Table of contents

1. Introduction 20
1.1 Overview 20
1.2 Purpose of the Environment Plan 20
1.3 Scope of the Environment Plan 21
1.4 Environment Plan summary 21
1.5 Structure of the Environment Plan 21
1.6 Description of the titleholder 23
1.6.1 Details of titleholder and nominated liaison person 24
1.6.1.1 Titleholder 24
1.6.1.2 Nominated liaison person 24
1.6.2 Arrangements for notifying change 24
1.7 Woodside Management System 24
1.7.1 Environment and Biodiversity Policy 26
1.8 Description of relevant requirements 26
1.8.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) 26
1.8.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth) 27
1.8.2.1 Goodwyn Area Infill Development Offshore Project Proposal 27
1.8.2.2 Recovery plans and threat abatement plans 28
1.8.2.3 Australian Marine Parks 28
1.8.2.4 World Heritage Properties 29
2. Environment Plan process 32
2.1 Overview 32
2.2 Environment risk management methodology 32
2.2.1 Woodside risk management process 32
2.2.2 Health, Safety and Environment Management Procedure 33
2.2.3 Impact Assessment Procedure 33
2.2.4 Process Safety Management Procedure and Process Safety Risk Assessment Procedure 33
2.3 Environment Plan development process 34
2.4 Establish the context 34
2.4.1 Activity description 34
2.4.2 Existing environment description 35
2.4.3 Environmental legislation and other requirements 35
2.4.4 Impact and risk management 35
2.4.4.1 Impact and risk identification and analysis 35
2.4.4.2 Decision support framework 36
2.4.4.3 Decision support framework tools 37
2.4.4.4 Decision calibration 38
2.4.5 Control measures 38
2.4.6 Impact and risk classification 39
2.4.6.1 Impact classification 39
2.4.6.2 Risk classification 40
2.5 Classification and analysis of major environmental events 41
2.5.1 Major Environmental Events identification 41
2.5.2 Major Environmental Events classification 42
2.5.3 Bowtie analysis 42

2.5.4 Major Environmental Event register 42
2.5.5 Safety and Environment Critical Elements and technical performance standards 42
2.5.6 Safety-critical management system barriers 43
2.6 Impact and risk evaluation 43
2.6.1 Demonstration of 'as low as reasonably practicable' 43
2.6.2 Demonstration of acceptability 44
2.7 Recovery plan and threat abatement plan assessment 44
2.8 Environmental performance objectives/outcomes, standards and measurement criteria 44
2.9 Implement, monitor, review and report 45
2.10 Stakeholder consultation 45
3. Description of the activity 46
3.1 Overview 46
3.2 Location 46
3.3 Operational Area 50
3.4 Timing 50
3.5 Facility layout and description 50
3.5.1 GWA topsides 50
3.5.1.1 Topsides substructure 53
3.5.2 Subsea components 54
3.5.3 Interfield line 54
3.5.4 Wells and reservoirs 54
3.5.4.1 Goodwyn 54
3.5.4.2 Echo/Yodel 56
3.5.4.3 Perseus/Searipple 56
3.5.4.4 Wilcox 56
3.5.4.5 Greater Western Flank 56
3.5.5 Field inventory 57
3.6 Operational details 57
3.6.1 Crewing and modes of operation 57
3.6.1.1 Major projects 58
3.6.1.2 Remote operations 58
3.6.1.3 Subsea export 58
3.6.2 Process description 58
3.6.2.1 Production process 58
3.6.2.2 Flare systems 59
3.6.2.3 High pressure system 59
3.6.2.4 Low pressure system 60
3.6.3 Produced water system 60
3.6.3.1 Produced water system description 60
3.6.4 Drainage systems 61
3.6.4.1 Hazardous open drains 61
3.6.4.2 Non-hazardous open drains 62
3.6.4.3 Closed drains 62
3.6.4.4 Drilling facility hazardous open drains 62
3.6.5 Utility systems 62
3.6.5.1 Platform lighting 62

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.5.2 Heating ventilation and air conditioning system 62
3.6.5.3 Seawater treatment systems 63
3.6.5.4 Power generation 64
3.6.5.5 Sewage and putrescible wastes 64
3.6.5.6 Sand management 64
3.6.5.7 Safety features and emergency systems 65
3.6.6 Lifting operations 65
3.6.6.1 Routine lifting from platform support vessels 65
3.6.6.2 Lifting around the facility 65
3.6.7 Operational flaring 65
3.6.7.1 Normal operations 65
3.6.7.2 Intermittent process upsets and activities 66
3.6.7.3 Emergency blowdown 66
3.6.7.4 Transient operations 66
3.6.7.5 Manual depressurisation 66
3.6.7.6 Subsea flowline depressurisation 66
3.6.7.7 Annual flared gas 66
3.6.8 Diesel bunkering 67
3.6.9 Bulk hydrocarbon inventories 67
3.6.10 Operational chemical usage 67
3.6.10.1 Operational process chemicals 67
3.6.10.2 Operational non-process chemicals 67
3.6.10.3 Non-operational chemicals 67
3.6.10.4 Indicative chemical inventories 68
3.6.11 Greenhouse gas emissions 68
3.7 Subsea inspection, monitoring, maintenance, and repair activities 69
3.7.1 Inspections 69
3.7.2 Monitoring 70
3.7.3 Maintenance 71
3.7.4 Repair 71
3.7.5 Subsea chemical usage 72
3.7.5.1 Discharges during IMMR activities 72
3.7.6 Marine growth removal 73
3.7.7 Pipeline pigging operations 73
3.7.8 Sediment relocation 73
3.7.9 Suspend and preserve redundant equipment 73
3.8 Support vessel operations 73
3.8.1 Platform support vessel 74
3.8.2 Subsea support vessels 74
3.8.2.1 Uncrewed surface vessel 75
3.8.3 Accommodation support vessel 76
3.8.4 Heavy lift vessel 76
3.8.5 Helicopter operations 77
3.9 Platform well management and maintenance 77
3.9.1 Well intervention 77
3.9.2 Routine wellhead maintenance 78
3.9.3 Well workover 78

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.9.4 Well kill 78
3.9.5 Management of activities 78
3.9.6 Well management chemical use 79
3.9.7 Well clean-up 79
3.9.8 Production from high water cut wells 79
3.10 GWF4 and future tie-in production well commissioning 80
4. Description of the existing environment 82
4.1 Overview 82
4.2 Regional context 85
4.3 Matters of national environmental significance (EPBC Act) 85
4.4 Physical environment 86
4.5 Habitats and biological communities 88
4.6 Protected species 96
4.6.1 Fish, sharks and rays 96
4.6.1.1 Whale shark 96
4.6.2 Marine reptiles 100
4.6.2.1 Flatback Turtle 100
4.6.3 Marine mammals 107
4.6.4 Seabirds and migratory shorebirds 112
4.6.4.1 Wedge-tailed shearwater 112
4.6.5 Seasonal sensitivities for protected species 118
4.7 Key ecological features 124
4.7.1 Ancient Coastline at 125 m Depth Contour 124
4.8 Protected places 126
4.8.1 Montebello Marine Park 127
4.9 Cultural values and heritage 129
4.9.1 Native Title 129
4.9.2 Coastally adjacent Indigenous groups 129
4.9.3 Marine parks 133
4.9.4 Indigenous protected areas 134
4.9.5 Sea Country values 134
4.9.5.1 Desktop assessment of Sea Country values 134
4.9.5.2 Indigenous archaeological heritage assessment 146
4.9.5.3 Submerged cultural heritage values 146
4.9.5.4 Feedback received via consultation to inform Existing Environment Description 146
4.9.6 Summary of cultural features and heritage values 162
4.9.7 Historic sites of significance 167
4.9.8 Historic underwater heritage 167
4.9.9 World, National and Commonwealth heritage listed places 169
4.10 Socio-economic environment 171
4.10.1 Commercial fisheries 171
4.10.2 Traditional and customary fishing 182
4.10.3 Tourism and recreation 182
4.10.4 Commercial shipping 182
4.10.5 Oil and gas facilities, infrastructure and other industries 184
4.10.6 Submarine communications infrastructure 186

4.10.7 Defence 188

5. Stakeholder consultation 190

5.1 Summary 190
5.2 Consultation – general context 191
5.3 Identification of relevant persons for consultation 194
5.3.1 Regulations 25(1)(a), (b) and (c) 194
5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c) 195
5.3.3 Regulation 25(1)(d) 195
5.3.4 Identification of relevant persons under Regulation 25(1)(d) 196
5.3.5 Regulation 25(1)(e) 202
5.3.6 Identification of relevant persons under Regulation 25(1)(e) 203
5.3.7 Persons or organisations Woodside chooses to contact 203
5.3.8 Assessment of relevant persons for the proposed activity 203
5.4 Consultation material and timing 203
5.4.1 Sufficient information 203
5.4.2 Reasonable period for consultation 206
5.4.3 Discharge of Regulation 25 207
5.5 Context of consultation approach with Traditional Custodians 208
5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal 208
5.5.2 Consultation method 208
5.5.3 Identification of relevant persons 210
5.5.4 Opportunity to self-identify and identifying other individuals 211
5.5.5 Sufficient information 212
5.5.6 Reasonable period for consultation 212
5.5.7 Discharge of Regulation 25 212
5.6 Providing feedback and assessment of merit of objections or claims 212
5.7 Ongoing consultation 213

6. Environmental impact and risk assessment, performance outcomes, standards and measurement criteria 214

6.1 Overview 214
6.2 Impact and risk analysis evaluation 217
6.3 Impacts and risks not deemed credible or outside the scope of this Environment Plan 217
6.3.1 Shallow/near-shore activities 217
6.4 Cumulative impacts 217
6.5 Environmental performance outcomes, standards and measurement criteria 218
6.6 Presentation 225
6.7 Planned activities (routine and non-routine) 228
6.7.1 Physical presence: interaction with other marine users 228
6.7.2 Physical presence: disturbance to the seabed 236
6.7.3 Routine acoustic emissions: generation of noise during routine operations 245
6.7.4 Routine and non-routine discharges: hydrocarbons and chemicals during subsea operations and activities 262
6.7.5 Routine and non-routine discharges: produced water 271
6.7.6 Routine and non-routine discharges: utility systems, drains and support vessels 298
6.7.7 Routine and non-routine atmospheric (direct) and greenhouse gas emissions (direct and indirect) 307

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.7.8 Routine atmospheric emissions: indirect emissions associated with gas processing onshore 346
6.7.9 Routine light emissions: light emissions from platform, support vessels and flaring 368
6.8 Unplanned activities (accidents, incidents, emergency situations) – major environmental events 375
6.8.1 Major environmental events overview 375
6.8.2 Quantitative spill risk assessment methodology 376
6.8.2.1 Worst-case scenarios ... 377
6.8.2.2 Hydrocarbon characteristics ... 378
6.8.2.3 Environment that may be affected and hydrocarbon contact thresholds ... 390
6.8.2.4 Operational and Scientific Monitoring ... 393
6.8.3 Unplanned hydrocarbon release: well loss of containment (MEE-01) 394
6.8.4 Unplanned hydrocarbon release: subsea equipment loss of containment (MEE-02) 427
6.8.5 Unplanned hydrocarbon release: topsides loss of containment (MEE-03) 444
6.8.6 Unplanned hydrocarbon release: loss of structural integrity (MEE-04) 457
6.8.7 Unplanned hydrocarbon release: loss of marine vessel separation (MEE-05) 470
6.8.8 Unplanned hydrocarbon release: loss of control of suspended load from GWA platform (MEE-06) 483
6.8.9 MEE common cause event failure mechanisms: SCE failure CCE-01 and human error CCE-02 491
6.9 Unplanned activities (accidents, incidents, emergency situations) ... 500
6.9.1 Unplanned hydrocarbon or chemical release: hydrocarbon release during bunkering/refuelling and chemical release during transfer, storage and use 500
6.9.2 Unplanned discharges: hazardous and non-hazardous waste management 507
6.9.3 Physical presence: interactions with marine fauna 512
6.9.4 Physical presence: introduction of invasive marine species 517
6.10 Recovery plan and threat abatement assessment ... 526
6.11 Cultural features and heritage values assessment ... 542
7. Implementation strategy ... 561
7.1 Overview ... 561
7.2 Systems, practices, and procedures ... 561
7.2.1 Woodside Management System operate processes 561
7.2.1.1 Operate plant ... 561
7.2.1.2 Maintain assets ... 562
7.2.2 Process safety management 562
7.2.2.1 Woodside safety culture framework ... 563
7.2.3 Selection, assessment and approval of chemicals 563
7.2.3.1 Selection criteria ... 564
7.2.4 Invasive marine species risk assessment 565
7.2.4.1 Objective and scope ... 565
7.2.4.2 Risk assessment process ... 565
7.2.5 Unexpected finds procedure 568
7.2.6 Offshore marine discharge adaptive management plan 569
7.2.6.1 Overview ... 569
7.2.6.2 Routine monitoring and management ... 569
7.2.6.3 Further investigations ... 570
7.2.6.4 ALARP/Acceptability Study ... 571
7.2.6.5 Review and revision ... 572

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.7 Risk management 572
7.2.7.1 Management of risks – contracting and procurement ... 572
7.2.7.2 Management of risks – subsea activities ... 573
7.2.7.3 Management of risks – major projects ... 573
7.2.7.4 Management of risks – well integrity ... 573
7.2.7.5 Management of risks – marine services ... 573
7.2.7.6 Management of risks – emissions and energy management ... 574
7.2.7.7 Management of risks – Indirect emissions management ... 575
7.2.7.8 Management of human factor related risks ... 576
7.2.8 Change management 576
7.2.8.1 Technical change management ... 577
7.2.9 Management of safety and environment critical element technical performance standards and management system performance standards 578
7.2.9.1 Management system performance standards ... 578
7.2.9.2 Safety and environment critical element technical performance standards ... 578
7.3 Woodside decommissioning framework ... 580
7.3.1 Decommissioning in operations 580
7.3.2 Facility decommissioning planning 581
7.3.2.1 Decommissioning critical systems ... 581
7.3.2.2 Management of redundant infrastructure ... 581
7.3.3 Inventory of property within the Petroleum Activity 582
7.3.3.1 Other infrastructure within the title areas ... 584
7.3.4 GWA decommissioning strategy 585
7.3.4.1 Echo Yodel subsea infrastructure decommissioning planning ... 585
7.3.4.2 Perseus over Goodwyn wells plug and abandonment ... 586
7.3.4.3 GWA dry tree platform wells decommissioning planning ... 586
7.3.4.4 Exploration wells decommissioning planning ... 586
7.3.4.5 GWA facility and subsea infrastructure decommissioning planning ... 587
7.4 Organisation Structure ... 589
7.5 Roles and responsibilities ... 589
7.6 Training and competency ... 593
7.6.1 Inductions and training 593
7.6.2 Specific environmental awareness 594
7.6.3 Inductions for offshore facility workers and visitors 594
7.6.4 Operations competency framework training 594
7.6.5 Permit to work system training 595
7.6.6 Emergency and hydrocarbon spill response training 595
7.6.7 Subsea inspection, monitoring, maintenance and repair activity environmental awareness 595
7.6.8 Management of training requirements 596
7.7 Monitoring, auditing, and managing non-conformance and review ... 596
7.7.1 Monitoring 596
7.7.1.1 Source-based impacts and risks ... 596
7.7.2 Auditing 599
7.7.2.1 Support vessel activities ... 599
7.7.2.2 Operations assurance ... 599
7.7.2.3 Annual offshore inspection / desktop review ... 600
7.7.2.4 Marine assurance ... 600

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7.2.5 Risk assessment ... 601
7.7.3 Management of non-conformance 602
7.7.4 Review 602
7.7.4.1 Management review ... 602
7.7.4.2 Learning and knowledge sharing ... 602
7.7.4.3 Continuous improvement ... 602
7.8 Management of knowledge ... 603
7.9 Management of newly identified impacts and risks ... 603
7.10 Management of change and revision ... 603
7.10.1 Environment Plan management of change 603
7.10.2 Oil Pollution Emergency Plan management of change 604
7.11 Record keeping ... 604
7.12 Ongoing consultation ... 604
7.13 Reporting ... 607
7.13.1 Routine reporting (internal) 607
7.13.1.1 Daily progress reports and meetings ... 607
7.13.1.2 Regular health, safety and environment meetings ... 607
7.13.1.3 Performance reporting ... 607
7.13.2 Routine reporting (external) 608
7.13.2.1 Start and end notifications of the Petroleum Activity ... 608
7.13.2.2 Cetacean and whale shark sighting reporting ... 608
7.13.2.3 Environmental performance review and reporting ... 608
7.13.3 Incident reporting (internal) 608
7.13.4 Incident reporting (external) – Reportable and recordable 609
7.13.4.1 Reportable incidents ... 609
7.13.4.2 Recordable incidents ... 610
7.13.4.3 Other external incident reporting requirements ... 610
7.14 Emergency preparedness and response ... 613
7.14.1 Overview 613
7.14.2 Emergency response training 613
7.14.3 Emergency response preparation 614
7.14.4 Initial response to a facility incident 614
7.14.5 Oil and other hazardous materials spill 615
7.14.6 Emergency and spill response 615
7.14.7 Emergency and spill response drills and exercises 615
7.14.8 Testing of hydrocarbon spill response arrangements 616
7.14.9 Testing of arrangements schedule 616
7.14.10 Cyclone and dangerous weather preparation 617

1. INTRODUCTION

1.1 Overview

Woodside Energy Ltd. (Woodside), as titleholder under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (Cth) (referred to as the Environment Regulations), on behalf of the Joint Venture detailed in Section 1.6, is operator of the Goodwyn Alpha (GWA) facility. The GWA facility commenced operation in 1995. Well fluids are recovered from a series of fields via wells, pipelines and subsea infrastructure, which are processed by the GWA facility. The following activities are proposed to occur within Permit Area(s) WA-1-L, WA-5-L, WA-6-L, WA-23-L, WA-24-L, WA-57-L, WA-7-R[1], WA- 2-PL, WA-9-PL, WA-13-PL, WA-24-PL, WA-27-PL and proposed Wilcox pipeline licence[2]:

- routine production
- routine inspection, monitoring, maintenance and repair (IMMR) of the platform and associated subsea infrastructure
- well clean-up and commissioning
- platform well intervention, workovers and well kill activities
- non-routine and unplanned activities and incidents associated with the above.

These activities will hereafter be collectively referred to as the Petroleum Activity and form the scope of this Environment Plan (EP). A detailed description of the activities is provided in Section 3.

This EP has been prepared as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

In accordance with the requirements of Regulation 41(1) of the Environment Regulations, Woodside has submitted a revision to the GWA Facility Operations EP to NOPSEMA at least 14 days prior to the end of the five-year period from the original acceptance under what is now Regulation 35 of the Environment Regulations. At the time of the original acceptance, the relevant provision was Regulation 11 of the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth).

In accordance with the requirements of Regulation 39(1) of the Environment Regulations, Woodside has revised the GWA Facility Operations EP to incorporate the start-up and operation of the Greater Western Flank-4 subsea infrastructure as a new stage.

1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- the potential environmental impacts and risks (planned [routine and non-routine) and unplanned [accidents, incidents, and emergency situations]) that may result from the Petroleum Activity are identified.
- appropriate management controls are implemented to reduce impacts and risks to a level that is ‘as low as reasonably practicable’ (ALARP) and acceptable.
- the Petroleum Activity is carried out in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in Section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (Cth) [EPBC Act]).

[1] At the time of EP submission, applications for two Petroleum Production Licences covering the WA-7-R (Wilcox) retention lease area are undergoing assessment by NOPTA and the relevant Joint Authority.

[2] At the time of EP submission, the application for a pipeline licence to authorise the proposed Wilcox pipeline connecting the WA-7-R (Wilcox) field development to existing NWS infrastructure, is undergoing assessment by NOPTA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.3 Scope of the Environment Plan

The scope of this EP covers the activities that define the Petroleum Activity, as described in Section 3, for a period of up to five years. The Operational Area defines the spatial boundary within which the Petroleum Activity is undertaken.

This EP addresses the environmental impacts from planned activities and the environmental risks associated with potential unplanned events arising from the Petroleum Activity within the Operational Area.

Transit to and from the Operational Area by support vessels, and port activities associated with these vessels, are not within the scope of this EP. Vessel operations outside of the Operational Area (e.g., transit to and from port) are managed in accordance with applicable maritime legislation and other regulatory requirements.

Section 3 contains a detailed description of the infrastructure and activities covered by this EP.

Full decommissioning of the GWA facility is not planned within the five-year duration of this EP. However, wells, pipelines and other subsea infrastructure that cease to be required for the Petroleum Activity during the life of the EP may be subject to a risk-based assessment to determine whether removal prior to end of field life (EOFL), or retention until EOFL, represents the lowest risk (ALARP) outcome.

Decommissioning activities associated with EOFL, or activities of a scale or nature not otherwise assessed within this EP, will be subject to separate future environmental assessment and approvals, including a future EP where required.

1.4 Environment Plan summary

Table 1-1 summarises the content of this EP, as required by Regulation 35(7).

Table 1-1: EP summary

EP summary material requirement	Relevant section of this EP containing EP summary material
The location of the activity	Section 3.2
A description of the receiving environment	Section 4
A description of the activity	Section 3
Details of the environmental impacts and risks	Section 6
The control measures for the activity	Section 6
The arrangements for ongoing monitoring of the titleholder's environmental performance	Section 7.7
Response arrangements in the oil pollution emergency plan	Section 7.14, Appendix G, and Appendix H
Consultation already undertaken and plans for ongoing consultation	Section 5 and Section 7.12
Details of the titleholder's nominated liaison person for the activity	Section 1.6.1.2

1.5 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(a): Is appropriate for the nature and scale of the activity	Regulation 21: • Environmental assessment Regulation 22: • Implementation strategy for the EP	The principle of 'nature and scale' is applicable throughout the EP	Section 2 Section 3 Section 4 Section 5

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
	Regulation 24: • Other information in the EP		Section 6
Regulation 34(b): Demonstrates that the environmental impacts and risks of the activity will be reduced to ALARP Regulation 34(c): Demonstrates that the environmental impacts and risks of the activity will be of an acceptable level	Regulations 21(1)–21(7): • 21(1) Description of the activity • 21(2) and (3) Description of the environment • 21(4) Requirements • 21(5) and (6) Evaluation of environmental impacts and risks • 21(7) Environmental performance outcomes and standards • Regulations 24(a)–24(b): • A statement of the titleholder's corporate environmental policy • A report on all consultations between the titleholder and any relevant person	Set the context (activity and existing environment) Define 'acceptable' (the requirements, the corporate policy, relevant persons) Detail the impacts and risks Evaluate the nature and scale Detail the control measures – ALARP and acceptable	Section 1 Section 2 Section 3 Section 4 Section 5 Section 6 Section 7 Appendix A Appendix B Appendix C Appendix F
Regulation 34(d): Provides for appropriate environmental performance outcomes, environmental performance standards and measurement criteria	Regulation 21(7): • Environmental performance outcomes and standards	Environmental performance outcomes (EPOs) Environmental performance standards (EPSs) Measurement criteria (MCs)	Section 6
Regulation 34(e): Includes an appropriate implementation strategy and monitoring, recording and reporting arrangements	Regulation 22: • Implementation strategy for the EP	Implementation strategy, including: Environmental Management System (EMS) Performance monitoring Oil Pollution Emergency Plan (OPEP – per Appendix G) and operational and scientific monitoring Ongoing consultation	Section 7 Appendix G
Regulation 34(f): Does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the EPBC Act.	Regulations 21(1)–21(3): • 21(1) Description of the activity • 21(2) Description of the environment • 21(3) Without limiting Regulation 21(2)(b), relevant values and sensitivities may include any of the following: o (a) the world heritage values of a declared World Heritage property within the meaning of the EPBC Act; o (b) the national heritage values of a National Heritage place within the meaning of that Act;	No activity, or part of the activity, undertaken in any part of a declared World Heritage property	Section 3 Section 4 Section 6 Appendix C

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
	○ (c) the ecological character of a declared Ramsar wetland within the meaning of that Act; ○ (d) the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act; ○ (e) the presence of a listed migratory species within the meaning of that Act; ○ (f) any values and sensitivities that exist in, or in relation to, part or all of: ▪ (i) a Commonwealth marine area within the meaning of that Act; or ▪ (ii) Commonwealth land within the meaning of that Act.		
Regulation 34(g): (i) the titleholder has carried out the consultations required by Regulation 25 (ii) the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate	Regulation 25: • Consultation with relevant authorities, persons and organisations, etc. Regulation 24(b): • A report on all consultations between the titleholder and any relevant person	Consultation undertaken in the preparation of this EP.	Section 5 Appendix F
Regulation 34(h): Complies with the Act and the regulations	Regulation 21(4)(a): • Describe the requirements, including legislative requirements, that apply to activity and are relevant to the environmental management of the activity Regulation 23: • Details of the titleholder and liaison person Regulation 24(a): • A statement of the titleholder's corporate environmental policy Regulation 24(c): • Details of all reportable incidents in relation to the proposed activity	All contents of the EP must comply with the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act) and the Environment Regulations	Section 1.6 Section 1.8 Section 7.13 Appendix A Appendix E

1.6 Description of the titleholder

Woodside is the titleholder for the Petroleum Activity, on behalf of the Joint Venture comprising of Woodside Energy Ltd., BP Developments Australia Pty. Ltd., Woodside Energy (North West Shelf) Pty Ltd, Chevron Australia Pty Ltd, Japan Australia LNG (MIMI) Pty. Ltd., CNOOC NWS Private Limited and Shell Australia Pty Ltd.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.6.1 Details of titleholder and nominated liaison person

In accordance with Regulation 23 of the Environment Regulations, details of the titleholder, liaison person and arrangements for notifying changes are described below.

1.6.1.1 Titleholder

Woodside Energy Ltd.

11 Mount Street

Perth, Western Australia

T: 08 9348 4000

ACN: 63 005 482 986

1.6.1.2 Nominated liaison person

Nicolas Wirtz

Corporate Affairs Manager

11 Mount Street

Perth, Western Australia

Telephone: 08 9348 4000

Email: feedback@woodside.com

1.6.2 Arrangements for notifying change

If the titleholder, titleholder's nominated liaison person, or the contact details for either change, then NOPSEMA will be notified in writing within 2 weeks or as soon as practicable.

1.7 Woodside Management System

The Woodside Management System (WMS), provides a structured framework of documentation to set common expectations governing how all employees and contractors at Woodside will work. Many of the standards presented in Section 6 are drawn from the WMS documentation, which comprises four elements as outlined below (and illustrated in Figure 1-1):

- Our Values and Policies: Set the enterprise-wide direction for Woodside by governing our behaviours, actions, and business decisions and ensuring we meet our legal and other external obligations.
- Expectations: Set essential activities or deliverables required to achieve the objectives of the key business activities and provide the basis for developing processes and procedures.
- Processes and Procedures: Processes identify the set of interrelated or interacting activities that transforms inputs into outputs, to systematically achieve a purpose or specific objective. Procedures specify what steps, by whom, and when required to carry out an activity or a process.
- Guidelines: Provide recommended practice and advice on how to perform the steps defined in procedures, together with supporting information and associated tools. Guidelines provide advice on how activities or tasks may be performed, information that may be taken into consideration, or how to use tools and systems.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

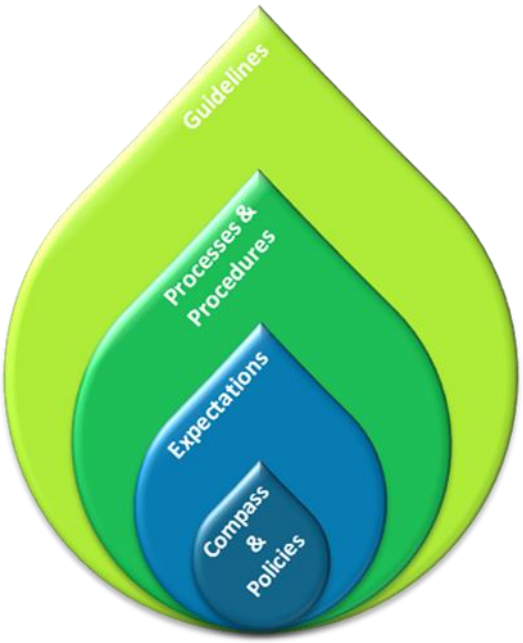

Figure 1-1: The four major elements of the Woodside Management System Seed

The WMS is organised within a business process hierarchy based on key business activities to ensure the system remains independent of organisation structure, is globally applicable, and is scalable wherever required. These key business activities are grouped into 'management', 'support' and 'value stream' activities as shown in Figure 1-2. The value stream activities capture, generate and deliver value throughout the exploration and production lifecycle. The management activities influence all areas of the business, while support activities may influence one or more value stream activities.

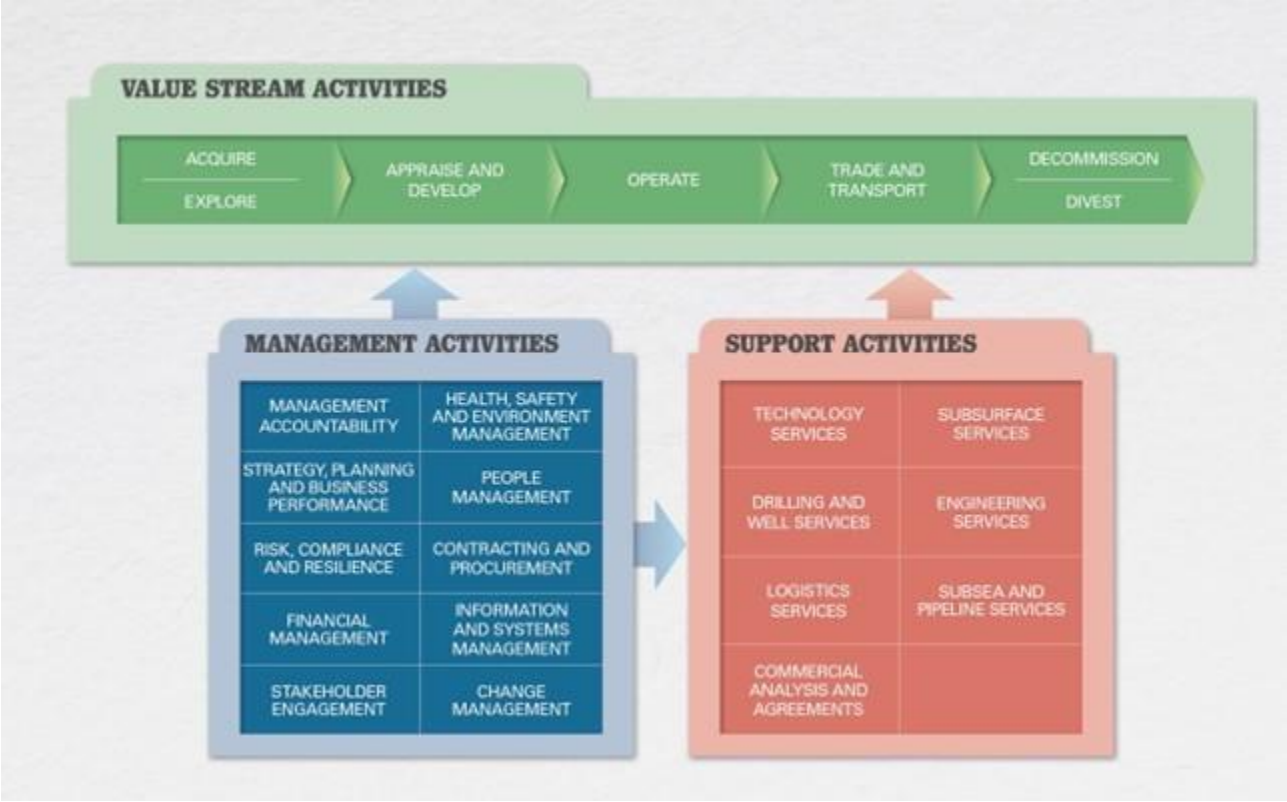

Figure 1-2: The Woodside Management System business process hierarchy

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.7.1 Environment and Biodiversity Policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside's Environment and Biodiversity Policy is provided in Appendix A of this EP.

The Environment and Biodiversity Policy is reviewed regularly and updated as required. The Environment and Biodiversity Policy is made available on our website: https://www.woodside.com/who-we-are/corporate-governance-and-policies. This EP will be implemented in accordance with the current Environment and Biodiversity Policy as shown on our website.

1.8 Description of relevant requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the Petroleum Activity and relevant to managing associated impacts and risks are detailed in Appendix B and key legislation is summarised in the following paragraphs.

1.8.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth)

The OPGGS Act sets up a system for regulating offshore petroleum and greenhouse gas (GHG) activities beyond 3 nautical miles (nm) from the baseline at which the breadth of the territorial sea is measured to the outer limits of the continental shelf of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 nm.

Under the OPGGS Act, the Environment Regulations apply to petroleum and GHG activities in Commonwealth waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ESD set out in section 3A of the EPBC Act.
- such that environmental impacts and risks of the activity will be reduced to ALARP; and
- such that environmental impacts and risks of the activity will be of an acceptable level.

This EP has been prepared in accordance with the relevant requirements of the OPGGS Act and the Environment Regulations.

Relevant decommissioning requirements of the OPGGS Act are detailed in Table 1-3.

Table 1-3 Relevant decommissioning requirements of the *Offshore Petroleum and Greenhouse Gas Storage Act*

Section number	Relevant requirement	Relevant section of the EP
Section 270(c)(i) and Section 270(c)(ii)	The Joint Authority may consent to the surrender sought by the application only if the registered holder of the permit, lease or licence: (c) has: (i) to the satisfaction of NOPSEMA, removed or caused to be removed from the surrender area (defined by subsection (7)) all property brought into the surrender area by any person engaged or concerned in the operations authorised by the permit, lease or licence, or (ii) made arrangements that are satisfactory to NOPSEMA in relation to that property, and…	Not relevant, decommissioning not proposed under this EP
Section 572(2)	A titleholder must maintain in good condition and repair all structures that are, and all equipment and other property that is: (a) in the title area, and (b) used in connection with the operations authorised by the permit, lease, licence or authority	Section 3.6
Section 572(3)	A titleholder must remove from the title area all structures that are, and all equipment and other property that is, neither used nor to be used in connection with the operations:	Section 7.3

	(a) in the title area, and (b) used in connection with the operations authorised by the permit, lease, licence or authority	

1.8.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth)

The EPBC Act includes objectives to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia, including matters of national environmental significance (MNES) protected under Part 3 of the EPBC Act. The EPBC Act also sets a framework to ensure that actions taken on, or impacting upon, Commonwealth land or waters are consistent with the principles of ESD.

The GWA facility commenced operations in 1995 and subsequent developments, tie-ins and projects have been referred for assessment under the EPBC Act, including:

- Echo Yodel Development (2000/11), the action was determined to be a controlled action under the EPBC Act and subsequently approved by the Environment Minister, subject to approval conditions.
- 'Goodwyn A' Low Pressure Train Project (EPBC 2003/014), the decision by the Environment Minister determined the action is not a controlled action.
- Perseus over Goodwyn Development (2004/1326), the decision by the Environment Minister determined the action is not a controlled action.
- Greater Western Flank (GWF) Phase 1 Gas Development (2011/5980) the decision by the Environment Minister determined the action is not a controlled action if undertaken in a particular manner.
- Greater Western Flank 2 and 3 were included in the Greater Western Flank Gas Development (2005/2464), the decision by the Environment Minister determined the action is not a controlled action.

There are no EPBC Act approval conditions relevant to the scope of this EP.

On 28 February 2014, NOPSEMA's environmental management authorisation process was endorsed by the then Minister for the Environment as a Program that meets the requirements of Part 10 of the EPBC Act. This ministerial endorsement streamlined environmental approvals for offshore petroleum activities and made NOPSEMA the sole regulator for environmental management of petroleum activities in Commonwealth waters.

The Streamlining Offshore Petroleum Approvals Program (Program) under the EPBC Act requires proponents of an offshore project after 28 February 2014 to submit an Offshore Project Proposal to NOPSEMA for assessment. An accepted Offshore Project Proposal (OPP) must be in place prior to submission and assessment of Environment Plans for the individual component activities. The definition of environment incorporated in the Program encompasses all aspects of the environment including, but not limited to, EPBC Act Part 3 protected matters. As a result, all Program functions relating to protection of the environment apply for EPBC Act Part 3 matters.

1.8.2.1 Goodwyn Area Infill Development Offshore Project Proposal

Woodside submitted the Goodwyn Area Infill Development Offshore Project Proposal (GWA OPP) to NOPSEMA for assessment in February 2024 and NOPSEMA accepted the OPP in August 2025 which included up to 8 wells tied into existing Greater Western Flank subsea infrastructure and production through the GWA facility. Existing GWF subsea infrastructure and the ongoing operation of the existing GWA facility were outside the direct scope of the OPP.

In accordance with Regulations 26 and 17 of the Environment Regulations, a titleholder must have submitted and have an accepted EP in place before commencing an activity. This EP includes the ongoing operation of up to seven new production wells (GWF4 or future tie-in) and associated subsea infrastructure developed under the accepted OPP.

The GWA OPP sets out the environmental performance outcomes (EPOs) for the project and the level of performance to be achieved, to ensure that environmental impacts and risks will be of an acceptable level and the project is consistent with the principles of ESD. Relevant EPOs established under the GWA OPP for

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

operation of infrastructure developed under the project have been considered and reflected within this EP, where applicable to the operational scope of the Petroleum Activity.

In accordance with Regulation 56 of the Environment Regulations, this EP references the accepted GWA OPP where relevant to the Petroleum Activity. The accepted GWA OPP is available on NOPSEMA's website using the following link: https://www.nopsema.gov.au/A1248938.

1.8.2.2 Recovery plans and threat abatement plans

Under Section 139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community, or a threat abatement plan for a species or community protected under the Act. Similarly, under Section 268 of the EPBC Act:

> *'A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.'*

In relation to offshore petroleum activities in Commonwealth waters, these requirements are administered by NOPSEMA via the commitments included in the Program. Specifically:

- NOPSEMA will not accept an EP that proposes activities that will result in unacceptable impacts to a listed threatened species or ecological community.
- NOPSEMA will not accept an EP that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community.
- NOPSEMA will have regard to any approved conservation advice in relation to a threatened species or ecological community before accepting an EP.

An assessment of the Petroleum Activity against relevant recovery plans and threat abatement plans is provided in Section 6.10.

1.8.2.3 Australian Marine Parks

Australian Marine Parks (AMPs) are marine Commonwealth reserves declared under the EPBC Act and are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP), supported by Parks Australia, is responsible for the management of AMPs and associated management plans. Under Section 362(2) of the EPBC Act, the Commonwealth and Commonwealth agencies must not perform functions or exercise powers in relation to a Commonwealth reserve that are inconsistent with management plans. Accordingly, NOPSEMA is required to consider the potential impacts of petroleum activities on AMPs when assessing an EP.

AMP management plans establish zoning arrangements and specify the activities that may be undertaken in each zone. The zones are assigned conservation objectives aligned with the Australian International Union for Conservation of Nature (IUCN) reserve management principles outlined in Schedule 8 of the Environment Protection and Biodiversity Conservation Regulations 2025 (EPBC Regulations).

Section 4 describes the AMPs and AMP zones overlapped by the Operational Area and environment that may be affected (EMBA), including those potentially interacted with by the Petroleum Activity.

The Petroleum Activity may include activities in the Montebello Marine Park Multiple Use Zone. In accordance with the North-west Marine Parks Network Management Plan (DNP 2018a), offshore petroleum activities and oil spill response activities may be undertaken within Multiple Use Zones and Special Purpose Zone Trawl areas (both IUCN category VI), subject to applicable approvals and conditions.

The DNP has issued class approvals for petroleum activities within designated IUCN Category VI AMP zones. For the Petroleum Activity, the North-west Marine Parks Network Mining Operations Class Approval is relevant, as detailed in Table 1-4.

Table 1-4: Conditions of Class Approval relevant to the Petroleum Activities

Number	Condition	Relevant section of EP
1	The Approved Actions must be conducted in accordance with:	Conditions 1a, b, c and f are met by the submitted EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Number	Condition	Relevant section of EP
	(a) an Environment Plan accepted under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009; (b) the EPBC Act; (c) the EPBC Regulations (d) the North-west Network Management Plan; (e) any prohibitions, restrictions or determinations made under the EPBC Regulations by the Director of National Parks; and (f) all other applicable Commonwealth and state laws (to the extent those laws are capable of operating concurrently with the laws and instruments described in paragraphs (a) to (e)).	Condition 1d - the impacts on the marine park values have been considered in Section 6. Condition 1e - consultation has been undertaken with the Director of National Parks and no prohibitions, restrictions or determinations have been made (see Section 5 of this EP)
2	If requested by the Director of National Parks, an Approved Person must notify the Director prior to conducting Approved Actions within Approved Zones.	Section 7.12 of this EP describes requirements to notify the DNP prior to activities within the Montebello Multiple Use Zone.
3	If requested by the Director of National Parks, an Approved Person must provide the Director with information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones.	If requested by the Director of National Parks, information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones will be provided.

1.8.2.4 World Heritage Properties

Section 323 of the EPBC Act requires the Commonwealth to prescribe principles for the management of World Heritage Properties (WHPs). Regulation 10.01 and Schedule 5 of the EPBC Regulations establish the Australian World Heritage management principles, which set out requirements for management and protection of WHPs.

Table 1-5 outlines the World Heritage management principles relevant to the assessment of potential impacts and risks from the Petroleum Activity to WHPs within the EMBA, as described in Section 4.8.

The Operational Area does not overlap any WHPs and the Petroleum Activity does not include an action that is likely to have a significant impact on the world heritage values of any WHP.

Table 1-5: Relevant management principles under Schedule 5 - Australian World Heritage management principles of the EPBC Act.

Number	Principle	Relevant section of the EP
3	**Environmental impact assessment and approval** 3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).	3.01 and 3.02: Three WHP are relevant to the Petroleum Activity (Murujuga Cultural Landscape, Shark Bay and Ningaloo Coast). The Petroleum Activity does not involve an action that is likely to have a significant impact on the world heritage values of these WHPs. This EP includes an assessment of impacts and risks to WHPs, as outlined in Section 6. These principles are met by the submitted EP.
	3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.	
	3.03 The assessment process should: • (a) identify the World Heritage values of the property that are likely to be affected by the action; and • (b) examine how the World Heritage values of the property might be affected; and	3.03 (a): World heritage values are identified in Section4. 3.03 (b): The world heritage values that may be affected are considered in an assessment of impacts and risks for the Petroleum Activity in Section 6, specifically:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Number	Principle	Relevant section of the EP
	• (c) provide for adequate opportunity for public consultation.	• planned indirect emissions are assessed in Section 6.7.8, which includes consideration of principle 3.01. • unplanned risks relevant to WHPs are assessed in Section 6.8. • assessment of impacts and risks associated with cultural values are considered in Section 6.11. 3.03 (c): Relevant persons consultation and feedback received in relation to impacts and risks to WHP is included in Section 5 and Appendix F. Woodside facilitates ongoing consultation for the duration of the EP, as outlined in Section 5. Principles are met by the accepted EP.
	3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.	3.04, 3.05 and 3.06: The management plans and objectives relevant to Murujuga Cultural Landscape WHP are: • The Murujuga Cultural Landscape Strategic Management Framework (2022) • Murujuga National Park Management Plan (2013, as amended in 2023) • Murujuga Cultural Management Plan (2016) The management plans and objectives relevant to the Ningaloo Coast WHP are: • Ningaloo Coast Strategic Management Framework (2011) • Ningaloo Marine Park Management plan (2002) • Ningaloo Marine Park and Muiron Islands Marine Management Plan (2005 and amended in 2016) • Nyinggulu (Ningaloo) Coastal Reserves: Red Bluff to Winderabandi joint management plan 101 (2022) The management plans and objectives relevant to the Shark Bay WHP are: • Shark Bay Terrestrial Reserves and Proposed Reserve Additions Management Plan (2012) • Shark Bay Marine Reserves Management Plan (1996–2006) • Shark Bay World Heritage Property Strategic Plan (2008-2020) • Shire of Shark Bay Town Planning Scheme No. 4 These management plans give effect to the duties and obligations of Australia under the World Heritage Convention and facilitate the protection, conservation, presentation or transmission to future generations of the world heritage values of the properties. For further consideration of the above management plans and their objectives, where relevant to the Petroleum Activity, including a demonstration of how this EP is not inconsistent with the protection, conservation, presentation or transmission to future generations associated with these plans, refer to Section 6. Specifically:
	3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.	
	3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.

2. ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process Woodside follows to prepare the EP once an activity has been defined as a Petroleum Activity. This includes a description of the environmental risk management methodology that is used to identify, analyse and evaluate risks to meet ALARP and acceptability requirements; and to develop EPOs and EPS'. This section also describes Woodside's risk management methodologies applicable to implementation strategies applied during the activity. The process outlined in this section is repeated when submitting a revised EP having regard to changes to operational processes as well as confirming that the environmental management practices applied remain consistent with good industry practice.

2.2 Environment risk management methodology

2.2.1 Woodside risk management process

Woodside recognises that risk is inherent to its business and that effective management of risk is vital to delivering on company objectives, success and continued growth. Woodside is committed to managing risk proactively and effectively. The objective of Woodside's risk management system is to provide a consistent process for recognising and managing risks across Woodside's business. Achieving this objective includes ensuring risks consider impacts across these key areas of exposure: health and safety, environment, finance, reputation and brand, legal and compliance, and social and cultural.

The environmental risk management methodology used in this EP is based on Woodside's Risk Management Procedure. This procedure aligns to industry standards, such as international standard ISO 31000. WMS risk management procedures, guidelines and tools provide guidance of specific techniques for managing risk, tailored for particular areas of risk within certain business processes. Procedures applied for environmental risk management include (Section 7.2.7):

- Health, Safety and Environment Management Procedure;
- Impact Assessment Procedure; and
- Process Safety Management Procedure.

The risk management methodology provides a framework to demonstrate that risks and impacts are continually identified, reduced to ALARP and assessed to be at an acceptable level, as required by the Environment Regulations. The key steps of Woodside's Risk Management Process are shown in Figure 2-1. A description of each step and how it is applied to the scopes of this activity is provided in Section 2.2 to Section 2.10.

Figure 2-1: Woodside risk management process

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.2.2 Health, Safety and Environment Management Procedure

The Health, Safety and Environment Management Procedure provides the structure for managing health, safety and environment (HSE) risks and impacts across Woodside, defines the decision authorities for company-wide HSE management activities and deliverables, and supports continuous improvement in HSE management.

2.2.3 Impact Assessment Procedure

To support effective environmental risk assessment, Woodside's Impact Assessment Procedure (Figure 2-2) provides the steps to meet the required environment, health and social standards by ensuring impact assessments are undertaken appropriate to the nature and scale of the activity, the regulatory context, the receiving environment, interests, concerns and rights of relevant persons, and the applicable framework of standards and practices.

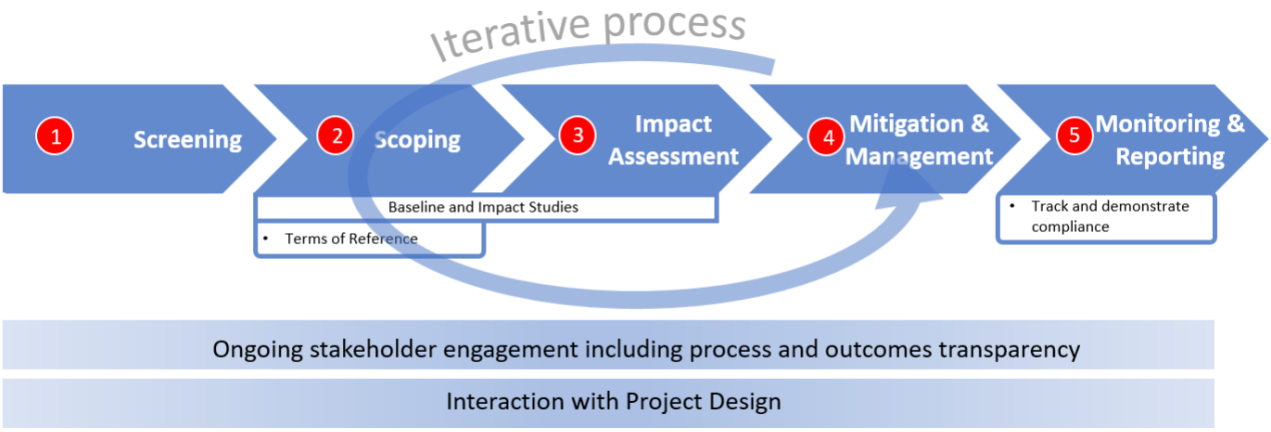

Figure 2-2: Woodside's impact assessment process

2.2.4 Process Safety Management Procedure and Process Safety Risk Assessment Procedure

Due to the nature and scale of petroleum activities, Woodside's Process Safety Management Procedure establishes Woodside's framework for Process Safety Management (Section 7.2.2). This framework includes the Process Safety Risk Assessment Procedure (PSRA). The PSRA is a key part of Woodside's process safety management framework for managing the integrity of systems and processes that handle hazardous substances over the exploration and production lifecycle. The PSRA sets out methods to ensure that process safety risks are understood and controlled, including that all process safety hazards are systematically identified, assessed and treated so that the associated risks are reduced to a level that is tolerable and ALARP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.3 Environment Plan development process

Figure 2-3 illustrates the EP development process. Each element of this process is discussed further in the following sections.

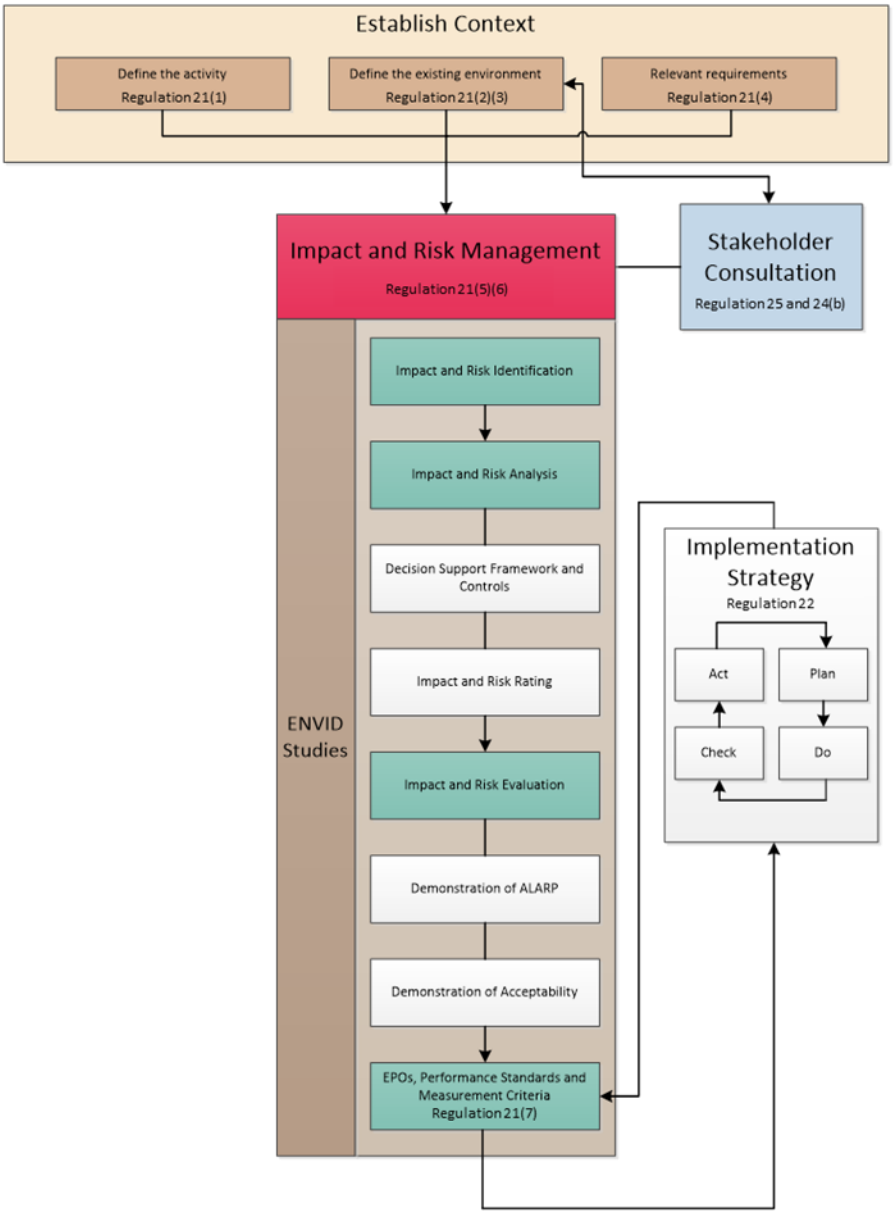

Figure 2-3: EP development process

2.4 Establish the context

Context is established by considering the proposed activities associated with a Petroleum Activity, and the environment in which the activities are planned to take place.

