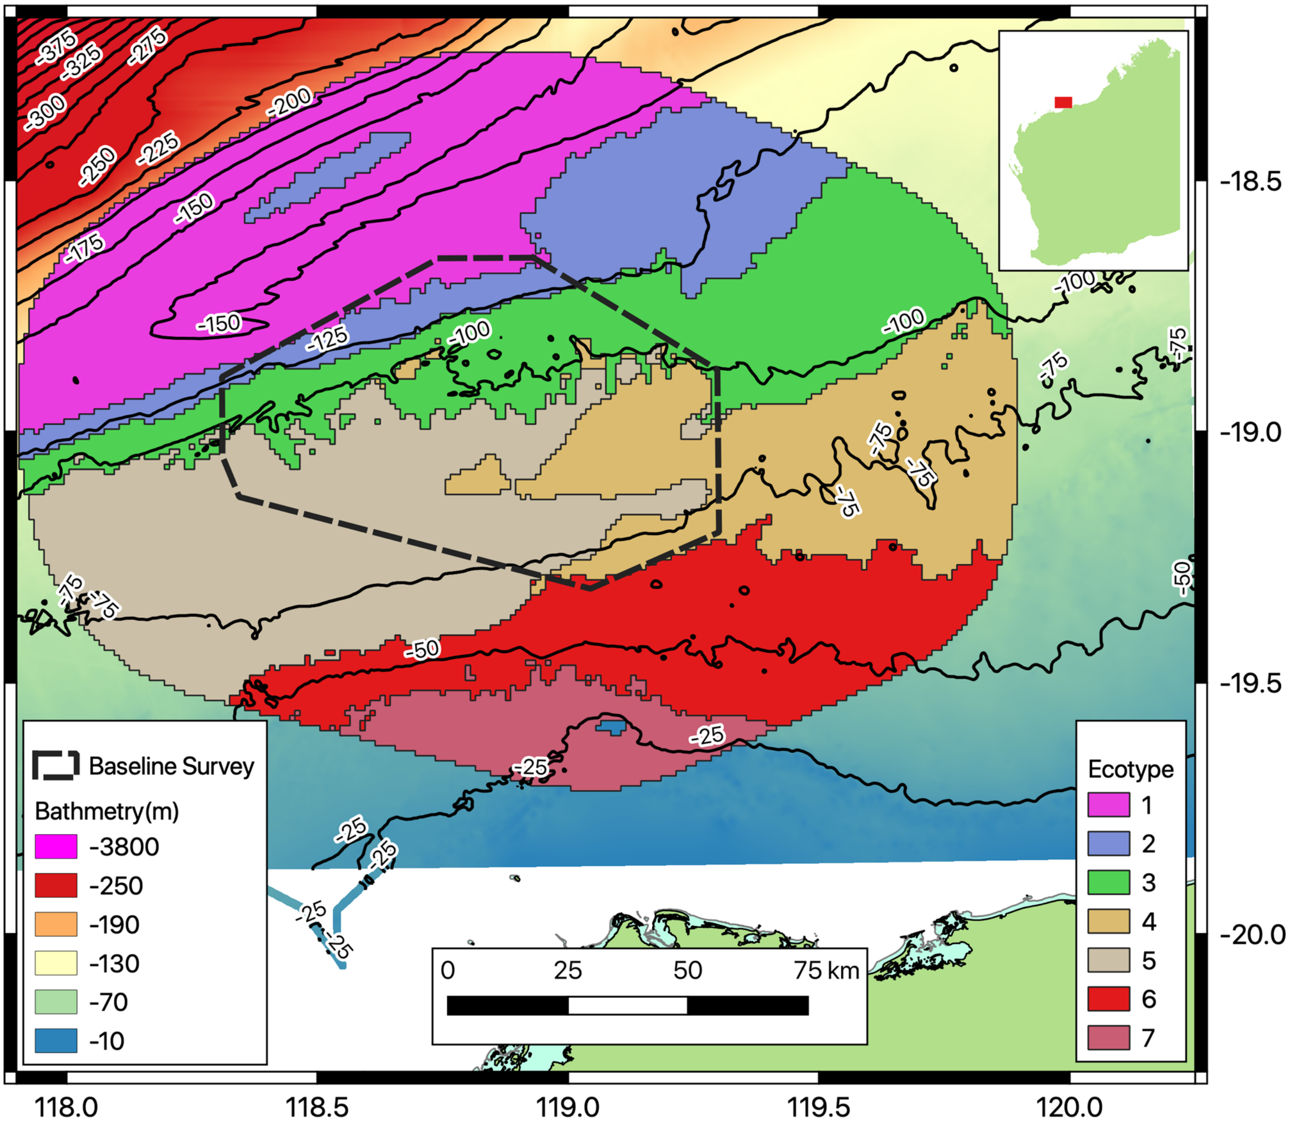

Figure 1. Map showing the spatial distribution of the seven ecotypes, identified by colour and number, within the survey area. The black polygon shows the survey area boundary. White area = area of < 10 m depth.

The area of interest for the proposed Dorado development focuses mainly around four ecotypes. The deepest, ecotype 2, forms a mostly narrow depth-parallel area at about 120–130 m and is characterised by sandy silt and soft mud habitats with usually < 5% cover of habitat-forming filter-feeder species. The transition between ecotype 2 and 3 overlays the area of the ancient coastline KEF, defined by depth (115–135 m water depth). This area has the most notably steep depth gradients and distribution of topographically complex terrain features within the study area. Ecotypes 3, 4 and 5 comprise the majority of the survey area and fall mainly in 60–100 m depths. While the majority of all sites surveyed both historically and recently comprise habitats composed largely by fine sediments (typically > 90% cover), each of these three ecotypes exhibit notable areas of habitat forming filter feeder communities, especially whip corals, gorgonians and sponges. These vary greatly from 10%–70% cover from site to site and typically 30%–40% cover. While biohabitat cover and composition varies to much the same degree among ecotypes 3, 4 and 5, the influence of environmental variables varies between each and the dominance of different fish species in terms of their distribution, abundance and biomass contributed to the delineation of ecotypes 3, 4 and 5. The analysis in the report documents these differences and provides examples of indicator species in each ecotype.

Table 1. Summary of the seven ecotypes in and around the area of the proposed Dorado development.

Ecotype 1	Silty-sand substrate Largely associated with waters 130 m and deeper, very low cover of benthic filter-feeder habitats. Much of the substrate is bioturbated sediment. Filter-feeders tend to be non-habitat forming types typical of soft sediments like anemones, sea pens and free-living crinoids.
Ecotype 2	Silty-sand and soft mud substrates Forms a mostly narrow depth-parallel band at about 120–130 m characterised by silty-sand and soft mud (silt) habitats. Usually < 5% habitat-forming filter-feeder species.
Ecotype 3	Variable substrates from silty-sand to hard reef with steep depth gradients and topographically complex terrain features Majority of ecotype 3 characterised by silty-sand substrates with notable areas of hard, topographically complex reef substrate, particularly in the area of the ancient coastline feature. Sea-whip habitat was a feature of hard substrate areas and filter-feeder habitat made up 10–65% of cover. Large seasonal range in water column properties such as oxygen and nutrients indicating a dynamic water column environment.
Ecotype 4	Variable substrate, predominantly silty-sand or coarse sand but with significant proportions of rubble. Ecotype 4 sites had between 20% and 45% of diverse filter-feeder biohabitat with sponges, soft corals, gorgonians, sea pens and whips. Some areas of soft bottom substrate with very abundant non-habitat forming filter-feeders, anemones and free-living crinoids.
Ecotype 5	Variable substrate ranging from silty-sand to rubble and stones Generally flat topography with an absence of terrain features and lacking in notable depth gradients. However, had the highest species richness for several datasets examined and the highest proportion of filter-feeder biohabitat cover (30%–65%) with sponges, gorgonians, hydroids, whips and sea pens most important. Ecotype 5 was the only ecotype exhibiting a notable number of ascidians.
Ecotype 6	Variable sandy and hard reef substrate Mostly less than 60 m depth. Majority excluded from study area thus substrate distribution not examined extensively. Some areas marked change in depth

	gradients and terrain features indicated hard substrate in some areas consistent with the presence of habitat-forming filter-feeders such as sponges. High biomass of soft bottom fish species such as goatfish also indicative of presence of extensive areas of largely featureless soft bottom habitats. Large seasonal range in temperature and bottom stress indicating important tidal influence.
Ecotype 7	Variable sandy and hard reef substrate Mostly inshore, less than 40 m depth and falling completely outside study area. Few data on proportion of substrate distribution but can be inferred from notable variations in depth gradient and terrain features, large proportion of area with sponge and sea-whip filter-feeder habitat and very high diversity and biomass of fish. Like ecotype 6, ecotype 7 also has large seasonal range in temperature and bottom stress indicating importance of large tidal range.

Summary of findings – fish and invertebrate biodiversity

Analysis of Atlas of Living Australia (ALA) records for seven phyla of marine invertebrates revealed a total of 722 species recorded from the survey area representing 18% of species recorded from the NWS Province as a whole. Overall, 15% of species of marine invertebrates recorded from the NWS Province were recorded only from the survey area. No firm conclusion can be made regarding differences in biodiversity between the survey and surrounding areas due to a sparsity of biodiversity data from this area, poor taxonomic knowledge of some animal groups, and incomplete ALA records. However, data for fishes, a group that has been relatively much better sampled and for which the taxonomy is very mature, showed no differentiation between the survey area and surrounding areas. Three hundred and seventy species were recorded from the survey area, with only two species not recorded elsewhere in the NWS Province. It is possible, however, that these 2 species represent errors in identification.

A number of species of particular conservation interest, including threatened, endangered or protected species (TEPS), have been recorded from the survey area but all have also been recorded elsewhere to the north and south on the NWS. These include four elasmobranch species: the Scalloped Hammerhead, *Sphyrna lewini*, currently listed as Conservation Dependent by the *Environment Protection and Biodiversity Conservation (EPBC) Act 1999* and critically endangered by the International Union for Conservation of Nature Red List of Threatened Species (herein IUCN Redlist), Oceanic Whitetip Shark, *Carcharhinus longimanus,* and Whitespotted Guitarfish, *Rhynchobatus australiae,* both listed as critically endangered by the IUCN Redlist, and the Silky Shark, *Carcharhinus falciformis,* (IUCN Redlist vulnerable) and listed in the EPBC Act as migratory and subject to the Bonn Convention (Convention on the Conservation of Migratory Species of Wild Animals). In addition, three syngnathid species known from the survey area are listed as marine species under the EPBC Act. These are Western Spiny Seahorse, *Hippocampus angustus,* Gunther's Pipehorse, *Solegnathus lettiensis*, and the Pallid Pipehorse, *Solegnathus* sp., all of which have a maximum depth range of between 63m and 190 m.

Concluding summary

The vast majority of the survey area consists of soft bottom habitats with little macro-benthic biota, however patches of diverse habitat-forming filter-feeder biota, typical of the NWS region occur throughout the area, mainly as sparse or medium density habitats. These habitats account for the diverse array of fish and invertebrate species recorded for the area including some species characterised as TEPS. These are however, in the most part, either highly mobile elasmobranchs or syngnathid species which occur elsewhere on the NWS. The study confirmed that the ancient coastline key ecological feature (KEF), which has notable changes in depth gradient and complex seabed terrain features associated with biological features, was an important influence on the characterisation and spatial stratification of habitats and species assemblages in the area. Furthermore, the information provided in this report provides a baseline for future monitoring of habitats and species assemblages in the area.

1 Introduction

1.1 Background and purpose

Santos is planning to develop the Dorado field on the North West Shelf (NWS) and is developing an Offshore Petroleum Proposal (OPP) as required under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009. Santos is required to assess all environmental impacts and risks from the Dorado Project and, as such, requires information about the benthic habitats and assemblages to inform this assessment. In particular, the assemblages associated with the ancient coastline key ecological feature (KEF) are of importance in determining the extent of biologically rich marine habitats in the area.

The first (Phase 1) report (CSIRO 2019) provided an interim prediction of spatial patterns and composition of ecotypes (areas with characteristic biological assemblages and environmental properties) in the general area of the proposed Dorado development, based on existing datasets held by CSIRO, mostly from the 1980s and 1990s.

Building on Phase 1, Phase 2 (CSIRO 2020) provided an updated habitat stratification by incorporating three more recent datasets: (1) fish data in the region of the ancient coastline KEF from stereo baited remote underwater video (SBRUV) deployments made in about 100m depths in October 2018 (RPS 2019); (2) towed video data of benthic habitat types in the area south of the Dorado field in about 50 m depths (RPS 2019); and (3) an improved digital elevation model (DEM) of the bathymetry produced by CSIRO (Berry 2019) based on data provided by Santos. Phase 2 (CSIRO 2020) also made recommendations for the site locations and sampling strategy for the benthic habitat video data acquisition voyage conducted in December 2019 by RPS (RPS 2020) within the survey area (Figure 2).

Phase 3 and Final Report includes Phase 1 and 2 results and provides a further update of the spatial patterns and composition of ecotypes in and around the area of the proposed Dorado development by incorporating the results of the December 2019 survey (RPS 2020). In addition, this report provides a more detailed description of the substrate, topography and benthic biohabitats from both the historical and most recent survey and an analysis of the fish and invertebrate biodiversity of the survey area placing this in the broader context of the NWS region as a whole.

1.2 Study area

The study area is defined as the Dorado Survey Area (Figure 2), herein referred to as the survey area. The survey area was proposed within the initial stages of the Dorado development engineering and was designed to capture all potential engineering options and future tiebacks at the time, as well as providing sufficient area to characterise the spatial distribution of habitat and biotic assemblages.

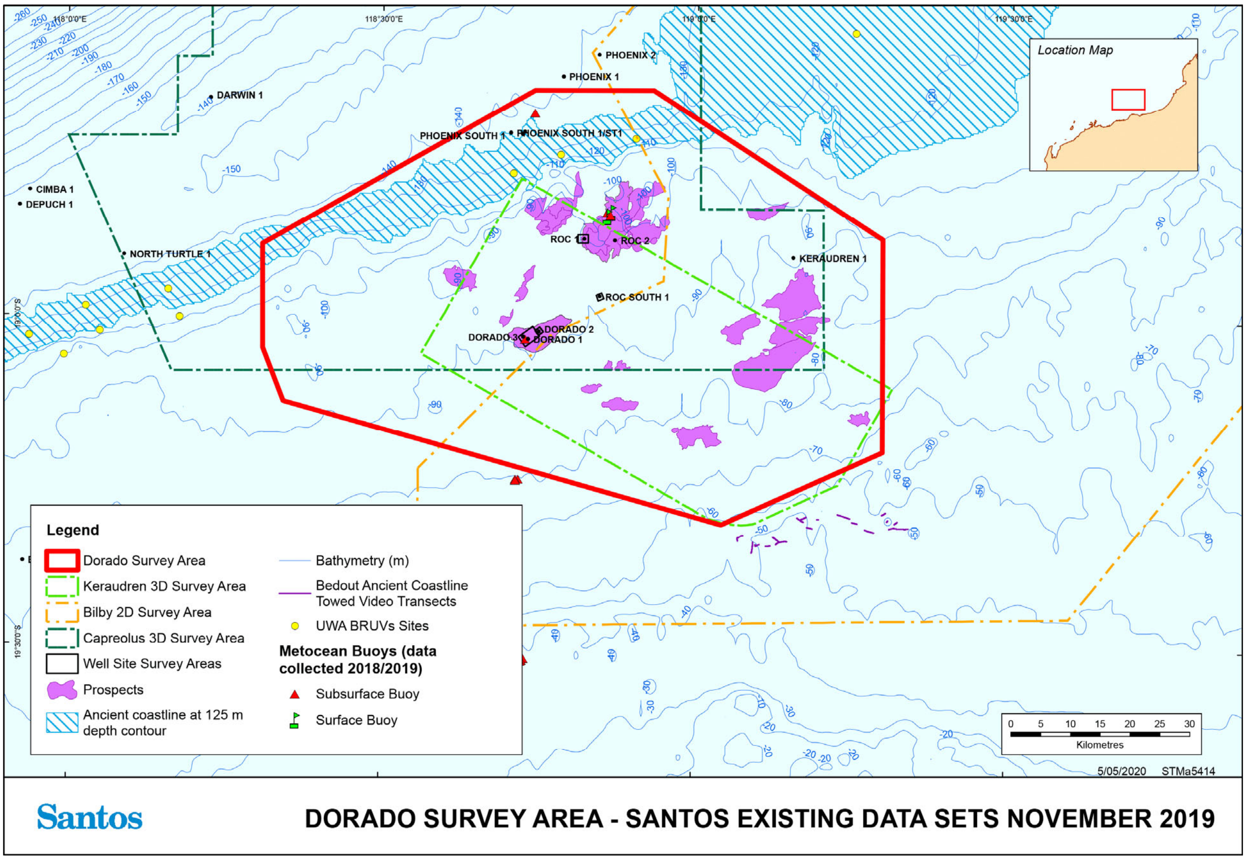

Figure 2. Map of the survey area showing bathymetry, extent of oil prospects and a range of locations for previous data acquisition events.

2 Seabed Characterisation and Habitat Mapping

2.1 Study domain

The initial survey area (Figure 3, grey line) was buffered by ~45 km (red dashed polygon) to provide a local study area for predictions of benthic biological assemblages in the vicinity. Figure 3 shows the depth range within the study prediction area from ~10 m (red) to ~210 m (dark blue). The black polygon is the final survey area boundary. The prediction area is about four-times larger than the survey area. The grey dotted polygon is the area from which data were selected for analyses (an additional 45 km buffer, ~8 x the survey area).

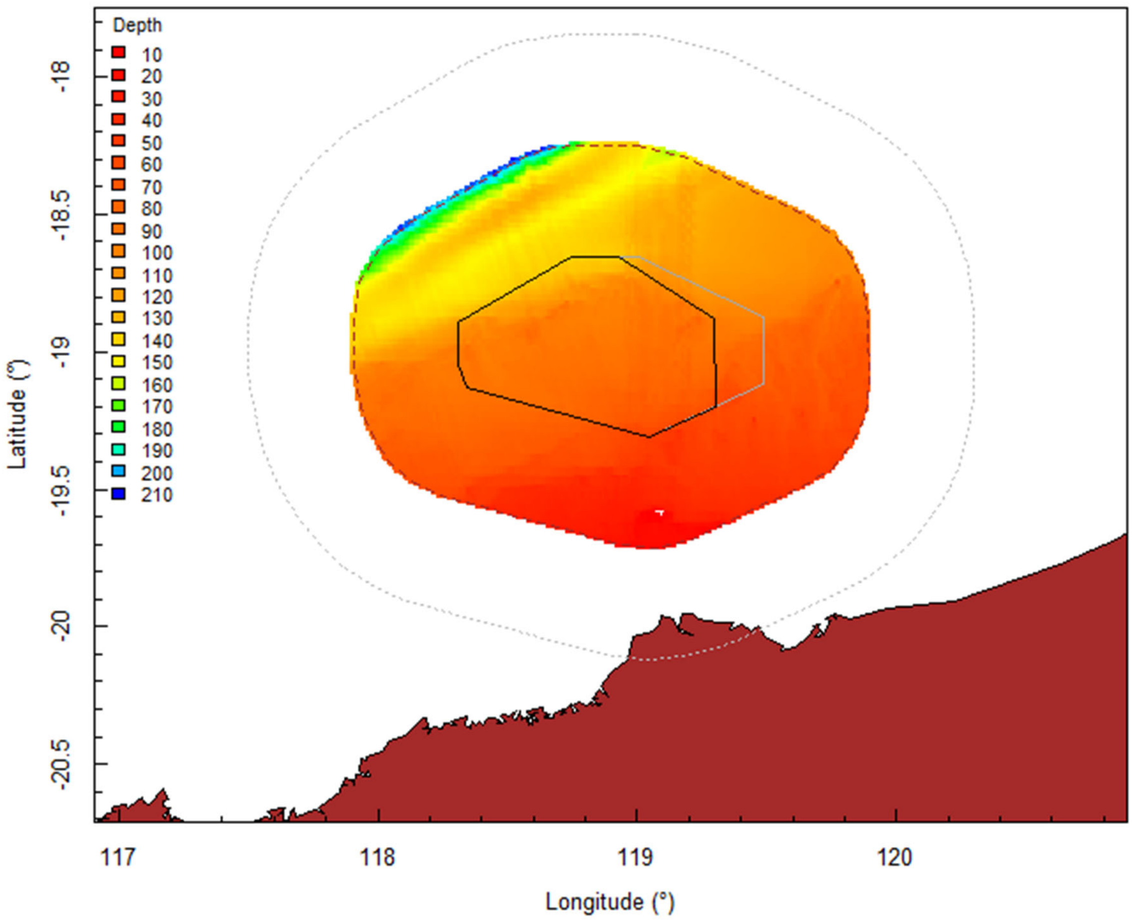

Figure 3. The survey area off the NWS showing continuous bathymetry overlain on the areal extent of habitat prediction grid (red dashed line). Very outer dotted line = extent from which data were selected to make predictions, based on buffering the initial survey area (grey line). Black polygon = final survey area boundary.

2.2 Data sets used in the analyses

2.2.1 Biological data sets

CSIRO (2019; 2020) provided interim habitat maps for the area based on five historical datasets held by CSIRO (up to 1997) which extended through or partly through the survey area, two datasets held by Santos (2018 surveys by RPS [RPS 2019]), and a detailed 2018 bathymetric survey transformed into a new digital elevation model [DEM] for the area by (Berry 2019). More recently, a Remotely Operated Vehicle (ROV) survey by RPS (RPS 2020) within the survey area acquired further data on seabed habitats at observed sites. For the final stratification of seabed habitats and assemblages, we have used all these available datasets to provide a final seabed habitat and benthic invertebrate/demersal fish assemblage characterisation. This was facilitated using analyses of seabed compositional change along environmental gradients for 41 variables mapped on a 0.01° grid for Australia's shelf and slope. The sites of the survey datasets are mapped (Figure 4) onto bathymetry (range 10–210 m).

The figures and tables below use the following abbreviations to refer to these datasets:

> NWS FnB Trawl – refers to fish trawl surveys made by CSIRO on the NWS between 1982 and 1991 using a Frank and Bryce design commercial scale trawl net. These trawls were made on voyages to determine the effects of trawling as part of the Sainsbury (1987; 1991; 1993; 1997) studies.
>
> NWS McKenna Trawl – refers to fish trawl surveys made by CSIRO on the NWS in 1995 and 1997 using a McKenna design commercial scale trawl net. It differs in minor ways to the Frank and Bryce net. The McKenna net is that used in current fishing operations on the NWS. Its use on the NWS is described in Wassenberg et al. (2002). This net was also used in the latter stages of the Sainsbury (1987; 1991; 1993; 1997) studies.
>
> NWS Photo-benthos – refers to a subset of the above two datasets that used a trawl headline camera to capture images of the seabed, which were then scored to count the abundance and size of different benthic habitat forming biota.
>
> Data Trawler FB trawl – refers to older fish trawl surveys conducted prior to the Sainsbury (1987; 1991; 1993; 1997) studies, but which also used the Frank and Bryce trawl net.
>
> Soviet Trawl – refers to fish trawl surveys conducted by the Russian fleet between 1966 and 1972.

The majority of these available data fall within the western part of the survey area and extend farther to the south west. Less data was available for the eastern part of the survey area and to the north east (Figure 4).

Four more recent datasets have been incorporated into the final analyses:

New high-resolution DEM – this was produced by Berry (2019) based on Santos seismic data and provided improved resolution of bathymetry and slope, from which new improved estimates of terrain shape variables: ridge, channel, peak, passage, pit and plane, were calculated.

Santos BRUVS – new demersal fish data collected in October 2018 (RPS 2019) in the area of the ancient coastline key ecological feature (about 100 m depth). Data used from this study was BRUVS maxN data for 56 species at 12 sites with 5 BRUVs each, but only 14 species occurred at > 5 sites and could be used in the analysis.

Santos Vid – tow-video derived habitat data from October 2018 (RPS 2019) for 59 benthos morpho-types at 144 transect-segments from 17 transects of 3–19 segments each. Data were of presence/absence type with 41 morpho-types having > 3 presences.

Santos.VidSvy2 – ROV survey seabed habitat data from 2019 conducted by RPS (RPS 2020) along 500 m transects at 38 sites scoring seabed substrate and filter feeder biohabitat cover in real time.

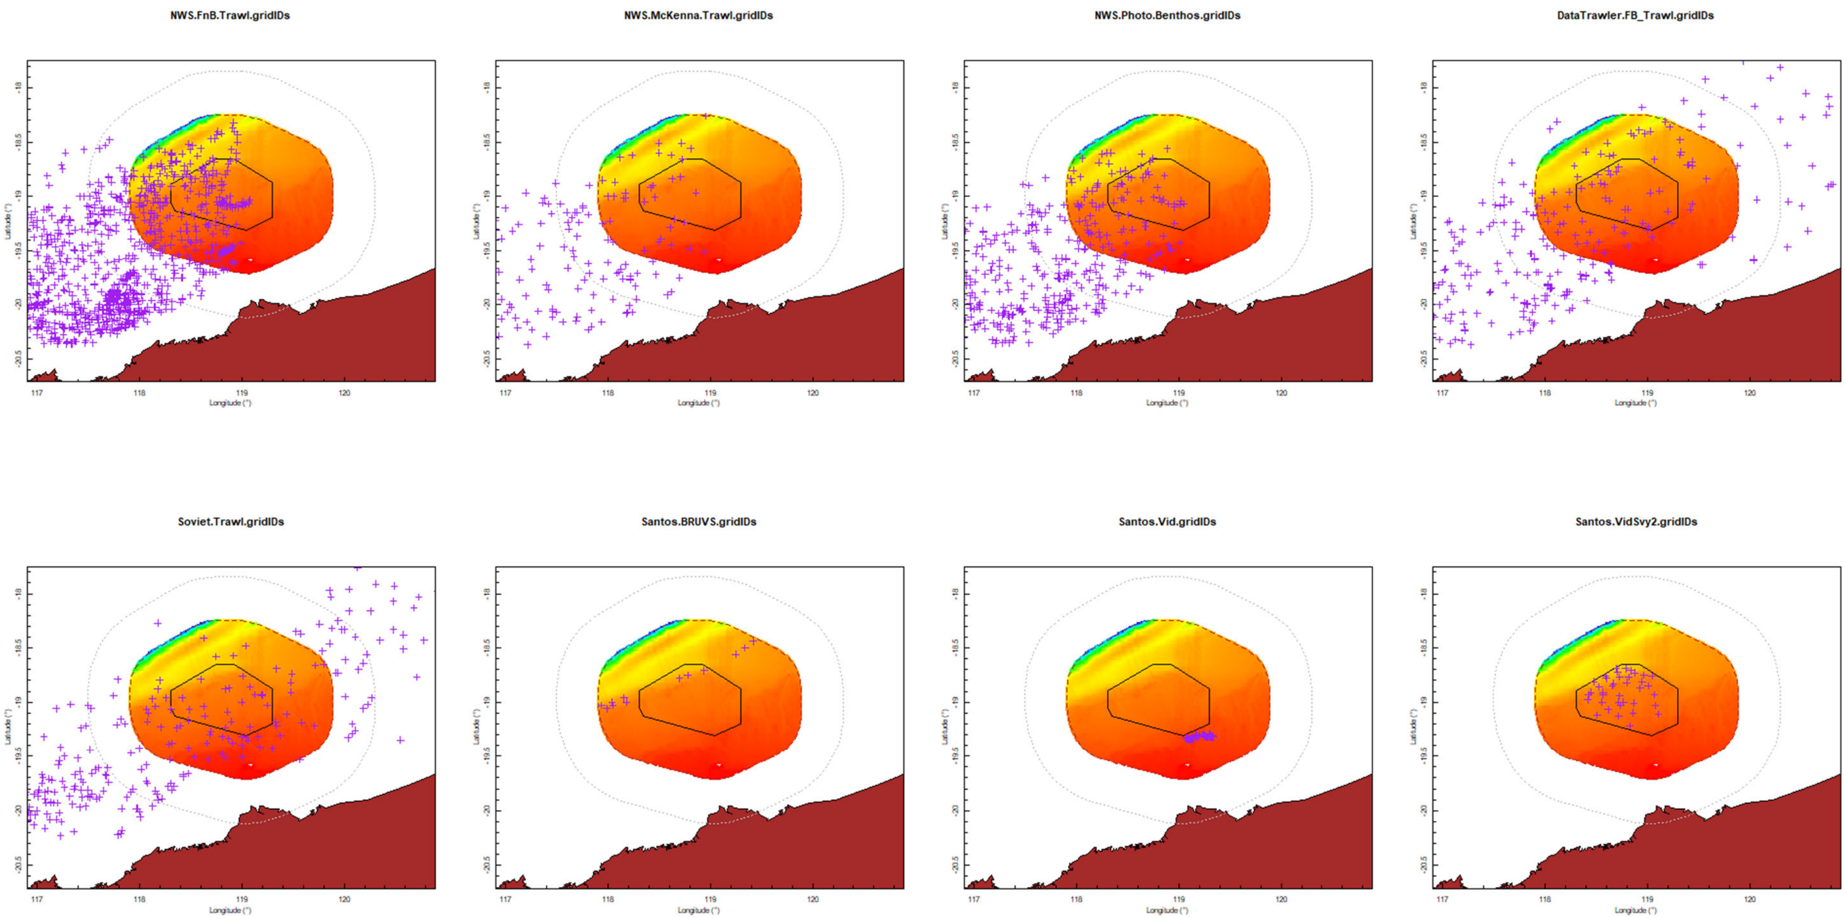

Figure 4. Distribution of sample sites overlain on bathymetry for each dataset in the vicinity of the survey area boundaries. Very outer dotted line = extent from which data were selected to make predictions, based on buffering the initial survey area (grey line). Black polygon = final survey area boundary.

2.3 Environmental datasets

A total of 41 geophysical and biochemical environmental variables were used as potential predictors of patterns in biological assemblages. These were drawn from a range of datasets, including the new bathymetric DEM product (Berry 2019) (3 variables) and from which 6 terrain variables were derived, the Geosciences Australia Marine Sediments (MARS) database (4 variables), the CSIRO Atlas of Regional Seas (CARS) (12 variables), NASA Oceancolour satellite derived variables (14 variables), and the CSIRO Ribbon Model (2 variables) which is a shelf scale hydrodynamic model covering the Australian region.

To derive the 6 terrain variables, the bathymetry map was classified into terrain features using the method of Wood (1996). With this method, each cell in the raster bathymetry map is assigned to a feature class (peak, ridge, pass, channel, pit or plane) based on morphometric parameters (e.g. slope and curvature), which are calculated on the cells within a window centred on the cell. To provide a more robust terrain characterisation, the classification is repeated at multiple scales (window sizes), and the resulting classifications are summarised as the percentage of times each cell is assigned to each feature class (Wood 1996). The classification was performed using the GRASS GIS command r.param.scale (GRASS Development Team 2019) at seven scales from 1.5 km to 7.5 km. The summary percentages for the six terrain features were used as the terrain predictor variables in the gradientForest analysis.

Table 2 provides the detail of each variable and the acronyms used in the analyses and figures which follow later in the report.

Table 2. Environmental variables used as potential predictors of habitat type and biological assemblages within the survey area.

Variable	Description	Aggregation	Units	Source
GA_BATHY	Bathymetry		m	Berry 2019
GA_SLOPE	Slope		degrees	Berry 2019
GA_ASPECT	Aspect		degrees	Berry 2019
GA_SAND	Sediment percent sand		%	MARS
GA_MUD	Sediment percent mud		%	MARS
GA_GRAVEL	Sediment percent gravel		%	MARS
GA_CRBNT	Sediment percent carbonate		%	MARS

2.4 Statistical analysis of data and spatial ecotype distribution prediction

Methods for predictively modelling the spatial distribution of ecotypes (or biological assemblages) closely follows those used in Pitcher et al. (2016) to provide a regional habitat and species assemblage characterisation of the Pilbara region. The spatial characterisation was achieved by analysing the biological datasets summarised above in an integrative analysis method, R package 'gradientForest' (http://r-forge.r-project.org/projects/gradientforest/; Ellis et al. 2012; Pitcher et al. 2012). GradientForest was used to obtain evidence-based relationships between species compositional change (turnover) and multiple environmental gradients, which were then used to transform all environmental data layers to the same 'biological' scale (for details, see http://gradientforest.r-forge.r-project.org/biodiversity-survey.pdf). The transformed layers provide a multi-dimensional biological space that represents biotic composition as associated with the environmental variables. The biological space was mapped in geographic space to provide a continuous characterisation, and an appropriate number of ecotypes defined by an evidence-based clustering procedure to provide a classified assemblage map for the region. These steps are explained further in the report.

Initially, multivariate regression tree (MRT) analysis of each dataset was used to provide a cross-validated estimate of the number of justifiable partitions of the species composition for each dataset, based on predictions on the environmental variables (Figure 5,Figure 6). These results are later used as one of the guides to the total number of assemblages or ecotypes in the survey area.

The NWS FnB trawl, NWS McKenna trawl (Figure 5) and NWS photo-benthos (Figure 6) datasets appear to discriminate some sites around the location of the ancient coastline as different from nearby sites, whereas the Data Trawler FB trawl and Santos.VidSvy2 datasets split clearly along the ancient coastline (Figure 6). The Soviet Trawl dataset appears to have little structure associated with the environmental gradients (Figure 5).

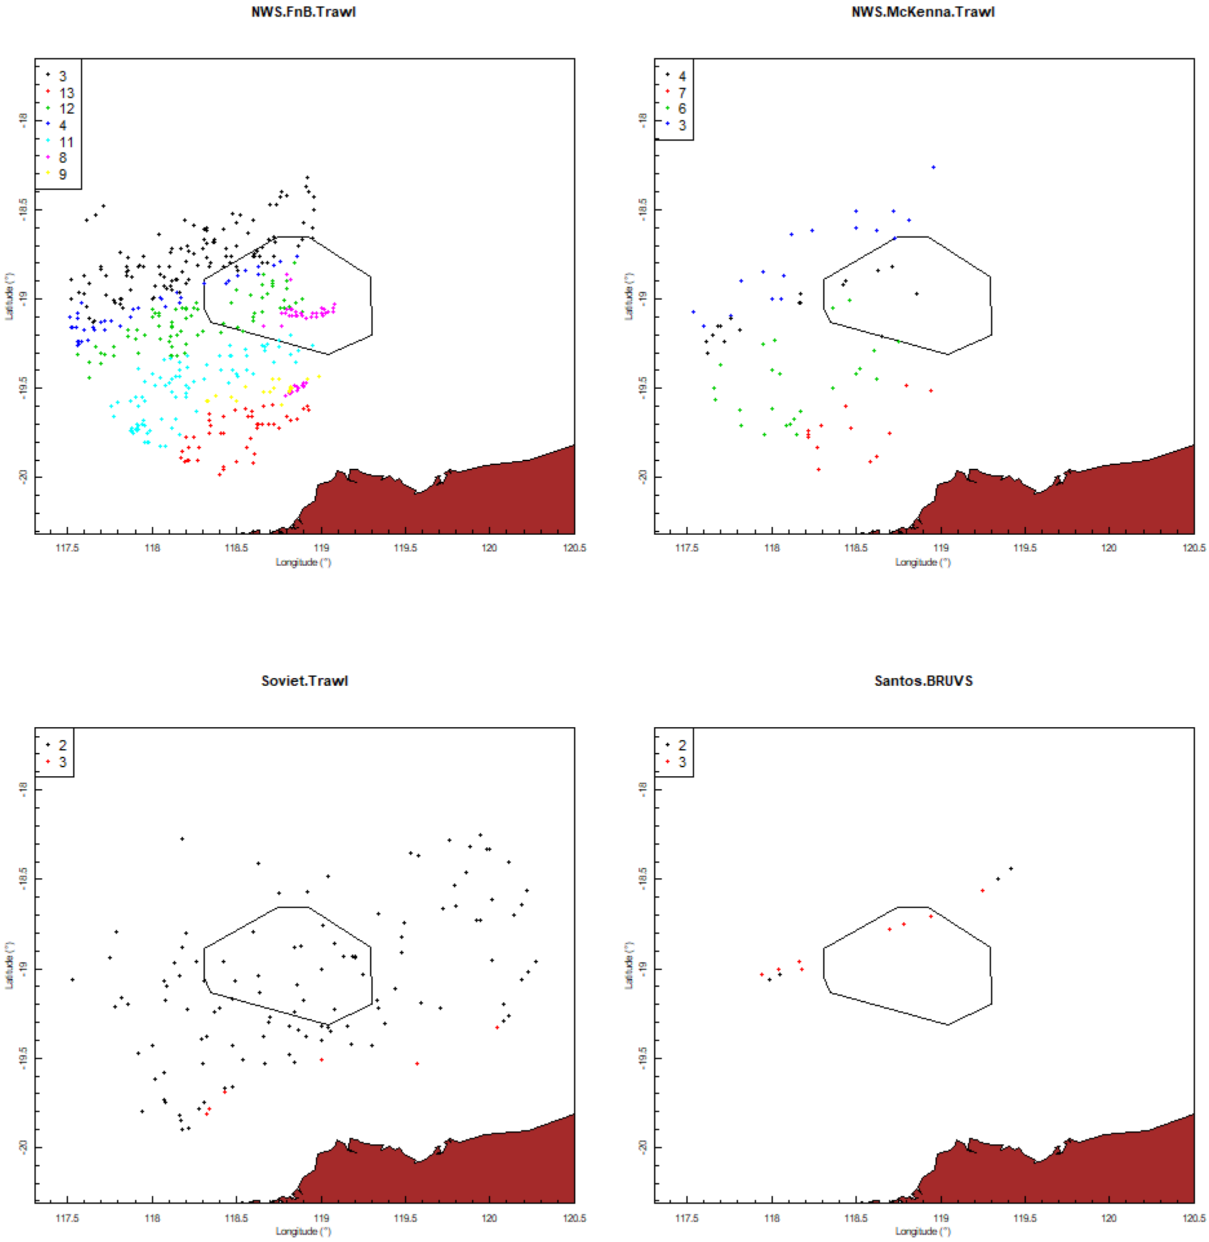

Figure 5. Distribution of sites sorted using MRT analysis of each dataset to provide a cross-validated estimate of the number of justifiable partitions of the species composition for each dataset, given predictions on the environmental variables. Black polygon = survey area boundary.

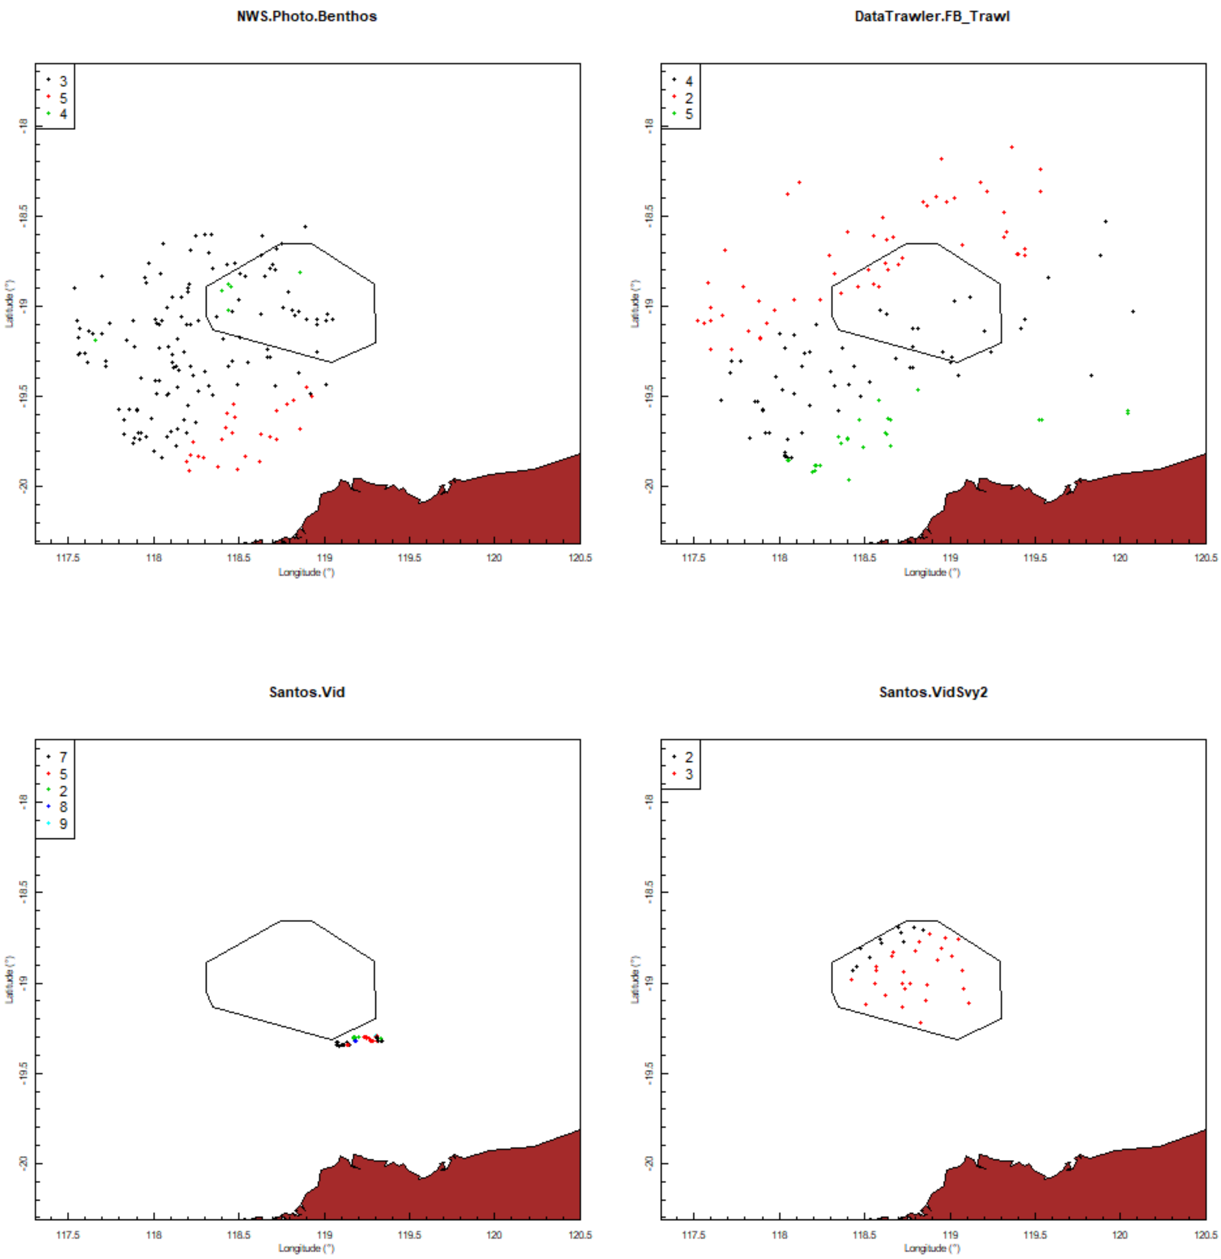

Figure 6. Distribution of sites sorted using MRT analysis of each dataset to provide a cross-validated estimate of the number of justifiable partitions of the species composition for each dataset, given predictions on the environmental variables. Black polygon = survey area boundary.

2.5 Regional Context

Ecoregions (ecotypes mapped at larger spatial scales) provide regional context for the survey area. Thus, the greater NWS has 18 of the 217 ecoregions mapped nationally (Pitcher et al. 2018). The survey area primarily overlaps two ecoregions (10 and 12) and has minor overlap with a shallower shelf ecoregion (8) and an upper-slope/shelf-break ecoregion (14) (Figure 7).

Ecoregions provide a broader regionalisation but are based on similar analyses used to define ecotypes but using 13 datasets with broad coverage of the NWS region. The outer-shelf ecotypes 10 and 12, which overlap the survey area, extend substantially along the shelf to the southwest and northeast. The ancient coastline occurs approximately at the boundary of ecotypes 12 and 14 (and also 10 & 7 with 13). The survey area overlaps slightly with the upper slope ecotype 14 and the shallower shelf ecotype 8.

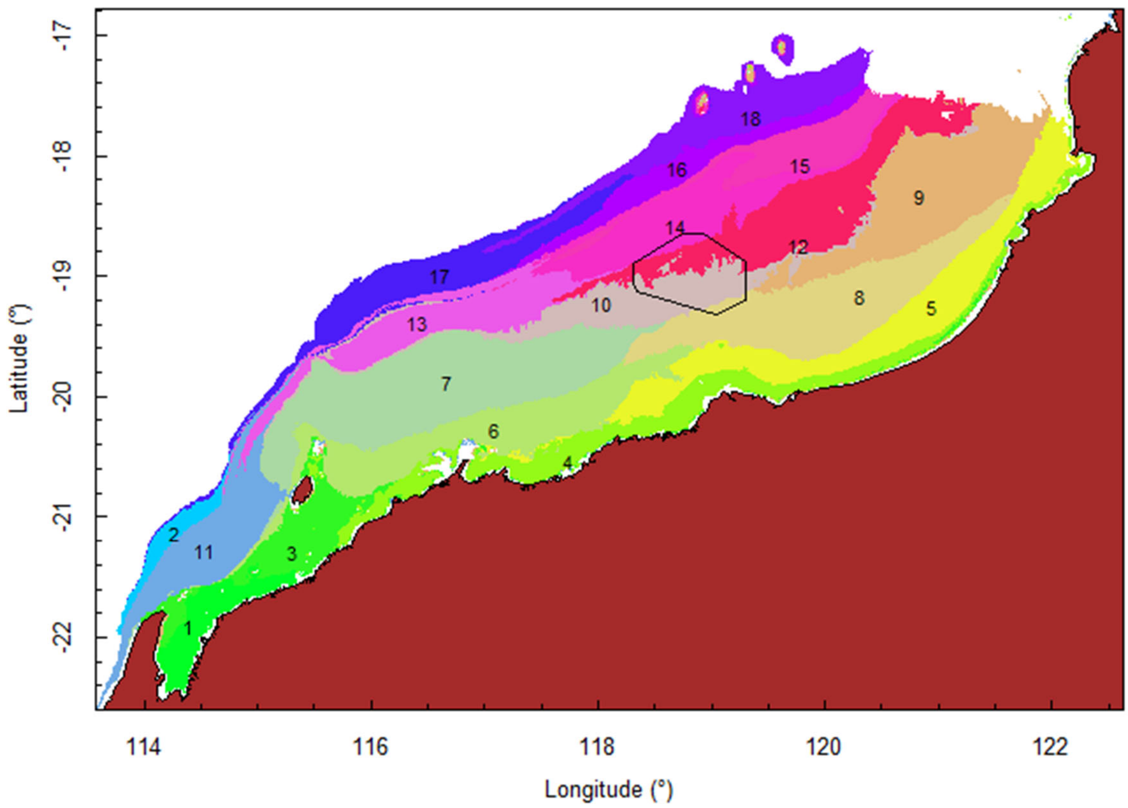

Figure 7. Regional distribution of biological assemblages on the NWS (from Pitcher et al. 2018). Colours and numbers 1–18 correspond to assemblages mapped by Pritcher et al. (2018). Maroon = Australian landmass. Black polygon = survey area boundary.

2.6 Spatial patterns in the Dorado Survey Area

2.6.1 North West Shelf Photo-benthos dataset

As an initial assessment of the historical sites was made with benthic photographic data (Figure 8, Figure 9), to plot maps of the observed abundance distributions of each type of sessile benthic morphotype were together with their MRT groupings (Figure 5, Figure 6). This shows that some of the previous observations of the distribution of branching sponges, gorgonians and whip corals (hereafter whips) is coincident with the ancient coastline and provides a good indication that the MRT clustering of habitats based on these data is revealing spatial patterns that are consistent with expected biota distributions.

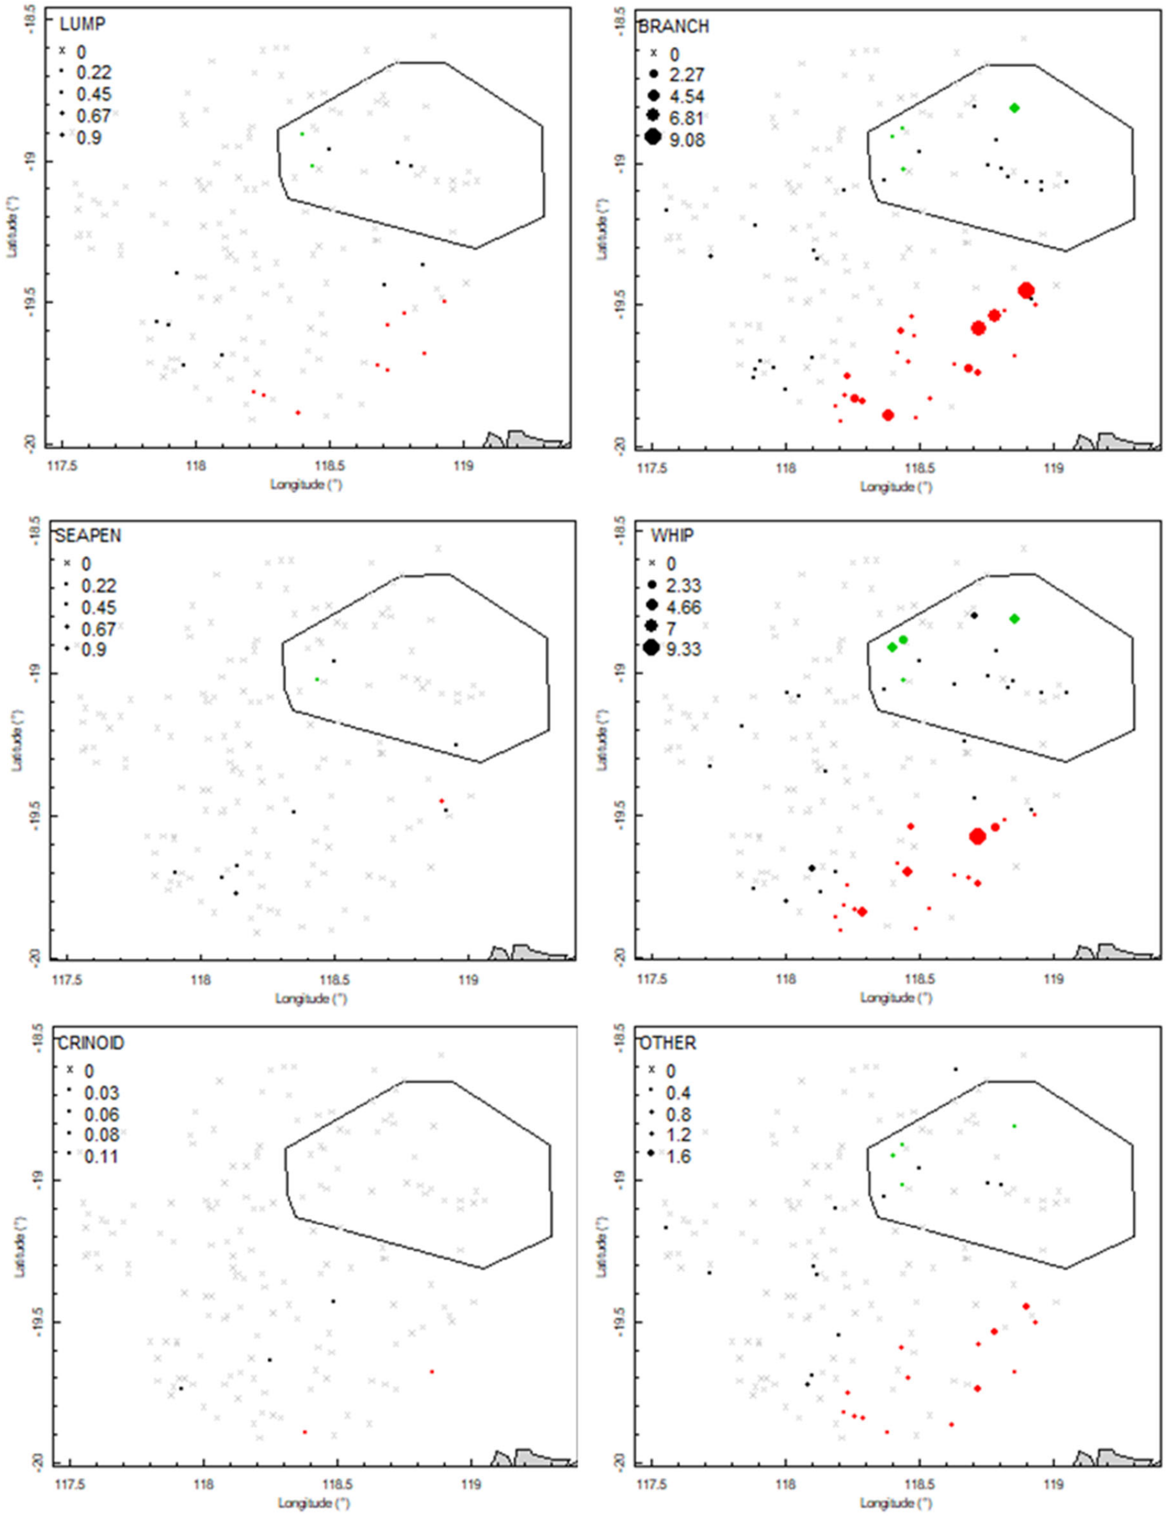

Figure 8. Distribution and relative abundance of habitat forming benthic filter feeder morphotypes from historical surveys within the survey area. Symbol colours (green, black, red) indicate the MRT nodes (or clusters) for the NWS Photo-benthos dataset shown in Figure 6. Morphotypes referred to are: lump-shaped sponges (lump), branched sponges (branch), seapens (seapen), sea whips (whip), crinoids (crinoid), and other difficult to distinguish types (other). Black polygon = survey area boundary.

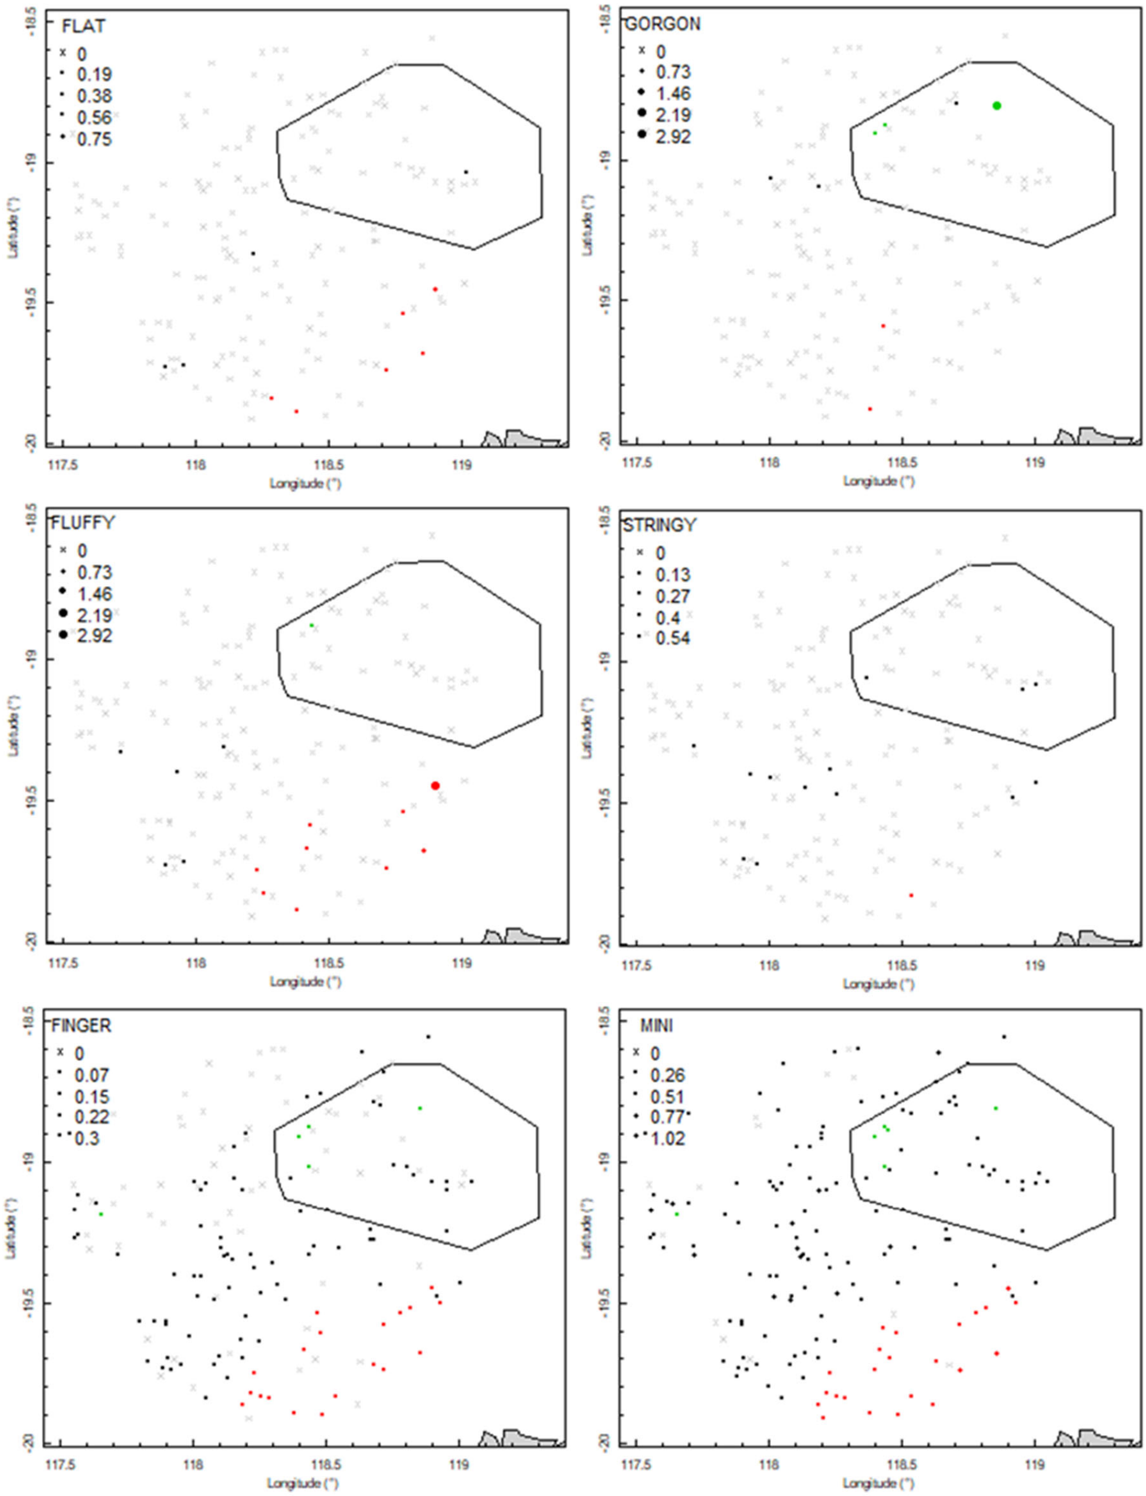

Figure 9. Distribution and relative abundance of habitat forming benthic filter feeder morphotypes for from historical surveys within the survey area. Symbol colours (green, black, red) indicate the MRT nodes (or clusters) for the NWS Photo-benthos dataset shown in Figure 6. Morphotypes referred to are: flat growth-form sponges (flat), gorgonians sea fans (gorgon), fluffy appearance biota mostly hydroids (fluffy), stringy appearance biota mostly hydroids (stringy), finger-shaped sponges (finger), and small filter feeders < 5 cm (mini). Black polygon = survey area polygon.

2.6.2 Influence of environmental gradients

Following bio-physical analysis of each dataset, using ‘gradientForest’ (Ellis et al. 2012; Pitcher et al. 2012), which quantifies the magnitude of compositional change along each environmental gradient for each dataset and for the combined response (Figure 10), the gridded environmental variables are transformed to a multidimensional ‘biological space’, using the combined response, which provides a prediction of the continuous compositional patterns that are associated with the environment (biplot, first 2 of 40 dimensions only) and to geographic space (Figure 11).

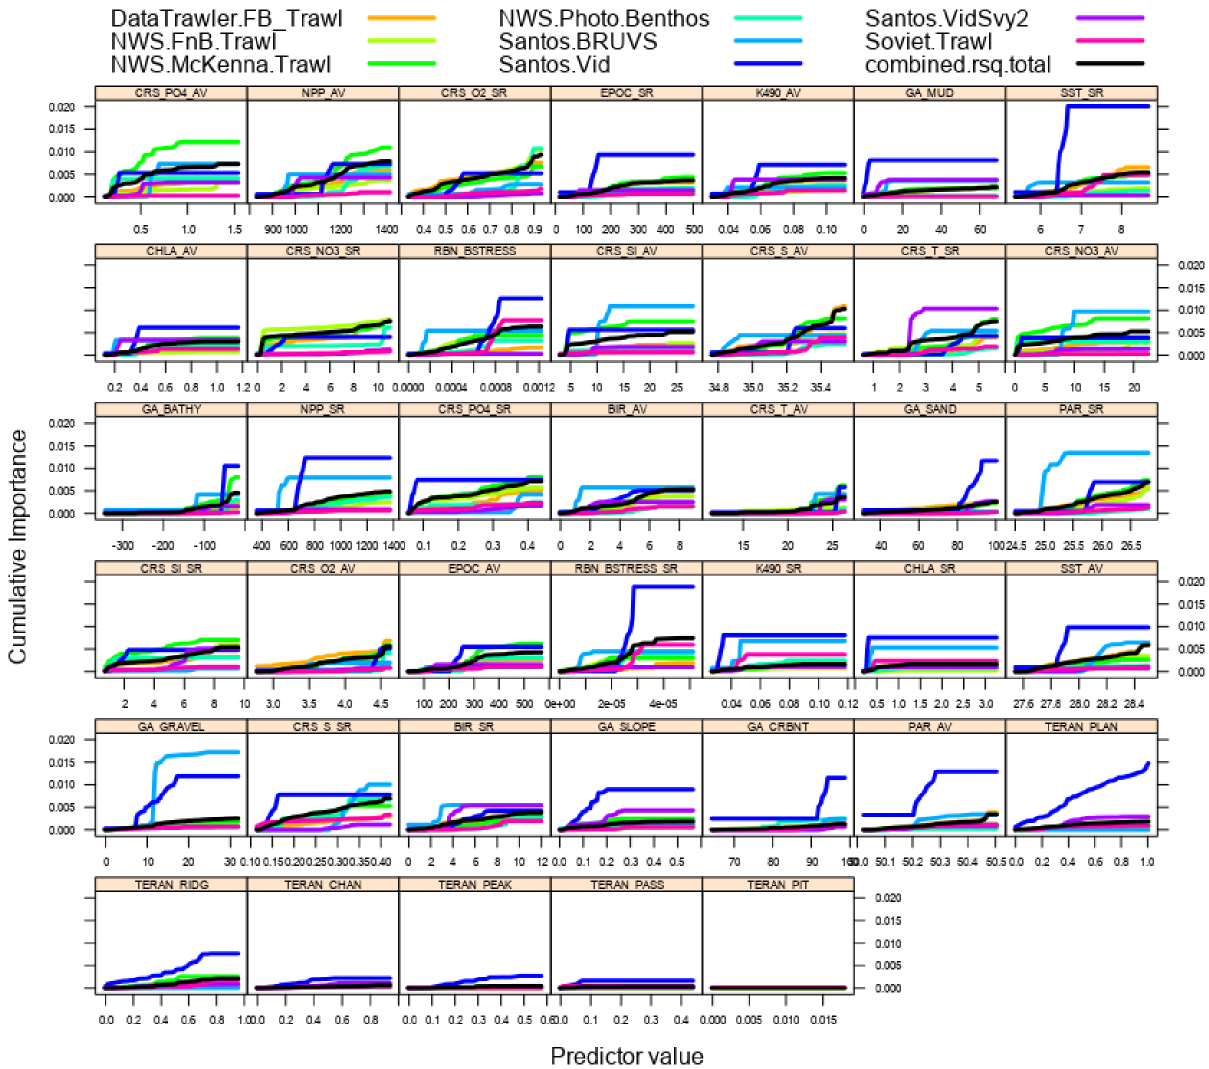

Figure 10. Magnitude of compositional change along each environmental gradient for each of the eight biological datasets and the combined response.

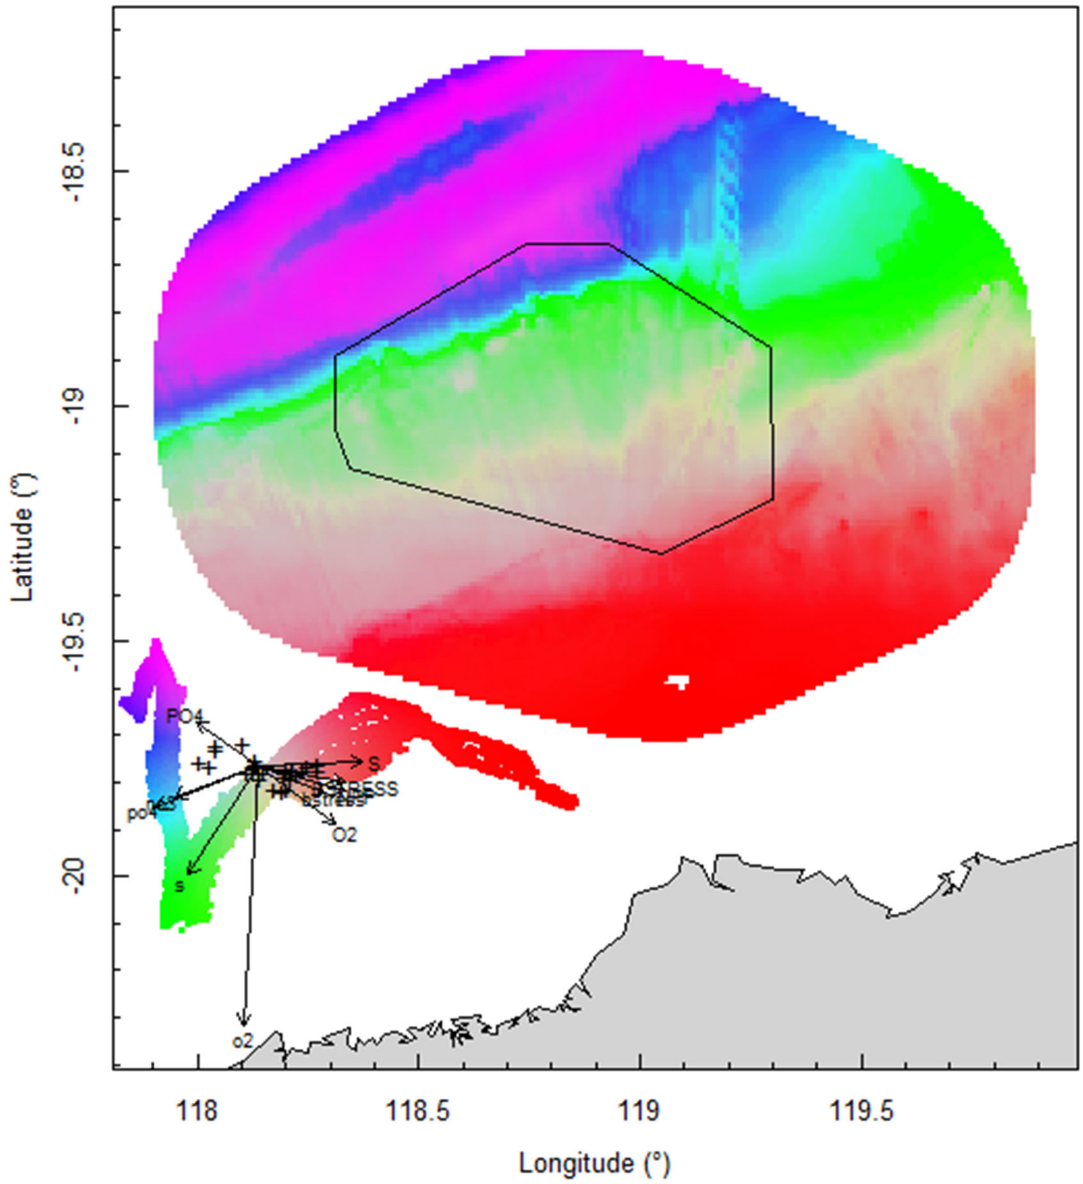

Figure 11. Prediction of the continuous change in compositional patterns of biological assemblages in relation to the environment (biplot) and to geographic space within the survey area. The biplot legend at lower left shows the continuous environmental variables in the first 2 dimension of multidimensional space; vectors indicate the direction of the key environmental variables (see Table 2 for list of environmental variables). Black polygon = survey area boundary.

2.6.3 Clustering of discrete habitats or ecotypes

While real compositional changes of species assemblages are continuous, many applications require a classified version where classes represent predicted assemblages or eco-types – these are the 'habitats' in terms of the environmental combinations where each mix of species compositions is distributed. Classification is achieved by cluster analysis, however some evidence supported objective basis is required for the appropriate number of clusters. The earlier MRT analysis results, and a multi-variate F-ratio statistic are used to help guide the selection of an appropriate number of clusters.

The MRT criterion (Figure 12) indicates the minimum number of regional clusters that is required to split each dataset according to the MRT analysis. The multi-variate F-ratio indicates how well each regional clustering, as a factor, explains the variation due to structure in each dataset. The smallest number of clusters that satisfies the MRT criterion for all datasets is seven (excluding the initial Santos video survey, which is an unreliable outlier in terms of MRT results – see Figure 5, Figure 6), because the sampling was focused within a very small geographic area and was not designed to determine the distribution of habitats in that area, rather it was targeted around trying to locate pearl oyster habitat. Moreover, seven clusters had a higher F ratio than any other number of clusters that satisfies the MRT criterion (Figure 13). Thus, a 7-cluster solution provided a reasonable balance between representing the most informative datasets, partitioning the environmental/biological patterns in sufficient detail but not too many to over-complicate, or over-interpret, the patterns.

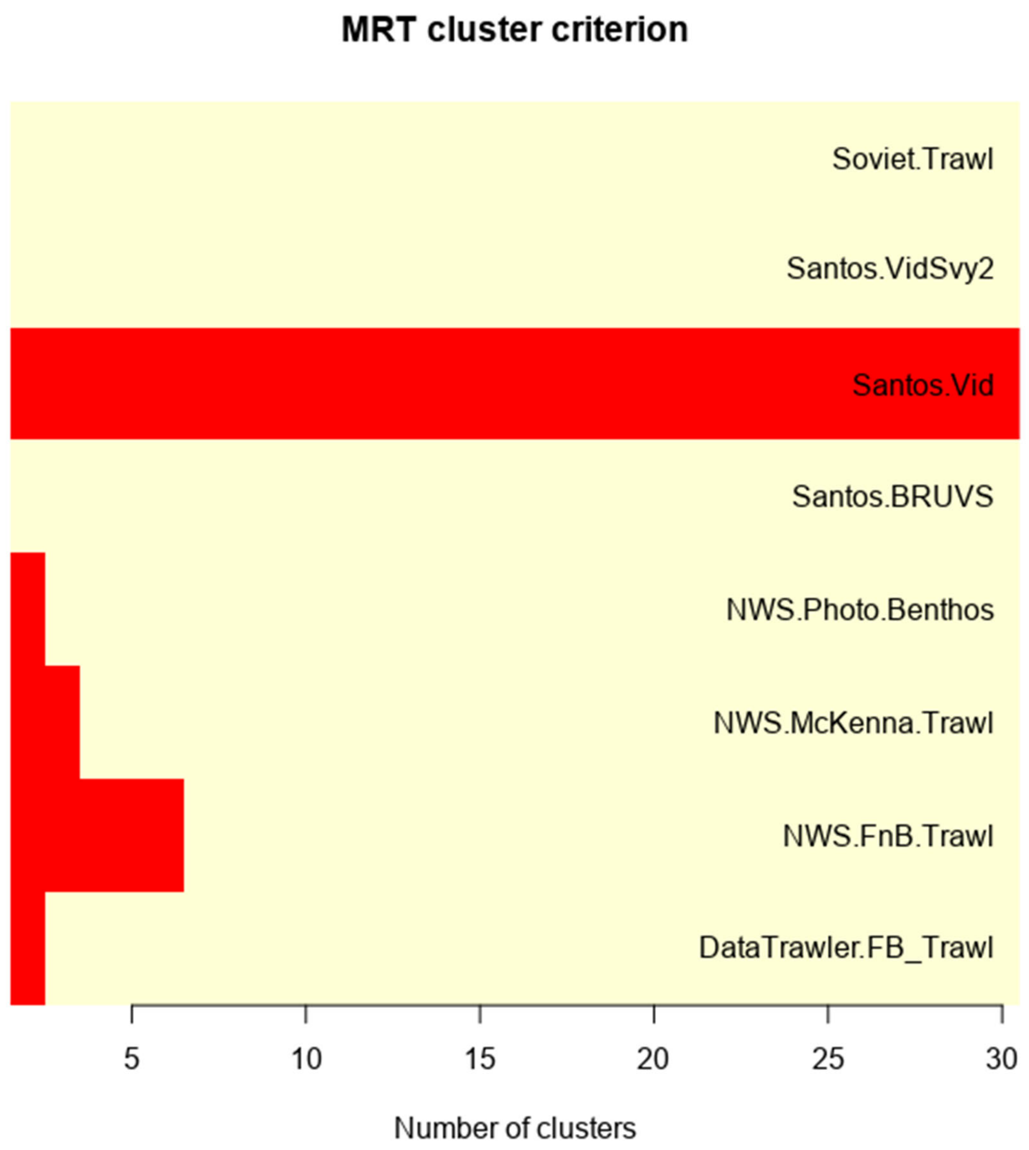

Figure 12. Multivariate regression tree results for each of the eight biological datasets.

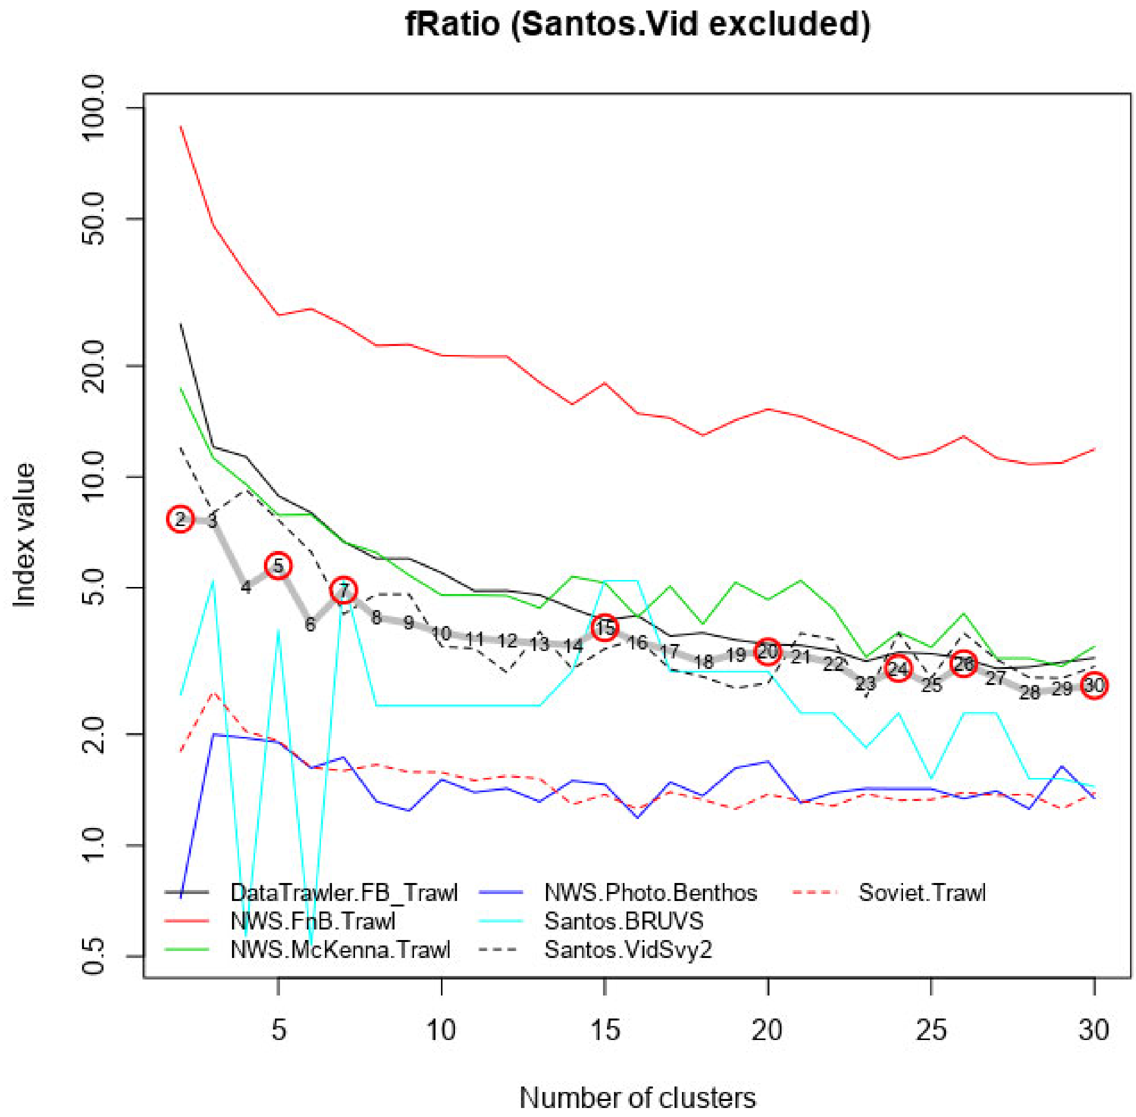

Figure 13. Multivariate F-ratio for each of the biological datasets. This statistic indicates the variation (or structure) in each dataset explained by each clustering in a range of numbers of clusters of the entire environment space of the study area in each dataset and assists with a more objective selection of the optimal number of ecotypes. The thick grey line indicates the weighted average F-ratio of across datasets for each cluster. Red circled numbers = local peaks in F-ratio for the cluster number.

2.6.4 Ecotypes present in the Dorado Survey Area

Figure 14 shows the map of the 7-cluster characterisation and prediction of seabed assemblages or ecotypes, along with a biplot showing associated distributions in the first 2 dimensions of ‘biological space’ and directions and magnitudes of the major environmental influences.

The most important environmental influences include the seasonal range and annual average of bottom water attributes such as oxygen, salinity, nutrients and temperature (Figure 15). The cluster boundaries align with depth even though depth *per se* is relatively unimportant – this is because several of the important variables vary with depth though in non-linear ways. The ancient coastline is located primarily near the outer boundary of ecotype 3 (see Figure 16 and Figure 17).

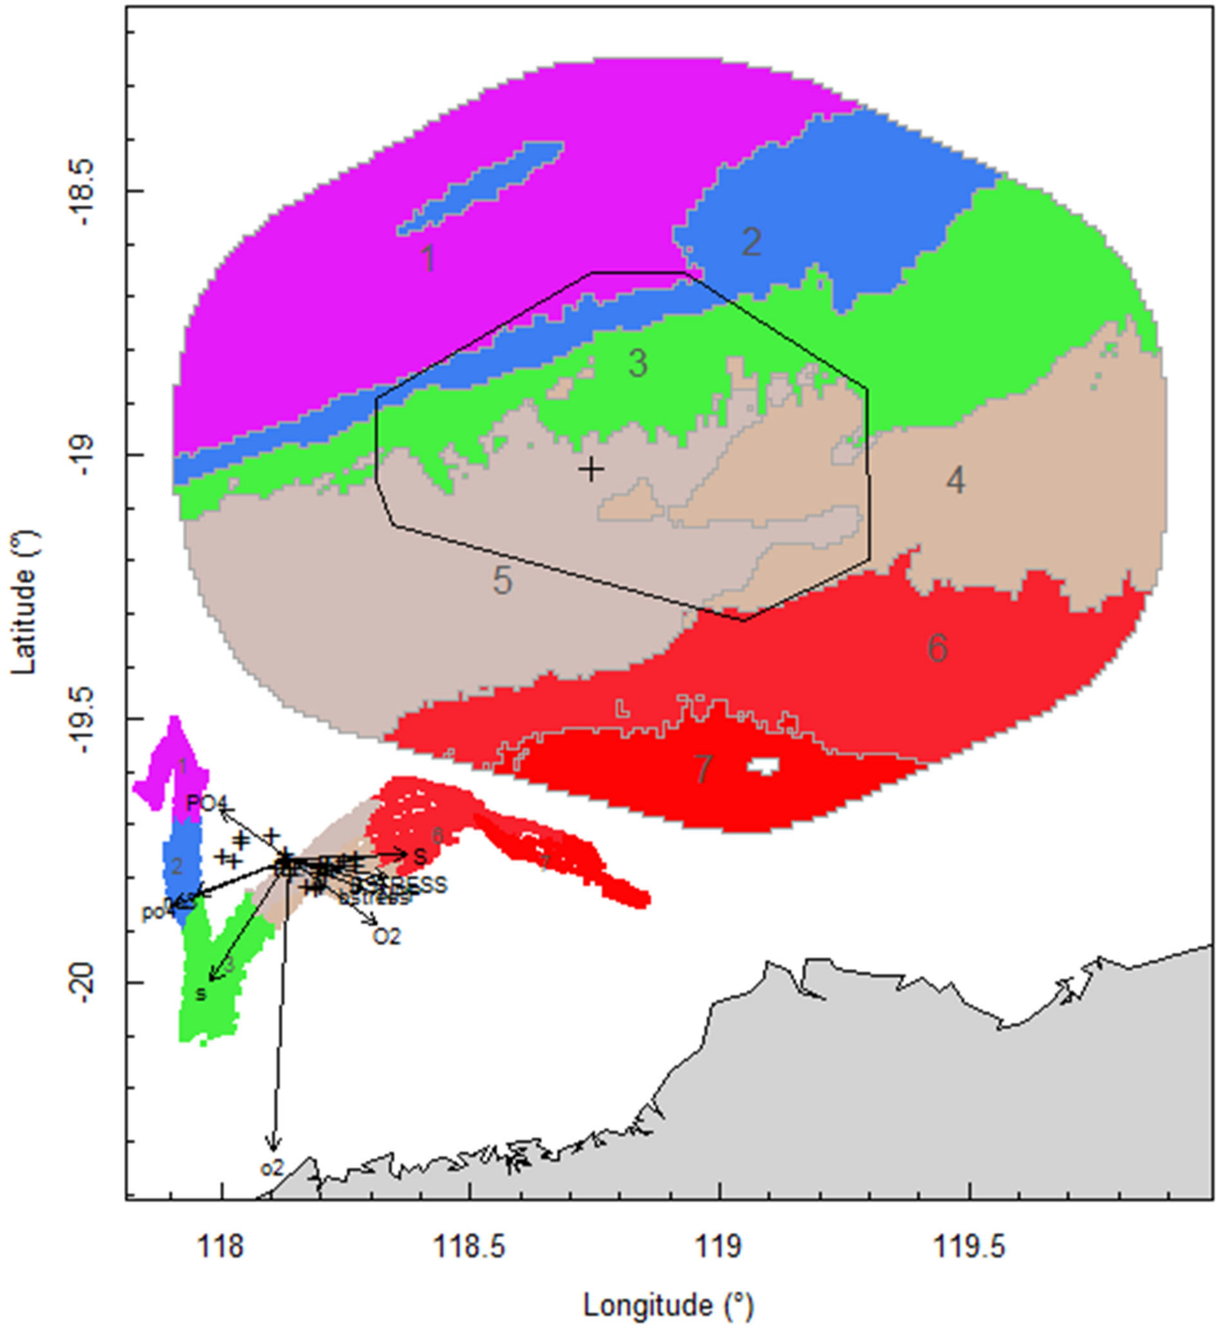

Figure 14. Map showing the spatial distribution of the seven ecotypes, identified by colour and number, within the survey area. The biplot legend at lower left shows the corresponding clustered environmental variables in the first 2 dimensions of multidimensional space; vectors indicate the direction of the key environmental variables (see Table 1 for list of environmental variables). "+" = WHPL. Outer grey line = initial survey area. Black polygon = survey area boundary. White area = area of < 10 m depth.

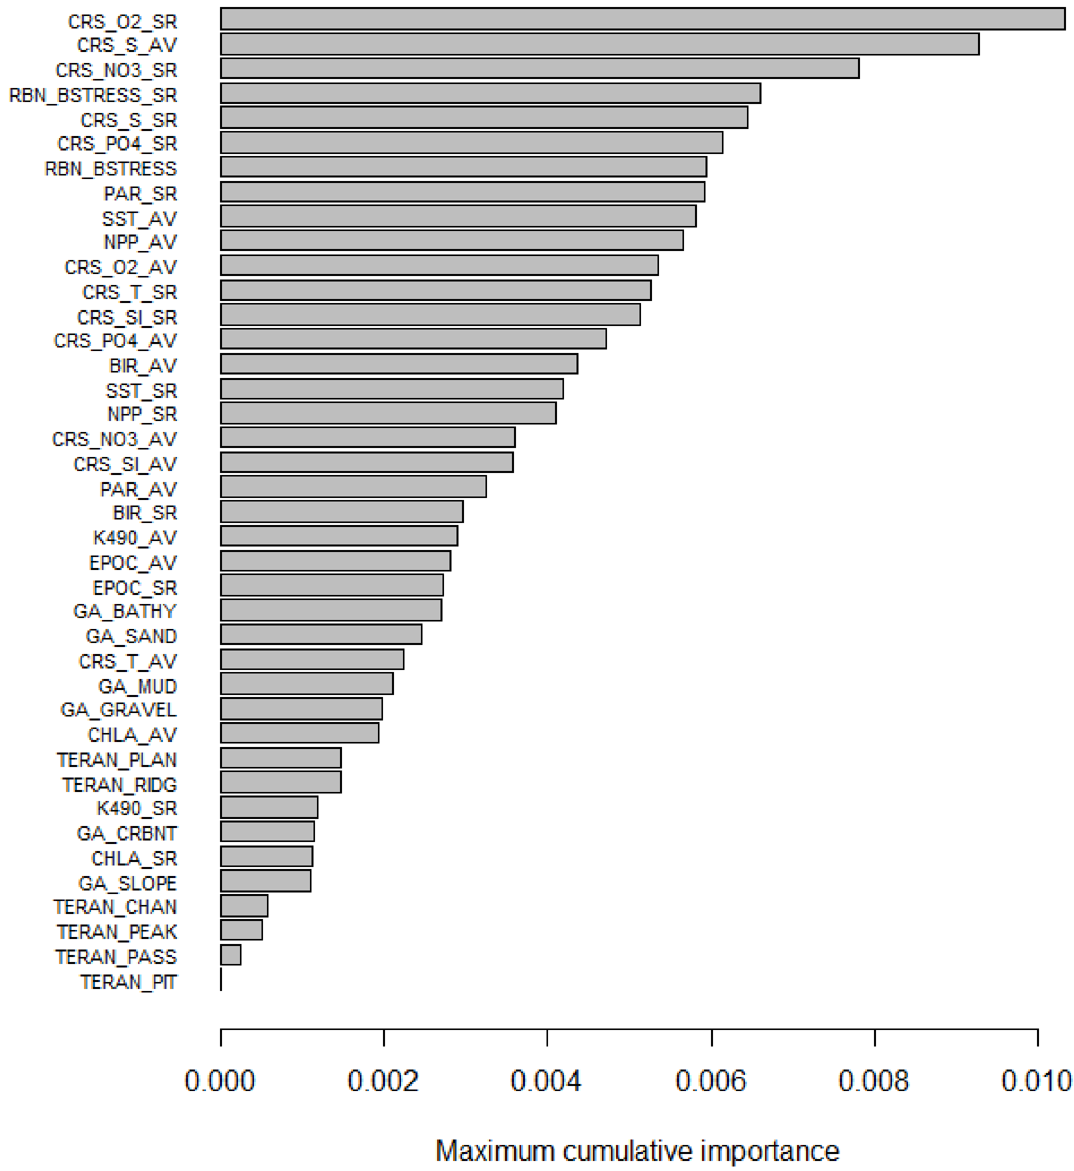

Figure 15. Relative importance of each of the environmental variables in predicting spatial patterns in biological attributes within the survey area. The maximum cumulative importance is the maximum of the combined cumulative importance in Figure 10.

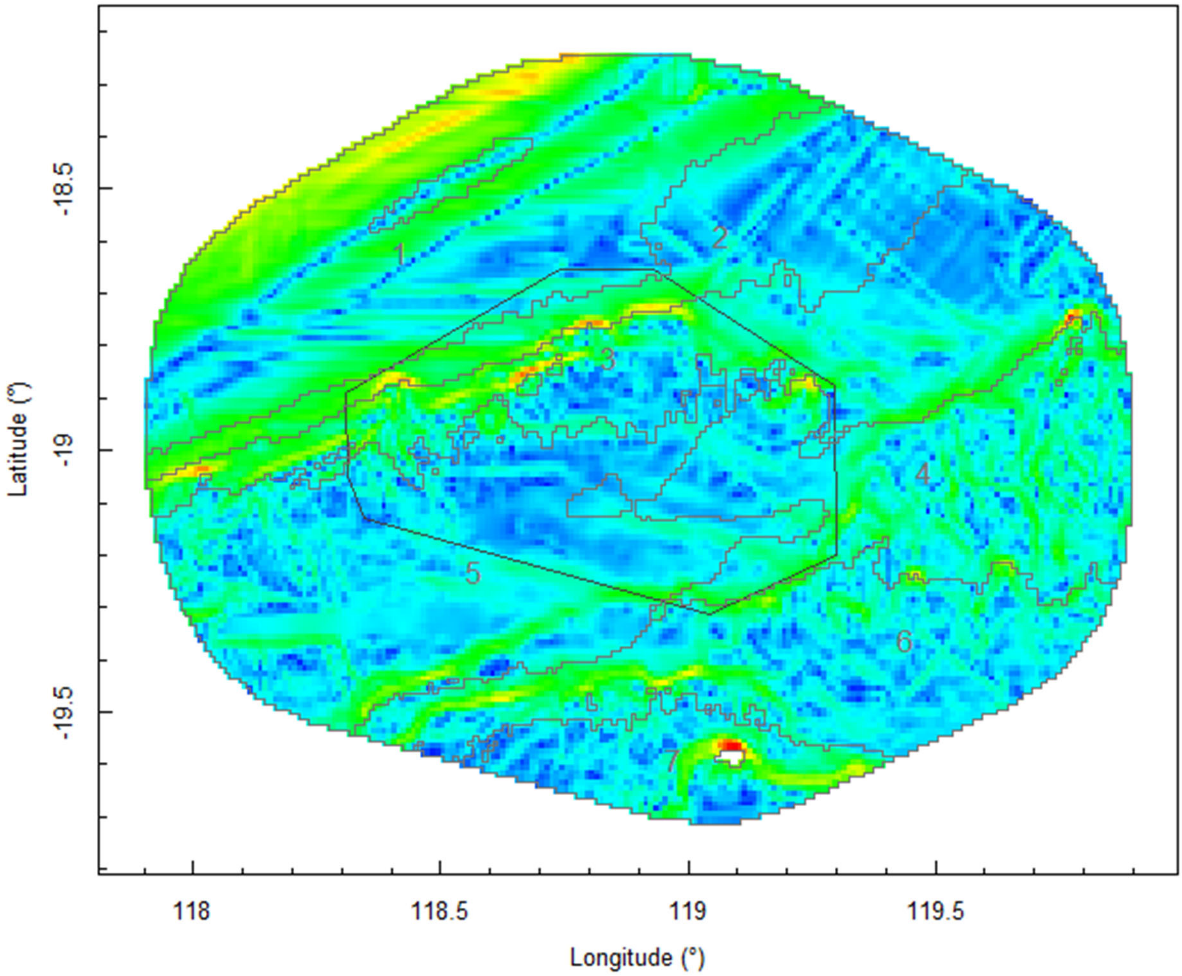

Figure 16. Map showing the seven ecotypes superimposed on the slope gradient derived from the bathymetry. Blue is the shallowest or flattest slope and red is the steepest slope. Numbers and lines correspond to ecotypes. Outer grey line = initial survey area. Black polygon = survey area boundary.

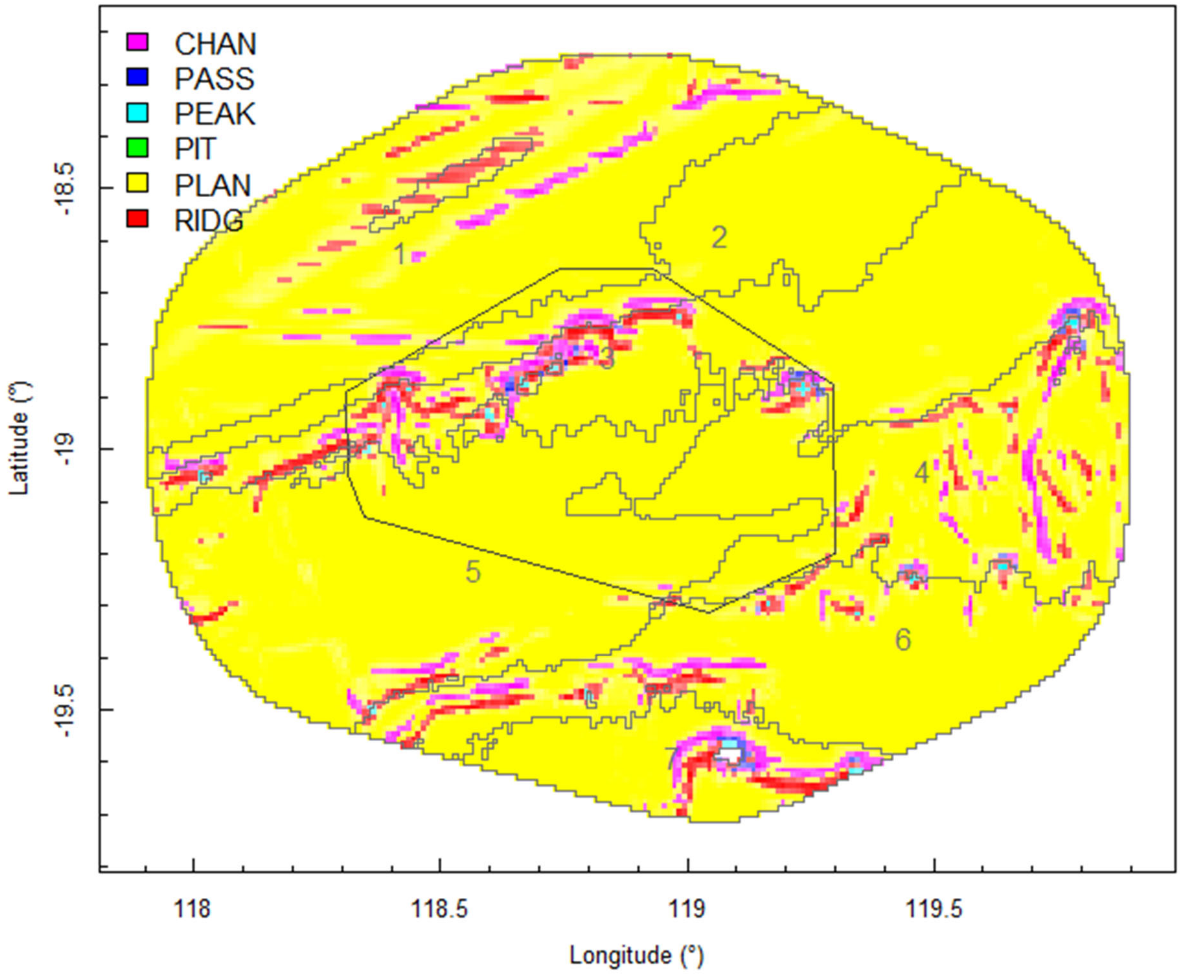

Figure 17. Map showing the seven ecotypes superimposed on the terrain features derived from the bathymetry. The terrain features are: channel, pass, peak, pit, plane and ridge (see Section 2.3 for explanation of terrain types). Each cell is coloured by its maximum terrain class probability and the probability value by respective colour intensity. Numbers and lines correspond to ecotypes. Outer grey line = initial survey area. Black polygon = study area boundary.

2.6.5 Environmental attributes of each ecotype

Box plots summarising the characteristic environmental attributes of each eco-type are shown in Figure 21 – Figure 21. Ecotype 3 – associated with the ancient coastline – stands out in having the highest seasonal range in oxygen, as well as high seasonal range for salinity and nutrients (NO_3 and PO_4). Most ecotypes are sand-dominated although silt/mud content (GA_MUD) increases with depth (Figure 20Figure 21) and is greatest for ecotype 1; note when the percentage of mud reaches 20%, it can substantially alter the characteristics of the sediment and the associated biota composition. Coarser substrates are more frequent in shallower ecotypes within the survey area (Figure 22, Figure 23).

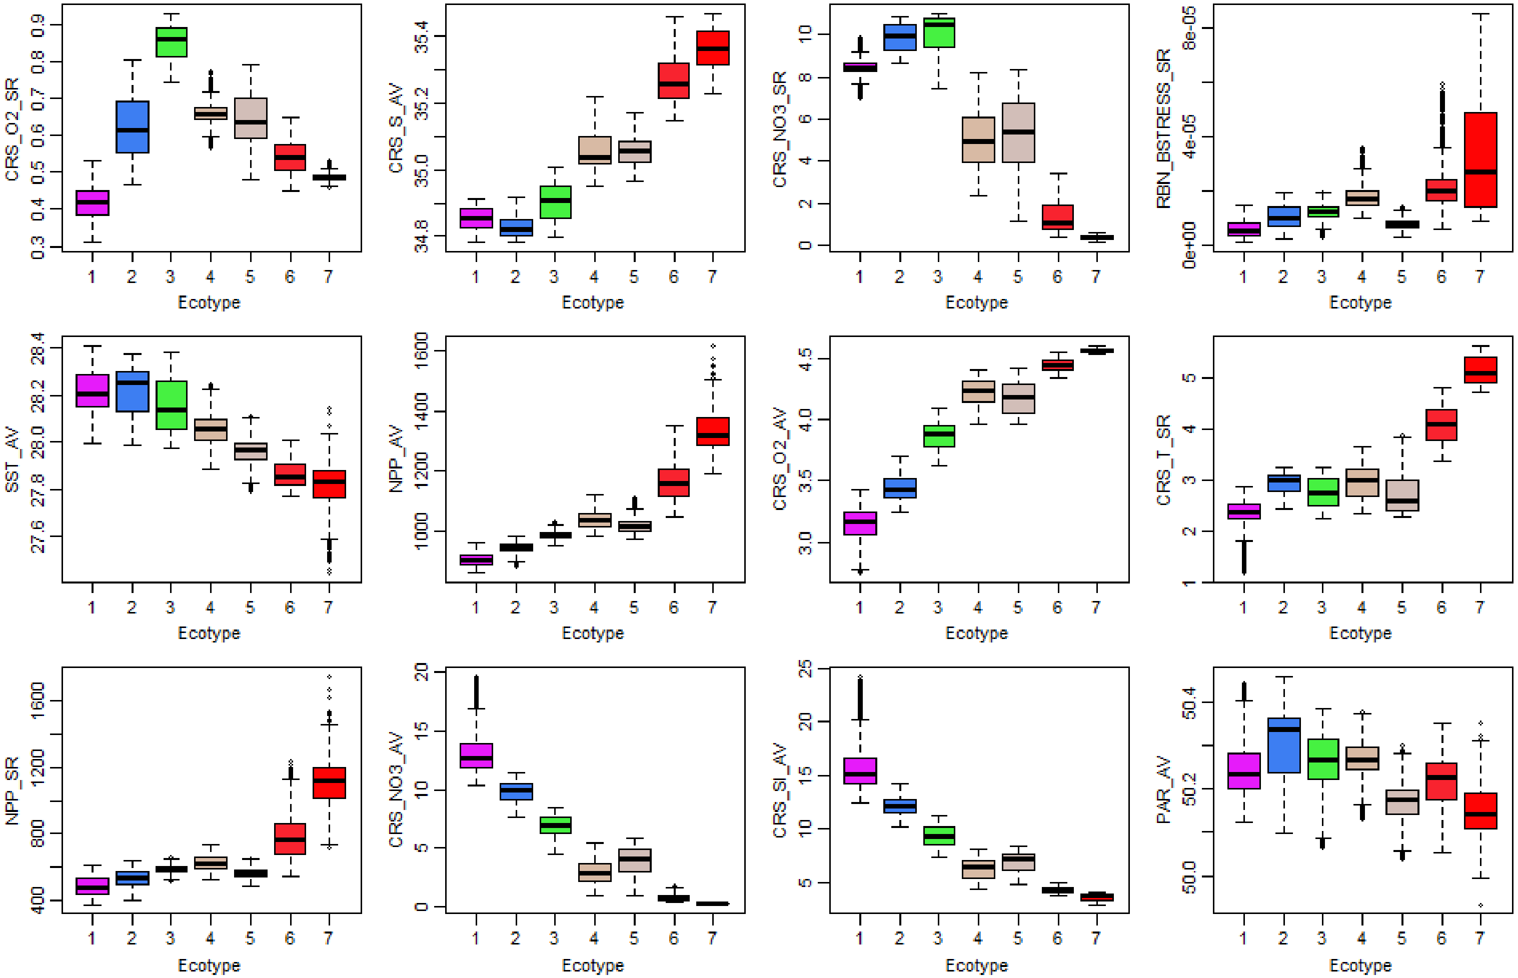

Figure 18. Predictor variables for each of the seven ecotypes within the survey area. Boxplots comprise median, first and third quartile, and 'whiskers' extending to the minimum of (a) the most extreme data point that is no more than 1.5x the interquartile range from the box, or (b) 1.5x the interquartile range from the box. Dots = outliers, values of any data points that are beyond the whiskers.

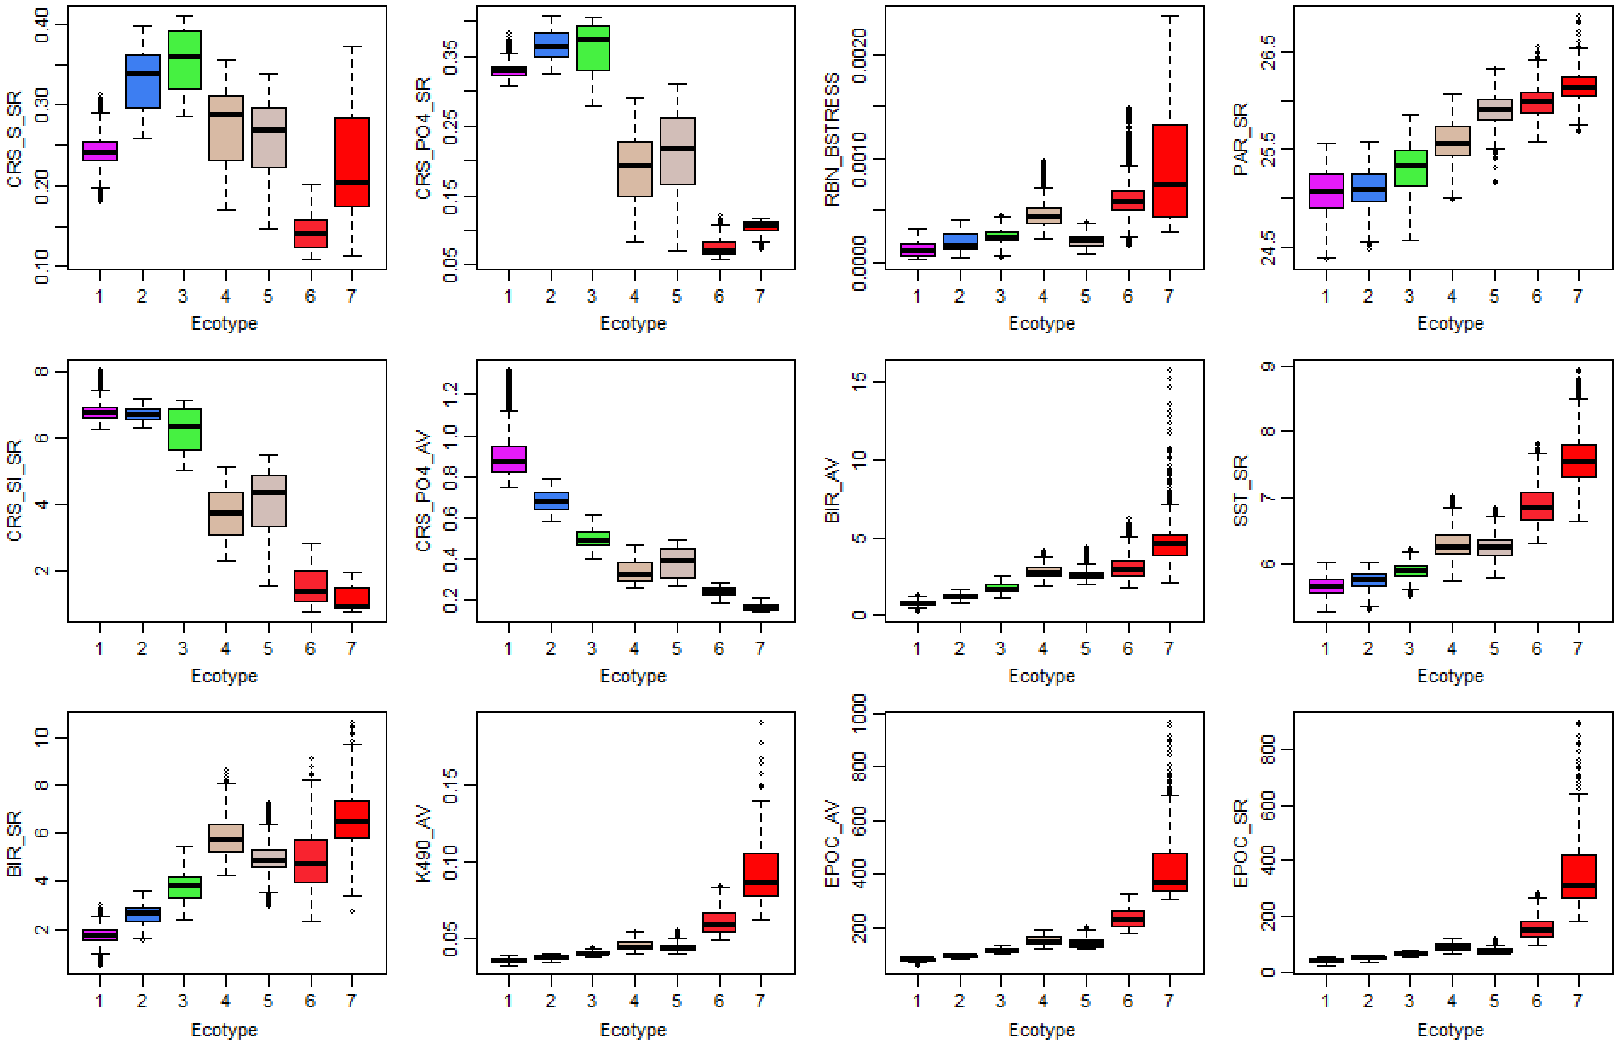

Figure 19. Predictor variables for each of the seven ecotypes within the survey area. Dots = outliers, values of any data points that are beyond boxplot whiskers.

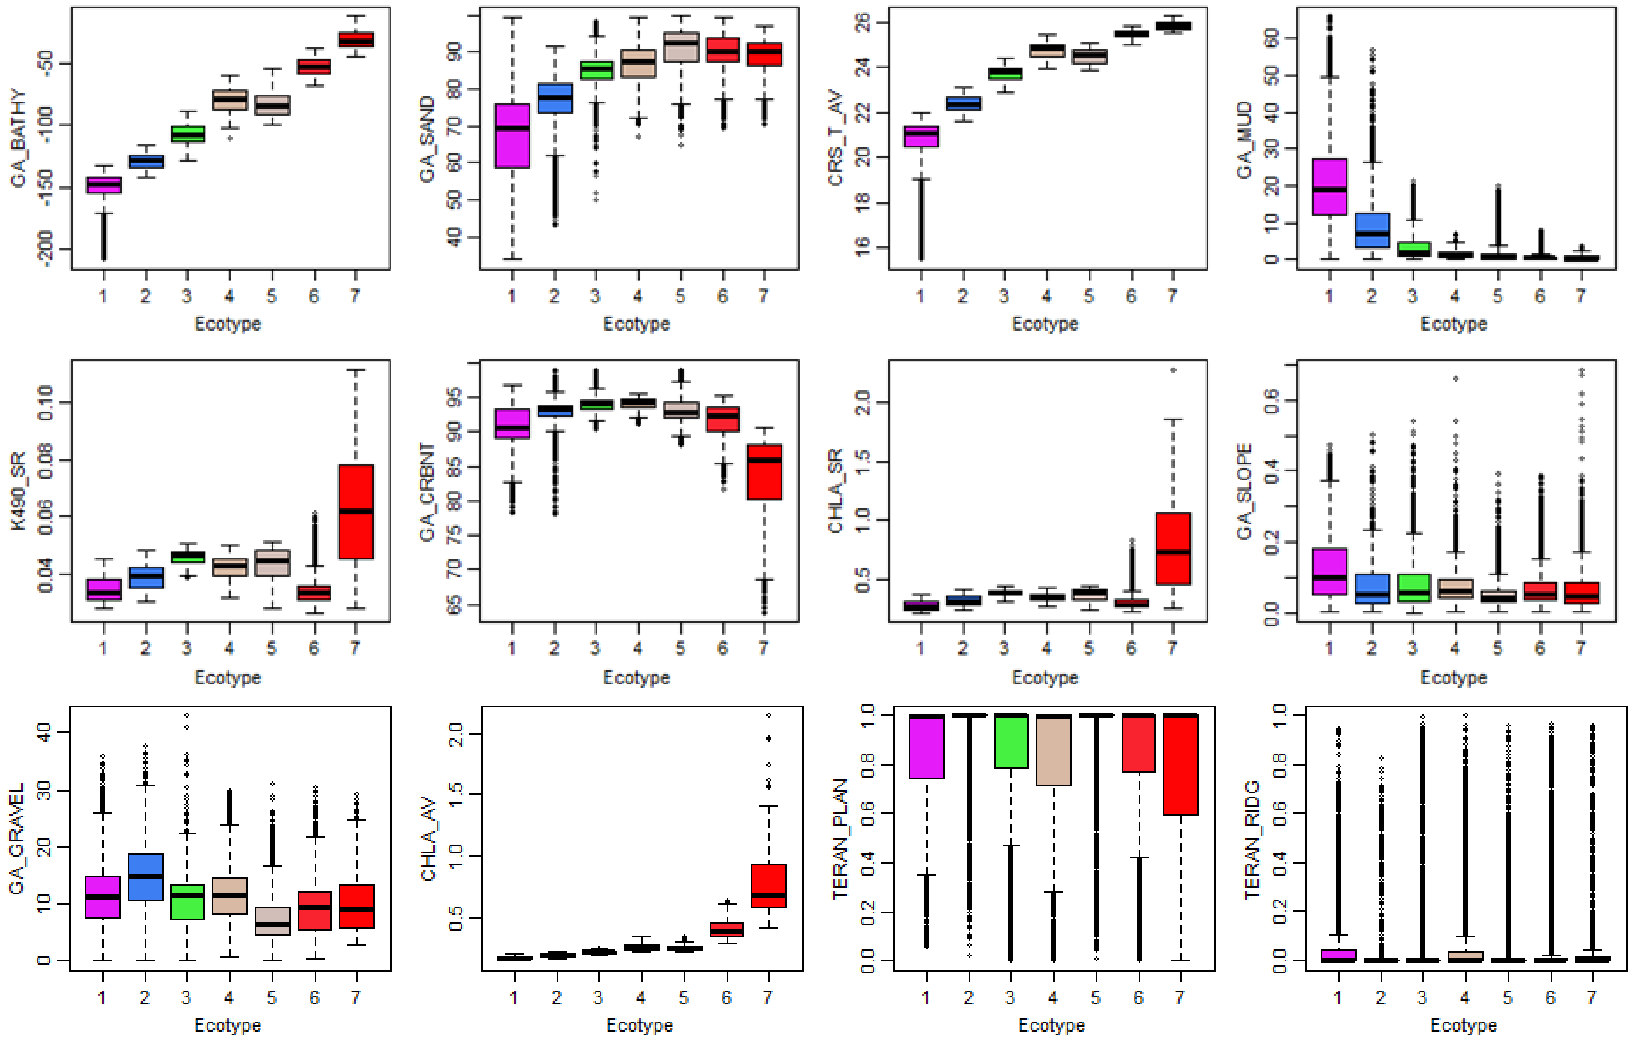

Figure 20. Predictor variables for each of the seven ecotypes within the survey area. Dots = outliers, values of any data points that are beyond boxplot whiskers.

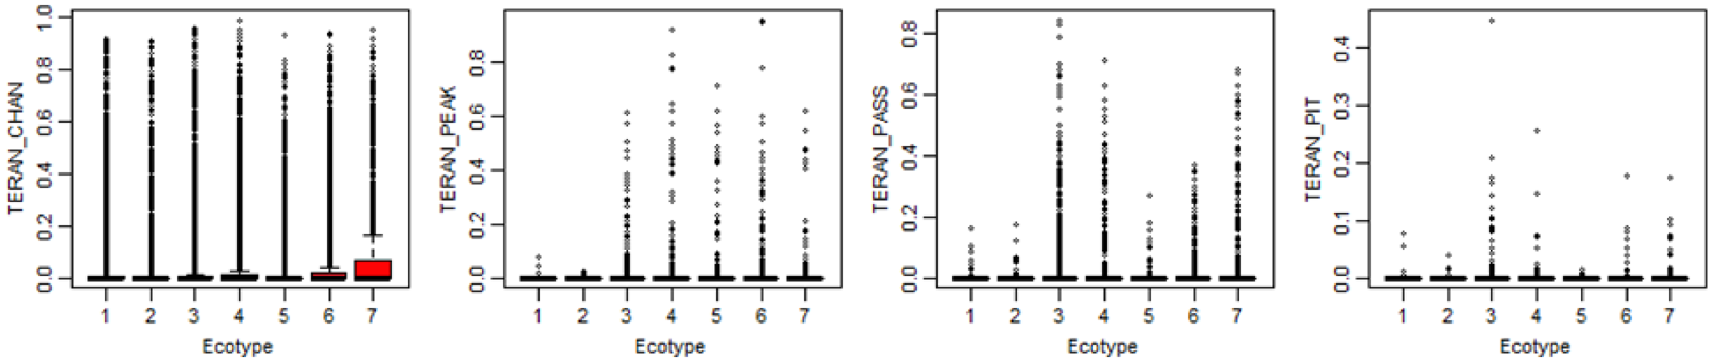

Figure 21. Predictor variables for each of the seven ecotypes within the survey area. Dots = outliers, values of any data points that are beyond boxplot whiskers.

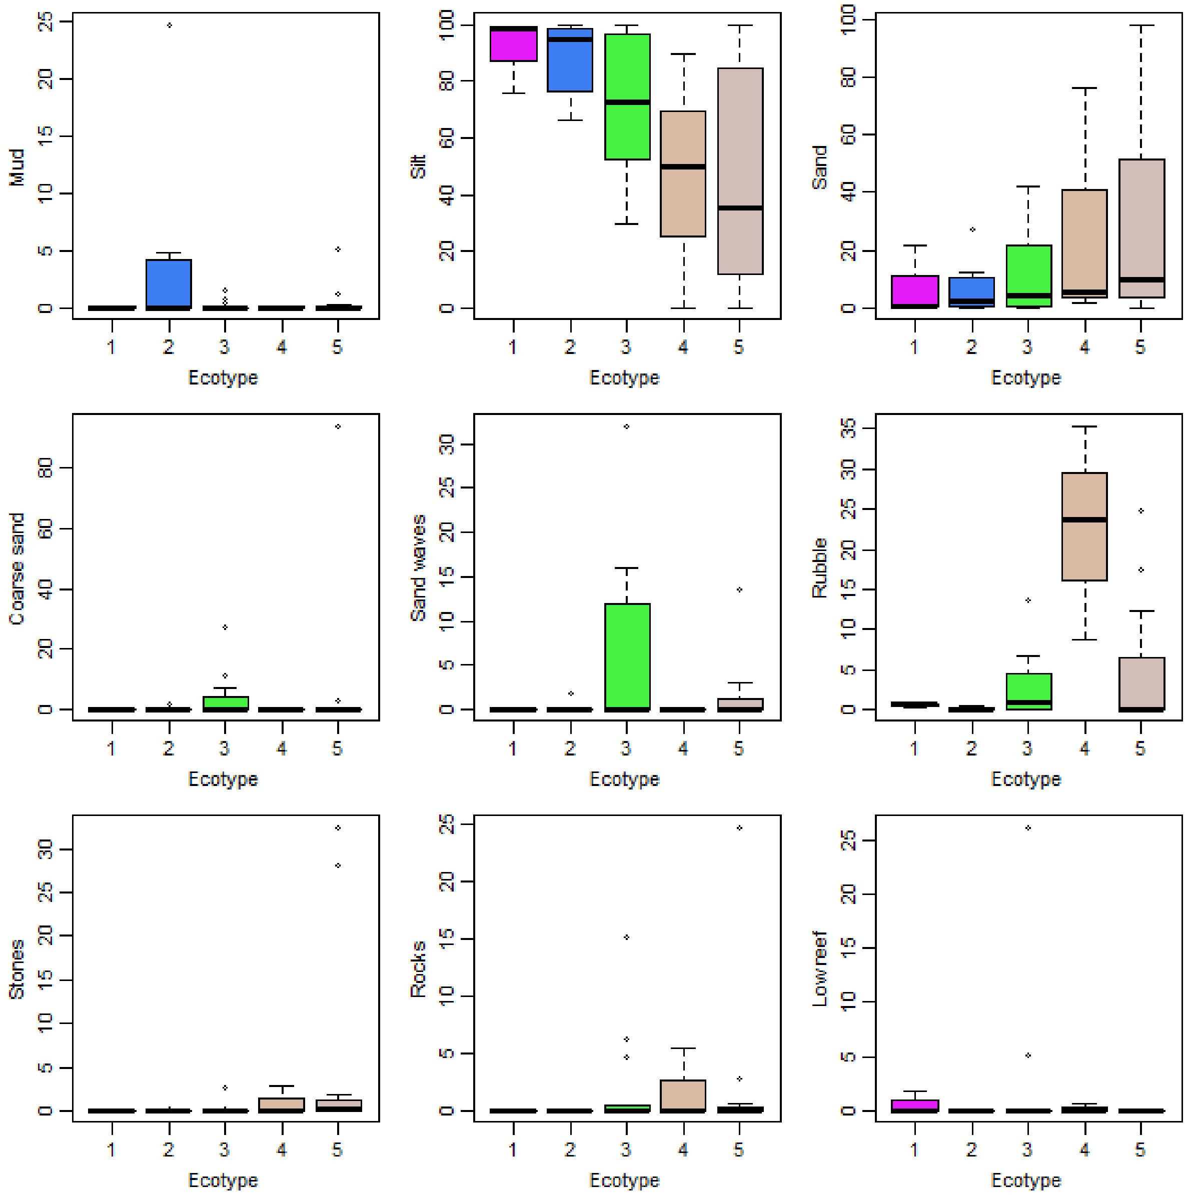

Figure 22. Box plots of substrate cover scores for sites within five ecotypes (out of a total of seven) that were represented within the survey area. Data are from the December 2019 RPS survey. Dots = outliers, values of any data points that are beyond the whiskers.

