ROV	remotely operated vehicle
SBM	synthetic based mud
SDS	Sustainable Development Scenario
SEL	sound exposure level
SEL_{24h}	cumulative 24-hour sound exposure level - a cumulative metric that reflects the measured dose impact of noise levels over 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position
SPL	sound pressure level
STEPS	Stated Policies Scenario
TEC	threatened ecological community
TTS	temporary threshold shift
VOC	volatile organic compound
WAFIC	Western Australian Fishing Industry Council
WBM	water-based mud

Acronym	Definition
WHA	World Heritage Area
WHP	wellhead platform

Executive Summary

ES-1. Introduction

Project Overview and Location

Santos WA Northwest Pty Ltd (Santos) proposes to develop petroleum resources in the Bedout Sub-basin, located in Commonwealth waters approximately 140 km offshore from Port Hedland, Western Australia (Figure 0-1).

The Dorado Development will develop the oil resources of the Dorado field and potential future tiebacks and will require gas reinjection to enhance oil recovery. There is potential for a second phase of development to recover and export the gas.

Phase 1 of the Dorado Development (Dorado Phase 1) will produce oil from the Dorado field and potentially from future tiebacks. In this phase, the recovered gas will be reinjected to the Dorado reservoir to enhance liquids recovery. Dorado Phase 1 will be designed for liquid handling rates of 100 thousand standard barrels per day (KSTB/d) and gas reinjection capacity of 235 million standard cubic feet per day (MMscf/d). With the inclusion of future tiebacks, Dorado Phase 1 will export a volume of up to 350 million barrels (MMbbl) of liquids over 20 years.

Dorado Phase 1 will contribute to meeting the world's future needs for oil resources, and will also bolster energy security for Australia in the wake of global energy supply shocks following the global pandemic and the Russia-Ukraine conflict.

Based on global energy studies and forecasts, oil plays a major role in the energy mix for a sustainable energy future and currently is forecast to provide the main source of energy for the transport sector into the future. Even under the most aggressive accelerated energy transition scenarios, including the IEA Net Zero by 2050 scenario, there remains a requirement for investment in oil and gas production to maintain sufficient supply through the transition.

Future gas production is subject to future exploration and investment decisions and would be executed as Phase 2 of the Dorado Development. The exploration and appraisal activities in the Bedout Basin are undertaken via separate environment plans and approvals. Should Phase 2 of the Dorado Development progress it would require separate assessment under environment regulatory approval processes if considered commercially and technically viable. The recovered gas will be exported for onshore processing to supply either domestic and/or international markets.

This offshore project proposal (OPP) has been submitted to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for assessment under Part 1A of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (OPGGS (E) Regulations). This OPP outlines Santos' commitment to undertaking Dorado Phase 1 in a manner that ensures environmental impacts and risks are acceptable.

The oil resources that will be developed lie within petroleum titles WA-437-P and WA-438-P. The Dorado Phase 1 development will consist of:

+ a wellhead platform (WHP) with up to sixteen wells (production and gas injection);
+ a floating production, storage and offloading (FPSO) facility;
+ subsea flowlines and umbilicals between the WHP and the FPSO facility; and
+ potential future tiebacks.

This OPP for Dorado Phase 1 includes potential for future tiebacks (noting that prospects have not yet been appraised) within the Project Area to augment Dorado field oil production. These tiebacks will connect to the Dorado WHP or FPSO.

All planned petroleum activities, including the future tiebacks, will take place within the Project Area defined for the Dorado Development (**Figure 0-1**) and will include:

+ site surveys;
+ drilling;
+ vertical seismic profiling (drilling and 3-D);
+ construction and installation;
+ commissioning;
+ operations and facilities maintenance; and
+ decommissioning of infrastructure and plug and abandonment of wells.

The proposed locations of the Dorado FPSO and WHP are approximately 143 km and 145 km north of the town of Port Hedland respectively. Future tiebacks, if developed, will be located within the Project Area. Water depths in the Project Area range between approximately 70 and 120 m.

Dorado Phase 1 is intended to operate for a life of 20 years (inclusive of potential future tiebacks), commencing operations as early as 2027. The Dorado Phase 1 infrastructure will be decommissioned at the end of the commercial life of the project in accordance with legislative requirements.

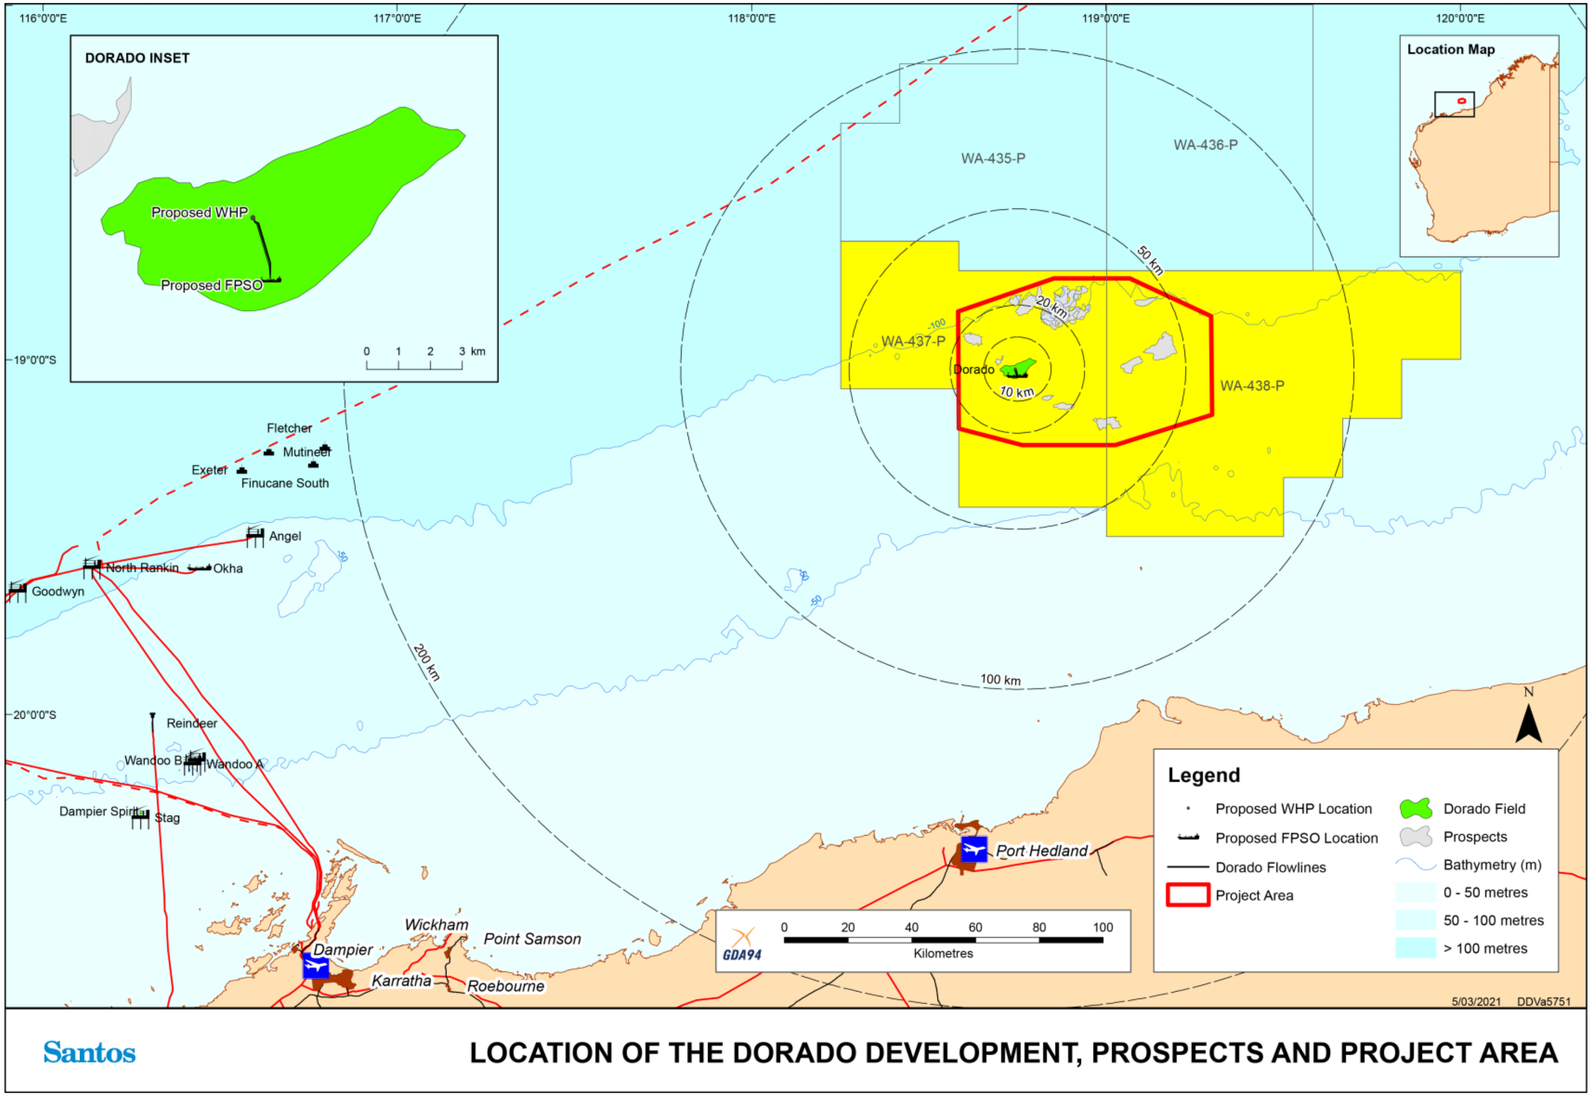

Figure 0-1: Location of the Dorado Development, Prospects and Project Area

Purpose of the Dorado Development Offshore Project Proposal

The purpose of the Dorado Development OPP is to:

+ provide a whole-of-project assessment of the environmental impacts and risks of Dorado Phase 1;
+ define and demonstrate the acceptable levels of environmental impacts and risks for Dorado Phase 1;
+ provide relevant information to the public and an opportunity for the public to comment on Dorado Phase 1; and
+ meet the regulatory requirements of the OPGGS (E) Regulations.

Information about the Proponent

Santos WA Northwest Pty Ltd (Santos), as operator of the Dorado Joint Venture, is the proponent for the Dorado Development OPP. An Australian company founded in 1954, Santos is one of the leading independent oil and gas producers in the Asia-Pacific region, supplying the energy needs of homes, businesses and major industries across Australia and Asia.

Santos originated in the Cooper Basin; has extensive exploration and production acreage in Australia, as well as extensive infrastructure; and is committed to supplying domestic markets, unlocking resources, and driving value and performance. Santos is dedicated to being the safest oil and gas operator in Australia and preventing harm to people and the environment.

ES-2. Relevant Requirements

Dorado Phase 1 lies entirely within Commonwealth waters and hence lies within the jurisdiction of the Australian Government. The two key pieces of Commonwealth legislation that apply to the environmental approval of Dorado Phase 1 are the:

+ *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act) and subsidiary regulations; and
+ *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act).

Other relevant requirements that apply to the environmental approval of Dorado Phase 1 include:

+ additional Commonwealth legislation;
+ international agreements and conventions; and
+ policy, advice and guidelines.

Santos has applied the above relevant requirements to the environmental impact assessment and management of Dorado Phase 1.

Offshore Petroleum and Greenhouse Gas Storage Act 2006

The OPGGS Act provides the regulatory framework for petroleum exploration and recovery and the injection and storage of greenhouse gas (GHG) substances in Commonwealth waters. The OPP is required under subsidiary OPGGS (E) Regulations.

The OPGGS (E) Regulations are the principal regulations for the environmental management of petroleum activities in Commonwealth waters. In addition to the OPP, the OPGGS (E) Regulations also require Santos to have in place accepted Environment Plans (EPs) and Oil Pollution Emergency Plans (OPEPs) for the petroleum activities within the scope of Dorado Phase 1.

Environment Protection and Biodiversity Conservation Act 1999

The EPBC Act and supporting regulations provide for the protection of the environment and conservation of biodiversity in Australia (including Commonwealth waters) specific to matters of national environment significance (MNES). Amendments to the OPGGS Act and OPGGS (E) Regulations in February 2014 require matters protected under Part 3 of the EPBC Act to be considered in the Dorado Development OPP.

ES-3. Description of the Environment

The OPP describes the physical, biological and socio-economic environment that may be affected (EMBA) from planned and unplanned events associated with the Dorado Phase 1 activities, including MNES protected under the EPBC Act. This description informs the assessment of environmental impacts and risks.

The outer boundary of the EMBA is the worst-case and largest spatial extent where unplanned hydrocarbon releases from Dorado Phase 1 activities could have an environmental consequence. The EMBA is based on the cumulative extent of 300 stochastic model simulations for all exposure probabilities, using the 'low' exposure values for each modelled oil component, that is 1 gram per square metre (g/m^2) floating oil, 10 parts per billion (ppb) dissolved and entrained oil and 10 g/m^2 for oil on shoreline. All planned activities will occur within the Project Area (**Figure 0-1**).

Environmental Studies

Santos commissioned a range of environmental studies to better understand the existing environment within and surrounding the Project Area. These studies are described in subsequent sections and include:

- benthic habitat surveys;
- benthic habitat modelling;
- sediment quality surveys; and
- water quality surveys.

Results of these studies supported the assessment of environmental impacts and risks.

Physical Environment

The seabed within the Project Area is generally flat and featureless, which is consistent with much of the mid-continental shelf in the North West Shelf (NWS) region. There are no known bathymetric features, such as reefs, shoals or banks, within the Project Area.

Water movement in the Project Area is dominated by strong tidal regimes, as such the water movement is regular and predictable, in a northwest and southeast direction. There is relatively little variation in this pattern throughout the year, with little apparent influence of the mesoscale currents, such as the Holloway Current, which typically occur on the outer continental shelf in water depths more than 100 m. Tides in the Project Area are semidiurnal (two high and two low tides per day), with slight diurnal inequality. The tidal range in the region is large, with the maximum tidal range at the port of Port Hedland in excess of 7 m. This large tidal range accounts for the strength of tidal currents observed in the Project Area. In the EMBA beyond the Project Area, mesoscale currents, such as the Holloway and Leeuwin currents, play an important role in water movements. Smaller-scale water movements, such as tidal and wind-driven currents, are superimposed over these mesoscale currents.

Water and sediment quality within the Project Area is high, with little evidence of contamination. Turbidity levels in surface waters are low, with increased levels of turbidity near the seabed likely due to sediment resuspension by currents at the seabed. Concentrations of metals and hydrocarbons in water and sediments were below the recommended guideline values for slightly to moderately disturbed marine systems, with many of the concentrations below the laboratory limits of reporting. Sediments in the Project Area were characterised as varying grades of sand – ranging from slightly gravelly muddy sand to gravelly sand.

The climate of the Project Area is arid and tropical, experiencing high summer temperatures and periodic tropical cyclones in summer. Rainfall in the region is low, although intense rainfall may occur during the passage of summer tropical cyclones and thunderstorms. The summer and winter seasons fall into the periods September to March and May to July, respectively. Winters are characterised by clear skies, fine weather, predominantly strong east to southeast winds and infrequent rain. Summer winds are more variable, with strong southwesterlies dominating. Transitional wind periods, during which either pattern may predominate, can be experienced in April, May and September of each year.

The Project Area is remote from potential sources of atmospheric pollutants, and air quality in the Project Area is high.

Biological Environment

Benthic habitat within the Project Area consists of bare sediments and hard substrate areas that typically have a low or no cover of epibenthic biota. These habitats were homogenous throughout the surveyed area and are well represented outside the Project Area.

Habitats within the Project Area can be described as the following:

+ Areas of flat, silty sand and silty mud that are sparsely populated with epibiota and support a low to medium density of tube worms, scattered sea pens, crinoids and anemones; bioturbation by small fish and invertebrates also occurs;
+ Areas of low, probably mobile, sand waves supporting very little epibiota other than occasional sea pens and worm tubes; and
+ Exposed hard substrates supporting a low to medium density of filter-feeding assemblages generally dominated by small gorgonians, sea whips, soft corals and sponges.

No key ecological features (KEF) occur within the Project Area. A range of other communities and habitats occur within the EMBA beyond the Project Area, including:

+ benthic habitats, such as:
  - bare substrate;
  - reefs, shoals and banks;
  - seagrasses; and
  - macroalgae.
+ coastal habitats, such as:
  - mangroves;
  - intertidal sand and mudflats;
  - intertidal platforms;
  - sandy beaches; and
  - rocky shorelines.

A number of threatened or migratory species listed under the EPBC Act were listed within the Project Area and EMBA, including:

- 13 fishes (including sharks) (10 within the Project Area and another three within the EMBA beyond the Project Area);
- 16 marine mammals (seven within the Project Area and another nine within the EMBA beyond the Project Area);
- nine reptiles (five within the Project Area and another four within the EMBA beyond the Project Area); and
- 76 birds (10 within the Project Area and another three within the EMBA beyond the Project Area).

Socio-economic Environment

No protected areas overlap the Project Area, although a number occur within the EMBA beyond the Project Area, including:

- 18 Commonwealth Australian marine marks (AMPs);
- 14 Western Australian marine protected areas;
- 14 Western Australian terrestrial protected areas; and
- six wetlands of international importance (Ramsar wetlands).

Nine Western Australian–managed fisheries overlap the Project Area, with the Pilbara Interim Trawl Fishery the most active within the Project Area. Three Commonwealth-managed fisheries overlap the Project Area, none of which have notable historic fishing effort within the Project Area. Numerous Western Australian and Commonwealth-managed fisheries overlap the EMBA beyond the Project Area. No aquaculture activities occur within the Project Area, but aquaculture occurs within the EMBA beyond the Project Area.

No World, Commonwealth or national heritage properties occur within the Project Area. Several heritage properties occur within the EMBA beyond the Project Area, including:

- two World Heritage Places (Ningaloo Coast and Shark Bay);
- eight Commonwealth heritage places; and
- nine national heritage places.

No Aboriginal heritage sites occur within the Project Area. Numerous Aboriginal heritage places registered under the Western Australian *Aboriginal Heritage Act 1972* occur along the coastline within the EMBA beyond the Project Area, predominantly along the Dampier Peninsula.

No tourism activities occur within the Project Area, but they do occur throughout the EMBA beyond the Project Area.

The maritime industry within the Project Area consists primarily of commercial shipping, with a shipping fairway for commercial vessels transiting to and from Port Hedland overlapping the Project Area. Maritime industry within the EMBA includes shipping, ports, and petroleum exploration and production.

There are no designated Department of Defence exercise areas overlapping the Project Area.

ES-4. Acceptable Levels of Impacts and Risks

The OPGGS (E) Regulations require that Santos demonstrate the environmental impacts and risks associated with Dorado Phase 1 are of an acceptable level. Santos has defined acceptable levels of impacts and risks for the environmental receptors that may credibly be impacted by Dorado Phase 1 to address this requirement. The predicted environmental impacts and risks from all aspects of Dorado Phase 1 were then compared to the predefined acceptable levels to evaluate whether the impacts and risks were below the acceptable level.

The following criteria were considered by Santos when developing receptor-specific acceptable levels of impacts and risks:

+ the environmental value of the receptor;
+ the principles of ecologically sustainable development;
+ relevant requirements;
+ internal context; and
+ external context.

ES-5. Analysis of Alternatives

The petroleum resources within the Project Area could be developed using numerous field development concepts, each concept could be implemented using different types of production facilities, and each alternative has relative advantages and disadvantages.

In progressing the Dorado Development, Santos has considered a range of alternatives to inform development concepts and to understand the feasibility of alternative field development concepts. The assessment process used by Santos involved a multidisciplinary evaluation of concept and design alternatives across five criteria: technical feasibility, health and safety (H&S), environment, economic, and societal. After identifying that technically and commercially viable alternatives existed, Santos started identifying the preferred Dorado Development concept. The development concept to develop the oil resource ('liquids only') was selected as it enables the use of LPG-rich gas reinjection, which is required to enhance the volume of recoverable liquids from the Dorado field. It will be implemented via a wellhead platform and FPSO to achieve the early development of the resource and maximise the recovery of the liquids resource. This is Dorado Phase 1. Adopting the gas reinjection concept also preserves the potential for a future gas export development (Dorado Phase 2), subject to separate approvals, including an OPP, once the oil resource has been recovered and the recoverable gas resources are well understood.

After selection of the preferred field development concept, Santos considered and assessed a wide range of facilities, installation and construction methods, field gas management, produced water management and mooring design alternatives. These are detailed in the OPP.

The alternatives analysis process used and described in the OPP will be continued through the detailed design and engineering stages of the project.

ES-6. Description of the Project

The Dorado Development will develop the oil resources identified in the Bedout Sub-basin, with initial production being the light oil from the Caley reservoir, the main target reservoir, and condensate from the Baxter, Crespin and Milne reservoirs (which underlie the Caley). Collectively, these resources make up the Dorado reservoir and are termed the Dorado field, will produce Dorado oil, and are the foundation for Dorado Phase 1. The key characteristics of the proposed Dorado Phase 1 development are summarised in **Table 0-1.** The current development concept shown in **Figure 0-2** comprises:

+ A not normally manned wellhead platform (Dorado WHP) with provision for 16 wells (oil/gas production and gas reinjection) drilled from a single drill centre on the WHP. Gas will be reinjected via the wells (located on the WHP) into the reservoir to enhance oil recovery. The WHP will be remotely powered and operated from the FPSO;

- Infield flowlines approximately 2.2-km in length to transport the hydrocarbons and associated production fluids and an umbilical to provide chemicals, power and communications between the Dorado WHP and the FPSO;
- An FPSO connected to the seabed via a disconnectable turret mooring (DTM). The FPSO will include accommodation and processing facilities and will allow for the storage and offloading of the hydrocarbons via an offtake tanker; and
- The future development of prospects identified in the Project Area (targeting the Archer Formation) as tiebacks to either the Dorado WHP or the FPSO to augment oil production for the project life. The characteristics of these future tieback reservoirs are expected to be similar to that of the Dorado field (i.e. from the Archer Formation, yielding similar products).

The Dorado field and future tiebacks are expected to produce hydrocarbons over the operating life of the facilities (20 years). At the end of the commercial lifetime, Dorado Phase 1 infrastructure will be decommissioned in accordance with standard industry practices and relevant legislation at the time of decommissioning.

Table 0-1: Key characteristics of the Dorado Phase 1 development

Project Element	Number, Extent, or Range
Project Area	The Dorado Development Project Area is spatially defined in **Figure 6-4.**
Wells	A maximum total of 38 wells, being a combination of oil and gas development wells and gas reinjection wells, located within the Project Area, will be comprised of: + Up to 16 wells with dry trees on the Dorado WHP, being: - 6 x oil production; - 2 x gas production; - 2 x gas reinjection; and - Up to 6 additional wells that are a combination of production and gas reinjection wells. + Up to 22 wells will be future tie-backs located within the project area, with the breakdown of production and gas reinjection wells to be determined by the tieback reservoir characteristics.
WHPs	A maximum of three (3) not normally manned WHPs, comprising: + One gravity based not normally manned WHP located in the Dorado field, in the vicinity of the site described in Table 6-2, with 16 slots for production and gas reinjection wells. + Up to an additional two (2) not normally manned WHP's located in the project area.
FPSO facility	One (1) FPSO located at the Dorado field, in the vicinity of the site described in **Table 6-2**, moored by a DTM system used for processing and treatment of the recovered liquids for export, reservoir gas for power generation, pilot flare, and gas reinjection. FPSO connected to the WHP via flowlines (initially two hydrocarbon production and one gas reinjection), an umbilical and risers.

Project Element	Number, Extent, or Range
Future tie-backs - pipelines and subsea systems	Comprising flowlines, umbilical's and potentially manifolds depending on the tie-back concept, providing for two future tie-backs.
Dorado Phase 1 hydrocarbons	Light oil and condensate as described in **Section 6.4,** with a total volume of 350 MMbbls over 20 years.
Project life	Project life is presented in **Table 0-2**, including operation of the FPSO for a 20-year period.

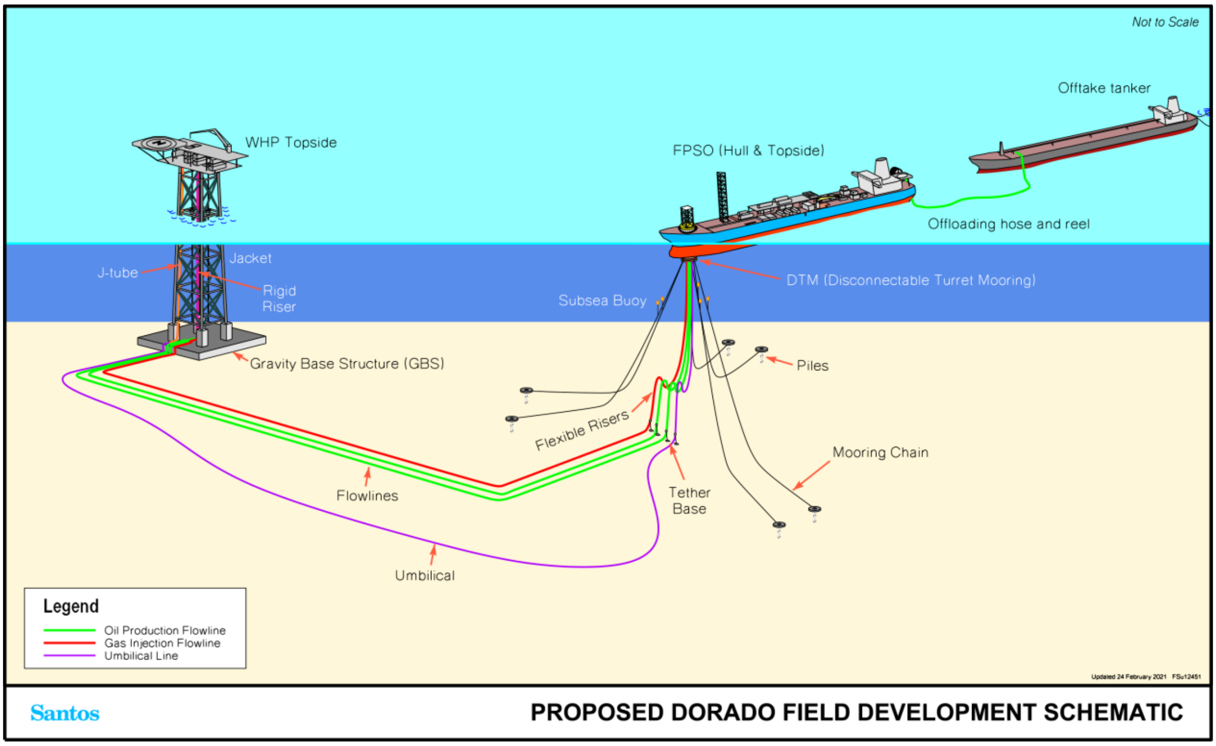

Figure 0-2: Proposed Dorado Phase 1 Field Development Concept

Vessels transiting to and from the Project Area are not considered a petroleum activity: they fall under other maritime legislation, including the Commonwealth Navigation Act 2012, and therefore are excluded from the scope of this OPP. In addition, helicopter activities outside a petroleum safety zone are also not defined as petroleum activities.

Development Schedule

The indicative timeframes and development schedule of key activities are presented in **Table 0-2.**

Table 0-2: Indicative Dorado Phase 1 schedule

Activity	Approximate Timing	Approximate Duration
Dorado WHP installation and FPSO mooring installation (including piling)	Approximately 18 to 24 months post FID	3 to 6 months

Activity	Approximate Timing	Approximate Duration
Dorado reservoir wells drilling (up to16)	Approximately 18 to 24 months post FID following Dorado WHP installation	24 months
FPSO arrival and commissioning (ready for start-up)	Approximately 4 years post-FID	3 months prior to the ready for start-up date
Production Operations commence	2027 (pending FID timing)	20 years
Future tieback well drilling (up to 22)	Within the 20-year operating life of Dorado Phase 1	
Decommissioning	At the end of the commercial lifetime of Dorado Phase 1 (expected to be approximately 2047 at the earliest).	

Project Stages

The key activities within these project stages are summarised in **Table 0-3**. Future tiebacks are expected to involve components of the same key stages and activities as those of the Dorado WHP and FPSO development. The Dorado WHP and FPSO locations will remain unchanged for Dorado Phase 1.

Table 0-3: Project stages and key activities

Project Stage	Key Activities
Installation of the Dorado WHP and FPSO mooring piles	+ Transport and installation of Dorado WHP substructure + Transport and installation of Dorado WHP topsides + Transport, piling and installation and of FPSO mooring piles
Development drilling	+ Drilling of oil/gas production and gas reinjection wells + Well testing
Installation of subsea equipment and connections between infrastructure	+ Installation of subsea system, including flowlines, MWA, risers, manifolds and umbilicals + Transport, installation and mooring of the DTM + Transport, piling and installation of FPSO mooring piles (optional if not completed at time of WHP installation activities)
Hook-up of FPSO	+ Sail away and connection of the FPSO to the DTM and FPSO hook-up
Commissioning	+ Commissioning, testing and monitoring of systems and equipment on the Dorado WHP and FPSO topsides + Commissioning of the flowlines and umbilicals (e.g. hydrotesting and dewatering)
Operations and maintenance	+ Dorado WHP and FPSO operations + Planned maintenance and shutdown campaigns + Periodic product offtake by offloading tankers temporarily connected to the FPSO for transport to market + Well interventions activities

Project Stage	Key Activities
	+ Drilling of infill wells at the Dorado WHP + Vertical seismic profiling (drilling and 3-D)
Future tiebacks	+ Development of reservoirs (currently identified as prospects) within the Dorado Development Project Area. Key activities associated with these future developments may include: - Site surveys - Drilling of additional wells (with the potential installation of subsea trees) - Installation and commissioning of subsea flowlines or pipelines, WHPs or manifolds (if subsea development) and umbilicals from the additional wells to the Dorado WHP or FPSO
Decommissioning	+ Flush flowlines and WHP from FPSO + Disconnection of the FPSO and sail away for offsite decommissioning or reuse + Plugging and abandonment of the production and gas reinjection wells + Disconnection and decommissioning of the Dorado WHP + Decommissioning of the subsea system

ES-7. Evaluation of Environmental Impacts and Risks

Santos has undertaken environmental impact and risk assessments for Dorado Phase 1 in accordance with the Santos' Risk Management General Procedure and risk management processes specific to Santos' offshore operations.

Santos operates under an overarching Risk Management Policy, which is underpinned by Santos' health, safety and environment management processes. The key steps of Santos' process for assessing environmental impacts and risks for this OPP are shown in **Figure 0-3**.

The impact or risk for each activity and associated hazards was assessed following the application of controls. For planned events, only the consequence of the impact was assessed. Likelihood was not assessed, as the occurrence of planned events is effectively certain. The consequence for planned events was based on all controls functioning effectively. For unplanned events, the environmental residual risk of the event was determined based on the likelihood and consequence of the events. The likelihood of an unplanned event occurring was based on all controls functioning effectively. The consequence was based on a worst-case event occurring with all controls having failed. This provides a conservative approach to assessing consequence, as the likelihood of a worst-case event with the failure of all controls is remote.

The resulting consequence (planned events) or residual risk (unplanned events) was then compared to Santos' acceptable levels of impact and risk, including receptor-specific acceptable levels of impact. If the impact or residual risk was determined to not be acceptable, additional controls were applied and the impact or risk was assessed again. This process was repeated until each impact or residual risk was reduced to an acceptable level. The impacts and risks resulting from planned events along with key controls are provided in **Table 0-4.** The impacts and risks resulting from unplanned events are provided in **Table 0-5**, along with the key controls.

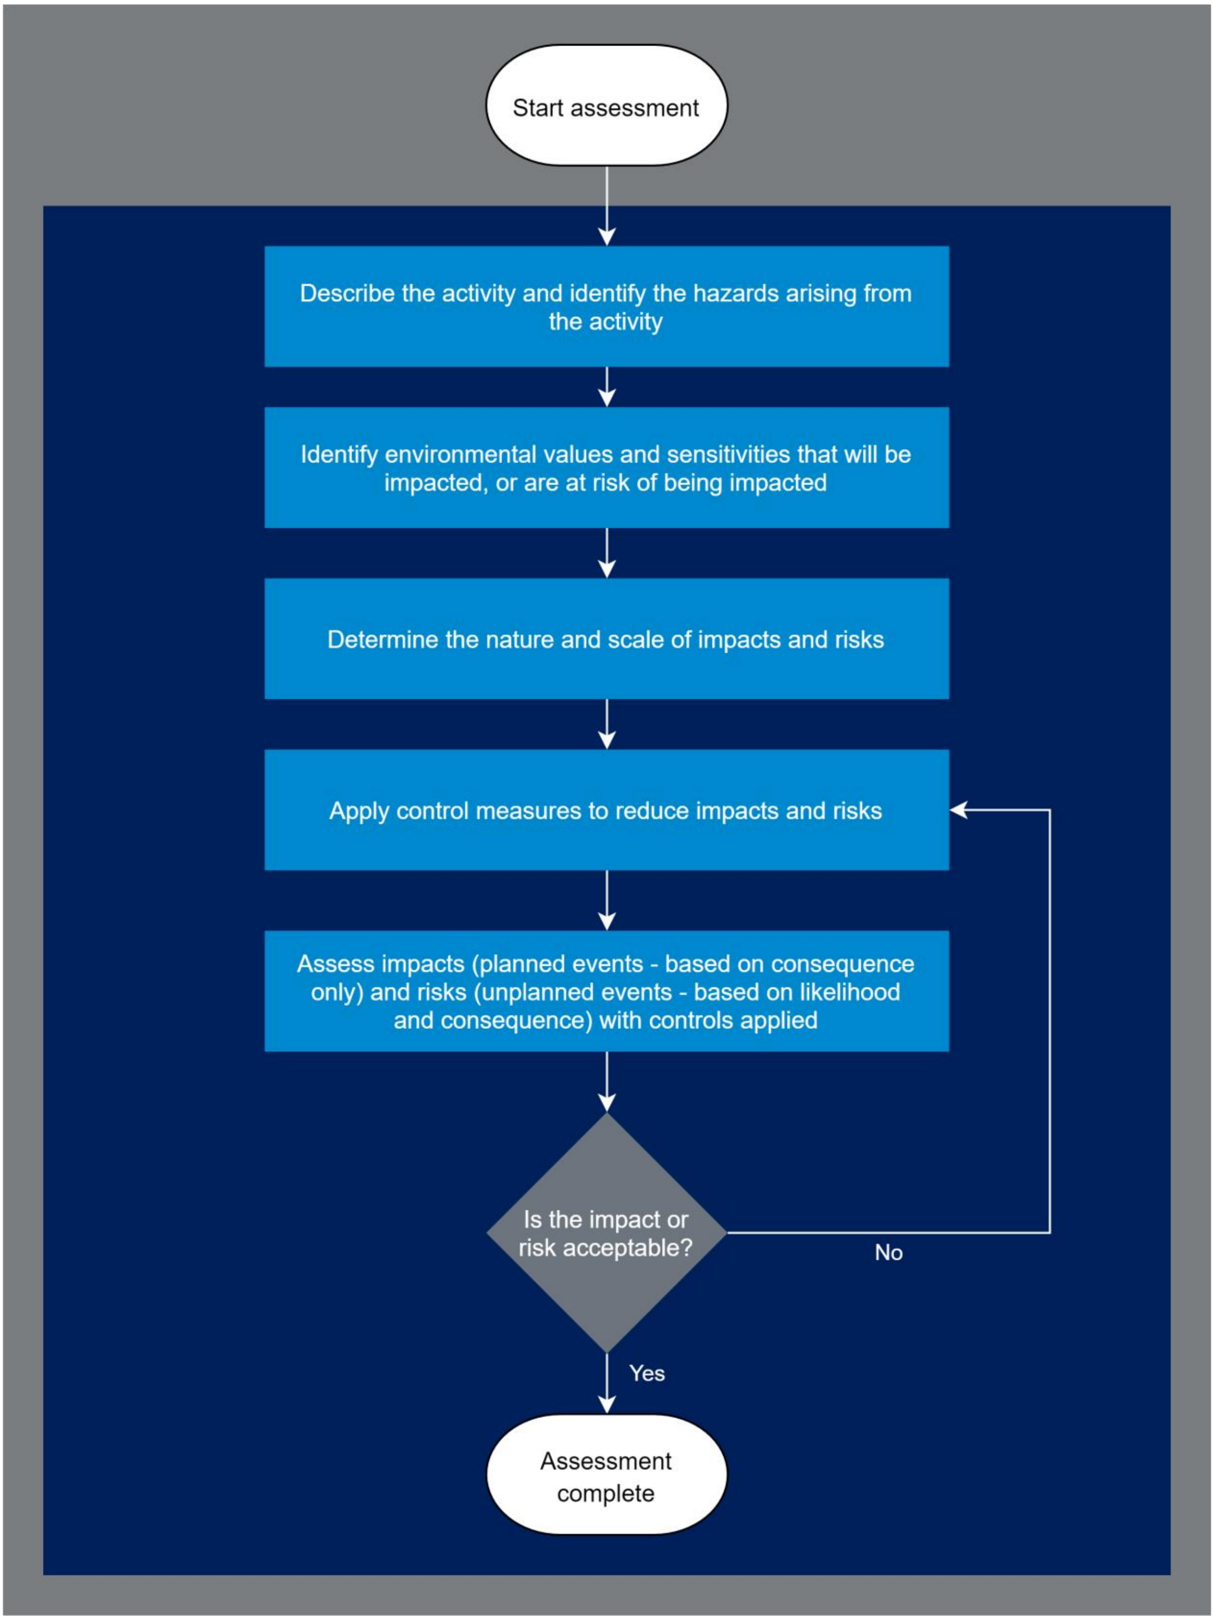

Figure 0-3: Environmental impact and risk assessment process

Cumulative Impact Assessment

In addition to assessing each aspect and its associated hazards independently, Santos has also undertaken a cumulative impact assessment. This cumulative impact assessment considered potential synergistic impacts on environmental values and sensitivities from all aspects of Dorado Phase 1 and third-party activities. The cumulative impact assessment was only undertaken for planned events. No consideration of cumulative impacts from unplanned events was made, as these events are not expected to occur during Dorado Phase 1.

All cumulative impacts were assessed against the acceptable levels of impact defined for Dorado Phase 1 and found to be acceptable.

ES-8. Environmental Performance Framework

Santos will ensure that environmental impacts and risks will be maintained within acceptable levels and that environmental performance outcomes (EPOs) will be achieved by implementing an environmental performance framework. The OPGGS (E) Regulations require that Santos develop and implement EPs for all petroleum activities within the scope of this OPP. Each EP must be assessed and accepted by NOPSEMA prior to Santos commencing the petroleum activities. EPs for activities within the scope of this OPP may not be submitted until this OPP has been accepted by NOPSEMA. The effective application of EPOs will be demonstrated through the implementation of subsequent EPs.

EPs will contain EPOs (these are the EPOs that will be accepted as part of this OPP), environmental performance standards, measurement criteria and a detailed implementation strategy. The EPOs in the EPs will maintain an equivalent level of environmental performance than that stated in this OPP.

Santos will have an Emergency Response Plan in place to address all credible operational risks and scenarios. The plan will provide procedural guidance specific to the activity to control, coordinate and respond to an emergency or incident, including hydrocarbon spills.

The OPGGS (E) Regulations require the implementation strategy in an EP to contain an OPEP. The OPEP must include adequate arrangements for responding to oil pollution that may arise from the petroleum activities considered in the EP, as well as testing arrangements to ensure ongoing capability. The arrangements must be tested at least every 12 months, as well as when they are introduced or modified.

Table 0-4: Summary of the assessment of planned environmental impacts and risks from Dorado Phase 1

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
Discharges-Drilling Fluids and Cuttings Discharges (**Section 7.2.1**)	Water Quality	Localised decrease in water quality during drilling operations.	**EPO1A**: Impacts to sediment quality and water quality as a result of Dorado Phase 1 drilling fluids and cuttings discharges restricted to a 1 km radius from Dorado facilities. **EPO2A**: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area. **EPO3A**: No mortality or significant[1] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of drilling fluids and cuttings.	**CM1**: All wells to be drilled using water-based mud (WBM), with non-aqueous fluid (NAF)/ synthetic based mud (SBM) only to be used where technical requirements preclude the use of WBM. **CM2**: Santos chemical selection process will be implemented to select drilling chemicals, muds and fluids with low environmental risk, while meeting technical requirements. **CM3**: Drilling fluids inventory will be developed and tracked to reduce discharge of excess powders, brines, and drilling fluids. **CM4**: Drill cuttings will be processed on the mobile offshore drilling rig (MODU) to recover drilling fluids and reduce residual fluids content prior to overboard discharge. **CM5**: An assessment of drill cuttings and fluids discharges will be undertaken prior to drilling future tieback wells to ensure impacts to environmental values and sensitivities are within acceptable levels. **CM6**: Benthic habitat surveys will be undertaken prior to drilling at future tieback locations to identify and avoid sensitive benthic habitat.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect
	Sediment Quality	Deposition of drill cuttings during drilling operations.			
	Benthic Habitats	Localised smothering and loss of habitat.			
	Marine Fauna (benthic infauna)	Oxygen degradation and bioaccumulation of contaminants in benthic infauna.			
Discharges-Produced Water Discharge (**Section 7.2.2**)	Water Quality	Localised decrease in water quality during the operational stage of the Dorado Development.	**EPO3B**: No mortality or significant[2] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of produced water (PW). **EPO4A**: Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring a 99 % species protection level (based on ANZG 2018) for water quality is achieved outside of the PW mixing zone boundary[2]. **EPO5A** Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring ANZG 2018 sediment quality guideline values are not exceeded outside the PW mixing zone[2]. **EPO6A:** Dorado Phase 1 is managed so that seafood caught within the project area remains safe for human consumption**.**	**CM7**: PW treatment system to meet OIW discharge standards: + Less than 30 mg/L OIW during steady state operations averaged over 24 h + between 30 mg/L and 100 mg/L OIW averaged over 24 h during the initial start-up period and for commissioning of future tieback (up to 6 months after first oil) **CM8**: Adaptive PW management plan including: + PW modelling, + in-field environmental monitoring to verify predicted mixing zone modelling, + in-field environmental monitoring to assess potential impacts against ANZG 2018 water quality and sediment quality guidelines, + PW chemical characterisation, + PW ecotoxicity testing, + tiered management system in response to off-specification water (e.g. storage onboard and retreatment prior to discharge), + studies to verify whether bioaccumulation of toxicants in biota attributable to the discharge of PW, + adaptive management triggers and mitigative measures in response to results of bioaccumulation studies, + adopt changes in relevant legislative requirements and updates to ANZG to PW discharges.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect
	Sediment Quality	Deposition of very small quantities of precipitated solids during the operational stage of Dorado Phase 1.			
	Marine Fauna	Bioaccumulation of contaminants in marine fauna.			

[1] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

[2] Produced water mixing zone determined to be 1000 m from the FPSO during a <30 mg/L PW discharge.

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
				CM9: Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements.	

Discharges-Wastewater Discharges
(Section 7.2.3)
	Water Quality	Localised decrease in water quality around wastewater discharge locations.	**EPO3C**: No mortality or significant[3] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of wastewater.
			EPO7A: Dorado Phase 1 routine planned wastewater discharges compliant with relevant established industry standard environmental discharge limits
				CM9: Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements.
				CM10: All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification):
				+ Marine Order 91 (Marine Pollution Prevention – Oil), which implements Annex I of MARPOL 73/78, including (as required by vessel class):
				  + Machinery space bilge/oily water shall have International Maritime Organization (IMO)-approved oil filtering equipment (oil/water separator) with an on-line monitoring device to measure OIW content to be less than 15 ppm prior to discharge.
				  + A deck drainage system capable of controlling the content of discharges for areas of high risk of fuel/oil/grease or hazardous chemical contamination.
				  + Valid International Oil Pollution Prevention Certificate.
				+ Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including:
				  + Garbage management plan in place.
				  + Garbage record book maintained onboard.
				+ Marine Order 96 (Marine Pollution Prevention – Sewage), which implements Annex IV of MARPOL 73/78, including (as required by vessel class):
				  + a valid International Sewage Pollution Prevention Certificate,
				  + an IMO-approved sewage treatment plant, or
				  + a sewage comminuting and disinfecting system, or
				  + a sewage holding tank sized appropriately to contain all generated waste (black and grey water), and
				  + discharge of sewage will occur at a moderate rate while vessel is proceeding (at more than 4 knots).
					Minor – II
					Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect

	Sediment Quality	Minor increase in concentrations of contaminants, nutrients and organic carbon in sediments, along with a small increase in biochemical oxygen nutrients around wastewater discharge locations.			
	Marine Fauna	Potential behavioural disturbance in close proximity to the discharge and bioaccumulation of contaminants in marine fauna.			
Emissions – Artificial Light **(Section 7.2.4)**	Plankton Fish Marine Mammals Reptiles Birds	Potential changes in behaviour, such as attraction, avoidance and disorientation, of marine fauna.	**EPO3D**: No mortality or significant[4] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 artificial light emissions. **EPO8A**: Artificial light emissions do not result in the displacement of marine turtles from habitat critical to their survival.	**CM11**: Align lighting design on Dorado Development facilities (e.g. WHP, FPSO) with light design described in National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia 2020), including: + Using minimum number and intensity of lighting to meet operational requirements (e.g. safety, navigation etc.), + Adapting lighting for colour, intensity and timing where practicable, and + Using non-reflective, dark-coloured surfaces where practicable (i.e. where safety is not compromised). **CM12:** Manage lighting on vessels to reduce light spill to the environment where practicable. **CM13**: Implement adaptive management (e.g. shielding, retrofitting with lower intensity lights etc.) of artificial light emissions if there is a moderate environment incident resulting from light emissions.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect

[3] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
				CM14: Flaring limited to operation of the flare pilot during steady state operations.	
Emissions- Acoustic Emissions (**Section 7.2.5**)	Marine Mammals	Potential permanent threshold shift (PTS), temporary threshold shift (TTS), behavioural impacts and masking.	**EPO3E**: No mortality or significant[4] impacts to EPBC Act listed, threatened, migratory or cetacean species as a result of Dorado Phase 1 acoustic emissions. **EPO9A** Undertake Dorado phase 1 in such a manner that noise in biologically important areas will be managed to prevent any displacement of threatened species as per EPBC Act species conservation requirements. **EPO10A** No impacts from Dorado Phase 1 acoustic emissions to pre-existing commercial fish stocks that occur within the project area that could be subject to existing or future fishing effort. **EPO11A:** No injury to pygmy blue whales in a pygmy blue whale BIA. **EPO12A:** noise generating activities of Dorado Phase 1 are managed in such a manner to prevent PTS and reduce the risk of TTS and biologically important behavioural disturbance to all whales in the Commonwealth marine area.	**CM15:** Vessels movements and helicopter flights comply with Part 8 of EPBC Regulations for interacting with cetaceans. **CM16**: Implement Santos' Protected Marine Fauna Interaction and Sighting Procedure. **CM17**: Undertake acoustic emissions modelling for piling, 3D VSP and drilling VSP activities for potential future tiebacks. **CM18**: Implement mitigation measures for drilling VSP and 3-D VSP activities aligned with EPBC Act Policy Statement 2.1 - Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a), including: + development of low-power and shutdown zones, + marine fauna observers, + pre-start visual observations, + soft-start procedures, + stop work procedures, and + night-time and low visibility procedures. **CM19**: Implement mitigation measures for piling activities, including: + marine fauna observers, + pre-start visual observations, + soft-start procedures, + stop work procedures, and + night-time and low visibility procedures **CM20:** Where future activity specific acoustic emissions modelling results indicate PTS, TTS envelopes overlap with a pygmy blue whale BIA, related impulsive noise generating activities will not occur during corresponding peak migration periods.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect
	Fishes	Potential mortal injury, recoverable injury, TTS and behavioural disturbance.			
	Reptiles	Potential PTS, TTS and behavioural disturbance.			
Emissions- Greenhouse Gas (**Section 7.2.6**)	Australian Environment	Potential impacts as a result of climate change have been modelled by Commonwealth Scientific and Industrial Research Organisation (CSIRO). The modelling indicates that temperatures will increase across Australia; rainfall patterns will change significantly; and extreme events, such as droughts, floods and wildfires, will become more common. These changes are likely to impact on individual species, ecosystems and ecosystem services, such as food and	**EPO13A**: Dorado Phase 1 Scope 1 GHG emissions managed in accordance with the Safeguard Mechanism benchmark baseline set by the Clean Energy Regulator, in support of meeting the Australian Government's Paris Agreement Nationally Determined Contribution of net zero emissions by 2050. **EPO14A**: As the Paris Agreement is the most comprehensive global agreement to seek to limit global temperature rise as specified in Article 2 of the Agreement and no significant[5] impacts to the environment globally, including in Australia, Dorado	**CM14:** Flaring limited to operation of the flare pilot during steady state operations. **CM21:** Optimise facility design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable. **CM22:** The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare, and direct them to be reinjected with the produced gas. **CM23:** Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities. **CM24**: During routine operations, reinject produced gas (other than safety flare and fuel gas) to recover liquids. **CM25:** Embed fugitive emissions surveillance and management into facilities operations and maintenance. **CM26:** Undertake fuel and flare analysis, baselining and forecasting throughout Dorado Development operational life.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect

[4] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013)

[5] As defined by the significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
		water availability. Within decades, environments across Australia may be substantially different (CSIRO and Bureau of Meteorology 2015).	Phase 1 oil is only sold to customers from countries that have: + a net-zero emissions by 2050 (NZE) commitment; and/or + are signatories to the Paris Agreement and have Nationally Determined Contributions (NDC) in place to reduce or offset GHG emissions.	**CM27:** Establish annual setting of energy efficiency improvements and targets throughout the life of Dorado Phase 1 facilities. **CM28:** Throughout the life of Dorado Phase 1 facilities undertake optimisation of energy efficiency through periodic opportunity identification workshops or studies, evaluation and implementation. **CM29**: Dorado Phase 1 will report on Scope 1 GHG emissions as required per the National Greenhouse and Energy Reporting (NGER) Scheme. **CM30**: Dorado Phase 1 will comply with the requirements of the Safeguard Mechanism, including purchase and/or surrender of Australian carbon credit units for any emissions above the baseline for the year, to support achievement of Australia's NDC emissions targets. **CM31**: Dorado Phase 1 will implement a GHG management plan that incorporates an adaptive management approach that facilitates a continuous cycle of monitoring, evaluating, and implementing improvements to minimise GHG emission to ALARP and acceptable levels over the life of field operations including: + Evaluation of emissions monitoring data and ensuring the implemented controls deliver predicted emission reductions; + Seeking new and relevant data/information from external sources relevant to GHG emission management including Commonwealth legislation or policy; + Ensuring effectiveness of internal processes and procedures to reduce and manage GHG emissions; + Responding to changes from detailed engineering outcomes; and + Implementing corrective actions identified from the above. **CM32**: Dorado Phase 1 will limit sales to customers from countries that have a NZE commitment or are signatories to the Paris Agreement, and will cease to supply customers in countries that withdraw from the Paris Agreement or NZE commitments. **CM33:** Regular monitoring of Dorado Phase 1 customer country compliance with NZE or NDC emissions targets (Article 4) through the Paris Agreement monitoring and assurance mechanisms: + the enhanced transparency framework 5-yearly reporting (Article 13) + the 5-yearly Global Stocktake (Article 14); and + implementation and compliance committee annual reporting (Article 15). **CM34:** If results of CM33 identify gaps in customer country compliance against NZE or NDC emissions targets, Dorado will cease to supply those customers or take mitigation actions to offset their Dorado Phase 1 product emissions.	
Emissions-Atmospheric Emissions (**Section 7.2.7**)	Air Quality	Change in air quality.	**EPO15A**: No significant[6] impacts to air quality throughout the life of Dorado Phase 1.	**CM14**: Flaring limited to operation of the flare pilot during steady state operations. **CM21:** Optimise facility design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable. **CM22:** The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare, and direct them to be reinjected with the produced gas.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect

[6] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
				CM23: Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities. **CM25:** Embed fugitive emissions surveillance and management into facilities operations and maintenance. **CM35**: The MODU, vessels, and FPSO will comply with MARPOL Annex VI (Prevention of Air Pollution from Ships), the Navigation Act 2012, the Protection of the Sea (Prevention of Pollution from Ships) Act 1983 and subsequent Marine Orders, which require vessels to have a valid International Air Pollution Prevention Certificate (for vessels more than 400 tonnage) and to use low-sulphur fuel. **CM36:** Ozone-depleting substances onboard vessels and the facilities will comply with relevant MARPOL 73/78 (Annex VI - air pollution), Navigation Act 2012, Protection of the Sea (Prevention of Pollution) Act 1983 *a*nd subsequent Marine Order requirements (as appropriate for vessel classification). **CM37**: Measure, monitor or estimate facility fuel and flare emissions (in accordance with the National Pollutant Inventory) to inform and optimise management practices and minimise environmental impact of emissions. **CM38**: National Pollutant Inventory reporting records (or contemporary requirements at the time of the activities) will be complied with during the project.	

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
Physical Presence- Interactions with Other Users (**Section 7.2.8**)	Commercial Fisheries Maritime industry	Displacement of other users from exclusion zones within the Project Area during installation/drilling operations Exclusion of other users from the gazetted PSZ during production operations	**EPO16A**: No adverse interactions[7] between Santos' activities and other maritime users within the Project Area. **EPO17A**: The installation and drilling operations, production operations and decommissioning activities of the project will be managed in a manner that does not interfere with other marine users within the Project Area to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of Santos under the Dorado petroleum titles. **EPO18A** Decommissioning of Dorado facilities in compliance with Section 572 (3) of the OPGGS Act 2009.	**CM39**: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the *Navigation Act 2012* and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM40**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM41**: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM42**: Should potential future tiebacks overlap within Australian Maritime Safety Authority (AMSA) fairways, Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way. **CM43**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM44**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM45**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development facilities. **CM46**: Decommissioning of Dorado Phase 1 facilities will be carried out in accordance with regulatory requirements per Section 572 (3) of the OPGGS Act. **CM47:** exclusion zones/petroleum safety zones will be limited to the minimum area necessary to exercise rights and perform duties under project specific petroleum titles. **CM48:** residual impacts to other marine users of the environment are managed to not interfere with their rights.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect
Physical Presence – Seabed Disturbance (**Section 7.2.9**)	Water Quality Sediment Quality	Temporary, localised decrease in water quality during installation and removal of components on the seabed. Localised, minor modification of sediment characteristics, such as geological origin and particle size distribution.	**EPO2B**: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area. **EPO18B** Decommissioning of Dorado facilities in compliance with Section 572 (3) of the OPGGS Act 2009	**CM49**: Decommissioning of Dorado Phase 1 facilities will be carried out in accordance with regulatory requirements per Section 572 (3) of the OPGGS Act. **CM50**: Seabed footprint to be reduced within the limits of technical requirements and practicability, as well as safety constraints. **CM51**: Undertake benthic habitat surveys for future tieback locations and proposed subsea infrastructure corridors prior to development to identify and avoid sensitive benthic habitat where practicable within technical and safety constraints.	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect

[7] Whether an interaction constitutes an adverse interaction will be determined on a case by case basis. Examples of adverse interactions may include substantiated complaints by other marine users to Santos or NOPSEMA, vessel collisions, or damage to unsupervised fishing equipment (e.g. traps). Interactions where other users have not taken reasonable measures to avoid the interaction (e.g. third-party vessel not adhering to standard maritime requirements or ignoring advice provided during consultation) are not considered to be adverse.

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Consequence
	Benthic Habitats	Localised, minor modification of benthic habitats from the introduction of artificial hard substrates.	**EPO3F**: No mortality or significant[8] impacts to EPBC act listed threatened and migratory species as a result of Dorado Phase 1 seabed disturbance. **EPO19A**: Impacts to sediment quality and water quality as a result of seabed disturbance from Dorado Phase 1 restricted to a 1 km radius from Dorado facilities		
	Fishes	Increased fish diversity and abundance due to modification of benthic habitats.			
	Fisheries	Potential enhanced recruitment of targeted species and increased catches.			

[8] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Table 0-5: **Summary of the assessment of unplanned environmental impacts and risks from Dorado Phase 1**

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Likelihood	Consequence	Residual Risk
Accidental Release – Hydrocarbon and Chemical Spills (**Section 7.3.1**)	Water Quality	Potential widespread decrease in water quality from hydrocarbon pollution.	**EPO20A** Undertake Dorado Phase 1 in a manner that will prevent unplanned discharge of chemicals or hydrocarbons to the marine environment. **EPO21A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of reservoir fluids to the marine environment due to a LOWC, or failure of a flowline or FPSO cargo tank. **EPO22A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of MDO/MGO or HFO to the marine environment due to vessel collision, failure of a storage tank or release during refuelling. **EPO23A** In an event of an unplanned release of chemicals or hydrocarbons, spill response control measures will be implemented in accordance with an accepted EP/OPEP.	**CM9** Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements. **CM52**: Accepted well operations management plans in place for all wells detailing: + blowout preventer installation and testing, + competency of the drillers engaged, + monitoring of wellbore progress and drilling fluid balance, and + well designs that consider reservoir characteristics. **CM53**: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the *Navigation Act 2012* and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM54**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM55**: All project vessels subject to Santos' marine assurance procedures. **CM56**: All offtake tankers subject to Santos' tanker vetting procedures. **CM57**: Bunkering procedures to manage the transfers of fuel that include: + weather limits on bunkering operations, + bunkering equipment specifications and inspections, + visual observations during transfers, and + emergency shutdowns. **CM58**: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM59**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM60**: Should potential future tiebacks overlap within AMSA fairways Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way. **CM61**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM62**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development.	Unlikely – B	Major -IV + Large-scale impact to Environmental Value(s) of conservation significance + Moderate scale surface water impact	Low
	Sediment Quality	Potential localised decrease in water quality from hydrocarbon pollution.					
	Communities and Habitats	Potential widespread impacts to benthic and coastal communities and habitats from hydrocarbon pollution.					
	Fishes	Potential acute and chronic toxic effects.					
	Marine Mammals						
	Reptiles						
	Birds						
	Protected Areas	Potential impacts to the natural and socio-economic values of marine and coastal protection areas.					
	Fisheries	Potential temporary closure of fisheries due to hydrocarbon pollution.					
	Heritage	Potential loss of cultural values of heritage sites.					
	Tourism	Potential impacts to tourism through loss of nature-based tourism resources due to hydrocarbon pollution.					

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Likelihood	Consequence	Residual Risk
				CM63: FPSO will be designed, constructed and operated to Santos' specified requirements, including: + double-hulled construction, + cyclone and adverse weather avoidance procedures, and + structural integrity inspection regime. **CM64:** Oil-spill modelling and environmental risk assessments for the Dorado Phase 1 Eps and OPEPs will consider the full range of worst-case scenario LOWC consequences based on the best available oil-spill modelling. **CM65:** During Development Well drilling and drilling of tieback wells, a simultaneous production and drilling (SIMOPS) workshop will be completed, and a procedure developed to manage and mitigate any additional risks due to concurrent activities. **CM66:** Accepted EP/OPEPs in place for all Dorado Development activities. **CM67**: All vessels involved in the project will have a valid Shipboard Oil Pollution Emergency Plan or Shipboard Marine Pollution Emergency Plan (as appropriate for vessel classification). **CM68**: Source control emergency response plans in place for all drilling activities. **CM69:** Emergency response capability (including equipment, personnel contracts, MOUs) will be maintained in accordance with approved SOPEPS accepted EPs and OPEPs.			

Accidental Release – Loss of Solid Material
(**Section 7.3.2**)
	Benthic Habitat	Modification of benthic habitats from accidental loss of solid material.	**EPO3G**: No mortality or significant[9] impacts to EPBC act listed threatened migratory or cetacean species as a result of Dorado Phase 1 loss of solid material.
			EPO24A: No significant impacts[8] to benthic habitats and communities.
			EPO25A Undertake the Dorado Phase 1 in a manner that will prevent an unplanned discharge of solid waste to the marine environment.
			EPO26A Undertake the Dorado Phase 1 in a manner that will prevent unplanned seabed disturbance.
				CM10: All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification):
				+ Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including:
				  + garbage management plan in place.
				  + garbage record book maintained onboard.
				CM70: Crane and lifting operations will comply with the following:
				+ lifting equipment will be inspected and certified,
				+ preventative maintenance will be carried out, and
				+ lifting operators will be competent and qualified.
				CM71: Objects dropped overboard will be recovered where practicable to mitigate the environmental consequences from objects remaining in the marine environment, unless the environmental consequences are minor or safety risks are disproportionate to the environmental consequences.
				CM72: Waste management procedures will include:
					Occasional – D	Minor – II
						Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect
							Low

	Marine Fauna	Injury or mortality of marine fauna due to ingestion of or entanglement with lost solid material.					

[9] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Likelihood	Consequence	Residual Risk
				+ classification of wastes, including segregation of wastes into recyclable and non-recyclable materials, + appropriate storage of wastes, and + transportation and disposal of wastes by a licenced waste contractor at licenced waste management facilities in accordance with waste classifications. **CM73:** After completion of the drilling and installation stages a site clean-up activity will be undertaken to identify and remove, if safe, any dropped objects or solid materials that may have been lost.			
Physical Presence – Introduction of Invasive Marine Species (IMS) **(Section 7.3.3)**	Benthic Habitats	Change in ecosystem dynamics.	**EPO27A:** Undertake Dorado Phase 1 in a manner that will prevent the introduction, establishment and spread of IMS in the natural environment attributable to the development. **EPO28A:** No significant[10] impacts to benthic habitats and communities, KEF and exploited fisheries resource stocks within the Project Area.	**CM74**: Ballast water exchange operations will comply with the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (as appropriate to vessel class), Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020), Protection of the Sea (Harmful Anti-fouling Systems) Act 2006 and Biosecurity Act 2015, including: + all ballast water exchanges conducted more than 12 nautical miles (nm) from land, and + Vessel Ballast Water Management Plan stipulating that ballast water exchange records will be maintained. **CM75**: Implementation of Dorado FPSO Biofouling Management Plan when the FPSO sails to the Project Area from international waters (such as when it first hooks up or comes back from dry dock) and as per the anti-fouling and in-water cleaning guidelines (Department of the Environment and New Zealand Ministry for Primary Industries 2015). **CM76**: Compliance with Santos IMS Management Plan. **CM77:** Biofouling management for vessels will be in accordance with the IMO Guidelines for the control and management of ships' biofouling to minimise the transfer of invasive aquatic species (Marine Environment Protection Committee 2011). **CM78:** Compliance with the International Convention on the Control of Harmful Anti-fouling Systems on Ships 2001, including vessels (of appropriate class) having a valid International Anti-fouling Systems Certificate. **CM79:** Fisheries will be provided with information on the timing, nature and scale of aspects of Dorado Phase 1 through Santos' consultation activities.	Unlikely (b)	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect	Very Low
	KEF	Changes to the functions, interests or activities of other users.					
	Fisheries	Reduction in fishery resource stocks.					
Physical Presence –Interactions with marine Fauna **(Section 7.3.4)**	Marine Mammals	Injury, disturbance/mortality to marine fauna.	**EPO29A**: No vessel or helicopter interactions within the Dorado Phase 1 Project operational area with EPBC Act listed threatened, migratory or cetacean species.	**CM16**: Implement Santos' Protected Marine Fauna Interaction and Sighting Procedure. **CM80:** Vessels within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans (except in emergency conditions or when manoeuvring is not possible), which include: + implement a caution zone of 150 m for dolphins and 300 m for whales, + vessels will not knowingly approach closer than 50 m to a dolphin and 100 m to a whale (i.e. no approach zone),	Unlikely – B	Minor – II Detectable but insignificant change to local population, industry or ecosystem factors.	Very Low
	Fishes						
	Reptiles						

[10] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)	Likelihood	Consequence	Residual Risk
				+ make sure a vessel does not drift or approach within 50 m of a dolphin or 100 m of a whale, + vessels will not knowingly travel more than 6 knots within the caution zone of a dolphin or whale, and + there will not knowingly be no more than three vessels within 300 m of a whale (i.e. caution zone). **CM81:** Helicopters within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans (except in emergency conditions or when manoeuvring is not possible), which includes: + not operating the helicopter at a height lower than 1 650 feet or within a horizontal radius of 500 metres of a cetacean + not allowing the aircraft to approach a cetacean from head on **CM82**: If a Part 13 Permit for the disturbance of listed migratory birds is required under the EPBC Act a Santos Bird Management Plan will be developed and implemented.		Localised effect	

ES-9. Stakeholder Consultation

To complement the NOPSEMA assessment process for OPPs and provide stakeholders with sufficient time to consider Dorado Phase 1, Santos will adopt a phased consultation approach for this OPP:

+ Phase 1 Consultation – prior to publication of the OPP by NOPSEMA (NOPSEMA Stage 1 Assessment);
+ Phase 2 Consultation – during formal public comment period on the OPP;
+ Phase 3 Consultation – after the public comment period and prior to resubmission of the OPP to NOPSEMA (NOPSEMA Stage 2 Assessment); and
+ Phase 4 Consultation – ongoing consultation post OPP acceptance to support preparation of EPs and operations.

Santos will consider all feedback provided by stakeholders and, where relevant, incorporate information provided by stakeholders into the environmental management of the Dorado Development.

1 Introduction

This document is the offshore project proposal (OPP) for the development of oil resources in the Bedout Sub-basin, located in Commonwealth waters approximately 140 km offshore from Port Hedland, Western Australia (**Figure 1-1**). Development of these resources is referred to within this OPP as the Dorado Development.

The Dorado Development will be developed through several phases: a first phase of oil production, including future tiebacks to augment oil production and export, and potentially a second phase for gas production:

- Dorado Phase 1 – oil production from the Dorado field and future tiebacks to augment oil production. In this phase recovered gas will be reinjected to the Dorado reservoir to enhance oil recovery. Dorado Phase 1 will be designed for liquid handling rates of 100 thousand standard barrels per day (KSTB/d) and gas reinjection capacity of 235 million standard cubic feet per day (MMscf/d). Dorado Phase 1 includes provision for future tiebacks with a total export volume of 350 million barrels (MMbbl) over 20 years.
- Dorado Phase 2 – future gas production. Recovered gas will be exported to either domestic gas and/or liquefied natural gas (LNG) facilities and will be optimised based on discovered resources in the Bedout Sub-basin at that time. Phase 2 will be subject to future exploration and investment decisions and separately assessed under environment regulatory approval processes.

This OPP seeks approval for Dorado Phase 1 only and has been prepared by Santos WA Northwest Pty Ltd, which is the proponent for the development. Santos WA Northwest Pty Ltd is a 100%-owned subsidiary of Santos Energy Limited (Santos). This OPP has been submitted to the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA) for assessment under Part 1A of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (OPGGS (E) Regulations), specifically its suitability for publication under Regulation 5C. This OPP outlines Santos' commitment to undertaking Dorado Phase 1 in a manner that ensures environmental impacts and risks are acceptable.

Dorado Phase 1 will contribute to meeting the world's future needs for oil resources, and will also bolster energy security for Australia in the wake of global energy supply shocks following the global pandemic and the Russia-Ukraine conflict.

Based on global energy studies and forecasts, oil plays a major role in the energy mix for a sustainable energy future and currently is forecast to provide the main source of energy for the transport sector into the future (**Section 7.2.6.5**). Even under the most aggressive accelerated energy transition scenarios, including the IEA Net Zero by 2050 scenario, there remains a requirement for investment in oil and gas production to maintain sufficient supply through the transition (refer to **Figure 1-1** and **Section 7.2.6.5**).

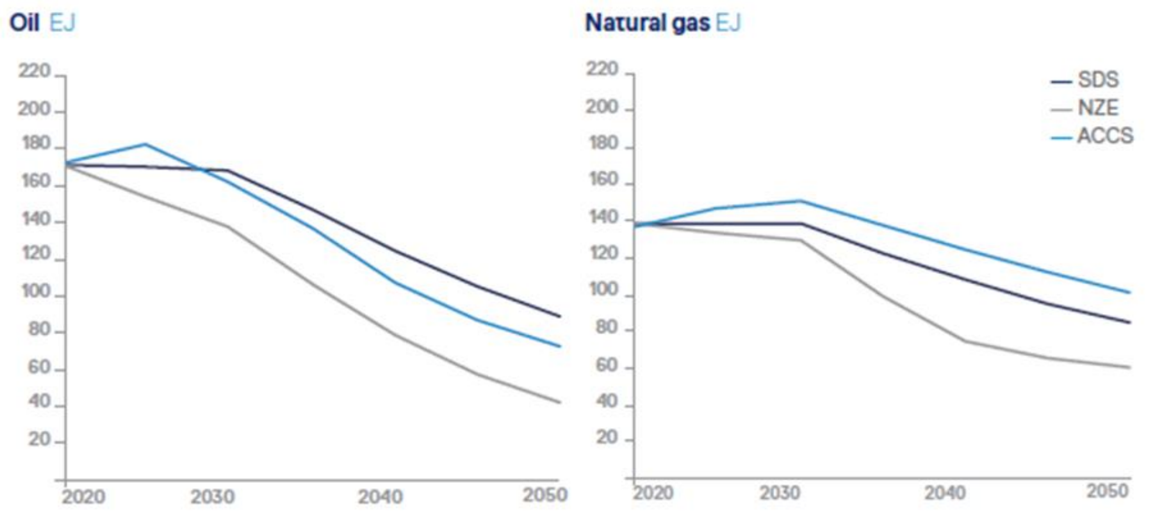

Figure 1-1: Total Energy Supply under Accelerated Energy Transition Scenarios; SDS – IEA Sustainable Development Scenario; NZE – IEA Net Zero Emissions by 2050 Scenario; ACCS – IHS Markit Accelerated CCS Scenario (Source: Santos 2022 Climate Change Report)

1.1 Project Overview and Location

The oil resources that will be developed lie within petroleum titles WA-437-P and WA-438-P. The foundation development of Dorado Phase 1 will consist of:

+ a wellhead platform (WHP) with up to 16 wells (production and gas injection);
+ a floating production, storage and offloading (FPSO) facility; and
+ subsea flowlines and umbilicals between the WHP and the FPSO.

This OPP for Dorado Phase 1 includes potential for future tiebacks to augment oil production. These tiebacks will connect to the Dorado WHP and FPSO. Each tieback may consist of a well or series of wells connected to the Dorado Phase 1 infrastructure by subsea risers, flowlines and umbilicals. Tieback wells may be subsea or connected to additional WHPs or subsea facilities, such as a subsea gathering system.

Exploration activities and appraisal drilling within the Bedout Sub-basin are excluded activities from the scope of this OPP. The NOPSEMA accepted Bedout Basin Multi-Well Drilling Environment Plan (Bedout Multi-Well Drilling Environment Plan - SO-00-BI-20003) includes for drilling of up to 8 wells (exploration and/or appraisal) in permit areas WA-437-P, WA-438-P , specifically within 2 operational areas located within the Dorado Phase 1 Project Area. Exploration drilling of the prospects identified within the Project Area as future tiebacks within this OPP (refer **Figure 1-2**) will be drilled using this accepted Environment Plan.

All planned petroleum activities, including the future tiebacks, will take place within the Dorado Development Project Area (**Figure 1-1**) and include:

+ drilling;
+ construction and installation;
+ commissioning;
+ operations; and
+ decommissioning.

The proposed locations of the FPSO and WHP are approximately 143 km and 145 km north of the town of Port Hedland respectively. Water depths for the Dorado Development range between approximately 70 and 120 m (**Figure 1-2**).

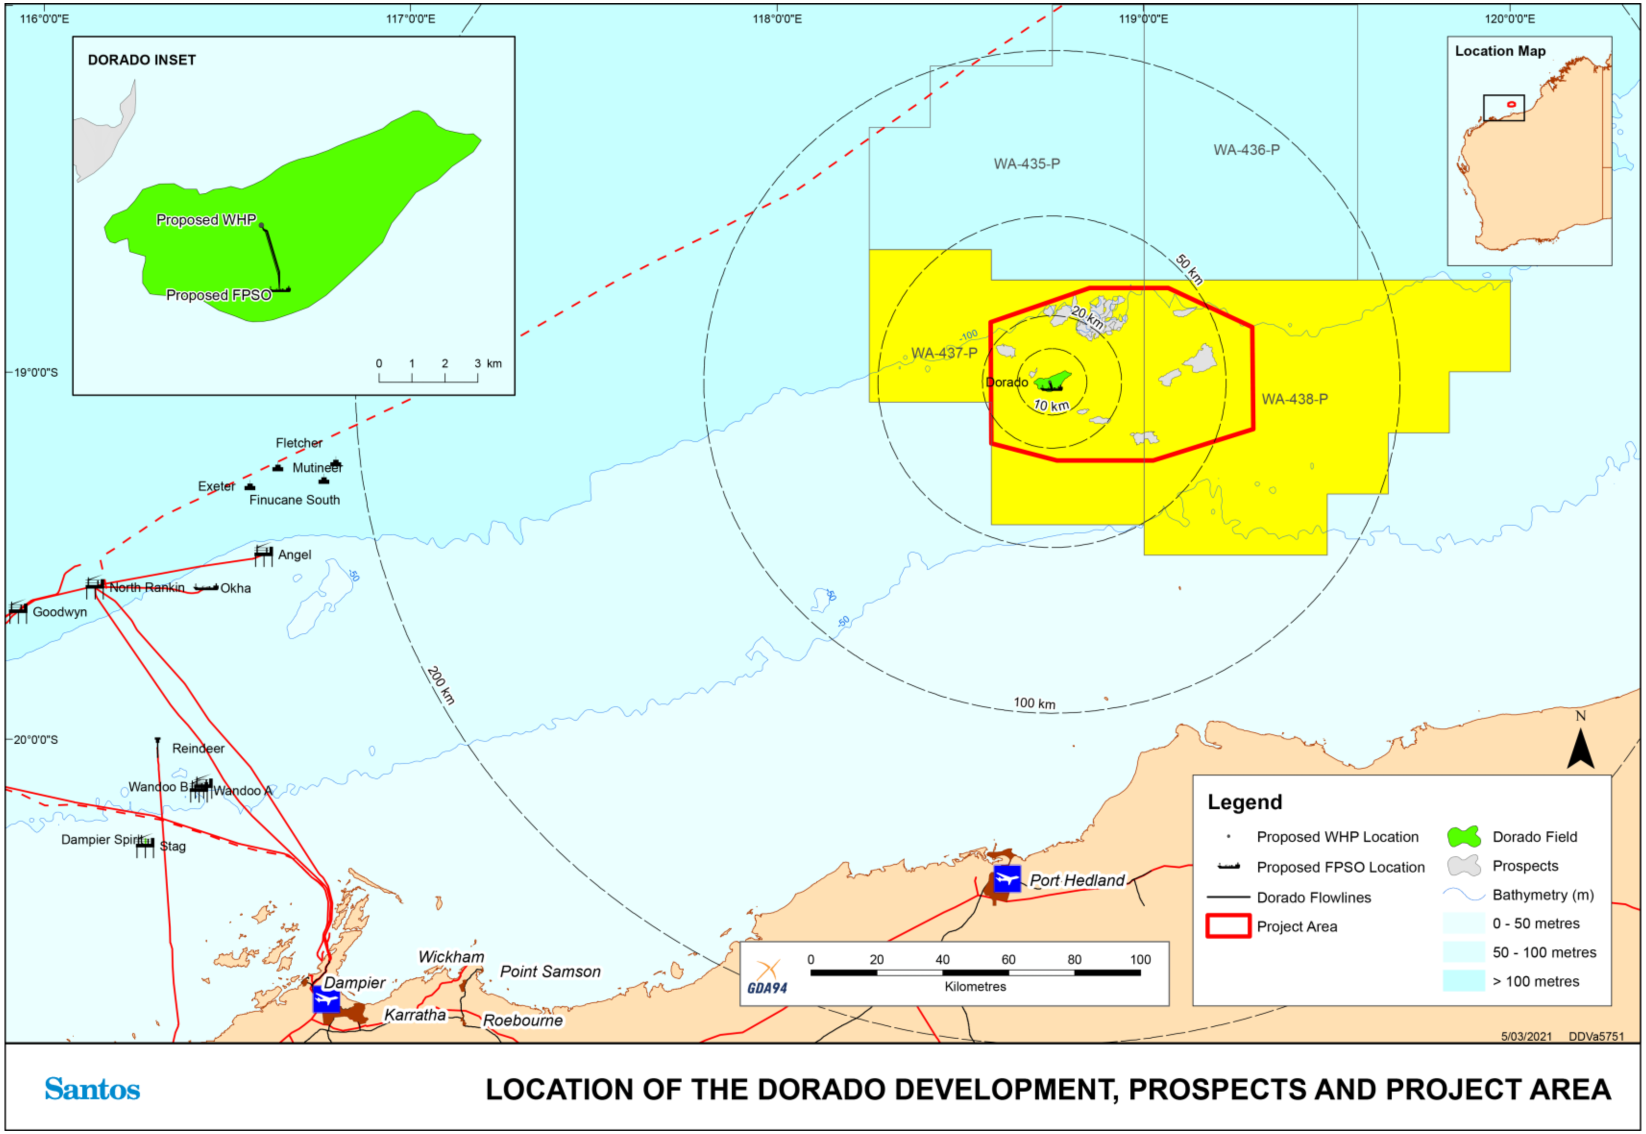

Figure 1-2: Location of the Dorado Development, Prospects and Project Area

Oil will be produced and gas will be reinjected into the reservoirs to enhance oil recovery. Produced water (PW) will be discharged overboard after being treated onboard the FPSO. Construction of Dorado Phase 1 facilities in construction yards is scheduled to commence 12 months post FID. Dorado Phase 1 is intended to operate for a life of 20 years commencing operations in 2027. Dorado Phase 1 infrastructure will be decommissioned at the end of the commercial life of the project in accordance with Section 572 of the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGS Act) and Australia's international obligations to remove disused installations and structures.

Potential prospects that could be future tie-backs, if exploration is successful and the reservoir commercially viable are shown on **Figure 1-2**. The hydrocarbons produced from future tie-backs are yet to be confirmed. As the potentially targeted prospects (within the Project Area) were generated by the same petroleum system within the Bedout Sub-basin, the hydrocarbon reservoir properties, geochemistry and pressures of the future tie-backs will be comparable to the Dorado reservoir hydrocarbons sourced from the Caley, Baxter, Crespin and Milne formations, as presented in the Bedout Basin Multi-Well Drilling Environment Plan (the plan under which exploration wells in future prospects will be drilled) which has been accepted by NOPSEMA. The hydrocarbons from any future tie-back wells will be processed on the FPSO located at Dorado, and gas not required for safety flare and energy supply will be re-injected. The timing of future tie-backs is currently unknown, but if tie-backs are to occur it will be within the proposed 20 year life of Phase 1 of the development.

A detailed description of the activities and timing of Dorado Phase 1 is provided in **Section 6**.

1.2 Purpose of the Dorado Development Offshore Project Proposal

The Dorado Development is a new petroleum activity in Commonwealth waters that will recover petroleum, as defined by the OPGGS (E) Regulations. The regulations require that an OPP be assessed and accepted by NOPSEMA prior to Santos undertaking any of the petroleum activities within the scope of the Dorado Development OPP. All petroleum activities within the scope of Dorado Phase 1 also require that an Environment Plan (EP) accepted by NOPSEMA be in place prior to commencing the activities.

The purpose of the Dorado Development OPP is to:

+ provide a whole-of-project assessment of the environmental impacts and risks of Dorado Phase 1;
+ define and demonstrate the acceptable levels of environmental impacts and risks for Dorado Phase 1;
+ provide relevant information to the public and an opportunity for the public to comment on Dorado Phase 1; and
+ meet the regulatory requirements of the OPGGS (E) Regulations.

NOPSEMA's assessment process for the OPP considers the potential environmental impacts and risks of petroleum activities conducted over the entire duration of Dorado Phase 1. The staged assessment process shown in **Figure 1-3** includes a public comment period prior to NOPSEMA's acceptance. Santos is required to demonstrate in the OPP that all environmental impacts and risks from Dorado Phase 1 are at an acceptable level. A detailed description of the OPP assessment process is provided in **Section 2.2**.

NOPSEMA became the sole Commonwealth regulator for environmental management of offshore petroleum activities in 2014 after streamlining of regulatory processes under the OPGGS Act and the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). The effect of the streamlining is that offshore petroleum activities in Commonwealth waters only require approval by NOPSEMA under the OPGGS Act and no longer require separate approval by the Minister for the Environment under the EPBC Act. The amendments require matters of national environmental significance (MNES) to be addressed in NOPSEMA's assessments of offshore petroleum development approvals as part of the Commonwealth streamlined environmental approvals process. Therefore, the OPP process under the OPGGS (E) Regulations supersedes the Commonwealth referral process under the EPBC Act and replaces the requirement to prepare environmental approvals for submission to the Department of Agriculture, Water and the Environment (DAWE) for petroleum development activities in Commonwealth waters. This OPP addresses the EPBC Act requirements for Dorado Phase 1, including those outlined in the EPBC Act management plans, recovery plans and conservation advice.

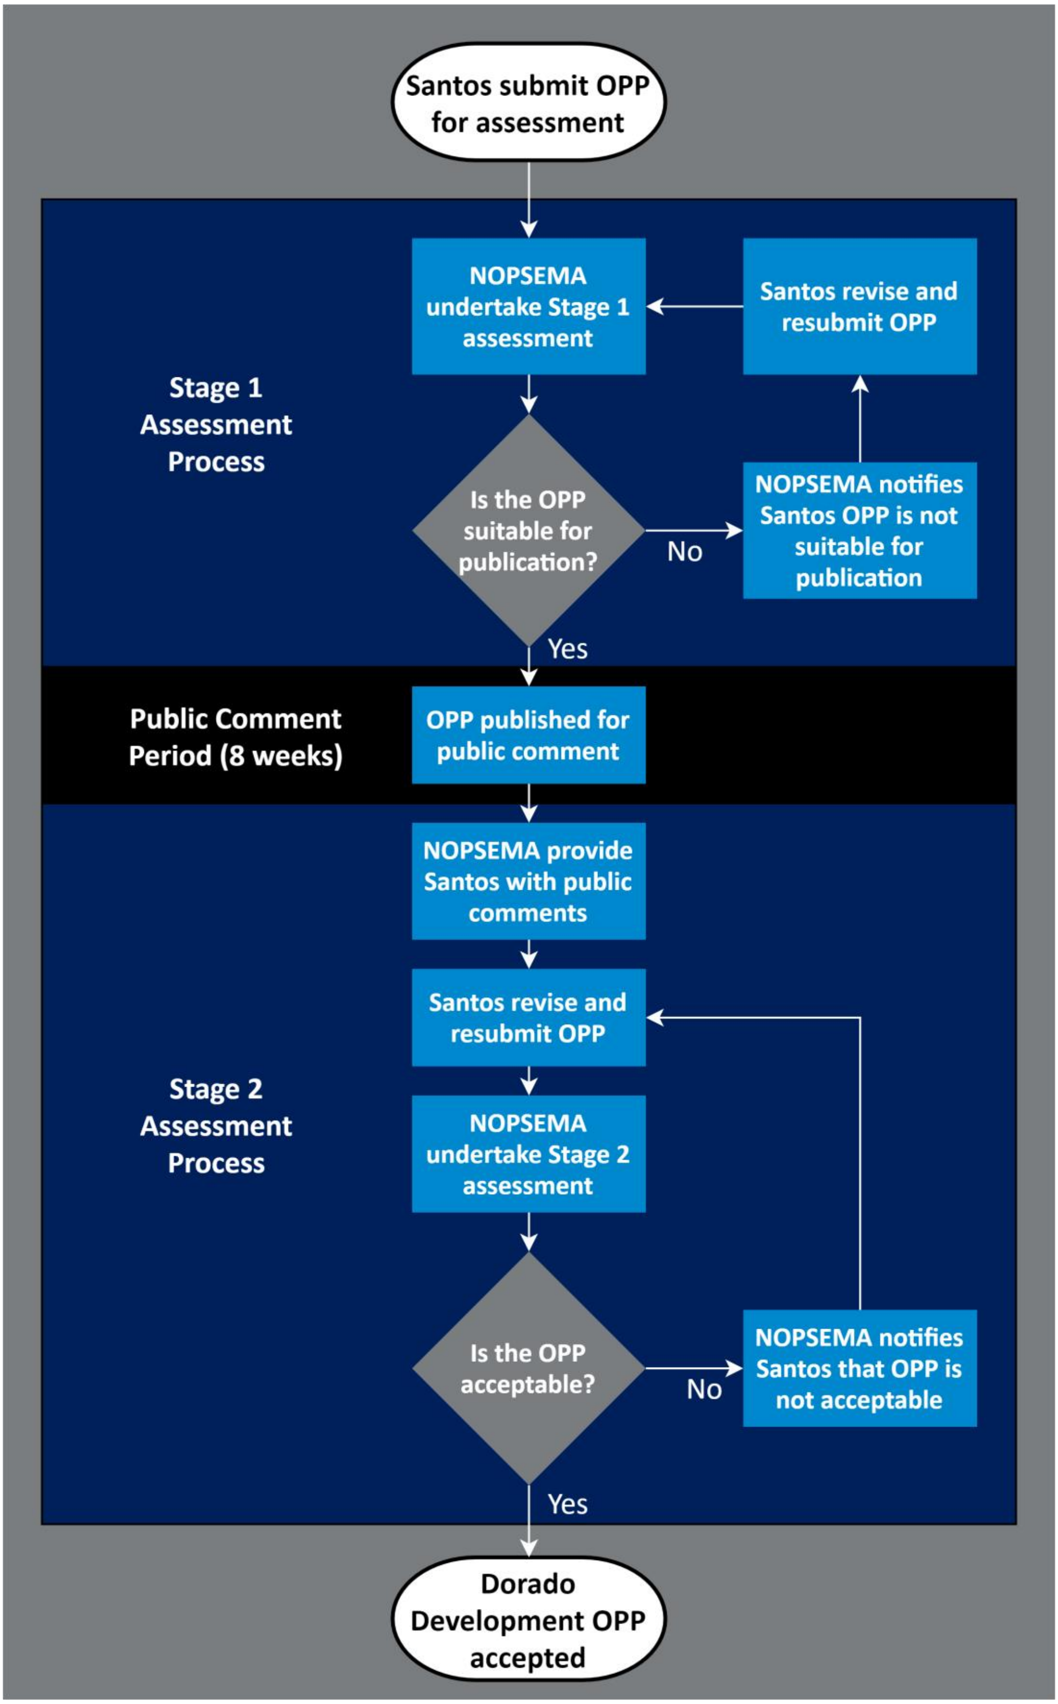

Figure 1-3: Assessment process flow chart for the Dorado Development OPP

1.3 Structure of the Dorado Development Offshore Project Proposal

The OPP has been prepared to align with NOPSEMA's current OPP content requirements (N-04790-GN-1663, Rev 4) (NOPSEMA March 2019a). The structure of the Dorado Development OPP for Phase 1 is outlined in **Table 1-1**. This structure is aligned to the processes that Santos uses to assess environmental risks and impacts, the requirements of the OPGGS (E) Regulations and NOPSEMA's content requirements for OPPs (NOPSEMA 2019a). Mapping of the OPP content to the requirements of the OPGGS (E) Regulations is provided in **Section 2**.

Table 1-1: Descriptions of Dorado Development OPP sections

Section Title	Description of Section Content
Executive Summary	A summary of the content in the Dorado Development OPP. It allows readers to become familiar with the key information contained in the OPP.
1 – Introduction	An introduction to the Dorado Development (Phase 1 and potential future Phase 2), and the OPP assessment process. It also provides information on Santos as the project's proponent.
2 – Relevant Requirements	A summary of legislation and other requirements that Santos must comply with during Phase 1 of the Dorado Development. Many of these requirements are references in the environmental management measures that Santos has committed to implementing during Phase 1.
3 – Description of the Environment	A description of the environmental values and sensitivities that will be affected or are at risk of being affected by Dorado Phase 1. These values and sensitivities are considered in the evaluation of environmental impacts and risks.
4 – Acceptable Levels of Impacts and Risks	A description of the acceptable levels of environmental impacts and risks specific to environmental values and sensitivities. Santos must demonstrate that the impacts and risks from Dorado Phase 1 are consistent with these acceptable levels of environmental impacts and risks.
5 – Analysis of Alternatives	Comparative assessments of the feasible alternatives to Santos' development concept for the Dorado Development. The comparative assessments considered environmental, technical, economic, safety and social criteria for each feasible alternative.
6 – Description of the Project	A description of Dorado Phase 1. The description summarises all of the petroleum activities and facilities within the scope of the Dorado Development OPP. The proposed timing and location of all activities is provided in this section.
7 – Evaluation of Environmental Impacts and Risks	Environmental impact and risk assessments for all of the aspects of Dorado Phase 1. This section includes demonstrations that all environmental impacts and risks will be managed to an acceptable level. The section also contains controls that will be implemented to manage environmental impacts and risks.
8 – Environmental Performance Framework	A description of the systems and processes that Santos will apply during Dorado Phase 1 to meet the levels of environmental performance outlined in the Dorado Development OPP.

Section Title	Description of Section Content
9 – Consultation	A description of the consultation Santos has undertaken in relation to the OPP and other activities within the Bedout Sub-basin. Guidance on making public comment on the OPP is provided in this section.
10 – References	A bibliography of the literature cited within the Dorado Development OPP.

1.4 Information about the Proponent

Santos WA Northwest Pty Ltd (Santos), as operator of the Dorado Joint Venture, is the proponent for the Dorado Development OPP. An Australian company founded in 1954, Santos is one of the leading independent oil and gas producers in the Asia-Pacific region, supplying the energy needs of homes, businesses and major industries across Australia and Asia.

Santos began in the Cooper Basin; has extensive exploration and production acreage in Australia, as well as extensive infrastructure; and is committed to supplying domestic markets, unlocking resources and driving value and performance. Santos is committed to being the safest oil and gas company wherever we have a presence and preventing harm to people and the environment.

The Dorado Development is a joint venture between Santos and Australian oil and gas exploration company Carnarvon Energy Pty Ltd.

As required by Regulation 5A (5)(a), Santos' name and contact details are provided in **Table 1-2**.

Table 1-2: Proponent's name and contact details

Name	Santos WA Northwest Pty Ltd, which is a 100%-owned subsidiary of Santos Energy Limited
Address	Level 7, 100 St Georges Terrace, Perth, Western Australia 6000
Website	https://www.santos.com/
Email	Offshore.environment.admin@santos.com
Telephone	+61 8 6218 7100
Facsimile	+61 8 6218 7200

2 Relevant Requirements

Identifying and complying with relevant requirements, such as legislation, standards and guidelines, is an integral part of the Santos management system. The system obliges Santos to ensure that relevant environmental management requirements are identified and met when undertaking Dorado Phase 1.

The OPGGS (E) Regulations require Santos to describe the requirements that apply to Dorado Phase 1, along with how they will be met in this OPP. These requirements have been considered by Santos in developing the environmental management measures that will be applied to Dorado Phase 1. This section provides an overview of the relevant legislation, standards and guidelines that are applicable to the environmental management of Dorado Phase 1. These include:

+ Commonwealth policy – **Section 2.1**;
+ Commonwealth legislation – **Section 2.2**;
+ international agreements and conventions – **Section 2.3**; and

+ guidelines – **Section 2.4**.

The following sections describe the items in each of the categories above. Each item is briefly described, along with its relevance to Dorado Phase 1.

Why isn't the Dorado Development being assessed under the EPBC Act?

NOPSEMA became the sole Commonwealth regulator for environmental management of offshore petroleum activities in 2014 after streamlining of regulatory processes under the OPGGS Act and the EPBC Act.

Prior to the streamlining arrangements, Phase 1 of the Dorado Development would have been referred for assessment, and assessed, under the EPBC Act by DAWE. It would also require EPs accepted by NOPSEMA in accordance with the OPGGS (E) Regulations for all of the petroleum activities within the scope of the Dorado Development. The Australian Government recognised there was duplication of regulatory effort under the two Acts, resulting in an administrative burden on proponents. This was the rationale for the streamlining of offshore petroleum industry environmental approvals.

The effect of streamlining is that offshore petroleum activities in Commonwealth waters only require approval by NOPSEMA under the OPGGS Act and no longer require separate approval by the Minister for the Environment under the EPBC Act. As such, the Dorado Development is subject to the OPP assessment process under the OPGGS (E) Regulations and is not assessed under the referral and assessment process under the EPBC Act.

The Program by which the streamlining arrangements are implemented has been endorsed by the Minister for the Environment. The Program outlines the commitments and undertaking of NOPSEMA to ensure adequate protection of matters protected under Part 3 of the EPBC Act. NOPSEMA consider the policy framework established by DAWE, along with the range of publications made under the EPBC Act in relation to matters protected under Part 3 of the Act (e.g. recovery plans and conservation advice).

2.1 Commonwealth Policy

2.1.1 Australian Offshore Petroleum Development Policy

The Australian Government has a long-standing policy of encouraging investment in, and development of, petroleum resources in Commonwealth waters. The policy is implemented through:

+ the identification and release of prospective petroleum acreage;
+ applications to explore petroleum acreage;
+ granting of petroleum titles;
+ regulation of petroleum activities; and
+ surrender of petroleum titles.

Dorado Phase 1 and associated activities are shown within this policy framework in **Figure 2-1**.

The exploration titles within the Project Area (WA-437-P and WA-438-P) were granted in 2009. These titles oblige the titleholder to explore for and develop petroleum resources. Exploration activities (e.g. seismic data acquisition and processing, exploration wells etc.) have been undertaken since the initial grant of these titles and have subsequently discovered the hydrocarbon resources that will be developed.

Implementation of Commonwealth policy on developing offshore petroleum resources includes an independent regulator (NOPSEMA) and a petroleum titles administrator (the National Offshore Petroleum Titles Administrator (NOPTA))

NOPSEMA perform a range of functions under the OPGGS Act and subsidiary regulations, including:

+ providing advice;
+ assessment;
+ inspection,
+ investigation; and
+ enforcement.

NOPTA provides advice and recommendations to the Joint Authorities and responsible Commonwealth minister, administers petroleum titles and manages data.

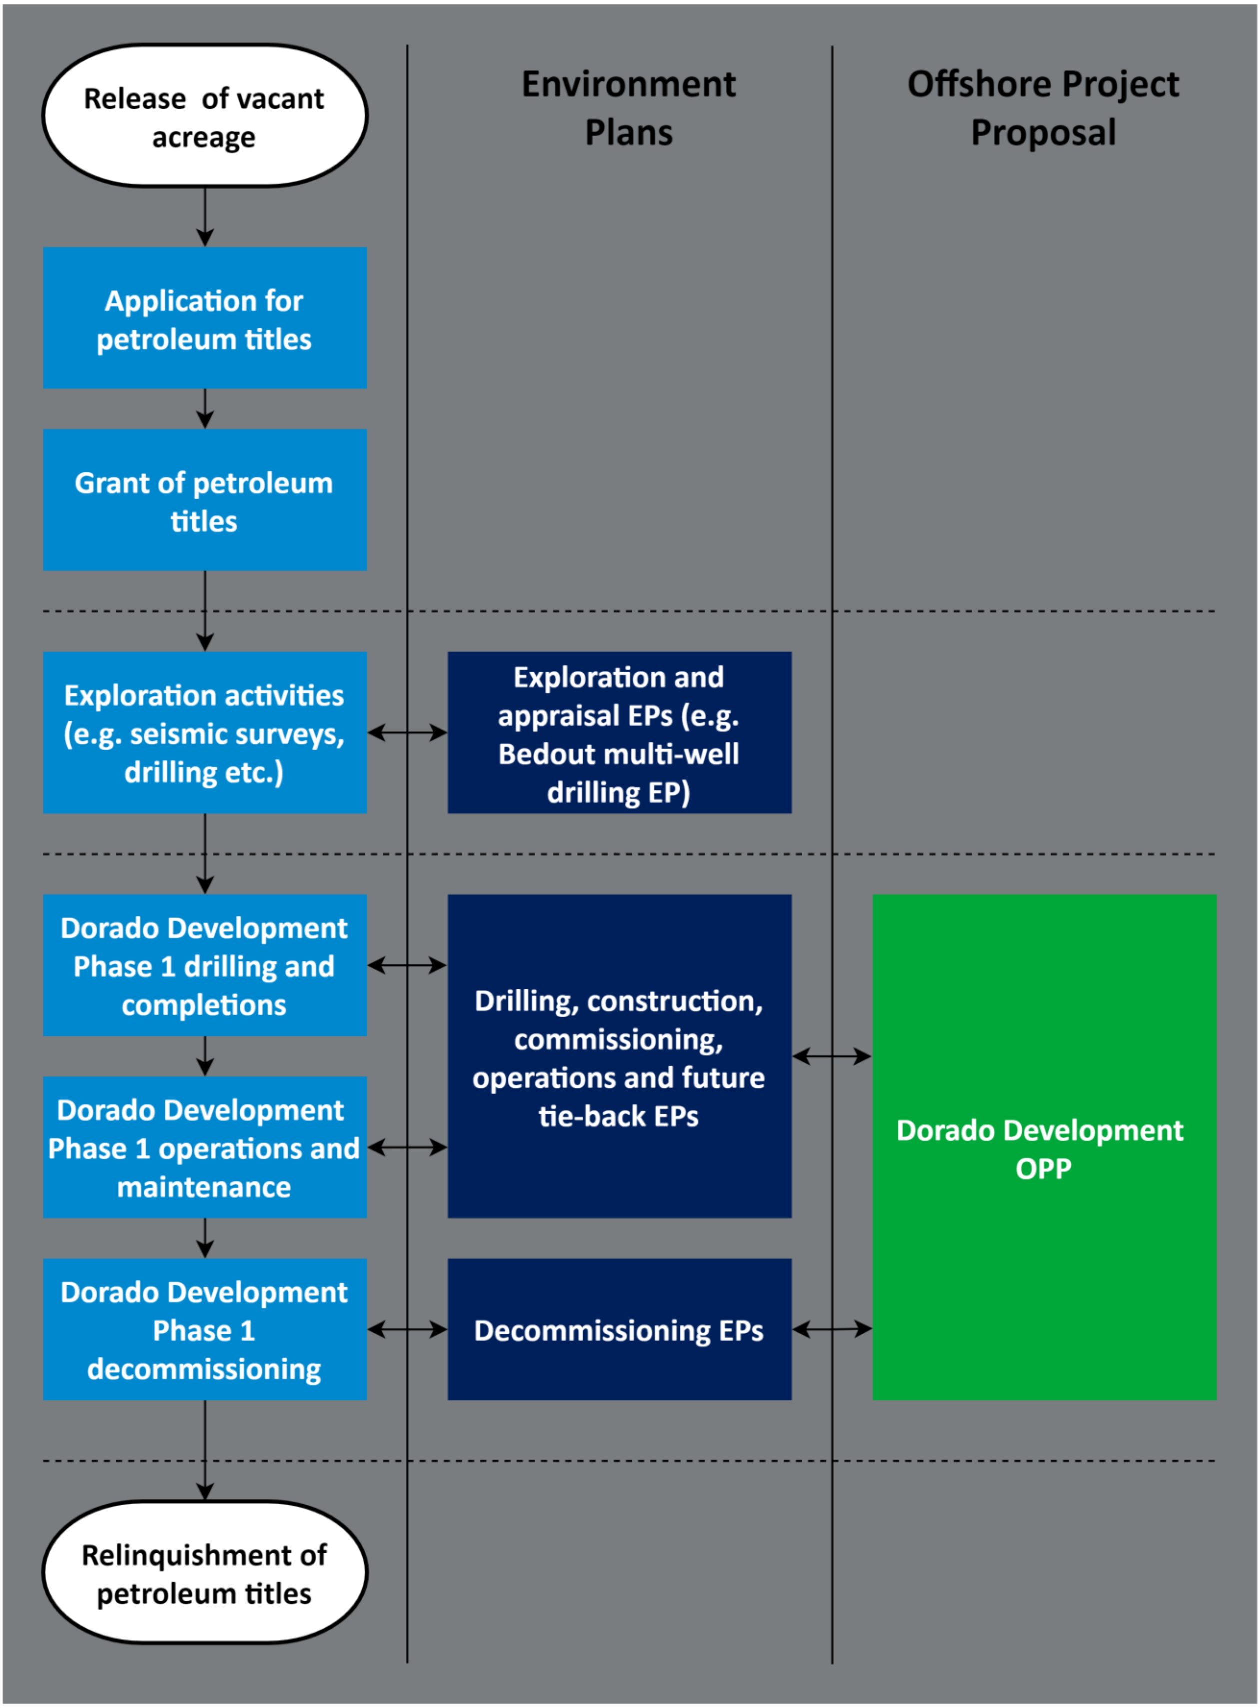

Figure 2-1: Application of Commonwealth petroleum policy in relation to the oil resources in the Dorado Development Project Area

2.1.2 Australia's Oceans Policy

Australia's Oceans Policy was introduced in 1998. The policy has a number of aims, including:

- exercising and protecting Australia's rights over its marine jurisdictions;
- meeting its obligations under the United Nations Conventions on the Law of the Sea 1982, which was ratified in 1994;
- understanding and protecting the marine environment; and
- promoting ecologically sustainable economic development and establishing integrated planning and management.

Under the Oceans Policy, a nationally representative system of Australian marine parks (AMPs) has been established. These are based on the principles of multiple-use and ecologically sustainable development (ESD). This policy has been implemented through the EPBC Act, as outlined in the Strategic Plan of Action for the National Representative System of Marine Protected Areas (Task Force on Marine Protected Areas 1998).

2.1.3 Climate Change Policy

As a party to the Paris Agreement, Australia sets commitments in the form of Nationally Determined Contributions (NDC) to reduce greenhouse gas (GHG) emissions, most recently updated in 2022:

- Reduce 43% below 2005 levels by 2030 and reach net zero emissions by 2050.

Australian Government climate change policy and its relevance to management of Dorado GHG emissions is discussed further in **Section 7.2.6.**

2.2 Commonwealth Legislation

Dorado Phase 1 is located wholly within Commonwealth waters and is therefore subject to Commonwealth legislation. Two key Commonwealth Acts (and subsidiary legislation) are relevant to the environmental management of Dorado Phase 1:

- the OPGGS Act; and
- the EPBC Act.

The relevance of these Acts and subsidiary legislation to Dorado Phase 1 is considered in **Section 2.2.1** and **Section 2.2.2**. Additional Commonwealth legislation that is applicable to Dorado Phase 1 is considered in **Section 2.2.3**.

2.2.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006

The OPGGS Act provides the regulatory framework for petroleum exploration and recovery and the injection and storage of GHG substances in Commonwealth waters. The Act provides for the granting of petroleum and GHG titles and licences and the establishment of an independent safety and environmental regulator (NOPSEMA) and titles administrator (NOPTA). The Act also provides for the "polluter pays" principle in the event of an oil spill. The Act requires titleholders to maintain adequate financial assurance arrangements (e.g. insurance) for liabilities that may arise from an oil spill.

Several subsidiary regulations made under the OPGGS Act are relevant to the environmental management of Dorado Phase 1:

- OPGGS (E) Regulations;

- *Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011* (OPGGS (RMA) Regulations); and
- *Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009* (OPGGS (S) Regulations).

Section 572 of the OPGGS Act places duties on titleholders in relation to the maintenance and removal of structures, equipment and property brought onto title. Decommissioning of the Dorado facilities to meet the requirements of Section 572 of the OPGGS Act is addressed in **Section 6.7.7**.

2.2.1.1 Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009

The OPGGS (E) Regulations are the principle legislative instrument for the environmental management of petroleum activities in Commonwealth waters. The object of the OPGGS (E) Regulations is to ensure that petroleum activities in Commonwealth waters are carried out in a manner:

- consistent with the principles of ESD set out in section 3A of the EPBC Act;
- by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP); and
- by which the environmental impacts and risks of the activity will be at an acceptable level.

The OPGGS (E) Regulations include requirements for Santos to consider MNES defined in Part 3 of the EPBC Act; refer to **Section 2.2.2** for a description of Matters of National Environmental Significance.

2.2.1.1.1 Offshore Project Proposal

The OPGGS (E) Regulations require that Santos submit an OPP to NOPSEMA for assessment of Dorado Phase 1. The Dorado Development OPP must undergo a two-stage assessment process and public comment period before it can be accepted. The OPP must be accepted prior to Santos submitting any EPs (and Oil Pollution Emergency Plans (OPEPs)) for activities within the scope of Dorado Phase 1. The OPP must demonstrate that all environmental impacts and risks are of an acceptable level. (Unlike EPs, the OPP is not required to demonstrate that all environmental impacts and risks are managed to ALARP.)

The OPGGS (E) Regulations specify the content requirements for the Dorado Development OPP. This includes consideration of all relevant environmental values and sensitivities that may credibly be affected by Dorado Phase 1. This includes MNES protected under Part 3 of the EPBC Act.

Regulation 5A of the OPGGS (E) Regulations states the requirements for an OPP. **Table 2-1** outlines and maps these requirements to the sections of the Dorado Development OPP that fulfil each requirement.

Table 2-1: OPGGS (E) Regulations regarding OPP requirements and the corresponding sections of the Dorado Development OPP

OPGGS (E) Regulations Reference	Regulation Text	Relevant Sections of the OPP
5A (5)(a)	The proposal must: + Include the proponent's name and contact details.	**Section 1.4**

OPGGS (E) Regulations Reference	Regulation Text	Relevant Sections of the OPP
5A (5)(b)	Include a summary of the project, including the following: + a description of each activity that is part of the project; + the location or locations of each activity, + a proposed timetable for carrying out the project, + a description of the facilities that are proposed to be used to undertake each activity, and + a description of the actions proposed to be taken, following completion of the project, in relation to the facilities.	**Section 6**
5A (5)(c) and 5 (5)(d)	Describe the existing environment that may be affected by the project. Include details of the particular relevant values and sensitivities (if any) of that environment.	**Section 3**
5A (5)(e)	Set out the environmental performance outcomes for the project.	**Section 8**
5A (5)(f)	Describe any feasible alternative to the project, or an activity that is part of the project, including: + a comparison of the environmental impacts and risks arising from the project or activity and the alternative; and + an explanation, in adequate detail, of why the alternative was not preferred.	**Section 5**
5A (6)	Without limiting paragraph (5)(d), particular relevant values and sensitivities may include any of the following: + the world heritage values of a declared World Heritage property within the meaning of the EPBC Act, + the national heritage values of a National Heritage place within the meaning of that Act, + the ecological character of a declared Ramsar wetland within the meaning of that Act, + the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act, + the presence of a listed migratory species within the meaning of that Act, and + any values and sensitivities that exist in, or in relation to, part or all of: i. a Commonwealth marine area within the meaning of that Act, or ii. Commonwealth land within the meaning of that Act.	**Section 3**
5A (7)	The proposal must: + describe the requirements, including legislative requirements, that apply to the project and are relevant to the environmental management of the project, and + describe how these requirements will be met.	**Section 2**
5A (8)	The proposal must include: + details of the environmental impacts and risks for the project, and	**Section 7**

OPGGS (E) Regulations Reference	Regulation Text	Relevant Sections of the OPP
	+ an evaluation of all the impacts and risks, appropriate to the nature and scale of each impact or risk.	

2.2.1.1.2 Environment Plans

The OPGGS (E) Regulations require Santos to submit an EP (or EPs) to NOPSEMA for assessment of all petroleum activities within the scope of the Dorado Development OPP. An EP for a petroleum activity within the scope of the OPP may not be submitted prior to NOPSEMA accepting the OPP. EPs for petroleum activities must be accepted by NOPSEMA prior to commencing the activity.

EPs are required to demonstrate that environmental impacts and risks from petroleum activities are managed to a level that is acceptable. EPs are also required to demonstrate that environmental impacts and risks are managed to a level that is ALARP. All environmental sensitivities that may credibly be affected by the petroleum activities must be considered in the EP, including MNES protected under Part 3 of the EPBC Act.

EPs for activities within the scope of the accepted Dorado Development OPP must ensure that the level of performance of the environmental management of the activity is as good as or better than the levels stated in the accepted OPP.

The OPGGS (E) Regulations require Santos to consult with all relevant persons when preparing an EP for activities within the scope of the Dorado Development OPP. This requirement is in addition to the public comment period of the OPP. Refer to **Section 9** for further information on Santos' consultation practices.

2.2.1.1.3 Oil Pollution Emergency Plans

Environment Plans are required to include an Oil Pollution Emergency Plan (OPEP). The OPEP is required to include adequate arrangements for responding to an oil spill. This includes testing of the response arrangements and environmental monitoring of impacts to the environment from spilled oil. Based on the nature and scale of the credible spill scenarios outlined in the EP and OPEP, response strategies are assessed as potentially applicable for combatting a spill through a Net Environment Benefit Assessment. Potential spill response strategies assessed may include:

- Source Control;
- In-situ Burning;
- Monitor and Evaluate;
- Chemical Dispersion;
- Offshore Containment and Recovery;
- Mechanical Dispersion;
- Protection and Deflection;
- Shoreline Clean-up;
- Oiled Wildlife Response; and
- Scientific Monitoring.

2.2.1.2 Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2011

The OPGGS (RMA) Regulations are intended to ensure that petroleum activities in Commonwealth waters:

- are carried out in accordance with good oilfield practice;
- optimise the long-term recovery of petroleum; and
- reduce risks to well integrity to ALARP.

The OPGGS (RMA) Regulations also ensure that information on petroleum exploration activities, discoveries, production and operations are provided in a timely manner to the administrators of the OPGGS Act.

The OPGGS (RMA) Regulations require Santos to have in place an accepted Field Development Plan for Dorado Phase 1 and an accepted Well Operations Management Plan in place for Dorado Development wells.

2.2.1.3 Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2009

The OPGGS (S) Regulations are intended to ensure that offshore facilities undertaking petroleum activities protect the health and safety of people undertaking these activities. The OPGGS (S) Regulations require:

- validation of the design, construction, operation and decommissioning of facilities undertaking petroleum activities;
- safety cases that provide for management of safety risks, including major accident events, for petroleum facilities; and
- diving safety management systems.

While intended to protect the health and safety of personnel, many management measures considered in validation of facilities and safety cases also protect the environment by preventing uncontrolled releases of hydrocarbons.

2.2.2 Environment Protection and Biodiversity Conservation Act 1999

The EPBC Act and supporting regulations provide for the protection of the environment and conservation of biodiversity in Australia (including Commonwealth waters). Amendments to the OPGGS Act and OPGGS (E) Regulations made in February 2014 require matters protected under Part 3 of the EPBC Act to be considered in the Dorado Development OPP. NOPSEMA became the sole environmental regulator in Commonwealth waters following these streamlining arrangements. Matters of National Environmental Significance (MNES) protected under Part 3 of the EPBC Act include:

- the world heritage values of a declared World Heritage property within the meaning of the EPBC Act;
- the national heritage values of a National Heritage place within the meaning of that Act;
- the ecological character of a declared Ramsar wetland within the meaning of that Act;
- the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act;
- the presence of a listed migratory species within the meaning of that Act; and
- any values and sensitivities that exist in, or in relation to, part or all of:
  - a Commonwealth marine area within the meaning of that Act; or

- Commonwealth land within the meaning of that Act.

The EPBC Act also gives effect to several international conventions for the protection of migratory species to which Australia is a signatory, including:

- the Convention on the Conservation of Migratory Species of Wild Animals (commonly referred to as the Bonn Convention);
- the Agreement between the Government of Australia and the Government of Japan for the Protection of Migratory Birds in Danger of Extinction and their Environment (commonly referred to as JAMBA);
- the Agreement between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment (commonly referred to as CAMBA);
- the Agreement between the Government of Australia and the Government of the Republic of Korea on the Protection of Migratory Birds (commonly referred to as ROKAMBA);
- the Convention on Wetlands of International Importance (commonly referred to as the Ramsar Convention); and
- the Agreement on the Conservation of Albatrosses and Petrels.

Environmental values and sensitivities, including matters protected under Part 3 of the EPBC Act, are described in **Section 3**. These descriptions inform the assessment of environmental impacts and risks in **Section 7**.

Why isn't the Dorado Development being assessed under the EPBC Act?

NOPSEMA became the sole Commonwealth regulator for environmental management of offshore petroleum activities in 2014 after streamlining of regulatory processes under the OPGGS Act and the EPBC Act.

Prior to the streamlining arrangements, Phase 1 of the Dorado Development would have been referred for assessment, and assessed, under the EPBC Act by DAWE. It would also require EPs accepted by NOPSEMA in accordance with the OPGGS (E) Regulations for all of the petroleum activities within the scope of the Dorado Development. The Australian Government recognised there was duplication of regulatory effort under the two Acts, resulting in an administrative burden on proponents. This was the rationale for the streamlining of offshore petroleum industry environmental approvals.

The effect of streamlining is that offshore petroleum activities in Commonwealth waters only require approval by NOPSEMA under the OPGGS Act and no longer require separate approval by the Minister for the Environment under the EPBC Act. As such, the Dorado Development is subject to the OPP assessment process under the OPGGS (E) Regulations and is not assessed under the referral and assessment process under the EPBC Act.

The Program by which the streamlining arrangements are implemented has been endorsed by the Minister for the Environment. The Program outlines the commitments and undertaking of NOPSEMA to ensure adequate protection of matters protected under Part 3 of the EPBC Act. NOPSEMA consider the policy framework established by DAWE, along with the range of publications made under the EPBC Act in relation to matters protected under Part 3 of the Act (e.g. recovery plans and conservation advice).

Does an OPP provide the same level of environmental assessment and protection as the EPBC Act?

There are a range of features of the environmental approvals process for offshore petroleum activities that ensure the level of environmental assessment and protection is equivalent to, or better than, that provided for under the EPBC Act.

The commitments under the streamlining arrangements require NOPSEMA to ensure adequate protection of matters listed under Part 3 of the EPBC Act. NOPSEMA must consider publications made under the EPBC Act in relation to matters protected under Part 3 of the Act. This includes material published by the Commonwealth intended to protect threatened and migratory species, such as conservation advice and recovery plans. This requirement is aligned to the decision-making process for assessments under the EPBC Act.

The OPP assessment process reflects the level of transparency and opportunity for public comment that is provided for through Environmental Impact Statement/Public Environmental Review assessments under the EPBC Act. Santos must respond to all comments made during the public comment period – this is the same standard applied to the EPBC Act process.

The OPGGS (E) Regulations require EPs also be accepted by NOPSEMA for all petroleum activities within the scope of the Dorado Development OPP. The levels of environmental performance in the EPs must be as good as, or better than, the levels committed to in this OPP. This in an important link between environmental management of specific activities and the overarching environmental assessment in the OPP.

NOPSEMA are the environmental regulator for offshore petroleum activities. NOPSEMA has a range of powers relating to assessment, inspection and enforcement. NOPSEMA frequently inspects the environmental performance of petroleum titleholders to verify compliance with environmental commitments. NOPSEMA can undertake enforcement actions, such as issuing directions, and can require a titleholder to cease an activity.

As described above, there is a clear intention for the OPP assessment process to provide the same, or better, level of environmental assessment and protection. The OPGGS (E) Regulations provide for an independent regulator with strong powers to assess, inspect and enforce environmental performance. This provides the Australian public with the confidence that the OPP assessment process delivers the same, or better, protection than the EPBC Act assessment process.

2.2.2.1 Principles of Ecologically Sustainable Development

NOPSEMA considers the principles of ESD defined in the EPBC Act when assessing the environmental performance outcomes (EPOs) in an OPP. These principles are:

- decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations;
- if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation;

- the principle of intergenerational equity-- that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations;
- the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; and
- improved valuation, pricing and incentive mechanisms should be promoted.

Santos has considered these principles when developing acceptable levels of environmental impacts and risks. Refer to **Section 4** for further information.

2.2.2.2 Environment Protection and Biodiversity Conservation Act Policy Statements

A number of policy statements have been made that give practical advice to the application of the EPBC Act. Relevant policies include:

- 'indirect consequences' of an action: Section 527E of the EPBC Act; and
- EPBC Policy Statement 2.1 Interaction between offshore seismic exploration and whales: Industry guidelines.

2.2.2.3 Marine Bioregional Plans

A series of marine bioregional plans have been developed for each of the marine regions within Commonwealth waters. The plans describe the conservation values within each region, identify pressures affecting conservation values and outline regional priorities, strategies and actions. The objectives of these plans are to:

- conserve biodiversity and maintain ecosystem health;
- ensure the recovery and protection of threatened species; and
- improve the understanding of the region's biodiversity and ecosystems and the pressures they face.

The Project Area and the spatial extent of all planned impacts from Dorado Phase 1 lie entirely within the North-west Marine Region. The Marine bioregional plan for the North-west Marine Region (Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC) 2012a) has been considered when describing the existing environment and the assessment of environmental impacts and risks from Dorado Phase 1.

Modelling studies indicate some worst-case credible unplanned hydrocarbon spills may impact upon environmental sensitivities in the South-west Marine Region. The Marine bioregional plan for the South-west Marine Region (DSEWPaC 2012b) has been considered when describing the existing environment and the assessment of environmental risks of some worst-case unplanned hydrocarbon spill scenarios.

2.2.2.4 Australian Marine Park Management Plans

The EPBC Act provides for the declaration of AMPs based on the International Union for the Conservation of Nature (IUCN) principles and guidelines for categorising protected areas. Australia has established a network of AMPs throughout Commonwealth waters, and these are managed under a series of region-based management plans. These plans detail the management objectives of the AMPs, the environmental values within each of the AMPs and the activities that area permissible within the zones of the AMPs. AMPs are part of the Commonwealth marine environment, which is an MNES.

Australian IUCN Reserve Management Principles (Environment Australia 2002) for each category are set out in the EPBC Regulations. The planned petroleum activities considered within this OPP will not credibly impact any AMPs. Some worst-case credible unplanned hydrocarbon spill scenarios may impact upon several AMPs within the North-west and South-west marine bioregions. Both the North-west Marine Parks Network Management Plan 2018 (Director of National Parks 2018a) and the South-west Marine Parks Network Management Plan 2018 (Director of National Parks 2018b) identify oil pollution as a pressure on the values of these AMPs. Santos has considered these plans when developing acceptable levels of environmental impacts and risks and controls to prevent hydrocarbon spills in the Dorado Development OPP.

2.2.2.4.1 Australian Whale Sanctuary

The EPBC Act established the Australian Whale Sanctuary (AWS) (from 3 nm extending 200 nm from the coast) in 1999 giving high levels of protection to all Cetaceans (45 species of whales, dolphins and a porpoise) in Commonwealth waters. This protection extends to all anthropogenic threats to cetaceans and is not limited to potential impacts from any one sector.

Under the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) all cetaceans (whales, dolphins and porpoises) are protected in Australian waters:

- the AWS includes all Commonwealth waters from the three nautical mile state waters limit out to the boundary of the Exclusive Economic Zone (i.e. out to 200 nautical miles and further in some places);
- within the AWS it is an offence to kill, injure or interfere with a cetacean. Severe penalties apply to anyone convicted of such offences; and
- all states and territories also protect whales and dolphins within their waters.

The AWS comprises the Commonwealth marine area, beyond the coastal waters of each state and the Northern Territory. It includes all of Australia's Exclusive Economic Zone (EEZ).

Table 2-2: EPBC Management plans for threatened species that may be affected by Dorado Phase 1

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
All Vertebrate Fauna	Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (DoEE 2018)	N/A	There are four main objectives: + Contribute to the long-term prevention of the incidence of harmful marine debris + Remove existing harmful marine debris from the marine environment + Mitigate the impacts of harmful marine debris on marine species and ecological communities + Monitor the quantities, origins and impacts of marine debris and assess the effectiveness of management arrangements over time for the strategic reduction of debris.	Marine debris	No explicit management actions for non-fisheries related industries (note that management actions in the plan relate largely to management of fishing waste (for example 'ghost' gear), and State and Commonwealth management through regulation.
Sawfish and River Sharks	Sawfish and river shark multispecies recovery plan (CoA 2015)	N/A	The primary objective of this recovery plan is to assist the recovery of sawfish and river sharks in Australian waters with a view to: + Improving the population status leading t the removal of the sawfish and river shark species from the threatened species list of the EPBC Act	Habitat degradation / modification	Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			+ Ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future. The specific objectives of the recovery plan (relevant to industry) are: + Objective 5: Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species. + Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.		
Great White Shark (*Carcharodon carcharias*)	Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPC, 2013)	Vulnerable	The overarching objective of this recovery plan is to assist the recovery of the white shark in the wild throughout its range in Australian waters with a view to: + Improving the population status leading to future removal of the	Habitat degradation / modification	No explicit relevant management actions; habitat modification identified as a threat.
				Climate change	No explicit relevant management actions; climate change identified as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			white shark from the threatened species list of the EPBC Act + Ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future. The specific objectives of the recovery plan (relevant to industry) are: + Objective 7: Continue to identify and protect habitat critical to the survival of the white shark and minimise the impact of threatening processes within these areas.		
Grey Nurse Shark (*Carcharias taurus* – west coast population)	Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) (DOE 2014)	Vulnerable	The overarching objective of this recovery plan is to assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: + Improving the population status + Ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark	Pollution and disease	Review and assess the potential threat of introduced species, pathogens and pollutants.
				Habitat degradation / modification	Review the level and spatial extent of protection measures at key aggregation sites to ensure appropriate levels of protection, and a consistent approach to the designation and implementation of protective measures, are applied.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
					Use Biologically Important Areas (BIA) to help inform the development of appropriate conservation measures, including through the application of advice in the marine bioregional plans on the types of actions which are likely to have a significant impact on the species and updating such conservation measures as new information becomes available.
				Climate change	No explicit relevant management actions; climate change identified as a threat.
Northern River Shark (*Glyphis garricki*)	Approved Conservation Advice for *Glyphis garricki* (northern river shark) (DoE 2014)	Endangered	No explicit relevant objectives	Habitat degradation / modification	Implement measures to reduce adverse impacts of habitat degradation and/or Modification.
				Marine Debris	No explicit relevant management actions; marine debris identified as a threat.
Dwarf Sawfish (*Pristis clavata*)	Approved Conservation Advice for *Pristis clavate* (Dwarf Sawfish) (DEWHA 2009)	Vulnerable	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; habitat loss, disturbance and modification identified as threats.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
Freshwater Sawfish (*Pristis pristis*)	Approved Conservation Advice for *Pristis pristis* (Largetooth Sawfish) (DoE 2014).	Vulnerable	No explicit relevant objectives	Habitat degradation / modification	Implement measures to reduce adverse impacts of habitat degradation and/or modification.
Green Sawfish (*Pristis zijsron*)	Approved conservation advice for Green Sawfish (DEWHA 2008)	Vulnerable	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; habitat loss, disturbance and modification identified as threats.
Whale Shark (*Rhinocodon typus*)	Conservation advice *Rhincodon typus* (Whale Shark) (DoE 2015) [Note the Recovery plan for the Whale Shark (DEH 2005a) ceased to be in effect from 1 October 2015]	Vulnerable	To maintain existing levels of protection for the whale shark in Australia while working to increase the level of protection afforded to the whale shark within the Indian Ocean and Southeast Asian region to enable population growth so that the species can be removed from the threatened species list of the EPBC Act.	Habitat degradation / modification	Implement measures to reduce adverse impacts of habitat degradation and/or modification.
				Vessel disturbance	Minimise offshore developments and transit time of large vessels in areas close to marine features likely to correlate with Whale Shark aggregations along the northward migration route that follows the northern Western Australian coastline along the 200 m isobath (as set out in the Conservation Values Atlas, DoE, 2014).
				Marine debris	No explicit relevant management actions; marine debris identified as a threat.

Santos

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
				Climate change	No explicit relevant management actions; climate change identified as threat.
Seabirds	Draft Wildlife Conservation Plan for Seabirds (CoA 2019)	N/A	Seabirds and their habitats are protected and managed in Australia.	Habitat degradation / modification	No explicit relevant management actions; identified as a threat.
				Anthropogenic disturbance	Ensure all areas of important habitat for seabirds are considered in the development assessment process. Manage the effects of anthropogenic disturbance to seabird breeding and roosting areas.
				Climate Change	No explicit relevant management actions; identified as a threat.
				Invasive species	Ensure seabirds are protected from the adverse effects of invasive species.
				Pollution (marine debris, light, water)	Enhance contingency plans to prevent and/or respond to environmental emergencies that have an impact on seabirds and their habitats.
Migratory Shorebirds	Wildlife Conservation Plan for Migratory Shorebirds (DoEE 2015)	N/A	Anthropogenic threats to migratory shorebirds in Australia are minimised or, where possible, eliminated.	Habitat degradation / modification	No explicit relevant management actions; identified as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
				Anthropogenic disturbance	Investigate the significance of cumulative impacts on migratory shorebird habitat and populations in Australia. Ensure all areas important to migratory shorebirds in Australia continue to be considered in development assessment processes (specifically for coastal developments).
				Climate change	Investigate the impacts of climate change on migratory shorebird habitat and populations in Australia.
Albatrosses and Giant Petrels	National recovery plan for threatened albatrosses and giant petrels 2011–2016 (DSEWPaC 2011)	N/A	Overall objective: + To ensure the long-term survival and recovery of albatross and giant petrel populations breeding and foraging in Australian jurisdiction by reducing or eliminating human related threats at sea and on land. Specific objectives: + Land-based threats to the survival and breeding success of albatrosses and giant petrels	Pollution	No explicit management actions; marine pollution recognised as a threat.
				Climate change	Where climate change is identified as having the potential for significant negative impacts on Australian populations of seabirds: + Appropriate monitoring strategies are implemented to fill information gaps + Mitigation actions are identified and adopted where feasible and appropriate.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			breeding within areas under Australian jurisdiction are quantified and reduced. + Marine-based threats to the survival and breeding success of albatrosses and giant petrels foraging in waters under Australian jurisdiction are quantified and reduced.		
Australian Lesser Noddy (*Anous tenuirostris melanops*)	Conservation Advice *Anous tenuirostris melanops* Australian lesser noddy (DoE 2015)	Vulnerable	No explicit relevant objectives	Habitat degradation / Modification (oil spills)	No explicit relevant management actions; oil pollution recognised as a threat.
Red Knot (*Calidris canutus*)	Conservation Advice Red Knot (*Calidris canutus*) (DOE 2016)	Endangered	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; oil pollution recognised as a threat.
				Climate change	No explicit relevant management actions; climate change recognised as a threat.
Curlew Sandpiper (*Calidris ferruginea*)	Conservation Advice Curlew Sandpiper (*Calidris ferruginea*) (DOE 2015)	Critically Endangered	Australian Objective: + Reduce disturbance at key roosting and feeding sites	Habitat degradation/ modification (oil pollution)	No explicit relevant management actions; oil pollution recognised as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
Great Knot (*Calidris tenuirostris*)	Conservation Advice Great Knot (*Calidris tenuirostris*) (DOE 2016)	Critically Endangered	No explicit relevant objectives	Habitat degradation/ modification (oil pollution)	Identifies research priorities and the need for actions to prevent destruction of key breeding and migratory staging sites.
Cape Barren Goose (*Cereopsis novaehollandiae grisea*)	Approved Conservation Advice for *Cereopsis novaehollandiae grisea* (Cape Barren Goose (south-western)) (DEWHA 2008)	Vulnerable	No explicit relevant objectives	Habitat degradation/ modification	No explicit relevant management actions; habitat loss, disturbance and modification recognised as a threat.
				Disease	No explicit management actions; disease, fungi and parasites recognised as a threat.
Greater Sand Plover (*Charadrius leschenaultia*)	Conservation Advice Greater Sand Plover (*Charadrius leschenaultii*) (DOE 2016)	Vulnerable	No explicit relevant objectives	Habitat degradation/ modification (oil pollution)	Identifies research priorities and the need for actions to prevent destruction of key breeding and migratory staging sites
Lesser Sand Plover (*Charadrius mongolus*)	Conservation Advice Lesser Sand Plover (*Charadrius mongolus*) (DOE 2016)	Endangered	No explicit relevant objectives	Habitat degradation/ modification (oil pollution)	Outlines research and survey priorities and recommends habitat restoration/ maintenance.
Christmas Island Frigatebird (*Fregata andrewsi*)	Conservation Advice for the Christmas Island Frigatebird – *Fregata andrewsi* (DAWE 2020)	Endangered	Long-term Objective: + To reduce anthropogenic threats to allow the conservation status of Fregata andrewsi (the Christmas Island Frigatebird) to improve so that it can be removed from the threatened species list of the Environment	Disease	Undertake a risk assessment to determine the most likely source of a new avian disease so that any changes to procedure are targeted.
				Habitat degradation/ modification	Preventing activities in habitat critical to the survival that will remove nesting and roosting habitat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			Protection and Biodiversity Conservation Act 1999 (EPBC Act). Short-term Objectives: + The extent and quality of habitat critical to the survival of the Christmas Island Frigatebird is maintained or improved. + Anthropogenic threats to Christmas Island Frigatebird are demonstrably reduced.		Preventing activities in buffer areas identified in Map 1 that may disturb nesting and roosting birds
				Pollution	No explicit management actions; marine pollution recognised as a threat.
				Marine debris	No explicit relevant management actions; marine debris recognised as a threat.
Blue Petrel (*Halobaena caerulea*)	Conservation Advice *Halobaena caerulea* blue petrel (DoE 2015)	Vulnerable	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; habitat loss, disturbance and modification recognised as a threat.
Bar-tailed Godwit (baueri) (*Limosa lapponica baueri*)	Conservation Advice *Limosa lapponica baueri* (Bar-tailed Godwit (Western Alaskan)) (DoE 2016)	Vulnerable	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; oil pollutions recognised as a threat.
Northern Siberian Bar-tailed Godwit (*Limosa lapponica menzbieri*)	Conservation Advice *Limosa lapponica menzbieri* Bar-tailed godwit (northern Siberian) (DoE 2016)	Critically Endangered	No explicit relevant objectives	Habitat degradation / modification	No explicit relevant management actions; oil pollutions recognised as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
Eastern Curlew (*Numenius madagascariensis*)	Conservation Advice for *Numenius madagascariensis* (Eastern Curlew) (DoE 2015)	Critically Endangered	Australian objectives: + Achieve a stable or increasing population. + Maintain and enhance important habitat. + Reduce disturbance at key roosting and feeding sites.	Habitat degradation / modification	No explicit relevant management actions; habitat loss and degradation recognised as a threat.
Fairy Prion (*Pachyptila turtur subantarctica*)	Conservation Advice Fairy Prion (*Pachyptila turtur subantarctica*) (DOE 2015)	Vulnerable	No explicit relevant objectives	Habitat degradation / Modification	No explicit management actions; habitat loss, disturbance and modification recognised as a threat.
Abbott's Booby (*Papasula abbotti*)	Conservation Advice for the Abbott's Booby - *Papasula abbotti* (DAWE 2020)	Endangered	Long-term Objective: + To reduce anthropogenic threats to allow the conservation status of Papasula abbotti (Abbott's Booby) to improve so that it can be removed from the threatened species list of the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act). Short-term Objectives: + The extent and quality of habitat critical to the survival of Abbott's Booby is maintained or improved.	Climate change	Develop and implement a response plan to enhance the adaptation of Abbott's Booby to climate change.
				Disease	No explicit management actions; disease recognised as a threat.
				Marine debris	No explicit management actions; marine debris recognised as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			+ Anthropogenic threats to Abbott's Booby are demonstrably reduced.		
Christmas Island White-tailed Tropicbird (*Phaethon lepturus fulvus*)	Conservation Advice *Phaethon lepturus fulvus* white-tailed tropicbird (Christmas Island) (DOE 2014)	Endangered	No explicit relevant objectives	Oil Spills	No explicit management actions; oil spills recognised as a threat.
Soft-plumaged Petrel (*Pterodroma mollis*)	Conservation Advice *Pterodroma Mollis* soft-plumaged petrel (DoE 2015)	Vulnerable	No explicit relevant objectives	Habitat degradation / Modification (wetlands)	No explicit management actions; habitat loss, disturbance and modification recognised as a threat.
Australian Painted Snipe (*Rostratula australis*)	Approved Conservation Advice Australian Painted Snipe (*Rostratula australis*) (DSEWPC 2013)	Endangered	No explicit relevant objectives	Habitat degradation / Modification (wetlands)	Habitat recovery actions are a priority.
Australian Fairy Tern (*Sternula nereis nereis*)	Conservation Advice for *Sterna nereis nereis* (Fairy Tern) (DSEWPaC 2011)	Vulnerable	No explicit relevant objectives	Habitat degradation / modification (oil pollution)	Ensure appropriate oil spill contingency plans are in place for the subspecies' breeding sites that are vulnerable to oil spills.
Shy Albatross (*Thalassarche cauta*)	Conservation Advice *Thalassarche cauta* Shy Albatross (DAWE 2020)	Endangered	Conservation Advice refers to the objectives set out in the National Recovery Plan for Threatened	Climate change	No explicit management actions; climate change recognised as a threat.
				Disease	No explicit management actions; disease recognised as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
			Albatrosses and Giant Petrels 2011-2016 (DSEWPaC 2011).	Marine debris	No explicit management actions; marine debris recognised as a threat.
Marine Turtles	Recovery plan for Marine Turtles in Australia (DoEE 2017)	N/A	Long-term recovery objective: + Minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list. Interim objective 3: + Anthropogenic threats are demonstrably minimised.	Habitat degradation / modification	Manage anthropogenic activities to ensure marine turtles are not displaced from identified habitat critical to the survival. Manage anthropogenic activities in Biologically Important Areas to ensure that biologically important behaviour can continue.
				Vessel disturbance	Vessel interactions identified as a threat; no specific management actions in relation to vessels prescribed in the plan.
				Light pollution	Minimise light pollution: + Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats. + Develop and implement best practice light management guidelines for existing and future developments adjacent to marine turtle nesting beaches.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
					+ Identify the cumulative impact on turtles from multiple sources of onshore and offshore light pollution.
				Pollution (persistent toxic pollutants)	Minimise chemical and terrestrial discharge.
				Climate change	Adaptively manage turtle stocks to reduce risk and build resilience to climate change and variability: + Continue to meet Australia's international commitments to address the causes of climate change. + Identify, test and implement climate-based adaptation measures.
				Marine debris	Reduce the impacts from marine debris: + Support the implementation of the EPBC Act Threat Abatement Plan for the impacts of marine debris on vertebrate marine life.
				Noise interference	Assess and address anthropogenic noise:

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
					+ Understand the impacts of anthropogenic noise on marine turtle behaviour and biology.
				Disease and pathogens	No explicit management actions; disease and pathogens recognised as a threat.
Short-nosed Seasnake (*Aipysurus apraefrontalis*)	Approved Conservation Advice for *Aipysurus apraefrontalis* (Shortnosed Seasnake) (DSEWPaC 2011)	Critically Endangered	No explicit relevant objectives	Habitat degradation / modification	Monitor known populations to identify key threats. Ensure there is no anthropogenic disturbance in areas where the species occurs, excluding necessary actions to manage the conservation of the species.
Leaf-scaled Seasnake (*Aipysurus foliosquama*)	Approved Conservation Advice for *Aipysurus foliosquama* (leaf-scaled sea snake) (DSEWPaC 2011)	Critically Endangered	No explicit relevant objectives	Habitat degradation / modification	Ensure there is no disturbance in areas where the Leaf-scaled Sea Snake occurs, excluding necessary actions to manage the conservation of the species.
Leatherback Turtle (*Dermochelys coriacea*)	Approved Conservation Advice for *Dermochelys coriacea* (Leatherback Turtle) (DEWHA 2008)	Endangered	No explicit relevant objectives	Vessel disturbance	No explicit relevant management actions; vessel strikes identified as a threat.
				Marine debris	No explicit relevant management actions; marine debris identified as a threat.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
				Climate change	No explicit relevant management actions; climate change identified as a threat.
Sei Whale (*Balaenoptera borealis*)	Conservation Advice *Balaenoptera borealis* sei whale (DoE 2015)	Vulnerable	There is insufficient data on sei whales in Australian waters to determine abundance estimates, or an increase or decline in the population, and the full extent of their distribution in Australian waters is uncertain. To implement a range of Conservation Management Actions research needs to be undertaken as a priority to define the spatial and temporal distribution of sei whales and further define biologically important areas so that adaptive management and additional mitigation measures can be implemented if necessary (ie: within defined foraging or breeding areas).	Noise interference	Once the spatial and temporal distribution (including biologically important areas) of Fin Whales is further defined, assess the impacts of increasing anthropogenic noise (including seismic surveys, port expansion, and coastal development).
				Climate change impacts	Understanding impacts of climate variability and change: + Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica.
				Vessel disturbance	Minimising vessel collisions: + Develop a national vessel strike strategy that investigates the risk of vessel strikes on Sei Whales and also identifies potential mitigation measures. + Ensure all vessel strike incidents are reported in the National Vessel Strike Database.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
				Pollution (persistent toxic pollutants)	No explicit relevant management actions; pollution identified as a threat.
Blue (*Balaenoptera musculus*) and Pygmy Blue Whale (*Balaenoptera musculus brevicauda*)	Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (DOE 2015)	Endangered	The long-term recovery objective is to minimise anthropogenic threats to allow the conservation status of the Blue Whale to improve so that it can be removed from the threatened species list under the EPBC Act.	Noise interference and anthropogenic noise	Assess and address anthropogenic noise: shipping, industrial and seismic noise. Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area. Ensure EPBC Act Policy Statement 2.1— Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a) is applied to all seismic surveys

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
	Guidance on key terms within the Blue Whale Conservation management plan (DAWE, 2021)			Vessel disturbance	Minimise vessel collisions: + Develop a national vessel strike strategy that investigates the risk of vessel strike on blue whales and also identifies potential mitigation measures. + Ensure all vessel strike incidents are reported in the National Ship Strike Database. + Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented.
				Climate change impacts	Understanding impacts of climate variability and change: + Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica.
Fin Whale (*Balaenoptera physalus*)	Conservation Advice *Balaenoptera physalus* fin whale (DoE 2015)	Vulnerable	No explicit relevant objectives	Noise interference	Once the spatial and temporal distribution (including biologically important areas) of Fin Whales is further defined, assess the impacts of increasing anthropogenic noise

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
					(including seismic surveys, port expansion, and coastal development).
				Vessel disturbance	Develop a national vessel strike strategy that investigates the risk of vessel strikes on Fin Whales and identifies potential mitigation measures. Ensure all vessel strike incidents are reported in the National Vessel Strike Database.
				Climate change impacts	Understanding impacts of climate variability and change: + Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica.
Southern Right Whale (*Eubalaena australis*)	Conservation Management Plan for the Southern Right Whale. A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999	Endangered	Long term recovery objective: + To minimise anthropogenic threats to allow the conservation status of the southern right whale to improve so that it can be removed from	Noise interference	Assess and address anthropogenic noise: shipping, industrial and seismic noise.
				Vessel disturbance	Address vessel collisions: + Develop a national ship strike strategy that quantifies vessel movements within the

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
	2011-2021 (DSEWPC 2012)		the threatened species list under the EPBC Act Interim Recovery Objective 5: + Anthropogenic threats are demonstrably minimised		distribution ranges of southern right whales and outlines appropriate mitigation measures that reduce impacts from vessel collisions.
				Climate change	Assess impacts of climate variability and change. Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica.
				Marine debris	No explicit relevant management actions; entanglement in marine debris identified as a threat.
Australian Sea Lion (*Neophoca cinerea*)	Conservation Advice *Neophoca cinerea* Australian Sea Lion (DAWE 2020)	Endangered	Primary conservation actions: + Mitigate the impacts of marine debris on Australian Sea Lions + Improve understanding of the threats posed to Australian Sea Lion populations, including cumulative impacts.	Habitat degradation / pollution	Require all vessels to have oil spill mitigation measures in place, and implement jurisdictional oil spill response strategies as required. Protect all sea lion habitat from habitat degradation due to onshore and offshore developments.

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
				Noise pollution	Monitor and mitigate impacts (including cumulative impacts) of human interactions on Australian Sea Lion colonies. Control access to breeding colonies to minimise the impacts of disturbance on Australian Sea Lions.
				Marine debris	Assess the impacts of marine debris on Australian Sea Lion populations and identify the sources of marine debris which have an impact. Develop and implement measures to mitigate the impacts of marine debris on the species (including reducing the amount of these marine debris entering the oceans), noting linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life.
				Climate change	Review and adjust management measures to address the threats from disease/parasites and prey depletion, if

Species / Sensitivity	Plan	EPBC Act Protection	Relevant Objectives	Relevant Key Threats Identified	Relevant Conservation Actions
					it is demonstrated that increased temperatures compound these threats.
				Disease and parasites	Improve human wastewater management to minimise dispersal of bacteria, parasites and pollutants into the marine environment.

2.2.2.5 Recovery Plans

The EPBC Act provides for the development of recovery plans for species listed as threatened under the EPBC Act. Recovery plans are intended to ensure the recovery of threatened species by setting recovery objectives. These objectives are informed by:

+ descriptions of the state of the threatened species in Australia and globally;
+ identification of threats to the species; and
+ identification of actions by which these threats may be mitigated and the recovery objectives achieved.

A number of threatened species have been identified as potentially occurring within the environment that may be affected (EMBA) by the planned and unplanned activities of Dorado Phase 1. Santos has considered the recovery plans (**Table 2-2**) in place for these species when describing the existing environment and assessing the environmental impacts and risks from Dorado Phase 1.

2.2.2.6 Conservation Advice

Conservation advice for threatened species and communities may be published under the EPBC Act. This advice is developed in consultation with the Threatened Species Scientific Committee. Conservation advice:

+ describes the threatened species, including its distribution, habitat and conservation status;
+ describes threats to the recovery of the species; and
+ outlines research priorities and conservation actions to prevent further decline of the threatened species.

A number of threatened species have been identified as potentially occurring within the EMBA and that may be affected by the planned and unplanned activities of Dorado Phase 1. Conservation advice in relation to these species is summarised in **Table 2-2**. Santos has considered the conservation advice in place for these species when describing the existing environment and assessing the environmental impacts and risks from Dorado Phase 1.

2.2.2.7 Wildlife Conservation Plans

Wildlife conservation plans may be made under the EPBC Act for the protection, conservation and management of species protected under the Act.

Wildlife conservation plans relevant to the Dorado Development OPP are:

+ Wildlife conservation plan for migratory shorebirds (Commonwealth of Australia 2015c); and
+ Wildlife Conservation Plan for Seabirds (DCCEEW 2022).

These plans apply to a number of seabirds and migratory shorebirds (listed as migratory under the EPBC Act). The objectives of these plans is to protect important habitat, address knowledge gaps and reduce anthropogenic risks to seabirds and migratory shorebirds.

2.2.2.8 Threat Abatement Plans

Threat abatement plans may be made under the EPBC Act for threatening processes on native species and ecological communities. These plans describe objectives for the mitigation of threatening processes and the actions intended to achieve these objectives.

One threat abatement plan is relevant to the Dorado Development OPP – the Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018). Relevant objective and actions from this plan are described in **Section** 3.3.3.3 **.** The assessment of environmental impacts and risks from Dorado Phase 1 presented in **Section 7** includes controls to prevent the release of debris to the marine environment.

2.2.3 Additional Relevant Commonwealth Legislation

In addition to the OPGGS Act and the EPBC Act, a range of other legislation is relevant to the environmental management of Dorado Phase 1. These are listed in **Table 2-3** along with a description of their relevance to Dorado Phase 1.

Table 2-3: Commonwealth legislation relevant to the environmental management of Dorado Development Phase 1 (in addition to the OPGGS Act, EPBC Act and subsidiary legislation)

Legislation	Description	Relevance to Dorado Phase 1
Air Navigation Act 1920	This Act is responsible for managing navigation within the avian environment.	Helicopter and other aircraft activities occurring throughout all phases of the project are required to abide to the requirements under this Act.
Australian Heritage Council Act 2003	This Act identifies and protects areas of heritage value, including those listed on the World Heritage List, National Heritage List and the Commonwealth Heritage List (all of which are MNES under the EPBC Act).	Heritage values protected under the Act may be impacted by Dorado Phase 1 (**Section 3.4.4**). These values are considered in the assessment of environmental impacts and risks (**Section 7**). No impacts to heritage values will occur as a result of the planned activities within the scope of Dorado Phase 1.
Australian Jobs Act 2013	This Act ensure Australian entities have full, fair and reasonable opportunity to supply key goods or services to the Dorado Development. The Act requires proponents to create Australian Industry Participation Plans for projects where the capital expenditure (CAPEX) is $500 million dollars or more. The plans are assessed by the Department of Industry, Science, Energy and Resources (DISER). Proponents must report to DISER on the implementation of an accepted plan.	Santos has an approved Australian Industry Participation Plan for the Dorado Development and for the Operations Phase of the Dorado Development. The summaries are published here: https://www.industry.gov.au/sites/default/files/aip/aip-dorado-project_summary-7feb20.pdf https://www.industry.gov.au/sites/default/files/aip/aip-dorado-operations_summary-7feb20.pdf
Australian Maritime Safety Authority Act 1990	The Act aims to: + promote maritime safety; + protect the marine environment from: - pollution from ships and - other environmental damage caused by shipping; and + provide for a national search and rescue service. The authority responsible for applying the Act is AMSA.	The Act applies to offshore petroleum activities that have the potential to affect maritime safety and/or result in environmental damage, including pollution associated with the operation of vessels. This is also relevant to oil spills from vessels during petroleum activities.

Legislation	Description	Relevance to Dorado Phase 1
Australian Radiation Protection and Nuclear Safety Act 1998	This Act aims at protecting the health and safety of people and the environment from radiation effects.	The use of radioactive material during formation evaluation must comply with the Act.
Biosecurity Act 2015	This Act and its supporting legislation are intended to manage the risk of pests and diseases entering Australian territory. The Act creates requirements intended to reduce the risk of the introduction of invasive marine species (IMS). The Act gives effect to the International Convention for the Control and Management of Ships' Ballast Water and Sediment 2004.	Controls to reduce the risk of the introduction of IMS as a result of Dorado Phase 1 are provided in **Section 7.3.3**. These controls are consistent with the requirements of the Act.
Environment Protection (Sea Dumping) Act 1981	This Act prevents pollution of the sea by prohibiting the discharge of controlled materials to the sea. The Act gives effect to the Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter (commonly referred to as the London Convention) under Commonwealth law.	The assessment of environmental impacts and risks from Dorado Phase 1 presented in **Section 7.3.1** includes controls to prevent the release of controlled materials to the marine environment. Any planned dumping of controlled materials arising from Dorado Phase 1 (e.g. decommissioning in situ) will be done in accordance with a sea dumping permit granted under the Act.
Environment Protection and Biodiversity Conservation Regulations 2000: 8.1	Provides regulations for operating aircraft and vessels in the vicinity of cetaceans.	All aircraft and vessels to operate at required distances from cetaceans. The requirements are detailed in the Australian National Guidelines for Whale and Dolphin Watching (DoE 2017)
Hazardous Waste (Regulation of Exports and Imports) Act 1989	This Act regulates the export, import and transport of hazardous waste to ensure that hazardous waste is managed appropriately so that human health and the environment are protected from the harmful effects of the waste. The Act gives effect to the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal, 1972 (commonly referred to as the Basel Convention) under Commonwealth law.	Dorado Phase 1 will comply with the requirements of the Act for the export, import and transport of hazardous waste. These requirements will be included in the waste management arrangements applied during Dorado Phase 1.

Legislation	Description	Relevance to Dorado Phase 1
National Environment Protection (National Pollutant Inventory) Measure 1998 (established under the *National Environment Protection Council Act 1994*)	This measure provides the framework for the development and establishment of the National Pollutant Inventory, which provides publicly available information on the types and amounts of numerous toxic substances being emitted into the Australian environment. These substances have been identified as important due to their possible effect on human health and the environment.	Dorado Phase 1 will comply with the National Pollutant Inventory National Environment Protection Measure through the reporting of relevant National Pollutant Inventory substances.
National Greenhouse and Energy Reporting Act 2007 National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015	The Act provides a single, national framework for the reporting and distribution of information related to GHG emissions, GHG projects, energy production and energy consumption. Reporting obligations are imposed upon corporations that meet emissions or energy thresholds. The Act includes National Greenhouse and Energy Reporting (NGER) requirements and the Safeguard Mechanism requirements.	Santos will report GHG emissions associated with Dorado Phase 1 in accordance with the NGER requirements.
Navigation Act 2012, Marine Order 21 (Safety and emergency arrangements) 2016, Marine Order 27 (Safety of navigation and radio equipment) 2016 Marine order 28 (Operations standards and procedures), Marine Order 30 (Prevention of Collisions) 2009,	This Act and subsidiary Marine Orders give effect to several international conventions relating to maritime safety to which Australia is a signatory, including: + International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, and + International Regulations for Preventing Collisions at Sea 1972. The Act regulates vessel crew, vessel survey and certification, occupational health and safety, passengers,	All vessels and facilities undertaking activities within the scope of Dorado Phase 1 will comply with the requirements of the Act. These requirements reduce the risk of accidents and unplanned interactions with other users of the marine environment in the Project Area.

Legislation	Description	Relevance to Dorado Phase 1
Marine Order 47 (Offshore Industry Units), Marine Order 60 (Floating offshore facilities), Marine Order 71 (Masters and Deck Officers) 2014.	personnel qualifications and welfare, vessel construction standards, handling of cargoes, marine pollution prevention, and monitoring and enforcement activities.	
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989	The Act and subsidiary regulations protect the environment by regulating emissions of ozone-depleting substances and synthetic greenhouse gases. Manufacturing, importing and exporting of ozone-depleting substances and synthetic greenhouse gases and products containing these gases are controlled under the Act and subsidiary regulations. The Act gives effect to several international conventions to which Australia is a signatory: + the Vienna Convention for the Protection of the Ozone Layer, + the Montreal Protocol on Substances that Deplete the Ozone Layer, and + United Nations Framework Convention on Climate Change and its Kyoto Protocol.	Dorado Phase 1 will adhere to restrictions on import and use of ozone-depleting substances and synthetic greenhouse gases.
Protection of the Sea (Harmful Anti-fouling Systems) Act 2006 Marine Order 98 (Marine pollution – anti-fouling systems)	The Act and subsidiary Marine Order prohibit the use of organotin compounds in anti-fouling coatings on ships. These compounds have been shown to result in deformations and sex changes in molluscs. The Act and subsidiary Marine Order give effect to the Convention on the Control of Harmful Anti-fouling Systems on Ships.	All vessels undertaking activities within the scope of Dorado Phase 1 are required comply with the requirements of the Act and subsidiary Marine Order.

Legislation	Description	Relevance to Dorado Phase 1
Protection of the Sea (Prevention of Pollution from Ships) Act 1983, Marine Order 91 (Marine pollution prevention — oil) 2014, Marine Order 93 (Marine pollution prevention — noxious liquid substances) 2014, Marine Order 94 (Marine pollution prevention — packaged harmful substances) 2014, Marine Order 95 (Marine pollution prevention — garbage) 2018, Marine Order 96 (Marine pollution prevention — sewage) 2018, and Marine Order 97 (Marine pollution prevention — air pollution) 2013	The Act controls discharges from ships to protect the sea from pollution. This includes regulation of discharges of oil or oily mixtures, noxious liquid substances, packaged harmful substances, sewage and garbage to the sea. The Act imposes a duty to report certain incidents involving prohibited discharges and to maintain record books and management plans. The Act and subsidiary Marine Orders enact the International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978 (commonly referred to as the MARPOL 73/78 Convention).	All vessels undertaking activities within the scope of Dorado Phase 1 are required comply with the requirements of the Act.
Underwater Cultural Heritage Act 2019	This Act protects shipwrecks and associated relics in Commonwealth waters that are more than 75 years old. The Act aims to ensure that historic shipwrecks are protected for their heritage values and maintained for recreational, scientific and educational purposes.	Santos will ensure that Dorado Phase 1 does not impact upon cultural heritage properties protected under the Act. No underwater cultural heritage properties have been identified within the Project Area.

2.3 International Agreements and Conventions

Australia is signatory to several international conventions and agreements that are relevant to the environmental management of Dorado Phase 1. These are typically implemented by Commonwealth legislation detailed in **Section 2.2.3**. International agreements and conventions relevant to Dorado Phase 1 are provided in **Table 2-4**. Refer to **Table 2-3** for the legislation giving effect to the agreements and conventions in **Table 2-4** and their relevance to Dorado Phase 1.

Table 2-4: Summary of relevant international agreements and conventions

International Agreement / Convention	Description
Agreement between the Government of Australia and the Government of Japan for the Protection of Migratory Birds in Danger of Extinction and their Environment, 1974 (commonly referred to as JAMBA)	JAMBA provides for cooperation between Japan and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to JAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.
Agreement between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment, 1986 (commonly referred to as CAMBA)	CAMBA provides for cooperation between China and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to CAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.
Agreement between the Government of Australia and the Government of the Republic of Korea for the Protection of Migratory Birds and their Environment, 2002 (commonly referred to as ROKAMBA)	ROKAMBA provides for cooperation between the Republic of Korea and Australia to minimise harm to major areas used by birds that migrate between the two countries. The EPBC Act gives effect to ROKAMBA by listing migratory birds recognised by the agreement as migratory under the EPBC Act. Migratory species are MNES.
Convention on the Conservation of Migratory Species of Wild Animals, 1979 (Bonn Convention)	The Bonn Convention aims to conserve migratory species within their migratory ranges. The Bonn Convention provides specific protection for migratory species threatened with extinction or requiring international cooperation to conserve effectively. The EPBC Act gives effect to the Bonn Convention through listing species as migratory under Part 3 of the Act. Migratory species are MNES.
Convention on Wetlands of International Importance (Ramsar Convention)	The Ramsar Convention provides for the conservation and sustainable use of wetlands. The EPBC Act gives effect to the Ramsar Convention by providing specific protection for wetlands recognised by the Convention under Part 3 of the EPBC Act. These wetlands are termed "wetlands of international importance" and are MNES.
International Convention for the Control and Management of Ships' Ballast Water and Sediment, 2004	The Convention aims to prevent the spread of harmful aquatic organisms from one region to another via ballast water and sediment. The *Biosecurity Act 2015* gives effect to the Convention.
Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, 1972 (London Convention)	The London Convention is an agreement to control pollution of the sea by dumping. The *Environment Protection (Sea Dumping) Act 1981* gives effect to the London Convention.

International Agreement / Convention	Description
The Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and their Disposal, 1972 (Basel Convention)	The Basel Convention reduces the movement of hazardous wastes (excluding radioactive wastes) between nations, particularly from developed to less developed countries. The *Hazardous Waste (Regulation of Exports and Imports) Act 1989* gives effect to the convention.
International Convention for the Safety of Life at Sea 1974	The International Convention for the Safety of Life at Sea 1974 sets minimum safety standards for construction, equipment and operation of merchant ships. The convention requires signatory flag states to ensure that ships flagged by them comply with these standards as a minimum. The *Navigation Act 2012* and subsidiary Marine Orders give effect to the convention.
International Convention on Standards of Training, Certification and Watchkeeping for Seafarers, 1978	The International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978 sets out minimum standards for masters, officers and watch personnel on merchant vessels. The *Navigation Act 2012* and subsidiary Marine Orders give effect to the convention.
International Regulations for Preventing Collisions at Sea 1972	The International Regulations for Preventing Collisions at Sea 1972 outline internationally recognised navigation rules to be used by vessels at sea to avoid collisions. The regulations are published by the International Maritime Organization (IMO). The *Navigation Act 2012* and subsidiary Marine Orders give effect to the regulations.
United Nations Framework Convention on Climate Change 1992	The United Nations Framework Convention on Climate Change is an international environmental treaty addressing climate change. The convention seeks the stabilisation of greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic (human-induced) interference with the earth's climate system. Such a level should be achieved within a timeframe sufficient to allow ecosystems to adapt naturally to climate change, to ensure that food production is not threatened and to enable economic development to proceed in a sustainable manner.
Kyoto Protocol	The Kyoto Protocol is an international treaty that extends the 1992 United Nations Framework Convention on Climate Change, which commits state parties to reduce greenhouse gas emissions, based on the scientific consensus that global warming is occurring and that human-made CO_2 emissions are driving it.
Convention on the Control of Harmful Anti-fouling Systems on Ships, 2001	The convention prohibits the use of harmful organotins in anti-fouling paints used on ships and establishes a mechanism to prevent the potential future use of other harmful substances in anti-fouling systems. The *Protection of the Sea (Harmful Anti-fouling Systems) Act 2006* and subsidiary Marine Order give effect to the Convention.

International Agreement / Convention	Description
Convention on the Control of Harmful Anti-fouling Systems on Ships, 2001	The convention prohibits the use of harmful organotins in anti-fouling paints used on ships and establishes a mechanism to prevent the potential future use of other harmful substances in anti-fouling systems. The *Protection of the Sea (Harmful Anti-fouling Systems) Act 2006* and subsidiary Marine Order gives effect to the Convention.
International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978 (MARPOL 73/78)	MARPOL 73/78s aim to minimise pollution of the sea from ships. All ships flagged under countries that are signatories to MARPOL 73/78 are subject to its requirements, regardless of where they sail. Member nations are responsible for vessels registered on their national ship registry. Several Annexes apply directly to offshore petroleum activities: MARPOL 73/78 Annex I (Prevention of pollution by oil), MARPOL 73/78 Annex II (Control of pollution by noxious liquid substances in bulk), MARPOL 73/78 Annex III (Prevention of pollution by harmful substances carried by sea in packaged form), MARPOL 73/78 Annex IV (Pollution by sewage from ships), MARPOL 73/78 Annex V (Pollution by garbage from ships), and MARPOL 73/78 Annex VI (Prevention of air pollution from ships). The *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* and subsidiary Marine Orders give effect to MARPOL 73/78.
The Paris Agreement	Article 2 of the Paris Agreement aims to limit global temperature increase to well below 2 C while pursuing efforts to limit the temperature increase to 1.5 C. As a party to the Paris Agreement, the Australian Government has developed local policy, legislation, regulation and a suite of initiatives and programs in support of meeting its commitments under the Paris Agreement. Santos will be required to comply with all applicable Commonwealth legislation.
The Minamata Convention on Mercury	The Minamata Convention on Mercury requires parties to address adverse effects of mercury to protect human health and the environment. Australia is a signatory and ratified the Minamata Convention on Mercury on 7th December 2021. Mercury releases associated with the Oil and Gas industry are proposed to be tabled at Conference of Parties 5 in 2023. The Minamata Convention on Mercury is applicable to all stages of the Dorado Development lifecycle and Santos will be required to comply.

2.4 Guidelines

Applicable guidelines for Dorado Phase 1 are summarised in **Table 2-5**. While guidelines do not typically have force under legislation, they are often considered to be consistent with good practice. Santos has considered the guidelines in **Table 2-5** in the environmental management of Dorado Phase 1.

Table 2-5: Guidelines, standards and codes of practice

Guidelines, Standards and Codes	Description	Relevance to Dorado Phase 1
Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018)	The guidelines provide a comprehensive set of tools for the assessment and management of ambient water and sediment quality in a range of water resource types.	Several aspects of Dorado Phase 1 may result in changes to water quality within the Project Area. Santos will use the methods and guideline concentrations for potential toxicants in the guideline when assessing environmental impacts and risks from Dorado Phase 1.
Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020)	The requirements state the obligations on vessel operators to manage ballast water and ballast sediment when operating in Australian waters.	Vessels undertaking Dorado Phase 1 will carry ballast water. All vessels undertaking Dorado Phase 1 will be required to comply with the requirements.
Code of Environmental Practice 2008 (Australian Petroleum Production and Exploration Association 2008)	The code outlines example environmental objectives for petroleum activities in Australia. This is intended to be align with objective-based, rather than proscriptive, environmental management.	Santos recognises the environmental objectives and will align the environmental management of Dorado Phase 1 with the code.
EPBC Act Policy Statement 2.1 – Interactions between offshore seismic activities and whales (Department of the Environment, Water, Heritage and the Arts 2008a)	This policy statement provides advice on reducing the risk of acoustic disturbance from seismic sources to whales. The policy statement also provides advice to operators conducting seismic surveys on their legal responsibilities under the EPBC Act.	Exploration seismic surveys are beyond the scope of the activities considered in the Dorado Development OPP. Vertical seismic profiling of wells may be undertaken, which will require a seismic source. Santos will align the environmental management of vertical seismic profiling with the policy statement, where relevant.
National biofouling management guidelines for the petroleum production and exploration industry (Marine Pest Sectoral Committee 2018)	The guidelines provide voluntary biofouling management advice to the offshore petroleum industry. The guidelines are intended to reduce the risk of translocation of IMS.	Vessels undertaking Dorado Phase 1 may have low levels of biofouling. Santos will align management of biofouling on vessels, facilities and equipment with the guidelines.

Guidelines, Standards and Codes	Description	Relevance to Dorado Phase 1
National Light Pollution Guidelines for Wildlife (Commonwealth of Australia 2020)	The guidelines outline a process for managing potential impacts of artificial lighting on fauna that may be sensitive to light pollution.	Dorado Phase 1 will emit artificial light into the environment. Santos will consider the advice provided by the guidelines when designing and operating Dorado Phase 1.
NOPSEMA Offshore Project Proposal Content Requirements Guidance Note (NOPSEMA 2020a)	The guidance note assists proponents in preparing an OPP in accordance with the OPGGS (E) Regulations by providing an overview of the content requirements of an OPP	Santos has developed the Dorado Development OPP in accordance with the guidance note.
Offshore Installations – Biosecurity Guide (Department of Agriculture and Water Resources 2020)	This document provides the offshore petroleum industry with guidance on Australian biosecurity requirements.	The vessels and petroleum facilities within the scope of Dorado Phase 1 will be subject to the requirements of this biosecurity guideline.
NOPSEMA Bulletins - Oil Spill Modelling (NOPSEMA 2019b)	The guidance note primarily gives advice relating to the application of stochastic modelling to support risk evaluations, but also has application to the use of deterministic modelling in response planning.	Santos has undertaken the oil spill modelling in accordance with the guidance note.
NOPSEMA Policy – Section 572 Maintenance and removal of property (NOPSEMA 2020b)	This policy outlines NOPSEMA expectation of what is to be included in an OPP submitted to NOPSEMA for acceptance.	Santos has included the required information in the OPP.
NOPSEMA Information paper - Reducing marine pest biosecurity risks through good practice biofouling management (NOPSEMA 2021)	This information paper clarifies the biosecurity requirements relevant to offshore activities, provides coordinated good practice advice that is consistent with the expectations of all jurisdictions responsible for regulating biofouling management within the Australian marine environment to the boundary of the Economic Exclusion Zone and/or over the continental shelf of Australia (Australian waters) and supports the industry's contribution to marine pest risk management consistent with objective 1 of Australia's National Strategic Plan for Marine Pest Biosecurity (2018-	Santos has complied with the relevant biosecurity requirements including adopting requirements that may apply to the movement of vessels into and between commonwealth and state jurisdiction.

Guidelines, Standards and Codes	Description	Relevance to Dorado Phase 1
	2023) – 'Minimise the risk of marine pest introduction, establishment and spread'.	

Santos

3 Description of the Environment

3.1 Introduction

This section describes the physical, biological and socio-economic characteristics of the EMBA by planned and unplanned Dorado Phase 1 activities. It describes the environmental values and sensitivities, including MNES protected under the EPBC Act. The section informs the evaluation of credible environmental impacts and risks from Dorado Phase 1 presented in **Section 7**.

3.1.1 Environment that May Be Affected

The EMBA is determined by the combined spatial extent of impacts and risks of the planned and unplanned Dorado Phase 1 activities. All planned activities will occur within the Project Area. Santos has used several methods for determining the spatial extent of the EMBA from Dorado Phase 1, including:

- the location and design of the facilities that will be constructed;
- the predicted characteristics and volumes of emissions and discharges; and
- modelling studies of planned and unplanned emissions and discharges, including:
  - drill cuttings and fluid discharges (**Attachment 6**);
  - PW discharges (**Attachment 7**);
  - credible worst-case hydrocarbon spills (**Attachment 8**);
  - artificial light emissions (**Attachment 9**);
  - underwater acoustic emissions (**Attachment 10, Attachment 14**); and
  - GHG emissions (**Attachment 12**).

Further information on the items listed above is available in **Section 6** and **Section 7**.

While the EMBA represents the largest possible spatial extent that could be contacted by any of the worst-case spill events modelled, an actual spill event is more accurately represented by only one of the simulations from the stochastic modelling, resulting in a much smaller spatial footprint in the event of an actual spill. The description of the EMBA also considers the nature and scale of the environmental impacts and risks of Dorado Phase 1. Additional detail has been provided in describing environmental values and sensitivities that are predicted to be impacted by planned activities. Impacts to these values and sensitivities are almost certain to occur as a result of Dorado Phase 1 and can be predicted with a relatively high degree of certainty.

Impacts to environmental values and sensitivities from unplanned activities are unlikely to occur. Santos invests significant effort to prevent unplanned activities, such as hydrocarbon spills, from occurring. Environmental values and sensitivities that have a relatively low probability of being impacted by unplanned activities are described in sufficient detail to inform the assessment of the impacts and risks from the unplanned activity. Examples of such environmental values and sensitivities include far-field receptors within the EMBA predicted by worst-case credible hydrocarbon spill modelling. Such values and sensitivities are described in sufficient detail to inform the assessment of environmental risks from unplanned activities. However, the level of detail of the description may be less than that provided for environmental values and sensitivities that will be impacted by planned activities.

The outer boundary of the description of the EMBA was derived from the results of stochastic modelling of the worst-case credible hydrocarbon spill scenarios that may occur from all activities during the Dorado Development. Santos has identified a Loss of well control as the worst-case type of credible oil release scenario that could potentially occur during the activity. A loss of well control incident may discharge directly to the sea surface or at the seabed, depending on the type of failure that occurs. Each stage of the development may have other spill scenarios (refer to **Table 7-69** and **Table 7-70**) that result in smaller spills than the worst-case credible spills used to inform the EMBA. Santos has used a combination of Loss of well control spill scenarios defined as the worst case credible for the Dorado Activity, whereby all other spill scenarios fit within this. These spill scenarios drive the EMBA and associated environmental impacts and risks described in **Section 7.**

The worst-case spill scenarios include:

- A loss of well control from the Dorado Development (refer to **Table 7-69**); and
- A loss of well control from Future Tieback Reservoirs (**Table 7-70**).

The low exposure values are used as a predictive tool to set the outer boundaries of EMBAs and may not necessarily result in ecologically significant impacts. To inform the evaluation of potential environmental consequences of a hydrocarbon release (impact assessment), modelling is undertaken using higher exposure values (the concentrations at which environmental consequences may result). This boundary was based on the concentrations of hydrocarbons that may result in impacts and risks to biological receptors derived from the oil spill modelling bulletin published by NOPSEMA (2019b). Two worst-case credible spill scenarios, the subsea and topsides loss of well containment scenarios (from the Dorado Reservoir), account for the outer boundary of the EMBA (**Section 7.3.1**). The largest EMBA is determined by the extent of the entrained hydrocarbon as a result of a loss of well control event. Modelling results indicate the spatial extents of potential impacts from other worst-case credible spill scenarios are considerably smaller than the two worst-case loss of well containment scenarios. Hydrocarbon spill modelling studies are provided in **Attachment 8** and considered in **Section 7.3.1**. The EMBA for both the low threshold and moderate threshold is shown in **Figure 3-1**. A low exposure threshold, which approximates a range of socio-economic effects, is considered to provide a conservative extent of potential impacts. Biological impacts are expected to occur within the moderate and high exposure values which represent a subset of the EMBAs.

Exploration drilling of the prospects identified within the Project Area as future tiebacks within this OPP (refer **Figure 1-2**) are proposed to be drilled under separate environment plans for exploration and appraisal drilling activities including the NOPSEMA accepted Bedout Basin Multi-Well Drilling Environment Plan (Bedout Multi-Well Drilling Environment Plan). The EMBA associated with the subsea and topsides loss of well containment scenario at the Bedout Apus-1 well location was compared with the Dorado Development EMBA. The EMBA defined in the Bedout Basin Multi-Well Drilling Environment Plan, has a smaller spatial extent when compared to the Dorado Development EMBA, excepting for the southern extent, which extends further south and east around the southern coast of Western Australia.

3.1.2 Dorado Development Environmental Studies

Santos commissioned a range of studies to better understand the EMBA within the Project Area. These are described in subsequent sections and include:

- benthic habitat surveys (**Attachment 2**);
- benthic habitat modelling (**Attachment 3**);
- sediment quality survey (**Attachment 4**); and
- water quality survey (**Attachment 5**).

Dorado Phase 1 environmental studies' boundaries and sampling locations are shown in **Figure 3-2.**

Santos has also undertaken, and continues to undertake, studies within the Project Area to inform the design of Dorado Phase 1, such as meteorological, oceanographic, geotechnical and geophysical studies. Results from these studies have informed the engineering design, and they have also been considered where their results inform the assessment of environmental impacts and risks from Dorado Phase 1.

3.1.2.1 Benthic Habitat Survey

Santos commissioned RPS to conduct a benthic habitat survey within and around the Project Area in December 2019. This sampling was conducted in conjunction with sediment and water quality sampling. The benthic habitat survey was designed by CSIRO, RPS and Santos to representatively sample the range of ecotypes (habitat types), with targeted sampling around the Dorado WHP and FPSO locations. The survey design focused on representation of the ecotypes identified by CSIRO in preliminary modelling and which lie within the Project Area. The survey report is provided as **Attachment 2**.

The benthic habitat survey included the following sampling methods:

+ benthic video transects completed by a remotely operated vehicle (ROV). A total of 39 sites were surveyed at water depth between 75 and 138 m below sea level (BSL). Benthic habitats and biota were described by an experienced marine biologist during each transect; and
+ infaunal samples were collected using a 0.25-m^2 van Veen grab from five sites across the Dorado Phase 1 baseline survey area.

Habitat characterisation was completed using CSIRO's Tappity software, which records data on benthic substrates, habitats and biota using predetermined descriptors. These descriptors were used by CSIRO to complete the ecotype modelling of the benthic habitat within the Dorado Phase 1 baseline survey area (**Attachment 3**). In addition to the Tappity descriptors, handwritten field notes were collected to provide benthic habitat and community descriptions prior to analyses completed by CSIRO.

3.1.2.2 Habitat Modelling

Santos commissioned CSIRO to undertake habitat modelling to predict the types and distributions of benthic habitats and biological assemblages within and around the Project Area. CSIRO used historical data sets (primarily fish trawl catch and benthic imagery), public databases of fish and marine invertebrate biodiversity, recent environmental surveys and bio geophysical environmental data to inform the modelling.

The habitat model produced by CSIRO (**Attachment 3**) provided predictions of the spatial patterns and composition of biological assemblages (ecotypes) in and around the proposed Project Area. Substrate types, topography and benthic habitats were also described based on historical and recent observations of the seabed. In addition, the report provided a description of the fish and invertebrate biodiversity of the Project Area and its surrounds in the context of the North West Shelf (NWS) region.

3.1.2.3 Sediment Quality

Santos commissioned RPS to undertake sediment quality sampling within and around the Project Area (**Attachment 4**). Sediment quality sampling was conducted in conjunction with the benthic habitat survey and water quality sampling. Sediment samples were collected using a van Veen grab at 14 locations, and the sediments were analysed for:

- metals;
- hydrocarbons;
- tributyltin;
- naturally occurring radioactive material;
- nutrients; and
- particle size distribution.

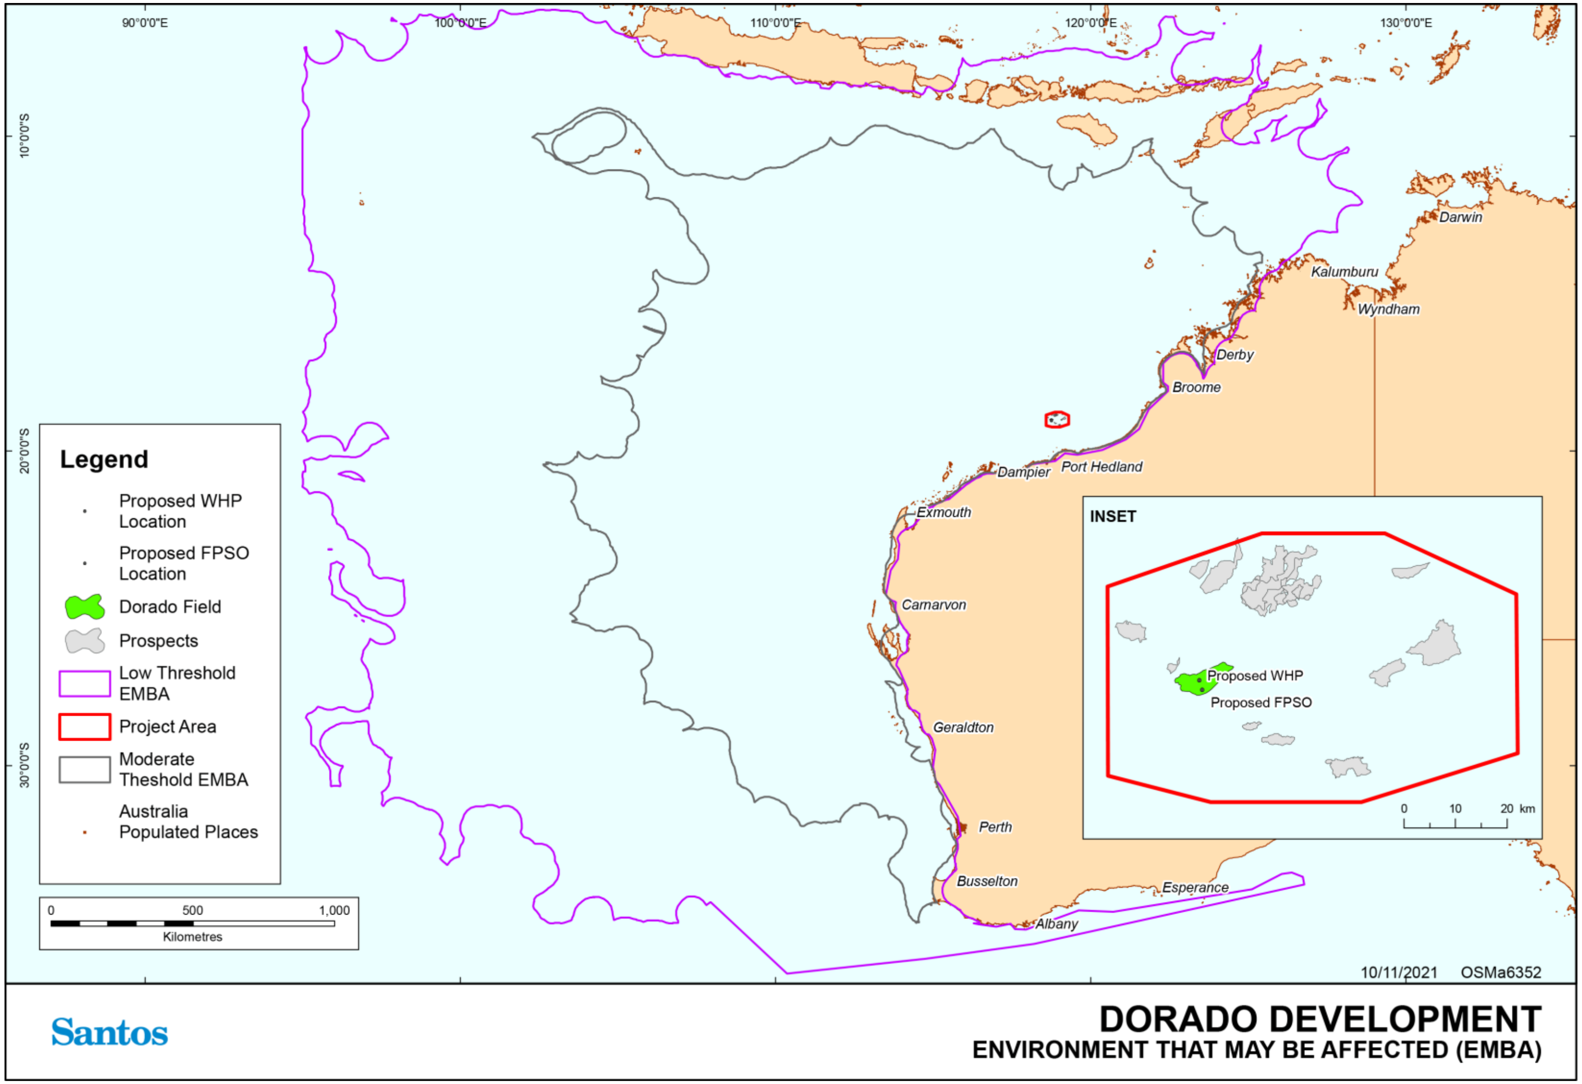

Figure 3-1: EMBA for planned and unplanned Dorado Phase 1 activities

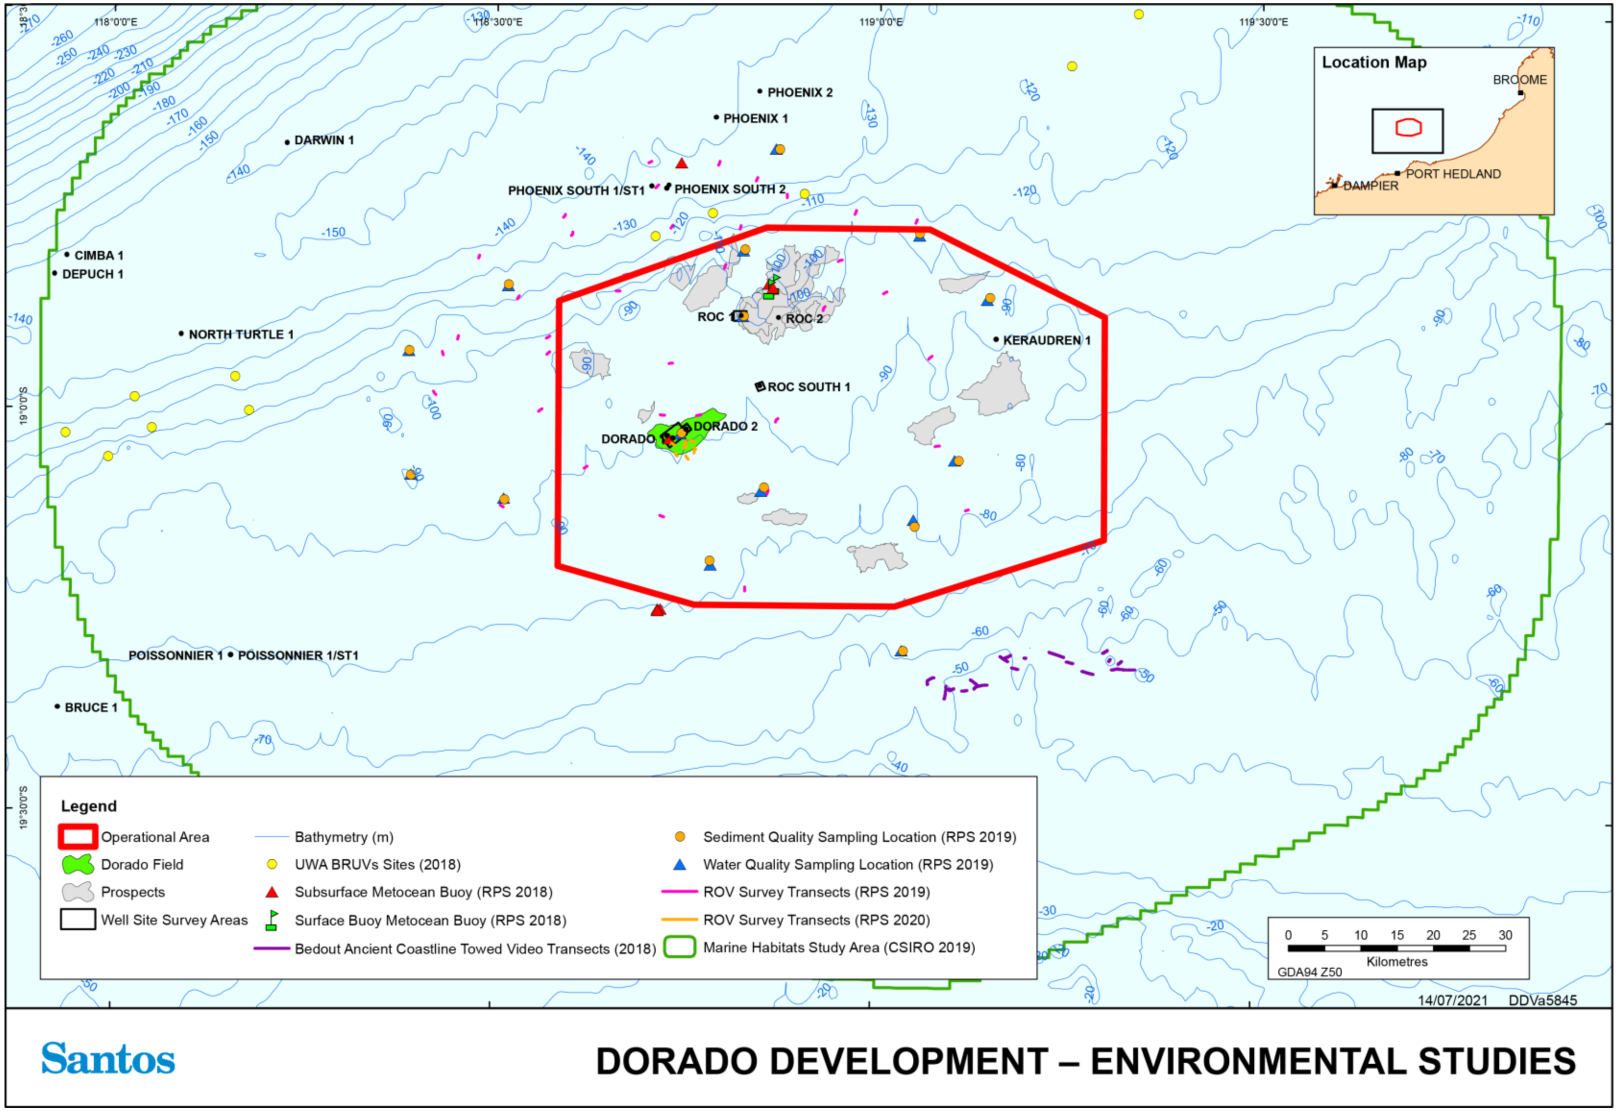

Figure 3-2: Dorado Development Environmental Studies

3.1.2.4 Water Quality

Santos commissioned RPS to undertake water quality sampling within, and around, the Project Area (**Attachment 5**). Water quality sampling was conducted in conjunction with the benthic habitat survey and sediment quality sampling. Water quality sampling was undertaken at 15 sites, with the following parameters sampled:

+ depth (pressure);
+ salinity (conductivity);
+ water temperature;
+ pH;
+ dissolved oxygen;
+ turbidity;
+ photosynthetically-active radiation;
+ chlorophyll a;
+ total suspended solids;
+ metals and metalloids;
+ naturally occurring radioactive material; and
+ hydrocarbons.

3.2 Physical Environment

3.2.1 Bathymetry

The seabed within the Project Area is generally flat and featureless (**Figure 3-3**), which is consistent with much of the mid-continental shelf in the NWS region. The northern part of the Project Area features relatively complex bathymetry, which corresponds to the relic shoreline from changes in sea level during the last 100,000 years. This relic shoreline was identified as a key ecological feature (KEF) – the Ancient Coastline at 125 m – in the Marine bioregional plan for the North-west Marine Region (DSEWPaC 2012a).

There are no known bathymetric features, such as reefs, shoals or banks, within the Project Area.

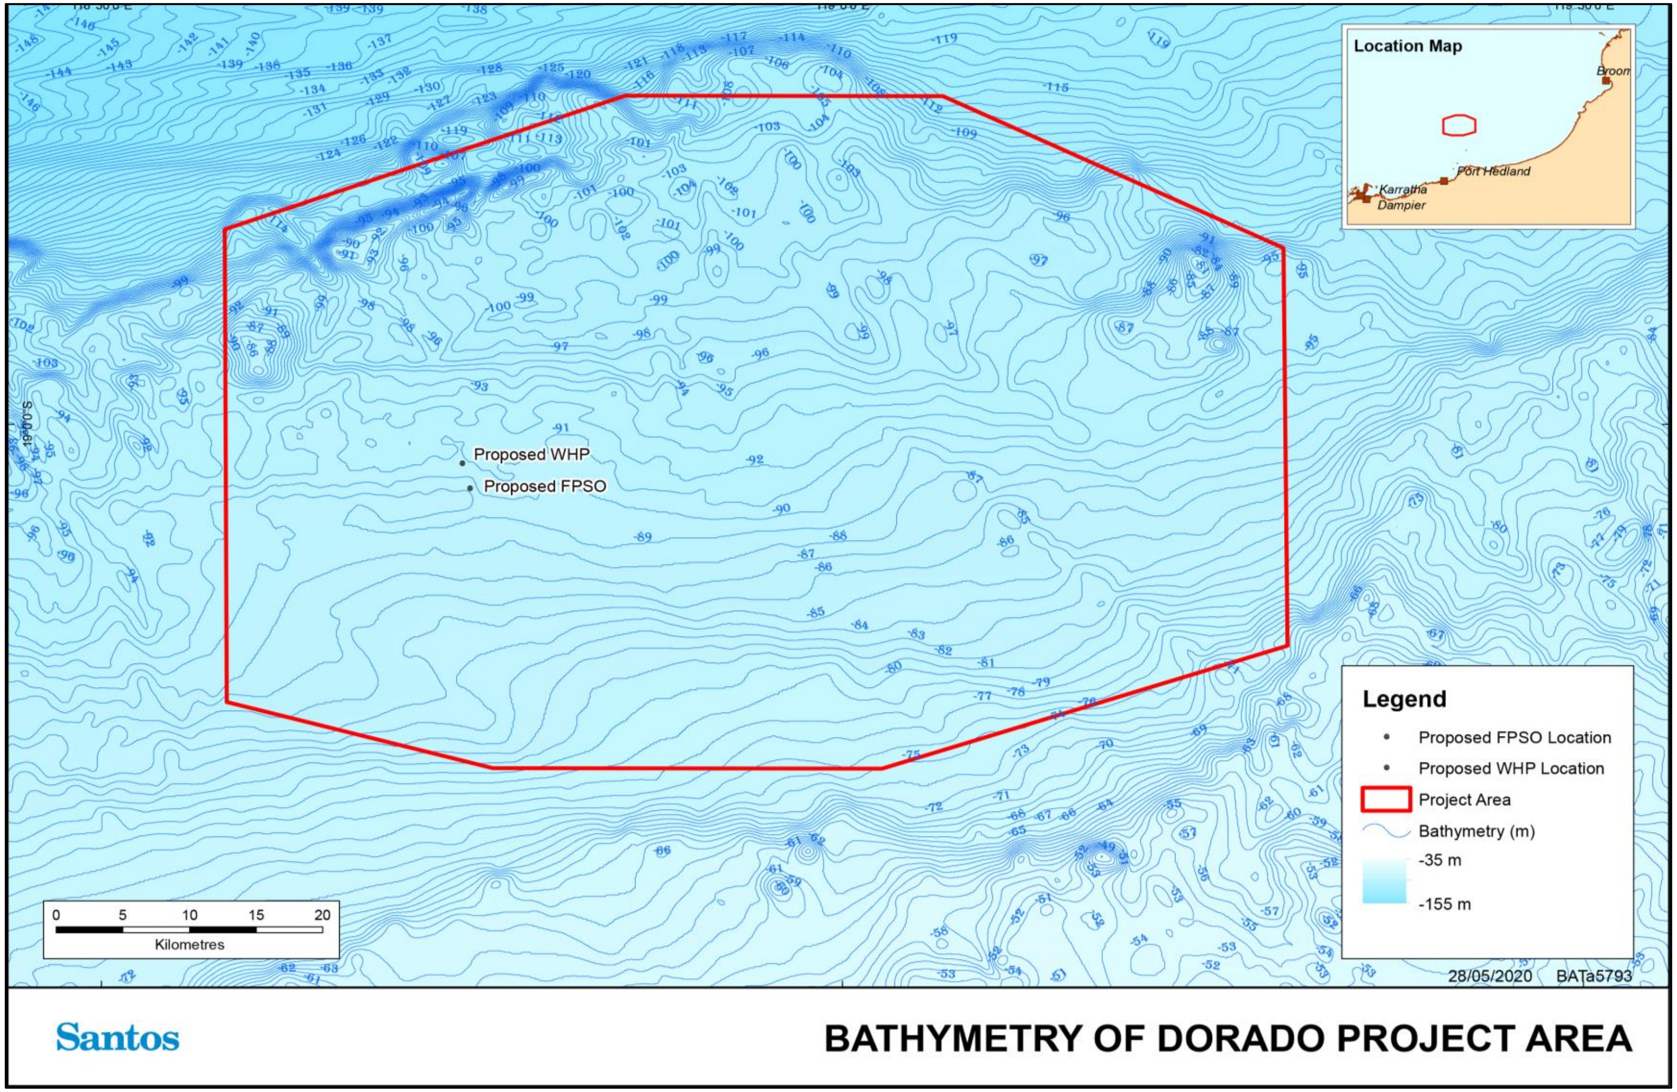

Figure 3-3: Bathymetry of the Project Area

3.2.2 Climate

The climate of the Project Area is arid and tropical, experiencing high summer temperatures and periodic tropical cyclones in summer (**Figure 3-4**). Long-term average daily maximum air temperatures range from 33.7°C in March to 25.1 C in July; long-term average daily minimum temperatures range from 27.7°C in March to 19.6°C in July (**Figure 3-4**). Rainfall in the region is low, although intense rainfall may occur during the passage of summer tropical cyclones and thunderstorms.

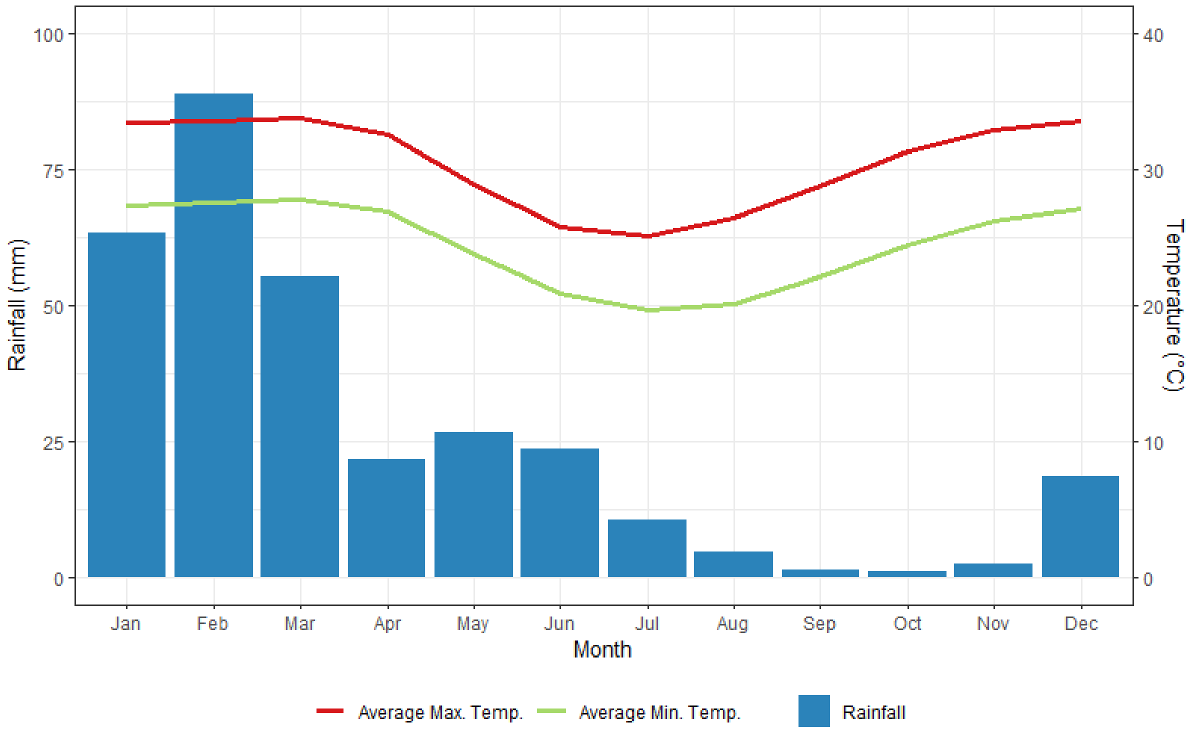

Figure 3-4: Average daily maximum and minimum temperatures and average monthly rainfall in the Dorado Project Area

The summer and winter seasons fall into the periods September to March and May to July, respectively. Winters are characterised by clear skies, fine weather, predominantly strong east to southeast winds and infrequent rain. Summer winds are more variable, with strong southwesterlies dominating. Transitional wind periods, during which either pattern may predominate, can be experienced in April, May and September of each year (**Figure 3-5**).

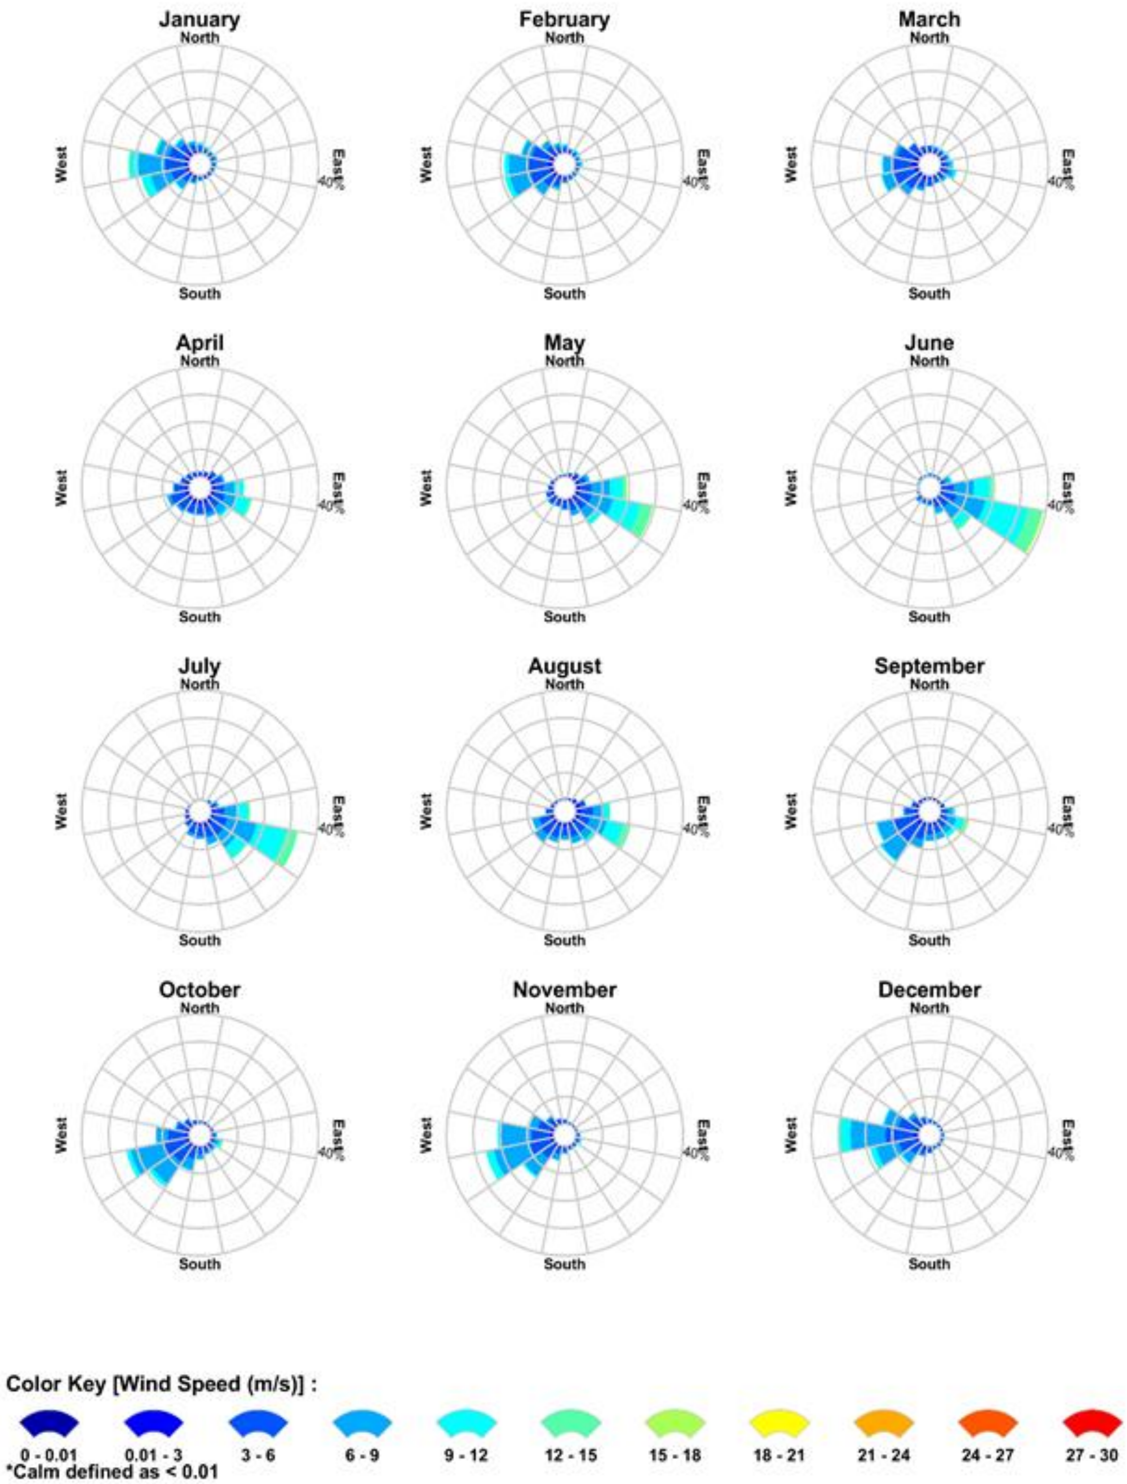

Figure 3-5: Monthly wind distribution (2009 to 2018, inclusive) derived from the Climate Forecast System Reanalysis closest data point modelled hydrocarbon release locations. The colour key shows the wind magnitude, the compass direction provides the direction from which the wind is blowing, and the size of the wedge gives the percentage of the record (RPS 2020a)

Tropical cyclones generate the most significant storm conditions in the area. These clockwise-spiralling storms have generated wind speeds of 50 to 120 knots. Tropical cyclones passing over the NWS region typically develop in the eastern Indian Ocean, Timor Sea and Arafura Sea during the summer months. Three to four cyclones per year are typical, with the official cyclone season being November through to April (Bureau of Meteorology n.d.).

3.2.3 Oceanography

Water movement in the Project Area is dominated by strong tidal regimes, which result in very regular, predictable water movement along a northwest and southeast axis (**Figure 3-7**). There is relatively little variation in this pattern throughout the year, with little apparent influence of mesoscale currents (such as the Holloway Current), which typically occur on the outer continental shelf in water depths greater than 100 m. Tides in the Project Area are semidiurnal (two high and two low tides per day), with slight diurnal inequality. The tidal range in the region is large, with the maximum tidal range at the Port of Port Hedland in excess of 7 m (Pilbara Ports Authority n.d.). This large tidal range accounts for the strength of tidal currents observed in the Project Area.

Waves in the Project Area include locally generated wind waves and oceanic swell. Locally generated wind waves vary in wave height and period, based on the winds that generated the waves and the available fetch. Non-cyclonic significant wave heights in the Project Area may reach up to 6 m; cyclonic wave heights may reach up to 10 m (RPS 2019). Oceanic swell in the region is generated by distant storms, primarily in the southern Indian Ocean, although other sources, such as monsoonal- and cyclone-generated swell, may also contribute to swell in the Project Area (RPS 2019).

Figure 3-6 presents the water temperature profiles measured in December 2019 (RPS 2020b). Waters within the Project Area are stratified during summer months, with a relatively warm, well-mixed surface layer extending between the sea surface and approximately 25 m water depth. A thermocline extends between approximately 25 m and 50 to 70 m, within which temperature decreases approximately 4.5 C (RPS 2020b). Water temperatures between the base of the thermocline and the seabed decrease at a lower rate. Thermal stratification is expected to reduce in winter months due to the reduction in heating of surface waters, with the strong tidal currents resulting in mixing of the water column.

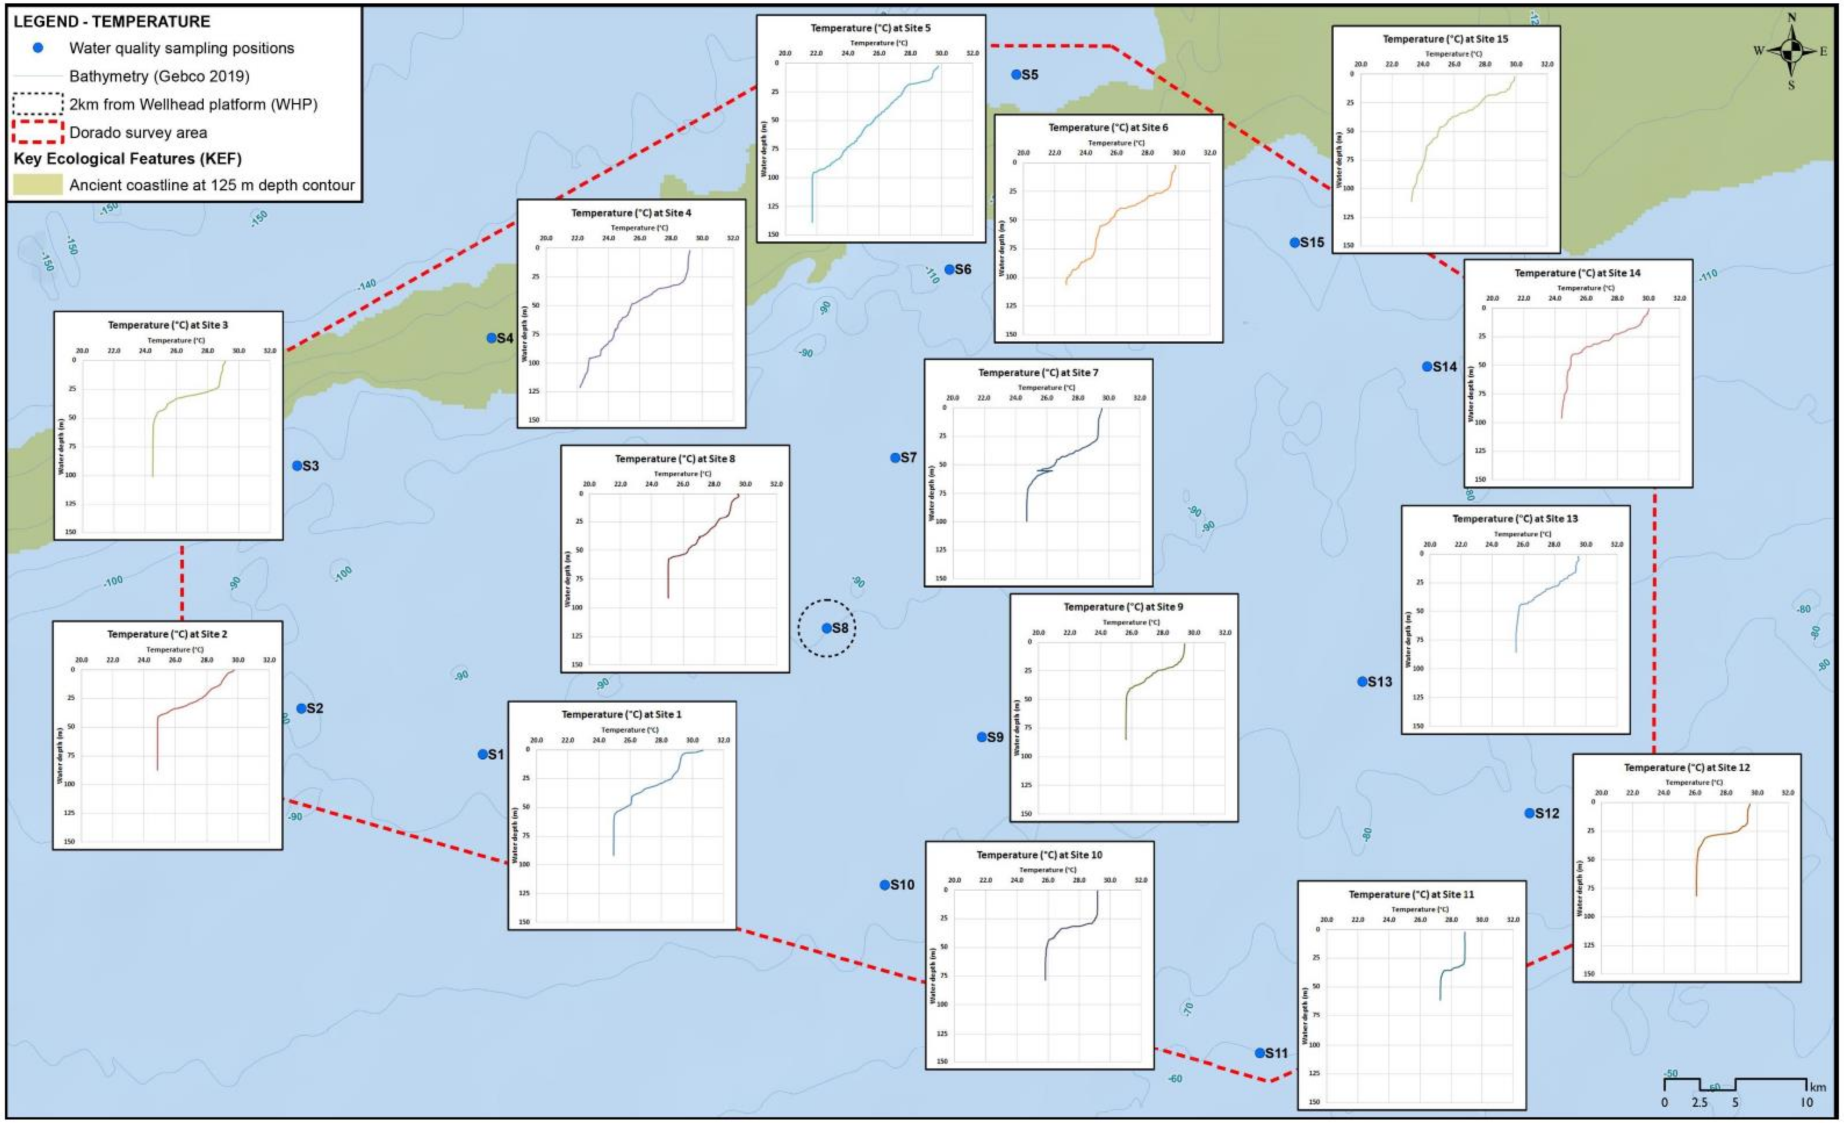

Figure 3-6: Water temperature profiles from water quality sampling locations within the Project Area (RPS 2020b)

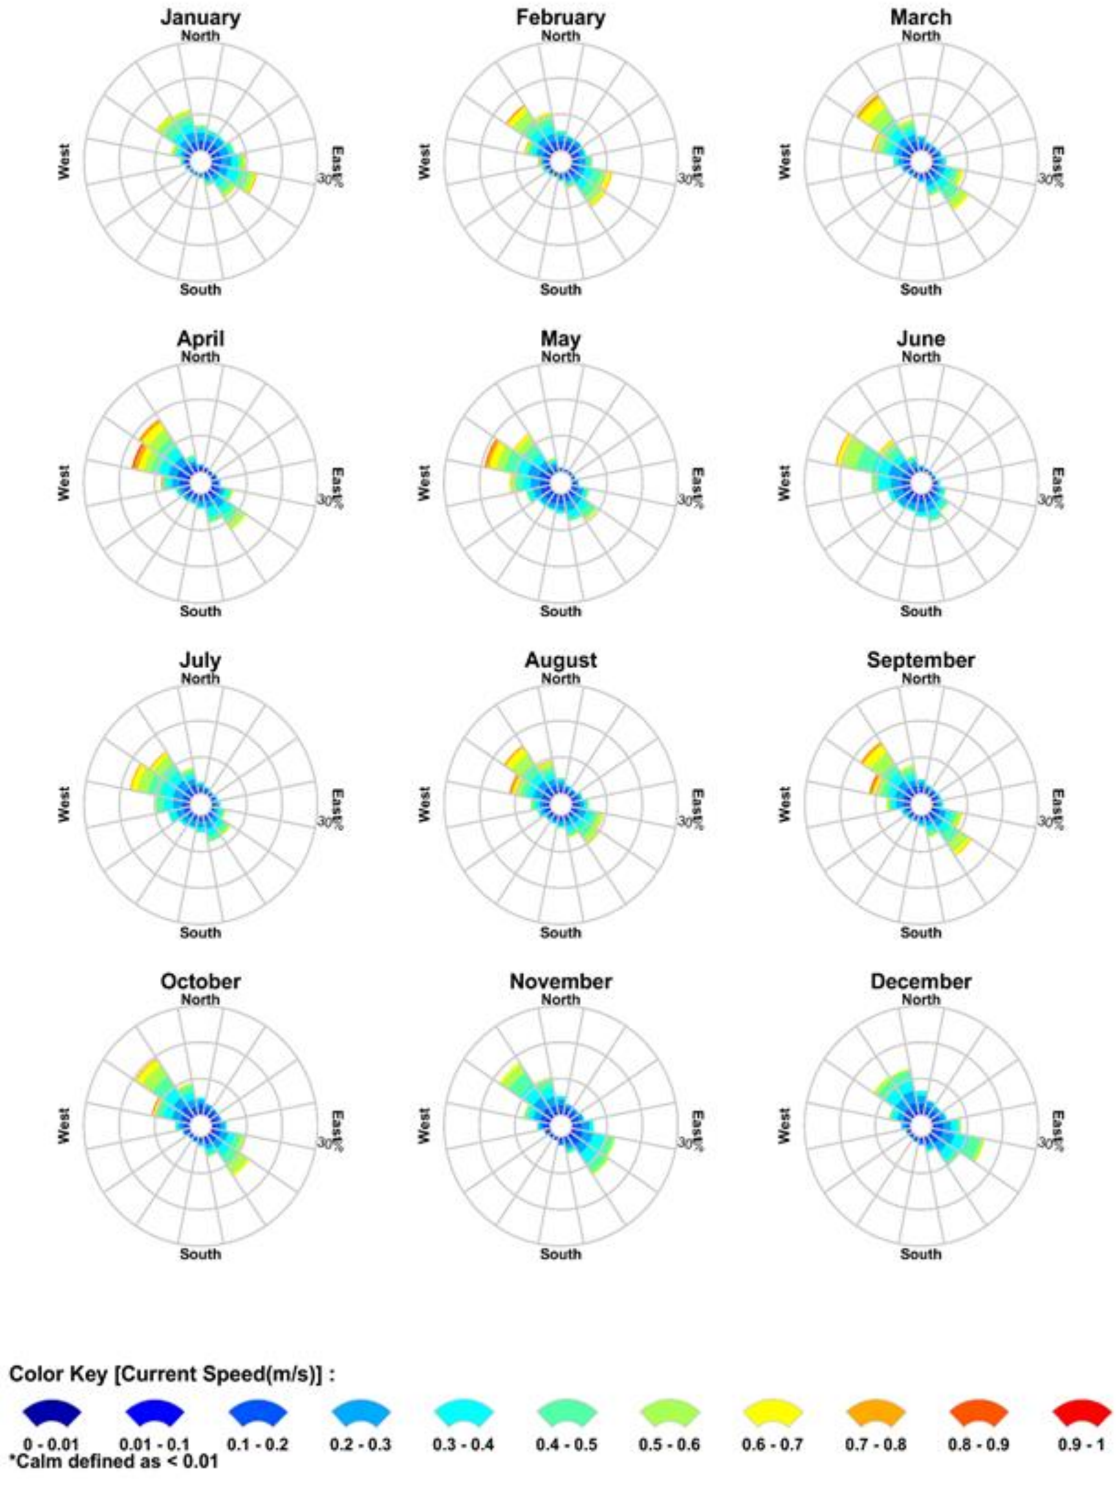

Figure 3-7: Monthly current distribution (2009 to 2018, inclusive) derived from the Hybrid Coordinate Ocean Model database near the Project Area. The colour key shows the current magnitude, the compass direction provides the direction towards which the current is flowing, and the size of the wedge gives the percentage of the record (RPS 2020a).

In the EMBA beyond the Project Area, mesoscale currents, such as the Holloway and Leeuwin currents, play an important role in water movements (**Figure 3-8**). These mesoscale currents influence a range of biological processes, such as larval transport, which in turn can influence marine ecosystems and fisheries within the EMBA. Smaller-scale water movements, such as tidal and wind-driven currents, are superimposed over these mesoscale currents.

The Holloway Current transports relatively warm, low salinity water from tropical regions along the NWS (**Figure 3-8**). The current flows to the southwest, along the outer continental shelf, with much of the water mass transported by the current in water depths between 100 and 200 m (Bahmanpour et al. 2016). Tropical water sources for the Holloway Current include tropical Pacific Ocean water emanating from South East Asian seas (the Indonesian Throughflow) and Indian Ocean water via the South Java Current (D'Adamo et al. 2007). The strength of the Holloway Current varies seasonally, with maximum flow during autumn and winter (April to July); monsoon cycles are suggested to drive this seasonal variability (Bahmanpour et al. 2016). The Holloway Current is a source of water for the Leeuwin Current.

The Leeuwin Current commences around the North West Cape, where the continental shelf narrows and its source waters consolidate (**Figure 3-8**). It flows southward along the edge of the continental shelf and may extend across southern Australia waters, with its influence being observed as far as waters off Tasmania. The Leeuwin Current is primarily a surface flow (up to 150 m deep). The Leeuwin Current is strongest during winter and slackens during summer months (Cresswell 1991). Interannual variation in the strength of the Leeuwin Current is influenced by the occurrence of El Niño and La Niña phases of the El Niño-Southern Oscillation (ENSO) (Pearce and Phillips 1988). The formation of meanders and eddies are also a feature of the Leeuwin Current (Waite et al. 2007). These may advect large masses of water away from the Western Australian coastline into the Indian Ocean. Northward-flowing wind-driven currents, such as the Ningaloo and Capes currents, may develop during summer months (Pattiaratchi and Woo 2009). These counter currents flow between the Leeuwin Current and the shore.