Describing the activity involves the evaluation of whether the activity meets the definition of a 'Petroleum Activity' as defined in the Environment Regulations. The activity is then described in relation to the location, what is to be undertaken and how. This allows for the identification of environmental aspects for each activity.

2.4.1 Activity description

The EP describes the activity, including:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- the location or locations of the activity; general details of the construction and layout of the facility used in undertaking the activity
- an outline of the operational details of the activity and proposed timetables for undertaking the activity
- additional information relevant to consideration of environmental impacts and risks of the activity.

The 'what' and 'how' are described in the context of 'environmental aspects' to inform the impact assessment for planned (routine and non-routine) and risk assessment for unplanned (accidents, incidents, emergency conditions) activities.

This activity is described in Section 3 and is referred to as the Petroleum Activity.

2.4.2 Existing environment description

Environmental values and sensitivities relevant to the Petroleum Activity are described in Section 4 to the extent necessary to inform impact and risk assessments associated with the Petroleum Activity.

A full description of relevant environmental values and sensitivities is contained within the Master Existing Environment document provided in Appendix C.

2.4.3 Environmental legislation and other requirements

Relevant legislation and other requirements applicable to the Petroleum Activity are presented in Section 1.8 and Appendix B, and have been considered throughout the development of this EP.

2.4.4 Impact and risk management

2.4.4.1 Impact and risk identification and analysis

The first step in environmental impact and risk management is to identify all credible sources of environmental impacts and risks associated with the Petroleum Activity, including potential emergency and accidental events. This may include environment impacts and risks that are a consequence of the Petroleum Activity but are not directly within Woodside's control. In this EP:

- planned (routine and non-routine) activities, including contingent activities, have the potential for inherent changes to the environment, are termed environmental 'impacts.'
- unplanned events, including potential emergency and accidental events which have the potential to result in a change to the environment, are termed environmental 'risks.'

An environmental impacts and risks identification and assessment workshop (ENVID) was undertaken by multidisciplinary teams comprising relevant operational, technical and environmental personnel with sufficient breadth of knowledge, training, and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents/incidents/emergency conditions) events. During this process, impacts and risks identified as not applicable (not credible) were removed from the assessment.

During the ENVID, environmental impacts and risks were assessed, and controls were assigned to manage the impact or risk. The ENVID also supported identification of relevant stakeholders to be consulted as part of development of this EP (Section 5). The output of the ENVID, an environmental impacts and risk register, was then used as a basis to develop the impact and risk assessment section of this EP (Section 6).

The environmental impact and risk assessments presented in this EP has been informed by historic as well as more recent hazard and environmental risk identification studies (e.g. HAZID/ENVID) as well as consequence modelling studies for high consequence, low probability environmental risks. These studies have been reviewed and revalidated, as required, for the revision of this EP. In preparing the revision, Woodside also considers environmental performance and compliance information gathered during the implementation phase of the in-force EP. Further, feedback from NOPSEMA to Woodside across Woodside's portfolio of EPs has been considered and integrated, where relevant.

Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside's stakeholder engagement process (Section 5). The environment outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned event, respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the impact or risk assessment and form the basis of EPOs, EPSs, and MCs. This information is presented in Section 6, following the layout presented in Table 2-1.

Table 2-1: Example of layout of impact or risk evaluation summary

Impact and risk evaluation summary													
Source of impact or risk	***Environmental value(s) potentially impacted or at risk***						***Evaluation***						
	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/ habitat	Species	Socio-economic	Decision type	Consequence/ impact	Likelihood	Risk rating	ALARP tools	Acceptability	Outcome
Summary of source of impact or risk													

2.4.4.2 Decision support framework

To support the impact and risk assessment process and Woodside's determination of acceptability, Woodside's HSE risk management procedures include using a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (OEUK 2025). Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental impact or risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher-order environmental impacts are subject to further evaluation and assessment).

The framework allows a decision type (A, B, or C) to be selected for each impact and risk, based on several criteria; the decision type is documented in the environmental impacts and risk register. Figure 2-4 summarises the framework, criteria, and resulting level of assessment for decision type A, B and C, which are discussed further below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

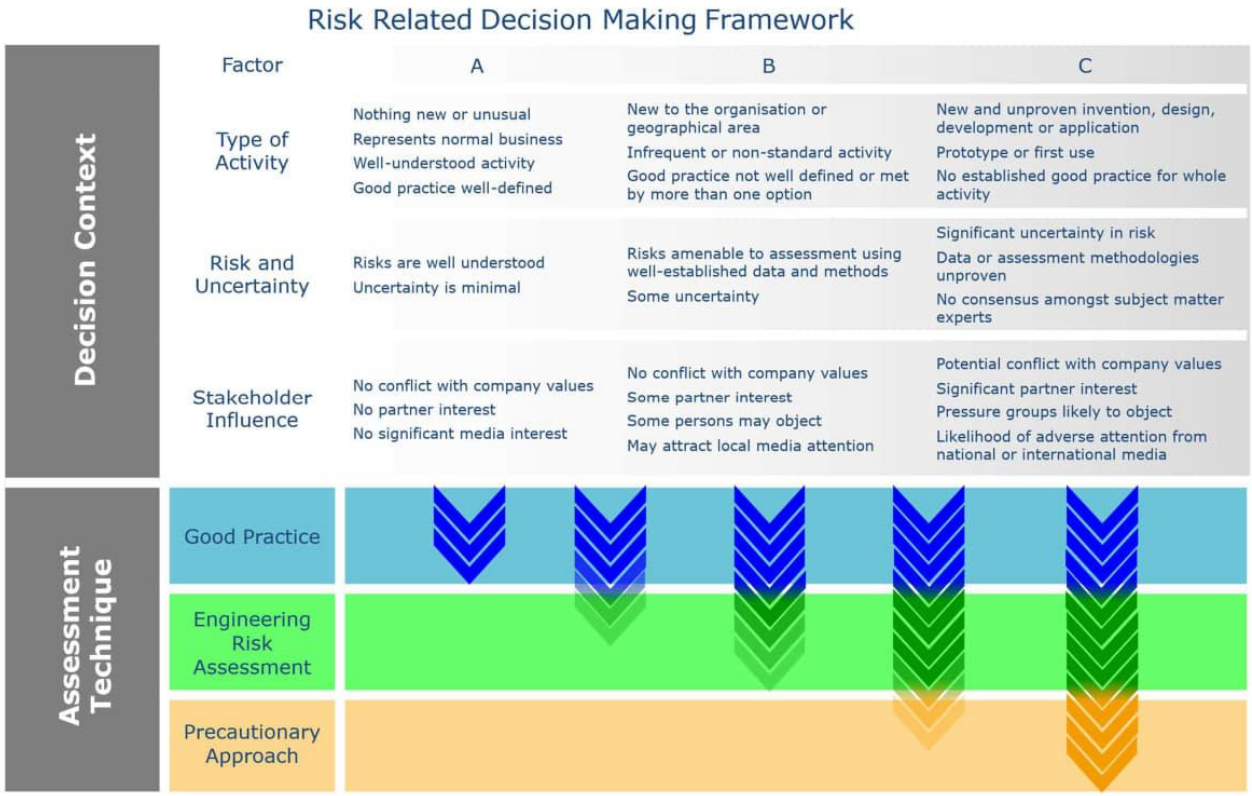

Figure 2-4: Risk-related decision-making framework

Source: (OEUK 2025).

2.4.4.2.1 Decision Type A

Decision Type A impacts and risks are well understood and established practice; they are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgement.

2.4.4.2.2 Decision Type B

Decision Type B impacts and risks typically involve greater uncertainty and complexity and are considered higher-order impacts and risks. These impacts and risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure that the risk is ALARP.

2.4.4.2.3 Decision Type C

Decision Type C impacts and risks typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty, therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, risk or exposure, or may elicit heightened stakeholder concerns. For these impacts and risks, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external stakeholder consultation as part of the impact and risk assessment process.

2.4.4.3 Decision support framework tools

The below framework tools were applied, as appropriate, when assessing each impact and risk to help identify control measures based on the selected decision type described above.

- Legislation, Codes and Standards (LCS): identifies the requirements of legislation, codes and standards that are to be complied with for the activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Good Industry Practice (GP): identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.
- Professional Judgement (PJ): uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- Risk-based Analysis (RBA): assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- Company Values (CV): identifies values identified in Woodside's code of conduct, policies and Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- Societal Values (SV): identifies the views, concerns and perceptions of relevant stakeholders and addresses relevant stakeholder views, concerns and perceptions.

2.4.4.4 Decision calibration

To determine that the decision type selected and the control measures applied are suitable, the following tools may be used for calibration (i.e. checking) where required:

- LCS/Verification of Predictions: Verification of compliance with applicable LCS and/or good industry practice.
- Peer Review: Independent peer review of PJs, supported by RBA, where appropriate.
- Benchmarking: Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- Internal Stakeholder Consultation: Consultation undertaken within Woodside to inform the decision and verify company values are met.
- External Stakeholder Consultation: Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the decision type and the activity.

2.4.5 Control measures

Once impacts and risks have been identified, the potentially affected receptors have been identified and understood, and the decision type has been selected, impact and risk reduction measures (i.e. controls) are applied. Controls are prioritised and categorised in accordance with the hierarchy of controls listed below, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- elimination of the impact or risk by removing the hazard[3].
- substitution of a hazard with a less hazardous one.
- engineering controls including design measures to prevent or reduce the frequency, or detect or control, the impact or risk event (limiting the magnitude, intensity and duration) such as:
  - prevention: design measures that reduce the likelihood of a hazardous event occurring
  - detection: design measures that facilitate early detection of a hazardous event
  - control: design measures that limit the extent/escalation potential of a hazardous event
  - mitigation: design measures that protect the environment if a hazardous event occurs
  - response equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.

[3] *A hazard has the potential to cause harm to the environment.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- procedures and administration including management systems and work instructions used to prevent or mitigate environmental exposure to hazards.
- emergency response and contingency planning including methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

As this EP is a revision of an existing EP, controls outlined in the previous revision were reviewed for effectiveness and updated, where necessary, to align with current Woodside best practice. The ENVID workshop also provided the opportunity to identify where additional controls may now be required and those controls were applied according to the process outlined above.

2.4.6 Impact and risk classification

Environmental impacts and risks are assessed to determine their potential impact consequence level or risk rating, which can then be evaluated, along with other criteria, against the ALARP and acceptability requirements under the Environment Regulations. The full process for impact and risk classification is described in the subsections below. Although this EP is a revision of an existing operations EP, a full impact and risk assessment was conducted as if it were a new Petroleum Activity. This allows Woodside the opportunity to analyse whether previous impact and risk consequence levels or risk ratings and existing control measures should be modified.

2.4.6.1 Impact classification

Using the Woodside Environment Risk and Impact Rating Tool as a guide, environmental impacts are assessed to determine the potential consequence level. The process for determining the consequence levels is described in Section 2.4.6.1.1

2.4.6.1.1 Assign the consequence level

The consequence level (Severe, Major, Moderate, Minor, Localised and Low-Level, and No Lasting Effect) is determined through a classification framework that incorporates:

- significance[4] of the feature of area
- scale of the impact on the feature (e.g. species, population, habitat) or area (size)
- recoverability, defined as the ability of the feature or area to naturally recover from the impact within a nominal period.

2.4.6.1.2 Consequence level descriptions

Table 2-2 describes the possible environment, community and culture consequence levels for each identified impact and risk, assuming all controls (preventative and mitigative) are absent or have failed. Where multiple receptors have the potential to be impacted, the worst-case consequence level is carried into the final impact and risk assessment and evaluation.

[4] For the purposes of describing the Woodside Environment Risk and Impact Rating Tool, references to significance in impact and risk classification, use significance as defined in the Woodside Environment Risk and Impact Rating Tool.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-2: Woodside impact and risk matrix (environment and community and culture) consequence descriptions

Environment	Social and cultural	Consequence level	
Severe impact on a sensitive feature(s) or receiving environment, such as permanent impairment on a highly sensitive area or feature.	Severe, long-term impact to a community, social infrastructure or highly valued areas or items of international cultural and social significance.	***Severe***	***A***
Major impact on environmental feature(s) or area(s), such as impact on feature or area of national importance with limited ability to recover.	Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	***Major***	***B***
Moderate impact on environmental feature(s) or area(s), such as impact on feature or area of heightened sensitivity with limited ability to recover.	Moderate, medium-term impact to a community, social infrastructure of highly valued areas or items of national cultural significance.	***Moderate***	***C***
Minor impact on environmental feature(s) or area(s) such as impact on feature of low significance with some ability to recover.	Minor, short-term impact to a community or areas or items of cultural significance.	***Minor***	***D***
Slight and low-level impact on environmental feature(s) or area(s) of low significance.	Slight, short-term impact to a community or areas or items of cultural significance.	***Localised and Low Level***	***E***
No lasting effect, localised impact not significant to environmental receptors	Temporary localised impact not significant to areas or items of cultural significance.	***No Lasting Effect***	***F***

2.4.6.2 Risk classification

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence (Section 2.4.6.1.1) and likelihood (Section 2.4.6.1.2). The assigned risk rating is determined with controls in place; therefore, the risk rating is determined after identifying the decision type and appropriate control measures. The risk ratings are assigned using the Woodside risk matrix (refer to Table 2-4).

2.4.6.2.1 Assign the likelihood level

Likelihood is determined based on the chance of the selected worst-case consequence occurring, assuming reasonable effectiveness of preventative and mitigative controls (Table 2-3).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-3: Woodside risk matrix likelihood levels

	Likelihood description					
	Remote	***Highly unlikely***	***Unlikely***	***Possible***	***Likely***	***Highly likely***
Frequency	1 in 100,000–1,000,000 years	1 in 10,000–100,000 years	1 in 1,000–10,000 years	1 in 100–1,000 years	1 in 10–100 years	>1 in 10 years
Experience	Unheard of in the industry	Has occurred once or twice in the industry	Has occurred many times in the industry but not in the company.	Has occurred once or twice in the company.	Has occurred frequently in the company.	Has occurred frequently in the location or activity.
Likelihood level	0	1	2	3	4	5

2.4.6.2.2 Determine the risk rating

The risk rating is derived from the consequence and likelihood levels determined above, in accordance with the Woodside Risk Matrix summarised in Table 2-4.

This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk in the environmental impacts and risk register for the EP (Section 2.6).

Table 2-4: Woodside risk matrix determination of risk rating

Consequence level	Likelihood level					
	0	***1***	***2***	***3***	***4***	***5***
A	A0	A1	A2	A3	A4	A5
B	B0	B1	B2	B3	B4	B5
C	C0	C1	C2	C3	C4	C5
D	D0	D1	D2	D3	D4	D5
E	E0	E1	E2	E3	E4	E5
F	F0	F1	F2	F3	F4	F5

Risk rating
Severe
Very High
High
Moderate
Low

NOTE: Very High and Severe risks based on HS&E impacts are intolerable – Action Required

2.5 Classification and analysis of major environmental events

For Woodside's offshore production facilities, a further level of analysis is undertaken to identify, classify and analyse MEEs. This extra level of rigour is applied to ensure sufficient controls are in place for risks with potential Major and above consequences. In the health and safety area, Major Accident Events (MAEs) are identified using a similar process, which supports consistency in managing key risks within Woodside in accordance with Process Safety Risk Management Procedures.

Woodside defines a MEE as an event with potential environment, reputation (pertaining to environment events), social or cultural consequences of level B or higher as per Woodside's Risk Matrix (Table 2-4). MEEs are evaluated against credible worst-case scenarios that may occur when all controls are absent or have failed.

For this EP, the MEEs presented in the previous revision of the GWA Facility Operations EP were reviewed and revised to ensure they remain accurate and are adequately managed.

2.5.1 Major Environmental Events identification

The ENVID process identifies numerous sources of risk with differing consequence levels. These risks are screened to identify those that meet the MEE criteria. Identified MEE risks are then subject to further

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

analysis, including detailed consequence modelling and probability/frequency assessment, and are evaluated for the 'appropriateness' of controls using a bowtie risk assessment approach.

Risks that do not meet the MEE definition, although screened out of the MEE process, are still evaluated for ALARP and acceptability using the methodology described in Section 2.6. Some high consequence/low probability events which do not meet the MEE consequence threshold may still undergo additional consequence and probability assessment where they could have a high adverse impact on the company's reputation or relationships with relevant persons, beyond requirement to demonstrate ALARP and acceptable risk levels following application of controls.

2.5.2 Major Environmental Events classification

A standard naming convention has been established for MEEs; this is based around ensuring the MEE titles reflect the cause of the event, e.g. 'subsea system loss of containment', rather than the event itself, e.g. significant hydrocarbon spill to the marine environment. The MEEs are assigned a unique identification code, e.g. MEE-01, MEE-02, etc.

2.5.3 Bowtie analysis

MEEs are subject to more detailed analysis using the bowtie risk assessment technique, which illustrates outcomes and controls in place to prevent the 'top event' or mitigate the consequences. The bowtie technique is adopted for MEEs as it:

- identifies the controls (prevention and mitigation barriers) necessary to ensure the risk is ALARP and of an acceptable level
- supports the process of demonstrating ALARP (described in Section 2.6)
- enables verification of and linking to the relevant sections of the WMS that supports barriers
- improves the capacity for lessons learned and incident prevention by being able to directly relate causes of an incident to those controls that failed
- ensures greater visibility and granularity in the assessment process and enables complex risk scenarios to be presented in an easy-to-understand format.

The bowtie technique shows the relationships between the 'causes' that may lead to a particular unwanted event ('top event'), together with the range of potential escalation paths that can lead to various 'outcomes' (or consequences). A bowtie also identifies the preventive barriers that act to prevent the top event from occurring specific for each cause, and the mitigation barriers that limit the potential consequences once the top event has occurred, specific to each credible MEE outcome.

2.5.4 Major Environmental Event register

A MEE register is prepared for each production facility after completing bowtie diagrams. This register records the MEE identification process, groupings, bowtie diagrams and datasheets in a consolidated format. Datasheets are prepared for each MEE, which includes the hazard description, hazard management, emergency response, ALARP summary and a list of critical barriers identified on the bowties (known as Safety and Environment Critical Elements [SCEs]).

Potential common causes that contribute to MEEs, or that can result in failure or degradation of the controls in place to protect against MEEs, include some generic mechanisms of SCE failure and generic human error. These are represented in bowties applicable to multiple MEEs. The generic SCE failure bowtie illustrates the causes, outcomes and controls in place to manage potential failure mechanisms. Human errors are managed via the WMS. The Generic Human Error bowtie is included in the MEE Register.

2.5.5 Safety and Environment Critical Elements and technical performance standards

Woodside identifies and manages SCE technical and management system performance standards in accordance with process safety management procedures, risk management procedures and change management procedures (further described in the implementation strategy in Section 7). SCEs are identified for MAEs and MEEs. An SCE is a hardware control, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the consequence of a MAE, MEE or process safety event. In addition, Woodside defines safety and environment component equipment as an item of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

equipment or structure forming part of a hardware SCE that supports the SCE in achieving the safety function.

Once each SCE is selected, technical performance requirements are developed in accordance with the SCE management procedure and form the SCE Technical Performance Standards. These standards are a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability). They are used to establish agreed assurance tasks for each SCE, support the management of operations within acceptable safety and/or environment risk levels, and ensure continuous management of risk to ALARP. An assurance task is an activity carried out by the operator to confirm that the SCE meets, or will meet, its SCE performance standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, instrumentation calibration, and reliability monitoring.

SCE Technical Performance Standards do not always align directly with EPSs. They are used in conjunction with the WMS to identify and treat potential step-outs from expected controls performance or integrity envelopes and ensure SCE performance can be optimised. Woodside's HSE Event Reporting Guideline describes the process for identifying 'damage to SCEs', which is an SCE failure presenting a risk level that requires immediate control actions be put in place to manage increased current risk. For applicable SCEs, 'damage to SCE' failures represent scenarios that may fail to achieve an EPS presented in this EP.

Section 6 of this EP presents the results of the MEE classification and analysis. More detail on the SCE and performance standards process, and the interrelationships to other parts of the SCE management procedures, is described in Section 7.

2.5.6 Safety-critical management system barriers

For each MEE, safety-critical management system specific measures are also identified. These are management system components (generally WMS processes) that are key barriers to, or measures for, managing MEEs.

2.6 Impact and risk evaluation

In accordance with Environment Regulation 34(a), 34(b), 34(c) and 21(5)(b), Woodside applies the following process to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.6.1 Demonstration of 'as low as reasonably practicable'

The descriptions in Table 2-5 articulate how Woodside demonstrates that each impact and risk identified within this EP is ALARP.

Table 2-5: Summary of Woodside's criteria for 'as low as reasonably practicable' demonstration

Risk	Impact	Decision type
Low and Moderate (C, D, E or F level consequence)	***No Lasting Effect, Localised and Low Level, or Minor (D, E or F)***	***A***
Woodside demonstrates these impacts, risks and decision types are reduced to ALARP if: • identified controls meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines, or • further effort towards impact/risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.		
High, Very High or Severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are reduced to ALARP where it can be shown good industry practice and RBA have been employed, if legislative requirements are met, societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.6.2 Demonstration of acceptability

The descriptions in Table 2-6 articulate how Woodside demonstrates how each impact and risk identified within this EP are acceptable.

Table 2-6: Summary of Woodside's criteria for acceptability

Risk	Impact	Decision type
Low and moderate (C, D, E or F level consequence)	***No lasting effect, localised and low level or minor (D, E or F)***	***A***
Woodside demonstrates these lower order impacts, risks and decision types are 'broadly acceptable' if they meet the ALARP requirements for lower order risks and impacts described above (Table 2-5).		
High, very high or severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are 'acceptable if ALARP' if it can be demonstrated using good industry practice and RBA, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for moderate and high risks, Woodside evaluates: • the principles of ESD as defined under the EPBC Act • the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, procedures and standards • the external context – consideration of the environment consequence and stakeholder acceptability are considered • other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies and consideration of applicable plans for management and conservation advices, conventions and significant impact guidelines (e.g. MNES). Additionally, very high and severe risks require 'escalated investigation' and mitigation. If after further investigation the risk remains in the very high or severe category, the risk requires appropriate business engagement with increasing involvement of senior management in accordance with Woodside's Risk Management Procedure to accept the risk. This includes due consideration of regulatory requirements.		

2.7 Recovery plan and threat abatement plan assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (Section 1.8.2.1). This assessment follows the following process:

- identify relevant listed threatened species and ecological communities (Section 4.4)
- identify relevant recovery plans and threat abatement plans (Section 6.10)
- list all objectives and (where relevant) the action areas of these plans and assess whether these objectives/action areas apply to government, the titleholder, and the Petroleum Activity (Section 6.10)
- for those objectives/action areas applicable to the Petroleum Activity, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (Section 6.10).

2.8 Environmental performance objectives/outcomes, standards and measurement criteria

The Environment Regulations define environmental performance outcomes (EPOs) to mean: "a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level". As such, the process of defining an appropriate EPO, has relied on the required levels of performance set either in:

- legislation (such as the OPGGS Act)
- regulator guidance notes such as the Matters of National Environmental Significance – Significant Impact Guidelines (DoE 2013), or

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- specific agreements or expectations with other relevant persons (e.g. fishers or other marine users).

For each evaluated impact and risk, controls adopted during the ENVID and through demonstrating ALARP are paired with activity-specific EPOs, environmental performance standards (EPSs) and measurement criteria (MCs). EPOs, EPSs and MCs form the basis for monitoring and auditing and allow Woodside's environmental performance to be measured through the implementation of this EP to ensure impacts and risks will be managed to a level that is ALARP and acceptable. EPOs, EPSs and MCs are defined for each identified credible impact and risk in Section 6**.**

EPs for petroleum activities submitted following the OPP process are required to include EPOs that are aligned with those established in the OPP. The EPOs presented in a subsequent EP are not required to be identical to those in the OPP, however, they should achieve the same environmental outcome (or better). Activity-specific EPs will also be required to contain MCs and performance monitoring, auditing and reporting processes relating to the EPOs.

2.9 Implement, monitor, review and report

An implementation strategy for the Petroleum Activity describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the requirements of the Environment Regulations, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activity to ALARP and acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activity are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in Section 7.

2.10 Stakeholder consultation

Woodside undertakes consultation in the course of preparing EPs. The consultation, along with the process for ongoing engagement and consultation throughout the activity, is presented in Section 5. Copies of the full text of initial consultation correspondence are provided in Appendix F.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3. DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations. It outlines the activities to be undertaken as part of the Petroleum Activity described in this EP. The section includes the location of the activity, general details of the facility layout, the operational details of the activity, and other relevant information necessary for assessing potential environmental impacts and risks.

The GWA facility produces dry gas and condensate from a series of reservoirs via associated subsea infrastructure. These fluids are initially processed before being exported via the interfield line (IFL) to the Karratha Gas Plant (KGP) for further processing. The facility was originally commissioned as an integrated platform supporting drilling, production, utilities, and accommodation. However, the GWA facility no longer has drilling capability, and drilling activities are not included within the scope of this EP. An overview of the Petroleum Activity is provided in Table 1-1.

Table 3-1: Petroleum activity overview

Item	Description
Production Licence Areas	WA-1-L, WA-5-L, WA-6-L, WA-23-L, WA-24-L, WA-57-L, WA-7-R
Pipeline Licences	WA-2-PL, WA-9-PL, WA-13-PL, WA-24-PL, WA-27-PL, proposed Wilcox pipeline licence (application under assessment)
Platform Location	Latitude: 19° 39’ 07” south Longitude: 115° 55’ 47” east
Water Depth (Lowest Astronomical Tide (LAT)) at GWA topsides location	131 m
End of Field Life (EOFL)	EOFL is between 2036-2040*
Key components of platform facilities	Fixed platform, processing equipment, platform wells and utilities
Key components of subsea infrastructure	Subsea wells, Xmas trees, manifolds, flowlines/pipelines and umbilicals
Vessels	Platform support vessels, subsea support vessels, accommodation support vessel and heavy lift vessels.
Key activities	• routine production • routine IMMR of the platform and associated subsea infrastructure • well clean-up and commissioning • platform well intervention, workovers and well kill activities • non-routine and unplanned activities and incidents associated with the above

**Current decommissioning planning for the GWA facility is based on provisional Cessation of Production (CoP) of ~2036. For emissions forecasting purposes, CoP has been extended beyond current decommissioning planning estimates to support conservative long-term emissions assessment scenario based on EOFL in 2040.*

3.2 Location

The GWA facility is located in Commonwealth waters on the NWS of WA within licence areas WA-1-L, WA-5-L, WA-6-L, WA-23-L, WA-24-L, WA-57-L, WA-7-R, WA-2-PL, WA-9-PL, WA-13-PL, WA-24-PL, WA-27-PL, and proposed Wilcox pipeline licence. The GWA platform stands in approximately 131 m of water and is situated approximately 138 km north-west of Dampier and 23 km south-west of North Rankin Complex (NRC) (Figure 3-1).

The GWA platform and associated infrastructure is marked on nautical maps. The platform is surrounded by a 500 m petroleum safety zone (PSZ). The coordinates, water depths, and petroleum titles associated with subsea infrastructure locations within the Petroleum Activity are presented in Table 3-2.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

NOTES:

1 – Echo Yodel (EY) pipeline is suspended and isolated. Activities associated with decommissioning are provided for under the approval of the Echo Yodel Subsea Decommissioning EP (NOPSEMA Doc ID A830461).Maintenance continues under this EP until decommissioning activity is complete.

2 – These are approximate locations based on current engineering designs for GWF4 and future tie-in production wells.

3 – PER02 and PER04 wells are production wells no longer in use (i.e. shut in and designated redundant). Further detail is provided in Section 7.3.4.2.

3.3 Operational Area

The Operational Area defines the spatial extent of the Petroleum Activity including all vessel-related petroleum activities within its boundary (Figure 3-1). The area includes:

- GWA platform and an area within a 500 m (PSZ) of the platform
- a 1,500 m area around the IFL from GWA to NRC (NRA SSIV) covered by Pipeline Licence WA-2-PL
- a 1,500 m area around the EY pipeline covered by Pipeline Licence WA-9-PL
- a 1,500 m area around the PoG subsea infrastructure, including the PoG pipeline (covered by pipeline licence WA 13 PL), four wells (PER01, PER02, PER03, PER04), umbilicals, jumpers and spools
- a 1,500 m area around the GWF1 subsea infrastructure, including the GWF1 pipeline (covered by pipeline licence WA-24-PL) back to GWA, five wells (GDA01, GDA02, TPA01, TPA02, TPA03), umbilicals, jumpers and spools
- a 1,500 m area around the GWF2 subsea infrastructure, including the GWF2 pipeline (covered by pipeline licence WA-27-PL), eight wells (LPA01, LPA02, LPA03, SRA01, SRA02, KDA01, KDA02, DOA-01), umbilicals, jumpers and spools
- a 1,500 m area around the GWF3 subsea infrastructure, utilising GWF1 infrastructure (covered by pipeline licence WA-24-PL) back to GWA, three wells (GDA03, GDA04, GDA05), flowlines and umbilicals
- a 1,500 m area around GWF4 subsea infrastructure, including the Wilcox flexible flowline covered by the proposed Wilcox pipeline licence, and utilising GWF1 and GWF2 pipelines (covered by Pipeline Licence WA-24-PL and WA-27-PL, respectively), 5 wells (WCA01, WCA02, YOD05, ESA01, TPA04), umbilicals, jumpers and spools
- a 1,500 m area around two future tie-in production wells, utilising GWF1 infrastructure (covered by pipeline licence WA-24-PL), including umbilicals, jumpers and spools.

Vessel-related activities within the Operational Area will comply with this EP. Vessels supporting the Petroleum Activity operating outside the Operational Area (e.g. transiting to and from port) are subject to applicable maritime regulations and other requirements which are not managed under this EP.

3.4 Timing

The GWA facility commenced production in 1995. The facility operates 24 hours a day, 365 days a year.

Commissioning of GWF4 infrastructure is planned to commence in 2027 and 2028. The two future tie-in production wells that form part of the scope of this EP would be commissioned after GWF4 and may be tied back either concurrently or as a separate development. The current forecast EOFL of the GWA facility is between 2036 and 2040. The facility is expected to remain operational for the duration of this EP.

Other future tie-back opportunities are continuously being reviewed for Woodside's offshore facilities, which have the potential to extend the life of the facility. These, and any future decommissioning, well plug and abandonment or drilling will be the subject to a separate EP(s).

3.5 Facility layout and description

This section provides an overview of the GWA facility and associated infrastructure, as relevant to consideration of the environmental risks and impacts of the Petroleum Activity.

3.5.1 GWA topsides

The GWA topsides structure consists of 11 modules (Figure 3-2). The plan view covers an area of 4,000 m^2, extending approximately 120 m north to south and 55 m east to west. The production deck is situated 25 m above sea level, while the platform reaches approximately 175 m above sea level at the top of the flare tower. The accommodation module (Module D, designated temporary refuge) is located at the southern end of the platform and is segregated from the production systems by the utilities and drilling support modules.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The product export pipeline riser is located at the northern end of the platform. Two A-frame pedestal cranes are used to service the platform and dropped object protection is provided at critical topsides and subsea locations.

The drilling derrick has been removed, and drilling systems are no longer operational. Residual or redundant drilling-related infrastructure may remain in place pending removal as part of future decommissioning or modification activities. Redundant equipment may be removed using a heavy lift vessel.

The following topside module designations have been used for the GWA facility as shown in Figure 3-2:

- module A: utilities area (located under drilling support module)
- module B: process area with module L stripping columns to the west face
- module C: wellheads (located under module G)
- module D: temporary refuge, including accommodation (located under helideck)
- module E: compression and flare tower area (located under module H)
- module F: drilling utilities/pipe deck
- module G: drilling facilities (located under Module K) (planned to be removed)
- module H: flare tower (on top of Module E)
- module K: drilling derrick (now fully removed)
- module L: stripping columns to the west of Module B
- module M: amenities building/store
- module X: module support frame.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

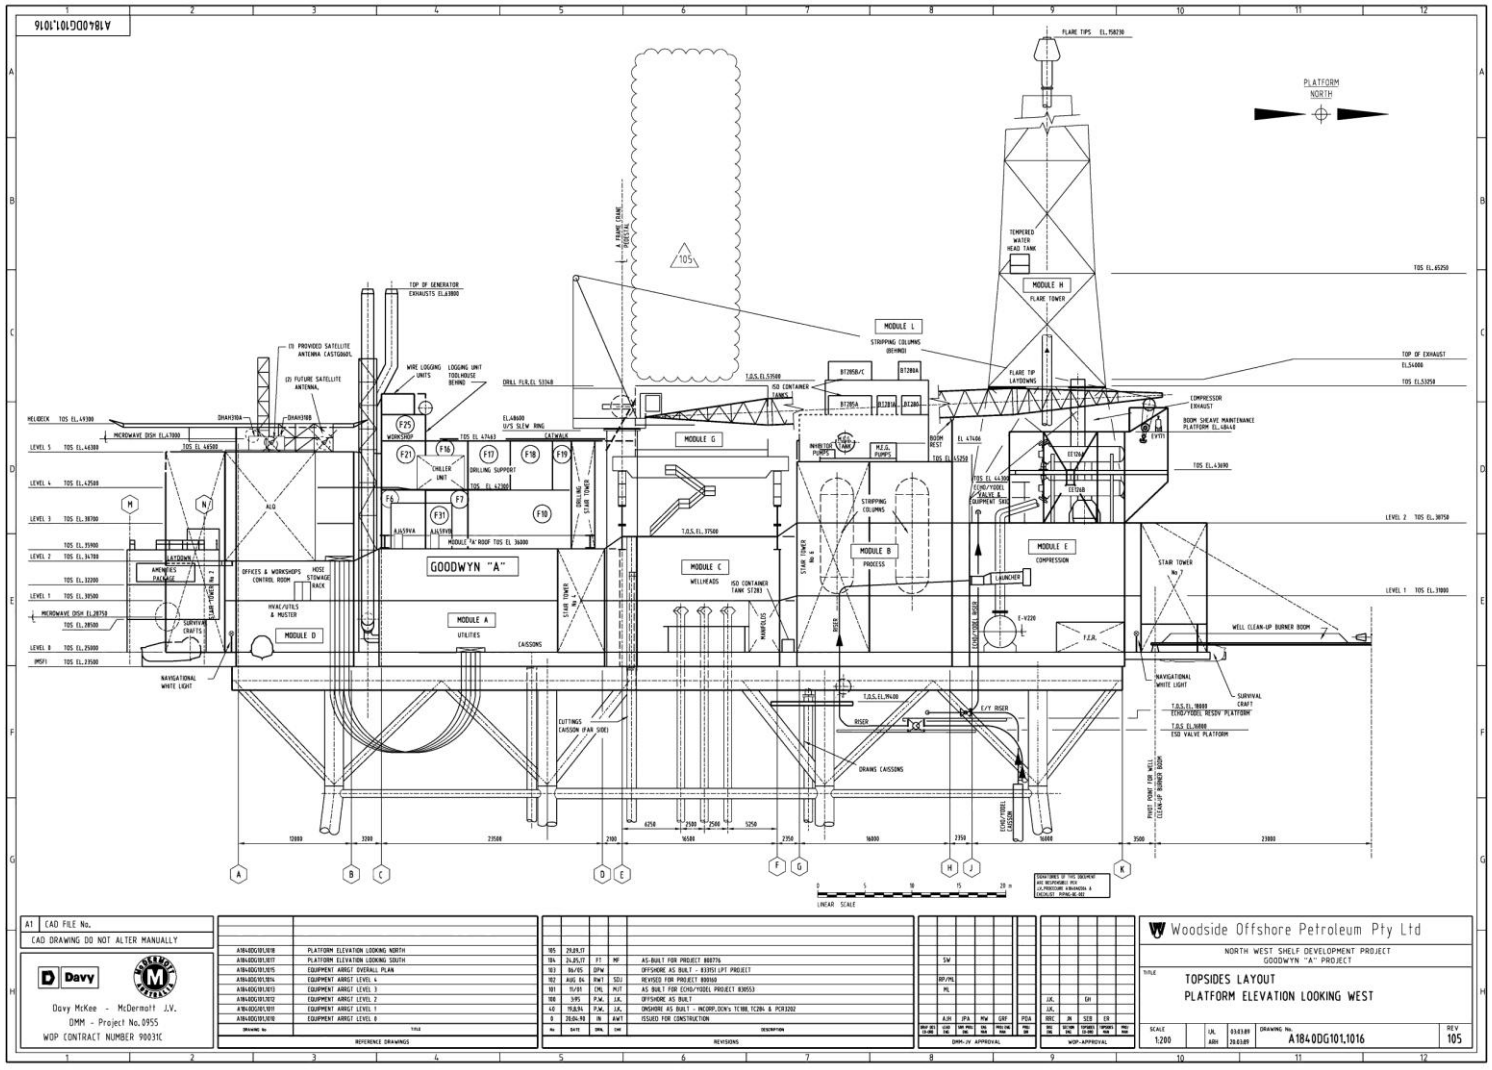

Figure 3-2: GWA platform topside module layout

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.5.1.1 Topsides substructure

The GWA platform substructure provides structural support to the topside modules via an integral deck Module Support Frame. The GWA jacket is constructed from steel with pile foundations and includes conductors, caissons and J-tubes. It also incorporates supports and guides for risers, conductors, caissons and J-tubes and the IFL SSIV support frame (Figure 3-3).

The jacket is supported on four pile groups each consisting of five primary piles and four insert piles. Four of the five primary piles at each pile group were drilled and grouted with insert piles. The weight of the GWA jacket and piles are 12,984 and 17,698 tonnes (t), respectively.

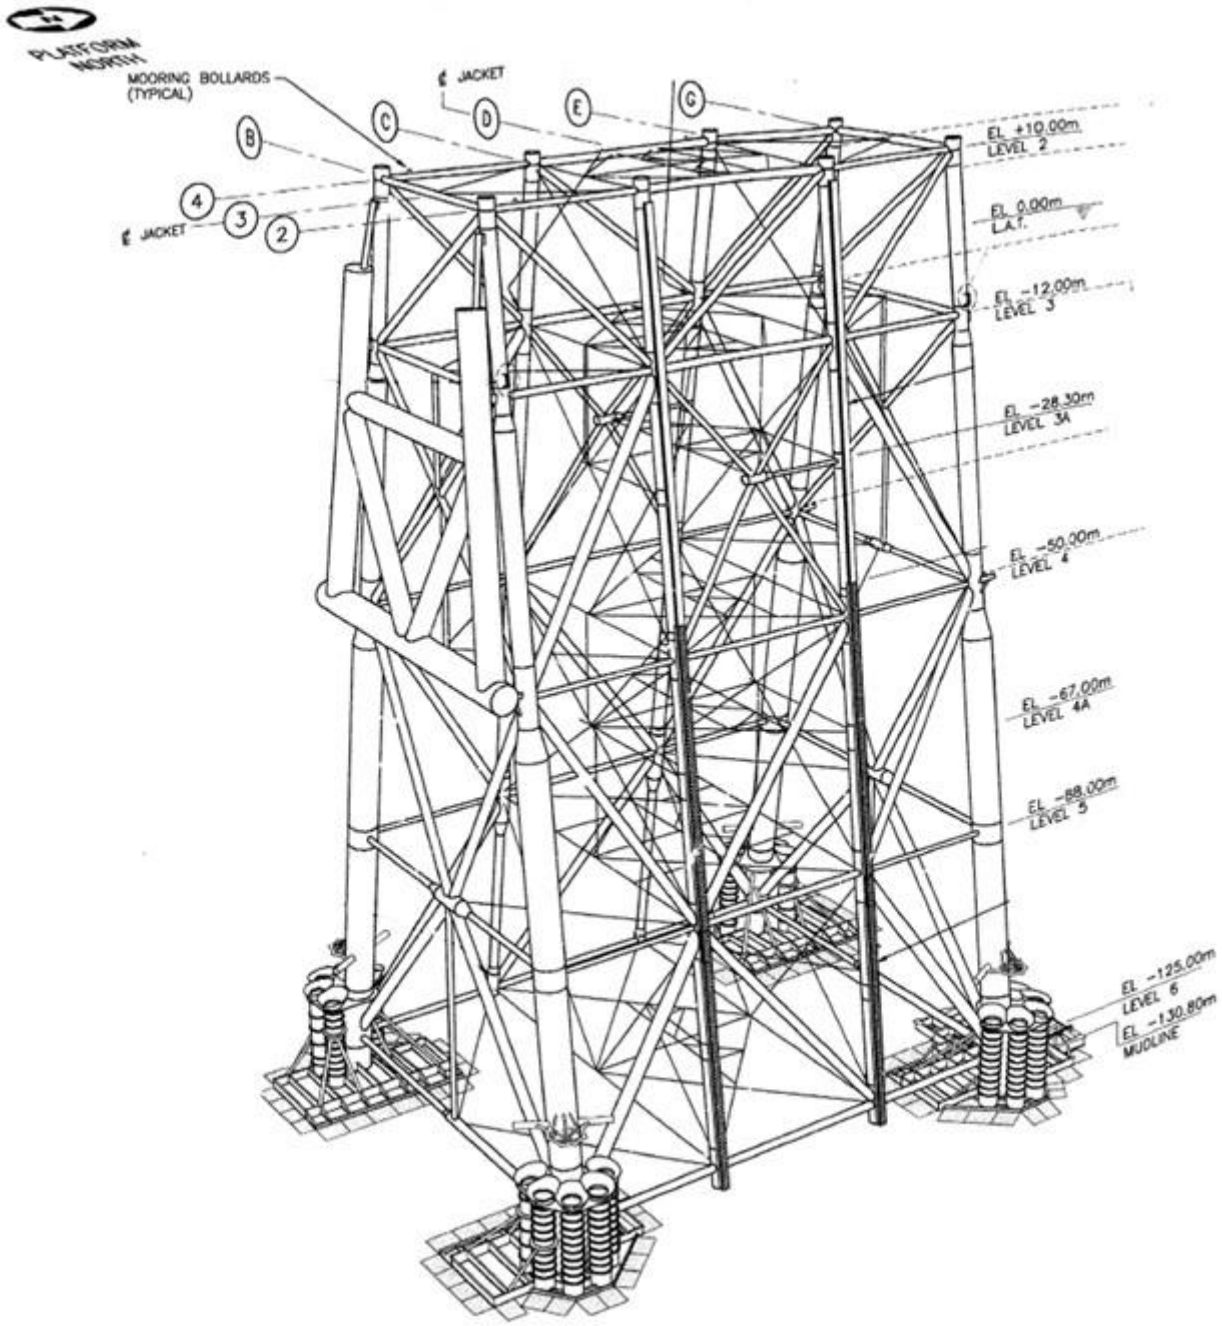

Figure 3-3: GWA substructure jacket general arrangement

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.5.2 Subsea components

The subsea system is controlled from the GWA platform through the following components:

- jumpers and umbilicals which provide hydraulic and electric power, communications and chemical supplies between the platform and subsea components through a number of cables and tubes. Umbilicals run between the platform and the subsea distribution units (SDU) and umbilical termination assemblies (UTA), umbilical termination baskets (UTBs) and jumpers run between SDUs/UTAs/UTBs and the manifold
- valves which control subsea operations and processes
- chokes which control pressure and flow rates of hydrocarbons
- subsea control modules (SCM) and electrical distribution units (EDU) are sealed and pressure compensated electro-hydraulic units and link surface and subsea controls.

A number of subsea valves may also be overridden manually from either an ROV or divers.

The layout of the GWA facility subsea infrastructure is shown in Figure 3-4.

3.5.3 Interfield line

Gas and condensate are exported via the ~23 km IFL from GWA platform, which joins the second trunkline (2TL) near NRC. A pig launcher is provided for servicing the IFL. The launcher is designed for single launchings of spheres and for launching pipeline inspection tools. The pipeline/riser includes two key isolation valves. The riser emergency shutdown valve (RESDV) is located on the module support frame ESD valve platform and the subsea isolation valve (SSIV) is located on the jacket mud mat.

Concrete mattresses are provided to protect the IFL from dropped objects in the vicinity of the GWA platform. Protection frames are provided around the riser and SSIV.

3.5.4 Wells and reservoirs

3.5.4.1 Goodwyn

There are 19 platform wells on the GWA platform, accessing the Goodwyn field. Tubing retrievable sub-sea safety valves (SSSV) and wireline retrievable SSSVs are installed on GWA wells as the primary down-hole safety system. These valves are controlled from the surface via a single control line or independent control lines located approximately 550 m below the wellhead.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

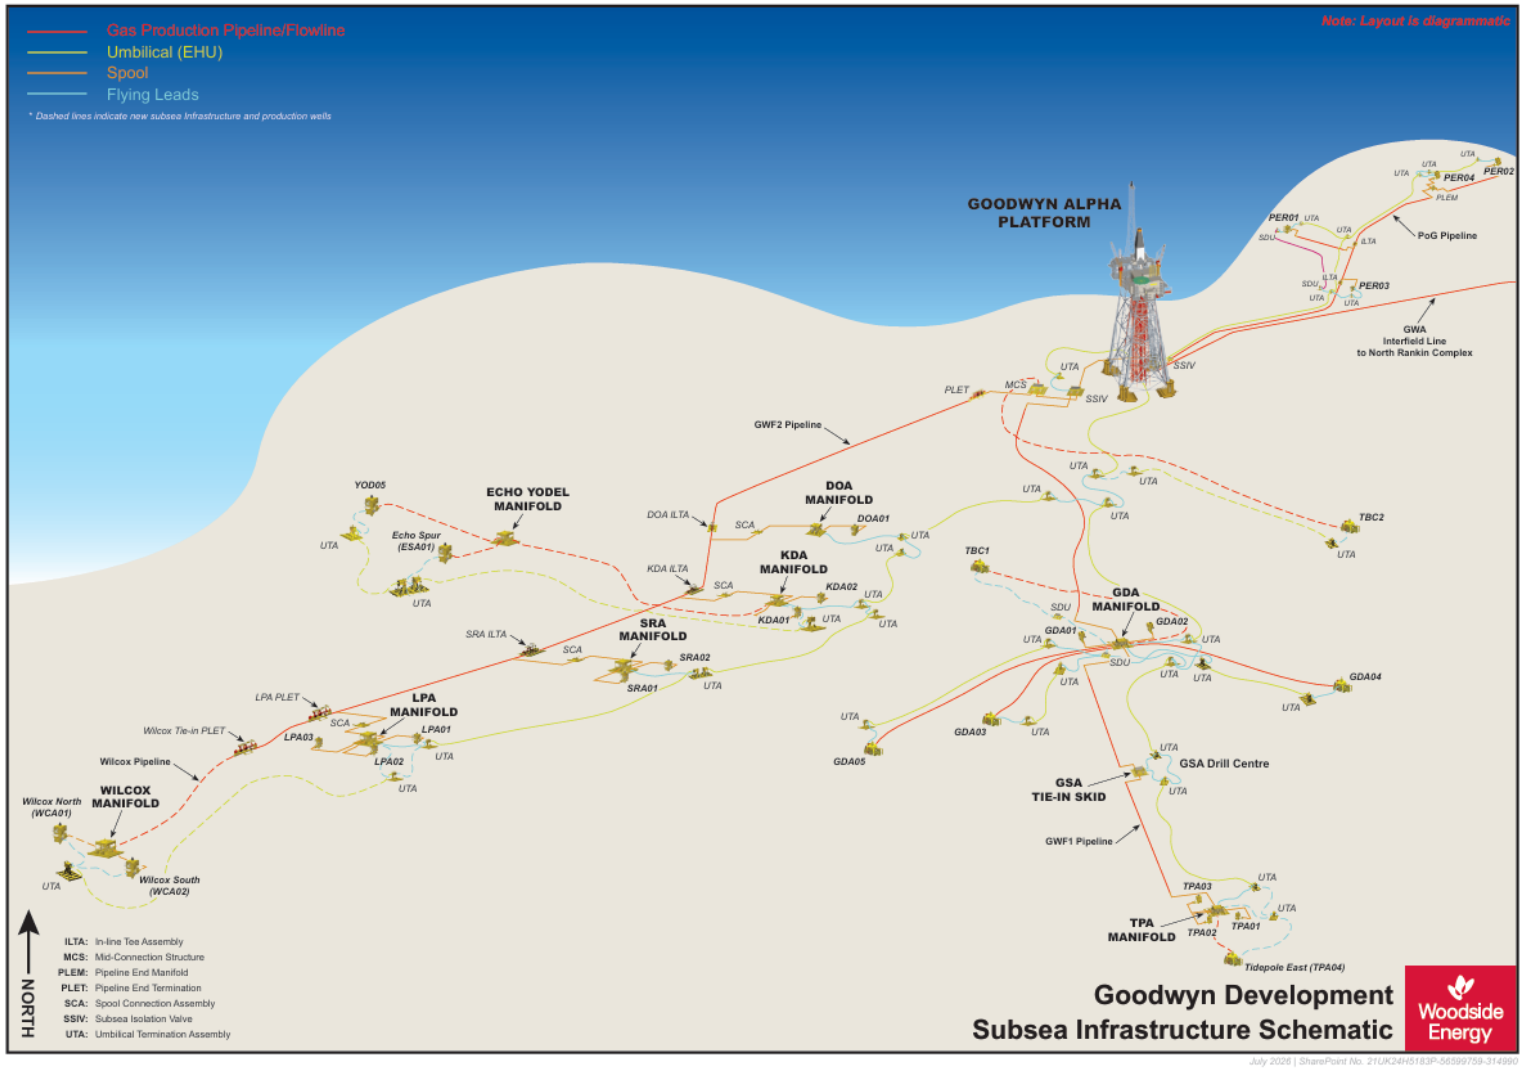

Figure 3-4: Schematic of the GWA facility subsea infrastructure

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.5.4.2 Echo/Yodel

The Echo Yodel (EY) subsea wells have been permanently plugged and abandoned under previously accepted EPs, and the associated well infrastructure has been recovered. Decommissioning of the remaining EY pipeline will be completed under the Echo Yodel Subsea Decommissioning EP (NOPSEMA Doc ID A830461). Further information on Echo Yodel decommissioning and the management of redundant infrastructure is described in Section 7.3.4.1.

As part of the GWF4 development, two production wells (YOD05 and ESA01) are planned to be drilled in the EY reservoir and tied back to the existing KDA manifold.

3.5.4.3 Perseus/Searipple

Perseus over Goodwyn (PoG) subsea infrastructure comprises a pipeline, four wells (PER01, PER02, PER03, PER04), and associated umbilicals, jumpers and spools. Control and monitoring of the wells is undertaken via an electro-hydraulic umbilical (EHU) from the GWA platform. The subsea architecture allows for future extension of the PoG pipeline system through drilling and tie-in of additional wells.