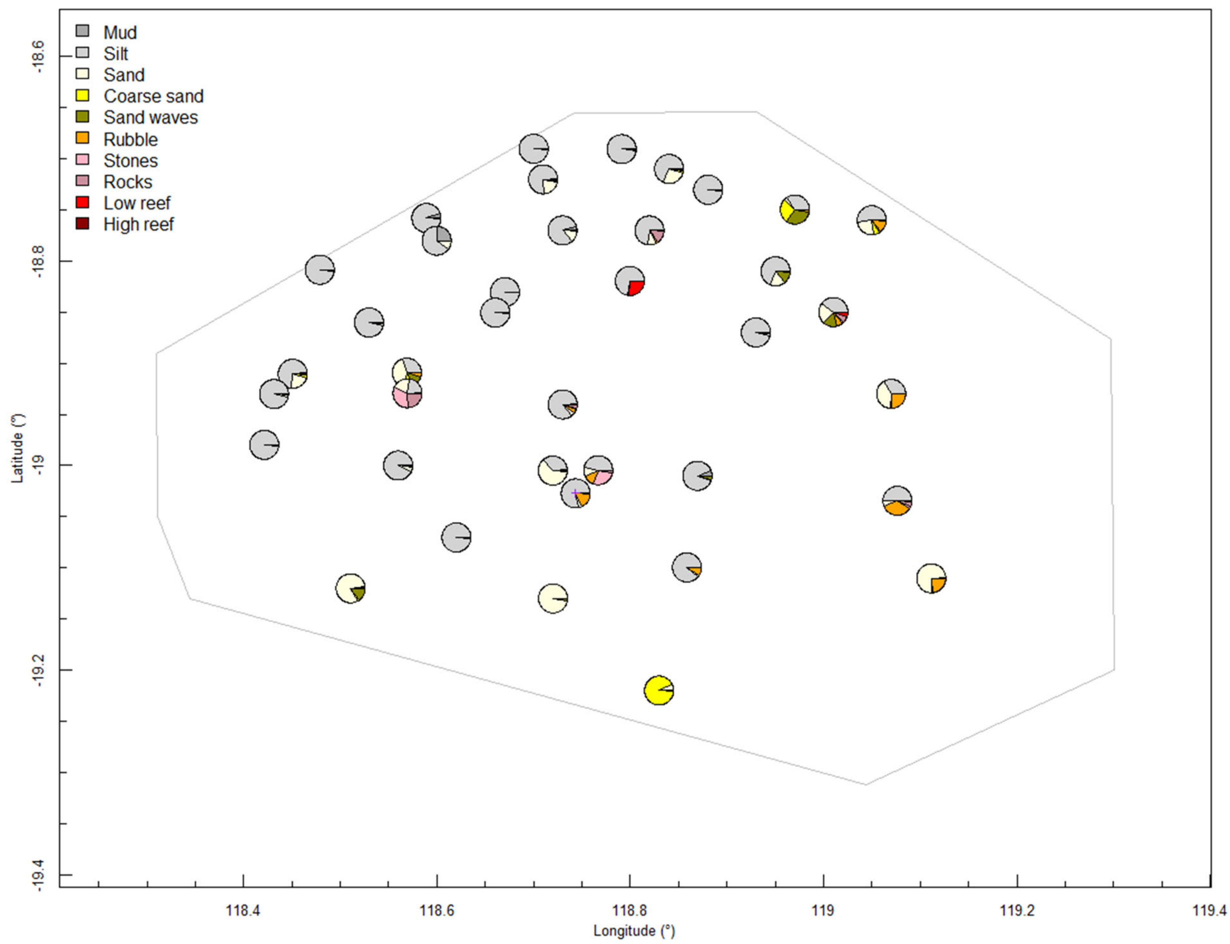

Figure 23. Site by site data for the proportion of substrate scores from ROV video data summarised by ecotype in Figure 22. Data are from the December 2019 RPS survey. See also Chapter 3 for detailed graphs plotted for each site. Grey line = survey area boundary.

2.6.6 Taxonomic richness and biomass of trawl samples of each ecotype

Box plots summarizing the taxonomic richness and biomass of trawl samples for sites that overlap each ecotype are shown in Figure 24. These samples are primarily dominated by fishes. The shallower ecotype 7 tends to have higher richness and biomass in some datasets.

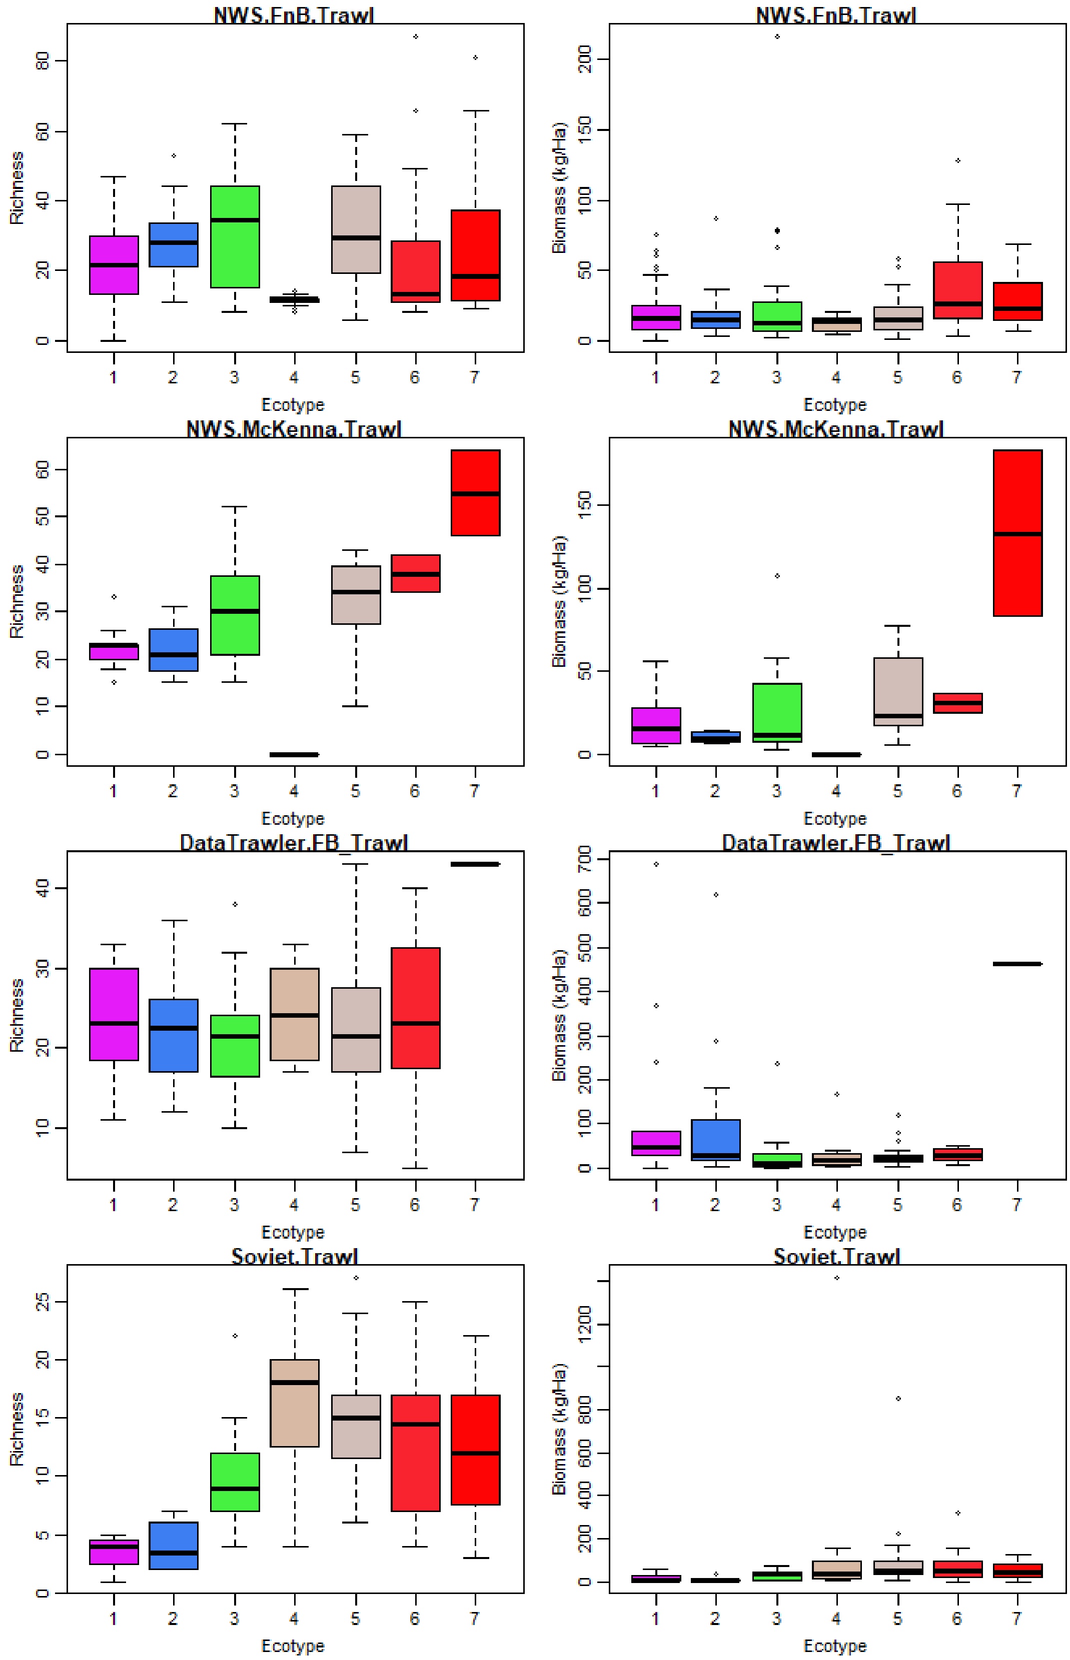

Figure 24. Taxonomic richness and biomass comparisons among the seven ecotypes within the survey area for each of the four trawl datasets analysed. Note that not all datasets include samples from within all ecotypes. Dots = outliers, values of any data points that are beyond boxplot whiskers.

2.6.7 Sessile benthic filter-feeder morphotypes characteristic of each ecotype

Box plots summarizing the observed sessile benthos morpho-types of each ecotype, for sites that overlap each ecotype are shown in Figure 25. While the shallower ecotype 7 has larger abundances of many of the benthos types, ecotype 3 – associated with the ancient coastline – also has notable abundances of several types. In the areas that have existing data, most of the other ecotypes tend to lack significant abundances of the larger benthos forms such as lump and branching sponges, gorgonians and whips. Somewhat similar patterns were observed among ecotypes 1-5 from the December 2019 RPS survey (Figure **26**, Figure 27, Figure 28 and Figure 29).

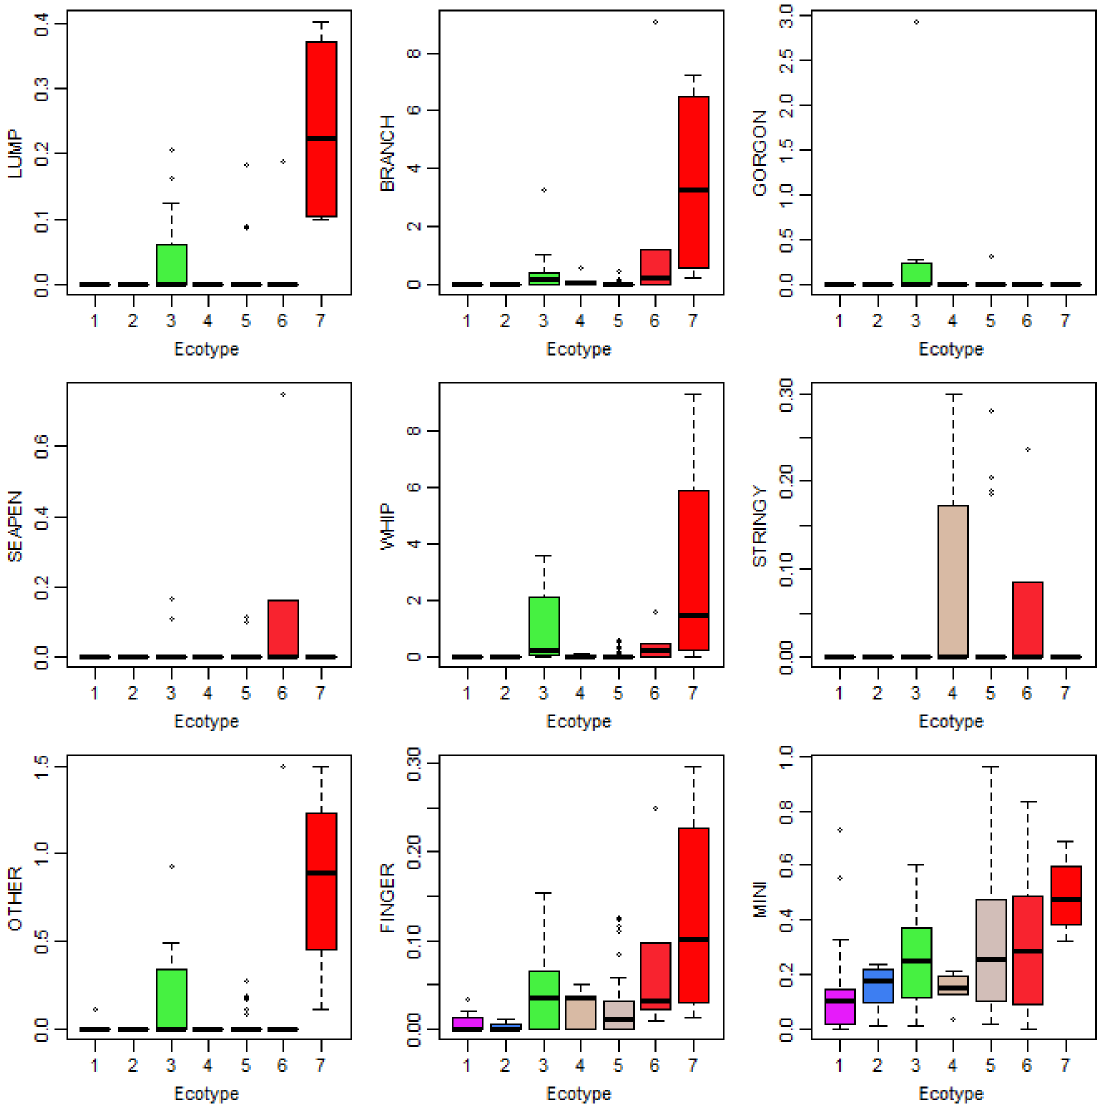

Figure 25. Distribution of habitat forming benthic filter feeder morphotypes by ecotype within the survey area. Data are from historical NWS photo-benthos dataset. Morphotypes referred to are: lump-shaped sponges (lump), branched sponges (branch), gorgonians sea fans (gorgon), seapens (seapen), sea whips (whip), stringy appearance biota mostly hydroids (stringy), other difficult to distinguish types (other), finger-shaped sponges (finger), and small filter feeders < 5 cm (mini). Dots = outliers, values of any data points that are beyond boxplot whiskers.

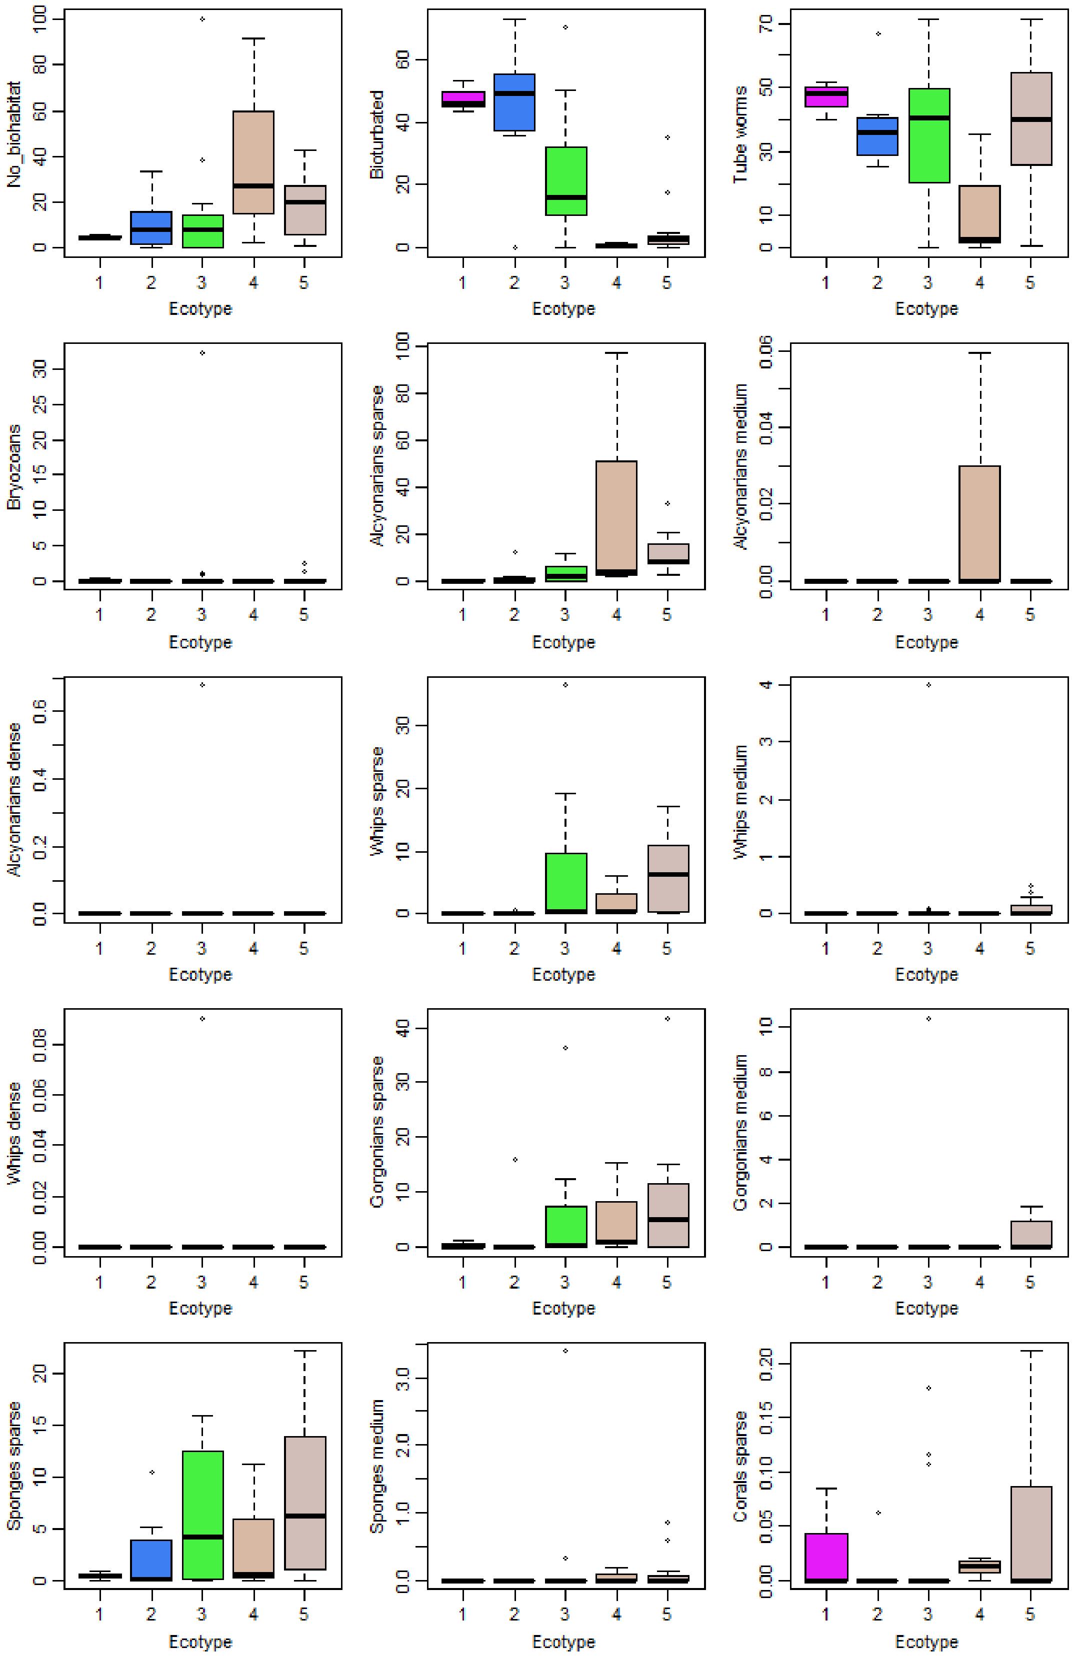

Figure 26. Box plots of biohabitat cover scores for sites within each of the five ecotypes (out of a total of seven) that were represented within the survey area. Data are from the December 2019 RPS survey. Dots = outliers, values of any data points that are beyond boxplot whiskers.

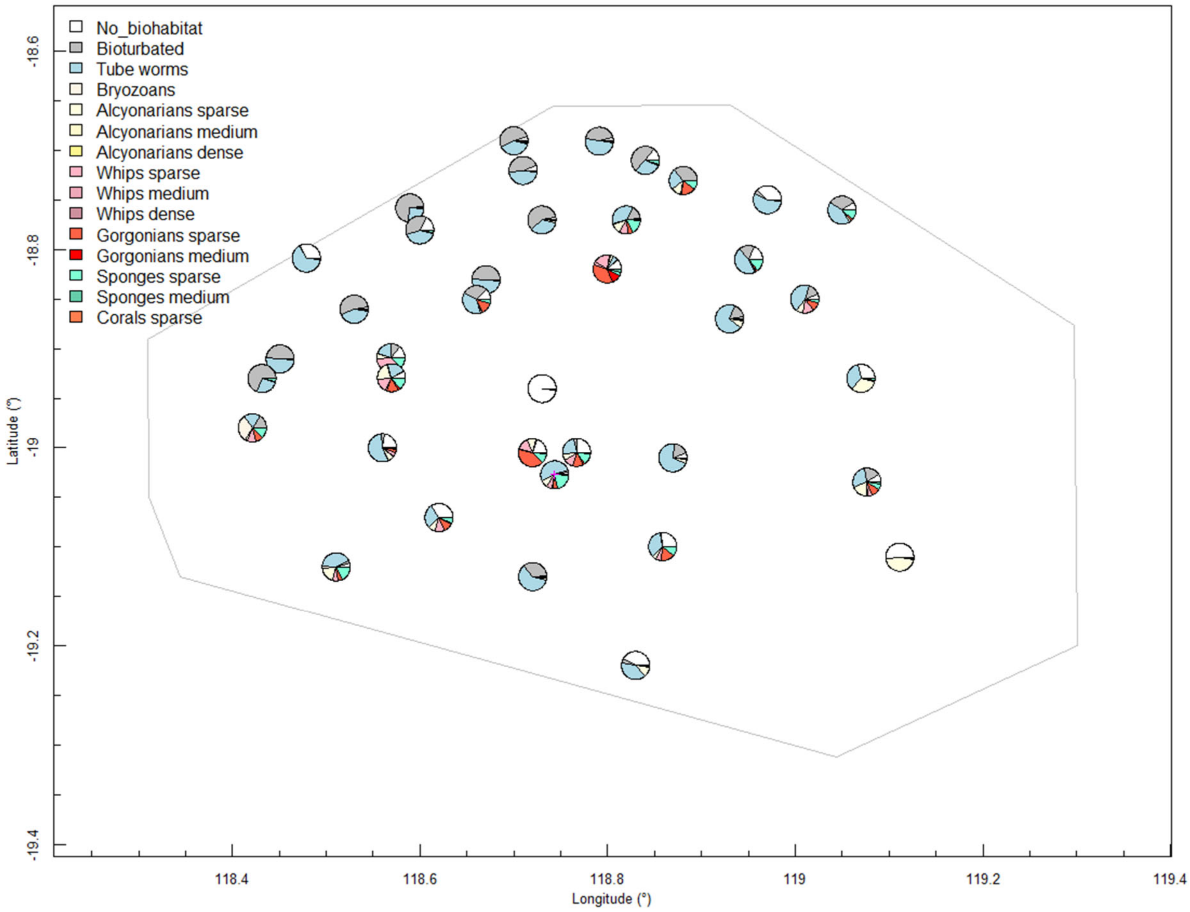

Figure 27. Site by site data for the proportion of biohabitat scores from ROV video data summarised by ecotype in Figure 26. Data are from the December 2019 RPS survey. See also Chapter 3 for detailed graphs plotted for each site. Grey line = survey area boundary.

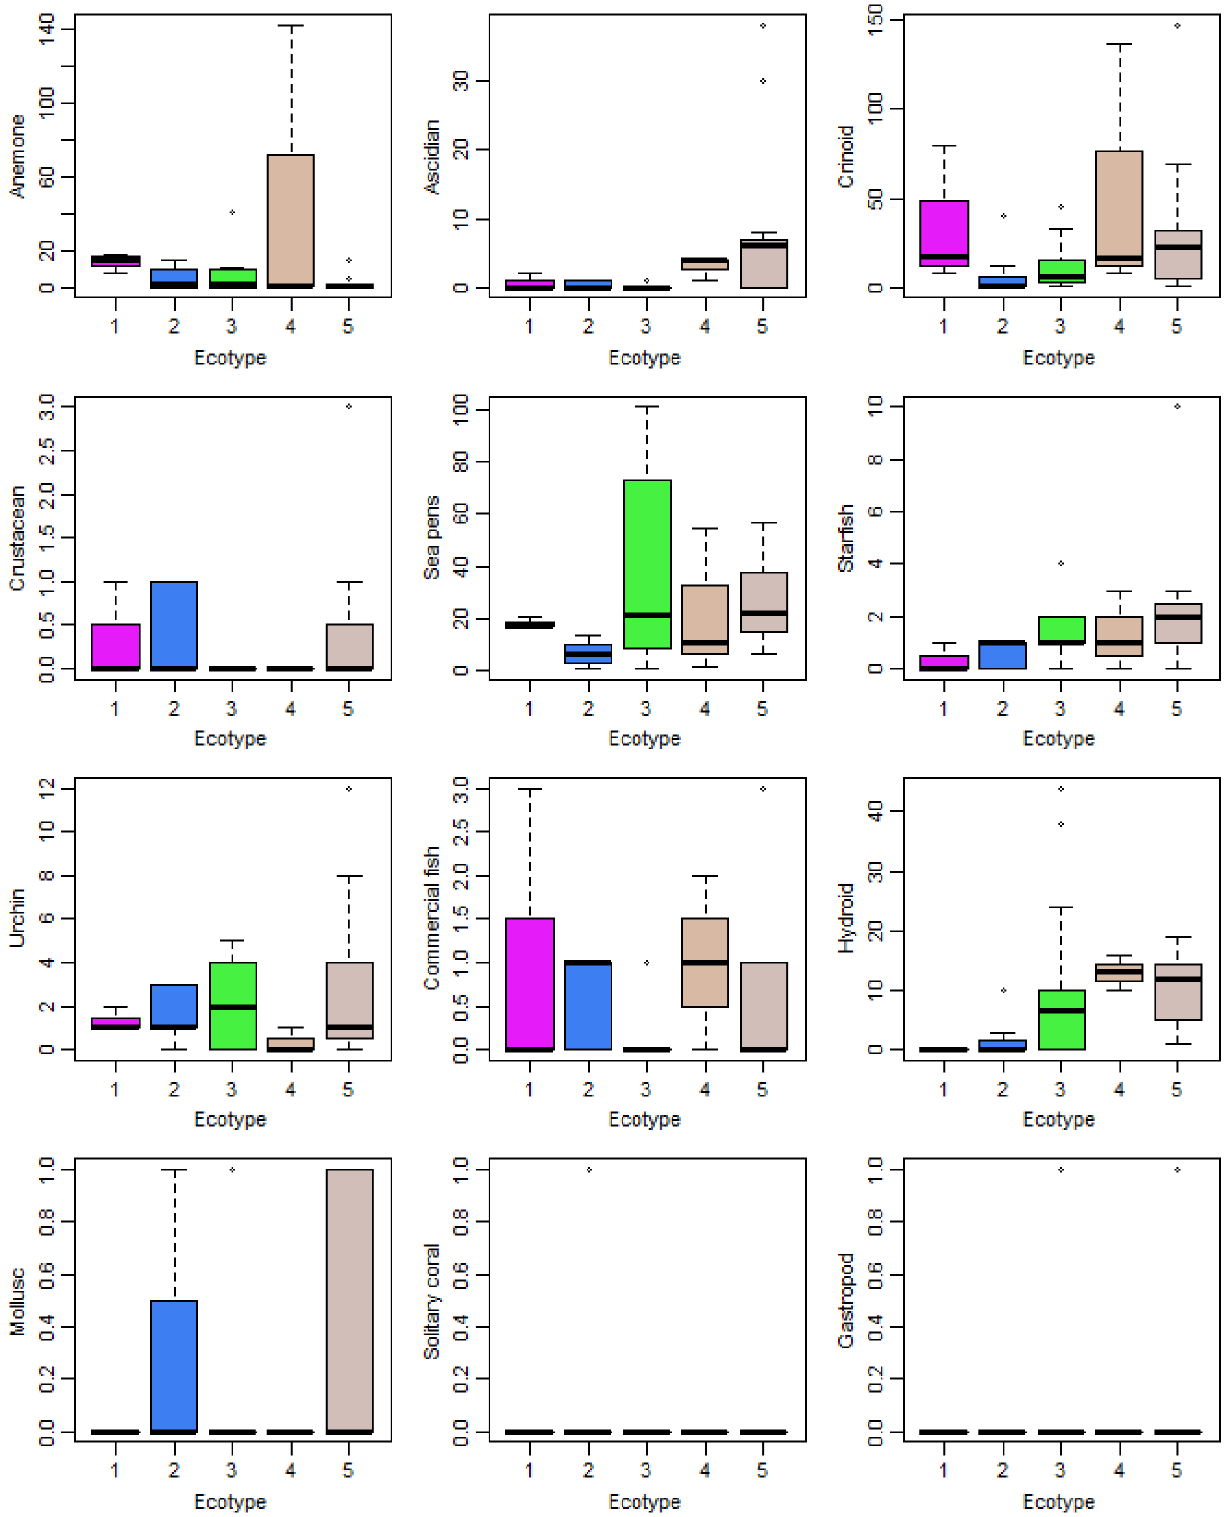

Figure 28. Box plots of animals (non-habitat forming biota) scored from videos for sites within each of the five ecotypes (out of a total of seven) that were represented within the survey area. Data are from the December 2019 RPS survey. Dots = outliers, values of any data points that are beyond boxplot whiskers.

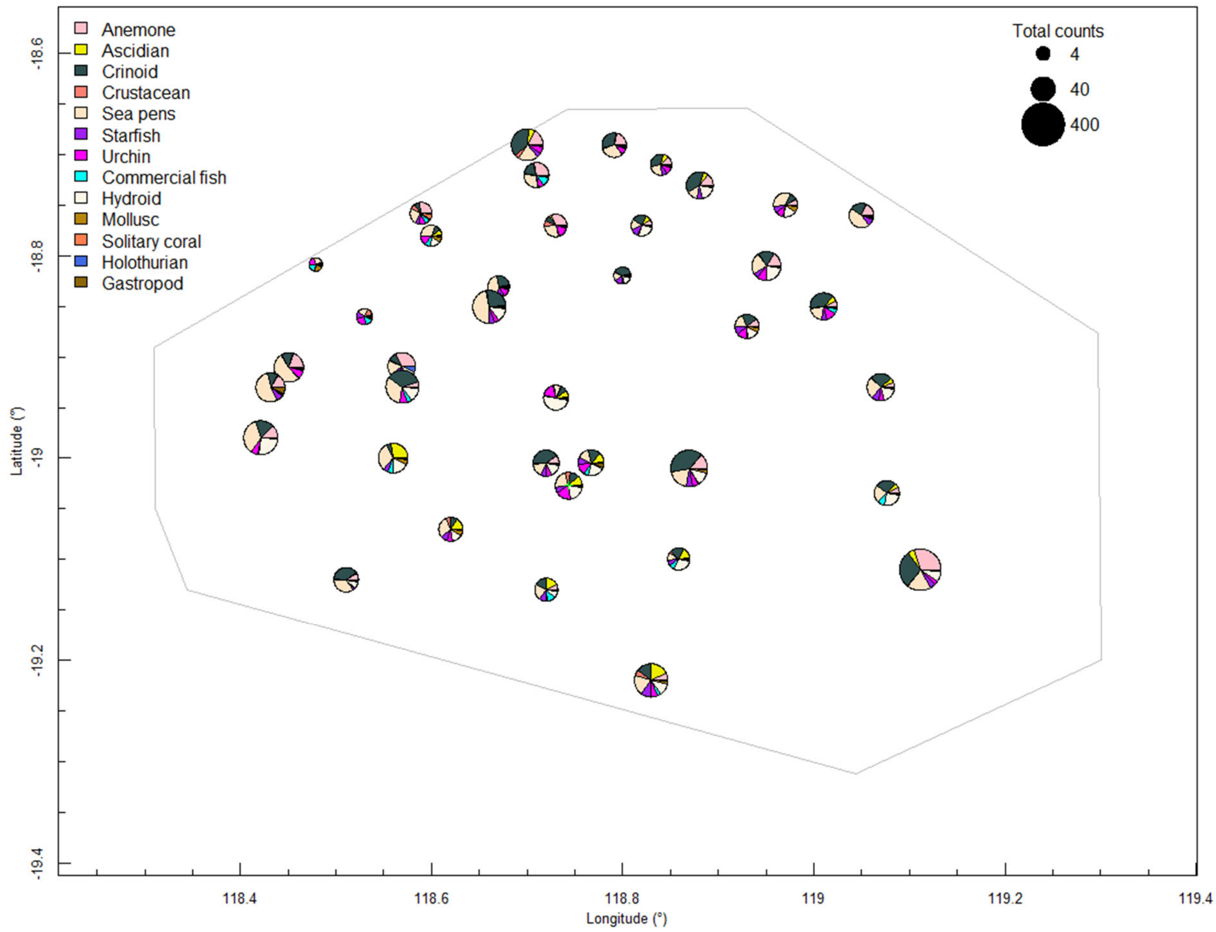

Figure 29. Site by site data for the animal event scores from ROV video data summarised by ecotype in Figure 28. Data are from the December 2019 RPS survey. See also Chapter 3 for detailed graphs plotted for each site. Grey line = survey area boundary.

2.7 Dominant taxa by ecotype

Tables 3 to 7 show the Dufrene-Legendre Indicator (DLI) for fish and some invertebrate taxa in each of the seven ecotypes in each the five biological datasets. The DLI is a measure of the extent to which a particular taxon is associated with a particular ecotype. A DLI of 1 indicates that a taxon was unique to that ecotype in the dataset examined. Only the top 20% (80^{th} percentile) of all DLI values are shown. Some clusters may not have any species in the 80^{th} percentile of DLIs. The column "MaxCl" indicates the ecotype for which the taxa had the highest DLI.

Tables 8 to 12 show the most abundant taxa (average biomass by ecotype), with only species in the top 5% (95^{th} percentile) of observed average ecotype abundances shown, and give an indication of the taxa that dominate each ecotype.

2.7.1 North West Shelf FnB Trawl dataset

There were 49 taxa spread across the seven ecotypes with DLI values in the top 20% (80^{th} percentile, Table 3). Among these, only one species, Grass Emperor, *Lethrinus laticaudis,* was indicated in more than two ecotypes, indicating each ecotype had a relatively distinct set of characteristic taxa. High DLI values (> 0.5) for each ecotype were as follows: Barred Javelin, *Pomadasys kaakan,* and Elongate Ponyfish, *Equulites elongatus* (ecotype 1), Malabar Trevally, *Carangoides malabaricus* (ecotype 2), sea lilies (crinoids) (ecotype 4) and Brownstripe Snapper, *Lutjanus vitta* (ecotype 7). The shallowest ecotype (7) had the largest number of taxa (14) in the top 20% (80^{th} percentile), suggesting a diverse set indicator fish fauna occurs in this ecotype, followed by ecotype 3 (11 taxa) associated with the ancient coastline KEF (Table 3). The top DLI scores in ecotype 4 were the invertebrates including crinoids, starfish, echinoids and bryozoa.

In terms of biomass, sponges were important in ecotype 6. Goatfishes occurred in the top taxa for biomass across all 7 ecotypes but the importance of different species varied between the deeper and shallow ecotypes. Bartail Goatfish, *Upeneus tragula,* and Luzon Goatfish, *U. luzonius,* were greatest in ecotypes 5, 6 and 7 and Opalescent Goatfish, *Paupeneus heptacanthus*, in ecotypes 1,2 and 3. Ecotype 3, associated with the ancient coastline KEF, had the largest number of taxa (18) with biomass in the top 5% (95^{th} percentile). The highest biomass for any species was Gulf Damselfish, *Pristotis obtusirostris*, in ecotypes 1 and 2 (Table 8).

2.7.2 North West Shelf McKenna Trawl dataset

The shallowest ecotype (7) had 22 of the 26 taxa with DLI scores in the top 80^{th} percentile. Fourteen of these had a DLI score of 0.98 or higher, indicating the importance of a wide range of species that characterised that ecotype (Table 4). Ecotype 1 had just Brownstripe Snapper, *Lutjanus vitta*, and Rosy Threadfin Bream, *Nemipterus furcosus*, while ecotypes 2, 3 and 4 had no species with a DLI in the top 80^{th} percentile, indicating there were no taxa in this dataset that specifically characterised these ecotypes.

For biomass, sponges were most important in ecotypes 2, 3, 5, 6 and 7. The shallowest ecotype (7) had the highest number of species (16) with biomass in the top 95th percentile. Threadfin bream and snappers had the highest biomass in the ancient coastline ecotype 3 (Table 9).

2.7.3 Datatrawler FB Trawl dataset

This dataset revealed similar patterns to the NWS McKenna Trawl dataset with 26 of 28 species with DLI scores in the top 80th percentile being in the shallowest ecotype (7). Thirteen of these species had DLI scores > 0.9 (Table 5).

In terms of biomass, the pattern was similar with 24 of 33 taxa with the highest biomasses (95th percentile) occurring in ecotype 1. There was a clear separation among species which dominated the shallowest ecotype (1) and the two deepest ecotypes (1 and 2, Table 10).

2.7.4 Soviet Trawl dataset

Most of the indicator taxa were in ecotype 4. All had moderate values between 0.22 and 0.4 with the most important being Notchedfin Threadfin Bream, *Nemipterus peroni*, and Spotted Bigeye *Priacanthus macracanthus* (Table 6). For biomass, most indicator species were in ecotypes 4 and 7. Starry Triggerfish *Abalistes stellatus* were the only indicator species for biomass in the deepest ecotype (1, Table 11).

2.7.5 North West Shelf Photo-benthos

Only the shallowest ecotype (7) had DLI indicator species in the top 20%, the highest of these were branched sponges and lump sponges. For abundance, branched sponges and whips were dominant indicators for the shallowest ecotype (7) while whips characterised the abundance in ecotype 3 associated with the ancient coastline KEF (Table 12).

Table 3. Dufrene-Legendre Indicator (DLI) by taxa by ecotype for the NWS FnB Trawl dataset. Only the top 20% (80th percentile) all DLI values are shown. Some clusters may not have any species in the 80th percentile of DLIs. The column "MaxCl" indicates the ecotype for which the taxa had highest DLI.

3 Descriptions of benthic substrate and biota

3.1 Historical data sources

Some of the historical datasets available for the NWS were described in the previous chapter. This section also makes use of data collected on the 1982–1997 CSIRO North West Shelf (NWS) Effects of Trawling project (Sainsbury 1988; 1991). Data used to describe benthic substrates and biota are principally derived from still camera images taken from the trawl headline camera which captured images ahead of the demersal trawl net every 3 seconds or about every 4 m. This is the NWS Photo-benthos dataset described in Chapter 2. A detailed description of the methods used to collect, score and analyse the images is given in Keesing (2019). The location of the trawl samples relative to the seven ecotypes identified for the broader area is shown in Figure 30.

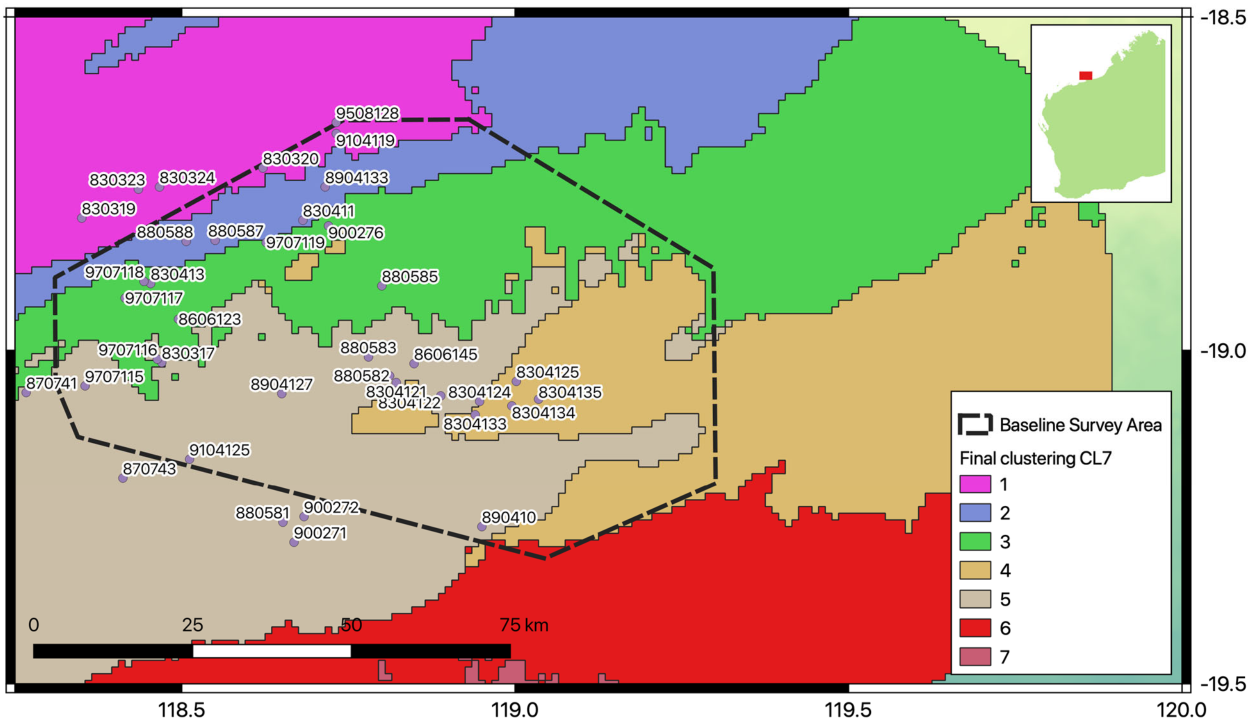

Figure 30. Location of historical trawls from 1982–1997 (blue) for which biota data were available. A table showing the start latitude and longitude for each trawl transect is given in Appendix Table A.2. Trawl number starts with the year, followed by the voyage number for that year and then the site number (e.g. 970758 was site 58 on the seventh voyage in 1997).

3.2 Recent data sources

More recent data was collected for this study in December 2019 using a Remotely Operated Vehicle (ROV). The detail of operation of the ROV are given in RPS 2020. Location of the ROV sites relative to the seven ecotypes identified for the broader area is shown in Figure 31.

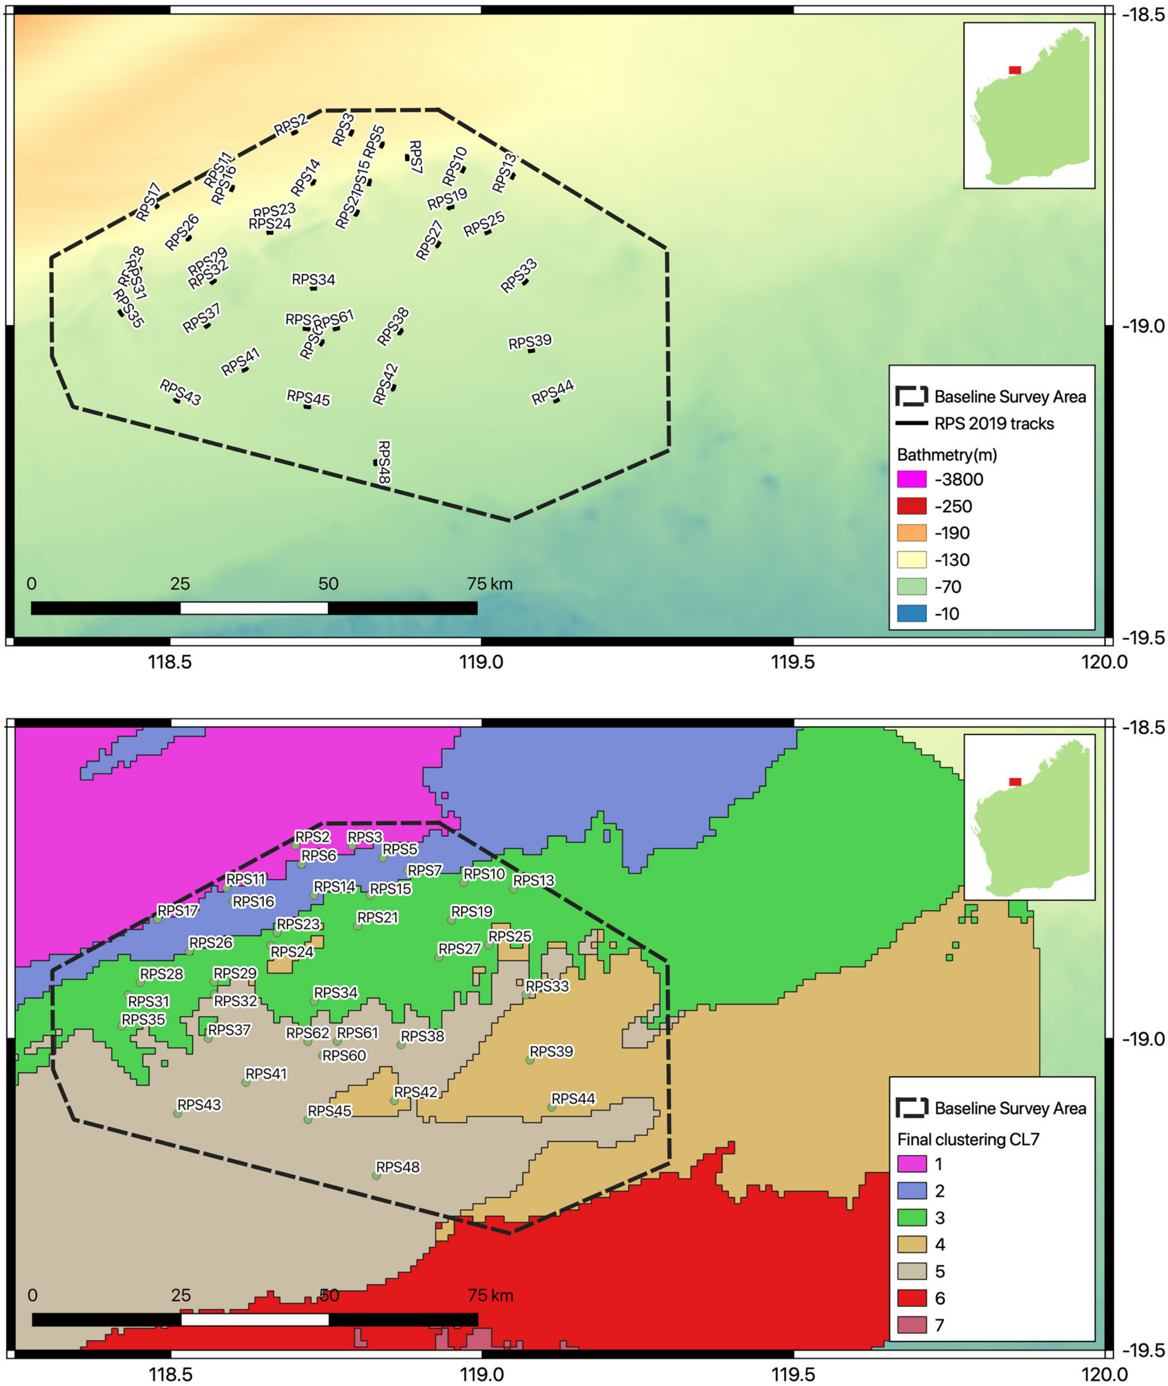

Figure 31. Location of ROV survey sites conducted in December 2019 overlain on bathymetry (top) and each of the seven ecotypes (bottom). A table showing the midpoint latitude and longitude for each transect is given in Appendix A (Table A.1).

3.3 Benthic substrate and topography

3.3.1 Classification of categories of substrate and topography

For the historical voyages (Figure 30), five substrate types were recognised from the camera images; silt, fine sand, coarse sand, rock and rubble and various combinations of these substrate types. Similarly, four types of topography were recognised from the camera images of soft bottom habitats; flat bottom, flat bottom with bioturbation, fine sand ripples and fine ripples with furrows. Examples of the substrate and topography categories from the historical voyages are illustrated in Figure 32 and Figure 33 respectively. For the December 2019 survey, substrate type was scored continuously in real time (RPS 2020) into ten categories: soft mud, silt/sandy mud, sand, coarse sand, sand waves/dunes, rubble 5–50 mm, stones 50–250 mm, rocks > 250 mm, low relief reef and high relief reef. Imagery from each site for the 2019 surveys is shown in RPS 2020.

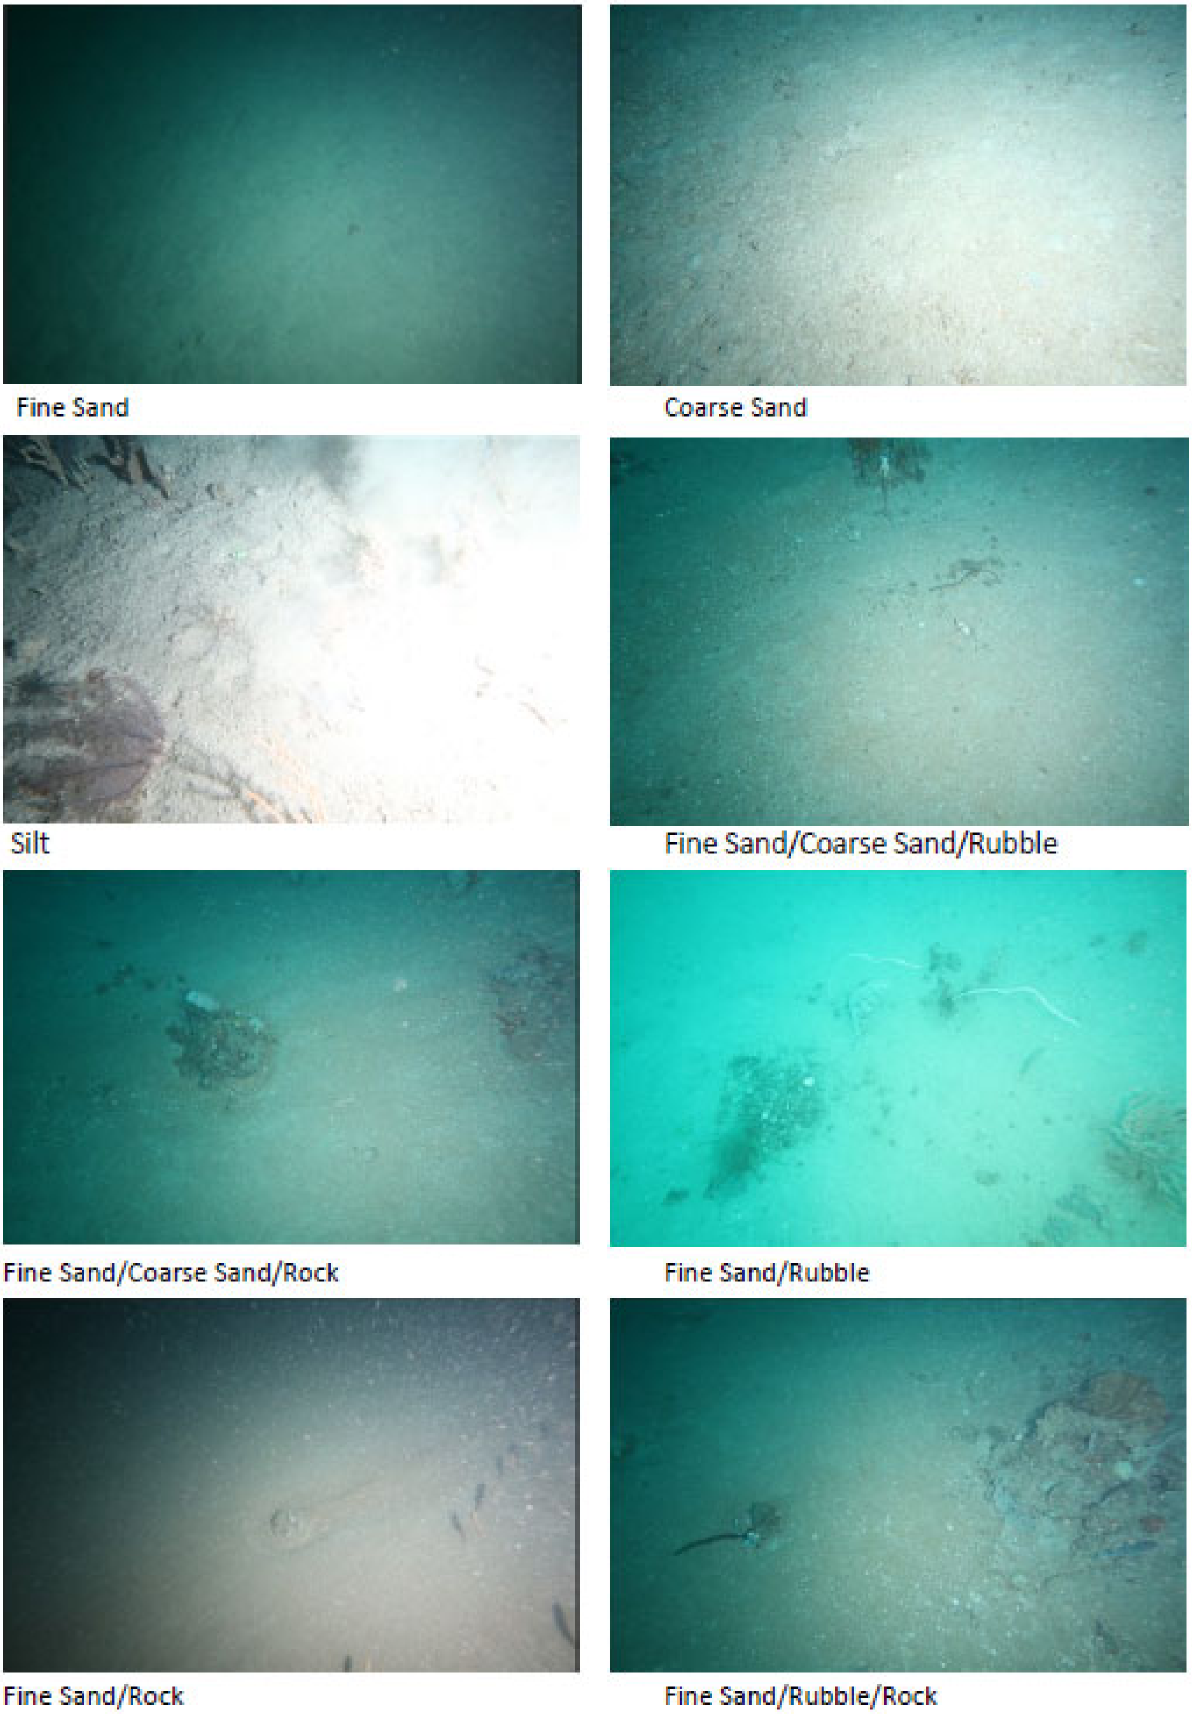

Figure 32. Examples of substrate categories from the NWS. Note: images are not from the survey area.

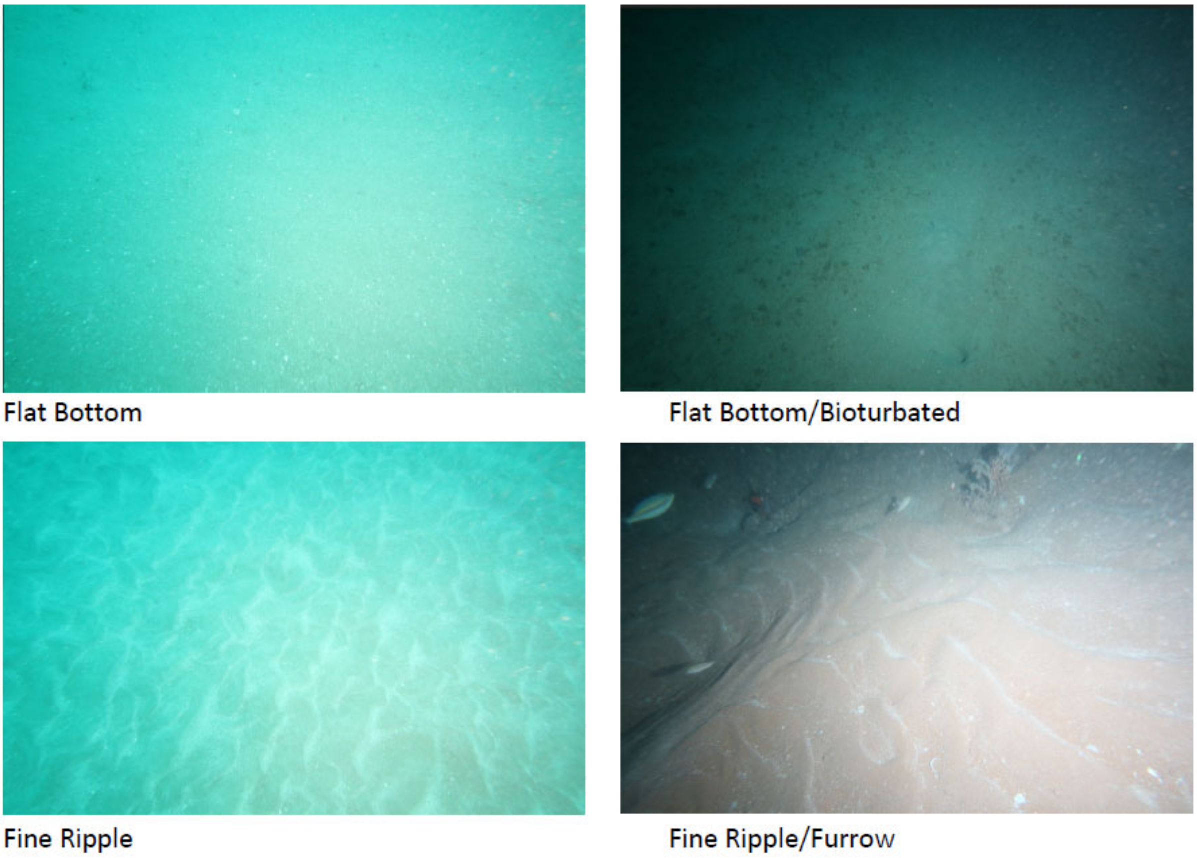

Figure 33. Classification of different soft bottom topography categories from the NWS. Note: images are not from the survey area.

3.3.2 Substrate and topography at historical survey sites

Data was selected for historical survey sites that fell within the survey area, or within 10 km of the boundary of the area. This was done to bolster the small number of sites that fell within some of the ecotypes determined for the area. The number of sites surveyed within each ecotype varied from two (ecotype 1) to nine (ecotype 5) (See Chapter 2 for description of ecotypes). Ecotypes 6 and 7 fell outside of the survey area. Substrate was dominated by fine sand across all sites (Figure 34, Figure 36). All ecotypes, except ecotype 2, showed a small proportion of coarse sand. Rubble and rock occurred to a very minor extent in ecotypes 3, 4 and 5.

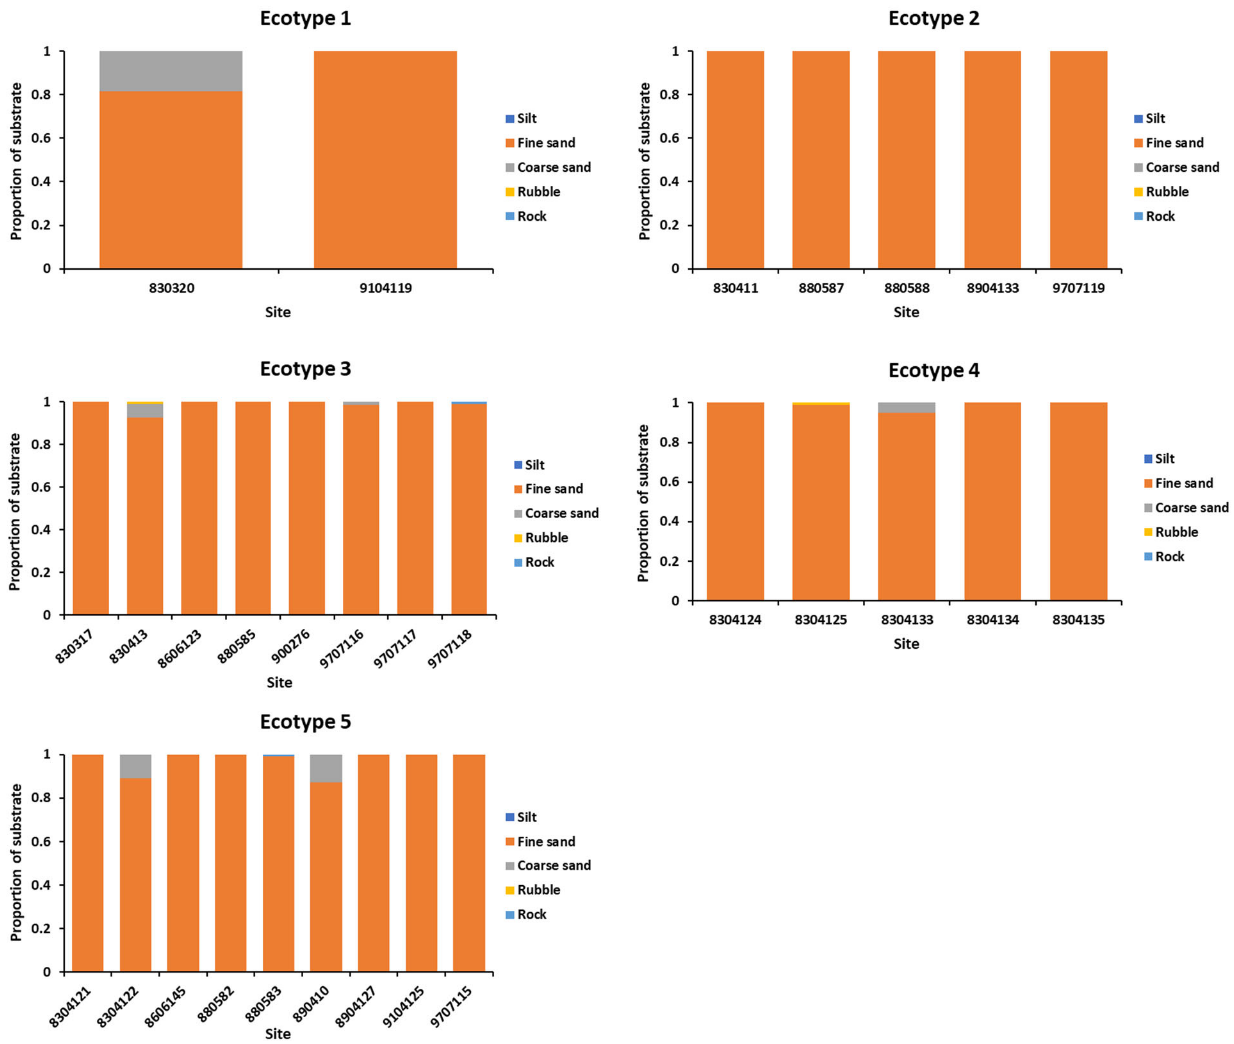

Figure 34. Proportion of substrate type by ecotype for each site surveyed within the survey area during historical trawls during 1982 - 1997. Site number is in format: year, voyage number, site number (e.g. 830320 – site 20, third voyage of 1983).

Topography was dominated by flat bottom and fine ripples across the five ecotypes (Figure 35, Figure 37). Ecotypes 3 and 5 showed a very small proportion of more structured habitat (ridge, furrow, large ripples).

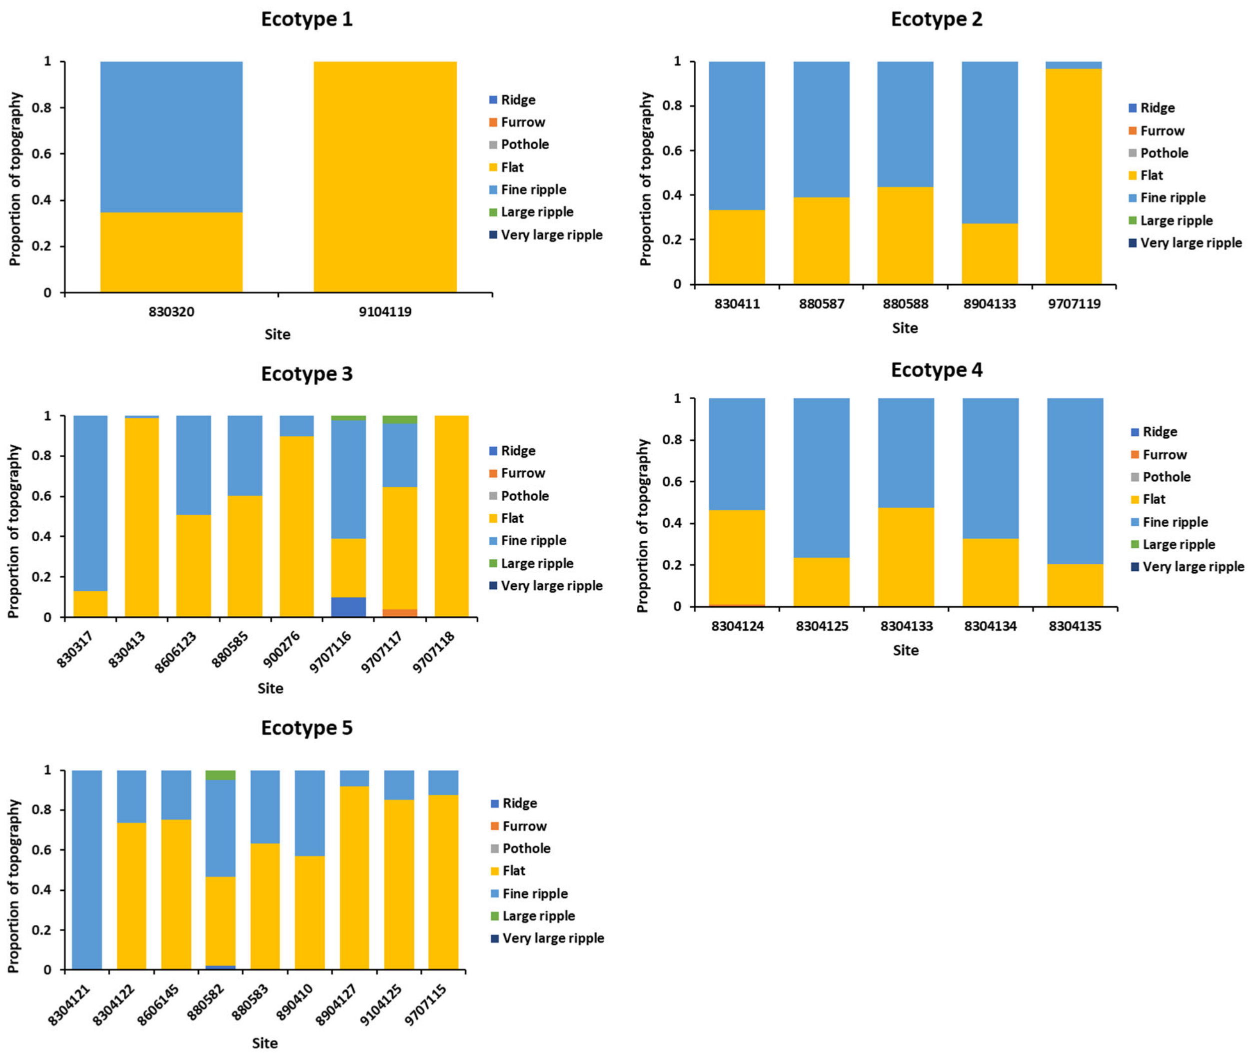

Figure 35. Proportion of substrate type by ecotype for each site surveyed within the survey area during historical trawls during 1982 - 1997. Site number is in format: year, voyage number, site number (e.g. 830320 – site 20, third voyage of 1983).

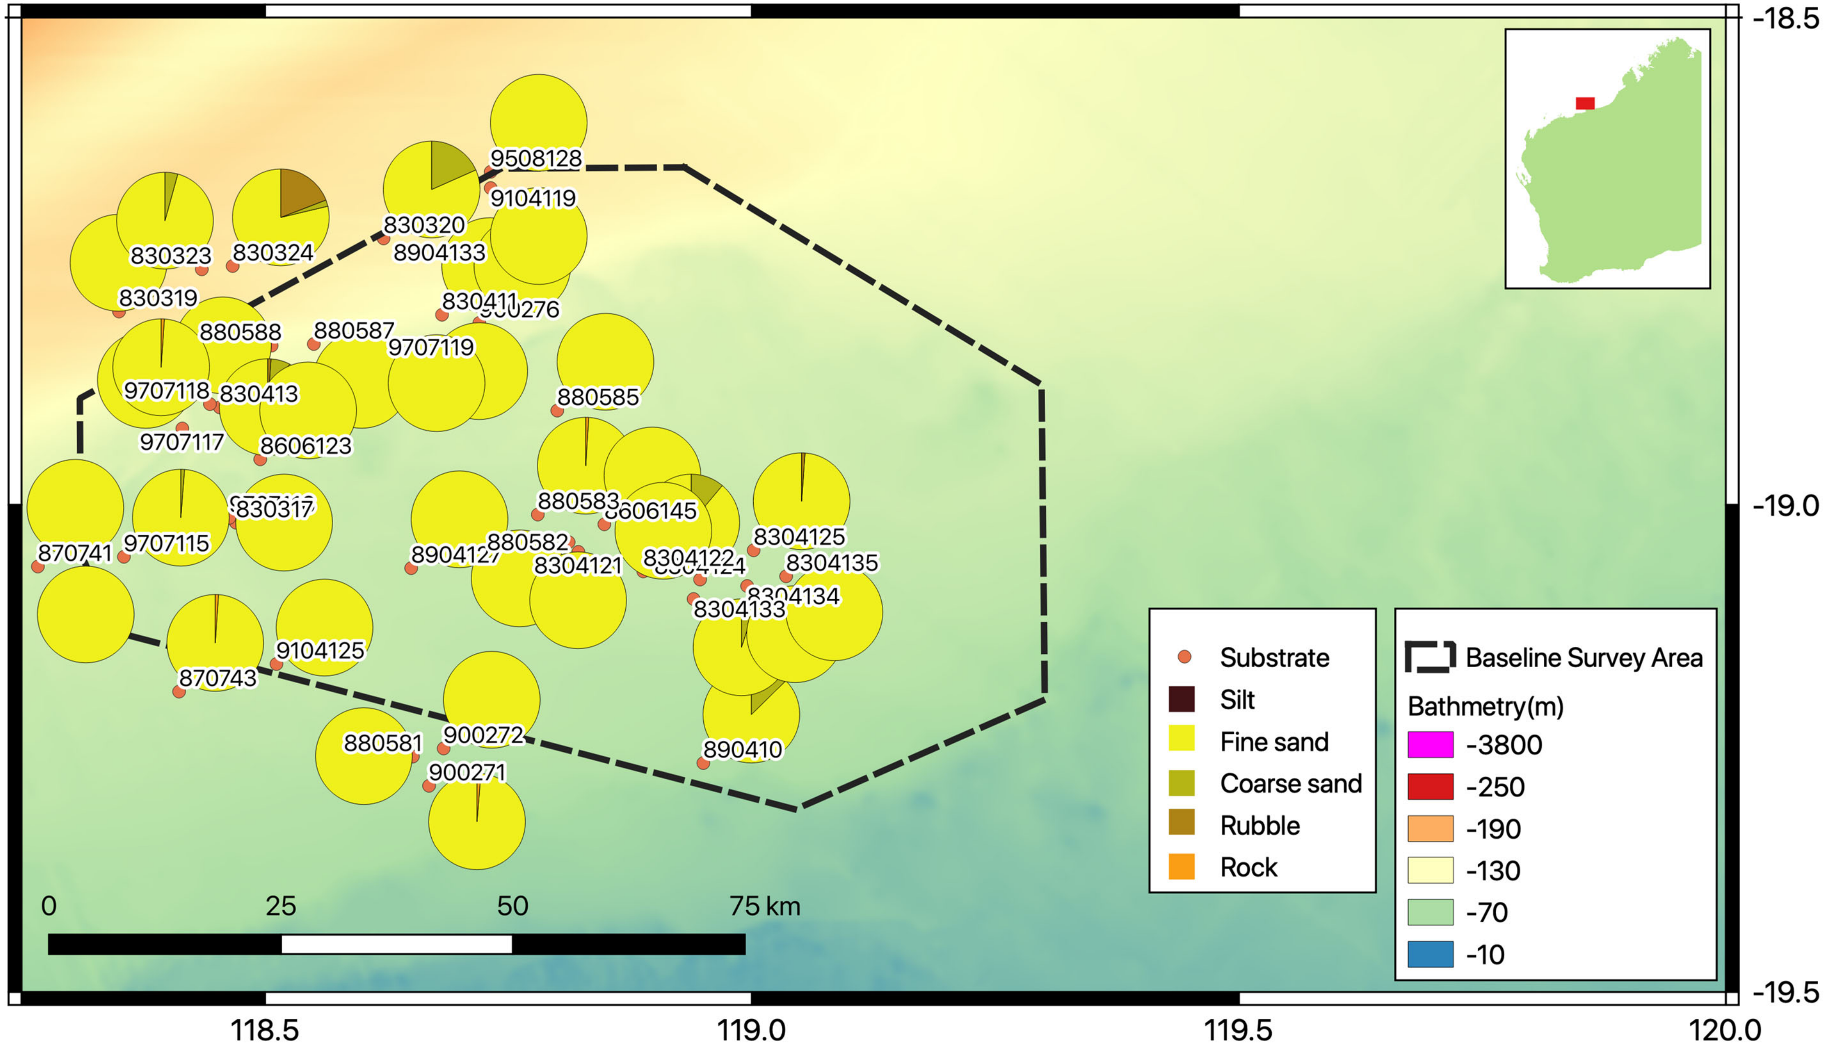

Figure 36. Proportion of substrate type at each of the historical stations in and around the survey area (black dashed line).

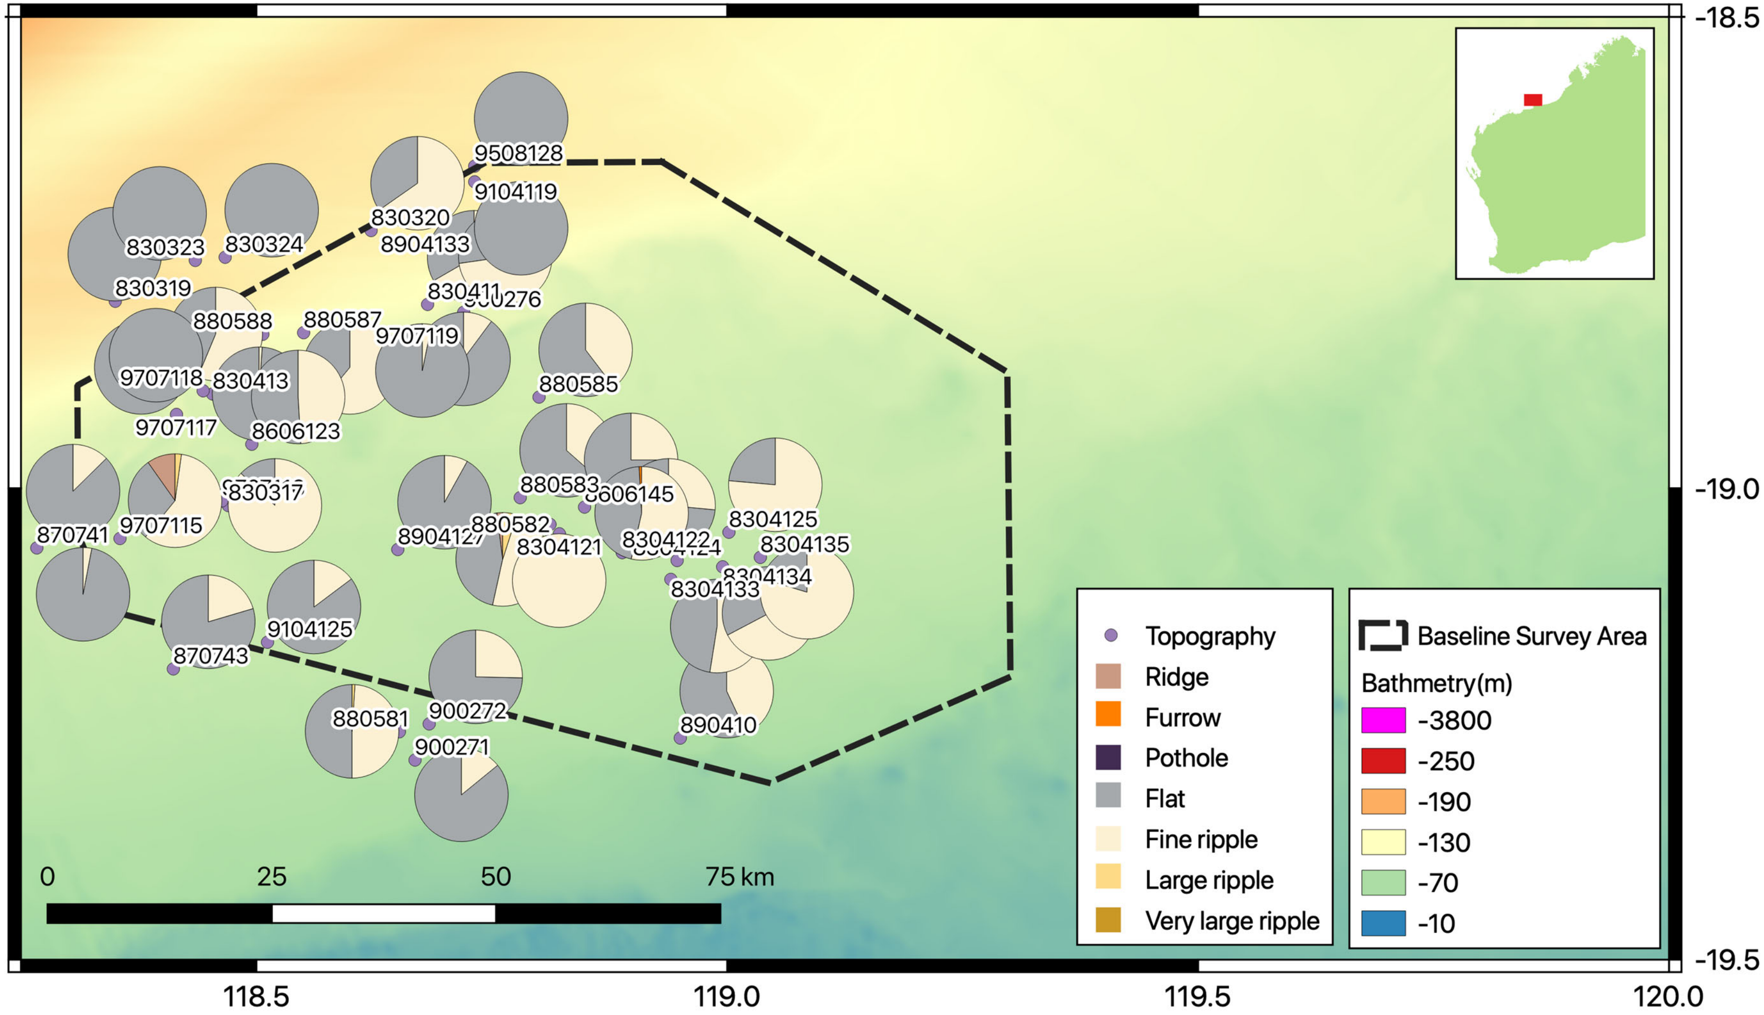

Figure 37. Proportion of topography type at each of the historical stations in and around the survey area (black dashed line).

3.3.3 Substrate and topography at 2019 survey sites

For the most recent survey (RPS 2020) the greatest proportion of seabed at most stations in most ecotypes was categorised as “silt/sandy mud” (Figure 38, Figure 39) compared to “fine sand” in the historical surveys (Figure 34). This almost certainly represents a slightly different emphasis in interpretation rather than any change in the seabed over time. Consistent with the historical surveys, the December 2019 survey showed greater structure and variability in the seabed at sites in ecotypes 3, 4 and 5.

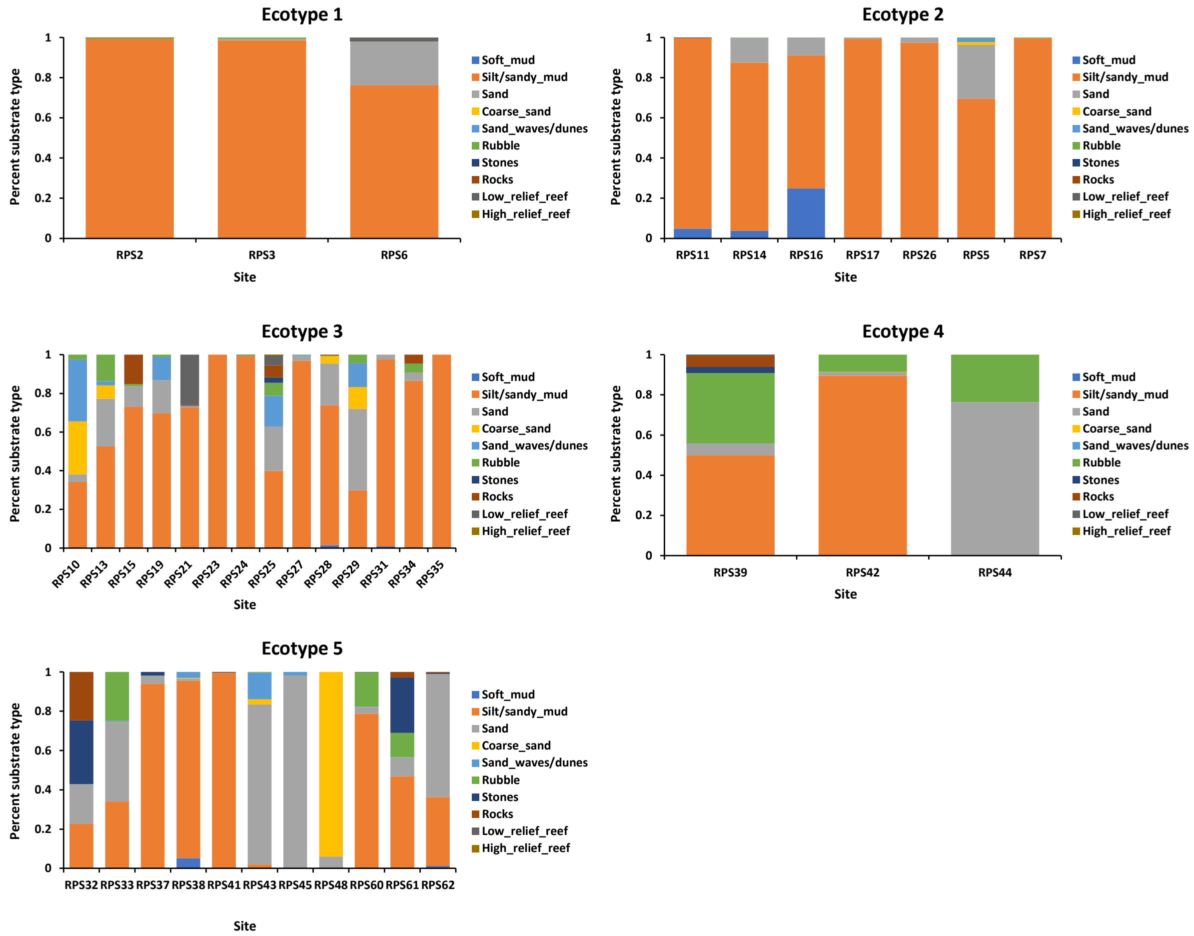

Figure 38. Proportion of substrate type by ecotype for each site surveyed within the survey area during December 2019.

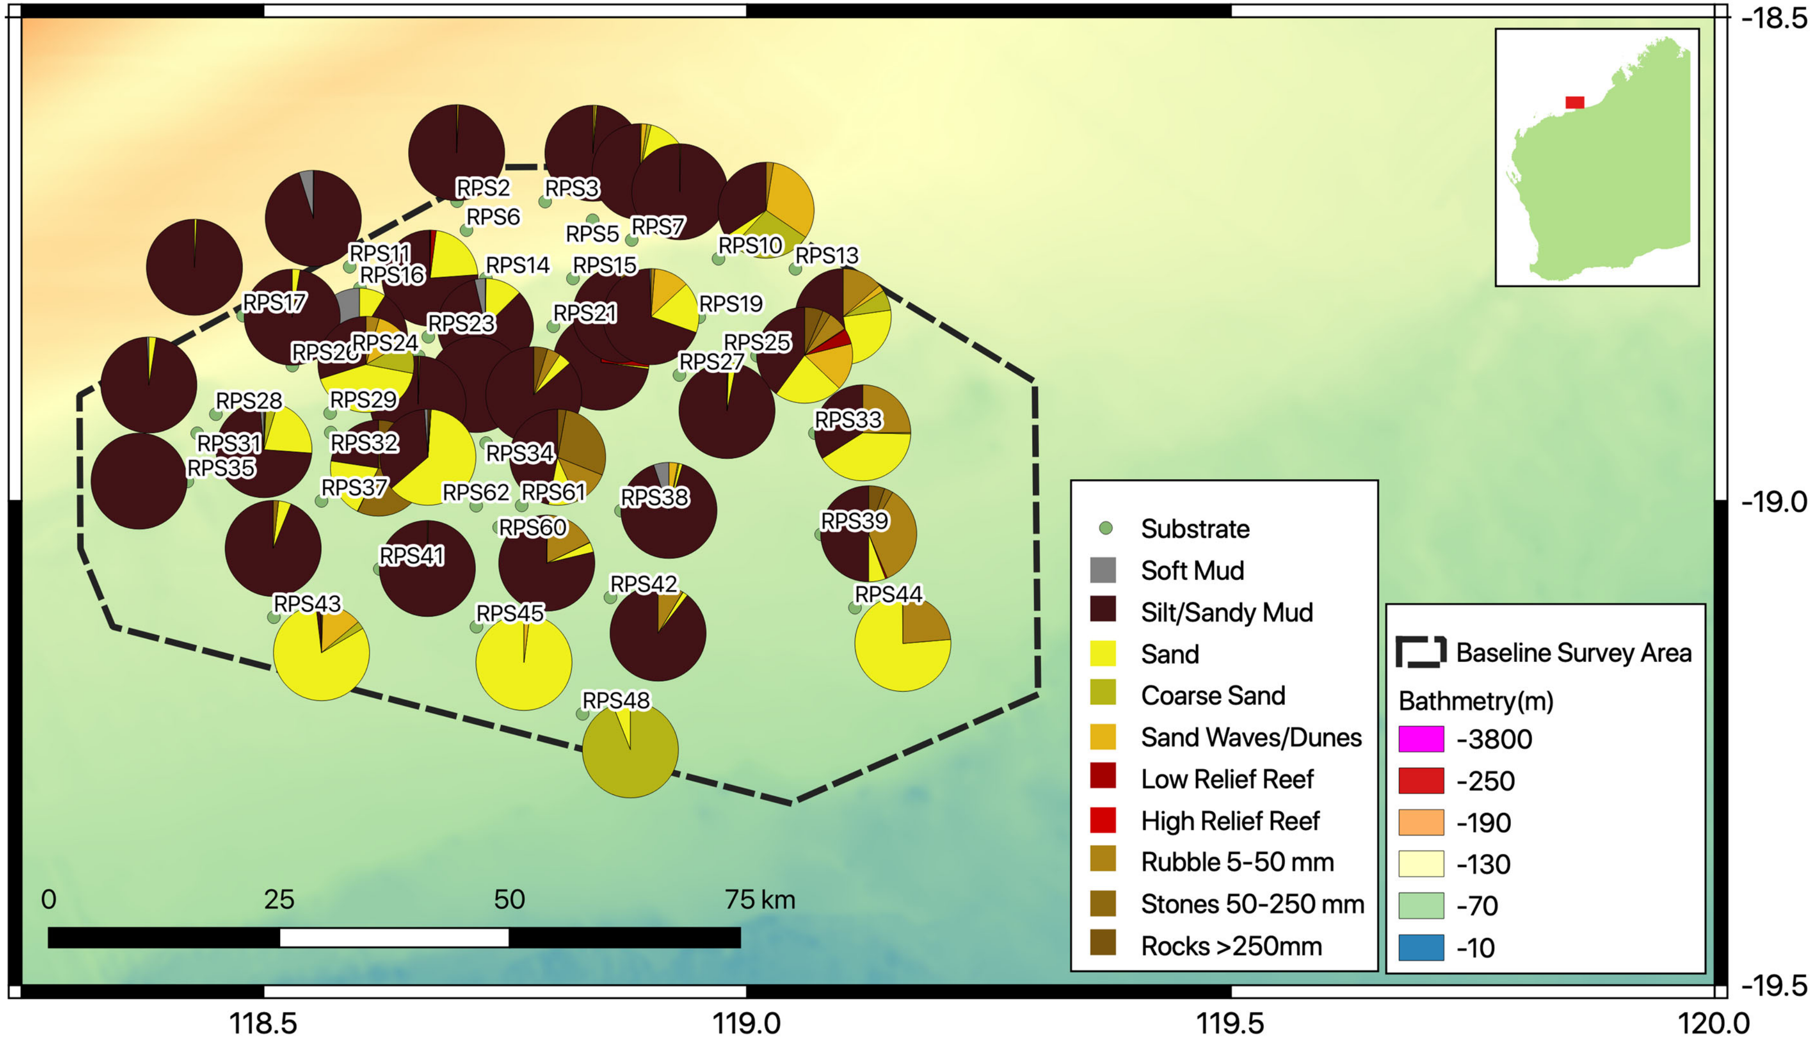

Figure 39. Proportion of substrate type for each site surveyed within the survey area (black dashed line) during December 2019.

3.3.4 Benthic biota at historical sites

A large proportion of all sites in all ecotypes was dominated by the "no biota" category when biohabitat was scored for the seabed imagery (Figure 40, Figure 41), indicating that habitat forming filter-feeders and other biota were not detected. This is consistent with the substrate being scored as mostly flat sandy habitat (Figure 34). The sites within ecotypes 1 and 2 had less than 20% and 10% filter-feeder biohabitat respectively (Figure 40). Sites in ecotype 3 associated with the ancient coastline had between 10 and 65% filter-feeder biohabitat with most sites having significant cover of whips and hydroids along with smaller proportions of soft corals and gorgonians. Ecotype 4 sites had between 20% and 45% filter-feeder biohabitat cover with sponges, seapens and whips being most important while ecotype 5 sites had the highest proportion of filter-feeder biohabitat cover (30% – 65%) with sponges, hydroids, whips and seapens being the most important.

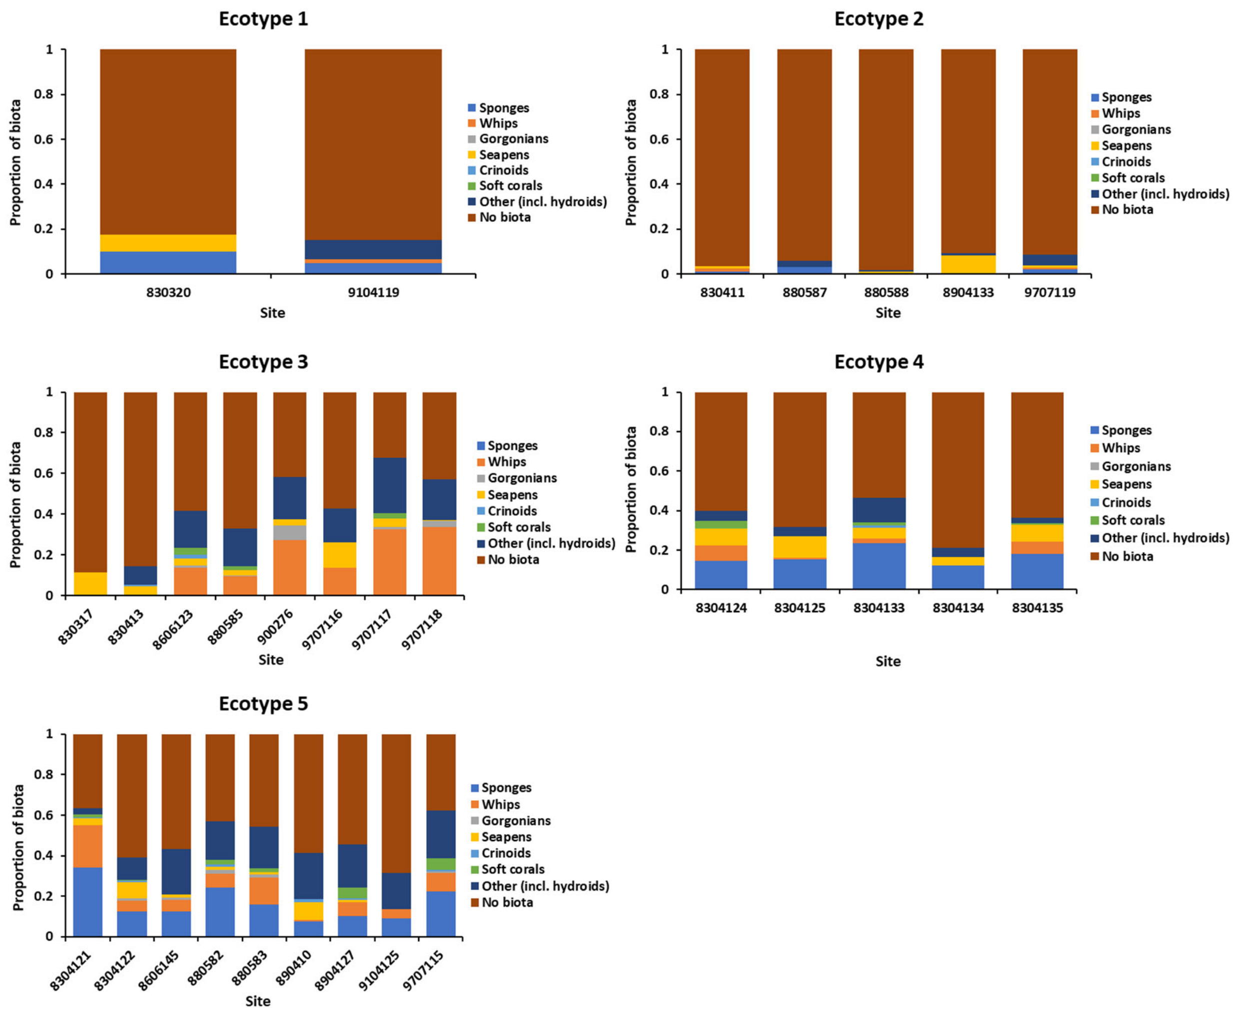

Figure 40. Proportion of biota types in seabed images along trawl lines for CSIRO 1982 – 1997 survey sites in ecotypes 1 - 6. Maroon = no biota present in the images. "Other" includes all other epibenthic organisms that could not be accurately allocated to these specified groups.

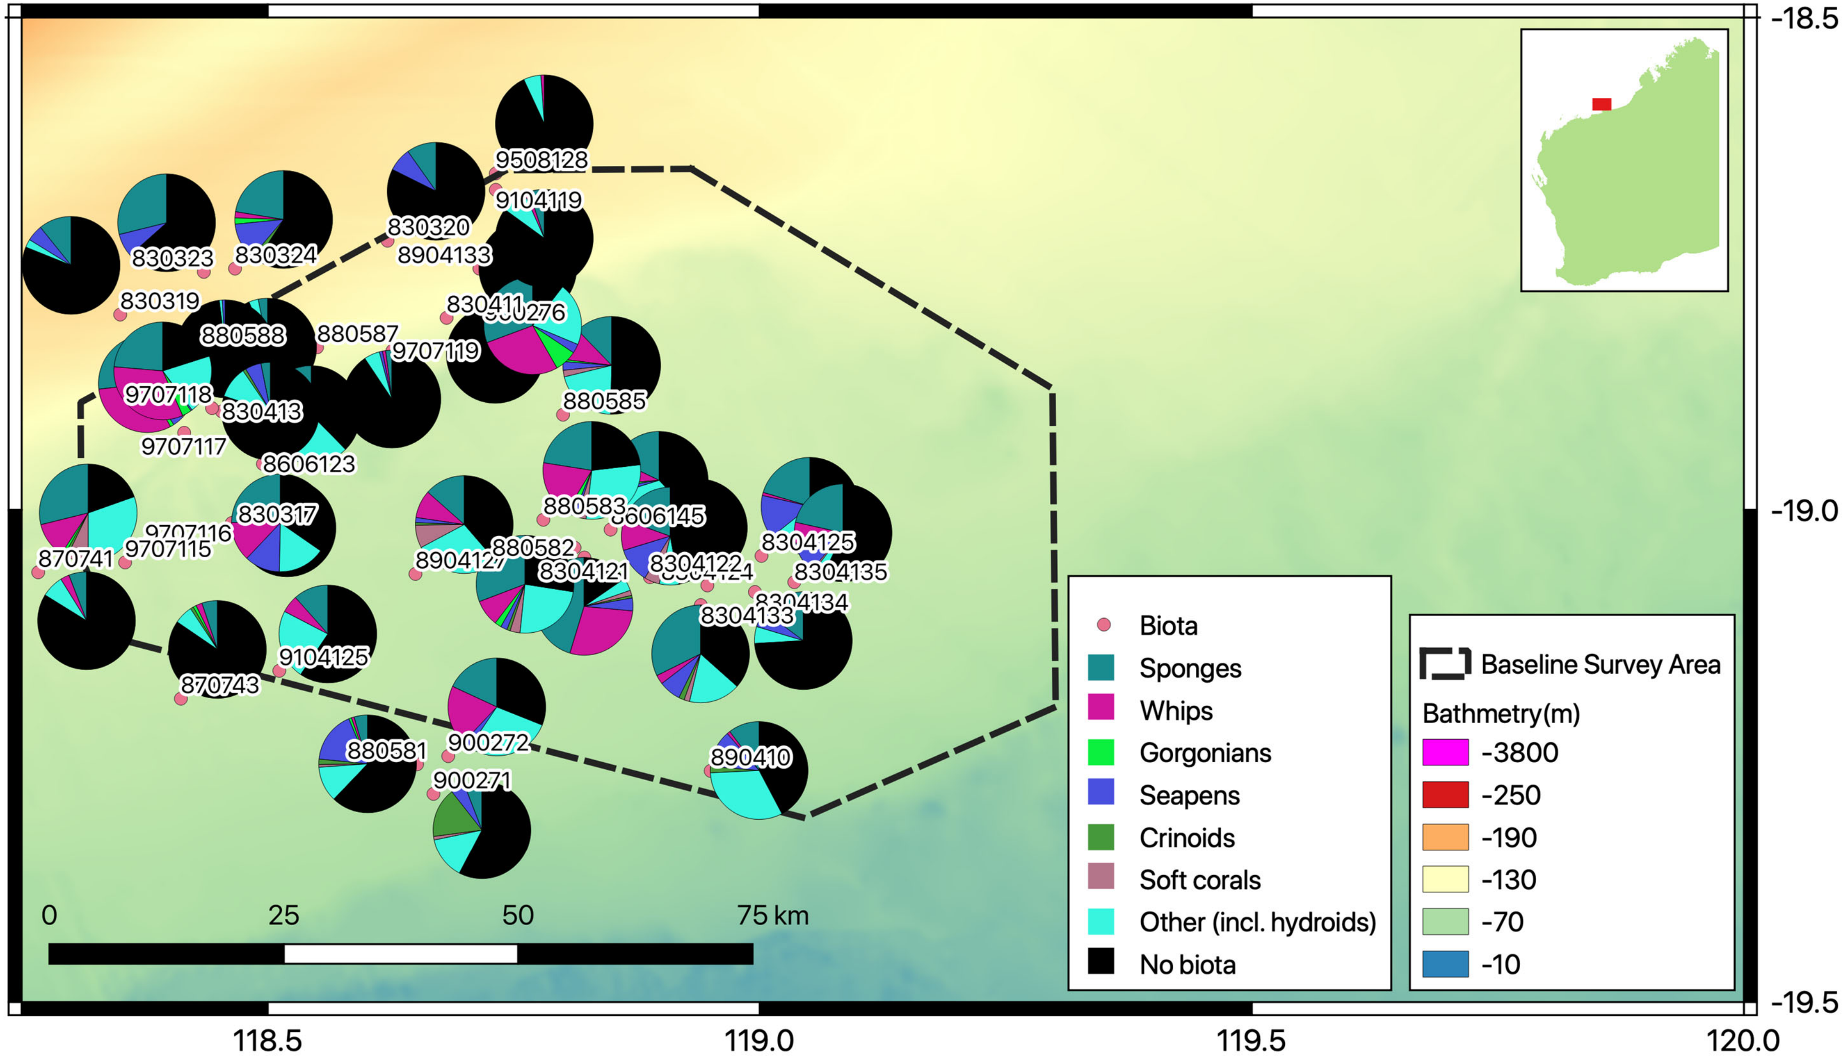

Figure 41. Proportion of biota type at each station in and around the survey area (black dashed line).

3.3.5 Benthic biota at 2019 sites

A high proportion (30% – 100%) of all sites in all ecotypes had either no obvious bioturbated biohabitat or worm tube sedimentary habitat (Figure 42, Figure 44). These are analogous to the "no biohabitat" category from historical surveys. The proportion of each benthic habitat type in December 2019 was scored from high-definition video footage in real time while for the 1982–1997 historical surveys this was done post-voyage from still images (photographic slides). Sites in the deepest and most offshore ecotype (1) were categorised by an almost complete absence of filter-feeder biohabitat (Figure 42) and animals associated with soft sediment habits, mostly seapens, free-living crinoids and anemones (Figure 43). Sites in ecotype 2 were very similar to ecotype 1 except that most sites had small proportions of sponges and soft corals present (Figure 42) and a more diverse array of free-living animals (Figure 43). Most sites within ecotype 3, associated with the ancient coastline KEF, also had low proportions of filter-feeder biohabitat, except for worm tube sediments, but several sites had significant coverage (four sites with more than 40%) of sponge, gorgonian, soft coral and whip biohabitat (Figure 42). Animals scored from sites in ecotype 3 included large numbers of hydroids and sea pens (Figure 43). Sites in ecotype 4 also had large proportions (ca. 40%) of sponge, whip, soft coral and gorgonian filter-feeder biohabitat (Figure 42) and site RPS44 had very high abundances (> 100) of anemones and free-living crinoids (Figure 43). Within ecotype 5, there were seven sites with > 35% filter-feeder biohabitat (predominantly sponge, whip, soft coral and gorgonians) with the dominant biota being seapens, crinoids, hydroids and ascidians (Figure 43). Ecotype 5 was the only ecotype that exhibited a notable number of ascidians.

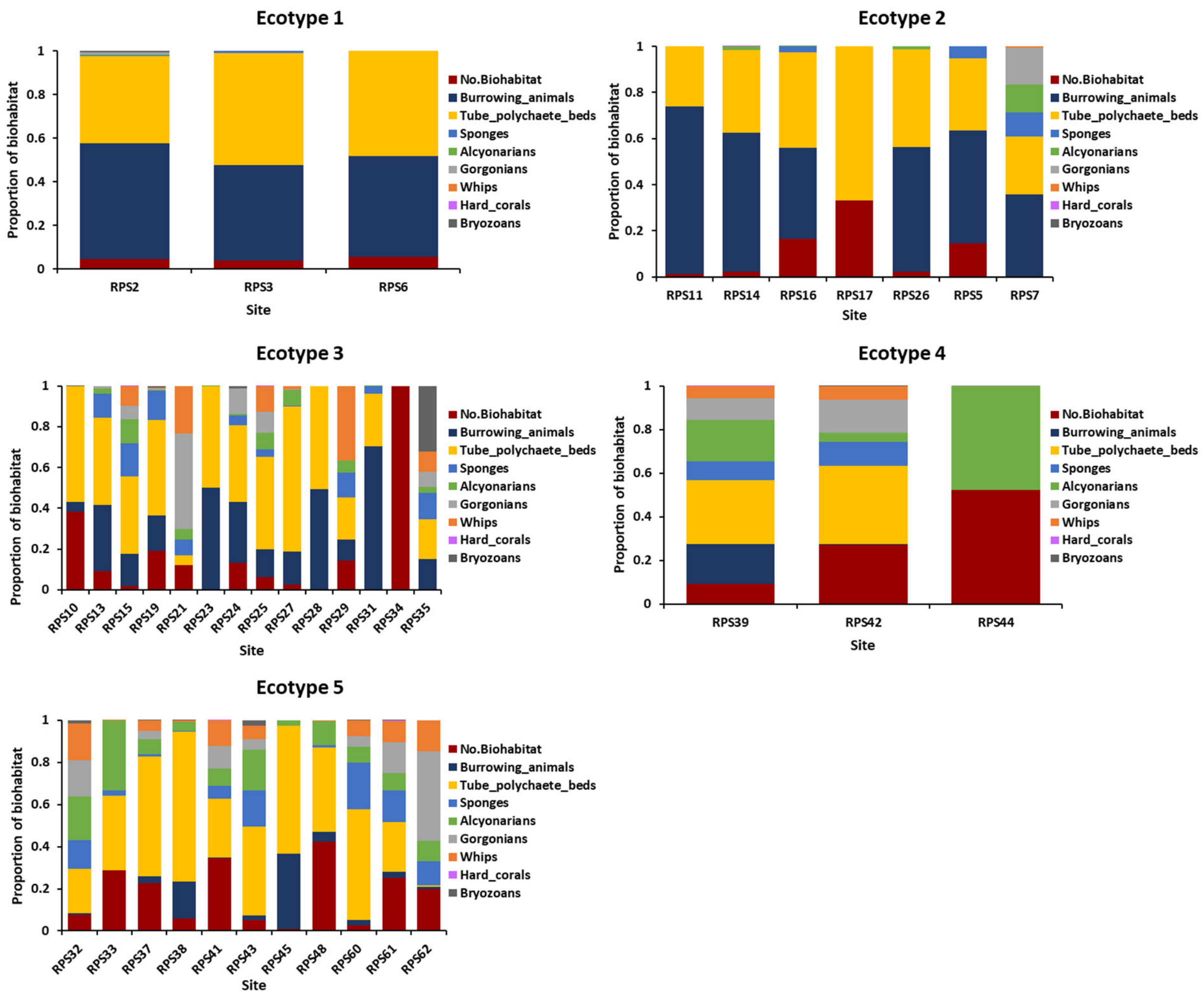

Figure 42. Proportion of each biohabitat type in seabed videos along ROV transects for December 2019 survey sites in each ecotype.

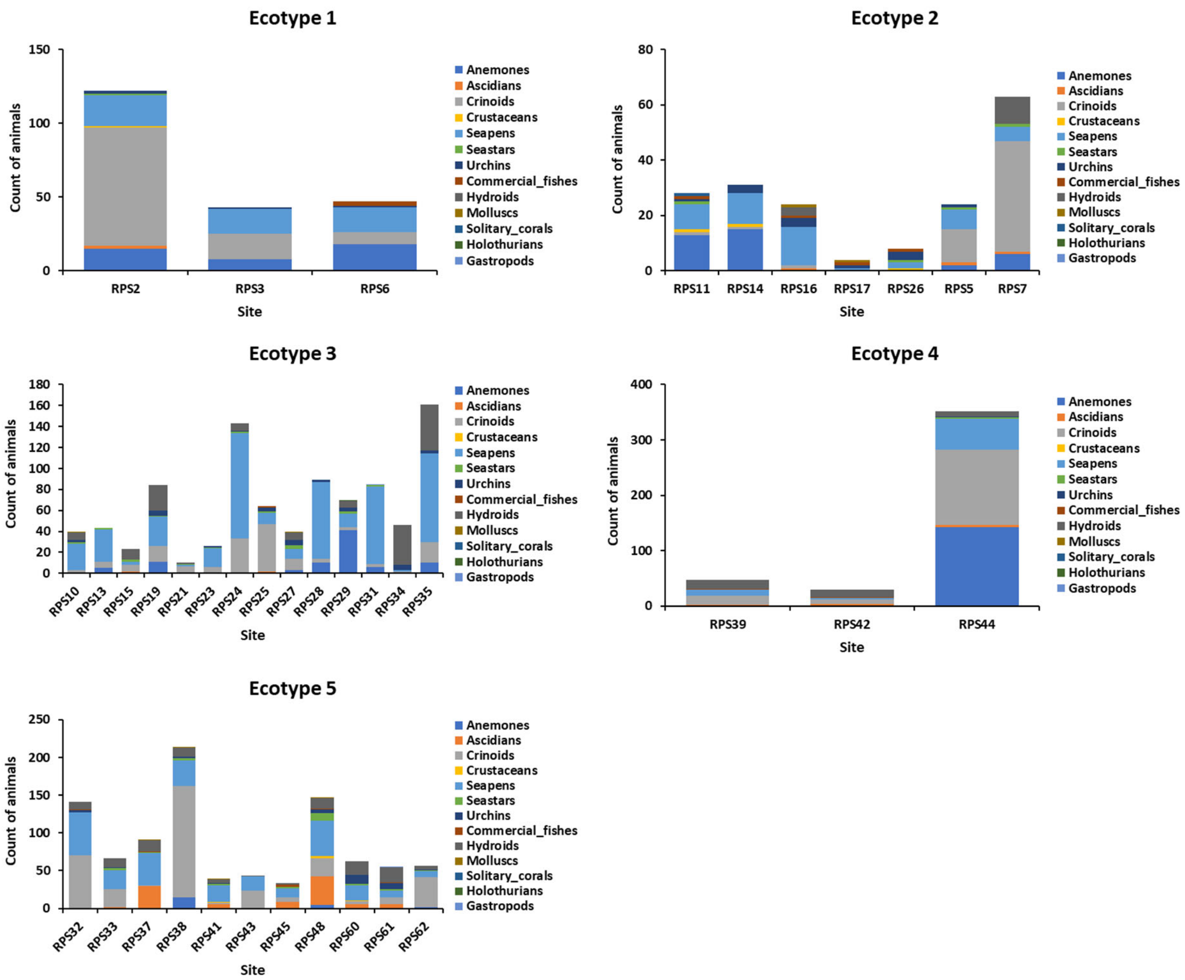

Figure 43. Number of animal events in seabed videos along ROV transects for December 2019 survey sites in each ecotype.

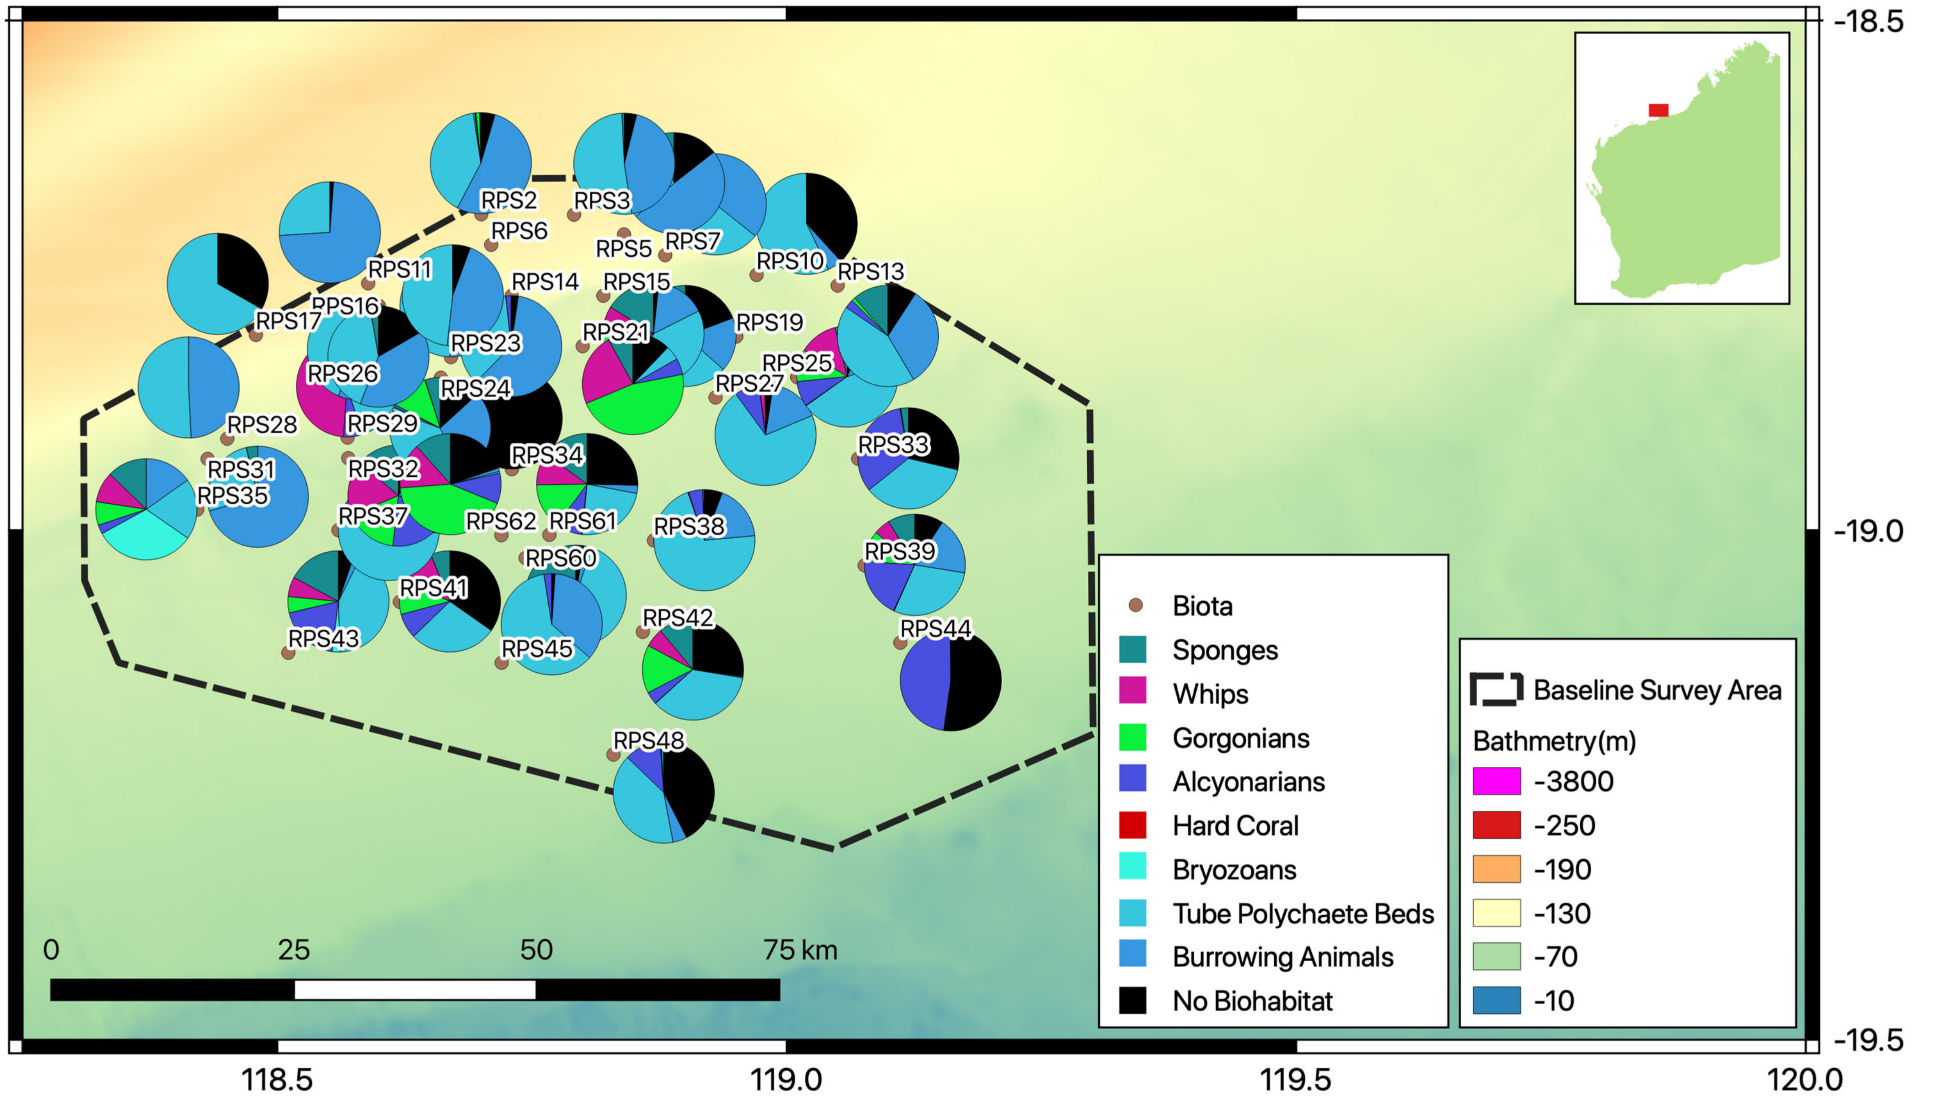

Figure 44. Proportion of biohabitat type at each of the December 2019 survey sites in the survey area (black dashed line).

4 Fish species diversity in the Dorado Survey Area

4.1 Data sources

A total of 4700 fish records, collected from 1967 to 1997, were downloaded from ALA records (Figure 45) for the survey area. Individual records were interrogated for identification accuracy using the CSIRO Australian National Fish Collection (ANFC) database, the Codes for Aquatic Australian Biota (CAAB) Database (Rees et al. 2020), the Australian Faunal Directory online (hereafter AFD online [Hoese et al. 2005]) and various other sources including online information and regional guide books. Dubious records (e.g. species significantly outside of their known range) and records not identifiable to species were excluded if not verifiable from an associated preserved specimen or image. Records to genus level were included only when the genus had been confirmed from the area and no other species of that genus were already recorded from the ALA records.

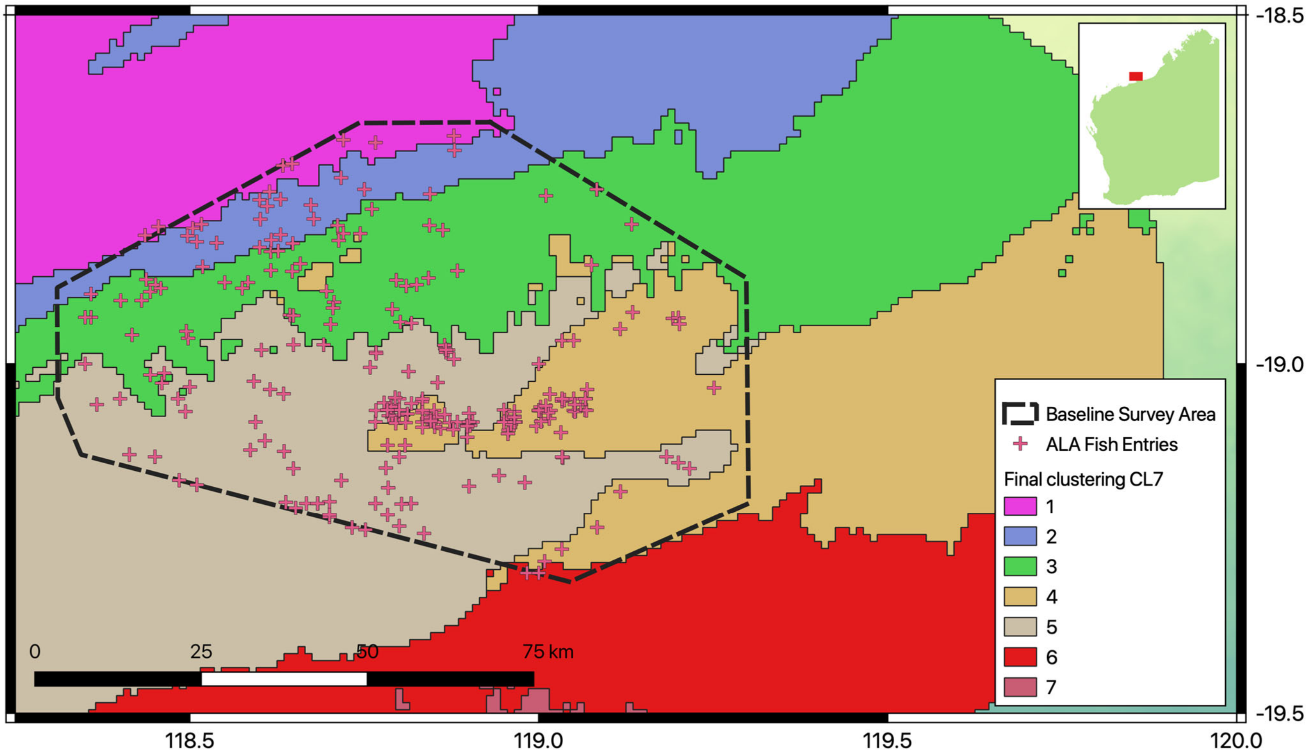

Figure 45. Locations of sample sites within the survey area (black dashed line) for fish biodiversity data records held in the ALA.