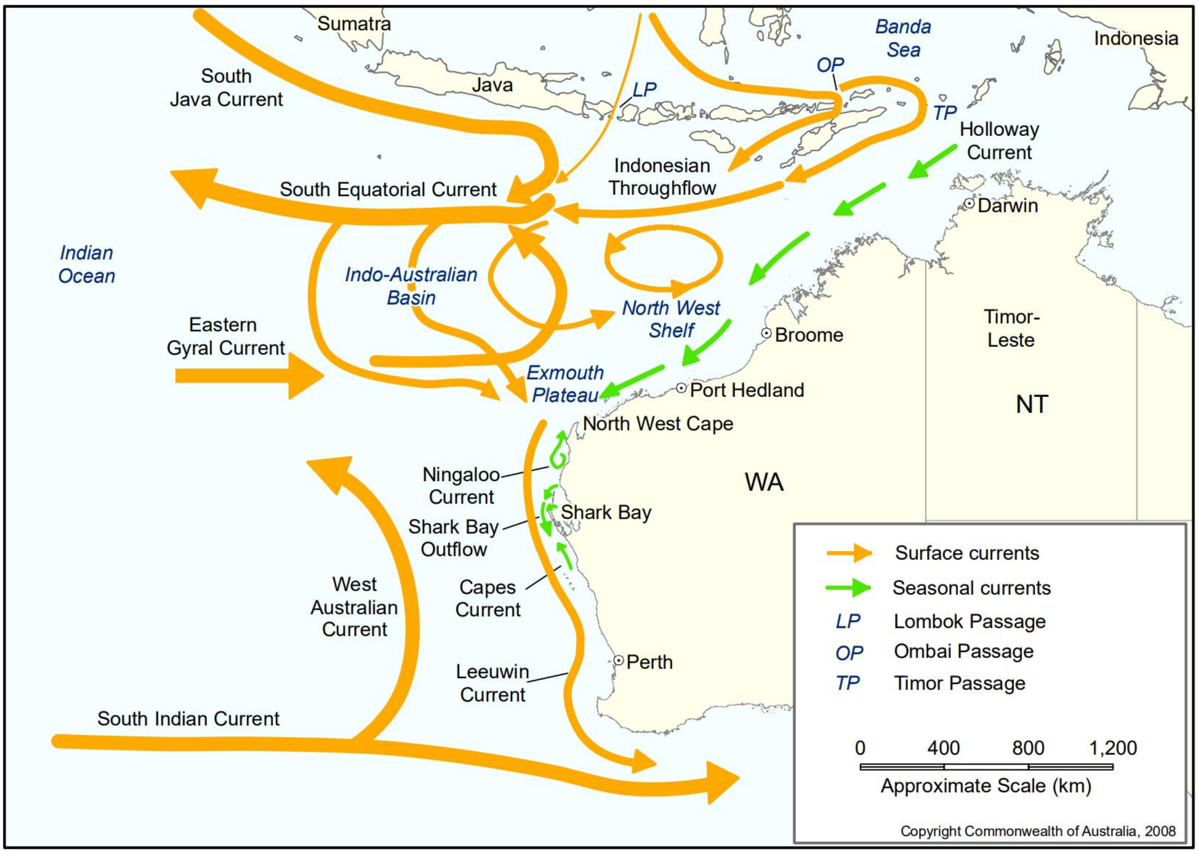

Figure 3-8: Surface currents off Western Australia (Department of the Environment, Water, Heritage and the Arts 2008b)

3.2.4 Water Quality

Results of water quality sampling in the Project Area showed that turbidity in surface waters was low, with increased levels of turbidity near the seabed suggested to be the result of sediment resuspension by currents near the seabed (RPS 2020b).

Concentrations of nutrients and photosynthetic pigments were relatively low compared to coastal waters, with no evidence of eutrophication. Highest concentrations of chlorophyll *a* were recorded midwater between 30 and 65 m BSL with low concentrations at surface or near seabed depths (RPS 2020b). Concentration of chlorophyll *a* in surface waters throughout the Project Area was below the default guideline of 9 µg/L for chlorophyll *a* in slightly disturbed tropical Australian marine offshore ecosystems (Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand 2000a).

Dissolved oxygen levels were high (approximately 100% saturated) in well-mixed surface waters, gradually declining through the thermocline to between approximately 60% (deeper sites) and 80% (shallower sites) near the seabed within the Project Area (RPS 2020b).

Concentrations of metals and hydrocarbons in water were below the recommended trigger values (where available) for slightly to moderately disturbed marine systems, with many analytes below the laboratory limits of reporting (RPS 2020b). These results are consistent with naturally low levels of contamination in mid-continental shelf waters (Wenziker et al. 2006), indicating low natural levels of potential contaminants.

Naturally occurring radioactive material concentration in the water was found to be low, with most samples recording concentration below the limit of reporting (**Attachment 5**) and all samples found to be one to two orders of magnitude lower than the trigger values presented in the guidelines for drinking water (National Health and Medical Research Council and National Resource Management Ministerial Council 2011). There are no trigger values for naturally occurring radioactive material in the *Australian and New Zealand guidelines for fresh and marine water quality* (Commonwealth of Australia and New Zealand Government 2018), and comparing the results to drinking water guidelines is deemed acceptable as they are expected to be more stringent as they relate to human health (**Attachment 5**).

3.2.5 Sediment Quality

Like water quality, results of environmental surveys by RPS (2020d) indicate sediment quality in the Project Area is high, with little evidence of contamination. Concentrations of potential contaminants, such as heavy metals, nutrients and hydrocarbons, were generally below the default guideline values (where available) for toxicants in sediments provided in the *Australian and New Zealand guidelines for fresh and marine water quality* (Commonwealth of Australia and New Zealand Government 2018).

Elevated concentrations of barium, which is a component of drilling muds, were recorded at one sediment sampling site within the Project Area. This is likely to be due to historical drilling activity (RPS 2020c). Barium is not considered to pose a high risk of inducing toxic effects; the *Australian and New Zealand guidelines for fresh and marine water quality* (Commonwealth of Australia and New Zealand Government 2018) does not specify a guideline value for barium in sediments.

Nutrient concentrations within the Project Area did not exhibit any clear spatial patterns, although a trend for slightly increased concentrations of total Kjeldahl nitrogen and total organic carbon at sites in the northern and western parts of the Project Area (RPS 2020c).

Sediments in the Project Area were characterised as varying grades of sand – ranging from slightly gravelly muddy sand to gravelly sand (RPS 2020c). Sediments were relatively coarse in the southern and south-eastern parts of the Project Area, becoming progressively finer to the north. This increase of relatively fine sediment fractions correlates with increasing water depth (RPS 2020c). Sediment particle sizes are likely to be a function of the water movement, with winnowing of relatively fine sediments by water movement near the seabed likely to account for the pattern in sediment particle sizes within the Project Area.

3.2.6 Air Quality

The Project Area is remote from potential sources of atmospheric pollutants, and air quality in the Project Area is high. The mainland coast is more than 100 km from the proposed WHP and the nearest town (Port Hedland) is approximately 145 km from the WHP.

Vessel traffic is the only known source of atmospheric pollutants in and around the Project Area. There is a relatively high density of commercial shipping traffic through and around the Project Area (**Figure 3-28)**; primarily bulk iron ore carriers transiting to and from Port Hedland. Reductions in air quality from shipping in the Project Area is localised and temporary.

3.2.7 Underwater Acoustic Environment

Ambient underwater acoustic environments, or soundscapes, consist of cumulative contributions from abiotic (geophonic e.g. sea state, wind speed, breaking waves, rainfall, earthquakes, sea ice movements), biotic (biophonic e.g. vocalisations by marine mammals, fish and invertebrates, consequences of behaviour) and man-made (anthrophonic e.g. vessel traffic, construction, oil and gas activity) sound sources (Krause 2008).

Underwater sound was recorded near the proposed Dorado WHP and FPSO with an Autonomous Multichannel Acoustic Recorder which was fitted with an M36 omnidirectional hydrophone (Lucke et al. 2022) with the goal being to document baseline underwater sound conditions at the Dorado Project Area. Recording took place between 16 December 2019 and 30 March 2020, a total of 105 days recording.

The dominant background geophonic contributor was tidal flow at low frequencies (10 – 100 Hz), however, this is considered pseudo-noise that results from eddies and vortices forming as water flows past the acoustic receiver. The most dominant biophonic contributor was fish choruses (100 – 1000 Hz) either showing a strong diurnal pattern, occurring for average of two hours at night or occurring almost continuously with fluctuations following a lunar or seasonal rhythm. Reliably detecting other sound sources is challenging if these sounds are fainter or completely overlap temporally and in frequency band with tidal or fish noise. Acoustic signals of Omura's whales, killer whales, and dolphins were also detected. Vessels were detected throughout the entire recording period, with a varying frequency from 0 to 4 vessel movements per day.

3.3 Biological Environment

The biological environment within the EMBA includes values and sensitivities, such as communities and habitats, plankton, mammals, fishes, reptiles and birds. Each of these values and sensitivities is described within this section.

Many of the species of fauna that may occur within the EMBA are listed as threatened or migratory (or both). These species are protected under Part 3 of the EPBC Act and are MNES. Threatened species typically have conservation advice published, which outlines threats to the species. Threatened species may also have recovery plans, made under the EPBC Act, which outline actions intended to assist in the recovery of threatened species. These advices and plans are considered within this section where appropriate.

3.3.1 Communities and Habitats

3.3.1.1 Benthic Habitats

The Project Area is located within the North-West Marine Region approximately 120 km from Port Hedland. Benthic habitat modelling completed by CSIRO, (**Attachment 3**) mapped three ecotypes within the Project Area and four additional ecotypes outside the Project Area (**Figure 3-9**). The ecotypes in the Project Area are characterised as soft bottom substrate of fine sediments (typically more than 90% cover) with discrete areas of filter-feeder communities. The seabed is relatively flat in topography throughout the Project Area, but hard reef substrate and complexity increase near the ancient coastline feature (outside the Project Area).

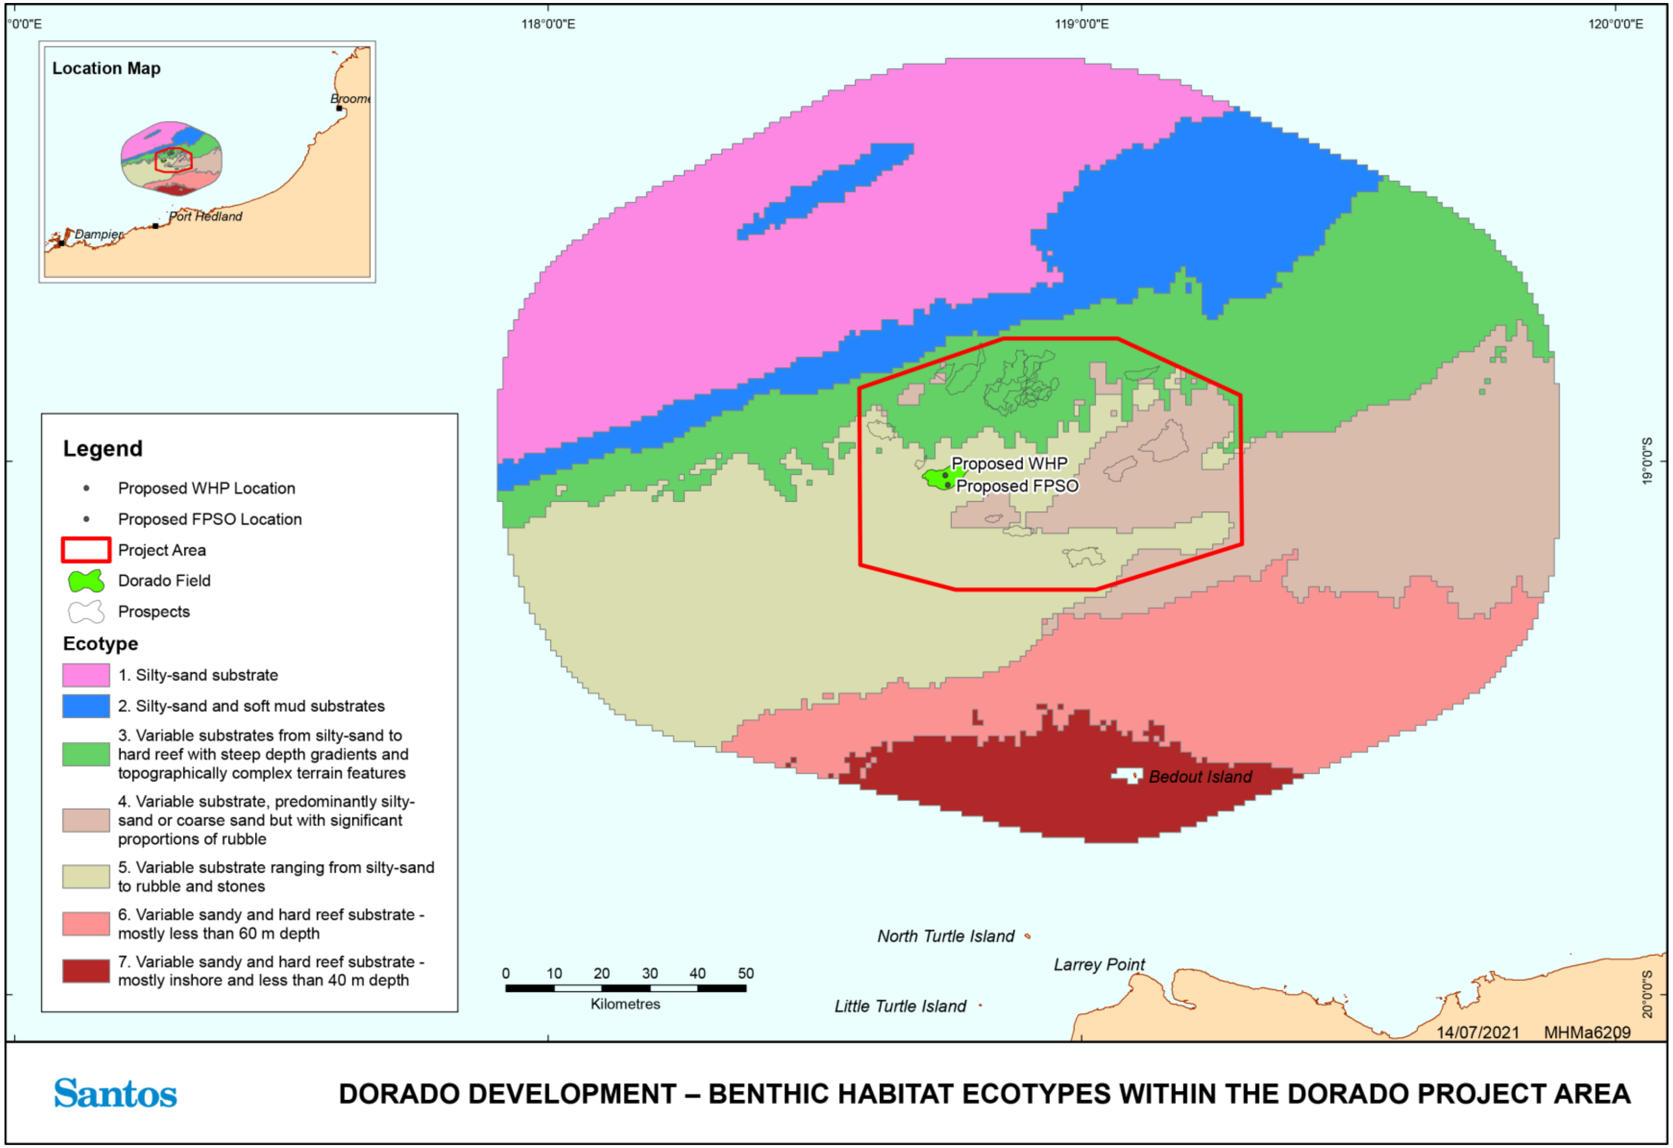

Figure 3-9: Benthic habitat ecotypes within the Project Area

3.3.1.1.1 Bare Substrate

Bare substrate habitats include sediments and hard substrate habitats that typically have a low or no cover of epibenthic biota. This benthic habitat type comprises almost all of the benthic habitat within the Project Area, with habitats composed largely of fine sediments (typically more than 90% cover) with some areas of hard pavement reef, which may host filter-feeder communities, especially whip corals, gorgonians and sponges (Keesing et al. 2020; RPS 2020d).

The benthic habitat survey identified both soft sediment (silt/sand sediment) and hard substrate (low-relief hard substrate) habitats within the Project Area (RPS 2020d). These habitats were homogenous throughout the baseline survey area and are well represented outside the baseline survey area (Keesing et al. 2020; RPS 2020d).

Habitats within the Project Area can be described as the following:

+ areas of flat, silty sand and silty mud that are sparsely populated with epibiota and support a low to medium density of tube worms. In addition, scattered sea pens, crinoids and anemones, bioturbation by small fish and invertebrates were occasionally observed;
+ areas of low, probably mobile sand waves supporting very little epibiota other than occasional sea pens and worm tubes; and
+ exposed hard substrates supported low- to medium-density filter-feeding assemblages that were generally dominated by small gorgonians, sea whips, soft corals and sponges.

Transects completed over the WHP site indicated a relatively flat and featureless soft sediment area (**Figure 3-10**), with no high conservation features or fish habitat identified within the site. The habitat mapping has indicated that the area surrounding the WHP is of a similar habitat type and is likely to continue well beyond the survey transects (RPS 2020d).

The proposed FPSO site can be inferred to be a combination of soft sediment and hard substrate habitats and communities. Both of these habitat types and the associated assemblages are well represented in the survey area; and while they have higher local environmental value, they are not significant in the broader area and there are equivalent or better examples at other sites surveyed, for example Site 21, which had extensive low- to medium-density filter-feeder communities (RPS 2020d).

Geophysical surveys have identified that the benthic habitats within the Project Area are dynamic (e.g. seasonal storms) with the changing seabed periodically covering and uncovering new habitat and communities (RPS 2020d). Communities within the Project Area did not appear to be well established, and individuals appear to be small. Therefore, the benthic communities within the Project Area are likely to have some resilience to disturbance from sediment movement and persistence for recolonisation of hard substrate when available (RPS 2020d).

No high conservation significant ecological values, habitats, communities or species were identified in the Project Area, and the habitats and communities are well represented in the local area and region (RPS 2020d).

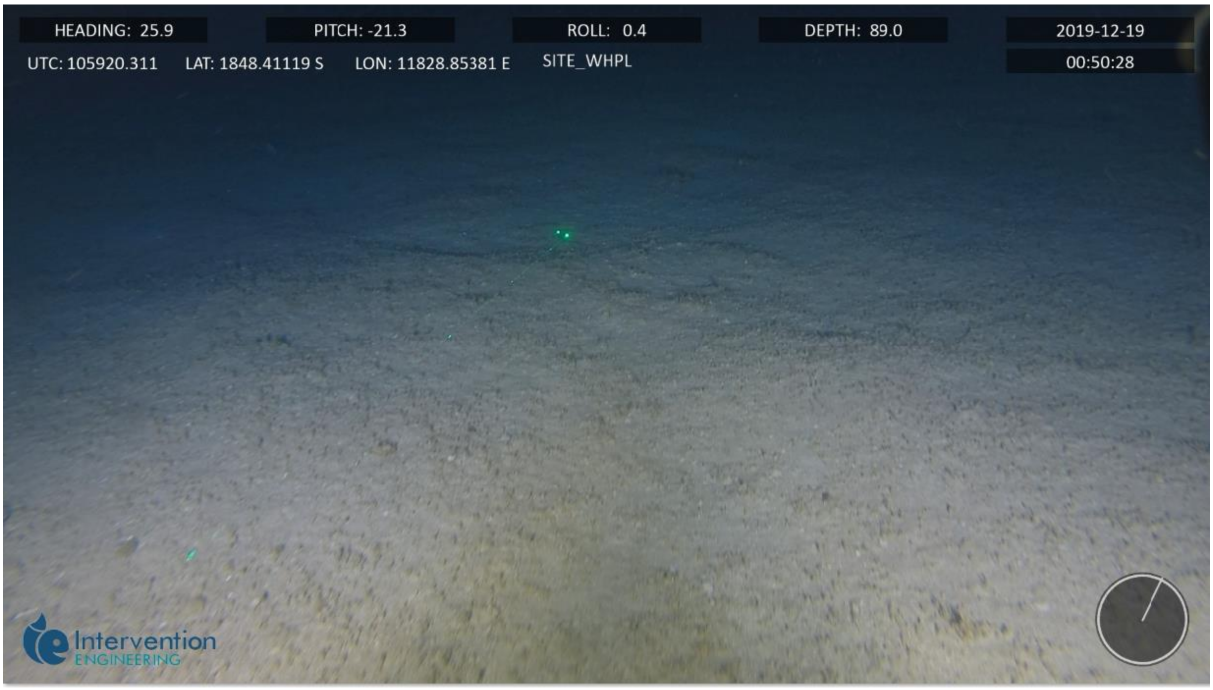

Figure 3-10: Typical benthic habitat at the WHP site

3.3.1.1.2 Reefs, Shoals and Banks

Reefs, shoals and banks typically have a higher diversity and abundance of marine organisms than the bare sediments. Reef habitats typically include reef-building corals, which may form highly productive and structurally complex habitats. These in turn host diverse fauna assemblages, such as fish and invertebrates.

There are no recognised reefs, shoals or banks within the Project Area. The seabed within the Project Area typically receives insufficient light to support zooxanthellate reef-building corals and has limited areas of hard substrate suitable for reef-building coral recruitment.

Several areas host extensive fringing coral reefs within the EMBA beyond the Project Area, including:

+ the Rowley Shoals;
+ the Dampier Archipelago;
+ Barrow, Lowendal and Montebello Islands; and
+ Ningaloo Reef.

Many of the reefs within the EMBA beyond the Project Area are within Commonwealth or state marine protected areas (**Section 3.4.2**), with Ningaloo Reef also lying within a World Heritage Area (WHA) (**Section 3.4.4.1**).

The Rowley Shoals are three distinct reef systems (Mermaid, Clerke and Imperieuse Reefs) approximately 30 to 40 km apart that rise vertically to the surface from depths of between 500 and 700 m. The nearest shoal, Imperieuse Reef, is approximately 147 km from the WHP (and 131 km from the Project Area). The marine fauna of the Rowley Shoals is considered to be exceptionally rich and diverse, including species typical of the oceanic coral reef communities of the Indo-West Pacific (Bryce 2009; Department of the Environment, Water, Heritage and the Arts 2008b). As many of these species are not found in the inshore tropical waters of northern Australia, such populations are of regional significance (DSEWPaC 2012b).

The Dampier Archipelago (approximately 230 km from the WHP) supports coral reefs in shallow waters near islands and submerged pinnacles. The most significant coral reefs have formed along the seaward slopes of Delambre Island, Hamersley Shoal, Sailfish Reef, Kendrew Island and northwest Enderby Island (Department of Conservation and Land Management 2005). Surveys of the Dampier Port and inner Mermaid Sound recorded approximately 120 coral species from 43 genera with coral reefs dominated by acroporids and pocilloporids (Blakeway and Radford 2004).

The Montebello, Lowendal and Barrow Islands (approximately 360 km from the WHP) include 315 islands associated with extensive coral reefs, the most significant of which occur in the sheltered waters on the eastern side of the islands. Examples of these significant reefs include Dugong Reef, Batman Reef and reefs along the Lowendal Shelf (Department of Environment and Conservation 2007). Subtidal coral reef communities around the islands are highly diverse, with at least 150 species of hard corals recorded from fringing and patch coral reef areas (Department of Environment and Conservation 2007).

Ningaloo Reef (approximately 560 km from the WHP) is unique in that it is the largest fringing reef in Australia and is the only large reef found on the western side of a continent in the southern hemisphere. Ningaloo Reef is comprised of a 300-km section of the coast that encompasses Red Bluff to North West Cape and extends to Bundegi in Exmouth Gulf. Ningaloo Reef supports lagoonal, intertidal and subtidal coral communities along its length. The reef is characterised by a high diversity of hard corals with at least 217 species representing 54 genera of hermatypic (reef-building) corals recorded to date (Veron and Marsh 1988). The most diverse coral communities are found in the shallow, relatively clear-water, high-energy environment of the fringing barrier reef and low-energy lagoonal areas to the west of North West Cape (Marine Parks and Reserves Authority and Department of Conservation and Land Management 2005).

3.3.1.1.3 Islands

No islands or emergent reef systems are located within the Project Area. Several islands and emergent reefs located within the EMBA in close proximity to the Project Area provide intertidal and shoreline habitats for a variety of marine fauna and ecological communities. These islands and reefs are summarised below.

Bedout Island is located 38 km south of the Project Area and is an A-class nature reserve. The island is a low and undulating, 0.3-km² sandy cay on limestone bedrock, heavily vegetated with *Spinifex longifolius*. Bedout Island supports breeding birds, such as masked booby, white-bellied sea eagle, silver gull, crested tern and lesser crested tern (BirdLife International 2018). Burbidge et al. (1987) report numbers of occupied nests of brown booby (approximately 10,000, one of the largest colonies in Western Australia), masked booby (approximately 178) and lesser frigatebird (2,290) surveyed in 1984 on Bedout Island. Bedout Island is fringed by coral reef and provides seabird and turtle foraging habitat.

North Turtle Island is located 71 km southwest of the Project Area and is an A-class nature reserve. The island is fringed by coral reef and provides turtle and seabird nesting and foraging habitat (BHP, 2011; Davidson and Thomas-Dans, Landscope article, n.d).

Bedwell Island on Clerke Reef and Cunningham Island on Imperieuse Reef are located 163 km and 131 km respectively from the Project Area and consist of unvegetated sand cays about 2 m and 3.7 m high respectively. Bedwell Island is home to one of only two colonies of red-tailed tropicbirds in Western Australia (the other being located at Ashmore Reef and Cartier Island over 300 km northwest of the WA coast), along with several other bird species. Bedwell Island also provides occasional nesting habitat for a small number of hawksbill and green turtles. Both Bedwell Island and Cunningham Island are known resting sites for migratory birds (Department of Environment and Conservation 2007).

Rowley Shoals is located 117 km from the Project Area and comprises three distinct reef systems, Imperieuse Reef, Clerke Reef and Mermaid Reef, each located approximately 30 to 40 km apart. Mermaid Reef includes low-lying sandy cays that are completely submerged at high tide and therefore fall under Australian Government jurisdiction (Commonwealth waters). The other two reefs, Clerke Reef and Imperieuse Reef, are emergent reefs with sandy islets above the high-water mark and are managed as the WA Rowley Shoals Marine Park. The marine reef fauna of the Rowley Shoals is considered to be exceptionally rich and diverse, including species typical of the oceanic coral reef communities of the Indo-West Pacific. As many of these species are not found in the inshore tropical waters of northern Australia, such populations are of regional significance (DSEWPaC 2012a).

3.3.1.1.4 Seagrass

Seagrasses are flowering plants (angiosperms) that grow on the seabed in shallow marine environments. Seagrasses require sufficient photosynthetically active radiation for growth, which restricts the distribution of seagrasses to relatively shallow waters due to the absorption of light within the water column. Seagrasses provide a range of valuable ecological functions, including primary production, habitat for biota, and sediment stabilisation. Seagrasses provide food for marine fauna, such as green turtles and dugongs. Seagrasses also provide important nursery habitat, with many animal species spending part of their lifecycle within seagrass meadows.

No seagrasses occur within the Project Area due to the water depth, although seagrasses are widespread in the EMBA beyond the Project Area. Seagrasses in the Pilbara and Kimberley coastal regions of the EMBA are typically small, ephemeral species, such as *Halophila* spp., *Cymodocea* spp. and *Syringodium* spp. (McMahon et al. 2017). Many of these species have broad Indo-Pacific tropical distributions in coastal waters, with the distributions of several species also extending along the Western Australian coastline into subtropical and temperate waters. These species tend to be adapted to disturbances, such as cyclones and grazing, and are considered to be pioneer or colonising species that typically grow from seeds (Kilminster et al. 2015).

Seagrass species assemblages in temperate waters within the EMBA also include larger, more persistent meadow-forming genera, such as *Posidonia* and *Amphibolis*. These genera tend to grow more slowly than tropical species, are persistent in the environment and can form extensive meadows (Kilminster et al. 2015). A notable example is the extensive seagrass meadows in Shark Bay (850 km from the WHP), which are characterised by extensive seagrass assemblages dominated by *Amphibolis antarctica* (Walker et al. 1988). These seagrass meadows support one of the largest populations of dugongs in the world (Preen et al. 1997).

3.3.1.1.5 Macroalgae

Macroalgae are important contributors to primary production and nutrient cycling in the marine environment, providing food and habitat for fauna, such as green turtles and dugongs (Arthur et al. 2008). Like seagrasses, macroalgae require sufficient photosynthetically active radiation for growth; hence, the distribution of macroalgae is restricted by available light at the seabed. Some macroalgae, such as red algae, can tolerate lower levels of photosynthetically active radiation compared to seagrasses and may occur over a wider range of water depths.

No macroalgae communities were observed within the Project Area. The water depths within the Project Area do not allow sufficient light to reach the seabed to support macroalgal growth. Macroalgae are widespread in coastal areas and reefs in the EMBA beyond the Project Area and are very commonly found on reefs and intertidal platforms.

3.3.1.2 Coastal Habitats

No coastal habitats occur within the Project Area. All coastal habitats described within this section occur within the EMBA for unplanned events.

3.3.1.2.1 Mangroves

Mangrove habitats are widely distributed in coastal environments throughout tropical and subtropical EMBAs beyond the Project Area. Mangroves are important primary producers and have a number of ecological and economic values, such as:

+ stabilisation of coastal sediments;
+ filtration of terrestrial run-off; and
+ breeding and nursery areas for juvenile fish and crustaceans, including commercially important species.

Mangroves play an important role in connecting the terrestrial and marine environments (Alongi 2009). Numerous studies (e.g. Nagelkerken *et al.* 2000; Alongi 2002; Alongi 2009; Kathiresan and Bingham 2001) have shown mangroves to be highly productive and an important breeding and nursery areas for juvenile fish and crustaceans, including commercially important species (Kenyon et al. 2004). They also provide habitat for many juvenile reef fish species. Mangroves also play an important ecosystem role in nutrient cycling and carbon fixing (NOAA2010). The trees absorb carbon dioxide from the atmosphere, and the organic matter – such as fallen leaves – forms nutrient-rich sediments creating a peat layer that stores organic carbon (Alongi 2009; Ayukai 1998). The muddy sediments that occur in mangrove forests are home to a variety of epibenthic, infaunal and meiofaunal invertebrates (Kathiresan and Bingham 2001). Crustaceans known to inhabit the mud in mangrove systems include fiddler crabs, mud crabs, shrimps and barnacles. Within the water channels of estuaries, various finfish are found, from the smaller fish (such as gobies and mudskippers, which are restricted to life in the mangroves) through to larger fish (such as barramundi (*Lates calcarifer*) and the mangrove jack (*Lutjanus argentimaculatus*)). Mangroves and their associated invertebrate-rich mudflats are also an important habitat for migratory shorebirds from the northern hemisphere, as well as some avifauna that are restricted to mangroves as their sole habitat (Garnet and Crowley 2000).

Substantial mangroves on the Western Australian coast range from Shark Bay to the Northern Territory border. Shark Bay supports the southernmost area of substantial mangrove habitat in Western Australia (Rule et al. 2012). The mangroves of Shark Bay comprise only one species, the white mangrove (*Avicennia marina*); and these trees occur around the coastline in widely dispersed and often isolated stands of varying size.

Mangroves occur along the mainland Pilbara coast and nearshore islands, particularly along estuaries and river deltas, such as the Ashburton and Robe rivers. Relatively small stands of mangrove are also found along the coastlines of some offshore islands within the EMBA, such as the Montebello Islands and Barrow Island. These arid-zone mangroves are unique and differ from tropical mangrove systems by tending to be smaller and less productive as a result of high water and salinity stress (Environmental Protection Authority 2001). The regional mangroves from Exmouth to Broome (within the Central Western Shelf Transition and southern part of the Northwest Shelf Province) represent Australia's only 'tropical-arid' mangroves. The most significant stand of mangroves in the Central Western Shelf Transition is Mangrove Bay on the western side of the Cape Range Peninsula in the Ningaloo Marine Park. This small area of mangrove (37 ha) represents the largest area of mangrove habitat within the Ningaloo Marine Park and is considered extremely important from a biodiversity conservation perspective (Department of Conservation and Land Management 2005).

Extensive mangrove stands occur along the Kimberley coastline and progressively become more typical of tropical mangrove systems with decreasing latitude.

3.3.1.2.2 Intertidal Sand and Mudflats

The Pilbara and Kimberley coastline experience a large tidal range and, as a result, host extensive intertidal sand and mudflats. These habitats occur to some extent along much of the sandy beach and mangrove shorelines in the region. Intertidal mudflats typically host a high abundance of invertebrates, which provide food for fish during high tide. During low tide, these intertidal areas provide foraging areas for shorebirds.

Significant areas of intertidal mudflats within the EMBA include Eighty Mile Beach and Roebuck Bay. These wetlands are important for many species of migratory shorebirds as feeding and resting areas. Both are recognised as Ramsar wetlands and listed under the EPBC Act as wetlands of international importance (**Section 3.4.2.4**).

3.3.1.2.3 Intertidal Platforms

Intertidal platforms are areas of hard bedrock and/or limestone with or without a sediment veneer of varying thickness. These platforms can vary from low to high relief and provide a habitat for a diverse range of intertidal organisms. They are common features along shorelines throughout the EMBA beyond the Project Area, both on the mainland coast and coastal islands. The large tidal range and diurnal nature of the tidal regime in the Pilbara and Kimberley regions result in relatively large intertidal platform habitat compared to areas with a smaller tidal range.

Notable areas of intertidal platform habitat within the EMBA include the Dampier Archipelago, Barrow Island, the Montebello Islands, Lowendal Islands, the Ningaloo Coast and the Dampier Peninsula. Much of the intertidal platform habitat within the EMBA lies within marine protected areas (**Section 3.4.2**).

3.3.1.2.4 Sandy Beaches

Sandy beaches are areas within the intertidal zone where unconsolidated sediment has been deposited (and eroded) by wave and tidal action. Sandy beaches can vary from low- to high-energy zones; the energy experienced influences the beach profile due to varying rates of erosion and accretion.

Sandy beaches are found throughout the EMBA and vary in length, width, gradient, sediment type, composition, and grain size. Sandy beaches provide habitat to a variety of burrowing invertebrates and subsequently provide foraging grounds for shorebirds (**Section 3.3.6**). Sandy beaches can also provide an important habitat for turtle nesting and breeding. Nature-based tourism and recreation are also important socio-economic uses of sandy beaches (**Section 3.4.5**).

3.3.1.2.5 Rocky Shorelines

Rocky shores can include pebbles or cobbles, boulders, and rocky limestone cliffs (often at the landward edge of reef platforms). Rocky outcrops typically consist of hard bedrock, but some of the coastline has characteristic karsted limestone cliffs with an undercut notch.

Rocky shorelines are found across the EMBA and are often indicative of high-energy areas (wave action) where sand deposition is limited or restricted. They are formed from limestone pavement extending out from the beach into subtidal zones, for example along the Ningaloo Coast and North West Cape; higher relief platforms (more than 0.5 m above the high water mark) are also present at a number of headlands along the North West Cape.

3.3.1.3 Key Ecological Features

KEFs are elements of the Commonwealth marine environment that are considered to be of regional importance for either a region's biodiversity or its ecosystem function and integrity. KEFs meet one or more of the following criteria (DSEWPaC 2012a):

+ a species, group of species or a community with a regionally important ecological role;
+ a species, group of species or a community that is nationally or regionally important for biodiversity; and
+ an area or habitat that is nationally or regionally important for:
  - enhanced or high biological productivity;
  - aggregations of marine life; or
  - biodiversity and endemism.
+ a unique seafloor feature with ecological properties of regional significance.

There are no KEFs within the Project Area; 19 KEFs occur in the EMBA beyond the Project Area. These are shown in **Figure 3-11** and **Figure 3-12** and are described in **Table 3-1**.

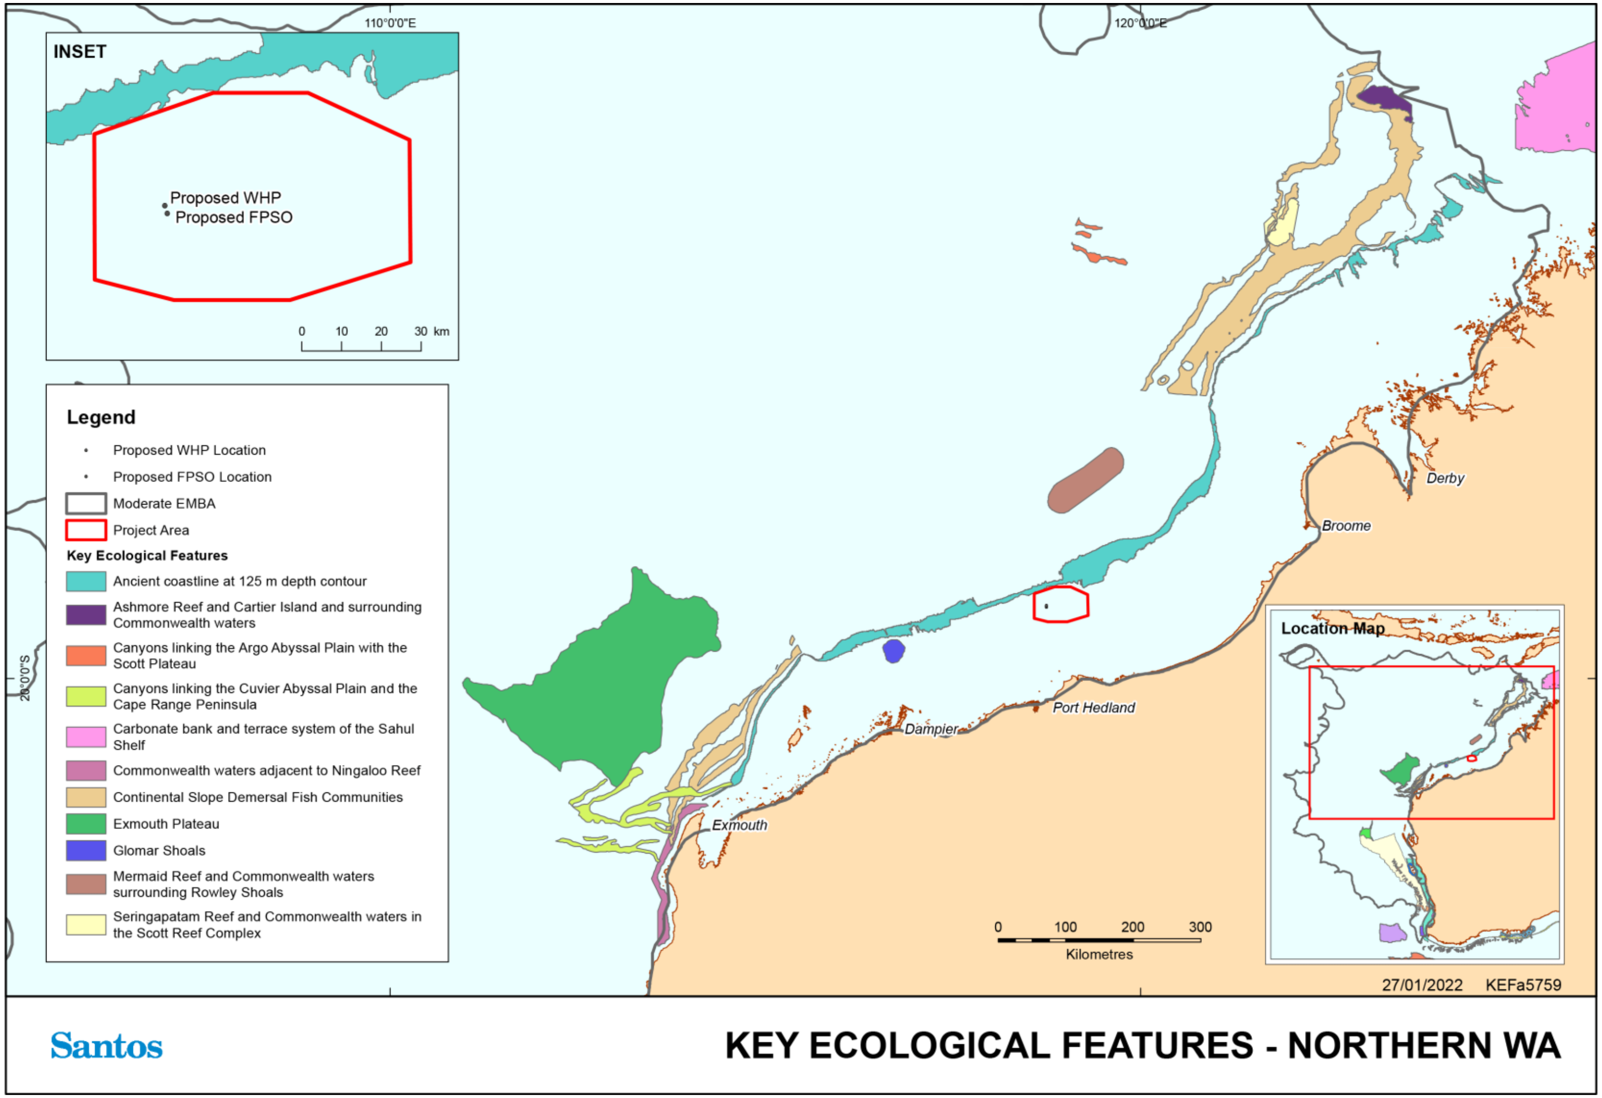

Figure 3-11: KEFs – Northern Western Australia

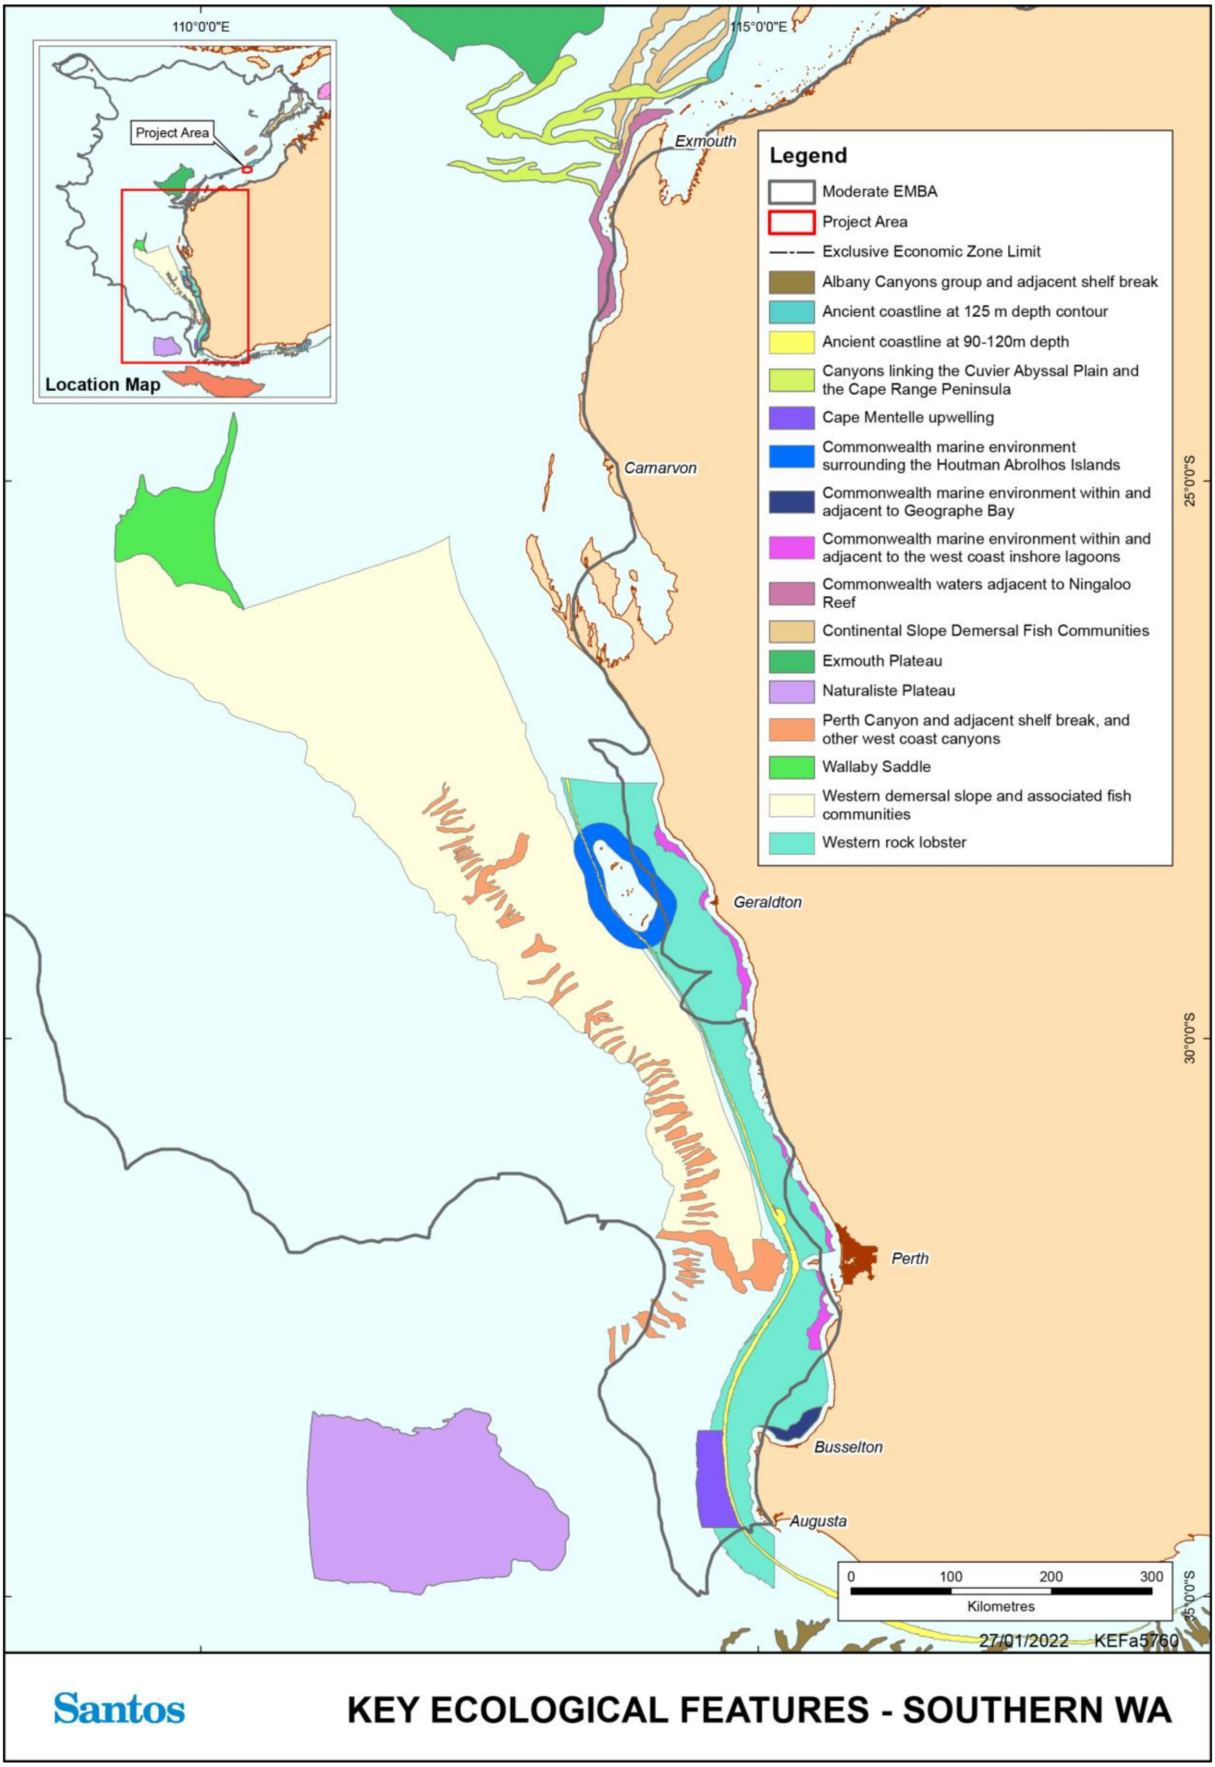

Figure 3-12: KEFs – Southern Western Australia

Santos

Table 3-1: Summary of KEFs within the EMBA (DSEWPaC 2012b; DSEWPaC 2012a)

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
Ancient coastline at 125 m depth contour	23	0.17	*Unique seafloor feature with ecological properties of regional significance* Parts of the ancient coastline, particularly where it exists as a rocky escarpment, are thought to provide biologically important habitats in areas otherwise dominated by soft sediments. The topographic complexity of these escarpments may also facilitate vertical mixing of the water column, providing relatively nutrient-rich local environments. 115 to 135 m water depth
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	138	108	*High productivity and aggregations of marine life* The Rowley Shoals consist of three atoll reefs – Clerke, Imperieuse and Mermaid Reef – that support 214 coral species and around 530 species of fish. The steep changes in slope around the reef also attract a range of migratory pelagic species, such as dolphins, tuna, billfish and sharks. The coral communities of Mermaid Reef are an important feature (300 to 480 m water depth). The enhanced productivity at the shoals is thought to be facilitated by the breaking of internal waves in the waters surrounding the reefs, causing mixing and resuspension of nutrients from water depths of 500 to 700 m into the photic zone.
Glomar Shoals	207	186	*High productivity and aggregations of marine life* The Glomar Shoals are a submerged littoral feature located approximately 150 km north of Dampier on the Rowley Shelf at depths of 33 to 77 m. While biological data is limited, the fish of Glomar Shoals are believed to be a subset of reef-dependent species. The shoals are known to be an important area for a number of commercial and recreational fish species, such as Rankin cod, brown-striped snapper, red emperor, crimson snapper, bream and yellow-spotted triggerfish.
Continental Slope Demersal Fish Communities	346	306	*Communities with high species biodiversity and endemism* There is a high diversity of demersal fish assemblages on the Australian continental slope from the North West Cape to the edge of the North Marine Region.

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
			Specifically, the continental slope between the North West Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in the whole of Australia. 180 to 1,000 m water depth.
Exmouth Plateau	459	441	*Unique seafloor feature with ecological properties of regional significance* Due to its large size, the plateau is thought to modify deep-water flow and be associated with the generation of internal tides in the Exmouth region. These oceanic processes may contribute to the upwelling of nutrients, which result in areas of increased productivity. The plateau ranges in depth between 800and 4,000 m and features valleys and channels that support a range of benthic environments. These features are also thought to provide conduits for the transport of sediment and other materials from the plateau surface to deeper areas. While the Exmouth Plateau has low habitat heterogeneity, it is likely to be an important area of biodiversity as it provides an extended area for communities adapted to depths of around 1,000 m.
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	509	485	*Unique seafloor features with ecological properties of regional significance* The nutrient-rich and highly productive waters of this KEF are associated with aggregations of whale sharks, manta sharks and rays, humpback whales, sea snakes, sharks, large predatory fish, and seabirds. The canyons are thought to connect to the Commonwealth waters adjacent to Ningaloo Reef, as well as to the Exmouth Plateau. The KEF also supports unique seafloor features of a regional significance with regards to both benthic and pelagic ecological habitats. 130 to 4,900 m water depth.

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
Canyons linking the Argo Abyssal Plain with the Scott Plateau	512	480	*High productivity and aggregations of marine life* The Bowers and Oats canyons are major canyons on the slope between the Argo Abyssal Plain and the Scott Plateau and deeply cut into the Scott Plateau at depths of approximately 2,000 to 3,000 m. The ocean area above the canyons is thought to be an area of moderately enhanced productivity, attracting aggregations of fish, sharks, toothed whales and dolphins. Water depths 3,300 to 5,100 m.
Commonwealth waters adjacent to Ningaloo Reef	555	531	*High productivity and aggregations of marine life* Ningaloo Reef is of global significance as it is the only coral reef in the world that fringes the west coast of a continent and is a seasonal aggregation site for the whale shark. The high degree of interconnectivity with regional canyons and plateaus contributes to the high levels of productivity and species richness of the Ningaloo Reef. The reef supports aggregations and migration pathways of whale sharks, manta rays, humpback whales, sea snakes, sharks, large predatory fish and seabirds. The deep water biodiversity includes unique assemblages of sponge and filter-feeder communities (compared with the Dampier Archipelago and Abrolhos Islands) which are indicative of areas of potentially high and unique sponge biodiversity. 30 to 700 m water depth.
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	619	576	*High productivity and aggregations of marine life* The coral communities at Seringapatam and Scott Reefs play a key role in maintaining species richness and aggregations of marine life. The reefs and the waters surrounding them attract aggregations of marine life, including humpback whales on their northerly migration, Bryde's whales, pygmy blue whales, Antarctic minke whales, dwarf minke whales, minke whales, dwarf sperm whales, spinner dolphins and whale sharks. Green and hawksbill turtles nest during the summer months on Sandy Islet on South Scott Reef. These species also internest and forage in the surrounding waters.

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
			Scott Reef is a particularly biologically diverse system and includes more than 300 species of reef-building corals, approximately 400 mollusc species, 118 crustacean species, 117 echinoderm species, around 720 fish species and several species of sea snakes. 400 to 1,600 m water depth.
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	873	830	*High productivity and aggregations of marine life* Ashmore Reef (100 to 400 m water depth) is the largest of only three emergent oceanic reefs present within the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. The emergent reefs are known to provide areas of enhanced primary productivity in otherwise oligotrophic environments (environments that offer little to sustain life). Ashmore Reef and Cartier Islands and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of seabirds and shorebirds and for other marine life. Ashmore Reef regularly supports more than 40,000 waterbirds (those ecologically dependent on wetlands) and is estimated to support as many as 100,000 seabirds in a 12-month period. The marine habitats supported by the reefs are nationally and internationally significant, providing habitat for diverse and abundant marine reptile populations (including feeding, nesting and internesting areas for green, hawksbill and loggerhead turtles) and marine mammal populations (including dugongs). Species at Ashmore Reef and Cartier Island include more than 225 reef-building corals, 433 molluscs, 286 crustaceans, 192 echinoderms, and 709 species of fish. Thirteen species of sea snakes occur in high numbers at Ashmore reef and Cartier Island but are in decline.
Wallaby Saddle	1,057	1,031	*High productivity and aggregations of marine life* The Wallaby Saddle is an abyssal geomorphic feature located on the upper continental slope at a depth of 4,000 to 4,700 m. The feature connects the northwest margin of the Wallaby Plateau with the margin of the Carnarvon

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
			Terrace. The Wallaby Saddle is situated within the Indian Ocean water mass and is thus differentiated from systems to the north that are dominated by transitional fronts or the Indonesian Throughflow. Little is known about the Wallaby Saddle; however, the area is considered one of enhanced productivity and low habitat diversity.
Western rock lobster	1,086	1,048	*Presumed ecological role on the West Coast Continental Shelf* This species is the dominant large benthic invertebrate in the region. The lobster plays an important trophic role in many of the inshore ecosystems of the South-west Marine Region. Western rock lobsters are an important part of the food web on the inner shelf, particularly as juveniles as they are preyed upon by octopus, cuttlefish, baldchin groper, dhufish, pink snapper, wirrah cod and breaksea cod. The high biomass of western rock lobsters and their vulnerability to predation suggest that they are an important trophic pathway for a range of inshore species that prey upon juvenile lobsters. 0 to 230m water depth.
Ancient coastline between 90 and 120 m depth	1,107	1,082	*High productivity and aggregations of marine life, biodiversity and endemism* This feature contains several terraces and steps reflecting a gradual increase in sea level across the shelf that occurred during the Holocene. Some of these features create escarpments of distinct elevation, creating topographic complexity through the exposure of rocky substrates. The most prominent of these occurs close to the middle of the continental shelf off the Great Australian Bight at a depth of 90 to 120 m, which provides a complex habitat for a number of species. The area has important conservation value due to its potential for high productivity, biodiversity and aggregations of marine life. Benthic biodiversity and productivity occur where the ancient coastline forms a prominent escarpment of exposed hard substrates, where it is dominated by sponge communities of significant biodiversity and structural complexity.

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
Commonwealth marine environment surrounding the Houtman Abrolhos Islands	1,128	1,104	*High levels of biodiversity and endemism in benthic and pelagic habitats* The Commonwealth marine environment surrounding the Houtman Abrolhos Islands (and adjacent shelf break) exhibits high levels of biodiversity and endemism in benthic and pelagic habitats (0 to 20 m water depth). The Houtman Abrolhos Islands and surrounding reefs support a unique mix of temperate and tropical species, resulting from the southward transport of species by the Leeuwin Current over thousands of years. The reefs are composed of 184 known species of corals that support about 400 known species of demersal fish, 492 known species of molluscs, 110 known species of sponges, 172 known species of echinoderms, and 234 known species of benthic algae. The Houtman Abrolhos Islands are the largest seabird breeding station in the eastern Indian Ocean. They support more than one million pairs of breeding seabirds. The Houtman Abrolhos Islands and surround waters are also important areas for Australian sea lions for foraging and breeding.
Commonwealth marine environment within and adjacent to the west coast inshore lagoons	1,261	1,083	*High productivity and aggregations of marine life* This KEF is composed of a chain of inshore lagoons of limestone reef (as deep as 30 m) extending along the Western Australian coast from south of Mandurah to Kalbarri. The mix of sheltered and exposed seabeds form a complex mosaic of habitats. The lagoons are dominated by seagrass and epiphytic algae. Although macroalgae (principally *Ecklonia* spp.) and seagrass appear to be the primary sources of production, groundwater enrichment may supplement the supply of nutrients to the lagoons. The lagoons are associated with high biodiversity and endemism, containing a mix of tropical, subtropical and temperate flora and fauna.
Commonwealth marine environment within and adjacent to Geographe Bay	1,641	1,591	*High productivity and aggregations of marine life* Geographe Bay is known for its extensive beds of tropical and temperate seagrass that account for about 80% of benthic primary production in the area. This habitat supports a diversity of species, many of them not found anywhere else. The bay (15 to 45 m water depth) provides important nursery habitat for many species,

KEF	Approx. Distance from WHP (km)	Approximate Distance from Closest Project Area Boundary (km)	Summary of Environmental Values
			including juvenile dusky whaler sharks. It is also an important resting area for migrating humpback whales.
Cape Mentelle upwelling	1,654	1,633	*High productivity and aggregation soft marine life* The Cape Mentelle upwelling (100 to 450 m water depth) draws relatively nutrient-rich water from the base of the Leeuwin Current, up the continental slope and onto the inner continental shelf, where it results in phytoplankton blooms at the surface. The phytoplankton blooms provide the basis for an extended food chain characterised by feeding aggregations of small pelagic fish, larger predatory fish, seabirds, dolphins and sharks. The Cape Mentelle upwelling has a disproportionate influence on the overall nutrient-poor nature of the region's water.

3.3.1.4 Threatened Ecological Communities

Threatened ecological communities (TECs) are ecological communities that have been identified as being threatened with extinction, typically by human activities. TECs are protected under the EPBC.

No TECs have been identified within the Project Area. One coastal TEC, Subtropical and Temperate Coastal Saltmarsh, was identified within the EMBA beyond the Project Area. This TEC occurs within the subtropical and temperate climatic zones and is present in coastal areas under regular or intermittent tidal influences. This TEC occurs in Western Australia from the south coast up to the southern part of Shark Bay. The community is made up of mainly salt-tolerant vegetation that includes halophytes and a number of non-vascular plant species. The community is listed as vulnerable under the EPBC Act.

3.3.2 Plankton

Plankton abundance and distribution is patchy, dynamic and strongly linked to localised and seasonal productivity (Evans et al. 2017). Fluctuations in abundance and distribution occur both vertically and horizontally in response to tidal cycles, seasonal variation (light, water temperature and chemistry, currents and nutrients) and cyclonic events. As a key indicator for ecosystem health and change, plankton distribution and abundance has been measured for over a century in Australia (Richardson et al. 2015). The compilation of this data has been made publicly available through the Australian Ocean Data Network (Australian Ocean Data Network 2017) and has been used in the Australia State of the Environment 2016 report (Jackson et al. 2017) to nationally assess marine ecosystem health. According to their findings, warming ocean temperatures have extended the distribution of tropical phytoplankton species (which have a lower productivity) further south, resulting in a decline in primary productivity in oceanic waters north of 35°S, especially the North West Shelf (Evans et al. 2017). Trends of primary productivity across Australia are, however, variable with southwestern Australia experiencing an increase in productivity and northern Australia experiencing no change between 2002 and 2016 (Evans et al. 2017).

Within the EMBA, peak primary productivity varies on a local and regional scale. For example, peak phytoplankton biomass in waters surrounding Broome has been observed in May with a high variability recorded in August, whereas recorded phytoplankton biomass in waters surrounding Geographe Bay has been found to peak during winter and is localised close to the coast (Bloundeau-Patissier et al. 2011). In general, these peaks are linked to mass coral spawning events, peaks in zooplankton and fish larvae abundance and periodic upwelling. Regional upwelling is most common close to the coast and where surface waters diverge. Despite the suppression of major upwelling along the WA coast by the Leeuwin Current, known key upwelling regions include the Ningaloo region (Hanson and McKinnon 2009)and Cape Mentelle (Pattiaratchi 2007). It is also expected that a high abundance of plankton will occur within areas of localised upwelling in the EMBA where the seabed disrupts the current flow.

In waters surrounding Indonesia, seasonal peaks in phytoplankton biomass are linked to monsoon-related changes in wind. When the winds reverse direction (offshore vs. onshore), nutrient concentrations decrease or increase because of the suppression or enhancement of upwelling (National Aeronautics and Space Administration 2010). Annual variability of phytoplankton productivity in waters surrounding Indonesia is heavily influenced by the El Niño-Southern Oscillation climate pattern (National Aeronautics and Space Administration 2017). For example, phytoplankton productivity around Indonesia increases during El Niño events.

3.3.3 Marine Mammals

The Project Area is not recognised as a critical area for marine mammals; however, a number of marine mammals were identified as potentially occurring within the Project Area. Most of these are baleen whales, along with killer whales and bottlenose dolphins. While there are no recognised critical habitats overlapping the WHP site, the closest biologically important areas (BIAs to the WHP and Project Area are (refer **Figure 3-13**):

+ the humpback whale migration BIA, which lies approximately 26 km south and east of the WHP at the closest point and slightly overlaps the Project Area;
+ pygmy blue whale migration BIA, which lies approximately 110 km northwest of the WHP at the closest point and 86 km northwest of the Project Area; and
+ Pygmy blue whale distribution range, which overlaps the project area.

The humpback whale was de-listed as a threatened species (vulnerable) under the EPBC Act as of 26 Feb 2022 (DOE, 2022) and associated conservation advice and recovery plans are no longer in place. As a result there are no specific requirements for the humpback whale migration BIA associated with conservation advice or a conservation management plan.

The distribution range of pygmy blue whales is described as cosmopolitan in the conservation management plan (CMP) for blue whales and has been designated as extending from the shorelines of Western Australia to beyond the Continental Slope, shown as a layer in the National Conservation Values Atlas. On this basis, the Project Area overlaps with the designated distribution range for pygmy blue whales (**Figure 3-13)** but does not overlap the migratory or foraging BIAs. There are no specific requirements associated with the distribution range described in the CMP, with the precautionary approach applied to activities in or adjacent to foraging areas, and the adoption of best practice adaptive management in the event pygmy blue whales are encountered to prevent unacceptable impacts. The historical catch area (Figure 1, in the CMP) and satellite tagging and passive acoustic data referred to in the CMP indicates that pygmy blue whales occupy the continental slope rather than the continental shelf of the North West region. A recent publication by Thums et al. (2022) on pygmy blue whale movement, distribution and important areas provides a synthesis of 46 passive acoustic instruments between 2006 and 2019 and satellite tag deployments between 2009 and 2021 and indicates extensive use of the continental slope during migration rather than the shelf. The migration BIA for pygmy blue whales encompassed 79% of satellite tagging data, with the majority of the remaining 21% due to presence to the west of the migratory BIA (Exmouth plateau) and Indonesia. Only 7% of tagged pygmy blue whales occurred in shelf waters and these were mostly to the south of Ningaloo. Analysis of the passive acoustic data also indicated minimal shelf use. **Figure 3-15** (adapted from Thums et al, 2022), shows the overlap of the Project Area and tracking data.

Pygmy blue whales migrate as solitary animals or in small groups along the continental slope, typically at depths between 500 m and 1000 m on the way to the Banda and Molucca seas near Indonesia, where calving is understood to occur (Double et al., 2014). The northern migration (Augusta to Derby) tends to pass along the shelf edge at depths of 500 m to 1000 m; moving closer to the coast in the Exmouth - Montebello Islands area on southern migration. Northern migration occurs April through July, peaking in May - June, whilst southern migration occurs October through January, peaking in November – December.

Santos

Many baleen whales that may occur within the EMBA have extensive ranges and undertake predictable seasonal migrations between feeding areas in high latitudes and calving and breeding areas in lower latitudes.

Some marine mammals identified within the EMBA, such as coastal dolphins and dugongs, have strong habitat preferences. The ranges of these species are typically large; however, their habitat preferences may result in locally high densities within their ranges interspersed with relatively low densities of these species.

Temperate species of marine mammals, such as Australian sea lions and southern right whales, may only be expected to occur within the southern part of the EMBA beyond the Project Area.

3.3.3.1 Threatened and Migratory Marine Mammals

A number of species of marine mammals listed as threatened or migratory under the EPBC Act were identified as potentially occurring within the Project Area and the EMBA beyond the Project Area based on Protected Matters Search Tool (PMST) data in **Attachment 1**. The full list of marine mammals including the species that are classified as threatened or migratory are presented in **Table 3-2** below**.** Omura's whale (*Balaenoptera omurai*) is not currently listed under the EPBC Act but is known to occur on the North West Shelf of WA.

Santos

Table 3-2: Marine mammal species that may occur within the Project Area and EMBA

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Balaenoptera acutorostrta	Minke Whale	The minke whale is a relatively small baleen whale that is distributed worldwide. Feeding grounds for minke whales in the southern hemisphere are around Antarctica, with migration to lower latitudes during winter months thought to occur, although to a lesser extent than other baleen whales. The most northerly record in Australian waters is approximately 21° S, approximately the same latitude as the North West Cape (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Balaenoptera bonaerensis	Antarctic Minke Whale, Dark-shoulder Minke Whale	The Antarctic minke whale is distributed worldwide and has been recorded off all Australian states, feeding in cold waters and migrating to warmer waters to breed. It is thought that the Antarctic minke whale migrates up the Western Australian coast to approximately 20° S to feed and possibly breed (Bannister et al. 1996).	-	Migratory	Cetacean	-	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Balaenoptera borealis	Sei Whale	Sei whales have a worldwide oceanic distribution and is expected to migrate seasonally between low-latitude wintering areas and high-latitude summer feeding grounds (Bannister et al. 1996; Prieto et al. 2012). Sei whales have been infrequently recorded in Australian waters (Bannister et al. 1996), which could be due to the similarity in appearance of sei whales and Bryde's whales leading to incorrect recordings.	Vulnerable	Migratory	Cetacean	Species or species habitat likely to occur	Foraging, feeding or related behaviour likely to occur
Balaenoptera edeni	Bryde's Whale	The Bryde's whale occurs in tropical and temperate waters (Bannister et al. 1996). Bryde's whales occur in both oceanic and inshore waters with the only key localities recognised in Western Australia being in the Abrolhos Islands and north of Shark Bay (Bannister et al. 1996). Two forms are recognised: inshore and offshore Bryde's whales. It appears that the offshore form may migrate seasonally, heading	-	Migratory	Cetacean	Species or species habitat may occur	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		towards warmer tropical waters during the winter; however, behaviour of the offshore form in the Indian Ocean is not well documented. This species has been detected within the Northwest Province from mid-December to mid-June, peaking in late February to mid-April (RPS Environment and Planning 2012).					
Balaenoptera musculus *Balaenoptera musculus brevicauda*	Blue and Pygmy Blue Whale	There are two recognised subspecies of blue whale in the Southern Hemisphere, both of which are recorded in Australian waters. These are the southern (or ”true”) blue whale (*Balaenoptera musculus*) and the “pygmy” blue whale (*Balaenoptera musculus brevicauda*) (Commonwealth of Australia 2015a). In general, southern blue whales occur in waters south of 60° S, and pygmy blue whales occur in waters north of 55°S (i.e. not in the Antarctic). On this basis, nearly all blue whales likely to occur in the Project Area	Endangered	Migratory	Cetacean	Species or species habitat likely to occur	Foraging, feeding or related behaviour known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		and known to occur in the EMBA are pygmy blue whales. Pygmy blue whales undertake seasonal migration between temperate or sub-Antarctic and tropical waters (Double et al. 2014). In the Northern marine region, pygmy blue whales migrate along the 500 to 1,000-m depth contour on the edge of the slope. Sea noise loggers and satellite tracking at various locations along the Western Australian coast have detected an annual northbound migration past Exmouth and the Montebello Islands between April and August and a southbound migration from October to the end of January, peaking in late November to early December (Double et al. 2014; McCauley and Duncan 2011; McCauley and Jenner 2010). More recently, a synthesis of existing and new data on the distribution and movement of pygmy blue whales by Thums et al. (2022) concurred with					

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		these timings and migratory paths in deeper waters of the continental slope, to the west of the Project Area.					
Balaenoptera physalus	Fin Whale	Like other baleen whales, fin whales migrate annually between high-latitude summer feeding grounds and lower-latitude over-wintering areas (Bannister et al. 1996). Fin whales are thought to follow oceanic migration paths and are not commonly encountered in coastal or continental shelf waters. Antarctic waters are important feeding grounds for fin whales, but there are no known mating or calving areas in Australian waters (Morrice et al. 2004).	Vulnerable	Migratory	Cetacean	Species or species habitat likely to occur	Foraging, feeding or related behaviour likely to occur
Berardius arnuxii	Arnoux's Beaked Whale	Arnoux's beaked whale (family Ziphiidae) with a circum-Antarctic distribution. It occurs in temperate, sub-Antarctic and Antarctic oceanic waters. In Australia, it occurs south of around 34° S (approximately Cape Leeuwin), with no known key	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		localities in Australian waters (Bannister et al. 1996).					
Caperea marginata	Pygmy Right Whale	The pygmy right whale is considered the most elusive baleen whale; and as a result, very little is known about the whale's distribution in Australian waters. Records of the pygmy right whale in Australian waters are distributed between 32° S and 47° S (Kemper 2002), far south of the Project Area.	-	Migratory	Cetacean	-	Foraging, feeding or related behaviour likely to occur
Delphinus delphis	Common Dolphin, Short-beaked Common Dolphin	The common dolphin has a cosmopolitan distribution and is found in all ocean basins in warm-temperate and tropical waters. The species is gregarious and is known to congregate in large numbers (thousands of individuals). The species in not known to occur in sub-Antarctic or Antarctic waters (Bannister et al. 1996).	-	-	Cetacean	Species or species habitat may occur	Species or species habitat may occur
Dugong dugon	Dugong	Dugongs are distributed throughout tropical coastal waters in the Indo-Pacific region. They occur along the Western Australian coast	-	Migratory	-	-	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		throughout the Gascoyne, Pilbara and Kimberley, with notable populations in the following (Marsh et al. 2002; Preen et al. 1997): + Ningaloo Marine Park (state waters), + Exmouth Gulf, and + Shark Bay. Dugong distribution is correlated with seagrass habitats in which dugong feed, although water temperature has also been correlated with dugong movements and distribution (Preen 2004; Preen et al. 1997).					
Eubalaena australis	Southern Right Whale	The southern right whale occurs primarily in waters between approximately 20 and 60° S and moves from high-latitude feeding grounds in summer to warmer, low-latitude coastal locations in winter (Bannister et al. 1996). Southern right whales aggregate in calving areas along the south coast of Western Australia, such as Doubtful	Endangered	Migratory	Cetacean	-	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Island Bay, east of Israelite Bay and to a lesser extent Twilight Cove (DSEWPaC 2012b). During the calving season, between May and November, female southern right whales that are either pregnant or with calf can be present in shallow protected waters along the entire southern Western Australian coast up to approximately Two Rocks, north of Perth. Sightings in more northern waters are relatively rare; however, they have been recorded as far north as Exmouth (Bannister et al. 1996).					
Feresa attenuata	Pygmy Killer Whale	The pygmy killer whale is a species of oceanic dolphin. It is the smallest cetacean species that includes “whale” in the common name, derived from some resemblance to the orca, or killer whale. The species has a wide distribution in tropical and subtropical waters worldwide (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Globicephala macrorhynchus	Short-finned Pilot Whale	The species is a large oceanic dolphin that has been recorded in all ocean basins in oceanic and continental shelf waters. Short-finned pilot whales form socially cohesive groups and have been recorded in mass strandings at several locations around the world, including most Australian states and the Northern Territory (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Globicephala melas	Long-finned Pilot Whale	Like the only other species in the genus *Globicephala*, the short-finned pilot whale, this species is a large oceanic dolphin that has been recorded in all ocean basins in oceanic and continental shelf waters. The species is widely recorded in waters off southern Australia and has been recorded stranding in all Australian states, but not the Northern Territory (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Grampus griseus	Risso's Dolphin, Grampus	Risso's dolphin is found worldwide in tropical and temperate waters. Preferred habitat appears to be just off the continental shelf where the continental slope is steep. Records in Australian waters occur from southwestern Australia along the south coast to Queensland (Bannister et al. 1996).	-	-	Cetacean	Species or species habitat may occur	Species or species habitat may occur
Hyperoodon planifrons	Southern Bottlenose Whale	The southern bottlenose whale is a species of beaked whale (family Ziphiidae) with a circumpolar distribution in the Southern Ocean, accounting for most sightings of beaked whales in Antarctic waters. Sightings occur primarily south of 29° S (approximately south of Geraldton) (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Indopacetus pacificus	Longman's Beaked Whale	The Longman's beaked whale is a species of beaked whale (family Ziphiidae) that occurs in temperate, sub-Antarctic and Antarctic oceanic waters (Bannister et al. 1996). The species may be primarily oceanic, like other beaked whale species.	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Kogia breviceps	Pygmy Sperm Whale	The pygmy sperm whale has a cosmopolitan distribution in tropical and temperate waters worldwide. Relatively little is known about this species compared to sperm whales, due to its small size, inconspicuous behaviour, and paucity of historical whaling records. The species feeds predominantly on pelagic squid in open ocean and is less frequent on continental shelf waters (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Kogia sima	Dwarf Sperm Whale	Like the pygmy sperm whale, the dwarf sperm whale has a cosmopolitan distribution in tropical and temperate waters worldwide. It is more likely to be frequenting continental shelf and continental slope waters than the pygmy sperm whale. Squid are the main prey item (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Lagenodelphis hosei	Fraser's Dolphin, Sarawak Dolphin	Fraser's dolphin is a pelagic, oceanic dolphin species found in all ocean basins. The species is most commonly observed in oceanic and	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		continental slope waters (more than 1,000 m deep), and is relatively rarely observed in continental shelf waters. Fraser's dolphin is typically found in tropical and subtropical waters and is relatively rare in temperate waters (Bannister et al. 1996).					
Lagenorhynchus obscurus	Dusky Dolphin	The dusky dolphin's distribution is strongly linked to colder waters. In Australia, the dusky dolphin has been sighted in southern Australia from Western Australia to Tasmania. It is presumed to be primarily an inshore species but has been known to move further offshore, possibly due to its desire for colder waters (Gill et al. 2000). Dusky dolphins are expected to be limited in their distribution along the Western Australian coastline due to the presence of the southward-flowing warm water of the Leeuwin Current.	-	Migratory	Cetacean	-	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Lissodelphis peronii	Southern Right Whale Dolphin	The southern right whale dolphin is an oceanic dolphin species distributed throughout the Southern Ocean. It is the only dolphin species in the southern hemisphere that lacks a dorsal fin (similar to the southern right whale, which is the basis for the species' common name). The species is usually found well offshore in ocean basins or outer continental shelfs between 30° S and 65° S (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Megaptera novaeangliae	Humpback Whale	The species undertakes regular seasonal migrations between feeding grounds in the Southern Ocean and breeding and calving grounds off northern Western Australia, particularly Camden Sound (Jenner et al. 2001). From the North West Cape, northbound humpback whales travel along the edge of the continental shelf passing to the west of the Muiron, Barrow and Montebello Islands, peaking in late	-	Migratory	Cetacean	Breeding known to occur	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		July (Jenner et al. 2001). The southern migratory route follows a relatively narrow track between the Dampier Archipelago and Montebello Islands, south of the Project Area. In particular, Exmouth Gulf is where cow/calf pairs may stay for up to two weeks during September (Jenner et al. 2001).					
Mesoplodon bowdoini	Andrew's Beaked Whale	Very little is known of Andrew's beaked whale, with very few observations of this species in the wild. Most information on the species has been collected from stranded individuals. Strandings have been recorded in Chile, the Falkland Islands, southern Australian and southern New Zealand, suggesting a circumpolar distribution in the Southern Ocean (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Mesoplodon densirostris	Blainville's Beaked Whale, Dense-beaked Whale	Blainville's beaked whale is found in tropical and subtropical waters in all ocean basins. It is one of the most widely distributed beaked whales. The latitudinal range in Australia	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		may be extended by the warm south-flowing Leeuwin and East Australian currents (Bannister et al. 1996). Most sightings occur in continental slope waters (more than 200 m water depth), with diving depths of more than 900 m recorded (Baird et al. 2006), indicating a preference for waters much deeper than the continental shelf.					
Mesoplodon ginkgodens	Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale	The ginkgo-toothed whale has a broad tropical and subtropical distribution in the Indian and Pacific oceans but has not been recorded in the Atlantic Ocean. It is thought to be more common in the western North Pacific Ocean, where it has occasionally been caught by whalers. Records in Australia are from a small number of stranding events in Victoria and New South Wales. The species is capable of deep dives and is thought to prefer deepwater habitats as do other	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		ziphiid species (Bannister et al. 1996).					
Mesoplodon grayi	Gray's Beaked Whale, Scamperdown Whale	Gray’s beaked whale has a circumpolar distribution at higher latitudes in the southern hemisphere. Observations of the species at sea are most common in deep water (more than 2,000 m), indicating a preference for outer continental shelf and deep ocean waters. Most recorded strandings have occurred in New Zealand (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Mesoplodon hectori	Hector's Beaked Whale	Hector's beaked whale is primarily a Southern Hemisphere cool temperate species. The records are from southern South America, South Africa, Australia, and New Zealand. Recently, there have been several strandings and possible sightings off southern California, but it is unknown whether these represent extralimital strays or normal occurrences.	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Mesoplodon layardii	Strap-toothed Beaked Whale, Strap-toothed Whale, Layard's Beaked Whale	The strap-toothed beaked whale has a circumpolar distribution in sub-Antarctic and temperate waters in the Southern Ocean. Analysis of the stomach contents of stranded strap-toothed whales found prey items were primarily deepwater squid, indicating the species forages in outer continental shelf and oceanic waters (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Mesoplodon mirus	True's Beaked Whale	True's beaked whale is distributed in deep circumpolar temperate and sub-Antarctic waters in the southern hemisphere. There is a population in the north Atlantic, although this may be a separate species given the geographic separation from the southern hemisphere population. Strandings have been recorded in South Africa, Australia and New Zealand (Bannister et al. 1996).	-	-	Cetacean	-	Species or species habitat may occur
Neophoca cinerea	Australian Sea Lion	The Australian sea lion is the only endemic pinniped in Australia, with only 76 known breeding colonies ranging from the Abrolhos Islands	Endangered	-	-	-	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		off Western Australia to the Page Islands, South Australia (DSEWPaC 2012b). The estimated total population of Australian sea lion is approximately 14,700, with only 14% found in Western Australia (DSEWPaC 2012b). On the west coast of Western Australia, rookeries are found on low-lying limestone islands that are well protected by perimeter reefs. Females typically travel less than 60 km from their natal site, while males may disperse approximately 200 km from natal sites to other breeding colonies or haul-out sites (Campbell 2003; Campbell et al. 2008). The breeding cycle of the species is approximately 17 to 18 months, leading to breeding and pupping timings that are not strongly correlated with season, with the pupping season at individual colonies ranging between five and					

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		nine months (Goldsworthy et al. 2009).					
Orcaella brevirostris	Irrawaddy Dolphin	The Irrawaddy dolphin is very closely related to the Australian snubfin dolphin and was recognised as a separate species relatively recently. Some authorities still consider the species synonymous with *O. heinsohni*. The species is distributed in southern Asia, southeastern Asia and northern Australia in shallow (less than 20 m) coastal and estuarine waters. In Western Australia, it is recorded north of Broome to the Brisbane River in Queensland (Bannister et al. 1996).	-	Migratory	Cetacean	-	Species or species habitat known to occur
Orcaella heinsohni	Australian Snubfin Dolphin	The Australian snubfin dolphin shares similar habitat preferences with the Indo-Pacific humpback dolphin, occurring in shallow coastal and estuarine tropical waters (typically less than 20 m deep). However, as with the Indo-Pacific humpback dolphin, the species has also been recorded up to 23 km	-	Migratory	Cetacean	-	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		offshore. In Australia, the species distribution covers the coastal waters of Queensland, the Northern Territory and northern Western Australia (Bannister et al. 1996). The population in Australian waters is thought to be continuous with the Papua New Guinea species but separate from populations in Asia.					
Orcinus orca	Killer Whale	The killer whale is widespread from polar to equatorial regions of all oceans and has been recorded off all states of Australia (Bannister et al. 1996). Killer whales appear to be more common in cold, deep waters; however, they have been observed along the continental slope and shelf (Bannister et al. 1996).	-	Migratory	Cetacean	Species or species habitat may occur	Species or species habitat may occur
Peponocephala electra	Melon-headed Whale	Melon-headed whales occur in deep tropical or subtropical oceanic waters in all ocean basins, between 40° N and 35° S. The species is gregarious, with groups of 150 to 1,500 animals recorded. Mass strandings have been recorded in New South Wales, Queensland and	-	-	Cetacean	-	Species or species habitat may occur within area

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Western Australia. It is primarily a pelagic and oceanic species that rarely occurs in continental shelf waters (Bannister et al. 1996).					
Physeter macrocephalus	Sperm Whale	Sperm whales are the largest of the toothed whales and are distributed worldwide in deep waters (deeper than 200 m) off continental shelves and sometimes near shelf edges (Bannister et al. 1996). Sperm whales have been recorded in all Australian state waters. The species is known to migrate northwards in winter and southwards in summer, but detailed information on the distribution and migration patterns of sperm whales off the Western Australian coast is not available (Bannister et al. 1996).	-	Migratory	Cetacean	-	Foraging, feeding or related behaviour known to occur
Pseudorca crassidens	False Killer Whale	False killer whales are found worldwide in deep tropical and temperate waters. They are distributed circumglobally between 45° S and 45° N. Strandings have been recorded in several locations	-	-	Cetacean	Species or species habitat likely to occur	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		around the Australian coast, including Western Australia (Bannister et al. 1996). The species has been recorded both in deep oceanic waters and continental shelf waters, although it appears to prefer deep offshore waters, with observations in relatively shallow waters made around oceanic islands, such as the Hawaiian Islands (Culik 2004).					
Sousa chinensis	Indo-Pacific Humpback Dolphin	The Indo-Pacific humpback dolphin is now recognised as two distinct species: the Indo-Pacific humpback dolphin (*Sousa chinensis*) and the Australian humpback dolphin (*S. sahulensis*) (Jefferson and Rosenbaum 2014). Distribution of the Indo-Pacific humpback dolphin in Australia is tropical, occurring north of 29° S and 24° S off the east and west coasts of Australia respectively (Bannister et al. 1996). Humpback dolphins inhabit shallow coastal, estuarine habitats in tropical and subtropical regions	-	Migratory	Cetacean	-	Breeding known to occur

Santos

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		generally in depths of less than 20 m (Corkeron et al. 1997; Jefferson 2000; Jefferson and Rosenbaum 2014).					
Stenella attenuata	Spotted Dolphin, Pantropical Spotted Dolphin	The spotted dolphin is distributed in tropical waters in all ocean basins. It is the second most-populous dolphin species, after the bottlenose dolphin. It occurs in deep oceanic waters, as well as on the continental slope and outer continental shelf waters (Bannister et al. 1996). The species associates with schooling tuna and was subject to historical high levels of mortality due to bycatch in tuna fisheries.	-	-	Cetacean	Species or species habitat may occur	Species or species habitat may occur
Stenella coeruleoalba	Striped Dolphin, Euphrosyne Dolphin	The striped dolphin occurs in tropical and temperate waters in all ocean basins from approximately 40° N to 30 °S. Like other species of *Stenella*, the striped dolphin is known to form large aggregations (more than 1,000 individuals) (Culik 2004). The species is generally considered to be pelagic and appears to prefer continental shelf	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		and oceanic waters (more than 200 m water depth) (Bannister et al. 1996; Culik 2004).					
Stenella longirostris	Spinner Dolphin, Long-snouted Spinner Dolphin	The spinner dolphin is distributed in tropical and temperate waters from 40° N to 40° S. It occurs in continental shelf, continental slope and oceanic waters. Like other species of *Stenella*, spinner dolphins may form large congregations and may associate with tuna and seabirds in pursuit of prey (Bannister et al. 1996; Culik 2004).	-	-	Cetacean	-	Species or species habitat may occur
Steno bredanensis	Rough-toothed Dolphin	The rough-toothed dolphin occurs in tropical and temperate waters in all ocean basins. The species is most often observed far offshore, usually well beyond the continental shelf (Culik 2004). The species often congregates in schools of less than 50 animals but may form larger groups up to 300 animals (Bannister et al. 1996; Culik 2004).	-	-	Cetacean	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Cetacean	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Tursiops aduncus	Spotted Bottlenose Dolphin (Arafura / Timor Sea populations)	The spotted bottlenose dolphin is generally considered to be a warm-water subspecies of the common bottlenose dolphin. Distribution is primarily inshore waters, often in depths of less than 10 m (Bannister et al. 1996). They are known to occur from Shark Bay north to the western edge of the Gulf of Carpentaria.	-	Migratory	Cetacean	Species or species habitat may occur	Species or species habitat known to occur
Ziphius cavirostris	Cuvier's Beaked Whale, Goose-beaked Whale	Cuvier's beaked whale is the only member of the monotypic genus *Ziphius* within the beaked whale (ziphiid) family. The species has a cosmopolitan distribution ranging from tropical to temperate waters in all ocean basins. The species is the deepest-diving mammal, with dives of almost 3,000 m recorded and with most animals recorded in more than 1,000 m water depth (Bannister et al. 1996; Culik 2004; Schorr et al. 2014).	-	-	Cetacean	-	Species or species habitat may occur

Table 3-3 outlines the management plans, recovery plans and conservation advice relevant to those species identified as potentially occurring or having habitat within the Project Area and summarises the key threats to those species as described in the relevant plans and advice.

Table 3-3: Summary of EPBC management plans, recovery plans and conservation advice relevant to the Project Area

Species	Recovery Plan/ Conservation advice	Key threats identified in the Recovery Plan/ Conservation advice	Relevant Conservation Action
Sei Whale	Conservation advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b)	Noise interference	Once the spatial and temporal distribution (including biologically important areas) of sei whales is further defined, assess the impacts of increasing anthropogenic noise (including from seismic surveys, port expansion, and coastal development) on this species.
		Vessel disturbance	Ensure all vessel strike incidents are reported in the National Vessel Strike Database.
Blue Whale	Conservation management plan for the blue whale: *A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999* 2015–2025 (Commonwealth of Australia 2015a) Guidance on key terms within the Blue Whale Conservation Management Plan (DAWE, 2021)	Noise interference	Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area. Ensure EPBC Act Policy Statement 2.1—Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a) is applied to all seismic surveys.
		Vessel disturbance	Ensure all vessel strike incidents are reported in the National Vessel Strike Database.
Fin Whale	Conservation advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c)	Noise interference	Once the spatial and temporal distribution (including BIAs) of fin whales is further defined, assess the impacts of increasing anthropogenic noise (including seismic surveys, port expansion, and coastal development) on this species.
		Vessel disturbance	Develop a national vessel strike strategy that investigates the risk of vessel strikes on fin whales and identifies potential mitigation measures.

			Ensure all vessel strike incidents are reported in the National Vessel Strike Database.

3.3.3.1.1 Whale Migration

Humpback whales traverse waters off the west coast of Australia as they migrate annually from summer feeding grounds in Antarctica to the nearshore waters of the Kimberley region where they breed and calve during winter. Humpback whales are likely to be present in the Project Area during the northbound migration. They appear to remain on or within the 200-m isobath near the Montebello Islands and then move closer to shore as they head further north to the calving grounds in the Kimberley. The humpback whale migration corridor is not an identified aggregation area or critical habitat: the whales are in transit and are migrating from their southern polar 'summer' feeding grounds to their northern tropical 'winter' calving and breeding grounds.

Peak northward migration across the NWS is approximately from late July to early August, and peak southward migration is approximately from late August to early September (Jenner et al. 2001) . Data collected between 1995 and 1997 by the Centre for Whale Research indicates that the period for peak northern migration into the calving grounds in the Kimberley is mid to late July (**Table 3–3**). The peak for southern migration is in the first half of September (Jenner et al. 2001).

Figure 3-13 shows the overlap of the Project Area with the humpback whale migration BIA. Satellite tracking data (Double et al. 2010, 2012a; Gales et al. 2009) for northbound and southbound humpback whales indicated that the tagged whales migrated in a consistently narrow inshore path along the northwest coast of Western Australia, with the satellite tracks greater than 50 km from the WHP site.

Based on migration data presented in Thums et al. (2018), it is possible that a small number of migrating individuals will traverse the Project Area (**Figure 3-14**). This migration data, collected over 2008, 2009 and 2011 for tagged humpback whales, shows there are no migration paths that overlap with the Project Area. The different tag numbers correlate to tags on each individual whale, data from 39 tagged whales is plotted. The data also shows that if the humpback whales were to migrate through the Project Area during their northern migration it would be for hours rather than days (i.e. less than 0.5 days, **Figure 3-16**).

Table 3-4: Critical periods for migrating humpback whales in the vicinity of the Project Area

Migrations	Description	Timing
Northbound migration: Port Hedland to Broome	Peaks July and tapers off by August (may vary by 3 weeks from year to year). Extends further compared to southern migration route.	Late July to early August
Southbound migration: Broome to Port Hedland	Southerly migration in this area is contracted in a narrower band than the northerly migration route, generally occurring closer to the coast within the 50-m isobath and generally in waters less than the 35 m deep.	Late September to early October

Sources: Jenner et al. (2001); Threatened Species Scientific Committee (2015a).

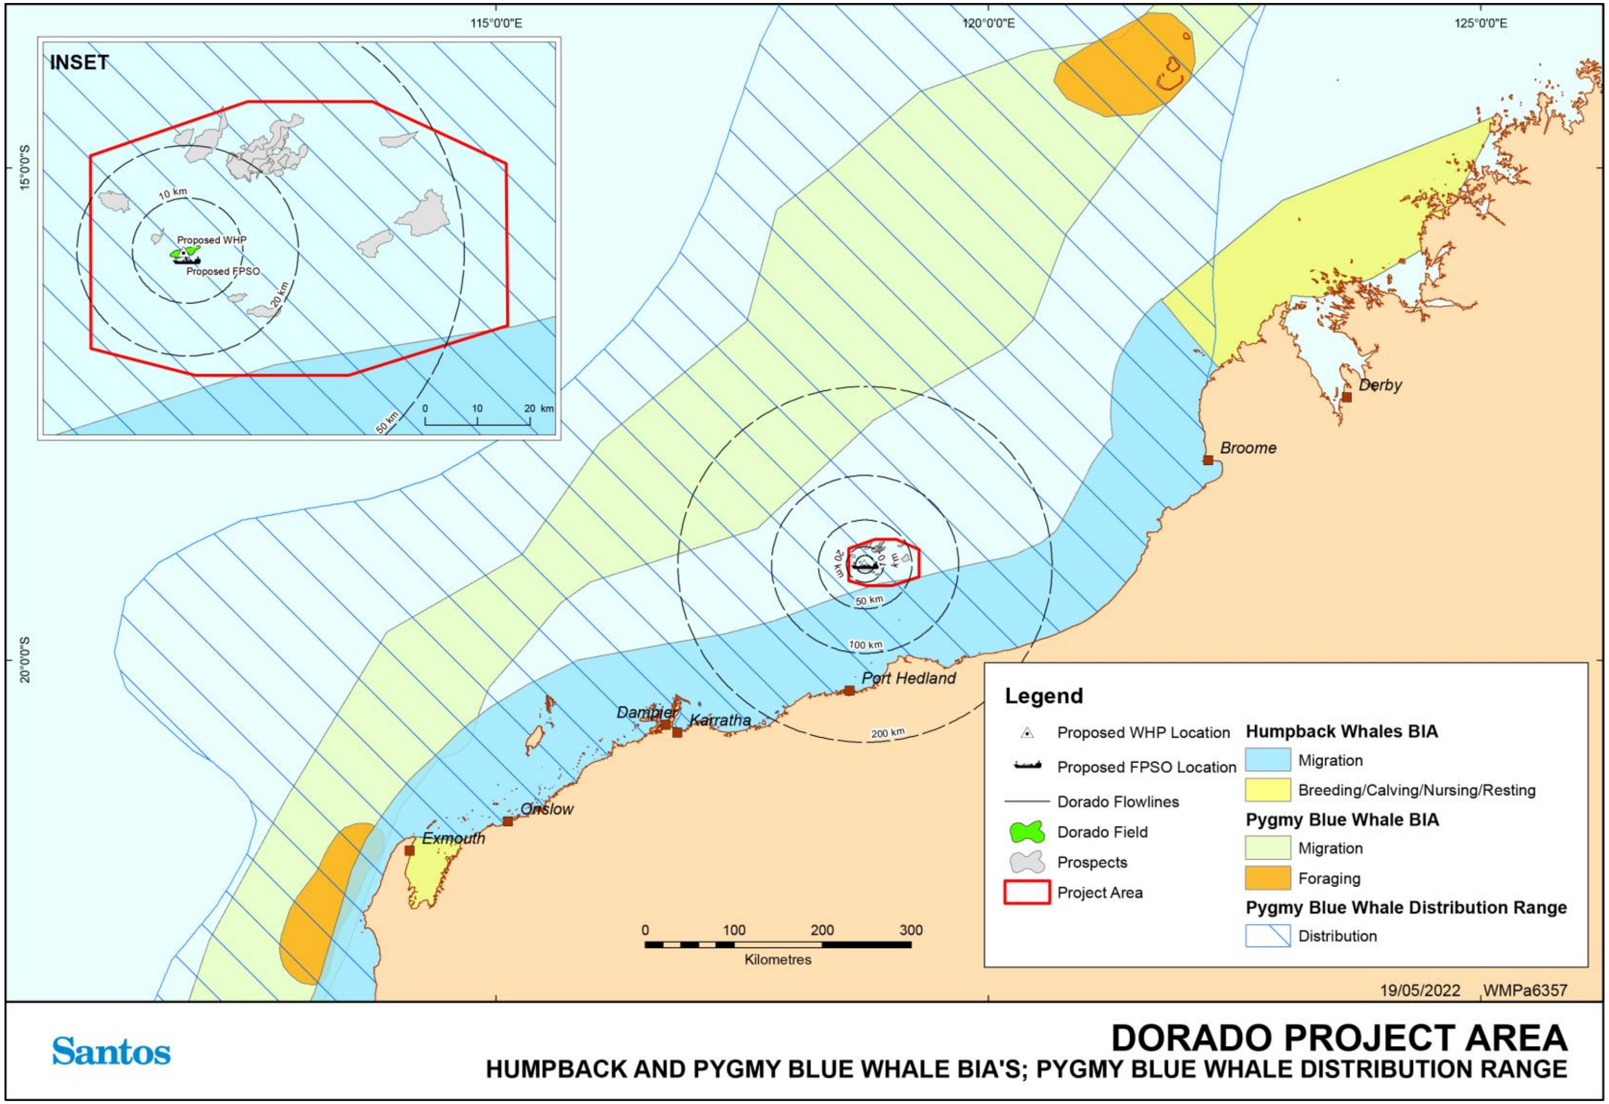

Figure 3-13: Project Area overlap with humpback whale BIAs, pygmy blue whale BIA and pygmy blue whale distribution range

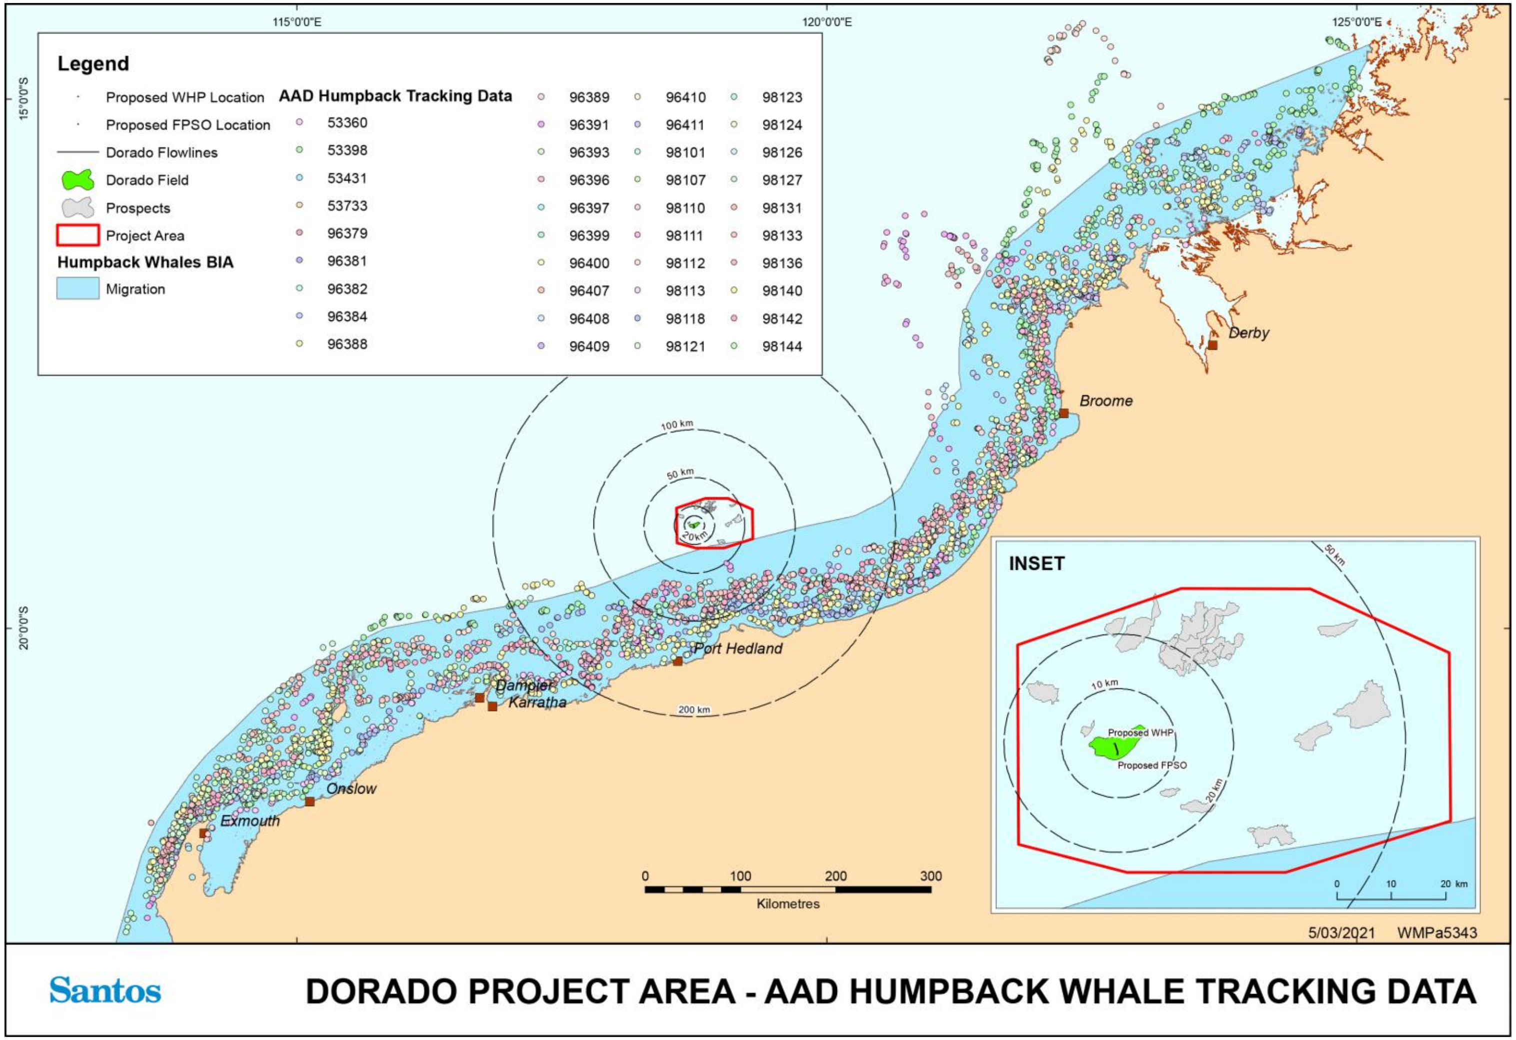
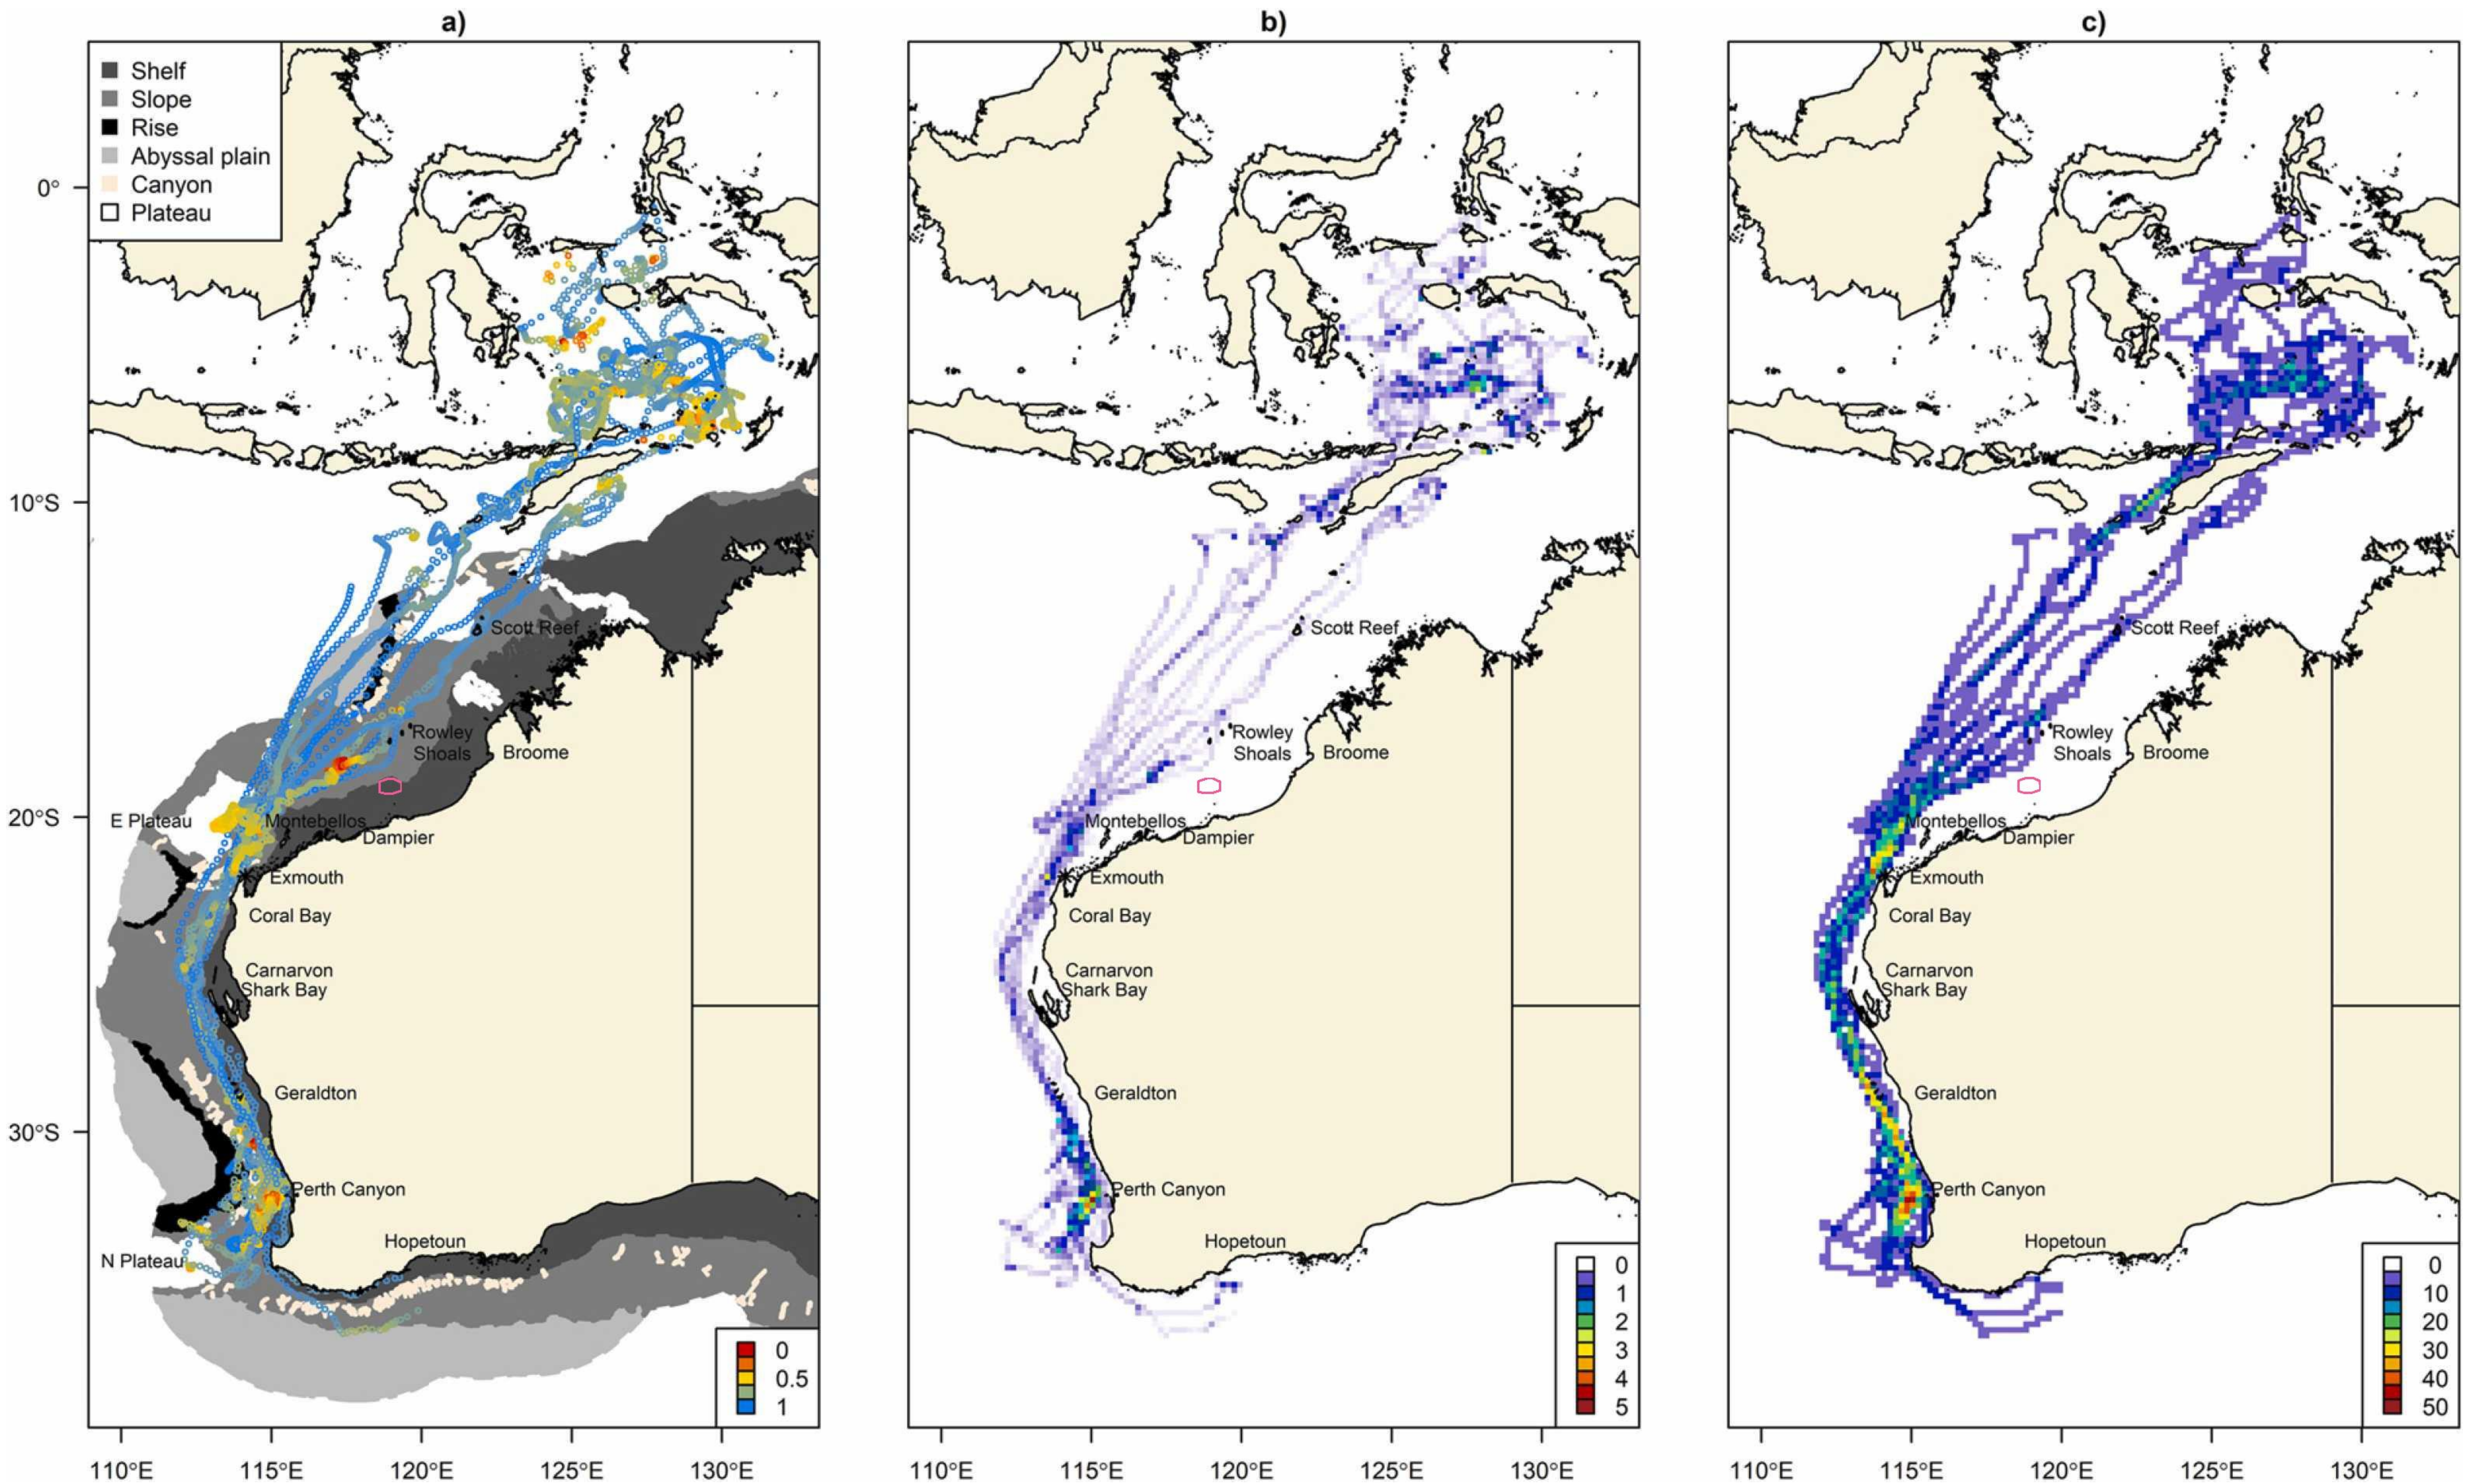


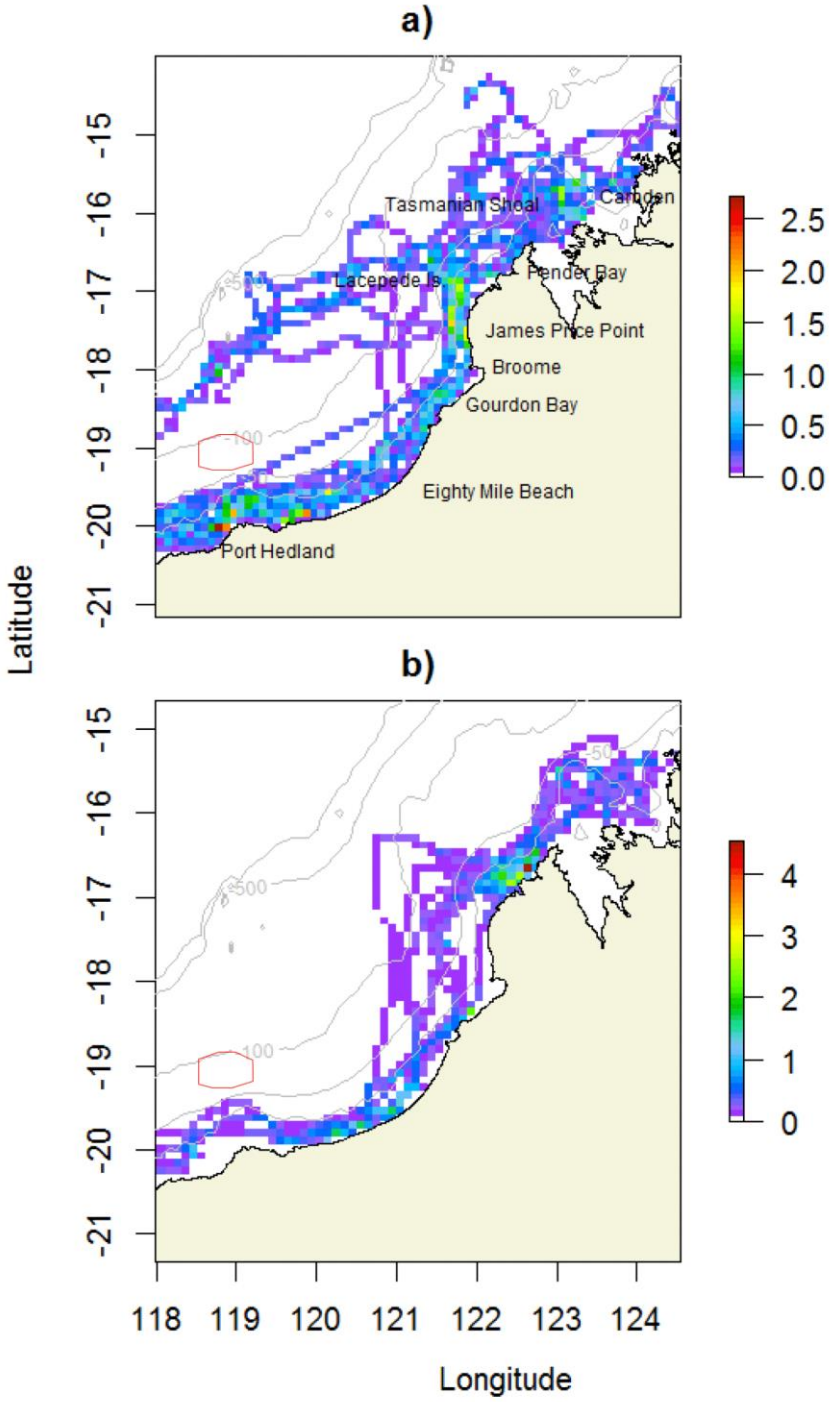
Sources: Double et al. (2012a); Gales et al. (2010).

Figure 3-14: Project Area overlap with humpback whale migration BIA and Australian Antarctic Division whale tracking data



Sources: Thums et al, 2022. a) Pygmy blue whale (n = 16) state space modelled position estimates are colour coded by move persistence with cooler colours indicating high move persistence (indicative of migration) and warmer colours indicating low move persistence (indicative of foraging, and/or resting/ breeding). b) shows the distributions calculated using the modelled position estimates with occupancy (time spent per grid cell in days), and c) shows percentage of pygmy blue whales per grid cell. Satellite tag deployment locations marked with an asterisk, including NW Cape (n = 6), Perth Canyon (n = 15), Bonney Upwelling, SA (n = 1), noting that only data from Hopetoun WA to Indonesia is shown for the latter deployment. Geomorphic features of the Australian EEZ are also shown, including the Exmouth (E) Plateau and the Naturaliste (N) plateau

Figure 3-15: Project Area overlap with pygmy whale tracking data



Number of days spent by northbound (a) and southbound (b) humpback whales per 10 km × 10 km grid cell for the Kimberley Region, within proximity of the Dorado project area, from tagged humpback whales from 2008, 2009 and 2011 (source Thums et al, 2018).

NORTHBOUND AND SOUTHBOUND HUMPBACK WHALES MIGRATION DURATIONS (2008-2011)

Figure 3-16: Northbound (a) and southbound (b) humpback whale migration durations (2008, 2009 and 2011) and overlap with Project Area

3.3.3.2 Biologically Important Areas and Critical Habitat

BIAs are not defined under the EPBC Act, but there are areas that are particularly important for the conservation of protected species and where aggregations of individuals display biologically important behaviour such as calving, foraging, resting or migration (DAWE, 2021). BIAs have been identified using expert scientific knowledge about species distribution, abundance and behaviour (DAWE, 2021). A number of BIAs for marine mammals that cover biologically important behaviours overlap the EMBA beyond the Project Area. These are summarised in **Table 3-5** along with distance from the WHP and the closest Project Area boundary.

Whilst it is not currently possible to define habitat critical to the survival of blue whales, the best information relates to biologically important areas where foraging occurs (DAWE, 2021). The distribution range of pygmy blue whales overlaps the Project Area, however based on data presented in Thums et al, 2022, and no observed pygmy blue whales during multiple drilling and seismic campaigns within the project area since 2015, pygmy blue whales are not expected to frequent the project area. No critical habitats for marine mammals were identified within the Project Area and EMBA.

Of the BIAs listed in **Table 3-5**, one overlaps the Project Area: the humpback whale migration (north and south) BIA, noting that the humpback whale is no longer a threatened species under the EPBC Act, and as such there are no conservation advice or conservation management plan requirements for the humpback whale migration BIA. This BIA partially overlaps approximately 3% of the Project Area and lies approximately 26 km south of the proposed Dorado Phase 1 WHP location. The portion of the BIA in the Project Area is approximately 0.065% of the total area of the BIA. The migration activities that formed the ecological reason for the designation of this BIA are described above in **Section 3.3.3.1.1**.

Table 3-5: Closest BIAs for marine mammals within the EMBA

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)	Shortest Distance from Project Area Boundary (km)

3.3.3.3 Conservation Advice and Recovery Plans

Material published by the Commonwealth under the EPBC Act for the conservation of threatened marine mammals, such as recovery plans, conservation advice, and threat abatement plans, is summarised in **Table 3-6**. Threats identified in this material that may credibly arise from Dorado Phase 1 are also listed, along with cross-references to the relevant assessment of environmental impacts and risks in **Section 7**.

Table 3-6: Summary of material published by the Commonwealth for the conservation of threatened marine mammals relevant to Dorado Phase 1

Scientific Name	Common Name	Recovery Plan / Conservation Advice	Credible Threats arising from Dorado Development identified in Plan / Advice	Relevant Assessment of Impacts and Risks
-	All marine mammal species	Threat abatement plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia 2018)	Marine debris	**Section 7.3.2**
Balaenoptera borealis	Sei Whale	Conservation advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b)	Noise interference	**Section 7.2.5**
			Vessel disturbance	**Section 7.3.4**
			Climate change	**Section 7.2.6**
			Oil pollution	**Section 7.3.1**
Balaenoptera musculus	Blue Whale	Conservation management plan for the blue whale: A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2015-2025 (Commonwealth of Australia 2015a) Guidance on key terms within the Blue Whale Conservation Management Plan (DAWE, 2021)	Noise interference	**Section 7.2.5**
			Vessel disturbance	**Section 7.3.4**
			Climate change	**Section 7.2.6**
Balaenoptera physalus	Fin Whale	Approved conservation advice for *Balaenoptera physalus* (fin whale) (Threatened Species Scientific Committee 2015c)	Noise interference	**Section 7.2.5**
			Vessel disturbance	**Section 7.3.4**
			Climate change	**Section 7.2.6**
Eubalaena australis	Southern Right Whale	Conservation management plan for the southern right whale: a recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2011-2021 (DSEWPaC 2012c)	Noise interference	**Section 7.2.5**
			Vessel disturbance	**Section 7.3.4**
			Climate change	**Section 7.2.6**
			Marine debris	**Section 7.3.2**
	Australian Sea Lion		Oil pollution	**Section 7.3.1**

Scientific Name	Common Name	Recovery Plan / Conservation Advice	Credible Threats arising from Dorado Development identified in Plan / Advice	Relevant Assessment of Impacts and Risks
Neophoca cinerea		Recovery plan for the Australian sea lion (*Neophoca cinerea*) (DSEWPaC 2013a)	Noise interference	**Section 7.2.5**
			Marine debris	**Section 7.3.2**
			Climate change	**Section 7.2.6**
			Disease and parasites from Wastewater	**Section 7.2.3**

3.3.4 Fishes

Historical data for fish diversity has identified 370 species that have the potential to occur within the Project Area (Keesing et al. 2020). The benthic habitat survey undertaken by RPS (2020d) has shown that demersal fish, including commercially important species, were uncommon in the Project Area. This observation is consistent with the relatively flat and featureless benthic habitat within the Project Area. The most common fish observed within the Project Area were small fish (e.g. flatfish, gurnards), which were commonly observed living or burrowing in sediment habitats. Large pelagic fish, including marlin and sharks, were observed at the sea surface (upper 40 m of water column) but not at the seabed (RPS 2020d).

Several fish assemblages occur within the EMBA beyond the Project Area. These include a wide range of demersal and pelagic fish species, many of which are distributed along a latitudinal gradient from tropical waters in the north to temperate waters in the south.

Many species of demersal fish occur within the EMBA beyond the Project Area, including species that support valuable commercial fisheries (**Section 3.4.3**). Areas of complex habitats within the EMBA, such as reefs and shoals, typically exhibit the highest levels of species diversity and abundance. While this may result in species distributions that are constrained within particular habitats, most species are widely distributed (i.e. species ranges of hundreds to thousands of km). The continental slope between North West Cape and the Montebello Trough has more than 500 demersal fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last et al. 2005). Recent surveys of the demersal fish on and off the Ancient Coastline KEF at 125 m water depth have indicated that while some surveyed sections of this KEF had hardbottom substrate and supported enhanced fish diversity, including over half of the total species observed, species richness and abundance overall were not greater on this KEF than on adjacent seabed. Instead, depth, seafloor complexity and habitat type explained patterns in richness and abundance and in structured fish assemblages at both local and broad spatial scales (Currey-Randall et al. 2021).

Like demersal fish, many species of pelagic fish occur within the EMBA beyond the Project Area, including commercially important species, such as mackerel. Relatively large pelagic species, such as billfish, pelagic sharks and tuna, have extensive Indo-Pacific species distributions. Pelagic fishes include species of smaller baitfish, which are an important food source for larger fish species, marine mammals and birds. Pelagic fish within the EMBA are also targeted by commercial and recreational fisheries (**Section 3.4.3**).

3.3.4.1 Threatened and Migratory Fishes

Several species of fish, including cartilaginous fish (e.g. sharks and rays), listed as threatened or migratory under the EPBC Act were identified from PMST reports in **Attachment 1** as potentially occurring within the Project Area and EMBA beyond the Project Area. The full list of fishes including the species that are classified as threatened or migratory are presented in **Table 3-7.**

Santos

Table 3-7: Fish species (including sharks and rays) that may occur within the Project Area and EMBA

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Acentronura australe	Southern Pygmy Pipehorse	Endemic to southern Australia, from Cape Jarvis and the SA Gulfs, and the Perth area, Western Australia. Inhabits shallow algal-covered reefs, sheltering among algae and seagrasses. Individuals may be site attached, remaining in the same area for several years.	-	-	-	Species or species habitat known to occur
Acentronura larsonae	Helen's Pygmy Pipehorse	Endemic to tropical waters of the Montebello Islands, north Western Australia. The species is known only from 2 specimens found clinging to Sargassum sp. attached to isolated coral rock on a sandy coral rubble bottom in a sheltered coral reef in 3 m at Alpha Island, Montebello Islands.	-	-	Species or species habitat known to occur	Species or species habitat may occur within area
Bhanotia fasciolata	Corrugated Pipefish, Barbed Pipefish	Recorded in Australia from Scott Reef, WA. Found elsewhere in the tropical East Indo-West Pacific, from the Andaman Sea to Vanuatu, including Northwestern Australia; inhabits inshore coral reefs, tide-pools and mudflats at 3-25 m.	-	-	-	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Anoxypristis cuspidata	Narrow Sawfish, Knifetooth Sawfish	The narrow sawfish is a marine or marginal (brackish water) species found from inshore waters to a depth of 40 m. Though details of its ecology are not precisely known, it probably spends most of its time on or near the bottom in shallow coastal waters and estuaries. Its Australian distribution is unclear although it is most common in the Gulf of Carpentaria with southward ranges extending to Broad Sound in Queensland and the Pilbara Coast, Western Australia.	-	Migratory	Species or species habitat may occur	Species or species habitat known to occur
Bulbonaricus brauni	Braun's Pughead Pipefish, Pug-headed Pipefish	A small eel-like reddish-brown pipefish with white dots peppering the body and a short white 'pug-faced' snout. Adults lack dorsal and pectoral fins, and have a pointed frontal process overhanging the mouth. Recorded from off North West Cape, Western Australia. Elsewhere the species is known to occur in the tropical East-Indo-west Pacific - Indonesia, Western Australia, Palau and Japan. Inhabits coral reefs at 1-20 m, living in association with dendrophyllid corals, including those of the genus Galaxea.	-	-	Species or species habitat known to occur	Species or species habitat may occur within area

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Campichthys galei	Gale's Pipefish	Gulf St Vincent, South Australia, to Shark Bay, Western Australia. Usually inhabits shallow shelly or rubble substrates, and sparse seagrass beds to about 18 m; occasionally on rocky reefs	-	-	-	Species or species habitat known to occur
Campichthys tricarinatus	Three-keel Pipefish	Endemic to tropical northern Australia from the Montebello Islands, WA to Thursday Island, Torres Strait, Qld; inhabits inshore coral reef and rubble areas at about 2-11 m.	-	-	-	Species or species habitat known to occur
Carcharias taurus (west coast population)	Grey Nurse Shark	The grey nurse shark occurs in tropical and temperate seas of the north and south Atlantic, Indian, and western Pacific oceans (Compagno 2001). In Australia, it is recorded from all States except Tasmania; it is rare in the Northern Territory (Last and Stevens 1994). The current distribution is now mainly confined to coastal waters of southern Queensland, the entire New South Wales coast and southwestern waters of Western Australia (Bruce et al. 2005). The species has been recorded at	Vulnerable	-	-	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		varying depths but is generally found between 15 and 40 m.				
Carcharodon carachariasi	Great White Shark	The great white shark is a wide-ranging but mostly temperate and coastal species; it has a global distribution and at times occurs in oceanic environments, in the tropics, and down to depths of at least 1,200 m (Bruce et al. 2005). It is most common over the continental shelf (often close inshore) of southern Australia, South Africa, northern California and the northeast United States (Compagno 2001). There are no known aggregation sites for great white sharks in the North-west Marine Region, but the species has been recorded in NWS waters during humpback migrations.	Vulnerable	Migratory	Species or species habitat may occur	Foraging, feeding or related behaviour known to occur
Carcharhinus longimanus	Oceanic Whitetip Shark	As the common name suggests, the oceanic whitetip shark is primarily an epipelagic, oceanic species of shark found in temperate and tropical waters more than 18° S. The shark is typically distributed between the sea surface and 150 m water depth. While primarily	-	Migratory	Species or species habitat may occur	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		oceanic, the species is known to occur in continental shelf waters (Bonfil et al. 2008). The fins of the oceanic whitetip shark are highly valued for shark fin soup, leading to concerns that the species is overfished.				
Centrophorus zeehaani	Southern Dogfish, Endeavour Dogfish, Little Gulper Shark	A small uniformly light greyish-brown deepwater shark (200-700 m), which may be darker above and paler on the belly. Juveniles have dark posterior margins on the dorsal fins and the tail, which fade in intensity in adults. Southern Dogfish have greenish eyes, and a relatively short and bulky snout compared with other gulper shark species.	Conservation Dependent	-	-	Species or species habitat likely to occur
Choeroichthys brachysoma	Pacific Short-bodied Pipefish, Short-bodied Pipefish	Exmouth Gulf and offshore reefs of north Western Australia, and Ashmore Reef in the Timor Sea, to Moreton Bay, Queensland; also Christmas Island in the eastern Indian Ocean. Elsewhere the species is widespread in the tropical, Indo-west-central Pacific: Red Sea and East Africa to the Marshall and Society Islands, north to the Philippines and Japan and south to Australia.	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Inhabits tide pools, seagrass areas, coral reef lagoons and seaward reefs, in depths to 27 m.				
Choeroichthys latispinosus	Muiron Island Pipefish	Endemic to Western Australia, from Port Denison to Brecknock Island in the east Kimberley; inhabits coral reef rubble slopes in 1-10m	-	-	-	Species or species habitat may occur
Choeroichthys sculptus	Sculptured Pipefish	Widespread in the tropical Indo-West Pacific from East Africa to the Tuamotos and Line islands, north to southern Japan and south to Australia. The Sculptured Pipefish is known in Australia from off northwestern Australia and the Great Barrier Reef, Queensland. The species inhabits coral reef flats, lagoons, seagrass beds and seaward reefs in 2-6m.	-	-	-	Species or species habitat may occur
Choeroichthys suillus	Pig-snouted Pipefish	Tropical, subtropical, known from northern Australia and Papua New Guinea; from Jurien Bay (WA) to Moreton Bay (Qld); in rubble habitats of inshore coral reefs to 15 m.	-	-	-	Species or species habitat may occur
Corythoichthys amplexus	Fijian Banded Pipefish, Brown-banded Pipefish	Known from the Dampier Archipelago and Scott Reef, Western Australia, and the northern Great Barrier Reef and	-	-	-	Species or species

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Ashmore Reef, Coral Sea, to Lady Musgrave Island, Queensland. Elsewhere, the species is widespread in the tropical Indo-west Pacific, from the Gulf of Oman and East Africa to Samoa, the Philippines, north to southern Japan. Inhabits coral reef lagoons and seaward reef areas, usually in caves and crevices in 3-30 m.				habitat may occur
Corythoichthys flavofasciatus	Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish	Offshore reefs of Western Australia - Rowley Shoals and Scott Reef, and the Great Barrier Reef, Queensland. Elsewhere the species is widespread in the tropical Indo-west-central Pacific, from the Red Sea to French Polynesia. Inhabits seagrass beds or sandy and rubble areas on sheltered reefs at depths of 1-25 m; often seen in pairs or small groups	-	-	-	Species or species habitat may occur
Corythoichthys haematopterus	Reef-top Pipefish	Tropical Indo-west Pacific, from East Africa to Vanuatu and Fiji, southern Japan and northern Australia; inhabits protected rubble and sandy areas in shallow reef lagoons, reef flats and fore-	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		reef slopes at 1-21 m, mostly above 5 metres.				
Corythoichthys intestinalis	Australian Messmate Pipefish, Banded Pipefish	Tropical Western Central Pacific, known from Indonesia, northern Australia, the Philippines to Samoa, and Micronesia; inhabits sheltered sponge and coral reefs in shallow lagoons and harbours at 3-12 m.	-	-	-	Species or species habitat may occur
Corythoichthys schultzi	Schultz's Pipefish	Widespread in the tropical Indo-Pacific from the Red Sea and East Africa to Tonga, north to southern Japan and south to the offshore islands of north Western Australia and throughout the Great Barrier Reef, Queensland; also Christmas Island in the eastern Indian Ocean. Schultz's Pipefish usually inhabits coarse sand and rubble areas along reef edges in lagoons and on seaward reefs at 1-30m.	-	-	-	Species or species habitat may occur
Cosmocampus banneri	Roughridge Pipefish	Clerke Reef, Rowley Shoals, Western Australia, Ashmore Reef, Timor Sea; also Cocos (Keeling) Islands and Christmas Island in the eastern Indian Ocean. Elsewhere the species is widespread in	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		the tropical, Indo-west-central Pacific from the Red Sea and East Africa to Fiji and the Marshall Islands, north to southern Japan. Rough-ridge Pipefish usually live amongst rubble or in crevices mostly on outer reefs, at 2-30 m				
Cosmocampus maxweberi	Maxweber's Pipefish	Tropical Indo-west-central Pacific, Red Sea, Indonesia, Great Barrier Reef, to Micronesia, Tonga and Samoa; inhabits inshore reefs among rubble to 35 m, although more common on shallow reefs to 4 m.	-	-	-	Species or species habitat may occur
Doryrhamphus baldwini	Redstripe Pipefish	Dunckerocampus baldwini is found in caves, rocky crevices, and the seaward slopes of coral reefs and it is an active cleaner which has been recorded cleaning small parasitic crustaceans on cave cardinal fish (Zapogon evermanni) and a moray eel (Gymnothorax sp.).	-	-	-	Species or species habitat may occur
Doryrhamphus dactyliophorus	Banded Pipefish, Ringed Pipefish	Tropical Western Pacific, from Indonesia, the Ryukyu Islands, Japan, to Australia, the Coral Sea, and east to Marshall and Society Islands, Tonga and Samoa; in Australian waters, known from Clerke	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Reef, WA, the Northenr Territory and the Great Barrier Reef, Queensland; inhabits protected reefs and lagoons, usually in caves and crevices to 10 m.				
Doryrhamphus excisus	Bluestripe Pipefish	Widespread throughout the tropical Indo-Pacific region, from the Persian Gulf and east Africa to the west coast of the Americas in the Eastern Pacific. Recorded in Australian waters from north of Clerke Reef (Western Australia) and the entire length of the Great Barrier Reef (Queensland).	-	-	-	Species or species habitat may occur
Doryrhamphus janssi	Cleaner Pipefish, Janss' Pipefish	Tropical East Indo-west Pacific from the Andaman Sea and Gulf of Thailand, to the Solomon Islands, Micronesia, the Philippines and northern Australia. Inhabits sheltered inshore coral reefs where pairs usually maintain cleaning stations in caves and crevices with sponges, and below large plate corals.	-	-	-	Species or species habitat may occur
Doryrhamphus multiannulatus	Many-banded Pipefish	Common among coral and in reef caves and crevices; usually found in pairs. Occurs at depths of at least 45 m	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Doryrhamphus negrosensis	Flagtail Pipefish, Masthead Island Pipefish	Tropical Western Pacific, Borneo to Micronesia, Vanuatu, northern Australia; inhabits sheltered inner reef flats, muddy areas and lagoons, usually within rubble habitats or associated with sea urchins to 10 m.	-	-	-	Species or species habitat may occur
Festucalex scalaris	Ladder Pipefish	Endemic to subtropical waters of Western Australia; inhabits intertidal algae or sargassum beds to 20 m.	-	-	-	Species or species habitat may occur
Filicampus tigris	Tiger Pipefish	Relatively common in subtropical waters of Australia's east and west coasts. A relic population also occurs in the warmer waters of Spencer Gulf, South Australia. Inhabits shallow seagrass beds and sponge, mud, sand, rock, and rubble areas in depths of 2-30 m.	-	-	-	Species or species habitat may occur
Galeorhinus galeus	School Shark, Eastern School Shark, Snapper Shark, Tope, Soupfin Shark	The School Shark occurs throughout the temperate coastal waters of southern Australia. They are found from Moreton Bay, in southern Queensland, to Perth, Western Australia. This species is mainly found in demersal waters, over the continental and insular shelves, but also	Conservation Dependent	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		over the upper slopes, in depths from near shore to 550 m.				
Halicampus brocki	Brock's Pipefish	Recorded in Australia from scattered locations in north Western Australia, the Northern Territory and Queensland. Found elsewhere in the tropical Western Pacific – from the Philippines and north to the Ryuk–u Islands, japan, south to northern Australia, the Coral Sea, eastwards to Micronesia. Usually inhabits patches of coral and macro-algae on coastal reefs at 3-45 m.	-	-	-	Species or species habitat may occur
Halicampus dunckeri	Red-hair Pipefish	Exmouth, and offshore reefs of northern Western Australia, Ashmore Reef, Timor Sea, to the northern Great Barrier Reef, Queensland, and possibly to the Capricorn-Bunker Group, Queensland. Elsewhere, the species is widespread in the tropical, Indo-west-central Pacific A reef associated species usually found on sandy and algal-rubble habitats.	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Halicampus grayi	Mud Pipefish, Gray's Pipefish	Widespread in the tropical Indo-west Pacific, from the Gulf of Aden across the Indian Ocean to northern Australia, north to Japan; inhabits silty and muddy soft bottoms on the continental shelf from inshore bays to deep offshore areas to 100 m.	-	-	-	Species or species habitat may occur
Halicampus macrorhynchus	Whiskered Pipefish, Ornate Pipefish	Rowley Shoals, Western Australia, and off Lizard Island, Great Barrier Reef, Queensland. Elsewhere, the species is widespread in the tropical Indo-west Pacific. Whiskered Pipefish live on sandy, rubble and weedy areas in lagoons and coastal reefs in 3-40 m. One specimen was reportedly trawled in 180-300 m.	-	-	-	Species or species habitat may occur
Halicampus mataafae	Samoan Pipefish	Northern Great Barrier Reef and reefs in the Coral Sea. Elsewhere the species is widespread in the tropical Indo-west Pacific, from the Red Sea and East Africa, across the Indian Ocean to Tonga and Samoa, north to Taiwan, south to northern Australia.	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Found in crevices, under rocks and rubble on shallow coastal, lagoon and outer reefs in depths to 15 m.				
Halicampus nitidus	Glittering Pipefish	Tropical Western Pacific, Vietnam to Fiji, north to the Ryukyu Islands, south to Rowley Shoals and New Caledonia, eastwards to Micronesia. Glittering Pipefish live in crevices and under rocks and rubble on coastal, lagoon and outer coral reef areas to 20 m.	-	-	-	Species or species habitat may occur
Halicampus spinirostris	Spiny-snout Pipefish	Known from the tropical Indo-west Pacific – Indonesia, northern Australia, the South China Sea, Vietnam across to American Samoa; inhabits shallow coral rubble areas in lagoons and intertidal zones of inshore coral reefs in 5-10 m.	-	-	-	Species or species habitat may occur
Haliichthys taeniophorus	Ribboned Pipehorse, Ribboned Seadragon	Shark Bay, Western Australia, to Cape York, Queensland. Elsewhere the species occurs in West Papua, Indonesia, and Papua New Guinea. Inhabits a variety of inshore shallow water areas including weedy regions bordering open substrates, coral reefs, rocky, gravel, sandy and muddy substrates; also	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		associated with sponges, macroalgae, hydroids, shells and seagrasses usually from 1-18 m.				
Heraldia nocturna	Upside-down Pipefish	Endemic to temperate waters of southern and southeastern Australia, from about Seal Rocks, New South Wales, around the southern half of Australia to Geographe Bay, Western Australia, and to Port Davey on the west coast of Tasmania. Upside-down Pipefish inhabit sheltered inshore reefs in harbours, bays and coves where they are usually seen beneath ledges, in holes, crevices and small caves at depths of 2-30 m.	-	-	-	Species or species habitat may occur
Hippichthys cyanospilos	Blue-speckled Pipefish	Widespread in the tropical Indo-West Pacific; Red Sea and east African coast to Fiji, Philippines and Australia; inhabiting brackish shallow-water environments in estuaries and lower reaches of coastal rivers and streams, often amongst mangroves to 4 m.	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Hippichthys heptagonus	Madura Pipefish	Widespread in the tropical Indo-West Pacific, from East Africa to Melanesia and north to Japan; inhabits inshore mangrove estuaries, tidal creeks and the lower reaches of freshwater streams.	-	-	-	Species or species habitat may occur
Hippichthys penicillus	Beady Pipefish	Carnarvon, Western Australia, to Woy Woy, New South Wales. Elsewhere the species occurs in the tropical, Indo-west Pacific, from western Persian Gulf (Kuwait, Saudi Arabia), north central Indian Ocean, and eastward to Japan and Australia.	-	-	-	Species or species habitat may occur
Hippichthys spicifer	Belly-barred Pipefish	In Australia, the species is known from Cape York, Queensland. Elsewhere the species is widespread in the Indo-west Pacific from east Africa and the Red Sea, eastwards to Kiribati and American Samoa.	-	-	-	Species or species habitat may occur
Hippocampus angustus	Western Spiny Seahorse	Endemic to tropical waters of Western Australia, from Shark Bay, north to the Dampier Archipelago. Inhabits sheltered algal-covered reefs and seagrass beds to about 10 m, although the species has been recorded from depths to 30 m	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Hippocampus breviceps	Short-head Seahorse	Endemic to temperate southern Australian waters from Port Welshpool, Victoria, eastern Tasmania, and west to at least Venus Bay, South Australia. The species may also occur in the eastern part of the Great Australian Bight, South Australia.	-	-	-	Species or species habitat may occur
Hippocampus histrix	Spiny Seahorse, Thorny Seahorse	Recorded in Australia from south of Ashmore Reef, Timor Sea, the Great Barrier Reef, Queensland, and in Port Stephens, New South Wales. Elsewhere the species occurs in the tropical and subtropical Western Pacific, from Bali, Indonesia, Papua New Guinea, New Caledonia and Japan. Inhabits areas with both hard and soft bottoms, often attached to soft corals or sponges at 10-95 m, usually below 15 m. The Thorny Seahorse may also be found on shallower algae-rubble or rocky reef areas in about 10 m.	-	-	-	Species or species habitat may occur
Hippocampus kuda	Spotted Seahorse, Yellow Seahorse	Hippocampus kuda is strictly a marine species, widely distributed throughout the Indo-Pacific region, from the Indian	-	-	-	Species or species

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Ocean to the northwestern, western central, and eastern central areas of the Pacific Ocean ("Project Seahorse", 2003; Foster et al., 2003). Approximately 23 countries have confirmed the native presence of H. kuda, ranging from Australia to China (Lourie et al., 2004).				habitat may occur
Hippocampus planifrons	Flat-face Seahorse	Endemic to Western Australia, from Dirk Hartog Island to Broome. Inhabits tidepools, macroalgal and rubble reefs in shallow bays from the intertidal to a depth of about 20 m.	-	-	-	Species or species habitat may occur
Hippocampus spinosissimus	Hedgehog Seahorse	Endemic to tropical waters of north-eastern Australia, from Princess Charlotte Bay to Southport, Queensland; benthic in inner reef waters on rubble substrates and in sponge and seagrass habitats near coral reefs at 20-63 m; often attached to corals in deep current-prone channels between reefs or islands.	-	-	-	Species or species habitat may occur
Hippocampus subelongatus	West Australian Seahorse	Endemic to subtropical and temperate waters of Western Australia, from about Cape Leeuwin to Shark Bay. Often found amongst macroalgae, sponges and sea	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		squirts in muddy and silty habitats in sheltered bays, and on jetty pylons and moorings at 1-25 m.				
Hippocampus trimaculatus	Three-spot Seahorse	he flat-faced seahorse, longnose seahorse, low-crowned seahorse or three-spot seahorse is a species of fish in the family Syngnathidae. It is found in Australia, Cocos Islands, French Polynesia, Hong Kong, India, Indonesia, Japan, the Philippines, Singapore, Taiwan, Thailand, and Vietnam.	-	-	-	Species or species habitat may occur
Histiogamphelus cristatus	Rhino Pipefish	Endemic to southern Australia, from Off Victor Harbour, South Australia, to Green Head, Jurien Bay, Western Australia. Inhabits seagrass beds and adjacent open sandy and rubble areas with patches of seagrass and detritus in estuaries and shallow protected waters, at depths of 1-17 m.	-	-	-	Species or species habitat may occur
Hoplostethus atlanticus	Orange Roughy, Deep-sea Perch, Red Roughy	The Orange Roughy is a deep-bodied bright red demersal fish with large, rough scales. Found in deep offshore waters (100-300 m).	Conservation Dependent	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Leptoichthys fistularius	Brushtail Pipefish	Endemic to temperate waters of southern Australia, from northern Tasmania and Corner Inlet, Victoria, to Albany, Western Australia. Inhabits inshore sheltered seagrass beds, mainly Zostera, but also Posidonia beds.	-	-	-	Species or species habitat may occur
Lissocampus caudalis	Australian Smooth Pipefish	Endemic to southern Australia, from Corner Inlet, Victoria, northern Tasmania and the Bass Strait Islands, across southern Australia, to Cervantes, north of Perth, Western Australia.	-	-	-	Species or species habitat may occur
Lissocampus fatiloquus	Prophet's Pipefish	Endemic to western and northern Australia, from about Rockingham in the south, to the southern Bonaparte Archipelago in the Kimberley, Western Australia, and Sweers Island, Gulf of Carpentaria, Queensland.	-	-	-	Species or species habitat may occur
Lissocampus runa	Javelin Pipefish	Endemic to temperate waters of southern and eastern Australia; known from northern New South Wales, south to Port Arthur, Tasmania, and west to about Perth, Western Australia. Inhabits bay and estuaries, including tidepools, often sheltering amongst seagrass	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		(usually Zostera spp.), in algal beds, and on rubble areas near reefs, at depths to about 20 m.				
Maroubra perserrata	Sawtooth Pipefish	Endemic to temperate southern Australian waters from southern Queensland to Rottnest Island, Western Australia. Inhabits coastal reefs at depths of 3-25 m, sheltering beneath ledges and in caves during day.	-	-	-	Species or species habitat may occur
Micrognathus brevirostris	thorntail Pipefish	In Australian waters, known from Cocos (Keeling) and Christmas islands, the Timor Sea, North West Cape, WA, and from the Great Barrier Reef, Cape York to Southport, Queensland. Elsewhere in the tropical western Pacific, from eastern Indonesia, Australia, Papua New Guinea, New Caledonia, Marshall Island, Bikini Atoll and the Ryukyu Islands, Japan.	-	-	-	Species or species habitat may occur
Micrognathus micronotopterus	Tidepool Pipefish	Tropical East-Indo-west Pacific, known from Singapore, Indonesia, northern Australia and the Philippines; recorded in Australian waters from Exmouth Gulf, WA, to the Gulf of Carpentaria near	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Yirrkala, Northern Territory. Usually inhabits shallow inshore reefs and tidepools, amongst sparse seagrasses and algae-rubble, in depths from 1-5m, although individuals have been collected from depths to 10m.				
Mitotichthys meraculus	Western Crested Pipefish	Endemic to temperate waters of southwestern Australia; only known from two specimens collected at Flinders Bay, Augusta and Perth, Western Australia; reportedly inhabits sheltered seagrass beds (Posidonia coriaceal) in 2m.	-	-	-	Species or species habitat may occur
Nannocampus subosseus	Bonyhead Pipefish	Endemic to Western Australia, from Point Dempster, Esperance, at the western edge of the Great Australian Bight, to Shark Bay. Occurs on shallow coastal and offshore coral and rocky reefs, in a range of habitats including rockpools, ledges, seagrass beds, coral, macroalgae and sandy areas at depths to 14 m.	-	-	-	Species or species habitat may occur
Notiocampus ruber	Red Pipefish	Endemic to southern Australia from Copacabana, New South Wales, to the Recherche Archipelago, Western Australia, including Tasmania. Usually	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		inhabits rocky reefs, often in crevices, in association with sponges and encrusting and filamentous red algae at depths to 20 m.				
Phoxocampus belcheri	Black Rock Pipefish	Widespread in the tropical Indo-West Pacific from the Red Sea and east and South Africa, Madagascar and the Seychelles, eastwards to Fiji and Tonga, north to China, Taiwan, southern Japan, south to Western Australia and New Caledonia; known in Australian waters from the Monte Bello Islands, Western Australia. Inhabits tidepools and shallow intertidal reefs, usually among coral rubble.	-	-	-	Species or species habitat may occur
Phycodurus eques	Leafy Seadragon	Endemic to temperate waters of southern Australia, from about Victor Harbor, South Australia, westwards Yanchep Beach, Western Australia, including Kangaroo Island, South Australia. Victorian records have not been verified. Leafy Seadragons usually inhabit sheltered bays where they are found in seagrass beds especially (Posidonia), and	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		around rocky reefs amongst kelp (Ecklonia) and other macroalgae, at depths of 4-50 metres.				
Phyllopteryx taeniolatus	Common Seadragon	Endemic to temperate coastal waters of southern Australia, from about Newcastle (New South Wales) south to Actaeon Island (Tasmania) and across southern Australia to about Geraldton (Western Australia). Common seadragons inhabit shallow estuaries to deeper offshore reefs, living seagrass beds and on rocky reefs covered in macroalgae, especially kelp beds, in depths of 1-50 m. Individuals usually remain within a broad home range.	-	-	-	Species or species habitat may occur
Pugnaso curtirostris	Pugnose Pipefish	Endemic to southern Australia, from Corner Inlet, Wilsons Promontory (Victoria), northern Tasmania and the Bass Strait islands, to Jurien Bay and the Houtman Abrolhos Islands (Western Australia). Uncommon in Gulf St Vincent and Spencer Gulf, South Australia; inhabits shallow seagrass, eelgrass and algal habitats in sheltered bays and	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		estuaries to about 11m. Juveniles often found amongst decaying seagrass leaves.				
Seriolella brama	Blue Warehou	A steely-blue to greenish-blue medusa-fish becoming slightly paler below, with a large black blotch above the pectoral-fin base, and a silvery-pinkish hue on the gill cover and lower jaw. Found in sahllow to deep offshore waters (3-550 m).	Conservation Dependent	-	-	Species or species habitat may occur
Solegnathus hardwickii	Pallid Pipehorse	Northeast of the Monte Bello Islands, Western Australia to north of Cartier Island, Timor Sea, to the Arafura Sea north of Maningrida, Northern Territory. Inhabits areas with hard substrates, in association with gorgonian corals, black corals, algae and sponges.	-	-	-	Species or species habitat may occur
Solegnathus lettiensis	Gunther's Pipehorse	Recorded in Australia from Rottnest Is, WA (32º00´E) to N of Bathurst Is, NT (130º09'S). Found elsewhere in the Indo-west Pacific.	-	-	-	Species or species habitat may occur
Solenostomus cyanopterus	Robust Ghostpipefish	Shark Bay region to NE of the Monte Bello Islands, Western Australia, and the northern Great Barrier Reef, Queensland, to Shellharbour, New South Wales; also Christmas Island in the eastern Indian	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Ocean. Elsewhere the species is widespread in the tropical Indo-west Pacific, from East Africa and the Red Sea, eastwards to Fiji and southern Japan, and south to Australia.				
Sphyrna lewini	Scalloped Hammerhead	The scalloped hammerhead is a coastal pelagic species; it occurs over continental and insular shelves and in nearby deeper water. It is found in warm temperate and tropical waters, worldwide from 46°N to 36°S. It can be found down to depths over 500 m (1,600 ft), but is most often found above 25 m (82 ft).	Conservation Dependent	-	Species or species habitat may occur	Species or species habitat may occur
Stigmatopora argus	Spotted Pipefish,	Seal Rocks, New South Wales, southwards to Dongara, Western Australia, including around Tasmania. Elsewhere the species occurs in New Zealand. Commonly inhabits seagrass beds in inshore bays and estuaries to depths of at least 8 m. Individuals are occasionally found among floating Sargassum sp.	-	-	-	Species or species habitat may occur
Stigmatopora nigra	Widebody Pipefish	Mooloolaba, Queensland, to Shark Bay, Western Australia, including around	-	-	-	Species or species

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Tasmania. Elsewhere the species occurs in New Zealand. Commonly inhabits sheltered seagrass and algal beds from the intertidal to depths of 35 m.				habitat may occur
Syngnathoides biaculeatus	Double-end Pipehorse	In Australian waters, known from Geraldton to Shark Bay, and north to Ashmore and Cartier Reefs, Western Australia, and from the Timor Sea, the Northern Territory, eastwards to Queensland and south to Batemans Bay (New South Wales). Elsewhere, widespread in the tropical Indo-West-Central Pacific from the Red Sea and East Africa, across the Indian Ocean to Samoa and Tonga.	-	-	-	Species or species habitat may occur
Thunnus maccoyii	Southern Bluefin Tuna	Southern Bluefin Tuna in Australian waters, ranges widely from northern Western Australia (WA) to the southern region of the continent. Southern bluefin tuna are highly migratory, occurring globally in waters between 30–50° S, though the species is mainly found in the eastern Indian Ocean and in the south-west Pacific Ocean.	Conservation Dependent	-	Species or species habitat may occur	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Trachyrhamphus bicoarctatus	Bentstick Pipefish	Widespread in the tropical Indo-west Pacific. Bentstick Pipefish are known in Australian waters from the central coast of Western Australia, northwards throughout the waters of the Northern Territory and Queensland to central New South Wales. They live in sheltered coastal lagoon and reef areas on sandy and rubble habitats amongst seagrasses and macroalgae at 1– 30 m.	-	-	-	Species or species habitat may occur
Trachyrhamphus longirostris	Straightstick Pipefish	Tropical Indo-west Pacific, known from the Red Sea and East Africa, eastwards to the Western Pacific (including Indonesia, the Philippines, Australia, Papua New Guinea, the South China Sea, Japan). Recorded in Australian waters from North West Cape, Western Australia, northwards around the tropical north to about Magnetic Island, Queensland. Most specimens have been trawled or dredged from muddy to sandy-bottom habitats in depths of 16-91m, in association with sand, rubble, seagrasses, algae, sponges, sea pens and hydroids.	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Urocampus carinirostris	Hairy Pipefish	Flynn Reef, Queensland, to the lower Swan River, Perth, Western Australia, including northern Tasmania. Elsewhere the species occurs in Papua New Guinea. The species is uncommon in South Australia.	-	-	-	Species or species habitat may occur
Vanacampus margaritifer	Mother-of-pearl Pipefish	Endemic to sub-tropical and temperate Australia, from North Stradbroke Island, QLD, southwards to Jurien Bay, WA, absent from Tasmania. Inhabits shallow estuarine and coastal waters where it occurs in seagrass beds (including Heterozostera, Zostera, Posidonia and Halophila), macroalgae (Ecklonia and other brown algae), rocky reef, boulder, rubble, sandy and muddy habitats between 2–15 m.	-	-	-	Species or species habitat may occur
Vanacampus phillipi	Port Phillip Pipefish	Jervis Bay, New South Wales, around southern Australia, to Ceduna, South Australia, including northern and eastern Tasmania (the species may occur further west to Cottesloe, Perth, Western Australia). Commonly inhabits seagrass beds (including Halophila, Heterozostera, Posidonia, Ruppia and Zostera) and	-	-	-	Species or species habitat may occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		macroalgae in shallow estuaries, coastal lagoons, and protected bays at depths to 25 m.				
Vanacampus poecilolaemus	Longsnout Pipefish	Endemic to temperate waters of southern Australia, from east of Flinders Island, Bass Strait, Tasmania, and Wilsons Promontory, Victoria in the east, to Cottesloe, Western Australia. Inhabits shallow seagrass and macroalgal beds in estuaries and other quiet, silty, clear-water areas to about 18 m.	-	-	-	Species or species habitat may occur
Glyphis garricki	Northern River Shark, New Guinea River Shark	The northern river shark is one of the rarest species of shark in the world. Adults have only been recorded in coastal waters, whereas neonates, juveniles and subadults have been recorded in freshwater, estuarine and marine environments. The distribution of the species is associated with tidal rivers and estuaries in northern Australia and Papua New Guinea; most records in Western Australia are from King Sound in the Kimberley (Morgan et al. 2010).	Endangered	-	-	Breeding likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Isurus oxyrinchus	Shortfin Mako	The shortfin mako is an oceanic pelagic species, although it has occasionally been recorded in coastal waters. Its distribution is throughout temperate seas, but it is rarely found in waters colder than 16°C. Tagging data has indicated a preference for the upper part of the water column, with occasional dives up to 880 m (Abascal et al. 2011; Stevens et al. 2010)	-	Migratory	Species or species habitat likely to occur	Species or species habitat likely to occur
Isurus paucus	Longfin Mako	The longfin mako is a widely distributed but rarely encountered oceanic shark that ranges from Geraldton around the north coast to at least Port Stephens in New South Wales. Like the shortfin mako, the species occurs in oceanic pelagic habitats. Little information is available regarding the population size and distribution of the longfin mako.	-	Migratory	Species or species habitat likely to occur	Species or species habitat likely to occur
Lamna nasus	Porbeagle, Mackerel Shark	The porbeagle is wide-ranging, typically occurring in oceanic waters off the continental shelf, although it occasionally enters coastal waters. The porbeagle is known to undertake seasonal migrations, although the timing and details of these	-	Migratory	-	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		migratory movements are not well understood (Saunders et al. 2011).				
Manta alfredi	Reef Manta Ray	The taxonomy of the reef manta ray was revised relatively recently (Marshall et al. 2009). The species is commonly sighted inshore but is also found around offshore coral reefs, rocky reefs and seamounts (Marshall et al. 2009). In contrast to the giant manta ray, long-term sighting records of the reef manta ray at established aggregation sites suggest that this species is more resident in tropical waters and may exhibit smaller home ranges, philopatric movement patterns, and shorter seasonal migrations than the giant manta ray (Deakos et al. 2011; Marshall et al. 2009).	-	Migratory	Species or species habitat likely to occur	Species or species habitat known to occur
Manta birostris	Giant Manta Ray	The giant manta ray is broadly distributed in tropical waters of Australia. The species primarily inhabits nearshore environments along productive coastlines with regular upwelling, but it appears to be a seasonal visitor to coastal or offshore sites, including offshore island groups, offshore pinnacles and	-	Migratory	Species or species habitat likely to occur	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		seamounts (Marshall et al. 2009). The Ningaloo Coast is an important area for giant manta rays in autumn and winter (Preen et al. 1997).				
Pristis clavata	Dwarf Sawfish, Queensland Sawfish	The dwarf sawfish is found in Australian coastal waters extending north from Cairns around the Cape York Peninsula in Queensland to the Pilbara coast (Kyne et al. 2013). Dwarf sawfish typically inhabit shallow (2- to 3-m) silty coastal waters and estuarine habitats, occupying relatively restricted areas and moving only small distances (Stevens et al. 2008). Juvenile dwarf sawfish utilise estuarine habitats in northwestern Western Australia as nursery areas and migrate to deeper waters as adults (Thorburn et al. 2008). The majority of capture locations for the species in Western Australian waters have occurred within King Sound and the lower reaches of the major rivers that enter the sound, including the Fitzroy, Mary and Robinson rivers (Morgan et al. 2010).	Vulnerable	Migratory	Species or species habitat known to occur	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Pristis pristis	Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish	The freshwater sawfish inhabits both riverine and marine environments in northern Australia. While primarily associated with rivers, tidal creeks and estuaries, the largetooth sawfish has been recorded up to 100 km offshore (Commonwealth of Australia 2015b). Riverine habitats are particularly important as pupping habitats. In Western Australia, the species is known from riverine and coastal environments in the Kimberley region.	Vulnerable	Migratory	Species or species habitat known to occur	Species or species habitat known to occur
Pristis zijsron	Green Sawfish, Dindagubba, Narrowsnout Sawfish	The green sawfish was once widely distributed in coastal waters along the northern Indian Ocean, although it is believed that northern Australia may be the last region where significant populations exist (Stevens et al. 2005). Within Australia, green sawfish are currently distributed from about the Whitsundays in Queensland across northern Australian waters to Shark Bay in Western Australia (Commonwealth of Australia 2015b). Despite records of the species in deeper offshore waters, green	Vulnerable	Migratory	Species or species habitat known to occur	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		sawfish typically occur in the inshore fringe with a strong association with mangroves and adjacent mudflat habitats (Stevens et al. 2005). Movements within these preferred habitats are correlated with tidal movements (Stevens et al. 2008).				
Rhinocodon typus	Whale Shark	The whale shark is a large pelagic shark that has a global tropical distribution. Whale sharks aggregate annually to feed in the waters of the Ningaloo Coast from March to July with the largest numbers recorded in April and May (Sleeman et al. 2010). The aggregation has been estimated to range between 300 and 500 individuals (Meekan et al. 2006). Timing of the whale shark migration to and from Ningaloo coincides with the coral mass spawning period when there is an abundance of food in the waters adjacent to Ningaloo Reef. After the aggregation period, the distribution of the whale shark is largely unknown. Tagging, aerial and vessel surveys suggest that the group disperses	Vulnerable	Migratory	Foraging, feeding or related behaviour known to occur	Foraging, feeding or related behaviour known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		widely, up to 1,800 km away. Satellite tracking has shown that the sharks may follow three migration routes from Ningaloo (Meekan and Radford 2010; Wilson et al. 2006): + northwest, into the Indian Ocean, + directly north, towards Sumatra and Java, and + northeast, passing through the NWS Province travelling along the shelf break and continental slope.				

3.3.4.2 Biologically Important Areas and Critical Habitat

BIAs are spatially defined areas where aggregations of individuals of a species are known to display biologically important behaviour, such as breeding, foraging, resting or migration. BIAs for fishes that overlap the Project Area and the EMBA beyond the Project Area are summarised in **Table 3-8.** No critical habitats for fishes were identified within the EMBA.

The Project Area (including the Dorado Phase 1 WHP and FPSO locations) overlaps a foraging BIA for whale sharks shown in the National Conservation Values Atlas (DAWE 2020). Whale sharks are known to congregate around geomorphic features to feed, such as reefs and islands, with steeply sloping seabeds in close proximity to relatively deep water (Copping et al. 2018). These congregations are particularly notable during periods of high food availability, such as coral spawning off Ningaloo Reef and land crab spawning off Christmas Island (Meekan et al. 2009; Taylor and Pearce 1999). The Project Area does not exhibit the geomorphic or biological features associated with whale shark aggregations (**Section 3.3.1.1**), and tagging studies of whale sharks congregating off Ningaloo Reef do not show whale sharks congregating near or migrating through the Project Area (Meekan and Radford 2010; Wilson et al. 2006). Based on the foraging habitat preferences of whale sharks and the results of tagging studies, the foraging BIA is unlikely to represent critical foraging habitat. The BIA may be used by migrating whale sharks moving to and from Ningaloo Reef; however, tagging studies indicate most tagged whale sharks do not use the majority of the BIA when moving away from Ningaloo Reef (**Figure 3-17**).

Table 3-8: Closest BIAs for fishes (including sharks and rays) within the EMBA

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)
Rhincodon typus	Whale Shark	Foraging (high-density prey)	0 (overlaps WHP)

Carcharodon carcharias	White Shark	Foraging	1149

3.3.4.3 Conservation Advice and Recovery Plans

Material published by the Commonwealth under the EPBC Act for the conservation of threatened fishes, such as recovery plans, conservation advice, and threat abatement plans, is summarised in **Table 3-9**. Threats identified in this material that may credibly arise from Dorado Phase 1 are also listed, along with cross-references to the relevant assessment of environmental impacts and risks in **Section 7**.

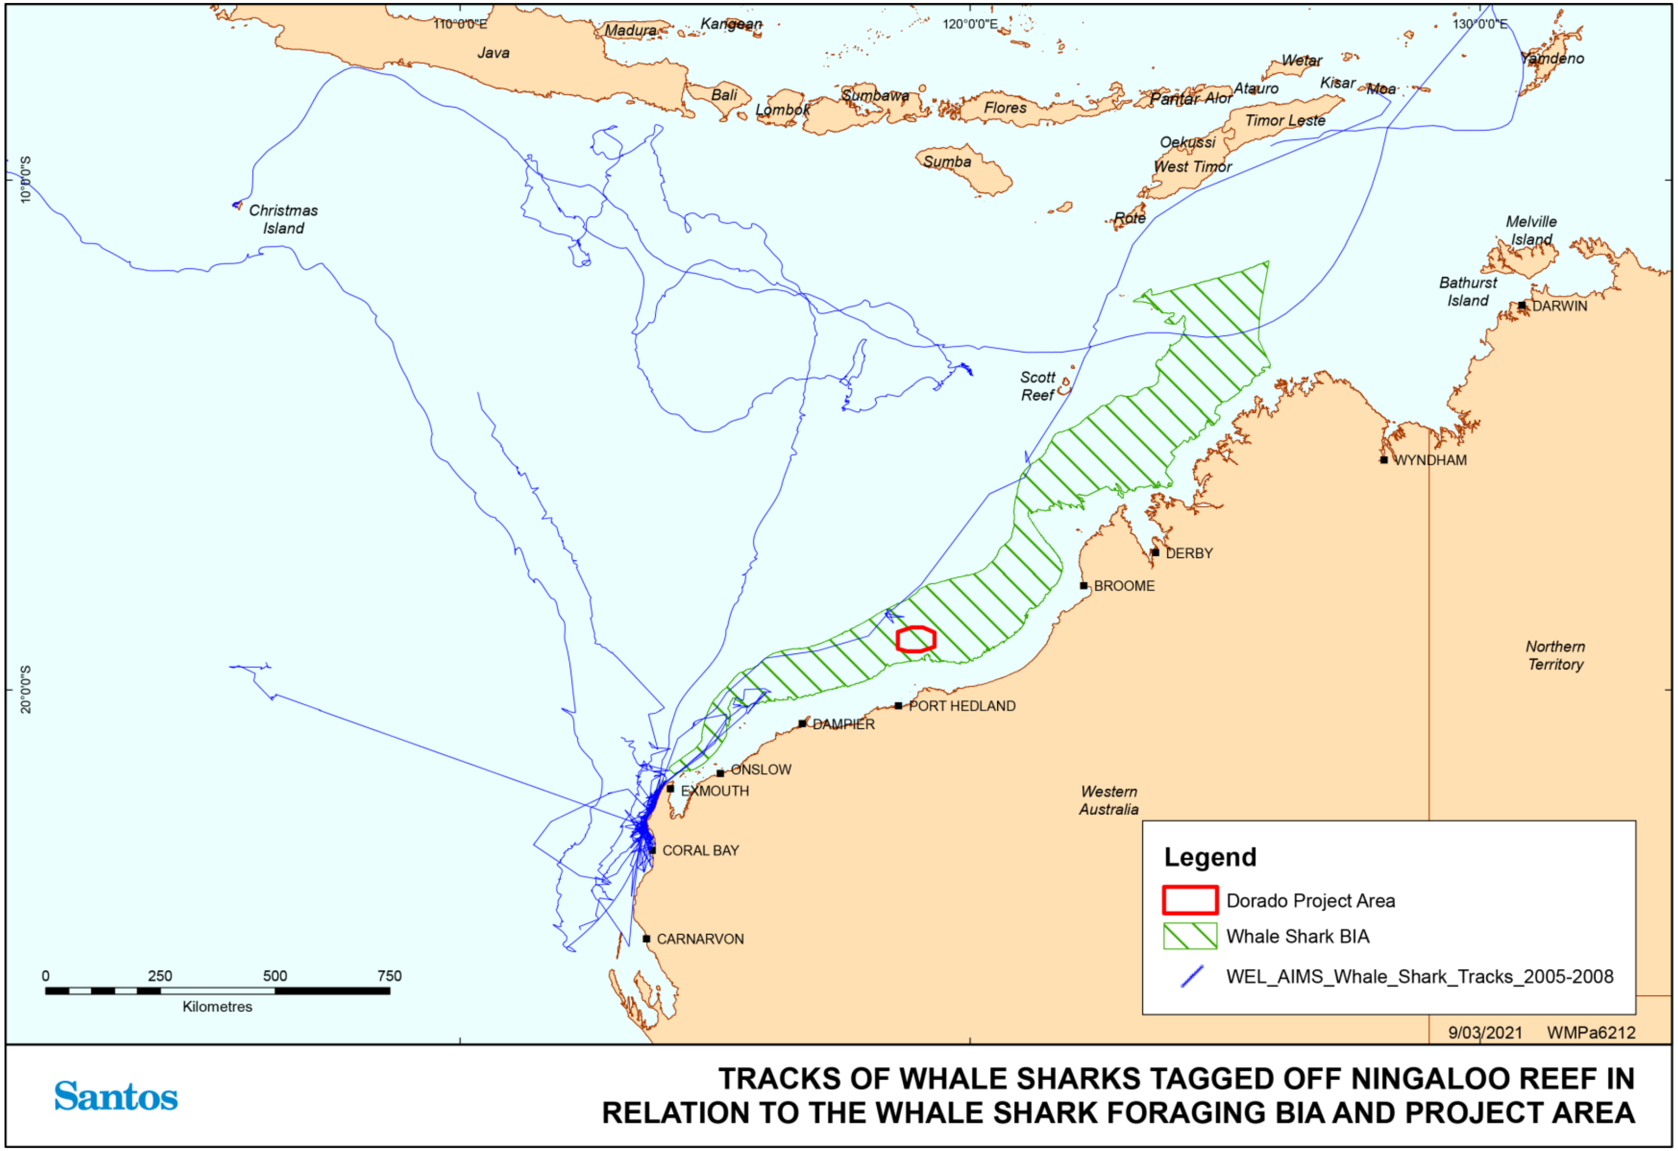

Figure 3-17: Tracks of whale sharks tagged off Ningaloo Reef in relation to the whale shark foraging BIA and Project Area

Table 3-9 Summary of material published by the Commonwealth for the conservation of threatened fishes relevant to Dorado Phase 1

Scientific Name	Common Name	Recovery Plan / Conservation Advice	Credible Threats arising from Dorado Development identified in Plan / Advice	Relevant Assessment of Impacts and Risks
-	All shark species	Threat abatement plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia 2018)	Marine debris	**Section 7.3.2**
Carcharias taurus (west coast population)	Grey Nurse Shark	Recovery plan for the grey nurse shark (*Carcharias taurus*) (Department of the Environment 2014)	Marine debris	**Section 7.3.2**

		Approved conservation advice for green sawfish (Threatened Species Scientific Committee 2008a)	Habitat degradation/ modification	**Sections 7.2.8** & **7.3.1**
Rhinocodon typus	Whale Shark	Approved Conservation Advice for Rhincodon typus (whale shark) (Threatened Species Scientific Committee 2015d)	Vessel disturbance	**Section 7.3.4**
			Habitat degradation/ modification	**Sections 7.2.8** & **7.3.1**
			Marine Debris	**Section 7.3.2**
			Climate change	**Section 7.2.6**

3.3.5 Reptiles

Six species of marine turtles have been recorded in northern Australia, all of which have a high conservation value. Of these six species, five (green turtle, flatback turtle, hawksbill turtle, loggerhead turtle and olive ridley turtle) are known to regularly breed in northern Australia; leatherback turtles are the exception. Sandy beaches along the Western Australian Pilbara and Kimberley coastlines and nearshore islands are important nesting sites for marine turtles, particular flatback, green and hawksbill turtles. The nearest turtle nesting beach to the Project Area is Bedout Island, which lies approximately 97 km south of the WHP.

One internesting BIA for flatback turtles intersects the Project Area and is located at North Turtle Island 10 km from the WHP location. However, there is no habitat critical to the survival of flatback turtles or other marine turtles within the Project Area. Benthic habitats within the Project Area do not constitute turtle foraging habitat due to the lack of suitable foods (e.g. soft corals, sponges, algae and seagrasses) (**Section 3.3.1.1**). Turtles that prey on pelagic fauna (e.g. leatherback turtles), such as jellyfish, may be present in the Project Area, along with turtles transiting the area; however, these are only expected to occur in low numbers.

Sea snakes of the families *Hydrophiidae* and *Laticaudidae* are widespread throughout tropical waters off northern Australia in both offshore and nearshore waters. They occupy diverse habitats including coral reefs, turbid water habitats and deeper water (Guinea et al. 2004). Species exhibit habitat preferences depending on water depth, benthic habitat, turbidity and season (Heatwole and Cogger 1993). An olive sea snake was observed in waters deeper than 100 m within the Project Area during the marine environmental studies campaign (RPS 2020d).

Saltwater crocodiles may occur within the EMBA beyond the Project Area in coastal and estuarine areas of the Kimberley.

3.3.5.1 Threatened and Migratory Marine Reptiles

A number of species of marine reptiles listed as threatened or migratory under the EPBC Act were identified from PSMT reports in **Attachment 1** as potentially occurring within the Project Area and EMBA beyond the Project Area. The full list of marine reptiles including the species that are classified as threatened or migratory are presented in **Table 3-10**.

Table 3-10: Threatened and migratory marine reptile species identified within the EMBA

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Acalyptophis peronii	Horned Seasnake	Gulf of Siam, Vietnam, Thailand, China (South Chinese sea, coast of Guangdong and Strait of Taiwan), Indonesia, Philippines, Papua New Guinea, New Caledonia, Australia (Northern Territory, Queensland, Western Australia).	-	-	Species or species habitat known to occur	Species or species habitat known to occur
Aipysurus apraefrontalis	Short-nosed Sea Snake	The short-nosed sea snake has primarily been recorded at Ashmore Reef and Cartier Island. The species has also been recorded along the Pilbara coast between Exmouth Gulf and Broome (Threatened Species Scientific Committee 2010a). Like all sea snakes, the short-nosed sea snake must come to the surface to breathe. The species has been recorded primarily in reef flats or in shallow waters (less than 10 m deep).	Critically endangered	-	-	Species or species habitat known to occur
Aipysurus duboisii	Dubois' Seasnake	Marine waters off New Guinea and the Coral Sea east to New Caledonia; the Continental Shelf off northern Australia (northwestern Western Australia to the Great Barrier Reef).	-	-	Species or species habitat known to occur	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Aipysurus eydouxii	Spine-tailed Seasnake	A. eydouxii is found in Western Australia, Northern Territory, Queensland, the South China Sea, the Gulf of Thailand, Indonesia, Peninsular Malaysia, Vietnam, and New Guinea.	-	-	Species or species habitat known to occur	Species or species habitat known to occur
Aipysurus foliosquama	Leaf-scaled Sea snake	The leaf-scaled sea snake has primarily been recorded at Ashmore Reef and Cartier Island. A single specimen was recorded in the Northern Territory (Threatened Species Scientific Committee 2010b). The species has been recorded primarily in reef flats or in shallow waters (less than 10 m deep) on the outer edges of reefs.	Critically endangered	-	-	Species or species habitat known to occur
Aipysurus fuscus	Dusky Seasnake	A. fuscus primarily inhabits reefs in shallow marine habitats. It has occasionally been recorded at depths of up to 30 metres (98 ft).The only reliable reports of this species in the wild are from the Timor Sea, from the reefs of Ashmore, Cartier and Hibernia of the Ashmore and Cartier Islands, and the reefs of Scott and Seringapatam.	-	-	-	Species or species habitat known to occur
Aipysurus laevis	Olive Seasnake	The olive sea snake is the most common sea snake along the northern coast of Australia and nearby island groups. It is a true snake	-	-	Species or species habitat known to occur	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		and gets its common name from the color of its skin. Like all reptiles, olive sea snakes breathe air, but unlike the sea turtles, crocodiles, sea kraits, and other marine reptiles – which must nest on shore – the olive sea snake's entire life cycle occurs in the ocean.				
Aipysurus pooleorum	Shark Bay Seasnake	The species' distribution is restricted to the mid-west coast of Western Australia, especially Shark Bay. Despite this, isolated specimens have been found further south (Storr et al. 1986).	-	-	-	Species or species habitat known to occur
Aipysurus tenuis	Brown-lined Seasnake	The Brown-lined Seasnake is large and elongate with a brown head and paler body. The dorsal scales have dark brown tips which form longitudinal lines on the back and cross-bars on the flanks. Head scales are more or less regular and symmetrical with some fragmentation of the frontal and parietal scales. Body scales are imbricate (overlapping) and smooth in 19 rows at the mid-body. There are 185–195 ventral scales and these are broad, notched and tuberculate (bumpy), especially in males. A	-	-	Species or species habitat known to occur	Species or species habitat known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		small tubercle is present on the lowest body scales of males.				
Astrotia stokesii	Stokes' Seasnake	The Stokes' Seasnake inhabits the tropical seas of northern Australia, including Western Australia, the Northern Territory and Queensland (Cogger 2000).	-	-	Species or species habitat known to occur	Species or species habitat known to occur
Caretta	Loggerhead Turtle	The loggerhead turtle is distributed throughout tropical, subtropical and temperate waters in all ocean basins. In Australia, the species ranges along most of the coastline but is rare in temperate waters (Commonwealth of Australia 2017a). Loggerhead turtles are carnivorous and mainly feed on benthic invertebrates in a wide range of habitats ranging from nearshore to 55 m in depth (Commonwealth of Australia 2017a). Nesting in Western Australia is concentrated from Shark Bay to the North West Cape. Foraging areas are more widely distributed with the Western Australia stock foraging from Shark Bay through to Arnhem Land, Gove and into the Java Sea of Indonesia (Limpus 2008a).	Endangered	Migratory	Species or species habitat likely to occur	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Chelonia mydas	Green Turtle	The green turtle is distributed in tropical and subtropical waters in the Pacific, Atlantic and Indian oceans. Within Australian waters, the species is predominately found off the Western Australia, Northern Territory and Queensland coastlines (Commonwealth of Australia 2017a). The species is primarily herbivorous and forages on algae, seagrass and mangroves, including where these habitats exist at offshore coral reef habitats (Commonwealth of Australia 2017a). Tagging studies have shown that green turtles can move considerable distances between nesting, with movements of hundreds to thousands of kilometres recorded (Limpus 2008b).	Vulnerable	Migratory	Species or species habitat likely to occur	Breeding known to occur
Crocodylus porosus	Saltwater Crocodile, Estuarine Crocodile	The saltwater crocodile occurs within the nearshore marine and estuarine waters throughout southern Asia and northern Australia. Large populations exist within the major river systems of the Kimberley.	-	Migratory	-	Species or species habitat likely to occur
Dermochelys coriacea	Leatherback Turtle	The leatherback turtle is distributed in tropical and temperate oceans worldwide. The species is known to forage and migrate	Endangered	Migratory	Species or species habitat likely to occur	Foraging, feeding or related

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		throughout the open offshore waters of Australia, with a distribution that extends further south into temperate waters than other marine turtle species (Limpus 2009a). Leatherback turtles eat jellyfish almost exclusively and are pelagic throughout their life in oceanic waters around Australia (Limpus 2009a). Records of leatherback turtle nesting in Australia are sparse and limited to the Cobourg Peninsula and Queensland coast (Limpus 2009a), far beyond the EMBA.				behaviour known to occur
Disteira kingii	Spectacled Seasnake	The Spectacled Seasnake has only been known to occur in Australia, between Safety Bay in Western Australia (in 2000) (Cogger 2001 pers. Com.) and across the northern coastline of Australia down to Moreton Bay in Queensland as recorded in the mid 1970s (Limpus 1975).	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur
Disteira major	Olive-headed Seasnake	The Olive-headed Seasnake is considered to be a prominent member of the sea snake fauna of sub-tropical Queensland (Limpus 1975). It becomes relatively common in the waters between Bundaberg and Fraser Island each year from August–January.	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
Emydocephalus annulatus	Turtle-headed Seasnake	The species occurs from Shark Bay in Western Australia to the southern Great Barrier Reef (Cogger 1975; Storr et al. 1986).	-	-	-	Species or species habitat likely to occur
Enhydrina schistosa	Beaked Seasnake	he species is known from widely scattered localities in northern Australia, including the Hey-Embley River, Mission River, and Repulse Bay in North Queensland. The Beaked Seasnake has not been recorded in Western Australia (Cogger 2000; Limpus 1975; Porter et al. 1997).	-	-	-	Species or species habitat likely to occur
Eretmochelys imbricata	Hawksbill Turtle	The hawksbill turtle has a worldwide distribution in tropical and subtropical waters. In Australia, hawksbill turtles predominately occur along the northern Western Australian, Northern Territory and northern Queensland coastlines (Limpus 2009b). Hawksbill turtles are omnivorous and feed on algae, sponges, soft corals and soft-bodied invertebrates. This species is typically associated with rocky and coral reef habitats.	Vulnerable	Migratory	Species or species habitat likely to occur	Breeding known to occur
Hydrelaps darwiniensis	Black-ringed Seasnake	The Black-ringed Seasnake was known (in 2000) to be endemic to the shallow coastal waters of northern Australia and southern	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur

		Papua New Guinea, west of Torres Strait (Cogger 2000).				
Hydrophis atriceps	Black-headed Seasnake	he Black-headed Seasnake was known to occur in northern Australia, between Darwin and the coast of Papua New Guinea in 2000 (Cogger 2000).	-	-	-	Species or species habitat likely to occur
Hydrophis coggeri	Slender-necked Seasnake	The Slender-necked Seasnake is found in the waters of the northern Australian coast (Cogger 2000). Slender-necked Seasnakes at Ashmore Reef appear to inhabit the deeper (30–50 m) water beyond the reef edges as well as the reef flat. This is in contrast to the populations in Fiji that are often encountered on reef flats and in lagoons, especially where there are seagrasses (Cogger 2000; Guinea 1982; Guinea & Whiting 2005; McCosker 1975).	-	-	-	Species or species habitat likely to occur
Hydrophis czeblukovi	Fine-spined Seasnake	Fine-spined Seasnakes have been recorded as incidental catch from research and commercial trawls in studies undertaken during the 1980s and 1990s. Specimens have been historically collected from the Arafura Sea (Kharin 1984a); Papua New Guinea (close to Lesson Island as H. geometricus, Smith	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur

		1986); and 84 km, 140 km, and 130 km north west of Dampier, Western Australia (Rasmussen & Smith 1997).				
Hydrophis elegans	Elegant Seasnake	The Elegant Seasnake is widespread in tropical Australia. This includes Queensland, Western Australia and the Northern Territory (Dell & Fry 2003). Its distribution extends from Shark Bay in Western Australia to Moreton Bay in Queensland (Cogger 2000; Storr et al. 1986).	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur
Hydrophis ornatus	Spotted Seasnake,	The Ornate Seasnake occurs in tropical northern Western Australia, the Northern Territory and northern Queensland. The species sometimes occurs further south in summer, extending its range as far as Tasmania (Cogger 1996)	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur
Lapemis hardwickii	Spine-bellied Seasnake	he spine-bellied sea snake, also commonly known as Hardwicke's sea snake and Hardwicke's spine-bellied sea snake, is a species of venomous sea snake in the family Elapidae.	-	-	-	Species or species habitat likely to occur
Lepidochelys olivacea	Olive Ridley Turtle, Pacific Ridley Turtle	The olive ridley turtle has a global distribution in tropical waters. In Australia, the species primarily occurs in the Northern	Endangered	Migratory	-	Breeding likely to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		Territory and Queensland (Limpus 2008c). The olive ridley turtle is primarily carnivorous and feeds predominantly on soft-bodied invertebrates (Commonwealth of Australia 2017a). The species is known to feed in water depths between 15 m and 200 m and may make movements of more than 1,000 km between their nesting and foraging grounds (Whiting et al. 2007). Low-density nesting has also been described on the Kimberley coast (Limpus 2008c).				
Natator depressus	Flatback Turtle	The flatback turtle occurs along the Western Australian, Northern Territory and Queensland coastlines and forages widely across the Australian continental shelf and into the continental waters off Indonesia and Papua New Guinea (Commonwealth of Australia 2017a). Unlike other species of marine turtle, the flatback turtle does not have a global tropical distribution, with all recorded nesting beaches within Australian waters (Limpus 2007). Flatback turtles nest throughout tropical Australia, although there are several distinct populations (Limpus 2007). Populations at	Vulnerable	Migratory	Congregation or aggregation known to occur	Breeding known to occur

Scientific Name	Common Name	Description	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)
		higher latitudes off central Queensland and Western Australia's Pilbara coast tend to have a nesting peak in summer (Limpus 2007). Internesting flatback turtles have been recorded travelling further from nesting beaches between laying clutches of eggs (Waayers et al. 2011' Whittock et al. 2014). Flatback turtles are primarily carnivorous and feed predominantly on soft-bodied invertebrates in relatively shallow waters (Limpus 2007). Their distribution is largely restricted to continental shelf waters (less than 200 m deep).				
Pelamis platurus	Yellow-bellied Seasnake	Yellow-bellied Seasnake is the most widely distributed of all sea snake species. In the beginning of the 21st century, the species was found to range from the east coast of Africa through the Indian and Pacific Oceans to the west coast of the Americas (Cogger 2000; Kropach 1975). It was found in most Australian waters with the exception of the colder southern coastline (Cogger 2000).	-	-	Species or species habitat likely to occur	Species or species habitat likely to occur

3.3.5.2 Biologically Important Areas and Critical Habitat

No important habitats for marine reptiles overlap the Project Area; however, several habitats important for the survival of marine turtles were identified within the EMBA beyond the Project Area. These are summarised in **Table 3-11**. BIAs for marine reptiles that overlap the Project Area and the EMBA beyond the Project Area are summarised in **Table 3-12**. The BIAs for turtles are shown in **Figure 3-18** to **Figure 3-21**.

The flatback turtle internesting BIA centred around North Turtle Island is the only one that overlaps the Project Area. North Turtle Island is a small sandy island approximately 96 km and 39 km south of the WHP location and the Project Area respectively. The island is known to host nesting flatback turtles. This BIA overlaps approximately 24% of the Project Area and lies approximately 10 km south of the proposed WHP location. The portion of the BIA in the Project Area is approximately 5% of the total area of the BIA.

Internesting flatback turtles may range more widely than other turtle species, with results from tagging studies of internesting flatbacks at the Lacepede Islands showing flatbacks dispersing further than internesting green turtles at the same location (Waayers et al. 2011). The maximum distance of internesting turtles from the nesting beach observed during this study was approximately 48 km (Waayers et al. 2011). Based on available bathymetry, locations of internesting flatback turtles from these studies are consistent with relatively shallow (less than 30 m deep) coastal waters; such behaviour is consistent with observations of internesting behaviour in other species (Hamel et al. 2008; Hays et al. 1999). Analysis of satellite tracking data for green turtles (Ferreira et al. 2020; Hamel et al. 2008; Hays et al. 1999) shows internesting turtles occupied mostly shallow waters at a median depth of 9 m, and 95% of the distribution was in less than 20-m water depth.

Water depths in the portion of the flatback turtle internesting BIA that overlaps the Project Area range from 72 m to 88 m. These water depths are considerably deeper than the diving depths of internesting flatback turtles (Waayers et al. 2011; Whittock et al. 2016), and hence internesting females are unlikely to be present within the Project Area.

The Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) describes protected habitats for flatback turtles in the following way:

+ Habitats critical for the survival of the species were identified by consensus of a panel of experts in marine turtle biology identifying nesting and internesting habitat for each stock. For flatback turtles, a 60-km buffer zone located immediately seaward of designated nesting habitat defines the habitat critical to the survival of this species to capture internesting behaviour; and
+ BIAs for marine turtles are areas where protected species display biologically important behaviour, such as breeding, foraging, resting and migration. These habitats are not yet described for flatback turtles such that habitat critical to the survival of the stock can be identified; however, this knowledge gap is to be addressed during the life of the recovery plan. In the interim, the recovery plan advises consideration of information in the National Conservation Values Atlas (DAWE 2020) and the Species Profile and Threat Database.

Following the Recovery Plan, the BIA and critical habitat for internesting flatback turtles and the BIA for other turtle species provided by the DotEE and represented in the National Conservation Values Atlas (DAWE 2020) is shown in **Figure 3-18** to **Figure 3-21**.

The EMBA overlaps the BIA for flatback, green, hawksbill and loggerhead turtles and the Project Area overlaps the BIA for flatback turtles as shown in **Figure 3-18** to **Figure 3-21**.

Table 3-11: Nesting habitats critical to the survival of marine turtles within the EMBA indicating shortest distance from the WHP

3.3.6 Birds

The Project Area does not host a large number or diversity of bird species. There are no emergent features for bird roosting or nesting, and the marine environment does not have high productivity or host consistently high numbers of prey for foraging seabirds. Birds within the Project Area are likely to consist of foraging seabirds and potentially migrating shorebirds (Sage 1979 cited in Ronconi et al. 2015). While migration pathways for species occurring at Eighty Mile Beach (a significant area of intertidal mudflats within the EMBA) are poorly defined, birds may migrate through the Project Area.

The EMBA beyond the Project Area includes a significant number of birds, including many species of seabirds and migratory shorebirds that are listed as threatened or migratory (or both) under the EPBC Act.

Seabirds within the EMBA include shearwaters, boobies, noddies, frigatebirds, terns, petrels and albatrosses. Many of these breed and nest on coastal and offshore islands within the EMBA. Islands hosting notable seabird colonies within the EMBA include:

+ many islands along the Pilbara coast;
+ Ashmore Reef and Cartier Island;
+ Rowley Shoals;
+ Montebello Islands;
+ Barrow Island; and
+ Houtman Abrolhos Islands.

Some, such as petrels and albatrosses, are only likely to be present in the southern temperate areas and are unlikely to breed or nest within the EMBA.

In addition to seabirds, the EMBA beyond the Project Area seasonally hosts large numbers of migratory shorebirds. These species typically nest and breed in Asia in the northern hemisphere summer and migrate to feeding grounds in the southern hemisphere during the southern hemisphere summer. Migratory shorebirds typically aggregate in wetlands, estuaries and coastal mudflat habitats in the EMBA to feed and rest during summer months. Many of these important habitats are recognised by the International Convention on Wetlands of International Importance (Ramsar Convention) and protected under the EPBC Act as wetlands of international importance. These wetlands are described in **Section 3.4.2.4.**

3.3.6.1 Threatened and Migratory Birds

A number of species of birds listed as threatened or migratory under the EPBC Act were identified from PMST reports in **Attachment 1** as potentially occurring within the Project Area and EMBA beyond the Project Area. The full list of birds including species that are classified as threatened or migratory are presented in **Table 3-14.**

Many species of birds listed as migratory within the EMBA undertake long-distance flights to and from Australia along the East Asian–Australasian Flyway, one of several flyways recognised for migratory shorebirds and waders (**Figure 3-22**). Flyways are broad, contiguous corridors between breeding areas in the northern hemisphere and feeding areas in the southern hemisphere. The East Asian–Australasian Flyway extends from Arctic Russia and North America to the southern limits of Australia and New Zealand. It encompasses large parts of East Asia and all of Southeast Asia and includes eastern India and the Andaman and Nicobar Islands. The flyway is used by millions of birds annually, although not all species migrating in the flyway use the full extent of the flyway (BirdLife International n.d.).

Families of migratory birds that use the East Asian-Australasian Flyway include:

+ plovers and lapwings (family *Charadriidae*);
+ sandpipers (family *Scolopacidae*); and
+ pratincoles (family *Glareolidae*).

Resting areas within these flyways are recognised as important for maintaining connectivity between these breeding and feeding areas, and many such habitats are listed under the Ramsar Convention. The EPBC Act gives effect to the Ramsar Convention, with such sites declared as wetlands of international importance under Part 3 of the Act. Ramsar-listed wetlands within the EMBA are described in **Section 3.4.2.4**.

Table 3-14: Bird species that may occur within the Project Area and EMBA

Scientific Name	Common Name	Threatened Status	Migratory Status	Presence within the Project Area (from Attachment 1)	Presence within the EMBA beyond the Project Area (from Attachment 1)

Figure 3-22: East Asian–Australasian Flyway

3.3.6.2 Biologically Important Areas and Critical Habitats

A number of BIAs for birds overlap the Project Area and the EMBA beyond the Project Area. These are summarised in **Table 3-15**. No critical habitats for birds were identified within the EMBA.

Two BIAs for birds overlap the Project Area, both of which are centred on Bedout Island:

+ a brown booby breeding BIA; and
+ a lesser frigatebird breeding BIA.

The brown booby breeding BIA is centred on Bedout Island (9,576 breeding pairs), which is recognised as one of several offshore islands in the Pilbara and Kimberley regions where this species breeds, including the Lacepede Islands (17,670 breeding pairs), Adele island (7,500 breeding pairs) and White island (4,000 to 5,000 breeding pairs) (Marchant and Higgins 1990 cited in Department of Agriculture, Water and the Environment n.d.). Breeding may be protracted, with egg laying recorded throughout the year at many locations (Marchant and Higgins 1990 cited in DSEWPaC 2012d). Brown boobies may forage widely around nesting islands while breeding (57 km on average, with a standard error of 22 km) and may undertake extensive migrations during non-breeding periods (Miller et al. 2018). Based on this range, brown boobies nesting on Bedout Island may forage in the Project Area and around the proposed WHP and FPSO locations, as well as future tiebacks if a second WHP is installed.

The lesser frigatebird breeding BIA is also centred on Bedout Island. Counts of nesting lesser frigatebirds on Bedout Island observed over 2,000 nesting pairs in June (Burbidge et al. 1987). Breeding at other sites (Ashmore Reef) spans from April to October (Clarke et al. 2011), and the species has a protracted breeding and rearing season due to the relatively high level of parental care for the young. Thus, breeding at Bedout Island may follow similar temporal patterns. Tagging of nesting lesser frigatebirds at Ashmore Reef showed foraging trips from nesting locations were on average 123.2 km, with a standard error of 10.4 km. Based on this range, lesser frigatebirds nesting on Bedout Island may forage in the Project Area and around the proposed WHP and FPSO locations, as well as future tiebacks if these require an additional WHP to be installed.

Table 3-15: Closest BIAs for birds within the EMBA

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)
Anous stolidus	Common Noddy	Foraging (provisioning young) – Around Houtman Abrolhos Islands.	1,135
		Foraging – Around Lancelin Island.	1,311
Anous tenuirostris melanops	Australian Lesser Noddy	Foraging (provisioning young) – Houtman Abrolhos Islands.	1,151
Ardenna carneipes	Flesh-footed Shearwater	Aggregation – Foraging from Cape Naturaliste to Eyre, 1 to 150 km offshore. Predeparture zone in some years from Rottnest Island to Bunbury.	1,469
		Foraging (in high numbers) – Foraging from Cape Naturaliste to Eyre, 1 to	1,651

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)
		150 km offshore. Predeparture zone in some years from Rottnest Island to Bunbury.	
Ardenna pacifica	Wedge-tailed Shearwater	Breeding – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef. Breeding presence may occur between mid-August to April (Pilbara) or to mid-May (Shark Bay).	45
		Foraging (in high numbers) – Breeding (in hundreds of thousands) off west coast from Ashmore Reef to Carnac Island.	982
Eudyptula minor	Little Penguin	Foraging (provisioning young) – Perth to Bunbury.	1,469
		Foraging (provisioning young) – Southwest Western Australia from Augusta to Twilight Cove.	1,732
Fregata ariel	Lesser Frigatebird	Breeding – Kimberley and Pilbara coasts and islands, also Ashmore Reef. Breeding season March to September.	0
Fregata minor	Greater Frigatebird	Breeding – Kimberley and Ashmore Reef.	498
Hydroprogne caspia	Caspian Tern	Foraging (provisioning young) – In Western Australia found on most coasts, mainly islands (as far offshore as Adele, Bedout, Trimouille and the Houtman Abrolhos) and at Lake Argyle, Lake Gregory and Lake MacLeod; accidental elsewhere in the interior.	1,085
Larus pacificus	Pacific Gull	Foraging (in high numbers) – West coast and islands from Point Quobba (24° 30’ S) south to Wedge I. (formerly south to Warnbro Sound and at Cape Naturaliste); casual further north (Point Cloates and Lake MacLeod).	1,140
Onychoprion anaethetus	Bridled Tern	Foraging (in high numbers) – West coast of Western Australia and around to Recherche Archipelago including offshore waters. Breeding season, late September to late February/early May.	982
Onychoprion fuscatus	Sooty Tern	Foraging – Timor Sea south to 14° 30' S, off northwest coast from Lacepede Island southwest to 117° E including Abrolhos,	1,006

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)
		Fisherman and Lancelin Islands; accidental on lower west coast to Hamelin Bay. Breeding visitor (late Augustto early May) Abrolhos & Lancelin Islands; casual winter (November to April) to Fisherman Island.	
Pelagodroma marina	White-faced Storm petrel	Foraging (in high numbers) – Offshore areas of the South-west Marine Region and into the adjacent South-east Marine Region and the North-west Marine Region to north of Shark Bay.	1,076
Phaethon lepturus	White-tailed Tropicbird	Breeding – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef. Breeding recorded between May and October.	47
Pterodroma macroptera	Great-winged Petrel (macroptera race)	Foraging (provisioning young) – Offshore south of Shark Bay, extending around southwest corner of Western Australia and east past Kangaroo Island.	1,646
Pterodroma mollis	Soft-plumaged Petrel	Foraging (in high numbers) – In Western Australia, found in seas north to 21° 30ˈ S.	1,223
Puffinus assimilis tunneyi	Little Shearwater	Foraging (in high numbers) – From Kalbarri to Eucla including offshore waters.	1,036
Sterna dougallii	Roseate Tern	Breeding – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef. Breeding presence may occur mid- March to July.	41
		Resting – Eighty Mile Beach (northern end).	265
		Breeding – North East and North West Twin islands near the mouth of King Sound.	520
		Foraging (provisioning young) – Northwestern and west coasts and islands from Sir Graham Moore Island (13° 50’ S), south to Mandurah (32° 32’ S) and as far offshore as Ashmore Reef, Bedout Island and the Houtman Abrolhos.	1,123
		Foraging – Northwestern and west coasts and islands from Sir Graham Moore Island (13° 50’ S), south to Mandurah (32° 32’ S)	1,258

Species Name	Common Name	Biologically Important Behaviour	Shortest Distance from WHP (km)
		and as far offshore as Ashmore Reef, Bedout Island and the Houtman Abrolhos.	
Sternula albifrons sinensis	Little Tern	Resting – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef.	140
		Breeding – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef. Breeding has been recorded June to October.	149
		Resting – Roebuck Bay Ramsar site.	365
Sternula nereis	Fairy Tern	Breeding – Pilbara and Gascoyne coasts and islands. Breeding may occur late July to September.	235
		Foraging (in high numbers) – Found in the vicinity of lower northwest coast (north to Dampier Archipelago), west coast (south to Peel Inlet) and south coast (from Flinders Bay east to Israelite Bay), including islands as far offshore as Trimouille Island and Houtman Abrolhos Islands.	1,124
Sula leucogaster	Brown Booby	Breeding – Kimberley and northern Pilbara coasts and islands, also Ashmore Reef. Breeding presence may occur February to October.	19
Sula sula	Red-footed Booby	Breeding – Northwest Kimberley and Ashmore Reef. Females lay a single egg every 15 months.	498
Thalassarche chlororhynchos bassi	Indian Yellow-nosed Albatross	Foraging (in high numbers) – Throughout offshore waters of South-west Marine Region, north to Shark Bay and extending east into Bass Strait.	1,737
Thalasseus bengalensis	Lesser Crested Tern	Breeding – Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef. Breeding may occur March to June.	39

3.3.6.3 Conservation Advice and Recovery Plans

Material published by the Commonwealth under the EPBC Act for the conservation of threatened birds, such as recovery plans, conservation advice, and threat abatement plans, is summarised in **Table 3-16**. Threats identified in this material that may credibly arise from Dorado Phase 1 are also listed, along with cross-references to the relevant assessment of environmental impacts and risks in **Section 7**.

In addition to conservation advice and recovery plans for threatened birds, the Commonwealth has also published the Wildlife conservation plan for migratory shorebirds (Commonwealth of Australia 2015c). While this plan considers birds that are listed as migratory, many of the migratory birds considered in this plan are also listed as threatened under the EPBC Act. The plan applies to many species of migratory birds, of which several were identified as potentially occurring within the EMBA. The plan identified habitat modification by acute pollution, such as an oil spill, as a threat to migratory birds. The risk of an oil spill to birds, including migratory birds, is considered in **Section 7.3.1**. No other threats identified in the plan were considered to credibly arise from Dorado Phase 1.

Table 3-16: Summary of material published by the Commonwealth for the conservation of threatened birds relevant to Dorado Phase 1

Scientific Name	Common Name	Recovery Plan / Conservation Advice	Credible Threats arising from Dorado Development identified in Plan / Advice	Relevant Assessment of Impacts and Risks
-	All bird species	Threat abatement plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia 2018)	Marine debris	**Section 7.3.2**
-	Seabirds and Migratory Shorebirds	National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (DOEE 2020)	Light pollution	**Section 7.3.2**
			Habitat degradation / modification	**Section 7.3.1**

3.4 Socio-economic Environment

3.4.1 Regional Centres

The nearest town to the Project Area is Port Hedland, which lies approximately 145 km south of the WHP. Other notable coastal population centres in the Pilbara and Kimberley regions are Dampier (280 km from the WHP) and Broome (387 km from the WHP). These population centres for the region provide important services for mining, offshore petroleum, tourism and fishing industries.

3.4.2 Protected Areas

A number of areas in the EMBA are protected under Commonwealth and Western Australian legislation. These include:

+ Commonwealth AMPs;
+ Western Australian marine protected areas;
+ Western Australian terrestrial protected areas; and
+ wetlands of international importance (Ramsar wetlands).

These areas are shown in **Figure 3-23** and **Figure 3-24.**

A number of heritage sites were also identified within the EMBA. Many of these lie within protected areas (e.g. WHAs). Heritage sites are described in **Section 3.4.4**.

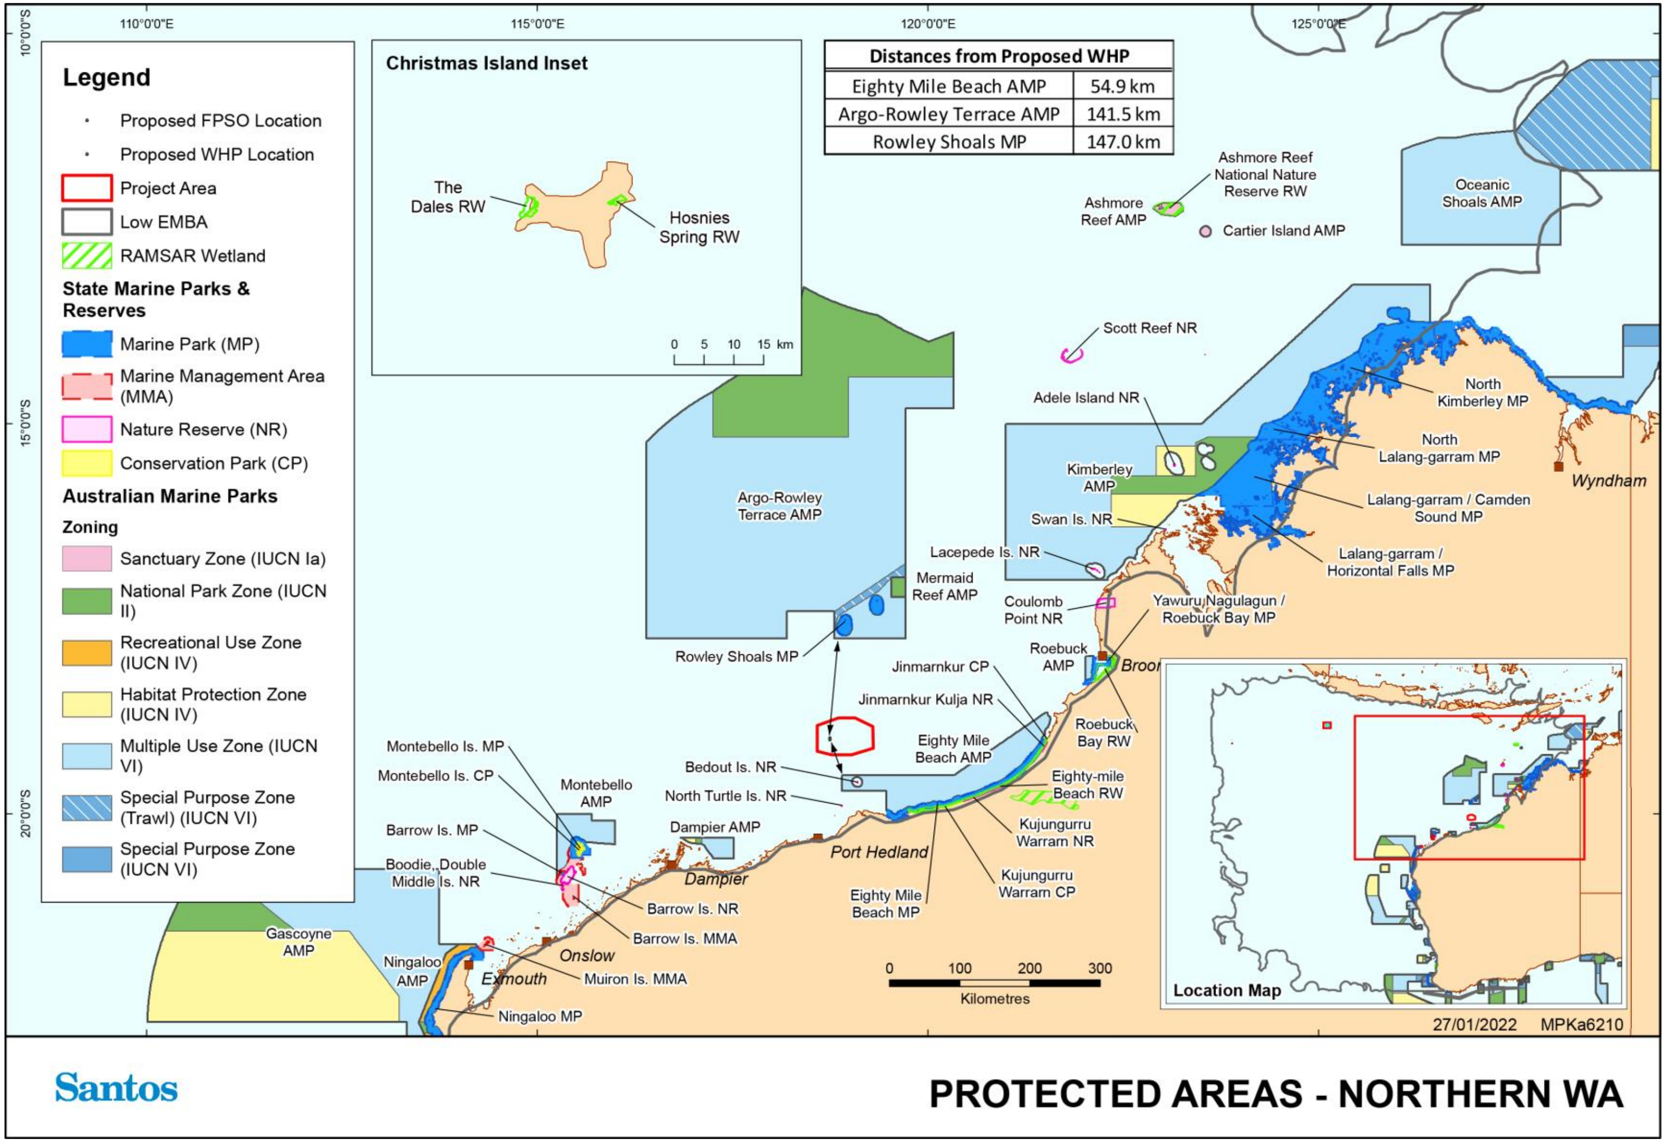

Figure 3-23: Protected areas that overlap the EMBA within Northern WA

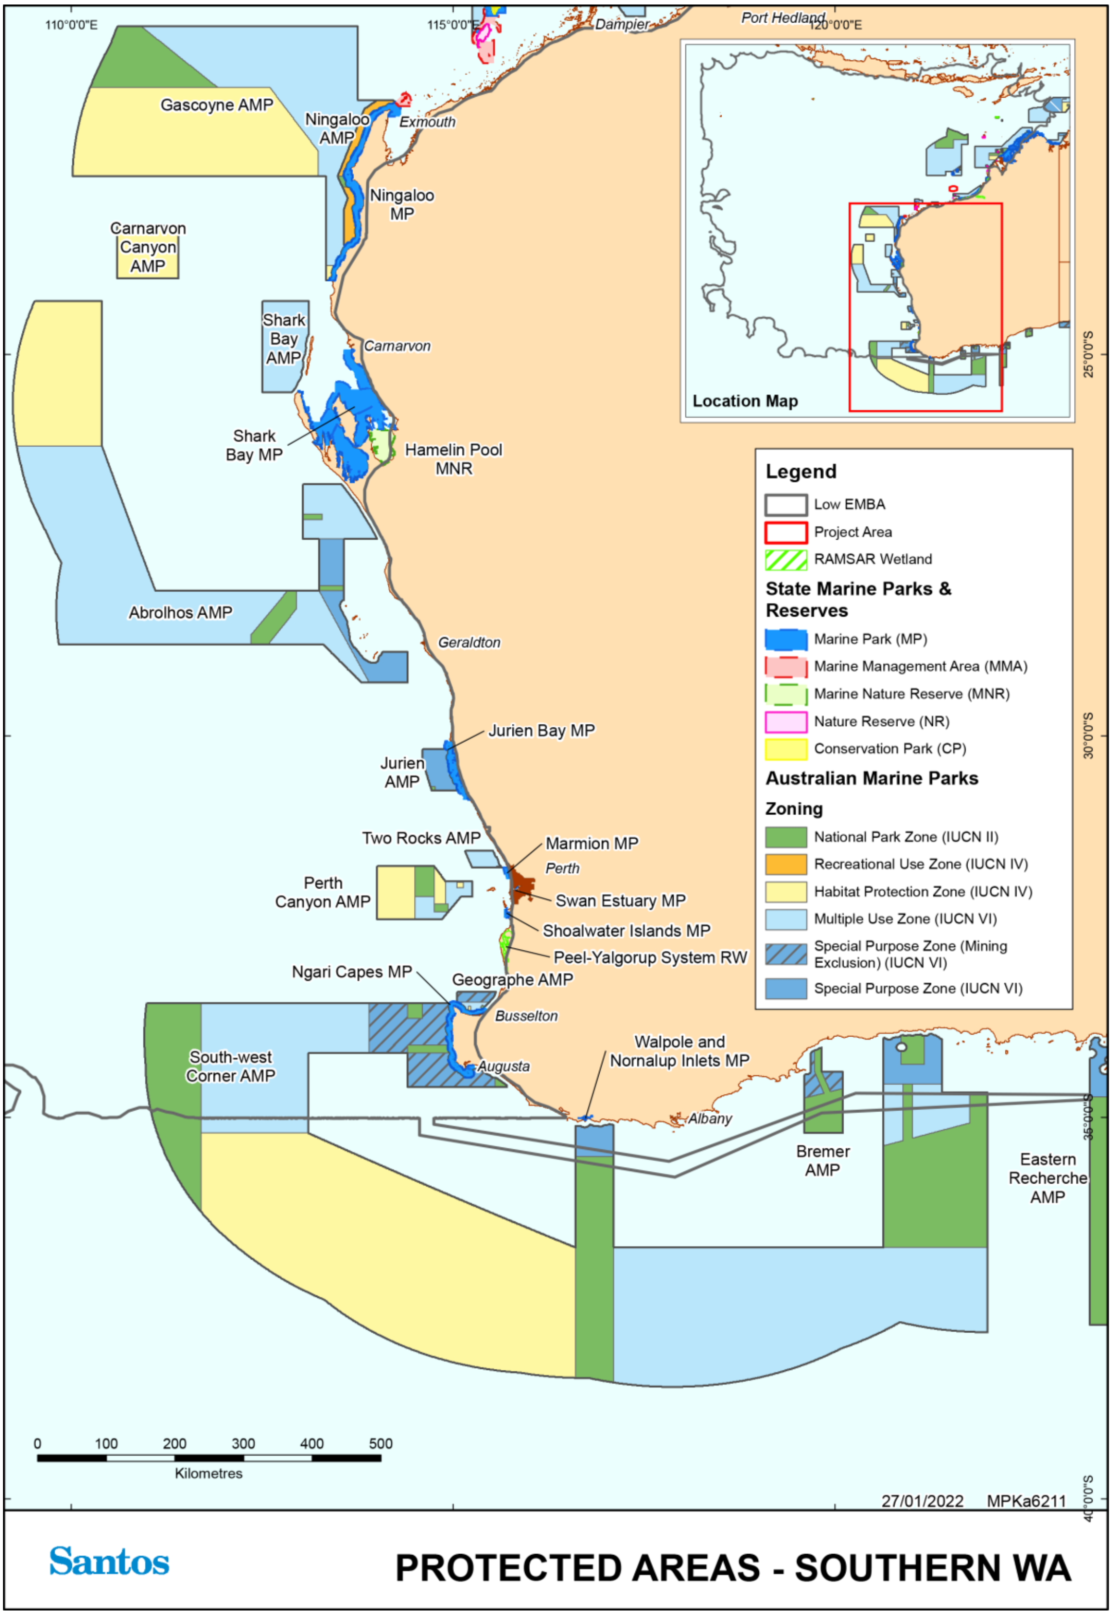

Figure 3-24: Protected areas that overlap the EMBA within Southern WA

3.4.2.1 Australian Marine Parks

In November 2012, the Commonwealth Marine Reserves Network was proclaimed under the EPBC Act with the purpose of protecting the biological diversity and sustainable use of the marine environment (Director of National Parks 2012). A series of AMPs were established within each of the six marine regions - the Coral Sea, the South-west, the Temperate East, the South-east, the North, and the North-west. Each AMP is managed under a marine region–based management plan.

The EPBC Act requires each management plan to assign an IUCN category to each marine park. Additionally, the Act also allows for the management plan to divide a marine park into zones and to assign a category to each zone, which may differ from the overall category of the marine park. Zoning considers the purposes for which the marine parks were declared, the objectives of the relevant management plans, the values of the marine park, and the requirements of the EPBC Act and EPBC Regulations.

The Project Area does not overlap any AMPs; however, the EMBA overlaps a number of them. Summaries of the environmental values of these AMPs, along with their distance from the WHP, are provided in **Table 3-17**.