Two wells (PER02 and PER04) are shut in and are designated as redundant, with plugging and abandonment planned under the accepted *NWS Phase 1 Plug and Abandonment and TPA03 Well Intervention EP* (NOPSEMA Doc ID A1282745). Pending abandonment, these wells remain in scope of this EP for inspection, monitoring and integrity management. Further information on the decommissioning associated with PER02 and PER04 is described in Section 7.3.4.2.

3.5.4.4 Wilcox

Wilcox subsea infrastructure will comprise the WCA01 and WCA02 wells, planned to be drilled under the GWF4 Drilling and Installation EP (NOPSEMA Doc ID A1327727), as well as a new flowline and associated manifolds, umbilicals, jumpers and spools (see Section 3.5.4.5 for more detail). Control and monitoring of these wells will be achieved via an EHU from the GWA platform.

The subsea architecture will be configured to allow for future expansion of the Wilcox system, subject on reservoir performance and operational requirements.

3.5.4.5 Greater Western Flank

The Greater Western Flank (GWF) developments are described below in terms of their functional integration with the GWA platform and subsea production system.

GWF1 subsea infrastructure comprises five wells within the Goodwyn (GDA01 and GDA02) and Tidepole reservoirs (TPA01, TPA02, TPA03). These wells are tied back to the GWA platform via a 16”, 16.3 km pipeline (GWF1 pipeline) which terminates at the GWF1 SSIV. The SSIV is connected by a series of spools to the GWF riser located in the centre of the platform and is protected from ship impact by the GWA jacket structure at depths below the ship-impact vulnerability threshold (approximately -12 m). In an emergency, the pipeline can be isolated from the riser using the SSIV, which is located on the seabed approximately 40 m from the platform.

GWF2 subsea infrastructure comprises eight wells (LPA01, LPA02, LPA03, SRA01, SRA02, KDA01, KDA02, DOA01) that tie in the Keast/Dockrell, Sculptor, Rankin and Lady Nora/Pemberton reservoirs. These wells are tied back to the GWA platform via a ~15 km pipeline (GWF2), which also terminates at the GWF1 SSIV.

The GWF3 subsea infrastructure accesses incremental volumes from the Goodwyn reservoir via existing GWF1 infrastructure. GWF3 infrastructure comprises three wells (GDA03, GDA04, GDA05), which are installed and tied back via the same GWF1 subsea infrastructure as GDA01 and GDA02.

GWF4 subsea infrastructure is planned to comprise:

- one additional Tidepole reservoir well (TPA04), tied back via the same GWF1 subsea infrastructure as TPA01, TPA02 and TPA03.
- two wells (YOD05 and ESA01) targeting the Echo/Yodel reservoir (described in Section 3.5.4.2), tied back to via the KDA manifold and 10” ID flexible jumpers to the existing GWF2 pipeline system which routes production to the GWF SSIV.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- two wells (WCA01 and WCA02), described in Section 3.5.4.4, tied back to a new 2-slot Wilcox manifold (WCA) via 200 m long flexible jumpers. This manifold will be tied back to the LPA Pipeline End Termination (PLET) on the GWF2 pipeline. The WCA manifold will be connected to the Wilcox outlet FLET via the new 11” ID, 25 km Wilcox flowline.

Hydrocarbons from GWF4 will be comingled with GWF1 and GWF2 production and routed through the common GWF spools and riser for further processing at the GWA platform.

Two future tie-in production wells may be tied back to the GWA platform via the GWF1 SSIV, using similar flowline and umbilical configurations.

3.5.5 Field inventory

The infrastructure within the Operational Area is recorded and tracked using a database, which is updated as equipment is brought into title, including replacement equipment. As-found and as-left surveys are undertaken during installation or replacement of infrastructure using a remotely operated vehicle (ROV) to identify the location of items installed on the seabed. This data is then used to update the inventory for the title. Material items dropped to the marine environment and not recovered are also added to the inventory for the title.

An inventory of the key subsea infrastructure for the title areas relevant to this EP is provided in Section 7.3.3 Table 7-4 to Table 7-6 of this EP. Table 7-7 provides a list of infrastructure which is located within the title areas however outside the scope of this EP and covered under separate EPs. Decommissioning planning for infrastructure is described in Section 7.3.

New developments, including GWF4 and two future tie-in production wells, will include additional subsea infrastructure such as umbilicals, spools, jumpers and flowlines. Upon installation and commissioning, these assets will be incorporated into the titleholder's subsea infrastructure inventory.

3.6 Operational details

This section provides a detailed description of the main operations associated with the GWA facility, described under the following headings:

- crewing and modes of operation (Section 3.6.1)
- process description (Section 3.6.2)
- produced water system (Section 3.6.3)
- drainage systems (Section 3.6.4)
- utility systems (Section 3.6.5)
- lifting operations (Section 3.6.5.7)
- operational flaring (Section 3.6.7)
- diesel bunkering (Section 3.6.8)
- bulk hydrocarbon inventories (Section 3.6.9)
- operational chemical usage (Section 3.6.10)
- greenhouse gas emissions (Section 3.6.11).

3.6.1 Crewing and modes of operation

Total overnight personnel onboard (PoB) capacity for the GWA platform is 137 people. The central control room (CCR) is crewed 24 hours per day. Personnel numbers may vary depending on activities scheduled, such as:

- crew change
- engineering projects
- campaign maintenance

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- inspections/audits
- cyclone shutdown de-staffing
- planned facility shutdowns.

Modes of operations influence crewing levels and include:

- production and maintenance including subsea IMMR activities
- platform well management and maintenance (Section 3.9)
- GWF4 and future tie-in production well commissioning (Section 3.10)
- major projects
- remote operations
- subsea export.

These listed modes of operation may be concurrent.

3.6.1.1 Major projects

Major projects involve refurbishment, modification or major maintenance. The Projects function is responsible for undertaking these projects. Such projects may include, but are not limited to, the refurbishment, modification, replacement and/or removal of:

- Caissons and associated utilities
- HVAC
- Cranes
- Well conductors
- Compressors, such as required to enable low low pressure operations (LLPO).
- Laydown areas.

Potential environmental impacts related to projects are managed through the process outlined in Section 7.2.7.3.

3.6.1.2 Remote operations

The GWA platform is typically operated as crewed. However, Woodside may temporarily de-staff the platform (e.g. as a precautionary safety measure during severe cyclones). In such circumstances, operation of the GWA facility is maintained via the remote operations centre (ROC) at Woodside's Perth headquarters (Mia Yellagonga).

Whilst operating in remote mode, the GWA facility continues to produce at stable rates usually established prior to de-staffing. Operation at these stable rates maintains consistent production and minimises the potential for process upsets. During periods when personnel are not present onsite, activities requiring direct field intervention (e.g. manual valve operation) cannot be performed.

3.6.1.3 Subsea export

The IFL receives export gas and condensate from production trains T100 and T200, which is transported to 2TL near NRC. From here, gas and condensate are sent to KGP for onshore processing.

3.6.2 Process description

3.6.2.1 Production process

The GWA platform receives well fluids (gas, condensate and associated produced water) for topside processing via gas dehydration and condensate dewatering. Processed gas and condensate are exported onshore to the KGP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The GWA platform has two processing trains (T100 and T200). T100 operates with a capacity of approximately 19.3 kt/d of dry gas plus associated condensate. T200, operating in low-pressure mode, has demonstrated capacity of approximately 15.0 kt/d of export gas plus associated condensate.

Production from the GWF and PoG fields is processed using existing capacity. Under the current configuration, GWF production is routed to T100, while PoG and platform well production are routed to T200. As reservoir pressure declines over the life of the fields, additional compression is required to maintain gas export to KGP.

LLPO involves topsides modifications to enable processing of lower pressure reservoir fluids. These modifications include modified compression capacity, updates to process control systems, and adjustments to separation and utility systems to maintain stable and efficient operations. Far-field well tie-ins such as GWF4 will also require topsides modifications to accommodate reservoir composition and temperature variations

As part of the currently planned LLPO modifications (anticipated in 2028), the two production trains are planned to be reconfigured in series to optimise recovery and processing efficiency. Under the planned configuration, PoG and platform well production would be routed to T100, which would incorporate a low-low-pressure compressor (LLPC) to enhance recovery. GWF production would be routed to T200, where gas would be combined with compressed vapor from T100 prior to compression, dehydration and export via the IFL. Condensate from T100 would be routed to the suction side of the T200 export pumps for injection into the IFL.

The gas export compressor takes suction at lower operating pressures and returns the gas to export pressure for transport onshore via the pressurised pipeline. The export compression package (compressor, power generation turbine and associated equipment) includes the following:

- export compressor and aftercooler
- gas generator
- power turbine
- reduction gearbox
- lube oil systems
- dry gas seal system
- suction scrubber.

3.6.2.2 Flare systems

The GWA platform has two flare systems, the High Pressure (HP) Flare and the Low Pressure (LP) Flare. The primary purpose of the flare systems is to safely discharge gas streams during emergency depressurisation. There are, however, also several process streams that continuously pass gas to the flare, such as gas flashed from the produced water (PW) system, and stripping gas used in glycol regeneration. Stripping gas for glycol regeneration is sourced from the medium-pressure (MP) fuel gas system or the glycol flash drum.

Other streams may intermittently flow to the flare, such as during maintenance activities and when vessels are depressurised and purged.

The flow of gas through each of the HP and LP flare networks is measured using separate ultrasonic flow meters with pressure and temperature compensation. A small portion of the fuel gas stream is used for flare purge to exclude air from the flare system.

3.6.2.3 High pressure system

The HP flare system collects vented hydrocarbons from process and utility systems with design pressures of 1,000 kPa or greater. Hydrocarbons are vented to the HP flare from pressure safety valves (PSV), manual blowdowns and automatic blowdowns.

The main HP flare header is routed to the HP flare drum, which is designed to separate all liquid droplets by gravity. Liquids collected in the drum are pumped away to the oily water treatment system. Vapours from the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

flare drum are disposed of at the flare tip (located at the top of the 113 m tower) via a multi nozzle sonic flare tip.

3.6.2.4 Low pressure system

The LP flare system collects vented hydrocarbons from process and utility equipment with design pressures of 350 kPa or less.

There are two separate LP headers, one to accommodate low temperature relief streams and the other to accommodate venting at ambient or higher temperatures. The two LP headers are routed to the LP flare drum, which separates liquid by gravity.

Liquids collecting in the drum (typically condensed water from the glycol regeneration system) drain to the closed drains break drum. Liquids from the closed drains break drum are pumped to the oily water drains separator prior to reinjection into the main process stream, with water treated via the PW system.

3.6.3 Produced water system

Produced water (PW) is brought to the surface from the reservoir, separated out from hydrocarbons during the production process and discharged to the marine environment via the closed drains caisson, which discharges below the sea surface.

PW discharge rates may vary over time as high water cut wells are unloaded, cycled and produced, and are expected to increase as the fields mature. The PW system has been designed to process a maximum of 7,500 m^3/day.

3.6.3.1 Produced water system description

The PW system comprises lines that connect the process to the primary water/condensate separators, the PW degasser and to the closed drains (Figure 3-5).

The PW stream is primarily made up of:

- water recovered from the condensate stream by the primary water/condensate separators on T100 and T200
- a lesser quantity of water removed downstream by the condensate coalescers on T100 and T200
- water from the underflow of the oily water drains separator (OWDS). This is predominantly water from the glycol reboiler overheads, which is routed to the OWDS from the LP Flare knock out (KO) Drum.

The PW system directs all PW streams from the process areas to the PW degasser to remove dissolved gas and condensate before discharge via the hazardous closed drains caisson. Recovered condensate is skimmed from the surface of the degasser vessel liquids and returned to the process via the closed drain break drum. Any residual oil that accumulates in the hazardous closed drains caisson is skimmed from the water surface and pumped into an ISO container for onshore disposal.

Adsorbent hydrocarbon filters are installed on the GWA platform to remove dispersed oil from the PW stream. The system is used sparingly and primarily to manage oil-in-water (OIW) upsets.

An online analyser continuously monitors the OIW content. If the OIW content is within specification, PW is discharged via the hazardous closed drains caisson. In addition to continuous OIW monitoring, routine chemical characterisation and ecotoxicity assessments are undertaken on PW immediately upstream of the hazardous closed drains caisson, representing end-of-pipe discharge quality.

During production restarts following a planned shutdown, the GWA facility may experience elevated OIW levels due to mobilisation of emulsions within the PW system. These temporary increases in OIW can occur for up to three days after restart.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

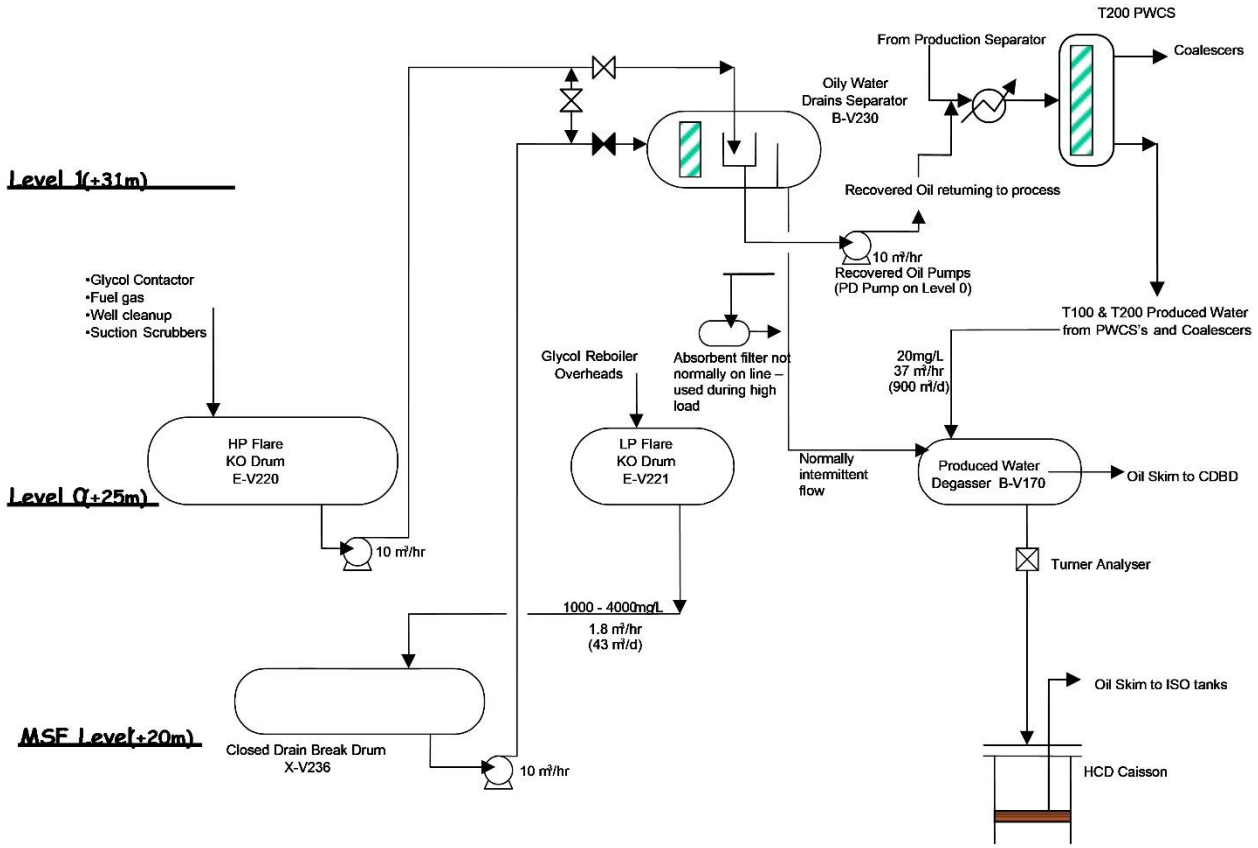

Figure 3-5: PW system configuration

3.6.4 Drainage systems

The open and closed drains system consists of both hazardous and non-hazardous open drains. The open drains system is required for disposal of water and hydrocarbons, which are at atmospheric pressure (e.g. deck water). Drains from hazardous areas are segregated from drains from non-hazardous areas to prevent ingress of gases into a non-hazardous area via the drains system.

3.6.4.1 Hazardous open drains

Operational process and non-process discharges, some maintenance activities discharges and potential spills contained within hazardous open drain system are routed to the hazardous open drains caisson. The drains collect spillage, process drainage, and washdown water from equipment/flooring and rain/deluge water from all areas designated as hazardous. Any hydrocarbons captured in the caisson are periodically pumped out/recovered. These drains originate from deck drains, tundishes and drip trays located in hazardous areas, principally in modules with large plated areas e.g. Modules B, E and L. Hazardous open drain sub-headers leaving a module are fitted with individual seal pots to segregate hazardous areas. The purpose of these seals is to limit the spread of gas from one module to another via the drains system.

The hazardous open drains caisson primary and back up instrumentation provide live visibility of calculated hydrocarbon inventories in the caisson to prevent underflow. Level instrumentation provides data linked to the control system, is historised and utilised to implement response actions. The hazardous open drains caisson is equipped with a sump pump to recover any hydrocarbons which may accumulate in the caisson over a period. These liquids are routinely pumped into a waste oil ISO container for disposal onshore. The pump is manually started and runs until seawater is observed at the sample point discharge. The sample line is located near the waste oil ISO container and leads to a tundish. Under routine conditions, the caisson is pumped out once per week. Non-routine flow conditions to the drain system (depending on process drainage and maintenance activities) may lead to the caisson being pumped out more frequently.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.4.2 Non-hazardous open drains

Non-hazardous open drains cover the utility and power generation module (Module A). Operational non-process discharges, maintenance activities, washdown water and potential non-hazardous area spills are routed to the non-hazardous open drain system. The main sources for potential unplanned spillage of hydrocarbons are limited to:

- firewater pumps
- emergency generator
- gas turbine power generators (lube oil)
- diesel day tanks for gas turbines.

The above equipment is provided with valved drip trays. Any lube oil drained down from machinery is collected in dedicated transportable containers. The main non-hazardous open drains collection system is routed directly overboard to allow for rainfall/washdown/deluge flows and for safety purposes.

3.6.4.3 Closed drains

The process closed drains system is used for draining volatile hydrocarbon liquids from all process equipment. The drained liquids are routed to the closed drains break drum, which is located below deck in the module support frame. From here, the liquids are pumped to the oily water drains separator for further treatment. Closed drain piping systems are classed as topsides pressure containing/hazardous pipework.

Hydrocarbons recovered from the closed drains system and liquids collected in the HP flare drum are also sent to the oily water drains separator. From the OWDS, recovered hydrocarbons are pumped into the process trains whilst water is routed to the PW degasser. Hydrocarbons are then processed as per the process description in Section 3.6.3, which ultimately leads to the IFL. The closed drains caisson forms part of the closed drain system used for PW disposal outlined in Section 3.6.4.

3.6.4.4 Drilling facility hazardous open drains

Currently, the drilling hazardous open drains system collects rainwater and wash down water and directs the flow to the hazardous open drains caisson. It also collects and drains drill water from the deluge systems during wet testing or any real events.

3.6.5 Utility systems

3.6.5.1 Platform lighting

The GWA platform has appropriate lighting to ensure a safe working environment to support 24-hour operations. Lighting is split between emergency and normal lighting. Approximately 30% of platform lighting is powered from the emergency generator supply in the appropriate module. The remainder is fed from the normal supply. The emergency light fittings have been located to illuminate the designated escape routes on the facility. There are also battery backed-up emergency lights on the platform.

There are navigational lights on the platform flare tower and on the booms and towers of the pedestal cranes. Helideck lighting is also provided to assist helicopter landing.

Unless required to support over-the-side activities (such as refuelling and lifting operations), lighting on the platform is directed to the work area, which aids in limiting light spill to sea.

3.6.5.2 Heating ventilation and air conditioning system

The heating, ventilation and air conditioning (HVAC) system comprises HVAC equipment, ductwork and associated pipework. It provides independent and inter-dependent subsystems with pressurised, conditioned, purge and exhaust air services to various areas including accommodation, and various modules which can be operated on as required basis and others on a continuous basis.

Ozone-depleting substances (ODS) are no longer used and refrigerants associated with the HVAC system are managed by a licenced refrigerant authority.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.6.5.3 Seawater treatment systems

3.6.5.3.1 Seawater system

The primary function of the seawater system is to provide process and HVAC cooling. Secondary, continuous users are the fire ring main pressurisation, electro-chlorination unit, caisson spillback lines and open drains seal pot water make-up.

Seawater is supplied by three shaft driven seawater lift pumps enclosed within protective caissons. An auxiliary totally submersed seawater lift pump supplies seawater for essential HVAC cooling, fire ring main pressurisation and chlorination requirements, when the main pumps are unavailable. It is also used for initial priming of the entire seawater system, prior to startup of the main pumps, in a black start situation.

Filtration of seawater to the condensate coolers is provided by two seawater filters located in the seawater to condensate cooler supply line.

Four seawater/tempered water plate heat exchangers transfer heat from the closed-circuit tempered water system. Seawater is also used as the cooling medium for the HVAC tempered water plate heat exchangers.

The seawater from both sets of heat exchangers, as well as other users, is routed by a collection system to the seawater dump caisson and then returned to the ocean. To prevent marine growth within the seawater system, an electrochlorination unit generates a concentrated sodium hypochlorite solution for injection into the circulation system, at a target chlorine level of 0.5 ppm. The seawater pump operates at 4,275 m^3 per hour with an average discharge temperature of 32°C.

3.6.5.3.2 Tempered water system

The tempered water system has the principal function of providing cooling for the well stream in the T100 and T200 production coolers and cooling gas downstream of the export compressor in the export compressor after cooler.

The system also provides subsidiary cooling in the following areas:

- stripping gas compressor lube and seal oil systems
- export compressor lube oil system
- glycol regeneration trim coolers
- drill water transfer pump recycle cooler
- auxiliary equipment room (AER) HVAC.

Two of three tempered water pumps are used to circulate inhibited fresh water within the closed system. Tempered water is not used for condensate cooling as the temperature difference between tempered water and the required condensate outlet temperature is inadequate. Cooling of the heated tempered water returning from its users is achieved by the use of seawater/tempered water heat exchangers.

The tempered water carbon steel piping and vessels are protected from internal corrosion by dosing the water with a corrosion inhibitor. Regular testing of the tempered water system is undertaken to ensure the correct concentration of corrosion inhibitor is maintained. Periodic maintenance may require the draining of the tempered water system, resulting in the discharge of water and residue corrosion inhibitor to the marine environment.

To better manage incoming fluids and temperature variations from far-field wells, the facility will incorporate two additional tempered water pumps to support the heating function of the T200 production cooler. This modification enables the tempered water system to heat incoming process fluids in the T200 production cooler by routing warm return tempered water from the EGC Aftercooler. As a result, the T200 production cooler can operate as a heater when required, helping suppress bubble point and prevent cavitation in the condensate export pumps.

3.6.5.3.3 Potable water

The reverse osmosis (RO) potable water maker unit is the primary means for potable water supply at GWA. The unit can produce 40 m^3/day of potable water. Chlorinated seawater from the sea water distribution header is fed into the RO water maker package. Within this package, the sea water pressure is boosted by a

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

LP feed pump to maintain the required inlet pressure to the RO HP feed pump. Seawater passes through a media filter to remove coarse suspended solids, a carbon filter to remove chlorine and odour, and a cartridge filter to remove fine suspended solids. Anti-scalant is added and the seawater pressure boosted by the HP feed pump to pressurise the feed to the RO membranes. The seawater passes through the RO membrane separation units to produce potable water (permeate) and saline water (sent to the non-hazardous open drains system). The potable water then passes through a calcite filter to remineralise and into two potable storage tanks before being transferred out to the potable water distribution. The RO package includes a clean-in-place (CIP) system for periodic cleaning.

Brine from the RO plant is generally 55-60 parts per thousand salts, with approximately 75 m^3 of brine produced per day. Small quantities of anti-scaling and cleaning chemicals may also be discharged with the brine.

A secondary potable water supply is also available. The water is transported to the platform by a platform support vessel (PSV) and transferred into the potable storage tanks via a dedicated bunkering hose.

3.6.5.4 Power generation

The main power generation system consists of six gas turbine-driven generator (GTG) units (Solar brand). The generators supply 3-phase electrical power at 6.6 kilovolt and 50 Hertz to the high voltage power distribution system. The system provides power to all process, utility and support systems on the platform. All GTG units are capable of operating on fuel gas or diesel.

Implementation of LLPO will increase power demand to support compression, resulting in increased fuel gas use for power generation. Continuous operation of up to five GTGs is expected to be required to support compression, with one additional GTG maintained in cold standby to provide contingency power during planned maintenance activities or in the event of an unplanned outage. Reliability improvements have been implemented across the GTG fleet and associated control systems to support stable power generation, enhance operational redundancy, and minimise the potential for production interruptions.

The GTG units are supplemented by a battery energy storage system (BESS) and a load shedding system (LSS), installed to support the GTGs in the event of a trip. The BESS consists of a 1MWh capacity lithium-ion battery backup system located within a standalone container in Module F.

In the unlikely event of failure of the main generation system, an emergency diesel generator provides emergency power. The system starts automatically, connects to essential switchboard AM832 bus ‘A’, and maintains all essential and vital services. Essential services are those which, when failing in operation or when failing if called upon, affects the continuity, quality or the quantity of the product. Vital services are those which, when failing in operation or if called upon, can cause unsafe conditions of the process and/or electrical installation, jeopardise life or cause major damage to the installation.

In the event of an emergency generator failure, two 415 Volt, 50 Hertz, 120 kVA uninterruptable power supply (UPS) systems, each supported by independent battery banks, provide continued power to essential equipment safety systems. These include the fire and gas detection system, the emergency shutdown (ESD) system, and the production shutdown (PSD) system. The vital load power architecture ensures redundancy through multiple sources including the UPS, emergency power system and dedicated battery backup, enabling safe operation and controlled shutdown of critical systems during loss of main power.

3.6.5.5 Sewage and putrescible wastes

Sewage from the ablutions is disposed to ocean via the sewage caisson.

Putrescible waste (principally food scraps) is either ground to less than 25 mm diameter and disposed to ocean via the sewerage caisson or bagged and transported to shore for disposal as domestic waste.

3.6.5.6 Sand management

In 2012, desanding equipment was commissioned to provide the capability to intercept and remove sand particles from the well stream that feeds the production processing equipment of GWA T200 (LP train). This equipment eliminates the need for production shutdowns to remove sand deposition from process vessels. The desanding system consists of a desander, accumulator and transportable disposal vessels.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The design basis for the equipment is to continuously collect sand in an accumulator on the platform and periodically transfer sand to one of two transportable disposal vessels for shipment and onshore disposal. The desander is capable of processing up to 500 kg/day sand.

3.6.5.7 Safety features and emergency systems

A range of safety features and emergency systems have been integrated into the design and operation of the GWA facility to manage safety risk and associated major environment risks. These include systems for fire and gas detection, emergency shutdown and firefighting.

Firefighting systems, including the helideck foam system, form part of the platforms safety management arrangements. There is no planned overboard discharge of chemicals associated with the testing of such emergency response systems. This includes the helideck fire suppression foam system, which is tested with water only.

The safety features and emergency measures in place are listed in the Goodwyn Alpha Operations Safety Case and, where relevant to the management of unplanned environmental impacts, safety features are described as controls in Section 6 of this EP.

3.6.6 Lifting operations

Two pedestal cranes are installed on the GWA platform, one on the east side and one on the west side. Both cranes feature an A-frame design and are powered by diesel engines. In addition, a beam-mounted electric hoist is located in Module A for the removal and installation of the seawater and fire water pumps. The hoist is being upgraded to a 20 t unit, with the supporting monorail strengthened accordingly.

3.6.6.1 Routine lifting from platform support vessels

Routine lifting operations primarily involve transferring stores and equipment from a support vessel to the facility. Lifts may be conducted using either of the main cranes, depending on weather conditions. Support vessels are equipped with dynamic positioning (DP) systems to maintain station during lifting operations.

The types of lifted equipment may vary but generally include containers or skips of various sizes. All stores and equipment required by the facility are secured inside the skip or container. Chemical supply containers are also routinely lifted, and all equipment is appropriately rated for offshore lifting.

Following the completion of offloading from the supply vessel, the facility backloads any items to be returned to shore to the supply vessel. These primarily include empty skips or containers or skips containing waste for onshore disposal.

3.6.6.2 Lifting around the facility

Once lifted to the lay down area, equipment may be re positioned to various locations throughout the facility for operational purposes. This includes lifting stores or equipment to different landing areas for unloading or use, moving waste bins to designated areas and relocating ISO containers to Module B.

Occasionally, non-routine equipment may require lifting. In such cases, the equipment is packed into a container or secured within an approved lifting frame.

3.6.7 Operational flaring

3.6.7.1 Normal operations

A relatively small quantity of gas is required to be continuously flared associated with purge and pilot of the flare system and disposal of waste streams which are not recovered to the process. The continuous flows to the LP flare are:

- flare pilot
- LP flare header and storage tank purges
- glycol regeneration process, including still column overheads and flash drum.

The continuous flows to the HP flare are:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- HP Flare Pilot
- flash gas from glycol flash drums (which is under on/off level control)
- flash gas from PW degasser
- flash gas from scrubber vessels, including fuel gas, export compressor and the glycol contactor integral suction scrubbers (all under on/off level control)
- leakage past flare header valves such as pressure safety valves and blow-down valves (BDVs).

3.6.7.2 Intermittent process upsets and activities

There are intermittent gas streams to the flare during process upsets, maintenance activities, and when process systems are depressurised and purged. The flow of gas through each of the HP and LP flare networks is measured using ultrasonic flow meters with pressure and temperature compensation. The flares are equipped with pilots and a flame front generator and are continuously purged with fuel gas to avoid ingress of air into the system.

3.6.7.3 Emergency blowdown

The topsides equipment and piping are divided into isolatable sections, each with a dedicated BDV. During an ESD, each section is separately depressurized to the HP flare. Each section contains a fail-open actuated BDV that allow blowdown of the entire platform inventory. Based on operational experience and facility inventory, approximately 50–100 t of hydrocarbon gas may be flared during an ESD event.

3.6.7.4 Transient operations

The GWA process relies on warm operating temperatures (above 35°C for T100 and above 46°C for T200) to allow seawater cooling to prevent vapour breakout in the condensate processing train, and to meet a minimum inlet temperature of 32°C for the condensate stripping column (the operation of which is adversely affected by low temperatures).

During transient operations, such as restarting production from the PoG, GWF1, GWF2, GWF3 or GWF4 and two future tie-in production wells that form part of the scope of this EP, it may not be possible to meet the required GWA process operating temperature requirements. In this event, temporary flaring of vapour break-out from the condensate train may be required. When possible, cold production from the subsea flowlines is commingled with warm platform well production to reduce flaring.

3.6.7.5 Manual depressurisation

Manual depressurisation results in intermittent flaring of hydrocarbons, triggered by routine equipment maintenance, planned ESD testing and/or pressurisation of equipment and piping to remove the equipment from service. Equipment must be depressurised prior to draining, as the closed drains system is not intended for HP service.

3.6.7.6 Subsea flowline depressurisation

The fluid in the subsea flowlines/pipelines (which carry hydrocarbons from the subsea wells to the GWA platform) may on occasions need to be routed to the flare to allow the pressure in the flowlines to be reduced. The flowlines may require depressurisation for the following reasons:

- production flowline maintenance and critical Leak-off Testing (LOT)
- to facilitate remediation in the event of an unplanned hydrate blockage in the subsea flowlines
- flowline hydrate management
- manage flowline integrity limit
- suspension of redundant pipelines/flowlines.

3.6.7.7 Annual flared gas

The amount of gas that may be flared on an annual basis is dependent on continuous and intermittent process sources, planned activities requiring flaring, and unplanned process upsets. The reported annual

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

mass of flared gas from routing and non-routine sources has ranged between approximately 10,000 and 15,000 t per year between FY22 and FY25 (Section 6.7.7).

3.6.8 Diesel bunkering

Low sulphur diesel is transferred in bulk to the GWA facility from supply vessels via the east and west bunkering stations. Diesel is filtered prior to entering the storage facilities in the east and west crane pedestals. It is then pumped to the filter/coalescer package for clean-up before distribution to the user areas. Diesel flow is metered and supplied through a continuously pressurised ring main. Any unused diesel is recycled back to the crane pedestals. Each user area is protected from diesel supply interruptions by dedicated break tanks. Diesel is required for:

- temporary equipment
- turbine generators (back up to fuel gas)
- emergency generator
- east and west cranes
- firewater pumps
- lifeboats.

3.6.9 Bulk hydrocarbon inventories

The main hydrocarbon inventories associated with major topside process equipment is presented in MEE-03 in Section 6.8.5. Non process inventories of hydrocarbons used on the GWA facility are outlined in Table 3-3.

Table 3-3: Bulk inventories of non-process hydrocarbons and chemicals

Material	Storage means	Storage capacity
Diesel	Diesel storage tanks (x2)	343 m^3 total (East crane pedestal 194 m^3, West crane pedestal 149 m^3)
Lube oil/seal oil/Hydraulic oil	Various size containers based on type and use	Various – general 20 L and 205 L drums and 1,000-4,000 L bulk containers

3.6.10 Operational chemical usage

Chemicals are utilised on the GWA facility for a variety of purposes and can be divided into two broad categories (operational and facility maintenance), as described below.

3.6.10.1 Operational process chemicals

A process chemical is the active chemical added to a process or static system, which provides functionality when injected in produced fluid, utility system streams or for pipeline treatment. These chemicals may be present in routine or non-routine discharge streams from the GWA platform. Examples include corrosion inhibitors, biocides, scale inhibitors, demulslifiers, glycols and hydrate inhibitors.

3.6.10.2 Operational non-process chemicals

Non-process chemicals include chemicals which do not fall into the category described above but which may be required for operational reasons and, by virtue of their use, may be intermittently discharged or have the potential to be discharged (e.g. required as a result of maintenance or intervention activities). Examples include subsea control fluids, dyes and well intervention/workover chemicals.

3.6.10.3 Non-operational chemicals

Non-operational chemicals include chemicals which are required for general maintenance or ‘housekeeping’ activities and are critical for overall maintenance of the facility and its equipment. These may include paints, degreasers, greases, lubricants and domestic cleaning products. They may also include chemicals required

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

for specialty tasks, such as laboratory testing and analysis. Maintenance chemicals generally present negligible risk to the environment as they are not discharged as a result of their use (e.g. paint) or are used intermittently and discharged in low volumes (e.g. domestic cleaning products).

3.6.10.4 Indicative chemical inventories

An indicative list of bulk chemicals commonly used on the GWA facility, and estimated storage quantities, is summarised in Table 3-4. Other chemicals may be used on GWA in the future if chemical requirements change, for example, during GWF4 commissioning activities, there may also be a temporary well clean-up skid which may include water clarifiers. In addition to the chemicals listed, the GWA platform may also maintain other small volumes of various operational chemicals and non-operational chemicals as previously described.

Table 3-4: Indicative bulk inventories of chemicals

Material	Storage means	Storage capacity
Corrosion Inhibitor	Transportable containers from supplier (usually one connected, one on standby)	4 m^3 per container. Generally maximum 8 m^3.
Triethylene Glycol (TEG)	Glycol storage tank	23 m^3
MEG	2 x MEG storage tanks	30 m^3
Biocide	Stored in the Chemical Store on GWA.	20 L containers
Scale Inhibitor (provision for future use)	Transportable containers from supplier	1 m^3 per container.
Subsea Control Fluid	Hydraulic Power Unit Tank stores 'in use' fluid. Additional fluid stored in drums.	~2 m^3

3.6.11 Greenhouse gas emissions

The main sources of greenhouse gas (GHG) emissions associated with GWA production are shown in Table 3-5. GHG sources that are not part of the facility (e.g. onshore processing emissions) are included for completeness. However, the GWA facility does not import electricity and therefore there are no GHG emissions associated with purchase/acquisition of electricity.

In the context of this EP, the emissions are classified as direct and indirect emissions.

Table 3-5: Direct and indirect greenhouse gas sources from the GWA facility and supply chain

Emission type	Emissions source	Location	Jurisdiction	Process
Direct	Offshore processing	Offshore	Commonwealth	GHG emissions associated with gas / diesel turbines (Section 3.6.5.4), flares, fugitives, and process vents
Indirect	Support vessels and helicopters (on charter)	Offshore	Commonwealth	GHG emissions associated with internal combustion engines and fugitives on support vessels and helicopters
	Onshore processing*	Onshore	State	GHG emissions associated with venting reservoir CO_2, combustion of gas as fuel, flares and fugitives associated with processing gas to LNG, LPG, condensate and domestic gas
	Transport	Transit	Subject to consumer location	GHG emissions associated with transport of products to market, including regasification and distribution of LNG in customer markets
	Regassification, distribution and combustion by third party user.	Market	Subject to consumer location	GHG emissions associated with combustion of products as part of power generation and other energy solutions within the final market

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

*ISO 19694:2021 defines indirect GHG emissions as GHG emission that is a consequence of an organisation's operations and activities, but that arises from GHG sources that are not owned or controlled by the organisation. For the purposes of this EP the "organisation" is the GWA facility and therefore onshore processing and support vessel operations are considered indirect emissions sources.

3.7 Subsea inspection, monitoring, maintenance, and repair activities

Subsea infrastructure, including the platform substructure, is designed to minimise the need for significant intervention. Inspection and maintenance are undertaken to maintain infrastructure integrity and identify potential vulnerabilities before they present a risk of loss of containment. Maintaining infrastructure integrity also supports decommissioning planning. Where required, intervention activities are undertaken to address identified issues.

Subsea IMMR activities are typically undertaken as discrete campaigns using subsea support vessels. Campaigns will generally operate continuously (24 hours per day) for the duration of the activity, with each campaign typically of short to medium duration (approximately 2 weeks to 1 month), depending on the scope and complexity of the work. These activities may occur at any time of year in accordance with operational requirements.

Vessels supporting IMMR activities may vary depending on operational requirements, vessel schedules, capability and availability. Maintenance and repair activities may require additional vessel time depending on the scale and complexity of the work scope; however, such activities are expected to be infrequent.

Subsea IMMR activities may utilise remotely operated vehicles (ROVs), autonomous underwater vessels (AUVs) and associated subsea equipment. ROVs may be fitted with tooling and specialist camera systems to support inspection, maintenance and repair activities and to record subsea infrastructure condition. For some activities, ROVs and AUVs may also be deployed from the GWA platform.

ROV operations also require temporary placement of tool baskets on the seabed. These typically have a mesh base with a footprint of approximately 15 m^2. Placement is temporary and baskets are recovered to the vessel at the completion of the activity.

The IMMR process for subsea infrastructure, including redundant equipment (Section 3.7.4), maintains equipment in serviceable condition for continued operations and supports future removal where required. Typical IMMR activities are described below.

3.7.1 Inspections

Inspection of subsea infrastructure is the process of physical verification and assessment of components in order to detect changes in location and condition relative to the as-installed state and previous inspections. Details of typical subsea infrastructure inspections/surveys and indicative frequencies are provided in Table 3-6.

The scope and frequency of subsea equipment (operational and redundant) and pipeline inspections are determined using a risk-based inspection (RBI) methodology and associated plans. RBI is widely used within the industry to determine inspection frequencies (Energy Institute 2009; DNV 2019).

Planned subsea inspections may include visual inspection of subsea infrastructure and confirmation of infrastructure condition. Inspection findings, including any evidence of minor subsea discharges, are recorded and managed in accordance with Woodside's subsea and pipelines integrity management processes.

Table 3-6: Typical subsea infrastructure inspections/surveys and frequencies

Type of inspection/survey	Subsea infrastructure	Purpose	Approximate frequency
General Visual Inspection	All subsea infrastructure, including exploration wellheads	Check general infrastructure integrity.	Varied – every 2-8 years
Close Visual Inspections	All subsea infrastructure	Investigate certain subsea infrastructure components.	Varied – every 2-6 years

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Cathodic Protection	All subsea infrastructure	Check for corrosion and renew sacrificial anodes, if required.	Varied – every 2-6 years
Wall Thickness Surveys	Production and crossover manifolds, flowlines and pipelines	Monitor the condition of subsea infrastructure. (i.e. ultrasonic testing). Typically only performed if a specific threat is identified through other means.	Typical: Once every 25 years. Worst Case: Once every 5 years
Acoustic survey including Multibeam Sonar (MBES)	Pipelines.	Identify buckling, movement, scour and seabed features. Low frequency/ intensity signals undertaken on the flowlines.	Varied – every 1-6 years
Non-Destructive Testing	Pipeline and manifolds (if required)	Evaluates the properties of material/items using electromagnetic, radio graphic, acoustic resonance technology, ultrasonic, or magnetic equipment.	Typical: Once every 25 years. Worst Case: Once every 5 years per well
Seabed sampling surveys including minor grabs/cores	NA	Identify benthic fauna, sediment characteristics, determine level of penetration / compaction, etc. Grabs/cores typically disturb 0.1 m^2 of seabed per sample.	Typical: Once every 25 years. Worst Case: Once every 5 years
Anode inspections and/or replacement	Production and crossover manifolds, trees, flowlines and pipelines	Samples taken of anode materials for testing.	Typical: Once every 25 years.
Marine growth sampling	All subsea infrastructure	Samples taken of marine growth for testing.	Typical: Once every 25 years. Worst Case: Once every 5 years
Sub bottom profiling (SBP)	Around subsea components	Low frequency echo sounder undertaken to identify returns of metals under the seabed	Varied – every 1-6 years
Laser surveys	Dimensional check on spools	Used to conduct dimensional checks on spools etc. and measure proximity.	Varied – every 1-6 years

3.7.2 Monitoring

Subsea infrastructure monitoring involves assessing the physical processes and chemical conditions to which subsea components are exposed. This monitoring is undertaken to identify if and when degradation may occur and, where relevant, to predict the rate or extent of that degradation.

Monitoring activities may include process composition testing, corrosion monitoring (e.g. probes and mitigation checks), vibration monitoring, metocean and seismic monitoring, and cathodic protection testing. Additional monitoring includes process parameters (e.g. temp, pressure), cyclone and weather monitoring, and hydraulic fluid usage.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.7.3 Maintenance

Maintenance activities on subsea infrastructure are undertaken at regular or planned intervals to prevent deterioration and maintain integrity. Activities may include cycling and actuating valves, flushing chemical and hydraulic fluid lines, pressure or leak testing, scour remediation, and the removal of excessive marine growth.

Table 3-7 outlines typical subsea infrastructure maintenance activities, their purpose and indicative frequencies.

Table 3-7: Typical maintenance activities, their purpose and approximate frequencies

Type of maintenance	Subsea infrastructure	Purpose	Approximate frequency
Cycling of valves via control system	Wells and manifolds	Test functionality of technical integrity valves	Well barriers are maintained as per the requirements in the current Performance Standard P10 Wells test regime.
Marine growth removal	Production and cross over manifolds and retrieval components (e.g. chokes) and jacket cleaning	Reduce weight or gain visual access	Based on outcomes from visual inspections (Table 3-6) and marine growth trends on regional infrastructure
Flushing of chemical hydraulic fluid lines	Hydraulic fluid lines	For repair scenarios	When required for repair
Leak and pressure testing	All subsea infrastructure	Test integrity of subsea infrastructure	Following installation of subsea infrastructure components after a repair or intervention, prior to return to service
Sediment relocation	All subsea infrastructure	Facilitates repair or inspection activities	When required
Scour and free span remediation	All subsea infrastructure	Integrity of subsea infrastructure	When required

3.7.4 Repair

Repair activities are undertaken when a subsea system or component is degraded, damaged or has deteriorated beyond defined acceptance limits. While such damage may not present an immediate threat to system integrity, it may represent an elevated risk to safety, environment or production reliability. Due to the design of subsea infrastructure and materials used, repairs are undertaken on an as needs basis. The requirement for, and frequency of, repairs is informed by the outcomes of the inspection and maintenance regimes described in Table 3-6 and Table 3-7, plus as the result of component operational failure. Typical subsea repair activities include:

- subsea control module (SCM) replacement
- hydraulic flying lead (HFL) replacement
- electrical flying lead (EFL) replacement
- pipeline or spool support with grout bag or mattress
- spool disconnection and/or replacement
- umbilical replacement
- riser or flowline replacement
- scour prevention installation
- corrosion protection.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

To improve the reliability of the GWF electrical system, electrical distribution units (EDUs) and EFLs are planned to be replaced in 2027 at the following drill centres; DOA, KDA, SRA, LPA, GDA and TPA.

Where equipment is replaced, redundant items may either remain in-situ or be removed from the field. The location of redundant subsea infrastructure is recorded as part of the ROV as-left survey and included in the in a database for the GWA subsea inventory.

3.7.5 Subsea chemical usage

Planned chemical discharges may occur during subsea system operation and IMMR activities. The chemicals and volumes released are activity-specific.

Operational chemicals to be used in the GWA subsea infrastructure are selected and assessed using Woodside's Environment Chemical Selection and Assessment Guideline, as detailed in Section 7.2.3.

Typical chemicals that may be released during IMMR activities include:

- control fluid – the subsea control fluid presently used in GWA subsea systems is HW443 (with the exception of the closed loop IFL SSIV system, which uses HW525). HW443 is a water-based product, with ethylene glycol as the primary component. Control fluid may be dosed with dye to support integrity monitoring.
- hydrate control – MEG
- corrosion inhibitor – used to manage and prevent corrosion within pipeline and flowlines
- biocide – used to prevent bacterial growth that may cause corrosion
- acid – typically sulphamic acid (or equivalent) used for removal of calcium deposits. Alternatives such as citric acid or calcium wash may be used
- oxygen scavenger – used to deoxygenate pipelines and reduce corrosion bacterial growth
- surfactant – used to remove water and organic deposits
- grout – typically concrete-based materials used in mattresses and rock stabilisation
- staurolite products – used for abrasive blasting. Staurolite is a naturally occurring mineral.

3.7.5.1 Discharges during IMMR activities

Discharges to the marine environment may occur during subsea IMMR activities (e.g. pressure and leak testing or flushing). Where practicable, systems are flushed prior to disconnection to minimise residual hydrocarbon or chemical releases. Flushing fluids may be supplied from the platform or via a support vessel. Where practicable, flushed fluids are returned to the platform for processing.

Table 3-8 summarises typical discharge volumes associated with IMMR activities.

Table 3-8: Typical discharge volumes during IMMR activities

Activity	Description
Pressure/leak testing	Chemical dye estimated <10 L.
Flushing	Residual hydrocarbon or chemical release (corrosion inhibitor and oxygen scavenger) volume is dependent upon injection port size, component geometry and pumping rates.
Hot stab change out	Hydrocarbons or control fluid estimated <10 L.
SCM change out	A typical release of diluted acid is estimated to be 400 L and control fluid is estimated to be 10 L.
Jumper and umbilical replacement	Typical releases of hydraulic fluid, MEG and corrosion inhibitor are estimated to be <40 L each, typical acid release of <80 L.
Choke change out	Release of hydrocarbons <10 L and a typical release of MEG is estimated to be 280 L, typical acid release of <80 L.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Activity	Description
Tree cap change out	Release of hydrocarbons estimated <50 L and a typical release of MEG is estimated to be <50 L.
Logic plate change out	Release of hydrocarbons estimated <20 L and a typical release of MEG is estimated to be <20 L.
Flowline or spools repair, replacement and recovery	Typical release of hydrocarbon or other chemicals depends on equipment configuration and flushing ability. This will be subject to an ALARP determination for the activity, as per normal practice.
Electrical flying lead replacement	A typical release of diluted acid is estimated to be 10 L per lead.
Barrier testing	Release of hydrocarbons estimated up to 50 L condensate and 150 kg gas per test.

3.7.6 Marine growth removal

Marine growth forms on hard substrates, including subsea infrastructure, and may require removal to enable IMMR activities. Removal is typically undertaken using a ROV or, where required, a diver. Techniques are described in Table 3-9.

Table 3-9: Marine growth removal techniques

Activity / equipment	Description
Water jetting	Uses HP and UHP water to remove marine growth and to allow ultrasonic and close visual inspections.
Brush systems	Uses brushes attached to a ROV to remove marine growth.
Acid (typically sulphamic acid)	Chemically dissolves calcium deposits.
Sand/abrasive blasting. This would be done by divers only.	Additional cleaning to allow close visual inspections.

3.7.7 Pipeline pigging operations

Pipeline or flowline pigging may be undertaken for inspection, maintenance, repair or modification activities. Where required, temporary subsea or topside pig launchers and receivers may be installed. The pigging system is designed to operate within the maximum operating pressure of the production system.

The IFL can be pigged using the permanently installed GWA sphere launcher, which is a permanently installed pig trap. Pigging activities are not expected to result in routine discharges. The SSIV may be temporarily locked open for pigging activities.

3.7.8 Sediment relocation

Where sediment accumulates around subsea infrastructure, a ROV-mounted suction or dredging system may be used to relocate sediment to enable inspection and intervention activities. Such activities are limited to the immediate vicinity of the infrastructure and typically results in minor, localised seabed disturbance and temporary turbidity.

3.7.9 Suspend and preserve redundant equipment

Subsea equipment that reaches end of useful life may be suspended and preserved on the seafloor until decommissioning activities are undertaken.

3.8 Support vessel operations

Support operations include activities related to use of vessels and helicopters.

Vessels, either LNG or diesel-powered, are used in a support capacity for transferring materials, equipment, to and from the platform. Support vessels will also assist in platform emergency situations. Vessels are also used for field work such as subsea intervention (e.g. IMMR of subsea infrastructure).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Helicopter use is the primary mode of transporting crew and/or urgent freight to and from the GWA facility and are also the preferred means of evacuating personnel in an emergency.

3.8.1 Platform support vessel

Platform support vessels (PSV) are used to support operations at the GWA platform, including the transfer of materials and equipment and provision of standby support. Vessel types and specifications may vary depending on operational requirements, availability and contract arrangements. Indicative specifications for a typical platform support vessel (e.g. *Go Aurelia*) are provided in Table 3-10.

A dedicated standby vessel is typically present at or in the vicinity of the GWA platform to provide emergency response capability. The standby vessel supports offshore operations, including personnel evacuation, monitoring of marine traffic, and assistance during offshore activities. Standby coverage is maintained on a continuous basis, with vessels operating on a rotational basis (typically in two-week periods).

In addition to the standby vessel, a PSV undertakes routine cargo operations, typically on a weekly basis. These visits involve the delivery of materials and equipment to the platform and backloading of waste and return cargo for transport to shore (e.g. King Bay Supply Facility near Dampier).

During cargo operations, the PSV operates within the 500 m Petroleum Safety Zone (PSZ), undertaking lifting and transfer activities. These activities are typically completed within a few hours, with the total duration of presence within the Operational Area generally less than 24 hours per visit.

The standby vessel and PSV may be present at the GWA platform concurrently during routine operations.

Table 3-10: Indicative platform support vessel specifications (*Go Aurelia*)

Attribute	Details
Type	Platform support vessel
Length overall	83.4 m
Breadth	18.0 m
Draft	6.7 m
Dead weight tonnage	3,964 tonnes
Accommodation	Berthing for 30 personnel
DP System	DP2
Fuel capability	1,475 m^3

3.8.2 Subsea support vessels

Subsea support vessels, including uncrewed surface vessels (USVs), are used to undertake subsea IMMR activities. Vessels supporting offshore subsea activities may vary depending on operational requirements, vessel schedules, capability and availability.

IMMR activities are undertaken as discrete campaigns, with each campaign typically of short to medium duration (approximately 2 weeks to 1 month per activity), depending on the scope and complexity of the work. These activities may occur intermittently throughout the year in accordance with operational requirements.

Subsea support vessels typically utilise DP systems to manoeuvre and avoid anchoring when undertaking works near subsea infrastructure. Anchors may be deployed in an emergency.