4.2 Fish diversity in the Dorado Survey Area compared with the broader NWS Province

After 782 records were excluded, 3917 records comprised of 359 fish species were confirmed as valid records for the survey area (Appendix B). All taxa had previously been recorded from the NWS Province (Hoese et al. 2005), although some names vary slightly between Appendix B and the AFD online (Hoese et al. 2005) due to the latter list including only described species or needing minor name updates. Consistency of names can be assured by matching distributions and voucher specimens from CAAB (Rees et al. 2020) and ANFC with names and CAAB codes used in AFD online (Hoese et al. 2005).

The SBRUV survey undertaken by RPS (2019) recorded 54 fish species, 36 of which were previously recorded through ALA records, 11 that were not recorded through ALA records, and 7 that could not be matched to ALA records due to lack of species identity (Appendix B). The 11 additional species not previously recorded from ALA records comprised mostly highly mobile species that are attracted to baits, such as sharks (four spp.), trevallies (two spp.) and other bony fishes from five different families (Appendix B). A total of 370 fish species have now been recorded from the survey area, equating to approximately 24% of the 1568 fish species (Hoese et al. 2005) known from the NWS Province as defined by the Integrated Marine and Coastal Regionalisation of Australia (IMCRA 1996).

Nine of the 11 newly recorded fish species for the survey area found during the RPS survey have previously been recorded to the north and south of the survey area, possibly suggesting inadequate prior sampling, rather than range extensions as the reason for not previously being detected. However, two species recorded during the RPS survey are either range extensions or dubiously identified from the video survey. If identified correctly, the Samsonfish, *Seriola hippos*, record would be a > 600 km range extension to the north of its currently documented northern limit near Exmouth Gulf. The Tille Trevally, *Caranx tille*, has not definitively been identified from inshore Western Australian waters, although a tentative identification of a juvenile from Port Hedland exists at CSIRO ANFC. These two NWS records would be a > 2500 km range extension to the southwest of the species Australian distribution, currently confirmed from Townsville westwards to the Arafura Sea ((Hoese et al. 2005) and also Christmas Island (Allen et al. 2007).

The NWS Province covers a large distributional area (238 759 km^2; latitude range approximately 14°00–22°30’S and longitude range approximately 114–125°E) and depth range from the intertidal zone to 200 m (DEWHA 2008). As such, higher diversity is to be expected than in the significantly smaller survey area that incorporates a depth range of about 50-150 m and area of 5512 km^2 (or 2.3% of the area of the NWS Province). Of significance in relation to the survey area, is the lack of offshore islands containing shallow subtidal and intertidal habitats and associated fish diversity. The broader NWS Province contains the Montebello Islands where 456 fish species in 75 families were recorded by Allen (2000), predominantly using visual census but supplemented by the ichthyocide rotenone for cryptic species. The ten most diverse fish families recorded by Allen (2000) accounted for 54% of the total fauna, namely Gobiidae (46 species versus 11 in the survey area), Labridae (39 vs. 11), Pomacentridae (37 vs. 3), Blenniidae (28 vs. 0), Apogonidae (22 vs. 7), Serranidae (19 vs. 15), Chaetodontidae (17 vs. 6), Carangidae (16 vs. 24), Lutjanidae (14 vs. 15) and Acanthuridae (11 vs. 1). The most diverse families in the survey area were Carangidae (24), Lutjanidae and Serranidae (15), Scorpaenidae (14), Nemipteridae and Carcharhinidae (12), Lethrinidae and Gobiidae (11 each), and Tetraodontidae (10 each). Within the survey area, comparable numbers to the most diverse families recorded by Allen (2000) were only achieved for families Serranidae, Carangidae and Lutjanidae. These families are represented by medium to large fishes that are usually either reef-dependent and easily sighted during visual surveys and/or readily trawled due to schooling behaviour.

Fish species diversity in the survey area is limited by the lack of shallow (< 50 m) inshore habitats and islands. For example, Moore et al. (2014) recorded 281 fish species from a much narrower depth range (0–30 m) around Broome to the north-east while Allen (2000) recorded 456 species around the Montebello Islands to the south-west of the survey area. Similarly, the maximum depth range of the survey area (c. 150 m) is significantly shallower than the continental shelf break (c. 200 m), where another unique assemblage of species typically occurs (e.g. see Last et al. 2005). Clearly, a diverse suite of collecting techniques mentioned in the above surveys provides the most comprehensive picture of the fish fauna in any given area.

4.3 Threatened, Endangered and Protected Species (TEPS)

4.3.1 Elasmobranchs

Of the elasmobranch fishes recorded from the survey area, only the Scalloped Hammerhead, *Sphyrna lewini*, is currently listed by the EPBC Act, where it has been listed as Endangered and Conservation Dependent since 2018. The occurrence of the species in the survey area is from three individuals recorded during CSIRO surveys in August 1983. From records on the ALA, it has been recorded both northwards and southwards of this area on numerous occasions since the 1960s, but data on its abundances are lacking from available sources searched for this study. Although the species can be confused with the Great Hammerhead, *Sphyrna mokarran*, which was also recorded during the SBRUV survey (RPS 2019), CSIRO shark experts at the time were likely aware of the two species and it is assumed that identification was correct.

It is unknown if the survey area contains any significant feeding, breeding or migratory habitat for the Scalloped Hammerhead. Although the species has a cosmopolitan distribution within tropical and warm temperate seas (including northern Australia), African and Indo-West Pacific populations may be distinct (Last & Stevens 2009). Large population declines have been recorded in some areas due to exploitation (Last & Stevens 2009) and despite the Endangered and Conservation Dependent listings under the EPBC Act, there is concern about the level of protection being inadequate in Australian waters (Rayns 2019). The species has a heightened conservation concern through an IUCN Redlist listing of Critically Endangered (Rigby et al. 2019b).

Another elasmobranch that occurs in the survey area is the Whitespotted Guitarfish, *Rhynchobatus australiae.* There are 10 records from the survey area obtained during CSIRO NWS surveys between 1980–1997 with the species also recorded during the SBRUV survey (RPS 2019). It is listed as Critically Endangered by the IUCN (Kyne et al. 2019).

The Silky Shark, *Carcharhinus falciformis*, is listed in the EPBC Act as migratory, subject to the Bonn Convention (Convention of the Conservation of Migratory Species of Wild Animals), and is listed as Vulnerable by the IUCN (Rigby et al. 2017). The Oceanic Whitetip Shark, *Carcharhinus longimanus*, is listed as Critically Endangered by the IUCN (Rigby et al. 2019a). Both species have been recorded from the survey area, during CSIRO NWS studies in 1980-1997 and Soviet Fishery Data in 1973, respectively.

All abovementioned elasmobranchs are likely afforded reasonable protection in the NWS area, including within the survey area, due to a lack of targeted commercial fishing practices for these species in these waters. While the NWS area is a small part of each of the species distributional ranges, they potentially offer important refuges for breeding, feeding and migration, although data on critical habitats for each of these species is not well defined in the literature.

4.3.2 Syngnathiformes

All Australian members of Syngnathidae and Solenostomidae are declared under s248 of the EPBC Act. The three relevant syngnathid species known from the survey area are Western Spiny Seahorse, *Hippocampus angustus,* Gunther's Pipehorse, *Solegnathus lettiensis* (*S. guentheri* is sometimes used for the same species in Australia), and Pallid Pipehorse, *Solegnathus* sp. 2 (Kuiter 2000) (*S. hardwickii* is also used for the same species in Australia). Because the taxonomy of some of these species is not fully resolved, there is some uncertainty about their distributions. However, the wide breadth of their distributions in northern Australia and the presumed lack of targeted fishing indicates there are suitable and widespread habitats to maintain populations.

5 Invertebrate species diversity

5.1 Data sources

Records of seven phyla of marine invertebrates were downloaded from the Atlas of Living Australia (Figure 46) with the purpose of determining what data on biodiversity existed for the survey area and how this compared with what is known for the broader area of the North West Shelf Province. These data can only be regarded as a guide of the recorded invertebrate biodiversity of the area as the area as a whole is poorly surveyed, not all Australian museums upload all records for all phyla (particularly older records) onto the ALA, and for some phyla (e.g. sponges, bryozoa), the taxonomy is not well known. However, the approach taken here compares like with like for recorded biodiversity for these phyla on the NWS.

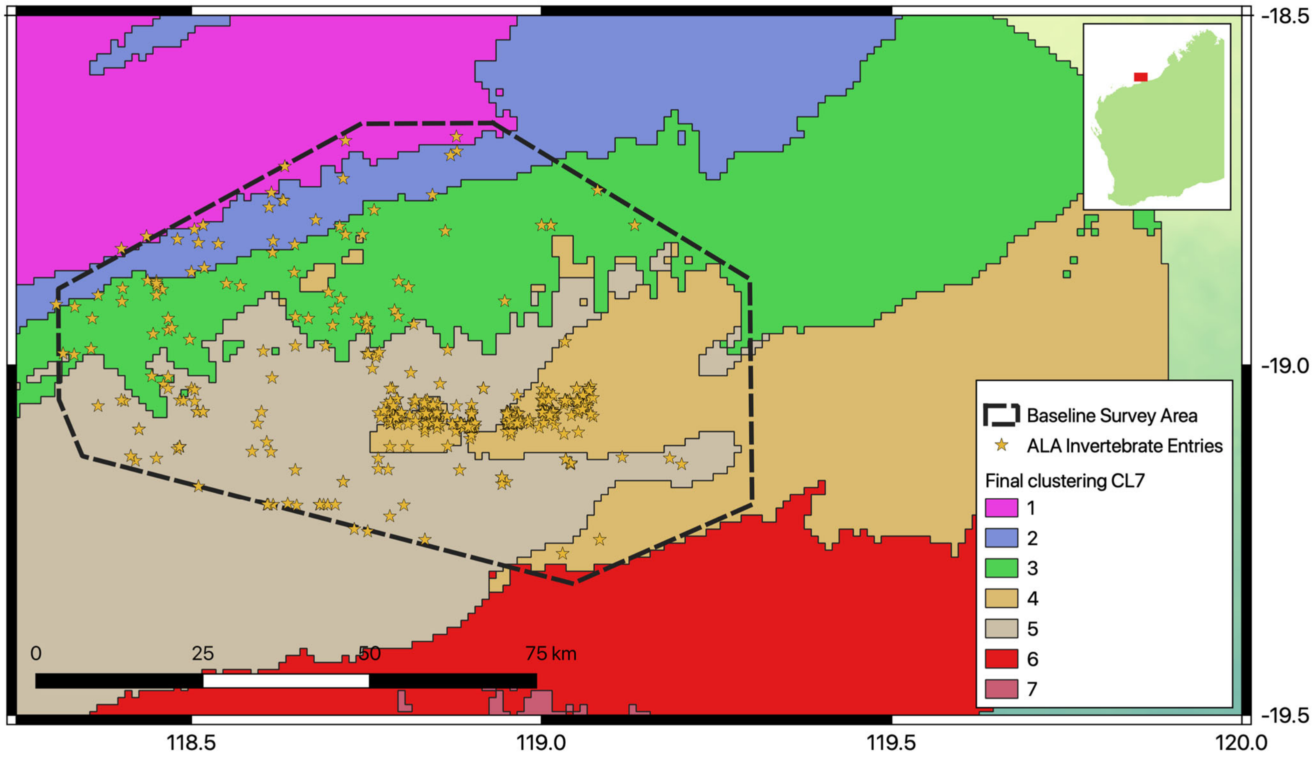

Figure 46. Locations of sample sites within the survey area (black dashed line) for marine invertebrate biodiversity data records held in the ALA.

5.2 Invertebrate species recorded from the Dorado Survey Area

Tables C.1 to C.7 in Appendix C set out the species recorded from the survey area for seven key phyla:

Porifera (sponges)

- 87 species recorded, all demosponges. This is likely to be a significant underestimate due, in part, to a large proportion of Australian sponges being undescribed. The ALA only records species with formal names (158 for the entire NWS Province) and although the high diversity of NWS sponges is gradually being documented (Hooper et al. 2002; Fromont 2004; Fromont et al. 2006; 2016) many uniquely identified and catalogued species lack a formal name. For example, a recent survey of the Dampier and Montebello Marine Parks found a total of 153 species of which 80 could not be named (Keesing 2019). Hooper et al. (2002) estimated there were 344 sponge species on the NWS with as many as 37% endemic.

Cnidaria (hydroids, soft corals, hard corals, whips, fans, seapens, zoanthids)

- 72 species recorded, comprising 45 Alcyonacea (17 soft corals of various types, 22 fans and gorgonians, six whips), two black corals, five hard corals (all solitary corals), three sea pens, three zoanthids and 14 hydroids. This is a similar diversity to that recorded from the Dampier and Montebello Marine Parks (46 species of Alcyonacea, Keesing 2019).

Bryozoa (lace corals)

- Three species recorded. This is certainly a large underestimate given bryozoa are not regularly sampled and the taxonomy is poorly known.

Annelida (polychaete worms)

- 23 species recorded

Mollusca (bivalves, gastropods, scaphopods, cephalopods)

- 208 species recorded, comprising 55 bivalves, 124 Gastropods, 11 scaphopods and 18 species of cephalopods which included two squid, 13 cuttlefish and three octopus. This is a relatively high diversity for a small area, especially when one considers that it lacks in shallow water and intertidal habitats where molluscs are abundant. A recent survey of the deeper (> 30 m) habitats of the Dampier and Montebello Marine Parks found 90 species of molluscs (Keesing 2019) while other surveys of similar areas on the NWS which included the shallow habits recorded over 600 species (Wells et al. 2000; 2003; Slack-Smith and Bryce 1996; 2004).

Echinodermata (starfish, crinoids [sea lilies], basket stars, brittle stars, sea cucumbers, sea urchins)

- 76 species recorded, comprising 18 starfish, 19 crinoids, 15 brittle stars, seven basket stars, three sea cucumbers and 14 echinoids. This group is also likely to be under-sampled especially for sea cucumbers. Keesing (2019) recorded 30 species of crinoids, seven basket stars and 26 brittle stars from the areas of the Dampier and Montebello Marine Parks.

Arthropoda (crustaceans and sea spiders, excludes small, mostly planktonic taxa such as maxillopods and ostracods)

- 253 species recorded, comprising 174 decapods (crabs and shrimps), 17 amphipods, 12 cumaceans, 28 isopods, seven stomatopods, four tanaids and 11 sea spiders. This is a similar diversity to that recorded from the Dampier and Montebello Marine Parks (154 species of decapods, [Keesing 2019]).

5.3 Comparison of invertebrate species diversity with the broader NWS region

Among the seven phyla of marine invertebrates examined, there were a total of 722 species recorded from the survey area, representing 18% of species recorded from the NWS Province as a whole (Table 13). Overlap between the survey area and the whole NWS Province varied between 9% for bryozoa and 55% for sponges, however for the better sampled taxa of molluscs, echinoderms and arthropods this overlap was between 12 and 24%.

Species recorded from the survey area but not recorded elsewhere in the NWS Province ranged from 9% of echinoderms to 22% of cnidarians (Table 13). Overall, 15% of species of marine invertebrates examined and recorded from the NWS Province were recorded only from the survey area (Table 13). Although the survey area made up just 2.3 % of the area of the NW Province, no firm conclusion can be made regarding differences in biodiversity between the survey and surrounding areas due to a sparsity of biodiversity data from this area, poor taxonomic knowledge of some animal groups, and incomplete ALA records. Data for fishes, a group that has been relatively much better sampled and for which the taxonomy is very mature, showed no differentiation between the survey area and surrounding areas. Thus, of the 370 species recorded from the survey area, only two species had not been recorded elsewhere in the NWS Province and it is possible these species represent errors in identification (see Chapter 4).

Table 13. Comparison of marine invertebrate diversity in the survey area with that of the broader area of the NWS Province (IMCRA – Integrated Marine and Coastal Regionalisation of Australia).

Phyla	Count of species recorded in Northwest IMCRA Province	Count of species recorded in survey area	Percentage of NWS species represented in survey area	Count of species in survey area that were not recorded elsewhere on NWS	Percentage of species in survey area that were not recorded elsewhere on NWS
PORIFERA	158	87	55	9	10
CNIDARIA	337	72	21	16	22
BRYOZOA	33	3	9	0	0
ANNELIDA	218	23	11	3	13
MOLLUSCA	1728	208	12	21	10
ECHINODERMATA	431	76	18	7	9
ARTHROPODA	1059	253	24	53	21
TOTALS	3964	722	18	109	15

Appendix A Data tables giving site locations referred to in this report

A.1 Data tables giving survey site locations referred to in this report

In various parts of the report maps and graphs refer to sample sites. The tables below provide the GPS coordinates for each site.

Apx Table A.1 Sites sampled during the December 2019 survey of the survey area. Mid points of ROV transect are given. Assigned ecotype at each site is given. There were no sites in ecotypes 6 or 7 which fall outside the survey area.

Site	latitude (deg)	longitude (deg)	Ecotype
RPS2	-18.6901	118.7001	1
RPS3	-18.6905	118.7911	1
RPS5	-18.7099	118.8402	2
RPS6	-18.7201	118.7098	1
RPS7	-18.7302	118.8806	2
RPS10	-18.7496	118.9703	3
RPS11	-18.7579	118.5891	2
RPS13	-18.7601	119.0498	3
RPS14	-18.7700	118.7299	2

Apx Table C 5. Table of Mollusc records from the survey area from ALA records. (*denotes taxa recorded in the survey area and not recorded elsewhere in the IMCRA NSW Province)

CLASS/ORDER	FAMILY	SCIENTIFIC_NAME	AUTHORITY	Not recorded elsewhere in IMCRA NWS Province
BIVALVIA				
Adapedonta	Hiatellidae	*Hiatella australis*	(Lamarck, 1818)	
Arcida	Arcidae	*Barbatia* sp.		
Arcida	Cucullaeidae	*Cucullaea labiata*	(Lightfoot, 1786)	
Arcida	Glycymerididae	*Glycymeris tenuicostata*	(Reeve, 1843)	
Arcida	Limopsidae	*Limopsis multistriata*	(Forsskål, 1775)	
Cardiida	Cardiidae	*Acrosterigma attenuatum*	(Sowerby, 1841)	
Cardiida	Cardiidae	*Acrosterigma transcendens*	(Melvill & Standen, 1899)	*
Cardiida	Cardiidae	*Afrocardium richardi*	(Audouin, 1826)	
Cardiida	Cardiidae	*Lunulicardia retusa*	(Linnaeus, 1767)	
Cardiida	Cardiidae	*Nemocardium bechei*	(Reeve, 1852)	*
Cardiida	Cardiidae	*Nemocardium probatum*	(Iredale, 1927)	
Cardiida	Cardiidae	*Vasticardium elongatum*	(Bruguière, 1789)	*

Cardiida	Galeommatidae	*Galeomma* sp.		*
Cardiida	Lasaeidae	*Rochefortia* sp.		
Cardiida	Mactridae	*Mactra iridescens*	Habe, 1958	
Cardiida	Psammobiidae	*Gari pulcherrima*	(Deshayes, 1855)	
Cardiida	Semelidae	*Theora nasuta*	Hedley, 1909	
Cardiida	Veneridae	*Antigona lamellaris*	Schumacher, 1817	
Cardiida	Veneridae	*Placamen retroversum*	(Deshayes, 1853)	
Carditida	Carditidae	*Cardita crassicosta*	Lamarck, 1819	
Carditida	Carditidae	*Centrocardita squamigera*	(Deshayes, 1832)	
Carditida	Condylocardiidae	*Warrana pellucida*	Middelfart, 2002	
Limida	Limidae	*Ctenoides annulata*	(Lamarck, 1819)	
Limida	Limidae	*Lima vulgaris*	(Link, 1807)	
Limida	Limidae	*Limea parvula*	Verco, 1908	
Limida	Limidae	*Limea torresiana*	(Smith, 1885)	
Lucinida	Lucinidae	*Divaricella irpex*	(E.A. Smith, 1885)	
Lucinida	Lucinidae	*Plicolucina flabellata*	Glover, Taylor & Slack-Smith, 2003	
Ostreida	Gryphaeidae	*Hyotissa* sp.		
Ostreida	Ostreidae	*Booneostrea subucula*	(Jousseaume in Lamy, 1925)	
Ostreida	Ostreidae	*Dendostrea folium*	(Linnaeus, 1758)	
Ostreida	Ostreidae	*Nicaisolopha tridacnaeformis*	(Cox, 1927)	*
Ostreida	Pteriidae	*Electroma physoides*	(Lamarck, 1819)	
Ostreida	Pteriidae	*Pteria* sp.		
Ostreida	Pteriidae	*Vulsella vulsella*	(Linnaeus, 1758)	
Pectinida	Pectinidae	*Amusium balloti*	(Bernardi, 1861)	
Pectinida	Pectinidae	*Annachlamys flabellata*	(Lamarck, 1819)	
Pectinida	Pectinidae	*Complicachlamys wardiana*	Iredale, 1939	
Pectinida	Pectinidae	*Cryptopecten nux*	(Reeve, 1853)	
Pectinida	Pectinidae	*Decatopecten strangei*	(Reeve, 1852)	
Pectinida	Pectinidae	*Glorichlamys quadrilirata*	(Lischke, 1870)	

Pectinida	Pectinidae	*Mimachlamys scabricostata*	(Sowerby, 1915)	
Pectinida	Pectinidae	*Pecten dijkstrai*	Duncan & Wilson, 2012	
Pectinida	Pectinidae	*Scaeochlamys livida*	(Lamarck, 1819)	
Pectinida	Pectinidae	*Semipallium dringi*	(Reeve, 1853)	
Pectinida	Pectinidae	*Serratovola pallula*	Dijkstra, 1998	
Pectinida	Pectinidae	*Ylistrum balloti*	Bernardi, 1861	
Pectinida	Plicatulidae	*Plicatula muricata*	Sowerby, 1873	
Pectinida	Propeamussiidae	*Parvamussium cristatellum*	(Dautzenberg & Bavay, 1912)	
Pectinida	Propeamussiidae	*Parvamussium retiolum*	Dijkstra, 1995	
Pectinida	Propeamussiidae	*Parvamussium scitulum*	(Smith, 1885)	
Pectinida	Spondylidae	*Spondylus sinensis*	Schreibers, 1793	
Pectinida	Spondylidae	*Spondylus victoriae*	Sowerby, 1860	
Trigoniida	Trigoniidae	*Neotrigonia* sp.		
Anomalodesmata	Verticordiidae	*Spinosipella deshayesiana*	(Fischer, 1862)	
CEPHALOPODA				
Octopoda	Argonautidae	*Argonauta hians*	Lightfoot, 1786	
Octopoda	Octopodidae	*Amphioctopus exannulatus*	(Norman, 1993)	
Octopoda	Octopodidae	*Octopus cyanea*	Gray, 1849	*
Sepiida	Sepiadariidae	*Sepiadarium auritum*	Robson, 1914	
Sepiida	Sepiadariidae	*Sepiadarium kochii*	Steenstrup, 1881	
Sepiida	Sepiadariidae	*Sepioloidea lineolata*	(Quoy & Gaimard, 1832)	*
Sepiida	Sepiidae	*Metasepia pfefferi*	(Hoyle, 1885)	
Sepiida	Sepiidae	*Sepia cottoni*	Adam, 1979	
Sepiida	Sepiidae	*Sepia elliptica*	Hoyle, 1885	
Sepiida	Sepiidae	*Sepia irvingi*	Meyer, 1909	
Sepiida	Sepiidae	*Sepia novaehollandiae*	Hoyle, 1909	*
Sepiida	Sepiidae	*Sepia papuensis*	Hoyle, 1885	
Sepiida	Sepiidae	*Sepia pharaonis*	Ehrenberg, 1831	
Sepiida	Sepiidae	*Sepia rhoda*	(Iredale, 1954)	
Sepiida	Sepiidae	*Sepia smithi*	Hoyle, 1885	
Sepiolida	Sepiolidae	*Euprymna* sp.		

Teuthida	Loliginidae	*Loligo* sp.		
Teuthida	Loliginidae	*Uroteuthis edulis*	(Hoyle, 1885)	
SCAPHOPODA				
Dentaliida	Calliodentaliidae	*Calliodentalium crocinum*	(Dall, 1907)	*
Dentaliida	Dentaliidae	*Dentalium aprinum*	Linnaeus, 1767	
Dentaliida	Dentaliidae	*Dentalium exmouthensis*	Lamprell & Healy, 1998	
Dentaliida	Dentaliidae	*Dentalium formosum*	Adams & Reeve, 1850	
Dentaliida	Dentaliidae	*Striodentalium thetidis*	(Hedley, 1903)	
Dentaliida	Fustiariidae	*Fustiaria caesura*	(Colman, 1958)	*
Dentaliida	Fustiariidae	*Fustiaria stenoschiza*	(Pilsbry & Sharp, 1897)	
Dentaliida	Laevidentaliidae	*Laevidentalium erectum*	(Sowerby, 1860)	*
Dentaliida	Laevidentaliidae	*Laevidentalium lubricatum*	(Sowerby, 1860)	
Dentaliida	Laevidentaliidae	*Laevidentalium marshae*	Lamprell & Healy, 1998	
Gadilida	Gadilidae	*Dischides prionotus*	(Watson, 1879)	
GASTROPODA				
Cephalaspidea	Philinidae	*Philine* sp.		
Cerithimorpha	Dialidae	*Paradiala* sp.		
Cerithimorpha	Siliquariidae	*Tenagodus* sp.		
Cerithimorpha	Turritellidae	*Archimediella fastigiata*	(Adams & Reeve, 1850)	
Cerithimorpha	Turritellidae	*Haustator cingulifera*	(Sowerby, 1825)	
Hypsogastropoda	Atlantidae	*Atlanta peronii*	Lesueur, 1817	
Hypsogastropoda	Borsoniidae	*Tomopleura* sp.		
Hypsogastropoda	Bursidae	*Bufonaria margaritula*	(Deshayes, 1832)	
Hypsogastropoda	Bursidae	*Bufonaria rana*	(Linnaeus, 1758)	
Hypsogastropoda	Bursidae	*Bursa granularis*	(Röding, 1798)	
Hypsogastropoda	Cancellariidae	*Trigonostoma thysthlon*	Petit & Harasewych, 1987	*
Hypsogastropoda	Cancellariidae	*Tritonoharpa antiquata*	(Reeve, 1844)	
Hypsogastropoda	Capulidae	*Capulus danieli*	(Crosse, 1858)	
Hypsogastropoda	Cassidae	*Semicassis angasi*	(Iredale, 1927)	
Hypsogastropoda	Cassidae	*Semicassis bisulcata*	(Schubert & Wagner, 1829)	

Hypsogastropoda	Clathurellidae	*Etrema spurca*	(Hinds, 1843)	
Hypsogastropoda	Clavatulidae	*Turricula nelliae*	(E.A. Smith, 1877)	
Hypsogastropoda	Columbellidae	*Mitrella merita*	(Brazier, 1877)	
Hypsogastropoda	Columbellidae	*Zafra succinea*	(Hervier, 1899)	
Hypsogastropoda	Conidae	*Conasprella longurionis*	(Kiener, 1850)	
Hypsogastropoda	Conidae	*Conus dampierensis*	Filmer & Coomans, 1985	
Hypsogastropoda	Conidae	*Conus trigonus*	Reeve, 1848	
Hypsogastropoda	Conidae	*Conus voluminalis*	Reeve, 1843	
Hypsogastropoda	Costellariidae	*Vexillum modestum*	(Reeve, 1845)	
Hypsogastropoda	Cymatiidae	*Cymatium pfeifferianum*	(Reeve, 1844)	
Hypsogastropoda	Cymatiidae	*Gyrineum lacunatum*	(Mighels, 1845)	
Hypsogastropoda	Cymatiidae	*Gyrineum pulchellum*	(Sowerby, 1825)	
Hypsogastropoda	Cymatiidae	*Monoplex comptus*	(Adams, 1855)	
Hypsogastropoda	Cymatiidae	*Ranularia sinensis*	(Reeve, 1844)	
Hypsogastropoda	Cymatiidae	*Turritriton labiosus*	(Wood, 1828)	
Hypsogastropoda	Cypraeidae	*Contradusta walkeri*	(Sowerby, 1832)	
Hypsogastropoda	Cypraeidae	*Erronea subviridis*	(Reeve, 1835)	
Hypsogastropoda	Cystiscidae	*Cystiscus angasi*	(Crosse, 1870)	
Hypsogastropoda	Cystiscidae	*Cystiscus melwardi*	(Laseron, 1957)	
Hypsogastropoda	Cystiscidae	*Gibberula compressa*	(Laseron, 1957)	
Hypsogastropoda	Drilliidae	*Conopleura striata*	Hinds, 1844	*
Hypsogastropoda	Enophoridae	*Onustus indicus*	(Gmelin, 1791)	
Hypsogastropoda	Enophoridae	*Stellaria chinensis*	(Philippi, 1841)	
Hypsogastropoda	Enophoridae	*Xenophora solarioides*	(Reeve, 1845)	
Hypsogastropoda	Epitoniidae	*Eglisia tricarinata*	Adams & Reeve, 1850	
Hypsogastropoda	Eratoidae	*Alaerato angistoma*	G.B. Sowerby II, 1832	*
Hypsogastropoda	Eratoidae	*Eratoena corrugata*	(Hinds, 1844)	
Hypsogastropoda	Fasciolariidae	*Fusinus colus*	(Linnaeus, 1758)	
Hypsogastropoda	Ficidae	*Ficus subintermedia*	(Orbigny, 1852)	
Hypsogastropoda	Harpidae	*Harpa articularis*	Lamarck, 1822	
Hypsogastropoda	Harpidae	*Morum* sp.		

Hypsogastropoda	Hipponicidae	*Cheilea* sp.		
Hypsogastropoda	Hipponicidae	*Hipponix* sp.		
Hypsogastropoda	Hipponicidae	*Malluvium devotus*	(Hedley, 1904)	
Hypsogastropoda	Mangeliidae	*Pseudorhaphitoma* sp.		
Hypsogastropoda	Marginellidae	*Dentimargo arvina*	(Laseron, 1957)	
Hypsogastropoda	Marginellidae	*Dentimargo tropica*	(Laseron, 1957)	
Hypsogastropoda	Marginellidae	*Dentimargo walkeri*	(Smith, 1899)	
Hypsogastropoda	Marginellidae	*Mesoginella brachia*	(Watson, 1886)	
Hypsogastropoda	Marginellidae	*Protoginella lavigata*	(Brazier, 1876)	
Hypsogastropoda	Marginellidae	*Volvarina rex*	(Laseron, 1957)	
Hypsogastropoda	Mitridae	*Imbricaria interlirata*	(Reeve, 1844)	
Hypsogastropoda	Mitridae	*Scabricola melvilli*	G.B. Sowerby II, 1882	
Hypsogastropoda	Muricidae	*Chicoreus cervicornis*	(Lamarck, 1822)	
Hypsogastropoda	Muricidae	*Ergalatax contracta*	(Reeve, 1846)	
Hypsogastropoda	Muricidae	*Favartia* sp.		*
Hypsogastropoda	Muricidae	*Murex acanthostephes*	Watson, 1883	
Hypsogastropoda	Muricidae	*Murex pecten*	Lightfoot, 1786	
Hypsogastropoda	Muricidae	*Orania* sp.		
Hypsogastropoda	Muricidae	*Pterochelus acanthopterus*	(Lamarck, 1816)	
Hypsogastropoda	Muricidae	*Pterynotus alatus*	(Röding, 1798)	
Hypsogastropoda	Muricidae	*Vokesimurex multiplicatus*	(Sowerby, 1895)	
Hypsogastropoda	Nassariidae	*Cyllene pulchella*	Adams & Reeve, 1850	
Hypsogastropoda	Nassariidae	*Nassaria acuminata*	(Reeve, 1844)	
Hypsogastropoda	Nassariidae	*Nassarius albescens*	(Dunker, 1846)	
Hypsogastropoda	Nassariidae	*Nassarius splendidulus*	(Dunker, 1846)	
Hypsogastropoda	Nassariidae	*Nassarius subtranslucidus*	(Smith, 1903)	
Hypsogastropoda	Nassariidae	*Phos sculptilis*	Watson, 1886	
Hypsogastropoda	Nassariidae	*Phos senticosus*	(Linnaeus, 1758)	
Hypsogastropoda	Naticidae	*Eunaticina* sp.		
Hypsogastropoda	Naticidae	*Glyphepithema alapapilionis*	(Röding, 1798)	

Hypsogastropoda	Naticidae	*Mammilla simiae*	(Deshayes, 1838)	
Hypsogastropoda	Naticidae	*Neverita peselephanti*	(Link, 1807)	
Hypsogastropoda	Naticidae	*Polinices flemingianus*	(Récluz, 1844)	
Hypsogastropoda	Naticidae	*Tanea euzona*	(Récluz, 1844)	
Hypsogastropoda	Naticidae	*Tanea luculenta*	(Iredale, 1929)	*
Hypsogastropoda	Olividae	*Ancillista cingulata*	(Sowerby, 1830)	
Hypsogastropoda	Olividae	*Ancillista muscae*	(Pilsbry, 1926)	
Hypsogastropoda	Olividae	*Oliva australis*	Duclos, 1835	
Hypsogastropoda	Personidae	*Distorsio reticularis*	(Linnaeus, 1758)	
Hypsogastropoda	Pseudomelatomidae	*Inquisitor lassulus*	Hedley, 1922	
Hypsogastropoda	Pseudomelatomidae	*Inquisitor odhneri*	Wells, 1994	
Hypsogastropoda	Ranellidae	*Reticutriton pfeifferianus*	Reeve, 1844	
Hypsogastropoda	Raphitomidae	*Daphnella* sp.		
Hypsogastropoda	Seraphsidae	*Terebellum terebellum*	(Linnaeus, 1758)	
Hypsogastropoda	Strombidae	*Doxander campbelli*	Griffith & Pidgeon, 1834	
Hypsogastropoda	Terebridae	*Duplicaria australis*	(Smith, 1873)	
Hypsogastropoda	Terebridae	*Hastula* sp.		
Hypsogastropoda	Terebridae	*Hastulopsis conspersa*	(Hinds, 1844)	
Hypsogastropoda	Terebridae	*Terebra amanda*	Hinds, 1844	
Hypsogastropoda	Terebridae	*Terebra trismacaria*	Melvill, 1917	
Hypsogastropoda	Terebridae	*Triplostephanus triseriatus*	(Gray, 1834)	
Hypsogastropoda	Tonnidae	*Tonna* sp.		
Hypsogastropoda	Triviidae	*Cleotrivia* sp.		*
Hypsogastropoda	Triviidae	*Dolichupis producta*	(Gaskoin, 1836)	
Hypsogastropoda	Triviidae	*Trivirostra hyalina*	Schilder, 1933	*
Hypsogastropoda	Triviidae	*Trivirostra oryza*	(Lamarck, 1811)	
Hypsogastropoda	Turbinellidae	*Syrinx aruanus*	(Linnaeus, 1758)	
Hypsogastropoda	Turbinellidae	*Tudivasum inerme*	(Angas, 1878)	
Hypsogastropoda	Turridae	*Gemmula diomedea*	Powell, 1964	
Hypsogastropoda	Turridae	*Gemmula hastula*	Reeve, 1843	
Hypsogastropoda	Turridae	*Gemmula monilifera*	(Pease, 1861)	

Hypsogastropoda	Turridae	*Lophiotoma indica*	(Röding, 1798)	
Hypsogastropoda	Volutidae	*Amoria damonii*	Gray, 1864	
Hypsogastropoda	Volutidae	*Amoria ellioti*	(Sowerby, 1864)	
Hypsogastropoda	Volutidae	*Amoria praetexta*	(Reeve, 1849)	
Hypsogastropoda	Volutidae	*Cymbiola nivosa*	(Lamarck, 1804)	
Lepetellida	Fissurellidae	*Diodora jukesii*	(Reeve, 1850)	
Lepetellida	Fissurellidae	*Diodora ticaonica*	(Reeve, 1850)	
Lepetellida	Fissurellidae	*Emarginula incisura*	A. Adams, 1852	
Nudibranchia	Arminidae	*Dermatobranchus* sp.		
Nudibranchia	Tritoniidae	*Tritonia* sp.		
Pleurobranchida	Pleurobranchidae	*Pleurobranchaea brockii*	Bergh, 1897	*
Pteropoda	Cavoliniidae	*Diacavolinia longirostris*	(Blainville, 1821)	
Pteropoda	Limacinidae	*Limacina bulimoides*	(d'Orbigny, 1836)	
Seguenziida	Chilodontaidae	*Hybochelus cancellatus*	(Krauss, 1848)	
Trochida	Calliostomatidae	*Laetifautor monilis*	(Reeve, 1863)	
Trochida	Solariellidae	*Solariella* sp.		*
Heterostropha	Mathildidae	*Mathilda* sp.		*

Apx Table C 6. Table of Echinoderm records from the survey area from ALA records. (*denotes taxa recorded in the survey area and not recorded elsewhere in the IMCRA NWS Province)

CLASS/ORDER	FAMILY	*SCIENTIFIC_NAME*	AUTHORITY	Not recorded elsewhere in IMCRA NWS Province
ASTEROIDEA				
Forcipulatida	Zoroasteridae	*Pholidaster squamatus*	Sladen, 1889	
Paxillosida	Astropectinidae	*Astropecten polyacanthus*	Müller & Troschel, 1842	
Paxillosida	Astropectinidae	*Astropecten zebra*	Sladen, 1883	
Paxillosida	Luidiidae	*Luidia maculata*	Müller & Troschel, 1842	
Spinulosida	Echinasteridae	*Echinaster stereosomus*	Fisher, 1913	
Spinulosida	Echinasteridae	*Metrodira subulata*	Gray, 1840	
Valvatida	Goniasteridae	*Anthenoides dubius*	H.L. Clark, 1938	
Valvatida	Goniasteridae	*Mediaster* sp.		
Valvatida	Goniasteridae	*Milteliphaster regenerator*	(Döderlein, 1922)	
Valvatida	Goniasteridae	*Rosaster nannus*	Fisher, 1913	*
Valvatida	Goniasteridae	*Stellaster equestris*	(Retzius, 1805)	
Valvatida	Ophidiasteridae	*Hacelia helicosticha*	(Sladen, 1889)	
Valvatida	Ophidiasteridae	*Heteronardoa carinata*	(Koehler, 1910)	
Valvatida	Ophidiasteridae	*Tamaria* sp.		
Valvatida	Oreasteridae	*Anthenea pentagonula*	(Lamarck, 1816)	
Valvatida	Oreasteridae	*Goniodiscaster granuliferus*	(Gray, 1847)	
Valvatida	Oreasteridae	*Pentaceraster gracilis*	(Lütken, 1871)	
Velatida	Pterasteridae	*Euretaster insignis*	(Sladen, 1882)	
CRINOIDEA				
Comatulida	Asterometridae	*Pterometra trichopoda*	(A.H. Clark, 1908)	
Comatulida	Calometridae	*Neometra conaminis*	A.H. Clark, 1914	
Comatulida	Calometridae	*Neometra diana*	(A.H. Clark, 1912)	
Comatulida	Comatulidae	*Capillaster multiradiata*	(Linnaeus, 1758)	
Comatulida	Comatulidae	*Capillaster sentosa*	(Carpenter, 1888)	
Comatulida	Comatulidae	*Clarkcomanthus alternans*	(Carpenter, 1881)	

Comatulida	Comatulidae	*Comanthus briareus*	(Bell, 1882)	
Comatulida	Comatulidae	*Comaster multifidus*	(Müller, 1841)	
Comatulida	Comatulidae	*Comaster schlegelii*	(Carpenter, 1881)	
Comatulida	Comatulidae	*Comatula pectinata*	(Linnaeus, 1758)	
Comatulida	Comatulidae	*Comatula purpurea*	Mï¿½ller, 1843	
Comatulida	Comatulidae	*Comatula rotalaria*	(Lamarck, 1816)	
Comatulida	Comatulidae	*Comatula solaris*	Lamarck, 1816	
Comatulida	Comatulidae	*Phanogenia multibrachiatus*	(Carpenter, 1888)	*
Comatulida	Himerometridae	*Amphimetra tessellata*	(Müller, 1841)	
Comatulida	Himerometridae	*Heterometra crenulata*	(Carpenter, 1882)	
Comatulida	Zygometridae	*Zygometra andromeda*	A.H. Clark, 1912	
Comatulida	Zygometridae	*Zygometra comata*	A.H. Clark, 1911	
Comatulida	Zygometridae	*Zygometra microdiscus*	(Bell, 1882)	
ECHINOIDEA				
Camarodonta	Temnopleuridae	*Salmaciella dussumieri*	(L. Agassiz, 1846)	
Camarodonta	Temnopleuridae	*Salmacis belli*	Döderlein, 1902	
Camarodonta	Temnopleuridae	*Temnopleurus* sp.		
Cidaroida	Cidaridae	*Prionocidaris baculosa*	(Lamarck, 1816)	
Cidaroida	Cidaridae	*Prionocidaris bispinosa*	(Lamarck, 1816)	
Clypeasteroida	Echinocyamidae	*Echinocyamus crispus*	Mazzetti, 1894	
Clypeasteroida	Echinocyamidae	*Echinocyamus provectus*	De Meijere, 1904	*
Clypeasteroida	Fibulariidae	*Fibularia cribrellum*	De Meijere, 1904	
Clypeasteroida	Fibulariidae	*Fibularia ovulum*	Lamarck, 1816	
Clypeasteroida	Fibulariidae	*Fibulariella acuta*	Yoshiwara, 1898	
Clypeasteroida	Fibulariidae	*Fibulariella oblonga*	Gray, 1851	
Clypeasteroida	Laganidae	*Peronella lesueuri*	(Valenciennes, 1841)	
Echinothurioida	Echinothuriidae	*Asthenosoma intermedium*	H.L. Clark, 1938	*
Echinothurioida	Echinothuriidae	*Asthenosoma varium*	Grube, 1868	
HOLOTHUROIDEA				
Dendrochirotida	Cucumariidae	*Loisettea amphictena*	Rowe & Pawson, 1985	

Dendrochirotida	Cucumariidae	*Plesiocolochirus dispar*	(Lampert, 1889)	*
Dendrochirotida	Cucumariidae	*Plesiocolochirus spinosus*	(Quoy & Gaimard, 1833)	*
OPHIUROIDEA				
Euryalida	Euryalidae	*Astrobrachion adhaerens*	(Studer, 1884)	
Euryalida	Euryalidae	*Astroceras pergamena*	Lyman, 1879	*
Euryalida	Euryalidae	*Euryale aspera*	(Lamarck, 1816)	
Euryalida	Gorgonocephalidae	*Astroboa nigrofurcata*	Döderlein, 1927	
Euryalida	Gorgonocephalidae	*Astroboa nuda*	(Lyman, 1874)	
Euryalida	Gorgonocephalidae	*Astroglymma sculptum*	(Döderlein, 1896)	
Euryalida	Gorgonocephalidae	*Astroglymna sculptum*	Dï¿½derlein, 1896	
Ophiurida	Ophiacanthidae	*Ophiacantha dallasi*	(Duncan, 1879)	
Ophiurida	Ophiactidae	*Ophiactis macrolepidota*	Marktanner-Turneretscher, 1887

1 Executive summary

CSIRO's Geophysical Survey & Mapping (GSM) team was contacted by John Keesing (Oceans & Atmosphere, CSIRO) on 31 October 2019 to prepare a Digital Elevation Model (DEM) for use in the Santos Dorado seabed habitat mapping project (R-14272). The DEM was to be utilized by CSIRO scientists to produce a seabed habitat map, description and regional evaluation which was to be included in Santos' Offshore Petroleum Proposal (OPP). The Dorado site is located approx. 160km North of Port Hedland, Western Australia.

The DEM of the Dorado site was created through combining bathymetry data from several sources. These sources included:

- Santos - Client issued data
- CSIRO - Data Trawler Archives
- Geoscience Australia - AusSeabed Marine Data Discovery
- Geoscience Australia - Australian Bathymetry and Topography Grid 2009

The bathymetry datasets of variable resolution and datums were combined to produce a model of uniform resolution and datum. The final DEM products were produced at a resolution of 0.001° on a horizontal datum of WGS84 (Geographic) & vertical datum of Mean Sea Level (MSL).

CARIS Base Editor was used to combine these datasets with Fledermaus being used for supplementary visualisation and analysis. The resolution of the final DEM was limited by the low resolution of the supplied and resourced bathymetry data covering the site.

Deliverables associated with the DEM included:

- XYZ file (*.xyz)
- Geotiff file (RGB)
- Geotiff file (Floating Point)
- Fledermaus scene file (*.scene)

Data caveat: *Third party bathymetry data has been utilised in the creation of the above-mentioned DEM. The low resolution of data sets limits the resolution of the final DEM and its associated products.*

2 Site Location

2.1 Site Location Overview

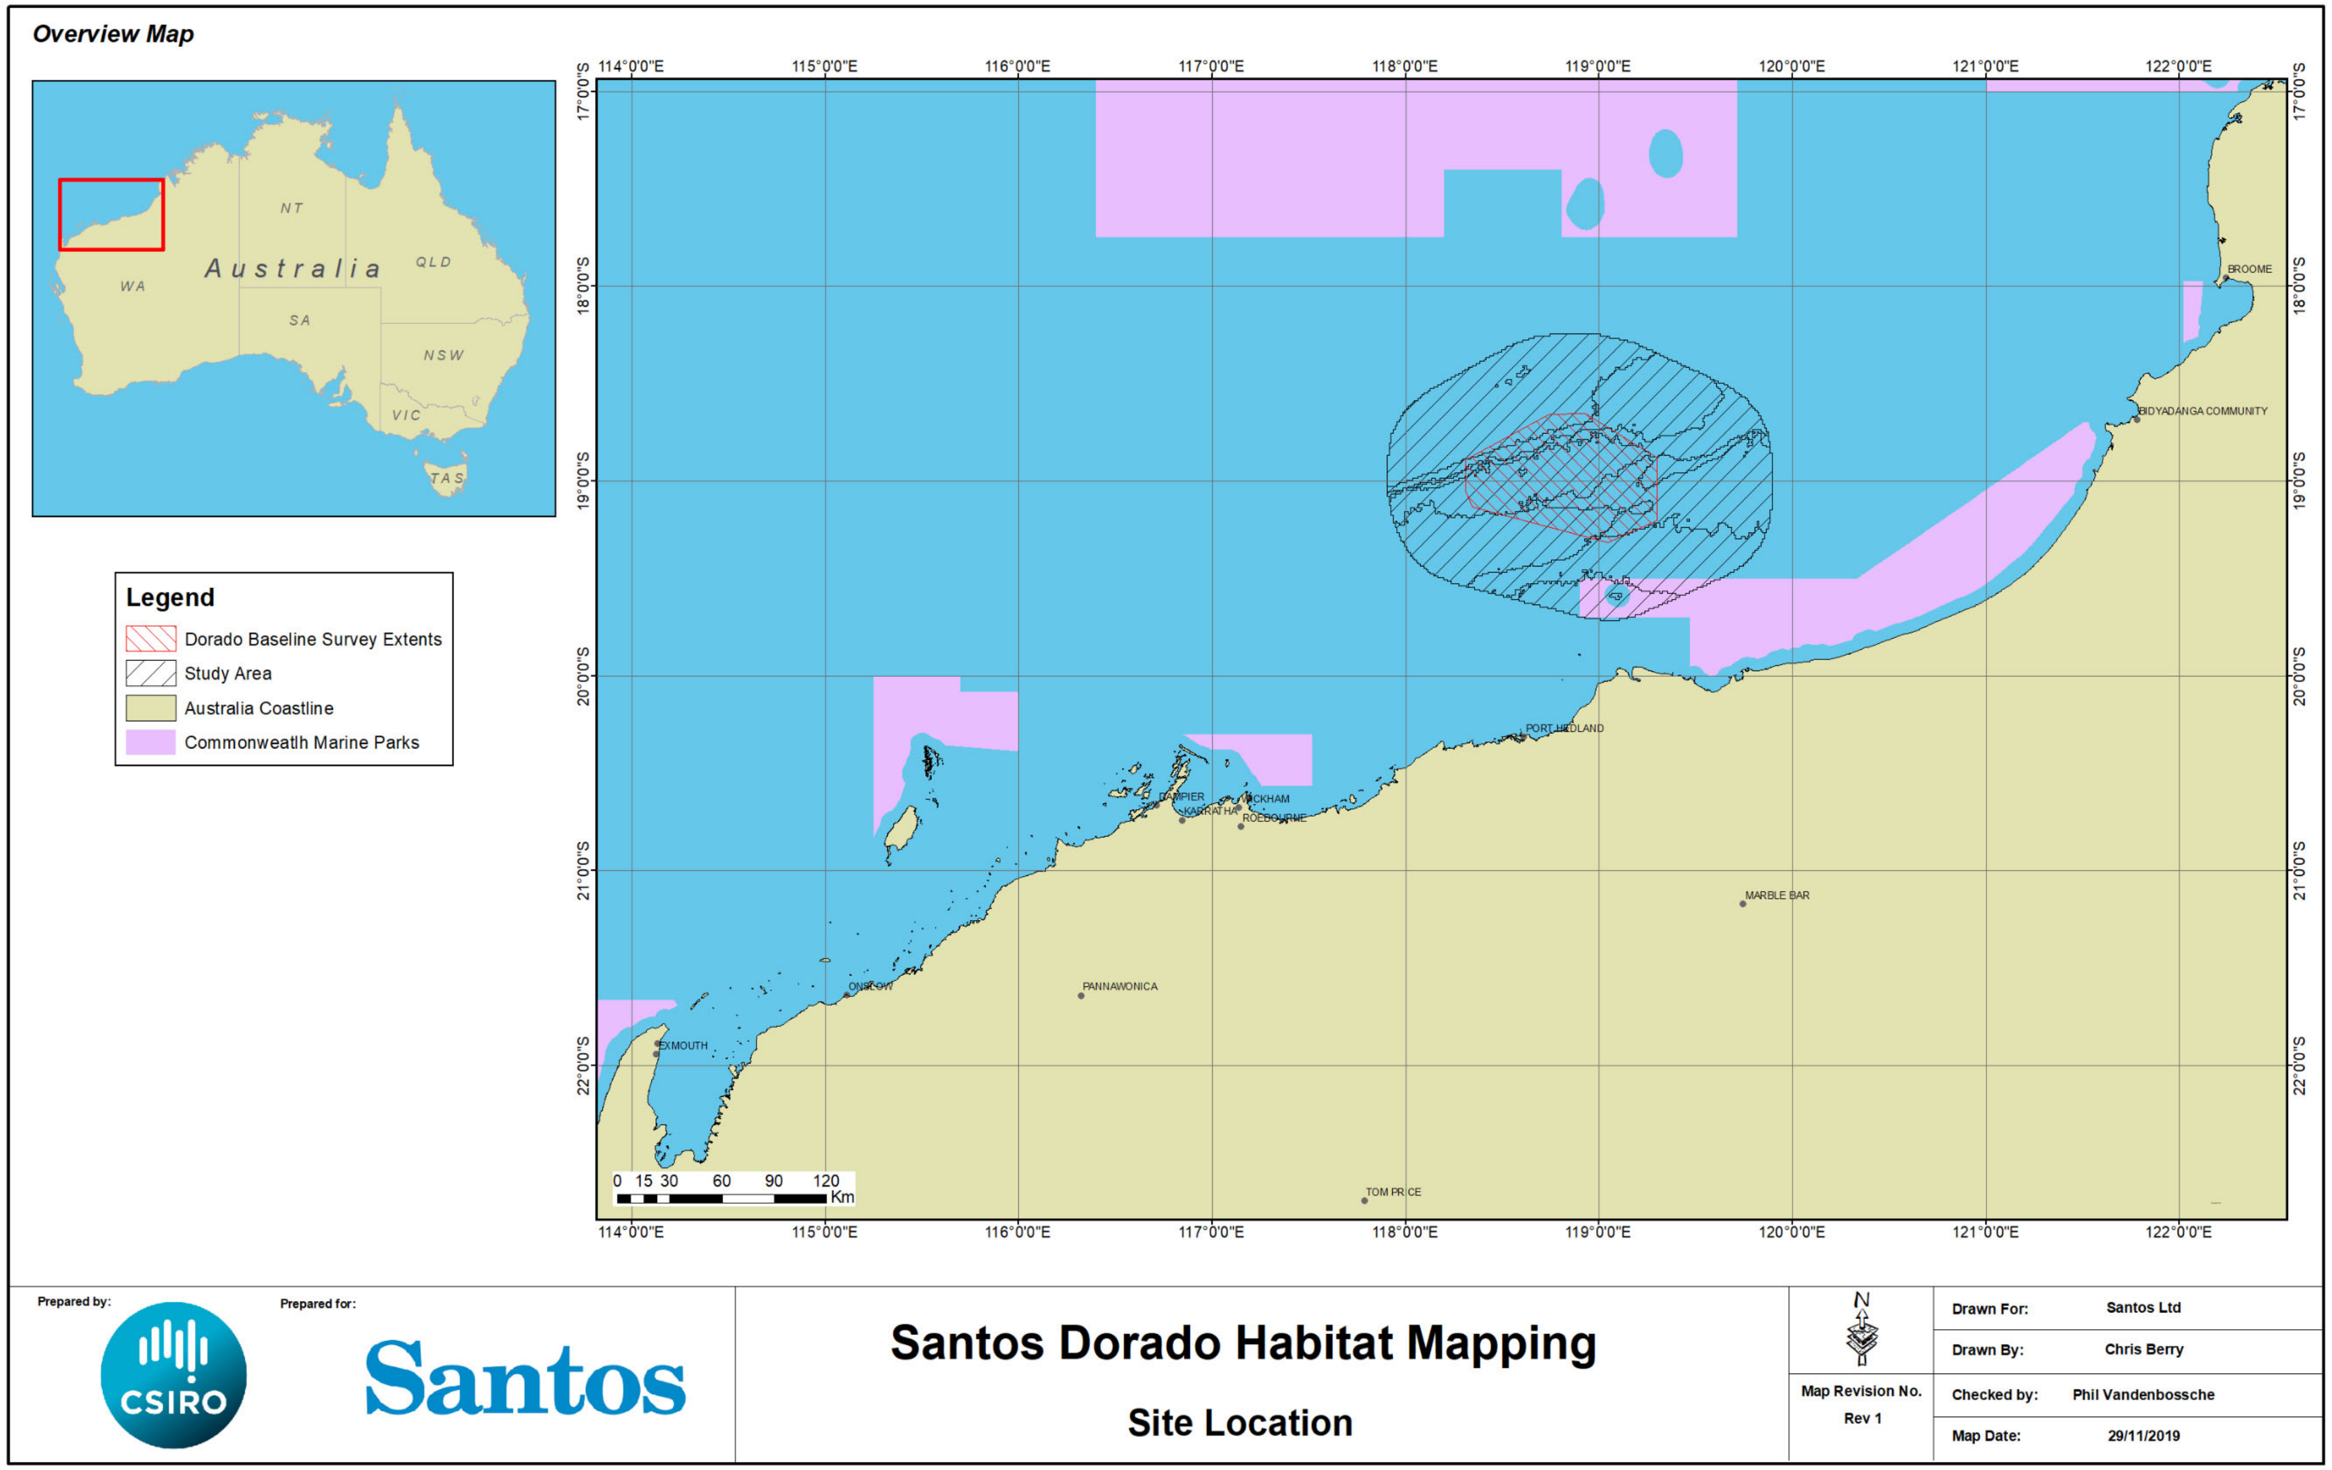

Figure 47: General site locality map

3 Bathymetry Data Sources

Bathymetry datasets were compiled from several sources for use in creation of the DEM. These datasets ensured the complete coverage of the Santos Dorado site while also providing redundancy through comparison of overlapping datasets. The datasets and their associated metadata are described below.

3.1 Santos Supplied Datasets

Table 14. Santos Supplied Bathymetry Metadata

4 Bathymetry Data Sources

4.1 Bathymetry Data Sources Overview

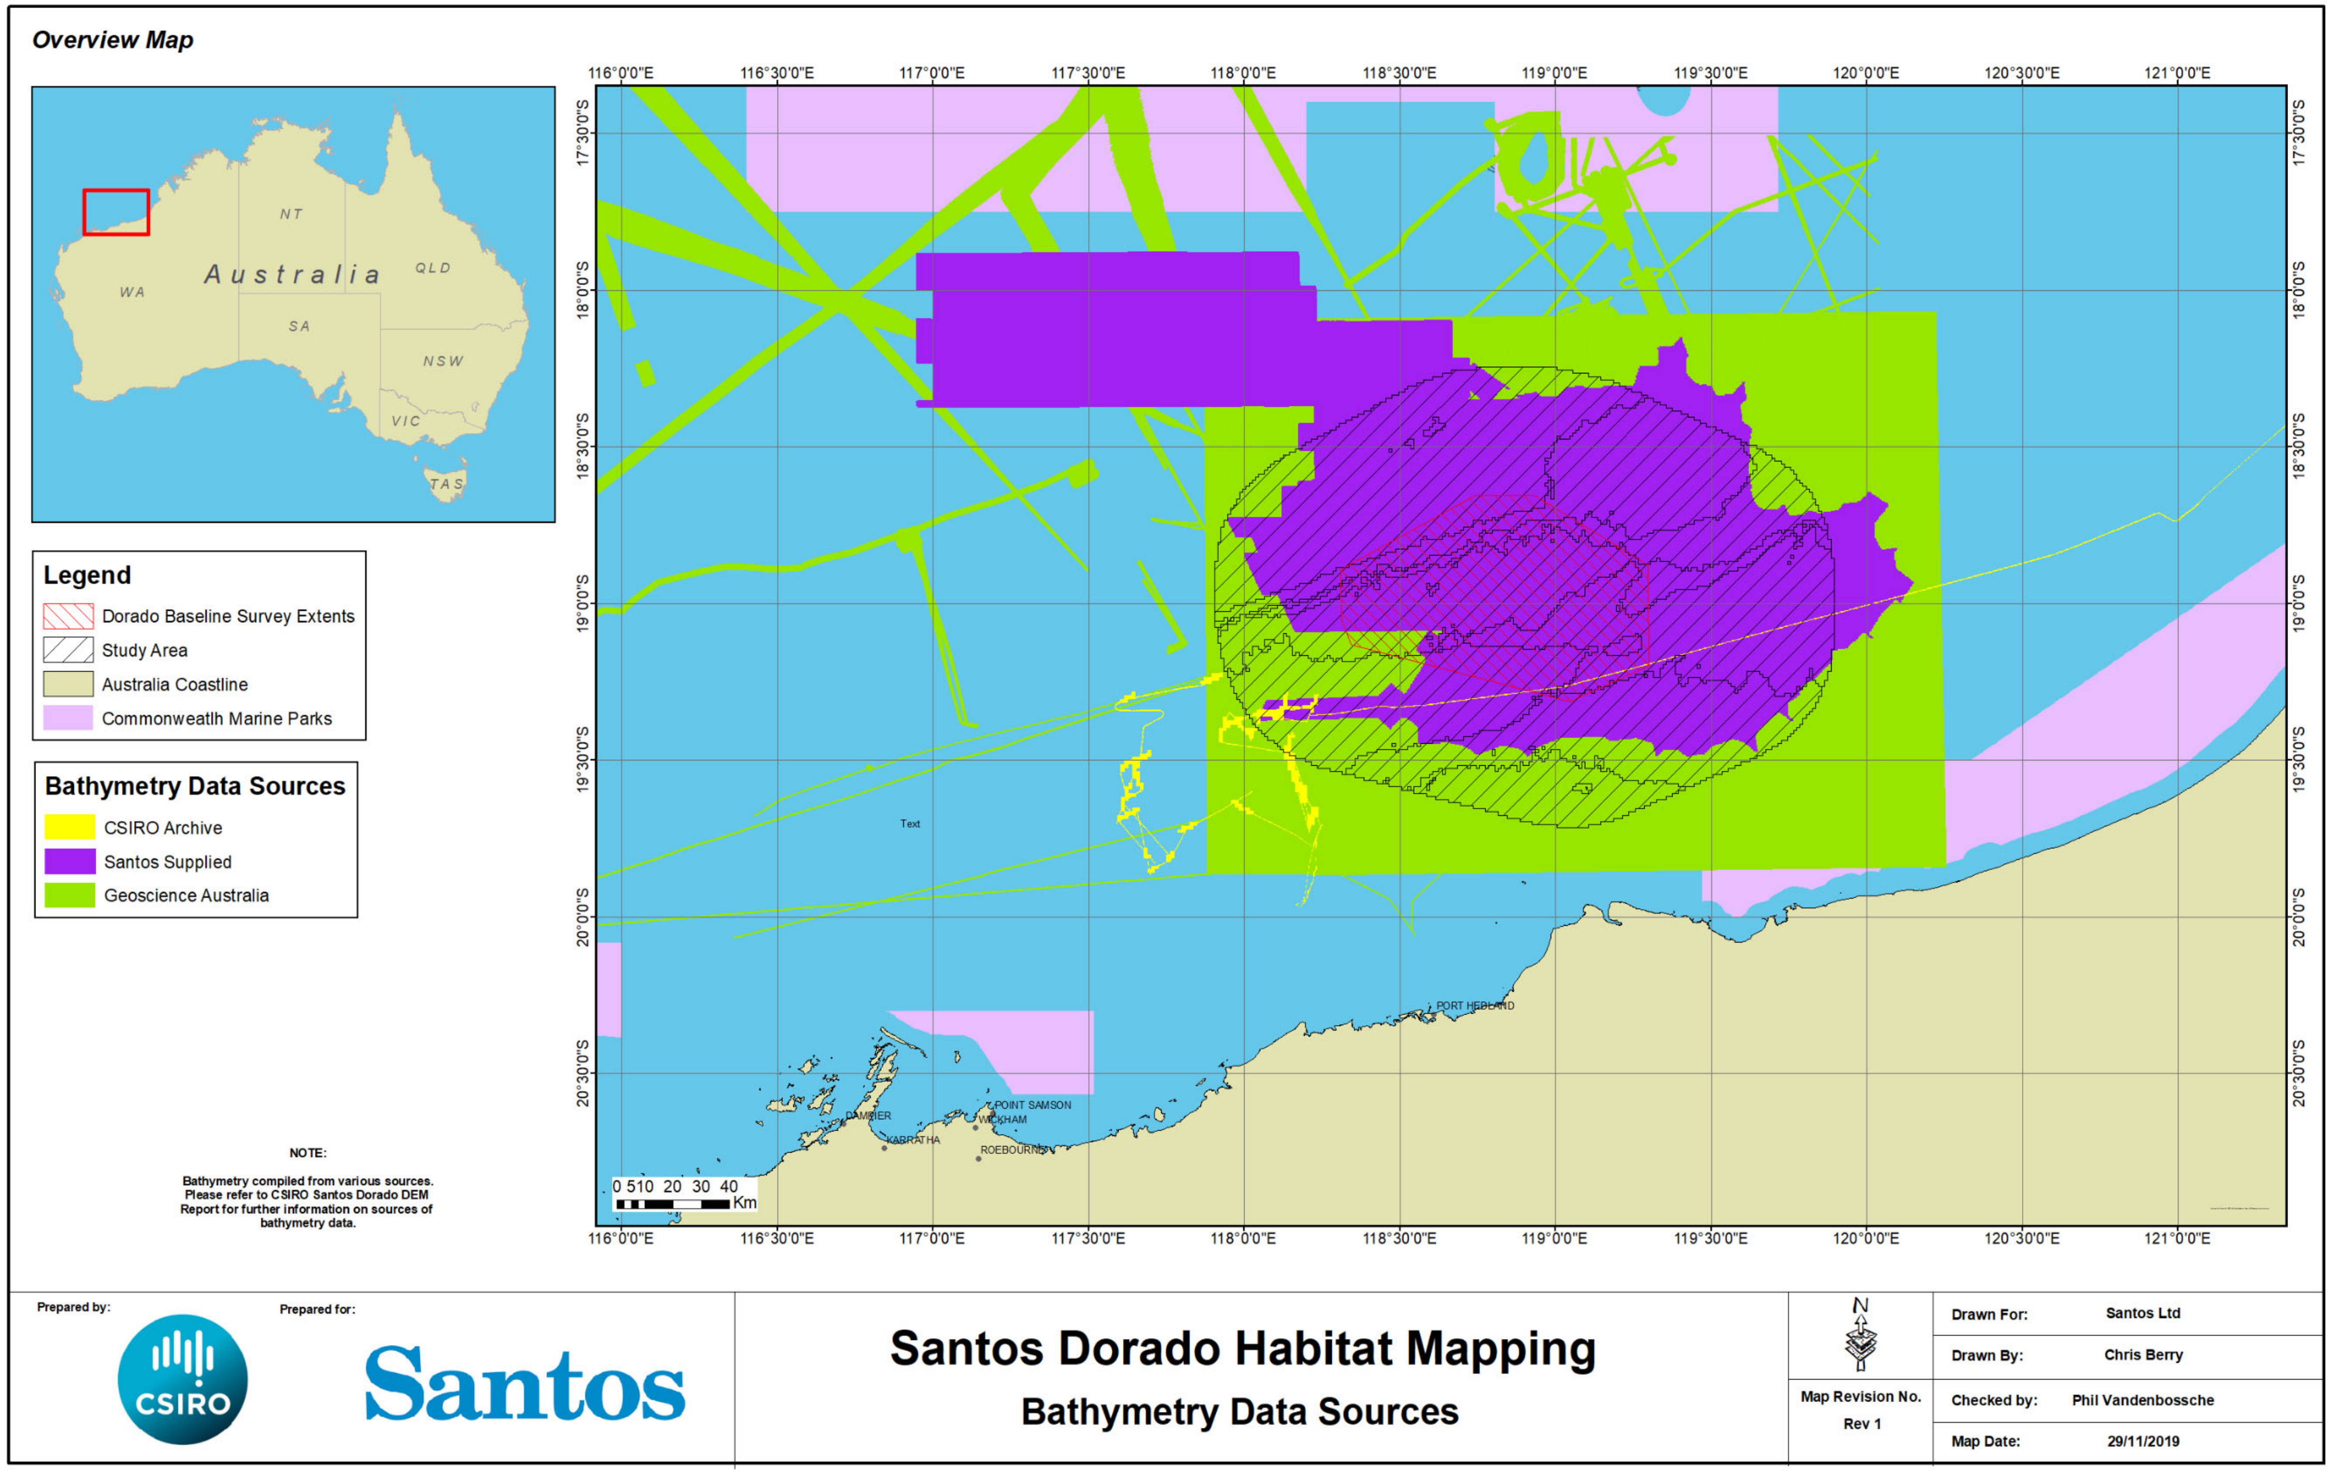

Figure 48. Bathymetry Data Source Overview

5 Data Processing

5.1 Workflow

The workflow for combining the sourced data and producing deliverables was as follows:

- Import datasets to Fledermaus software on common horizontal datum for visual analysis
- Calculate differences in vertical datums through performing surface difference calculations
- Shift data to a common vertical datum
- Import shifted data to CARIS Base Editor for re-gridding
- Re-grid data preserving the highest resolution datasets and utilising lower resolution data to fill gaps in the model
- Confirm resolution is fit for purpose with habitat mapping science staff
- Produce deliverable products including *.xyz, *.tif (Image and Floating Point) and *.scene files

5.2 Methodology

5.1.1 Initial Visualisation

Bathymetry datasets were initially imported into the QPS Fledermaus (Version 7.8.8) software package to allow for visualisation and analysis. Each dataset was imported on a common horizontal datum of WGS84 (Geographic).

5.1.2 Vertical Datum Analysis

In order to address slight differences in the vertical datums of each data set, which could be attributed to differences in resolutions and processing methods, the datasets were vertically shifted to a common datum. The required vertical datum, Mean Sea Level (MSL), was adopted from the CSIRO 2017_V05 (2017_V05) dataset. This data was chosen to provide the vertical datum as the data acquisition and processing methods were known to be robust, while the data was of a high resolution (5m Resolution data acquired by RV Investigator in 2017, reduced to Mean Sea Level (MSL) datum utilising GPS Tides reduced to the Ausgeoid09 (MSL)).

The median difference between each dataset compared to the 2017_V05 data was established through differential surface comparisons in the Fledermaus software. These surface comparisons provided a value to vertically shift each dataset. The vertical shift of each dataset maybe seen below in Table 5.

Table 18. Summary of Vertical Datum Shifts

DATASET	VERTICAL SHIFT (M)
Capreolous 3D	0.56
Bilby 3D	0.56
Keraudren 3D	0.56
GA2012 (SE50a)	2.2
GA2009 (Aus. Bathy. & Topo 2009)	1.48

5.1.3 Re-gridding

CARIS Base Editor (Version 5.3.12) software was utilised for re-gridding datasets. The re-gridding Smethod involved preserving the highest resolution data utilising the lower resolution data to fill gaps in the model. A weighted mean average method was utilised for creating the final model. The data was combined and re-gridded at various resolutions with the optimal result providing maximum detail while avoiding any disruption to the completeness of the DEM. Once an acceptable resolution was established this was confirmed as being fit for purpose with CSIRO Habitat Mapping Science Staff.

6 Combined Digital Elevation Model

6.1 Santos Dorado Combined DEM Overview

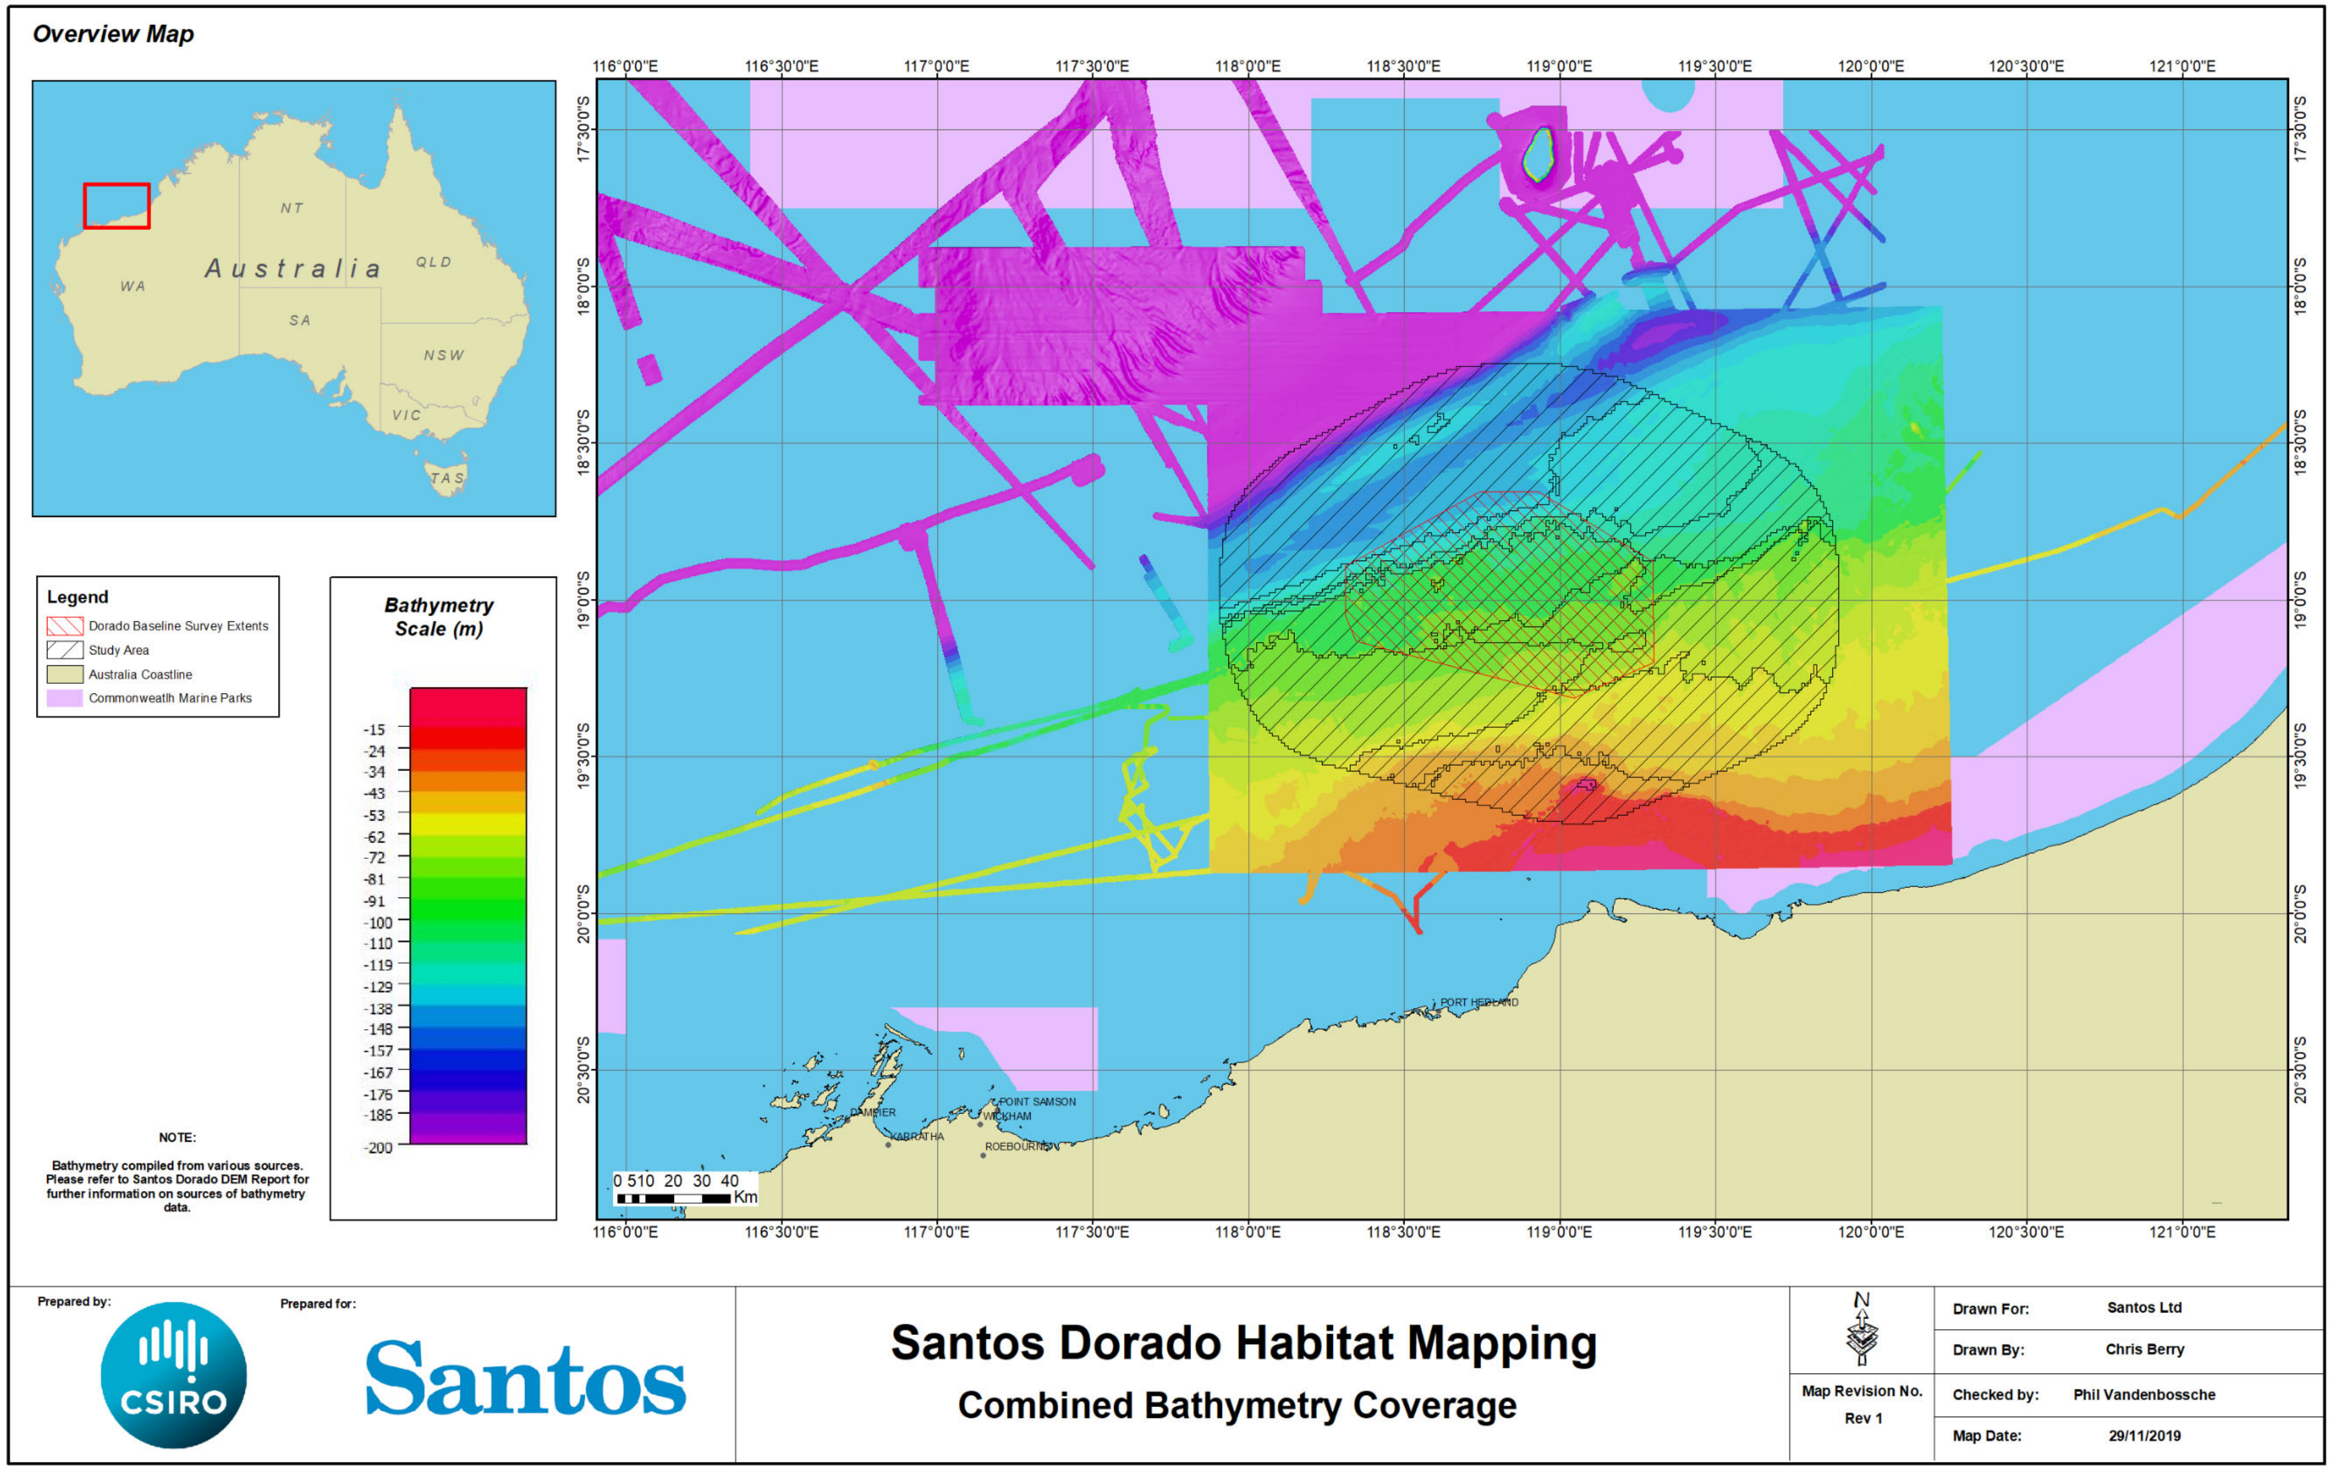

Figure 3. Santos Dorado Combined DEM.

7 DEM Product Parameters

The compiled datasets were of varying coordinate reference systems and datums (See Tables 1-4). These datasets were each transformed to a common coordinate reference system and vertical datum. As directed by CSIRO Habitat Mapping Science Staff the DEM products are presented in a horizontal datum of WGS84 (Geographic) and vertical datum of Mean Sea Level (MSL). The final resolution of the combined DEM was established as 0.001° (~ 100m),

Table 19. DEM Parameters

AT CSIRO, WE DO THE
EXTRAORDINARY EVERY DAY

We innovate for tomorrow and help improve today – for our customers, all Australians and the world.

Our innovations contribute billions of dollars to the Australian economy every year. As the largest patent holder in the nation, our vast wealth of intellectual property has led to more than 150 spin-off companies.

With more than 5,000 experts and a burning desire to get things done, we are Australia's catalyst for innovation.

CSIRO. WE IMAGINE. WE COLLABORATE.
WE INNOVATE.

EXECUTIVE SUMMARY

Santos is planning the Dorado Oil Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 130 km north of Port Hedland. The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority. The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk.

A key component of the marine environmental characterisation studies being undertaken to inform the development and OPP is a sediment quality survey that was undertaken from 15 to 20 December 2019.

Fifteen sediment quality sampling sites were distributed across the study area to provide coverage of the proposed field development, allow consideration of sites where previous oil and gas drilling activities had been undertaken (i.e. Roc-1), the ancient coastline Key Ecological Feature (KEF) and provide representative data across CSIRO's preliminary ecotypes for the area.

Sediment samples were collected from each site for the analysis of contaminants (metals/metalloids, hydrocarbons, naturally-occurring radioactive materials), nutrients (total Kjeldahl nitrogen, total phosphorous and total organic carbon) and particle size distributions. Fourteen of the fifteen sites were successfully sampled, ranging in depth from 62 m to 137 m below sea level (BSL). All sediment samples were collected, handled, preserved, and delivered to the analytical laboratories within specified holding times for all analytes.

Key conclusions from the sediment quality survey include:

- Arsenic was the only metal/metalloid in the sediments sampled from the survey area which exceeded its ANZG (2018) ISQG-Low trigger value, and this only occurred at one site (Site 13).
- The concentrations of arsenic, chromium and iron had a negative (inverse) relationship with sediment silt content, with declining metal concentrations up to 20 % silt, then concentrations remained relatively consistent with increasing silt content to ~32 % silt. Silt content was also related to water depth, though the trend was increasing sediment silt content with increased depth. The pattern of decreasing metals and metalloids with increasing silt content observed in the present study is contrary to the common trend of metals being associated with smaller particle grain sizes (Martincic et al. 1990). This is an important point for the interpretation of any future survey programs, as the concentrations of these metals/metalloids may naturally occur at up to three or more times higher in the vicinity of the proposed wellhead platform location than in the finer sediments in the deeper waters to the north. DEC (2006) found that total arsenic concentrations were relatively high across the region (with a median concentration of 36 mg/kg recorded for one site off Onslow), and exceeded the recommended sediment quality guideline at some of the essentially unimpacted locations sampled. These exceedances were considered to be natural by DEC (2006), and likely to be related to the local geology. Higher total arsenic concentrations in shallower water (with less silt content) in the southern sampling locations may therefore be due to effects of the underlying geology.
- Tributyltin concentrations were below the limit of reporting at all sites.
- Oil and grease concentrations ranged from 220 mg/kg at site 11, to 1900 mg/kg at site 15. The concentration at site 15 was significantly higher than all other sites. The second highest value (~ 450 mg/kg) was recorded at site 1 and in duplicate 2 taken from site 6. The source of the high concentration of oil and grease in the sample from site 15 was not determined in this study, as total recoverable hydrocarbons (TRH) were below limits of detection in this sample.
- Total petroleum hydrocarbons (TPH), TRH and benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN) concentrations were below the laboratory LOR at all sites within the survey area. Consequently, no analysis of polycyclic aromatic hydrocarbons (PAHs) was required.
- The combined concentration of radium^{226}, radium^{228} and thorium^{228} ('combined NORMs') was below the guideline value of 35 Bq/kg at all sites, even when considering upper confidence limits.
- Nutrients (nitrogen, phosphorus) and organic carbon are released as by-products of the decay of organic matter. Total Kjeldahl nitrogen (TKN) concentrations exhibited low variability, but were generally marginally higher at sites along the northern and western edges of the survey area. Nutrient concentrations were found to be comparable with other studies from offshore environments in northern Australia. There was no discernible spatial pattern in total phosphorus concentrations or correlation with

depth. Total organic carbon concentrations also exhibited limited variation, and closely corresponded with TKN concentrations, with the highest levels recorded at the siltier sites along the northern and western edges of the survey area.

- The survey area was characterised by a gradual transition in sediment coarseness, with the coarsest sediments (highest gravel component and lowest silt component) at the southern and south-eastern sites, and siltier sediments in the northern sites. This distribution generally related to water depth, with the deepest northern sites generally having a greater silt component than the shallower southern sites. The silt component of sediments at Roc-1 (~20.3 %) was comparable with particle size data previously collected at the Roc-1 location (NGI 2017). Folk sediment classifications were useful in identifying trends in sediment types across the study area, and highlighted the relative consistency in the broad sediment types recorded (ranging from slightly gravelly muddy sand to gravelly sand).

1 INTRODUCTION

1.1 Background

Santos is planning the Dorado Oil Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 130 km north of Port Hedland. The Dorado Project will target the Dorado oil field with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading facility (FPSO). There is also potential for future development of the surrounding reservoirs. These may be developed by drilling additional subsea production wells and tied back to the WHP via flowlines. The locations of the wells, and associated areas of seabed disturbance, will be guided by ongoing exploration work and are not known currently. Given the uncertainty in the location of seabed disturbing activities, Santos has taken the approach of describing sediment types such that development in any part of the Dorado Project Area can be assessed accordingly when the locations are better defined.

The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority. The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk. A program of environmental studies was required to characterise the benthic habitats, macrofaunal and infaunal communities, water and sediment quality within the Dorado survey area. This report provides the outcomes of the sediment quality survey conducted between 15 and 20 December 2019.

The sediment quality survey was intended to provide information on the physico-chemical characteristics of the sediments within the Dorado Project Area. The outcomes will inform the assessment of potential environmental impacts and risks to sediment quality from the Dorado project. Outcomes may also be used to inform the design of any potential future environmental monitoring for the Dorado Project. Infaunal samples were collected during the sediment quality field survey, but the outcomes will be reported in the Dorado benthic habitats survey report (RPS 2020).

1.2 Objectives

This sediment quality survey is a key component of the Dorado marine environmental characterisation studies program.

The specific objectives of the Dorado sediment quality survey were to:

- Characterise the physico-chemical characteristics of the marine sediments within the Dorado survey area.
- Compare the existing condition of the sediments with relevant sediment quality guidelines (e.g. ANZG 2018).

1.3 Summary of survey operations

The Dorado sediment characterisation survey was undertaken between 15 and 20 December 2019. Sediment quality sampling (and infauna sampling for the benthic habitat study) was undertaken over a four-day period spanning 16 to 19 December 2019. The water depths of the sites at which sediments were surveyed ranged from 62 to 137 m below sea level (BSL). Fifteen locations were sampled within the survey boundary (see Figure 2-1), with Site 7 located at the Roc-1 well location to identify potential impacts from historic drilling campaigns in the area. Particle size distribution (PSD) and contaminant samples were retrieved from fourteen sites, while infauna samples were collected from five sites across the target area. Site 12 was abandoned following repeated unsuccessful sampling attempts; review of the vessel echosounder indicated a hard seabed at this site (insufficient sediment to sample). A summary of the sample types obtained from each sampling site is presented in Appendix A.

2 METHODS

2.1 Sampling sites

An array of fifteen pre-determined sampling sites provided coverage across the Dorado survey area, extending from the Dorado Project Area into and beyond the ‘ancient coastline at 125 m water depth’ key ecological feature (KEF) (DEWHA 2008) (Figure 2-1, Table 2-1). Sites were also distributed to provide representative samples across a range of CSIRO preliminary ecotypes (Keesing et al. 2020).

Water depths at sampling sites ranged from 62 to 137 m. Site 4 was located within the ancient coastline KEF and Site 7 was located at the previous Roc-1 well location.

Table 2-1: Sample site coordinates

*Note: Datum used was WGS84.

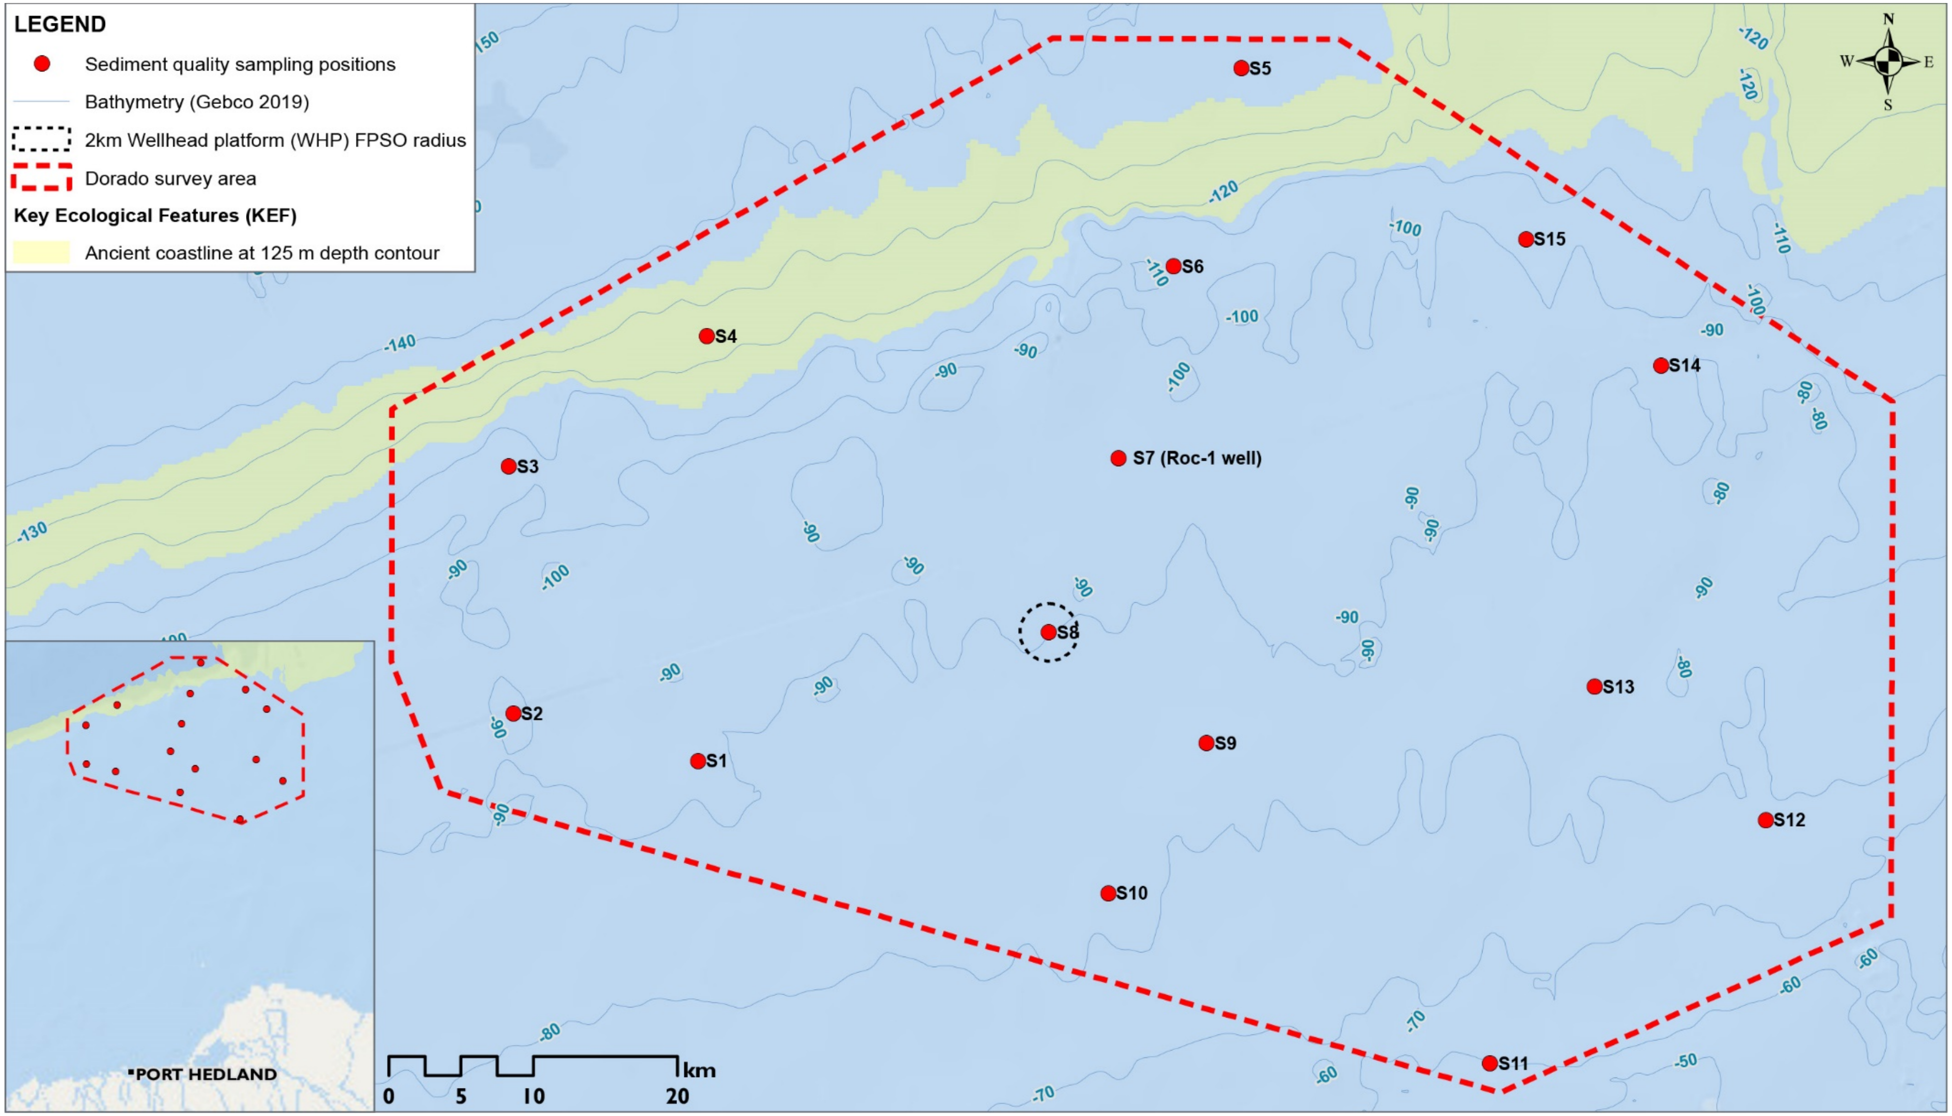

Figure 2-1: Sediment quality sampling positions

2.2 Timing

Sediment and infauna sampling was undertaken overnight, from 16 to 19 December 2019, during the Austral summer.

2.3 Quality control

The field survey was conducted in accordance with the agreed Sampling Analysis and Quality Plan (SAQP) for the survey (RPS 2019). The SAQP was approved by Santos prior to mobilisation and covered the planned survey sites, methods, schedule, analytes and data handling. The key elements for survey quality control relate to sample and data integrity and chain-of-custody tracking of samples.

2.4 Sediment sampling

2.4.1 Grab samples

Sediments were sampled using a 0.25 m^2 van Veen grab (Figure 2-2) that was deployed from the stern A-frame of the Jetwave Maddison. Prior to deployment at each site, the internal surface of the grab was cleaned with Decon 90™ to prevent between-site contamination of samples. Once deployed, the grab was lowered to the seabed, and allowed to settle. The grab was then retrieved to the deck. A qualitative description of the sample was recorded, including conspicuous biota, sediment type, and any features (e.g. smell, anthropogenic material, conspicuous layers or hydrocarbons).

Of the grab sample samples collected at each site:

- One was collected for contaminants, nutrients and particle size distribution (PSD).
- A second grab collected for infauna (as part of the benthic habitat study).

The following information was recorded on grab sample logs sheets when the samples hit the seabed, irrespective of whether the sample was successful or not:

- Site number
- GPS waypoint number
- Date and time
- Water depth (below sounder, which was mounted ~1.8 m BSL).

Upon retrieval to the deck, the following information was also recorded for each attempt (see Appendix A):

- Successful (Y/N)?
- Volume of sample collected (either proportion of grab or estimated volume in litres)
- Sediment description
- Sediment features
- Conspicuous fauna
- Sample type(s) collected from sample (where relevant)
- A photograph of the sample, with a photo slate in view showing project number, site number and date (e.g. Figure 2-3).

Where sample volumes were insufficient to provide sufficient sediment, the attempt was rejected. Due to the need to return contaminant samples to the laboratory within sample holding times, sampling effort per site had to be constrained to a maximum of six sampling attempts at each site. Where repeated failures to obtain sufficient sediment occurred, a process (described below) was applied to prioritise samples collected.

Figure 2-2: van Veen grab sampler being deployed during the study

2.4.2 Sampling process

The process for sample collection required prioritisation of different sample types. The following rationale was applied, as per the SAQP:

1. Contaminants and nutrients. These were priority for collection as information pertaining to sediment contaminants and nutrients could not be derived by the other sampling methods used in the Dorado environmental characterisation surveys (i.e. ROV imagery and water quality sampling)
2. Particle size distribution was a lower priority than contaminants sampling, as broad sediment descriptions may be defined from subsea imagery. These samples were taken after contaminants and nutrients samples had been collected.
3. Infauna. Infauna samples required to support the benthic habitat survey scope (RPS 2020) were collected during the sediment survey as they require the same sampling equipment.

Figure 2-3: van Veen grab (0.25 m²) with infauna sediment sample from Site 1

2.4.3 Sample processing, preservation and storage

Contaminants samples were taken from the surface layer of sediment (upper 2–5 cm) at each sampling site where possible. Full contamination risk mitigation protocols and were implemented during sampling, which included careful assessment of sampling areas and use of clean gloves each time samples were collected.

Surficial sediment within the grab was carefully removed and transferred to a glass bowl using plastic sampling utensils pre-cleaned with Decon 90™. Sediment within 5 mm of the sides of the grab were not analysed to minimise risk of contamination.

The collected sediment was then homogenised in a glass bowl before being transferred to sample jars. Two 70 ml samples were collected for metals, nutrients and total organic carbon (TOC); a 150 ml sample collected for hydrocarbons and tributyl tin (TBT); and a 250 ml sample collected for naturally occurring radiative materials (NORMs). These samples were processed on board by filling the jars to the neck whilst leaving sufficient air to allow for expansion when frozen. Since contaminants sampling did not require the full amount of collected sediment, a 300–500 g sub-sample for PSD analysis was obtained and placed in a plastic ziplock bag and chilled to ~4 °C. Samples for contaminants and PSD were collected at 14 of the 15 sampling sites, with no successful samples collected from Site 12.

Infauna samples were collected from five sites – 3, 4, 5, 8 and 13 (Figure 2-1). Infauna samples were photographed with a slate identifying the sample site name and date, before being sieved using a 1 mm box sieve. Samples were carefully transferred to a sample bag and preserved in 80 % ethanol. The results of taxonomic analysis of these samples are summarised in the benthic habitat survey report.

All samples were clearly labelled with the following information:

- Sample type: i.e. contaminants/nutrients type(s), PSD or infauna

- Sample ID: Site number (i.e. S1)
- Date of sampling
- The job number: EEN19234.001.

2.4.4 Storage and transport

All samples were preserved and handled in accordance with the requirements of the Australian and New Zealand Standards (AS/NZS 5667.12:1999 Water quality – sampling guidance on sampling of bottom sediments) and the National Association of Testing Authorities (NATA) accredited laboratories. Given the survey location is remote, the preservation techniques were selected to achieve maximum holding times for each parameter and samples stored in accordance with the laboratory requirements until delivery within the required holding times (see Appendix B).

Sample storage and transport were in accordance with the information provided in Table B.1 of Appendix B. Samples for chemical analysis were chilled immediately and frozen as soon as possible. Frozen samples were packed into eskies to ensure that they remained frozen until received by the laboratory.

Infauna samples preserved in ~80% ethanol needed to be kept cool but did not require refrigeration or freezing. Further information pertaining to infauna analysis and interpretation can be found in the Dorado benthic habitat survey report (RPS 2020).

All samples were transported with chain of custody (CoC) forms that detailed the sample identifications, sample type, date and time of sampling, and the analyses required.

2.5 Sample analysis

The analytes, corresponding limits of reporting (LOR) and guideline values are presented in Table B.1 of Appendix B. All analyses were undertaken using standard methods at NATA-accredited laboratories (see Table B.2 in Appendix B).

PSD analysis was undertaken using a combination of laser diffraction and sieving, with the results combined to provide a full PSD curve:

- Laser diffraction of particles sized from 0.022 µm to 1 mm
- Wet/dry sieving of sediments for the following sizes: <500 µm, 500 µm, 1 mm, 2 mm, 4 mm, 8 mm and >16 mm.

The following chemical geophysical parameters were analysed from contaminants samples:

- Heavy metals/metalloids (Al, As, Ba, Cd, Cr, Co, Cu, Fe, Hg, Ni, Pb, Zn)
- Total recoverable hydrocarbons (TRH) (C6-C40)
- Oil and grease
- NORMs (radium^{226}, radium^{228} and thorium^{228})
- Nutrients (total Kjeldahl nitrogen [TKN] and total phosphorus [TP])
- Total organic carbon (TOC)
- Tributyltin (TBT).

2.6 Data analysis

Sediment analyte concentrations were compared to relevant guideline levels (see Appendix B). Where relevant (i.e. for TBT and hydrocarbons), results above limits of detection were normalised to 1% carbon prior for comparison with guideline levels.

The PSD data for each sample was described in terms of the Folk sediment classification, skewness, kurtosis and sorting. This information is useful for sediment mapping and to identify relationships between physical sediment characteristics and contaminant concentrations or biological assemblages.

Multivariate analysis of sediment quality data was undertaken using the Plymouth Routines In Multivariate Ecological Research (PRIMER) v7 software (Clarke & Gorley 2015).After transformation and normalisation of contaminants and PSD data, resemblance matrices were derived using Euclidean distance. The ‘Cluster’ routine with similarity profile (SIMPROF) permutational tests were used to identify groupings of samples based on survey data. Non-metric multi-dimensional scaling (n-MDS) was used to represent the relative distribution of sample data in 2-dimensional space to identify relationships between sample sites. The principal components analysis (PCA) routine was used to determine the effect of sediment components on the distribution of sample sites.

2.7 Quality control procedures

The following quality control process was undertaken to quantify potential sample contamination that could have occurred during collection, handling, storage or transport. Low analyte concentration water provided by the laboratories were used in two tests:

- Field blank: low analyte water was poured into a sample container in the field during sampling, but with no filtering or additional handling. Water was used rather than inert sediment as it was considered to be a more sensitive test. Field blanks test for any contamination of samples during sample collection.
- Transport blank: low analyte water was poured into a sample container at the end of field sampling, with no filtering or additional handling. Water was used rather than inert sediment as it was considered to be a more sensitive test. Transport blanks test for any contamination of samples during transport and storage.

The following duplicate sediment samples were also collected to determine potential variability in analysis:

- Duplicate 1 (a replicate sample collected for QA/QC purposes; collected at Site 7)
- Duplicate 2 (collected at Site 6).

In addition, the following protocols to mitigate for contamination risk were put in place:

- Sterile, Decon 90™ cleaned latex gloves were worn when handling sediments samples, with a new pair of gloves worn for each grab sample. Gloves, bowls and sampling utensils were cleaned with Decon 90 ™ between sampling attempts.
- The internal surfaces of the grab sampler were thoroughly cleaned with Decon 90 ™ between sampling sites to prevent between-site contamination.
- The sample processing area was located far from potential sources of contamination (e.g. the A-frame and vessel exhaust fumes). No smoking was allowed in or near the sampling or processing area.
- The insides of sample jars and bags did not contact potentially contaminated surfaces.
- Once sealed, contaminants and PSD samples were transferred to eskies with ice blocks to keep samples chilled until they could be transferred to a fridge or freezer (in line with sample storage requirements).

Procedural and record keeping quality control measures implemented included:

- Global positioning systems (GPS) waypoints were recorded for all sampling attempts when the grab reached the seabed.
- Water depths, dates, samples collected, times and in situ observations were recorded in field logs.
- Appropriate CoC forms to accompany samples were completed for each laboratory. These indicated the sample ID, the type of sample, the date of sampling and the analysis required.
- Any changes to the field procedures were documented.

3 RESULTS

3.1 Sediment quality

Sediment survey logs, showing sampling data for all sampling attempts (e.g. date, geographic position, sample descriptions) can be found in Appendix A. Photographs of sediment samples can be found in Appendix C. A summary of samples collected is presented in Table 3-1. PSD and contaminant samples were successfully retrieved from fourteen sites, while infauna samples were collected from five sites across the survey area. Site 12 was abandoned following repeated failed sampling attempts (insufficient sediment to sample). Review of the vessel's echosounder indicated a hard seabed at this site.

Table 3-1: Samples obtained at each sampling site.

Site	Longitude (S)	Latitude (E)	Sample type

1 Organics, metals, hydrocarbons and NORMs

2 Particle size distribution

3.1.1 Metals and metalloids

Of the total metals/metalloids in the sediments sampled from the Dorado survey area, only arsenic was recorded at concentrations above the ANZG (2018) ISQG-Low trigger value (Table 3-2). Total arsenic concentrations were recorded above the ISQG-Low trigger value at only one site (Site 13), with a concentration of 21 mg kg^{-1} dry weight (dry wt). This marginally exceeded the ISQG-low trigger value of 20 mg kg^{-1} dry wt. Arsenic levels at all other sites ranged from 5 to 17 mg kg^{-1} dry wt and thus did not exceed the ISQG-Low trigger value.

Nickel concentrations were well below the ISQG-Low trigger value (21 mg kg^{-1} dry wt) at all sites. Both arsenic and chromium were generally 2–3 times greater in the shallow water sites (60–80 m) than in the deeper water sediments (90–120 m). Similarly, concentrations of iron also tended to decline with site depth, decreasing from approximately 4000 mg kg^{-1} dry weight at the shallowest sites (Sites 9–11) to approximately 2000 mg/kg at the deepest (Sites 4 and 5).

To determine potential correlations between metals concentrations and particle size distributions (which was also found to be related to depth), the concentrations of total arsenic, total chromium (Figure 3-1) and total iron (Figure 3-2) were plotted against sediment silt content. Trendlines were used to identify relationships between analyte concentration and silt content, with R^2 values used to identify the strength of the relationship (i.e. how well the trendline fitted the scatterplot data). In all cases, analyte concentrations declined with increasing silt content to ~20 % silt, then remained relatively consistent with increasing silt content. Trendlines were considered representative of the data (R^2= >0.8). Total arsenic showed the greatest decline between ~1.6 % silt and ~20.3 %, with a 74 % reduction in concentration (21 mg/kg to 5 mg/kg). Total iron showed a 52 % reduction (4700 mg/kg to 2300 mg/kg) and total chromium showed a 45 % loss (20 mg/kg to 11 mg/kg). Potential relationships between analyte concentrations and sand/gravel were also investigated, but potential relationships were found to be much weaker (maximum R^2= <0.5 and <0.2, respectively).

Total concentrations of lead and zinc showed little variation between sites and were well below the ANZG (2018) ISQG-Low trigger values for each (50 mg/kg dry weight and 200 mg kg^{-1} dry weight, respectively). Total cadmium concentrations ranged from 0.1 to 0.3 mg kg^{-1} dry weight at all sites, well below the ANZG (2018) ISQG-low reliability trigger value of 1.5 mg kg^{-1} dry wt.

3.1.2 Tributyltin

Tributyltin concentrations at all sites were below the limit of reporting (LOR) (Table 3-3) and thus well below the ANZG (2018) ISQG-low reliability trigger value of 9 µg Sn kg^{-1}.

Table 3-3: Tributyltin concentrations

3.1.3 Hydrocarbons

Oil and grease concentrations ranged from 220 mg/kg at site 11, to 1900 mg/kg at site 15 (Table 3-4). The concentration at site 15 was significantly higher than at all other sites – 450 mg/kg was the second highest value recorded (at site 1 and in duplicate 2 taken from site 6). As total organic carbon (TOC) in the Dorado sediments was very low (0.3-0.5 %), oil and grease concentrations ranged from 520 mg/kg to 4,750 mg/kg when normalised to 1% total organic carbon. There is no guideline value for oil and grease in sediments.

Total petroleum hydrocarbons (TPH), total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN) concentrations were below the laboratory LOR at all sites within the survey area (Table 3-4). Consequently, no analysis of polycyclic aromatic hydrocarbons (PAHs) was required.

Table 3-4: Oil and grease, total petroleum hydrocarbons, total recoverable hydrocarbons and BTEXN (in mg kg^{-1} dry wt)

3.1.4 Naturally occurring radioactive materials

All NORMs samples, with the exception of radium^{228} in the duplicate 2 sample, were above laboratory limits of reporting (LORs). Due to the nature of radionuclides and the methods used to measure them, limits of reporting are determined for each measurement. This means that measurements can be obtained for some samples that are below the limit of reporting for others, even for the same radionuclide (e.g. see the results for radium^{228} in Table 3-5). Where results are considered statistically robust, data with confidence limits are provided.

The combined value for radium^{226}, radium^{228} and thorium^{228} ('combined NORMs') were below the guideline value of 35 Bq/kg at all sites, even when considering upper confidence limits.

Table 3-5: Naturally-occurring radioactive materials (NORMs)

Parameter	Radium^{226}	Radium^{228}	Thorium^{228}	Combined NORMs
Units	Bq/kg	Bq/kg	Bq/kg	Bq/kg

3.1.5 Nutrients

Total Kjeldahl nitrogen (TKN) concentrations exhibited low variability, ranging from 0.3 mg N g^{-1} (Sites 1, 8, 10, 11, 13 and 15) to 0.5 mg N g^{-1} (Sites 2–5) (Table 3-6). TKN concentrations were generally greatest at sites along the northern and western edges of the survey area, although the difference was slight.

Total phosphorus (TP) concentrations ranged from 0.47 mg P g^{-1} at S11 to 1.0 mg P g^{-1} at Site 15. The minor variation in TP concentrations between sites did not exhibit any discernible spatial pattern or correlation with depth.

Total organic carbon (TOC) concentrations also exhibited limited variation, ranging from 0.3% at Sites 8, 10, 11 and 13 to 0.5% at Sites 2–5. TOC levels closely corresponded with TKN concentrations, with the highest levels recorded at sites along the northern and western edges of the survey area.

There are no ANZG (2018) trigger values for sediment nutrient concentrations.

Table 3-6: Sediment concentrations of total Kjeldahl nitrogen (TKN), total phosphorus (TP) and total organic carbon (TOC)

3.1.6 Multivariate analysis of sediment quality data

Data for metals/metalloids and nutrients were combined and normalised for multivariate analysis. Data that were consistently or wholly below the laboratory LOR or minimum reporting limit (i.e. TBT, TPH, TRH, BTEXN) were excluded from the analysis. Analysis using PRIMER v7 was based on Euclidean distance resemblance. Cluster analysis with SIMPROF identified three significant groups and one outlier (Site 2) (Figure 3-3):

1. Group A consisted of site 15 only.
2. Group B consisted of three samples (Sites 14, 7 and duplicate 1), which included the previous Roc-1 drilling location (Site 7 and duplicate 1). The grouping of these sites was predominantly driven by oil and grease, barium, TP and cadmium concentrations.
3. Group C corresponded to Site 2 only.
4. Group D corresponded to four north-western deep sites (Sites 3 to 6, and includes duplicate 2 which was taken at site 6). The grouping of these sites was predominantly driven by cadmium, barium, nickel, aluminium and TKN concentrations.
5. Group E corresponded to the six southern survey area sites (Sites 1, 8, 9, 10, 11 and 13). The grouping of these sites was predominantly driven by TP, barium, nickel, copper, lead and zinc concentrations.

These groupings are also shown in a n-MDS ordination plot showing relative similarity between sites and groups (Figure 3-4).

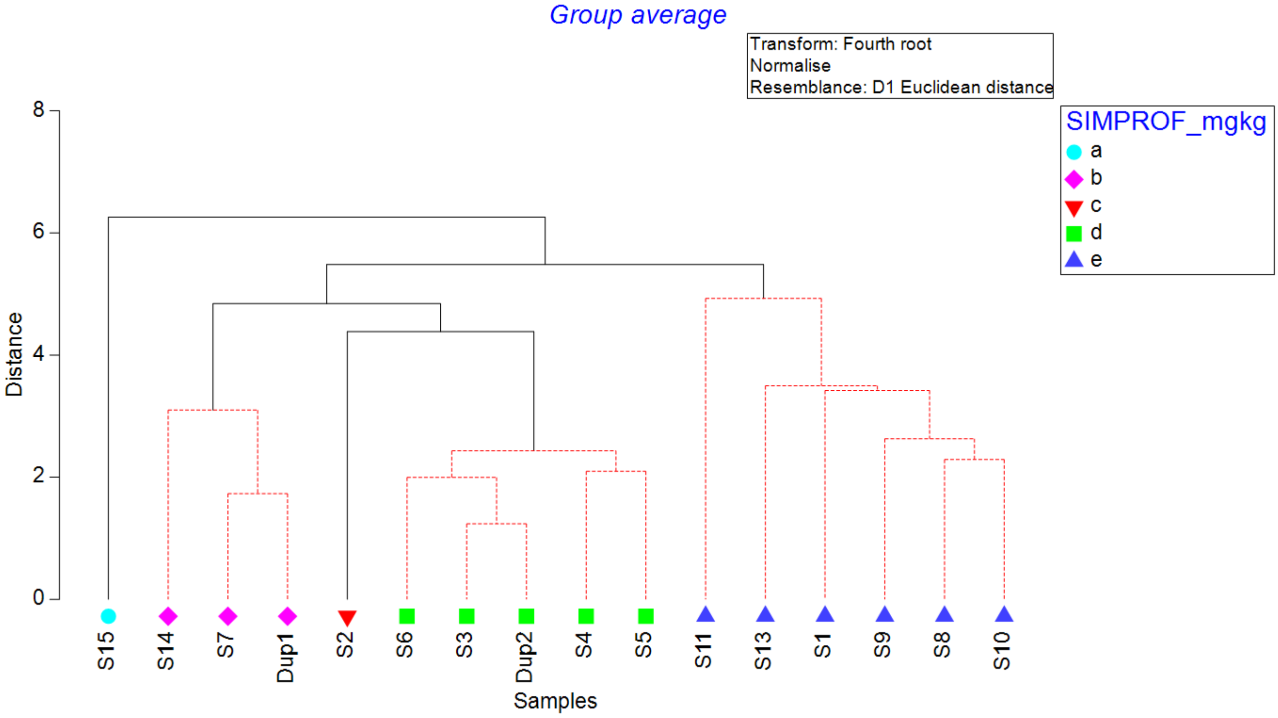

Figure 3-3: Cluster analysis of sites based on contaminants and nutrients. Red lines indicate significant SIMPROF groups

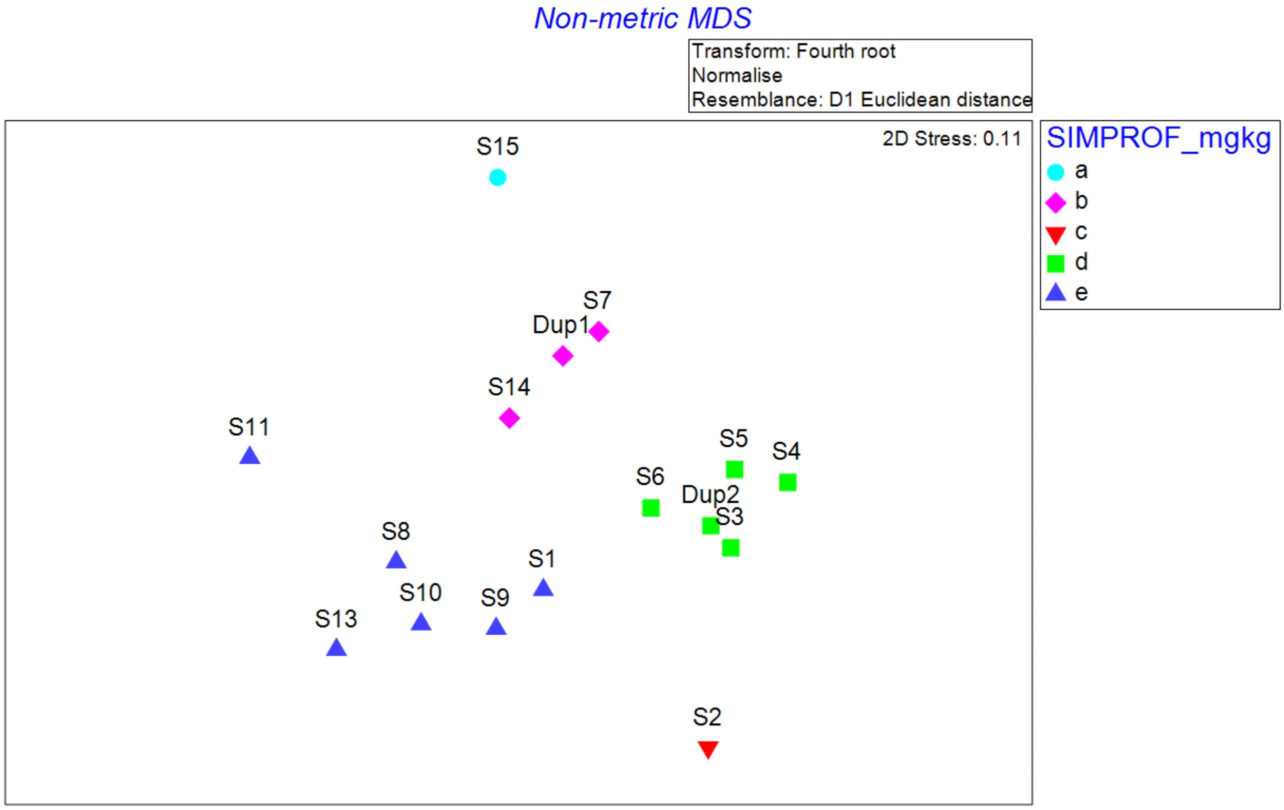

Figure 3-4: n-MDS ordination plot of sites based on contaminants and nutrients

3.1.7 Particle size distributions

Laboratory PSD results can be found in Appendix D. Prior to statistical analysis, data were analysed to characterise sediment samples in terms of Folk sediment classification, sorting, skewness and kurtosis (Table 3-7, Figure 3-5).