Table 3-17: Summary of environmental values and sensitivities of AMPs within the EMBA (Director of National Parks 2018a, 2018b)

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
Eighty Mile Beach	55/ 29	VI - Multiple Use Zone (100%)	+ Breeding, foraging and resting habitat for seabirds (one of the world's most important feeding grounds for migratory shorebirds and waders and is listed under the Ramsar Convention); + Internesting and nesting habitat for marine turtles (it supports a significant nesting population of flatback turtles, which are endemic to northern Australia); + Foraging, nursing and pupping habitat for sawfish; + Migratory pathway for humpback whales; + Coastal waters provide critical habitat for several shark and ray species at varying life stages; + The Nyangumarta, Karajarri and Ngarla people's sea country extends into Eighty Mile Beach Marine Park. Access to sea country by families is important for cultural traditions, livelihoods and future socio-economic development opportunities; and + Three known shipwrecks listed under the *Underwater Cultural Heritage Act 2018*: *Lorna Doone* (wrecked in 1923), *Nellie* (wrecked in 1908), and *Tifera* (wrecked in 1923).	The marine park is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Province; its shallow shelf habitats include terraces, banks and shoals. The marine park is adjacent to the Eighty Mile Beach Ramsar site, recognised as one of the most important areas for migratory shorebirds in Australia, and the Western Australian Eighty Mile Beach Marine Park, providing connectivity between offshore and inshore coastal waters of Eighty Mile Beach.
Argo-Rowley Terrace	142/ 113	II - National Park Zone (25%) VI - Multiple Use Zone (75%)	+ Foraging areas that are important for migratory seabirds, as well as the endangered loggerhead turtle; + Important habitat and foraging for sharks; + Migratory pathway for pygmy blue whales;	The Argo–Rowley Marine Park is significant because it contains habitats, species and ecological communities associated with the Northwest Transition and Timor Province. It includes two key ecological features: canyons linking the Argo Abyssal Plain with the Scott Plateau (valued for high productivity and aggregations of

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
		VI - Special Purpose Zone (Trawl) (1%)	+ Protection for communities and habitats of the deeper offshore waters (220 m to over 5,000 m) of the region; + Seafloor features, including aprons and fans, canyons, continental rise, knolls or abyssal hills, and the terrace and continental slope; + Communities and seafloor habitats of the Northwest Transition and Timor Province provincial bioregions; + Connectivity between the existing Mermaid Reef Marine National Nature Reserve and reefs of the Western Australian Rowley Shoals Marine Park and the deeper waters of the region; + Two KEFs in the reserve include: The canyons linking the Argo Abyssal Plain with the Scott Plateau (unique seafloor feature with enhanced productivity and feeding aggregations of species); and + Mermaid Reef and the Commonwealth waters surrounding Rowley Shoals (an area of high biodiversity with enhanced productivity and feeding and breeding aggregations).	marine life) and Mermaid Reef and Commonwealth waters surrounding Rowley Shoals (valued for enhanced productivity, aggregations of marine life and high species richness). The marine park is the largest in the North-west Network, surrounding the existing Mermaid Reef Marine Park and reefs of the Western Australian Rowley Shoals Marine Park. It includes the deeper waters of the region and a range of seafloor features, such as canyons on the slope between the Argo Abyssal Plain, Rowley Terrace and Scott Plateau. These are believed to be up to 50 million years old and are associated with small, periodic upwellings that result in localised higher levels of biological productivity.
Dampier	191/ 166	II - National Park Zone (6%) IV - Habitat Protection Zone (8%) VI - Multiple Use Zone (86%)	+ Foraging areas for migratory seabirds that are adjacent to important breeding grounds; + Important foraging areas for marine turtles adjacent to significant nesting sites; + Part of the migratory pathway of the protected humpback whale; + Protection for offshore shelf habitats and shallow shelf habitats adjacent to the Dampier Archipelago; and	The Dampier Marine Park is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Province. The marine park provides protection for offshore shelf habitats adjacent to the Dampier Archipelago, as well as the area between Dampier and Port Hedland, and is a hotspot for sponge biodiversity. The marine park contains several submerged coral reefs and shoals, including Delambre Reef and Tessa Shoals.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Includes communities and seafloor habitats of the Northwest Shelf Province provincial bioregion, as well as the Pilbara (nearshore) and Pilbara (offshore) mesoscale bioregions.	
Mermaid Reef	217/ 179	II - National Park Zone (100%)	+ Mermaid Reef and Commonwealth waters surrounding Rowley Shoals KEF is valued for its high productivity, aggregations of marine life and high species richness; + Mermaid Reef, Clerke Reef and Imperieuse Reef are biodiversity hotspots and key topographic features of the Argo Abyssal Plain; + Rowley Shoals present some of the best geological examples of shelf atolls in Australian waters and are ecologically significant in that they are considered ecological steppingstones for reef species originating in Indonesian/western Pacific waters, are one of a few offshore reef systems on the North West Shelf, and may also provide an upstream source for recruitment to reefs further south; + Breeding habitat for seabirds; + Migratory pathway for the pygmy blue whale; and + One known shipwreck listed under the *Underwater Cultural Heritage Act 2018*: Lively (wrecked in 1810).	The marine park is significant because it contains habitats, species and ecological communities associated with the Northwest Transition and includes one KEF. Mermaid Reef is one of three reefs forming the Rowley Shoals; the others are Clerke Reef and Imperieuse Reef and occur to the southwest of the marine park. The Rowley Shoals have been described as the best geological examples of shelf atolls in Australian waters. The reefs of the Rowley Shoals are ecologically significant in that they are considered ecological stepping stones for reef species originating in Indonesian/western Pacific waters, are one of a few offshore reef systems on the North West Shelf, and may also provide an upstream source for recruitment to reefs further south.
Montebello	311/ 288	VI - Multiple Use Zone (100%)	+ Foraging areas for migratory seabirds that are adjacent to important breeding areas; + Areas used by vulnerable and migratory whale sharks for foraging;	The Montebello Marine Park is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Province. The marine park includes one KEF, the ancient coastline at the 125-m depth contour. The marine park provides connectivity between deeper waters of the continental shelf and slope

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Foraging areas for marine turtles that are adjacent to important nesting sites; + Section of the north- and southbound migratory pathway of the humpback whale; + Shallow shelf environments with depths ranging from 15 to 150 m that provide protection for shelf and slope habitats, as well as pinnacle and terrace seafloor features; + Seafloor habitats and communities of the Northwest Shelf Province provincial bioregion as well as the Pilbara (offshore) mesoscale bioregion; and + One KEF for the region is the ancient coastline at 125-m depth contour (a unique seafloor feature that provides areas of enhanced biological productivity).	and the adjacent Western Australian Barrow Island and Montebello Islands marine parks. A prominent seafloor feature in the marine park is Trial Rocks, which has two close coral reefs; these reefs are emergent at low tide.
Kimberley	328/ 275	II - National Park Zone (9%) IV - Habitat Protection Zone (8%) VI - Multiple Use Zone (84%)	+ Diverse benthic and pelagic fish communities; + Migratory pathway for humpback whales; + High levels of species diversity; + Reefs and islands of the bioregion are regarded as biodiversity hotspots; + High endemism in demersal fish communities of the continental slop (two distinct communities have been identified on the upper and mid slopes); + Ancient coastline at the 125 m depth contour where rocky escarpments are thought to provide biologically important habitats in areas otherwise dominated by soft sediments;	The Kimberley Marine Park is significant because it includes habitats, species and ecological communities associated with the Northwest Shelf Province, Northwest Shelf Transition and Timor Province and includes two KEFs. The marine park provides connectivity between deeper offshore waters and the inshore waters of the adjacent Western Australian North Kimberley and Lalang-garram/Camden Sound Marine Parks.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Continental slope demersal fish communities characterised by high diversity of demersal fish assemblages; + Breeding and foraging habitat for seabirds; + Internesting and nesting habitat for marine turtles; + Breeding, calving and foraging habitat for inshore dolphins; + Calving, migratory pathway and nursing habitat for humpback whales; + Migratory pathway for pygmy blue whales; + Foraging habitat for dugong and whale sharks; + The Wunambal Gaambera, Dambimangari, Mayala, Bardi Jawi and the Nyul Nyul people's sea country extends into the Kimberley Marine Park. Access to sea country by families is important for cultural traditions, livelihoods and future socio-economic development opportunities, and + More than 40 known shipwrecks listed under the *Underwater Cultural Heritage Act 2018*.	
Roebuck	356/ 295	VI - Multiple Use Zone (100%)	+ Foraging habitat area for migratory seabirds adjacent to important breeding areas; + Foraging area adjacent to important nesting sites for flatback turtles; + Parts of the migratory pathway of the protected humpback whale; + Habitat adjacent to important foraging, nursing and pupping areas for freshwater, green and dwarf sawfish;	The marine park includes examples of ecosystems representative of the Northwest Shelf Province—a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities ancient coastline thought to be an important seafloor feature, and migratory pathway for humpback whales. The marine park supports a range of species, including species listed as threatened,

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Foraging and calving areas for Australian snubfin, Indo-Pacific humpback and Indo-Pacific bottlenose dolphins; + Foraging habitat for dugong; + Protection for shallow shelf habitats ranging in depth from 15 to 70 m; + Ecosystem examples of the Northwest Shelf Province provincial bioregion and the Canning mesoscale bioregion, and + Sea country valued for indigenous cultural identity, health and well-being for the Yawuru people.	migratory, marine or cetacean under the EPBC Act. Biologically important areas within the marine park include breeding and resting habitat for seabirds, foraging and internesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat for dugong.
Gascoyne	555/ 532	II - National Park Zone (11%) IV - Habitat Protection Zone (48%) VI - Multiple Use Zone (41%)	+ Important foraging areas for: migratory seabirds, threatened and migratory hawksbills and flatback turtles, and vulnerable and migratory whale shark; + A continuous connectivity corridor from shallow depths around 15 m out to deep offshore waters on the abyssal plain at over 5,000 m in depth; + Seafloor features including canyon, terrace, ridge, knolls, deep hole/valley and continental rise. It also provides protection for sponge gardens in the south of the reserve adjacent to Western Australian coastal waters; + Ecosystems examples from the Central Western Shelf Transition, the Central Western Transition and the Northwest Province provincial bioregions, as well as the Ningaloo mesoscale bioregion; + Four KEFs for the region:	The Gascoyne Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Transition, Central Western Transition, and Northwest Province and includes four KEFs. The marine park includes some of the most diverse continental slope habitats in Australia, in particular the continental slope area between the North West Cape and the Montebello Trough. Canyons in the marine park link the Cuvier Abyssal Plain to the Cape Range Peninsula and are important for their role in sustaining the nutrient conditions that support the high diversity of Ningaloo Reef.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula (enhanced productivity, aggregations of marine life and unique sea-floor feature); Exmouth Plateau (unique sea-floor feature associated with internal wave generation); Continental slope demersal fish communities (high species diversity and endemism – the most diverse slope bioregion in Australia with over 500 species found with over 64 of those species occurring nowhere else); and + Commonwealth waters adjacent to Ningaloo Reef.	
Ningaloo	555/ 532	II - National Park Zone (5%) IV - Recreational Use Zone (95%)	+ Important habitat (foraging areas) for vulnerable and migratory whale sharks; + Areas used for foraging by marine turtles adjacent to important internesting sites; + Part of the migratory pathway of the protected humpback whale; + Foraging and migratory pathway for pygmy blue whales; + Breeding, calving, foraging and nursing habitat for dugong; + Shallow shelf environments that provide protection for shelf and slope habitats, as well as pinnacle and terrace seafloor features; + Seafloor habitats and communities of the Central Western Shelf Transition; + Three KEFs; and	The Ningaloo Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Transition, Central Western Transition, Northwest Province, and Northwest Shelf Province and contains three KEFs. The marine park provides connectivity between deeper offshore waters of the shelf break and shallower coastal waters. It includes some of the most diverse continental slope habitats in Australia, in particular the continental slope area between the North West Cape and the Montebello Trough. Canyons in the Marine Park are important for their role in sustaining the nutrient conditions that support the high diversity of Ningaloo Reef. The marine park is located in a transition zone between tropical and temperate waters and sustains tropical and temperate flora and fauna, with many species at the limits of their distributions.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ The Ningaloo Coast World Heritage Property, the Ningaloo Coast National Heritage listing and the Ningaloo Marine Area Commonwealth Heritage Listing.	
Shark Bay	825/ 800	VI - Multiple Use Zone (100%)	+ Foraging areas adjacent to important breeding areas for several species of migratory seabirds; + Part of the migratory pathway of protected humpback whales; + Internesting habitat for marine turtles; + Waters that are adjacent to the largest nesting area for loggerhead turtles in Australia; + Marine park and adjacent coastal areas important for shallow-water snapper; + Protection to shelf and slope habitats, as well as a terrace feature; + Examples of the shallower ecosystems of the Central Western Shelf Province and Central Western Transition provincial bioregions, including the Zuytdorp mesoscale bioregion; and + Connectivity between the inshore waters of the Shark Bay WHA and the deeper waters of the area.	The Shark Bay Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Shelf Province and Central Western Transition. The marine park provides connectivity between deeper Commonwealth waters and the inshore waters of the Shark Bay world heritage property.
Ashmore Reef	873/ 830	Ia - Sanctuary Zone (94%) IV - Recreational Use Zone (6%)	+ Ecosystems, habitats and communities associated with; the NWS, Timor Province, and emergent oceanic reefs; + Nesting and internesting habitat for green turtles (including one of three genetically distinct breeding populations in the North-west Marine Region). Low-level nesting activity by loggerhead turtles has also been recorded;	The Ashmore Reef Marine Park is significant because it includes habitats, species and ecological communities associated with the Timor Province. It includes two key ecological features: Ashmore Reef and Cartier Island and surrounding Commonwealth waters (valued for high productivity and breeding aggregations of birds and other marine life); and continental slope demersal fish

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Populations of green, hawksbill and loggerhead turtles occur around the reefs (it is estimated that approximately 11,000 marine turtles feed in the area throughout the year); + Supports a small dugong population of less than 50 individuals that breed and feed around the reef. This population is thought to be genetically distinct from other Australian populations; + Migratory pathway for pygmy blue whales; + Important seabird rookeries on the NWS, including colonies of bridled terns, common noddies, brown boobies, eastern reef egrets, frigatebirds, tropicbirds, red-footed boobies, roseate terns, crested terns and lesser crested terns; + important staging point or feeding area for many migratory seabirds; + significant for its abundance and diversity of sea snakes; + Two KEFs: Ashmore Reef and Cartier Island and surrounding Commonwealth waters; and Continental slope demersal fish communities; + Cultural and heritage sites, including; Ashmore lagoon as a rest/staging area for traditional Indonesian fishers; Indonesian artefacts; and Grave sites; and.	communities (valued for high levels of endemism). Ashmore Reef is the largest of three emergent oceanic reefs in the region and the only one with vegetated islands. The marine park is an area of enhanced biological productivity and a biodiversity hotspot supporting a range of pelagic and benthic marine species and an important biological stepping stone facilitating the transport of biological material to the reef systems along the Western Australian coast via the south-flowing Leeuwin Current, which originates in the region. The Ashmore Reef Ramsar site is located within the boundary of the marine park. The site was listed under the Ramsar Convention in 2002 and is a wetland of international importance under the EPBC Act. An ecological character description that sets out the Ramsar listing criteria met by the site, the key threats and the knowledge gaps is available on the DAWE's website.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Commonwealth heritage listing – Ashmore Reef.	
Carnarvon Canyon	899/ 847	IV - Habitat Protection Zone (100%)	+ A single channel canyon with seabed features that include slope, continental rise and deep holes and valleys; + Ranges in depth from 1,500 to 5,000 m, thereby providing habitat diversity for benthic and demersal species; and + Contains Central Western Transition provincial bioregion ecosystem examples, which are characteristic of the biogeographic faunal transition between tropical and temperate species.	The Carnarvon Canyon Marine Park is significant because it contains habitats, species and ecological communities associated with the Central Western Transition. This includes deepwater ecosystems associated with the Carnarvon Canyon. The marine park lies within a transition zone between tropical and temperate species and is an area of high biotic productivity.
Oceanic Shoals Marine Park	1060/ 1150	Multiple Use Zone - IUCN Category VI (57%) Special Purpose Zone – IUCN VI (43%)	The marine park protects the following conservation values (DoE 2014): + Important resting area for turtles between egg laying (internesting area) for the threatened flatback turtle and olive ridley turtle; + Important foraging area for the threatened loggerhead turtle and olive ridley turtle; + Examples of the ecosystems of two provincial bioregions: the Northwest Shelf Transition Province (which includes the Bonaparte, Oceanic Shoals, and Tiwi meso-scale bioregions) and the Timor Transition Province; + KEFs represented in the park are (Director of National Parks 2018c): – Carbonate bank and terrace system of the Van Diemen Rise (unique sea-floor feature);	The Oceanic Shoals Marine Park is significant because it contains habitats, species and ecological communities associated with the Northwest Shelf Transition. It contains four key ecological features: carbonate bank and terrace systems of the Van Diemen Rise; carbonate bank and terrace systems of the Sahul Shelf; pinnacles of the Bonaparte Basin; and shelf break and slope of the Arafura Shelf (all valued as unique seafloor features with ecological properties of regional significance). The Marine Park is the largest marine park in the North Network.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			– Carbonate banks and terrace system of the Sahul Shelf (unique sea-floor feature); – Pinnacles of the Bonaparte Basin (enhanced productivity, unique sea-floor feature); and – Shelf break and slope of the Arafura Shelf (unique sea-floor feature). No heritage listings apply to the marine park. Commercial fishing and mining are important socio-economic values for the park (Director of National Parks 2018c). A spatial predictive benthic habitat model of the Oceanic Shoals Marine Park has been developed by AIMS, as part of the Australian National Environmental Science Programme, to determine the spatial heterogeneity of the benthic environment and key classes of organisms within the reserve. The benthic habitat model maps the 10 broad classes of benthic organisms; alcyons, gorgonians, soft corals, hard corals, halimeda, macroalgae, seagrass, filterers (e.g. sponges), burrowers (e.g. sea urchins) and no biota detected (Radford and Puotinen 2016).	
Abrolhos	1,003/ 1,019	IV - Habitat Protection Zone (26%) II - National Park Zone (3%) VI - Multiple Use Zone (64%)	+ Important foraging areas for the: - Threatened Australian lesser noddy; - Northernmost breeding colony of the threatened Australian sea lion; - Great white shark; and - Migratory common noddy, wedge-tailed shearwater, bridled tern, Caspian tern and roseate tern. + Important migration habitat for the protected humpback whale and pygmy blue whales;	The Abrolhos Marine Park is significant because it contains habitats, species and ecological communities associated with four bioregions: Central Western Province; Central Western Shelf Province; Central Western Transition; and South-west Shelf Transition. It includes seven KEFs: the Commonwealth marine environment surrounding the Houtman Abrolhos Islands (valued for high levels of biodiversity and endemism); western demersal slope and associated fish communities (in the Central Western Province and valued as a species group that is nationally or regionally important to

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
		VI - Special Purpose Zone (7%)	+ The second largest canyon on the west coast, the Houtman Canyon; + Examples of the northernmost ecosystems of the Central Western Province and South-west Shelf Transition (including the Central West Coast mesoscale bioregion); + Examples of the deeper ecosystems of the Abrolhos Islands mesoscale bioregion; + Examples of the shallower, southernmost ecosystems of the Central Western Shelf Province provincial bioregion, including the Zuytdorp mesoscale bioregion; + Examples of the deeper ecosystems of the Central Western Transition provincial bioregion; + Examples of diversity of seafloor features, including southernmost banks and shoals of the North-west marine region; deep holes and valleys; slope habitats; terrace and shelf environments; and + Seven KEFs.	biodiversity); mesoscale eddies (valued for high productivity and aggregations of marine life); Perth Canyon and adjacent shelf break, and other west-coast canyons (valued for high biological productivity and aggregations of marine life and unique seafloor features with ecological properties of regional significance); western rock lobster (valued as a species that plays a regionally important ecological role); ancient coastline between 90 m and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism); and Wallaby Saddle (valued for high productivity and aggregations of marine life). The southern shelf component of the marine park partially surrounds the Western Australian Houtman Abrolhos Islands Nature Reserve. The islands and surrounding reefs are renowned for their high level of biodiversity, due to the southward movement of species by the Leeuwin Current. The marine park contains a number of seafloor features, including the Houtman Canyon, the second largest submarine canyon on the west coast (the Perth Canyon being the largest).
Jurien	1,294/ 1,272	II - National Park Zone (2%) VI - Special Purpose Zone (98%)	+ Important foraging areas for the: - Threatened soft-plumaged petrel; - Threatened Australian sea lion; - Threatened white shark; and - Migratory roseate tern, bridled tern, wedge-tailed shearwater, and common noddy.	The Jurien Marine Park is significant because it includes habitats, species and ecological communities associated with two bioregions: South-west Shelf Transition and Central Western Province. It includes three KEFs: ancient coastline between 90 and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism); demersal slope and associated fish communities of the Central

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Important migration habitat for the protected humpback whale; + Examples of the ecosystems of two provincial bioregions: the central part of the South-west Shelf Transition (which includes the Central West Coast mesoscale bioregion) and small parts of the Central Western Province; + Three KEFs; and + Heritage values represented by the *Cambewarra* and *Oleander* historic shipwrecks.	Western Province (valued as a species group that are nationally or regionally important to biodiversity); and western rock lobster (valued as a species that plays a regionally important ecological role). The marine park contains a mixture of tropical species carried south by the Leeuwin Current and temperate species carried north by the Capes Current. The marine park's shelf habitats are defined by distinct ridges of limestone reef with extensive beds of macroalgae. Inshore lagoons are inhabited by a diverse range of invertebrates and fish. Seagrass meadows occur in more sheltered areas, as well as in the inter-reef lagoons along exposed sections of the coast. The marine park includes habitats connecting to and complementing the adjacent Western Australian Jurien Bay Marine Park.
Two Rocks	1,425/ 1,397	II - National Park Zone (2%) VI - Multiple Use Zone (98%)	+ Important foraging areas for the: - Threatened soft-plumaged petrel; - Threatened Australian sea lion; and - Migratory roseate tern, bridled tern, Caspian tern, wedge-tailed shearwater, and common noddy. + Important migratory areas for protected humpback whales and pygmy blue whales; + Seasonal calving habitat for the threatened southern right whale; + Examples of the ecosystem of the southernmost parts of the South-west Shelf Transition (including the Central West Coast mesoscale bioregion); and + Three KEFs.	The Two Rocks Marine Park is significant because it includes habitats, species and ecological communities associated with the South-west Shelf Transition. It includes three KEFs: the Commonwealth marine environment within and adjacent to the west-coast inshore lagoons (valued for high productivity and aggregations of marine life and high levels of biodiversity and endemism); western rock lobster (valued as a species that plays a regionally important ecological role); and ancient coastline between 90 m and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism). The marine park is shallow and provides connectivity between offshore waters and the west

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
				coast inshore lagoons, which are key areas for the recruitment of rock lobster and other commercially and recreationally important fish species.
Perth Canyon	1,460/ 1,437	IV - Habitat Protection Zone (59%) II - National Park Zone (17%) VI - Multiple Use Zone (25%)	+ Globally important seasonal feeding aggregation for the threatened blue whale; + Important foraging areas for the: - Threatened soft-plumaged petrel; - Migratory sperm whale; and - Migratory wedge-tailed shearwater. + Important migratory areas for protected humpback whales and blue whales; + Seasonal calving habitat for the threatened southern right whale; + Examples of the ecosystems of the southernmost parts of the Central Western Province and South-west Shelf Transition (including the Central West Coast mesoscale bioregion), and the northernmost parts of the South-west Transition and Southwest Shelf Province (including the Leeuwin-Naturaliste mesoscale bioregion); and + Four KEFs.	The Perth Canyon Marine Park is significant because it includes habitats, species and ecological communities associated with four bioregions: Central Western Province; South-west Shelf Province; Southwest Transition; and South-west Shelf Transition. It includes four key ecological features: Perth Canyon and adjacent shelf break, and other west-coast canyons (valued for high biological productivity and aggregations of marine life and unique seafloor features with ecological properties of regional significance); demersal slope and associated fish communities of the Central Western Province (valued as a species group that are nationally or regionally important to biodiversity); western rock lobster (valued as a species that plays a regionally important ecological role); and mesoscale eddies (valued for high productivity and aggregations of marine life). The marine park includes the majority of the Perth Canyon, Australia's largest submarine canyon, which is home to the largest feeding aggregations of blue whales in Australia. This unique feature is also of particular significance because it cuts into the continental shelf at approximately 150 m depth west of Rottnest Island, linking the shelf with deeper ecosystems at depths of up to 5,000 m. The Marine Park represents the southern end of the transition area from tropical to temperate marine environments.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
Geographe	1,627/ 1,596	IV - Habitat Protection Zone (2%) II - National Park Zone (2%) VI - Multiple Use Zone (30%) VI - Special Purpose Zone (Mining Exclusion) (67%)	+ Important foraging areas for the: - Threatened soft-plumaged petrel; and - Migratory wedge-tailed shearwater. + Important premigration aggregation area for the migratory flesh-footed shearwater; + Important migratory habitat for the protected humpback whale and blue whale; + Seasonal calving habitat for the threatened southern right whale. + Representation of the South-west Shelf Province on the continental shelf, as well as the Leeuwin-Naturaliste mesoscale bioregion; + Two KEFs; and + Representation of the seagrass habitats of the Geographe Bay KEF, which in this location extends the furthest into Commonwealth waters.	The Geographe Marine Park is significant because it contains habitats, species and ecological communities associated with the South-west Shelf Province. It includes two KEFs: the Commonwealth marine environment within and adjacent to Geographe Bay (valued for high productivity and aggregations of marine life and high levels of biodiversity and endemism); and western rock lobster (valued as a species that plays a regionally important ecological role). The marine park contains an area of high productivity supported by extensive and diverse seagrass beds that cover approximately 60% of Geographe Bay. Tropical and temperate seagrass species account for 80% of the benthic primary production in the area. These meadows provide habitat for fish and invertebrates. Geographe Bay provides important nursery habitat, resting areas and foraging habitats for sharks, whales and seabirds. The marine park includes habitats connecting to and complementing the adjacent Western Australian Ngari Capes Marine Park.
South-west Corner	1,647/ 1,625	IV - Habitat Protection Zone (35%) II - National Park Zone (20%) VI - Multiple Use Zone (39%)	+ Important migratory area for protected humpback whales and blue whales; + Important foraging areas for the: - Threatened white shark; - Threatened Australian sea lion; - Threatened Indian Yellow-nosed albatross and soft-plumaged petrel; - Sperm whale; and	The South-west Corner Marine Park is significant because it contains habitats, species and ecological communities associated with three bioregions: Southern Province; South-west Transition; and South-west Shelf Province. It includes six KEFs: Albany Canyon group and adjacent shelf break (valued for high productivity, aggregations of marine life and unique seafloor features with properties of regional significance); Cape Mentelle upwelling (valued for high productivity and aggregations

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
		VI - Special Purpose Zone (2%) VI - Special Purpose Zone (Mining Exclusion) (4%)	- Migratory flesh-footed shearwater, short-tailed shearwater and Caspian tern; + Seasonal calving habitat for the threatened southern right whale; + Representation of three provincial bioregions (the South-west Transition and Southern Province in the off-shelf area and the South-west Shelf Province on the continental shelf) and two mesoscale bioregions (southern end of the Leeuwin-Naturaliste mesoscale bioregion and western and central parts of the Western Australia South Coast mesoscale bioregion); + Representation of the Donnelly Banks, east of Augusta, characterised by higher productivity and including nursery habitats; and + Six KEFs.	of marine life); Diamantina Fracture Zone (valued as a unique seafloor feature with ecological properties of regional significance); Naturaliste Plateau (valued as a unique seafloor feature with ecological properties of regional significance); western rock lobster (valued as a species that plays a regionally important ecological role); and ancient coastline between 90 m and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism). As the largest marine park in the South-west Network, it contains a wide range of important ecosystems in both shallow and deep water, reaching abyssal depths, including the Diamantina Fracture Zone, Naturaliste Plateau and Donnelly Banks, along with many reefs and canyons. The marine park contributes to a transect that extends from coastal land (Leeuwin–Naturaliste and D’entrecasteaux national parks) to coastal waters (Ngari Capes Marine Park) and the deep ocean.
Eastern Recherche Marine Park	1570/ 1525	II – National Park Zone (76%) VI - Special Use Zone (24%)	The Eastern Recherche Marine Park is part of the South-West Marine Park Network. It lies adjacent to the Recherche Archipelago about 135km east of Esperance and includes important foraging areas for: + Threatened white shark; + Threatened Australian sea lion + Pygmy blue whales are distributed across the marine park; and	The Eastern Recherche Marine Park is significant because it contains habitats, species and ecological communities associated with three bioregions: South-west Shelf Province; Southern Province; and the Great Australian Bight Shelf Transition. It includes three key ecological features: mesoscale eddies (valued for high productivity and aggregations of marine life); ancient coastline between 90 m and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism); and the

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			+ Southern right whales migrate through the region to important nursery areas in coastal waters. The marine park does not contain any international, Commonwealth or National heritage listings (Director of National Parks 2018a) but it is adjacent to the Recherche Archipelago which is home to the only breeding population of great-winged petrels in Australia.	Commonwealth marine environment surrounding the Recherche Archipelago (valued for aggregations of marine life and high levels of biodiversity and endemism). The Marine Park includes representative examples of habitats adjacent to the Recherche Archipelago, an area recognised globally for its biodiversity. The Archipelago contains over 150 islands stretching over 200 km^2 of ocean and represents the most extensive area of rocky reef environments in the region. Its reef and seagrass habitats support a high diversity of warm temperate species. The Marine Park captures one of the few areas where the reef extends into Commonwealth waters and includes Chester and Pollock reefs which are located south of Salisbury Island about 60–70 km offshore
Bremer Marine Park	1495/ 1458	II – National Park Zone (70%) VI – Special Purpose Zone (Mining exclusion) (30%)	The Bremer Marine Park protects the following conservation values (Director of National Parks 2018a): + Contains habitats, species and ecological communities associated with two bioregions: Southern Province and South-west Shelf Province; + Two key ecological features (Albany Canyon group and adjacent shelf break and ancient coastline between 90 m and 120 m depth); + Important foraging areas for: – Threatened white shark; – Threatened Australian sea lion;	The Bremer Marine Park is significant because it contains habitats, species and ecological communities associated with two bioregions: Southern Province and South-west Shelf Province. It includes two key ecological features: Albany Canyon group and adjacent shelf break (valued for high productivity, aggregations of marine life and unique seafloor features with properties of regional significance); and ancient coastline between 90 m and 120 m depth (valued for relatively high productivity, aggregations of marine life and high levels of biodiversity and endemism). The Marine Park contains the Bremer Canyon and significant calving and aggregation area for whales as well as important foraging areas for sharks, sea lions, and a range of seabirds.

Name	Distance from the WHP (km)/ Project Area Boundary (km)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities	Statement of Significance
			– Threatened Indian yellow-nosed albatross, Australian fairy tern and soft-plumaged petrel; and – Migratory flesh-footed shearwater, short-tailed shearwater, bridled tern and Caspian tern. – Important migratory pathway for humpback whales; – Significant calving habitat for the threatened southern right whale; and – Important aggregation area for killer whales The marine park does not contain any international, Commonwealth or National Heritage listings (Director of National Parks 2018a). Commercial tourism, fishing, shipping and recreation are important supported socio-economic activities in the park.	

3.4.2.2 Western Australian Marine Protected Areas

In addition to the AMPs described in **Section 3.4.2.1**, a number of Western Australian marine protected areas were identified as overlapping the EMBA beyond the Project Area. These are described in **Table 3-18** and shown in **Figure 3-23** and **Figure 3-24**.

No Western Australian marine protected areas overlap the Project Area. The Western Australian marine protected areas that overlap the EMBA comprise two categories:

- marine parks; and
- marine protected areas.

Marine parks are created to protect natural features and aesthetic values while allowing recreational and commercial uses that do not compromise conservation values. Marine parks are multiple-use reserves that cater for a wide range of activities. Marine parks are zoned in accordance with the IUCN categories for protected areas. Each marine park has a “management plan” that contains strategies to protect the high-value assets in the park, as well as permitted-activities tables.

Marine management areas provide an integrated management structure over areas that have high conservation value and intensive multiple-use.

Table 3-18: Summary of environmental values and sensitivities of State marine protected areas within the EMBA

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
Eighty Mile Beach Marine Park	128/90	VI - Multiple Use Zone (100%)	+ Aboriginal cultural heritage; + Intertidal sand and mudflat communities supporting a high abundance and diversity of invertebrate life; + Diverse subtidal filter-feeding communities; + Macroalgal and seagrass communities; + High-diversity intertidal and subtidal coral reef communities; + Mangrove communities and adjacent saltmarshes; + High-diversity and abundance of shorebirds and waders (including migratory species); + Flatback turtles nesting; + Dugongs and several whale and dolphin species; and + Recreational and commercial fishing.
Rowley Shoals Marine Park	147/117	II - National Park (0.14%) VI - Multiple Use Zone (99.86%)	+ Reefs form part of a series of important ecological "steppingstones" for biota originating in Indonesian/western Pacific waters; + Provides an important upstream source for recruitment to reefs further south; + Marine biota, including: - 184 species of corals, primarily Indo-West Pacific species; - 264 species of molluscs; - 82 species of echinoderms, and - 389 species of finfish.

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
Montebello Islands Marine Park	357/334	VI - Multiple Use Zone (100%)	+ Important habitats including: - corals reefs and bommies; - mangroves; - seagrass and macroalgae meadows; - rocky shorelines and hard substrate, and - intertidal sand and mudflat communities. + Large diversity of species, including dugongs, turtles, whales, other protected cetaceans and birds, as well as sea snakes and fish. + Socio-economic values including: - hydrocarbon exploration and production; - pearling; - nature-based tourism; and - commercial and recreational fishing.
Barrow Island Marine Management Area	371/347	IV - Habitat / Species Management Area (100%)	+ Regionally significant coral reefs; + Diversity of tropical marine fauna; + Seabirds and migratory shorebirds; + Unique mangrove communities; + Green, hawksbill and flatback turtles nesting and breeding; and + Nature-based tourism.
Barrow Island Marine Park	401/377	VI - Multiple Use Zone (100%)	+ Biggada Reef, an ecologically significant fringing reef; + Turtle Bay, an important turtle aggregation and breeding area; and + Representative areas of seagrass, macroalgal and deepwater habitat.

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
Muiron Islands Marine Management Area	533/509	IV - Habitat / Species Management Area (100%)	+ Immediately adjacent to the northern end of the Ningaloo Marine Park and Ningaloo WHA; + Sandy beaches, macroalgae and seagrass beds in the shallow waters (particularly on the eastern sides); and + Coral reef up to depths of 5 m, which surrounds both sides of South Muiron Island and the eastern side of North Muiron Island.
Ningaloo Marine Park	553/529	VI - Multiple Use Zone (100%)	+ Aligns with the Ningaloo WHA in Western Australian waters; + Over 217 species of coral (representing 54 genera); + Over 600 species of mollusc (clams, oysters, octopus, cuttlefish, snails); + Over 460 species of fish; + Ninety-seven species of echinoderms (sea stars, sea urchins, sea cucumbers); + Habitat for numerous threatened species, including whales, dugong, whale sharks and turtles; and + Habitat for over 25 species of migratory birds.
Lalang-garram/ Camden Sound Marine Park	607/549	VI - Multiple Use Zone (100%)	+ Aboriginal cultural heritage values, including three recognised traditional owner groups; + Species of special conservation interest, including: - humpback whales, which calve and rest within the park; - dolphins; - dugongs; - marine turtles; - crocodiles; - fish (including sharks and rays); - birds; and

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
			- benthic invertebrates (molluscs, crustaceans, echinoderms and sponges). + Geology and geomorphic features; + Habitats and communities; + Nature-based tourism; and + Fishing.
Lalang-garram/ Horizontal Falls Marine Park and North Lalang-garram Marine Park	612/553	VI - Multiple Use Zone (100%)	+ Cultural heritage values and sites of the Dambimangari traditional owners; + Habitats and communities, including: - mangroves and saltmarshes; - coral reefs; - seagrass and macroalgae; - estuaries; and - pelagic habitat. + A range of coastal geomorphologies; + Fauna of special conservation interest, including: - marine turtles; - dugongs; - dolphins; - crocodiles; - fish (including sharks and rays); - whales (particularly humpback whales); - sea snakes; and - birds. + Recreation and nature-based tourism values.

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
North Kimberley Marine Park	754/697	VI - Multiple Use Zone (100%)	+ Four separate management areas including, Uunguu, Balanggarra, Miriuwung Gajerrong, and Wilinggin traditional owners; + Species of special conservation interest, including: - dolphins; - dugongs; - marine turtles; - crocodiles; - fish (including sharks and rays); and - birds. + Habitats and communities; + Nature-based tourism; and + Fishing.
Shark Bay Marine Park	835/810	VI - Multiple Use Zone (100%)	+ 323 fish species, comprising: - 83% tropical species; - 11% warm temperate species; and - 6% cool temperate species. + 218 species of bivalves, comprising: - 75% with a tropical range; and - 10% with a southern Australian range. + 12 species of seagrass, making it one of the most diverse seagrass assemblages in the world; + An estimated population of about 11,000 dugongs, one of the largest populations in the world;

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
			+ Humpback and southern right whales use the bay as a migratory staging post; + Bottlenose dolphins occur in the bay, and green turtle and loggerhead turtle nest on the beaches; + Large numbers of sharks including whaler, tiger shark and hammerhead are present, as well as an abundant population of rays, including the manta ray; + Hamelin Pool in Shark Bay contains the most diverse and abundant examples of stromatolite forms in the world, representative of life forms that lived some 3,500 million years ago; and + Aligns with the Shark Bay WHA.
Jurien Bay Marine Park	1,281/1,258	VI - Multiple Use Zone (100%)	+ Ecological values: - geomorphology, such as intertidal reef platforms; - water and sediment quality; - seagrass meadows and macroalgal communities; and - fauna such as seabirds, invertebrate communities, finfish, sea lions, cetaceans and turtles. + Social values: - indigenous heritage and maritime heritage; - commercial fishing, recreational fishing and aquaculture; - coastal use; - seascapes; - marine nature-based tourism and water sports; - petroleum drilling and mineral development; and - scientific research and education.

Name	Distance from the WHP/ closest Project Area Boundary (km) (approximate)	IUCN Zones and Areas (% of park total)	Summary of Values and Sensitivities
Shoalwater Islands Marine Park	1,507/1,472	VI - Multiple Use Zone (100%)	+ Representative rocky shoreline habitats; + Roosting and nesting areas for birds, including little penguins; + Seagrass meadows; + Marine fauna, such as: - fishes (including sharks and rays); - bottlenose dolphins; - sea lions; - crustaceans (including western rock lobster); - worms; and - shellfish.
Ngari Capes Marine Park	1,643/1,619	VI - Multiple Use Zone (100%)	+ Aboriginal cultural heritage values; + Seagrass communities; + Intertidal, shallow subtidal and deep reef communities; + Coral communities; + Finfish; + Marine mammals, including sea lions; + Seabirds and shorebirds; + Recreational uses; and + Scientific research.

3.4.2.3 Western Australian Terrestrial Protected Areas

The Western Australian terrestrial protected areas that overlap the EMBA comprise two categories:

- nature reserves; and
- conservation parks.

Nature reserves and conservation parks are intended to protect and conserve flora and fauna.

The hydrocarbon spill modelling studies (**Attachment 8**) identified several Western Australian terrestrial reserves as potentially having shoreline accumulation of oil above impact thresholds. These are described in **Table 3-19**.

Table 3-19: Nature reserves and conservation parks within the EMBA

Reserve Name	Distance from the WHP (km)	Distance from Closest Project Area Boundary (km)
Nature Reserves		
Bedout Island Nature Reserve	72	38
North Turtle Island Nature Reserve	96	71
Kujungurru Warrarn Nature Reserve	170	117
Jinmarnkur Kulja Nature Reserve	152	105
Coulomb Point Nature Reserve	406	345
Lacepede Islands Nature Reserve	429	372
Barrow Island Nature Reserve	389	365
Boodie, Double Middle Islands Nature Reserve	412	389
Swan Island Nature Reserve	545	487
Adele Island Nature Reserve	609	553
Scott Reef Nature Reserve	625	582
Conservation Parks		
Kujungurru Warrarn Conservation Park	176	121
Jinmarnkur Conservation Park	292	234
Montebello Islands Conservation Park	363	340

3.4.2.4 Wetlands of International Importance (Ramsar Wetlands)

Wetlands of international importance, commonly called Ramsar sites, are protected under the EPBC Act as wetlands of international importance. The Project Area does not overlap any wetlands of international importance; however, a number are overlapped by the EMBA (potentially impacted in the unlikely event of a hydrocarbon spill). These are listed in **Table 3-20**, along with the shortest distance between the WHP and the AMP.

Table 3-20: Ramsar wetlands within the EMBA

Wetland	Distance from Dorado WHP (km)	Distance from Closest Project Area Boundary (km)
Eighty-mile Beach	146	99
Roebuck Bay	366	305
Ashmore Reef National Nature Reserve	873	829
Peel-Yalgorup System	1,526	1,503
Hosnies Spring	1,700	1,676
The Dales	1,712	1,687

These sites are recognised as being critically important to migratory bird species that utilise habitats in more than one country. Descriptions of each of these Ramsar sites are in the following sections. Refer to **Section 3.3.6** for a summary of migratory birds that may occur within the EMBA.

3.4.2.4.1 Eighty-mile Beach

The Eighty-mile Beach Ramsar site is located between Port Headland and Broome and is made up of Eighty Mile Beach and Mandora Salt Marsh (about 40 km inland from the beach). Eighty Mile Beach is a long (220 km) relatively uninterrupted sand coast and associated mudflats, ranging in width from 1 km to 4 km (Hale and Butcher 2009). The boundary of the Ramsar site along the beach is defined by the tide, extending from mean low water to 40 m above mean high water. The intertidal zone is comprised of a large expanse of intertidal mudflats (up to 4 km wide at the lowest tides) and a narrow strip at the landward edge of coarser quartz sands. Mandora Salt Marsh includes two large seasonal wetlands and a series of small permanent mound springs. A summary of the environment and ecological character of the Ramsar site is provided in **Table 3-21**.

Table 3-21: Environmental and ecological character description of the Eighty-mile Beach Ramsar site (from Hale and Butcher 2009)

Ecosystem Components and Processes	
Climate	Semi-arid monsoonal with a prolonged dry period, more than 80% of rainfall in the wet season (December to March). High interannual variability. High occurrence of tropical cyclones.
The Beach	+ Geomorphology: Extensive intertidal mudflats comprised of fine-grained sediments. Site is backed by steep dunes comprised of calcareous sand. + Hydrology: Macro-tidal regime. No significant surface water inflows. Groundwater interactions unknown (knowledge gap). + Primary production and nutrient cycling: Data deficient, but organic material deposited from ocean currents driving the system through bacterial or microphytobenthos-driven primary production. + Invertebrates: Large numbers and diversity of invertebrates within the intertidal mudflat areas. + Fish: Data deficient, but anecdotal evidence of marine fish (including sharks and rays) using inundated mudflats.

	+ Waterbirds: Significant site for stopover and feeding by migratory shorebirds. Regularly supports more than 200,000 shorebirds during summer and more than 20,000 during winter. High diversity with 97 species of waterbird recorded from the beach. Regularly supports more than 1% of the flyway population of 20 species. + Marine turtles: Significant breeding site for the flatback turtle.
Mandora Salt Marsh	+ Geomorphology: Wetland formation dominated by alluvial processes. Wetlands were once a part of an ancient estuary. Freshwater springs have been dated at 7,000 years old. + Hydrology: Walyarta, East Lake and the surrounding intermittently inundated paperbark thickets are inundated by rainfall and local run-off. Extensive inundation occurs following large cyclonic events. Salt Creek and the mound springs are groundwater-fed systems through the Broome Sandstone Aquifer. + Water quality: Most wetlands are alkaline, reflecting the influence of soils and groundwater. Salinity is variable: mound springs are fresh, Salt Creek is hypersaline, and Walyarta is variable with inundation. Nutrient concentrations in groundwater and groundwater-fed systems are high. + Primary production and nutrient cycling: Data deficient. However, evidence of boom and bust cycle at Walyarta with seasonal inundation. + Vegetation: Inland mangroves (*Avicennia marina*) lining Salt Creek are one of only two occurrences of inland mangroves in Australia. Paperbark thickets dominated by the saltwater paperbark (*Melaleuca alsophila*) extend across the site on clay soils, which retain moisture longer than the surrounding landscape. Samphire (*Tecticornia* spp.) occurs around the margins of the large lakes. Freshwater aquatic vegetation occurs at Walyarta when inundated and at the mound spring sites year-round. + Invertebrates: Data limited, but potentially unique species. + Waterbirds: Significant site for waterbirds and waterbird breeding, particularly during extensive inundation events. 66 waterbirds recorded. Supports more than 1% of the population of at least two species. Breeding recorded for at least 24 species.
Ecosystem Services	
Provisioning service	+ Freshwater: The freshwater springs at Mandora Salt Marsh provide drinking water for livestock. + Genetic resources: Plausible, but as yet no documented uses. + Climate regulation: Plausible, but data deficient.
Regulating service	+ Biological control of pests: Evidence that many of the shorebirds feed on the adjacent pastoral land and that the incidence of 2.88 million oriental pratincole coincided with locusts in almost plague proportions, upon which the birds fed.
Cultural Services	+ Recreation and tourism: The beach portion of the site is important for recreational fishing, tourism, bird watching and shell collecting. + Spiritual and inspirational: Spiritually significant for the Karajarri and Nyangumarta and contains a number of specific culturally significant sites. The site has inspirational, aesthetic and existence values at regional, state and national levels.

	+ Scientific and educational: Mandora Salt Marsh and Eighty Mile Beach have been the sites of a number of significant scientific investigations. In addition, Eighty Mile Beach is a significant site for migratory shorebird monitoring and is currently part of the Shorebirds 2020 program.
Supporting services	As evidenced by the listing of the Eighty-mile Beach Ramsar site as a wetland of international importance. The system provides a wide range of biodiversity-related ecological services critical for the ecological character of the site, including: + containing a diversity of wetland types; + supporting significant numbers of migratory shorebirds; + supporting significant wetland bird breeding; and + supporting flatback turtle breeding.

3.4.2.4.2 Roebuck Bay

The Roebuck Bay Ramsar site covers an area of 34,119 hectares and is primarily comprised of intertidal mudflats. The site extends from Campsite (a location on the northern shore of Roebuck Bay) east of the town of Broome to south of Sandy Point. The site was listed for several reasons including, most notably, outstanding shorebird values. The high biomass of benthic invertebrates at Roebuck Bay (for a tropical mudflat) is a key characteristic that makes it such an important shorebird habitat. The soft-bottom intertidal mudflats of the northern and eastern shores of Roebuck Bay and high tide roosts at Bush and Sandy points are the most biologically significant parts of the site (Bennelongia 2009).

The site regularly supports over 100,000 waterbirds. It is the fourth most important site for waders in Australia in terms of absolute numbers and the most important in terms of the number of species it supports in internationally significant numbers. A summary of the environment and ecological character of the Ramsar site is provided in **Table 3-22**.

Table 3-22: Environmental and ecological character description of the Roebuck Bay Ramsar Site (from Bennelongia 2009)

Ecosystem Components and Processes	
Climate	Semi-arid monsoonal with hot, wet summers and warm, dry winters. Mean monthly temperature ranges from a maximum of approximately 35°C to a minimum of 13.6°C, and average daily sunshine is around 15 hours. Winters are mild, with overnight temperatures rarely falling below 5°C. Mean annual rainfall at Broome is 601 mm, mostly falling from December to March
Tides	Semi-diurnal tides with an amplitude up to 10 m. Spring tides occur every fortnight. These flood low-lying salt marshes behind the mangrove woodlands fringing the bay at high tide and expose about 190 km^2 of mudflat (45% of the bay area) at low tide. The twice daily tidal flushing across the mudflat is a driving factor in the ecology of most life forms in the extensive intertidal zone of the bay.
Roebuck Bay	+ Wetland values: The site is an example of a tropical marine embayment within the Northwest bioregion. It is one of only a dozen intertidal flats worldwide where benthic food sources are found in sufficient densities that they regularly support internationally significant numbers of waders.

	+ Threatened species/communities: Loggerhead and green turtles regularly use the site as a seasonal feeding area and as a transit area on migration. Flatback turtles regularly nest in small numbers around Cape Villaret during the summer months. Sawfish regularly use the tidal creeks and mangrove areas for breeding and refuge. + Regional biodiversity: The site supports a significant component of the regional intertidal and shallow marine biodiversity in terms of the marine mammals, marine invertebrate infauna, and avian fauna across the site. The total density of macrobenthic animals is high by global standards for a tropical mudflat, and species richness is very high (estimated to be between 300 and 500 species). + Key habitat in life cycle. The site is one of the most important migration stopover areas for shorebirds both in Australia and globally. It is the arrival and departure point for large proportions of the Australian populations of several shorebird species, notably the bar-tailed godwit and great knot. The site provides essential energy replenishment for many migrating species, some of which fly non-stop between continental east Asia and Australia.
Primary Determinants of Ecological Character	
Sedimentary and Geomorphic Processes	+ Geomorphology: A megascale irregular curved embayment that contains a wide expanse of intertidal mud and sand flats indented by microscale linear tidal creeks. + Sedimentology: Three main sediment provinces have been identified: northern sands province, eastern silt and clay province and southern sands province.
Nutrient Processes and Carbon Supply	Nitrogen and phosphorus are frequently the most important because their biological availability limits rates of growth of marine plants. There are probably several sources of carbon supply to the intertidal flats of Roebuck Bay, namely in situ fixation by microalgae, phytoplankton deposits during flooding tides, detritus from adjacent mangrove systems, and some transport of macroalgal and seagrass material. There may also be input of terrestrial carbon, particularly after major rainfall events following the passage of cyclones.
Groundwater Movements	The only available measurements of the relationship between groundwater and the coastal systems of Roebuck Bay are from Vogwill (2003) who used a series of piezometers to record changes in groundwater levels in mudflats behind Crab Creek and Dampier Creek. Groundwater levels in both systems were affected by tidal movement and rainfall, with each being dominant close to the coast and hinterland respectively.
Tides and Water Exchange	The daily ebb and flow of the tides in Roebuck Bay are a significant factor in determining the ecological character of the bay, as are the lunar and annual tidal regimes.
Intrinsic Ecological Factors	Within a systems approach to describing the ecological character of a geographical area, there is a need to include those intrinsic ecological factors, such as recruitment, trophic structure, resources depletion and other attributes of habitat utilisation. It is not possible to describe all of the intrinsic attributes of Roebuck Bay here as many of them are species specific and not documented.

3.4.2.4.3 Ashmore Reef National Nature Reserve

The Ashmore Reef Ramsar site is located within the Commonwealth Ashmore Reef Marine Park. Ashmore Reef is located on the outer continental shelf, approximately 320 km off the northwest coast of mainland Australia. The site was listed in 2002. In addition to providing an important site for migratory shorebirds, Ashmore Reef also hosts regionally important populations of migratory and non-migratory seabirds.

A summary of the environmental and ecological character of the Ashmore Reef Ramsar site is provided in **Table 3-23**.

Table 3-23: Environmental and ecological character description of the Ashmore Reef Ramsar Site (from Hale and Butcher 2013)

Ecosystem Components and Processes	
Climate	+ Arid tropical monsoonal climate. + Located outside the main belt of tropical cyclones in the Timor Sea.
Geomorphic Setting	+ Located in an area of high oil and gas reserves, with active hydrocarbon seeps. + Geomorphic groups within the site include reef slope, reef crest, reef flat, back reef sands, lagoons and islands.
Tides and Currents	+ Strong seasonal influences of the Indonesian Throughflow and Holloway currents. + Internal waves are a feature of the region, and Ashmore Reef may act to break these resulting in increased nutrients from bottom waters. + High-energy environment with spring tides over 4.5 m and large flushing on tidal cycles.
Water Quality	+ Seasonal variations in temperature and salinity in ocean and lagoon water. + Water clarity, turbidity and other water quality parameters remain a knowledge gap.
Vegetation	+ Five species of seagrass recorded with *Thalassia hemprichii* dominant, comprising over 85% of total cover. + Total cover of 470 hectares, but much of this is sparse, and there is only 220 hectares with a mean cover of greater than 10%. + Over 3,000 hectares of macroalgae, mostly on the reef slope and crest areas + Algae dominated by turf and coralline algae with fleshy macroalgae comprising typically less than 10% of total algal cover.
Ecosystem Services	
Supports Near Natural Wetland Types	Contains examples of the following wetland types: + Permanent shallow marine waters. + Marine subtidal aquatic beds; includes kelp beds, sea-grass beds, tropical marine meadows. + Coral reefs. + Sand, shingle or pebble shores; includes sand bars, spits and sandy islets; includes dune systems and humid dune slacks. + Intertidal mud, sand or salt flats.
Supports Biodiversity	The Ashmore Reef Ramsar site is considered a hotspot of biodiversity with the highest species richness of many groups of fauna in the bioregion and more broadly across the North West Shelf. This includes many groups of invertebrates, such as

	coral, molluscs, echinoderms and crustaceans, as well as finfish and sea snakes. Biodiversity at the site is supported by the habitat provided by the near-natural wetland types and the interactions between the biota within the atoll environment, such as trophic relationships and the transfer of energy.
Provides Physical Habitat for Breeding Waterbirds	Twenty species of wetland bird have been recorded breeding within the Ashmore Reef Ramsar site, the majority of which are seabirds. The species recorded breeding at the site utilise a range of different habitats within the system. This includes the shrubby and grassy vegetation, the ground beneath shrub vegetation, and the sandy beaches. Maintaining this diversity of habitat is essential to maintaining this service.
Supports Migratory Birds	Ashmore Reef Ramsar site supports a diversity and abundance of migratory shorebirds in the East Asian–Australasian Flyway. The majority of birds in the flyway migrate from breeding grounds in northeast Asia and Alaska to non-breeding grounds in Australia and New Zealand, covering the journey of 10,000 km twice in a single year.
Supports Threatened Species	Supports a range of species that are of ecological significance, several of which are listed as threatened under the EPBC Act. Taxa include: + corals; + sea cucumbers; + fishes; + sea snakes; + marine turtles; and + dugong.

3.4.2.4.4 Peel-Yalgorup System

The Peel-Yalgorup System Ramsar site is composed of the Peel-Harvey estuary and a series of lakes. The estuary and lakes were designated as a Ramsar site in 1990. Of these components, only the Peel-Harvey estuary (approximately 1526 km from the Dorado WHP) could credibly be at risk of impacts from Dorado Phase 1; hence, the Peel-Harvey estuary is the only component of the Ramsar site described here.

A summary of the environmental and ecological character of the Peel-Harvey estuary component of the Peel-Yalgorup System Ramsar site is provided in **Table 3-24**.

Table 3-24: Environmental and ecological character description of the Peel-Harvey estuary component of the Peel-Yalgorup Ramsar site (from Hale and Butcher 2013)

Ecosystem Components and Processes	
Geomorphology	+ Geomorphology: estuary formed since last glacial period. Formerly a natural bar-built estuary that would intermittently open to the sea; currently permanently open to the sea via the Mandurah Channel that was dredged and is maintained at 1.9 m water depth. Peel-Harvey estuary is relatively shallow, with much of the estuary having less than 0.5 m water depth.
Hydrology	+ Water derived from: - direct rainfall; - surface water flows from catchment via Serpentine, Murray and Harvey rivers (the primary source of inflows into the estuary); and

	- groundwater inflows. + Tidal exchange historically limited, but currently facilitated by permanently opened channel.
Water Quality	+ Strong seasonal patterns in salinity: - low in winter (less than 5 ppt) due to freshwater inputs from rainfall and rivers; and - high in summer (more than 35 ppt) due to evaporation and lack of freshwater input. + Waters generally well oxygenated due to shallow nature of estuary facilitating diffusion of atmospheric oxygen into the water column, but high biological oxygen demand may lead to local, short-term deoxygenation. + Historically severe eutrophication due to agricultural practices in river catchments.
Vegetation	+ Phytoplankton: seasonal patterns linked to nutrient availability and hydrology. Dominated by diatoms during autumn and winter, cyanobacteria becoming conspicuous in spring and early summer, particularly in the Harvey estuary. Historical eutrophication has contributed to phytoplankton blooms. + Benthic plants: dominated by macroalgae, with higher abundance in the Peel estuary due to relatively shallow waters depths compared to Harvey estuary. Historical eutrophication results in high macroalgae biomass. Seagrass growth of *Ruppia* and *Halophila* is seasonal, with senescence during winter. + Littoral vegetation: tidal saltmarsh communities are common in the littoral environment around the Peel-Harvey estuary.
Fauna	+ Invertebrates: significant invertebrate population supported by high levels of primary productivity. Invertebrates such as polychaetes, crustaceans and molluscs support birds. + Fish: most species in the estuary are considered marine or estuarine species that recruit as larvae or juveniles. + Marine mammals: anecdotal evidence of small numbers of bottlenose dolphins moving between the Peel-Harvey estuary and the ocean. + Birds: 86 species of waterbirds recorded in the Peel-Harvey estuary. Up to 150,000 birds recorded, which is the highest number recorded for wetlands in southwestern Australia. The site has been recorded supporting more than 1% of the populations of waterbirds, including several migratory species utilising the East Asia–Australasia Flyway.
Determinants of Ecological Character	
Nutrients	Eutrophication in the Peel-Harvey estuary resulting from nutrient inputs from river catchments has altered the ecosystem. Increased primary productivity supports higher biomass of plants and invertebrates, which in turn supports migratory bird and waterbird populations. Negative effects may include smothering of intertidal flats due to high levels of macroalgae.
Salinity	Salinity limits the range of aquatic organisms that may survive in the estuary due to osmotic stress. The salinity in the estuary varies significantly on an annual cycle from brackish (less than 5 ppt) to higher than marine (more than 35 ppt).

	The continuous intrusion of marine water due to the permanent channel has altered the natural salinity regime.
Habitat	The estuary provides a range of habitats: + open water; + mudflats; + aquatic plants; + samphire; + paperbark; and + sedgeland. The diversity of habitats is reflected in the relatively high species richness and diversity of migratory birds and waterbirds that use the estuary.

3.4.2.4.5 Hosnie's Spring

Hosnie's Spring Ramsar site is located on the eastern side of Christmas Island in the Indian Ocean approximately 2,800 km west of Darwin, Australia, and 1700 km from the Dorado WHP. At the time of listing (1990) Hosnie's Spring comprised less than one hectare of freshwater spring. In 2010, the boundary of Hosnie's Spring was expanded from 0.33 hectares to 202 hectares (Hale and Butcher 2010).

A summary of the environmental and ecological character of the Hosnie's Spring Ramsar site is provided in **Table 3-25.**

Table 3-25: Environmental and ecological character description of the Hosnie's Spring Ramsar site (from Hale and Butcher 2010)

Ecosystem Components and Processes	
Climate	+ Warm tropical climatic zone; warm to hot year round. + High rainfall (2,000 mm/year).
Geomorphic setting	+ Site is located within the shore terrace on an area of gravel overlying phosphoric soils. + Spring is situated at the base of the inland cliffs where spring water flows over a limestone flowstone.
Water quality	+ Limited information (two snapshot surveys only). + Typical of limestone karst systems with alkaline conditions and relatively high concentrations of calcium. + Trace elements and metals are all low. + Nitrogen is predominantly in the form of nitrate. + High concentrations of sulphate result in a sulphurous odour.
Critical Components and Processes	
Hydrological Regime	+ Groundwater dominant. + Source for Hosnie's Spring is a perched, unconfined aquifer that discharges where impermeable volcanic rocks are close to the surface. + Flow rate is not known but expected to be low.

	+ Spring is perennial.
Mangroves	+ Stand of mangroves from the genus *Bruguiera* covers the majority of the wetland. + Comprises a range of age classes with evidence of active regeneration. + A number of very large trees (large than typical for the species), with the largest tree measuring 82 cm diameter at breast height and exceeding 40 m in height. + Between 300 and 600 trees in total (more than 2.5 cm diameter at breast height) and a density of between 10 and 20 trees per 100 m^2.
Land Crabs	+ Supports large populations of at least three species: - red crabs (*Gecarcoidea natalis*); - robber crabs (*Birgus latro*); and - blue crabs (*Discoplax hirtipes*).
Cultural and Supporting Services	
Recreation and Tourism	While the site is open to the public, tourism to the site is not promoted. Rather, the site is managed to provide a limited number of visitors an opportunity to visit a unique wetland that is largely undisturbed by humans.
Scientific and Educational	The unique nature of the site and the pristine condition provide excellent opportunities for research.
Supports Near-natural Wetland Types	The spring at the Ramsar site is in near-natural condition and significant within the bioregion. It is the only area on Christmas Island that supports freshwater mangroves.
Biodiversity	Supports a variety of wetland species, communities and habitats, including marine, terrestrial and freshwater-dependent species.
Food Webs	Interactions between land crabs and mangroves form an important food web at the site.
Distinct Wetland Species	Blue crabs are reliant on the few permanent freshwater sites on Christmas Island (including Hosnie's Spring) for reproduction and for survival in the dry season.
Ecological Connectivity	Red crabs migrate from the plateau to the ocean to breed each year.

3.4.2.4.6 The Dales, Christmas Island

The Dales, Christmas Island Ramsar site is located on Christmas Island in the Indian Ocean approximately 2,800 km west of Darwin, and approximately 1712km from the Dorado WHP. The Dales Ramsar site is located entirely within the Christmas Island National Park, in the west of the island, with the western boundary of the site extending to 50 m seaward from the low water mark. The site was listed as a Ramsar site in 2002. The Dales Ramsar site comprises a system of seven watercourses collectively known as "The Dales". Three of the Dales support permanent springs, while the remaining Dales support intermittent streams during the wet season (Butcher and Hale 2010).

A summary of the environmental and ecological character of The Dales Ramsar site is provided in **Table 3-26.**

Table 3-26: Environmental and ecological character description of The Dales Ramsar site (from Butcher and Hale 2010)

Ecosystem Components and Processes	
Climate	+ Warm tropical climatic zone; warm to hot year round. + High rainfall (2,000 mm/year).
Geomorphic Setting	+ Site is located within the shore terrace on an area of gravel overlying phosphoric soils. + Springs are situated at the base of the inland cliffs where spring water flows over a limestone flowstone.
Water Quality	+ Limited site-specific data – information from one survey in 2003 for Hugh's Dale may provide baseline data for time of listing. + Water quality is good, with higher concentrations of some trace metals and major ions compared to upstream reference sites, due to the presence of volcanic rocks and significant crab populations.
Terrestrial Vegetation	+ Limited site-specific data; descriptions of the vegetation are limited.
Coral reef	+ The coral reef is limited and dominated by abiotic and hard corals of low diversity.
Fish	+ Community predominantly of Indo-Pacific origin. + Endemism is low, but a number of species are at the western extent of their range at Christmas Island; and there is evidence of hybridisation. One endemic freshwater species recorded from the site.
Invertebrates (Excluding Crabs)	+ The site supports a low diversity of benthic marine invertebrates but may also support anchialine fauna, although no site-specific data has been sourced to confirm this.
Critical Components and Processes	
Geomorphic Setting	+ The island is a karstic landscape with key geomorphic features including the terrace formations, sea cliffs, and caves and other karst features, such as tufa at Hugh's Dale.
Hydrology	+ Karstic drainage system of groundwater and surface ephemeral streamflow post heavy rainfall events during the wet season. + Spring outflow of groundwater at three of the Dales is permanent.
Land Crabs	+ All 20 species of land crab occur within the boundary of the site. + The Dales provide a major migration pathway for crabs to and from the ocean during spawning. + The site is important for blue crabs in particular.
Waterbirds	+ Eleven waterbirds, including nine endemic species, one nationally listed vulnerable and one endangered species are found at the site. + The site supports breeding seabirds, including Abbott's booby and red-footed booby.
Cultural and Supporting Services	

Recreation and Tourism	The Dales are a popular recreational area for both tourists and locals. Two timber boardwalks have been installed at No. 1 Dale and Hugh's Dale. The Dales are the most popular sightseeing destination on the island with the waterfall at Hugh's Dale being the greatest attraction.
Science and Education	Parks Australia undertakes and supports a range of research programs across the Christmas Island National Park, many of which are directly relevant to The Dales. For example, research investigations include impacts of the yellow crazy ant, land crab ecology, and Abbott's booby.
Food Webs	Crab spawning provides a rich food supply to marine biota, including whale sharks. In addition, the land crabs play a significant role in the energy dynamics of the forest, affecting seedling recruitment and ultimately the structure of the forest. The invasion of the yellow crazy ant has significantly affected trophic relationships on Christmas Island.
Provides Physical Habitat (for Breeding Waterbirds).	Terrestrial vegetation provides roosting and breeding sites for several species of waterbirds.
Biodiversity	Supports a variety of wetland species, communities and habitats, including marine, terrestrial and freshwater-dependent species.
Special Ecological, Physical or Geomorphic Features	Provides critical habitat for the blue crabs and freshwater crabs, provides examples of karst features such as tufa deposits at the Hugh's Dale waterfall, and possibly provides anchialine cave communities.
Distinct or Unique Wetland Species	Red crabs are considered keystone species on the island.
Threatened Wetland Species, Habitats and Ecosystems	The Dales Ramsar site supports nesting sites for the endangered Abbott's booby. The Christmas Island frigatebird has also been recorded from the site.
Priority Wetland Species	Christmas Island supports a number of vagrant species listed under various international agreements
Supports Near-natural Wetland Types	Springs and karst systems are representative of the bioregion and considered in near natural condition at the time of listing.
Ecological Connectivity	The streams of The Dales provide critical migration pathways for downward migration of red, blue and robber crabs and return pathways for juvenile blue crabs in particular.

3.4.3 Fisheries

The waters off Western Australia support a range of commercial, recreational and traditional fisheries. These provide employment, food and recreation for thousands of people and drive important economic activities, especially in coastal regional centres.

3.4.3.1 Commercial Fishing

Commercial fisheries within the EMBA can be considered in two categories:

- Western Australian (state) managed fisheries, and
- Commonwealth managed fisheries.

State managed fisheries are shown in **Figure 3-25**, and Commonwealth managed fisheries are shown in **Figure 3-26**. Identification of relevant fisheries within the Bedout Sub-basin has been ongoing since 2008 through consultation with the Department of Primary Industries and Regional Development (DPIRD) and Western Australian Fishing Industry Council (WAFIC). A review of available fishery management information for pelagic and demersal finfish fisheries indicated that while fisheries management measures include annual quotas and closure of specific areas all the time, none of the fisheries have specific time periods of closure for spawning or aggregation.

Both fishery categories are considered, with fisheries that overlap the Project Area described in more detail.

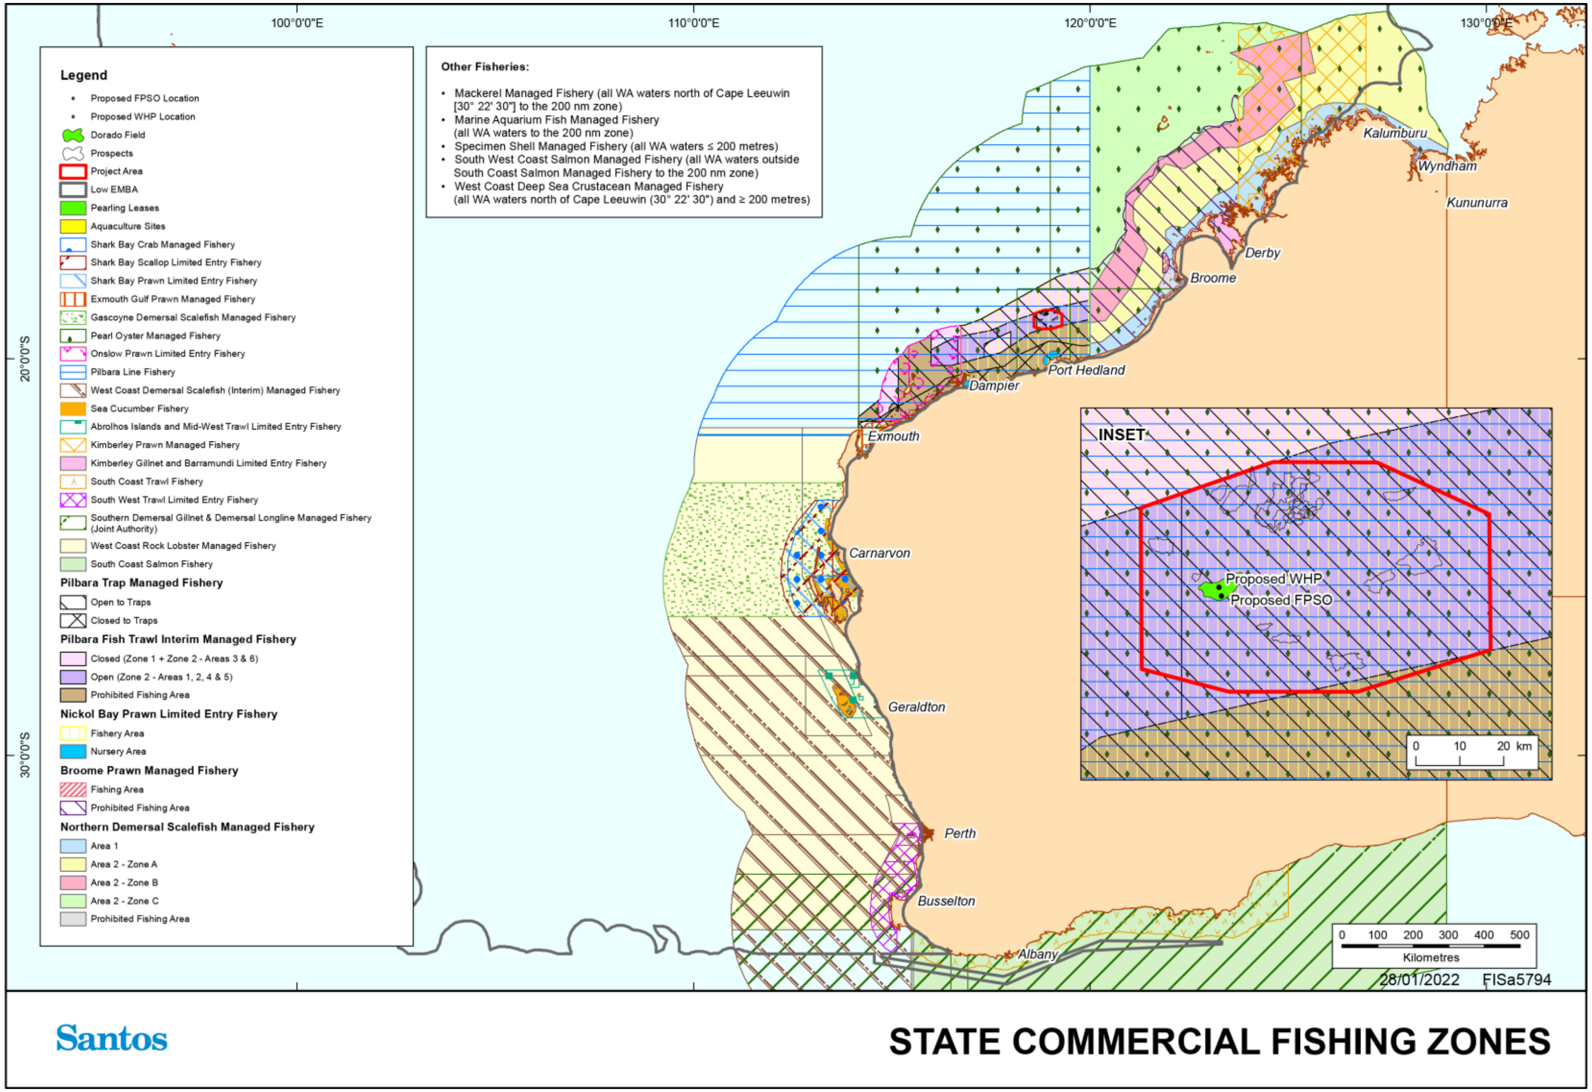

Figure 3-25: Western Australian (state) managed fisheries within the EMBA

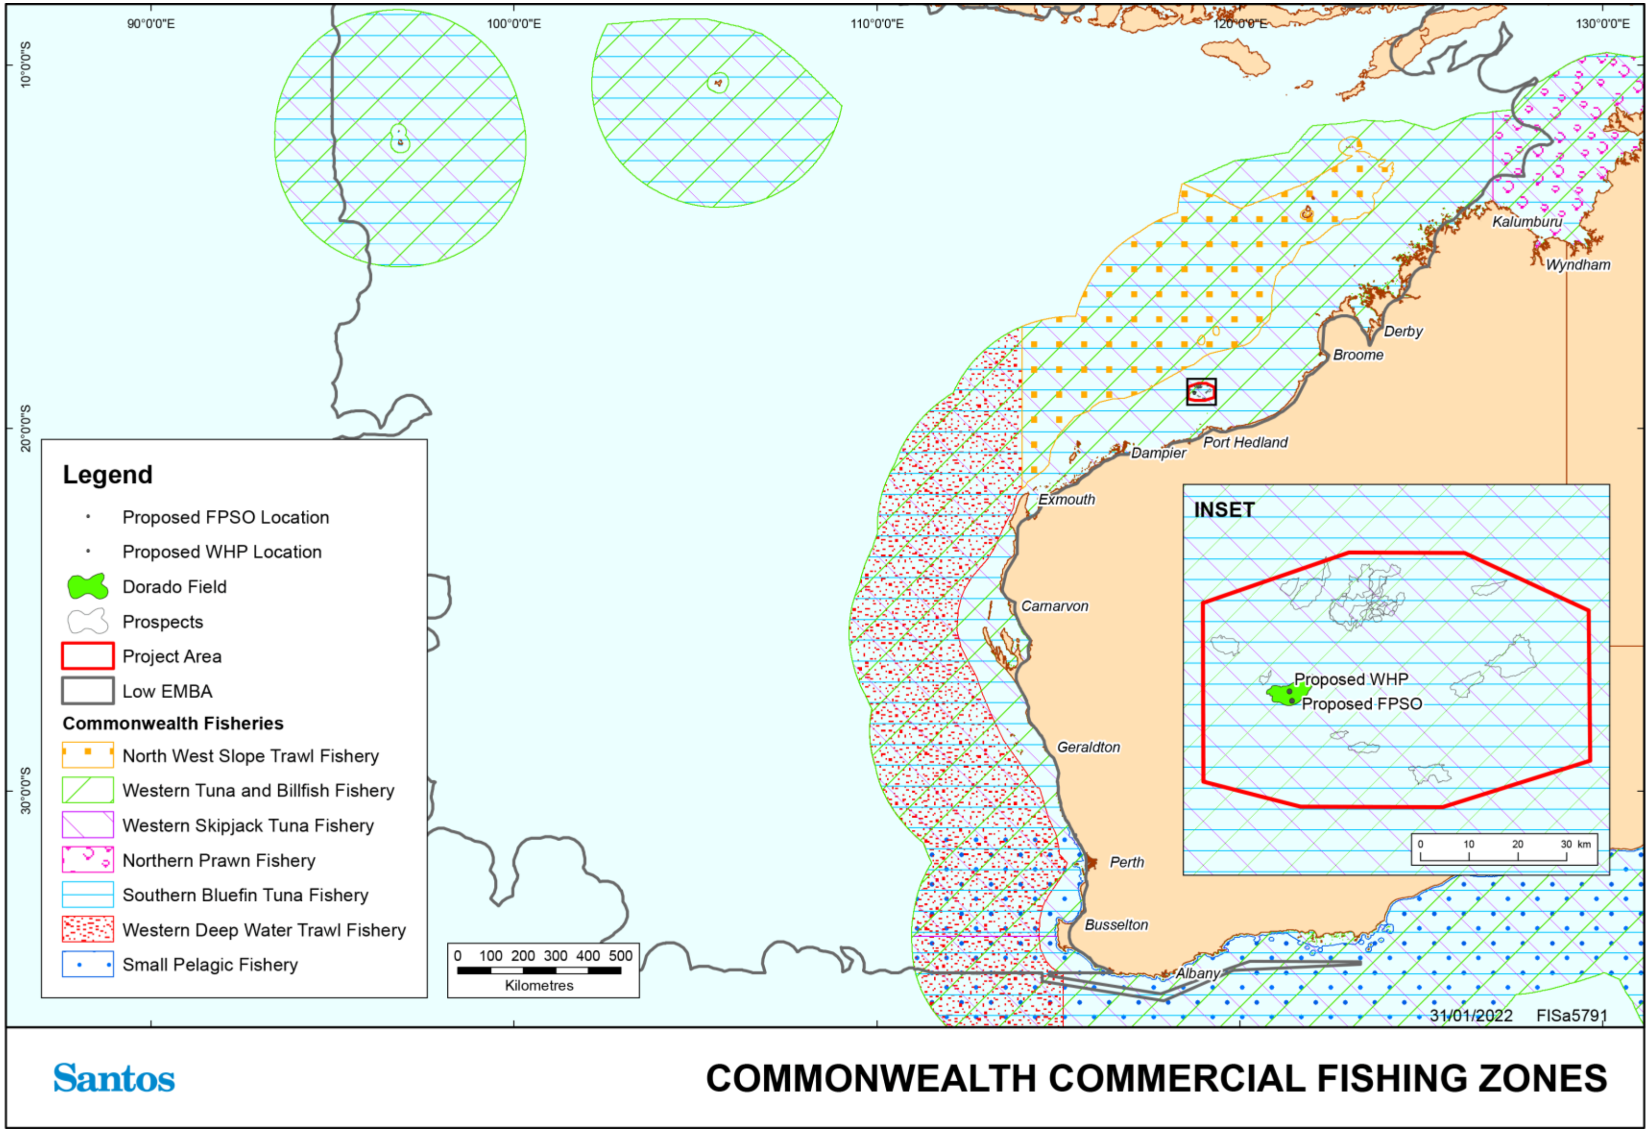

Figure 3-26: Commonwealth managed fisheries within the EMBA

3.4.3.1.1 State Managed Fisheries

State fisheries are managed by DPIRD (formerly Department of Fisheries) with specific management plans, regulations and a variety of subsidiary regulatory instruments under the Western Australian *Fish Resources Management Act 1994*. The information on state managed fisheries has been derived from Status reports of the fisheries and aquatic resources of Western Australia 2017/18: state of the fisheries (Gaughan et al. 2019) and direct consultation with DPIRD. Santos consults regularly with state fisheries relevant to activity operational areas, mainly by distribution of an Annual Consultation Update by post. Santos has undertaken engagement with the State Managed Fishers, via WAFIC, to support recent drilling and seismic activities within the Bedout Sub-basin (refer accepted Environment Plans for Archer 3D Marine Seismic Survey - https://info.nopsema.gov.au/activities/432/show_public , Keraudren Extension Survey - https://info.nopsema.gov.au/activities/404/show_public , and more recently the Bedout Multi-Well Drilling, accepted by NOPSEMA - https://info.nopsema.gov.au/environment_plans/535/show_public). Santos bases its understanding of the fisheries on reviews of annual status of the fishery reports published by DPIRD and the Australian Bureau of Agricultural and Resource Economics and Sciences, on other relevant fisheries management publications, and on fishery catch and effort data (**Section 7.2.8.2.1)**.

Santos requested annual catch and effort data (FishCube data) from DPIRD for fisheries understood to operate within or near to the Project Area. Data was assessed for 60 nautical mile (nm) x 60 nm Catch and Effort System (CAES) blocks and for 10 nm x 10 nm CAES blocks for the following:

+ catch and effort data for the most recent 10 years (2009 to 2018, aggregated); and
+ annual catch and effort data for each of the most recent five years (2014, 2015, 2016, 2017, 2018).

Data was assessed to identify where the greatest fishing effort in each fishery occurred and the relative importance of waters within the Project Area.

Data provided by DPIRD included:

+ weight (kg) – a measure of fish catches per CAES block during the period of interest;
+ vessel count – a measure of the number of vessels that fished in a CAES block during the period of interest; and
+ fishing day count – a measure of fishing effort, represented by the number of days when one or more vessels fished in a CAES block during the period of interest.

Due to confidentiality reasons, DPIRD do not release catch and effort data for CAES blocks where less than three vessels fished during the period of interest (i.e. less than three vessels per year or less than three vessels over the complete 10-year period). Where this applies, the Vessel Count is marked 'Less than 3', while Weight and Fishing Day Count are marked as 'N/A'. CAES blocks where the results are provided in this way confirm that fishing effort did occur within the block during that period, but the associated catch and effort values are not available. CAES blocks where no fishing is recorded do not return any data.

FishCube data has been mapped for the following fisheries (refer **Section 7.2.8.2.1**), to determine the spatial overlap and/or recorded fishing effort within the Project Area:

+ Mackerel Managed Fishery (Area 2 - Pilbara) (**Figure 7-30**);
+ Pilbara Fish Trawl (Interim) Managed Fishery (**Figure 7-31**);

- Pilbara Line Fishery (**Figure 7-32**);
- Pilbara Trap Managed Fishery (**Figure 7-33**);
- Nickol Bay Prawn Managed Fishery;
- Pilbara Crab Managed Fishery;
- Specimen Shell Managed Fishery; and
- Western Australian North Coast Shark Fishery.

Figure 3-27 shows the specific state managed within proximity of the Project Area. A summary of the state managed fisheries intersecting or within proximity of the Project Area is provided in **Table 3-27**. In addition to the fisheries that overlap the Project Area, a range of state managed fisheries overlap the EMBA beyond the Project Area. These are summarised in **Table 3-28**.

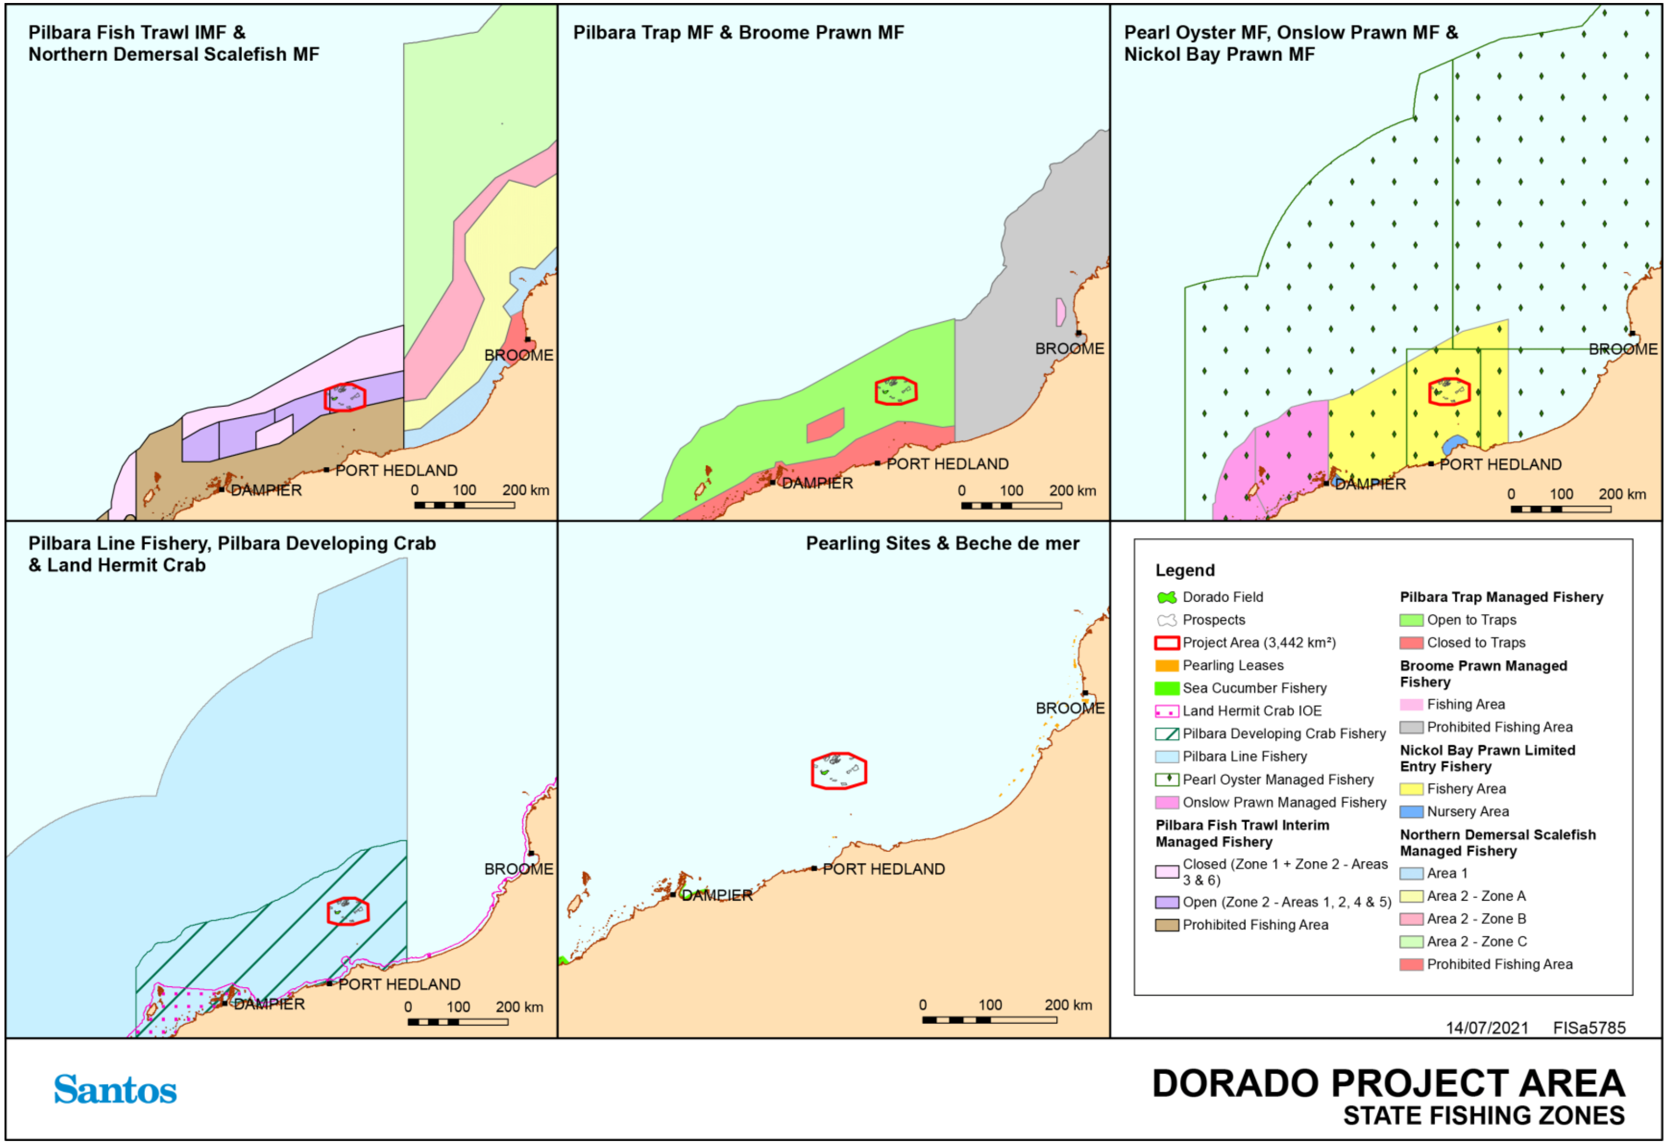

Figure 3-27: State managed fisheries in proximity of the Project Area

Table 3-27: Western Australian (state) commercial fisheries within the Project Area

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Pilbara Fish Trawl Interim Managed Fishery (IMF) Newman et al. (2019a)	The Pilbara Fish Trawl Interim Managed Fishery is situated in the Pilbara region in the northwest of Australia. It occupies the waters north of latitude 21°35ˈ S and between longitudes 114° 9ˈ 36" E and 120° E. The fishery is seaward of the 50-m isobath and landward of the 200-m isobath. The fishery consists of two zones: Zone 1 in the southwest of the fishery (which is closed to trawling) and Zone 2 in the north, which consists of six management areas, Areas 1 to 6. Areas 1, 2, 4 and 5 are open to trawl fishing all year round. The total area of these areas is 6,900 nm^2 (23,666 km^2).	Demersal trawl	Bluespotted emperor (*Lethrinus punctulatus*) Red emperor (*Lutjanus sebae*) Rankin cod (*Epinephelus multinotatus*) Goldband snapper (*Pristipomoides multidens*) Other demersal snapper, emperor, cod and grouper species are also caught.	In 2018, the total catch for the fishery was 1,975 tonnes (Gaughan et al. 2019), making up 75% of the total catch by the Pilbara Demersal Scalefish Fisheries, which is comprised of the trawl, trap and line fisheries. In the 2018 season, there were 11 licences in this fishery held by four licence holders. According to FishCube data, up to four vessels were active during the 2018 season. Fishing occurs year-round.	Fishing activity and target species occur in the Project Area. FishCube data shows fishing effort in the last 10 years occurs over an area of 23,058 km^2. The Project Area overlaps with 3,389 km^2 (15%) of the area of fishing effort. Fishing effort has occurred consistently within the Project Area each year for the last five years.

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Pilbara Trap Managed Fishery (MF) Newman et al. (2019a)	The Pilbara Trap MF lies north of latitude 21° 44' S and between longitudes 114° 9.6' E and 120°00'E on the landward side of a boundary approximating the 200-m isobath and seaward of a line generally following the 30-m isobath.	Demersal fish traps	Bluespotted emperor (*Lethrinus punctulatus*) Red emperor (*Lutjanus sebae*) Rankin cod (*Epinephelus multinotatus*) Goldband snapper (*Pristipomoides multidens*) Other demersal snapper, emperor, cod and grouper species are also caught.	In the 2018 season, there were six licenses in the Pilbara Trap MF, held between two operators. According to FishCube data, less than three vessels were active for the majority of the season, with a third vessel active only in July. In 2018, the total catch for the fishery was 562 tonnes (Gaughan et al. 2019), making up 21% of the total catch by the Pilbara Demersal Scalefish Fisheries, which is comprised of the trawl, trap and line fisheries. Fishing occurs year-round.	Fishing activity and target species occur in the Project Area. The fishery operates primarily from Onslow. Traps are limited in number with the greatest effort in waters less than 50 m depth. Given the water depth, fishing activity is not expected to occur within the Project Area. Fishing effort occurs over an area of 86,006 km^2. The Project Area overlaps with 3,442km^2 (4 %) of the area of fishing effort. Less than three vessels have operated in the Project Area each year for the last 5 years.
Pilbara Line Fishery Newman et al. (2019a)	The Pilbara Line Fishery fishing boat licensees are permitted to operate anywhere within "Pilbara waters", bounded by a line commencing at the intersection of 21° 56' S latitude and the high water	Demersal longline	Goldband snapper (*Pristipomoides multidens*) Ruby snapper (*Etelis carbunculus*) Other demersal snapper, emperor, cod and grouper	In the 2018 season nine individual licences were held in the Pilbara Line Fishery, held by seven operators. According to FishCube data, less than three vessels were active during the season.	Fishing activity and target species occur in the Project Area. FishCube data shows fishing effort in the last 10 years has occurred over an area of 146,414 km^2. The Project

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
	mark on the western side of the North West Cape on the mainland of Western Australia;,west along the parallel to the intersection of 21° 56' S latitude and the boundary of the 200-nm Australian Fishing Zone (AFZ), and north to longitude 120° E.		species are also caught.	The total catch in 2018 for the Pilbara Line Fishery was 95 tonnes (Gaughan et al. 2019), making up 4% of the total catch by the Pilbara Demersal Scalefish Fisheries, which is comprised of the trawl, trap and line fisheries. Fishing occurs year-round.	Area overlaps with 2,787 km^2 of the area of effort (2%). FishCube data reports that less than three vessels have operated in the Project Area each year for the last five years, compared with greater fishing effort located to the west of the Project Area between Exmouth and Dampier.
Mackerel Managed Fishery (Area 2 – Pilbara) Lewis and Brand-Gardner (2019) Mackie et al. (2010)	The Mackerel Managed Fishery licence area extends from Cape Leeuwin in the southwest of Western Australia to the Western Australian–Northern Territory border. Management Area 1 of the fishery (Kimberley sector) extends from 121° E to the Western Australian–Northern Territory border. Management Area 2 of the fishery (Pilbara sector) extends from 114° E near the North West Cape to 121° E.	Primarily surface or mid-water trolling by line. Jigging methods are also used.	Spanish mackerel (*Scomberomorus commerson*) Grey mackerel (also called broad-barred Spanish mackerel), school mackerel, spotted mackerel, shark mackerel and other pelagic species are also caught as bycatch species.	Most fishing efforts focused in Pilbara and Kimberley waters. Mackerel fishers troll for mackerel in nearshore waters. The fishery mainly relies on near-surface trolling and jig fishing around coastal reefs, shoals and headlands. FishCube data (**Attachment 1**) shows that fishing effort in the vicinity of the Project Area occurs in less than 60 m water depth, which is corroborated by	Considering the habitats and features that the fishery targets (reefs, shoals and headlands) are absent from the Project Area, participants in the fishery are not expected to be present in the Project Area. FishCube data for the last 10 years shows the Mackerel Managed Fishing effort within Area 2 is 51,526 km^2. The Project Area overlaps with 523 km^2 of the area of effort (1%). Fishing effort is restricted to the southern portion of the Project Area.

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
	Management Area 3 of the fishery (Gascoyne/West Coast sector) extends south from 114° E to Cape Leeuwin. The Project Area overlaps Area 2 – Pilbara sector.			consultation with fishing stakeholders for previous Bedout Sub-basin activities. The fishery operates year-round; however, most fishing effort occurs from April/May to October/November. In the Pilbara sector, about 65% of effort has historically occurred from July to August. The commercial catch of Spanish mackerel from all sectors of the fishery has been 270 to 330 tonnes (Gaughan et al. 2019) per year since 2006.	
Pearl Oyster Managed Fishery Hart et al. (2016, 2019)	The Pearl Oyster Managed Fishery licence area extends from 114° 10ˈ E near Exmouth to the Western Australian–Northern Territory border and out to the edge of the AFZ (200 nautical miles). The licence	Drift diving in waters up to 35 m depth	Indo-Pacific, silver-lipped pearl oysters (*Pinctada maxima*).	Drift diving, with divers towed behind vessels, allows collection of legal-sized pearl oysters from the seabed by hand. Following collection, pearl oysters are kept in wire mesh panels on the seabed at holding sites	The Project Area overlaps with Zones 1 and 2 of the fishery. However, pearl collection, holding and farming activities are limited to nearshore waters. Recent literature suggests more than 90% of individuals occurred shallower than 40 m

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
	area is subdivided into four zones. Zone 1 extends from 114° 10' E to 119° 30' E. Zone 2 extends from 118° 10' E and includes the Eighty Mile Beach region out to 18° 14' S. Zone 3 includes waters offshore from Broome and the North Kimberley coast, north of 18° 14' S and between 119° 00' E and 125° 20' E. Zone 4 extends from 125° 20' E to the Western Australian–Northern Territory border.			near fishing grounds. After 2 to 3 months, oysters are transferred from holding sites to pearl farm leases for cultivating pearls. The principal fishing grounds for pearl oyster collection are located off Eighty Mile Beach within water depths of approximately 20 m. A deeper water collection site called 'Compass Rose' lies offshore from Eighty Mile Beach in water depths of approximately 35 m. Holding sites are located near the fishing grounds in water depths up to 30 m (Hart et al. 2016). Fishing usually commences in March/April and ceases in June/July. Seeding of the pearl oysters is undertaken during winter months (June to August).	and less than 2% were found deeper than 50 m, supporting that extensive populations do not extend into deep water in the region (Whalan et al 2021). Pearl diving activities do not intersect the Project Area. FishCube data shows no effort within the Project Area, due to the restriction of pearl diving operational activities to shallow diving depths below 35 m. The nearest pearl diving activities in the last 10 years have occurred near Port Hedland, North Turtle Island, Little Turtle Islet and the DeGrey River mouth (approximately 50 km south of the Project Area). No fishing has been undertaken at these sites since 2016. The principal pearl oyster fishing grounds are located off Eighty Mile Beach approximately 120 km from the Project Area.

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
				This may occur at holding sites or at pearl farms. The principal fishing grounds, holding sites and pearl farms are in waters off Eighty Mile Beach and Broome. A single approved pearl farm lease is located near North Turtle Island, and pearl diving activities have previously occurred in coastal waters near Port Hedland and the De Grey River mouth.	
Nichol Bay Prawn Managed Fishery Kangas et al. (2019)	The boundaries of the Nichol Bay Prawn MF are all the waters of the Indian Ocean and Nickol Bay between 116° 45' E longitude and 120° E longitude on the landward side of the 200-m isobath. The fishery incorporates the Nickol Bay, Extended Nickol Bay, Depuch and De Grey River size-managed fish grounds.	Trawl	Banana prawns Brown tiger prawns	Fishing effort is concentrated in waters less than 50 m depth. The total landings of major penaeids for the 2017 season were 227.1 tonnes. Fishing effort in 2017 increased to 281 boat days, well up on the low effort of 43 boat days in 2016 (Kangas et al. 2017).	Prawn trawling activities are unlikely to occur in the Project Area. FishCube data shows effort in the fishery does not intersect the Project Area.

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Western Australia North Coast Shark Fishery Department of Fisheries (2005)	The fishery includes Australian waters north of Broome, from longitude 120° E to 123° 45' E (Koolan Island).	Longline	Dusky whaler shark Sandbar shark Gummy shark Whiskery shark	This fishery is currently closed to protect the breeding grounds of the resource that supports the two southern shark fisheries. No fishing effort since 2008/09.	The fishery is currently closed. Target species may occur in the Project Area.
Pilbara Crab Managed Fishery Johnston et al. (2019)	The boundaries of the fishery are consistent with the boundaries of the Nickol Bay Prawn Managed Fishery and the Onslow Prawn Fishery, which include waters between 114° 39.9' E and 120° E, and on the landward side of the 200-m depth isobath.	Traps	Blue swimmer crab	Crabbing activity along the Pilbara coast is centred largely on the inshore waters from Onslow through to Port Hedland, with most commercial and recreational activity occurring in and around Nickol Bay. Blue swimmer crabs are targeted by the fishery within inshore waters around Nickol Bay using hourglass trap (Gaughan and Santoro 2018).	Fishery activities are not expected to intersect the Project Area due to the distance from inshore waters. FishCube data shows no fishing effort within the Project Area. Consultation with WAFIC has indicated that while they do mostly fish nearshore (less than 50 m of water) they may venture into deeper waters.

Fishery	License Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Specimen Shell Managed Fishery Hart et al. (2019b)	This fishery occurs in all Western Australian state waters. Effort is concentrated in the area adjacent to the largest population centres, such as Broome, Karratha, Shark Bay, Mandurah, Exmouth, Cape region, Albany and Perth.	Hand collection, wading, diving in shallow coastal waters. One licence exemption permits the use of ROV.	The fishery targets the collection of specimen shells for display, collection, cataloguing and sale.	The main method of specimen shell collection is by hand, by a small group of divers operating from small boats in shallow coastal waters or by wading along coastal beaches below the high water mark. A current exemption permits the use of an ROV at depths of up to 300 m. This is a limited entry fishery with 23 active licences in 2016. A maximum of 2 divers are allowed in the water per licence at any one time, and specimens may only be collected by hand. ROVs were limited to one per license in 2016.	FishCube data for the last 10 years (**Section 7.2.8.2.1**) shows the Specimen Shell Managed Fishing effort area is 43,320km^2. The Project Area overlaps. The Project Area overlaps with 1,358km^2 of the area of effort (3%). Fishing effort to date is along the eastern extent of the Project Area.

Table 3-28: Western Australian (state) commercial fisheries within the EMBA and not the Project Area

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
Abalone Managed Fishery Strain et al. (2019)	Roe's abalone Brownlip abalone Greenlip abalone		Hand collection, diving	Abalone are collected by hand in shallow coastal waters in the southwest of Western Australia. Fishing effort from the dive-based fishery is restricted to shallow coastal waters off the southwest and south coasts of Western Australia, particularly around the Perth metropolitan area. Abalone is harvested by divers, limiting the fishery to shallow waters. The target species do not occur in tropical waters. The management area covering waters north of Moore River (near Perth) is closed.
Abrolhos Islands and Mid-West Trawl Managed Fishery	Saucer scallops (*Ylistrum balloti*), with a small component targeting the western king prawn (*Penaeus latisulcatus*).	2017/2018: 651 tonnes	Operates using low- opening otter trawl systems.	All the waters of the Indian Ocean adjacent to Western Australia between 27° 51ˈ S latitude and 29° 03ˈ S latitude on the landward side of the 200-m isobath.
Broome Prawn Managed Fishery Kangas et al. (2019)	Western king prawns (*Penaeus latisulcatus*) and coral prawns (a combined category of small penaeid species).	Extremely low fishing effort occurred. Only trial fishing was undertaken by one boat during 2016 to investigate whether commercial fishing was warranted. This resulted in negligible landings.	Otter trawl	The fishery operates in a designated trawl zone off Broome. The boundaries of the fishery are all Western Australian waters of the Indian Ocean lying east of 120° E longitude and west of 123° 45' E longitude on the landward side of the 200- m isobath. The actual trawl area is contained within a delineated small area northwest of Broome. The majority of the fishery is permanently closed to trawling and is not fished.

[11] Sources for catch data: Department of Agriculture 2019; Gaughan et al., 2019; DPIRD 2018.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
Cockburn Sound Mussel Managed Fishery	Blue mussels (*Mytilus galloprovincialis*)	2015: Unspecified.	Aquaculture	Main mussel farming occurs in southern Cockburn Sound.
Cockburn Sound Crab Managed Fishery	Blue swimmer crab (*Portunus armatus)*	2017/2018: closed to commercial and recreational fishing since April 2014.	Drop nets, scoop nets, diving	Encompasses the inner waters of Cockburn Sound, from South Mole at Fremantle to Stragglers Rocks, through Mewstone to Carnac Island and Garden Island, along the eastern shore of Garden Island and back to John Point on the mainland.
Cockburn Sound Line and Pot Managed Fishery	Southern garfish (*Hyporhamphus melanochir*), Australian herring (*Arripis geogianus*)	2017/2018: 257 tonnes.	Line (fish) Shelter and trigger pots (octopus)	Encompasses the inner waters of Cockburn Sound, from South Mole at Fremantle to Stragglers Rocks, through Mewstone to Carnac Island and Garden Island, along the eastern shore of Garden Island and back to John Point on the mainland.
Exmouth Gulf Prawn Managed Fishery	Western king prawns (*Penaeus latisulcatus*), brown tiger prawns (*Penaeus esculentus*), endeavour prawns (*Metapenaeus* spp.) and banana prawns (*Penaeus merguiensis*).	2017/2018: 713 tonnes.	Low-opening otter trawls.	Sheltered waters of Exmouth Gulf. Essentially the western half of the Exmouth Gulf (eastern part is a nursery ground). The Muiron Islands and Point Murat provide the western boundary; Serrurier Island provides the northern limit.
Gascoyne Demersal Scalefish Managed Fishery	Targets pink snapper (*Pagrus auratus*) and goldband snapper (*Pristipomoides multidens*). Other demersal species caught include the rosy snapper (*P. filamentosus*), ruby snapper (*Etelis carbunculus*), red emperor (*Lutjanus sebae*), emperors (Lethrinidae, including	2017/2018: Snapper: 133 tonnes. Other demersals: 144 tonnes.	Mechanised handlines	The fishery operates in the waters of the Indian Ocean and Shark Bay between latitudes 23° 07' 30" S and 26° 30' S. Vessels are not permitted to fish in inner Shark Bay.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
	spangled emperor (*Lethrinus nebulosus*) and redthroat emperor (*L. miniatus*)), cods (Epinephelidae, including Rankin cod (*Epinephelus multinotatus*) and goldspotted rockcod (*E. coioides*)), pearl perch (*Glaucosoma burgeri*), mulloway (*Argyrosomus japonicas*), amberjack (*Seriola dumerili*) and trevallies (Carangidae).			
Hermit Crab Fishery	Australian land hermit crab (*Coenobita variabilis*)	2017/2018: 58,643 (lowest reported in the last 10 years (2008 to 2017); catch range 58,643 to 118,203)).	Activity is land-based and occurs on beaches along large areas of the Western Australian coastline.	Operates in Western Australian waters north of the Exmouth Gulf (22° 30' S).
Kimberley Developing Mud Crab Managed Fishery	Mud crab (*Scylla serrata*)	2017/2018: 60 tonnes (also includes catch data from Pilbara Developmental Crab Fishery).	Mud crab traps	This fishery operates between Broome and Cambridge Gulf. Three commercial operators are permitted to fish from King Sound to the Northern Territory border, with closed areas around communities and fishing camps. One Aboriginal Corporation is permitted to fish in King Sound, with the other Aboriginal Corporation permitted to fish in a small area on the western side of the Dampier peninsula, north of Broome.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
				Notices issued under the *Fish Resources Management Act 1994* prohibit all commercial fishing for mud crabs in Roebuck Bay and an area of King Sound near Derby.
Kimberley Gillnet and Barramundi Managed Fishery	Barramundi *(Lates calcarifer)* King threadfin *(Polydactylus macrochir)* Blue threadfin *(Eleutheronema tetradactylum)*	2017/2018: 79.9 tonnes.	Gillnet in inshore waters	Nearshore and estuarine zones of the North Coast Bioregion from the Western Australian–Northern Territory border (129° E) to the top end of Eighty Mile Beach, south of Broome (19° S). The waters of the Kimberley Gillnet and Barramundi Managed Fishery are defined as all Western Australian waters north of 19° S latitude and west of 129° E longitude and within three nautical miles of the high water mark of the mainland of Western Australia and the waters of King Sound south of 16° 21.47ˈ S latitude.
Kimberley Prawn Managed Fishery	Banana prawns (*Penaeus merguiensis*) Tiger prawns (*Penaeus esculentus*) Endeavour prawns (*Metapenaeus endeavouri*) Western king prawns (*Penaeus latisulcatus*)	2017/2018: 269 tonnes.	Trawl	The Kimberley Prawn Managed Fishery operates off the north of the state between Koolan Island and Cape Londonderry. The boundaries of the Kimberley Prawn Managed Fishery are all Western Australian waters of the Indian Ocean lying east of 123° 45ˈ E longitude and west of 126° 58ˈ E longitude. It abuts the western boundary of the Commonwealth Northern Prawn Fishery.
Mandurah to Bunbury Developing Crab Fishery	Blue swimmer crab (*Portunus armatus)*	2017/2018: 5.2 tonnes.	Drop nets, scoop nets, diving	Fishery extends from south of the Shoalwater Islands Marine Park (32° 22ˈ 40" S) to Point McKenna near Bunbury (33° 16ˈ S) and offshore to 115° 30ˈ E. The fishery is divided into two zones with crab fishing historically being permitted within Area 1, Comet Bay between 32° 22ˈ 40" S and 32° 30ˈ S, and Area 2, Cape Bouvard to the southern boundary of the fishery. In 2015, crab fishing within Area 2 ceased.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
Marine Aquarium Fish Managed Fishery	Over 250 target species of finfish. (228 species caught in 2012). Fishermen can also take coral, live rock, algae, seagrass and invertebrates. The main fish species landed in 2012 were scribbled angelfish (*Chaetodontoplus duboulayi*) and green chromis (*Chromis cinerascens*) The main coral species landed in 2012 were the coral-like anemones of the Corallimorpharia.	2017/2018: Total catch of 150,544 fishes; 21.9 tonnes of coral, live rock and living sand; and 322 litres of marine plants.	Hand harvest while diving or wading. Handheld nets	Dive-based fishery operating all year throughout Western Australian waters (to 200 nM), but restricted by diving depths. The Marine Aquarium Fish Managed Fishery is able to operate in all state waters (between the Northern Territory border and South Australian border). The fishery is typically more active in waters south of Broome, with higher levels of effort around the Capes region, Perth, Geraldton, Exmouth and Dampier. Operators in the Marine Aquarium Fish Managed Fishery are also permitted to take coral, live rock, algae, seagrass and invertebrates under the Prohibition on Fishing (Coral, 'Live Rock' and Algae) Order 2007 and by way of Ministerial Exemption (Gaughan and Santoro 2018).
North Coast Trochus Fishery	Trochus (*Tectus niloticus*)	2017/2018: Unspecified.	Harvested with handheld levers or chisels	Indigenous fishery operating within King Sound.
Northern Demersal Scalefish Managed Fishery	Red emperor (*Lutjanus sebae*) Goldband snapper (*Pristipomoides multidens*)	2017/2018:1317 tonnes (total). Goldband snapper (not including other jobfish): 473 tonnes. Red emperor: 34 to 47 tonnes.	The permitted means of operation within the fishery include handline, dropline and fish traps, but since 2002 it has essentially been a trap-based fishery that uses gear,	The Northern Demersal Scalefish Managed Fishery operates off the northwest coast of Western Australia in the waters east of 120° E longitude. These waters extend out to the edge of the AFZ (200 nautical miles). The fishery consists of three zones: Zone A is an inshore area, Zone B comprises the area with most historical fishing activity and Zone C is an offshore deep-slope developmental area. The fishery is further divided into two fishing areas: an inshore sector and an offshore sector. The inshore waters in the vicinity of Broome are closed to commercial fishing.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
			time of access and spatial zones as the primary management measures (State of the Fisheries 2014-15).	The fishery is located to the east of the Project Area. Therefore, no fishing activity will occur overlapping the Project Area. Target species occur in the Project Area.
Octopus Interim Managed Fishery	*Octopus cf. tetricus*, with occasional bycatch of *O. ornatus* and *O. cyanea* in the northern parts of the fishery and *O. maorum* in the southern and deeper sectors.	2017/2018: Commercial: 257 tonnes Recreational: 1 tonne	Line and pots Trawl and trap (land octopus as byproduct)	Fishery is in the development phase. Four main categories in Western Australian waters. Octopus are primarily caught in the Developing Octopus Interim Managed Fishery (largest fishery) area is limited to the boundaries of the developmental fishery, which is an area bounded by the Kalbarri Cliffs (26° 30ˈ S) in the north and Esperance in the south. Passive and by-product harvests of octopus occur in both the Cockburn Sound Line and Pot Managed Fishery and the West Coast Rock Lobster Managed Fishery.
Onslow Prawn Managed Fishery Kangas et al. (2019)	Western king prawns (*Penaeus latisulcatus*) Brown tiger prawns (*Penaeus esculentus*) Endeavour prawns (*Metapenaeus* spp.)	2017/2018: Negligible (Minimal fishing occurred in 2017). Only 5 days of fishing effort was undertaken (one boat) in 2017.	Trawl	Operates along the western part of the North West Shelf with most prawning activities concentrated in the shallower water off the mainland. The boundaries of the fishery are 'all the Western Australian waters between the Exmouth Prawn Fishery and the Nickol Bay prawn fishery east of 114°39.9' on the landward side of the 200 m depth isobath'.
Roe's Abalone	Western Australian Roe's abalone (*Haliotis roei*)	2017/2018: Commercial: 49 tonnes Recreational: 23 tonnes	Dive and wade The commercial fishery harvest method is a single diver working off a "hookah" (surface-supplied breathing	Operating in shallow coastal waters along the Western Australian western and southern coasts from Shark Bay to the South Australian border. Divided into eight management areas. Commercial fishing for Roe's abalone is managed in six separate regions from the South Australian border to Busselton Jetty: Areas 1, 2, 5, 6, 7 and 8. Area 8 of the fishery was not fished in 2013.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
			apparatus) using an abalone "iron" to prise the shellfish off rocks. Abalone divers operate from small fishery vessels (generally less than 9 m in length).	
Shark Bay Crab Interim Managed Fishery	Blue swimmer crab (*Portunus armatus*)	2017/2018: 443 tonnes total Crab: 153 tonnes	Trawl and trap	Waters of Shark Bay north of Cape Inscription, to Bernier and Dorre Islands and Quobba Point. In addition, two fishers with long-standing histories of trapping crabs in Shark Bay are permitted to fish in the waters of Shark Bay south of Cape Inscription.
Shark Bay Prawn Managed Fishery	Western king prawn (*Penaeus latisulcatus*) Brown tiger prawn (*Penaeus esculentus*) Variety of smaller prawn species including endeavour prawns (*Metapenaeus* spp.) and coral prawns (various species).	2017/2018: 1,608 tonnes	Low-opening otter trawls	The boundaries of the Shark Bay Prawn Managed Fishery are located in and near the waters of Shark Bay.
Shark Bay Scallop Limited Entry Fishery	Saucer scallop (*Ylistrum balloti*)	2017/2018: 1,632 tonnes	Low-opening otter trawls	The boundaries of the Shark Bay Scallop Limited Entry Fishery are located in and near the waters of Shark Bay.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
South Coast Open Access Netting Fishery	Insufficient information	Insufficient information	Insufficient information	Bunbury to the South Australian border.
South Coast Salmon Managed Fishery	Western Australian salmon (*Arripis truttaceus*)	2017: 50 tonnes	Beach seine net, rod and line	Licensees operate from 18 designated beaches within the South Coast Bioregion, many of which have huts that are referred to as salmon camps.
South West Coast Salmon Managed Fishery	Western Australian salmon (*Arripis truttaceus*)	Insufficient information	Beach seine nets	The fishery includes all Western Australian waters north of Cape Beaufort (south coast) except Geographe Bay. The South West Coast Salmon Managed Fishery operates on various beaches south of the metropolitan area.
South West Coast Beach Net	Insufficient information	Insufficient information	Insufficient information	Insufficient information
South West Trawl Limited Entry Fishery	Saucer scallops (*Ylistrum balloti*)	2017/2018: 460 t meat weight (2,301 t whole weight)	Otter trawls	Waters between 31° 34ˈ 27" S and 115° 8ˈ 8" E where the fishery intersects with the high water mark at Cape Leeuwin and on the landward side of the 200-m isobath.
Temperate Demersal Gillnet and Demersal Longline Fisheries	Gummy shark (*Mustelus antarcticus*) Dusky shark (*Carcharhinus obscurus*) Whiskery shark (*Furgaleus macki*) Sandbar shark (*Carcharhinus plumbeus*)	2017/2018: Sharks and rays: 936 tonnes Scalefish: 133 tonnes	Demersal gillnets and power-hauled reels (to target sharks) Demersal longline	The Temperate Demersal Gillnet and Demersal Longline Fisheries consist of Zone 1 of the Joint Authority Southern Demersal Gillnet and Demersal Longline Managed Fishery and the West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery. The Joint Authority Southern Demersal Gillnet and Demersal Longline Managed Fishery spans the waters from 33° S latitude to the Western Australian–South Australian border and comprises three management zones. Zone 1 extends southwards from 33° S to 116° 30ˈ E longitude off the south coast. Zone 2 extends from 116° 30ˈ E to the Western Australian–South Australian border (129° E). A small number of Zone 3 units permit fishing throughout Zone 1 and eastwards to 116° 55ˈ 40" E.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
				The West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery technically extends northwards from 33° S latitude to 26° S latitude. However, the use of shark fishing gear has been prohibited north of 26° 30' S (Steep Point) since 1993. Demersal gillnet and longline fishing inside the 250-m depth contour has been prohibited off the metropolitan coast (between latitudes 31° S and 33° S) since November 2007.
Warnbro Sound Crab Managed Fishery	Blue swimmer crab (*Portunus armartus)*	2017/2018: closed to commercial and recreational fishing	Drop nets, scoop nets, diving	Includes Warnbro sound and adjacent water, extending from Becher Point to John Point.
West Coast Deep Sea Crustacean (Interim) Managed Fishery	Crystal (snow) crabs (*Chaceon albus*) Giant (king) crabs (*Pseudocarcinus gigas*) Champagne (spiny) crabs (*Hypothalassia acerba*)	2017/2018: 164.4 tonnes	Baited pots operated in a longline formation in the shelf edge waters (more than 150 m deep)	North of latitude 34° 24' S (Cape Leeuwin) and west of the Northern Territory border on the seaward side of the 150-m isobath out to the extent of the AFZ, mostly in 500 to 800 m of water.
West Coast Demersal Scalefish Interim Managed Fishery	West Coast inshore demersals: West Australian dhufish (*Glaucosoma hebraicum*), pink snapper (*Pagrus auratus*) with other species captured including redthroat emperor (*Lethrinus miniatus*), bight redfish (*Centroberyx gerrardi*) and baldchin groper (*Choerodon rubescens*).	2017/2018: 248 tonnes	Handline and dropline	The fishery encompasses the waters of the Indian Ocean just south of Shark Bay (at 26° 30' S) to just east of Augusta (at 115° 30' E) and extends seaward to the 200-nm boundary of the AFZ. The commercial fishery is divided into five management areas comprising four inshore areas and one offshore area. The inshore areas, i.e. Kalbarri, Mid-West, Metropolitan and South-West, extend outwards to the 250-m depth contour, while the Offshore Area extends the entire length of the fishery from the 250-m depth contour to the boundary of the AFZ.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
	West Coast offshore demersals: Eightbar grouper (*Hyporthodus octofasciatus*), hapuku (*Polyprion oxygeneios*), blue-eye trevalla (*Hyperoglyphe antarctica*) and ruby snapper (*Etelis carbunculus*).			
West Coast Estuarine Managed Fishery	Blue swimmer crab (*Portunus armartus)*	2017/2018: Commercial: 353 tonnes (blue swimmer crab) Recreational: 58 to 77 tonnes	Drop nets, scoop nets, diving (crabs)	Includes the waters of the Swan and Canning Rivers (Area 1), the waters of the Peel Inlet and Harvey Estuary, together with the Murray Serpentine, Harvey and Dandalup Rivers (Area 2) and waters of the Hardy Inlet (Area 3). Of these areas only Areas 1 and 2 are permitted for crab fishing.
West Coast Nearshore and Estuarine Finfish Fisheries	Nearshore: whitebait (*Hyperlophus vittatus*), western Australian salmon (*Arripis truttaceus*), Australian herring (*Arripis georgianus*), sourthern school whiting (*Sillago bassensis*), yellowfin whiting (*Sillago schomburgkii*), yelloweye mullet (*Aldrichetta forsteri*), tailor (*Pomatomus saltarix*), southern garfish	2017/2018: 353 tonnes	Haul, beach seine and gill netting (commercial). Line fishing (recreational)	Five commercial fisheries target nearshore and/or estuarine finfish in the West Coast Bioregion. Nearshore: Cockburn Sound Fish Net Managed Fishery operating within in Cockburn sound, South West Coast Salmon Managed Fishery operating on various beaches south of the Perth Metropolitan area, West Coast Beach Bait Managed Fishery operating on beaches spanning from Moore River to Tim's Thicket and the South West Beach Seine Fishery operating on various beaches from Tim's Thicket southwards to Port Geographe Bay Marina. Estuarine*:* West Coast Estuarine Managed Fishery operating in the Swan/Canning and Peel Harvey estuaries, and in the Hardy Inlet.

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
	(*Hyporhamphus melanochir*), silver trevally (*Pseudocaranx georgianus*) and King George whiting (*Sillaginodes punctate*). Estuarine*:* sea mullet (*Mugil cephalus*), estuary cobbler (*Cnidoglanis macrocephalus*) and black bream (*Acanthopagrus butcheri*).			
West Coast Nearshore Net Managed Fishery	Southern garfish (*Hyporhamphus melanochir*) Australian herring (*Arripis georgianus*)	Insufficient information	Insufficient information	Insufficient information
West Coast Purse Seine Fishery	Scaly mackerel (*Sardinella lemuru*) Pilchard (*S. sagax*) Australian anchovy (*Engraulis australis*) Yellowtail scad (*Trachurus novaezelandiae*) Maray (*Etrumeus teres*)	2017/2018: 1,095 tonnes	Purse seine gear	Waters between Ningaloo and Cape Leeuwin including three separate zones: Northern Development (22° 00' S to 31° 00' S), Perth Metropolitan (31° 00' S to 33° 00' S) and Southern Development Zone (33° 00' S to Cape Leeuwin).
West Coast Rock Lobster Managed Fishery	Western rock lobster (*Panulirus cygnus*)	2016: 272 to 400 tonnes (346 to 481 tonnes based on updated average weight)	Baited traps (pots) Pots and diving (recreational catch)	The fishery is situated along the west coast of Australia between Latitudes 21° 44' S to 34° 24' S. The fishery is managed in three zones: Zone A – Abrolhos Islands, north of latitude 30° S excluding the Abrolhos Islands (Zone B) and south of latitude 30° S (Zone C).

Fishery	Target Species	Catch[11]	Fishing Method	Area Description
West Coast Demersal Gillnet and Demersal Longline	Gummy shark (*Mustelus antarcticus*) Dusky shark (*Carcharhinus obscurus*) Whiskery shark (*Furgaleus macki*) Sandbar shark (*C. plumbeus*)	2016/2018: 936 tonnes of sharks and rays	Demersal gillnets and demersal longline (not widely used)	Operates between 26° S and 33° S.
Western Australian Sea Cucumber Fishery (formerly known as Beche-de-mer Fishery) Gaughan et al. (2019)	Sandfish (*Holothuria scabra*) Deepwater redfish (*Actinopyga echinites*).	2016: 93 tonnes	Hand-harvest fishery, with animals caught principally by diving and a smaller amount by wading.	The fishery is primarily based in the northern half of the state, from Exmouth Gulf to the Northern Territory border. The Western Australian Sea Cucumber Fishery is permitted to operate throughout Western Australian waters with the exception of a number of specific closures around the Dampier Archipelago, Cape Keraudren, Cape Preston and Cape Lambert, the Rowley Shoals and the Abrolhos Islands (Gaughan and Santoro 2018).

3.4.3.1.2 Commonwealth Managed Fisheries

Commonwealth managed fisheries are those within the 200-nm AFZ managed by Australian Fisheries Management Authority. In some cases, by agreement with the states and territory, Commonwealth fisheries also extend to the low water mark. Information on Commonwealth managed fisheries has been derived from 'Fishery Status' Report 2019 (Department of Agriculture 2019).

Commonwealth managed fisheries that overlap the Project Area are described in **Table 3-29:**

+ Southern Bluefin Tuna Fishery;
+ Western Skipjack Tuna Fishery; and
+ Western Tuna and Billfish Fishery.

Commonwealth fisheries that have permits to operate in the EMBA are described in **Table 3-30** and include:

+ North West Slope Trawl Fishery;
+ Northern Prawn Fishery;
+ Small Pelagic Fishery;
+ Southern and Eastern Scalefish and Shark Fishery; and
+ Western Deepwater Trawl Fishery.

Table 3-29: Commonwealth managed commercial fisheries within the Project Area

Fishery	Licence Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Southern Bluefin Tuna Fishery Patterson and Nicol (2018)	Fishery includes all waters of Australia, out to 200 nm from the coast. Young fish move from spawning grounds in the northeast Indian Ocean into the Australian exclusive economic zone and southward along the Western Australian coast (Patterson et al. 2019).	Purse seine vessels primarily in Great Australian Bight all year round Pelagic longline off southern New South Wales in winter	Southern bluefin tuna	Most of the Australian catch has been taken by purse seine, targeting juvenile tuna in the Great Australian Bight. Australian domestic longliners operating along the east coast catch some tuna, and recreational fishing has increased (Patterson et al. 2019). No current effort occurs on the NWS; fishing activity is concentrated in the Great Australian Bight and off southeast Australia (Patterson et al. 2019).	Although the fishery boundaries encompass the Project Area, the lack of effort outside the Great Australian Bight and the east coast of Australia means activity within the Project Area is not expected.
Skipjack Tuna Fishery	This fishery extends around the whole of Australia in waters out to 200 nm from the coast.	Purse seine fishing gear (98%) and some pole-and-line effort	Skipjack Tuna	There has been no fishing effort in the fishery since the 2008–09 fishing season.	Given the lack of fishing effort across the whole fishery, activity within the Project Area is not expected.

Fishery	Licence Area Description	Gear Types	Key Target / Indicator Species	Summary of Fishing Activities	Project Area Presence
Western Tuna and Billfish Fishery	This fishery has a wide area of operation, extending from the tip of Cape York around Western Australia to the border of Victoria and South Australia within both the AFZ and further offshore within the high seas, with major landing ports for the fishery being in Fremantle and Geraldton.	Pelagic longline fishing methods and some use of minor line fishing methods	Bigeye tuna (*Thunnus obesus*) Yellowfin tuna (*Thunnus albacares*) Albacore tuna (*Thunnus alalunga*) Broadbill Swordfish (*Xiphias gladius*) Striped marlin (*Kajikia audax*)	Fishing occurs in both the AFZ and adjacent high seas of the Indian Ocean. Fishing occurs year-round. In recent years, fishing effort has concentrated off southwest Western Australia and South Australia with no current effort on the NWS (Department of Agriculture 2019). Between 2014 and 2018, fishing effort has consistently focused on waters west of Carnarvon and south of southwest Western Australia. The main landing ports are Geraldton and Fremantle. Since 2005, fewer than five vessels have been active in the fishery each year (three vessels in 2016; four vessels in 2017).	Although the fishery boundaries encompass the Project Area, in recent years, effort has concentrated off southwest Western Australia and South Australia and therefore activity within the Project Area is not expected.

Table 3-30: Commonwealth managed commercial fisheries within the EMBA but not the Project Area

Fishery	Key Target/ Indicator Species	Summary of Fishing Activities	Gear Type?	License Area Description
North West Slope Trawl Fishery	Scampi (crayfish): velvet scampi (*Metanephrops velutinus*) and boschmai scampi (*Metanephrops boschmai*). Deepwater prawns (penaeid and carid): pink prawn (*Parapenaeus longirostris*), red prawn (*Aristaeomorpha foliacea*), striped prawn (*Aristeus virilis*), giant scarlet prawn (*Aristaeopsis edwardsiana*), red carid prawn (*Heterocarpus woodmasoni*) and white carid prawn (*Heterocarpus sibogae*). Snapper.	There has been no fishing effort in the Project Area. Fishing effort occurs within the EMBA. Fishing occurs on the continental slope in water depths greater than 200 m. Fishing effort has typically occurred along the slope offshore from the Pilbara region, in the Rowley Shoals area and northeast towards and around Scott Reef. Fishing occurs year-round. The number of vessels involved in the fishery has been one or two vessels each year since 2008/2009. The primary landing ports are Point Samson in Western Australia and Darwin in the Northern Territory. Four fishing permits and two vessels were active in the fishery during the 2016-17 fishing season. Total catch in the 2016-17 fishing season was 57.8 tonnes over 114 days of fishing effort. Fishing effort increased in the 2017-2018 season. Total catch was 79.7 tonnes over 219 days.	Demersal crustacean trawl seaward of the 200-m isobath.	Extends from 114° E to approximately 125° E off the Western Australia coast between the 200-m isobath and the outer limit of the AFZ.
Western Skipjack Tuna Fishery Australian Fisheries Management Authority (2019)	Skipjack tuna (*Katsuwonus pelamis*)	2017-18: None in either zone. Fishing in the Western Skipjack Tuna Fishery is opportunistic and highly dependent on availability and the domestic cannery market. Currently, no domestic cannery has active contracts for skipjack tuna.	Purse seine Some pole and line	The Skipjack Tuna Fishery is split into two sectors: east and west. The Western Skipjack Tuna Fishery is located in all Australia waters west of 142° 30ʹ 00" E, out to 200 nm from the coast. There has been no fishing effort in the Skipjack Tuna Fishery since the 2008-09 season, and in that season activity

				concentrated off South Australia (Department of Agriculture 2019).
Small Pelagic Fishery	Australian sardine (*Sardinops sagax*) Blue mackerel (*Scomber australasicus*) Jack mackerel (*Trachurus declivis*) Redbait (*Emmelichthys nitidus*).	2018-19: 9,424 tonnes	Purse seine and midwater trawling	Extends from Queensland to southern Western Australia.
Western Deepwater Trawl Fishery	A diverse range of species are caught, ranging from tropical and ruby snappers on the shelf edge to orange roughy (*Hoplostethus atlanticus*), oreo dories and bugs (*Ibacus* spp.) in the deeper temperate waters.	2017-18: 101.9 tonnes	Demersal fish trawl seaward of the 200-m isobath	The fishery's northernmost point is from the boundary of the AFZ to longitude 114° E, and its southernmost point is from the boundary of the AFZ to longitude 115° 08ˈE. Deep water off Western Australia, from the 200-m isobath to the edge of the AFZ.

3.4.3.2 Recreational Fishing

Consultation for previous petroleum activities undertaken by Santos in the Project Area has confirmed that no charter boats operate out of Port Hedland.

Similarly, consultation with Recfishwest identified that recreational fishing often occurs around the Port Hedland port marker buoys. In consultation with the Port Hedland Game Fishing Club and Port Hedland Volunteer Marine Rescue, it was identified that recreational fishing activity may occur 50 nm offshore, with some locals targeting game fish up to the 50-m water depth and the area surrounding Bedout Island. Therefore, no interaction with recreational fishers is anticipated in the Project Area but may occur in the EMBA.

3.4.3.2.1 North Coast Bioregion

The North Coast Bioregion (Pilbara/Kimberley) runs from the Ashburton River to the Western Australia–Northern Territory border. The oceanography of this region includes waters of Pacific Ocean origin that enter through the Indonesian archipelago, bringing warm, low-salinity waters polewards via the Indonesian throughflow and Holloway currents, which flow seasonally and interact with Indian ocean waters. Recreational fishing is experiencing a significant growth in this region, with a distinct seasonal peak in winter when the local population increases by significant numbers of metropolitan and interstate tourists. This has been added to by the increased recreational fishing by those involved in the construction or operation of major developments in this region. Owing to the high tidal range, much of the angling activity is boat-based with beach fishing limited by periods of flood tides and high water. Numerous creek systems, mangroves, rivers and ocean beaches provide shore and small-boat fishing for a variety of species, including barramundi, tropical emperors, mangrove jack, trevallies, sooty grunter, threadfin, mud crabs and cods. Offshore islands, coral reef systems and continental shelf waters provide species of major recreational interest, including saddletail snapper and red emperor, cods, coral and coronation trout, sharks, trevally, tuskfish, mackerels and billfish.

3.4.3.2.2 Gascoyne Coast Bioregion

The Gascoyne Coast Bioregion extends from just north of Kalbarri to the Ashburton River, south of Onslow. The marine environment of this region represents a transition between the fully tropical waters of the northwest shelf of the North Coast Region and the temperate waters of the West Coast Region. This region has been identified as one of the 18 world "hotspots" in terms of tropical reef endemism and the second most diverse marine environment in the world in terms of tropical reef species. This region is a focal point for winter recreational fishing and is a key component of many tourist visits. Angling activities include beach and cliff fishing (e.g. Steep Point and Quobba), embayment and shallow-water boat angling (e.g. Shark Bay, Exmouth Gulf and Ningaloo lagoons), and offshore boat angling for demersal and larger pelagic species (e.g. off Ningaloo). The predominant target species include the tropical species, such as emperors, tropical snappers, groupers, mackerels, trevallies and other game fish. Temperate species at the northern end of their ranges, such as pink snapper, tailor and whiting, also provide significant catches, particularly in Shark Bay.

3.4.3.2.3 West Coast Bioregion

The marine environment of the West Coast Bioregion, which lies between Kalbarri and Augusta, is predominantly a temperate oceanic zone, but it is heavily influenced by the Leeuwin Current, which transports warm tropical water southward along the edge of the continental shelf. This region contains the state's major population centres and is the most heavily used bioregion for recreational fishing (Fletcher and Santoro 2015). The range of recreational fishing opportunities includes estuarine fishing, beach fishing and boat fishing either in embayments or offshore for demersal and pelagic game species often around the islands and out to the continental shelf.

3.4.3.3 Traditional Fishing

Within the northern and northwestern extent of the EMBA is a defined area where a Memorandum of Understanding exists between the Australian and Indonesian Governments. The Agreement between the Government of Australia and the Government of the Republic of Indonesia Relating to Cooperation in Fisheries (1992 Fisheries Cooperation Agreement) provides the framework for fisheries and marine cooperation between Australia and Indonesia and facilitates information exchange on research, management and technological developments; complementary management of shared stocks; training and technical exchanges; aquaculture development; trade promotion; and cooperation to deter illegal fishing.

Cooperation under the agreement today takes place under the auspices of the Working Group on Marine Affairs and Fisheries. Established in 2001, the Working Group on Marine Affairs and Fisheries is the primary bilateral forum to enhance collaboration across the spectrum of marine and fisheries issues relevant to the areas of the Arafura and Timor seas. The working group brings together the fisheries, environment and scientific research portfolios and agencies from both countries.

The fishers focus their activities in and around the shallow water lagoons of Scott Reef, primarily targeting trepang and opportunistically gathering trochus shells. They also catch fish largely for subsistence purposes although the average fish catch per *lete-lete* (traditional Indonesian fishing vessel) in 2008 increased to commercial volumes. Although deeper waters are more plentiful in trepang, deep diving is generally not undertaken by the fishers due to the Memorandum of Understanding stipulation on the exclusive use of traditional equipment only.

3.4.3.4 Aquaculture

3.4.3.4.1 North Coast Bioregion

Aquaculture development in this region is dominated by the production of pearls from the species *Pinctada maxima*. A large number of pearl oysters for seeding are obtained from wild stocks and supplemented by hatchery-produced oysters with major hatcheries operating at Broome and the Dampier Peninsula. Pearl farm sites are located mainly along the Kimberley coast, particularly in the Buccaneer Archipelago, in Roebuck Bay and at the Montebello Islands. Developing marine aquaculture initiatives in this region include growing trochus and barramundi.

The Pearl Oyster Fishery of Western Australia operates in shallow coastal waters (Fletcher et al. 2006). All the leases are within the 35-m diving depth. Through consultation, the Pearl Producer's Association have raised concern that spawning stock is found to the 100-m depth contour. However, this is not supported in the study by Condie et al. (2006), who modelled oyster larva transport in the Eighty Mile Beach region and found that, while some larvae travelled more than 60 km, most were transported less than 30 km. The model results suggest that spawning in the Eighty Mile Beach region is concentrated around the 8- to 15-m depth range, with potential smaller contributions from the northeast. These spawning events are likely to lead to successful recruitment locally and alongshore to the southwest.

The spawning events also feed larvae into neighbouring shallow coastal environments (through tidal oscillations) and deeper waters to the west (more than 20 m deep). However, spat (juvenile pearl oysters) abundance seems to be low in these areas, suggesting that recruitment is strongly limited by habitat availability and possibly high mortality rates in shallow water. High local abundances of brood stock and spat observed occasionally in deeper water (less than 30 m deep) seem to be supported by intermittent larval transport from inshore populations. Spawning in this area seems to contribute little to recruitment in the inshore populations.

3.4.3.4.2 Gascoyne Coast Bioregion

Hatchery production of oysters is the core of the pearling industry in the Gascoyne region. Hatcheries in Carnarvon and Exmouth supply spat to pearl farms in the northwest, and several hatcheries supply juveniles to the developing black-lip pearl oyster farms in the region. Pearl production is carried out on a small scale in Shark Bay and Exmouth Gulf. The local aquaculture sector is also focusing on the production of aquarium species.

3.4.3.4.3 West Coast Bioregion

The principal aquaculture development activities in this region are the production of mussels (*Mytilus galloprovincialis*) and marine algae (*Dunaliella salina*) and the emerging black pearl industry based on the production of *Pinctada margaritifera* at the Abrolhos Islands. The main mussel farming area is in southern Cockburn Sound, where conditions are sheltered and the nutrient and planktonic food levels are sufficient to promote good growth rates.

3.4.4 Heritage

3.4.4.1 World Heritage Places

There are two WHAs located within the EMBA: the Ningaloo Coast (533 km from the Dorado WHP) and Shark Bay (835 km from the Dorado WHP).

3.4.4.1.1 The Ningaloo Coast

The Ningaloo Coast was included on the World Heritage List in 2011 and was inscribed for outstanding natural universal values as follows:

- an example of superlative natural phenomena and areas of exceptional natural beauty and aesthetic importance;
- outstanding examples representing major stages of Earth's history, including the record of life, significant ongoing geological processes in the development of landforms, or significant geomorphic or physiographic features; and
- the most important and significant natural habitats for in situ conservation of biological diversity, including those containing threatened species of outstanding universal value from the point of view of science or conservation.

The Ningaloo Coast WHA includes:

- Ningaloo Marine Park (Commonwealth waters);
- Ningaloo Marine Park (Western Australian state waters);
- Muiron Island Marine Management Area (including the Muiron Islands);
- Jurabi Coastal Park;
- Bundegi Coastal Park;
- Cape Range National Park; and
- Learmonth Air Weapons Range.

The Ningaloo Coast WHA (including the Muiron Islands) is managed under a plan that is consistent with the World Heritage Convention and Australia's World Heritage management principles. World Heritage management principles are set out in regulations and cover matters relevant to the preparation of management plans, the environmental assessment of actions that may affect the property and community consultation processes.

The Australian World Heritage management principles are outlined under Schedule 5 of the Environment Protection and Biodiversity Conservation Regulations 2000. The objective is to ensure that any likely impact of an action on the World Heritage values of the property should be considered. Any action should be consistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.

The marine environment of the Ningaloo Coast WHA is protected as a Commonwealth marine park and state marine park and is discussed further in **Section 3.4.2**.

3.4.4.1.2 Shark Bay

Shark Bay was included on the World Heritage List in 1991 and is one of the few properties inscribed for all four outstanding natural universal values:

- an outstanding example representing the major stages in the earth's evolutionary history;
- an outstanding example representing significant ongoing ecological and biological processes;
- an example of superlative natural phenomena; and
- containing important and significant habitats for in situ conservation of biological diversity.

Since 1997, an agreement established the joint management of the Shark Bay WHA by the Australian Government and the Western Australian state government, with the operational responsibility by the Western Australian agencies. This agreement also created a Community Consultative Committee and a Scientific Advisory Committee, both of which provide advice as required. The entire WHA encompasses islands and peninsulas, with an area of approximately 2.2 million hectares (70% of which is marine waters), and includes the following areas:

- Hamelin Pool Marine Nature Reserve;
- Francois Peron National Park;
- Shell Beach Conservation Park;
- Monkey Mia Reserve;
- Monkey Mia Conservation Park;
- Zuytdorp Nature Reserve;
- Bernier, Dorre and Koks Islands Nature Reserves;
- Dirk Hartog Island National Park; and
- Various pastoral leases.

The marine environment of the Shark Bay WHA is protected as a state marine reserve and is discussed further in **Section 3.4.2**.

3.4.4.2 Commonwealth Heritage Places

The Commonwealth Heritage Places List comprises natural, indigenous and historic heritage places that are either entirely within a Commonwealth area or are outside the Australian jurisdiction and owned or leased by the Commonwealth or a Commonwealth Authority (**Table 3-31**). Eight natural Commonwealth Heritage Places were identified within the EMBA, none of which lie within the Project Area. Three of these places (Ashmore Reef, Mermaid Reef and the Ningaloo Marine Area – Commonwealth Waters) are found in marine parks and are discussed further in **Section 3.4.2**. The HMAS *Sydney II* and HSK *Kormoran* Shipwreck Sites is listed under both National and Commonwealth Heritage Lists.

Table 3-31: Commonwealth heritage places within the EMBA

Commonwealth Heritage Place	Place Type	Distance from WHP (km) (approximate)
Mermaid Reef - Rowley Shoals	Natural	226
Ningaloo Marine Area - Commonwealth Waters	Natural	555
Yampi Defence Area	Natural	570
Scott Reef and Surrounds - Commonwealth Area	Natural	632
Learmonth Air Weapons Range Facility	Natural	635
Ashmore Reef National Nature Reserve	Natural	873
HMAS *Sydney II* and HSK *Kormoran* Shipwreck Sites	Historic	1,111
Christmas Island Natural Areas	Natural	1,697

3.4.4.3 National Heritage Places

Natural, historic and indigenous places that are of outstanding heritage value to the Australian nation are recorded as National Heritage Places. Nine National Heritage Places are found in waters from the South Australian border to the Northern Territory border, with nine of these occurring within the EMBA (**Table 3-32**). Shark Bay and The Ningaloo Coast are listed as both WHAs and National Heritage Places and are discussed in **Section 3.4.4.1**.

Table 3-32: National heritage places within the EMBA

National Heritage Place	Place Type	Distance from WHP (km) (approximate)
Dampier Archipelago (including Burrup Peninsula)	Indigenous	248
The West Kimberley	Natural	318
Barrow Island and the Montebello-Barrow Islands Marine Conservation Reserves	Natural	357

National Heritage Place	Place Type	Distance from WHP (km) (approximate)
The Ningaloo Coast	Natural	533
Shark Bay, Western Australia	Natural	835
Dirk Hartog Landing Site 1616 - Cape Inscription Area	Historic	928
HMAS *Sydney II* and HSK *Kormoran* Shipwreck Sites	Historic	1,111
Batavia Shipwreck Site and Survivor Camps Area 1629 - Houtman Abrolhos	Historic	1,159
Christmas Island Natural Areas	Natural	1,698

3.4.4.4 Marine Archaeology

All historic shipwrecks older than 75 years are protected under the *Underwater Culture Heritage Act 2018*. Details of historic shipwreck sites are available on the Australian National Shipwreck Database, although precise locations of the wrecks are sometimes unknown. A search of the Australian National Shipwreck Database indicated there are no historic shipwrecks within the Project Area, nor has Santos observed any debris or wreckage from ships within the Project Area. There are no historic sunken aircraft (older than 75 years) located within the Project Area. There are, however, 25 historic shipwrecks located in the EMBA, the closest being the Twin Screw Steamer (1912), approximately 13 km from the Project Area. There is also one sunken aircraft located in the EMBA off Eighty Mile Beach, the Dornier Do-24 X-36 (1942), located approximately 210 km southeast of the Project Area.

3.4.4.5 Indigenous Heritage

Indigenous people have a strong ongoing association with the area that extends from the beginning of human settlement in Australia some 50,000 years ago. The close, long-standing relationship between Indigenous peoples and the coastal and marine environments of the area is evident in Indigenous culture today, in addition to archaeological sites such as the Burrup Peninsula. The traditional owners of the northwest continue to rely on coastal and marine environments and resources for their cultural identity, health and wellbeing, as well as their domestic and commercial economies.

Marine resource use by Indigenous people is generally restricted to coastal waters. Fishing, hunting and the maintenance of maritime cultures and heritage through ritual, stories and traditional knowledge continue as important uses of the nearshore region and adjacent areas. However, while direct use by Indigenous people of deeper offshore waters is limited, many groups continue to have a direct cultural interest in decisions affecting the management of these waters. The cultural connections Indigenous people maintain with the sea may be affected, for example, by offshore fisheries and industries. In addition, some Indigenous people are involved in commercial activities such as fishing and marine tourism, so have an interest in how these industries are managed in offshore waters with respect to their cultural heritage and commercial interests (Department of the Environment, Water, Heritage and the Arts 2008b).

A search of the Department of Planning, Lands and Heritage's Aboriginal Heritage Inquiry System was undertaken to identify registered Aboriginal sites (Registered Sites) as outlined under Section 5 of the Aboriginal Heritage Act 1972 (WA). A total of 194 Registered Sites were identified within the EMBA.

Identified Registered Sites have been designated for a number of aspects including (but not limited to) artefact scatters; ceremonial, mythological, and camp sites; water sources; engravings; and burial. In addition to Registered Sites, there are a number of other Heritage Places along the northwest coastline of Western Australia (refer to **Attachment 1**).

3.4.5 Tourism

The Kimberley, Pilbara and Gascoyne regions are popular visitor destination for Australian and international tourists. Tourism is concentrated in the vicinity of population centres including Broome, Dampier, Exmouth, Coral Bay and Shark Bay.

Marine and coastal use is also clustered around major population centres along the Western Australian coastline including Perth, Bunbury, Geraldton, Jurien Bay and Margaret River.

Tourism contributes to local economies in terms of both income and employment; and tourists include local, interstate and international visitors. Popular water-based activities include fishing, swimming, snorkelling, diving, surfing, windsurfing/kiting, and boating, while popular land-based activities include bushwalking, camping, bird watching and four-wheel driving.

Seasonal nature-based tourism, such as humpback whale watching, whale shark encounters and tours of turtle hatching, mainly occurring around Ningaloo Reef, Cape Range National Park, Broome and Perth. Seasonal aggregations of whale sharks, manta rays, sea turtles and whales, as well as the annual mass spawning of coral, attract large numbers of visitors to Ningaloo each year. There is no tourism activity with the Project Area. A low level of recreational diving may occur in the waters surrounding Bedout Island, located approximately 38.8 km south of the Project Area.

3.4.6 Maritime Industry

3.4.6.1 Ports

The two largest ports within the Pilbara region are Port Hedland (located approximately 143 km south of the proposed FPSO) and the Port of Dampier. Port Hedland is Australia's second largest port and exports bulk commodities of iron ore and salt. Total throughput at Port Hedland for 2019 was recorded to be approximately 521 million tonnes (Pilbara Ports Authority n.d.). The Port of Dampier is one of the major tonnage ports in Australia, with prime export commodities of iron ore, LNG and salt.

3.4.6.2 Shipping

The Project Area is subject to considerable shipping activity, particularly bulk carriers transiting to and from the Port of Port Hedland (**Figure 3-28**). AMSA has established a network of shipping fairways off the northwest coast of Australia to manage traffic patterns. The shipping fairways are designed to keep shipping traffic away from offshore infrastructure and aim to reduce the risk of collision. Use of the fairways is strongly recommended but not mandatory. The International Regulations for Preventing Collisions at Sea 1972 apply to all vessels navigating within or outside the shipping fairways. The use of these fairways does not give vessels any special right of way.

The Dorado WHP is located 13.2 km west and 17.5 km east of the closest commercial shipping fairways.

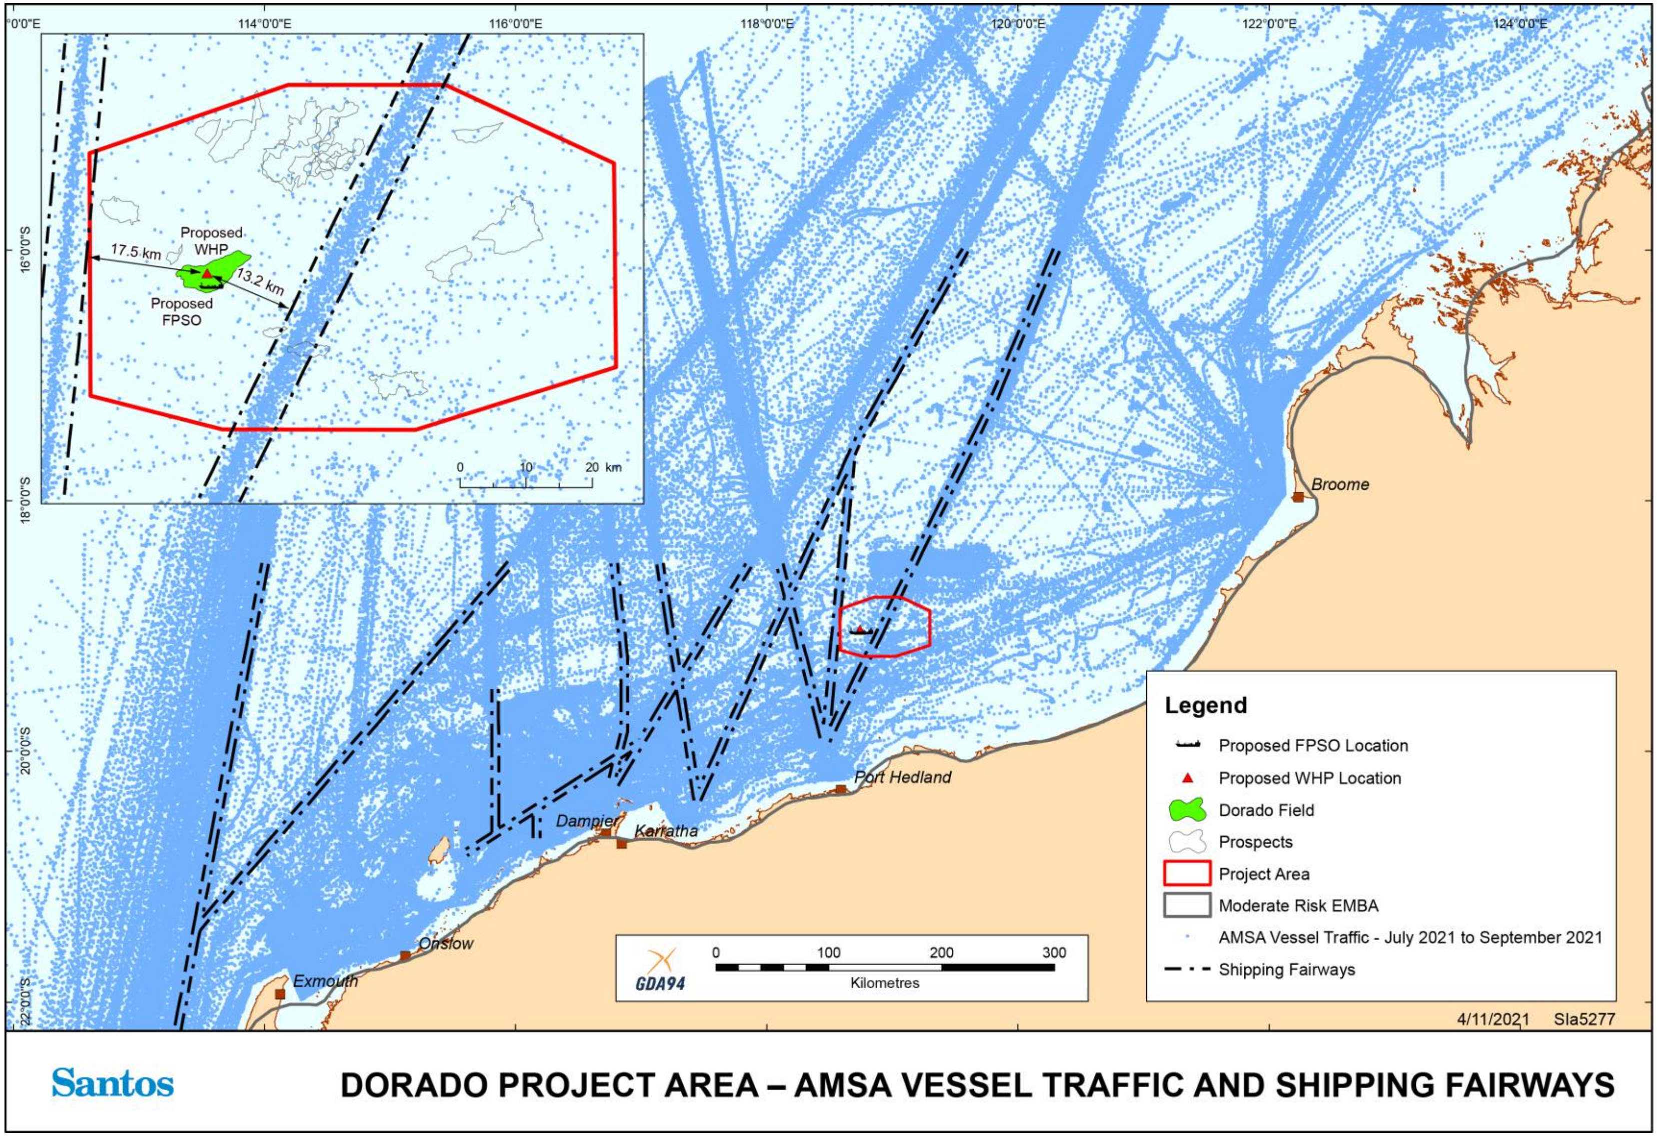

Figure 3-28: AMSA ship locations and shipping fairways

3.4.6.3 Petroleum

In 2018/19, Western Australia's petroleum industry was worth $38.4 billion per annum. The petroleum sector accounted for 26% of the total value of Western Australia's mineral and petroleum sales in 2018/19, with 20% of all mineral and petroleum sales coming from LNG. Currently Western Australia has four operating LNG projects: the NWS, Gorgon, Pluto and Wheatstone. There are also a number of FPSO facilities on the NWS, as shown in **Figure 3-29**. There are also domestic gas plants on Varanus Island in the NWS, Devil Creek Onshore Gas Plant and Macedon Gas Plant in the Pilbara region and an oil facility near Dongara called Cliff Head.

There are several exploration and production permits and leases throughout Western Australian and Commonwealth waters in the EMBA. Existing petroleum infrastructure, permits and licences are shown in **Figure 3-29**.

The Project Area occurs in a particularly isolated area of the NWS with respect to the main oil and gas operational and exploratory fields. There are currently no existing facilities in the Project Area. The nearest operating facility is Woodside's Angel oil field and associated infrastructure, located approximately 250 km from the WHP.

One optical submarine telecommunication cable traverses the western edge of the Project Area (refer to **Figure 3-29**), the North West Cable System, which connects offshore oil and gas facilities in the Browse, Bonaparte and Carnarvon Basins to onshore locations. The JASURAUS cable system, which connects Port Hedland to Jakarta, is adjacent to and west of the Project Area.

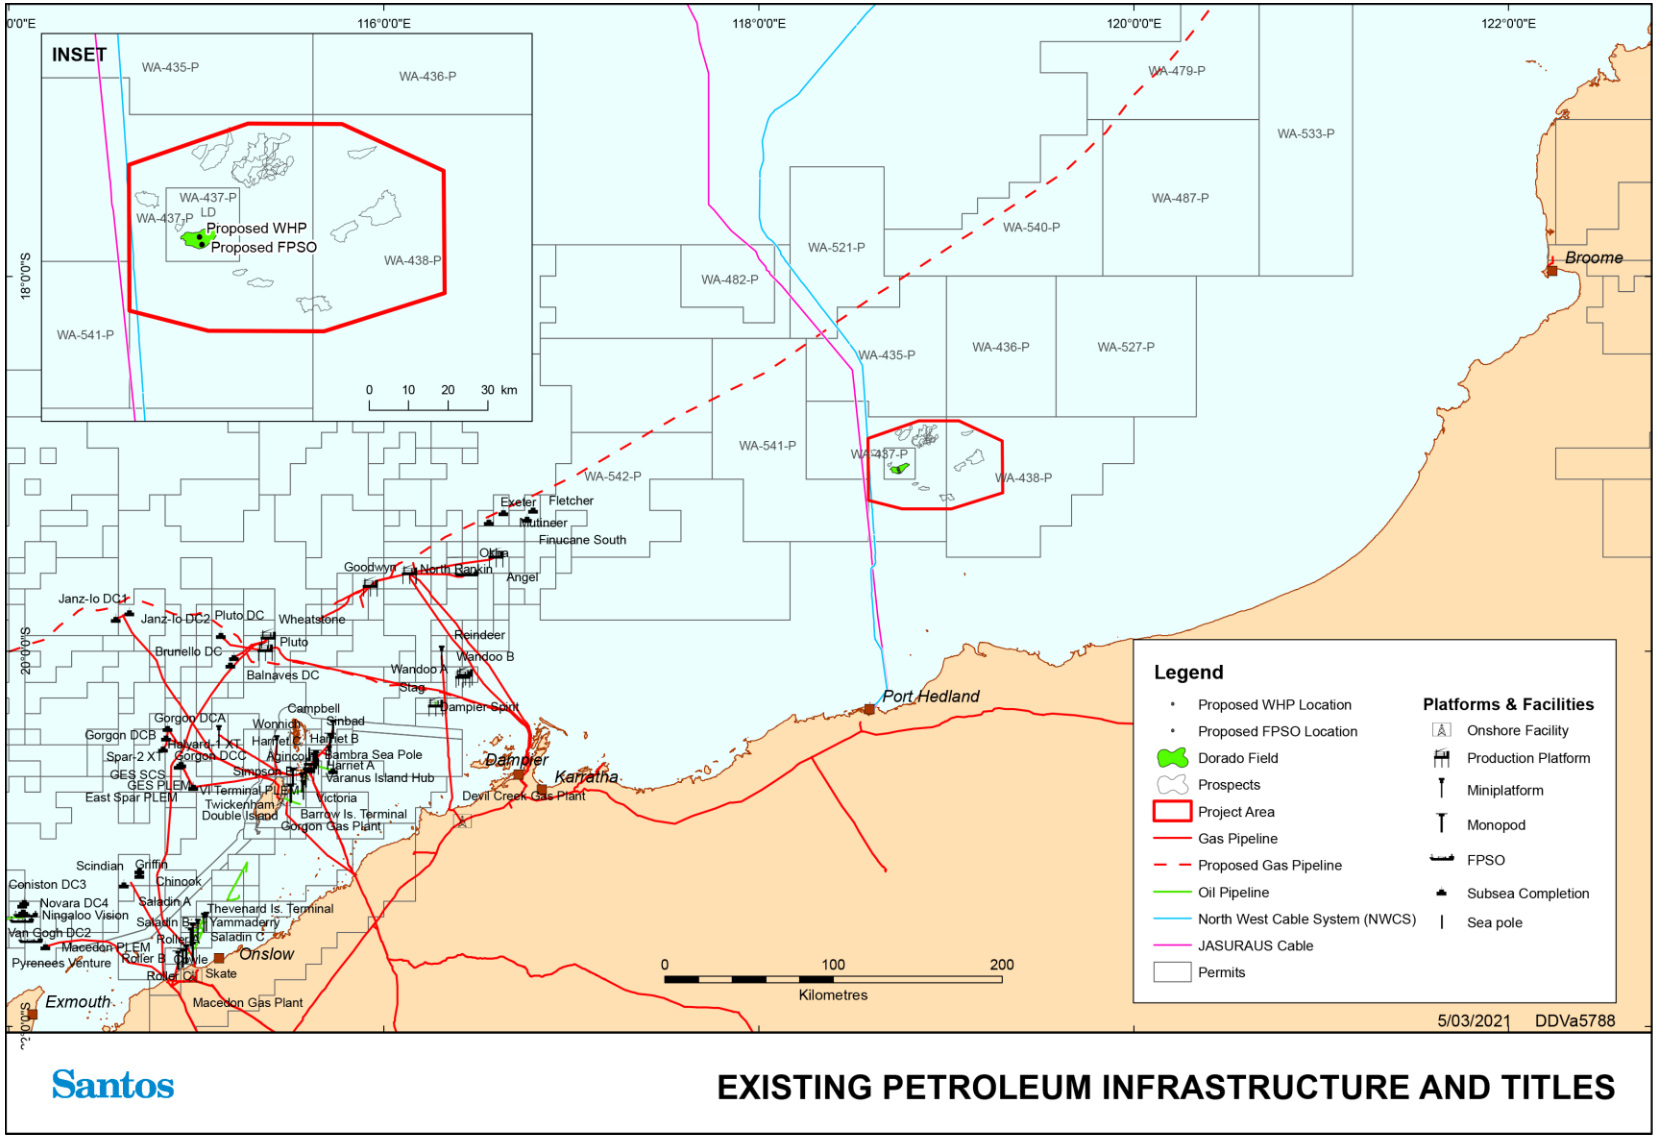

Figure 3-29: Existing petroleum infrastructure, permits and licences

3.4.7 Defence

The Naval Communication Station Harold E. Holt is located on the northwest coast of Australia, 6 km north of Exmouth. The town of Exmouth was built at the same time as the communications station to provide support to the base and to house dependent families of United States Navy personnel (Shire of Exmouth 2014; DoE 2014).

No designated Department of Defence areas overlap the Project Area. Two Royal Australian Air Force (RAAF) bases are located in the northwest of Western Australia: Learmonth RAAF Base (approximately 602 km from the WHP near Exmouth) and Curtin RAAF Base (approximately 561 km from the WHP near Derby) (RAAF 2014). The EMBA overlaps these bases.

Designated military exercise areas occur over waters and airspace of the northwest of Western Australia and may be activated following the required notifications. There are two training and practice areas located near the Learmonth RAAF Base, approximately 363 km (training area) and 538 km (practice area) southwest of the Project Area. These overlap with the EMBA.

Additional defence activities that occur within the EMBA include:

+ Broome training depot;
+ Exmouth admin and high-frequency transmitting;
+ Exmouth very low–frequency transmitting station;
+ Geraldton training depot “A” Company 16th Battalion;
+ HMAS *Stirling*-Rockingham;
+ HMAS *Stirling*-Garden Island;
+ Karratha training depot;
+ Learmonth – air weapons range;
+ Learmonth radar site – Vlaming Head, Exmouth; and
+ Yampi Sound training area.

Key defence bases and facilities are illustrated in **Figure 3-30**.

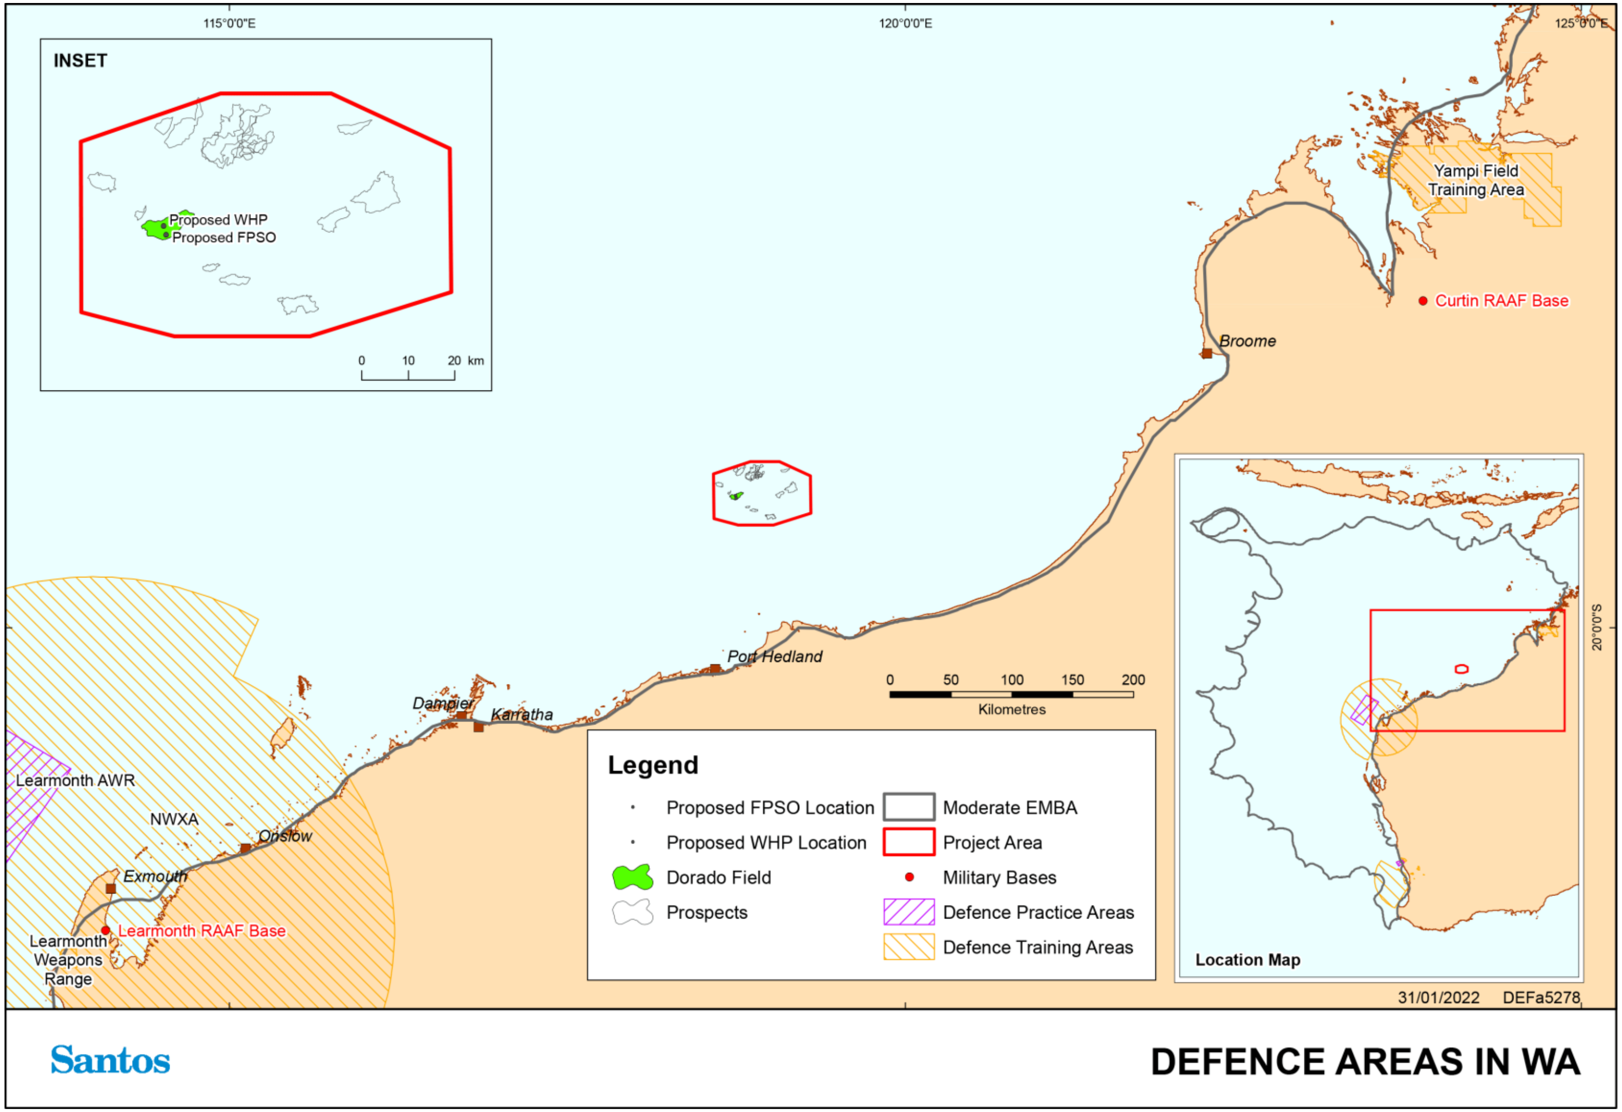

Figure 3-30: Defence areas in Western Australia

4 Acceptable Levels of Impacts and Risks

The OPGGS (E) Regulations require that the Dorado Development OPP demonstrate that the environmental impacts and risks associated with Dorado Phase 1 are of an acceptable level. Santos has defined acceptable levels of impacts and risks for the environmental receptors that may credibly be impacted by Dorado Phase 1 to address this requirement. The predicted environmental impacts and risks from all aspects of Dorado Phase 1 were then compared to the predefined acceptable levels to evaluate whether the impacts and risks associated were below the acceptable level.

The following criteria were considered by Santos when developing receptor-specific acceptable levels of impacts and risks:

+ the environmental value of the receptor;
+ the principles of ESD;
+ relevant requirements (**Section 2**), such as:
  - legislation;
  - policies;
  - conventions; and
  - material published under the EPBC Act, including recovery plans, conservation advice and the Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013);
+ internal context, including Santos' environment policy, environmental risk management framework, technical guidance material and expert technical advice from internal stakeholders; and
+ external context, such as advice provided by stakeholders and subject matter experts.

The acceptable levels of impacts and risks were developed independently of the environmental impact and risk assessments. This was done to ensure that the acceptable levels were based on the criteria outlined above, rather than the predicted impacts of Dorado Phase 1.

A description of how the criteria were considered in developing receptor-specific acceptable levels of impacts and risks is provided below.

4.1 Considerations when Defining Acceptable Levels of Impacts

4.1.1 Environmental Value of Receptors

The environmental value of each receptor was considered when developing receptor-specific acceptable levels of impact. The determination of the environmental value of a receptor considered attributes such as:

+ uniqueness – uniqueness is the quality of an environmental value or sensitivity being particularly remarkable, special or unusual. Impacts to receptors that are unique are less acceptable than impacts to receptors that are common within the environment. For example, impacts to a rare, endangered species are less acceptable than the same impacts to a common species;
+ connectedness – connectedness is the quality of an environmental value or sensitivity being joined to or linked with other features of the environment. Impacts to receptors that are highly connected to other receptors are more likely to result in effects to ecosystems and are

hence less acceptable than impacts to receptors that are not highly connected to other receptors; and
- socio-economic value – Socio-economic value is the value of an environmental value or sensitivity to society, including social, cultural and economic value. Impacts to receptors that have a high socio-economic value (including receptors that are of particular conservation, cultural or economic value) are less acceptable than impacts to receptors that have a low socio-economic value.

The uniqueness, connectedness and socio-economic value for each receptor was assessed on a qualitative basis. This assessment was informed by the description of environmental values and sensitivities in **Section 3**. The concepts of uniqueness, connectedness and socio-economic value were assessed qualitatively to provide an aggregated environmental value for each receptor.

The environmental value of many receptors is reflected by the relevant requirements that apply to the receptors. Receptors that have a high environmental value typically have a high degree of protection by relevant requirements, such as WHAs, marine protected areas and species listed as threatened under the EPBC Act. The degree of protection provided by relevant requirements is typically correlated to the environmental value of the receptor.

4.1.2 Principles of Ecologically Sustainable Development

The principles of ESD stated in the EPBC Act have been considered by Santos in defining acceptable levels of impacts and risks. These principles were also considered in progressing the concept for the Dorado Development and management of environmental impacts and risks. These principles are:

- decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations;
- if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation;
- the principle of intergenerational equity — that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations;
- the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; and
- improved valuation, pricing and incentive mechanisms should be promoted.

Energy is fundamental to societies and their sustainable development. The UN has a 2030 Agenda for Sustainable Development (2030 Agenda) which establishes 17 Sustainable Development Goals (SDGs) and 169 targets that build on the Millennium Development Goals. The SDGs and targets are integrated and indivisible and balance three dimensions of sustainable development: economic, social and environmental. This was considered for evaluating acceptability for those potential impacts which extend outside of Australia's jurisdiction.

4.1.3 Relevant Requirements

The requirements identified in **Section 2** that are relevant to environmental receptors were considered when developing receptor-specific acceptable levels of impact. Santos has included the acceptability of impacts and risks to matters protected under Part 3 of the EPBC Act as this forms part of NOPSEMA's assessment for the Dorado Development OPP. Several international agreements are given effect by Part 3 of the EPBC Act, such as the Ramsar Convention (Wetlands of International

Importance); the World Heritage Convention (WHAs); and the Bonn Convention, CAMBA, ROKAMBA and JAMBA (migratory species).

Santos considered the Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013) when defining acceptable levels of impacts and risks. While these guidelines are intended to assist proponents in determining whether an action may have a significant impact upon a matter of national environmental significance, Santos has used the guidelines to inform the definition of receptor-specific acceptable levels of impact. The significant impact criteria for matters protected under Part 3 of the EPBC Act are summarised in **Table 4-1**. Santos considers significant impacts to matters protected under Part 3 of the EPBC Act to be unacceptable.

Table 4-1: Significant impact criteria relevant for matters protected under Part 3 of the EPBC Act (Department of the Environment 2013)

Category	Significant Impact Criteria
Critically Endangered and Endangered Species	An action is likely to have a significant impact on critically endangered or endangered species if there is a real chance or possibility that it will: + lead to a long-term decrease in the size of a population; + reduce the area of occupancy of the species; + fragment an existing population; + adversely affect habitat critical to the survival of a species; + disrupt the breeding cycle of a population; + modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline; + result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat; + introduce disease that may cause the species to decline; or + interfere with the recovery of the species.
Vulnerable Species	An action is likely to have a significant impact on vulnerable species if there is a real chance or possibility that it will: + lead to a long-term decrease in the size of an important population; + reduce the area of occupancy of an important population; + fragment an existing important population into two or more populations; + adversely affect habitat critical to the survival of a species; + disrupt the breeding cycle of a population; + modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline; + result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat; + introduce disease that may cause the species to decline; or + interfere substantially with the recovery of the species.
Migratory Species	An action is likely to have a significant impact on migratory species if there is a real chance or possibility that it will: + substantially modify, destroy or isolate an area of important habitat for a migratory species;

Category	Significant Impact Criteria
	+ result in an invasive species that is harmful to the migratory species becoming established in an area of important habitat for the migratory species; or + seriously disrupt the lifecycle of an ecologically significant proportion of the population of a migratory species.
Wetlands of International Importance (i.e. Declared Ramsar Wetland)	An action is likely to have a significant impact on a wetland of international importance if there is a real chance or possibility that it will result in: + areas of wetland being destroyed or substantially modified; + a substantial and measurable change in the hydrological regime of the wetland; + the habitat or lifecycle of native species dependent upon the wetland being seriously affected; + a substantial and measurable change in the water quality of the wetland that may adversely impact on the biodiversity, ecological integrity, social amenity or human health; or + an invasive species that is harmful to the ecological character of the wetland being established in the wetland.
Commonwealth Marine Environment	An action is likely to have a significant impact on the environment in a Commonwealth marine area if there is a real chance or possibility that it will: + result in a known or potential pest species becoming established in the commonwealth marine area; + modify, destroy, remove, isolate or disturb an important or substantial area of habitat such that an adverse impact on marine ecosystem functioning or integrity on a commonwealth marine area results; + have a substantial adverse effect on a population of a marine species or cetacean, including its lifecycle and spatial distribution; + result in a substantial change in air quality or water quality that may adversely impact on biodiversity, ecological integrity , social amenity or human health; + result in persistent organic chemicals, heavy metals, or other potentially harmful chemicals accumulating in the marine environment such that biodiversity, ecological integrity, social amenity or human health may be adversely affected; or + have a substantial adverse impact on heritage values of the Commonwealth marine area, including damage or destruction of an historic shipwreck.
World Heritage Properties	An action is likely to have a significant impact on the World Heritage values of a declared World Heritage property if there is a real chance or possibility that it will cause: + one or more of the world heritage values to be lost; + one or more of the world heritage values to be degraded or damaged; or

Category	Significant Impact Criteria
	+ one or more of the World Heritage values to be notably altered, modified, obscured or diminished.
National Heritage Places	An action is likely to have a significant impact on the National Heritage values of a National Heritage place if there is a real chance or possibility that it will cause: + one or more of the national heritage values to be lost; + one or more of the national heritage values to be degraded or damaged; or + one or more of the National Heritage values to be notably altered, modified, obscured or diminished.

4.1.4 Internal Context

Santos considers an impact or risk associated with the proposed activity to be acceptable if:

+ the consequence of a planned event is ranked as I or II; or a risk of impact from an unplanned event is ranked Very Low to Medium;
+ an assessment has been completed to determine whether further information or studies are required to support or validate the consequence assessment;
+ assessment and management of risks have addressed the principles of ecologically sustainable development;
+ that the acceptable levels of impact and risks have been informed by relevant species recovery plans, threat abatement plans and conservation advice can be demonstrated;
+ performance standards are consistent with legal and regulatory requirements;
+ performance standards are consistent with the Santos' Environment, Health and Safety Policy and/or Climate Change Policy; and
+ performance standards are consistent with industry standards and best practice guidance (for example, National Biofouling Management Guidance Guidelines for the Petroleum Production and Exploration Industry (Marine Pest Sectoral Committee, 2018)).

These consequence and risk descriptors are defined in the Santos risk matrix (**Section 7.1**). Environmental consequences greater than Moderate for planned impacts and risks greater than Medium for unplanned events are unacceptable to Santos.

4.1.5 External Context

The external context considered by Santos in establishing acceptable levels of impacts and risks includes any available information provided by stakeholders or from subject matter experts in relation to Dorado Phase 1. Santos understands the OPP public comment period will provide additional external context, in addition to any consultation undertaken during the development of the OPP. Stakeholder comments provided on the OPP during the public comment period will be considered in the revised version of the OPP submitted to NOPSEMA for Stage 2 assessment following the public comment period.

Santos considers an impact or risk associated with the proposed activity to be acceptable if it is consistent with relevant and reasonable stakeholder expectations. In instances where stakeholders object to a proposed activity or expectations are not aligned, Santos may consider the impact or risk acceptable if it can be demonstrated that the objections and expectations are not relevant or are not reasonable.

4.2 Acceptable Levels of Impact for Dorado Phase 1

Based on the considerations outlined in **Section 4.1**, the acceptable levels of impact to environmental values and sensitivities that may be affected by aspects of Dorado Phase 1 are presented in **Table 4-2**.

Some receptors described in **Section 3** will not credibly be impacted by Dorado Phase 1:

+ bathymetry;

- oceanography;
- regional centres; and
- defence.

Table 4-2: Acceptable levels of impact to environmental values and sensitivities for Dorado Phase 1

Key Environmental Values/Sensitivities	Receptor-Specific Acceptable Levels of Impact (RSAL)	Justification for the Acceptable Level
Physical Environment		
Climate	**RSAL1**: No significant[1] impacts to key Australian ecosystems attributable to Dorado Phase 1 GHG emissions. **RSAL2**: Dorado Phase 1 is an insignificant CO_{2-e} emissions contributor to Australian and global CO_{2-e} emissions [1] Significant - As defined by the significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).	To date, the currently observed global warming and the associated anthropogenic climate changes cannot be directly attributed to any one development or activity, as they are the result of net global GHG emissions and GHG sinks that have accumulated in the atmosphere since the industrial revolution began. Despite the uncertainties in linking global warming and associated ecosystem impacts to GHG emissions from an individual project, Santos considers the potential for significant impact to key Australian ecosystems to result from Dorado Phase 1 GHG emissions to be unacceptable if it were to occur, and the basis for RSAL1. RSAL2 is premised on Dorado Phase 1 GHG emissions being an insignificant contributor to Australian and global GHG emissions, thereby reducing the likelihood that Dorado Phase 1 GHG emissions specifically will result in significant ecosystem impacts from climate change.
Water quality	**RSAL3**: Impacts to water quality that do not result in a loss of ecological integrity[2] are acceptable. **RSAL4**: Substantial[3] impacts to water quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable. [2] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010). [3] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.	Water quality is not unique, and the continental shelf waters in the Project Area are very widely represented in the region. Water quality is highly connected to marine ecosystems, and impacts to water quality have the potential to result in impacts to other receptors, such as fauna. A substantial change in water quality may adversely impact on biodiversity, ecological integrity, social amenity or human health. The socio-economic value of water quality in the Project Area is limited, as there are few other users that rely on high water quality in the Project Area. Impacts to water quality from Dorado Phase 1 cannot be avoided; but by limiting substantial impacts to within 1 km of the discharge locations the potential impacts to marine ecosystems will be very low. Given the offshore location and absence of sensitive marine ecosystems within the Project Area, substantial impacts to water quality within 1 km of the discharge location are acceptable.
Sediment quality	**RSAL5**: Impacts to sediment quality that do not result in a loss of ecological integrity[2] are acceptable. **RSAL6**: Substantial[3] impacts to sediment quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable. [2] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010). [3] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) value for sediments for contaminants derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.	Sediment quality is not unique, and the sediments within the Project Area are very widely represented in the region. Sediment quality is connected to marine ecosystems, particularly benthic fauna. The socio-economic value of sediment quality in the Project Area is limited, as there are few other users that rely on high sediment quality in the Project Area. Impacts to sediment quality from Dorado Phase 1 cannot be avoided; but by limiting substantial impacts to within 1 km of sources of potential sediment contamination (e.g. drilling locations) the potential impacts to marine ecosystems will be very low. By limiting potentially substantial impacts to sediment to within 1 km of the WHP, FPSO and drilling activities, the potential for environmental impacts as a result of contaminated sediments will be highly localised. These impacts are considered to be acceptable.
Air quality (excluding GHG emissions)	**RSAL7**: No substantial changes in air quality that may adversely impact on biodiversity, ecological integrity, social amenity or human health as a result of Dorado Phase 1.	Dorado Phase 1 is located in the open ocean and is well-removed from nearest residential or sensitive populations of the Australian mainland. Air quality in the Project Area is high and is widely represented in the offshore Pilbara region; air quality in the Project Area is not unique. Air quality is connected to other environmental values and sensitivities, such as air-breathing fauna and other marine users. The defined acceptable level provides a high degree of confidence that impacts to air quality will not result in substantial impacts to other receptors.

Key Environmental Values/Sensitivities	Receptor-Specific Acceptable Levels of Impact (RSAL)	Justification for the Acceptable Level
Biological Environment		
Benthic habitats	**RSAL8**: No significant[1] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities. [1] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).	Environmental surveys and habitat modelling indicate benthic communities within the Project Area are largely bare sediments interspersed with relatively small areas of hard substrates. These habitats are widely represented in the region and are not considered to be particularly sensitive. Sensitive habitats, such as hard corals, are unlikely to occur within the Project Area and, if they do occur, will be protected from direct disturbance. Santos has not placed a limit on the size of the footprint, as the footprint of potential tiebacks (if any) is currently unknown. Given the widespread nature and low sensitivity of the benthic habitats observed and predicted throughout the Project Area, Santos considers the direct disturbance footprint of the foundation facility and potential tiebacks will not result in substantial impacts to biodiversity, ecological integrity, social amenity or human health. Santos considers the footprint of the foundation facility and any future tiebacks to be acceptable.
Coastal habitats	**RSAL10**: No impacts to coastal habitats.	Coastal habitats would only be impacted by a large-scale hydrocarbon spill, such as a well blowout. Santos considers any large-scale hydrocarbon spill to be unacceptable.
KEFs	**RSAL11**: No significant impacts[1] to environmental values of KEFs. [1] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).	KEFs in the region are largely geomorphic features that provide important ecosystem services primarily as a result of their unique physical features (e.g. provision of hard substrates, facilitation of upwelling etc.). These are geographically diverse features that cover a large extent. The Project Area has been designed to exclude KEFs in the region; hence, there will be no direct disturbance of the seabed within a KEF. Impacts to KEFs that do not significantly impact upon the environmental values of the KEF are acceptable.
TECs	**RSAL12**: No impacts to TECs.	TECs would only be impacted by a large-scale hydrocarbon spill, such as a well blowout. Santos considers any large-scale hydrocarbon spill to be unacceptable.

Fishes
Marine mammals
Reptiles
Birds
	RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.
	RSAL14: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE.
	RSAL15: No injury to pygmy blue whales in a pygmy blue whale BIA
	RSAL16: No significant[1] impacts to EPBC listed threatened, migratory or cetacean species under the EPBC Act as a result of Dorado Phase 1.
	[1] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).
		Santos considers that significant impacts to threatened or migratory fauna defined in the Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013) to be unacceptable. These criteria are specific to the particular threatened and migratory classifications of fauna under the EPBC Act and are provided in **Table 4-1**.
		Santos supports the intent of conservation advice, recovery plans and threat abatement plans for these species, which is to prevent further decline and enhance the recovery of these species. Santos considers any mortality of or significant impact to species listed as threatened or migratory under the EPBC Act as a result of Dorado Phase 1 to be unacceptable.
		Recent clarification of terms in the CMP for the Blue Whale 2021-25 (DAWE, 2015) advise that PTS and TTS do constitute an injury. Acceptable levels of impact with regard to potential for 'injury' to cetaceans from the Dorado Development is limited to protection of threatened cetacean species where 'injury' is a defined term in applicable threatened species conservation advice or conservation management plans and includes potential sources of injury from underwater noise such as PTS or TTS (pygmy blue whales).
		
		Further acceptable levels for turtles relevant to light impacts from the Turtle Recovery Plan and National Light Pollution Guidelines are as followed:
		+ The Dorado Development will not result in disruption within, or displacement from, habitat critical to the survival of marine reptiles identified as potentially affected.
		+ The Dorado Development will not result in impacts which disrupt critical behaviours such as nesting, hatchling orientation, sea finding and dispersal behaviour in marine reptiles identified as potentially affected.
		+ The Dorado Development will not result in significant impacts to marine reptiles identified as potentially affected, defined as a possibility that it will'
		  - have a substantial adverse effect on a population of migratory/marine species, or the spatial distribution of the population.
		  - modify, destroy, fragment, isolate or disturb an important or substantial area of habitat such that an adverse impact on marine ecosystem functioning or integrity results.
		  - seriously disrupt the lifecycle (breeding, feeding, migration or resting behaviour) of an ecologically significant proportion of the population of a migratory/marine species.
		  - have an adverse effect on a population of listed threatened species, or the spatial distribution of the population.
		  - modify, destroy or isolate an area of important habitat for a listed threatened species.
		  - disrupt the lifecycle (breeding, feeding, migration or resting behaviour) of an ecologically significant proportion of the population of a listed threatened species.

Key Environmental Values/Sensitivities	Receptor-Specific Acceptable Levels of Impact (RSAL)	Justification for the Acceptable Level
Socio-economic and Cultural Environment		
Protected Areas	**RSAL17**: No impacts to ecological values of Ramsar wetlands. **RSAL18**: No impacts to the values of marine parks.	Protected areas such as Ramsar wetlands, AMPs and Western Australian marine protected areas and terrestrial reserves would only be impacted by a large-scale hydrocarbon spill, such as a well blowout. Santos considers any large-scale hydrocarbon spill to be unacceptable.
Fisheries	**RSAL19**: No negative impacts to the economic viability of the commercial fish resources. **RSAL20**: Short-term displacement of commercial fishing activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL21**: Long-term (up to 20 years) exclusion of commercial fishing activities from the gazetted PSZ during production operations is acceptable.	The presence of the Dorado Project infrastructure may result in an increase in the abundance of commercially targeted fish species due to habitat modification. Santos considers the displacement of other users (e.g. commercial fishers) from relatively small areas of the Project Area to be acceptable. Exclusion of fishers from these areas is not expected to affect landings and is required for the safe operation of Dorado Phase 1. Given the widespread nature of fish resources in the region and the limited overlap of the Santos project area with commercial fisheries, Santos considers the impacts to fish will not result in negative impacts to commercially exploited fish resources at a population level.
Heritage	**RSAL22**: No significant[1] impacts to World Heritage properties, National Heritage places, Commonwealth Heritage places or registered Aboriginal heritage sites. [1] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).	The World, National, Commonwealth and Aboriginal heritage properties would only be impacted by a large-scale hydrocarbon spill, such as a well blowout. Santos considers any large-scale hydrocarbon spill to be unacceptable.
Tourism	**RSAL23**: No impacts to nature-based tourism resources resulting in demonstrated loss of income. **RSAL24**: Short-term displacement of tourism activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL25**: Long-term (up to 20 years) exclusion of tourism activities from the gazetted PSZ during production operations is acceptable.	There are no known tourist attractions or destinations within the Project Area or surrounding waters. Santos considers the displacement of other users (e.g. tourism operators) from the Project Area, which is a relatively small area of the open ocean environment where existing tourism and recreation use is very low, to be acceptable.
Maritime Industry	**RSAL26**: Short-term displacement of commercial shipping from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL27**: Long-term (up to 20 years) exclusion of commercial shipping from the gazetted PSZ during production operations is acceptable.	Santos considers the displacement of other users (e.g. commercial shipping) from relatively small areas of the open ocean environment in Dorado Phase 1 area to be acceptable. Santos acknowledges there is commercial shipping in the region, which is concentrated in the shipping fairways designated by AMSA.
Defence	**RSAL28**: Short-term displacement of defence activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL29**: Long-term (up to 20 years) exclusion of defence activities from the gazetted PSZ during production operations is acceptable.	Santos considers the displacement of other defence activities from relatively small areas of the open ocean environment in Dorado Phase 1 area to be acceptable. There are no designated defence areas within the Project Area.

5 Analysis of Alternatives

The OPGGS (E) Regulations require that the OPP describe any feasible alternatives to the Dorado Development or to an activity that is part of the Dorado Development, including:

- a comparison of the environmental impacts and risks arising from the project or activity and the alternative; and
- an explanation as to why the alternative was not preferred.

This section of the OPP presents the alternatives considered for the Dorado Development, providing an overview of the advantages and disadvantages of each alternative with an emphasis on environmental impacts and risks. It also provides a justification for the selection of the preferred option. Some decisions will be determined during FEED (preliminary engineering) and others during detailed engineering stages of the Dorado Development. Decisions remaining to be made and their environmental implications are summarised at the end of this section.

The process of assessing the Dorado Development alternatives started in 2018, with an early identification of potential development concepts and understanding of the feasibility of early field development. Upon identifying the technically and commercially viable options, Santos identified the preferred Dorado Development concept. This process was undertaken in two main phases:

- analysis of concept alternatives; and
- analysis of design alternatives.

During the early identification of potential development concepts, only those that were technically and commercially viable and were appropriate for the reservoir type were carried into the concept alternatives analysis (i.e. options considered feasible, refer to **Section 5.1**). Following the determination of the field development option, the following concept alternatives (**Section 5.3)** were considered:

- the type of production trees to be installed (the production tree options); and
- the facilities that would be required to process the hydrocarbons (the facility options).

Once the preferred Dorado Development concept was identified, analysis of design alternatives for the preferred development concept was undertaken (**Section 5.4**). This included technical options for specific utility and processing systems (such as PW management).

5.1 Field Development Options

Immediately following the Dorado discovery, the following development options were considered to recover the light oil, condensate and gas resources:

- no development;
- developing liquids only – producing light oil and condensate, with gas reinjected; and
- developing liquids with gas export– full integrated resource development of light oil, condensate and gas resources.

Developing the petroleum resources aligns with the Australian Government's offshore development policy to explore and develop offshore petroleum resources. The policy recognises that development of these resources provides benefits to the Australian community, including:

- Government royalties and taxation revenue that is used to provide government services;
- employment for Australians;

+ production of petroleum resources to sustain a high standard of living;
+ improved energy resources security; and
+ regional industrial development.

The offshore petroleum policy encourages the development of commercially viable petroleum reserves. This requirement is a feature of the administration of petroleum titles. As the titleholder for WA-437-P and WA-438-P petroleum titles, Santos has an obligation to undertake exploration and develop any commercially viable petroleum resources (refer to **Section 2.1.1**). In this context, the 'no development' alternative is not consistent with the legal obligations and commercial objectives of Santos and was therefore not considered further.

Santos acknowledges that the 'no development' option results in no associated impacts to the environment. However as detailed in this OPP, Santos considers that the environmental impacts of planned activities associated with the Dorado Development can be managed to acceptable levels and the associated petroleum activities are consistent with the principles of ESD.

Dorado Phase 1 was selected as the 'liquids only' development concept, primarily as there is a requirement to enhance the liquids recovery through reinjection of reservoir gas via a phenomena called "miscible flood". Miscible flood is a general term for injection processes that introduce miscible gases into the reservoir. A miscible displacement process maintains reservoir pressure and improves oil displacement because the interfacial tension between oil and water is reduced.

For Dorado Phase 1, the LPG-rich gas (which is produced during recovery of the oil) will be reinjected back into the reservoir at high pressure to ensure miscibility between the injected gas and the in situ oil; thereby, previously immobile oil, trapped in smaller pores of the reservoir rock, will be mobile enough to be extracted and will enhance the overall recoverable liquids from the Dorado field.

The reinjection of the gas avoids flaring and also preserves the option for a future gas export project, a potential Phase 2 of the Dorado Development. If commercially and technically viable, this next phase would be subject to separate approvals and is not included in this Offshore Project Proposal, as further understanding of the recoverable gas resources and development of concept design and facility options is required.

Given the objective of Dorado Phase 1 is to extract the oil, the "liquids with gas export" development option was not selected, as the recovery of oil would be substantially less due to no reinjection of the LPG-rich gas. The following sections provide an overview of the alternatives considered for undertaking Dorado Phase 1.

5.2 Methodology

To assess the concept and design alternatives for Dorado Phase 1 and to understand the merits of each option, a multidisciplinary evaluation of options across the following five criteria was undertaken:

+ technical feasibility;
+ health and safety (H&S);
+ environment;
+ economic; and
+ societal.

To further facilitate the comparisons of options, the above criteria were subdivided into subcriteria. The subcriteria, along with key considerations, are presented in **Table 5-1**.

Table 5-1: Alternatives analysis criteria and subcriteria

Criteria	Subcriteria	Key Considerations
Technical feasibility	Technical complexity	How technically complex the design of the option is
	Proposal execution risk	Level of risk associated with constructing the option
	Management of reservoir performance	How is the reservoir managed – maximum production from the reservoir being preferable
Health and Safety	Safety risk during construction	Level of health and safety risks to construction personnel associated with the option during construction
	Safety risk during operations	Level of health and safety risks to operations personnel associated with the option during operations
Environment	Physical presence and seabed footprint	Extent of the physical presence and seabed footprint associated with the option – as an indicator of the likely seabed disturbance
	Number of vessel movements	What vessel movements and their frequencies are associated with the option – as an indicator of potential disturbance to marine fauna
	Light emissions	Quantity of light emitted by the option – as an indicator of potential impact on marine fauna and migratory birds
	Underwater noise	Level of expected underwater noise from the option – as an indicator of potential impact on marine fauna
	Atmospheric emissions, including GHG	Volume of expected atmospheric emissions associated with the option
	Planned liquid discharges	Types, volume and frequency of expected planned liquid discharges associated with the option
	Planned solid waste generation	Expected volume of solid waste generated from the option
	Risk of IMS translocation	Risk level of IMS translocation associated with the option
	Risk of unplanned discharges	Types and risk of potential unplanned discharges associated with the option
Economic	Schedule risk	How long it would take to construct the option
	Commercial risk	The CAPEX and operating expenses (OPEX) associated with the option
Societal	Socio-cultural impacts	Potential socio-cultural impacts associated with the option – as an indicator of impacts to recreational and cultural activities, such as traditional fishing and marine parks
	Socio-economic impacts	Potential socio-economic impacts associated with the option – as an indicator of impacts to the broader economy, such as job creation, and impacts to commercial operations, such as commercial fisheries

The options were not assessed quantitatively but rather by comparing the options to each other, in each alternative category. During the comparison, a value was assigned to each subcriteria as per **Table 5-2**. As the number of subcriteria is different for each criterion, the average score for each criterion was established. The greater the number, the more desirable the option is. The average scores of all criteria were summed up to establish the option's relative ranking. Similarly, the option with the highest score is the preferred option. The relative ranking can be regarded as the desirability of the option.

Table 5-2: Scoring values

Score	Key Considerations
1	Significantly worse when compared to the other options
2	Marginally worse when compared to the other options
3	All options are equal when compared to each other
4	Marginally better compared to other options
5	Significantly better compared to other options

To establish the desirability ranking, equal weighting was given to each criterion (technical feasibility, health & safety, environment, economic, and societal). This approach ensured that environmental considerations were on an equal footing with the other criteria.

5.3 Concept Alternatives

This section provides the comparative assessment undertaken for the concept alternatives:

- the type of production trees to be installed (the production tree options); and
- the facilities that would be required to process the hydrocarbons (the facility options).

5.3.1 Production Tree Options for Dorado Reservoir

To operate a well, a production tree is required to control the pressure and flow from the reservoir. The type of production trees used can have a significant influence on the facilities required.

The production tree options considered for the Dorado reservoir were:

- wet subsea production trees (i.e. production trees located on the seabed); and
- dry production trees (i.e. production trees located at the surface on the facilities and the wellheads remain on the seabed).

The assessment of the above options is presented in **Table 5-3**.

It is expected that the Dorado field will require significant reservoir management and potential intervention, so reducing the complexity and safety risk of these activities as well as associated costs, were significant drivers in the decision-making.

The "dry production trees" option was identified as the preferred option and adopted as it ranked first for all criteria, including:

  - the production trees on the facility providing better access and visibility and simplified installation and maintenance and repair activities;
  - presenting a lower execution risk profile than wet production trees and also expected to present a lower risk profile during installation activities;
  - reducing the expected seabed disturbance during maintenance and repair activities. It is acknowledged that tubulars would need to be installed to connect the subsea wellheads to the dry production trees and that seabed disturbance will occur during the installation activities;
  - the dry production trees will facilitate inspection (via the WHP) and early detection of potential leaks, reducing the risk of potential escalation and unplanned discharges;
  - the CAPEX and OPEX associated with dry production trees are expected to be less than that of wet production trees; and
  - Response planning considerations are not expected to be affected by the production trees decision.

The societal subcriteria were found not to be differentiators between the two options. The main drawbacks associated with the “wet production trees” were:

- reduced access (which complicates installation and maintenance activities);
- increased safety risks (associated with more complex installation activities, the potential need of divers and limited access/visibility during maintenance operations);
- reduced opportunity to identify and address potential leaks; and
- higher overall CAPEX and OPEX.

The type of production trees required for future tiebacks of additional resource discoveries is not able to be determined at this stage as it requires information on location and reservoir management that is not currently available (**Section 5.5**).

Table 5-3: Production trees options assessment

Criteria	Subcriteria	Production Trees Alternatives			
		Wet Production Trees		Dry Production Trees	
		Score	Justification	Score	Justification
Technical feasibility	Technical complexity	2	The trees being underwater complicates installation and future maintenance and repair operations due to difficult and limited accessibility.	4	Having trees on a facility provides greater accessibility and visibility, which simplifies the installation, maintenance and repair during operations.
	Proposal execution risk	2	Access to the trees is limited and difficult as it requires vessels, ROVs and potentially divers, which increases the execution risks.	4	Due to better tree access and visibility, the activities associated with installation, maintenance and repair are considered easier and have lower execution risks associated with them.
	Management of reservoir performance	2	Well intervention to assist with reservoir performance is more complex for wet production trees than dry production trees.	4	Well intervention to assist with reservoir performance is simpler for dry production trees.
Average technical feasibility		**2**		**4**	
Health and Safety	Safety risk during construction	2	Installation operations will be more complex with wet production trees, which increases the construction safety risk profile.	4	Installation operations will not be as complex with dry production trees, which reduces the construction safety risk profile.
	Safety risk during operations	3	Safety risks during operations are expected to be higher than with dry production trees due to limited access and visibility and the requirement for diving operations to undertake inspection, monitoring, maintenance and repair (IMMR) activities, increasing the safety risk.	3	It is expected that reservoir management and intervention will be required during operations. Having dry production trees will allow for easier access and greater visibility, which reduces the safety risk profile.
Average Health and Safety		**2.5**		**3.5**	

Criteria	Subcriteria	Production Trees Alternatives			
		Wet Production Trees		Dry Production Trees	
		Score	Justification	Score	Justification
Environment	Physical presence and seabed footprint	3	During installation, maintenance and repair operations, diver and/or ROV will be required near or at seabed, which presents an increase in potential seabed disturbance.	3	Potential seabed disturbance will be eliminated during maintenance and repair operations as the trees will be on the facility; however, some seabed disturbance may occur during installation when tubulars are installed to connect the subsea wellheads to the production trees.
	Number of vessel movements	3	The number of vessel movements is not expected to be affected by the production trees decision.	3	The number of vessel movements is not expected to be affected by the production trees decision.
	Light emissions	3	Light emissions are not expected to be affected by the production trees decision as wet production trees would be tied-back to a lit facility.	3	Light emissions are not expected to be affected by the production trees decision. Dry production trees would be either directly tied-back to a lit facility, as per the wet production trees, or tied-back by the intermediary of an unmanned facility. On an unmanned facility, the lighting levels would be kept to minimum navigational safety requirements, and therefore the overall light profile is not expected to be a differentiator between the two options.
	Underwater noise	3	While wet production trees will require subsea maintenance and repair activities, it is not expected that the resultant underwater noise will be a significant addition to the ambient underwater noise.	3	Underwater noise level is not expected to be affected by the production trees decision.
	Atmospheric emissions, including GHG	3	Atmospheric emissions are not expected to be affected by the production trees decision.	3	Atmospheric emissions are not expected to be affected by the production trees decision.
	Planned liquid discharges	3	Planned liquid discharges are not expected to be affected by the production trees decision.	3	Planned liquid discharges are not expected to be affected by the production trees decision.

Criteria	Subcriteria	Production Trees Alternatives			
		Wet Production Trees		Dry Production Trees	
		Score	Justification	Score	Justification
	Planned solid waste generation	3	Planned solid waste generation is not expected to be affected by the production trees decision.	3	Planned solid waste generation is not expected to be affected by the production trees decision.
	Risk of IMS translocation	3	IMS translocation risks are not expected to be affected by the production trees decision.	3	IMS translocation risks are not expected to be affected by the production trees decision.
	Risk of unplanned discharges – during drilling/ well intervention activities	3	Response planning considerations are not expected to be affected by the production trees decision as the same rig type (i.e Jack up) would be used.	3	Response planning considerations are not expected to be affected by the production trees decision as the same rig type (i.e Jack up) would be used.
	Risk of unplanned discharges – during operations	2	The potential risk of unplanned discharges is higher with the trees being subsea, as leaks are not as easy to detect and repair.	4	Having the production trees on the facility will make it easier to identify and repair potential leaks, thereby reducing the potential risk of unplanned discharges.
	Response planning considerations for unplanned LOWC scenario	3	Response planning considerations are not expected to be affected by the production trees decision. Due to the shallow water depth at Dorado (88 m), Santos considers a relief well as the primary source control strategy for a complete LOWC event, therefore the duration and volume of spill associated with a LOWC event is the same for both alternatives considered. Although a wet production tree development may allow for the potential use of subsea direct intervention source control methods, the ability to deploy these methods is not guaranteed.	3	Response planning considerations are not expected to be affected by the production trees decision. The primary source control strategy is still a relief well therefore the duration and volume of spill associated with a LOWC event is the same for both alternatives considered (no change for the wet tree alternative). Direct intervention source control for wells drilled with a jack-up MODU (access by Well Control Specialists to target a well via the platform or jack-up MODU) is common. Although constructing the wells this way precludes the use of subsea direct intervention source control methods (as the well is not being constructed in open water, with wellhead/BOP equipment close to the seabed), this is the case for many existing offshore assets.

Criteria	Subcriteria	Production Trees Alternatives			
		Wet Production Trees		Dry Production Trees	
		Score	Justification	Score	Justification
Average environment		**2.6**		**3.1**	
Economic	Schedule risk	3	The overall schedule risk is not expected to be affected by the production trees decision.	3	The overall schedule risk is not expected to be affected by the production trees decision.
	Commercial risk	2	The overall CAPEX and OPEX associated with wet production trees are expected to be the highest of the two options due to the complexity and additional requirements imposed by subsea activities.	4	CAPEX and OPEX of dry production trees will be less than that of wet production trees. It is expected that less well and equipment downtime due to better accessibility will result in better production.
Average economic		**2.5**		**3.5**	
Societal	Socio-cultural impacts	3	The socio-cultural impacts are not expected to differ between the two options.	3	The sociocultural impacts are not expected to differ between the two options.

Average societal		**3**		**3**	
Overall Score (desirability)		**12.6**		**17.1**	

5.3.2 Facility Options

During the early identification of potential development concepts, it was recognised that, should dry trees be required, integrating them directly into an FPSO facility or a central processing platform (CPP) or a gravity-based storage structure (GBSS) (ie gravity-based structure with "liquids" storage cells on the seabed) would have execution risk and associated health & safety risks, fabrication complexity, and operability issues caused by congestion and so were disregarded early as concepts. Taking into consideration the findings of the early identification of potential development concepts, a WHP was therefore required to host the dry production trees.

Following the decisions of liquids only production and dry production trees on a WHP, the next decision was to identify the facility or facilities assemblage that would be required to develop and operate the Dorado field.

The following facility options for Dorado Phase 1 were considered:

- WHP with an FPSO – dry production trees located on a WHP with the production fluids exported to an FPSO for treatment, storage and offloading;
- WHP with a CPP and a floating storage and offloading (FSO) facility – dry production trees located on a WHP with the production fluids exported to a CPP for treatment, with saleable products exported to an FSO for storage and offloading. The CPP would stand separate to the WHP on a conventional steel jacket; and
- WHP with a GBSS – dry production trees located on a WHP with the production fluids exported to a GBSS for storage (in storage cells on the seabed) prior to periodic offloading. The GBSS would be based on a tripod type concrete structure with subsea storage of liquids prior to offloading.

The assessment of the above options is presented in **Table 5-4**. The "WHP with an FPSO" option was identified as the preferred facility option and was adopted because:

- it represents the lowest utilities discharges and solid waste generation;
- it has no subsea hydrocarbon storage cells (such as the "WHP with a GBSS" option), reducing the risk of small undetectable leaks of hydrocarbons to the marine environment; and
- the associated execution and operational risks are the lowest of the three options considered given the experience in the region and similarity of other WHP/FPSO facilities operated by Santos.

The overall score for the "WHP with an FPSO" option was the highest, however this option scored lower on some environment sub-criteria :

- potential environmental impact associated with increased underwater noise associated with the use of thrusters on the FPSO; however, this is not expected to be a significant noise addition in the Project Area, which overlaps with two shipping fairways (background ambient noise elevated by transiting ships) and is assessed in **Section 7.2.5**; and
- potential environmental risk due to an IMS translocation resulting from the FPSO moving off station for significant maintenance (up to every five years); however, this risk is well managed by Santos through operating similar assets in the region and is assessed in **Section 7.3.3.**

As this option performed sufficiently well in the other criteria and given that the associated risks can be managed to acceptable levels, the "WHP with an FPSO" option was adopted as the preferred facility concept. The selected concept for the Phase 1 development of the petroleum resources is therefore a WHP, housing dry production trees, connected to an FPSO producing liquids only.

As presented above, during the assessment a clear preference was identified between the “WHP with an FPSO” option and the “WHP, CPP & FSO” and “WHP with a GBSS” options. This was not the case between the “WHP, CPP & FSO” and “WHP with a GBSS” options, where a very slight preference was identified for the “WHP with a GBSS” option.

For the technical feasibility criterion, the “WHP, CPP & FSO” option performed as well as the “WHP with an FPSO” option while the “WHP with a GBSS” option was the least desirable due to its increased complexity and limited gravity-based structure regional experience. The “WHP, CPP & FSO” and “WHP with a GBSS” options presented an identical level of desirability for the health and safety criterion, with the “WHP, CPP & FSO” option presenting a lower operations safety risk than the “WHP with an FPSO” option (due to not requiring flexible dynamic risers) but a higher construction safety risk (due to higher offshore installation activities).

For the environment criterion, the “WHP with a GBSS” option was identified as preferred over the “WHP with an FPSO” option, with the main advantages being the absence of thrusters (which is associated with a reduction in underwater noise and atmospheric emissions) and a reduction of potential IMS translocation risk. Its main draw backs were the larger footprint and the potential risk of hydrocarbon leaks associated with the storage cells on the seabed within the GBSS. The “WHP, CPP & FSO” option was identified as the least preferred for the environment criterion as it represents the highest levels of light emissions, utility discharges to the marine environment and solid waste generated.

For the economic criterion, the only difference between the “WHP with an FPSO” and the “WHP, CPP & FSO” options is that the “WHP, CPP & FSO” option is associated with a higher schedule risk (due to not being able to refurbish an existing facility). The “WHP with a GBSS” option presented the highest schedule and commercial risks (mostly associated with the lack of regional experience with gravity-based structures).

For the societal criterion, the “WHP with a GBSS” option performed as well as the “WHP with an FPSO” option while the “WHP, CPP & FSO” option was the least preferred due to its potentially larger exclusion zone.

Santos

Table 5-4: Facility options assessment

Criteria	Subcriteria	Facility Alternatives					
		WHP with an FPSO		WHP, CPP & FSO		WHP with a GBSS	
		Score	Justification	Score	Justification	Score	Justification
Technical feasibility	Technical complexity	4	The level of technical complexity is not a differentiator between the "WHP with an FPSO" and the "WHP, CPP & FSO" options (comparable hydrocarbons processing and storage systems). The hydrocarbons storage system is less complex than that of the "WHP with a GBSS" option.	4	The level of technical complexity is not a differentiator between the "WHP with an FPSO" and the "WHP, CPP & FSO" options (comparable hydrocarbons processing and storage systems). The hydrocarbons storage system is less complex than that of the "WHP with a GBSS" option.	2	This is the most technically complex option as it requires the integration of the subsea oil storage systems and the topsides of the GBSS.
	Proposal execution risk	4	WHP with FPSO systems are common in the region and are not expected to present a heightened execution risk.	4	WHP, CPP and FSO systems for oil production are less common in the region but are not expected to present a heightened execution risk.	2	Regional industry experience with WHP with a GBSS is limited and generally GBSSs present a higher execution risk, inherent to the substructure itself.
	Management of reservoir performance	3	Reservoir management is not impacted by the choice of facilities.	3	Reservoir management is not impacted by the choice of facilities.	3	Reservoir management is not impacted by the choice of facilities.
Average technical feasibility		**3.7**		**3.7**		**2.3**	
Health and Safety	Safety risk during construction	4	This option is associated with the lowest offshore installation work	2	The construction safety risk profile is similar between this option and the "WHP	2	The construction safety risk profile is similar between this option and the "WHP, CPP & FSO" option, but

Criteria	Subcriteria	Facility Alternatives					
		WHP with an FPSO		WHP, CPP & FSO		WHP with a GBSS	
		Score	Justification	Score	Justification	Score	Justification
			requirement and as such represents the lowest safety risk during construction. The FPSO will sail down prior to commissioning and be hooked up to the installed DTM.		with GBSS" option, but it represents an increase in construction safety risk compared to the "WHP with an FPSO" option, as there is more offshore installation activity required to install the CPP and the FSO.		it represents an increase in construction safety risk compared to the "WHP with an FPSO" option, as there is more offshore installation activity required to install the GBSS.
	Safety risk during operations	2	Subsea flowlines and loadout lines are common to all three options. Operating flexible dynamic risers (specific to FPSO) introduces a safety risk that is not present with the other options.	4	Subsea flowlines and loadout lines are common to all three options. Not having to operate flexible dynamic risers marginally lowers the safety risk profile.	4	Subsea flowlines and loadout lines are common to all three options. Not having to operate flexible dynamic risers marginally lowers the safety risk profile.

5.4 Design Alternatives

The WHP platform function and design were set at the early stage during the concept alternatives analysis as being a gathering facility to house the dry production trees with no processing capacity. Following the decision to progress with the “WHP with an FPSO” option, alternatives in the production system design on the FPSO were evaluated.

5.4.1 Mooring Design

Continuous dynamic positioning of the FPSO is disregarded given the metocean conditions (including cyclone conditions) on the North West Shelf. Given that the FPSO will not use dynamic positioning, the FPSO will have to be secured in position via a mooring system. The mooring system will connect the FPSO to multiple chains anchored to the seabed. The following mooring design options were considered:

+ permanent (the FPSO will remain on station through all weather conditions) – 4 x 6 “leg” system comprising anchor chain and ground chain; and
+ disconnectable turret mooring (DTM – the FPSO will move off station during adverse weather events) – 3 x 4 “leg” system comprising anchor chain, ground chain, subsea buoy and a fairlead chain.

The assessment of the above options is presented in **Table 5-8**. The “disconnectable mooring” option ranked first in all but the economic criterion, wherein the “disconnectable mooring” option was penalised by the potential loss of days of production associated with the FPSO moving off station during cyclonic events.

Overall, the “disconnectable mooring” option was identified as the most desirable mooring design option and adopted because it:

+ has the lower overall health and safety profile for both the installation and operations stages. The FPSO moving off station during cyclonic events reduces the risk profile compared to the FPSO staying on station. It is noted that some health and safety risks persist due to the requirement to shut down, disconnect, move away, return, and resume production prior to and after cyclonic events;
+ presents a lower noise profile due to a shorter installation timeframe; and
+ has the smaller seabed footprint due to a lower number of anchors and anchor legs being required.

While the risk of IMS translocation associated with the “disconnectable mooring” option is greater, due to the FPSO disconnecting for maintenance activities in dry dock (expected approximately every five years), this risk is well understood: and to date, IMS risks have been effectively managed by Santos. It is important to note that, during cyclonic events, the FPSO will disconnect but will remain at sea until safe to connect. Therefore, choosing the “disconnectable mooring” option does not present an unacceptable IMS translocation risk.

The technical feasibility and societal criteria were found not to be differentiators between the two options. The “permanent mooring” option does present a more desirable option as it reduces the potential for IMS introduction, but when considering other environment subcriteria (seabed footprint and atmospheric emissions in particular), there was less preference for the option overall based on the environment criterion. The “permanent mooring” option does present less of a commercial risk, as it does not involve loss of production days when the FPSO has to move off station for cyclones, but this economic advantage was not sufficient to identify the “permanent mooring” option as preferable.

There are no other permanently moored FPSO on the NWS of Australia. Permanently moored floating facilities, such as Montara, Prelude, and Ichthys, are located in the Timor Sea and therefore not subject to the same metocean conditions as on the NWS, i.e. Dorado location.

Table 5-5: Mooring design options assessment

Criteria	Subcriteria	Mooring Design Alternatives			
		Permanent		Disconnectable Mooring	
		Score	Justification	Score	Justification
Technical feasibility	Technical complexity	3	Technical complexity is not expected to be a differentiator between the options. This option will require a simpler but much larger mooring system. The technical difficulties associated with the size of the mooring system will be compensated by being less complex.	3	Technical complexity is not expected to be a differentiator between the options. This option will require a smaller but more complex mooring system. The technical complexity advantages brought by a smaller system will be counterbalanced by the additional difficulty of being removable.
	Proposal execution risk	3	The execution risk profile is not expected to be impacted by the mooring design decision.	3	The execution risk profile is not expected to be impacted by the mooring design decision.
	Management of reservoir performance	3	The management of reservoir performance is not expected to be impacted by the mooring design decision.	3	The management of reservoir performance is not expected to be impacted by the mooring design decision.
Average technical feasibility		**3**		**3**	
Health and Safety	Safety risk during construction	2	The anchor laying and connecting activities are expected to take longer due to the increased number of anchors and mooring “legs”, thus slightly increasing the construction safety risk profile.	4	The construction safety risk profile is lower with this option due to the reduced number of anchors and anchoring “legs” that are to be installed.
	Safety risk during operations	1	The operational safety risk profile is greater with this option due to the FPSO staying on station during cyclonic events. The preparations required for such event will be more complex than those for moving off station.	5	Operational safety risks associated with shutdown, disconnection and resumption of production are considered less risky than preparations for cyclones and severe weather events.

Criteria	Subcriteria	Mooring Design Alternatives			
		Permanent		Disconnectable Mooring	
		Score	Justification	Score	Justification
Average Health & Safety		**1.5**		**4.5**	
Environment	Physical presence and seabed footprint	2	Additional anchors and anchor "legs" (24 anchors on 4 anchor legs instead of 12 anchors on 3 legs) result in the seabed footprint being greater.	4	Fewer anchors and anchor "legs" equates to a smaller seabed footprint.
	Number of vessel movements	3	The number of vessel movements is not expected to be significantly impacted by the mooring design decision.	3	The number of vessel movements is not expected to be significantly impacted by the mooring design decision.
	Light emissions	3	While with this option the FPSO will remain on station and may continue production during cyclonic conditions, the overall light emissions are not different to normal operating conditions and are not impacted by the mooring design decision.	3	The light emissions are not expected to be impacted by the mooring design decision.
	Underwater noise	2	The installation activities are expected to be longer and therefore generate underwater acoustic emissions for a longer period. During operations it is not expected that the noise level will differ between the two options.	4	The installation activities are expected to be shorter and therefore generate underwater noise for a shorter period. During operations it is not expected that the noise level will differ between the two options.
	Atmospheric emissions, including GHG	3	The FPSO will remain on station and may continue production during cyclonic conditions; however, the overall atmospheric emissions are not expected to vary sufficiently to differentiate between the mooring design options.	3	The FPSO will navigate away from the cyclonic conditions on its own power; therefore, the overall atmospheric emissions are not expected to vary sufficiently to differentiate between the mooring design options.
	Planned liquid discharges	3	The planned liquid discharges are not expected to vary significantly between the mooring design options.	3	The planned liquid discharges are not expected to vary significantly between the mooring design options.

5.4.2 Power Supply

The operation of the Dorado facilities requires a power supply. The power requirement includes electricity for rotating machinery such as pumps and compressors and power in the form of heat for processing the recovered fluids. The total power demand ie. electrical load, is estimated at approximately 30 MW.