DP operations may require the temporary deployment of seabed transponders to support vessel positioning and subsea operations. During IMMR activities, typically a single seabed transponder is deployed in combination with other vessel positioning systems. Transponders are attached to small, recoverable moorings (e.g. clump weights or tripods) and deployed to the seabed by ROV. These have a small footprint (typically less than 0.5 m^2) and are recovered at the completion of the activity.

Indicative specifications for a typical subsea support vessel (e.g. *Fugro Etive*) are provided in Table 3-11.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 3-11: Indicative subsea support vessel specifications (*Fugro Etive*)

Attribute	Details
Type	Subsea Support Vessel
Length overall (LOA)	92.95 m
Breadth	19.70 m
Depth	7.7 m
Gross tonnage	4,926 t
Accommodation	~100 POB
Dynamic Positioning System	DP2
Fuel Capacity	2,225 m^3 (241 m^3 largest diesel tank)

3.8.2.1 Uncrewed surface vessel

USVs will be remotely controlled from an onshore remote operations centre (ROC) in Australia which is staffed 24 hours a day whilst the vessel is in transit or undertaking activities. Key roles in the ROC mirror those on a usual vessel management team and include a Vessel Master, Offshore Manager and ROV Supervisor.

USVs are designed with multiple forms of high speed and reliable communication systems to allow connection to the ROC and provide redundancy in the case of disconnection during operations, including an independent emergency low-bandwidth satellite communications system for emergency use. The vessels are also fitted with 360-degree cameras monitored by the remote vessel master supporting safe navigation.

In the unlikely event of a communication failure between the ROC and USV, the USV Emergency Response Plan (ERP) is activated. The ERP includes process steps for attempting to regain control and issuing alerts or warnings to local authorities or other marine users. Depending on the type of communication loss, available controls may include, deployment of a physical anchor, mobilisation of a standby vessel or physical retrieval.

USVs are assessed by Woodside Marine (Section 7.7.2.4) to review compliance with marine laws, flag requirements, vessel class and Woodside's safety and environment requirements.

Because there are no facilities to support human occupancy on USVs, emissions and discharges are typically limited to cooling water and combustion of marine diesel. The vessel is equipped with bilge monitoring systems to monitor the bilge tanks for hydrocarbons (such as leaks from engine machinery spaces or from marine diesel tanks) and where detected the bilge pumps will auto disable and the vessel will be required to immediately return to port.

USVs have a maximum speed of 10 knots and may be equipped with a built-in work class ROV with the ability to deploy and retrieve equipment such as transponders to and from the seabed.

Indicative specifications for a typical USV are provided in Table 3-12.

USV activities are typically undertaken as part of IMMR campaigns, with durations consistent with those described in Section 3.7.

Table 3-12: Indicative USV parameters

Parameter	USV (based on *Reach Remote 2*)	USV (based on *Fugro Maali*)
Draft (max)	6 m	2.6 m
Length	23.9 m	12 m
Displacement (Gross Tonnage)	~340 t	14 t
Propulsion System	Diesel-electric hybrid	Diesel-electric hybrid
Total fuel volume	74.1 m^3	3.3 m^3

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.8.3 Accommodation support vessel

An accommodation support vessel (ASV) may be required to support planned maintenance campaigns, shutdown activities or major projects. During the life of this EP, ASV use is expected to be infrequent, with up to one campaign within the EP period (5 years). Each campaign may be of short to medium duration (typically up to 3 months).

ASV operations may occur at any time of year, depending on operational requirements. When deployed, the ASV is typically located adjacent to the GWA platform within the 500 m PSZ for the duration of the campaign.

ASV specifications vary depending on operational requirements and vessel availability. Typical ASVs utilise dynamic positioning (DP) systems to maintain station without anchoring when operating near the platform. Anchors may be deployed in an emergency. Alternative ASVs may be semi-submersible vessels with moorings installed by support vessels prior to arrival. Vessel selection is based on factors such as seasonal conditions (e.g. cyclone vs non-cyclone season) and campaign duration.

When on location, the ASV will be surrounded by a 500 m Safety Exclusion Zone (SEZ) under the control of the vessel master. Indicative ASV specifications are provided in Table 3-13.

Table 3-13: Indicative accommodation support vessel specifications (*Floatel Triumph*)

Attribute	Details
Type	Accommodation Support Vessel
Length overall (LOA)	125 m
Breadth	80 m
Dead weight tonnage (DWT)	27,111 t
Accommodation	~500 POB
Dynamic Positioning System	DP 3
Fuel Capacity	Largest tank ~300 m^3 Total capacity ~1,800 m^3

3.8.4 Heavy lift vessel

A heavy lift vessel (HLV) may be used for the removal of redundant equipment and to support major projects. During the life of the EP, HLV use is expected to be infrequent, with up to one campaign within the EP period (5 years). Each campaign is typically of short duration (up to 1 month).

HLV operations may occur at any time of year, depending on operational requirements. When deployed, the HLV would operate in proximity to the GWA platform and subsea infrastructure.

HLVs typically utilise a DP system to maintain station and manoeuvrability without anchoring, given the proximity of subsea infrastructure. Anchors may be deployed in an emergency.

Indicative HLV specifications are provided in Table 3-14.

Table 3-14: Indicative heavy lift vessel specifications

Attribute	Details
Type	Heavy Lift Vessel
Length overall	Up to 210 m
Breadth	Up to 47 m
Draft	Approximately 11 m
Dead weight tonnage	Up to 51,000 t
Accommodation	~60 POB
DP System	Minimum DP2

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Attribute	Details
Fuel capacity	Up to 5,000 m^3 in total (individual tanks in the order of 1,000 m^3)

3.8.5 Helicopter operations

Helicopters are the primary means of transporting passengers and/or urgent freight to and from the GWA platform and support vessels. They are also the preferred means of evacuating personnel in the event of an emergency. No helicopter refuelling occurs on GWA. Helicopter support is principally supplied from Karratha Airport. There are typically 5-7 transfers per week, depending on operational requirements.

3.9 Platform well management and maintenance

Well management and well activities for platform wells are conducted from the platform. This may include routine maintenance and inspection activities through to well interventions, workovers and well kill. An outline of platform-based well management and maintenance activities are provided below.

Interventions of subsea wells would require a suitable vessel or drill rig to accommodate and support intervention activities. Interventions of the subsea wells do not form part of the scope of this EP.

3.9.1 Well intervention

Well interventions may be required for reservoir surveillance, enhancing productivity / injectivity, assessing wellbore condition, restoring well integrity, or other scenarios that develop during operate phase.

Well interventions may include the following activities:

- wellhead maintenance (including actuator, valve, choke and tree change outs)
- annulus fluid top-ups, Echo meter shots and chemical inhibition
- electric-line, slick-line and coiled tubing interventions
- logging or surveys
- fishing junk or lost-in-hole equipment
- setting and recovering plugs and wireline insert subsurface safety valves
- mitigating safety critical failures (e.g. failed safety valve)
- chemical squeeze operations
- perforating the wellbore.

In addition to above, platform well intervention activities may be performed to prepare redundant platform wells for plug and abandonment. These “pre-rig” well intervention P&A activities utilise the same type of equipment as the above well intervention activities and may include;

- wireline/slick-line operations to drift the well-bore.
- wireline/slick-line plug recovery and/or fishing operations to provide well access for deep-set pre-P&A plugs
- wireline/slick-line operations to install down-hole mechanical equipment for well-bore access (e.g. straddles)
- high-pressure pumping operations to bullhead / circulate wells (to donor well) with inhibited sea-water
- high-pressure pumping to pressure test wells and well barriers.
- wireline logging surveys (including annulus cement evaluation logs)
- wireline installation of down-hole plugs
- venting and pumping operations to “top-up” well volumes and pressure test down-hole plugs
- wireline installation (e.g. dump-bailing) of through-tubing cement plugs

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- wireline installation of alternative barrier material (e.g. Bismuth alloy) plugs
- cement batch-mixing and pumping operations to install through-tubing cement plugs (pumped from surface)
- perforating / cutting of the tubing to prepare for P&A.
- wellhead and XT maintenance, cavity testing, seal remediation etc.

3.9.2 Routine wellhead maintenance

Wellhead maintenance is conducted routinely on all surface wellheads/trees in accordance with the relevant Facility Well Integrity Management Plan.

Wellhead maintenance consists of greasing and functioning the wellhead/Xmas tree valves and replacement of any non-serviceable items. Integrity testing of the valves is also completed and recorded by the facility.

3.9.3 Well workover

Well workovers generally involve recovery and re-installation or replacement of production/injection completion strings. On the GWA facility, well workovers are undertaken using a hydraulic workover unit (HWU). Workovers may be required to replace or repair failed downhole well equipment including tubing, casing, liners or other completion components. In order to workover a well, it must be plugged.

During the workover activities, the well fluids are isolated by a deep well plug (and packer) and Blowout Preventer (BOP). In addition, the combination of the choke/kill manifold and brine is used as means of detecting and controlling the well fluids. If a kick is detected, appropriate controls are initiated to prevent further escalation, e.g. kill fluid pumped into the well (see below) or BOP shut.

3.9.4 Well kill

This is an operation to displace reservoir fluids from the wellbore by replacing them with a weighted fluid system (kill fluid) to achieve zero and stable shut-in tubing head pressure. A well kill may be required in the event that well integrity is compromised and provides a means of mitigation until such time that a more permanent fix can be implemented to re-instate full well integrity. A well kill may also be carried out to facilitate planned, routine well workover and intervention activities.

The kill fluid formula is selected according to the characteristics of the well and the reservoir fluids. Chemically treated and coarsely filtered seawater has been concluded to be an acceptable kill fluid for all GWA wells.

The following two well kill options would most likely be used on GWA:

- bull heading, where well kill fluid is pumped at a high rate and the hydrocarbon is forced back into the reservoir
- lubricate and bleed, where the reservoir is isolated/plugged and well kill fluid is introduced into the well bore and the hydrocarbon (gas) is bled off.

A mobile well kill unit may be mobilised to the GWA facility, as required, for platform well management and maintenance activities.

3.9.5 Management of activities

During intervention and workover activities, well control for the prevention of any release of reservoir fluids to the environment is achieved by various barriers such as plugs (including deep set), kill fluids and BOPs. Under normal circumstances, two or more verified barriers are maintained. Where fluid columns are used as a barrier, wells are continuously monitored for signs of a kick. If a barrier fails or a kick is detected, appropriate actions (consistent with good oil field practice and standards) are undertaken to restore barrier integrity and/or re-establish well control. However, as the work being undertaken on the GWA facility relates to production platform wells with known reservoir pressure, the likelihood of a kick is low, especially if fluid levels are maintained.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.9.6 Well management chemical use

Interventions, workovers and well kills may typically involve the use and discharge of chemicals which may include, but not limited to:

- glycol
- high viscous (hi-vis) polymer pills or sweeps
- surfactant and / or solvent pills or sweeps
- fluid loss control and / or lost circulation material pills
- seawater, raw or inhibited with any combinations including biocide, oxygen scavenger, caustic or soda ash
- brine, KCl / NaCl, raw or inhibited with any combinations including biocide, oxygen scavenger, caustic or soda ash.
- cement including cement additives

Any chemicals or fluids used for the above operations are selected in accordance with the Woodside Environment Chemical Selection and Assessment Guideline (Section 7).

3.9.7 Well clean-up

Following well intervention or workover activities, wells may require clean-up to remove residual fluids within the wellbore. These fluids may include reservoir hydrocarbons, workover fluids and other introduced chemicals.

Well clean-up is typically undertaken via the test separator, which allows for controlled handling and monitoring of produced fluids within the production process. Where required (e.g. where rapid unloading of well fluids is necessary), wells may be routed directly to the production process, noting that the test separator may not be suitable for handling large initial fluid volumes.

All recovered fluids, including hydrocarbons and workover fluids, enter the production process downstream of the well choke. The test separator is used where required to manage and monitor flow prior to integration with the main process streams. Gas is preferentially routed to the process system, with flaring occurring only where necessary (e.g. during upset or operational constraints).

Solids generated during well clean-up (e.g. sand or debris) are primarily removed via the sand filter located upstream of the test separator. Recovered solids are collected and managed for onshore disposal in accordance with waste management procedures. No additional filtration equipment is installed within the flowlines for well clean-up activities.

As well clean-up activities are non-routine they are managed to achieve an oil-in-water (OIW) concentration of 100 mg/L as a 24-hour rolling average (for up to 4 days), where fluids are routed to the produced water system. The 30 mg/L monthly rolling average OIW threshold must be achieved at all times.

3.9.8 Production from high water cut wells

Water production from GWA platform wells has increased over time, resulting in a number of high water cut wells (e.g. GWA03, GWA05, GWA08, GWA18 and GWA19). Under routine operations, these wells are managed using operational controls (e.g. choke management and well shut-in) to optimise production while maintaining PW quality within operational limits. Routine GWA operations are managed to achieve a PW OIW concentration limit of 30 mg/L as a 24-hour rolling average.

Well unloading of long-term shut-in high water cut wells requires a faster than usual bean-up rate to ensure a successful kick-off of these wells and unload the formation water in the wellbore. This ensures the gas velocity is sufficient to lift the accumulated column of liquid in the wellbore initially and subsequently sustain production of reservoir fluids without loading the wellbore with water. This rapid bean-up does not allow sufficient water residence time in the separation process units, potentially resulting in higher-than-normal instantaneous OIW values. Historically, these higher-than-normal OIW values caused the well to be shut-in again, before the kick-off activity could be completed.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Trials undertaken between 2019-2021 demonstrated that elevated OIW concentrations associated with short-term high or unstable water production during well unloading were temporary and did not represent long-term PW performance. OIW concentrations reduced once steady production was established, and subsequent restart events from the same wells generally exhibited progressively lower OIW peaks depending on the duration of the preceding shut-in period.

Accordingly, GWA distinguishes between three operating states for high water cut wells: well unloading, well cycling and normal production (Table 3-15). Well unloading and well cycling are planned, non-routine operational activities undertaken under defined operational controls. Because these activities involve transient operating conditions rather than steady-state production, a temporary operating threshold of 100 mg/L OIW as a 24-hour rolling average applies during the activity. A monthly rolling average OIW concentration of 30 mg/L is maintained at all times.

Table 3-15: High water cut well start up activities based on duration since last production

Activity	Description	Production history
Non-routine: Well Unloading	• Offline for a substantial period and can behave differently when returned to production • Requires faster than usual bean-up rate to ensure a successful kick-off to unload formation water in the wellbore • Rapid bean-up does not allow sufficient water residence time in the separation process units potentially resulting in higher-than-normal instantaneous OIW values	>12 months since last production
Non-routine: Well Cycling	• Well has previously been unloaded following an extended shut-in period. • A receding aquifer with reservoir properties such as high permeability sands to facilitate aquifer movement into the reservoir. Sufficient reservoir pressure to support well kick off • Shut-in when gas can no longer be lifted to topsides due to water-gas ratio (WGR), cycled on and off approximately three monthly	>3 and <12 months since last production
Routine: Normal production	• Wells that are part of normal, recent production (including high water cut)	<3 months since last production

3.10 GWF4 and future tie-in production well commissioning

The commissioning activities of GWF4 infrastructure are planned to occur over multiple campaigns in 2027 and 2028. Two additional future tie-in production wells that form part of the scope of this EP, if progressed, would be commissioned after GWF4. All activities may be rescheduled based on operational requirements of the GWA facility or for other production scheduling reasons.

The scope of this EP commences once hydrocarbons are introduced into the system (i.e. during hot commissioning). Following introduction of hydrocarbons, preservation fluids are displaced to the GWA platform, where they are processed through the production system, and wells are subsequently cleaned-up to achieve stable production. If unloading to MODU, preservation fluids are processed through a rig for well unload, and the wells are then routed to the facility for introduction of hydrocarbon to the platform and complete clean-up.

Gas produced during commissioning is generally treated as production gas and routed through separation systems to export. However, during specific commissioning activities (nitrogen displacement from flowlines), additional flaring may be required to safely manage non-hydrocarbon gases and off-specification gas streams.

Commissioning and performance testing activities include (amongst other):

- subsea valve leak-off testing and function testing
- flowline preservation fluid and nitrogen displacement from flowlines and subsea infrastructure
- final well clean-up
- simulated emergency shutdown (ESD) test

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- flowmeter calibration
- control valve functionality
- system performance testing
- fluid sampling.

During commissioning, the facility may experience short periods (up to 4 days) of elevated OIW levels (up to 100 mg/L 24 hour rolling average). This is primarily due to the introduction of preservation fluids (MEG, water and biocide mixtures) during well start-up. To manage this, a temporary OIW polishing skid will be deployed to support treatment and maintain OIW within acceptable limits.

The Wilcox wells are planned to be unloaded to MODU prior to being routed to the facility to complete well clean-up. Installation of the 25 km Wilcox flowline will result in the flowline being filled with nitrogen, which will require controlled displacement during commissioning. Nitrogen is managed through the facility and must be flared, in accordance with operational constraints, to maintain safe operation of topsides systems and prevent impacts to export gas specifications and equipment performance.

Flaring associated with commissioning activities will be planned, controlled and minimised, with commissioning sequences optimised to reduce hydrocarbon flaring while maintaining safe and stable operations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4. DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulations 21(2) and 21(3) of the Environment Regulations, this section describes the existing EMBA by the Petroleum Activity (planned and unplanned, as described in Section 3), including details of the particular relevant values and sensitivities of the environment, which were considered for the impact and risk assessments.

The EMBA is the largest spatial extent where unplanned events could have an environmental and/or socio-cultural consequence on the surrounding environment. For this EP, the EMBA is the combined potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the event of the following credible worst-case scenarios (Section 6.8.2):

- scenario 1 - well blowout – seabed release from highest flow rate subsea well (YOD05, part of the GWF4 development)
- scenario 2 - well blowout – surface release from platform wellhead (GWA08)
- scenario 4 - subsea release from IFL (including 2TL inventory) downstream of SSIV but within 500 m of GWA facility
- scenario 5 - surface release from IFL (including 2TL inventory) from rupture of riser at GWA facility.

The ecological impact thresholds used to delineate the EMBA are defined in Section 6.8.2.3. The EMBA also includes areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations

Woodside recognises that hydrocarbons may be visible at lower concentrations than the ecological impact thresholds defined in Table 4-1. These visible hydrocarbons have the potential to cause socio-cultural impacts. In respect of this, the EMBA also includes hydrocarbon thresholds where socio-cultural impact could occur. Receptors relevant to the socio-cultural hydrocarbon thresholds include cultural values and heritage, Commonwealth and State marine protected areas (MPAs), National and Commonwealth Heritage Listed places, areas of tourism and recreation, and commercial and traditional fisheries. For this EP, the socio-cultural hydrocarbon thresholds for surface hydrocarbons encompasses a wider area than the EMBA for ecological impacts. The EMBA and socio-cultural hydrocarbon thresholds are shown in Figure 4-1 and described in Table 4-1.

The EMBA does not represent the predicted coverage of any one hydrocarbon spill nor depict a slick or plume at any particular point in time. Rather, the EMBA represents a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define the EMBA for surface and in-water hydrocarbons

Hydrocarbon type	Ecological hydrocarbon thresholds[1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for operational and scientific monitoring
Surface (floating)	10 g/m^2 This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m^2 This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for operational and scientific monitoring.	
Dissolved	10 ppb The biological effects of hydrocarbons are driven by the fraction of hydrocarbons that are dissolved and therefore bioavailable to aquatic organisms. Toxicity studies show 10 ppb is protective of more than 95% of species for acute exposures, while still capturing		10 ppb This low concentration value establishes the planning area for operational and scientific monitoring within which further analysis can be

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Hydrocarbon type	Ecological hydrocarbon thresholds[1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for operational and scientific monitoring
	the onset of effects in the most sensitive species and life stages (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		undertaken to inform monitoring priorities. In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold (Table 7-13).
Entrained	1,000 ppb Entrained hydrocarbons have limited bioavailability as toxic effects are driven by the small soluble fraction (typically less than 1% of the oil mass) that dissolves into the water column (French-McCay 2026). As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		
Shoreline	100 g/m^2 This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m^2 This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	

[1] Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 6.8.2.3.

4.2 Regional context

The Operational Area is located in Commonwealth waters within the North-west marine region (NWMR), as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMC

RA v4.0) (DSEWPC 2012), in water depths of approximately 74 to 200 m. Within the NWMR, the Operational Area lies within the NWS Province (Figure 4-2). The EMBA also overlaps the Northwest Province, the Northwest Transition and the South-west Marine Region. The Master Existing Environment document (Appendix C) summarises the characteristics for the relevant marine bioregions.

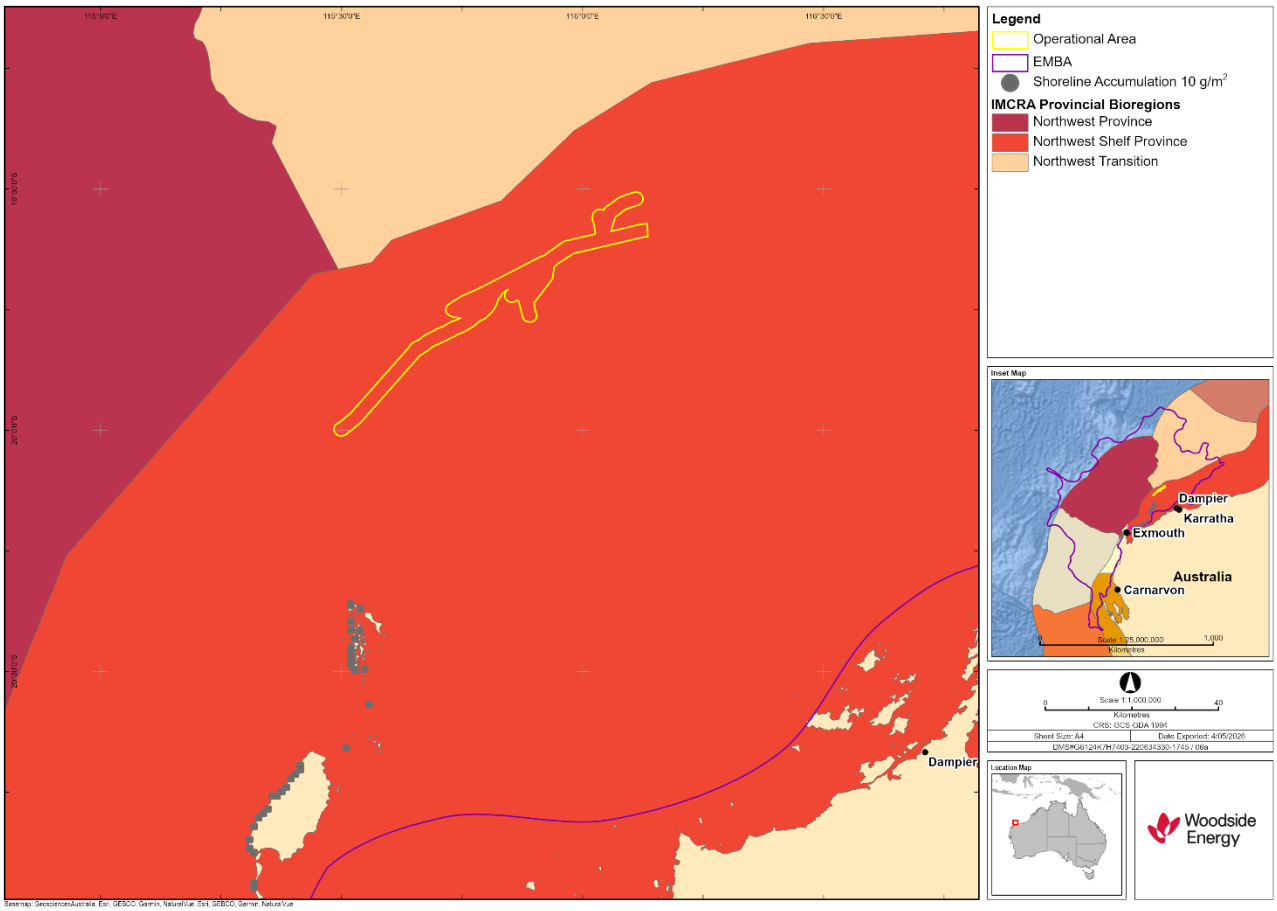

Figure 4-2: Location of the Operational Area and relevant marine bio-regions

4.3 Matters of national environmental significance (EPBC Act)

Table 4-2 summarises the matters of national environmental significance (MNES) that overlap the Operational Area and EMBA, based on results from the Protected Matters Search Tool (PMST) (Appendix D).

The EPBC Act PMST is a screening tool that identifies MNES with the potential to occur within a search area using a conservative, grid-based approach. In offshore marine environments (>30 km from the coast), the PMST applies grid cells of 32 km × 32 km. Accordingly, the PMST report may indicate the presence of MNES that do not directly intersect with the Operational Area or EMBA (Appendix D).

To ensure accurate consideration of potential impacts to MNES, spatial datasets (shapefiles) provided by DCCEEW were analysed using Geographic Information System (GIS) software to determine the actual spatial overlap with, and proximity to relevant MNES. Table 4-2 provides a summary of relevant MNES identified by the PMST as potentially occurring within the Operational Area and EMBA and reflects the outcomes of the refined spatial assessment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Further information on MNES relevant to the Petroleum Activity is provided in the following sections and detailed in Appendix D.

Table 4-2: Summary of relevant MNES identified by the EPBC Act PMST as potentially occurring within the Operational Area and EMBA

MNES	Number of MNES in Operational Area	Number of MNES in EMBA
WHPs	0	3
National Heritage Places (NHPs)	0	3
Wetlands of International Importance (Ramsar)	0	0
Commonwealth Marine Area	2	3
Listed Threatened Ecological Communities	0	0
Listed Threatened Species[1]	27	46
Listed Migratory Species[1]	43	68
Listed Migratory and Threatened Species[1]	50	81

[1] MNES which are not known to inhabit shorelines, nor rely on the marine environment for their diet, have been discounted from these totals and have not been assessed.

4.4 Physical environment

Water depth along the IFL is between 78 and 130 m. The GWA platform stands in approximately 131 m of water and is situated approximately 138 km north-west of Dampier and 23 km south-west of NRC. The subsea gathering system extends to depths of 200 m.

The Operational Area lies on the outer continental shelf in waters approximately 74 to 200 m deep (Figure 4-3). The bathymetry within the Operational Area is generally flat, which is consistent with the broader NWS Province shelf region (Baker et al. 2008). The seabed has a gentle (0.05°) seaward gradient extending to a steep distal slope occurring between 200 to 300 km offshore in water depths of around 200 m (Dix et al. 2005). The continental slope then descends more rapidly from the shelf edge to depths greater than 1,000 m to the north-west (James et al. 2004).

Appendix C provides a summary of the physical characteristics of the environment within the EMBA.

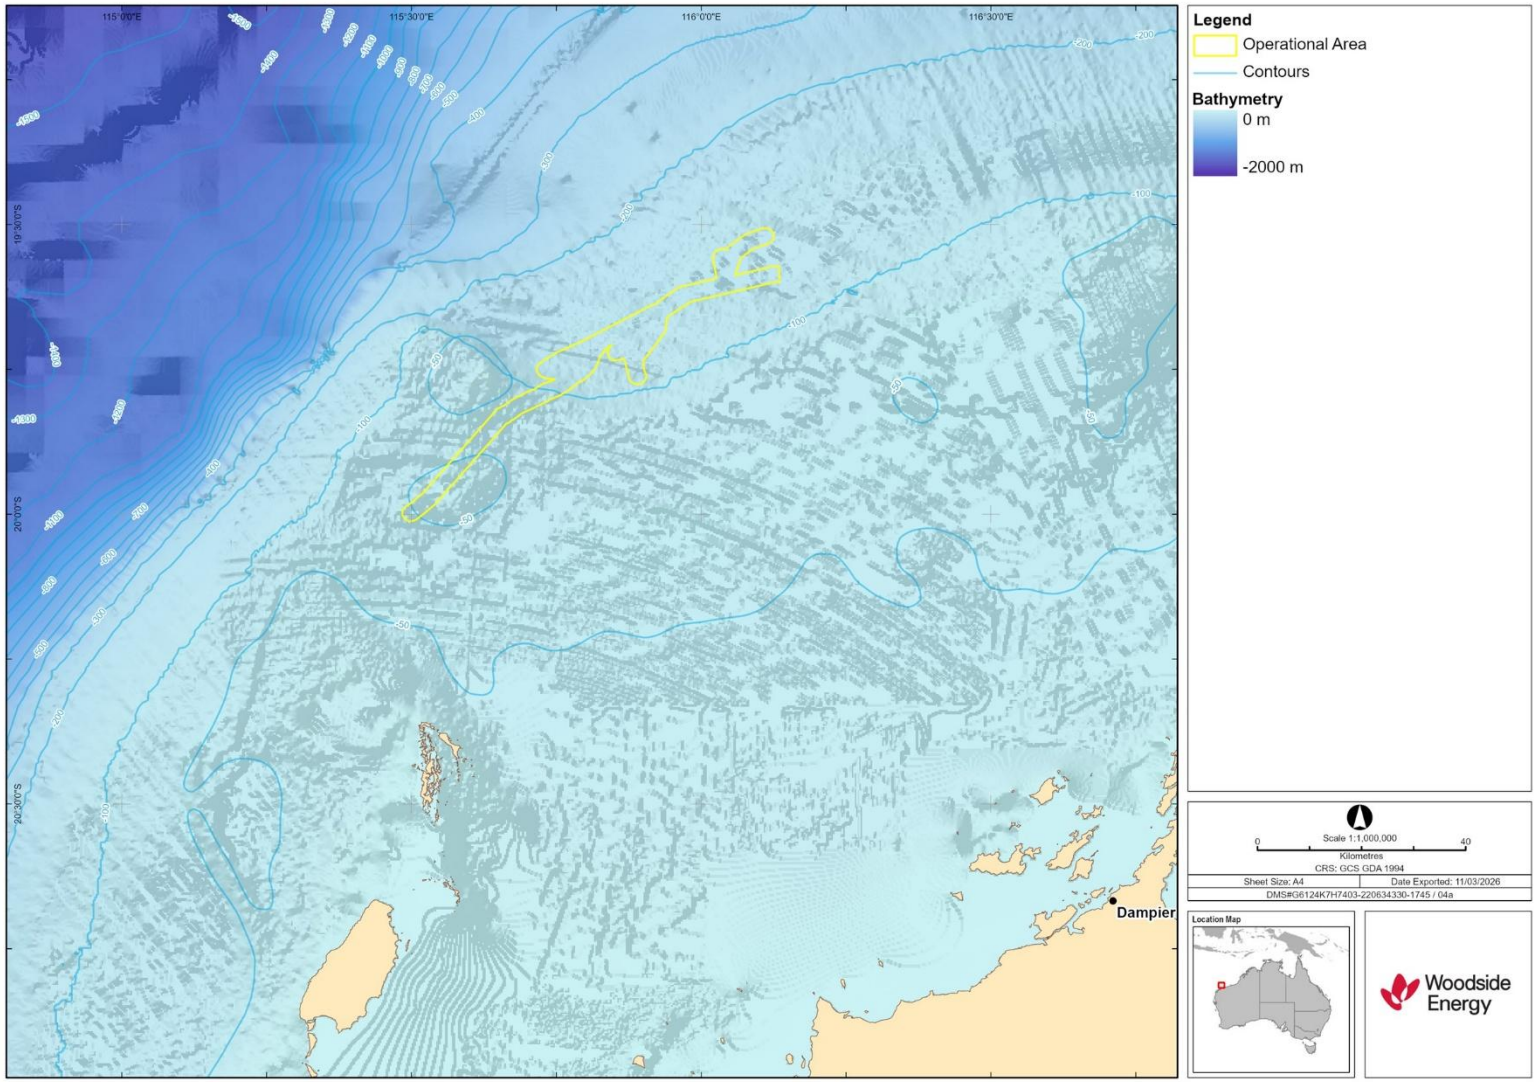

Figure 4-3: Bathymetry of the Operational Area and broader region

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.5 Habitats and biological communities

Sediments in the Operational Area are broadly consistent with those in the NWS Province, with typically low levels of potential contaminants of geogenic origin (often below laboratory limits of detection). Sediments in the outer NWS Province are relatively homogenous and are typically dominated by sands and a small portion of gravel (Baker et al. 2008). Fine sediment size classes (e.g. muds) increase with proximity to the shoreline and the shelf break but are less prominent in the intervening continental shelf (Baker et al. 2008). Carbonate sediments typically account for the bulk of sediment composition, with both biogenic and precipitated sediments present on the outer shelf (Dix et al. 2005). Beyond the shelf break, the proportion of fine sediments increases along the continental slope towards the Exmouth Plateau and the abyssal plain (Baker et al. 2008).

Across the NWS Province, localised areas of elevated barium (AIMS 2014b, RPS 2012) have been identified, which have been attributed to contamination from historical drilling activities (AIMS 2014b). Around the GWA platform, the contamination of sediments with barite (barium sulphide), is considered to be localised within 200-400 m, with other potential contaminants such as heavy metals present in low concentrations (BMT Oceanica 2015). Sediments in the Operational Area are expected to be comprised primarily of fine sands, very fine sands and silt, with monitoring near the GWA platform indicating these size fractions constitute the majority of sediments (BMT Oceanica 2015).

While hard substrates are not known to occur within the Operational Area, they occur in the region more broadly and can host more diverse benthic communities. Hard substrate may be associated with the Ancient Coastline at 125 m Depth Contour Key Ecological Feature (KEF) (Section 4.7), which overlaps the Operational Area.

The southern extent of the Operational Area partially overlaps the Montebello Marine Park (Figure 4-14). An ROV survey within the northern extent of the Montebello Marine Park was undertaken in 2019 to characterise the benthic habitats and communities within the area (Advisian 2019). Video imagery was collected from transects, and the habitat was classified in accordance with the Collaborative and Automated Tools for the Analysis of Marine Imagery (CATAMI) classification system. Five areas within the Montebello Marine Park were surveyed, of which three (Area 2, Area 3, Area 4) are in the vicinity of the Operational Area (Figure 4-4). Water depths in the three areas were very similar, with the midpoints depth of transects ranging from ~70–78 m. The Advisian (2019) survey findings are summarised in Table 4-3.

Area	Summary description	Example ROV footage
	fish, echinoderms and jellyfish, were also noted on the videos.	
3	• the seafloor in Area 3 was relatively flat and sandy with a light to high cover of biologenic gravel and/or organic material over its entire length (continually changing). Small undulations of the seabed and some small sand waves were present on occasion, but no other regular bedforms such as sand ripples or sand waves were apparent. • no significant moderate or high relief habitat features were observed on the video or can be seen on the transect maps with detailed bathymetry. Any features seen are ~1 m high and occur over relatively large scales. • the seabed was a mosaic of bare substrate and low (~5%) to high (~75%) density cover of benthic organisms (e.g. sponges, corals). Benthic fauna comprised a diverse array of sponges and corals with varying forms, sizes and colours. Hydroids and cnidarians were also apparent on occasion along the transect length. • bioturbation of the seafloor in the form of small cones, craters, burrows and small and large trails was apparent. Mobile organisms including fish, echinoderms and jellyfish were also noted on the videos. Fish fauna diversity was quite high, and varying sizes of fish were seen amongst the aggregations of corals and sponges and also over bare sandy seafloor.	 
4	• the seafloor within Area 4 was typically flat sand with a high level of biogenic gravel of unknown origin. Small mounds, waves and undulations all <50 cm high were seen on occasion, mainly around aggregations of benthic epifauna (i.e. sponges and corals). • no significant moderate or high relief features or significant areas of consolidated hard substrate were present in Area 4 that could be seen on the video or transect maps. • the seafloor was scattered with sponges and corals of varying forms and sizes; these occurred as individuals with a low-density cover (~5%) up to more dense clusters (~50%). Other benthic epifauna included echinoderms and cnidaria. Mobile fauna (mainly small bony fishes) were most common around the larger clusters of sponges and corals. • areas of bare sand occurred amongst the patches of epifauna. The switch between bare

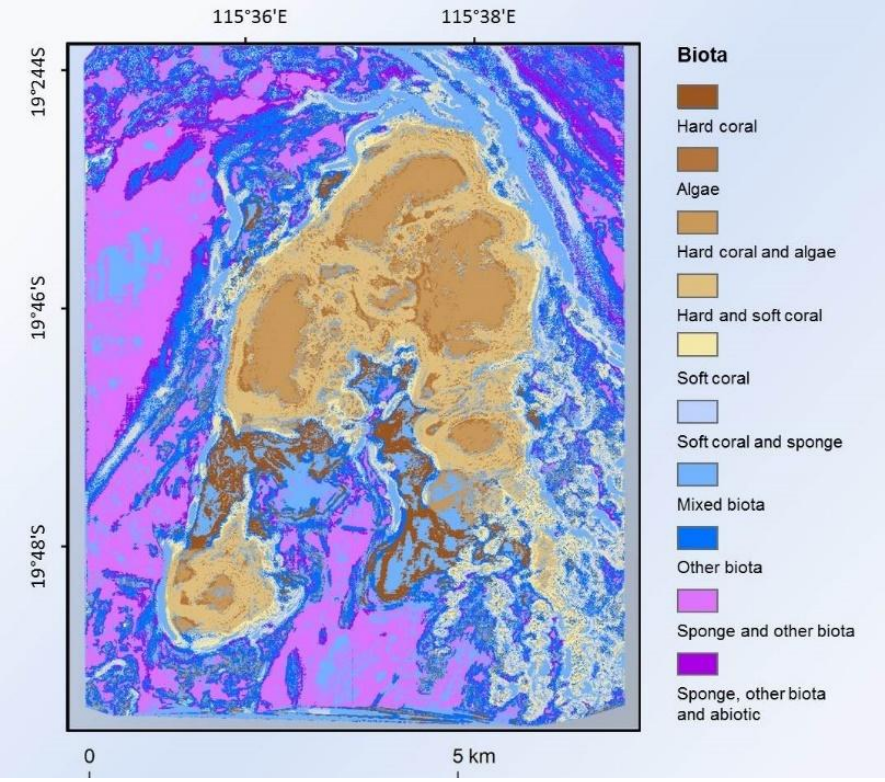
Area	Summary description	Example ROV footage
	sand and benthic cover changed constantly and over short distances. • bioturbation of the seafloor in the form of small mounds and craters was evident along the entire transect length.	

There are three shoals within or close to the Operational Area that are relatively shallow and described further in Table 4-4:



- Rankin Bank – water depths of ~18-30.5 m, located 3.7 km north-west from the Operational Area
- Unnamed Shoal – water depths of ~40-50 m, located within the Operational Area
- Wilcox Shoal – water depths of ~25-80 m, located 2.4 km south-east from the Operational Area.

Key habitats and ecological communities, including shallow water shoals within the EMBA, are briefly described and identified in Table 4-4, and displayed in Figure 4-6. A full description of the habitats and ecological communities is contained within the Master Existing Environment (Appendix C).

Table 4-4: Habitats and communities within the environment that may be affected (distance calculated from Operational Area)

Habitat/ community	Key locations within the EMBA
Seabed characteristics	
Ancient Coastline at 125 m Depth Contour	The Ancient Coastline at 125 m Depth Contour KEF (Ancient Coastline KEF), overlaps part of the Operational Area (DAWE 2019a; Section 4.7). Areas of this KEF comprise hard substrate and may occur within the Operational Area. Hard substrate seabed habitats present within the Operational Area are likely to support filter feeding biota such as sponges and gorgonians (sea whip and fans), as reported for hard substrate seabed habitat in similar water depths along this outer shelf area of the NWS.
Glomar Shoal	Glomar Shoal is a large (~215 km^2) and complex bathymetric feature situated on the outer continental shelf off the Pilbara coast. Glomar Shoal is ~8.5 times wider than Rankin Bank at the 60 m contour. Glomar Shoal is a shallow sedimentary bank comprising coarser biogenic material than the surrounding seabed. The shoal is ~26–70 m below the sea surface (Falkner et al. 2009) and is 51.5 km east of the Operational Area. Glomar Shoal has been identified as a KEF for its high productivity and aggregations of marine life (Falkner et al. 2009). This KEF encompasses a wider area than the shoal feature itself. Together with Rankin Bank, these remote shallow-water shoals represent regionally significant habitats and are considered likely to play an important role in the productivity of the Pilbara region (AIMS, 2014a; Abdul Wahab et al. 2018). Glomar Shoal has a high percentage of marine-derived sediments with high carbonate content and gravels of weathered coralline algae and shells (McLoughlin and Young 1985) The area's higher concentrations of coarse material compared to surrounding areas are indicative of a high-energy environment subject to strong seafloor currents (Falkner et al. 2009). Cyclones are also frequent in this area and stimulate periodic bursts of productivity because of increased vertical mixing (Abdul Wahab et al. 2018). Studies by Abdul Wahab et al. (2018) found several hard coral and sponge species in water depths <40 m.
Rankin Bank	Rankin Bank is located 3.7 km north of the Operational Area. Although it is not a KEF, Rankin Bank, along with Glomar Shoal, are large and complex bathymetric features on the outer western shelf of the Pilbara and represents habitats that are likely to play an important role in the productivity of the Pilbara region (AIMS 2014b). Rankin Bank comprises three submerged shoals delineated by the 50 m depth contour, with water depths of ~18–30.5 m (AIMS 2014b). Rankin Bank has a diverse marine environment, predominantly comprising consolidated reef and algae habitat (~55% cover at depths of <40 m), followed by hard corals (~25% cover at depths of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat/ community	Key locations within the EMBA
	<40 m), unconsolidated sand/silt habitat (~16% cover with increasing prevalence at depth), and benthic communities comprising macroalgae, soft corals, sponges and other invertebrates (~3% cover) (AIMS 2014b; Figure 4-5). Hydrocarbon and trace metal concentrations in sediments indicate the bank has not been affected by anthropogenic pollution (AIMS 2014b). Hard corals are a significant component of the benthic community of some parts of the bank, with abundance in the upper end of the range observed elsewhere on the submerged shoals and banks of north-west Australia (Heyward et al. 2012).  *Source: North West Atlas; https://maps.northwestatlas.org* **Figure 4-5**: **Rankin bank benthic habitats** The habitat surrounding Rankin Bank (<50 m) was mapped by AIMS on behalf of Woodside (AIMS, 2014b) and hosts filter-feeding communities in areas of consolidated substrate interspersed by sand. Further surveys in 2017, in water depths greater than 70 m at the, at the GWF4 LPA manifold location, found that epibenthic taxa were very sparse but typically clumped and comprised of mixed filter feeders such as sea whips, sea fans (gorgonians) other soft corals, sponges and hydroids (Jones et al. 2021). It is expected that these filter feeder communities may be sparsely distributed in the south-west section of the Operational Area. Rankin Bank has been shown to support a diverse fish assemblage (AIMS 2014b). This is consistent with studies showing a strong correlation between habitat diversity and fish assemblage species richness (Gratwicke and Speight 2005, Last et al. 2005).
Unnamed Shoal	Unnamed Shoal is located within the Operational Area and approximately 1.9 km north of the nearest flowline. It is a small shoal around ~1 km^2 in water depths between 40 and 50 m. The reef top has moderate to high relief rock with stony corals (~40 m water depth) with ~30% cover and then transitioning to mixed biota on the reef slopes in depths 50 to 60 m. Unnamed Shoal supports some high relief coral reef but lacks the extent and structural complexity of the coral habitat on Wilcox Shoal (Worley 2025). Deeper water habitats surrounding Unnamed Shoal are very similar to Wilcox Shoal consisting of sparsely distributed gorgonians, sea whips, soft corals, sponges, and sea fans (Worley 2025). To the southwest there are areas of rock veneer that were mostly bare, and to the north there are areas of sand veneer, unconsolidated gravel, and unconsolidated sand, similar to Wilcox Shoal (Worley 2025).
Wilcox Shoal	The Wilcox Shoal is located 2.4 km south-east of the Operational Area. Wilcox Shoal is an isolated submerged oceanic shoal, rising from 80 m depth and reaching 26 m depth at its shallowest point

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat/ community	Key locations within the EMBA
	(Worley 2025). The top of the shoal has high structural complexity owing to the presence of shallow (<30 m) surface reef communities dominated by hard corals. The north and north-eastern sides of the shoal have steep slopes that drop from 40 m to 75 m, whereas the southern side has a gentle depth gradient and a long plateau out to the 70 m contour (Worley 2025). In general, the habitat transitions from coral-dominated within the reef top into consolidated cobbles (coral rubble) and unconsolidated (soft) sand with sparsely distributed hard corals and other invertebrates including octocorals and porifera (e.g. gorgonians, sea whips, soft corals, sponges, and sea fans) along the shoal slope at ~30 m to 60 m depth (Worley 2025). The seabed surrounding the base of the shoal was characterised as unconsolidated sand with intermittent octocorals and porifera in deep (70–80 m) waters (Worley 2025). The range of habitat types recorded at Wilcox Shoal were similar to those recorded at other shoals along the Western Australian coastline, including Rankin Bank (Worley 2025).
Tryal Rocks	Tryal Rocks is located 29.7 km southwest of the Operational Area, and within the Montebello Marine Park Tryal Rocks are a small group of low-lying coral reef structures, comprising two closely spaced reef systems aligned northeast–southwest, with shallow depths (locally less than 20 m) and sections that dry at low tide.
Marine primary producers	
Coral	• Rankin Bank (3.7 km north-west from the Operational Area) • Glomar Shoal (51.5 km east from the Operational Area) • Montebello Islands (38 km south from the Operational Area) • Barrow Island (72 km south from the Operational Area) • Ningaloo Coast (240 km south-south-west from the Operational Area) • Muiron Islands (212 km south-south-west from the Operational Area)
Seagrass beds and macroalgae	• Montebello Islands (38 km south from the Operational Area) • Barrow Island (72 km south from the Operational Area) • Ningaloo Coast (240 km south-south-west from the Operational Area) • Muiron Islands (212 km south-south-west from the Operational Area) • Exmouth Gulf (222 km south-west from the Operational Area)
Mangroves	• Ningaloo Coast (240 km south-south-west from the Operational Area) • Montebello Islands (38 km south from the Operational Area) • Exmouth Gulf (222 km south-west from the Operational Area)
Other communities and habitats	
Plankton	Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR, as detailed in Appendix C, Section 4.3. Peak primary productivity within the EMBA occurs in late summer/early autumn, along the shelf edge of the Ningaloo Reef. It also links to a larger biologically productive period in the area that includes mass coral spawning events, peaks in zooplankton and fish larvae abundance (CALM 2005a), with periodic upwelling throughout the year. Further detail regarding productivity at other notable locations within the EMBA (e.g. North-west Cape) is provided in Appendix C, Section 4.3.3.
Pelagic and demersal fish populations	Pelagic and demersal fish populations within the Operational Area and EMBA are expected to be representative of the NWMR (described in Appendix C, Section 6.2). Particular features within the EMBA that are known to support pelagic and demersal fish populations include the Ancient Coastline at 125 m Depth Contour KEF (which also overlaps the Operational Area), the Continental Slope Demersal Fish Communities KEF, the Western demersal slope and associated fish communities of the Central Western Province KEF, Rankin Bank and Glomar Shoal (including the Glomar Shoal KEF). Detail regarding these features is provided in Appendix C, Section 11.
Epifauna and infauna	Filter feeders such as sponges, ascidians, soft corals, and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2008). Filter feeders within the EMBA are expected to be representative of the NWMR, with notable areas of high sponge diversity occurring in the

Habitat/ community	Key locations within the EMBA
	Commonwealth waters of Ningaloo Marine Park and at shoals (such as Glomar Shoal) within the EMBA (see Appendix C, Section 5.2). Discrete areas of hard substrate hosting sessile filter feeding communities may also be associated within the Ancient Coastline at 125 m Depth Contour KEF, which overlaps the Operational Area. Filter feeder communities within the Operational Area are present on the subsea infrastructure and GWA platform, which provides hard substrate for attachment in an otherwise generally featureless, soft and sandy substrate.

4.6 Protected species

A total of 81 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 50 species were identified as potentially occurring within the Operational Area. The full list of marine species identified by the PMST is provided in Appendix D. As outlined in Section 4.3, the PMST report is produced from a grid-based search, which can cause species outside of the search area to be detected, such as terrestrial. Species identified in the PMST that are not known to inhabit shorelines, nor rely on the marine environment for their diet, are not assessed. Two conservation dependent species have also been identified with a potential to occur within the Operational Area and EMBA.

Species identified as potentially occurring within the Operational Area and EMBA as well as biologically important areas (BIAs) or habitat critical to their survival (habitat critical) that overlap the Operational Area and EMBA are listed in Table 4-5 to Table 4-13. Figure 4-7 to Figure 4-11 show the spatial overlap between relevant BIAs and habitat critical areas and the Operational Area and EMBA. Species that are predicted to have ecologically significant interactions in the Operational Area are described in further detail in this section. Key threatened and migratory species and associated biologically important behaviours in the EMBA are further described in Appendix C.

4.6.1 Fish, sharks and rays

A total of 16 EPBC Act listed threatened and migratory fish species have been identified to potentially occur within the EMBA, of which 14 occur in the Operational Area (Table 4-5).

An additional 44 EPBC Act listed fish, shark and ray species, including a variety of pipefish and sea dragons, which do not have a threatened or migratory status are recorded to occur within the EMBA. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

Fish, shark and ray BIAs that overlap the EMBA are presented in Figure 4-7 and in Table 4-5. Further description of BIAs is provided in Appendix C.

4.6.1.1 Whale shark

The Operational Area overlaps a foraging BIA for the whale shark (Figure 4-7, Table 4-5). The whale shark, *Rhincodon typus*, is a planktivorous shark and feeds on a variety of planktonic organisms including krill, jellyfish, and crab larvae (Last and Stevens 2009). Whale sharks form seasonal aggregations at Ningaloo Reef between March and July (TSSC 2015c). However, seasonal aggregation can be variable, with individual whale sharks recorded at other times of the year.

This species migrate annually along the 200 m isobath of the WA coast between July and November (TSSC 2015c). Timing of the whale shark migration to and from Ningaloo coincides with the coral mass spawning period when there is an abundance of food (krill, planktonic larvae and schools of small fish) in the waters adjacent to Ningaloo Reef (DCCEEW 2024a). At Ningaloo Reef, whale sharks stay within a few kilometres of the shore and in waters about 30–50 m deep (Wilson et al. 2005). After the aggregation period, the distribution of whale sharks is largely unknown. Satellite tracking has shown that the sharks may follow three migration routes from Ningaloo (Meekan and Radford 2010):

- north-west, into the Indian Ocean
- directly north, towards Sumatra and Java
- north-east, passing through the NWS and travelling along the shelf break and continental slope.

Anecdotal evidence from sightings data collected from the Woodside offshore facilities on the NWS indicate that whale sharks are present on the NWS in April, and between July and October. Sightings between July and October correspond with the whale shark's seasonal northward migration from Ningaloo Reef (July to November). However, the numbers of individual whale sharks that transit through the Operational Area is expected to be low, based on the number of whale sharks aggregating at Ningaloo and on the different migration paths that individuals may follow. It is expected that whale sharks may traverse the vicinity of the Operational Area during their migrations to and from Ningaloo Reef. However, presence of the whale shark within the area would be of a relatively short duration and not in significant numbers, given the main aggregations are recorded in coastal waters, particularly the Ningaloo Reef edge (DPW 2013, MPRA 2005).

4.6.2 Marine reptiles

A total of eight EPBC Act listed threatened and migratory marine reptile species have been identified to potentially occur within the EMBA and Operational Area (Table 4-7).

An additional 17 EPBC Act-listed marine reptile species which do not have a threatened or migratory status are predicted to occur within the EMBA. The majority of these marine-listed species are sea snakes and are described in Appendix C. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

The Operational Area overlaps the flatback turtle internesting BIA and internesting buffer BIA, and the internesting habitat critical to the survival of flatback turtle. Marine reptile BIAs that overlap the EMBA are presented in Figure 4-8 and described in Figure 4-8. Further description of BIAs is provided in Appendix C.