Folk sediment classifications provide a high-level description of sediment characteristics. The description is provided in the form of a code, which is made of abbreviations for principal sediment components. The code describes the sediment starting with the least characteristic component and finishing with the most characteristic component (which is capitalised), where:

m/M = muddy/Mud (which is synonymous with silt/clay)

s/S = sandy/Sand

g/G = gravelly or Gravel

() = slightly

For example:

(m)sG = slightly muddy sandy Gravel

gmS = gravelly muddy Sand

The sediment samples in the survey area ranged from slightly gravelly muddy sand ((g)mS) at the northern (deepest) section of the survey area (Sites 4, 6 and 15), to gravelly sand (gS) at Sites 8 to 11 (Figure 3-5). Sites in the northern (deeper) section of the survey area tended to consist of muddier sediment that became slightly coarser towards the shallower south-eastern section (gravelly sand as opposed to gravelly muddy sand). Sediments were characterised by finer particles in a northerly (offshore) direction within the survey area, increasing from ~5% silt at southern sites to ~20% silt at northern sites (Table 3-7). The proportion of sand ranged between 60 and 90% across sites, but there was no obvious spatial pattern to the variation. The central southern sites (Sites 8 to 10) had the highest proportion of gravel, with between 10 and 19% (Table 3-7). No sample was obtained from Site 12, potentially due to hard substrate at this site.

Table 3-7: Sediment sample particle size characteristics

Site	% silt/ clay (<63 µm)	% sand (0.063–2 mm)	% gravel (2–>16 mm)	Sorting	Skewness	Kurtosis	Folk
S1	8.21	89.56	2.23	Poorly sorted	Coarse skewed	Very leptokurtic	(g)S
S2	13.8	76.68	9.52	Very poorly sorted	Symmetrical	Leptokurtic	gmS

S9	5.25	75.03	19.72	Very poorly sorted	Strongly fine skewed	Leptokurtic	gS
S10	4.42	85.39	10.19	Poorly sorted	Fine skewed	Very leptokurtic	gS
S11	6.82	84.32	8.86	Poorly sorted	Symmetrical	Leptokurtic	gS
S13	1.61	96.7	1.69	Moderately sorted	Symmetrical	Leptokurtic	(g)S
S14	16.23	74.39	9.38	Very poorly sorted	Symmetrical	Leptokurtic	gmS
S15	13.85	82.27	3.88	Poorly sorted	Symmetrical	Leptokurtic	(g)mS

Sorting is a classification used to describe the distribution of grain sizes within samples. Well-sorted sediments comprise similarly-sized particles, whereas poorly sorted sediments comprise a wide range of different-sized particles. Sorting, therefore, has implications for both the physico-chemical characteristics of sediments (e.g. sediment oxygenation based on impacts to pore water flow) and the biological characteristics of sediments (e.g. energy required to move through sediments). Sediments in the study area ranged from moderately sorted at Site 13 in the eastern part of the survey area, to very poorly sorted through the central area (Sites 2, 3, 7, 8, 9 and 14) and at the deepest site (Site 5). Sediments at all other sites were poorly sorted (Table 3-7).

Skewness and kurtosis describe the shape of the particle size distribution curve, relative to the bell-shaped normal curve. Skewness describes a shift in the curve to the left (finer end of the size scale, hence 'fine skewed') or to the right (coarser particle sizes or 'coarse skewed'). Kurtosis describes the relative contribution of all particle sizes. A leptokurtic curve (which appears 'sharp' or 'pointed') is characteristic of a sediment sample that is highly dominated by a small number of similar size classes. A platykurtic curve ('plate-like') describes a sediment sample that has a relatively even representation of particle sizes across the full size range. Sediments in the survey area ranged from strongly fine skewed and leptokurtic at Site 9 to strongly coarse skewed and mesokurtic at Site 6 (Table 3-7).

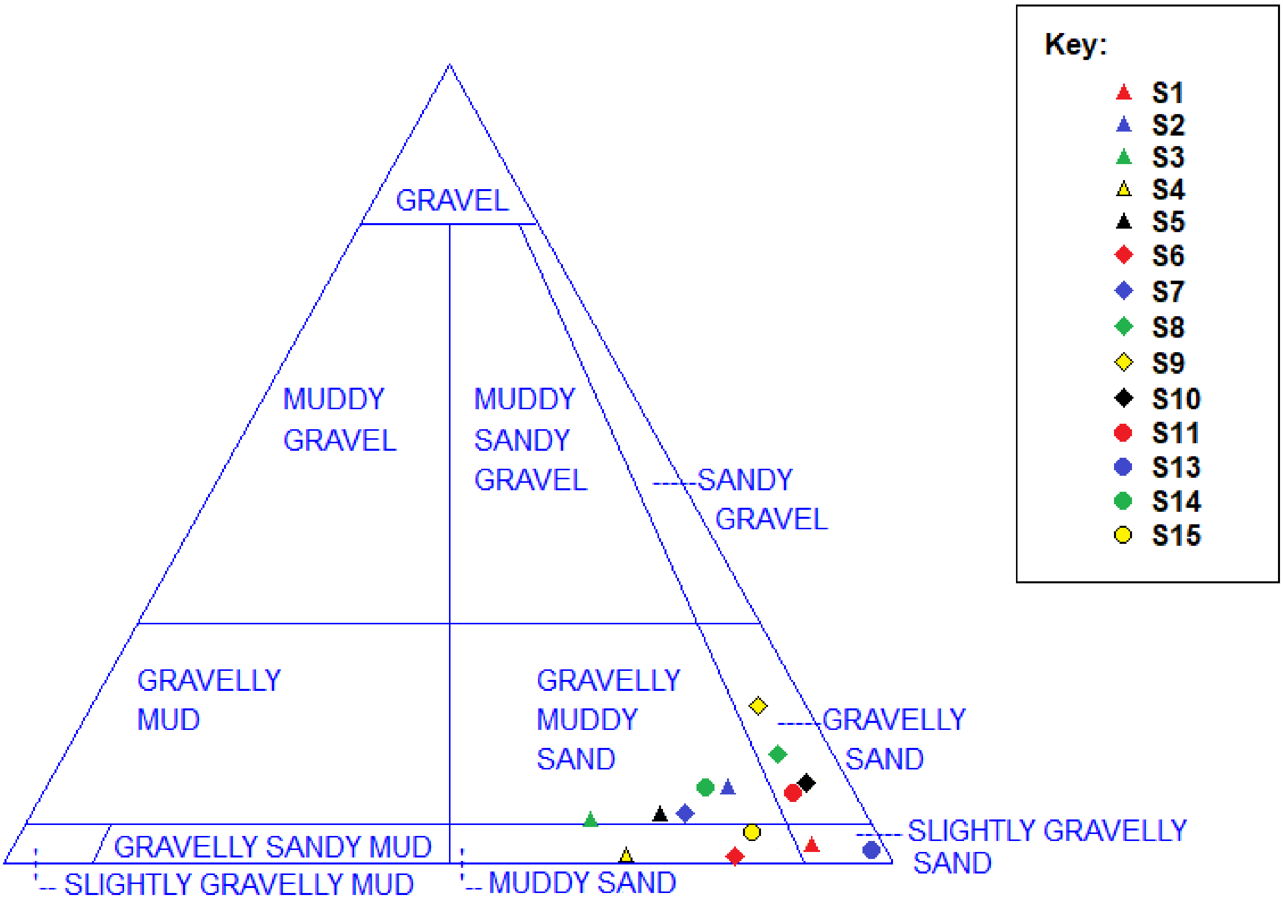

Figure 3-5: Folk classification ternary plot of Dorado sediments

Cluster analysis of PSD data identified six main groups of sediments and two outliers (Figure 3-6). When applying Folk sediment classifications, these groups could be classified into coarser groups (slightly gravelly sand and gravelly sand; Sites 1, 8, 9, 10, 11 and 13) and finer sediments (slightly gravelly muddy sand and gravelly muddy sand). Principal component analysis (PCA; Figure 3-7) showed the effect of the contribution of different size classes on the distribution of samples and their Folk classifications. The size classifications used in the analysis and interpretation of particle size data are described in Table 3-8.

Clay, silt and very fine sand (4 µm, 63 µm and 125 µm) were primarily responsible for change in sediment type along the PC1 axis, with increased contribution of fines with decreasing PC1 value (i.e. from right to left). This explained the distribution of the muddy sands on the left hand side of the plot (i.e. they all had negative PC1 values). The coarser slightly gravelly sands and gravelly sands were distributed to the right of the plot. Coarse and very coarse sands (i.e. 500 µm and 1000 µm) were responsible for the distribution of sites along a diagonal vector towards the top right of the plot (i.e. a positive PC1 and positive PC2 trajectory). The sites classified as slightly gravelly sands (sites 1 and 13) were distributed along this trajectory. The medium sands (250 µm) and coarser grain sizes (granules to coarse pebbles, i.e. 2000 to >16,000 µm) vectors roughly equated to a negative PC2 trajectory, i.e. they had an increasing contribution with decreasing PC2 value. This means that the sediments with a greater contribution of coarser grain sizes (i.e. the 'gravelly', rather than 'slightly gravelly' classifications) were distributed in the lower have of the plot. The outcome is that sites with slightly gravelly sediments are in the top left of the figure (sites 4, 6 and 15), the sites with slightly gravelly sands are in the top right (sites 1 and 13); the sites with gravelly muddy sands are in the bottom left (sites 2, 3, 5, 7 and 14), and the sites with gravelly sands in the bottom right (sites 8, 9, 10 and 11).

Table 3-8: Hierarchy of sediment size classes, after Wentworth (1922)

Principal sediment component	Subclass	Size range (to nearest µm)
Clay		<4 µm
Silt		4-62 µm
Sand	Very fine	63-124 µm
	Fine	125-249 µm
	Medium	250-499 µm
	Coarse	500-999 µm
	Very coarse	1000-1999 µm
Pebbles	Granules to very fine	2000-3999
	Fine	4000-7999
	Medium	8000-15,999
	Coarse	>16,000

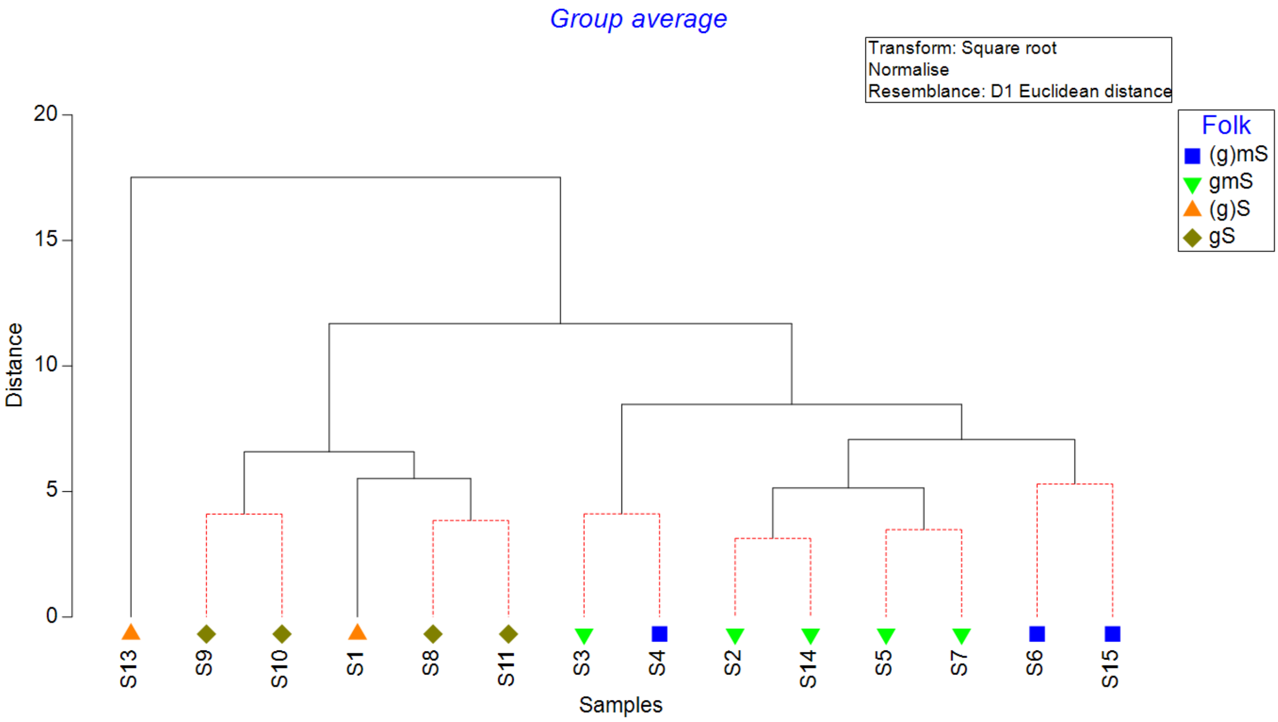

Figure 3-6: Grouping of sites based on sediment particle size characteristics. Colours represent folk groupings, and red lines represent significant SIMPROF groups

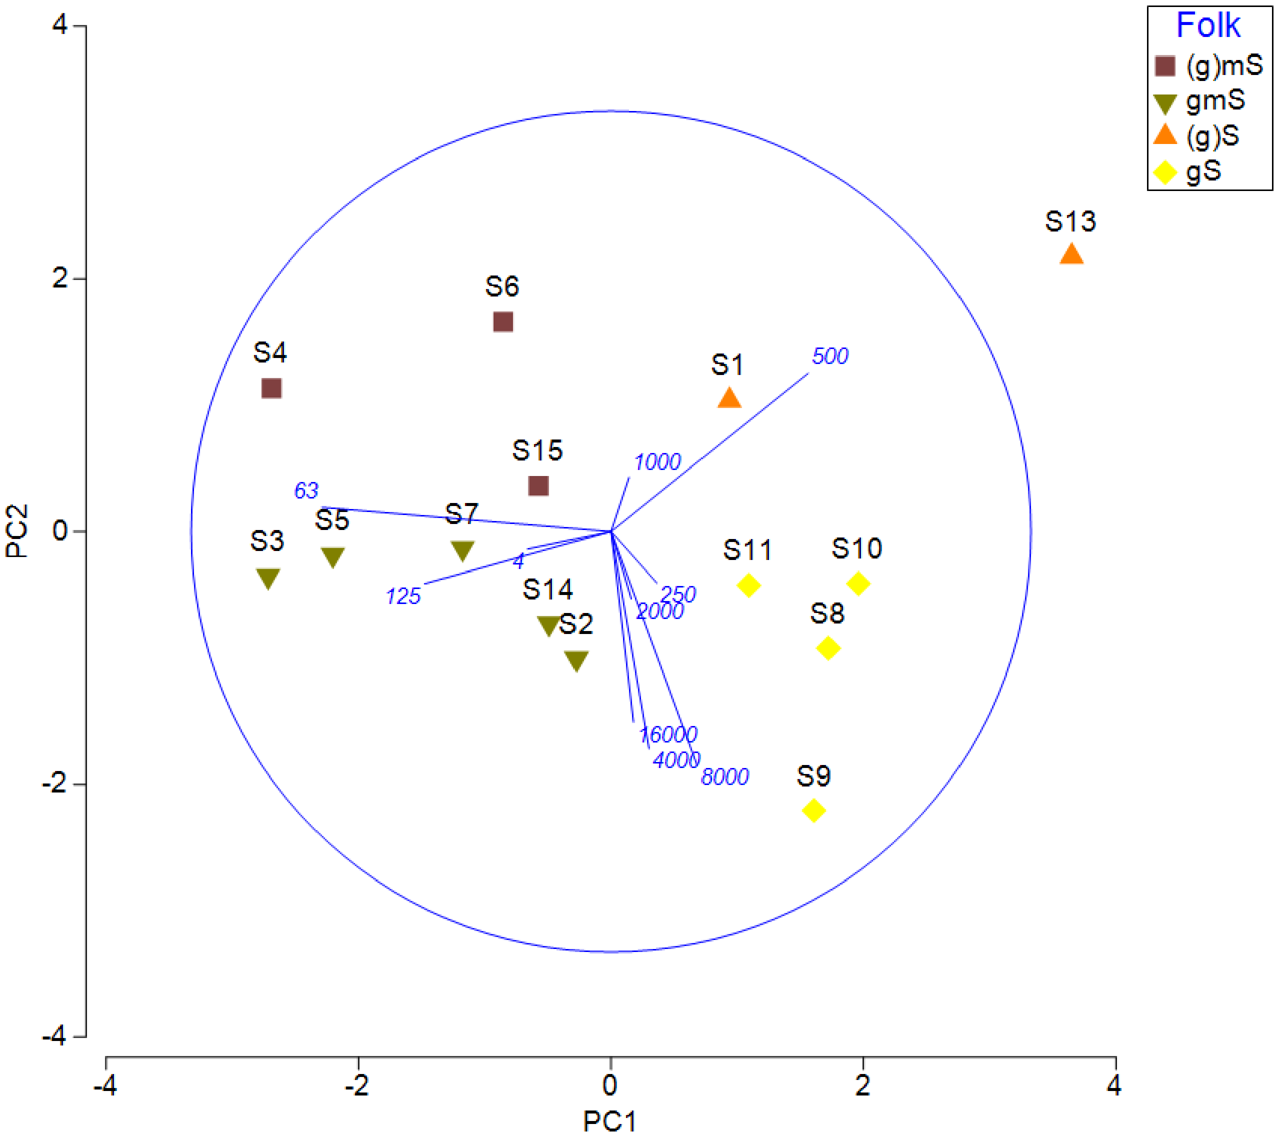

Figure 3-7: Principal component analysis (PCA) plot showing the relative effect of sediment particle size classes on the distribution of sample sites and Folk classifications

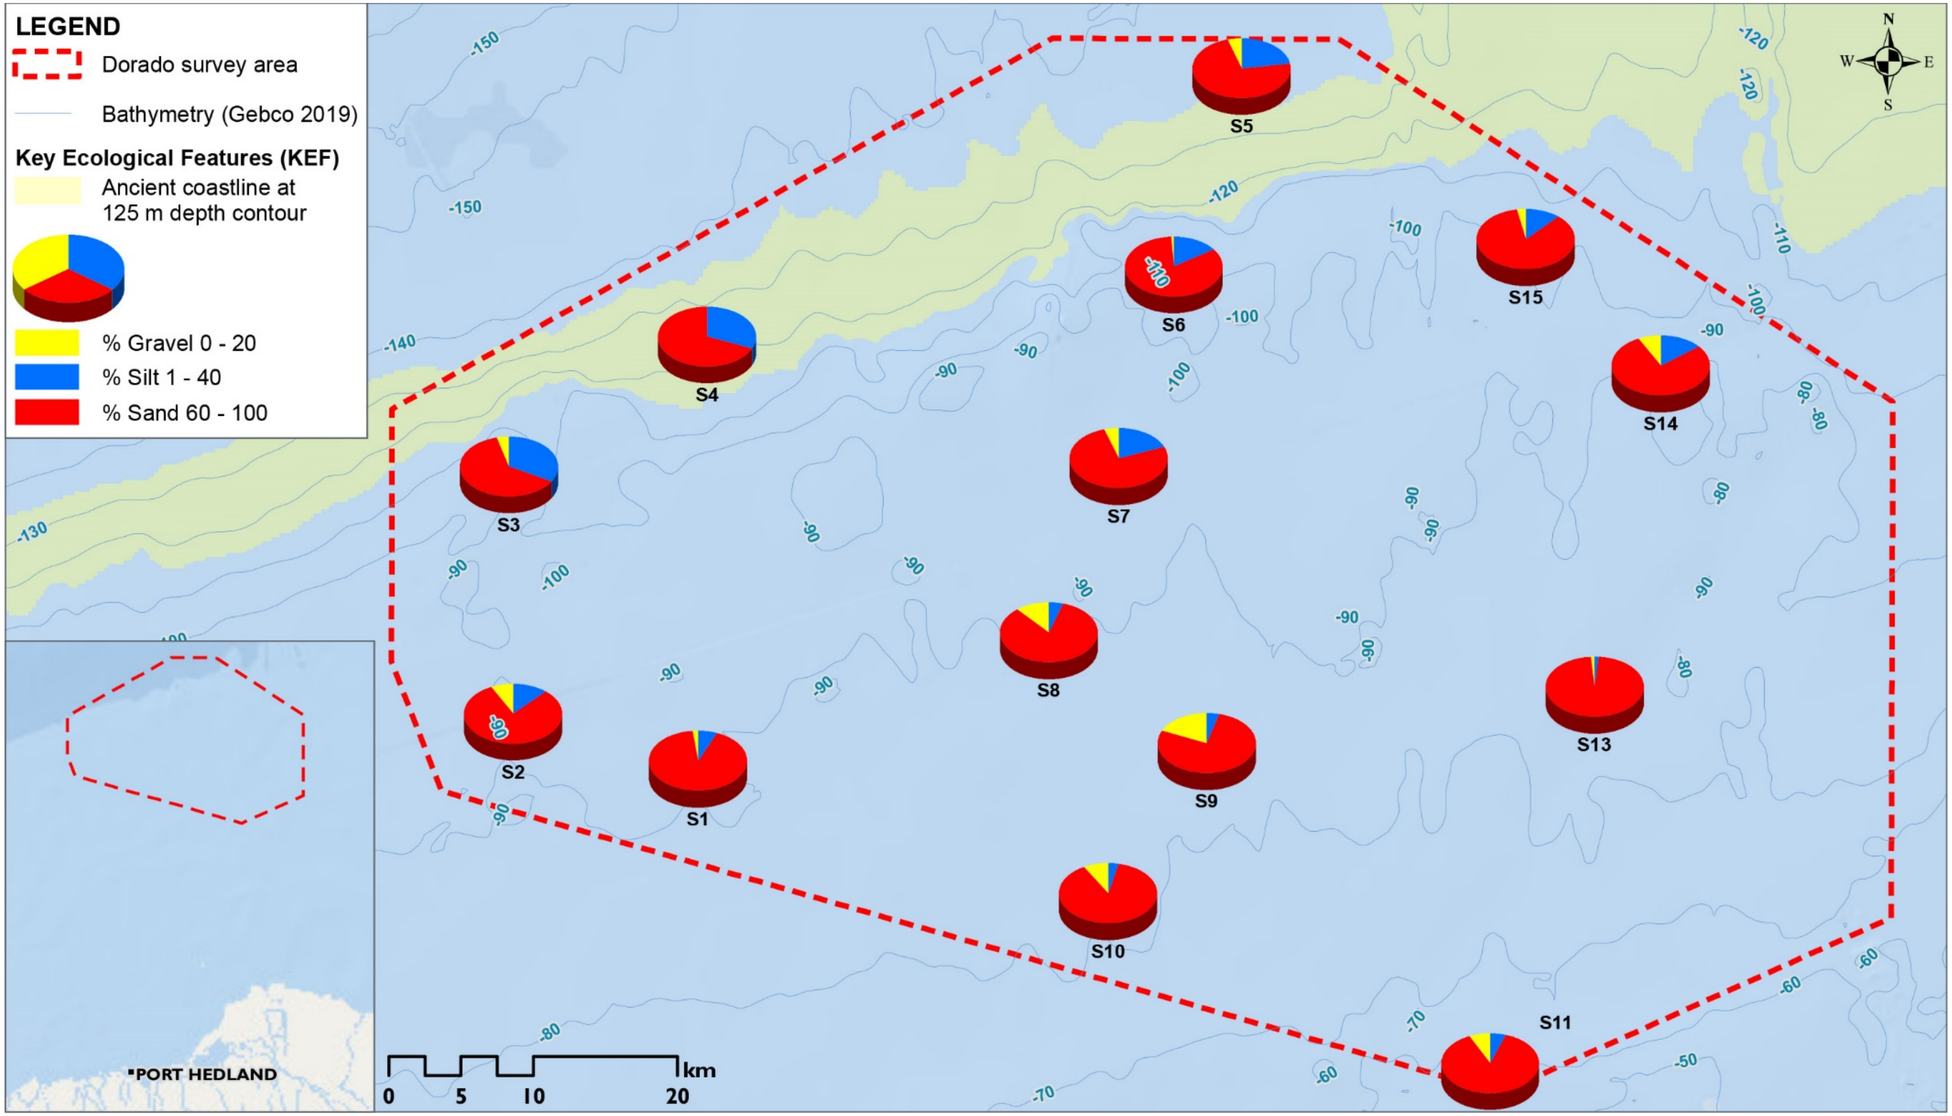

Figure 3-8: Proportion of silt, sand and gravel at sampling locations throughout the study area

3.2 Quality control samples

Results from laboratory analysis of the transport blank and field blank showed that samples were below limits of detection for all analytes. This confirms that no contamination was introduced during transport of the samples or during the process of collecting them on the vessel.

Multivariate analysis identified that duplicate samples taken as sites 7 (duplicate 1) and site 6 (duplicate 2) were not significantly different in terms of their contaminants and nutrients composition to the sites samples (see section 3.1.6). This confirms that the samples were sufficiently repeatable and therefore representative of the sampling sites.

These results demonstrated that QA/QC procedures implemented to mitigate risk of sample contamination were effective.

4 DISCUSSION

The present survey provided data characterising sediment quality (physico-chemical characteristics) within the Dorado study area. Water depths of sampling sites ranged from 56 m at the most southern site to 137 m at the most northern site. Sediments were specifically sampled in the ancient coastline KEF (Site 4) to determine if this was a unique sediment type in the area.

Site 7 was located at the previous Roc-1 drilling location to test for potential impacts from historic drilling campaigns in the area. Roc-1 was drilled in late 2015 – early 2016; four years prior to the current survey. Although drilling had been undertaken at Site 7 (Roc-1) no impacts on sediment quality from these activities were detected, apart from a slightly higher barium concentration. The higher barium concentrations probably reflect the presence of drilling mud components (barite) in the sediment matrix. No petroleum hydrocarbons or heavy metal exceedances were detected at the Roc-1 drilling site. The multi-variate analyses showed that the physical characteristics of the sediments at Site 7 were similar to those at surrounding sites.

Of the total metals/metalloids in the sediments sampled from the survey area, only arsenic exceeded the ANZG (2018) ISQG-Low trigger value and only at one site (Site 13).

Concentrations of the metals and metalloids total arsenic, total chromium and total iron showed a negative (inverse) relationship with site depth and sediment silt content, with declining analyte concentrations up to 20 % silt, then concentrations remained relatively consistent with increasing silt content to ~32 % silt. Silt content was also related to water depth, increasing with increased depth. The pattern of decreasing metals and metalloids with increasing silt content observed in the present study is contrary to the common trend of metals being associated with smaller particle grain sizes (Martincic et al. 1990). This is an important point for the interpretation of any future survey programs, as the concentrations of these metals/metalloids may naturally occur at up to three or more times higher in the vicinity of the proposed wellhead platform location than in the finer sediments in the deeper waters to the north. DEC (2006) found that total arsenic concentrations were relatively high across the region (with a median concentration of 36 mg/kg recorded for one site off Onslow), and exceeded the recommended sediment quality guideline at some of the essentially unimpacted locations sampled. These exceedances were considered to be natural by DEC (2006), and likely to be related to the local geology. Higher total arsenic concentrations in shallower water (with less silt content) in the southern sampling locations may therefore be due to effects of the underlying geology.

With the exception of cadmium (and barium, which is not represented in DEC 2006), all metals and metalloid concentrations were equal to or less than the estimated natural background concentrations for Pilbara coastal marine sediments (DEC 2006).

Nickel was recorded at concentrations below guideline at all sites, despite the fact that nickel tends to be strongly associated with organic molecules (Wenziker et al. 2006) and is commonly found in high concentrations in Australian sediments (Commonwealth of Australia 2009).

Tributyltin and hydrocarbon concentrations at all sites were below the limit of reporting at all sites. Similar results have been recorded in other studies of sediment quality in offshore areas in northern Australia (e.g. ConocoPhillips 2018).

Oil and grease ranged from 220 mg/kg at site 11, to 1900 mg/kg at site 15. The result for site 15 was significantly higher than all other sites – 450 mg/kg was the second highest value recorded (at site 1 and in duplicate 2 taken from site 6). Site 15 is one of the northern deep-water sites not previously exposed to drilling. Total recoverable hydrocarbons (TRH) were below limits of detection at this site, making identification of the source difficult - even potential grease contamination from the winch wire is unlikely due to the absence of TRH.

Total petroleum hydrocarbons (TPH), total recoverable hydrocarbons (TRH) and benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN) concentrations were below the laboratory LOR at all sites within the survey area. Consequently, no analysis of polycyclic aromatic hydrocarbons (PAHs) was required.

The combined value for radium^{226}, radium^{228} and thorium^{228} (‘combined NORMs’) were below the guideline value of 35 Bq/kg at all sites, even when considering upper confidence limits.

Nutrients (nitrogen, phosphorus and organic carbon) are released in the decay of organic matter. Total Kjeldahl nitrogen (TKN) concentrations exhibited low variability, but were generally marginally higher at sites along the northern and western edges of the survey area. They were comparable to levels recorded from other offshore surveys in Northern Australia (e.g. ConocoPhillips 2018), though total organic carbon concentrations were considered to be low. There was no discernible spatial pattern in total phosphorus or correlation with depth. Total organic carbon concentrations also exhibited limited variation, and closely corresponded with TKN concentrations, with the highest levels recorded at the siltier sites along the northern and western edges of the survey area.

The survey area was characterised by a gradual transition in sediment coarseness, with the coarsest sediments (greatest gravel component and least silt component) at the southern and south-eastern sites, and higher silt content in the northern sites. This distribution generally related to water depth, with the deepest northern sites (Sites 2, 3, 4, 5, 6, 7, 14 and 15) generally having a greater silt component than the southern sites (Sites 1, 8, 9, 10, 11 and 12). Site 13 was distinct as it has a low contribution of both silt and gravel, and has the highest contribution of sand.

The relative increase in silt component with increased depth is a common feature in offshore areas (e.g. ConocoPhillips 2018, Shell 2018), due to a reduction in near-seabed current speeds, which may be insufficient to resuspend finer particle sizes than at shallower sites and/or result in increased deposition of finer material, as the increased fine content with increased water depth is a common occurrence in the offshore marine environment. The silt component of sediments at Roc-1 (~20.3 %) were comparable with particle size data previously collected at the Roc-1 location (NGI 2017). Silt content at Roc-1 (20.3 %) was greater than the other 'central' sites (i.e. sites 1,2, 8 and 14) with silt content of 8.2, 13.8, 6.0 and 16.2 %, respectively, though this variability was within the range of sediment silt content at sites in other depth ranges and therefore cannot be directly attributed to historic drilling activities at site 7 (Roc-1). Folk sediment classifications were useful in identifying trends in sediment types across the study area and showed there was low variability in the sediment types across the survey area, which only ranged from slightly gravelly muddy sand to gravelly sand. Offshore sediments are often dominated by sands and muddy sands, with varying contributions of gravel (which can be biogenic in origin, e.g. shell fragments).

CERTIFICATE OF ANALYSIS

Work Order	: **EP1913671**	Page	: 1 of 11
Client	: **RPS Australia West Pty Ltd**	Laboratory	: Environmental Division Perth
Contact	: GARNET HOOPER	Contact	: Rhiannon Steere
Address	: PO BOX 170 WEST PERTH WA 6872	Address	: 26 Rigali Way Wangara WA Australia 6065
Telephone	: 08 9211 1131	Telephone	: 08 9406 1306
Project	: Santos	Date Samples Received	: 23-Dec-2019 07:00
Order number	: ----	Date Analysis Commenced	: 24-Dec-2019
C-O-C number	: RPS19-2	Issue Date	: 13-Jan-2020 15:59
Sampler	: ----		
Site	: Dorado		
Quote number	: EP/954/19		
No. of samples received	: 16		
No. of samples analysed	: 16		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Chris Lemaitre	Laboratory Manager (Perth)	Perth Inorganics, Wangara, WA
David Viner	SENIOR LAB TECH	Perth Organics, Wangara, WA
Diana Mesa	2IC Organic Chemist	Brisbane Organics, Stafford, QLD
ShukHui Li	Client Services - Technical Manager	WRG Subcontracting, Wangara, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP090 Organotin: Sample 'S1' shows poor surrogate recovery due to matrix interference. Confirmed by re-extraction and re-analysis.
- Oil and Grease Analysis (CM067) is conducted by ALS Scoresby NATA accreditation no. 992, site no. 989.. NATA accreditation does not cover performance of this method.

NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Chris Lemaitre	Laboratory Manager (Perth)	Perth Inorganics, Wangara, WA

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: ----	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Regular Sample Surrogates

Sub-Matrix: **SEDIMENT**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP090S: Organotin Surrogate	EP1913671-001	S1	**Tripropyltin**	----	34.3 %	35.0-130 %	**Recovery less than lower data quality objective**
EP090S: Organotin Surrogate	EP1913671-012	S13	**Tripropyltin**	----	131 %	35.0-130 %	**Recovery greater than upper data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Oil and Grease	CM067	SOIL	Oil & Grease analysis subcontracted to ALS Scoresby. NATA accreditation does not cover performance of this service.
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
TPH - Semivolatile Fraction	EP071-SD	SOIL	In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	In house: Referenced to USEPA SW 846 - 8270D Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house: 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.

METHOD	METHODOLOGY SUMMARY
AS303/406	Analysis of radionuclides in solid samples by high resolution gamma ray spectrometry after preparation to meet standard calibrated geometries. Preparation involves drying, crushing and sieving, and setting in an epoxy resin where necessary.

FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
**	Indicative data, theoretical holding time exceeded.	NVL	Not validated.	LOR	Limit of Reporting.
		IS	Insufficient sample for analysis.	↑↓	Raised/lowered Limit of Reporting.
		LNR	Sample listed, but not received.		

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

TSS	Total suspended solids
WHP	Wellhead platform

EXECUTIVE SUMMARY

Santos is planning the Dorado Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 130 km north of Port Hedland. The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority.

The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project and this assessment requires an understanding of the status of the receiving environment. Santos identified uncertainty in the status of the marine environment in the vicinity of the development and commissioned ecological studies to provide environmental data to support appropriate assessment. A key component of the marine environmental characterisation studies was a water quality survey.

RPS was commissioned to conduct a water quality survey at the Dorado Project location between 16 and 19 December 2019. The objective of the study was to characterise the physico-chemical characteristics of the marine waters in the area.

The survey team measured a range of physical and chemical analytes throughout the water column at 15 locations spread across the Survey Area. Sampling involved water column profiling and collection of water samples for laboratory analyses of a suite of potential contaminants, nutrients, microalgal pigments and suspended solids. There was a clear relationship between some analytes and water depth (and therefore distance from shore) and the inshore sites.

Stratification of the water column was indicated by temperature, pH and dissolved oxygen measurements, with levels generally decreasing with depth. At shallower sampling sites a thermocline was observed at depths between 25-50m with warmer water near the surface possibly due to solar heating and a lack of vertical mixing. These data are comparable to data collected off the North West Cape (Exmouth) where thermoclines were observed in both surface waters (0-100m) and mid-profile waters (75-150m) (Lowe et al. 2012). They found thermoclines are seasonal, therefore this trend may change in future sampling events for the Dorado Project. pH levels were generally consistent and higher towards the surface, possibly due to the uptake of dissolved carbon dioxide in surface waters by planktonic photosynthesis. pH then decreased rapidly with increased depth possibly due to oxidation possibly decaying organic matter sinking from shallower depths. It has been demonstrated that decomposition produces carbonic acid (from the dissolution of liberated carbon dioxide) and the release of hydrogen ions cause a decrease in pH (Hinga 2002). Finally, increased oxygen levels are commonly recorded in surface waters due to exchange of oxygen across the air-water interface, therefore a decline in dissolved oxygen with depth is not unexpected.

Profiles at sampling locations in deeper waters were generally different to those in shallower waters. Sites S4, S5, S6 and S15 tended to have different profiles in temperature, pH, dissolved oxygen, NTU and chlorophyll a. The differences in temperature and pH profiles suggest there may be some vertical mixing associated with the sloping seabed at these locations because temperature and pH continued to decline with depth beyond 50m, whereas temperature and pH at the shallower sites tended to remain constant below 50m.

1 INTRODUCTION

1.1 Background

Santos is planning the Dorado Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 130 km north of Port Hedland (Figure 3 1). The Dorado Project will target the Dorado oil field with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading (FPSO) facility. There is also potential for future development of surrounding reservoirs within the Dorado Project Survey Area (Dorado Survey Area). These may be developed and tied back to a WHP via flowlines.

The Dorado Project will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009, administered by the National Offshore Petroleum Safety and Environmental Management Authority. The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project, appropriate to the nature and scale of each impact or risk. A marine environmental characterisation survey program was required to characterise the benthic habitats, macrofaunal and infaunal communities, and water and sediment quality within the Dorado Survey Area. This report provides the outcomes of the water quality survey conducted between 16 and 19 December 2019.

The water quality data herein will inform the evaluation of potential impacts to water quality associated with the Dorado Project.

1.2 Objectives

The specific objective of the study was to characterise the marine water quality within the Dorado Survey Area. This report provides a technical summary of the data from water samples collected in the survey area in December 2019.

2 METHODS

Field sampling was conducted in accordance with the Sampling Analysis and Quality Plan (SAQP).

2.1 Water quality sampling sites

An array of fifteen pre-determined sampling sites provided coverage across the Survey Area (Table 2-1, Figure 2-1). The sampling sites extended from the Dorado Project Area into and beyond the ‘ancient coastline at 125 m water depth’ key ecological feature (DSEWPaC 2008). Sites were also distributed to provide representative samples across a range of CSIRO preliminary ecotypes (Keesing et al. 2020).

Table 2-1: Water quality sampling site depths (m below sea level (BSL)) and locations

Site	Depth (m BSL)	Latitude (DMS)*	Longitude (DMS)*	Easting (m)*	Northing (m)*
S1	91.9	19° 6' 33.228" S	118° 30' 46.440" E	659143	7886398

*GPS Datum = WGS84; UTM Zone 50K.

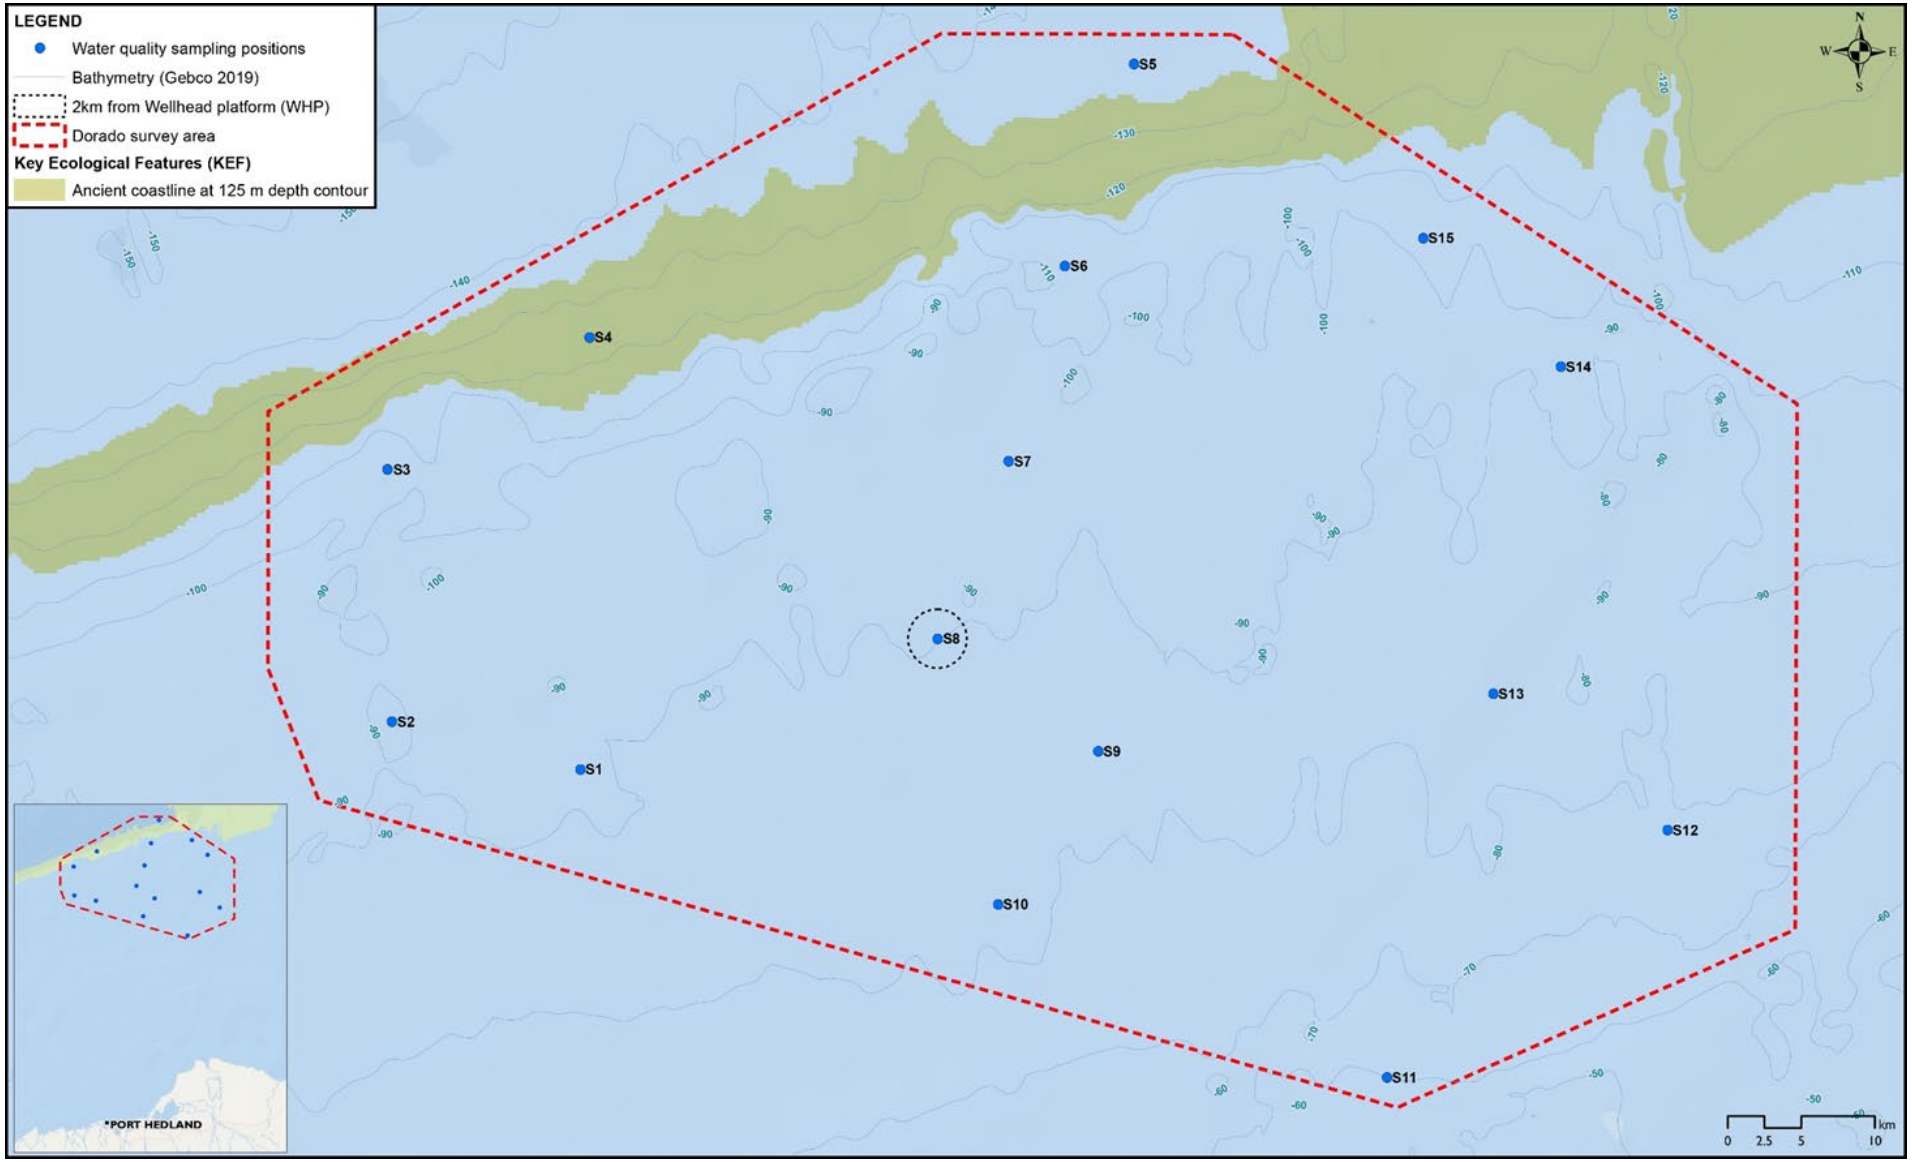

Figure 2-1: Water quality sampling sites

2.2 Timing

Water sampling was undertaken in summer, during daylight hours from 16 to 19 December 2019.

2.3 Water column profiling

The water column at each site was profiled using a Seabird Electronics SBE 19+ v2 profiler with auxiliary sensors and a 600 m depth rating. All sensors had been calibrated by the Marine and Freshwater Research laboratory (MAFRL) prior to mobilisation (see Appendix A for calibration certificate). During deployment, the profiler was lowered through the water column at a consistent rate of ~0.5 ms-1.

The measured physico-chemical parameters of the water column comprised the following:

- Depth (pressure)
- Salinity (conductivity)
- Water temperature
- pH
- Dissolved oxygen
- Turbidity
- Photosynthetically-active radiation (PAR)
- Chlorophyll-a
- Hydrocarbon concentration (using an ultraviolet fluorimeter calibrated for crude oil products, which measures the fluorescence of six-sided aromatic carbon rings. The term ‘crude oil’ simply identifies that the fluorimeter is measuring the fluorescence of heavier oil types with lower API gravity).

2.4 Water quality sampling

Sampling was conducted using 10 L Niskin bottles, arranged in a “daisy chain” to facilitate collection of samples from the mid-water and near seabed. A separate Niskin was used to collect the near surface samples. Water samples were collected from three depths:

- Near surface - between 2 and 5 m below sea level (BSL)
- Mid-water - half the full depth of the water column
- Near seabed - within 5 m of the seabed.

2.4.1 Sample collection

Pre-cleaned sample containers were obtained from the relevant analytical lab prior to mobilisation. All water samples were filtered on site, preserved and handled in accordance with Australian and New Zealand Standards (AS/NZS 5667.1:1998 water quality sampling – guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples). The following information was recorded when samples were collected:

- Site name
- Time and date each sample was collected
- Waypoint number (global positioning system (GPS) coordinates)
- Water depth from which the sample was collected.

2.4.2 Sample processing, preservation and storage

All samples were processed and preserved in accordance with Australian and New Zealand Standard (AS/NZS 5667.1:1998) and the requirements of the analytical laboratories. Due to the remote nature of the survey area, preservation methods were selected to maximise sample holding times. Water sampling was planned to ensure samples could be delivered to the analytical laboratories within holding time requirements for each parameter.

Sample containers were supplied by the analytical laboratories and were pre-labelled prior to the survey. Samples collected were recorded on sample log sheets, then stored under required conditions (Appendix B). A chain of custody form detailing the samples and analyses required was supplied to the National Association of Testing Authorities (NATA)-accredited laboratories with the samples.

Samples were filtered on board the vessel for nutrients, pigments (chlorophyll-a and phaeophytin a) and metals/metalloids. Both filtered and unfiltered samples were collected for the analysis of metals/metalloids. Unfiltered samples provide data on total metals in solution, whereas filtered samples provide data on the bioavailable component. A known volume of water was filtered through 0.2 µm GF/F filter paper for pigment sampling. These were then carefully sealed in pre-labelled envelopes and frozen. Nutrients and metals/metalloids were filtered into a pre-rinsed sample container. Nutrient samples were frozen, whereas metal/metalloid samples with pre-added acid were kept chilled at ~4 °C.

The following procedures were implemented for sampling of dissolved ultra-trace metals and organics (hydrocarbons):

- Sample containers were not pre-rinsed
- Metals samples were passed through a 0.45 µm filter
- Samples containers were not filled completely
- Samples were stored at ~4 °C (not frozen), and organics samples were also kept in the dark.

The following procedures were implemented for sampling of total nutrients:

- Sample containers were pre-rinsed three times
- Samples containers were not filled completely
- Samples were stored frozen.

Hydrocarbon samples were poured into sample bottles (leaving minimal air space), then chilled. Sample containers for volatile hydrocarbons (total recoverable hydrocarbons (TRH) C6-C9 and benzene, toluene, ethylbenzene and naphthalene (BTEXN)) contained sulphuric acid preservative.

Unfiltered naturally-occurring radioactive materials (NORMs) samples were transferred into sample containers with nitric acid as a preservative, then chilled.

During water sampling, the holding container, syringe and filter were flushed three times using sample water to mitigate contamination risk.

2.4.3 Sample analysis

Analytes, analytical laboratories, relevant storage and preservation methods and holding times are presented in Appendix B. All laboratory analyses were undertaken using standard NATA-accredited methods.

2.4.4 Data analysis

The water quality data were compared against relevant guideline levels (where available) from the ANZG 2018 guidelines.

Multivariate analysis of water quality sample data at surface, middle and bottom water depths was undertaken using the Plymouth Routines In Multivariate Ecological Research (PRIMER) v7 software (Clarke & Gorley 2015).

After transformation and normalisation of data, resemblance matrices were derived based on Euclidean distance. The ‘Cluster’ routine with similarity profile (SIMPROF) were used to identify groupings of samples based on survey data. Non-metric multi-dimensional scaling (n-MDS) was used to represent the relative distribution of sample data in 2-dimensional space to identify relationships between sample sites. The principal components analysis (PCA) routine was used to determine the relationship between principal analytes and the distribution of sample sites.

2.4.5 Quality control procedures

Each Niskin was cleaned at the beginning of the trip and stored with the ends closed between deployments. Decon 90 was used to rinse the Niskin bottles in any cases where contamination may have occurred during the survey. The bottles were further washed with site water as they were lowered to sampling depth.

The following quality control process was undertaken to quantify potential sample contamination that could have occurred during collection, handling, storage or transport. Low analyte concentration water provided by the laboratories were used in two tests:

- Field blank: low analyte water was poured into a sample container in the field during sampling, but with no filtering or additional handling. Field blanks test for any contamination of samples during sample collection.
- Transport blank: low analyte water was poured into a sample container at the end of field sampling, with no filtering or additional handling. Transport blanks test for any contamination of samples during transport and storage.

Duplicate samples collected to determine potential variability in analysis. A duplicate sample is collected by deploying the Niskin at the same location a second time. Duplicates were collected at the following sites:

- Duplicate 1 (collected at Site S9)
- Duplicate 2 (collected at Site S5)
- Duplicate 3 (collected at Site S12)
- Duplicate 4 (collected at Site S4).

3 RESULTS

The following sections summarise the data collected from the water column profiles and laboratory analysis of water samples. Full laboratory reports can be found in Appendix C.

3.1 Water column profiles

3.1.1 Salinity (conductivity)

There was very little difference in salinity profiles across sites and water depths, with salinity ranging from ~34.5 to ~35.4 practical salinity units (PSU). At most sites, salinity remained relatively high in the upper 20–25 m of the water column, but then decreased by an average of around 0.1–0.3 PSU between around 25–30 m BSL. Data indicated that this was potentially due to formation of a halocline at this depth as values varied greatly (within a range of up to ~0.7 PSU) over a short depth range. Salinity generally remained relatively consistent throughout the rest of the water column (i.e. deeper than ~30 m BSL). However, considerable variability in PSU over small depth ranges was evident to at least 100 m BSL at Sites S4, S5, S6 and S15 (the deepest and northernmost sites). The maximum range in salinity recorded throughout the profile at any one site was at Site S10 (0.66 PSU), with the minimum range recorded at Site S11 (0.32 PSU). There were no apparent cross-shelf variations in salinity profiles (Figure 3-1).

3.1.2 Water temperature

Sea surface water temperatures ranged from 28.8°C to 30.7°C across the study area, with both minimum and maximum temperatures recorded at shallow sites (sites S11 and S1, respectively). Near seabed temperatures varied with depth at each site, ranging from 21.7°C at the deepest site (Site S5) to 27.3°C at the shallowest site (Site S11). Seabed temperatures were consistent with those recorded in the region during December 2017 (RPS 2019). Temperatures remained relatively consistent in the upper 15–30 m of the water column, but generally decreased by up to 4.5°C at around 70 m BSL. Data indicated a potential thermocline in this depth range. A continuous decline in seawater temperature was recorded at Site S5 (the deepest site sampled) to a depth of ~100 m BSL, with temperature then remaining consistent to the seabed. Temperature profiles at the northern-most sites (sites S4, S5, S6 and S15) tended to decline at a constant rate and did not o show a clear thermocline (Figure 3-2).

3.1.3 pH

The pH in surface waters in the survey area ranged from 8.18 to 8.32 across the study area. Profiles in shallower water sites tended to have small differences in pH through the water column, with bottom waters generally lower in pH than surface waters. The pH profiles at the offshore sites tended to have a larger difference in pH through the water column (due to the greater water depth) and also tended to have greater changes in pH in the mid-water column compared to shallow water sites (Figure 3-3).

3.1.4 Dissolved oxygen

Dissolved oxygen in surface waters ranged from ~95 % to >100% saturation. Levels then remained consistent or increased to a depth of 30–60 m BSL, then either decreased rapidly over a ~15 m depth range and remained relatively consistent to the seabed, or declined more gradually to the seabed. The general trends in the dissolved oxygen profiles were similar to those of the pH profiles. Dissolved oxygen at the offshore, deeper sites (sites S4, S5, S6, S14, and S15) showed a less steep decline in dissolved oxygen in the mid-water column and dropped to a much lower level of dissolved oxygen (60 – 70%) near the seabed (Figure 3-4).

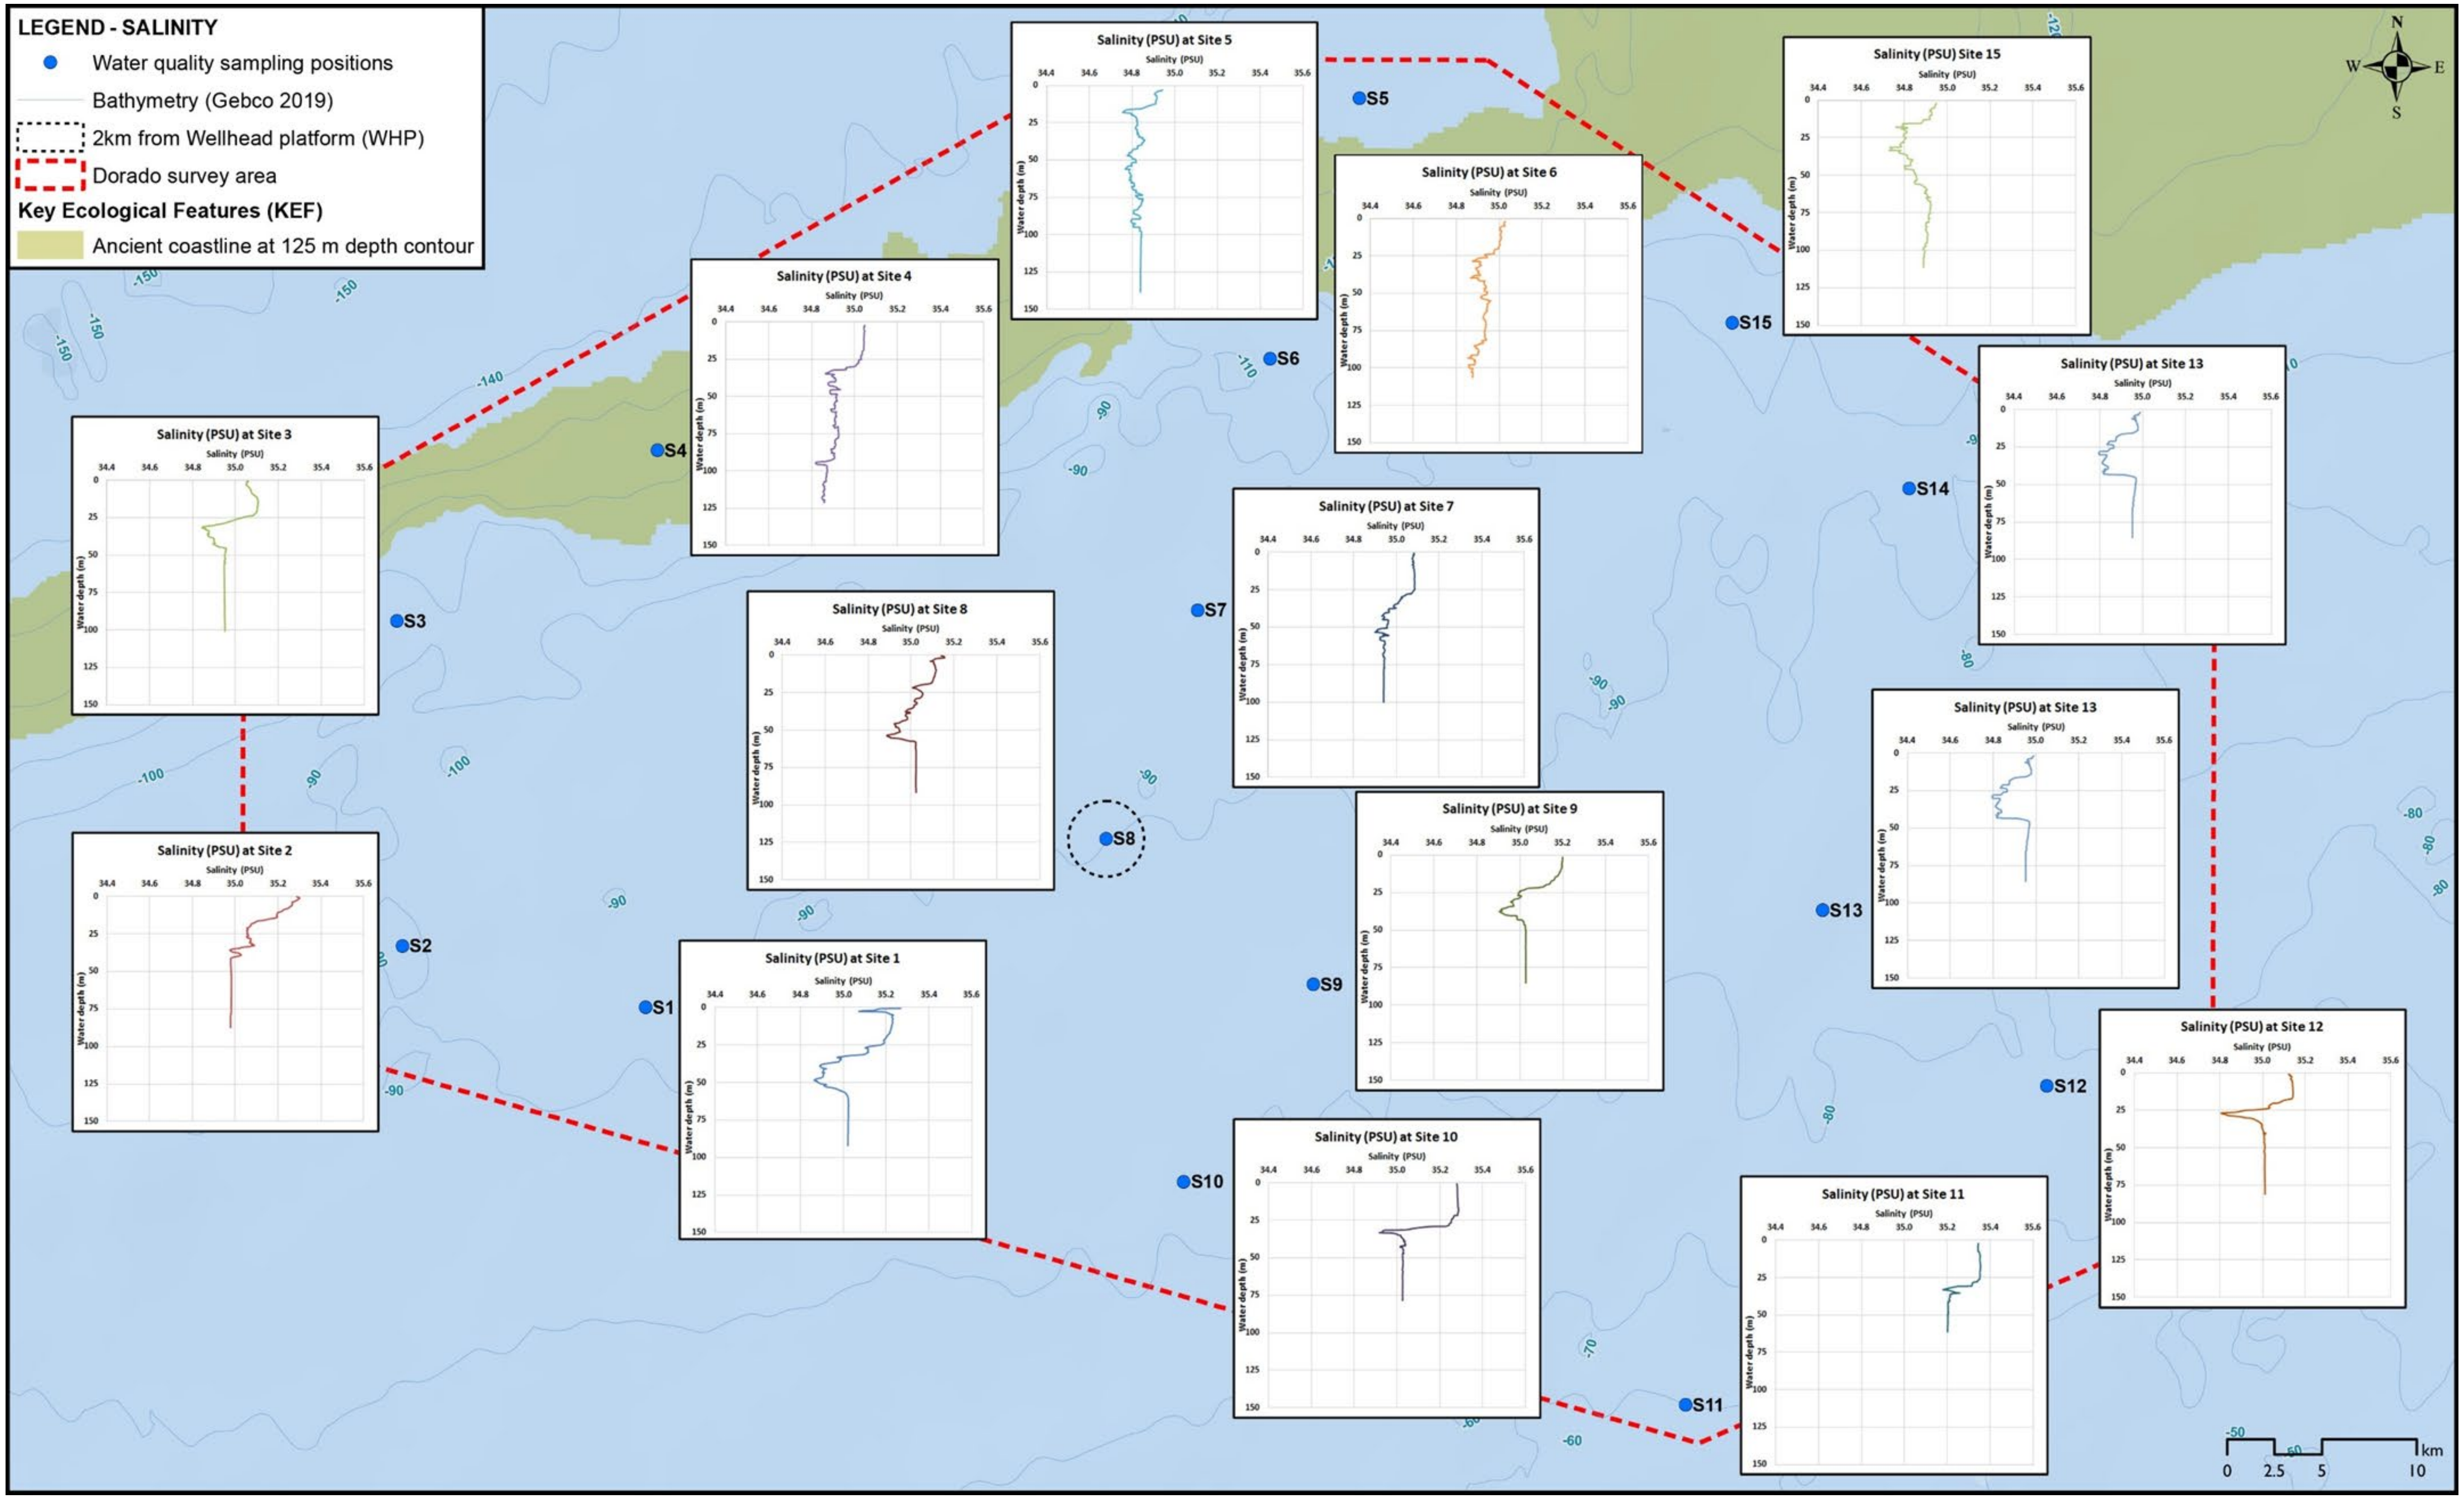

Figure 3-1: Across shelf salinity profiles

3.1.5 Turbidity

Turbidity was low (<0.5 NTU) in the upper 30 – 80 m of the water column. Turbidity increased with depth, increasing to around 1 – 2.5 NTU (Sites S2, S3, S4, S14 and S15) and 3.5 – 4.2 NTU at Sites S2, S5 and S6. The large increase in turbidity at the bottom of the profile at Site S7 (peak of 30.4 NTU) was probably due to the water column profiler contacting the seabed and generating a turbid plume.

Turbid water was recorded up to 50 m above the seabed at Sites S2, S3, S5, S6, S7, S14 and S15 which are located in deeper waters (Figure 3-5).

3.1.6 Photosynthetically active radiation (PAR)

PAR generally declined with depth in a logarithmic relationship and there was very little light below 50m. Due to differences in sampling times and weather conditions, clear trends in PAR levels were not comparable among sites. The data for PAR profiles at each site are in Appendix D.

3.1.7 Chlorophyll-a

Chlorophyll-a concentrations in surface waters ranged from around 0 to 0.3 µg L-1, then generally increased gradually over the upper ~30 m of the water column. Concentrations then increased to a peak of between 2.2 to 4.2 µg L-1 between 33 and 63 m BSL (depending on site). Chlorophyll-a then declined to around one-third to one-half of peak concentrations before remaining consistent to the seabed at most sites, or declined more gradually towards the seabed (at Sites S4, S6 and S15).

While all sites showed an increase in chlorophyll-a concentrations at approximately 50 m BSL which declined slightly for the remainder of the profile, sites S4, S5, S6, and S15 showed a greater rate of decline in chlorophyll-a concentration as depth increased and decreased to a lower concentration (Figure 3-6).

3.1.8 Hydrocarbons (crude oil)

Hydrocarbon concentrations ranged from 0 to 0.77 µg L-1 in surface waters, with variability decreasing with depth to concentrations of between 0.06 and 0.25 µg L-1 by 20 m BSL (Figure 3 8). Concentrations then either increased gradually to between 60 and 100 m at some sites (e.g. Sites S4, S5, S6, S7, S8, and S15) or increased more rapidly to a peak at between 40 and 50 m BSL, before remaining relatively consistent to the seabed at the shallower sampling sites.

There were no cross shelf trends in profiles of hydrocarbons (Figure 3-7).

3.2 Water quality samples

3.2.1 Nutrients and pigments

3.2.1.1 Nitrogen

The test for total nitrogen provides data for all nitrogen compounds in the water samples, which is present as nitrite (NO_2), nitrate (NO_3), ammonium (NH_4^+) and organic nitrogen compounds.

Nitrite and nitrate were recorded at detectable levels at all sites except Site S11 (Figure 3-8, Table 3-1). Nitrite and nitrate were recorded in bottom water samples only at Sites S1, S2, S5, S7, S10 and S15. The compounds were recorded in both bottom (near seabed) and midwater samples at Sites S3, S4, S6, S8, S9, S12 and S14, and in bottom and surface water samples (but not in midwater) at Site S13. Nitrite and nitrate were recorded at concentrations of 2 to 15 µg N L-1 in midwater samples, but at much higher concentrations (8–150 µg N L-1) in near-seabed samples. Concentrations ranged from 2 µg N L-1 at Sites S8 and S12 to ≥100 µg N L-1 at Sites S4, S5, S6 and S15 (i.e. all of the deepest sites), with a maximum concentration of 150 µg N L-1 in the bottom waters of Site S5 (the deepest site). Near seabed concentrations were related to the water depth at the site, with lowest concentrations recorded at the shallowest sites (<80 m BSL; Sites 10, 11 and 12) and greatest at the deepest sites (>100 m BSL; Sites S4, S5, S6 and S15). The ANZG (2018) default guideline value for nitrate and nitrite in slightly disturbed tropical Australian marine offshore ecosystems is 4 µg N L-1.

Ammonium was only detected at one site, Site S15, in the mid-water sample (5 µg N L-1). This was below the ANZG (2018) default species protection guideline value of 6 µg N L-1 for ammonium in slightly disturbed tropical Australian marine offshore ecosystems which 95% species protection. The slightly disturbed level of protection has been applied here because the environment being assessed has had some small but measurable level of human activity.

Total nitrogen concentrations indicated the presence of other organic nitrogen compounds, with only the Site S5 midwater sample (excluding the field and transport blanks) being below the LOR of 50 µg N L-1. Total nitrogen concentrations ranged from 50 µg N L-1 in the Site 12 bottom sample to 170 µg N L-1 in the Site S4 and S5 bottom samples. Near seabed (Sites S1, S2, S3, S4, S5, S6, S8, S9, S14 and S15), midwater (Site S6) and surface (Sites S8, S12 and S14) samples were found to meet or exceed the ANZG (2018) default guideline value of 100 µg N L-1 for total nitrogen in slightly disturbed tropical Australian marine offshore ecosystems.

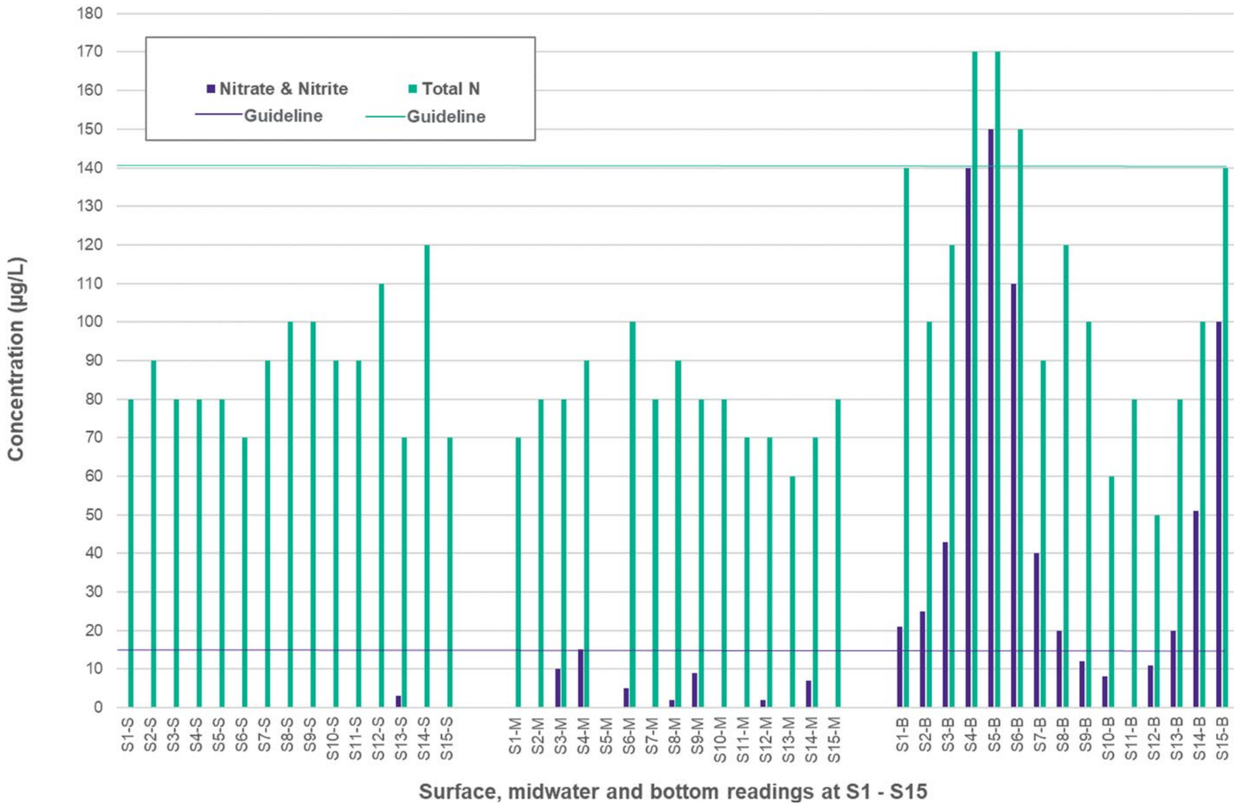
In summary, the data from samples collected in the Dorado baseline survey area indicated that total nitrogen concentrations varied greatly and generally increased with depth. Total nitrogen in surface samples mainly comprised organic nitrogen, while the contribution of nitrate and nitrite to total nitrogen increased with depth (Figure 3-8).

3.2.1.2 Phosphorus

The results for total phosphorus comprise the concentration of phosphorus that occurs in orthophosphate and organic phosphate compounds.

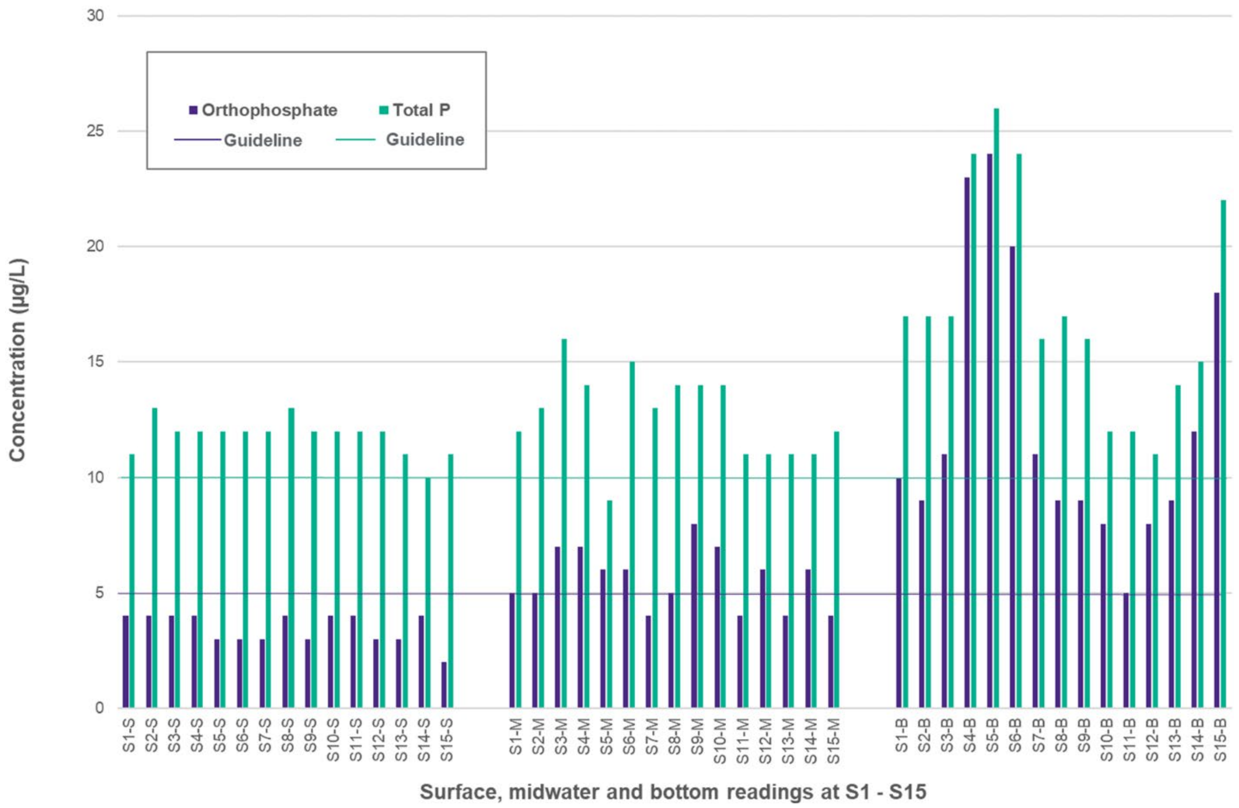
Orthophosphate (filterable reactive phosphorus) concentrations ranged from 2 to 24 µg P L-1 (Figure 3-9, Table 3-1). All results were above LOR. Twenty-two of the 45 samples collected exceeded the ANZG (2018) default guideline value of 5 µg P L-1 for orthophosphate in slightly disturbed tropical Australian marine offshore ecosystems. Surface waters at all sites were below the guideline value; exceedances either occurred in near seabed samples (Sites S1, S2, S7, S8, S13 and S15) or both near seabed and midwater samples (Sites S3, S4, S5, S6, S9, S10, S12 and S14). Surface concentrations ranged from 2 to 4 µg P L-1, midwater concentrations ranged from 4 to 8 µg P L-1, and near-seabed concentrations ranged from 5 to 24 µg P L-1. Highest near seabed concentrations were found at the deepest sites (Sites S4, S5, S6 and S15).

Total phosphorous showed the same general trend of increasing concentrations of phosphorus with depth (Figure 3-9), with peak concentrations at the same four deepest sites (Sites S4, S5, S6 and S15). Almost all samples, with the exception of Site S5 midwater and Site S14 surface, exceeded the ANZG (2018) default guideline value of 10 µg P L-1 for total phosphorus in slightly disturbed tropical Australian marine offshore ecosystems.



*Note: Concentrations below limits of reporting have not been presented. Guideline value for Nitrate & Nitrite is 15 µg/L; Guideline value for Total Nitrogen is 140 µg/L.

Figure 3-8: Nitrate and nitrite and total nitrogen (N) concentrations in surface, midwater and near-bottom samples at sites S1 to S15



*Note: Guideline value for orthophosphate is 5 µg/L; Guideline value for Total P is 10 µg/L.

Figure 3-9: Orthophosphate and total phosphorous (P) concentrations in surface, midwater and near-bottom samples at sites S1 to S15

3.2.1.3 Pigments

Chlorophyll-a concentrations were used as an indicator of the likely level of phytoplankton biomass across the Dorado Survey Area. Chlorophyll-a concentrations ranged from <0.1 µg L-1 to 0.8 µg L-1 (Table 3-1). All concentrations were below the ANZG (2018) default guideline value of 9 µg L-1 for chlorophyll-a in slightly disturbed tropical Australian marine offshore ecosystems. Concentrations were lowest at the surface, and highest in either midwater (Sites S3, S4, S5, S6, S8, S9, S12) or near seabed samples (Sites S1, S2, S7, S10, S11, S13, S14, S15).

Phaeophytin a was also sampled as this pigment is a breakdown product of chlorophyll-a and can be used to indicate if phytoplankton are blooming or declining. Phaeophytin a was detected in 18 samples and 13 of those were taken near the seabed. Concentrations ranged from <0.2 µg L-1 (i.e. below LOR) to 0.6 µg L-1 (Table 3-1). There is no ANZG (2018) default guideline value for phaeophytin a.

3.2.2 Total suspended solids

Total suspended solids (TSS) concentrations were low and ranged from <0.5 mg L-1 (below LOR) to 5.4 mg L-1 (Figure 3-10, Table 3-1). Highest TSS concentrations were recorded in near seabed samples (5.4 mg L-1 was recorded at Site 5 – the deepest site) and lowest values in surface waters (concentrations were only slightly above LOR at Site S1, at 0.7 mg L-1). Midwater concentrations peaked at 1.0 mg L-1 at Sites S11 and S14.

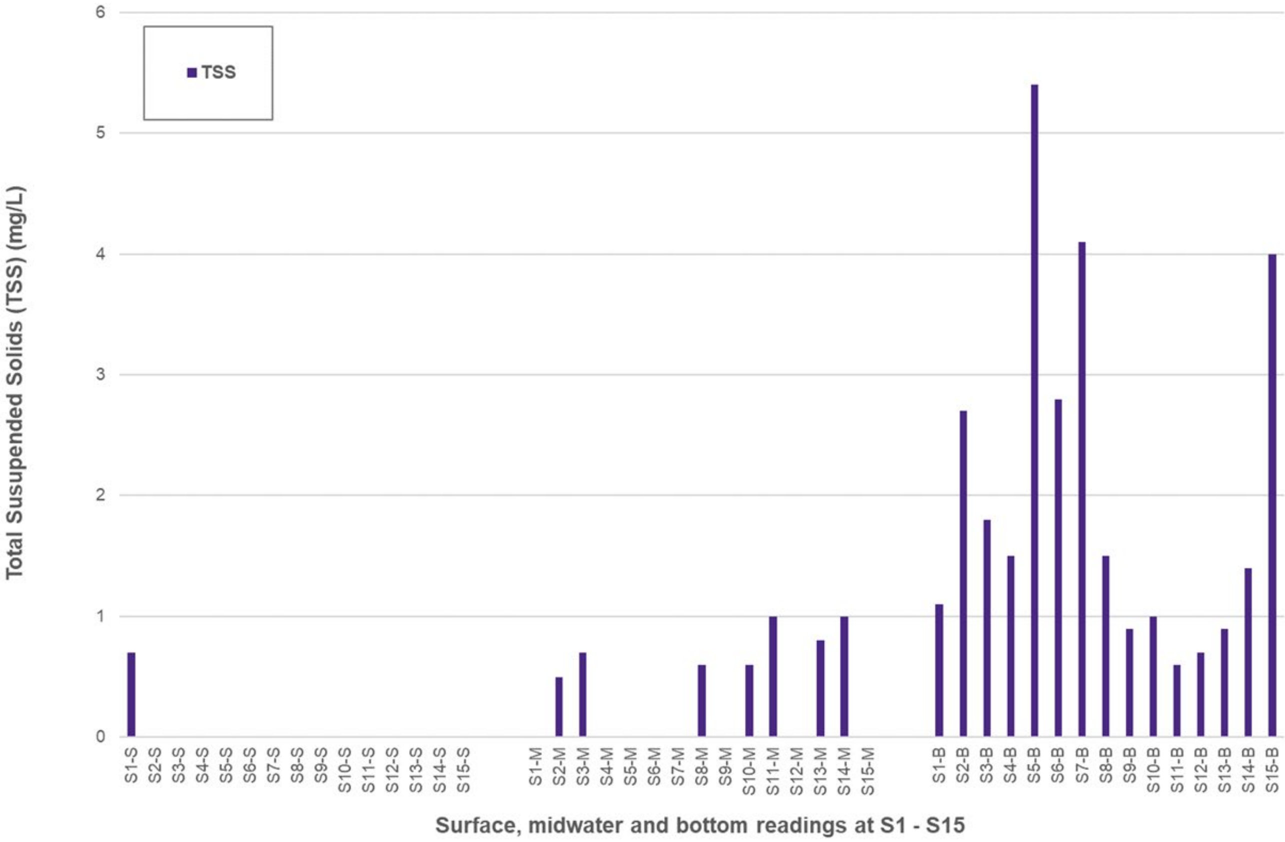


Figure 3-10: Total suspended solids (TSS) concentrations in surface, midwater and near-bottom samples at sites S1 to S15

A Default trigger value for slightly disturbed tropical marine offshore ecosystems (ANZG 2018). Exceedances of default trigger values are indicated by values in bold and underlined.

3.2.3 Metals/metalloids

No metals/metalloids in the water samples collected across the Dorado baseline survey area were above ANZG (2018) recommended trigger values for slightly to moderately disturbed marine systems (where available) or, in the case of arsenic (As), above the ANZG (2018) low reliability trigger values (Table 3-2).

Filtered and unfiltered cadmium (Cd), chromium (Cr), lead (Pb), nickel (Ni) and mercury (Hg) concentrations were all at or below LOR and hence guidelines levels. Filtered and unfiltered cobalt (Co) concentrations were all at or below LOR except S6-M at 0.06 µg L-1, with all samples below ANZG (2018) guideline levels (Table 3-2).

Filtered arsenic (As) concentrations ranged from 1.6 to 1.9 µg L-1, with lowest concentrations recorded from Site S1 surface and midwater samples, and peak concentrations recorded in nine samples. Unfiltered arsenic was recorded over a similar range, with 1.7 µg L-1 recorded from nine samples and 2.0 µg L-1 recorded in Site S11 and Site S13 midwater samples. All recorded concentrations were below the ANZG (2018) guideline level of 4.5 µg L-1 (Table 3-2).

Filtered barium (Ba) concentrations were recorded between 5.2 and 6.3 µg L-1. Unfiltered barium concentrations were also recorded over a similar range (5.1–6.4 µg L-1). In both cases, lowest levels were recorded from Site S14 surface waters and peak levels from the Site S6 midwater sample (Table 3-2). There is no guideline level for barium.

Filtered copper (Cu) concentrations ranged from below LOR (<0.2 µg L-1) in 28 samples to 0.7 µg L-1 in the Site S7 surface sample. Unfiltered copper was also recorded below LOR (<0.2 L-1) in 20 samples, with peak concentrations of 0.4 µg L-1 recorded in Site S2 midwater and Site S7 surface samples. All concentrations were below the ANZG (2018) guideline level of 1.3 µg L-1 (Table 3-2).

Filtered zinc (Zn) concentrations ranged from below LOR (<1.0 µg L-1) in 28 samples to 3 µg L-1 in the Site S8 midwater sample. Unfiltered zinc was also recorded below LOR (<1.0 µg L-1) in 32 samples, with the peak concentration of 5 µg L-1 recorded from the Site S13 surface sample. All samples were below the ANZG (2018) guideline level of 7.0 µg L-1 (Table 3-2).

3.2.4 Hydrocarbons

Total recoverable hydrocarbon (TRH) concentrations were not measured above limits of reporting in any samples except in the Site 8 surface sample, where very low concentrations of the C29-C36 fraction were recorded (70 µg L-1) (Table 3-3). BTEXN were also recorded at low concentrations in the same sample (Table 3-3). Relative to guideline values toluene was at the 99% species protection of 110 µg L-1 , at the 90% level of species protection limit for ethylbenzene, and below the 80% species protection factor for naphthalene and m-xylene (ANZG 2018).

Table 3-2: Filtered and unfiltered metals/metalloids

Sample	As	Ba	Cd	Co	Cr	Cu	Hg	Ni	Pb	Zn	As	Ba	Cd	Co	Cr	Cu	Hg	Ni	Pb	Zn
	Filtered (bioavailable fraction)										Unfiltered (total)									
Unit	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	mg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	µg L-1	mg L-1	µg L-1	µg L-1	µg L-1

a ANZG (2018) Low reliability trigger value

b ANZG (2018) 99% species protection level default guideline value (DGV), recommended for slightly to moderately disturbed marine systems

c ANZG (2018) 95% species protection level DGV, recommended for slightly to moderately disturbed marine systems (for chromium, value represents CrIII DGV).

3.2.5 Naturally occurring radioactive materials (NORMS)

Nearly all the samples taken for naturally occurring radioactive materials (NORMS) were below the LOR (Table 3-4). In accordance with ISO 11929 testing standards, each separate test for an analyte has an individual LOR based on the statistical probability of detection due to the nature of testing radio nucleotides. Therefore, the LORs for an analyte (e.g. Radium266) are different among samples. Data points that are prefixed by the symbol '<' demonstrate that result is below the LOR for that sample. Three samples that exceeded the LOR for that sample include S1 Bottom Thorium228, S6 Middle Radium266, and S9 Bottom Radium266.

There are no ANZG (2018) trigger values for NORMs, however, there are guidelines for drinking water National Health and Medical Research Council (NHMRC) & ARMCANZ (2011) which are generally more stringent guidelines because they are related to human health. According to these guidelines, concentrations of Radium226 and Radium228 should not be above 4.89 (Bq/L) and 1.98 (Bq/L). All the data for the samples, including the three that exceeded LORs, are one to two orders of magnitude below these trigger values.

Table 3-4: Naturally occurring radioactive materials (NORMS)

3.2.6 Quality control samples

All samples were returned to the analytical laboratories within holding time requirements. one sample (S15-S) exceeded the holding time for hydrocarbons because the first laboratory extraction taken within the holding time was broken during analysis. The second extraction exceeded the holding time by six days (see Appendix C). The results from the second extraction were all below limits of reporting for hydrocarbons. This result was consistent with the other results for the site.

Results from laboratory analysis of the transport blank and field blank showed that samples were below limits of detection for all analytes, demonstrating that QA/QC procedures to mitigate risk of sample contamination were effective.

Multivariate analysis of sample data, including QA/QC samples, identified that duplicates 1, 2 and 4 were not significantly different to the representative sample for each site (surface samples from sites 9, 5 and 4, respectively). Duplicate sample 3 was found to be significantly different to the representative site sample (surface site 12), due to lower levels of chlorophyll-a, unfiltered copper and unfiltered zinc. Filtered copper was at the limit of detection in the duplicate sample, but below the limit of detection in the representative sample. Field notes taken at the time of sample collection indicated that there was a ‘slick’ of plankton at the surface, and the differences in the chlorophyll-a recorded indicate that patchiness in this slick (due to windrows) may explain the differences observed between the duplicate and the representative sample in surface waters of site 12.

3.3 Multivariate analysis of water quality samples

Multivariate analysis was undertaken to identify if any trends existed between analytes and sampling locations. The data analysed in these analyses are all the analytes collected from the surface (S), middle (M), and bottom (B) water samples as indicated by their colour, including quality control (QC) samples and the number against each sample indicates the sampling location.

A cluster analysis generally identified three separate clusters of data as identified by the grouping of red lines (Figure 3-11). The field blank (FB) and transport blank (TB) are nested separately given they did not contain the analytes tested and show they were not contaminated with the tested analytes. Samples taken from the bottom at locations 4, 5, 6, and 15 are also grouped separately from all the other samples.

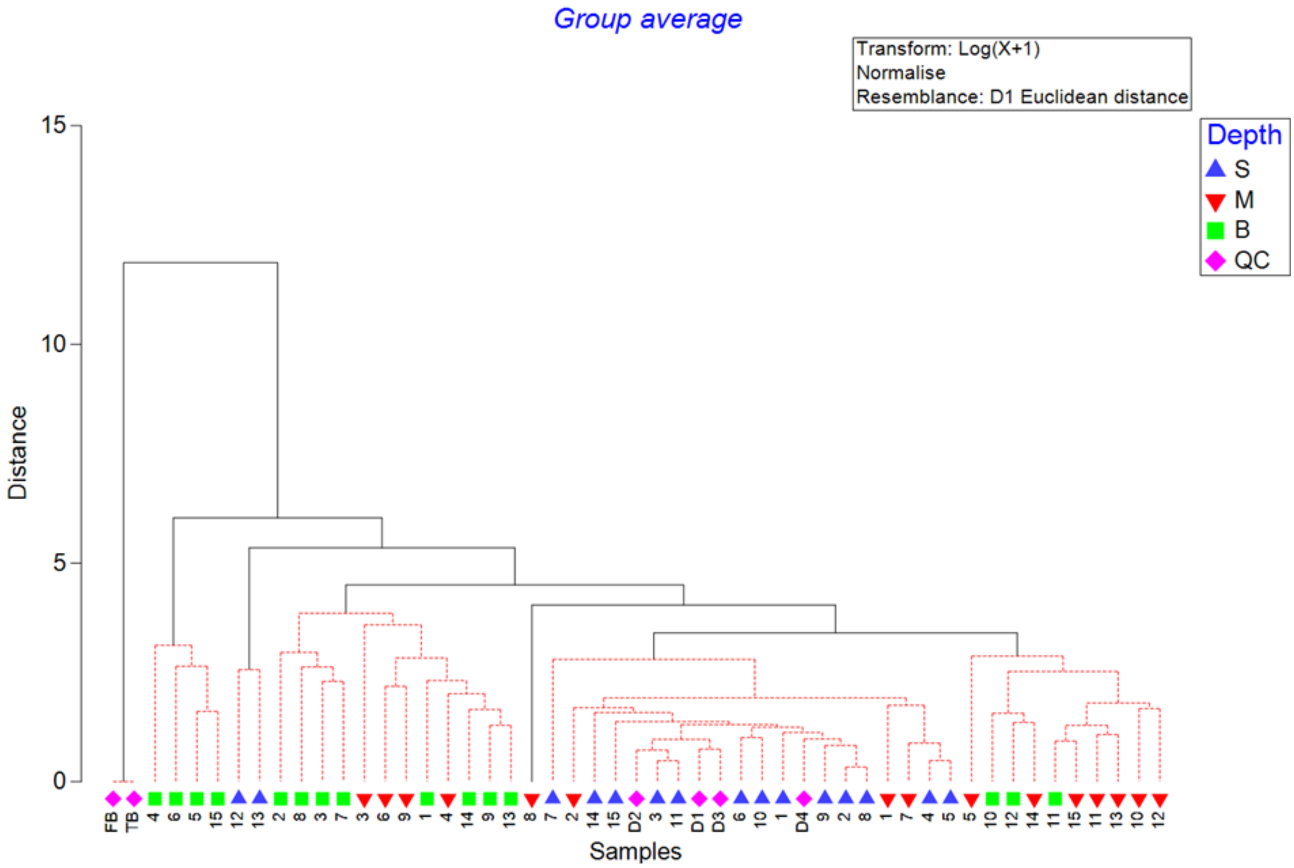

Figure 3-11: Cluster analysis of water quality sample analytes at surface, middle and bottom depths across all sampling sites

Similarly, an n-MDS analysis shows there are differences in the samples taken between the surface (S), middle (M) and bottom (B) locations as indicated by the spatial separation of these samples (Figure 3-12). The duplicate quality control samples (QC) are grouped amongst the samples in which they were taken and demonstrate that contamination has not occurred. The n-MDS plot does not directly identify what is driving differences between surface, middle and bottom samples, so PCA analysis was undertaken.

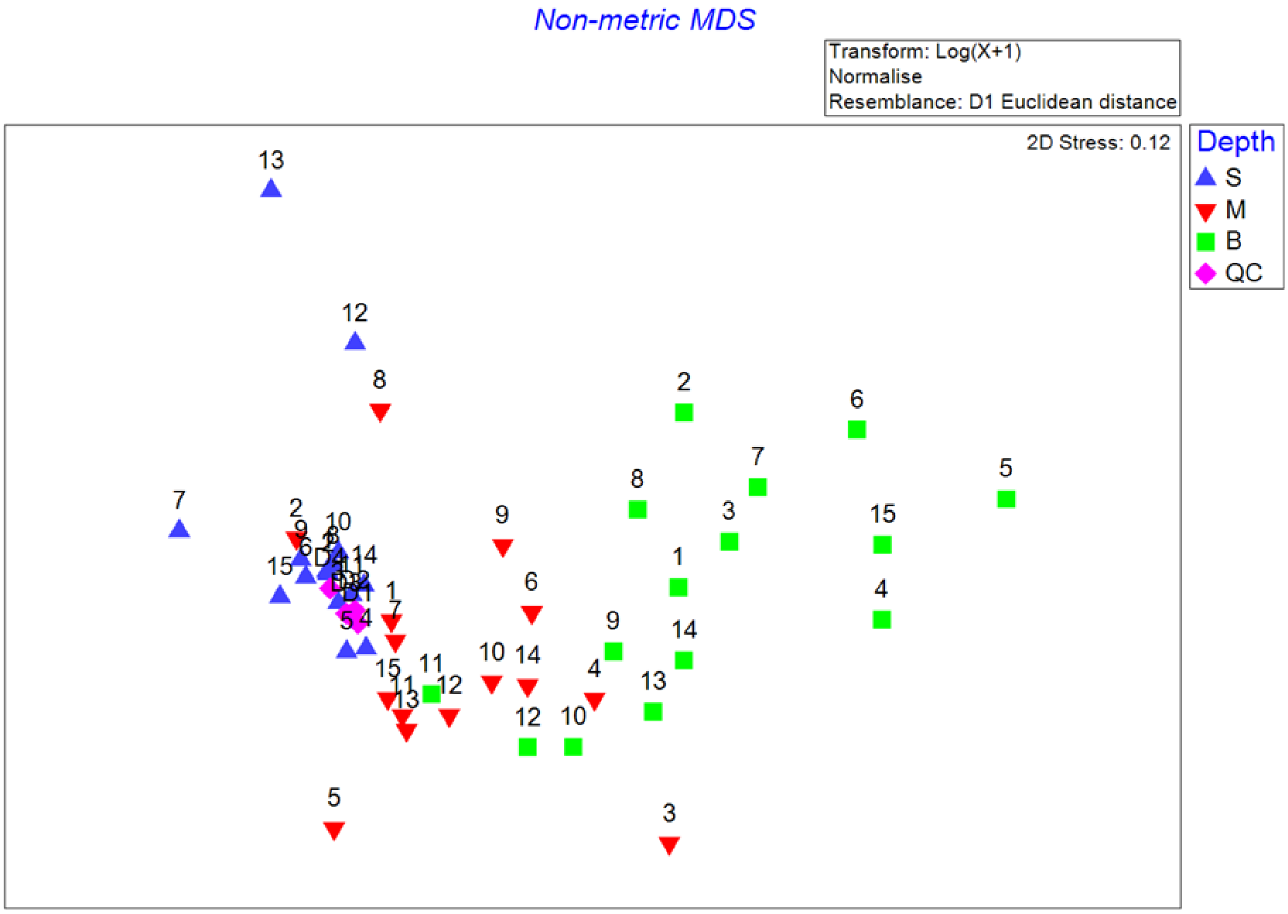

Figure 3-12: MDS analysis of water quality sample analytes at surface, middle and bottom depths across all sampling sites

The PCA analysis below shows the factors that are driving the separation and groupings identified in the cluster analysis and MDS plot (Figure 3-13). The vectors in the circle are the analytes that were tested, the direction relates to the direction in which the vector is explaining differences between samples, and length of each vector relates to the relative strength of the relationship between the factor and sample. This analysis shows the bottom samples generally had different levels of TSS, Chlorophyll a, Ortho-P, Phaeophytin a and NO3 + NO2 as indicated by the grouping of the locations in the direction of these vectors, relative to the other sampling locations. The grouping of locations 4, 5, 6, and 15 identified in the cluster analysis are slightly separated along the same vector trajectory suggesting these factors were likely explaining the differences at these locations. The pink duplicate samples are grouped with the surface samples suggesting they are similar, while the field and travel blanks (FTB) are completely separate and show they were not contaminated.

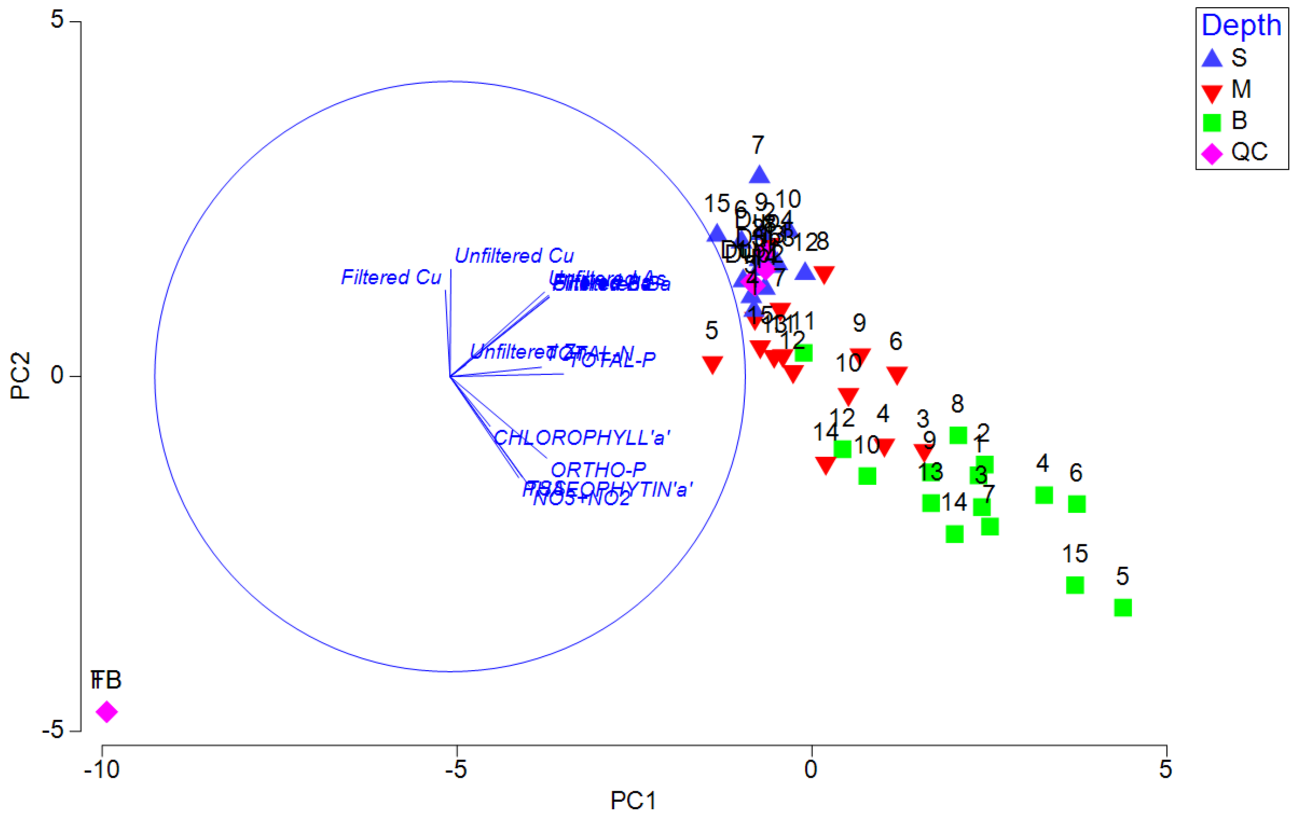

Figure 3-13: PCA analysis of water quality sample analytes at surface, middle and bottom depths across all sampling sites discussion

This study characterises the water quality conditions through the water column at 15 sites across the Dorado Survey Area during the Austral summer. The data showed that water quality conditions were typical of offshore waters of the Pilbara and North West Shelf. For example, water temperatures were within the range recorded between October 2017 and April 2019 during the Bedout Basin metocean deployments (RPS 2019). The water column profiles during the present study showed a maximum of 30.65 °C at the surface and a minimum of 21.73 °C near the seabed; water temperatures measured during the metocean deployment ranged from a maximum of 31.18°C at ~13 m below the sea surface in 100 m water depth to a minimum of 19.68°C at ~1.5 m above seabed in 140 m water depth (RPS 2019).

There was a general trend of higher salinity near the sea surface which may be explained by increased evaporation. Since the survey area is remote from any potential terrestrial sources of freshwater input, factors affecting salinity are likely to be either climatic or hydrographic. Mahjabin et al. (2016) found salinity was higher in the Pilbara waters during the summer months and attributed this to higher rates of evaporation in this season. The elevated salinity in surface waters has also been linked to stratification off the Pilbara coast with heavier, more saline waters sinking and forming a dense layer closer to the seabed (Mahjabin et al. 2016). However, this is generally a winter phenomenon and was not observed in the present study conducted in summer, suggesting that the structure of the water column may change seasonally.

Stratification of the water column was also indicated by temperature, pH and dissolved oxygen changes with depth. At shallower sampling sites a thermocline was observed at depths between 25 - 50 m BSL, with warmer water near the surface, possibly due to solar heating and a lack of vertical mixing. Temperature levels below the thermocline generally decreased with depth. These data are comparable to data collected by RPS (2019), where a thermocline was recorded in the upper water column, which moved downwards in the water column in January due to the cooling of near seabed waters caused by very strong advective cooling events. Similarly, Lowe et al. (2012) observed thermoclines in surface waters (0-100 m BSL) and mid-column waters (75-150 m BSL) off the North West Cape (Exmouth). These thermoclines were found to be seasonal, and the occurrence and depth of thermoclines are likely to be variable across the year at the Dorado Project location also.

The pH levels were generally consistent and higher towards the surface, possibly due to the removal of acidic dissolved carbon dioxide from surface waters by planktonic photosynthesis. The pH then decreased rapidly with increased depth, potentially due to oxidation of decaying organic matter sinking from shallower depths. It has been demonstrated that decomposition produces carbonic acid (from the dissolution of liberated carbon dioxide) and the release of hydrogen ions cause a decrease in pH (Hinga 2002). Higher oxygen concentrations are common in surface waters due to the exchange of oxygen across the air-water interface.

Profiles at sampling locations in deeper waters further offshore (sites S4, S5, S6 and S15) tended to have a greater difference in temperature, pH, dissolved oxygen, NTU and chlorophyll-a values between the surface and seabed. The upper 20 m of the water column were mostly similar between all profiles, however values for these parameters at these locations continued to decline with increasing depth generally at a consistent rate. The differences in temperature and pH profiles among deeper and shallower sites suggest there may be some vertical mixing associated with the sloping seabed at these locations because temperature and pH continued to decline with depth beyond 50 m BSL, whereas temperature and pH at the shallower sites tended to remain constant below 50 m BSL.

Turbidity was generally higher near the seabed and at deeper sites further offshore. The deeper, offshore locations also had higher levels of silt in sediment samples (RPS 2020) which suggests this turbidity resulted from the resuspension of fine surficial sediments by current or tidal movements near the seabed. RPS (2019) also found higher turbidity during spring tide periods – when the water column profiling and water sampling was undertaken when water column currents tend to be much faster.

The chlorophyll-a data obtained from the profiles using the Seabird logger generally reflected what was recorded in the water quality samples taken from the surface, middle and bottom waters at each site. The highest concentrations of chlorophyll-a were observed in the mid-water column at approximately 50 m BSL. The North West Shelf Joint Environmental Management Study (2007) found a similar pattern of primary production, with a peak at around 70 m BSL. The peak was attributed to balance between sufficient light levels to support photosynthesis combined with elevated nitrate levels to maximise phytoplankton growth. Despite nutrient levels generally increasing with depth, light availability appears to be the factor that limits phytoplankton growth at depth in the Dorado Survey Area.

Most potential contaminants tested were below the limits of reporting or ANZG (2018) recommended trigger values. Nutrients were the only analytes which exceeded trigger values; however, these values are generally only a guide since they can fluctuate greatly under natural conditions and have previously been recorded at higher concentrations off the North West Shelf (e.g. Woodside 2007, Woodside 2020). Nutrient concentrations (ammonia, nitrate, nitrite and orthophosphate) generally increased with depth, likely due to nutrient compounds being released during the decay of organic material, which sinks through the water column and accumulates on the sea floor. Other studies on the North West Shelf have found much higher nutrient concentrations, with nitrogen concentrations at depth reaching 711 µg/L (Woodside 2007). Nutrient concentrations measured in such low concentrations (µg/L) can vary greatly due to complex cycling that involves both biotic and abiotic factors. The natural exceedance of nutrient trigger levels highlights the need for this study which has characterised water quality conditions that are location specific and can inform future activities in the Dorado Survey Area.

	36.7 ± 0.1	36.781	36.738	Pass	6/12/2019 K.Wienczugow

[1]Laboratory salinity check water was prepared by calibrating against IAPSO standard seawater 35.00 psu. [2]MAFRL's SBE 19 *Plus V2 - 100m* CTD was tested as an additional comparitive measure.

Table 2 Temperature Calibration Check

SBE 19 Plus V2 - 600m	[3]Laboratory Temperature Check	[2]Laboratory SBE 19 Plus V2 Comparison	SBE 19 Plus V2 - 600m	Tolerance ± 0.1°C	Date Checked / Name
Serial No: 19P-7123	Temperature (± 0.1 °C)	Temperature (°C)	Temperature Reading (°C)	Pass/Fail	
	24.3 ± 0.1	24.261	24.245	Pass	6/12/2019 K.Wienczugow

[3]Laboratory temperature check made with a NATA accredited -5.0 to 50.0°C immersion thermometer (Serial number: 0681667). [2]MAFRL's SBE 19 *Plus V2* - 100m CTD was tested as an additional comparitive measure.

Table 3 pH Calibration Check

Model: SBE 18-I	[4]Laboratory pH Check		SBE 19 Plus V2 - 600m	Tolerance ± 0.1 pH Unit	Date Calibrated / Name
Serial Number:18-0946	pH Standard (± 0.01)		pH Reading post Cal	Pass/Fail	
	4.00 @ 20°C		4.00	Pass	6/12/2019 K.Wienczugow
	7.02 @ 20°C		7.00	Pass	6/12/2019 K.Wienczugow
	10.06 @ 20°C		9.93	Pass	6/12/2019 K.Wienczugow

[4]pH calibration performed with traceable pH standards according to Sea-Bird Application note 18-1 for pH sensor calibration (Slope = 4.7257, Offset = 2.5828)

Table 4 DO Calibration Check

Model: SBE 43		[5]Laboratory SBE 19 Plus V2 Comparison	SBE 19 Plus V2 - 600m	Tolerance ± 5%	Date Checked / Name
Serial Number:432365		Dissolved Oxygen (%)	Dissolved Oxygen Reading (%)	Pass/Fail	
		86.96	83.93	Pass	6/12/2019 K.Wienczugow

[5]Dissolved Oxygen calibration checked and compared against a cleaned and calibrated SBE 43 DO sensor from MAFRL's SBE 19 *Plus V2* - 100m CTD.

Table 5 Turbidity Calibration Check

Model: Wet Labs - NTU	[6]Laboratory Turbidity Standard		[7]SBE 19 Plus V2 - 600m	Tolerance ± 5%	Date Calibrated / Name
Serial Number: 201	Turbidity (NTU ± 0.1)		Turbidity Reading (NTU)	Pass/Fail	
	0.0		0.00	Pass	6/12/2019 K.Wienczugow
	5.0		5.01	Pass	6/12/2019 K.Wienczugow
	10.0		10.04	Pass	6/12/2019 K.Wienczugow

[6]Zero NTU standard prepared from 0.2µm filtered deionised distilled water. Freshly prepared primary formazin standard 4000 NTU was diluted for a three point check carried out in a non reflective black plastic bucket.

[7]Average turbidity readings were calculated using Sea Save software taken from WET Labs ECO-NTU turbidity probe and calibration coefficients were optimised for maximum accuracy within operational range (Range 0-34 NTU) (Scale factor = 6.30000, Dark Output = 0.09600).

SBE 19 Plus V2 - 600m (19P-7123) - Salinity, Temperature, DO, pH,Turbidity Chlorophyll 'a' and Cude Oil sensor check

Client: RPS Australia Asia Pacific — Analyst: K.Wienczugov

Address: Level 2, 27-31 Troode St, West Perth WA 6005 — Date: 6/12/2019

Contact: Garnet Hooper   Email: Garnet.Hooper@jrpsgroup.com.au   Phone: 9211 1131   Job: Santos Dorado Survey December 2019

Table 6 Chlorophyll 'a' - Fluorescence Calibration Check

Model: Cyclops-7 2108-000	[8]Laboratory Zero Standard		[9]SBE 19 Plus V2 - 600m	Tolerance ± %	Date Checked / Name
Serial Number: 2180475			**Fluorescence Response (Volts)**	**Pass/Fail**	
	DDI Blank water / Full Response		0.00 / 4.91	Pass	6/12/2019 K.Wienczugow

[8]Zero Fluorescence standard prepared from 0.2µm filtered deionised distilled water in black plastic bucket.

[9]Measurements taken with Cyclops-7 Chorophyll 'a' Fluorescence probe are logged as raw voltage (Range 0-5 Volts) for post processing against field extracted Chlorophyll 'a' samples (Scale factor = 1.0, Offset= 0.0).

Table 7 Crude Oil - Fluorescence Calibration Check

Model: Cyclops-7 2108-000	[10]Laboratory Quinine Sulphate Standards			[10]SBE 19 Plus V2 - 600m	Date Calibrated / Name
Serial Number: 2180528	**Concentration (µg/L)**			**Crude oil Response (V)**	
	0			0.310	6/12/2019 K.Wienczugow
	10			0.490	6/12/2019 K.Wienczugow
	20			0.692	6/12/2019 K.Wienczugow
	40			0.940	6/12/2019 K.Wienczugow
	100			3.400	6/12/2019 K.Wienczugow

[10]Average readings were calculated using Sea Save software and a Cyclops-7 Crude Oil sensor and calibration coefficients were calculated against Quinine Sulphate standard (Range: 0-100µg/L QS) (Scale = 21.00, Offset= -4.00).

Crude Oil Fluorescence measurements require post processing against laboratory tested water samples to enable concentrations of PAH's to be extrapolated to the water column profile data.

APPENDIX B: DETAILS OF LABORATORY ANALYSIS

Table B-1: Analytes, laboratories, sample storage/preservation and holding times

Analyte	Laboratory	Storage container	Preservation	Holding time
Total nitrogen	MAFRL	Polypropylene	Freeze	1 month
Total phosphorus	MAFRL	Polypropylene	Freeze	1 month
Ammonium	MAFRL	Polypropylene	0.45 µm filter and freeze	1 month
Nitrate and nitrite	MAFRL	Polypropylene	0.45 µm filter and freeze	1 month
Orthophosphate	MAFRL	Polypropylene	0.45 µm filter and freeze	1 month
Chlorophyll-*a* and phaeophytin *a*	MAFRL	Seed envelope	GFF filter and freeze	1 month
Total suspended solids	MAFRL	Seed envelope	GFC filter and freeze	1 month
Arsenic	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Barium	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Cadmium	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Chromium	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Cobalt	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Copper	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Mercury	MAFRL	Amber glass with Teflon cap liner	Acidify with nitric acid to pH 1–2, add potassium dichromate	1 month
Nickel	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Lead	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
Zinc	MAFRL	Polypropylene	Acidify with nitric acid to pH 1–2	1 month
BTEXN	ALS	Amber glass with Teflon cap liner	Acidify with sulphuric acid, chill to 4 °C	1 week
TRH (C_{10}–C_{36})	ALS	Amber glass with Teflon cap liner	Chill to 4 °C	1 week
PAHs	ALS	Amber glass with Teflon cap liner	Chill to 4 °C	1 week
$Radium^{226}$	SGS	Polypropylene	Acidify with nitric acid to pH 1–2	2 months
$Radium^{228}$	SGS	Polypropylene	Acidify with nitric acid to pH 1–2	2 months
$Thorium^{228}$	SGS	Polypropylene	Acidify with nitric acid to pH 1–2	2 months

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

METHOD	METHODOLOGY SUMMARY
ARS-SOP-AS301/AS406	Analysis of radionuclides in liquids by high resolution gamma ray spectrometry after radiochemical preparation. Radiochemical preparation involves total sample evaporation, sample co-precipitation using stable elemental carriers, or a combination thereof. In some cases, preparation may involve merely transferring liquid to a standard geometry container such as a Marinelli beaker.

FOOTNOTES

*	NATA accreditation does not cover the performance of this service.	-	Not analysed.	UOM	Unit of Measure.
**	Indicative data, theoretical holding time exceeded.	NVL	Not validated.	LOR	Limit of Reporting.
		IS	Insufficient sample for analysis.	↑↓	Raised/lowered Limit of Reporting.
		LNR	Sample listed, but not received.		

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.
Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the " Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.
Note that in terms of units of radioactivity:

a. 1 Bq is equivalent to 27 pCi
b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

EXECUTIVE SUMMARY

Santos Limited (Santos) is planning for the development of the Dorado Oil Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia and approximately 140 km north of Port Hedland. The Dorado Project will target the Dorado oil field with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading (FPSO) facility.

To inform the impact assessment and support the preparation of the Offshore Project Proposal (OPP), a drill cuttings and drilling muds discharge modelling study was commissioned. The study considered the discharge of cuttings and muds from 12 successive wells from the WHP based on the proposed drilling schedule by Santos that comprised of 528 days for the total operation and 216 days of discharge.

The principal aim of the study was to calculate and quantify the distribution and sediment thicknesses from discharged drill cuttings and drilling muds on the sea floor.

Summary of Modelling Results

Results for a single well

- The modelling results demonstrated that larger particles (greater than 0.25 mm diameter) were predicted to settle typically within 1 km from the well, while the currents transported the smaller sediments (less than 0.25 mm) further away from the well.
- The maximum sediment thickness (or height of mound) was predicted to be 126 mm adjacent to the well location (<20 m).
- The maximum distance from the well to the natural threshold level (≥0.1 mm) was 1,115 m with a corresponding area of coverage of 0.65 km^2.
- The maximum distances to the low (1-10 mm) and high (≥10 mm) exposure thresholds was 837 m and 251 m, respectively.
- The greatest areas of coverage on the seafloor at the low and high exposure thresholds, was recorded as 0.29 km^2 and 0.02 km^2, respectively.

Results for the twelve wells

- The combined maximum thickness (or height of mound) predicted was 1,315 mm adjacent to the well location.
- Modelling predicted a zone of potential influence at the natural threshold level up to 2,871 m from the well while covering an area of 8.81 km^2.
- The low and high exposure thresholds were more localised and not expect beyond 954 m and 447 m, respectively.
- Greatest areas of coverage on the seafloor at the low and high exposure thresholds were 0.92 km^2 and 0.28 km^2, respectively.

1 INTRODUCTION

1.1 Background

Santos Limited (Santos) is planning for the development of the Dorado Development, located in the Bedout Basin offshore north-west Western Australia and approximately 140 km north of Port Hedland. The Dorado Development targets the Dorado reservoir with hydrocarbon being collected on a wellhead platform (WHP) and pumped by infield flowlines for processing on a floating production storage and offloading (FPSO) facility.

The Dorado Development will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (OPGGS (E) Regulations), administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk.

To inform the impact assessment and support the preparation of the OPP, CDM Smith (on behalf of Santos) has commissioned RPS to undertake a detailed sediment dispersion modelling study of discharged cuttings and drilling muds. This study considered the discharged cuttings and muds from 12 successive wells drilled at the WHP following installation of the WHP (see Table 1.1 and Figure 1.1). . The study considered the discharge of cuttings and muds from 12 successive wells from the WHP based on the proposed drilling schedule by Santos that comprised of 528 days for the total operation and 216 days of discharge. The principal aim of the study was to calculate and quantify the distribution and sediment thicknesses from discharged drill cuttings and drilling muds on the sea floor.

Table 1.1 Location of the proposed Dorado WHP used as the release site for the drill cuttings and drilling fluids dispersion modelling assessment.