The following alternative options to supply power were identified and considered:

+ import power from the existing mainland grid;
+ import power from existing oil and gas facilities;
+ Photovoltaic (PV) system or wind turbine system adjacent to or on the FPSO;
+ power generation on the FPSO using produced gas; and
+ power generation on the FPSO using diesel fuel.

The options were primarily assessed against energy efficiency criteria and associated potential to reduce the GHG emissions from the Dorado Development; and the technical maturity and practicability of each alternative.

5.4.2.1 Import Power from Mainland Electricity Grid Supply

One option for powering the Dorado Development facilities is via transmission of power from the mainland electricity grid supply. The imported electricity would likely be generated at Port Hedland Power Station (closest power station to Dorado) which is a natural gas-fired power station (where gas is combusted to generate electricity). There would be a requirement to install a subsea transmission line between the FPSO and the mainland (approximately 145km in length) which would incur energy losses during transmission. FPSO process heat requirements of 15 MWh would also need to be transmitted in the form of additional electricity (~15 Mwe) from the mainland, in lieu of captured waste heat from offshore power generation, which incurs further inefficiencies.

5.4.2.2 Import Power from Existing Offshore Oil and Gas Facility

Electricity could also be imported from an existing offshore oil and gas facility. This would require the installation of a transmission line between the FPSO and the power generating facility. The closest offshore oil/ gas facility to the Dorado Development is approximately 200km away. To further consider this option it has to be assumed:

+ that it is possible to identify an offshore oil and gas facility which generates excess power and has power transmission facilities (or its operator is willing to modify the facility so it does);
+ the distance and seabed between the facility and FPSO does not preclude the installation of a subsea transmission line and;
+ a mutually acceptable commercial and contractual agreement can be reached between Santos and the facility operator.

Offshore facilities generating their own power in the region do so by combusting produced gas, in the same manner that power would be generate don the Dorado FPSO given that heat cannot be transmitted from the mainland as for the option of importing power from the mainland, the heat required for hydrocarbon processing would have to be generated on the FPSO.

5.4.2.3 Photovoltaic (PV) System and/or Wind Turbine System

Photovoltaic (PV) and/ or wind turbines also produce electricity and are both available technologies.

PV and wind turbine systems are intermittent generators of electricity such that battery systems would also be required to ensure a continuous and stable supply of power to the FPSO. The size of the supply would require greater than 250 MW of solar panels (1x1 km array) or greater than 25 of the largest wind turbines at the time of preparing this OPP. The size of the battery system required to store generated electricity (for when the PV/wind turbine system is not operational) would likely need to be greater than 1 GW/hr and the mass of this system would be approximately 5,000te.

To further consider this option it has to be assumed the PV system/wind turbine system would be installed offshore, adjacent to the Dorado WHPO and FPSO. If the PV/wind turbine system were constructed onshore then there would be a requirement to build a subsea transmission line between the FPSO and the mainland (approximately 145km in length) as per the "import power" options (**section 5.4.2.1**).

There would be an additional electrical load requirement to generate the heat for hydrocarbon processing on the FPSO.

5.4.2.4 Power Generation on the FPSO using produced gas

Gas turbine generators are commonly used onboard offshore oil and gas facilities. Gas turbines are compact, have high reliability, require relatively little maintenance and can be run using fuel gas produced from the Development reservoirs. The engineering design process for the Development will consider the application of lower emission energy systems for supplementary power loads for the facilities and potential integration of battery storage systems to optimise the efficiency of this solution.

5.4.2.5 Power Generation on the FPSO using diesel

Power can also be generated by diesel-powered turbines.

Should diesel be the only fuel source for power there would be a requirement to transfer, bunker and store large volumes of diesel (approximately 900m^3 for 5 days) to meet the electricity demands of oil production. Typically these engines require frequent maintenance/ service every 500 hours. In the event that a produced gas power generation system is used, the FPSO would still require diesel power generation capacity to support the FPSO operation for commissioning (until the power generation system is commissioned), when the field is not producing gas, or the FPSO is not on station.

Similar to using produced gas, diesel power would utilise onboard heat recovery units for process heat.

5.4.2.6 Preferred Option

The assessment of the options is presented in **Table 5-6**. The "produced gas electricity supply - FPSO" option was identified as the preferred option and was adopted because:

- the associated execution and operational risks are the lowest of the five options considered given the experience in the region and similarity of other WHP/FPSO facilities operated by Santos;

+ this option offers the best reliability for operating;
+ the PV/wind turbine systems options are more technically complex and have not been executed offshore of WA previously; and
+ of the technically feasible power supply alternatives, it offers optimal energy efficiency, particularly when considering the combined electricity and heat requirements for production processing systems.

In both options that "import" electricity to the Dorado facilities, the power most likely will have been generated by combusting gas. The quantity of GHG emissions emitted from either of these options are not expected to be materially different to those generated from gas turbine generators located on the FPSO so these options do not provide a significant GHG emissions reduction benefit for the Dorado Development. The Dorado Development would have to include emissions associated with generation of the imported electricity (Scope 2 emissions) in its annual emissions reporting, which are expected to be comparable to those associated with generating electricity on the FPSO. These options require Santos to depend on a third party to provide power which represents an undesirable position, as Santos would not have control or visibility on potential outages if the facilities were interrupted or shutdown their operations. Both of these options also require installation of a subsea transmission line, increasing the development footprint, with potential to impact sensitive habitat. A subsea transmission line also introduces energy losses which need to be compensated for by additional onshore power generation resulting in additional emissions.

Whilst the PV/ wind turbine system options will result in no GHG emissions to produce electricity, the need for a continuous uninterrupted power supply for safe operations, the quantity of panels/ turbines and additional battery storage required to generate the required power and associated space requirements rendered this option infeasible. This option would also require additional structures to be installed offshore (separate to the WHP/FPSO) to house the equipment, increasing the seabed disturbance footprint of Dorado Phase 1.

Generating power solely from diesel rather than produced gas results in increased GHG emissions. Even if the GHG emissions associated with the transport and storage of diesel to the Dorado facilities are disregarded, the NGER Act GHG emissions calculation methodology for a similar volume indicates combusted diesel emits approximately 30% more GHG emissions than produced gas for power generation. Although technically feasible, this option would represent an increase in GHG emissions relative to the produced gas power supply option and as a result it was not adopted as the primary power supply option. The FPSO will still require diesel power generation for contingent power supply when the field is not producing gas, or the FPSO is not on station.

A benefit of onboard power generation is that the electrical power demand (and associated emissions) is less by at least 15 MW due to the recovery of exhaust heat from gas turbine generators which is used to process the oil. This gives FPSO power generation a GHG emissions efficiency advantage over imported power generated by gas fuels of approximately 27%.

Using produced gas for FPSO power generation was selected as the power generation option for Dorado Phase 1.

5.4.2.6.1 FPSO Gas Turbine Power Generation Alternatives

To optimise the energy efficiency for FPSO gas turbine power generation, a number of design alternatives were considered and assessed during engineering design. Key to the assessment of design alternatives for the power generation system, is the combined demand for process electricity and heating. The provision of process heating is often linked to power generation configuration, of which waste heat recovery units (WHRU) are the most efficient means of generating a heat source. Reducing heat or electrical consumption through energy efficient design allows for a reduction in power generation, resulting in a reduction in fuel consumption and GHG emissions. Given the interdependency between power and heat supply systems - the provision of process heating and the configuration of power generation systems needs to be assessed holistically to determine optimal energy efficiency outcomes.

The main sources of electrical power demand for the Dorado facilities includes:

- compressor drivers;
- pumps;
- heat generation and distribution; and
- cooling.

The largest sources of heating requirements for the facility operations include:

- Crude oil heater;
- Fuel gas heating; and
- Glycol regenerator reboiler.

The total process heat requirements are significant, requiring up to 17 Megawatts (MW) heat load. Heat is typically generated in one of three ways:

- through the combustion of fuel in an indirect fired heater;
- using electricity with an electrical heating element; or
- captured from the exhaust of an engine.

The combination of power supply and process heating requirements have trade-offs in terms of energy required, reliability, and associated emissions. Key energy efficiency considerations relevant to design alternatives for the FPSO gas turbine power generation system are assessed in Table 5-7.

Table 5-7: FPSO Gas Turbine Power Generation Design Alternatives and Energy Efficiency Strengths/ Weaknesses – Design Considerations

Design Alternatives	Strengths	Weaknesses
Combined Cycle Gas Turbine System	+ Relatively high efficiency + Reduction in energy requirement and GHG emissions (~6MW of energy and ~5000 tCO_2e/yr of emissions).	+ Heat load already partially captured with waste heat recovery for integrated heat and power system (see Open Cycle Waste heat recovery design alternative).

Design Alternatives	Strengths	Weaknesses
		+ Significantly increases the complexity and utilities requirements of the FPSO. + Increases cost per MW by a factor of 10 for minimal additional benefit (~6MW or a reduction of 5000 tCO2e/yr).
Open Cycle Gas Turbine System Waste Heat Recovery	Recovery of heat from exhaust to meet facility process heating requirements, with zero additional emissions – eliminates need for fired boilers for heating medium and associated emissions ~6,000 tCO2e/yr	Integrates the heat and power system which may cause challenges during startup and upset conditions, potentially leading to a cascade trip and flaring.

Table 5-8: FPSO Gas Turbine Power Generation Design Alternatives and Energy Efficiency Strengths/ Weaknesses – Operations Considerations

Operations Alternatives	Strengths	Weaknesses
Gas Turbine Generator 3 X 50% Approximately 137,000 tCO2e/yr	+ Spinning reserve (3rd turbine) provides optimal power load stability for operations and production + Energy efficiency further optimised when combined with waste heat recovery	+ Additional fuel use degrades overall efficiency + Spinning reserve (3rd turbine) results in an increase of approximately 46,000 tC02e/yr.
Gas Turbine Generator 2 x 50% + 1 x 0% (standby) Approximately 91,000 tCO2e/yr	Decreased fuel use and increased energy efficiency – approximately 33% less CO2e emissions (~46,000 tCO2e/yr) compared with the 3 x 50% configuration Energy efficiency further optimised when combined with waste heat recovery	Reduced power load stability for operations and production

Following the assessment of design and operations alternatives, and associated energy efficiency and emissions reduction considerations, the design basis for the FPSO power generation system includes:

+ 2 x 50% + 1 x 0% (standby) gas turbine generator configuration resulting in a 33% reduction in CO2e emissions (~46,000 tCO2e/yr), due to elimination of emissions from spinning reserve, associated with continuous operation of a 3rd gas turbine generator (3 x 50% alternative);
+ Inclusion of waste heat recovery on open cycle gas turbine system to maximise utilisation of waste heat for process heating resulting in a further reduction of ~6,000 tCO2e/yr. Inclusion of waste heat recovery negates the potential benefits of the combined cycle gas turbine system alternative; and
+ The current operations philosophy for this design basis is to load shed any non-producing electrical load for a duration long enough to start the spare generator.

Potential further optimisations to the design basis and operations philosophy to be considered in the subsequent Project phase, and key decision criteria, are further discussed in **Section 5.5**.

5.4.3 Reservoir Management

The Dorado reservoir is geologically complex, with the recovery of hydrocarbons from a number of reservoirs within the Archer Formation. The requirement to manage the hydrocarbon recovery from the Dorado reservoir drives some of the alternative options assessed for the Dorado Project.

The reservoir development concept and drainage plan is designed to optimise overall liquid hydrocarbon recovery during Dorado Phase 1. Reservoir simulation studies have been undertaken during the concept selection stage to assess recovery factors associated with alternative recovery mechanisms, including natural depletion, along with gas flooding and water flooding or injection (with and without gas lift) schemes to enhance production.

Water flooding is a reservoir displacement process, and therefore miscibility[12] is irrelevant (i.e. miscibility is only produced through the gas flooding process).

Gas flooding is the injection of gas into the reservoir to maintain reservoir pressure and enhance overall liquid recovery. Gas lift is a small injection of gas into the wellbore (not the reservoir) to reduce the density of the fluids within the wellbore (not the reservoir itself) thus allowing them to flow back to the surface more easily. Detailed studies showed that the composition of the gas being reinjected back into the reservoir, coupled with the oil composition and the pressure and temperature conditions of the reservoir, means that the gas flood within the Caley reservoir will be miscible and not immiscible.

Extensive laboratory testing supported by reservoir modelling predicts that reinjection of an LPG-rich gas into the reservoirs will enhance oil recovery through a miscible process. Enhanced oil recovery through miscible gas flooding is a proven technology widely used both onshore and offshore and, in the case of the Dorado field, is expected to achieve high hydrocarbon liquid recovery factors of up to 75% (**Table 5-9**). The miscible flood relies on injected LPG-rich gas contacting the reservoir oil and, through a complex process of component exchange, oil and gas phases mixing to become a single phase, resulting in an enhancement to production and improved recovery factors.

Table 5-9: Hydrocarbon liquids recovery factors by recovery mechanism

Recovery Mechanism	Hydrocarbon Liquids Recovery Factors
Water flood (no gas lift)	43%
Water flood (with gas lift)	68%
Miscible gas flood	Up to 75%

Studies suggest that a development concept utilising water injection for the purpose of enhanced liquids recovery would erode hydrocarbon liquid recovery potential by more than 15 MMbbl. Reinjecting PW into the lower members of the reservoir carries the risk that reinjection may result in the wells watering out earlier, reducing the volume of hydrocarbon liquids that can be recovered.

[12] Miscibility occurs when two fluids with similar polarity (and, therefore, similar intermolecular interactions) are combined and the fluids mix to form a homogeneous solution.

The option of reinjecting the PW into the reservoir for the purpose of oil recovery was disregarded due to the increased risk of water breakthrough in the down-dip oil production wells and the resulting negative impact on overall hydrocarbon liquid recovery.

5.4.4 Flaring Management

Dorado Phase 1 operations will generate GHG emissions. **Section 5.4.2** assesses the power supply options, inclusive of evaluating the associated GHG emissions, adopting fuel gas power generation on the FPSO as the preferred option. **Section 5.4.2.6.1** assesses the options for reservoir management and the requirement for reinjection of the majority of the produced gas back into the Dorado reservoir to enhance oil recovery.

Other sources of GHG emissions throughout the project life requiring assessment are planned flaring during routine operations, as well as flaring from non-routine events during operations i.e process upsets, and the non-routine operational activities including well clean-up/ completions, well workovers and facility commissioning.

For safety reasons, during operations, there is a requirement to continuously flare a small portion of the produced gas, via the flare pilot (further information presented in **Section 6** and **7.2.6**). Flare pilots are a safety feature on flare systems to ensure gas releases are ignited and completely burned. Pilotless flares are available, however these pose increased safety risk in the case where the flare fails to ignite and GHG emissions reduction benefit is eroded with a single unignited methane gas release event.

During well testing, facility commissioning and other non-routine events during operations such as loss of compression, controlled shutdown, emergency conditions, pressure relief events, and start-up after non-routine events, there is a requirement to safely process the associated gas (refer **Table 7-40**). These scenarios occur for limited periods of time over the project life.

The following alternative options were identified to manage the gas from these events:

+ reduced emissions during well testing (Reduced Emissions Completion);
+ compressed natural gas for storage and other users;
+ gas to wire;
+ carbon capture and storage; and
+ flaring the gas.

Table 5-10 describes the options and assesses the technical feasibility for implementation and potential environmental benefit for Dorado Phase 1.

During commissioning, start-up and controlled shutdown of all systems on the FPSO are available (being turned on or off in a predetermined sequence) and therefore limited use of the flaring reduction options would be available. It is not possible to commission/ start-up the reinjection compressor system without first having the separation system and gas treatment system running, therefore this off-spec gas would require flaring. The wells will be operated during this stage to minimise flaring. During planned shutdowns depressurisation of the system or parts of the system might be required which is only possible to achieve with the flare.

Pressure relief events/emergency shutdowns generally escalate rapidly and occur over a short time period. Given the escalation and short notice occurrence of such events it is difficult to activate flare reduction systems (which require ramping up to the required operating conditions).

At the time of preparing the OPP, management of the GHG emissions associated with well testing, facility commissioning and non-routine events during operations via flaring is considered the preferred option.

Table 5-10: Flaring Options Assessment

Option	Description	Feasibility Assessment	
Compressed Natural Gas	The compressed natural gas (CNG) option requires that the gas typically is compressed and stored for future use, such as power generation on the FPSO, or exported for use at other facilities. This option requires the installation of a treatment, compression and export facility on the FPSO, and if the gas is to be exported - a pipeline to transport the gas. Alternatively large storage facilities (high pressure bullets) will be required.	Given the short term nature of well clean-up/ work-overs and commissioning, and the intermittent/ unknown nature of non-routine operational events, as well as the lack of existing infrastructure (no transmission line/ gas export pipeline from Dorado to the mainland or another offshore facility - therefore infrastructure would be required to be installed) the options that included exporting the gas, or power were not considered feasible for the Dorado Project on the basis that they: + increase technical complexity and safety risk (due to the addition of pressurised systems on the FPSO), + result in additional seabed disturbance and additional decommissioning requirements, + would not provide a reliable source of gas or power for the end user (so are not economically viable) due to the short term source from well testing and commissioning and the intermittent nature of non-routine events during operations, and + do not reduce the overall GHG emissions as the end user will likely combust the product. The World Bank (2015) concludes in general that marine Compressed Natural Gas (CNG) is not yet commercially proven, and there are currently no analogues in operation. Storage of the CNG is not possible on the FPSO due to weight, space limitations (large storage bullet) and the associated increased safety risk (storing large volumes of high pressure gas) and complexity. Storage space on the WHP/ FPSO is limited, if there is no associated pipeline available to transfer the gas to onshore or offshore users. Gas to wire would require large offshore and onshore transformers and 150km sub-sea cable, which is not economical for short term nature of the supply of the gas.	Not adopted
Gas to Wire	This requires the combustion of the gas in the FPSO power generation system to generate electricity and the generated electricity to be transmitted onshore or to another offshore facility.		Not adopted
Reduced Emissions	REC is a method that can be used during well clean-up/ completions, where the produced gas is captured, compressed and stored for future	The technology has been typically used for wells involving hydraulic fracturing that have higher rates of flowback compared to normal well completions (USEPA, 2019). This technology is in the early stages of assessing its potential applicability for offshore	Not adopted

Option	Description	Feasibility Assessment	
Completion (REC)	use rather than being flared, therefore reducing GHG emissions during well testing.	conventional wells and is currently not proven for conventional well completions offshore. For REC to work gas treatment, gas compression and gas storage facilities are required on the WHP or MODU. This is not feasible due to space and weight restrictions on both facilities. Additionally, the safety risk is increased due to storage of large volumes of high pressure gas on a small facility.	
Carbon Capture Storage	The CCS option requires the capturing of carbon dioxide (CO_2) for compression, and potentially transportation, prior to being reinjected where it would not enter the atmosphere thereby reducing GHG emissions.	Capturing emissions from the flare is not possible because the flare produces widely variable heat and emissions and is required to be unimpeded and physically separate from process equipment. Carbon capture and storage equipment for capturing and treating exhaust emissions on the FPSO from the gas fired equipment would require a large amount of process equipment exceeding the weight and space allowance on the FPSO. Santos is actively pursuing CCS opportunities in Australia (see **Section 7.2.6.4.1**). The technology is at the conceptual phase regarding application for offshore oil and gas activities. The Dorado LPG-rich gas also has a very low percentage of naturally occurring CO_2, limiting the benefit gained by capturing and reinjecting the CO_2. In view of the complex issues which require resolution prior to CCS being a viable option for GHG emissions management for Dorado Phase 1, and the limited emissions benefit associated with the Dorado gas, this option was disregarded.	Not adopted
Flaring	Flare stacks are used to combust flammable gas released by pressure release valves (referred to as flaring).	Flaring of associated gas is considered feasible for Dorado Phase 1 as the flare system on the FPSO can be designed for maximum process upset gas rate in all cases. No additional process systems are required, and there is no increase in safety risk. This option offers low capital cost as this option utilises the existing flare which is required for safety reasons.	Adopted

5.4.5 Produced Water Management

As with all oil and gas developments, even though PW is not expected to occur in the initial years of production, following initial water production it will gradually increase over time for the remainder of field life. To minimise impacts to oil production, the facilities and well operations teams will manage production across the reservoir to minimise water production where possible. For the purposes of this alternatives assessment and the produced water impact assessment (**Section 7.2.2**) conservative PW rates (based on those expected towards end of field life) are assumed based on maximum rate possible per facility design.

Following separation from hydrocarbons during processing, PW requires disposal. The following PW disposal management alternatives were considered:

+ overboard discharge – the PW is treated to reduce its oil-in-water content to 30 mg/L oil in water (OIW) or less before being discharged overboard to the marine environment; and
+ shallow reinjection – the PW is treated and reinjected into formations such as the Depuch Formation above the Archer formation (Dorado reservoir) as the primary means of disposal. Due to operational constraints, this option may include some occasions (e.g PW injection system not available, insufficient storage capacity to hold the PW onboard the FPSO due to a non-routine event) whereby PW may have to be discharged overboard after treatment to reduce OIW content to 30 mg/L or less.

The assessment of the above options is presented in **Table 5-11.** The "overboard discharge" option was identified as the most desirable PW management option and was adopted because of the following key factors:

+ far field modelling to assess discharge of the produced water to the marine environment determined that a dilution factor of less than 1:1000 (required dilution to achieve background water quality levels) was achieved within a 1km radius of the discharge. This was assessed using the Santos risk matrix as having a negligible environmental impact as the development is not located in a sensitive marine environment, with the closest sensitive receptor being Bedout Island 72km to the south of the discharge location;
+ available produced water treatment technology means that a high standard of treatment can be achieved prior to discharge, ensuring the impact of the discharge stream is within acceptable limits (as demonstrated by far field modelling);
+ overboard discharge results in lower CO_2 emissions by avoiding the emissions associated with installing shallow reinjection wells from MODU drilling operations and drilling support vessel operations;
+ it eliminates drill cuttings discharges to the seabed from reinjection well drilling operations; and
+ overboard discharge is the preferred alternative when considering other non-environmental criteria including lower safety risk, less technically complex, less execution risk, lower reservoir management risk and lower commercial and schedule risk.

Table 5-11: PW management options assessment

Criteria	Sub-criteria	Shallow Reinjection		Overboard Discharge	
		Score	Justification	Score	Justification
Technical feasibility	Technical complexity	2	The drilling of reinjection wells introduces an additional level of complexity compared with the "overboard discharge" option. The reinjection option still requires installation of PW treatment system as "contingent", in event the reinjection system fails, and to avoid shut-in of the facility the PW will require treatment prior to discharge overboard.	4	The technical complexity of this option would be limited to the design and operation of the PW treatment system. PW treatment systems are commonplace in the industry and well understood.
	Proposal execution risk	2	The drilling operation introduces additional execution risk due to the additional time required to drill the wells and install the associated reinjection equipment.	4	As PW treatment systems are common throughout the industry and readily available, it is expected to represent a lower execution risk than the reinjection options. The PW system is installed in the shipyard during FPSO construction.
	Management of reservoir performance	3	The management of reservoir performance is not impacted by shallow reinjection.	3	The management of reservoir performance is not impacted by overboard discharge.
Average technical feasibility		**2.3**		**3.6**	
Health & Safety	Safety risk during construction	2	Drilling additional wells for reinjection increases the overall risk of the drilling activity by extending the drilling activity duration and thereby increasing exposure.	4	With no requirement for additional wells, the construction safety risk profile associated with this option is lower.
	Safety risk during operations	3	The operations safety risk profile is expected to be similar between the options.	3	The operations safety risk profile is expected to be similar between the options.

Criteria	Sub-criteria	Shallow Reinjection		Overboard Discharge	
		Score	Justification	Score	Justification
Average Health & Safety		**2.5**		**3.5**	
Environment	Physical presence and seabed footprint	3	The reinjection wells would be within the footprint of the WHP jacket (up to 16 wells), thus physical presence and footprint are not differentiators.	3	The extent of physical presence and associated seabed footprint are not expected to be differentiators.
	Number of vessel movements	2	Drilling support vessels required during reinjection drilling operations	4	No drilling support vessels required.
	Light emissions	3	The level of light emitted is not impacted by the PW management decision.	3	The level of light emitted is not impacted by the PW management decision.
	Underwater noise	3	Underwater noise is not a differentiator between the options.	3	Underwater noise is not a differentiator between the options.
	Atmospheric emissions, including GHG	2	An increase in atmospheric emissions (~ 3-4000 tCO_2e/yr) is expected due to the additional fuel that would be combusted to provide power to the compression and injection systems.	4	It is expected that the PW system will require minimal electrical or hydraulic power, if any, to be operated. This option is therefore associated with the lowest atmospheric emissions
	Planned liquid discharges	4	Primary disposal method is reinjection; however, contingency discharge of treated PW may occur. These volumes would be substantially less than the volumes involved in the "overboard discharge" option.	2	PW discharges to marine environment will result in elevated contaminants concentrations compared to background level but subject to treatment to acceptable levels (<30 mg/L OIW) prior to discharge, and will achieve dilution to background water quality levels within a 1km radius of the discharge location, avoiding impacts to any sensitive receptors beyond the 1km mixing zone. The extent of the mixing zone where these elevated concentrations are predicted

Criteria	Sub-criteria	Shallow Reinjection		Overboard Discharge	
		Score	Justification	Score	Justification
					to be observed will be managed to ALARP and acceptable levels. The potential for contaminants in the PW to interact with sediment in the Commonwealth Marine area, either directly or through deposition of precipitates or natural suspended sediment with adsorbed contaminants, is very low (**Section 7.2.2.2.2**).
	Planned solid waste generation	3	The planned solid waste generation is not impacted by the PW management decision.	3	The planned solid waste generation is not impacted by the PW management decision.
	Risk of IMS translocation	3	The risk of IMS translocation is not impacted by the PW management decision.	3	The risk of IMS translocation is not impacted by the PW management decision.
	Risk of unplanned discharges	3	The risk of unplanned discharges is associated with the discharge of off-specification PW when the reinjection system is not operational. The system used to reduce OIW to less than 30 mg/L would be similar for both options, and therefore the risk of the system malfunctioning is expected to be similar between all options.	3	While it would be online significantly more frequently with the "overboard discharge" option, the system used to reduce OIW to less than 30 mg/L would be similar for both options and therefore the risk of the system malfunctioning is expected to be similar for all options.
Average environment		**2.9**		**2.9**	
Economic	Schedule risk	2	The additional drilling duration and the associated schedule uncertainty presents a slight increase in schedule risk compared to the "overboard discharge" option.	4	As PW treatment systems are readily available and their installation common practice, the option presents a lower schedule risk than the other two options.
	Commercial risk	2	The CAPEX and OPEX associated with the reinjection options is expected to be higher	4	As this option only requires a PW treatment system, it represents the lowest commercial risk.

Criteria	Sub-criteria	Shallow Reinjection		Overboard Discharge	
		Score	Justification	Score	Justification
			due to the additional drilling cost, the cost of procuring and maintaining the necessary reinjection equipment (such as pumps, flowline, another WHP riser, and another swivel path) and the cost of designing, installing and maintaining a PW discharge system.		
Average economic		**2**		**4**	
Societal	Socio-cultural impacts	3	The socio-cultural impacts are not expected to be impacted by the PW management decision.	3	The socio-cultural impacts are not expected to be impacted by the PW management decision.
	Socio-economic impacts	3	The socio-economic impacts are not expected to be a differentiator between the options.	3	Following treatment of the PW, it is expected that the potential impact on the abundance and quality of commercially targeted fish from the discharge of PW will be undetectable. Therefore, the socio-economic impacts are not expected to be a differentiator between the options
Average societal		**3**		**3**	
Overall Score (desirability)		**12.7**		**17**	

Santos

Against the environment criteria, with consideration for all environment sub-criteria, overboard discharge scored slightly higher compared with shallow reinjection. During the environmental impact assessment, the discharge of PW (based on OIW of 30 mg/L or less) was found to be acceptable (see **Section 7.2.2**). Through supporting studies completed by Santos (**Section 7.2.2**) it has been demonstrated that following treatment prior to discharge to 30 mg/L or less OIW, the mixing/dilution zone to reach no-effects concentrations is limited to a 1km radius, noting that the nearest significant sensitive receptor Bedout Island is 72km to the south. In addition, the shallow reinjection option has GHG and atmospheric emissions and drill cuttings discharges associated with drilling a reinjection well.

Santos will need to actively manage Dorado Phase 1 PW discharges to ensure the extent of the mixing zone (i.e. the area in which elevated concentrations of PW contaminants may be observed) in the marine environment is reduced to ALARP and acceptable levels. Further assessment during engineering and design will be undertaken to evaluate the full range of treatment technologies to reduce the potential levels of contaminants within the PW to ALARP.

Following selection of overboard discharge as the preferred alternative, considerations were directed to the height of the PW outfall from the FPSO. Three heights were considered: 10 m above mean sea level (AMSL), at mean sea level (MSL), and 10 m below mean sea level (BMSL).

Numerical modelling studies were commissioned to inform the height of the PW outfall decision process. PW discharges were modelled for each discharge configuration to predict the likely extent of the discharge plume and the dilution of PW in the marine environment. The modelled findings are based on the combined annualised results (150 simulations per case). Further detail on the modelling studies, the inputs, model, and modelling criteria is included in the modelling report provided in **Attachment 7** and summarised in **Section7.2.2** where modelling is discussed.

Figure 5-1 shows the modelled maximum spatial extents to the 1:1,000 dilution contour for each of the discharge heights. **Table 5-12** summarises the modelling results, providing the annualised maximum distance and area from the Dorado FPSO to achieve a dilution factor of 1:1,000 at the 99th percentile for each of the discharge heights. Discharging the PW at 10 m below sea surface results in the shortest maximum distance and the smallest potential area of impact.

Table 5-12: Annualised maximum distance and area from the Dorado FPSO to achieve a dilution factor of 1:1,000 at the 99th percentile for PW discharge released at 10 m above sea surface, at sea surface (0m) and 10 below sea surface.

Parameter	PW Discharge Depth		
	10 m above sea surface	At Sea Surface (0 m @ MSL)	10 m below sea surface
Maximum Distance to achieve 1:1000 dilution factor	770 m	900 m	590 m
Maximum Area to achieve 1:1000 dilution factor	0.86 km^2	1.37 km^2	0.5 km^2

Discharging the PW below sea surface resulted in enhanced mixing of the PW, resulting in the smallest area of impact compared with above surface and at surface discharge options. Discharge at or below surface also reduces overspray and corrosion risk to the FPSO. Therefore, discharge of PW below sea surface is preferred both technically and environmentally.

The selected overboard discharge option is premised on reducing PW OIW content to 30 mg/L or less before being discharged to the marine environment. To achieve this OIW content, the PW will be subject to primary and secondary phases of treatment. The FPSO design will include provision for a dedicated off-specification storage tank to segregate off-specification produced water for re-treatment if needed, to supplement the primary and secondary treatment processes. The FPSO layout also includes space for future installation of additional tertiary treatment system if required. The Dorado Operations Environment Plan will include provision for adaptive management of overboard discharge in the event that PW composition differs significantly from design assumptions, or if mixing/dilution processes deviate from modelled predictions. Examples of adaptive management may include tertiary treatment to improve treatment performance; or evaluation of alternative process chemicals to reduce potential impact of emulsions on treatment system performance. Based on the acceptability of overboard discharge and the significant safety, technical complexity, execution, reservoir management, commercial and schedule risk associated with shallow reinjection; future consideration of shallow reinjection is not proposed as part of Dorado adaptive management for produced water management.

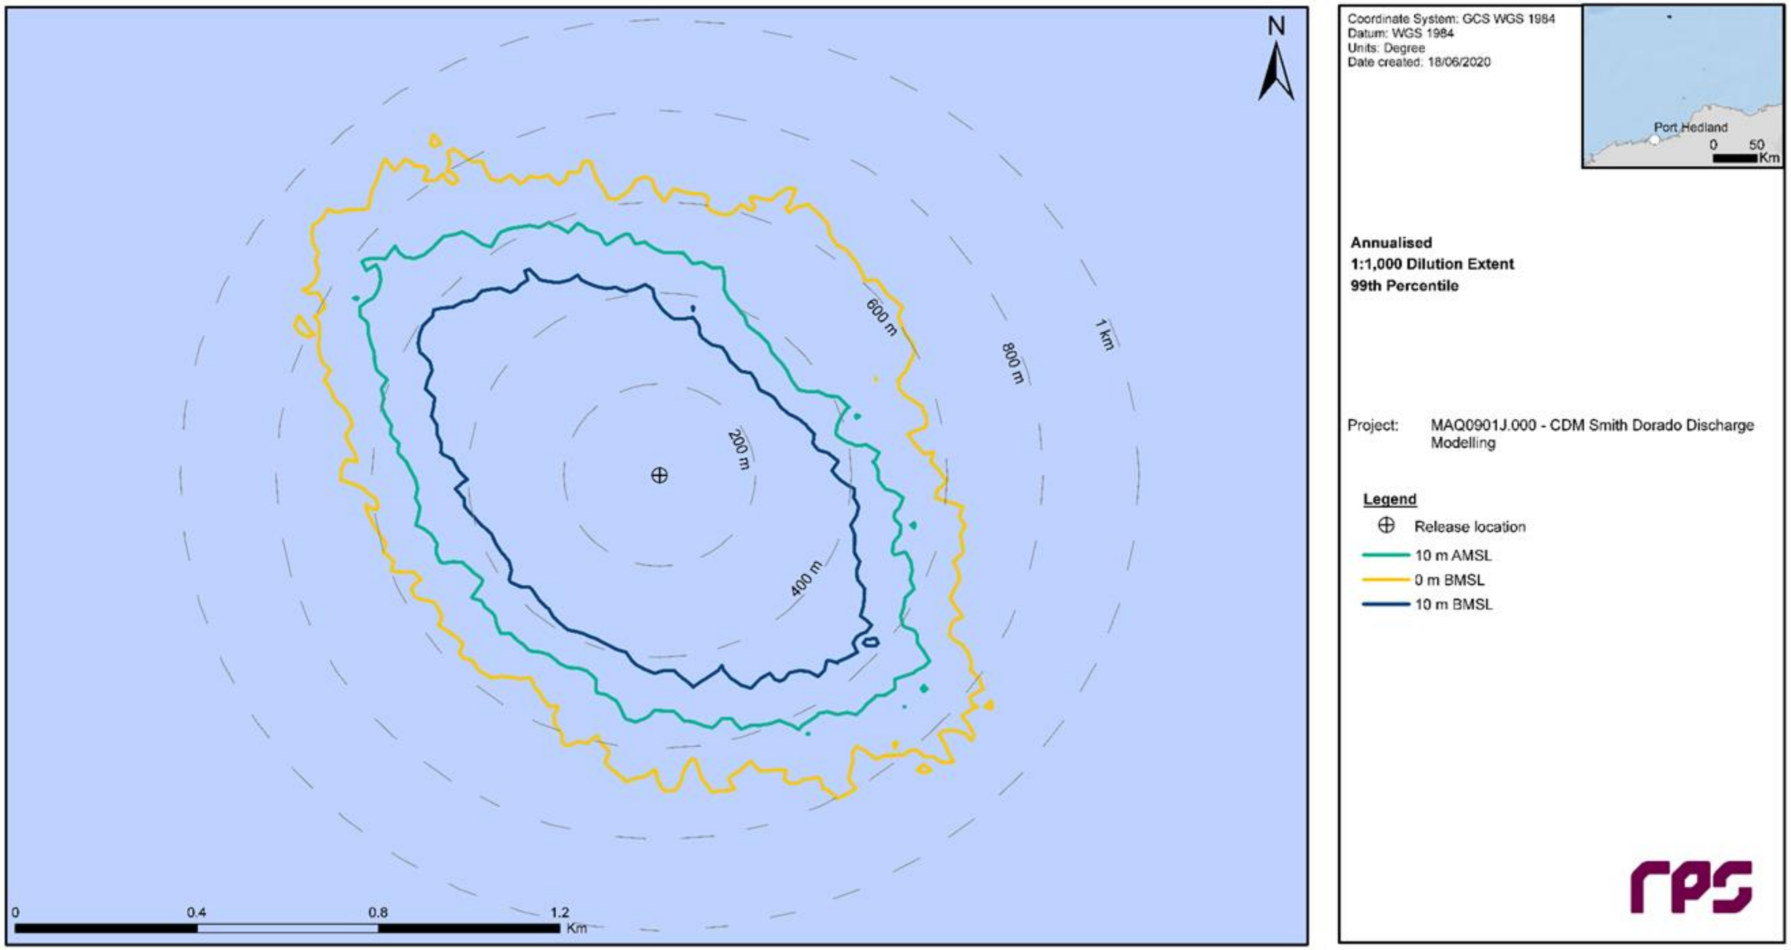

Figure 5-1: Maximum spatial extents to the 1:1,000 dilution contour for a 4,350 m^3/day PW discharge released at 10 m above sea surface (10m AMSL),at sea surface (0 m BMSL) and 10 m below sea surface (10m BMSL) for the 99th percentile analysis.

5.5 Decisions taken and remaining to be made

During this early design stage, some decisions remain for Dorado Phase 1. The decision-making process shown for the above alternatives will be used to determine outcomes in a transparent manner and to meet regulatory requirements and stakeholder expectations. Given that some design decisions are yet to be made and that environmental benefit is one of the factors Santos evaluates during options assessment, for the purpose of this OPP Santos has assessed the option that provides for the worse-case environmental outcome (i.e. conservative assessment). The resulting environmental outcomes of these decisions are presented in the Evaluation of Environmental Impacts and Risk section of this OPP (**Section 7**) including a demonstration of the acceptability of the resultant environment impacts.

Prior to execution of Dorado Phase 1, selected facility design and operating systems will be further assessed in the subsequent activity specific EPs where Santos will be required to demonstrate that the potential environmental risks and impacts from the activities of Dorado Phase 1 have been reduced to ALARP and acceptable levels.

Decisions taken during early design or remaining to be made during detailed design are presented below:

+ Produced Water treatment system – the PW treatment system as described in **Section 5.4.5** will be designed to achieve OIW concentration of 30 mg/L or less during normal operations based on primary and secondary treatment systems, supplemented by inclusion of a dedicated off-specification storage tank for re-treatment of off-specification PW. During detailed engineering and design, there will be further consideration of tertiary treatment systems to inform the ALARP assessment for the Operations EP, which will include consideration of tertiary treatment technologies such as macroporous polymer extraction (where produced water is passed through beds of macroporous polymer particles that attract oil, thus separating oil from the water phase to remove dissolve hydrocarbons). The FPSO layout includes space and weight allowance for additional tertiary treatment systems to be installed in the future if PW composition differs significantly from design assumptions, or if mixing/dilution processes deviate from modelled predictions;
+ Power generation system – the FEED design solution for the power generation system will consist of 2 by 50% and 1 by 0% (standby) gas generator turbines with waste heat recovery as described in **Section 5.4.2**. During detailed engineering and design, further design optimisations for power generation will consider alternative measures to avoid flaring or production outages to manage gas turbine generator outages and mitigate a potential shortfall of electrical power to the facility. Alternative measures could include battery energy storage system technology (BESS) or combining BESS with diesel fuel essential power generators to minimise flaring from load-shedding during outages.
+ Gas Reinjection Compressors – reinjection compressor turbines are planned to be direct drive. An alternative to direct drive compressors is electric motors. Direct drive has advantages over an electric motor driven compressor because there is less equipment required, less associated energy losses and better overall energy efficiency;
+ Further energy-efficiency considerations will also include, at a minimum:
    - Flash gas compressor design to allow for re-wheeling to avoid inefficient operation and unnecessary emissions later in the life of the facility as the flash gas compression load profile changes

  - Flash-gas compressor critical sparing philosophy to minimise compressor downtime and unplanned flaring
  - Vapour recovery unit (VRU) critical sparing philosophy to reduce potential for VRU downtime and associated unplanned flaring
  - Cooling system set-up (i.e. open, closed or once through system; requirements; size and number of variable flow fans and pumps), the use of a heat exchangers system and insulation of the facilities' systems to reduce heating and cooling requirements.
+ Treatment system for drains containing hydrocarbons – the drains' oil and water separation system is still to be finalised. At a minimum deck drainage design will segregate non-contaminated (ie. open deck runoff) from contaminated sources (ie. process system runoff), any hydrocarbon and chemical inventories will be bunded, any contaminated wastewater will be subject to treatment to 30 ppm OIW at a minimum or to a higher standard where required e.g. MARPOL requirement for bilge discharge to be treated to 15 ppm (**Section 7.2.3**).

During FEED, best available techniques or best practicable environmental options studies were undertaken to select the PW and open drains treatment systems, the power generation system, and the energy-efficiency measures to be adopted.

The aim of these studies is in keeping with the twelfth report of the Royal Commission on Environmental Pollution (1988) which defines best practicable environmental option as "*the outcome of a systematic consultative and decision-making procedure which emphasises the protection and conservation of the environment across land, air and water. The...procedure establishes, for a given set of objectives, the option that provides the most benefit or least damage to the environment as a whole, at acceptable cost, in the long-term as well as the short-term*".

During the studies, the performance of alternative options will be assessed against key objectives, reflected through a range of criteria, to identify the option that performs best overall. A multidisciplinary quantitative comparison across the following four criteria will therefore be undertaken: engineering practicability (which will consider elements such as options' development status, performance, operations and maintenance requirements, and space and weight requirements), environment (which will include elements such as discharges to the marine environment, atmospheric emissions and generated waste to land), health and safety (such as personnel risk exposure change, work limitation or restriction, and training requirements) and cost (such as CAPEX and OPEX, liability and reputation, and cost of future compliance). The outcomes of the FEED studies will be reviewed during detail design to assess, among other factors, potential technology, project and/or legislation changes.

Prior to the development of prospects within the Project Area, the following will need to be determined:

+ Tiebacks to the Dorado WHP or FPSO – arrangements for potential future tiebacks will be designed and operated to meet the environmental performance outcomes, requirements and constraints presented in this OPP; and
+ Tieback flowline installation – the flowlines associated with future tiebacks might be flexible or rigid flowlines (as presented in **Section 6.7.2.2**). This decision will influence the flowline laying method. The design and execution of the activity will be assessed against environmental acceptability criteria; will meet the environmental performance outcomes, requirements and constraints presented in this OPP; and will demonstrate in the EP that the associated environmental risks have been reduced to ALARP.

6 Description of the Development

6.1 Overview

This section of the OPP provides a description of the expected key stages and activities associated with Dorado Phase 1, as relevant to the assessment of environmental impacts and risks. It defines the nature and scale of Dorado Phase 1, which has been used to facilitate an appropriate description of the existing marine environment (**Section 3**). Understanding both the petroleum activities and the existing marine environment allows the sources of impacts and risks to be appropriately evaluated (**Section 7**).

Dorado Phase 1 includes oil production from the Dorado field and future tiebacks (currently identified as prospects in the Dorado Project Area) to augment oil production. In this phase, recovered gas will be reinjected to the Dorado reservoir to enhance oil recovery. Dorado Phase 1 will be designed for liquid handling rates of 100 KSTB/d and gas reinjection capacity of 235 MMscf/d. Dorado Phase 1, including future tiebacks, is estimated to produce a total export volume of 350 MMbbls over 20 years.

6.2 Dorado Development Project Concept

Dorado Phase 1 will develop resources identified in the Bedout Sub-basin, with initial production being light oil[13] from the Caley reservoir, the main target reservoir, and both oil and condensate[14] from the Baxter, Crespin and Milne reservoirs (which underly the Caley). Collectively, these resources are termed the Dorado field. The key characteristics of the proposed Dorado Phase 1 development are summarised in **Table 6-1**. The current development concept (Dorado Phase 1) shown in **Figure 6-1** comprises:

+ a not normally manned WHP, with provisioning for 16 Dorado field wells (oil and gas production and gas reinjection) drilled from a single drill centre that connects to the WHP (dry trees). Gas will be reinjected via the wells into the reservoir to enhance oil recovery. The WHP will be remotely powered and operated from the FPSO;
+ infield flowlines approximately 12 inches in diameter and 2.2 km in length to transport the hydrocarbons and associated production fluids, and an umbilical to provide chemicals, power and communications between the Dorado WHP and the FPSO;
+ an FPSO connected to the seabed via a DTM. The FPSO will include accommodation and processing facilities and will allow for the storage and offloading of the hydrocarbons via an offtake tanker; and
+ the future development of prospects identified in the Dorado Development Project Area (**Figure 6-2)** as tiebacks to either the Dorado WHP or the FPSO enabling ongoing operation of the facilities.

Dorado Phase 1 will produce:

---

[13] Oil, also known as petroleum or crude, is a low-American Petroleum Institute (API) gravity unrefined petroleum liquid composed primarily of hydrogen and carbon.

[14] Condensate is a low-density (high-API gravity) liquid hydrocarbon. Its presence as a liquid phase depends on temperature and pressure conditions in the reservoir allowing condensation of liquid from vapour.

- stabilised light oil and condensate. All liquid products will be comingled on the FPSO and sold as a single liquid product – Dorado oil;
- associated produced gas with a high LPG content. The majority of the gas that is not used as fuel gas or for the flare pilot on the FPSO will be reinjected to enhance oil recovery; and
- PW (a combination of condensed and formation water) that will be treated and discharged overboard.

The foundation development targets the Dorado field. There is potential for future tiebacks to the WHP or the FPSO from within the Project Area (**Figure 6-2**) pending exploration success of identified prospects (**Figure 6-3**). The characteristics of these future tie-back reservoirs are expected to be similar to that of the Dorado field (i.e. yielding similar products).

The Dorado field and future tiebacks are expected to produce hydrocarbons over the operating life of 20 years. At the end of the commercial life of the field, Dorado Development infrastructure will be decommissioned in accordance with standard industry practices and relevant legislation at the time of decommissioning (refer to **Section 6.7.7**).

Table 6-1 Key characteristics of the Dorado Phase 1 development

Project Element	Number, Extent, or Range
Project Area	The Dorado Development Project Area is spatially defined in **Figure 6-4.**
Wells	A maximum total of 38 wells, being a combination of oil and gas development wells and gas reinjection wells, located within the Project Area, will be comprised of: + Up to 16 wells with dry trees on the Dorado WHP, being: - 6 x oil production; - 2 x gas production; - 2 x gas reinjection; and - Up to 6 additional wells that are a combination of production and gas reinjection wells. + Up to 22 wells will be future tie-backs located within the project area, with the breakdown of production and gas reinjection wells to be determined by the tieback reservoir characteristics.
WHPs	A maximum of three (3) not normally manned WHPs, comprising: + One gravity based not normally manned WHP located in the Dorado field, in the vicinity of the site described in Table 6-2, with 16 slots for production and gas reinjection wells. + Up to an additional two (2) not normally manned WHP's located in the project area.
FPSO facility	One (1) FPSO located at the Dorado field, in the vicinity of the site described in **Table 6-2**, moored by a DTM system used for processing and treatment of the recovered liquids for export, reservoir gas for power generation, pilot flare, and gas reinjection. FPSO connected to the WHP via flowlines (initially two hydrocarbon production and one gas reinjection), an umbilical and risers.

Project Element	Number, Extent, or Range
Future tie-backs - pipelines and subsea systems	Comprising flowlines, umbilicals and potentially manifolds depending on the tie-back concept, providing for two future tie-backs.
Dorado Phase 1 hydrocarbons	Light oil and condensate as described in **Section 6.4,** with a total volume of 350 MMbbls over 20 years.
Project life	Project life is presented in **Table 6-3,** including operation of the FPSO for a 20-year period.

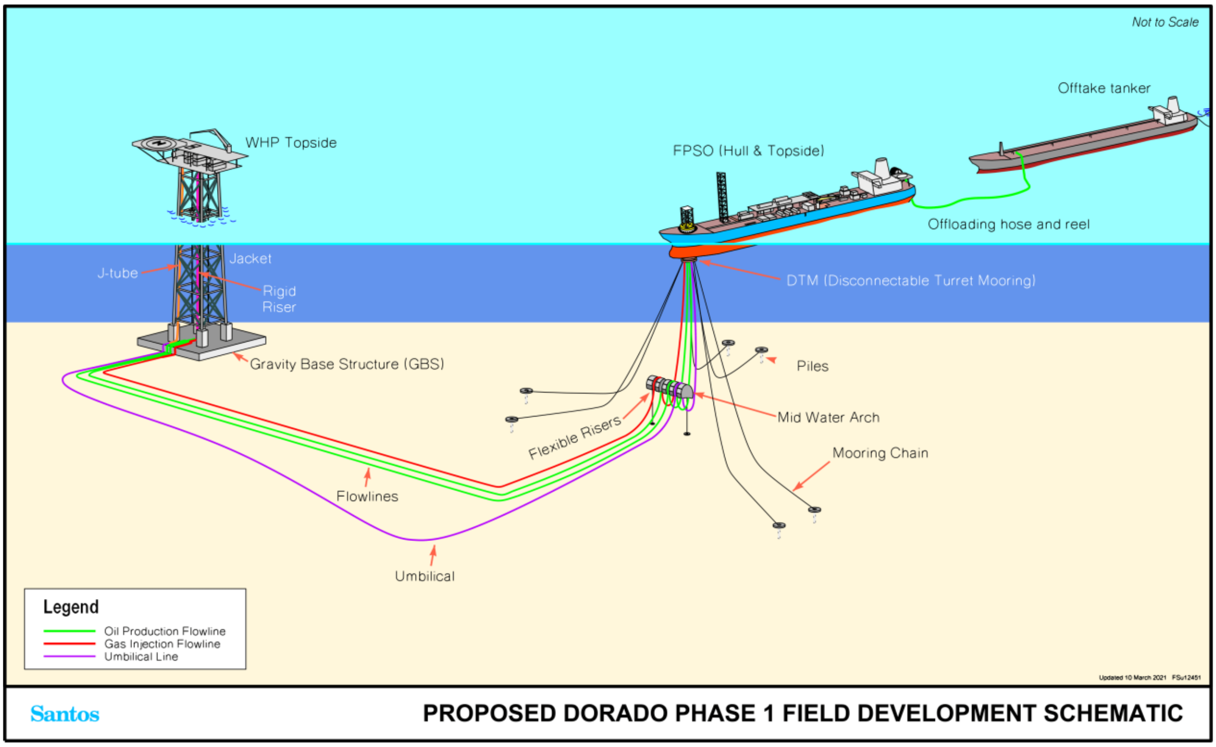

Figure 6-1: Proposed Dorado Phase 1 Development Schematic

6.3 Location

The Dorado Development is located in the offshore Bedout Sub-basin, approximately 140 km offshore of northwest Western Australia (from the centre of the Dorado WHP), in Commonwealth marine waters. The nearest regional centre of Port Hedland is approximately 145 km south of the proposed FPSO location (refer **Figure 6-2**).

The Dorado Development Project Area (as defined in **Section 6.3.1**) does not contain any emergent reefs or islands or submerged shoals or banks. The nearest reef or island to the Dorado WHP is Bedout Island, which is approximately 70 km to the southeast. The nearest shoal or bank is Rowley Shoals, which is approximately 120 km to the north of the Dorado WHP.

The proposed locations of the Dorado WHP and FPSO are presented in **Table 6-1**. The final locations are dependent on further geotechnical studies and detailed engineering.

Table 6-2: Proposed surface locations for Dorado WHP and FPSO infrastructure

Parameter	Coordinates (Datum/Projection: GDA 94 Zone 50)			
	Latitude	Longitude	Easting	Northing
Dorado WHP	19° 01' 38" S	118° 44' 37" E	683,500	7,895,250
FPSO	19° 02' 41" S	118° 44' 55" E	684,000	7,893,314

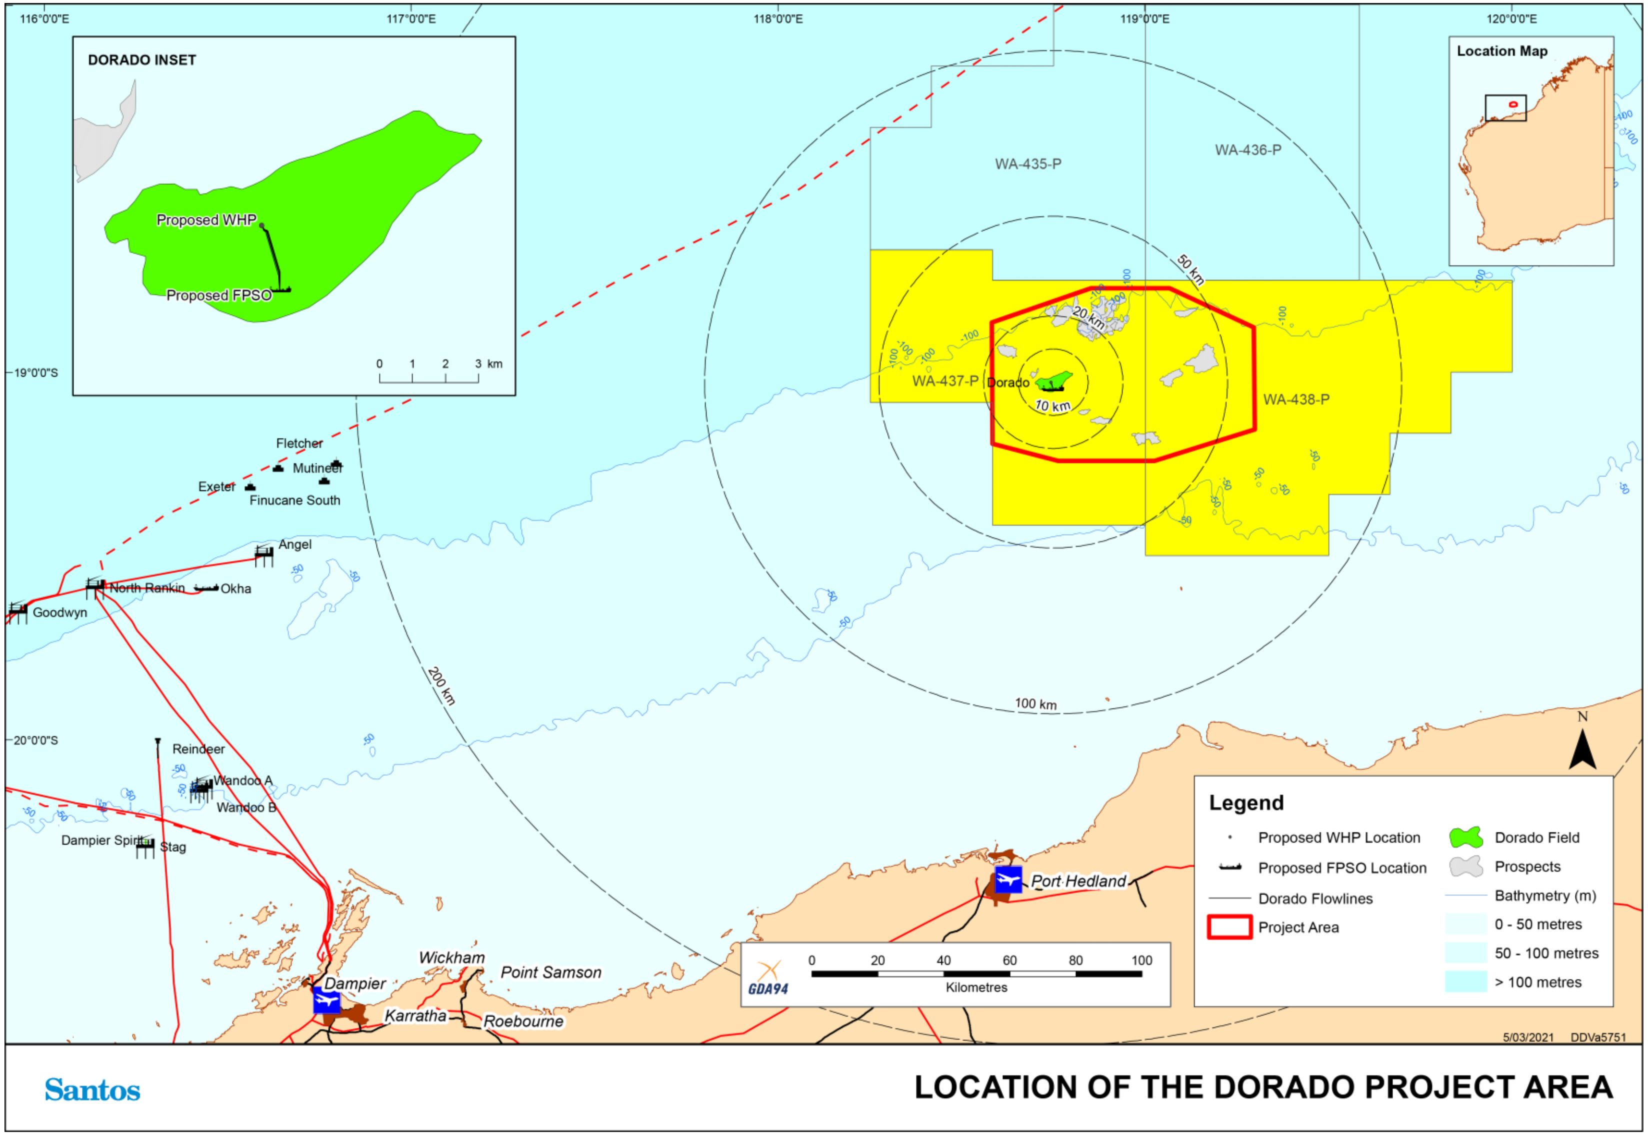

Figure 6-2: Location of the Dorado Development Project Area

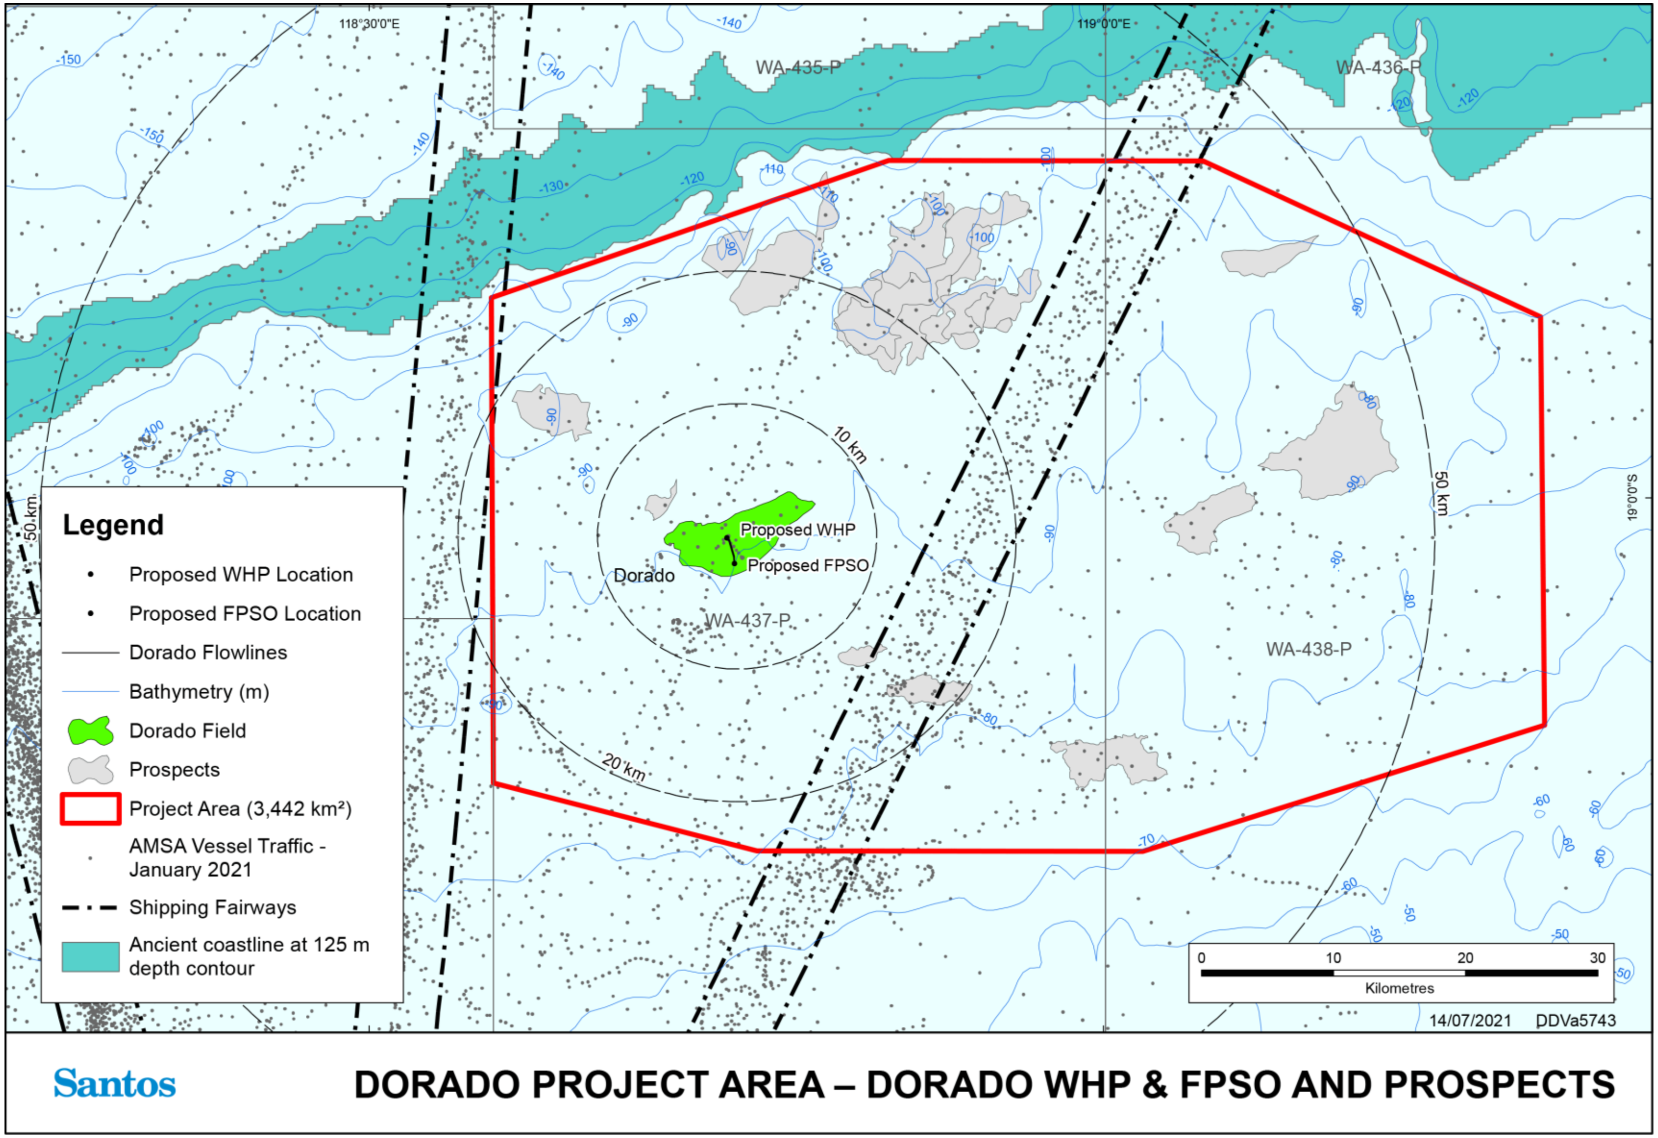

Figure 6-3: Identified prospects within the Dorado Development Project Area

6.3.1 Project Area Definition

The Dorado Development Project Area defines the geographic extent where petroleum activities are planned to take place. The extent of the Dorado Development Project Area is considered to comprise the area outlined in **Figure 6-4** and includes allowance for a staged development with the potential for future tiebacks, should future exploration and appraisal of prospects prove commercially viable. The Dorado WHP, FPSO, flowlines, and potential future tiebacks including associated infrastructure (such as wells, potential WHP or subsea infrastructure and flowlines) are all encompassed within the Project Area. The Dorado WHP location has been determined based on optimal access to the Dorado field. The current Project Area is 3,443 km². The Project Area has been designed to avoid potential overlap with any KEFs (such as ancient coastline at 125 m depth contour) and fishing sensitivities (such as pearl oyster). Each of these facilities will result in either short-term or long-term exclusion of some activities by other maritime users, such as shipping and commercial fishing, within the Project Area. This exclusion is necessary to ensure the safety of other marine users and of the vessels and facilities associated with Dorado Phase 1.

The Dorado Development Project Area also covers the operation and movement of project vessels that will be undertaking activities directly related to the development activities (such as installation vessels when installing facilities and vessels supporting drilling operations). The general transit of vessels to or from the Project Area is within the jurisdiction of AMSA, and outside the scope of this OPP. Vessel transit will be undertaken in accordance with relevant maritime legislation, such as the Commonwealth *Navigation Act 2012* and Marine Orders. Helicopter activities outside of the Project Area are not defined as petroleum activities, and therefore such activities are only considered in the OPP while occurring inside the Project Area for the purposes of Dorado Phase 1.

The operation of onshore facilities required to support the offshore development is outside the scope of this OPP. Onshore support facilities required (likely to be those already used by Santos through other projects) during construction, commissioning, operation and decommissioning will be located in existing ports and associated industrial areas, and subject to separate regulatory approvals processes specific to each jurisdiction e.g. State offshore waters, State onshore. Dorado Phase 1 is not expected to significantly increase the demand on these existing facilities/ services.

		Latitude	Longitude
Project Area	1	18° 51' 48.857" S	118° 34' 59.710" E
	2	18° 46' 12.714" S	118° 51' 12.663" E
	3	18° 46' 13.519" S	119° 04' 03.299" E
	4	18° 52' 36.282" S	119° 17' 50.318" E
	5	19° 09' 17.074" S	119° 18' 00.560" E
	6	19° 14' 25.796" S	119° 01' 36.082" E
	7	19° 14' 24.990" S	118° 45' 49.897" E

Figure 6-4: Dorado Development Project Area extent (latitude and longitude)

6.4 Description of the Dorado Field and Hydrocarbon

The produced light oil and condensate from Dorado Phase 1 would have a density of 773 kg/m^3 (American Petroleum Institute (API) gravity of 51.4), a low pour point (-1.5°C), and low viscosity (1.45 cP). The produced hydrocarbons would be in a liquid form and would quickly evaporate at atmospheric conditions, with a low likelihood of forming solids.

For context, in **Figure 6-5**, the hydrocarbons produced from Dorado Phase 1 are presented against other hydrocarbons produced in the region (the greater the API gravity, the lighter the product and the more likely it will evaporate at atmospheric conditions).

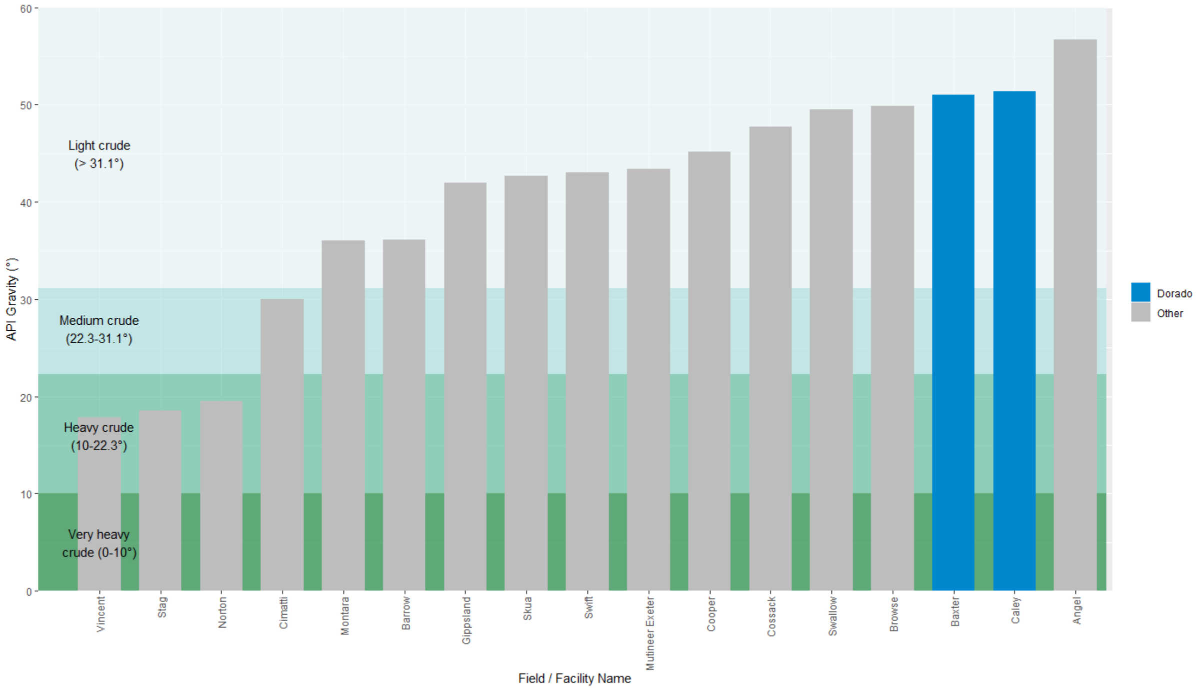

Figure 6-5: Dorado field light oil and condensate API gravity

6.5 Schedule

The indicative timeframes and development schedule of key activities are presented in **Table 6-2**.

Table 6-3: Indicative Dorado Development schedule

Activity	Approximate Commencement Timing	Approximate Duration
Dorado WHP installation and FPSO mooring installation (including piling)	Approximately 18 to 24 months post FID, 2024	3 to 6 months
Dorado field wells drilling (production and reinjection wells; up to 16 total)	Approximately 18 to 24 months post FID following Dorado WHP installation, 2024	24 months
FPSO arrival and commissioning (ready for start-up)	Approximately 4 years post-FID	3 months prior to the ready for start-up date
Production Operations commence	2027 (pending FID timing)	20 years

Activity	Approximate Commencement Timing	Approximate Duration
Future tiebacks well drilling (production and reinjection; up to 22)	Within the 20-year operating life of Dorado Phase 1	
Decommissioning	At the end of the commercial life of the Dorado Development, which would be 2047 at the earliest.	

6.6 Dorado Phase 1 Facilities Description

Dorado Phase 1, inclusive of any potential future tiebacks, will comprise:

+ Dorado WHP, positioned over the Dorado field;
+ Production and gas reinjection wells with dry trees located on the Dorado WHP;
+ Flowlines, risers and umbilicals connecting the WHO to the FPSO;
+ FPSO, approximately 2.2 km from the Dorado WHP; and
+ Potential future tieback facilities: WHP and/or subsea facilities (e.g. subsea well heads, flowlines), flowlines and umbilicals.

Figure 6-6 illustrates the concept layout for the Dorado WHP, FPSO and moorings and subsea flowlines.

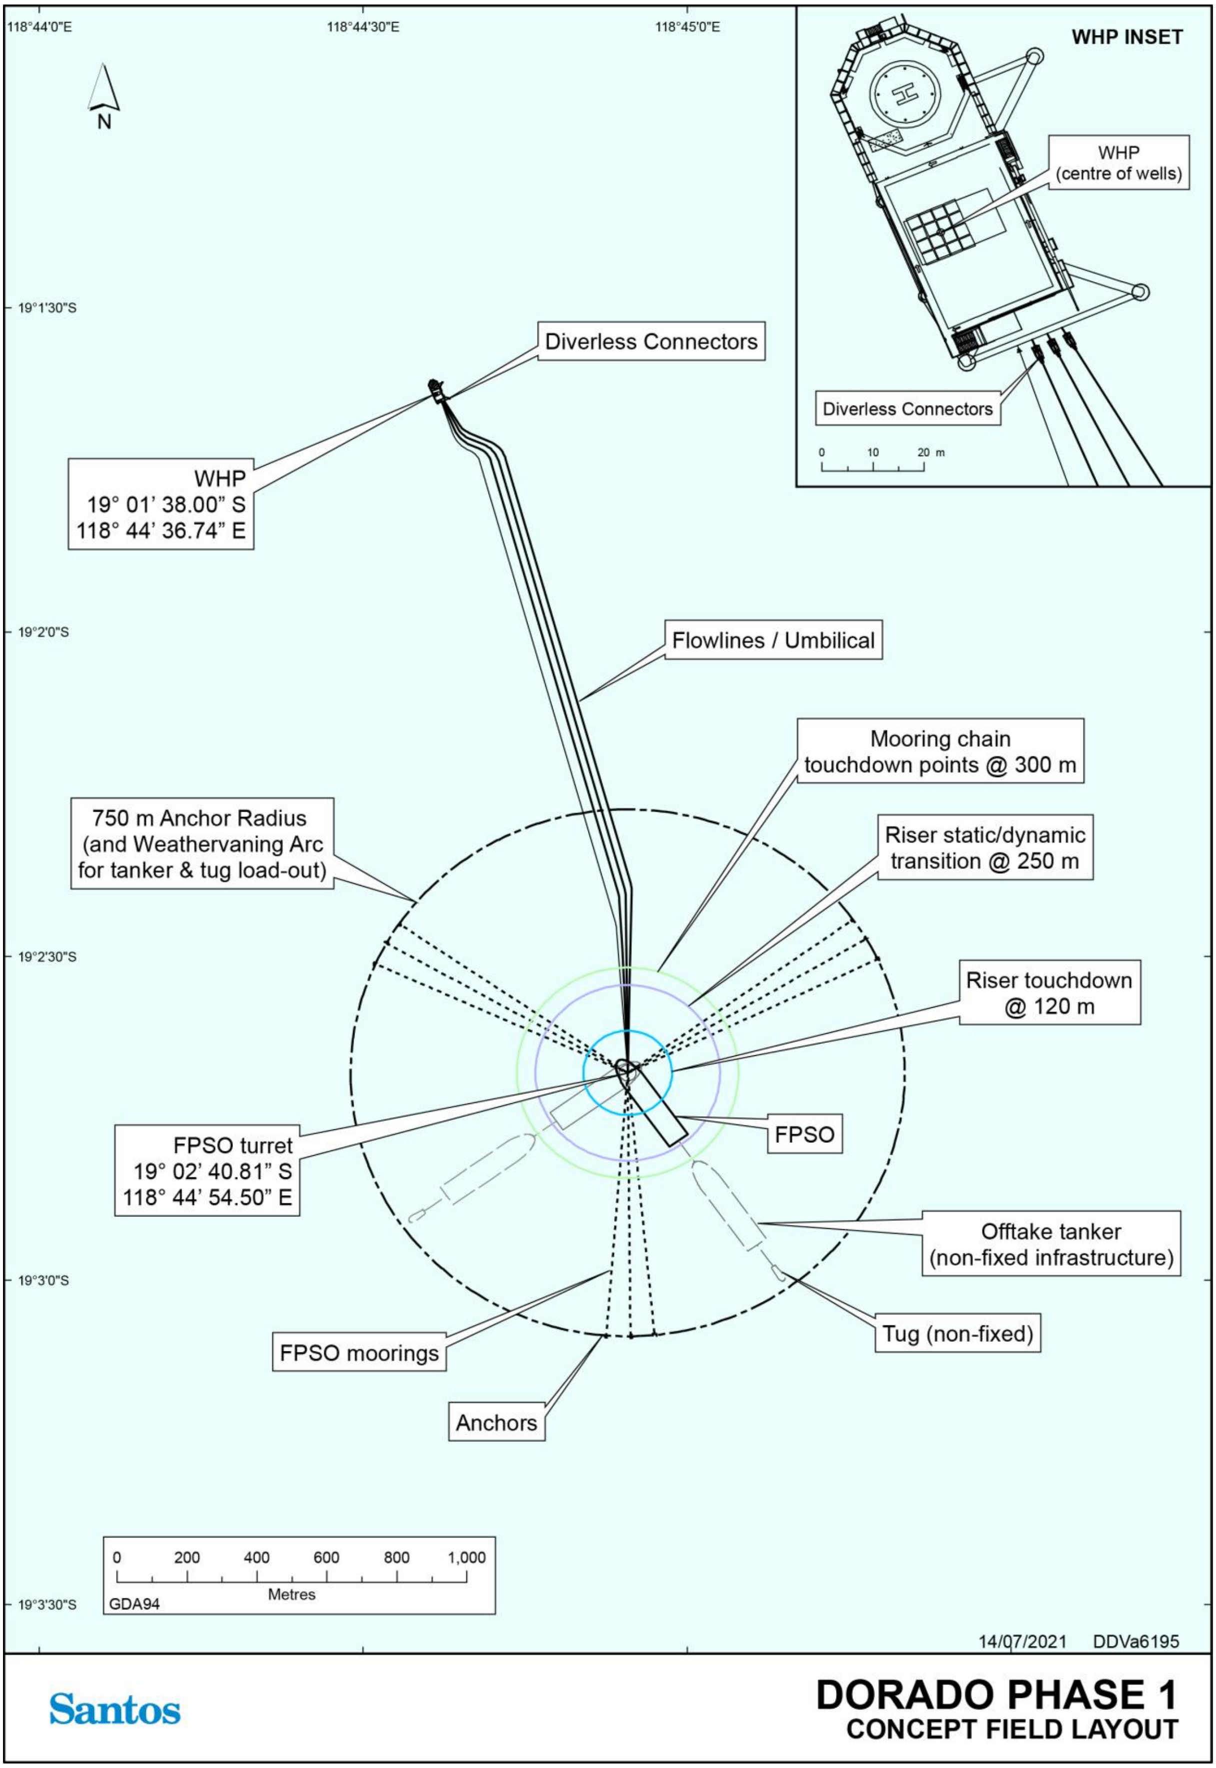

Figure 6-6: Conceptual field layout – Dorado Phase 1

6.6.1 Dorado Wellhead Platform

The Dorado WHP will be a steel substructure that will accommodate 16 slots for production and reinjection wells with associated instrumentation, gathering manifolds and metering of production fluids. There will not be any processing of production fluids on the Dorado WHP. There will be chemical injection facilities (with the chemicals either stored on the Dorado WHP or pumped from the FPSO via the umbilical) and a non-hazardous and hazardous drainage system. The collected fluids from the non-hazardous drains will be discharged overboard while the hazardous fluids will be redirected for processing and treatment on the FPSO.

Initially, 10 wells will be drilled and completed, with capacity for six future infill wells from the same drill centre. The design life for the WHP and the wells is 20 years. An illustration of the above-water section of the Dorado WHP is presented in **Figure 6-7**.

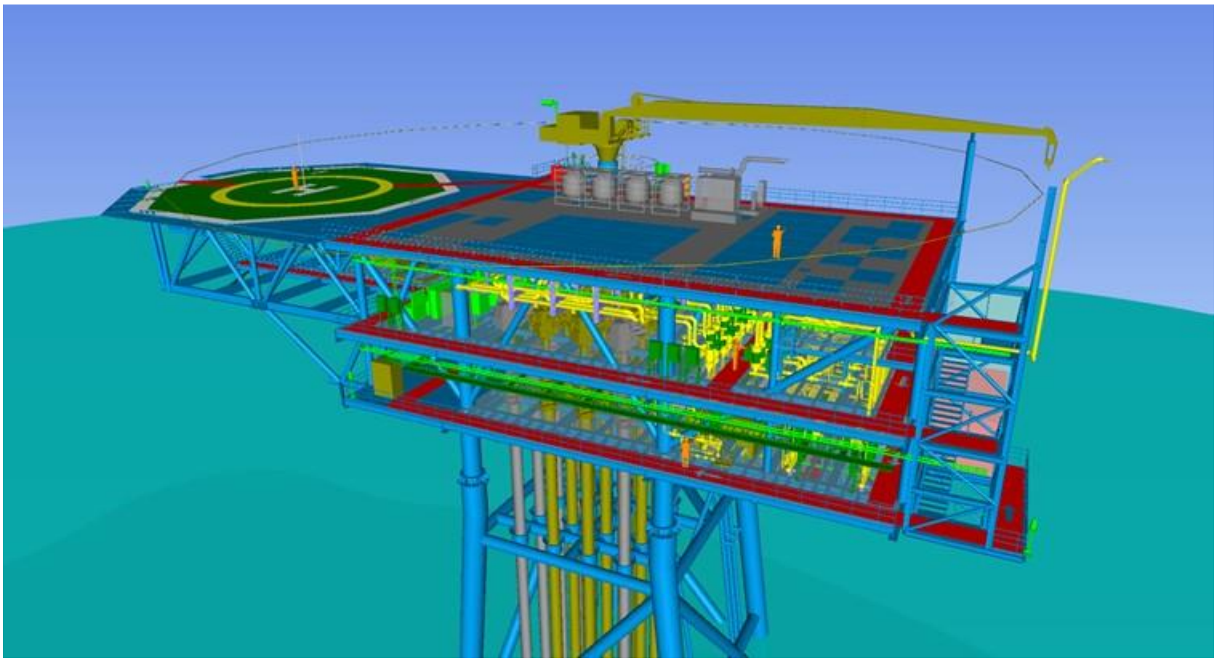

Figure 6-7: Illustration of the above-water section of the proposed Dorado WHP

The production and gas reinjection wells' dry trees will be located on the Dorado WHP topsides. The Dorado WHP topsides will include production well flow control or choke valves and production emergency shutdown valves and may also include a pig launching manifold. All piping on the WHP is fully rated to 392 barg which negates the requirement for a flare system on the WHP. During emergency shutdown events, WHP depressurisation would be to the FPSO flare via the flowlines.

The Dorado WHP (and potential WHPs for future tiebacks) will be designed to be a not normally manned platform remotely powered and operated from the FPSO, including monitoring capability. Where FPSO supplied power will be insufficient for Dorado WHP activities such as well intervention campaigns, power will be supplied through temporary diesel generators. Use of battery storage to reduce reliance on temporary diesel generators is subject to further engineering assessment. As the Dorado WHP will not normally be manned, a bird deterrent system will be required to ensure safe helideck opeations, and to prevent the build-up of seabird excreta (guano) over time which presents a workplace hazard to the workforce when attending the platform for maintenance/campaign activities.

The geotechnical conditions at the WHP location will require that the Dorado WHP be secured in position to the seabed by a steel gravity-based structure (GBS) onto which the "topsides" will be mounted.

The jacket of the Dorado WHP will include a J-tube, to house the umbilical from seabed to the topsides, and rigid risers that will transport hydrocarbons between the topsides and the flowlines on the seabed.

The Dorado WHP will be connected to the FPSO facility via flowlines and umbilical. Up to two additional WHPs may be installed for future tiebacks pending exploration success (further information presented in **Section 6.6.6**) and the design basis to extract hydrocarbons from tieback reservoirs.

6.6.2 Production Wells

The foundation Dorado Development production wells (oil and gas) will target all hydrocarbon zones within the Dorado field (Archer Formation). The initial development wells will be drilled from a single drill centre, within the Dorado WHP footprint, most likely in a single drilling campaign, using a jack-up MODU. The wells will be tied back to the Dorado WHP and completed through dry production trees. The deviated wells will be located to effectively access all hydrocarbon zones and maximise drainage across the target reservoirs.

Production wells for future tiebacks within the Dorado Development Project Area (**Figure 6-3**) would be either via subsea wells with subsea trees tied-back to the Dorado WHP through a subsea system or via a new WHP and tied back to the Dorado WHP or directly to the FPSO. These wells may be drilled with either a semi-submersible or jack-up MODU, depending on water depth.

It is proposed to drill a maximum of 38 development wells for Dorado Phase 1. Of the 16 Dorado field wells, 6 will be oil production wells, 2 will be gas production wells and 2 will be gas reinjection wells (see **Section 6.6.3**). The remaining six platform wells will be a combination of production and injection wells, with the exact breakdown dependent on Dorado field performance. Of the 22 wells associated with potential future tiebacks (refer **Section 6.6.6)** the breakdown of production and reinjection wells will be determined by tieback reservoir characteristics.

6.6.3 Reinjection Wells

The gas reinjection wells will receive treated fluids from the FPSO via one or more subsea flowlines and will reinject gas into multiple reservoir zones – Caley and underlying gas reservoirs. Gas is reinjected for the purpose of reservoir management, specifically:

+ maintaining pressure of the Caley reservoir; and
+ optimising liquids recovery by allowing condensate production from deeper gas-bearing reservoirs.

The reinjection wells will be drilled during the same drilling campaign as the production wells and will use the same techniques (i.e. the same drill centre and wells within the footprint of the Dorado WHP).

Well design will provide the required functionality to effectively manage the miscible flood, maintain reservoir pressure and optimise production. Where possible, the wells will be designed with flexibility to allow for future production of gas.

Of the 16 Dorado field wells, 2 of the initial 10 wells will be gas reinjection wells. The remaining six platform wells will be a combination of production and injection wells, with the exact breakdown dependent on Dorado field performance. Depending on the reservoir characteristics for future tiebacks, there may also be a requirement for reinjection wells for the future tiebacks (refer to **Section 6.6.6**).

6.6.4 Subsea System

For the Dorado WHP and FPSO, the subsea system will consist of flowlines (initially two hydrocarbon production flowlines and one gas reinjection flowline), risers and an umbilical between the Dorado WHP and FPSO.

Flowlines will transport production fluids from the Dorado WHP to the FPSO and will transport reinjection gas from the FPSO to the Dorado WHP.

The umbilical will transfer electrical signals, hydraulic fluids, chemicals (such as hydrate inhibitor scale, corrosion or wax inhibitor), and communication signals to the wellheads and other equipment requiring remote control from the FPSO.

The flowlines will not be trenched and may be either rigid or flexible. Pigging of in-field flowlines may be required (subject to further flow assurance studies to be undertaken during detailed design).

The subsea system layout in relation to the FPSO will allow simultaneous operations to be undertaken on the wells by a workboat or MODU and simultaneous tandem offtakes to be conducted (i.e. outside of the swing radius of the DTM system) (refer to **Figure 6-6**).

6.6.5 Floating, Production, Storage and Offloading Facility

The FPSO will receive production fluids via the flowlines from the Dorado WHP and enable the fluids to be processed and exported periodically from within the Dorado Development Project Area. The processing facilities will stabilise the light oil and condensate to meet storage and export specifications, while the gas will be recompressed and reinjected to the reservoir via the Dorado WHP. The export of the product from the FPSO is expected to occur up to once a week during the initial stages of production, before transitioning to a less frequent schedule. PW will be treated on the facility and discharged to the marine environment. An indicative illustration of the FPSO, with a support vessel and helicopters present for scale, is presented in **Figure 6-8**.

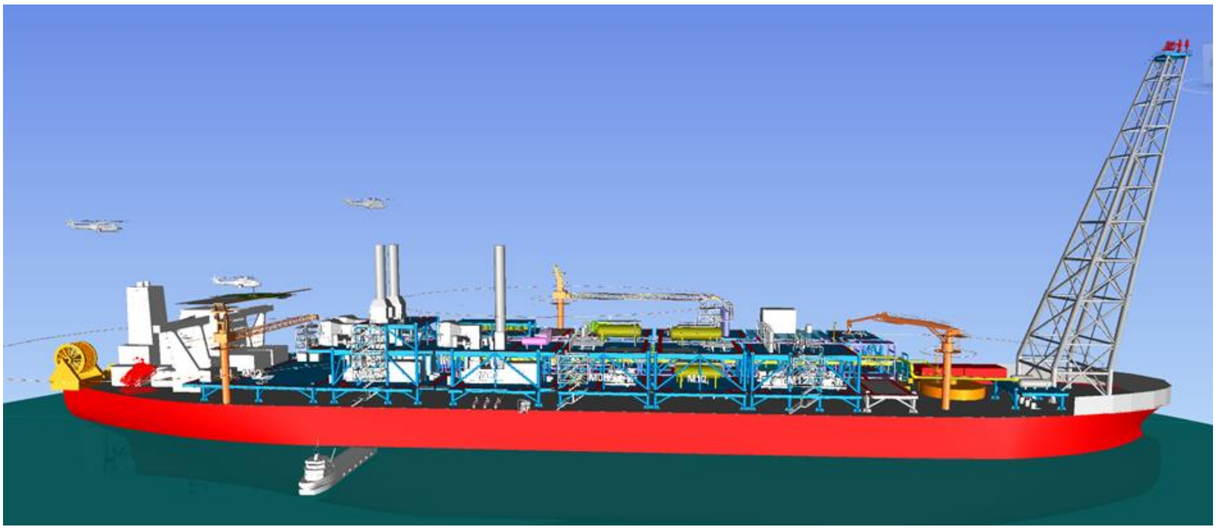

Figure 6-8: Illustration of the proposed FPSO

The FPSO will be double hulled and have a DTM system (further information presented in **Section 6.6.5.1**) to allow the FPSO to move away from the field under its own power if required (such as during adverse weather conditions and planned and unplanned maintenance requirements). The FPSO will have thrusters for positioning under offloading conditions. The FPSO will have double-sided cargo tanks providing two physical barriers between oil inventories and the marine environment.

The key design elements of the FPSO facility are likely to include:

- production fluids separation system to remove the oil and condensate from the reservoir gas, separate the light oil and condensate from the PW, and process the hydrocarbons to meet offloading export market specifications. Oil production is expected to peak at around 100,000 barrels per day (bpd), and the gas handling facilities, which include gas reinjection, at about 220 million standard cubic feet per day (MMscfd);
- gas dehydration (via a triethylene glycol system) and gas compression facilities to enable gas reinjection into the reservoir;
- flash gas compression facilities;
- vapour recovery system for control of emissions during vessel or tank venting;
- flare or blowdown facilities to maintain safe operations;
- fuel gas system for power generation and supply of electrical power;
- PW treatment (to 30 gm/L OIW concentration) and overboarding at an expected maximum rate of 4,350 m^3/day. Discharge volumes are expected to be negligible at start-up but will increase gradually over time as the reservoirs are depleted;
- storage tank suitable for receipt of PW when it does not meet discharge specification (in which case the PW will be redirected for re-treatment on the FPSO);
- cooling water systems to allow seawater to be used as a heat-exchange medium for the cooling of facilities, particularly the processing and compression facilities (up to a maximum rate of 12,879 m^3/hour);
- remote control system to manage operations of the Dorado WHP and subsea system (for example, the control of the dry production trees and subsea manifolds to enable the receipt of production fluids from the production wells in a controlled manner);
- chemical injection system to provide dosing chemicals such as hydrate inhibitor, scale, corrosion or wax inhibitors and hydraulic fluids. These chemicals ensure flow assurance and

integrity of the processing equipment can be managed and maintained. The use of scale inhibitor, demulsifier, wax suppressant and asphaltenes dispersant may be required;
+ heating medium system for any oil and condensate stabilisation requirements;
+ storage facilities for fuel and production support chemicals, such as hydrate inhibitor and scale, corrosion or wax inhibitors;
+ oil storage of up to 1 million barrels (MMbbl), with an offloading parcel size of 650,000 barrels (bbl) to an offtake tanker;
+ reeled offtake hose for connection to the offtake tanker during offloading operations;
+ potable water treatment plant to provide potable water for both process and personnel needs;
+ sewage and greywater treatment systems to manage wastes generated from domestic processes, such as toilets, dishwashing, laundry and showers;
+ drainage systems to separate deck drainage (consisting of mainly washdown water or rainwater) from areas that contain hazardous and non-hazardous materials. The non-hazardous drains will be discharged overboard. The hazardous open drains fluids will either be routed to a dedicated treatment system or be comingled with the bilge system and treated to reduce the hydrocarbon content prior to being discharged overboard. The hazardous closed drains fluids will be circulated through the processing systems for treatment;
+ bilge system to treat and remove bilge water that has collected in any watertight compartments at the base of the FPSO facility hull. The treatment will reduce the OIW content to 15 parts per million or less by volume as required by MARPOL 73/78;
+ ballast water system to manage stability of the facility;
+ the ability to use diesel as a temporary fuel when the FPSO is no longer producing (i.e. when disconnected from the DTM, when production is stopped during events such as shutdown and to operate safety-critical equipment such as fire pumps);
+ fire water and foam system;
+ sands and solids recovery (the recovered sands and solids are expected to settle in the processing equipment);
+ accommodation facilities – the FPSO will normally be manned with the standard operating crew of approximately 40 persons on board. However, the FPSO will be designed to accommodate approximately 100 persons on board during peak periods, such as campaign maintenance;
+ supply vessel; and
+ helicopter deck to enable transfer of personnel.

6.6.5.1 Disconnectable Turret Mooring System

The FPSO has a disconnectable internal turret, referred to as the disconnectable turret mooring (DTM) system, which allows the FPSO to weathervane around the mooring in response to the prevailing weather conditions. The system provides support for the riser and umbilical system and the mooring lines, as well as fluid and electrical swivels and pipework. The mooring system will have multiple legs anchored to the seabed (up to 12 piled anchors expected).

When not connected to the FPSO (i.e. when the FPSO is not on station), the DTM will be lowered into the water column to approximately 30 m BSL.

6.6.5.2 Processing and Treatment Systems

The processing and treatment systems on the FPSO may include the following:

- liquids processing system for the recovered liquids, including stabilisation, dehydration, and storage, with fuel gas blanketing and vapour recovery during normal operations and inert gas blanketing for tank entry activities;
- gas treatment system, including dehydration and compression for gas reinjection; and
- PW treatment for the reduction of hydrocarbon content prior to the PW being discharged overboard.

6.6.6 Future Tiebacks

The extended life of the facilities beyond the Dorado field is subject to future exploration and investment decisions for potential tiebacks. Santos will continue to explore for other similar commercially viable reservoirs in the Bedout Sub-basin, within the Project Area. The future tiebacks will augment oil production and export throughout the life of the Dorado facilities. As outlined in **Section 6.2**, Dorado Phase 1 includes provision for future tiebacks within the Project Area. A number of prospects have been identified by Santos for future exploration (refer to **Figure 6–3**). Following exploration success, if commercially viable, the reservoirs may be developed via tiebacks to the existing facilities to support continued production and operation.

Future tiebacks may be developed via subsea production wells or dedicated WHPs, tied back to the Dorado WHP or FPSO. Key components of future tiebacks may include:

- production and reinjection wells;
- WHP or subsea facilities, such as a subsea gathering system containing manifolds allowing the production fluids to be co-mingled and directed via flowlines to the FPSO; and
- subsea infrastructure, such as flowlines and umbilicals.

It is expected that the reservoir properties, geochemistry, temperature and pressure of the potential tiebacks will be similar to that of the Dorado field. The design of the processing equipment on the FPSO will limit the range of fluids that can be accepted and processed. Dorado Phase 1 is expected to produce 350 MMbbl of oil over the 20-year development life from the Dorado field and future tiebacks, assuming exploration success and commerciality of the tiebacks.

The reservoir properties, geochemistry and pressures of the surrounding fields that may be tied-back to the Dorado WHP and FPSO in future are expected to be comparable to the Dorado field. This includes properties related to PW and hydrocarbon characteristics (refer to **Section 7.2.2** and **Section 7.3.1** for further information). The operating range of the Dorado WHP and FPSO facilities is considered wide enough to safely produce the hydrocarbons and water expected from these surrounding potential fields. This operating range incorporates such considerations as operating pressures, compatible metallurgy and resulting PW composition.

The hydrocarbons received by the Dorado FPSO will have to meet the required specifications to be processed on the facility. For each future tieback, Santos will undertake assurance studies to assess whether the future tieback hydrocarbons can be received and processed by the Dorado WHP and FPSO. The maximum footprint for each potential future tieback (subsea infrastructure or WHP) will depend on the type of development, i.e. either a subsea development or a WHP; however, it is expected to be similar to the Dorado facilities. Additional WHPs, if required for future tiebacks, may be gravity based similar to the Dorado WHP or may have piled foundations at each of the platform peripheral legs (dependent on subsurface conditions). Depending on the final WHP design, there could be one or two piles at each leg. The WHP foundation design, whether gravity based or piled, must ensure the WHP is held in position during all weather and sea conditions. If required, the piles will be driven and/or drilled into the seabed.

The interconnecting flowlines or pipelines will have a similar width corridor to that of the foundation development, i.e. 250 m wide, and will connect back to the Dorado WHP or FPSO. As the hydrocarbons from future tiebacks will be processed on the Dorado FPSO, there will be no additional types of emissions or discharges associated with hydrocarbon processing. Produced gas will continue to be used to supply fuel gas for the FPSO power generation system and flare pilot; otherwise excess gas will be dehydrated, compressed and reinjected into the reservoir via existing reinjection wells (or additional reinjection wells if needed).

6.6.7 Climate Resilience

In alignment with the *National Climate Resilience and Adaptation Strategy 2021-2025,* Santos recognises that effective adaptation to the potential impacts of climate change must be informed by the best available science and information. Santos has considered the potential impacts of climate change as they relate to the Dorado Development design and operations and how they are most appropriately addressed through the Project design phase.

The climate change impact assessment detailed in **Table 6-4** below is informed by the Regional Projections for Western Australia (CSIRO, 2021) which considers the future impacts of climate change for the whole of Western Australia. The regional projections collate available science and literature to predict the climate and weather events out to the year 2040. Dorado Phase 1 development facilities are designed to operate for a life of 20 years through to 2046 (inclusive of potential tiebacks) therefore the timeframe for these predictions are considered broadly suitable for the life of Dorado Phase 1. The regional predictions do however represent a coarse assessment over a large geographical area, and as such should only be considered general indicators for predicted impacts specific to the Dorado Development project area.

The West Australian regional predictions indicate that ambient temperatures will increase; ocean temperatures will rise; rainfall patterns will change significantly; and extreme events, such as droughts, floods, wildfires, and cyclones will become more common. These changes are likely to impact individual species, ecosystems and ecosystem services, such as food and water availability. Within decades, environments across Australia may be substantially different (CSIRO and Bureau of Meteorology 2015).

Table 6-4 summarises the climate resilience impact assessment prepared for the Dorado Development based on regional predictions for Western Australia (CSIRO, 2021). Aspects such as future increases in ambient temperature will require ongoing application of existing Santos heat stress management procedural controls. Other potential impacts related to increase in ocean temperature, sea level rise and frequency/intensity of storm events have been adequately accounted for in the Project basis of design for the Dorado WHP and FPSO, and are considered adequate to mitigate potential future impacts from climate change to an acceptable level.

Santos

Table 6-4: Climate resilience impact assessment for Dorado Phase 1 based on CSIRO projections for Western Australia.

Environmental Indicator	Predicted changes by 2040	Project impact	Comments
Ocean Temperature	0.5 – 1.0 C increase in average ocean temperature by 2040 Marine Heatwaves = >200-day increase. The increase in temperature, currently seen in marine heatwaves will likely extend throughout most of the year (>300 days).	+ WHP and FPSO basis of design, and design/operating temperature philosophy is sufficiently conservative to allow for up to a 1 degree Celsius in ambient ocean temperature and increase in occurrence of marine heatwaves	+ No impact to construction or Operation of the Dorado Project infrastructure. + Equipment design and selection as per engineering specifications. + The design temperature limits for all associated equipment for the Dorado WHP and FPSO were identified in the Design Temperature & Pressure Philosophy This document details the minimum and maximum temperatures under a range of potential conditions (e.g. marine heatwaves). Key elements of the Temperature philosophy include: - Normal operating temperature for equipment plus at least 25°C - Maximum operating temperature plus at least 15°C. - 80°C for equipment that can be exposed to direct solar radiation - 45°C for equipment that cannot be exposed to direct solar radiation + The FPSO basis of design includes cooling water system design parameters, indicating there is sufficient conservatism to accommodate a 1°C increase in ambient water temperature associated with marine heatwaves. + The operating temperature philosophy allows for the increased temperatures associated with increased marine temperatures and heatwave.
Ambient Temperature	Increase in Max temp by 1.4 to 2.1C by 2040	+ Existing controls for heat stress management adequate for potential impacts to workforce. + Given the offshore location of this activity, large bodies of water such as oceans, create a moderate climate with smaller temperature range, when compared to terrestrial environments. Temperature change will have negligible project	+ Santos has an existing Heat Stress Management procedure for managing work in hot environments. A number of key controls from the exposure management procedure will continue to be relevant to managing increases in max temperatures and the number of hot days, including: - Schedule work outside of the summer period - Keep non-essential people out of the field during summer - Conduct work in cooler environment - Work different shift patterns to avoid the heat of the day - Technology alternate work practices to minimise daytime work - Adjust summer work schedules to reduce workloads - Rotate workers to avoid consecutive days in the heat - Use portable cooling, cool suits, erect shade - Establish work/rest cycles with cool refuges for regular relief - Plenty of water, ice, low sugar electrolytes available

Environmental Indicator	Predicted changes by 2040	Project impact	Comments
		impact relative to existing conditions and controls, with predicted temperature changes within equipment design specifications therefore no further assessment is required.	- Light weight breathable clothing, cooling vests/neck bands - Monitor fluid intake, urine, frequency/colour, body temp + The design temperature limits for equipment for the Dorado WHP and FPSO were identified in the Design Temperature & Pressure Philosophy. This document details the minimum and maximum operating temperatures under a range of potential conditions. Key outcomes of the Temperature philosophy include: - Normal operating temperature plus at least 25°C - Maximum operating temperature plus at least 15°C. - 80°C for equipment that can be exposed to direct solar radiation - 45°C for equipment that cannot be exposed to direct solar radiation
Sea Levels	100 – 200 mm sea level rise within the life of the project.	Structural design of the FPSO and WHP anticipates significant storm surge associated with changes in sea level.	**WHP** + As per the WHP Foundation Design for Extreme and Abnormal Environment Conditions, specific requirements to mitigate against sea level rise include: - Alignment with foundation design guidance in "Petroleum and natural gas industries — Specific requirements for offshore structures (ISO 19901)" which contains an environment impact study including erosion from sea level rise and routine and maintenance activities during the life of the structure. - WHP design to account for sea level rise of up to 300 mm. **FPSO Mooring** + Fatigue analysis of the mooring system was carried out, including as a minimum the assessment of the following: - Dynamic loads due to FPSO motions during sea level rise. - Motion at the touchdown point. - Fatigue and wear at all connection points. - Fatigue of fairlead chain due to in-plane and out-of-plane bending of chain links, and tension fatigue during sea level rise. - Risk of fatigue acceleration by small pitting, preferential groove, etc. - Higher corrosion rates at water surface level
Extreme weather events	More intense, longer, unpredictable, and	+ WHP design basis is sufficiently conservative through adherence to	+ The WHP and FPSO (including moorings) structural design is engineered to accommodate extreme weather conditions, including more intense storm events and cyclone activity. Further considerations include:

Environmental Indicator	Predicted changes by 2040	Project impact	Comments
	increased frequency.	conservative design factors up to and including structural resistance to 1000yr storm events. + The FPSO is designed with a disconnectable turret mooring enabling the vessel to move away during storm events. Although there may be some impacts to production if there are more storm events over time, this has been offset by optimisations to the disconnection timeframe.	**WHP:** + Partial load and resistance factors consistent with ISO 19901 recommendations, as summarised in the table below, with the following exceptions for Ultimate Limit State conditions. These design factors ensure the structure is sufficiently robust to account for abnormal storm events: - A partial environmental load factor of 1.35 shall be adopted. - A partial permanent load factor of 1.0 shall be adopted. + The WHP design limit states for ultimate/extreme and abnormal cyclonic events will be 100 Year and 1000 Year return periods respectively, ensuring the structure is strong enough to account for even an abnormal 1 in a 1000 year storm event.

Event	Resistance	Permanent Load	Environment Load
Extreme Level Storm (100 yrp)	1.25	1.0	1.35
Abnormal Level Storm (1000 yrp)	1.0	1.0	1.0

+ The highest risk associated with extreme storm events was determined as the wave crest reaching the main deck of the WHP, which could result in significant increase in overall loads on the structure. Rather than increase the storm return period from 1 in a 1000 year storm event, the decision was taken to design the platform for the maximum omni directional loads using inputs from metocean data reports. This is conservative as it applies the maximum wind, wave and ocean current loads in a single direction, noting that the probability of this actually occurring is unlikely.
+ Additionally, the main deck level was set to include allowances for the following events to occur simultaneously:
  - Storm Surge for a 1000 year cyclonic storm
  - Sea level rise of up to 300 mm
  - Wave crest for a 1000 year cyclonic storm
  - Maximum settlement from a 1000 year cyclonic storm

Environmental Indicator	Predicted changes by 2040	Project impact	Comments
			+ The basis for the WHP design is considered sufficiently conservative by assessing the robustness of the WHP design to withstand simultaneous wind, wave and ocean current loads in a single direction, without needing to increase return periods for storm events. **FPSO:** + The FPSO will be double hulled and have a Disconnectable Turret Mooring (DTM) system to allow the FPSO to disconnect and move away from the field under its own power if required (such as during adverse weather conditions or cyclone). - The DTM has been optimised to minimise the disconnection timeframe to reduce the loss of production during disconnection. + When the FPSO is disconnected (via the DTM system), the top of the DTM Buoy sits at 30m below sea level which allows protection of the DTM system and mooring infrastructure from extreme event conditions while the FPSO is off station. A load case screening study to assess the integrity of the DTM buoy system to various Load and extreme Environment cases (100 yrp) is presented in Feed Riser Design Basis (7806-110-DBM-0002). This study considers an analysis on the integrity of the DTM Buoy in both a connected and disconnected state, confirming the DTM Buoy has been designed to ensure the structure is sufficiently robust to account for abnormal storm events.
Ocean Acidification	25-30% increase in ocean acidification.	+ Ocean acidification has the potential to accelerate corrosion. Structural design of the Dorado WHP and FPSO protects against corrosive processes, and is sufficiently conservative to accommodate increases in ocean acidification.	+ The nature of the environment surrounding the dorado project is highly susceptible to corrosion and marine growth. + All reasonable engineering solutions have been adopted to ensure impacts from corrosion is prevented, including (but not limited to): - Cathodic protection (anode design) - Selection materials (steel, insulated rubber piping for SURF) - Corrosion resistant paint (copper paint), - Impressed currents and cathodic protection + Additionally, integrity corrosion control is part of planned integrity management and IMMR activities. This is further described in Section 6.7.5. + Dorado facilities design has adopted very conservative marine growth density values, in the order of 2-3 times higher than marine growth assumptions adopted for the majority of similar oil and gas developments in the North West Shelf region. This
Ocean acidification and	Cumulative impacts of ocean acidification +	+ The combination of ocean acidification and increased marine temperatures has	

Environmental Indicator	Predicted changes by 2040	Project impact	Comments
temperature increase	temperature increase (referenced above)	potential to accelerate corrosion and marine growth. Structural design of the Dorado WHP and FPSO protects against corrosive processes, and is sufficiently conservative to accommodate the combination of increases in ocean acidification and temperature.	conservatism ensures more vulnerable structures such as the mid-water arch (MWA), the DTM buoy, riser/umbilical and mooring systems are designed to tolerate increases in marine growth densities associated with future increases in ocean temperature. It should be noted that structures such as the DTM buoy and the riser/umbilical system tend to attract a smaller amount of marine growth due to a washing effect as a result of severe weather conditions which are also expected to increase with future climate change. + Marine growth preventative measures will include specifying an anti-fouling polymer coating for the MWA to minimise marine growth accumulation. + In the event a higher marine growth density is observed during routine subsea asset integrity inspections, an in-place marine growth cleaning campaign can be undertaken during production operations.

6.7 Project Stages and Key Activities

6.7.1 Overview

As presented in **Table 6-2**, Dorado Phase 1 will be undertaken in a number of key stages, being:

+ installation of the Dorado WHP;
+ development drilling (this term is used to collectively refer to oil and gas production and gas reinjection well drilling);
+ installation of the FPSO and subsea equipment and connections between infrastructure;
+ commissioning;
+ operations and maintenance, including any future tiebacks to existing facilities within the Dorado Development Project Area; and
+ decommissioning.

The key activities within these project stages are summarised in **Table 6-5**. Future tiebacks are expected to involve components of the same key stages and activities as those of the initial development. The Dorado WHP and FPSO locations will remain unchanged for Dorado Phase 1.

Table 6-5: Project stages and key activities

Project Stage	Key Activities
Installation of the Dorado WHP & FPSO mooring piles	+ Transport and installation of Dorado WHP substructure + Transport and installation of Dorado WHP topsides + Transport, installation and piling of FPSO mooring piles
Development drilling	+ Drilling of oil and gas production and gas reinjection wells + Well testing
Installation of subsea equipment and connections between infrastructure	+ Installation of subsea system, including flowlines, risers, manifolds and umbilicals + Transport, installation and mooring of the DTM + Transport, installation and piling of FPSO mooring piles (if not completed at time of WHP installation activities)
Hook-up of FPSO	+ Sail away and connection of the FPSO to the DTM
Commissioning	+ Commissioning, testing and monitoring of systems and equipment on the Dorado WHP and FPSO topsides + Commissioning of the flowlines and umbilicals (e.g. hydrotesting and dewatering)
Operations and maintenance	+ Dorado WHP and FPSO operations + Planned maintenance and shutdown campaigns + Periodic product offtake by offloading tankers temporarily connected to the FPSO for transport to market + Well interventions campaigns + Drilling of infill wells (up to 6) at the Dorado WHP
Future tiebacks	+ Development of reservoirs (currently identified as prospects) within the Dorado Development Project Area. Key activities associated with these future developments may include: - Survey activities such as side-scan sonar, multibeam echo sounders etc

Project Stage	Key Activities
	- Drilling of additional wells (with the potential installation of subsea production trees) - Installation and commissioning of subsea flowlines or pipelines, WHP or manifolds (if subsea development) and umbilicals from the additional wells to the Dorado WHP or FPSO
Decommissioning	+ Flush flowlines between the WHP and the FPSO + Disconnect the FPSO and sail away for remote offsite decommissioning or reuse + Plug and abandon the production and gas reinjection wells + Disconnect and decommission the Dorado WHP + Decommission the subsea system

6.7.2 Installation

While the specific details of Dorado Phase 1 installation have not been finalised, as detailed design has not been completed, this section provides information based on the most likely installation method. The description of key activities and aspects are considered sufficiently representative to incorporate potential future design changes and provide a conservative estimate of the maximum extent and nature of the activities.

The Dorado WHP and FPSO will be constructed off-site. The Dorado WHP substructure and topsides will be transported to the Dorado Phase 1 location either on a barge or possibly by a heavy-lift vessel. The topsides will be a lifted installation placed onto the substructure. Installation activities will take approximately three months.

The FPSO will travel to the Dorado field on its own power. Up to 12 FPSO anchor piles may be drilled and/or driven into position (via a subsea hydraulic impact hammer). If drilled, a large-diameter pile-top reverse-circulation drilling rig or a conventional drilling rig will be used, aided by seawater and if necessary prehydrated gel sweeps. Conservatively, as the worst case, approximately 8,000 m^3 of drill cuttings may be discharged, assuming the anchor piles are all drilled. The cuttings generated during the pile drilling activities may be discharged either at seabed or above the sea surface. This piling operation is expected to last approximately 30 to 40 days. As part of each anchor pile, up to 200 m of chain and wire may lay on the seabed until connected to the DTM mooring lines. Support vessels and derrick barges will be required to support the FPSO mooring installation.

6.7.2.1 Dorado Wellhead Platform

The Dorado WHP will be installed in two phases: first the gravity-base substructure, then the topsides. The Dorado WHP gravity-base substructure will be transported, positioned and installed by an installation spread (potentially including heavy lift and support vessels). It will be ballasted and directed into position on the seabed. Once lowered onto the seabed, grout will be injected between the base and the seabed to fill any voids under the mudmat foundation of the gravity-base substructure. Once the substructure is in place, the Dorado WHP topsides will be lifted and secured on top of the substructure by a derrick barge (i.e. the topsides will be raised above the substructure and lowered into position).

6.7.2.2 Subsea System

Three 8 to 12-inch diameter and 2.2km long flexible or rigid flowlines will be installed between the Dorado WHP rigid riser and the FPSO flexibles risers.

For either flowline type, the flowlines will be connected to the Dorado WHP subsea connectors and the FPSO flexibles risers. The Dorado WHP subsea connectors will provide the connection between the WHP rigid riser's stress joint and the flowlines. The flowlines (for the flexible option) and umbilical will be laid on the seabed from reels located on the installation vessel. It is expected that multiple umbilical and flowline reels will be required during the laying operations, and therefore transfer of umbilical reels from a support or heavy-lift vessel to the pipelaying vessel will be required. For rigid flowlines, lengths of steel pipe (joints) will be continuously welded, inspected and coated (with anti-corrosion and concrete coating) in a horizontal working plane (called a firing line) on board the pipelay vessel. As the pipelay vessel moves forward along the flowline route, the pipe gradually exits the firing line, curving downward through the water until it reaches the seabed. For both laying methods, an anchor point (which could be a temporary pile or a deadman anchor) from which to initiate the laying of the flowlines may be required.

The flowlines will be connected to the Dorado WHP via the rigid riser and to the FPSO via the DTM through the flexible risers. Similarly, the umbilical will be connected to the Dorado WHP via the J-tube and to the FPSO via the DTM. To support the flexible risers and umbilical, a mid-water arch will be installed to secure the risers and umbilical to the seabed near the FPSO. During the connection of the Dorado WHP J-tube and the rigid risers, it is anticipated that preservation chemicals (such as biocide and corrosion inhibitor) dosed into the J-tube and the rigid risers will be discharged to the marine environment. Anchoring (aside from flowline initiations) is not expected with either pipelaying method. It is expected that it would take between 20 and 30 days to lay the flowlines and umbilical.

While the flowlines will not be trenched, some secondary stabilisation may be required at discrete locations to ensure their stability and long-term integrity. It is expected that either gravel, grout bags, or concrete mattresses will be used for this purpose.

Following completion of the flowline laying activities, a leak test will be performed. The leak test will involve pressuring up the subsea system, using either treated seawater (likely dosed with biocide, corrosion inhibitor, and a dye) or freshwater, and monitoring the pressure to ensure it is maintained for up to a 24-hour period to verify there are no leaks. Upon completion of the test, depending on flowline integrity requirements and the expected ecotoxicity of the fluids, the treated seawater or freshwater will be either left in the flowlines for treatment and disposal on the FPSO during commissioning (treated seawater) or discharged overboard (fresh water). It has been estimated that up to 2,500 m^3 of treated seawater or freshwater could be discharged.

6.7.2.3 Floating Production, Storage and Offloading Facility

Similar to the Dorado WHP, the FPSO will be installed in two stages: first the DTM, then the FPSO. The DTM will either be transported directly to the site via a barge or heavy-lift vessel or transported to a Western Australian port before being towed to site depending on the installation methodology determined during detailed engineering and/ or availability of vessels. Prior to the DTM arriving on site, some or all of the anchor piles may be pre-laid using support vessels. Pre-laid anchors will be connected to the DTM mooring lines on arrival. The tension of the mooring lines will then be adjusted to place the DTM in the required position.

Following the completion of development drilling, the self-propelled FPSO (sails down from shipyard as a vessel) will then be connected to the DTM. As outlined in **Section 6.6.5.1**, the DTM will be lowered into the water column (to approximately 30 m BSL) when not connected to the FPSO.

6.7.3 Development Drilling

A jack-up MODU is proposed to be used for undertaking drilling of the Dorado reservoir, accessing and constructing wells over and through the Dorado WHP.

Future wells (i.e. future tiebacks) could be drilled with either a jack-up MODU or from a semi-submersible MODU dependent on the water depths: jack-up MODUs are typically used in water depths of less than 100 m, while semi-submersible MODUs are used in deeper water. The Project Area water depths range from approximately 70 m to 120 m water depth.

The jack-up MODU will be in direct contact with the seabed, while the semi-submersible MODU will hold station via a temporary mooring system with anchors. Anchor handling vessels will assist with semi-submersible MODU anchoring by deploying an expected eight to 12 anchors laid out approximately 3 km from the MODU (depending on water depth). Prior to a semi-submersible MODU arriving, some or all of the anchors may be pre-laid using support vessels. Pre-laid anchors will be connected to the MODU's existing mooring lines on arrival at the site. Anchors will be retrieved upon completion of the activity, and pre-laid anchors may be retrieved after the MODU has departed.

The future tieback wells are expected to yield similar drilling discharges as the foundation development wells, given that the prospects are targeting the Archer Formation.

For Dorado Phase 1, three broad well types will be drilled:

+ oil producers;
+ gas or condensate producers; and
+ gas injectors.

The Dorado field wells will be drilled from a single drill centre that lies within the footprint of the Dorado WHP jacket footprint. It is expected that initial drilling activities will be continuous over approximately two-year period and that it will take about 60 to 70 days to complete each development well (includes drilling, well construction, well testing and clean-up activities). Future tieback wells may have a central drill centre or may be spread further apart depending on the reservoir characteristics.

All the development wells will be drilled in sections that will decrease in diameter at increasing depths until the target reservoir is reached. Protective steel casing will be inserted into the wells and cemented in place to isolate each section from the subsequent sections and provide structural support and stability to the well. In the process of drilling, drilling muds (drilling fluids) will be used to lubricate and cool the drill bit, maintain well bore stability, and remove drill cuttings (i.e. rock fragments) from the well sections as they are drilled. It is envisaged that water-based muds (WBMs) will be appropriate to drill and complete the wells and that up 8,000 m^3 of WBMs per well will be discharged to the marine environment.

Non-aqueous fluid (NAF) or synthetic-based mud (SBM) were assessed to provide little to no benefit to drilling for the lower sections. Nevertheless, they have been included as contingency should unexpected conditions (for example, increased lubrication or heat resistance needed) be encountered during the drilling operations. It is estimated that up to 100 m^3 of NAF/SBM could be discharged to the marine environment per well. **Table 6-6** presents the types of drilling fluids and their typical components proposed to be used for the different well sections.

Table 6-6: Drilling fluid types and typical components

Well Section Diameter (inches)	Drilling Fluid Type and Typical Main Components
36	WBM – seawater and prehydrated gel sweeps (i.e. seawater to which high-viscosity prehydrated bentonite has been added).
26	
17-½	WBM – drilling fluids in which seawater is the major component of the liquid phase and to which bentonite clay, barite, brine and/or gellants (such as guar gum or xanthum gum) have been added
12-¼	
8-½	
Contingency (for the 17-½ to the 8-½ sections)	NAF/SBM – drilling fluids in which synthetic oil is the base fluid with bentonite clay, barite, fluid-loss control agents, lime, aqueous chloride, bridging agents and emulsifiers added

Drilling fluids and cuttings will be discharged at the seabed during drilling of the tophole (36-inch) sections as a riser connecting the MODU to the wellhead will not yet be installed. The drilling fluids and cuttings from deeper well sections will be circulated to the MODU and discharged overboard. If required, cuttings from the sections drilled with NAF/SBM will be passed through a treatment system onboard the MODU prior to discharge overboard to reduce the volume of NAF/SBM coating the cuttings. Residual NAF/SBM base fluid on cuttings content will be reduce to ALARP levels prior to discharge overboard. It is expected that approximately 1,000 m^3 of drill cuttings per well will be discharged.

A blowout preventer (a valve assemblage or mechanical device used to seal, control and monitor wells) will be installed prior to drilling the lower well sections for well control purposes during drilling. The blowout preventer is removed once drilling is complete. Function and pressure tests of the blowout preventer will be conducted regularly throughout drilling to ensure the system reliability is maintained.

Following completion (drilled, cased and cemented) of each well, well testing and clean-up will be undertaken to ascertain the pressure, flow and composition of the reservoir products. Base oil (NAF) may be used for well integrity testing and to provide underbalance during the completion phase; this fluid will be captured and separated on board the MODU for re-use, or safely flared during well clean-up. All production and reservoir parameters will be recorded. Well clean-up will remove debris, such as drill cuttings not circulated to the MODU with the drilling mud, and residual drilling muds from the well. Well testing involves the production of reservoir fluids back to the MODU via a temporary processing and handling facility installed on the MODU. The resulting hydrocarbons (oil and/or gas) will be flared (combusted) using burners to alleviate the need to store produced hydrocarbons on board the MODU or support vessels, and PW (mainly residual WBM fluids) will be discharged overboard following treatment. For the purpose of this OPP, it has been conservatively assumed that flaring will happen periodically throughout the drilling campaign for each well clean up at completion, typically 1-2 days flaring per well. Once the wells are completed, they will be secured at the tree (barriers tested and verified) and handed over to operations.

It is expected that two permanent support vessels (usually offshore multiple-purpose or anchor-handling vessels) will be required to assist the MODU for the duration of the drilling activities, with a third vessel required on an ad hoc basis for approximately six months. The support vessels will assist with towing operations (where even a fourth vessel might be required), equipment and material transfers, standby operations and emergency response. Anchoring of these vessels in the Dorado Development Project Area is not planned.

Equipment and material transfers will be required and may include, but are not limited to, crew supplies, hydrocarbons (diesel, engine oil, hydraulic fluids, grease, etc.), bulk drilling products, MODU drilling equipment and parts, and waste. Bulk products will be transferred via hose from the support vessels and the MODU. Bulk products include drilling fluids and solids, brine, drilling water, cement and fuel oil (diesel).

6.7.3.1 Drilling Vertical Seismic Profiling

Drilling vertical seismic profiling may be acquired during well installation operations. This involves measurements using geophones, placed inside the vertical wellbore, and a surface seismic source, commonly a small air gun array. During drilling vertical seismic profiling operations, the airgun array is discharged approximately for a few seconds at intervals, which generates sound pulses that reflect through the seabed and are recorded by the geophones to generate a profile of the wellbore. This process is repeated as required at different depths in the wellbore and may take up to 24 hours (per well) to complete, depending on the wellbore's depth and the number of profiles required.

6.7.4 Commissioning

Precommissioning activities for the Dorado WHP and FPSO will occur at the onshore construction yard and are therefore excluded from the scope of the OPP.

Commissioning activities (i.e. preparing and bringing hydrocarbons onto the facilities) of the subsea system, the Dorado WHP, and the FPSO will occur within the Dorado Development Project Area. The commissioning of these system or facilities is concurrent but for ease of presentation, they have been split into subsea system commissioning and Dorado WHP and FPSO commissioning.

The key steps in the Dorado WHP and FPSO commissioning process are expected to include:

+ FPSO processing equipment commissioning, including:
  - stabilisation; and
  - gas compression and gas dehydration.
+ once the dry production trees and tie-in spools are installed, they will be tested on the Dorado WHP prior to introducing hydrocarbons. The fluids used during these tests will be either captured (i.e. not discharged to the marine environment) or sent to the FPSO for disposal via the processing systems;
+ leak testing of the swivel, flowlines, and umbilical;
+ commissioning and testing of the DTM to FPSO connection/disconnection system; and
+ testing the cause and effect system for emergency shutdowns.

Leak testing activities will be similar to the testing activities undertaken during the installation stage of the subsea system where treated seawater (likely dosed with biocide, corrosion inhibitor, and a dye) or freshwater will be pressurised. The ability of swivel, flowlines and umbilical to maintain pressure will be monitored. Upon completion of the test, test fluids, depending on their expected ecotoxicity, will either be recovered or treated and disposed of on the FPSO or discharged overboard. It has been estimated that up to approximately 2,500 m^3 could be discharged.

It is also possible that leak testing will be undertaken with nitrogen, in which case the nitrogen will be vented (inert gas) upon testing completion. Similarly, nitrogen will be vented upon completion of gas compression and gas dehydration commissioning.

Prior to introducing reservoir hydrocarbons, the flowlines will be dried by flushing with hydrate inhibitor and/or diesel. If diesel is used it will be recovered on the FPSO for future use or disposed of onshore. Depending on the quality of the recovered hydrate inhibitor, it will be collected for reuse or disposed overboard.

The initial steps in the field start-up are expected to include:

+ initial start-up and performance testing of each well (the wells will be started up sequentially on a predetermined schedule); and
+ interwell reservoir connectivity testing.

During these activities, the produced gas will be flared, but production rates will be within the safe gas flaring limit. Note that flaring will be intermittent throughout the duration of commissioning.

The following activities will then be undertaken:

+ production ramp-up to nameplate capacity; and
+ gas tracers injection for the reinjection system (once steady-state production has been achieved).

The above activities are expected to last approximately 40 to 60 days.

Throughout the commissioning activities, heightened flaring is expected due to testing and ramping-up of the processing equipment, as well as emergency shutdown testing. It is also expected that preservation fluids, which will have been injected into the Dorado WHP and FPSO systems during onshore precommissioning, will be, depending on the expected ecotoxicity of the fluids, treated before discharge overboard or directly discharged overboard. Preservation fluids might include treated seawater, corrosion inhibitors, oxygen scavengers, biocide, hydrate inhibitor, and fluorescein dye. These fluids are essential to maintaining systems integrity by preventing metal corrosion, bacterial growth, and accumulation of scale on internal surfaces.

Commissioning activities could also take place concurrently with operations and maintenance activities, especially for future tiebacks. It is expected that, to prepare for and during the commissioning of the tieback, the following activities will be undertaken:

+ ROV operations on subsea infrastructure;
+ flushing and priming activities on subsea infrastructure;
+ cleaning subsea infrastructure;
+ pressure testing; and
+ dewatering and start-up.

6.7.5 Operations and Maintenance

Once a steady flow of production fluids has been established along with the stabilisation of the Dorado WHP and FPSO processing systems, Dorado Phase 1 will be regarded as entering the operations and maintenance stages. The following operational and maintenance activities are anticipated to occur throughout the life of the facility:

- extraction of production fluids;
- processing of the production fluids;
- reinjection of reservoir gas;
- storage and offtake of the light oil and condensate;
- planned maintenance and shutdown campaigns;
- ongoing planned integrity testing to ensure operations are safe at all times;
- well intervention and well testing; and
- well suspension and/or abandonment.

Once production fluids have been extracted from the reservoirs, they will be sent from the Dorado WHP to the FPSO where they will be processed. The main aim of the processing system is to separate the light oil and condensate from the reservoirs' gas and the PW. Once separated, the light oil and condensate will be stored on the FPSO for offloading. A fraction of the reservoirs' gas will be used to keep the pilot flare ignited and as fuel gas for facilities power generation. The remaining gas will be dehydrated prior to being compressed and reinjected into the reservoirs. The PW will be treated (i.e. hydrocarbons removed) and discharged overboard. The entire extraction, processing, offtake, and reinjection activities will be monitored and managed from the FPSO.

The frequency of the offtake operations will depend on the production rates, but it is expected to occur approximately weekly initially. The maximum offloading parcel size is 650,000 bbl, which is expected to take around 48 hours to offtake (excluding mooring and disconnection time of the offtake tanker). It is too early at this stage to know which tankers will be used, but it has been assumed (conservatively) that they will be fuelled with heavy fuel oil (HFO).

Topside and subsea IMMR activities are expected to be undertaken using dedicated crew, ROVs, autonomous underwater vehicles or diving contractors. IMMR activities will include:

- general inspections;
- topside cleaning of facilities;
- integrity corrosion control;
- facilities and subsea infrastructure installation, cleaning, repair and modifications;
- flowlines and seafloor imaging surveys;
- marine growth removal;
- installation of replacement equipment or parts;
- installation of subsea structures' additional secondary stabilisation;
- flowlines stabilisation; and
- rigless well servicing or intervention.

It is expected that planned maintenance campaigns, for minor work when the facilities are still producing, will take place regularly on the FPSO (through an estimated six-week cycle) and WHP (under an estimated 12-week cycle). During maintenance activities on the Dorado WHP, it might be necessary to mobilise on the facility a dedicated temporary generator. Both the WHP and FPSO may be shut down annually simultaneously (approximately for two weeks) to undertake annual maintenance.

As part of the IMMR, it is also anticipated that the FPSO external hull in-field inspection will be undertaken as per Class requirements (verification of the structural strength and integrity of essential parts of the FPSO's hull and its appendages, the reliability and function of the propulsion and steering systems, power generation and those other features and auxiliary systems which have been built into the FPSO in order to maintain essential services on board) with ROV or any other suitable Class-approved automated systems. Similarly, to meet Class requirements, the vessel mooring system will be inspected and maintained via ROV or any other suitable Class-approved automated systems. Additionally, unmanned aerial vehicles may be used to survey and inspect the submerged exterior of the FPSO and Dorado WHP. Unmanned aerial vehicles may also be used to conduct aerial surveys within the Dorado Development Project Area.

Throughout the operations and maintenance stages, it might be necessary to undertake well interventions or workovers. Well interventions may be required to service a well and undertake chemical treatments (such as lubricating bleed, topping up annulus fluids, applying corrosion and/or scale treatment), to improve production (by installing bridge plugs to isolate water zones and perforating new zones in the well), or to monitor bottom-hole pressure and determine hydrocarbons and water content. Interventions could also occur when tools, fluids, and/or equipment are deployed in pressurised or dead completed wells. Interventions may also be required to temporarily suspend or plug a well or to suspend a well in preparation for re-entry and drilling of a side-track, or for permanent abandonment. This will involve the placing of cement plugs in the casing of the well at various intervals and flooding the casing with fluids containing corrosion inhibitor and/or biocide. Well workovers may be carried out when major maintenance or remedial treatments are required.

To support the operations and maintenance activities within the Project Area, support vessels will be used. Such vessels will typically undertake:

- transportation of materials, fuel (marine diesel oil (MDO) for refuelling of the FPSO) and chemicals;
- backload of equipment, waste, and materials;
- support offtake operations; and
- support FPSO DTM reconnection activities.

It is expected that a support vessel will be present at the FPSO/WHP Petroleum Safety Zone (PSZ) approximately 75% of the time. IMMR activities may require project-specific vessels, which will be chosen specifically for the technical requirements of the project.

Helicopters will also be used for crew changes. During operations, it is expected that, on average, three round trips a week will be required (depending on operational requirements). Support vessels and helicopters will also be used to transfer personnel from the FPSO and/or shore to the Dorado WHP.

6.7.5.1 3-D Vertical Seismic Profiling

During production, there is potential for additional vertical seismic profiling acquisition over the Dorado field (and within the Project Area) and future developed reservoirs. This would be to assess reservoir properties and subterranean oil movement to optimise oil recovery.

To facilitate vertical seismic profiling, fibre optics (which act as seismic receivers) would be installed in the development wells during well construction. The VSP acquisition survey would involve a source vessel and a seismic source that sails a planned circular course covering approximately 100 km^2 over the Dorado field. Note the vessel does not tow streamers as the fibre optics in the well act as the seismic receivers.

A baseline three-dimensional (3-D) vertical seismic profiling survey would be undertaken ahead of field start-up, with periodic vertical seismic profiling surveys acquired approximately every two to three years during field production, if the technology proves successful. The approximate duration of each survey would be approximately 25 days. Assessment to understand the feasibility and logistics of acquiring fibre optic vertical seismic profiling surveys over the Dorado field is ongoing.

6.7.6 Future Tiebacks

The future tiebacks may either be developed subsea or via a WHP.

Future tiebacks may require surveys to be undertaken to assess the suitability of the seabed for infrastructure or surveys may be needed along the length of proposed flowlines routes. These geotechnical surveys may include techniques that involve using high-frequency sonar to provide high-resolution bathymetry and geophysical data, such as side-scan sonar, sub bottom profiler or multibeam echo sounder. Sonar generates high-frequency acoustic emissions that attenuate rapidly in the underwater environment. These geophysical surveys would be expected to take up to seven days to complete, depending on the length of the flowline route.

Any additional WHP (if required) may be fixed to the seabed either by piles or by a gravity base, dependent on the nature of the subsurface conditions at the relevant locations. Up to eight foundation piles (two at each leg) may be drilled and/or driven into position.

If a piled foundation is suitable, it would be installed via a two-stage piling system, consisting of a primary driven pile and a drilled and grouted insert pile. The driven piles would be relatively shallow in depth and are expected to be driven by a subsea hydraulic-impact hammer. For the drilled and grouted piles, a large-diameter pile-top reverse-circulation drilling rig or a conventional drilling rig may be used to drill a hole into which the insert pile will be grouted into place. The hole may be drilled with seawater and, if necessary, prehydrated gel sweeps as used for drilling the development wells. Depending on the drilling rig selected, the generated drill cuttings may be discharged either at seabed or above the sea surface. Conservatively, as the worst case, approximately 8,000 m^3 of drill cuttings may be discharged, assuming the piles are all drilled. The piling operation is expected to last approximately one day per driven pile and three days per drilled and grouted pile. Fluorescein dye may be used in the grouting operations. Support vessels and derrick barges will be required to support the piling installation. If a gravity-based substructure is required, then the installation method will be similar to that described in **Section 6.7.2.1** for the Dorado WHP.

It is not anticipated that the associated flowlines or pipelines and risers will require to be trenched, but secondary stabilisation may be needed in some areas to ensure the stability and long-term integrity of the subsea facilities.

Drilling activities for the future tiebacks are described in **Section 6.7.3.**

As the hydrocarbons from future tiebacks will be processed on the Dorado FPSO, there will be no additional types of emissions or discharges associated with hydrocarbon processing. Produced gas will continue to be used to supply fuel gas for the FPSO power generation system and flare pilot; otherwise excess gas will be dehydrated, compressed and reinjected into the reservoir via existing reinjection wells (or additional reinjection wells if needed).

6.7.7 Decommissioning

Dorado Phase 1 will be decommissioned at the end of its operating life when production from the reservoirs ceases to be economically viable, and will be decommissioned in accordance with the prevailing legislation at that time. Decommissioning of petroleum facilities requires approval under the OPGGS Act, including acceptance of appropriate EPs under the OPGGS Environment Regulations prior to decommissioning activities commencing.

As part of the asset life cycle management requirements, Dorado Phase 1 will be required to have a decommissioning strategy and plan. Santos' current decommissioning strategy is based on removing property at the end-of-field-life (EOFL) unless infrastructure/equipment is no longer being used, in which case property will be managed in compliance with Section 572 of the OPGGS Act.

Santos commits to achieving full compliance with decommissioning requirements under Section 572 the OPGGS Act. These requirements will be subject to other provisions of the OPGGS Act and regulations, directions given by NOPSEMA or the responsible Commonwealth Minister, and other applicable laws such as the *Environmental Protection (Sea Dumping) Act 1981*. The policy of the Department of Industry, Science, Energy and Resources (2020) and NOPSEMA's draft policy *Section 572 Maintenance and removal of property* (NOPSEMA 2020b) may permit Santos to make alternative arrangements for decommissioning, provided that the alternative arrangements (e.g. decommissioning of infrastructure in situ) are demonstrated to result in equal or better environmental outcomes when compared to the removal of property. NOPSEMA's acceptance of an EP proposing alternative arrangements would mean that Santos' obligations under Section 572 of the OPPGS Act are met with respect to the property covered under the EP.

During front end engineering and design for Dorado Phase 1, Santos will incorporate decommissioning considerations into project equipment and infrastructure design, and plan for the removal of property (as defined in Section 572 of the OPPGS Act).

In-field decommissioning activities are expected to take several years to complete. Prior to decommissioning, an EP will be submitted to NOPSEMA for acceptance after considering a range of decommissioning options.

After the successful completion of decommissioning activities, Santos will apply to surrender the relevant production and infrastructure licences. Once satisfied that Santos has complied with all requirements for the surrender of these licences, the Joint Authority can give consent to the surrender of the licences.

Key environmental risks associated with decommissioning have been broadly addressed through the evaluation of project impacts and risks in **Section 7**. Further detailed information on the nature and scale of the activity, potential environmental impacts and risks, and the control measures that will be implemented will be provided in future activity-specific decommissioning EP(s). This OPP only outlines broad EPOs relating to decommissioning activities, as aligned with the intent for this to be an 'early stage, whole-of-project' assessment.

7 Evaluation of Environmental Impacts and Risks

7.1 Impact and Risk Assessment Methodology

Santos operates under an overarching Risk Management Policy, which is underpinned by Santos' health, safety and environment management processes. The Santos Risk Procedure (SMS-MS1-ST01) underpins the Risk Policy and is consistent with the requirements of AS/NZS ISO 31000:2018, Risk Management – Guidelines (International Organization for Standardization, 2018). The key steps of Santos' process for assessing environmental impacts and risks for this OPP are shown in **Figure 7-1**. This process is aligned to the risk management process outlined in **Table 7-2** and the Risk Management Policy. Each element of **Figure 7-1** is described in further detail below. Common terms applied during the impact and risk assessment process are defined in **Table 7-1**.

The process outlined in **Figure 7-1** was implemented during a series of environmental impact and risk assessment workshops in which hazards, impacts and risks were identified and assessed using the Santos risk matrix (**Table 7-2**). Participants in the workshops included Santos' environmental, drilling and completions, engineering, operations and geology disciplines, with facilitation support from external consultants. The workshop participants were suitably skilled and experienced to identify and understand environmental impacts and risks that may credibly arise from the Dorado Development. All stages of Dorado Phase 1 were considered.

Table 7-1: Impact and Risk Assessment Terms

Name	Definition
Acceptability	An 'acceptable level' is the specified amount of environmental impact and risk that an activity may have that is tolerable, is consistent with all relevant principles, and does not compromise the EPOs. A definition of receptor-specific acceptable levels adopted in this OPP is provided in **Section 4**.
EMBA	Environment that may be affected by planned or unplanned events.
Consequence	The severity of an impact in terms of its adverse effects on the environment.
Impact	Any change to the environment, whether adverse or beneficial, wholly or partly resulting from the planned activity.
Risk	Applies to unplanned events. Risk is a function of the likelihood of the unplanned event occurring and the severity (consequence) of the environmental impact that arises from that event.
Hazard	Something with the potential to cause harm.
Likelihood	Probability of an unplanned event occurring.
Planned activity	The activity to be undertaken, including the services, equipment, products, assets, personnel, timing, duration and location.
Receptor	A feature of the environment that may have environmental, social and/or economic values.
Unplanned event	An event that results in some level of environmental impact and may occur despite preventive safeguards in place. An unplanned event is not intended to occur during the activity.

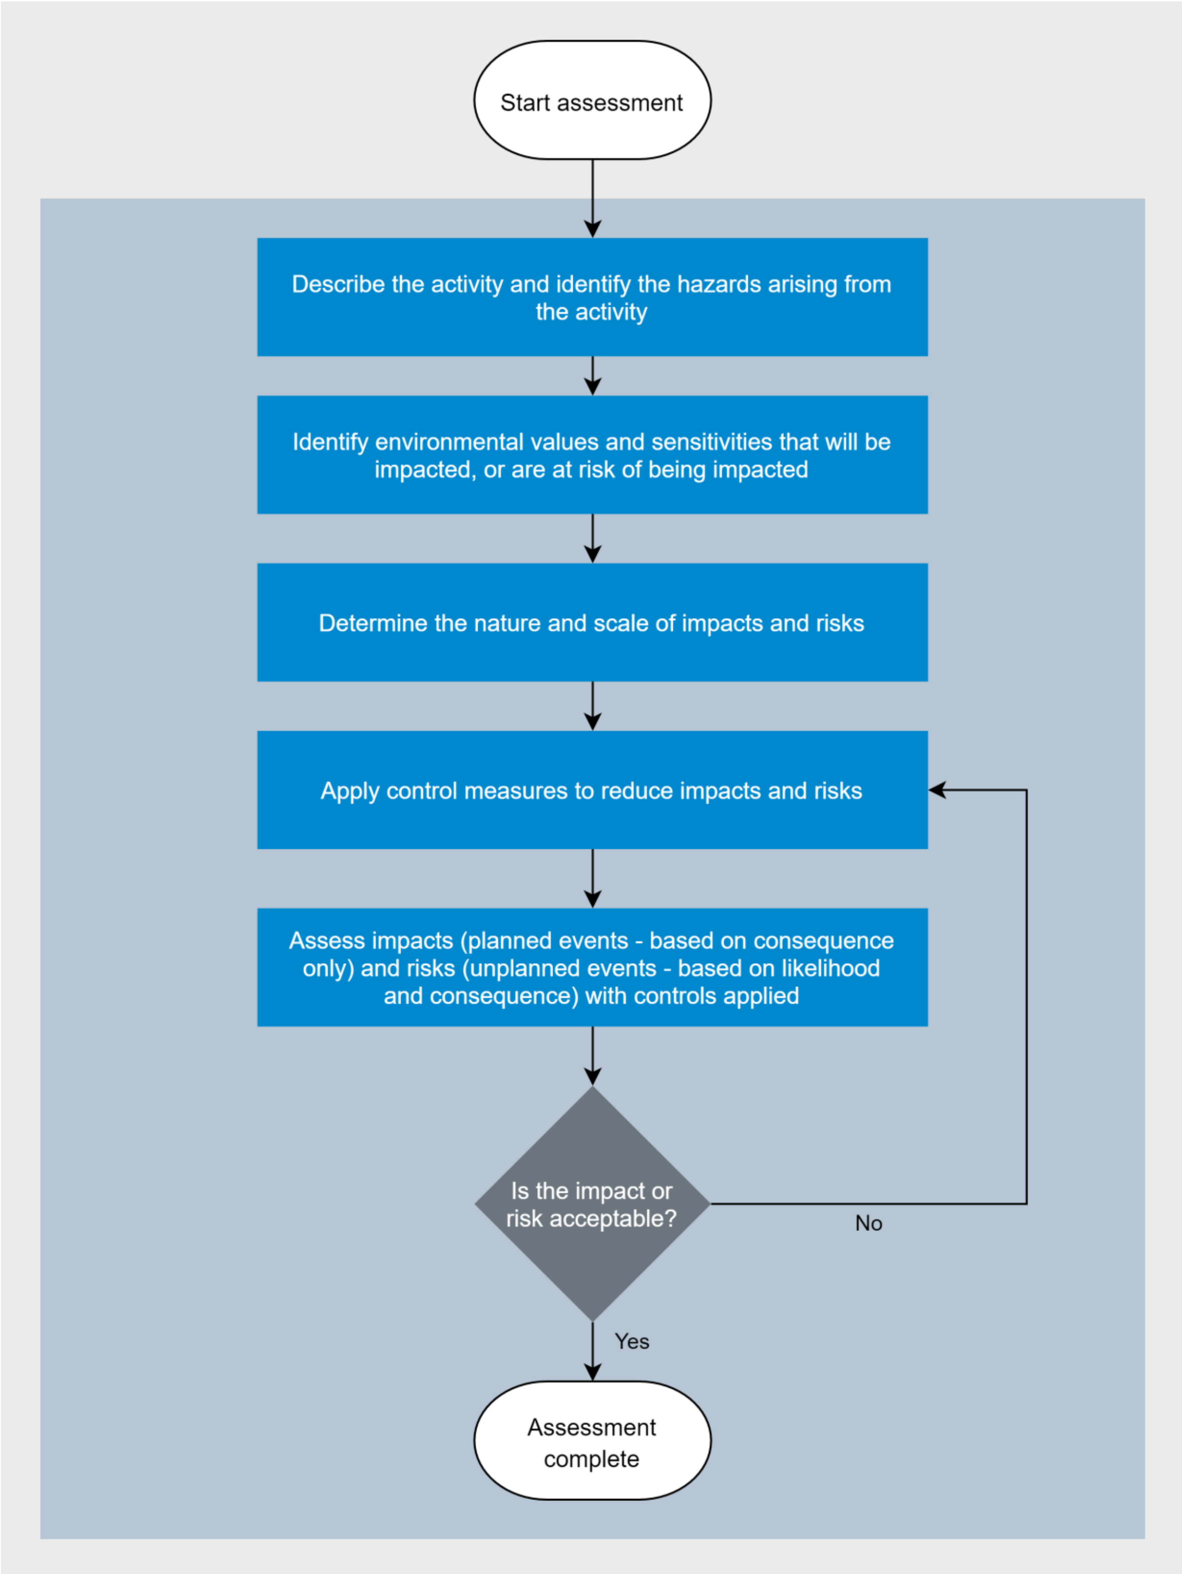

Figure 7-1: Environmental impact and risk assessment process

Table 7-2: Santos risk matrix

Consequence	I	II	III	IV	V	VI
Safety	**Negligible Harm** + No bodily damage or minimal harm or impairment (hours to days)	**Minor Harm** + Short term impairment (days to weeks)	**Moderate Harm** + Temporary disablement or medium term impairment (weeks to months)	**Severe Harm** Long term/life altering disablement or impairment	**Single fatality OR critical life threatening injuries**	**Multiple Fatalities**
Environment	+ No impact to Environmental Value(s)	+ Small-scale impact to Environmental Value(s) of conservation significance + Potential surface or groundwater impact	+ Moderate scale impact to Environmental Value(s) of conservation significance + Localised surface or groundwater impact	+ Large-scale impact to Environmental Value(s) of conservation significance + Moderate scale surface water impact + Localised impact to groundwater with potential or known beneficial use	+ Extensive population or community scale impacts to Environmental Value(s) of conservation significance + Extensive impact to other EV(s)	+ Irreversible impact to Environmental Value(s)
Community & Reputation	+ No actual or potential community criticism + Details remain within Santos sites and/or offices	+ Minor level local community criticism (less than week) + No reputation impact	+ Local community criticism (more than week) or one-day community protest + Local company reputation impacted	+ State-level community criticism or protect over multiple days/locations + State-based company reputation impacted + Very short-term share price impact (less than week)	+ National community criticism or large scale protest + Company reputation and approvals impacted + Shareholder intervention or short-term share price impact (less than month)	+ Sustained national community criticism or widespread protest + Industry reputation and approvals impacted + Changes at executive/board level or long-term share price impact (more than month)
Financial (A$)	less than $30K	$30K to $300K	$300K to $3m	$3m to $30m	$30m to $300m	more than $300m
Workforce	+ Will request some staff attention over several days + No actual or potential impact to culture	+ Will require several days local management time + Minor impact to employee engagement and limited staff turnover	+ Will require several weeks of senior management time + Moderate impact to employee engagement and staff turnover above industry average with some key roles	+ Will require several weeks of senior management time + Impact to employee engagement (less than 6 months), moderate turnover of key roles and no succession	+ Will require several months of senior management time + Impact to employee engagement (less than 18 months), high staff turnover and attraction issues	+ Will require more than a year of senior management involvement and operations severely disrupted + Impact to employee engagement (more than 18 months), significant key role turnover and attraction issues
Compliance	+ Non-conformance with legislation, instruments (e.g. tenure licence) or contract + No regulatory or punitive action	+ Minor breach of legislation, instruments or contract + Notification/report to, request for information by, and/or administrative / warning notice from the regulator	+ Limited number of minor breaches of legislation, instruments or contract + Statutory notice from the regulator	+ Systemic minor breaches (or one moderate breach) of legislation, instruments or contract + Company charged with an offence with minor penalty/fine	+ Systemic moderate breaches (OR single material breach) of legislation, instruments or contract + Company charged with an offence with moderate penalty/fine	+ Material breaches of legislation, instruments or contract + Company or officers charged with an offence with material penalty/fine or loss of tenure/operatorship

Likelihood		I	II	III	IV	V	VI
Almost Certain (less than 4 months) Occurs in almost all circumstances OR could occur within days to weeks	f	Low	Medium	High	Very High	Very High	Very High
Likely (4 monthly to 1 yearly) Occurs in most circumstances OR could occur within weeks to months	e	Low	Medium	High	High	Very High	Very High
Occasional (1 to 3 yearly) Has occurred before in Santos OR could occur within months to years	d	Low	Low	Medium	High	High	Very High
Possible (3 to 10 yearly) Has occurred before in the industry OR could occur within the next few years	c	Very Low	Low	Low	Medium	High	Very High
Unlikely (10 to 30 yearly) Has occurred elsewhere OR could occur within decades	b	Very Low	Very Low	Low	Low	Medium	High
Remote (30 to 100 yearly) Requires exceptional circumstances and is unlikely, even in the long term OR only occurs as a "one in 100 year event"	a	Very Low	Very Low	Very Low	Low	Medium	Medium

Santos

7.1.1 Describe the Aspect and Identify Hazards

An assessment of Dorado Phase 1 activities described in **Section 6** was undertaken to identify the aspects of activities that may interact with the environment. Each of these aspects was assessed to determine what environmental hazards could credibly arise from the aspect. Hazards were characterised by their:

+ duration – how long in the hazard present;
+ spatial extent – how far could the hazard extent in the environment; and
+ magnitude – how great is the potential for the hazard to cause impacts.

Additional studies were undertaken where there was uncertainty in the characteristics of a hazard. These studies include the numerical modelling studies provided in **Attachment 2** to **Attachment 12** and additional early engineering design.

The aspects of Dorado Phase 1 that may result in environmental impacts and risks, along with the environmental values and sensitivities these aspects may interact with, are summarised in **Table 7-3**.

Table 7-3: Interactions between aspects of Dorado Phase 1 and environmental values and sensitivities

Aspect		Physical							Biological					Socio-economic						
		Bathymetry	Climate	Oceanography	Water Quality	Sediment Quality	Air Quality	Acoustic Environment	Communities and Habitats	Fishes	Marine Mammals	Reptiles	Birds	Regional Centres	Protected Areas	Fisheries	Heritage	Tourism	Maritime Industry	Defence

7.1.2 Identify Environmental Values and Sensitivities

Environmental values and sensitivities were identified based on the nature and scale of the environmental aspects of Dorado Phase 1. The spatial and temporal extent of each aspect and any associated hazards were considered when identifying environmental values and sensitivities. These environmental values and sensitivities are presented in **Section 3**.

Santos estimated the spatial and temporal extents of environmental aspects using a range of methods, such as:

+ calculations of direct seabed footprints (**Section 7.2.9**);
+ scheduling and duration of project activities (**Section 6**);
+ characteristics of project components (e.g. vessels) (**Section 6**);
+ modelling studies to predict the extent of emissions and discharges, such as:
+ PW discharge modelling (**Attachment 7**);
+ drill cuttings and fluids discharge modelling (**Attachment 6**);
+ acoustic emissions modelling (**Attachment 10, Attachment 14**);
+ atmospheric emissions inventory (**Attachment 12**);
+ artificial light emissions modelling (**Attachment 9**); and
+ hydrocarbon spill modelling (**Attachment 8**).

Santos has also undertaken a range of environmental investigations to provide information on environmental values and sensitivities, including:

+ sediment quality surveys (**Attachment 4**);
+ water quality surveys (**Attachment 5**);
+ benthic habitat surveys (**Attachment 2**);
+ benthic habitat modelling (**Attachment 3**); and
+ stakeholder engagement (**Section 9**).

7.1.3 Determine the Nature and Scale of Impacts

The nature and scale of impacts to environmental values and sensitivities was assessed for each aspect. This assessment was undertaken qualitatively by environmental impact and risk assessment workshops participants. The assessment considered a range of factors, such as:

+ the potential pathways between the hazards and the environmental values and sensitivities;
+ the vulnerability of the environmental values and sensitivities to hazards;
+ the value of the environmental values and sensitivities (**Section 4**);
+ the potential for the environmental values and sensitivities to recover after being exposed to the aspect; and
+ sources of uncertainty in the characteristics of the hazard or the environmental values and sensitivities.

The nature and scale of impacts and risks was used to determine the consequence when assessing impacts and risk (**Section 7.1.5**).

7.1.4 Apply Control Measures

Control measures to reduce environmental impacts and risks were applied to each aspect after determining the nature and scale of environmental impacts and risk. Controls that reduce the consequence of a planned activity or an unplanned event, as well as controls that reduce the likelihood of an unplanned event, were considered.

Controls were identified from a range of sources, such as:

+ Santos' environmental management systems and practices;
+ Santos' operational experience;
+ industry standards and good practice;
+ relevant requirements;
+ material published under the EPBC Act, such as recovery plans and conservation advice; and
+ feedback received from stakeholders.

The effectiveness of each control was considered when applying control measures. This included considerations such as:

+ Does the control deliver the intended benefit?
+ Is the control available when it is needed?
+ Does Santos have a history of successfully implementing the control?
+ Is the control resilient?

Controls having a relatively high effectiveness were prioritised for implementation. Multiple iterations of the application of control measures were carried out as required until the impacts or risks were reduced to an acceptable level (**Section 7.1.5**).

7.1.5 Assess Impacts and Risks

The impact or risk for each aspect and associated hazards was assessed following the application of controls. The consequence level of the impact is determined for each planned and unplanned event using the Corporate Santos Risk Matrix (**Table 7-2**) and the more detailed environmental consequence descriptors provided as guidance in Table 7-4 and Table 7-5.

For planned impacts, only the consequence of the impact was assessed (refer Table 7-4). Likelihood was not assessed, as the occurrence of planned events is effectively certain. The consequence for planned activities was based on all controls functioning effectively. During the workshops it was identified that all planned activities could result in a potential impact to environmental value, even if the impact is not measurable, quantifiable, or identifiable. The minimum consequence of a potential environmental impact was therefore regarded as "Minor – II" in the Santos risk matrix.

Table 7-4: Summary of Environmental Consequence Descriptors

Consequence Level	Consequence Level Description
I	**Negligible** - No impact or negligible impact.
II	**Minor** - Detectable but insignificant change to local population, industry or ecosystem factors.
III	**Moderate** - Significant impact to local population, industry or ecosystem factors.
IV	**Major** - Major long-term effect on local population, industry or ecosystem factors.
V	**Severe** - Complete loss of local population, industry or ecosystem factors AND/ OR extensive regional impacts with slow recovery.

VI	**Critical** - Irreversible impact to regional population, industry or ecosystem factors.

For unplanned events, the environmental residual risk of the event was determined based on the likelihood and consequence of the events. The likelihood of an event occurring was based on all controls functioning effectively. The consequence was based on a worst-case event occurring with all controls having failed. This provides a conservative approach to assessing consequence, as the likelihood of a worst-case event with the failure of all controls is remote. This approach is expected to over-estimate the environment consequence of an event, which is consistent with the precautionary principle and the principles of ESD.

The resulting consequence (planned activities) or residual risk (unplanned events) was then compared to Santos' acceptable levels of impact and risk, including receptor-specific acceptable levels of impact described in **Section 4**. If the impact or residual risks was determined to not be acceptable, additional controls were applied and the impact or risk assessed again. This process was repeated until each impact or residual risk was reduced to an acceptable level.

Table 7-5: Detailed Environmental Consequence Descriptor

Consequence Level		I	II	III	IV	V	VI
Acceptability		Acceptable	Acceptable	Unacceptable	Unacceptable	Unacceptable	Unacceptable
Severity Description		**Negligible** No impact or negligible impact.	**Minor** Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect	**Moderate** Significant impact to local population, industry or ecosystem factors.	**Major** Major long-term effect on local population, industry or ecosystem factors.	**Severe** *Complete loss of local population, industry or ecosystem factors AND/ OR extensive regional impacts with slow recovery.*	**Critical** *Irreversible impact to regional population, industry or ecosystem factors.*
Environmental Receptors	**Fauna** In particular, EPBC Act listed threatened/migratory fauna or WA Biodiversity Conservation Act 2016 specially protected fauna	Short term behavioural impacts only to small proportion of local population and not during critical lifecycle activity; No decrease in local population size; No reduction in area of occupancy of species; No loss/disruption of habitat critical to survival of a species; No disruption to the breeding cycle of any individual; No introduction of disease likely to cause a detectable population decline.	Detectable but insignificant decrease in local population size; Insignificant reduction in area of occupancy of species; Insignificant loss/disruption of habitat critical to survival of a species; Insignificant disruption to the breeding cycle of local population.	Significant decrease in local population size but no threat to overall population viability; Significant behavioural disruption to local population; Significant disruption to the breeding cycle of a local population; Significant reduction in area of occupancy of species; Significant loss of habitat critical to survival of a species; Modify, destroy, remove, isolate or decrease availability of quality of habitat to the extent that a significant decline in local population is likely; Introduce disease likely to cause a significant population decline.	Long term decrease in local population size and threat to local population viability; Major disruption to the breeding cycle of local population; Major reduction in area of occupancy of species; Fragmentation of existing population; Major loss of habitat critical to survival of a species; Modify, destroy, remove, isolate or decrease availability of quality of habitat to the extent that a long term decline in local population is likely; Introduce disease likely to cause a long term population decline.	Complete loss of local population; Complete loss of habitat critical to survival of local population; Wide spread (regional) decline in population size or habitat critical to regional population.	Complete loss of regional population; Complete loss of habitat critical to survival of regional population.
	Physical Environment / Habitat Includes: air quality; water quality; benthic habitat (biotic/abiotic), particularly habitats that are rare or unique; habitat that represents a Key Ecological Feature[15]; habitat within a protected area; habitats that include benthic primary producers[16] and/ or epi-fauna[17]	No or negligible reduction in physical environment / habitat area/function.	Detectable but localised and insignificant loss of area/function of physical environment / habitat. Rapid recovery evident within about 2 years (two season recovery)	Significant loss of area and/or function of local physical environment / habitat. Recovery over medium term (2 to 10 years)	Major, large-scale loss of area and/or function of physical environment / local habitat. Slow recovery over decades.	Extensive destruction of local physical environment / habitat with no recovery; Long term (decades) and wide spread loss of area or function of primary producers on a regional scale.	Complete destruction of regional physical environment / habitat with no recovery. Complete loss of area or function of primary producers on a regional scale.

[15] As defined by DaWE.

[16] Benthic photosynthetic organisms such as seagrass, algae, hard corals and mangroves.

[17] Fauna attached to the substrate including sponges, soft corals and crinoids.

Consequence Level		I	II	III	IV	V	VI
Acceptability		Acceptable	Acceptable	Unacceptable	Unacceptable	Unacceptable	Unacceptable
Severity Description		**Negligible** No impact or negligible impact.	**Minor** Detectable but insignificant change to local population, industry or ecosystem factors. Localised effect	**Moderate** Significant impact to local population, industry or ecosystem factors.	**Major** Major long-term effect on local population, industry or ecosystem factors.	**Severe** *Complete loss of local population, industry or ecosystem factors AND/ OR extensive regional impacts with slow recovery.*	**Critical** *Irreversible impact to regional population, industry or ecosystem factors.*
	Threatened ecological communities (EPBC Act listed ecological communities)	No decline in threatened ecological community population size, diversity or function; No reduction in area of threatened ecological community; No introduction of disease likely to cause decline in threatened ecological community population size, diversity or function.	Detectable but insignificant decline in threatened ecological community population size, diversity or function; Insignificant reduction in area of threatened ecological community.	Significant decline in threatened ecological community population size, diversity or function; Significant reduction in area of threatened ecological community; Introduction of disease likely to cause significant decline in threatened ecological community population size, diversity or function.	Major, long term decline in threatened ecological community population size, diversity or function; Major reduction in area of threatened ecological community; Fragmentation of threatened ecological community; Introduce disease likely to cause long term decline in threatened ecological community population size, diversity or function.	Extensive, long term decline in threatened ecological community population size, diversity or function; Complete loss of threatened ecological community.	Complete loss of threatened ecological community with no recovery.
	Protected Areas Includes: World Heritage Properties; Ramsar wetlands; Commonwealth/ National Heritage Areas; Land/ Marine Conservation Reserves.	No or negligible impact on protected area values; No decline in species population within protected area; No or negligible alteration, modification, obscuring or diminishing of protected area values.	Detectable but insignificant impact on one of more of protected area's values. Detectable but insignificant decline in species population within protected area. Detectable but insignificant alteration, modification, obscuring or diminishing of protected area values	Significant impact on one of more of protected area's values; Significant decrease in population within protected area; Significant alteration, modification, obscuring or diminishing of protected area values.	Major long term effect on one of more of protected area's values Long term decrease in species population contained within protected area and threat to that population's viability Major alteration, modification, obscuring or diminishing of protected area values	Extensive loss of one or more of protected area's values; Extensive loss of species population contained within protected area.	Complete loss of one or more of protected area's values with no recovery; Complete loss of species population contained within protected area with no recovery.
	Socio-economic receptors Includes: fisheries (commercial and recreational); tourism; oil and gas; defence; commercial shipping.	No or negligible loss of value of the local industry; No or negligible reduction in key natural features or populations supporting the activity.	Detectable but insignificant short-term loss of value of the local industry. Detectable but insignificant reduction in key natural features or population supporting the local activity.	Significant loss of value of the local industry; Significant medium term reduction of key natural features or populations supporting the local activity.	Major long-term loss of value of the local industry and threat to viability. Major reduction of key natural features or populations supporting the local activity.	Shutdown of local industry or widespread major damage to regional industry; Extensive loss of key natural features or populations supporting the local industry.	Permanent shutdown of local or regional industry; Permanent loss of key natural features or populations supporting the local or regional industry.

7.1.5.1 Cumulative Impacts

In addition to assessing each aspect and its associated hazards independently, Santos has also undertaken a cumulative impact assessment. This cumulative impact assessment considered potential synergistic impacts on environmental values and sensitivities from all aspects of Dorado Phase 1 and third-party activities. The cumulative impact assessment was only undertaken for planned activities. No consideration of cumulative impacts from unplanned events was made, as these events are not expected to occur during Dorado Phase 1. Refer to **Section 7.3.3** for additional information on the assessment of cumulative impacts, including the methods used and the assessment outcomes.

7.2 Impact Assessment of Planned Activities

7.2.1 Discharges – Drilling Fluids and Cuttings Discharges

7.2.1.1 Description of the Event

Activities for Dorado Phase 1 that will generate drilling discharges include the drilling of the FPSO anchor and future tieback WHP piles, drilling of the Dorado reservoir development wells, drilling of future tieback wells, well intervention and well abandonment activities. The Dorado WHP does not require piling as its foundation will be gravity based.

Routine discharges from these activities will include drilling fluids, drill cuttings, subsea control fluids, cement and completion fluids (such as well clean up and suspension fluids).

7.2.1.1.1 Dorado Drilling Operations

Development Wells

The drilling of development wells will generate drill cuttings, broken formation solids removed from the borehole, and fluids. Drilling fluids are used to cool and lubricate the drill bit, maintain overbalance, and remove cuttings from the well. Cuttings and drilling fluids from the top-hole sections will be discharged directly to the seabed. Cuttings and drilling fluids from the bottom-hole sections will be circulated to the MODU via a riser (lower sections), processed onboard the MODU to recover drilling mud, and then discharged into the marine environment. Some residual drilling fluids will adhere to the drill cuttings.

It is anticipated that a total of 10 wells (oil and gas production and gas injection wells) will be batch drilled at the WHP location during the initial development drilling stage of Dorado Phase 1, with a further 6 infill wells planned for the Dorado WHP to be drilled during the operational stage. These will be drilled using a jack-up MODU in a similar fashion to the initial production and gas injection wells.

The development drilling of potential additional wells for future tiebacks (up to 22 wells may be drilled) within the Project Area is expected to require the same drilling activities as those presented above. Moored semi-submersible or jack-up MODUs may be used to drill tieback wells; the selection of MODU type will largely depend on the water depth at the future tieback location.

The development wells for Dorado Phase 1 will be a conventional monobore design, and will be drilled using a jack-up MODU. The well design is expected to contain five sections:

+ Conductor (36” bore diameter);

+ Surface hole (26”);
+ Intermediate hole (17 ½”);
+ Production hole (12 ¼”); and
+ Production hole (8 ½”).

It is proposed that the drilling activities will be undertaken in batches with the top-hole sections (36” and 26”) of all wells being drilled first, followed by a second drilling stage where all downhole sections (17 ½” to 8 ½”) will be drilled sequentially.

The top-hole sections will be drilled using seawater and prehydrated gel sweeps. The extracted drill cuttings and drilling muds will be discharged directly to the seabed for the conductor section, while the cuttings and drilling muds generated within the surface section will be returned up to the surface (a diverter may be used for this section).

Following completion of the surface section, a riser will be installed for the remainder of the drilling activity to circulate the cuttings and muds to the MODU. Cuttings will then be separated before being discharged along with unrecoverable or spent muds into the marine environment above the sea surface. With the riser in place, WBM will be used in the drilling of the intermediate and production sections (17 ½” to 8 ½”). While not planned, it might be required to drill these sections with NAF / SBM should unexpected conditions be encountered (e.g. required for increased lubrication or heat resistance). In this instance, cuttings from sections drilled with NAF / SBM will be passed through a treatment system onboard the MODU prior to discharge overboard to reduce the volume of NAF coating the cuttings. Residual NAF / SBM base fluid on cuttings content will be reduced to ALARP levels prior to discharge overboard.

All discharges associated with the initial drilling operations will occur at the WHP location. The expected drill cutting and mud volumes to be discharged and activities duration are presented in **Table 7-6**.

During drilling operations, a casing will be cemented in place within each well (the casing is a hollow pipe within the wellbore which protects and supports the well stream). There will be minor planned cement discharges at seabed during cementing of surface casings. Likewise, a small cement discharge (up to 5 m^3) is expected to be discharged at sea surface when flushing tanks and lines. However, as a contingency, it might be required to discharge up to 150 m^3 at seabed and up to 45 m^3 at sea surface of cement slurry should a cement job not meet technical and safety standards. Following completion of the cementing activity, any surplus mixed concrete will also be discharged overboard.

During drilling completions activities brine (mostly saturated sodium chloride), up to 2,500 m^3 per well, might be discharged to the marine environment. During well construction, wells will be suspended at a number of stages to facilitate access, install different pieces of equipment and optimise the well construction sequence. Details of how this process will be managed (within Company Standards, Industry Standards and consistent with Regulations) will be included in the well operations management plan. Following completion of the drilling, the wells will be secured at the tree (barriers tested and verified) ready for commissioning activities.

Pressure-control equipment such as blow out preventers use hydraulics for operation. Subsea control fluids are water-based hydraulic control fluids used in control systems on the blowout preventers.

Subsea control fluids will be discharged during function testing of the blowout preventer control system. The maximum volume of control fluid that will be released to the marine environment per well is 1,320 to 2,250 L of water-based fluid containing about 3% active ingredient (40 to 68 L of control fluid additive).

Completion fluids are used to run well completions, and during wellbore clean-up and flowback during drilling. Wellbore and casing clean-up are required at various stages of the drilling operations to ensure the contents of the well are free of contaminants before the next stage of drilling. A chemical wellbore cleanout fluid train may be used to remove residual fluids from the wellbore. The wellbore cleanout fluid is usually brine (similar to completion fluid) that can include several chemicals, such as biocide and surfactant. Completion fluids are usually brines (i.e. a mixture of seawater or formation water) with additives that can include, chlorides (often sodium, potassium or calcium), bromides, hydrate inhibitor (MEG), biocide, oxygen scavenger. They are designed to have the proper density and flow characteristics to be compatible with the reservoir formation. During the clean-up process, fluids are circulated back to the MODU, and, if required, analysed before they are discharged overboard. Discharge volume would be about 400 m^3 (based on the designs of the proposed production wells). Kill-weight brine may also be used during well suspension or well abandonment, which is a brine (e.g. sodium chloride) of adequate density to control formation pressure.

Pile Drilling

Pile installation will be required for the FPSO anchor piles, and potentially contingent for the Dorado WHP GBS, as well as potentially required for future tieback WHP. The piles may be installed by pile driving and/ or drilling dependant on the subsurface conditions.

The FPSO is proposed to have 12 anchor piles and future tieback WHP (if required) may be piled and have up to 8 piles each, depending on the subsurface conditions. All the piles are planned to be driven; however, drilling may be required as a contingency if the required pile depth cannot be achieved by driving. The Dorado WHP GBS substructure may also require up to 4 piles.

It is conservatively estimated that up to 8,000 m^3 of cuttings for the FPSO anchor piling activities and 16,000 m^3 of cuttings for the pilling activities associated with future tieback WHP (allowing for 8 drilled piles for a WHP) will be discharged to the environment, if the piles are fully drilled.

It is anticipated that seawater will be used as the drilling fluid. Prehydrated gel sweeps (i.e. seawater to which high-viscosity prehydrated bentonite has been added) may be used. To assist in removing cuttings from the pile borehole. Bentonite is a naturally occurring clay mineral with minimal ecotoxicity potential. The discharge volumes of drill cuttings and fluids required for potential future tiebacks would be expected to be less than this volume, as each tieback could consist of a WHP which requires jacket foundation piles and wells to be drilled. If pile grouting is required fluorescein dye will be added assist with detection of grout at surface of piles.

Drilling of the piles will be from a barge using reverse circulation, with the cuttings and fluids returned to the surface, and discharged overboard.

Well Intervention and Workovers

Well intervention activities to maintain, repair or replace well components may be required during the life of the development wells. These activities generally occur within the wellbore and could include well logging, well testing and flowback and well workovers. Typical discharges from intervention activity includes subsea control fluid, completions and well annular fluids. Well annular fluids refer to the fluids that remain in the wellbore or annular space between the casing (typically consists of weighted drilling fluid, cement contaminated mud, sweater, barite, cement polymer and may include small amounts of hydrocarbon).

Well Abandonment

Well abandonment activities include installing and pressure testing the blowout preventer, cutting/ perforation of casing or production tubing and installing permanent reservoir and surface barrier (cementing). Typical discharges include subsea control fluid, completions and well annular fluids. Drilling fluids used during riserless drilling will be released to the environment when the well head is removed during abandonment. Upon wellhead removal, small volumes (approximately $1m^3$) of this fluid may be exchanged to the marine environment. The exchange is not instantaneous as the fluids are typically heavier than seawater.

Table 7-6: Expected drill cutting and mud volumes and activities duration for a typical Dorado Phase 1 well (including future tiebacks)

Well Section	Hole Diameter (inch)	Discharge Methodology	Discharged Cutting per Well (m^3)	Drilling Fluid	Drilling Fluid Discharges per Well[1] (m^3)	Discharge Duration for a Well (days)	Drilling Operations Duration (days) – 10 Wells
Conductor	36	Returned directly to the seafloor	82	WBM (seawater & prehydrated gel sweeps)	10,000	1 day of cuttings discharge every 2 days	24
Surface	26	Cuttings brought to surface (diverter expected to be used)	385	WBM (seawater & prehydrated gel sweeps)	6,000	2 days of cuttings discharge every 4 days	48
Intermediate	17 ½	Cuttings brought to drilling rig, then discharged to surface	330	WBM		5 days of cuttings discharge, then no discharge for 5 days	120
Production 12¼”	12 ¼	Cuttings brought to drilling rig, then discharged to surface	214	WBM		7 days of cuttings discharge, then no discharge for 6 days	156
Production 8½”	8 ½	Cuttings brought to drilling rig, then discharged to surface	46	WBM		3 days of cuttings discharge, then no discharge for 6 days	252
Contingency	17 ½ to 8 ½	Cuttings brought to drilling rig and treated prior to being discharged to surface	NA*	NAF /SBM	200	NA*	NA*
Total			**1,057**	**-**	**16,000**	**18**	**600**

[1] To account for the level of uncertainty associated with the specific wells conditions to be encountered during the drilling of each well and the possibility of having to side-track or redrilled section(s) of the well, the volumes presented include 100% contingency (i.e. the expected WBM volumes discharged, under normal conditions, per well are 8,000 m^3)

* It is not expected that NAF / SBM will be required, but it has been included as contingency should unexpected conditions be encountered during the drilling operations of the 17 ½, 12 ¼, or 8 ½ sections. The use of NAF / SBM will have no impact on the maximum amount of drill cuttings discharged or the duration of the activity.

7.2.1.1.2 Development Well Drill Cutting Dispersion Modelling

A numerical modelling study was undertaken to inform the assessment of the potential environmental impacts and risks from the discharge of drill cuttings and muds into the marine environment (**Attachment 6**). The study focused on:

- establishing a sediment dispersion model to simulate all stages of the development drilling program; and
- mapping the distribution and sediment thicknesses from discharged drill cuttings and drilling fluids on the seabed based on the hydrodynamic regime of the Project Area.

Plume Model

MUDMAP, a 3-D plume model, was used. The model predicts the dynamics of the discharge material and resulting seabed concentrations and bottom thicknesses over the near-field (i.e. the immediate area of the discharge) and the far-field (the wider region). **Figure 7-2** shows a conceptual diagram of the dispersion and fates of drill cuttings and fluids discharge to the ocean and an idealised representation of the three discharge phases (**Attachment 6**).

Larger particles (such as rocks, gravel to sand) tend to settle quickly, forming a pile that aligns with the predominant current axis. Smaller particles (especially silts and clays) tend to remain suspended for exponentially longer time periods and will therefore be dispersed more widely by local currents. Dispersion of the finer discharged material will tend to be enhanced with increased current speeds and water depth, and with greater variation in current direction over time and depth (**Attachment 6**).

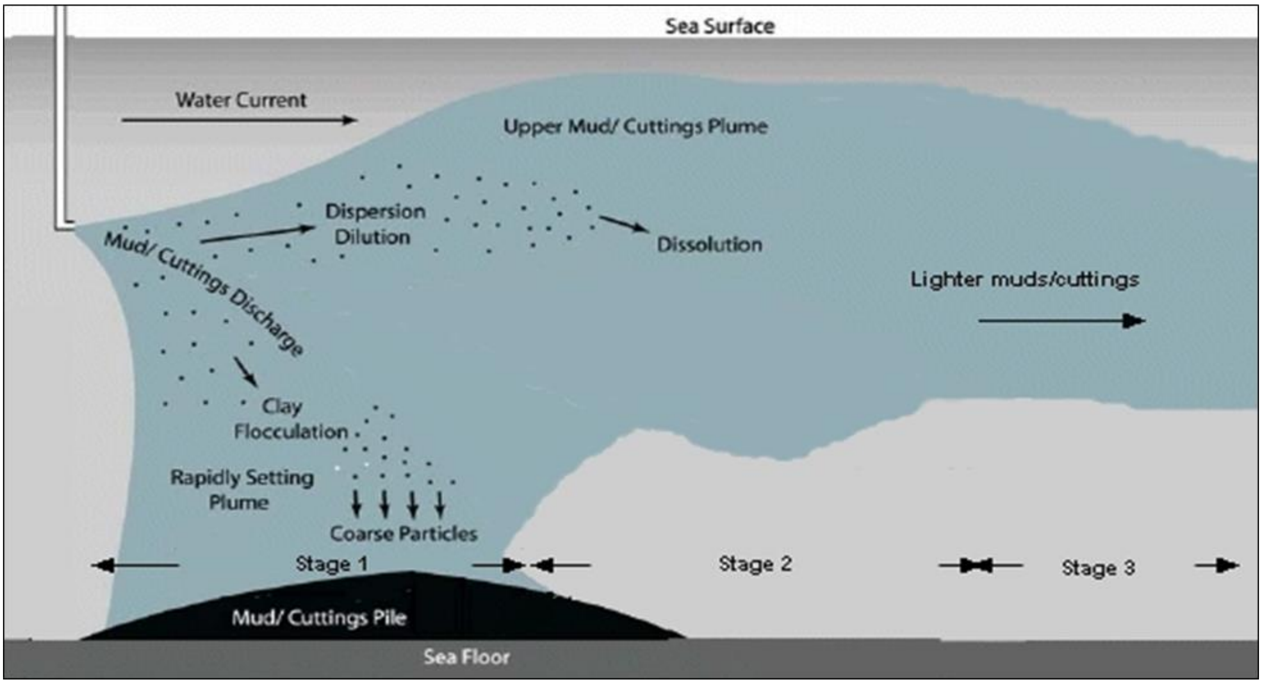

Figure 7-2: Conceptual diagram showing the general behaviour of cuttings and muds discharged to the ocean and the idealised representation of the three discharge phases (Neff 2005).

Key inputs into the MUDMAP model simulations included:

- estimated cuttings volumes;
- discharge sequence and durations;
- the particle size distributions (measured during previous drilling campaign in the Bedout Basin) and associated settling velocities;
- the bulk density of the released material;
- the temperature and salinity profiles of the receiving waters;
- the height of the discharge points relative to mean sea level; and
- the current data representing local physical forcing.

A uniformly sized rectangular grid covering a 20 km (longitude, x-direction) by 20 km (latitude, y-direction) region around the WHP location was used to calculate the concentration of drill cuttings and muds in the water column and on the seafloor. The resolution of each grid cell was approximately 20 m (x) x 20 m (y) x 5 m (z).

Hydrodynamic Model

Water movement and characteristics, along with characteristics of cuttings, are the principle determinants of the distribution of discharged drilling fluids and cuttings. A hydrodynamic model of the currents within the cuttings model domain was developed to predict the effect of currents on the distribution of discharged drilling cuttings and fluids. The model comprised two components:

- a mesoscale current model (HYCOM); and
- a regional tidal current model (HYDROMAP).

The hydrodynamic model was used to model a 10-year hindcast period between 2009 and 2018. The model was validated and found to agree well with metocean observations made over the same period (**Attachment 6**). This provides confidence that the hydrodynamic model is representative of the currents that may occur in the Project Area.

Metocean Conditions

El Niño-Southern Oscillation (ENSO) refers to irregular periodic variations in winds and sea surface temperatures over the tropical eastern Pacific Ocean. ENSO phases in the eastern Pacific Ocean consist of a warming phase (El Niño), a cooling phase (La Niña) and a transitional phase between the El Niño and La Niña phases. ENSO phases affect the large-scale currents in the western Indian Ocean. To examine the potential range of seasonal variability from ENSO events, the Southern Oscillation Index was used to identify interannual trends in metocean conditions (e.g. water temperature and currents) over the same 10 years as the current data set (2009 to 2018 (inclusive)). The index broadly defines transitional, El Niño and La Niña conditions based on differences in the surface air-pressure between Tahiti on the eastern side of the Pacific Ocean and Darwin (Australia), on the western side (Philander 1989; Rasmusson and Wallace 1983). Based on the index's assessment, 2010 was selected as a representative El Niño year, 2012 was selected as a representative neutral year, and 2015 was selected as a La Niña year (**Attachment 6**).

Thresholds

Sedimentation exposure thresholds for the interpretation of modelling results were set based on natural sedimentation rates in the region and studies of biological impacts from deposition. A study by Glenn (2004) found that the maximum natural sedimentation rate for northwest Australia is

223.21 cm/thousand years (or 0.0061 mm/day). Trannum et al. (2010) found a significant decrease in species count, abundance of individuals, and biomass of marine animals with deposited cuttings of 3 to 24 mm. Furthermore, a study by Kjeilen-Eilertsen et al. (2004) reports that depositional thicknesses greater than 9.6 mm are likely to cause smothering impacts on benthic ecosystems, including corals. It is also worth noting that a study by Smit et al. (2008) established that a thickness threshold of greater than 6.5 mm would be needed before potential harm to benthic macrofauna occur. Based on this information 0.1 mm, 1 mm, and 10 mm have been used as natural, low and high exposure thresholds respectively (**Attachment 6**). While considering and interpreting the modelling results, it is important to note that observations of the seabed in the Project Area indicate sediments are mobile (e.g. bedforms consistent with water movement) (**Section 3.2.5**). The processes that transport sediments and generate bedforms on natural sediments are also expected to act upon any drill cuttings deposited on the seabed.

Results

For a single well modelling simulation, the results showed that deposition of cuttings was concentrated in the vicinity of the well (**Table 7-5**). The maximum thickness (or height of mound) was predicted to be 126 mm adjacent to the well location during El Niño conditions. The maximum distance from the well to the natural threshold (0.1 to 1 mm) was 1,115 m, occurring during neutral conditions and the corresponding area of coverage was 0.65 km^2 (***Table 7-8***). The maximum distances to the low (1 to 10 mm) and high (equal to or greater than 10 mm) exposure thresholds was 837 m (neutral conditions) and 251 m (El Nino conditions), respectively. The greatest areas of coverage on the seabed at the low and high exposure thresholds, was recorded as 0.29 km^2 and 0.02 km^2, respectively.

When combining the results for 12 wells (representing consecutive drilling of these wells) and the three ENSO events, the modelling results showed that the settlement of drill cuttings and fluids were generally spread along the northwest–southeast axis, coinciding with the dominant tidal current directions (**Figure 7-3**). The maximum thickness was predicted to be 1,315 mm adjacent to the well location (within 20 m). The natural threshold was predicted to extend up to 2,871 m from the well location and cover an area of 9.81 km^2. The maximum distances from the release site to the low and high exposure thresholds were 954 m and 447 m, respectively (**Table 7-8**).

Modelling of the distribution of TSS within the water column indicates that the greatest spatial extent of TSS is expected to occur near the sea surface, with TSS concentrations through the water column expected to be elevated only directly under the cuttings and fluids discharge point on the MODU (**Figure 7-4**).

Given that future tieback wells are targeting the same formation, likely to have the same drilling methodology and well design, located within 50 km of the Dorado drill centre and the Project Area experiences similar metocean conditions across the area, it is expected that the development wells associated with the tiebacks, if drilled, will deposit drill cuttings in a similar manner to that modelled for the Dorado reservoir.

Table 7-7: Predicted maximum sediment thickness, area of coverage and maximum distance for 1 well

ENSO event	Maximum sediment thickness (mm)	Total area of coverage (km²) above threshold			Maximum distance from well to thresholds (m)		
		0.1 to 1 mm (natural threshold)	1 to 10 mm (low exposure)	Equal to or more than 10 mm (high exposure)	0.1 to 1 mm (natural threshold)	1 to 10 mm (low exposure)	Equal to or more than 10 mm (high exposure)
La Niña	91	0.66	0.21	0.02	771	451	190
Neutral	112	0.65	0.29	0.00	1,115	837	40
El Niño	126	0.58	0.16	0.01	863	398	251

Table 7-8: Predicted maximum sediment thickness, area of coverage and maximum distance for all 12 wells and the three ENSO conditions

ENSO event	Maximum sediment thickness (mm)	Total area of coverage (km²) above threshold			Maximum distance from well to thresholds (m)		
		0.1 to 1 mm (natural threshold)	1 to 10 mm (low exposure)	Equal to or more than 10 mm (high exposure)	0.1 to 1 mm (natural threshold)	1 to 10 mm (low exposure)	Equal to or more than 10 mm (high exposure)
La Niña	1,205	7.69	0.78	0.27	2,501	736	426
Neutral	1,315	8.93	0.73	0.25	2,813	954	447
El Niño	1,224	8.39	0.73	0.23	2,871	758	391

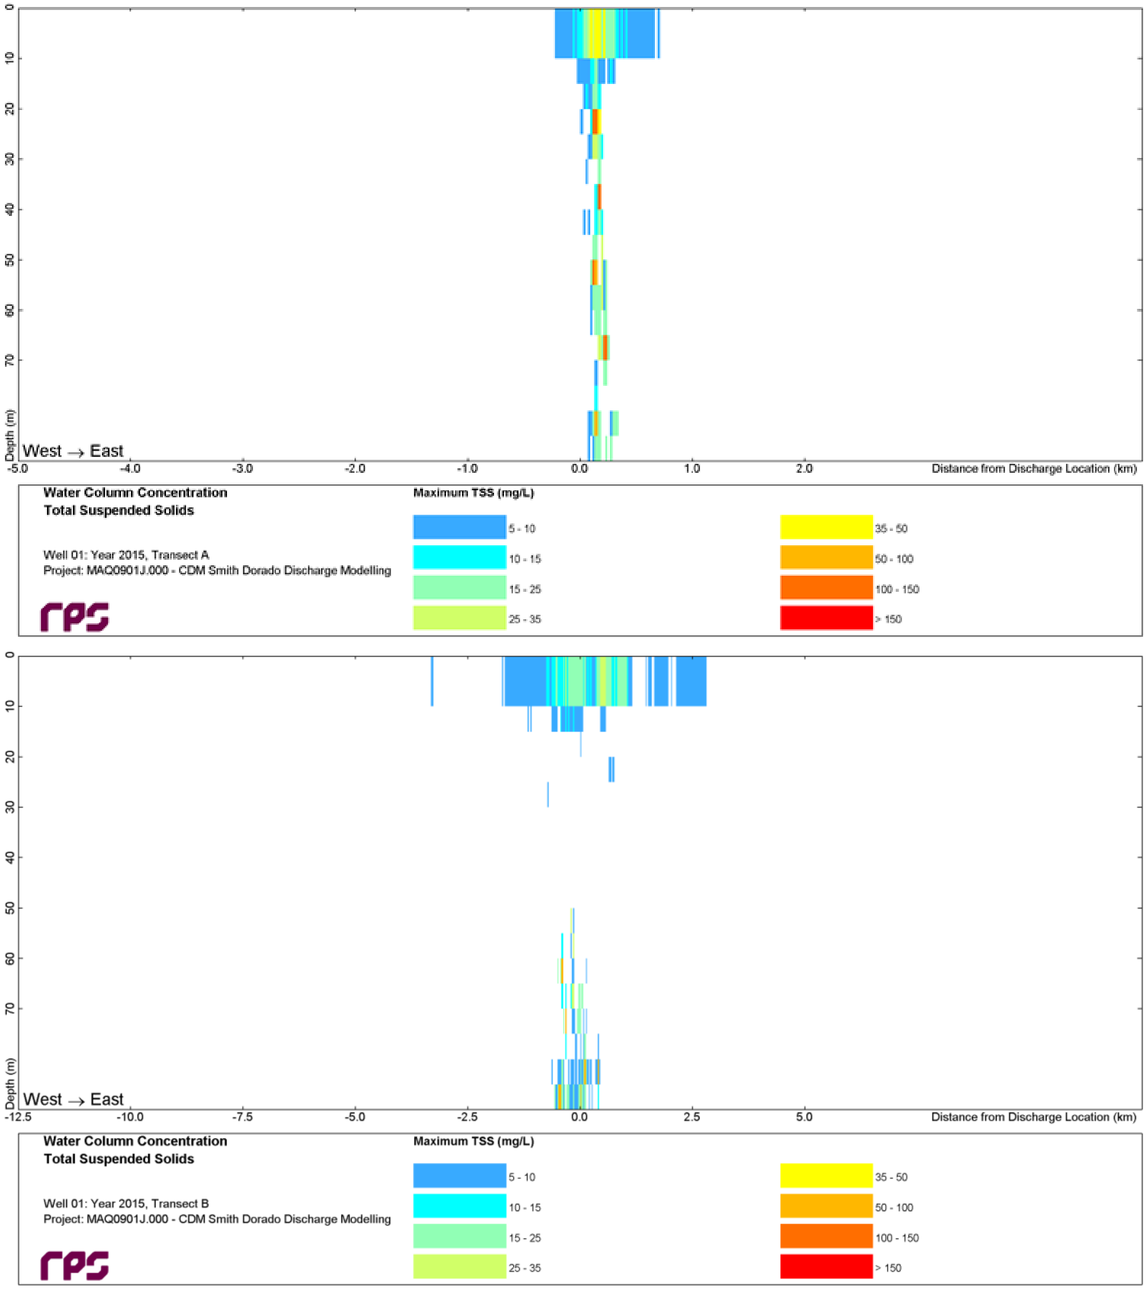

Figure 7-4: Cross-section (a) east–west and (b) north–south of the predicted maximum suspended sediment concentrations within the water column resulting from the drill cuttings and muds discharges for Well 1 over 18 days commencing in El Niño conditions (Attachment 6)

7.2.1.2 Details of Environmental Impacts and Risks

A summary of the analysis of the environmental impact of the discharge of drill cuttings and fluids to the marine environment as a result of Dorado Phase 1 is provided in this section. **Table 7-9** identifies the potentially impacted receptors as a result of the discharge of drill cuttings and fluids within the Project Area.

Table 7-9: Receptors potentially impacted by the discharge of drilling fluids and cuttings

Description of the Impact	Receptor Categories

Localised decrease in water and seabed quality during the drilling activities Deposition of drill cuttings on the seabed Change in fauna behaviour	Water Quality – **Section 7.2.1.2.1** Sediment Quality – Section **7.2.1.2.2** Benthic Habitats – Section **7.2.1.2.3** Marine Fauna – Section **7.2.1.2.4**

7.2.1.2.1 Water Quality

The discharge of drill cuttings from the Dorado WHP location, or potential future tieback locations, will temporarily increase the turbidity and toxicity in the receiving marine environment within the Project Area. The natural turbidity of the water across the Project Area is typically low in the upper 75m of the water column (water depth across the Project Area ranges from more than 70m up to 115m) with increased turbidity generally recorded near the seabed due to resuspension of benthic sediments by seabed currents (**Attachment 5**). The discharge of drill cuttings to the seabed will result in a temporary increase in turbidity and total suspended solids. As presented in **Section 7.2.1.1.2** larger particles (such as rocks, gravel to sand) tend to settle quickly and therefore have little potential to impact water quality (International Association of Oil and Gas Producers 2016).

As cuttings particle size decreases, the settling velocity will typically decrease, and the ratio of residual drilling fluids to cutting size increases. Cuttings may also entrain in the water column and reach neutral buoyancy. This will result in a turbidity plume that will decrease as the plume is diluted and the suspended particles are deposited on the seabed. The increase in total suspended solids from the discharge of drill cuttings will be concentrated in surface waters, and will extend through the water column at the discharge location (**Figure 7-4**). A study undertaken by Hinwood (1994) indicates that a drilling cuttings and fluids plume will have diluted by a factor of at least 10,000 within 100 m of the discharge point. Neff (2005) indicates that within well-mixed ocean waters (similar to that of the Project Area), drilling cuttings and fluids will have diluted by over 100-fold within 10 m of the discharge point. The dilution factor determined by Neff (2005) of 10,000 is widely accepted within industry. Using this dilution factor, it has been predicted that discharges of cuttings and adhered fluids will reach 100 ppm within 100 m of the MODPU within about 16 minutes, assuming a conservative 0.1 m/s current speed (noting the average current speed for the Project Area approximately 0.3 m/s – refer **Attachment 6**). Therefore, changes in water quality associated with increased turbidity are restricted to close to the discharge source. Discharges from the surface are expected to impact a larger area than that of subsea discharges, however, volumes are much lower and drilling cuttings and adhered fluids will disperse rapidly within the offshore marine environment, resulting in a relatively small footprint of water quality change. Neff (2005), states that although total drilling cuttings discharge volumes associated with drilling a well are large, environmental impacts within the water column are low due to the intermittent nature of such discharges.

Dissolved components of the plume, particularly the salts and water-soluble drilling fluid organic additives, dilute rapidly by mixing in the water column. Most of the organic additives in WBM are strongly adsorbed to inorganic cuttings particles and are deposited to the sediments rather than being available in the water column.

There are no known bathymetric features, such as reefs, shoals or banks, within the Project Area. Due to the relatively short duration of the discharge (i.e. only during drilling activities) the potential for decreased water quality to impact upon receptors such as plankton or benthic communities is limited.

Impacts to water quality from the discharge of drill cuttings and fluids typically occur within close proximity of the discharge point, and likely in a northwest and southeast direction, the dominant water movement across the Project Area, driven by the large tidal range (refer **Section 3.2.3**). Very fine cuttings form a very small portion of the total amount of drill cuttings and fluids as they tend to clump together to form larger particles that sink relatively quickly. The potential increase in turbidity levels is therefore expected to be very low. This reduction in light availability is typically intermittent and brief (International Association of Oil and Gas Producers 2016). Increased turbidity from natural events (e.g. cyclones) occurs in the Project Area, and the biotas of the area are adapted to short duration increases in turbidity and therefore no significant adverse impacts are expected.

7.2.1.2.2 Sediment Quality

Following drilling of the conductor section of the wells (where drill cuttings and drilling muds will be discharged directly to the seafloor), the drill cuttings will be discharged into the marine environment from the MODU after being treated by solids control equipment to reduce the concentration of residual drilling fluids. The majority of drill cuttings and residual fluids will be deposited in the area around the discharge location and will form a cuttings pile. The accumulation of cuttings will physically modify the sediments by modifying the particle size distribution. Modelling results indicate the cuttings pile may reach a thickness of up to 126 mm for a single well (**Attachment 6**), which will be largely comprised of coarse cuttings directly under the discharge location. Due to the dispersive nature of chemical discharges within the highly mixed offshore marine environment, toxins associated with surface discharges are not expected to reach marine sediments at concentrations that will result in notable changes to sediment quality.

The initial development drilling campaign for the Dorado reservoir (10 wells) will result in deposition of drill cuttings at the base of the WHP. Sediments at this location will be considerably modified by the discharges of drill cuttings and fluids, however modelling studies indicate impacts to sediment will decline with increasing distance away from the wells. Modelling for the cumulative deposition of drill cuttings and fluids indicated the maximum thickness would be up to 1,315 mm at the base of the platform, with cumulative cuttings from 10 wells reaching the 1 mm thickness 'no-effects' threshold at a maximum distance of 954 m from the discharge location (**Attachment 6**) and cover a potential worst case area of 2.86 km^2 (assuming deposition in a 954 m radius from the drill centre). It is important to note that the soft sediment and biota at the WHP location is well represented in the area (**Attachment 2**). Similar level of impacts are expected from the discharge of pile drilling cuttings associated with the FPSO anchor moorings, and if required for stabilisation of the WHP GBS.

Cuttings from potential individual future tieback wells are expected to become progressively finer with increasing distance from the well location, with the thickness of deposited cuttings expected to be ≤ 1 mm (considered to represent a low ecological threshold) within a maximum distance of 837 m of the discharge location (single well) (**Attachment 6**). Deposition ≥ 10 mm thickness (representative of a high ecological threshold) for a single tieback well was predicted to extend up to a maximum distance of 251 m from the release location and cover an area of approximately 0.2 km^2. The silty sand/ hard reef substrate to predominantly silty sand, coarse sand with rubble sediment found at each of the tieback prospect locations is also well represented across the area (refer **Figure 3-9, Attachment 2)**.

The coarser sediments deposited directly under the discharge location are unlikely to be resuspended by currents and will gradually be buried by naturally deposited sediments over time.

Finer sediments deposited further will likely be reworked by currents and transported via saltation or as suspended sediments.

The deposition of the drill cuttings and fluids may lead to a decrease in sediment quality in the area within which cuttings will be deposited, noting that benthic habitats in the Project Area are broadly homogeneous (**Attachment 2**). The modelling indicates that for the initial 10 wells drilled from a single location, deposition was expected to be ≤ 1 mm (low ecological impact threshold) within a maximum of 954 m of the discharge location and more than 10 mm (high ecological impact threshold) within a maximum 447 m (**Table 7-8**). However, for a single well (i.e. for future subsea tie backs), deposition thicknesses of ≤ 1 mm and more than 10 mm were predicted to be within a maximum 837 m and 251 m, respectively (**Table 7-7**). Modelling results also indicate that the natural threshold is expected to be reached within 1,115 m from the drilling location for one well, and within 2,871 m for 12 wells (**Table 7-7** and **Table 7-8**). The sandy sediments within this deposition footprint, and the associated benthic communities, are very widely represented in the region (refer **Figure 3-9, Attachment 2** and **Attachment 3**) and are not considered to be particularly sensitive or of high conservation value. Prospects identified for future tiebacks are located within silty sand/ hard reef substrate to predominantly silty sand, coarse sand with rubble, and silty sand to rubble similar to conditions at the Dorado WHP location (**Figure 3-9**). These ecotypes are widely represented in the region.

WBM will constitute most of the drilling fluids discharged to the marine environment. The residual WBM may contain metals (predominantly barium, a component of the commonly used weighting agent barium sulphate), as well as residual organic matter. Microbial degradation of residual organic matter can lead to depletion of oxygen in sediments within the cuttings pile, although this is unlikely to impact upon biota. Upon completion of a well, excess WBM may be discharged to the ocean from the drilling rig but pose little environmental risk or impact beyond a localised, temporary sediment plume.

As mentioned, Barite is one of the main constituents in WBM, which results in elevated levels of barium (Ba) in drill cuttings. Published literature has concluded that barium sulfate associated with the deposition of drill cuttings and fluids does not pose a significant toxicity risk to finfish due to the insolubility of barium sulphate (Payne, 2011). Other chemicals of concern in drill cuttings, either because of their potential toxicity and/or abundance in WBM include arsenic (As), chromium (Cr), cadmium (Cd), copper (Cu), iron (Fe), lead (Pb), mercury (Hg), nickel (Ni) and zinc (Zn) (Breuer et al., 2004).

Acidic conditions in anoxic cuttings piles may lead to barium and other heavy metal contaminants present in the barite becoming more soluble, and slowly leaching out(Neff. et al., 2005). Breuer et al. (2008) has also observed that metals in cuttings, migrate either upward into the water column (Ba, Mn, and Fe), or diffuse downward (Cr, Cu and Pb) where they become incorporated into Fe monosulfides as part of seabed sediment. The exposure of these Fe monosulfides to oxygen via bioturbation or advection and/or cuttings resuspension may then lead to the release of the associated metals into the water column (Saulnier and Mucci, 2000; Huerta-Diaz et al., 1998), noting that the release would be gradual over time limiting the release and concentration of metals at any one time.. In a stable cuttings pile with minimal physical disturbance or bioturbation, the fraction of metals in the total cuttings pile that is dissolved and bioavailable remains low. Cuttings piles are expected to mostly remain in a stable condition, with only intermittent disturbance or bioturbation. If used, it is expected that cuttings with NAF/ SBM will clump together in large particles that settle rapidly to the seabed (Neff et al. 2000) and will be more likely to be concentrated around the release location , in contrast to cuttings with residual WBM. NAF/SBM may contain a range of synthetic hydrocarbons such as paraffins and olefins, which have low potential for toxicity and bioaccumulation, but may persist in the environment. Cuttings with residual NAF/SBM are expected to have a higher concentration of residual organic matter compared to WBM. The seabed affected by cuttings with residual SBM have greater potential for oxygen reduction via microbial degradation and associated changes to sediment chemistry (e.g. modified reduction/oxidation (redox) potential). Due to the expected aggregating behaviour of the NAF/ SBM cuttings, it is expected to result in a smaller impacted area than that drilled with WBM. Excess NAF/ SBM will not be discharged to the marine environment and may either be reused or disposed of onshore.

For cement discharges, the potential for toxicity is associated with the chemical additives that are added to cement mixtures; therefore, toxicity associated with the discharge of cement is limited to the subsurface release of cement (not discharge of dry cement). Terrens et al. (1998) suggest that once the cement has hardened, the chemical constituents are locked into the hardened cement. Consequently, the extent of this hazard is limited to the waters directly adjacent to the displaced subsea cement (expected to be 10 to 50 m from the well) or pelagic waters within 150 m of the well (BP Azerbaijan, 2013). Overspill of cement will alter physical sediment properties in the long-term, immediately adjacent to the well (within less than 50 m).

7.2.1.2.3 Benthic Habitats

The discharge of drill cuttings and residual fluids has the potential to impact benthic communities due to the potential physical and chemical changes to sediments (refer to the above section). As presented earlier the deposition of cuttings has the potential to smother sessile benthic organisms, with effects predicted to occur at a deposition thickness more than 6.5 mm (International Association of Oil and Gas Producers 2016).

The Project Area is characterised as soft bottom substrate of fine sediments (typically more than 90% cover) with discrete areas of filter-feeder communities, and the seabed is relatively flat in topography throughout. The soft sediment (silt/sand sediment) and hard substrate (low relief hard substrate) habitats identified in the habitat survey (RPS 2020d) within the Project Area were well represented across the survey area.

The majority of the Project Area comprises habitats composed largely by fine sediments (typically more than 90% cover) but it also contains areas of hard pavement reef, which represents habitat for forming filter feeder communities, especially whip corals, gorgonians and sponges, typical of the NWS (**Figure 3-9**, **Attachment 2**). Benthic habitat surveys revealed predominantly soft sediment habitats, with low sand waves (ripples) and scattered rocky reef over the Project Area (**Attachment 2**). The sediment habitats support low abundance of infauna and epifauna, and the rocky substrates support low to medium density filter-feeder communities and other fauna including fish at low densities (**Attachment 2**). These are widely represented in the region and are considered to be of low sensitivity. There are no high conservation features or fish habitat identified within the Project Area (RPS 2020d). Mobile fauna associated with benthic habitats, such as fish and crustaceans, are expected to temporarily move away from areas subject to relatively high levels of deposition and are unlikely to experience injury or mortality as a result of the discharge of drill cuttings and fluids.

Benthic communities subject to deposition at or above the high threshold are predicted to be restricted to within 251 m and 457 m from the drilling location for a single and twelve consecutive wells respectively (**Table 7-7** and **Table 7-8**). Sessile benthic fauna within this deposition footprint may experience smothering that may result in mortality. The recovery of the area subject to deposition ≥ 10 mm thickness will potentially take many years, depending on natural sedimentary processes. Recovery may be linked to the deposition of relatively fine natural sediments on the coarse sediments in the cuttings pile to create suitable habitat. Studies of the recovery of benthic communities on visible cuttings piles (consistent with the area subject to drill cuttings and fluids deposition ≥ 10 mm) indicated considerable recovery within three years (particularly where deposition was thinner), however the benthic communities had not yet recovered to be similar to predischarge conditions or the surrounding unaffected seabed (Gates and Jones 2012).

Benthic communities subject to deposition between 1 mm and 10 mm thickness are less likely to experience mortality but may experience sub-lethal impacts (International Association of Oil and Gas Producers 2016), such as impaired feeding due to clogging of filter feeding organs and increased energy expenditure from removing sediment from burrows. Modelling results indicate these impacts will be restricted to within 837 m (**Table 7-7**) and 954 m (**Table 7-8**) from the drilling location for a single well and twelve consecutive wells respectively. Recognising that sediment deposition from drill cuttings and fluids is in addition to natural processes, benthic communities subject to deposition of drill cuttings and fluids of less than 1 mm thickness are unlikely to experience impacts from physical deposition of cuttings, as this thickness is consistent with natural sedimentary deposition rates.

Changes in sediment chemistry may impact upon benthic communities, particularly changes in oxygen demand from biodegradation of organic compounds in residual drilling fluids. Trannum *et al.* (2010) examined the effects of cuttings with residual WBM and found a significant reduction in abundance and diversity of benthic infauna with increasing cuttings thickness compared to natural sediment and suggested that changes in sediment chemistry were a significant factor. Increased oxygen demand resulting from aerobic degradation of organic compounds in the WBM were suggested as a cause, along with fluxes in silicon and phosphorous (Trannum et al. 2010). The effects at low sediment thickness (less than 10 mm) were much less apparent than relatively high rates of burial. These results are consistent with findings from other investigations of potential impacts of WBM (Smit et al. 2006). The increased oxygen demand will diminish over time as organic material is consumed and natural conditions return.

Given the nearest KEF, the Ancient Coastline and 125 m Depth Contour, lies approximately 23 km from the WHP, no impacts to the environmental values of any KEFs from the deposition of drill cuttings or fluids will occur. The nearest prospect that may be tied back to the FPSO is approximately 3.2 km from the Ancient Coastline and 125 m Depth Contour, which is a greater distance than the modelled furthest extent of drill cuttings (cumulative 10 wells from a single drill centre and considered worst case for a future tieback) of 2.8km. Applying the same reasoning, no impacts to KEFs from the discharge of drilling fluids and cuttings for tieback wells will occur based on the modelling results presented in **Table 7-7**and **Table 7-8.**

7.2.1.2.4 Plankton

Studies by Smit et al. (2008) indicated that phytoplankton and filter-feeding zooplankton typically exhibit greater effects from suspended solids from drilling fluids and cuttings and suggest that these biotas are less well-adapted to relatively high concentrations of suspended sediments than benthic biota. Smit et al. (2008) suggested that impacts to zooplankton were primarily the result of physical effects to filter-feeding and respiration organs, while impacts to phytoplankton were the result of reduced light levels. It is expected that drilling cuttings and fluids discharges will have a negligible effect on plankton populations at a measurable level. Jenkins and McKinnon (2006) identified suspended sediment concentrations greater than 500 ppm will likely result in a measurable impact to larvae species of most fish species, with concentrations of 100 ppm effecting larvae species of most fish if exposed to for longer than 96 hours. Changes in water quality associated with increased turbidity are likely to be restricted to close to the discharge source.

Assuming the drilling fluids dilute 100-fold within 10 m of the discharge source (Vik et al. 1996), the drilling fluid concentrations are likely to fall below acute toxicity thresholds (10,000 ppm) within 100 m of the discharge source, assuming that 100% fluids concentrations and adopting a conservative current speed of 0.1 m/s.

Studies of zooplankton indicate effects of drilling fluids and cuttings at concentrations greater than 100 ppm are unlikely, based on 96 hours exposure duration experiments. Concentrations greater than 100 ppm for more than 96 hours during the drilling activities would only occur in the immediate vicinity of the discharge location.

7.2.1.2.5 Marine Fauna

The toxicity of widely used NAFs/SBMs is generally considered low, with WBMs inherently less toxic. Neff (2005) states that in well-mixed ocean waters (as is likely to be the case within the drilling area), drilling mud is diluted by more than 100-fold within 10 m of the discharge point, indicating that, following dilution, concentrations would be well below acute impact levels. This is further demonstrated by Melton et al. (2000), who used modelling to demonstrate that WBM and synthetic based fluids cuttings and solids within the water column fall below the United States Environment Protection Agency (USEPA) minimum 96-hour LC50 for drilling fluids within the first few metres of a surface discharge point. Various other studies support the understanding that only organisms very close to the discharge point will be exposed to chemical concentrations above toxicity thresholds (Boehm et al., 2001; Kinhill, 1998; IRCE, 2003; SKM, 1996; Melton, 2000).

The transfer and accumulation of contaminants (heavy metals, hydrocarbons) through trophic levels (known as biomagnification) resulting from marine organisms feeding in proximity to drilling locations is one potential pathway that could lead to accumulation of contaminants in higher order marine fauna (e.g. fish, marine reptiles, marine mammals). However the area impacted by drill cuttings deposition represents a fraction of the total foraging area for mobile marine fauna, greatly reducing the potential for biomagnification in mobile marine fauna. Also, given the limited bioavailability of contaminants within drill cuttings, combined with marine species natural avoidance of turbid stretches of water, risk of biomagnification to mobile marine fauna is further reduced. This is supported by Hartley et al.(2003) finding that marine fauna, specifically fish, starfish and crabs; that are exposed to drill cuttings in sediments do not bioaccumulate significant quantities of metals (Hartley et al., 2003).

There is some evidence of potential for bioavailability for some metals, such as Pb and Zn, which are present in cuttings piles. However, the estimated concentrations are likely insufficient to cause harmful effects in marine fauna (fish, crabs) living on or near cuttings piles (OSPAR, 2019), with potential impact limited to species living within the cuttings and sediment matrix (benthic infauna).

There is no evidence to support the risk of bioaccumulation of contaminants to fish exposed to drill fluids and cuttings. Published literature indicates that the relative insolubility of barium sulfate in drilling fluids and cuttings does not pose a significant toxicity risk to finfish (Payne, 2011). Furthermore, there is no indication that the levels of trace metals in fish and shellfish collected in close proximity to existing offshore installations are significantly different from natural background concentrations (Bakke et al., 2013). Neff et al. (2000) also found that drilling cuttings are of little risk to water column biota due to WBMs having low toxicity levels and are considered by OSPAR to pose little or no risk to the environment (PLONOR). If contingency NAFs/SBMs are used, returns will be treated to reduce oil on cuttings (OOC) to 10%, which is aligned with Santos and industry standards. As the discharges of drill fluids and cuttings will be localised and subject to rapid dilution, and considering the transitory nature of fish movements, impacts to fish populations and commercial fisheries are unlikely.

There is no known significant benthic habitat or benthic features within the Project Area that would result in the aggregation of marine fauna (fish, marine mammals, marine reptiles) within the Project area. Mobile marine fauna, such as fish, marine mammals and marine reptiles, are expected to actively avoid discharge plumes and associated turbidity and toxicity within the water column.

Refer to **Section 3.3** for the full list of Marine species listed under the EPBC Act within the Project Area. The Project Area intersects with a foraging BIA for the whale shark. Within the North West Shelf, Whale Sharks are primarily found in seasonal aggregations around Ningaloo Reef, between March and June. However, they have also been reported from oceanic and coastal waters across the region (Wilson et al. 2006). Based on the foraging habitat preferences of whale sharks and the results of tagging studies, the foraging BIA overlap with the Project Area is unlikely to represent critical foraging habitat. The BIA may be used by migrating whale sharks moving to and from Ningaloo Reef, however tagging studies indicate most tagged whale sharks to not use the majority of the BIA when moving away from Ningaloo Reef (**Figure 3-17**). The approved Conservation Advice for Whale Sharks (Threatened Species Scientific Committee 2015d) states that the main threat to the species occurs outside Australian waters. Whale Sharks are highly mobile, therefore they are not expected to be affected by negligible increases in toxicity and short-term turbidity increases.

The Project Area overlaps the Humpback Whale migration BIA. Humpback Whales migrate between May and November each year; with peak northern migration occurring during June and July, and no noted peak for the southern migration (Threatened Species Scientific Committee 2015a).

The EPBC PMST also shows that five species of turtle listed as either Vulnerable (Green Turtle, Hawksbill Turtle and Flatback Turtle) or Endangered (Loggerhead Turtle and Leatherback Turtle) are known or are likely to occur within the Project Area. The Project Area overlaps with the flatback turtle internesting BIA centred around North Turtle Island, approximately 39km from the Project Area. The Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) identifies chemical and terrestrial discharge as a threat; however, this is mostly in relation to pollution from agricultural, terrestrial industrial and domestic sources.

Drill fluids and cuttings discharges within the Project Area are localised and rapidly dilute, and given that fish, marine mammals and marine reptile species are highly mobile and transitory in nature, the impacts of these discharges are expected to be negligible. The expected volumes of discharges would not be significant enough to cause any notable impact to marine fauna, in the well-mixed marine environment. The discharge of drill fluids and cuttings will impact upon seabed habitat below the cuttings pile, particularly where the thickness of the cuttings deposition is ≥ 10 mm. This may result in a highly localised, temporary behavioural impact to marine fauna such as turtles and fishes (e.g. avoidance). Drill cuttings accumulation on seafloor sediments can cause changes in the physical properties and chemical composition of the seabed sediments. However, impact is limited to species living within the cuttings-sediment matrix (benthic infauna), and there is no evidence to support the bioaccumulation of contaminants to fish, starfish and crabs and higher order species (marine reptiles and cetaceans) due to the limited bioavailability of contaminants within drill cuttings and mobile marine species avoidance of turbid stretches of water from metals.

As impacts to fish are not expected from drilling fluids and cuttings discharges, indirect impacts to fish populations and commercial fisheries are not expected.

7.2.1.3 Summary of Impact Evaluation

The controls outlined in **Table 7-10** will be implemented by Santos to manage the potential impacts of the discharge of drilling fluids and cuttings during Dorado Phase 1.

Table 7-10: Summary of impacts, EPOs, controls and consequence evaluation of drill cuttings and fluid discharges during Dorado Phase 1

EPOs	
EPO1A: Impacts to sediment quality and water quality as a result of Dorado Phase 1 drilling fluids and cuttings discharges restricted to a 1 km radius from Dorado facilities. **EPO2A**: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area. **EPO3A**: No mortality or significant[18] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of drilling fluids and cuttings.	
Receptor	**Impact**
Water Quality	Localised decrease in water quality during drilling operations.
Sediment Quality	Deposition of drill cuttings during drilling operations.
Benthic habitats	Localised smothering and loss of habitat.
Marine Fauna (benthic infauna)	Oxygen degradation and bioaccumulation of contaminants in benthic infauna.
Control Measures (CM)	
CM1: All wells to be drilled using WBM, with NAF/SBM only to be used where technical requirements preclude the use of WBM. **CM2**: Santos chemical selection process will be implemented to select drilling chemicals, muds and fluids with low environmental risk, while meeting technical requirements. **CM3**: Drilling fluids inventory will be developed and tracked to reduce discharge of excess powders, brines, and drilling fluids. **CM4**: Drill cuttings will be processed on the MODU to recover drilling fluids and reduce residual fluids content prior to overboard discharge. **CM5**: An assessment of drill cuttings and fluids discharges will be undertaken prior to drilling future tieback wells to ensure impacts to environmental values and sensitivities are within acceptable levels. **CM6**: Benthic habitat surveys will be undertaken prior to drilling at tieback locations to identify and avoid sensitive benthic habitat.	
Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

[18] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013)

7.2.1.4 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by the discharge of drilling fluids and cuttings during Dorado Phase 1 compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-11** and **Table 7-12.** The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case consequence for the discharge of drilling fluids and cuttings was evaluated as minor (**Table 7-10**). This consequence is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from discharge of drilling fluids and cuttings are acceptable.

Table 7-11: Demonstration of acceptability for the discharge of drilling fluids and cuttings

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	The risks and impacts from discharge of drilling fluids and cuttings are consistent with the principles of ESD based on: + the environmental values and sensitivities within the Project Area are not expected to be substantially impacted (refer **Section 7.2.1.2**), and + the precautionary principle has been applied through habitat surveys of the existing environment (**Attachment 2**) and modelling studies of the discharge of drilling fluids and cuttings studies (**Attachment 6**) where knowledge gaps were identified.
Internal Context	The management of drilling fluids and cuttings discharges is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of potential impacts and risks.
MNES	**Threatened Migratory Species** The evaluation of impacts and risks indicates or significant impacts[19] to marine species listed under the EPBC Act including threatened and migratory species will not credibly result from the discharge of drilling fluids and cuttings from Dorado Phase 1. Alignment of Dorado Phase 1 with management plans, recovery plans and conservation advice for threatened and migratory fauna is provided below. Commonwealth Marine Environment - Conservation Advice The below conservation advice and recovery plans identify habitat degradation as a threat to threatened species. Impacts to benthic habitats from the discharge of drilling fluids and cuttings will be highly localised. The benthic habitats that may be affected are very widely distributed throughout the Project Area and beyond. As such,

[19] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Acceptability Criteria	Demonstration of Acceptability
	Santos considers the impacts of drilling fluids and cuttings to not be inconsistent with applicable conservation advice: + Approved conservation advice for *Pristis clavata* (dwarf sawfish) (Threatened Species Scientific Committee 2009), + Approved conservation advice for *Pristis pristis* (largetooth sawfish) (Threatened Species Scientific Committee 2014b), and + Approved conservation advice for *green sawfish* (Threatened Species Scientific Committee 2008a). + Conservation advice for *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b) + Conservation Advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c) **Commonwealth Marine Environment – Recovery Plans** Sawfish and river shark multispecies recovery plan (Commonwealth of Australia 2015b) - This recovery plan identifies habitat degradation as a threat to sawfish. Impacts to benthic habitats from the discharge of drilling fluids and cuttings will be highly localised within the Project Area. The benthic habitats that may be affected are very widely distributed throughout the Project Area and beyond. The closest Sawfish BIA (for pupping, nursing and foraging) is approximately 87 km from the southern extent of the Project Area. Santos considers the impacts of drill cuttings and fluids discharges to not be inconsistent with the recovery plan. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) - This recovery plan identifies chemical discharges as a threat to marine turtles. Impacts from chemical discharges (e.g. drilling fluids) may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of drill cuttings and fluids discharges to be consistent with the recovery plan. Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPac, 2013b) – This recovery plan identifies habitat modification as a potential threat to White Sharks. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges (e.g. drilling fluids) may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of drill cuttings and fluids discharges to not be inconsistent with the recovery plan. Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a) – this recovery plan identifies acute and chronic chemical discharge as a threat to Blue Whales. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges (e.g. drilling fluids) may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of drill cuttings and fluids discharges to not be inconsistent with the recovery plan.

Acceptability Criteria	Demonstration of Acceptability
	Recovery Plans / Conservation Advices for other species that may occur in the Project Area do not identify habitat degradation as a key threat; or have any explicit relevant objectives or management actions related to habitat degradation.
Other Relevant Requirements	Management of the impacts and risks from the discharges of drilling fluids and cuttings associated with Dorado Phase 1 are consistent with relevant legislative requirements, including the management of emissions and releases of mercury and mercury compounds as per the obligations under the Minamata Convention on Mercury. At present there are no specific guidelines in the Minamata convention regarding acceptable levels of mercury in drilling fluid releases. The ANZG 2018 provide for guidance and levels of protection for both water and sediment associated with Mercury. Santos' management of the discharge of drilling fluids and cuttings is consistent with industry practice in Australia, for example **CM2** chemical selection process and **CM**4 reducing residual fluid volumes discharged overboard The chemical selection process adopts relevant changes in legislation and ANZG.