Habitat critical to the survival of the flatback turtle, green turtle, hawksbill turtle, and loggerhead turtle is overlapped by the EMBA as shown in Figure 4-9 and Table 4-9.

4.6.2.1 Flatback Turtle

Flatback turtle nesting on Barrow Island occurs between October and March, with peak nesting activity occurring between November and January (Commonwealth of Australia 2017a). On Barrow Island, nesting activity is concentrated on the east coast on sandy, low-sloped, low-energy beaches with wide, shallow intertidal zones (K. Pendoley 2005, Pendoley et al. 2014).

The Montebello Islands and Barrow Island are identified as nesting habitat critical to the survival of the species, as is the 60 km internesting buffer (Figure 4-8) around the Montebello Islands (Commonwealth of Australia 2017a).

Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia 2017a). However, the foraging ecology of post hatchling flatback turtles is currently unknown. Limited observations suggest they feed on small animals living in the water column (Commonwealth of Australia 2017a). During internesting turtles remain close to the nesting beach or rookery (Commonwealth of Australia 2017a).

A habitat suitability modelling study for internesting flatback turtles in the NWS region of WA (Whittock, Pendoley and Hamann 2016) was conducted to identify areas of suitable flatback turtle internesting habitat and determine overlap with identified industrial hazards. The study used a turtle tracking dataset of 47 nesting female turtles from five main rookeries in the NWS study area, including Barrow Island.

The results showed internesting flatback turtles from all rookeries remained within water depths of <44 m, with a mean depth of <10 m (Whittock, Pendoley and Hamann 2016). Results also showed internesting turtles from all rookeries remained within <28 km of the nearest coast, with a mean distance from the coast of <6.1 km.

The habitat suitability modelling study defined suitable flatback turtle internesting habitat as water depths of 0–16 m within 5–10 km of the coast. Unsuitable flatback turtle internesting habitat was defined as waters >25 m deep and >27 km from the coast (Whittock, Pendoley and Hamann 2016). Given the water depths and distance from the coast within the Operational Area, the area is considered unsuitable for internesting flatback turtles.

Other previous studies (Dobbs 2007, Guinea, Sperling and Whiting 2006, Pendoley Environmental 2010) have also presented findings that internesting behaviour was only observed in water depths of <40 m. One of these studies (Pendoley Environmental 2010) further indicates that internesting flatback turtles have relatively shallow dives, with 85% of the time spent in ≤20 m water depth, of which most was spent in 5–10 m (27±2.7%) and 10–15 m (22.3±3.5%) water depths.

Although individuals may transit through and forage within the Operational Area, habitat typically associated with species aggregations is not present due to the distance offshore (138 km from mainland), and to nesting beaches (~30 km).

4.6.3 Marine mammals

A total of 14 EPBC Act listed threatened and migratory marine mammal species have been identified as potentially occurring within the EMBA, of which 11 occur in the Operational Area (Table 4-10). Several threatened terrestrial mammal species were listed in the PMST report for the EMBA, but do not inhabit shorelines or rely on the marine environment for their diet, so are not included in Table 4-10. These included the northern quoll, golden bandicoot and rock wallaby, amongst other mammal species. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

An additional 21 EPBC Act-listed marine mammal species which do not have a threatened or migratory status are predicted to occur within the EMBA. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

The Operational Area does not overlap any BIAs for threatened or migratory marine mammal species. Marine mammal BIAs that overlap the EMBA are presented in Table 4-11, Figure 4-10 and Figure 4-11.

Further description of BIAs is provided in Appendix C.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-10: Threatened and migratory marine mammal species predicted to occur within the Operational Area and EMBA

Species name	Common name	EPBC Act (as per PMST report Appendix D)		Potential for interaction	
		Threatened status	***Migratory status***	***Operational Area***	***EMBA***
Balaenoptera bonaerensis	Antarctic Minke Whale	N/A	Migratory	N/A	Species or species habitat likely to occur within area
Balaenoptera borealis	Sei Whale	Vulnerable	Migratory	Species or species habitat likely to occur within area	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni	Bryde's Whale	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
Balaenoptera musculus	Blue Whale	Endangered	Migratory	Migration route known to occur within area	Migration route known to occur within area
Balaenoptera omurai	Omura's Whale	N/A	Migratory	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
Balaenoptera physalus	Fin Whale	Vulnerable	Migratory	Species or species habitat likely to occur within area	Foraging, feeding or related behaviour likely to occur within area
Dugong dugon	Dugong	N/A	Migratory	N/A	Species or species habitat likely to occur within area
Eubalaena australis	Southern Right Whale	Endangered	Migratory (as *Balaena glacialis australis*)	N/A	Species or species habitat likely to occur within area
Megaptera novaeangliae	Humpback Whale	N/A	Migratory	Breeding known to occur within area	Breeding known to occur within area
Orcaella heinsohni	Australian Snubfin Dolphin	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat known to occur within area
Orcinus orca	Killer Whale, Orca	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area
Physeter macrocephalus	Sperm Whale	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area

4.6.4 Seabirds and migratory shorebirds

A total of 43 EPBC Act listed threatened seabirds and migratory shorebird species have been identified to potentially occur within the EMBA, of which 17 occur in the Operational Area (Table 4-12).

An additional eight EPBC Act-listed marine seabird and shorebird species which do not have a threatened or migratory status are recorded to occur within the EMBA. A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

The Operational Area overlaps a breeding BIA for the Wedge-tailed shearwater (Table 4-12, Figure 4-12). BIAs that overlap the EMBA are presented in Table 4-12 and Figure 4-12.

Detailed descriptions of seabirds and migratory shorebirds in the EMBA are provided in Appendix C**.**

4.6.4.1 Wedge-tailed shearwater

The wedge-tailed shearwater (*Arena pacifica*) is a pelagic, marine seabird known from tropical and subtropical waters (DCCEEW 2024). Its distribution is widespread across the Indian and Pacific oceans with a global population of 2.6 million pairs. Of this, approximately one million pairs breed in Australia, most of which do so on islands in WA between Rottnest Island in the south to Ashmore Reef in the north (DCCEEW 2024).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late June onwards to re-excavate their burrows (Pendoley Environmental 2019). This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period (Pendoley Environmental 2019). Once hatched, adults leave the burrows to forage locally during the day returning at night to feed chicks until they are ready to fledge (Nicholson 2002). Due to the high synchronicity in egg laying, fledging is restricted to the first two weeks of April (Nicholson 2002).

This species is seen in North West WA from June to April (DBCA 2017). The breeding season in the Pilbara region occurs between November and April (DBCA 2017). Breeding behaviours are typically nocturnal in wedge-tailed shearwaters.

Breeding behaviours are nocturnal in wedge-tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead up to fledging, chicks also leave their burrows to exercise their wings outside burrows. Known breeding locations in the NWMR include Forestier Island (Sable Island), Bedout Island, Dampier Archipelago, Passage Island, Lowendal Island, islands off Barrow Island (Mushroom, Double and Boodie islands), islands in the Onslow area (including Airlie, Bessieres, Serrurier, North and South Muiron and Locker islands), islands in Freycinet Estuary, and south Shark Bay (Slope, Friday, Lefebre, Charlie, Freycinet, Double and Baudin islands (DSEWPC 2012). This species forages relatively close to breeding islands and its diet consists of squid, fish and crustaceans (DSEWPC 2012), tracking studies found that foraging activities at sea were more frequent during the day compared with at night (Catry et al. 2009, Weimerskirch, de Grissac et al. 2020).

Wedge-tailed shearwaters breeding on the Muiron Island (north) undertook extensive foraging trips during the incubation period (1,200 – 1,400 km) and shorter trips during chick rearing (<300 km; Cannell, Hamilton and Driessen 2019). Longer foraging trips took individuals in a NW direction offshore towards oceanic seamounts. Conversely, the shorter tended to include waters to the west and NW of the Muiron Islands (Cannell, Hamilton and Driessen 2019). In addition to the Muiron Islands, this dual foraging strategy, whereby parents alternate or mix short and long trips, have been recorded in Wedge-tailed shearwaters breeding in the east of Australia (Peck and Congdon 2005), and New Caledonia (Weimerskirch, Le Corre, et al. 2005). However, divergent foraging strategies have been detected between colonies, which is linked to the proximity of colonies to high productivity waters (Peck and Congdon 2005, Weimerskirch, Le Corre, et al. 2005).

The breeding BIA of the wedge-tailed shearwater overlaps the Operational Area.

4.6.5 Seasonal sensitivities for protected species

Seasonal sensitivities for EPBC migratory listed species identified as likely or known to occur within the Operational Area, and relevant to the defined planned impact pathways, are identified in Table 4-14. Seasonal sensitivities for species in the wider NWMR are described in Appendix C.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-14: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area

Species	Description of seasonality	January	February	March	April	May	June	July	August	September	October	November	December
Fish, sharks and rays													
Whale shark – foraging (northward from Ningaloo)	Whale shark foraging northward from Ningaloo in Spring[1] Migration along the north coast of WA also known to occur between July–November[2] Potential presence of whale sharks year-round at Ningaloo[3]												
Whale shark – foraging (high density prey, Ningaloo Reef)	Whale shark foraging (high density prey) Ningaloo April–June, Autumn[1] March–July[2] Potential presence of whale sharks year-round at Ningaloo[3]												
Dwarf sawfish – reproduction[1]	Potential to occur all seasons												
Dwarf sawfish – foraging[1]	Potential to occur all seasons												
Largetooth (freshwater) sawfish – reproduction (pupping)[1]	Pupping occurs from January to May												
Largetooth (freshwater) sawfish – foraging[1]													
Green sawfish (reproduction)[1]													
Green sawfish (foraging)[1]													
Marine mammals													
Fin whale[5]	Fin whale presence NWMR May–October												

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Description of seasonality	January	February	March	April	May	June	July	August	September	October	November	December
	Migrating north from Cape Leewuin (SWMR) May–October Present offshore Dampier August–October												
Humpback whale – northern migration[6]	Range June–September [1 6 14] Peak July to August [7]												
Humpback whale – southern migration[7]	Range July–November. Peak August- October 6 7 8 14												
Humpback whale – reproduction (nursing, Kimberley coast)[8]	Reproduction (nursing, Kimberley coast) Winter [1] Breeding August–September [6 14] Calves present off Kimberley in October [9]												
Omura's whale	Limited data however sightings reported year-round [9]												
Pygmy blue whale – northern migration[10]	Pygmy blue whale northern migration April–August [1 6 11 12] Peak April–July [13] From the Perth Canyon (April/May) to the North West Shelf (June/July) [13]												
Pygmy blue whale – southern migration[11]	Migration October–December, possibly into January [1 6] Peak November–December [13]												
Southern right whale (calving/presence in NWMR)[12]	Calving and migratory presence in Exmouth Gulf (NWMR) June to September with peak months July and August 1												
Marine reptiles – marine turtle nesting [note: hatchling emergence is generally 6-8 weeks post-nesting activity]													
Green Turtle													
Ashmore Reef Stock (G-AR)[14]	Mating occurs Sep–Nov Nesting occurs year-round (peak Dec-Jan)

Species	Description of seasonality	January	February	March	April	May	June	July	August	September	October	November	December
Unknown genetic stock Kimberley, Western Australia[1 4]	May to July												
Loggerhead Turtle													
Western Australia Stock (LH-WA)[1 4]	Mating: Unknown Nesting: Nov–Mar (peak Jan) Hatching: Jan–May												
Seabirds (high occurrence seabirds with designated BIAs[15])													
Wedge-tailed shearwater - breeding / foraging	Fledgling emergence (first two weeks of April)												
Australian lesser noddy	NWMR presence in non-breeding period Breeding – Ashmore Reef and Abrolhos, may forage in NWMR												
Common noddy – breeding													
Bridled tern – breeding and foraging													
Great frigatebird – breeding / foraging	Possibly present in NWMR in non-breeding and foraging in breeding season												
Lesser frigatebird – breeding / foraging	Possibly present in NWMR in non-breeding and foraging in breeding season												
Little tern – breeding / foraging	Maybe present in NWMR outside breeding season – foraging and resting												
Roseate tern – breeding													

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Description of seasonality	January	February	March	April	May	June	July	August	September	October	November	December
Caspian tern – breeding	Dampier Archipelago and North-west Cape												
Greater crested tern													
White-tailed and red-tailed tropicbird – breeding	Largest breeding populations on Christmas Island												

Key	
	Species may be present in the Operational Area
	Peak period. Presence of animals is reliable and predictable each year
	Species not likely to be undertaking biologically important behaviour in NWMR (the species may still be present in the NWMR).

4.7 Key ecological features

One KEF, the Ancient Coastline at 125 m Depth Contour, overlaps the Operational Area. KEFs within the Operational Area and EMBA are identified in Table 4-15 and described in Appendix C. Figure 4-13 shows the spatial overlap with KEFs and the Operational Area and EMBA.

Table 4-15: KEFs within the Operational Area and EMBA

Key ecological feature	Distance and direction from Operational Area to KEF (km)
Ancient Coastline at 125 m Depth Contour	Overlaps
Continental Slope Demersal Fish Communities	25 km west-southwest
Glomar Shoal	45.2 km east
Exmouth Plateau	122 km west
Canyons Linking the Cuvier Abyssal Plain and the Cape Range Peninsula	181 km southwest
Commonwealth Waters Adjacent to Ningaloo Reef	226 km southwest
Western Demersal Slope and associated Fish Communities of the Central Western Province	693 km southwest

4.7.1 Ancient Coastline at 125 m Depth Contour

The Ancient Coastline at 125 m Depth Contour KEF is recognised for its biodiversity values (unique sea-floor feature with ecological properties of regional significance), which apply to both the benthic and pelagic habitats within the feature (DSEWPC 2012).

Parts of the KEF, particularly where it exists as a rocky escarpment, are thought to provide biologically important habitats in areas otherwise dominated by soft sediments (DSEWPC 2012). The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient rich environment. Little is known about fauna associated with the hard substrate of the escarpment, but it is likely to include sponges, corals, crinoids, molluscs, echinoderms and other benthic invertebrates' representative of hard substrate fauna in the North West Shelf bioregion (DSEWPC 2012).

Although the KEF adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner, et al. 2009).

4.8 Protected places

The Montebello Marine Park overlaps the Operational Area. Protected places within the Operational Area and EMBA are identified in Table 4-16 and presented in Figure 4-14. No Ramsar Wetlands were identified within the Operational Area or EMBA. Features which are overlapped by the Operational Area are described in further detail in the subheadings below.

Appendix C outlines the values and sensitivities of protected places and other sensitive areas in the Operational Area and EMBA.

Table 4-16: Established protected places and other sensitive areas overlapping the Operational Area and EMBA

	Distance and direction from Operational Area to protected place or sensitive area (km)	IUCN category* and relevant management zone overlapping the Operational Area and/or EMBA
AMPs

**Conservation objectives for IUCN categories include:*

Ia: Strict Nature Reserve

Ib: Wilderness Area

II: National Park

III: Natural Monument or Feature

IV: Habitat/Species Management Area

V: Protected Landscape

VI: Protected area with sustainable use of natural resources – allow human use but prohibits large scale development.

IUCN categories for marine parks are provided and, in brackets, the IUCN categories for specific zones within each marine park as assigned under the North-west Marine Parks Network Management Plan 2018 (DNP, 2018).

4.8.1 Montebello Marine Park

The Montebello Marine Park includes shallow shelf environments and provides protection for shelf and slope habitats, as well as pinnacle and terrace seabed features. The North-west Marine Parks Network Management Plan (DNP 2018) identifies the following values for the Montebello Marine Park:

- **natural values**: the marine park includes examples of ecosystems representative of the Northwest Shelf Province - a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities. A key ecological feature of the Marine Park is the Ancient Coastline at the 125 m Depth Contour. The marine park supports a range of species listed under the EPBC Act. Biologically important areas within the Marine Park include breeding habitat for seabirds, internesting, foraging, mating, and nesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks.
- **cultural values**: the Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara region. Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years.
- **heritage values**: no international, Commonwealth or national listings apply to the marine park, however it is located adjacent to the Western Australia Barrow Island and the Montebello–Barrow Island Marine Conservation Reserves which have been nominated for national heritage listing. The marine park contains two known shipwrecks listed under the *Historic Shipwrecks Act 1976*: (since updated to the *Underwater Cultural Heritage Act 2018*): Trial (wrecked in 1622), the earliest known shipwreck in Australian waters and Tanami (wrecked in 1935) (see Table 4-22).
- **social and economic values**: tourism, commercial fishing, mining and recreation are important activities in the marine park.

4.9 Cultural values and heritage

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of these areas are described. Description of cultural values and heritage as they relate to the wider North-west Marine Region (NWMR) are described in Appendix C.

4.9.1 Native Title

For the activity in this EP, there are six native title claims or determinations, overlapping the EMBA and nine that are coastally adjacent to the EMBA. Table 4-17 lists these; however, it does not differentiate between claims and determinations, as it is acknowledged that rights and interest may exist within either of these.

There are also seven ILUAs overlapping the EMBA and 25 that are coastally adjacent to the EMBA (Table 4-17).

As a starting point for understanding social and cultural features of the environment for Indigenous groups, Woodside uses the existing systems, such as native title, to identify Indigenous groups that may have functions, interests or activities that may be affected. To that end, Woodside identifies native title representative bodies and nominated representative entities (defined in Section 5.5), as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. While acknowledging that cultural features and heritage values may exist outside of the native title framework, native title claims, determinations and ILUAs are defined under the *Native Title Act 1993* (Cth). Woodside considers this to be the broadest extent over which Indigenous groups have claimed native title rights and interests.

Figure 4-15 shows the relevant native title claims or determinations and ILUAs relevant to the EMBA. Further description of how Woodside considers native tile rights and interest is provided in Appendix C.

4.9.2 Coastally adjacent Indigenous groups

To identify cultural features and heritage values which may exist outside of a native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant Indigenous groups to be consulted (see Section 5.3.4).

Table 4-17: Summary of native title claims, determinations and Indigenous land use agreements which overlap or are coastally adjacent to the EMBA

Claim/ determination/ ILUA	Registered Native Title Body Corporate	Overlap with EMBA	Coastally adjacent to the EMBA

4.9.3 Marine parks

Woodside undertakes an assessment of cultural values within Marine Park Management Plans where the Operational Area or EMBA overlaps a Marine Park.

Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified Traditional Custodians or representative bodies referenced to contact regarding potential cultural features and heritage values. For completeness, Woodside considers cultural features and heritage values identified in the management plans, where EP relevant Traditional Custodians or representative bodies are represented. These values are outlined in Table 4-19.

The Operational Area overlaps the Montebello Marine Park. The EMBA overlaps with features of the following Commonwealth Australian Marine Parks:

- Argo-Rowley Terrace Marine Park
- Carnarvon Canyon Marine Park
- Dampier Marine Park
- Gascoyne Marine Park
- Ningaloo Marine Park
- Shark Bay Marine Park.

These marine parks are managed under the North-west Marine Parks Network Management Plan (DNP 2018).

The EMBA overlaps a further eight State protected areas. Where these plans specify identify representative bodies who may hold knowledge of heritage values or cultural features – including but not limited to Registered Native Title Bodies Corporate – these bodies are consulted (Section 5.5 and Appendix F). Consultation with these group(s) may identify heritage values and cultural features beyond those addressed in the marine park management plans. Identifiable representative bodies were specified for the marine parks overlapped by the EMBA (Table 4-18).

The State Management Plan for the Ningaloo Marine Park and Muiron Islands Marine Management Area 2005–2015: Management Plan Number 52 (MPRA and CALM 2005) notes the aesthetic values of the seascape as a cultural value and that “Panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves.” In particular, the plan notes that “Inappropriate structures along the coastline, on the islands and in the surrounding waters have the potential to degrade the aesthetic values of the reserves. Coastal developments and maritime infrastructure projects must therefore be planned with careful consideration of this issue.” As the activity described in this EP does not include the addition of any structures within these parks, no impacts on the aesthetic values of these parks are anticipated.

A number of management plans for the State Marine Parks also note Indigenous and maritime heritage within the marine parks. These are addressed in Section 4.9.5.3.

Table 4-18: Summary of the Operational Area and EMBA overlap with Commonwealth and State Marine Park Management Plan areas

Nature Reserves			
Thevenard Island Nature Reserve	No	Yes	No identifiable body specified

4.9.4 Indigenous protected areas

Indigenous Protected Areas (IPAs) are areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation through voluntary agreements with the Australian Government.

No IPAs overlap the Operational Area or EMBA.

IPAs within the broader NWMR are described in Appendix C.

4.9.5 Sea Country values

Sea Country values of marine ecosystems are further described in Appendix C. An impact to marine ecosystems has the potential to impact cultural values where the impact is detectable within Sea Country. Potential impacts to these cultural values are assessed in Section 6.

Woodside initiates consultation on cultural values of Sea Country where Traditional Custodians or representative institutions are identified, or self-identify, as relevant persons.

Cultural features or heritage values related to marine species within the Operational Area or EMBA raised by Traditional Custodians in the course of preparing the EP have been outlined in Table 4-20. Values identified in publicly available literature are summarised in Table 4-19.

4.9.5.1 Desktop assessment of Sea Country values

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the EMBA or Operational Area. Where cultural features or Sea Country values were identified these are summarised in Table 4-19 according to the Indigenous groups (where identified or inferable) who hold these values.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.5.2 Indigenous archaeological heritage assessment

Indigenous archaeological heritage in relation to the North-west Marine Region (NWMR) is described in Appendix C.

The Department of Planning, Lands and Heritage (DPLH) Aboriginal Heritage Inquiry system was searched which showed 56 Registered Aboriginal Sites and 58 Lodged Aboriginal Sites for the EMBA (Department of Planning Land, Heritage and Aboriginal Enquiry System Results - Appendix I). The exact location, access, and traditional practices for a number of these sites may not be disclosed and if required, such as in the event of a major oil spill, would involve prioritising further consultation with key contacts within DPLH and relevant local Indigenous communities

No sites of significance within the Petroleum Activity or EMBA were identified by Traditional Custodians during consultation in the course of preparing the EP.

4.9.5.3 Submerged cultural heritage values

The Ancient Coastline at 125 m Depth Contour KEF overlaps the Operational Area and EMBA. Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline at 125 m Depth Contour KEF as an area where potential Indigenous archaeological material may exist on the seabed, as this covers the full extent of this possible Indigenous occupation.

Further information regarding Indigenous archaeological heritage in relation to the Ancient Landscape in the NWMR is described in Appendix C.

4.9.5.4 Feedback received via consultation to inform Existing Environment Description

Indigenous cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that “Aboriginal and Torres Strait Islander heritage is managed... according to community ownership” (Heritage Chairs of Australia and New Zealand 2020). Dhawura Ngilan also specifically notes that “Aboriginal and Torres Strait Islander...intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community...” Through consultation with relevant persons, Registered Native Title Bodies Corporate have identified or raised topics relating to environmental values of cultural interest. These include a broad interest in the marine fauna, including whales and turtles (Appendix F).

During previous consultation, BTAC advised it has a cultural obligation to care for the environmental values of Sea Country (Appendix F). In the course of consultation specific to another Woodside EP, BTAC raised the importance of archaeological sites on nearshore islands. Given the EMBA for this activity extends to nearshore areas coastally adjacent to BTAC native title lands, these values may be relevant in the event of an unplanned hydrocarbon spill.

Feedback received on potential cultural features and heritage values during consultation are described in Table 4-20.

Woodside has committed to ongoing engagement to further understand these values. Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.2.8).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.6 Summary of cultural features and heritage values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under regulation 25 of the Environment Regulations.

The cultural features and heritage values identified in Sections 4.9.1 to 4.9.7 confirms whether there is any potential for these to exist within the Operational Area or EMBA. As previously described, topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Sections 6.7, 6.8, 6.9 and 6.11.

A summary of cultural features and heritage values identified through both consultation and desktop assessment is provided in Table 4-21.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-21 Summary of cultural features and heritage values

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Archaeological heritage and landscapes					
Coastal/ island archaeological sites	Coastal archaeological sites include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources.	✓	✓	No	Possible
Petroglyphs	Petroglyphs are a form of rock art. Petroglyphs are a prominent feature particularly at Murujuga where it is found on hard, volcanic rock.	✓	✓	No	Possible (submerged)
Fish traps	Stone arrangements constructed in intertidal areas which fill with fish at high tide and trap them at low tide.	✓	✓	No	Possible (submerged)
Submerged archaeological sites	The Ancient Landscape extends between 125m and 130m below current sea level. Ancient occupation of this area may have left traces through now submerged archaeological sites.	✓	✓	Possible	Possible
Rivers, waterholes, tidal channels and seeps	Water sources on the Ancient Landscape which may be culturally significant or archeologically prospective.	x	✓	Possible	Possible
Submerged hills	Hills on the Ancient Landscape which may be culturally significant or archeologically prospective. As sea level rose these hills would have become islands and eventually submerged.	x	x	Possible	Possible
Intangible values					
Songlines	Publicly available literature talks to Songlines associated with ancestral beings that travelled Sea Country.	✓	✓	Possible (unspecified)	Possible (unspecified)
Creation/ Dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to creation/dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally.	✓	✓	Possible (unspecified)	Possible (unspecified)
Ceremonial sites	Places where ceremony (e.g. thalu ceremonies) are performed. All identified ceremonial sites are located onshore.	✓	✓	Possible (unspecified)	Possible (unspecified)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Cultural obligations to care for Country	Cultural obligation to care for the environmental values of Sea Country. Exclusion of Traditional Custodians from Sea Country or decision making processes may inhibit ability to care for Country.	✓	✓	Possible (unspecified)	Possible (unspecified)
Knowledge of Country/ customary law and transfer of knowledge	The preservation and transmission of knowledge is dependent on the preservation of the environment generally. Exclusion of Traditional Custodians from Sea Country may inhibit the transfer of knowledge.	✓	✓	Possible (unspecified)	Possible (unspecified)
Connection to Country	Connection to Country is described in publicly available literature as “important to the Traditional owners’ spirituality and religion”. Connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge	✓	✓	Possible (unspecified)	Possible (unspecified)
Access to Country	Limitations on Traditional Custodians accessing or enjoying areas of Sea Country	✓	✓	Possible (unspecified)	Possible (unspecified)
Kinship systems and totemic species	Traditional Custodians have connection to species through kinship and totemic systems. An individual may have obligation to care for or not consume a species to which they are kin.	✓	✓	Possible (unspecified)	Possible (unspecified)
Resource collection	Fishing, hunting, gathering of marine species including marine mammals, marine reptiles, fish and invertebrates.	✓	✓	Possible (unspecified)	Possible (unspecified)
Marine ecosystems and species					
Water quality	Interest only, raised as a natural environment interest	✓	x	Yes	Yes
Marine species Marine mammals: Whales	Generally raised in consultation and literature as an interest Generally raised in consultation and identified in publicly available literature Thalu species of totemic importance Linked to Songlines and Dreaming stories Humpback whales in particular	✓	✓	Possible	Possible

4.9.7 Historic sites of significance

Historic sites of significance and heritage value are found along foreshores of the NWMR. Heritage places are protected in Western Australia under the *Heritage Act 2018*.

There are no known sites of Historic cultural heritage significance within the Operational Area.

4.9.8 Historic underwater heritage

The protection of historic underwater heritage under Commonwealth and State legislation is described in Appendix B.

The Australasian Underwater Cultural Heritage database records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters. The Australian National Shipwreck Database lists all known shipwrecks in Australian waters.

A search of these databases indicated that there are no sites within the Operational Area, however, a number of sites (shipwrecks) exist within the EMBA. Recorded historical shipwrecks within approximately 50 km of the Operational Area are listed in Table 4-22 and displayed in Figure 4-16. Appendix C lists the recorded historical shipwrecks present within the EMBA.

Table 4-22: Historic shipwrecks within approximately 50 km of the Operational Area

Shipwreck	ID number	Year wrecked	Distance and direction from Operational Area to shipwreck
Curlew	3925	1911	33 km west
Marietta	4457	1905	33 km west
Tanami	4898	1935	33 km south
Trial (also Tryall or Tryal)	4938	1622	33 km south
Vianen	5062	1628	33 km west
Wild Wave (China)	5113	1873	33 km west
McCormack	8223	1989	40 km south
McDermott Derrick Barge No 20	4502	1989	40 km south
Plym HMS	4667	1952	44 km south
Tropic Queen	8284	1975	46 km south
Parks Lugger	-	4614	51 km south

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

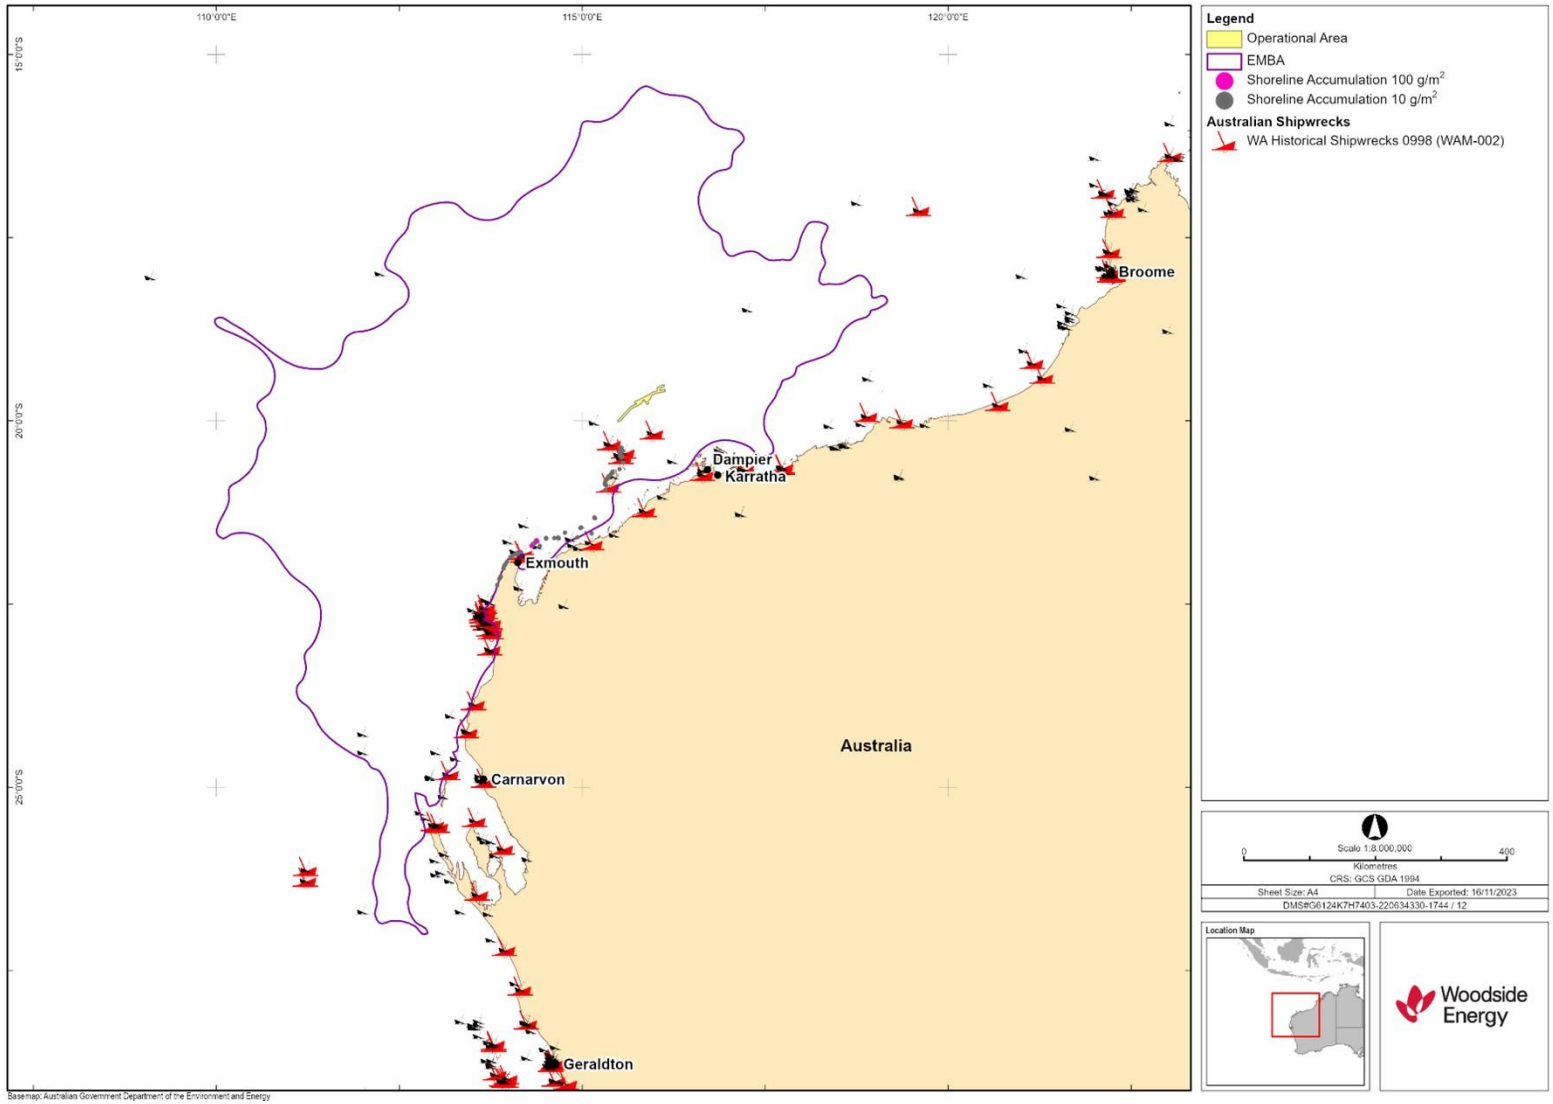

Figure 4-16: Historic shipwrecks overlapping and adjacent to the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.9 World, National and Commonwealth heritage listed places

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in Table 4-23 and displayed in Figure 4-17. Appendix C outlines the values, and sensitivities of these places, including the Outstanding Universal Values (OUV) of the World Heritage Places listed below.

Table 4-23: World, National and Commonwealth heritage listed places within the EMBA

Listed place	Distance and direction from Operational Area to listed place
World Heritage Places / WHPs	
Murujuga Cultural Landscape	104 km south
Ningaloo Coast	208 km southeast
Shark Bay, Western Australia	570 km south
NHPs	
Dampier Archipelago (including Burrup Peninsula)	104 km southeast
Ningaloo Coast	208 km south
Shark Bay, Western Australia	570 km south
Commonwealth Heritage Places (CHP)	
Ningaloo Marine Area - Commonwealth Waters	226 km south
Learmonth Air Weapons Range Facility	314 south

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

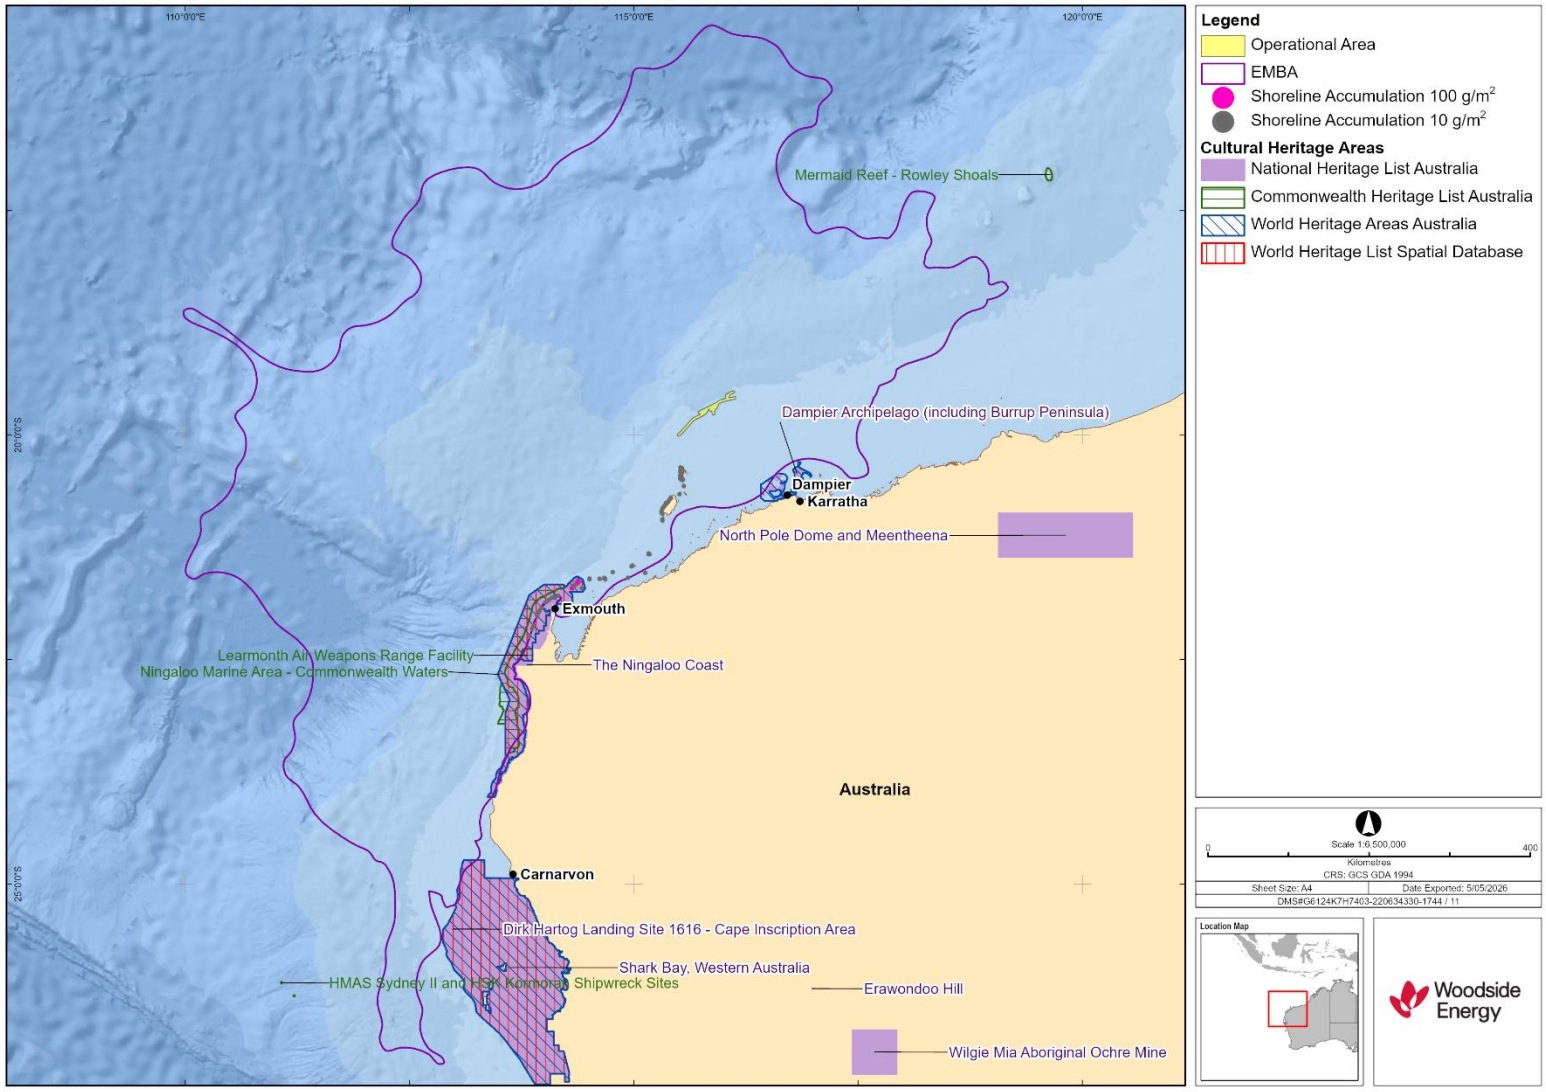

Figure 4-17: World, National and Commonwealth heritage listed places overlapping and adjacent to the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10 Socio-economic environment

4.10.1 Commercial fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. Data from the Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES) were used to identify if Commonwealth managed fisheries have fished within the Operational Area and EMBA in the most recently available five-year period of catch and effort data (2020-2024). FishCube data was also requested from the WA Department of Primary Industries and Regional Development (DPIRD) for the most recently available five-year period of fishery catch and effort data (2020-2025). This data was used to analyse the potential for interaction of fisheries with the Operational Area and EMBA. Data was reviewed from the last five years as a subset of past fishing effort. This was deemed an appropriate period to represent potential future fishing effort over the lifecycle of this EP.

This information was used to determine relevant fisheries for consultation who may be affected by the Petroleum Activity. Table 4-24 provides an assessment of the potential interaction and Appendix C provides further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5).

No Commonwealth managed fisheries were identified as having potential for interaction with the Petroleum Activity within the Operational Area; and three were identified within the EMBA. Seven State managed fisheries were identified as having potential for interaction with the Petroleum Activity within the Operational Area and 20 were identified within the EMBA (Figure 4-18).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-24: Commonwealth and State commercial fishery management areas overlapping the Operational Area and EMBA

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
Commonwealth managed fisheries			
North West Slope Trawl Fishery (NWSTF)	X	✓	The North West Slope Trawl Fishery management area overlaps the EMBA. The fishery operates off north-western Australia from 114°E to 125°E roughly between the 200 m isobath and the outer boundary of the Australian Fishing Zone (Butler et al. 2025). The fishery commenced in 1985, and the number of active vessels peaked at 21 in the 1986–87 season, decreasing to between 1 and 6 vessels per year since 2005-06 (Butler et al.,2025). Three vessels operated in each of the 2022–23 and 2023–24 seasons (Butler et al. 2025). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Southern Bluefin Tuna Fishery (SBTF)	✓	✓	This Southern Bluefin Tuna Fishery management area overlaps the Operational Area and EMBA. Fishing mainly occurs in the Great Australian Bight during summer months, and off the New South Wales coastline during winter months (Butler et al. 2025). Five purse seine vessels and 27 longline vessels were recorded in the 2023-24 period, a decrease from six purse seine vessels and an increase from the 24 longline vessels in the 2022–23 period (Butler et al. 2025). No fisheries catch effort data has been recorded within the Operational Area or the EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or EMBA.
Western Deepwater Trawl Fishery (WDTF)	X	✓	The Western Deepwater Trawl Fishery management area overlaps the EMBA. The fishery operates off the Western Australian coast, in the Gascoyne Region ranging between the North West Cape and Shark Bay. The fishery uses demersal trawling methods, in waters seaward of a line approximating the 200 m isobath (Butler et al. 2025). Since 2004–05, one to three vessels have been active in the fishery, with one active vessel in recorded in the 2023–24 season (Butler et al. 2025) Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Western Skipjack Fishery (WSF)	✓	✓	The Western Skipjack Fishery management area overlaps the Operational Area and EMBA. The fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The fishery is currently not active, and no fishing has occurred since 2009 (Butler et al. 2025).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
			No fisheries catch effort data has been recorded within the Operational Area or the EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or the EMBA.
Western Tuna and Billfish Fishery (WTBF)	✓	✓	The Western Tuna and Billfish Fishery management area overlaps the Operational Area and EMBA. The majority of Australian catch has concentrated off south-west Western Australia with occasional activity off South Australia (Butler et al. 2025). Four pelagic longline and 3 minor line vessels were active during the 2023-24 season (Butler et al. 2025). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
State managed fisheries			
Abalone Managed Fishery	✓	✓	The Abalone Managed Fishery management area overlaps the Operational Area and EMBA. The fishery includes all coastal waters from the WA and SA border to the WA and NT border (DoF 2011). The abalone fishery is typically only active to depths of up to 40 m (Newman et al. 2024). No fisheries catch effort data has been recorded within the Operational Area or the EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or the EMBA.
Exmouth Gulf Beach Seine and Mesh Net Managed Fishery	X	✓	The Exmouth Gulf Beach Seine and Mesh Net Managed Fishery management area does not intersect with the Operational Area but overlaps the EMBA. Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Exmouth Gulf Prawn Managed Fishery	X	✓	The Exmouth Gulf Prawn Managed Fishery management area overlaps the EMBA. The fishery operates in the Exmouth Gulf, targeting species generally more than 50 m water depth. The fishery is limited to the spatial extent within the Exmouth Gulf and Muiron Islands (WAFIC 2026). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
Gascoyne Demersal Scalefish Managed Fishery	X	✓	The Gascoyne Demersal Scalefish Managed Fishery management area overlaps the EMBA. The fishery is located between the southern Ningaloo Coast to the south of Shark Bay with a closure area at Point Maud to Tantabiddi (WAFIC 2026). Eight vessels were active during 2023, seven of which fished for more than 10 days during peak pink snapper season (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Mackerel Managed Fishery	✓	✓	The Mackerel Managed Fishery management area overlaps the Operational Area (Area 2) and EMBA (Areas 2 and 3). The commercial fishery extends from the West Coast Bioregion to the WA/NT border. There are three managed fishing areas: Area 1: Kimberley (121º E to the WA/NT border); Area 2: Pilbara (114º E to 121º E) and Area 3: Gascoyne (27º S to 114º E) and West Coast (Cape Leeuwin to 27º S) (Newman et al. 2024). There were 15 active vessels in the 2023 season, primarily from May to November (Newman et al. 2024). The mackerel fishery primarily uses near-surface trolling gear and also jig fishing from vessels in coastal areas around reefs, shoals and headlands to target Spanish mackerel. Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Marine Aquarium Fish Managed Fishery	✓	✓	The Marine Aquarium Fish Managed Fishery management area overlaps the Operational Area and EMBA. The fishery can operate throughout WA State waters. The fishery is typically more active in waters south of Broome and higher levels of effort around the Capes region, Perth, Geraldton, Exmouth, Dampier, and Broome (Newman et al. 2024). There were 12 licences were active in 2023 across the Marine Aquarium Fish Managed Fishery and the Hermit Crab Fishery (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Nickol Bay Prawn Managed Fishery	X	✓	The Nickol Bay Prawn Managed Fishery management area overlaps the EMBA. The fishery operates in nearshore and offshore waters of the Pilbara region along the NWS. Trawling has been reported to occur at several locations along the Pilbara coast to the east of the Burrup Peninsula, including within the waters of Nickol Bay. There were 5 vessels active in the 2023 season (Newman et al. 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
			No fisheries catch effort data has been recorded within the 10 nm CAES block for the EMBA for the five-year period 2020-2025. However, the fishery has been active within the 60 nm CAES block. Woodside therefore considers there could be potential for interaction with this fishery within the EMBA.
Octopus Managed Fishery	X	✓	The Octopus Interim Managed Fishery management area overlaps the EMBA. The fishery operates from Kalbarri Cliffs in the north to Esperance in the south. There were 28 active vessels in the 2023 season (Newman et al. 2024). No fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the EMBA.
Onslow Prawn Managed Fishery	✓	✓	The Onslow Prawn Managed Fishery management area overlaps the Operational Area and EMBA. The fishery encompasses a portion of the continental shelf off the Pilbara. Fishing primarily occurs in water depths of 15 m or less for this fishery. There was one active vessel recorded in the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA within the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Open Access in the North Coast, Gascoyne Coast and West Coast Bioregions	X	✓	The Open Access in the North Coast, Gascoyne Coast and West Coast Bioregions is not a specific fishery; it's an area in which there is no limit on the number of operators or vessels (c.f. Limited entry fishery). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Pearl Oyster Managed Fishery (Zone 1 and 2)	✓	✓	The Pearl Oyster Managed Fishery management area overlaps the Operational Area and the EMBA. Fishing effort is mostly focused within coastal waters (10-15 m depth) with a maximum depth of 35 m, collecting wild oysters for use in the aquaculture production of pearls (Newman et al. 2024). These are collected from fishing grounds primarily off the coast of Eighty Mile Beach, smaller catches from the Lacepede Islands (Newman et al. 2024). No fisheries catch effort data has been recorded within the Operational Area or the EMBA within the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or the EMBA.
Pilbara Crab Managed Fishery	✓	✓	The Pilbara Crab Managed Fishery management area overlaps the Operational Area and EMBA. The Operational Area is overlapped by Area A of this fishery. Fishing is permitted within Area A (limited to 300 traps). There is no information currently publicly available on vessel data for this fishery (Newman et al. 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
			Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Pilbara Fish Trawl (Interim) Managed Fishery *Part of the Pilbara Demersal Scalefish Fishery (includes trawl, trap and line fisheries)*	✓	✓	The Pilbara Fish Trawl (Interim) Managed Fishery management area overlaps the Operational Area and EMBA. The fishery is a high intensity fishery divided into two zones and an area that is prohibited to trawling. In addition to the Prohibited Trawl Fishing area, no fish trawl units are allocated for use in Zone 1 or Areas 3 and 6 of Zone 2 (which comprises six management areas) (Newman et al. 2024). There were 4 active vessels reported in the trawl sector for the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Pilbara Line Fishery (Condition) *Part of the Pilbara Demersal Scalefish Fishery (includes trawl, trap and line fisheries)*	✓	✓	The Pilbara Line Managed Fishery management area overlaps the Operational Area and EMBA. Fishing effort is typically reported in waters less that are less than 50 m, however, through consultation fishers have reported setting traps in waters greater than 50 m deep. There were six active vessels reported in the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Pilbara Trap Managed Fishery *Part of the Pilbara Demersal Scalefish Fishery (includes trawl, trap and line fisheries)*	✓	✓	The Pilbara Trap Managed Fishery management area overlaps the Operational Area and EMBA. The fishery covers the area from Exmouth northwards and eastwards to the 120° line of longitude, and offshore as far as the 200 m isobath. The fishery includes six licences allocated to three vessels, operating principally from Onslow (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Shark Bay Crab Managed Fishery	X	✓	The Shark Bay Crab Managed Fishery management area overlaps the EMBA. The fishery is based primarily in Carnarvon but operates throughout the waters of Shark Bay. In 2023 there were three trap vessels and 21 trawl vessels active within the fishery (Newman et al. 2023).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
			Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Shark Bay Prawn Managed Fishery	X	✓	The Shark Bay Prawn Managed Fishery's management area overlaps the EMBA. There were 12 licensed vessels in the 2023 season, a decrease from the 2022 season which has 18 licensed vessels (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Shark Bay Scallop Managed Fishery	X	✓	The Shark Bay Scallop Managed Fishery's management area overlaps the EMBA. Within the fishery there are boats that are licensed to take scallops (11 Class A licences) and boats that also fish for prawns (18 Class B licenses). There were nine active vessels recorded during the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
South-West Coast Salmon Fishery	✓	✓	The South-west Coast Salmon Managed Fishery management area overlaps the Operational Area and EMBA. The fishery operates on various beaches south of the metropolitan area and includes all WA waters north of Cape Beaufort except Geographe Bay. The number of active vessels or licences in 2023 is unknown, however there were approximately 12 commercial fishers employed in 2018 (Newman et al. 2024). No fisheries catch effort data has been recorded within the Operational Area or the EMBA within the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or the EMBA.
Specimen Shell Managed Fishery	✓	✓	The Specimen Shell Managed Fishery overlaps the Operational Area and the EMBA. The fishery encompasses the entire WA coastline, but effort is concentrated in areas adjacent to the population centres such as Broome, Exmouth, Shark Bay, Geraldton, Perth, Mandurah, the Capes area and Albany (Newman et al. 2024). There are several closed areas where the fishery is not permitted to operate. However, shells are typically collected in waters less than 30 m deep. There was a total of 30 licenses active within this fishery, of which 18 licenses were fished in 2023 (Newman et al. 2024). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
Western Australia North Coast Shark Fishery	✓	✓	The Western Australia North Coast Shark Fishery management area overlaps the Operational Area and EMBA. The fishery has been inactive since the 2008-09 season. No fisheries catch effort data has been recorded within the Operational Area or EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the Operational Area or the EMBA.
West Australian Sea Cucumber Fishery	X	✓	The Western Australian Sea Cucumber Fishery management area overlaps the EMBA. Fishing occurs mostly in the northern half of WA from Exmouth Gulf to the NT border and is managed under Ministerial Exemption (Newman et al. 2024). Three vessels operated in the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery management area overlaps the Operational Area and EMBA. The fishery extends north from Cape Leeuwin to the WA/NT border in water depths greater than 150 m within the AFZ. There were 7 license holders with three vessels active in the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
West Coast Demersal Gillnet & Demersal Longline	X	✓	The West Coast Demersal Gillnet and Demersal Longline (Interim) Managed Fishery management area overlaps the EMBA. The fishery is part of the Temperate Demersal Gillnet and Demersal Longline Fishery, which operates between 26° and 33° S, and the Joint Authority Southern Demersal Gillnet and Demersal Longline Managed Fishery, which operates from 33° S to the WA/SA border (Newman et al. 2024). The vessel and license data for this fishery is not publicly available. There were approximately 5 to 6 skippers and crew employed during 2022–23 period. No fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers there to be no potential for interaction with this fishery and the EMBA.
West Coast Demersal Scalefish (Interim) Managed Fishery	X	✓	The West Coast Demersal Scalefish Interim Managed Fishery management area overlaps the EMBA. The fishery is the main commercial fishery that targets demersal species in the West Coast Bioregion. It encompasses the waters from just south of Shark Bay down to just east of Augusta and extends seaward to the 200 NM boundary. The fishery is divided into four inshore management areas and one offshore management area (Newman et al. 2024). There were 28 licensed vessels operating in the 2023 season (Newman et al. 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
			Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
West Coast Rock Lobster Managed Fishery	X	✓	The West Coast Rock Lobster Fishery management area overlaps the EMBA. The fishery operates from Shark Bay south to Cape Leeuwin. The fishery is managed using zones, seasons and total allowable catch. The recreational fishery targets the western rock lobsters using baited pots and by diving between North-west Cape and Augusta (Newman et al. 2024). There were 218 vessels active during the 2023 season (Newman et al. 2024). Fisheries catch effort data has been recorded within the EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Charter-based Commercial Operators			
Tour Operator	✓	✓	Fishing Tour Operators are permitted to operate across WA State waters and are required to report monthly logbook records of client fish catches. Tour operator (charter) catches are almost exclusively boat-based using hook and line (Newman et al. 2023). Fisheries catch effort data has been recorded within the Operational Area and EMBA for the five-year period 2020-2025. Therefore, Woodside considers it a possibility that interactions with fishing tour operators may occur in the Operational Area and EMBA.