Release Site	Latitude (°S)	Longitude (°E)	Water depth (m)
Dorado WHP	19° 01′ 38.001″	118° 44′ 36.744″	90

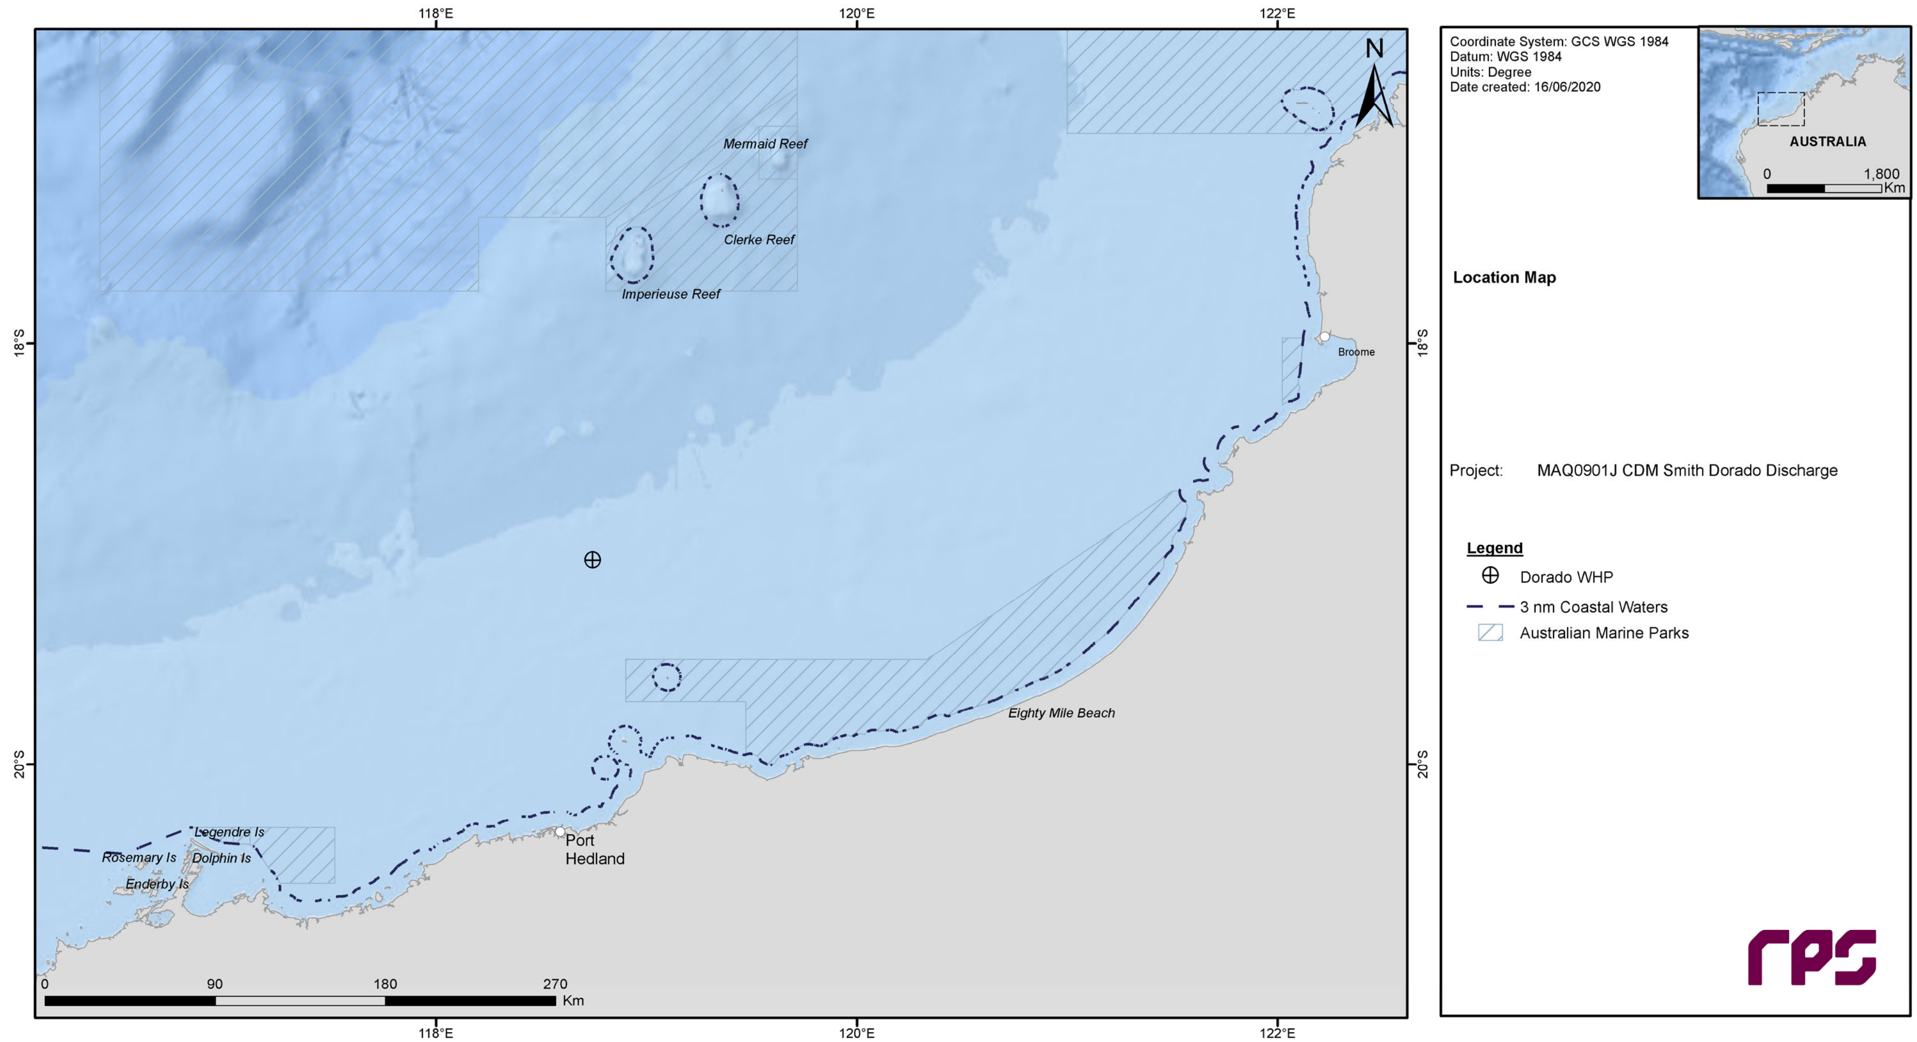

Figure 1.1 Location of the proposed Dorado WHP used as the release site for the cutting dispersion modelling assessment.

1.2 Modelling Scope

The scope of the modelling included the following components:

1. Assess Environmental Conditions.

- Assess the Southern Oscillation Index (SOI) for the period covering the ten-year (2009 to 2018), three-dimensional currents and determine a year representative of El Niño (2010), Neutral (2012) and La Niña (2015) conditions (or ENSO events), respectively.

2. Summarise the 528 day total drilling operation and consider the discharge of cuttings and muds from 12 successive wells drilled at the WHP for as input into the sediment dispersion model.
3. As part of a more robust approach, to consider the interannual variability (albeit minimal at the study site) the discharge of drill cuttings and muds were at the start of the El Niño (2010), Neutral (2012) and La Niña (2015) conditions.
4. Analysis of the results by commencing the discharge during El Niño (2010), Neutral (2012) and La Niña (2015) conditions and map the distribution and sediment thicknesses on the sea floor as well as suspended sediment concentrations in the water column.
5. Combine the results for the twelve wells and the ENSO events.

2 REGIONAL OCEAN CURRENTS

2.1 Overview

The area of interest for this study is typified by strong tidal flows over the shallower regions, particularly along the inshore region (< 100 m water depth). However, the offshore regions with water depths exceeding 100-200 m experience significant large-scale drift currents. These drift currents can be relatively strong (1-2 knots) and complex, manifesting as a series of eddies, meandering currents and connecting flows. These offshore drift currents also tend to persist longer (days to weeks) than tidal current flows (hours between reversals) and thus will have an influence upon the net trajectory of discharges over time scales exceeding a few hours.

Wind shear on the water surface also generates local-scale currents that can persist for extended periods (hours to days) and result in long trajectories. Hence, the current-induced transport of plumes can be variably affected by combinations of tidal, wind-induced and density-induced drift currents. Depending on their local influence, it is important to consider all these potential advective mechanisms to rigorously understand patterns of potential transport from a given discharge location. A comprehensive description of the circulation patterns of the Northwest Shelf is provided in a review by Condie and Andrewartha (2008).

To appropriately allow for temporal and spatial variation in the current field, dispersion modelling requires the current speed and direction over a spatial grid covering the potential migration zone of plumes. Estimates of the net currents were derived by combining predictions of the drift currents, available from a mesoscale ocean model (HYCOM), with estimates of the tidal currents generated by an RPS model set up for the study area (HYDROMAP).

2.2 Ocean Currents

The large scale drift currents were derived from the output of the global circulation model the Hybrid Coordinate Ocean Model (HYCOM; Bleck, 2002; Chassignet et al., 2007, 2009), created by the National Ocean Partnership Program (NOPP), as part of the US Global Ocean Data Assimilation Experiment (GODAE). The HYCOM model is a three-dimensional model that assimilates ocean observations of sea surface temperature, sea surface salinity and surface height, obtained by satellite observations, along with atmospheric forcing conditions from atmospheric models to predict drift currents generated by such forces as wind shear, density and sea height variations and the rotation of the earth.

The HYCOM model is configured to combine the three vertical coordinate types currently in use in ocean models: depth (z-levels), density (isopycnal layers), and terrain-following (σ-levels). HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas. Thus, this hybrid coordinate system allows for the extension of the geographic range of applicability to shallow coastal seas and unstratified parts of the world ocean. It maintains the significant advantages of an isopycnal model in stratified regions while allowing more vertical resolution near the surface and in shallow coastal areas, hence providing a better representation of the upper ocean physics. The model has global coverage with a horizontal resolution of $1/12^{th}$ of a degree (approximately 7 km at mid-latitudes) and a temporal resolution of one day.

A hindcast data set of HYCOM currents was obtained for a ten-year period spanning 2009 to 2018 (inclusive).

2.3 Tidal Currents

2.3.1 Description of Tidal Model: HYDROMAP

As the HYCOM model does not include tidal forcing, and because the data is only available at a daily frequency, a tidal model was developed for the study region using RPS' three-dimensional hydrodynamic model, HYDROMAP.

The model formulations and output (current speed, direction and sea level) of this model have been validated through field measurements around the world for more than 25 years (Isaji & Spaulding, 1984; Isaji et al., 2001;

Zigic et al., 2003). HYDROMAP current data has also been widely used as input to forecasts and hindcasts of oil spill migrations in Australian waters. This modelling system forms part of the National Marine Oil Spill Contingency Plan for the Australian Maritime Safety Authority (AMSA) (AMSA, 2002).

HYDROMAP simulates the flow of ocean currents within a model region due to forcing by astronomical tides, wind stress and bottom friction. The model employs a sophisticated dynamically nested-gridding strategy, supporting up to six levels of spatial resolution within a single domain. This allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, or of particular interest to a study.

The numerical solution methodology of HYDROMAP follows that of Davies (1977a, 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji & Spaulding (1984).

2.3.2 Tidal Grid Setup

The same tidal model grid used in the oil spill study was used for this study. The grid extends approximately 3,870 km east-west by 3,220 km north-south over the eastern Indian Ocean. Figure 2.1 shows a subset of the grid between Exmouth and Derby.

The tidal domain is sub-gridded down to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids were allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over more complex bathymetry

Bathymetric data used to define the three-dimensional shape of the study domain was extracted from the CMAP electronic chart database and supplemented where necessary with manual digitisation of chart data supplied by the Australian Hydrographic Office (see Figure 2.2). Depths in the domain ranged from shallow intertidal areas through to approximately 7,200 m.

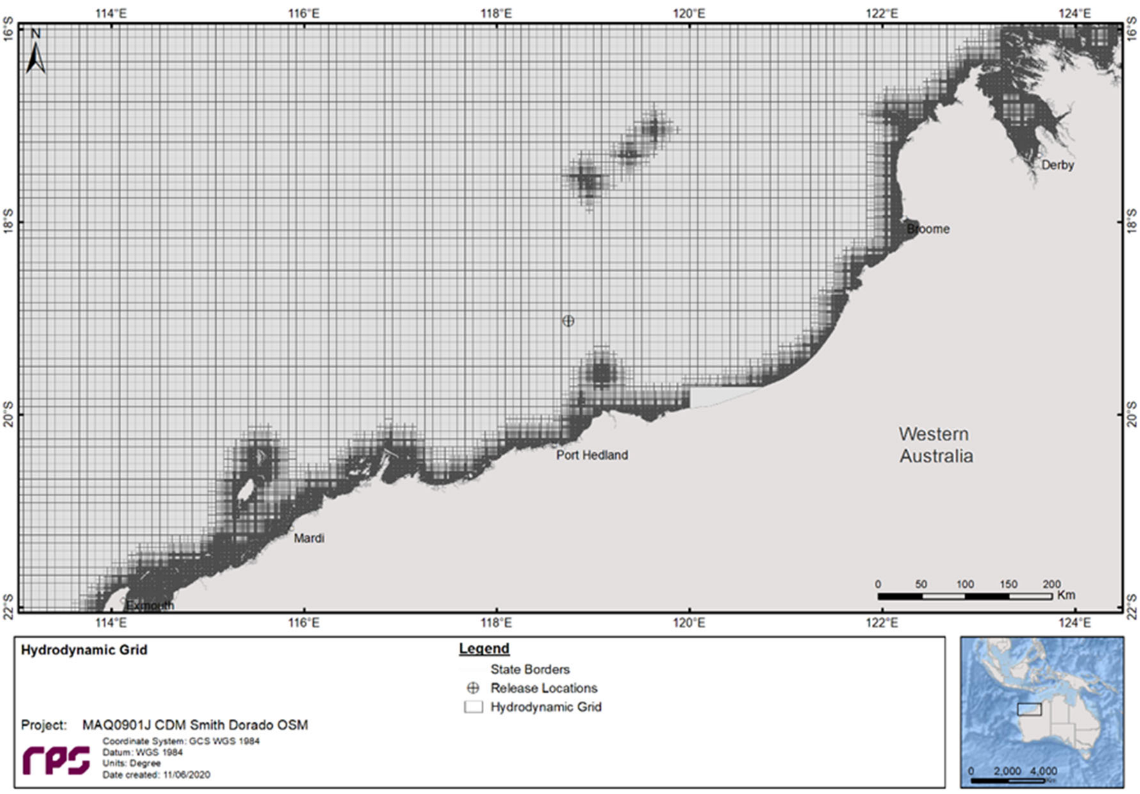

Figure 2.1 Subset of the model grid (grey wire mesh) used to generate the tidal currents. Higher-resolution areas are indicated by the denser mesh zones.

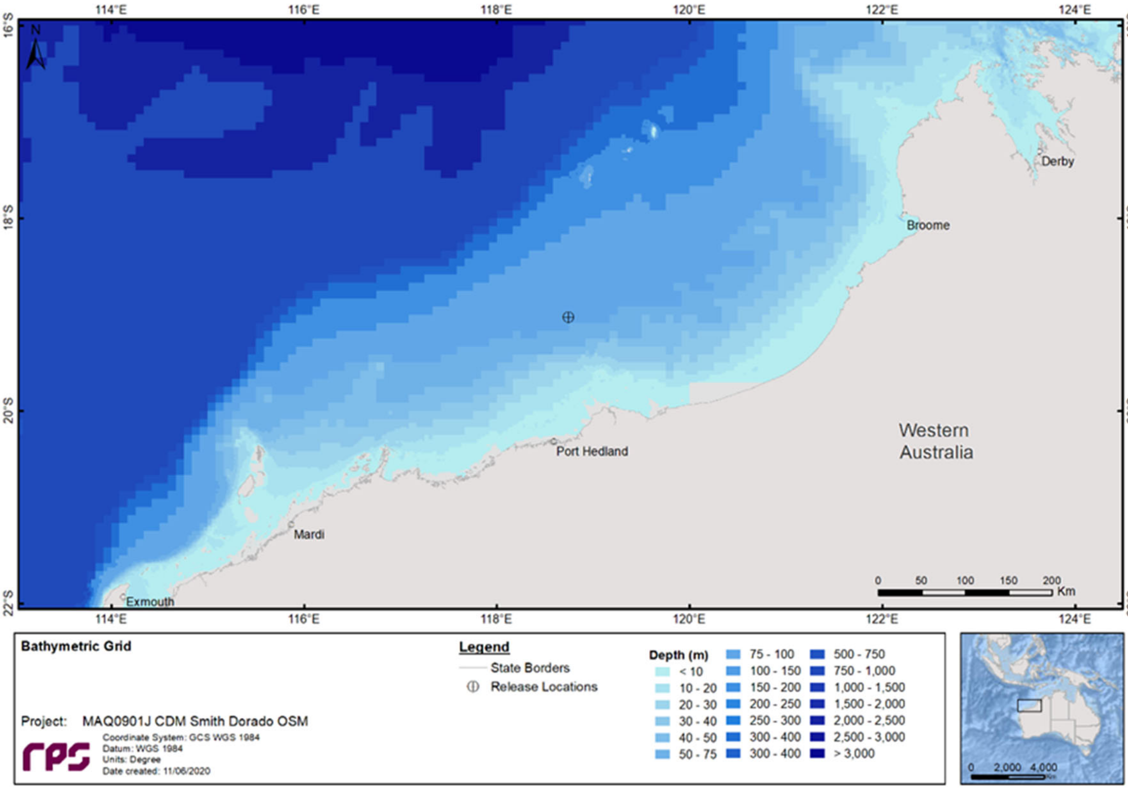

Figure 2.2 Subset of the bathymetry data used generate the tidal currents.

2.3.3 Tidal Boundary Conditions

Ocean boundary data for the HYDROMAP model was obtained from the TOPEX/Poseidon global tidal database (TPXO7.2) of satellite-measured altimetry data, which provided estimates of tidal amplitudes and phases for the eight dominant tidal constituents (designated as K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1) at a horizontal scale of approximately 0.25°. Using the tidal data, sea surface heights are firstly calculated along the open boundaries at each time step in the model.

The TOPEX/Poseidon satellite data is produced, and quality controlled by the US National Atmospheric and Space Agency (NASA). The satellites, equipped with two highly accurate altimeters capable of taking sea level measurements accurate to less than ±5 cm, measured oceanic surface elevations (and the resultant tides) for over 13 years (1992–2005). In total, these satellites carried out more than 62,000 orbits of the planet. The TOPEX/Poseidon tidal data has been widely used amongst the oceanographic community, being the subject of more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen, 2010). As such, the TOPEX/Poseidon tidal data is considered suitably accurate for this study.

2.3.4 Tidal Model Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at five locations (see Figure 2.3).

Figure 2.4 and Figure 2.5 illustrate a comparison of the predicted and observed surface elevations for each location for January 2014. As shown on the graphs, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott and Matsuura, 2005) were used.

The MAE is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood.

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i|$$

The Index of Agreement (IOA) is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2}$$

Where: X represents the variable being compared and the time mean of that variable. A perfect agreement exists between the model and field observations if the index gives an agreement value of 1 and complete disagreement will produce an index measure of 0 (Willmott, 1981). Willmott et al. (1985) also suggests that values meaningfully larger than 0.5 represent good model performance. Clearly, a greater IOA and lower MAE represent a better model performance.

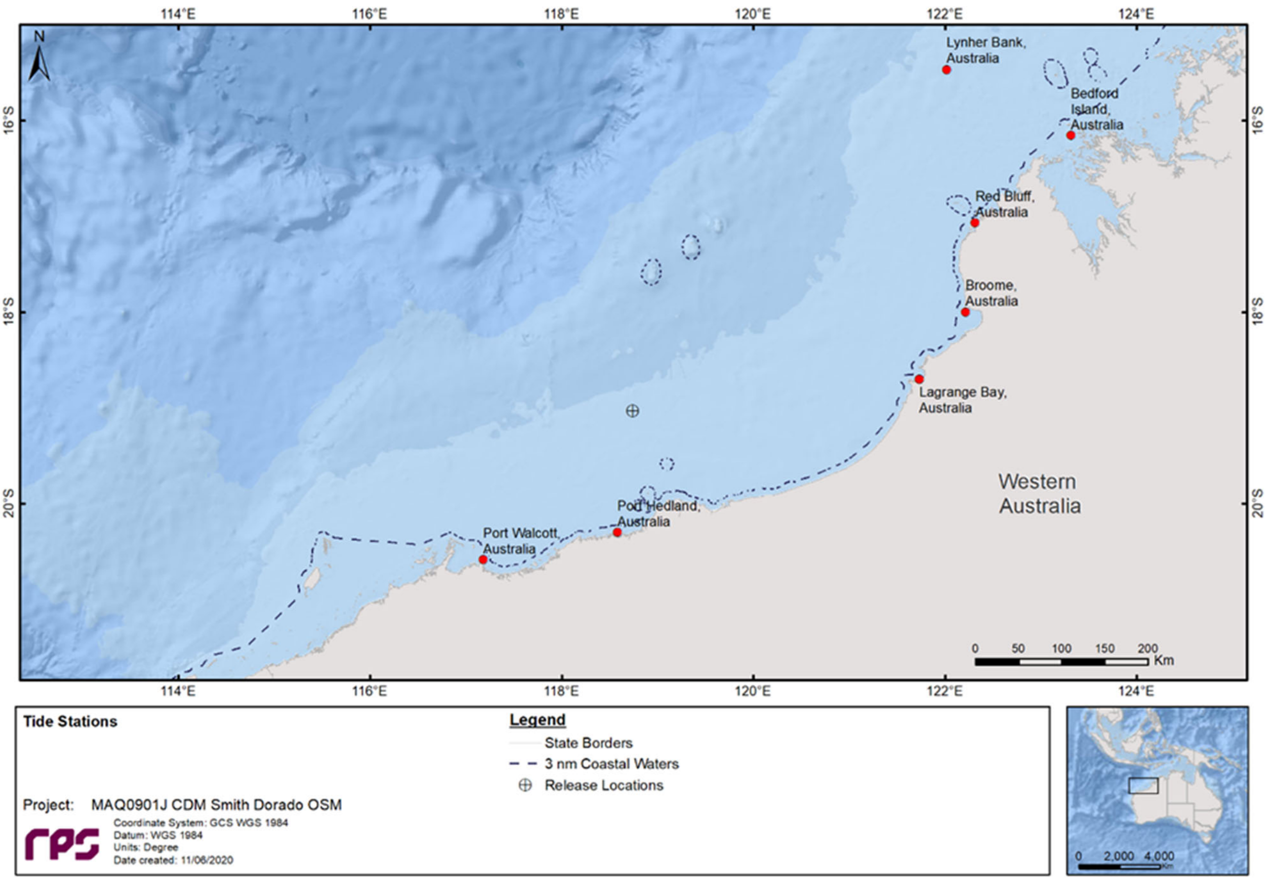

Figure 2.3 Tide stations used to validate surface elevation within the model.

Table 2.1 Statistical comparison between the observed and predicted surface elevations.

Tide Station	IOA	MAE (m)
Broome	0.90	1.11
Lagrange Bay	0.96	0.71
Lynher Bank	0.98	0.31
Port Hedland	0.98	0.33
Port Walcott	0.99	0.20
Red Bluff	0.98	0.46

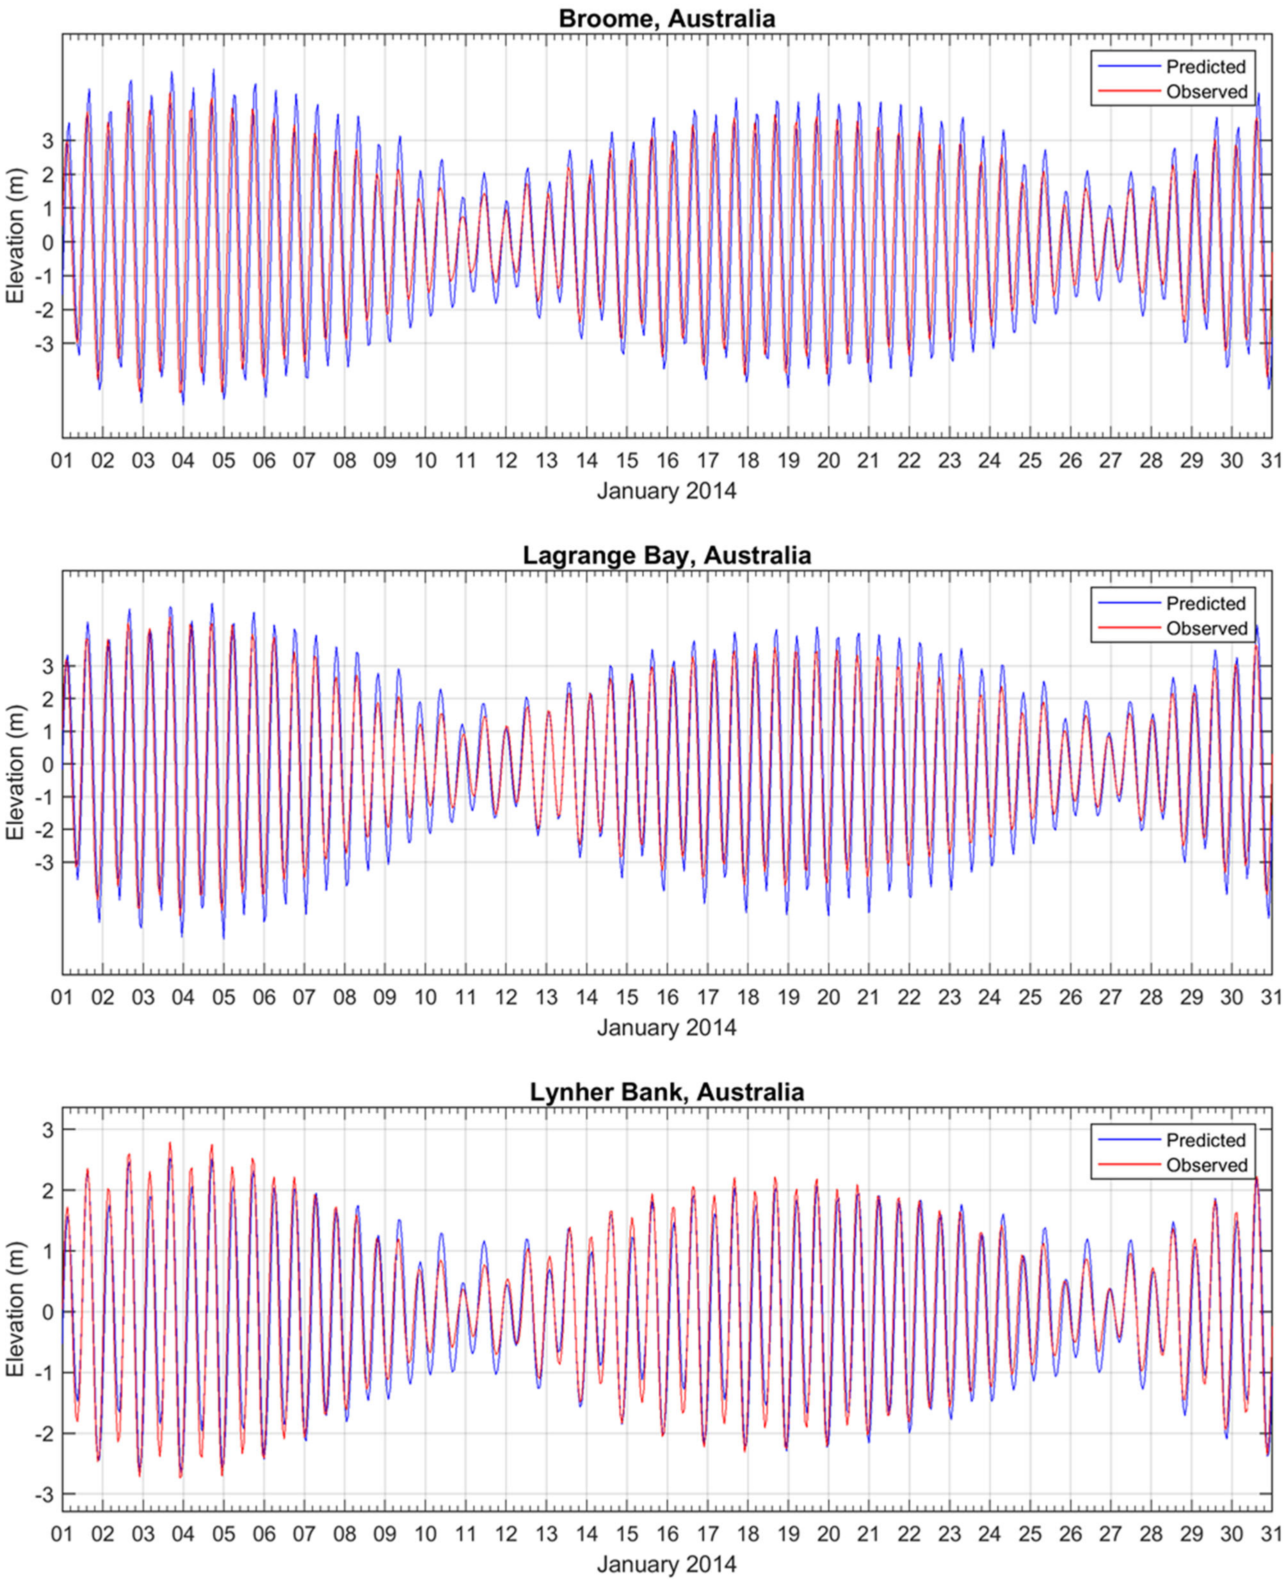

Figure 2.4 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

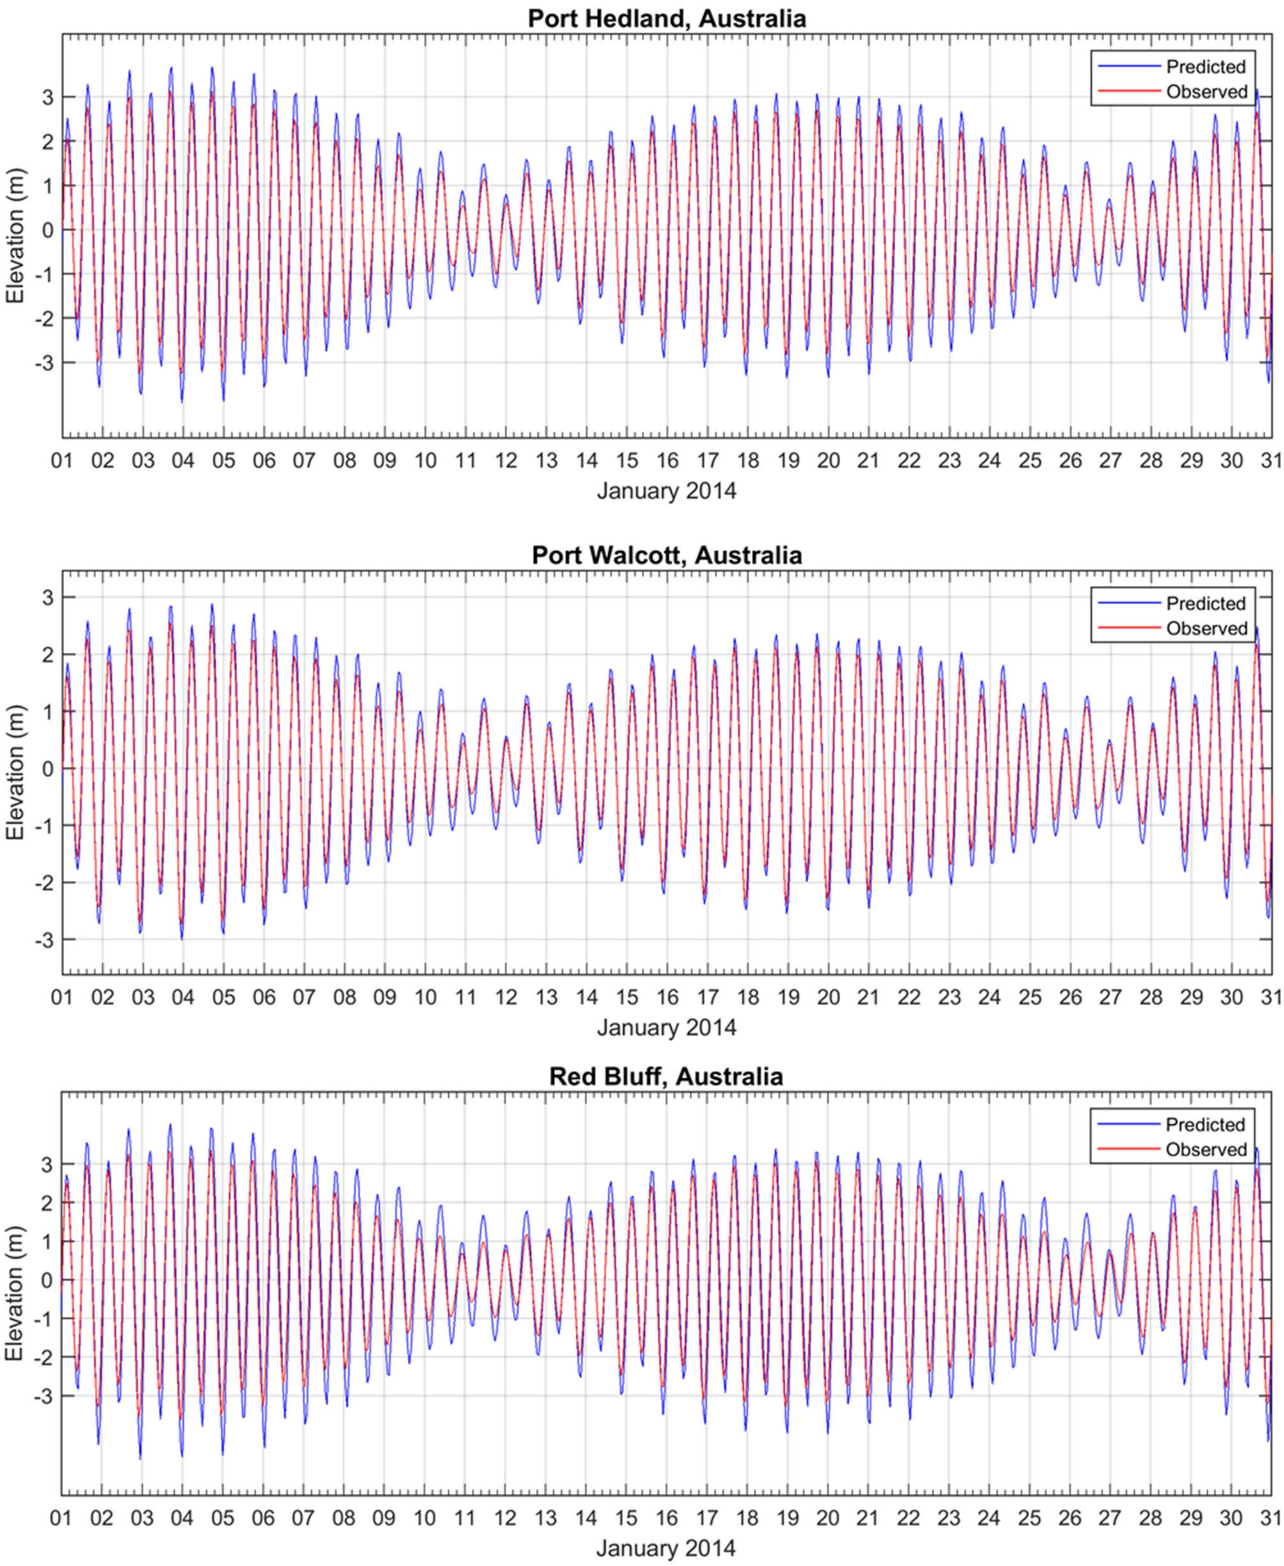

Figure 2.5 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

2.3.5 Current Model Validation

Generated current data were compared against current measurements within the Dorado Development area, using quantitative and visual comparisons at a range of depths.

Time series comparisons of the predicted and measured current speed and direction components at water depths of 40 m, 70 m and 110 m are presented in Figure 2.6, Figure 2.7 and Figure 2.8, respectively, for a two month period (January and February 2018). The time series comparisons reveal that the predicted currents offer a good match with the measured current speed and direction components at all water depths, with the magnitudes and timings of the peaks and troughs matching well.

To provide a statistical quantification of the model accuracy, comparisons were performed by determining the deviations between the predicted and measured data. As such, the root-mean square error (RMSE), root-mean square percentage (RMS %) and relative mean absolute error (RMAE) were calculated. Qualification of the RMAE ranges are reported in accordance with Walstra et al. (2001). The RMAE is relatively low in all depth layers indicating that the magnitude and range of current speeds match well, however, a slight overprediction of the predicted current magnitude is evident at times.

To compare directionality, roses for the predicted and measured currents at 40 m, 70 m and 110 m water depths over the full measurement period are shown in Figure 2.9. The roses show that the predicted current direction is a good match with the measured direction. Both the predicted model direction and the measured data direction were in good alignment at each depth layer, portraying a dominant current direction along a northwest/southeast axis. The range and variability in the measured current direction is captured by the composite model data, which matches best with the measured data at the water depth of 110 m.

Based on the validation performance, the composite model data set is a good model of standard conditions at the Dorado Development area and will adequately resolve local and regional circulation patterns. As such, the model is considered suitable for use in the numerical modelling studies conducted as part of the Dorado Development.

Table 2.2 Statistical comparison of predicted (HYDROMAP+HYCOM) and observed current speeds and directions at various depths at the Dorado Development area (January and February 2018).

Depth (m BMSL)	RMSE (m/s)	Measured peak value (m/s)	RMSE (%)	RMAE qualification
40 m	0.26	0.71	36.7	Good
70 m	0.26	0.80	29.9	Very good
110 m	0.26	0.85	27.9	Very good

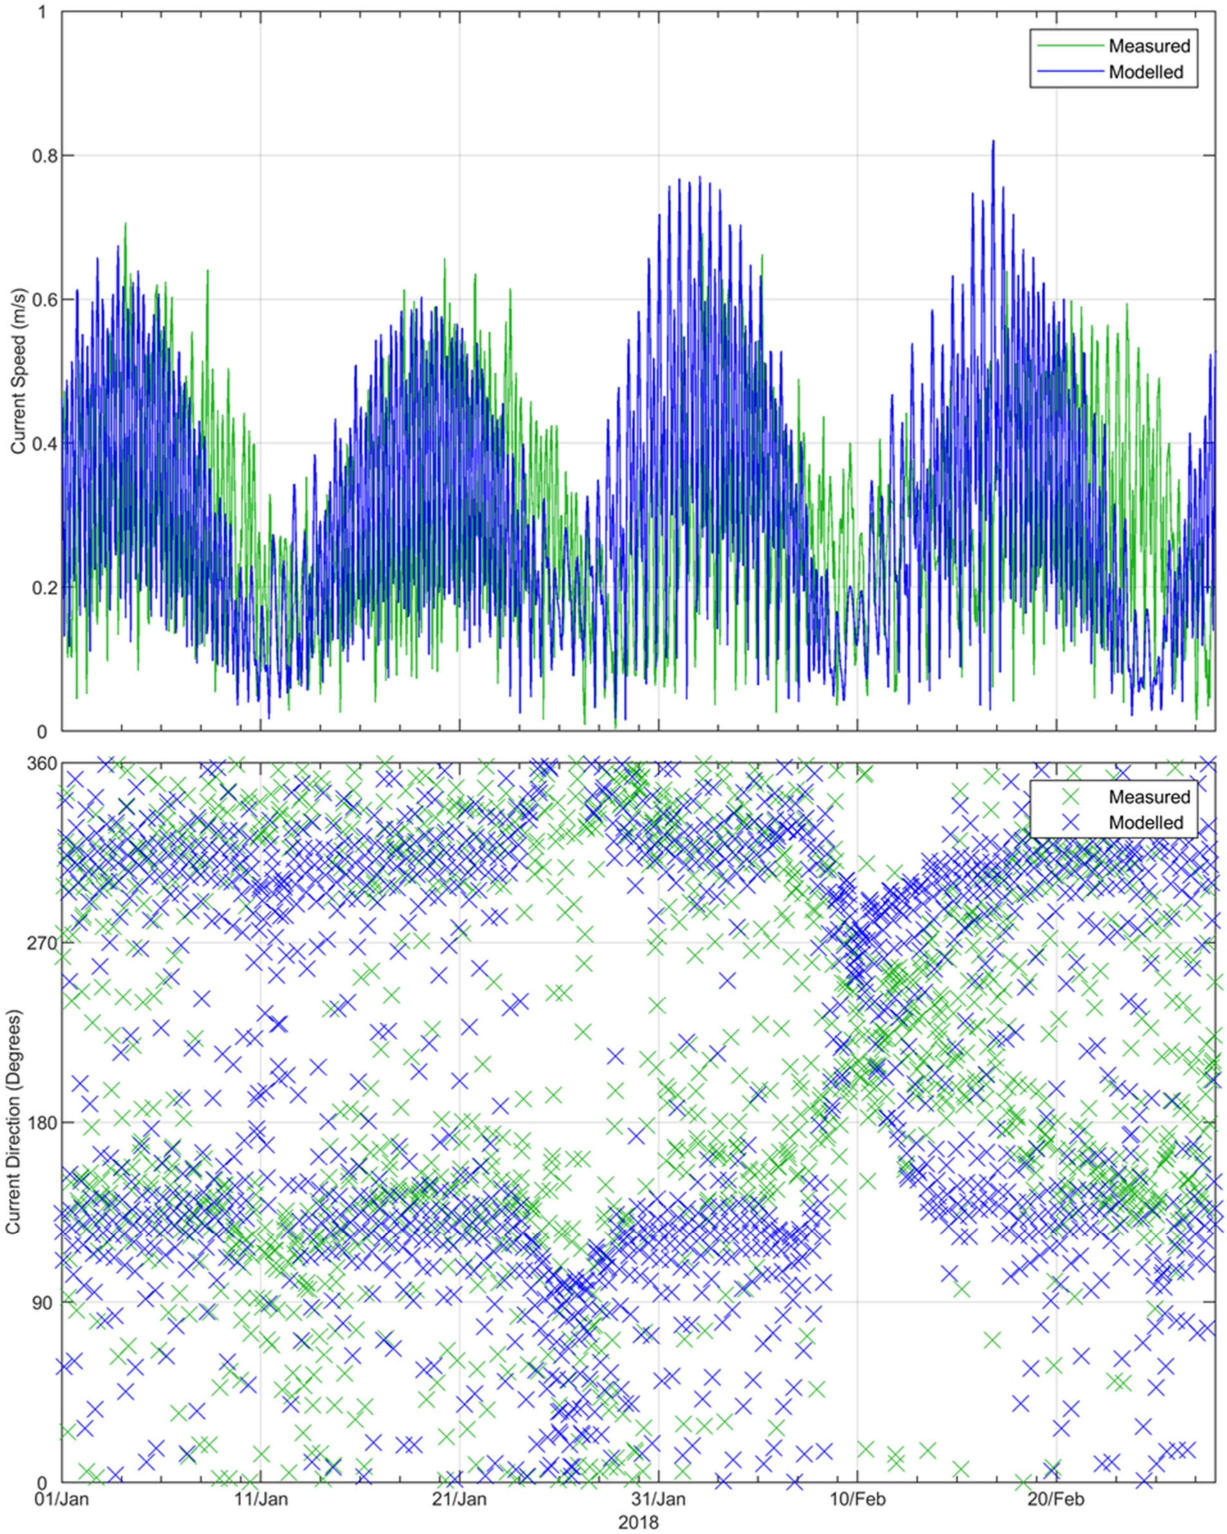

Figure 2.6 Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 40 m for January and February 2018.

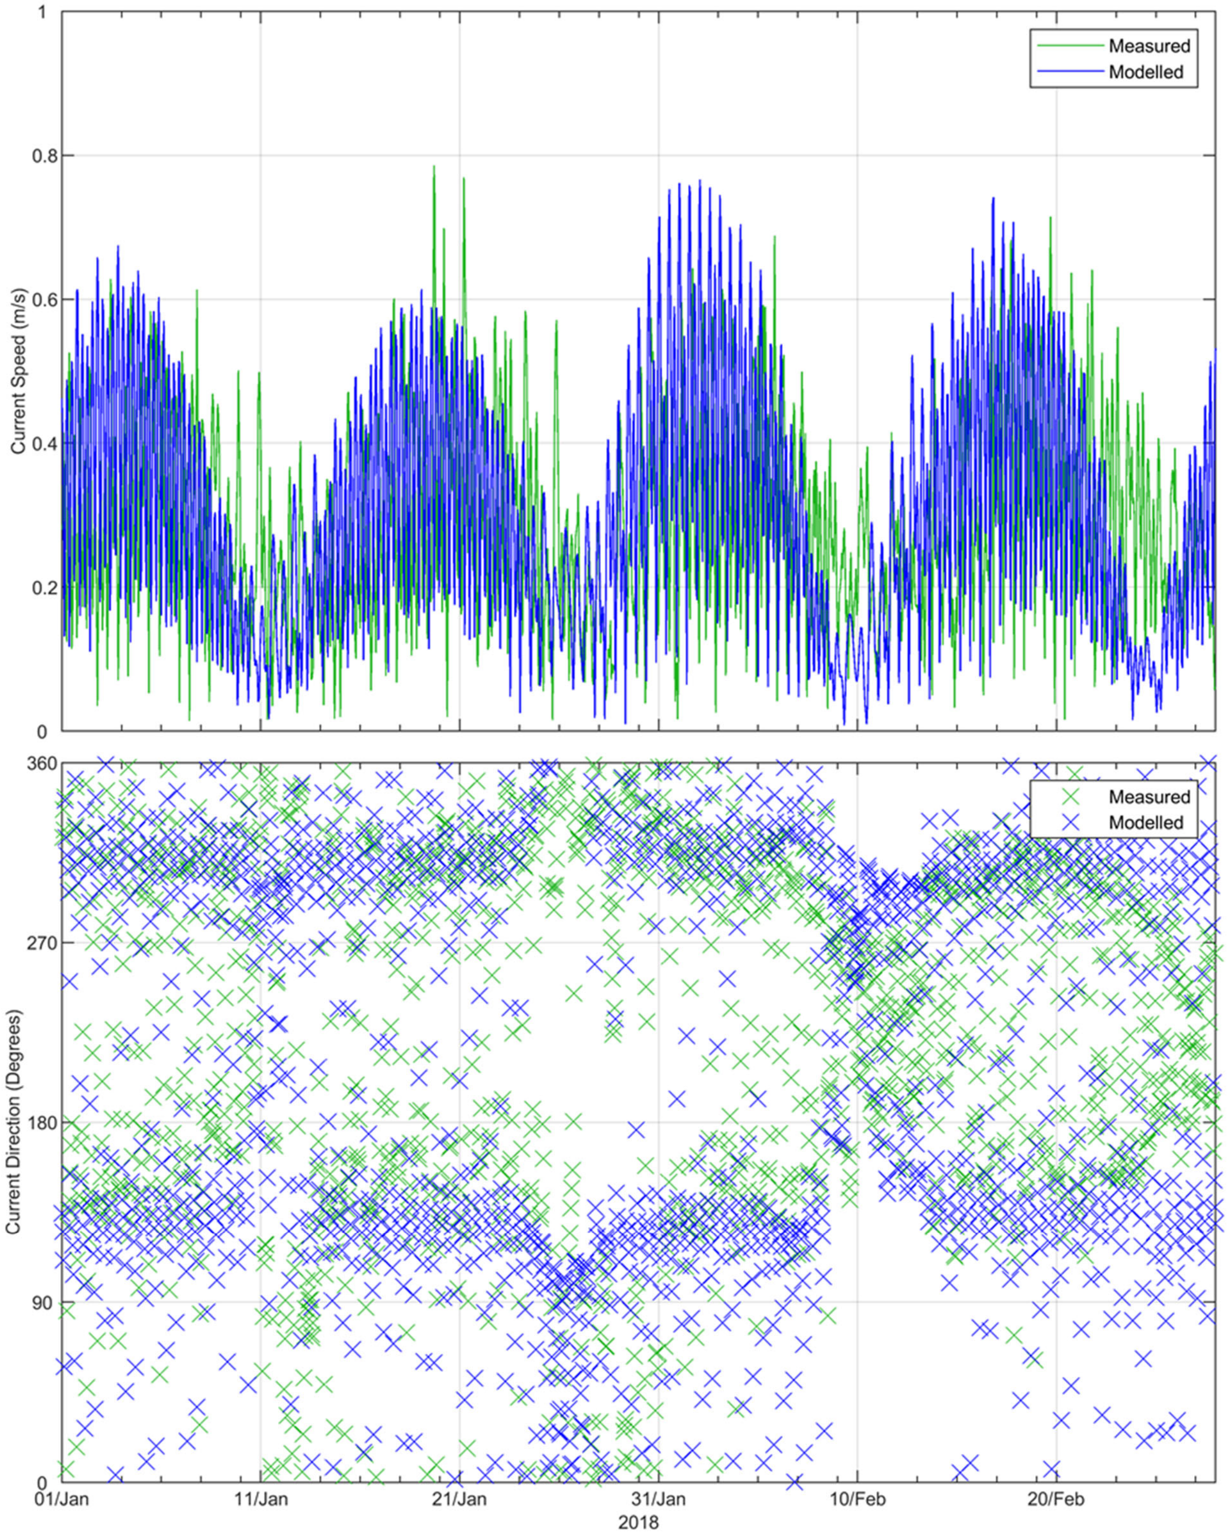

Figure 2.7 Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 70 m for January and February 2018.

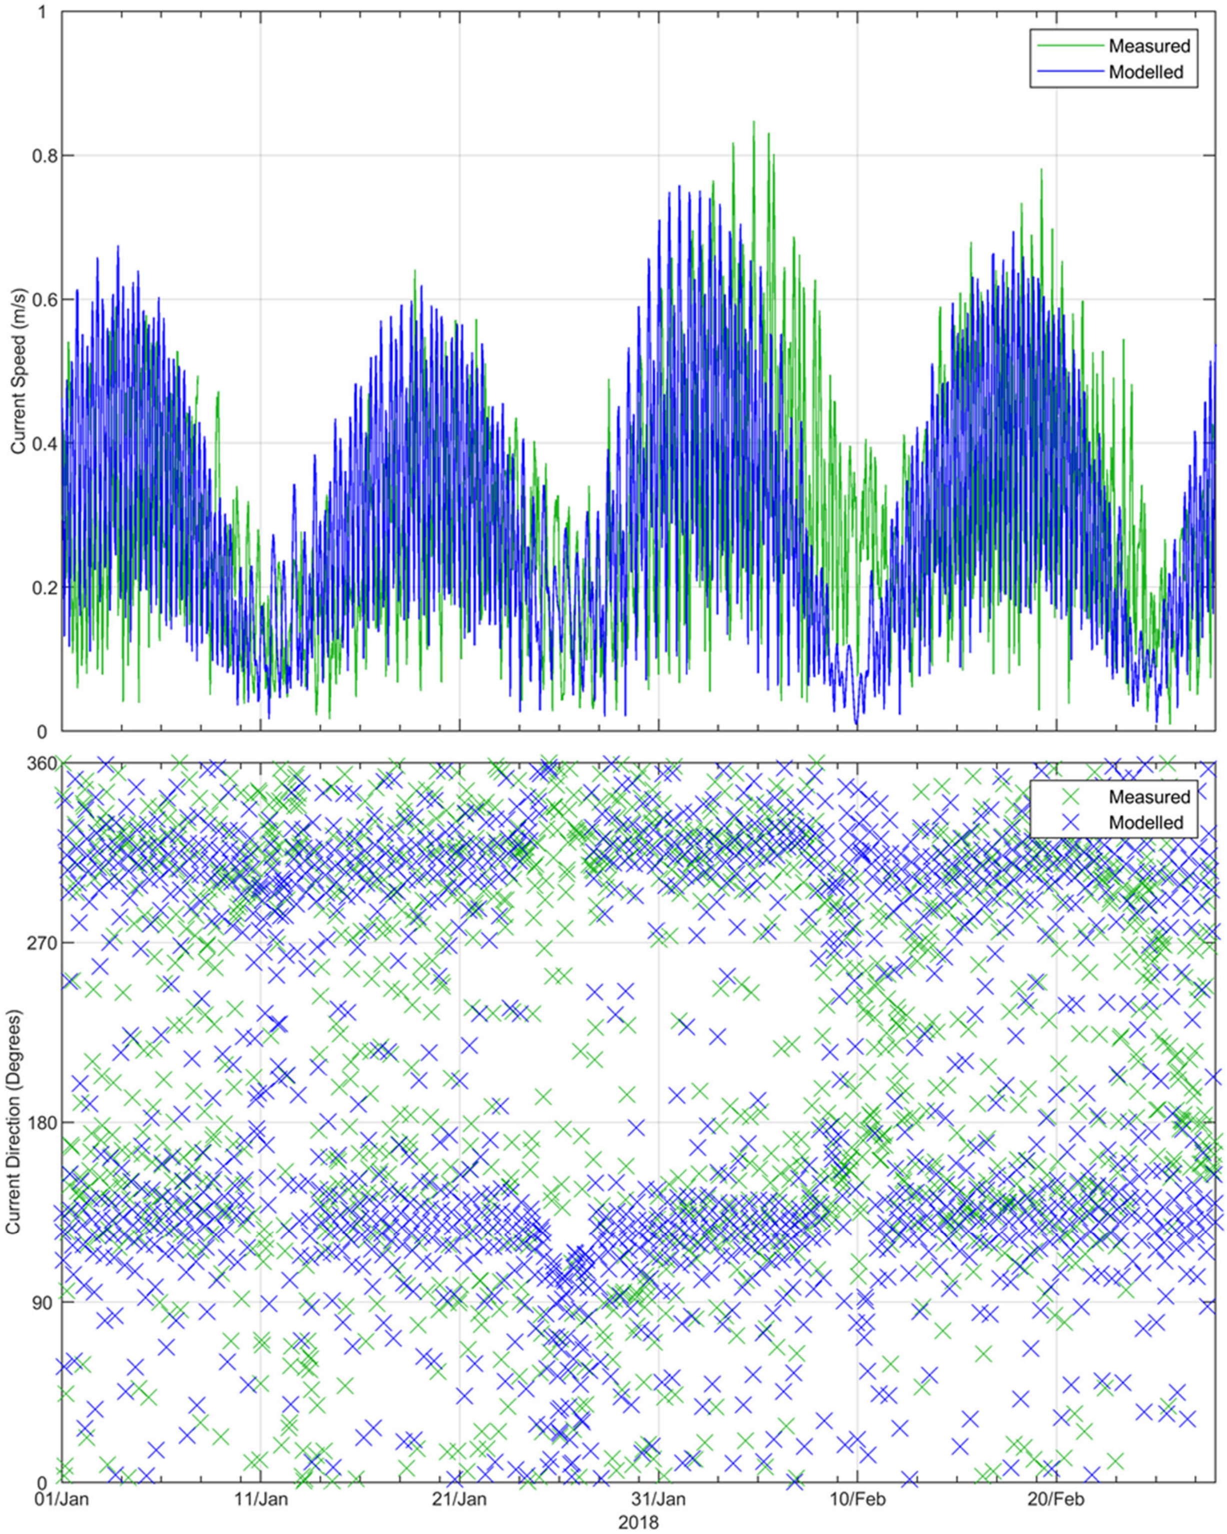

Figure 2.8 **Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 110 m for January and February 2018.**

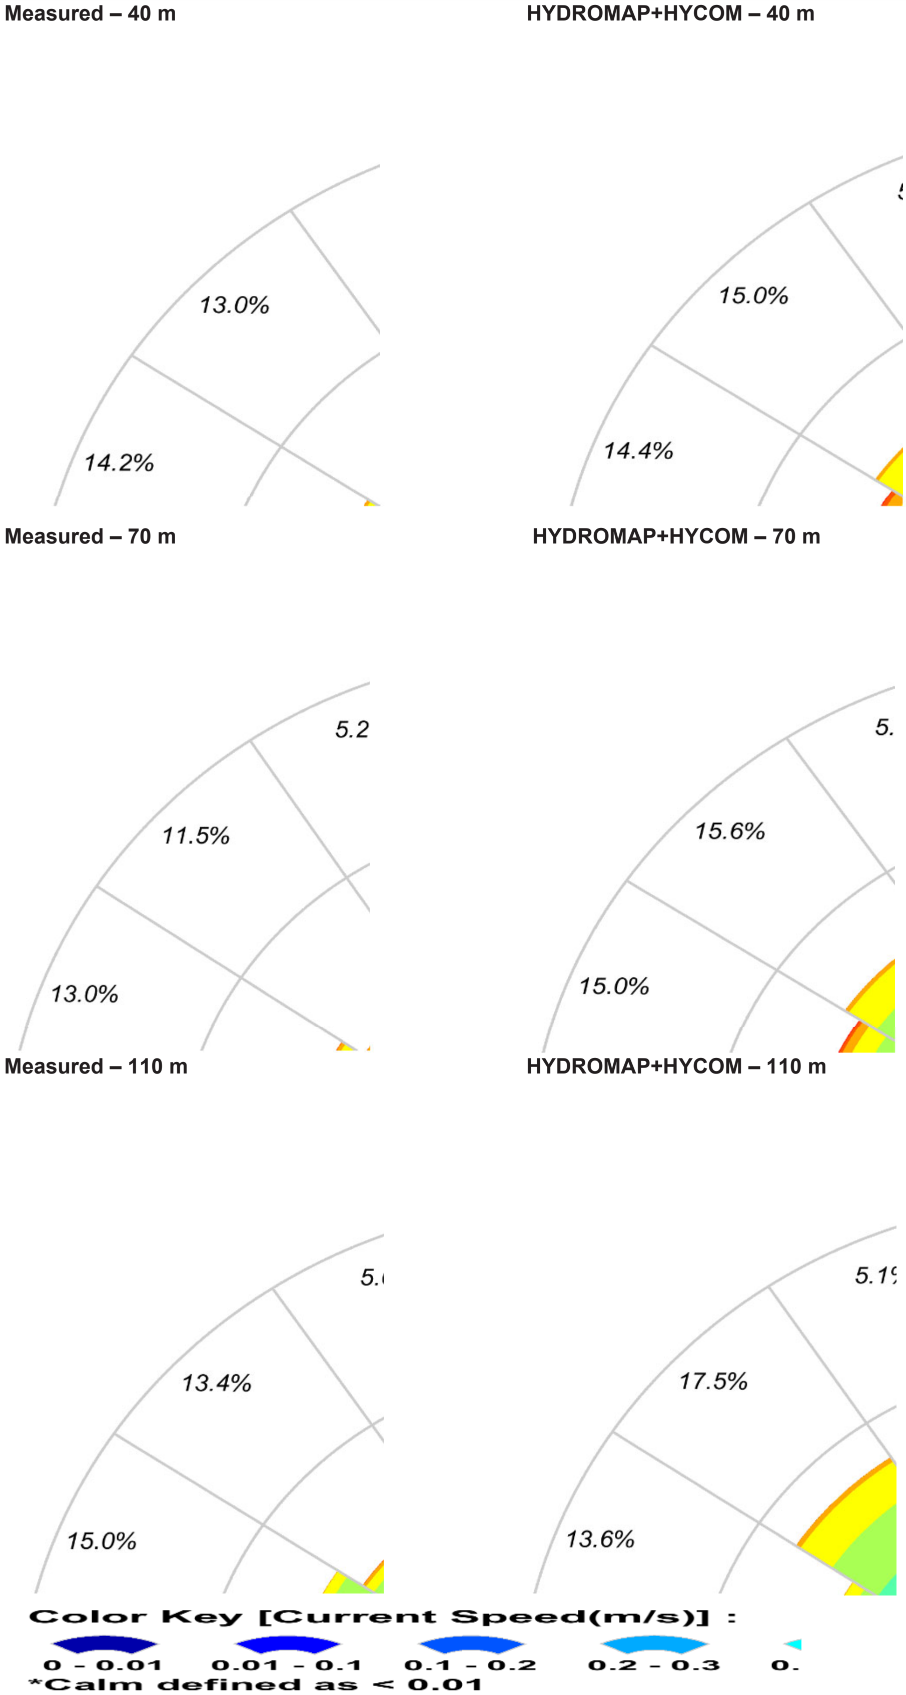

Figure 2.9 Comparative distributions for measured (left column) and predicted (HYDROMAP+HYCOM, right column) current data at the Dorado Development area (2017-2018) at depths of approximately 40 m (top row), 70 m (middle row) and 110 m (bottom row). The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

2.4 Surface Currents

Table 2.3 displays the predicted monthly average and maximum surface current speeds adjacent to the release site, while Figure 2.10 and Figure 2.11 show monthly, seasonal and total surface current rose distributions from 2009 – 2018 (inclusive). The currents are from the combination of HYCOM large-scale ocean currents and HYDROMAP tidal currents to account for the total drift throughout the model domain.

Note the convention for defining current direction is the direction the current flows **towards**, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. The rose branches are each divided into segments of different colour according to speed intervals of 0.1 m/s, which represent current speeds within the monthly or seasonal datasets, respectively. The length of each coloured segment (indicative of speeds) is relative to the proportion of time the currents flow to the corresponding direction.

The surface modelled current data indicated a consistent monthly average of approximately 0.3 m/s and a dominant current direction towards the northwest and east-southeast to southeast throughout the year, while maximum current speeds varied between 0.70 m/s (November) to 1.42 m/s (October).

Table 2.3 Predicted average and maximum surface current speeds adjacent to the release locations. Data derived by combining HYCOM ocean data and HYDROMAP tidal data from 2009-2018 (inclusive).

Season	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction (towards)
Summer	January	0.30	0.86	East-southeast (variable)
	February	0.31	1.32	Northwest
	March	0.32	1.41	Northwest
Transitional	April	0.31	1.07	Northwest and West-northwest
Winter	May	0.30	0.91	West-northwest
	June	0.29	0.81	West-northwest
	July	0.31	0.88	West-northwest and northwest
	August	0.31	0.89	Northwest
Transitional	September	0.32	0.91	Northwest and Southeast
Summer	October	0.29	1.42	Northwest
	November	0.26	0.70	Northwest
	December	0.26	0.72	East-southeast (variable)
	Minimum	**0.26**	**0.70**	
	Maximum	**0.32**	**1.42**	

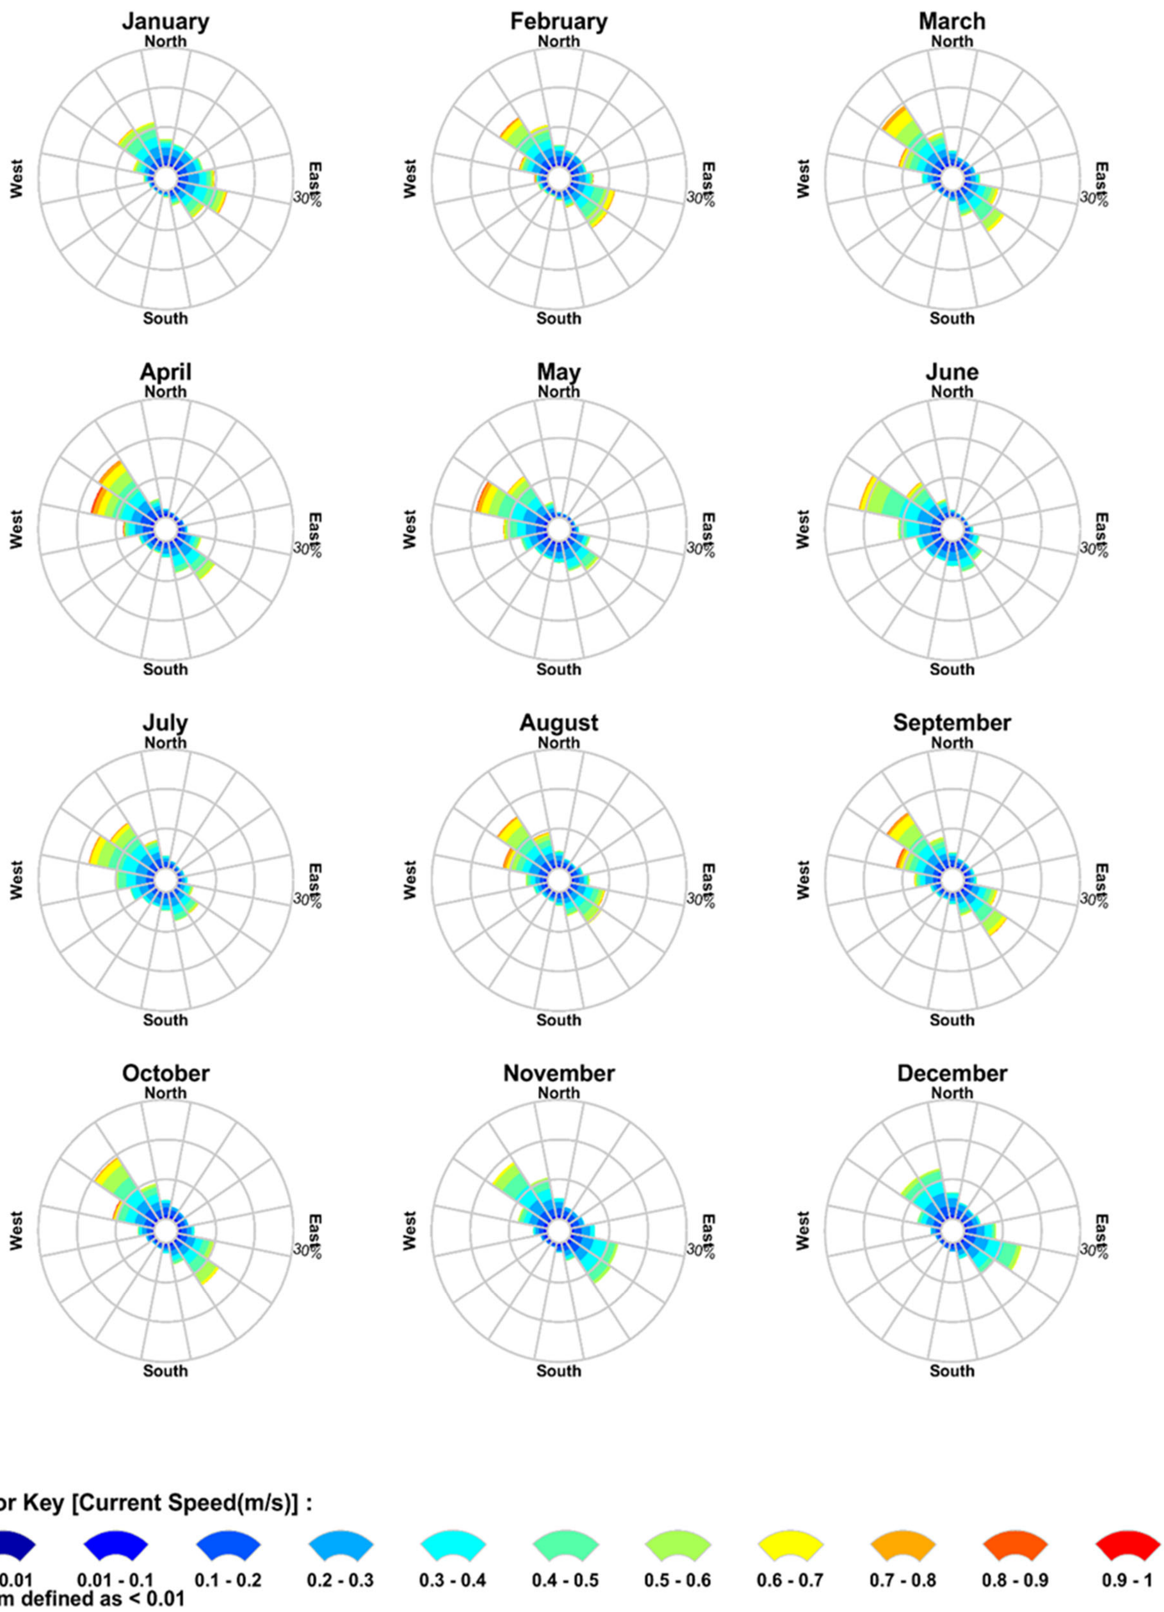

Figure 2.10 Monthly current distribution (2009-2018, inclusive) derived from the HYCOM database near the release site. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

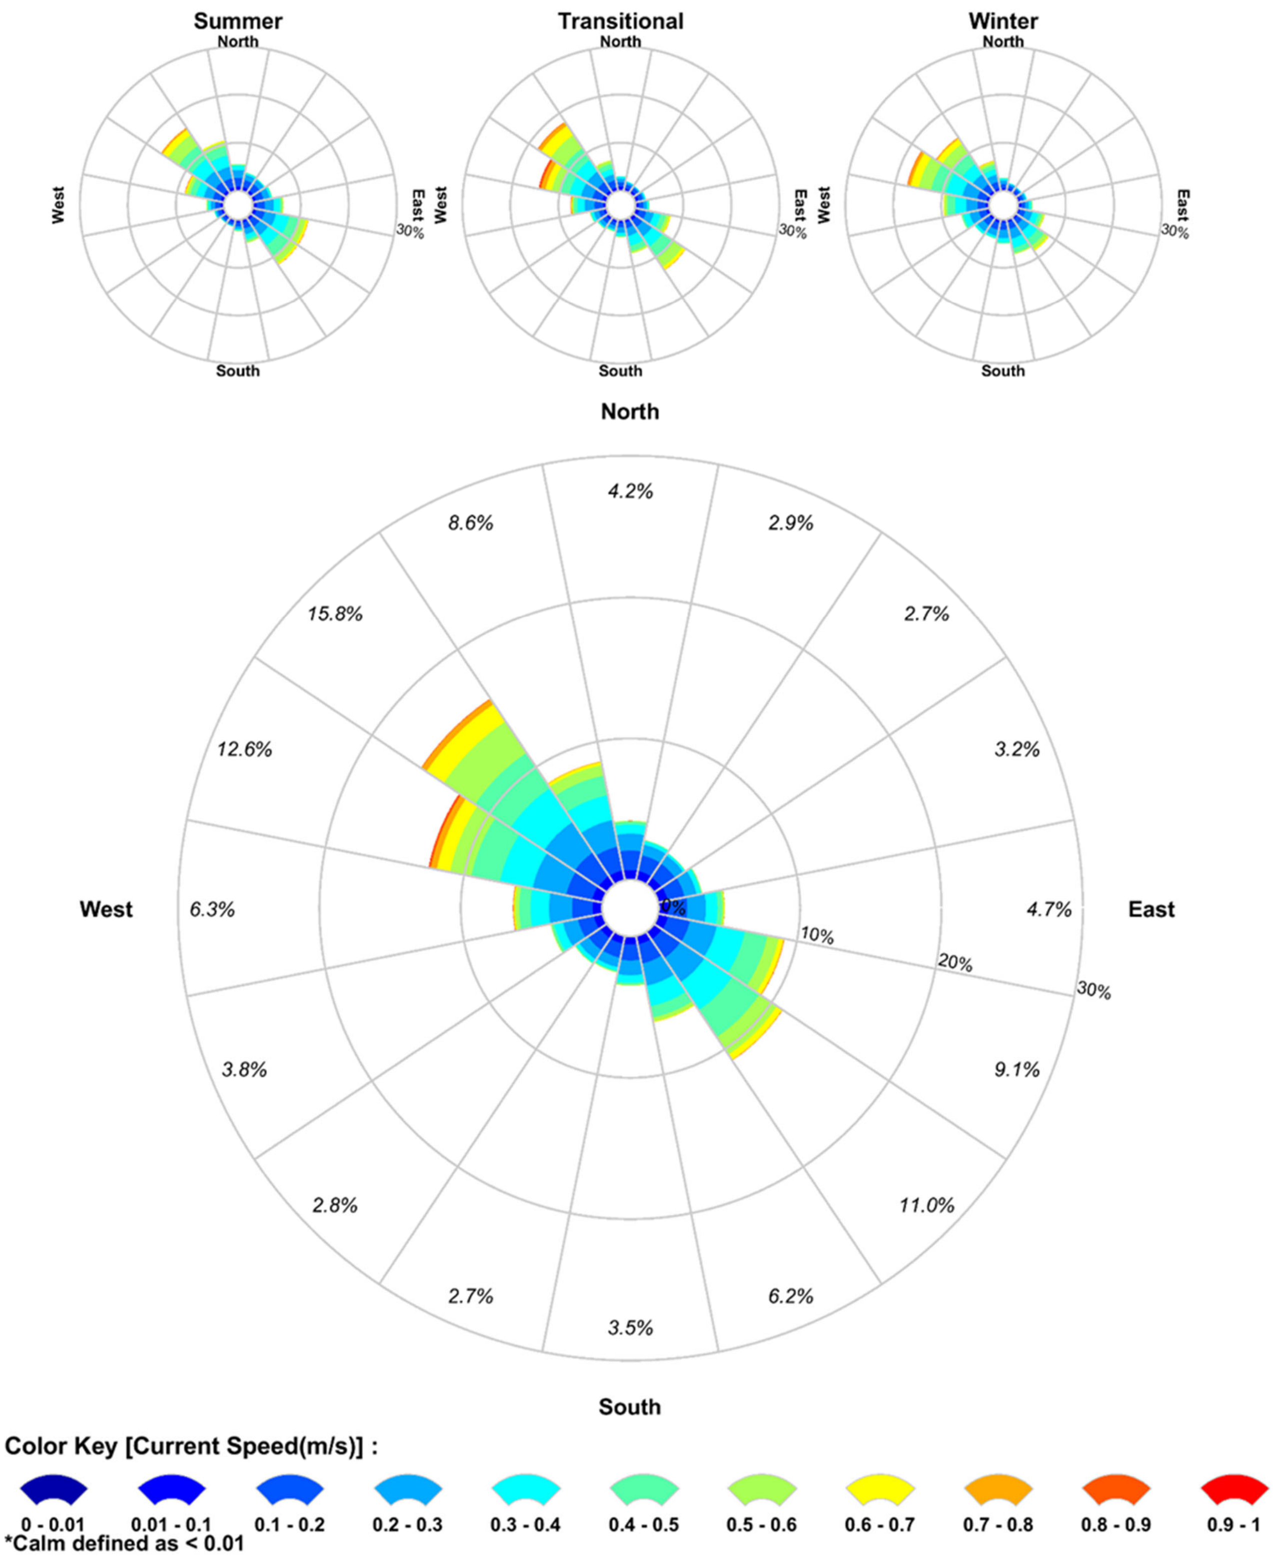

Figure 2.11 Seasonal (top) and total (bottom) current distribution (2009-2018, inclusive) derived from the HYCOM database near the Dorado Development area. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

While the site is dominated by the tide, it can be episodically affected by the ocean currents. Therefore, in order to examine the potential range of variability, the study considered the interannual variability. The Southern Oscillation Index (SOI) data sourced from the Australian Bureau of Meteorology was used to identify interannual trends over the same 10 years as the current data set (2009 – 2018 (inclusive)). The SOI broadly defines Neutral, El Niño (sustained negative values of the SOI below −8 often indicate El Niño episodes) and La Niña (sustained positive values of the SOI above +8 are typical of La Niña episodes) conditions based on differences in the surface air-pressure between Tahiti on the eastern side of the Pacific Ocean and Darwin (Australia), on the western side (Rasmusson and Wallace, 1983; Philander, 1990). El Niño episodes are usually accompanied by sustained warming of the central and eastern tropical Pacific Ocean and a decrease in the strength of the Pacific trade winds. La Niña episodes are usually associated with converse trends (i.e. increase in strength of the Pacific trade winds). The three phases (Neutral, El Niño and La Niña) are referred to as the El Nino-Southern Oscillation (ENSO) events.

Figure 2.12 shows the SOI monthly values for 2009 – 2018 (inclusive). Based on the SOI assessment, 2010 was selected as a representative El Niño year, 2012 was selected as a representative Neutral year, and 2015 was selected as a La Niña year.

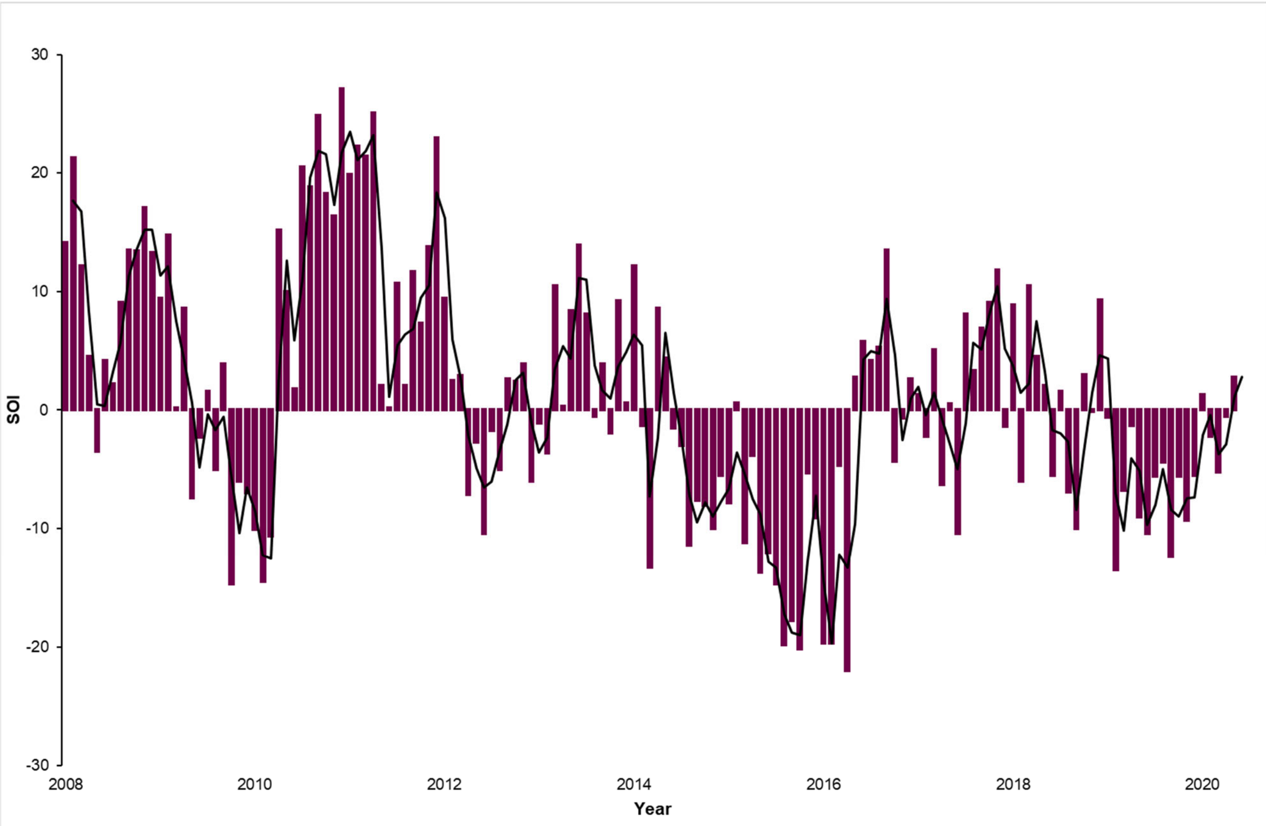

Figure 2.12 Monthly values of the SOI 2008-2020 (inclusive). Sustained positive values indicate La Niña conditions, while sustained negative values indicate El Niño conditions (sourced from Australian Bureau of Meteorology, 2020).

3 MODELLING METHODS

3.1 Sediment Dispersion Model: MUDMAP

MUDMAP is a three-dimensional plume model used by industry and regulators to aid in assessing the potential environmental effects from discharges such as drill cuttings and drilling fluids. The model has been applied to hundreds of assessments in over 35 countries, including Australia.

The far-field calculation (passive dispersion stage) employs a particle-based, random walk procedure. The model predicts the dynamics of the discharge material and resulting seabed concentrations and bottom thicknesses over the near-field (i.e. the immediate area of the discharge) and the far-field (the wider region). Figure 3.1 shows a conceptual diagram of the dispersion and fates of drill cuttings and fluids discharge to the ocean.

Settling under currents is selective for particle size, with the larger particles (rocks, gravel to sand) tending to settle quickly, forming a pile that aligns with the predominant current axis. Smaller particles (especially silts and clays) tend to remain suspended for exponentially longer time periods and will therefore be dispersed more widely by local currents. Dispersion of the finer discharged material will tend to be enhanced with increased current speeds and water depth, and with greater variation in current direction over time and depth.

MUDMAP can simulate up to six classes of discharged drilling material (each with up to 6 sub-categories, for a total of 36 sub-categories). Each material class can be set up with a unique density and particle-size distribution. During the dispersion stage, particles are transported in three dimensions according to the current data and horizontal and vertical dispersion coefficients at each time step, following the governing equations.

MUDMAP has been extensively validated and applied for discharge operations in Australian coastal and ocean waters, and around the world (e.g. Burns et al., 1999; Spaulding, 1994; King & McAllister, 1997, 1998).

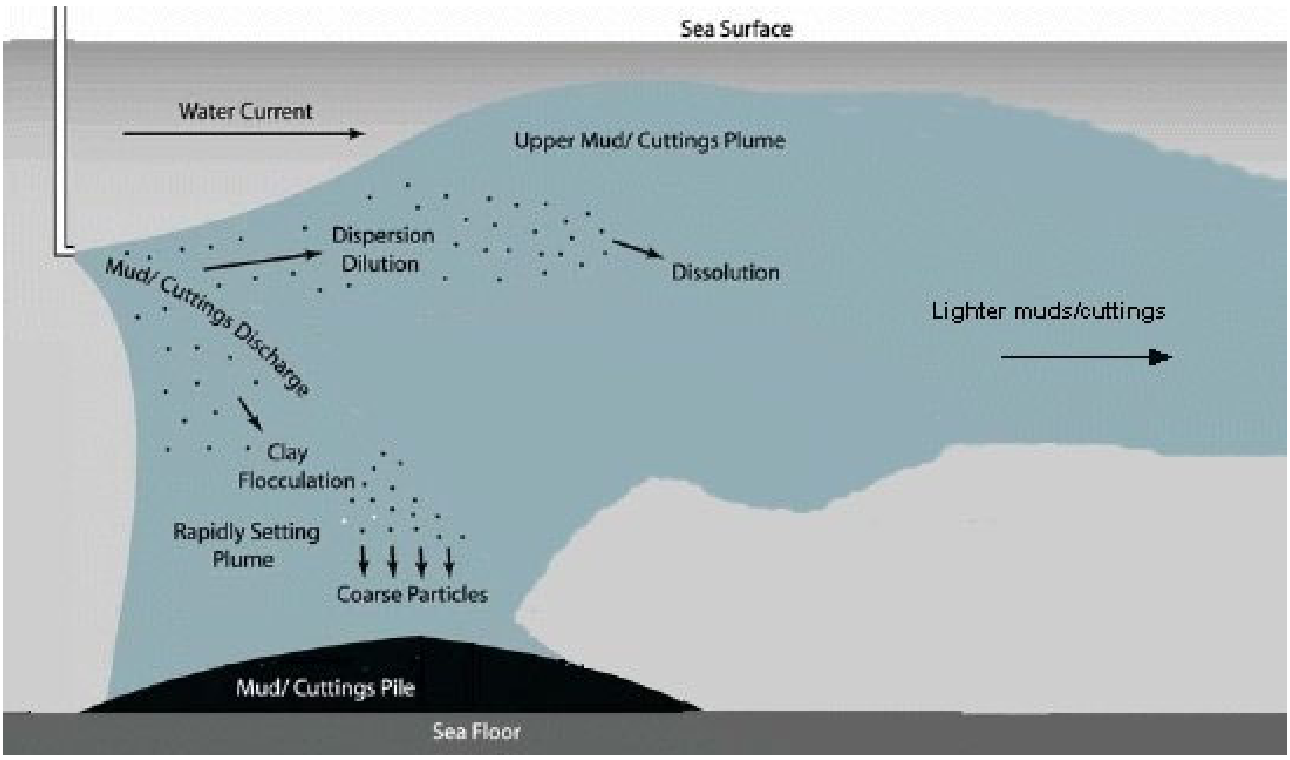

Figure 3.1 Conceptual diagram showing the general behaviour of cuttings and muds discharged to the ocean (modified from Neff, 2005).

3.2 Discharge Program

Santos indicated that the Dorado Development is expected to comprise of five drilling intervals: Conductor, Surface Hole, Intermediate Hole, 12 ¼” Production Hole and 8 ½” Production Hole. Santos has indicated that the 12 wells will be drilled using a conventional monobore design.

Drilling operations will be conducted as two separate stages:

- Conductor and surface hole sections; and
- Intermediate and production hole sections

Conductor and surface hole sections for the 12 wells will be batch drilled in the first stage.

Following the drilling of the Conductor and Surface Hole sections (12 wells), the wells will be drilled sequentially in 3 intervals (Intermediate, 12 ¼” Production and 8 ½” Production).

The Conductor and Surface well intervals (36” and 26” bore diameter) will be drilled using Seawater+Pre-Hydrated Gel Sweeps. The extracted drill cuttings and drilling muds will be discharged directly to the seafloor during the Conductor well interval, while the cuttings and drilling muds for the Surface interval will be brought up to the surface (diverter expected to be used). A riser will then be installed for the remainder of the drilling to circulate the cuttings and muds to the drilling rig, where cuttings will be separated before cuttings and muds are discharged through a vertically orientated pipe above the sea surface. With the riser in place, Water Based Mud (WBM) will be used in the drilling of the Intermediate Hole (17.5” bore diameter), Production Hole (12.25” bore diameter) and Production Hole (8.5” bore diameter) intervals.

Table 3.1 Summary of the estimated volumes of discharged drill cuttings and unrecoverable mud solids for each well interval for a single well.

Well Interval	Hole Diameter (inches)	Discharge Method	Cuttings Volume Discharged (m^3)	Muds (Solids Only)		Discharge Duration (days)
				Type	Volume Discharged (m^3)	
Conductor	36	Returned directly to the seafloor	82	Seawater/Gel	23	1
Surface Hole	26	Cuttings brought to surface (diverter expected to be used)	385	Seawater/Gel	108	2
Intermediate Hole	17.5	Cuttings brought to drilling rig, then discharged to surface	330	WBM	97	5
12.25” Production Hole	12.25	Cuttings brought to drilling rig, then discharged to surface	214	WBM	112	7
8.5” Production Hole	8.5	Cuttings brought to drilling rig, then discharged to surface	46	WBM	57	3
Totals			**1,057**	**-**	**397**	**18**

Note: Only discharged solids used as model input.

WBM – Water Based Mud.

Table 3.2 provides a summary of the proposed drilling schedule, provided by Santos, which was modelled.

Table 3.2 Summary of the proposed drilling schedule.

Activity	Discharge Duration	Total duration
Batch drilling 36" hole section for all 12 wells	1 day of cuttings discharge every 2 days	23 days
Batch drilling 26" hole section for all 12 wells	2 days of cuttings discharge every 4 days	52 days
Well 1		
Drill 17.5" intermediate hole section	5 days of cuttings discharge, then no discharge for 5 days (running casing etc)	10 days
Drill 12.25" production hole section	7 days of cuttings discharge, then no discharge for 6 days (running casing etc)	13 days
Drill 8.5" production hole section	3 days cuttings discharge, then no discharge for 18 days (running casing, wireline logs etc)	21 days
Well 2		
Drill 17.5" intermediate hole section	5 days of cuttings discharge, then no discharge for 5 days (running casing etc)	10 days
Drill 12.25" production hole section	7 days of cuttings discharge, then no discharge for 6 days (running casing etc)	13 days
Drill 8.5" production hole section	3 days cuttings discharge, then no discharge for 18 days (running casing, wireline logs etc)	21 days
Well 3		
Drill 17.5" intermediate hole section	5 days of cuttings discharge, then no discharge for 5 days (running casing etc)	10 days
Drill 12.25" production hole section	7 days of cuttings discharge, then no discharge for 6 days (running casing etc)	13 days
Drill 8.5" production hole section	3 days cuttings discharge, then no discharge for 18 days (running casing, wireline logs etc)	21 days
Well 4		
Drill 17.5" intermediate hole section	5 days of cuttings discharge, then no discharge for 5 days (running casing etc)	10 days
Drill 12.25" production hole section	7 days of cuttings discharge, then no discharge for 6 days (running casing etc)	13 days
Drill 8.5" production hole section	3 days cuttings discharge, then no discharge for 18 days (running casing, wireline logs etc)	21 days

Repeat of each well through to 12 Wells…

3.3 Discharge Input Data

The input data used to set up the dispersion model included:

- Volumes and discharge durations of the cuttings and unrecoverable drilling muds;
- Particle size distributions measured during a recent drilling campaign, and associated settling velocities;
- Bulk density of the released material;
- Temperature and salinity profiles of the receiving waters;
- The height of the discharge points relative to mean sea level;
- Current data to represent local physical forcing.

Table 3.3 provides a summary of the discharge configuration and the estimated volumes of cuttings and muds used as input into the discharge model.

As per the proposed drilling schedule, modelling was first carried out for the Conductor hole sections which will incorporate 984 m^3 of drill cuttings and 274 m^3 of drilling muds discharged at the seabed over 12 days (23 days of operation). Followed by the Surface hole sections which will also be batch drilled with 4,620 m^3 of drill cuttings and 1,296 m^3 of drilling muds discharged at the seabed over 24 days (52 days of operation). Lastly, modelling was carried out for the remaining hole sections (Intermediate, 12 ¼" Production and 8 ½" Production) for the 12 wells which will be drilled sequentially and comprised of a total of 7,080 m^3 of drill cuttings and 3,192 m^3 of drilling muds were discharged from the surface over 180 days (528 days of operation).

Table 3.3 Key inputs to the drill cuttings and unrecoverable mud solids dispersion modelling.

Parameter	Dorado Development wells
Volume of cuttings discharged (m^3) (1 Well)	1,057
Volume of muds discharged (m^3) (1 Well)	397
Volume of cuttings discharged (m^3) (12 Wells)	12,684
Volume of muds discharged (m^3) (12 Wells)	4,764
Density of drill cuttings (kg/m^3)	2,601
Density of drilling WBM (kg/m^3)	4,200
Discharge duration (days) (1 Well)	18
Discharge duration (days) (12 Wells)	216
Depth of seafloor discharges	2 m above the seabed
Depth of surface discharges	at the surface
Sea surface discharge pipe orientation	Vertical
Sea surface discharge pipe diameter (inches)	8" [0.203 m]

3.4 Geotechnical Information

The drill cuttings material was based on samples collected by Santos for each of the hole sizes. A large proportion of the material sampled across the various hole sizes consisted of coarse material (>250 µm). The collected samples were sieved to separating the cuttings that were <250 µm which were then placed into a Particle Size Distribution (PSD) machine.

The most critical geotechnical information required as input into the modelling is PSD data for the finer material. The resultant PSDs for each hole size have been redistributed to match the material size classes and used in the MUDMAP model, as shown in Table 3.4.

For the top two intervals (36" and 26"), most of the material is medium and coarse sand/gravel sized (94.11%) with the remaining distributed between the clay to fine sand classes. The proportion of coarse sand/gravel steadily reduces over the next three hole sections with more material distributed between the clay to fine sand classes.

Table 3.4 Drill cuttings PSD's broken down into material classes for each well interval.

Sediment Grain Size Class	Size Range (µm)	Conductor (36") (%)	Surface Hole (26") (%)	Intermediate Hole (17 ½") (%)	Production (12 ¼") (%)	Production (8 ½") (%)
Medium Clay	0.06-0.63	0.45	0.45	1.20	0.00	0.00
Coarse Clay	0.63-2	2.75	2.75	7.38	1.24	2.06
Fine Silt	2-6.3	0.98	0.98	2.58	2.91	6.05
Medium Silt	6.3-20	0.41	0.41	1.03	8.87	20.35
Coarse Silt	20-63	0.63	0.63	1.70	10.58	27.18
Fine sand	63-250	0.66	0.66	1.70	30.33	27.38
Medium sand	250-500	2.31	2.31	6.13	22.80	9.22
Coarse sand	500-2000	91.80	91.80	78.28	23.27	7.77

The drilling muds material was also based on samples collected and supplied by Santos. The PSD data indicated that all the solids material in the drilling muds consisted on fines (<250 µm). The geotechnical information for the PSDs of each sample was again redistributed to match defined sediment grain size classes and then averaged across all samples (Table 3.5).

Most of the material is fine to coarse silt sized (87.22%) with the remaining material distributed across the finer (clay) and coarser (fine sand) ends of the supplied PSDs. The same distribution of muds was assumed across all the well intervals.

Table 3.5 Drilling muds PSD's broken down into material classes for each well.

Sediment Grain Size Class	Size Range (µm)	Conductor (36") (%)	Surface Hole (26") (%)	Intermediate Hole (17 ½") (%)	Production (12 ¼") (%)	Production (8 ½") (%)
Medium Clay	0.06-0.63	1.04	1.04	1.04	1.04	1.04
Coarse Clay	0.63-2	7.46	7.46	7.46	7.46	7.46
Fine Silt	2-6.3	22.18	22.18	22.18	22.18	22.18
Medium Silt	6.3-20	36.20	36.20	36.20	36.20	36.20
Coarse Silt	20-63	28.84	28.84	28.84	28.84	28.84
Fine sand	63-250	4.53	4.53	4.53	4.53	4.53

3.5 Grid Configuration

A uniformly sized rectangular grid covering a 20 km (longitude, x-direction) by 20 km (latitude, y-direction) region around the well location was employed to calculate the concentration of drill cuttings and muds in the water column and on the seafloor. The resolution of each grid cell was approximately 20 m (x) x 20 m (y) x 5 m (z).

3.6 Mixing Parameters

The horizontal and vertical dispersion coefficients are used in dispersion modelling to represent the mixing and diffusion processes caused by turbulence, which are sub-grid processes at the scale of the hydrodynamic model drivers. The dispersion coefficients are expressed in units of rate of area of change (m^2/s). Increasing the horizontal dispersion coefficient will increase the horizontal spread of the discharge plume and decrease the centreline concentrations. Increasing the vertical dispersion coefficient spreads the discharge further across the vertical layers.

The horizontal turbulent diffusion of the plume is dependent on the hydrodynamic conditions (i.e. wind, wave and current) and the physical scale of the plume compared to the scales of the oceanic processes that disperse the plume. For a plume of approximately 10-100 m width, dispersion occurs primarily through small-scale horizontal swirling motions and vertical mixing, with a horizontal dispersion rate of the order of 0.1 m^2/s. As the plume grows to a scale of 1-10 km, it begins to be subject to mesoscale eddies and horizontal dispersion rate becomes of the order of a few to tens of m^2/s. At even larger scales, the plume would be larger than the mesoscale eddies and eddy mixing becomes the dominant mechanism, with a rate of horizontal dispersion 100-1,000 m^2/s.

For this project, with an open ocean environment and length scales of 10 m to 1 km, a horizontal diffusion rate of 0.25 m^2/s was applied. A value of 0.10 cm^2/s was set for the vertical dispersion coefficient to account for the influence of turbulence within the water column, as well as wave-induced turbulence. The values are based on previous experience and informed by studies by Copeland (1996).

3.7 Reporting Thresholds

The MUDMAP model predicts sediment concentrations and thicknesses to very low levels that may not be of practical and ecological significance; therefore, a series of minimum detectable levels and impact thresholds were defined for reporting of the model-predicted outcomes.

A study by Glen (1997) found that the maximum natural sedimentation rate for Northwest Australia is 223.21 cm/thousand years (or 0.0061 mm/day). As a conservative measure, the natural threshold thickness of 0.1 mm was calculated daily natural sedimentation rate of 0.0061 mm/day by the discharge duration of a single well (18 days).

The thresholds are supported by studies from Trannum et al. (2009) which found a significant decrease in species count, abundance of individuals, and biomass of marine animals with deposited cuttings 3-24 mm. Furthermore, a study by Kjeilen-Eilertsen et al. (2004) reports that depositional thicknesses greater than 9.6 mm are likely to cause smothering impacts on benthic ecosystems, including corals. It is also worth noting that a study by Smit et al. (2008) established that a thickness threshold of greater than 6.5 mm would be needed before potential harm to benthic macrofauna occur.

Table 3.6 presents a summary of the natural and impact threshold levels used in this study for assessment of sedimentation.

Table 3.6 Natural and impact threshold levels for sediment thickness.

Parameter	Natural Threshold Level (mm)	Impact Threshold Level (mm)	
		Low Exposure	High Exposure
Sediment thickness	0.1	1	10

It is important to note that the predicted deposition is quoted as the level above any background deposition process relevant to the Dorado Development. Moderate levels of sediment mobility are expected in this region due to the drift and tidal current magnitudes, and therefore it is expected that these results are conservative (i.e. more sedimentation predicted than would be the case).

4 MODELLING RESULTS

The modelling results from the discharge of drill cuttings and drilling muds from a single well and all twelve wells for each ENSO event are presented in Section 4.1 and Section 4.2, respectively. Section 4.3 present the integrated combined results for the twelve wells.

4.1 Single Well Results for Each ENSO Events

Figure 4.1, Figure 4.3 and Figure 4.5 show the coverage and sediment thicknesses calculated from drill cuttings and drilling muds discharges from a single well (Well-1) during La Niña, Neutral and predominantly El Niño conditions, respectively.

The modelling results demonstrated that larger particles (greater than 0.25 mm diameter) were predicted to settle typically within 1 km from the well, while the currents transported the smaller sediments (less than 0.25 mm) further away from the well.

Table 4.1 shows the predicted maximum sediment thickness, area of coverage and the maximum distance from well location to each threshold for each ENSO event.

The maximum thickness (or height of mound) was predicted to be 126 mm adjacent to the well location during El Niño conditions. The maximum distance from the well to the natural threshold level (≥0.1 mm) was 1,115 m, occurring during Neutral conditions and the corresponding area of coverage was 0.65 km^2. The maximum distances to the low (1-10 mm) and high (≥10 mm) exposure thresholds was 837 m (Neutral conditions) and 251 m (El Niño conditions), respectively. The greatest areas of coverage on the seafloor at the low and high exposure thresholds, was recorded as 0.29 km^2 and 0.02 km^2, respectively.

Table 4.1 Predicted maximum sediment thickness, area of coverage and maximum distance for each threshold resulting from the drill cuttings and drilling muds discharge for Well-1. The results are presented based on each ENSO event.

ENSO event	Maximum Sediment thickness (mm)	Total Area of Coverage (km^2) above Threshold			Maximum Distance (m) from Well to Threshold		
		0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)	0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)
La Niña	91	0.66	0.21	0.02	771	451	190
Neutral	112	0.65	0.29	0.00	1,115	837	40
El Niño	126	0.58	0.16	0.01	863	398	251

Figure 4.2, Figure 4.4 and Figure 4.6 show cross-sections of the predicted maximum concentrations within the water column resulting from the drill cuttings and muds discharge from a single well during La Niña, Neutral and predominantly El Niño conditions, respectively.

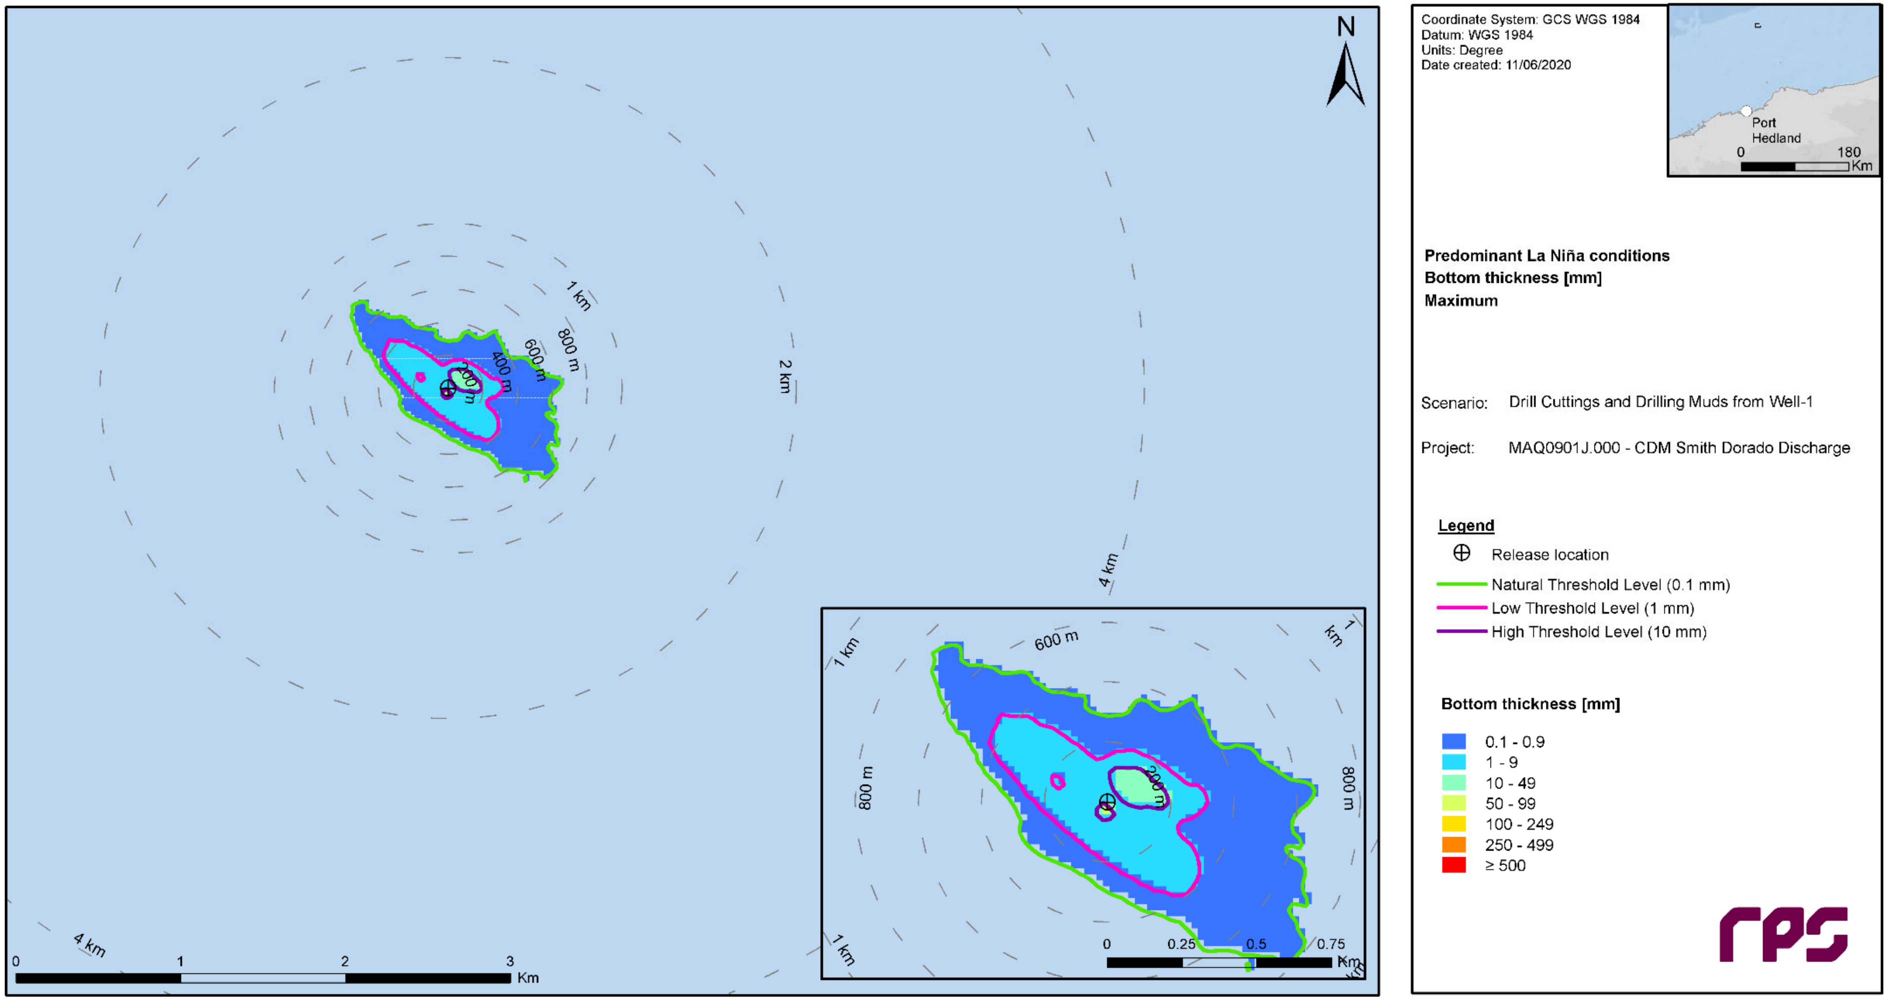

Figure 4.1 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for Well-1 over 18 days commencing in La Niña conditions.

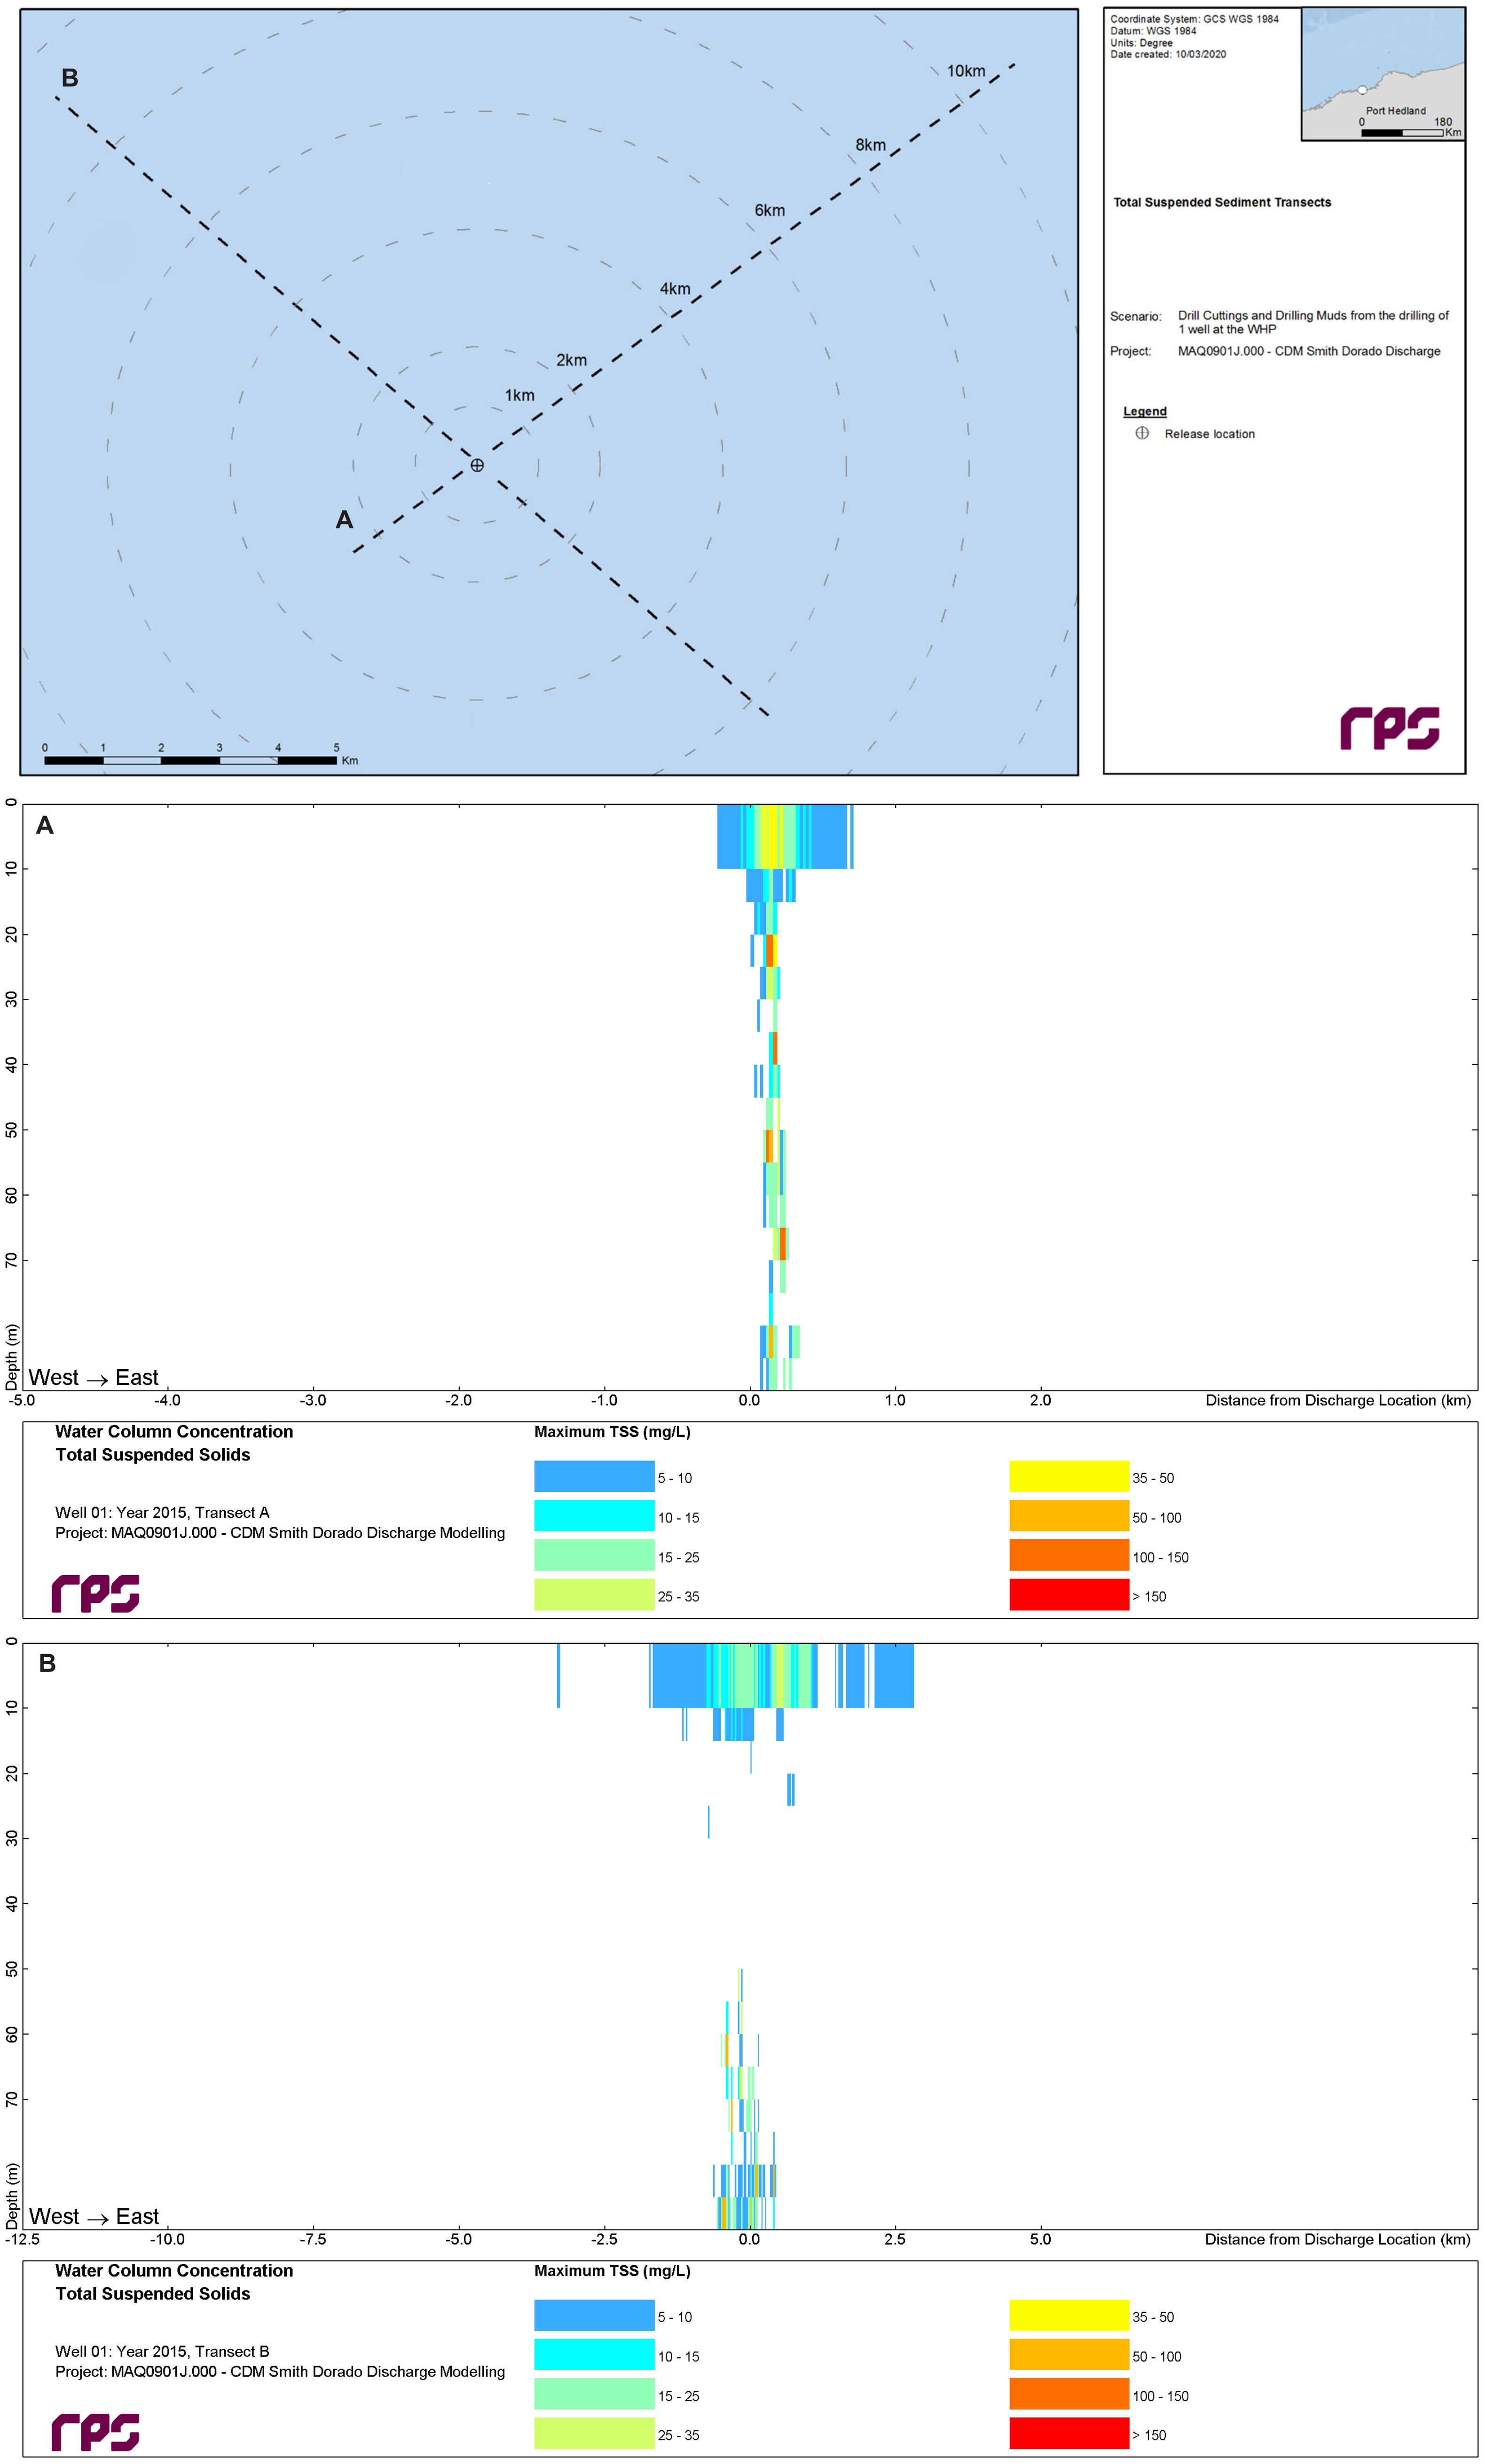

Figure 4.2 Cross-sections (a) east-west and (b) north-south of the predicted maximum suspended sediment concentrations within the water column resulting from the drill cuttings and muds discharges for Well-1 over 18 days commencing in La Niña conditions.

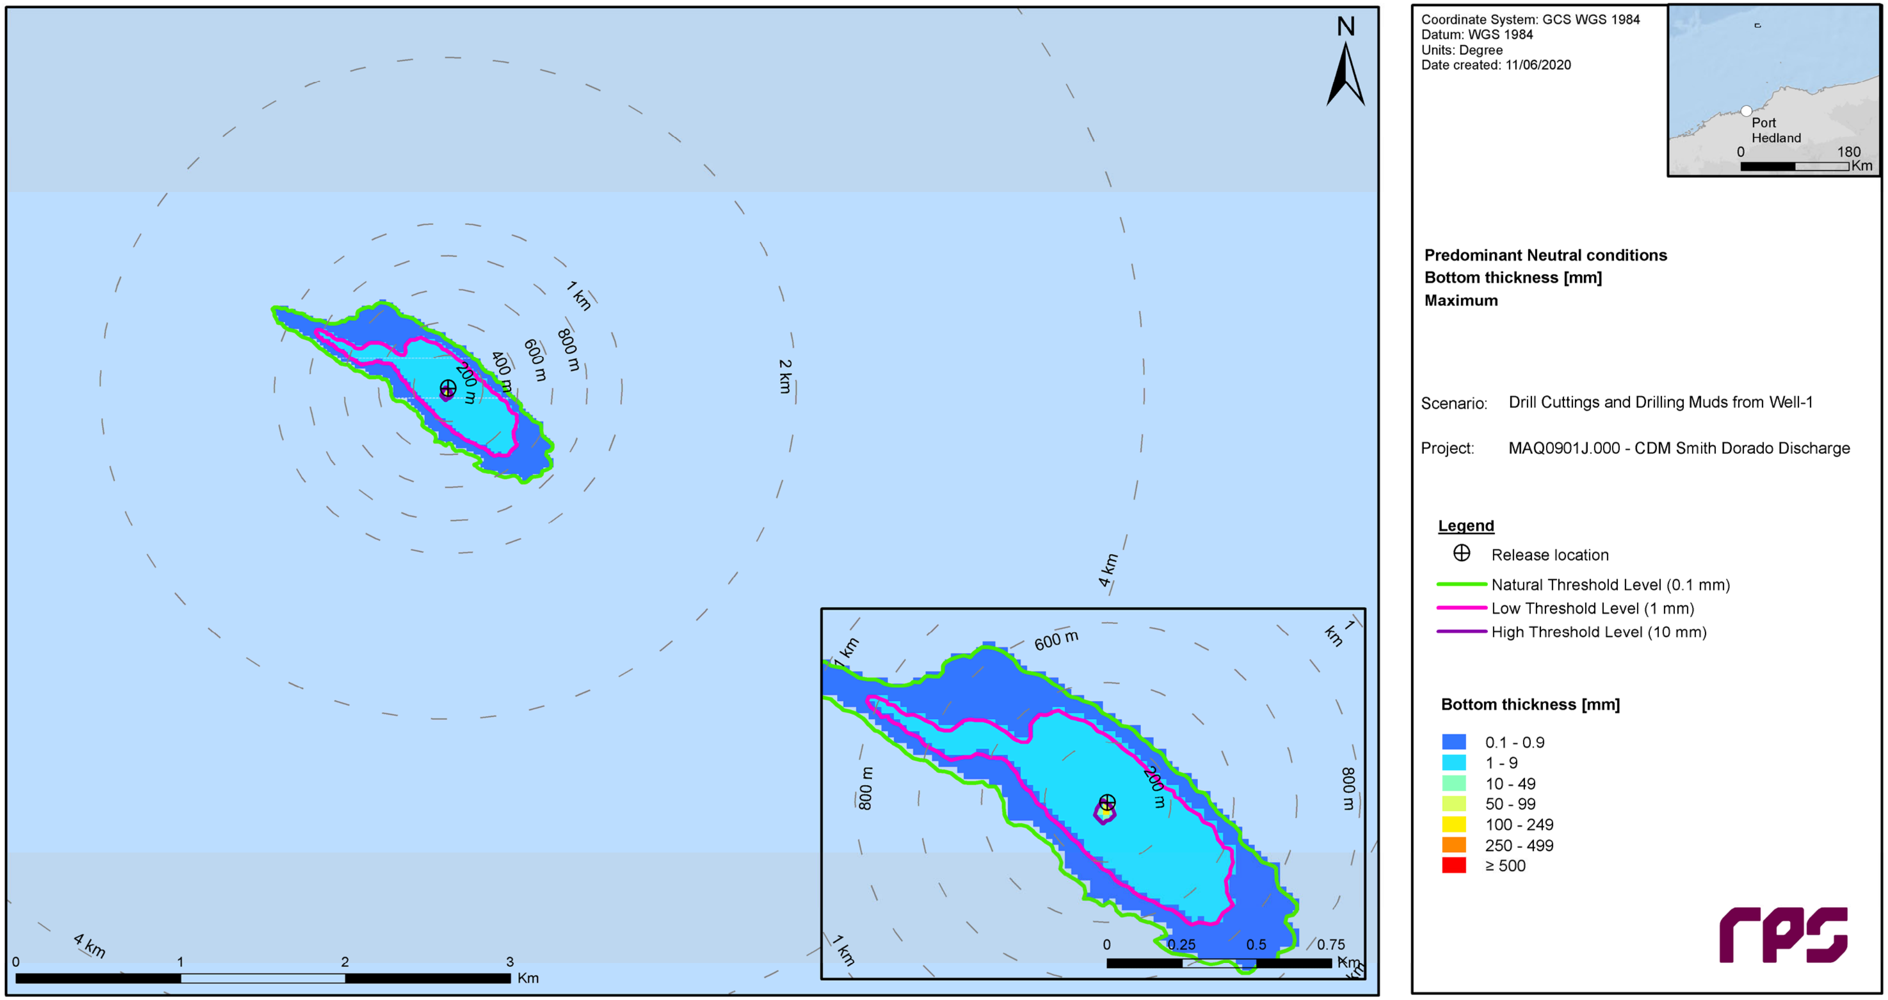

Figure 4.3 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for Well-1 over 18 days commencing in Neutral conditions.