Table 7-12: Demonstration of acceptability of the discharge of drilling cuttings and fluids against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels (RSAL)	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[20] are acceptable. **RSAL4**: Substantial[21] impacts to water quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	The discharge of drilling fluids and cuttings will result in a temporary reduction in water quality at the discharge location, primary due to increased total suspended solids and turbidity. Modelling and operational experience indicates these impacts will be limited to a small area around and directly below the discharge location. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity will be maintained outside the immediate vicinity of the discharge location, and that no substantial impacts to water quality will be observed within 1 km of the discharge point. It is also anticipated that water quality will recovery rapidly once the discharge ceases.
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity[17] are acceptable.	The discharge of drilling fluids and cuttings will result in a decrease in sediment quality at drilling locations. Modelling studies indicate that the potential for substantial impacts to sediment quality are highly localised around the discharge location. The controls will reduce the amount of potential sediment contaminants that are discharged with

[20] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[21] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

Receptor-specific Acceptable Levels (RSAL)	Demonstration of Acceptability
RSAL6: Substantial[18] impacts to sediment quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	the drilling fluids and cuttings. The impacts to sediment quality will not result in changes to the environment beyond a highly localised environment around the drilling location. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity will be maintained outside the vicinity of the discharge location, and that no substantial impacts to sediment quality will be observed within 1 km of the discharge location.
RSAL8: No significant[22] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities	The benthic communities within the Project Area that may be impacted by drilling fluids and cuttings discharges are broadly represented in the region and are not considered to be particularly sensitive. Prior to undertaking future tieback activities, a habitat survey will be completed to identify and avoid potentially sensitive benthic habitat. The discharge of drilling fluids and cuttings will not result in substantial impacts to these benthic habitats.
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1. **RSAL19**: No negative impacts to the economic viability of the commercial fish resources.	Impacts from drill cuttings and fluid discharges within the Project Area are localised (less than 0.1% of the project area), and given that fish, marine mammals and marine reptile species are transitory in nature, the impacts of these discharges will not result in significant impacts to listed threatened, migratory or cetacean species under the EPBC Act. Drill cuttings accumulation on seafloor sediments can cause changes in the physical properties and chemical composition of the seabed sediments. Chemical selection process will be implemented to select chemicals for the drilling campaign with low environmental risk, reducing the likelihood of any impacts. Due to low toxicity of drilling fluids and limited bioavailability of contaminants within drill cuttings, bioaccumulation is not expected. In addition, mobile marine species are expected to either avoid turbid stretches of water or pass through, limiting their exposure to contaminants in drilling fluids and cutting discharges and the potential for bioaccumulation. Potential bioaccumulation impacts are limited to species living within the cuttings-seabed matrix (benthic infauna) due to prolonged exposure to contaminants. However, the potential transfer and bioaccumulation of contaminants through trophic levels from feeding by marine organisms in proximity to drilling locations is not anticipated, due to the drill cuttings piles representing only 0.1% of the project area. Accordingly, no impact at a population level is expected for higher order marine species (fish, cetaceans and marine reptiles). As no impacts to fish populations are expected from drilling fluids and cuttings discharges (discharges will be localised, are expected to dilute

[22] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

Receptor-specific Acceptable Levels (RSAL)	Demonstration of Acceptability
	rapidly and fish are transitory in nature) indirect impacts to fish populations and commercial fisheries are not expected. The negligible impacts associated with drilling fluids and cuttings discharges are not inconsistent with relevant recovery plans.

7.2.2 Discharges – Produced Water Discharge

7.2.2.1 Description of the Event

PW is the amalgamation of the formation water (water that is naturally present in the reservoir) and condensed water (water that is condensed out of the reservoir hydrocarbons due to temperature and pressure changes during extraction and processing). The elevated salinity of the formation water drives the overall salinity of the PW.

PW is returned to the FPSO via the subsea wells and flowlines during extraction of hydrocarbons (e.g. oil and natural gas). The composition of PW is a complex mixture of dissolved and particulate organic and inorganic chemicals (Neff et al. 2011). The composition of PW will vary depending on several variables, including the attributes of the reservoir geology and when the reservoir and production characteristics change (International Association of Oil and Gas Producers 2005; Neff et al. 1992; OSPAR Commission 2014). PW generated at offshore petroleum facilities is generally warmer and more saline than seawater.

The characteristics of the PW discharge will change during the life of Dorado Phase 1. During the initial period of operations, it is not expected that formation water will be extracted from the reservoir. The PW volume will therefore be small and mostly made up of condensed water with intermittent discharges of treated PW to the marine environment. As the formation water breaks through, the amount of PW generated and requiring treatment prior to disposal will gradually increase over time. The maximum rate of water production per facility design is 4,350 m^3/day, although in practice is expected to be much lower than this as the facilities and well operations teams manage production across the reservoir to minimise water production. Notwithstanding, the impact assessment has assumed continuous discharge of PW to the marine environment at a maximum design rate of 4,350 m^3/day.

PW will be discharged to the marine environment from the FPSO during hydrocarbon processing throughout the operational life of Dorado Phase 1 (**Section 5**). The discharge will be via a single discharge point that is planned to be approximately 10 m below the sea surface. This discharge scenario has been computationally modelled to inform the nature and scale of the PW discharge in the environment. The modelling studies are summarised in **Section 7.2.2.1.2** and provided as **Attachment 7**.

The PW stream is expected to include potential contaminants from the reservoir, such as hydrocarbons and metals, as well as residual amounts of production chemicals. As Dorado Phase 1 is not yet producing, it is not possible to undertake chemical characterisation or ecotoxicological tests on the PW stream to define its characteristics. A description of expected and representative potential contaminants that are likely to be present in the PW are provided in **Section 7.2.2.1.1**. For the purpose of impact assessment, the actual discharge concentrations for OIW for the PW will be reduced to ALARP and are likely to be less than 30 mg/L (but the actual concentrations will be determined during FEED). The PW treatment system onboard the FPSO will be designed to reduce the residual OIW to less than 30 mg/L prior to marine discharge.

7.2.2.1.1 Characteristics of Produced Water

PW often contains small amounts of naturally occurring contaminants, including dispersed oil, dissolved organic compounds (aliphatic and aromatic hydrocarbons (organic compounds that are made out of only carbon and hydrogen atoms), organic acids, and phenols), and inorganic compounds (e.g. soluble inorganic chemicals and dissolved metals).

Hydrocarbons

Hydrocarbons in the PW will consist of both relatively low and high molecular-weight compounds. Hydrocarbon solubility generally decreases with increasing molecular weight, and aromatic hydrocarbons also tend to have increased water solubility and have the greatest potential for toxicity compared to non-aromatic hydrocarbons of equivalent molecular weight (Neff et al. 2011). These compounds include benzene, toluene, ethylbenzene and xylene (BTEX) and polycyclic aromatic hydrocarbons (PAHs). Higher molecular weight compounds typically pose less environmental risk and are largely recovered during the production process and the PW treatment system onboard the FPSO. Residual high molecular-weight hydrocarbons will occur as very fine entrained oil droplets.

BTEX compounds are the most common hydrocarbon component of PW. BTEX are highly volatile and do not persist in the environment; upon release, evaporation and dilution rapidly reduce the concentration of BTEX in the receiving environment (Ekins et al. 2005; International Association of Oil and Gas Producers 2005; Neff et al. 2011). BTEX is known to be toxic to marine organisms and has been shown to result in developmental defects (Fucik et al. 1995) but does not significantly bioaccumulate (Neff 2002).

PAHs are less volatile and soluble than BTEX and have greater potential to accumulate in the marine environment (Neff et al. 2011). PAHs can be broadly divided into two types: low molecular weight and high molecular weight. PAHs dissolved in PW are predominantly low molecular weight; and, while toxic, they are neither mutagenic nor carcinogenic (although their metabolic by-products may be) (International Association of Oil and Gas Producers 2005). Higher molecular-weight PAHs are rarely detected in treated PW due to their low aqueous solubility. These compounds are primarily associated with dispersed oil droplets, which are removed by the production process and PW treatment system (Neff et al. 2011; Schmeichel 2017). PAHs are generally removed from the water column through volatilisation to the atmosphere upon reaching the sea surface, particularly the lower molecular-weight fractions (Schmeichel 2017). PAHs can also degrade in the water column, with half-lives ranging from less than a day to several months, with the more abundant and lower molecular-weight compounds being more degradable (International Association of Oil and Gas Producers 2002).

Dissolved Solids

PW typically contains a range of dissolved solids. The most abundant inorganic ions in high-salinity PW are, in order of relative abundance, sodium, chloride, calcium, magnesium, potassium, sulphate, bromide, bicarbonate, and iodide (Neff et al. 2011). Heavier metals most frequently present in PW include barium, iron, manganese, mercury, and zinc (Neff 1987).

The heavier metals are potentially toxic. With the exception of iron, heavy-metal guideline values for marine water quality are provided in the *Australian and New Zealand Guidelines for Fresh and*

Marine Water Quality (Commonwealth of Australia and New Zealand Government 2018). Dissolved heavy metal concentrations in PW are typically low. Metals such as iron and manganese may precipitate out of solution once the PW is exposed to oxygen (PW is typically anoxic in the reservoir), with other metals potentially also being co-precipitated (Neff et al. 2011). Any precipitated solids discharged to the marine environment will be present as very fine particles. These particles will remain suspended in the water for long periods of time and consequently will be dispersed over a wide area.

Salinity

PW discharge salinity for Dorado Phase 1 is estimated to range between 20 ppt and 30 ppt and most likely will be around 25.5 ppt. The salinity of seawater ranges between 32 and 36 ppt.

Nutrients

The presence of elevated ammonia concentrations in some PW streams have been shown to elicit toxicity and/or eutrophication within receiving waters (Neff et al. 2011). Other plant nutrients, such as nitrate and phosphate, are usually found in low concentrations in PW.

Temperature

PW usually has a naturally high temperature due to exposure to geothermal heat in the reservoir. The temperature of PW discharged from the FPSO is expected to vary between 45°C and 60°C. Once discharged into the marine environment, PW cools through mixing with the receiving waters.

Process Chemicals

Chemicals may be used in the wells and production system to aid in the recovery and pumping of hydrocarbons; protect the production system from corrosion; and facilitate separation of oil, gas, and water. Examples include reverse emulsion breakers, scale and corrosion inhibitors, and oxygen scavengers. These are used sparingly to reduce operating costs; however, residual chemicals may be discharged in small quantities in the PW. The PW therefore may contain traces of added process chemicals, such as biocides, corrosion inhibitors, scale inhibitors, emulsion breakers, coagulants or flocculants, and oxygen scavengers, which are required for the production operations (Johnsen et al. 2004; Neff 2002). All these chemicals may be used during Dorado Phase 1 operations.

7.2.2.1.2 Produced Water Discharge Modelling

Numerical modelling studies were commissioned to inform the environmental impact assessment regarding the discharge of PW. PW discharges were modelled to predict the likely extent of the discharge plume and the dilution of PW in the marine environment. The modelling studies included near- and far-field modelling of dilution for summer, winter, and transitional conditions. The model was based on the characteristics in **Table 7-13**. Note alternatives for the discharge height were modelled as part of the options analysis in **Section 5** and 10 m BSL selected as the preferred option based on better environmental outcome. The model outputs for the seasonal results per case were combined and presented on an annualised basis. The modelling report is provided in **Attachment 7**.

Table 7-13: Summary of PW discharge modelling characteristics

Parameter	Description / Value
Outlet characteristics	
Location	FPSO
Number of ports	1
Outlet pipe orientation	Vertical (downwards)
Outlet pipe internal diameter (m) [in]	0.35 [13.78]
Flow velocity on exit (m/s)	0.52
Discharge port height/depth	10 m below sea surface
Discharge characteristics	
Flow rate (m^3/day) – maximum flow rate	4,350
Duration	Continuous
Discharge salinity (ppt)	25.5
Discharge temperature (°C)	45 to 60

A custom composite regional hydrodynamic model for the Project Area, comprising both tidal (HYDROMAP) and mesoscale (HYCOM) models, was used to inform the produced water modelling studies. The tidal, mesoscale, and composite models were validated against oceanographic observations, including data collected within the Project Area, and showed strong agreement with oceanographic observations (**Attachment 7**).

Two environmental criteria were used for the PW modelling study, as follows:

+ The World Bank Group's *Environmental Health and Safety Guidelines for Offshore Oil and Gas Development* (International Finance Corporation 2015) cooling water discharge guideline of '*no more than 3°C at edge of the zone where initial mixing and dilution take place*' was used as a guide due to the absence of any formally recognized PW discharge criterion; and
+ Maximum plume extent with far-field modelling results are presented as a range of dilution contour maps. This approach permits interpretation of the modelling results based on dilutions required to achieve particular environmental outcomes (e.g. reducing the concentration of potential contaminants below the predicted no-effect concentration derived from the species protection levels for water quality presented in the *Australian and New Zealand guidelines for fresh and marine water quality* (Commonwealth of Australia and New Zealand Government 2018) or – for contaminants not included in the guidelines – from published concentrations using methods aligned with the guidelines).

Target dilution thresholds for PW are typically based on chemical characterisation and ecotoxicity testing of the PW. This information is used to determine the number of dilutions after which the PW will no longer pose an environmental risk to the receiving environment. This information can only be collected once the FPSO commences operation and hence is unavailable to inform this impact assessment. A predicted no-effect concentration of 70.5 µg/L has been established for dispersed OIW (OSPAR Commission 2014). This predicted no-effect concentration was developed from toxicity data from marine species from five taxonomic groups (OSPAR 2014; Smit et al. 2009). The predicted no-effect concentration values for naturally occurring substances in PW were compiled in support of OSPAR Recommendation 2012/5 and Guidelines 2012/7 (OSPAR 2012a; OSPAR 2012b). Given OIW is a notable potential contaminant and that concept design for the PW treatment system will reduce OIW to less than 30 mg/L as the detailed engineering has not yet been undertaken, a target dilution of 1:425 is required to assign a zone beyond which there are no predicted impacts to the marine environment from OIW.

This target dilution of 1:425 is considered conservative and is expected to overestimate potential impacts based on Santos' operational experience:

+ Once stabilised, the PW treatment system is expected to consistently reduce OIW to less than 30 mg/L whereas the dilution factor is based on 30 mg/L; and
+ Target dilutions based on predicted no-effect concentrations derived from PW chemical characterisation and ecotoxicity testing at other facilities on the NWS are generally well below a 1:425 target dilution.

Near-field Modelling Results

The near-field mixing and dispersion of the PW discharge was simulated using the 3-D flow model, CORMIX (**Attachment 7**). CORMIX is a mixing-zone model and decision-support system for environmental impact assessment of mixing zones. The near-field model was used to predict the movement and dilution of the PW plume where the plume's inertial forces and buoyancy are the main processes forcing the dilution of the plume.

The near-field modelling of the PW discharge predicted the following:

+ Discharge height and current speed have a strong effect on PW discharge. The lowest dilutions predicted were identified under weak currents with high dilutions predicted under increasing current speeds;
+ Temperature of the PW plume was predicted to be within 3°C of the ambient (background) temperature within 100 m from the FPSO discharge location. The PW plume temperature was generally predicted to return to ambient water temperature within 15 m (i.e. horizontally) from the release location;
+ Depth of the plume was between approximately 10 and 12 m below the sea surface. This provides a greater vertical distance for the plume to rise under buoyancy and entrain with the ambient waters;
+ A maximum near-field horizontal distance of 129.7 m under higher current speeds with plume diameter predicted to be approximately 4 m (**Figure 7-5**); and
+ Average dilution factors ranged from 1:85 to 1:981 at the end of the near-field zone; hence, the 1:425 target dilution may be met within the near-field zone under some conditions.

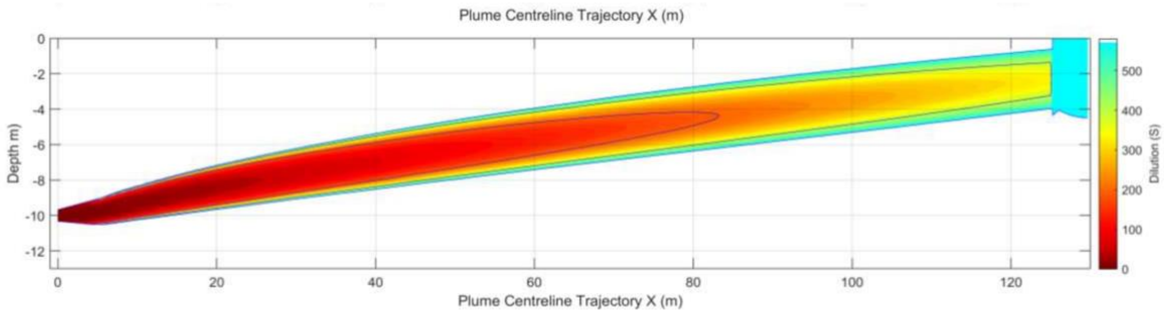

Figure 7-5: PW discharge cross-section at 10 m below sea surface for a 4,350 m^3/day discharge rate under strong current conditions (annualised results)

Far-field Modelling Results

The far-field modelling dilution of the PW discharges was predicted using the 3-D discharge and plume behaviour model, MUDMAP (**Attachment 7**). The far-field modelling simulated the processes once the transition from the near-field dilution has occurred (i.e. inertia and buoyancy no longer account for most of the mixing of the plume). Dilution of the PW plume in far-field modelling is driven by water currents. The far-field model simulated processes such as the potential for localised build-up when current speeds are low (e.g. at the turning of the tide) and recirculation of the plume back to the discharge location.

A stochastic procedure was applied for the far-field modelling, running 50 simulations per season over three seasons – summer, winter, and a transitional season (i.e. 150 simulations in total), with each simulation representing discharge for 10 days. **Figure 7-6** and **Figure 7-7** illustrate the predicted spatial extent of the PW discharge plume for the 95th and 99th percentile dilutions respectively. The far-field modelling of the PW discharge predicted the following:

+ the 1:425 target dilution for OIW would be met within 200 m of the discharge based on the 99th percentile dilutions;
+ PW discharges would rapidly disperse within the receiving marine environment and were expected to achieve 1:1,000 dilution within 591 m of the discharge based on the 99th percentile dilutions;
+ the maximum areas to have less than 1:1,000 dilution from the PW discharge location would be 0.072 km^2 and 0.550 km^2 at the 95th and 99th percentile dilutions, respectively; and
+ the maximum depth below the discharge location to achieve the 1:1,000 PW dilution level would be 4 m, approximately 14 m below the sea surface, depending on the volume of oil the FPSO is carrying.

7.2.2.2 Details of Environmental Impacts and Risks

A summary of the analysis of the environmental impact of the FPSO PW discharges as a result of Dorado Phase 1 is provided in this section. **Table 7-14** describes the impacts and identifies the potentially impacted receptors as a result of the discharge of PW within the Project Area.

Table 7-14: Receptors potentially impacted by the discharge of PW

Description of the Impact	Receptor Categories
Localised decrease in water quality during the operational stage of Dorado Phase 1. Localised decrease in sediment quality from the deposition of very small quantities of precipitated solids during the operational stage of Dorado Phase 1 Potential bioaccumulation of contaminants in marine fauna.	Water Quality – **Section 7.2.2.2.1** Sediment Quality – **Section 7.2.2.2.2** Plankton – **Section 7.2.2.2.3** Marine Fauna and Flora – **Section 7.2.2.2.4**

7.2.2.2.1 Water Quality

Water quality will change as a result of the chemical and physical properties of PW discharges (described in Section 7.2.2.1.1). Based on a conservative 1:1,000 dilution threshold, modelling results show these impacts will be localised to within approximately 600 m from the discharge location (**Figure 7-7**) given that the target dilution of 1:425 is achieved within 200 m of the discharge location. Impacts are expected to be much more localised during the early operational stage, where the PW discharge rate is expected to be much lower than 4,350 m^3/day, which has been assumed as the worst-case discharge rate expected in later field life. Dispersed OIW is buoyant and may float to the sea surface, potentially resulting in a very thin layer of oil that may be visible as a sheen. Given the volatile nature of the oils that will be produced by Dorado Phase 1, any surface sheen is expected to evaporate and weather rapidly in the tropical conditions experienced in the Project Area.

As BTEX is highly volatile, it will evaporate and dilute such that there will only be a localised zone of increased concentrations. PAHs within PW discharge have a greater potential to accumulate within the marine environment than BTEX due to their solubility, toxicity and persistence. It is expected that PAHs will be mostly removed from the water column through volatilisation to the atmosphere upon reaching the sea surface, particularly the lower molecular-weight fractions (Schmeichel 2017). Therefore, only localised increased concentrations are anticipated.

Dissolved metals may be present in low concentrations in the PW stream. Azetsu-Scott et al. (2007) indicated three different pathways for these inorganic elements once they enter the marine environment with the PW:

+ elements that stayed in solution would rapidly dilute along with the PW plume;
+ elements that oxidize or precipitate to form insoluble inorganic compounds would either form precipitates, which will be transported away from the discharge location while suspended in the water column, or would sink; and
+ elements that associate with oil droplets that are lighter than seawater and would rise to the surface.

While concentrations of dissolved metals in PW can be greater than those in the marine environment, they are rapidly reduced through dilution and mixing processes and other physico-chemical reactions to levels that pose a low risk to the receiving environment (International Association of Oil and Gas Producers 2005). Elevated dissolved metals concentrations are therefore only expected within close vicinity of the discharge point.

The PW discharge is expected to be warmer (45 to 60°C) than the receiving environment (which is typically less than 30°C), with the discharge predicted to be less dense (i.e. positively buoyant) than the receiving seawater. Turbulent mixing from the inertia and buoyancy of the plume will mix the PW discharge rapidly, resulting in the temperature of the PW discharge dropping rapidly. Temperature is predicted to be within 3°C of ambient seawater temperatures well within 100 m of the discharge location in most circumstances. Given that the predicted “impact” zone is less than the 500-m exclusion that will be in place around the FPSO (and therefore around the discharge location), there will be no fishing or other commercial activity taking place (other than that associated with Dorado Phase 1); therefore, the localised, poorer water quality within the immediate vicinity is of no consequence to socio-economic activity.

7.2.2.2.2 Sediment Quality

Very little solid material (e.g. produced sand) will be discharged with the PW, as the majority of solids are removed by the production and PW treatment systems. Solids in the PW discharge are expected to be limited to a very small mass of precipitates formed from dissolved ions in the anoxic PW after being exposed to atmospheric oxygen.

Discharge modelling suggests that PW is unlikely to reach the seabed due to the buoyant nature of the plume and the rapid mixing with the receiving waters upon discharge. Direct contact of the PW with the sediments is not expected to occur, given the water depth (approximately 90 m) at the FPSO location.

While the PW plumes are expected to disperse mainly within surface waters, there is the potential for particles within the plume, which may comprise metal oxides and low solubility hydrocarbon droplets (such as higher molecular weight PAHs), to drop out of the plume in the far-field mixing zone (Neff et al., 2011). These components of the PW therefore have the potential to accumulate in sediments.

Dissolved elements (particularly metals) in the PW may also form precipitates once released into the environment due to changes in pH and availability of reactants (e.g. oxygen and sulphide). While the exact composition of the PW cannot reasonably be characterised prior to commencing production (and may change character as reservoirs become depleted), metals commonly encountered at elevated levels in PW include barium, iron, manganese, mercury and zinc (Neff et al. 2011). Solids formed by precipitation will initially be very small and will have low settling velocities. As with solid particles in the PW discharge plume, precipitates are unlikely to be deposited near the discharge location and will disperse widely. Sediment quality in the Commonwealth Marine area is therefore not expected to be significantly impacted in the vicinity of the discharge.

The low natural suspended sediment load indicates the potential for adsorption of potential contaminants is limited (RPS 2020a). Due to the small particle size, the potential for adsorbed contaminants to be deposited at the discharge location is low; particles with adsorbed contaminants are expected to be diluted and widely dispersed, resulting in no measurable impact to sediment quality in the region.

The potential for contaminants in the PW to interact with sediment in the Commonwealth Marine area, either directly or through deposition of precipitates or natural suspended sediment with adsorbed contaminants, is very low. It is possible that contaminants from the discharge of PW may accumulate through sedimentation on the seabed, however this is highly unlikely due the following:

- Elevated currents, leading to higher dispersion prior to settling,
- Natural sediment resuspension,
- Only the fine sand fraction would settle to the seabed with the silts dispersing over a wide area at very low concentrations levels,
- High degradation rates of both biogenic (carbon) and hydrocarbons at the sediment interface (Burns et al 2003).

Given that PW contaminants are unlikely to be detectable in sediments in the vicinity of the FPSO discharge point, potential impacts to sediments from the discharge of PW are expected to be minimal.

7.2.2.2.3 Plankton

As presented in **Section 7.2.2.2.1**, water quality may be impacted by PW discharges, which could in turn have an impact on plankton.

Phytoplankton can accumulate hydrocarbons at a rapid rate but are generally not sensitive to hydrocarbons. Exposure to hydrocarbons has the potential to affect their photosynthetic ability, which may result in cascading effects into higher trophic levels (Hook et al. 2016). At low concentrations of hydrocarbons in the water column (10 to 30 ppb), photosynthesis may be stimulated, although inhibiting effects have been shown to occur at concentrations above 50 ppb (Volkman et al. 1994). Other studies have indicated that phytoplankton have been shown to be less affected by weathered oil (Bretherton et al. 2018; Özhan et al. 2014). Potential impacts to phytoplankton are therefore expected to be localised and transient, with phytoplankton replenishing rapidly.

Exposure of zooplankton to hydrocarbons in the water column has the potential to cause mortality or a decline in egg production and hatching rates along with a decline in swimming speeds (Hook et al. 2016). Low molecular-weight hydrocarbons have been shown to cause acute toxic effects in zooplankton (Almeda et al. 2013; Jiang et al. 2010). PAHs within PW discharge have a greater potential to accumulate within the marine environment than BTEX due to their solubility, toxicity and persistence. Based on 1:1000 dilution of PW, these impacts will be restricted to within a few hundred metres of the discharge location.

Plankton is generally abundant in the upper layers of the water column and is the basis of the marine food web; therefore, the discharge of PW is unlikely to have impacts on plankton populations at a regional level. Larval plankton stages are known to be more susceptible to impacts of increased salinity than are most other marine life (Neuparth et al. 2002) and are therefore expected to be the most affected by the increase in salinity in the PW discharge plume. Early life stages of fish (embryos and larvae) and other plankton would also be most susceptible to toxic exposure from residual chemicals in the PW discharges, as they have limited mobility and are therefore likely to be exposed at the discharge location, if present. However, these types of organisms are expected to rapidly recover once background water quality is re-established (International Tanker Owners Pollution Federation 2011) as they are known to have high levels of natural mortality and a rapid replacement rate (United Nations Environment Program 1985). Rapid recovery is also expected due to the fast growth rates of zooplankton and the dispersal and mixing of zooplankton (CSIRO 2017) from both inside and outside of the PW plume. A change in water quality may cause injury or mortality to plankton species through increased toxicity levels and increased water temperatures. The potential impacts of PW discharges on plankton are expected to be localised and are considered to be minor.

7.2.2.2.4 Marine Fauna

As presented in **Section 7.2.2.2.1**, water quality may be impacted by PW discharges, and this could in turn have an impact on marine fauna such as fish, marine mammals and marine reptiles. Given PW discharges occur near the sea surface and will mix rapidly following discharge, pelagic fauna that are at or near the sea surface are most likely to be exposed to the PW plume.

Uptake of dissolved hydrocarbons is less likely for marine mammals and reptiles than for fish and invertebrates, since marine mammals and reptiles are air breathing and do not possess gill structures that promote cellular uptake of dissolved constituents. Fish may be more vulnerable as their gills form an area through which potential PW contaminants may be trapped. Pelagic fish are transient marine fauna that are unlikely to remain within the discharge location and associated plume, which will move around depending on the metocean conditions. Chemicals present in the PW have the potential to cause harm and/or be lethal to fish. Production chemicals are managed via the chemical selection process, which prioritises the use of chemicals that meet technical requirements but have a low environmental risk. There are only expected to be minor traces of production chemicals within the PW discharge from residual production chemicals that aren't fully consumed in the topsides process, significantly reducing the potential toxicity of such chemicals.

The transfer and accumulation of contaminants through trophic levels (known as bioaccumulation) is one potential pathway that could lead to adverse impacts from extended feeding around the activities. Given the transient nature of marine mammals and reptiles, combined with the absence of gill structures to promote cellular uptake, bioaccumulation is not expected in these species.

Presence of pelagic fish is commonly associated with offshore structures, which could increase exposure of these species to the PW discharge for longer periods. However, due to the relatively low concentrations of residual chemicals within the PW discharge, the high level of dilution and mixing within the receiving offshore environment, and the ability of pelagic species to avoid discharge plumes, impacts to pelagic fish populations are not expected. Laboratory and field studies of PW have also concluded that significant biological effects on pelagic organisms will be limited to a distance of less than one km due to rapid effluent dilution, with no expected impact at the population level (Bakke et al,. 2013). This finding is consistent with PW modelling performed for the Dorado Development, with anticipated impacts limited to within 1 km of the PW discharge from the FPSO.

Elevated water temperatures have the potential to induce minor physical stress in marine fauna and may result in potential mortality after prolonged exposure. Wolanski (1994) demonstrated that elevated seawater temperatures have the potential to alter the physiological processes of exposed biota. These alterations may cause a variety of effects, ranging from behavioural responses (including attraction and avoidance behaviour), minor stress, and potential mortality after prolonged exposure (Walkuska and Wilczek 2010).

The potential area of impact from PW discharge is conservatively estimated at up to 0.550 km^2 which equates to 0.02% of the Project Area (3, 443 km^2). Although the Pilbara trap and trawl fishery overlaps 15% of the total Project Area, the extent of the fishery potentially impacted by the PW discharge is negligible. The risk to fish populations is further reduced as discussed above, given the constituents of the PW and the overall risk from PW discharge to pelagic fish is not anticipated.

7.2.2.3 Summary of Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-15**

Table 7-15: Summary of impacts, environmental performance outcomes, controls and consequence evaluation of PW discharge during Dorado Phase 1

<table>
<tr><th colspan="2">Environmental Performance Outcomes (EPOs)</th></tr>
<tr><td colspan="2">EPO3B: No mortality or significant[23] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of produced water (PW).
EPO4A: Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring a 99 % species protection level (based on ANZG 2018) for water quality is achieved outside of the PW mixing zone boundary[24].
EPO5A Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring ANZG 2018 sediment quality guideline values are not exceeded outside the PW mixing zone[21].

+ in-field environmental monitoring to verify predicted mixing zone modelling, + in-field environmental monitoring to assess potential impacts against ANZG 2018 water quality and sediment quality guidelines, + PW chemical characterisation, + PW ecotoxicity testing, + tiered management system in response to off-specification water (e.g. storage onboard and retreatment prior to discharge), + studies to verify whether bioaccumulation of toxicants in biota attributable to the discharge of PW, + adaptive management triggers and mitigative measures in response to results of bioaccumulation studies, + adopt changes in relevant legislative requirements and updates to ANZG to PW discharges. **CM9**: Santos chemical selection process will be implemented to select process chemicals with low environmental risk, while meeting technical requirements.	
Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.2.4 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by discharge of PW as a result of Dorado Phase 1 compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-16** and **Table 7-17**. The method by which these acceptable levels were determined and a justification as to why these are acceptable are discussed in **Section 4**.

The worst-case consequence for the discharge of PW was evaluated as minor (**Table 7-15**). This consequence is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from the discharge of PW are acceptable.

Table 7-16: Demonstration of acceptability for the discharge of PW

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	Management of the discharge of PW from Dorado Phase 1 is consistent with the principles of ESD because: + there is no threat of serious or irreversible environmental damage; + the environmental resources within the Project Area are not expected to be significantly impacted; and + the precautionary principle has been applied by setting a trigger zone that is within the modelled discharge plume to meet a conservative 1:1000 dilution, and studies have been undertaken where knowledge gaps were identified (**Attachment 7**). + Adaptive management will also be implemented to compensate for current uncertainties such as actual composition of PW, mixing/dilution processes and bioaccumulation.

Acceptability Criteria	Demonstration of Acceptability
Internal context	The management of PW is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPOs and the controls that will be implemented are consistent with Santos' internal requirements.
External context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	The below conservation advice and recovery plans identify water quality, sediment quality and therefore habitat degradation as an impact to threatened species. **Conservation Advice** + Approved conservation advice for *Pristis clavata* (dwarf sawfish) (Threatened Species Scientific Committee 2009), + Approved conservation advice for *Pristis pristis* (largetooth sawfish) (Threatened Species Scientific Committee 2014b), and + Approved conservation advice for green sawfish (Threatened Species Scientific Committee 2008a). + Conservation advice for *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b) + Conservation Advice Balaenoptera *physalus fin* whale (Threatened Species Scientific Committee 2015c) **Recovery Plans** Sawfish and river shark multispecies recovery plan (Commonwealth of Australia 2015b) - This recovery plan identifies habitat degradation as a threat to sawfish. Impacts to benthic habitats from the discharge of PW will be highly localised within the Project Area. The closest Sawfish BIA (for pupping, nursing and foraging) is approximately 87 km from the southern extent of the Project Area outside the PW modelled impact, therefore,. Santos considers the impacts of produced water discharges to not be inconsistent with the recovery plan. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) - This recovery plan identifies chemical discharges (including PW) as a threat to marine turtles. Impacts from chemical discharges may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of produced water discharges to not be inconsistent with the recovery plan. Recovery Plan for the White Shark (Carcharodon carcharias) (DSEWPac, 2013b) – This recovery plan identifies habitat modification as a potential threat to White Sharks. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges (including PW) may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of PW discharges to not be inconsistent with the recovery plan. Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth

Acceptability Criteria	Demonstration of Acceptability
	of Australia 2015a) – This recovery plan identifies acute and chronic chemical discharge (including PW) as a threat to Blue Whales. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of produced water discharges to not be inconsistent with the recovery plan. Recovery Plans / Conservation Advice for other species that may occur in the Project Area do not identify PW or chemical discharge as a key threat; or have any explicit relevant objectives or management actions related to PW discharge **Commonwealth Marine Areas** Given that the precise composition of the PW is not possible until production is underway, the adaptive management framework provides certainty that the impacts from the discharge of PW in the Commonwealth Marine Area, including the potential for bioaccumulation, will remain within acceptable levels.
Other relevant requirements	Management of the impacts and risks from the discharge of PW associated with Dorado Phase 1 are consistent with relevant legislative requirements, including the management of emissions and releases of mercury and mercury compounds as per the obligations under the Minamata Convention on Mercury. At present there are no specific guidelines in the Minamata convention regarding acceptable levels of mercury in PW releases. The ANZG 2018 provide for guidance and levels of protection for both water and sediment associated with Mercury. Receptor-specific acceptable levels for the management of the discharge of PW have been derived from the species protection levels for water quality presented in the *Australian and New Zealand guidelines for fresh and marine water quality* (Commonwealth of Australia and New Zealand Government 2018). Santos' management of PW is consistent with industry best practice in Australia, for example **CM2** chemical selection process and **CM8** PW adaptive management plan. The adaptive management plan provides for adopting relevant changes in legislation and ANZG 2018 during the Dorado Development.

Table 7-17: Demonstration of acceptability of the discharge of PW against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[25] are acceptable.	The evaluation of impacts from the discharge of PW show that potential impacts will be localised around the discharge location. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity (within the ANZG 2018 water quality guidelines) will be maintained

[25] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

RSAL4: Substantial[26] impacts to water quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable.	beyond 1 km of the discharge location. Given the widespread nature of the open water environment in the region, the discharge of PW from the FPSO will not result in significant impacts to water quality that results in a loss of ecological integrity.
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity[20] are acceptable. **RSAL6**: Substantial[23] impacts to sediment quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable.	The evaluation of impacts from the discharge of PW show that the potential for contaminants in the PW discharge to interact with sediment is very low, given the water depths and resulting dispersion from ocean currents. Although unlikely, it is expected that any potential impacts will be localised to the sediments within the vicinity of the FPSO discharge point. It is also expected that a high level of ecological integrity (within the ANZG 2018 sediment guidelines), will be maintained beyond 1 km of the discharge location. Given the widespread nature of the open water environment in the region, the discharge of PW from the FPSO will not result in significant impacts to sediment quality that result in a loss of ecological integrity.
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1. **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to species listed as threatened or migratory under the EPBC Act as a result of Dorado Phase 1. **RSAL19**: No negative impacts to the economic viability of the commercial fish resources.	The expected potential impacts on marine fauna from PW discharges are limited to fishes. While there is the potential for residual traces of production chemicals in PW discharge, these will be at concentrations that do not pose a significant risk to fish. The risk to fish from production chemicals in the PW discharge, will be further reduced by implementation of Santos' chemical selection process to select chemicals with low environmental risk, reducing the likelihood of any impacts. The transfer and accumulation of contaminants through trophic levels (known as bioaccumulation) is one potential pathway that could lead to adverse impacts if fish congregate and feed in the vicinity of the Dorado facilities for extended periods. However, due to the relatively low concentrations of residual chemical within the PW discharge, the high level of dilution and mixing within the receiving offshore environment, and the ability of pelagic species to avoid discharge plumes, impacts to pelagic fish populations are not expected. To address the uncertainty for potential of bioaccumulation, the adaptive management for produced water discharges includes bioaccumulation studies. The potential area of impact from PW discharge covers a small portion of the Project area (0.02%), posing negligible impact to managed fisheries. The risk to fish populations is further reduced given the constituents of the PW and the overall risk from PW discharge to pelagic fish is not anticipated. As such, impacts on the abundance and quality of commercially targeted fishes are not anticipated.

[26] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

	The assessment of impacts from PW discharges shows that mortality of or significant impacts to threatened or migratory species will not occur. PW has not been identified as a threat in any recovery plans or conservation advice for threatened and migratory species.

7.2.3 Discharges – Wastewater Discharges

7.2.3.1 Description of the Event

A range of wastewater streams will be generated throughout all stages of Dorado Phase 1 and discharged into the marine environment including:

- cooling water;
- grey water;
- sewage;
- reverse osmosis (RO) brine;
- bilge water;
- deck wash;
- drainage water; and
- pipeline hydrotest water.

Each of these discharge streams is described below. Other wastewater streams including PW (**Section 7.2.2**), ballast water (**Section 7.2.3**) and drill cuttings and fluids (**Section 7.2.1**) have been assessed separately, as the nature and scale of these discharges warrants specific assessments.

It should be noted that the actual discharge rates, temperatures and concentrations discussed in this section may vary, however these values have been selected as conservative indications for the purpose of describing and assessing the potential impacts.

7.2.3.1.1 Utility and Cooling Water

The FPSO is expected to generate the highest volumes of utility and cooling water discharges from Dorado Phase 1. The main FPSO systems requiring seawater are the engine room/ bilge ballast and general services; freshwater generator; inert gas system scrubber; ballast and firewater; utility cooling; anchor wash; and process seawater cooling. The FPSO may discharge between 5,100 m^3 to 13,000 m^3 per hour through several discharge ports situated around the FPSO hull during the operational stage.

Utility and cooling water is seawater drawn from sea chest in the FPSO hull, which is treated with a biocide (such as chlorine or copper base biocide) to reduce biofouling risks. The dosing of biocides within the cooling water system will be sufficient to meet technical requirements while making efficient use of biocides (e.g. not over-dosing). Most of the biocide is expected to be consumed within the cooling water system, and the concentration of residual biocide that will be discharged into the marine environment is expected to be relatively low. The biocides typically used in the industry are highly reactive and degrade rapidly in the marine environment. Other chemicals, such as scale inhibitors, may also be used to dose cooling water. Scale inhibitors are typically phosphorous compounds that are water soluble. The cooling water is used in a once-through system and following its use it is discharged to the marine environment. Some systems require constant cooling (such as the freshwater generator and process sweater cooling) while others only require temporary cooling or utility water supply (such as the firewater). The expected maximum utility and cooling water discharge rate (i.e. when all the systems are discharging simultaneously) is approximately 13,000 m^3/h. This assumes that all systems requiring utility or cooling water are discharging at the same time. The minimum (i.e. when only the continuously cooled systems are discharging) is 5,100 m^3/h. The temperature of the discharged utility and cooling water is expected to range between the ambient water temperature and 60°C depending on the system the seawater has been pumped through, and may contain residual traces of biocidal treatment.

Cooling water discharges from other sources (i.e. vessels and MODUs) during Dorado Phase 1 will represent a negligible additional volume compared to the volume discharged by the FPSO. For example, vessels may discharge 210 m^3 to 420 m^3 per hour per vessel.

7.2.3.1.2 Domestic Wastewater

A range of domestic wastewater streams will be discharged during Dorado Phase 1, including:

+ grey water;
+ sewage; and
+ putrescible wastes.

Discharge of these wastes into the marine environment is a standard maritime practice. These discharges will all be made in accordance with relevant requirements including Australian legislation giving effect to MARPOL 73/78.

Grey water is represented by the domestic wastewater from the FPSO, MODU and vessels that is not comingled with sewage. Sources of grey water include showers, sinks and washing machines. The level of grey water generated typically depends on the crewing levels onboard each vessel. Grey water will be generated during all stages of Dorado Phase 1 from the FPSO, MODU and project vessels.

Sewage (also referred to as blackwater) is wastewater that is contaminated with human faeces, urine and toilet paper. It is expected that 0.5 m^3 to 1 m^3 per person per day will be released to the marine environment. Like grey water, sewage will be discharged into the marine environment following treatment in accordance with MARPOL 73/78 during all stages of the Dorado Development. The volumes discharged will depend on crewing levels and the capacity of sewage systems onboard the FPSO, MODU and project vessels. The FPSO, MODU and project vessels will have sewage treatment systems that are in compliance with maritime requirements. Vessels typically discharge sewage when underway, while the FPSO and MODU will discharge sewage when on station under normal circumstances.

Putrescible wastes, such as food scraps, may also be discharged into the marine environment following treatment in accordance with MARPOL 73/78.

7.2.3.1.3 Reverse Osmosis Brine

RO systems are routinely used offshore to generate fresh water from seawater. RO units will be used onboard the FPSO and may also be used on other project vessels. Brine produced as reject water from RO systems will be routinely discharged into the marine environment while RO systems are in operation. Brine discharges are expected to be at ambient seawater temperature and will be approximately 20% to 50% more saline than receiving marine waters.

7.2.3.1.4 Bilge Water

Bilge water collects in the lowest parts of the FPSO and project vessels. It is often water that has drained from other parts of the FPSO or vessel, such as machinery spaces. Bilge water may be contaminated with hydrocarbons, such as lubricating oil or fuel. Bilge water discharges are passed through an oily water separator that will reduce OIW content to ≤ 15 ppm prior to discharge.

7.2.3.1.5 Drains

The FPSO, MODU and vessels will have drain systems. The FPSO will have a range of hazardous (i.e. from hydrocarbon processing areas) and non-hazardous drains. The drainage system will be designed to prevent the discharge of hydrocarbons and chemicals into the marine environment. Drains in non-hazardous areas will be open and drain to the marine environment. Drains in hazardous areas (such as hydrocarbon processing areas) will be closed. All water from the closed drains will be directed inboard of the FPSO to the Slops tank, and treated by an oily water separator that will reduce OIW content to less than 30 ppm prior to discharge.

7.2.3.1.6 Hydrotest Water

Pressure testing of the subsea system is required to assess its structural integrity. Pressure testing is undertaken by using treated seawater and internal pressures monitored to detect any leaks. Hydrostatic testing of the subsea system between the Dorado WHP and the FPSO will require approximately 2,500 m^3 of treated seawater, which will contain biocide and corrosion inhibitor. This will be displaced from the subsea system and discharged into the marine environment, most likely from the FPSO. Hydrotest water is also expected to be discharged during the construction of any future tiebacks.

Hydrotesting to ensure structural integrity of the facilities (Dorado WHP and FPSO), is expected to occur overseas at the construction yards. Nonetheless, hydrotesting could take place in the Project Area, resulting in the discharge of treated seawater to the marine environment.

The chemicals that will be used to treat the seawater have not yet been determined, however all chemicals will be subject to Santos' chemical assessment process. This process will ensure chemicals have an acceptable environmental risk as well as addressing technical constraints, readily degrade in the marine environment, and have a low risk of bioaccumulation. The chemical dosages required will be sufficient to achieve the desired technical outcome (i.e. effective preservation of the subsea system).

7.2.3.2 Details of Environmental Impacts and Risks

A summary of the analysis of the environmental impact of the wastewaters discharges as a result of Dorado Phase 1 is provided in this section. **Table 7-18** identifies the potentially impacted receptors as a result of the discharge of wastewater within the Project Area.

Table 7-18: Receptors potentially impacted by the discharge of wastewaters

Description of the Impact	Receptor Categories
Localised decrease in water quality during the operational stage of Dorado Phase 1.	Water Quality – **Section 7.2.3.2.1** Sediment Quality – **Section 7.2.3.2.2** Marine Fauna – **Section 7.2.3.2.3**

Localised decrease in sediment quality due to the deposition of small quantities of solids during the operational stage of Dorado Phase 1. Potential bioaccumulation of contaminants in marine fauna.	

7.2.3.2.1 Water Quality

A change in water quality will occur following routine and non-routine cooling water discharges due to the addition of biocides and scale inhibitors into the water column. This will result in increased toxicity levels, increased salinity levels and increased water temperature within the vicinity of the discharge points. Water quality within the Project Area, where the discharge would occur, is typical of the offshore marine environment. Surface waters experience high-levels of energy, with wave action and surface currents resulting in rapid dissipation of discharges. Within the immediate area of influence of the discharge, water temperatures will be elevated impacting water quality.

The discharge of wastewater may result in a range of changes in ambient water quality, including:

+ potential toxicity from residual chemicals;
+ increased nutrients;
+ increased temperature; and
+ changes in salinity.

Water quality in the Project Area is considered to be representative of the typical high-water quality found in offshore Western Australian waters.

Residual Chemicals

Several wastewater streams may include residual chemicals which may result in toxic effects, reducing water quality. The wastewater streams with the greatest potential for toxicity are the hydrotest water (due to the presence of biocide and corrosion inhibitor) and the cooling water (due to the presence of residual biocide).

The plume of hydrotest water is expected to mix in the surrounding water once released into the marine environment, either at the FPSO or subsea near the Dorado WHP or FPSO. As the hydrotest water will have similar physical properties to the receiving seawater (e.g. density), there is not expected to be a density interface between the hydrotest water and the surrounding water that would inhibit mixing. The strong tidal currents that occur within the Project Area are expected to rapidly mix the hydrotest water in the receiving marine environment.

The biocide will be the most toxic component of the hydrotest water. As the hydrotest water mixes in the marine environment, the residual biocide will be consumed as it reacts with material in the water column. While the hydrotest water will be anoxic upon release and may have a chemical oxygen demand due to the residual corrosion inhibitor, the surrounding seawater is expected to be well oxygenated as the water column at the release location is well mixed through the majority of the depth profile (**Attachment 5**). The discharge of hydrotest water may result in a localised, short-term decrease in water quality due to the toxic effects of residual chemicals. This decrease is expected to impact primarily upon planktonic communities that cannot avoid the hydrotest water plume. Mobile fauna, such as fish, are expected to detect and move away from the plume. Given the high level of mixing in the receiving waters and high productivity of planktonic communities, any impacts from the discharge are expected to be short term and to recover within days. The planned discharge of hydrotest water is a one-off event and the potential contaminants will degrade within the environment. Hence, the duration of the environmental hazard and associated impacts to water quality will be short-term.

Cooling water discharges may also reduce water quality due to the potential toxic effects of residual biocide. The biocide for use in the cooling water system has not yet been determined but is expected to be either chlorine (e.g. hypochlorite) or copper based. Cooling water containing chemical additives are inherently safe at the low dosages used. The chemical additives are usually consumed in the inhibition process, so there is little or no residual chemical concentration remaining upon discharge.

The proposed biocides are highly reactive and residual traces will be consumed rapidly upon release into the marine environment. Upon release into the marine environment, the cooling water stream will dilute rapidly as the plume becomes mixed in the water column. Studies by Taylor (2006) investigated the effects of chlorination (from biofouling agents used in seawater cooling units) on coastal and estuarine environments which suggested very limited impact of biocide use and the associated chlorination by products on receiving waters, both in terms of plume toxicity or any more widespread ecotoxicological influence. Cooling water will be discharged continuously from the FPSO during the operational stage of Dorado Phase 1. Hence, the impacts from cooling water will be a low intensity but persistent impact to the marine environment. The biocides that may be used will not persist in the environment and impacts from cooling water will cease once the discharge of cooling water ceases.

The concentrations of residual chemicals within the cooling water stream will be relatively low. These chemicals will dilute rapidly upon discharge and will not persist in the environment. The impact to water quality form residual chemicals in cooling water discharges is considered to be minor.

Increased Nutrients

The discharge of sewage and putrescible wastes may result in localised increase in nutrients in the marine environment. Increased nutrients can result in increased productivity, such as blooms of algae, which can result in eutrophication, particularly in waters with little water movement or exchange. The receiving waters in the Project Area are naturally low in nutrients and are very well mixed. The receiving waters are expected to be able to absorb any increases in nutrients with little or no apparent effects. Santos' operational experience indicates nutrients and photosynthetic pigments (an indicator of algal growth) around operating facilities are consistent with reference sites well beyond any potential nutrient sources. As such, impacts to water quality from increased nutrients will be limited to a temporary, very small, localised increase in nutrients and primary productivity around the discharge location following discharge. Eutrophication will not occur as the Project Area is in the open sea and has continuous water exchange driven by tidal currents. The impacts to water quality from increased nutrients are considered to be minor.

Increased Temperature

The cooling water discharge will be warmer than the ambient receiving waters, which will lead to an increase in water temperature in the receiving waters. From industry and Santos' experience operating FPSOs in the NWS, the temperature of the cooling water discharge is expected to rapidly decrease near the discharge location as the cooling water plume mixes with the receiving water. It is expected that the cooling water discharge temperature would be within 3°C of ambient temperature within 100 m of the discharge location.

Water temperatures, particularly in surface waters, vary naturally and planktonic communities are adapted to changes in temperature. Thermal stress of a temperature differential of approximately 5°C has been demonstrated to induce mortality in copepods in a laboratory setting, however the effect could not be detected in response to cooling water discharge in the natural environment (Choi et al. 2012). Choi et al. (2012) suggested this was due to rapid mixing of the cooling water upon release to the receiving waters.

Given the area of potential temperature increases will be highly localised (less than 100 m) around the discharge location, impacts from temperature increases will only occur in a small area. These impacts will be limited to plankton and are expected to not be detectable beyond 100 m from the discharge points. The impacts to water quality from increased temperature are considered to be minor.

Changes in Salinity

The discharge of RO brine will result in an increase in salinity, with the salinity of the brine expected to be up to 50 ppt, compared to a typical salinity of between 32 to 36 5 ppt in the receiving waters. The RO brine will be denser than the receiving water and will sink into the water column. This will encourage turbulent mixing of the brine. Any brine plumes are expected to mix rapidly in surface waters, with any differences in salinity restricted to surface waters. While brine plumes discharged from desalination plants in coastal waters have been shown to result in impacts to benthic communities in coastal waters (Lattemann and Höpner 2008), the volumes discharged by desalination plants are several orders of magnitude greater than the expected brine discharges during Dorado Phase 1. Similar impacts will not occur during Dorado Phase 1 due to the much smaller brine volumes that will be discharged and the water depth of the discharge location (90 m at the FPSO location).

Some of the wastewater discharges, such as domestic waste, may have a lower salinity than the receiving waters. These low salinity discharges are relatively small in volume and are expected to mix rapidly in the receiving environment. The impacts of lower salinity discharges to the marine environment are expected to be similar to natural freshwater inputs, such as rainfall.

Based on the relatively small volumes of discharges that may alter salinity in the receiving waters, along with the well-mixed nature of the environment, impacts from changes in salinity will be limited to very close proximity to the discharge point. The impacts to water quality from changes in salinity are not expected to be of significance.

7.2.3.2.2 Sediment Quality

Wastewater discharges during Dorado Phase 1 will occur at the sea surface (except potentially hydrotest water) and mix rapidly. This will prevent direct interaction between wastewater plumes and the sediments within the Project Area. Some discharge streams are expected to have a high load of suspended solids, such as sewage and putrescible wastes. These solids may be deposited to the seabed, resulting in potential impacts to sediment quality. The FPSO is the most notable source of wastewater with suspended solids due to the sustained crew complement and the long period of time it will be on station within the Project Area. Wastewater discharges from project vessels and MODUs are less like to result in impacts to sediments as they are present in the Project Area for relatively short periods of time.

Studies of suspended solids in sewage indicate the rapid settling of particles achieving settling velocities of up to 25 mm/second (equal to 1.5 m/minute) and most particles had settling velocities much slower than this (Rinas et al. 2019). Assuming this worst-case settling velocity, particles are expected to take approximately one hour to reach the seabed at the FPSO location, where the water depth is approximately 90 m. Given the relatively high levels of water movement in the Project Area, deposition of suspended solids in sewage discharges will be spread over a wide area.

Decomposition of organic matter in wastewater solids is expected to occur upon discharge to the marine environment and continue once deposited on the seabed. This may result in slightly increased concentrations of nutrients and organic carbon in sediments, along with a small increase in biochemical oxygen demand.

Given the expected dilution of wastewater discharges, settling velocity of suspended solids, the water depth in the Project Area and the water movement due to currents, impacts to sediments from wastewater discharges are expected to be limited to a slight increase in nutrients and organic matter, along with a small increase in biochemical oxygen demand. There may be an increase in deposit-feeding benthic biota as a result of these impacts, however any changes in fauna assemblages will not affect ecosystem function. These potential impacts are considered to be minor.

7.2.3.2.3 Marine Fauna

The marine fauna which could be impacted by the discharges of wastewater include plankton, fish, marine mammals and marine reptiles. Given wastewater discharges will primarily occur near the sea surface and will mix rapidly following discharge, pelagic fauna that are at or near the sea surface are most likely to be exposed to wastewater streams. Larval plankton stages are known to be more susceptible to impacts of increased salinity than that of most marine life (Neuparth et al. 2002) and are therefore expected to be the most affected by the increase in salinity in the wastewater discharge plume. Early life stages of fish (embryos and larvae) and other plankton would also be most susceptible to toxic exposure from residual chemicals in the wastewater discharges, as they have limited mobility and are therefore likely to be exposed to at the discharge location, if present. However, these types of organisms are expected to rapidly recover once background water quality is re-established (International Tanker Owners Pollution Federation 2011a), as they are known to have high levels of natural mortality and a rapid replacement rate (Joint Group of Experts on the Scientific Aspects of Marine Pollution 1984). The potential impacts of wastewater discharges on plankton are expected to be localised and are considered to be minor.

Air-breathing marine fauna, such as turtles, cetaceans and seabirds, are generally resistant to potential contaminants in wastewater discharges as their skin forms an impermeable barrier, and thus no noticeable impacts are expected on air-breathing fauna. Fish may be more vulnerable as their gills may form a large area through which potential contaminants may be trapped. Pelagic fish are transient marine fauna that are unlikely to remain within the discharge location and associated plume, which will move around depending on the metocean conditions. Abarnou and Miossec (1992) suggest that mobile organisms such as fish and marine mammals and reptiles may detect and avoid areas with low levels of chlorine (which may be present as residual traces of biofouling treatment in the hydrotest and cooling waters). Chlorine does not persist for extended periods in seawater but is very reactive and its by-products persist longer. It is expected that residual traces of chlorine would rapidly be converted to hypochlorous acid and hydrochloric acid in receiving waters (Australian and New Zealand Environment and Conservation Council and Agriculture and Resource Management

Council of Australia and New Zealand 2000b). Elevated water temperatures have also the potential to induce minor physical stress in marine fauna and may result in potential mortality for prolonged exposure. Wolanski (1994) demonstrated that elevated seawater temperatures have the potential to alter the physiological processes of exposed biota. These alterations may cause a variety of effects, ranging from behavioural responses (including attraction and avoidance behaviour), minor stress and potential mortality for prolonged exposure (Walkuska and Wilczek 2010).

Due to the relatively inert properties and low concentrations of residual chemical traces within the wastewater discharges, the high level of dilution and mixing within the receiving offshore environment as well as the ability of pelagic species to avoid discharge plumes, impacts to pelagic fish would be limited to species that experienced prolonged exposure close to the source of the discharge. The transfer and accumulation of contaminants through trophic levels (known as biomagnification) is one potential pathway that could lead to higher order vertebrate consumers (e.g. marine reptiles and marine mammals, such as the humpback whale and pygmy blue whale) accumulating contaminants and suffering adverse impacts from extended feeding around the activities. While it is difficult to estimate the number that may be affected, it is expected that this would be limited to individuals and a negligible proportion of the population or a species. There is substantial anecdotal evidence of fishes aggregating around offshore petroleum infrastructure discharging wastewater to the sea with little or no apparent impacts. Mobile marine fauna are expected to move away from any areas affected by wastewater discharges that may result in injury or mortality. The potential impacts of wastewater discharges on plankton, fish, marine mammals and marine reptiles are expected to be localised and are considered to be minor. Potential impacts associated with the discharge of wastewater into the marine environment will typically be restricted to within a few hundred metres of the discharge location, and it is expected that the potential impact on the abundance and quality of commercially targeted fishes will be undetectable.

The potential impacts on marine fauna associated with organic enrichment due to wastewater discharges (such as sewage) is expected to be of an order of magnitude less than those associated with residual chemical discharges and the localised increased water temperature.

7.2.3.3 Summary of Impact Evaluation

A summary of the impact analysis and evaluation, including adopted control measures and EPOs is provided in **Table 7-19**.

Table 7-19: Summary of impacts, EPOs, controls and consequence evaluation discharge of wastewater during Dorado Phase 1

EPOs
EPO3C: No mortality or significant[27] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of wastewater. **EPO7A**: Dorado Phase 1 routine planned wastewater discharges compliant with relevant established industry standard environmental discharge limits

[27] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Receptor	Impact
Water Quality	Localised decrease in water quality around wastewater discharge locations.
Sediment Quality	Minor increase in concentrations of contaminants, nutrients and organic carbon in sediments, along with a small increase in biochemical oxygen nutrients around wastewater discharge locations.
Marine Fauna	Potential behavioural disturbance in close proximity to the discharge and bioaccumulation of contaminants in marine fauna.
Controls	
CM9: Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements. **CM10:** All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification): + Marine Order 91 (Marine Pollution Prevention – Oil), which implements Annex I of MARPOL 73/78, including (as required by vessel class): - Machinery space bilge/oily water shall have IMO-approved oil filtering equipment (oil/water separator) with an on-line monitoring device to measure OIW content to be less than 15 ppm prior to discharge. - A deck drainage system capable of controlling the content of discharges for areas of high risk of fuel/oil/grease or hazardous chemical contamination. - Valid International Oil Pollution Prevention Certificate. + Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including: - Garbage management plan in place. - Garbage record book maintained onboard. + Marine Order 96 (Marine Pollution Prevention – Sewage), which implements Annex IV of MARPOL 73/78, including (as required by vessel class): - a valid International Sewage Pollution Prevention Certificate, - an IMO-approved sewage treatment plant, - a sewage comminuting and disinfecting system, - a sewage holding tank sized appropriately to contain all generated waste (black and grey water), and - discharge of sewage will occur at a moderate rate while vessel is proceeding (more than 4 knots).	
Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.3.4 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by wastewater discharges as a result of Dorado Phase 1 compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-20** and **Table 7-21.** The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case consequence for the discharge of wastewater was evaluated as minor (**Table 7-19**). This consequence is considered to be acceptable when assessed against the Santos risk matrix (**Section 4**).

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from the discharge of wastewater are acceptable.

Table 7-20: Demonstration of acceptability for the discharge of wastewater

Acceptability Criteria	Demonstration of Acceptability
Consistency with the principles of ESD.	Management of wastewater discharges from Dorado Phase 1 is consistent with the principles of ESD because: + there is no threat of serious or irreversible environmental damage, + the environmental resources within the Project Area are not expected to be significantly impacted, and + biological diversity and ecological integrity will be maintained.
Internal Context.	The management of wastewater is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context.	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of potential impacts and risks from wastewater discharges.
MNES	The below conservation advice and recovery plans identify habitat degradation as a threat to threatened species. Impacts to the marine environment from the discharge of wastewater will be highly localised. The marine environment that may be affected is widely distributed throughout the Project Area and beyond. As such, Santos considers the impacts of wastewater discharge to not be inconsistent with these conservation advice and recovery plans: **Conservation Advice** + Approved conservation advice for Pristis clavata (dwarf sawfish) (Threatened Species Scientific Committee 2009), + Approved conservation advice for Pristis pristis (largetooth sawfish) (Threatened Species Scientific Committee 2014b), and + Approved conservation advice for green sawfish (Threatened Species Scientific Committee 2008a). + Conservation advice for Rhincodon typus (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice Balaenoptera borealis sei whale (Threatened Species Scientific Committee 2015b) + Conservation Advice Balaenoptera physalus fin whale (Threatened Species Scientific Committee 2015c) **Recovery Plans** Sawfish and river shark multispecies recovery plan (Commonwealth of Australia 2015b) - This recovery plan identifies habitat degradation as a threat

	to sawfish. Impacts to benthic habitats from the discharge of drilling fluids and cuttings will be highly localised within the Project Area. The benthic habitats that may be affected are very widely distributed throughout the Project Area and beyond. The closest Sawfish BIA (for pupping, nursing and foraging) is approximately 87 km from the southern extent of the Project Area. Santos considers the impacts of wastewater discharge to not be inconsistent with the recovery plan. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) - This recovery plan identifies chemical discharges as a threat to marine turtles. Impacts from chemical discharges may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of wastewater discharge to not be inconsistent with the recovery plan. Recovery Plan for the White Shark (Carcharodon carcharias) (DSEWPac, 2013b) – This recovery plan identifies habitat modification as a potential threat to White Sharks. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of wastewater discharge to not be inconsistent with the recovery plan. Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a) – This recovery plan identifies acute and chronic chemical discharge as a threat to Blue Whales. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from chemical discharges may result in a temporary, localised decrease in water quality, which will recover rapidly. Santos considers the impacts of wastewater discharge to not be inconsistent with the recovery plan. Recovery Plans / Conservation Advices for other species that may occurring the Project Area do not identify habitat degradation as a key threat; or have any explicit relevant objectives or management actions related to habitat degradation.
Other Relevant Requirements.	Management of wastewater discharges will be consistent with MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification).

Table 7-21: Demonstration of acceptability of the discharge of wastewater against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[28] are acceptable. **RSAL4**: Substantial[29] impacts to water quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable.	The evaluation of impacts from the discharge of wastewater show that impacts will be localised around the discharge locations. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity will be maintained beyond 1 km of the of the WHP, FPSO and drilling activities. Given the widespread nature of the open water environment in the region, the discharge of wastewater will not result in impacts to water quality that result in a loss of ecological integrity.
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity[24] are acceptable. **RSAL6**: Substantial[25] impacts to sediment quality within 1 km of the WHP, FPSO, future tiebacks and drilling activities are acceptable.	The evaluation of impacts from the wastewater discharge shows that potential for contaminants in wastewater to interact with sediment is low (limited to a slight increase in nutrients and organic matter, along with a small increase in biochemical oxygen demand). Given the anticipated dilution of wastewater discharges, settling velocity of suspended solids, the water depth in the Project Area and the water movement due to currents, it is expected that potential impacts will be localised to the sediments within the vicinity of the discharge points. It is also expected that a high level of ecological integrity will be maintained beyond 1 km of the Dorado WHP, FPSO and drilling activities. Given the widespread nature of the open water environment in the region, the discharge of wastewater will not result in impacts to sediment quality that result in a loss of ecological integrity.
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat	The expected potential impacts on marine fauna from wastewater discharges are limited to localised impacts on plankton and fishes. While there is the potential for levels of residual chemicals or temperature increases that could injure or kill marine fauna in the event of prolonged exposure, the transient nature of the marine fauna does not suggest that this would occur. Impacts will be limited to any individual that remain within the plume for a prolonged period, and it is not likely that there would be any notable impact to fish populations. These impacts are expected to

[28] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[29] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

abatement plans published by the DAWE. **RSAL16**: No significant[30] impacts to species listed as threatened or migratory under the EPBC Act as a result of Dorado Phase 1. **RSAL19**: No negative impacts to the economic viability of the commercial fish resources.	be minor and localised, with no impact on the abundance and quality of commercially targeted fish populations. The assessment of impacts from wastewater discharges shows that mortality or significant impacts to EPBC Act listed threatened, migratory or cetacean species will not occur. Wastewater discharge has not been identified as a threat in any recovery plans or conservation advice for threatened and migratory species.

7.2.4 Emissions – Artificial Light

7.2.4.1 Description of the Event

The operation of drilling rigs, vessels and facilities associated with the project will generate artificial light emissions. Light emissions from the project will be associated with lighting of drilling rigs, project vessels and facilities for operational and safety requirements within the Project Area. Light sources are summarised in **Table 7-22**.

Table 7-22: Summary of potential light sources for Dorado Phase 1

Project stage	Light source	Lighting Requirement	Lighting Details
Installation	Project vessels (Installation and Support)	Installation activities	Installation of WHP, flowlines, FPSO facility moorings and riser column via project vessels. Lighting will be required temporarily to support installation activities which will be 24 hour operations. Light sources will include navigational and operational light on vessels.
	MODU	Development drilling	Temporary lighting at the WHP location during the development drilling stage (approximately two years). Light sources include continuous navigational and operational lighting on the MODU, and intermittent flaring (1 to 2 days per well, up to 16 wells) associated with wellbore and casing clean-up and flowback (to remove any remaining drilling or completion fluids, debris and solids coming out of the formation and perforations).

[30] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

Project stage	Light source	Lighting Requirement	Lighting Details
Commissioning	FPSO Commissioning	Facility Commissioning	Intermittent high-pressure flaring occurs during commissioning of the FPSO topside systems. Four compressions systems require commissioning individually (reinjection compression, HP compression, LP compression, Vapour recovery unit). Each well will need to be commissioned on a sequential basis, building up to full field flow. During this period the above compression systems will be commissioned as the gas flow rates allow. An allowance for flaring during this period for problems that are encountered during commissioning of the compressors. Short duration of activity approximately up to 3 months, and intermittent flaring (as each system is commissioned).
Operations	Not normally manned WHP	Operations	Light sources include continuous navigational lighting and intermittent operational light during manned periods to support maintenance campaigns, well interventions.
	Manned FPSO	Operations	Continuous lighting (except when the FPSO is disconnected from the mooring). Light sources include continuous navigational and operational light and flaring. FPSO equipped with a low-pressure and a high-pressure flare. The low-pressure flare is a continuous flare required to support safe operations. High-pressure flaring occurs during upset conditions and emergency shutdown. The flare height has been conservatively estimated as 110 m, noting that this will be revised during FPSO design and in accordance with safety requirements.
	Offtake tankers	Operations	Navigational and operational lighting on offtake tankers. Offtakes expected to initially be once per week, with frequency of offtake declining as production declines. Offtake operations may take up to 48 hours.
	Support vessels	Support operations, IMMR activities	Support vessels will be continuously present within the Project Area. Light sources will include navigational and operational light.
Future tiebacks	Project vessels	Future tiebacks	Construction and other vessels will be required to support installation of infrastructure for future tiebacks. The timing and duration of tieback activities has not been determined. Light sources will include navigational and operational light.
Wel l inte rve	MODU	Development Drilling (infill	Periodic MODU lighting associated with well intervention or infill drilling at the WHP or

Project stage	Light source	Lighting Requirement	Lighting Details
		wells and future tiebacks) and well intervention	development drilling associated with future tiebacks. Light sources will include navigational and operational light, and intermittent flaring associated with well clean-up, 1 to 2 days per well, with flaring sequential as each well is completed. The flaring will be limited by the capacity of the rig used to drill the well (less than the FPSO flare). The timing and duration of tieback development and infill activities have not been determined.
Decommissioning	Project vessels	Removal of infrastructure	Lighting requirements on vessels during decommissioning activities. Light sources will include navigational and operational light. The timing and nature of decommissioning activities has not been determined.
	MODU	Plugging and abandonment of wells	Lighting requirements during well abandonment activities. Light sources will include navigational and operational light. No flaring is expected. The timing and nature of well abandonment activities has not been determined.

The characteristics of light emissions associated with sources described in **Table 7-22** will differ depending upon the number, intensity, spectral output and type of light. Historically, vessels and facilities use a combination of high-pressure sodium, fluorescent, metal halide and mercury vapour lights. Recent advances in light emitting diode technology has seen a switch to this more efficient and cost-effective technology. The nature of the emissions will be a result of the final project design and schedule of activities. Operational lights of the FPSO are intended to be light emitting diodes, although the light sources associated with vessels and facilities are currently unknown and could comprise of any or a combination of those mentioned above. As such a conservative approach has been taken where the greatest potential emissions have been modelled and assessed for the purpose of describing potential impacts from light emissions.

There is limited published information regarding light characteristic of flares. Pendoley (2000) showed that the intensity of two flares (a tower flare and a pit flare) at Thevenard Island, Western Australia, peaked at between 650 to 700 nm. This result is similar to three other flares measured in Australia (Pendoley Environmental, unpublished data). Pendoley (2000) found no significant spectral difference between the two flares types, or when varying flow rates.

7.2.4.1.1 Artificial Light Emissions Modelling

The two main sources of light emissions for the Dorado Project are facility lighting and the flare. FPSO operations presents the greatest source of artificial light based on its size, maximum possible intensity (from a full process blowdown flaring event), permanently manned operations, and continuous presence in the Project Area over an estimated 20 year field life (aside from when disconnected and off station). Light sources on the FPSO also include navigation and operational lighting.

The following light emissions sources have been excluded from the modelling to inform the risk assessment:

- Light emissions from support vessels throughout operations or development well drilling (including future tiebacks) due to low intensity and/or temporary and transient nature of support vessel movements;
- Light emissions from the MODU during development well drilling (including future tiebacks) due to low intensity and temporary duration (1 to 2 days per well, with flaring sequential as each well is completed) and limited by the rig flare capacity (less than FPSO); and
- Light emissions during commissioning due to the short duration (approximately up to 3 months) and intermittent flaring over that period (as each system is commissioned sequentially).

Light emissions associated with the FPSO were modelled to represent light emissions associated with Dorado Phase 1 (**Attachment 9**).

Two scenarios were modelled:

- operational lighting with no flaring; and
- operational lighting including flaring.

The facility's lighting design and luminaire specifications were applied to the ILLUMINA artificial light at night model (Aubé et al. 2005). The ILLUMINA model is a 3-D model that predicts both the extent of visible light and radiance (light received in a specific area) (**Attachment 9**). In this assessment light is described in terms of radiance. Radiance describes the light received in a specific area and is provided in the units $W/m^2/sr$, where W = watts, m^2 = meters squared and sr = steradian (unit of solid angle, equal to the angle at the centre of a sphere subtended by a part of the surface equal in area to the square of the radius) (**Attachment 9**).

In the absence of any published or generally accepted units or scale for measuring the impact of ALAN on wildlife, moonlight was selected as a proxy (considered representative of ambient light levels marine fauna are adapted to). The light model output (radiance, units of $W/m^2/sr$) was converted to units of full moon equivalents in an attempt to give the radiance output some biological relevance and to aid interpretation in an environmental impact assessment context. The light emissions are considered to have reduced to ambient when radiance is less than the equivalent of 0.01 ($1/100^{th}$) of one full moon.

In the non-flaring scenario, the model results show that radiance has reduced to ambient (less than 0.01 full moon equivalent) at 17.7 km from the source. In the flaring scenario, the flare is no longer directly visible at 42.4 km, when the flare drops below the horizon (**Figure 7-8** and **Figure 7-9**). At this distance, the radiance is equivalent to 0.25 full moons. As the flare drops below the horizon, radiance declines rapidly and is no longer visible.

The nearest shorelines are Bedout and Turtle Island, at approximately 70 km and 95 km from the FPSO respectively. No light associated with the FPSO will be visible from beaches on these islands, as shown in **Figure 7-8** and **Figure 7-9**.

Figure 7-9 presents the combined critical and important habitat for marine turtles (hawksbill, green and loggerhead turtles). Radiant light sources overlap one important habitat, the flatback turtle internesting BIA centred around North Turtle Island, approximately 39km from the Project Area.

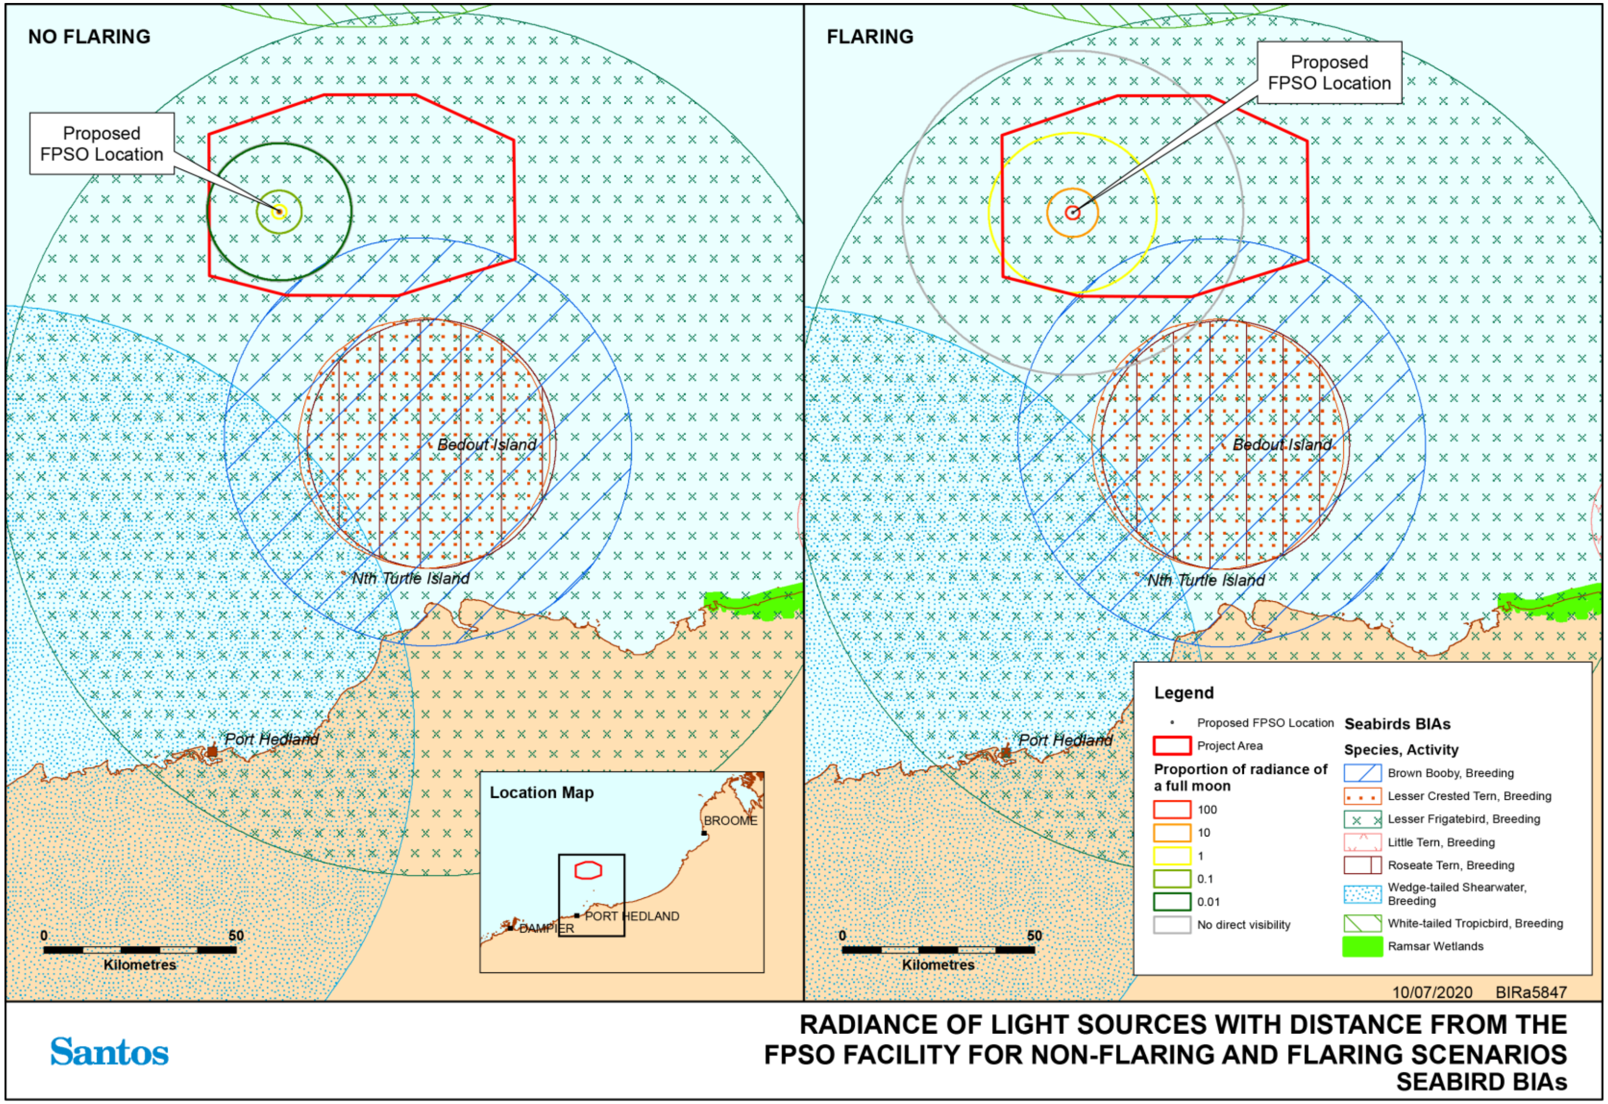

Figure 7-8: Radiance of light sources with distance from the FPSO facility for non-flaring and flaring scenarios in relations to seabird BIAs

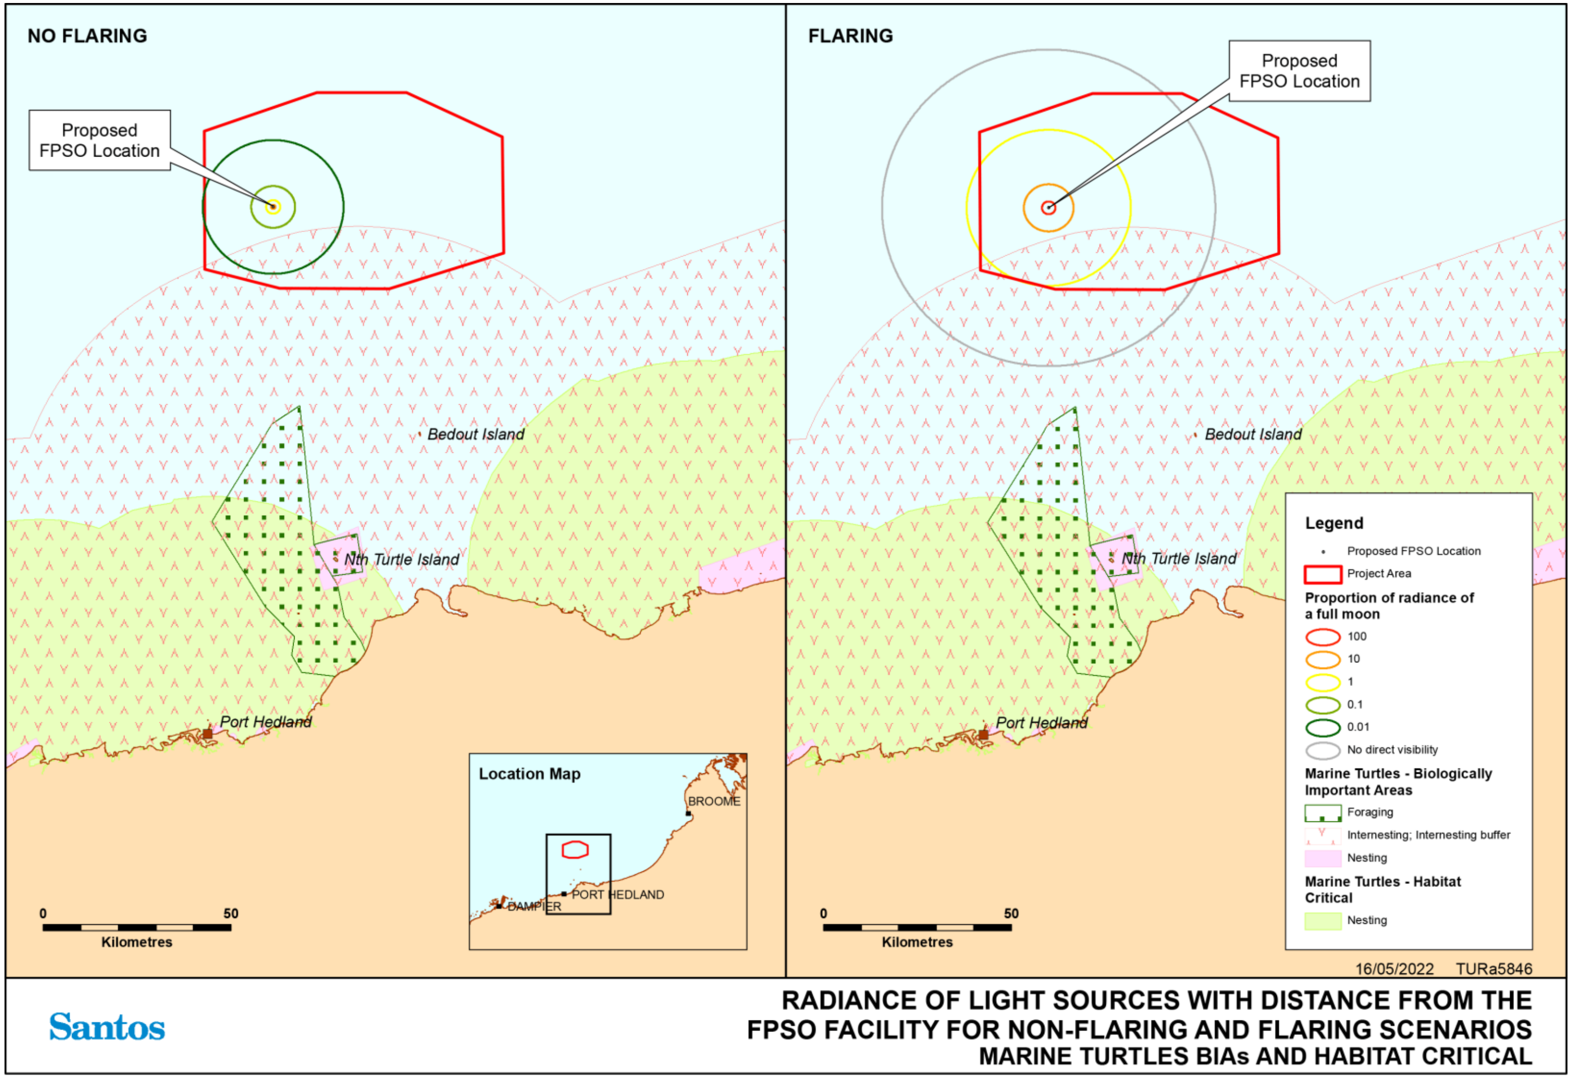

Figure 7-9: Combined BIAs for marine turtles (hawksbill, green and loggerhead turtles), including radiance of light sources with distance from the FPSO facility for non-flaring and flaring scenarios. in relation to turtle critical habitats and BIAs

Given that the future tiebacks may include flaring, light emissions modelling results for the Dorado facilities has been extrapolated for a potential tieback location in the southern extent of the Project Area (**Figure 7-10**) selected as a 'worst-case' location due to its proximity to the turtle and bird sensitivities. It should be noted, as per **Table 7-22** the flaring from future tiebacks would be intermittent, lower intensity and of short duration (1-2 days) from the drilling MODU, therefore the application of modelling is conservative. **Figure 7-10** shows should flaring occur at the southern edge of the operational area (from drilling potential tieback wells), light emissions would not overlap critical habitats for marine turtles. The lack of permanent infrastructure in the area suggests that other artificial light sources will be restricted to the temporary presence of shipping vessels associated with the shipping fairway, and fishing vessels.

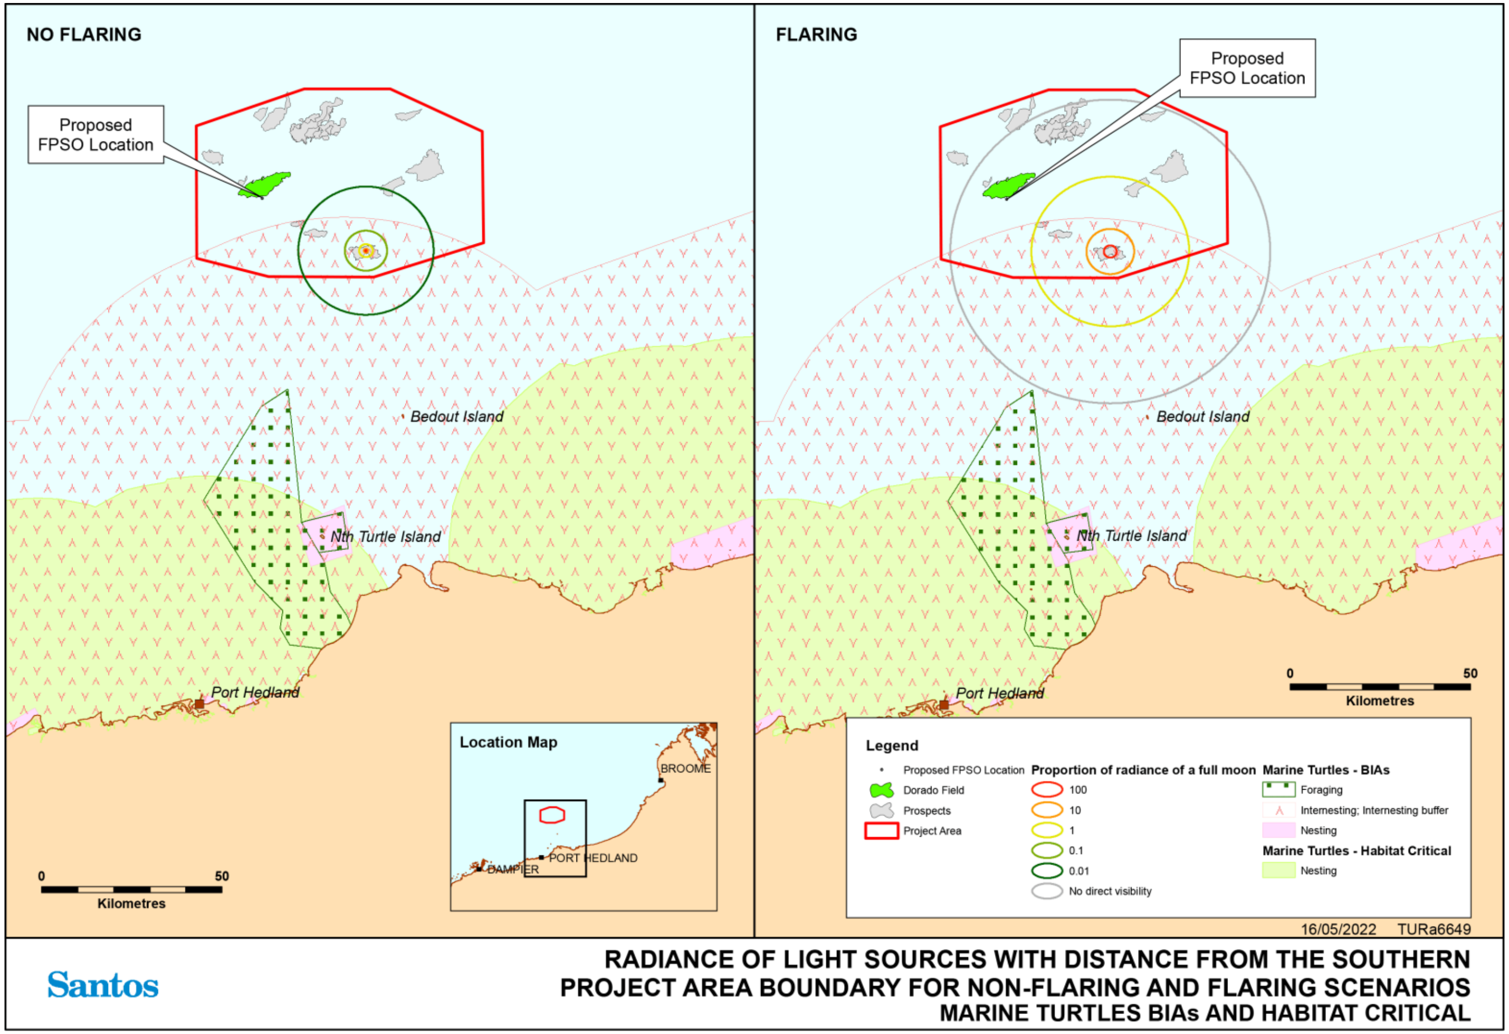

Figure 7-10: Combined BIAs for marine turtles (hawksbill, green and loggerhead turtles), including radiance of light sources from a worst case future tieback location for non-flaring and flaring scenarios.

7.2.4.2 Details of Environmental Impacts and Risks

Light is a form of energy that is emitted over a particular band of frequencies and wavelengths of the electromagnetic spectrum. The visible range (for humans) is typically 400 to 700 nm, with ultraviolet below this wavelength range, and infra-red above it. Fauna perceive light differently to humans, and their visible spectrum can vary between about 300 nm and more than 700 nm depending on the species (Commonwealth of Australia 2020); i.e. it can extend into the ultraviolet and infra-red spectra. Therefore, the potential impact from artificial light emissions can vary depending on the specific characteristics of the source (e.g. light intensity, wavelength) and the sensitivities of the receptor.

Artificial lighting can alter critical behaviours in wildlife. For some species, artificial lighting may extend diurnal or crepuscular behaviours by improving an animal's ability to forage (e.g. Hill 1992). For nocturnal species, artificial light can result in detrimental changes in behaviour.

The severity to which artificial light negatively impacts individuals depends upon the vulnerability, which varies between and within species, depending upon their behaviour, and on the spectral output of the light emissions. The sensitivity of different species to different wavelengths is summarised in **Figure 7-10** which shows that most species are sensitive to short wavelength light (ultraviolet/violet/blue). The potential impact of light emissions associated with Dorado Phase 1 on these receptors are described below.

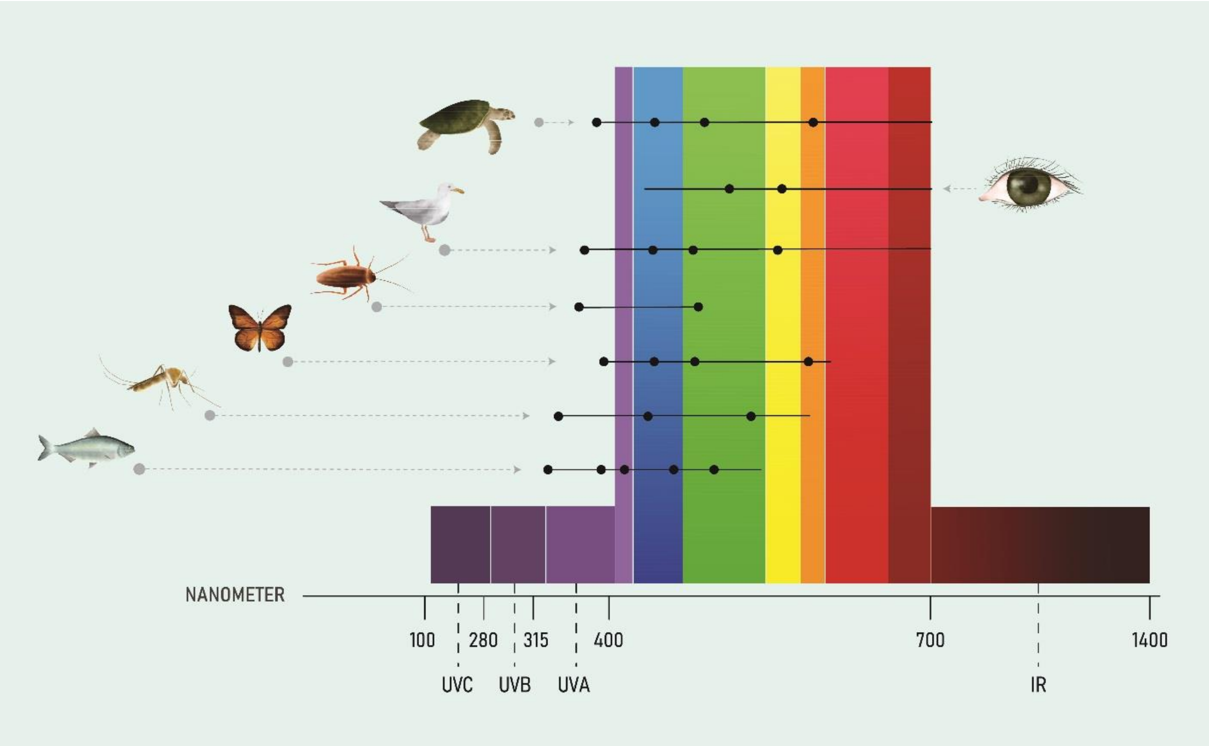

Figure 7-11: Visibility of different wavelengths of light in humans and wildlife is shown by horizontal lines. Black dots represent reported peak sensitivity (Commonwealth of Australia, (2020a).

Impacts of artificial light emissions are expected to be restricted to within line of sight of Dorado Phase 1 for receptors above the sea (e.g. migratory birds). Impacts of artificial light emissions within the water column will be restricted to the vicinity of Dorado Phase 1 facilities due to the rapid attenuation of light in water compared to air. Considering the water depths of the Project Area (70 to 120 m) light emissions from surface infrastructure and vessels are unlikely to penetrate to the seafloor.

Table 7-23 identifies the potentially impacted receptors as a result of artificial light emissions within the Project Area.

Table 7-23: Receptors potentially impacted by artificial light emissions

Description of the Risk	Receptor Categories
Behavioural impacts to marine fauna as a result of artificial light emissions.	Plankton – **Section 7.2.4.2.1** Fish – **Section 7.2.4.2.2** Marine Mammals – **Section 7.2.4.2.3** Reptiles – **Section 7.2.4.2.4** Birds – **Section 7.2.4.2.5**

No credible impacts to the physical environment as a result of artificial light emissions were identified. Impacts to socio-economic receptors, such as reduced visual amenity, will not credibly occur as artificial light emissions will not be visible from residential areas. The nearest town, Port Hedland, lies approximately 143 km from the proposed FPSO location, which is well beyond the distance at which the flare will be below the horizon.

7.2.4.2.1 Plankton

Diel vertical migration is an omnipresent phenomenon in plankton communities whereby plankton migrate to surface waters at dusk and return to deeper waters at dawn (see Hays 2003 for review). The migration patterns have also been shown to be influenced by the lunar cycle (Ochoa et al. 2013). Although evidence has shown that such migration also occurs in the deep sea where no direct and background sunlight penetrates (van Haren and Compton 2013), light levels in the water column are thought to be strong cues for DVM (Hays 2003). These vertical migrations of zooplankton are integral to structuring pelagic communities since they influence the behaviour of predators (Hays 2003). While not empirically tested, it is possible that artificial light could disrupt Diel vertical migration should the intensity of the light exceed other light cues. Disruption to migration could potentially reduce survival of zooplankton on an individual level.

The reproductive biology of marine invertebrates is influenced by light cues, and may include broadcast spawning, larval phototaxis and recruitment (see Garratt et al. 2019 for review). Micronekton invertebrates (such as krill) may be affected by artificial light via the same pathways described for zooplankton above.

The effects of artificial light on zooplankton would most likely be confined to areas of direct light spill on the ocean surface which would be restricted to areas in close proximity to facilities and vessels, and in the case of impacts to fish spawn, limited to surface waters. Any mortality to zooplankton as a result of artificial light is not expected to be detectable above natural morality rates, which are very high (exceeding 50% per day in some species and commonly exceeding 10% per day) (Tang et al. 2014). Further, ocean currents in the region will continually circulate and replenish zooplankton in Project Area. This will limit potential impacts to localised changes in zooplankton distribution, potentially altering predator distribution at most. Population or ecosystem level effects, both in terms of the regional biomass of zooplankton and of fish or invertebrate populations which may include egg or larval stages, are not considered credible.

7.2.4.2.2 Fish

Behavioural responses of fish to artificial light have been demonstrated in various fish species (Marchesan et al. 2005; Nguyen and Winger 2019). Nguyen and Winger (2019) describe four common movement patterns of fish in response to light; phototaxis (movement towards or away from light), photokinesis (movement or lack of movement in response to light), aggregation and DVM (see **Section 7.2.4.2.1**) and showed that behavioural responses are influenced by both wavelength and intensity. Since many predatory fish rely on visual cues to locate and capture prey, increased light can lead to changes in predator-prey interactions. For example, the proportion of herring *Clupea harengus* feeding increased with prey density in high light intensity experiments, while under dark conditions, increased food availability failed to trigger a similar increased feeding response (Batty et al. 1990).

Light emissions associated with Dorado Phase 1 may influence behaviour of fish resulting in aggregation or increased abundance of fish in the vicinity of facilities. Aggregation around moving vessels is less likely. Whale sharks may forage around the facilities if prey abundance is increased, however, this is unlikely to impede migration. Light has not been identified as a key threat for the whale shark (Commonwealth of Australia, 2005).

The area of impact is likely to be restricted to areas where light is directly visible to fish such as areas of light spill on the ocean surface. The behavioural responses are unlikely to significantly alter critical behaviours such as migration or spawning, reducing the credibility of population level effects.

7.2.4.2.3 Marine Mammals

There is a paucity of research investigating the effects of artificial lighting on marine mammals and direct effects of artificial lighting on cetaceans have not been reported. Many dolphin species are thought to be diurnal, or at least more active during the day, possibly related to prey availability (Sekiguchi and Kohshima 2003). Since fish species may pool in areas of light spill, dolphins may be indirectly attracted to lit structures or illuminated marine environments for foraging purposes.

Since mammals use variations in the length of day to anticipate environmental changes and time their reproduction, light pollution which affects day length perception could lead to changes in biological functions. However, marine mammals occurring within the region will be transient in the Project Area. There is potential for opportunistic foraging should prey abundance be increased; however, individuals are unlikely to be exposed to artificial light for durations sufficient to impact biological functions.

7.2.4.2.4 Reptiles

Marine turtles

Potential impacts of artificial light on marine turtles has been well documented, although the vulnerability of individuals to negative impacts is influenced by life history stage and behaviour.

While the behavioural responses of marine turtles are relatively well understood, there is currently no quantitative impact thresholds for artificial light due to the expansive suite of factors that influence individual vulnerability. In addition to the intensity of the light source, the spectral power distribution (wavelength and colour), atmospheric scattering, cloud reflectance, spatial extent of sky glow, duration of exposure, horizon elevation and lunar phase can all influence behavioural responses to varying degrees.

Wavelength in particular has been shown to significantly affect the vulnerability of individuals to artificial light. In general, artificial light rich in short wavelength blue and green light are most disruptive (Fritsches 2012; Pendoley 2005; Witherington 1992). Green, flatback and loggerhead turtles all show increased sensitivity to wavelengths less than 600 nm (Fritsches 2012; Levenson et al. 2004; Pendoley 2005) with green and flatback turtles showing stronger preference for blue light less than 500 nm (Fritsches 2012; Pendoley 2005). Although longer wavelengths of light are less attractive than shorter wavelengths, long wavelength light can still disrupt sea-finding of hatchlings (Pendoley and Kamrowski 2015, Pendoley 2005, Robertson et al. 2016), and if bright enough can elicit a similar response to shorter wavelength light (Cruz et al. 2018; Mrosovsky 1972; Pendoley and Kamrowski 2015). Hence, the disruptive effect of light on hatchlings is also strongly correlated with intensity. Red light must be almost 600 times more intense than blue light before green turtle hatchlings show an equal preference for the two colours (Mrosovsky 1972).

Pendoley Environmental (**Attachment 9**) outline conservative potential impact criteria at light intensities relative to moon phase. It is considered that at intensities greater than the equivalent of $1/10^{th}$ of a full moon (0.1 full moon equivalents) behavioural impacts are possible, depending on ambient moon phase at the time of exposure, which will influence the visibility of the artificial light sources equivalent to the light output.

Foraging and Migration

Foraging adult turtles have been observed feeding on prey presumed to be attracted by lights of oil production platforms in the Gulf of Mexico (Kebodeaux 1994). However, illumination of fishing gear has been shown to reduce the bycatch of green turtles as it is thought that light sources alert them to the presence of a net (Ortiz et al. 2016). This suggests that marine turtles are most likely attracted to increased prey abundance around offshore facilities, rather than the light sources itself. Foraging marine turtles may be observed around Dorado Phase 1 facilities and vessels in response to increase prey abundance, however, this is not expected to result in negative impact at the individual or population level.

Mating, Internesting and Migration

Marine turtles do not forage during the breeding season and light cues are not thought to guide migration, mating or internesting behaviours. Further, to date, there is no evidence to suggest internesting turtles are attracted to light from offshore vessels. The Flatback Turtle inter-nesting BIA is the only BIA that intersects the Project area or extends to locations where light from flaring (FPSO and/or southern tieback flaring) is visible.

Nesting and Hatchling Emergence

Adult female marine turtles return to land, predominantly at night, to nest on sandy beaches, relying on visual cues to select and orient on nesting beaches and return to the ocean post nesting. Artificial lighting on or near beaches has been shown to disrupt nesting behaviour (see Witherington and Martin 2000 for review). Hatchling turtles emerge from the nest, typically at night, and must rapidly reach the ocean to avoid predation (Salmon 2003). Artificial lights interfere with natural light levels and silhouettes, which disrupts hatchling sea-finding behaviour (Kamrowski et al. 2014; Pendoley and Kamrowski 2015; Witherington and Martin 2000).

Results of the light modelling show that light in either modelled scenario is not visible at the nearest turtle nesting beaches on Bedout and Turtle Islands (**Attachment 9**). Therefore, artificial light associated with the FPSO, including during flaring, is not expected to result in negative impacts to nesting females and emerging hatchlings.

Hatchling Dispersal

Once in nearshore waters, artificial lights on land can also interfere with the dispersal of hatchlings. Presence of artificial light can slow down their in-water dispersal (Wilson et al. 2018; Witherington and Bjorndal 1991) or increase their dispersion path, potentially depleting yolk reserves, or even attract hatchings back to shore (Truscott et al. 2017). In addition to interfering with swimming, artificial light can influence predation rates, with increased predation of hatchlings in areas with significant sky glow (Gyuris 1994; Pilcher et al. 2000). Since the nearshore area tends to be predator-rich, hatchling survival may depend on them exiting this area rapidly (Gyuris 1994). Should this be the case, aggregation of predatory fish occurring in artificially lit areas and under artificial structures (Wilson et al. 2019) may further increase predation of hatchlings.

Results of the light modelling suggest that light levels of the FPSO without flaring may result in a behavioural response within 5.5 km and more likely within 1.8 km (**Attachment 9**). During flaring these distances are increased to 42.4 km and 20.7 km (**Attachment 9**). The spectral output of the flare is expected to be outside the peak sensitivity of marine turtles reducing the vulnerability of individuals to behavioural impacts. However, impacts may still occur if intensity is great enough, especially considering the absence of competing light sources in the vicinity of the Project Area.

While not tested empirically due to the logistical constraints of tracking large numbers of hatchlings concurrently, the density of hatchlings will decrease with distance from the nesting beach as individuals disperse in open ocean. Given the distance between the proposed FPSO location and the nearest turtle nesting beaches (Bedout and Turtle Islands, 70 km and 95 km respectively), the density of hatchlings is expected to be low within 42.4 km of the flare, and lower still within 5.5 km of the FPSO. Due to the strong tidal currents in the region (**Section 3.2**), it is not considered credible that hatchlings would be able to swim towards, and remain in, areas of light spill. However, should hatchlings be carried within a distance of light sources where attraction may occur, an increase in energy expenditure could occur in a small number of hatchlings attempting to remain in the areas of light spill. Given that attraction could only occur during hours of darkness, the potential impact at the individual level is temporary only. At the population level, the consequence of increased energy expenditure in a negligible number of hatchlings is not expected to increase mortality above that of natural levels.

Sea Snakes

Documentation of the effects of artificial lighting on sea snakes is lacking. However, as active and intensive foragers that display prolonged episodes (weeks) of continuous effort in search of prey (Bonnet 2012), sea snakes may be attracted to well-lit areas around marine infrastructure due to the associated attraction of prey species. It is not expected that such a behavioural response would significantly alter behaviour or habitat use to the long-term detriment of sea snake populations.

7.2.4.2.5 Birds

Artificial light can have a variety of effects on seabirds depending upon the species and the life stage or behaviours being undertaken at the time. Negative responses of birds to artificial light may include collision, entrapment, stranding, grounding, disorientation or interference with navigation (being drawn off course from usual migration route), potentially resulting in reduced fitness, injury and/or death (see Commonwealth of Australia 2020 for review).

Species with a nocturnal component of their life history, such as procellariforms (albatrosses, petrels and shearwaters), are at greater risk of negative impacts. The bulk of the literature concerning impacts of lighting upon procellariforms relate to the synchronised mass exodus of fledgling seabirds from their nesting sites (Deppe et al. 2017; Le Corre et al. 2002; Raine et al. 2007; Reed et al. 1985, Rodríguez et al. 2015b, 2015a), with fewer investigating the impacts of light at sea. Reports of interactions between seabirds and artificial light at sea is generally anecdotal following significant interaction events (e.g. Black 2005) or by unsystematic monitoring by oil and gas operators (e.g. Day et al. 2015; Glass and Ryan 2013; Ronconi et al. 2015; Wiese et al. 2001). Deck lights and spotlights on fishing vessels have been recorded attracting numerous seabirds at night, particularly on nights with little moon light or low visibility (Black 2005; Merkel and Johansen 2011; Montevecchi 2006).

While it has been shown that all seabirds are sensitive in the shorter, violet – blue region of the visible spectrum (380 nm to 440 nm (Machovsky-Capuska et al. 2011)), white light poses a potential threat to seabirds as they contain all wavelengths of light (Deppe et al. 2017; Wiltschko et al. 1993). Further, Raine et al. (2007) concluded the intensity of light may be a more important cue than colour; a very bright light will attract seabirds, regardless of the colour.

That procellariforms are shown to be attracted to artificial lights on land, and anecdotally to vessels and oil and gas facilities, in addition to undertaking nocturnal foraging on bioluminescent prey, makes them susceptible to attraction to light sources in the Project Area and negative impacts that could result. The light modelling undertaken assumed the receptor was located at ground level and does not account for a bird in flight. This is most relevant to the result of the flaring scenario where light intensity decreased rapidly once the source dropped below the horizon.

The nearest BIA for procellariform species is approximately 45 km of the Dorado FPSO (a wedge-tailed shearwater breeding BIA) suggesting that any interaction between procellariforms and the facilities would be limited to individuals rather than populations.

Diurnal seabird species, such as terns, noddies and boobies, in contrast to procellariforms, are less vulnerable to impacts resulting from nocturnal behaviours. However, the presence of facilities can alter foraging behaviours and provide artificial roosting sites. Several species of terns and boobies nest in large numbers at Bedout Island, in addition to the lesser frigatebird (Burbidge et al. 1987). Although reports describing the interaction between these species and offshore facilities are lacking, Tasker et al. (1986) reported that a variety of seabird species recorded around oil platforms were observed feeding by the light of the gas flare at night, pecking at small unidentified items in the sea, a behaviour was noted less frequently during the day. Ortego (1978) reported that the only impact of artificial light associated with an oil rig in the Gulf of Mexico on the blue faced booby was increased foraging.

There is a paucity of literature on the sensitivity of diurnal seabirds to different wavelengths. Studies on the eye physiology of gulls and terns found that visual pigments were present in some, but not all, species for vision in the short wavelength ultraviolet region of the spectrum, in addition to the violet (blue) region of the spectrum (Machovsky-Capuska et al. 2011). However, despite being a predatory diving bird, experiments on cormorants suggest that these birds have poor visual resolution in water (Martin et al. 2008).

Presence of light sources in the Project Area may attract diurnal seabird species via increased prey availability and extended foraging activities. The artificial light emissions from offshore facilities may also have the potential to impact seabirds through collisions with infrastructure due to visual disorientation, particularly during periods of low visibility (e.g. cloudy, overcast or foggy conditions) (Wiese et al., 2001). Newly fledged juvenile birds leaving breeding colonies for the first time are the most prone to disorientation by artificial light (Commonwealth of Australia, 2019). Although such attraction increases the risk of collision with facilities, incidents of collision of diurnal species, or similar taxonomic groups, are few (see Ronconi et al. 2015 for review).

As with diurnal seabirds, artificial lighting has been shown to influence the foraging behaviour in shorebirds, with increased foraging success in areas illuminated by artificial light (Santos et al. 2010). Although shorebirds may be attracted to foraging areas with increased illumination, artificial light near nocturnal roosting sites may displace shorebirds if they select darker roost areas where risk of predation is perceived to be lower (Rogers et al. 2006). Given the lack of natural roost sites or intertidal foraging areas in the vicinity of the Project Area, artificial light is unlikely to impact these behaviours.

Artificial light may attract migratory shorebirds in flight (Longcore et al. 2013), influencing stopover selection and impacting successful migration and decrease fitness (McLaren et al. 2018). The FPSO is located approximately 146 km from Eighty Mile Beach, a Ramsar site of international importance for migratory shorebirds in the east Asian-Australasian flyway (Bamford et al. 2008) (**Figure 3-22**). While migration pathways for species occurring at Eighty Mile Beach are poorly defined, birds may migrate through the Project Area. Sage (1979) (cited in Ronconi et al. 2015) reports incidents of migrating waders colliding with offshore platforms, though whether this was due to attraction by artificial light is unknown. The exact mechanism for navigation of migratory birds is not clear, however, it is widely thought they use a mixture of natural cues, including the earth's magnetic field, solar and celestial orientation and polarised light patterns to determine their migratory pathway (Weindler and Liepa, 1999; Wiltschko and Wiltschko, 2001).

There is a risk that artificial light sources along migratory pathways may alter natural patterns, specifically in the absence of terrestrial landmarks (i.e. offshore). Studies have demonstrated that light from offshore facilities has been shown to attract migrating birds, with species that migrate during the night more likely to be affected (Marquenie et al., 2008; Verheijen, 1985). Birds can either be attracted by the light source itself or indirectly as lighted structures in marine environments tend to attract marine life at all trophic levels, creating food sources and shelter for seabirds. In some cases, sources of artificial light may provide enhanced capability for seabirds to forage at night (Verheijen, 1985). Studies in the North Sea indicate that migratory birds may be attracted to lights on offshore platforms when travelling within a radius of 3 to 5 km from the light source. Outside this area their migratory paths are likely to be unaffected (Marquenie et al., 2008). Artificial lighting may interfere with a bird's internal magnetic compass. It is thought that migratory birds require light from the blue-green part of the spectrum for magnetic compass orientation (Muheim et al., 2002; Wiltschko and Wiltschko, 2001, 1995) whereas red light, the long-wavelength component of light, is more likely to disrupt magnetic compass orientation.

Studies have indicated the potential impact of artificial lighting on the diversion of migratory pathways of seabirds (Verheijen, 1985), particularly those dependent on visual cues. Migratory birds that use the East Asian Australasian Flyway (EAAF) flight paths may include overlap over or near the Dorado Phase 1 (**Figure 3-22**). Light (other than flaring) from the MODU, vessels, WHP and FPSO facilities is unlikely to attract a significant number of seabirds or shorebirds as activities are a considerable distance from known key aggregation areas, such as Bedout Island (70km) Eighty Mile Beach (146 km).

The National Light Pollution Guidelines currently apply to marine turtles, seabirds and migratory shorebirds (CoA 2020a). Given the location of the Project Area, all artificial light sources are offshore and >15 km distance from breeding islands, and therefore are not predicted to adversely impact the nesting of adult birds or emergence of fledglings.

High rates of fallout, or the collision of birds with structures, has been reported in seabirds nesting adjacent to urban or developed areas and at sea where seabirds interact with offshore oil and gas platforms (CoA 2020a). Gas flares can also attract seabirds, potentially due to both the light and noise of the flare, and the birds can become disoriented, grounded or be injured or killed. This potential impact is expected to be spatially restricted to the immediate vicinity of the WHP and FPSO and affect only individuals, if any, rather than populations.

7.2.4.3 Summary of Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-24.**

Table 7-24: Summary of impacts, EPOs, controls and consequence evaluation of artificial light emissions during Dorado Phase 1

EPOs	
EPO3D: No mortality or significant[31] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 artificial light emissions **EPO8A**: Artificial light emissions do not result in the displacement of marine turtles from habitat critical to their survival.	
Receptor	**Impact**
Plankton	Potential changes in behaviour, such as attraction, avoidance and disorientation, of marine fauna.
Fish	
Marine Mammals	
Reptiles	
Birds	

[31] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Controls
CM11: Align lighting design on Dorado Development facilities (e.g. WHP, FPSO) with light design principles described in National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia 2020), including: + Using minimum number and intensity of lighting to meet operational requirements (e.g. safety, navigation etc.), + Adapting lighting for colour, intensity and timing where practicable, + Use non-reflective, dark coloured surfaces where practicable (i.e. where safety is not compromised). **CM12**: Manage lighting on vessels to reduce light spill to the environment where practicable. **CM13**: Implement adaptive management (e.g. shielding, retrofitting with lower intensity lights etc.) of artificial light emissions if there is a moderate environment incident resulting from light emissions. **CM14**: Flaring limited to operation of the flare pilot during steady state operations.

Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.4.4 Demonstration of Acceptability

The potential impacts of artificial light emissions as a result of Dorado Phase 1 have been compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-25** and **Table 7-26.** The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case consequence for artificial light emissions was evaluated as minor (**Table 7-24**). This consequence is considered to be acceptable when assessed against the Santos risk matrix (**Section 4**).

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from artificial light emissions are acceptable.

Table 7-25: Demonstration of acceptability for artificial light emissions

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	The environmental impacts of artificial light emissions as a result of Dorado Phase 1 are consistent with the principles of ESD based on the following points: + Artificial light emissions from Dorado Phase 1 do not degrade the biological diversity or ecological integrity of the Commonwealth marine area based on the offshore location of the development and the distance from sensitive receptors. + Significant impacts to MNES are not predicted to occur based on the remote offshore location and limited emissions. + The precautionary principle has been applied, and studies undertaken where knowledge gaps were identified (i.e. artificial light emissions modelling). This knowledge has been applied during the evaluation of environmental impacts and risks.
Internal Context	The management of artificial light emissions is aligned with Santos' policies and standards. The consequence is minor, which is acceptable.

Acceptability Criteria	Demonstration of Acceptability
	The EPO and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	The management of artificial light emissions are aligned with the National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia 2020) through CM11. The design of lighting on the FPSO will consider the Guidelines **Table 7-22**. Santos will implement adaptive management if operational experience indicates a high frequency of light-related interactions with fauna that result in impacts. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a).The plan identifies nesting females and hatchling turtles are at greatest risk of light impacts; the nearest potential turtle nesting habitat is Bedout Island (approximately 70 km from the FPSO). Modelling of light emissions from Dorado Phase 1 indicated light-related impacts to turtles on nesting beaches is not credible. Therefore, actions related to the impacts to turtles on nesting beaches in the Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) relating to the threat of artificial light do not apply. Other actions in the recovery plan include managing anthropogenic activities to ensure marine turtles are not displaced from identified habitat critical to the survival of marine turtles, and managing activities in BIAs to ensure that biologically important behaviour can occur. Modelling results indicate light emissions from Dorado Phase 1 do not overlap any known important habitat for marine turtles, hence no impacts from light emissions on habitats critical to the survival of marine turtles are expected to occur. While light emissions from flaring (FPSO and/or southern tieback flaring) are expected to be visible from within a portion of the flatback turtle internesting BIA, light cues are not thought to guide turtle internesting behaviours and there is no evidence to date to suggest internesting turtles are attracted to light from offshore vessels to the extent that it would impact foraging activity. CM's 11-14 address Action Area A8 of the Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a). Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australia 2015c). Dorado Phase 1 is aligned to 'Objective 4' of the plan by ensuring that anthropogenic disturbance is considered in development assessment processes. Migratory birds have been considered as an environmental receptor in the evaluation of impacts and risks. Wildlife Conservation Plan for Seabirds (DCCEEW 2022). Dorado Phase 1 is aligned to 'Objective 2' of the plan by ensuring seabirds and their habitats are protected and managed. This is achieved through the implementation of control measures 12-15 where lighting on vessels is managed and minimised to reduce light spill to the environment and seabird habitat. Management of aspects of Dorado Phase 1 must not be inconsistent with conservation advice, recovery plans and threat abatement plans for fishes published under the EPBC Act. + Potential impacts to threatened or migratory fishes (e.g. whale sharks, sawfish) are expected to be limited to minor, temporary behavioural changes (e.g.

Acceptability Criteria	Demonstration of Acceptability
	attraction) that will have no effect on populations of these species - impacts to fish are expected to be restricted to a small area around the FPSO. + Potential impacts to threatened or migratory marine mammals are expected to be limited to minor, temporary behavioural changes (e.g. attraction) that will have no effect on populations of these species - impacts to marine mammals are expected to be restricted to a small area around the artificial light source (e.g. around the FPSO or installation activities). + Potential impacts to threatened or migratory reptiles are expected to be limited to minor, temporary behavioural changes (e.g. attraction) that will have no effect on populations of these species - impacts to reptiles (particularly marine turtles) are expected to be restricted to a small area around the FPSO. Light from the FPSO is not visible from the any turtle nesting beaches. + Potential impacts to threatened or migratory birds are expected to be limited to minor, temporary behavioural changes (e.g. attraction) that will have no effect on populations of these species - impacts to birds are expected to be restricted to the area around the FPSO. Light from the FPSO is not visible from any bird nesting or roosting areas, including Ramsar sites. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify light as a key threat or have explicit relevant objectives or management actions relating to light. The impacts of artificial light emissions from Dorado Phase 1 on the Commonwealth marine environment do not exceed any of the significant impact criteria provided in **Section 4**.
Other Relevant Requirements	Management of artificial light emissions is aligned with guidelines, conservation advice, and recovery plans for threatened species, including: + the National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia 2020), and + the Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a). Implementation of recognised industry standard practice, such as: + external lighting on offshore facilities/ infrastructure will be minimised to that required for navigation and safety, except in the case of an emergency.

Table 7-26: Demonstration of acceptability of artificial light emissions against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Justification
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery	The assessment of impacts and risks from artificial light emissions predicts impacts to threatened or migratory species will be limited to minor, temporary behavioural changes (e.g. attraction, avoidance etc.) that will have no effect on populations of these species. Mortality of individual animals as a result of artificial light emissions is not expected to occur. Modelled light emissions from the worst-case flaring scenario, from both FPSO flaring and southern tieback flaring scenarios show no

plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to species listed as threatened or migratory under the EPBC Act as a result of Dorado Phase 1.	overlap with critical habitat for marine turtles. Therefore, the management of artificial light emissions is consistent with conservation advice and recovery plans that identify artificial light emissions as a threat. Significant impacts to EPBC Act listed threatened, migratory or cetacean species under the EPBC Act are not predicted to occur. Areas of importance for species, such as Ramsar sites and turtle nesting beaches, will not credibly be impacted by artificial light emissions from Dorado Phase 1.

7.2.5 Emissions – Acoustic Emissions

Acoustic emissions refer to noise generated during an activity. Activities conducted during Dorado Phase 1 may produce noise and associated vibrations in the air, underwater and beneath the earth's surface.

Sound (or noise generated from human activity) is altered as it propagates away from the source to receptors in the marine environment. Factors influencing propagation include the bathymetry and composition of the seabed and the temperature and salinity of the water column. The physical processes affecting sound along its propagation path are attenuation due to geometric spreading, reflection, scattering at the sea surface and seabed, refraction due to sound speed gradients, and absorption by seawater. A given sound emitted in different locations, or in the same location at different times, may therefore be detectable for varying distances, depending on regional and temporal changes in sound propagation conditions (Richardson et al. 1995).

To assess potential impacts from acoustic emissions it is necessary to understand how underwater sound is measured and referenced. **Attachment 10** provides a detailed account; however, a summary is also provided here. Three metrics are commonly used for analysing and describing the acoustic characteristics of underwater sound and for evaluating underwater sound impacts on marine fauna:

+ peak sound pressure level (PK);
+ sound pressure level (SPL); and
+ sound exposure level (SEL).

The period of accumulation associated with SEL must always be defined and can be per-pulse or accumulated over time, typically 24 hours.

The decibel (dB) is a logarithmic scale that expresses the ratio of two values of a physical quantity and is used to measure the amplitude or 'loudness' of a sound. As the dB scale is a ratio, it is denoted relative to a reference level and in underwater acoustics this is 1 micropascal (µPa).

These metrics and their units are summarised in **Table 7-27,** following the metrics in ISO 18405 Underwater Acoustics – Terminology (International Organization for Standardization 2017).

Table 7-27: Acoustic metrics used in this assessment

Metric	Abbreviation	Symbol	Unit
Sound pressure level	SPL	L_p	dB re 1 µPa
Peak sound pressure level	PK	L_{pk}	dB re 1 µPa
Sound exposure level (per pulse)	Per-pulse SEL	L_E	dB re 1 µPa^2·s

Sound exposure level (accumulated over time)	SEL_{24h}	$L_{E,24h}$	dB re 1 µPa²·s
Source level	SL	$L_{S,pk}$ $L_{S,p}$ $L_{S,E}$	dB re 1 µPa·m (peak source pressure level, SPL source level) or dB 1 µPa²m²s (per-pulse source SEL)

Underwater noise is also divided into two categories, with different metrics used to describe the sound levels in decibels:

+ continuous - continuous noise is a continual non-pulsed sound that can be transient (short duration) but without the rapid rise-time (pulse) (Southall et al. 2007), examples are vessel and drilling operations; and
+ impulsive - impulsive noise is a series of pulsed sound events that are brief, broadband, atonal and transient, examples are acoustic emissions from hammer strikes during pile driving or discharges of air guns during vertical seismic profiling.

7.2.5.1 Description of the Event

7.2.5.1.1 Sources of Acoustic Emissions

Aspects of Dorado Phase 1 will generate noise received underwater throughout all stages of the development. Potential noise emitting activities include:

+ movement of vessels;
+ piling for the Dorado FPSO anchor piles and the WHP jacket piles (if required for future tiebacks);
+ acoustic positioning and survey (e.g. ultra-short baseline, side-scan sonar etc.);
+ drilling;
+ drilling vertical seismic profiling (VSP);
+ 3-D VSP;
+ operation of the WHP and FPSO (including offtake activities);
+ ROV operations; and
+ helicopters.

Each of these noise sources is described further below.

Table 7-28 provides indicative acoustic signatures (frequency and noise levels) for noise sources associated with Dorado Phase 1. Numerical modelling of noise sources that have a relatively high potential for environmental impacts was undertaken (**Attachment 10**).

Table 7-28: Indicative acoustic emissions source characteristics

Source	Operating Frequency	Source Level (@1m or near)	Impulsive or Continuous	References
Impulsive Sources				
Impact piling	less than 1 kHz	210 to 250 dB re 1 µPa (SPL)	Impulsive	**Attachment 10**

Source	Operating Frequency	Source Level (@1m or near)	Impulsive or Continuous	References
Drilling VSP	less than 300 Hz	less than 239 dB re 1 µPa m (SPL)	Impulsive	**Attachment 10**
Survey Ultra-short baseline Side-scan sonar	18 to 36 kHz 70 and 400 kHz	204 dB re 1 µPa m (SPL) 229 dB re 1 µPa RMS @ 1 m	Impulsive Impulsive	Warner and McCrodan (2011) Austin et al. (2013)
3-D VSP	less than 300 Hz	232 to 244.7 dB re 1 µPa m (SPL, PK)	Impulsive	**Attachment 14**
Continuous Sources				
Vessels	10 Hz-10 kHz	less than 175 dB re 1 µPa m (SPL)	Continuous	**Attachment 10**
Drilling operations	less than 2 kHz	120 dB re 1 µPa m (SPL)	Continuous	Todd and White (2012)
WHP operations	100 Hz-2.5 kHz	113 dB re 1 µPa (SPL_{RMS})	Continuous	McCauley (2002)
FPSO Operations – using thruster	10 Hz-10 kHz	less than 175 dB re 1 µPa m (SPL)	Continuous	**Attachment 10**
FPSO Operations – no thruster	10 Hz-10 kHz	less than 175 dB re 1 µPa m (SPL)	Continuous	**Attachment 10**
ROV	3-200	150 to 235 re 1 µPa m (SPL)	Continuous	Jimenez-Arranz et al., (2017)
Helicopter operations	500 Hz	109 dB re 1 µPa	Continuous	Richardson et al. (1995)

Vessels

Vessels will be involved throughout all stages of Dorado Phase 1, with relatively high vessel use during installation, drilling and decommissioning activities. The types of vessels used may range from relatively small supply vessels to large construction vessels. Vessel activity will be concentrated around the foundation Dorado WHP and FPSO location and future tieback locations (refer **Figure 1-2**). Shipping noise generally dominates ambient noise at frequencies from 20 to 300 Hz (Richardson et al. 1995). High-frequency components of the sound source spectrum rapidly dissipate with distance from the sound source, allowing the lower frequency wavelengths to travel further distances.

Sound emitted from vessels differs depending on type and state of propulsion system, vessel installed power, size, transit speed, and load (Vancouver Fraser Port Authority 2018). Vessels generate underwater noise from their propellers and thrusters when moving and may use dynamic positioning where propellers and thrusters are used to hold position rather than anchoring. Propellers and thrusters tend to generate broadband noise due to cavitation, with a noise frequency spectrum ranging from less than 10 Hz to more than 8,000 Hz (McCauley 1998). Thruster noise will typically be the highest intensity noise source generated by the vessels during Dorado Phase 1. Machinery noise may also be transmitted through the vessel hull, although this is expected to be lower intensity than noise from propellers and thrusters.

Acoustic emissions from vessels, particularly thrusters, has the potential to impact upon environmental receptors due to the relatively high source level and potential occurrence throughout all stages of Dorado Phase 1. As such, vessel noise was selected to be modelled as a scenario in the underwater noise modelling studies presented in **Attachment 10**.

Impact Piling

The installation of the FPSO DTM will include mooring anchor piles, and piling may also be required for future tiebacks if developed via a WHP. Impact piling using a hammer to strike each pile is the planned piling method. An alternative lower-noise method such as the adoption of suction piles is not technically feasible due to unsuitable geotechnical conditions in the Dorado Project area. The number of piles required is yet to be finalised, however an indicative number of up to 8 and 16 piles are expected to be installed for the FPSO moorings and the WHPs if required for potential future tiebacks. Driving of individual piles is expected to require less than 24 hours of continuous hammering (impact piling). Hammering of consecutive piles will not occur continuously; there will be a break between the hammering stage for the installation of each pile.

Impact piling has the potential to generate high-intensity noise when the hammer strikes the pile (impact piling). Each hammer strike induces the pile to vibrate briefly, converting some of the energy applied to the pile into a pressure wave in the water column. This pressure wave is perceived as noise and is radiated from the pile into the water column. Piles driven into the seafloor by impact piling are characterised as impulsive sound-radiating sources. This characterisation strongly depends on the rate and extent of pile penetration, pile dimensions, and pile driving equipment.

Piling noise is not continuous, with each strike of the hammer on the pile generating a short, discrete sound impulse. This type of noise contrasts with continuous sources of noise, such as continuous use of vessel thrusters. Piling will not be undertaken concurrently with drilling or vertical seismic profiling.

Given the impulsive nature of impact piling acoustic emissions modelling was undertaken for impact piling (**Attachment 10**).

Surveys and Acoustic Positioning

Geotechnical/ geophysical surveys may be undertaken to assess the suitability of the seabed for infrastructure or surveys along the length of proposed flowlines routes, using high-frequency sonar to provide high-resolution bathymetry and geophysical data, such as side-scan sonar, subbottom profiler or multibeam echo sounders. Sonar generates high-frequency acoustic emissions that attenuate rapidly in the underwater environment.

Santos

Side-scan sonar towfish can use a range of operating frequencies, but typically they are between 70 and 400 kHz. Representative systems could include those from Edgetech, such as the 4200 range which output signals at 120 and 410 kHz. Measurements of an EdgeTech 4200 were reported in Austin et al. (2013), focusing on the 120 kHz impulses. The authors reported a PK of less than 175 dB re 1 µPa and an SPL of less than 170 dB re 1 µPa at 39 m, with the distance from in-beam pulses to an SPL of 160 dB re 1 µPa calculated to be 130 m. The sonar is highly directional, with distances to sound levels outside the beam significantly less than those in the beam. Side-scan sonar towfish are towed close to the seafloor, typically 10 to 20 m above the seabed; thus the beam will be restricted to a swath close to the seabed. Additionally, this type of sonar generates only high frequency signals, and as such will only be relevant for fauna with sensitivity to signals of approximately 110 kHz or higher, as shown in Austin et al. (2013), which excludes low-frequency cetaceans, fish, and turtles.

Acoustic positioning systems will likely be used during the installation, operations and decommissioning stages of the development, with operational frequency and ping rates depending upon different activities. For acoustic positioning systems such as ultra-short baseline, an acoustic pulse is transmitted by the transceiver and detected by the subsea transponder, which replies with its own acoustic pulse. This return pulse is detected by the shipboard transceiver.

Specific noise modelling from acoustic positioning systems was not carried out as there is sufficient information available in peer-reviewed literature to estimate the potential sound levels and inform the risk assessment. The acoustic emissions will decrease rapidly due to the relatively high frequency of the acoustic emissions, with received sound levels estimated to be reduced to 160 dB re 1 µPa within tens of metres.

Drilling

MODUs are expected to produce low-intensity continuous sound during drilling operations. Drilling sound usually exhibits tones below 2 kHz, with harmonics present to 10 kHz and can vary substantially between operations. Underwater noise levels from jack-up and semi-submersible MODUs during routine drilling operations (i.e. excluding vertical seismic profiling) are generally less than 130 dB re 1 µPa, and noted as being considerably lower than noise emissions from support vessels (McCauley 1998; Todd and White 2012). As such, underwater noise from drilling operations excluding VSP have not been modelled have been extrapolated from underwater noise from a semi-submersible drilling rig by McCauley (1998) indicates noise source levels for non-drilling and drilling noise from a rig range from 160 to 164 dB re 1 µPa at 1 m.

Drilling Vertical Seismic Profiling

Drilling VSP will be undertaken during drilling activities and operations to provide detail on the geological formations. It will be done by installing, or lowering, a series of receivers within the well bore. A seismic source will then be suspended below the MODU, or below a vessel if walkaway vertical seismic profiling is undertaken. The seismic source will be discharged repeatedly, and the receivers will record the resulting seismic energy reflected from geological formations. The data will then be processed to characterise the geological formations. Drilling VSP is critical to effectively managing the Dorado field for the efficient recovery of the petroleum resources.

Drilling VSP operations will generate relatively high levels of low frequency underwater noise, which may propagate for long distances. The frequency of underwater noise generated by vertical seismic profiling overlaps the functional hearing range of cetaceans, and hence has the potential to result in impacts to these species. Thus, drilling VSP was modelled as a scenario in the underwater noise modelling studies presented in **Attachment 10**.

3-D VSP

As described in Section 6.7.5.1, 3-D VSP will be undertaken prior to field start-up and may be repeated at two or three yearly intervals throughout the production phase.

The 3-D VSP acquisition survey involves a source vessel with a seismic source secured 5 m below the sea surface sailing a planned circular course covering approximately 110 km^2 over the Dorado field and taking up to 25 days. As with drilling VSP, 3-D VSP will also generate relatively high levels of low frequency underwater noise, which may propagate long distances. 3-D VSP was modelled using a 1,200 cubic inch air gun array towed by a vessel travelling at 2.5 knots, with an overall inter-pulse-interval of 25 m and a total of 4448 seismic pulses (Koessler and McPherson, 2022).

FPSO Operation

Machinery onboard the FPSO, such as topside processing equipment and the flare, may generate noise emissions., however this is unlikely to contribute significantly to underwater noise levels as most noise will be reflected by the sea surface. Topside equipment and other machinery may contribute to hull vibrations, which may then be transmitted into the sea through the FPSO hull. However, this source of noise is expected to be low as most equipment is topside and the FPSO is double hulled which will insulate the environment from FPSO noise (Erbe et al. 2013).

The FPSO may use its engines and thruster when manoeuvring on, or disconnected from, the DTM, which will generate underwater noise from propeller cavitation. The FPSO may also use its thruster to hold a given heading during offtake operations, which may last for up to 48 hrs. Offtake operations may be as frequent as weekly during the early operational stage of the development, with the interval between offtake operations becoming progressively longer as production declines over time. The use of thrusters may generate relatively high levels of broadband underwater noise.

Underwater noise emissions from the FPSO were modelled, as they represent a long-term source of noise emissions throughout the operational stage of Dorado Phase 1. The underwater noise modelling studies are presented in **Attachment 10**.

ROV Operations

An ROV is a tethered underwater vehicle equipped with at least a video camera and lights. Additional equipment that the ROV may have installed could include sonars, magnetometers, a still camera, a manipulator or cutting arm, water samplers, and instruments that measure water clarity, water temperature, water density, sound velocity, light penetration and temperature. ROVs may be used during all stages of Dorado Phase 1. The ROVs may be fitted with measurement devices such as sonar, that emit a pulse of sound (often called a ‘ping’) and then listens for reflections (echo) of that pulse. ROVs may be used during construction, operation and decommissioning stages of the Project. Typical frequency and sound source levels for ROV mounted sonar is (Jimenez-Arranz et al., 2017):

+ frequency range between 3k Hz to 200 kHz; and
+ source level 150 to 235 dB re 1 uPa SPL @ 1 m.

Helicopters

Sound traveling from a source in the air (e.g. a helicopter) to a receiver underwater is affected by both in-air and underwater propagation processes, which are further complicated by processes occurring at the air-seawater surface interface (e.g., wind and waves). The level of noise received underwater depends on source altitude and lateral distance, receiver depth, water depth, and other variables.

Helicopter engine noise is emitted at various frequencies; however, the dominant tones are generally of a low frequency below 500 Hertz (Hz) (Richardson et al. 1995). Sound pressure in the water directly below a helicopter is greatest at the surface and diminishes with increasing receiver depth. Noise also reduces with increasing helicopter altitude, but the duration of audibility often increases with increasing altitude, with sound penetrating water at angles less than 13°. The noise from the flyover of a Bell 214 helicopter (stated to be a noisy model) has been recorded underwater (Richardson et al. 1995). The recorded broadband sound level was 109 dB re 1 µPa (SPL) when the helicopter was 152 m from the surface, with dominant frequencies below 500 .

7.2.5.1.2 Noise Effect Criteria

Elevated underwater noise can result in changes to marine fauna behaviour by masking or interfering with other biologically important sounds, including vocal communication, echolocation, signals and sounds produced by predators or prey, and through disturbance leading to behavioural changes or displacement from important areas (Richardson et al. 1995). The sensitivity of fauna behaviour to elevated noise levels vary both inter- and intraspecifically, with individual responses often being influenced by the present behaviour, such as reproductive behaviours, foraging or migration. Thresholds, where appropriate, for behavioural response of different species to noise are discussed in the sections that follow.

Exposure to sufficiently intense sound may lead to an increased hearing threshold. If this shift is reversed and the hearing threshold returns to normal, the effect is called a temporary threshold shift (TTS). Southall et al., 2007 defined TTS as a threshold shift of 6 dB above the normal hearing threshold. If the threshold shift does not return to normal, permanent threshold shift (PTS) has occurred. Threshold shifts can be caused by acoustic trauma from a very intense sound of short duration, as well as from exposure to lower level sounds over longer time periods (Houser et al.,2017).

Where the functions, interests or activities of other marine users involve marine fauna, any effect to fauna presence or abundance may indirectly impact these users. The potential impact may occur for the duration of the noise emission; however, following cessation of the activity, long term changes in fauna abundance or distribution are not expected. Given the location, short-term nature of the more significant noise generating activities, and that the impacts to fish populations will be negligible, changes to the functions, interests or activities of other users, such as commercial fisheries, from acoustic emissions are not notable. A change in noise can potentially impact on the functions, interests or activities of other marine users that are dependent on underwater communications (e.g. Defence).

A summary of the criteria used in the impact assessment is provided below, with **Attachment 10** providing details.

Plankton

There are few studies that have reported negative impacts of impulsive noise on zooplankton (including meroplankton or temporary members of the plankton such as fish eggs and larvae, and invertebrate and coral larvae), and none from more than 10 m away from an airgun. This suggests the range of chronic effects on fish eggs and larvae due to seismic discharges is likely to be restricted to less than 10 m (**Table 7-31** and **Table 7-32**). Popper et al., (2014) presented a threshold of more than 210 dB re 1 µPa2.s (SEL) or 207 dB re 1 µPa (PK) for mortality and potential mortal injury, which is lower (and therefore more conservative) than the observed effects provided in **Table 7-31** and **Table 7-32**.

Marine Mammals

Thresholds for the onset of permanent threshold shift (PTS) and temporary threshold shift (TTS) in marine mammals (low-frequency, high-frequency, and very-high-frequency cetaceans) were derived from Southall et al. (2019) and considered two metrics: peak pressure levels (PK; L_{pk}) and frequency-weighted accumulated SEL ($L_{E,24h}$). Thresholds for marine mammal behaviour were based on the current Section 7 ESA Consultation Tools for Marine Animals on the West Coast (National Oceanic and Atmospheric Administration 2019). These thresholds are summarised in **Table 7-29** for impulsive noise and **Table 7-30** for continuous (non-impulsive) noise.

Applying the auditory frequency weighting functions developed for low-, mid- and high-frequency cetaceans to the derived SEL ($L_{E,24h}$) in the ambient noise monitoring in the Dorado Project Area (**Section 3.2.7**), indicated that all functional hearing groups received at least an SEL of approximately 150 dB re 1 µPa^2·s (Lucke et al, 2022).

Table 7-29: Criteria for impulsive noise effects on marine mammals: SPL, weighted SEL$_{24h}$ and unweighted PK thresholds.

Hearing Group	Behaviour	PTS onset thresholds* (received level)		TTS onset thresholds* (received level)	
	SPL (L_p; dB re 1 µPa)	Weighted SEL$_{24h}$ ($L_{E,24h}$; dB re 1 µPa^2·s)	PK (Lpk; dB re 1 µPa)	Weighted SEL$_{24h}$ ($L_{E,24h}$; dB re 1 µPa^2·s)	PK (L_{pk}; dB re 1 µPa)
Low-frequency cetaceans	160	183	219	168	213
High-frequency cetaceans		185	230	170	224
Very-high-frequency cetaceans		155	202	140	196

* Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS onset. If a non-impulsive sound has the potential of exceeding the peak SPL thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes SPL period.
$L_{pk,flat}$ denotes peak sound pressure is flat weighted or unweighted.
L_E denotes cumulative SEL over a 24-hour period.

Table 7-30: Criteria for continuous noise effects on marine mammals: SPL and weighted SEL_{24h} thresholds.

Hearing Group	Behaviour	PTS onset thresholds (received level)	TTS onset thresholds (received level)
	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)
Low-frequency cetaceans	120	199	179
High-frequency cetaceans		198	178
Very-high-frequency cetaceans		173	153

L_p denotes SPL period.
L_E denotes cumulative SEL over a 24-hour period.

Fishes

Sound is perceived by fish through the ears and the lateral line which are sensitive to vibration. Potential impacts on fish, fish eggs, and larvae were assessed using the guidelines developed by the Popper et al. (2014). The guidelines define quantitative thresholds for three types of immediate effects:

+ Mortality, including injury leading to death;
+ Recoverable injury, including injuries unlikely to result in mortality, such as hair cell damage and minor haematoma; and
+ TTS.

Masking and behavioural effects can be assessed qualitatively, by assessing relative risk rather than by specific sound level thresholds.

Because the presence or absence of a swim bladder has a role in hearing, fish's susceptibility to injury from noise exposure depends on the species and the presence and possible role of a swim bladder in hearing. Thus, different thresholds were proposed for fish without a swim bladder (also appropriate for sharks and applied to whale sharks in the absence of other information), fish with a swim bladder not used for hearing, and fish that use their swim bladders for hearing. Fish eggs and fish larvae are considered separately.

The criteria listed in **Table 7-31** were used to assess the effects from impulsive noise (piling and vertical seismic profiling). The criteria listed in **Table 7-32** were used to assess the effects from continuous, or non-impulsive sound sources.

Table 7-31: Criteria for impulsive noise exposure for fish

Fish Group	Mortality / Potential Mortal Injury	Impairment			Behaviour
		Recoverable Injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	more than 219 dB SEL_{24h} or more than 213 dB PK	more than 216 dB SEL_{24h} or more than 213 dB PK	More than 186 dB SEL_{24h}	Pile driving: + (N) Moderate, (I, F) Low Seismic: + (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	210 dB SEL_{24h} or more than 207 dB PK	203 dB SEL_{24h} or more than 207 dB PK	More than 186 dB SEL_{24h}	Pile driving: + (N) Moderate, (I, F) Low Seismic: + (N, I, F) Low	(N) High (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	207 dB SEL_{24h} or more than 207 dB PK	203 dB SEL_{24h} or more than 207 dB PK	186 dB SEL_{24h}	Pile driving: + (N, I) High, (F) Moderate Seismic: + (N, I) Low, (F) Moderate	(N, I) High (F) Moderate
Fish eggs and fish larvae	more than 210 dB SEL_{24h} or more than 207 dB PK	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Low (F) Low	Pile driving: + (N) Moderate, (I, F) Low Seismic: + (N, I, F) Low	(N) Moderate (I, F) Low

Source: Adapted from Popper et al. (2014)
Peak SPL dB re 1 µPa; SEL_{24h} dB re 1µPa^2·s.
All criteria are presented as sound pressure even for fish without swim bladders since no data for particle motion exist.
Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres), and far (F – thousands of metres).

Table 7-32: Criteria for continuous noise exposure for fish, adapted from Popper et al. (2014)

Type of animal	Mortality and Potential mortal injury	Impairment			Behavior
		Recoverable injury	TTS	Masking	
Fish: No swim bladder (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder not involved in hearing (particle motion detection)	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: Swim bladder involved in hearing (primarily pressure detection)	(N) Low (I) Low (F) Low	170 dB SPL for 48 h	158 dB SPL for 12 h	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Sound pressure level dB re 1 µPa.

Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres), and far (F – thousands of metres).

Reptiles

There is a paucity of data regarding responses of turtles to acoustic exposure, and no studies of hearing loss due to exposure to loud sounds. Popper et al. (2014) suggested thresholds for onset of mortal injury (including PTS) and mortality for sea turtles and, in absence of taxon-specific information, adopted the levels for fish that do not hear well (suggesting that this likely would be conservative for sea turtles).

Sea turtles have best sensitivity at low frequencies and are known to have poor auditory sensitivity (Ketten and Bartol 2006). Accordingly, TTS and PTS thresholds for turtles are likely more similar to those of fishes than to marine mammals (Popper et al. 2014). Finneran et al. (2017) presented revised thresholds for sea turtle injury and hearing impairment (TTS and PTS). The Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) acknowledges the sound levels reported in McCauley et al. (2000) as levels associated with behavioural responses in sea turtles. There are no thresholds available to apply to the assessment of potential impacts to sea snakes.

The recommended criteria for sea turtle PTS, TTS and behavioural response/disturbance for impulsive noise is presented in **Table 7-33**, while that for vessel and non-impulsive noise is presented in **Table 7-34.**

Table 7-33: Criteria for assessing acoustic effects of impulsive noise on sea turtles: SPL, weighted SEL_{24h}, and unweighted PK thresholds.

Effect type	Source	SPL (L_p; dB re 1 µPa)	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)	PK (L_{pk}; dB re 1 µPa)
Behavioural response	NSF (2011)	166	NA	
Behavioural disturbance	McCauley et al. (2000b)	175		
PTS onset thresholds* (received level)	Finneran et al. (2017)	NA	204	232
TTS onset thresholds* (received level)			189	226

* Dual metric acoustic thresholds for impulsive sounds: Use whichever results in the largest isopleth for calculating PTS onset. If a non-impulsive sound has the potential of exceeding the peak SPL thresholds associated with impulsive sounds, these thresholds should also be considered.
L_p denotes SPL period and has a reference value of 1 µPa.
L_{pk}, flat denotes peak sound pressure that is flat weighted or unweighted and has a reference value of 1 µPa.
L_E denotes cumulative SEL over a 24-hour period and has a reference value of 1 µPa²s.

Table 7-34: Criteria for assessing acoustic effects of non-impulsive noise on sea turtles: Relative risk and SEL_{24h} thresholds.

Effect type	Criterion	Relative risk	Weighted SEL_{24h} ($L_{E,24h}$; dB re 1 µPa²·s)
Behaviour	Popper et al. (2014)	(N) High (I) Moderate (F) Low	NA
PTS onset thresholds (received level)	Finneran et al. (2017)	NA	220
TTS onset thresholds (received level)			200

Relative risk (high, moderate, low) is given for animals at three distances from the source defined in relative terms as near (N, tens of meters), intermediate (I, hundreds of meters), and far (F, thousands of meters).
L_E denotes cumulative SEL over a 24-hour period and has a reference value of 1 µPa²s.

Birds

Seabirds and migratory shorebirds may be affected by atmospheric noise emissions from helicopters transiting between the Port Hedland (most likely location for heliport) and the Project Area. Anthropogenic disturbance is identified in the Wildlife Conservation Plan for Migratory Shorebirds as a threat to the conservation of migratory shorebirds (Commonwealth of Australia, 2015a).

The generation of underwater noise from helicopters will be brief, typically during take off and landing, with peak received levels diminishing with increased altitude. Given the high visibility and noise levels associated with helicopter movements, bird species are expected to actively avoid interaction. Any disturbance from helicopters in transit will be of limited duration as they pass by. Impacts to bird species in the area surrounding Port Hedland are expected to be negligible as helicopters passing by bird aggregation areas (eg Bedout Island) will be at significant altitude, impacts are not considered credible. The impacts to birds from atmospheric noise emissions resulting from Dorado Phase 1 were not assessed further.

Other Receptors

To assess impacts to plankton, there are only a few studies to base threshold criteria on. Popper et al. (2014) cites many of the references and studies on potential impacts of noise emissions on fish eggs and larvae prior to 2014. Literature primarily relates to impulsive noise. Results presented in Day et al. (2016) for embryonic lobsters and Fields et al. (2019) for copepods align with those presented in Popper et al. (2014), which is that mortality and sub-lethal injury are limited to within tens of metres of seismic sources. Research by McCauley et al. (2017) has indicated the potential for effects at longer range; however, Fields et al. (2019) noted that it was difficult to reconcile the high mortality reported by McCauley et al. (2017) with the low mortalities reported in the greater previous body of earlier research and their experiment.

While there are reputable published studies indicating the potential for underwater noise to impact upon invertebrates, no suitable published guidelines were identified. Invertebrates have been considered in the assessment of risks and impacts from underwater noise, although no threshold values have been applied.

7.2.5.1.3 Summary of Underwater Noise Modelling Results

Ambient noise levels in the Project Area may be elevated during all stages of the project. Underwater noise surveys in the region detected marine fauna vocalisations and anthropogenic sources including vessel noise; seismic survey signals; mooring noise artefacts (McCauley 2011). Ambient noise levels in the Project Area are expected to be elevated given the presence of shipping fairways and associated high vessel traffic that cross over the Project Area. Underwater noise modelling was undertaken for activities/ scenarios that were considered to have the greatest source levels, and therefore the greater potential impact. The modelling study s are provided as **Attachment 10 and Attachment 14**. The noise sources that were modelled comprised:

+ pile driving – underwater noise from piling is expected to have a high source level and is impulsive in nature;
+ Drilling VSP and 3-D VSP– impulsive underwater noise from vertical seismic profiling is expected to have a high source level with noise energy concentrated at relatively low frequencies, which is expected to result in the potential for long sound transmission distances;
+ support vessels – support vessels using dynamic positioning to hold position are expected to emit broadband noise at a high source level; and
+ FPSO operations (including offtakes).

Modelling results for each of the modelled scenarios are provided in **Table 7-35**. These results have been compared to the noise effect criteria outlined in **Section 7.2.5.1.2** and used to inform the assessment of environmental impacts and risks.

Figures showing the predicted maximum radius at which noise effect criteria in **Table 7-35** are reached are provided for as follows:

+ WHP piling:
  - SPL (**Figure 7-11**); and
  - SEL_{24h} (**Figure 7-12**).
+ FPSO mooring piling:
  - SPL (**Figure 7-13**); and
  - SEL_{24h} (**Figure 7-14**).
+ Drilling VSP:
  - SPL (**Figure 7-15**); and
  - SEL_{24h} (**Figure 7-16**).
+ 3-D VSP:
  - SPL (**Figure 7-20**); and
  - SEL_{24h} (**Figure 7-21**)
+ FPSO offtake operations:
  - SPL (**Figure 7-17**); and
  - SEL_{24h} (**Figure 7-18**).

These figures are based on the maximum-over-depth modelled received noise levels and hence represent the worst-case output from the modelling results.

Table 7-35: Maximum-over-depth distances (in km) from noise modelling derived by applying noise effect criteria (Refer to Attachment 10 for further information)

Receptor Category	Impact Type	WHP Jacket Pile	FPSO Anchor Pile	Drilling VSP	3-D VSP	FPSO not using Thrusters	FPSO using Thrusters	FPSO Offtake Operations	Vessel

7.2.5.2 Details of Environmental Impacts and Risks

Marine fauna use sound in a variety of functions, including social interactions, foraging, orientation, and responding to predators. Underwater noise can impact upon marine fauna in six main ways:

- Inducing stress;
- Masking or interfering with other biologically important sounds such as vocal communication echolocation, signals and sounds produced by predators or prey;
- Disturbance leading to behavioural changes or displacement of fauna;
- Injury or fatigue to hearing or other organs;
- Mortality and mortal injury resulting in immediate or delayed death either due to injury or substantially reduced fitness; and
- Cumulative or chronic effects from repeated or long-term exposure to noise leading to additive severity of noise-induced effects.

Detailed descriptions of these impacts are provided in **Attachment 11**.

Table 7-36 identifies the potentially impacted receptors as a result of acoustic emissions from Dorado Phase 1.

Table 7-36: Receptors potentially impacted by Acoustic Emissions

Description of the Risk	Receptor Categories
Potential impacts to marine fauna including PTS, TTS, behavioural disturbance and masking	Plankton – **Section 7.2.5.2.1** Benthic Communities and Habitats – **Section 7.2.5.2.1** Marine Mammals – **Section 7.2.5.2.1** Fishes – **Section 7.2.5.2.3** Reptiles – **Section 7.2.5.2.4**

7.2.5.2.1 Plankton

Applying sound exposure guidelines for eggs and larvae (SEL_{24h} more than 210 dB re 1 µPa2.s) (Popper et al. 2014) indicates that mortality or potential permanent injury may occur within 5.59 km of the largest acoustic source. A study by McCauley (1994) calculated the impact in seismic survey area assuming plankton mortality of 100% within 10 m of an airgun. It argued that the total mortality due to seismic testing would be less than 1% of plankton in the surveyed area.

A more recent study undertaken by McCauley et al. (2017) showed potential for noise impulses discharged from a single 150 cui airgun resulted in zooplankton mortality and reduction in abundance out to more extended ranges (1.2 km), at levels up to 178 dB re 1 µPa PK-PK Pressure. Furthermore, Richardson et al. (2017) modelled the effect proposed by McCauley et al. (2017) in the context of ocean ecosystem dynamic and zooplankton population dynamic. The report concluded that even if the full effect reported by McCauley et al. (2017) did exist, plankton abundance would not be adversely affected, due to extensive movement of water masses carrying plankton through survey areas, and the rapid reproductive cycle and high reproductive potential characteristics of planktonic organisms.

Acoustic modelling results suggest that the worst-case maximum distance for impacts to plankton may occur within 88 m of the acoustic source, representing a small proportion of the plankton stock across the northwest shelf. Rapid recovery and repopulation are expected and the overall impact to plankton abundance is likely to be negligible, and not evaluated further.

7.2.5.2.2 Benthic Communities and Habitats

There is some evidence to suggest components of benthic communities may be vulnerable to underwater noise-related impacts, while other components are not. Studies have indicated scallops exposed to seismic survey noise show increased potential for mortality (Day et al. 2016; Harrington et al. 2010), whereas other studies have shown no evidence of mass mortality in the short-term post exposure or other negative impacts of seismic airgun arrays on scallops (Przeslawski et al. 2016). Preliminary studies on the effects of underwater noise on sponges did not observe any effects attributable to noise exposure (Wilmut et al. 2006).

Underwater noise generated by operational platforms does not appear to have any detrimental effect on benthic communities. Inspection of fixed platforms worldwide shows these structures serve as artificial reefs and develop relatively diverse benthic communities.

Benthic habitat surveys of the Project Area did not indicate the presence of particularly diverse or sensitive benthic communities (**Attachment 2**). Potentially vulnerable taxa, such as bivalve molluscs, were not observed. Given the duration, frequency spectrum and intensity of potential noise generated during Dorado Phase 1, no impacts to benthic communities as a consequence of underwater noise are expected to occur.

7.2.5.2.3 Marine Mammals

As described in **Section 3**, a number of species of marine mammals may occur in the Project Area. Acoustic signals of Omura's whales, killer whales, and dolphins and possibly a sperm whale were detected during ambient noise monitoring in the Dorado Project Area (Section 3.2.7). Note that the absence of acoustic signals from other marine mammals does not necessarily mean that they were not present. Omura's whales are not currently listed under the EPBC Act. The Project Area does not overlap any known resting, nursing, breeding or foraging BIA's for any marine mammal species; however, sensitivities for consideration include the following:

+ Humpback whale migration BIA, which occurs in nearshore waters and is 26 km southeast of the WHP at the closest point and slightly overlaps the Project Area (**Figure 3-13**);
+ Pygmy blue whale migration BIA, which passes approximately 110 km northwest of the WHP location at the closest point and 87 km northwest of the Project Area (**Figure 3-13**); and.
+ Pygmy blue whale distribution range, which overlaps the Project Area (see **Section 3.3.3** for context).

A number of other cetacean species may also occur in the Project Area (refer to **Section 3**), but the Project Area and surrounding waters are not identified as significant habitat for these species.

Most cetacean species use sound to communicate (e.g. humpback whale calls) or perceive their environment (e.g. echolocation of prey). This reliance on underwater noise, and their high conservation value, makes cetaceans of concern when assessing potential impacts from underwater noise.

The type and scale of the effect of sound on marine mammals will depend on a number of factors including the level of exposure, the physical environment, the location of the animal in relation to the sound source, how long the animal is exposed to the sound, the exposure history, how often the sound repeats (repetition period) and the animal sensitivity within the soundscape. The behavioural context of the exposure plays a critical and complex role in the way an animal might respond (Ellison et al. 2012; Gomez et al. 2016).

Direct mortality of marine mammals due to tissue damage from acoustic emissions are not considered credible. Direct tissue damage from sound in laboratory animals have been reported to require SPL in the order of 240 dB re 1 µPa (Carstensen 1997, cited in Cato et al. 2004). Piling, drilling VSP and 3-D VSP sources approach this source level at a maximum, and a marine mammal would need to be very close to the source to be subjected to this SPL. This scenario is not considered to be credible given marine mammals would move away from the noise source at levels well below these.

Permanent Threshold Shift – WHP and FPSO Piling and 3-D VSP

The activity with the highest potential to result in PTS is driving of the WHP jacket piles and the FPSO anchor piles. Considering the Southall et al. (2019) SEL_{24h} threshold criterion, there is potential that low-frequency cetaceans (such as humpback and pygmy blue whales) could experience PTS at a maximum distance of 5.84 km from piling and 3.4 km from the 3-D VSP noise sources (**Table 7-35**). Ranges at which high-frequency and very-high-frequency cetaceans PTS effect criteria are met is approximately less than 1 km from the source.

For low frequency cetaceans, acoustic emissions from piling at the Dorado facilities locations potentially resulting in PTS, are approximately 20 km clear of the northern boundary of the humpback whale migration BIA (**Table 7-35)** and 104 km clear of the southern boundary of the pygmy blue whale migration BIA. Distances for acoustic emissions from 3-D VSP to the BIAs potentially resulting in PTS will be approximately 2.5 km further away than piling noise sources. These distances are sufficient to ensure that humpback whales and pygmy blue whales within their respective migration BIAs will not be exposed to acoustic emissions at levels that would induce PTS.

As shown in **Figure 7-22**, satellite tracking data for humpback whales indicates a more south-easterly route within the migration BIA and away from the Dorado Project Area.

The SEL_{24h} is a cumulative metric that reflects the measured dose impact of noise levels over 24 hours based on the assumption that an animal is consistently exposed to such noise levels at a fixed position. Driving of individual piles is expected to require less than 24 hours of continuous hammering and installation of consecutive piles will not occur continuously; there will be a break between the hammering stage for the installation of each pile. Whilst 3-D VSP may occur continuously over 25 days, whales would not stay in the same location or at the same range when exposed to underwater noise levels sufficient to induce PTS, as animals would move away from painful noise stimuli. This would particularly be the case for an animal migrating through the Project Area. A humpback whale passing the Project Area within the migration BIA or at a distance of 50 km (as per Australian Antarctic Division tagging data) in less than a day is unlikely to remain within a fixed range of the piling or 3-D VSP. Migrating humpback whales in the region have been recorded travelling between 40 and 60 km per day (Double et al. 2012a). This speed is sufficient to allow humpback whales to avoid the area that may be exposed to noise levels that may induce PTS. Improved modelling techniques which more accurately simulate aquatic species' behaviour, movement and densities will be utilised in future acoustic modelling to reduce conservatism and improve confidence in predictions to inform activity specific environment plan impact assessments.

Noise from the FPSO and vessels would only result in PTS if a whale remained relatively close (less than 1 km) to the source. This is not considered a credible scenario, as whales typically move away from vessels and noise sources (Dunlop et al. 2017, 2015).

On this basis, PTS in marine mammals as a result of underwater noise emissions from Dorado Phase 1 are not considered to be credible.

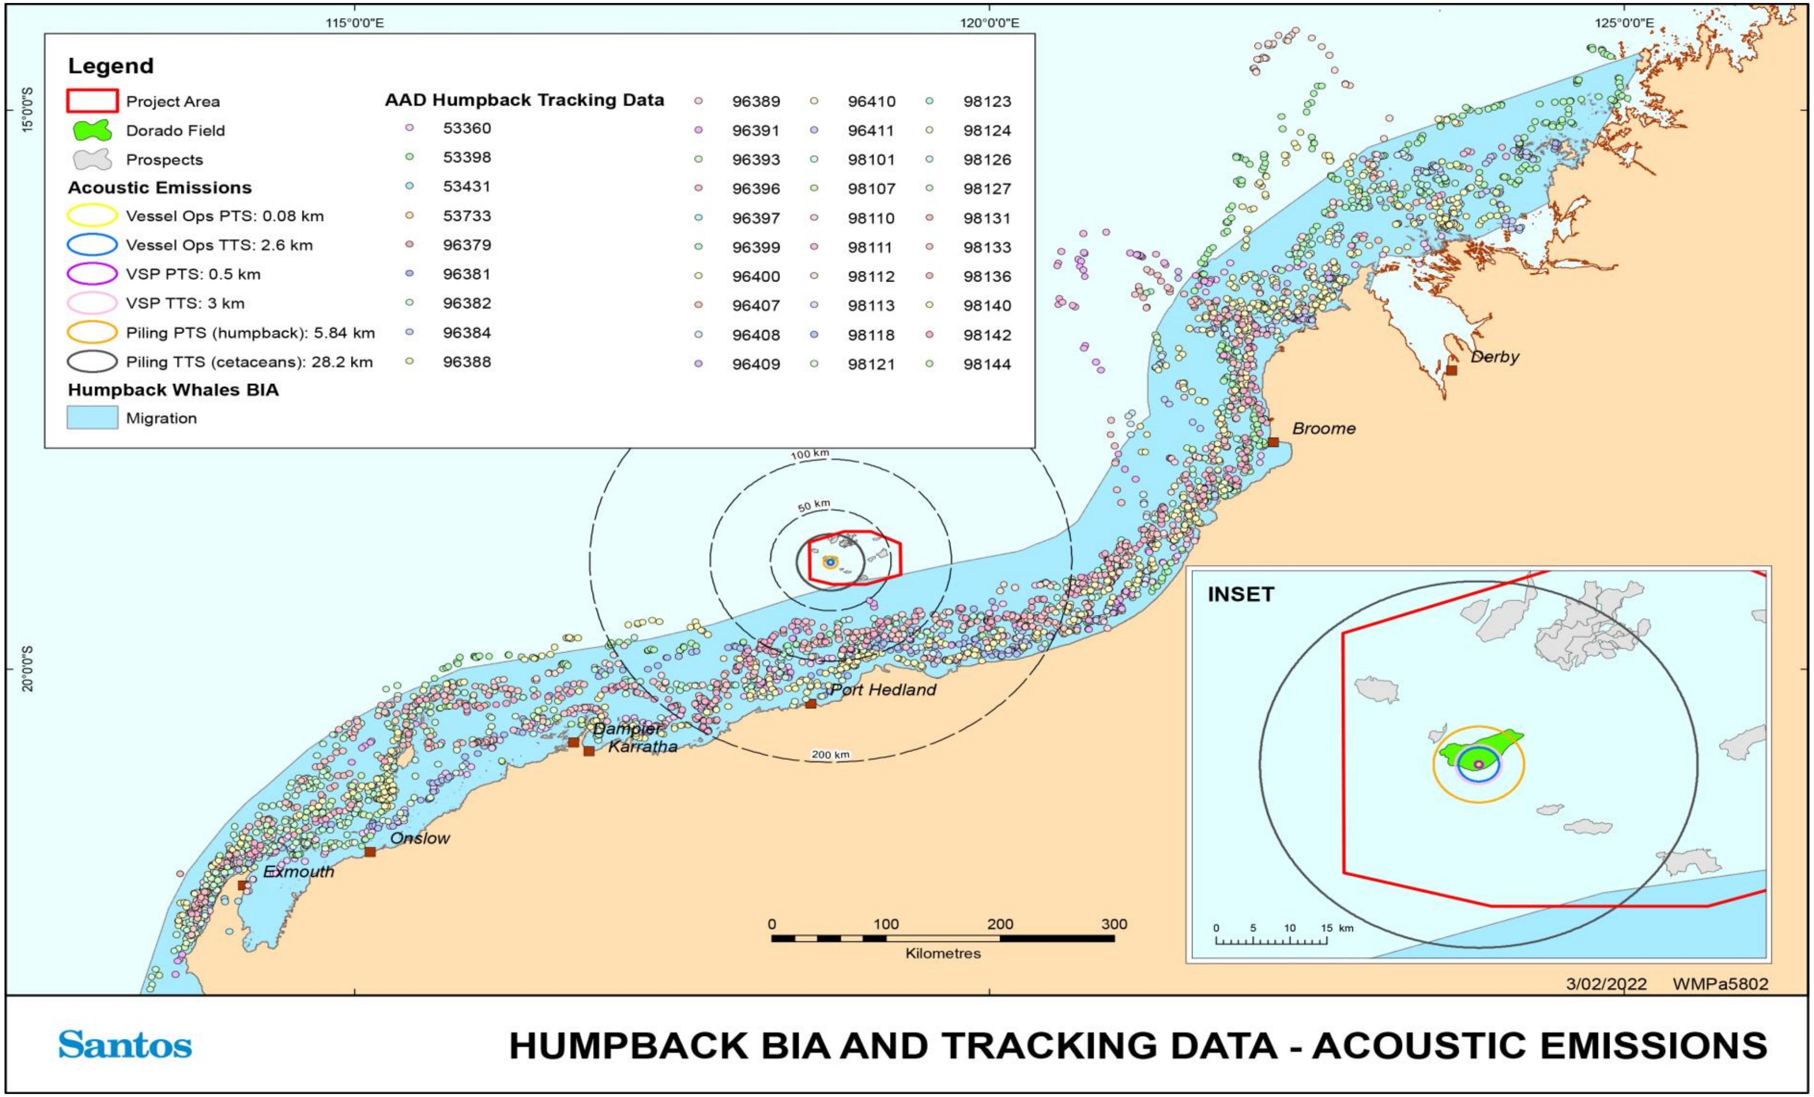

Figure 7-22: Extent of acoustic emissions related to humpback whales, showing the migration BIA and satellite tracking data.

Given that the future tiebacks may include piling (depending on geotechnical conditions) and 3-D VSP, acoustic modelling results for the Dorado facilities has been extrapolated for a potential tieback locations in the southern and northern extent of the Project Area (**Figure 7-23**) selected as a 'worst-case' location due the proximity to the humpback and pygmy blue whale migration BIAs. The threshold for PTS for piling activity at the southern-most prospect overlaps the western margin of the humpback whale migration BIA but does not overlap any humpback whale migration tracking data. The Northern prospect does not overlap any pygmy blue whale BIAs.

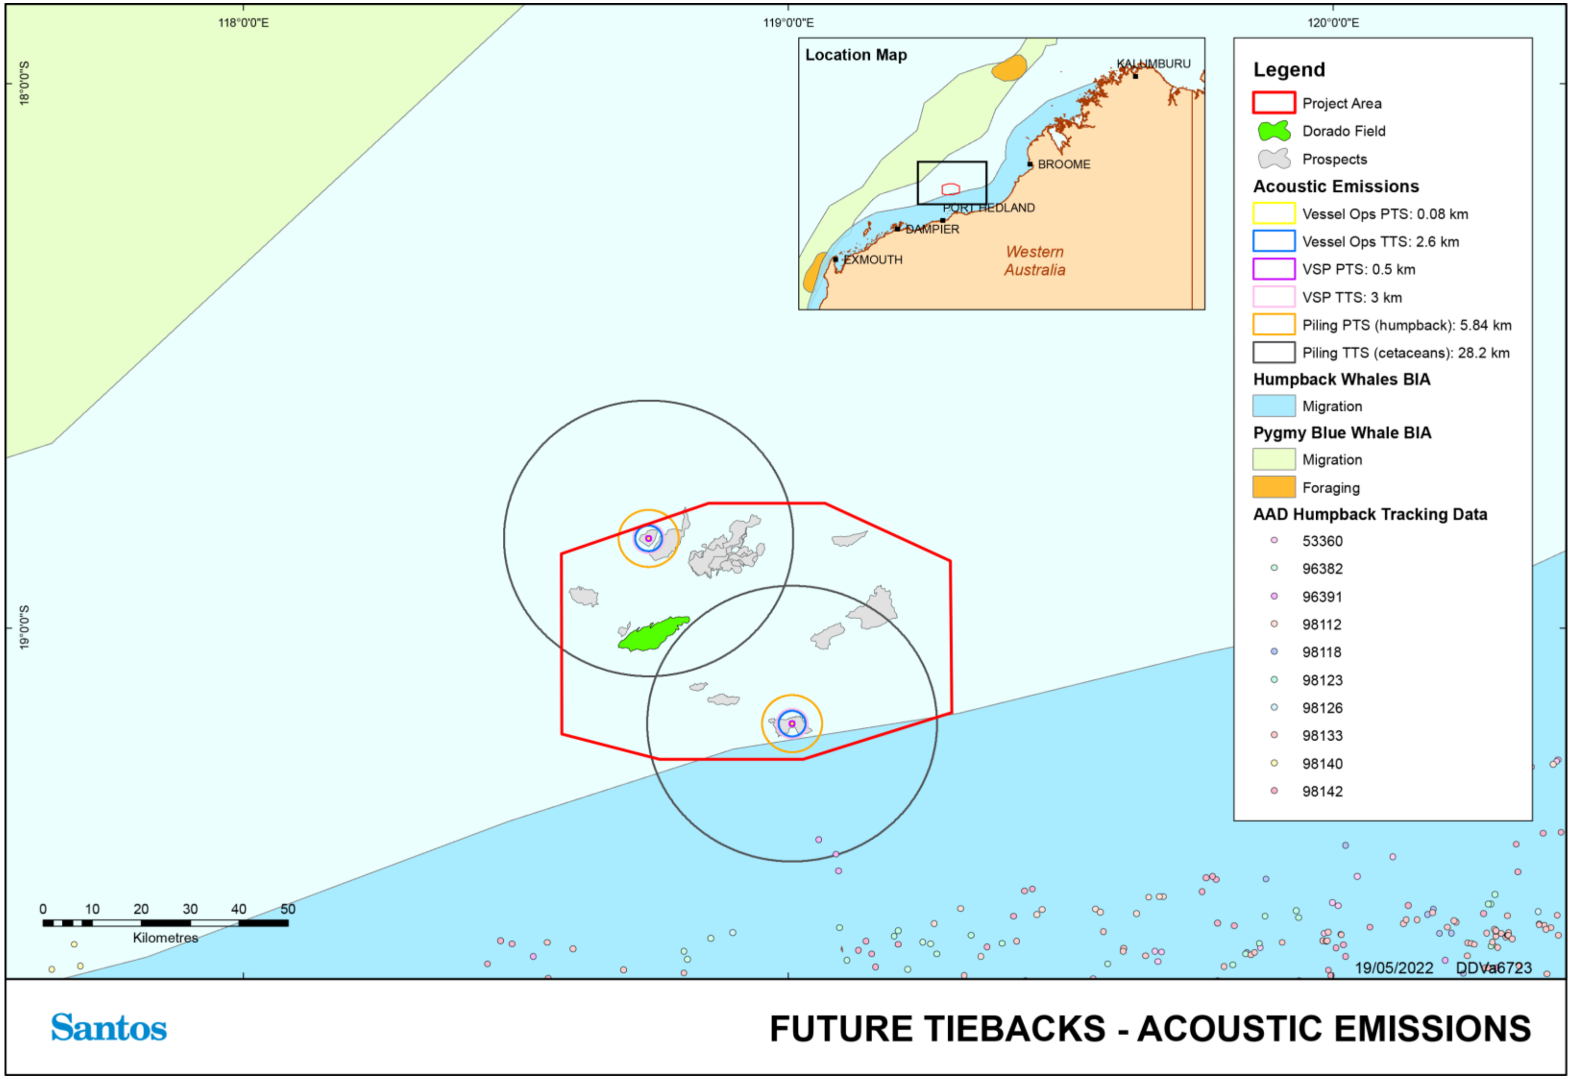

Figure 7-23: Extent of acoustic emissions related to Humpback Whales from a potential future tieback location in the southern extent of the Project area showing the humpback whale migration BIA and satellite tracking data.

Temporary Threshold Shift – WHP and FPSO Piling and 3-D VSP

Like PTS, the activity with the highest potential to result in TTS is Dorado facility piling, followed by 3-D VSP. Considering the Southall et al. (2019) SEL_{24h} threshold criterion, low-frequency cetaceans (such as humpback and pygmy blue whales) are predicted to experience TTS at a maximum distance of 28.2 km from FPSO anchor piling operations and 15 km from 3-D VSP. The TTS envelope for FPSO anchor piling overlaps by approximately 4km with the humpback whale migration BIA south of the Project Area, but does not overlap with any of the satellite tracking with humpback whales migrating to the south and further inshore (**Figure 7-22**).

At the closest possible point within the Project Area, the TTS modelled exposure range for piling is at least 59 km from the pygmy blue whale migration BIA and 72 km for 3-D VSP. Recent clarification of terms in the Conservation Management Plan for the Blue Whale (DAWE, 2021)defines 'injury' as impacts from PTS or TTS. Given the distance between the Project Area and the pygmy blue whale migration BIA, any pile driving and 3-D VSP activity within the Project Area would not cause injury to a migrating pygmy blue whale and would not be inconsistent with the relevant action of the Conservation Management Plan for the Blue Whale (DAWE, 2021).

TheSEL_{24h} criteria for TTS is considered to be a very conservative noise effect criterion, as cetaceans are unlikely to remain stationary within the sound field for 24 consecutive hours. Additionally, the duration of piling for individual piles is expected to be shorter than 24 hrs, hence accumulation of a 24 hr dose of impulsive noise is very unlikely to occur. Improved modelling techniques which more accurately simulate aquatic species' behaviour, movement and densities will be utilised in future acoustic modelling to reduce conservatism and improve confidence in predictions to inform activity specific environment plan impact assessments.

The range at which TTS as a result of acoustic emissions from Drilling-VSP source may occur is much shorter, at 3.1 km for low-frequency cetaceans and 0.24 km for very-high-frequency cetaceans (**Table 7-33**). The noise effect criteria for TTS in high-frequency cetaceans was not predicted to be exceeded by this VSP.

Noise from the FPSO and vessels exceeded the TTS threshold for very-high-frequency cetaceans up to 4.51 km from the source. Very-high-frequency cetaceans, such as orcas and dolphins, are highly mobile and not expected to occur in the Project Area in high numbers.

Marine mammals are expected to move away from noise sources before being exposed to sufficient noise to induce TTS. In the event that any whales do experience TTS, it is likely that there will be full recovery after sound exposure ceases (National Marine Fisheries Service 2018).

Given that the future tiebacks may include piling (depending on geotechnical conditions) and may include 3-D VSP, acoustic modelling results for the Dorado facilities have been extrapolated for a potential tieback location in the southern and northern extent of the Project Area (**Figure 7-23**) selected as a 'worst-case' location due to the proximity to the humpback and pygmy blue whale migration BIAs . It is recognised that the threshold for TTS for piling activity at the southern-most prospect overlaps the western margin of the humpback whale migration BIA and several humpback whales from the tracking data. The Northern prospect does not overlap any pygmy blue whale BIAs.

Behavioural

Behavioural impacts may be variable, with individual whales of the same species reacting differently when exposed to the same sound (Southall et al. 2019). The Behavioural Response of Australian

Humpback Whales to Seismic Surveys study provides one of the most comprehensive assessments of behavioural responses of whales to underwater noise. Key results from the study included (Dunlop et al. 2017, 2015):

- The likelihood of a behavioural response (avoidance of the survey vessel) typically increased when:
  - the vessel was within 3 km of the whale, and
  - received SEL_{24h} exceeding 140 dB re 1 µPa^2s.
- The typical behavioural response consisted of a deviation from their expected swimming patterns in the order of hundreds of metres and a decrease in dive time. These responses were much smaller than the avoidance responses the species is capable of;
- The behavioural responses observed were within the normal suite of behaviours exhibited by humpback whales. No behaviours considered abnormal were observed; and
- The exposure to acoustic emissions did not appear to inhibit the southward migratory movement of the whales.

Behavioural impacts (e.g. avoidance, displacement from a foraging area, disruption to resting), may occur if marine mammals pass close to the noise source. The noise source with the greatest predicted distance to illicit a marine mammal behavioural response (120 dB re 1 µPa SPL) is for FPSO offtake operations at a distance of 11 km, followed by the FPSO using thrusters (10.4 km), WHP jacket piling (5.4 km), FPSO anchor piling (4.6 km), support vessel operations (4.5 km), 3-D VSP (3.78 km), drilling VSP at (2.4 km) and FPSO not using thrusters (1.49 km) (**Table 7-35**). FPSO offtake operations may occur as frequently as weekly during the early operational stage of Dorado Phase 1, and will decline over time as production diminishes. At these distances, potential behavioural response impacts associated with any of the sources are restricted to an area close to the source which does not overlap the migration BIAs for humpback whales and pygmy blue whales.

Recent clarification of terms in the Conservation Management Plan for the Blue Whale (DAWE, 2021) advise that activities proposed to occur outside designated foraging areas must adopt best practice adaptive management approaches in the event that indicators of whale foraging are evident to ensure impacts to whales are not unacceptable. No such measures are required for the Dorado Project as the activity is not inconsistent with the Conservation Management Plan for the Blue Whale given: i) designated foraging areas are a minimum of 527 km away, ii) the Dorado Project Area is not an area of upwelling or known for high primary productivity, iii) any foraging activity that may take place whilst migrating is at least 87 km away based on location of the migration BIA and iv) it is highly unlikely that pygmy whales would be present in the Dorado Project Area given historic whale catch data, satellite tracking and passive acoustic records (Figure 1, CMP; Double et al., 2014; Thums et al., 2022) corroborated by the absence of their acoustic signals during ambient underwater noise monitoring in the Dorado Project Area overlapping with migration timing (**Section 3.2.7**).There are relatively few studies of the effects of helicopter noise on marine mammals. Observations of bowhead whales exposed to helicopter noise indicate that most individuals are unlikely to react significantly to occasional single helicopter passes by low-flying helicopters ferrying personnel and equipment to offshore operations at altitudes above 150 m (Richardson et al. 1995). Given the typical altitude of helicopter flights to the FPSO are only below 150 m when taking off or landing at the FPSO, no behavioural impacts to marine mammals are expected to occur in response to helicopter flights.

Masking

Given the relatively short duration and intermittent nature of piling, 3-D VSP and drilling VSP and the distance to noise sources from Dorado to the migration BIAs, these activities are unlikely to result in any significant period of masking of whale calls, although may cause whales to cease or alter their vocalisations at times, as outlined in Erbe et al. (2016).

Operational noise from the FPSO and vessels will occur throughout much of Dorado Phase 1, and hence represents a relatively long-term source of noise that may result in masking. While the frequency range of these noise sources is broadband and may overlap the functional hearing ranges of most marine mammals, the source levels are relatively low. Noise from these sources is not expected to result in masking beyond the range at which behavioural impacts were predicted to occur (up to 11 km from the FPSO). Humpback whales are often sighted very close to other FPSOs located on the northwest shelf, including Santos' Ningaloo Vison. In terms of pygmy blue whale impacts, the same reasoning detailed above for behavioural impacts applies to masking.

Positioning equipment could cause masking of vocalisations of high-frequency and very-high-frequency cetaceans due to the overlap in frequency range between signals and vocalisations. However, due to the rapid attenuation of the relevant frequencies, the range at which the impact could occur will be small (within hundreds of meters). Hence, positioning equipment acoustic emissions are not expected to result in masking.

7.2.5.2.4 Fishes

The presence or absence of a swim bladder and ancillary structures determines the level of susceptibility of fishes to injurious effects from exposure to intense sound. Accordingly, different exposure guidelines were developed for fishes without a swim bladder, fishes with a swim bladder not involved in perception of acoustic signals and fishes that use their swim bladders for hearing.

Most fish species detect sounds from below 50 Hz up to 500 to 1,500 Hz. A smaller number of species can detect sounds to over 3 kHz, while a very few species can detect sounds to well over 100 kHz. The critical issue for understanding whether an anthropogenic sound affects hearing is whether it is within the hearing frequency range of a fish and loud enough to be detectable above threshold.

The fish receptors identified for this assessment, such as site-attached species (including syngnathids) and demersal fish species, are included in the category of fish having a swim bladder while mackerel, a pelagic fish species, do not have a swim bladder. See **Attachment 10** for a detailed description of typical fish common in Australian waters related to the classifications of Popper et al. (2014) from which the noise effects criteria presented in **Section 7.2.5.1.2** were derived. Individual demersal fish may be impacted in the vicinity of the Project Area, and tuna and billfish and other mobile pelagic species may transverse the Project Area. However, the Project Area is not known to be an important spawning or aggregation habitat for commercially caught targeted species.

The fish groups most likely to be present within the Project Area are pelagic fish, such as Spanish mackerel (*Scomberomorus commerson*), and demersal fish, such as snapper and emperor (family Lutjanidae). These groups are classified by Popper et al. (2014) as fish with no swim bladder (Group I) and fish with a swim bladder which is not involved in hearing (Group II). Fish with swim bladder involved in hearing (Group III), are uncommon in the Project Area. Sharks, such as whale sharks, are considered to be fish with no swim bladder for the purpose of this assessment.

Injury

The activity with the highest potential of risk is subsea impact driving of the WHP jacket piles and the FPSO anchor piles followed by 3-D VSP. The most sensitive fish group in the Project Area, those with a swim bladder not involved in hearing (demersal fish), could experience mortality or potential mortal injury within 470 m of piling operations and recoverable injury within 1 km and for 3-D VSP, mortality/potential mortal injury and recoverable injury within 70 m, based on threshold criteria (**Table 7-33**). The ranges for these effects drilling VSP are considerably shorter: potential mortal injury within 37 m and potential recoverable injury within 50 m. The noise criteria ranges for fish without swim bladders, such as pelagic fishes and sharks, are also shorter (**Table 7-33**).

Meekan et al. (2021) undertook a large-scale experiment that quantified the impacts of exposure of an assemblage of tropical demersal emperors (family Lutjanidae), snappers (family Lethrinidae) and groupers (family Epinephelidae) to a commercial-scale seismic source on the North West Shelf off Western Australia. The effective source level in this experiment was 231 dB re 1 µPa (SPL), that is, within the range of source levels for piling and 3-D VSP (**Table 7-28**). A combination of Baited Remote Underwater Video Systems (BRUVS) and acoustic tagging methods were used to measure the behaviours and movements of fishes at high (directly below source), medium (300 m from source) and low exposure sites (2 km), as well as at vessel control (10 km) and control sites (11 km). The maximum modelled SEL values received at the high, medium and low exposure sites were in the order of 180 – 200 dB re 1 $\mu Pa^2 \cdot s$, 130 – 160 dB re 1 $\mu Pa^2 \cdot s$ and 115 – 125 dB re 1 $\mu Pa^2 \cdot s$ respectively. There were no short-term (days) or long-term (months) effects of exposure detected on the composition, abundance, size structure, behaviour, or movement of fishes at any exposure sites.

The impulses from piling, 3-D VSP and drilling VSP will not occur simultaneously and will occur with time periods in between sufficient for recovery from injury to occur. Given the conservative threshold criteria considered, relevant field experiment findings and intervals between noise emitting activities the potential impacts from piling, 3D VSP and drilling VSP to fish will be localised, restricted to the area immediately around the noise source, and occur only over a short periods of time throughout the Dorado Phase 1.

Noise from vessels and the FPSO is considered to present a low risk of mortal or recoverable injury to fish. Based on the assessment above, injuries to fish as a result of acoustic emissions from Dorado Phase 1 are not expected to occur.

Temporary Threshold Shift

The most sensitive fish group likely to be in the Project Area, those with a swim bladder not involved in hearing (particle motion detection), could experience TTS within 5.59 km of piling noise sources, within 4.65 km of the 3-D VSP and within 840 m of the drilling vertical seismic profiling source (**Table 7-33**). The impulses from piling and vertical seismic profiling are unlikely to occur continuously for 24 hrs, and recovery in the ability to perceive noise is likely to occur within the 24 h period assessed. Fish recover from TTS relatively quickly (**Attachment 10**) and as the longest pile driving activity will take approximately 4.7 hours with breaks between the driving of each pile, the impact period is limited. The 3-D VSP, whilst over a longer duration of 25 days, is a moving noise source such that demersal and pelagic fish are not exposed continuously to noise levels that may induce TTS.

Noise from vessels and the FPSO is considered to present a low risk of TTS to fish at ranges of more than tens of metres.

Masking

Underwater noise sources that overlap the functional hearing range of fishes include piling, vertical seismic profiling (3-D and drilling) and vessel noise. Given piling and vertical seismic profiling activities are of short duration and 3-D VSP is a moving source, masking-related impacts would only credibly occur over a short duration. Operational noises, such as FPSO and vessel-related noise, are relatively low intensity and are only expected to potentially mask biologically important noise in a localised area around the noise source. Given the widespread and homogeneous habitats in the Project Area, these impacts are not expected to result in impacts to fish.

Larval coral reef fish have been shown to use noise cues to locate suitable habitat for settlement (Leis et al. 2002). Given the lack of coral reef habitat within the Project Area, acoustic emissions from Dorado Phase 1 are not expected to result in impacts to recruitment of reef fish.

Behavioural

Behavioural impacts to fish will be limited to responses within metres of the noise source, and fish may be temporarily displaced from the vicinity of the noise emissions. As demonstrated by Meekan et al. (2021), behavioural responses of demersal fishes to a simulated seismic survey in the field in a similar area to Dorado Project Area on the North West Shelf were not detected at high, medium and low exposure sites compared to control sites. The acoustic tags and telemetry found little evidence that fish were displaced by the exposure to the seismic source. Movements of tagged fish occurred over a limited area focused on two or three acoustic receivers, and there was no evidence for the departure of tagged fish after exposure. These multiple lines of evidence suggest that seismic surveys have little impact on the behaviours of demersal fishes in this environment.

7.2.5.2.5 Reptiles

Marine reptiles such as turtles and sea snakes are not known to be particularly sensitive to underwater noise. Research on marine turtles suggests that functional hearing is concentrated at frequencies between 100 and 800 Hz (Ketten and Bartol 2006), which is a subset of the low-frequency cetacean functional hearing range.

Several turtle species were identified as likely to occur within the Project Area, with only one BIA (Flatback Turtle inter-nesting BIA) intersecting the Project Area. The water depth and benthic habitat within the Project Area is typically too deep for turtle foraging for several species (e.g. Hays et al. 2001; Polovina et al. 2003), although species that eat primarily pelagic prey (e.g. leatherback and juvenile green turtles) may forage for pelagic prey. As such, turtles are expected to occur only at low densities within the Project Area and are likely to be transiting the area rather than foraging, breeding or inter-nesting.

Permanent Threshold Shift

The activity with the highest potential of risk is subsea impact driving of piles and vertical seismic profiling. The noise modelling results indicate PTS may occur at ranges of 0.72 km and 0.03 km for piling and 3-D and drilling VSP (**Table 7-33**). These results are based on a SEL_{24h}, and it is not considered credible that such a long noise exposure would occur, as piling and VSP activities will be of shorter duration than 24 hrs and turtles are unlikely to remain within the noise field for this length of time.

The vessel and FPSO noise did not exceed the PTS noise effect criteria for turtles. These noise sources will not credibly result in PTS in turtles.

Temporary Threshold Shift

The TTS noise effect thresholds for marine turtles were reached at ranges of 4.11 km, 2.92 km and 0.38 km for piling, 3-D VSP and drilling VSP respectively **Table 7-33**). These results are based on a SEL_{24h}, and it is not considered credible that such a long noise exposure would occur, as piling and drilling vertical seismic profiling activities will be of shorter duration than 24 hrs, 3-D VSP involves a moving source and turtles are unlikely to remain within the noise field of these sources for this length of time.

The TTS noise effect threshold was only exceeded by vessel and FPSO noise sources at very close ranges. Turtles are not expected to remain in such close proximity to vessels for any length of time; TTS in marine turtles is not considered to be credible as a result.

Behavioural

The behavioural disturbance and response noise effect criteria were exceeded by piling, 3-D VSP and drilling VSP at 3.51 km, 2.91 km and 1.22 km, respectively. These criteria were not exceeded by any vessel or FPSO modelled scenarios. Given the low number of turtles expected to be in the Project Area, along with the relatively short durations and small area ensonified above the behavioural noise effect criteria, any behavioural impacts will be short-term and restricted to a small number of turtles.

7.2.5.2.6 Commercial Fisheries

Management areas for the State and Commonwealth-managed fisheries active in the area are presented in **Section 3.4.3**.

The impact assessment of underwater noise on fish is described in **Section 7.2.5.2.4**. The impacts to fish from underwater noise are limited to localised behavioural changes that will not have any flow on impact to commercial fishing operations**.** As demonstrated by Meekan et al. (2021), behavioural responses of demersal fishes to a simulated seismic survey in the field in a similar area to Dorado Project Area on the North West Shelf were not detected at high, medium and low exposure sites compared to control sites. The experiment was focused on tropical demersal emperors (family Lutjanidae), snappers (family Lethrinidae) and groupers (family Epinephelidae) targeted by commercial fisheries. Dominant species included spangled emperor (*Lethrinus punctulatus*), red emperor (*Lutjanus sebae*), and brownstripe snapper (*L. vitta*). There were no short-term (days) or long-term (months) effects of exposure on the composition, abundance, size structure, behaviour, or movement of fishes at any exposure sites. The researchers suggest that the behavioural responses of demersal fishes to the bait cue provided by the Baited Remote Underwater Video Systems are a realistic proxy of the likely response of the same species to baited hooks or traps used by the commercial fisheries that target them. The acoustic tags and telemetry found little evidence that fish were displaced by the exposure to the seismic source. These multiple lines of evidence suggest that seismic surveys have little impact on the behaviours of demersal fishes in this environment. The effective source level in this experiment was 231 dB re 1 µPa (SPL), that is, within the range of source levels for piling and 3-D VSP.

In addition, negligible impacts are expected to plankton (including fish eggs and larvae, Section 7.2.5.2.1) or benthic habitats and communities (Section 7.2.5.2.2) that would have any flow on impact to commercial fishing operations.

7.2.5.3 Summary of Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-37**.

Table 7-37: Summary of impacts, environmental performance outcomes, controls and consequence evaluation of acoustic emissions during Dorado Phase 1

EPOs	
EPO3E: No mortality or significant[32] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 acoustic emissions. **EPO9A** Undertake Dorado phase 1 in such a manner that noise in biologically important areas will be managed to prevent any displacement of threatened species as per EPBC species conservation requirements **EP010A** No impacts from Dorado Phase 1 acoustic emissions to pre-existing commercial fish stocks that occur within the project area that could be subject to existing or future fishing effort. **EPO11A:** No injury to pygmy blue whales within a biologically important area. **EPO12A:** noise generating activities of Dorado Phase 1 are managed in such a manner to prevent PTS and reduce the risk of TTS and biologically important behavioural disturbance to all whales in the Commonwealth marine area.	
Receptor	**Impact**
Marine Mammals	Potential PTS up to 5.84 km from FPSO anchor piling, 3.4 km from 3-D VSP, 0.47 km from drilling VSP sources, and 0.21 km from FPSO operations. Potential TTS up to 28.2 km from FPSO anchor piling, 15 km from 3-D VSP, 3.1 km from VSP drilling source, and 4.51km from FPSO operations. Potential behavioural disturbance up to 5.4 km from FPSO anchor piling, 3.78 km from 3-D VSP, 2.42 km from drilling VSP source, and 11 km from FPSO operations. Only the TTS envelope resulting from Dorado FPSO anchor piling, and future tieback piling (at a worst-case tieback location) overlaps with the humpback whale migration BIA. No noise sources (including future tieback activities) resulting in potential PTS, TTS injury overlap with the pygmy blue migration BIA.
Fishes	Potential mortal injury up to 0.56 km from piling, 0.07 km from 3-D VSP and 0.037 km from VSP sources. Potential recoverable injury up to 1 km from piling, 0.07 km from 3-D VSP and 0.05 km from drilling VSP sources. Potential TTS up to 5.88 km from piling, 4.65 km from 3-D VSP and 0.84 km from drilling VSP sources. Moderate risk (at 10s of metres) to low risk (at all distances) of behavioural disturbance from all other noise sources.
Reptiles	Potential PTS up to 0.72 km from piling, and 0.03 km from VSP (3-D and drilling) sources.

[32] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

	Potential TTS up to 4.11 km from piling, 2.92 km from 3-D VSP, and 0.38 km from drilling VSP source. Behavioural response up to 3.51 km from piling, 1.99 km from 3-D VSP and 1.22 km from drilling VSP sources
Controls	

CM15: Vessels movements and helicopter flights comply with Part 8 of EPBC Regulations for interacting with cetaceans.

CM16: Implement Santos' Protected Marine Fauna Interaction and Sighting Procedure.

CM17: Undertake acoustic modelling for piling, 3-D VSP and drilling VSP activities for potential future tiebacks.

CM18: Implement mitigation measures for drilling VSP and 3-D VSP activities aligned with EPBC Act Policy Statement 2.1 - Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a), including:

- development of low-power and shutdown zones,
- marine fauna observers,
- pre-start visual observations,
- soft-start procedures,
- stop work procedures, and
- night-time and low visibility procedures.

CM19: Implement mitigation measures for piling activities, including:

- marine fauna observers,
- pre-start visual observations,
- soft-start procedures,
- stop work procedures, and
- night-time and low visibility procedures.

CM20: Where future activity specific acoustic emissions modelling results indicate PTS, TTS envelopes overlap with a pygmy blue whale BIA, related impulsive noise generating activities will not occur during corresponding peak migration periods.

Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.5.4 Demonstration of Acceptability

The potential impacts from underwater noise emissions as a result of Dorado Phase 1 have been compared against receptor-specific acceptable levels of impact and other considerations, which are summarised in **Table 7-38** and **Table 7-39**. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case consequence for underwater noise emissions was evaluated as minor (**Table 7-37**). This consequence is considered to be acceptable when assessed against the acceptable levels of impacts and risks outlined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from acoustic emissions are acceptable.

Table 7-38: Demonstration of acceptability for acoustic emissions

Acceptability Criteria	Justification
To meet the principles of ESD	The risks and impacts from underwater noise associated with Dorado Phase 1 are consistent with the principles of ESD based on: + the environmental values/sensitivities within the Project Area are not expected to be significantly impacted, and + the precautionary principle has been applied and studies undertaken where knowledge gaps were identified (**Attachment 10** and **Attachment 11, Attachment 14**).
Internal Context	Management of underwater noise is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Underwater noise emissions are not expected to result in impacts to stakeholders, such as commercial fishers. Santos' ongoing consultation program will consider stakeholders' feedback.
MNES	The following material published in relation to threatened and migratory species within and adjacent to the Project Area identify acoustic emissions as a threat: + Conservation advice: Conservation advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b), Approved conservation advice for *Balaenoptera physalus* (fin whale) (Threatened Species Scientific Committee 2015c), + Recovery plans: Conservation management plan for the southern right whale: a recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2011-2021 (DSEWPaC 2012c). This recovery plan identifies noise interference as a threat to Southern Right Whales. Adoption of CMs 15 – 20 satisfies Action Area A.2 from the management plan: Assessing and addressing anthropogenic noise. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a). This recovery plan identifies noise interference as a threat to marine turtles. Adoption of CMs 15 – 20 satisfies Action Area B.3 from the management plan: Assessing and addressing anthropogenic noise., and Conservation Management Plan for the blue whale: A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2015-2025 (Commonwealth of Australia 2015a). This recovery plan identifies noise interference as a threat to Blue Whales. Adoption of CMs 15 – 20 satisfies Action Area A.2 from the management plan: Assessing and addressing anthropogenic noise; and Guidance on key terms within the Blue Whale Conservation Management Plan (DAWE, 2021). The objectives of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The controls outlined in **Table 7-37** are consistent with the objectives of the material listed above

Acceptability Criteria	Justification
	and Santos considers the impacts of acoustic emissions to not be inconsistent with the EPBC management plans. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify noise as a key threat or do not have explicit relevant objectives or management actions related to noise.
Other Relevant Requirements	Management of the impacts of underwater noise emissions are not inconsistent with relevant legislative requirements, including: + alignment with EPBC Act Policy Statement 2.1 - Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a) + The AWS provides for a high level of protection to all cetaceans including whales from all anthropogenic threats.

Table 7-39: Demonstration of acceptability of acoustic emissions against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Justification
RSAL8: No significant[33] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities	Benthic habitat surveys of the Project Area did not indicate the presence of particularly diverse or sensitive benthic communities, and potentially vulnerable taxa, such as bivalve molluscs, were not observed. Given the duration, frequency spectrum and intensity of potential noise generated during Dorado Phase 1, no impacts to benthic habitats and communities as a consequence of underwater noise are expected to occur.
RSA13: No mortality of species listed as threatened, migratory or cetacean under the EPBC Act as a result of Dorado Phase 1. **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL15**: No injury to pygmy blue whales in a pygmy blue whale BIA. **RSAL16**: No significant[31] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	Potential noise-related impacts will be concentrated around the Dorado WHP and FPSO locations during the installation and operations stages, and potential future tieback locations within the Dorado Project rea. This area is not important habitat for threatened or migratory MNES that may be impacted by acoustic emissions, such as cetaceans and marine turtles. As required in the CMP for the Blue Whale, a precautionary approach has been adopted through inclusion of control measures (CM15 to CM20) to manage potential impacts to blue whales, given that the project area is outside of PBW foraging or migration BIAs, but overlaps the distribution range. The CMP for the Blue Whale does not suggest controls for distribution ranges, and as such, overlapping of the PBW distribution range with the Dorado Project Area is not inconsistent with the CMP for the Blue Whale. Recent distribution and movement of pygmy blue whales by Thums et al. (2022) reveals migratory paths in deeper waters of the continental slope to the west of

[33] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

RSAL19: No negative impacts to the economic viability of the commercial fish resources.	the Project Area (**Figure 3-13** and **Section 3.3.3**), which further reduces the risk of anthropogenic noise impacts within the PBW distribution range. Recent clarification of terms in the CMP for the Blue Whale 2021-25 (DAWE, 2015) advise that PTS and TTS do constitute an injury. No Dorado noise sources resulting in potential PTS, TTS or behavioural impacts overlap with the pygmy blue migration BIA and as such Dorado development activities are not inconsistent with the CMP for the Blue Whale (DAWE, 2021). Under the AWS and *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) all cetaceans (whales, dolphins and porpoises) are protected in Australian waters, and it is an offence to kill, injure or interfere with a cetacean. EPO12A provides an appropriate level of performance to prevent PTS and reduce the risk of TTS and biologically important behavioural disturbance to all whales in the AWS, attributable to noise generating activities of the Dorado Phase 1 Development. Santos' management of acoustic emissions is aligned to industry practices and relevant requirements. Santos has experience in effectively implementing these controls. This management is aligned to relevant conservation advice and recovery plans for threatened and migratory species. While impacts to individual fish may occur, these are expected to consist of recoverable TTS. These impacts will not result in impacts to commercially exploited fish resources as a whole.

7.2.6 Emissions – Greenhouse Gas

This section details the assessment of direct (Scope 1) greenhouse gas (GHG) emissions from the development, operation and decommissioning stages of Dorado Phase 1 and the indirect (Scope 3) GHG emissions from the transportation, processing and third-party consumption of product. This assessment includes the predicted GHG emissions from Dorado Phase 1 and the potential impacts of climate change on sensitive receptors, including matters of national environmental significance, within Australian jurisdictions.

GHG emissions refers to gases that trap heat within the atmosphere through the absorption of longwave radiation reflected from the Earth's surface. The emissions of carbon dioxide (CO_2), nitrous oxide (N_2O), methane (CH_4), sulphur hexafluoride (SF_6), hydrofluorocarbons (HFCs) and perfluorocarbons (PFCs) are recognised as GHG emissions.

To quantify potential GHG emissions impact, the emissions of carbon dioxide equivalent ($CO_{2\text{-}e}$) are used as a metric to compare the emissions of GHG on the basis of their global-warming potential by converting amounts of GHG emissions emitted to the equivalent amount of carbon dioxide based on global-warming potential.

The assessment is framed within the national and international legally binding Paris Agreement treaty to limit global warming, and country-specific emissions reduction policies and regulation to reduce their greenhouse gas emissions in line with the long-term temperature goal of the Paris Agreement, of which Australia is a signatory.

7.2.6.1 GHG Emission Sources

GHG emissions will be generated in the Dorado Development Project Area during the following stages:

+ development drilling;
+ installation;
+ commissioning;
+ operations and maintenance; and
+ decommissioning.

The GHG emissions generated during the above stages will be associated with:

+ fuel combustion – emissions from power generation on the support and installation vessels, helicopters, MODU, and FPSO. For instance, the FPSO will be self-sufficient in power generation and will supply power to a range of production operations, such as separation, oil export and gas reinjection, as well as the utilities, support systems and power to the Dorado WHP and potential future tiebacks;
+ flaring – the recovered gas from the reservoir will be reinjected (approximately 235 MMscfd), with the exception of a portion used as fuel gas on the FPSO (approx. 12 MMscfd) and to maintain a pilot flame on the FPSO flare system (0.1 MMscfd), which is required for safety reasons. Flaring of the pilot gas is regarded as planned flaring for safety purposes. planned flaring from the FPSO is expected to be minimal relative to combustion of gas for fuel and will occur continuously to ensure hydrocarbons disposed of in the flare system are combusted prior to discharge. Unplanned flaring may also occur as a result of non-routine plant trips or process upsets, and similar to planned flaring, is also required to ensure safe operations during upset conditions. Examples of non-routine events may include loss of compression, emergency conditions (such as emergency depressurisation and unplanned shutdown and start-up) and pressure relief events. Other non-routine events that may result in flaring, include well testing, commissioning, planned maintenance shutdowns, blowdown and re-start (before and after planned maintenance shutdowns). Flaring associated with well testing is estimated at 890 MMscf (assuming 38 wells). The assessment of episodic unplanned flaring associated with non-routine events considered both the expected frequency of non-routine events and the expected quantity flared during event. Santos conservatively estimates that 4,196 MMscf may be flared for non-routine events over the 20-year life of Dorado Phase 1 inclusive of potential future tiebacks;
+ venting – venting is the atmospheric emission of non-combusted gas resulting from safety devices designed to release emissions to atmosphere to prevent overpressure of process piping/vessels/equipment such as pressure safety valves and is limited to two main sources:
    - WHP maintenance drain drum venting. The maintenance drain drum and associated atmospheric vent are to allow sections of pipework to be isolated and drained/vented for maintenance purposes. This is manually operated vent system for when maintenance operations are being performed by personnel on the WHP. Any depressurisation would be initially to the flowlines to their operating pressure and then the last ~100 bar via the maintenance drum vent to minimise venting to atmosphere; and
    - systems pressure testing (generally nitrogen is used during flowline or equipment pressure testing to identify potential leak pathways prior to introducing hydrocarbons);

+ fugitive emissions – unintentional atmospheric emissions from pressurised piping components and equipment leaks. Fugitive emissions from leaks are typically caused by corrosion or wear of mechanical joints, seals, and rotating surfaces over time and can occur from devices that are not operating properly, such as intermittent pneumatic devices that are malfunctioning and continuously bleeding gas or stuck liquid drain valves on separators.

A breakdown of the expected Dorado Phase 1 Scope 1 GHG emissions sources and the predicted quantity of those emissions as million tonnes of CO2-e (MtCO2-e) by project stage is presented in Table 7-40. The volume of gas to be released, combusted, and reinjected by Dorado Phase 1 is summarised in Table 7-41.

Table 7-40: Scope 1 GHG emissions sources and basis for estimated emissions for Dorado Phase 1 (Attachment 12)

Stage	Emissions Sources	Description	Estimated Emissions ($MtCO_{2-e}$)
Development drilling (Dorado field and future tiebacks) Installation (Dorado and future tieback facilities) Commissioning	MODU Support vessels Installation vessels FPSO	To generate the necessary power onboard the MODU, installation vessels, and support vessels, marine diesel oil (MDO) will be combusted as fuel. **Drilling** As part of the drilling operations, wells will flow back to the MODU during well clean-up and testing, and the recovered hydrocarbons will be flared (both liquids and gas) (allowance for up to 38 wells to be drilled and cleaned up). Drilling support vessels on location to support drilling campaigns (assumed duration for drilling and completing up to 38 wells, with two vessels permanently on location and allowance for a third vessel for periodic support). **Construction and Installation Activities** Construction and installation support vessels (assume five vessels at approximately 12 m^3/day/vessel, for a total period of up to 12 months: four months for the foundation Dorado WHP and FPSO installation and up to a further eight months for associated future tieback construction and installation activities). **Commissioning** On the FPSO, during commissioning activities (when the FPSO first arrives in the field) the produced hydrocarbons will be flared and MDO will be combusted as fuel to generate the necessary power (until an appropriate and sufficient supply of produced gas is established). An allowance of up to four months of support vessel emissions is included (assumes approximately 12 m^3/day/vessel).	0.77
Operations and maintenance (Dorado field and future tiebacks)	FPSO Dorado WHP Future tieback WHP and/or subsea facilities) Support vessels	On the FPSO, during operations and maintenance activities: + a portion of the produced gas will be combusted as fuel gas to generate the necessary power. To include a suitable level of conservatism, given that the maintenance downtime requirements and number of cyclone demobilisations are not known (i.e. when the FPSO will not be operating), it has been assumed that power generation and compression equipment are used at full capacity (i.e.	14.65

Stage	Emissions Sources	Description	Estimated Emissions ($MtCO_{2-e}$)
		100% of the time) during the operations and maintenance stage of Dorado Phase 1 (20 years), inclusive of future tiebacks. + a portion of the produced gas will be used to maintain the flare pilot flame (a safety feature), which is continuously lit (approximately 0.1 MMscf/day). **Non-routine Events** To maintain safe operations there will be a requirement to send gas to the flare during non-routine events such as process upsets/trips, emergency shutdown (ESD), and unplanned shutdowns (i.e. unplanned flaring). A conservative assumption of up to 15 extended unplanned flaring events (12 spurious and three associated with cyclones), each up to 48 hours in duration, at a rate of approximately 125 MMscfd per annum is the basis of unplanned flaring estimates. These events may be associated with process upsets, gas compressor downtime, cyclone avoidance. When the FPSO is not producing or is off station (i.e. when it is disconnected from the DTM or when production is stopped during events such as shutdown), diesel will be combusted as fuel to operate safety-critical equipment such as fire pumps. On the WHP there may be a requirement to vent produced hydrocarbon gas during planned maintenance activities. It is a reasonable expectation that there will be some fugitive emissions from non-point sources (such as valves or flanges) on the Dorado WHP and FPSO. For the purpose of calculations that dictate equipment fugitives as a result of gas throughput, annual gas reinjection is assumed to be constant through the project lifetime, independent of crude production. To generate the necessary power onboard the support vessels, MDO will be combusted as fuel.	
Decommissioning	MODU FPSO Installation vessels Support vessels Future tieback facilities	To generate the necessary power onboard the MODU, FPSO, installation and support vessels for infrastructure removal, MDO will be combusted as fuel. It has been assumed that it would take four weeks to decommission one well; up to 38 wells may require decommissioning for Dorado Phase 1 (inclusive of Dorado reservoir and future tiebacks). Removal of infrastructure has assumed similar timeframe as for installation.	0.16

Table 7-41: Breakdown of total gas flows by project activity and basis for GHG emission estimates

Stage	Activity	Location	Unprocessed Gas (tonnes)	Contribution to Total Gas Flows during the Dorado Phase 1 (%)
Drilling and installation	Flaring	Dorado wells	10,500	0.02%
		Dorado infill wells	3,500	0.01%
		Future tieback wells	14,500	0.03%
FPSO commissioning	Flaring	FPSO	21,400	0.04%
Operations and maintenance	Flare pilot	FPSO Dorado WHP Future tiebacks WHP and/or subsea facilities	20,900	0.04%
	Unplanned flaring		2,140,000	3.97%
	Compressor fuel gas		2,600,000	4.82%
	Gas reinjection		49,100,000	91.07%
	Gas venting		0	0%
	Fugitives		3,650	0.01%

7.2.6.2 GHG Emissions Estimate

A quantification study was undertaken to inform the assessment of the potential impacts and risks from the GHG emissions associated with Dorado Phase 1 (**Attachment 12**). The study focused on quantifying the predicted GHG emissions.

To describe the direct and indirect emission sources, improve transparency, and satisfy the interests of different organisations and different climate policies and business goals, three emissions "scopes" (Scope 1, Scope 2, and Scope 3) are defined for GHG accounting and reporting purposes:

- Scope 1 emissions are direct GHG emissions that occur from sources that are owned or controlled by Santos; this includes fuel combustion, flaring and venting;
- Scope 2 emissions account for GHG emissions from the generation of purchased electricity consumed by Santos. Dorado Phase 1 will not generate Scope 2 emissions; and
- Scope 3 emissions are indirect GHG emissions from sources not owned or controlled by Santos, including the transportation, refining and use of sold products by customers.

The above definitions have widely been accepted globally and throughout the energy industry (for instance, Scope 1 and Scope 2 emissions definitions align with those presented in the *National Greenhouse and Energy Reporting Act 2007* (NGER Act)).

In this section, to put the Dorado Phase 1 lifecycle $CO_{2\text{-}e}$ emissions into context, the estimated total annual average emissions of Dorado Phase 1 are used. The total annual average $CO_{2\text{-}e}$ emissions were established by adding the estimated annual average $CO_{2\text{-}e}$ emissions of each stage of Dorado Phase 1. To better categorise emissions aligned with comparable sources across the five stages of Dorado Phase 1, they have been grouped as follows:

- drilling, installation, and commissioning – including development drilling, installation and commissioning; and
- operations and maintenance (for a duration of 20 years, including future tiebacks); and
- decommissioning.

The average annual emissions for each group was established by estimating the overall $CO_{2\text{-}e}$ emissions associated with the group and dividing this by the number of years for each group. At this early stage of Dorado Phase 1, these values represent the best possible estimate based on the current understanding of Dorado Phase 1 project.

Dorado Phase 1 is expected to produce 350 MMbbl of oil from up to 38 wells (refer to **Section 6.6.6**) over the 20-year project life from the Caley reservoir (approximately 150 MMbbl) and the proposed future tiebacks (approximately 200 MMbbl), assuming exploration success and commerciality of the tiebacks. The future tiebacks will augment oil production and export throughout the life of Dorado Phase 1. For the purpose of this assessment, timing on up to two future tiebacks has been estimated to occur in year 6 and year 10 of the operations and maintenance stage for Dorado Phase 1. For the Caley reservoir and each future tieback, oil export is expected to peak during the first years of production from the reservoir before steadily decreasing as the reservoir is depleted.

7.2.6.2.1 Scope 1 GHG Emissions

The boundary of Scope 1 emissions has been set as operations occurring with the Dorado WHP, FPSO, MODU, support vessels and potential future tiebacks over the key stages presented in **Section 6.7**.

The key activities generating Scope 1 GHG emissions and the phase at which they are expected are summarised in Table 7-42**.**

Table 7-42: Key activities generating Scope 1 emissions

Activity	Drilling, Installation, and Commissioning including Future Tiebacks	Operations and Maintenance including Future Tiebacks	Decommissioning
Fuel gas combustion – power generation and compression		✓	
Diesel combustion – power generation (FPSO during commissioning and when it is no longer connected to the DTM during operations and maintenance)	✓	✓	✓
Diesel combustion – support and installation vessels and the MODU	✓	✓	✓
Flaring (planned and unplanned)	✓ (well clean-up flaring)	✓	
Venting		✓	
Fugitive emissions		✓	

To estimate GHG emissions, the calculation method presented in the *National Greenhouse and Energy Reporting (Measurement) Determination 2008* together with the most recent emission factors outlined in the *National greenhouse accounts factors - Australian National Greenhouse Accounts* (Department of Industry, Science, Energy and Resources August 2021) were adopted. This allowed for the establishment of the CO_{2-e} emissions associated with the CO_2, CH_4, and N_2O emissions. It also enabled the direct comparison of the GHG emissions associated with each stage of Dorado Phase 1 on a uniform metric basis. Further information on the emissions methods and the factors used are detailed in Table 9 of **Attachment 12**.

Throughout the life of Dorado Phase 1, approximately 15.6 $MtCO_{2-e}$ of Scope 1 emissions are estimated to be emitted (the expected GHG emissions by activities and stages of Dorado Phase 1 are presented in **Table 7-43)**. The majority (85%) is attributable to CO_2 emissions, 15% to CH_4, and 0% to N_2O.

Table 7-43: Estimate Scope 1 GHG emissions by activities and project stages (Attachment 12)

Activity	Total Scope 1 GHG Emissions ($MtCO_{2-e}$) by Stage		
	Drilling, Installation, and Commissioning, including Future Tiebacks (assumes 38 wells)	Operations and Maintenance including Future Tiebacks	Decommissioning
Fuel gas combustion	0	6.21	0
Diesel combustion	0.42	0.05	0.16
Flaring:			
Flare pilot	0	0.08	0
Unplanned flaring	0.08	8.06	0
Well clean-up flaring	0.27	NA	NA
Fugitive emissions	0	0.25	0

Nearly all of the Scope 1 emissions (94%) are related to activities taking place during the operations and maintenance stage, approximately 5% to drilling, installation, and maintenance, and 1% to decommissioning (**Figure 7-20**). The annual average emissions during the operations and maintenance stage is 0.732 $MtCO_{2-e}$/a based on total emissions (including for assumed unplanned events), and 0.767 $MtCO_{2-e}$/a based on the year of highest production. The majority (52%) of the operations and maintenance stage emissions are due to flaring (planned and unplanned associated with non-routine events) and 40% to combustion of fuel gas. The remaining 8% made up of diesel combustion (4%), well clean-up activities (2%), fugitive emissions (2%) and flare pilot (less than 1%). Due to the early engineering stage of the project, the unplanned flaring component of GHG emissions has been conservatively estimated to account for a number of design and operational outcomes that are yet to be finalised. There are many non routine events that may result in unplanned flaring. The estimate provided includes events and situations such as:

- control and shut down system reliability issues;
- systems redundancy level (which is yet to be confirmed) that may result in flaring due to non-spared equipment, i.e. 2x 50% trains or 1 x 100% train for flash gas compression and reinjection;
- compressor response to unsteady operation and overall control scheme of the compression trains;
- power configuration and time to recover from process trips;
- cyclone disconnect requirements, such as depressurising the plant and/or the flowlines;
- start-up restrictions due to cold temperatures resulting in extended flaring to ensure minimum temperature material constraints are not exceeded;
- design of the fuel gas system and time to bring back on line after a trip;
- well injectivity issues resulting in unsteady operation of reinjection compressors and resultant trips or flaring;
- gas turbine and compressor reliability; and
- process configuration.

As the design is further defined and the equipment selection is agreed on, it is likely that the current assumption for flaring due to faults and/or cyclone preparedness can be optimised. This will both benefit the GHG emissions volume and provide greater liquid production due to the direct link between gas reinjected and liquids recovered from the reservoir. The success of the miscible flood in the reservoir is related to maintaining pressure via gas reinjection. More gas flared, less gas reinjected. Less gas reinjected, less oil produced.

In **Table 7-43** and **Figure 7-20**, the contribution of fugitive emissions did not take into consideration the vapour recovery system, which will further reduce emissions from unplanned flaring and venting.