4.10.2 Traditional and customary fishing

Traditional or customary fishing is typically carried out in shallow coastal waters and/or areas with hard substrates such as reef. The Western Australia Recreational Fishing Guide (2024) states that Indigenous people do not need a recreational fishing licence, in any waters, if it is in accordance with continuing tradition, for individual or familial consumption, and not for a commercial purpose.

There are no traditional or customary fisheries within the Operational Area, as these are typically restricted to shallow coastal waters and/or areas with structures such as reefs. However, it is recognised that Barrow Island, Montebello Islands and Ningaloo Reef, all within the wider EMBA, have a known history of fishing when areas were occupied (as from historical records) (CALM 2005, DEC 2007).

Refer to Section 4.9.2 for coastally adjacent Indigenous groups which may undertake traditional fishing within the EMBA.

Traditional fishing methods in the NWMR are further described in Appendix C.

4.10.3 Tourism and recreation

No tourist activities take place specifically within the Operational Area. However, growth and the potential for further expansion in tourism and recreational activities is recognised for the Pilbara and Gascoyne regions, with the development of regional centres and a workforce associated with the resources sector (SGS Economics and Planning 2012).

Tourism is one of the major industries of the Gascoyne region and contributes significantly to the local economy in terms of both income and employment. The main marine nature-based tourist activities are concentrated around and within the Ningaloo Coast World Heritage Property (approximately 208 km south-west of the Operational Area). Activities undertaken include recreational fishing, snorkelling and scuba diving and wildlife watching and encounters (including whale sharks, manta rays, humpback whales and turtles) (Schianetz et al. 2009).

The Montebello Islands (38 km from the Operational Area) are the closest location for tourism with some charter boat operators taking visitors to these islands (DEC 2007).

Recreational fishing in the Pilbara and Gascoyne regions is mainly concentrated around coastal waters and islands and has grown considerably with the expanding regional centres, seasonal tourism and increasing residential and fly in/fly out work force, particularly in the Pilbara region (Fletcher et al. 2017). Some recreational fishing has historically taken place at Rankin Bank and the Glomar Shoal (approximately 3.7 km north-west and 51.5 km east of the Operational Area respectively). However, due to the distance from access nodes, such as Dampier and Onslow (approximately 138 km and 202 km from the Operational Area at the closest point respectively) recreational fishing effort is expected to be restricted to relatively large vessels and hence is considered to be low.

Tourism and recreation in the context of the wider North-west Marine Region is described in Appendix C.

4.10.4 Commercial shipping

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR to reduce the risk of vessel collisions with offshore infrastructure. It is noted that the fairway overlaps the Operational Area west of the GWA platform (Figure 4-20). Vessel tracking data suggest shipping is concentrated to the south-east of the Operational Area, which is likely associated with ports.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.5 Oil and gas facilities, infrastructure and other industries

Table 4-25 details other oil and gas facilities, assets and infrastructure located within 50 km of the Operational Area. Appendix C describes current oil and gas development within the EMBA, also shown in Figure 4-21.

Table 4-25: Other oil and gas facilities within 50 km of the Operational Area

Facility or asset and Operator	Distance and direction from Operational Area
North Rankin Complex (Woodside)	Adjacent
Pluto (Woodside)	12 km west
Wheatstone Platform (Chevron)	18 km west
Armada Claire (Woodside)	31 km west
Okha (Woodside)	32 km west
Angel (Woodside)	44 km east
Campbell (Woodside)	50 km south-east
Reindeer (Santos)	50 km south-east

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10.6 Submarine communications infrastructure

The Operational Area is in a region with submarine communications infrastructure. The submarine communications infrastructure located within 50 km of the Operational Area is listed in Table 4-26 and displayed in Figure 4-22.

Table 4-26: Communications infrastructure located within 50 km of the Operational Area.

Cable name	Cable description	Distance and direction from Operational Area (km)
Chevron Fibre Optic Cable Route	As Laid – BU5 to Wheatstone	Overlap
Chevron Fibre Optic Cable Route	As Laid – Wheatstone West	Overlap
Woodside Fibre Optic Cable Route	As-laid_BU7-CEM	Overlap
Woodside Fibre Optic Cable Route	As-laid_BU5-BU6-BU7	9.2
Woodside Fibre Optic Cable Route	As-laid_BU7-Tail	14.36
SCA Fibre Optic Cable	Project Highclere Segment 4.4 (Dorado)	14.75
Chevron Fibre Optic Cable Route	As Laid – BU5 to BU7 tail	15.64
Chevron Fibre Optic Cable Route	As Laid – Wheatstone West BU	17.34
Chevron Fibre Optic Cable Route	As Laid – Wheatstone East	20.35

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5. STAKEHOLDER CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations. (In this Section, references to 'regulations' are to the Environment Regulations, unless otherwise stated).

The consultation process is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to assess the merits of objections or claims about the adverse impact of each activity to which the EP relates that are received from relevant persons and for Woodside to adopt appropriate measures (if any) in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP) and will be of an acceptable level.

Consultation is informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 (Tipakalippa Appeal) (see Section 5.2 and 5.5.1) and *Munkara v Santos NA Barossa Pty Ltd* (No 3) [2024] FCA 9 (Munkara Case).

For this EP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- the first section (Section 5.2 to 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 25(1) to identify relevant persons
- the second section (Section 5.6 to 5.7) details Woodside's approach to accepting feedback and assessment of the merits of each objection or claim about the adverse impact of each activity to which the EP relates, and engaging in ongoing consultation for this EP.

Woodside's consultation record is in Appendix F and includes a summary of the following:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other stakeholders Woodside chose to consult
- engagement with persons or organisations that Woodside chose to contact who are 'not relevant' persons for the purposes of regulation 25(1) (see Section 5.3.7)
- opportunities provided to persons or organisations to participate in consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

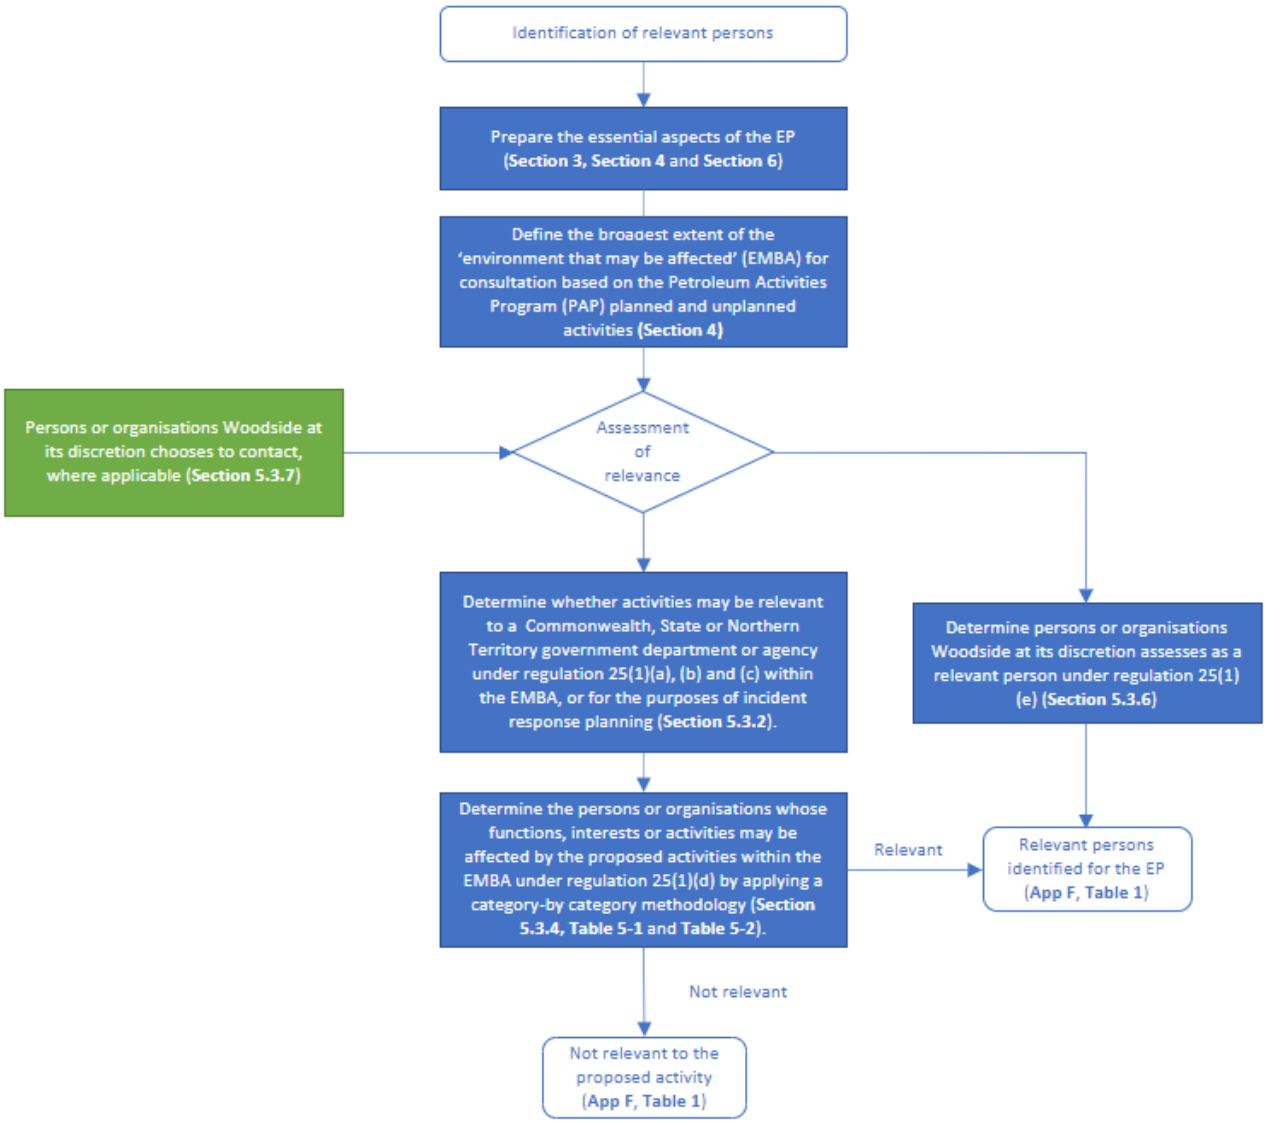

Figure 5-1: Overview of Woodside's methodology to identify relevant persons

5.2 Consultation – general context

Woodside has a portfolio of quality oil and gas assets and more than 40 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential impacts and risks associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations, enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult but, rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a Petroleum Activity. The information in the consultation list has been captured from years of experience; it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's GL2086 – *Consultation in the course of preparing an environment plan guideline (May 2023)* as well as judicial guidance in the *Tipakalippa Appeal* on the intent of consultation, as follows:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- at paragraph 54 of the appeal decision: … *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined*.
- at paragraph 89 of the appeal decision: …*its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The *Tipakalippa Appeal* and *Munkara Case* have also been further considered in the context of specific methods for consultation with Indigenous relevant persons (Section 5.5.1).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons in accordance with regulation 25(1) (Section 5.3). This methodology is consistent with NOPSEMA's Guideline and demonstrates that, to meet the requirements of regulation 34 (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.3)
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 6.8).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 25, which requires a Titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
  - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant
  - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister
  - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister
  - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP
  - any other person or organisation that the Titleholder considers relevant (regulation 25(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 25(2))
- allow a relevant person a reasonable period for the consultation (regulation 25(3))
- tell each relevant person that the Titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the EPBC Act – see Section 2
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (regulation 4)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity
- is collaborative. Woodside respects that, for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.9).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

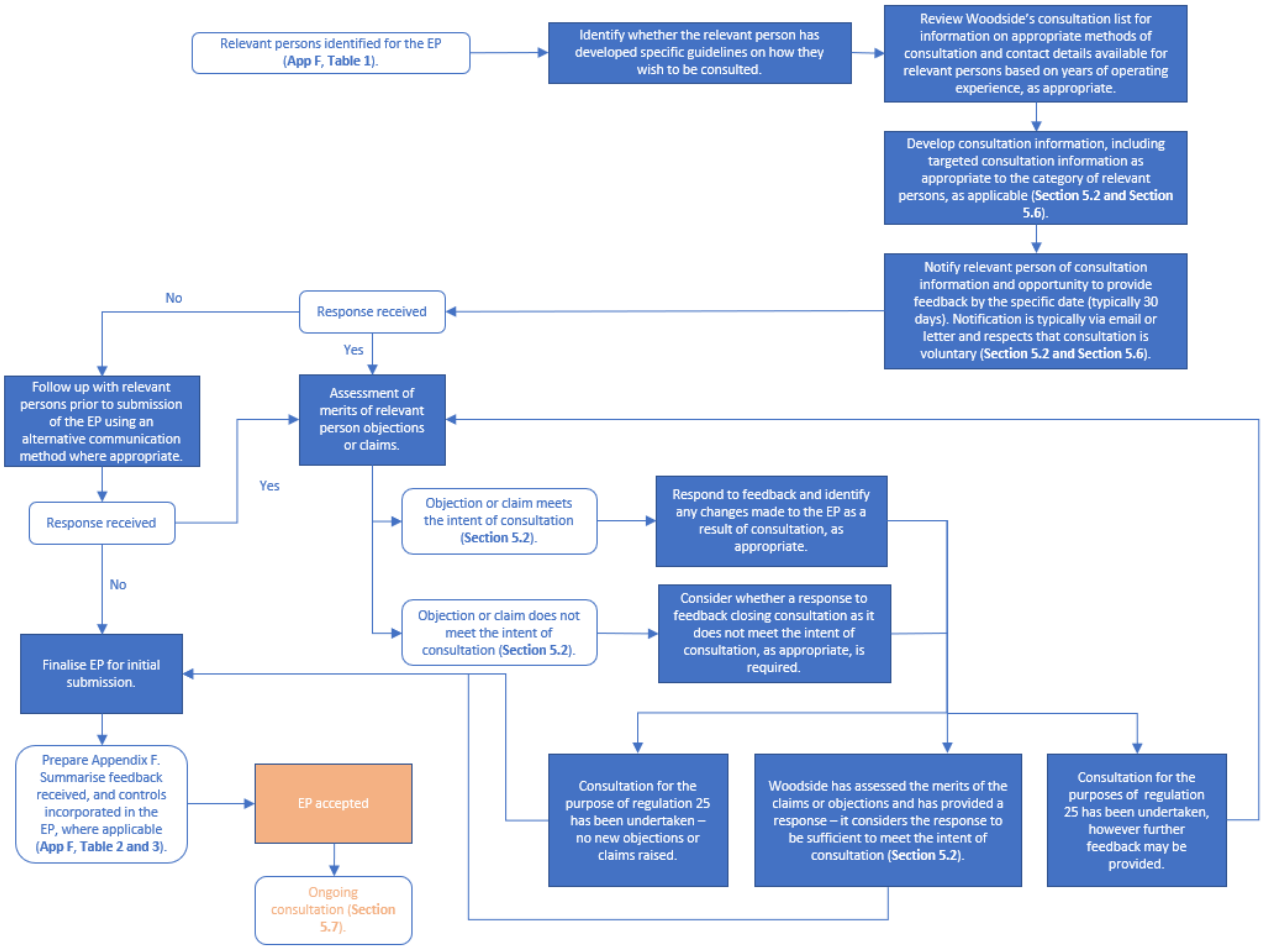

Figure 5-2: Overview of Woodside's consultation approach

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

Federal Court:

- Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193
- Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9

5.3 Identification of relevant persons for consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons under regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with regulation 25(1)(b), Woodside consults with the Department of the relevant State Minister.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments, as set out on their websites, in *NOPSEMA's GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline (January 2024)*, which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.
- Woodside has categorised government department or agency groups as per Table 5-1.

Table 5-1: Classifications of government department and agency groups

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies, determining whether those responsibilities overlap with potential impacts and risks specific to the Petroleum Activity in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry; and AHO is responsible for maritime safety and Notices to Mariners. To undertake proposed activities in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Operational Area/s. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- the list of government departments and agencies assessed as relevant is set out in Appendix F, Table 1.
- feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with impacts or risks specific to the Operational Area or the EMBA or would not be involved in incident response planning.

5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of regulation 25(1)(d), the meaning of "functions, interests or activities" needs to be understood. In regulation 25(1)(d), the phrase "functions, interests or activities" should be construed broadly and consistently with the objects of the Environment Regulations (regulation 4) and the objects of the EPBC Act (Section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance from *NOPSEMA's GL2086 – Consultation in the course of preparing an environment plan guideline* (May 2023) (Table 5-2).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 5-2: Guidance from NOPSEMA GL2086

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of 'interest' in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of 'activity' in regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside's methodology for determining 'relevant persons' for the purpose of regulation 25(1)(d) includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.

5.3.4 Identification of relevant persons under Regulation 25(1)(d)

Relevant persons under regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 3)
- the EMBA by unplanned events (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within regulation 25(1)(d), Woodside adopts the following methodology and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions, interests or activities that overlap with the Operational Area/s and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities to be carried out under the EP. The broad categories are identified in Table 5-3 below and identification methodology applied as set out in Table 5-4.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-3, as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as 'not relevant' but whom Woodside chose to contact, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 3.

Table 5-3: Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the *Commonwealth Fisheries Management Act 1991* (Cth) and the *Western Australian Fish Resources Management Act 1994* (WA), which may be amended from time to time.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Explanation
	Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and Operators	Registered holder of an offshore petroleum title or greenhouse gas (GHG) title under the OPGGS Act and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are Indigenous Australians with cultural rights and interests or cultural functions or who perform cultural activities over particular lands and waters. Where an Indigenous person, group or entity self-identifies and asserts cultural rights, functions, interests or activities they will be considered under the definition of Traditional Custodian for the purpose of this EP (as appropriate).
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the *Native Title Act 1993* (Cth) by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the Native Title Act 1993 (Cth) with prescribed functions, set out in Part 11 of the *Native Title Act 1993* (Cth), which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Local government and elected Parliamentary representatives and recognised local community reference/liaison groups or organisations	Local government body formed under the Local Government Act 1995 (WA) and elected Parliamentary representatives which are responsible for representing the local community. Recognised local community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-4: Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category

Category	Relevant person identification methodology
Commercial fisheries (Commonwealth and State) and peak representative bodies	Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	• defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • confirming whether the EMBA overlaps with the fisheries management area (i.e., the spatial area the fishery is legally permitted to fish in) (see Section 4.10.1 • Woodside acknowledges WAFIC's consultation guidance[7], that Titleholders develop separate consultation strategies for significant unplanned events (for example an oil spill) where Titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC's guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs (see Appendix G). • for Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA, ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.10.2). Assessment of relevance: • State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.2) are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC's guidance, Woodside only consults individual licence holders based on WAFIC's advice. Woodside also utilises WAFIC's consultation service whereby WAFIC: ○ directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area ○ consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario. • Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.2) are assessed as relevant to the proposed activity. Where a relevant fishery is identified, or where Woodside chooses to contact fisheries at its discretion, Woodside consults directly with individual licence holders in that fishery. • A Commonwealth fishery's representative body is assessed as relevant where the EMBA overlaps the fishery's management area, even where the fishery itself has been assessed as not relevant based on potential for interaction. This recognises the representative body's role in representing fishing entitlements and broader fisheries considerations within the management area. Recognised Commonwealth fishery representative bodies are identified by AFMA through information on its website. For State fisheries, representative bodies are assessed as relevant where the fishery they represent is assessed as relevant based on potential for interaction. WAFIC is the only recognised State fishery representative body.
Recreational marine users and peak representative bodies	Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology: • using Woodside knowledge and operating experience, applying knowledge of recreational marine users in the area. This assessment is both activity and location based.

Category	Relevant person identification methodology
	• defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years. Assessment of relevance: • recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. • if Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside's existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.
Titleholders and Operators	Woodside assesses relevance for other Titleholders and Operators using the following steps in its methodology: • using GPInfo to determine overlap with other Titleholders' or Operators' permit areas within the EMBA. • using Woodside knowledge and operating experience, applying knowledge of other operators in the area. • Woodside produces a map showing the outcome of this assessment. Assessment of relevance: • titleholders and operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.
Peak industry representative bodies	Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology: • review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside's proposed activities within the EMBA. • review of Woodside's existing consultation list. • website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. Assessment of relevance: • peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed activities within the EMBA are assessed as relevant.
Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations	Consistent with its understanding of the matters discussed in Section 4.9, to identify Traditional Custodian groups or individuals, Woodside: • uses existing systems of recognition to identify Indigenous groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under Native Title or cultural heritage legislation, or marine park management plans, or identification by other Indigenous groups or entities) • notifies and invites consultation with Indigenous people through their nominated representative corporation (for example

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	Prescribed Bodies Corporate (PBCs)); or, in the case of Native Title and where appropriate, the Native Title Representative Body • requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders); • requests advice as to other Indigenous groups or individuals that should be consulted • advertises widely so as to invite self-identification and consultation by Indigenous groups and individuals. Further detail to Woodside's methodology is as follows. Woodside uses the databases of the National Native Title Tribunal: • to understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA • to understand whether there are any relevant Indigenous Land Use Agreements (ILUAs), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. Where there is a positive determination of Native Title, contacting the PBC or, where their representative is a Native Title Representative Body, contacting the Native Title Representative Body. Where appropriate, contacting the relevant Native Title Representative Body to request a list of any Indigenous groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA. Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. In Victoria, using the Victorian Aboriginal Heritage Council data to determine whether there are any Registered Aboriginal Parties (RAP) appointed under the Aboriginal Heritage Act 2006 (Vic), that overlap or are adjacent to the EMBA. Indigenous groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body. Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means. Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its impacts and risks, and self-identify. Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means that an individual/s functions, interests and activities may be affected by other activities where EMBAs overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess impacts and risks to their values, and enable individuals to self-identify. Assessment of relevance: • Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
Native Title Representative Bodies	Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology: • a Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the Native Title Act 1993 with prescribed functions set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. • review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA. Assessment of relevance: • where the area for which a Native Title Representative Body is recognised under the Native Title Act 1993, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Historical heritage groups or organisations	Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following steps in its methodology: • using the Australasian Underwater Cultural Heritage Database to assess known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (see Section 4.9.1). Assessment of relevance: • where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.
Local government and recognised local community reference/liaison groups or organisations	Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following steps in its methodology: • review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries 'My Council' database and WA Local Government Association (WALGA) Local Government Directory maps to assess overlap between the local government's defined area of responsibility and the EMBA. • Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. • Woodside reviews the community reference/liaison group's terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e., onshore). Assessment of relevance: • the local government whose defined area of responsibility overlaps the EMBA is assessed as relevant.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	• the community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups, organisations or individuals	Woodside assesses relevance for other non-government groups, organisations or individuals using the following steps in its methodology: • review of Woodside's existing consultation list. • website search of registered non-government groups or organisations (i.e., registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website and/or social media material specific to the proposed activity at the time of development of the EP. • organisation has a publicly available statement (or purpose) that clearly describes their collective functions, interests or activities. • review of current website and/or social media material to identify targeted information which demonstrates functions, interests or activities relevant to the potential impacts and risks associated with planned activities associated with the EMBA. • review of an organisation's/individual's feedback to consider whether their functions, interests or activities within the EMBA may be affected by the activities to be carried out under the EP. Considering interests outside the EMBA would be considered too remote and contrary to the purpose of EP consultation. Assessment of relevance: • registered non-government groups or organisations with current targeted public material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential impacts and risks associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant. • individual demonstrates their functions, interests or activities may be impacted will be assessed as relevant.
Research institutes and local conservation groups or organisations	Woodside assesses relevance for research institutes and local conservation groups or organisations using the following steps in its methodology: • review of Woodside's existing consultation list. • website search for research institutes that may operate within the EMBA. This assessment is both activity and location based. • website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA. Assessment of relevance: • where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant. • local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.

5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under regulation 25(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 25(1)(e).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.3.6 Identification of relevant persons under Regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 25(1)(e).

5.3.7 Persons or organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under regulation 25(1), from time to time there are persons or organisations that Woodside chooses to contact in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 25(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to regulation 25(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisation's relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside's assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

5.3.8 Assessment of relevant persons for the proposed activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as 'not relevant' but chose to contact at its discretion in accordance with Section 5.3.7, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 1 and Appendix F, Table 3.

5.4 Consultation material and timing

Regulation 25(2) provides that a Titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) provides that the Titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons of the proposed activities, respecting that consultation is voluntary, and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Operational Area/s. Woodside acknowledges published guidance for good practice consultation, relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.4.1 Sufficient information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes:

- a description of the proposed petroleum activity.
- the Operational Area
- where the activity will take place
- the timing and duration of the activity
- a location map of the Operational Area and EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- a description of the EMBA
- relevant exclusion zones
- a summary of relevant impacts and risks and mitigation and management control measures relevant to the proposed petroleum activity.

It also sets out contact details to provide feedback to Woodside.

The level of information necessary for a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person have not been provided. Woodside acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises persons being consulted that they may inform Titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the Native Title Act 1993 for Native Title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters
- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate
- Let's Talk newsletter – digital and hard copy
- maps outlining a person or organisation's defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate
- attendance at on-the-ground community events or planned regional roadshows
- broader awareness campaigns on the how to be involved in the EP consultation process

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside communicates with relevant persons in different ways (Table 5-5). Woodside recognises that, as part of genuine two-way dialogue, these forms of communication may evolve including, for example due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Table 5-5: Categories of relevant persons and typically accepted forms of communications

Category of relevant person	Typically accepted form of communication
Government departments / agencies – marine Government departments / agencies – environment Government departments / agencies – industry	Woodside applies NOPSEMA's guideline for engagement with Commonwealth government departments or agencies GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024 by using email for its consultation unless another form of communication is requested. Other forms of communication, such as phone calls, meetings and/or presentation briefings are used on request.
Commercial fisheries and peak representative bodies Recreational marine users and peak representative bodies	**Commonwealth commercial fisheries**: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **State commercial fisheries and recreational marine users**: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the Fish Resources Management Act 1994 and Aquatic Resources Management Act 2016, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder's discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **Peak representative bodies**: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Titleholders and Operators	Email is used as the primary form of communication between Titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Historical heritage groups or organisations	NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024) for engagement with government departments or agencies is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category of relevant person	Typically accepted form of communication
Local government and recognised local community reference/liaison groups or organisations	**Local government:** NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024) for engagement with local government is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. **Community reference/liaison groups and chambers of commerce**: Email and presentations are used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Other non-government groups or organisations	Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 2.

Appendix F, Table 3 sets out the information which is provided to persons or organisations that are 'not relevant' for the purposes of regulation 25 but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 25(4), the relevant person may request that the Titleholder notifies NOPSEMA that particular information the person or organisation provides in the consultation not be published, and that information subject to that request will not be published under the Environment Regulations.

5.4.2 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside's methodology allows relevant persons a reasonable period for consultation (regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

- Regulation 30 sets out a public consultation period of 30 days.
- The Department of Mines, Petroleum and Exploration (DMPE) *Guidelines for Consultation with Indigenous People by Mineral Explorers* directs a period of 21-30 days of consultation with traditional owners.

This period of consultation demonstrates that Woodside has provided a "reasonable period" for relevant persons to consult in accordance with regulation 25(3). Commentary in the *Tipakalippa Appeal* judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

"it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time..."

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside seeks feedback in order to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- advertising in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected
- providing consultation materials directly to identified relevant persons as well as persons who are 'not relevant' but Woodside chose to contact and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided.

Woodside considers that consultation for this EP has closed.

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all stages of the life of the EP as per Woodside's ongoing consultation approach described in Section 5.7.

5.4.3 Discharge of Regulation 25

The Full Federal Court made clear in the *Tipakalippa Appeal* that consultation should be approached in a "*reasonable*", "*pragmatic*" and "*not so literal*" way, so that consultation obligations were capable of being met by Titleholders (Section 5.5.1). Consultation is a "*real world activity*" and must be capable of reasonable discharge. The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.

When the Titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, then regulation 25 consultation requirements are met. Meeting these obligations requires evaluative judgement to determine reasonable satisfaction of the consultation obligation and, as such, the Regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.

While a Titleholder is required to provide an opportunity to consult, the Titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a "reasonable opportunity" for consultation must be afforded to relevant persons. A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities; and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under regulation 25 and considers that it is complete.

Appendix F, Table 2 and Table 3 of this EP set out the history of consultation under regulation 25. To the extent a relevant person says that they have further information to share or claims that consultation under

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

regulation 25 has not been completed, Appendix F, Table 2 and Table 3 provide reasons why Woodside considers consultation under regulation 25 has been met, in relation to that relevant person.

5.5 Context of consultation approach with Traditional Custodians

To comply with regulation 25, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal

Woodside has implemented a consultation methodology consistent with regulation 25 and guidance provided in the Tipakalippa Appeal (Section 5.2). Woodside's consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Section 5.5.3 to 5.5.7).

Woodside notes the Full Federal Court discussed several *Native Title Act 1993* (Cth) cases in response to a submission made in that case that a requirement under regulation 25 to consult "each and every" relevant person would be "*unworkable*". The reference to Native Title cases dealt with how decision-making processes under the NTA requiring "all" members of a group to be contacted for communal approval are interpreted by courts in a "*reasonable*", "*pragmatic*" and "*not so literal*" way, and how obligations to consult "*each and every*" person under regulation 25 should be interpreted in a similarly pragmatic way, so that consultation is workable. The reference to NTA authorities was made by analogy:

"It can be seen that the terms of [the native title legislation] are somewhat absolute – "all". However, [the native title legislation] has consistently been construed in a way that is not so literal … The cases concerning [the native title legislation] … have reiterated … that [the native title legislation] does not require that "all" of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting."

"We consider the authorities in relation to processes under the NTA to be illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner" (emphasis added).

"…there is no definition of what constitutes "consultation for the purpose of Reg11A [now regulation 25] ... A titleholder will need to "demonstrate" to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons" (emphasis added).

The Judgment in the Tipakalippa Appeal makes it clear that a Titleholder will have some decisional choice in identifying which person(s) are to be approached, how the information will be given to allow the "relevant person" to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken. Consultation is not fixed to a rigid process and will be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 25 requirements through its consultation methodology (Section 5.2).

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style "*full group*" meetings are not required for there to be compliance with regulation 25. Nominated representative corporations (such as PBCs established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. It is not appropriate for Titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation method

Woodside's Indigenous Affairs team has experience in engaging and working with Traditional Custodian organisations and individuals, including within the Commonwealth Native Title and cultural heritage systems,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

and state and territory cultural heritage and land rights systems. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with Traditional Custodian groups' established channels of communication and methods of consultation. Woodside's Indigenous Affairs team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with Traditional Custodian groups. The Indigenous Affairs team's approach is also informed by the established systems of recognition for Traditional Custodian groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with Traditional Custodian groups in the Northern Territory ('not relevant' for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (*Cth*)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them.

By contrast, recognition for Traditional Custodian groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993 (Cth*) because the vast majority of the Western Australian coastline is settled under the Native Title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to, Native Title Representative Bodies and PBCs.

Native Title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA and help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgment in the *Tipakalippa Appeal* endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.[8] Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective Traditional Custodian communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (Section 5.5.4), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- advertising in relevant Indigenous and non-Indigenous newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian.
- creating carefully considered Summary Consultation Information Sheets with content developed by Woodside's Indigenous Affairs Team to remove jargon and present information in a simplified format.
- directing contact through nominated representative corporations.
- using social media (i.e. Facebook/Instagram), texts, phone calls and emails. These mediums are one of the preferred communication methods used by Traditional Custodians throughout Western Australia and, on that basis, used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. Indigenous woman Professor Bronwyn Castle, through 10 years of research, found *"Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among Indigenous peoples] than the national average across all geographical locations*" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- for ongoing consultation post Regulation 25 consultation, Woodside supports ongoing engagement with Traditional Custodians. Woodside is committed to ongoing engagement and support to care for and manage country, including Sea Country, basing members of its Indigenous Affairs team in Karratha and Roebourne who serve as on-Country points of contact for Traditional Custodian organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including distributing

information and providing notice to the community to support Traditional Custodian attendance and involvement at Woodside's information sessions and Community roadshows.

- ensuring that from the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as elders).
- holding meetings on Country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate).
- providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The Indigenous Affairs team approach to consultation is also consistent with the Federal Court's decision in the *Munkara Case*. The *Munkara Case* notes that the word "*culture*" (and hence the word "*cultural*") has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people *as a people*. For values, features or beliefs that are expressed by an individual to be "*cultural*" they cannot simply be an individual's belief - the belief must have a communal aspect too, and demonstrate that the "*individual beliefs are broadly representative of the beliefs of other members of the group*"[9]. The phrase "*cultural features*", when applied to "*people*" as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual[10]. When the Indigenous Affairs team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

5.5.3 Identification of relevant persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) (Section 5.2 and 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's Indigenous Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation, where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.4). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporation. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate, including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.4 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title*

[9] *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]*

[10] *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024] FCA 9 at [205]*

Act 1993 (Cth), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with Indigenous peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and Native Title/compensation claims under the *Native Title Act 1993* (*Cth*)[11].

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.4 Opportunity to self-identify and identifying other individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section 5.5.3). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Custodians authorised representative entities.
- recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so, nor seek to audit the representative entities for compliance with any request.
- representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- while Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.5.5 Sufficient information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which is provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.4.1). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities. These methods are specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet is developed and reviewed by Woodside's Indigenous Affairs Team to ensure that content is appropriate to the intended recipients, which is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face-to-face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians location of choice (where practicable) and with their nominated attendees. Along with members of Woodside's Indigenous Affairs engagement team, key personnel and environmental experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions typically incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a Titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.6 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.4.2).

5.5.7 Discharge of Regulation 25

Woodside's consideration and approach to discharging regulation 25 for relevant persons is discussed in Section 5.4.3. In addition to this, Woodside has considered the application of regulation 25 specific to Traditional Custodians based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 is complete (Section 5.4.3).

5.6 Providing feedback and assessment of merit of objections or claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information* for the community, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the EP and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under regulation 34(g), there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

During consultation, relevant persons may seek to introduce other issues (such as agreements) that are not specific to EP consultation. While concepts of agreements may be associated with broader consultation processes, consultation for specific EPs can occur in parallel.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.4 and 5.3.7). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 26(8), sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

5.7 Ongoing consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7.12), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its Management of Change and Revision process as appropriate (see Section 7.10.1).

6. ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MCs for the Petroleum Activity, using the methodology described in Section 2. Impacts and risks associated with the Petroleum Activity are summarised in Table 6-1 and evaluated throughout Section 6.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-1: Environmental impact and risk analysis summary of planned and unplanned activities

Aspect	EP section	Risk rating				Acceptability of impact or risk
		Consequence /impact	Consequence/impact description	Likelihood	Risk rating	
Planned activities (routine and non-routine)						
Physical presence: interaction with other marine users	Section 6.7.1	F	Temporary localised impact not significant to areas or items of cultural significance.	-	-	Broadly Acceptable
Physical presence: disturbance to the seabed	Section 6.7.2	E	Slight and low-level impact on environmental feature(s) or area(s) of low significance.	-	-	Broadly Acceptable
Routine acoustic emissions: generations of noise during routine operations	Section 6.7.3	F	No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly Acceptable
Routine and non-routine discharges: hydrocarbons and chemicals during subsea operations and activities	Section 6.7.4	F	No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly Acceptable
Routine and non-routine discharges: produced water	Section 6.7.5	E	Slight and low-level impact on environmental feature(s) or area(s) of low significance.	-	-	Acceptable, if ALARP
Routine and non-routine discharges: utility systems, drains and support vessels	Section 6.7.6	Cumulative – E	Slight and low-level impact on environmental feature(s) or area(s) of low significance. Slight, short-term impact to a community or areas or items of cultural significance.	-	-	Broadly Acceptable
Routine and non-routine atmospheric (direct) and greenhouse gas emissions (direct and indirect)	Section 6.7.7	F	No lasting effect, localised impact not significant to environmental receptors Slight, short-term impact to a community or areas or items of cultural significance.	-	-	Acceptable, if ALARP
Routine and atmospheric emissions: indirect emissions associated with gas processing onshore	Section 6.7.8	F	No lasting effect, localised impact not significant to environmental receptors No attributable impact	-	-	Acceptable, if ALARP
Routine light emissions: light emissions from platform lighting, vessel operations and operational flaring	Section 6.7.9	F	No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly Acceptable
Unplanned activities (accidents, incidents, emergency situations) – Major Environmental Events						
Unplanned hydrocarbon release: well loss of containment (MEE-01)	Section 6.8.3	B	Major impact on environmental features or areas, such as impact on feature or area of national importance with limited ability to recover. Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	1	M	Acceptable, if ALARP
Unplanned hydrocarbon release: subsea equipment loss of containment (MEE-02)	Section 6.8.4	B	Major impact on environmental features or areas, such as impact on feature or area of national importance with limited ability to recover. Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	1	M	Acceptable, if ALARP
Unplanned hydrocarbon release: topsides loss of containment (MEE-03)	Section 6.8.5	C	Moderate impact on environmental features or areas, such as impact on feature or area of heightened sensitivity with limited ability to recover. Moderate, medium-term impact to a community, social infrastructure of highly valued areas or items of national cultural significance.	1	M	Acceptable, if ALARP
Unplanned hydrocarbon release: loss of structural integrity (MEE-04)	Section 6.8.6	B	Major impact on environmental features or areas, such as impact on feature or area of national importance with limited ability to recover. Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	1	M	Acceptable, if ALARP
Unplanned hydrocarbon release: loss of marine vessel separation (MEE-05)	Section 6.8.7	B	Major impact on environmental features or areas, such as impact on feature or area of national importance with limited ability to recover. Major, long-term impact to a community, social infrastructure or highly valued areas or items of national cultural significance.	1	M	Acceptable, if ALARP
	Section 6.8.8	C	Moderate impact on environmental features or areas, such as impact on feature or area of heightened sensitivity with limited ability to recover.	1	M	Acceptable, if ALARP

6.2 Impact and risk analysis evaluation

As required by Regulations 21(5) and 21(6) of the Environment Regulations, the following analysis and evaluation demonstrates that the identified impacts and risks associated with the Petroleum Activity are reduced to ALARP and are of an acceptable level. This assessment considers all aspects of the activity, including normal operations and potential emergency conditions.

Impacts and risks identified during the ENVID workshops (including decision type, consequence and risk rating, and tools used to demonstrate acceptability and ALARP) have been categorised as either:

- planned (routine and non-routine) activities
- unplanned events (accidents, incidents or emergency situations).

Within each category, impacts and risks are further grouped by environmental aspect (e.g. physical presence, discharges and emissions).

For all hazardous events (i.e. unplanned events), a worst-case risk scenario has been assumed.

Impacts and risks related to Indigenous cultural features and heritage values are assessed in Section 6.11. Where appropriate, consideration of cultural heritage is also integrated into the assessment of planned activities and unplanned events, to demonstrate that impacts and risks are reduced to ALARP and are of an acceptable level.

The ENVID identified 9 impacts and 10 risks, including 6 MEEs, associated with the Petroleum Activity. Planned activities and unplanned events are summarised in Table 6-1. Assigned impact consequences and risk ratings were determined with controls in place, as described in Section 2.4.6**.**

The analysis and evaluation indicate that the impacts and risks are reduced to ALARP and are of an acceptable level, as discussed further in Section 6.7, Section 6.8 and Section 6.9**.**

The environmental impacts and risks for all aspects are summarised in Table 6-1.

6.3 Impacts and risks not deemed credible or outside the scope of this Environment Plan

During the ENVID, certain impacts and risks were identified and screened out where they were not relevant to the Petroleum Activity.

6.3.1 Shallow/near-shore activities

The Petroleum Activity is located in water depths of about 74 to 200 m deep, noting that water depths at Unnamed Shoal are about 40-50 m, and is about 38 km to the nearest landfall (Montebello Islands). Consequently, impacts and risks associated with shallow/near-shore activities such as vessel grounding were assessed as not credible.

6.4 Cumulative impacts

Woodside has assessed the cumulative impacts of the Petroleum Activity in relation to other relevant petroleum activities that may result in overlapping temporal and spatial extents. Nearby facilities include NRC, located at the eastern end of the IFL and the Wheatstone platform, approximately 18 km west of the Operational Area. Planned drilling and installation activities at GWF4 (assessed under the GWF-4 Drilling and Installation Environment Plan (NOPSEMA Doc ID A1327727)) may occur concurrently to the Petroleum Activity.

Given that the primary sources of environmental impacts associated with the Petroleum Activity are concentrated around the GWA platform, the potential for cumulative impacts is considered to be low. Cumulative impacts are considered for sources of impact where such impacts are assessed as credible. Where relevant, cumulative impacts of activities associated with undertaking multiple activities concurrently have been assessed and are discussed in the appropriate sections below (Section 6.7).

Three streams of liquid wastes are discharged to the marine environment in the Petroleum Activity:

- hydrocarbons and chemicals released from subsea operations, including well control at wellhead locations and IMMR activities, which occur intermittently throughout the Operational Area (Section 6.7.4)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- PW discharged from the GWA platform at varying rates up to a maximum of 7,500 m^3/day (but typically lower), which disperses within a mixing zone of 1,200 m radius from the platform (Section 6.7.5)
- routine operational discharges of sewage, grey water, putrescible waste, deck, bilge and drain water, brine and cooling water from the GWA platform and/or support vessels, which are low-toxicity and relatively low-volume discharges (Section 6.7.6).

These discharges occur in deep waters and are expected to disperse rapidly, such that cumulative impacts (spatially or chemically) are unlikely.

6.5 Environmental performance outcomes, standards and measurement criteria

Regulation 21(7) of the Environment Regulations requires that an EP includes EPOs, EPSs and MCs to demonstrate that environmental impacts and risks of the activity will be managed to ALARP and to an acceptable level.

As defined in Regulation 5 of the Environment Regulations, an EPO for an activity, means a measurable level of performance required for the management of environmental aspects of the activity to ensure that environmental impacts and risks of the activity will be of an acceptable level.

The EPOs, EPSs and MC specified in this EP are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the Codes and Standards, Good Industry Practice and Professional Judgement outlined in Section 2.4.5 and Section 2.4.6 as part of the acceptability and ALARP justification process.

The EPOs, EPSs and MC are presented throughout this section and in Appendix G (Oil Spill Preparedness and Response Mitigation Assessment). A breach of these EPOs or standards constitutes a 'Recordable Incident' under the Environment Regulations (refer to Section 7.13.4).

The GWA OPP identified the environmental impacts and risks associated with proposed developments and established the corresponding EPOs. The GWA OPP EPOs have been cascaded to the relevant aspects under this EP or, where appropriate, supplemented by new EPOs that provide the same or greater level of protection of the environment. The relationship between GWA OPP EPOs and the EPOs developed for this EP is summarised in Table 6-2.

For the physical and biological receptors within the EMBA, Woodside has set EPOs that are consistent with the Matters of National Environmental Significance – Significant impact guidelines 1.1 (DEWHA 2013). EPOs are set so that they are consistent with the principles of ESD as defined in Section 3A of the EPBC Act and demonstrated through the acceptability process (described in Section 2.6.2), which is applied to the aspects in Section 6. The EPOs for planned activities have been set at a level of environmental performance that considers the planned activities and associated level of environmental impact. This means that it can be demonstrated that changes which do not trigger EP resubmission as per MOC process (refer to Section 7.2.8) are able to be managed to the Acceptable level.

For socio-economic receptors, including fishing and other commercial activities, the EPOs that have been set reflect the requirements in the Section 280(2) of the OPGGS Act, in that the activities undertaken as a part of the development of the Petroleum Activity should not interfere with other marine users, to a greater extent than is necessary for the exercise of right conferred by the titles granted.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-2: Comparison of Goodwyn Area Infill Development OPP and Goodwyn Alpha Facility Operations EP EPOs as applicable to relevant wells

Aspect	EPO(s) in this EP	Relevant EPO(s) from the GWA OPP	Comparison
Planned Activities			
Physical presence: interaction with other marine users	EPO 1 Impacts to relevant marine users from the Petroleum Activity planned activities will be limited through the provision of appropriate information / notification.	EPO-01 No interference with other marine users to a greater extent than is necessary for the exercise of rights and performance of duties as conferred to the titleholder	The EP EPO 1, to limit impacts to planned activities through provision of appropriate information, is aligned with the notion of not interfering with other marine users beyond the extent necessary to exercise rights conferred by the title(s) granted and therefore aligns with the intention of OPP EPO-01 concerning interaction with other marine users.
Physical presence: disturbance to the Seabed	EPO 2 Seabed disturbance to be limited to planned activities and impacts described as part of the Petroleum Activity and to not occur outside the Operational Area.	EPO-04 No long-term adverse effects to the values of Australian Marine Parks from the petroleum activity.	The EP EPO 2 is aligned with OPP EPO-04 as there is no infrastructure within the Montebello Marine Park and by limiting seabed disturbance to planned activities and impacts, as described in Section 6.7.2 no long-term impacts are expected.
	EPO 3 No adverse impact[12] to unexpected finds of Underwater Cultural Heritage[13] without a permit[14].	EPO-27: Prevent adverse changes to UCH (as protected under the UCH Act [Cth]), or to declared areas or objects of particular significance (as protected under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984 [Cth]) from the petroleum activity.	The EP EPO 3 aligns with OPP EPO-27 as both seek to prevent adverse impacts to Underwater Cultural Heritage arising from petroleum activities.
Routine acoustic emissions: generations of noise during routine operations	EPO 4a No injury of, or mortality to, EPBC Act 1999 listed marine fauna as a result of noise generated by the Petroleum Activity. EPO 4b No displacement of marine turtles from habitat critical during nesting/breeding (incl internesting	EPO-04 No long-term adverse effects to the values of Australian Marine Parks from the petroleum activity. EPO-06: The petroleum activity will not be undertaken in a manner that is inconsistent with any threatened species or community	EP EPO 4a aligns with OPP EPO-07 while EP EPO 4b aligns with OPP EPO-06. EP EPO 4a and 4b provide broader protection of EPBC-listed marine fauna, habitat critical to survival and biologically important areas from noise impacts which supports the protection of

[12] Adverse impacts to UCH without a permit are defined under the Underwater Cultural Heritage Act 201, subsection 30(2).

[13] Underwater Cultural Heritage is defined as any trace of human existence that has a cultural, historical or archaeological character and is located under water, in accordance with the UCH Act

[14] Permit for Entry into a Protected Zone or to Impact Underwater Cultural Heritage would be acquired under the UCH Act.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	EPO(s) in this EP	Relevant EPO(s) from the GWA OPP	Comparison
	periods for turtles) and ensure biologically important behaviour can continue in biologically important areas.	recovery plan, or Threat Abatement Plan, as made or adopted under the EPBC Act. EPO-07: Planned noise-generating activities of Goodwyn Area Infill Development are managed in such a manner to prevent auditory injury[15] and temporary threshold shift.	Australian Marine Park values and align with the intent of OPP EPO-04.
Routine and non-routine discharges: hydrocarbons and chemicals during subsea operations and activities	EPO 5 Routine and non-routine discharges from subsea operations and IMMR activities are limited to those described for the Petroleum Activity.	EPO-04 No long-term adverse effects to the values of Australian Marine Parks from the petroleum activity. EPO-13 No adverse effects greater than temporary changes to water quality, with no lasting effect (return to natural levels within 3 days[16]) to water quality from routine and non-routine hydrocarbon and chemical discharges during the petroleum activity.	The EP EPO aligns with the OPP EPO-04 and EPO-13 by limiting the activities and impacts to those described which has demonstrated no long-term adverse effects to the values of the Montebello Marine Park and that changes to water quality from operations of the relevant OPP wells, will have no lasting effect.
Routine and non-routine discharges; produced water	EPO 6 No impact to the environment outside the Approved Mixing Zone from planned discharges of produced water.	EPO-19: No impact to ecosystem integrity from produced water outside the Approved Mixing Zone boundary.	The EP EPO provides a higher level of protection than the OPP EPO-19 due to requirement for no impact to the environment rather than the ecosystem integrity set in the OPP.
Routine and non-routine discharges: utility systems, drains and support vessels	EPO 7 Impacts from routine and non-routine discharges of liquid waste will be limited to planned activities and impacts described as part of the Petroleum Activity.	EPO-04 No long-term adverse effects to the values of Australian Marine Parks from the petroleum activity. EPO-14: No adverse effects greater than temporary changes to water quality and biological communities, while vessels/MODU are within the Project Area, with no lasting effect from routine and non-routine MODU/vessel discharges.	The EP EPO aligns with the OPP EPO-04 and EPO-14 by limiting the activities and impacts to those demonstrated to have no long term adverse effects to the values of the Montebello Marine Park and that changes to water quality, from a vessel undertaking IMMR activities at the relevant OPP wells to have no lasting effect.