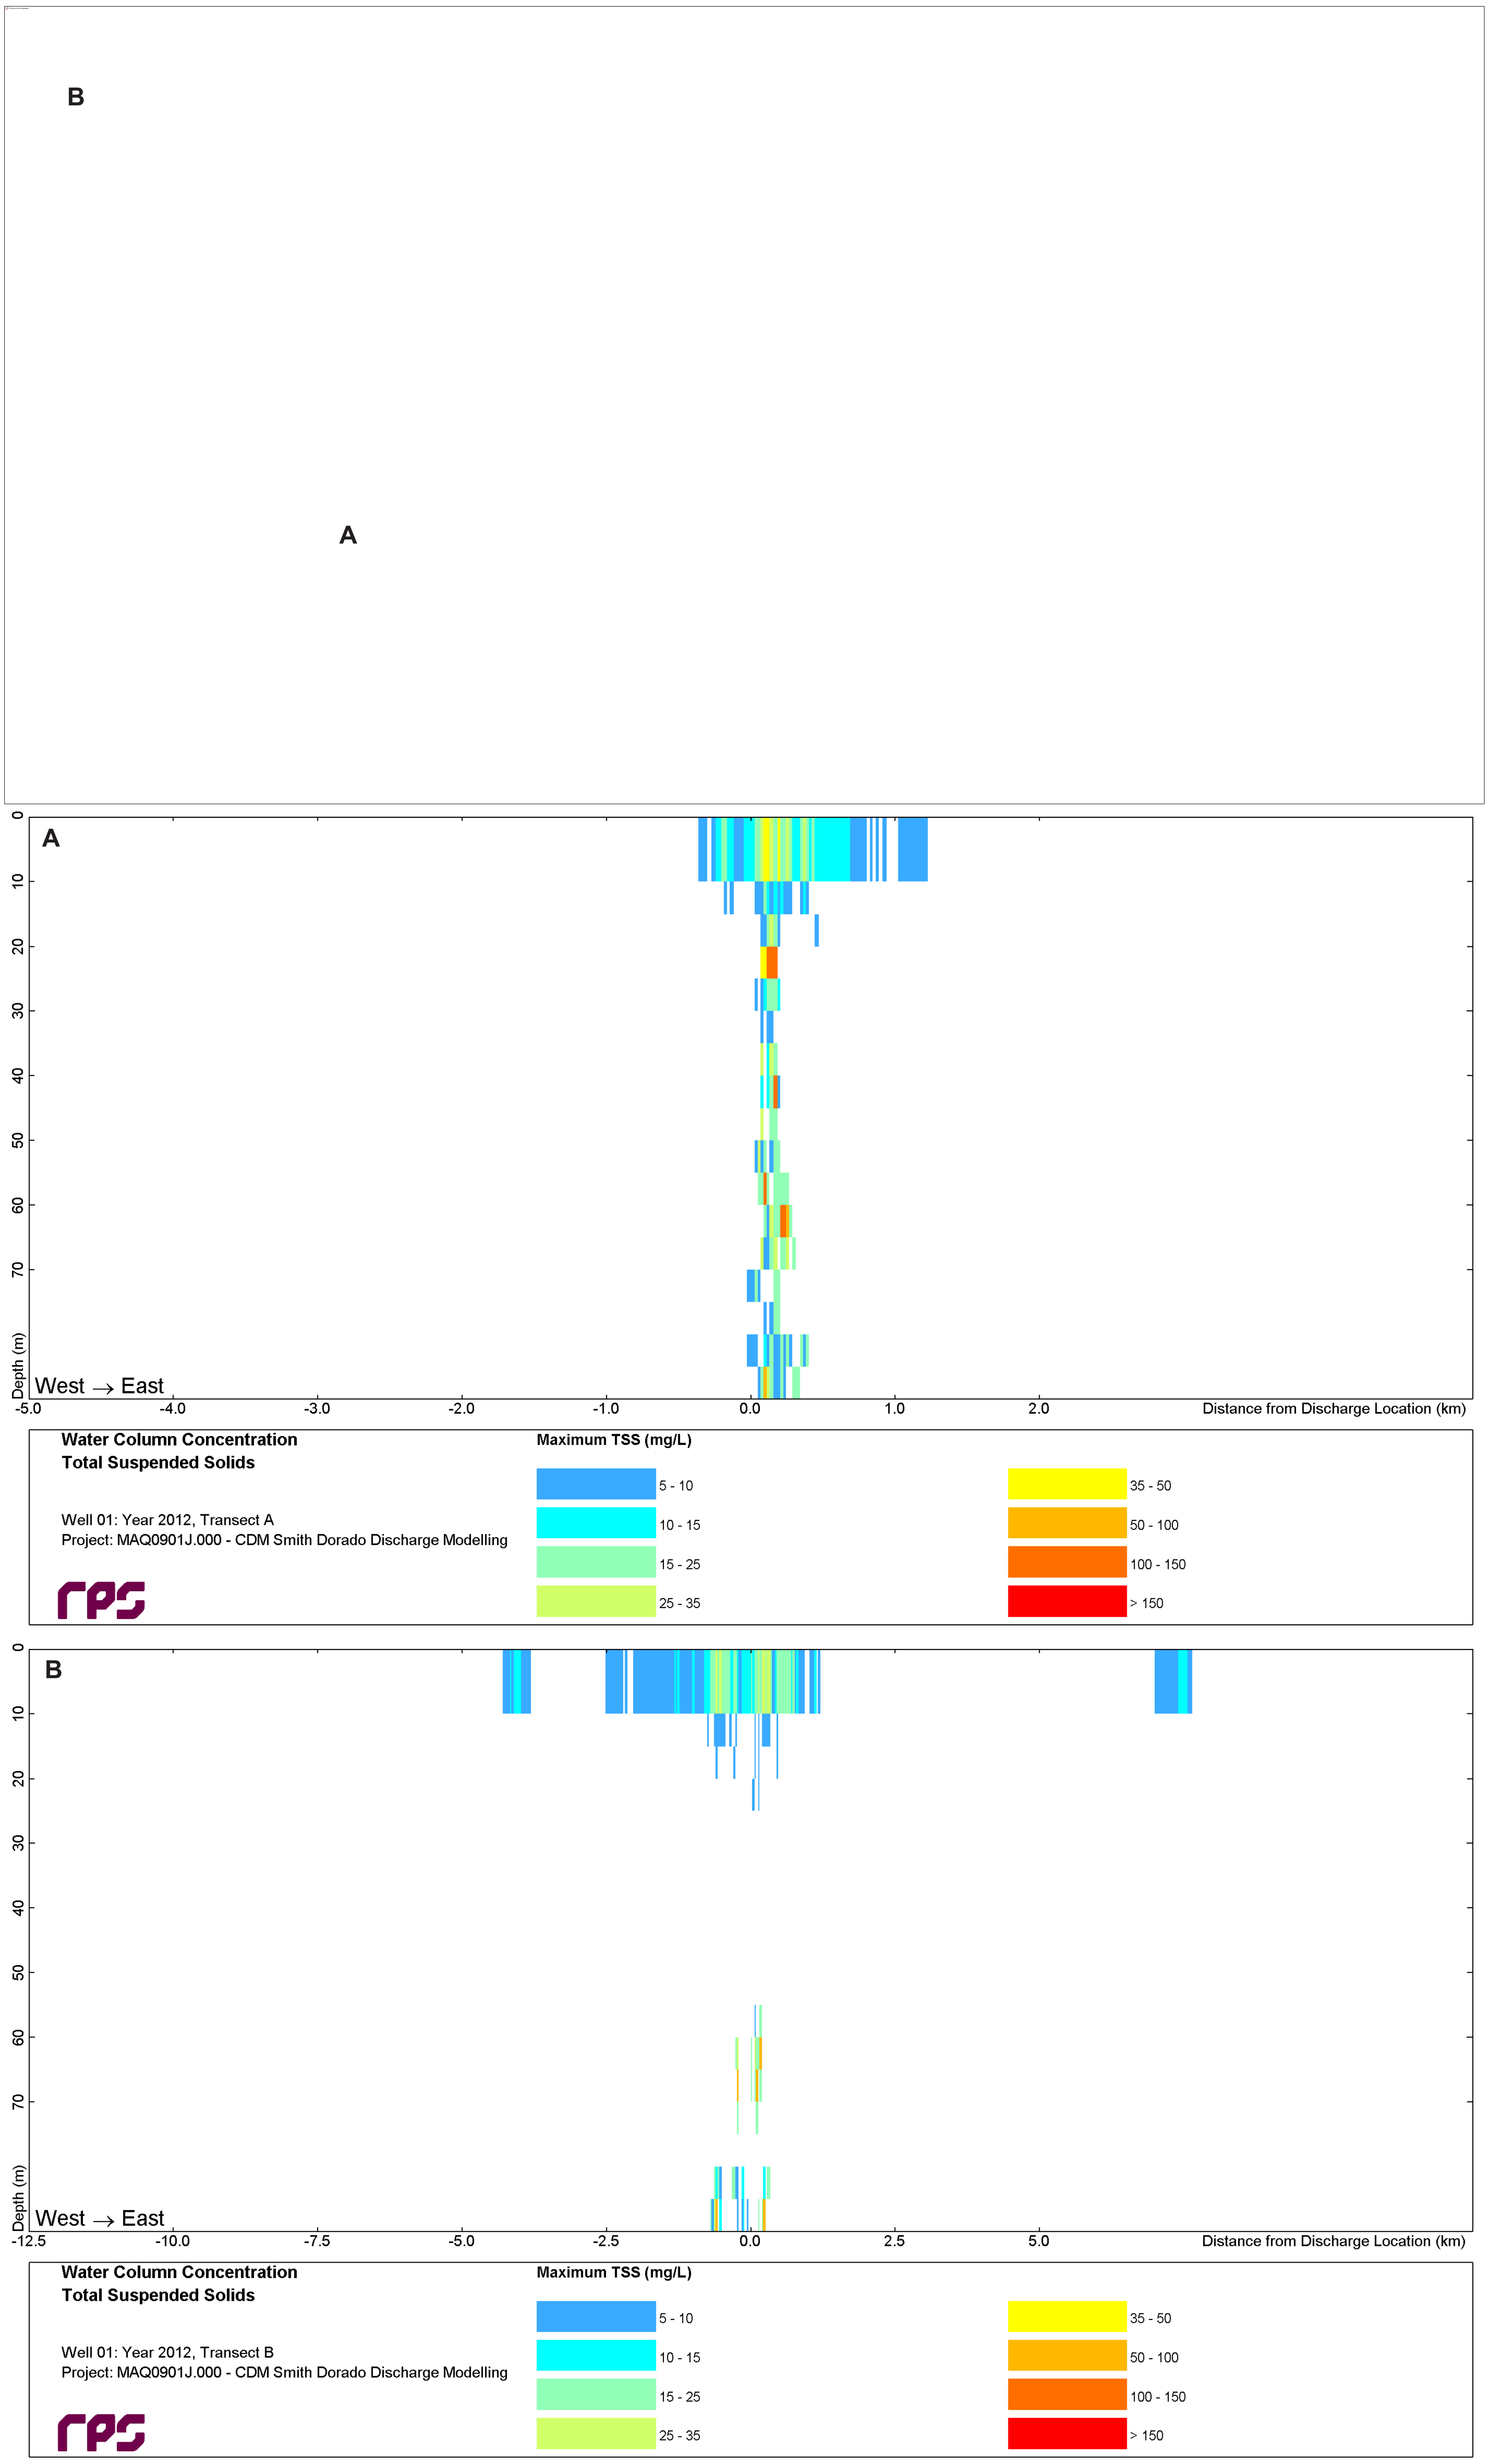

Figure 4.4 **Cross-sections (a) east-west and (b) north-south of the predicted maximum suspended sediment concentrations within the water column resulting from the drill cuttings and muds discharges for Well-1 over 18 days commencing in Neutral conditions.**

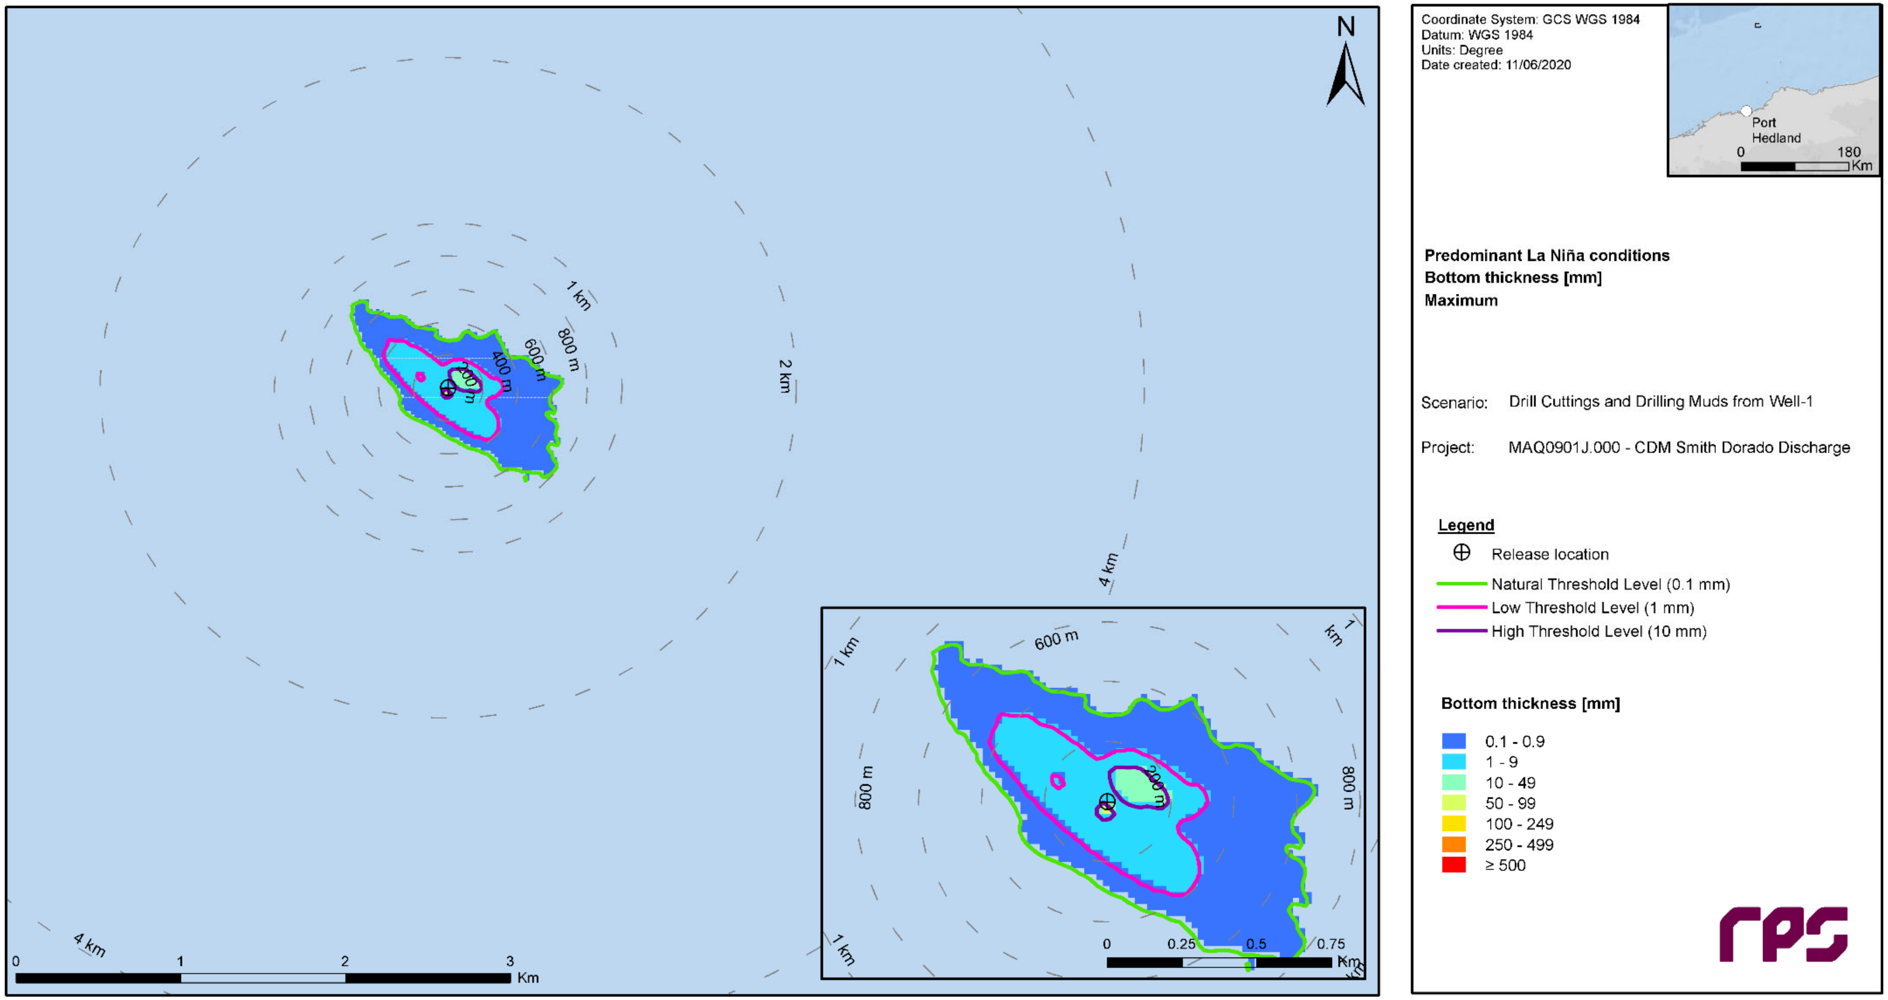

Figure 4.5 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for Well-1 over 18 days commencing in El Niño conditions.

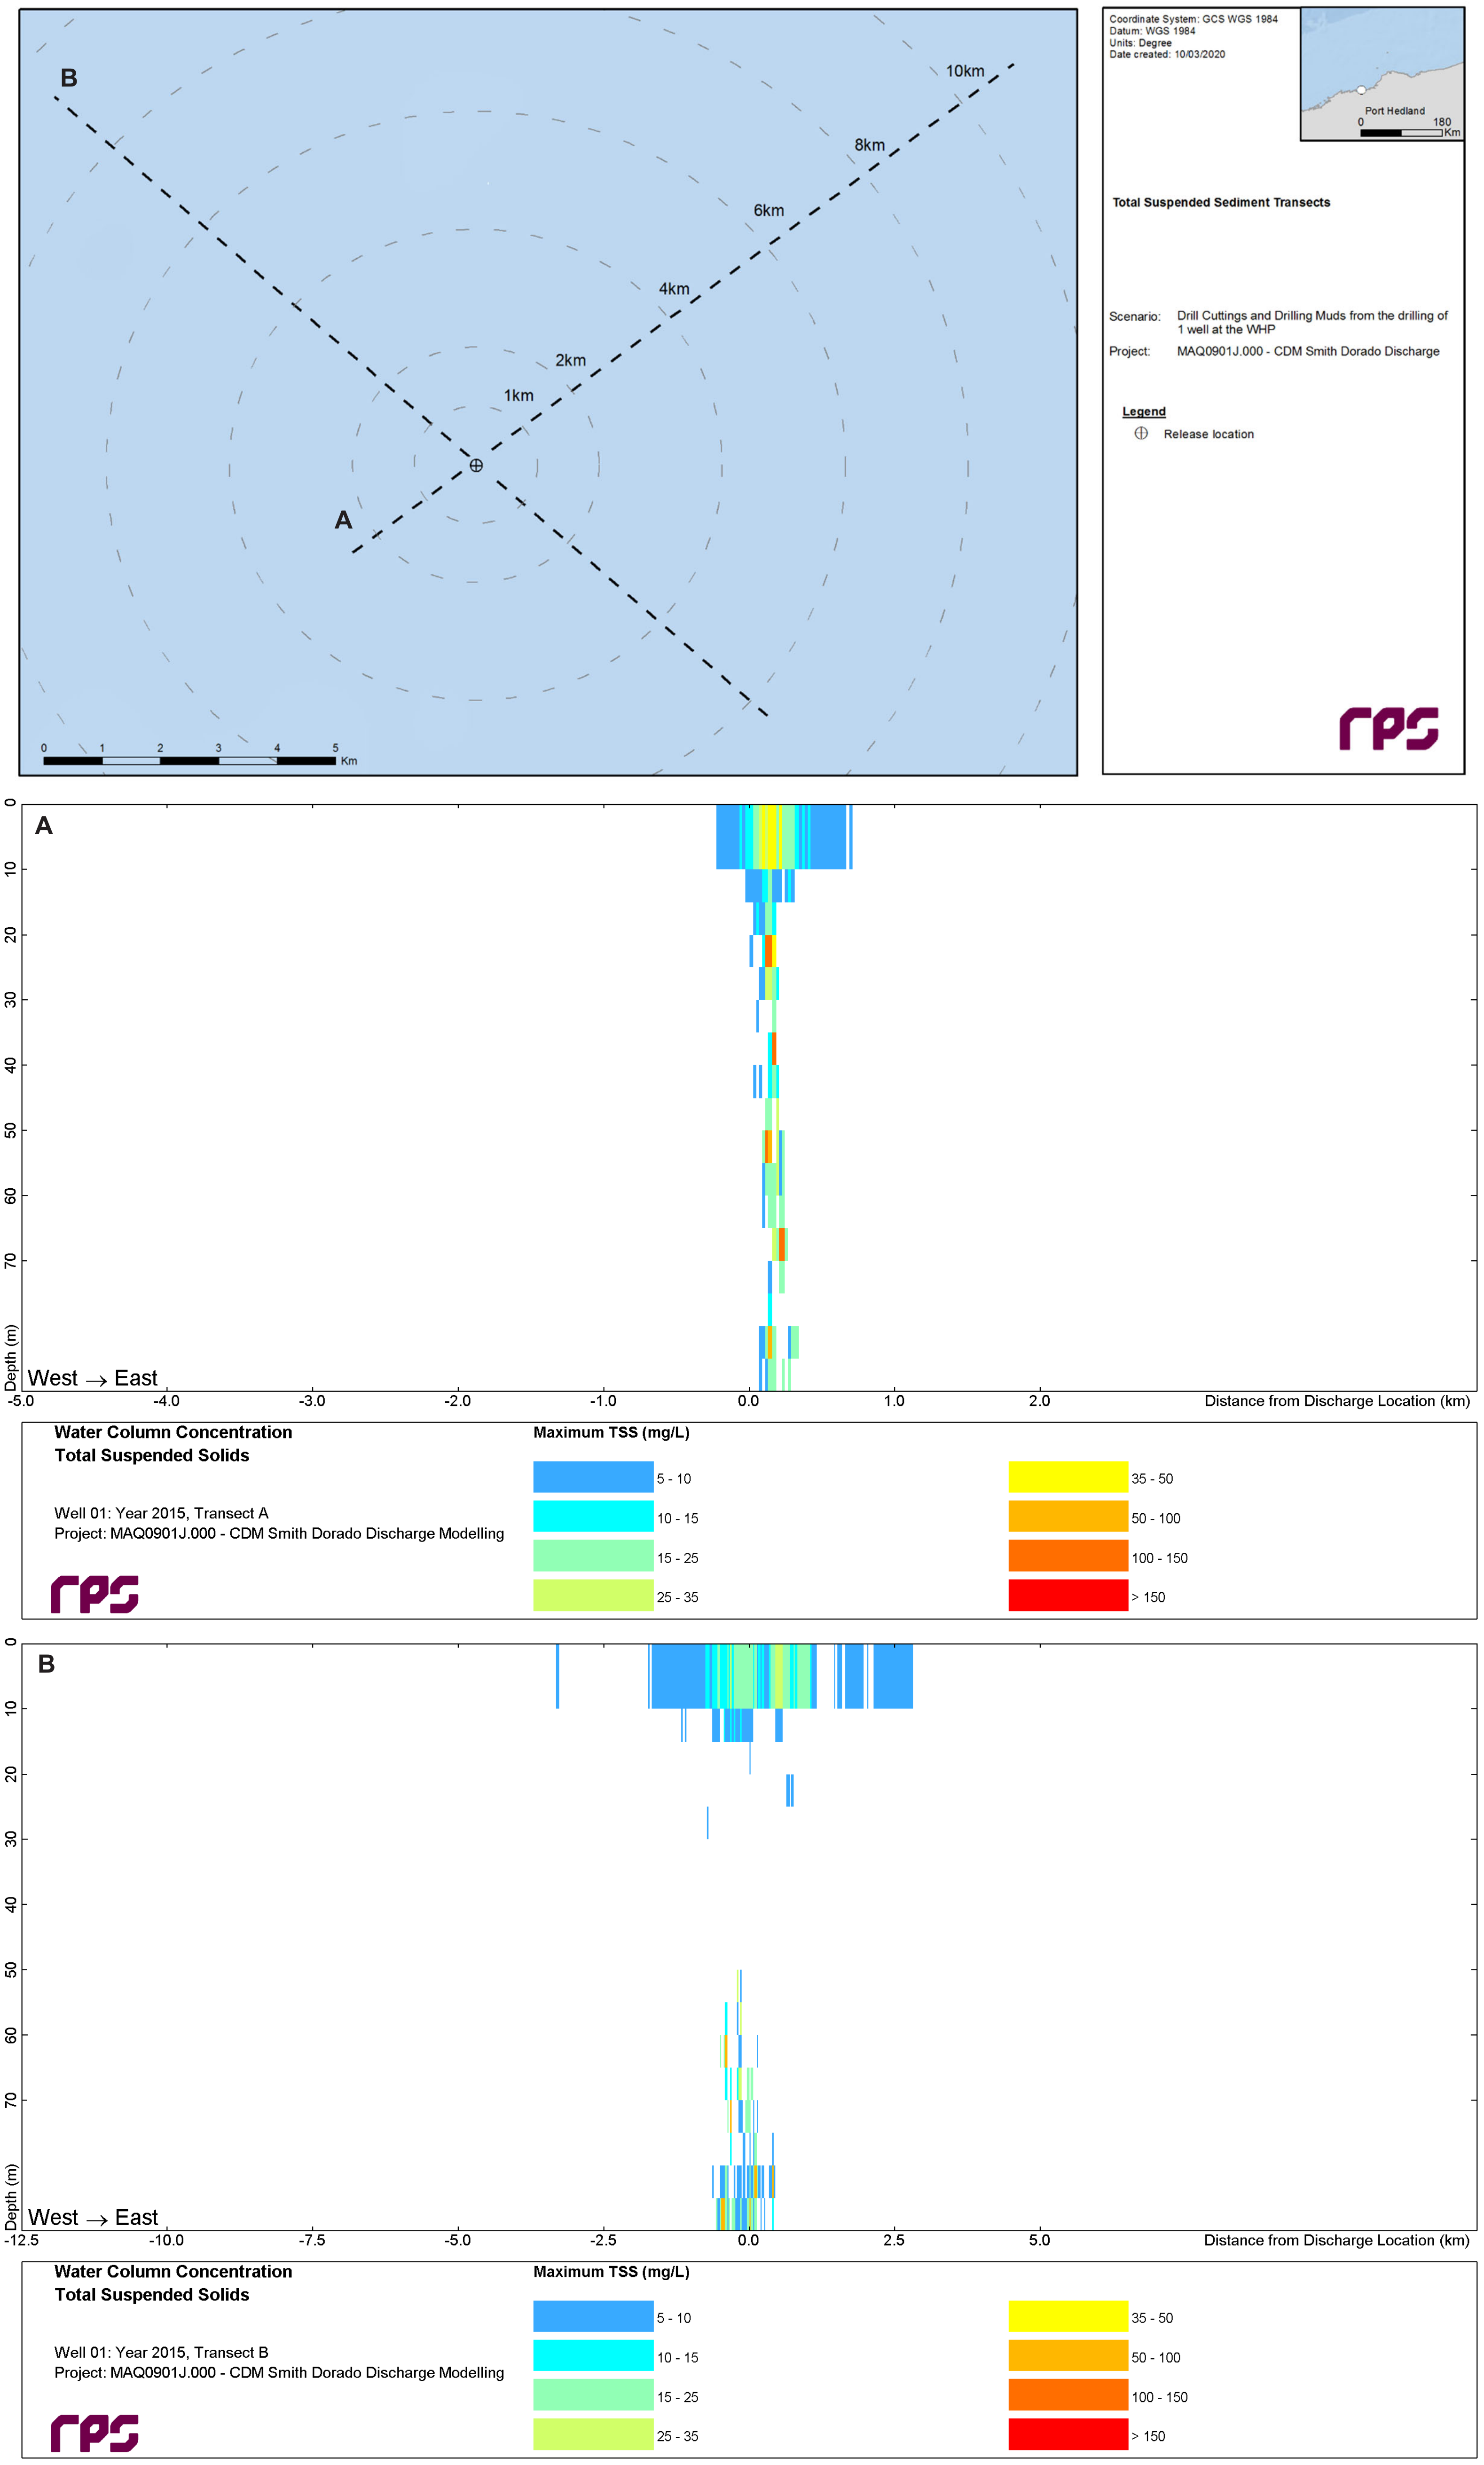

Figure 4.6 **Cross-sections (a) east-west and (b) north-south of the predicted maximum suspended sediment concentrations within the water column resulting drill cuttings and muds discharges for Well-1 over 18 days commencing in El Niño conditions.**

4.2 Twelve Wells Results for Each ENSO Events

The results for the twelve wells were integrated and Figure 4.7, Figure 4.8 and Figure 4.9 show the distribution of sediment thickness calculated for the discharge of drill cuttings and drilling muds commencing in La Niña, Neutral and El Niño conditions, respectively.

Table 4.2 the predicted maximum sediment thickness, area of coverage and the maximum distance from well location to each threshold for each ENSO event.

The maximum thickness (or height of mound) was predicted to be 1,315 mm (during Neutral conditions) adjacent to the well location (Table 4.2).

Modelling predicted a zone of potential influence at the natural threshold level, with thicknesses of 0.1 mm or greater expected up to 2,871 m from the well location while covering an area of 8.39 km^2 (during predominantly El Niño conditions). The low and high exposure thresholds were more localised and not expected beyond 758 m and 391 m, respectively. Greatest areas of coverage on the seafloor at the low and high exposure thresholds were 0.78 km^2 and 0.27 km^2, respectively.

Table 4.2 Predicted maximum sediment thickness, area of coverage and maximum distance for each threshold resulting from the drill cuttings and drilling muds discharge for the 12 wells. The results are presented based on each ENSO event.

ENSO event	Maximum Sediment thickness (mm)	Total Area of Coverage (km^2) above Threshold			Maximum Distance (m) from Well to Threshold		
		0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)	0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)
La Niña	1,205	7.69	0.78	0.27	2,501	736	426
Neutral	1,315	8.93	0.73	0.25	2,813	954	447
El Niño	1,224	8.39	0.73	0.23	2,871	758	391

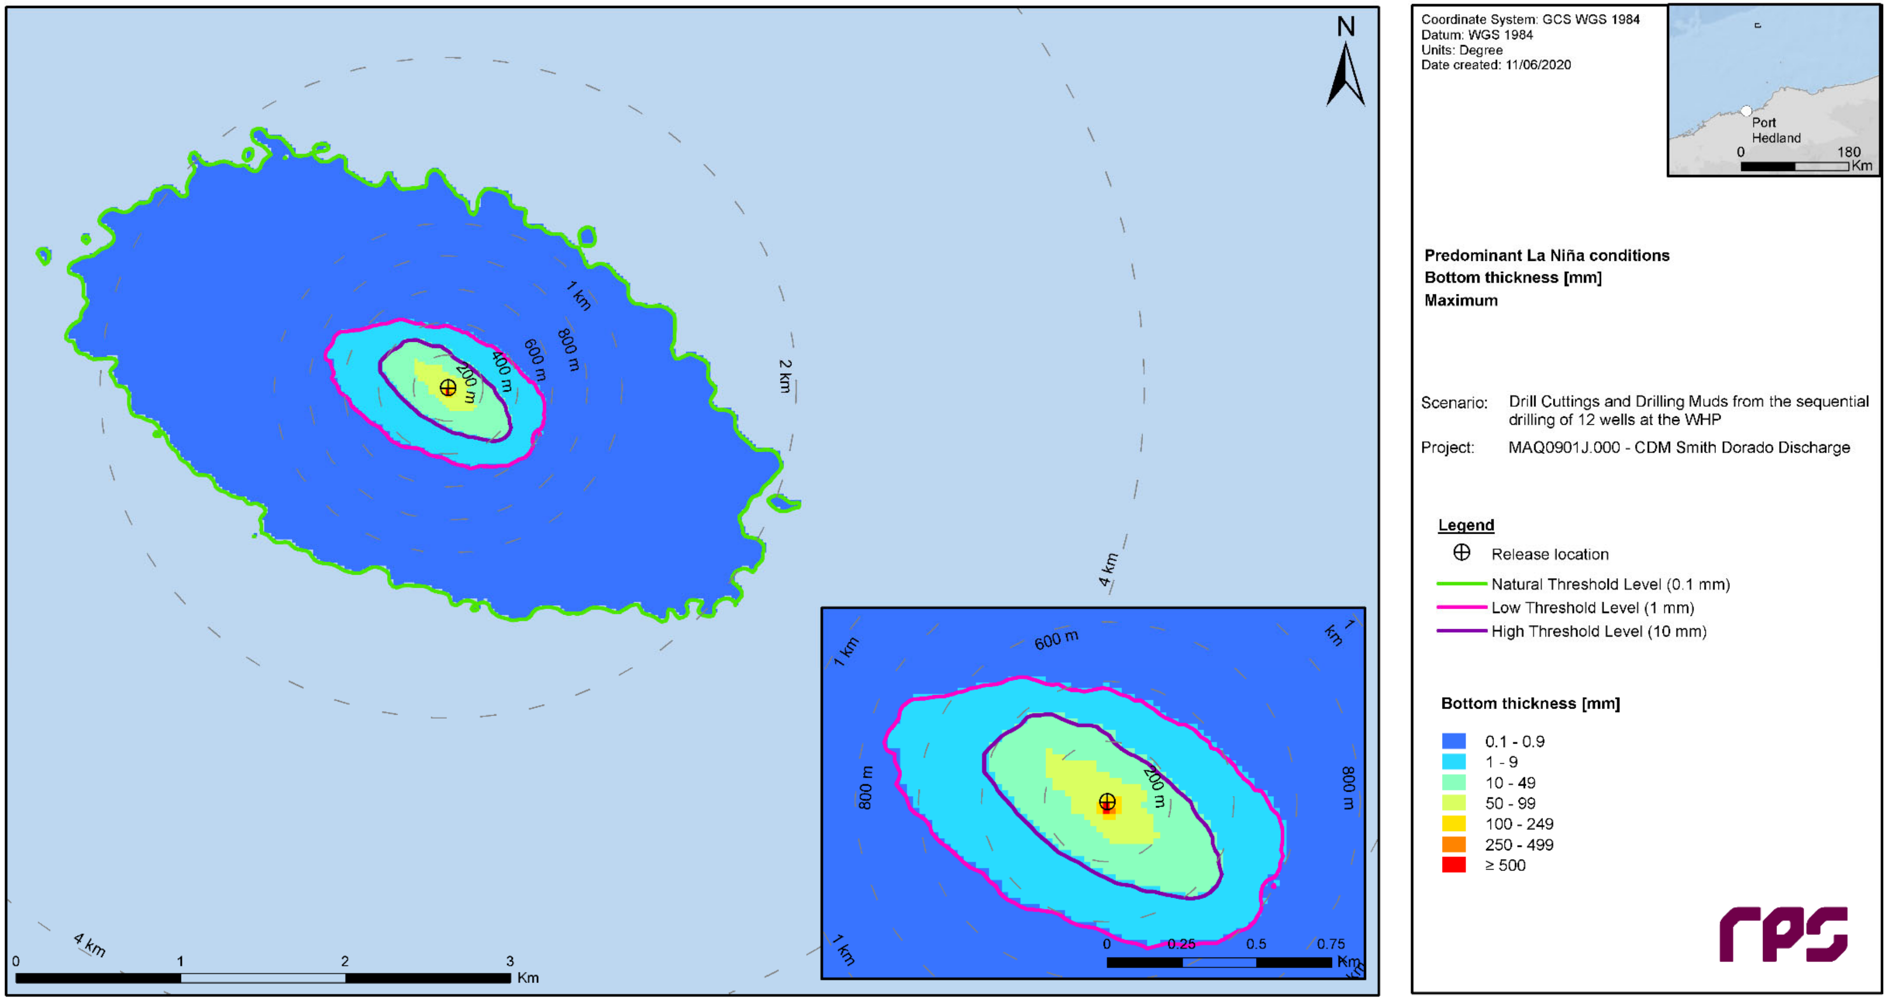

Figure 4.7 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for all 12 wells over 528 days, commencing in La Niña conditions.

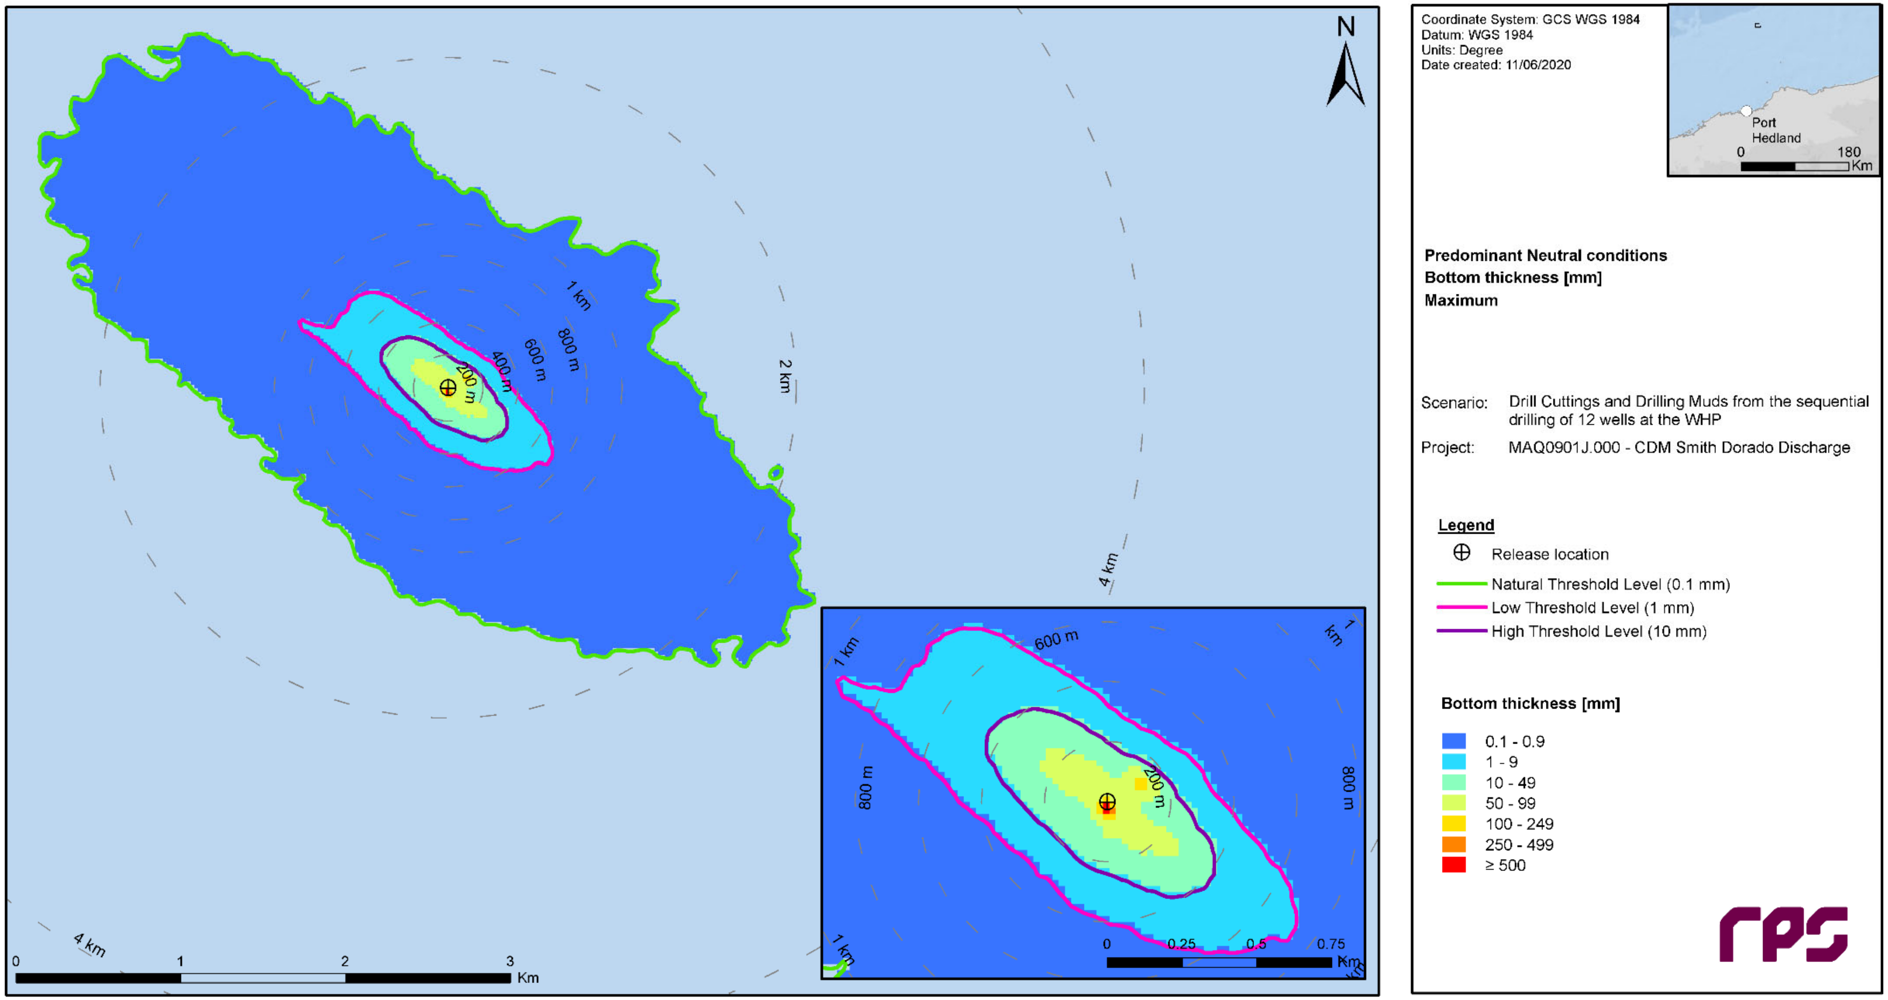

Figure 4.8 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for all 12 wells over 528 days, commencing in Neutral conditions.

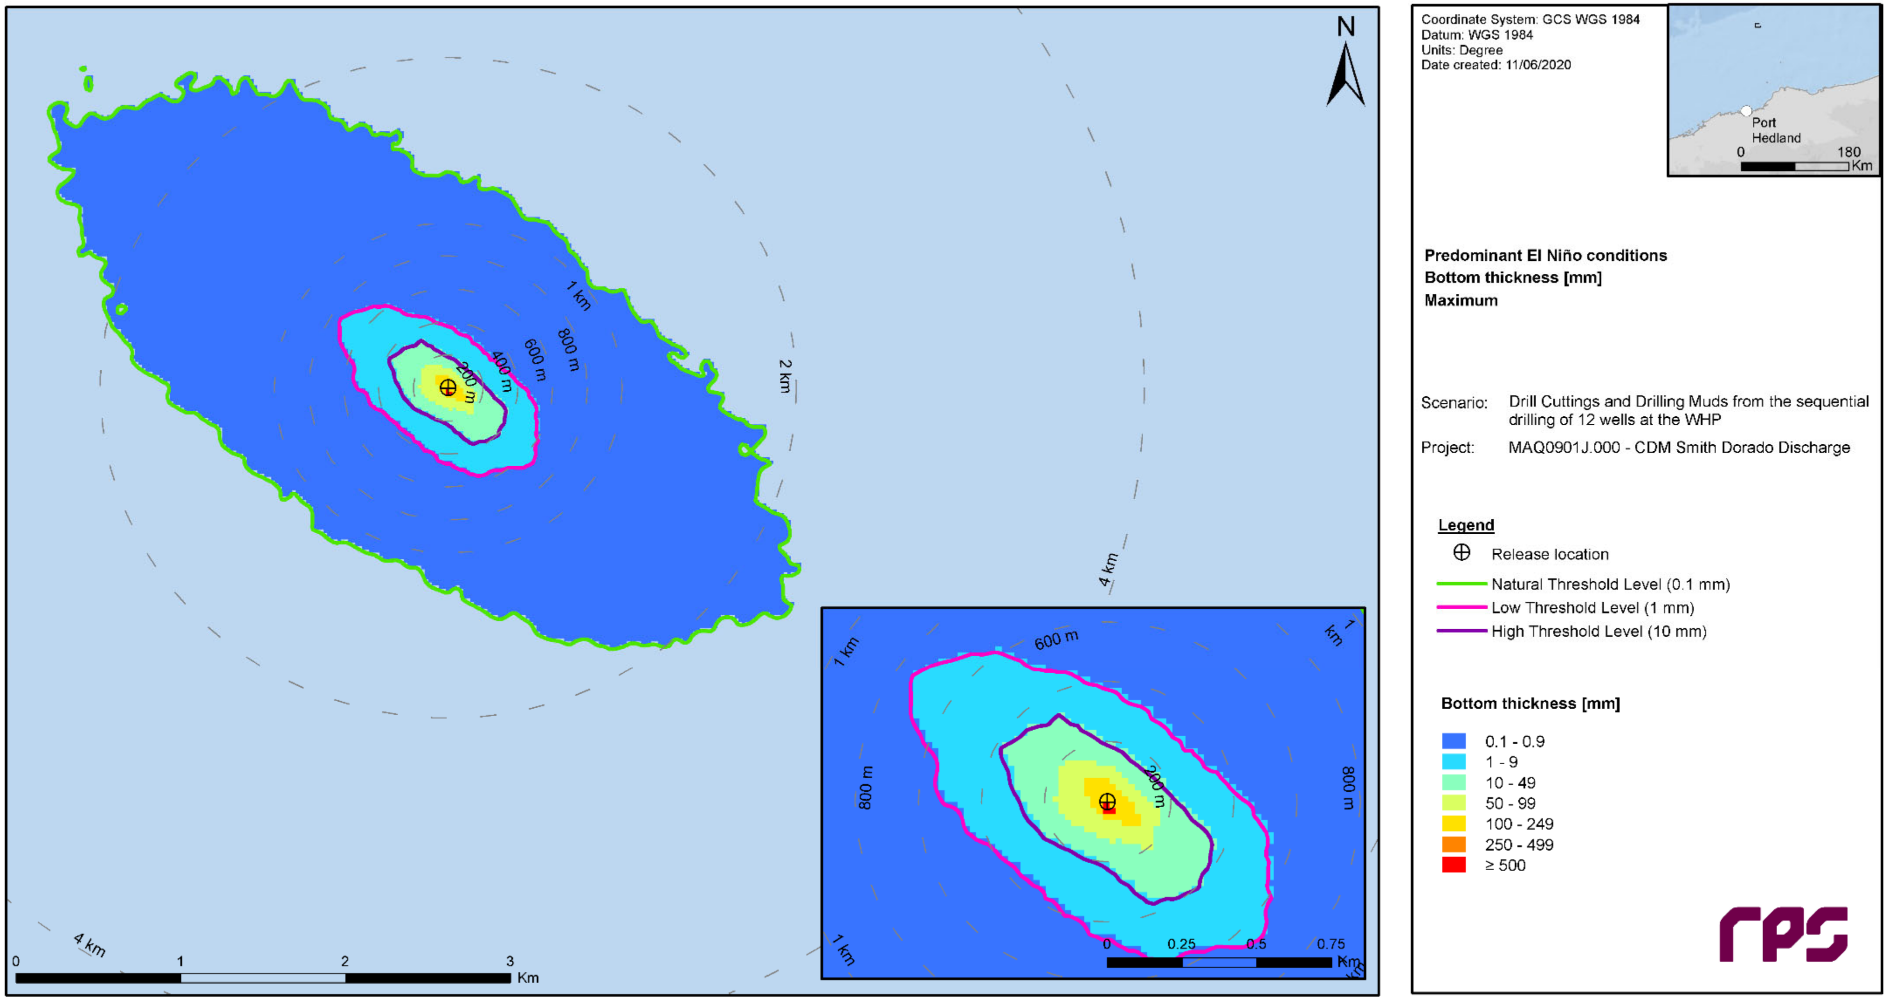

Figure 4.9 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for all 12 wells over 528 days, commencing in El Niño conditions.

4.3 Combined Overall Results

The combined results show the maximum likely extent of the drill cuttings and muds on the seabed, the results for the twelve wells and the three ENSO conditions were combined and are presented in Figure 4.10.

Table 4.3 shows the predicted maximum sediment thickness, area of coverage and the maximum distance from the well location to each threshold.

In all instances the modelling results demonstrated that the settlement of the cuttings and drilling muds were generally spread along the northwest–southeast axis, coinciding with the dominant tidal current directions. The maximum thickness (or height of mound) was predicted to be 1,315 mm adjacent to the well location (within 20 m).

The minimum or natural threshold was predicted to extend up to 2,871 m from the well location and cover an area of 9.81 km^2. The maximum distances from the release site to the low and high exposure thresholds were 954 m and 447 m, respectively.

Table 4.3 Predicted maximum sediment thickness, area of coverage and maximum distances to each threshold from the discharge drill cuttings and drilling muds for the proposed Dorado Development. The combined results are calculated from the amalgamation of all 12 wells and the three ENSO conditions.

Maximum Sediment thickness (mm)	Total Area of Coverage (km^2) above Threshold			Maximum Distance (m) from Well to Threshold		
	0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)	0.1 - 1 mm (natural threshold)	1-10 mm (low exposure)	≥10 mm (high exposure)
1,315	9.81	0.92	0.28	2,871	954	447

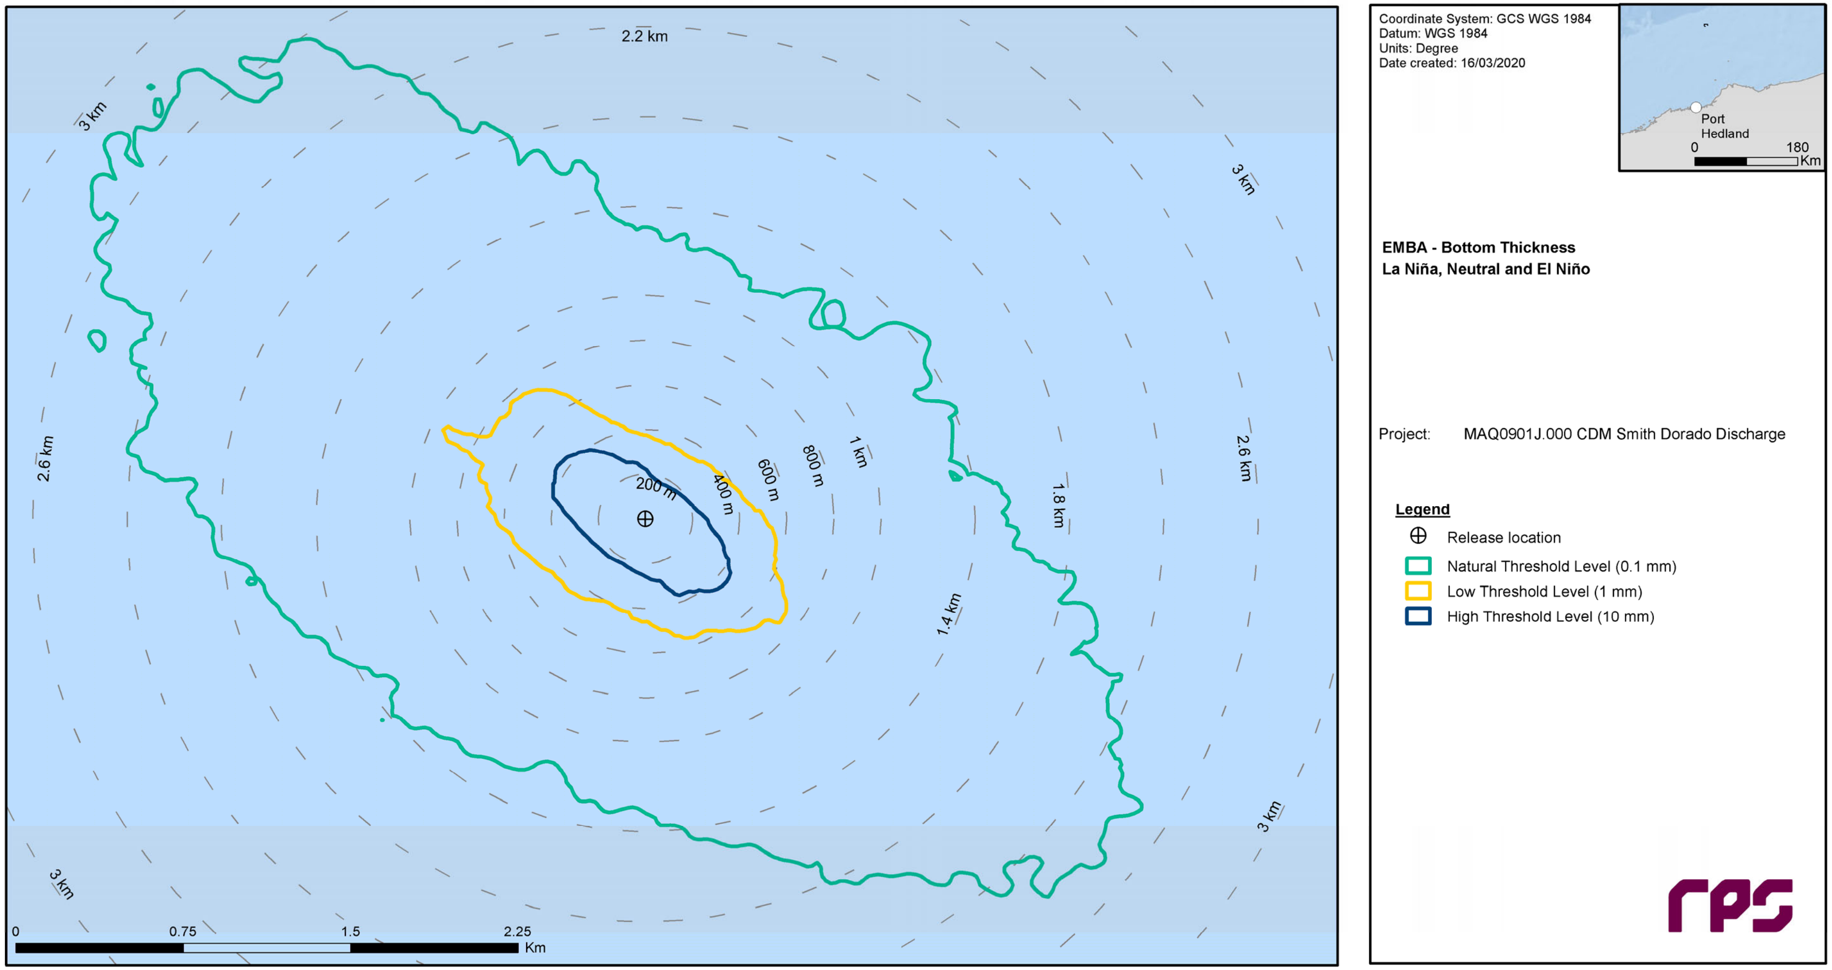

Figure 4.10 Predicted coverage and sediment thicknesses from the drill cuttings and muds discharges for all 12 wells and the three ENSO conditions

EXECUTIVE SUMMARY

Santos Limited (Santos) is planning for the Dorado Development located in the Bedout Basin offshore north-west Western Australia, approximately 140 km north of Port Hedland. The Dorado Development will target the Dorado oil field with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading (FPSO) facility.

To inform the impact assessment and support the preparation of the Offshore Project Proposal (OPP), a detailed produced water (PW) discharge modelling study was commissioned.

The principal aim of the study was to determine change in temperature and dilution for a continuous PW flow rate of 4,350 m^3/d released at the Dorado FPSO for a range of discharge heights (Case 1 - 10 m above mean sea level (AMSL), Case 2 - 0 m below mean sea level (BMSL) and Case 3 - 10 m BMSL).

The dilution and extent of the PW discharge was assessed on a seasonal basis ((i) summer (October to March); (ii) transitional periods (April and September); and (iii) winter (May to August)). An annualised aggregation of seasonal outcomes was also compiled.

To accurately determine the dilution of the PW discharge and the total potential area of influence, the effect of near-field mixing was considered first, followed by an investigation of the far-field mixing. Different modelling approaches are required for calculating near-field and far-field dilutions due to the differing hydrodynamic scales. Given the field is not in production, it is not possible to undertake ecotoxicological tests on the PW stream, so the modelling results have been presented as a range of dilutions.

The main findings of the study are as follows:

Near-Field Modelling

- A discharge from 10 m AMSL was predicted to plunge up to 4.4 m BMSL when the current speed was low before rising and collapses under the water surface while being diverted by the prevailing current. The plunge depth was calculated to decrease under medium (2.6 m) and strong (1.3 m) currents, while the maximum distance of the near-field dilution zone was forecast to increase under high current speed conditions to 13.9 m, compared to 7.2 m for the weak current.
- Calculations for the discharge at 0 m BMSL indicated lower penetration depths (~ 1.5 m maximum) and shorter distances (up to 3.9 m) before all near-field mixing ceases compared to discharge at 10 m AMSL. Lower average dilution rates (up to 1:15) were calculated at the completion of the near-field mixing processes compared to the 10 m AMSL discharge (1:68).
- Discharge at 10 m BMSL was forecast to result in a relatively short plunge distance due to momentum (< 2 m maximum) but provided a greater vertical distance for the plume to rise under buoyancy and entrain with the ambient waters. The additional distance to surface, and the effect on dilution, was calculated to compound with increased current speed. Highest near-field average dilutions overall are calculated for this discharge configuration (up to 1:981 at 129.7 m from the release site).
- Overall, the results indicated a strong effect by the discharge height and current speed. Lowest dilutions were calculated during a weak current and higher dilutions were predicted for medium and high current speeds.

Far-Field Modelling

- The results indicated rapid dispersion of the PW discharge within the ambient environment and dilutions of up to 1:1,000 were within 902 m (based on the 99th percentile analysis) from the discharge location for all three cases.
- At the 95th percentile, the maximum extents to the 1:1,000 dilution contour were 298 m, 608 m and 255 m for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.

- Based on the 95th percentile analysis, the total areas of influence to achieve a 1:1,000 dilution were 0.102 km^2, 0.136 km^2 and 0.072 km^2 for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.
- Maximum depths to the 1:1,000 dilution level were predicted as 4 m, 3 m and 4 m for 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.

1 INTRODUCTION

1.1 Background

Santos Limited (Santos) is planning for the Dorado Development located in the Bedout Basin offshore north-west Western Australia, approximately 140 km north of Port Hedland. The Dorado Development will target the Dorado oil field with reservoir fluid being collected on a wellhead platform (WHP) and transported by infield flowlines for processing on a floating production storage and offloading (FPSO) facility.

The Dorado Development will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (OPGGS (E) Regulations), administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk.

To inform the impact assessment and support the preparation of the OPP, CDM Smith (on behalf of Santos) has commissioned RPS to undertake a detailed produced water (PW) discharge modelling study.

The PW will be generated during the project and will be discharged into the open ocean. The PW stream is generally characterised as having a naturally high temperature due to exposure to geothermal heat in the reservoir and may contain a mixture of constituents including dissolved and dispersed hydrocarbons at levels exceeding the receiving marine waters.

The principal aim of the study was to determine change in temperature and dilution for a continuous PW flow rate of 4,350 m^3/d released at the Dorado FPSO (Figure 1.1) for a range of discharge heights (Case 1 - 10 m above mean sea level (AMSL), Case 2 - 0 m below mean sea level (BMSL) and Case 3- 10 m BMSL).

The dilution and extent of the PW discharge was assessed on a seasonal basis ((i) summer (October to March); (ii) transitional periods (April and September); and (iii) winter (May to August)). An annualised aggregation of seasonal outcomes was also compiled.

Table 1.1 Coordinates of the proposed Dorado FPSO used as the release site for the PW dispersion modelling assessment.

Release site	Latitude (°S)	Longitude (°E)	Water depth (m)
Dorado FPSO	19° 02' 49.546"	118° 44' 36.744"	90

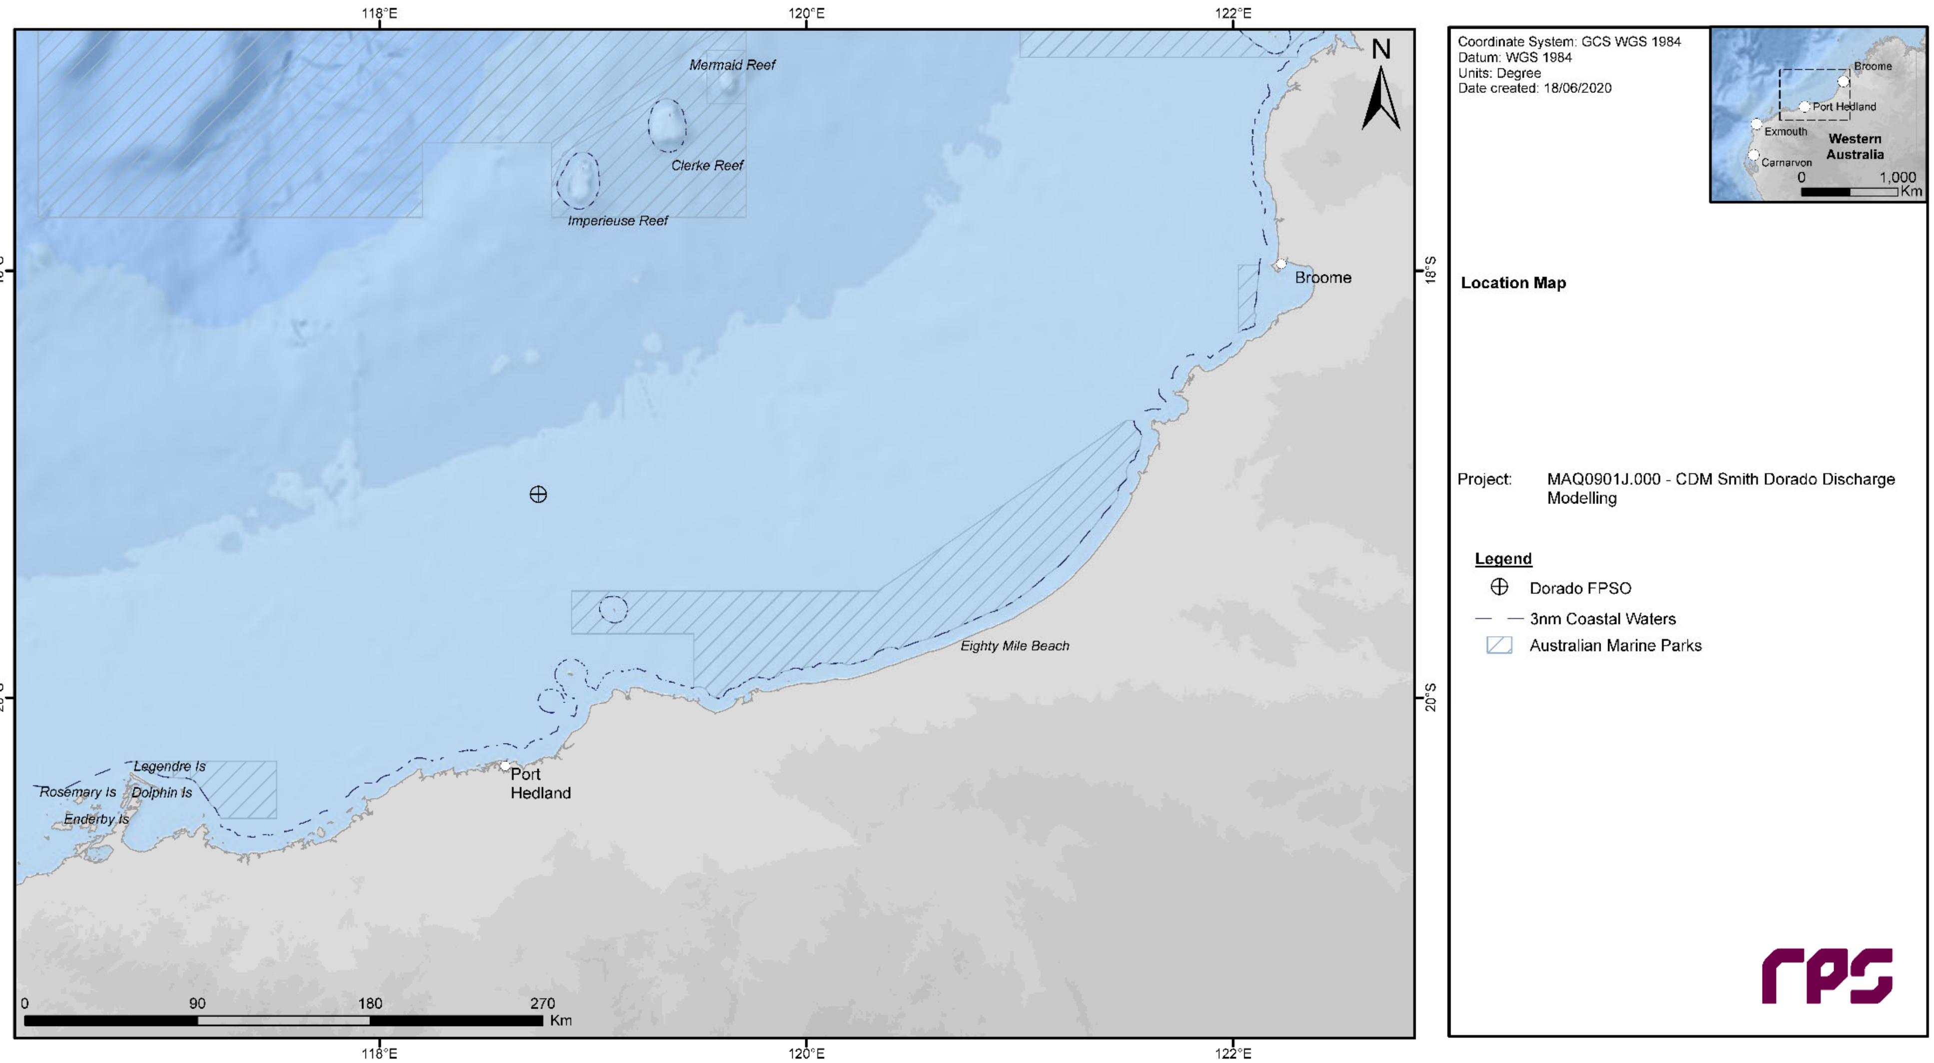

Figure 1.1 Location of the proposed Dorado FPSO used as the release site for the PW dispersion modelling assessment.

1.2 Modelling Scope

The scope of the modelling includes the following components:

1. Generate ten-years (2009-2018) of three-dimensional current data, that includes the combined influence of drift and tidal currents and is suitably long to be indicative of interannual variability in ocean currents.
2. Assess the near-field mixing and dilution for the PW discharge for each case under weak, medium and strong seasonal and annualised current strengths;
3. Establish a far-field dispersion model to calculate dispersive mixing and dilution of the PW discharge for each case, randomly sampling a wide range of current conditions from the ten-year time series of current data.
4. Determine the maximum distances and total areas of influence in which a 1:1,000 dilution is achieved for each case.

The physical mixing of the PW discharge can be separated into two distinct zones: (a) near-field; and (b) far-field. The limits of the near-field zone are defined by the area where the levels of mixing and dilution are controlled by the plume's initial jet momentum and the buoyancy flux, resulting from the density difference. When the plume encounters a boundary such as the water surface, seabed or density stratification layer, the near-field mixing is complete and the far-field mixing begins. During the far-field phase, the plume is transported and mixed by the ambient currents.

Therefore, to accurately determine the dilution and the mixing zone of the PW stream, the effect of near-field mixing needs to be considered first, followed by an investigation of the far-field mixing. In this report the near-field and far-field modelling results are presented.

2 REGIONAL OCEAN CURRENTS

2.1 Overview

The area of interest for this study is typified by strong tidal flows over the shallower regions, particularly along the inshore region. However, the offshore regions with water depths exceeding 100-200 m experience significant large-scale drift currents. These drift currents can be relatively strong (1-2 knots) and complex, manifesting as a series of eddies, meandering currents and connecting flows. These offshore drift currents also tend to persist longer (days to weeks) than tidal current flows (hours between reversals) and thus will have an influence upon the net trajectory of discharges over time scales exceeding a few hours.

Wind shear on the water surface also generates local-scale currents that can persist for extended periods (hours to days) and result in long trajectories. Hence, the current-induced transport of plumes can be variably affected by combinations of tidal, wind-induced and density-induced drift currents. Depending on their local influence, it is important to consider all these potential advective mechanisms to rigorously understand patterns of potential transport from a given discharge location.

To appropriately allow for temporal and spatial variation in the current field, dispersion modelling requires the current speed and direction over a spatial grid covering the potential migration zone of plumes. Estimates of the net currents were derived by combining predictions of the drift currents, available from a mesoscale ocean model (HYCOM), with estimates of the tidal currents generated by an RPS model set up for the study area (HYDROMAP).

2.2 Ocean Currents

The large scale drift currents were derived from the output of the global circulation model the Hybrid Coordinate Ocean Model (HYCOM; Bleck, 2002; Chassignet et al., 2007, 2009), created by the National Ocean Partnership Program (NOPP), as part of the US Global Ocean Data Assimilation Experiment (GODAE). The HYCOM model is a three-dimensional model that assimilates ocean observations of sea surface temperature, sea surface salinity and surface height, obtained by satellite observations, along with atmospheric forcing conditions from atmospheric models to predict drift currents generated by such forces as wind shear, density and sea height variations and the rotation of the earth.

The HYCOM model is configured to combine the three vertical coordinate types currently in use in ocean models: depth (z-levels), density (isopycnal layers), and terrain-following (σ-levels). HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas. Thus, this hybrid coordinate system allows for the extension of the geographic range of applicability to shallow coastal seas and unstratified parts of the world ocean. It maintains the significant advantages of an isopycnal model in stratified regions while allowing more vertical resolution near the surface and in shallow coastal areas, hence providing a better representation of the upper ocean physics. The model has global coverage with a horizontal resolution of $1/12^{th}$ of a degree (approximately 7 km at mid-latitudes) and a temporal resolution of one day.

A hindcast data set of HYCOM currents was obtained for a ten-year period spanning 2009 to 2018 (inclusive).

2.3 Tidal Currents

2.3.1 Description of Tidal Model: HYDROMAP

As the HYCOM model does not include tidal forcing, and because the data is only available at a daily frequency, a tidal model was developed for the study region using RPS' three-dimensional hydrodynamic model, HYDROMAP.

The model formulations and output (current speed, direction and sea level) of this model have been validated through field measurements around the world for more than 25 years (Isaji & Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003). HYDROMAP current data has also been widely used as input to forecasts and hindcasts of oil spill migrations in Australian waters. This modelling system forms part of the National Marine Oil Spill Contingency Plan for the Australian Maritime Safety Authority (AMSA) (AMSA, 2002).

HYDROMAP simulates the flow of ocean currents within a model region due to forcing by astronomical tides, wind stress and bottom friction. The model employs a sophisticated dynamically nested-gridding strategy, supporting up to six levels of spatial resolution within a single domain. This allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, or of particular interest to a study.

The numerical solution methodology of HYDROMAP follows that of Davies (1977a, 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji & Spaulding (1984).

2.3.2 Tidal Grid Setup

The same tidal model grid used in the oil spill study was used for this study. The grid extends approximately 3,870 km east-west by 3,220 km north-south over the eastern Indian Ocean. Figure 2.1 shows a subset of the grid between Exmouth and Derby.

The tidal domain is sub-gridded down to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids were allocated in a step-wise fashion to more accurately resolve flows along the coastline, around islands and over more complex bathymetry

Bathymetric data used to define the three-dimensional shape of the study domain was extracted from the CMAP electronic chart database and supplemented where necessary with manual digitisation of chart data supplied by the Australian Hydrographic Office (see Figure 2.2). Depths in the domain ranged from shallow intertidal areas through to approximately 7,200 m.

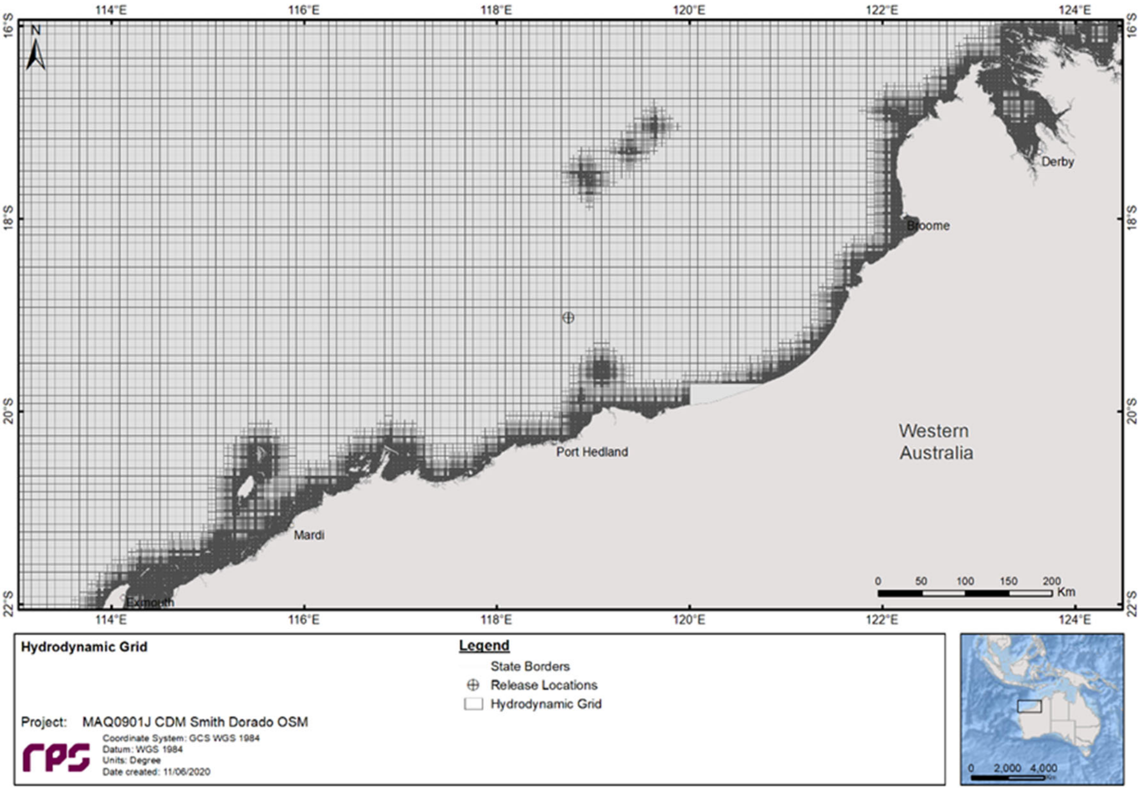

Figure 2.1 Subset of the model grid (grey wire mesh) used to generate the tidal currents. Higher-resolution areas are indicated by the denser mesh zones.

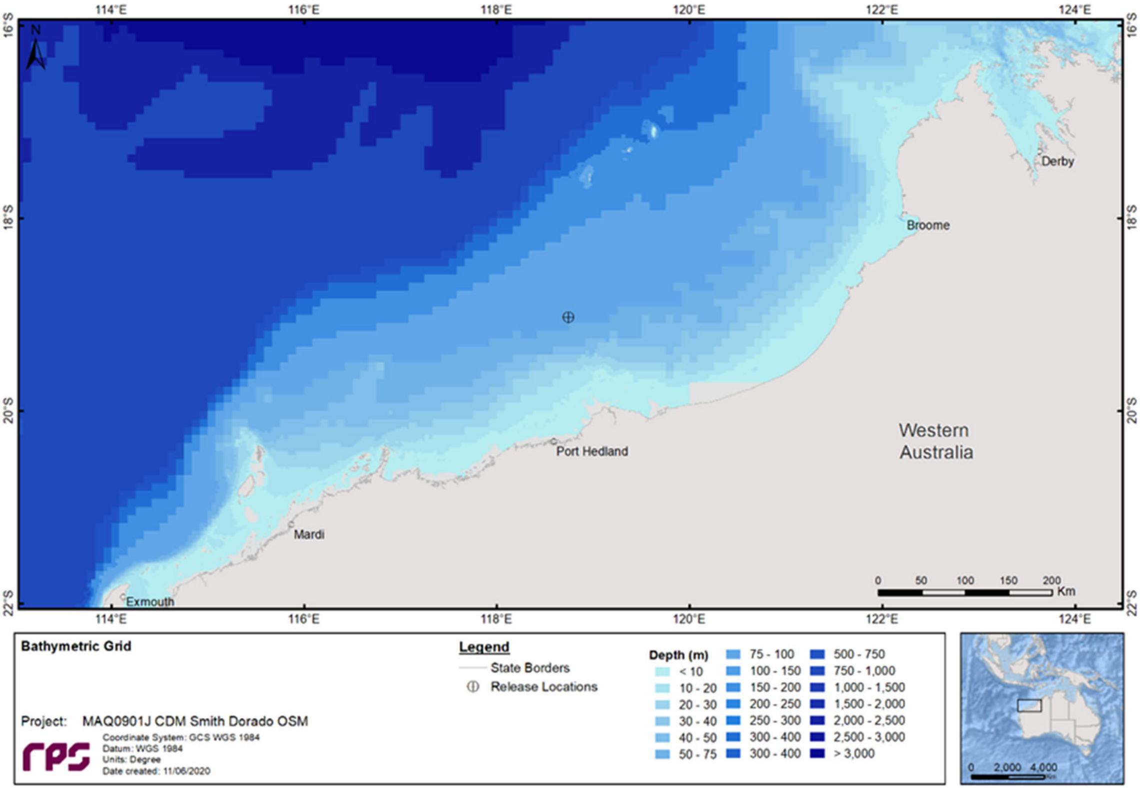

Figure 2.2 Subset of the bathymetry data used generate the tidal currents.

2.3.3 Tidal Boundary Conditions

Ocean boundary data for the HYDROMAP model was obtained from the TOPEX/Poseidon global tidal database (TPXO7.2) of satellite-measured altimetry data, which provided estimates of tidal amplitudes and phases for the eight dominant tidal constituents (designated as K_2, S_2, M_2, N_2, K_1, P_1, O_1 and Q_1) at a horizontal scale of approximately 0.25°. Using the tidal data, sea surface heights are firstly calculated along the open boundaries at each time step in the model.

The TOPEX/Poseidon satellite data is produced, and quality controlled by the US National Atmospheric and Space Agency (NASA). The satellites, equipped with two highly accurate altimeters capable of taking sea level measurements accurate to less than ±5 cm, measured oceanic surface elevations (and the resultant tides) for over 13 years (1992–2005). In total, these satellites carried out more than 62,000 orbits of the planet. The TOPEX/Poseidon tidal data has been widely used amongst the oceanographic community, being the subject of more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen, 2010). As such, the TOPEX/Poseidon tidal data is considered suitably accurate for this study.

2.3.4 Tidal Model Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at five locations (see Figure 2.3).

Figure 2.4 and Figure 2.5 illustrate a comparison of the predicted and observed surface elevations for each location for January 2014. As shown on the graphs, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott and Matsuura, 2005) were used.

The MAE is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood.

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i|$$

The Index of Agreement (IOA) is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2}$$

Where: X represents the variable being compared and the time mean of that variable. A perfect agreement exists between the model and field observations if the index gives an agreement value of 1 and complete disagreement will produce an index measure of 0 (Willmott, 1981). Willmott et al. (1985) also suggests that values meaningfully larger than 0.5 represent good model performance. Clearly, a greater IOA and lower MAE represent a better model performance.

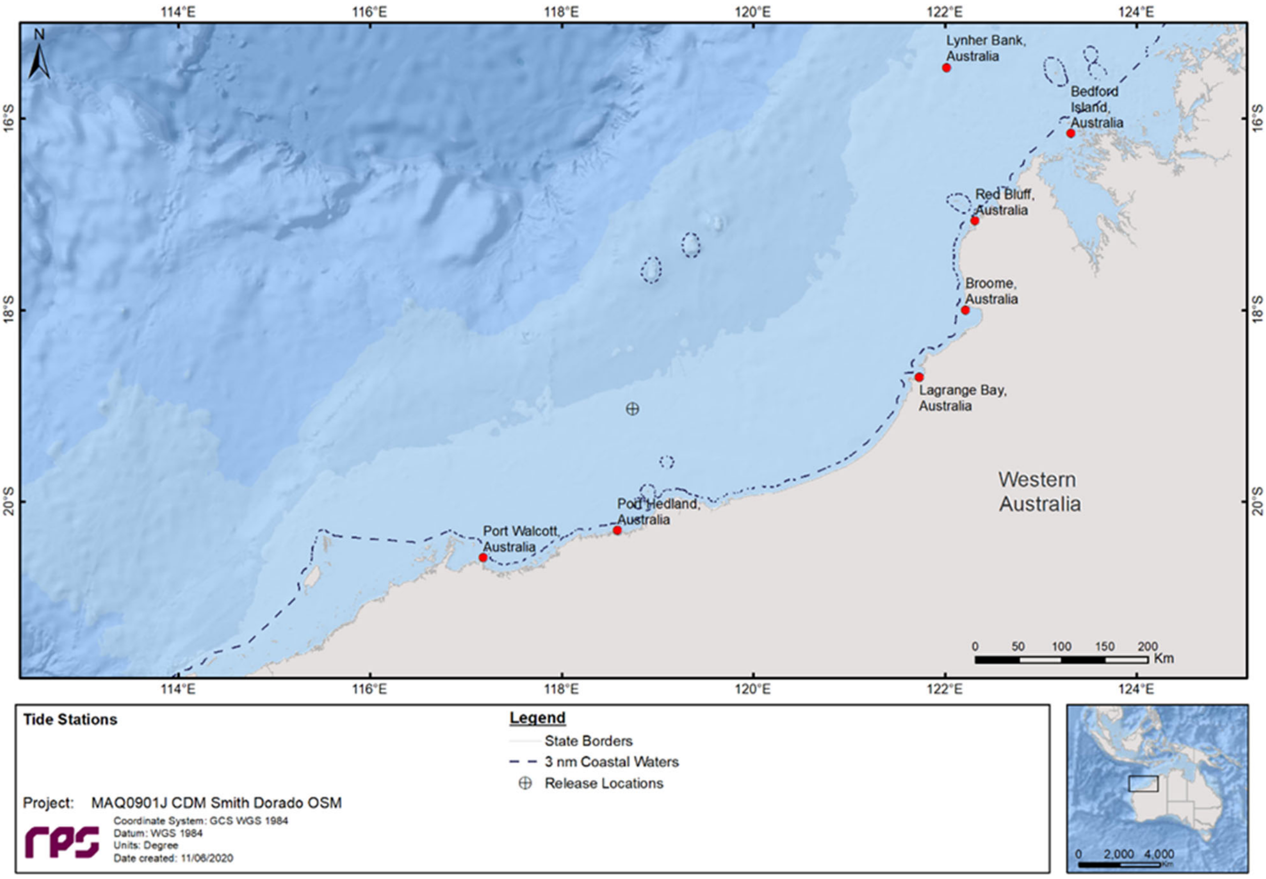

Figure 2.3 Tide stations used to validate surface elevation within the model.

Table 2.1 Statistical comparison between the observed and predicted surface elevations.

Tide Station	IOA	MAE (m)
Broome	0.90	1.11
Lagrange Bay	0.96	0.71
Lynher Bank	0.98	0.31
Port Hedland	0.98	0.33
Port Walcott	0.99	0.20
Red Bluff	0.98	0.46

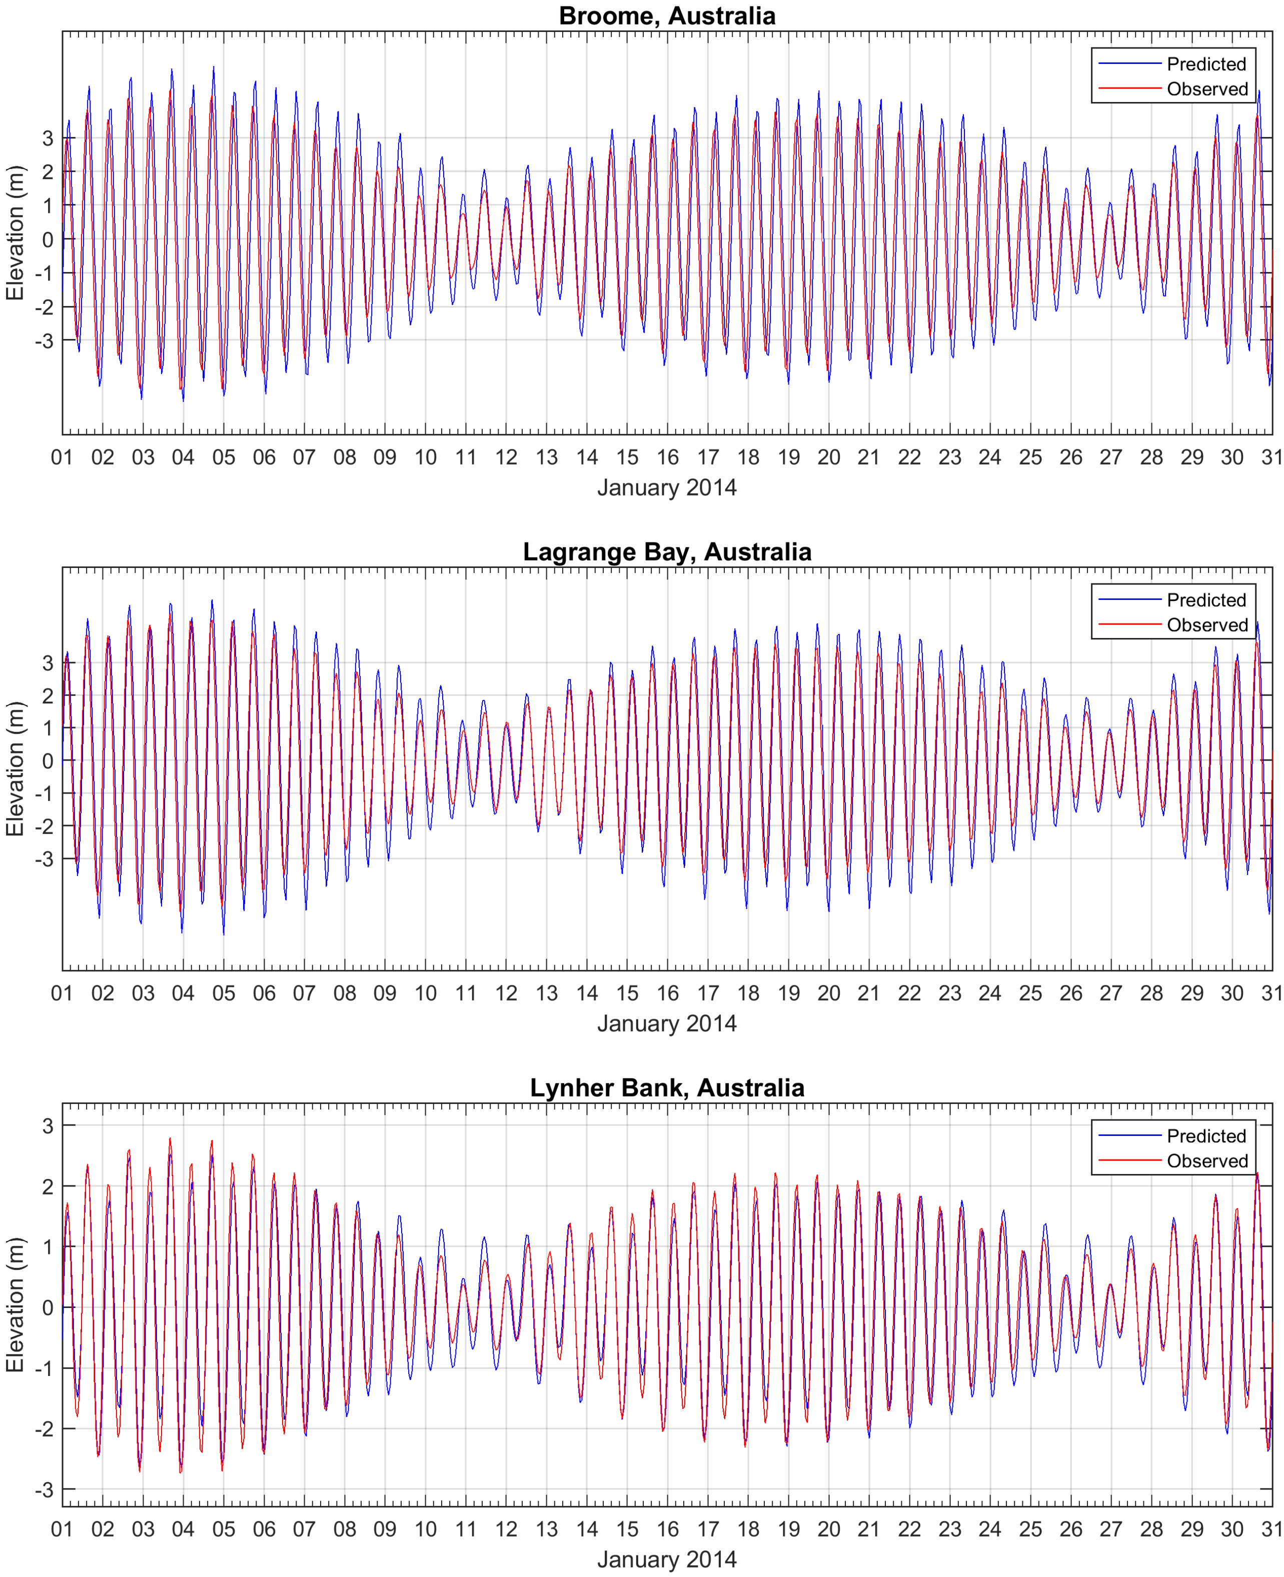

Figure 2.4 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

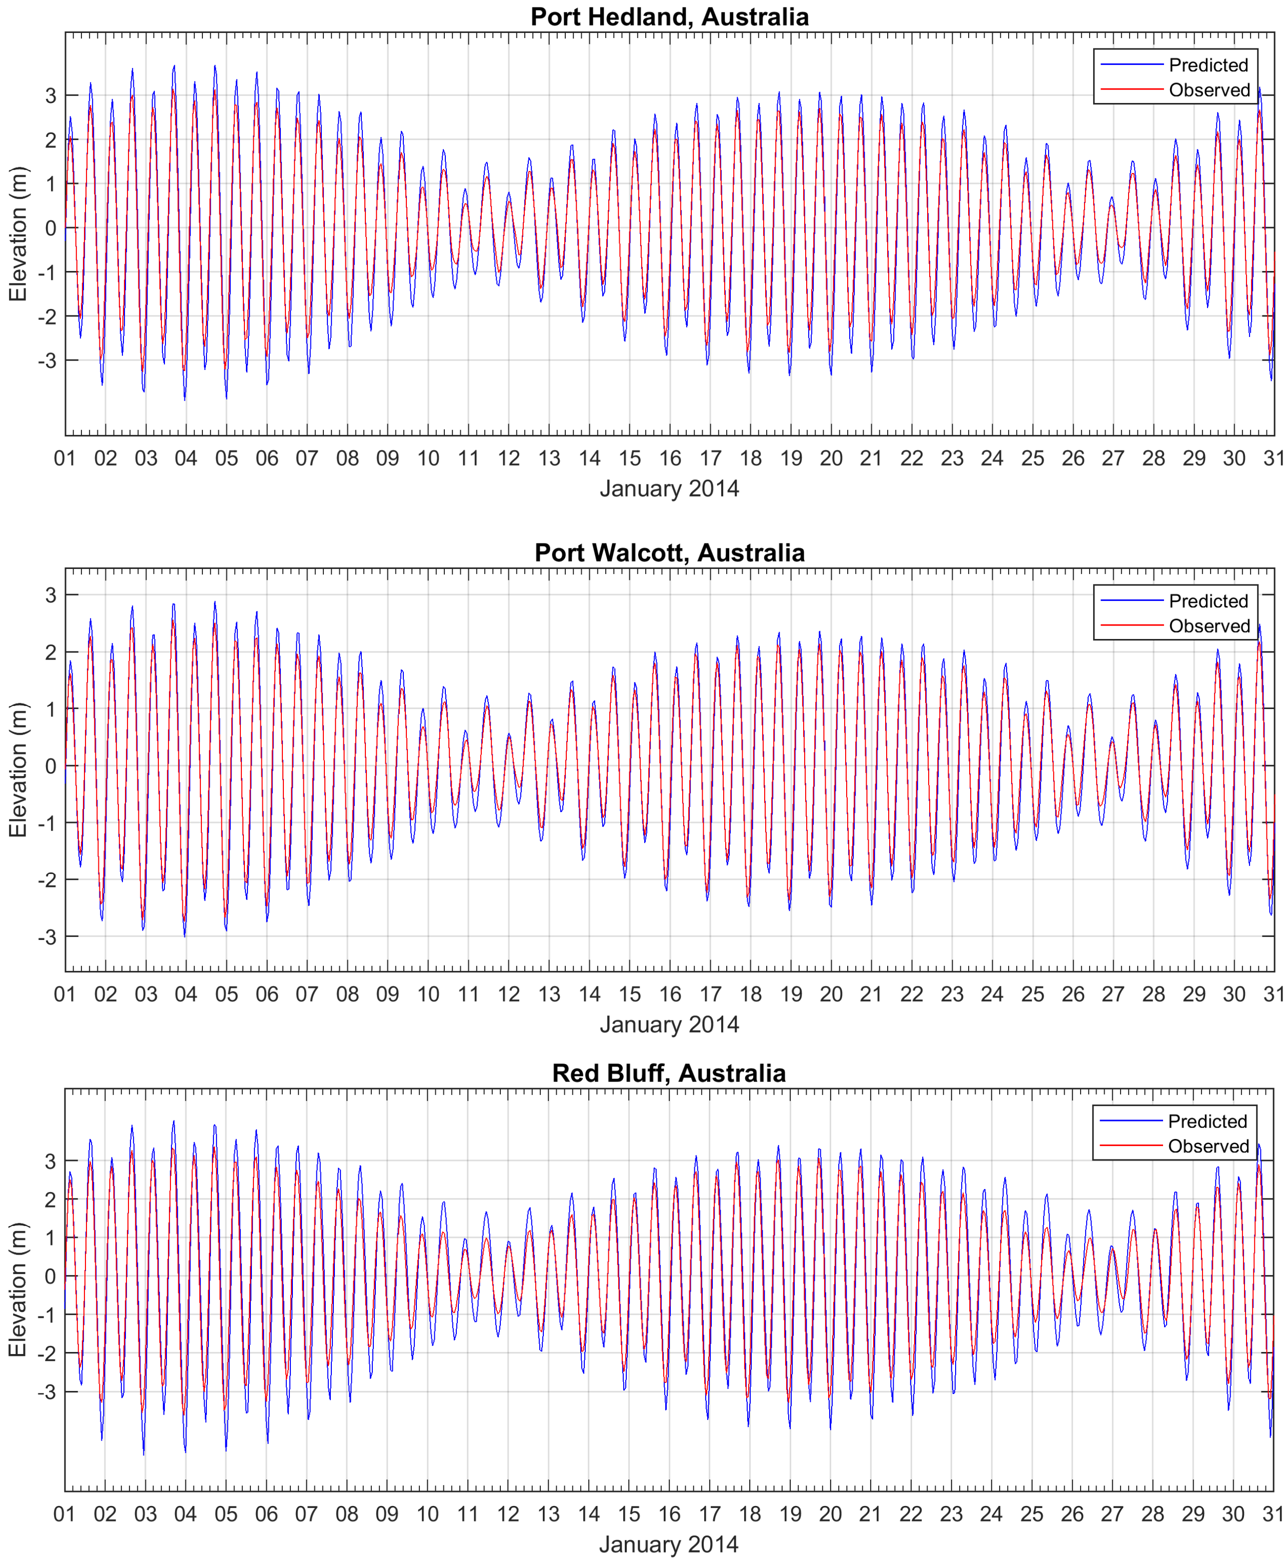

Figure 2.5 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

2.3.5 Current Model Validation

Generated current data were compared against current measurements within the Dorado Development area, using quantitative and visual comparisons at a range of depths.

Time series comparisons of the predicted and measured current speed and direction components at water depths of 40 m, 70 m and 110 m are presented in Figure 2.6, Figure 2.7 and Figure 2.8, respectively, for a two month period (January and February 2018). The time series comparisons reveal that the predicted currents offer a good match with the measured current speed and direction components at all water depths, with the magnitudes and timings of the peaks and troughs matching well.

To provide a statistical quantification of the model accuracy, comparisons were performed by determining the deviations between the predicted and measured data. As such, the root-mean square error (RMSE), root-mean square percentage (RMS %) and relative mean absolute error (RMAE) were calculated. Qualification of the RMAE ranges are reported in accordance with Walstra et al. (2001). The RMAE is relatively low in all depth layers indicating that the magnitude and range of current speeds match well, however, a slight overprediction of the predicted current magnitude is evident at times.

To compare directionality, roses for the predicted and measured currents at 40 m, 70 m and 110 m water depths over the full measurement period are shown in Figure 2.9. The roses show that the predicted current direction is a good match with the measured direction. Both the predicted model direction and the measured data direction were in good alignment at each depth layer, portraying a dominant current direction along a northwest/southeast axis. The range and variability in the measured current direction is captured by the composite model data, which matches best with the measured data at the water depth of 110 m.

Based on the validation performance, the composite model data set is a good model of standard conditions at the Dorado Development area and will adequately resolve local and regional circulation patterns. As such, the model is considered suitable for use in the numerical modelling studies conducted as part of the Dorado Development.

Table 2.2 Statistical comparison of predicted (HYDROMAP+HYCOM) and observed current speeds and directions at various depths at the Dorado Development area (January and February 2018).

Depth (m BMSL)	RMSE (m/s)	Measured peak value (m/s)	RMSE (%)	RMAE qualification
40 m	0.26	0.71	36.7	Good
70 m	0.26	0.80	29.9	Very good
110 m	0.26	0.85	27.9	Very good

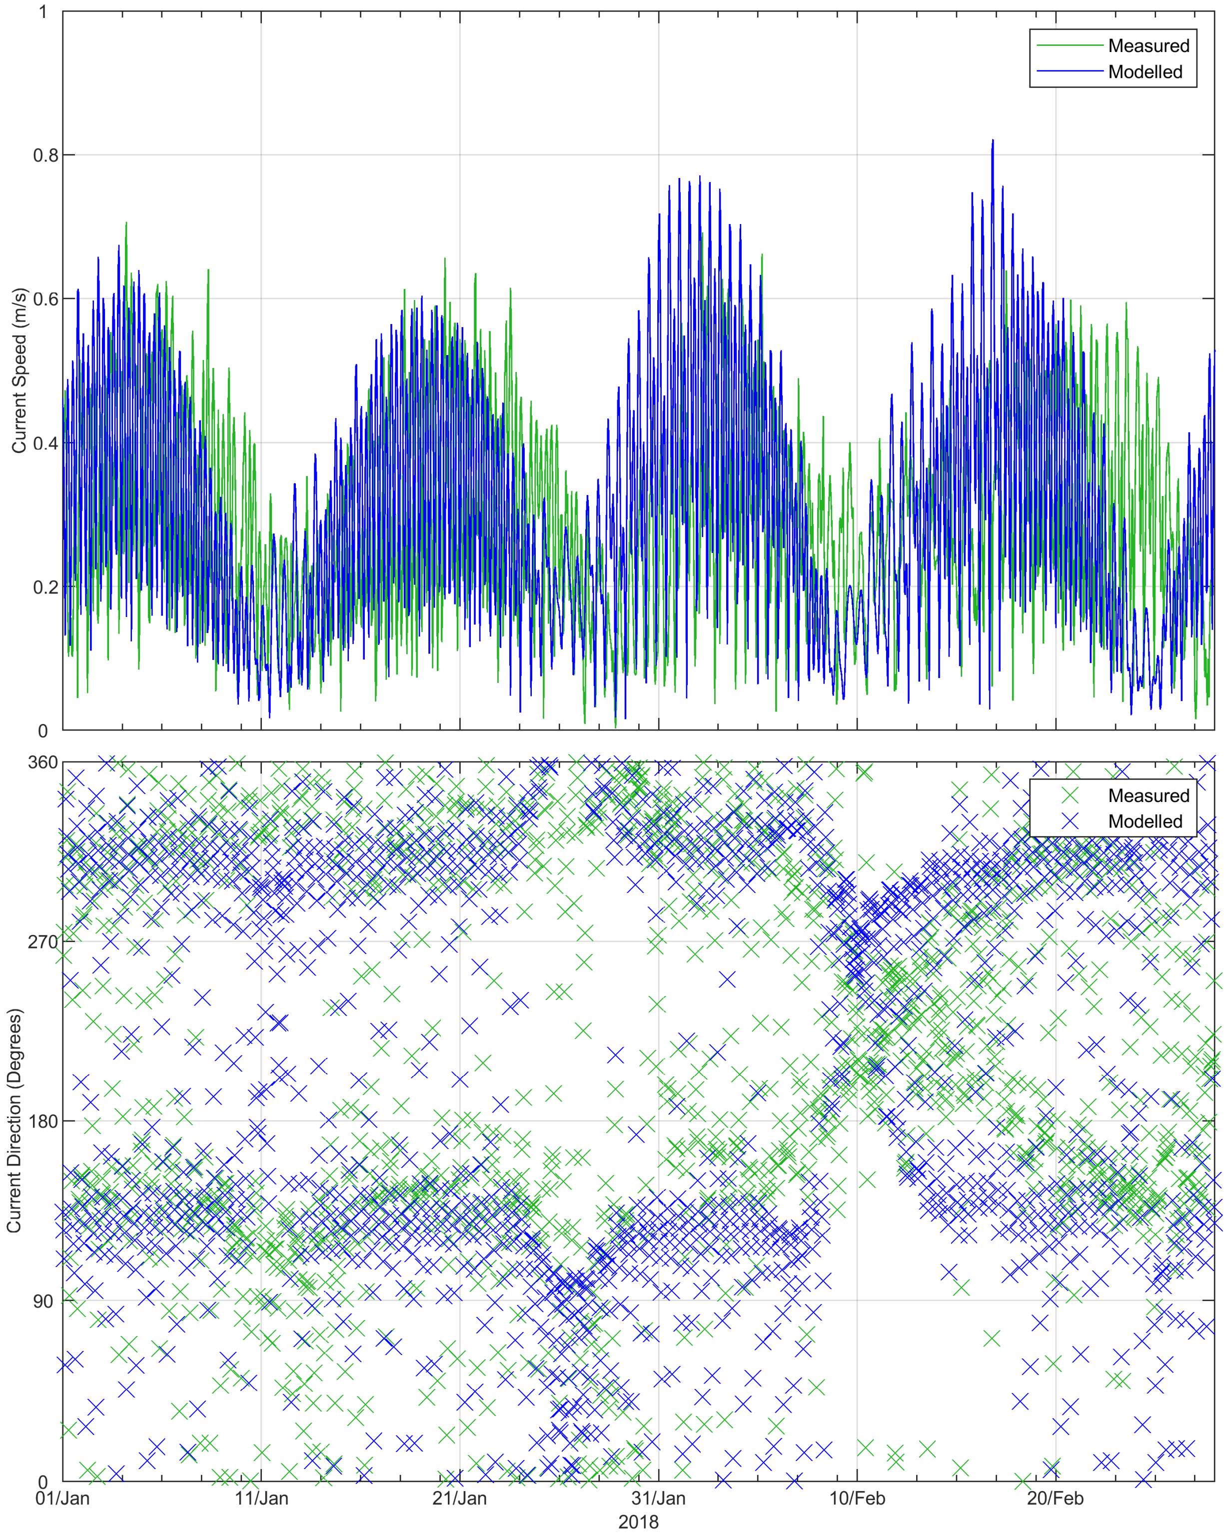

Figure 2.6 Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 40 m for January and February 2018.

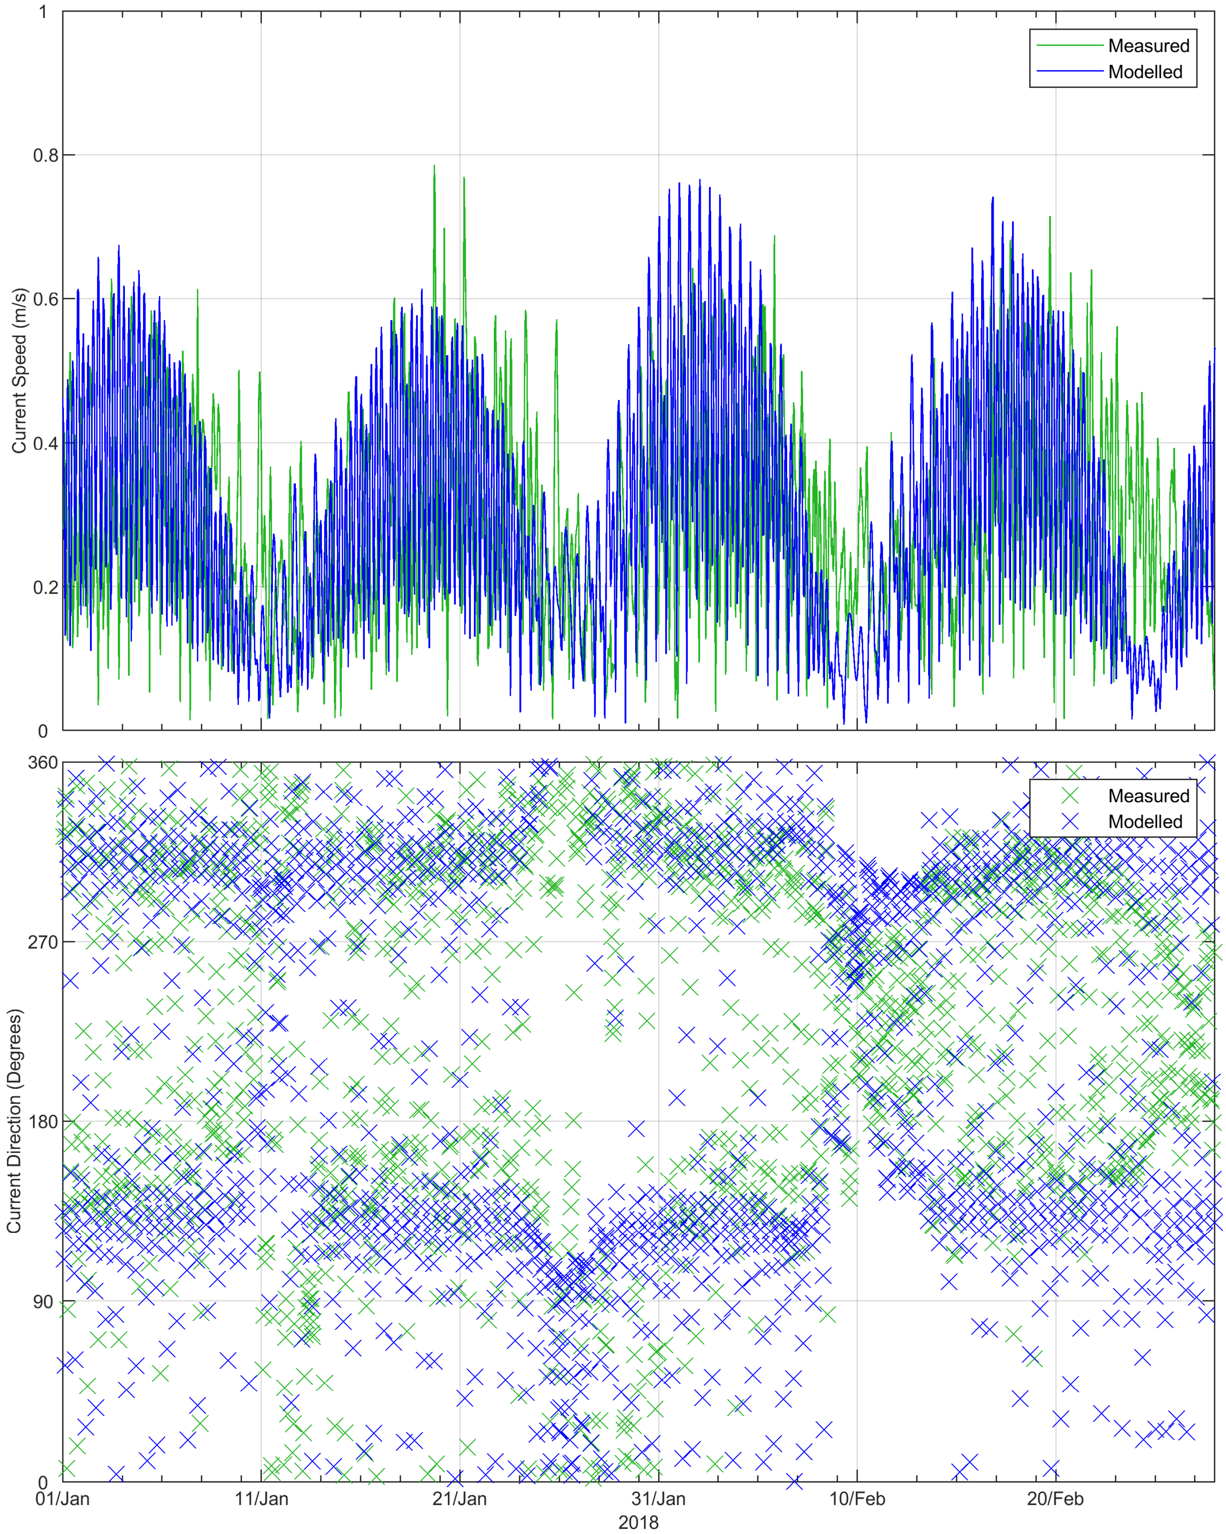

Figure 2.7 Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 70 m for January and February 2018.

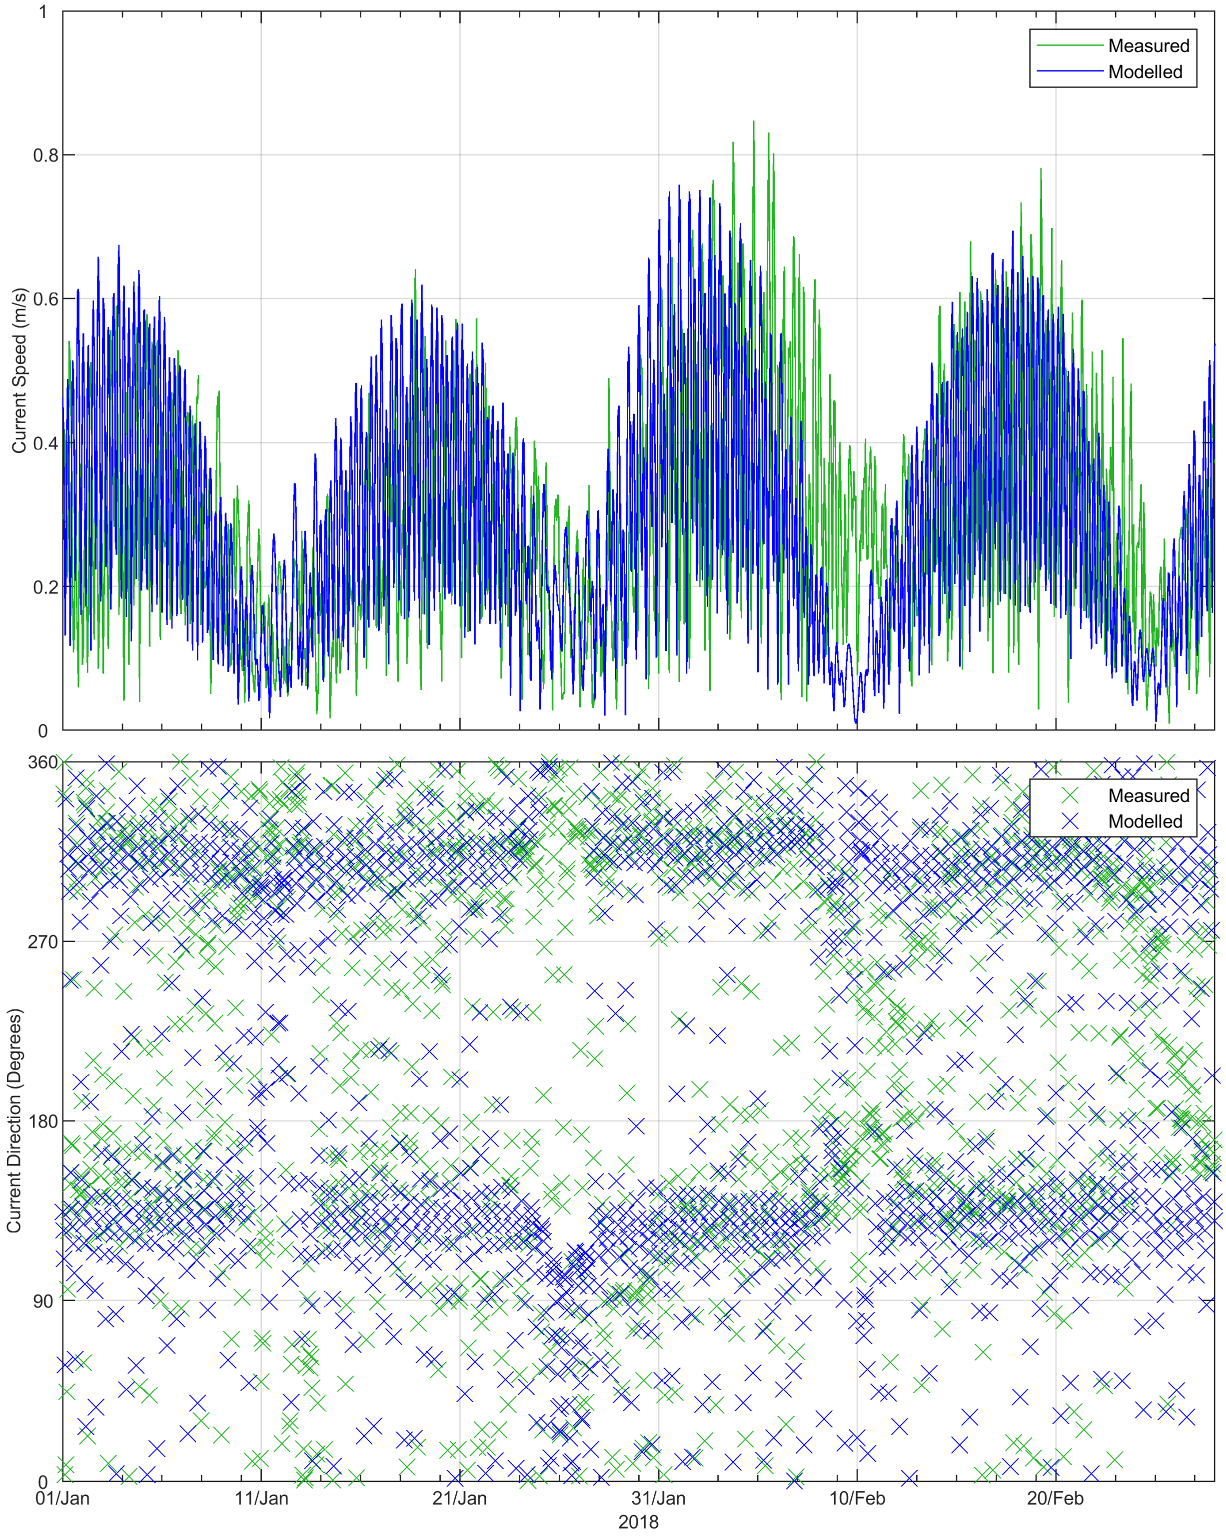

Figure 2.8 Time series comparisons between predicted (HYDROMAP+HYCOM, green line) and measured (blue line) current speeds (top) and current directions (bottom) at the Dorado Development area at a depth of approximately 110 m for January and February 2018.

Figure 2.9 Comparative distributions for measured (left column) and predicted (HYDROMAP+HYCOM, right column) current data at the Dorado Development area (2017-2018) at depths of approximately 40 m (top row), 70 m (middle row) and 110 m (bottom row). The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

2.4 Surface Currents

Table 2.3 displays the predicted monthly average and maximum surface current speeds adjacent to the release site, while Figure 2.10 and Figure 2.11 show monthly, seasonal and total surface current rose distributions from 2009-2018 (inclusive). The currents are from the combination of HYCOM large-scale ocean currents and HYDROMAP tidal currents to account for the total drift throughout the model domain.

Note the convention for defining current direction is the direction the current flows **towards**, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. The rose branches are each divided into segments of different colour according to speed intervals of 0.1 m/s, which represent current speeds within the monthly or seasonal datasets, respectively. The length of each coloured segment (indicative of speeds) is relative to the proportion of time the currents flow to the corresponding direction.

The surface modelled current data indicated a consistent monthly average of approximately 0.3 m/s and a dominant current direction towards the northwest and east-southeast to southeast throughout the year, while maximum current speeds varied between 0.70 m/s (November) to 1.42 m/s (October).

Table 2.3 Predicted average and maximum surface current speeds adjacent to the release locations. Data derived by combining HYCOM ocean data and HYDROMAP tidal data from 2009-2018 (inclusive).