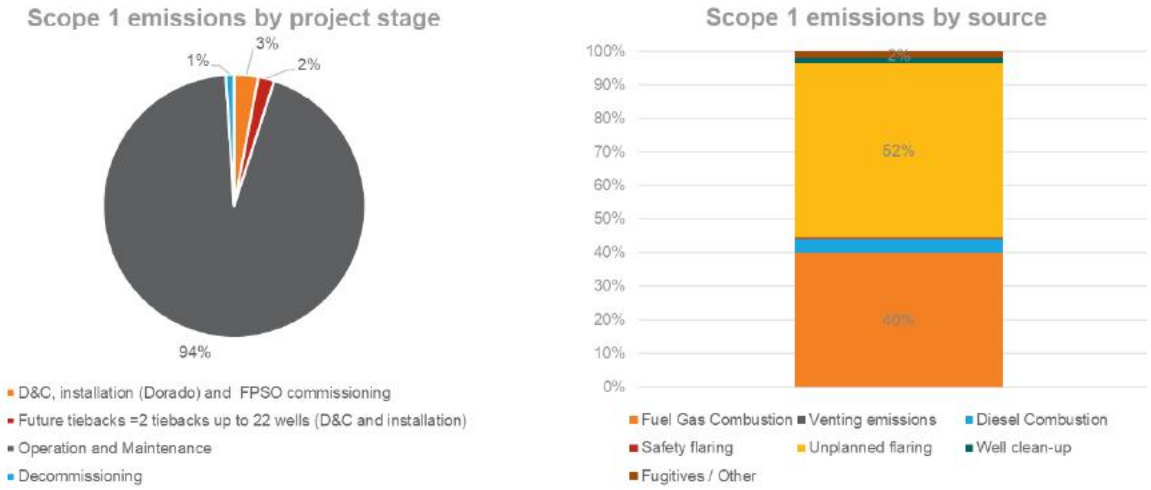

Figure 7-24: Scope 1 emissions overview (refer to Attachment 12)

7.2.6.2.2 Scope 3 GHG Emissions

Australian and international carbon accounting rules mean that each country and each emitter reports their own Scope 1 and Scope 2 emissions. Santos is not required to report Scope 3 emissions under the Australian NGER reporting framework because they are the Scope 1 and 2 emissions of other emitters. Scope 3 emissions are disclosed in Santos' Climate Change Report (Santos 2022), in accordance with the World Resources Institute Greenhouse Gas Protocol Technical Guidance for Scope 3 Emissions.

For the purposes of providing a Scope 3 emissions estimate for the Dorado Development, Scope 3 GHG emissions have been split into 15 subcategories as presented in the GHG Protocol Corporate Value Chain (Scope 3) Accounting and Reporting Standard. **Table 7-44** presents the subcategories that apply to Dorado Phase 1. This selection defines the boundary of Dorado Phase 1 Scope 3 emissions.

Table 7-44: GHG Protocol Corporate Value Chain Accounting and Reporting Standard Scope 3 emissions subcategories

GHG Protocol Subcategory	Included in Scope 3 Emissions	Key Reasons for Inclusion or Exclusion
Purchased goods and services	✓	- Goods (such as production chemicals) will be purchased and transported to the facilities.
Capital goods	✓	- Capital goods (such as the steel required to build the Dorado WHP and FPSO) will be purchased and acquired throughout Dorado Phase 1 lifecycle. The mass of the materials that make up the structure of the WHP and FPSO were used to quantify this category. - Assumes installation of up to 3 WHPs (to account for future potential tiebacks).
Fuel- and energy-related activities (not included in Scope 1 or Scope 2)	✓	- Additional fuel (such as diesel) will be acquired and transported to the facilities (emissions from the use of such fuel are accounted for in Scope 1 emissions).
Upstream transportation and distribution	×	- The transportation and distribution of goods upstream is likely to be immaterial noting that the transport of raw materials like diesel to the FPSO will be covered in the above subcategory (fuel- and energy-related activities) and Scope 1 transport-related emissions. The exclusion of this category is in accordance with the size and influence criteria in Table 6.1 of the GHG Protocol.
Waste generated in operations	×	- Offshore waste treatment and disposal is already accounted for in Scope 1 emissions.
Business travel	✓	- Being an offshore project, business travel will be dominated by flights between Perth and Dampier (via plane) and Dampier and the FPSO (via helicopter).
Employee commuting	×	- Material emissions associated with the movement of people are included in the above subcategory business travel.
Upstream leased assets	×	- It is possible that leased assets may be required at some stage during Dorado Phase 1 lifecycle, but this emission source is unlikely to be material relative to the whole inventory.
Downstream transportation and distribution	✓	- The transportation and distribution of sold products will take place between Dorado Phase 1 area and the refineries. The furthest refinery port, i.e. Kobe, Japan, is assumed and no domestic use. Assume cargo ship travels back empty to be reloaded. The emissions associated with travel back to the FPSO fall within Santos' Scope 3 inventory

GHG Protocol Subcategory	Included in Scope 3 Emissions	Key Reasons for Inclusion or Exclusion
Processing of sold products	✓	- The products sold will have to be refined before being sold on for use. As no estimates for the refining slate (the mix of crude oil grades that a refinery is processing) for Caley or Baxter crude were readily available, public sources of similar light sweet condensates were considered as a proxy. Cossack crude was identified as the closest to these in terms of geographic location and API gravity. Cossack crude is extracted from the North West Shelf and exhibits an API gravity of 48.8, comparable with Caley and Baxter.
Use of sold products	✓	- Limited to the combustion of fuels and excludes any downstream emissions related to the production and use of plastics and chemicals. The products from the refining process will follow the typical slate from the processing of Cossack crude. It is recognised that vacuum residues (residues from the vacuum refining process) are commonly used to produce non-fuel products; however, a conservative approach has been taken, and it is assumed that this fraction will be combusted using the emissions factor for fuel oil based on the categorisation of this heavy residue product as low-sulphur waxy residue.
End-of-life treatment of sold products	×	- Excluded as this category is limited to the combustion of fuels and excludes any downstream emissions related to the production and use of plastics and chemicals. The combustion of fuels is covered in the above category
Downstream leased assets	×	- The downstream leased assets will fall under the company-wide emissions reporting and are not specific and/or significant to Dorado Phase 1
Franchises	×	- The operations of franchises will fall under the company-wide emissions reporting and are not specific and/or significant to Dorado Phase 1
Investments	×	- The operations of investments will fall under the company-wide emissions reporting and are not specific and/or significant to Dorado Phase 1

At this early stage of Dorado Phase 1, it is not possible to know the exact destination/s of the produced oil, how it will be processed, and who the final end user will be. The assumptions presented in the subsections below have been made for the following subcategories:

- downstream transportation and distribution;
- processing of sold products; and
- use of sold products.

Downstream Transportation and Distribution

To present the most conservative case for GHG emissions from the transport and distribution of Dorado Phase 1 products, the Scope 3 emissions calculations have assumed that 100% of Dorado Phase 1 products will be shipped to Asia for refining (with Japan chosen as the furthest expected destination for calculations and assumptions in determining the inventory). To include sufficient conservatism, the return tanker travels (from Kobe, Japan, to the FPSO) were also included.

Processing of Sold Products

Caley light oil has been used as a proxy for Dorado Phase 1 product (this is conservative as the product will contain Caley light oil, as well as condensates from other reservoirs) inclusive of potential future tiebacks. The processing stages required to refine a product depend largely on the market the processed oil is being sold into. 'Light' oils, such as those from the Caley reservoir, have a lower density than heavy oils due to a higher proportion of shorter chain hydrocarbons. Caley oil is expected to require less processing to yield high-value fuel products, such as petrol and diesel (Gordon et al. 2015). Additionally, emissions through the product lifecycle are lower for light sweet crudes than for other oils because the shorter hydrocarbon chains take less energy to convert into end products than do the heavy crudes. The Intergovernmental Panel on Climate Change found that heavy oils can have up to 24% more CO_2 emissions per barrel than light oils (IPCC2018).

Conservatively, the emissions factor established for the refining of Arab medium-crude oil (a conventional crude) was used for assessing emissions in this subcategory. This resulted in a conservative estimation of GHG emissions, given that the Dorado Phase 1 product is a sweet light oil and its processing is expected to be a less energy and emissions-intensive process than the processing of a typical Arab medium-crude oil (**Attachment 12**).

Use of Sold Products

The refined final products are not known definitively; thus, Scope 3 emissions calculations have assumed they will be similar to Cossack crude. Emissions from the combustion of the sold product were conservatively estimated by assuming 100% combustion of 100% of the refined product (this is a conservative approach as it assumes that the carbon in the oil is most rapidly released to the atmosphere as a GHG as these products are combusted in use). This does not take into consideration the vacuum residues, which are expected to be processed into non-fuel products (such as road material or asphalt) (**Attachment 12**). The calculated emissions intensity for Cossack crude (0.38 tCO_{2-e}/bbl) falls within the range of the average emissions intensity for oil combustion identified by the International Energy Agency (2020b). However, the significance of this category to total Scope 3 emissions underscores the importance of understanding the final processing and market placement of the oil from Dorado Phase 1.

To calculate Scope 3 emissions, emission factors from the DISER's compilation of National Greenhouse Account Factors (DISER August 2021) were used as much as possible. When no National Greenhouse Account Factors were available, published sources were used; for example, Ecoinvent Database (v3) (Gregor Wernet et al (2016) was used as the source of lifecycle emissions factors for the "purchased goods and services" subcategory (**Attachment 12**).

Scope 3 CO_{2-e} emissions over the life of Dorado Phase 1 are estimated at 153 $MtCO_{2-e}$. As presented in **Figure 7-21**, most of the Scope 3 emissions (87%) are associated with the combustion of sold products ("use of sold products" subcategory) and 9% with the refining process ("processing of sold products" subcategory). The "downstream transportation and distribution" subcategory represents

3%, and the remaining subcategories less than 1%. **Table 7-45** provides a further breakdown of the Scope 3 emissions categories contributions.

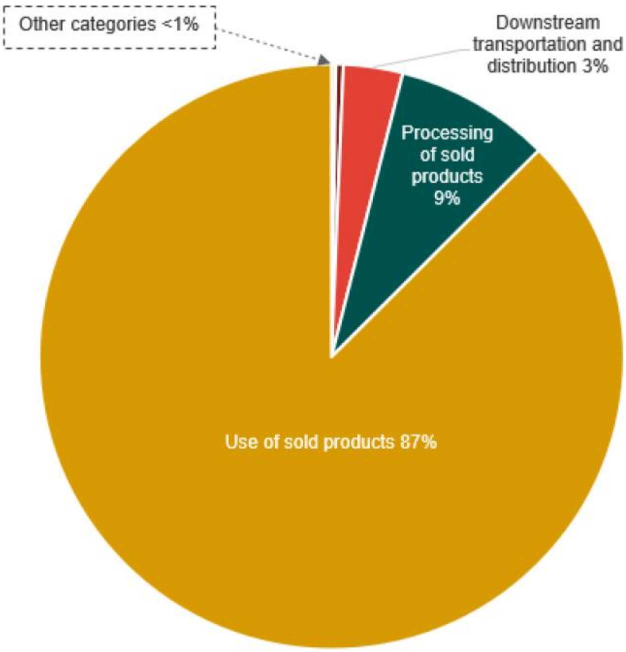

Figure 7-25: Scope 3 emissions overview (Attachment 12)

Table 7-45: Summary of Scope 3 GHG emissions

GHG Protocol Subcategory	Emissions ($ktCO2_e$)	Proportion of Scope 3 Inventory	Boundary
Purchased goods and services	3.75	0.002%	Limited to spend on chemicals and diesel
Capital goods	319	0.21%	Limited to WHP and FPSO
Fuel- and energy-related activities (not included in Scope 1 or Scope 2)	44.3	0.03%	Limited to use of diesel on FPSO
Business travel	617	0.40%	Limited to use of helicopters and support vessels
Downstream transportation and distribution	5,010	3.28%	Limited to sea transport from FPSO to sale port
Processing of sold products	13,200	8.61%	Limited to activities at the refining facility
Use of sold products	134,000	87%	Limited to combustion of fuel products

Hereafter, the "use of sold products", the "processing of sold products" and the "downstream transportation and distribution" subcategories have been grouped and are referred to as "end-user combustion".

7.2.6.3 Paris Agreement

A reduction in net global atmospheric GHG emissions is required to minimise the risk of temperature increases caused by atmospheric GHGs absorbing infrared radiation and trapping energy as heat.

The United Nations Framework Convention on Climate Change came into force in 1994 and has been ratified by 197 countries. The convention established a goal of preventing dangerous anthropogenic interference with the climate system. Subordinate treaties and agreements have been ratified by parties to the convention, including the Paris Agreement, which was agreed under the convention at the 21st Conference of the Parties in 2015 and has been endorsed by 197 countries. The Paris Agreement is currently the world's most comprehensive climate action agreement underpinned by broad international support with 192 countries party to the agreement as at July 2022.

One of the key aspects of the Paris agreement (the agreement) is Article 2 which in seeking to strengthen the global response to climate change, reaffirms the goal of limiting global temperature increase to well below 2 degrees Celsius, while pursuing efforts to limit the increase to 1.5 degrees. Australia is a signatory to the agreement; and in support of meeting the aims of the agreement, the Australian Government has set a target of reducing emissions by 43% below 2005 levels by 2030 and committing to net zero emissions by 2050 (refer to **Section 7.2.6.3.1**).

The Paris Agreement requires all Parties to put forward their best efforts through "nationally determined contributions" (NDCs) to reduce greenhouse gas emissions and to strengthen these efforts in the years ahead. The NDCs represent national action for each country individually; and as such, countries will choose to implement their nationally determined contributions in a variety of ways, consistent with their domestic policies and strategies. Countries are required to regularly and transparently report on their climate actions and support, including whether they have met or are on track to meet the goals per their NDCs. As at July 2022, there are 192 parties to the Paris Agreement that have put forward NDCs.

The participating Paris Agreement parties aim to reach global peaking of greenhouse gas emissions as soon as possible, to achieve a climate neutral world by 2050 (recognising that developing country parties' peaking emissions may occur later than developed countries). Following the peak in greenhouse gas emissions, it is expected that there will be rapid reductions in accordance with best available science, so as to achieve a balance between anthropogenic emissions by sources and removals by sinks of greenhouse gases in the second half of this century, on the basis of equity and in the context of sustainable development and efforts to eradicate poverty (United Nations Framework Convention on Climate Change 2021).

The convention recognises that to achieve the Paris Agreement's long-term goals, climate action will need to get more ambitious over time. To sustain this rising ambition, the agreement establishes a continuous improvement cycle through which countries plan and communicate their NDCs, then implement their plans, and finally review individual and collective progress to inform future planning and updates to their next NDCs. This process provides the foundation for countries to fully bring the objectives of the Paris Agreement to fruition (World Resources Institute 2021).

Effective interaction between climate science and policy underpins the Paris Agreement. Scientific observations, research and assessment continue to inform the international climate regime, as well as national and regional climate policies. The UN climate change process, under the Paris Agreement, relies on scientific information on climate change.

This continuous improvement cycle supports the agreement's commitment to comprehensively take stock of collective progress every five years (global stocktake – Article 14 of the Paris Agreement), a key element of the process that is sometimes referred to as the agreement's ambition mechanism. The global stocktake process assesses the collective progress towards achieving the purpose of the agreement and its long-term goals, evaluates both the performance of countries in meeting their NDCs and contemporary climate and environmental scientific literature. The Intergovernmental Panel on Climate Change (IPCC) assesses the scientific, technical and socioeconomic information relevant for understanding the risk of human-induced climate change and prepares comprehensive assessment reports and special reports to support the global stocktake process. The IPCC is currently in its Sixth Assessment cycle with reports in preparation for publishing at the end of 2022. The global stocktake will inform countries as they each consider how to strengthen their NDCs in light of their different national circumstances. Each round of NDCs is meant to reflect a country's most ambitious plans and to be stronger than the last.

The Paris Agreement is underpinned by the international environmental legal principle of common but differentiated responsibilities. The principle holds that all states (i.e. countries rather than businesses) are responsible for addressing global environmental degradation yet are not equally responsible. The principle balances, on the one hand, the need for all countries to take responsibility for global environmental problems and, on the other hand, the need to recognize the wide differences in levels of economic development between countries. Australia, for example, has a more ambitious target than developing countries precisely because of this principle.

The enhanced transparency framework (ETF) established within the Paris Agreement (Article 13), requires that, starting in 2024, countries report transparently on actions taken and progress in climate change mitigation, adaptation measures and support provided or received. It also provides for international procedures for review of submitted performance reports and contemporary climate and environmental scientific literature. The information gathered through the ETF is intended to then feed into 5-yearly global stocktakes, which in turn feed into review and updates to NDCs.

To facilitate implementation of the Paris Agreement, the Katowice climate change package (United Nations Framework Convention on Climate Change 2018) sets out the essential procedures and mechanisms that brings the Paris Agreement into operation and contains operational guidance on:

+ the information about domestic mitigation and other climate goals and activities that governments will provide in their nationally determined contributions;
+ how to communicate about efforts to adapt to climate impacts;
+ the rules for functioning of the transparency framework for action and support (referred to in Article 13 of the agreement), which will show what countries are doing about climate change;
+ establishing a committee to facilitate implementation of the Paris Agreement and promote compliance with the obligations undertaken under the agreement;
+ how to conduct the global stocktake (the first stocktake is in 2023) of overall progress towards the aims of the Paris Agreement;
+ how to assess progress on the development and transfer of technology; and
+ how to provide advance information on financial support to developing countries and the process for establishing new targets on finance from 2025 onwards.

The Katowice package provides countries with detailed guidance for carrying out the continuous improvement cycle of the agreement, guidance on how to prepare their nationally determined contributions (clear and transparent information on how GHG emissions are calculated and timeframes for contributions commitments), and what types of information participating countries should share concerning adaptation priorities, plans and actions.

To inform further planning for meeting the global Paris Agreement targets, countries must review their efforts, individually and collectively. The review of individual countries' progress will aim to verify data quality and assess progress against each country's targets, while the global stocktake review will assess the collective progress toward the agreement's long-term goals and identify the remaining gaps, challenges and opportunities for further action. The agreement has also set up an expert committee focused on facilitating implementation and promoting compliance to help countries address barriers to implementation and further climate action.

The countries to which Dorado oil will be exported will report their associated GHG emissions from processing, refining and use of the Dorado oil as their Scope 1 and 2 GHG emissions, within the context of their own NDCs and associated emissions reduction policies and regulation, as parties to the Paris Agreement. These are described and accounted for in this OPP within the Scope 3 emissions estimates (assumed as 100% refined and based on the volumes of oil exported and associated transport of the oil cargo).

7.2.6.3.1 Australia's Nationally Determined Contributions

As a party to the Paris Agreement, the Australian Government most recently updated its Nationally Determined Contributions (NDCs) on 16 June 2022, when the Prime Minister and Minister for Climate Change and Energy wrote to the Executive Secretary of the United Nations (UN) Framework Convention on Climate Change updating Australia's 2030 GHG emissions target confirming the 2030 target to reduce emissions by 43% below 2005 levels and committing to net zero emissions by 2050. In support of meeting its NDC emission reduction targets, the Australian Government establishes appropriate climate and energy policy and regulation (where required).

7.2.6.3.2 Australia's Legislative Frameworks for Regulating and Reporting GHG Emissions

7.2.6.3.2.1 Safeguard Mechanism

One of the key statutory instruments for regulating Australia's emissions in line with Australia's NDCs under the Paris Agreement, is the National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015 (Cth) (the Safeguard Mechanism) made under the NGERS Act and administered by the Clean Energy Regulator. The Safeguard Mechanism was developed to ensure that Australia's largest greenhouse gas emitters keep their net emissions below an emissions limit (a baseline). The Safeguard Mechanism currently applies to facilities that emit more than 0.1 $MtCO_{2\text{-}e}$ per annum and requires annual emissions to be reported against a designated emissions 'baseline'. The Safeguard Mechanism can be considered one element of a whole of economy approach implemented to achieve Australia's NDCs, and is complementary to a range of programs that measure, manage, reduce or offset Australia's GHG emissions. In turn, achievement of Australia's NDCs supports achievement of the Paris Agreement long-term temperature goal, therefore management of Dorado Phase1 emissions in accordance with the Safeguard Mechanism indirectly supports achievement of the Paris Agreement temperature goal to mitigate the impacts of global climate change.

Dorado Phase 1 emissions will be regulated under the Safeguard Mechanism through establishment of a cap (baseline) on Dorado facility emissions. Under this policy, annual emissions are reported under the National Greenhouse & Energy Reporting Scheme (**Section 0**) and compared against the facility baseline, and Santos is required to generate or procure and surrender Australian Carbon

Credit Units for any emissions above the baseline for the compliance period, to ensure that net emissions for the facility remain under the prescribed baseline.

Key elements of the mechanism include:

- safeguard facilities must meet the reporting and record-keeping requirements of the NGER Act, including the Clean Energy Regulator's requirements for audits prior to baseline setting or to check compliance management;
- if a safeguard facility is likely to exceed its baseline, the responsible emitter must act, including by purchasing and/or surrendering Australian carbon credit units, to offset excess emissions; and
- penalties for non-compliance.

Santos transparently reports its GHG emissions, including fugitive emissions pursuant to NGER methodology, as demonstrated in annual climate change reporting consistent with the G20's Taskforce on Climate-related Financial Disclosures.

Subject to any changes resulting from the current federal Government's review of the Safeguard Mechanism (currently underway) new facilities are required to apply to the Clean Energy Regulator for a benchmark baseline. Benchmark baselines are intended to be aligned with 'best-practice' emissions performance as relevant to each industrial sector. The Dorado facility will be subject to baseline requirements for new facilities.

7.2.6.3.2.2 National Greenhouse & Energy Reporting Scheme

The National Greenhouse and Energy Reporting (NGER) Scheme is a single national framework for reporting company information about:

- greenhouse gas emissions;
- energy production; and
- energy consumption.

Key NGER Scheme legislation includes:

- the National Greenhouse and Energy Reporting Act 2007 (the Act);
- the National Greenhouse and Energy Reporting Regulations 2008; and
- the National Greenhouse and Energy Reporting (Measurement) Determination 2008 (the Measurement Determination).

The NGER Act provides a single, national framework for the reporting and distribution of information related to GHG emissions, energy production, and energy consumption to meet the following objectives:

- inform government policy;
- inform the Australian public;
- help meet Australia's international reporting obligations;
- assist Commonwealth, state and territory government programs and activities; and
- avoid duplication of similar reporting requirements in the states and territories.

The reporting of GHG emissions under the NGER Act will apply to reporting of Scope 1 GHG emissions from Dorado Phase 1. Santos is not required to report Scope 3 emissions under the Australian NGER reporting framework because they are the Scope 1 and 2 emissions of other emitters.

7.2.6.3.3 27th Annual Conference of Parties – Egypt

COP27 was the 27th annual meeting of the Conference of Parties held in November 2022, a meeting that primarily focuses on climate change and global efforts involving mitigation. Since the inception of the Paris Agreement in 2015, the main goal of the annual COP meetings is to ensure that the global temperatures stay well below the 2-degree Celsius threshold.

Key outcomes from COP27 were as follows:

- Agreement to establish a loss and damage fund to support developing countries impacted by extreme weather events.
- Reaffirmation of the agreement reached at COP26 at Glasgow to focus on limiting temperature increase to 1.5C, and associated progressive ratcheting of cuts to greenhouse gas emissions at each subsequent COP to stay within the 1.5C limit. A resolution to cause emissions to peak by 2025 did not pass.
- A resolution was passed to boost ‘low-emissions’ energy.
- A resolution to phase down all fossil fuels did not pass. The resolution passed at COP27 to phase down use of coal was retained without change.
- Reforms to World Bank financing and other public funded financing to provide funds to poorer countries to help them cut their greenhouse gas emissions was discussed but no resolution passed.
- Reaffirmation of the COP26 agreement to double the proportion of funding provided by richer countries to fund climate adaptation and resilience initiatives for poorer countries, from $20bn/annum to $40bn/annum.
- The final text included reference to the latest IPCC findings, regarding “tipping points” which refers to potential for the climate to exhibit rapid, escalating changes, rather than gradual, linear changes.
- The final text also included reference to “the right to a clean healthy and sustainable environment" drawing the link between global heating and health.

7.2.6.4 Santos’ Climate Change Strategy

Santos recognises the scientific consensus of climate change assessed by the Intergovernmental Panel on Climate Change and supports the objective of the Paris Agreement to limit global temperature rise to less than 2 degrees Celsius and pursue efforts to limit the temperature rise to 1.5 degrees Celsius. In 2022, Santos released new 2030 emission reduction targets, in addition to its previously announced long-term target of achieving net-zero equity Scope 1 and 2 emissions by 2040:

- Reduce absolute Scope 1 and 2 equity emissions by 30 per cent by 2030 (from the Santos and Oil Search combined 2019-20 equity Scope 1 and 2 baseline of 5.9 $MtCO_{2\text{-}e}$, representing a reduction to 4.1 $MtCO_{2\text{-}e}$ or lower);
- Reduce Scope 1 and 2 equity emissions intensity by 40 per cent by 2030 (from Santos’ 2019-20 equity Scope 1 and 2 baseline of 55 $ktCO_{2\text{-}e}$/mmboe, representing a reduction to 33 ktCO2e/mmboe or lower);
- Use CCS technology to accelerate the economic feasibility of hydrogen and deliver a step change in emissions reduction by 2030; and
- Reduce customers’ emissions by at least 1.5 million tonnes per year of $CO_{2\text{-}e}$ from the supply of clean fuels by 2030.

Santos' purpose is to be a global leader in the transition to cleaner energy and clean fuels, by helping the world decarbonise to achieve net-zero in an affordable and sustainable way. At the same time, Santos' recognises the importance of price stability and supply security to ensure a just transition, especially for the world's most vulnerable communities.

Santos is committed to supplying critical fuels such as oil and gas in a more sustainable way at the same time investing today to deliver cleaner fuels tomorrow. The world continues to rely on hydrocarbon fuels for around 80 per cent of its primary energy (IEA, 2021). These fuels will be in demand for decades and making them progressively cleaner is essential to meet global climate goals.

In support of delivering on its Climate Change Strategy and Targets, Santos has established a Climate Transition Action Plan. The Action Plan focuses efforts in the following areas:

+ Operational Efficiencies - Broad range of initiatives that are designed to reduce the Scope 1 and 2 emissions of Santos operations. Operational efficiency initiatives include fuel, flare and vent reductions, electrification, renewable integration, and fugitive emissions reduction and will be managed under adopted control measures in **Table 7-51;**
+ Carbon Capture and Storage - Step-change technology that will reduce emissions and pave the way for future transition initiatives;
+ Carbon Reduction Solutions - Opportunities to reduce carbon emissions and generate offsets for Santos and customers;
+ Clean Fuel Hubs - Leverage CCS hubs as pathway to generating clean fuels; and
+ Supply Chain Collaboration - Working with customers to cultivate demand for lower carbon fuels.

Santos continually reviews the appropriateness of its climate change strategy, and updates associated emissions reduction targets from time to time. Santos will continue to adapt the Climate Transition Action Plan to take account of the evolving energy transition environment between now and 2040 and apply disciplined economic and commercial criteria to inform investment decisions.

7.2.6.4.1 Carbon Capture and Storage

CCS is a critical technology that will be needed to meet the goals of the Paris agreement. Santos will use CCS technology to accelerate the economic feasibility of clean hydrogen and deliver a step-change in emissions reduction by 2030.

CCS is the process whereby carbon dioxide is captured from a facility, then dehydrated and compressed for transportation via pipeline to a storage site. The carbon dioxide is then injected underground via deep wells into depleted reservoirs that have previously produced natural gas, with proven seals and capacity.

CCS is expected to play a critical role in global decarbonisation efforts by providing the opportunity to achieve low cost and large-scale emissions reductions. Today, there are more than 27 commercial CCS facilities operating around the world, with a storage capacity of over 36 million tonnes of carbon dioxide each year (Global CCS Institute, 2021).

Building on decades of experience injecting and storing gas in oil and gas reservoirs, Santos has developed a strategic hub CCS strategy, with the potential to create more than 30 million tonnes per annum of carbon storage capacity, with line of sight to 10 million tonnes per annum of online carbon storage capacity by 2030.

1. Eastern Australia CCS Hub
   - 100 $MtCO_2$ total storage resource booked in the Cooper Basin;
   - Moomba CCS Phase 1;
     - Carbon capture of 1.7 Mtpa (1.1 $MtCO_2pa$ Santos share);
     - Facilities construction to start in 3Q 2022 and four injector wells to be drilled into depleted gas reservoirs by year-end. First injection expected in 2024; and
     - Estimated Moomba CCS capacity ~20 $MtCO_2pa$.
2. Northern Australia and Timor-Leste Hub
   - CCS services at DLNG enable development of regional resources and clean fuels production; and
   - Estimated Bayu-Undan CCS capacity ~10 MtCO2pa.
3. Western Australia Hub
   - Desktop studies underway to confirm CO_2 injection capacity; and
   - Estimated Western Australia CCS capacity >2 $MtCO_2pa$, with expansion opportunities.

The CCS hubs will give Santos the ability to both store carbon dioxide emitted from our own operations as well as carbon dioxide that is generated from third-party facilities.

7.2.6.5 Global Energy Outlook

To inform and test the robustness of Santos' climate change strategy and action plans, Santos considers four global macro-economic scenarios, against a reference case scenario which is reflective of current market conditions.

- One scenario reflective of today's announced policy intentions and targets: the Stated Policies Scenario (STEPS) from the IEA 2021 World Energy Outlook;
- Three scenarios demonstrating possible paths towards an accelerated energy transition:
  1. The Sustainable Development Scenario (SDS) from the IEA 2021 World Energy Outlook, delivering sustainable development in line with the Paris Agreement while limiting global temperature increase to 1.65 degrees Celsius
  2. The 2021 IEA Net Zero by 2050: A Roadmap for the Global Energy Sector case (NZE), achieving net zero emissions from the global energy sector in 2050 while limiting global temperature increase to 1.5 degrees Celsius
  3. The IHS Markit 2021 Accelerated CCS case (ACCS), achieving net zero emissions in 2050 from the combined global energy and non-energy sectors while limiting global temperature increase to 1.5 degrees Celsius

It is important to note that the scenarios modelled do not reflect a forecast or a definitive outcome. Scenario analysis relies on assumptions that may or may not be, or prove to be, correct and may or may not eventuate, and scenarios may be impacted by additional factors to the assumptions disclosed. As such, while interpretation of modelled scenarios can be a useful aid for strategy and policy development, the scenarios should not be confused with actual government policy or in-force legislative frameworks, nor should they be used as a basis to evaluate Dorado Scope 1 GHG emissions impacts or risks or determine acceptability of future oil and gas developments for the purposes of the OPP.

Notwithstanding the limitations of modelled scenarios, Santos has considered the potential risks and opportunities of each scenario. In all scenarios modelled, Santos achieves its 2030 emission reduction targets and net-zero 2040 target.

7.2.6.5.1 IEA STEPS

Under the IEA STEPS scenario reflecting current policy, the continued growth in global energy demand drives continued growth in demand for hydrocarbon fuels including oil and gas. This growth in demand compared to 2020, combined with the need to replace production from depleting fields, maintains elevated oil and LNG prices in order to promote investment in new supply. Under this scenario, Santos would continue seeking to supply the energy needs of its customers, maximising the value from its base business and growth projects, while maintaining its commitment to decarbonise its operations in line with its net zero strategy. In this way, Santos would continue contributing to the decarbonisation of the global energy sector, while providing affordable and reliable energy to regional economies.

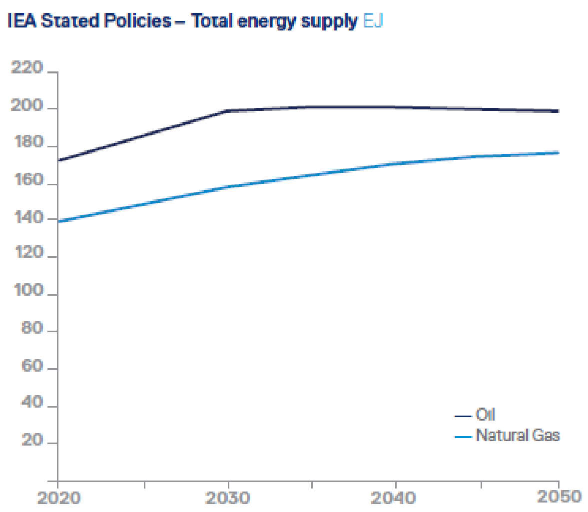

Figure 7-26: Oil and natural gas supply under IEA World Energy Outlook 2021 Stated Policies Scenario (STEPS)

7.2.6.5.2 Accelerated Energy Transition Scenarios

Under accelerated energy transition scenarios such as the IEA SDS, NZE and the IHS ACCS, the demand for oil and natural gas declines after 2030 as transport and heating is electrified and an increasing proportion of electricity is generated from renewables (**Figure 7-27**). The extent and timing of the demand decline depends on specific scenario assumptions relating to policy and technology developments; however, each scenario still requires investment in oil and gas production to maintain sufficient supply through the transition. Natural gas demand is particularly robust with demand increasing through to 2030 under the SDS and ACCS scenarios due to its role as an affordable, lower carbon fuel for the industrial and electricity sectors, particularly for developing countries within Asia Pacific.

Offsetting the decline in oil and natural gas demand is the increasing demand for carbon capture and hydrogen technologies, which experience significant growth under accelerated energy transition scenarios due to their ability to decarbonising sectors which are difficult to electrify (**Figure 7-28**).

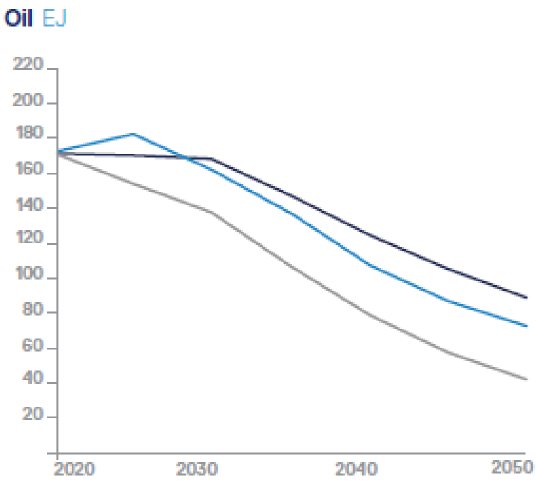

Figure 7-27: Oil and natural gas supply under accelerated energy transition scenarios – IEA World Energy Outlook 2021 Sustainable Development (SDS) and Net Zero by 2050 (NZE) scenarios and the IHS Markit Accelerated CCS scenario (ACCS)

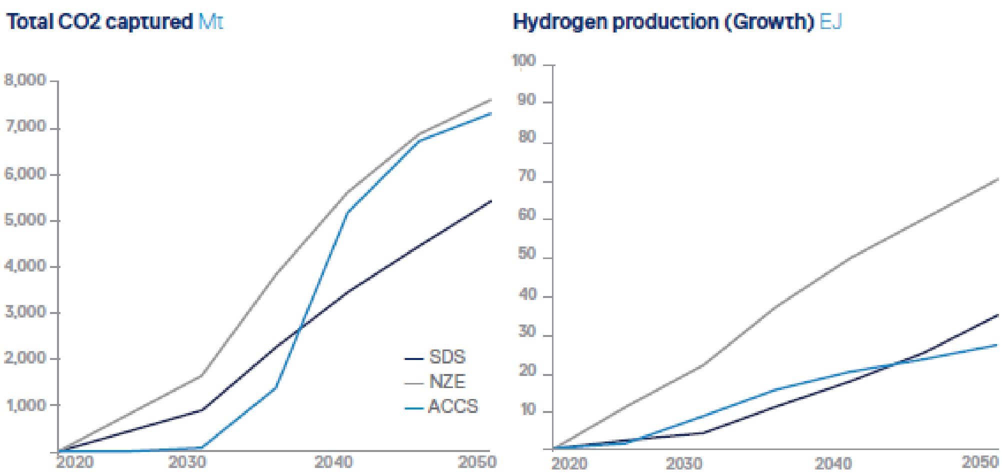

Figure 7-28: Carbon capture and hydrogen under accelerated energy transition scenarios – IEA World Energy Outlook 2021 Sustainable Development (SDS) and Net Zero by 2050 (NZE) scenarios and the IHS Markit Accelerated CCS scenario (ACCS)

In October 2022, the IEA released its updated World Energy Outlook for 2022 (IEA, 2022). The 2022 WEO explores the existing three scenarios (STEPS, APS and NZE) for the future, all of which are fully updated to include the latest energy market and cost data. The 2022 WEO no longer includes the Sustainable Development Scenario. Santos' will continue to consider the IEA and other global macro-economic scenarios to provide a framework for thinking about the future of energy and to test the robustness of Santos' climate change strategy and action plans.

7.2.6.5.3 Dorado Development in Context

Even under the most aggressive accelerated energy transition scenarios, there remains a requirement for investment in oil and gas production to maintain sufficient supply through the transition. In fact, US$10 trillion in oil and gas supply would be needed to meet the world's energy needs between 2022 and 2050 even under the IEAs Net Zero Emissions by 2050 (NZE) scenario (IEA

Net Zero by 2050, A Roadmap for the Global Energy Sector). In the NZE by 2050 scenario, an assumed rapid rise in low emissions fuels is one of the key reasons – along with greater efficiency and electrification – why the IEA claimed no new oil and gas fields would be required beyond those already approved for development. However, the IEA also noted that actual deployment of low emissions fuels is well off track. For example, despite increasing interest in low-carbon hydrogen, the pipeline of planned hydrogen projects falls short of the levels of use in 2030 implied by announced pledges, and even further short of the amounts required in the NZE (which are nine times higher than in the announced pledges scenario). The 2021 World Energy Outlook also states that “Oil and gas spending today is one of the very few areas that is reasonably well aligned with the levels seen in the NZE to 2030” and warns that the world is not investing enough to meet its future energy needs, and that uncertainties over policies and demand trajectories create a strong risk of a volatile period ahead for energy markets. Therefore, it is too simplistic to assert that no new oil developments will be required, even under the IEA NZE by 2050 scenario.

In its 2022 World Energy Outlook (IEA, 2022), when assessing the current global energy crisis, exacerbated by Russia’s invasion of Ukraine, the IEA acknowledges that immediate shortfalls in fossil fuel production will need to be replaced by production elsewhere – even in a world working towards net zero emissions by 2050. The IEA also discusses the need for a new energy security paradigm to maintain reliability and affordability while reducing emissions, where both energy systems (fossil fuels and clean energy) are required during the energy transition in order to deliver the energy services needed by consumers, even as their respective contributions change over time (IEA, 2022). The Dorado Development is well placed to make an important and necessary contribution across all scenarios through the energy transition, with supply of Australian oil to the market from 2027 for 20 years. The Asia-Pacific region is likely to be an important market for oil and oil-derived products from Dorado Phase 1 oil.

7.2.6.6 Dorado GHG Emissions Comparison

The currently observed global warming and associated climate changes, which are facilitated by the increased atmospheric concentrations of GHG, cannot be meaningfully linked to emissions from an individual project. Global climate change is the result of atmospheric accumulation of GHG emissions and sinks since the start of the industrial revolution. Making a prediction of GHG emissions’ impacts at the ecosphere level is an inherently complex exercise because of the influence of variables such as surface pressure, wind, temperature, humidity and rainfall within multiple ecosystems. The listed items are all interdependent variables that would have to be taken into consideration in determining a contribution to global temperature increase. For each variable a series of generalising assumptions would be required to be able to make a sensible calculation of the impacts. Considering the complex and dynamic natural processes within the ecosphere, there is substantial uncertainty in determining a specific increase in global temperature due to the Dorado project and its emissions. As such, it is equally speculative to suggest an isolated climate event, or series of climate events, that lead to a change to any environmental value or sensitivity within Australia (including Matters of National Environmental Significance (MNES), are solely attributable to a specific increase in global temperature. As such, it is not possible to isolate the influence of Dorado emissions to any conclusive impact on the Australian environment. This results in a lack of full scientific certainty about the potential impacts of Dorado GHG emissions.

Regardless of where the end-user emissions occur, combusting the Dorado oil contributes to global emissions which have effects that occur at a global level. Given the uncertainty of the scale, timing and location of any climate impact (or of the Dorado Phase 1 portion), it is reasonable to focus more on the emissions than the impacts, as the end-user is not known. It is appropriate to contextualise Dorado Phase 1 contribution to international and national GHG emissions.

The estimated annual average $CO_{2\text{-}e}$ emissions associated with Dorado Phase 1 are presented in **Table 7-46**. In contextualising the contribution of the emissions nationally in Australia and globally both to fossil fuel emissions and under the IEA Sustainable Development Scenario (SDS), which aligns with the goals of the Paris Agreement (refer to **Section 7.2.6.1**), the following peer-reviewed, published GHG emissions have been used:

+ 2021 Australian energy sector. Electricity (emissions from the combustion of fuel used to generate electricity), stationary energy, transport and fugitive emissions estimated by DISER to produce annual $CO_{2\text{-}e}$ emissions (as of March 2021) of 401.2 $MtCO_{2\text{-}e}$ (Commonwealth of Australia 2021);
+ 2021 global fossil fuel $CO_{2\text{-}e}$ emissions estimated by the Global Carbon Project to be 36,400 Mt (Friedlingstein et al. 2021). The Global Carbon Project is a global research project formed in the international science community to establish a common and mutually agreed knowledge base. It integrates knowledge of GHG for human activities and the Earth system, and establishes annual global GHG budget;
+ predicted world energy-related $CO_{2\text{-}e}$ emissions estimated by the International Energy Agency to be 33,861 Mt in 2040 (International Energy Agency 2022) should the current and announced policies and targets be met (this is referred to by the agency as the Stated Policies Scenario - STEPS). The agency is an autonomous intergovernmental organisation. Further information regarding the International Energy Agency scenarios is presented in **Section 7.2.6.5**;
+ predicted world energy-related $CO_{2\text{-}e}$ emissions estimated by International Energy Agency to be 16,441 Mt in 2040 (International Energy Agency 2021) should the policies and systems be in place to limit the global temperature rise to below 1.8°C (this is referred to by the agency as the Sustainable Development Scenario - SDS); and
+ predicted world energy-related CO2-e emissions estimated by International Energy Agency to be 5,799 Mt in 2040 (International Energy Agency 2022) should the policies and systems be in place to limit the global temperature rise to below 1.5°C (this is referred to by the agency as the Net Zero Emissions by 2050 Scenario - NZE).

Table 7-46: Dorado Phase 1 GHG emissions in context

Stage	Estimated Average Annual $CO_{2\text{-}e}$ Emissions Dorado Phase 1 (Mtpa)	Dorado Contribution (%)				
		Australian Energy-related $CO_{2\text{-}e}$ Emissions in 2021	Global Fossil Fuel $CO_{2\text{-}e}$ Emissions in 2021	2022 IEA WEO STEPS Predicted 2040 Global $CO_{2\text{-}e}$ Emissions	2021 IEA WEO SDS Predicted 2040 Global $CO_{2\text{-}e}$ Emissions	2022 IEA WEO NZE Predicted 2040 Global $CO_{2\text{-}e}$ Emissions
Drilling, installation and commissioning (Scope 1)	0.085	0.021	0.0002	0.0003	0.0005	0.001

Stage	Estimated Average Annual CO_{2-e} Emissions Dorado Phase 1 (Mtpa)	Dorado Contribution (%)				
		Australian Energy-related CO_{2-e} Emissions in 2021	Global Fossil Fuel CO_{2-e} Emissions in 2021	2022 IEA WEO STEPS Predicted 2040 Global CO_{2-e} Emissions	2021 IEA WEO SDS Predicted 2040 Global CO_{2-e} Emissions	2022 IEA WEO NZE Predicted 2040 Global CO_{2-e} Emissions
Operations and maintenance (Scope 1)	0.732	0.182	0.002	0.002	0.004	0.013
End-user combustion (Scope 3)	7.65	0*	0.021	0.023	0.047	0.132
Totals	8.467	0.203	0.023	0.025	0.051	0.146

* All end-user combustion of Dorado Phase 1 oil will occur outside Australia.

In a national context, Dorado Phase 1 emissions that are expected to contribute to Australian GHG emissions are the entire Scope 1 emissions. The total annual average CO_{2-e} emissions associated with Dorado Phase 1 (Scope 1) would equate to 0.203% of the 2021 national energy-related CO_{2-e} emissions.

In a global context, the estimated total annual average Dorado Phase 1 emissions CO_{2-e} emissions from all stages of Dorado Phase 1 (Scope 1 and Scope 3) equate to 0.023% of the 2021 global emissions from fossil fuel; and 0.025%, 0.051% and 0.146% of the predicted 2040 global CO_{2-e} emissions under the IEA Stated Policies Scenario, the IEA Sustainable Development Scenario and the IEA Net Zero emissions by 2050 scenario respectively.

As the annual average CO_{2-e} emissions from Dorado Phase 1 have been estimated to represent up to 0.203% (Scope 1) of the 2021 national energy-related emissions and 0.146% (Scope 1 and Scope 3) of the predicted 2040 global CO_{2-e} emissions in the Net Zero Emissions by 2050 scenario, it can be concluded that Dorado Phase 1 is not expected to be a significant GHG emissions contributor on a national or global scale.

As presented in “Use of Sold Products” in **Section 7.2.6.2.2**, the refining and fate of final products is not known definitively and therefore Santos has conservatively assumed that 100% of the refined products will be combusted (i.e. the carbon in the oil is most rapidly released when the oil is combusted) yielding the greatest potential “end-user combustion” emissions. Dorado Phase 1 oil being a sweet light oil (“Processing of Sold Products” in **Section 7.2.6.2.2**) is expected to require less processing to yield high-value fuel products, such as petrol and diesel. As a result, the actual energy and emissions associated with its processing are expected to be lower than the estimated value which is based on processing of heavier oils (Gordon et al. 2015). Dorado Phase 1 product is also expected to be used in the regional market (Asia), reducing the GHG emissions associated with downstream product transportation and distribution (compared with the estimated emissions which assumed transportation to more distant markets), further reducing the “end-user combustion” emissions (which accounts for 87% of the total Dorado Phase 1 CO_{2-e} emissions).

7.2.6.7 Details of Environmental Impacts and Risks

As presented in **Section 7.2.6.6**, the currently observed global warming trends and associated climate changes are reflective of the cumulative impact of GHG emissions from a range of human endeavours and industries and cannot be meaningfully attributed to an individual activity such as the Dorado development. This section provides a discussion of a wide range of predicted effects on global and Australian environments from human-induced climate change. Most marine and terrestrial systems are susceptible to impacts from climate change; however, the predicted impact is highly variable, both between ecosystems and within individual ecosystems. **Table 7-47** identifies the potentially impacted receptors as a result of increased global GHG emissions.

Table 7-47: Receptors potentially impacted by GHG emissions

Description of the Risk	Receptors
Potential indirect environmental impacts associated with GHG emissions as a result of Dorado Phase 1	Species-related Effects (Mammals, Birds, Reptiles, Amphibians, Fish, Invertebrates and Plants) refer to **Section 7.2.6.7.1** Ecosystem-related Effects refer to **Section 7.2.6.7.2**

As presented in **Section 7.2.6.6**, Dorado Phase 1 is not expected to be a significant national or global GHG emissions contributor; and it can be concluded that the associated potential incremental environmental impacts would be minor.

The Intergovernmental Panel on Climate Change (IPCC) published their 6th working report in August of 2021. The IPCC is known for published material based on the assessment of available scientific, technical, and socio-economic literature that is relevant to global warming and the increased surface temperatures. This report was the first to unequivocally relate climate change to human influences and the use of fossil fuels, the IPCC states with *high confidence* that many extreme heat events and global surface temperature rise would not have occurred without human influence.

Although there are some opportunities to limit future climate change and global temperature increases such as carbon dioxide removal (CDR), the removal of CO_2 from the atmosphere will not reverse all impacts from climate change. Some impacts cannot be reversed for centuries to millennia. These irreversible impacts include sea level rise, glacial melting, and polar melting. Due to these impacts being irreversible, the ecosystems that thrive in these conditions will be impacted. It has been shown that marine organisms are already being pushed to move into deeper marine depths due to the need for lower temperatures and these patterns will continue for the foreseeable future. Lasting impacts due to climate change should be addressed as these impacts have been shown to be difficult and/or impossible to repair.

The State of the Climate report (CSIRO and Bureau of Meteorology 2022) is forecasting that Australia will experience ongoing changes to its weather and climate:

+ Continued increase in air temperatures, more heat extremes and fewer cold extremes.
+ Continued decrease, on average, in cool season rainfall across many regions of southern and eastern Australia, which will likely lead to more time in drought, but with ongoing climate variability that will give rise to short-duration heavy-rainfall events at a range of timescales.
+ Continued increase in the number of dangerous fire weather days and a longer fire season for southern and eastern Australia.

- Further sea level rise and continued warming and acidification of the oceans around Australia.
- Increased and longer-lasting marine heatwaves that will affect marine environments, such as kelp forests, and increase the likelihood of more frequent and severe bleaching events in coral reefs around Australia, including the Great Barrier Reef and Ningaloo Reef.
- Fewer tropical cyclones, but a greater proportion is projected to be of high intensity, with large variations from year to year.
- Reduced average snow depth in alpine regions, but with variations from year to year.

7.2.6.7.1 Potential Species-related Effects

While climate change is expected to affect marine and terrestrial species, the effects are likely to be highly species-dependent and to vary geographically. At a broad-scale, fauna distribution patterns are likely to shift in response to climate change. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles and upwards in elevation and shifts in lifecycle events (Dunlop et al. 2012). Some of the predicted potential taxa-level effects (potential vulnerabilities) are presented in **Table 7-48.**

Table 7-48: Potential effects of climate change on future vulnerability of particular taxa

Taxa	Potential Vulnerability
Mammals	Narrow-ranged endemics susceptible to rapid climate change in situ; changes in competition between grazing macropods in tropical savannas mediated by changes in fire regimes and water availability; herbivores affected by decreasing nutritional quality of foliage as a result of CO_2 fertilisation
Birds	Changes in phenology of migration and egg-laying; increased competition of resident species with migratory species due to migratory birds staying longer at breeding grounds; breeding of waterbirds susceptible to reduction in freshwater flows into wetlands; top predators vulnerable to changes in food supply as a result of increased sea temperatures; rising sea levels affecting birds that nest on sandy and muddy shores, saltmarshes, intertidal zones, coastal wetlands and low-lying islands; saltwater intrusion into freshwater wetlands affecting breeding habitat
Reptiles	Warming temperatures may alter sex ratios of species with environmental sex determination (e.g. turtles and crocodiles); some species may modify their use of microhabitats to cope with warming in situ
Amphibians	Frogs may be the most at-risk terrestrial taxa; amphibians may experience altered interactions between pathogens, predators and fires
Fish	Freshwater species vulnerable to reduction in water flows and water quality; limited capacity for freshwater species to migrate to new waterways; all species susceptible to flow-on effects of warming on the phytoplankton base of food webs
Invertebrates	Expected to be more responsive than vertebrates due to short generation times, high reproduction rates and sensitivity to climatic variables
Plants	Climate change may impact various functional dynamics of plants due to changes in fires, plant phenology and insect life cycles and specific environmental characteristics; longer lived plants may be more vulnerable if climate change “moves” suitable establishment sites for seedlings beyond their dispersal distances; narrow-ranged endemic plants

Taxa	Potential Vulnerability
	requiring specific conditions will have limited capacity to disperse to sites with similar conditions

Source: Adapted from Steffen et al. (2009).

Climate change may not only change species distribution patterns but also life-history traits, such as migration patterns, reproductive seasonality and sex ratios. As an example, in marine turtles, cooler temperatures produce more male hatchlings while warmer temperatures produce more females. Research undertaken into the genetically distinct breeding population of green turtles on the northern and southern Great Barrier Reef has indicated that recent warming has led to an abundance of female turtles being born to the northern breeding population. The results showed turtles originating from warmer northern Great Barrier Reef nesting beaches were significantly female-biased, with female turtles accounting for 99.1% of juvenile, 99.8% of subadult, and 86.8% of adult-sized turtles (Jensen et al. 2018). In comparison, turtles originating from the cooler southern Great Barrier Reef nesting beaches showed a more moderate female sex bias, with female turtles accounting for 68% of juvenile, 65% of subadult, and 69% of adult-sized turtles (Jensen et al. 2018).

7.2.6.7.2 Potential Ecosystem-related Effects

As the biotic and abiotic components of ecosystems change, so too will the structure and function of the overall ecosystem. A summary of the predicted effects to key Australian ecosystems as a result of increased CO_2 and climate change is presented in **Table 7-49.** Most marine and terrestrial ecosystems are susceptible to climate change; however, the predicted impact is highly variable, both between ecosystems and within individual ecosystems.

Changes in climate, such as altering temperature, rainfall patterns and fire regimes, due to climate change is likely to result in changes in vegetation structure across all terrestrial ecosystems within Australia (Dunlop et al. 2012). Increases in fire regimes will impact Australian ecosystems by altering composition structure, habitat heterogeneity and ecosystem processes and may assist in the spread of introduced species (which may further alter or increase the incidence of fires). Changes in climate variability, as well as averages, could also be important drivers of altered species interactions (Dunlop et al. 2012).

Table 7-49: Predicted effects of GHG emissions increase and climate change on key Australian ecosystems

Key Component of Environmental Change	Predicted Effects
Coral Reefs	
CO_2 increases leading to increased ocean acidity	Reduction in ability of calcifying organisms, such as corals, to build and maintain skeletons.
Sea-surface temperature increases, leading to coral bleaching	If the frequency of bleaching events exceeds the recovery time, reefs will be maintained in an early successional state or be replaced by communities dominated by macroalgae. Warming will increase the susceptibility of corals to diseases. Potential for new reefs to develop at higher latitudes where suitable substrates are available and until light becomes limiting; potential decrease in beta diversity of coral

Key Component of Environmental Change	Predicted Effects
	communities as tropical-adapted taxa expand their range to the south, amplified by differential survival of different taxa.
Increases in cyclone and storm surge	Increased physical damage to reef structure.
Oceanic Systems (including planktonic systems, fisheries, sea mounts and offshore islands)	
Ocean warming	Many marine organisms are highly sensitive to small changes in average temperature (1 to 2°C), leading to effects on growth rates, survival, dispersal, reproduction and susceptibility to disease. Increasing temperatures reduce larval development time, potentially reducing dispersal distances; warm-water assemblages may replace cool-water communities.
Changed circulation patterns, including increase in temperature stratification and decrease in mixing depth, and strengthening of East Australian Current	Distribution and productivity of marine ecosystems is heavily influenced by the timing and location of ocean currents; currents transfer the reproductive phase of many organisms, thereby playing an important role in dispersal and maintenance of populations. Climate change may suppress upwelling in some areas and increase it in others, leading to shifts in location and extent of productivity zones.
Changes in ocean chemistry	Increasing CO_2 in the atmosphere is leading to increased ocean acidity and a parallel decrease in the availability of carbonate ions, which are the building blocks of calcium carbonate skeletons (such as those of many planktonic species and corals). Increased dissolved CO_2 may increase productivity.
Estuaries and Coastal Fringe (including benthic, mangrove, saltmarsh, rocky shore, and seagrass communities)	
Sea level rise	Landward movement of some species (particularly mangroves) as inundation provides suitable habitat; changes to upstream freshwater habitats will have flow-on effects to species such as wetland birds.
Increase in water temperature	Effects on phytoplankton production will affect secondary production in benthic communities.
Savannas and Grasslands	
Elevated CO_2	Shifts in competitive relationships between woody and grass species due to differential responses.
Increased rainfall in north and northwest regions	Increased plant growth will lead to higher fuel loads, in turn leading to fires that are more intense and more frequent, occur over large areas, and occur later in the dry season. Change to ecotonal boundaries between savanna woodlands, grasslands and monsoonal rainforest patches. Changes in rainfall seasonality are likely to be more important that changes in amount.
Tropical Rainforests	
Warming and changes in rainfall patterns	Increased probability of fires penetrating rainforest vegetation, resulting in shift from fire-sensitive vegetation to communities dominated by fire-tolerant species. Cool-adapted species forced to higher elevations, altering competitive interactions.
Change in length of dry season	Altered patterns of flowering, fruiting and leaf flush will affect resources for animals.

Key Component of Environmental Change	Predicted Effects
Increased intensity of storms or tropical cyclones	Increased physical disturbance to forests, which alters gap dynamics and succession rates; shallow-rooted tall rainforest trees are particularly susceptible to uprooting, breakage and defoliation.
Rising atmospheric CO_2	Differential response of different growth forms to enhanced CO_2 may alter structure of vegetation.
Temperate Forests	
Potential increases in frequency and intensity of fires	Changes in structure and species composition of communities with obligate seeders may be disadvantaged compared with vegetative resprouters.
Warming and changes in rainfall patterns	Potential increases in productivity in areas where rainfall is not limiting; reduced forest cover associated with soil drying projected for some Australian forests.
Rising atmospheric CO_2	Overall increase in productivity and vegetation thickening.
Inland Waterways and Wetlands	
Reductions in precipitation; increased frequency and intensity of drought	Reduced river flows and changes in seasonality of flows; reduction of the area available for waterbird breeding. More intense rainfall events will increase flooding, affecting movements of nutrients, pollutants and sediments, riparian vegetation, and erosion. Groundwater-dependent ecosystems may be negatively affected.
Changes in water quality, including changes in nutrient flows, sediment, oxygen and CO_2 concentration	May affect eutrophication levels, incidence of blue-green algal outbreaks; loss of cool-adapted species and increase in populations of warm-adapted species.
Sea level rise	Saltwater intrusion into low-lying floodplains, freshwater swamps and groundwater; replacement of existing riparian vegetation by mangroves.
Warming of water column; increase in depth of seasonal thermoclines in still water	Changes in abundance of temperature-sensitive species, such as algae and zooplankton; reduction in depth of lowest oxygenated zones in some instances.
Arid and Semi-arid Regions	
Increasing CO_2 coupled with drying in some regions	Interaction between CO_2 and water supply critical, as 90% of the variance in primary production can be accounted for by annual precipitation.
Shifts in seasonality or intensity of rainfall events	Any enhanced run-off redistribution will intensify vegetation patterning and erosion cell mosaic structure in degraded areas. Changes in rainfall variability and amount will also effect fire frequency. Dryland salinity could be affected by changes in the timing and intensity of rainfall.
Warming and drying, leading to increased frequency and intensity of fires	Reduction in patches of fire-sensitive mulga in spinifex grasslands potentially leading to landscape-wide dominance of spinifex.
Alpine Areas	

Key Component of Environmental Change	Predicted Effects
Reduction in snow cover depth and duration	Potential loss of species dependent on adequate snow cover for hibernation and protection from predators; increased establishment of plant species at higher elevations as snow pack is reduced.

Source: Adapted from Steffen et al. (2009).

Hoegh-Guldberg et al. (2018), in the IPCC (2018) Special Report, describe impacts of warming above pre-industrial levels to key receptor groups, including terrestrial ecosystems, mangroves, warm-water corals, unique and threatened systems, and arctic regions. These receptor groups show varying sensitivity to warming conditions, with a range of responses shown at 1°C warming, from corals suffering moderate impacts, to mangroves not showing any impacts that are detectable and attributable to climate change (Hoegh-Guldberg et al. 2018). Once warming reaches 1.5°C, all receptor groups show impacts attributable to climate change with severity ranging from moderate detectable impacts (mangroves) to severe and widespread impacts (warm-water corals) (Hoegh-Guldberg et al. 2018). At the point where global temperature rise reaches 2°C, increasing numbers of receptor groups suffer impacts that are high to very high and likely to be irreversible (terrestrial ecosystems, warm-water corals, unique and threatened systems, and arctic regions) (Hoegh-Guldberg et al. 2018). Some key impacts are discussed further in the following subsections.

Terrestrial Ecosystems

All terrestrial ecosystems are likely to be impacted by a changing climate (Dunlop et al. 2012; Hoegh-Guldberg et al. 2018; Hughes 2011; Steffen et al. 2009) (**Table 7-49**). The predicted impact of climate change on these ecosystems is highly variable, both between ecosystems and within individual ecosystems (Dunlop et al. 2012). A summary of impacts to key terrestrial ecosystems is provided below (other terrestrial ecosystems are summarised in **Table 7-49**).

Tropical Rainforests

Projections of future climate changes in the wet tropics of Australia under different scenarios are outlined by CSIRO and Bureau of Meteorology (2015). It is likely that temperatures in the wet tropics will become hotter and potentially fires and cyclones will be more intense. Consequently, there is an increased probability of fires penetrating into rainforest vegetation, resulting in a shift from fire-sensitive vegetation to communities dominated by fire-tolerant species, and changing rainforest disturbance regime as cyclones become more intense (Hughes 2011; Steffen et al. 2009). Changes in the timing of seasons (e.g. extended summer) could cause changes in the seasonal response of plants and alterations to species ranges and abundances (Hoegh-Guldberg et al. 2018).

Alpine/Montane Areas

Alpine systems are generally considered to be among the most vulnerable to future climate change (Hughes 2003). The extent of true alpine habitat in Australia is very small (0.15% of the Australian land surface) with limited high-altitude refuge (Hughes 2003).

Australian alpine regions are home to a variety of alpine vertebrates who rely on snow cover for their survival. There is evidence of a reduction in populations of dusky antechinus, broad-toothed rats and the mountain pygmy possum. The first two species are active under the snow throughout winter and are therefore subject to increased predation by foxes when snow is reduced (Hughes 2003). The pygmy possum depends upon snow cover for stable, low temperatures during hibernation (Hughes 2003).

Marine Ecosystems

Between 1920 and 2000, sea level is estimated to have risen on average by 1.2 mm per year due to climate change (Church et al. 2006). In addition to changes in sea level, oceanic warming has also served to alter ocean currents around Australia. In response to both ocean warming and stratospheric ozone depletion, the East Australian Current has increased in strength by about 20% since 1978 (Cai and Cowan 2006).

Sea-surface temperatures have increased across the globe over recent decades, which poses a significant threat to marine ecosystems, including changes to species abundance, community structure, and increased frequency and intensity of thermally induced coral bleaching events (CSIRO n.d.).

Sea-surface temperatures are projected to continue to increase, with estimates of warming of between 0.6 and 0.9°C in the southern Tasman Sea and between 0.3 and 0.6°C elsewhere along the Australian coast by 2030 (Church et al. 2006). Sea levels will increase by 18 to 59 cm by 2100 in response to both thermal expansion and melting of icesheets (Solomon et al. 2007). This will lead to some coastal inundation affecting mangroves, salt marshes and coastal freshwater wetlands. Furthermore, as CO_2 is gradually absorbed by oceans and fresh water, the water becomes more acidic, which increases the solubility of calcium carbonate, the principal component of the skeletal material in aquatic organisms (Steffen et al. 2009). Below is a summary of potential climate change impacts to two key ecosystems - mangroves and coral reefs.

Mangroves

Mangrove ecosystems in Australia will face higher temperatures, increased evaporation rates and warmer oceans (CSIRO and Bureau of Meteorology 2015), as well as an associated sea-level rise (Hoegh-Guldberg et al. 2018). Modelling indicates an increased likelihood of future severe and extended droughts across parts of northern Australia (Dai 2013). Consequently, mangrove ecosystems may increase their southern range as a result of warmer temperatures. However, higher temperatures and evaporation rates and extended droughts could lead to mangrove die-offs in northern Australia and a change in mangrove distribution and abundance (Duke et al. 2017). Mangrove systems should cope with rising sea level by accumulating more peat or mud, which will give them the opportunity to adjust (Field 1995).

Coral Reefs

Climate change has emerged as a threat to coral reefs, with temperatures over 4 to 6 weeks of just 1°C above the long-term summer maximum for an area being enough to cause mass coral bleaching and mortality (Baker et al. 2008; Hoegh-Guldberg et al. 2018; Hughes et al. 2017; Spalding and Brown 2015). Coral mortality or die off following coral bleaching events can stretch across thousands of square kilometres of ocean (Gilmour et al. 2016; Hoegh-Guldberg et al. 2018; Hughes et al. 2017). The impacts associated with a warming ocean, coupled with increasing acidification, are expected to undermine the ability of tropical coral reefs to provide habitat for fish and invertebrates, which together provide a range of ecosystem services (e.g. food, livelihoods, and coastal protection) (Hoegh-Guldberg et al. 2018).

KEFs, AMPs, Protected Places, Commonwealth Managed Fisheries, State Management Fisheries, Tourism and Recreation, and Coastal Settlements

Changes to climate can result in impacts to social receptors that have values that include the ecological receptors (discussed above). This includes KEFs and AMPs.

Climate change can also impact on the functions, interests or activities of other users that rely on ecological value, including commercial and recreational fisheries and tourism.

7.2.6.8 Summary of Impact Evaluation

It is not possible to directly attribute GHG emissions from Dorado Phase 1 with global climate change trends or climate-related impacts given:

- that it is the cumulative load of global GHG emissions across a range of human endeavours and industries that cause climate change and climate-related impacts;
- the contribution of estimated Scope 1 and Scope 3 emissions associated with Dorado Phase 1 is minor in the context of existing and future predicted global GHG emissions;
- the difficulty in predicting the amount of total future global GHG emissions and rate of increase/change over time; and
- the inability to predict future national and international initiatives on climate change, collective progress against these initiatives, and the impact they will have on total future global GHG emissions, including the minor contribution of GHG emissions from Dorado Phase 1.

Santos recognises the scientific consensus of climate change assessed by the Intergovernmental Panel on Climate Change and supports the objective of the Paris Agreement to limit global temperature rise to less than 2 degrees Celsius and pursue efforts to limit the temperature rise to 1.5 degrees Celsius. Santos has made the following commitments under its Climate Change policy:

- Work with governments and stakeholders in the design of climate change regulation and policies in support of low-cost abatement and incentivising innovation and investment in emissions reduction in an equitable manner;
- Factor carbon pricing and greenhouse gas emissions into all material business decision-making;
- Set greenhouse gas emission targets consistent with the objective of limiting global temperature rise to less than 2 degrees Celsius and in pursuit of 1.5 degrees Celsius;
- Identify and pursue opportunities to reduce greenhouse gas emissions within our operations and through the supply chain;
- Work with our customers to reduce their greenhouse gas emissions and sell the products we generate only to customers from countries that have a net-zero commitment or are signatories to the Paris Agreement;
- Avoid any unnecessary flaring from our activities and reduce flaring required for the safe conduct of our operations to as low as reasonably practicable;
- Make Final Investment Decision for new offshore greenfield projects from 2025 only if they abate and/or offset reservoir CO2 emissions;
- Identify and implement cost-effective opportunities to sequester carbon, integrate new technologies and offset greenhouse gas emissions, in pursuit of our emission reduction targets;
- Identify, manage and mitigate climate change risks for our activities and in doing so, continue to adapt and develop our operational, financial and strategic resilience;
- Report annually on the company's climate change governance, strategy, risk management and targets and metrics in a transparent manner in alignment with recommendations of the Task Force on Climate-related Financial Disclosures; and
- Provide our shareholders with an advisory vote, known as a ‘Say on Climate’ at regular intervals. As part of the Santos portfolio, Dorado Phase 1 is subject to the above commitments and will operate in a manner consistent with Santos’ GHG strategy.

Section 3A of the EPBC Act defines the following principles of ESD:

- decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations;
- if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation;
- the principle of intergenerational equity: that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations;
- the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; and
- improved valuation, pricing and incentive mechanisms should be promoted.

As outlined in **Section 2.2.2.1**, these principles must be considered in the Dorado Development OPP. The principle of intergenerational equity is of particular relevance to Dorado Phase 1, which proposes to develop the Dorado resource to provide reliable and affordable energy for current generations to maintain adequate supply of traditional fuel sources throughout the energy transition while limiting the impact of global climate change for future generations. As was observed in 2021, an unbalanced focus on only limiting supply of traditional fuel sources has resulted in significant escalation of energy prices, often for the most vulnerable in our society, leading to the perverse outcome of an increased global coal-fired electricity generation by 9% to an all time high. Therefore, the Dorado development has an important contribution to make in supporting an orderly 'energy transition', to ensure near term access to reliable, affordable energy against the backdrop of a broader longer-term transition from traditional fossil fuels to cleaner fuels and energy sources as part of a collective global effort to achieve the goals and objectives of the Paris Agreement. In supporting an orderly energy transition, the Dorado development aligns with the intent of the principle of intergenerational equity.

Oil produced from Dorado Phase 1 is predicted to be used primarily as fuel for transportation, with some potentially used as feedstock for petrochemical manufacturing, and is not expected to be used for the generation of electricity. There are currently no renewable alternatives that can contribute significantly to meeting the needs of the present generation or near-term future generations for transportation fuel and petrochemical feedstocks. Significant progress is being made developing electric vehicles for road transportation; however, these vehicles are currently relatively expensive and beyond the reach of most of the world's population and cannot meet the existing or near-term future needs for transportation. There is currently no credible alternative to oil-based fuels for aviation. Hence, the need for oil for transportation fuel is expected to continue into the future and for the duration of Dorado Phase 1.

While the present and near-term future need for oil is clear, the consumption of oil resources results in the emission of GHGs that contribute to climate change. The predicted environmental impacts from climate change pose a risk to the maintenance of the health, diversity and productivity of the environment. Hence, the unmitigated consumption of fossil fuel resources is inconsistent with the principle of intergenerational equity defined in the EPBC Act.

Given the inherent uncertainties in linking Dorado Phase 1 emissions with global temperature change and resulting ecosystem impacts, and that the unmitigated impacts of climate change to ecosystems are unacceptable (RSAL1) – to ensure acceptable levels of impacts to key Australian ecosystems, Dorado Phase 1 GHG emissions will be managed under jurisdiction-specific NDC or NZE by 2050 emissions targets, and associated jurisdiction specific emissions regulations. This is possible because all jurisdictions where Dorado Phase 1 emissions will occur are signatories to the Paris Agreement or have a net-zero by 2050 commitment, including Australia and customer countries where Dorado Phase 1 product is sold. Dorado Phase 1 Scope 1 GHG emissions will be regulated under the Australian Government's safeguard mechanism which is designed to ensure facility emissions are capped at a prescribed level ie. facility baseline, and any emissions above the baseline limit are offset through surrender of accredited offsets. The implementation of the Safeguard Mechanism is such that it ensures emissions reductions from facilities covered by the Safeguard Mechanism make an appropriate contribution (through progressive ratcheting of baselines) towards economy wide emission reductions and achievement of Australia's Paris Agreement Nationally Determined Contributions (NDC) emission reduction targets.

Restricting sales of Dorado Phase 1 product to customers from countries that are signatories to the Paris Agreement, or have made a net-zero commitment, ensures that Dorado Phase 1 Scope 3 emissions are managed under export country regulation for management of their Scope 1 and 2 emissions in order to achieve their Paris Agreement NDC emissions reduction targets. Regulation and management of both Scope 1 and Scope 3 Dorado Phase 1 GHG emissions under Paris Agreement-aligned regulatory frameworks, ensures all sources of Dorado Phase 1 GHG emissions are managed in accordance with the Paris Agreement treaty which is designed to limit global temperature increase and ensure acceptable levels of impacts to ecosystems (inclusive of key Australian ecosystems).

In proposing to develop the Dorado oil resource, a consensus must also be obtained with stakeholders and regulators to agree that it is the most timely and appropriate use of the resources, while managing Dorado Phase 1 in a manner that reduces its GHG emissions to as low as reasonably practicable (emissions management measures are presented in **Section 7.2.6.8.1**) and in the context of international agreements, national policies and legislative frameworks. The process by which Santos is engaging stakeholders is presented in **Section 9**. Throughout the various stages of Dorado Phase 1, Santos will continue to proactively seek stakeholders' feedback on the proposed activities and will openly manage the feedback received. As part of developing Dorado Phase 1, Santos will seek all relevant regulatory approvals and assess the global demand for the Dorado oil. Through this process, Santos will engage with the required regulators and ensure that each regulator's concerns and requirements are satisfactorily addressed.

7.2.6.8.1 Greenhouse Gas Management and Mitigation Relating to Dorado Phase 1

Under the Australian Government Safeguard Mechanism, Dorado Phase 1 will be allocated a "benchmark" baseline for new facilities. Reporting Dorado Phase 1 Scope 1 GHG emissions to the Clean Energy Regulator under the NGER Act and managing compliance with the Safeguard Mechanism baseline, will ensure that Scope 1 GHG emissions from Dorado Phase 1 emissions are managed and reduced, as required, in order to achieve Australia's NDC emission reduction targets under the Paris Agreement, as part of economy wide emissions reductions. This section describes a range of initiatives to be implemented by Santos to manage Scope 1 emissions that will be covered under the facility baseline set by the Clean Energy Regulator.

Dorado Phase 1 will reinject the majority of the produced gas (approximately 235 MMscfd) back into multiple reservoir zones to enhance liquids recovery and to limit planned flaring to operation of the flare pilot (continuously). For Dorado Phase 1, further proposed management of direct (Scope 1) GHG emissions includes:

+ design optimisations during the engineering design stage, incorporating energy efficiency considerations to reduce direct GHG emissions to ALARP. These efficiencies could include

optimisation of equipment selection and configuration to include the use of waste heat recovery to avoid fuel gas combustion for additional electricity generation;
+ fuel and flare analyses, baselining and forecasting throughout the operational life;
+ ongoing optimisation of energy efficiency through periodic opportunity identification workshops and studies, evaluation and implementation; and
+ annual setting of energy-efficiency improvement and flare reduction strategies throughout the operational life.

To consider the contribution of Scope 3 emissions to climate change impacts requires consideration of variables that may or may not be reasonably predicted by Santos. Variables such as third-party modifications of the product, third-party combustion efficiencies, effectiveness of emissions-reduction policies in the emitting jurisdiction, and implications of the current and future supply cannot be reliably estimated. And consistent with a recent ruling in the NSW Land and Environment Court on another Santos Project (Mullaley Gas and Pipeline Accord Inc v Santos NSW (Eastern) Pty Ltd, 2021) Santos does not have operational control over Scope 3 emissions from Dorado Phase 1. For the oil sold to customers from Dorado Phase 1, Santos can make some broad assumptions about the potential end user and the emission-control regimes in potential end-user jurisdictions.

GHG emissions arising from third-party consumption of Dorado oil are managed through the international treaty established by the Paris Agreement, and in turn the national emissions policies and targets set by the customer countries agreed through their NDCs and other Paris Agreement commitments (Section 7.2.6.3).

In respect of end-user actions occurring internationally, two international environmental legal principles are of relevance: the principle of common but differentiated responsibilities and the principle of sovereignty and responsibility. It is upon these legal principles that the United Nations Framework Convention on Climate Change's global carbon accounting framework has been established, and it places the responsibility for mitigating end-user emissions on the emitting country. In identifying potential end users, Santos considers the Ichthys condensate to have a comparable grade with similar composition to the exported Dorado oil. Buyers of Ichthys condensate include PTT Public Company Limited (Rayong refinery in Thailand), Trafigura Group Pte. Ltd. (Napa refinery in Papua New Guinea), Exxon Mobil Corporation (Singapore Jurong refinery) and Taiyo Oil Co., Ltd. (Shikoku Refinery in Japan).

The Paris Agreement is a legally binding treaty on climate change that provides for management of Scope 3 emissions for those Paris-agreement nations that will be customer countries of Dorado Phase 1 oil, to ensure that international emissions are managed in line with the Paris Agreement long-term temperature goal. A condition of the sale of Dorado oil will require customer countries to either have a net-zero commitment or be signatories to the Paris Agreement and have NDCs to reduce or offset GHG emissions. Under the Paris Agreement and global GHG accounting conventions, each country is responsible for accounting for, reporting and reducing emissions that physically occur in its jurisdiction. The host countries of customers that purchase Dorado oil will be accountable for reporting against their commitments under the Paris Agreement. The Paris Agreement (**Section 7.2.6.3**) requires ratified parties to publish NDCs and review and improve emissions reduction targets and NDCs over time, reflecting their long-term commitment towards achieving the Paris Agreement temperature goal to mitigate the impacts of climate change to acceptable levels. The commitments under the relevant NDCs at the time of preparing the OPP for a sample of potential countries that customers of Dorado oil are domiciled are summarised in **Table 7-50**.

It is important to note that NDCs will differ between countries depending on their individual capabilities. Article 2 of the Paris Agreement states that "This Agreement will be implemented to reflect equity and the principle of common but differentiated responsibilities and respective capabilities, in the light of different national circumstances". For some countries, this may mean that their NDC may not cover all GHG emissions across all sectors. The appropriateness of individual country NDCs is a matter for the Conference of Parties, and is assessed according to the cumulative impact of all NDCs across all countries that are parties to the Paris Agreement.

Table 7-50: Nationally determined contribution and policies/climate change action commitments for likely Dorado Phase 1 oil customer countries

Likely Customer Country	Nationally Determined Contributions and Climate Change Action Commitments
Thailand	Thailand intends to reduce its greenhouse gas emissions by 20% to 25% from the projected business-as-usual level by 2030. Long Term Strategy that states Thailand's ambition to move towards net zero emissions as early as possible within the second half of this century, and towards carbon neutrality by 2065. The Strategy is supported by sectoral action plans, with short, medium and long term sectoral targets.
Papua New Guinea	Papua New Guinea intends to reduce fossil fuel emissions in the electricity generation sector by transitioning as far as possible to using renewable energy, reaching 100% renewable energy by 2030, contingent on funding being made available. In addition, Papua New Guinea will improve energy efficiency sector-wide and reduce emissions where possible in the transport and forestry sectors. Papua New Guinea is a member of the Climate Ambition Alliance, under which members commit to reach net zero CO_2 emissions by 2050.
Japan	Japan will continue to aim at resolutely achieving reduction of GHG emissions by 46% by FY 2030 against baseline FY 2013 (which was a 25.4% reduction compared to FY 2005). Japan's NDC is aligned with the long-term goal of achieving net zero by 2050. Japan submitted an updated Long-Term Strategy (LTS) to the UNFCCC on 29 October 2021, '*Long-Term Strategy under the Paris Agreement*'. The LTS includes whole of economy, long term sector visions for net zero emissions by 2050, including cross-sectoral issues including: innovation; green finance; international cooperation; and carbon pricing. Japan's original LTS was submitted on 26 June 2019. Japan's *Global Warming Countermeasures Law 2021* legislated that "a decarbonised society will be realized by 2050".
Singapore	In its second NDC update, Singapore intends to reduce emissions to around 60 million tonnes of carbon dioxide equivalent (MtCO2e) in 2030 after peaking its emissions earlier. . Long Term Strategy that outlines targets to 2030 and 2050 and defines policies and measures across all sectors to achieve them. Singapore will focus on transformations in all sectors, driven by carbon pricing, adoption of low-emissions technologies, performance standards, targeted grants and international collaboration. In February 2022, Singapore's Finance Minister stated that Singapore will be bringing forward its net-zero target to "by or around mid-century". Singapore is a member of the Climate Ambition Alliance, under which members commit to reach net zero CO_2 emissions by 2050.

Santos understands the importance of setting GHG targets consistent with the Paris Agreement objective of limiting global temperature rise to less than 2°C and in pursuit of 1.5 degrees Celsius.

Santos will monitor the effectiveness of GHG emissions reduction efforts brought about by the Paris Agreement through the IPCC and Paris Agreement global stocktake process. A key outcome of the global stocktake process is the requirement for countries that have ratified the Agreement to strengthen their NDCs/ emissions reduction targets to meet the framework's goals. Santos will regularly monitor customer country compliance and progress towards the goals of the Paris Agreement by leveraging the transparency and reporting mechanisms under the Paris Agreement, including:

+ the enhanced transparency framework 5-yearly reporting (Article 13)
+ the 5-yearly Global Stocktake (Article 14) including emissions reports and projections published by independent international agencies such as the United Nations Environment Programme (UNEP); and
+ implementation and compliance committee annual reporting (Article 15).

If results of monitoring identify any Dorado Phase 1 customer countries are not meeting, or are not on track to meet, their NDC or NZE by 2050 emissions reduction targets, Dorado will cease to supply to those customers or take mitigation actions to offset their Dorado Phase 1 product emissions.

A summary of the potential impacts, adopted control measures and environmental performance outcomes (EPOs) are provided in **Table 7-51**.

Table 7-51: Summary of impacts, environmental performance outcomes, controls and consequence evaluation of GHG emissions during Dorado Phase 1

Environmental Performance Outcome (EPO)	
EPO13A: Dorado Phase 1 Scope 1 GHG emissions managed in accordance with the Safeguard Mechanism benchmark baseline set by the Clean Energy Regulator, in support of meeting the Australian Government's Paris Agreement Nationally Determined Contribution of net zero emissions by 2050. **EPO14A**: As the Paris Agreement is the most comprehensive global agreement to seek to limit global temperature rise as specified in Article 2 of the Agreement and no significant[34] impacts to the environment globally, including in Australia, Dorado Phase 1 oil is only sold to customers from countries that have: + a net-zero emissions by 2050 (NZE) commitment; and/or + are signatories to the Paris Agreement and have Nationally Determined Contributions (NDC) in place to reduce or offset GHG emissions.	
Receptor	**Impact**
Australian Environment	Potential impacts as a result of climate change have been modelled by CSIRO. The modelling indicates that temperatures will increase across Australia, rainfall patterns will change significantly and extreme events such as droughts, floods and wildfires will become more common. These changes are likely to impact on individual species, ecosystems and ecosystem services such as food and water availability. Within decades, environments across Australia may be substantially different (CSIRO 2015). As presented in **Section 7.2.6.5**, the annual average CO_{2-e} emissions (Scope 1 + Scope 3) from Dorado Phase 1 equate to 0.023% of the 2021 global emissions from fossil fuel, and 0.134%

[34] As defined by the significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

	of the predicted 2040 global CO2-e emissions under the International Energy Agency's Net Zero Emissions by 2050 scenario. Dorado Phase 1 is not expected to be a significant contributor to global GHG emissions and the associated potential incremental environmental impacts attributed to the Dorado Development would be minor. Management of Dorado Phase 1 Scope 1 emissions in accordance with the Safeguard Mechanism benchmark baseline set by the Clean Energy Regulator will ensure Dorado Scope 1 emissions are managed as part of broader Australian Government climate and energy policy settings to achieve Australia's Paris Agreement NDC of net zero emissions by 2050, in support of Paris Agreement Article 2 objectives to limit global temperature rise to less than 2°C while pursuing 1.5°C. With regard to Dorado Phase 1 Scope 3 emissions, Dorado oil will only be sold to countries that have a net zero commitment or are signatories to the Paris Agreement with NDCs to reduce or offset GHG emissions, ensuring that Dorado Scope 3 emissions are also managed in accordance with the Paris Agreement.

Controls

CM14: Flaring limited to operation of the flare pilot during steady state operations.

CM21: Optimise facilities design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable.

CM22: The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare, and direct them to be reinjected with the produced gas.

CM23: Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities.

CM24: During routine operations, reinject produced gas (other than safety flare and fuel gas) to recover liquids.

CM25: Embed fugitive emissions surveillance and management into facilities operations and maintenance

CM26: Undertake fuel and flare analysis, baselining and forecasting throughout Dorado Development operational life.

CM27: Establish annual setting of energy efficiency improvement and targets throughout the life of Dorado Phase 1 facilities.

CM28: Throughout the life of Dorado Phase 1 facilities undertake optimisation of energy efficiency through periodic opportunity identification workshops or studies, evaluation and implementation.

CM29: Dorado Phase 1 will report on Scope 1 GHG emissions as required per the National Greenhouse and Energy Reporting (NGER) Scheme.

CM30: Dorado Phase 1 will comply with the requirements of the Safeguard Mechanism, including purchase and/or surrender of Australian carbon credit units for any emissions above the baseline for the year, to support achievement of Australia's NDC emissions targets.

CM31: Dorado Phase 1 will implement a GHG management plan and energy management program that incorporates an adaptive management approach that facilitates a continuous cycle of monitoring, evaluating, and implementing improvements to minimise GHG emission to ALARP and acceptable levels over the life of field operations including:

+ Evaluation of emissions monitoring data and ensuring the implemented controls deliver predicted emission reductions,
+ Seeking new and relevant data/information from external sources relevant to GHG emission management including Commonwealth legislation or policy,
+ Ensuring effectiveness of internal processes and procedures to reduce and manage GHG emissions;
+ Responding to changes from detailed engineering outcomes; and

+ Implementing corrective actions identified from the above. **CM32**: Dorado Phase 1 will limit sales to customers from countries that have a NZE commitment or are signatories to the Paris Agreement, and will cease to supply customers in countries that withdraw from the Paris Agreement or NZE commitments. **CM33:** Regular monitoring of Dorado Phase 1 customer country compliance with NZE or NDC emissions targets (Article 4) through the Paris Agreement monitoring and assurance mechanisms: + the enhanced transparency framework 5-yearly reporting (Article 13) + the 5-yearly Global Stocktake (Article 14); and + implementation and compliance committee annual reporting (Article 15). **CM34**: If results of CM33 identify gaps in customer country compliance against NZE or NDC emissions targets, Dorado will cease to supply those customers or take mitigation actions to offset their Dorado Phase 1 product emissions.

Consequence	Minor (B/II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.6.9 Demonstration of Acceptability

The acceptable level of impact for the receptors that may credibly be impacted by GHG emissions as a result of Dorado Phase 1 against receptor specific acceptable levels of impact and other considerations are summarised in **Table 7-52** and **Table 7-53** respectively. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**. The worst-case consequence for GHG emissions was evaluated as minor (**Table 7-51**). This consequence is considered to be acceptable when assessed against the Santos risk matrix (**Table 7-2**).

Through regular monitoring (CM33), Santos will identify customer countries that are not meeting, or are not on track to meet, their NDC or NZE by 2050 emissions reduction targets; or those customer-countries that are no longer signatories to the Paris Agreement or have withdrawn their net-zero commitment. If results of monitoring identify any Dorado Phase 1 customer countries are not meeting, or are not on track to meet, their NDC or NZE by 2050 emissions reduction targets, Santos will take action by ceasing to supply those customers. For those countries that are no longer signatories to the Paris Agreement or have withdrawn their net zero emissions commitment, Santos will also cease to supply customers from these countries.

The Paris Agreement provides the process for defining and adopting criteria applicable to the performance of customer countries in meeting GHG emissions reduction commitments and/or NDCs. For customer countries where Dorado oil would be sold, implementation and compliance with the Paris Agreement and NDCs is not within the operational control of Santos and is a matter for nation states and the UNFCCC framework. Santos' climate transition strategy and action plan to become a net-zero emissions energy and fuels business by 2040 is in step with the temperature goal of the UN Paris agreement on climate change. Santos' Climate Transition Action Plan is adaptive and will be periodically reviewed as required in support of the Paris Agreement objective to limit global temperature rise by 2100 to less than 2 degrees Celsius and pursue efforts to limit the temperature rise to 1.5 degrees Celsius above pre-industrial levels.

Based on the evaluation of impacts and risks in the context of Australia's NDC emissions reduction targets under the Paris Agreement and supporting policies and legislation (including the Safeguard

Mechanism), Santos' commitment to only sell Dorado oil to customer countries that have either made a net-zero emissions commitment or are signatories to the Paris Agreement; and Santos' commitment to cease to supply those customers or take mitigation actions to offset their Dorado Phase 1 product emissions for customers from countries that either withdraw from the Paris Agreement or their NZE commitment or are not on track to meet their NZE or NDC emissions targets, Santos considers the potential impacts that may result from Dorado Phase 1 GHG emissions to be acceptable.

Table 7-52: Demonstration of acceptability for GHG emissions

Acceptability Criteria	Justification
To meet the principles of ESD	The management of risks and impacts from Dorado Phase 1 GHG emissions are consistent with the principles of ESD: + meeting existing end-user demand for energy; + the environmental resources within Dorado Phase 1 Project area are not expected to be significantly impacted; + the global treaty (Paris Agreement) relevant to management of climate change impacts to future generations from GHG emissions have been considered, and supporting Australian policy and legislation, will be complied with; + the consideration and integration of both long and short-term economic, environmental, social and equity considerations in the Paris Agreement; + the precautionary principle has been applied, and studies have been undertaken where knowledge gaps were identified (**Attachment 12**); and + Santos' recognition that Dorado Phase 1 will contribute to global GHG emissions and proposed design and operations mitigation measures to reduce Dorado Phase 1 Scope 1 emissions Santos considers that the Australian Government as a party to the Paris Agreement, its NDCs target of net zero emissions by 2050 and supporting national policies and legislation, ensures a precautionary approach that addresses uncertainty in the quantification of any identifiable change in the environment. Furthermore, if Dorado Phase 1 Scope 1 emissions exceed the benchmark baseline set by the Clean Energy Regulator, offsets (in the form of Australian carbon credit units) are legally mandated to ensure no net-increase in emissions above what is permitted under the benchmark baseline. Through the Paris Agreement, customers to which the Dorado oil is sold must report and manage their Scope 1 and 2 GHG emissions (Dorado Phase 1 Scope 3 emissions) in compliance with customer country targets and policies to meet their net zero emissions commitments and/or NDCs as a party to the Paris Agreement. The principle of intergenerational equity is of particular relevance to Dorado Phase 1, which proposes to develop the Dorado resource to provide reliable and affordable energy for current generations to maintain adequate supply of traditional fuel sources throughout the energy transition while limiting the impact of global climate change for future generations. In supporting an orderly energy transition to ensure current generations are not unduly impacted by the aspirations of future generations, the Dorado development aligns with the intent of the principle of intergenerational equity.

Acceptability Criteria	Justification
Internal context	Santos has considered the internal context, including Santos' Climate Change policy, and commitments in the 2022 Climate Change Report (Santos 2022). The environmental performance outcomes and the controls that will be implemented are consistent with Santos' internal requirements. Dorado Phase 1 will be incorporated into the total emissions reporting by Santos once the project becomes operational. Climate change management is embedded within Santos' business strategy, including lowering operating emissions. Santos has committed to net-zero Scope 1 and 2 emissions by 2040, which will include Dcope1 emissions from Dorado Phase 1 operations, which has a 20-year project life and is scheduled to commence production in 2027.
External context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	The following material published in relation to threatened and migratory species within and adjacent to the Project Area identify climate change as a threat: *Threatened and migratory species:* **Conservation Advice:** + Conservation advice *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice Red Knot (*Calidris canutus*) (Threatened Species Scientific Committee 2016f) + Conservation Advice for the Abbott's Booby – *Papasula abbotti* (Threatened Species Scientific Committee 2020b) + Approved Conservation Advice for *Dermochelys coriacea* (Leatherback Turtle) (Threatened Species Scientific Committee 2008b) + Conservation Advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b) + Conservation Advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c) **Recovery Plans:** Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPC, 2013b). This recovery plan identifies climate change as a threat to Whale Sharks, however, no relevant actions are listed. Wildlife Conservation Plan for Seabirds (DCCEEW 2022). This draft recovery plan identifies climate change as a threat to seabirds. Action 3D: investigate the impacts of climate variability and change on seabirds and their habitats, is relevant to Dorado Phase 1. Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australian 2015c). This recovery plan identifies climate change as a threat. Action 3B: Investigate the impacts of climate change on migratory shorebird habitat and populations in Australia. is relevant to Dorado Phase 1. Recovery plan for Marine Turtles in Australia (Commonwealth of Australia 2017a). This recovery plan identifies climate change and variability as a threat to marine turtles. Action Area A.2: continuing to meet Australia's international commitments to

Acceptability Criteria	Justification
	address the causes of climate change and identify, test and implement climate-based adaptive measures, is relevant to Dorado Phase 1. Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a). This recovery plan identifies climate change as a threat to Blue Whales. Action Area A.3: continuing to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica, is relevant to Dorado Phase 1. Dorado Phase 1 GHG emissions will not credibly result in significant impacts to threatened or migratory species. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify climate change as a key threat or do have explicit relevant objectives or management actions related to climate change. The objectives and actions of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives and Santos considers the impacts of greenhouse gas emissions to not be inconsistent with the EPBC management plans. GHG emissions from Dorado phase 1 will not credibly result in direct significant impacts to threatened or migratory species given that Dorado phase 1 emissions will be managed in accordance with the Safeguard Mechanism, as part of Australia's wider *whole of economy plan to achieve net zero emissions by 2050* under its Paris Agreement NDCs. Achievement of the Paris Agreement temperature goal to limit global temperature rise to 2 degrees Celsius and in pursuit of 1.5 degrees Celsius will limit ecosystem and species impacts to an acceptable level accordingly. *Commonwealth marine environment* The impacts and risks from Dorado Phase 1 GHG emissions on the Commonwealth marine environment do not exceed any of the significant impact criteria provided in **Table 4-2**.
Other relevant requirements	Management of the impacts and risks from GHG emissions associated with Dorado Phase 1 are consistent with relevant legislative requirements, including: + Compliance with international conventions, including: - The Paris Agreement as agreed under the United Nations Framework Convention on Climate Change at the 21st Conference of the Parties in 2015, which sets an ambitious long-term temperature goal (Article 2) and establishes a global goal on adaptation of enhancing adaptive capacity, strengthening resilience and reducing vulnerability to climate change (Article 7). The Paris Agreement commits individual signatory countries to define their nationally determined contributions, reach peak GHG emissions as soon as possible (Article 4), adopt rules and procedures to mitigate GHG emissions, and adopt a compliance and reporting mechanism (Articles 13 and 15), as well as adaptive management and continuous improvement. + Compliance with Australian GHG emissions legislative requirements, including: - The regulatory mechanism of primary relevance to Dorado Phase 1 GHG emissions is the National Greenhouse and Energy Reporting (Safeguarding

Acceptability Criteria	Justification
	Mechanism) Rule 2015. This requires any Scope 1 emissions above a facility-specific baseline to be offset; - Relevant requirements of the National Greenhouse and Energy Reporting Act 2007 (or contemporary requirements at the time); and + Further to the management commitments made in the OPP, the Environment Regulations provide the future legislative mechanism for EP assessments for the Dorado Phase 1 activities that: - requires a detailed evaluation of all activity-specific environmental risks and impacts, including those associated with GHG emissions and global climate change, and requires demonstration that GHG emissions will be reduced to ALARP and acceptable levels; and - provides for the regulator to further assess measures proposed by Santos for Dorado Phase 1 oil, in order to meet the established EPOs, which will be subject to regular review and compliance monitoring. + Implementation of recognised industry standard practice, such as: - Preventative maintenance system; - Optimise planned and unplanned flaring to enable the safe and efficient operation of the facility; and - Equipment selection in design, to achieve emissions efficiencies.

Table 7-53: Demonstration of acceptability of GHG emissions against receptor-specific acceptable levels of impacts

Receptor-specific Acceptable Levels	Justification
RSAL1: No significant[35] impacts to key Australian ecosystems attributable to Dorado Phase 1 GHG emissions.	To ensure no significant impacts to key Australian ecosystems from climate change, Dorado Phase 1 GHG emissions (Scope 1 and Scope 3) will be managed under country-specific emissions reduction policies and regulation that are aligned with the long-term temperature goal of the Paris Agreement , both nationally via the Australian Government's Paris Agreement NDC emissions reduction targets (covering Dorado Scope 1 emissions) and internationally through customer country Paris Agreement NDC emissions targets (covering Dorado Scope 3 emissions). The Paris Agreement is the established legally binding treaty on climate change to limit temperature increase to below 2 degrees in order to prevent and/or limit environmental impacts, including significant impacts to key Australian ecosystems. As a party to the Paris Agreement, Australia has committed to achieving its Nationally Determined Contributions (NDCs), which were most recently revised in 2022, and includes both 2030 and 2050 targets. Achievement of net zero emissions by 2050 is premised on implementation of a range of measures across all sectors of the economy which when implemented collectively enable the net zero target to be achieved. The Safeguard Mechanism is one such measure,

[35] As defined by the significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

	which provides a framework for Australia's largest emitters to measure, report and manage their emissions, including a requirement to offset any emissions above the facility baseline. The Safeguard Mechanism is complemented by a suite of Australian Government climate and energy policy measures that collectively are designed to achieve net zero emissions by 2050. Although a Safeguard Mechanism baseline has not yet been set by the Clean Energy Regulator for Dorado Facilities (which wouldn't be expected at the OPP assessment stage of a new development), it is the role of the Clean Energy Regulator (as Regulator for the Safeguard Mechanism) to determine a suitable baseline for Dorado facilities in the context of broader government climate and energy policy and achievement of Australia's NDC emissions reduction targets. Dorado's Phase 1 Scope 1 GHG emissions will be regulated under the Australian Government's safeguard mechanism which is designed to ensure facility emissions are capped at a prescribed level ie. facility baseline, and any emissions above the baseline limit are offset through surrender of accredited offsets. The design of the Safeguard Mechanism is such that it ensures emissions reductions from facilities covered by the Safeguard Mechanism make an appropriate contribution (through progressive ratcheting of baselines) towards economy wide emission reductions and achievement of Australia's Paris Agreement Nationally Determined Contributions (NDC) emission reduction targets. By restricting sales of Dorado Phase 1 product to customers from countries that are signatories to the Paris Agreement or have made a net-zero commitment, this ensures that the Dorado Scope 3 emissions are managed under export country policies and regulation for management of their Scope 1 and 2 emissions in order to achieve their Paris Agreement NDC emissions reduction targets. Regulation and management of both domestic and export Dorado Phase 1 GHG emissions under a Paris-aligned framework, ensures all sources of Dorado Phase 1 GHG emissions are managed in accordance with the Paris Agreement treaty which is designed to limit global temperature increase (Article 2) to prevent significant impacts to ecosystems (inclusive of key Australian ecosystems).Net-zero emissions commitments and/or Paris Agreement NDCs by Dorado Phase 1 customer countries provide the most certain pathway to achieving the Paris Agreement temperature goal (Article 2), which, based on the available science, is the most credible means of ensuring acceptable levels of impact to Australian ecosystems from the impacts of global climate change (RSAL1). However, while it is in Santos' control to elect to only sell Dorado Phase 1 oil to customers from countries with net-zero emissions by 2050 commitments and/or Paris Agreement NDCs to reduce or offset emissions (EPO14A), it is not within Santos' control to ensure customer countries comply with net-zero emissions commitments and/or Paris Agreement NDCs. In the event that Dorado Phase 1 customer countries withdraw from the Paris Agreement or their NZE by 2050 commitment, Santos will cease to supply to those customers. And if monitoring through Paris Agreement monitoring and assurance mechanisms reveals Dorado Phase 1 customer countries are not on track to meet their NZE or NDC targets, Santos will cease to supply those customers or take mitigation actions to offset their Dorado Phase 1 product emissions. Even under the most aggressive accelerated energy transition scenarios, including the IEA Net Zero by 2050 scenario, there remains a requirement for

	investment in oil and gas production to maintain sufficient supply through the transition. The 2021 World Energy Outlook states that "Oil and gas spending today is one of the very few areas that is reasonably well aligned with the levels seen in the NZE to 2030" and warns that the world is not investing enough to meet its future energy needs, and that uncertainties over policies and demand trajectories create a strong risk of a volatile period ahead for energy markets. Therefore, it is too simplistic to assert that no new oil developments will be required, even under the IEA NZE by 2050 scenario. In its 2022 World Energy Outlook (IEA, 2022), when assessing the current global energy crisis, exacerbated by Russia's invasion of Ukraine, the IEA acknowledges that immediate shortfalls in fossil fuel production will need to be replaced by production elsewhere – even in a world working towards net zero emissions by 2050. The IEA also discusses the need for a new energy security paradigm to maintain reliability and affordability while reducing emissions, where both energy systems (fossil fuels and clean energy) are required during the energy transition in order to deliver the energy services needed by consumers, even as their respective contributions change over time (IEA, 2022). In summary, the environmental impacts from Dorado Phase 1 GHG emissions will be of an acceptable level because: + All Dorado Phase 1 GHG emissions (Scope 1 and Scope 3) will be managed under jurisdiction-specific Paris Agreement aligned emissions reduction regulatory frameworks, in step with the temperature goal of the UN Paris Agreement on climate change to ensure acceptable levels of impact to ecosystems (inclusive of key Australian ecosystems). + Even under the most aggressive accelerated energy transition scenarios, including the IEA Net Zero by 2050 scenario, there remains a requirement for investment in oil and gas production to maintain sufficient supply through the transition; + Renewable fuels alone cannot meet current energy and product needs, and probably cannot meet projected global energy and product needs, before the planned end to Dorado production in 2047; + Both traditional forms of fossil fuel energy and new clean energy sources are required throughout the energy transition to maintain reliability and affordability while reducing emissions.
RSAL2: Dorado Phase 1 is an insignificant $CO_{2\text{-}e}$ emissions contributor to Australian and Global $CO_{2\text{-}e}$ emissions	Dorado Phase 1 (Scope 1) emissions contribution to Australia's national $CO_{2\text{-}e}$ emissions will be less than 0.5%. Dorado Phase 1 (Scope 1 + Scope 3) emissions contribution to Global $CO_{2\text{-}e}$ emissions will be less than 0.25%.

7.2.7 Emissions – Atmospheric

Non-GHG atmospheric emissions refer to the emissions of nitrogen oxides (NO_x), sulphur oxides (SO_x), carbon monoxide (CO), volatile organic compounds (VOCs) and particulate matter (less than 10 µm (PM_{10}) and less than 2.5 µm ($PM_{2.5}$)) with potential resultant impacts on natural ecosystems and human health or amenity. These emissions may cause effects at a local and regional scale. Non-GHG atmospheric emissions are hereafter referred to as atmospheric emissions. GHG emissions are discussed in **Section 7.2.6**.

7.2.7.1 Description of the Event

Atmospheric emissions will be generated in the Project Area during all stages of Dorado Phase 1 (from development drilling to decommissioning). The main sources where atmospheric emissions will be generated are the Dorado WHP, FPSO, MODU, and support and installation vessels. The following activities will generate atmospheric emissions:

- combustion emissions from power generation and processing facilities (including all equipment and generators);
- periodic emissions from flaring of gas during commissioning, start-up and shutdown activities on the FPSO;
- periodic emissions from venting (release of non-combusted gas for overpressure release, facility depressurisation events, and systems pressure testing);
- fugitive emissions (unplanned emissions from pressurised piping components and equipment leaks, which are not regarded as venting);
- emissions from transportation activities, such as vessel and helicopter movements; and
- on-vessel atmospheric emissions, including internal combustion engines, fugitive emissions and onboard incinerators.

The following sections provide some context to Dorado Phase 1 atmospheric emissions.

7.2.7.1.1 Combustion Emissions

Fuel combustion for power generation in internal combustion engines will occur on a routine basis on all vessels, MODUs and the FPSO. Vessels, MODUs and the FPSO, when not producing or not on station, will be powered by MDO. During normal operating conditions, power on the Dorado WHP, however, will be provided by the FPSO via the umbilical. During specific maintenance campaigns, a MDO-fuelled power generation kit may be used on the Dorado WHP. Under normal operating conditions, the FPSO will use field gas as a fuel source. SO_x and particulate-matter emissions are heavily influenced by the type of fuel used and its relative sulphur content. For instance, combustion of MDO releases a greater volume of atmospheric emissions than the combustion of produced gas. Thus, the use of produced gas as fuel is expected to represent a reduction in atmospheric emissions when compared to using MDO. It will nevertheless be required to use MDO as fuel during commissioning, when the FPSO is disconnected from the DTM, when production is stopped during events such as shutdown, and to operate safety-critical equipment such as fire pumps. The use of MDO is expected to occur sporadically for discrete time periods.

Depending on the vessel used, MDO, intermediate fuel oil (IFO) and HFO may be used as fuel. IFO and HFO are only expected to be used on certain installation vessels, such as the heavy-lift vessel. It is expected that the MODU will use MDO as fuel. Lower atmospheric emissions are expected from the combustion as fuel of MDO than from IFO and less from IFO than from HFO. Emissions produced by support and installation vessels are also expected to be substantially less than that of the MODU or FPSO.

On board the vessels and MODU, another combustion source might be the incinerators. Incinerators are shipboard facilities designed for the incineration of wastes to reduce waste to ash for disposal. The type and quantities of material that can be disposed of in incinerators are regulated via the International Maritime Organization.

7.2.7.1.2 Flaring and Venting Emissions

Flaring is expected to occur during the development drilling and operations and maintenance stages. On the MODU, flaring will be required during well-cleaning and testing activities. For this assessment, it has been conservatively assumed that flaring will be continuous during the drilling campaign. During the operations and maintenance stage, the FPSO flare will not be routinely operated, except for the safety flare pilot flame (for which small quantities of produced gas will be used). Flaring is anticipated during start-ups, shutdowns, and process upsets or in emergency events (refer to **Section 7.2.6.2.1**).

Venting (emissions of non-combusted gas) is also expected on the Dorado WHP during facility depressurisation events (such as controlled shutdown, emergency conditions, and pressure-relief events) and for overpressure release (passive safety system, which ensures tanks and other vessels on a facility are not overpressured and therefore safeguarding a facility's systems integrity). Venting from facility depressurisation and overpressure release on the FPSO will be directed to the flare. On both the Dorado WHP and FPSO, venting will occur during systems pressure testing (generally nitrogen is used during flowline or equipment pressure testing to identify potential leak pathways prior to introducing hydrocarbons). For both the WHP and the FPSO venting sources, the inventory is expected to be small.

7.2.7.1.3 Fugitive Emissions

Fugitive emissions are unintentional emissions of non-combusted gas (i.e. they are not occurring due to the design of the equipment or operational practices). As hydrocarbons are gathered, processed and stored on the Dorado WHP and FPSO, it is a reasonable expectation that there will be some fugitive emissions from non-point sources (such as valves or flanges) on those facilities.

7.2.7.1.4 Atmospheric Emissions Estimation

A quantification study was undertaken to inform the assessment of the potential impacts and risks from the atmospheric emissions associated with Dorado Phase 1 (**Attachment 12**). To estimate the atmospheric emissions, guidance manuals developed by the National Pollutant Inventory were used (such as the Emission Estimation Technique Manual for Oil and Gas Extraction and Production – Version 2.0 (DSEWPAC 2013c)). The guidance manuals were used for both the method and emission factors. This allowed the quantification of NOx, SOx, CO, VOCs, and particulate-matter emissions associated with each stage of Dorado Phase 1. It also allowed the comparison of atmospheric emissions per project stage on a uniform metric basis. The activities generating atmospheric emissions in the Project Area and activities assumptions are those presented in **Attachment 12**. To better categorise emissions aligned with comparable sources across the stages of Dorado Phase 1, they have been grouped as follows:

- drilling, installation, and commissioning – including development drilling, installation, hook-up and commissioning;
- operations and maintenance (for a duration of 20 years); and
- decommissioning.

The expected atmospheric emissions throughout the Dorado Phase 1 lifecycle are presented in **Table 7-54.**

Table 7-54: Expected atmospheric emissions by emission type and project stage

Emission	Total Atmospheric Emissions (t) by Stage		
	Drilling, Installation, and Commissioning	Operations and Maintenance	Decommissioning
NO_x	8,470	25,100	3,020
SO_x	0	33	0
CO	3,570	25,100	803
VOCs	506	15,100	75.8
PM_{10}	255	155	94
$PM_{2.5}$	249.8	154	91.8

The majority of the atmospheric emissions are predicted to occur during the operations and maintenance stage (**Figure 7-29**), with most of the total atmospheric emissions being comprised of NO_x and CO (44% and 36% respectively). VOCs represent 19% of the atmospheric emissions, with SO_x and particulate matter representing less than 1%.

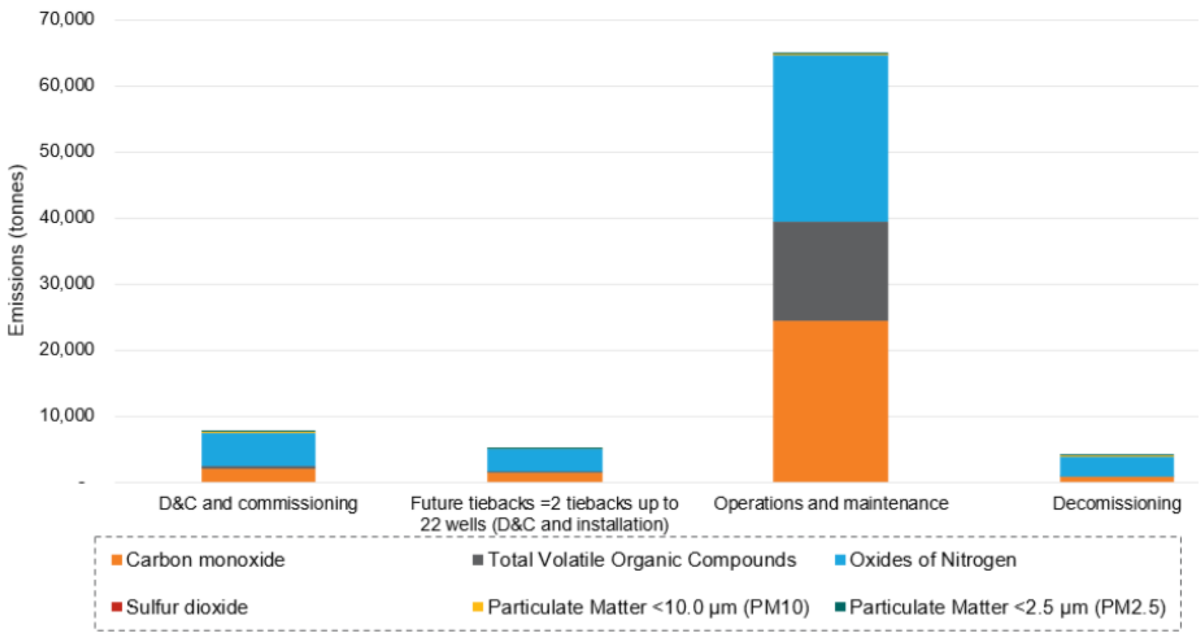

Figure 7-29: Summary of atmospheric emissions during Dorado Phase 1 stages

7.2.7.2 Details of Environmental Impacts and Risks

A summary of the analysis of the environmental impact of atmospheric emissions as a result of Dorado Phase 1 is provided in **Table 7-55**. Atmospheric emissions are not expected to impact the biological environment or socio-economic environment.

Atmospheric emissions can cause direct impacts to fauna if the fauna are close to the area of discharge. Given that these emissions will be remote from any sensitive locations, including significant seabird habitats, there are no expected impacts to the biological environment. Given the offshore location, atmospheric emissions are not likely to result in socio-economic impacts, such as visual amenity, nuisance or health issues.

Table 7-55: Receptors potentially impacted by atmospheric emissions

Description of the Risk	Receptor Categories
Potential environmental impacts associated with atmospheric emissions as a result of	Air Quality – **Section 7.2.7.2.1** Birds – Section

7.2.7.2.1 Air Quality

Most of the total atmospheric emissions in Australian waters associated with Dorado Phase 1 are related to the operations of the FPSO (up to 97%). The quantity of emissions emitted during the operations of the FPSO are relatively low as the gas recovered from the reservoir (with the exception of the fraction taken for fuel gas and keeping the flare pilot flame lit) will be reinjected into the reservoir formation. It is expected that, under normal circumstances, these emissions will be quickly dissipated into the surrounding environment through natural dispersion (e.g. wind and mixing). In general terms, the sensitivity of local air quality in the Project Area is considered low due to the absence of existing emissions sources and the absence of sensitive receptors. Considering the location of the Dorado Development in the open ocean, which is well-removed from the nearest residential or sensitive populations of the Western Australian coast (the proposed FPSO is 110 km from the nearest coast and 143 km from Port Hedland), and the localised nature of the emissions, it is considered that atmospheric emissions will not result in significant impacts to ambient air quality at a local or regional scale.

Atmospheric emissions will result in a minor deterioration in local air quality and are not considered to have a detectable local-scale impact. Taking into account the low sensitivity of the receiving environment subject to local and regional air quality changes (absence of receptors in the open offshore context), the residual impact is concluded to be minor.

7.2.7.2.2 Birds

Atmospheric emissions can cause direct impacts to fauna such as seabirds and migratory shorebirds, if they are present in the immediate vicinity of significant releases. Anthropogenic disturbance is identified in the Wildlife Conservation Plan for Migratory Shorebirds as a threat to the conservation of migratory shorebirds (Commonwealth of Australia, 2015a). The nearest roosting site for seabirds and migratory shorebird is Bedout Island (70 km) and Eighty Mile Beach (146 km) so large numbers of seabirds or migratory shorebirds are not expected to occur in close proximity to the WHP and FPSO. Given that atmospheric emissions will be typical of other operating facilities and equipment, and that seabird and migratory shorebird numbers will be low at the FPSO location no lasting impact to seabirds and migratory shorebirds as a result of atmospheric emissions is expected.

7.2.7.3 Summary of Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-56**.

Table 7-56: Summary of impacts, environmental performance outcomes, controls and consequence evaluation for atmospheric emissions during Dorado Phase 1

Environmental Performance Outcome (EPO)	
EPO15A: No significant[36] impacts to air quality throughout the lifecycle of Dorado Phase 1	
Receptor	**Impact**
Air Quality	Change in air quality
Controls	
CM14: Flaring limited to operation of the flare pilot during steady state operations. **CM21:** Optimise facility design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable. **CM22:** The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare, and direct them to be reinjected with the produced gas. **CM23:** Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities. **CM25:** Embed fugitive emissions surveillance and management into facilities operations and maintenance. **CM35**: The MODU, vessels, and FPSO will comply with MARPOL Annex VI (Prevention of Air Pollution from Ships), the Navigation Act 2012, the Protection of the Sea (Prevention of Pollution from Ships) Act 1983 and subsequent Marine Orders, which require vessels to have a valid International Air Pollution Prevention Certificate (for vessels more than 400 tonnage), and to use low-sulphur fuel. **CM36:** Ozone-depleting substances onboard vessels and the facilities will comply with relevant MARPOL 73/78 (Annex VI - air pollution), Navigation Act 2012, Protection of the Sea (Prevention of Pollution) Act 1983 and subsequent Marine Order requirements (as appropriate for vessel classification). **CM37**: Measure, monitor or estimate facility fuel and flare emissions (in accordance with the National Pollutant Inventory) to inform and optimise management practices and minimise environmental impact of emissions. **CM38**: National Pollutant Inventory reporting records (or contemporary requirements at the time of the activities) will be complied with during the project.	
Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.

7.2.7.4 Demonstration of Acceptability

The acceptable levels of potential impact for the receptors that may be credibly impacted by atmospheric emissions as a result of Dorado Phase 1 compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-57** and **Table 7-58.** The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

[36] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

The worst-case consequence for atmospheric emissions were evaluated as minor (**Table 7-56**). This consequence is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential from the atmospheric emissions aspect of Dorado Phase 1 are acceptable.

Table 7-57: Demonstration of acceptability for atmospheric emissions

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	The environmental impacts of atmospheric emissions as a result of Dorado Phase 1 are consistent with the principles of ESD based on the following points: + the environmental resources within the Dorado Development Project Area are not expected to be significantly impacted; and + the precautionary principle has been applied, and studies have been undertaken where knowledge gaps were identified (**Attachment 12**).
Internal context	The management of atmospheric emissions is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPO and the controls that will be implemented are consistent with Santos' internal requirements.
External context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	Recovery Plans / Conservation Advice for species that may occur in the project area do not identify atmospheric emissions as a key threat or have explicit relevant objectives or management actions. Atmospheric emissions will not credibly result in significant impacts to threatened or migratory species.
Other relevant requirements	Compliance with international conventions, including: + MARPOL 73/78: Annex VI: Regulations for the prevention of air pollution from ships. Compliance with Australian legislation and requirements, including: + Navigation Act 2012 and Protection of the Sea (Prevention of Pollution from Ships) Act 1983; + Marine Order 97 (Marine Pollution Prevention – Air Pollution); and + Relevant requirements of the National Pollutant Inventory National Environmental Protection Measure.

Table 7-58: Demonstration of acceptability of atmospheric emissions against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL7: No substantial changes in air quality that may adversely impact on biodiversity, ecological	Impacts to air quality from atmospheric emissions associated with Dorado Phase 1 will be localised. Given the remoteness of the Dorado

integrity, social amenity or human health as a result of Dorado Phase 1.	Development Project Area, there is no potential for significant environmental impacts to occur.

7.2.8 Physical Presence – Interactions with Other Users

7.2.8.1 Description of the Event

Dorado Phase 1 will require a range of facilities and supporting project vessels to be present within the Project Area, such as:

- support and installation vessels;
- the MODU (jack-up for drilling the Dorado field, jack-up or semi-submersible MODU for tiebacks);
- the Dorado WHP;
- the FPSO facility, including associated DTM, mooring lines and anchors;
- subsea infrastructure, such as flowlines and umbilicals; and
- Future tieback infrastructure including WHPs (if required), flowlines, umbilicals.

Each of these facilities will temporarily exclude some activities by other maritime users, such as shipping and commercial fishing, within the Project Area, both in the short-term during installation/drilling operations, and over the long term during production operations over ~20 years. This exclusion is required to ensure the safety of other users and of the vessels and facilities associated with Dorado Phase 1. Project activities, such as drilling and installation, will be undertaken by relatively large vessels that are easily detectable.

The FPSO and Dorado WHP are large steel structures and they will be clearly visible at a long range under most metocean conditions in the Project Area. The main deck height of the FPSO is 36 m above sea level, which will be visible on the horizon approximately 21 km away. The flare tower (110 m above sea level) will be visible on the horizon approximately 37 km from the FPSO; further when flaring (**Attachment 9**).

The decommissioning concept for Dorado Phase 1 has not been selected at this stage in the development planning however, decommissioning of the infrastructure in the Dorado field will be conducted in accordance with accepted decommissioning practices and regulatory requirements at the time of decommissioning.

7.2.8.2 Details of Environmental Impacts and Risks

Table 7-59 identifies the potentially impacted receptors as a result of interactions with other users within the Project Area.

Table 7-59: Receptors potentially impacted by Dorado Development Infrastructure and Activities

Description of the Risk	Receptor Categories
Displacement of other users within the Project Area during installation and drilling activities. Exclusion of other users from within gazetted PSZs during production operations	Commercial Fisheries – **Section 7.2.8.2.1** Maritime Industry – **Section 7.2.8.2.2**

There are no tourism activities within the Project Area. The Project Area does not overlap any designated Department of Defence areas or any existing oil and gas facilities (**Section 3**). Hence, these receptors will not credibly be impacted.

Vessels will be required to comply with relevant international and Australian maritime navigation and safety requirements at all times. Santos has an existing marine assurance framework that stipulates these requirements prior to third party vessels being contracted for undertaking project activities. Temporary or short-term project activities that may result in interactions with other users (e.g. tieback drilling) will typically be undertaken with a Notice to Mariners issued by the Australian Hydrographic Service in place. These Notices will communicate the nature, location and expected duration of these activities. This, along with Santos' stakeholder consultation program, will provide a sufficient level of communication to other marine users regarding Dorado Phase 1 activities to be conducted within the Project Area.

Dorado Phase 1 facilities will also be clearly marked on nautical charts once installed. The FPSO will maintain a manned control room and will be able to detect and communicate with other maritime users that may come within proximity of the FPSO and Dorado WHP. The FPSO will also have a support vessel on standby much of the time, which will maintain a watch for other vessels and implement the PSZ. As such, the Dorado WHP and FPSO will be readily detectable by other maritime users and the FPSO will maintain the ability to communicate with other users at all times.

The FPSO and Dorado WHP will be lit and will maintain navigation aids in accordance with maritime safety requirements. The large size and material (predominantly steel) of these facilities is expected to provide a strong radar return for other maritime users.

7.2.8.2.1 Commercial Fisheries

A number of Western Australian managed fisheries overlap the Project Area. Of these, the following fisheries were recorded as being active within the Project Area based on spatial catch and effort (FishCube) data maintained by DPIRD and confirmed with WAFIC through consultation (refer **Section 9.1.4.1**):

+ Mackerel Managed Fishery (Area 2 - Pilbara) (State), and
+ Pilbara Demersal Scalefish Fishery comprising:
    - Pilbara Fish Trawl (Interim) Managed Fishery (State);
    - Pilbara Line Fishery (State); and
    - Pilbara Trap Managed Fishery (State).

None of the Commonwealth fisheries (which includes the Western Tuna and Billfish Fishery, Western Skipjack Tuna Fishery and the Southern Bluefin Tuna Fishery) that overlap the Project Area have been active within the Project Area in recent years. Effort in these fisheries is typically concentrated in areas outside of the Project Area. Therefore, no interactions with participants in these fisheries are expected to occur during Dorado Phase 1.

Potential impacts to commercial fisheries as a result of Dorado Phase 1 range from operational inconveniences (e.g. manoeuvring around transiting vessels) to longer term (i.e. for the life of Dorado Phase 1) loss of access to fishing areas due to presence of WHP/FPSO infrastructure. Displacement may result in reduced catches and income, or increased costs to operate elsewhere (i.e. relocation costs). Through engagement with WAFIC key concerns raised or requiring clarification included the exclusion zones proposed by Dorado Phase 1 (**Section 8**).

Dorado Phase 1 is not expected to result in any decline in fish resources targeted by commercial fishing. There is also evidence that indicates petroleum infrastructure provides habitat that supports more diverse and abundant fish assemblages and that the exclusion zones associated with the facilities provide an area protected from fishing (Bond et al. 2018; McLean et al. 2017).

FishCube data are available for Western Australian fisheries in 60 nm x 60 nm and in 10 nm x 10 nm CAES blocks. The fishery data provided includes weight of fish catch, vessel count and fishing day count – which is a measure of fishing effort, represented by the number of days when one or more vessels fished in a CAES block during the period. The dataset provides an understanding of the relative distribution of fishing effort. For the fisheries that overlap the Project Area, fishing effort (fishing day count) has been mapped for each fishery for the 10-year (2009 to 2019) dataset to assess the potential impact to the commercial fisheries associated with Dorado Phase 1 infrastructure and petroleum activities (see the following sub-sections).

Mackerel Managed Fishery (Area 2)

The Mackerel Managed Fishery operates throughout the nearshore waters of the Pilbara and the vessel and gear types make them relatively mobile. Fishing effort is distributed along the Pilbara and Kimberley coasts, with areas of significant effort located off Eighty Mile Beach, Port Hedland, Dampier, and near Barrow Island and the Montebello Islands (**Section 3.4.3**).

An assessment of FishCube data for the 10 nm CAES for the Mackerel Managed Fishery indicates 4 fishing blocks overlap the Project Area (**Figure 7-30**). The data indicates a low level of fishing effort within these blocks, with less than three vessels recorded in these Mackerel Managed Fishery 10 nm fishing blocks between 2014 to 2018. There was no recorded activity overlapping with the planned Dorado WHP/ FPSO PSZ.

Fishing effort for this fishery is typically restricted to water depths less than 60 m. This was corroborated in 2019 during stakeholder consultation for the Keraudren 3-D marine seismic survey in the Bedout Basin (Santos 2019). The entire Project Area is more than 60 m water depth (i.e. beyond the typical depths in which fishers operate). Participants in the Mackerel Managed Fishery may experience operational inconvenience or area displacement from the PSZs, however, the loss of fishing ground due to the PSZ is a small area for the life of Dorado Phase 1 and is not expected to result in any notable decline in total catch.

Pilbara Fish Trawl Interim Managed Fishery

Fishing effort for the Pilbara Fish Trawl Interim Managed Fishery occurs throughout the Project Area and beyond. The areas of greatest historical fishing effort in the fishery are in Area 1 and Area 2 (**Figure 7-31**), located approximately 223 km and 114 km west of the Dorado WHP respectively. These areas are closest to the home ports of the fishers (Exmouth and Point Samson near Karratha). Two trawl fishing companies are understood to operate across the entire fishery. The area of the fishery is 86,000km^2.

An assessment of FishCube data for the 10 nm CAES indicated there are 19 fishing blocks that overlap the Project Area (**Figure 7-31**). Across the Project Area, fishing occurred in all the years from 2014 to 2018, and recently across all months. All the blocks had fishing activity. Dorado Phase 1 will restrict fishing within the PSZ (3.25km^2 in area), which represents approximately 1% of the overall fishing block area (Block 19184 is 324km^2 in area). Approximately 99% of block 19184 would remain accessible for the Pilbara Fish Trawl Interim Managed Fishery.

The benthic habitats within the proposed PSZs are widely represented within the Project Area. The associated fish assemblages targeted by the Pilbara Fish Trawl Interim Managed Fishery are likely to also be widely distributed within the Project Area. No fish species targeted by the fishery were observed at the WHP location during benthic habitat surveys, although targeted fish were observed elsewhere within the Project Area (RPS 2020d). Given the widespread, homogeneous nature of benthic habitats within the Project Area, and the small loss of fishing ground due to the PSZ, the displacement of operators in the fishery is not expected to result in any reduction in total catch within the fishery.

Pilbara Line Fishery

FishCube data for the Pilbara Line Fishery was available in 60 nm CAES block resolution (**Figure 7-32**). CAES data indicates that effort in the fishery is concentrated in waters between North West Cape and Dampier, with highest effort around Barrow Island and the Montebello Islands. Santos understands that there were nine licences within the fishery for the 2018/2019 season, which were held by seven operators.

A review of FishCube data (**Figure 7-32**), indicates 3 fishing blocks overlap the Project Area, one block overlaps the PSZ. Fishing occurred periodically in 2014, 2015 and 2016 within the block overlapping the PSZ. All blocks recorded less than three vessels between 2014 and 2018.

Participants in the fishery may experience operational inconvenience or area displacement from the PSZs, however, this is not expected to result in any notable decline in total catch due to the relatively low levels of fishing effort within the Project Area and PSZ.

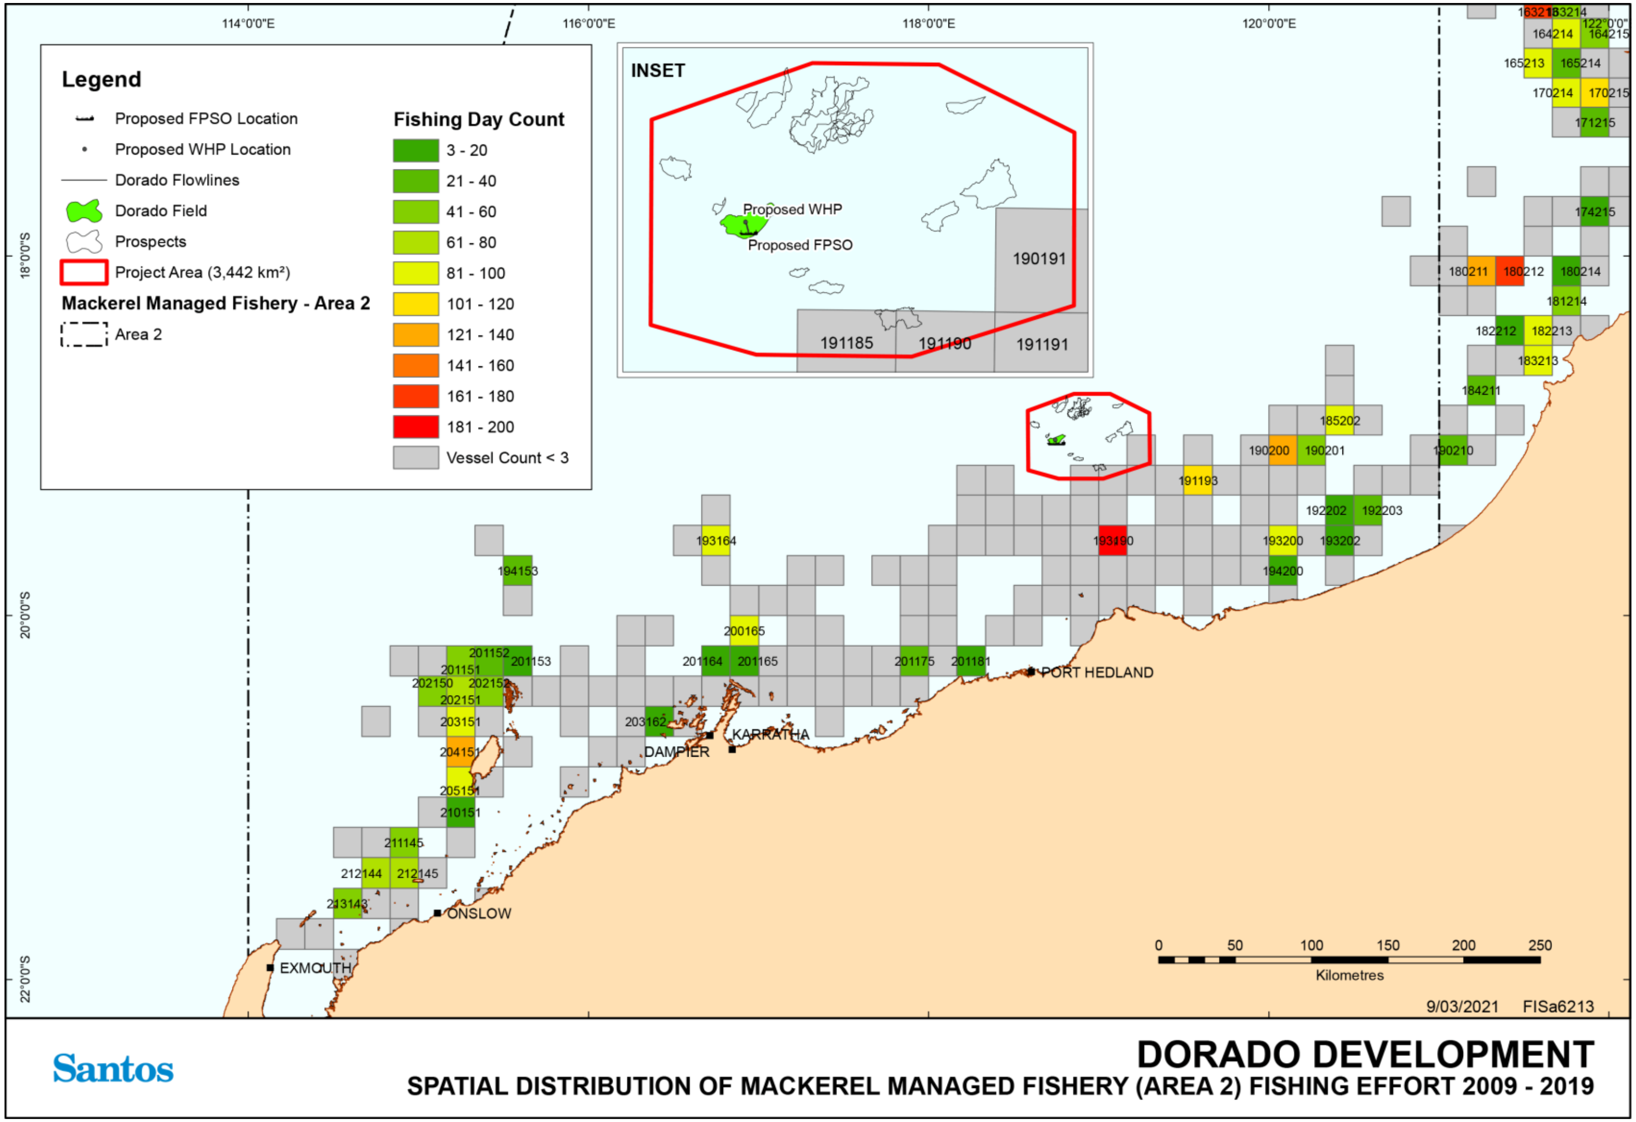

Figure 7-30: Spatial distribution of mackerel managed fishery (Area 2) fishing effort

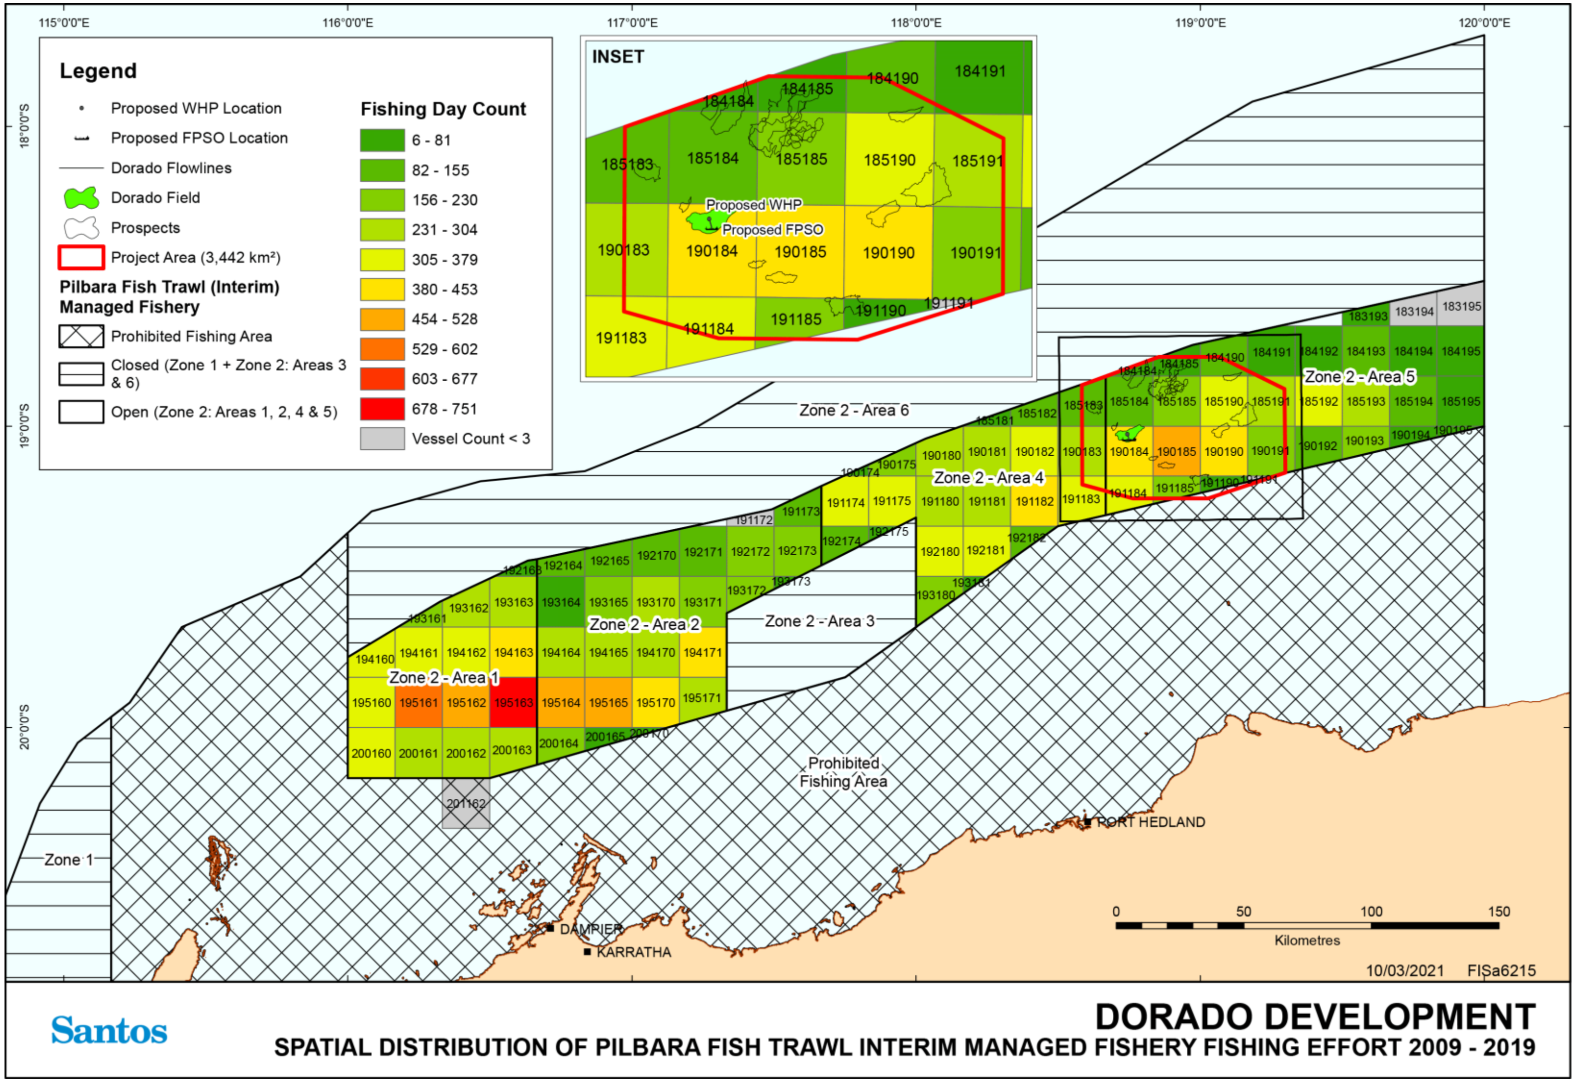

Figure 7-31: Pilbara fish trawl (interim) managed fishery fishing effort

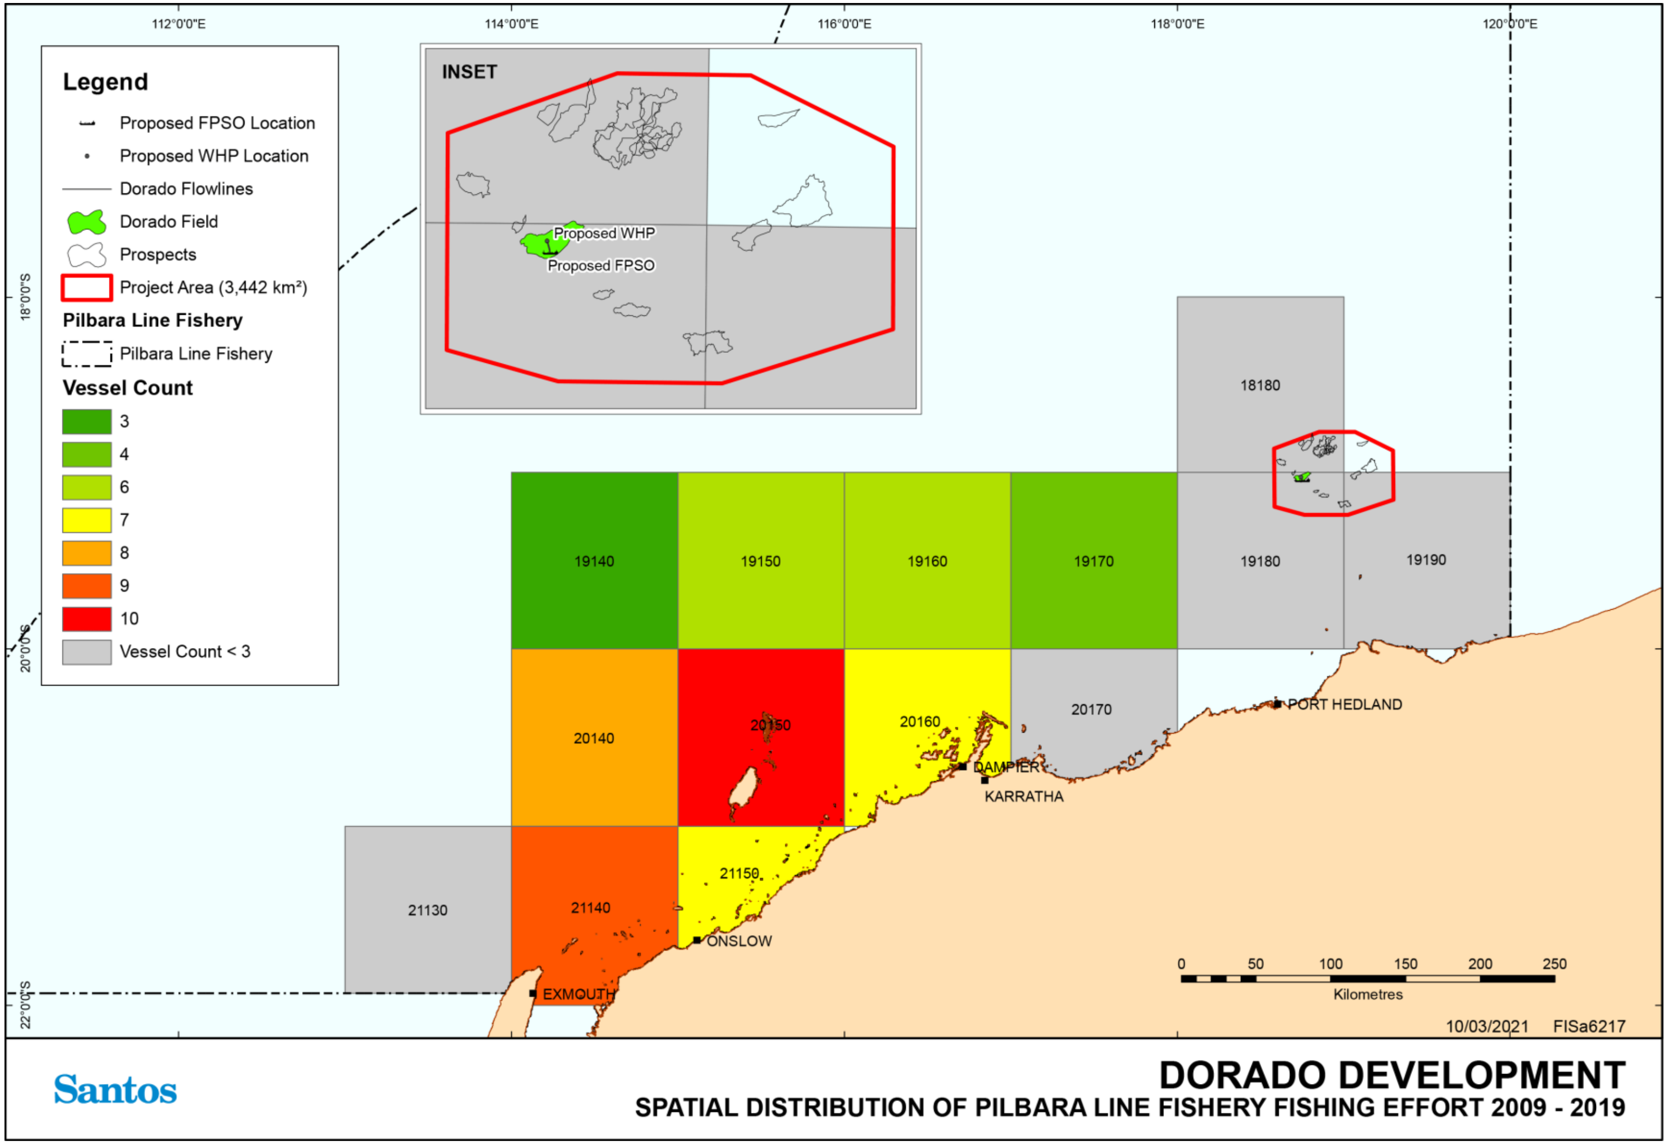

Figure 7-32: Pilbara line fishery fishing effort

Pilbara Trap Managed Fishery

FishCube data for the Pilbara Trap Managed Fishery was available in 60 nm CAES block resolution (**Figure 7-33**). The data indicated four Pilbara Trap Managed Fishery fishing blocks overlap the Project Area, and only one block overlaps the PSZ around the WHP, flowlines and FPSO. The data indicates fishing effort in the overlapping blocks was periodic (in different months) in all years 2014 to 2018. FishCube data suggests less than three vessels have operated in fishing blocks overlapping the Project Area between 2014 to 2018.

Participants in the fishery may experience operational inconvenience or area displacement from the PSZs, however, the loss of fishing ground due to the PSZ is a small area for the life of Dorado Phase 1 and is not expected to result in any notable decline in total catch.

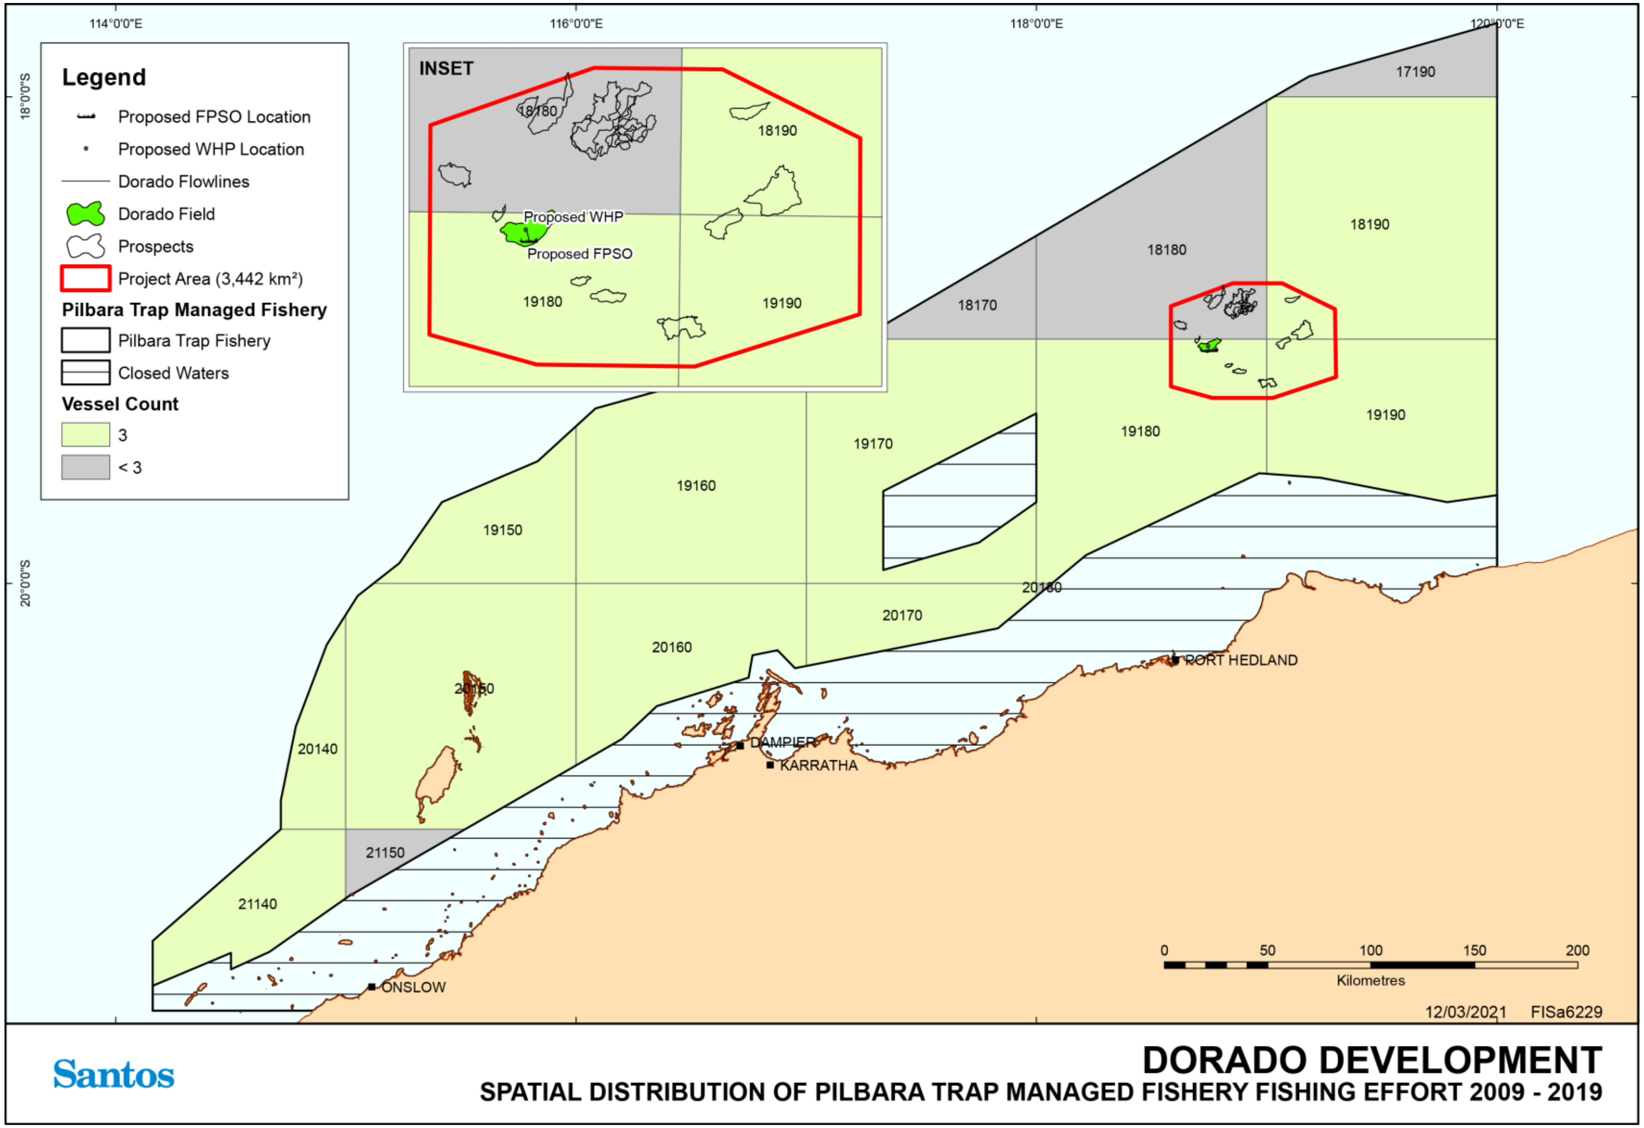

Figure 7-33: Pilbara trap managed fishery fishing effort

7.2.8.2.2 Maritime Industry

Shipping

The proposed Dorado WHP and FPSO locations and associated PSZ is located between two AMSA fairways leading to the port of Port Hedland. Shipping traffic is concentrated in these fairways, with vessel traffic outside the fairway significantly lower than within the fairway (**Section 3.4.6**). These fairways are intended to reduce the risk of collisions in areas of high commercial shipping traffic. Use of the fairways is not mandatory, but is strongly recommended. Shipping traffic data within the Project Area available from AMSA shows that commercial shipping in the Project Area is concentrated within the fairways (**Figure 3-24**).

The proposed PSZ around the WHP, flowlines and FPSO is located beyond the fairways and hence outside the areas of highest vessel traffic. The closest component of the proposed PSZ to either of these fairways is the FPSO, which is located approximately 12 km from the eastern-most fairway in the Project Area. Waters in the Project Area have no restrictions to navigation aside from the recommended fairways (e.g. shallow water, channels, banks etc.) and vessels attempting to avoid the Dorado PSZ will not have any natural restrictions on their ability to manoeuvre around them.

The presence of Dorado Phase 1 may impact shipping activity due to exclusion of vessels from areas designated as a PSZ. Also, the presence of vessels to support the petroleum activities can create navigational hazards that may disturb other marine activities, especially vessels that may have restricted manoeuvrability. Local vessels may have to alter course as a result, increasing journey time and fuel consumption.

The locations of potential future tiebacks have not yet been determined. In the event that a future tieback is located within or near a shipping fairway, there may be potential interactions between commercial shipping and tieback activities. There is therefore a potential for temporary displacement of shipping traffic around the tieback while it is being installed, commissioned, operated and decommissioned.

Petroleum

Santos is the Operator for the petroleum titles that overlap the Project Area. Hence, interactions with other petroleum titleholders as a result of Dorado Phase 1 are not expected to occur. The closest operational oil and gas facility to the Project Area is Woodside's Angel platform, located approximately 231 km west of the WHP.

Telecommunications

The Project Area overlaps the North West Cable System, connecting offshore oil and gas facilities in the Browse, Bonaparte and Carnarvon Basins to onshore locations. There is no proposed activity overlapping the North West Cable System.

7.2.8.3 Summary of Impact Evaluation

A summary of the outcomes of impact evaluation, including adopted control measures and EPOs is provided in **Table 7-60.**

Table 7-60: Summary of impacts, environmental performance outcomes, controls and consequence evaluation of interactions with other users during Dorado Phase 1

EPOs	
EPO16A: No adverse interactions[37] between Santos' activities and other maritime users within the Project Area. **EPO17A**: The installation and drilling operations, production operations and decommissioning activities of the project will be managed in a manner that does not interfere with other marine users within the Project Area to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of Santos under the Dorado petroleum titles. **EPO18A:** Decommissioning of Dorado facilities in compliance with Section 572 (3) of the Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Act 2009.	
Receptor	**Impact**
Commercial fisheries	Displacement of other users from exclusion zones within the Project Area during installation/drilling operations. Exclusion of other users from within the gazetted PSZ during production operations
Maritime industry	
Controls	
CM39: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the Navigation Act 2012 and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM40**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM41**: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM42**: Should potential future tiebacks overlap within AMSA fairways Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way. **CM43**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM44**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM45**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development facilities.	

[37] Whether an interaction constitutes an adverse interaction will be determined on a case by case basis. Examples of adverse interactions may include substantiated complaints by other marine users to Santos or NOPSEMA, vessel collisions, or damage to unsupervised fishing equipment (e.g. traps). Interactions where other users have not taken reasonable measures to avoid the interaction (e.g. third-party vessel not adhering to standard maritime requirements or ignoring advice provided during consultation) are not considered to be adverse.

CM46: Decommissioning of Dorado Phase 1 facilities will be carried out in accordance with regulatory requirements per Section 572 (3)of the OPGGS Act. **CM47:** Exclusion zones/petroleum safety zones will be limited to the minimum area necessary to exercise rights and perform duties under project specific petroleum titles. **CM48:** Residual impacts to other marine users of the environment are managed to not interfere with their rights.		
Consequence	Minor (B/ II) Detectable but insignificant change to local population, industry or ecosystem factors. Localised effects.	

7.2.8.4 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by interactions with other users as a result of Dorado Phase 1 against receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-61** and **Table 7-62** respectively. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case consequence for interactions with other users was evaluated as minor (**Table 7-60**). This consequence is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from interactions with other users are acceptable.

Table 7-61: Demonstration of acceptability for interactions with other users

Acceptability Criteria	Justification
To meet the principles of ESD	The environmental impacts of interactions with other users as a result of Dorado Phase 1 are consistent with the principles of ESD based on the following points: + Dorado Phase 1 does not impinge upon the rights of other parties to access environmental resources (e.g. commercial fishers) in an unacceptable way. + The precautionary principle has been applied, and analysis undertaken (e.g. analysis of FishCube data and consultation with fishers) where knowledge gaps were identified. This knowledge has been applied during the evaluation of environmental impacts and risks.
Internal Context	The management of interactions with other users is aligned with Santos' policies and standards. The worst-case consequence is minor, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of potential impacts and risks. Santos has been working with commercial fishing interests for over 7 years as of 2022, as part of ongoing exploration activities in the Bedout basin. Relatively small scale exclusion zones associated with short term exploration drilling and seismic activities have not impacted the economic viability for commercial fishers given the large fishing area.

Acceptability Criteria	Justification
MNES	The following material published in relation to threatened and migratory species within and adjacent to the Project Area identify anthropogenic disturbance as a threat: **Conservation Advice:** + Conservation Advice Red Knot (Calidris canutus) (Threatened Species Scientific Committee 2016f) **Recovery Plans:** Wildlife Conservation Plan for Seabirds (DCCEEW 2022). This recovery plan identifies anthropogenic disturbance as a threat to seabirds. Action 2D: ensure all areas of important habitat for seabirds are considered in the development assessment process; and 2E: manage the effects of anthropogenic disturbance to seabird breeding and roosting areas, are relevant to Dorado Phase 1. Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australian 2015c). This recovery plan identifies anthropogenic disturbance as a threat to migratory shorebirds. Action 3C: Investigate the significance of cumulative impacts on migratory shorebird habitat and populations in Australia; and Action 3F: Ensure all areas important to migratory shorebirds in Australia continue to be considered in development assessment processes, are relevant to Dorado Phase 1. The guidelines, conservation advice and recovery plans for MNES that may occur within the Project Area do not identify interactions with other users as a threat. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify anthropogenic disturbance as a key threat or have explicit relevant objectives or management actions related to anthropogenic disturbance. The objectives and actions of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The environmental impacts of interactions with other users as a result of Dorado Phase 1 will not result in impacts to the environmental values of the Commonwealth marine environment. None of the significant impact criteria for the Commonwealth marine environment (**Table 4-2**) will be met as a result of interactions with other users.
Other Relevant Requirements	Management of the environmental impacts of interactions with other users as a result of Dorado Phase 1 are consistent with relevant legislative requirements, including compliance with international maritime conventions and Australian legislation, including: + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + International Convention for the Safety of Life at Sea 1974, and + International Regulations for Preventing Collisions at Sea 1972. + *Navigation Act 2012*, including: - Marine Order 21 (Safety and emergency arrangements) - Marine Order 30 (Prevention of Collisions), and - Marine Order 71 (Masters and Deck Officers).

Acceptability Criteria	Justification
	Santos will not interfere with the rights of other marine users to a greater extent than is necessary for the reasonable exercise of Dorado Phase 1, as per Section 280 of the OPGGS Act as committed in **EPO17A** and **CM47**. NOPSEMA administer the petroleum safety zones in accordance with Chapter 6, Part6.6 of the OPGGS Act (NOPSEMA Safety Zone Assessments Policy Document No N-04800-PL0886 A196273, April 2020. Key features of NOPSEMA's approach to administration include: + only considering safety zones for petroleum or greenhouse gas wells, structures or items of equipment as provided for in Sections 616 and 617 of the OPGGS Act + formal processes incorporating decision making criteria and timeframes; + a requirement for applicants to demonstrate effective consultation with parties which may be directly impacted + a mechanism for interested parties to be informed of notices being gazetted.

Table 7-62: Demonstration of acceptability of interactions with other users against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Justification
RSAL19: No negative impacts to the economic viability of the commercial fish resources. **RSAL20**: Short-term displacement of commercial fishing activities from exclusion zones within the Project Area (excluding the gazetted PSZ) during installation/drilling operations is acceptable. **RSAL21**: Long-term exclusion (up to 20 years) of commercial fishing activities from the gazetted PSZ during production operations is acceptable.	The Australian Government actively promotes investment in offshore oil and gas exploration through its annual release of petroleum exploration acreage. Through Santos' Dorado petroleum permits (WA-437-P and WA-438-P), it has obligations to explore, appraise and if commercially viable, develop the associated petroleum resources. Australian Commonwealth waters is home to many different commercial, recreational and marine conservation endeavours; and inevitably there will be instances where there are multiple parties with differing objectives competing for access to Commonwealth waters resources. Installation, operations and decommissioning of petroleum facilities requires a level of exclusion from other marine users for the mutual safety of both petroleum operators and other marine users. As a result, some level of impact, by way of exclusion, to other marine users is unavoidable in order to safely develop petroleum resources. While Operators such as Santos take all reasonable and practicable measures through consultation with relevant stakeholders to avoid or minimise impacts to other marine users, some level of residual impact is mostly unavoidable. These residual impacts are the by-product of necessary trade-offs between the needs of multiple users with access to a common resource. Facilities installation and drilling operations outside of the gazetted petroleum safety zone will be of short-term duration, in the order of several weeks/months approximately. Therefore impacts from displacement of
RSAL26: Short-term displacement of commercial shipping within the Project Area (excluding the gazetted PSZ) during installation/drilling operations is acceptable. **RSAL27**: Long-term (up to 20 years) exclusion of commercial shipping from the gazetted safety zone during production operations is acceptable.	

	commercial fishing activities due to exclusion zones during installation/drilling operations will be limited. The areas where commercial fishing activity will be excluded from longer term production operations through the gazetted petroleum safety zone (PSZ) represents a very small portion of the managed fishery areas. The Dorado facilities PSZ (3.25 km^2) represents 0.01% of the total Dorado Project area that would be excluded from commercial fishing during production operations. If the PSZ is extended to future tieback facilities the area excluded from commercial fishing would still represent less than 1% of the total Project area. With respect to specific managed fisheries, even though the Project area overlaps with ~15% of the Pilbara Fish Trawl Interim Managed Fishery (PFTIMF), the area excluded from fishing activity due to the PSZ (3.25 km^2) during production operations represents ~0.004% of the total area of the PFTIMF (86,000km^2). Under NOPSEMA's administration of PSZs as provided for in Chapter 6, Part 6.6 of the OPGGS Act, NOPSEMA will assess future applications for Dorado Phase 1 petroleum safety zones, both for the Dorado field and future tiebacks. The assessment of applications by NOPSEMA will consider parties directly impacted by the nominated PSZ and related stakeholder consultation undertaken by the applicant. The assessment of the PSZ application by NOPSEMA, and eventual gazettal will inform the acceptable level of impact to commercial fishers. Santos considers the displacement of other defence activities from relatively small areas of the open ocean environment in Dorado Phase 1 area to be acceptable. There are no designated defence areas within the Project Area. Fishing effort within the Project Area has historically been relatively low, with the exception of the Pilbara Fish Trawl Interim Managed Fishery. Santos considers that in developing Dorado it is not expected that the PFTIMF will experience any notable decline in total catch. While there is considerable shipping activity in the Project Area, the WHP and FPSO PSZs are not located within any existing shipping fairway. The open sea environment does not impose any constraints on the ability for vessels to manoeuvre to avoid components of Dorado Phase 1 that may present an obstacle to navigation. The controls Santos will implement will provide other maritime users with sufficient information to be aware of, and avoid, petroleum activities within Dorado Phase 1.

7.2.9 Physical Presence – Seabed Disturbance

7.2.9.1 Description of the Event

Seabed disturbance is expected throughout the life cycle of Dorado Phase 1, and will include changes to the existing physical (e.g. substrate) and biological (e.g. habitat) values of the environment. Seabed disturbance may result in short-term (e.g. temporary changes in water quality due to sediment resuspension) and/or long-term impacts (e.g. modification of benthic habitats). Installation, decommissioning and other works, such as anchoring, associated with the following components of the project will disturb areas of the seabed:

+ Dorado WHP jacket;
+ FPSO anchor spread;
+ MODUs spud cans;
+ drilling and installation of wells;
+ subsea system (e.g. flowlines and subsea connectors); and
+ potential future facilities associated with tieback infrastructure (e.g. wells, flowlines, and WHP).

A temporary stand-by mooring may also be installed within the Project Area to assist reducing vessels diesel consumption.

During the operation stage, seabed disturbance associated with activities such as maintenance, repair and well intervention are expected. To develop potential future tiebacks semi-submersible MODU and some vessels, which may be held in place using anchors, may be required. The exact anchoring configuration will vary for each MODU/ vessel. Physical disturbance of the seabed will mainly be associated with laying and retrieval of anchors and chains. Decommissioning activities such as well plug and abandonment, removal of subsea infrastructure, disconnection of the Dorado WHP will also generate seabed disturbances.

Section 572 of the OPGGS Act obliges titleholders to remove property when it is neither used nor to be used on connection with current or future operations. The policy of the Department of Industry, Science, Energy and Resources is that "*complete removal of infrastructure is the 'base case'*" for decommissioning of offshore petroleum infrastructure (Department of Industry, Science, Energy and Resources 2020). As such, Dorado Phase 1 infrastructure above the seabed will be designed such that removal of the infrastructure is feasible for decommissioning.

The policy of the Department of Industry, Science, Energy and Resources (2020) and NOPSEMA's draft policy *Section 572 Maintenance and removal of property* (2020b) may permit Santos to make alternative arrangements for decommissioning, provided that the alternative arrangements (e.g. decommissioning of infrastructure in situ) are expected to have equal or better environmental outcomes when compared to the removal of property. The existing regulatory frameworks requires Santos to demonstrate that alternative arrangements will result in equal or better environmental outcomes when compared to the removal of property in an EP. NOPSEMA's acceptance of an EP proposing alternative arrangements would mean that the removal of obligations under Section 572 of the OPPGS Act are met with respect to the property covered under the EP.

If decommissioning *in situ* is undertaken, the modification of the seabed by the decommissioned infrastructure will effectively be long term (i.e. many decades to potentially hundreds of years) before reverting to a condition consistent with the natural seabed. The infrastructure remaining *in situ* will provide artificial hard substrates for colonisation of biota.

The expected approximate area extent of direct seabed disturbance is provided in **Table 7-63.**

Table 7-63: Proposed Direct Seabed Disturbance

Facility/Infrastructure	Approximate Area of Disturbance (km^2)
Initial Development	
Jack-up MODU – spudcans	0.00078 km^2 (780 m^2)
Wells (based on cumulative cuttings discharges of 12 wells)	9.81 km^2
Dorado WHP jacket (including additional footprint which may be required for activities such as mattressing, wet parking, and surveying), noting this is within the well cuttings footprint.	0.01 km^2 (10,000 m^2)
Vessel anchoring (including mooring)	0.00013 km^2 (130 m^2)
FPSO – moorings	2 km^2
Subsea system – flowlines, umbilicals, and manifolds (including stabilisation support, if required), based on 250m wide corridor within which the subsystem is laid.	0.55 km^2
Total Area Foundation Dorado Development	**Approximately 12.4 km^2**
Future Tiebacks	
Semi-submersible MODU – anchoring and mooring lines, assumed as this has a larger footprint than a jackup rig.	0.01 km^2 (10,000 m^2)
Wells (Assume that a maximum number of wells from a single slot would be 12 wells)	9.81 km^2
Vessel anchoring (including mooring)	0.00013 km^2 (130 m^2)
WHP (including additional footprint which may be required for activities such as mattressing, wet parking, and surveying)	0.01 km^2 (10,000 m^2) (per WHP or subsea facilities, such as a subsea gathering system)
Subsea system – flowlines, umbilicals, and manifolds (including stabilisation support, if required) based on 250 m wide corridor within which the subsystem is laid, and a maximum distance of up to 50 km (to identified prospects within the Project Area) from the Dorado WHP/ FPSO to tieback to (refer **Figure 0-2**).	12.5 km^2 – maximum expected area per tieback.
Total Area Per Future Tieback	**Approximately 22.3 km^2**
Total Area Dorado Phase 1 (Foundation Development and 2 future tiebacks)	**Approximately 57.1 km^2**

Indirect seabed disturbance may also occur as a result of localised sedimentation and turbidity generated from activities associated with the controlled placement of infrastructure on the seabed, such as the Dorado WHP jacket and FPSO anchoring piles and the flowlines. In addition, the planned discharge of drilling cuttings and fluids during development drilling will also result in a temporary increase in sedimentation and turbidity levels.

The seabed disturbance from the discharge of drilling fluids and cuttings has been assessed in **Section 7.2.1** and is not considered here. The physical presence of components of Dorado Phase 1 may also result in interactions with other users. The potential impacts of interactions with other users are assessed in **Section 7.2.8**.

7.2.9.2 Details of Environmental Impacts and Risks

A summary of the analysis of the environmental impact of the seabed disturbance as a result of Dorado Phase 1 is provided in this section. **Table 7-64** identifies the potentially impacted receptors as a result of seabed disturbance within the Project Area.

Seabed disturbance from the installation, operation and decommissioning stages and activities (**Section 7.2.9.1**) required for Dorado Phase 1 is not expected to result in impacts to marine mammals, reptiles or birds. These fauna species are typically associated with surface waters and the water column. Observations of the benthic habitats within the Project Area made during environmental surveys (**Attachment 2**) do not suggest these habitats are important foraging areas for marine mammals, reptiles or birds.

Table 7-64: Receptors potentially impacted by seabed disturbance

Description of the Impact	Receptor Categories
Temporary, localised decrease in water quality during installation and removal of components on the seabed. Localised, minor modification of sediment characteristics, such as geological origin and particle size distribution. Localised, minor modification of benthic habitats from the introduction of artificial hard substrates. Increased fish diversity and abundance due to modification of benthic habitats.	Water Quality – **Section 7.2.9.2.1** Sediment Quality – **Section 7.2.9.2.2** Benthic Habitats – **Section 7.2.9.2.3** Fishes – **Section 7.2.9.2.4**

7.2.9.2.1 Water Quality

Impacts to water quality from seabed disturbance of Dorado Phase 1 are likely to be restricted to localised turbidity during deployment and recovery of MODU spud cans, project vessel and semi-submersible MODU anchors and moorings, installation of WHP piles, FPSO piles and mooring lines, and installation of the subsea system. Decommissioning activities are expected to have the same level of suspended sediments and increased turbidity levels as during installation.

Sediment plumes from these activities may result in a slight and temporary decrease in water quality due to increase in suspended sediments close to the point of disturbance. The amount of sediment suspended will be proportional to the size of the structure and the speed (i.e. force) it is placed on the seabed. Considering the placement of infrastructure and equipment will be controlled (i.e. slow descent) it is expected that only small amounts of sediment will be resuspended. Sediments in the Project Area are characterised by a relatively high portion of sand-sized particles (Attachment 4), which are likely to settle out within close proximity of the disturbed area. These localised, temporary impacts to water quality will not impact biodiversity or ecological integrity within the Project Area and are considered to be of minor consequence.

7.2.9.2.2 Sediment Quality

Impacts to sediment quality from physical presence during all stages of Dorado Phase 1 are not expected to be significant. Changes to physical properties, such as particle size distribution and geological origin, are not expected to occur beyond the immediate footprint of the components presented in **Table 7-63**. Fouling organisms growing on subsea components may alter the geological origin of sediments, with an increase in biogenic sediments as a result of these organisms (e.g. increases in sediment derived from mollusc shells). These changes will not impact biodiversity or ecological integrity within the Project Area.

7.2.9.2.3 Benthic Habitats

The majority of the Project Area consists of habitats composed largely of sediments characterised by sand-sized particles with varying portions of mud- and gravel-sized particles (typically more than 90% cover) but it also contains some areas of exposed limestone pavement, which may host filter feeders such as whip corals, gorgonians and sponges (**Attachment 2**). These habitats are widely represented throughout the NWS and are not considered to be sensitive benthic habitats. No known seabed features (e.g. shoals, banks) or habitats of high environmental value were identified within the Project Area.

The Project Area deliberately avoids overlapping the Ancient Coastline at 125 m water depth KEF (**Figure 6-2**). The water depths within the Project Area (approximately 70 to 120 m) are not expected to support benthic primary producer habitats due to insufficient light penetration to the seabed, although macroalgae and corals are expected to grow as biofouling on the WHP structure in the shallower photic zone.

The seabed at the WHP location is characterised by featureless soft sediment habitat, while the FPSO location is represented by soft sediment interspersed by hard substrate habitat. The presence of the subsea infrastructure will create hard substrate habitat layered over any soft sediments and will have a localised disturbance to hard substrate communities present.

The presence of the WHP, DTM moorings, subsea infrastructure and any materials placed on the seabed (such as flowlines or gravel bags) will provide hard substrate for the settlement of marine organisms that would not otherwise be successful in colonising the area. Over time the colonisation of this infrastructure can lead to the development of a 'fouling' community, which subsequently provides predator or prey refuges, foraging resources for pelagic fish species and artificial reefs potentially supporting fish aggregations (Forteath et al. 1982; Gallaway et al. 1981; Todd et al. 2016).

The decommissioning concept for Dorado Phase 1 has not been determined and all facilities will be designed, installed and operated so that they can be removed. A potential decommissioning concept is to partially retain end-of-life facilities, such as the Dorado WHP jacket, in the sea following the removal of all hazardous materials. This may occur in situ, or they may be moved to another location. These end-of-life facilities can then provide hard substrate for the development of artificial reefs.

The majority of the Project Area consists of habitats composed largely by sediments characterised by sand-sized particles with varying portions of mud- and gravel-sized particles (typically more than 90% cover) but it also contains some areas of exposed limestone pavement, which may host filter feeders such as whip corals, gorgonians and sponges (**Attachment 2**). These habitats are widely represented throughout the NWS and are not considered to be sensitive benthic habitats. No known seabed features (e.g. shoals, banks) of habitats of high environmental value were identified within the Project Area. The seabed at the foundation WHP location is characterised by featureless soft sediment habitat, while the FPSO location is represented by soft sediment interspersed by hard substrate habitat.

As described in **Section 3.3.1.1**, the Project Area overlaps three ecotypes that are all widely represented adjacent to or outside of the Project Area, and across the northwest shelf. Based on the location of the potential prospects and the foundation Dorado development, it is expected at a worse case that up to 45km^2 in area may be impacted within a single ecotype (refer **Figure 3-9**). This is conservatively based on assuming 2 future tiebacks may occur within the same ecotype, including the subsea system (flowline corridor). Given that Ecotype 3 covers 916km^2 of the Project Area, and this is the smallest (Ecotype 4 covers 991 km^2 and Ecotype 5 covers 1532km^2) less than 5% of the ecotype within the Project Area will be impacted, and excludes that this ecotype (as well as Ecotype 4 and 5) extends well beyond the Project Area.

The Project Area deliberately avoids directly overlapping the Ancient Coastline at 125 m water depth KEF (**Figure 6-2**), so there is no direct seabed disturbance associated with infrastructure.

The water depths within the Project Area (70 to 120 m) are not expected to support benthic primary producer habitats due to insufficient light penetration to the seabed, although macroalgae and corals are expected to grow as biofouling on the WHP structure in the shallow photic zone.

The potential living in situ of infrastructures will continue to provide hard substrate for the settlement of marine organisms that would not otherwise be successful in colonising the area. Over time the colonisation of this infrastructure can lead to the development of a 'fouling' community, which subsequently provides predator or prey refuges, foraging resources for pelagic fish species and artificial reefs potentially supporting fish aggregations (Forteath et al. 1982; Gallaway et al. 1981; Todd et al. 2016). These reefs may have a range of environmental benefits, such as increased abundance and diversity of marine biota, increased commercially and recreationally important fish stocks (Boswell et al. 2010).

Potentially living in situ infrastructures after decommissioning is expected to provide additional habitats to benthic communities, and the resulting potential environmental impacts were assessed as minor.

Overall, the potential impacts to benthic habitats from seabed disturbance will be limited to modification of bare sediment and hard substrate habitats within the Project Area, which will be replaced by artificial hard substrate. This is expected to modify existing habitats, with the structures likely to develop fouling communities over time. The potential impact to alteration of the benthic environment from flowline activities is expected to be highly localised (i.e. within the footprint of the components). There will be no installation of infrastructure or equipment in sensitive benthic habitats, such as KEFs. On this basis, impacts to benthic habitats from seabed disturbance will be minor.

7.2.9.2.4 Fishes

The modification to benthic habitats from the presence of components of Dorado Phase 1 has the potential to modify fish assemblages within the immediate vicinity of the components. These components will provide relatively complex artificial structural habitat in an area otherwise devoid of complex seabed features. This will likely result in an increase in the diversity and abundance of fish assemblage in the immediate vicinity of the project infrastructure. This effect has been observed in response to the establishment of pipelines and platforms, although the increase in diversity and abundance is generally localised to the infrastructure (Bond et al. 2018; Boswell et al. 2010; McLean et al. 2017).

Santos considers that the changes in fish assemblages in response to the modification of benthic habitats is likely to have a net environmental benefit due to the increases in fish abundance and diversity, particularly within the proposed exclusion zones that will exclude fishing activity.

The Project Area overlaps a foraging BIA for whale sharks shown in the National Conservation Values Atlas (DAWE 2020). Whale sharks are known to congregate around geomorphic features to feed, such as reefs and islands, with steeply sloping seabeds in close proximity to relatively deep water (Copping et al. 2018). These congregations are particularly notable during periods of high food availability, such as coral spawning off Ningaloo Reef and land crab spawning off Christmas Island (Meekan et al. 2009; Taylor and Pearce 1999). The Project Area does not exhibit the geomorphic or biological features associated with whale shark aggregations (**Section 3.3.1.1**), and tagging studies of whale sharks congregating off Ningaloo Reef do not show whale sharks congregating near or migrating through the Project Area (Meekan and Radford 2010; Wilson et al. 2006) (**Figure 3-17**).

The *Conservation advice* Rhincodon typus *whale shark* (Threatened Species Scientific Committee 2015d) identifies the following conservation action: "*Minimise offshore developments and transit time of large vessels in areas close to marine features likely to correlate with whale shark aggregations (Ningaloo Reef, Christmas Island and the Coral Sea) and along the northward migration route that follows the northern Western Australian coastline along the 200 m isobath (as set out in the Conservation Values Atlas, DotE, 2014).*" Based on the lack of features consistent with known whale shark congregations and the lack of episodic high food availability (e.g. mass spawning of invertebrates) within the Project Area, whale sharks are very unlikely to aggregate in the Project Area. Tagging studies do not show whale sharks migrating through the Project Area, or along the mid and inner continental shelf in the region, with all whale sharks tagged at Ningaloo Reef travelling away from the congregation area in water considerably deeper than the Project Area (Meekan and Radford 2010; Wilson et al. 2006). As such, Dorado Phase 1 is consistent with the conservation advice, as the Development does not occur in areas close to marine features likely to correlate with whale shark aggregations, nor does it overlap the northward migration route along the 200 m isobath, as the water depth in the deepest part of the Project Area is approximately 118 m.

7.2.9.2.5 Fisheries

End-of-life facilities retained in the sea have the potential to modify fish assemblages within the immediate vicinity of the facilities. These facilities will provide relatively complex artificial structural habitat in an area otherwise devoid of complex seabed features. This will likely result in an increase in the diversity and abundance of fish assemblage in the immediate vicinity of the project infrastructure. This may result in benefits to fishers such as enhanced recruitment of targeted species and increased catches. These effects may be localised to the location of the facility (Boswell et al. 2010).

Santos considers that the changes in fish assemblages in response to the modification of benthic habitats will have a net environmental benefit due to the increases in fish abundance and diversity, and assessed the resulting potential environmental impacts as minor.

Santos

7.2.9.3 Summary of Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-65.**

Table 7-65: Summary of impacts, EPOs, controls and consequence evaluation of seabed disturbance during Dorado Phase 1

<table>
<tr><th colspan="3">EPOs</th></tr>
<tr><td colspan="3">EPO2B: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area.
EPO18B: Decommissioning of Dorado facilities in compliance with Section 572 (3) of the Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Act 2009.
EPO3F: No mortality or significant[38] impacts to EPBC act listed threatened, and migratory species as a result of Dorado Phase 1 seabed disturbance.

[38] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

7.2.9.4 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by seabed disturbance as a result of Dorado Phase 1 compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-66** and **Table 7-67**. The method by which these acceptable levels were determined, along with a justification as to why these are considered acceptable, are discussed in **Section 4**.

The worst-case consequence for seabed disturbance was evaluated as minor (**Table 7-65**). This consequence is considered to be acceptable when assessed against the acceptable levels of risk defined in Santos risk matrix **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from seabed disturbance are acceptable.

Table 7-66: Demonstration of acceptability of seabed disturbance

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD.	Management of seabed disturbance from Dorado Phase 1 is consistent with the principles of ESD because: + there is no threat of serious or irreversible environmental damage, + the environmental resources within the Project Area will not be significantly impacted, and + biological diversity and ecological integrity will be maintained.
Internal Context.	The management of seabed disturbance is aligned with Santos' policies and standards. The consequence is minor, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context.	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of potential impacts and risks with respect to vessel collisions with marine fauna.
MNES	The Dorado Phase 1 benthic environment contains no known seabed features (e.g. shoals, banks) or habitats of high environmental value within the Project Area, including no overlap with KEFs. The below conservation advice and recovery plans identify habitat degradation as a threat to threatened species. Impacts to the marine environment from seabed disturbance will be highly localised. The marine environment that may be affected is widely distributed throughout the Project Area and beyond. As such, Santos considers the impacts of seabed disturbance to not be inconsistent with these conservation advice and recovery plans. **Conservation Advice** + Approved conservation advice for *Pristis clavata* (dwarf sawfish) (Threatened Species Scientific Committee 2009), + Approved conservation advice for *Pristis pristis* (largetooth sawfish) (Threatened Species Scientific Committee 2014b), and + Approved conservation advice for green sawfish (Threatened Species Scientific Committee 2008a).

	+ Conservation advice for *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b) + Conservation Advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c) **Recovery Plans** Sawfish and river shark multispecies recovery plan (Commonwealth of Australia 2015b) - This recovery plan identifies habitat degradation as a threat to sawfish. Impacts to benthic habitats from the discharge of seabed disturbance will be highly localised within the Project Area. The benthic habitats that may be affected are very widely distributed throughout the Project Area and beyond. The closest Sawfish BIA (for pupping, nursing and foraging) is approximately 87 km from the southern extent of the Project Area. Santos considers the impacts of seabed disturbance to not be inconsistent with the recovery plan. Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a) - This recovery plan identifies habitat modification as a threat to marine turtles. Impacts from seabed disturbance may result in a temporary, localised impact to the benthic environment, which will recover rapidly. Santos considers the impacts of seabed disturbance to not be inconsistent with the recovery plan. Recovery Plan for the White Shark (Carcharodon carcharias) (DSEWPac, 2013b) – This recovery plan identifies habitat modification as a potential threat to White Sharks. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from seabed disturbance may result in a temporary, localised impact to the benthic environment, which will recover rapidly. Santos considers the impacts of seabed disturbance to not be inconsistent with the recovery plan. Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a) – This recovery plan identifies habitat modification as a threat to Blue Whales. The species is highly mobile and transitory in nature and the area impacted is small compared to the amount of habitat available. Impacts from seabed disturbance may result in a temporary, localised impact to the benthic environment, which will recover rapidly. Santos considers the impacts of seabed disturbance to not be inconsistent with the recovery plan. Recovery Plans / Conservation Advice for other species that may occurring the Project Area do not identify habitat degradation as a key threat; or have any explicit relevant objectives or management actions related to habitat degradation.
Other Relevant Requirements	No other relevant requirements

Santos

Table 7-67: Demonstration of acceptability of seabed disturbance against receptor-specific acceptable levels of impact

Acceptability Criteria	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[39] are acceptable. **RSAL4**: Substantial[40] impacts to water quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	The evaluation of impacts from the seabed disturbance show that impacts are likely to be restricted to very localised sediment plumes, and a slight and temporary decrease in water quality could be experienced due to increase in suspended sediment. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity will be maintained beyond 1 km of the disturbance location. Given the widespread nature of the open water environment in the region, the seabed disturbance from Dorado Phase 1 will not result in impacts to water quality that result in a loss of ecological integrity.
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity[38] are acceptable. **RSAL6**: Substantial[39] impacts to sediment quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	The evaluation of impacts from the seabed disturbance show that changes to sediment physical properties, such as particle size distribution and geological origin, are not expected to occur beyond the immediate footprint of the components installed on the seabed. It is also expected that a high level of ecological integrity will be maintained beyond 1 km of the disturbance location. Given the widespread nature of the open water environment in the region, seabed disturbance will not result in impacts to sediment quality that result in a loss of ecological integrity.
RSAL8: No significant[41] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities.	The benthic habitats in the Project Area are widely represented throughout the NWS and are not considered to be sensitive benthic habitats. The potential impacts to benthic habitats are expected to be limited to modification of bare sediment and hard substrate habitats within the Project Area, which will be replaced by artificial hard substrate. These potential impacts have been identified as minor. The Project Area has been designed to avoid potential overlap with any KEFs (such as ancient coastline at 125 m depth contour).
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1	The assessment of impacts from seabed disturbance shows that Dorado Phase 1 may result in an increase in the diversity and abundance of fish assemblage in the immediate vicinity of the project infrastructure. Mortality of or significant impacts to threatened or migratory species is not expected to occur.

[39] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[40] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

[41] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

RSAL14: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	Seabed disturbance has not been identified as a threat in any recovery plans or conservation advice for threatened and migratory species.

7.3 Risk Assessment of Unplanned Events

7.3.1 Accidental Release – Hydrocarbon and Chemical Spills

7.3.1.1 Description of the Event

7.3.1.1.1 Hydrocarbons

There is a risk that unplanned (i.e. accidental) events may occur and result in hydrocarbon spills to the marine environment. Unplanned hydrocarbon releases of Dorado oil, gas, MDO and HFO could unintentionally be released into the marine environment. These unplanned spill events have a very low probability of occurring and are caused by accidental events, vessel collisions (particularly with errant third-party vessels) or emergency conditions (Det Norske Veritas 2011). Activities and facilities associated with Dorado Phase 1 that may result in the unplanned discharge of hydrocarbons to the marine environment are:

+ drilling operations (MODU and vessel operations);
+ installation and commissioning activities (vessel operations);
+ FPSO and WHP operations including:
  - hydrocarbon extraction and processing;
  - intervention drilling (MODU and vessel operations); and
  - oil export (offtake tanker operations); and
+ decommissioning (MODU and vessel operations).

These activities and facilities and their relation to possible hydrocarbon or chemical spills is set out in **Table 7-68**.

To support the environmental risk assessment, Santos considered the worst-case credible spill scenarios associated with each stage of Dorado Phase 1. Santos has identified a Loss of well control as the worst-case type of credible oil release scenario that could potentially occur during the activity. A loss of well control incident may discharge directly to the sea surface or at the seabed, depending on the type of failure that occurs. Each stage of the development may have other spill scenarios (refer to **Table 7-69** and **Table 7-70**) that result in smaller spills than the worst-case credible spills presented in this section. Santos has used a combination of Loss of well control spill scenarios defined as the worst case credible for the Dorado Activity, whereby all other spill scenarios fit within. The combination of these spill scenarios determine the EMBA described in **Section 3.1.1** and associated environmental impacts and risks described in the sections below. The worst-case spill scenarios include:

+ A loss of well control from the Dorado Development (refer to **Table 7-69)**; and
+ A loss of well control from Future Tieback Reservoirs (**Table 7-70)**.

Given that the potential consequences of the other spills are much smaller, they have not been modelled or further assessed for impact in this section.

Table 7-68: Activities and facilities and their relation to possible hydrocarbon or chemical spills

Drilling Operations Dorado Phase 1 involves the drilling, completion, and production from wells. Drilling will take place both before the FPSO arrives on location and then during operations (intervention drilling, infill well drilling, and drilling of potential future tieback wells). The Dorado field drilling campaign has an expected duration of two years, with future wells requiring approximately 40 days to drill and complete each well. **The type of well (production v reinjection) is not relevant to the magnitude of loss of hydrocarbon events and the associated impact assessment. The throughput capacity of the FPSO is the limiting factor for the volume of hydrocarbon that could be released at any one time in a loss of containment event rather than the number of wells or the number of each well-type.**	
Loss of Well Control	Santos has engineering standards to manage loss of well control events to very low levels of impact; however, there is a possibility that a loss of well control may occur during the drilling and operation stages of Dorado Phase 1. Even though the likelihood is very small, a complete loss of well control (a well blowout) has the potential to release significant volumes of condensate into the environment (assuming no mitigation or spill response is implemented), which may result in significant environmental damage. During the Conceptual D&C design phase, consideration was given to the largest credible Worst-Case Discharge (WCD) scenario, and dynamic well kill capabilities across various proposed casing schemes. An alternate case of a 12-1/4" hole section was also modelled and whilst provided a larger WCD volume, confirmed that the well was still able to be killed by a single relief well. Thus, on the basis of a smaller WCD the 8-1/2" hole has been selected for Dorado. Controls and commitments relating to this risk will be discussed in the Well Operations Management Plan (WOMP), and [if relevant] the Environment Plan (EP). Santos has extensive experience with safe and environmentally responsible drilling and reservoir engineering and has a detailed understanding of the Dorado field through seismic surveys and drilling activities. The offshore oil and gas industry has improved environmental performance since the Macondo and Montara events, and Australian regulations require that all environmental risks be managed to a level that is ALARP and acceptable. This is done through NOPSEMA's EP framework (refer **Section 2.2.1.1.2**). All petroleum activities considered in this OPP will be undertaken under an accepted EP that has been submitted and assessed prior to the drilling and completion campaigns. All wells will be drilled and operated in accordance with an accepted well operations management plan, in accordance with the OPGGS Act. The likelihood and potential release volumes of a loss of well event will change during different stages of Dorado Development. Industry statistics from wells using similar controls that will be applied during development drilling of and production from the wells within the scope of this OPP indicate the likelihood of a well blowout from development drilling and completions is much smaller than during production (Det Norske Veritas 2011). This is consistent with well blowout data observations in Australia and similar jurisdictions around the world. Most loss of well control incidents do not result in a worst-case well blowout scenario, and typically release relatively small volumes of hydrocarbons. Whilst the duration of the drilling campaign is 2 years, only a small

	percentage of this time is spent drilling into the reservoir. Once the drilling of the reservoir is completed, tested barriers are in place which significantly reduce the likelihood of a loss of well control. A loss of well containment could result in hydrocarbons released either at the sea surface or at the seabed (summarised in **Table 7-69**). The causes of a surface loss of well containment during drilling are the same as a subsea loss of well containment; however, the reservoir fluids travel up the riser and are released on the MODU instead of at the seabed. This results in the oil spilling to the sea surface instead of within the water column. A surface loss of well containment during production could occur as a result of well interventions (e.g. workover activities) or failure of the topside components of the well (e.g. leak from a Christmas tree valve in event subsea wells are drilled for future tiebacks). As with subsea loss of well containment, surface loss of well containment during production typically releases much smaller volumes of hydrocarbons than releases during drilling activities. Subsea loss of well containment during production is very uncommon, with industry statistics indicating the volumes released by such events are typically much smaller than the volumes released during drilling (ExproSoft 2017). Subsea loss of well containment during production may be caused by external impacts, such as dropped objects. Given that the Dorado WHP wells will be protected by the platform jacket, external impacts to these wells resulting in a loss of well containment is highly unlikely to occur. If the future tieback wells are subsea, they may be more vulnerable to external impacts; however, such an event is also very unlikely to occur. Given that the OPP includes for developing the Dorado reservoir, and also potential future tiebacks (following successful appraisal drilling), Santos has conservatively undertaken the potential environmental impact assessment based on the worst-case credible spill scenario that could occur from a complete well blowout (loss of well control) during the drilling and completion of the production wells in the Dorado reservoir and future tiebacks within the Project Area. The future tieback loss of well control scenario has been described and assessed in the publicly available Bedout Multi-Well Drilling Environment Plan (accepted by NOPSEMA), and detailed in **Section 7.3.1.1.4**. This loss of well control scenario for the Dorado reservoir consists of a 98 day uncontrolled release of 2,031,794m^3 of Dorado oil (20,733m^3 per day). The loss of well control scenario for future tiebacks, based on the current known information for these tiebacks (described in the Bedout Multi-Well Drilling Environment Plan) consists of a 77 day uncontrolled release of 2, 102, 831m^3 of Dorado oil. The duration is based on the credible worst-case time required to control the well (either by capping or drilling of a relief well) and the volume is based on the maximum credible rate of release derived from the proposed well design and reservoir characteristics. While a loss of well control scenario is very unlikely, using the worst-case credible spill from both the Dorado reservoir (appraised) and future tiebacks (not yet appraised) as the basis for the risk assessment provides an environmentally conservative assessment of the potential impacts and risks posed by the Dorado Development. Santos has undertaken numerical modelling to inform the risk assessment (**Section 7.3.1.3**).
Vessel Collision	Drilling activities will require support vessels. It is considered credible that a release of MDO to the marine environment could occur as the result of a collision between the support vessels, between a support vessel and the MODU, or between a passing third-party vessel and the MODU or a support vessel. The

	worst-case environmental incident resulting from a vessel collision is the rupturing of a vessel fuel tank resulting in the release of marine diesel oil (MDO) or marine gas oil (MGO) to the environment. Vessel collision could occur due to factors such as human error, poor navigation, vessel equipment failure or poor weather. A maximum credible spill volume has been determined based on technical guidance provided by AMSA (2015). This guidance states that, for a vessel other than an oil tanker, the maximum credible spill from a collision can be determined from the volume of the largest single fuel tank. In reviewing the general arrangements and fuel tank capacities of typical vessels likely to be utilised for the drilling activities, the largest single fuel tank capacity identified was no greater than approximately 650 m^3 of MDO for support vessels. This scenario would result in a spill of diesel at the sea surface.
Refuelling Spill	During drilling operations there will be a requirement to refuel the MODU. There is potential for a loss of MDO during these activities as a result of fuel hose failure or rupture, coupling failure or tank overfilling where fuel bunkering would need to be stopped manually. Fuel released prior to the cessation of pumping, as well as fuel remaining in the transfer line, may escape to the environment. The AMSA (2015) Technical Guidelines for Preparing Contingency Plans for Marine and Coastal Facilities provides guidance for calculating a maximum credible spill volume for a refuelling spill. The guidance provided by AMSA (2015) for a refuelling spill under continuous supervision is considered appropriate given refuelling will be constantly supervised. The maximum credible spill volume during refuelling is calculated as: transfer rate (150 m^3/hr) x 15 minutes of flow giving a volume of 37.5 m^3. The detection time of 15 minutes is seen as conservative but applicable following failure of multiple barriers followed by manual detection and isolation of the fuel supply.
Installation and Commissioning Activities Dorado Phase 1 will require support from a range of vessels. The types of vessels, and the durations of the activities varies with each stage. Installation and decommissioning will be peak periods of vessel activity, and vessels will include heavy-lift and construction vessels. Installation and commissioning activities have an expected duration of up to six months.	
Vessel Collision	The nature and scale of the environmental risks and impacts from a loss of fuel from a vessel varies significantly based on the vessel type and activities. Typically, construction and installation vessels store relatively large quantities of fuel. Often these types of vessels are fuelled using relatively heavy fuel oils, such as heavy fuel oil (HFO). Smaller vessels, such as support vessels, typically store smaller quantities of fuel and are fuelled using lighter fuel oils, such as MDO, which are less persistent in the environment than heavier fuel oils. Santos determined that the worst-case credible release from a loss of containment of fuel would be the loss of HFO. This worst-case credible spill scenario is considered to provide an environmentally conservative assessment of the potential impacts and risks from a loss of containment of fuel from a vessel. Dorado Phase 1 will require the use of a range of project vessels ranging from relatively small (e.g. platform support vessels) to very large (e.g. heavy-lift vessels). A high-energy collision with a project vessel was identified as potentially resulting in the loss of containment of vessel fuel. Such collisions are very uncommon and typically of insufficient force to cause damage to a fuel tank. Most project vessels are expected to use MDO as the fuel source for the main engines. This type of fuel spreads on the sea surface when spilled and readily evaporates and disperses. Some very large vessels (e.g. heavy-lift vessels) may use HFO or intermediate fuel oil (IFO). These fuels are much more viscous and if spilled persist in the environment for much longer than MDO.

	The worst-case credible spill from a vessel collision was determined to be an instantaneous release of the entire contents (1,800 m^3) of HFO at the surface (summarised in **Table 7-69**). This is based on the complete loss of the largest single HFO tank that could credibly be onboard a vessel involved in Dorado Phase 1. This volume is very conservative; the largest single HFO or IFO tanks onboard vessels undertaking Dorado Phase 1 are expected to be considerably smaller. Santos has undertaken numerical modelling to inform the risk assessment (**Section 7.3.1.5**).
Refuelling Spill	While it is unlikely, there may be a requirement for refuelling of support vessels within the operational area during Installation and Commissioning activities, refer refuelling spill under Drilling Operations (above) for further detail. There will be no HFO refuelling activities.
Operations and Maintenance The commissioning and operations stages will involve relatively low vessel activity when compared with the installation and commissioning stage of Dorado Phase 1. The Operations stage for Dorado Development is 20 years, with short maintenance campaigns throughout this period.	
Drilling	Given that drilling of infill wells, well intervention activities or drilling of future tieback wells (dependant on exploration results) will be undertaken during the Operations and Maintenance stage of the project, the worst-case credible spill scenario associated with this stage will be a complete well blowout during development drilling either infill drilling the Dorado reservoir, or development drilling of a future tieback (as per the development drilling stage). Potential loss of well control events associated with drilling future tiebacks are described the publicly available Bedout Multi-Well Drilling Environment Plan and detailed in **Section 7.3.1.1.4**. The duration for the infill wells and tieback drilling campaigns will depend on the number of wells drilled. Each development well is estimated to take approximately 40 days to complete. Refer Drilling Operations above for further information.
Cargo Offtake	Spills may occur during the transfer of oil from the FPSO to an offtake tanker (summarised in **Table 7-69**). This scenario assumes the loss of the entire contents of the transfer hose. Cargo transfers will always take place within controlled circumstances (e.g. within weather limits and under the supervision of trained crew). Spills during transfer operations may occur due to partial or total failure of a bulk transfer hose or fittings during transfer.
Vessel Collision	The FPSO will store large quantities of Dorado oil, up to 650,000 barrels. The Dorado FPSO will process and store the well liquids before transfer to an offtake tanker. This will result in large volumes of processed oil being stored in the cargo tanks of the FPSO. A loss of containment from an FPSO cargo tank may result in processed oil being released to the marine environment. The worst-case scenario of a loss of oil from a cargo tank is the complete loss of a single tank (summarised in **Table 7-69**). The complete loss of a full cargo tank is incredibly unlikely and would only occur as a result of a catastrophic failure of the FPSO's structure.
Loss of pipeline integrity	A loss of containment of the flowline between the FPSO and the WHP, or from future tiebacks to the WHP or FPSO, may result in the release of hydrocarbons to the marine environment (summarised in **Table 7-69**). Flowline loss events can range from a 'pinhole' leaks (e.g. due to degradation) through to complete rupture of the flowline (e.g. due to significant mechanical impacts such as a semi-submersible MODU anchor being dragged over the flowline). The loss of a significant volume of hydrocarbons from a flowline would

	trigger alerts on the FPSO and result in the control valves on the WHP being closed. These valves are always closed when the FPSO is not on location.
Refuelling Spill	While it is unlikely, there may be a requirement for refuelling of support vessels within the operational area during Operations, refer refuelling spill under Drilling Operations (above) for further detail.

7.3.1.1.2 Chemicals

A range of process and non-process chemicals will routinely be transferred to, and stored on, vessels and facilities undertaking Dorado Phase 1. Chemicals may also be transferred via the umbilical from the FPSO to the WHP during operations for use in wells and the subsea system. The volumes of chemicals may vary throughout Dorado Phase 1, but will be substantially smaller than the hydrocarbon inventories on the FPSO. The quantities of chemicals stored and used during Dorado Phase 1 will generally be limited to those required to meet operational needs.

All chemicals will be subject to Santos' chemical selection process, which requires chemicals to pose the lowest environmental risk while meeting technical requirements. Chemical storage areas will typically be set up in cabinets or bunded storage areas to contain any releases to deck from transportable containers (e.g. intermediate bulk containers, barrels, drums, pails etc.).

The quantities of chemicals stored and used during Dorado Phase 1 will generally be limited to those required to meet operational needs. Indicative chemical inventories onboard the FPSO are provided below:

+ demulsifier – 25 m^3
+ de-oiler/water polisher – 3 m^3
+ biocide – 5 m^3
+ scale inhibitor – 5 m^3
+ wax inhibitor – 10 m^3 (space only)
+ antifoam – 15 m^3
+ corrosion inhibitor – 36 m^3
+ methanol – 35 m^3
+ asphaltene inhibitor – 25 m^3

Relatively small accidental releases may occur during the transfer, storage and use of chemicals (less than 5m^3).

Non-process chemicals, such as cleaning chemicals, are typically stored on the FPSO, vessels and MODUs in much smaller volumes (usually less than 200 L). Spills of these chemicals onboard the FPSO, vessels or the MODU will typically be captured by the drainage systems and not be released to the environment. If they were to be accidentally released to the environment, the credible spill volumes are less than 200 L.

The impacts from accidental chemical spills are expected to be similar to those of from a spill of a similar volume of hydrocarbons. These impacts may include a reduction in water quality and acute toxic effects on marine biota. The credible volumes of chemicals that may accidentally be spilled are much smaller than the worst-case credible hydrocarbon spill described below. As such, the assessment of environmental impacts and risks for the worst-case hydrocarbon spills is considered to encompass any potential impacts and risks from an accidental chemical spill. Hence, the impacts and risks from an accidental chemical spill have not been considered separately from those of a hydrocarbon spill.

7.3.1.1.3 Summary of Worst-Case Credible Hydrocarbon Spill Scenarios Dorado Development

A total of six worst-case hydrocarbon spill scenarios that could occur were identified and modelled based on the activities that will be undertaken during Dorado Phase 1. These worst-case spills are summarised in **Table 7-69**. The methods used to determine these worst-case spills were consistent with guidance provided by AMSA (2015).

These hydrocarbon spill scenarios do not encompass all possible spills; rather, these worst-case spills are based on the maximum volume of hydrocarbons that could credibly be spilled in a given event during Dorado Phase 1 activities including drilling, construction and installation, operations and decommissioning. These scenarios make no allowance for any spill prevention, control, containment or clean-up measures (i.e. the scenarios are entirely unmitigated) and are considered conservative and worst case. Industry experience shows that worst-case spills are extremely rare, and only occur as the result of a catastrophic failure or event. Incidental spills, such as refuelling spills, small spills on vessel decks and so on have not been modelled, as the volumes of such spills are typically very small and of negligible environmental consequence. Industry experience shows that hydrocarbon spills are uncommon events and typically involve much smaller volumes than those shown in **Table 7-69.**

Based on the spill modelling results (**Attachment 8**), this section presents the impact assessment based on 4 of the modelled scenarios, being both a subsea and surface loss of well control event (Caley crude), loss of containment of HFO from support vessels mobilised for the installation campaign, and a loss of containment of the FPSO cargo tank (Caley crude). These scenarios represent the greatest potential environment impacts associated with unplanned hydrocarbon and chemical spills.

Both the worst-case scenario of subsea loss of well containment and a worst-case scenario of surface loss of well containment are presented. While the spill duration, hydrocarbon type and release volume for both scenarios were similar, the fate of the spilled hydrocarbon differed considerably between these scenarios. The subsea scenario has a much greater potential for spilled oil to become entrained within the water column, which can slow the weathering of the oil compared to a surface release. A subsea release may also have a greater amount of oil in the dissolved and entrained phases when compared to a surface release.

The spill location for the hydrocarbon spill scenarios assessed in this section are based on the foundation Dorado facilities (the WHP and FPSO) and the potential future tiebacks. The release from the tieback scenarios have been assessed based on the NOPSEMA accepted Bedout Multi-Well Drilling Environment Plan. This plan assesses the drilling of exploration and appraisal wells within the Bedout Basin, which the Project Area overlaps. The location selected for the tieback scenario LOWC modelling was the Apus-1 exploration well location as it is the closest of the two proposed exploration wells to the receptors of Bedout Island and the Australian mainland. Of the wells assessed by Santos for this activity, the worst-case discharge rates during a LOWC incident are predicted to occur at the Pavo-1 well. Despite this, Santos has defined a LOWC event at the Apus-1 well to represent the worst-case scenario in terms of potential environmental impacts[42]. Given that the future tiebacks if progressed are up to approximately 50km from the WHP, and that a key determining factor in the EMBA size definition for hydrocarbon spills is the reservoir characteristics,

[42] The higher Pavo-1 flow rate was applied to the Apus-1 release location.

rather than the location of the spill, the EMBA for a loss of well control event at any future tiebacks would not be significantly different to that presented in the following sections.

Santos

Table 7-69: Summary of worst-case hydrocarbon spill scenarios for Dorado Development

Phase of Activity or Duration	Description	Modelled	Modelled Scenario Number (Attachment 8)	Location	Hydrocarbon Type	Maximum Flow Rate (m^3/day)	Total Volume Released (m^3)	Release Duration	Release Depth (m)
Drilling or well intervention	Subsea loss of well control	Yes	Scenario 1	WHP	Caley crude	Approx. 20,733*	2,031,794	98 days**	91 (seabed)
	Surface loss of well control	Yes	Scenario 2	WHP	Caley Crude	Approx. 20,733*	2,031,794	98 days **	Surface
	Surface spill from support vessel collision	Not modelled based on the spill volume and nature of hydrocarbon		WHP	MDO/ MGO	N/A (instantaneous)	650	Instantaneous	Surface
	Surface spill from refuelling	Not modelled based on the spill volume and nature of hydrocarbon		WHP	MDO/ MGO	150 m^3/hr	37.5	15 minutes	Surface
Construction/ Installation	Surface spill from construction vessel collision	Yes	Scenario 5	WHP/ FPSO/ flowlines	HFO	N/A (instantaneous)	1,800	Instantaneous	Surface
	Surface spill from support vessel collision	Not modelled based on the spill volume and nature of hydrocarbon		WHP/ FPSO/ flowlines	MDO/ MGO	Instantaneous	650	Instantaneous	Surface
	Surface spill from refuelling	Not modelled based on the spill volume and nature of hydrocarbon		WHP/ FPSO/ flowlines	MDO/ MGO	150 m^3 /hr	37.5	15 minutes	Surface

Phase of Activity or Duration	Description	Modelled	Modelled Scenario Number (Attachment 8)	Location	Hydrocarbon Type	Maximum Flow Rate (m^3/day)	Total Volume Released (m^3)	Release Duration	Release Depth (m)
Operations/ Maintenance	Subsea loss of flowline control	Yes	Scenario 3	Flowlines between WHP and FPSO	Caley crude	N/A (instantaneous)	1,080	1 hour	91 (seabed)

* Modelled as a decreasing discharge rate over time

**The duration of this scenario (98 days) was based on the time estimated to drill a relief well, which is considered to be the worst-case scenario for bringing a subsea loss of well containment under control. This duration is based on a range of factors, such as MODU availability, formation depth and drilling rates.

7.3.1.1.4 Summary of Worst-Case Credible Hydrocarbon Spill Scenarios Future Tieback Reservoirs

Should exploration and appraisal activities of prospects within the Project Area be successful and development of the reservoirs commercially viable, the drilling of the future tieback wells will likely be undertaken during the Operations phase of the project. To be conservative Santos has included the assessment of the worst-case credible spill scenarios associated with this phase based on currently described loss of well control scenarios presented in the Bedout Multi-Well Drilling Environment Plan which assesses for the proposed appraisal drilling activities within the Dorado Project Area **(Table 7-70**) – Apus-1 well location being the most representative.

The impact assessment presented in the OPP is based on the spill modelling results presented in the Bedout Multi-Well Drilling Environment Plan and summarised in **Section 7.3.1.5** for 2 of the modelled scenarios (subsea and surface loss of well control event of Caley crude at the Apus-1 location which is within the Dorado Project Area and therefore the most relevant). These scenarios represent the largest potential environment impacts associated with a potential hydrocarbon release in the event that future tiebacks are drilled and connected back to the Dorado WHP and FPSO.

Both the worst-case credible scenario of subsea loss of well containment and a worst-case scenario of surface loss of well containment are presented. While the spill duration, hydrocarbon type and release volume for both scenarios were similar, the fate of the spilled hydrocarbon differed between these scenarios. The subsea scenario has a much greater potential for spilled oil to become entrained within the water column, which can slow the weathering of the oil compared to a surface release. A subsea release may also have a greater amount of oil in the dissolved and entrained phases when compared to a surface release, while the surface release resulted in more accumulated hydrocarbons on surrounding shorelines.

Santos

Table 7-70: Summary of worst-case hydrocarbon spill scenarios for future tieback reservoirs

Phase of Activity/ Duration	Description	Modelled	Location	Hydrocarbon Type	Total Volume Released (m^3)	Release Duration	Release Depth (m)
Drilling future tieback reservoirs	Subsea loss of well control	Yes	50 km from WHP	Caley crude	1, 745, 986	77 days	99 (seabed)
	Surface loss of well control	Yes	50 km from WHP	Caley Crude	1, 746, 355	77 days	Surface

7.3.1.2 Hydrocarbon Characteristics

This section describes the characteristics of the Caley Crude oil and Heavy Fuel Oil which are the 2 hydrocarbons in the modelled worst case spill scenarios.

7.3.1.2.1 Caley Crude Oil

Of the crudes produced from the Dorado reservoir (Archer Formation), the Caley Crude is expected to be the most persistent oil produced by Dorado Phase 1 and will constitute the majority of the oil produced from the Dorado reservoir. On this basis, the Caley crude has been adopted as the proxy for Dorado oil and properties of Caley Crude have been used for the modelling of hydrocarbon spill scenarios associated with Dorado oil. The Caley crude is also considered a representative analogue for future tiebacks based on the reservoir properties, geochemistry and pressures of the surrounding fields inferred from the seismic data interpretation and the Bedout basin geology. The prospects identified for exploration target the Archer Formation, which is the formation within which the Dorado Reservoir is located.

The crude is characterised by a low viscosity and is considered a Group II light persistent oil, as per the grouping classification presented by AMSA (2015). If spilt on the sea surface, the crude would rapidly spread and thin out resulting in a large surface area of hydrocarbon available for evaporation. The volatile component of Group II oils tend to dissipate through evaporation within a few hours (International Tanker Owners Pollution Federation 2011b). Based upon the Caley crude assay (boiling point range in **Table 7-71**), up to 48% of the hydrocarbon would evaporate over the first few hours or day, with up to 67% evaporated after a few days when on the sea surface. Fifteen percent of the crude is considered persistent, which would eventually breakdown due to the decay. When on the surface Caley crude may also become entrained into the water column in the presence of moderate winds (above 10 knots) and in turn breaking waves, however, it would resurface under calm conditions (less than 10 knots). An indicative weathering plot of a surface release of Caley crude oil is provided as **Figure 7-34**.

Table 7-71: Characteristics of Caley crude

Oil Name			Caley Crude
Initial density (g/cm^3) (15°C)			0.773
Viscosity (cP) (20°C)			1.45
Wax content (whole oil)			9%
Wax Content (residual oil fraction)			29%
Pour-point for the residual oil fraction			more than 45 °C
Persistence	Component	Boiling Point (°C)	% of Whole Oil
Non-persistent	Volatiles (%)	less than 180 (C4 to C10)	48.0
	Semi-volatiles (%)	180 to 265 (C11 to C15)	19.0
	Low Volatility (%)	265 to 380 (C16 to C20)	18.0
Persistent	Residual (%)	more than 380 (more than C20)	15.0

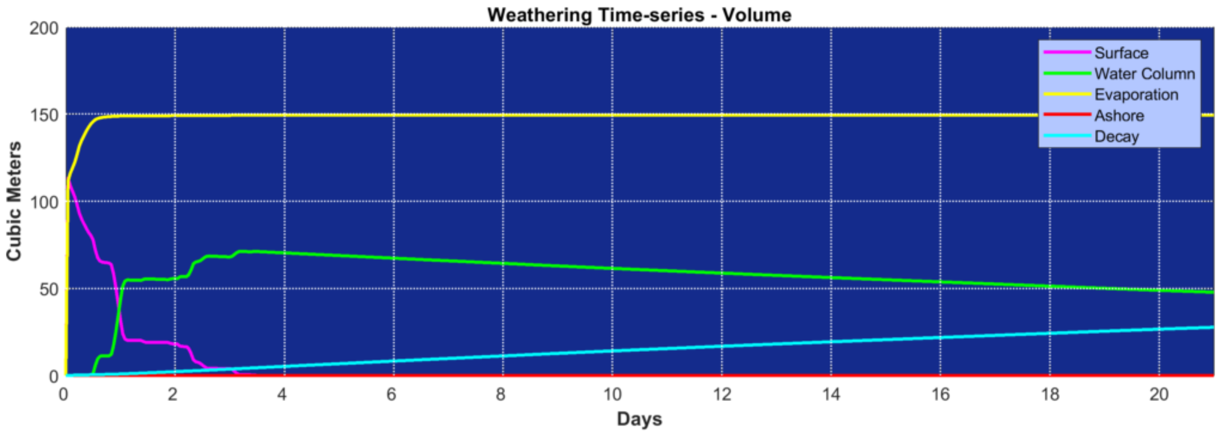

Figure 7-34: Predicted weathering and fates graph for the single spill trajectory from an indicative surface spill scenario of Caley crude oil (loss of containment during cargo offtake)

7.3.1.2.2 Heavy Fuel Oil

HFO is comprised of a high percentage of persistent components (82.8%), which will not evaporate. When spilt at sea the HFO will initially remain as a liquid as sea surface temperatures above its pour point during all seasons. The volatile components (1%) are immediately lost via evaporation and the physical properties will change quickly as the lighter more fluid components evaporate and disperse by the action of wind and waves (**Table 7-72**). The residual component (approximately 83%) is expected to become semi-solid to solid at ambient temperatures and is susceptible to decay overtime (**Figure 7-35**).

The toxic potential of weathered HFO is low in comparison to other crudes, MDO and condensates as weathered oil is insoluble, and the bioavailable portion of the oil is soon lost through evaporation. Solid residues can persist in the marine environment for extended periods and its longevity is dependent on its unique physio-chemical properties.

Table 7-72: Characteristics of heavy fuel oil (Attachment 8)

Oil Name			HFO
Initial density (g/cm³) (15°C) **API Gravity**			0.9749 12.3
Viscosity (cP) (25°C)			3,180
Persistence	**Component**	**Boiling Point (°C)**	**% of Whole Oil**
NON-PERSISTENT	**Volatiles (%)**	**less than 180 (C4 to C10)**	1.0
	Semi-volatiles (%)	**180 to 265 (C11 to C15)**	4.9
	Low Volatility (%)	**265 to 380 (C16 to C20)**	11.3
PERSISTENT	**Residual (%)**	**more than 380 (more than C20)**	82.8

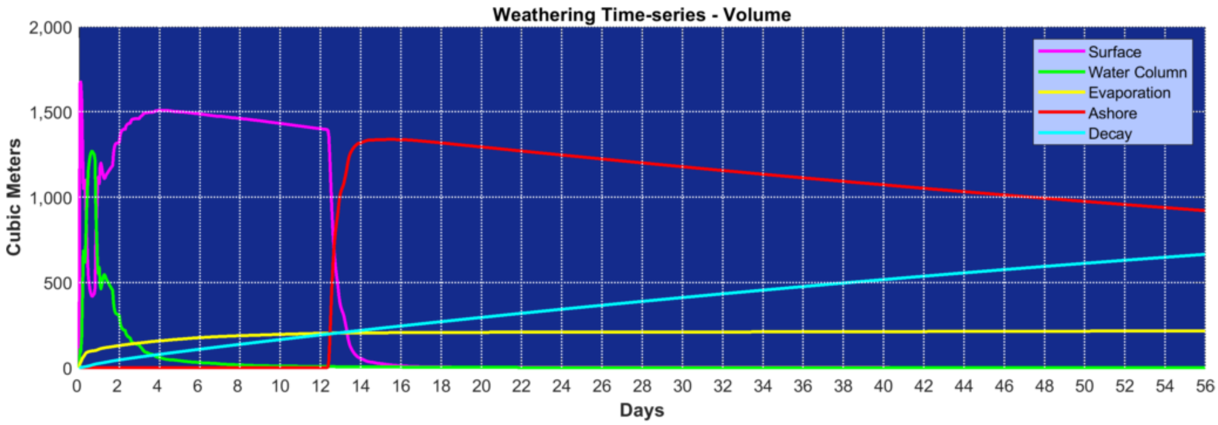

Figure 7-35: Predicted weathering and fates graph for the single spill trajectory from an indicative surface spill scenario of heavy fuel oil (loss of containment due to vessel collision).

7.3.1.3 Overview of Hydrocarbon Spill Modelling

Stochastic and deterministic modelling was undertaken to predict the potential environmental impacts for the worst-case credible scenarios for the Dorado development and future reservoir tieback drilling based on proposed exploration and appraisal drilling described in Bedout Multi-Well Drilling Environment Plan. The difference between these types of modelling approaches, and the results they yield, is important to understand when interpreting tabulated and visually displayed modelling results and applying them to an environmental risk assessment. NOPSEMA has also provided information on the difference between stochastic and deterministic modelling, which may be useful for readers seeking further information (NOPSEMA 2018). Importantly, no single oil spill scenario will result in an area contacted as large as the EMBA. For the Dorado Development and future tieback drilling, the EMBA is the combined boundary of multiple possible spill simulations, done separately for each of the spill scenarios (refer **Section 3.1.1**).