[15] Previously PTS in Southall et al. (2019)

[16] A conservative duration has been applied based on study which demonstrated that the maximum time for concentrations to fall below threshold concentrations, for a large dewatering volume, was ~3 days (Scarborough Seabed Intervention and Trunkline Installation Environment Plan).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	EPO(s) in this EP	Relevant EPO(s) from the GWA OPP	Comparison
Routine and non-routine atmospheric (direct) and greenhouse gas emissions (direct and indirect)	EPO 8a GWA facility GHG emissions shall assist in NWS Project Facility achieving GHG reductions under reformed Safeguard Mechanism (inclusive of legislated net zero emissions by 2050). EPO 8b Air quality from direct atmospheric emissions will be limited to planned impacts and activities described as part of the Petroleum Activity. EPO 8c Minimise GHG emissions from support vessels through efficient fuel usage and consideration of fuel types utilised[17]. EPO 9 Woodside will support customers to reduce their GHG emissions.	EPO-08: No adverse effects greater than temporary changes in air quality while vessels/MODU are within the Project Area, with no lasting effect from atmospheric emissions. EPO-09: Minimise GHG emissions from vessels through efficient fuel usage and consideration of fuel types utilised[18]. EPO-10: Net GHG emissions associated with offshore and onshore processing will achieve reduction requirements under the reformed Safeguard Mechanism (inclusive of legislated net zero emissions by 2050). EPO-11: Woodside will support customers to reduce their GHG emissions. EPO-12: Estimated GHG emissions associated with Goodwyn Area Infill Development will not materially or substantially contribute to global GHG emissions levels.	EP EPO 8a and OPP EPO-10 are effectively equivalent, as both outcomes require GHG emissions associated with processing activities to contribute to achievement of Safeguard Mechanism reduction requirements and legislated net zero objectives. EP EPO 8b and OPP EPO-08 align by seeking to ensure atmospheric emissions remain within the impacts assessed for the activity. The EP EPO is broader because it applies to all operational atmospheric emission sources associated with the operating GWA Facility, whereas the OPP is primarily focused on atmospheric emissions from development-phase vessels, MODUs and associated activities. EP EPO 8c and OPP EPO-09 aligns directly as both seek to minimise GHG emissions from support vessel operations through fuel efficiency and fuel selection measures. EP EPO 9 and OPP EPO-11 align directly, and both seek to support customers to reduce their GHG emissions. OPP EPO-12 is inherent in the activity as described in Section 6.7.7 and is therefore met through this EP.
Routine and atmospheric emissions: indirect emissions associated with gas processing onshore	EPO 10 Prevent accelerated weathering of Murujuga rock art or impact to human health from air emissions that result from onshore processing of GWA gas.	EPO-28: Prevent accelerated weathering of Murujuga rock art from air emissions that result from onshore processing of Goodwyn Area Infill Development gas.	There is no change to the EPO in the EP.

[17] Other upstream indirect emissions such as those associated with helicopter travel and suppliers are not considered material.

[18] Other upstream indirect emissions such as those associated with helicopter travel and suppliers are not considered material.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	EPO(s) in this EP	Relevant EPO(s) from the GWA OPP	Comparison
	EPO 11a No adverse impacts[19] to cultural features and heritage values from the Petroleum Activity EPO 11b Woodside will actively support Traditional Custodians' capacity for ongoing engagement and consultation on environment plans for the purpose of avoiding impacts to cultural features and heritage values.	EPO-29: Woodside will support First Nations capacity for ongoing engagement and consultation on EPs for the purpose of avoiding impacts to cultural features and heritage values.	EP EPO 11a is a new EPO. EP EPO 11b and OPP EPO-29 are effectively equivalent.
Routine light emissions from platform, support vessel and flaring	EPO 12 No impacts to marine fauna greater than that caused by minimum required light emissions for safe work and navigation.	EPO-04 No long-term adverse effects to the values of Australian Marine Parks from the petroleum activity. EPO-05: No adverse effects greater than a change to behaviour, with no lasting effect to marine fauna from artificial light emissions during the petroleum activity. EPO-06: The petroleum activity will not be undertaken in a manner that is inconsistent with any threatened species or community recovery plan, or Threat Abatement Plan, as made or adopted under the EPBC Act.	The EP EPO 12 aligns with the OPP EPO-04, EPO-05 and EPO-06 as the impact assessment has demonstrated that the light emissions required for safe work and navigation do not adversely affect the values of the Montebello Marine Park, result in impacts greater than a change to behaviour, or are inconsistent with recovery plans. Therefore, the implementation of EP EPO 12 meets or is better than the level of performance in OPP EPO-04, EPO-05 and EPO-06.
Unplanned Activities			
Unplanned hydrocarbon release: well loss of containment (MEE-01)	EPO 13 No release of hydrocarbons to the marine environment due to well loss of containment.	EPO-25: No unplanned release of hydrocarbons to the marine environment due to a loss of well integrity or due to a flowline loss of containment.	The EP EPO-13 is directly aligned with OPP EPO-25. Both outcomes seek to prevent hydrocarbon releases to the marine environment resulting from loss of well integrity.
Unplanned hydrocarbon release: subsea equipment loss of containment (MEE-02)	EPO 14	EPO-25: No unplanned release of hydrocarbons to the marine environment due to a loss of well integrity or due to a flowline loss of containment.	The EP EPO-14 is directly aligned with OPP EPO-25, which specifically requires prevention of unplanned hydrocarbon releases resulting from flowline loss of containment. As flowlines

[19] *For the purposes of the Petroleum Activity, an adverse impact to cultural features or heritage values is considered to occur where there is: direct physical disturbance causing observable damage to a site or object of cultural significance; a measurable and significant decline in the population or habitat of a culturally significant species attributable to the activity; or a substantiated impact on recognised intangible cultural values.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	EPO(s) in this EP	Relevant EPO(s) from the GWA OPP	Comparison
	No release of hydrocarbons to the marine environment due to loss of containment from subsea equipment.		form part of the subsea equipment associated with the development, EPO-25 addresses the same environmental outcome sought by the EPO-14.
Unplanned hydrocarbon release: topsides loss of containment (MEE-03)	EPO 15 No release of hydrocarbons to the marine environment due to a topsides loss of containment.	Not applicable as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP	
Unplanned hydrocarbon release: loss of structural integrity (MEE-04)	EPO 16 No release of hydrocarbons to the marine environment from loss of structural integrity.	Not applicable as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP	
Unplanned hydrocarbon release: loss of marine vessel separation (MEE-05)	EPO 17 No release of hydrocarbons to the marine environment due to loss of marine vessel separation associated with the Petroleum Activity.	Not applicable as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP	
Unplanned hydrocarbon release: loss of control of suspended load from GWA platform (MEE-06)	EPO 18 No release of hydrocarbons to the marine environment due to loss of control of suspended load from platform associated with the Petroleum Activity	Not applicable as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP	
Unplanned hydrocarbon or chemical release: hydrocarbon release during bunkering/ refuelling and chemical release during transfer, storage and use	EPO 20 No unplanned release of hydrocarbons or chemicals to the marine environment.	EPO-24: No unplanned release of hydrocarbons or chemicals to the marine environment.	The EP EPO-20 is directly aligned with OPP EPO-24 (noting the OPP EPO only relates to vessel based activities as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP)
Unplanned discharges: hazardous and non-hazardous waste management	EPO 21 No unplanned release of solid hazardous or non-hazardous waste[15] to the marine environment.	EPO-23: No unplanned release of solid hazardous or non-hazardous waste[20] to the marine environment.	The EP EPO-21 is directly aligned with OPP EPO-23 (noting the OPP EPO only relates to vessel based activities as the GWA Facility was outside the scope of the Goodwyn Area Infill Development OPP)

[20] *Waste as defined in the Woodside Offshore Facilities Waste Management Plan*

Impact evaluation summary

Source of impact	***Environmental value(s) potentially impacted***						***Evaluation***						
	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/ habitat	Species	Socio-economic	Decision type	Consequence/ impact	Likelihood	Risk rating	ALARP tools	Acceptability	Outcome
Presence of GWA platform and subsea infrastructure.						✓	A	F	-	-	LCS GP PJ	Broadly Acceptable	EPO 1
Exclusion of other users from the PSZ and SEZ.						✓							
Presence of support vessels undertaking routine activities including IMMR within the Operational Area.						✓							

Description of source of impact

The GWA platform commenced operation in 1995 and has been marked on nautical charts since that time. The platform is surrounded by a 500 m radius PSZ, measured from each point of the outer edge of the structure, within which unauthorised vessels are prohibited. The PSZ is a critical safety control that reduces the likelihood of vessels-platform interactions. Implementation of the PSZ restricts access to a small area of the sea (approximately 0.79 km^2).

The platform is clearly visible under most conditions and is fitted with lighting in accordance with navigational requirements. Its physical structure provides a strong radar return, enabling detection by vessels equipped with marine radar systems.

Routine vessel activities associated with the Petroleum Activity are primarily concentrated within the PSZ and include both continuous standby support and routine supply operations. A dedicated standby vessel is present at the GWA platform on a continuous basis, with coverage maintained through vessel rotations (typically in two-week periods). In addition, PSV visits to support routine cargo operations typically occur on a weekly basis with total presence in the Operational Area usually less than 24 hours per visit.

Subsea support vessels and HLVs may undertake activities within the Operational Area at any time, including outside the PSZ. These activities are typically undertaken as discrete campaigns (e.g. IMMR activities or removal of redundant equipment), with durations generally ranging from approximately two weeks to one month per campaign, depending on the nature and complexity of the work.

An ASV may be deployed to support extended maintenance campaigns, shutdowns or major projects and would also be surrounded by 500 m Safety Exclusion Zone (SEZ). During such campaigns, the ASV may be located adjacent to the platform within the PSZ and operate continuously (24 hours per day). ASV use is expected to be infrequent, with up to one campaign within the EP period (5 years), typically of up to three months' duration.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Subsea infrastructure associated with operations may also present a potential for interactions with other marine users. The Australian Hydrographic Office (AHO) has been notified of the location of all existing subsea infrastructure, including infrastructure maintained for decommissioning, for inclusion on nautical charts. Water depths of subsea infrastructure range between approximately 74 and 200 m.

Impact assessment

Environmental value(s) potentially impacted

Exclusion and displacement of other users

Interaction between the Petroleum Activity and other marine users may result in temporary and localised changes to their functions, interests or activities while vessel-based activities are underway.

The duration and extent of potential for interaction will depend on the activity undertaken, and is outlined below:

- **GWA facility operations** - ongoing, for the duration of the Petroleum Activity and primarily limited to the PSZ surrounding the platform and the SEZ surrounding the ASV (if deployed). The PSZ and SEZ exclude unauthorised vessels from a 500 m radius around the platform and ASV, respectively. A dedicated standby vessel (typically present in two-week periods) and a PSV to support routine supply operations (weekly visits for up to 24 hours) may be present concurrently within the PSZ.
- **subsea support operations (IMMR)** – activities are undertaken intermittently, with frequency varying depending on operational requirements (Table 3-6 and Table 3-7). IMMR activities are typically conducted as discrete campaigns, with durations generally ranging from approximately two weeks to one month per activity. These activities may occur within the PSZ and SEZ or more broadly within the Operational Area.

Commercial fishing

The Operational Area overlaps three Commonwealth fisheries and 13 State managed commercial fisheries management areas (Section 4.10.1). Historical fisheries effort data was assessed to evaluate the actual fishing effort of fisheries within management areas that overlap the Operational Area. The assessment indicated that no Commonwealth managed fisheries have potential for interaction with the Operational Area. Seven State managed fisheries were identified as having a potential interaction with the Petroleum Activity within the Operational Area (Table 4-24). The likely interaction and presence of commercial fishing vessels was assessed based on fisheries management plan areas, catch-effort methodologies, historical effort and consultation (Section 4.10.1).

Commercial fishing vessels in the vicinity of the Operational Area are most likely to be licenced under the Mackerel Managed Fishery, and the Pilbara Demersal Scalefish Fishery (PDSF).

The mackerel fishery primarily uses near-surface trolling gear and also jig fishing from vessels in coastal areas around reefs, shoals and headlands to target Spanish mackerel.

The PDSF includes the Pilbara Fish Trawl (Interim) Managed Fishery (PFTIMF), the Pilbara Trap Managed Fishery (PTMF) and the Pilbara Line Fishery (PLF). The PDSF uses a combination of limited entry, effort allocations (time), gear limits, plus spatial zones (including extensive trawl closures) as management measures. A small area of the Operational Area lies within Zone 2 – Area 6 of the PFTIMF, as designated Pilbara offshore closed waters, an area closed to trawling since 1997. Trawl fishing may occur from fisheries in the PDSF. Therefore, the presence of subsea infrastructure could present a risk of equipment entanglement and subsequent equipment damage or loss. However, such interactions are expected to be infrequent and localised.

While interactions with the Specimen Shell Managed Fishery, Marine Aquarium Fish Managed Fishery and Onslow Prawn Managed Fishery are possible within the Operational Area based on 60 nm CAES activity, consideration of the fisheries' collection methods and operating depths indicates interactions are unlikely.

As such, impacts from the physical presence of the GWA platform, subsea support vessel activity and subsea infrastructure on these fisheries are expected to be temporary and localised.

Tourism and recreation

Tourism and recreation activity in the Operational Area is expected to be infrequent, with recreational and charter fishing from vessels the only tourism and recreation activities identified as potentially occurring in the Operational Area. Fishing tours operate across WA State waters and report monthly logbook records of client catch. Recreational and charter fishing activities are typically undertaken using hook and line methods. The GWA platform is ~138 km north-west of Dampier.

There are three shoals within or close to the Operational Area that are relatively shallow and may support some recreational fishing:

- Unnamed Shoal – water depths of between 40 and 50 m, located within the Operational Area
- Wilcox Shoal – water depths of 25 to 80 m, located 2.4 km from the Operational Area.
- Rankin Bank – water depths of ~18–30.5 m, located 3.7 km from the Operational Area

During consultation, Recfishwest confirmed that due to the activities' proximity to the Montebello Islands, the Montebello Marine Park, and Rankin Bank, charter vessels and larger recreational vessels may still access the general area (Section 5 and Appendix F).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

However, given the distance from boating facilities, proximity to an operating petroleum facility and the water depth of the Operational Area, very little recreational or charter fishing is expected to occur within the Operational Area. As such, impacts to recreational and charter fishing are expected to be temporary and localised.

Shipping

Significant commercial shipping occurs in the region, with a commercial shipping lane passing through the Operational Area. Commercial vessels in the area comprise the following:

- bulk carriers (e.g. mineral ore, salt etc.) from Port Hedland, Dampier and Cape Preston
- offtake tankers
- support vessels for offshore oil and gas activities
- LNG carriers from Dampier, Barrow Island and Ashburton North.

To reduce the likelihood of interactions between commercial vessels and offshore facilities, AMSA has introduced a network of shipping fairways within which commercial vessels are advised to navigate (Figure 4-20). The fairways are not mandatory; however, AMSA strongly recommends commercial vessels remain within fairways when transiting the region. The use of shipping fairways is good seafaring practice, with MASTREP (Modernised Australian Ship Tracking and Reporting System) data from AMSA indicating cargo ships and tankers routinely navigate within the established fairways.

The fairway intended to direct north- and south-bound vessel traffic from Barrow Island and the southern Montebello Islands overlaps the Operational Area west of the GWA platform. Operational history of the GWA platform indicates that commercial vessels rarely enter the PSZ.

The presence of the GWA platform, support vessels and subsea infrastructure are not expected to result in impacts to commercial shipping beyond localised exclusion of shipping traffic from the PSZ and the temporary displacement in the wider Operational Area of commercial shipping due to the presence of support vessels undertaking activities.

Oil and gas

The NRC is the nearest oil and gas platform to the GWA platform, and they are connected by the IFL. NRC is operated by Woodside and any impacts from the Petroleum Activity on NRC will not affect third parties.

The nearest facility not operated by Woodside is the Chevron-operated Wheatstone platform, which is located approximately 18 km west of the Operational Area.

Given the distance between the Operational Area and petroleum activities undertaken by other operators, no impacts to other operators are expected to occur as a result of the presence of the GWA platform, subsea infrastructure or support vessels.

ALARP statement: On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage the potential impacts of the physical presence of the GWA platform, subsea infrastructure and vessels on other users. As no reasonably practicable additional or alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, the physical presence of the GWA platform, subsea infrastructure and subsea support vessels may result in temporary and localised impacts to commercial fishing, recreational fishing and shipping within a limited area. Consultation with relevant persons has identified shipping traffic and vessel movements in, or in close proximity to, the Operational Area but has not indicated any objections in relation to interaction with other marine users. On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), the adopted controls are considered appropriate to manage impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPO is met.

Subsea operations and IMMR activities	✓	✓		✓		✓							
Presence of redundant infrastructure remaining infield until EOFL	✓	✓		✓		✓							

Description of source of impact

Seabed disturbance associated with the Petroleum Activity may occur during operations, including as a result of:

- physical presence of the GWA platform and subsea infrastructure (operational and redundant), including scour, spans and flowline movement inherent to design
- subsea IMMR activities (Section 3.7).

Physical presence

The physical presence of the GWA platform and subsea infrastructure (operational and redundant) provides hard substrate habitats from the sea surface to the seabed via jackets and risers, as well as along the seabed through pipelines, flowlines and manifolds.

The presence of subsea infrastructure, and its interaction with hydrodynamic processes, may result in localised seabed disturbance, including scouring and localised sedimentation of fine substrates around infrastructure. Scour may occur due to currents, subsurface waves and seabed sediment dynamics, and may necessitate IMMR activities as part of integrity management practices.

Flowline movement may occur as a result of normal operations and within defined integrity limits along the flowline corridor. This movement may result from flowline buckling, walking and varying metocean conditions, with lateral movement occurring within the corridor. Management of flowline buckling and walking may also necessitate IMMR activities.

Refer also to MEE-02 Subsea Equipment Loss of Containment in Section 6.8.4, which includes controls to manage scour and flowline movement within integrity requirements.

Subsea IMMR activities

Woodside may undertake routine subsea IMMR activities within the Operational Area as described in Section 3.7. These activities may result in localised impacts to the benthic environment in the vicinity of the activity.

IMMR activities with the potential to impact the benthic environment include:

- inspections – localised sediment resuspension by ROV

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- marine growth removal – localised sediment resuspension and removal of marine biota from subsea infrastructure and the GWA platform jacket
- sediment relocation – localised modification of benthic habitat and sediment resuspension
- span rectification, pipeline/umbilical protection and stabilisation – minor, localised modification of benthic habitat within footprint of area subject to rectification/protection/stabilisation
- EFL and HFL replacement.
- jumper, flowline and umbilical replacement – minor, localised modification of benthic habitat in the vicinity of the equipment
- spool repair/replacement – minor, localised modification of benthic habitat in the vicinity of the spool
- temporary placement of tools on the seabed (e.g. tool baskets) – minor localised modification of benthic habitat

The area of seabed disturbance varies depending on the nature and scale of the IMMR activity; however, impacts are expected to be localised. Span rectification represents the activity with the greatest potential to modify the seabed, due to the alteration of the soft sediment habitat to localised areas of artificial hard substrate.

Operational experience on the North West Shelf indicates that such activities (e.g. span rectification, pipeline protection and stabilisation) are typically limited to short (tens of metres) linear sections of pipeline, with up to approximately 100 m^2 of seabed affected.

The GWA platform and associated subsea infrastructure also provide hard substrate habitat for benthic fauna, both within the water column (e.g. jackets and risers) and along the seabed (e.g. pipelines, flowlines and manifolds).

Impact assessment

Environmental value(s) potentially impacted

The seabed within the direct physical footprint of the GWA platform and subsea infrastructure is characterised predominantly by soft sediments. This habitat type is associated with sparsely distributed infauna and sessile fauna and is widely represented within the Operational Area and across the NWS Province.

The presence of the GWA platform and subsea infrastructure provides hard substrate for the settlement of marine organisms, noting the availability of hard substrate is often a limiting factor in benthic communities. As such, installation of infrastructure has facilitated the development of localised ecological communities which would not otherwise occur in the surrounding soft sediment environment. For example, pipeline infrastructure has been shown to support diverse fish assemblages and benthic biota (McLean et al. 2017; Bond 2018). These communities may be more diverse than those in adjacent soft sediment habitats.

The provision of artificial habitat associated with the GWA platform and subsea infrastructure is not expected to result in adverse impacts to benthic communities and may result in slight and low-level changes in community composition and diversity.

Subsea operations and IMMR activities

Subsea operations resulting in scour and infrastructure movement, may result in continuous, low-level seabed disturbance. Scour around subsea infrastructure may alter surrounding soft sediment benthic habitats, however, these impacts are expected to be slight and result in low-level effects to environmental receptors. Flowline movement is limited to design and integrity envelopes and may result in slight, low-level disturbance to soft sediment habitats, typically on the scale of metres to tens of metres along flowline corridors.

IMMR activities may result in:

- direct physical disturbance of benthic habitat; and
- indirect disturbance to benthic habitats from sedimentation.

An assessment of these impacts to relevant receptors is provided below.

Water and sediment quality

Seabed disturbance may result in slight and low-level reductions in water quality due to increased suspended sediment concentrations and subsequent sediment deposition. Similarly, marine growth removal (e.g. water jetting) may cause slight, low-level increases in turbidity.

Each discrete IMMR activity is expected to generate a short-lived plume of sediment, which will settle rapidly in the vicinity of the activity. Sediment loads are expected to be low due to relatively small footprint of individual activities (Section 3.7).

Impacts to water and sediment quality are expected to be slight and low-level.

Benthic habitats

Benthic habitats within the Operational Area are predominately soft sediment, supporting sparsely distributed infauna and epifauna that are broadly represented throughout the NWS Province and wider NWS (Section 1.1). Communities are typically characterised by burrowing infauna (e.g. polychaetes) and low-abundance epifauna, with sessile filter feeders associated with hard substrate such as subsea infrastructure (RPS Environment and Planning 2012).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The extent of benthic disturbance varies depending on the nature and scale of the IMMR activity. Direct seabed disturbance, including low-level and potentially permanent modification of benthic habitat, may occur for activities such as span rectification, pipeline protection and stabilisation. These activities represent the greatest potential for habitat modification due to the introduction of artificial hard substrate. Operational experience on the NWS indicates such activities are typically limited to short (tens of metres) sections of pipeline, with up to approximately 100 m² of seabed affected.

Scour and flowline movement may also result in low-level disturbance to soft sediment habitats. Where remediation is required (e.g. installation of mattresses or rock), soft sediment habitat is replaced with hard substrate. Over time, this substrate is expected to be colonised by sessile benthic biota, potentially increasing localised habitat complexity.

ROV operations and minor sediment relocation may result in slight, short-term increases in turbidity and localised sedimentation. These effects are expected to be transient and not result in consequential impacts to environmental receptors.

Marine growth removal (e.g. water jetting) may also result in temporary suspension of organic material and localised increases in turbidity. Activities are limited to what is necessary to facilitate inspection or intervention.

The overall extent of disturbance is small relative to the widespread soft sediment habitats present within the Operational Area and the broader NWS Province. Such disturbances may affect small areas of seabed and associated biota; however, impacts are expected to be slight and low-level. Smothering or burial impacts are not expected. Instead, impacts are likely limited to temporary increases in suspended sediments, to which local biota are adapted due to naturally occurring turbidity from tides and cyclonic events. Accordingly, any impacts to benthic habitats will be slight and low-level.

Shoals

Three shoals occur within or near the Operational Area:

- Unnamed Shoal (~40-50 m depth; within the Operational Area)
- Wilcox Shoal (~25-80 m depth; located 2.4 km from the Operational Area).
- Rankin Bank (~18-30.5 m depth; 3.7 km from the Operational Area)

The NWS region experiences naturally high episodic sediment resuspension due to tidal movements and cyclones. Existing survey data of Rankin Bank did not indicate any observable turbidity effects from operations (AIMS 2014b; Section 1.1). Unnamed Shoal is located within the Operational Area, however, there is no overlap with subsea infrastructure. The closest flowline is located ~350 m from the perimeter of the shoal. Any resuspended sediments from IMMR activities are expected to remain slight and low-level and settle prior to reaching the shoal.

Values and sensitivities

Ancient Coastline at 125 m Depth Contour (KEF)

The Operational Area overlaps approximately 276 km² (~1.7%) of the 16,190 km² KEF. The Operational Area represents a 1,500 m buffer around subsea infrastructure, while seabed disturbance is much more localised (typically within tens of metres).

Recent surveys indicate that the KEF is characterised by unconsolidated soft sediments with limited epibenthic biota, consistent with the broader NWS Province (Wakeford et al. 2023). The geomorphic feature is regionally and globally widespread. No features of elevated ecological significance (e.g. escarpments, high productivity areas, or species of conservation significance) have been identified within the Operational Area.

Accordingly, no lasting impacts to this regional-scale KEF are expected.

Montebello Marine Park

The Operational Area overlaps approximately 3 km² (~0.1%) of the 3,413 km² marine park, however, subsea infrastructure does not overlap the marine park. Seabed disturbance is confined to small areas (tens of metres) around infrastructure.

Benthic habitats within the marine park are consistent with the broader NWS region (predominantly sand and rubble with sparse biota) (Keesing 2019, Advisian 2019).

Given the limited spatial overlap, absence of infrastructure within the park, and highly localised nature of disturbance, potential impacts to the environmental values of the Montebello Marine Park are expected to be localised with no lasting effect.

Cultural heritage

Refer to Section 6.11 for an assessment of potential impacts to cultural values and archaeological material from seabed disturbing activities from the Petroleum Activity. Control measures related to cultural heritage have been captured in the tables below to demonstrate that impacts are reduced to ALARP and are of an acceptable level.

Cumulative impacts

Seabed disturbance may arise from the GWA platform, subsea infrastructure and IMMR activities. All vessels used for IMMR activities operate using DP systems and not anchor, except in emergency situations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

IMMR activities within 500 m of Unnamed Shoal are subject to a supplementary impact assessment to ensure impacts remains appropriately managed.

At a regional scale, cumulative impacts may also arise from the presence of other oil and gas facilities (Table 4-25), associated subsea infrastructure and activities. These activities may result in slight and low-level reductions in water quality and localised modification of soft sediment habitats where infrastructure has a physical footprint.

These impacts are limited in spatial extent and are considered minor relative to the widespread distribution of similar habitats within the Operational Area and the broader region. Accordingly, cumulative impacts are expected to be slight and low-level in the context of the regional availability of comparable habitats.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[24]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
A ROV as left survey is undertaken, to confirm all temporary equipment has been removed and to record location of new subsea infrastructure.	F: Yes. CS: Minimal cost ROV as left survey is standard practice.	In accordance with OPGGS Act Section 572 (3) all temporary equipment is removed when no longer in use.	Legislative requirement – must be adopted	Yes **C 2.1**
Remove redundant production infrastructure as soon as it is no longer used, nor to be used.	F: Yes. CS: Removal of property throughout the operational life where it is incorporated within or located close to live infrastructure introduces additional complexities and HSE risk that can be avoided if removed during EOFL decommissioning.	While subsea equipment is in-situ, risks and impacts to the seabed are considered to be low, so only a minor reduction in sediment disturbance from less infrastructure in the Operational Area if removal occurred immediately.	Cost of standalone retrieval work scopes are considered disproportionate to the benefit gained when considering the risks of retrieval during current operations versus risk of extending duration in-situ. Wet stored subsea infrastructure is also RBI assessed and managed while preserved to ensure integrity and retrieval options are maintained for removal.	No
Monitoring and maintenance of redundant infrastructure is undertaken in accordance with the IMMR/RBI process.	F: Yes. CS: Minimal cost. Standard practice. ALARP statement:

On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the adopted controls appropriate to manage the potential impacts of seabed disturbance associated with the GWA platform, subsea infrastructure and IMMR activities on benthic habitats and environmental receptors.

As no reasonably practicable additional or alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.

Demonstration of Acceptability
Acceptability statement:
The impact assessment has determined that, given the adopted controls, seabed disturbance associated with the ongoing presence of the GWA platform and subsea infrastructure represents a slight, low-level impact to benthic habitats that is not expected to affect ecosystem function. Seabed disturbance from subsea operations and IMMR activities is short-term and localised and also represents slight, low-level impacts to benthic habitats.
On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), Woodside considers the adopted controls appropriate to manage impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPOs are met.

Description of source of impact

The GWA platform and subsea infrastructure, support vessels, helicopter operations and subsea IMMR activities generate airborne and underwater noise as a result of machinery and propulsion systems. Typical noise levels for these sources are provided in Table 6-3 and Table 6-4, with further detail described below.

These sources contribute to, and may exceed, ambient noise levels, which typically range from approximately 90 dB re 1 µPa (root square mean sound pressure level [rms SPL]) under calm, low wind conditions, to approximately 120 dB re 1µPa (rms SPL) under higher wind conditions (McCauley 2005).

Sound levels will vary over the course of the Petroleum Activity depending on concurrent operations. Noise associated with the GWA platform and associated subsea infrastructure is generally continuous but relatively low compared to transient vessel and helicopter activities.

Routine vessel activities associated with the Petroleum Activity are primarily concentrated within the PSZ and include both continuous standby vessel operations (typically in two-week periods) and a PSVs to support routine supply operations (weekly visits with total presence in the Operational Area typically less than 24 hours per visit). The standby and PSV may be present at the platform concurrently during routine operations. Subsea support vessels and HLVs may undertake activities (e.g. IMMR activities, removing redundant equipment) throughout the Operational Area, including outside the PSZ. The duration and location of these activities vary depending on operational requirements.

An ASV may be deployed during extended maintenance campaigns, shutdowns or major projects. During such campaigns, the ASV may operate continuously (24 hrs/day) adjacent to the platform. ASV use is expected to be infrequent, with up to one campaign within the EP period (5 years) and for up to three months' duration.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Key acoustic sources associated with the Petroleum Activity are described in Table 6-3 and Table 6-4. Potential concurrent activities contributing to cumulative underwater noise levels have been used to inform worst-case credible sound propagation scenarios for modelling and cumulative impact assessment.

Table 6-3: Indicative source characteristics of continuous underwater noise associated with the Petroleum Activity

Continuous (non-impulsive) sources

Platform machinery

Production platforms have machinery mounted on decks raised above the sea. As a result, most noise is radiated to the environment via the air. Machinery noise onboard the GWA platform may be transmitted into the underwater environment via structural pathways jacket legs and risers, which can act as transducers.

Underwater noise generated by the GWA platform is expected to be minimal. Monitoring programs indicating that underwater noise from production facilities is typically low, or in some cases, not detectable above ambient levels (McCauley 2002).

Gales (1982) assessed noise from 18 oil and gas platforms, including 11 bottom-standing fixed platforms during production operations (i.e. comparable to the GWA platform). The study found that the strongest noise levels were relatively low frequency (< 100 Hz, predominantly between 4 and 38 Hz), with sound levels of 110 to 130 dB re 1 µPa @100 m. Noise from platforms was found to be lower than that from support vessels, with support vessel activity contributing an increase of approximately 20–30 dB in overall underwater noise levels when operating in the vicinity of a platform (Gales 1982).

Noise emissions from the GWA platform are expected to be limited relative to larger processing facilities, reflecting its scale and configuration. Accordingly, the range reported by Gales (1982) is considered conservative.

In summary, underwater noise generated by the GWA platform is expected to be low relative to other noise sources associated with the Petroleum Activity, particularly support vessels.

Flaring

The HP and LP flare system generate noise as a result of combustion. Flaring noise represents a potential occupational health and safety risk consideration and has been accounted for in the design of the GWA platform (e.g. flare tower height and configuration).

Noise from flaring is emitted at the flare tip, located approximately 175 m above sea level, and propagates through the air in all directions.

Airborne propagation modelling has been used to estimate corresponding underwater received levels during flaring activities (Woodside 2019). Only a very small proportion of acoustic energy generated by flaring is transmitted across the air-water interface, with the majority reflected due to the strong impedance contrast between air and water.

Modelled underwater sound pressure levels associated with flaring are estimated to be up to approximately 136 dB re 1 µPa at 1 m below the sea surface but attenuate rapidly to ambient levels over short distances (in the order of metres). Accordingly, underwater noise associated with flaring is expected to be highly localised and of short duration and is not considered a significant contributor to underwater noise levels within the Operational Area and are therefore not considered further in the impact assessment.

Wellhead, pipelines and subsea infrastructure

The noise produced by operational wellheads has been measured by McCauley (2002), with broadband noise levels reported at approximately 113 dB re 1 µPa. This is only marginally above ambient noise levels under rough sea

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

conditions. For multiple wellheads, cumulative noise levels would only increase where sources are in close proximity (e.g. <50 m apart), with two adjacent sources increasing the overall sound level by approximately three db.

Accordingly, broadband noise level in the vicinity of wellheads are expected to be in the order of 113 dB re 1 µPa, attenuating rapidly to ambient conditions with distance, and typically returning to background levels within approximately 200 m of the source.

Based on the measurements presented in McCauley (2002), which include flow noise within pipelines, noise emissions from pipelines are expected to be of similar magnitude to wellheads, with radiated noise attenuating to ambient levels over relatively short distances (in the order or tens to hundreds of metres).

Woodside has also undertaken acoustic measurements of noise generated by choke valves at the Angel facility (JASCO 2015), which are comparable in design to subsea valves at GWA. These measurements indicated that choke valve noise is continuous, with frequency and intensity dependent on production rates. Measured sound levels ranged from approximately 154-155 dB re 1 µPa at lower production rates to 141-144 dB re 1 µPa at higher production rates.

Noise from choke valve operation is broadband in nature, with most energy concentrated at frequencies above 1 kHz. While higher than wellhead and pipeline noise at source, choke valve noise is dominated by higher frequencies, which attenuate relatively rapidly in the water column. In addition, noise from subsea infrastructure is minor compared to that generated by vessel thrusters operating in the area.

Overall, noise emissions from subsea infrastructure (including wellheads, pipelines and valves) are expected to be localised and of limited spatial extent, attenuating to ambient levels over relatively short distances. Accordingly, these sources are not expected to represent a significant contributor to underwater noise levels within the Operational Area and are therefore not considered further in the impact assessment.

Support vessels

The primary source of noise from support vessels (PSVs, subsea support vessels, ASVs and HLVs) is the use of DP thrusters, particularly due to cavitation from propellers. Thruster noise is typically high intensity and broadband in nature.

McCauley (1998) reported sound pressure levels of approximately 137 dB re 1 µPa at 405 m from a typical offshore support vessel holding station in strong currents. McCauley (2005) measured broadband noise levels of up to approximately 182 dB re 1 µPa at 1 m from a support vessel holding station in the Timor Sea. Similar noise levels may be generated by vessels operating dynamic positioning (DP) during the Petroleum Activity.

Thruster noise is typically the dominant noise source for vessels holding station, with other sources (e.g. main engines and auxiliary machinery) contributing relatively less to overall underwater noise levels (McCauley 1998).

Vessel presence associated with the Petroleum Activity reflects the range of support activities described in Section 3.8 and varies depending on operational requirements:

- **platform support vessels (PSVs) and standby vessels:**
  A dedicated standby vessel is present at the GWA platform on a continuous basis typically in two-week periods. A separate PSV is used to transfer materials and equipment to and from the GWA platform and typically visits the platform on a weekly basis with total presence in the Operational Area typically less than 24 hours per visit.
- **subsea support vessels (including USVs):**
  Subsea support vessels are used to undertake IMMR activities as discrete campaigns. These campaigns are typically of short to medium duration (approximately 2 weeks to 1 month per campaign) and occur intermittently throughout the year. Activities may be undertaken anywhere within the Operational Area, including outside the PSZ.
- **accommodation support vessels (ASVs):**
  ASVs may be deployed to support planned maintenance campaigns, shutdown activities or major projects. ASV use is expected to be infrequent, with up to one campaign within the EP period (5 years). Campaigns are typically of short to medium duration (up to approximately 3 months), during which the vessel may operate continuously (24 hours per day) adjacent to the platform within the PSZ.
- **heavy lift vessels (HLVs):**
  HLVs may be used for removal of redundant equipment or to support major projects. HLV use is expected to be infrequent, with up to one campaign within the EP period (5 years), typically of short duration (up to 1 month), and undertaken in proximity to the GWA platform or subsea infrastructure.

Support vessels are therefore expected to represent the dominant and most variable source of underwater noise associated with the Petroleum Activity, with variability driven by the frequency and duration of vessel activities.

Helicopter transfers

Helicopter operations involve take-off and landing on the GWA platform helideck and, where required, on support vessels. Within the Operational Area, helicopter movements are typically associated with crew transfers and urgent freight, occurring at an average frequency of approximately 5–7 transfers per week.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Helicopter noise is primarily airborne, with most sound energy concentrated at frequencies below 500 Hz (Richardson et al. 1995). Sound levels decrease with increasing distance from the source, however, the duration of audibility may increase with altitude as the sound footprint expands.

Due to the strong acoustic impedance contrast between air and water, the sea surface acts as an effective reflector of sound energy. As a result, only a small proportion of airborne noise from helicopter operations is transmitted into the water column, with the majority reflected back into the atmosphere. The angle of incidence also influences transmission, with sound waves approaching the sea surface at angles greater than approximately 13° from vertical being almost entirely reflected (Richardson et al. 1995).

Empirical measurements indicate that while helicopter noise may be audible in air for several minutes prior to overflight, underwater detectability is limited to short durations. Richardson et al. (1995) reported that helicopter noise was detectable underwater for approximately 38 seconds at 3 m depth and 11 seconds at 18 m depth during flyover. Reported peak underwater sound pressure levels include approximately 162 dB re 1 µPa for a Bell 212 helicopter and 108 dB re 1 µPa at 305 m for a Sikorsky S-61 (Simmonds et al. 2004).

Given the limited transmission of sound across the air–water interface, short duration of underwater exposure, and typical operational characteristics (frequency, altitude and transit speed), underwater noise associated with helicopter operations is expected to be highly localised and transient and is not considered a significant contributor to underwater noise levels within the Operational Area. Underwater noise from helicopter operations is therefore not considered further in the impact assessment.

Impulsive sources

Subsea IMMR activities

Subsea IMMR activities may result in localised, temporary increased in underwater noise. Table 6-4 summarises the sources proposed, which have frequency outputs ranging from 2 kHz (SBP CHIRP) to 900 kHz (SSS) and identifies potential overlaps between frequency output and marine fauna hearing ranges.

MBES is a low-energy, high-resolution geophysical survey instrument that may be required for use every 1 to 6 years to identify buckling, movement, scour and seabed features. MBES have operating frequencies ranging from 12 kHz to 700 kHz (Jimenez-Arranz et al. 2017) with peak pressure (PK) source levels between approximately 210 and 245 dB re 1 µPa at 1 m (Jimenez-Arranz et al. 2017; Zykov 2013; MacGillivray et al. 2013). MBES generate micro-pulses of high frequency sound in a highly focused beam directed towards the seabed, which attenuates rapidly underwater compared to lower frequency sound sources. Due to this directionality and short pulse duration, there is relatively low sound energy and very limited horizontal sound propagation. Additionally, sound sources generated closer to the seabed have a lower received noise level in the horizontal direction due to seafloor scattering and absorption.

Sub-bottom profiling may also be undertaken every 1-6 years to identify features under the seabed. Most commercial SBPs are small, low-powered, high-resolution and shallow-penetrating systems, producing electrical pulses across a range of frequencies (Salgado Kent et al. 2016; Jiménez-Arranz et al. 2017). The instruments proposed for the survey produce pulses of sound between approximately 2 kHz and 30 kHz with source levels between approximately 170 and 230 dB re 1 µPa PK at 1 m.

Table 6-4: Frequency ranges of IMMR sources and marine fauna

IMMR source	Frequency range (kHz) (Jimenez-Arranz et al. 2017)	Estimated range of source level (dB re 1 µPa SPL @1 m	Potential disturbance from acoustic source

[1] NMFS 2024

[2]The estimated auditory bandwidth of whale sharks is unknown, a range of 0.02 – 0.8 kHz has been applied which is the known approximate sensitivity of among sharks as outlined in Myrberg 2001. Although there are no known studies on whale shark auditory hearing bandwidths, research suggests the large hearing structures of the whale shark would be most responsive to long-wave length, low-frequency sound (Myrberg 2001).

[3]The estimated auditory bandwidth of turtles is 0.1 – 0.7 kHz as determined by electro-physical studies (McCauley 1994)

[4]Effects of seismic airguns and other sources of pulsed sound on marine fishes (URS 2007).

Positioning equipment

Long baseline (LBL) and/or ultra-short baseline (USBL) acoustic transponders may be used for positioning during IMMR activities. These systems emit pulses of medium-frequency sound, typically within the range of approximately 21-31 kHz. Sound levels are estimated to range from approximately 180-202 dB re 1 µPa SPL at 1 m (Jiménez-Arranz et al. 2017).

Transmissions are not continuous but consist of short pulses ('chirps'), typically ranging from approximately 3-40 milliseconds. Transponders do not emit sound when on standby and, when active for positioning, typically emit a single pulse approximately every five seconds.

Cumulative noise sources

Concurrent activities contributing to cumulative underwater noise from operations may occur where vessel activities overlap within the Operational Area.

A conservative worst-case scenario for cumulative underwater noise considers concurrent operation of:

- the GWA platform and subsea infrastructure
- a platform support vessel operating within or transiting the PSZ
- a subsea support vessel undertaking IMMR activities within the Operational Area
- the potential for a HLV operating within the Operational Area (typically up to 1 month duration)
- the potential for an ASV operating within the PSZ during extended campaigns (typically up to 3 months duration).

Cumulative noise levels are most likely to occur during overlapping vessel campaigns. However, these scenarios are infrequent and of limited duration, reflecting the intermittent nature of IMMR and major project activities.

These concurrent activity scenarios have been used to inform a conservative assessment of cumulative underwater noise, supported by analogue sound propagation modelling representative of the types of activities undertaken during the Petroleum Activity.

Sound transmission loss modelling

Noise modelling was commissioned by Woodside for the Greater Western Flank 4 (GWF4) activities (Warren et al. 2026), which are located within the Operational Area. Scenario 2 in the modelling report considers a combination of vessels operating in close proximity, including a moored MODU, anchor handling tug (AHT) vessel, offshore support vessel (OSV) and subsea construction vessel (SCV).

This scenario represents a conservative analogue for the worst-case concurrent vessel activities described in this EP, noting that it includes multiple high-powered vessels operating simultaneously in close proximity. The GWF4 modelling is also spatially aligned with the GWA Operational Area, allowing direct application of the results without adjustment for environmental parameters such as water depth or sediment type.

To further inform cumulative noise associated with IMMR activities, Woodside commissioned a separate study assessing underwater noise from multiple offshore facilities and support vessels, including a representative IMMR vessel (Fugro *Etive*) (Li et al. 2024). This study provides a conservative estimate of the ensonified area associated with IMMR vessel operations and supports assessment of concurrent vessel activity scenarios.

Impact assessment

Receptors

The Operational Area is located in waters about 74 m to 200 m deep, with depths decreasing around shoal features such as Unnamed Shoal (~40-50 m depth). The fauna associated with these areas is predominantly pelagic species of fish, with migratory species such as turtles, birds, whale sharks and cetaceans potentially present in the area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

seasonally. These fauna species may include those associated with Indigenous peoples' cultural values. Noise interference is a key threat to a number of migratory and threatened cetaceans and marine turtles identified as potentially occurring within the Operational Area (Section 6.10).

A number of EPBC listed marine species with credible impact pathways have BIAs which overlap the Operational Area, including:

- flatback turtle internesting buffer BIA
- whale shark foraging BIA

In addition, habitat critical to the survival of the flatback turtle also overlaps the Operational Area.

Flatback turtles nest in the region between October and March, however, given water depths and distance from shore, the area does not constitute foraging or important internesting habitat. Satellite tracking of flatback turtle nesting populations (Barrow Island and mainland sites) indicates this species travels to the east of Barrow Island between nesting events, within WA mainland coastal waters less than 70 m deep (Chevron Australia Pty Ltd 2015).

Whale sharks will be present between March and November and wedge-tailed shearwaters between August and April. Due to the lack of roosting or nesting habitat for wedge-tailed shearwaters in proximity to the Operational Area, only a low density is expected even during peak nesting periods. Cetaceans, such as blue whales and humpback whales, and other marine turtle species may also be present within the Operational Area seasonally; however, no BIAs or other important areas for these species overlap the Operational Area.

While the Ancient Coastline at 125 m Depth Contour KEF may be associated with outcroppings of hard substrate, no evidence of significant reefs associated with such outcroppings has been found in the Operational Area. Note some demersal fish are likely to be associated with subsea infrastructure such as pipelines (McLean et al. 2017). Rankin Bank hosts marine fauna such as fishes and is located approximately 3.7 km from the Operational Area (at the closest point), and 33 km from the GWA facility. Unnamed Shoal is overlapped by the Operational Area and located 1.9 km from the nearest flowline, whilst Wilcox Shoal is located 2.4 km from the Operational Area. Shoals and banks are typically shallower than surrounding environment and may therefore host fish assemblages.

The Operational Area overlaps the Montebello Marine Park, the values and sensitivities of which include the Ancient Coastline at 125 m Depth Contour KEF and BIAs for flatback turtles, whale sharks and wedge-tailed shearwaters.

The Conservation Management Plan for the Blue Whale (BWCMP) (Commonwealth of Australia 2015a) is a recovery plan established under the EPBC Act. The BWCMP specifically identifies areas crucial for the whales' survival, referencing BIAs, including foraging areas and migration corridors representing two essential aspects of their life cycle. Action Area A.2.3 of the BWCMP states: "Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury and is not displaced from a foraging area". Furthermore, from the Guidance on Key Terms within the Blue Whale Conservation Management Plan (DAWE 2021), underwater noise emissions from the Petroleum Activity must not:

- result in injury[28] (TTS or PTS) to any pygmy blue whale in BIAs; or
- displace a pygmy blue whale from a foraging BIA.

These requirements have been considered throughout the impact assessment with respect to blue whales.

As noted above, the Operational Area does not overlap BIAs or other important areas for blue whales and humpback whales. The Operational Area is approximately 26 km from the blue whale migration BIA and 15 km from the humpback whale migration BIA.

The National Recovery Plan for the Southern Right Whale (DCCEEW 2024a) also identified anthropogenic noise as a threat, however the BIAs and habitat critical to the survival are over 200 km away, well outside the area where behavioural responses are expected to extend from the Operational Area and as such, there is not expected to be any anthropogenic noise from the petroleum activity that could displace or interfere with life cycle activities within, or near, the reproduction or migration BIAs and habitat critical to the survival.

Potential impacts of noise

Elevated underwater noise can affect marine fauna, including cetaceans, fish, turtles, sharks and rays, in three main ways (Richardson et al. 1995; Simmonds et al. 2004):

- by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift (TTS) referred to as auditory fatigue), or permanent threshold shift (PTS) (injury)
- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)

[28] *For the purpose of interpreting and applying Action Area A.2 of the Blue Whale CMP, injury is both permanent and temporary hearing impairment (Permanent Threshold Shift and Temporary Threshold Shift) and any other form of physical harm arising from anthropogenic sources of underwater noise (DAWE, 2021).*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- through disturbance leading to behavioural changes or displacement from important areas (e.g. BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

Increasing the distance from the noise source usually results in the level of noise reducing, due primarily to the spreading of the sound energy with distance. The way that the noise spreads (geometrical divergence) will depend upon several factors such as water column depth, pressure, temperature gradients, and salinity, as well as surface and bottom conditions.

Cetaceans

Species sensitivity and exposure thresholds

Marine mammals and especially cetaceans rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart 2007; Erbe et al. 2015; Erbe et al. 2018). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold (PTS and TTS), physical damage and stress (Erbe 2012; Rolland et al. 2012).

Frequency-specific hearing sensitivity differs among marine mammals, influencing how they are affected by noise exposure. For the purposes of predicting the effects of noise exposure on different groups of cetaceans, blue whales, humpback whales, southern right whales and other large mysticete (baleen) whales are categorised as LF cetaceans, while odontocetes (toothed whales and dolphins) are categorised as HF or VHF cetaceans (Southall et al. 2019).

As discussed within Accomando et al. (2025) and NMFS (2024), intense noise exposures can cause auditory injury (without PTS occurring). Therefore terms 'PTS' and 'auditory injury' are used interchangeably in this impact assessment and the acoustic modelling study. It is acknowledged auditory injury may occur without PTS.

The thresholds that could result in behavioural response, TTS and PTS for cetaceans as a result of continuous and impulsive noise sources are presented in Table 6-5. These thresholds have been adopted by the United States National Oceanic and Atmospheric Administration (NOAA) (National Marine Fisheries Service [NMFS] 2024; Southall et al. 2019; NOAA 2019). The NMFS (2024) thresholds were retained, consistent the recommendations presented by NMFS (2025). While Accomando, et al (2025) subdivided cetaceans into four groups, the thresholds applied remained consistent with the NMFS (2024) values. The behavioural response criterion from the US National Oceanic and Atmospheric Administration (NOAA, 2019) has been applied. The adopted thresholds are based on best data available and published in peer-reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds.

Table 6-5: Thresholds for PTS, TTS and behavioural response onset for LF, HF and VHF cetaceans for continuous and impulsive noise.

Hearing group	Impulsive					Continuous		
	PTS onset		TTS onset		Behavioural response	PTS onset	TTS onset	Behavioural response
	SEL_{24h}	PK	SEL_{24h}	PK	SPL	SEL_{24h}	SEL_{24h}	SPL
LF cetaceans	183	222	168	216	160	197	177	120
HF cetaceans	193	230	178	224		201	181	
VHF cetaceans	159	202	144	196		181	161	

Source: NMFS (2024); Southall (2019); NOAA (2019). SEL24h expressed as dB re 1 µPa².s; Peak pressure (PK) and SPL expressed as dB re 1 µPa.

Predicted underwater noise impacts to cetaceans

The Operational Area does not overlap any BIAs for threatened or migratory marine mammal species.

Concurrent vessel activities

The modelling study (Warren et al. 2026) indicated that, for concurrent vessel activities (Scenario 2), the maximum distances at which PTS and TTS thresholds may be exceeded for low frequency (LF) cetaceans are 680 m and 5.17 km from the source, respectively (Table 6-6). For HF and VHF cetaceans, the maximum distances at which PTS and TTS thresholds may be exceeded is 60 m (Table 6-6).

The PTS and TTS thresholds considered the criteria from NMFS (2024) and are based on a cumulative sounds exposure over a 24 hour period (SEL_{24h}) and assume an animal is consistently exposed to such noise levels at a fixed position. In practice, it is unlikely that individual cetaceans transiting through the Operational Area would remain within

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the predicted exposure zones for sufficient time to experience PTS or TTS. For LF cetaceans, this would require an individual to remain within approximately 680 m of the source for PTS, or within 5.17 km for TTS, for a period of 24 hours. Similarly, it is highly unlikely that HF or VHF cetaceans would experience PTS or TTS as the relevant thresholds are only exceeded within 60 m of the source.

Potential impacts to cetaceans may also include behavioural disturbance from support vessels. The threshold that could result in behavioural response for LF cetaceans if exceeded, is expected to be 120 dB re 1 µPa (SPL) for continuous noise sources such as support vessels. This threshold may be exceeded at a distance of 11.5 km from the source (Table 6-6).

Table 6-6: Modelled horizontal distances (R_{max}) for cetacean impact thresholds for concurrent vessel activities (Warren et al. 2026)

Hearing group	Maximum modelled distance to noise effect criteria (Scenario 2 Rmax)		
	Behavioural response [a] (km)	***PTS/ auditory injury [b] (km)***	***TTS [b] (km)***
LF cetaceans	11.5 (SPL)	0.68 (SEL_{24h})	5.17 (SEL_{24h})
HF cetaceans		0.06 (SEL_{24h})	0.69 (SEL_{24h})
VHF cetaceans		0.06 (SEL_{24h})	1.24 (SEL_{24h})

Noise exposure criteria: a NOAA (2019) and b NMFS (2024)

IMMR Activities

Zykov (2013) conducted acoustic modelling for five low energy survey instruments off the coast of California, including MBES, SSS and sub-bottom profiler. All equipment types were modelled in the sandy bottom environment, similar to that of the Operational Area. Although the bathymetry, salinity, water temperature and sub-seafloor sediment type may differ, given the similarities in equipment type and seafloor habitat, the modelling is considered comparable for the nature and scale of the low energy IMMR survey equipment.