Season	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction (towards)
Summer	January	0.30	0.86	East-southeast (variable)
	February	0.31	1.32	Northwest
	March	0.32	1.41	Northwest
Transitional	April	0.31	1.07	Northwest and West-northwest
Winter	May	0.30	0.91	West-northwest
	June	0.29	0.81	West-northwest
	July	0.31	0.88	West-northwest and northwest
	August	0.31	0.89	Northwest
Transitional	September	0.32	0.91	Northwest and Southeast
Summer	October	0.29	1.42	Northwest
	November	0.26	0.70	Northwest
	December	0.26	0.72	East-southeast (variable)
	Minimum	**0.26**	**0.70**	
	Maximum	**0.32**	**1.42**	

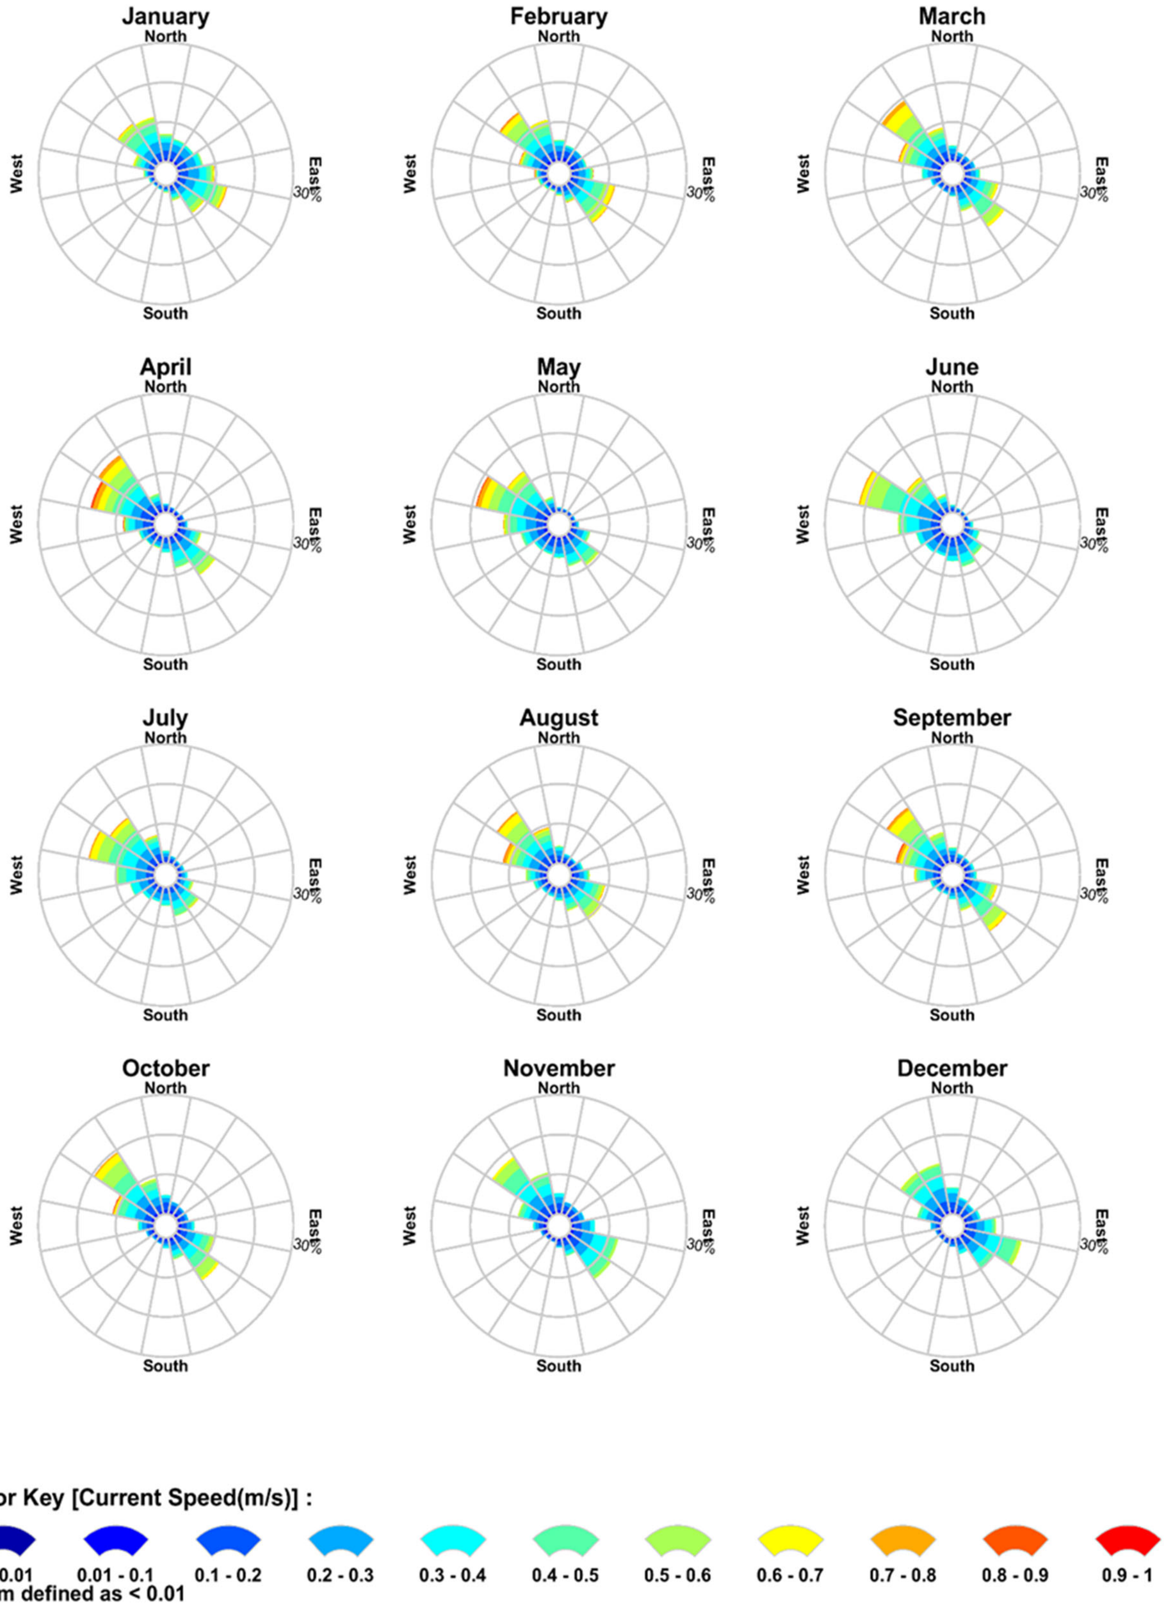

Figure 2.10 Monthly current distribution (2009-2018, inclusive) derived from the HYCOM database near the release site. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

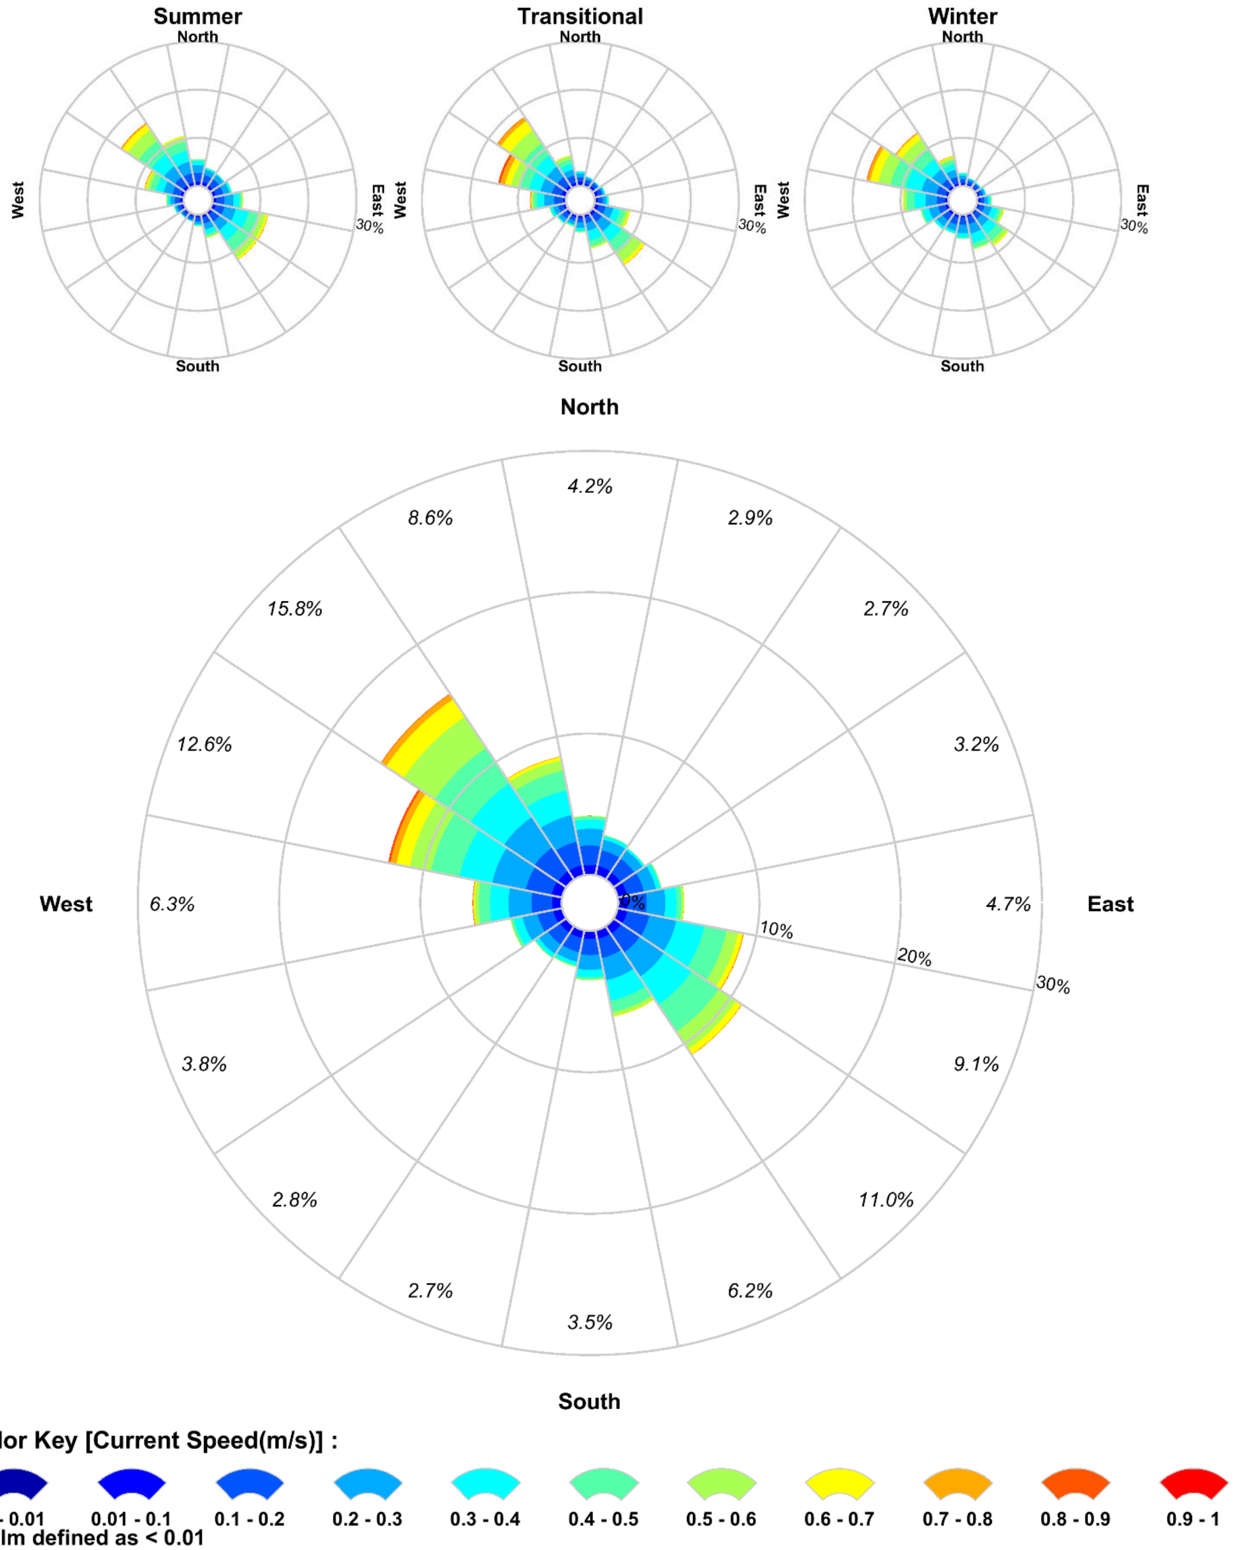

Figure 2.11 Seasonal (top) and total (bottom) current distribution (2009-2018, inclusive) derived from the HYCOM database near the Dorado Development area. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

3 ENVIRONMENTAL REPORTING CRITERIA

The following environmental criteria were used for the modelling study.

Temperature

A temperature differential of 3 ˚C within 100 m from the release location was assessed in the PW modelling study. This criterion represents a commonly adopted industry standard as part of the International Finance Corporation (IFC) Industry Environmental, Health and Safety Guideline for Offshore Oil and Gas Development (IFC 2015) for cooling water discharges and is therefore not directly applicable to PW. However, it has been used as a guide in the absence of any formally recognised criterion for PW discharges.

Maximum extent of the plume

As the field is not yet producing, it is not possible to undertake ecotoxicological tests on the PW stream. Therefore, the far-field modelling results are presented as a range of dilution contour maps. CDM Smith requested that dilutions up to 1:5,000 be considered in the modelling as a potential upper criterion, while dilutions up to 1:1,000 be presented in the analysis of results. The 1:1,000 dilution is expected to result in the PW discharge reaching the 99% species protection limits for potential contaminants (e.g. metals and hydrocarbons) at concentrations typically recorded in PW in Australian waters. This dilution is also consistent with ecotoxicity testing results of PW from many facilities, which typically show the 99% species protection limit is reached in < 1:500 dilutions While a dilution of 1:5,000 provides continency data if the concentrations of potential contaminants within the PW discharge are found to be unusually high.

This approach allows a direct comparison of the minimum dilutions for various chemicals (or whole stream) once ecotoxicological testing has been undertaken.

4 MODELLING METHODOLOGY

4.1 Near-Field Modelling

4.1.1 Overview

The dispersion of the PW discharge will depend, initially, on the geometry and hydrodynamics of the discharges themselves, where the induced momentum and buoyancy effects dominate over background processes. This region is generally referred to as the near-field zone and is characterised by variations over short time and space scales. CORMIX calculates the nearfield behaviour due to:

1. Mixing generated as the jet penetrates the receiving water body and moves under momentum, resulting in turbulence;
2. Subsequent entrainment of ambient water as the plume bends in response to buoyancy differences between the plume and ambient water as well as the prevailing current;
3. For buoyant plumes, spreading and dilution that is generated as the plume layer impinges onto the water surface and widens.

As the discharges mix with the ambient waters, the influences of these processes are eroded, and dispersion by currents and turbulence in the water column, referred to as far-field dispersion processes, become dominant processes.

The shape and orientation of the PW, and hence the distribution and dilution rate of the plume, will vary significantly with natural variation in prevailing water currents. Therefore, to best calculate the likely outcomes of the discharges, it is necessary to simulate discharge under a statistically-representative range of current speeds representative of the Dorado Development area.

4.1.2 Description of the Near-Field Model: CORMIX

The near-field mixing and dispersion of the PW discharge was simulated using the three-dimensional flow model, CORMIX. CORMIX is a mixing zone model and decision support system for environmental impact assessment of regulatory mixing zones. CORMIX contains a series of elements for the analysis and design of single or multi-port discharges. Discharges may be submerged or above surface, buoyant or denser than receiving water and the receiving water may be stratified or unstratified. The emphasis of the model is the influence of the geometry and dilution characteristics on the initial mixing zone (Doneker and Jirka, 1990; Jirka et al., 1991). CORMIX is widely applied worldwide and has been validated in many independent studies (http://www.cormix.info/validations.php).

CORMIX is a collection of analytic solutions to simplified forms of the mathematical equations describing transport and dispersion of water borne constituents. The simplifications come about through a range of assumptions about the source configuration, source characteristics (discharge and buoyancy) and the ambient environment. These assumptions effectively limit the domain within which the analytic solutions apply. For the typical outfall source flow, two main zones can be defined as described in Figure 4.1.

Although CORMIX does calculate far-field dispersion, the assumptions of the algorithms limit application to homogeneous environments with no eddies in the ambient flow and little recirculation. For this reason, the CORMIX component of the calculations for this study were limited to the near-field zone.

CORMIX specifies the average dilution or bulk dilution (flux averaged) as 1.7 times the centreline dilution. The centreline is defined by the points of maximum concentration (maximum temperature, minimum dilution etc) at each vertical section along the longitudinal axis. Accordingly, centreline depth is defined as the depth of the maximum concentration point (maximum temperature, minimum dilution) along the longitudinal axis.

4.1.2.1 Discharges above mean sea level

Large-scale plunging jets impacting a free surface of water, such as the discharge of a PW stream above the sea surface through a downward-pointing pipe, is a complex problem subject to contemporary research. For jet diameters of more than ~10 cm, studies include those of Guyot et al. (2016). Jet dynamics under these circumstances involve a range of physical properties: acceleration due to gravity, liquid surface tension, viscosity, air-entrainment caused by transition between confined and unconfined flows, and density contrast between the air and receiving water (Eggers & Villermaux, 2008). Flow states may range from laminar to turbulent. Laminar flows will reduce in diameter as they free-flow between the discharge pipe and the water surface, without entrainment of air bubbles into the stream, which will maximise the momentum of the stream on reaching the sea, and hence the depth to which the discharge will plunge below the surface due to momentum. In contrast, a turbulent flow will widen and entrain air bubbles, reducing the depth of penetration. Figure 4.1 shows a conceptual diagram of a turbulent and laminar flow case to illustrate the different outcomes.

Flow of a circular water stream is laminar if the Reynolds number (a unitless measure of the ratio between the inertial forces and viscous forces in a fluid), is less than 2,000. Flow is considered turbulent if the Reynolds number exceeds 4,000. Between these limits, transitional flow conditions occur. The Reynolds number is calculated as follows:

$$Re = \frac{\rho_l V_0 D_0}{\mu}$$

Where: *Re* is the Reynolds number, ρ_l is the volumetric mass density of the liquid, V_0 is the average velocity at the outlet, D_0 is the outlet diameter and μ is the dynamic viscosity of the liquid.

A relatively high Reynolds number (339,000) is calculated for the above-sea discharge indicating that the discharge stream would be turbulent, which has implications for the width and momentum of the plume at the point of impacting the sea surface.

Air entrainment of a plunging jet occurs when the confined flow of a jet breaks the free-surface of the water causing air-disturbed flows (Guyot et al., 2016). This produces air bubbles under the free surface with an ascent velocity which can further impact on the penetration depth of the plume. The following empirical formula proposed by Nakasone (1987), found to be in good agreement with the experimental results detailed in Guyot et al. (2016), was used to calculate the penetration depth in this study:

$$H = \frac{2}{3} * H_C$$

Where: *H* is the penetration depth and H_c is the height of the discharge.

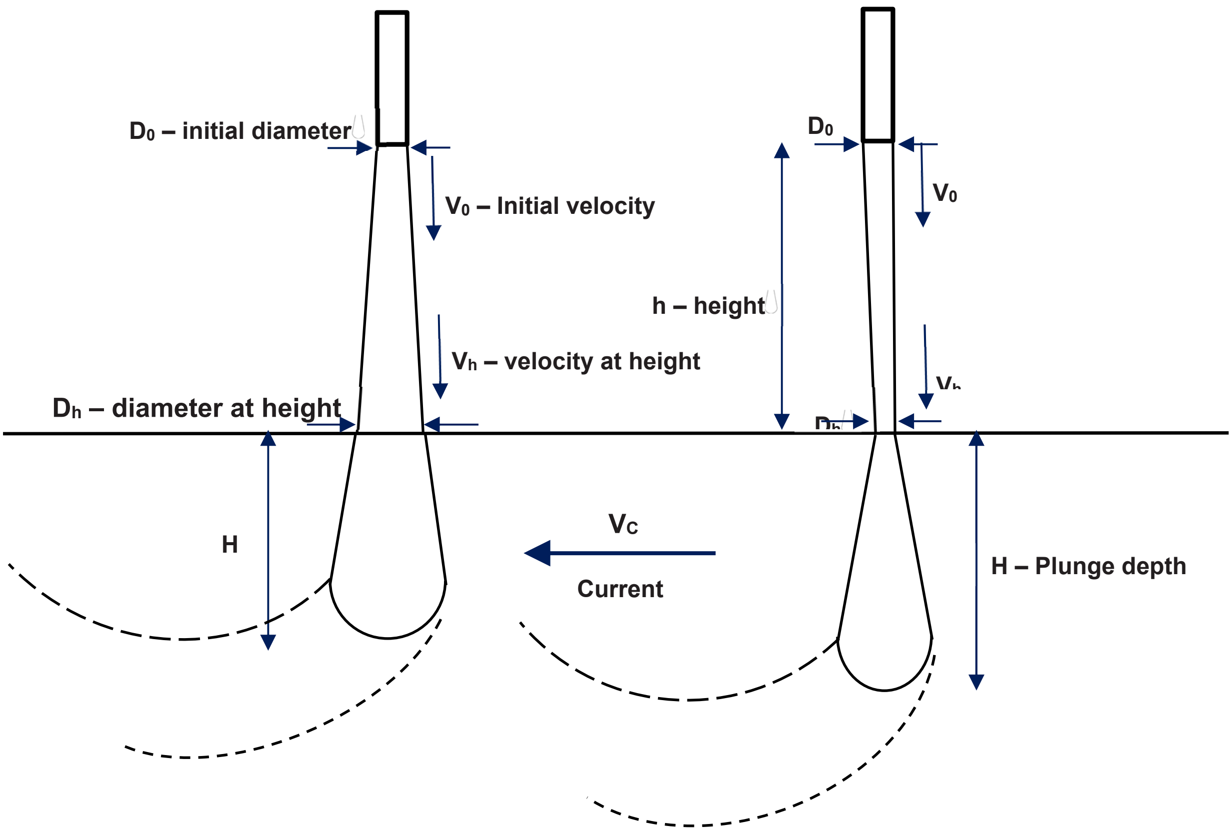

Figure 4.1 Conceptual diagram of the continuous turbulent (left) and laminar (right) flow cases of a largescale plunging jet from a height.

4.1.2.2 Discharges at or below mean sea level

The physical mixing and dilution of PW discharged directly into receiving waters occurs through a series of processes. Initial mixing is generated during what is referred to as the "near-field" mixing zone. As the discharge is ejected from the pipe as a jet, turbulence occurs due to the momentum of the jet displacing ambient water. This process occurs within metres of the discharge pipe and within seconds to minutes. As the plume descends, momentum is lost due to the energy required to displace receiving water. If there is a lateral current, the centreline of the plume will bend in the direction of the current flow. Once downward momentum is lost, the fate of the plume will depend upon plume density.

If the plume remains buoyant relative to receiving water (i.e. warmer and/or at lower salinity than the receiving water), the plume will rise, undergoing further mixing by entrainment of ambient water, until either neutral density is reached or the plume collapses into a layer below the water surface. At this point, the plume enters the "far-field" mixing zone, where subsequent mixing is generated by water currents and turbulence in the water column.

Figure 4.2 shows a conceptual diagram of the dispersion and fates of a positively buoyant discharge below sea level and the idealised representation of the discharge phases.

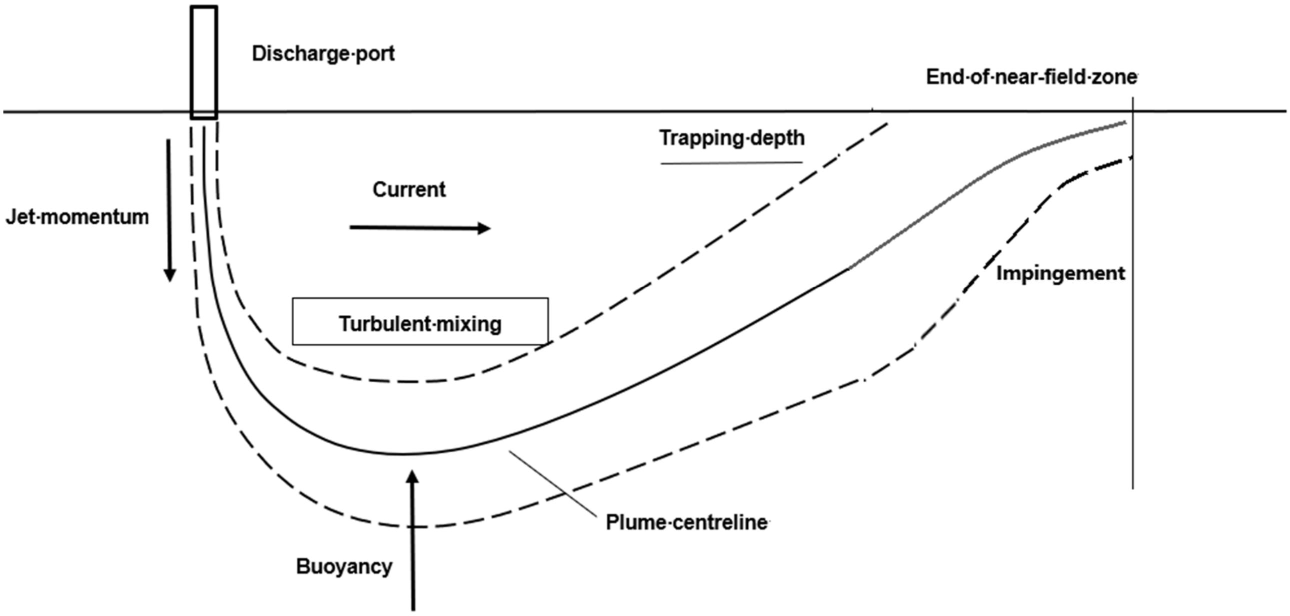

Figure 4.2 Conceptual diagram showing the general behaviour of a positively-buoyant discharge occurring vertically downward into receiving water that is moving due to current. Cormix follows processes until the end of the surface-impingement phase.

4.1.3 Setup of the Near-Field Model

4.1.3.1 Discharge Characteristics

The PW discharge characteristics used in the modelling study are summarised in Table 4.1.

The same discharge rate, pipe diameter and pipe orientation were applied to all cases, with varying discharge heights. The pipe diameter and discharge specified indicate a relatively low discharge velocity (~ 0.5 m/s).

Table 4.1 Summary of the PW discharge near-field characteristics.

Parameter	Case 1 - 10 m AMSL	Case 2 - 0 m BMSL	Case 3 - 10 m BMSL
Flow rate (m^3/d)		4,350	
Location		Dorado FPSO	
Duration (min)		Continuous	
Outlet pipe internal diameter (m) [in]		0.35 [13.78]	
Number of ports		1	
Flow velocity on exit		0.52 m/s	
Outlet pipe orientation		Vertical (downwards)	
Discharge height/depth	10 m AMSL	0 m BMSL	10 m BMSL
Discharge salinity (ppt)		25.5	
Discharge temperature (°C)		50	

4.1.3.2 Ambient Environmental Conditions

Inputs of ambient environmental conditions to the CORMIX model included a vertical profile of temperature and salinity, along with constant current speeds and general direction (per simulation). The temperature and salinity profiles are required to accurately account for the relative buoyancy of the diluting plume, while the current speeds control the intensity of initial mixing and the deflection of the PW plumes. These inputs are described in the following sections.

4.1.3.2.1 Ambient Temperature and Salinity

Temperature and salinity data applied to the near-field modelling was sourced from the World Ocean Atlas 2013 (WOA13) database produced by the National Centers for Environmental Information (National Oceanic and Atmospheric Administration, NOAA) and its co-located World Data Center for Oceanography (Levitus et al., 2013). The WOA13 data was found to compare very well to measurements carried out in the Dorado Development area.

Table 4.2 shows the average seasonal water temperature and salinity levels at varying depths from 0 m to 70 m near the Dorado FPSO location.

The seasonal temperature profiles exhibit a reasonably consistent reduction in temperature with increasing depth (3 ˚C between the surface and bottom waters). Salinity levels are generally most consistent with depth and indicate a vertically well-mixed water body (34.7-34.8 practical salinity unit, PSU), irrespective of season or depth. The data is considered representative of seasonal conditions near the release site.

Table 4.2 Average temperature and salinity levels adjacent to the Dorado FPSO location.

Season	Depth (m)	Temperature (°C)	Salinity (PSU)
Summer	0	27.1	34.7
	10	27.0	34.8
	40	25.6	34.7
	70	24.1	34.8
Transitional	0	26.6	34.7
	10	26.5	34.7

	70	24.8	34.8
Winter	0	25.8	34.8
	10	25.8	34.8
	40	25.6	34.8
	70	25.2	34.8
Annual	0	26.6	34.7
	10	26.5	34.7
	40	25.7	34.7
	70	24.6	34.8

Data source: WOA13 database produced by the National Centers for Environmental Information.

4.1.3.2.2 Ambient Current

The ten-year data was statistically analysed to determine the 5th, 50th and 95th percentile current speeds at varying depths for each season and across an annual period (Table 4.3) for input to the near-field model to reflect contrasting dilution and advection cases:

- 5th percentile current speed: weak currents, low dilution and slow advection.
- 50th percentile (median) current speed: average currents, moderate dilution and advection.
- 95th percentile current speed: strong currents, high dilution and rapid advection to nearby areas.

The 5th, 50th and 95th percentile values are referenced as weak, medium and strong current speeds, respectively.

Table 4.3 Adopted ambient current conditions adjacent to the proposed Dorado FPSO location.

Season	Depth (m)	5th percentile (weak) current speed (m/s)	50th percentile (medium) current speed (m/s)	95th percentile (strong) current speed (m/s)
Summer	0	0.082	0.333	0.733
	10	0.079	0.314	0.716
	40	0.076	0.306	0.708
	70	0.077	0.305	0.710
Transitional	0	0.077	0.347	0.805
	10	0.076	0.334	0.766

	40	0.078	0.303	0.676
	70	0.081	0.300	0.673
Annual	0	0.083	0.339	0.748
	10	0.079	0.318	0.718
	40	0.076	0.308	0.707
	70	0.077	0.307	0.707

4.2 Far-Field Modelling

4.2.1 Overview

The far-field modelling expands on the near-field work by allowing the time-varying nature of currents to be included, with the potential for localised build-up when current speeds are low (e.g. at the turning of the tide) and recirculation of the plume back to the discharge location might occur. In this case, concentrations near the discharge point can be increased due to the discharge plume mixing with the remnant plume from an earlier time. This may be a potential source of episodic increases in pollutant concentrations in the receiving waters.

4.2.2 Description of Far-Field Model: MUDMAP

The mixing and dispersion of the discharges was predicted using the three-dimensional discharge and plume behaviour model, MUDMAP (Koh & Chang, 1973; Khondaker, 2000).

The far-field calculation (passive dispersion stage) employs a particle-based, random walk procedure. Any chemicals/constituents within the discharge stream are represented by a sample of Lagrangian particles. These particles are moved in three dimensions over each subsequent time step according to the prevailing local current data as well as horizontal and vertical mixing coefficients.

MUDMAP treats the Lagrangian particles as conservative tracers (i.e. they are not removed over time to account for chemical interactions, decay or precipitation). Predicted concentrations will therefore be conservative overestimates where these processes actually do occur. Each particle represents a proportion of the discharge, by mass, and particles are released at a given rate to represent the rate of the discharge (mass per unit time). Concentrations of constituents are predicted over time by counting the number of particles that occur within a given depth level and grid square and converting this value to mass per unit volume.

The system has been extensively validated and applied for discharge operations in Australian waters (e.g. Burns *et al.*, 1999; King & McAllister, 1997, 1998).

4.2.3 Stochastic Modelling

A stochastic procedure was applied for the far-field modelling to sample a representative set of conditions that could affect the mixing and dispersion of the PW discharge. This approach involved running 50 simulations per season per case (i.e. 150 simulations in total per case), with each simulation representing discharge for 10 days under a different, randomly selected start times and in turn sequence of current speeds and directions from the ten-year database. This methodology ensures that the calculated movement and fate of each discharge is representative of the range of prevailing currents that occur at the discharge location.

4.2.4 Setup of Far-Field Model

4.2.4.1 Discharge Characteristics

The MUDMAP model simulated the discharge into a time-varying current field with the initial dilution set by the near-field results described in Section 5.1.

The PW discharge characteristics are summarised in Table 4.4. The discharges were assumed to occur at 10 m AMSL, 0 m BMSL and 10 m BMSL, with a continuous flow rate of 4,350 m^3/d released at the Dorado FPSO. The initial dilution and shape of the discharge was set by the results of the near-field results described in Section 5.1.

The PW discharge cases were modelled as continuous discharges using 50 simulations for each season under time-varying current assuming the initial dilution and density change imposed by the near-field mixing. Once the simulations were complete, they were combined and reported for three distinct seasons: (i) summer (October to March); (ii) transitional periods (April and September); and (iii) winter (May to August). An annualised aggregation of seasonal outcomes was also compiled.

The seasonal results are presented in Appendix B.

Table 4.4 Summary of the PW far-field discharge characteristics.

Parameter	10 m AMSL	0 m BMSL	10 m BMSL
Hindcast modelling period		2009 to 2018	
Seasons		Summer (October to March) Transitional (April and September) Winter (May to August) Annual	
Location		Dorado FPSO	
Flow rate (m^3/d)		4,350	
Initial depth of centreline (m)	1	0.5	1.5
Initial buoyancy (aqueous component)		Neutral	
Number of simulations per case		150 (50 per season)	
Simulated discharge type		Continuous	
Simulated discharge period (days)		10	

4.2.4.2 Mixing Parameters

The horizontal and vertical dispersion coefficients represent the mixing and diffusion caused by turbulence, both of which are sub-grid-scale processes. Both coefficients are expressed in units of rate of area change per second (m^2/s). Increasing the horizontal dispersion coefficient will increase the horizontal spread of the discharge plume and decrease the centreline concentrations faster. Increasing the vertical dispersion coefficient spreads the discharge across the vertical layers (or depths) faster.

Spatially constant, conservative dispersion coefficients of 0.25 m^2/s and 0.0001 m^2/s were used to control the spreading of the PW plume in the horizontal and vertical directions, respectively. Each of the mixing parameters was selected following extensive sensitivity testing to recreate the plume characteristics predicted by the near-field modelling. It would be expected that the in-situ mixing dynamics would be greater under average and high energy conditions by a factor of 10 (King & McAllister, 1997, 1998) and thus the far-field model results are designed to produce a conservative result for concentration extents.

4.2.4.3 Grid Configuration

MUDMAP uses a three-dimensional grid to represent the geographic region under study (water depth and bathymetric profiles). Due to the rapid mixing and small-scale influences of the discharge, it was necessary to use a fine grid with a resolution of 20 m x 20 m to track the movement and fate of the discharge plume. The extent of the grid region measured approximately 20 km (longitude or x-axis) by 20 km (latitude or y-axis), which was subdivided horizontally into 1,000 x 1,000 cells. The vertical resolution was set to 1 m. It is important to note, that the 20 m grid cell sizes were selected following extensive sensitivity testing in order to achieve similar dilution rates at the end of the near-field mixing.

5 MODELLING RESULTS

5.1 Near-Field Modelling

Table 5.1 summarises the nearfield modelling results for the three cases; 10 m AMSL, 0 m BMSL and 10 m BMSL.

The results indicated a strong effect of changing the discharge height and current speed. The 10 m AMSL discharge was predicted to plunge up to 4.4 m BMSL when the current speed was weak, before rising and collapsing under the water surface while being diverted by the prevailing current. The plunge depth was calculated to decrease, and the total length of the near-field dilution zone was forecast to increase under higher current speed. The top of the plume was calculated to rise to the surface within approximately 7.2 m of the discharge under weak current, with distance increasing to 12.4 m under a medium current and 13.9 m under a strong current. Higher rate of dilutions were calculated for the medium and high current speeds (average dilution of 1:68 and 1:43, respectively) compared to the dilutions achieved under the weak current speed (average dilution of 1:34).

Cross sections illustrating the change in dilution with distance for each discharge height (10 m AMSL, 0 m BMSL and 10 m BMSL) are shown spatially in Figure 5.1 (weak current), Figure 5.2 (medium current) and Figure 5.3 (strong current). Highest concentrations were observed through the centreline of the vertical cross-sections.

By discharging at 0 BMSL, the modelling showed reduced plunge depths (~ 1.5 m maximum) and shorter distances before the plume begins impinging onto the water surface and shorter distances before all near-field mixing ceases compared to discharge at 10 m AMSL. Lower average dilution rates (< 1:15) were calculated at the completion of the near-field mixing processes compared to the 10 m AMSL case (< 1:68).

A discharge at 10 m BMSL resulted in a relatively short plunge distance (< 2 m maximum) due to momentum but provides a greater vertical distance for the plume to rise under buoyancy, while entraining ambient water. The distance to the surface (10 m plus plunge depth of < 2 m) and the ability for the plume to mix with ambient waters greatly improved the rate of dilution when compared to the other two cases (average dilution < 1:981). While discharge at 10 m BMSL was calculated to potentially achieve a target dilution of 1:1,000 under strong current (occurring ~5% of the time), insufficient dilution is indicated over the wider range of currents for all discharge configurations. This indicates that further dilution under far-field processes would be required to achieve the target dilution.

The seasonal near-field results for the 10 m AMSL, 0 m BMSL and 10 m BMSL discharges are presented in Appendix A.

For all three cases, the temperature of the PW plume was predicted to be within 3 °C of the ambient (background) temperature within 100 m from the release location, therefore meeting the environmental criteria. The temperature of the PW plume generally returned to within 3 °C of ambient water temperature within 15 m horizontally from the release location. Note that for the 0 m BMSL weak and medium current speeds, the temperature of the PW was not predicted to drop below 3 °C of ambient in the near-field.

Table 5.1 Predicted plume characteristics at the end of the near-field mixing zone for each case under weak, medium and strong current speeds during annualised conditions.

Case	Surface current speed (m/s)	Maximum plume diameter (m)	Maximum plunge depth (m) BMSL	Plume temp (°C)	Plume-ambient temp difference (°C)	Plume dilution (1:x)		Maximum horizontal distance
						Minimum (centreline)	Average	
10 m AMSL	Weak (0.08)	1.7	4.4	27.8	1.2	20	34	7.2
	Medium (0.34)	1.7	2.6	27.2	0.6	40	68	12.4
	Strong (0.75)	0.9	1.3	26.8	0.2	25	43	13.9
0 m BMSL	Weak (0.08)	1.0	1.4	34.5	7.9	3	5	3.9
	Medium (0.34)	0.6	0.6	33.0	6.4	4	7	1.0
	Strong (0.75)	0.5	0.5	29.3	2.7	9	15	2.7
10 m BMSL	Weak (0.08)	2.8	11.4	27.0	0.5	50	85	9.9
	Medium (0.32)	4.7	10.2	26.6	0.1	280	476	40.5
	Strong (0.72)	4.6	10.1	26.5	0.1	577	981	129.7

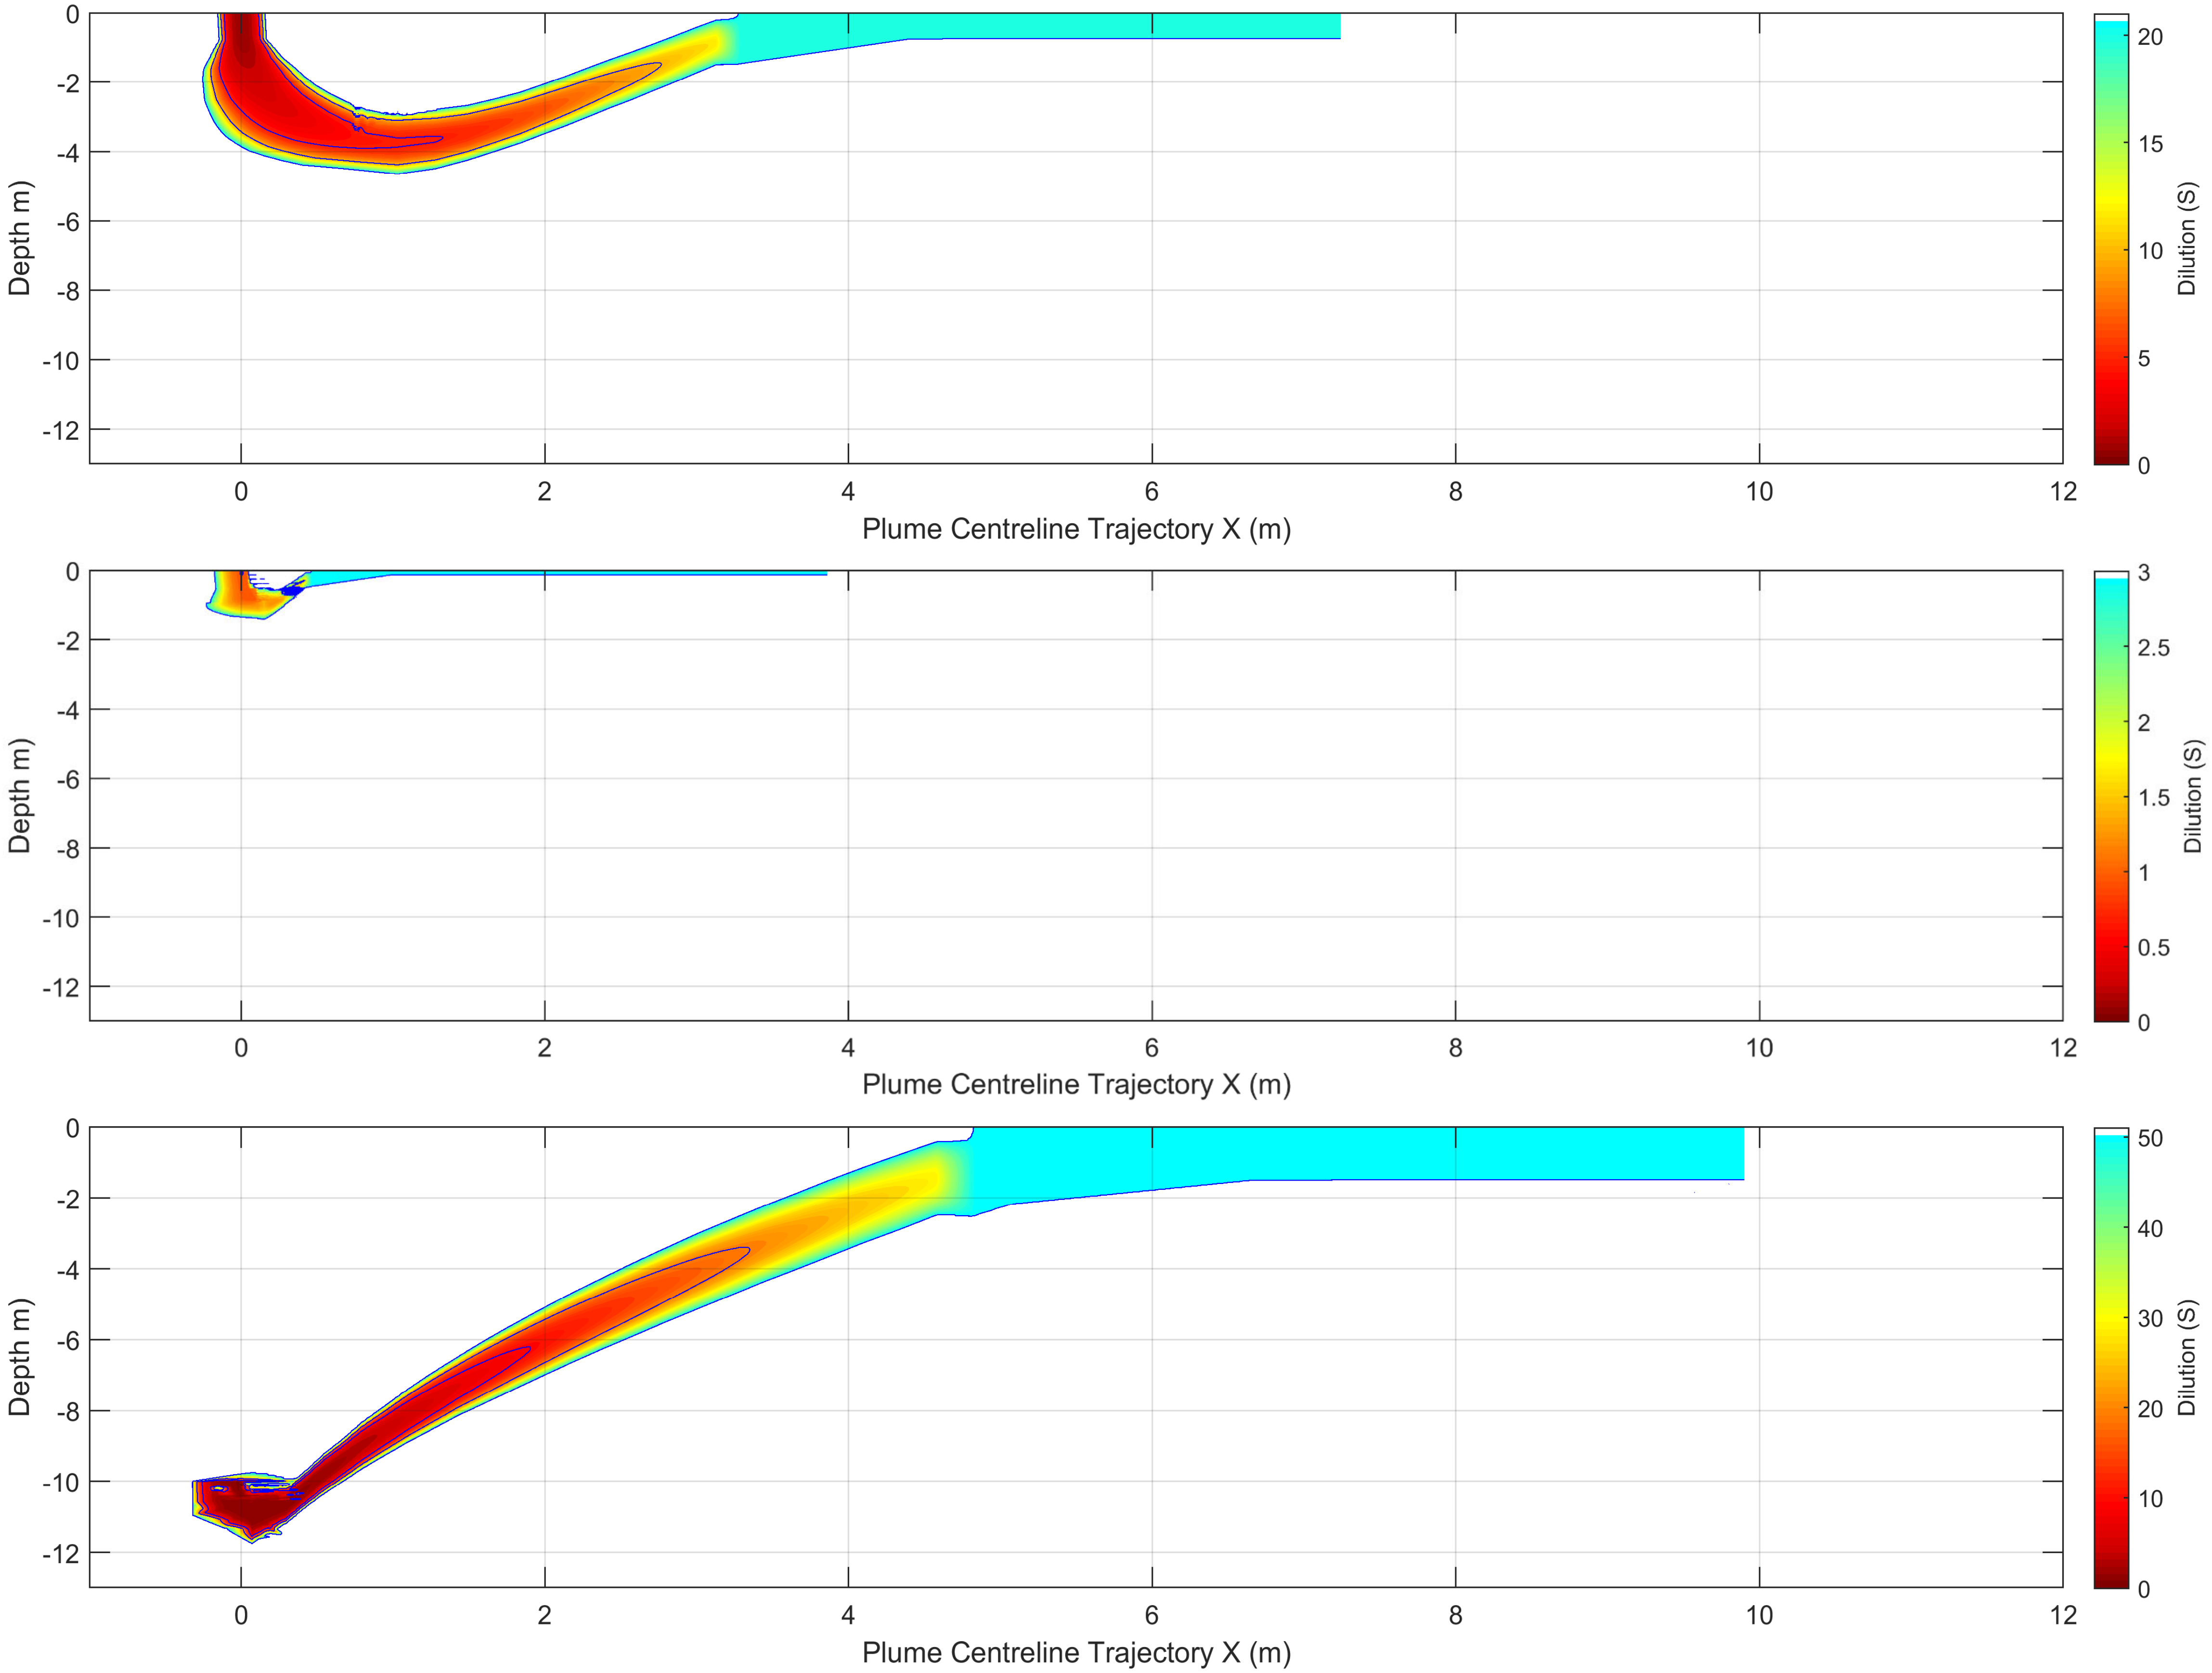

Figure 5.1 Cross-sections of the near-field dilutions for a 4,350 m³/d discharge rate released under weak (annualised) currents at 10 m AMSL (top pane), 0 m BMSL (middle pane) and 10 m BMSL (bottom pane).

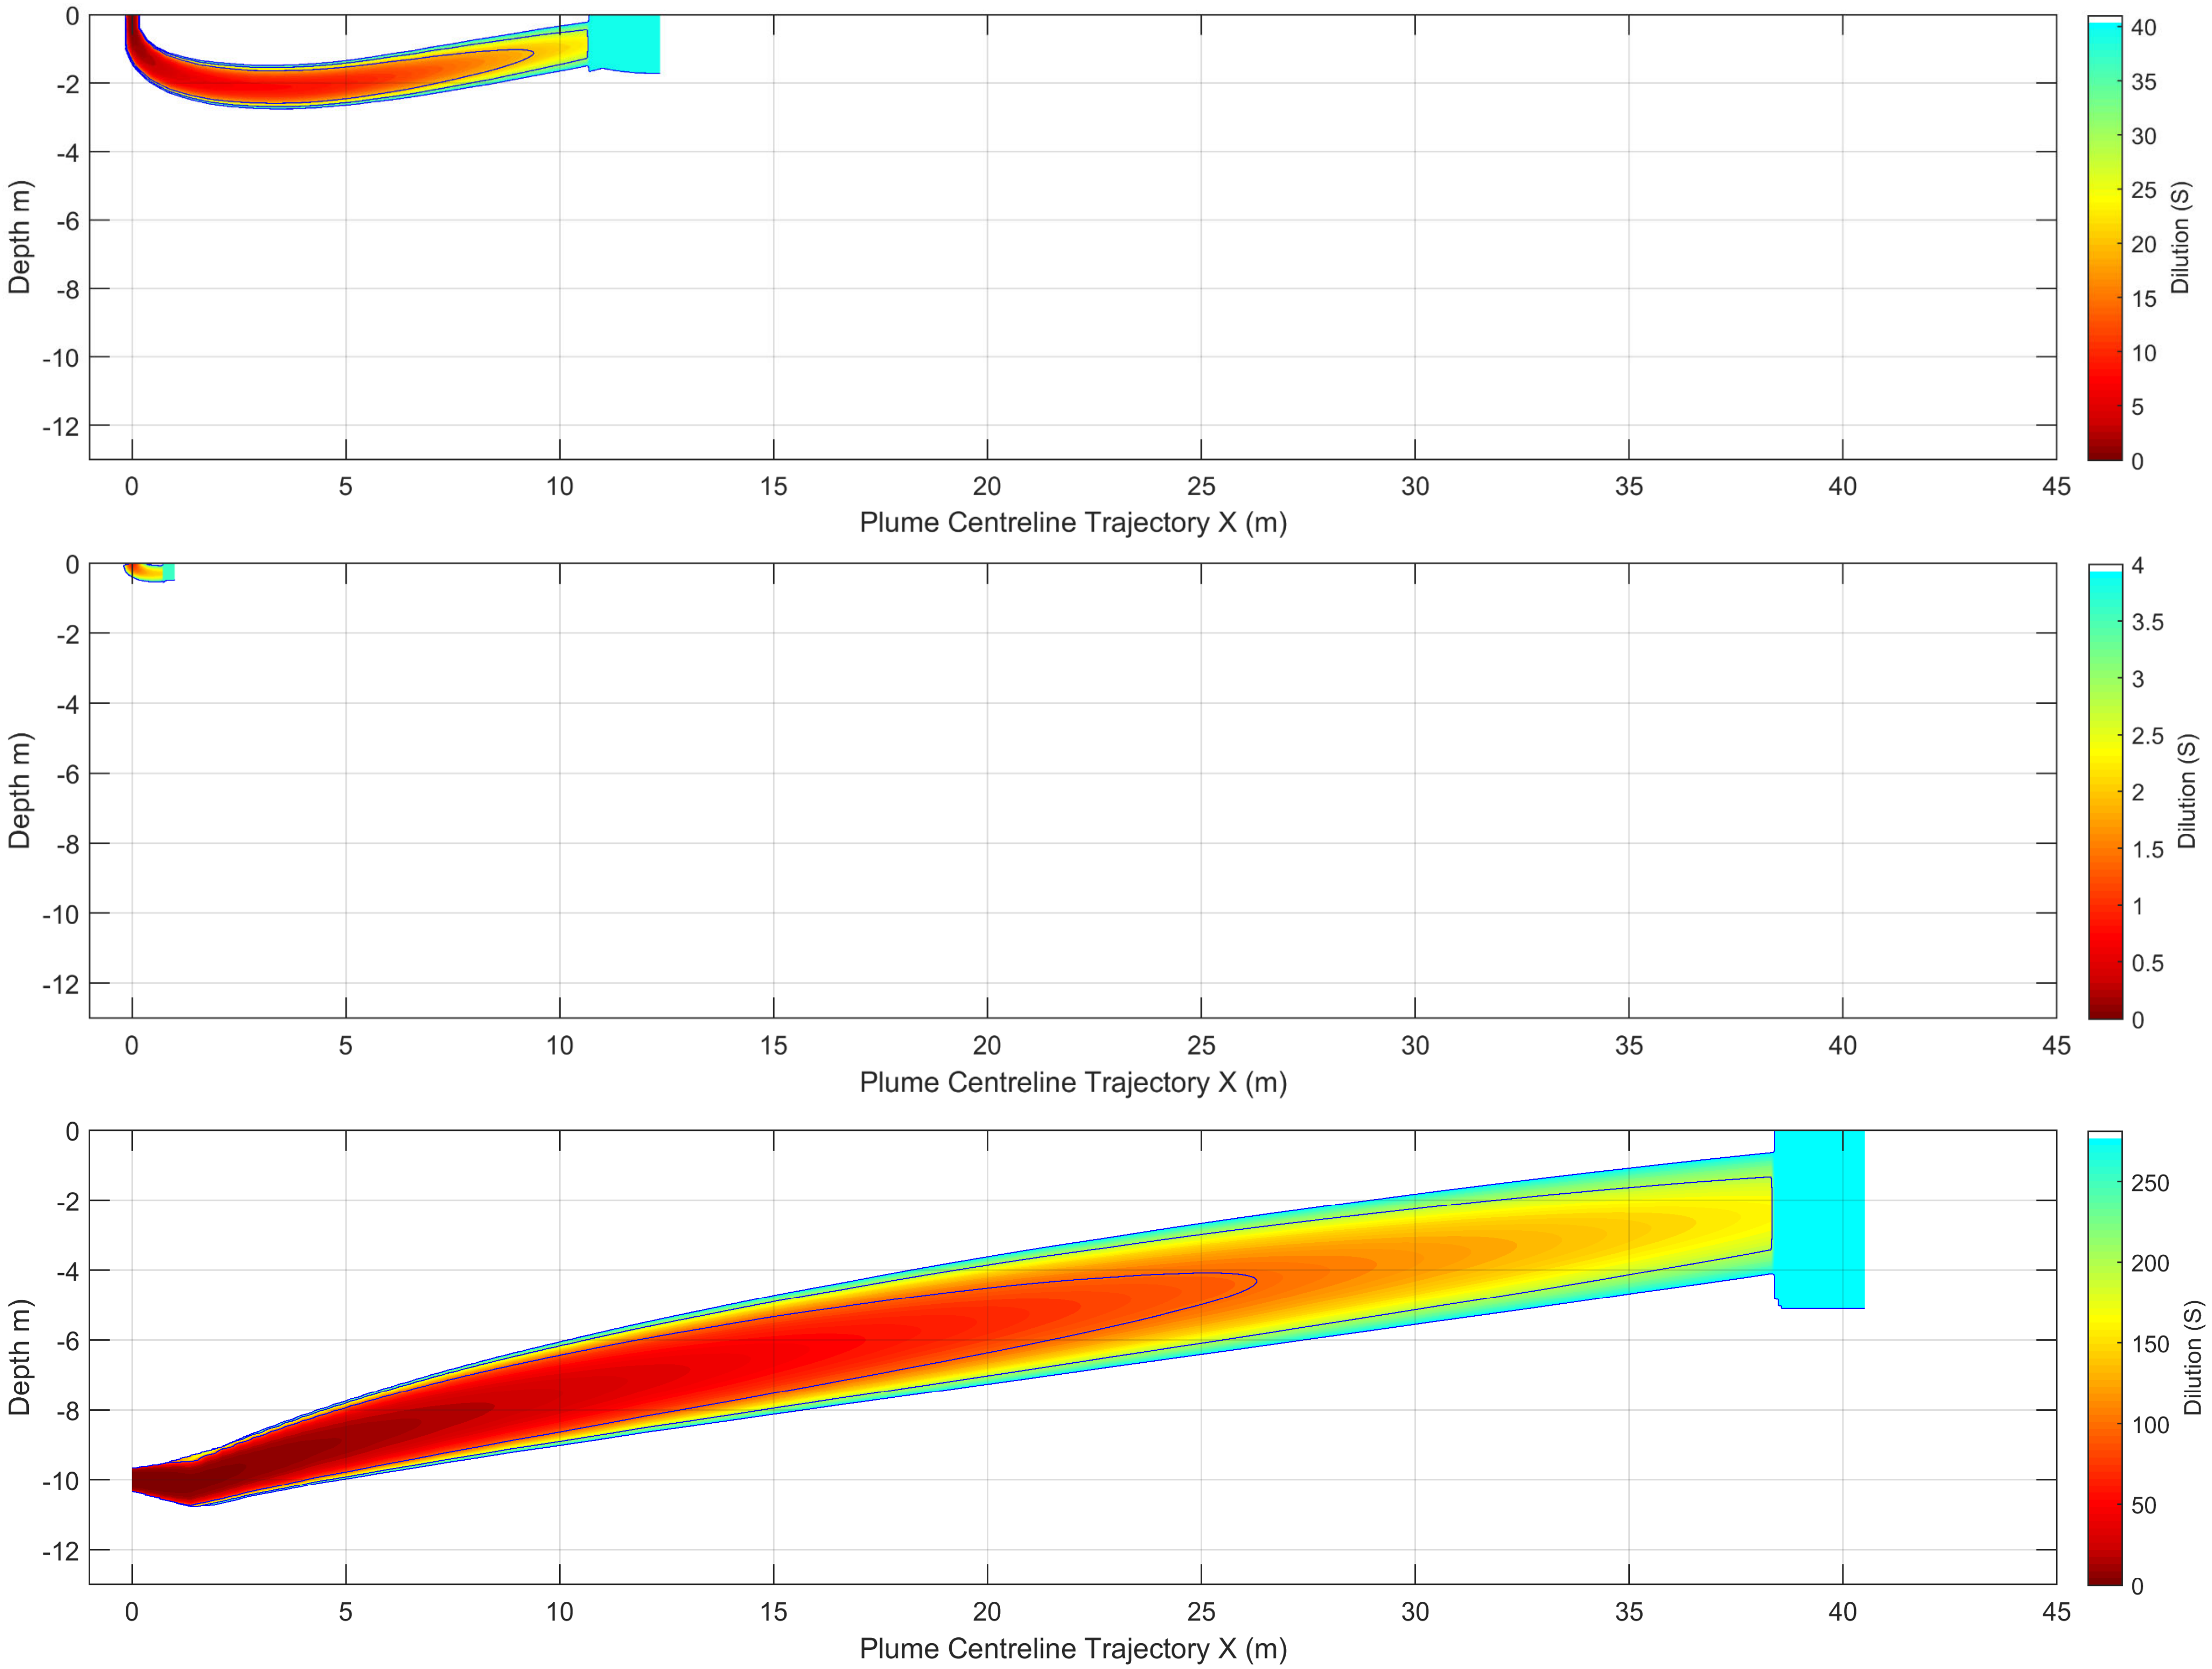

Figure 5.2 Cross-sections of the near-field dilutions for a 4,350 m^3/d discharge rate released under medium (annualised) currents at 10 m AMSL (top pane), 0 m BMSL (middle pane) and 10 m BMSL (bottom pane).

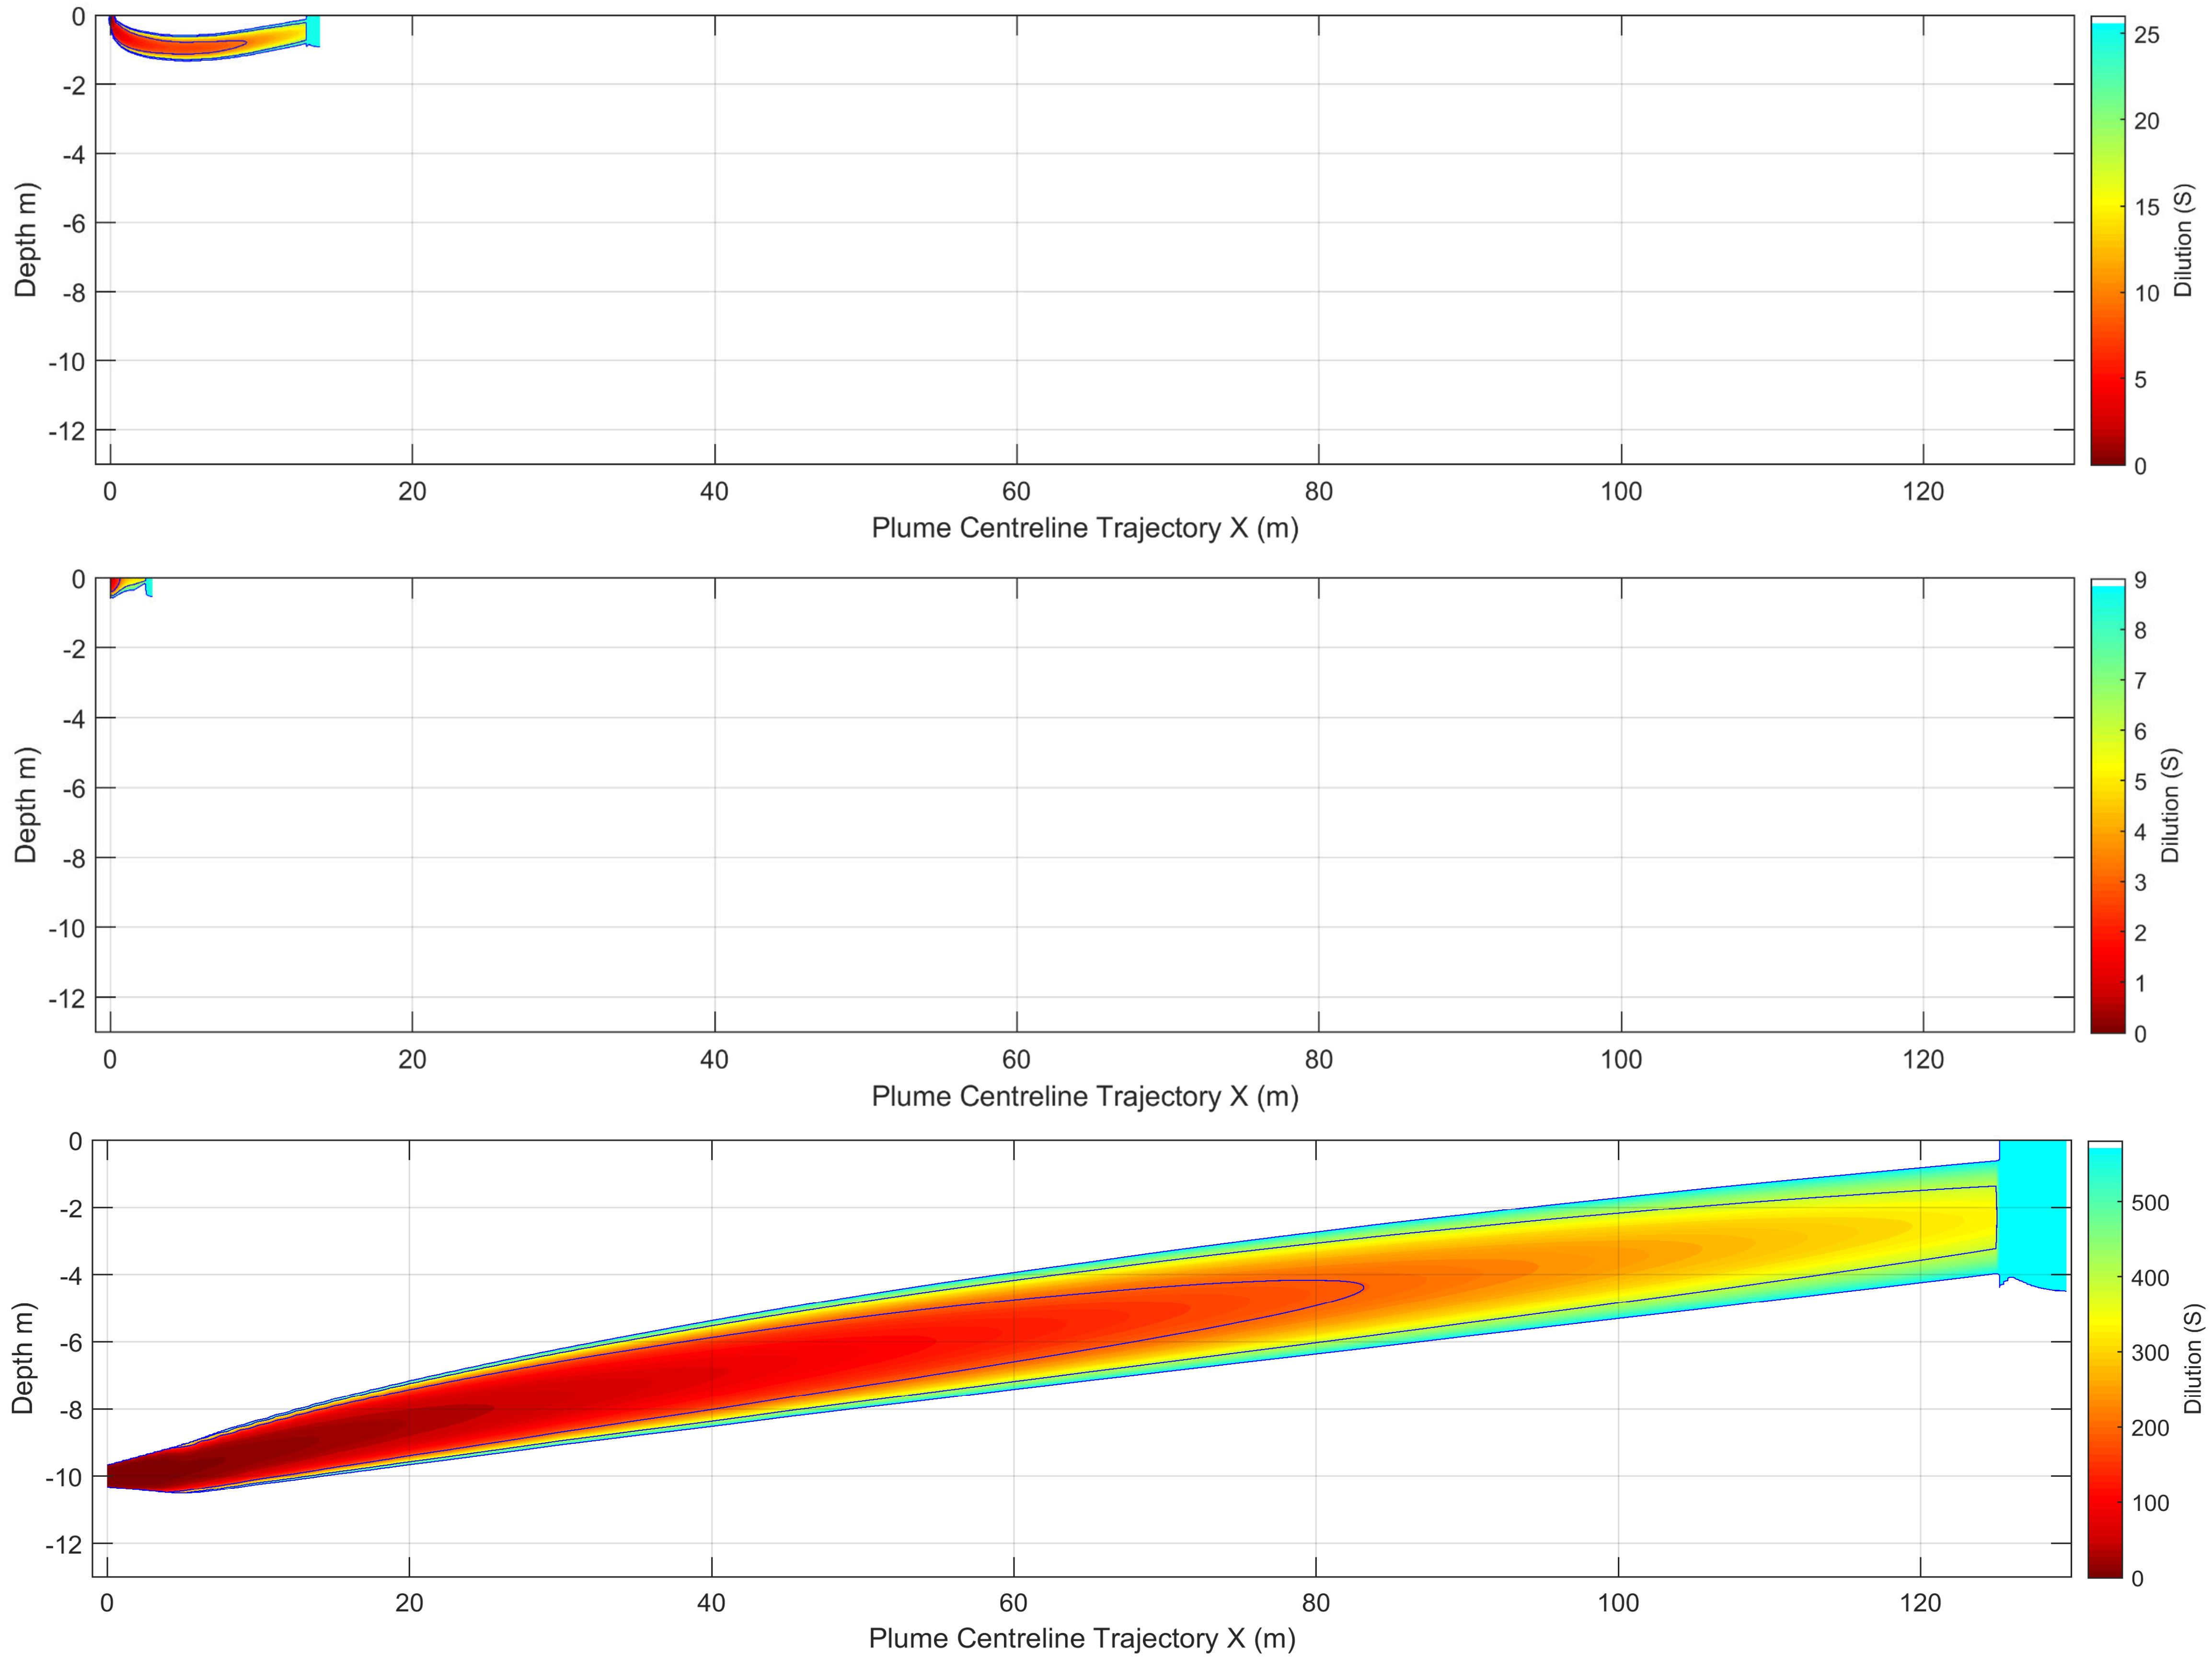

Figure 5.3 Cross-sections of the near-field dilutions for a 4,350 m³/d discharge rate released under strong (annualised) currents at 10 m AMSL (top pane), 0 m BMSL (middle pane) and 10 m BMSL (bottom pane).

5.2 Far-Field Modelling

5.2.1 Overview

Near-field and far-field modelling are used to describe different processes and scales of effect. While the near-field modelling is conducted at fine time and space scales and uses static current, the far-field model considers larger time and space scales and accounts for dispersion under time-changing current. The far-field modelling may capture episodes of pooling of the discharge plume under weak currents, which will result in lower dilution (higher concentrations) patches moving further from the discharge source than is indicated by the near-field modelling.

5.2.2 Interpretation of Percentile Dilution Contours

For each of the modelled discharge cases, the results for all simulations were combined and a statistical analysis performed to produce percentile contours of the predicted dilutions. In the following sections, outcomes are presented for mean, 95th percentile and 99th percentile dilutions. The mean statistic is calculated to represent the central tendency, while calculation of 95th percentile and 99th percentile statistics captures outcomes that might be expected for the most ephemeral and extreme forcing conditions.

Note that the percentile figures do not represent the location of a plume at any point in time; they are a statistical and spatial summary of the percentage of time that dilution values occur across all replicate simulations and time steps. For example, if the lowest 95th percentile dilution at a location in the model domain is predicted as a value of 100, this means that for 95% of the time the dilution level will be higher than 100 and for 5% of the time the dilution level will be lower than 100.

Dilutions were calculated from the ratios of the initial concentrations of the contaminant to the initial concentrations in the receiving waters. Note that this assumes the background concentration of the contaminant in the receiving waters is zero and there is no significant biodegradation.

Table 5.2 summarises the expected initial concentrations of Total Petroleum Hydrocarbons (TPH) as dispersed oil-in-water and the equivalent concentrations required to yield particular dilution levels. These concentrations may be useful to consider when interpreting the contour plots of percentile dilutions.

Table 5.2 Initial concentrations of TPH and equivalent concentrations at example dilution levels.

Parameter	TPH in mg/L of dispersed oil-in-water)	
Initial concentration in discharge	15.0	30.0
Initial concentration in receiving waters	0.0	
Concentration at 1:50 dilution	0.3	0.6
Concentration at 1:75 dilution	0.2	0.4
Concentration at 1:100 dilution	0.15	0.3
Concentration at 1:150 dilution	0.1	0.2
Concentration at 1:200 dilution	0.075	0.15
Concentration at 1:300 dilution	0.05	0.1
Concentration at 1:500 dilution	0.03	0.06
Concentration at 1:1,000 dilution	0.015	0.03

5.2.3 Timeseries Observations

Figure 5.4 to Figure 5.6 show snapshots of predicted dilutions for single simulations at 3-hour intervals for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively. Note the periods chosen for each simulation and the intention of the simulations selected was to show the spatially-varying orientation of the plume and the rapidly-varying nature of the dilutions that could be observed under typical conditions. The snapshots also show the combined effect of the tide and the drift currents, with a clear tidal oscillation.

The snapshots illustrated that the dilutions (and in turn concentrations) became more variable over time because of changes in current speed and direction. Higher dilutions (lower concentrations) were predicted during periods of increased current speed, whereas patches of lower dilutions (higher concentrations) tend to accumulate during the turning of the tide or during periods of weak drift currents. During prolonged periods of lowered current speed, the plume had a more continuous appearance, with higher-concentrated patches moving as a unified group.

The snapshots in Figure 5.4 to Figure 5.6 show a relatively thin and discontinuous plume emanating from the discharge location interspersed with patches of lower dilutions of the plume which separated over time from the connecting plume. This pattern is attributable to periodic tide reversals which cause the existing plume to repeatedly pass over the discharge location.

These findings agree with the research of King & McAllister (1997, 1998) who noted that concentrations within effluent plumes generated by an offshore platform were patchy and likely to peak around the reversal of the tides.

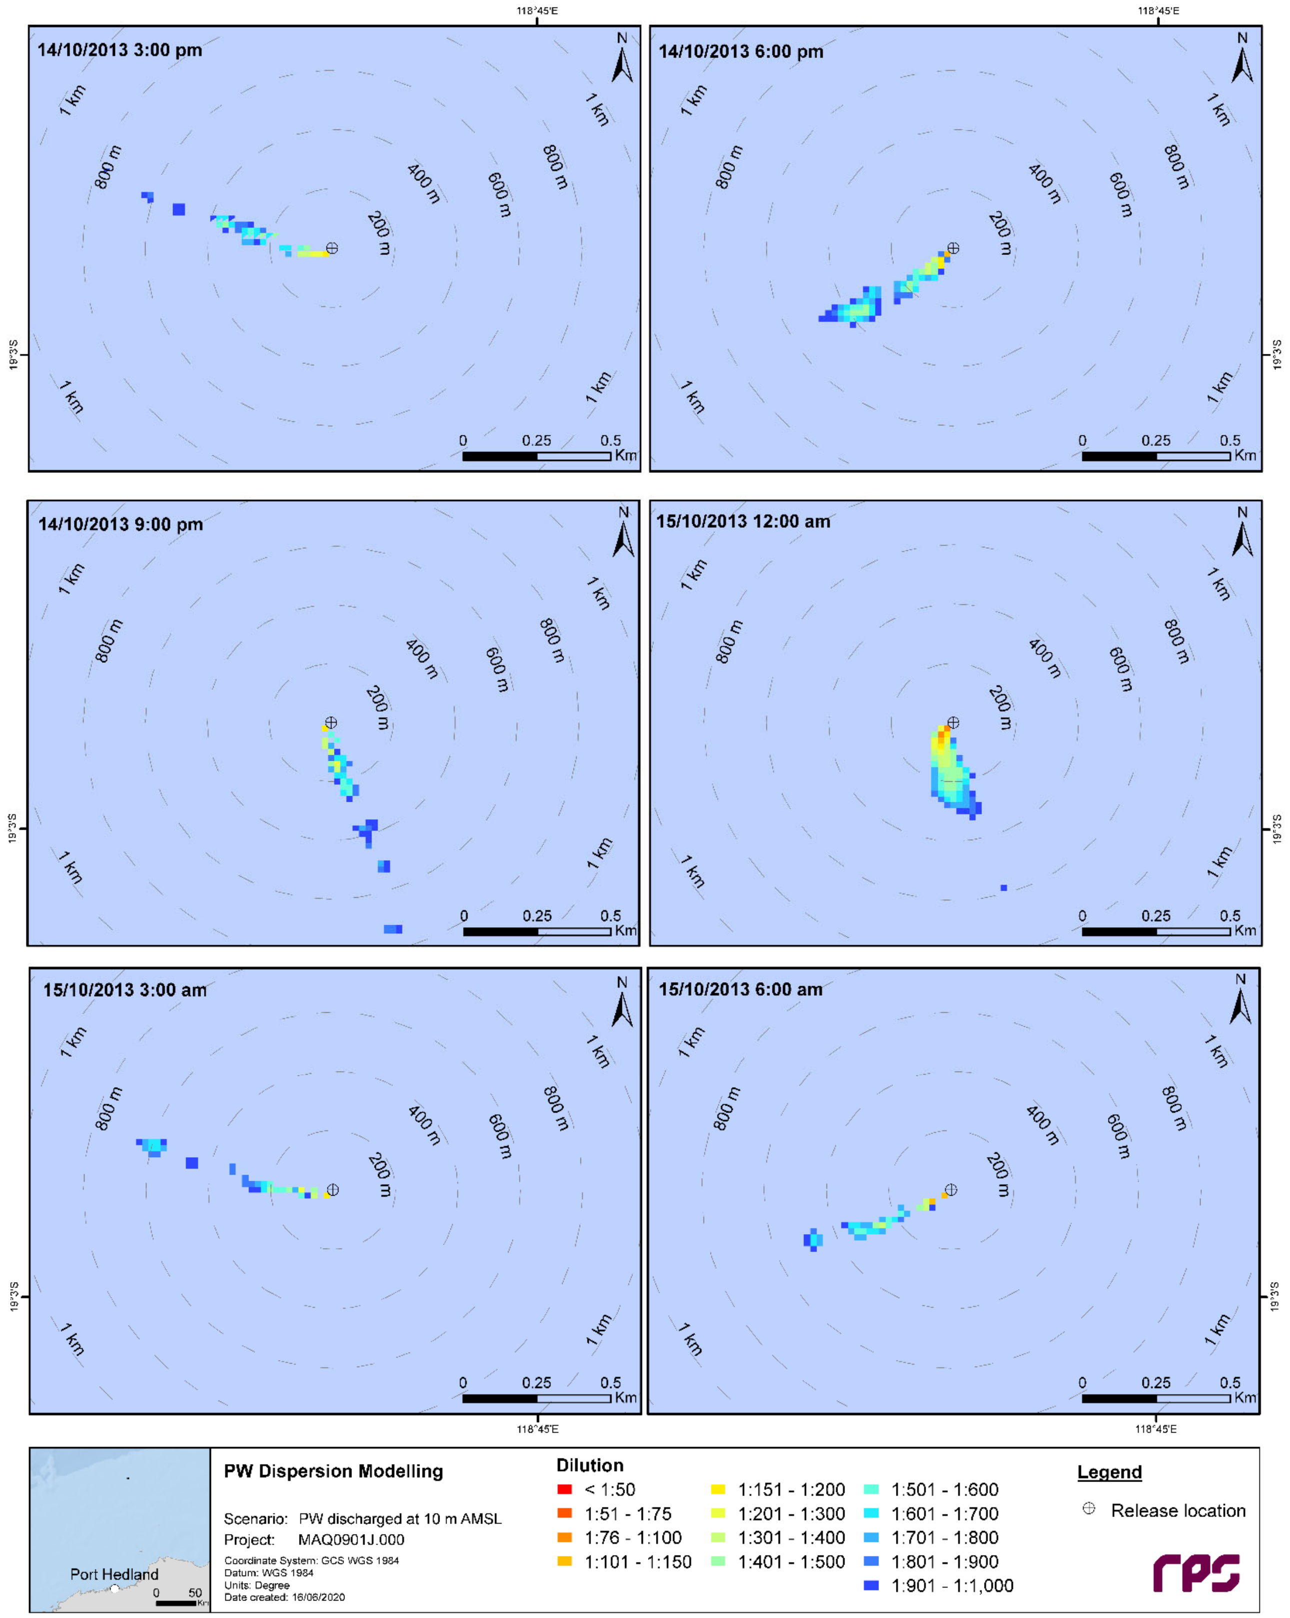

Figure 5.4 Snapshots of predicted maximum dilution levels, at 3-hour intervals from 3.00 pm on the 14th of October 2013 to 6.00 am on the 15th of October 2013 for a discharge of 4,350 m³/day occurring at 10 m AMSL.

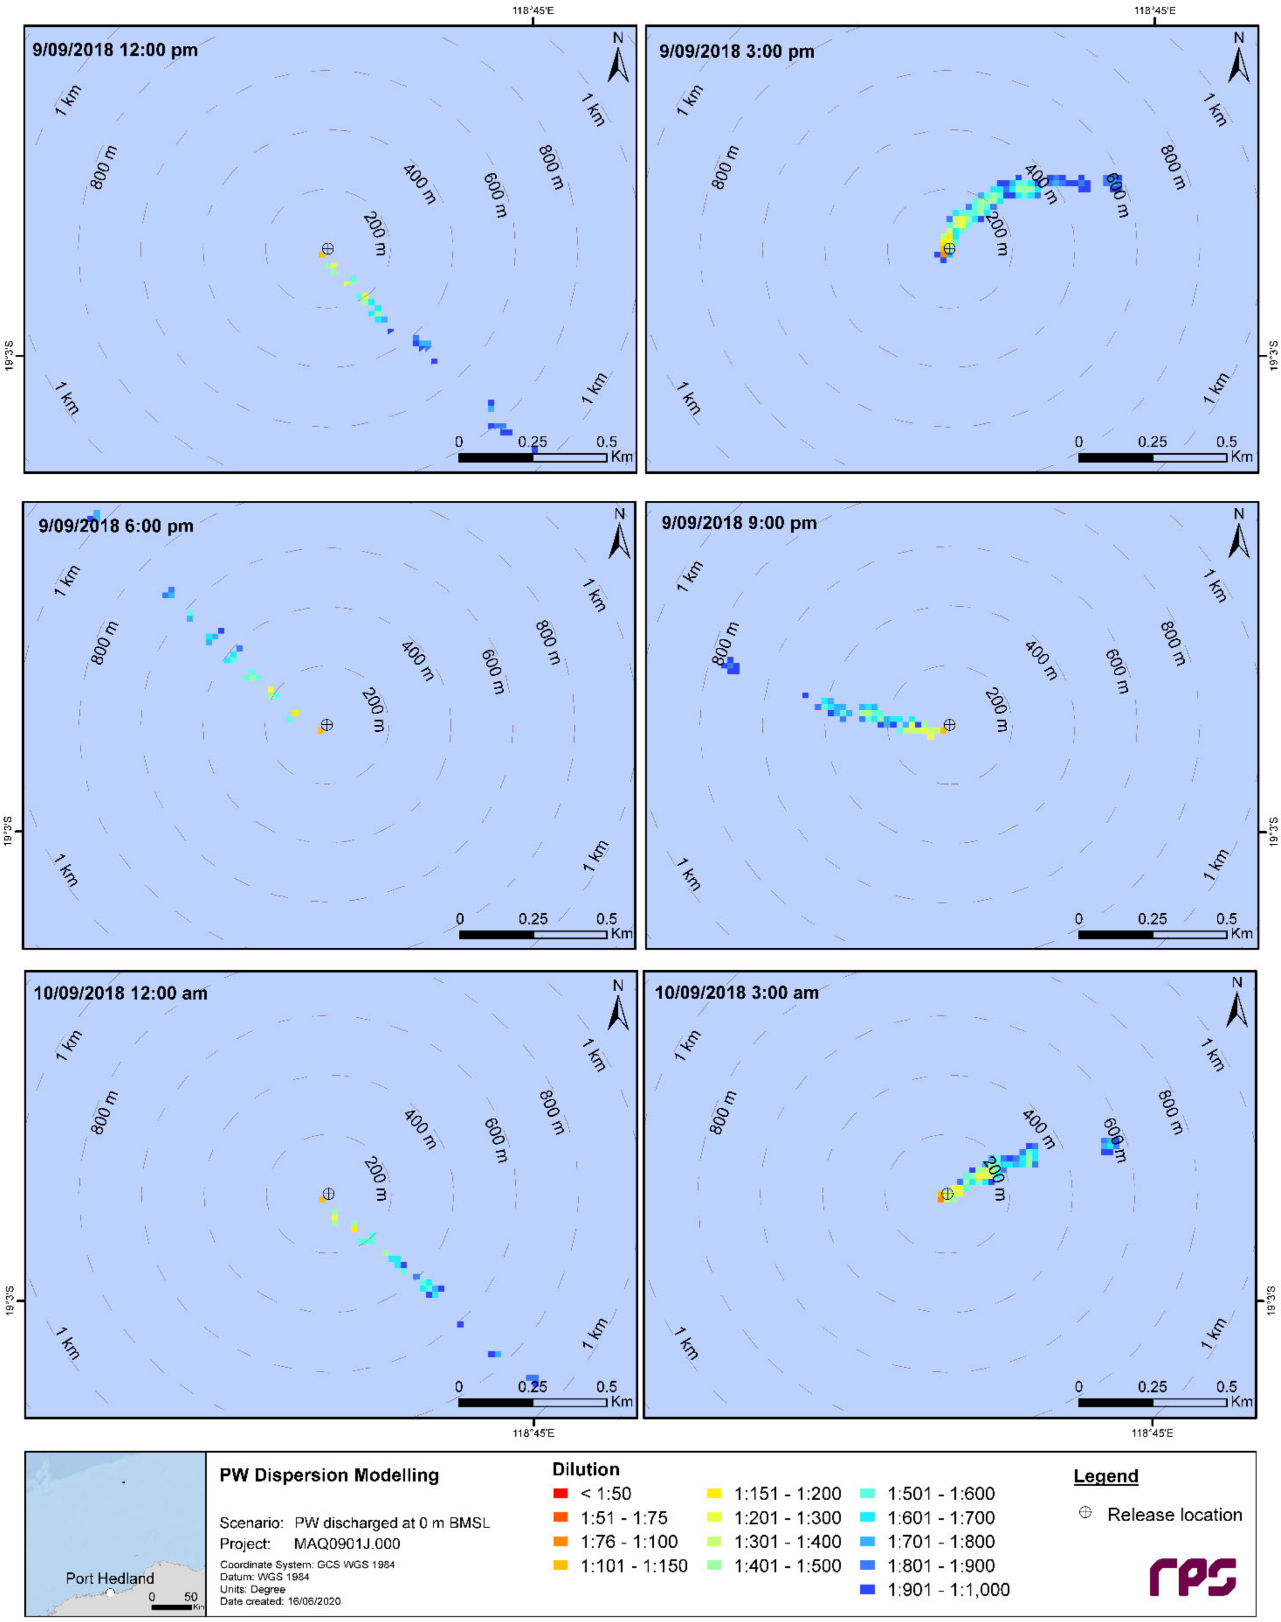

Figure 5.5 Snapshots of predicted maximum dilution levels, at 3-hour intervals from 12.00 pm on the 9th of September 2018 to 3.00 am on the 10th of September 2018 for a discharge of 4,350 m^3/day occurring at 0 m BMSL.

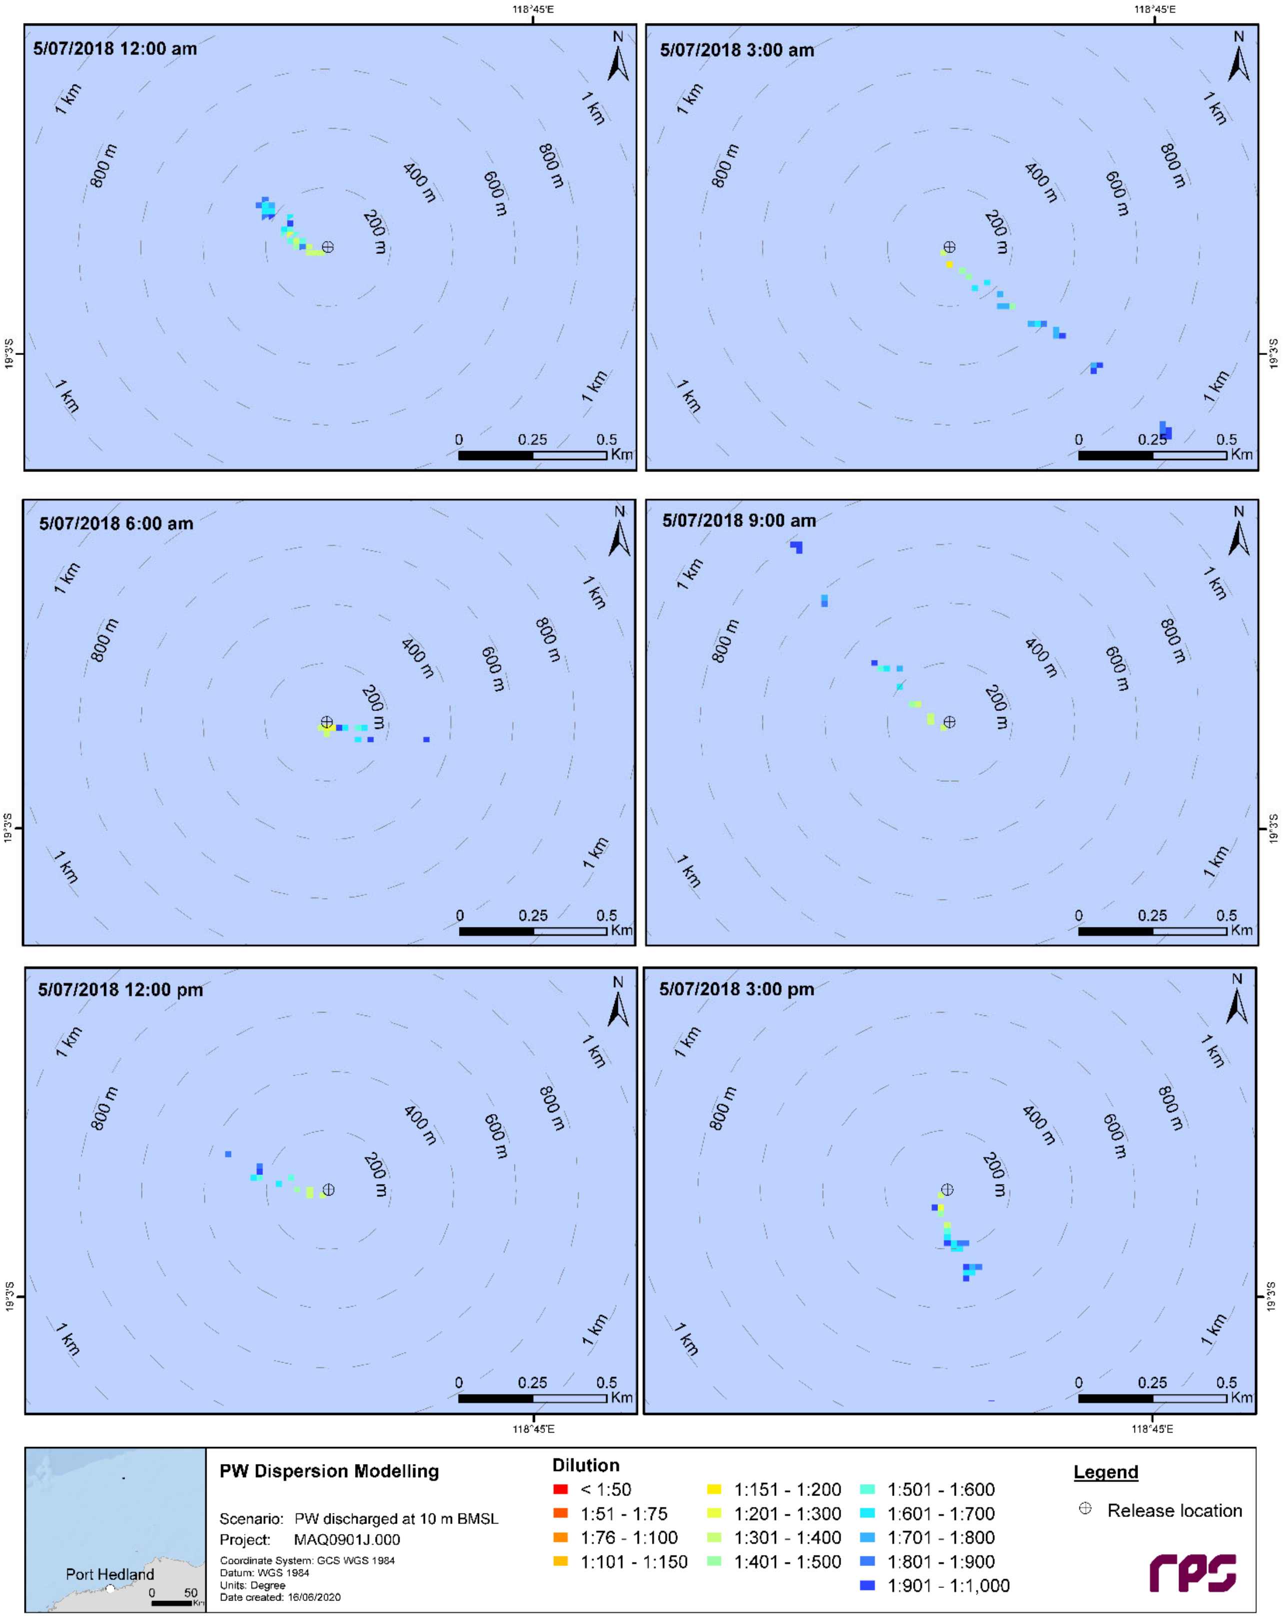

Figure 5.6 Snapshots of predicted maximum dilution levels, at 3-hour intervals from 12.00 am on the 5th of July 2018 to 3.00 pm on the 5th of July 2018 for a discharge of 4,350 m^3/day occurring at 10 m BMSL.

5.2.4 Annualised Analysis

The model outputs for the 150 simulations per case were combined and presented on an annualised basis.

Table 5.3 summarises the annualised maximum distances from the discharge location to achieve 1:50, 1:100, 1:200, 1:300, 1:400, 1:500, 1:600, 1:700, 1:800, 1:900; and 1:1,000 dilutions for each case. The results indicate that the release of effluent under all conditions results in rapid dispersion within the ambient environment. At the 95th percentile, the maximum spatial extents to the 1:1,000 dilution contour were 298 m, 608 m and 255 m for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.

Table 5.4 summarises the total area of influence for the 1:1,000 dilution contour for each statistic for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL. At the 95th percentile, the maximum areas of exposure to the specified dilution contour were 0.102 km^2, 0.136 km^2 and 0.072 km^2 for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.

Table 5.5 summarises the maximum depths from the discharge location to achieve 1:1,000 dilutions for each season and statistic. Maximum depths were predicted as 4 m, 3 m and 4 m for 10 m AMSL, 0 m BMSL and 10 m BMSL, respectively.

Figure 5.7 to Figure 5.15 show mean, 95th and 99th percentile dilutions for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL. Note that the contours represent the lowest predicted dilution (highest concentration) at any given time step through the water column for the particular statistic and does not consider frequency or duration.

Comparison figures of the maximum spatial extents to the 1:1,000 dilution contour for discharges at 10 m AMSL, 0 m BMSL and 10 m BMSL are presented in Figure 5.16 (mean), Figure 5.17 (95th percentile) and Figure 5.18 (99th percentile).

The results presented assume that no processes other than dilution would reduce the source concentrations over time.

The seasonal far-field results for the 10 m AMSL, 0 m BMSL and 10 m BMSL discharges are presented in Appendix B.

Table 5.3 Maximum distances from the PW discharge location to achieve given dilution factors for each case. Findings are based on the combined annualised results (150 simulations per case).

Dilution	Maximum distance (m) from discharge location to achieve given dilutions								
	Case 1 - 10 m above mean sea level			Case 2 - 0 m below mean sea level			Case 3 - 10 m below mean sea level		
	mean	95th percentile	99th percentile	mean	95th percentile	99th percentile	mean	95th percentile	99th percentile
1:50	-	-	-	-	-	42	-	-	-
1:100	-	42	42	42	42	608	-	-	42
1:200	42	42	86	42	608	608	-	42	58
1:300	42	76	166	42	608	608	42	51	114
1:400	42	95	212	42	608	622	42	76	175
1:500	42	130	283	42	608	624	42	103	220
1:600	42	184	374	42	608	637	42	148	286
1:700	42	198	468	58	608	639	42	184	355
1:800	42	242	566	58	608	709	42	198	438
1:900	58	270	652	58	608	837	42	214	538
1:1,000	58	298	765	58	608	902	42	255	591

Table 5.4 Total area of influence to achieve a dilution factor of 1:1,000 for each case. Findings are based on the combined annualised results (150 simulations per case).

Percentile	Total area (km^2) of influence for given dilution of 1:1,000		
	Case 1 - 10 m above mean sea level	Case 2 - 0 m below mean sea level	Case 3 - 10 m below mean sea level
Mean	0.002	0.003	0.001
95th	0.102	0.136	0.072
99th	0.856	1.369	0.550

Table 5.5 Maximum depth the 1:1,000 dilution was achieved for each case. Findings are based on the combined annualised results (150 simulations per case).

Maximum depth (m) from discharge location to achieve given dilution of 1:1,000		
Case 1 - 10 m above mean sea level	Case 2 - 0 m below mean sea level	Case 3 - 10 m below mean sea level

TERMS AND ABBREVIATIONS

°	Degrees
‘	Minutes
“	Seconds
μm	Micrometre (unit of length; 1 μm = 0.001 mm)
Actionable oil	Oil which is thick enough for the effective use of mitigation strategies
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
API	American Petroleum Institute gravity. A measure of how heavy or light a petroleum liquid is compared to water.
ASTM	American Society for Testing and Materials
bbl	Barrel of oil
Bonn Agreement	An agreement for cooperation in dealing with pollution of the North Sea by oil and other harmful substances, 1983, includes: Governments of the Kingdom of Belgium, the Kingdom of Denmark, the French Republic, the Federal Republic of Germany, the Republic of Ireland, the Kingdom of the Netherlands, the Kingdom of Norway, the Kingdom of Sweden, the United Kingdom of Great Britain and Northern Ireland and the European Union.
Biodegradation	Decomposition of organic material by microorganism
BTEX	Benzene, toluene, ethylbenzene, and xylenes
°C	degree Celsius (unit of temperature)
CDC	Climate Diagnostics Center
CFSR	Climate Forecast System Reanalysis
cP	Centipoise (unit of dynamic viscosity)
Decay	The process where oil components are changed either chemically or biologically (biodegradation) to another compound. It includes breakdown to simpler organic carbon compounds by bacteria and other organisms, photo-oxidation by solar energy, and other chemical reactions.
DEWHA	Department of the Environment, Water, Heritage and the Arts
Dissolved hydrocarbons	Hydrocarbon droplets which are dissolved in water.
Dynamic viscosity	The dynamic viscosity of a fluid expresses its resistance to shearing flows, where adjacent layers move parallel to each other with different speeds.
EEZ	Exclusive Economic Zone
Entrained hydrocarbons	Hydrocarbon droplets that are suspended into the water column, though not dissolved.
EP	Environmental plan
Evaporation	The process whereby components of the oil mixture are transferred from the sea-surface to the atmosphere as vapours.
FPSO	Floating production storage and offloading facility
g/m^2	Grams per square meter (unit of surface area density)

GCS WGS 1984	Geographic Coordinate System World Geodetic System 1984 (WGS84); reference coordinate system
GEP	Gas Export Pipeline
GODAE	Global Ocean Data Assimilation Experiment
HYCOM	Hybrid Coordinate Ocean Model. A data-assimilative, three-dimensional ocean model.
HYDROMAP	Advanced ocean/coastal tidal model used to predict tidal water levels, current speed and current direction.
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IBRA	Interim Biogeographic Regionalisation of Australia
Isopycnal layer	Water layer characterised by the same density
ITOPF	International Tankers Owners Pollution Federation
km	Kilometre (unit of length)
km^2	Square Kilometres (unit of area)
KEF	Key Ecological Feature
Knots	unit of speed (1 knot = 0.514 m/s)
KP	Kilometre post. Refers to the surveyed distance along the main line or lateral line of a pipeline.
LC_{50}	Median lethal dose required for mortality of 50% of a tested population after a specified exposure duration.
m	Meter (unit of length)
m/s	Meter per Second (unit of speed)
m^3	Cubic meter (unit of volume)
MAHs	Monoaromatic hydrocarbons
MNP	Marine National Park
MNR	Marine Nature Reserve
MP	Marine Park
MPA	Marine Protected Area
MSL	Mean Sea Level
NASA	National Aeronautics and Space Administration
NCEP	National Centres for Environmental Prediction
NOAA	National Oceanic and Atmospheric Administration
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NP	National Park
NR	Nature Reserve
NRC	National Research Council
OPP	Offshore Project Proposal
PAHs	Polynuclear aromatic hydrocarbons
ppb	parts per billion (concentration)
Pour Point	The pour point of a liquid is the temperature below which the liquid loses its flow characteristics.
PSU	Practical salinity units

Ramsar site	A site listed under the Ramsar Convention on wetlands which is an international intergovernmental treaty that provides the framework for the conservation and wise use of wetlands and their resources.
RSB	Reefs, shoals and banks
Sea surface exposure	Contact by floating oil on the sea surface at concentrations equal to or exceeding defined threshold concentrations. The consequence will vary depending on the threshold and the receptors.
Shoreline contact	Arrival of oil at or near shorelines at on-water concentrations equal to or exceeding defined threshold concentrations. Shoreline contact is judged for floating oil arriving within a 1 km buffer zone from any shoreline as a conservative measure
SIMAP	Spill Impact Model Application Package. SIMAP is designed to simulate the fate and effects of spilled hydrocarbons for surface or subsea releases
Single Oil spill modelling	Oil spill modelling involving a computer simulation of a single hypothetical oil spill event subject to a single sequence of wind, current and other sea conditions over time. Single oil spill modelling, also referred to as "deterministic modelling" provides a simulation of one possible outcome of a given spill scenario, subject to the metocean conditions that are imposed. Single oil spill modelling is commonly used to consider the fate and effects of 'worst-case' oil spill scenarios that are carefully selected in consideration of the nature and scale of the offshore petroleum activity and the local environment (NOPSEMA, 2018). Because the outcomes of a single oil spill simulation can only represent the outcome of that scenario under one sequence of metocean conditions, worst-case conditions are often identified from stochastic modelling. It is impossible to calculate the likelihood of any outcome from a single oil spill simulation. Single oil spill modelling is generally used for response planning, preparedness planning and for supporting oil spill response operations in the event of an actual spill.
State waters	Low water mark seaward for three nautical miles
Stochastic Oil spill modelling	Stochastic oil spill modelling is created by overlaying and statistically analysing the outcomes of many single oil-spill simulations of a defined spill scenario, where each simulation was subject to a different sequence of metocean conditions, selected objectively (typically by random selection) from a long sequence of historic conditions for the study area. Analysis of this larger set of simulations provides a more accurate indication of the area that maybe affected (EMBA) and also indicates which particular locations are more likely to be affected (as well as other statistics). Stochastic oil spill modelling avoids biases that affect single oil spill modelling (due to the reliance on only one possible sequence of conditions). However, when interpreting stochastic modelling, which is based on a wide range of potential conditions that might happen to occur, it is essential to understand that calculations for the Risk EMBA will enclose a much larger area than could be affected in any single spill event, where a more limited set of conditions will occur. Consequently, it is misleading to imply that the Risk EMBA contours derived from stochastic modelling indicate the outcomes expected from a single spill event (NOPSEMA, 2018). Stochastic modelling is generally used for risk assessment and preparedness planning by indicating locations that could be exposed and may require response or subsequent impact assessment.
Summer	December to the following March
TOPEX/Poseidon	A joint satellite mission between NASA and CNES to map ocean surface topography using an array of satellites equipped with detailed altimeters
Transitional	April and September
Weathered oil	Oil that no longer contains volatile or soluble components
WHP	Well Head Platform
WHS	World Heritage Site
Winter	May to August

EXECUTIVE SUMMARY

Background

Santos Limited (Santos) is planning the development of the Dorado Development (Dorado Project), located in the Bedout Basin offshore north-west Western Australia (WA), approximately 140 km north of Port Hedland. The Dorado Project targets the Dorado reservoir with hydrocarbons being collected on a wellhead platform (WHP) and pumped by infield flowlines for processing on a floating production storage and offloading (FPSO) facility. There is also potential for future development of surrounding fields within the Dorado Project Area. These fields will be developed by drilling additional wells and tied back to the Dorado WHP and/or FPSO via flowlines.

To assess the potential environmental impacts and risks arising from unplanned activities associated with the project a detailed oil spill modelling study was commissioned, which examined the following scenarios:

- Scenario 1: An uncontrolled subsea blowout of crude at the WHP over 14 weeks, releasing a total 12,779,600 bbl (2,031,794 m^3) with a decreasing discharge rate;

- Scenario 2: An uncontrolled surface blowout of crude at the WHP over 14 weeks, releasing a total 12,779,600 bbl (2,031,794 m^3) with a decreasing discharge rate;

- Scenario 3: A 1,080 m^3 subsea release of crude over 1 hour from the export pipeline, between the FPSO and WHP;

- Scenario 4: An instantaneous surface release of 225 m^3 of crude at the FPSO due to an offtake incident;

- Scenario 5: A tanker colliding with the FPSO and the tanker instantly releasing 1,800 m^3 of heavy fuel oil (HFO) at the surface; and

- Scenario 6: An instantaneous surface release of 10,108 m^3 of crude to represent the loss of contents from the FPSO storage tank.

The potential risk of exposure to the surrounding waters and accumulation to shorelines was assessed over defined seasonal periods: summer (October to March), winter (May to August) and transitional (April and September). This approach assists with identifying the environmental values and sensitivities that would be at risk of exposure on a seasonal basis.

The purpose of the modelling is to further improve the understanding of a conservative ‘outer envelope’ of the potential area that may be affected in the unlikely event of a hydrocarbon release event. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbons may influence based on 300 different spill simulations combined. To understand the potential area that might be affected during an isolated (single) spill event, the results for single deterministic simulations were also presented.

Methodology

The modelling study was carried out in several stages. Firstly, a ten-year current dataset (2009–2018) that includes the combined influence of large-scale ocean and nearshore tidal currents was developed. Secondly, the currents, local winds and detailed hydrocarbon characteristics were used as inputs in the three-dimensional oil spill model (SIMAP) to simulate the drift, spread, weathering and fate of the spilled oil.

As spills can occur during any set of wind and current conditions, for each scenario modelling was conducted using a stochastic (or statistical) approach, which involved running 100 spill simulations per season (300 total) using the same release information (i.e. spill volume, duration and oil composition), though different start times. This ensured that each simulation was subjected to different wind and current conditions and, in turn, movement and weathering of the oil. Once all 100 simulations were run, the model combined the results to determine the risk and potential exposure/accumulation to the surrounding waters and shorelines and specific sensitive resources over each seasonal period.

This study used thresholds for, shoreline, and in-water (entrained and dissolved) oil, which are consistent with NOPSEMA spill modelling bulletin (NOPSEMA 2019). Reporting thresholds represent potential effects ranging from possible social and economic effects, degradation of water quality (low threshold) as well as possible effects on the behaviour, survival and recruitment success on biota (medium and high thresholds).

Oil Properties

The Caley crude was used as the representative hydrocarbon from the reservoir, given that it is expected to be the most persistent oil from the Archer formation reservoirs and constitutes the largest volume of the extracted hydrocarbons. The physical-chemical properties of Caley crude were based on a detailed assay provided by Santos. It has a density of 773 kg/m^3 (API of 51.4) and a low pour point (-15°C). The low viscosity (1.45 cP) indicates that the crude would rapidly spread and thin out resulting in a large surface area of hydrocarbon available for evaporation. Based upon the Caley crude assay, up to 48% of the hydrocarbon would evaporate over the first few hours or day, with up to 67% evaporated after a few days when on the sea surface. Fifteen percent of the crude is considered persistent, which would eventually breakdown due to the decay. The oil is categorised as a group II oil (light-persistent) based on categorisation and classification derived from AMSA (2015) guidelines.

Heavy fuel oil (HFO) has a high density of 947.9 kg/m^3 (API of 12.3) and a relatively high pour point (7°C). The high viscosity (3,180 cP) indicates that this oil will not readily spread when released and will form a thick slick on the sea surface, decreasing the rate of evaporation. This oil contains approximately 82.8% (by mass) of hydrocarbon compounds (or residuals) that is expected to become semi-solid to solid at ambient temperatures and is susceptible to decay overtime. The oil is categorised as a group IV oil (heavy-persistent) based on categorisation and classification derived from AMSA (2015) guidelines

Key Findings

Scenario 1: 12,779,600 bbl (2,031,794 m^3) subsea release of crude at the WHP

- The maximum distance from the release location to the low (1-10 g/m^2), moderate (10-50 g/m^2) and high (≥ 50 g/m^2) floating oil exposure thresholds was 1,278.2 km west-southwest, 528.3 km west-southwest and 304.5 km west-southwest, respectively, all predicted during summer conditions.

- There are a total of 8 Australian Marine Parks (AMP) and 3 reefs, shoals and banks (RSB) within the low exposure zone across the 3 seasons. While floating oil was predicted to cross WA State Waters during every season with probabilities of 1-12%.

- The probability of hydrocarbon accumulating on any shoreline at, or above, the low threshold (10-100 g/m^2) was 10% and 1% during summer and transitional conditions, with no accumulation at, or above, this threshold predicted in winter months. The minimum time for hydrocarbon accumulating at, or above, the low threshold was approximately 2.88 days and the maximum volume of oil ashore was 64.7 m^3. Port Hedland recorded the highest probability of shoreline accumulation at the low threshold (7%) during summer conditions while the shortest time before shoreline accumulation was predicted during transitional conditions as 2.88 days.

- Twenty AMPs, 8 Key Ecological Features (KEF) and 103 RSB are within the entrained hydrocarbon low exposure zone. Entrained hydrocarbons drifted into state waters during every season with probabilities ranging from 81-94%. One hundred percent exposure was recorded at the Argo-Rowley Terrace AMP during winter.

- Across the 3 seasons, there are 12 AMPs, 4 KEFs and 45 RSBs within the low exposure zone. The probability of dissolved hydrocarbons drifting into WA State Waters ranged from 38-64% and the quickest time for it to reach the boundary was 2.83 days.

Scenario 2: 12,779,600 bbl (2,031,794 m^3) surface release of crude at the WHP

- The maximum distance from the release location to the low, moderate and high floating oil exposure thresholds was 1,201.9 km southwest (summer), 497.3 km west-southwest (transitional) and 304.5 km west-southwest (summer and transitional), respectively.

- Within the floating oil low threshold zone, there are 7 AMPs and 3 RSBs across the 3 seasons. Floating oil was predicted to cross WA State Waters during every season with probabilities of 1-12%. Montebello AMP recorded the highest probability of exposure to floating oil at 18% during summer conditions. The shortest time for floating oil at the low threshold to reach an AMP was recorded at Argo-Rowley Terrace as 7.50 days during summer conditions.

- The probability of hydrocarbon accumulating on any shoreline at, or above, the low threshold was 11% and 1% during summer and transitional conditions, with no accumulation at, or above, this threshold predicted in winter months. The minimum time for hydrocarbon accumulating at, or above, the low threshold was approximately 2.88 days and the maximum volume of oil ashore was 38.1 m^3. Port Hedland recorded the highest probability of shoreline accumulation at the low threshold (9%) during summer conditions and the maximum length of hydrocarbon accumulating on any shoreline (at the low threshold) of 3 km.

- There are 20 AMP in the entrained hydrocarbon low exposure zone and 104 RSB receptors. The highest probability of exposure to an RSB receptor was predicted at Rankin Bank during all three seasons (summer 96%; transitional 94% and winter 97%). While the quickest time to reach an RSB receptor was predicted at Madeleine Shoals (4 days during transitional conditions).

- The dissolved hydrocarbon low exposure zone surrounded 12 AMP and 42 RSB receptors. Dissolved hydrocarbons were predicted to drift into WA state waters during every season with probabilities ranging from 39-64%.

Scenario 3: 1,080 m^3 subsea release of crude from the export pipeline

- The maximum distance from the release location to the low (1-10 g/m^2), moderate (10-50 g/m^2) and high (≥ 50 g/m^2) floating oil exposure thresholds was 153.1 km west-southwest (transitional), 40.5 km northeast (winter) and 34.6 km west-northwest (transitional), respectively.

- No floating oil exposure to any of the receptors assessed.

- No shoreline accumulation was predicted above the low threshold (10-100 g/m^2) for this scenario.

- A combined total of 7 AMPs are within the low exposure zone across the 3 seasons, with the Montebello AMP recording the highest probability of exposure of 7% during transitional conditions. The shortest time for exposure at the low threshold to an AMP was recorded at Dampier during transitional conditions at 0.88 days (21 hours). No KEF receptors were predicted to be exposed by entrained hydrocarbons at the low threshold.

- Dissolved hydrocarbons were not predicted to impact any receptors (other than the Northwest Shelf IMCRA, which the release location resides within) at, or above, the low (10-50 ppb) threshold for this scenario.

Scenario 4: 225 m^3 surface release of crude at the FPSO

- The maximum distance from the release location to the low (1-10 g/m^2), moderate (10-50 g/m^2) and high (≥ 50 g/m^2) floating oil exposure thresholds was 151.8 km southwest (transitional), 30.2 km north-northeast (winter) and 17.2 km northwest (summer), respectively.

- There was no floating oil exposure to any of the receptors assessed.

- No shoreline accumulation was predicted above the low threshold (10-100 g/m^2) for this scenario.

- No KEF receptors were predicted to be exposed by entrained hydrocarbons at the low threshold. A total of 5 AMPs are within the low exposure zone for the summer and transitional results and the probability of exposure was between 1 – 2%. Rankin Bank was the only RSB predicted to be exposed by entrained hydrocarbons at the low threshold during transitional (2%) and winter (1%) conditions, while Imperieuse Reef was the only receptor exposed during summer conditions (1%).

- Argo-Rowley Terrace AMP was the only AMP to be exposed to dissolved hydrocarbons at the low threshold, with a probability of 1% predicted in summer conditions. And it took 8.17 days for exposure. No KEF or RSB receptors were predicted to be exposed by dissolved hydrocarbons at the low threshold.

Scenario 5: 1,800 m^3 surface release of HFO at the FPSO

- The maximum distance from the release location to the low (1-10 g/m^2), moderate (10-50 g/m^2) and high (≥ 50 g/m^2) floating oil exposure thresholds was 2,143.4 km west-northwest (transitional), 1,707.1 km west-northwest (winter) and 1,013.6 km west-southwest (transitional), respectively.

- The floating oil low exposure zone encompasses Nine AMPs are within the predicted zone of floating oil exposure (at the low threshold) during summer conditions, 6 for transitional and 5 for winter conditions. There are 14 RSBs within the low exposure zone across the 3 seasons and 13 during summer. The Imperieuse Reef recorded the highest probability of exposure at 20%, which occurred during transitional conditions, with the minimum time before exposure at 11.6 days. Floating oil was predicted to cross WA state waters during every season with probabilities of 12-69%.

- The probability of hydrocarbon accumulating on any shoreline at, or above, the low threshold (10-100 g/m^2) during summer, transitional and winter seasons was 72%, 31% and 16%, respectively. The minimum time for hydrocarbon accumulating at, or above, the low threshold was approximately 11.67 days and the maximum volume of oil ashore was 1,684.5 m^3. Broome recorded the highest probability of shoreline accumulation at the low threshold (45%) during summer conditions while the shortest time for hydrocarbon accumulating at the low threshold was predicted during transitional conditions (11.67 days at Imperieuse Reef).

- Three AMPs are within the entrained hydrocarbon low exposure zone for summer and 1 AMP (Montebello) during transitional conditions. Montebello AMP recorded the highest probability of exposure of 2%. No KEF receptors were predicted to be exposed by entrained hydrocarbons at the low threshold. was predicted at Rankin Bank only during transitional conditions with a probability of 2%. The quickest time before exposure was 7 days.

- No KEF or RSB receptors were predicted to be exposed by dissolved hydrocarbons at the low threshold.

Scenario 6: 10,108 m^3 surface release of crude from the FPSO

- The maximum distance from the release location to the low (≥ 1 g/m^2), moderate (≥ 10 g/m^2) and high (≥ 50 g/m^2) exposure thresholds was 361.3 km west, 152.3 km west-southwest and 151.5 km west-southwest, respectively, all during transitional conditions.

- Exposure at the low threshold was predicted at 1 AMP (Mermaid Reef) during only the summer season with a probability of 1% and a time of exposure of 24.5 days. Two RSB (Clerke Reef and Mermaid Reef) were exposed by floating oil only during summer conditions and the probability of exposure was 1% at both receptors. The shortest time before exposure was predicted at Clerke Reef, taking 12.71 days.

- No shoreline accumulation was predicted above the low threshold (10-100 g/m^2) for this scenario.

- Ten AMPs are within the entrained hydrocarbon low exposure zone across the three seasons, with the Montebello AMP recording the highest probability of exposure of 20% during winter conditions. Glomar Shoals was the only KEF exposed to entrained hydrocarbons at the low threshold during all 3 seasons with the probability varying from 21 to 24%. The Commonwealth waters adjacent to Ningaloo Reef KEF was the only other receptor exposed to entrained hydrocarbons at the low threshold during transitional conditions only (1% probability).

- Across the 3 seasons, 10 AMPs are within the dissolved hydrocarbon low exposure zone, with Argo-Rowley Terrace AMP recording the highest probability of exposure of 7% during transitional conditions. Dampier AMP was predicted to be exposed quickest at 4.13 days during transitional conditions. Glomar Shoals was the only KEF to be exposed by dissolved hydrocarbons at the low threshold with probabilities between 1 – 6%. Five RSB are within the low exposure zone across the three seasons, with the highest probability predicted at Clerke Reef during transitional conditions (6%).

1 INTRODUCTION

1.1 Background

Santos Limited (Santos) is planning the development of the Dorado Development located in the Bedout Basin offshore north-west Western Australia (WA), approximately 140 km north of Port Hedland. The Dorado Project targets the Dorado reservoir with hydrocarbons being collected on a wellhead platform (WHP) and pumped by infield flowlines for processing on a floating production storage and offloading (FPSO) facility. There is also potential for future development of surrounding fields within the Dorado Project Area.

The Dorado Development will be subject to regulatory assessment as an Offshore Project Proposal (OPP) in accordance with the requirements of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (OPGGS (E) Regulations), administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The OPP is required to assess all environmental impacts and risks arising from planned and unplanned activities associated with the project appropriate to the nature and scale of each impact or risk.