The modelling studies for the Dorado development (**Attachment 8)**, and the future tieback reservoirs (Bedout Multi-Well Drilling Environment Plan) and summarised in **Section 7.3.1.5)** contain details on the modelling methods including hydrocarbon characteristics, metocean modelling, oil spill weathering and subsea plume modelling, summarised in **Table 7-73.**

Table 7-73: Modelling concepts for the worst-case credible scenarios

Modelling Concepts and Parameters	Dorado Development	Future Tie-back Reservoirs
Spill Model	Used SIMAP's spill model which provides detailed predictions of the three-dimensional trajectory, fate, biological effects, and other impacts of spilled oil and fuels.	Used SINTEF's OSCAR (Oil Spill Contingency and Response) model which provides a 3-dimensional dynamic, simulation tool for planning for and response to oil spills.
Spill Model Simulation Structure	The spill modelling simulation structure is designed for development activities associated with Dorado, using a total of 300 deterministic runs to generate stochastic modelling results. The start date of each deterministic modelling run was varied by randomly selecting the start time of each run (stratified within seasons) over a 10-year period hindcast metocean model. This incorporates variability in meteorological and oceanographic conditions into the results set. The results provide a robust, conservative method for identifying environmental values and sensitivities that may be at risk from a spill event. For the Dorado Development, the potential risk of exposure to the surrounding waters and contact to shorelines was assessed for three distinct seasons; (i) summer (October to March), (ii) the transitional periods (April and September) and (iii) winter (May to August). Each season is represented by 100 possible spill simulations. This approach assists with identifying the environmental values and sensitivities that would be at potential risk of exposure on a	The spill modelling simulation structure for the future tie-back reservoirs is based on the exploration/ appraisal activities for the Bedout North well (overlaps with the Project Area) as described in the Bedout Multi-Well Drilling Environment Plan. The OSCAR model was configured in stochastic mode to simulate a range of environmental conditions. The start dates for the stochastic simulations were staggered approximately fortnightly across five years of hydrodynamic and wind data. A total of 150 individual 'realisations' made up the full stochastic simulation set for each of the spill scenarios. For each set of 150 stochastic realisations, OSCAR spatially tracked the surface oil, total submerged oil in the water column, dissolved oil and oil on shorelines. The 'total submerged oil' is comprised of dissolved oil and entrained oil (or droplets), and therefore provides a conservative (over) representation of the NOPSEMA (2019) thresholds for entrained oil described in the hydrocarbon impact thresholds section below.

<table>
<tr><th>Modelling Concepts and Parameters</th><th>Dorado Development</th><th>Future Tie-back Reservoirs</th></tr>
<tr><td></td><td>seasonal basis. The oil is tracked as surface oil, accumulated oil on shorelines, dissolved oil and entrained oil.</td><td></td></tr>
<tr><td>Stochastic Modelling Approach</td><td colspan="2">Stochastic Modelling is used to predict the fate of a discharge in the environment when the environmental conditions at the time of discharge are unknown, which is the case for predicting impacts from potential oil spill scenarios. One single modelled spill would not be a reliable method to identify the range of possible environmental values and sensitivities that may be affected. Under different metocean and environmental conditions, each single model run differs in spill direction, extent, and duration (i.e. area of exposure). Stochastic oil spill modelling is created by overlaying a great number of individual computer-simulated hypothetical releases, creating the EMBA.</td></tr>
<tr><td rowspan="2">Deterministic Modelling Approach</td><td colspan="2">Deterministic modelling is used to predict the fate of a discrete hydrocarbon spill event, either in an actual event or for the purposes of informing a risk assessment of the worse case spill from a single event. The outputs of a deterministic model are completely dependent on the inputs. If the inputs to a deterministic model are unchanged, the output will be the same every time the model is run (i.e. there is no variability in the results given the same starting conditions).

If the input parameters are consistent with environmental conditions, and the model is a realistic simulation of environmental processes, outputs from the deterministic model will provide a realistic indication of the fate of the discharge. This makes deterministic models useful where there is a high degree of confidence in the initial conditions, but less useful where the initial conditions are variable, such as dynamic meteorological and oceanographic conditions in the Project Area.</td></tr>
<tr><td>The criteria used to identify the worst-case deterministic model runs for selected Dorado Development worst-case oil spill scenarios include:
(i) largest volume of oil accumulated ashore;
(ii) longest length of shoreline upon which oil was predicted to accumulate; and
(iii) largest area of floating oil above 10 g/m^2 (only considered where no shoreline accumulation was predicted to occur).</td><td>Deterministic modelling was also carried out on the simulation for each of the LOWC scenarios that resulted in the highest shoreline loading, as well as the one LOWC simulation that resulted in the greatest mass of surface oil exceeding a containment and recovery response threshold of 50 g/m^2 to further characterise impacts and to inform response planning.</td></tr>
</table>

7.3.1.3.1 Hydrocarbon Exposure Values

Spilled hydrocarbons can exist as a range of fates, or phases, in the marine environment:

+ floating;
+ entrained;
+ dissolved; and
+ accumulated (i.e. stranded onshore).

Each of these fates, or phases, can interact with the environment in different ways due to different pathways to receptors and impact mechanisms.

A series of impact thresholds for floating, entrained, dissolved and accumulated hydrocarbons were determined. These thresholds were applied to the hydrocarbon spill modelling studies and used to inform the assessment of potential impacts and risks. Thresholds applied to each fate, or phase, of hydrocarbons are described in **Table 7-74**. These thresholds are aligned with guidance from NOPSEMA (NOPSEMA 2019b).

The EMBA is based on stochastic modelling using various impact thresholds (**Table 7-74**) for each hydrocarbon fate providing the basis for determining the EMBA for the environmental risk assessment of hydrocarbon spills. The low thresholds are typically not expected to result in impacts to environmental receptors, but are used for evaluating socio-economic impacts and will also be used in Santos' oil spill response preparations (e.g. operational and scientific monitoring) and response arrangements which will be detailed in the activity specific EPs prepared subsequent to this OPP.

Table 7-74: Oil spill modelling exposure thresholds

Exposure Level	Threshold	Justification
Floating Hydrocarbon (Surface)		
Low	1 g/m^2	A surface oil concentration of 1 g/m^2 (equivalent to a thickness of 0.001 mm or 1 ml of oil per m^2) is visible as a rainbow sheen on the sea surface. Although this is lower than the exposure value for ecological impacts, it may be relevant implementing environmental monitoring of oil spills and hence was used in the modelling studies. This exposure value has been used to define the spatial extent of the environment that might be contacted (EMBA) from floating oil.
Moderate	10 g/m^2	There is a paucity of data on surface oil concentrations with respect to impacts to marine organisms. Hydrocarbon concentrations for registering biological impacts resulting from contact of surface slicks have been estimated by different researchers at about 10 to 25 g/m^2 (French et al. 1999; Koops et al. 2004; National Oceanic and Atmospheric Administration 1996). The impact of surface oil on birds is better understood than on other receptors. This floating hydrocarbon threshold was used to identify environmental values and sensitivities that may be at risk of impacts from floating oil.
High	50 g/m^2	At greater thicknesses the potential for impact of surface oil to wildlife increases.
Shoreline Accumulation		

Exposure Level	Threshold	Justification
Low	10 g/m^2	An accumulated concentration of oil above 10 g/m^2 on shorelines is considered to represent a level of socio-economic effect: e.g. reduction in visual amenity of shorelines. This value has been used in previous studies to represent a low contact value for interpreting shoreline accumulation modelling results (French-McCay et al. 2005).
Moderate	100 g/m^2	A shoreline accumulated concentration of 100 g/m^2 is derived from levels likely to cause adverse impacts to marine or coastal fauna and habitats. Environmental risk assessment studies (French-McCay 2009) report that an oil thickness of 0.1 mm (100 g/m^2) on shorelines is assumed as the lethal exposure value for invertebrates on hard substrates (rocky, artificial or man-made) and sediments (mud, silt, sand or gravel) in intertidal habitats.
High	1000 g/m^2	At greater thicknesses the potential for impact of accumulated oil to shoreline receptors increases. Similar thresholds have been found in studies assessing oil impacts on mangroves (Grant et al. 1993; Suprayogi and Murray 1999).
Dissolved Aromatic Hydrocarbon		
Low	10 ppb	Dissolved hydrocarbons include the monoaromatic hydrocarbons (compounds with a single benzene ring such as BTEX) and PAHs (compounds with multiple benzene rings such as naphthalenes and phenanthrenes). These compounds have a greater bioavailability that other components of oil and are the main contributors to oil toxicity. The toxicity of dissolved hydrocarbons is a function of the concentration and the duration of exposure by sensitive receptors with greater concentration and exposure time causing more sever impacts. Although this is lower than the exposure value at which ecological impacts are expected to occur, it may be relevant implementing environmental monitoring of oil spills and hence was used in the modelling studies.
Moderate	50 ppb	Approximates potential toxic effects, particularly sublethal effects to sensitive species. For most marine organisms, a concentration of between 50 and 400 ppb is considered to be more appropriate for risk evaluation.
High	400 ppb	Approximates toxic effects including lethal effects to sensitive species.
Entrained Hydrocarbon / total submerged hydrocarbon (for future tieback scenario's)[43]		
Low	10 ppb	The 10 ppb exposure value represents the very lowest concentration and corresponds generally with the lowest trigger levels for chronic exposure for entrained hydrocarbons in water quality guidelines (Commonwealth of Australia et al. 2018). Although this is lower than the exposure value at which most ecological impacts are expected to

[43] The GHD modelling presents 'total submerged oil', which is comprised of dissolved oil and entrained oil (or droplets), and therefore provides a conservative (over) representation of the NOPSEMA (2019) thresholds for entrained oil.

Exposure Level	Threshold	Justification
		occur, it may be relevant implementing environmental monitoring of oil spills and hence was used in the modelling studies.
Moderate	100 ppb	The 100 ppb exposure value is considered to be representative of sub-lethal impacts to most species and lethal impacts to sensitive species based on toxicity testing. This is considered conservative as toxicity to marine organisms from oil is likely to be driven by the more bioavailable dissolved aromatic fraction, which is typically not differentiated from entrained hydrocarbon in toxicity tests using dissolved hydrocarbons. Given entrained hydrocarbon is expected to have lower toxicity than dissolved aromatics, especially over time periods where these soluble fractions have dissolved from entrained hydrocarbon, the moderate exposure value is considered appropriate for environmental risk assessment.

7.3.1.4 Spill Risk Assessment Approach

The spill risk assessment approach adopted is based on Santos' Oil Spill Risk Assessment and Response Planning Procedure (QE-91-II-20003).

A consistent risk assessment approach is applied to unplanned hydrocarbon release scenarios. The spill risk assessment approach is based on Santos' Oil Spill Risk Assessment and Response Planning Procedure (QE 91 II-20003). The procedure describes the spill risk assessment process as follows:

- Identify the spatial extent of the EMBA. This has been completed for this OPP as part of the assessment of the existing environment and receptors that are known to occur or may occur within the EMBA are described in **Section 3.1.1**;
- Identify areas of high environmental value (HEV) within the EMBA (HEVs are described in **Section 7.3.1.4.2**); and
- Identify and then risk assess hot spots. Hot spots are effectively a subset of HEVs, and their determination is described in **Section 7.3.1.4.3**.

7.3.1.4.1 Spill environment that may be affected

Defining the EMBA by an oil spill is the first step in oil spill risk and impact assessment. For activities where there is the potential for multiple spill scenarios, the spill scenario, or combination of spill scenarios, resulting in the greatest spatial extent is used to define the overall EMBA for the activity. The EMBA is further described in **Section 3.1.1**. To determine the potential impact to receptors within the EMBA, the moderate threshold EMBA is used to determine them as described in **Section 3.1.1**.

7.3.1.4.2 Areas of high environmental value

Santos has predetermined areas of HEV (**Figure 7-36** and **Figure 7-37**) along the Australian coastline by ranking these areas based on:

- Protected area status – This is used as an indicator of the biodiversity values contained within that area, where a World Heritage Area, RAMSAR Wetland and Marine Protected Area will score higher than areas with no protection assigned; and

- BIAs of listed threatened species – These are spatially defined areas where aggregations of individuals of a species are known to display biologically important behaviour, such as breeding, feeding, resting or migration. Each one of these within the predefined areas contributes to the score.

Further input to determine areas of HEV included:

- sensitivity of habitats to impact from hydrocarbons in accordance with the guidance document Sensitivity Mapping for Oil Spill Response produced by IPIECA, the International Maritime Organisation and International Association of Oil and Gas Producers;
- sensitivities of receptors with respect to hydrocarbon-impact pathways;
- status of zones within protected areas (IUCN (1A) and sanctuary zones compared to IUCN (VI) and multiple use zones);
- listed species status and predominant habitat (surface versus subsurface); and
- social values, socio-economic and heritage features (such as commercial fishing, recreational fishing, amenities, aquaculture).

Tallied scores for each predefined area along the Western Australian coastline were then ranked from 1 to 5, with an assignment of 1 representing areas of the highest environmental value and those with 5 representing the areas of the lowest environmental value.

7.3.1.4.3 Hot spots

While the entire Moderate Exposure Value EMBA in **Figure 3-1** will be considered during risk assessment, it is best practice to concentrate greatest effort and level of detail on those parts of the EMBA that have the:

- greatest intrinsic environmental value – considered by Santos to be HEV areas ranked 1 to 3;
- highest probability of contact by oil (either floating, entrained or dissolved aromatic); and
- greatest potential concentration or volume of oil arriving at the area.

These areas are termed 'hot spots'. Defining hot spots is typically the first step in undertaking detailed spill risk assessment and spill response planning. Hot spots are a subset of HEV areas that:

- have the highest probability of contact (at least higher than 5%) above the impact assessment exposure value for surface hydrocarbons and shoreline accumulation based on modelling results; and
- receive the greatest concentration or volume of oil, either floating or stranded oil, entrained/total submerged oil or DAH above contact exposure values described in **Section 7.3.1.3.1**.

During a hotspot workshop, an environment consequence assessment is conducted against each of the hotspots identified, using the Santos risk assessment process identified in **Section 7.1**, the outcome of this is provided in **Attachment 8 – 2**.

Additional hotspots may be included through discretion of workshop attendees where they do not strictly meet all of the above criteria. E.g. a HEV ranked 1-3 with <5% probability, or a HEV ranked 4 or 5 with >5% probability, depending on the concentrations and volumes of hydrocarbons presented in the modelling report.

Santos

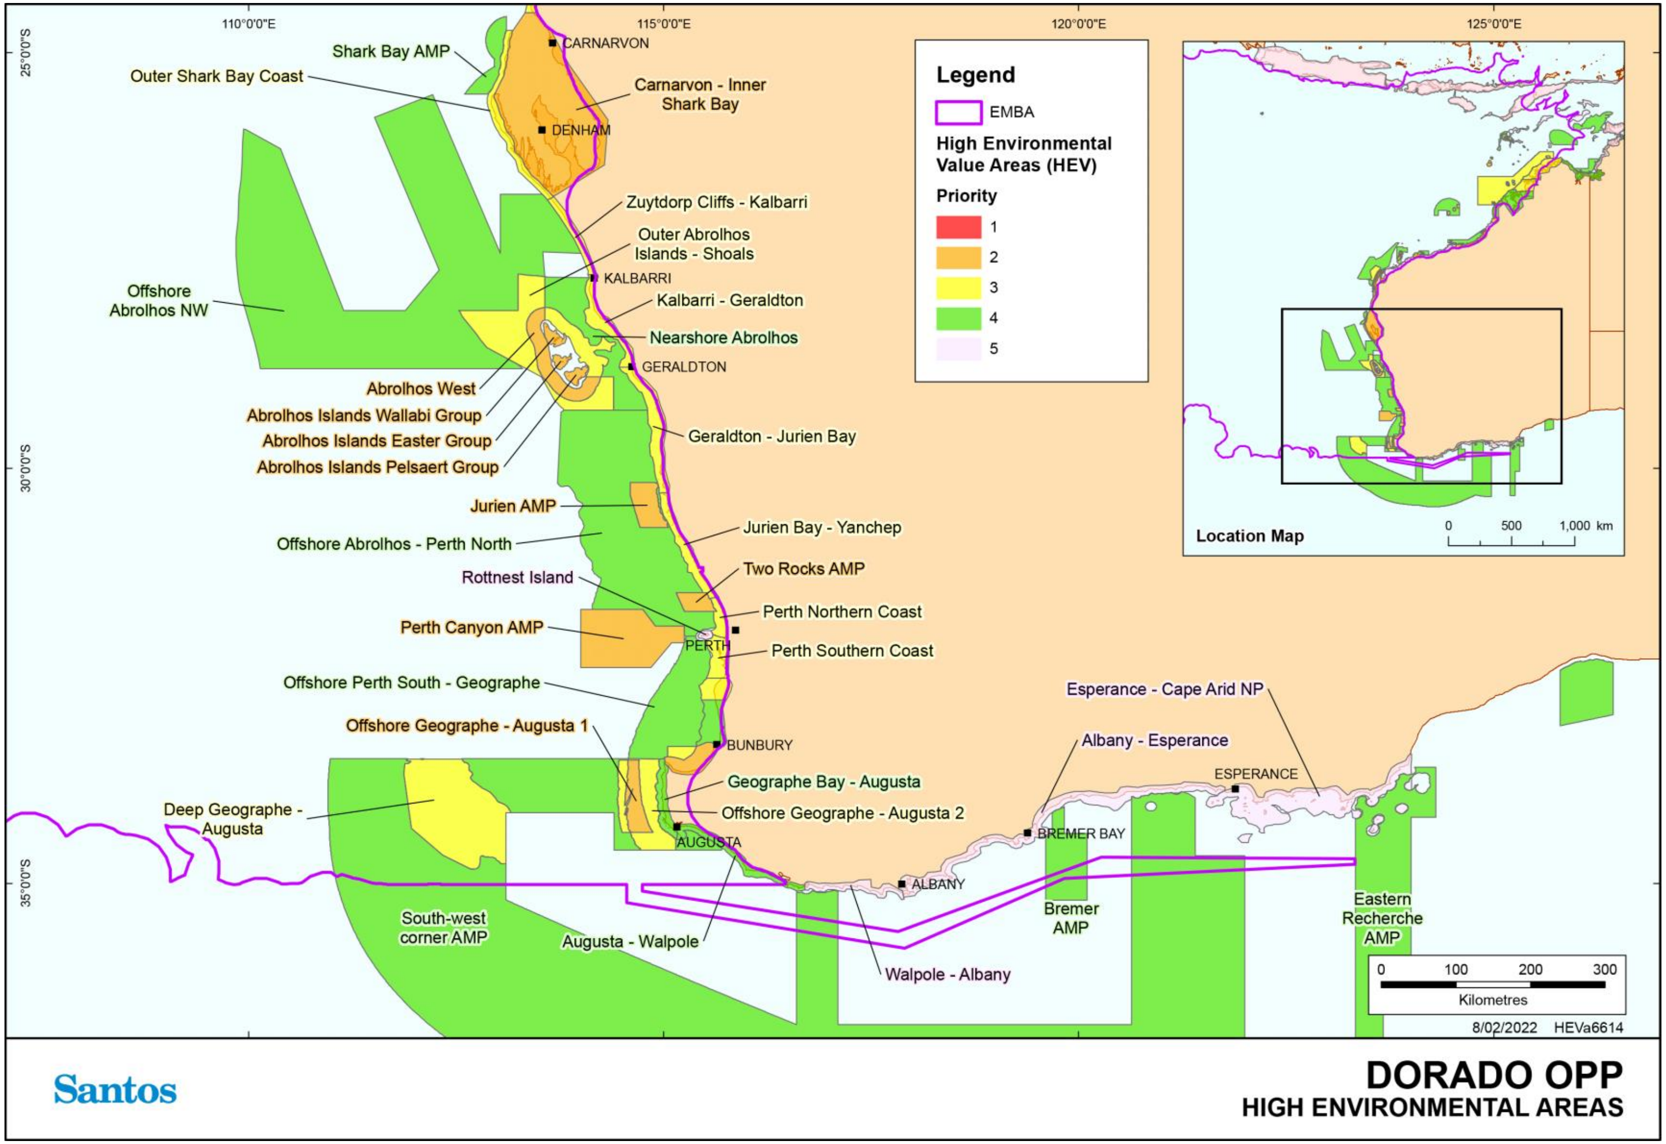

Figure 7-37: High environmental values within the southern part of the environment that may be affected

7.3.1.4.4 Potential Impact Pathways and values and sensitivities

To help inform the hydrocarbon spill risk assessment environmental values and sensitivities and potential impact pathways have been defined (**Table 7-75** and **Table 7-76**). The potential impact pathways consider physical and chemical pathways. Physical pathways include contact from floating oil, accumulated shoreline oil, or entrained oil droplets. Chemical pathways include ingestion, inhalation or contact from any hydrocarbon phase. These are summarised in **Table 7-76** and the information is drawn upon within the hydrocarbon risk assessment for the spill scenario.

Table 7-75: Summary of environmental values and sensitivities potentially contacted by hydrocarbons from worst-case spill scenarios during Dorado Phase 1

Oil Phase	Physical			Biological					Socio-economic				
	Water Quality	Sediment Quality	Air Quality	Communities and Habitats	Fishes	Mammals	Reptiles	Birds	Protected Areas	Fisheries	Heritage	Tourism	Maritime Industry

Table 7-76: Physical and chemical pathways for hydrocarbon exposure and potential impacts to receptors

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Rocky shorelines	Shoreline loading and attachment may result in thin and sporadic coating of hydrocarbon residues. Degree of oil coating is dependent upon the energy of the shoreline area, the type of the rock formation and continual biodegradation of the oil.	Impacts to flora and fauna further described below.	Chemical pathway to fauna and flora via adsorption through cellular membranes and soft tissue, ingestion, irritation/ burning on contact and inhalation.	Impacts to flora and fauna further described below.
Sandy beaches	Shoreline loading and water movement may allow hydrocarbon residue to filter down into sediments, continue to biodegrade on the surface or remobilise into surf zone. Degree of loading is dependent upon the energy and tidal reach of the shoreline, the type of the sandy shore and continual weathering of the oil.	Indirect impacts to nesting and foraging habitats for birds and turtles. Direct impacts to infauna.	Chemical pathway to fauna and flora via adsorption through cellular membranes and soft tissue, ingestion, irritation/burning on contact and inhalation.	Indirect impacts to nesting and foraging habitats for birds and turtles. Direct impacts (mortality) to infauna through toxic effects and smothering.
Intertidal platforms	Shoreline loading and water movement may allow hydrocarbon residue to filter down into sediments or continue to biodegrade on the surface or remobilise into surf zone. Degree of loading is dependent upon the energy and tidal reach of the shoreline, the type of the substrate and continual weathering of the oil.	Indirect impacts to foraging habitats for birds and turtles. Direct impacts to infauna.	Chemical pathway to fauna and flora via adsorption through cellular membranes and soft tissue, ingestion, irritation/burning on contact and inhalation.	Indirect impacts to foraging habitats for birds. Direct impacts (mortality) to infauna through toxic effects and smothering.
Shallow sub-tidal soft sediments	Hydrocarbon residue in the shallow waters adjacent to shorelines may settle to filter down into sediments. Degree of loading is dependent upon the energy and tidal reach of the shoreline, the type of the substrate and continual weathering of the oil.	Indirect impacts to foraging habitats for turtles and fish. Direct impacts to infauna.	Adsorption via cellular membranes and soft tissue, ingestion, irritation/burning on contact and inhalation.	Indirect impacts to foraging habitats for turtles and fish. Direct impacts (mortality) to infauna through toxic effects and smothering.

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Mangroves	Coating of root system reducing air and salt exchange. Degree of coating is dependent upon the energy and tidal reach of the shoreline, the type of the substrate and continual weathering of the oil.	Yellowing of leaves. Defoliation. Increased sensitivity to stressors. Tree death. Reduced growth. Reduced reproductive output. Reduced seed viability.	External contact by oil and adsorption across cellular membranes.	Yellowing of leaves. Defoliation. Increased sensitivity to stressors. Tree death. Reduced growth. Reduced reproductive output. Reduced seed viability. Growth abnormalities.
Seagrasses and macroalgae	Coating of leaves/thalli reducing light availability and gas exchange. Degree of coating depends upon the energy and tidal reach of the shoreline, the type of the receptor and continual weathering of the oil.	Bleaching or blackening of leaves. Defoliation. Reduced growth.	External contact by oil and adsorption across cellular membranes.	Mortality. Bleaching or blackening of leaves. Defoliation. Disease. Reduced growth. Reduced reproductive output. Reduced seed/propagule viability.

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Hard corals (coral reefs)	Coating of polyps, shading resulting in reduction on light availability. Degree of coating is dependent upon the metocean conditions, dilution, if corals are emergent at all and continual weathering of the oil.	Bleaching. Increased mucous production. Reduced growth.	External contact by oil and adsorption across cellular membranes.	Mortality. Cell damage. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced reproductive output. Reduced egg/larval success. Growth abnormalities.
Non-coral benthic invertebrates	Coating of adults, eggs and larvae. Degree of coating is dependent upon the energy and tidal reach of the shoreline, the type of the receptor and continual weathering of the oil.	Mortality. Behavioural disruption. Impaired growth.	Ingestion and inhalation. External contact and adsorption across exposed skin and cellular membranes. Uptake of DAH across cellular membranes. Reduced mobility and capacity for oxygen exchange.	Mortality. Cell damage. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced reproductive output. Reduced egg/larval success. Growth abnormalities. Behavioural disruption.

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Sharks, rays and fish	Coating of adults but primarily eggs and larvae – reduced mobility and capacity for oxygen exchange.	Mortality. Oxygen debt. Starvation. Dehydration. Increased predation. Behavioural disruption.	Ingestion. External contact and adsorption across exposed skin and cellular membranes. Uptake of DAH across cellular membranes (for example, gills).	Mortality. Cell damage. Flesh taint. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced reproductive output. Reduced egg/larval success. Growth abnormalities. Behavioural disruption.
Birds (seabirds and shorebirds)	Contact possible in the water and onshore. Onshore, the degree of coating is dependent upon the energy and tidal reach of the shoreline, the type of the receptor and continual weathering of the oil.	Feather and skin irritation and damage.	Ingestion (during feeding or preening). External contact and adsorption across exposed skin and membranes.	Mortality. Cell damage, lesions. Secondary infections. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced reproductive output. Growth abnormalities. Behavioural disruption.

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Marine reptiles	Contact possible in the water and onshore. Onshore, the degree of coating is dependent upon the energy and tidal reach of the shoreline, the type of the receptor and continual weathering of the oil.	Behavioural disruption particularly during turtle nesting periods.	Inhalation. Ingestion. External contact and adsorption across exposed skin and membranes.	Mortality. Cell damage, lesions. Secondary infections. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced hatchling success. Reduced reproductive output. Growth abnormalities. Behavioural disruption.
Marine mammals	Fur damage and matting, reduced mobility and buoyancy (for applicable species). Coating of feeding apparatus in some species (baleen whales).	Behavioural disruption such as deviation from migration pathways and commonly frequented feeding grounds. For smooth skinned marine mammals more susceptible to chemical pathways than physical pathways.	Inhalation. Ingestion. External contact and adsorption across exposed skin and membranes.	Mortality. Cell damage, lesions. Secondary infections. Reduced metabolic capacity. Reduced immune response. Disease. Reduced growth. Reduced reproductive output. Growth abnormalities. Behavioural disruption.
Plankton	Coating of feeding apparatus. Reduced mobility and capacity for oxygen exchange.	Mortality. Behavioural disruption (for example, reduced mobility).	Inhalation. Ingestion. External contact.	Mortality. Impairment of biological activities (for example, feeding, respiration). Reduced mobility.

Receptor	Potential Physical pathway	Potential impacts	Potential Chemical pathway	Potential impacts
Water quality and sediment quality	Presence of hydrocarbon residue in the water, which may filter down to sediments or continue to biodegrade on the surface. Degree of loading in the water column is dependent upon the influence of wave energy and tidal range. Degree of loading in sediments also dependent on movement at the seabed.	Impacts to flora and fauna, as discussed in rows above.	Adsorption via cellular membranes and soft tissue, ingestion, irritation/burning on contact and inhalation. Impacts to flora and fauna, as discussed in rows above.	Impacts to flora and fauna, as discussed in rows above.
Protected areas	Coating of benthic habitats, shoreline habitats and marine fauna/flora within protected areas as discussed in above.	Mortality, injury or behavioural disruption to marine fauna. Death or impairment of habitats within protected areas. Reduction in the quality of the marine environment within protected areas. Environmental value of protected areas is degraded.	Impacts to flora and fauna, as discussed above.	Mortality, injury or behavioural disruption to marine fauna. Death or impairment of habitats within protected areas. Reduced growth of benthic habitats. Reduction in the quality of the marine environment within protected areas. Environmental value of protected areas is degraded.
Socio-economic environment (fisheries, tourism, shipping, defence, shipwrecks, Indigenous users, oil and gas)	Presence of hydrocarbon residue in the water, which may filter down to sediments or continue to biodegrade on the surface. Coating of benthic habitats, shoreline habitats and marine fauna/flora within protected areas as discussed in above.	Degradation of cultural or maritime heritage sites. Disruption to tourism, recreation or shipping activities. Reduction in resource available for commercial and recreational fisheries.	Impacts to flora, fauna and the physical environment as discussed above. Commercial/recreational fish species – refer to 'fish' as discussed above.	Degradation of cultural or maritime heritage sites. Disruption to tourism, recreation or shipping activities. Reduction in resource available for commercial and recreational fisheries.

7.3.1.5 Summary of Spill Modelling Results

The potential risk of exposure to the surrounding waters and contact to shorelines was assessed for three distinct seasons; (i) summer (October to the following March), (ii) the transitional periods (April and September) and (iii) winter (May to August). The EMBA for the worst-case deterministic and stochastic modelling results are shown for each of the worst-case spill scenarios.

7.3.1.5.1 Subsea Loss of Well Containment Dorado Development

Stochastic modelling results from the worst-case subsea loss of well containment scenario for the Dorado Project are shown in **Figure 7-38** and **Figure 7-39**. The worst-case deterministic runs, based on the largest volume of oil onshore and longest length of shoreline accumulation are shown in **Figure 7-58** and **Figure 7-42**, and a summary of the results included in **Table 7-77**.

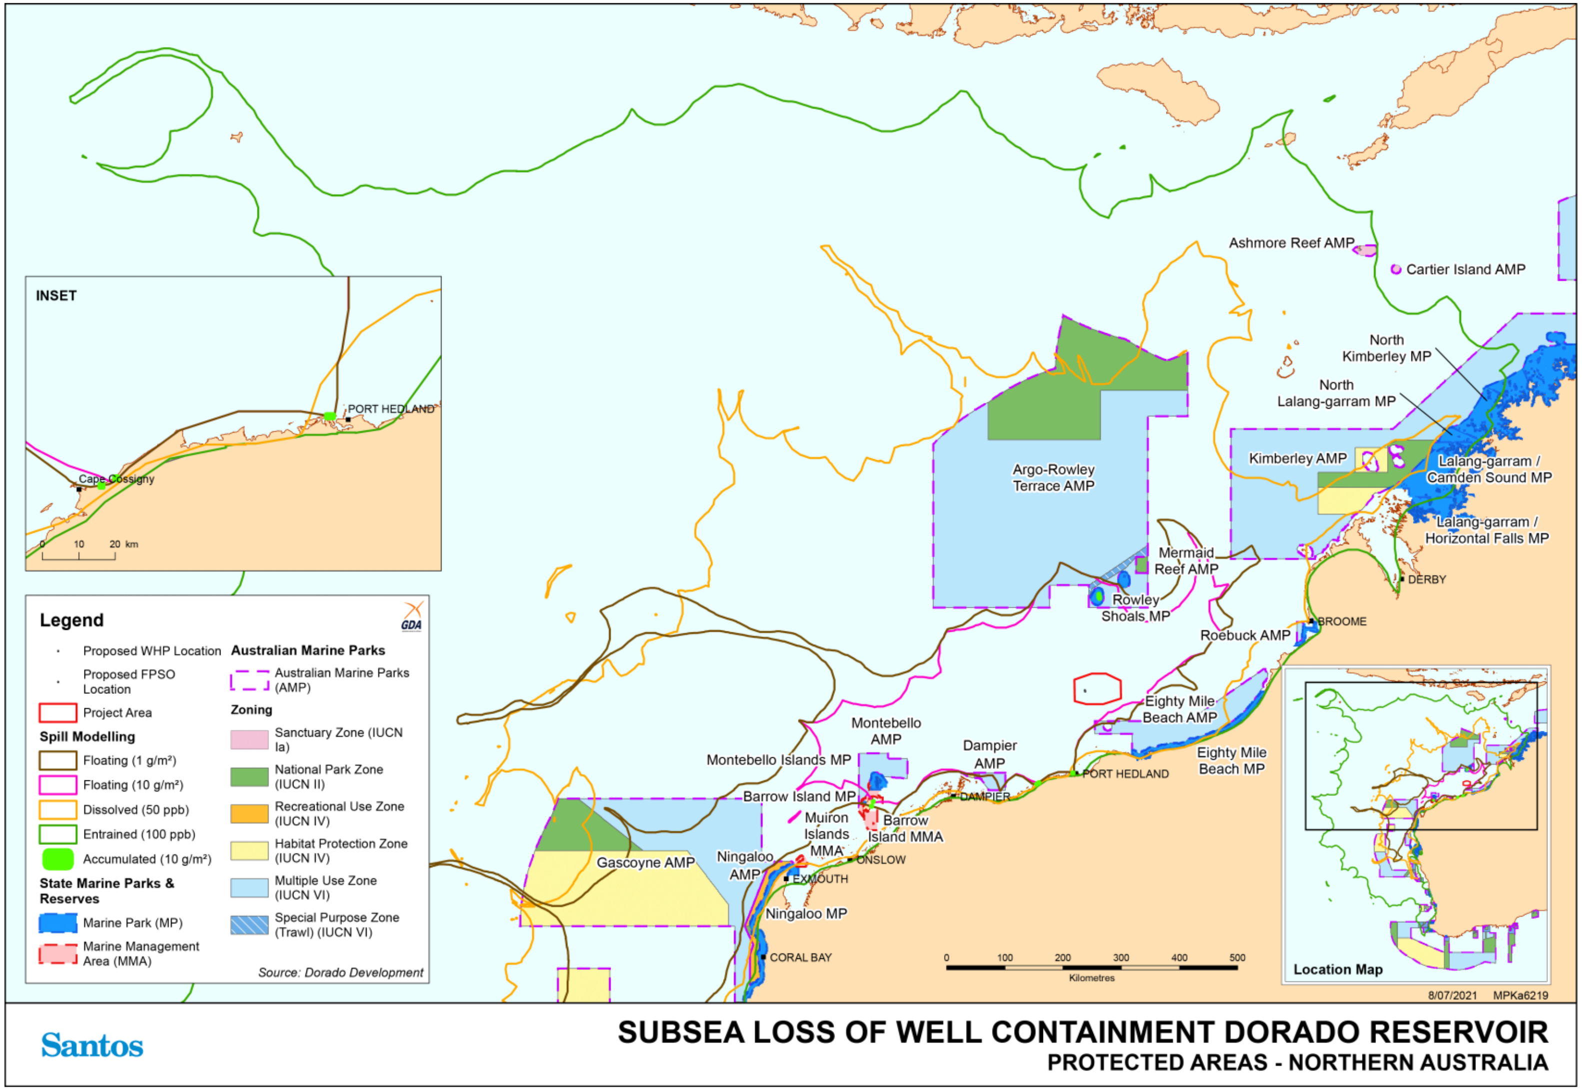

Figure 7-38: EMBA derived from stochastic modelling for floating, entrained, dissolved and shoreline accumulation oil phases for a worst-case subsea loss of well containment (Dorado Reservoir) – protected areas north

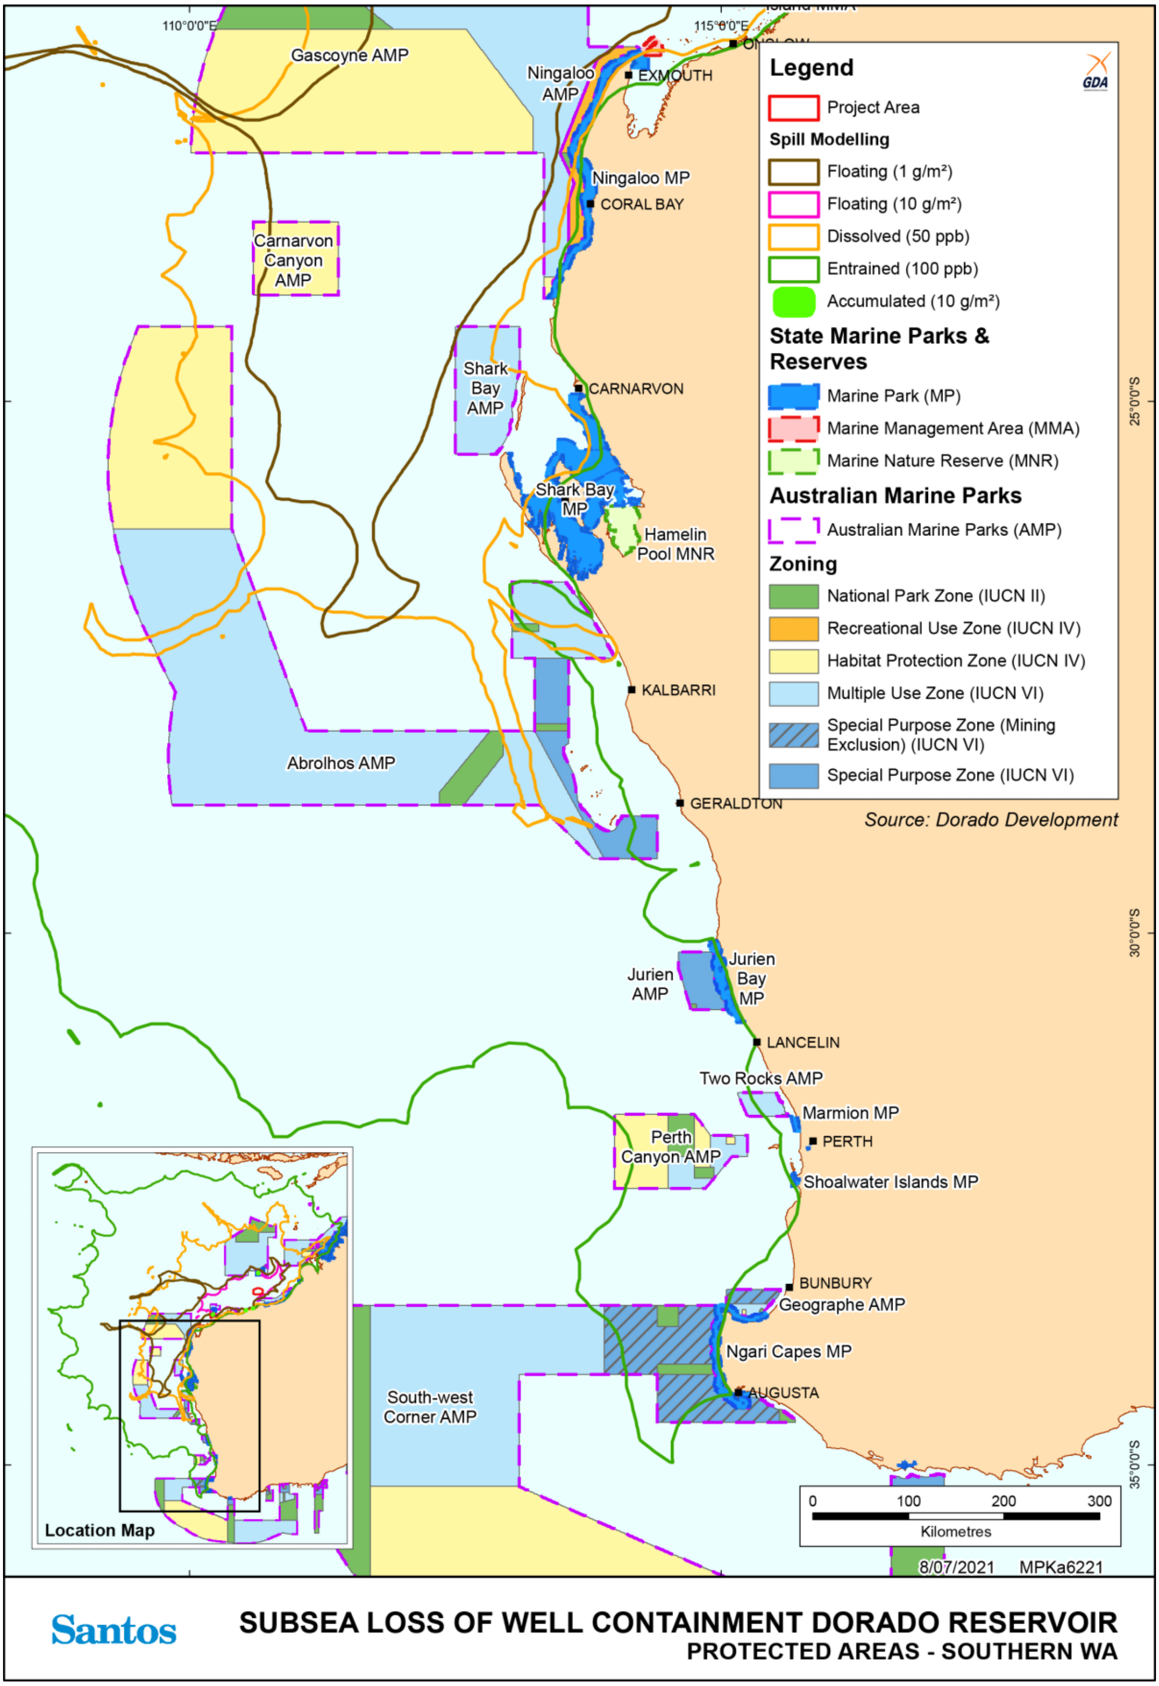

Figure 7-39: EMBA derived from stochastic modelling for floating, entrained, dissolved and shoreline accumulation oil phases for a worst-case subsea loss of well containment (Dorado Reservoir) – protected areas south.

High 1000 g/m² Impacts to shoreline receptors	+ Maximum length of shoreline accumulation was 1 km + Based on all 100 simulations combined - 1 shoreline receptor with probability of exposure of 7% - Port Hedland to the south within 11 days, peak loading 2,781g/m^2, with a peak volume of 34.3m^3, and a maximum length of shoreline loading @ 1km.	+ Maximum length of shoreline accumulation 2 km + Based on all 100 simulations combined - 1 shoreline receptor with probability of exposure of 1% - Port Hedland to the south within 11 days, peak loading 3,061g/m^2, with a peak volume of 64.7 m^3, and a maximum length of shoreline loading @ 2km.	+ <1% probability of shoreline accumulation
DISSOLOVED AROMATIC HYDROCARBONS			
Low 10 ppb Lower than the exposure value at which ecological impacts are expected to occur. Relevant for implementing environmental monitoring in event of oil spills	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-38** and **Figure 7-39**). The figures show the dissolved hydrocarbons at 50ppb (low threshold). Further information is located in Section 9.1.3.4 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		
	Summer + Maximum extent from release location – 1,581km southwest + Based on all 100 simulations combined - 12 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 61 to 3%, with Montebello AMP being most probable (61% in minimum time of 12 days after spill), followed by Gascoyne (44% in minimum time of 16 days after spill). The shortest time to contact predicted at Argo-Rowley Terrace within 7.5 days. Maximum dissolved concentrations of 2,449 ppb at Argo-Rowley Terrace AMP. + 1 to 38% probability of contacting 7 State Marine Parks. 38% probability at Rowley Shoals in minimum time of 9 days after spill and a maximum concentration of 922 ppb. The maximum dissolved concentration was 1,122 ppb at Montebello Islands.	Transition + Maximum extent from release location – 1,321km south southwest + Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 55 to 2%, with Montebello AMP being most probable (55% in minimum time of 4 days after spill), followed by Argo Rowley Terrace (48% in minimum time of 10 days after spill). The shortest time to contact predicted at Dampier within 3 days. Maximum dissolved concentrations of 1,007 ppb at Argo-Rowley Terrace AMP. + 1 to 43% probability of contacting 7 State Marine Parks. 43% probability at Rowley Shoals in minimum time of 14 days after spill and a maximum concentration of 1,100 ppb. + 43% probability of entering State Waters in minimum time of 2.8 days after spill, and maximum dissolved hydrocarbon 1,100ppb.	Winter + Maximum extent from release location – 1,339km west + Based on all 100 simulations combined - 12 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 35%, with Argo-Rowley Terrace AMP being most probable (74% in minimum time of 13 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 6.6 days. Maximum dissolved concentrations of 1,947 ppb at Gascoyne AMP. + 1 to 64% probability of contacting 6 State Marine Parks. 64% probability at Rowley Shoals in minimum time of 16 days after spill and a maximum concentration of 408 ppb. The maximum dissolved concentration was 711 ppb at Montebello Islands.

	+ 38% probability of entering State Waters in minimum time of 9 days after spill, and maximum dissolved hydrocarbon 2,947ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 37 receptors within the EMBA are predicted to be exposed. The greatest probability being 72% at Rankin Bank within 13 days, and a maximum dissolved hydrocarbon concentration of 1,048 ppb. + 1 Ramsar receptor within the combined simulations is potentially exposed with the probability of 12% at Eighty Mile Beach within 31 days with a maximum dissolved hydrocarbon concentration of 323ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 12% within 27 days and a maximum dissolved hydrocarbon concentration of 209 ppb. Highest probability of dissolved contact at Imperieuse Reef of 35% within 12 days. Maximum dissolved hydrocarbon concentration of 2,257 ppb at Legendre Island. + Based on all 100 simulations combined - 3 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs ranged from 28%, at Houtman Abrolhos Islands (within 33 days at 492 ppb maximum) and 1% at Western Rock Lobster (within 33 days @ 18 ppb). The probability of exposure at the 125m water depth Ancient Coastline adjacent to the Project Area was <1%.	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 19 receptors within the EMBA are predicted to be exposed. The greatest probability being 80% at Glomar Shoals within 4 days, and a maximum dissolved hydrocarbon concentration of 834 ppb. + <1% probability of Ramsar receptors being contacted by dissolved hydrocarbons. + Bedout Island (closest nearshore receptor to the south) with probability of 1% within 18 days and a maximum dissolved hydrocarbon concentration of 26 ppb. Highest probability of dissolved contact at Cunningham Island of 37% within 17 days. Maximum dissolved hydrocarbon concentration of 444 ppb at Clerke Reef. + Based on all 100 simulations combined - 4 of the KEFs within the EMBA are predicted to be exposed, probability of greatest exposure is 14%, at Glomar Shoals (within 4 days at 549 ppb maximum). The probability of exposure at the 125m water depth Ancient Coastline adjacent to the Project Area was <1%.	+ 64% probability of entering State Waters in minimum time of 10 days after spill, and maximum dissolved hydrocarbon 1,426ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 15 receptors within the EMBA are predicted to be exposed. The greatest probability being 95% at Glomar Shoals within 10 days, and a maximum dissolved hydrocarbon concentration of 518 ppb. The maximum dissolved hydrocarbon concentration is at Rankin Bank of 1,004ppb. + 1 Ramsar receptor within the combined simulations is potentially exposed with the probability of 1% at Roebuck Bay within 114 days with a maximum dissolved hydrocarbon concentration of 14 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 3% within 11 days and a maximum dissolved hydrocarbon concentration of 49 ppb. Highest probability of dissolved contact at Imperieuse Reef of 53% within 20 days. Maximum dissolved hydrocarbon concentration of 485 ppb at Hermite Island. + Based on all 100 simulations combined - 3 of the KEFs within the EMBA are predicted to be exposed, the highest probability of exposure at Glomar Shoals (11 % within 9 days at 425 ppb maximum). the probability of exposure at

			the 125m water depth Ancient Coastline adjacent to the Project Area was <1%.
Moderate 50 ppb Approximates potential toxic effects, particularly sublethal effects to sensitive species.	Summer + Maximum extent from release location – 1,342km southwest + Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, with Montebello AMP being most probable (34% in minimum time of 12 days after spill), followed by Argo-Rowley Terrace at 24% within 7.5 days. + 6 to 18% probability of contacting 4 State Marine Parks. 18% probability at Rowley Shoals in minimum time of 9 days after spill + 18% probability of entering State Waters in minimum time of 9 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 19 receptors within the EMBA are predicted to be exposed. The greatest probability being 44% at Rankin Bank within 13 days. + 1 Ramsar receptor within the combined simulations is potentially exposed with the probability of 6% at Eighty Mile Beach within 32 days. + Bedout Island (closest nearshore receptor to the south) with probability of 4% within 27 days. Highest probability of dissolved contact at Imperieuse Reef and Barrow Island of 11% within 12 days and 15 days respectively. + Based on all 100 simulations combined - 3 of the KEFs within the EMBA are predicted to be exposed, probability of 12%,at Houtman Abrolhos Islands (within 99 days).	Transition + Maximum extent from release location – 1,124km southwest + Based on all 100 simulations combined - 10 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 26 to 1%, with Montebello and Argo-Rowley Terrace AMPs being most probable (26% in minimum time of 4 days and 11 days respectively after spill), The shortest time to contact predicted at Dampier within 3 days. + 1 to 14% probability of contacting 4 State Marine Parks. 14% probability at Rowley Shoals in minimum time of 16 days after spill. + 14% probability of entering State Waters in minimum time of 2.8 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 11 receptors within the EMBA are predicted to be exposed. The greatest probability being 56% at Glomar Shoals within 5 days. + <1% probability of Ramsar receptors being contacted by dissolved hydrocarbons. + <1% probability of Bedout Island (closest nearshore receptor to the south) being contacted by dissolved hydrocarbon. The highest probability for nearshore contact is Clerke Reef at 12% within 17 days. + Based on all 100 simulations combined - 1 KEFs within the EMBA is predicted to be	Winter + Maximum extent from release location – 1,171km southwest. + Based on all 100 simulations combined - 11 of the AMPs within the EMBA greatest probability of exposure at Argo-Rowley Terrace AMP (35% in minimum time of 16 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 7.2 days. + 2 to 30% probability of contacting 3 State Marine Parks. Greatest probability of exposure at Rowley Shoals (30 % in minimum time of 18 days. + 30% probability of entering State Waters in minimum time of 10 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 10 receptors within the EMBA are predicted to be exposed. The greatest probability being 57% at Glomar Shoals within 10 days. + <1% probability of Ramsar receptors being contacted by dissolved hydrocarbons. + <1% probability of Bedout Island (closest nearshore receptor to the south) being contacted by dissolved hydrocarbons. Highest probability of dissolved contact at Imperieuse Reef of 22% within 24 days. + Based on all 100 simulations combined - 2 of the KEFs within the EMBA are predicted to be exposed, the highest

		exposed with a probability of exposure of 3%, at Glomar Shoals (within 4 days).	probability of exposure at Glomar Shoals (2% within 10 days).
High 400 ppb Approximates toxic effects including lethal effects to sensitive species	Summer + Maximum extent from release location – 930km west southwest + Based on all 100 simulations combined – 8 of the AMPs within the EMBA are predicted to be exposed, with Argo Rowley Terrace AMP being most probable (7% in minimum time of 7.5 days. + <1% probability of State marine parks being contacted at the high exposure threshold. + 6% probability of entering State Waters in minimum time of 11 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 4 receptors within the EMBA are predicted to be exposed. The greatest probability being 44% at Rankin Bank within 13 days. + 1 Ramsar receptor within the combined simulations is potentially exposed with the probability of 6% at Eighty Mile Beach within 32 days. + Bedout Island (closest nearshore receptor to the south) with probability of 4% within 27 days. Highest probability of dissolved contact at Imperieuse Reef and Barrow Island of 11% within 12 days and 15 days respectively. + Based on all 100 simulations combined - 3 of the KEFs within the EMBA are predicted to be exposed, probability of 12%,at Houtman Abrolhos Islands (within 99 days).	Transition + Maximum extent from release location – 582km, west southwest + Based on all 100 simulations combined - 4 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 2 to 1%, with Argo-Rowley Terrace AMP being most probable (2% in minimum time of 13.8 days after spill), The shortest time to contact predicted at Kimberley within11 days. + 1 State Marine Park is predicted to be contacted with a probability of 2 %, Rowley Shoals in minimum time of 19 days after spill. + 2% probability of entering State Waters in minimum time of 29 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 3 receptors within the EMBA are predicted to be exposed. The greatest probability being 5% at Glomar Shoals within 11.8 days. + <1% probability of Ramsar receptors being contacted by dissolved hydrocarbons. + <1% probability of Bedout Island (closest nearshore receptor to the south) being contacted by dissolved hydrocarbon. The highest probability for nearshore contact is Clerke Reef at 1% within 31 days. + Based on all 100 simulations combined - 1 KEFs within the EMBA is predicted to be exposed with a probability of exposure of 1%, at Glomar Shoals (within 11 days).	Winter + Maximum extent from release location – 843km southwest + Based on all 100 simulations combined - 6 of the AMPs within the EMBA greatest probability of exposure at Argo-Rowley Terrace, Eighty Mile Beach and Montebello AMPs (3% in minimum time of 19 days, 10 days and 62 days respectively after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 10 days. + 1% probability of contacting 2 State Marine Parks, Montebellos and Rowley Shoals (in minimum time of 86 and 80 days respectively). + 3% probability of entering State Waters in minimum time of 61 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 3 receptors within the EMBA are predicted to be exposed. The greatest probability being 3% at Rankin Bank within 72 days. + <1% probability of Ramsar receptors being contacted by dissolved hydrocarbons. + <1% probability of Bedout Island (closest nearshore receptor to the south) being contacted by dissolved hydrocarbons. Highest probability of dissolved contact at Hermite Island of 1% within 100 days,

			only sensitive nearshore receptor with probability of exposure. + Based on all 100 simulations combined - the KEF within the EMBA predicted to be exposed is Glomar Shoals (1% within 18 days).
ENTRAINED HYDROCARBON			
Low 10 ppb Lower than the exposure value at which most ecological impacts are expected to occur,. Relevant for implementing environmental monitoring in event of an oil spill.	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-38** and **Figure 7-39**). The figures show the entrained hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. Further information is located in Section 9.1.3.3 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		
	<u>Summer</u> + Maximum extent from release location – 2,635km + Based on all 100 simulations combined - 20 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 95 to 3%, with Montebello AMP being most probable (95% in minimum time of 12 days after spill), followed by Gascoyne (93% in minimum time of 13 days after spill). The shortest time to contact predicted at Eighty Mile Beach and Argo-Rowley Terrace within 7.5 days. Maximum concentrations of 15,871 ppb at Argo-Rowley Terrace AMP and 10,823 ppb at Montebello AMP. + 7 to 81% probability of contacting 15 State Marine Parks (Ningaloo and Rowley Shoals) in minimum time of 13 to 8 days after spill and a maximum concentration of 2,073 ppb and 10,088ppb. + 81% probability of entering State Waters in minimum time of 8 days after spill, and maximum entrained hydrocarbon 10,088ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 103 receptors within the EMBA are predicted to be	<u>Transition</u> + Maximum extent from release location – 2,498km + Based on all 100 simulations combined - 20 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 97 to 1%, with Argo-Rowley Terrace AMP being most probable (97% in minimum time of 8.5 days after spill), followed by Montebello AMP (94% in minimum time of 4 days after spill). The shortest time to contact predicted at Dampier AMP within 3.6 days. Maximum concentrations of 9,076 ppb at Argo-Rowley Terrace AMP and 6,204 ppb at Mermaid Reef AMP. + 1 to 81% probability of contacting 15 State Marine Parks (Rowley Shoals and Montebello MP) in minimum time of 11 to 31 days respectively after spill and a maximum concentration of 7,567 ppb at Rowley Shoals and 1,710 ppb at Montebellos.	<u>Winter</u> + Maximum extent from release location – 2878km (west- northwest). + Based on all 100 simulations combined - 19 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 100 to 1%, with Argo-Rowley Terrace AMP being most probable (100% in minimum time of 11 days after spill), followed by Montebello AMP (98% in minimum time of 16 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 6 days. Maximum concentrations of 8,867 ppb at Argo-Rowley Terrace AMP and 8,439 ppb at Montebello AMP. + 1 to 94 % probability of contacting 14 State Marine Parks. Rowley Shoals (94% probability in a minimum time 12 days with a maximum concentration of 7,130 ppb). Montebello (87% probability in a minimum time 22 days with a maximum concentration of 1,146 ppb).

	exposed. The greatest probability being 97% at Rankin Bank within 12 days, and a maximum entrained hydrocarbon concentration of 10,233 ppb. + 4 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 23% at Eighty Mile Beach within 15 days with a maximum entrained hydrocarbon concentration of 3,157ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 37% within 17 days and a maximum entrained hydrocarbon concentration of 2,008 ppb. Highest probability of contact at Imperieuse Reef of 67% within 10 days. + Based on all 100 simulations combined - 8 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs ranged from 89%, at Houtman Abrolhos Islands (within 32 days at 5,215 ppb maximum) and 1% at Sahul Shelf (within 85 days @ 17 ppb). The 125m water depth Ancient Coastline adjacent to the Project Area has a probability of exposure of 5% within 1 day, at a maximum concentration of 31 ppb.	+ 81% probability of entering State Waters in minimum time of 2.7 days after spill, and maximum entrained hydrocarbon 7,253 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 83 receptors within the EMBA are predicted to be exposed. The greatest probability being 94% at Rankin Bank within 6 days, and a maximum entrained hydrocarbon concentration of 5,576 ppb, followed by Imperieuse Reef at 81% probability, and a maximum concentration of 6,406 ppb. + 3 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 11 % at Peel-Yalgorup System within 68 days and maximum concentration of 65ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 17 days and a maximum entrained hydrocarbon concentration of 199 ppb. Highest probability of contact at Imperieuse Reef of 79% within 13 days at 3,776 ppb maximum. + Based on all 100 simulations combined - 7 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs ranged from 79% at Houtman Abrolhos Islands (within 55 days at 776 ppb maximum) and Geographe Bay (within 79 days @ 19 ppb).	+ 94% probability of entering State Waters in minimum time of 9 days after spill, and maximum entrained hydrocarbon 6,609 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 74 receptors within the EMBA are predicted to be exposed. The greatest probability being 94% at Rankin Bank within 6 days, and a maximum entrained hydrocarbon concentration of 5,576 ppb, followed by Imperieuse Reef at 81% probability, and a maximum concentration of 6,406 ppb. + 5 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 10 % at Ashmore Reef Nature Reserve within 97 days with a maximum concentration of 32ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 17 days and a maximum entrained hydrocarbon concentration of 199 ppb. Highest probability of contact at Imperieuse Reef of 79% within 13 days at 3,776 ppb maximum. + Based on all 100 simulations combined - 7 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs ranged from 79% at Houtman Abrolhos Islands (within 55 days at 776 ppb maximum) and Geographe Bay (within 79 days @ 19 ppb).

Moderate 100 ppb Representative of sub-lethal impacts to most species and lethal impacts to sensitive species. Considered appropriate for environmental risk assessment. (NOPSEMA 2019)	+ Maximum extent from release location – 1964km + Based on all 100 simulations combined - 18 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 85 to 1%, with Montebello AMP being most probable (85% in minimum time of 12 days after spill), followed by Gascoyne (81% in minimum time of 14 days after spill). The shortest time to contact predicted at Eighty Mile Beach and Argo-Rowley Terrace within 7.5 days. + 1 to 57% probability of contacting 13 State Marine Parks (Ningaloo and Rowley Shoals) in minimum time of 15.5 to 9 days respectively after the spill. + 57% probability of entering State Waters in minimum time of 9 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 53 receptors within the EMBA are predicted to be exposed. The greatest probability being 90% at Rankin Bank within 12 days. + 4 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 16 % at Eighty Mile Beach within 15 days. + Bedout Island (closest nearshore receptor to the south) with probability of 33% within 15 days. Highest probability of contact at Imperieuse Reef of 53% within 11 days. + Based on all 100 simulations combined - 5 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs of 50% at Houtman Abrolhos Islands (within 32 days) and 3% at Glomar Shoals (within 11 days and a maximum concentration of 226ppb).	+ Maximum extent from release location – 1,739km + Based on all 100 simulations combined - 13 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 88 to 1%, with Argo-Rowley Terrace AMP being most probable (88% in minimum time of 9 days after spill), followed by Montebello AMP (75% in minimum time of 4 days after spill). The shortest time to contact predicted at Dampier AMP within 2.5 days. + 1 to 55% probability of contacting 10 State Marine Parks (Rowley Shoals and Montebello MP) in minimum time of 11 to 7 days respectively after spill. + 55% probability of entering State Waters in minimum time of 2.7 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 28 receptors within the EMBA are predicted to be exposed. The greatest probability being 84% at Rankin Bank within 6 days, followed by Imperieuse Reef at 53% probability, within 14 days. + No exposure of Ramsar receptors. + Bedout Island (closest nearshore receptor to the south) with probability of 3% within 23 days. Highest probability of contact at Imperieuse Reef of 50% within 14 days. + Based on all 100 simulations combined - 5 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs of 37% at Houtman Abrolhos Islands (within 56 days) and 4% at Glomar Shells	+ Maximum extent from release location – 2158km (west- northwest). + Based on all 100 simulations combined - 12 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 97 to 2%, with Argo-Rowley Terrace AMP being most probable (97% in minimum time of 12 days after spill), followed by Montebello AMP (88% in minimum time of 17 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 6 days. + 1 to 55% probability of contacting 10 State Marine Parks (Rowley Shoals and Montebello MP) in minimum time of 11 to 7 days respectively after spill. + 81% probability of entering State Waters in minimum time of 10 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 23 receptors within the EMBA are predicted to be exposed. The greatest probability being 92% at Rankin Bank within 16 days, followed by Imperieuse Reef at 80% probability, within 17 days + 1 Ramsar receptor within the combined simulations potentially exposed with the probability of 2% at Roebuck Bay within 109 days. Probability of exposure at Eighty Mile Beach of 1% within 97 days. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 11 days. Highest probability of

		within 3 days at maximum concentration of 216 ppb.	contact at Imperieuse Reef of 79% within 18 days. + Based on all 100 simulations combined - 2 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs of 6% at offshore Ningaloo Reef (within 33 days) and 4% at Glomar Shells within 9 days at maximum concentration of 264 ppb.

Predicted impacts and risks based on deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in:

1) **largest volume of oil ashore**
2) **longest length of shoreline with oil accumulation**

Largest volume of oil ashore (Figure 7-41)	Longest length of shoreline accumulation (Figure 7-47)
+ Floating oil exposure predicted north/northeast and west/southwest from the spill location. + Maximum volume onshore of 64.7m^3 occurring 3 days after the spill. + Shoreline accumulation at Port Hedland. + Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 58 days after spill started, approximately 330 km^2. + At end of spill, 61% spilled oil lost to the atmosphere through evaporation, 31% predicted to have decayed, 8% remained in the water column and 22m^3 (<0.1%) predicted to remain on the shoreline.	+ Floating oil exposure predicted northeast and west/southwest from the spill location + Shoreline accumulation at Port Hedland, Cunningham Island and Imperieuse Reef. + Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 46 days after the spill started approximately 559 km^2. + Maximum length of actionable shoreline oiled (above 100 g/m^2) at any given time was 2 km, at approximately 80 days after the spill. + At end of spill, 62% spilled oil lost to the atmosphere through evaporation. 29% predicted to have decayed, 8% remained in the water column and 15 m^3 (<0.1%) predicted to remain on the shoreline.

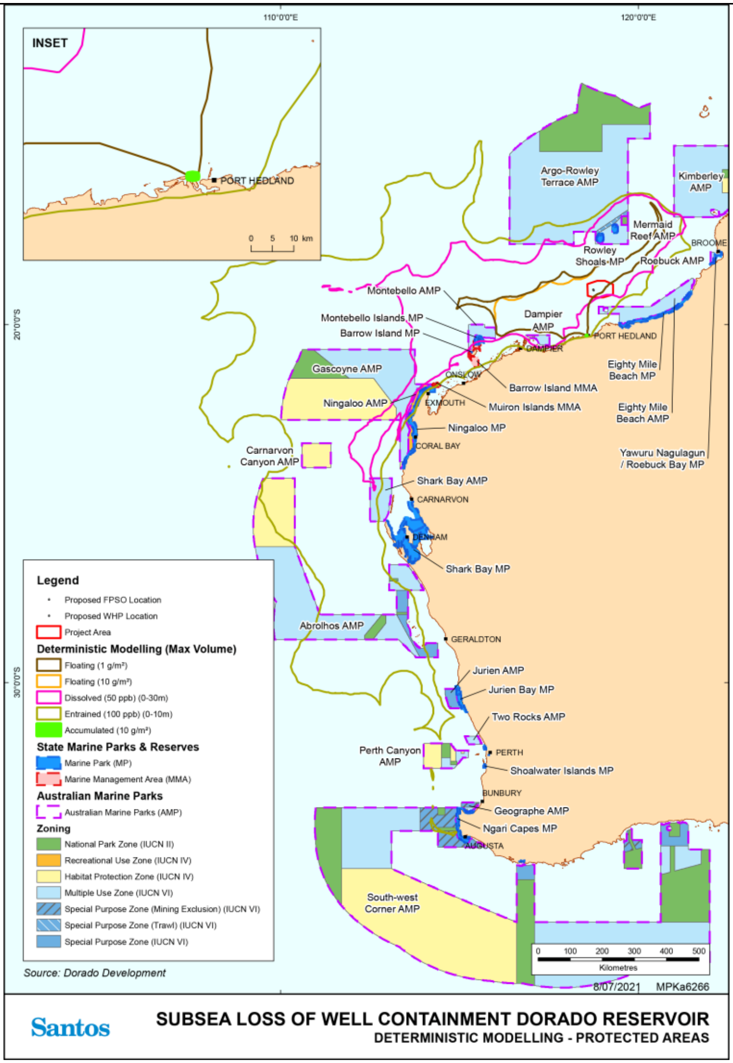

Figure 7-41 Worst-case deterministic model results based on largest volume of shoreline oil ashore (Dorado Reservoir)

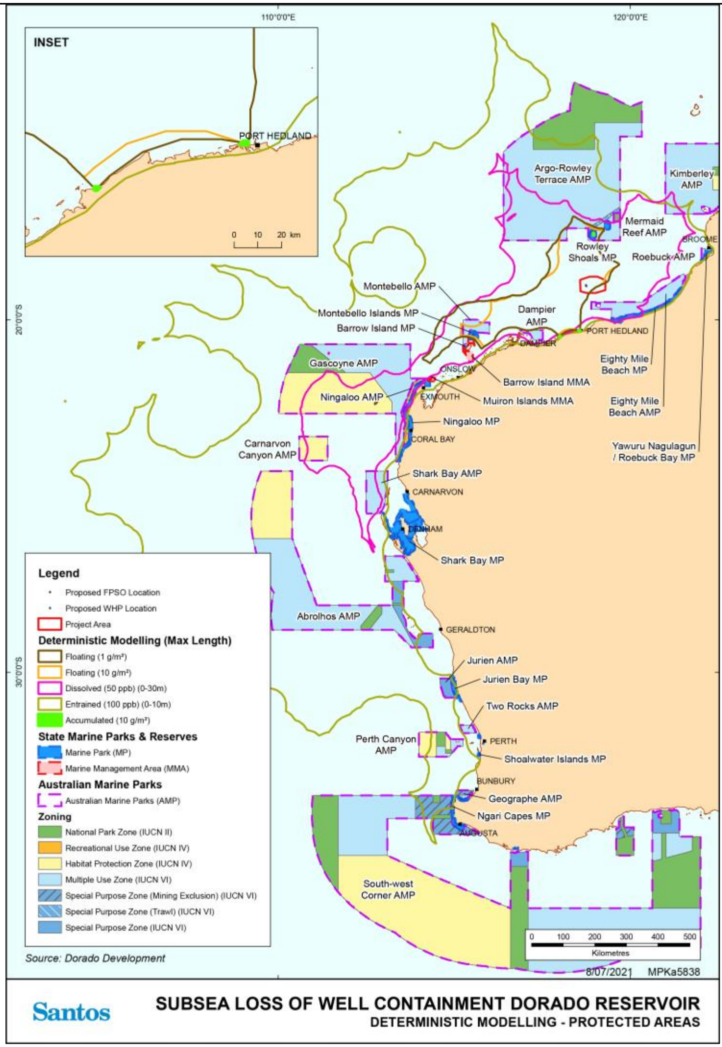

Figure 7-42: Worst-case deterministic model results based on maximum length of shoreline contact (Dorado Reservoir)

7.3.1.5.2 Surface Loss of Well Containment Dorado Development

Stochastic modelling results from the worst-case surface loss of well containment scenario are shown in **Figure 7-43** and **Figure 7-44.** A summary of the stochastic modelling results for floating oil, shoreline accumulation, dissolved and entrained hydrocarbons for a subsea loss of well containment for each season is provided in **Table 7-78.**The worst-case deterministic runs, based on the largest volume of oil onshore and longest length of shoreline accumulation are shown in **Figure 7-46** and **Figure 7-47** and a summary of the results included in **Table 7-78.**

+ No KEFs contacted by floating oil.</td></tr>
</table>

	+ No KEFs contacted by floating oil.		
Moderate 10 g/m^2 (environment values and sensitivities may be at risk)	+ Spill direction West – Southwesterly, maximum distance 408km from release site + Based on all 100 simulations combined - 3 AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 6 to 11%, with Argo-Rowley Terrace AMP being most probable (11% in minimum time of 7 days after spill), the shortest time to contact at Argo-Rowley Terrace AMP in 7.5 days. + 10% probability of contact with Rowley Shoals State Marine Park (minimum time of 10 days after the spill). + 12% probability of entering State Waters in minimum time of 10 days after spill + 1 to 8% probability of contacting shorelines at Barrow Island, Imperieuse Reef and Port Hedland in minimum time of 11 days (Port Hedland) to 45 days (Imperieuse Reef) after spill. + 4 to 2% probability of contacting reefs, shoals and banks (Imperieuse Reef and Tryal Rocks) in minimum time of 12 to 14 days respectively after spill + No KEFs contacted by floating oil.	+ Spill direction West – Southwesterly, maximum distance 497km from release site + Based on all 100 simulations combined- Montebello AMP within the EMBA are predicted to be exposed with 5% probability of exposure in minimum time of 7 days + No predicted contact with State Marine Parks. + 1% probability of entering State Waters in minimum time of 2 days after spill + 1 % probability of contacting shorelines at Port Hedland in minimum time of 2 days (Port Hedland) after spill. + 2 % probability of contacting reefs, shoals and banks at Rankin Bank in minimum time of 24 days after spill + No KEFs contacted by floating oil.	+ Spill direction – Northeast, maximum distance 375km from release site + 1% probability of contacting Dampier AMP or Montebello AMP in minimum time of 60 days and 61 days respectively after spill + No predicted contact with State Marine Parks. + 1% probability of entering State Waters in minimum time of 62 days after spill + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks + No KEFs contacted by floating oil.
High 50 g/m^2 (Impacts and actionable)	+ Spill direction West – Southwesterly + Maximum distance 217km from release site + One AMP exposed, Argo-Rowley Terrace with 11% probability of exposure in minimum time of 7 days + No predicted contact with State Marine Parks. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks + No KEFs contacted by floating oil.	+ Spill direction West – Southwesterly + Maximum distance 304km from release site + No predicted contact with AMPs + No predicted contact State Marine Parks. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks + No KEFs contacted by floating oil.	+ Spill direction – Northeast + Maximum distance 221km from release site + No predicted contact with AMPs + No predicted contact State Marine Parks. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks + No KEFs contacted by floating oil.

SHORELINE ACCUMULATION	
	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-43** and **Figure 7-44**. **Figure 7-45** shows the shoreline accumulation at 10 g/m^2 (low threshold). Further information is located in Section 9.2.3.3 of **Attachment 8-1.** The seasonal assessment below is based on 100 spill simulations for each season.

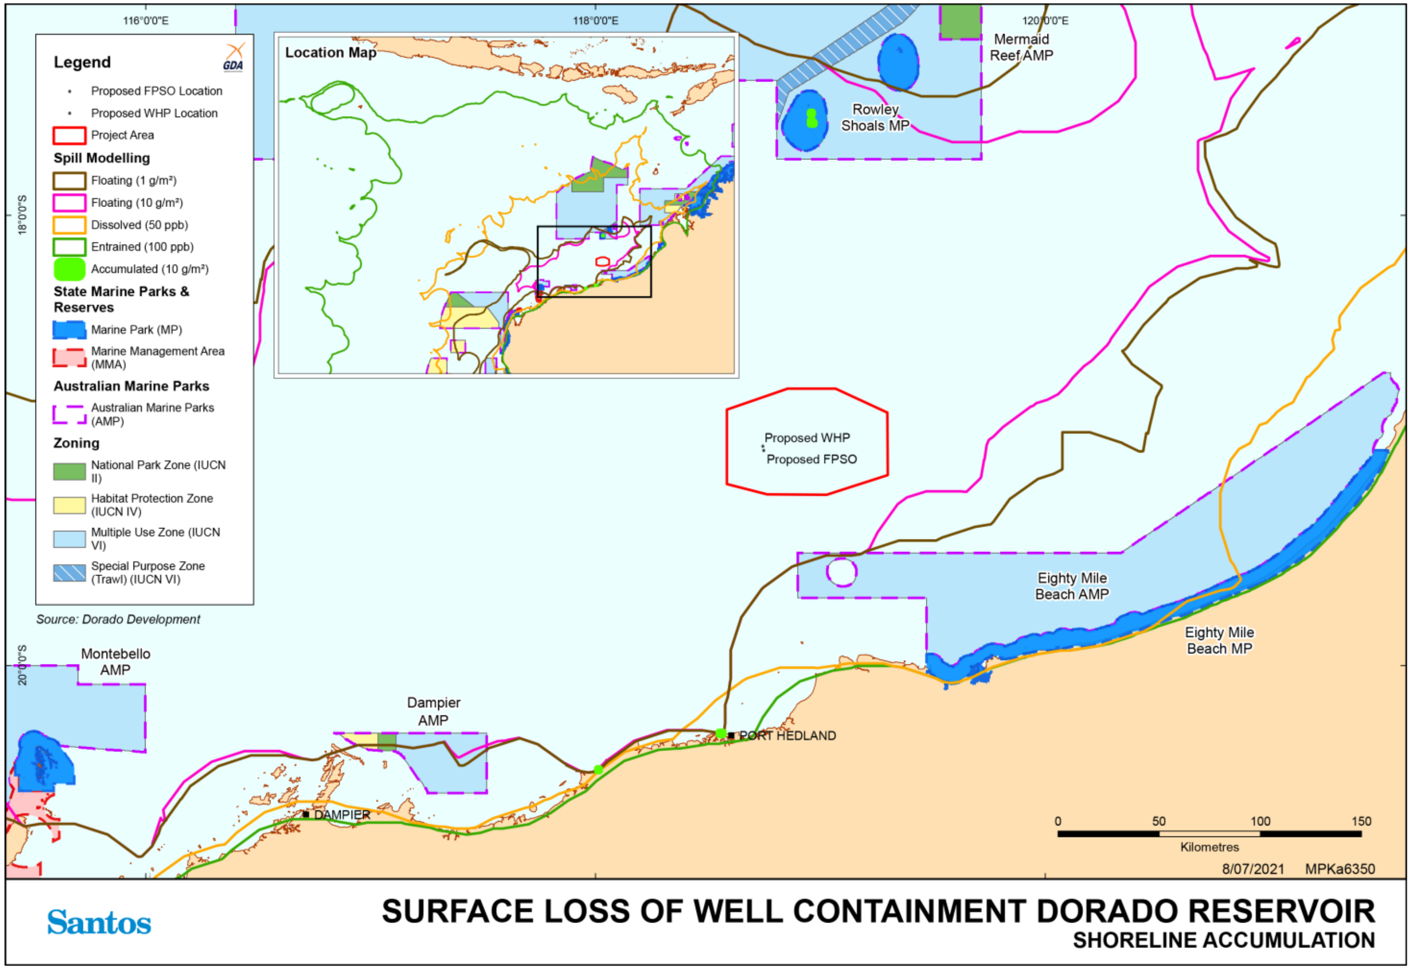

Figure 7-45: Stochastic modelling shoreline accumulation for a worst-case subsea loss of well containment (Dorado Reservoir)

Low 10 g/m² Represents a level of socio-economic effect	<u>Summer</u> + 11% probability of shoreline accumulation in minimum time of 11 days + 9% probability of shoreline accumulation at Port Hedland in minimum time of 11 days, 38m^3 maximum volume of oil ashore + Maximum length of shoreline accumulation at a sensitive receptor was 3 km at Port Hedland, with a peak shoreline loading of 2,320 g/m^2.	<u>Transition</u> + 1% probability of shoreline accumulation in minimum time of 2.8 days + 1% probability of shoreline accumulation at Port Hedland in minimum time of 2days, 10m^3 maximum volume of oil ashore + Maximum length of shoreline accumulation at a sensitive receptor was 1 km at Port Hedland, with a peak shoreline loading of 854 g/m^2	<u>Winter</u> + No predicted shoreline accumulation
Moderate 100 g/m^2 Likely to cause adverse impacts to marine or coastal fauna and habitats	+ 9% probability of shoreline accumulation at Port Hedland in minimum time of 11 days, along 3 km + Maximum length of shoreline accumulation was 4 km	+ 1% probability of shoreline accumulation at Port Hedland in minimum time of 3 days, along 1km	+ No predicted shoreline accumulation
High 1000 g/m^2 Impacts to shoreline receptors	+ 6% probability of shoreline accumulation at Port Hedland in minimum time of 11 days, along 2 km + Maximum length of shoreline accumulation was 2 km	+ No predicted shoreline accumulation	+ No predicted shoreline accumulation
DISSOLOVED AROMATIC HYDROCARBONS			
Low 10 ppb Lower than the exposure value at which ecological impacts are	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-43** and **Figure 7-44**. The figures show the dissolved hydrocarbons at 50ppb (moderate threshold). Further information is located in Section 9.2.3.4 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		
	<u>Summer</u> + Maximum extent from release location – 1,509km west-southwest.	<u>Transition</u> + Maximum extent from release location – 1,334km west southwest.	<u>Winter</u> + Exposure predicted up to maximum distance of 1,334km west southwest

expected to occur. Relevant for implementing environmental monitoring in event of oil spills	+ Based on all 100 simulations combined - 12 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 64 to 3%, with Montebello AMP being most probable (64% in minimum time of 12 days after spill and a maximum hydrocarbon concentration of 1,366ppb), followed by Gascoyne (43% in minimum time of 15.5 days after spill). The shortest time to contact predicted at Argo-Rowley Terrace within 7.5 days. Maximum dissolved concentrations of 3,000 ppb at Argo-Rowley Terrace AMP. + 1 to 38% probability of contacting 7 State Marine Parks. 39% probability at Rowley Shoals in minimum time of 8.8 days after spill and a maximum concentration of 982 ppb. The maximum dissolved concentration was 1,124 ppb at Montebello Islands. + 39% probability of entering State Waters in minimum time of 9 days after spill, and maximum dissolved hydrocarbon 1,799ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 32 receptors within the EMBA are predicted to be exposed. The greatest probability being 70% at Rankin Bank within 13 days, and a maximum dissolved hydrocarbon concentration of 1,469 ppb. + 2 Ramsar receptor within the combined simulations is potentially exposed with the probability of 12% at Eighty Mile Beach within 13 days with a maximum dissolved hydrocarbon concentration of 393ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 10% within 15 days and a maximum dissolved hydrocarbon concentration of 290ppb. Highest probability of dissolved	+ Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 57 to 1%, with Montebello AMP being most probable (57% in minimum time of 4.1 days after spill, maximum concentration of 608ppb), followed by Argo-Rowley Terrace AMP (47% in minimum time of 10 days after spill). The shortest time to contact predicted at Dampier AMP within 2.7 days. Maximum concentrations of 1,449 ppb @ Argo-Rowley Terrace AMP. + 2 to 46% probability of contacting 7 State Marine Parks, 46% at Rowley Shoals in minimum time of 13.5 days after spill and a maximum concentration of 571 ppb. The shortest time to contact was 9 days at the Montebello Islands. + 46% probability of entering State Waters in minimum time of 2.8 days after spill, and maximum entrained hydrocarbon 699 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 22 receptors within the EMBA are predicted to be exposed. The greatest probability being 78% at Glomar Shoal within 4 days, and a maximum entrained hydrocarbon concentration of 1,005 ppb, followed by Rankin Bank at 62% probability, within 6.8 days and a maximum concentration of 555 ppb. + <1% probability of exposure to Ramsar receptors. + Bedout Island (closest nearshore receptor to the south) with probability of 2% within	+ Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 78 to 4%, with Argo-Rowley Terrace AMP being most probable (78% in minimum time of 15.7 days after spill), followed by Montebello AMP (52% in minimum time of 18 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 7 days. Maximum concentrations of 2,387 ppb at Montebello AMP. + 1 to 64 % probability of contacting 6 State Marine Parks. Rowley Shoals (64% probability in a minimum time 16.5 days with a maximum concentration of 464 ppb). Montebello (7% probability in a minimum time 29 days with a maximum concentration of 804 ppb). + 64% probability of entering State Waters in minimum time of 10.75 days after spill, and maximum entrained hydrocarbon 1,735 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 14 receptors within the EMBA are predicted to be exposed. The greatest probability being 93% at Glomar within 9.4 days, and a maximum entrained hydrocarbon concentration of 494 ppb, followed by Rankin Bank at 66% probability (within 16 days), and a maximum concentration of 440 ppb. + 1 Ramsar receptor within the combined simulations potentially exposed with the

	contact at Imperieuse Reef of 37% within 12 days. Maximum dissolved hydrocarbon concentration of 1,556 ppb at Legendre Island, and the shortest time to contact of 11.5 days. + Based on all 100 simulations combined - 4 of the KEFs within the EMBA are predicted to be exposed, probability of exposure to individual KEFs, maximum probability of 24% at Ningaloo Reef (within 16 days @ 215 ppb). The probability of exposure at the 125m water depth Ancient Coastline adjacent to the Project Area was <1%.	18 days and a maximum entrained hydrocarbon concentration of 70ppb. Highest probability of contact at Imperieuse Reef of 38% within 18 days at 150 ppb maximum. The shortest time to contact was at Karratha in 2.96 days, and the maximum entrained hydrocarbon was at Karratha of 699ppb. + Based on all 100 simulations combined - 14 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 100% for the ancient coastline at 125m depth contour, within 1.5 days, and a maximum hydrocarbon concentration of 5,374ppb.	probability of 1% at Roebuck Bay within 115 days with a maximum concentration of 10 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 7% within 12 days and a maximum entrained hydrocarbon concentration of 296 ppb. Highest probability of contact at Imperieuse Reef of 55% within 19 days at 232 ppb. The maximum dissolved concentration at Hermite Island, within 29 days at 607ppb. + Based on all 100 simulations combined - 11 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 100% for the ancient coastline at 125m depth contour, within 0.9 days, and a maximum hydrocarbon concentration of 7,116 ppb.
Moderate 50 ppb Approximates potential toxic effects, particularly sublethal effects to sensitive species.	<u>Summer</u> + Maximum extent from release location – 1,265km, southwest. + Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, with Montebello AMP being most probable (35% in minimum time of 12 days after spill), followed by Argo-Rowley Terrace at 26% within 7.5 days. + 6 to 18% probability of contacting 4 State Marine Parks. 18% probability at Rowley Shoals in minimum time of 9 days after spill + 18% probability of entering State Waters in minimum time of 10 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 19 receptors within the EMBA are predicted to be	<u>Transition</u> + Maximum extent from release location – 1,117km west southwest. + Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 26 to 1%, with Montebello AMP being most probable (26% in minimum time of 5 days after spill). The shortest time to contact predicted at Dampier AMP within 2.75 days. + 1 to 14% probability of contacting 3 State Marine Parks, 14% at Rowley in minimum time of 13.5 days. + 14% probability of entering State Waters in minimum time of 2.9 days after spill.	<u>Winter</u> + Maximum extent from release location – 1,181km west. + Based on all 100 simulations combined - 11 of the AMPs within the EMBA are predicted to be exposed, maximum probability of exposure at Argo-Rowley Terrace of 33% in minimum time of 16 days after spill), followed by Montebello AMP (12% in minimum time of 20 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 8 days. + 1 to 64% probability of contacting 6 State Marine Parks, 64% at Rowley Shoals in minimum time of 16.5 days after the spill.

	exposed. The greatest probability being 44% at Rankin Bank within 14 days. + 1 Ramsar receptor within the combined simulations is potentially exposed with the probability of 5% at Eighty Mile Beach within 14 days. + Bedout Island (closest nearshore receptor to the south) with probability of 5% within 31 days. Highest probability of dissolved contact at Imperieuse Reef and Barrow Island of 11% within 12 days and 31 days respectively. + Based on all 100 simulations combined - 2 of the KEFs within the EMBA are predicted to be exposed, probability of 5%, at Ningaloo Reef (within 16 days).	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 11 receptors within the EMBA are predicted to be exposed. The greatest probability being 30% at Rankin Bank within 6.9 days. + No exposure of Ramsar receptors. + Highest probability of contact to nearshore receptor at Karratha of 1% within 3.5 days. + Based on all 100 simulations combined - 5 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 94% for the ancient coastline at 125m depth contour, within 1.8 days.	+ 28% probability of entering State Waters in minimum time of 10 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 23 receptors within the EMBA are predicted to be exposed. The greatest probability being 92% at Glomar Shoals within 9 days, followed by Rankin Bank at 92% probability, within 16 days + 1 Ramsar receptor within the combined simulations potentially exposed with the probability of 3% at Roebuck Bay within 82 days. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 12 days. Highest probability of contact at Imperieuse Reef of 79% within 19 days. + Based on all 100 simulations combined - 11 of the KEFs within the EMBA are predicted to be exposed, maximum probability of exposure at 100% at the ancient coastline at 125m depth contour, within 0.9 days
High 400 ppb Approximates toxic effects including lethal effects to sensitive species	Summer + Maxim west southwestern extent from release location – 892km + Based on all 100 simulations combined – 7 of the AMPs within the EMBA are predicted to be exposed, with Argo Rowley Terrace AMP being most probable (8% in minimum time of 7.5 days. + 1 to 3% probability of contacting 3 State Marine Parks. 3% probability at Eighty Mile Beach in minimum time of 13 days after spill.	Transition + Maximum extent from release location – 509km west + Based on all 100 simulations combined - 4 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 3% to 1%, with Argo-Rowley AMP being most probable (3% in minimum time of 13.6 days after spill.	Winter + Maximum extent from release location – 975km, southwest. + Based on all 100 simulations combined - 6 of the AMPs within the EMBA are predicted to be exposed, maximum probability of exposure at Montebello AMP of 3% in minimum time of 43 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 8 days.

	+ 5% probability of entering State Waters in minimum time of 11 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 3 receptors within the EMBA are predicted to be exposed. The greatest probability being 4% at Rankin Bank within 14 days. + <1% probability of exposure to Ramsar receptors. + 4% probability of exposure at nearshore receptors of Legendre Island and Haury Island within 12 days and 43 days respectively. <1% probability of contact at Bedout Island + <1% probability of exposure to the KEFs within the EMBA.	+ 1 % probability of contacting 1 State Marine Parks, 1% at Rowley Shoals in minimum time of 17 days. + 1% probability of entering State Waters in minimum time of 3.5 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 3 receptors within the EMBA are predicted to be exposed. The greatest probability being 5% at Glomar Shoals within 12 days. + No exposure of Ramsar receptors. + Highest probability of contact to nearshore receptor at Karratha of 1% within 3.5 days. + Based on all 100 simulations combined - 5 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 94% for the ancient coastline at 125m depth contour, within 1.8 days.	+ 1 to 2% probability of contacting 2 State Marine Parks, 2% at Montebello MP in minimum time of 66 days after the spill. + 3% probability of entering State Waters in minimum time of 25 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – only 1 receptor, with a probability of 1% at Glomar Shoals within 45 days. + No exposure of Ramsar receptors. + Highest probability of contact at Hermite Island of 2% within 67 days, <1% probability of contact at Bedout Island. + Based on all 100 simulations combined - 6 of the KEFs within the EMBA are predicted to be exposed, maximum probability of exposure at 100% at the ancient coastline at 125m depth contour, within 0.9 days
ENTRAINED HYDROCARBON			
Low 10 ppb Lower than the exposure value at which ecological impacts are expected to occur. Relevant for implementing environmental monitoring in	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-43** and **Figure 7-44**. The figures show the entrained hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. Further information is located in Section 9.2.3.3 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		
	<u>Summer</u> + Maximum extent from release location – 2,600km + Based on all 100 simulations combined - 20 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 95 to 5%, with Montebello AMP being most probable (95% in minimum time of 12 days after spill, maximum entrained hydrocarbon concentration of 10,713 ppb), followed by Gascoyne (93% in minimum time of 13	<u>Transition</u> + Maximum extent from release location – 2,488km + Based on all 100 simulations combined - 20 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 96 to 1%, with Argo-Rowley Terrace AMP being most probable (96% in minimum time of 8 days after spill), followed by Montebello AMP	<u>Winter</u> + Exposure predicted up to maximum distance of 2,932km west-northwest + Based on all 100 simulations combined - 19 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 100 to 1%, with Argo-Rowley Terrace AMP being most probable (100% in minimum time of 13 days after spill),

event of oil spills	days after spill). The shortest time to contact predicted at Eighty Mile Beach and Argo-Rowley Terrace within 7.5 days. + 7 to 83% probability of contacting 15 State Marine Parks, 83% probability at Ningaloo AMP in minimum time of 13.7 days after spill and a maximum concentration of 1,992ppb. Rowley Shoals had the shortest time to contact within 9 days and the maximum entrained hydrocarbon concentration of 10,648ppb. + 4 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 26% at Roebuck Bay within 44 days with a maximum entrained hydrocarbon concentration of 673ppb. Eighty Mile Beach is contacted in the shortest timeframe of 12.5 days, and has a maximum entrained hydrocarbon concentration of 2,912ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 104 receptors within the EMBA are predicted to be exposed. The greatest probability being 96% at Rankin Bank within 12.8 days, and a maximum entrained hydrocarbon concentration of 9,809 ppb. Imperieuse Reef is contacted within 10 days, and has the maximum entrained hydrocarbon concentration of 10,648ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 38% within 15 days and a maximum entrained hydrocarbon concentration of 1,743ppb. Highest probability of contact at Exmouth of 75% within 16 days. The shortest time to contact is at Delambre Island within 12 days, and Cunningham Island had the maximum entrained concentration of 10,648ppb. + Based on all 100 simulations combined - 7 of the KEFs within the EMBA are predicted to be	(94% in minimum time of 4 days after spill). The shortest time to contact predicted at Dampier AMP within 2.6 days. Maximum concentrations of 9,274 ppb @ Argo-Rowley Terrace AMP. + 1 to 81% probability of contacting 15 State Marine Parks, 81% at Rowley Shoals in minimum time of 10.8 days after spill and a maximum concentration of 7,374 ppb. The shortest time to contact was 7 days at the Montebello Islands. + 81% probability of entering State Waters in minimum time of 2.7 days after spill, and maximum entrained hydrocarbon 7,350 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 88 receptors within the EMBA are predicted to be exposed. The greatest probability being 97% at Glomar Shoal within 3 days, and a maximum entrained hydrocarbon concentration of 6,044 ppb, followed by Rankin Bank at 94% probability, within 6.2 days and a maximum concentration of 4,973 ppb. + 3 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 11 % at Peel-Yalgorup System within 79 days and maximum concentration of 70ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 17 days and a maximum entrained hydrocarbon concentration of 203 ppb. Highest probability of contact at Imperieuse Reef of 79% within 14 days at 3,953 ppb	followed by Montebello AMP (97% in minimum time of 16 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 6 days. Maximum concentrations of 9,426 ppb at Argo-Rowley Terrace AMP and 8,658 ppb at Montebello AMP. + 1 to 93 % probability of contacting 14 State Marine Parks. Rowley Shoals (93% probability in a minimum time 13.9 days with a maximum concentration of 6,812 ppb). Montebello (86% probability in a minimum time 22 days with a maximum concentration of 1,235 ppb). + 93% probability of entering State Waters in minimum time of 8.75 days after spill, and maximum entrained hydrocarbon 6,812 ppb. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 75 receptors within the EMBA are predicted to be exposed. The greatest probability being 99% at Glomar within 9 days, and a maximum entrained hydrocarbon concentration of 5,576 ppb, followed by Rankin Bank at 97% probability (within 16 days), and a maximum concentration of 10,764 ppb. + 5 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 11 % at Ashmore Reef Nature Reserve within 76 days with a maximum concentration of 30 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 18%

	exposed, probability of exposure of 79%, at Ningaloo Reef (within 14 days at 1,707 ppb maximum). The 125m water depth Ancient Coastline adjacent to the Project Area is not predicted to be contacted. + 83% probability of entering State Waters in minimum time of 8 days after spill, and maximum entrained hydrocarbon 10,648ppb.	maximum. The shortest time to contact was at Delambre Island in 2.75 days, and the maximum entrained hydrocarbon was at Clerke Reef of 5,829 ppb. + Based on all 100 simulations combined - 21 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 100% for the ancient coastline at 125m depth contour, within 1.2 days, and a maximum hydrocarbon concentration of 61,797ppb. The Continental Slope Demersal Communities KEF also has a probability of 100% for exposure, within 7 days, and a maximum entrained hydrocarbon concentration of 7,096ppb.	within 11 days and a maximum entrained hydrocarbon concentration of 199 ppb. Highest probability of contact at Imperieuse Reef and Cunningham Island of 92% within 18 and 19 days respectively at 3,460 ppb and 2,652ppb maximum concentrations respectively. + Based on all 100 simulations combined - 21 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 100% for the ancient coastline at 125m depth contour, within 1 days, and a maximum hydrocarbon concentration of 48,104ppb. The Continental Slope Demersal Communities KEF also has a probability of 100% for exposure, within 8.4 days, and a maximum entrained hydrocarbon concentration of 14,247 ppb.
Moderate 100 ppb	+ Maximum extent from release location – 1,994km + Exposure predicted at 18 AMPs, maximum probability of exposure 85% (Montebello AMP in minimum time of 12 days after spill) + Exposure predicted at 12 State Marine Parks maximum probability of exposure 57% (Rowley Shoals MP and Ningaloo MP, 57% and 36% respectively) in minimum time of 9 days and 15 days after spill respectively. + 57% probability of entering State Waters in minimum time of 9 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 50 receptors within the EMBA are predicted to be exposed. The greatest probability being 89% at Rankin Bank within 12 days.	+ Maximum extent from release location – 1,735km + Based on all 100 simulations combined - 13 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 87 to 1%, with Argo-Rowley Terrace AMP being most probable (87% in minimum time of 9 days after spill). The shortest time to contact predicted at Montebello AMP within 4.1 days. + 1 to 56% probability of contacting 8 State Marine Parks, 56% at Rowley in minimum time of 11.3 days, and a maximum entrained hydrocarbon concentration of 7,374ppb.	+ Exposure predicted up to maximum distance of 2,169km west-northwest + Based on all 100 simulations combined - 12 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 98 to 2%, with Argo-Rowley Terrace AMP being most probable (98% in minimum time of 14 days after spill), followed by Montebello AMP (87% in minimum time of 17 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP within 7 days. + 1 to 82% probability of contacting 9 State Marine Parks, 82% at Rowley Shoals in minimum time of 16 days after the spill.

	+ 4 Ramsar receptors within the combined simulations are potentially exposed with the greatest probability of 15% at Eighty Mile Beach within 19 days. + Bedout Island (closest nearshore receptor to the south) with probability of 33% within 15 days. Highest probability of contact at Imperieuse Reef of 53% within 12 days. The shortest time to contact is at Delambre Island within 12 days. + Based on all 100 simulations combined - 5 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 30%, at Ningaloo Reef (within 14 days). The 125m water depth Ancient Coastline adjacent to the Project Area is not predicted to be contacted.	+ 56% probability of entering State Waters in minimum time of 2.7 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 26 receptors within the EMBA are predicted to be exposed. The greatest probability being 86% at Rankin Bank and Glomar Shoals within 6.5 and 3.8 days respectively. + No exposure of Ramsar receptors. + Bedout Island (closest nearshore receptor to the south) with probability of 4% within 24 days. Highest probability of contact at Imperieuse Reef of 50% within 14 days. + Based on all 100 simulations combined - 17 of the KEFs within the EMBA are predicted to be exposed, probability of exposure of 100% for the ancient coastline at 125m depth contour, within 1.2 days. The Continental Slope Demersal Communities KEF has a probability of 94% for exposure, within 7 days.	+ 81% probability of entering State Waters in minimum time of 10 days after spill. + Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 23 receptors within the EMBA are predicted to be exposed. The greatest probability being 92% at Glomar Shoals within 9 days, followed by Rankin Bank at 92% probability, within 16 days + 1 Ramsar receptor within the combined simulations potentially exposed with the probability of 3% at Roebuck Bay within 82 days. + Bedout Island (closest nearshore receptor to the south) with probability of 6% within 12 days. Highest probability of contact at Imperieuse Reef of 79% within 19 days. + Based on all 100 simulations combined - 11 of the KEFs within the EMBA are predicted to be exposed, maximum probability of exposure at 100% at the ancient coastline at 125m depth contour, within 0.7 days.

Predicted impacts and risks based on Deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in:

1) **largest volume of oil ashore**
2) **longest length of shoreline with oil accumulation**

Largest volume of oil ashore (Refer Figure 7-46)	**Longest length of shoreline accumulation (Refer Figure 7-47)**
+ Floating oil exposure predicted north/northeast and west/southwest from the spill location + Shoreline accumulation from Day 42. + Maximum area of floating oil sea surface at 1g/m^2 is on Day 9 of 650m^3. + Shoreline accumulation at Port Hedland.	+ Floating oil exposure predicted northeast and west/southwest from the spill location + Shoreline accumulation at Port Hedland, Cunningham Island and Imperieuse Reef.

+ Maximum length of shoreline accumulation (at 100g/m^2) of 3km. + At end of spill, 61% spilled oil lost to the atmosphere through evaporation, 31% predicted to have decayed, 8% remained in the water column and 15 m^3 (<0.1%) predicted to remain on the shoreline.	+ Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 42 days after the spill started approximately 550 km^2. + Maximum length of actionable shoreline oiled (above 100 g/m^2) at any given time was 2 km, at approximately 76 days after the spill. + Largest volume of oil onshore at the low threshold (10g/m^2), 12m^3 on Day 75. + At end of spill, 60% spilled oil lost to the atmosphere through evaporation. 31% predicted to have decayed, 8% remained in the water column and 5 m^3 (<0.1%) predicted to remain on the shoreline.

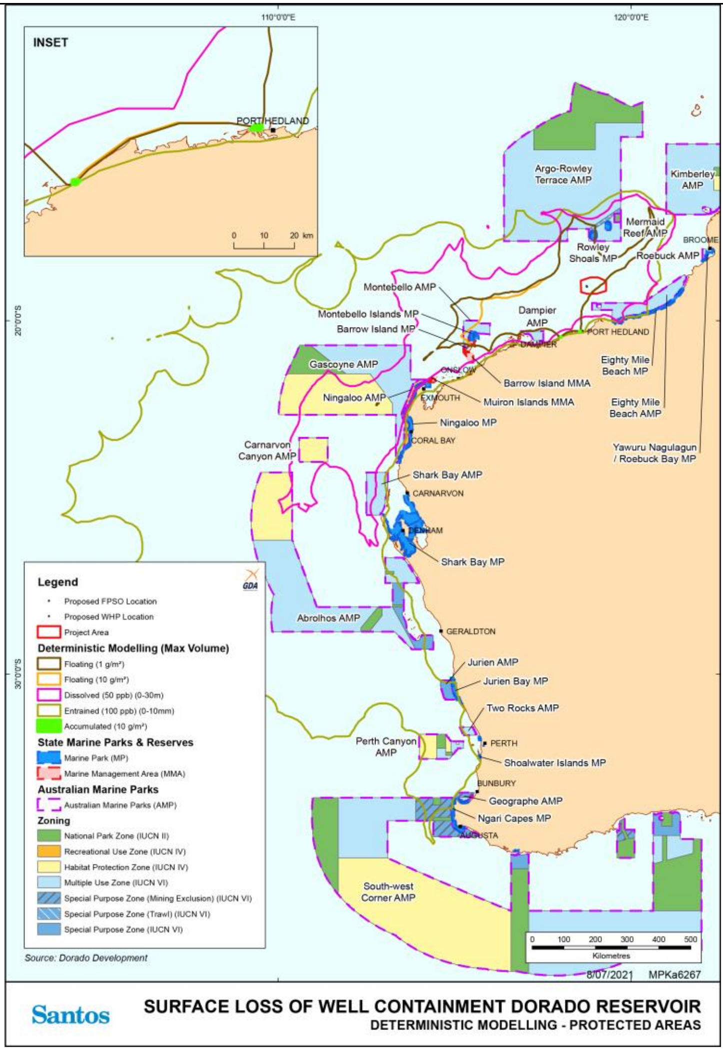

Figure 7-46: Worst-case deterministic model results for floating oil phase for a worst-case surface loss of well containment (Dorado Reservoir) based on largest volume of shoreline oil

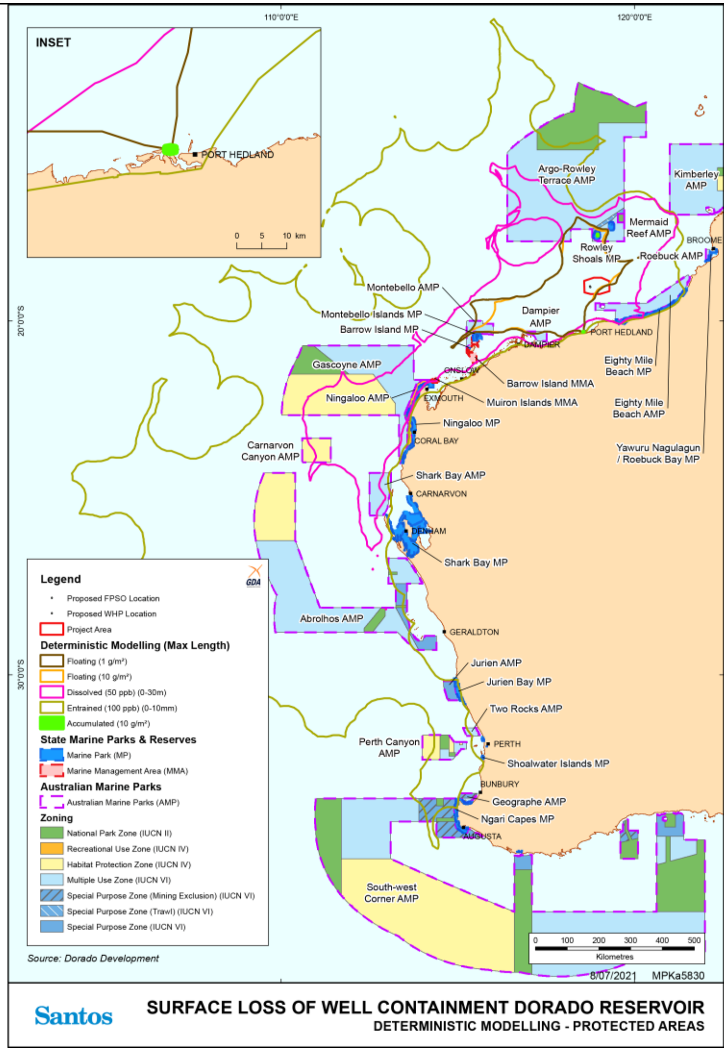

Figure 7-47: Worst-case deterministic model results for floating oil phase for a worst-case surface loss of well containment (Dorado Reservoir) based on largest maximum length of shoreline contact

7.3.1.5.3 Loss of Containment HFO due to Vessel Collision

Stochastic modelling results from the worst-case loss of containment due to a vessel collision scenario are shown in **Figure 7-48.** A summary of the stochastic modelling results for floating oil, shoreline accumulation, dissolved and entrained hydrocarbons for a subsea loss of well containment for each season is provided in **Table 7-79**. The worst-case deterministic runs, based on the largest volume of oil onshore and longest length of shoreline accumulation are shown in **Figure 7-50** and **Figure 7-51** and a summary of the results included in **Table 7-79**.

Winter + Spill direction – west at maximum distance 695km from release site + Based on all 100 simulations combined – one AMPs within the EMBA is predicted to be exposed, probability of exposure 3% at Argo-Rowley Terrace AMP minimum time of 7.7 days after spill. + No predicted contact State Marine Parks. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks
SHORELINE ACCUMULATION			
	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-49**. shows the shoreline accumulation at 10 g/m^2 (low threshold). Further information is located in Section 9.5.3.2 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		

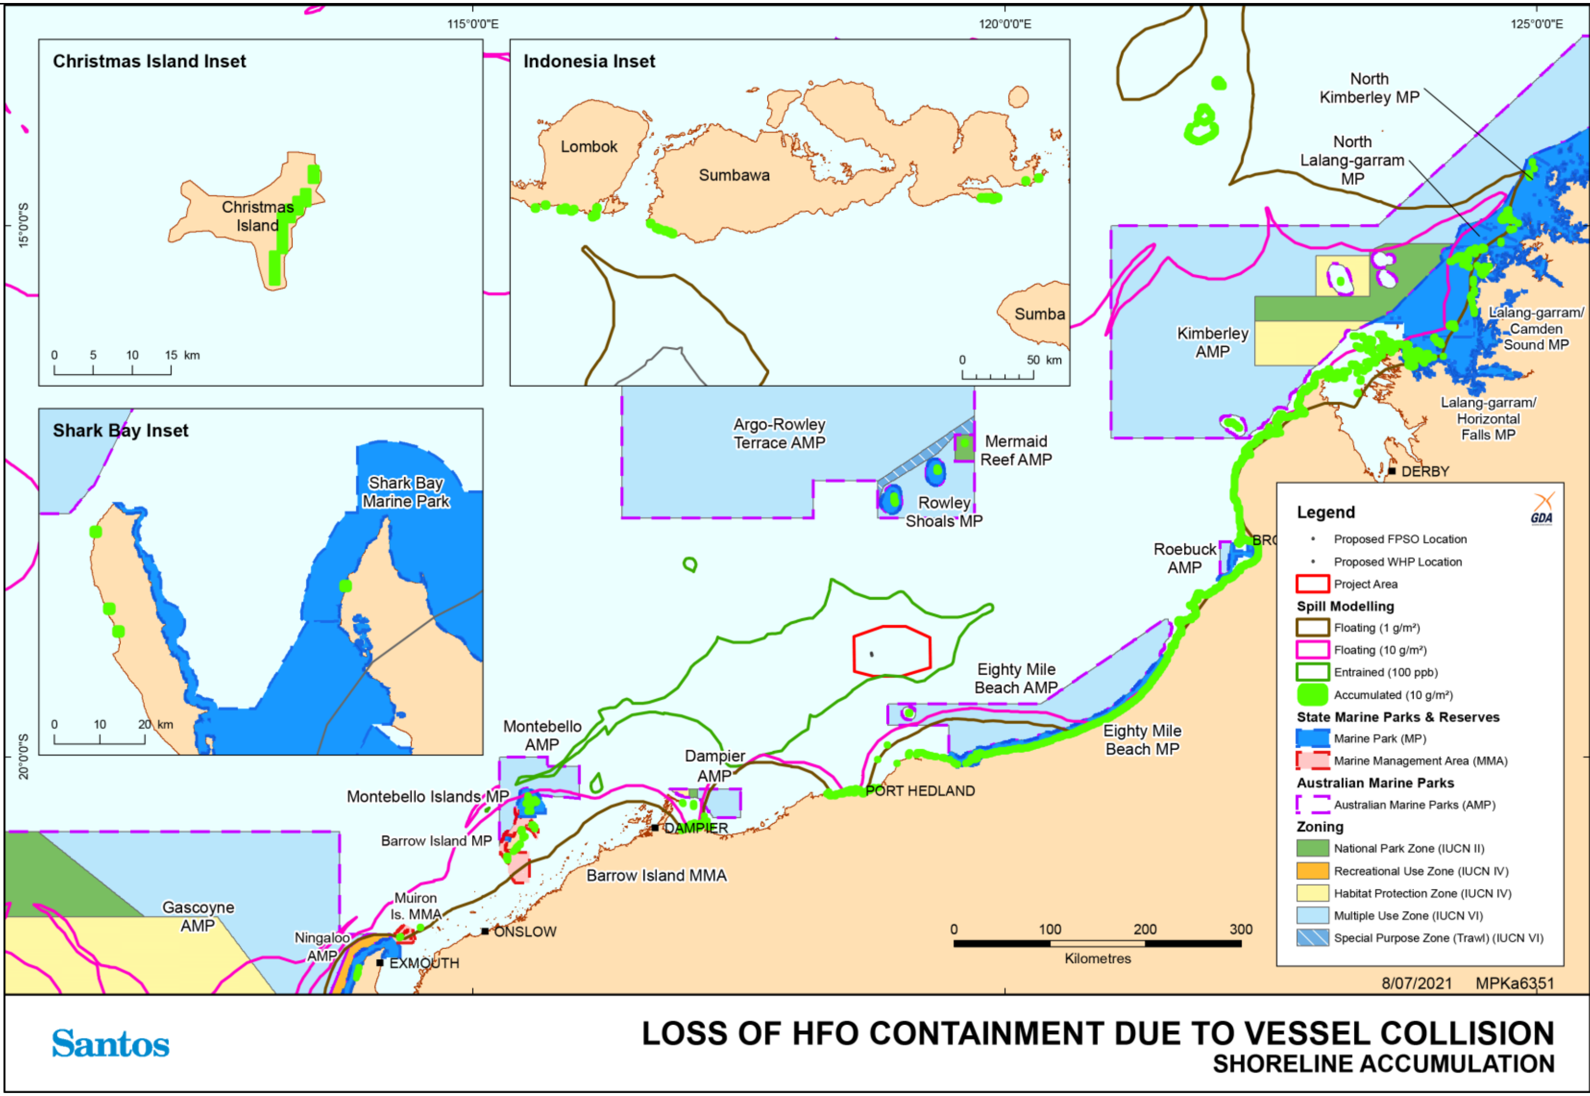

Figure 7-49: Stochastic modelling shoreline accumulation for a worst-case FPSO loss of HFO containment

Low 10 g/m² Represents a level of socio-economic effect	Summer + 72% probability of shoreline accumulation in minimum time of 12.3 days, maximum volume of oil ashore 1,684.5 m³ + Maximum length of shoreline accumulation 259km. + Maximum probability of 45% at sensitive receptor shoreline - Broome, within 12.3 days, peak shoreline loading 17,532g/m², peak volume 1,684m³, with a maximum length of 252km.	Transition + 31% probability of shoreline accumulation in minimum time of 11.7 days, maximum volume of oil ashore 1,383 m³ + Maximum length of shoreline accumulation 159km. + Maximum shoreline loading at sensitive receptor Broome of 10,684g/m², with a maximum length of shoreline accumulation of 118km. + Maximum probability of 21% at sensitive receptor shorelines – - Imperieuse Reef within 11.6 days, peak shoreline loadings of 17,468g/m², peak volume of 440m³ with a maximum length of 5km. - Cunningham Island within 12 days, peak shoreline loading of 3,991 g/m², peak volume of 1,383m³, with a maximum length of 2km.	Winter + 16% probability of shoreline accumulation in minimum time of 13.4 days, maximum volume of oil ashore 958 m³ + Maximum length of shoreline accumulation 112km. + Maximum shoreline loading at sensitive receptor Mermaid Reef of 10,149 g/m², with a maximum length of shoreline accumulation of 2km. + Maximum probability of 10% at sensitive receptor shorelines – - Cunningham Island within 13.9 days, peak shoreline loadings of 4,975 g/m², peak volume of 110 m³ with a maximum length of 2km. - Mermaid Reef within 15 days, peak shoreline loading of 10,149 g/m², peak volume of 225m³, with a maximum length of 2km.
Moderate 100 g/m² Likely to cause adverse impacts to marine or coastal fauna and habitats	+ Maximum length of shoreline accumulation 160km. + Maximum probability of 44% at sensitive receptor shoreline - Broome, within 12.3 days, with a maximum length of 148km.	+ Maximum length of shoreline accumulation 77km. + Maximum probability of 12% at sensitive receptor shoreline of Imperieuse Reef within 13.7 days, with a maximum length of 5km.	+ Maximum length of shoreline accumulation 84km + Maximum probability of 10% at sensitive receptor shorelines – - Cunningham Island within 14 days with a maximum length of 2km. - Imperieuse Reef within 13.5 days with a maximum length of 5km.

Santos

High 1000 g/m^2 Impacts to shoreline receptors	+ Maximum length of shoreline accumulation 44km. + Maximum probability of 41% at sensitive receptor shoreline - Broome, within 12.4 days, with a maximum length of 44km.	+ Maximum length of shoreline accumulation 31km. + Maximum probability of 12% at sensitive receptor shoreline of Imperieuse Reef within 13.7 days, with a maximum length of 5km.	+ Maximum length of shoreline accumulation 28km + Maximum probability of 5% at sensitive receptor shoreline of Imperieuse Reef within 13.6 days, with a maximum length of 3km.
DISSOLOVED AROMATIC HYDROCARBONS			
Low 10 ppb	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-48**. The figures show the dissolved hydrocarbons at 50 ppb (moderate threshold). Further information is located in Section 9.5.3.4 of **Attachment 8**. The seasonal assessment below is based on 100 spill simulations for each season.		
	Summer + Maximum extent from release location 42km northwest. + No predicted of contact of sensitive receptors	Transition + Maximum extent from release location 215km north-northwest. + No predicted of contact of sensitive receptors	Winter + No dissolved hydrocarbon exposure + No predicted of contact of sensitive receptors
Moderate 50 ppb	+ Maximum extent from release location 375km west. + No predicted of contact of sensitive receptors	+ No predicted of contact of sensitive receptors	+ No predicted of contact of sensitive receptors
High 400 ppb	+ No predicted of contact of sensitive receptors	+ No predicted of contact of sensitive receptors	+ No predicted of contact of sensitive receptors
ENTRAINED HYDROCARBON			
Low 10 ppb Lower than the exposure value at which most ecological impacts are expected to occur.	Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer **Figure 7-48**. The figures show the entrained hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. Further information is located in Section 9.5.3.3 of **Attachment 8-1**. The seasonal assessment below is based on 100 spill simulations for each season.		
	Summer + Maximum extent from release location 850km southwest. + Based on all 100 simulations combined - 3 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs was 1%, Montebello AMP being	Transition + Maximum extent from release location 506km + Based on all 100 simulations combined - 1 of the AMPs within the EMBA is predicted to be exposed, probability of exposure of 2%, Montebello AMP being contacted in the shortest	Winter + Maximum extent from release location 290km + No predicted of contact of sensitive receptors

Relevant for implementing environmental monitoring in event of an oil spill.	contacted in the shortest time of 5 days and a maximum concentration of 141 ppb. + No predicted contact State Marine Parks. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks + No predicted contact with Ramsar receptors or KEFs	time of 6.255 days and a maximum concentration of 92ppb. + No predicted contact State Marine Parks. + One Ramsar receptors within the combined simulations is potentially exposed with the probability of 2% at Rankin Bank within 7 days and maximum concentration of 37ppb. + No predicted entry to State Waters + No predicted contact with shorelines + No predicted contact with reefs, Shoals and Banks. + No predicted contact with KEFs	
Moderate 100 ppb Representative of sub-lethal impacts to most species and lethal impacts to sensitive species. Considered appropriate for environmental risk assessment.	+ Maximum extent from release location 411km west southwest. + Based on all 100 simulations combined - 1 of the AMPs within the EMBA is predicted to be exposed, probability of exposure of 1%, Montebello AMP being contacted in the shortest time of 5 days.	+ Maximum extent from release location 175km + No predicted of contact of sensitive receptors	+ Maximum extent from release location 125km + No predicted of contact of sensitive receptors

Predicted impacts and risks based on deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in:

1) **largest volume of oil ashore**
2) **longest length of shoreline with oil accumulation**

Largest volume of oil ashore refer Figure 7-50	Longest length of shoreline accumulation refer Figure 7-51
+ Floating oil exposure predicted northeast from the spill location, with accumulation along the Broome shoreline. + Maximum volume ashore 1,684m^3, 16 days after spill.	+ Floating oil exposure predicted northeast from the spill location, with accumulation along the Broome shoreline. + Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 12 days after the spill started approximately 424 km^2.

- Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 11 days after spill started, approximately 320 km^2.
- Maximum length of shoreline accumulation 48km on Day 17.
- At end of spill, 12% spilled oil lost to the atmosphere through evaporation, 37% predicted to have decayed, <0.1% remained in the water column and 921m^3 (51%) predicted to remain on the shoreline.

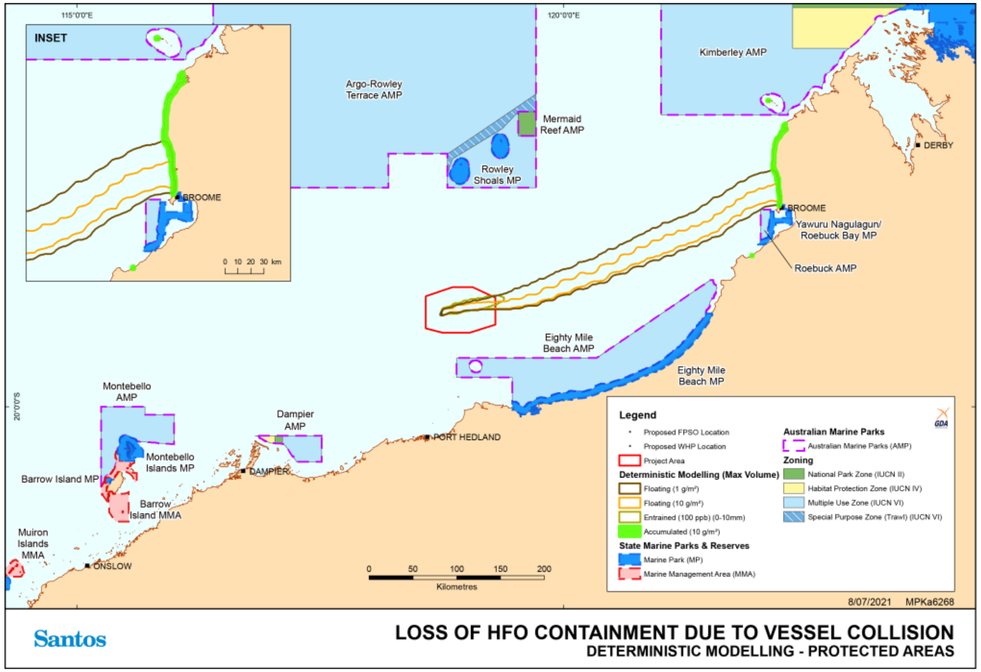

Figure 7-50: Worst-case deterministic model results for floating oil phase for a worst-case loss of HFO containment due to vessel collision based on the largest volume of oil ashore

- Shore accumulation from day 37. Maximum shoreline accumulation length of 155km from Day 50. Largest volume onshore (10 g/m^2) on Day 50 of 950m^3.
- At end of spill, 13% spilled oil lost to the atmosphere through evaporation. 37% predicted to have decayed, <0.1% remained in the water column and 895 m^3 (50%) predicted to remain on the shoreline.

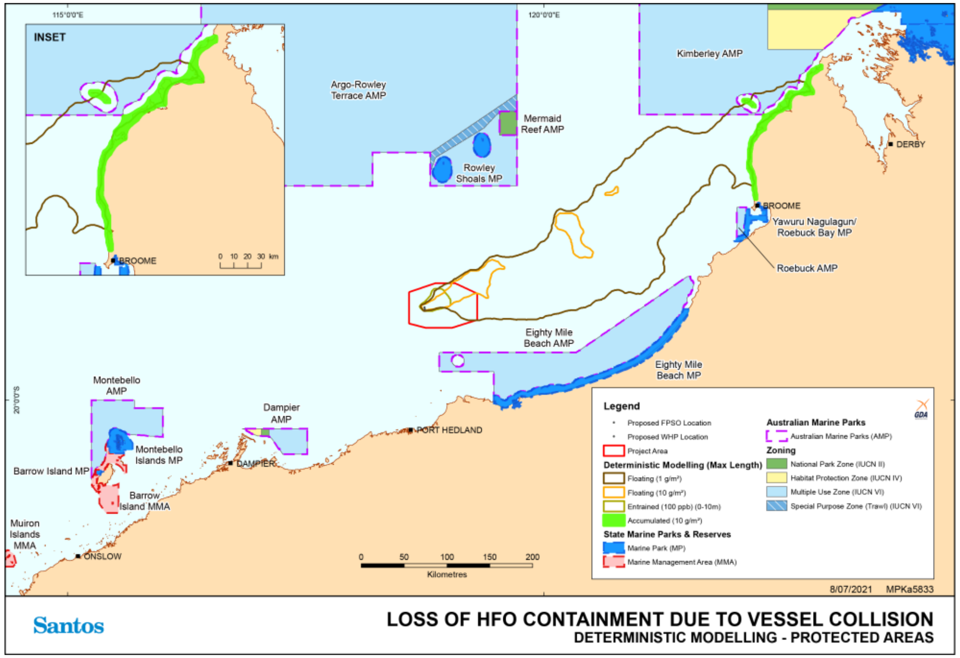

Figure 7-51: Worst-case deterministic model results for floating oil phase for a worst-case loss of HFO containment due to vessel collision based on the longest length of shoreline accumulation

7.3.1.5.4 Loss of Containment of FPSO Cargo Tank

Stochastic modelling results from the worst-case loss of containment due to a vessel collision scenario are shown in **Figure 7-52.** A summary of the stochastic modelling results for floating oil, shoreline accumulation, dissolved and entrained hydrocarbons for a subsea loss of well containment for each season is provided in **Table 7-80**. The worst-case deterministic model runs, based on the largest area of floating oil and largest area of entrained oil, are shown in **Figure 7-53** and **Figure 7-54.**

<table>
<tr><td rowspan="2">Low
10 ppb
Lower than the exposure value at which most ecological impacts are expected to occur.
Relevant for implementing environmental monitoring in event of an oil spill.</td><td colspan="3">Stochastic model predictions (EMBA is for all seasons that is 300 spill simulations, refer Figure 7-52. The figures show the entrained hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. Further information is located in Section 9.5.3.3 of Attachment 8-1. The seasonal assessment below is based on 100 spill simulations for each season.</td></tr>
<tr><td><u>Summer</u>
+ Maximum extent from release location 1,017km southwest.
+ Based on all 100 simulations combined - 8 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 2 to 12%, with Kimberley AMP being most probable (12% in minimum time of 15 days after spill, maximum entrained hydrocarbon concentration of 440 ppb), Argo-Rowley Terrace AMP being contacted in the shortest time of 7.9 days and a maximum concentration of 1,107 ppb.
+ 1-8 % probability of contacting 4 State Marine Parks, 8% probability at Rowley Shoals in minimum time of 10.9 days after spill and a maximum concentration of 1,082 ppb. Montebello Islands had the shortest time to contact within 10.9 days and the maximum entrained hydrocarbon concentration of 188ppb.
+ 8% probability of entering State Waters in minimum time of 6.9 days after spill
+ Highest probability of shoreline contact at sensitive receptors Clerke Reef, Cunningham Island and Imperieuse Reef of 5% at each, within 12, 15 and 16 days respectively. The shortest time to contact is at Legendre Island within 7 days, and Clerke Reef had the maximum entrained concentration of 1,020 ppb. Bedout Island is not predicted to be contacted.</td><td><u>Transition</u>
+ Based on all 100 simulations combined - 10 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 15%, with Argo Rowley Terrace and Montebello AMPs being most probable (15% in minimum time of 4 and 9 days respectively after spill, maximum entrained hydrocarbon concentration of 1,319 and 2,305 ppb respectively). Dampier AMP being contacted in the shortest time of 3 days and a maximum concentration of 29 ppb.
+ 1-8 % probability of contacting 5 State Marine Parks, 11% probability at Rowley Shoals in minimum time of 11.2 days after spill and a maximum concentration of 950 ppb. Montebello Islands had the shortest time to contact within 7.8 days and the maximum entrained hydrocarbon concentration of 232ppb.
+ 11% probability of entering State Waters in minimum time of 4.6 days after spill
+ Bedout Island (closest nearshore receptor to the south) with probability of 1% within 11.5 days and a maximum entrained hydrocarbon concentration of 14 ppb. Highest probability of shoreline contact at sensitive receptor Clerke Reef of 11% within 12 days. The shortest time to contact is at Hermite Island within 7.8 days, and Clerke Reef had the maximum entrained concentration of 888 ppb.
+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined</td><td><u>Winter</u>
+ Based on all 100 simulations combined - 9 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 20%, with Montebello AMP being most probable (20% in minimum time of 9 days after spill, maximum entrained hydrocarbon concentration of 505 ppb), Eighty Mile Beach AMP being contacted in the shortest time of 4.13 days and a maximum concentration of 92 ppb. Argo-Rowley Terrace had the maximum entrained concentration of 539ppb.
+ 1-15% probability of contacting 3 State Marine Parks, 15% probability at Rowley Shoals in minimum time of 18.7 days after spill and a maximum concentration of 227 ppb.
+ 15% probability of entering State Waters in minimum time of 18.7 days after spill
+ Highest probability of shoreline contact at sensitive receptors Cunningham Island and Imperieuse Reef of 12% at each, within 21 and 20 days respectively. Imperieuse Reef had the maximum entrained concentration of 222 ppb. Bedout Island is not predicted to be contacted.
+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 8 receptors within the EMBA are predicted to be exposed. The greatest probability being 29% at Glomar Shoal within 5.3 days, and a maximum entrained hydrocarbon concentration of 1,369 ppb.</td></tr>
</table>

	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 9 receptors within the EMBA are predicted to be exposed. The greatest probability being 12% at Rankin Bank within 8 days, and a maximum entrained hydrocarbon concentration of 466 ppb. Clerke Reef has the maximum entrained hydrocarbon concentration of 1,069 ppb. + No predicted contact with Ramsar receptors + Based on all 100 simulations combined – one KEF within the EMBA is predicted to be exposed, with a probability of exposure of 21%, at Glomar Shoals (within 6.5 days at 641 ppb maximum). The 125m water depth Ancient Coastline adjacent to the Project Area is not predicted to be contacted.	– 10 receptors within the EMBA are predicted to be exposed. The greatest probability being 25% at Glomar Shoal within 7 days, and a maximum entrained hydrocarbon concentration of 469 ppb. Clerke Reef has the maximum entrained hydrocarbon concentration of 936 ppb. + No predicted contact with Ramsar receptors + Based on all 100 simulations combined – 2 KEFs within the EMBA are predicted to be exposed, with a probability of exposure of 24%, at Glomar Shoals (within 3.7 days at 1,835 ppb maximum). The 125m water depth Ancient Coastline adjacent to the Project Area is not predicted to be contacted.	+ No predicted contact with Ramsar receptors + Based on all 100 simulations combined – one KEF within the EMBA is predicted to be exposed, with a probability of exposure of 26%, at Glomar Shoals (within 5.2 days at 457 ppb maximum). The 125m water depth Ancient Coastline adjacent to the Project Area is not predicted to be contacted.
Moderate 100 ppb Representative of sub-lethal impacts to most species and lethal impacts to sensitive species. Considered appropriate for environmental risk assessment.	+ Maximum extent from release location 939km west-southwest. + Based on all 100 simulations combined - 7 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 6%, with Kimberley AMP being most probable (6% in minimum time of 16 days after spill), Argo-Rowley Terrace AMP being contacted in the shortest time of 8.3 days. + 1-3 % probability of contacting 3 State Marine Parks, 3% probability at Rowley Shoals in minimum time of 11 days. + 3% probability of entering State Waters in minimum time of 11 days after spill + Highest probability of shoreline contact at sensitive receptors Clerke Reef and Cunningham Island of 2% at each, within 11.5 and 17 days respectively.	+ Maximum extent from release location 973km. + Based on all 100 simulations combined - 5 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 8%, with Argo Rowley Terrace AMPs being most probable (8% in minimum time of 9 days after spill. Montebello AMP being contacted in the shortest time of 4.6 days. + 1-9 % probability of contacting 3 State Marine Parks, 9% probability at Rowley Shoals in minimum time of 11.5 days. Montebello Islands had the shortest time to contact within 7.8 days. + 11% probability of entering State Waters in minimum time of 4.6 days after spill + No predicted contact at Bedout Island (closest nearshore receptor to the south). Highest probability of shoreline contact at sensitive receptor Clerke Reef of 11% within 12 days.	+ Maximum extent from release location 754km. + Based on all 100 simulations combined - 4 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 6%, with Argo-Rowley Terrace AMP being most probable (6% in minimum time of 17.6 days), Eighty Mile Beach AMP being contacted in the shortest time of 9.3 days. + 5% probability of contacting one State Marine Parks, 5% probability at Rowley Shoals in minimum time of 20.6 days. + 4% probability of entering State Waters in minimum time of 20.6 days after spill + Highest probability of shoreline contact at sensitive receptors Cunningham Island and Imperieuse Reef of 1% at each, within 28 days at both.

	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 4 receptors within the EMBA are predicted to be exposed. The greatest probability being 6% at Rankin Bank within 8 days. + Based on all 100 simulations combined – one KEF within the EMBA is predicted to be exposed, with a probability of exposure of 2%, at Glomar Shoals within 6.5 days.	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 6 receptors within the EMBA are predicted to be exposed. The greatest probability being 11% at Glomar Shoal within 11.2 days. + No predicted contact with Ramsar receptors + Based on all 100 simulations combined – one KEF within the EMBA is predicted to be exposed, with a probability of exposure of 6%, at Glomar Shoals within 3.7 days.	+ Reef, shoal and bank receptors vary between seasons, based on all 100 simulations combined – 3 receptors within the EMBA are predicted to be exposed. The greatest probability being 14% at Glomar Shoal within 5.4 days. + No predicted contact with Ramsar receptors + Based on all 100 simulations combined – one KEF within the EMBA is predicted to be exposed, with a probability of exposure of 11%, at Glomar Shoals within 5.4days.

Predicted impacts and risks based on deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in:

1) **Largest area of floating oil (above 50g/m^2)**
2) **Largest area of entrained hydrocarbons**

Largest area of floating oil refer Figure 7-53	Largest area of entrained hydrocarbons refer Figure 7-54
+ Floating oil exposure predicted northwest from the spill location, up to a maximum distance of 59km (1-10 g/m^2) + Maximum area of coverage of visible oil (>1g/m^2) on the sea surface predicted 4 days after spill started, approximately 86 km^2. + Maximum length of shoreline accumulation 48km on Day 17. + At end of spill, 66% spilled oil lost to the atmosphere through evaporation, 20% predicted to have decayed, 14% remained in the water column. No floating oil remaining after 5 days.	+ Maximum distance of entrained hydrocarbons at the low threshold (10-100ppb) extend 1,010km to the northwest. + At end of spill, 41% spilled oil lost to the atmosphere through evaporation. 43% predicted to have decayed, 16% remained in the water column.

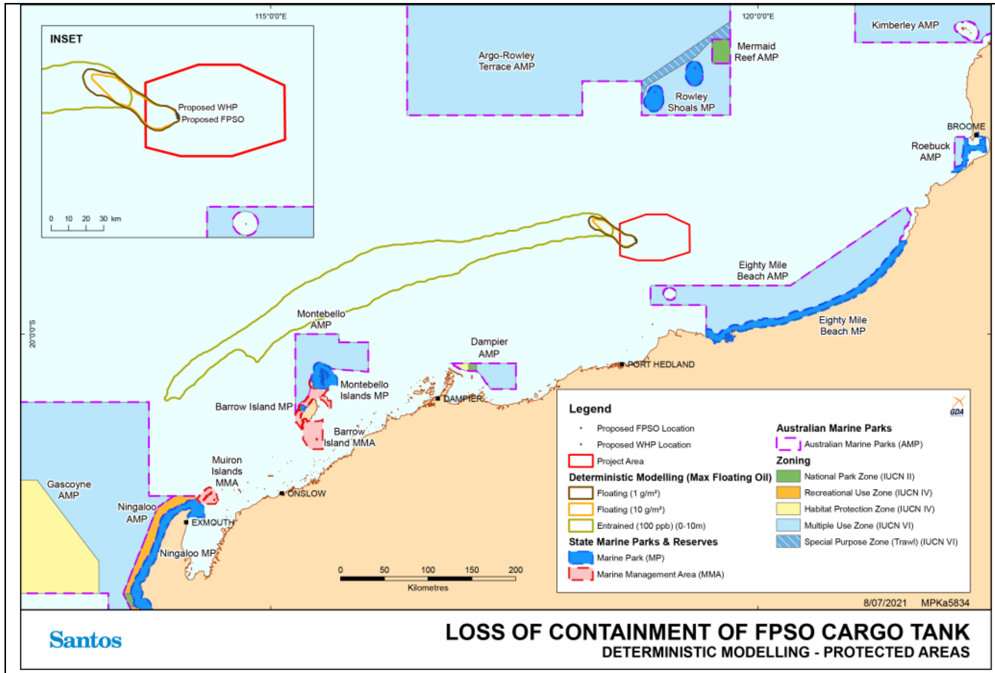

Figure 7-53: Worst-case deterministic model results for floating oil phase for a worst-case loss of Caley crude containment due to vessel collision based on the largest area of floating oil

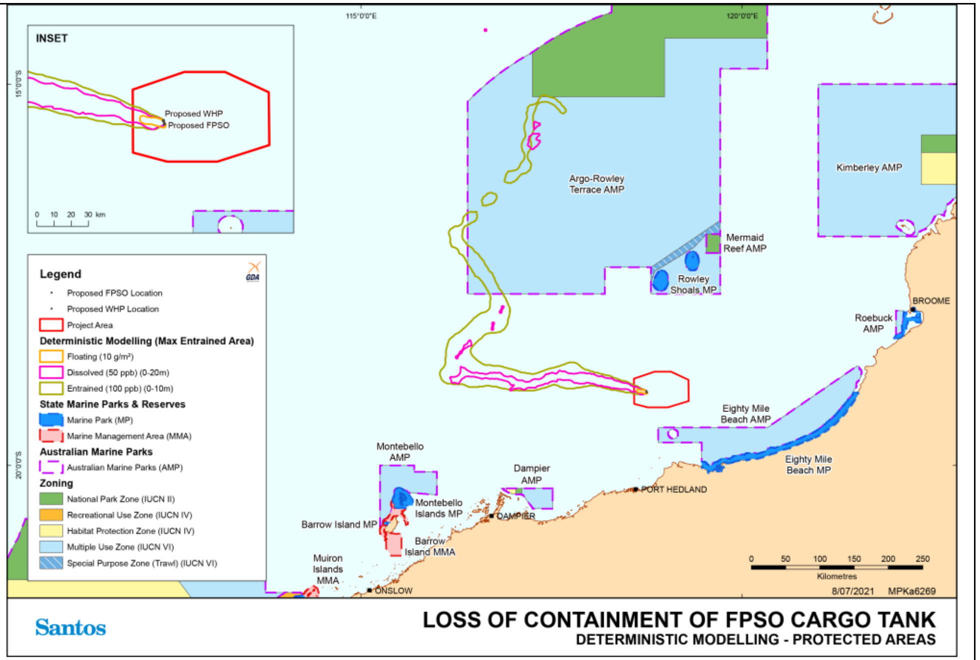

Figure 7-54: Worst-case deterministic model results for floating oil phase for a worst-case loss of Caley crude containment due to vessel collision based on the largest area of entrained hydrocarbon

7.3.1.5.5 Subsea Loss of Well Containment from Future Tieback (based on the Bedout Multi Well EP)

Results from the worst-case subsea loss of well containment scenario for the Bedout Apus-1 well location as described and presented in the Bedout exploration activity (Bedout Multi-Well Drilling Environment Plan) and representing future tiebacks for Dorado Phase 1, are shown in **Figure 7-55** and **Figure 7-56**. A summary of the stochastic modelling results for floating oil, shoreline accumulation, dissolved and total submerged hydrocarbons for a subsea loss of well containment for each season is provided in. The worst-case deterministic runs, based on the largest volume of oil onshore are shown in **Figure 7-58.**

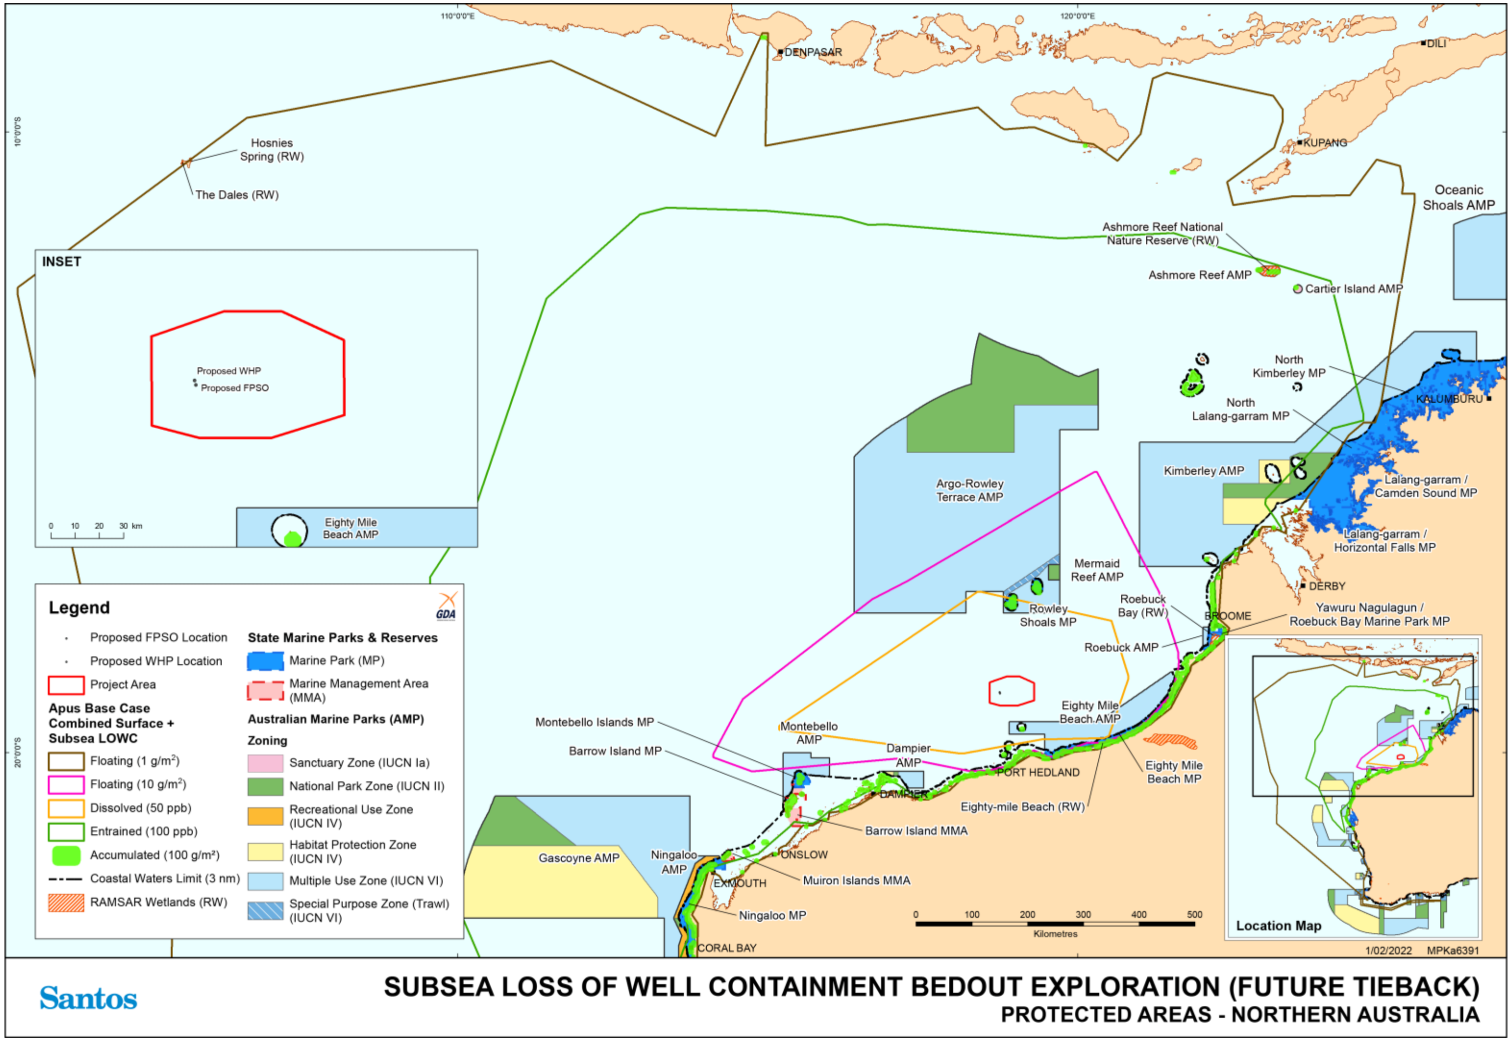

Figure 7-55: EMBA derived from stochastic modelling for floating, dissolved, total submerged oil and shoreline accumulation oil phases for a worst-case subsea loss of well containment (representing future tiebacks for Dorado Phase 1) – protected areas north

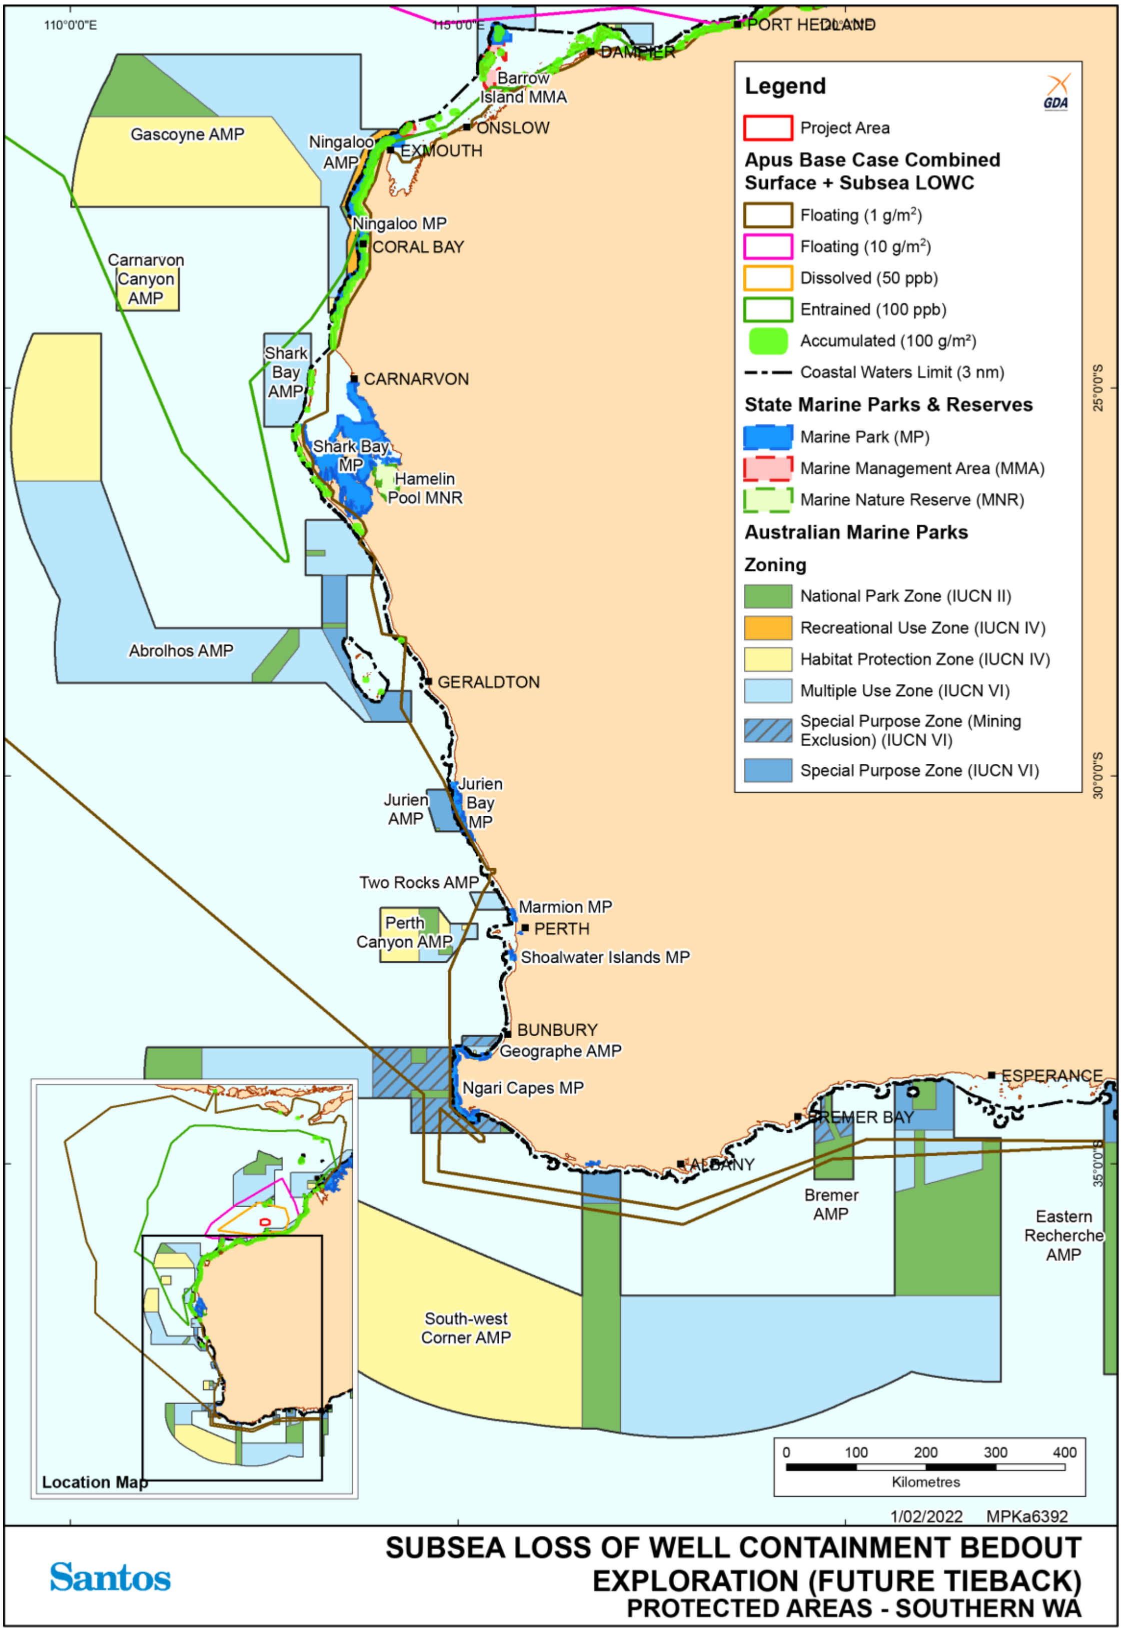

Figure 7-56: EMBA derived from stochastic modelling for floating, dissolved, total submerged oil and shoreline accumulation oil phases for a worst-case subsea loss of well containment (representing future tiebacks for Dorado Phase 1) – protected areas south

Table 7-81: Worst-case subsea loss of well containment scenario for Bedout exploration activity (representing future tiebacks for Dorado Phase 1)

Impact Thresholds (NOPSEMA, 2019b)	Predicted impacts and risks based on stochastic model predictions = footprint (trajectory and fate) encompassing 150 releases (staggered approximately fortnightly across five years of hydrodynamic and wind data). A total of 150 individual 'realisations' made up the full stochastic simulation set.
FLOATING OIL (SURFACE)	
Low 1 g/m^2 Visible but no biological effects. Lower than the exposure value for ecological impacts Relevant for implementing environmental monitoring in event of oil spills	**Figure 7-55** and **Figure 7-56** show the stochastic modelling predictions for floating oil at 1 g/m^2 (low threshold) and 10 g/m^2 (moderate threshold). Maximum extents predicted at the 1 g/m^2 threshold + Maximum extent from release location – 1,100 km, west southwest. + Based on all 150 simulations - 5 of the AMPs within the EMBA are predicted to be exposed. Probability of exposure to individual AMPs ranged from 16% to 91%, with Eighty Mile Beach AMP being most probable (91% in minimum time of 1.8 days after spill), followed by Roebuck – Eighty Mile Beach AMP (27% in minimum time of 16.1 days after spill). The shortest time to contact predicted at Eighty Mile Beach AMP at 1.8 days. + 1 to 37% probability of contacting shorelines at King sound, Broome North Coast, Port Hedland-Eighty Mile Beach, Eighty Mile Beach Northern Island Coast, Ningaloo Coast North and Southern Island Coast in minimum time of 6 to 89 days after spill. + 1% to 63% probability of contacting reefs, shoals, islands and banks (Barracouta Shoals, Browse Island, Bedout Island, Montebello Islands Seringapatam Reef, Scot Reef North, Scott Reef South, Clerke Reef, Imperieuse Reef, Glomar Shoals, Ranking Bank and Rowley Shoals in minimum time of 3 to 94 days after spill. + KEFs at seabed or near seabed features are not contacted by floating oil.
Moderate 10 g/m^2 Environmental values and sensitivities may be at risk of impacts from floating oil.	+ Maximum extent from release location – 550 km, west. + Based on all the 150 simulations - 2 AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1 to 54%, with Eighty Mile Beach AMP more probable (54% in minimum time of 1.8 days) and Mermaid Reef AMP 1 % in 17.5 days. + 23% probability of contacting Bedout Island in minimum time of 3.3 days after spill. + 4 to 5% probability of contacting reefs, shoals and banks (Glomar Shoals and Rowley Shoals) in minimum time of 18 to 23 days after spill + KEFs are seabed or near seabed features are not contacted by floating oil.

High 50 g/m² Potential for impact of surface oil to wildlife	+ Maximum extent from release location – 225 km, west northwest. + Contact limited to Eighty Miley Beach AMP (7% probability with a minimum time of 3.8 days) and Bedout island (3.3% probability with a minimum time of 13.6 days).
SHORELINE ACCUMULATION	
Low 10 g/m² Represents a level of socio-economic effect	Stochastic model predictions EMBA is for the 100 simulations in **Figure 7-55** and **Figure 7-56**. **Figure 7-57** shows the shoreline accumulation at 10 g/m² (low threshold). The seasonal assessment below is based on 150 simulations annualised.  **Figure 7-57: Stochastic modelling shoreline accumulation for a worst-case subsea loss of well containment (representing future tiebacks for Dorado Phase 1)**

	+ Maximum shoreline accumulation is 2, 054 tonnes. + Highest probability of contact is 82% with the minimum time of 3.5 days + Maximum length of shoreline accumulation 210 km + Based on 150 replicate simulations combined - 37 shoreline receptors with probability of exposure to each ranging from 1 to 81%. Key receptors with highest probability of contact and minimal arrival time include: - Bedout Island (82% contact within 3.5 days, peak loading 27, 259 g/m^2, with peak volume 324 tonnes, maximum length of shoreline loading @5.7 km). - Imperieuse (58% within 13.5 days, peak loading 33,593 g/m^2, with a peak volume of 1,014 tonnes, and a maximum length of shoreline loading @ 56.9km). - Dampier Archipelago (55% within 15 days, peak loading 21, 712 g/m^2, with a peak volume of 848.9 tonnes, and a maximum length of shoreline loading @ 91 km). - Montebello Island (49% within 22 days, peak loading 12, 989 g/m^2, with a peak volume of 337 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (44% within 24 days, peak loading 17,043 g/m^2, with a peak volume of 473 tonnes, and a maximum length of shoreline loading @ 73km). - Southern Island Coast (41% within 26 days, peak loading 12, 788, with peak loading of 315 tonnes, and maximum length of shoreline loading 22.7 km). - Ningaloo Coast North (41% contact within 31 days, peak loading 7, 498g/m^2, with peak volume of 400 tonnes, and maximum length of shoreline loading @ 210 km)
Moderate 100 g/m^2 Likely to cause adverse impacts to marine or coastal fauna and habitats	+ Maximum shoreline accumulation is 2, 054 tonnes. + Highest probability of contact is 81% with the minimum time of 3.5 days + Maximum length of shoreline accumulation 187 km + Based on 150 replicate simulations combined - 31 shoreline receptors with probability of exposure to each ranging from 1 to 81%. Key receptors with highest probability of contact and minimal arrival time include: - Imperieuse (57% within 13.5 days, peak loading 27, 259 g/m^2, with a peak volume of 1014 tonnes, and a maximum length of shoreline loading @ 56.9km). - Dampier Archipelago (55% within 15 days, peak loading 21, 712 g/m^2, with a peak volume of 849 tonnes, and a maximum length of shoreline loading @ 85.3 km). - Montebello Island (46% within 19 days, peak loading 17, 238 g/m^2, with a peak volume of 419 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (42% within 24 days, peak loading 12, 989 g/m^2, with a peak volume of 337 tonnes, and a maximum length of shoreline loading @ 68km). - Ningaloo Coast North (40% contact within 30 days, peak loading 7, 498 g/m^2, with peak volume of 397 tonnes, and maximum length of shoreline loading @ 187 km)

	- Bedout Island (81% contact within 3.5 days, peak loading 28, 497 g/m2, with peak volume 324 tonnes, maximum length of shoreline loading @5.7 km).
High 1000 g/m² Impacts to shoreline receptors	+ Maximum shoreline accumulation is 2, 040 tonnes. + Highest probability of contact is 70% with the minimum time of 5.7 days + Maximum length of shoreline accumulation 68 km + Based on 150 replicate simulations combined - 22 shoreline receptors with probability of exposure to each ranging from 1 to 70%. Key receptors with highest probability of contact and minimal arrival time include: - Imperieuse (45% within 13.5 days, peak loading 27, 259 g/m², with a peak volume of 1008 tonnes, and a maximum length of shoreline loading @ 56.9km). - Dampier Archipelago (51% within 15 days, peak loading 27, 712 g/m², with a peak volume of 833 tonnes, and a maximum length of shoreline loading @ 68 km). - Montebello Island (38% within 17 days, peak loading 17, 238 g/m², with a peak volume of 417 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (33% within 24 days, peak loading 12, 989 g/m², with a peak volume of 331 tonnes, and a maximum length of shoreline loading @ 51 km). - Southern Island Coast (31% within 29 days, peak loading 17, 788, with peak loading of 27 tonnes, and maximum length of shoreline loading 17.1 km). - Ningaloo Coast North (26% contact within 31 days, peak loading 7, 498 g/m², with peak volume of 307 tonnes, and maximum length of shoreline loading @ 68 km) - Bedout Island (70% contact within 3.5 days, peak loading 24,165 g/m2, with peak volume 274 tonnes, maximum length of shoreline loading @5.7 km).
DISSOLOVED AROMATIC HYDROCARBONS	
Low 10 ppb Lower than the exposure value at which ecological impacts are expected to occur. Relevant for implementing environmental monitoring in event of oil spills	Stochastic model predictions EMBA is based on 100 spill simulations, refer to **Figure 7-55** and **Figure 7-56**. The figures show the dissolved hydrocarbons at 50 ppb (moderate threshold).
	+ Maximum extent from release location – 350 km northeast + Based on all 150 simulations combined – Eighty Mile Beach was the only AMP contacted (47% probability) + Bedout island was the only other shoreline contacted at low probability (1.3%)
Moderate	+ Maximum extent from release location – 150 km northeast

50 ppb Approximates potential toxic effects, particularly sublethal effects to sensitive species.	+ Eighty Mile Beach AMP was the only receptor contacted at low probability (5%)
High 400 ppb Approximates toxic effects including lethal effects to sensitive species	+ Maximum extent from release location – 100 km northeast + No contact above the high exposure value (400 ppb) for dissolved hydrocarbons.
Total Submerged Oil	
Low 10 ppb Lower than the exposure value at which most ecological impacts are expected to occur. Relevant for implementing environmental monitoring in event of an oil spill.	Stochastic model predictions (EMBA is for 150 spill simulations, refer **Figure 7-55** and **Figure 7-56.** The figures show the total submerged hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. + Maximum extent from release location – 1800 km + Based on all 150 simulations combined - 9 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 2% to 99%, with Eighty Mile Beach AMP with the highest probability and shortest time to contact (99% in minimum time of 2.2 days after spill). + 14 Reef, shoal and bank receptors within the EMBA are predicted to be exposed. The greatest probability being 93% at Glomar Shoals within 9.3 days, and a maximum concentration of 128.4 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 95% within 3.8 days and a maximum hydrocarbon concentration of 320.4 ppb.
Moderate 100 ppb Representative of sub-lethal impacts to most species and lethal impacts to sensitive species. Considered appropriate for environmental risk assessment.	+ Maximum extent from release location – 1100 km + Based on all 150 simulations combined - 6 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 2% to 99%, with Eighty Mile Beach AMP with the highest probability and shortest time to contact (99% in minimum time of 2.2 days after spill). + 4 Reef, shoal and bank receptors within the EMBA are predicted to be exposed. The greatest probability being 58% at Glomar Shoals within 11 days, and a maximum concentration of 872 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 73% within 4 days.

(NOPSEMA 2019)	

Predicted impacts and risks based on deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in the largest volume of oil ashore and longest length of shoreline with oil accumulation (Figure 7-58)

- Stochastic realisation 24 of the Apus Base Case Subsea LOWC scenario resulted in the highest accumulated shoreline load (for that scenario) of 2,054 tonnes (of which the entire accumulated load exceeded 10 g/m^2 and 100 g/m^2).
- Shoreline loading greater than 10 and 100 g/m^2 extended up to ~350 km of the release site (**Figure 7-58**).
- Total submerged oil exceeding 100 ppb extended up to ~700 km in sparse patches that travelled to the north-east of the release site, while the majority of exceedances were confined to within ~300 km of the release site (**Figure 7-58**).
- Dissolved hydrocarbons exceeding 50 ppb were limited in spatial extent to within ~50 km from the release location **(Figure 7-58**).

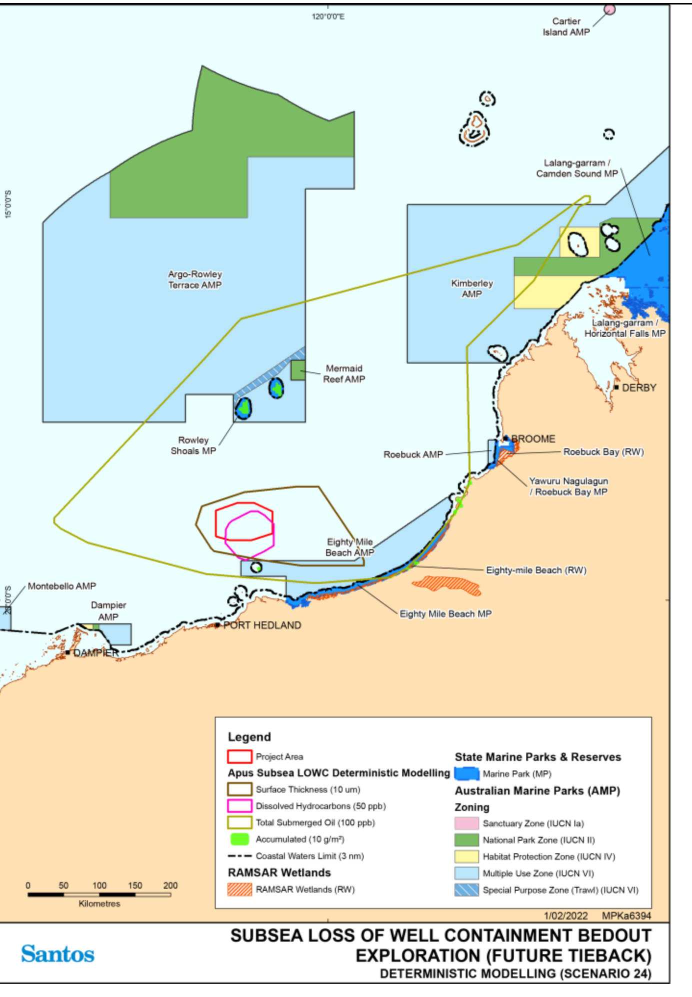

Figure 7-58: Worst-case deterministic model results based on largest volume of shoreline oil ashore.

7.3.1.5.6 Surface Loss of Well Containment from Future Tieback (based on the Bedout Exploration EP)

Results from the worst-case surface loss of well containment scenario for the Bedout Apus-1 well location as described and presented in the Bedout exploration activity (Bedout Multi-Well Drilling Environment Plan) and representing future tiebacks for Dorado Phase 1, are shown in **Figure 7-59**. A summary of the stochastic modelling results for floating oil, shoreline accumulation, dissolved and total submerged hydrocarbons for a surface loss of well containment for each season is provided in **Table 7-82**. The worst-case deterministic runs, based on the largest volume of oil onshore as shown in **Figure 7-61**.

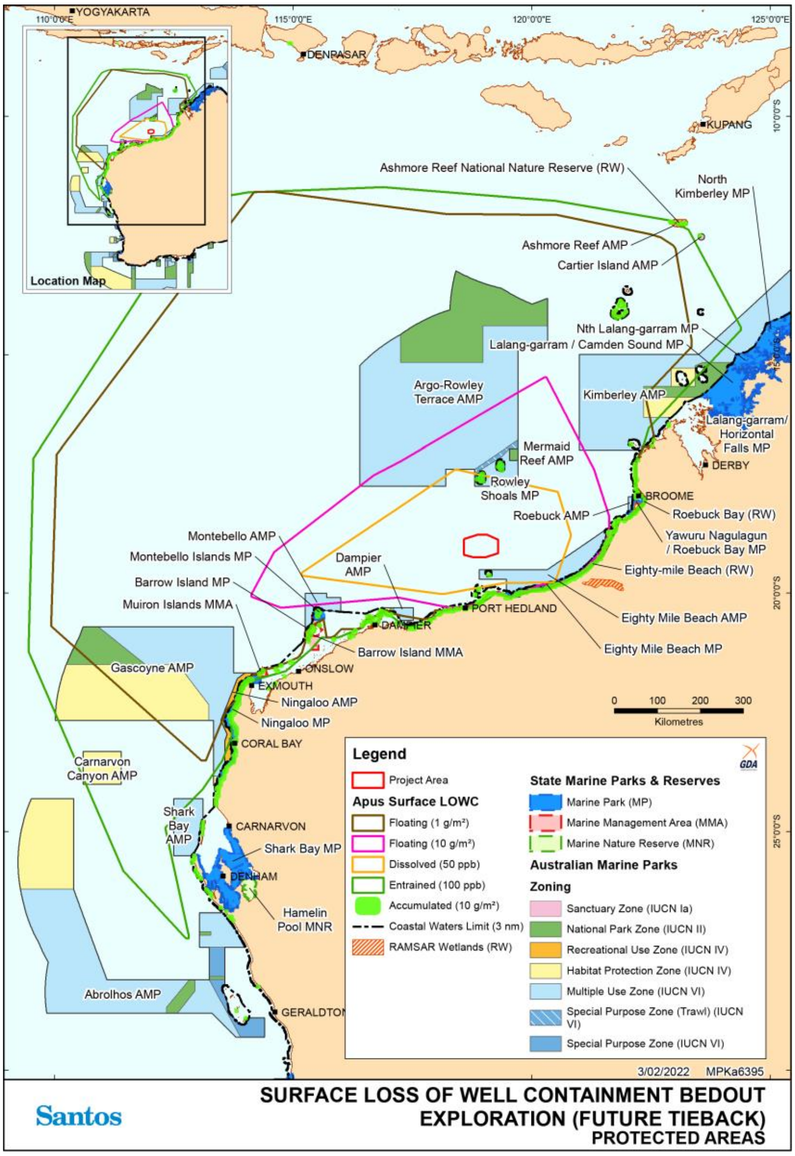

Figure 7-59: EMBA derived from stochastic modelling for floating, dissolved, total submerged oil and shoreline accumulation oil phases for a worst-case surface loss of well containment (representing future tiebacks for Dorado Phase 1) – protected areas north

Santos

Impact Thresholds (NOPSEMA, 2019b)	Predicted impacts and risks based on stochastic model predictions = footprint (trajectory and fate) encompassing 150 releases (start dates for each simulation staggered approximately fortnightly across five years of hydrodynamic and wind data). A total of 150 individual 'realisations' made up the full stochastic simulation set
FLOATING OIL (SURFACE)	
Low 1 g/m^2 Visible but no biological effects. Lower than the exposure value for ecological impacts Relevant for implementing environmental monitoring in event of oil spills	**Figure 7-60** show the stochastic modelling predictions for floating oil at 1 g/m^2 (low threshold) and 10 g/m^2 (moderate threshold). Maximum extents predicted at the 1 g/m^2 threshold + Maximum extent from release location – 1,100 km, west southwest. + Based on all 150 simulations - 5 of the AMPs within the EMBA are predicted to be exposed. Probability of exposure to individual AMPs ranged from 1% to 85%, with Eighty Mile Beach and Montebello AMP being most probable (85% in minimum time of 1 and 11.3 and days after spill. The shortest time to contact predicted at Eighty Mile Beach AMP at 1 day. + 1 to 59% probability of contacting shorelines at Adele Island, King Sound, Lacepede Islands, Broome North Coast, Dampier Archipelago, Northern Island Coast, Montebello Islands, Lowendal Islands, Barrow Islands, Thevenard Islands, Southern Island Coast, Muiron Islands, Ningaloo Coast North, Ningaloo Coast South, Indonesia East, Eighty Mile Beach, Broome Roebuck, Bedout Island, with the minimum time to contact 1.1 days after spill (Bedout Island). + 1% to 58% probability of contacting reefs, shoals and banks (Mermaid Reef, Clerke Reef, Imperieuse Reef, Glomar Shoals, Scott Reef South and Rankin Bank) in minimum time of 5.8 to 38 days after spill. + KEFs at seabed or near seabed features are not contacted by floating oil.
Moderate 10 g/m^2 Environmental values and sensitivities may be at risk of impacts from floating oil.	+ Maximum extent from release location – 600 km, northeast. + Based on all the 150 simulations – Eighty Mile Beach was the only AMP to be contacted (70% probability within 1 day) + <1% probability to contact State Marine Parks. + 1 to 46% probability of contacting shorelines at Port Hedland Eighty Mile Beach, Outer Ningaloo Coast North and Bedout Island in minimum time of 1.5 to 29 days after spill. + 1 to 14% probability of contacting reefs, shoals and banks (Clerke Reef, Imperieuse Reef, Glomar Shoals) in minimum time of 2 to 12 days after spill + KEFs are seabed or near seabed features are not contacted by floating oil.

High 50 g/m^2 Potential for impact of surface oil to wildlife	+ Maximum extent from release location – 300 km, west northwest. + Eighty Mile Beach AMP is contacted >50 g/m^2 within 1.8 days (49% probability). + 29% probability of contact at Bedout island within 2 days.
SHORELINE ACCUMULATION	
Low 10 g/m^2 Represents a level of socio-economic effect	Stochastic model predictions EMBA is for the 100 simulations in **Figure 7-60**. **Figure 7-57** shows the shoreline accumulation at 10 g/m^2 (low threshold. The seasonal assessment below is based on 150 simulations annualised.

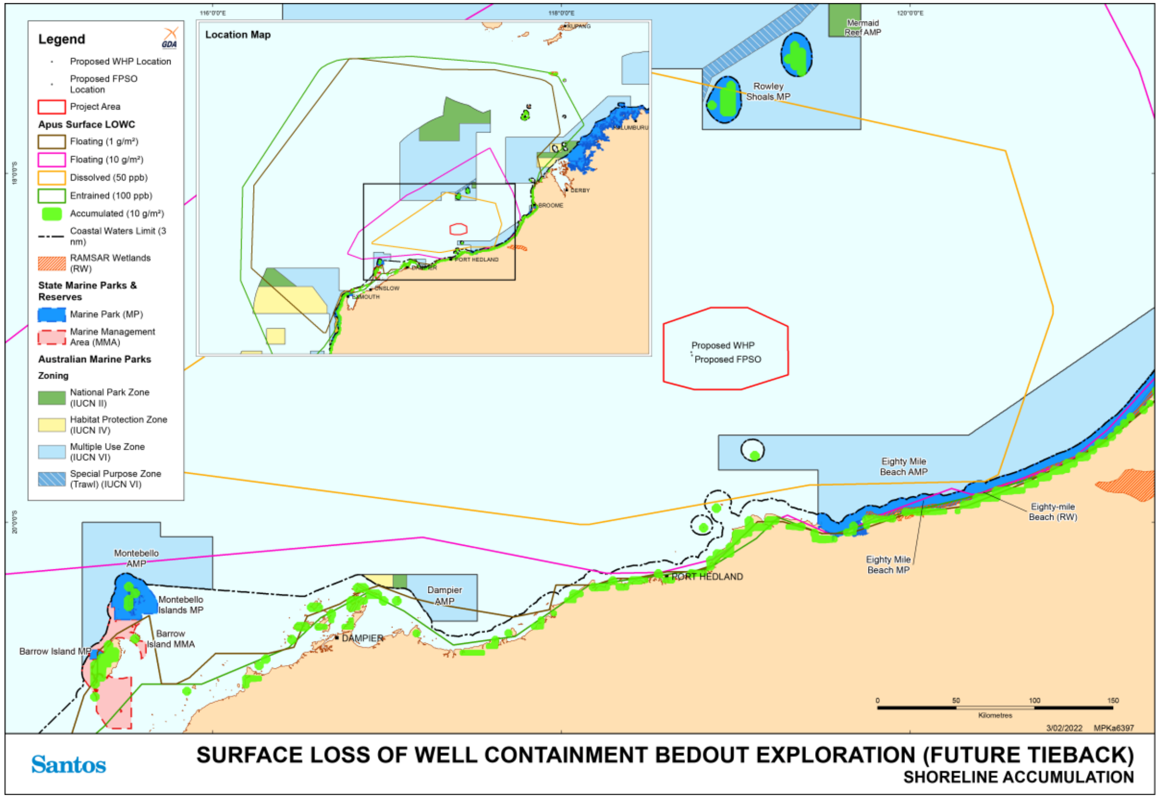

Figure 7-60: Stochastic modelling shoreline accumulation for a worst-case surface loss of well containment

	+ Maximum shoreline accumulation is 5, 127 tonnes. + 77% probability of shoreline accumulation in minimum time of 2 days + Maximum length of shoreline accumulation 233 km + Based on 150 replicate simulations combined - 27 shoreline receptors with probability of exposure to each ranging from 1 to 76%. Key receptors with highest probability of contact and minimal arrival time include: - Imperieuse MP (59% within 11 days, peak loading 29, 886 g/m^2, with a peak volume of 2, 040 tonnes, and a maximum length of shoreline loading @ 56.9 km). - Clerke Reef MP (53% within 16 days, peak loading 23, 606 g/m^2, with a peak volume of 1, 455 tonnes, and a maximum length of shoreline loading @ 51.2 km). - Dampier Archipelago (58% within 12.1 days, peak loading 21, 248 g/m^2, with a peak volume of 864 tonnes, and a maximum length of shoreline loading @ 96.6 km). - Montebello Islands (48% within 17 days, peak loading 25, 077 g/m^2, with a peak volume of 663 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (47% within 19 days, peak loading 13,827 g/m^2, with a peak volume of 628 tonnes, and a maximum length of shoreline loading @ 76.9km). - Thevenard Islands (40% within 23.9 days, peak loading 10, 264 g/m^2, with peak loading of 178 tonnes, and maximum length of shoreline loading 11.4 km). - Muiron Islands (45% within 26.6 days, peak loading 20,143 g/m^2, with peak loading of 350 tonnes, and maximum length of shoreline loading 17.1 km). - Ningaloo Coast North (41.3% contact within 31 days, peak loading 10, 938 g/m^2, with peak volume of 698 tonnes, and maximum length of shoreline loading @ 233.1 km) - Bedout Island (77% contact within 2 days, peak loading 26, 295 g/m^2, with peak volume 299 tonnes, maximum length of shoreline loading @5.7 km).
Moderate 100 g/m^2 Likely to cause adverse impacts to marine or coastal fauna and habitats	+ Maximum shoreline accumulation 5, 125 tonnes + 77% probability of shoreline accumulation in minimum time of 2 days + Maximum length of shoreline accumulation 227 km + Based on 150 replicate simulations combined- 23 shoreline receptors with probability of exposure to each ranging from 1 to 77% Key receptors with highest probability of contact and minimal arrival time include: - Imperieuse MP (58% within 11 days, peak loading 29, 886 g/m^2, with a peak volume of 2, 040tonnes, and a maximum length of shoreline loading @ 56.9 km). - Clerke Reef MP (53% within 16 days, peak loading 23, 606 g/m^2, with a peak volume of 14, 55 tonnes, and a maximum length of shoreline loading @ 51.2 km). - Dampier Archipelago (57% within 12days, peak loading 21, 248 g/m^2, with a peak volume of 864 tonnes, and a maximum length of shoreline loading @ 96. 6 km).

	- Montebello Islands (46% within 17 days, peak loading 25, 077 g/m^2, with a peak volume of 663 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (46% within 19 days, peak loading 13, 827 g/m^2, with a peak volume of 628 tonnes, and a maximum length of shoreline loading @ 68km). - Muiron Islands (43.7% within 26.6 days, peak loading 20, 143 g/m^2, with peak loading of 350 tonnes, and maximum length of shoreline loading 17.1 km). - Ningaloo Coast North (41% contact within 31 days, peak loading 10, 938 g/m^2, with peak volume of 698 tonnes, and maximum length of shoreline loading @ 227.4 km) - Bedout Island (76% contact within 2 days, peak loading 26, 295 g/m^2, with peak volume 299 tonnes, maximum length of shoreline loading @5.7 km).
High 1000 g/m^2 Impacts to shoreline receptors	+ Maximum shoreline accumulation 5, 099 tonnes + 72% probability of shoreline accumulation in minimum time of 2days + Maximum length of shoreline accumulation 96 km + Based on 150 replicate simulations combined- 23 shoreline receptors with probability of exposure to each ranging from 1 to 72% Key receptors with highest probability of contact and minimal arrival time include: - Imperieuse MP (48% within 11.4 days, peak loading 29, 886 g/m^2, with a peak volume of 2, 040 tonnes, and a maximum length of shoreline loading @ 56.9 km). - Clerke Reef MP (43% within 16 days, peak loading 23, 606 g/m^2, with a peak volume of 1, 455 tonnes, and a maximum length of shoreline loading @ 51.2 km). - Dampier Archipelago (50% within 12.1 days, peak loading 21, 248 g/m^2, with a peak volume of 844.9 tonnes, and a maximum length of shoreline loading @ 62.5km). - Montebello Islands (40% within 17 days, peak loading 25, 077 g/m^2, with a peak volume of 663 tonnes, and a maximum length of shoreline loading @ 22.7km). - Barrow Island (39% within 19 days, peak loading 13, 827 g/m^2, with a peak volume of 628 tonnes, and a maximum length of shoreline loading @ 56.9km). - Muiron Islands (45% within 28 days, peak loading 20, 143 g/m^2, with peak loading of 350 tonnes, and maximum length of shoreline loading 17.1 km). - Ningaloo Coast North (32% contact within 31 days, peak loading 10, 938 g/m^2, with peak volume of 573 tonnes, and maximum length of shoreline loading @ 96 km) - Bedout Island (72% contact within 2 days, peak loading 26, 295 g/m^2, with peak volume 299 tonnes, maximum length of shoreline loading @5.7 km).
DISSOLOVED AROMATIC HYDROCARBONS	
Low	Stochastic model predictions EMBA is based on 100 spill simulations, refer **Figure 7-59**. The figures show the dissolved hydrocarbons at 50 ppb (moderate threshold).

10 ppb Lower than the exposure value at which ecological impacts are expected to occur. Relevant for implementing environmental monitoring in event of oil spills	+ Maximum extent from release location – 500 km northeast + Based on all 150 simulations combined – contacted was limited to one AMP at the Eighty Mile Beach AMP in1 day (67% probability at 346 ppb) + Contact was predicted at Imperieuse Reef MP Glomar Shoals and Bedout Island between 2.7 and 38%, with the shortest time to contact at Bedout Island in 1.9 days.
Moderate 50 ppb Approximates potential toxic effects, particularly sublethal effects to sensitive species.	+ Maximum extent from release location – 250 km northeast + Based on all 150 simulations combined – contacted was limited to one AMP at Eighty Mile Beach AMP in 1 day (60% probability at 346 ppb) + Contact was predicted at Imperieuse Reef MP Glomar Shoals and Bedout Island between 1.3 and 28%, with the shortest time to contact at Bedout Island in 2 days.
High 400 ppb Approximates toxic effects including lethal effects to sensitive species	+ Maximum extent from release location – 150 km northeast + Based on all 150 simulations combined – contacted was limited to one AMP at Eighty Mile Beach AMP in 1 day (8.7% probability at 653 ppb) + No contact at any shorelines at this exposure value.
Total Submerged Oil	
Low 10 ppb Lower than the exposure value at which most ecological impacts are expected to occur,. Relevant for implementing environmental monitoring in event of an oil spill.	Stochastic model predictions (EMBA is for 150 spill simulations, refer **Figure 7-59**. The figure shows the total submerged hydrocarbons at 100 ppb (moderate threshold) at the water depths of 0-10m from the sea surface. + Maximum extent from release location – 1, 800 km + Based on all 150 simulations combined - 10 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1% to 98%, with Eighty Mile Beach AMP being most probable (98% in minimum time of 1 days after spill), followed Montebello AMP (75% in minimum time of 11 days after spill). The shortest time to contact predicted at Eighty Mile Beach within 1 days. Maximum concentrations of 1, 597 ppb at Kimberley AMP. + 11 Reef, shoal and bank receptors within the EMBA are predicted to be exposed. The greatest probability being 58% at Glomar Shoals within 9 days, and a maximum concentration of 9 ppb.

	+ Bedout Island (closest nearshore receptor to the south) with probability of 59% within 1.1 days and a maximum hydrocarbon concentration of 145.3 ppb.
Moderate 100 ppb Representative of sub-lethal impacts to most species and lethal impacts to sensitive species. Considered appropriate for environmental risk assessment. (NOPSEMA 2019)	+ Maximum extent from release location – 1200 km + Based on all 150 simulations combined - 5 of the AMPs within the EMBA are predicted to be exposed, probability of exposure to individual AMPs ranged from 1% to 94%, with Eighty Mile Beach AMP being most probable (94% in minimum time of 1 days after spill), followed Montebello Reef AMP (52% in minimum time of 11 days after spill). The shortest time to contact predicted at Eighty Mile Beach within 1 days. Maximum concentrations of 2, 611 ppb at Kimberley AMP. + 10 Reef, shoal and bank receptors within the EMBA are predicted to be exposed. The greatest probability being 62% at Glomar Shoals within 6.7 days, and a maximum concentration of 446 ppb. + Bedout Island (closest nearshore receptor to the south) with probability of 68% within 1.9 days and a maximum hydrocarbon concentration of 1, 292 ppb.

Predicted impacts and risks based on deterministic model predictions = footprint (trajectory and fate) of single worse-case release resulting in the largest volume of oil ashore and longest length of shoreline with oil accumulation (Figure 7-61)

+ Stochastic realisation 31 of the Apus Base Case Surface LOWC scenario resulted in the highest accumulated shoreline load (of all LOWC scenarios simulated) of 5,127 tonnes above 10 g/m2 and 5,125 tonnes above 100 g/m2 (**Figure 7-61**).
+ surface slick exceeding 10 µm thickness that extended up to 300 km from the release location (**Figure 7-61**).
+ Shoreline loading greater than 10 and 100 g/m^2 extended up to 350 km of the release site **(Figure 7-61**).
+ Total submerged oil exceeding 100 ppb extended up to 400 km, while dissolved hydrocarbons exceeding 50 ppb were limited in spatial extent to within 150 km from the release location (**Figure 7-61**).

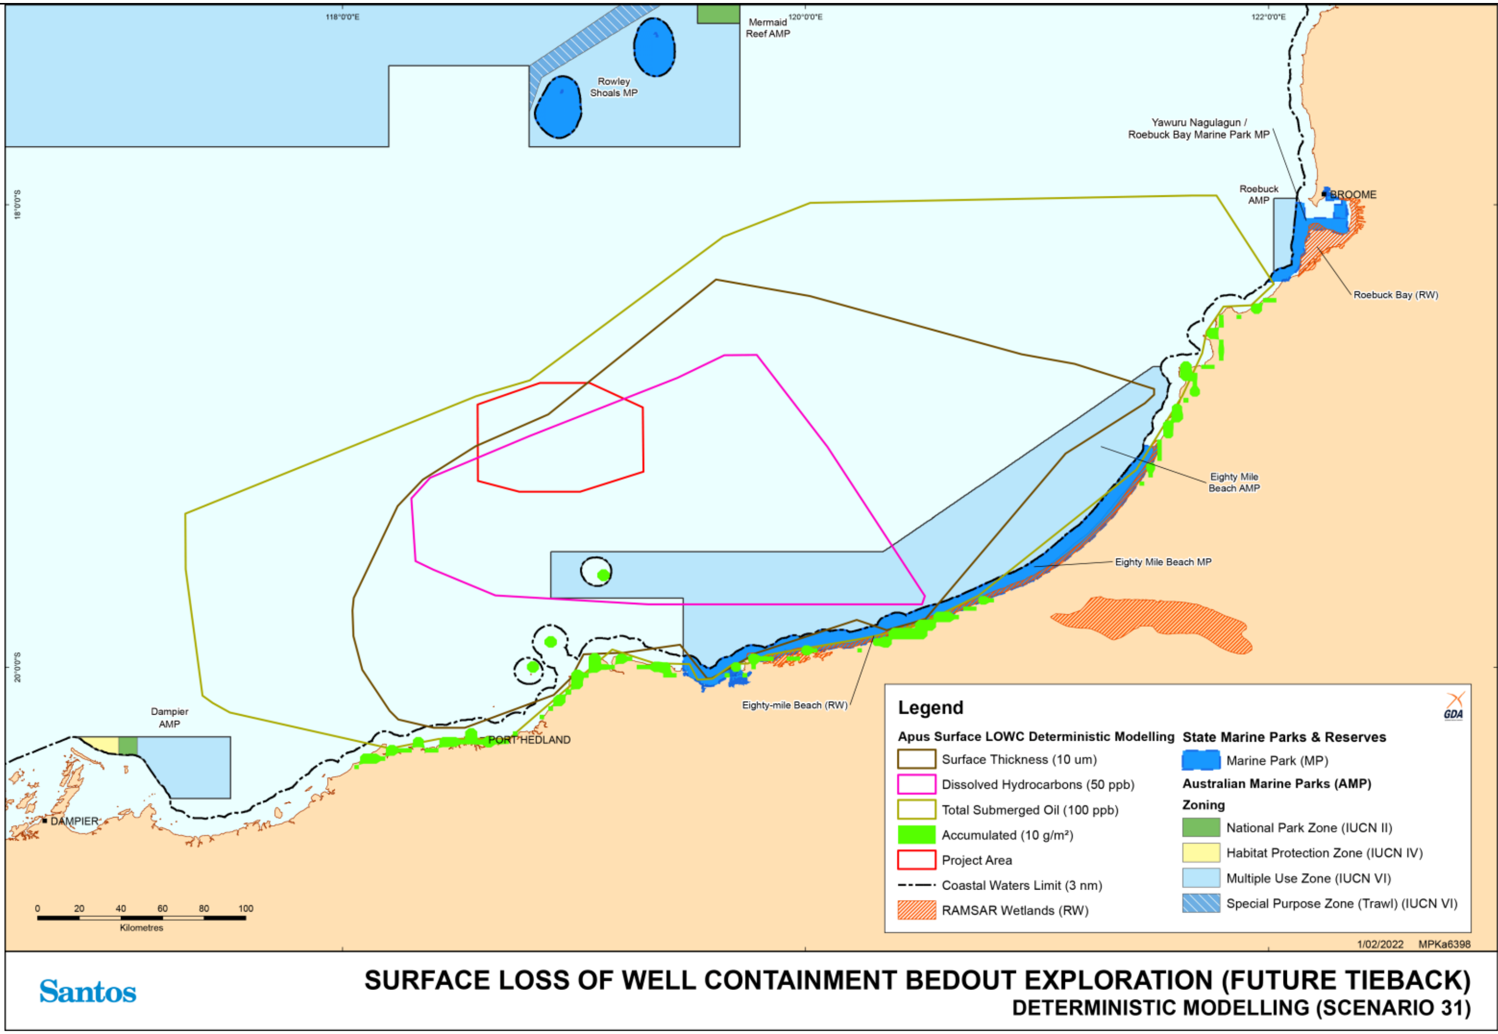

Figure 7-61: Worst-case deterministic model results based on largest volume of oil ashore

7.3.1.6 Details of Environmental Impacts and Risks

The below environmental impact assessment follows the risk assessment approach detailed in **Section 7.3.1.4**

7.3.1.6.1 Identification of hot spots for consequence assessment

As described in **Section 7.3.1.4.2**, all HEVs within the EMBA for LOWC are listed in **Table 7-83**. Further to this, **Table 7-83** filters the HEVs to identify the Hot Spots where they meet the criteria (as described in **Section 7.3.1.4**) from either the subsea or surface loss of well control scenario of any hydrocarbon phase for the tieback and Dorado LOWC scenarios. As noted in **Section 7.3.1.4**, discretion was applied during the workshop to include hotspots that didn't meet the criteria, these are marked with "x" and the rationale for their inclusion as a hotspot is included in **Table 7-83** below.

Note that the worst-case values were taken from both surface and subsea modelling scenarios across both the Dorado and subsea tieback LOWC scenarios to identify the hot spots.

Table 7-83: Receptors potentially impacted by an accidental release of hydrocarbons or chemicals

Receptor	HEV ranking	Exposure Threshold		Hot Spot *	Hotspot Selection rationale
		Low (EMBA)	Moderate/high (Impact)		
Ashmore Reef AMP	1	✓	✓	Y	HEV 1 and in the moderate exposure value.
Ningaloo - Outer Coast North	1	✓	✓	Y	HEV 1 and in the moderate exposure value.
Mermaid Reef AMP	2	✓	✓	Y	HEV 2 and in the moderate exposure value.
Muiron Islands	2	✓	✓	Y	HEV 2 and in the moderate exposure value.
Exmouth Gulf Coast	2	✓	X	N	No contact at the moderate exposure value
Ningaloo Coast North	2	✓	✓	Y	HEV 2 and in the moderate exposure value.
Carnarvon - Inner Shark Bay	2	✓	X	N	No contact at the moderate exposure value
Abrolhos Islands Wallabi, Easter and Oelsaert Group, Abrolhos West	2	✓	✓	Y	7% probability of contact at the moderate exposure value for entrained hydrocarbons (maximum concentration 585 ppb)
Geographe Bay	2	✓	✓	N	<5% probability at the moderate exposure value.
Perth Canyon AMP	2	✓	✓	Y	>5% probability of contact above the moderate exposure value for entrained hydrocarbons.
Eighty Mile Beach	2	✓	✓	Y	HEV 2 and in the moderate exposure value.
Broome - Roebuck	2	✓	✓	Y	HEV 2 and in the moderate exposure value.
Jurien AMP	2	✓	✓	N	<5% probability at the moderate exposure value.
Kimberley Coast	3	✓	X	N	No contact at the moderate exposure value
Cartier Island AMP	3	✓	✓	N	<5% probability of shoreline oil accumulations above the moderate threshold.
Scott Reef North	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Scott Reef South	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Clerke Reef MP	3	✓	✓	Y	HEV 3 and in the moderate exposure value.

Receptor	HEV ranking	Exposure Threshold		Hot Spot *	Hotspot Selection rationale
		Low (EMBA)	Moderate/high (Impact)		
Imperieuse Reef MP	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Dampier Archipelago	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Montebello Islands	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Lowendal Islands	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Barrow Island	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Barrow-Montebello Surrounds	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Ningaloo Coast South	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Shark Bay - Coast Outer	3	✓	✓	Y	HEV 3 and in the moderate exposure value for entrained hydrocarbons (maximum concentration of 1, 020 ppb).
Zuytdorp Cliffs - Kalbarri	3	✓	X	N	No contact at the moderate exposure value
Kalbarri - Geraldton	3	✓	X	N	No contact at the moderate exposure value
Geraldton - Jurien Bay	3	✓	✓	N	Entrained oil contact only but at concentrations lower than those discharged by vessels under Marine Orders in high vessel usage area
Abrolhos - Outer Island Shoals	3	✓	✓	N	HEV >3 Entrained oil contact only but at concentrations lower than those discharged by vessels under Marine Orders in high vessel usage area
Perth Southern Coast	3	✓	X	N	No contact at the moderate exposure value
Mandurah - Dawesville	3	✓	X	N	No contact at the moderate exposure value
Jurien Bay - Yanchep	3	✓	✓	N	Entrained oil contact only but at concentrations lower than those discharged by vessels under Marine Orders in high vessel usage area
Perth Northern Coast	3	✓	X	N	No contact at the moderate exposure value
Kimberley AMP	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Johnson Bank	3	✓	X	N	No contact at the moderate exposure value
Ningaloo - Outer NW	3	✓	✓	Y	HEV 3 and in the moderate exposure value.
Seringapatam Reef	4	✓	X	N	No contact at the moderate exposure value
King Sound	4	✓	✓	N	<5% probability of contact above moderate thresholds
Lacepede Islands	4	✓	✓	Y[X]	HEV> 3, Contact at the moderate exposure threshold for entrained hydrocarbons (max exposure 1, 124 ppb)
Broome North Coast	4	✓	✓	Y[X]	Shoreline loading <100 tonnes along >20km length of shoreline in area of high tourism value
Dawesville - Bunbury	4	✓	X	N	No contact at the moderate exposure value
Geographe Bay - Augusta	4	✓	X	N	No contact at the moderate exposure value
Augusta - Walpole	4	✓	X	N	No contact at the moderate exposure value
Dampier AMP	4	✓	✓	N	HEV >3, limited to entrained contact.
Montebello AMP	4	✓	✓	N	HEV > 3, limited to entrained contact.

Receptor	HEV ranking	Exposure Threshold		Hot Spot *	Hotspot Selection rationale
		Low (EMBA)	Moderate/high (Impact)		
Bremer AMP	4	✓	X	N	No contact at the moderate exposure value
Shark Bay AMP	4	✓	X	N	No contact at the moderate exposure value
Ashmore/Cartier - Outer	4	✓	✓	N	<5% probability of total submerged oil contact above moderate thresholds
Eighty Mile Beach AMP	4	✓	✓	Y[x]	>50% probability of contact of surface, total submerged and dissolved oil above moderate threshold
Rowley Shoals surrounds	4	✓	✓	Y[x]	>50% probability of total submerged oil contact above moderate threshold
South-west corner AMP	4	✓	X	N	No contact at the moderate exposure value
Ningaloo - Offshore	4	✓	✓	Y[x]	>30% probability of entrained oil contact above moderate threshold
Abrolhos	4	✓	✓	N	HEV >3 Entrained oil contact only but at concentrations lower than those discharged by vessels under Marine Orders in high vessel usage area
Christmas Island	4	✓	X	N	No contact at the moderate exposure value
Echo Shoals	5	✓	X	N	No contact at the moderate exposure value
Sahul Banks	5	✓	X	N	No contact at the moderate exposure value
Gale Bank	5	✓	X	N	No contact at the moderate exposure value
Fantome Shoals	5	✓	X	N	No contact at the moderate exposure value
Barracouta Shoals	5	✓	✓	N	<5% probability of total submerged oil contact above moderate thresholds. HEV rank 5.
Vulcan Shoals	5	✓	X	N	No contact at the moderate exposure value
Hibernia Reef	5	✓	X	N	No contact at the moderate exposure value
Woodbine Bank	5	✓	X	N	No contact at the moderate exposure value
Heywood Shoals	5	✓	X	N	No contact at the moderate exposure value
Echuca Shoals	5	✓	X	N	No contact at the moderate exposure value
Browse Island	5	✓	X	N	No contact at the moderate exposure value
Port Hedland-Eighty Mile Beach	5	✓	✓	Y[x]	2000 tonnes of shoreline oil accumulation, total submerged oil concentration >1800 ppb, short time to contact >2 days above moderate threshold
Glomar Shoals	5	✓	✓	N	Submerged feature, low HEV ranking
Karratha-Port Hedland	5	✓	✓	Y[x]	>130 tonnes of shoreline oil accumulation, time to contact >7 days above moderate threshold
Rankin Bank	5	✓	✓	N	Submerged feature, low HEV ranking
Northern Islands Coast	5	✓	✓	N	>26 days to contact above moderate threshold, low volume spread across lengths of shoreline. Low HEV ranking.
Middle Islands Coast	5	✓	✓	N	<5% probability of contact at moderate thresholds
Thevenard Islands	5	✓	✓	N	HEV = 5, >24 days to shoreline accumulation above moderate threshold

Receptor	HEV ranking	Exposure Threshold		Hot Spot *	Hotspot Selection rationale
		Low (EMBA)	Moderate/high (Impact)		
Southern Islands Coast	5	✓	✓	Y[x]	>39% probability of shoreline accumulation above moderate threshold
Rottnest Island	5	✓	X	N	No contact at the moderate exposure value
Indonesia - East	5	✓	X	N	No contact at the moderate exposure value
Indonesia - West	5	✓	X	N	No contact at the moderate exposure value
Roebuck - Eighty Mile Beach	5	✓	✓	Y[x]	>25% probability of shoreline accumulation >340 tonnes accumulated, total submerged oil contact >840 ppb above moderate threshold
Bedout Island	5	✓	✓	Y[x]	23-81% probability of contact of surface, total submerged and shoreline accumulation in short timeframes (2 days) above moderate threshold

* Greater than 5% probability of contact at the medium/high exposure value for consideration for further hotspot assessment.

[x] Discretionary hotspot.

This process identified the following hot spots:

- Outer Ningaloo Coast North
- Ashmore Reef AMP
- Eighty Mile Beach
- Mermaid Reef AMP
- Muiron Islands
- Ningaloo Coast North
- Imperieuse Reef MP
- Clerke Reef MP
- Scott Reef North
- Ningaloo Coast South
- Dampier Archipelago
- Kimberley AMP
- Eighty Mile Beach AMP
- Karratha-Port Hedland
- Roebuck – Eighty Mile Beach
- Lacepede Islands
- Broome-Roebuck
- Barrow-Montebello surrounds
- Montebello Islands
- Lowendal Islands
- Barrow Island
- Outer NW Ningaloo
- Perth Canyon AMP
- Scott Reef South
- Bedout Island
- Rowley Shoals surrounds
- Offshore Ningaloo
- Broome North Coast
- Port Hedland-Eighty Mile Beach
- Southern Islands Coast.
- Abrolhos Islands Wallabi, Easter and Pelsaert Group

Attachment 8-2 provides a simplified summary of the consequence assessment results for each of the Hot Spot areas. The consequence assessment was based on predicted contact and concentration of floating oil, accumulated oil, total submerged oil, entrained and dissolved oil**.** For each Hot Spot area, the consequence to the key values were assessed using the methodology described in **Section 7.3.1.4.**

Table 7-84 identifies the potentially impacted receptors as a result of an accidental release of hydrocarbons or chemicals within the Project Area.

Table 7-84: Receptors potentially impacted by an accidental release of hydrocarbons or chemicals

Description of the Risk	Receptor Categories
Potential widespread decrease in water quality from hydrocarbon pollution Potential localised decrease in water quality from hydrocarbon pollution Potential widespread impacts to benthic and coastal communities and habitats from hydrocarbon pollution Potential acute and chronic toxic effects Potential impacts to the natural and socio-economic values of marine and coastal protection areas Potential temporary closure of fisheries due to hydrocarbon pollution Potential loss of cultural values of heritage sites Potential impacts to tourism through loss of nature-based tourism resources due to hydrocarbon pollution.	Water Quality – **Section 7.3.1.2.1** Sediment Quality – **Section 7.3.1.2.2** Air Quality – **Section 7.3.1.2.3** Communities and Habitats – **Sections 7.3.1.2.4, 7.3.1.2.5 & 7.3.1.2.6** Mammals – **Section 7.3.1.2.7** Reptiles – **Section 7.3.1.2.8** Birds – **Section 7.3.1.2.9** Fishes – **Section 7.3.1.2.10** Protected Areas – **Section 7.3.1.2.11** Heritage – **Section 7.3.1.2.12** Fisheries – **Section 7.3.1.2.13** Tourism – **Section 7.3.1.2.14** Maritime Industry – **Section 7.3.1.2.15**

7.3.1.6.2 Physical Environment or habitat

Water Quality

The concentrations of hydrocarbons in the water column will decrease over time once the release has stopped due to processes such as dispersion, dilution, physical and biological degradation, and evaporation. For short duration release scenarios, these processes will begin to reduce the total amount of hydrocarbons in the water column shortly after the release. The worst-case subsea and surface release from the WHP will continue to release fresh hydrocarbons for the duration of the release, and the amount of hydrocarbons will increase until the release is stopped. Modelling results (**Attachment 8**) indicate that exposure to entrained hydrocarbons at the low threshold was predicted to occur up to a maximum distance of 2,878 km (west-northwest) from the spill site (winter). This distance reduced to 2,158 km (west-northwest) based on the moderate threshold in winter.

Large volume releases of Caley crude from the Dorado Development including future tiebacks have the potential to result in increased concentrations of dissolved hydrocarbons, which include BTEX and PAHs. BTEX and PAH are known to be toxic to marine biota. BTEX compounds do not persist in the marine environment due to their volatility and will diminish once released into the environment. The concentration of BTEX is expected to be highest near the release location and will decline as the spilled hydrocarbon weathers of time. PAHs are less volatile than BTEX and are expected to persist for longer in the environment. HFO typically contains relatively low concentrations of BTEX and PAH and does not readily entrain in the water column. Hence, HFO spills are expected to have a lower potential for toxic effects, although HFO may remain as a persistent floating oil for long periods of time. Modelling results (**Attachment 8-1**) indicate that exposure to entrained hydrocarbons at the low threshold was predicted to occur up to a maximum distance of 850 km (southwest) from the spill site (summer).

The decrease in water quality from worst-case hydrocarbon spills are expected to consist of short-term acute toxic effects to phytoplankton and zooplankton. Plankton utilising the sea surface layer could be impacted by floating oil. There is potential for localised mortality of plankton due to reduced water quality and toxicity. Also, through physical contact of small oil droplets, plankton mobility, feeding and/or respiration may be impaired. Plankton could include the eggs and larvae of marine invertebrates and fish and therefore entrained oil could impact on recruitment of invertebrate/fish species. The likelihood of this would be determined by the extent and timing of the spill; for example, hard coral spawning occurs primarily in March/April, so there is a heightened potential for impacts to coral eggs and larvae to occur during this period. Effects will be greatest in the upper 10 m of the water column and areas close to the spill source where hydrocarbon concentrations are likely to be highest.

Plankton could include the eggs and larvae of marine invertebrates and fish and therefore impact on recruitment of invertebrate/fish species. The Project Area has the potential to overlap with spawning of some fish species given the year round spawning of some species. In the unlikely event of a spill occurring, fish larvae may be impacted by hydrocarbons entrained in the water column. Following a hydrocarbon release a portion of the slick will rapidly evaporate and disperse in the offshore environment, reducing the concentration and toxicity of the spill. Maximum entrained oil concentrations were predicted at Argo-Rowley Terrace AMP. Plankton utilising the sea surface layer, as well as pelagic invertebrates, could be impacted from floating oil. Exposure to entrained oils and DAHs may result in lethal or sub-lethal impacts to plankton or pelagic invertebrates through a direct contact pathway. Such contact could impair the mobility, feeding and respiration of these fauna and exchange of chemicals could occur.

Planktonic communities are characterised by relatively rapid turnover rates of short-lived biota. The high turnover rate will lead to rapid recovery as the spilled hydrocarbons decay in the marine environment. Within plankton communities, there is evidence from laboratory studies that some taxonomic groups, particularly zooplankton (e.g. copepods) may be more sensitive to hydrocarbon pollution (Almeda et al. 2013; Jiang et al. 2010). Few reliable studies have shown any impacts of hydrocarbon spills on planktonic communities, with most studies concluding that impacts from hydrocarbon pollution cannot be distinguished from natural variability (Abbriano et al. 2011; Davenport et al. 1982; Varela et al. 2006).

Sediment Quality

Sediment quality in the offshore or nearshore environment is not expected to be significantly affected by any of the worst-case scenarios that release Caley oil. Hydrocarbon contaminants (e.g. PAHs) from surface releases are unlikely to reach the seabed due to the water depth and low natural sedimentation rates in the region. Hydrocarbon contaminants from the subsea releases (loss of well control) may contaminate sediments by advective transport of the plume that will be formed during the release (Romero et al. 2015). This is considered most likely to occur with the worst-case loss of well containment scenario due to the relatively long duration of the release. Any resulting contamination will be concentrated around, and down-current from, the wellhead. Due to the low density and volatile nature of the hydrocarbon and water depth weathered Caley oil is unlikely to be deposited to the seabed or accumulate on shorelines in large volumes (63m^3).

Shoreline sediments are likely to be impacted for scenarios particularly from the future tieback loss of well control scenarios described in **Section 7.3.1.1.4**. The surface release loss of well control scenario described has potential for 5,127 tonnes of accumulated hydrocarbon across 27 shorelines surrounding the release locations (**Table 7-82**). Key receptors with environment values including sandy beaches with predicted accumulation above the moderate exposure threshold include: Bedout Island, Eighty Mile Beach, Ningaloo Coast North, Middle and South, Broome Roebuck Bay and Outer Shark Bay Coast. The stranding of high volumes of accumulated oil lead to smothering of sediments and long-term contamination of these sediments. Under these circumstances hydrocarbons often continue to remobilise into the surf zone, impacting intertidal sensitivities.

The HFO release from a loss of fuel from a vessel collision scenario has a relatively low portion of volatiles, which are expected to evaporate quickly following release. The remaining HFO may sink to the seabed if sufficient sediment adheres to the surface of the residual oil. This weathered oil may subsequently become deposited in sediments. Residual HFO near shorelines may be exposed to higher sediment loads and be more likely to sink. Stranding of residual HFO on shorelines can lead to smothering of sediments and long-term contamination of sediments with high-molecular weight hydrocarbons. These compounds are typically much less toxic than low-molecular weight hydrocarbons. HFO, if released, will likely result in large amounts of weathered oil accumulating onshore with the maximum volume of 1684.5 m^3 predicted on shorelines surrounding Broome.

Air Quality

Surface releases of Caley oil will readily evaporate, resulting in an increase in volatile hydrocarbons in the air directly above the floating oil. This decrease in air quality will be temporary, with most evaporation occurring within the first day (**Figure 7-30**). Wind will disperse the volatile hydrocarbons, which will degrade naturally.

Bare Sediments

Bare sediment habitat is very widely represented in the offshore waters of northwestern Western Australia, and the associated fauna assemblages are not considered to be particularly sensitive or of high conservation value (**Section 3**).

The majority of the Project Area consists of habitat composed largely of fine sediments (typically more than 90% cover) but it also contains notable areas of hard pavement reef, which is habitat for filter feeder communities, especially whip corals, gorgonians and sponges (**Section 3**). These habitats are widely represented in the region and are not considered to be particularly sensitive. These fauna may be subject to acute and chronic toxic effects from exposure to hydrocarbons. The extent of hydrocarbons contacting shorelines (accumulated and floating hydrocarbons) and subsea sediments (entrained, and dissolved hydrocarbons) are expected across the range of scenarios described in **Section 7.3.1**.

Shoreline loading and water movement may allow hydrocarbon residue to filter down into sediments, continue to biodegrade on the surface or remobilise into the surf zone. The degree of loading is dependent upon the energy and tidal reach of the shoreline, the type of the sandy shore and continual weathering of the oil. Indirect impacts to nesting and foraging habitats for birds and turtles, with direct impacts to infauna would be expected.

Many benthic fauna species have planktonic larval phases (e.g. corals, echinoderms, sponges etc.). Organisms with planktonic larval phases typically produce very high numbers of larvae. A worst-case credible spill may result in increased mortality of planktonic larvae (which are subject to high natural mortality); however, this is not expected to result in population-scale impacts.

Filter feeding benthic communities may be vulnerable to entrained and dissolved hydrocarbons. Entrained hydrocarbons can be ingested by filter feeders, leading to increased exposure due to accumulation of ingested oil droplets (Payne and Driskell 2003). While typically less toxic than dissolved hydrocarbons, entrained oil may still cause toxic effects. Similarly, entrained oil may also result in physical impacts such as clogging of filter feeding organs, potentially resulting in reduced feeding efficiency. Filter feeder, and sessile organisms in general, may be exposed to concentrations of dissolved hydrocarbons that result in acute and chronic toxic effects.

Seagrasses and Macroalgae

Several key environmental receptors with recognised seagrass and macroalgal habitat within the EMBA for entrained and/or dissolved hydrocarbons include: Mermaid Reef AMP, Muiron Islands, Exmouth Gulf Coast, Ningaloo Coast North, Middle and South, Abrolhos Islands, Imperieuse and Clerke Reef, Eighty Mile beach, Lowendal Islands, Scott Reef, Cartier Island, Dampier Archipelago and Broome- Roebuck bay.

Most seagrasses within the EMBA of the worst-case hydrocarbon spill scenarios are subtidal, although there may be relatively small areas of intertidal seagrasses along the mainland coastline. Seagrass in the subtidal and intertidal zones have different degrees of exposure to hydrocarbon spills. Subtidal seagrass is unlikely to be exposed to spilled hydrocarbons, as most hydrocarbons in subtidal environments will be concentrated at the surface. Intertidal seagrasses are vulnerable to smothering by floating oil slicks, which can lead to mortality if it coats their flowers, leaves and stems (Dean et al. 1998; Taylor and Rasheed 2011). Long-term impacts to seagrass are unlikely unless hydrocarbon is retained within the seagrass meadow for a sustained duration (Wilson and Ralph 2011). Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al. 2010). The potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should serve to lower the content of soluble aromatic components before contact occurs. Caley crude is expected to be highly weathered prior to reaching shallow areas where seagrasses may occur.

Like seagrasses, the potential impacts to macroalgae depend on the exposure pathway; most macroalgae in the region are subtidal, although intertidal macroalgae may be present. Studies of subtidal macroalgal assemblages exposed to fuel oil spills have shown that impacts from exposure is slight (Edgar et al. 2002; Lobón et al. 2008). Effects of exposure to oil on intertidal macroalgae are more variable; some studies reported little evidence of impacts (Díez et al. 2009), while others show significant impacts (De Vogelaere and Foster 1994). Recovery of intertidal macroalgae has been shown to occur faster in areas where oil has been left to degrade naturally compared to areas subject to intensive clean-up operations (De Vogelaere and Foster 1994).

Seagrass and macroalgae provide important habitat for ecosystem function within the region, with significant seagrass meadows known as being important for dugong feeding at Ashmore Reef, Exmouth Gulf and Lowendal Islands.

Coral Reefs, Banks and Shoals

Numerous named reefs, shoals and banks occur within the EMBA (**Section 3**). Of particular note is Ningaloo Reef, which is the largest fringing (i.e. nearshore) coral reef in Australia. Other notable reefs include those surrounding the Muiron Islands, Barrow Island, the Montebello Islands and the Rowley Shoals. The relatively shallow depth results in these reefs, banks and shoals being at risk of impacts from hydrocarbon spills. Reefs, banks and shoals have relatively high biodiversity value and are of regional importance (Bryce 2009; Wahab et al. 2018). They may also act as sources of larvae of corals and other reef fauna, and impacts to these reefs, banks and shoals may result in reduced larval supply to areas relatively far away.

Contact with dissolved and entrained hydrocarbons above moderate exposure thresholds may result in mortality of benthic biota associated with reefs, banks and shoals. The loss of habitat-forming biota such as corals, macroalgae or sponges could result in changes to habitats, with subsequent changes to fauna assemblages and composition.

The time required for recovery following disturbance will depend on the nature and scale of the impact. Shoals and banks in the region have been exposed to significant intermittent disturbance for long periods of time, such as damage from cyclones and changes in water temperature associated with the El Niño-Southern Oscillation. Hence, the communities of reefs, shoals and banks in the region will be in various states of natural succession. The intermittent nature of natural disturbance may mean the biological communities of reefs, shoals and banks in the region are adapted to recovering from disturbance. Hence, they are expected to recover over time if exposed to an oil spill, although the recovery time may take decades.

The shorelines of offshore reefs and islands (e.g. the Rowley Shoals) typically consist of intertidal reef flats and sandy beaches; shoreline types such as rocky shores, estuaries and mangroves typically occur much less frequently. Stranding of floating oil on offshore islands and reefs may result in a band of weathered oil between the low- and high-water marks on shorelines and intertidal corals. In the highly unlikely event of a subsea or surface LOWC event, hydrocarbons will likely reach both subsea and shoreline habitats of the offshore reefs (Clerke and Imperieuse Reef), islands (Bedout island, Lacepede Island) and shoals (Glomar shoals and Rankin Bank). This may result in impacts to fauna in these habitats, such as nesting turtles and wading birds. Hydrocarbons that reach nearshore environments also have the potential to impact benthic coral reefs, which may result in a long-term decrease in ecological values given toxicity impacts associated with hydrocarbon exposure.

Corals within the intertidal and shallow subtidal zone may be susceptible to impacts from hydrocarbons, ranging from potentially sublethal to lethal impacts. Impacts from physical coating of corals appears to also depend on coral morphology. Coral species more likely to retain oil coatings (e.g. due to polyp morphology, or gross morphology with high surface area to volume ratios such as branching corals) have been shown to be more susceptible to impacts (Shigenaka 2001). Exposure to dissolved and entrained hydrocarbons may result in acute and chronic toxic effects, with longer exposure durations typically leading to greater potential for mortality (Shigenaka 2001). Corals may also ingest entrained oil particles, potentially leading to update of hydrocarbons into coral tissue (Loya and Rinkevich 1980). Experimental studies and field observations indicate all coral species are sensitive to the effects of oil, although there are considerable differences in the degree of tolerance between species (e.g. NOAA 2010a). Differences in sensitivities may be due to the ease with which oil adheres to the coral structures, the degree of mucous production and self-cleaning, or simply different physiological tolerances. For example, laboratory and field studies have demonstrated that branching corals appear to have a higher susceptibility to hydrocarbon exposure than massive corals or corals with large polyps Physical oiling of coral tissue can cause a decline in metabolic rate and may cause varying degrees of tissue decomposition and death (Negri and Heyward 2000). Direct contact of coral by hydrocarbons may also impair respiration and photosynthesis by symbiotic zooxanthellae (Peters 1981; Knap et al. 1985). Chronic effects of oil exposure have been consistently noted in corals and, ultimately, can kill the entire colony. Chronic impacts include histological, biochemical, behavioural, reproductive and developmental effects.

Mangroves

Intertidal mangrove habitats occur throughout much of the Kimberley, and are highly susceptible to oil pollution. Several receptors within the EMBA have mangrove habitats predicted to be contacted by floating and accumulated hydrocarbons. These receptors include: Eighty Mile Beach, Exmouth Gulf Coast, Ningaloo Coast North Mangroves, Abrolhos Islands, Montebello/ Lowendal Islands, Barrow Island and Broome- Roebuck Bay. These receptors are vulnerable to contact with floating and accumulating hydrocarbons, such as weathered HFO, and Caley Crude (from the future tieback scenario, **Section 7.3.1.1.4**) which may coat prop roots and pneumatophores (aerial roots that support oxygen uptake) (Duke and Archibald 2016). Exposure can result in direct effects such as yellowed leaves, defoliation and mortality, and indirect effects such as reduced recruitment and increased sensitivity to other stressors (National Oceanic and Atmospheric Administration 2014). Like seagrasses, mangroves can also be impacted by entrained, dissolved aromatic and accumulated hydrocarbons either in the water or sediment.

Intertidal Sand and Mudflats

Intertidal mudflats are susceptible to potential impacts from hydrocarbons as they are typically low energy environments and therefore trap oils. The extent of oiling is influenced by the neap and spring tidal cycle and seasonal highs and lows affecting mean sea level. Potential impacts to tidal flats include heavy accumulations covering the flat at low tide. It is unlikely that oil will penetrate water-saturated sediments in intertidal sand and mudflats. However, oil can penetrate fine sediments through animal burrows and root pores.

Intertidal mudflats provide resting and feeding areas for migratory bird species. Extensive mudflats occur along Eighty Mile Beach, which seasonally hosts large aggregations of migratory birds and is recognised as a Ramsar site (**Section 7.3.1.2.11**).

Intertidal Platforms

Like intertidal sand and mudflats, the extent of oiling of intertidal platforms is influenced by the neap and spring tidal cycle and seasonal highs and lows affecting mean sea level. Unlike intertidal sand and mudflats, intertidal platforms typically have a veneer of organisms such as macroalgae and sessile invertebrates. These organisms will be vulnerable to potential toxic and smothering impacts from spilled oil, depending on the degree of weathering and the volume of oil deposited. Given the location of the Project Area, spilled oil reaching intertidal platforms is likely to be highly weathered, hence smothering effects may be the main mechanism of impact.

Sandy Beaches

Hydrocarbons at sandy shores are incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores (International Petroleum Industry Environmental Conservation Association 2000). Hydrocarbons in the intertidal zone can adhere to sand particles however high tide may remove some or most of the hydrocarbons back out of the sediments. Typically, hydrocarbons are only incorporated into the surface layers to a maximum of 10 cm (International Petroleum Industry Environmental Conservation Association 2000). It is predicted that a number of sandy shores along the coastline may have accumulation of hydrocarbons above the moderate shoreline accumulation exposure threshold, particularly as a result of a worst-case spill of HFO (**Figure 7-42** and **Figure 7-43**) and Caley Crude (**Table 7-81** and **Table 7-82)**. The persistence of the hydrocarbons will be dependent on the wave exposure but can be months to years.

Shoreline accumulation on sandy beaches may also result in oiling of fauna such as nesting female turtles and turtle hatchlings, as well as shorebirds. Impacts to fauna are considered in **Section 7.3.1.2.8.**

Rocky Shorelines

The impact of oil on rocky shores are largely dependent on the localised incline and energy environment. On steep/vertical rock faces on wave exposed coasts there is likely to be no impact from a spill event, as the oil does not typically get deposited due to wave action. However, a gradually sloping boulder shore in calm water can potentially trap large amounts of oil (International Petroleum Industry Environmental Conservation Association 2000).

Caley crude release from the drilling of future tieback wells, presented in **Table 7-81** and **Table 7-82,** present the scenarios with the greatest potential for impacts to shoreline due to the greatest tonnage of oil predicted to contact shorelines (5, 127 tonnes). Most impacts to rocky shorelines would occur as a result of physical effects, such as smothering.

Islands

Several islands are susceptible to potential impacts from hydrocarbons, particularly from the scenarios associated with the drilling of future tieback wells described in **Table 7-81** and **Table 7-82,** A very high contact probability of 88% was predicted for the proximal island receptor of Bedout Island. This receptor was predicted to receive a maximum shoreline accumulation of 299 tonnes, with a minimum arrival time of 2 days and maximum oiled shoreline length of 6 km. Bedout Island is fringed by coral reef and provides seabird and turtle foraging habitat susceptible to impact from hydrocarbons.