To suitably inform the impact assessment and support the preparation of the OPP, CDM Smith (on behalf of Santos) has commissioned RPS to undertake a detailed oil spill modelling study.

Santos identified six worst-case credible hydrocarbon spill scenarios that may be associated with the Dorado project:

- Scenario 1: An uncontrolled subsea blowout of crude at the WHP over 14 weeks, releasing a total 12,779,600 bbl (2,031,794 m^3) with a decreasing discharge rate;
- Scenario 2: An uncontrolled surface blowout of crude at the WHP over 14 weeks, releasing a total 12,779,600 bbl (2,031,794 m^3) with a decreasing discharge rate;
- Scenario 3: A 1,080 m^3 subsea release of crude over 1 hour from the export pipeline, between the FPSO and WHP;
- Scenario 4: An instantaneous surface release of 225 m^3 of crude at the FPSO due to an offtake incident;
- Scenario 5: A tanker colliding with the FPSO and the tanker instantly releasing 1,800 m^3 of heavy fuel oil (HFO) at the surface; and
- Scenario 6: An instantaneous surface release of 10,108 m^3 of crude to represent the loss of contents from the FPSO storage tank.

The coordinates of the release locations are presented in Table 1.1 and graphically in Figure 1.1

Each scenario was modelled and assessed over defined seasonal periods: summer (October to March), winter (May to August) and transitional (April and September).

The purpose of the modelling is to further improve the understanding of a conservative ‘outer envelope’ of the potential area that may be affected in the unlikely event of a hydrocarbon release event. The modelling does not take into consideration any of the spill prevention, mitigation and response capabilities that would be implemented in response to the spill. Therefore, the modelling results represent the maximum extent that the released hydrocarbons may influence based on 300 different spill simulations combined. To understand the potential area that might be affected during an isolated (single) spill event, the results for single simulations were also presented.

The spill modelling was performed using an advanced three-dimensional trajectory and fates model; Spill Impact Model Application Program (SIMAP). The SIMAP model calculates the transport, spreading, entrainment and evaporation of spilled hydrocarbons over time, based on the prevailing wind and current conditions and the physical and chemical properties.

Note that the oil spill model, the method and analysis presented herein uses modelling algorithms which have been anonymously peer reviewed and published in international journals. Furthermore, RPS warrants that this work meets and exceeds the American Society for Testing and Materials (ASTM) Standard F2067-13 "*Standard Practice for Development and Use of Oil Spill Models*".

Table 1.1 Coordinates of the Dorado Development hydrocarbon spill modelling release locations.

Scenario	Location	Latitude	Longitude	Water depth (m)
1, 2	WHP	19° 01' 38.001" S	118° 44' 36.744" E	91
4, 5, 6	FPSO (2.2 km directly south of the WHP)	19° 02' 49.546" S	118° 44' 36.744" E	90
3	Export pipeline release location (point between the WHP and FPSO)	19° 02' 13.773" S	118° 44' 36.744" E	90.5

The WGS84 Geographic projection is used throughout the report.

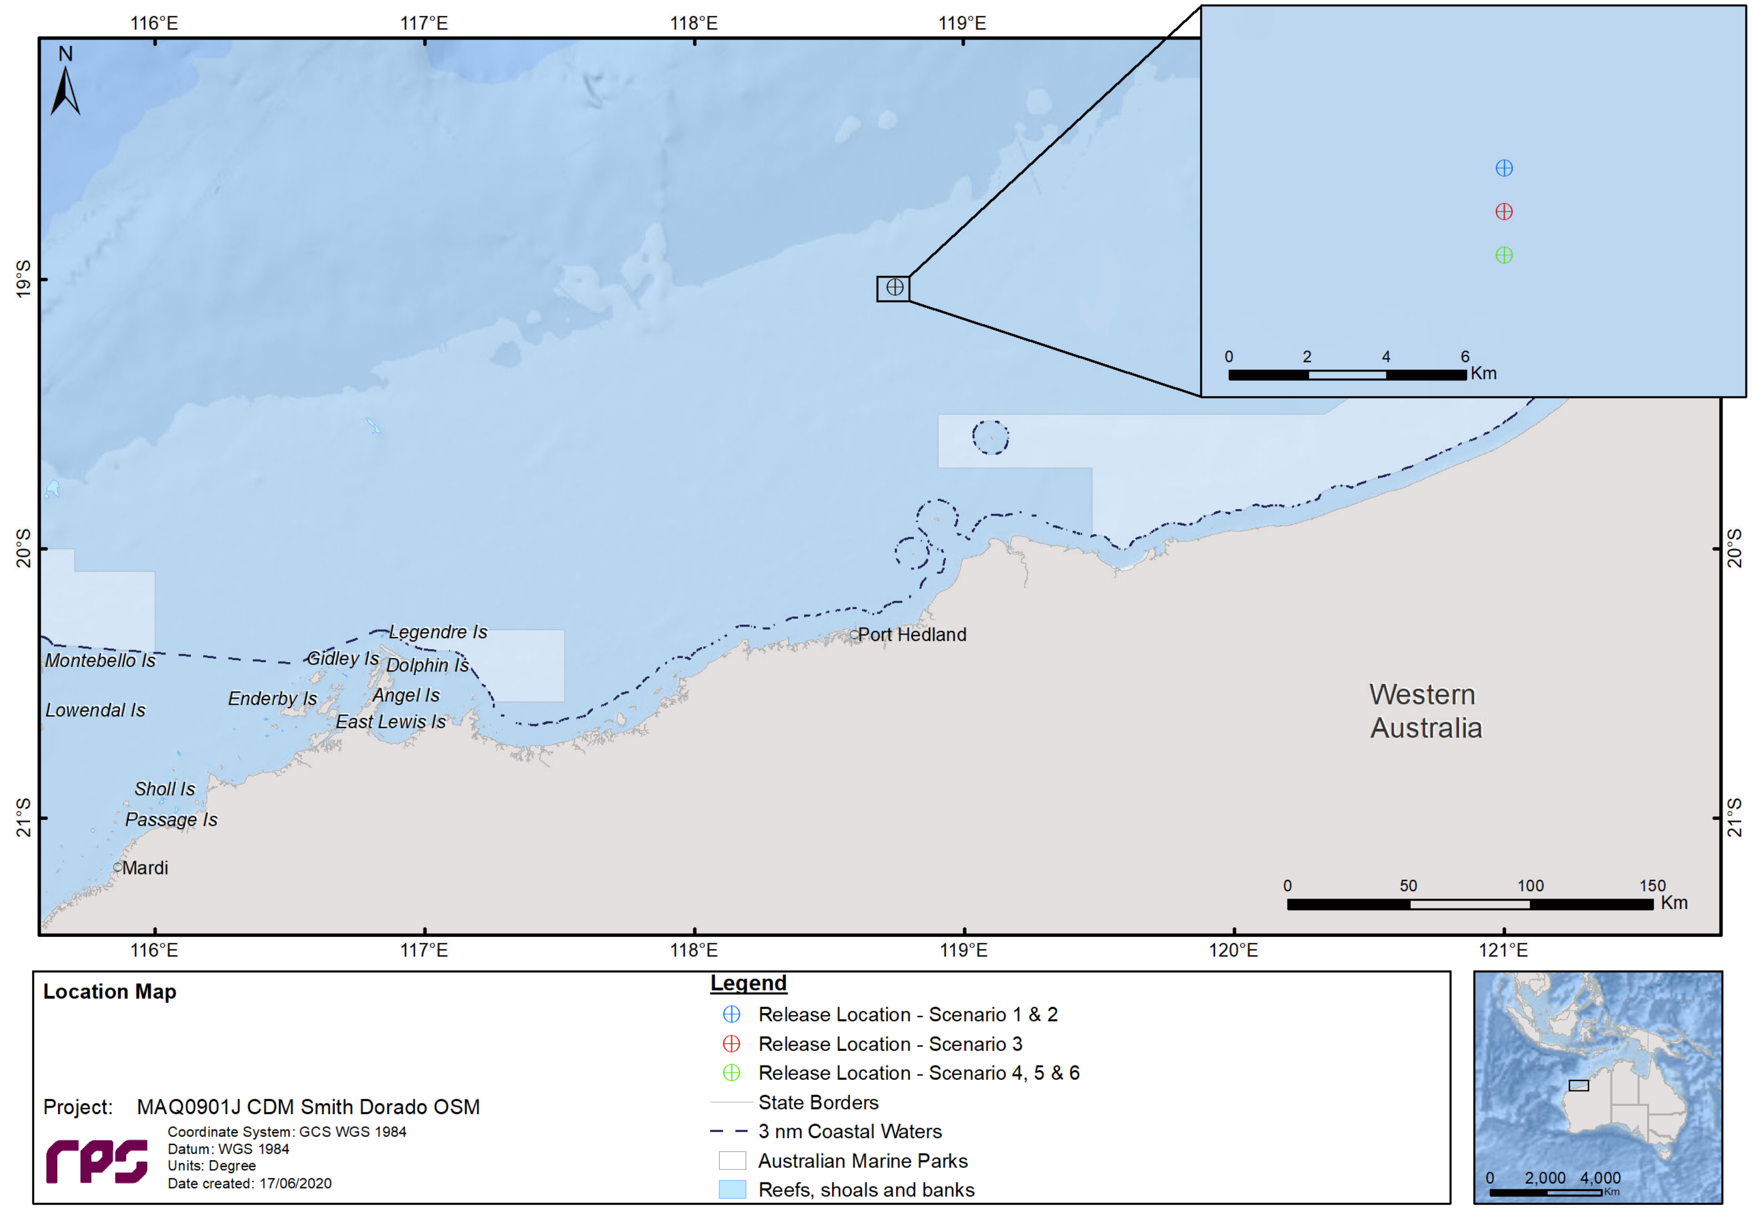

Figure 1.1 Map of the Dorado Development oil spill modelling release locations.

1.2 What is Oil Spill Modelling?

Oil spill modelling is a valuable tool widely used for risk assessment, emergency response and contingency planning where it can be particularly helpful to proponents and decision makers. By modelling a series of the most likely oil spill scenarios, decisions concerning suitable response measures and strategic locations for deploying equipment and materials can be made, and the locations at most risk can be identified. The two types of oil spill modelling often used are stochastic and deterministic modelling.

1.2.1 Stochastic Modelling (Multiple Spill Simulations)

Stochastic modelling involves running numerous individual oil spill simulations to provide insight into the potential area of effect using a range of prevailing wind and current conditions that are historically representative of the location of where the spill event may occur. As part of this study, 300 oil spills were simulated for each scenario using the same spill information (release location, spill volume, duration and oil type) but with varied start dates and times corresponding to the period represented by the available wind and current data. Each season is represented by 100 spill scenarios. Once the simulations were complete, the results were overlaid (NOPSEMA, 2018, Figure 1.2) to understand the range of environments that could be influenced or impacted by a spill (the Environment that May Be Affected - EMBA).

- Exposure load (concentrations and volumes);
- Minimum time before exposure;
- Probability of accumulation above defined concentrations;
- Volume of oil that may strand on shorelines from any single simulation;
- Concentration that might occur on sections of individual shorelines;
- Exposure (instantaneous or over a specified time window) to dissolved hydrocarbons in the water column; and
- Exposure (instantaneous or over a specified time window) to entrained hydrocarbons in the water column.

The EMBA that is presented and interrogated in this assessment for the spill scenarios presents the combined boundary of all 300 spill scenarios (each being a “deterministic” run). Each single spill is independent of the other, and will extend within the EMBA (which is all the spills combined).

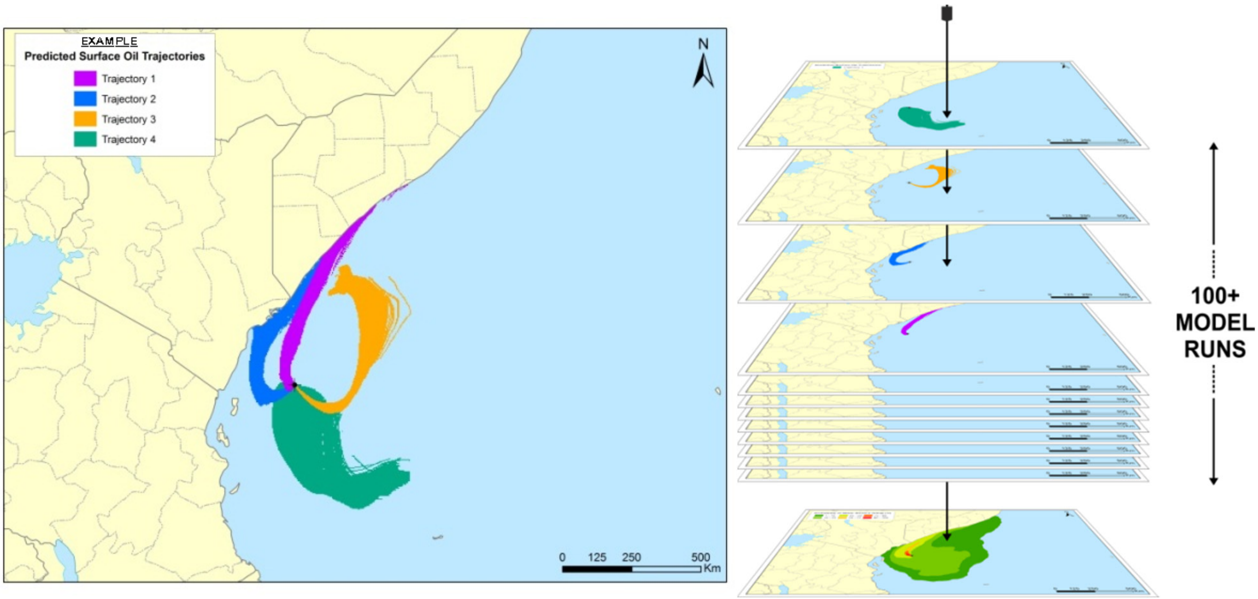

Figure 1.2 Examples of spill trajectories predicted by SIMAP for the same scenario. The frequency of contact with given locations is used to calculate the probability of impacts during a spill. Essentially, all model runs are overlain (shown as the stacked runs on the right) and the number of times that trajectories contact a given location at a concentration is used to calculate the probability.

1.2.2 Deterministic Modelling (Single Spill Simulation)

Deterministic modelling is the predictive modelling of a single incident subject to a single sample of wind and weather conditions over time (NOPSEMA, 2018; Figure 1.3).

Deterministic modelling is often paired with stochastic modelling to place the large stochastic footprint into perspective. This deterministic analysis is generally a single run selected from the stochastic analysis and serves as the basis for developing the plans and equipment needs for a realistic spill response.

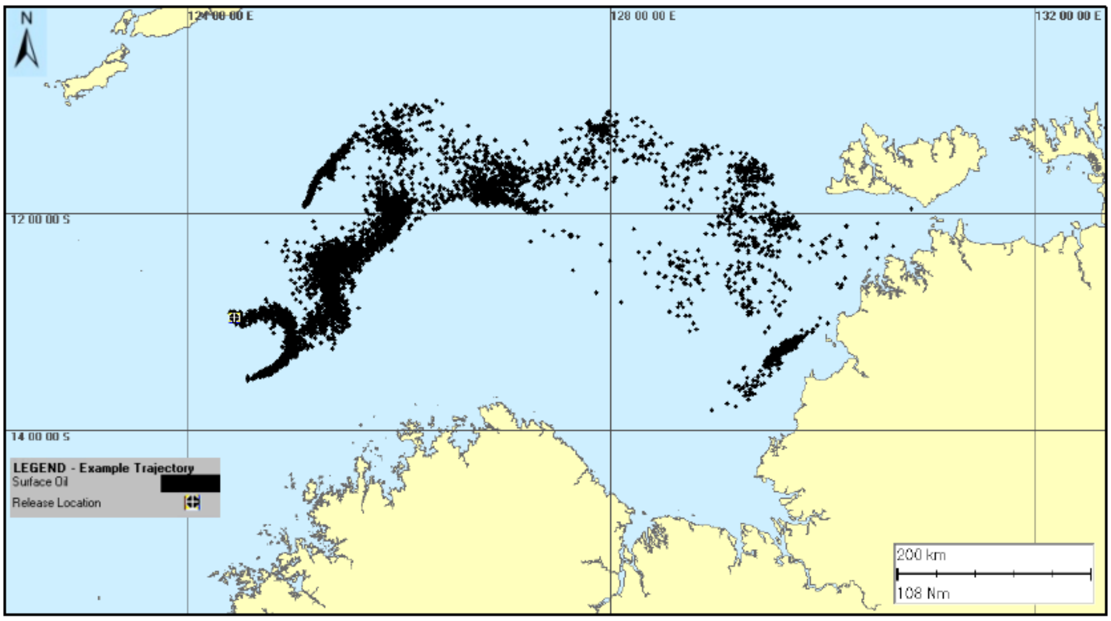

Figure 1.3 Example of an individual spill simulations predicted by SIMAP for a spill scenario.

2 SCOPE OF WORK

The scope of work included the following components:

1. Generate ten years (2009 to 2018 (inclusive)) wind and current data. The three-dimensional current data includes the combined influence of ocean and tidal currents;

2. Confirm the suitability of the generated current data by comparing it against measurements within the Dorado project area, collected over a 2-month period (January and February 2018), using quantitative and visual comparisons at water depths of 40 m, 70 m and 110 m;

3. Use 10 years of high-resolution wind, aggregated current data and hydrocarbon characteristics as input into the 3-dimensional oil spill model to represent the movement, spreading, entrainment and weathering of the oil over time;

4. Use SIMAP's stochastic model to calculate exposure to surrounding waters (sea surface and water column) and accumulation on shorelines. This involved running 100 randomly selected single simulations for each season (i.e. 300 simulations per scenario), with each simulation having the same spill information (spill volume, duration and composition of hydrocarbons) but varying start times. This will ensure that each spill is subjected to unique wind and current conditions.

5. Combine the 100 spill trajectories per season to determine the exposure by floating oil and in the water column, in addition to accumulation on shorelines (for a defined low, moderate and high threshold); and

6. For the scenarios (1, 2 and 5) resulting in shoreline accumulation above impact thresholds, the "worst case" deterministic runs were identified and presented based on the following criteria:

    a. Largest volume of oil ashore; and

    b. Longest length of shoreline upon which oil was predicted to accumulate.

7. For the scenarios (3, 4 and 6) where there was no shoreline accumulation above impact thresholds, the "worst case" deterministic runs were identified and presented based on the following criteria:

    a. Largest swept area of floating oil on the sea surface above 50 g/m^2 (high or actionable floating oil threshold); and

    b. Largest area of entrained hydrocarbon exposure above 10 ppb (low threshold).

3 REGIONAL OCEAN CURRENTS

3.1 Overview

The area of interest for this study is typified by strong tidal flows over the shallower regions, particularly along the inshore region (< 100 m water depth). However, the offshore regions with water depths exceeding 100-200 m experience significant large-scale drift currents. These drift currents can be relatively strong (1-2 knots) and complex, manifesting as a series of eddies, meandering currents and connecting flows. These offshore drift currents also tend to persist longer (days to weeks) than tidal current flows (hours between reversals) and thus will have an influence upon the net trajectory of discharges over time scales exceeding a few hours.

Wind shear on the water surface also generates local-scale currents that can persist for extended periods (hours to days) and result in long trajectories. Hence, the current-induced transport of plumes can be variably affected by combinations of tidal, wind-induced and density-induced drift currents. Depending on their local influence, it is important to consider all these potential advective mechanisms to rigorously understand patterns of potential transport from a given discharge location. A comprehensive description of the circulation patterns of the Northwest Shelf is provided in a review by Condie and Andrewartha (2008).

To appropriately allow for temporal and spatial variation in the current field, dispersion modelling requires the current speed and direction over a spatial grid covering the potential migration zone of plumes. Estimates of the net currents were derived by combining predictions of the drift currents, available from a mesoscale ocean model (HYCOM), with estimates of the tidal currents generated by an RPS model set up for the study area (HYDROMAP).

3.1.1 Ocean Currents

The large scale drift currents were derived from the output of the global circulation model the Hybrid Coordinate Ocean Model (HYCOM; Bleck, 2002; Chassignet et al., 2007, 2009), created by the National Ocean Partnership Program (NOPP), as part of the US Global Ocean Data Assimilation Experiment (GODAE). The HYCOM model is a three-dimensional model that assimilates ocean observations of sea surface temperature, sea surface salinity and surface height, obtained by satellite observations, along with atmospheric forcing conditions from atmospheric models to predict drift currents generated by such forces as wind shear, density and sea height variations and the rotation of the earth.

The HYCOM model is configured to combine the three vertical coordinate types currently in use in ocean models: depth (z-levels), density (isopycnal layers), and terrain-following (σ-levels). HYCOM uses isopycnal layers in the open, stratified ocean, but uses the layered continuity equation to make a dynamically smooth transition to a terrain-following coordinate in shallow coastal regions, and to z-level coordinates in the mixed layer and/or unstratified seas. Thus, this hybrid coordinate system allows for the extension of the geographic range of applicability to shallow coastal seas and unstratified parts of the world ocean. It maintains the significant advantages of an isopycnal model in stratified regions while allowing more vertical resolution near the surface and in shallow coastal areas, hence providing a better representation of the upper ocean physics. The model has global coverage with a horizontal resolution of $1/12^{th}$ of a degree (approximately 7 km at mid-latitudes) and a temporal resolution of one day.

A hindcast data set of HYCOM currents was obtained for a ten-year period spanning 2009 to 2018 (inclusive).

3.1.2 Tidal Currents

3.1.2.1 Description of Tidal Model: HYDROMAP

As the HYCOM model does not include tidal forcing, and because the data is only available at a daily frequency, a tidal model was developed for the study region using RPS' three-dimensional hydrodynamic model, HYDROMAP.

The model formulations and output (current speed, direction and sea level) of this model have been validated through field measurements around the world for more than 25 years (Isaji & Spaulding, 1984; Isaji et al., 2001; Zigic et al., 2003). HYDROMAP current data has also been widely used as input to forecasts and hindcasts of oil spill migrations in Australian waters. This modelling system forms part of the National Marine Oil Spill Contingency Plan for the Australian Maritime Safety Authority (AMSA) (AMSA, 2002).

HYDROMAP simulates the flow of ocean currents within a model region due to forcing by astronomical tides, wind stress and bottom friction. The model employs a sophisticated dynamically nested-gridding strategy, supporting up to six levels of spatial resolution within a single domain. This allows for higher resolution of currents within areas of greater bathymetric and coastline complexity, or of particular interest to a study.

The numerical solution methodology of HYDROMAP follows that of Davies (1977a, 1977b) with further developments for model efficiency by Owen (1980) and Gordon (1982). A more detailed presentation of the model can be found in Isaji & Spaulding (1984).

3.1.2.2 Tidal Grid Setup

A HYDROMAP model was established over a domain that extended approximately 3,870 km east-west by 3,220 km north-south over the eastern Indian Ocean. Figure 3.1 shows a subset of the grid between Exmouth and Derby.

The tidal domain is sub-gridded down to a resolution of 500 m for shallow and coastal regions, starting from an offshore (or deep water) resolution of 8 km. The finer grids were allocated in a step-wise fashion to resolve flows more accurately along the coastline, around islands and over more complex bathymetry.

Bathymetric data used to define the three-dimensional shape of the study domain was extracted from the CMAP electronic chart database and supplemented where necessary with manual digitisation of chart data supplied by the Australian Hydrographic Office (see Figure 3.2). Depths in the domain ranged from shallow intertidal areas through to approximately 7,200 m.

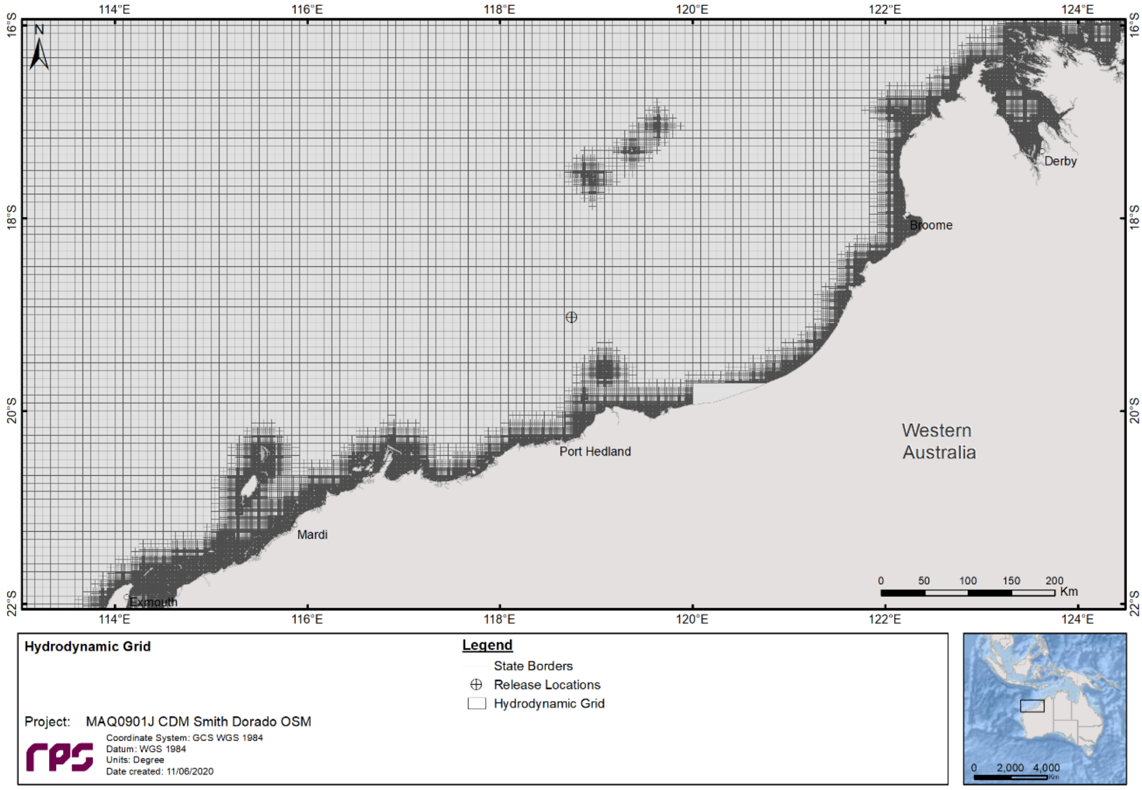

Figure 3.1 Subset of the model grid (grey wire mesh) used to generate the tidal currents. Higher-resolution areas are indicated by the denser mesh zones.

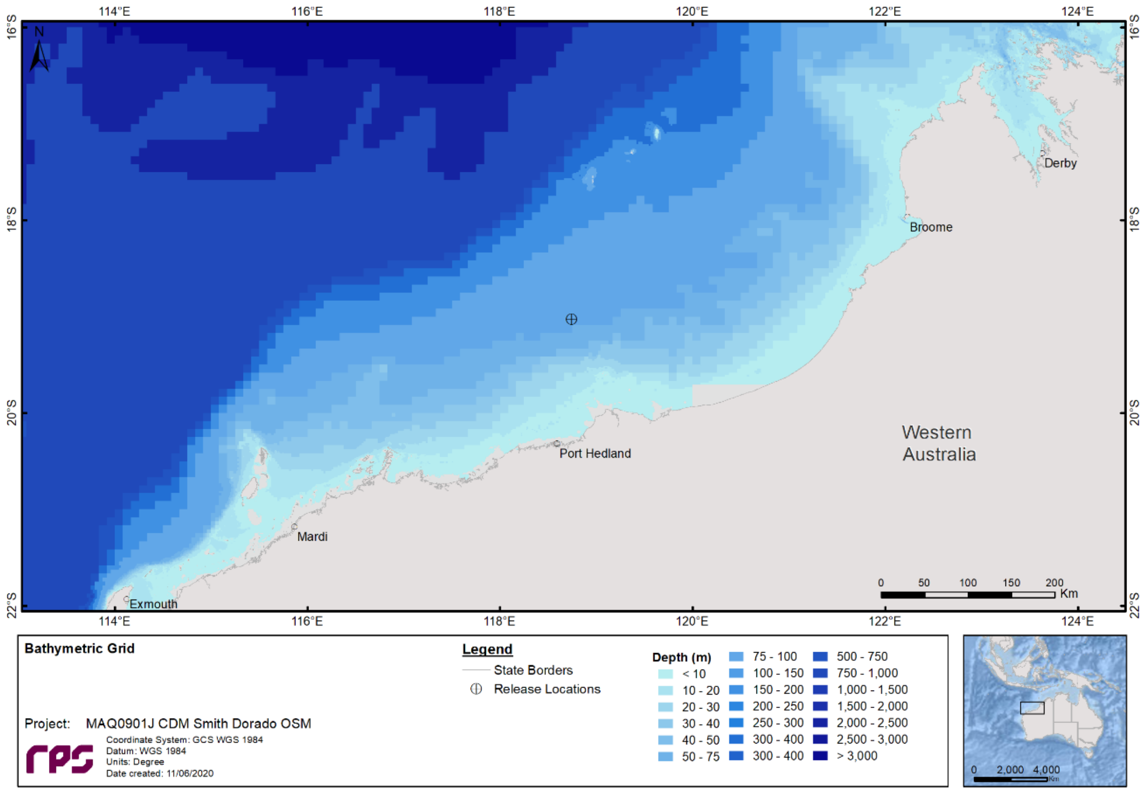

Figure 3.2 Subset of the bathymetry data used to generate the tidal currents.

3.1.2.3 Tidal Boundary Conditions

Ocean boundary data for the HYDROMAP model was obtained from the TOPEX/Poseidon global tidal database (TPXO7.2) of satellite-measured altimetry data, which provided estimates of tidal amplitudes and phases for the eight dominant tidal constituents (designated as K2, S2, M2, N2, K1, P1, O1 and Q1) at a horizontal scale of approximately 0.25°. Using the tidal data, sea surface heights are firstly calculated along the open boundaries at each time step in the model.

The TOPEX/Poseidon satellite data is produced, and quality controlled by the US National Atmospheric and Space Agency (NASA). The satellites, equipped with two highly accurate altimeters capable of taking sea level measurements accurate to less than ±5 cm, measured oceanic surface elevations (and the resultant tides) for over 13 years (1992–2005). In total, these satellites carried out more than 62,000 orbits of the planet. The TOPEX/Poseidon tidal data has been widely used amongst the oceanographic community, being the subject of more than 2,100 research publications (e.g. Andersen, 1995; Ludicone et al., 1998; Matsumoto et al., 2000; Kostianoy et al., 2003; Yaremchuk & Tangdong, 2004; Qiu & Chen, 2010). As such, the TOPEX/Poseidon tidal data is considered suitably accurate for this study.

3.1.2.4 Tidal Model Elevation Validation

To ensure that tidal predictions were accurate, predicted surface elevations were compared to data observed at five locations (see Figure 3.3).

Figure 3.4 and Figure 3.5 illustrate a comparison of the predicted and observed surface elevations for each location for January 2014. As shown on the graphs, the model accurately reproduced the phase and amplitudes throughout the spring and neap tidal cycles.

To provide a statistical measure of the model performance, the Index of Agreement (IOA – Willmott, 1981) and the Mean Absolute Error (MAE – Willmott, 1982; Willmott and Matsuura, 2005) were used.

The MAE is simply the average of the absolute values of the difference between the model-predicted (P) and observed (O) variables. It is a more natural measure of the average error (Willmott and Matsuura, 2005) and more readily understood.

$$MAE = N^{-1} \sum_{i=1}^{N} |P_i - O_i|$$

The Index of Agreement (IOA) is determined by:

$$IOA = 1 - \frac{\sum |X_{model} - X_{obs}|^2}{\sum (|X_{model} - \overline{X_{obs}}| + |X_{obs} - \overline{X_{obs}}|)^2}$$

Where: X represents the variable being compared and the time mean of that variable. A perfect agreement exists between the model and field observations if the index gives an agreement value of 1 and complete disagreement will produce an index measure of 0 (Willmott, 1981). Willmott et al. (1985) also suggests that values meaningfully larger than 0.5 represent good model performance. Clearly, a greater IOA and lower MAE represent a better model performance.

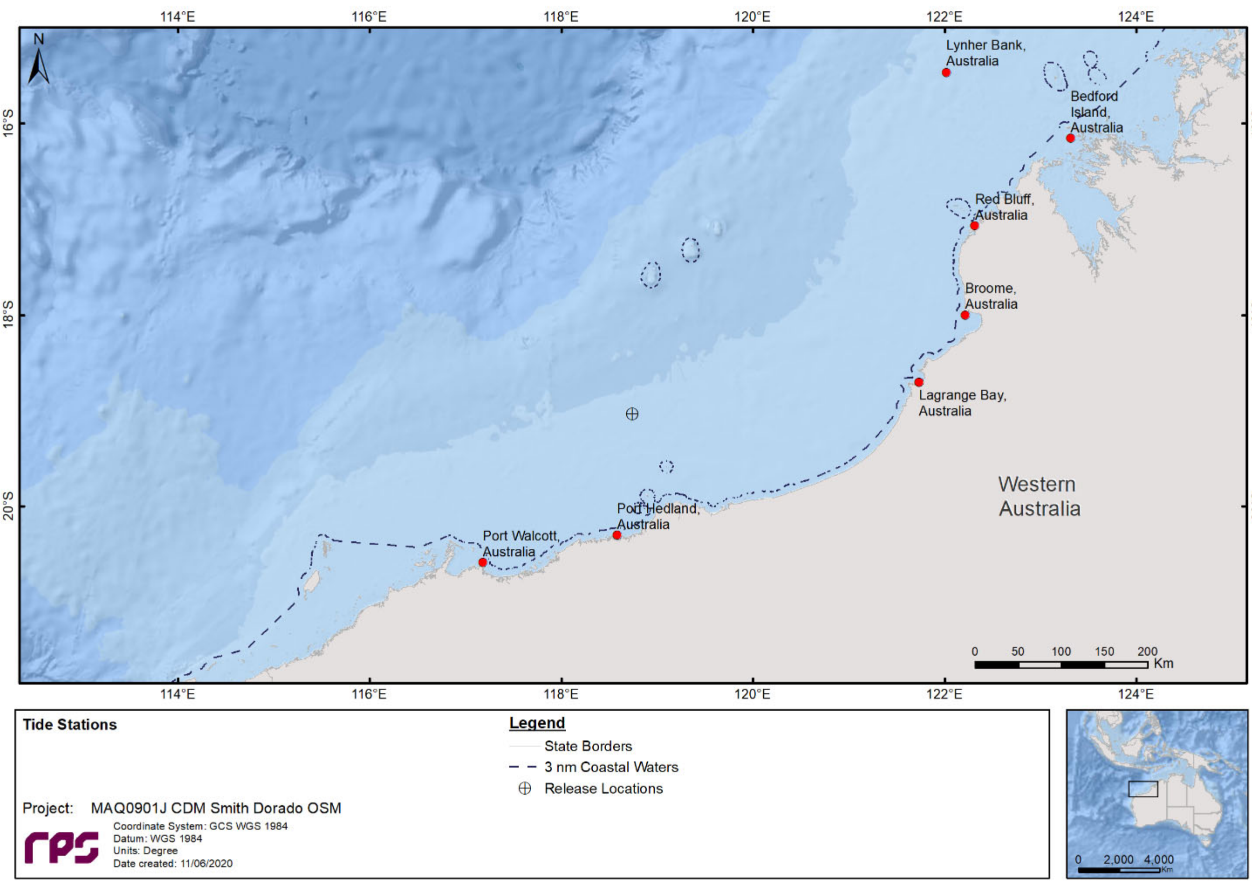

Figure 3.3 Tide stations used to validate surface elevation within the model.

Table 3.1 Statistical comparison between the observed and predicted surface elevations.

Tide Station	IOA	MAE (m)
Broome	0.90	1.11
Lagrange Bay	0.96	0.71
Lynher Bank	0.98	0.31
Port Hedland	0.98	0.33
Port Walcott	0.99	0.20
Red Bluff	0.98	0.46

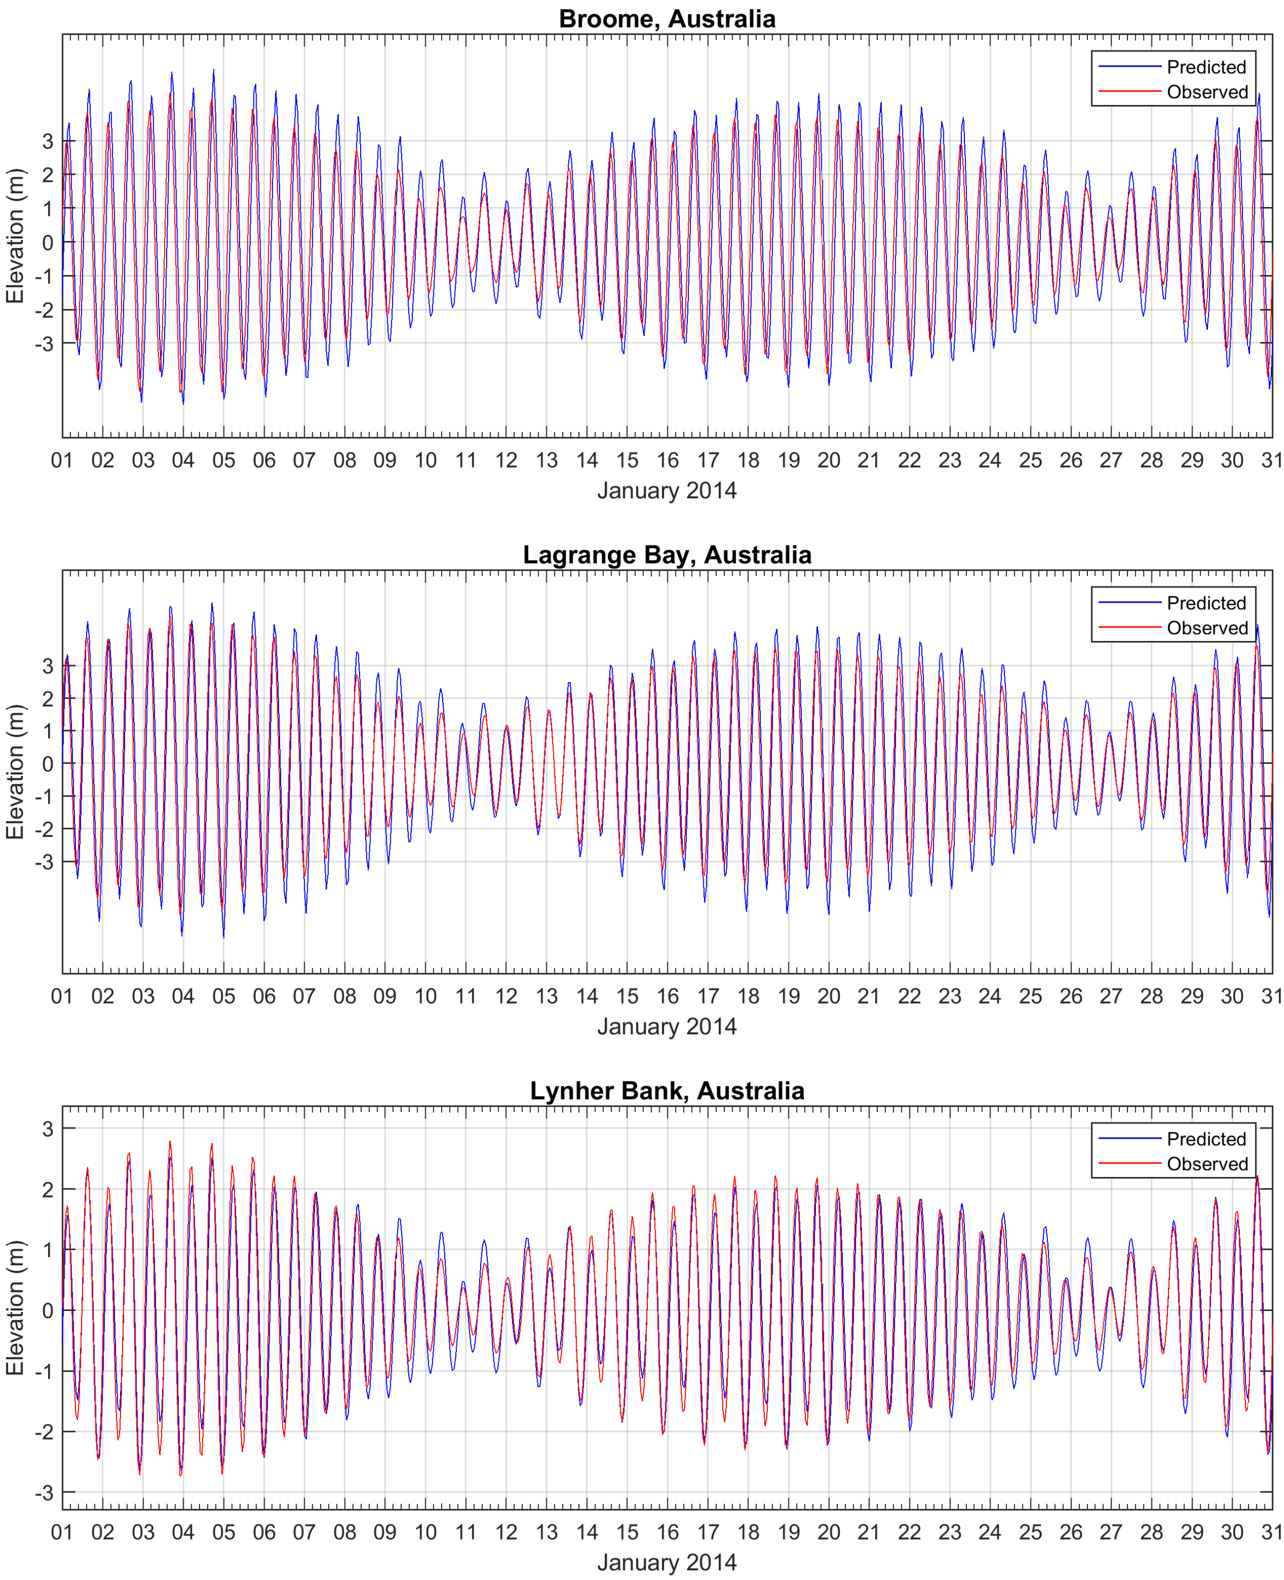

Figure 3.4 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

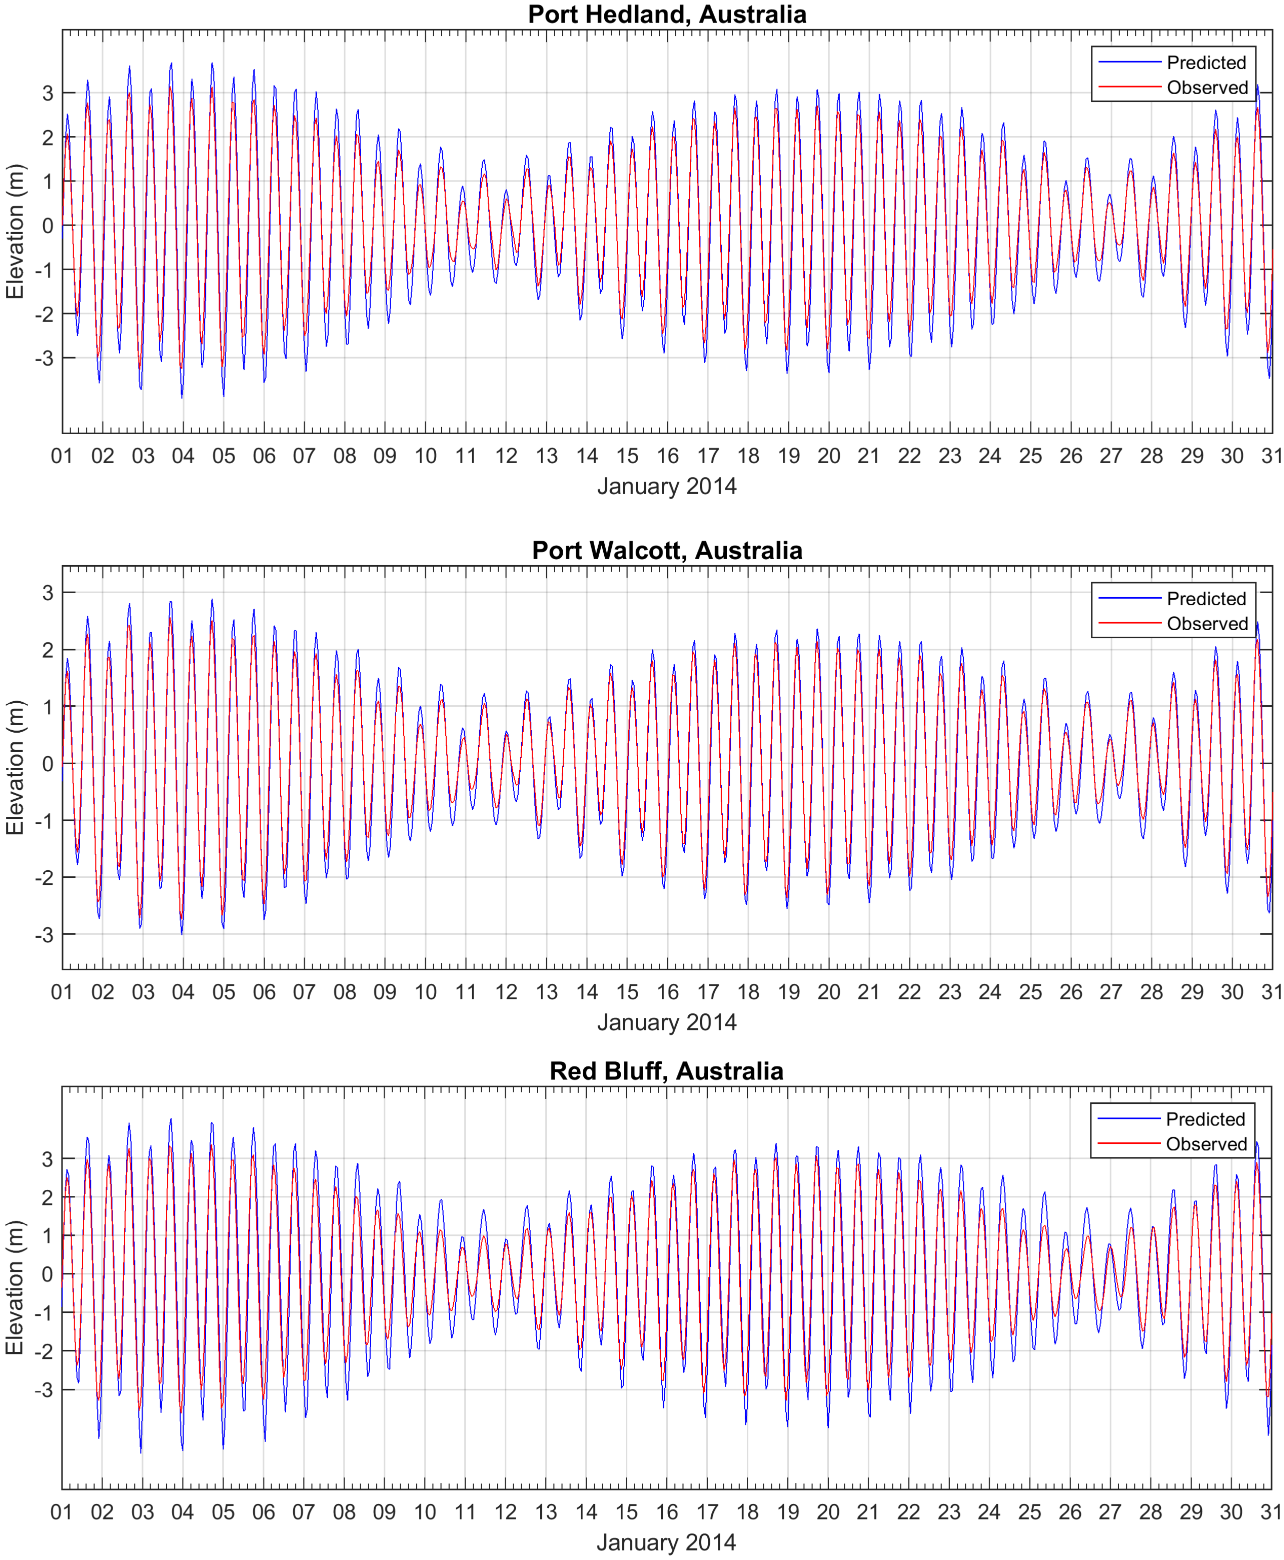

Figure 3.5 Comparison between HYDROMAP predicted (blue line) and observed (red line) surface elevation.

3.1.3 Current Model Validation

To confirm the suitability of the generated current data, it was compared against current measurements within the Dorado project area, using quantitative and visual comparisons at a range of depths.

Time series comparisons of the predicted and measured current speed and direction components at water depths of 40 m, 70 m and 110 m are presented in Figure 3.6, Figure 3.7 and Figure 3.8, respectively, for a two month period (January and February 2018). The time series comparisons reveal that the predicted currents offer a good match with the measured current speed and direction components at all water depths, with the magnitudes and timings of the peaks and troughs matching well.

To provide a statistical quantification of the model accuracy, comparisons were performed by determining the deviations between the predicted and measured data. As such, the root-mean square error (RMSE), root-mean square percentage (RMS %) and relative mean absolute error (RMAE) were calculated. Qualification of the RMAE ranges are reported in accordance with Walstra et al. (2001). The RMAE is relatively low in all depth layers indicating that the magnitude and range of current speeds match well, however, a slight overprediction of the predicted current magnitude is evident at times.

To compare directionality, roses for the predicted and measured currents at 40 m, 70 m and 110 m water depths over the full measurement period are shown in Figure 3.9. The roses show that the predicted current direction is a good match with the measured direction. Both the predicted model direction and the measured data direction were in good alignment at each depth layer, portraying a dominant current direction along a northwest/southeast axis. The range and variability in the measured current direction is captured by the composite model data, which matches best with the measured data at the water depth of 110 m.

Based on the validation performance, the composite model data set is a good model of standard conditions at the Dorado Project area and will adequately resolve local and regional circulation patterns. As such, the model is considered suitable for use in the numerical modelling studies conducted as part of the Dorado Project.

Table 3.2 Statistical comparison of predicted (HYDROMAP+HYCOM) and observed current speeds and directions at various depths at the Dorado Project area (January and February 2018).

Depth (m BMSL)	RMSE (m/s)	Measured peak value (m/s)	RMSE (%)	RMAE qualification
40 m	0.26	0.71	36.7	Good
70 m	0.26	0.80	29.9	Very good
110 m	0.26	0.85	27.9	Very good

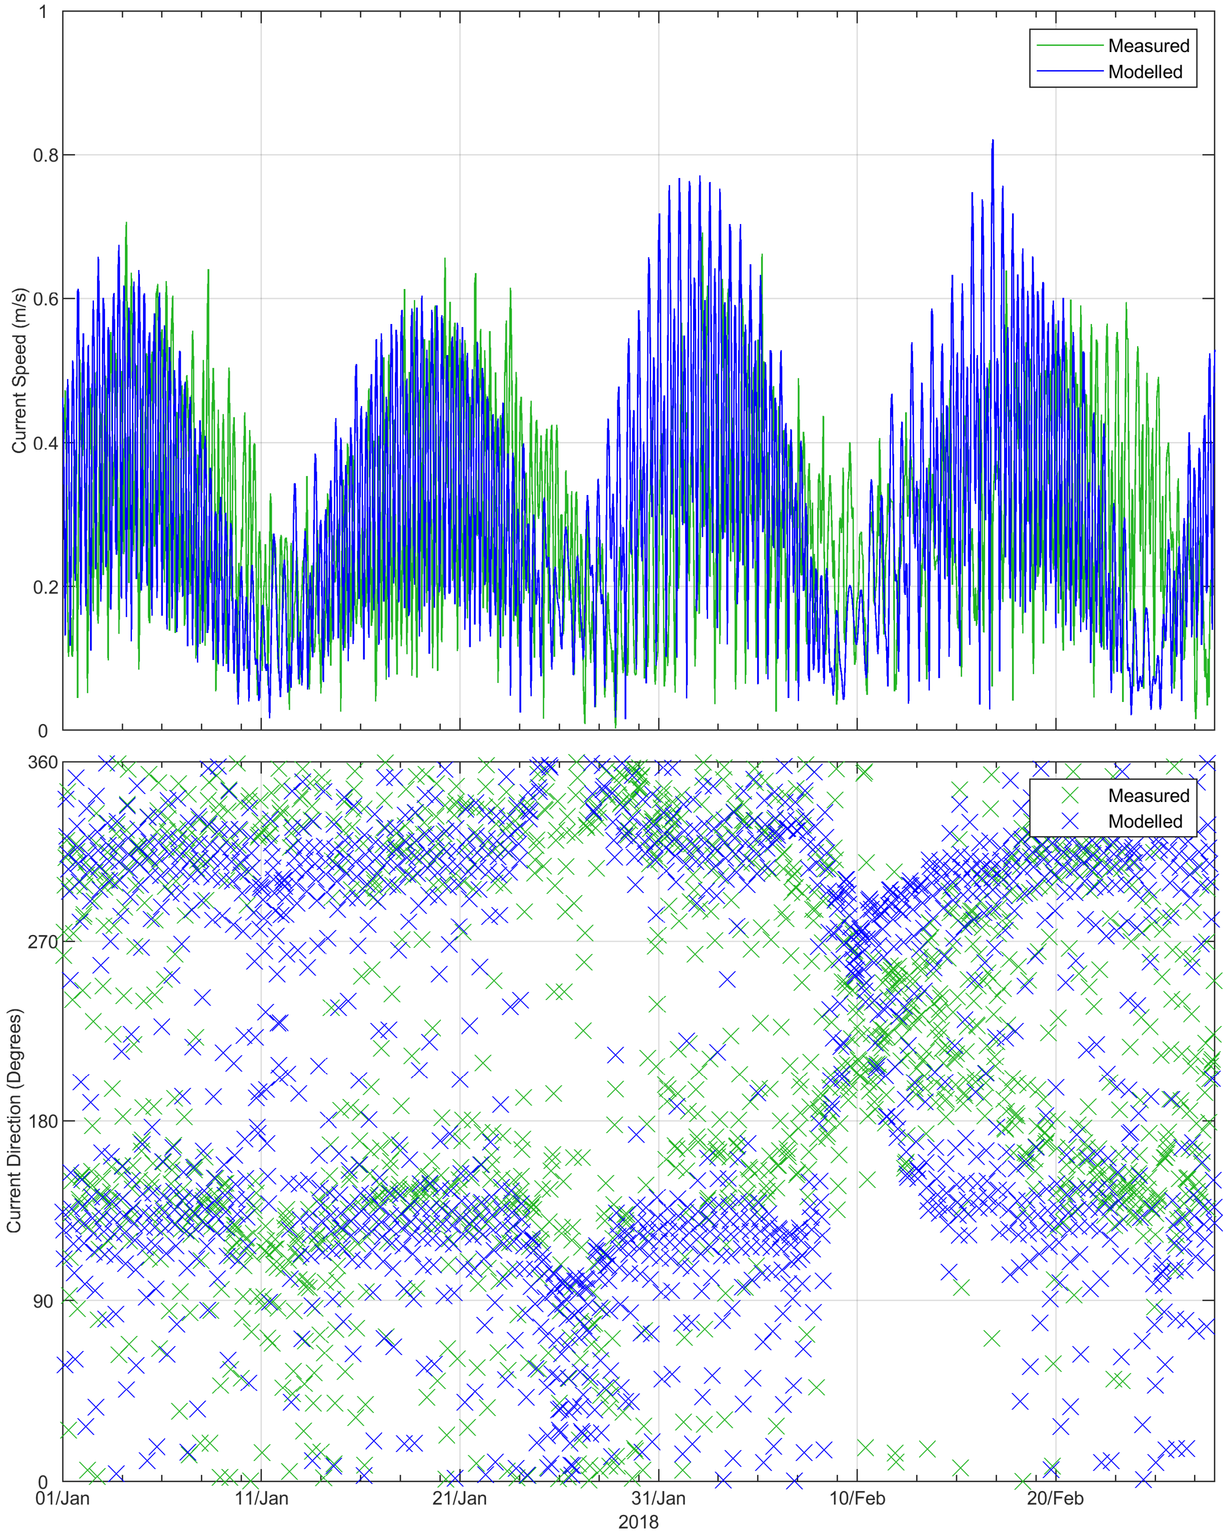

Figure 3.6 Time series comparisons between predicted (HYDROMAP+HYCOM, blue line) and measured (green line) current speeds (top) and current directions (bottom) at the Dorado Project area at a depth of approximately 40 m for January and February 2018.

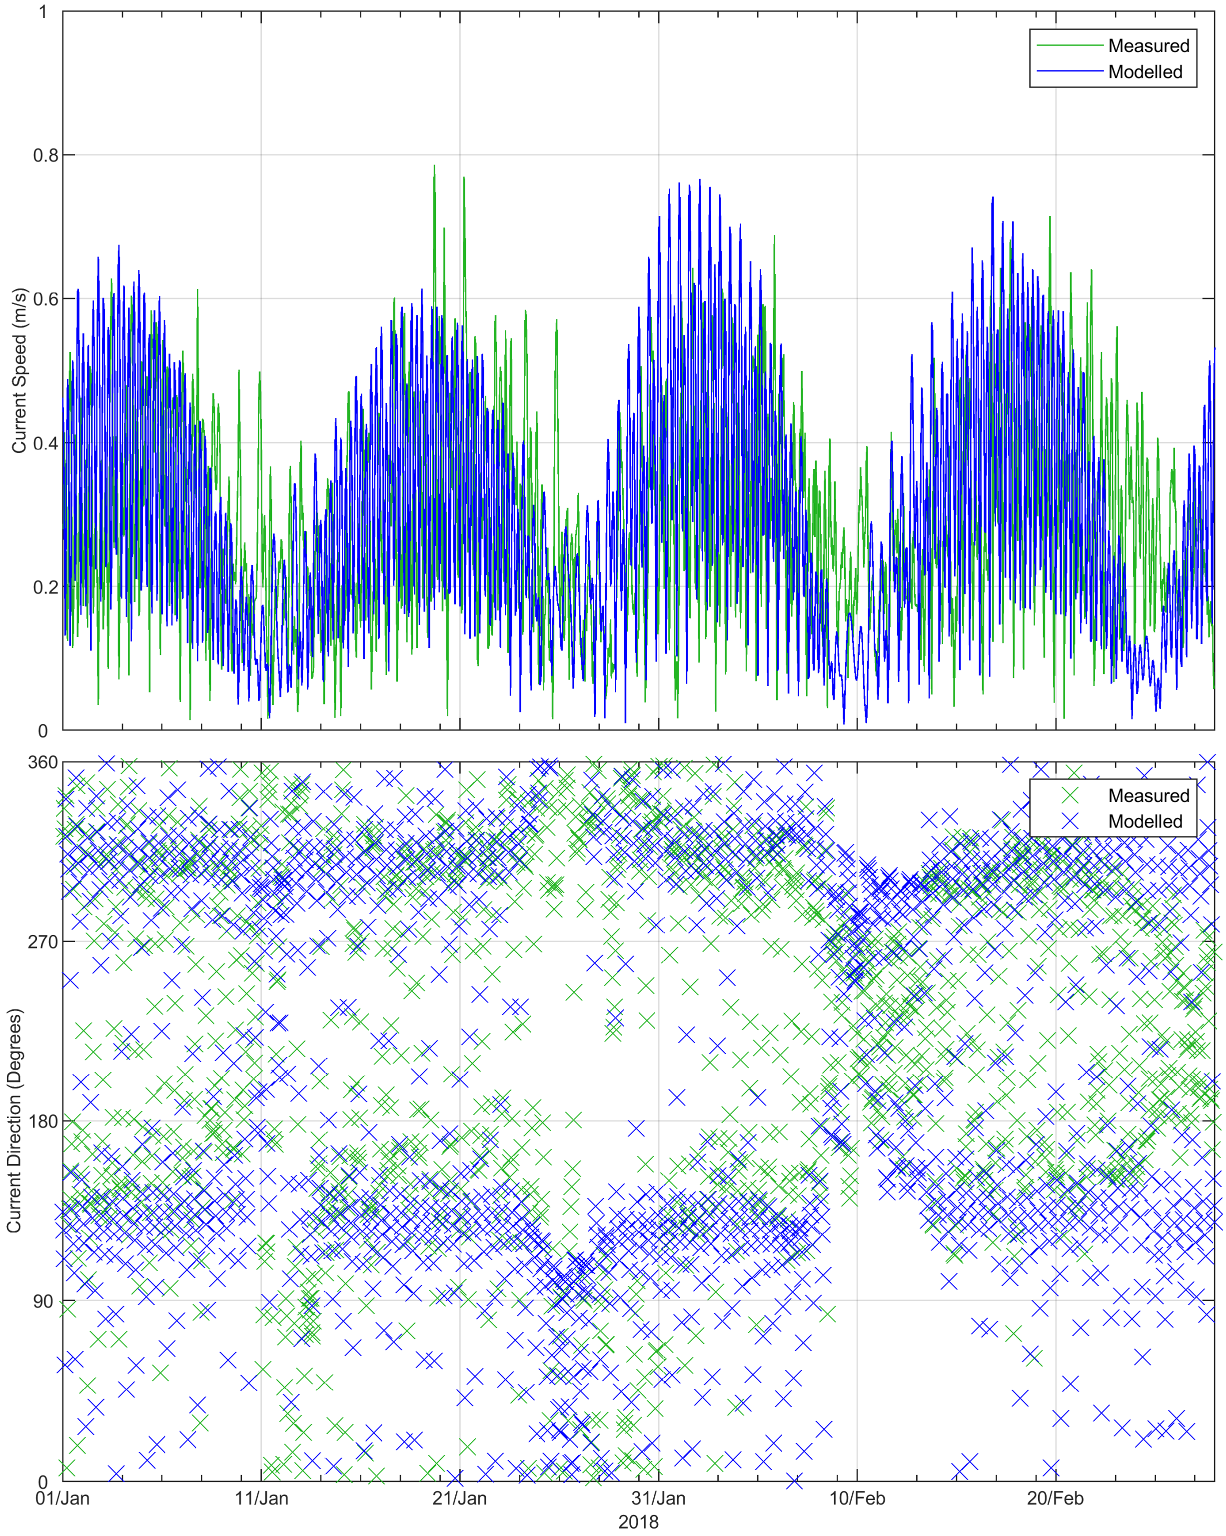

Figure 3.7 Time series comparisons between predicted (HYDROMAP+HYCOM, blue line) and measured (green line) current speeds (top) and current directions (bottom) at the Dorado Project area at a depth of approximately 70 m for January and February 2018.

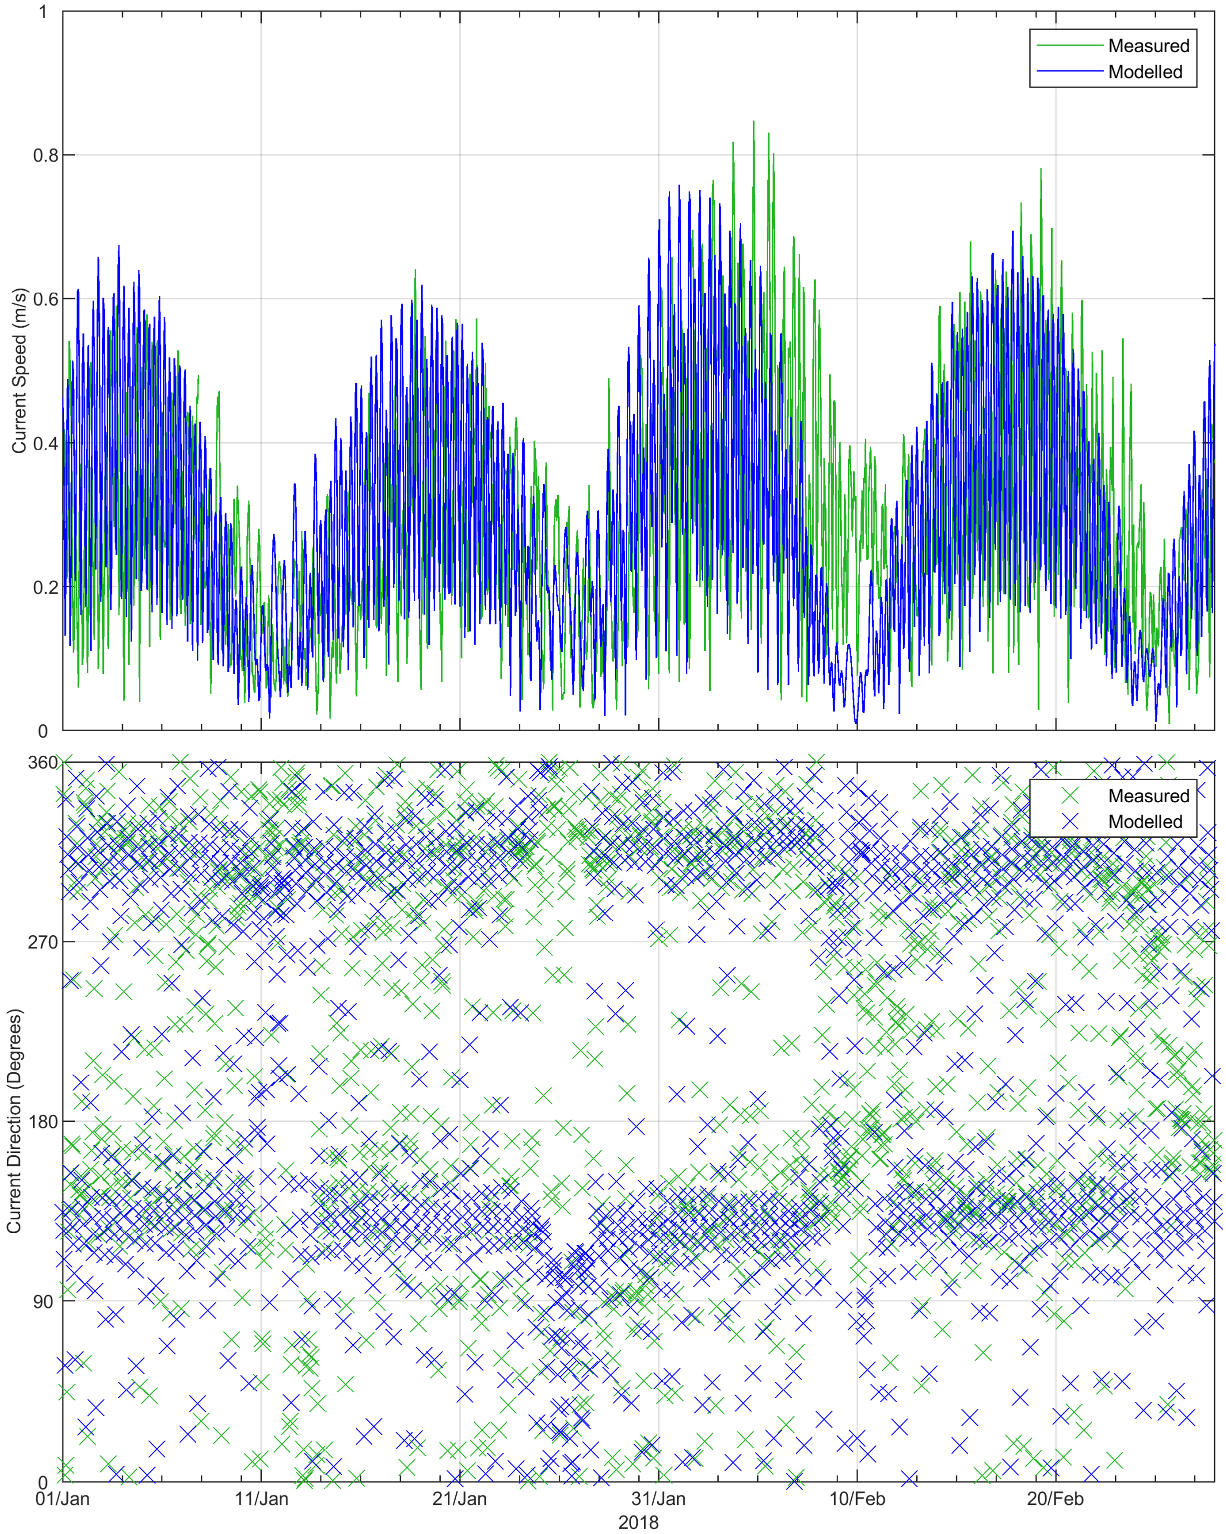

Figure 3.8 Time series comparisons between predicted (HYDROMAP+HYCOM, blue line) and measured (green line) current speeds (top) and current directions (bottom) at the Dorado Project area at a depth of approximately 110 m for January and February 2018.

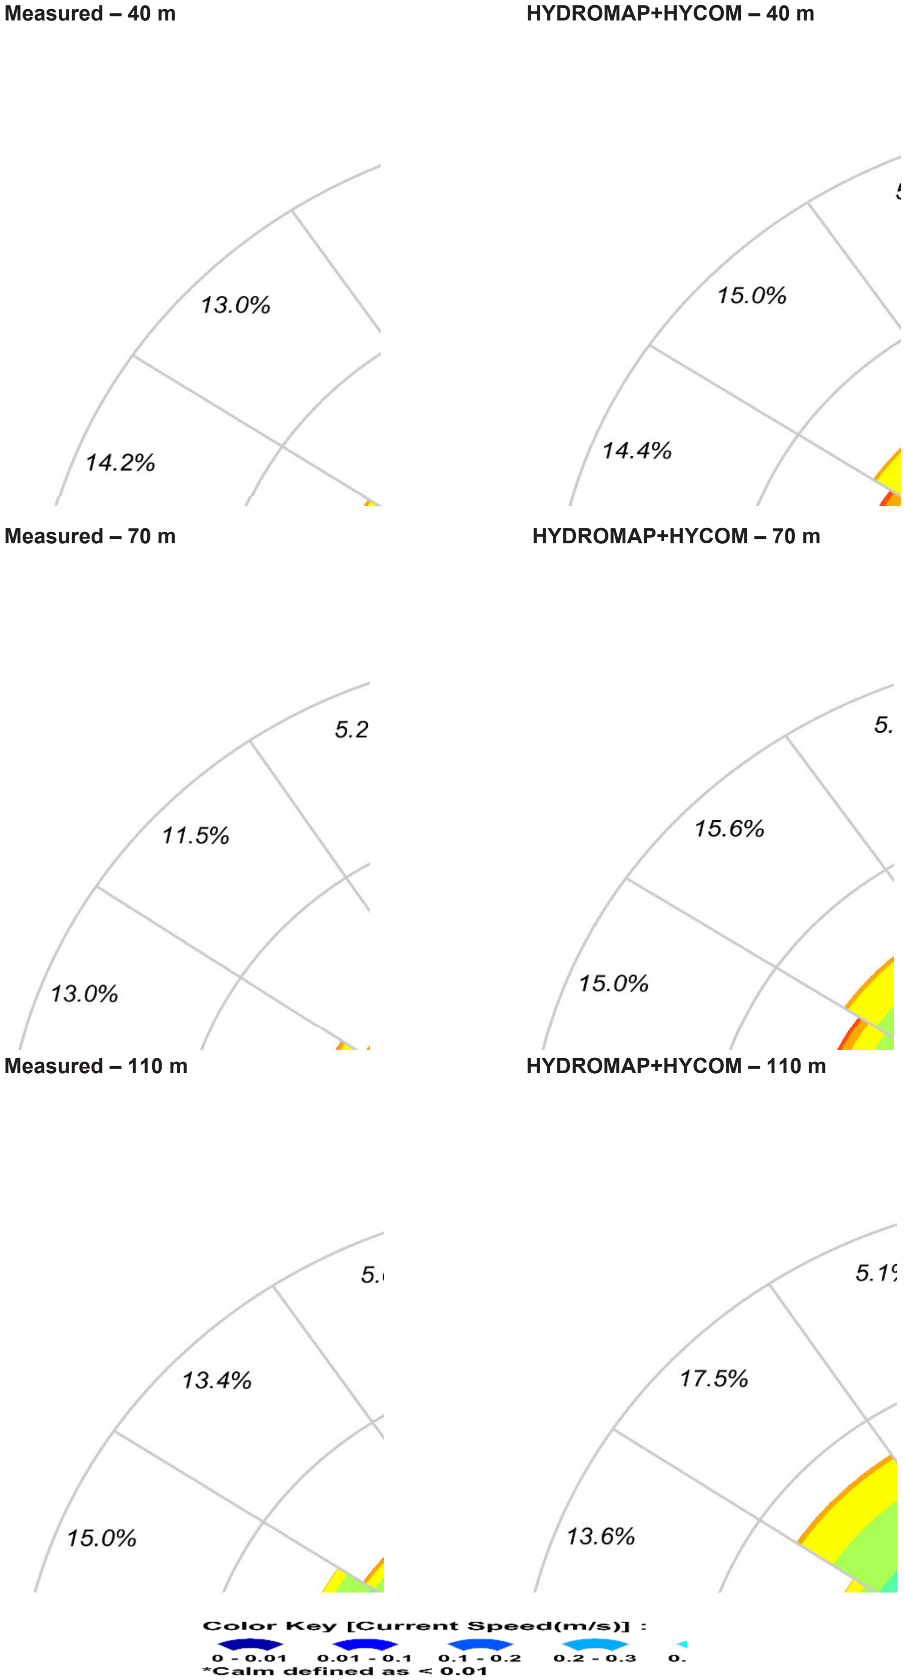

Figure 3.9 Comparative distributions for measured (left column) and predicted (HYDROMAP+HYCOM, right column) current data at the Dorado Project area (2017-2018) at depths of approximately 40 m (top row), 70 m (middle row) and 110 m (bottom row). The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

3.2 Surface Currents

Table 3.3 displays the predicted monthly average and maximum surface current speeds adjacent to the release locations, while Figure 3.10 and Figure 3.11 show monthly, seasonal and total surface current rose distributions from 2009 – 2018 (inclusive). The currents are from the combination of HYCOM large-scale ocean currents and HYDROMAP tidal currents to account for the total drift throughout the model domain.

Note the convention for defining current direction is the direction the current flows **towards**, which is used to reference current direction throughout this report. Each branch of the rose represents the currents flowing to that direction, with north to the top of the diagram. The rose branches are each divided into segments of different colour according to speed intervals of 0.1 m/s, which represent current speeds within the monthly or seasonal datasets, respectively. The length of each coloured segment (indicative of speeds) is relative to the proportion of time the currents flow to the corresponding direction.

The surface modelled current data indicated a consistent monthly average between of approximately 0.3 m/s and a dominant current direction towards the northwest and east-southeast to southeast throughout the year, while maximum current speeds varied between 0.70 m/s (November) to 1.42 m/s (October).

Table 3.3 Predicted average and maximum surface current speeds adjacent to the release locations. Data derived by combining HYCOM ocean data and HYDROMAP tidal data from 2009-2018 (inclusive).

Season	Month	Average current speed (m/s)	Maximum current speed (m/s)	General direction (towards)
Summer	January	0.30	0.86	East-southeast (variable)
	February	0.31	1.32	Northwest
	March	0.32	1.41	Northwest
Transitional	April	0.31	1.07	Northwest and West-northwest
Winter	May	0.30	0.91	West-northwest
	June	0.29	0.81	West-northwest
	July	0.31	0.88	West-northwest and northwest
	August	0.31	0.89	Northwest
Transitional	September	0.32	0.91	Northwest and Southeast
Summer	October	0.29	1.42	Northwest
	November	0.26	0.70	Northwest
	December	0.26	0.72	East-southeast (variable)
	Minimum	**0.26**	**0.70**	
	Maximum	**0.32**	**1.42**

The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

Figure 3.11 Seasonal (top) and total (bottom) current distribution (2009-2018, inclusive) derived from the HYCOM database near the Dorado Project area. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record.

4 WIND DATA

To account for the influence of the wind on surface-bound hydrocarbons, representation of the wind conditions was provided by spatial wind fields sourced from the National Center for Environmental Prediction (NCEP), National Oceanic and Atmospheric Administration (NOAA) Cooperative Institute for Research in Environmental Sciences (CIRES) Climate Diagnostics Center in Boulder, Colorado, United States of America (USA). The NCEP Climate Forecast System Reanalysis (CFSR; Saha et al., 2010) is a fully-coupled, data-assimilative hindcast model representing the interaction between the Earth's oceans, land and atmosphere. The gridded data output, including surface winds, is available at 0.25° resolution and 1-hourly time intervals.

Time series of wind speed and direction were extracted from the CFSR database for all nodes in the model domain for the same temporal coverage as the current data (2009-2018, inclusive). The data was assumed to be a suitably representative sample of the wind conditions over the study area for future years.

Table 4.1 shows the monthly average and maximum winds derived from the CFSR node located near the release locations. This region typically experiences moderate winds all year round with monthly average wind speeds ranging from 5.1 m/s (April) to 7.6 m/s (June) while the maximum wind speeds can reach 28.7 m/s (December).

Figure 4.1 shows the monthly wind roses while Figure 4.2 shows the seasonal and total wind roses near the release locations. The data shows that wind speeds and directions vary between seasons. During summer (October to March), the winds blow predominantly from the west, in winter (May to August) the winds blow predominantly from the east and during transitional conditions, wind directionality is more variable.

The extracted wind data near the release location suggests that, in the absence of any current effects, the wind acting on hydrocarbons on the sea surface will tend to result in initial trajectories that will most frequently be towards the east during summer months and towards the west during winter period. Note that the actual trajectories of the hydrocarbons on the sea surface will be the net result of a combination of the prevailing wind and current vectors acting at a given time and location. For long duration spills which may span multiple "periods" of the year (like the well blowout scenarios), the net outcomes may be a blend between the seasons.

Table 4.1 Predicted average and maximum wind speeds for the closest data point to the release locations.

Season	Month	Average wind (m/s)	Maximum wind (m/s)	General direction (from)
Summer	January	6.0	19.7	West
	February	5.7	22.8	West
Transitional	March	4.9	27.0	West-southwest (variable)
Winter	April	5.1	16.2	East-southeast
	May	6.5	17.4	East-southeast
	June	7.6	17.8	East-southeast
	July	6.7	14.8	East-southeast
	August	5.7	15.8	East-southeast
Transitional	September	5.5	16.1	Southwest
Summer	October	5.6	15.1	West-southwest
	November	5.8	13.9	West-southwest
	December	5.8	28.7	West
	Minimum	**5.1**	**13.9**	
	Maximum	**7.6**	**28.7**	

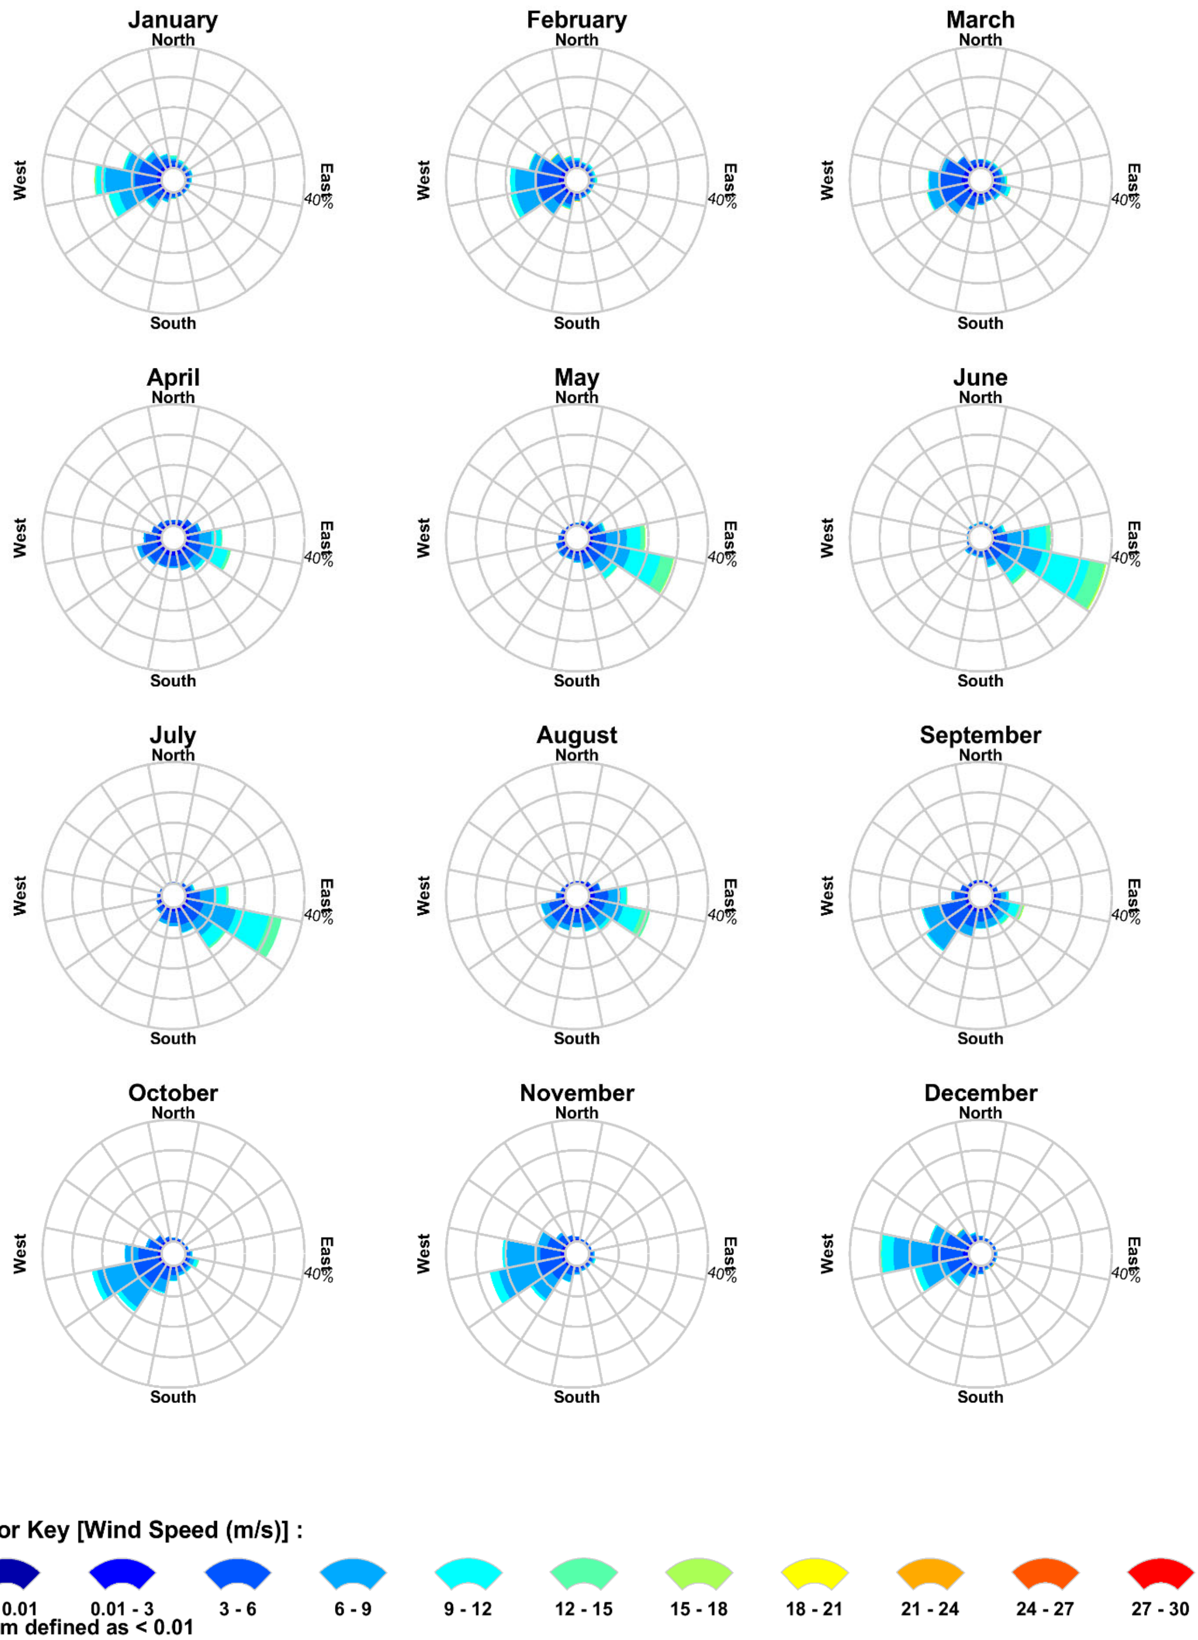

Figure 4.1 Monthly wind distribution (2009-2018, inclusive) derived from the CFSR closest data point to the release locations. The colour key shows the wind magnitude, the compass direction provides the direction from which the wind is blowing, and the size of the wedge gives the percentage of the record.

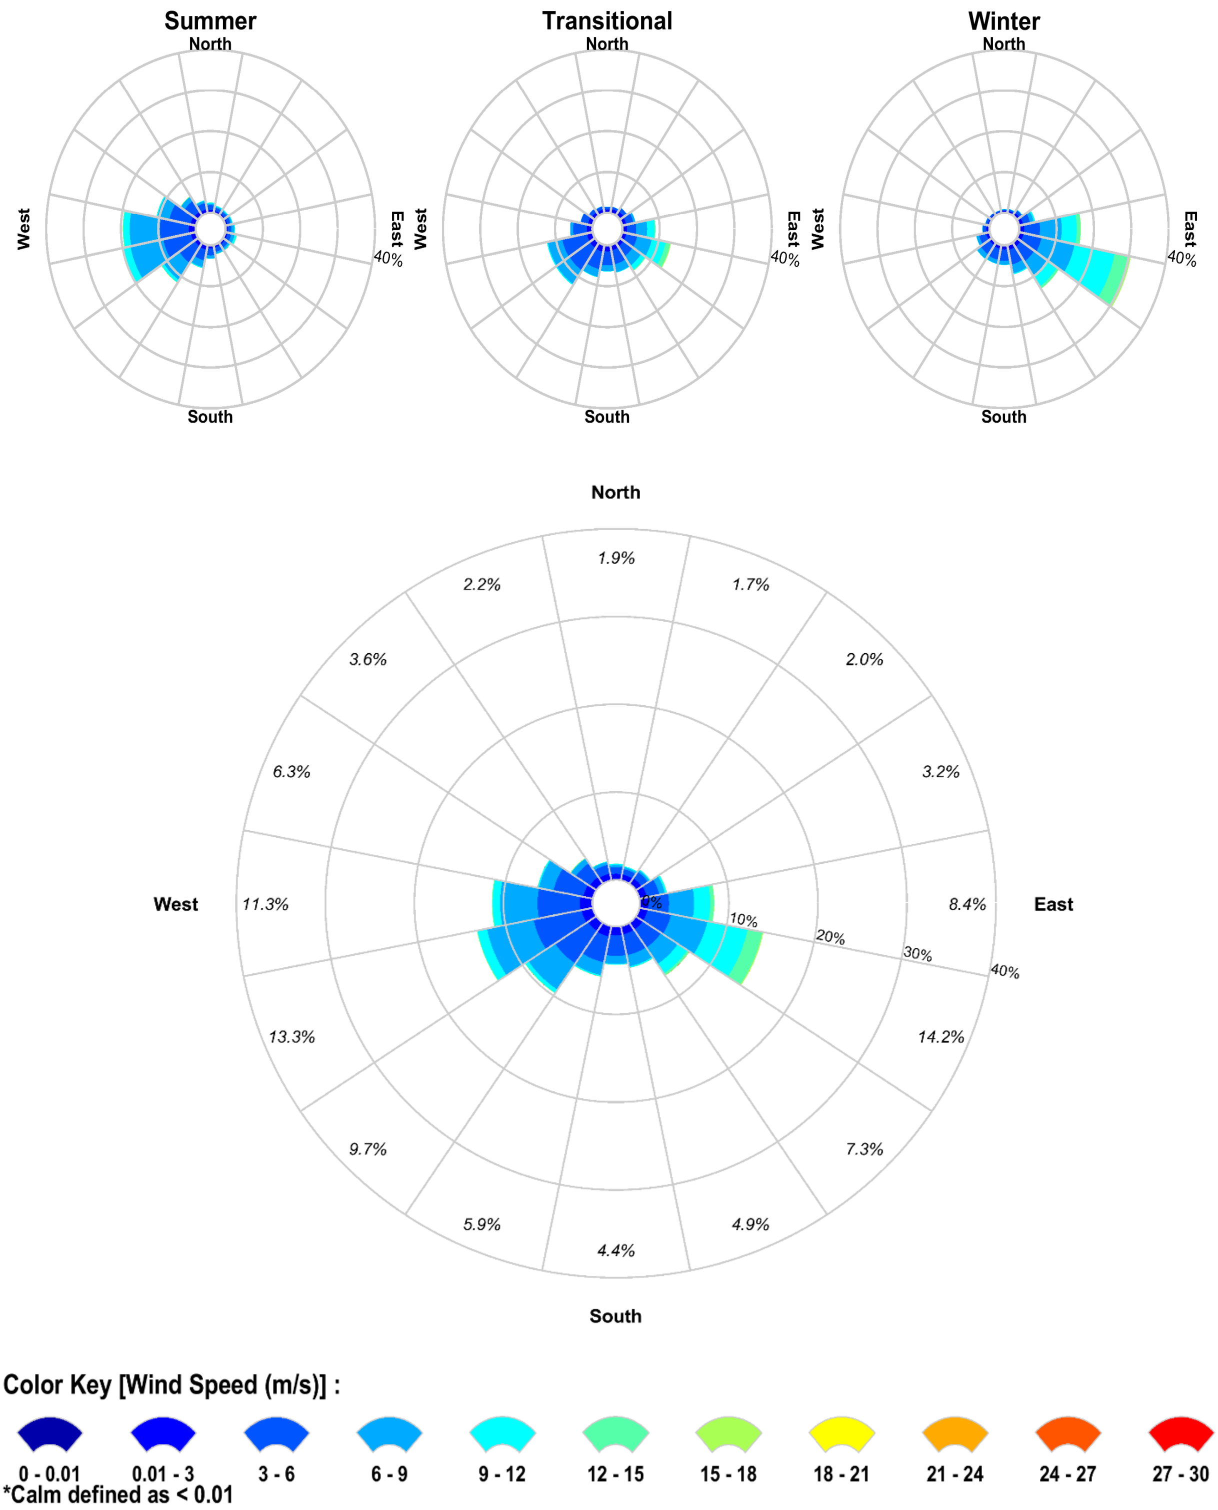

Figure 4.2 Seasonal (top) and total (bottom) wind distribution (2009-2018, inclusive) derived from the CFSR closest data point to the release locations. The colour key shows the wind magnitude, the compass direction provides the direction from which the wind is blowing, and the size of the wedge gives the percentage of the record.

5 WATER TEMPERATURE AND SALINITY DATA

To accurately represent the water column temperature and salinity, monthly data was obtained from the World Ocean Atlas 2013 database produced by the National Oceanographic Data Centre (National Oceanic and Atmospheric Administration) and its co-located World Data Center for Oceanography (Levitus et al. 2013). The data is used to inform the weathering, movement and evaporative loss of hydrocarbon spills in the surface and subsurface layers.

The World Ocean Atlas 2013 is a set of objectively analysed (1°grid) fields of in situ parameters (e.g. temperature, salinity and dissolved oxygen) at standard depth levels for annual, seasonal, and monthly periods for the global oceans. The dataset represents the largest collection of restriction-free ocean profile data available internationally. Locarnini et al. (2013) and Zweng et al. (2013) provide discussion regarding the temperature and salinity data as part of the World Ocean Atlas 2013 database.

The monthly mean sea surface temperature and salinity values in the 0-5 m depth layer derived from the World Ocean Atlas 2013 database are detailed in Table 5.1. Monthly temperatures were shown to range from 24.8°C (August) to 30.9°C (March). Salinity remained consistent throughout the year oscillating between 34.4 ppt and 35.2 ppt.

Figure 5.1 shows the temperature and salinity profiles at 5 m intervals through the water column near exploration well.

It is important to note that the WOA13 data was found to compare very well to measurements carried out at the Dorado development area.

Table 5.1 Monthly sea surface temperature and salinity per month in the 0-5 m depth layer for the closest data point to the release locations.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Temperature (°C)	29.1	29.5	30.9	29.3	26.6	26.9	24.9	24.8	25.0	26.2	28.1	28.5
Salinity (ppt)	34.8	34.7	34.6	34.8	34.4	35.0	34.6	34.7	34.7	34.9	35.0	35.2

6 SUBSEA PLUME MODEL – OILMAPDeep

In the event of an uncontrolled subsea blowout, the oil and associated gas released from the seabed is driven upward into the water column due to the momentum of the high-pressure release. It will initially behave like a jet, which dissipates in the water column over a short distance (<10 m). The escaping oil shears into small droplets due to turbulence generated by passing through the exit hole and subsequent turbulence generated in the plume jet. The size-distribution of the oil droplets will vary with the exit velocity and viscosity of the oil. Following this phase, the density and buoyancy difference of the gas, water and oil mixture relative to the surrounding waters, forces the plume upward. As the plume rises, the volume of gas will increase due to reduction of water pressure, with gas bubbles dividing into an increasing number of bubbles due to the shearing effect exerted by the water column.

In shallow water (<200 m) the rising plume of gas, oil and water will tend to reach the sea surface before deflecting as a radial, surface flow zone which will spread the oil droplets rapidly away from the centre of the plume (Spaulding et al., 2000). The velocity and oil concentrations in this surface flow zone decrease while the depth of the zone increases. Figure 6.1 conceptually illustrates the various stages of a subsea release of oil and gas.

OILMAPDeep model (Spaulding et al. 2015) was used to simulate the near-field behaviour of the gas-oil subsea release in two phases – the initial jet phase and the buoyant plume phase. The initial jet phase is predominately driven by the exit velocity. During this phase, the oil droplet-size-distribution is calculated for a range of classes or bins. Next, the plume model predicts the rise dynamics of the oil and gas plumes to calculate at which point gas lift will be lost (i.e. the trapping height).

Outputs from OILMAPDeep (plume trapping height, plume diameter and droplet size distribution) are used as input to the SIMAP model to simulate the rise and dispersion of the oil droplets from this point onwards.

More details on the OILMAP-DEEP model, can be found in Spaulding et al. (2015). The model has been validated against observations from Deepwater Horizon as well as small and large-scale laboratory studies on subsurface oil releases (Brandvik et al 2013, 2014; Belore 2014; Spaulding et al. 2015; Li et al. 2017).

The droplet size distribution was calculated using a modified form of the OILMAP Deep droplet size algorithm (Li et al., 2017). For releases in shallow water (<300 m) or with high gas to oil ratios, the modified algorithm improves the accuracy of the droplet prediction with a scaled pressure term that represents a balance between ambient hydrostatic pressure and the reservoir pressure. The typical effect of the inclusion of reservoir pressure in the droplet size algorithm is to increase predicted droplet sizes relative to those that would have been predicted if ambient hydrostatic pressure alone were used.

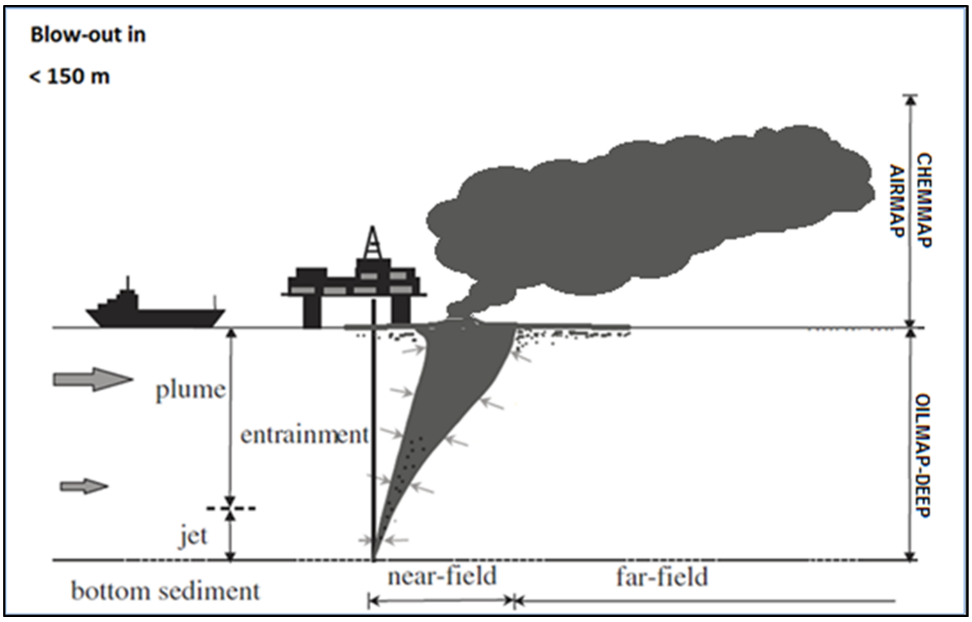

Figure 6.1 Example of a blowout plume illustrating the various stages of the plume in the water column (Source: Applied Science Associates, 2011).

Near-field modelling was carried out to better understand the plume dynamics due to the amalgamation of crude and gas at the seabed for Scenario 1 uncontrolled subsea blowout of crude. Near-field plume modelling was not necessary for the subsea pipeline release scenario (scenario 3) due to the smaller volume, short-term nature of the release and lower pressures.

Table 6.1 presents the input parameters for the subsea plume model and key results related to the near-field plume dynamics. Note a depleting release rate was used as input into the model, starting with 181,712 bbl/day on day 1 and decreasing to 105,923 bbl/day at week 14.

The near-field modelling showed that in the event of a blowout from a well, the amalgamated gas and crude would propel rapidly upward from the seabed and rupture the sea surface. Due to the velocity of the plume, the model predicted droplet sizes would be relatively small, ranging from 146 µm to 631 µm at day 1 to 182 µm to 787 µm by week 14. There were 10 oil droplet-size classes defined, which were evenly distributed (10%), to simulate the rise and dispersion of the oil droplets more accurately.

Table 6.1 Physical characteristics of the subsea releases and key results for the near-field model OILMAP-DEEP.

Input Variable	Value
Scenario	Scenario 1
Well name	WHP
Water depth (m)	90
Tubing diameter (inch)	12.25
Oil rate (stb/day)	181,712 (day 1) depleting to 105,923 (week 14)
Gas rate (MMscf/day)	594 (day 1) depleting to 285 (week 14)
Gas to oil ratio (scf/stb)	3,269 (day 1) depleting to 2,691 (week 14)
Flowing bottom hole pressure (psia)	4,1429 (day 1) depleting to 2,220 (week 14)
Key findings	
Plume execution depth (m BMSL)	Breach the surface
Droplet sizes (µm)	146 to 631 (day 1) to 182 to 787 (week 14)

7 OIL SPILL MODEL - SIMAP

The spill modelling was carried out using a purpose-developed oil spill trajectory and fates model, SIMAP (Spill Impact Mapping and Assessment Program). This model is designed to simulate the transport and weathering processes that affect the outcomes of hydrocarbon spills to the sea, accounting for the specific oil type, spill scenario, and prevailing wind and current patterns.

SIMAP is the evolution of the United States Environmental Protection Agency (US EPA) Natural Resource Damage Assessment model (French & Rines, 1997; French, 1998; French *et al.*, 1999) and is designed to simulate the fate and effects of spilled oils and fuels for both the surface slick and the three-dimensional plume that is generated in the water column. SIMAP includes algorithms to account for both physical transport and weathering processes. The latter are important for accounting for the partitioning of the spilled mass over time between the water surface (surface slick), water column (entrained oil and dissolved compounds), atmosphere (evaporated compounds) and land (stranded oil). The model also accounts for the interaction between weathering and transport processes.

The physical algorithms calculate transport and spreading by physical forces, including surface tension, gravity and wind and current forces for both surface slicks and oil within the water column. The fates algorithms calculate all the weathering processes known to be important for oil spilled to marine waters. These include droplet and slick formation, entrainment by wave action, emulsification, dissolution of soluble components, sedimentation, evaporation, bacterial and photo-chemical decay and shoreline interactions. These algorithms account for the specific oil type being considered.

Entrainment is the physical process where globules of oil are transported from the sea surface into the water column by wind and wave-induced turbulence or be generated subsea by a pressurised discharge at depth. It has been observed that entrained oil is broken into droplets of varying sizes. Small droplets spread and diffuse into the water column, while larger ones rise rapidly back to the surface (Delvigne & Sweeney, 1988; Delvigne, 1991).

Dissolution is the process by which soluble hydrocarbons enter the water from a surface slick or from entrained droplets. The lower molecular weight hydrocarbons tend to be both more volatile and more soluble than those of higher molecular weight.

The formation of water-in-oil emulsions, or mousse, which is termed 'emulsification', depends on oil composition and sea state. Emulsified oil can contain as much as 80% water in the form of micrometre-sized droplets dispersed within a continuous phase of oil (Wheeler, 1978; Daling & Brandvik, 1991; Bobra, 1991; Daling et al., 1997; Fingas, 1995; Fingas, 1997).

Evaporation can result in the transfer of large proportions of spilled oil from the sea surface to the atmosphere, depending on the type of oil (Gundlach & Boehm, 1981).

Evaporation rates vary over space and time dependent on the prevailing sea temperatures, wind and current speeds, the surface area of the slick and entrained droplets that are exposed to the atmosphere as well as the state of weathering of the oil. Evaporation rates will decrease over time, depending on the calculated rate of loss of the more volatile compounds. By this process, the model can differentiate between the fates of different oil types.

Decay (degradation) of hydrocarbons may occur as the result of photolysis, which is a chemical process energised by ultraviolet light form the sun, and by biological breakdown, termed biodegradation. Many types of marine organisms ingest, metabolise and utilise oil as a carbon source, producing carbon dioxide and water as by-products. The biodegradable portion of various crude oils range from 11 to 90% (NRC, 1985, 1989).

Entrainment, dissolution and emulsification rates are correlated to wave energy, which is accounted for by estimating wave heights from the sustained wind speed, direction and fetch (i.e. distance downwind from land barriers) at different locations in the domain. Dissolution rates are dependent upon the proportion of soluble, short-chained hydrocarbon compounds, and the surface area at the oil/water interface of slicks. Dissolution rates are also strongly affected by the level of turbulence. For example, dissolution rates will be relatively high at the site of the release for a deep-sea discharge at high pressure.

In contrast, the release of hydrocarbons onto the water surface will not generate high concentrations of soluble compounds. However, subsequent exposure of the surface slick to breaking waves will enhance entrainment of oil into the upper water column as oil droplets, which will enhance dissolution of the soluble components. Because the compounds that have high solubility also have high volatility, the processes of evaporation and dissolution will be in dynamic competition with the balance dictated by the nature of the release and the weather conditions that affect the oil after release. The SIMAP weathering algorithms include terms to represent these dynamic processes. Technical descriptions of the algorithms used in SIMAP and validations against real spill events are provided in French (1998), French et al. (1999) and French-McCay (2004).

Input specifications for oil types include the density, viscosity, pour-point, distillation curve (volume of oil distilled off versus temperature) and the aromatic/aliphatic component ratios within given boiling point ranges. The model calculates a distribution of the oil by mass into the following components:

- Surface-bound or floating oil.
- Entrained oil (non-dissolved oil droplets that are physically entrained by wave action).
- Dissolved hydrocarbons (principally the aromatic and short-chained aliphatic compounds).
- Evaporated hydrocarbons.
- Sedimented hydrocarbons.
- Decayed hydrocarbons.

7.1 Hydrocarbon Properties

Two different hydrocarbons were modelled as part of the study: Caley crude and Heavy Fuel Oil (HFO). Table 7.1 and Table 7.2 outlines the physical characteristics and boiling point ranges for the two oil types, respectively, which will determine the way it behaves in the marine environment.

Table 7.1 Physical properties of oil types used in this study.

Characteristic	Caley Crude	Heavy Fuel Oil
Density (kg/m^3)	773 (at 15 °C)	975 (at 25ºC)
API	51.4	12.3
Dynamic viscosity (cP)	1.45 (at 20ºC)	3,180 (at 25ºC)
Wax content (%)	9.2	2
Pour point (°C)	-15	7
Hydrocarbon property category	Group II	Group 4
Hydrocarbon property classification	Light persistent	Persistent

Table 7.2 Boiling point ranges of the oil types used in this study.

Characteristics	Non-Persistent			Persistent
	Volatile (%)	*Semi-volatile (%)*	*Low-volatility (%)*	*Residual (%)*
Boiling point (°C)	*<180*	*180-265*	*265-380*	*>380*
Caley crude	48	19	18	15
Heavy Fuel Oil	1	5	11	83

The boiling points are dictated by the length of the carbon chains, with the longer and more complex compounds having a higher boiling point, and therefore lower volatility and evaporation rate.

Atmospheric weathering will commence when oil droplets float to the water surface. Typical evaporation times once the hydrocarbons reach the surface and is exposed to the atmosphere are around:

- Up to 12 hours for the C4 to C10 compounds (or less than 180 °C BP);
- Up to 24 hours for the C11 to C15 compounds (180 – 265 °C BP);
- Several days for the C16 to C20 compounds (265 – 380 °C BP); and
- N/A for the residual compounds (BP>380 °C), which will resist evaporation, persist in the marine environment for longer periods, and be subject to relatively slow degradation.

7.1.1.1 Caley Crude

The physical-chemical properties of Caley crude were based on a detailed assay provided by Santos. The assay is considered to be representative of the reservoir characteristics of the Dorado field and the composition used to determine the weathering characteristics.

The crude is characterised by a low viscosity and is considered a Group II light persistent oil, as per the grouping classification presented by AMSA (2015). If spilt on the sea surface, the crude would rapidly spread and thin out resulting in a large surface area of hydrocarbon available for evaporation. The volatile component of Group I oils tend to dissipate through evaporation within a few hours (ITOPF 2014). Based upon the Caley crude assay (boiling point range, Table 7.2), up to 48% of the hydrocarbon would evaporate over the first few hours or day, with up to 67% evaporated after a few days when on the sea surface. Fifteen percent of the crude is considered persistent, which would eventually breakdown due to the decay. When on the surface Caley crude may also become entrained into the water column in the presence of moderate winds (above 10 knots) and in turn breaking waves, however, it would re-surface under calm conditions (less than 10 knots).

7.1.1.2 Heavy Fuel Oil

HFO is characterised by a very high density at 974.9 (API Gravity of 12.3) and a high dynamic viscosity (3,180 cP (@ 25ºC). It is comprised of a high percentage of persistent components (82.8%), which will not evaporate. When spilt at sea the HFO will initially remain as a liquid as sea surface temperatures are above its pour point during all seasons. The volatile components (1%) are immediately lost via evaporation and the physical properties will change quickly as the lighter more fluid components evaporate and disperse by the action of wind and waves. The residual component (approximately 83%) is expected to become semi-solid to solid at ambient temperatures and is susceptible to decay overtime. Previous weathering tests with HFO used as bunker fuels have shown that both the pour point and the viscosity of the oil increased with time (by an average of two orders of magnitude within 96 hours of weathering). Once the pour point of oil exceeded the seawater temperature (within 9-12 hours during all seasons) the oil weathered to a point where mostly solid non-spreading oil remained (up to 70% of bunker fuel remained as a solid residue even after the most extreme weathering tests).

Laboratory tests with Bunker C Crude oil (Fingas et al. 2002, Fingas and Fieldhouse 2004) which has similar physical properties to the HFO modelled in this study have shown that HFO does not form stable emulsions. Rather, when HFO is spilt at sea it takes up water very rapidly over a short energy range and the stability of the water-oil mixture remains the same in that it does not stabilise with increasing energy. This behaviour is consistent with entrained water in oil, where spilt oil will first appear as a black viscous liquid with large water droplets and within one week will become separated into oil and water as water energies abate.

The toxic potential of weathered HFO is low in comparison to other crudes, MDO and condensates as weathered oil is insoluble and the bioavailable portion of the oil is soon lost through evaporation. Solid residues can persist in the marine environment for extended periods and its longevity is dependent on its unique physio-chemical properties. The heaviest fractions (>C20) often break into discrete patches and may float or sink depending on density relationships and become incorporated into soils or sediments (American Petroleum Institute 2012). Selective biodegradation can also deplete hydrocarbons on sediments and on the sea surface overtime (Lee et al. 2003). Direct consumption of the residual tar patties or contaminated sediment poses the greatest risk to macrofauna and would present a greater threat for shallow coastal embayment's with concentrated populations and coastal vegetation.

7.2 Floating Oil, Shoreline and In-Water Thresholds

The thresholds described below for surface, shoreline, and in-water (entrained and dissolved) oil have been adopted according to low, moderate and high thresholds, based on increasing concentrations:

Low thresholds are unlikely to affect species but would be visible and detectable by instrumentation and may trigger socioeconomic impacts, such as temporary closures of areas such as fishing grounds as a precautionary measure.

Moderate thresholds represent moderate concentrations of oil exposure/accumulation which are anticipated to result in behavioural changes and sub-lethal effects to biota (effects that may result in changes in reproduction or growth) and are unlikely to result in lethal effects (representing potential death of individuals) although lethality may occur if ingestion occurs.

High thresholds represent high concentrations of oil that are expected to result in sub-lethal and lethal effects to at least some species (representing potential death of individuals).

Reporting threshold values (based on the scientific literature) represent potential effects ranging from possible social and economic effects, degradation of water quality as well as possible effects on the behaviour, survival and recruitment success on biota. The changes in the state of the oil over time, in addition to a wide range of sensitivities and in turn potential effects on marine life, does not make it possible to strictly assign single specific effect thresholds. Instead, the analysis presented herein is presented for ranges of low, moderate and high threshold levels, with separate analysis for oil floating at the sea surface, stranded on shoreline, dissolved in the water column and suspended in the water column.

Moderate levels were defined based on available evidence that indicated the potential for low-level sub-lethal effects on some biota, or else evidence of reduced survival rates of sensitive species. This level can be considered a lower ecological threshold. The higher threshold was defined on the assumption that there would be more potential for reduced survivorship of less sensitive species.

It is important to note that the thresholds used herein are consistent with NOPSEMA spill modelling bulletin (NOPSEMA 2019).

7.2.1 Sea-surface Exposure Thresholds

As a conservative approach, the same reporting thresholds for fresh and weathered oil exposure on the sea surface were applied in this study, which were 1 g/m^2 (low), 10 g/m^2 (moderate) and above 50 g/m^2 (high; Table 7.3). As the effects of fresh oil are better understood than for weathered oil, appropriate effects thresholds for fresh oil are more readily identifiable. Exposure pathways of species to weathered oil (i.e. smothering and potential ingestion for some species) are less likely to result in adverse effects.

Table 7.3 Floating oil exposure thresholds used in this report (in alignment with NOPSEMA 2019).

Exposure level	Floating oil threshold (g/m^2)	Description
Low	1	Approximates range of socioeconomic effects and establishes planning area for scientific monitoring
Moderate	10	Approximates lower limit for harmful exposures to birds and marine mammals
High	50	Approximates surface oil slick and informs response planning

The lowest threshold to assess the potential for sea surface exposure, was 1 g/m^2, which equates approximately to an average thickness of 1 µm, referred to as visible oil. Oil of this thickness is described as rainbow sheen in appearance, according to the Bonn Agreement Oil Appearance Code (Bonn Agreement 2009) (see Table 7.4). This threshold is considered below levels which would cause environmental harm and it is more indicative of the areas perceived to be affected due to its visibility on the sea surface and potential to trigger temporary closures of areas (i.e. fishing grounds) as a precautionary measure. Table 7.4 provides a description of the appearance in relation to exposure zone thresholds used to classify the zones of sea surface exposure.

Ecological impact has been estimated to occur at 10 g/m^2 (a film thickness of approximately 10 µm or 0.01 mm) according to French et al. (1996) and French-McCay (2009) as this level of fresh oiling has been observed to mortally impact some birds through adhesion of oil to their feathers, exposing them to secondary effects such as hypothermia. The appearance of oil at this average thickness has been described as a metallic sheen (Bonn Agreement, 2009).

Scholten et al. (1996) and Koops et al. (2004) indicated that oil concentrations on the sea surface of 25 g/m^2 (or greater), would be harmful for all birds that have landed in an oil film due to potential contamination of their feathers, with secondary effects such as loss of temperature regulation and ingestion of oil through preening. The appearance of oil at this thickness is also described as metallic sheen (Bonn Agreement, 2009). For this study, the high exposure threshold was set to 50 g/m^2 and above based on NOPSEMA (2019) and because it is an appropriate threshold for spill response planning, as it is more suitable for targeted spill response strategies such as dispersant application and containment and recovery.

Figure 7.1 shows examples of the differences between oil colour and corresponding thickness on the sea surface. Hydrocarbons in the marine environment may appear differently due the ambient environmental conditions (wind and wave action).

Table 7.4 The Bonn Agreement Oil Appearance Code.

Code	Description/Appearance	Layer Thickness Interval (g/m^2 or μm)	Litres per km^2
1	Sheen (silvery/grey)	0.04 – 0.30	40 – 300
2	Rainbow	0.30 – 5.0	300 – 5,000
3	Metallic	5.0 – 50	5,000 – 50,000
4	Discontinuous True Oil Colour	50 – 200	50,000 – 200,000
5	Continuous True Oil Colour	≥ 200	≥ 200,000

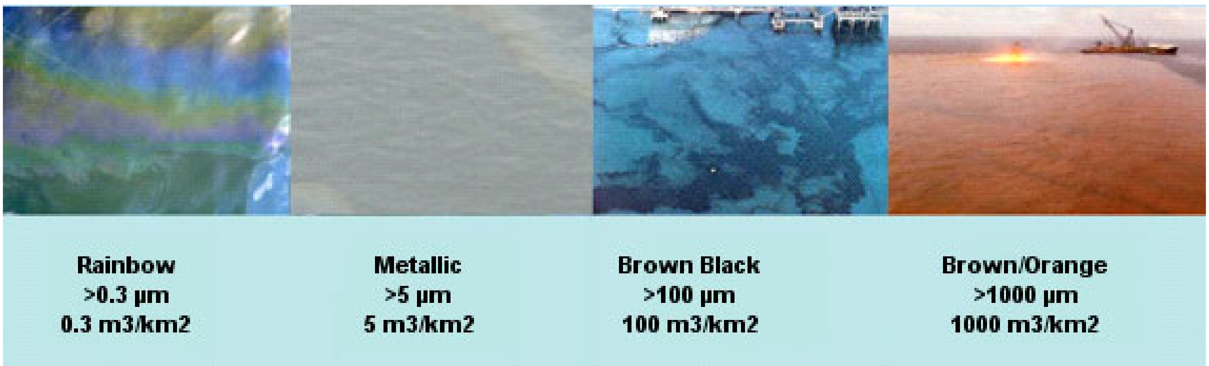

Figure 7.1 Photographs showing the difference between oil colour and thickness on the sea surface (source: adapted from Oil Spill Solutions.org, 2015).

7.2.2 Shoreline Accumulation Thresholds

The thresholds for accumulation of oil after it reaches shoreline were 10 g/m^2 (low), 100 g/m^2 (moderate) and above 1000 g/m^2 (high). Table 7.5 shows the number of weathered oil patches per square meter on the shoreline for corresponding thresholds, if each patch was a sphere that was 1 inch in diameter.

The lower threshold (10 g/m^2) was applied as the reporting limit for oil on shore. This threshold may trigger socio-economic impact, such as triggering temporary closures of beaches to recreation or fishing, or closure of commercial fisheries and might trigger attempts for shore clean-up on beaches or man-made features/amenities (breakwaters, jetties, marinas, etc.). In previous risk assessment studies, French-McCay et al. (2005a; 2005b) used a threshold of 10 g/m^2, equating to approximately two teaspoons of oil per square meter of shoreline, as a low impact threshold when assessing the potential for shoreline accumulation.

French et al. (1996) and French-McCay (2009) define a shoreline oil accumulation threshold of 100 g/m^2, or above, would potentially harm shorebirds and wildlife (furbearing aquatic mammals and marine reptiles on or along the shore) based on studies for sub-lethal and lethal impacts. This threshold has been used in previous environmental risk assessment studies (see French-McCay, 2003; French-McCay et al., 2004, French-McCay et al., 2011; 2012; NOAA, 2013). Additionally, a shoreline concentration of 100 g/m^2, or above, is the minimum limit that the oil can be effectively cleaned according the AMSA (2015) guideline. This threshold equates to approximately ½ a cup of oil per square meter of shoreline. The appearance is described as a thin oil coat.

The higher threshold of 1,000 g/m^2, and above, was adopted to inform locations that might receive oil accumulation levels that could have a higher potential for ecological effect. Observations by Lin & Mendelssohn (1996), demonstrated that loadings of more than 1,000 g/m^2 of oil during the growing season would be required to impact marsh plants significantly. Similar thresholds have been found in studies assessing oil impacts on mangroves (Grant et al., 1993; Suprayogi & Murray, 1999). This concentration equates to approximately 1 litre or 4 ¼ cups of fresh oil per square meter of shoreline accumulation. The appearance is described as an oil cover.

Table 7.5 Thresholds for oil accumulation on shorelines.

Exposure level	Shoreline oil threshold (g/m^2)	Description
Low	10	Predicts potential for some socio-economic impact
Moderate	100*	Loading predicts area likely to require clean-up effort
High	1,000	Loading predicts area likely to require intensive clean-up effort

* 100 g/m^2 also used to define the threshold for actionable shoreline oil.

7.2.3 Dissolved and Entrained Hydrocarbon Thresholds

Oil is a mixture of thousands of hydrocarbons of varying physical, chemical, and toxicological characteristics, and therefore, demonstrate varying fates and impacts on organisms. As such, for in-water exposure, the SIMAP model provides separate outputs for dissolved and entrained hydrocarbons from oil droplets. The consequences of exposure to dissolved and entrained components will differ because they have different modes and magnitudes of effect.

Entrained hydrocarbon concentrations were calculated based on oil droplets that are suspended in the water column, though not dissolved. The composition of this oil would vary with the state of weathering (oil age) and may contain soluble hydrocarbons when the oil is fresh. Calculations for dissolved hydrocarbons specifically calculates oil components which are dissolved in water, which are known to be the primary source of toxicity exerted by oil.

7.2.3.1 Dissolved Hydrocarbons

Laboratory studies have shown that dissolved hydrocarbons exert most of the toxic effects of oil on aquatic biota (Carls et al., 2008; Nordtug et al., 2011; Redman, 2015). The mode of action is a narcotic effect, which is positively related to the concentration of soluble hydrocarbons in the body tissues of organisms (French-McCay, 2002). Dissolved hydrocarbons are taken up by organisms directly from the water column by absorption through external surfaces and gills, as well as through the digestive tract. Thus, soluble hydrocarbons are termed “bioavailable”.

Hydrocarbon compounds vary in water-solubility and the toxicity exerted by individual compounds is inversely related to solubility, however bioavailability will be modified by the volatility of individual compounds (Nirmalakhandan & Speece, 1988; Blum & Speece, 1990; McCarty, 1986; McCarty et al., 1992a, 1992b; Mackay et al., 1992; McCarty & Mackay, 1993; Verhaar et al., 1992, 1999; Swartz et al., 1995; French-McCay, 2002; McGrath et al., 2009). Of the soluble compounds, the greatest contributor to toxicity for water-column and benthic organisms are the lower-molecular-weight aromatic compounds, which are both volatile and soluble in water. Although they are not the most water-soluble hydrocarbons within most oil types, the polynuclear aromatic hydrocarbons (PAHs) containing 2-3 aromatic ring structures typically exert the largest narcotic effects because they are semi-soluble and not highly volatile, so they persist in the environment long enough for significant accumulation to occur (Anderson et al., 1974, 1987; Neff & Anderson, 1981; Malins & Hodgins, 1981; McAuliffe, 1987; NRC, 2003). The monoaromatic hydrocarbons (MAHs), including the BTEX compounds (benzene, toluene, ethylbenzene, and xylenes), and the soluble alkanes (straight chain hydrocarbons) also contribute to toxicity, but these compounds are highly volatile, so that their contribution will be low when oil is exposed to evaporation and higher when oil is discharged at depth where volatilisation does not occur (French-McCay, 2002).

French-McCay (2002) reviewed available toxicity data, where marine biota was exposed to dissolved hydrocarbons prepared from oil mixtures, finding that 95% of species and life stages exhibited 50%