Key Ecological Features

KEFs by their nature are typically geomorphic features and have an inherently low likelihood of being impacted by oil spills from Dorado Phase 1. This is because spilled oil is typically closely associated with the sea surface due to the buoyancy of the oil and unlikely to penetrate to the seabed. While some features associated with the KEFs are subtidal or submerged and would not be directly contacted by a surface slick or accumulated hydrocarbons, they all may support increased productivity or abundance of marine fauna that use surface waters above the features (including plankton, pelagic invertebrates and fish, marine mammals, marine reptiles and seabirds) which may be impacted by floating oil. Impacts to these marine fauna are described in the following sections. Most KEFs within the EMBA are relatively far from the Project Area, meaning that any hydrocarbons reaching these KEFs will be highly weathered. Exceptions to this general pattern are listed below, all of which lie in relatively close proximity to the Project Area:

+ Ancient coastline at 125 m depth contour (23 km from WHP);
+ Mermaid Reef and Commonwealth waters surrounding Rowley Shoals (138 km from WHP); and
+ Glomar Shoals (207 km from WHP).

These KEFs host benthic habitats and communities that may be impacted by hydrocarbons; refer to **Section 7.3.1.2.4** for a discussion of these potential impacts.

7.3.1.6.3 Threatened and Migratory Species

Marine Mammals

Marine mammals are at risk of direct contact with surface hydrocarbons due to chance of surfacing within slick. Effects include irritation of eyes/mouth and potential illness. Surface respiration could lead to accidental ingestion of hydrocarbons or result in the coating of sensitive epidermal surfaces. Potential impact to feeding apparatus of some species (baleen whales). Marine mammals exposed to the entrained hydrocarbons and DAHs in the water column may experience lethal or sub-lethal physical and toxic effects such as irritation of eyes/mouth and potential illness. **Table 7-76** provides further information about environmental impacts to marine mammals from hydrocarbon exposure and increased toxicity.

Cetaceans exposed to hydrocarbons may exhibit avoidance behaviour. Geraci (1988) documented apparent avoidance of floating oil by bottlenose dolphins, suggesting that cetaceans can detect and avoid surface slicks. However, observations during spills have recorded whales and dolphins traveling through and feeding in oil slicks. During the Deepwater Horizon spill in the Gulf of Mexico, cetaceans were routinely witnessed swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al. 2017). Cetaceans observed during the spill response for the Montara oil spill (Timor Sea), included oceanic species such as false killer whales, bottlenose dolphins, spotted dolphins and spinner dolphins (Watson et al. 2009).

Cetaceans exposed to surface, entrained or dissolved aromatic hydrocarbons above moderate exposure thresholds may suffer external oiling, ingestion of oil and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees 2016). Cetaceans in coastal waters (e.g. coastal dolphin species and humpback whales at the northern limit of their migration) are at lower risk of impacts than cetaceans in offshore water due to the oil weathering that will occur prior to the oil reaching coastal waters. Impacts from direct oiling from a spill of Caley crude are considered unlikely due to the light persistent nature of the hydrocarbon and the thick layer of skin and blubber of cetaceans. Impacts from direct exposure are expected to be irritation of eyes and mucous membranes. Entrained hydrocarbons may be ingested by cetaceans during feeding, particularly by baleen whales. Some species of baleen whale, such as humpback and blue whales, may be seasonally present during their migrations. Opportunistic feeding may occur during migration may occur, with most baleen whale feeding occurring in waters well south of the Project Area. Some whales, particularly those with coastal migration and reproduction, display strong site fidelity to specific resting, breeding and feeding habitats, as well as to their migratory paths. Migratory BIAs identified for the Pygmy Blue Whale and Humpback Whale occur within the area that may be exposed from an oil spill from the Dorado Development.

Dugongs are known to occur in coastal waters and around offshore islands within the moderate EMBA, at locations including: Dampier Archipelago, Abrolhos Islands, Lowendal Islands, Exmouth Gulf and Ashmore Reef. There is a paucity of studies examining the effects of hydrocarbon spills on dugongs, although the direct impacts of exposure to hydrocarbons may be similar to cetaceans. Like cetaceans, dugongs are expected to be resilient to direct impacts from a spill due to their thick skin and blubber. Suitable dugong habitat is associated with seagrass meadows, which are typically restricted to shallow waters around the mainland coast and islands. The distance of dugong habitat from the worst-case credible spill release locations means that oil reaching dugong habitat will be highly weathered (the distance from the WHP to the mainland coast is approximately 145 km).

Marine Reptiles

Marine turtles may be exposed to floating hydrocarbons when at the sea surface (e.g. breathing, basking etc.), and are not expected to avoid floating hydrocarbon slicks (National Oceanic and Atmospheric Administration 2010). Exposure to floating or entrained hydrocarbons may result in external oiling, which could result in physical impacts such as inflammation or infection (Gagnon and Rawson 2010; Lutcavage et al. 1995; National Oceanic and Atmospheric Administration 2010). Oiling can also irritate and injure skin which is most evident on pliable areas such as the neck and flippers (Lutcavage et al. 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of their salt gland (Lutcavage et al. 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large ‘tidal’ volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton and Lutz 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (National Oceanic and Atmospheric Administration 2010). Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces causing irritation of mucous membranes in the nose, throat and eyes leading to inflammation and infection (Gagnon and Rawson 2010).

The EMBA overlaps with BIAs for five turtle species (flatback, green, hawksbill, Olive Ridley and loggerhead)**.** Sea snakes are associated with the offshore reefs and banks within the EMBA, particularly those at Ashmore, Imperieuse and Clerke Reef within the Rowley shoals, which are known for their abundance and diversity of sea snakes. The saltwater crocodile may also occur in small numbers in the EMBA, potential impacts to the crocodile are similar to those of turtles.

Important habitat including important nesting beaches for turtle species are present within the EMBA, including locations where spill modelling indicated the accumulation of hydrocarbons on shorelines such as Ashmore Reef AMP (nesting green turtles and foraging for other turtle species), Eighty Mile Beach (flatback turtle nesting) and further afield at Muiron Islands (loggerhead and green turtles) and Ningaloo Coast (loggerhead, green and hawksbill). The highest shoreline accumulations, above the 100 g/m² exposure value, were predicted at Ashmore Reef, Rowley shoals (Clerke and Imperieuse reefs) and Eighty Mile Beach. In the event of a spill, the presence of hydrocarbons on beaches would disrupt behaviour which could present a risk to turtle populations. For further detailed environmental impacts to marine reptiles from hydrocarbon exposure and increased toxicity, refer to **Table 7-75.**

HFO from the worst-case loss of containment due to vessel collision may result in shoreline accumulation above the moderate exposure threshold on nesting beaches throughout this region. Marine turtles rely on nesting beaches to reproduce, which makes them vulnerable to impacts from spilled hydrocarbon accumulations on shorelines through oiling of nesting females and emergent hatchlings (Lauritsen et al. 2017). Hydrocarbons accumulated on sandy beaches may also potentially impact nesting females, incubating eggs and emerging hatchlings through direct contact with the hydrocarbon.

Impacts to sea snakes from direct contact with hydrocarbons include potential damage to the dermis and irritation to mucous membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation 2011a).

Birds

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may result in matted feathers leading to potential hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons. These impacts combined, can lead to mortality (Hassan and Javed 2011) and sub lethal toxic effects such as irritation of eyes/ mouth. Seabirds may encounter floating oil when foraging for food or resting on the sea surface. Seabird foraging is typically concentrated around roosting locations, such as offshore and coastal islands. The EMBA contacts multiple areas where seabirds are known for breeding including Bedout Island, Eighty Mile Beach and Ashmore Reef, impacts to birds may include coating by oil when floating in open water, diving into open and coastal waters to feed on fish, wading and foraging on shallow intertidal mud/sand flats or roosting on oil affected sandy beaches. For further detailed environmental impacts to birds from hydrocarbon exposure and increased toxicity, refer to **Table 7-75.** Lethal or sub-lethal physical and toxic effects such as irritation of eyes/mouth and potential illness may occur should seabirds and shorebirds be exposed to MDO, HFO and Caley crude at moderate exposure values.

Caley crude (future tieback scenarios, **Table 7-81** and **Table 7-82** and HFO (vessel collision, **Table 7-79**) spills may result in a considerable amount of persistent floating oil. This oil is expected to remain on the sea surface, and may result in contact with seabirds that are foraging or resting within a floating oil slick. A number of BIAs for seabirds, including terns, shearwaters, boobies and frigatebirds, occur within the moderate floating HFO and Caley crude EMBA for the worst-case hydrocarbon spill scenarios described in **Section 7.3.1.1.3** and **Section 7.3.1.1.4**. The BIAs are located in the vicinity of coastal and offshore islands; these islands host large numbers of birds during the breeding seasons for these species. A spill resulting in floating oil around these islands may cause oiling of nesting birds, which may result in mortality of oiled birds. Other impacts could include behavioural impacts whereby birds avoid important nesting and migratory stop-over areas including RAMSAR wetlands or reduced food availability if important foraging areas are impacted.

Migratory shorebirds are seasonally abundant during summer months, and a spill during this period would have greater potential to impact migratory shorebirds. Migratory shorebirds are not likely to encounter floating oil at sea, but they may be affected by shoreline accumulation of oil or by oil and shallow foraging habitats, such as intertidal mudflats. Unlike seabirds, shorebird mortality due to hypothermia from matted feathers is relatively uncommon (Henkel et al. 2012). Indirect impacts, such as reduced prey availability and bioaccumulations of PAHs, may occur (Henkel et al. 2012). Impacts of an oil spill to migratory shorebird prey in important foraging areas, such as the intertidal flats off Eighty Mile Beach, could result in reduced food availability for portions of migratory shorebird populations.

There are a number of wetlands of international importance (RAMSAR sites) for migratory birds within the moderate EMBA; refer to the Protected Areas sub-section (subsection of **Section 7.3.1.2.11**) for a discussion of the potential impacts of an oil spill on these wetlands.

Fish

Fish respire through gills, which may make them more vulnerable to dissolved hydrocarbon fraction compared to fauna with less permeable skins, such as cetaceans, marine reptiles and birds. Despite this apparent vulnerability, fish mortalities are rarely observed to occur because of hydrocarbon spills (Fodrie and Heck 2011; International Tanker Owners Pollution Federation 2011c), although instances of fish mortality from spills in confined areas (e.g. bays) have been recorded. These observations are consistent with fish moving away from hydrocarbons in the water (Hjermann et al. 2007).

Exposure of fish to hydrocarbons may results in acute and chronic effects and may vary depending on a range of factors such as exposure duration and concentration, life history stage, interspecies differences and other environmental stressors (Westera and Babcock 2016). Environmental monitoring of pelagic and demersal fishes immediately following the Montara oil spill indicated that fish were exposed to hydrocarbons, although no adverse effects were detected (Gagnon and Rawson 2012, 2011). Further sampling and testing over time indicated that fish captured in close proximity to the Montara wellhead were comparable to those collected from reference sites (Gagnon and Rawson 2012, 2011).

The NWS supports a diverse assemblage of fish particularly in shallower water near the mainland and islands. Threatened species identified by the PMST include the white shark, whale shark, grey nurse shark, sawfishes (freshwater, dwarf, green, narrow and large-tooth), giant manta ray and reef manta ray, mako sharks, blind gudgeons and cave eel, porbeagle, Balston's pygmy perch, Northern river shark and oceanic white tip sharks which may be present in the EMBA. Given the absence of critical habitat for most of these species, significant numbers are not expected to be exposed to hydrocarbons in the event of a spill. These threatened and migratory fish and sharks could be present at low densities all year round within the EMBA; however, the absence of any known feeding, resting or breeding areas means significant numbers are unlikely to be impacted if an unplanned release were to occur.

Stochastic modelling results indicate that hydrocarbons are likely to be concentrated in surface waters. As a result, demersal fish are unlikely to be directly affected unless located near to a subsea release, as these are likely to be associated with seabed features (e.g. reefs, shoals, banks and KEFs). Pelagic fish are more likely to encounter dissolved and entrained hydrocarbons above adverse exposure thresholds but may move away from affected areas, particularly larger pelagic fishes such as mackerel.

Most marine fish species produce very high numbers of eggs, which then undergo a planktonic larval development phase. Early life history stages of fish (planktonic eggs and larvae) may be more vulnerable to hydrocarbon pollution than juvenile and adults, as these early life history phases cannot actively avoid water with high concentrations of hydrocarbons. Fish embryos and larvae may exhibit genetic and developmental abnormalities from long-term exposure to low concentrations of hydrocarbons (Fodrie and Heck 2011), although such long exposures may not be representative of real world conditions. PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al. 2017).

Given the temporal and spatial scale of the worst-case credible spill scenarios (as shown by a single deterministic run), and the typically high supply of eggs and larvae, it is unlikely that any of the worst-case credible spill scenarios will result in significantly reduced recruitment of fish due to impacts during early life history phases. This conclusion is supported by studies of fish stocks following large-scale hydrocarbon spills, which have shown relatively little evidence of reduced recruitment at the scale of fish stocks/populations (Fodrie and Heck 2011).

Transitory and resident sharks may occur within the moderate exposure threshold EMBA identified by the stochastic spill modelling. Whale sharks are expected to occur within the Project Area (e.g. traversing the Project Area during migration to and from the main aggregation location off Ningaloo Reef) and a BIA for foraging whale sharks overlaps with the Project Area. Whale sharks may be exposed to entrained and dissolved hydrocarbons by contact with their gills and ingestion during feeding, damaging their gilds and tissues and organs. The large volume filter feeding behaviour of whale sharks may result in a relatively high potential for exposure to entrained hydrocarbons compared to many other marine species (Campagna et al. 2011).

Tagging studies off Ningaloo Reef have shown that whale sharks disperse broadly (Meekan and Radford 2010; Wilson et al. 2006). Genetic studies of whale sharks have shown low genetic diversity, which suggests flow of genetic material through the movement of individual sharks over large spatial scales (Schmidt et al. 2009). On this basis, only a portion of the whale shark population would be within the moderate EMBA at any one time and impacts such as toxic effects leading to mortality would be expected to affect a small number of individual animals.

A number of threatened species of demersal sawfish were identified as potentially occurring within the Project Area and the EMBA. Impacts to these species within the Project Area are unlikely to occur as a result of an oil spill, as the oil will be concentrated in surface waters. Entrained or dissolved hydrocarbons that encroach into relatively shallow coastal waters may expose sawfish in coastal areas to hydrocarbon, potentially resulting in toxic effects which may lead to mortality. Hydrocarbons are not expected to penetrate upstream into river systems that are important pupping and juvenile habitats for these species. Any impacts from an oil spill would be restricted to adults in coastal waters. Given the wide distribution of these species, this is not expected to result in population-scale impacts.

Other oceanic (e.g. mako) and resident (e.g. reef) sharks will occur throughout the moderate exposure threshold EMBA. Potential impacts to other oceanic shark species are likely to be similar to pelagic fish. Any reduction of shark numbers may take longer to recover due to the relatively long lifespans and low reproductive output compared to finfish species.

7.3.1.6.4 Protected Areas

Australian Marine Parks, State Marine Parks, Management Areas and Reserves

The operational areas do not intercept any Australian or State Marine Parks, Management Areas or Reserves. The closest AMP is the Eighty Mile Beach AMP, with predicted contact of accumulated hydrocarbons from well LOWC. These areas are further identified and detailed in **Section 3.4.2**

The EMBA at the moderate exposure value overlaps several AMPs and state marine parks, management areas and reserves, with key protected areas including Eighty Mile Beach AMP, Imperieuse Reef MP, Clerke Reef MP, Montebello Islands, Lowendal Islands and Barrow Island. Marine protected areas (including marine parks and heritage listed places) may be vulnerable to hydrocarbon exposures from an oil spill. As the values and sensitivities of these protected places are a combination of quality, habitat, marine fauna and flora, and human use, the impact pathways are varied. Refer also to impact assessments for related receptors, including water quality, sediment quality, coastal and benthic habitats and communities and marine fauna.

Wetlands of International Importance – Ramsar Wetlands

Spill modelling identified Ramsar sites as potentially being impacted by spilled hydrocarbons (**Section 3)**, based on modelling results from the future tieback scenarios described in **Section 7.3.1.1.4.** Migratory bird species associated with Ramsar sites are most vulnerable to nearshore floating oil and oil accumulations along the shoreline. One particular RAMSAR location of high sensitivity and value is Eighty Mile Beach, displaying high predicted volumes of shoreline oil (2, 303 tonnes). Eighty Mile Beach RAMSAR wetlands provides habitat for 97 wetland bird species, 42 of which are listed under CAMBA, JAMBA and ROKAMBA. Up to 500, 000 birds use the area as a migration terminal annually, making it one of the most valuable bird rookeries globally. Broome-Roebuck is another RAMSAR wetland of significance with predicted shoreline accumulation (180 tonnes), with intertidal mudflats of the northern and eastern shores of Roebuck Bay supporting very large numbers of migratory shorebirds. Impacts to these RAMSAR wetlands include behavioural impacts, whereby birds avoid important nesting and migratory stop-over areas and reduced food availability if important foraging areas are impacted.

Potential impacts of spilled hydrocarbons on migratory shorebirds are discussed in **Section 7.3.1.2.9**.

7.3.1.6.5 Socio Economic

World Heritage Areas

The Ningaloo Coast WHA and National Heritage Area was identified by stochastic modelling as potentially being exposed to entrained, dissolved and accumulated hydrocarbons from worst-case subsea and surface loss of well containment scenarios. Stochastic modelling of the subsea loss of well containment scenario indicated the Ningaloo World and National Heritage Areas had a less than 50% probability of being contacted above the moderate entrained exposure threshold, with the shortest time to contact of 15 days and a maximum concentration of approximately 2,000 ppb.

The heritage values of these reefs are primarily their outstanding natural values, including habitats and fauna. These values are described in **Section 3**. Refer to **Section 7.3.1.2.4** for a discussion of potential impacts to these natural values.

Probability of oil contact as far south as Shark Bay WHA was predicted to be less than Ningaloo WHA and ranged from 5-29% for entrained oil and 1-6% for dissolved oil over all seasons. There was a low probability of contact of shoreline oiling predicted in Shark Bay WHA at the moderate exposure threshold (7.3%). On the basis of the nature and scale of the contact predicted by the modelling, impacts to the environmental values of the Shark Bay WHA are unlikely to occur given the low probability of contact above moderate exposure thresholds.

National Heritage

The environmental values and sensitivities of the Ningaloo Coast and Shark Bay National Heritage Areas are aligned with those of the WHAs discussed above. Refer to **Section 7.3.1.2.11** for a discussion of the potential impacts to these areas.

Stochastic modelling results indicated that the shorelines of the Dampier Archipelago and the West Kimberley National Heritage Places may be impacted by floating, accumulated, entrained and dissolved hydrocarbons above moderate exposure thresholds. These heritage places contain a range of shoreline types, including rocky shores, sandy beaches and mangroves. Many of the heritage values of the Dampier Archipelago and the West Kimberley National Heritage Place lie above the shoreline and will not be impacted by a hydrocarbon spill.

Commonwealth Heritage

Several offshore islands and reefs listed as Commonwealth Heritage Places were identified by the spill modelling results as potentially being contacted by hydrocarbons. These include:

+ Ashmore Reef National Nature Reserve Commonwealth Heritage Place;
+ Scott Reef and Surrounds Commonwealth Heritage Place;
+ Mermaid Reef – Rowley Shoals Commonwealth Heritage Place;
+ Christmas Island Natural Areas - Commonwealth Heritage Place; and
+ Ningaloo Marine Area – Commonwealth Heritage Place.

The heritage values of these reefs are primarily their outstanding natural values, including habitats and fauna. These values are described in **Section 3**. Refer to **Section 7.3.1.2.4** for a discussion of potential impacts to these natural values.

Indigenous Heritage

Hydrocarbon accumulation above the moderate exposure threshold may occur along the Pilbara and Kimberley coastlines, which could result in potential impacts to Aboriginal heritage sites. A search of the Department of Planning, Lands and Heritage's Aboriginal Heritage Inquiry System was undertaken to identify registered Aboriginal sites (Registered Sites) as outlined under Section 5 of the *Aboriginal Heritage Act 1972*. A total of 194 Registered Sites were identified to intersect the predicted areas of shoreline accumulation. Identified Registered Sites have been designated for a number of aspects including (but not limited to) artefact scatters, ceremonial, mythological, campsites, water sources, engravings and burial. In addition to Registered Sites, there are a number of other Heritage Places along the Northwest coastline of Western Australia which may also be impacted from a surface release of HFO.

The majority of the Registered Sites are located to the east of the Project Area along the coastline of Broome (both to the north and south). The deterministic model run with the greatest length of shoreline above the moderate accumulation threshold indicated up to 154 km of shore could be subject to accumulation more than 100 g/m^2. Modelling predicted the maximum length of shoreline contact was expected to be 154 km (summer conditions) for a worst-case loss of containment due to a vessel collision. Oil accumulation above the moderate exposure threshold may interfere with traditional uses of the coastal environment, such as fishing.

Fisheries

The worst-case credible hydrocarbon spill scenarios may result in a range of impacts to commercial fishing activities (International Tanker Owners Pollution Federation 2011c), such as:

+ displacement of fishing effort from areas affected by a spill or spill response activities;
+ damage to fish stocks due to mortality;
+ closure of fisheries by management agencies;
+ inability to sell catch due to perceived or actual fish tainting or contamination; and
+ oiling of fishing gear, particularly by floating oil.

A significant hydrocarbon spill would likely result in the temporary closure of areas of the fisheries within the EMBA. The spatial extent and duration of the closure would depend on the nature and scale of the pollution resulting from the hydrocarbon spill. Given the large spatial extent of managed fisheries in the area potentially contacted above moderate exposure thresholds, a spill is unlikely to result in complete closure of a fishery. Rather, the closure of areas to fishing is more likely to result in the displacement of fishing effort. Displacement from productive fishing areas may result in impacts to fishers such as increased costs and reduced catch per unit effort. The fisheries most likely to be affected by a worst-case hydrocarbon spill are those active within and around the Project Area, including:

+ Pilbara Fish Trawl (Interim) Managed Fishery;
+ Pilbara Line Fishery;
+ Pilbara Trap Managed Fishery; and
+ Mackerel Managed Fishery (Area 2 - Pilbara).

Exposure of fish to hydrocarbons may result in tainting, which may render landings unsuitable for human consumption. Tainting may occur even at low levels of hydrocarbon exposure. Monitoring of fish for taint immediately following capping of the Montara well detected differences between fish likely to have been exposed to hydrocarbons; however, these differences were not conclusively linked to oil contamination and fell within the range of "normal" fish odours (Rawson et al. 2011). Samples collected at the same monitoring locations two and four months after were not distinguishable (Rawson et al. 2011). These results are consistent with other studies of fisheries resources exposed to hydrocarbon pollution, which acknowledge the potential for impacts to fisheries resources and have shown little potential risk for consumers if suitable fisheries management actions are undertaken (Law and Hellou 1999; Law and Kelly 2004).

The actual effects of hydrocarbons on marine fisheries yield or other ecological processes are not well known. There are multiple studies on toxicological effects of exposure to hydrocarbons for fish, including lethal and sublethal effects from laboratory, modelling and field studies (e.g. Bax 1987; Marty et al. 1997), which indicate there is a potential for long-term changes in development, reproduction and growth. The Deepwater Horizon oil spill in April 2010 resulted in fisheries closures across the Gulf of Mexico (Mccrea-Strub et al. 2011). Because of concerns over food safety, in May 2010 NOAA initiated closures of waters to commercial and recreational fishing. By January 2011, 10,911 km^2 of waters around the well and coastal waters remained closed to commercial and recreational fishing (Gohlke et al. 2011). Federal agencies, in collaboration with impacted Gulf states, developed a protocol to determine when it is safe to reopen fisheries based on sensory and chemical analyses of seafood. In April 2011, NOAA reopened all remaining waters (Gohlke et al. 2011). Continued analysis of Gulf seafood was recommended to determine potential long-term health impacts and restore consumer confidence in Gulf fisheries (Oil Spill Commission 2011). The Deepwater Horizon incident may differ from other spills because of the depth at which the LOWC occurred, and the unprecedented volume of dispersants used (Gohlke et al. 2011).

Fish caught in areas affected by a worst-case hydrocarbon spill may be perceived as being of poorer quality, even if no decrease in quality is evident. This may result in lower prices at the time of sale and subsequently lead to reduced income for commercial fishers.

Tourism

There are currently no known tourism activities in the Project Area due to the remoteness of the area. A number of tourism destinations occur within the EMBA, including Ningaloo Reef (which is within a World Heritage Area, National Heritage Place and a Commonwealth Heritage Place) and offshore islands such as the Montebello Islands, Rowley Shoals and the Abrolhos Islands. A number of areas with high diversity or which have unique ecological values are protected within AMPs. These activities are expected to be exclusively nature-based tourism and potential impacts to the environmental values associated with these islands and reefs may subsequently impact upon tourism activities.

Mainland coastline and islands will typically host more nature-based tourist activities compared to offshore islands. This activity is expected to be seasonal, with increased visitation during the winter dry season months.

As well as reducing the visual amenity of these areas, a spill could impact the habitats and marine fauna of these areas thereby impacting the environmental values of these tourism areas. Depending upon the extent of impact, loss of revenue to coastal towns and communities could also occur.

Impacts to tourism activities are expected to be minor based on the likelihood and nature of contact to environmental values that support tourism activities. Impacts to these values may result in displacement of tourism activity, and potentially minor loss of revenue for tourist operators (e.g. charter fishing cancellations due to fishery closures). A large-scale oil spill is expected to attract national or international media attention. Reporting on the oil spill may lead to a perceived decrease in the environmental value of the region, which may subsequently impact upon tourism visitation numbers.

Maritime Industry

Potential impacts to ports and commercial shipping from the worst-case credible spill scenarios may result in temporary displacement of other users from areas where oil is present or from spill response activities are underway. Spill response activities would be concentrated around the release location and spill clean up activities concentrated on shoreline areas where oil had accumulated which may require access by sea.

A surface slick has the potential to disrupt production or exploration activity with associated economic impact. Exclusion zones surrounding spills will reduce access potentially resulting in delays to work schedules with possible subsequent financial implications.

7.3.1.7 Summary of Risk Evaluation

A summary of the outcomes of the risk evaluation, including, likelihood, consequence rankings, adopted control measures and EPOs is provided in **Table 7-85.** Given that the scenarios impact assessed are the worst case scenarios as described in **Section 7.3.1.3**, only these have been risk ranked.

Table 7-85: Summary of impacts, EPOs, controls and consequence evaluation for accidental spills of hydrocarbons and chemicals during Dorado Phase 1

EPOs
EPO20A Undertake Dorado Phase 1 in a manner that will prevent unplanned discharge of chemicals or hydrocarbons to the marine environment. **EPO21A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of reservoir fluids to the marine environment due to a LOWC, or failure of a flowline or FPSO cargo tank. **EPO22A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of MDO/MGO or HFO to the marine environment due to vessel collision, failure of a storage tank or release during refuelling. **EPO23A** In an event of an unplanned release of chemicals or hydrocarbons, spill response control measures will be implemented in accordance with an accepted EP/OPEP.
Control Measures (CM)
CM9 Santos Chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements. **CM52**: Accepted well operations management plans in place for all wells detailing: + blowout preventer installation and testing, + competency of the drillers engaged, + monitoring of wellbore progress and drilling fluid balance, and + well designs that consider reservoir characteristics. **CM53**: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the *Navigation Act 2012* and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM54**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM55**: All project vessels subject to Santos' marine assurance procedures. **CM56**: All offtake tankers subject to Santos' tanker vetting procedures. **CM57**: Bunkering procedures to manage the transfers of fuel that include: + weather limits on bunkering operations, + bunkering equipment specifications and inspections, + visual observations during transfers, and + emergency shutdowns.

CM58: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM59**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM60**: Should potential future tiebacks overlap within AMSA fairways Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way **CM61**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM62**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development. **CM63**: FPSO will be designed, constructed and operated to Santos' specified requirements, including: + double-hulled construction, + cyclone and adverse weather avoidance procedures, and + structural integrity inspection regime. **CM64:** Oil-spill modelling and environmental risk assessments for development of Dorado Phase 1 EPs and OPEPs will consider the full range of credible worst-case scenario LOWC consequences based on best available oil-spill modelling **CM65:** During Development Well drilling and drilling of tieback wells, a simultaneous production and drilling (SIMOPS) workshop will be completed, and a procedure developed to manage and mitigate any additional risks due to concurrent activities. **CM66:** Accepted EP/OPEP in place for all Dorado Development activities. **CM67**: All vessels involved in the project will have a valid Shipboard Oil Pollution Emergency Plan or Shipboard Marine Pollution Emergency Plan (as appropriate for vessel classification). **CM68**: Source control emergency response plans in place for all drilling activities. **CM69:** Emergency response capability (including equipment, personnel contracts, MOUs) will be maintained in accordance with approved SOPEPS accepted EPs and OPEPs.

Accidental release of Caley crude from a worst-case subsea or surface loss of well containment (Dorado development (Sections 7.3.1.1.3) including the future tieback drilling (Section 7.3.1.1.4))	
Likelihood	Unlikely – B The likelihood of a LOWC event occurring during Dorado Phase 1 is extremely low when applying industry statistics, Santos statistics and the standard preventive control measures in place. Wells are designed with essential engineering and safety control measures to prevent a loss of containment occurring. Blowout events during wildcat exploration drilling has been reported at a frequency of 1.5 x 10^{-4} per drilled well (IOGP, 2019; wildcat exploration drilling operations on deep, normal wells of North Sea standard). This frequency is based on two blowout incidents occurring in the UK between 1980 and 2014 during wildcat exploration drilling (IOGP, 2019) and supports the likelihood of 'has occurred elsewhere OR could occur within decades'. Although likelihood generally reduces for development drilling, a major loss of well control event has occurred as recently as 2009 offshore Australia (Montara). Wells are designed with essential engineering and safety control measures to prevent a loss of containment occurring. Management controls in place to control the flow of hydrocarbons include construction design, safety shutdown systems, regular inspection and maintenance, and competent personnel. Additional industry-standard and activity specific control measures

	to reduce the chance of a loss of containment event resulting in a release have also been implemented including (but not limited to) procedures such as the well operations management plan, safety case, crew training and awareness, and a spill response plan (OPEP) to be produced along with the environment plan (EP). These control measures are considered to reduce the risk of a loss of containment (and minimise impacts) occurring to a level that is acceptable.
Consequence	Major – IV Major long-term effect on local population, industry, or ecosystem factors.
	The detailed consequence assessment for each hot spot is provided in **Attachment 8-2**. A summary of the consequence assessment for each receptor category is presented below. *Physical environment or habitat* In the highly unlikely event of a LOWC subsea or surface, hydrocarbons will likely reach both subsea and shoreline habitats. Hydrocarbons that reach nearshore environments also have the potential to impact benthic coral reefs and mangrove areas, which may result in a long-term decrease in ecological values given toxicity impacts associated with hydrocarbon exposure. The worst case consequence assessment for physical environment at any identified hotspot was IV – Major at Imperieuse Reef MP, Clerke Reef MP and Montebello Islands. *Threatened or migratory fauna* In the highly unlikely event of a LOWC, the volume of condensate released would result in a reduction in water quality with the potential to impact marine fauna. Marine fauna present in the area may be potentially impacted by a spill through exposure to floating oil, entrained oil, or dissolved aromatic hydrocarbons. A description of impacts to marine fauna from exposure to condensate is provided in **Table 7-75** and **section 7.3.1.6.3** Impacts from a LOWC release would be greatest within several kilometres from the spill when the toxic aromatic components of the fuel will be at their highest concentration and when the hydrocarbon is at its thickest on the surface of the receiving waters. Upon release to the marine environment, the condensate will rapidly lose toxicity with time and will spread thinner at the surface as evaporation continues or will become entrained within the water column. The potential sensitive receptors in the surrounding areas of the spill will include fish, marine mammals, marine reptiles and seabirds at the sea surface, as discussed in **Table 7-75** and **section 7.3.1.6.3.** The worst case consequence assessment for threatened or migratory fauna at any identified hotspot was IV – Major at Eighty Mile Beach AMP, Imperieuse Reef MP, Clerke Reef MP, Montebello Islands, Lowendal Islands and Barrow Island. *Protected areas* The moderate exposure value EMBA intersects several protected areas including RAMSAR wetlands, AMPs and marine management areas (**Section 7.3.1.6.4**). Combined, these areas support all the habitats and faunal groups described above. Impacts to the habitat or fauna receptors described above therefore have an impact on the values of these reserves, which could have flow-on effects to tourism revenue of coastal communities that provide

	access to these marine reserves. Many of these receptors are values of protected areas, and there could be moderate-term effects to them. The worst case consequence assessment for protected areas at any identified hotspot was IV – Major at Eighty Mile Beach AMP, Imperieuse Reef MP, Clerke Reef MP, Montebello Islands, Lowendal Islands and Barrow Island. *Socio-economic receptors* There is the potential for entrained oil to temporarily disrupt fishing activities if the surface or entrained oil moves through fishing areas. Entrained oil at more than 100 ppb could reach pearl farming activities at the Montebello Islands and Eighty Mile Beach. Pearl oysters are filter feeders therefore, entrained oil droplets could create negative impacts through ingestion and accumulation of hydrocarbon compounds in oyster tissues or interference with respiratory structures. Ecotox (2009) reported that no observable effect concentration levels from weathered condensates for a comparable oyster species ranged from approximately 9,000 to 28,000 mg/l. Significant impacts on aquaculture would therefore be unlikely, as predictive modelling reported that the maximum time-averaged submerged total concentration for the worst realisation at the Montebello Islands was 3, 577 ppb and 5, 322 ppb at Eighty Mile Beach (AMP). Some loss of value to the local industry could occur in the event of a LOWC In addition, recreational fishing hot spots including the Montebello Islands, Barrow Island, Lowendal Islands, Muiron Islands and Ningaloo are of high value to recreational fishers. Tourism could be affected by spilled condensate, either from reduced water quality or shoreline oiling preventing recreational activities, reducing aesthetic appeal or from impacts to habitats and marine fauna as described in **Section 7.3.1.6.5**. Indigenous users may be impacted in the event that a land-based response is required. However, consultation will help manage activities such that potential impacts are reduced to acceptable levels. A number of oil and gas operators operate within the moderate EMBA. The worst case consequence assessment for socio-economic receptors at any identified hotspot was IV – Major at Eighty Mile Beach AMP, Imperieuse Reef MP, Clerke Reef MP and Montebello Islands. On the basis of the above assessment, a LOWC has the potential to impact an array of receptors. Given the extent and the presence of protected areas within the moderate exposure value EMBA , the worst-case consequence is considered to be Major (IV).
Residual Risk	Low
Accidental release of HFO crude from a worst-case loss of containment due to a vessel collision (Spill Scenario 5)	
Likelihood	Unlikely – B The likelihood of a rupture of the largest fuel tank of an offshore installation vessel is extremely low. Industry data shows that vessel collisions are rare, with only 37 collisions reported from 1200 marine incidents in Australian waters from 2005-2012.

	Most vessel collisions involve damage to a forward tank which are generally double-lined and smaller than other tanks; therefore, the loss of the maximum credible scenario of 1,500 m^3 of HFO is conservative and unlikely. Further given the speed at which the vessels will be undertaking activities within the Project Area it is unlikely that the larger internal fuel tanks would be breached due to a collision. Controls in place including exclusion zones for third party vessels will reduce the likelihood of this event occurring.
Consequence	Moderate – III Significant impact to local population, industry or ecosystem factors.
Residual Risk	Low
Accidental release of Caley crude from a worst-case loss of containment of FPSO cargo tank (Spill Scenario 6)	
Likelihood	Unlikely – B Significant impact to local population, industry or ecosystem factors. External impacts to the FPSO have not occurred within Santos, controls in place limiting third party vessels within a 500m radius of the DTM buoy and FPSO, standard navigational controls, double hulled FPSO reduce the likelihood of the event occurring to unlikely.
Consequence	Moderate – III
Residual Risk	Low

7.3.1.8 Demonstration of Acceptability

The acceptable levels of impact for the receptors that may credibly be impacted by accidental hydrocarbon and chemical spills as a result of Dorado Phase 1 against receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-86** and **Table 7-87.** The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case residual risk for accidental hydrocarbon and chemical spills was evaluated as low (**Table 7-85**). This consequence is considered to be acceptable when assessed against acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental risks that may result from accidental hydrocarbon and chemical releases are acceptable.

Table 7-86: Demonstration of acceptability for accidental hydrocarbon and chemical spills

Acceptability Criteria	Justification
To meet the principles of ESD	The risks and impacts from the worst-case credible spill scenarios are inherently inconsistent with some of the principles of ESD based on the following: + environmental resources may be significantly impacted in the event a worst-case credible spill occurs, and + a worst-case credible spill may prevent others exercising their right to access environmental resources.

Acceptability Criteria	Justification
	Santos will apply a range of controls to ensure that a worst-case credible spill from Dorado Phase 1 is highly unlikely to occur. These include a range of industry practices that have been developed through extensive experience, including the lessons learned from significant unplanned releases such as the Macondo and Montara well blowouts. Following successful application of these controls, Santos considers the residual risk to be consistent with the principles of ESD. This consistency is achieved by: + developing natural resources in an environmentally responsible manner, resulting in income for government, generation of Australian jobs, and developing an increased understanding of the environment (e.g. environmental surveys undertaken by Santos in the Project Area). + application of conservative inputs/assumptions and scalable response strategies to compensate for inherent uncertainties in managing oil spill risk by: + assessing the full range of worst-case credible spill scenarios (and combining where appropriate) for development activities to ensure the EMBA is sufficiently conservative for oil spill impact assessment and planning purposes. Industry statistics indicate the vast majority of unplanned spills are significantly smaller than the worst-case credible spills. + using conservative assumptions, based on field specific data where possible, to inform potential loss of well control volume + using qualified and competent oil-spill modelling providers and widely used and accepted oil-spill modelling tools + using a stochastic modelling approach for numerical modelling of the worst-case credible spill scenarios that includes a large number (300 for Dorado project, 150 for future tieback wells) of replicate runs covering a range of seasonal and metocean conditions, using environmentally conservative adverse exposure zone threshold to set a conservative EMBA to assess impact and inform response planning, + routine practices for further reducing uncertainty during the operational response phase (in the event of an actual incident) through implementation of monitor and evaluation response strategy actions such as oil spill trajectory modelling informed by real time met ocean data, and + robust oil response planning capability and capacity, with the ability to leverage significant external spill response support (personnel, equipment, expertise) to ensure scalability of Santos' response regardless of potential differences between oil spill modelling predictions and actual spill outcomes and consequences
Internal Context	The management of the risk of accidental hydrocarbon and chemical releases is aligned with Santos' policies and standards. The worst-case risk is low, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	The impact assessment, consequence levels and proposed controls for the Dorado Development are consistent with national and international standards, laws, and policies, and significant impact guidelines for MNES. The Dorado Development will

Acceptability Criteria	Justification
	also be managed in a manner that is consistent with management objectives and/or actions related to Accidental Release - from management plans for relevant WHAs, AMPs, or species recovery plans and conservation plans/advice. The following Conservation Advice/Recovery Plans identify pollution and / or habitat degradation as a key threat which may be a consequence of accidental release of hydrocarbons: <u>Conservation advice:</u> Approved conservation advice for *Glyphis garracki* (northern river shark) (Threatened Species Scientific Committee 2014a). Approved Conservation Advice for *Pristis clavate* (Dwarf Sawfish) (Threatened Species Scientific Committee 2009) Approved Conservation Advice for *Pristis pristis* (Largetooth Sawfish) (Threatened Species Scientific Committee 2014b). Approved conservation advice for Green Sawfish (Threatened Species Scientific Committee 2008a) Conservation advice *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) Conservation Advice *Anous tenuirostris melanops* Australian lesser noddy (Threatened Species Scientific Committee 2015e) Conservation Advice Red Knot (*Calidris canutus*) (Threatened Species Scientific Committee 2016f) Conservation Advice Curlew Sandpiper (*Calidris ferruginea*) (Threatened Species Scientific Committee 2015f) Conservation Advice Great Knot (*Calidris tenuirostris*) (Threatened Species Scientific Committee 2016a) Approved Conservation Advice for Cereopsis novaehollandiae grisea (Cape Barren Goose (south-western)) (DEWHA 2008c) Conservation Advice Greater Sand Plover (*Charadrius leschenaultii*) (Threatened Species Scientific Committee 2016b) Conservation Advice Lesser Sand Plover (*Charadrius mongolus*) (Threatened Species Scientific Committee 2016c) Conservation Advice for the Christmas Island Frigatebird – *Fregata andrewsi* (Threatened Species Scientific Committee 2020a) Conservation Advice *Halobaena caerulea* blue petrel (Threatened Species Scientific Committee 2015g) Conservation Advice *Limosa lapponica baueri* (Bar-tailed Godwit (Western Alaskan)) (DoE 2016) Conservation Advice *Limosa lapponica menzbieri* Bar-tailed godwit (northern Siberian) (DoE 2016) Conservation Advice for *Numenius madagascariensis* (Eastern Curlew) (DoE 2015) Conservation Advice Fairy Prion (Threatened Species Scientific Committee 2015h) Conservation Advice *Phaethon lepturus fulvus* white-tailed tropicbird (Threatened Species Scientific Committee 2014c)) Conservation Advice *Pterodroma Mollis* soft-plumaged petrel (Threatened Species Scientific Committee 2015i)

Acceptability Criteria	Justification
	Approved Conservation Advice Australian Painted Snipe (Rostratula australis) (Threatened Species Scientific Committee 2013) Conservation Advice for *Sterna nereis nereis* (Fairy Tern) (Threatened Species Scientific Committee 2011) Approved Conservation Advice for *Aipysurus apraefrontalis* (Shortnosed Seasnake) (Threatened Species Scientific Committee 2010a) Approved conservation advice for *Aipysurus foliosquama* (leaf-scaled sea snake) (Threatened Species Scientific Committee 2010b) Conservation advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b) Conservation advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c) Approved Conservation Advice for Pezoporus wallicus flaviventris (Western Ground Parrot) (DSEWPC, 2013e) <u>Recovery plans:</u> Recovery Plan for the White Shark (*Carcharodon carcharias*) (DSEWPC, 2013b) Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) (Department of the Environment 2014) Wildlife Conservation Plan for Seabirds (DCCEEW 2022) Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australian 2015c) National recovery plan for threatened albatrosses and giant petrels 2011–2016 (DSEWPaC 2011) Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a), identified as acute chemical discharge (oil pollution)Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a) Conservation Management Plan for the Southern Right Whale. A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 2011-2021 (DSEWPC 2012c) Recovery plan for the Australian sea lion (*Neophoca cinerea*) (DSEWPaC 2013a) The objectives of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The controls outlined are consistent with the objectives of the material listed above. Santos considers the impacts of hydrocarbon and chemical spills to not be inconsistent with the EPBC management plans. The Dorado Development will be managed in a manner that is consistent with management objectives and actions for all relevant WHA's, AMPs and RAMSAR wetlands further described in Section 3.4.2.
Other Relevant Requirements	Santos' management of the risk of accidental hydrocarbon and chemical releases is consistent with: + international maritime conventions, including: - International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978,

Acceptability Criteria	Justification
	- International Convention for the Safety of Life at Sea 1974, - International Regulations for Preventing Collisions at Sea 1972, and - MARPOL 73/78: Annex I: prevention of pollution by oil and oily water. + Australian legislation and requirements, including: - *Navigation Act 2012* and *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*: ○ Marine Order 21 (Safety and emergency arrangements), ○ Marine Order 27 (Safety of navigation and radio equipment), ○ Marine Order 30 (Prevention of Collisions), ○ Marine Order 71 (Masters and Deck Officers), and ○ Marine Order 91 (Marine pollution prevention – oil). - *OPGGS* (E) Regulations: ○ an accepted OPP for Dorado Phase 1, ○ accepted well operations management plans for all well activities, including drilling, operation, suspension and abandonment, and ○ accepted EPs and OPEPs for all petroleum activities associated with Dorado Phase 1. + recognised industry best practices, such as: - use of blowout preventers while drilling over-pressured formations with potential for flow, including regular function and pressure testing of the blowout preventers, and - design, construction and operation of wells, WHP and FPSO in accordance with recognised industry standards. - Using a Jack-up MODU rather than a semi-submersible MODU for developing the Dorado field with a wellhead platform and surface wellheads. Santos have a long history of successfully and safely operating jack-up MODU in Australia, including extensive experience constructing and managing platform well operations. For a semi submersible MODU to be viable, the platform would have to be many times larger than proposed to accommodate the additional equipment and dynamic loads. Direct intervention source control for wells drilled with a jack-up MODU is common (access by Well Control Specialists to target well via the platform or jack-up MODU); however, constructing the wells this way precludes the use of a subsea Capping Stack (as the well is not being constructed in open water, with wellhead/BOP equipment close to the seabed). As direct access cannot be guaranteed for a source control response, the primary source control strategy that is premised to be captured in the Development Drilling Environment Plan (EP) and Well Operations Management Plan (WOMP) is a relief well. This is the case for many existing assets, and the same for other currently accepted EPs and WOMPs. - Operations performed under various Environment Plans on the Dorado field will be assessed against commitments made in the Environment Plan prior to Operations commencing. Should any simultaneous spill risk profiles exceed the Worst-Case Credible volume, these activities will not run concurrently.

Acceptability Criteria	Justification
	This will be managed within the Matrix of Permitted Operations documented in the safety case or safety case revision.

Table 7-87: Demonstration of acceptability of accidental hydrocarbon and chemical releases against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Justification
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[44] are acceptable.	Santos considers large-scale releases of hydrocarbons during Dorado Phase 1 to be unacceptable. Such spills have potential to result in extensive, long-term environmental impacts. Santos applies a level of conservatism in all aspects of oil spill impact assessment, planning and response preparedness, to ensure the management of uncertainty associated with oil spill risk is consistent with the principles of ESD, specifically, *if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.* Examples of how this is applied in practice include the following: + assessing the full range of worst-case credible spill scenarios (and combining where appropriate) for development activities to ensure the EMBA is sufficiently conservative for oil spill impact assessment and planning purposes. Industry statistics indicate the vast majority of unplanned spills are significantly smaller than the worst-case credible spills. + Using conservative assumptions, based on field specific data where possible, to
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity[36] are acceptable.	
RSAL7: No substantial changes in air quality which may adversely impact on biodiversity, ecological integrity, social amenity or human health as a result of Dorado Phase 1.	
RSAL8: No significant[45] impacts to benthic habitats and communities.	
RSAL10: No impacts to coastal habitats.	
RSAL11: No significant[47] impacts to environmental values of KEFs.	
RSAL12: No impacts to TECs.	
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of the Dorado Development must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	
RSAL17: No impacts to ecological values of Ramsar wetlands. **RSAL18**: No impacts to the values of marine parks.	

[44] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[45] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

Receptor-specific Acceptable Levels	Justification
RSAL19: No negative impacts to the economic viability of the commercial fish resources. **RSAL22**: No significant[46] impacts to World Heritage Properties, National Heritage Places, Commonwealth Heritage. Places or registered Aboriginal Heritage Sites. **RSAL23**: No impacts to nature-based tourism resources resulting in demonstrated loss of income. **RSAL24**: Short-term displacement of tourism activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL25**: Long-term (up to 20 years) exclusion of tourism activities from the gazetted PSZ during production operations is acceptable. **RSAL26**: Short-term displacement of commercial shipping within the Project Area (excluding the gazetted PSZ) during installation/drilling operations is acceptable. **RSAL28**: Short-term displacement of defence activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL29**: Long-term (up to 20 years) exclusion of defence activities from the gazetted PSZ during production operations is acceptable.	inform potential loss of well control volume + Using qualified and competent oil-spill modelling providers and widely used and accepted oil-spill modelling tools + using a stochastic modelling approach for numerical modelling of the worst-case credible spill scenarios that includes a large number (300 for Dorado project, 150 for future tieback wells) of replicate runs covering a range of seasonal and metocean conditions, using environmentally conservative adverse exposure zone threshold to set a conservative EMBA to assess impact and inform response planning, + routine practices for further reducing uncertainty during the operational response phase (in the event of an actual incident) through implementation of monitor and evaluation response strategy actions such as oil spill trajectory modelling informed by real time met ocean data, and + robust oil response planning capability and capacity, with the ability to leverage significant external spill response support (personnel, equipment, expertise), to ensure scalability of Santos' response regardless of potential differences between oil spill modelling predictions and actual spill outcomes and consequences. On the basis of the points above, while the event itself is not considered acceptable, Santos considers the likelihood of large hydrocarbon releases and the reduction in impacts should one occur from Dorado Phase 1 to be acceptable.

[46] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

7.3.2 Accidental Release – Loss of Solid Material

7.3.2.1 Description of the Event

The accidental release of solid materials, such as equipment or wastes may occur during any stage of Dorado Phase 1. Accidental release of solid materials may occur from vessels, MODU, FPSO and Dorado WHP resulting from human error, incorrect or inappropriate waste storage, mechanical failure or breakdown of equipment used to store wastes, inadequate hazardous waste management or dropped objects.

Material and waste onboard vessels, MODUs or FPSO may be hazardous or non-hazardous. Hazardous wastes are defined as an object or substance that displays toxic, explosive, poisonous or flammable characteristics, which can no longer fulfil its intended use and requires disposal. Hazardous waste that may be accidentally lost to the marine environment includes batteries, aerosol cans, empty paint cans, printer cartridges, fluorescent tubes, hydrocarbon-contaminated materials (e.g. pipe dope, oily rags, oil filters), contaminated personal protective equipment and hazardous process waste. Non-hazardous wastes are those which are not classified as hazardous (as per the characteristics described above) but which, if released into the marine environment, may pose a threat to receptors through smothering, entanglement or ingestion. Non-hazardous materials and wastes will be disposed of onshore, however they could be accidentally dropped or lost overboard due to overfull bins or crane operator error. Non-hazardous materials and wastes include paper and cardboard, wooden pallets, scrap steel, metal, aluminium, cans, etc, glass and plastics

While Santos will implement controls to prevent the unintended release of solid material to the marine environment, such releases may occur during unloading and backloading of solid materials to support vessels, lifting activities (potentially resulting in dropped objects such as drill string), failing to keep external bins covered or from inappropriate handling of solid material. Industry experience shows most solid material accidentally lost overboard are generally small in size, such as personal protective equipment (e.g. gloves and hard hats), paper and cardboard packaging, and hand-held tools.

Heavy objects could potentially be dropped on infrastructure containing hydrocarbons (e.g. topside processing equipment and subsea risers or flowlines) possibly resulting in the release of hydrocarbons (although unlikely to occur). Accidental hydrocarbon spills are assessed in **Section 7.3.1**.

7.3.2.2 Analysis of Impacts and Risks

A summary of the analysis of the environmental impact of loss of solid material as a result of Dorado Phase 1 is provided in this section. **Table 7-88** identifies the potentially impacted receptors as a result of the discharge of PW within the Project Area.

Table 7-88: Receptors potentially impacted by the loss of material

Description of the Impact	Receptor Categories
Modification of benthic habitats from accidental loss of solid material. Injury or mortality of marine fauna due to ingestion of or entanglement with lost solid material.	Water Quality – **Section 7.3.2.2.1** Benthic Habitats – **Section 7.3.2.2.2** Marine Fauna – **Section 7.3.2.2.3**

While fish may potentially be impacted by an unplanned loss of solid material, this area of influence is highly localised and of an insignificant area, and is not expected to result in a change in the viability of the population of commercially important species. Therefore, impacts to commercial fisheries from unplanned loss of solid material are not expected, and have not been evaluated further.

7.3.2.2.1 Water Quality

Unplanned discharges of hazardous waste may leach into the marine environment causing localised contamination and increased toxicity within the water column. The level of impact to water quality depends on the nature of the discharge, which are typically small volumes such as residual paint in cans or oily rags lost overboard. Due to wave action and local ocean currents minor releases of residual hazardous waste will be rapidly mixed and diluted resulting in temporary and highly localised changes to the water quality. Therefore, no long-term changes in water quality are expected. Given the small volumes, occasional nature of the events and the offshore location, potential impacts to the biodiversity, ecological integrity, social amenities and human health the loss of solid material will be minor.

7.3.2.2.2 Benthic Habitats

Impacts to benthic habitats from the loss of solid materials to the marine environment will depend on the nature of the material and the sensitivity of the benthic habitat upon which it lands. Loss of solid material is most likely to occur around the Dorado WHP and the FPSO, as these locations are where activities will be concentrated. Future tieback locations, which are yet to be determined, may also represent the location where solid material is lost to the marine environment.

The majority of the Project Area consists of habitats composed largely of fine sediments (typically more than 90% cover) but it also contains some areas of hard pavement reef, which may host filter feeder communities, especially whip corals, gorgonians and sponges (**Attachment 2**). These habitats are widely represented throughout the NWS and are not considered to be sensitive benthic habitats. The Project Area deliberately avoids overlapping the Ancient Coastline at 125 m water depth KEF, and there are no known bathymetric features (e.g. shoals, banks) or high conservation significant ecological values, habitats or communities of species identified within the Project Area.

Relatively large items that may be accidentally released to the marine environment, such as drill string and wooden pallets, are largely inert and do not represent a contamination risk to sediments or benthic habitats. Potential impacts from inert solid materials that may be released to the marine environment are expected to be limited to direct physical disturbance of the seabed (e.g. depressions in the sediment). The benthic habitats within the Project Area are not particularly sensitive to direct physical disturbance due to the absence of benthic primary producer habitat and the sparse density of epibenthic biota (RPS, 2020). If the inert material can be recovered, depressions in the seabed will recover over time through natural sedimentary processes.

Some solid materials that may be lost overboard may not be inert. Examples include plastics (e.g. hard hats), powders (e.g. drilling chemicals) and potentially hazardous wastes (e.g. used batteries). These items may result in impacts to benthic habitat from toxicity effects. Potentially hazardous materials will be handled in accordance with Santos' requirements. Santos' operational experience operating offshore facilities has demonstrated that the loss of potentially hazardous material to the marine environment is very unlikely to occur.

Impacts to the seabed from accidental releases of solid materials are expected to be restricted to a localised area in proximity to where the material may be released. Given that the benthic habitats within the Project Area are well represented throughout the region and no sensitive benthic habitats occur, potential impacts to benthic habitats from the loss of solid material will be minor.

7.3.2.2.3 Marine Fauna

Marine fauna with the potential to be impacted as a result of an unplanned discharge of solid material include:

- Fish;
- marine mammals;
- marine reptiles; and
- birds.

Marine fauna that ingest or become entangled in solid material may be subject to physical harm, which may limit feeding/foraging behaviours, resulting in death. Under the EPBC Act (2003), injury/fatality of vertebrate marine life as a result of entanglement or ingestion of marine debris was listed as a key threatening process. The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018) identifies EPBC Act listed species that have been scientifically documented as being sensitive to interactions with marine debris (Commonwealth of Australia 2018). C&R Consulting (2009) reported that between 1974 and 2008, a total of 77 individuals (variety of different species) had been subject to impacts associated with entanglement in, or ingestion of, plastic debris within Australian waters. The records were dominated by humpback whales, marine turtles, Australian pelicans and a range of cormorant species, with the sources of waste being unknown. Marine turtles and seabirds in particular may be at risk from plastics which may cause entanglement or be mistaken for food (e.g. Department of the Environment and Energy 2018, 2017) and ingested causing damage to internal tissues and potentially preventing feeding activities.

7.3.2.2.4 Fish

Plastic released to the marine environment will degrade over time. As plastic breaks down, it degrades into progressively smaller particles over time until if forms relatively persistent microplastics. Degradation of microplastic materials is primarily by physical means, as very few naturally occurring biota (e.g. bacteria) can consume plastics (Andrady 2011). Plastic and microplastic materials have the potential to impact upon marine organisms that may consume this material. Microplastics have been shown to be toxic through the concentration of persistent organic pollutants and may also cause blockage of the gastrointestinal track in fauna (Andrady 2011).

Pelagic and demersal fish may ingest microplastics. Studies show ingestion of microplastics by fish is relatively common, with over a third of all fish examined in studies in European waters having microplastics within their gastrointestinal tract (Lusher et al. 2013; Murphy et al. 2017). Ingestion of fish with a microplastics load may result in bioaccumulation within higher trophic levels, although most microplastics may pass through an animal and be expelled via faeces (Gil-Delgado et al. 2017). The consequences of microplastic ingestion by fishes has not received significant attention to date (Commonwealth of Australia 2018).

The ubiquity of microplastics on the sea and the relatively high portion of fishes observed with microplastics in their gut with little apparent consequence, suggests that significant effects of microplastics on fishes is minor.

While the recovery plan for the whale shark (Department of the Environment and Heritage 2005a) ceased to be in effect from 1 October 2015 it stated that the main threat to the whale shark occurs outside Australian waters. While pollution and marine debris was listed as a future threat, at present, these do not have an impact on the numbers of whale sharks visiting Australian waters (Department of the Environment and Heritage 2005a).

While fish may potentially be impacted by an unplanned loss of solid material, the portion of fish communities that may credibly be affected is relatively small. Impacts to fish from a loss of solid material is not expected to result in a change in the viability of the population of commercially important species.

7.3.2.2.5 Marine Mammals

As presented in **Section 3.3.2** the Project Area is not recognised as an important area for marine mammals. Nonetheless, the Project Area partially overlaps a BIA migratory area for humpback whales. The recovery plan for the humpback whale (Department of the Environment and Heritage 2005b) (ceased to be in effect from 1 October 2015) listed pollution as a threat although this is primarily in relation to run-off from land-based agriculture and outputs from aquaculture.

Marine mammals may be impacted through ingestion or entanglement with solid material (C&R consulting 2009). Entanglement, resulting in fauna becoming trapped, is usually associated with large solids such as ropes and ghost nets. The limited use of ropes (when compared to fishing and other maritime activities) during Dorado Phase 1, and the size of the ropes used will not credibly result in the entanglement of Humpback Whales. It is nonetheless possible (even if only remotely) that other marine mammals could become entangled. Potential impacts, such as injury or mortality, would be limited to a small number of individuals.

Humpback whales, and other marine mammals, may ingest microplastic. Filter feeders, such as humpback whales, ingest microplastic directly through the water column and via prey species (Besseling et al. 2015). While ingestion of microplastic has not yet been reported for most whale species, it might be of specific concerns (Besseling et al. 2015). Dorado Phase 1 will not be a significant source of plastic or microplastic in the marine environment as plastic waste will be sent to shore for disposal at appropriately licensed facilities, and Santos' operational experience with offshore facilities shows that the loss of solid materials such as plastics to the marine environment is an uncommon event. Humpback whales are thought to only feed opportunistically during migration (Stockin and Burgess 2005), and hence are unlikely to ingest any solid material that may be lost to the sea within the Project Area. It has therefore conservatively been assessed that potential impacts, such as injury, would be limited to a small number of individuals.

The risk to marine mammals associated with the loss of solid material (through potential entanglement or degradation and ingestion of microplastic) has been assessed as a minor consequence (as it would be limited to a small number of individuals), and will not result in significant impacts to marine mammal populations.

7.3.2.2.6 Marine Reptiles

Marine reptiles, specifically turtles, may be impacted through ingestion or entanglement of solid material or through exposure to toxic chemicals. Turtles are known to be indiscriminate feeders and may mistake plastic for jellyfish (Mrosovsky et al. 2009). The Recovery plan for marine turtles in Australia 2017 – 2027 (Commonwealth of Australia 2017a) and the Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018) identifies ingestion of marine debris as a threat to all species of marine turtles. Once ingested, plastics can damage internal tissues and inhibit physiological processes, which can potentially result in fatality.

Several species of turtles are common in nearshore waters of the Pilbara, with considerable nesting activity occurring throughout the region. Turtles are less common in offshore waters, such as those of the Project Area, but are still expected to occur within the Project Area in low numbers. A flatback internesting BIA partially overlaps the Project Area, but this does not overlap the WHP or FPSO locations. No habitats identified as critical for the survival of marine turtles overlap the Project Area.

Turtles foraging within the Project Area may consume plastics accidentally released into the marine environment. This may result in impacts such as injury or mortality. Turtles that forage at sea, such as juvenile turtles of all species and adult green and leatherbacks, have been identified as being at particular risk of ingesting plastic (Schuyler et al. 2014). In a review of plastic ingestion by turtles, Schuyler et al. (2014) identified plastic ingestion as a cause of death in 4% of turtles necropsied, and concludes that ingestion of small quantities of plastics by turtles is common, with a relatively small portion of turtles ingesting sufficient plastic to cause death.

Based on Santos' operational experience with offshore facilities, the loss of solid materials such as plastics to the marine environment will be an uncommon event. Given the amount of plastic released to the marine environment will be very low, the expected encounter rate between plastics accidentally released from Dorado Phase 1 and foraging turtles will be correspondingly very low. Potential impacts, such as injury or mortality, will be limited to a small number of individual turtles. This potential consequence is considered to be minor, and will not result in significant impacts to turtle populations.

7.3.2.2.7 Birds

The loss of solid material to the marine environment may impact upon marine fauna, such as seabirds. Plastics have been identified as posing a particular risk to marine fauna due to ingestion or entanglement (Commonwealth of Australia 2018).

Seabirds are common around the islands and Pilbara coast beyond the Project Area. There are two seabird breeding BIAs which intersect the Project Area:

+ lesser frigatebird (overlaps the WHP); and
+ brown booby (19 km from the WHP).

Both of these species, along with other seabird species, are expected to forage within the Project Area. Seabirds may be attracted to Dorado Phase 1 facilities, which may concentrate birds around these facilities in the Project Area.

Foraging seabirds have been shown to ingest plastics, potentially resulting in impacts such as gut obstruction or reduced stomach volume, resulting in a loss of fitness (Wilcox et al. 2015). Increased levels of plastics within seabirds has also been correlated with increased organic pollutant loads

(Wilcox et al. 2015). Once ingested, plastics can damage internal tissues and inhibit physiological processes, which can potentially result in fatality.

Seabirds foraging within the Project Area may ingest plastics accidentally released into the marine environment, causing injury and/or mortality. Based on Santos' operational experience with offshore facilities, the loss of solid materials such as plastics to the marine environment will be an uncommon event. Given the amount of plastic released to the marine environment will be very low, the expected encounter rate between plastics accidentally released from Dorado Phase 1 and foraging seabirds is unlikely. Potential impacts, such as injury or mortality, will be limited to a small number of individual birds. This potential consequence is considered to be minor, and will not result in significant impacts to seabird populations.

7.3.2.3 Risk and Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-89**.

Table 7-89: Summary of impacts, EPOs, controls and consequence evaluation of loss of solid material during Dorado Phase 1

EPOs	
EPO3G: No mortality or significant[47] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 loss of solid material. **EPO24A**: No significant[45] impacts to benthic habitats and communities. **EPO25A** Undertake Dorado Phase 1 in a manner that will prevent unplanned discharge of solid waste to the marine environment. **EPO26A** Undertake Dorado Phase 1 in a manner that will prevent unplanned seabed disturbance.	
Receptor	**Impact**
Water Quality	Localised decrease in water quality in the vicinity of the loss of solid material.
Benthic Habitat	Modification of benthic habitats from accidental loss of solid material.
Marine Fauna	Injury or mortality of marine fauna due to ingestion of or entanglement with lost solid material.
Controls	
CM10: All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification): + Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including: - Garbage management plan in place. - Garbage record book maintained onboard.	

[47] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

CM70: Crane and lifting operations will comply with the following: + Lifting equipment will be inspected and certified, + Preventative maintenance will be carried out, and + Lifting operators will be competent and qualified **CM71**: Objects dropped overboard will be recovered where practicable to mitigate the environmental consequences from objects remaining in the marine environment, unless the environmental consequences are minor or safety risks are disproportionate to the environmental consequences. **CM72**: Waste management procedures will include: + classification of wastes, including segregation of wastes into recyclable and non-recyclable materials, + appropriate storage of wastes, and + transportation and disposal of wastes by a licenced waste contractor at licenced waste management facilities in accordance with waste classifications. **CM73**: After completion of the drilling and installation stages a site clean-up activity will be undertaken to identify and remove, if safe, any dropped objects or solid materials that may have been lost.		
Likelihood	Occasional – D Control measures proposed ensure that the risk of dropped objects, lost equipment or release of solid waste to the environment has been minimised. Given the controls in place, the likelihood of releasing non-hydrocarbon solids to the environment resulting in a minor consequence is considered to occur occasionally.	
Consequence	Minor – II	
Residual Risk	Low	

7.3.2.4 Demonstration of Acceptability

The residual risks of the potential loss of solid material as a result of Dorado Phase 1 have been compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-90** and **Table 7-91**. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case residual risk for the potential loss of solid material was evaluated as low (**Table 7-89**). This residual risk level is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from the unintentional loss of solid material are acceptable.

Table 7-90: Demonstration of acceptability for loss of solid materials

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	Management of accidental release of solid material from Dorado Phase 1 is consistent with the principle of ESD because: + the management in place to prevent the accidental release of solid material to the marine environment will contribute towards maintaining biological diversity and ecological integrity.

Acceptability Criteria	Demonstration of Acceptability
Internal Context	The prevention and management of loss of solid material is aligned with Santos' policies and standards. The residual risk is very low, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.
MNES	The following material published in relation to threatened and migratory species within and adjacent to the Project Area identify marine debris as a threat: **Conservation Advice** + Conservation advice *Rhincodon typus* (Whale Shark) (Threatened Species Scientific Committee 2015d) + Conservation Advice for the 'bbott's –ooby - *Papasula abbotti* (Threatened Species Scientific Committee 2020b) + Approved Conservation Advice for *Dermochelys coriacea* (Leatherback Turtle) (Threatened Species Scientific Committee 2008b) **Recovery Plans** + Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018). This plan identifies marine debris as a threat to marine vertebrates. There are four objectives of the plan that involve prevention, removal, mitigation and monitoring of marine debris in marine environments which are relevant to Dorado Phase 1. + Wildlife Conservation Plan for Seabirds (DCCEEW 2022). This plan identifies pollution – marine debris as a threat to seabirds. Action 2H: enhance contingency plans to prevent and/or respond to environmental emergencies that have an impact on seabirds and their habitats, relates to pollution (including marine debris) and is relevant to Dorado Phase 1. + Recovery plan for Marine Turtles in Australia (Commonwealth of Australia 2017a). This recovery plan identifies marine debris as a threat to marine turtles. Action A3: reduce the impacts from marine debris, and is relevant to Dorado Phase 1. + Conservation Management Plan for the Blue Whale: A Recovery Plan under the Environment Protection and Biodiversity Conservation Act 1999 (Commonwealth of Australia 2015a). This recovery plan identifies marine debris as a threat to Blue Whales and is considered a minor risk to the species. Given the long-term recovery objective is to minimise anthropogenic threats to allow the conservation status of the Blue Whale to improve so that it can be removed from the threatened species list under the EPBC Act, it is considered relevant to Dorado Phase 1. The objectives of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The controls outlined in **Table 7-89** are consistent with the objectives of the material listed above and Santos considers the impacts of unplanned loss of solid material to not be inconsistent with the EPBC management plans.

Acceptability Criteria	Demonstration of Acceptability
	Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify marine debris as a key threat or do not have explicit relevant objectives or management actions related to marine debris.
Other Relevant Requirements	By reducing potential marine pollution, the management to prevent the accidental loss of solid material to the marine environment is consistent with: + Threat abatement plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018) Recovering objects dropped overboard, where practicable, to mitigate the environmental consequences from objects remaining in the marine environment is consistent with the requirements presented in the OPGGS Act (Section 572(3)).

Table 7-91: Demonstration of acceptability of potential loss of solid material against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[48] are acceptable. **RSAL4**: Substantial[49] impacts to water quality within 1 km of the Dorado WHP, FPSO and drilling activities are acceptable.	The evaluation of impacts from the loss of solid material which may leach into the marine environment shows that impacts will be localised around the vicinity of the lost. Due to the minor consequence of the potential environmental impacts, it is expected that a high level of ecological integrity will be maintained beyond 1 km of the discharge location. Given the widespread nature of the open water environment in the region, the loss of solid material which may leach into the marine environment will not result in impacts to water quality that result in a loss of ecological integrity.
RSAL8: No significant[50] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities.	Impacts to the seabed from accidental releases of solid materials are expected to be restricted to a localised area in proximity to the area where the material may be lost (if it is not retrieved). Given that the benthic habitats within the Project Area are well represented throughout the region and no sensitive benthic habitats occur, potential impacts to benthic habitats from the loss of solid material will be minor. Santos' operational experience with offshore facilities shows that the loss of solid materials to the marine environment will be an uncommon event.

[48] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[49] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

[50] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	Santos' operational experience with offshore facilities shows that the loss of solid materials to the marine environment will be an uncommon event. It is therefore expected that the likelihood of marine fauna becoming entangled or ingesting the loss material is low. Potential impacts, such as injury or mortality, has been conservatively assessed as being limited to a small number of individual marine fauna. This potential consequence is considered to be minor and will not result in significant impacts to marine fauna populations.

7.3.3 Physical Presence – Introduction of Invasive Marine Species

7.3.3.1 Description of the Event

IMS are marine organisms that are translocated from one location to another location in which they do not occur naturally, become established and result in potential environmental impacts. The major vector pathways for the introduction of marine pest species into Australia are ballast water carried in vessels and biofouling on vessels (or internal parts of the vessel that are exposed to sea water) (Department of Agriculture and Water Resources 2018). IMS are recognised as an environmental risk globally, with the IMO providing guidelines for the management of biofouling and ballast water to reduce the risk of IMS (IMO 2011, MIAL 2020).

Commonwealth, state and territory governments have also developed legislation, regulations and guidelines for managing the risk of IMS (which are considered in **Section 7.3.3.3**).

A number of factors influence the survivability of IMS during translocation and then establishment, such as the presence of natural predators, level of physical disturbance, dispersion and reproductive rates, the environment conditions (water temperature etc.), vessel speeds and vessel age. The establishment of IMS in the Project Area requires all of the following to occur:

+ the IMS to be present on a vector such as a vessel or MODU (typically as biofouling or in ballast water);
+ the IMS must be released from the vector; and
+ the IMS must become established in the receiving environment.

Interruption of any of the conditions above may prevent an IMS from becoming established. Once established in a location, IMS can be very difficult or in some instances, impossible to eradicate. Bax et al. (2003) states that rather than just blend into their new environment, many IMS will significantly change it. This can occur through increasing the predation pressure on native organisms or modifying the habitat by smothering or providing new structural habitat such as Japanese seaweeds (Bax et al. 2003). IMS introduction primarily occurs in shallow waters with high levels of slow-moving or stationary shipping traffic such as in ports. IMS colonisation also requires a suitable habitat in which to establish itself such as rocky and hard substrates or subsea infrastructure, especially with pre-existing biofouling.

7.3.3.1.1 Biofouling

Biofouling refers to the growth of marine organisms on hard surfaces immersed in the marine environment for extended periods of time. Biofouling commonly occurs on the parts of ships that are below the waterline, such as the vessel hull and water intakes. Parts of the hull that experience high water movement, such as propellers, typically have relatively low levels of biofouling. Vessels that are stationary for long periods typically develop higher levels of biofouling than vessels that are moving more frequently.

Biofouling communities typically develop as three phases:

- primary biofouling – the development of a biofilm of microscopic bacteria and algae on a previously clean surface. This layer in itself is generally considered to be of little IMS risk, however, it supports the development of secondary and tertiary biofouling, which are considered relatively higher risk;
- secondary biofouling – the growth of fouling organisms facilitated by primary biofouling, such as macroalgae growing from spores; and
- tertiary biofouling – the growth of relatively large encrusting organisms, such as ascidians and mussels. Most species identified as an IMS risk in Australian waters can be characterised as tertiary biofouling species.

All marine vessels have some degree of biofouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a good surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc.). Biofouling is usually controlled using antifouling coatings on areas of the vessel below the waterline. Seawater used on vessels (e.g. cooling water) may be dosed with biocides to prevent the growth of biofouling within piping, which may also reduce biofouling levels and associated IMS risk.

7.3.3.1.2 Ballast Water

Ballast water is required for the stability and safe operations of marine vessels at sea. Ballast water is used to maintain or increase the displacement of a vessel (e.g. when not fully loaded) and is subsequently discharged at a later time. Ballast water may include IMS from different life history phases, such as eggs, larvae and adult organisms. The discharge of ballast water containing IMS may lead to IMS becoming established in the vicinity of the discharge location. Release of unmanaged ballast water could transfer IMS into the marine environment, depending on the location that ballast water was taken onboard. A study done by Gollasch et al. (2002) on 1,508 samples identified a total of 990 different species within the ballasts of ships. The species varied in taxa from fungi, bacteria, algae and protozoans to small fish and invertebrates at varying life stages.

Ballast water has been recognised as a major pathway for introducing IMS into new environments, giving rise to adoption of the International Convention for the Control and Management of'Ships' Ballast Water and Sediments (Ballast Water Convention). The Ballast Water Convention aims to prevent the spread of IMS from one region to another, by establishing standards and procedures for the ballast water management, including phasing out the use of ballast water exchange. In Australian waters, vessels are required to demonstrate compliance to Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020), which outlines approved methods of ballast water management in line with the Ballast Water Convention, including:

- use of a Ballast Water Management System;
- ballast water exchange conducted in an acceptable area;

- use of low risk ballast water (such as fresh potable water, high seas water or fresh water from an on-board freshwater production facility);
- retention of high-risk ballast water on board the vessel; and
- discharge to an approved ballast water reception facility.

7.3.3.1.3 Sources of IMS and Dorado Development

There are several potential IMS vectors associated with different stages of Dorado Phase 1, including:

- MODU (development drilling);
- FPSO;
- offshore support vessels and equipment (installation, operations, maintenance and decommissioning); and
- Offtake tankers.

The WHP, DTM, moorings and mooring lines, umbilical and flowlines may be mobilised from within or outside Australian waters. This equipment is unlikely to host IMS as it will be new and transported dry on vessels for installation.

A jack-up MODU will be used for the initial development drilling. Future tiebacks may require either a jack-up or a moored semi-submersible MODU depending on water depth. Both types will have below the waterline external surfaces (e.g. spud cans on a jack-up and pontoons on a semi-submersible) and likely require ballast water to maintain stability. The MODU may be mobilised to the Project Area from outside Australian waters, which may present a higher risk of IMS introduction than a MODU that mobilises from within Australian waters. The MODU will only be present in the Project Area during drilling and well-related activities (e.g. well workovers).

The FPSO will not be constructed in Australia (location yet to be determined) and will enter Australian waters as part of installation activities. The FPSO will spend part of its construction time in-water at the construction location prior to arriving on station within the Project Area. Once on-station, the FPSO may occasionally leave the Project Area for cyclone avoidance and maintenance (which is likely to be carried out in a shipyard beyond Australian waters). The FPSO will be present in the Project Area for most of the duration of Dorado Phase 1, including installation, operations and some of the decommissioning.

Project vessels and equipment will be used throughout Dorado Phase 1, with the types of vessels varying depending on the specific activity and stage. The installation and decommissioning stages of Dorado Phase 1 may require specialised vessels, which are typically mobilised from beyond Australian waters. Equipment, such as mooring lines, is typically stored dry on vessels prior to installation. This equipment is unlikely to host IMS due to desiccation of biofouling when the equipment is not submerged for long periods of time. Project vessels will be present during all stages of Dorado Phase 1. Vessels required during the operational stage of Dorado Phase 1 (the longest stage) such as supply vessels are expected to be present within Australian waters for long periods of time.

Offtake tankers will be present in the Project Area during the operational stage of Dorado Phase 1. Offtake tankers are expected to be sourced from the global oil tanker fleet. Offtake tankers will discharge ballast water while loading oil from the FPSO. Each offtake is expected to take up to 48 hours.

Once installed on location structures such as the WHP and FPSO will provide hard substrate and a potential vector pathway for IMS from offtake tankers establishing on the surfaces provided by these structures.

7.3.3.2 Details of Environmental Impacts and Risks

The introduction of IMS as part of Dorado Phase 1 into the marine environment has the potential to result in impacts to the following receptors:

+ benthic habitats;
+ KEFs; and
+ fisheries.

Most potential IMS have evolved in coastal waters and are not adapted to the open ocean offshore environment (Department of Agriculture, Fisheries and Forestry 2011). The offshore environment of the Project Area is relatively deep (70 to 120 m) with water depths at the Dorado WHP and FPSO of approximately 90 m. Benthic habitats in these water depths are unsuitable for the survival of many species of IMS identified as a risk to Australia (Department of Agriculture, Fisheries and Forestry 2010). Many species of IMS require hard substrate for attachment, which is present intermittently within the Project Area, with the most common substrate being silty to coarse sands with some rubble (**Section 3**).

Table 7-92 identifies the potentially impacted receptors should IMS be introduced within the Project Area.

Table 7-92: Receptors Potentially Impacted by the introduction of IMS

Description of the Impact	Receptor Categories
Change in ecosystem dynamics Changes to the functions, interests or activities of other users Reduction in fishery resource stocks	Benthic Habitats – **Section 7.3.3.2.1** KEF – Section 7.3.3.2.2 Fisheries – Section 7.3.3.2.3

The likelihood of introducing IMS from bringing the FPSO on location is regarded as unlikely based on the Santos risk matrix (**Table 7-2**). Noting that the WHP, DTM, moorings and mooring lines, umbilical and flowlines will be new and transported dry on vessels for installation, therefore not hosting IMS. The FPSO will be constructed in a dry dock and is expected to sail away from the dry dock being flooded within a timeframe (typically 7 days) which would not allow sufficient time for IMS to settle on the FPSO hull as per Santos IMS Management Plan. Should it not be possible for the FPSO to sail away within the required timeframe, in water biofouling inspection will be undertaken to verify the absence of IMS. Upon confirmation that the FPSO is IMS free, the FPSO will then sail away within the appropriate timeframe to ensure no IMS have sufficient time to settle on the FPSO hull. The same IMS controls will be used during major FPSO maintenance campaigns which will likely require the FPSO to travel outside Australian waters and be dry docked. FPSO ballast exchange will be undertaken to comply with relevant international and national requirements (**Table 7-93**) to further reduce the risk of IMS introduction.

Following construction of the WHP and installation of the FPSO within the Project Area, it is possible that IMS may become established on the artificial habitat provided by Dorado Phase 1 facilities. The likelihood of this risk is considered unlikely in the Santos risk matrix (**Table 7-2**), as the potential vectors (e.g. offtake tankers) will typically be near these components for relatively short periods of time. Furthermore, the vessels and tankers supporting Dorado Phase 1 will comply with the IMO Guidelines for the control and management of ships biofouling to minimise the transfer of IMS, and ballast water exchanges will be undertaken as per international and national requirements (**Table 7-93**) to further reduce the risk of IMS introduction. To ensure IMS management requirements are clearly identified, a specific Dorado FPSO Biofouling Management Plan will be prepared and implemented to comply with relevant regulations and Santos' comprehensive IMS Management Plan which has been developed in consultation with the relevant authorities. Santos IMS Management Plan has been successfully implemented on the NWS where Santos has operated FPSOs and brought, on numerous occasions, FPSO from dry dock outside Australian waters without introducing IMS. The same plan has also been successfully implemented to avoid introducing IMS from support vessels. It is important to note that in the unlikely event an IMS becomes established on the WHP and/or FPSO, it is even less likely that it will spread in the marine environment due to the water depth and remoteness of the area.

Considering the remote likelihood of IMS becoming established on the WHP and FPSO, and with support vessel and tankers following biofouling and ballast water legal requirements it is expected that transmission of IMS from the facilities to vessels is even less likely. Santos is not aware of a sequence of events, such as IMS being established on an oil and gas facility then transferred to a support vessel prior to IMS establishing in a harbour, being documented anywhere in the world.

7.3.3.2.1 Benthic Habitats

The introduction of an IMS has the potential to cause impacts to benthic habitats and communities through a change in ecosystem dynamics. Changes in ecosystem dynamics can include:

- predation on native and farmed species;
- out-competing native species for space and food; and
- alter nutrient cycles and lead to a loss of diversity in local species.

Benthic communities within the Project Area are characterised by relatively sparse assemblages of filter feeding and deposit feeding organisms (RPS 2020d). No benthic primary producer habitat, such as seagrasses, macroalgae or zooxanthellate corals, were observed during benthic habitat surveys within the Project Area (RPS 2020d). These benthic habitats are not expected to occur due to insufficient photosynthetically active radiation required to sustain these habitats on the seabed as a result of the 70 to 120 m water depth.

Of the non-oceanic species identified in the Australian Marine Pest Monitoring Manual (Department of Agriculture, Fisheries and Forestry 2010), very few IMS (aside from planktonic oceanic species such as dinoflagellates) could credibly survive in the Project Area (70 to 120 m water depth); only three species (European clam, soft-shell clam and Northern Pacific sea star) were identified as potentially surviving in more than 90 m water depth. These three species are typically found in shallow, coastal waters (Department of Agriculture, Fisheries and Forestry 2011). Therefore, in the unlikely event that any IMS are introduced into the Project Area, they are unlikely to survive or become established on the seabed due to incompatibility with the water depth.

In the unlikely event that IMS were to become established within the Project Area because of Dorado Phase 1, potential impacts may include:

- reduced abundance and diversity in benthic communities due to:
  - competition with local species for resources such as food and hard substrate;
  - increased mortality of local species due to predation; and

- fouling of infrastructure on the Dorado Phase 1 FPSO and WHP.

7.3.3.2.2 KEF

The Ancient coastline at 125 m depth contour KEF located adjacent to the Project Area is shown in (**Figure 6-2**).

The KEF (defined by the depth range 115 to 135 m in the Northwest Shelf Province and Northwest Shelf Transition provincial bioregions) is beyond the depths within which most IMS can survive and therefore the likelihood of an IMS impacting upon the environmental values of the KEF is considered to be unlikely. The environmental values of the KEF are primarily a result of the geomorphic features of the KEF (e.g. provision of hard substrate and potentially enhanced vertical mixing of the water column). Potential impacts and likelihood of impacts to benthic habitats within the KEF due to IMS may be similar to those described above in **Section 7.3.3.2.1**.

7.3.3.2.3 Fisheries

The socio-economic receptor within the Project Area that may credibly be impacted by the introduction of an IMS is the commercial fishing industry (**Section 3.4.3**). The establishment of IMS may cause changes to the target prey abundance, distribution or behaviour, and in turn result in impacts to the activities of commercial fisheries.

The introduction of IMS within the Project Area may result in increased abundance of prey for fish species targeted by commercial fisheries, although this is unlikely to result in any detectable change in the abundance of targeted fish. IMS may also be taken as bycatch by these fisheries, however this is also unlikely to result in any impacts to fishing activity. It is also important to note that many IMS species require a suitable substrate on which to settle such as a hard or rock surface. As this type of substrate is lacking at the Project Area, settlement and colonisation is very unlikely and therefore likelihood of potential impacts to fisheries are considered unlikely.

7.3.3.3 Summary of Residual Risk Evaluation

A summary of the outcomes of the residual risk evaluation, including adopted control measures and EPOs is provided in **Table 7-93**.

Table 7-93: Summary of residual risks, EPOs, controls, likelihood and consequence evaluation of potential introduction of IMS during Dorado Phase 1

EPOs	
EPO27A: Undertake Dorado Phase 1 in a manner that will prevent the introduction, establishment and spread of IMS in the natural environment attributable to the development. **EPO28A**: No significant[51] impacts to benthic habitats and communities, KEF and exploited fisheries resource stocks within the Project Area.	
Receptor	**Impact**
Benthic habitats	Change in ecosystem dynamics.

[51] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

KEF	Change in ecosystem dynamics
Fisheries	Reduction in fishery resource stocks. Changes to the functions, interests or activities of other users
Control Measures (CM)	
CM74: Ballast water exchange operations will comply with the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (as appropriate to vessel class), Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020), Protection of the Sea (Harmful Anti-fouling Systems) Act 2006 and Biosecurity Act 2015, including: + all ballast water exchanges conducted more than 12 nm from land, and + vessel Ballast Water Management Plan stipulating that ballast water exchange records will be maintained. **CM75**: Implementation of Dorado FPSO Biofouling Management Plan when the FPSO sails to the Project Area from international waters (such as when it first hooks up or comes back from dry dock) and as per the anti-fouling and in-water cleaning guidelines (Department of the Environment and New Zealand Ministry for Primary Industries 2015). **CM76**: Compliance with Santos IMS Management Plan **CM77:** Biofouling management for vessels will be in accordance with the IMO Guidelines for the control and management of ships' biofouling to minimise the transfer of invasive aquatic species (Marine Environment Protection Committee 2011). **CM78:** Compliance with the International Convention on the Control of Harmful Anti-fouling Systems on Ships 2001, including vessels (of appropriate class) having a valid International Anti-fouling Systems Certificate. **CM79:** Fisheries will be provided with information on the timing, nature and scale of aspects of Dorado Phase 1 through Santos' consultation activities.	
Likelihood	Unlikely (b) The pathways for IMS introduction are well known, consequently, standard preventive measures are proposed. The ability for invasive marine species to colonise a habitat is dependent on a number of environmental conditions. It has been found that highly disturbed environments (such as marinas) are more susceptible to colonisation than open water environments where the number of dilutions and the degree of dispersal are high (Paulay et al., 2002). Given the depth of the Project Area creating an unfavourable habitat for colonisation (i.e. light limiting and low habitat biodiversity with sparse epibiota) and distance from shallow coastal habitats, there is a very low likelihood that IMS would be able to survive translocation and subsequently establish and colonise. Given the dispersive open-ocean environment of the operational area, the successful translocation to surrounding shallower habitats of an IMS introduced to the operational area is unlikely. With controls in place to reduce the risk of IMS introduction, the likelihood is considered Unlikely.
Consequence	Minor – II
Residual risk	Very low

7.3.3.4 Demonstration of Acceptability

The residual risks of the potential introduction of IMS as a result of Dorado Phase 1 have been compared to receptor-specific acceptable levels of impact and other considerations are summarised **Table 7-94** and **Table 7-95**. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case residual risk for the potential introduction of IMS was evaluated as very low (**Table 7-93**). This residual risk level is considered to be acceptable when assessed against the acceptable levels of risk defined in **Section 4**.

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from the unintentional introduction of IMS are acceptable.

Table 7-94: Demonstration of acceptability for potential introduction of IMS

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	The introduction of IMS resulting from Dorado Phase 1 are inherently inconsistent with some of the principles of ESD based on the following: + the introduction of an IMS poses a risk to the biological diversity and ecological integrity of benthic communities. Santos will apply controls to ensure that the risk of IMS introduction is reduced to a level that is acceptable. Following effective application of these controls, Santos considers the risk to be consistent with the principles of ESD. IMS introduced to the Project Area are unlikely to survive given the water depth and paucity of hard substrates.
Internal Context	IMS management is aligned with Santos' policies and standards. The residual risk is very low, which is acceptable. The EPOs and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	IMS introduced to the Project Area are unlikely to result in any detectable change in fish resources or the ability of fishers to target these resources. Santos' ongoing consultation program will consider stakeholders' feedback.
MNES	***Threatened and Migratory Species*** The following material published in relation to threatened and migratory species within and adjacent to the Project Area identify invasive species or as a threat: **Conservation Advice** + Conservation Advice for the 'Abbott's –Booby - *Papasula abbotti* (Threatened Species Scientific Committee 2020b **Recovery Plans** + Wildlife Conservation Plan for Seabirds (DCCEEW 2022). This plan identifies invasive species as a threat to seabirds. Action 2F: ensure seabirds are protected from the adverse effects of invasive species, is relevant to Dorado Phase 1. + Recovery plan for Marine Turtles in Australia (Commonwealth of Australia 2017a). This plan identifies diseases and pathogens as a threat to marine turtles. Given the long-term recovery objective is to minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that

Acceptability Criteria	Demonstration of Acceptability
	they can be removed from the EPBC Act threatened species list, it is considered relevant to Dorado Phase 1. The objectives of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The controls outlined in **Table 7-93** are consistent with the objectives of the material listed above and Santos considers the impacts of unplanned introduction of invasive marine species to not be inconsistent with the EPBC management plans. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify invasive species or disease as a threat or do not have explicit relevant objectives or management actions related to invasive species or disease. ***Commonwealth Marine Environment*** The Project Area does not overlap any KEFs. The water depth Ancient coastline at 125 m depth contour KEF means any IMS would be unlikely to survive. The environmental values of the KEF which could be impacted by IMS introduction are well represented in the Project Area (**Attachment 2**). Introduction of IMS as a result of Dorado Phase 1 will not credibly impact upon marine protected areas such as AMPs as AMPs are too far away (the nearest AMP is located 29 km from the Project Area) from Dorado Phase 1 and not within support vessels or tankers route.
Other Relevant Requirements	Management of the potential impacts and risks from an introduction of IMS resulting from Dorado Phase 1 are consistent with relevant legislative requirements, including: + compliance with international maritime conventions, including The International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004, The International Convention on the Control of Harmful Anti-Fouling Substances on Ships 2001, and IMO 2011 Guidelines for the control and management of ships' biofouling to minimise the transfer of invasive aquatic species (Marine Environment Protection Committee 2011). + compliance with Australian legislation, requirements and guidelines, including: Protection of the Sea (Harmful Anti-fouling Systems) Act 2006: Marine Order 98 – Marine Pollution prevention – anti-fouling systems *Biosecurity Act 2015*, Western Australian *Aquatic Resources Management Act 2016*, DPIRD Biofouling Biosecurity Policy, National biofouling management guidance for the petroleum production and exploration industry (Department of Agriculture, Fisheries and Forestry 2009), and Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020). Marine Biosecurity Management of Vessels servicing the Offshore Industry (MIAL 2020) Reducing marine pest biosecurity risks through good practice biofouling management (NOPSEMA 2020d)

Acceptability Criteria	Demonstration of Acceptability
	Marine Pest Plan 2018 – 2023: national Strategic Plan for Marine Pest Biosecurity (2018-2023) (Commonwealth of Australia 2018) Offshore Installations Biosecurity Guide (DAWE 2020)

Table 7-95: Demonstration of acceptability of potential introduction of IMS against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL8: No significant[52] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities.	By implementing the Dorado FPSO Biofouling Management Plan (which will comply with relevant regulations and Santos IMS Management Plan) and following international and national requirements for ballast water exchanges, the likelihood of introducing IMS is very low. In the unlikely event an IMS becomes established on the WHP and/or FPSO, it is even less likely that it will spread in the marine environment due to the water depth and remoteness of the area. The Invasive Marine Species Management Plan (IMSMP) (EA-00-RI-10172) is consistent with the Biosecurity Act 2015 and National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (Marine Pest Sectoral Committee 2018). The IMSMP provides guidance on assessing the risk for vessels translocating marine pest species and utilises the risk assessment, to assess the risk of marine pests entering operational areas from contracted vessel from out of State waters. Generally, vessels are sourced from local waters although out of State vessels may be used provided, they are assessed as 'low risk' in accordance with the IMSMP. The biofouling risk assessment approach adopted by Santos will ensure that the Aquatic Resources Management Act 2016 and associated regulations prohibiting the introduction of non-endemic fish species will be met. The Invasive Marine Species Management Plan (IMSMP) is consistent with the Biosecurity Act 2015 and National Biofouling Management Guidance for the Petroleum Production and Exploration Industry (Marine Pest Sectoral Committee 2018). The IMSMP provides guidance on assessing the risk for vessels translocating marine pest species and utilises the risk assessment, to assess the risk of marine pests entering operational areas from contracted vessel from out of State waters.
RSAL11: No significant[56] impacts to environmental values of KEFs.	The likelihood of IMS establishing on the WHP and/or FPSO is unlikely and it is even less likely it will spread in the marine environment. Due to the depth of the Ancient coastline at 125 m

[52] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

	depth contour KEF it is not expected to offer a suitable environment for IMS colonisation.
RSAL19: No negative impacts to the economic viability of the commercial fish resources.	In the unlikely event of IMS introduction, it is expected that the potential impact on the abundance of targeted fish resources will be undetectable. The potential presence of IMS as bycatch by commercial fishers, is also unlikely to result in any impacts to fishing activity.

7.3.4 Physical Presence –Interaction with Marine Fauna

7.3.4.1 Description of the Event

There are potential opportunities for a negative interaction between the physical presence of the operation and biological receptors. These primarily fall within airborne or seaborne collision risk, as well as negative behavioural response from the physical presence of the operation.

Vessel and helicopter movements will occur within the Project Area throughout the life of Dorado Phase 1. The type, number and size of vessels and the nature and duration of their movements will change, depending on the petroleum activities that are being undertaken. Vessel presence is expected to be greatest during the installation and drilling stages (e.g. for WHP installation, flowline installation, development drilling), with the longer-term operational project stage requiring fewer vessels at any one time. Helicopter presence will occur for the duration of the project. Depending on project phase, there are expected to be up to 3 helicopter flights per week. In addition to vessels and aircraft, there is also potential for direct collision of birds with infrastructure during periods of bad weather or poor visibility. For light emissions impacts see **Section 7.2.4.**

Finally, there may be a negative behavioural impact resulting from the physical presence of any bird deterrent system on the FPSO/WHP during all project phases. Although the latter is intentional as there are operational and safety requirements that may dictate its use.

A summary of the key types and the stage at which they could be expected in the Project Area is provided in **Table 7-96.**

Table 7-96: Expected presence of key vessels and aircraft in the Project Area

Vessel and AircraftType	Project Phase

* Including infill and tieback drilling						

Vessels undertaking project activities may collide with large marine fauna that occur at or near the water surface, potentially resulting in impacts to marine fauna. Vessels will transit to and from the Project Area and when undertaking petroleum activities, they will likely be holding station or moving slowly within the Project Area. In-field vessels operating within the Project Area will typically travel at speeds slower than those operating in offshore waters, and therefore exhibit a lower risk profile in terms of interactions with marine fauna.

Helicopters arriving at or departing from infrastructure run the risk of bird collision resulting in a safety risk to the helicopter, and potential bird mortality. Helicopters arriving and departing will be travelling at reduced speed during take-off and landing. Coupled with the noise level it is likely that bird collisions will be dramatically reduced in relation to infrastructure in the Project Area.

Bird deterrence measures employed are designed to disturb or disrupt roosting or potential nesting behaviours. Whilst having a negative impact on behaviour, the deterrence measures are non-lethal and cause no lasting harm to birds.

7.3.4.2 Details of Environmental Impacts and Risks

Physical interaction with marine fauna, as a result of the presence of vessels, aircraft and infrastructure required for Dorado Phase 1 has the potential to result in injury, disturbance and/or mortality to marine fauna.

The following risk evaluation and analysis of environmental impacts has focused on large marine species, such as whales, turtles, birds and whale sharks.

Table 7-97 identifies the potentially impacted receptors as a result of interactions with marine fauna within the Project Area.

Table 7-97: Receptors potentially impacted by interactions with marine fauna

Description of the Risk	Receptor Categories
Accidental interactions between project vessels, helicopters, facilities and marine fauna within the Project Area	Marine Mammals – **Section 7.3.4.2.1** Fish – **Section 7.3.4.2.2** Reptiles – **Section 7.3.4.2.3** Birds- **Section7.3.4.2.1**

7.3.4.2.1 Marine Mammals

Marine mammals must surface to breathe periodically and may spend much of their time at or near the surface. This behaviour makes marine mammals, particularly large mammals such as baleen whales, vulnerable to vessel strikes particularly due to moving vessels. The typical behavioural response of baleen whales to the presence of a vessel is to avoid the vessel, either by moving away (e.g. increasing swimming speed) or by diving (e.g. Corkeron 1995; Scheidat et al. 2004). This response reduces the likelihood of a vessel collision or strike compared to no behavioural response or an attraction response. Conservation advice for humpback whales identifies vessel disturbance and strike as a threat (Threatened Species Scientific Committee 2015a).

Despite the typical avoidance response of cetaceans, interactions between vessels and cetaceans have occurred. The probability of vessel strikes between a whale and a vessel, and the consequence of such an interaction, is influenced by vessel speed. Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots.

In general, large cetaceans tend to have wide-ranging oceanic distributions meaning that while occurrence in the Project Area is possible, the absence of aggregating behaviours overlapping with the Project Area reduces the likelihood that encounters will involve large numbers of individuals. Numbers may be increased during migration. Surveys indicate the majority of migrating humpback whales, which are seasonally present between July and October during the north- and southbound migrations, have been observed in highest densities inshore of the Project Area. Humpback whales tend to migrate close to the coastline, generally within a few tens of kilometres of shore (Double et al. 2012a, 2010, 2014). This is consistent with tagging data curated by the Australian Antarctic Division, which showed the highest concentrations of humpback whales were between the mainland coast and the Project Area (**Figure 3-13**).

While the BIA for humpback whale migration marginally overlaps the southern extent of the Project Area, it does not overlap the Dorado WHP or FPSO locations, where vessel activities will be concentrated. Other whale species, such as blue and pygmy blue whales, are not expected to occur within the Project Area in large numbers. Blue and pygmy blue whales typically migrate in deeper waters (more than 1,000 m) on the outer continental shelf (Double et al. 2014).

The likelihood of a vessel collision or strike with a large whale resulting in injury is considered unlikely given the relatively low speed (typically less than 6 knots) of vessels undertaking petroleum activities within the Project Area and the expected low numbers of whales within the Project Area. Based on reported data contained in the National Ocean and Atmospheric Administration database, there are only two known instances of vessel collisions when the vessel was travelling at less than 6 knots; both of these were from whale watching vessels that were deliberately placed among whales (Jensen and Silber 2004).

Vessel interactions with smaller marine mammals, such as dolphins and porpoises, are very infrequent due to the mobility of these species and their avoidance response to vessels. Interactions leading to harm between vessels associated with Dorado Phase 1 petroleum activities and smaller marine mammals (i.e. non-baleen whales) are not expected to occur (Commonwealth of Australia 2017b).

Dugong distribution is correlated with their preference for shallow seagrass habitats. Due to the lack of suitable habitat within the Project Area it is highly unlikely that dugongs will occur within the Project Area.

7.3.4.2.2 Fish

Whale sharks are at risk from vessel strikes when at the surface or in shallow waters, where there is limited option to dive. Studies of scarring patterns on whale sharks at several locations in the Indian Ocean, including the Ningaloo Coast, observed that scarring caused by vessel strikes was almost as commonly observed as scarring from predator attacks (Speed et al. 2008). Conservation advice for whale sharks also identifies vessel strikes as a threat (Threatened Species Scientific Committee 2015d).

Whale sharks are known to congregate around geomorphic features to feed, such as reefs and islands, with steeply sloping seabeds in close proximity to relatively deep water (Copping et al. 2018). Whales sharks are known to aggregate seasonally off the Ningaloo Coast, after which individuals disperse in a broadly northward direction (**Section 3**). While there is a broad (~125 km wide) whale shark foraging BIA overlapping the Project Area, including the Dorado WHP and FPSO locations, tagging studies indicate this is more likely to be an area through which whale sharks migrate rather than an important foraging area (Meekan and Radford 2010; Wilson et al. 2006). The Project Area does not exhibit the geomorphic or biological features associated with whale shark aggregations (**Section 3.3.1.1**). The entire whale shark BIA which overlaps the Project Area is approximately 220,000 km^2, with the Project Area comprising approximately 1.6% of the total BIA.

The *Conservation advice* Rhincodon typus *whale shark* (Threatened Species Scientific Committee 2015d) identifies the following conservation action: "Minimise offshore developments and transit time of large vessels in areas close to marine features likely to correlate with whale shark aggregations (Ningaloo Reef, Christmas Island and the Coral Sea) and along the northward migration route that follows the northern Western Australian coastline along the 200 m isobath (as set out in the Conservation Values Atlas, DotE, 2014)." Based on the lack of features consistent with known whale shark congregations and the lack of episodic high food availability (e.g. mass spawning of invertebrates) within the Project Area, whale sharks are very unlikely to aggregate in the Project Area. Tagging studies do not show whale sharks migrating through the Project Area, or along the mid and inner continental shelf in the region, with all whale sharks tagged at Ningaloo Reef travelling away from the congregation area in water considerably deeper than the Project Area (Meekan and Radford 2010; Wilson et al. 2006). As such, Dorado Phase 1 is consistent with the conservation advice, as the Development does not occur in areas close to marine features likely to correlate with whale shark aggregations, nor does it overlap the northward migration route along the 200 m isobath, as the water depth in the deepest part of the Project Area is approximately 118 m.

Whale sharks are not expected to occur in the Project Area in large numbers, and there are no environmental constraints (e.g. shallow water, complex bathymetry) that prevent whale sharks from avoiding project vessels. As such, interactions between vessels and whale sharks are considered to be unlikely.

7.3.4.2.3 Reptiles

Several species of marine turtle are known to nest on beaches along the Pilbara coastline. These species may be present within the Project Area, although they are not expected to occur in large numbers due to the absence of foraging habitat. Benthic habitat surveys (**Attachment 2**) and habitat modelling (**Attachment 3**) did not identify areas of potential foraging habitats, such as sponges or soft corals. Turtles that forage on pelagic prey (e.g. jellyfish) may feed within the Project Area, however the Project Area has not been documented as being important foraging habitat.

Vessel disturbance is identified as a threat in the Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a). The typical response from turtles on the sea surface to the presence of vessels is to dive (a potential “startle” response), which decreases the risk of vessel collisions (Hazel et al. 2007). As with cetaceans, the risk of vessel collisions between turtles and vessels increases with vessel speed (Hazel et al. 2007). Hazel et al. (2007) noted that visual and auditory detection of vessels are important in inducing a diving behavioural response, and infer that small, fast moving vessels pose the greatest risk for turtle collisions. Given the typically low speeds of vessels, vessel interactions with turtles are considered to be unlikely.

7.3.4.2.1 Birds

The Project Area does not host a large number or diversity of bird species. As there are no emergent features for bird roosting or nesting, and the marine environment does not have high productivity or host consistently high numbers of prey for foraging seabirds. Birds within the Project Area are likely to consist of foraging seabirds and potentially migrating shorebirds (Sage 1979 cited in Ronconi et al. 2015). In addition to seabirds, the EMBA beyond the Project Area seasonally hosts large numbers of migratory shorebirds.

Seabirds and migratory seabirds may opportunistically rest on the Dorado WHP and FPSO. Santos has experienced the presence of birds resting on its other offshore WHP facilities including Reindeer and John Brookes platforms. The unmanned WHP may provide a resting point for marine birds, there has been no nesting or breeding at Santos offshore WHP.

The risk of bird collision with helicopter operations is an ongoing concern for the safety of flights to and from infrastructure. The consequence of a helicopter bird strike is related to seasonal distribution, body mass, flocking behaviour, and flight behaviour, while the probability of a strike is related to the abundances of different bird species on or near the platforms. Santos take the position that a significant bird strike of any species puts both helicopter and birds at risk. As safety is paramount, and as this automatically puts any risk in the ‘critical’ consequence, then Santos will seek to deter all species with equal effort.

Collision risk from the presence of infrastructure is well documented. Birds are often attracted to illuminated offshore structures (For further information on the impact of light emissions see Birds – Section 7.2.4.2.5.), particularly nocturnally migrating species. Poor light conditions particularly during adverse weather conditions can also increase the risk of collision. Collision is ranked as one of the highest instances of bird mortality with man made structures. Offshore, potentially disoriented, or stormbound terrestrial birds have no alternatives for landing, so increased risk of collision occurs especially during low light conditions. Although instances are rare, sometimes several thousand birds impacted in a single event (Huppop et al , 2016).

The impact of deterrent non-lethal deterrence measures that seeks to displace or disturb birds is by definition of low impact to bird mortality or population size for the species targeted. However, there may be unexpected consequences for migratory species that attempt to utilise the platform as a rest stop or to stormbound birds. Although this is hard to quantify, as with collision the impacts on terrestrial species may be more significant with limited options for sanctuary close by. The deterrence measures should also be designed to reduce secondary threats, such as forcing birds to lower levels that then scatter as helicopters land.

7.3.4.3 Summary of Environmental Impact Evaluation

A summary of the outcomes of the impact evaluation, including adopted control measures and EPOs is provided in **Table 7-98.**

Table 7-98: Summary of impacts, EPOs, controls and risk evaluation of vessel and aircraft interactions with marine fauna during Dorado Phase 1

EPOs	
EPO29A: No vessel or helicopter interactions within the Dorado Phase 1 Project operational area with EPBC Act listed threatened, migratory or cetacean species.	
Receptor	**Impact**
Marine Mammals	Injury/mortality to marine fauna from vessel or helicopter collisions, disturbance from bird deterrence measures .
Fish	
Reptiles	
Birds	
Control Measures (CM)	
CM16: Implementation of Santos' Protected Marine Fauna Interaction and Sighting Procedure **CM80**: Vessels within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans, (except in emergency conditions or when manoeuvring is not possible), which include: + Implement a caution zone of 150 m for dolphins and 300 m for whales, + Vessels will not knowingly approach closer than 50 m to a dolphin and 100 m to a whale (i.e. no approach zone), + Make sure a vessel does not drift or approach within 50 m of a dolphin or 100 m of a whale, + Vessels will not knowingly travel more than 6 knots within the caution zone of a dolphin or whale, and + There will not knowingly be no more than three vessels within 300 m of a whale (i.e. caution zone). **CM81:** Helicopters within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans (except in emergency conditions or when manoeuvring is not possible), which includes: + not operating the helicopter at a height lower than 1 650 feet or within a horizontal radius of 500 metres of a cetacean + not allowing the aircraft to approach a cetacean from head on **CM82**: If a Part 13 Permit for the disturbance of listed migratory birds is required under the EPBC Act a Santos Bird Management Plan will be developed and implemented.	
Likelihood	Unlikely – B Vessel Collision Marine fauna is expected to be present within the Project Area at various times of the year. Support vessels will be moving very slowly

	while inside the operational area, posing a low risk of collision with marine fauna. In addition, the noise generated from vessel operations will deter marine fauna from coming in close proximity to vessels. With controls in place ensuring the vessels are compliant with EPBC Regulations, the likelihood of a collision with marine fauna resulting in a very low/negligible consequence is considered to be Unlikely. Aircraft collision The primary hazard recorded on local Santos platforms is birds taking flight as helicopters approach. This causes pilot distraction and introduces the potential for bird strike, which could lead to helicopter damage / crash, potentially escalating to a multiple fatality event. Unmanned Santos platforms have recorded four and two birds strikes respectively. With the control measures and deterrence strategies in place, incidence is reduced to unlikely. targeted terrestrial bird species is predicted to be negligible.
Consequence	Minor – II
Risk	Very Low

7.3.4.4 Demonstration of Acceptability

The potential impacts and risks of vessel or helicopter collision risk with marine fauna as a result of Dorado Phase 1 have been compared to receptor-specific acceptable levels of impact and other considerations are summarised in **Table 7-99** and **Table 7-100**. The method by which these acceptable levels were determined, along with a justification as to why these are acceptable, are discussed in **Section 4**.

The worst-case risk of interactions with marine fauna was evaluated as very low (**Table 7-98**). This risk is considered to be acceptable when assessed against the Santos risk matrix (**Section 4**).

Based on the outcomes of the evaluation of impacts and risks, Santos considers that the potential environmental impacts that may result from vessel or helicopter interactions with marine fauna are acceptable.

Table 7-99: Demonstration of acceptability for the risk of interactions with marine fauna

Acceptability Criteria	Demonstration of Acceptability
To meet the principles of ESD	Management of interactions with marine fauna during Dorado Phase 1 is consistent with the principle of ESD because: there is no threat of serious or irreversible environmental damage as a result of vessel movements within the Project Area, and the risk of vessel or aircraft interactions with marine fauna does not pose a threat to the conservation of biological diversity or ecological integrity.
Internal Context	The management of the risk of vessel interactions with marine fauna is aligned with Santos' policies and standards. The residual risk is very low, which is acceptable. The EPO and the controls which will be implemented are consistent with Santos' internal requirements.
External Context	Santos' ongoing consultation program will consider statements and claims made by stakeholders when undertaking the assessment of impacts and risks.

Acceptability Criteria	Demonstration of Acceptability
MNES	The following material published in relation to threatened and migratory species within the Project Area identify vessel strikes or anthropogenic disturbance as a threat: <u>Conservation advice:</u> Conservation advice *Rhincodon typus* whale shark (Threatened Species Scientific Committee 2015d), Conservation Advice *Calidris canutus* Red knot (Threatened Species Scientific Committee 2016f) (identifies bird strike with helicopters as a threat) Approved Conservation Advice for *Dermochelys coriacea* (Leatherback Turtle) (Threatened Species Scientific Committee 2008b) Conservation advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015b), Approved conservation advice for *Balaenoptera physalus* (fin whale) (Threatened Species Scientific Committee 2015c), and <u>Recovery plans:</u> Recovery plan for marine turtles in Australia 2017-2027 (Commonwealth of Australia 2017a). This plan identifies vessel interactions as a threat to marine turtles. Given the long-term recovery objective is to minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so that they can be removed from the EPBC Act threatened species list, it is considered relevant to Dorado Phase 1. Conservation management plan for the blue whale: A recovery plan under the Environment Protection and Biodiversity Conservation Act 1999 2015-2025 (Commonwealth of Australia 2015a). This recovery plan identifies vessel collisions as a threat to Blue Whales. Action A4: minimising vessel collisions by ensuring the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required appropriate mitigation measures are implemented; and ensure all vessel strike incidents are reported in the National Ship Strike Database. These actions are relevant to Dorado Phase 1. Wildlife Conservation Plan for Migratory Shorebirds (Commonwealth of Australian 2015c). This recovery plan identifies anthropogenic disturbance as a threat to migratory shorebirds. Action 3C: Investigate the significance of cumulative impacts on migratory shorebird habitat and populations in Australia; and Action 3F: Ensure all areas important to migratory shorebirds in Australia continue to be considered in development assessment processes, are relevant to Dorado Phase 1. Wildlife Conservation Plan for Seabirds (DCCEEW 2022). This recovery plan identifies anthropogenic disturbance as a threat to seabirds. Action 2D: ensure all areas of important habitat for seabirds are considered in the development assessment process; and 2E: manage the effects of anthropogenic disturbance to seabird breeding and roosting areas, are relevant to Dorado Phase 1. <u>Other material:</u> National Strategy for Reducing Vessel Strikes on Cetaceans and other Marine Megafauna (Commonwealth of Australia 2017b). The objectives of these publications were considered during the assessment of impacts and risks. The activity is not inconsistent with these objectives. The controls outlined in **Table 7-83** are consistent with the objectives of the material listed above

Acceptability Criteria	Demonstration of Acceptability
	and Santos considers the impacts of unplanned interaction with marine fauna to not be inconsistent with the EPBC management plans. Recovery Plans / Conservation Advice for other species that may occur in the project area do not identify vessel strike or anthropogenic disturbance as a key threat or do not have explicit relevant objectives or management actions related to vessel strike or anthropogenic disturbance. The controls outlined in **Table 7-83**are consistent with the objectives of the material listed above.
Other Relevant Requirements	Management of the risk of vessel interactions with marine fauna during Dorado Phase 1 are consistent with relevant legislative requirements, including: + compliance with Australian legislation and requirements, including: - adherence to the requirements of Part 8 of the EPBC Regulations (Interacting with cetaceans and whale watching). + alignment with policies, strategies, guidelines, conservation advice, and recovery plans published under the EPBC Act.

Table 7-100:Demonstration of acceptability of the risk of vessel interactions with marine fauna against receptor-specific acceptable levels of impact

Receptor-specific Acceptable Levels	Demonstration of Acceptability
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No or significant impacts[53] to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	The assessment of impacts and risks from vessel interactions with marine fauna predicts the risk is very low, with no effect on populations of these species. Management of the risk of vessel interactions with marine fauna is consistent with conservation advice and recovery plans that identify vessel strike as a threat. Significant impacts to species listed as threatened or migratory under the EPBC Act are not predicted to occur.

7.4 Cumulative Impacts

Cumulative impacts to environmental receptors may occur when more than one hazard impacts upon a receptor. Cumulative impacts to environmental receptors may occur as a result of:

+ more than one aspect from Dorado Phase 1 impacting upon a receptor; or
+ hazards from Dorado Phase 1 and third-party actions impacting upon the same receptor.

In order to assess cumulative impacts to environmental receptors, Santos has undertaken receptor-specific cumulative impact assessments for both multiple aspects of Dorado Phase 1 and third-party activities. The cumulative impact assessment was conducted after the aspect-specific impact

[53] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

assessments for Dorado Phase 1. The methodology used for, and the outcomes of, this assessment are described below.

Cumulative impacts may arise from causes such as (Minerals Council of Australia 2015):

- Space crowding - occurs when a system is disturbed by several similar activities, or by different activities producing a similar effect, in an area too small to assimilate the combined impacts; and
- Time crowding - occurs when impacts are so close in time that the impact of one action are not dissipated before the next occurs.

Interactive effects - interactive effects can be additive or synergistic, reflecting the interactive nature of ecosystems. Additive is the simple linear addition of one impact on another, whereas synergistic is when two or more agents combine to cause an impact greater than the sum of their individual impacts. Antagonistic effects can also occur, where the combined impact of more than one agent is less than the sum of the individual impacts.

Indirect effects - arising as a result of the direct effect, and include the impacts of activities facilitated by a project, including reasonably foreseeable impacts from downstream users.

The cumulative impact assessment only considered the impacts from planned activities during Dorado Phase 1 and third-party activities. Unplanned events, such as hydrocarbon spills, are not intended to occur at any time during Dorado Phase 1 and hence have not been assessed.

Santos has considered all third-party activities that are known to occur, or are reasonably expected to occur, in the Project Area during Dorado Phase 1 based on the information available to Santos during the preparation of this OPP. Santos has made a reasonable effort to identify credible third-party activities, but acknowledges that there is the potential for future activities to occur within the Project Area may not be considered as they are unknown or due to the inherent uncertainty of the future. The activity-specific EPs that will be prepared subsequent to this OPP will provide an opportunity to undertake additional cumulative impact assessments that consider activities known to, or reasonably expected to, occur in the future that are identified at a later date.

7.4.1 Cumulative Impact Assessment Methodology

The cumulative impact assessment methodology is aligned with Santos' method for evaluating environmental impacts and risks (**Section 7.1**). The steps for the cumulative impact assessment process are shown in **Figure 7-62** each step is described further below.

7.4.1.1 Describe the Aspects of Dorado Phase 1 and Third-party Activities

Each of the planned aspects of Dorado Phase 1 was reviewed to identify the environmental receptors that may credibly be impacted. These environmental impacts for these planned activities are assessed in **Section 7.2**.

Third-party activities that are known to occur, or are reasonably expected to occur, within the area were identified. Methods used to identify third-party activities include:

- Consultation undertaken by Santos for Dorado Phase 1 and previous petroleum activities in the Bedout Basin;
- Santos' operational experience in undertaking previous petroleum activities in the Bedout Basin;
- Reviewing of publicly available data (e.g. AMSA's craft tracking system, fisheries reports etc.);

- Review of regulatory submission websites, including for submissions under the EPBC Act and OPGGS Act; and
- Predicting future activities that may reasonably occur based on Santos' knowledge of the known resources and existing uses in the Project Area.

Third-party activities and aspects that were identified as potentially contributing to cumulative environmental impacts are summarised in **Table 7-101**.

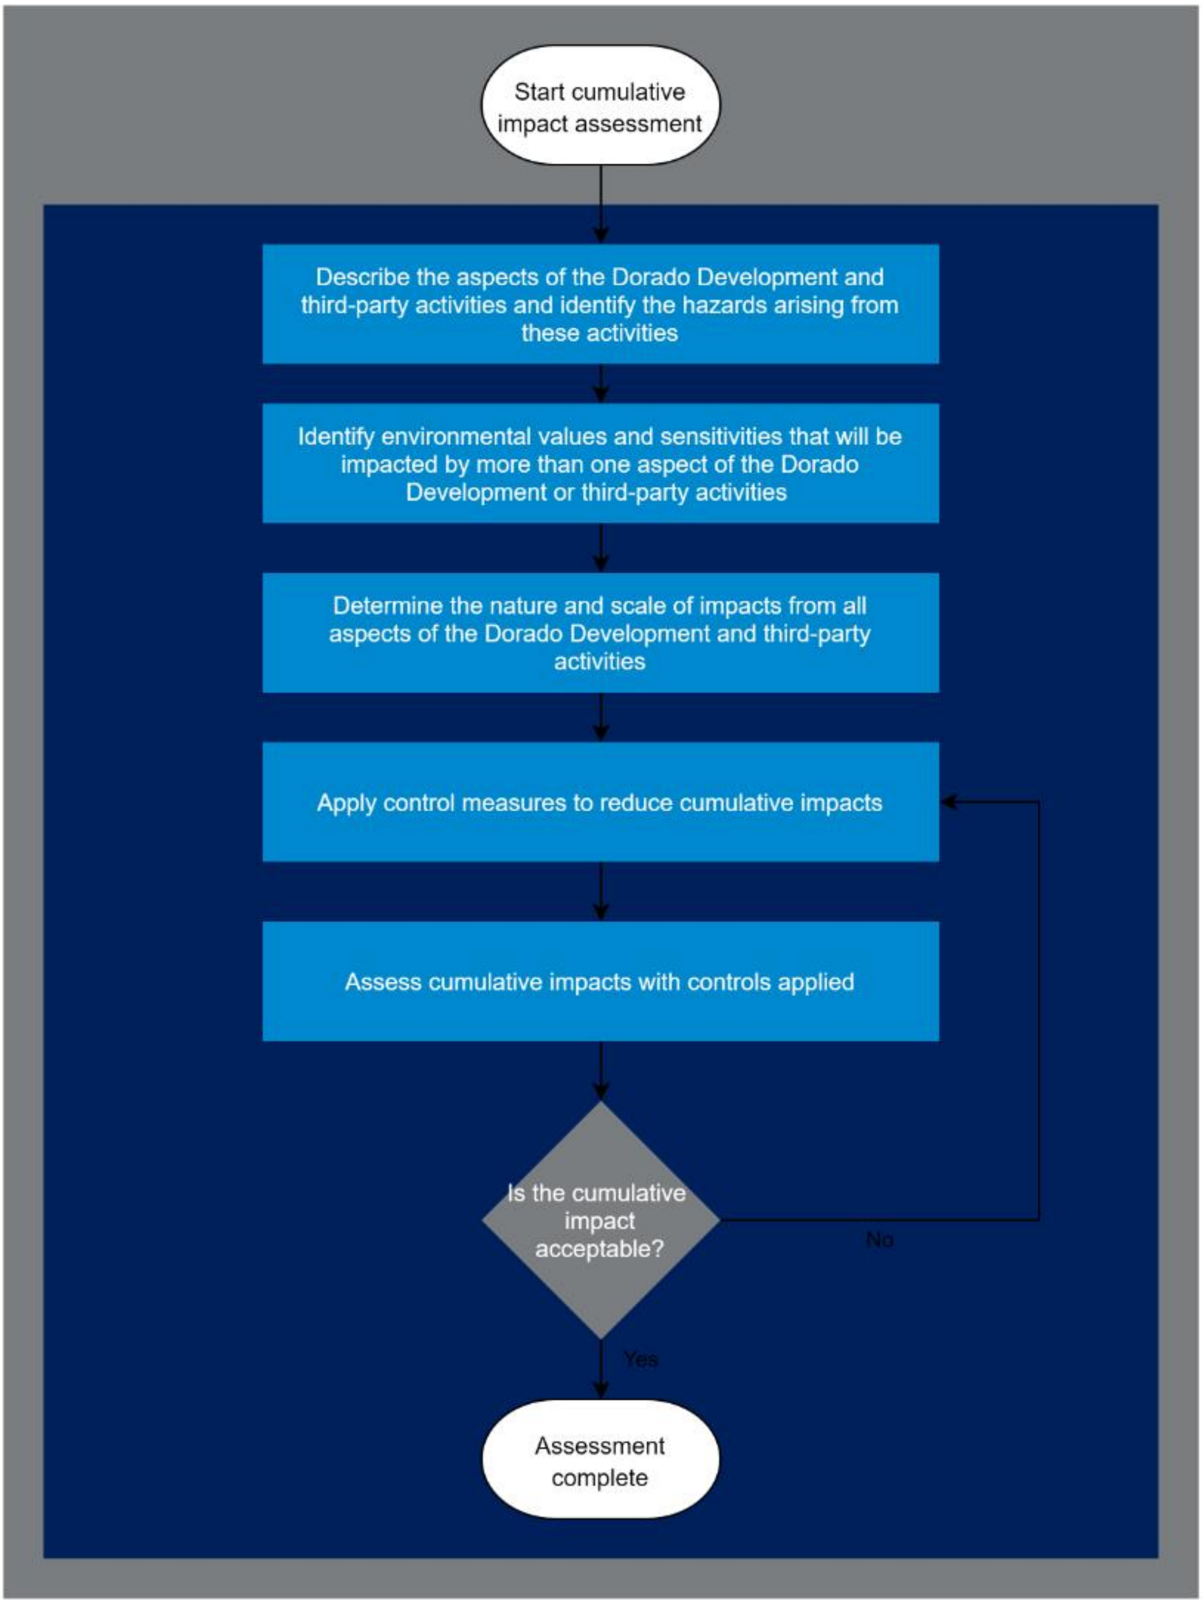

Figure 7-62: Cumulative environmental impact and risk assessment process

Table 7-101:Third-party activities and aspects that may contribute to cumulative impacts of Dorado Phase 1

Third-party Activities	Aspects
Commercial Shipping	+ wastewater discharges + light emissions + acoustic emissions + atmospheric emissions
Commercial Fishing	+ wastewater discharges + light emissions + acoustic emissions + atmospheric emissions + seabed disturbance
Oil and Gas Exploration	+ wastewater discharges + light emissions + acoustic emissions + atmospheric emissions

Activities that occur in the same location (i.e. space crowding) and at the same time (i.e. time crowding) have greater potential to cause cumulative impacts. To identify activities in the same location, the spatial extent of aspects from Dorado Phase 1 and third-party activities were compared. Aspects that were identified as occurring in the same location were further assessed to determine their relative timing.

7.4.1.2 Identify Environmental Values and Sensitivities

Environmental values and sensitivities were identified based on the nature and scale of the environmental aspects of Dorado Phase 1 and third-party activities. The methods used to identify these are described in **Section 7.1**; the environmental values and sensitivities are described in **Section 3**. The potential interactions between environmental values and sensitivities and aspects of Dorado Development and third-party activities are shown in **Table 7-102.**

7.4.1.3 Determine Nature and Scale of Impacts

The methods used to determine the nature and scale of impacts to environmental values and sensitivities is described in **Section 7.1**. The nature and scale of environmental impacts to these receptors from planned activities during Dorado Phase 1 are described in **Section7.2**. This process was also applied to aspects of third-party activities, with the nature and scale of impacts from third-party activities considered in the cumulative impact assessment (**Section 7.4.2**).

All aspects from Dorado Phase 1 and third-party activities that may impact upon a single receptor were considered together to identify the potential for:

+ space crowding;
+ time crowding;
+ interactive effects; and
+ indirect effects.

7.4.1.4 Apply Control Measures

Control measures were considered once the nature and scale of cumulative impacts had been assessed. This was done in the same manner as the assessment of impacts and risk from Dorado Phase 1. Refer to **Section 7.1** for further information.

7.4.1.5 Assess Cumulative Impacts

The cumulative impacts from aspects of Dorado Phase 1 and third-party activities were assessed using the Santos risk matrix (**Table 7-2**). As per the planned impacts from Dorado Phase 1, only consequence was assessed for cumulative impacts. The resulting consequence was then compared to Santos' acceptable levels of impact, including receptor-specific acceptable levels of impact described in **Section 4**. All cumulative impacts were deemed to be acceptable with the controls identified in the impact assessment of planned activities.

Table 7-102:Environmental values and sensitivities that may be subject to cumulative impacts

7.4.2 Cumulative Impact Assessment

The following environmental values and sensitivities were identified as potentially being affected by cumulative impacts.

Physical environment:

- Climate;
- Water quality;
- Sediment quality;
- Air quality; and
- Acoustic environment.
- Biological environment:
- Communities and habitats; and
- Marine fauna (fishes, marine mammals, reptiles, and birds).

Socio-economic environment:

- Fisheries; and
- Maritime industry.

Cumulative impacts to each of these receptors are considered below.

7.4.2.1 Climate

Climate change as a result of GHG emissions is a cumulative impact resulting from anthropogenic emissions from a range of sources. A detailed cumulative impact assessment of GHG emissions from Dorado Phase 1 is provided in **Section 7.2.6.**

7.4.2.2 Water Quality

Aspects of Dorado Phase 1 that may impact water quality include:

- drill cuttings and fluids;
- PW discharge;
- wastewater discharges; and
- seabed disturbance.

Third-party activities that may impact upon water quality include wastewater discharges from commercial shipping, commercial fishing and petroleum exploration activities.

Potential impacts to water quality from the discharge of drill cuttings and fluids are predicted to be localised to the discharge location (**Section 7.2.1**). Drill cuttings and fluids during the initial development drilling stage will not occur at the same time as PW discharges, and water quality is expected to recover quickly once discharges of drill cuttings and fluids cease. Infill and tieback drilling discharges are not expected to interact with wastewater discharges or PW discharges to result in cumulative impacts to water quality, as these activities will occur away from the FPSO, where the discharges will occur. On this basis, cumulative impacts to water quality from the discharge of drilling cuttings and fluids and other aspects of Dorado Phase 1 are not expected to occur. The discharge of drill cuttings and fluids will occur at the Dorado WHP only once the jacket and the Dorado WHP foundation piles are in place and therefore no water quality cumulative impacts are expected. Then only seabed disturbance which could interact with the discharge of drill cuttings and fluids, is the installation of the flowlines and umbilicals near the Dorado WHP. These activities will generate small amounts of suspended sediments and are not expected to significantly add to or modify the drill cuttings and fluids impacts.

PW and wastewater discharges from the FPSO will occur throughout the operational stage of Dorado Phase 1 (**Sections 7.2.2** and **7.2.3**). Potential contaminants in the PW and wastewater discharge streams are unlikely to interact synergistically, as only trace amounts of chemicals are expected to be present in wastewater discharges. The main trace chemical in wastewater discharges is expected to be residual biocide (chlorine or copper), neither of which are known to interact synergistically with potential contaminants in the PW at the concentrations that will occur. As such, cumulative impacts from PW and wastewater discharges are expected to be additive in nature only.

Impacts to water quality from seabed disturbance of Dorado Phase 1 are likely to be restricted to very localised sediment plumes during deployment and recovery of MODU spud cans, project vessel and semi-submersible MODU anchors and moorings, installation of the Dorado WHP foundation piles, FPSO piles and mooring lines, and installation of the subsea system (**Section 7.2.1**).

Decommissioning activities are expected to have the same level of suspended sediments and increased turbidity levels as during installation. Sediment plumes from these activities may result in a slight and temporary decrease in water quality due to increase in suspended sediments close to the point of disturbance. Due to their location in the water column seabed disturbance (in the lower layer near the seabed) and PW and wastewater plumes (upper 15 m of the water column) are not expected to interact with each other.

Impacts to water quality from third-party activities (e.g. wastewater discharges from commercial shipping and fishing vessels) are expected to be highly localised, temporary and present a small environmental risk. (**Section 7.2.3**). Given the localised impacts to water quality from Dorado Phase 1 and third-party activities and the spatial separation of discharges due to exclusion zones and PSZ, cumulative impacts from additive and synergistic effects of impacts to water quality from Dorado Phase 1 and third-party activities are not predicted to occur.

Based on the assessment presented above, cumulative impacts to water quality are considered to be minor. An assessment of cumulative impacts against the acceptable levels of impact for water quality is provided in **Table 7-103**.

Table 7-103: Demonstration of acceptability of cumulative impacts to water quality from Dorado Phase 1 and third-party activities

Acceptable levels of Impact	Demonstration of Acceptability
RSAL3: Impacts to water quality that do not result in a loss of ecological integrity[54] are acceptable. **RSAL4**: Substantial[55] impacts to water quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	The separation of several discharge streams in space and time means the environment will assimilate these impacts before cumulative impacts will occur. PW and wastewater discharges from the FPSO are crowded in space and time, however they are not expected to interact synergistically, only additively. The additive impacts of PW and wastewater discharges will be minor and will not exceed the defined receptor-specific acceptable levels.

7.4.2.3 Sediment Quality

Aspects of Dorado Phase 1 that may impact sediment quality include:

- drill cuttings and fluids;
- PW discharges;
- wastewater discharges; and
- seabed disturbance.

Third-party activities within the Project Area could have a potential impact on sediment quality through the discharge of wastewater from commercial shipping and fishing vessels and the trawling of fishing gear on the seabed. No detectable impact is expected from the discharge of wastewater (**Section 7.2.3**). While the trawling of fishing gear may disturb and resuspend the top layer of the seabed being trawled, it is not expected to impact the quality of the sediment (no chemical changes or long-term particle size change). As such, cumulative impacts from Dorado Phase 1 and third-party activities are not expected to occur.

Impacts to sediments from the discharge of drill cuttings and fluids will be concentrated around the Dorado WHP and any future tieback locations, which could be some distance from the Dorado WHP. Hence, impacts to sediment quality from drill cuttings and fluids will be separated from impacts to sediments from PW and wastewater discharges, which will be concentrated around the FPSO. (**Sections 7.2.1**, **7.2.2** and **7.2.3**). As such, cumulative impacts from space crowding of sediment impacts is more likely to occur around the FPSO. Synergistic effects from impacts to sediment quality from PW and wastewater discharges are not expected to occur, although additive effects may occur. As impacts to sediments from PW discharges and wastewater discharges are predicted to be very minor, any additive effects are also expected to be minor.

---

[54] Ecological integrity is generally referred to as the self-sustaining nature of a natural ecosystem, including ecological processes and biological communities. An ecosystem is considered to have ecological integrity if the natural ecological processes are intact and self-sustaining, the ecosystem evolves naturally and its capacity for self-renewal is maintained; and the ecosystem's biodiversity is ensured (Office of the Auditor General of British Columbia 2010).

[55] Substantial - Substantial impacts are considered to be an exceedance of the 95% species protection levels for water quality or the default guideline value (high) for sediments for contaminants in the PW derived from either Australian and New Zealand guidelines for fresh and marine water quality (Commonwealth of Australia and New Zealand Government 2018) or discharge-specific whole effluent toxicity testing result using methodology aligned with the guidelines.

Santos

Impacts to sediments from the discharge of drill cuttings and fluids tend to be relatively long-term, with assimilation of impacts to sediment (e.g. reductions in concentrations of potential contaminants) expected to occur over years (**Section 7.2.1**). While this may increase the risk of cumulative impacts due to time crowding, no other aspects of Dorado Phase 1 are expected to impact upon sediments within the area impacted by drill cuttings and fluids. Therefore, cumulative impacts to sediments from drill cuttings and other aspects that may impact upon sediments are not expected to occur.

Impacts to sediments from seabed disturbance are predicted to be restricted to modification of particle size distribution **(Section 7.2.9**). This impact will not credibly result in cumulative impacts to sediment quality.

Based on the assessment presented above, cumulative impacts to sediment quality are considered to be minor. An assessment of cumulative impacts against the acceptable levels of impact for sediment quality is provided in **Table 7-104.**

Table 7-104:Demonstration of acceptability of cumulative impacts to sediment quality from Dorado Phase 1 and third-party activities

Acceptable levels of Impact	Demonstration of Acceptability
RSAL5: Impacts to sediment quality that do not result in a loss of ecological integrity are acceptable. **RSAL6**: Substantial impacts to sediment quality within 1 km of the WHP, FPSO and drilling activities are acceptable.	The greatest potential for cumulative impacts to sediment quality is expected to be around the FPSO due to PW and wastewater discharges. These impacts are expected to be very minor and result in additive cumulative impacts. Cumulative impacts to sediments from other aspects of Dorado Phase 1 or third-party activities are not expected to occur. Hence, cumulative impacts to sediment quality are predicted to be within acceptable levels.

7.4.2.4 Air Quality

Cumulative impacts to air quality may occur as a result of atmospheric emissions (excluding GHG emissions, refer to **Section 7.4.2.1** for consideration of GHG emissions) during Dorado Phase 1 and from commercial shipping, fishing vessels and petroleum activities (**Section 7.2.7**). Atmospheric emissions from Dorado Phase 1 may occur from sources such as combustion engine emissions, flaring and venting, resulting in emissions of:

+ nitrogen oxides (NO_x);
+ sulphur oxides (SO_x);
+ CO;
+ VOCs; and
+ particulate matter of differing size classes.

Third-party emissions are expected to be primarily form commercial shipping in the region, which is concentrated within the shipping fairways designated by AMSA. Commercial fishing and other petroleum activities may make minor contributions to atmospheric emissions in the Project Area. Emissions from the third-party activities are expected to be similar to those listed above for Dorado Phase 1.

The air shed in the Project Area is far offshore and is not constrained. The environment is expected to have a high capacity to assimilate the impacts to air quality from Dorado Phase 1 and third-party activities. As such, cumulative impacts to air quality from Dorado Phase 1 and third-party activities are not expected to occur. No assessment of cumulative impacts to air quality against the acceptable levels of impact to air quality is required.

7.4.2.5 Acoustic Environment

Notable sources of acoustic emissions from Dorado Phase 1, inclusive of future tiebacks, include:

- piling;
- 3-D vertical seismic profiling (3-D VSP);
- vertical seismic profiling of wells (drilling VSP);
- thruster noise from the FPSO; and
- vessel noise.

These are described in detail in **Section 7.2.5**. These noise sources are typically separated in time, with:

- piling occurring during installation activities;
- 3-D VSP occurring after installation activities, prior to start up and possibly repeated at 2-to-3-year intervals during production;
- Drilling VSP occurring during production drilling activities;
- FPSO thruster noise occurring primarily during offtakes in the operational stage; and
- vessel noise occurring throughout all stages of Dorado Phase 1, but is relatively less intense than piling, vertical seismic profiling or the FPSO thruster noise.

Third-party activities with the potential to generate acoustic emissions that may result in cumulative impacts include commercial shipping and petroleum exploration (particularly seismic surveys). Commercial fishing vessels will also generate acoustic emissions due to vessel noise; the intermittent nature and low intensity of these emissions results in a negligible potential for cumulative impacts.

Impacts from acoustic emissions, such as behavioural disturbance of marine fauna or some mortality of planktonic organisms, typically persist for the duration of the acoustic emission. Receptors impacted by acoustic emissions are expected to recover rapidly once the acoustic emissions are ceased. On this basis, the environment has a high capacity to recover from underwater noise impacts.

While acoustic emissions from Dorado Phase 1 are space crowded around the Dorado WHP and FPSO locations and potential future tieback locations, the separation of high intensity acoustic emissions in time, along with the capacity for the environment to recover between emissions, supports the ranking of minor for cumulative impacts from acoustic emissions from Dorado Phase 1.

Commercial shipping noise occurs frequently in the vicinity of the Project Area due to iron ore carrier movements to and from Port Hedland. These vessels frequently transit the shipping fairways around the Project Area and contribute to the anthropogenic underwater noise in the region. The acoustic emissions from Dorado Phase 1 after installation and production drilling will be a relatively small increase over this background noise and will be generally similar in nature.

Seismic surveys generate high intensity acoustic emissions. Seismic surveys could occur within or in close vicinity of the Project Area, which would result in acoustic emissions in and around the Project Area. Santos is aware that there are seismic surveys that overlap the Project Area, which have accepted EPs, or EPs in assessment and are intended to be acquired in the period 2021 to 2024. These surveys include:

- Keraudren Extension Survey, activity prior to December 2022;
- Rollo multi-client 3-D Survey, activity prior to October 2023; and
- Capreolus-2 3-D Survey, activity between 2020 and 2024.

The Keraudren Extension survey would be completed prior to activities commencing in the Dorado Project Area.

The Rollo multi-client 3-D Survey covers a large area across the Carnarvon Basin including overlap with the Dorado Project Area and has the potential to overlap in timing with piling activities, however, given the interference that noise emissions from piling would have on seismic interpretation it is highly unlikely that this would occur concurrently in close proximity to each other. The Capreolus-2 3-D Survey does overlap the Dorado Project Area, but does not spatially overlap with the Dorado reservoir, WHP foundation or FPSO mooring piles. There is potential for acoustic emissions from the Capreolus-2 3-D survey to occur at the same time as the installation and development drilling activities for Dorado Phase 1.

Third party seismic surveys such as the Capreolus and Rollo surveys will require authority from Santos to access WA-437-P and WA 438-P and therefore the Project Area, via an access authority agreement. Santos acknowledges that acoustic emissions from beyond the Project Area, such as seismic surveys, have the potential to result in cumulative impacts to receptors within the Project Area.

Given there is potential for the Capreolus and Rollo seismic surveys to be undertaken at the same time as installation and development drilling activities for Dorado Phase 1 some cumulative impacts may occur resulting in disturbance to marine receptors in this location. To reduce potential cumulative impacts, Santos will impose a corridor of 40 km between the Dorado WHP/FPSO locations and sources of simultaneous seismic surveys. The corridor width was established by the Bureau of Ocean Energy Management in the published environmental review of geological and geophysical survey activities in the south Atlantic Ocean (Bureau of Ocean Energy Management 2014) where, to minimise potential impacts to marine fauna, based on a worst-case scenario a 40 km geographic separation distance between sources of simultaneous seismic surveys was adopted. Adopting a 40 km width corridor is considered conservative as the ranges at which potential PTS and TTS injury to pygmy blue whales from Dorado drilling and installation activities may occur are substantially less than 40 km (**Table 7-35**). This space separation is also consistent with some seismic survey EPs on the NWS. With this control in place, it is expected that potentially affected ecological receptors would recover from the effects of concurrent seismic survey activity and Dorado Development activities within days to months of completion of the seismic survey.

The Sauropod 3D seismic survey proposed by CGG, with an operational area adjacent to Dorado Project Area in WA-527-P, was accepted by NOPSEMA in February 2022. Planned activity is scheduled to take place between January and May in 2022 so will not overlap in time with Dorado Development activities.

Santos Bedout Multi-Well Drilling EP was accepted by NOPSEMA on 20 December 2021 and allows for the drilling of up to 8 exploration wells within permits WA-437-P and WA-439-P within a 5 year window from the date of acceptance of the EP. Thus, it is possible that exploration drilling in these permits could take place during the installation of the piles for the Dorado WHP and FPSO and production drilling. The closest distance between the Dorado WHP (relevant for drilling VSP and vessel noise sources) and the Dorado FPSO (relevant for piling and vessel noise sources) is 21 km and 19.6 km respectively. Acoustic emissions from vessels associated with exploration and appraisal drilling had physiological and behavioural impacts to low frequency cetaceans predicted at 12 m for PTS onset threshold, 266 m for TTS onset threshold and within 1,200 m for the behavioural onset threshold. VSP associated with exploration and appraisal drilling, conducted over a period of up to 18 hours, results in onset thresholds for PTS and TTS of 260 m and behavioural response at 2.42 km. Given these distances, the only overlapping thresholds for exploration drilling and Dorado Phase 1 activities is TTS during PSO piling activities. However, given the short duration of VSP and the commitment to implementing controls aligned with Part A of EPBC Act Policy Statement 2.1 in the Bedout Multi-Well Drilling EP (BD-CM-018) and in the Dorado OPP (CM-18), cumulative impacts are not predicted for low frequency cetaceans such as humpback and pygmy blue whales.

Future tiebacks within the Project Area are not proposed to be developed prior to the ready for start-up date in 2027; and, at this stage, seismic surveys that may overlap or occur adjacent to the Project Area beyond December 2023 are unknown. The Bedout Basin may be subject to future seismic surveys as it is a prospective petroleum basin. However, the nature and timing of future surveys is unknown at this time and hence has not been considered in this cumulative impact assessment.

The current ambient underwater acoustic emissions near the Dorado WHP and FPSO sites for all functional cetacean hearing groups receive at least an SEL of approximately 150 dB re 1 µPa2 ·s (Lucke et al, 2022) including noise from vessel traffic in the shipping lanes. The continuous operational noises contributed by operational activities during Dorado Phase 1 are not adding significantly to ambient conditions across the Dorado Project Area.

Based on the considerations above, cumulative impacts to the acoustic environment from Dorado Phase 1 and third-party activities will be minor. An assessment of cumulative impacts against the acceptable levels of impact for the acoustic environment is provided in **Table 7-105**.

Table 7-105:Demonstration of acceptability of cumulative impacts to the acoustic environment from Dorado Phase 1 and third-party activities

Acceptable levels of Impact	Demonstration of Acceptability
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1. **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL15:** No injury to pygmy blue whales in a pygmy blue whale BIA. **RSAL16**: No significant impacts to EPBC listed threatened, migratory or cetacean species under the EPBC Act as a result of Dorado Phase 1.	The cumulative impacts of acoustic emissions from Dorado Phase 1 and third-party activities will not result in PTS or TTS injury to pygmy blue whales in a pygmy blue whale BIA or significant impacts to EPBC listed threatened, migratory or cetacean species, due to temporal and spatial distancing between activities as well as the application of temporal controls where modelling shows PTS or TTS impacts in the pygmy blue whale BIA; and piling, drilling VSP and 3-D VSP activity controls aligned with Part A of the EPBC Act Policy Statement 2.1. Nor will it result in significant behavioural impacts to noise-sensitive marine fauna. On this basis, cumulative impacts to the acoustic environment are acceptable. The objectives of relevant conservation advices and recovery plans (as presented in **Section 7.2.5**) were considered during the cumulative impacts assessment. With the addition of the above control measure, the concurrent activities are not inconsistent with these objectives.

7.4.2.6 Artificial Light

Light emissions from the project will be associated with lighting of drilling rigs, project vessels and facilities for operational and safety requirements within the Project Area. Based on the worst-case scenario (Operational flaring) the flare is no longer directly visible at 42.4 km, when the flare drops below the horizon. At this distance, the radiance is equivalent to 0.25 full moons. As the flare drops below the horizon, radiance declines rapidly and is no longer visible. To inform the cumulative impact assessment for light impacts, the distance of 42.4 km is used.

Third-party activities with the potential to generate light emissions that may result in cumulative impacts include commercial shipping and petroleum activity. Light emissions from Commercial fishing vessels within the cumulative assessment envelope for artificial light will be intermittent and low intensity resulting in a minor potential for cumulative impacts.

Maritime industry within the cumulative assessment envelope consists of commercial shipping, which is largely restricted to shipping fairways. The Dorado WHP and FPSO locations are over 10 km from the nearest shipping fairway (within the cumulative assessment envelope for artificial light). Commercial shipping and project vessels undertaking Dorado Phase 1 are all required to comply with international and Australian maritime requirements, which include requirements for safe navigation and lighting. The maritime industry addition to light emissions from vessel transit is intermittent and low intensity resulting in a minor potential for cumulative impacts.

Based on the considerations above, cumulative impacts from artificial lighting from Dorado Phase 1 and third-party activities will be minor. An assessment of cumulative impacts against the acceptable levels of impact for the light emissions is provided in **Table 7-106.** The cumulative impact assessment for light impacting marine fauna further considered in **Section 7.4.2.8.**

Table 7-106:Demonstration of acceptability of cumulative impacts from artificial light from Dorado Phase 1 and third-party activities

Receptor-specific Acceptable Levels	Justification
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	The assessment of cumulative impacts and risks from artificial light emissions predicts impacts to threatened or migratory species will be limited to minor, temporary behavioural changes (e.g. attraction, avoidance etc.) that will have no effect on populations of these species. Mortality of individual animals as a result of cumulative artificial light emissions is not expected to occur. Significant impacts to species listed as threatened or migratory under the EPBC Act are not predicted to occur. Areas of importance for species, such as Ramsar sites and turtle nesting beaches, will not credibly be impacted by artificial light emissions from Dorado Phase 1. The objectives of relevant conservation advices and recovery plans (as presented in **Section 7.2.4**) were considered during the cumulative impacts assessment. Concurrent activities are not inconsistent with these objectives.

7.4.2.7 Communities and Habitats

Benthic communities and habitats may be impacted by Dorado Phase 1 as a result of:

+ the discharge of drill cuttings and fluids;
+ seabed disturbance during installation; and
+ decommissioning in situ (waste management).

Third-party activities that may impact upon benthic communities and habitats consist of fishing, particular bottom trawl fishing. Trawl fishing has historically occurred, and continues to occur, within the Project Area. (**Section 3.4.3**). Trawl fishing disturbs benthic habitats by removing epibenthic biota, such as sponges, corals and gorgonians. Trawl fishing will not be permitted within the exclusion zones and PSZs that will be introduced during Dorado Phase 1. As most seabed disturbance from Dorado Phase 1 will be within these zones, impacts to benthic habitats and communities from Dorado Phase 1 and trawl fishing will not be space crowded. Hence, cumulative impacts to benthic habitats and communities will be negligible.

The seabed within the Project Area is largely bare sediment, with some areas of hard substrate. These habitats are well represented in the region and are not considered to be sensitive habitats (**Section 3.3.1**). Seabed disturbance from Dorado Phase 1 will be concentrated around the Dorado WHP and FPSO, and will be localised to these locations. The construction and potential *in situ* decommissioning of Dorado Phase 1 facilities will create an artificial reef, which may enhance biodiversity within the Project Area. Conversely, the removal of the facilities would result in small scale, temporary seabed disturbance (**Section 7.2.9**). Cumulative impacts to benthic habitats and communities from Dorado Phase 1 are not expected to be of significance.

Based on the considerations above, cumulative impacts on communities and habitats from Dorado Phase 1 and third-party activities will be minor. An assessment of cumulative impacts against the acceptable levels of impact to communities and habitats is provided in **Table 7-107**.

Table 7-107:Demonstration of acceptability of cumulative impacts to communities and habitats from Dorado Phase 1 and third-party activities

Acceptable levels of Impact	Demonstration of Acceptability
RSAL8: No significant[56] impacts to benthic habitats and communities. **RSAL9**: No direct disturbance to sensitive benthic habitats and communities.	Cumulative impacts to benthic communities from Dorado Phase 1 and third-party activities will not result in significant impacts to benthic habitats or direct disturbance to sensitive benthic habitats and communities. Benthic habitats in the Project Area are largely bare sediment and small areas of hard substrate. These habitats are broadly represented in the region and are not considered to be sensitive or unique. Hence, cumulative impacts to benthic habitats and communities are acceptable.

7.4.2.8 Marine Fauna

Marine fauna, such as fishes, marine mammals, reptiles and birds, may be impacted by aspects of Dorado Phase 1 such as:

+ drill cuttings and fluids;
+ PW discharges;
+ wastewater discharges;
+ light emissions; and
+ acoustic emissions.

Third-party activities in the Project Area are limited to commercial shipping, commercial fishing and petroleum exploration. Risks to marine fauna from these activities is low, and the aspects of these activities are not predicted to interact synergistically with aspects of Dorado Phase 1. These third-party activities will typically be separated in space from Dorado Phase 1. Hence, cumulative impacts to marine fauna as a result of Dorado Phase 1 and third-party activities is considered to be minor.

Impacts to fauna from discharges to the marine environment, such as PW, wastewater discharges and drill cuttings and fluids are predicted to be highly localised. The discharge of drill cuttings and fluids will be separated in time from PW discharges and the majority of wastewater discharges, reducing the potential for cumulative impacts. As outlined in the cumulative impact assessment for water quality (**Section 7.4.2.2**), PW and wastewater discharges are not expected to interact synergistically and any cumulative impacts are expected to be limited to within the mixing zone around the discharge location. Impacts to marine fauna are expected to be limited to behavioural disturbance, such as avoidance of discharge of the nearfield area of plumes.

Light emissions during flaring may be visible 42.4 km from the FPSO, at which point the flare drops below the horizon (**Section 7.2.4**). There are no third-party light sources within this radius aside from lighting associated with commercial shipping and commercial fishing, which are relatively low intensity and transient in nature. Hence cumulative impacts of lighting form Dorado Phase 1 and third-party activities are minor.

[56] Significant - As defined by the Commonwealth marine environment significant impact criteria in Matters of National Environmental Significance - Significant impact guidelines 1.1. *Environment Protection and Biodiversity Conservation Act 1999* (Department of the Environment 2013).

Cumulative impacts from acoustic emissions to marine fauna are considered above in **Section 7.4.2.5**.

When considering all aspects of Dorado Phase 1 that may impact upon marine fauna, there is the potential for cumulative impacts to occur as many aspects are space or time crowded. However, when considering the nature and scale of the impacts that may arise from these aspects, potential impacts to fauna will be concentrated around discharge locations (i.e. the Dorado WHP and FPSO) and are expected to be limited to avoidance of the nearfield discharge plumes. These impacts are not expected to persist beyond 1 km from the discharge location. While light and acoustic emissions may extend for considerable distances form the FPSO and Dorado WHP, they are expected to impact upon fauna in different ways. Fauna considered vulnerable to impacts from artificial light emissions, such as roosting birds and nesting and hatchling turtles, are not particularly vulnerable to acoustic emissions. Likewise, fauna vulnerable to impacts from acoustic emissions, such as marine mammals, are not particularly vulnerable to artificial light emissions. Hence, cumulative impacts to marine fauna from Dorado Phase 1 are considered to be minor.

Based on the considerations above, cumulative impacts to marine fauna from Dorado Phase 1 and third-party activities, such as commercial shipping and petroleum exploration, will be minor. An assessment of cumulative impacts to marine fauna against the acceptable levels of impact is provided in **Table 7-108.**

Table 7-108: Demonstration of acceptability of cumulative impacts to marine fauna from Dorado Phase 1 and third-party activities

Acceptable levels of Impact	Demonstration of Acceptability
RSAL13: No mortality of EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 **RSAL14**: Management of aspects of Dorado Phase 1 must not be inconsistent with relevant conservation advice, recovery plans and threat abatement plans published by the DAWE. **RSAL16**: No significant impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1.	Cumulative impacts to marine fauna from Dorado Phase 1 and third-party activities will not result in mortality or significant impacts to species listed as threatened or migratory under the EPBC Act. Santos' proposed management of the aspects of Dorado Phase 1 that may impact upon marine fauna are consistent with conservation advice, recovery plans and threat abatement plans published under the EPBC Act (refer to aspect-specific assessments for further details). The cumulative impacts of acoustic emissions from Dorado Phase 1 and third-party activities will not result in PTS or TTS to sensitive marine fauna due to temporal and spatial distancing between activities as well as the application of control measures (alignment with Part A of the EPBC Act Policy Statement 2.1 for piling and VSP activities associated with Dorado and VSP activities associated with exploration drilling). Nor will it result in significant behavioural impacts to noise-sensitive marine fauna The objectives of relevant conservation advices and recovery plans (as presented in **Section7.2.5**) were considered during the cumulative impacts assessment. With the addition of the above control

	measure, the concurrent activities are not inconsistent with these objectives.

7.4.2.9 Fisheries

Aspects of Dorado Phase 1 that may impact upon fisheries and commercial fishing include:

- acoustic emissions;
- interactions with other users; and
- decommissioning *in situ* (if undertaken).

Seismic surveys presented in **Section 7.4.2.5** are the known third-party activities within the Project Area, which Santos is aware of that may have an impact on fisheries. The expected potential impacts on fish from acoustic emissions, such as behavioural disturbance, typically persist for the duration of the acoustic emission, and impacted fish are expected to recover rapidly once the acoustic emissions are ceased.

Acoustic emissions from Dorado Phase 1 are not expected to result in impacts to fish resources or commercial fishers. Impacts to fish are only expected to occur as a result of relatively high intensity noise emissions, such as piling and vertical seismic profiling. These emissions are temporary in nature, and impacts are expected to consist of short-term behavioural impacts to individual fish such as avoidance. No impacts to the fish resource as a whole, such as a reduction in the biomass, age structure or catchability of the fish resources, will occur.

Dorado Phase 1 will result in exclusion of commercial fishers from the gazetted PSZs around the Dorado WHP and FPSO as well as the necessary additional deviations area for trawl fishing to avoid the PSZs. Most commercial fisheries in the region have little or no historical fishing activity overlapping the Dorado WHP and the FPSO, with the exception for the Pilbara Fish Trawl Interim Managed Fish (**Section 3.4.3**). The areas from which commercial fishing will be excluded from is a small portion of the total area of the managed fishery (**Section 7.2.8**). Commercial fishers will have to plan trawl lines to avoid the exclusion zones and PSZs in place for Dorado Development activities. Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations, therefore trawl fishers will have prior knowledge of the activities and their proposed timings. The PSZ for the Dorado WHP and FPSO will be gazetted and the Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation activities.

The *in situ* decommissioning of Dorado Phase 1 facilities may result in an increase in the abundance and diversity of fish resources, which may result in a net increase in the fish resources available to the fishery. Conversely, the removal of the structures after decades in place may result in a net decrease in the fish resources available to the fishery. Note, decommissioning options have not been determined for Dorado Phase 1.

Based on the considerations above, cumulative impacts to fisheries from Dorado Phase 1 will be minor. An assessment of cumulative impacts to fisheries against the acceptable levels of impact is provided in **Table 7-109.**

Table 7-109: Demonstration of acceptability of cumulative impacts to fisheries from Dorado Phase 1

Acceptable levels of Impact	Demonstration of Acceptability
RSAL19: No negative impacts to the economic viability of the commercial fish resources. **RSAL20**: Short-term displacement of commercial fishing activities from exclusion zones during Project installation/drilling operations within the Project Area is acceptable. **RSAL21**: Long-term exclusion (up to 20 years) of commercial fishing activities from the gazetted PSZ during production operations is acceptable.	Cumulative impacts from Dorado Phase 1 will not result in impacts to the exploited fisheries resource stocks in the Project Area. Hence, impacts are considered to be acceptable.

7.4.2.10 Maritime Industry

Maritime industry in the Project Area consists of commercial shipping, which is largely restricted to shipping fairways. The Dorado WHP and FPSO locations are over 10 km from the nearest shipping fairway, and hence are separated in space from commercial shipping. Commercial shipping and project vessels undertaking Dorado Phase 1 are all required to comply with international and Australian maritime requirements, which include requirements for safe navigation. Compliance with these requirements will reduce the potential for impacts to commercial shipping from aspects of Dorado Phase 1. On this basis, cumulative impacts to maritime industry as a result of Dorado Phase 1 are not considered to be credible.

8 Environmental Performance Framework

The OPP has defined the activities which will be undertaken during the duration of the Dorado project (**Section 6**) and the acceptable levels of the risks and impacts which will arise from the implementation of Dorado Phase 1 (**Section 4**). The OPP also defines EPOs for the petroleum activities within the scope of the OPP. Santos will ensure environmental impacts and risks will be maintained within acceptable levels, and EPOs achieved, through its environmental performance framework as detailed below.

8.1 Santos Management System

The Santos Management System exists to support its moral, professional and legal obligations to undertake work in a manner that does not cause harm to people or the environment. The Santos Management System is a framework of policies, standards, processes, procedures, tools and control measures that, when used together by a properly resourced and competent organisation, result in:

+ a common environmental approach is followed across the organisation;
+ environmental management is proactively managed and maintained;
+ the mandatory requirements of environmental management are implemented and auditable;
+ workforce commitments are understood and demonstrated;
+ environmental management performance is measured and corrective actions are taken; and
+ opportunities for improvement are recognised and implemented.

The Santos Management System is aligned to the requirements of the OPGGS (E) Regulations and requires:

+ environmental impacts and risks continue to be identified for the duration of the activity and reduced to ALARP;
+ control measures are effective in reducing environmental impacts and risks to ALARP and acceptable levels;
+ EPOs and environmental performance standards set out in EPs are met; and
+ stakeholder consultation is maintained throughout the activity as appropriate.

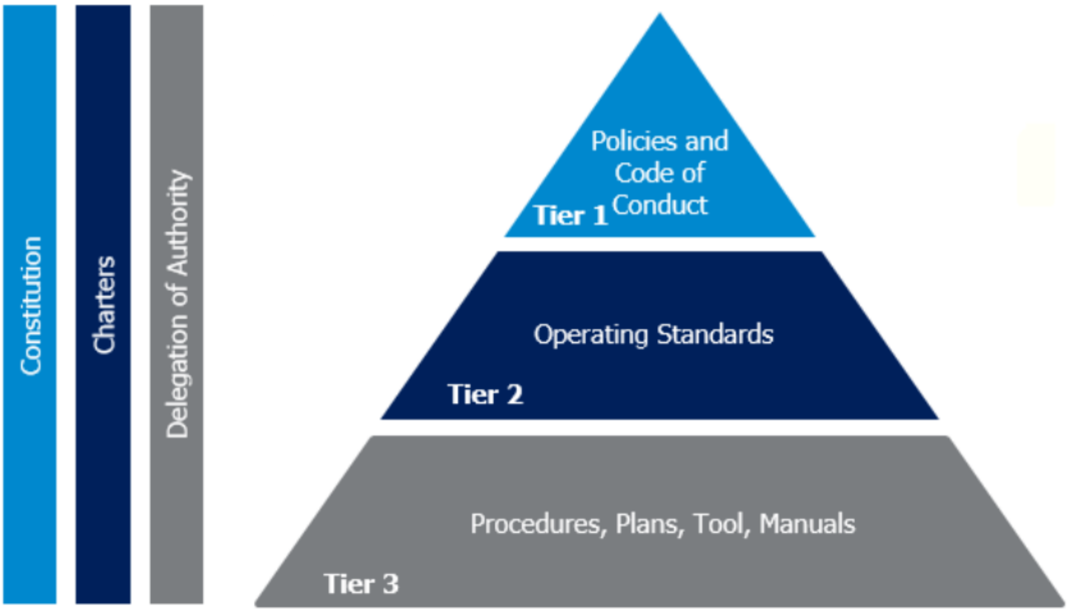

Figure 8-1: Santos management system hierarchy.

8.1.1 Santos' Environment, Health and Safety Policy

Santos' Environment, Health and Safety Management Policy (**Figure 8-2**) sets out Santos' commitment to environment, health and safety management and the responsibility to successfully implement this policy. The Dorado Development OPP has been prepared in accordance with the objectives and actions stated in this policy. By accepting employment with Santos, each employee and contractor is made aware during the recruitment process that he or she is responsible for the application of this policy.

Environment, Health & Safety

Santos

Policy

Our Commitment

Santos is committed to being the safest gas company wherever we have a presence and preventing harm to people and the environment

Our Actions

We will:

1. Integrate environment, health and safety management requirements into the way we work
2. Comply with all relevant environmental, health and safety laws and continuously improve our management systems
3. Include environmental, health and safety considerations in business planning, decision making and asset management processes
4. Identify, control and monitor risks that have the potential for harm to people and the environment, so far as is reasonably practicable
5. Report, investigate and learn from our incidents
6. Consult and communicate with, and promote the participation of all workers to maintain a strong environment, health and safety culture
7. Empower our people, regardless of position, to "Stop the Job" when they feel it necessary to prevent harm to themselves, others or the environment
8. Work proactively and collaboratively with our stakeholders and the communities in which we operate
9. Set, measure, review and monitor objectives and targets to demonstrate proactive processes are in place to reduce the risk of harm to people and the environment
10. Report publicly on our environmental, health and safety performance

Governance

The Environment Health Safety and Sustainability Committee is responsible for reviewing the effectiveness of this policy.

This policy will be reviewed at appropriate intervals and revised when necessary to keep it current.

8.1.2 Santos' Climate Change Policy

Santos also has a Climate Change policy, which was most recently reviewed and approved by the Santos' Board in December 2021. Santos' Climate Change policy is reviewed periodically and updated as required.

Santos

Climate Change

Policy

Our Commitment

Santos recognises the scientific consensus of climate change assessed by the Intergovernmental Panel on Climate Change. We support the objective of the Paris Agreement to limit global temperature rise to less than 2 degrees Celsius and pursue efforts to limit the temperature rise to 1.5 degrees Celsius.

We believe that access to reliable and affordable energy is critical to meeting sustainable development goals and improving living standards and economic prosperity in developed and developing nations. Santos is committed to being part of the solution by supporting the twin objectives of limiting greenhouse gas emissions and providing cleaner fuels to domestic and global markets.

Santos has a target of net-zero scope 1 and 2 greenhouse gas emissions by 2040. Our strategy focuses on natural gas as a reliable transition fuel source and the development of technologies such as carbon capture and storage and clean fuels, such as hydrogen, as foundations for our decarbonisation pathway.

Our Actions

We will:

+ Work with governments and stakeholders in the design of climate change regulation and policies in support of low-cost abatement and incentivising innovation and investment in emissions reduction in an equitable manner
+ Factor carbon pricing and greenhouse gas emissions into all material business decision-making
+ Set greenhouse gas emission targets consistent with the objective of limiting global temperature rise to less than 2 degrees Celsius and in pursuit of 1.5 degrees Celsius
+ Identify and pursue opportunities to reduce greenhouse gas emissions within our operations and through the supply chain
+ Work with our customers to reduce their greenhouse gas emissions and sell the products we generate only to customers from countries that have a net-zero commitment or are signatories to the Paris Agreement
+ Avoid any unnecessary flaring from our activities and reduce flaring required for the safe conduct of our operations to as low as reasonably practicable
+ Make Final Investment Decision for new offshore greenfield projects from 2025 only if they abate and/or offset reservoir CO2 emissions
+ Identify and implement cost-effective opportunities to sequester carbon, integrate new technologies and offset greenhouse gas emissions, in pursuit of our emission reduction targets
+ Identify, manage and mitigate climate change risks for our activities and in doing so, continue to adapt and develop our operational, financial and strategic resilience
+ Report annually on the company's climate change governance, strategy, risk management and targets and metrics in a transparent manner in alignment with recommendations of the Task Force on Climate-related Financial Disclosures
+ Provide our shareholders with an advisory vote, known as a 'Say on Climate' at regular intervals.

Governance

The Environment Health Safety & Sustainability Committee is responsible for reviewing the effectiveness of this policy.

This policy will be reviewed at appropriate intervals and revised when necessary to keep it current.

Kevin Gallagher
Managing Director & CEO

Figure 8-3: Santos' Climate Change Policy

8.2 Implementation and Review

8.2.1 Leadership, Accountability and Responsibility

To ensure the effective implementation and management of EPOs identified in this OPP, key roles and responsibilities for Santos employees and contractors will be defined within specific petroleum activity EPs.

Santos employees and contractors will be responsible for implementing the Santos Environment, Health and Safety Policy and Climate Change Policy in their areas of responsibility and ensure they are suitably trained and competent in their respective roles.

It is the responsibility of all Santos employees and contractors to implement the Santos Environment, Health and Safety Policy and Climate Change policy in their areas of responsibility and to ensure personnel are suitably trained and competent in their respective roles. Environmental responsibilities for the Dorado Development include:

- Ensure preparation and implementation of accepted EPs for all Dorado Phase 1 activities;
- Ensure systems and procedures are in place to manage Dorado Phase 1 activities so they are undertaken in accordance with the relevant standards and commitments in the OPP and EPs;
- Communicate environment performance, relevant information and environment expectations to Dorado Phase 1 Project team members and contractors;
- Undertake stakeholder consultation for Dorado Phase 1 activities; and
- Undertake relevant audits/ periodic reviews and inspections of accepted EPs, record evidence of implementation and close out corrective actions in a timely manner.

8.2.2 Environment Plans – Environmental Performance Outcomes (EPOs)

The effective application of EPOs outlined in this OPP will be demonstrated through the implementation of subsequent EPs for petroleum activities within the scope of this OPP. The OPGGS (E) Regulations require that Santos develop and implement EPs for all petroleum activities within the scope of this OPP. Each EP must be assessed and accepted by NOPSEMA prior to Santos commencing the petroleum activities. EPs for activities within the scope of this OPP may not be submitted until this OPP has been accepted by NOPSEMA.

EPs will contain EPOs (these are the EPOs that will be accepted as part of this OPP), environmental performance standards, measurement criteria and a detailed implementation strategy. The EPOs in the EPs will maintain an equivalent level of environmental performance to that stated in this OPP. **Table 8-1** provides a summary of the EPOs and key management controls relevant to each aspect of the Dorado Oil Development.

Each EP for petroleum activities within the scope of this OPP will:

- describe the petroleum activities considered by the EP and their relationship to this OPP;
- describe the environmental values and sensitivities that may be impacted by the petroleum activities;
- describe the relevant requirements that apply to the petroleum activities;
- incorporate as required updates to relevant legislation, guidelines and published scientific papers;
- detail and evaluate the environmental impacts and risks that may credibly occur as a result of the petroleum activities;
- define EPOs, controls, environmental performance standards and measurement criteria for the environmental management of the petroleum activities;
- provide an implementation strategy for the EP, which will include an OPEP; and
- describe the reporting requirements to NOPSEMA that Santos will meet, including:
  - reportable incidents – any incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage;

- recordable incidents – any breach of an EPO or environmental performance standard in the EP that is not a reportable incident;
- environmental performance reporting; the frequency of this reporting is typically 12 months; and
- contain activity-specific consultation outcomes.

Table 8-1: Summary of aspects, EPOs, RSALs and controls that will be implemented throughout Dorado Phase 1

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
Planned Events				
Discharges- Drilling Fluids and Cuttings Discharges (**Section 7.2.1**)	Water Quality	Localised decrease in water quality during drilling operations.	**EPO1A**: Impacts to sediment quality and water quality as a result of Dorado Phase 1 drilling fluids and cuttings discharges restricted to a 1 km radius from Dorado facilities. **EPO2A**: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area. **EPO3A**: No mortality or significant[73] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of drilling fluids and cuttings.	**CM1**: All wells to be drilled using WBM, with NAF only to be used where technical requirements preclude the use of WBM. **CM2**: Santos chemical selection process will be implemented to select drilling chemicals, muds and fluids with low environmental risk, while meeting technical requirements. **CM3**: Drilling fluids inventory will be developed and tracked to reduce discharge of excess powders, brines, and drilling fluids. **CM4**: Drill cuttings will be processed on the MODU to recover drilling fluids and reduce residual fluids content prior to overboard discharge **CM5**: An assessment of drill cuttings and fluids discharges will be undertaken prior to drilling future tieback wells to ensure impacts to environmental values and sensitivities are within acceptable levels. **CM6**: Benthic habitat surveys will be undertaken prior to drilling at future tieback locations to identify and avoid sensitive benthic habitat.
	Sediment Quality	Deposition of drill cuttings during drilling operations.		
	Benthic habitats	Localised smothering and loss of habitat.		
	Marine Fauna	Bioaccumulation of contaminants in benthic infauna.		
Discharges- Produced Water Discharge (**Section 7.2.2**)	Water Quality	Localised decrease in water quality during the operational stage of Dorado Phase 1.	**EPO3B**: No mortality or significant[73] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of PW. **EPO4A**: Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring a 99 % species protection level(based on ANZG 2018) for water quality is achieved outside of the PW mixing zone boundary[57]. **EPO5A**: Limit adverse impacts to the values and ecological integrity to the commonwealth marine area by ensuring ANZG 2018 sediment quality guideline values are not exceeded outside the PW mixing zone[55] **EPO6A:** Dorado Phase 1 is managed so that seafood caught within the project area remains safe for human consumption**.**	**CM7**: PW treatment system to meet OIW discharge standards: + less than 30 mg/L OIW during steady state operations averaged over 24 h + between 30 mg/L and 100 mg/L OIW averaged over 24 h during the initial start-up period and for commissioning of future tieback (up to 6 months after first oil) **CM8**: Adaptive PW management plan including: + PW modelling, + in-field sampling to verify modelling results are within ANZG 2018 water quality and sediment quality guidelines e.g. predicted mixing zone, sediments. + PW chemical characterisation, + PW ecotoxicity testing, + tiered management system in response to off-specification water (e.g. storage onboard and retreatment prior to discharge) + studies to verify whether bioaccumulation of toxicants in biota attributable to the discharge of PW, + adaptive management triggers and mitigative measures in response to results of bioaccumulation studies, + adopt changes in relevant legislative requirements and updates to ANZG to PW discharges. **CM9:** Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements.
	Sediment Quality	Deposition of very small quantities of precipitated solids during the operational stage of Dorado Phase 1.		
	Marine Fauna	Bioaccumulation of contaminants in marine fauna.		
Discharges- Wastewater Discharges (**Section 7.2.3**)	Water Quality	Localised decrease in water quality around wastewater discharge locations.	**EPO3C**: No mortality or significant[58] impacts to EPBC act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 discharge of wastewater. **EPO7A**: Dorado Phase 1 routine planned wastewater discharges compliant with relevant established industry standard environmental discharge limits	**CM9**: Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements. **CM10**: All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification): + Marine Order 91 (Marine Pollution Prevention – Oil), which implements Annex I of MARPOL 73/78, including (as required by vessel class):
	Sediment Quality	Minor increase in concentrations of contaminants, nutrients and organic carbon in sediments, along with a small increase in biochemical oxygen		

57 Produced water mixing zone determined to be 1000 m from the FPSO during a <30 mg/L PW discharge.

58 As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
		nutrients around wastewater discharge locations.		Machinery space bilge/oily water shall have IMO approved oil filtering equipment (oil/water separator) with an on-line monitoring device to measure OIW content to be less than 15 ppm mg/L prior to discharge. A deck drainage system capable of controlling the content of discharges for areas of high risk of fuel/oil/grease or hazardous chemical contamination. Valid International Oil Pollution Prevention Certificate. + Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including: – Garbage management plan in place. – Garbage record book maintained onboard. + Marine Order 96 (Marine Pollution Prevention – Sewage), which implements Annex IV of MARPOL 73/78, including (as required by vessel class): – a valid International Sewage Pollution Prevention Certificate, – an IMO approved sewage treatment plant, – a sewage comminuting and disinfecting system, – a sewage holding tank sized appropriately to contain all generated waste (black and grey water), and – discharge of sewage will occur at a moderate rate while vessel is proceeding (more than 4 knots).
	Marine Fauna	Potential behavioural disturbance in close proximity to the discharge and bioaccumulation of contaminants in marine fauna.		
Emissions – Artificial Light (**Section 7.2.4**)	Plankton Fish Marine Mammals Reptiles Birds	Potential changes in behaviour, such as attraction, avoidance and disorientation, of marine fauna.	**EPO3D**: No mortality or significant[59] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 artificial light emissions **EPO8A**: Artificial light emissions do not result in the displacement of marine turtles from habitat critical to their survival.	**CM11**: Align lighting design on Dorado Development facilities (e.g. WHP, FPSO) with light design described in National Light Pollution Guidelines for Wildlife including Marine Turtles, Seabirds and Migratory Shorebirds (Commonwealth of Australia 2020), including: + Using minimum number and intensity of lighting to meet operational requirements (e.g. safety, navigation etc.), + Adapting lighting for colour, intensity and timing where practicable, + Use non-reflective, dark coloured surfaces where practicable (i.e. where safety is not compromised). **CM12:** Manage lighting on vessels to reduce light spill to the environment where practicable. **CM13**: Implement adaptive management (e.g. shielding, retrofitting with lower intensity lights etc.) of artificial light emissions if there is a moderate environment incident resulting from light emissions. **CM14:** Flaring limited to operation of the flare pilot during steady state operations.
Emissions- Acoustic Emissions (**Section 7.2.5**)	Marine Mammals	Potential permanent threshold shift (PTS), temporary threshold shift (TTS), behavioural impacts and masking	**EPO3E**: No mortality or significant[75] impacts to EPBC Act listed threatened, migratory or cetacean species as a result of Dorado Phase 1 acoustic emissions. **EPO9A** Undertake Dorado phase 1 in such a manner that noise in biologically important areas will be managed to prevent any displacement of threatened species as per EPBC species conservation requirements. **EPO10A** No impacts from Dorado Phase 1 acoustic emissions to pre-existing commercial fish stocks that occur within the project area that could be subject to existing or future fishing effort. **EPO11A:** No injury to pygmy blue whales in a pygmy blue whale BIA	**CM15:** Vessels movements and helicopter flights comply with Part 8 of EPBC Regulations for interacting with cetaceans. **CM16**: Implement Santos' Protected Marine Fauna Interaction and Sighting Procedure. **CM17**: Undertake acoustic emissions modelling for piling, 3D VSP and drilling VSP activities for potential future tiebacks. **CM18**: Implement mitigation measures for drilling VSP and 3-D VSP surveys and activities aligned with EPBC Act Polic– Statement 2.1 - Interaction between offshore seismic exploration and whales (Department of the Environment, Water, Heritage and the Arts 2008a), including: + development of low-power and shutdown zones, + marine fauna observers, + pre-start visual observations, + soft-start procedures, + stop work procedures, and + night-time and low visibility procedures. **CM19**: Implement mitigation measures for piling activities, including:
	Fishes	Potential mortal injury, recoverable injury, TTS and behavioural disturbance		
	Reptiles	Potential PTS, TTS and behavioural disturbance		

[59] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
			EPO12A: noise generating activities of Dorado Phase 1 are managed in such a manner to prevent PTS and reduce the risk of TTS and biologically important behavioural disturbance to all whales in the Commonwealth marine area.	+ marine fauna observers, + pre-start visual observations, + soft-start procedures, + stop work procedures, and + night-time and low visibility procedure **CM20:** Where future activity specific acoustic emissions modelling results indicate PTS, TTS envelopes overlap with a pygmy blue whale BIA, related impulsive noise generating activities will not occur during corresponding peak migration periods
Emissions- Greenhouse Gas (**Section 7.2.6**)	Australian Environment	Potential impacts as a result of climate change have been modelled by Commonwealth Scientific and Industrial Research Organisation (CSIRO). The modelling indicates that temperatures will increase across Australia, rainfall patterns will change significantly and extreme events such as droughts, floods and wildfires will become more common. These changes are likely to impact on individual species, ecosystems and ecosystem services such as food and water availability. Within decades, environments across Australia may be substantially different (CSIRO 2015).	**EPO13A**: Dorado Phase 1 Scope 1 GHG emissions managed in accordance with the Safeguard Mechanism benchmark baseline set by the Clean Energy Regulator, in support of meeting the Australian Government's Paris Agreement Nationally Determined Contribution of net zero emissions by 2050. **EPO14A**: As the Paris Agreement is the most comprehensive global agreement to seek to limit global temperature rise as specified in Article 2 of the Agreement and no significant[60] impacts to the environment globally, including in Australia, Dorado Phase 1 oil is only sold to customers from countries that have: + a net-zero emissions by 2050 (NZE) commitment; and/or + are signatories to the Paris Agreement and have Nationally Determined Contributions (NDC) in place to reduce or offset GHG emissions.	**CM14:** Flaring limited to operation of the flare pilot during steady state operations. **CM21:** Optimise facility design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable. **CM22:** The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare, and direct them to be reinjected with the produced gas. **CM23:** Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities. **CM24**: During routine operations, reinject produced gas (other than safety flare and fuel gas) to recover liquids. **CM25:** Embed fugitive emissions surveillance and management into facilities operations and maintenance. **CM26:** Undertake fuel and flare analysis, baselining and forecasting throughout Dorado Development operational life. **CM27:** Establish annual setting of energy efficiency improvements and targets throughout the life of Dorado Phase 1 facilities. **CM28:** Throughout the life of Dorado Phase 1 facilities undertake optimisation of energy efficiency through periodic opportunity identification workshops or studies, evaluation and implementation. **CM29**: Dorado Phase 1 will report on Scope 1 GHG emissions as required per the National Greenhouse and Energy Reporting (NGER) Scheme. **CM30**: Dorado Phase 1 will comply with the requirements of the Safeguard Mechanism, including purchase and/or surrender of Australian carbon credit units for any emissions above the baseline for the year, to support achievement of Australia's NDC emissions targets. **CM31**: Dorado Phase 1 will implement a GHG management plan that incorporates an adaptive management approach that facilitates a continuous cycle of monitoring, evaluating, and implementing improvements to minimise GHG emission to ALARP and acceptable levels over the life of field operations including: + Evaluation of emissions monitoring data and ensuring the implemented controls deliver predicted emission reductions, + Seeking new and relevant data/information from external sources relevant to GHG emission management including Commonwealth legislation or policy, + Ensuring effectiveness of internal processes and procedures to reduce and manage GHG emissions, + Responding to changes from detailed engineering outcomes, and + Implementing corrective actions identified from the above.

[60] As defined by the significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
				CM32: Dorado Phase 1 will limit sales to customers from countries that have a NZE commitment or are signatories to the Paris Agreement, and will cease to supply customers in countries that withdraw from the Paris Agreement or NZE commitments. **CM33**: Regular monitoring of Dorado Phase 1 customer country compliance with NZE or NDC emissions targets (Article 4) through the Paris Agreement monitoring and assurance mechanisms: + the enhanced transparency framework 5-yearly reporting (Article 13) + the 5-yearly Global Stocktake (Article 14); and + implementation and compliance committee annual reporting (Article 15). **CM34**: If results of CM33 identify gaps in customer country compliance against NZE or NDC emissions targets, Dorado Phase 1 will take mitigation actions including ceasing to supply to those customers or offsetting their Dorado Phase 1 product emissions.
Emissions-Atmospheric Emissions (**Section 7.2.7**)	Air Quality	Change in air quality	**EPO15A**: No significant[61] impacts to air quality throughout the lifecycle of Dorado Phase 1.	**CM14**: Flaring limited to operation of the flare pilot during steady state operations. **CM21:** Optimise facility design to reduce Dorado Phase 1 Scope 1 GHG emissions to ALARP and acceptable. **CM22:** The vapour recovery system on the Dorado FPSO will be designed to capture low pressure, continuous sources of vented gas that would otherwise be sent to flare and direct them to be reinjected with the produced gas. **CM23:** Design facilities in a manner that can accommodate the adoption of economically and technically viable emission reduction technologies that may become available during the operating life of the facilities. **CM25:** Embed fugitive emissions surveillance and management into facilities operations and maintenance. **CM35**: The MODU, vessels, and FPSO will comply with MARPOL Annex VI (Prevention of Air Pollution from Ships), the Navigation Act 2012, the Protection of the Sea (Prevention of Pollution from Ships) Act 1983 and subsequent Marine Orders, which require vessels to have a valid International Air Pollution Prevention Certificate (for vessels more than 400 tonnage) and to use low-sulphur fuel. **CM36:** Ozone-depleting substances onboard vessels and the facilities will comply with relevant MARPOL – 3/78 (Annex VI - air pollution), Navigation Act 2012, Protection of the Sea (Prevention of Pollution) Act 1983 and subsequent Marine Order requirements (as appropriate for vessel classification). **CM37**: Measure, monitor or estimate facility fuel and flare emissions (in accordance with the National Pollutant Inventory) to inform and optimise management practices and minimise environmental impact of emissions. **CM38**: National Pollutant Inventory reporting records (or contemporary requirements at the time of the activities) will be complied with during the project.

[61] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
Physical Presence-Interactions with Other Users (**Section 7.2.8**)	Commercial Fisheries Shipping	Changes to the functions, interests or activities of other users	**EPO16A**: No adverse interactions[62] between Santos' activities and other maritime users within the Project Area. **EPO17A**: The installation and drilling operations, production operations and decommissioning activities of the project will be managed in a manner that does not interfere with other marine users within the Project Area to a greater extent than is necessary for the reasonable exercise of the rights and performance of the duties of Santos under the Dorado petroleum titles. **EPO18A** Decommissioning of Dorado facilities in compliance with Section 572 (3) of the Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Act 2009.	**CM39**: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the *Navigation Act 2012* and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM40**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM41**: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM42**: Should potential future tiebacks overlap within AMSA fairways Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way. **CM43**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM44**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM45**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development. **CM46**: Decommissioning of Dorado Phase 1 facilities will be carried out in accordance with regulatory requirements per Section 572 (3) of the OPGGS Act. **CM47:** exclusion zones/petroleum safety zones will be limited to the minimum area necessary to exercise rights and perform duties under project specific petroleum titles. **CM48:** residual impacts to other marine users of the environment are managed to not interfere with their rights.
Physical Presence – Seabed Disturbance (**Section 7.2.9**)	Water Quality	Temporary, localised decrease in water quality during installation and removal of components on the seabed.	**EPO2B**: Direct impacts to benthic habitats from Dorado Phase 1 will be limited to less than 2% of the Project Area and less than 5% within a single ecotype within the Project Area. **EPO18B** Decommissioning of Dorado facilities in compliance with Section 572 (3) of the Offshore Petroleum and Greenhouse Gas Storage (OPGGS) Act 2009. **EPO3F**: No mortality or significant[63] impacts to EPBC act listed threatened and migratory species as a result of Dorado Phase 1 seabed disturbance	**CM49**: Decommissioning of Dorado Phase 1 facilities will be carried out in accordance with regulatory requirements per Section 572 (3) of the OPGGS Act. **CM50**: Seabed footprint to be reduced within the limits of technical requirements and practicability, as well as safety constraints. **CM51**: Undertake benthic habitat surveys for future tieback locations and proposed subsea infrastructure corridors prior to development to identify and avoid sensitive benthic habitat where practicable within technical and safety constraints.
	Sediment Quality	Localised, minor modification of sediment characteristics, such as geological origin and particle size distribution.		
	Benthic Habitats	Localised, minor modification of benthic habitats from the introduction of artificial hard substrates.		

[63] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
	Fishes	Increased fish diversity and abundance due to modification of benthic habitats.	**EPO19A**: Impacts to sediment quality and water quality as a result of seabed disturbance from Dorado Phase 1 restricted to 1 km radius from Dorado facilities.	
	Fisheries	Potential enhanced recruitment of targeted species and increased catches.		
Unplanned Events				
Accidental Release – Hydrocarbon and Chemical Spills (**Section 7.3.1**)	Water quality	Potential widespread decrease in water quality from hydrocarbon pollution	**EPO20A** Undertake Dorado Phase 1 in a manner that will prevent unplanned discharge of chemicals or hydrocarbons to the marine environment. **EPO21A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of reservoir fluids to the marine environment due to a LOWC, or failure of a flowline or FPSO cargo tank. **EPO22A** Undertake Dorado Phase 1 in a manner that will prevent an accidental release of MDO/MGO or HFO to the marine environment due to vessel collision, failure of a storage tank or release during refuelling. **EPO23A** In an event of an unplanned release of chemicals or hydrocarbons, spill response control measures will be implemented in accordance with an accepted EP/OPEP.	**CM9**: Santos chemical selection process will be implemented to select chemicals with low environmental risk, while meeting technical requirements. **CM52**: Accepted well operations management plans in place for all wells detailing: + blowout preventer installation and testing, + competency of the drillers engaged, + monitoring of wellbore progress and drilling fluid balance, and + well designs that consider reservoir characteristics. **CM53**: All project vessels operating within the Project Area will adhere to the navigation safety requirements including: + International Regulations for Preventing Collisions at Sea 1972, + Chapter 5 of International Convention for the Safety of Life at Sea 1974, + International Convention on Standards of Training, Certification and Watchkeeping for Seafarers 1978, + the *Navigation Act 2012* and any subsequent Marine Orders that specify standards for crew training and competency, navigation, communication, and safety measures. **CM54**: The Australian Hydrographic Service will be advised of project activities and installed infrastructure to facilitate issuing Notices to Mariners and maintaining nautical charts prior to commencement of installation or drilling activities and operations. **CM55**: All project vessels subject to Santos' marine assurance procedures. **CM56**: All offtake tankers subject to Santos' tanker vetting procedures. **CM57**: Bunkering procedures to manage the transfers of fuel that include: + weather limits on bunkering operations, + bunkering equipment specifications and inspections, + visual observations during transfers, and + emergency shutdowns. **CM58**: Santos will undertake consultation with relevant persons for all petroleum activities within the scope of Dorado Phase 1 in accordance with the OPGGS (E) Regulations. **CM59**: The WHP, FPSO and MODU(s) will maintain navigation aids to facilitate identification by other users (e.g. radar response beacons). **CM60**: Should potential future tiebacks overlap within AMSA fairways Santos will engage with relevant authorities to facilitate the development of these tiebacks in an acceptable way. **CM61**: A 500-m exclusion zone will be established and maintained around all drilling and installation activities. **CM62**: Santos will consult with relevant commercial fishers and the Western Australian Fishing Industry Council to establish the required gazetted Petroleum Safety Zone, Exclusion Zone and Cautionary Zones for Dorado Development. **CM63**: FPSO will be designed, constructed and operated to Santos' specified requirements, including:
	Sediment quality	Potential localised decrease in water quality from hydrocarbon pollution		
	Communities and habitats	Potential widespread impacts to benthic and coastal communities and habitats from hydrocarbon pollution		
	Fishes	Potential acute and chronic toxic effects		
	Marine mammals			
	Reptiles			
	Birds			
	Protected Areas	Potential impacts to the natural and socio-economic values of marine and coastal protection areas		
	Fisheries	Potential temporary closure of fisheries due to hydrocarbon pollution		
	Heritage	Potential loss of cultural values of heritage sites		
	Tourism	Potential impacts to tourism through loss of nature-based tourism resources due to hydrocarbon pollution.		

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
				+ double hulled construction, + cyclone and adverse weather avoidance procedures, and + Structural integrity inspection regime. **CM64:** Oil-spill modelling and environmental risk assessments for the Dorado Phase 1 Eps and OPEPs will consider the full range of worst-case scenario LOWC consequences based on the best available oil-spill modelling. **CM65:** During Development Well drilling and drilling of tieback wells, a simultaneous production and drilling (SIMOPS) workshop will be completed, and a procedure developed to manage and mitigate any additional risks due to concurrent activities. **CM66:** Accepted Eps/OPEPs in place for all Dorado Development activities. **CM67**: All vessels involved in the project will have a valid Shipboard Oil Pollution Emergency Plan or Shipboard Marine Pollution Emergency Plan (as appropriate for vessel classification). **CM68**: Source control emergency response plans in place for all drilling activities. **CM69:** Emergency response capability (including equipment, personnel contracts, MOUs) will be maintained in accordance with approved SOPEPS accepted EPs and OPEPs.
Accidental Release – Loss of Solid Material (**Section 7.3.2**)	Benthic habitat	Modification of benthic habitats from accidental loss of solid material.	**EPO3G**: No mortality or significant[64] impacts to threatened, migratory or cetacean species as a result of Dorado Phase 1 loss of solid material. **EPO24A**: No significant[72] impacts to benthic habitats and communities. **EPO25A** Undertake Dorado Phase 1 in a manner that will prevent an unplanned discharge of solid waste to the marine environment. **EPO26A** Undertake Dorado Phase 1 in a manner that will prevent unplanned seabed disturbance.	**CM10**: All wastewater discharges will comply with relevant MARPOL 73/78, *Navigation Act 2012*, *Protection of the Sea (Prevention of Pollution) Act 1983* and subsequent Marine Order requirements (as appropriate for vessel classification): + Marine Order 95 (Marine Pollution Prevention – Garbage), which implements Annex V of MARPOL 73/78, including: – Garbage management plan in place. – Garbage record book maintained onboard. **CM70**: Crane and lifting operations will comply with the following: + Lifting equipment will be inspected and certified, + Preventative maintenance will be carried out, and + Lifting operators will be competent and qualified **CM71**: Objects dropped overboard will be recovered where practicable to mitigate the environmental consequences from objects remaining in the marine environment, unless the environmental consequences are minor or safety risks are disproportionate to the environmental consequences. **CM72**: Waste management procedures will include: + classification of wastes, including segregation of wastes into recyclable and non-recyclable materials, + appropriate storage of wastes, and + transportation and disposal of wastes by a licenced waste contractor at licenced waste management facilities in accordance with waste classifications. **CM73:** After completion of the drilling and installation stages a site clean-up activity will be undertaken to identify and remove, if safe, any dropped objects or solid materials that may have been lost.
	Marine Fauna	Injury or mortality of marine fauna due to ingestion of, or entanglement with, lost solid material.		
Physical Presence – Introduction of Invasive Marine Species (IMS)	Benthic habitats	Change in ecosystem dynamics.	**EPO27A:** Undertake Dorado Phase 1 in a manner that will prevent the introduction, establishment and spread of IMS in the natural environment attributable to the development. **EPO28A:** No significant[72] impacts to benthic habitats and communities, KEF and exploited fisheries resource stocks within the Project Area.	**CM74**: Ballast water exchange operations will comply with the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (as appropriate to vessel class), Australian Ballast Water Management Requirements (Department of Agriculture, Water and the Environment 2020), Protection of the Sea (Harmful Anti-fouling Systems) Act 2006 and Biosecurity Act 2015, including: + All ballast water exchanges conducted more than 12 nautical miles (nm) from land, and + Vessel Ballast Water Management Plan stipulating that ballast water exchange records will be maintained.
	KEF	Changes to the functions, interests or activities of other users.		
	Fisheries	Reduction in fishery resource stocks.		

[64] As defined by the Commonwealth marine environment significant impact criteria in *Matters of National Environmental Significance - Significant impact guidelines 1.1.* Environment Protection and Biodiversity Conservation Act 1999 (Department of the Environment 2013).

Aspect	Receptor	Potential Impacts	Environmental Performance Outcome (EPO)	Control Measure (CM)
				CM75: Implementation of Dorado FPSO Biofouling Management Plan when the FPSO sails to the Project Area from overseas (such as when it first hooks up or comes back from dry dock) and as per the anti-fouling and in-water cleaning guidelines (Department of the Environment and New Zealand Ministry for Primary Industries 2015). **CM76**: Compliance with Santos IMS Management Plan. **CM77:** Biofouling management for vessels will be in accordance with the IMO Guidelines for the control and management of ships' biofouling to minimise the transfer of invasive aquatic species (Marine Environment Protection Committee 2011). **CM78:** Compliance with the International Convention on the Control of Harmful Anti-fouling Systems on Ships 2001, including vessels (of appropriate class) having a valid International Anti-fouling Systems Certificate. **CM79:** Fisheries will be provided with information on the timing, nature and scale of aspects of Dorado Phase 1 through Santos' consultation activities.
Physical Presence – Interactions with Marine Fauna (**Section 7.3.4**)	Marine Mammals Fish Reptiles Birds	Injury, disturbance or mortality to marine fauna	**EPO29A**: No vessel or helicopter interactions within the Dorado Phase 1 Project operational with EPBC Act listed threatened, migratory or cetacean species.	**CM16**: Implement Santos' Protected Marine Fauna Interaction and Sighting Procedure. **CM80:** Vessels within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans, (except in emergency conditions or when manoeuvring is not possible), which include: + Implement a caution zone of 150 m for dolphins and 300 m for whales, + Vessels will not knowingly approach closer than 50 m to a dolphin 100 m to a whale (i.e. no approach zone), + Make sure a vessel does not drift or approach within 50 m of a dolphin or 100 m of a whale, + Vessels will not knowingly travel more than 6 knots within the caution zone of a dolphin or whale, and + There will not knowingly be no more than three vessels within 300 m of a whale (i.e. caution zone). **CM81:** Helicopters within the designated Project operational area will adhere to the requirements of the EPBC Regulations Part 8.1 – Interacting with cetaceans (except in emergency conditions or when manoeuvring is not possible), which includes: + not operating the helicopter at a height lower than 1 650 feet or within a horizontal radius of 500 metres of a cetacean + not allowing the aircraft to approach a cetacean from head on **CM82**: If a Part 13 Permit for the disturbance of listed migratory birds is required under the EPBC Act a Santos Bird Management Plan will be developed and implemented.

8.2.3 Santos' Decarbonisation Program

In support of delivering on its decarbonisation aspirations, Santos has established a Climate Transition Action Plan. The Climate Transition Action Plan sets out Santos' vision for materially reducing emissions within its operational control and delivering value for shareholders through the energy transition by offering carbon solutions and partnering across the energy supply chain to produce cleaner energy and clean fuels that will reduce Santos' customers' emissions. The Action Plan focuses efforts in the following areas:

+ Operational Efficiencies - Broad range of initiatives that are designed to reduce the Scope 1 and 2 emissions of Santos operations. Operational efficiency initiatives include fuel, flare and vent reductions, electrification, renewable integration, and fugitive emissions reduction;

+ Carbon Capture and Storage - Step-change technology that will reduce emissions and pave the way for future transition initiatives;

+ Carbon Reduction Solutions - Opportunities to reduce carbon emissions and generate offsets for Santos and customers;

+ Clean Fuel Hubs - Leverage CCS hubs as pathway to generating clean fuels; and

+ Supply Chain Collaboration - Working with customers to cultivate demand for lower carbon fuels.

Santos will continue to adapt the Climate Transition Action Plan on an ongoing basis to take account of the evolving energy transition environment and apply disciplined economic and commercial criteria to inform investment decisions. Periodic reviews and associated updates (as required) by the Santos Board are published annually in Santos' annual Climate Change Report.

8.2.4 Emergency Preparedness and Response

Santos will have an Emergency Response Plan in place to address all credible operational risks and scenarios. The plan will provide procedural guidance specific to the activity to control, coordinate and respond to an emergency or incident including hydrocarbon spills.

The OPGGS (E) Regulations requires the implementation strategy in an EP to contain an OPEP. The OPEP must include adequate arrangements for responding to oil pollution that may arise from the petroleum activities considered in the EP. The arrangements must be tested at least every 12 months, as well as when they are introduced or modified.

The OPEP will detail the actions to be undertaken in response to an incident, the hierarchy for command, control and communication, and the emergency specialist response groups, statutory authorities and other relevant external bodies required for interface. Santos will be required to have OPEPs tailored to the nature and scale of the hydrocarbon spill associated with the activity being undertaken.

Unplanned releases of hydrocarbons are by their very nature unpredictable, and planning for and responding to a significant oil spill incident requires management of significant uncertainty. To manage this uncertainty, Santos employs a range of measures to counter the impact uncertainty may have on the effectiveness of spill response in the unlikely event of a major oil spill incident:

+ assessing the full range of worst-case credible spill scenarios to ensure the EMBA is sufficiently conservative for oil spill impact assessment and planning purposes;

- Using conservative assumptions to inform potential loss of well control volume;
- Using qualified and competent oil-spill modelling providers and widely used and accepted oil-spill modelling tools;
- using a stochastic modelling approach for numerical modelling of the worst-case credible spill scenarios that includes a large number of replicate runs covering a range of seasonal and metocean conditions;
- using environmentally conservative adverse exposure zone threshold to set a conservative EMBA to assess impact and inform response planning;
- further reducing uncertainty during the operational response phase through implementation of monitor and evaluation response strategy actions such as oil spill trajectory modelling informed by real time met ocean data; and
- robust oil response planning capability and capacity, with the ability to leverage significant external spill response support (personnel, equipment, expertise), to ensure scalability of Santos' response regardless of potential differences between oil spill modelling predictions and actual spill outcomes and consequences.

8.2.5 Environmental Monitoring

Santos will undertake environmental monitoring during Dorado Phase 1. This monitoring will provide a greater understanding of the environment within the Project Area and assist in verifying the outcomes achieve through mitigation and management controls.

Any future environmental monitoring requirements will be determined as the design of Dorado Phase 1 is refined. Environmental monitoring commitments will be developed and included in EPs for petroleum activities within the scope of this OPP.

The environmental monitoring will also be used to inform the ongoing environmental adaptive management of Dorado Phase 1 environmental impacts and risks.

8.2.6 Performance Reporting

Regulation 26 of the OPGGS (E) Regulations requires the reporting of environmental performance for EPs for petroleum activities within the scope of this OPP (**Table 8-2**).

Table 8-2: Routine external reporting requirements

Reporting Requirement	Description	Reporting to	Timing
Environmental Performance Report	Report includes: + Summary of activities undertaken throughout the reporting period. + Compliance with EPOs outlined in petroleum activity EPs. + Compliance with controls and standards outlined in any future EPs.	NOPSEMA	Annually
Recordable Incident Report	Report includes:	NOPSEMA	Monthly

Reporting Requirement	Description	Reporting to	Timing
	Details of recordable incidents that have occurred during the petroleum activity for the previous month (if any)		

8.2.7 Incident Reporting

A reportable incident as defined under Regulation 4 of the OPGGS (E) Regulations is an incident relating to the activity that:

"*has caused, or has the potential to cause, moderate to significant environmental damage.*"

NOPSEMA will be notified of all reportable incidents, as per the requirements of Regulations 26, 26A and 26AA of the OPGGS (E) Regulations.

8.3 Auditing and Assurance

The Santos Management System ensures a process is in place to enable conformance with applicable legal and company requirements, verify necessary safeguards are in place and functioning, and non-compliances are reported and corrective actions tracked to closure. Environmental performance of the activities defined in this OPP will be audited and reviewed. These reviews are undertaken to ensure that:

+ environmental performance standards to achieve the EPOs are being implemented, reviewed and, where necessary, amended;
+ potential non-compliances and opportunities for continuous improvement are identified; and
+ all environmental monitoring requirements are being met.

Further details including the schedule for environmental performance auditing will be provided in future EPs for petroleum activities.

9 Stakeholder Consultation

9.1 Overview

Stakeholder engagement and consultation is an integral part of Santos' impact assessment and project development process, assisting the company make informed business decisions as well as identifying important issues that may need to be addressed. Information provided by stakeholders is considered by Santos in assessing the potential impacts of its activities and determining measures to avoid or minimise those impacts to an acceptable level.

Santos has committed to building and maintaining mutually beneficial relationships with local industry, and local and Indigenous communities wherever we operate.

9.1.1 Objectives

The objective of Santos' stakeholder engagement process for the Dorado Development OPP is to:

- introduce stakeholders to Dorado Development Phase 1;
- provide easily accessible information on the development;
- provide stakeholders with the opportunity to comment on the development and raise any key concerns;
- inform stakeholders of the project timeframes and the mechanisms by which they can receive further updates or provide additional comment;
- provide key stakeholders with a point of contact for the development; and
- provide transparency to stakeholders that relevant issues raised have been addressed by Santos.

9.1.2 Approach to Stakeholder Consultation

Santos has developed a Stakeholder Management Plan for Dorado Phase 1 which has guided the stakeholder consultation process for this OPP. This plan includes the following elements:

- stakeholder identification and mapping; and
- stakeholder engagement strategy.

9.1.3 Stakeholder Identification and Mapping

Santos has been undertaking activities in the Bedout Sub-basin since 2014, and the Dorado Development is a continuation of these activities. Previous activities include drilling of nine exploration and appraisal wells over five years between 2014 and 2019, and the Keraudren 3-D marine seismic survey conducted in 2019. Santos continues to engage with stakeholders in the Bedout sub-basin on its' exploration activities.

Santos has a working history with stakeholders that may be affected by its activities in the Bedout Sub-basin and is familiar with their interests in the Project Area (**Figure 1-1**).

Santos has worked through a stakeholder identification process for this OPP to ensure all potentially interested and affected stakeholders are identified and afforded the opportunity to comment on the proposed Dorado Development. This identification process included:

- a review of Santos' stakeholder database, including stakeholders consulted for other recent activities in the area;

+ a review of legislation applicable to petroleum and marine activities to ensure relevant administrative agencies are consulted;
+ identification of marine user groups and interest groups active in the area (e.g., commercial fisheries, other oil and gas producers, merchant shipping, etc.);
+ identification of relevant stakeholders, dependant on environment risk and impacts identified;
+ a review of the Department of Primary Industry and Regional Development (DPIRD) fishery catch data;
+ utilisation of the WAFIC Oil and Gas consultation services to advise on relevant and potentially impacted State and Commonwealth managed commercial fisheries and fishers; and
+ discussions with other identified stakeholders and industry organisations to identify other potentially impacted persons.

Currently identified stakeholders for the purposes of consultation for this OPP are listed in **Table 9-1.** Santos will continue to revise and update this stakeholder list throughout the life of the project.

Table 9-1: Stakeholders identified for consultation

Stakeholder Group	Stakeholder
Australian Government Departments and Agencies	Australian Border Force (Department of Immigration and Border Protection)
	Australian Fisheries Management Authority
	Australian Marine Safety Authority
	Clean Energy Regulator
	DAWE (Fisheries)
	DAWE (Biosecurity Vessels and aircraft)
	DAWE (Marine Pests)
	Department of Defence
	Department of Foreign Affairs and Trade
	DISER
	Director of National Parks
	Australian Hydrographic Service
State Government Departments and Agencies	Department of Biodiversity, Conservation and Attractions
	Department of Jobs, Tourism, Science and Innovation
	Department of Mines, Industry Regulation and Safety (DMIRS)
	DPIRD – Fisheries Division
	Department of Transport
	Pilbara Development Commission
	Pilbara Port Authority
Local Government	Town of Port Hedland

Stakeholder Group	Stakeholder
Marine Organisations	Australian Marine Oil Spill Centre
Fisheries and Representative Organisations	Commonwealth Fisheries Association
	Australian Southern Bluefin Tuna Industry Association
	Pearl Producers Association
	Recfishwest
	Marine Tourism WA
	WAFIC
State Managed Fisheries	Pilbara Fish Trawl (Interim) Managed Fishery Pilbara Trap Managed Fishery Mackerel Managed Fishery (Area 2) Pilbara Line Fishery
Commonwealth Managed Fisheries	Consult via the Commonwealth Fisheries Association
Other Operators / Exploration Companies	3D Oil Limited
	Finder Exploration
	Inpex
	Pathfinder Energy
	PGS
Port Hedland Community	GT Diving
	Care for Hedland
	Port Hedland Chamber of Commerce and Industry
	Port Hedland Game Fishing Club
Communications	Telstra
	Vocus Communications

Santos has also conducted a stakeholder mapping exercise to identify the potential issues and opportunities for each stakeholder. This assessment has helped Santos to provide more targeted information for specific stakeholders. For example, commercial fishers whose activities may overlap the Project Area were provided additional information which included:

+ Maps relevant to a specific fishery;
+ Historical fish catch data for fisheries that may overlap the Project Area; and
+ Additional information on access to the Project Area and potential exclusion zones.

Santos will continue to revise and update the Dorado Phase 1 stakeholder list to ensure all stakeholders with an interest in the development are identified and included in future development communications.

9.1.4 Stakeholder Engagement Strategy

To complement the NOPSEMA assessment process for OPP (**Figure 1-2**), and to provide stakeholders with sufficient time to consider Dorado Phase 1, Santos will adopt a phased consultation approach for this OPP:

- Phase 1 Consultation – prior to publication of the OPP by NOPSEMA (NOPSEMA Stage 1 Assessment, **Figure 1-2**);
- Phase 2 Consultation – during formal public comment period on the OPP;
- Phase 3 Consultation – after the public comment period and prior to resubmission of the OPP to NOPSEMA (NOPSEMA Stage 2 Assessment, **Figure 1-2**); and
- Phase 4 Consultation – ongoing consultation post OPP acceptance to support preparation of EPs and operations.

Table 9-2 contains a summary of the four consultation phases and engagement approach, subject to specific stakeholder requirements identified in the mapping process.

Table 9-2: Stakeholder Consultation Phases and Engagement Overview for Dorado Phase 1

Consultation Phase	Engagement
Phase 1 Consultation Prior to publication of the OPP by NOPSEMA (NOPSEMA Stage 1 Assessment)	Dorado Development Consultation Fact Sheet sent to all identified stakeholders in **Table 9-1.** Briefings/ meetings/ phone calls to selected stakeholders in **Table 9-1** or as requested. Dorado Phase 1 Risks and Mitigations Fact Sheet, incorporating project updates and the proposed environmental management, sent to all stakeholders in **Table 9-1** prior to commencement of the public comment period.
Phase 2 Consultation During public comment period for OPP, duration determined by NOPSEMA.	Notification (via email) to all stakeholders in **Table 9-1** advising OPP is open for public comment. Public notice in national, state and Pilbara region newspapers advising Santos' Dorado Development OPP is open for public comment. Public notice on Santos' website providing access to the Dorado Development Consultation Fact Sheets and advising the Dorado Development OPP is open for public comment. Ongoing consultation as required to address stakeholder feedback.
Phase 3 Consultation After the public comment period and prior to resubmission of the OPP to NOPSEMA (NOPSEMA Stage 2 Assessment)	Assessment of public comments and follow-up consultation as required.
Phase 4 Consultation Ongoing consultation post OPP acceptance to support preparation of EPs and operations.	Relevant persons will be consulted during the preparation of the Dorado Phase 1 activity-specific EPs as per the OPGGS (E) Regulations.

9.1.4.1 Phase 1 Consultation - prior to publication of the OPP by NOPSEMA

The OPGGS (E) Regulations do not require titleholders to consult with relevant persons prior to the submission of the OPP. Santos has considered it best practice to consult with stakeholders prior to publication of the OPP for public comment, to afford them sufficient time to provide feedback on Dorado Phase 1. This initial consultation aimed to:

- Introduce Dorado Phase 1;
- Provide stakeholders with the opportunity to comment on the development and any key concerns;
- Inform stakeholders of the project timeframes and the mechanisms by which they can receive further updates or provide additional comment; and
- Provide key stakeholders with a point of contact for the development.

The Dorado Development Consultation Fact Sheet includes details such as a development summary, location map, coordinates, water depth, distance to key regional features and vessel exclusion zone details.

Commercial fishers were provided additional information which included:

- Maps and information relevant to a specific fishery;
- Information about the timing and duration of the survey; and
- Information on proposed exclusion zones and gazetted PSZs and concurrent operations.

All stakeholders identified in **Table 9-1** were provided a copy of the Dorado Development Fact Sheet via email on 15 June 2020. Stakeholders were encouraged to provide feedback on the proposed Development and where requested, Santos met directly with stakeholders to discuss the development in more detail prior to submission to NOPSEMA for Stage 1 Assessment and continue to work with stakeholders prior to commencement and during the stage 2 assessment.

A summary of the Stage 1 consultation activities undertaken to date are provided in **Table 9-3**.

Table 9-3: Summary of Stakeholder feedback received for the submission to NOPSEMA for Stage 1 Assessment

Stakeholder	Stakeholder feedback and Santos response
Australian Marine Safety Authority	15/06/2020 - Dorado Development Fact Sheet sent by email. 18/06/2020 - AMSA responded outlining notification requirements. 22/06/2020 - Santos responded advising development was still in planning stages, will keep AMSA updated and will incorporate their requirements into the relevant EPs (**Section 7.2.8**). 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. 25/08/2021 – AMSA responded acknowledging update and referred to maritime safety information sent previously. 8/11/21 – Santos responded and acknowledged information provided. *Consultation Summary: No objections were raised. Santos has addressed notification requirements in **Section 7.2.8** of the OPP. As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
Director of National Parks	15/06/2020 Dorado Development Fact Sheet sent by email. 22/06/2020 Santos and the Director of National Parks discussed development by phone. 25/06/2020 The Director of National Parks responded seeking coordinates for FPSO & DTM. 02/07/2020 The Director of National Parks responded advising the planned activities do not overlap any AMPs. Therefore, there are no authorisation requirements from the Director of National Parks. The Director of National Parks requested to be notified when the OPP was available for public comment and requested additional information on the target resource, planned and unplanned impacts and proximity to AMPs. 02/07/2020 Santos responded and addressed all questions raised by the Director of National Parks. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*

DAWE (Biosecurity)	15/06/2020 Dorado Development Fact Sheet sent by email. 11/11/2020 Department responded requesting further project information. 16/02/2021 Santos responded to the Department with the revised timing for Dorado Phase 1, and to continue to provide project updates as they become available. Santos also committed to consult with the department on all activity specific environment plans when they are in preparation and will meet the department's biosecurity requirements. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
DAWE (Fisheries)	15/06/2020 Dorado Development Fact Sheet sent by email. 24/06/2020 Department noted the information and requested + to be informed of future developments relating to this project, and + Santos communicate future developments with the Australian Fisheries Management Authority and the relevant fishing industry representation organisations in that region. 07/07/2020 Santos acknowledged response and confirmed the department's requests would be met. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. Santos has addressed feedback received regarding consulting with relevant fisheries (**Section 9.1.3**). As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
Australian Fisheries Management Authority (AFMA)	15/06/2020 Dorado Development Fact Sheet sent by email. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. 1/09/2021 – AFMA responded and advised: + it is important to consult with all fishers who have entitlements to fish within the proposed area. This can be done through the relevant fishing industry associations or directly with fishers who hold entitlements in the area. 8/11/2021 – Santos responded and advised it will continue to keep the Australian Fisheries Management Authority and relevant fishing industry representative organisations informed on the development. *Consultation Summary: No objections were raised. Santos has addressed feedback received regarding consulting with relevant fisheries (**Section 9.1.3**). As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
Department of Home Affairs (Former Department of Immigration and Border Protection)	15/06/2020 Dorado Development Fact Sheet sent by email. 25/06/2020 Department responded on requesting to discuss the development. 25/06/2020 Santos and department spoke by phone on to discuss project in more detail. Department's interest was to ensure Santos was aware of requirements for an Offshore Security Plan. 26/06/2020 Department emailed Santos guidance materials for an Offshore Security Plan. 07/07/2020 Santos acknowledged information provided.

	24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
DMIRS	15/06/2020 Dorado Development Fact Sheet sent by email. 30/06/2020 DMIRS responded and advised no further information required at this stage. DMIRS requested to be kept informed of project updates. 07/07/2020 Santos acknowledged DMIRS response and confirmed the department would be informed of project updates. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
Department of Transport	15/06/2020 Dorado Development Fact Sheet sent by email. 03/07/2020 The Department of Transport responded acknowledging notification and advising they looked forward to receiving the respective OPEPs for the activities. 07/07/2020 Santos confirmed the Department of Transport would receive copies of all related OPEP's. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
DPIRD – Fisheries	15/06/2020 Dorado Development Fact Sheet sent by email. 30/06/2020 DPIRD request briefing on Dorado Development. Meeting scheduled for 23/07/2020. 23/07/2020 Santos met and briefed DPIRD on the Dorado Development. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. Santos has addressed fisheries in* ***Section 7.2.8****. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
Department of Biodiversity, Conservation and Attractions	15/06/2020 Dorado Development Fact Sheet sent by email. 18/06/2020 The department advised that, based on the documentation provided and other readily available information, the department currently has no comments to provide in relation to its responsibilities under the *Conservation and Land Management Act 1984* and *Biodiversity Conservation Act 2016*. 08/07/2020 Santos acknowledged response. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
WAFIC	05/06/2020 Santos and WAFIC commence discussions on consultation material for relevant commercial fishers. Key issues and points of clarification raised during these discussions include:

	+ Exclusion zones; + Potential future seismic activity over Project Area; and + Potential future developments in Project Area. 15/06/2020 Dorado Development Fact Sheet sent by email. 03/07/2020 Santos provided final draft of commercial fisher consultation to WAFIC, addressing and clarifying each issue raised by WAFIC. 28/07/2020 Santos provided WAFIC final consultation information for relevant commercial fishers to issue on behalf of Santos. 10/08/2020 WAFIC provided the Santos Dorado Development Consultation material to relevant commercial fishers and fishing industry bodies, on behalf of Santos. 7/10/2020 WAFIC responded to Santos specifically regarding the extent of the gazetted Petroleum Safety Zones. 15/02/2021 WAFIC requested further information on proposed exclusion zones for Dorado Development 23/02/2021 - Santos clarified with WAFIC that the zones will be sought in accordance with OPGGS Act section 616 around the WHP and FPSO and that Santos has not finalised a proposed Petroleum Safety Zone and commits to engaging with WAFIC and fishers once the studies have been completed and the proposed extent of the Petroleum Safety Zone is understood. 25/02/2021 – WAFIC acknowledged Santos' clarification regarding proposed exclusion zones. 2/03/2021 – Santos re-iterated its commitment to engage with WAFIC to seek detailed information on potential impacts from fishing vessels (e.g the weights of anchors and traps) so that this information can be considered in the design phase. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. 31/08/2021 – Santos & WAFIC met to discuss OPP. 11/11/2021 – Santos & WAFIC met to discuss the proposed exclusion zones. *Consultation Summary: To date, Santos has received one comment from a commercial fisher seeking clarification on the proposed Dorado Development safety zones. Santos has responded and provided further information to this licence holder. Santos has addressed potential interaction with fishers in **Section 7.2.8.** As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
Recfishwest	15/06/2020 Dorado Development Fact Sheet sent by email. 15/06/2020 Advised Dorado Development is too far out to sea to impact any of their constituents. 08/07/2020 Santos acknowledged response. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. As per **Section 9.1.4** Santos will continue to provide Dorado Development updates.*
Telstra	15/06/2020 Dorado Development Fact Sheet sent by email. 15/06/2020 Advised the subsea cable JASURAUS is out of service and retired. 08/07/2020 Santos acknowledged response.

	24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. Santos has addressed infrastructure within the Project Area in* ***Section 7.2.8****. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*
Town of Port Hedland	15/06/2020 Dorado Development Fact Sheet sent by email. 15/06/2020 Santos briefed the Town of Port Hedland on the Dorado Development. 10/07/2020 The Town of Port Hedland acknowledged Santos' consultation material and noted: + The proposal provides economic and industry diversification opportunities within the Port Hedland region and the town is supportive of such projects. + The town and its residents place a high value on the natural environment and maintaining that environment for future generations. The town would expect that the highest environment safety standards and processes would be applied by Santos, with similar stringent conditions being included on any license by the relevant regulators. + The town is ideally positioned to support Santos in its venture. 13/07/2020 Santos acknowledged the town's feedback and confirmed the town would be included in all future updates on the development. 24/08/2021 – Advised by email Dorado Development Offshore Project Proposal is on the NOPSEMA website for public comment. *Consultation Summary: No objections were raised. This OPP includes Santos environment management controls. As per* ***Section 9.1.4*** *Santos will continue to provide Dorado Development updates.*

Santos will provide stakeholders identified in **Table 9-1** with the Dorado Development Risks and Mitigations Fact Sheet, incorporating project updates and the proposed environmental management prior to commencement of the OPP public comment period.

9.1.4.2 Phase 2 Consultation – During Public Comment Period on OPP

The public comment period provides all interested persons, including those not considered to be a relevant person under the OPGGS (E) Regulations, are offered an opportunity to comment on the Dorado Development OPP.

The formal public review of an OPP is undertaken for a period of between 4 – 12 weeks as determined by NOPSEMA. It was determined by NOPSEMA that an 8-week formal consultation period would apply for the Dorado OPP and the formal consultation period ran from 20th of August 2021 until 29th of October 2021.

To support the public comment period, Santos placed Notifications (as required by NOPSEMA) in the following media:

- The Australian newspaper;
- Pilbara News newspaper;
- West Australian newspaper; and
- the Santos website.

Santos continues to consult with stakeholders on specific areas of interest in the OPP.

NOPSEMA published the Dorado Development OPP on its website, along with the relevant links and information for providing public comment. All public comment is provided to NOPSEMA who provide a copy of the comments received to Santos as the Operator of Dorado for their consideration to update to the draft OPP described in the phase 3 consultation below.

9.1.4.3 Phase 3 Consultation – after public comment and prior to resubmission of the OPP to NOPSEMA

Santos is committed to considering all information provided during the public comment period and addressing all relevant comments. During this stage, the OPP may require revision to address comments received from stakeholders.

The phase 2 public consultation report is included as **Attachment 13** for NOPSEMA's stage 2 assessment and summarises the key comments (including objections and claims) and assesses the merits of these, along with Santos' response including changes made in this OPP submission in response to the comments.

The process for assessment of the OPP, including the formal public review process, is summarised in **Figure 1-3**.

9.1.4.4 Phase 4 Consultation - ongoing post OPP acceptance to support preparation of environment plans and operations

Following acceptance of the Dorado Development OPP, all the petroleum activities within the scope of the Dorado Development OPP must have a NOPSEMA accepted EP in place before Santos can commence development specific activities. The OPGGS (E) Regulations require that Santos consult with all relevant persons when preparing an EP and undertaking petroleum activities.

Santos has established processes to provide for ongoing consultation throughout the EP development and assessment process and throughout the life of the petroleum activity.

Santos