The high operating frequencies of MBES places the majority of sound frequencies above the auditory range of LF cetaceans. Dolphins and other HF cetaceans, which have peak hearing sensitivity up to 110 kHz, with potential for some limited hearing ability up to approximately 160 kHz (NMFS 2018; Southall et al. 2019), may be able to detect a small amount of the sound energy from some instruments in the lower operating frequency ranges available for MBES and SSS (MacGillivray et al. 2013; Zykov 2013). The modelling by Zykov (2013) indicates that the sound emissions from MBES do not exceed PTS and TTS accumulated sound exposure criteria for LF cetaceans at any distance, and do not exceed criteria for HF cetaceans beyond 2 to 3 m horizontal distance from the source, which is not considered to be a credible exposure scenario for mobile marine fauna.

Zykov (2013) also estimated the maximum distance at which the unweighted 160 dB re 1 µPa (SPL) behavioural disturbance threshold for impulsive sound was reached was 290 m for MBES. Again, it is emphasised that many MBES instruments may operate at frequencies outside of the hearing range of cetaceans and so these would not be audible or result in behavioural disturbance. For instruments with frequencies that overlap with the hearing ranges of cetaceans, a significant proportion of the sound energy may still be outside of their hearing ranges; therefore, the perceived sound levels are reduced and the horizontal distances at which behavioural disturbances may occur are less than those inferred by the unweighted 160 dB re 1 µPa (SPL) behavioural disturbance threshold. For example, modelling of weighted SPLs by Zykov (2013) for MBES indicated that the 160 dB re 1 µPa (SPL) behavioural threshold was not exceeded for LF cetaceans at any distance and was limited to approximately 205 m horizontal distance for HF cetaceans.

Acoustic modelling of sub-bottom profilers by Zykov (2013) and McPherson and Wood (2017), indicates limited horizontal sound propagation outside of the main directional field of sound. The modelling studies also indicate that PK and SEL24h thresholds for PTS are not exceeded. The potential for TTS resulting from SEL24h is limited to within a few metres from the moving sound source (Zykov 2013; McPherson and Wood 2017), which is not considered to be a credible exposure for mobile marine fauna. Exceedance of the 160 dB re 1 µPa SPL behavioural response threshold for impulsive sound is limited to within a few metres in most instances, or up to a maximum of 50 m depending upon which SBP instrument is used, water depth and the seabed sediment characteristics (Zykov 2013; McPherson and Wood 2017). Potential impacts to cetaceans from MBES and sub-bottom profiler may, therefore, include behavioural disturbance if in close proximity to the survey instruments, but ranges to disturbance are less than or equivalent to disturbance ranges for the IMMR vessel itself. PTS or TTS are not considered credible, given individuals would need to be directly next to the noise sources for prolonged duration.

Transponders used for positioning during IMMR activities have the potential to cause some temporary behavioural disturbance to cetaceans. The typical frequencies of 21 to 31 kHz produced by the transponders are most audible to HF cetaceans such as toothed whales and dolphins rather than LF cetaceans, and the source levels (180 to 202 dB re 1 µPa at 1 m SPL) rapidly attenuate within a very short distance from the source, such that PTS or TTS are not considered credible. Based on empirical spreading loss estimates measured by Warner and McCrodan (2011),

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

received levels from USBL transponders are expected to exceed the cetacean behavioural response threshold for impulsive sources to a distance of ~42 m.

Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders do not emit sound when on standby. When required for general positioning, they emit one chirp every five seconds (estimated to be required for 4 hrs at a time). When required for precise positioning, they emit one chirp every second (estimated to be required for 2 hrs at a time). Due to the short duration chirps, the temporary and intermittent use and the mid frequencies used by positioning equipment, the acoustic noise from the transponders is unlikely to have a substantive effect on the behavioural patterns of cetaceans. Potential impacts from predicted noise levels from the GWA facility, support vessels, and IMMR activities are not considered to be ecologically significant at a population level.

Impact Assessment – Behavioural

Acoustic modelling indicated that the Rmax from the source to SPL noise effect criteria for all marine mammals was predicted to be 11.5 km from worst-case concurrent vessel activities (Warren et al. 2026). Potential impacts to cetaceans from a single subsea support vessel operating concurrently with other noise sources may include behavioural disturbance from DP. In 2024, JASCO modelled cumulative noise sources including a representative IMMR vessel, Fugro Etive (Li et al. 2024). The distance from the Fugro Etive at which the behavioural impact threshold for cetaceans was no longer exceeded was ~7.5 km. This result was achieved in conjunction with other vessels and facilities in the region and is considered conservative relative to a single vessel planned for IMMR activities.

As identified in Section 4.6.3, several marine mammal species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area. The threatened and/or migratory cetaceans that may be present within the Operational Area are low-frequency (pygmy blue whale, humpback whale, sei whale, Bryde's whale, Omura's whale, fin whale) and high-frequency (dolphins and toothed whale) cetaceans (Section 4.6.3). Of the threatened and/or migratory cetaceans that may be present within the Operational Area, the following is of note:

- the humpback whale migration BIA is located ~15 km from the Operational Area and is not expected to overlap the concurrent vessel activities predicted ensonified area
- the pygmy blue whale migration BIA is located ~26 km from the Operational Area and is not expected to overlap the predicted ensonified area for any combination of concurrent or cumulative activities.

All cetacean species present within the Operational Area may transit through the area; however, no areas of known aggregation within or around the ensonified area have been identified. Migrating pygmy blue whales are likely to occur in the Exmouth to Montebello Islands region from April to July (peak northern migration) and November to December (peak southern migration). Humpback whales are typically present from July to August (peak northern migration) and August to October (peak southern migration) (Section 4.6.5). Opportunistic cetacean sighting data from Woodside's facilities on the NWS indicate that humpback whales are the most commonly observed cetacean species.

Marine mammals are not expected to occur within the Operational Area in significant numbers because no known aggregation areas occur there, and their presence would be seasonal, transitory, and of a short duration. There are no physical constraints (e.g. shallow embayments or shorelines) that prevent marine mammals from moving away from the platform or vessels if disturbed.

Accordingly, behavioural responses are expected to be limited to temporary avoidance or short-term behavioural changes by individual animals in proximity to the activity, with no population-level effects and no significant impact to the ecological function of any BIAs.

Impact assessment – auditory impairment (TTS) or auditory injury (PTS)

LF cetaceans

Acoustic modelling (Warren et al. 2026) indicated that the R_{max} from the source to TTS and PTS SEL_{24h} noise effect criteria during concurrent vessel activities for low-frequency cetaceans was 5.17 km and 680 m, respectively (Table 6-6), whilst Li et al. (2024) predicts the R_{max} from cumulative activities (for LF cetaceans) to be 1.78 km and 100 m respectively. As identified in Section 4.6.3, several marine mammal species listed as either threatened and/or migratory under the EPBC Act have the potential to occur within the Operational Area.

Summary

Exposure of cetaceans, including marine mammal species listed as threatened and/or migratory under the EPBC Act, to sound levels associated with PTS or TTS is expected to be limited to a localised area around vessels during concurrent vessel activities. Given the transient nature of cetacean occurrence within the Operational Area, the absence of overlapping marine mammal BIAs, and the limited spatial extent of the predicted PTS and TTS zones, auditory injury (PTS) and auditory impairment (TTS) are not considered likely, and no lasting effects are expected. Potential impacts are expected to be limited to temporary behavioural responses by individual animals in proximity to vessels with no lasting effects on individuals, populations, or the ecological function of nearly BIAs.

Marine turtles

Species sensitivity and exposure thresholds

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The Recovery Plan for Marine Turtles (Commonwealth of Australia 2017) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100 to 700 Hz (Bartol and Musick 2003).

Acute noise, or temporary exposure to loud noise, may result in the avoidance of important habitats and in some situations physical damage to marine turtles. The thresholds that could result in a behavioural response, TTS and PTS for marine turtles as a result of continuous and impulsive noise sources are presented in Table 6-7. These thresholds are based on best data available and published in peer-reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds. Accomando et al (2025) presented thresholds for auditory impairment (TTS) and auditory injury/PTS and are shown in Table 6-7. No numerical thresholds have been developed for behavioural impacts of continuous sources (e.g. vessel noise) on marine turtles. A Popper et al. (2014) review assessed thresholds for marine turtles and found qualitative results that the risk of behavioural disturbance was high for near field exposure, moderate for intermediate exposure and low for far field exposure and is presented in Table 6-7. The Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017) acknowledges the 166 dB re 1 µPa SPL reported McCauley et al. (2000) as the level that may result in a behavioural response to marine turtles. The 175 dB re 1 µPa level from McCauley et al. (2000) is recommended as a criterion for behavioural disturbance; these thresholds are shown in Table 6-7.

Table 6-7: Thresholds for PTS, TTS and behavioural response onset in marine turtles for continuous and impulsive noise

Hearing group	Impulsive			Continuous		
	PTS/ auditory injury onset thresholds: SEL_{24h} (dB re 1 µPa².s)	TTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)	Behavioural response: SPL (dB re 1 µPa)	PTS/ auditory injury onset thresholds: SEL_{24h} (dB re 1 µPa².s)	TTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)	Behavioural response (dB re 1 µPa)
Marine turtles	184[4]	169[4]	166[1] 175[2]	198[4]	178[4]	(N) High (I) Moderate (F) Low[3]

1. *Behavioural response threshold (impulsive) (McCauley et al. 2000).*
2. *Behavioural disturbance threshold (impulsive) (McCauley et al. 2000).*
3. *Behavioural disturbance threshold (continuous) (Popper et al. 2014)*
4. *Revised thresholds (Accomando et al. 2025)*

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al. 2014).

Predicted underwater noise impacts to turtles

The Operational Area overlaps an internesting BIA and internesting habitat critical to the survival of flatback turtle (Section 4.6.2). Habitat suitability modelling for internesting flatback turtles in the NWS region of WA (Whittock, Pendoley and Hamann 2016) concluded that unsuitable flatback turtle internesting habitat was defined as waters >25 m deep and >27 km from the coast (Whittock, Pendoley and Hamann 2016), and therefore the Operational Area is classified as unsuitable for internesting flatback turtles.

Concurrent vessel activities

Modelling (Warren et al. 2026) indicated that PTS and TTS thresholds for turtles may be exceeded at a maximum distance of 160 m and 2.91 km, respectively (Table 6-8). Prolonged exposure (≥ 24 hours) of marine turtles at close range is not considered credible.

Table 6-8: Modelled horizontal distances (Rmax) for marine turtle impact thresholds for concurrent vessel activities (Warren et al. 2026)

Hearing group	Maximum modelled distance to noise effect criteria (Scenario 2 R_{max})	
	PTS/ auditory injury [a] (km)	TTS [a] (km)
Marine turtles	0.16	2.91

Noise exposure criteria: a Accomando at al. (2025)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Routine vessel activities are mostly concentrated within the PSZ within the Operational Area, with the nearest nesting beaches over 35 km away (Section 4.6.2). Therefore, no lasting effect from behavioural response impacts are expected and limited to transient individuals passing through the area, with no population-level effects anticipated.

Marine turtles are not expected to occur in high densities in the Operational Area, even during internesting periods. Turtles are also capable of avoiding noise sources, and there are no barriers to movement within the Operational Area. Based on the limited spatial and temporal overlap and the low likelihood of sustained exposure, the potential behavioural response impacts on turtles from the Petroleum Activity are assessed to be of no lasting effect and with no measurable effect on population viability.

IMMR activities

As outlined above for cetaceans, Zykov (2013) conducted noise modelling for low energy survey instruments, with the modelling for MBES and sub-bottom profiler considered comparable for the nature and scale of the low energy IMMR survey equipment. The operating frequencies of MBES (12 to 700 kHz) are well above the hearing range of turtles (0.1 to 0.7 kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2 to 30 kHz) may be audible to turtles, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Modelling of impulsive sub-bottom profiler sound emissions by Zykov (2013) and McPherson and Wood (2017) indicates that the 166 dB re 1 µPa (SPL) behavioural response threshold for turtles may only be exceeded within metres or tens of metres of the survey instruments. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of turtles.

Transponders used for positioning during IMMR activities typical operate at frequencies of 21 to 31 kHz which is well outside the peak hearing frequency range of turtles (0.1 to 0.7 kHz). Therefore, no impacts are considered credible.

Summary

Potential impacts from predicted noise levels from the facility, support vessels, and IMMR activities are not considered to be ecologically significant at a population level, with no lasting impacts to marine turtles.

Fish, sharks and rays

Species sensitivity and exposure thresholds

Fishes are primarily sensitive to the particle motion component of sound at close range to a sound source, while the presence of the swim bladder results in a varying degree of sensitivity of some fishes to sound pressure (Popper and Hawkins 2018; Popper et al. 2019). Consequently, fishes are broadly categorised into three groups with respect to their hearing capabilities that are relevant to the types of fishes and sharks that may be present in the Operational Area (Popper et al. 2014):

- fishes with no swim bladder or other gas chamber (e.g. sharks, mackerels) – Sensitive only to particle motion, not sound pressure changes.
- fishes with swim bladders, but without a direct connection between the swim bladder and the inner ear (e.g. demersal snappers and emperors) – Hearing primarily involves particle motion with some limited ability to indirectly detect changes in sound pressure.
- fishes with a swim bladder or other gas volume connected directly to the inner ear (e.g. herrings, sardines, pilchards, shads) – These fishes are able to detect both sound pressure as well as particle motion.

Sound exposure criteria applicable to continuous sound sources are presented in Table 6-9. Popper et al. (2014) propose relative risk criteria (high, moderate, low) for injury, impairment and behavioural effects to fishes at three distance categories, near (N) (tens of metres from the source), intermediate (I) (hundreds of metres from the source), and far (F) (kilometres from the source).

Table 6-9: Thresholds for PTS, TTS and behavioural response onset in fishes for continuous and impulsive noise

Receptor	Mortality and potential mortal injury	Impairment			Behaviour
		Recoverable injury	TTS	Masking	
Fish: no swim bladder	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) High (I) High (F) Moderate	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not involved in hearing	(N) Low (I) Low	(N) Low (I) Low	(N) Moderate (I) Low	(N) High (I) High	(N) Moderate (I) Moderate

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	(F) Low	(F) Low	(F) Low	(F) Moderate	(F) Low
Fish: swim bladder involving hearing	(N) Low (I) Low (F) Low	170 dB SPL for 48-hours	158 dB SPL for 12-hours	(N) High (I) High (F) High	(N) High (I) Moderate (F) Low
Fish eggs and fish larvae	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) Low (I) Low (F) Low	(N) High (I) Moderate (F) Low	(N) Moderate (I) Moderate (F) Low

Note: The sound units provided in the table above include relative risk (high, medium and low) is given for fish (all types) at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al. 2014).

Predicted Underwater Noise Impacts to Fish

The whale shark foraging BIA overlaps the Operational Area, and the species may be seasonally present (particularly between March and July) during their annual migration to and from the aggregation area off Ningaloo Reef. The only quantitative sound exposure thresholds for fish are for those species where the swim bladder is involved in hearing. All threatened and migratory fish species occurring within the Operational Area (Section 4.6.1), including whale shark, are Chondrichthyes (sharks and rays) which do not have a swim bladder. Therefore, there are currently no quantitative sound exposure thresholds relevant to listed threatened and migratory species in the Operational Area.

Concurrent vessel activities

Modelling (Warren et al. 2026) indicated that TTS thresholds for fish (swim bladder involved in hearing) may be exceeded at a maximum distance of 80 m, however recoverable injury thresholds are not reached (Table 6-10). Li et al. (2024) predicts the R_{max} from cumulative activities to be 20 m for recoverable injury and 5 m for TTS.

Table 6-10: Modelled horizontal distances (Rmax) for fish impact thresholds for concurrent vessel activities (Warren et al. 2026)

Hearing group	Maximum modelled distance to noise effect criteria (Scenario 2 R_{max})	
	Recoverable injury[a] (km)	TTS[a] (km)
Fish (swim bladder involved in hearing)	-	0.08

Noise exposure criteria: a Popper et al. (2014)

A dash (–) indicates the acoustic threshold was not reached within the 20 m modelling resolution.

Vessels holding station using DP are expected to produce sound equivalent to about 182 dB re 1 µPa SPL at 1 m. Modelling undertaken by McPherson et al. (2019) of sound produced by facility and vessel operations found that recoverable injury to some types of fish would only be possible if they remained within a distance of less than 10 m for 48 hours, and TTS if fishes remained within 10 m for at least 12 hours. Pelagic fish are highly mobile and the types of demersal fishes known to occur in the vicinity of the GWA facility (e.g. snappers, emperors, cods and groupers) will exhibit some fidelity to the area but are still relatively free-swimming and are not constrained to such close ranges (i.e. 10 m). Therefore, free-swimming fish remaining in close range to sound sources for periods that subject themselves to TTS and injury is not considered to be a credible scenario.

There are no quantitative sound exposure thresholds for impacts on sharks and rays (as found in the Operational Area) resulting from continuous noise sources. The relative risk of behavioural response is expected to be high within tens of metres of the source, medium within hundreds of metres and low within kilometres from the source (refer Table 6-9). In the context of the GWA facility, the largest contribution to operational noise is from the topside and near the surface, with lower sound levels produced from subsea infrastructure such as choke valves. Similarly, sound from support vessels would be at the surface. While some localised behavioural avoidance and masking in the vicinity of the loudest sound sources from the facility, choke valves and support vessels may occur in some fishes, no lasting effect is anticipated. Fish are also known to habituate to continuous noise sources, which is consistent with fish congregating around operating offshore oil and gas structures.

The foraging BIA for whale shark overlaps the Operational Area. It is expected that the potential effects of noise on whale sharks are the same as for other fish species, resulting in minor, localised and temporary behavioural change such as avoidance. Therefore, impacts to whale sharks from support vessels or the platform are expected to have no lasting effect.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Other fauna associated with the Operational Area includes predominantly pelagic species of fish, with migratory species such as rays transiting through the Operational Area; these species may be similarly affected by noise from the Petroleum Activity. Potential impacts from predicted noise levels from the operating facility, support vessels and concurrent vessel activities are not considered to be ecologically significant at a population level for fish, sharks and rays.

Rankin Bank and Wilcox shoal are known to support diverse fish assemblages (Section 4.5). Unnamed Shoal is located within the Operational Area, and its bathymetry and known benthic communities indicate it is also likely to support site attached fish communities (Section 4.5). However, subsea infrastructure is located away from these shoal features, and behavioural response distances for fish are predicted to occur over hundreds rather than thousands of metres. Accordingly, fish assemblages associated with Rankin Bank, Wilcox Shoal and Unnamed Shoal are not expected to be exposed to noise levels that would result in behavioural disturbance.

IMMR Activities

As outlined above, Zykov (2013) conducted noise modelling for low energy survey instruments, with the modelling for MBES and sub-bottom profiler considered comparable for the nature and scale of the low energy IMMR survey equipment. The operating frequencies of MBES (12 to 700 kHz) are well above the peak hearing ranges of fish (100 Hz to several kHz) and so no disturbance is expected. It is possible that some of the lower frequency sound emitted by sub-bottom profilers (2 to 30 kHz) will be audible to fish, but again, a large proportion of the sound energy may be at frequencies that are outside of their normal auditory range. Therefore, behavioural impacts would be highly localised. PTS or TTS is not considered to be credible given the rapid attenuation of sound close to the source and a large proportion of the sound energy is produced at frequencies outside the peak hearing frequency range of fish.

Transponders used for positioning during IMMR activities typical operate at frequencies of 21 to 31 kHz which is well outside the hearing frequency range of fish. Therefore, no impacts are considered credible.

Summary

Potential impacts from predicted noise levels from the facility, support vessels and IMMR activities are not considered to be ecologically significant at a population level, with no lasting effect to fish, sharks or rays.

Values and Sensitivities

Ancient Coastline at 125 m Depth Contour

The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF. No significant escarpments, species of conservation significance, emergent features or areas of high biological productivity characteristically associated with this KEF have been observed in the Operational Area (Section 4.7). As evaluated above, impacts to marine fauna from acoustic emissions are localised, with no population level impacts expected. Therefore, potential impacts to this regional-scale KEF will be localised with no lasting effect.

Montebello Marine Park

While the Operational Area overlaps the Montebello Marine Park, GWA subsea infrastructure does not. As evaluated above, impacts to marine fauna from acoustic emissions are localised, with no population level impacts expected. Therefore, potential impacts to marine park values will be localised with no lasting effect.

from the caution zone at a constant speed of less than 6 knots.		potential for exposure to sound levels in direct proximity to vessels.		
Implementing a shutdown zone around MBES for the following fauna: • whales • marine turtles • whale sharks.	F: Yes. However, as equipment is underwater, effective implementation of zones is challenging from topside observation. CS: Moderate. Requires the provision of a dedicated and suitably trained crew member to undertake Marine Fauna Observations.	Limited. The areas of disturbance for these devices are limited, and injury/PTS/TTS is not expected to occur. In addition, it is noted that for MBES, the frequency range of these devices are outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks).	Acoustic MBES and sub-bottom profiler surveys are infrequently conducted (every 1 to 6 years) as part of the Petroleum Activity. The source levels and frequency range of these devices are mostly outside the estimated frequency hearing range of identified protected species (whales, turtles and whale sharks), so costs are considered disproportionate to benefits.	No
Have a dedicated experienced and trained Marine Fauna Observer (MFO) onboard vessels to undertake marine fauna observations.	F: Yes, however additional cost for dedicated and experienced MFO to be present during IMMR CS: Moderate, requires the provision of a dedicated experienced MFO to undertake Marine Fauna Observations.	Use of an MFO may detect fauna in the area, however control provides limited benefit when managing impacts associated with vessel noise alone.	Given limited benefit associated with the management of vessel noise impacts and costs associated with control implementation an experienced MFO is not considered necessary.	No
Professional judgement – Eliminate				
Eliminate the use of DP on vessels during the Petroleum Activity.	F: No. Both PSVs and subsea support vessels are required to reliably hold station during the Petroleum Activity. Failure to do so may lead to loss of separation between vessels and infrastructure. This would result in unacceptable safety and environmental risk (loss of vessel separation has been identified as a MEE-05 – Section 6.8.7). CS: Not assessed, control not feasible.	Not assessed, control not feasible.	Not assessed, control not feasible.	No

Application of bubble curtains to reduce noise propagation.	F: No, Bubble curtain installation and operation in offshore open water not feasible due to technical operation constraints i.e. water depth/current.	Not considered, control not feasible.	Not considered, control not feasible.	No
ALARP statement: On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage potential impacts from routine acoustic emissions generated by the Petroleum Activity. As no reasonably practicable additional or alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of Acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine acoustic emissions from the Petroleum Activity are limited and do not affect population-level processes or ecosystem function. Any impacts are predicted to have no lasting effect. On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), the adopted controls are considered appropriate to manage the impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPOs are met.

Description of source of impact

Hydrocarbons and chemicals may be discharged during routine and non-routine operations and activities. Discharges associated with subsea operations may include:

- subsea control fluids used to remotely operate valves. The system is open-loop and designed to discharge small volumes of fluids during valve actuation
- non-routine hydraulic fluid discharge associated with subsea equipment losses (e.g. weeps) minor hydrocarbon discharges associated with subsea equipment (e.g. gas bubbles)
- chemicals introduced into subsea infrastructure and the production stream (e.g. corrosion inhibitors, biocides, scale inhibitors), with residual chemicals discharged as a component of the PW (assessed in Section 6.7.5).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Discharges associated with IMMR and platform well management and maintenance activities (described in Section 3.7.5.1 and Section 3.9) may include:

- residual hydrocarbons in subsea lines and equipment, and small gas discharges associated with barrier testing and breaking containment
- residual chemicals in subsea lines and equipment, and intermittent use of chemicals during activities such as Component replacement, SCMs, HFLs, etc, flushing and pigging and platform well management and maintenance
- excess cement slurry from platform well management and maintenances.

Subsea control fluids

Subsea control fluid is used to operate wellhead valves remotely from the GWA platform (Section 3.6.10). Control fluid is supplied via an open-loop system, which discharges small volumes during operation (e.g. valve actuation), typically up to approximately 2 m^3/day across the subsea system.

Additional discharges may occur during IMMR activities (e.g. leak detection or subsea control module change-out) (refer to Section 3.7.5.1).

Hydrocarbons

Hydrocarbon discharges associated with IMMR activities are described in Section 3.7.5.1 and may include small gas and condensate discharges during barrier testing or when breaking containment.

Hydrocarbon discharged from subsea infrastructure are typically buoyant, however, given the water depth, pressure, and small volumes discharged, they are unlikely to reach the sea surface and are expected to disperse and dissolve within the water column.

Chemicals

Chemicals may be introduced into subsea infrastructure and the production stream as process or non-process chemicals (e.g. corrosion inhibitors, biocides, scale inhibitors). Residual chemicals flow through the production process and are discharged as a component of the PW discharged overboard (refer to Section 6.7.5).

Chemicals may also be used intermittently during IMMR or well management and maintenance activities, with small volumes discharged following flushing and disconnection (Section 3.7.5.1 and Section 3.9). Cement may be required to install through tubing cement plugs on redundant dry tree platform wells. Any leftover cement slurry in the cement pump unit and the surface lines is flushed and discharged to the sea to prevent clogging of the lines and equipment. This activity may result in non-routine discharge of a small volume of excess cement slurry (~ 5 m^3 per plug).

The use of operational chemicals is limited to that required to complete the activity, and all chemicals are selected in accordance with the chemical selection process described in Section 7.2.3 (refer also **C 5.1**).

Impact assessment

Environmental value(s) potentially impacted

There is potential for localised water column contamination and associated effects on marine biota as a result of planned routine and non-routine hydrocarbon and chemical discharges. However, these discharges are minor and are minimised as far as practicable (e.g. though flushing of lines back to the platform where feasible). Discharge locations are subsea valves (subsea control fluids), disconnection points in subsea infrastructure, surface discharge of well maintenance fluids such as excess cement slurry and the PW stream.

Water quality

Subsea control fluids are discharged at relatively small volumes during valve actuations and IMMR activities at or near the seabed. Once discharged, control fluids are expected to disperse and dilute within the water column.

Small quantities of hydrocarbons (liquid and gas) may be discharged during operational and IMMR activities (including pigging) that involve barrier testing and breaking containment of isolated subsea infrastructure. These discharges are typically buoyant and will rise within the water column, however, given the water depth, pressure, and small volumes involved, they are not expected to reach the sea surface and are expected to disperse and dissolve within the water column. Chemicals may be discharged intermittently and in small volumes. Cement discharge may result in localised turbidity in the water column, however any reduction in water quality will be temporary and subject to rapid dispersion and dilution by prevailing currents.

Accordingly, there is potential for short-term, localised decrease in water quality at planned discharge locations. Impacts to pelagic species including planktonic organisms are expected to be limited to localised and short-term avoidance or decline in the immediate vicinity of the discharge location with no lasting effect.

Sediment quality

Accumulation of contaminants in sediments is influenced by discharge volume and concentration, the potential for adsorption to particulates, the area over which particulates may settle (influenced by current and water depth), and subsequent resuspension, bioturbation and microbial degradation.

Valve actuation discharges are frequent but very low in volume (approximately 2 m^3/day across the subsea system). The subsea control fluid used in the open loop system (HW443) is water-based and has an OCNS rating of D with a

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

substitution warning associated with fluorescein dye (~150 ppm) due to its low biodegradability. However, the product is considered non-toxic and is not expected to bioaccumulate.

Once discharged, control fluids are expected to disperse and dilute rapidly within the water column, and accumulation in sediments is not considered likely.

Given the small volumes and buoyant nature of hydrocarbon discharges, impacts to sediment quality are not expected.

Impacts of cement on the marine environment are associated mainly with smothering of surrounding benthic and/or infauna communities. Cement is the most common material currently used in artificial reefs around the world (Carral et al., 2020) and is not expected to pose any toxicological impacts to receptors from leaching or direct contact. The potential impacts to sediment and benthic communities caused by smothering from a surface release of cement are expected to be minimal due to the high dispersal by ocean currents and short-term duration of these discharges.

Benthic habitats

Benthic habitats within the Operational Area are expected to be broadly consistent with the NWS Province, comprising sparsely populated silty and sandy sediment (Section 1.1). Filter feeders (e.g. sponges, ascidians, soft corals and gorgonians) are typically associated with hard substrates, which in the Operational Area are limited to artificial habitat structures associated with subsea infrastructure.

Three shoals occur within or near the Operational Area:

- Unnamed Shoal – water depths of 40-50 m, located within the Operational Area and 1.9 km from the nearest flowline
- Wilcox Shoal – water depths of 25-80 m, located 2.4 km from the Operational Area.
- Rankin Bank – water depths of ~18-30.5 m, located 3.7 km from the Operational Area

Shoals are typically characterised by shallower water and hard substrates that may support more diverse benthic assemblages. However, given the distance of these features from discharge locations, no lasting effects to the values and sensitivities of shoals are expected.

Impacts to benthic habitats, including shoals, are expected to be localised with no lasting effects.

Values and sensitivities

Ancient Coastline at 125 m Depth Contour (KEF)

The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF, however, no significant escarpments, emergent features, areas of high productivity or species of conservation significance have been identified within the Operational Area (Section 4.7).

Given the limited spatial extent of a changes in water or sediment quality from subsea discharges (typically within tens of metres), potential impacts to this regional-scale KEF are expected to be localised with no lasting effects.

Montebello Marine Park

While the Operational Area overlaps the Montebello Marine Park, subsea infrastructure does not.

Given the limited spatial extent of a changes in water or sediment quality from subsea discharges (typically within tens of metres), potential impacts to the marine park are expected to be localised with no lasting effects.

None identified				
Good practice				
Chemical Selection and Assessment Environment Guideline: • where Gold/Silver/E/D OCNS rating (and no OCNS substitution or product warning), chemicals are selected, no further control required. • if chemicals with a different OCNS rating, substitution warning, product warning or non-OCNS rated chemicals are required, chemicals will be assessed in accordance with the procedure prior to use.	F: Yes. Woodside routinely implements a chemical selection process based on OCNS at GWA. CS: Minimal. The OCNS is widely used throughout the industry, and chemical suppliers are aware of the requirements of the scheme.	Selection and assessment of chemicals in accordance with the Woodside process, reduces environmental impacts associated with planned chemical discharge.	Woodside's chemical selection process is used to ensure fluids discharged meet Woodside's chemical environmental risk assessment standards while still providing the required technical capability.	Yes **C 5.1**
Subsea infrastructure is flushed, where practicable, during IMMR disconnection activities to reduce the volume and concentration of hydrocarbons discharged to the environment.	F: Yes. Subsea infrastructure has been designed such that much of the hydrocarbon-containing fluids can be flushed back to the GWA platform. CS: Minor. Flushing may prolong the cessation of production required for subsea IMMR activities, leading to reduced production.	Flushing reduces the volumes and concentration of hydrocarbons discharged to the environment.	Benefit outweighs cost/sacrifice.	Yes **C 5.2**
Monitoring subsea control fluid use, investigate material discrepancies, and using control fluid with dye marker, to support identification of potential integrity failures.	F: Yes. The use of control fluid is monitored to maintain adequate fluid in the system. CS: Minimal cost.	Limits the volumes of subsea control fluid discharged to the marine environment.	Benefit outweighs cost/sacrifice.	Yes **C 5.3**
Implement Woodside Engineering Operating Standard – Subsea Isolation. Proven isolation in place for relevant IMMR activities.	F: Yes CS: Minimal cost. Standard practice.	Maintaining and testing the ability to isolate wells and pipelines will ensure barriers are in place and verified, thereby limiting the volume of hydrocarbon discharged.	Control is a WMS requirement – must be adopted.	Yes **C 5.4**

[32] *Qualitative measure*

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[32]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
Professional judgement – substitute				
Installing closed-loop subsea valve control system.	F: Yes. Closed-loop subsea valve control systems can be installed; however, they may not perform as reliably as open-loop systems. CS: Significant. The design, procurement and retrofitting of a closed-loop valve control system would result in considerable offshore logistics, exposure to safety hazards during installation, and significant financial burden through direct costs and lost production.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location, and types of fluid discharged in an open-ocean environment, and avoiding the discharges would provide little or no environmental benefit.	When considering the very low environmental impact associated with control fluid discharges, the risk and costs of retrofitting a closed-loop subsea valve control system is considered to be grossly disproportionate to the environmental benefit.	No
Professional judgement – engineered solution				
Routing hydrocarbons to vessel during disconnection of subsea infrastructure.	F: Not reasonably practicable. While technically possible in some circumstances, routing or recovery of hydrocarbons to support vessels would introduce significant additional safety risks to vessel crew including fire, explosion and asphyxiation hazards. In addition, the safety cases of some IMMR vessels (e.g. Fugro Etive) do not permit routing or recovery off hydrocarbons to the vessel. CS: Significant. Modification to vessel systems, additional equipment, specialist operating procedures and training would be required, in addition to management of increased safety risk.	Limited additional environmental benefit due to the low volume and low concentration nature of hydrocarbon discharges associated with subsea IMMR activities.	Given the increased safety risks, vessel limitations and the limited additional environmental benefit, the cost and risk associated with routing hydrocarbons to the vessel are grossly disproportionate to the potential environmental benefit.	No
Decreasing the frequency of valve actuation.	F: Yes. However, decreasing the frequency of valve actuation may adversely impact the safe functionality and reliability of valves. Reducing the performance of subsea valves may introduce operability impacts, and increased safety and environmental risk associated with loss of containment events. CS: Minimal cost.	The potential consequence of the discharges is ranked as incidental, based on the volume, frequency, location and types of fluid discharged in an open-ocean environment, and reducing the number of discharges would provide little or no environmental benefit.	Decreasing the frequency of valve actuations would lead to a potential decrease in safe functionality and reliability of valves. When considering the potential safety and environmental risks from such a performance degradation,	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[32]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
			along with the minor impact from discharge of control fluids, the cost of decreasing the frequency of valve actuations is considered to be grossly disproportionate to the environmental benefit.	
Substitute subsea control fluid HW443 with less hazardous alternative	F: No, chemical substitution assessment of three alternative subsea control fluids concluded that change is not feasible. CS: Not assessed, as not feasible.	Not assessed, as deemed not feasible. Even if an alternative were feasible, there would be little reduction in impact given the already low toxicity of the product. Fluorescein dye drives the OCNS substitution warning and is required to support leak detection and IMMR troubleshooting.	Not assessed, as deemed not feasible. Even if it was feasible, a substitution would be of little benefit.	No
ALARP statement: On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type, (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage the impacts of planned routine and non-routine discharges during subsea operations and IMMR activities. As no reasonable additional or alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of Acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine and non-routine discharges during subsea operations and IMMR activities are expected to result in localised and short-term impacts to water quality, sediments and benthic habitats, with no lasting effect on ecosystem function. On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), the adopted controls are considered appropriate to manage the impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPOs are met.

Description of source of impact

Produced water (PW) is formation water (water reservoir below the hydrocarbon) or condensed water (vapour within gas/condensate that condenses), or a combination of both. Separation of formation water from reservoir fluids is not 100% effective and separated formation water often contains small amounts of naturally occurring contaminants including:

- organic compounds: dispersed oil, dissolved aliphatic and aromatic hydrocarbons, organic acids and phenols
- inorganic compounds: soluble salts and metals
- residual process chemicals.

These contaminants vary depending on reservoir characteristics, production history, and operational processes, as shown in Table 6-11.

Table 6-11: Contaminant characterisation and variability

Contaminant	Typical range	Monitoring method
OIW	<30 mg/L under normal operations	Online analyser/manual sampling
Hydrocarbons (BTEX, polycyclic aromatic hydrocarbons (PAHs), total petroleum hydrocarbons (TPH), total recoverable hydrocarbons (TRH))	Low ppm concentrations, varies with reservoir and process	End-of-pipe chemical and ecotoxicity analysis
Metals	Detectable at low concentrations (near limits of laboratory reporting or guideline values). Low risk	End-of-pipe chemical and ecotoxicity analysis

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	non conservative tracers (e.g. barium, iron) at higher concentrations and able to be traced after dilution. Vary with reservoir	
Organic acids, phenols	Low concentrations, present in formation water	End-of-pipe chemical and ecotoxicity analysis
Process chemicals	Minor, dependent on operational use	Individual chemical assessments End-of-pipe chemical and ecotoxicity analysis

A description of the PW system has been provided in Section 3.6.3.

Discharge volumes

PW discharge is expected to continue for the duration of this EP with PW discharge averaging 341 m^3 per day over 2025. Historically, daily PW discharge volumes have ranged from a high of ~4,500 m^3/day (common before 2014) to much lower volumes (<1,000 m^3/day) since 2022 (Figure 6-1).

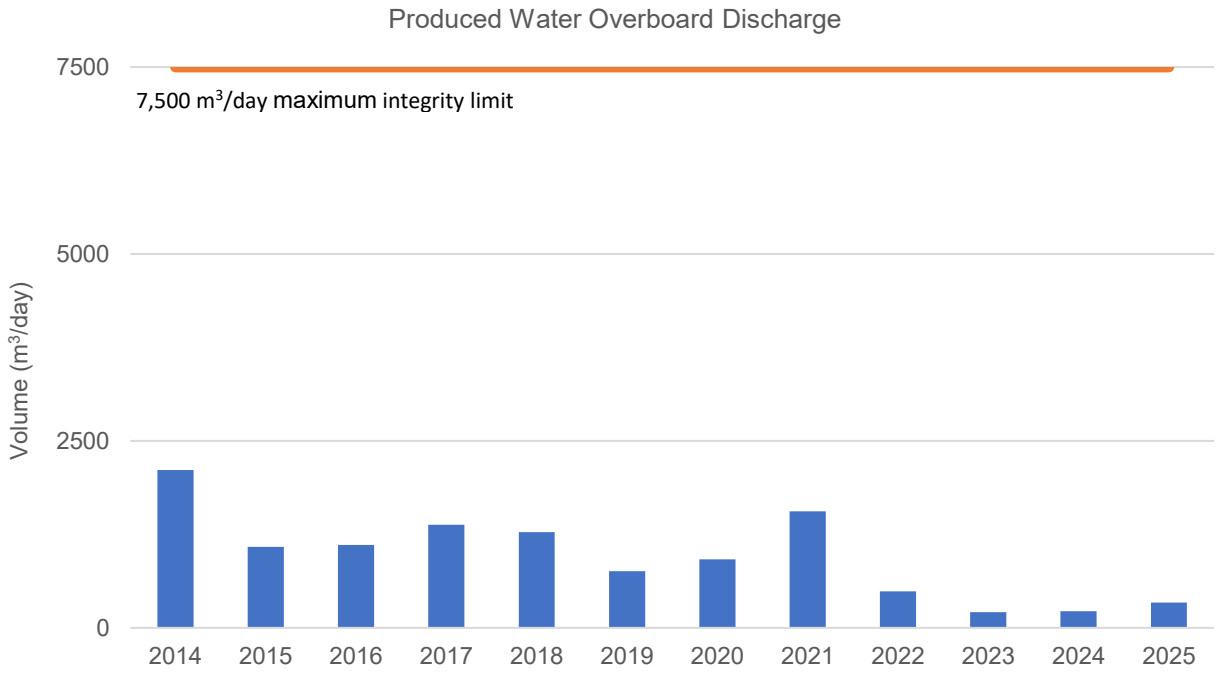

Figure 6-1: Historical average daily PW discharge volumes

PW rates are expected to increase as the fields mature, new fields are tied-in and production from high water cut wells is managed. The PW system has a maximum design capacity of 7,500 m^3/day although average daily discharge rates are expected to remain well below this value over the near term. The environmental assessment adopts the maximum design discharge rate as a conservative upper operating case to demonstrate that environmental impacts remain acceptable across the full operating envelope of the PW system over the life of the EP.

Monitoring and management framework

Overview

This section describes the monitoring and management framework that Woodside has developed to support the monitoring of PW discharges from offshore assets, including verification that discharge quality and volumes remain within the bounds assessed in the environmental impact assessment. The monitoring and management framework comprises of:

- operational monitoring of OIW
- produced water routine monitoring.

Further details are provided in Section 7.2.6 which describes Woodside's Offshore Marine Discharge Adaptive Management Plan (OMDAMP). The monitoring and management of PW will be implemented in accordance with the OMDAMP which details guidelines (ANZG 2018) for water and sediment quality monitoring including chemical assessments (metals, BTEX, PAH, phenols, organic acids, TPH and TRH), and ecotoxicity testing.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Oil-In-Water - operational monitoring

OIW monitoring is undertaken via an online analyser to support management of the PW discharges within the environmental envelope. Online analyser information is transmitted to the distributed control system (DCS) and captured within the process historian database (PHD). The DCS provides visibility in the control room to support manual or automated process control actions, operational oversight and alarm management (e.g. high OIW alarms). PHD information is also available onshore for analysis and trending.

Manual sampling occurs if the online analyser is unavailable or there is a lack of confidence in the data. Manual sampling is undertaken during regular intervals when online analysers are unavailable, if safe and practicable. Manual sampling results are recorded and managed through an Operator Proactive Monitoring (OPAM) process and uploaded to the production allocation system, to support production and environmental reporting.

Historical operational data from GWA facility demonstrates that, during routine production, OIW concentrations are typically maintained below the 30 mg/L rolling 24-hour limit. This provides confidence that the PW treatment system has demonstrated effective performance within the assessed environmental envelope.

Short-term elevation in OIW concentrations may occur due to natural variability in PW characteristics, process restarts (including planned well unloading and well cycling activities), changing well contributions or operational adjustments. These events can occur over short timescales, and the available response window for process adjustments may be limited. The 30 mg/L rolling 24-hour limit, together with the defined operating envelope for planned well unloading and well cycling activities, supported by online monitoring, secondary analyser monitoring, and DCS control, provides an effective and practicable control framework for managing this operational variability.

Routine monitoring

The monitoring and management framework is implemented in accordance with the OMDAMP provided in Section 7.2.6), which details routine monitoring assessment against guideline values (ANZG 2018), analytical methods, and actions when a trigger value is exceeded which effectively reduce impacts to ALARP and acceptable levels.

Monitoring of produced water based on the OMDAMP consists of end of pipe samples for annual chemical characterisation, WET testing to assess toxicity every three years, and monitoring of overboard discharge volumes to ensure PW characteristics are within the modelled parameters and impact assessment. PW samples should represent normal operations and be undertaken during periods of normal routine production at the facility. Where practicable, samples are taken at a time when all (or as many as reasonably possible) PW-producing wells are online.

The guideline values are applied through a risk-based approach that is intended to capture uncertainty around the level of impact by staging monitoring and management responses according to the degree of risk based on multiple lines of evidence. Routine monitoring applicable to the facility, is undertaken to compare against trigger values (described in Table 6-12). Changes in water quality can be detected early and can indicate the potential for an impact to biota and sediment prior to it occurring. Single species toxicity and Whole Effluent Testing (WET) provide additional lines of evidence if to test if there is a potential for impacts to biota.

Results of chemical characterisation and WET testing are compared against OMDAMP trigger values, and any exceedances of trigger values are investigated as part of a multiple lines of evidence approach to determine the potential for an impact. If the trigger value has been exceeded, a review of single species toxicity testing is immediately conducted, operational management actions will be implemented as appropriate to reduce risk and additional WET testing may be completed as required. If risks of impact to the environment outside of the mixing zone are possible in situ field sampling may be initiated as per of the OMDAMP response actions. Monitoring will be conducted in accordance with the OMDAMP where rigorous monitoring triggers, methods and appropriate scientific standards are applied to ensure consistency and comparability of data.

Ecological protection level and trigger values

The guidelines for 99% species protection have been adopted for the approved mixing zone boundary and relevant trigger values are presented in Table 6-12 and the OMDAMP. An approved mixing zone of 1200 m has been determined (described further below) based on produced water dispersion modelling and toxicity testing which predicts the protection of 99% of species, as calculated using the ANZG (2018) statistical distribution methodology on the results of direct toxicity assessment. The protection of 99% of species maintains a high level of ecological protection at the boundary of the approved mixing zone.

Table 6-12: Trigger values and frequency of routine monitoring

Parameter	Trigger Values	Frequency
Chemical characterisation: physiochemical and toxicants	Results that are predicted to be higher than the 99% species protection guideline value at approved mixing zone boundary and are above the results from the earlier toxicity year[1] or above the toxicity year when no guideline was available.	Annual
WET testing	The 99% species protection safe dilutions derived from the WET testing species sensitivity distributions are not predicted to be achieved at the	Every three years, conducted in parallel with annual chemical

	boundary of approved mixing zone and are higher than previous years.	characterisation where feasible.
Review of continuous operational OIW monitoring results	Increases in the average monthly OIW concentration by 5 mg/L for more than six consecutive months or by 10 mg/L for two consecutive months	Monthly review
Discharge Volume	Monthly mean discharge volume (m^3/day) is equal to or less than the modelled flow rates used to confirm 99% species protection can be met at the approved mixing zone.	Monthly review

Note 1: earlier toxicity year means the year in which the most recent WET test occurred.

Determination of approved mixing zone

To determine the potential impact of the PW to the marine environment, dispersion modelling was conducted to predict the distance at which 99% species protection level (SPL) safe dilutions are achieved, using WET testing results available to reflect the potential toxicity. A modelling study was carried out in 2018 and informs this impact assessment in relation to the determination of the approved mixing zone (Jacobs 2018).

Model simulations of dilutions were undertaken for three main seasons prevalent on the NWS, based on measured current and wind data. Ocean current data was collected at multiple depths through the water column. As the modelling of ocean current speed and direction varies substantially within each season, the full current records were analysed to select periods typical of the three seasons on the NWS but erring on the side of low current speeds to give conservative model results (Jacobs 2016).

The 2015 WET testing results were used to develop predicted no-effect concentration (PNEC) values, that were inputs to the model. The 2015 WET testing results have been used as they are historically the most conservative. The four-day PEC (Predicted Effects Concentration) value is used to determine the PEC/PNEC ratios and the distances from the discharge point at which 99% species protection safe dilutions (PC99) are achieved, based on a maximum discharge rate (7,500 m^3/day). The modelling shows a surface-buoyant plume that is readily diluted to 99% SPL safe dilution within 1200 m of the discharge location under worst-case conditions at maximum discharge rates. In 2025, PW discharge averaged 341 m^3 per day but PW rates may increase as the field ages and as further high water cut wells are produced. Therefore, it is proposed to maintain a 1200 m approved mixing zone to reflect 99% SPL safe dilutions at the maximum potential discharge 7,500 m^3/day. WET testing has also been completed in 2020 and 2023, and confirmed that the required dilutions, based on the discharge volume are being achieved at the mixing zone boundary.

Field verification of dispersion modelling and PW plume tracking

Water quality surveys in 2015 and 2021 were focused on sampling the plume to verify the dilutions were achieved as estimated by the dispersion modelling and assessing in situ water quality against ANZG 99% SPL thresholds (BMT Oceanica 2015, BMT 2021). Discharge rates were approximately 1,500 m^3/day in 2014 and 2,560 m^3/day in 2021. Parameters sampled included TRH, BTEX, PAH, metals, organic acids, inorganics and nutrients, TSS, conductivity and temperature. During both surveys the PW plume was tracked by deploying three satellite tracker buoys, at the beginning of a tidal cycle, at the point of discharge and collecting water samples and conductivity, temperature and depth (CTD) profiles at set distances along the plume vector and along vectors at 90, 180 and 270 degrees of the main vector. This, in combination with the chemical characterisation data, which was collected from the facility at the time of deploying the tracker buoys, allowed for analysis of dilutions being achieved. In situ contaminant concentrations measured were compared against the contaminant concentration at the point of discharge to verify if dilutions were being achieved based on distance from the discharge point. Contaminants were below the limit of reporting (LOR) or indistinguishable from the background concentrations within 50 m of the GWA facility during both surveys demonstrating the rapid dilutions being achieved.

In addition to the standard water quality sampling, an autonomous underwater vehicle (AUV) (Slocum G2 Glider) was also used in 2015 which measured conductivity, temperature, depth (CTD), dissolved oxygen (DO), turbidity and coloured dissolved organic matter (CDOM) and a calibrated Turner C3 optical sensor for hydrocarbons throughout the water column in a grid pattern in and around the plume. The AUV was not able to detect a distinct PW plume.

During the 2021 survey, an autonomous underwater vehicle (AUV) (L3 HARRIS Iver-3) was also used which measured conductivity, temperature, depth (CTD), dissolved oxygen (DO), turbidity and fluorescent dissolved organic matter (FDOM) throughout the water column in a grid pattern in and around the plume. The AUV was not able to detect a distinct PW plume. These findings from the comprehensive surveys, which took samples at multiple water depths per site, support the modelled outputs and impact assessment that the required dilutions are rapidly being achieved, particularly in the near field from the discharge of PW at a depth of 51 m, and the dispersion modelling is adequately conservative.

Impact assessment – routine PW discharge

Potential impacts of PW discharge include:

- changes to water quality
- toxicity to biota
- changes to sediment quality
- changes to Key Ecological Features (KEFs).

To understand potential impacts from PW discharges, Woodside has undertaken a suite of comprehensive in-situ testing and sampling related to PW discharges representing long-term operational periods at GWA and from its other offshore production facilities. The details of this testing and resultant understanding of potential environmental impacts are outlined below.

Potential impacts to water quality

PW is discharged via a caisson 51 m below sea level and forms positively buoyant jets which rise towards the surface. As mixing increases and buoyancy of the plume erodes, the rise towards the surface slows. On reaching the surface the plume collapses and spreads horizontally whilst mixing vertically downwards. Potential impacts to water quality have been assessed through chemical characterisation of PW, dispersion modelling and discharge volumes.

Chemical characterisation of PW (physio-chemical parameters and toxicants)

Historical monitoring provides confidence that impacts from PW discharge are highly localised and pose no lasting effects to environmental receptors. Samples of undiluted PW collected annually between 2011 to 2025 were analysed for key physio-chemical parameters and toxicants including: TRH, BTEX, PAH, metals, organic acids, inorganics and nutrients. In most cases results are below guideline values, or similar to the results of chemical characterisation when the previous year's WET testing was undertaken (i.e. previous toxicity year) and resulted in concentrations being below guideline values within the approved mixing zone of 1200 m after taking into account modelled dilutions.

PW analysis in 2025 confirmed that chemical composition is similar to previous years. All constituents achieved 99% species protection guideline values within the approved mixing zone, with aluminium requiring the highest number of dilutions at 148 (Worley 2025). Modelling predicts 10,908 dilutions would be achieved at the mixing zone boundary at the maximum design discharge rate (7,500 m^3/day). When compared to previous years, routine chemical characterisation undertaken in 2025, indicated a stable discharge with no additional non-routine monitoring triggered.

In-situ water quality surveys

In 2015 and 2021, in-situ water quality monitoring was undertaken concurrently with routine PW discharge monitoring. Results indicated that the physical influence of the PW discharge could not be detected in the water column (to 50 m water depth) at distances of ≥ 50 m from the discharge location (BMT Oceanica 2015, BMT 2021), confirming that impacts from planned PW discharges did not extend beyond the mixing zone.

During both surveys, drifters were deployed close to the facility to determine the prevailing current direction and PW plume direction. An autonomous underwater vehicle (AUV) measured conductivity, temperature, depth (CTD), dissolved oxygen (DO), turbidity and fluorescent dissolved organic matter (FDOM) throughout the water column. Water samples were collected along the prevailing current (0°) vector and at various water depths and distances away from the facility. Additional water samples were also collected along the 90°, 180° and 270° vectors. All water samples were analysed for hydrocarbons (total recoverable hydrocarbons [TRHs], benzene, toluene, ethyl benzene and xylene [BTEX], polycyclic aromatic hydrocarbons [PAHs] and phenols), dissolved and total metals, organic acids, non-metallic inorganics and nutrients, dissolved and total organic carbon (DOC and TOC), total dissolved and solid suspended solids (TDS and TSS), chemical oxygen demand (COD), salinity, and electrical conductivity. Hydrocarbons (TRHs, BTEX and phenols) were not detected in receiving waters. Concentrations of dissolved and total metals were below all their available ANZG (2018) 99% species protection default guideline values (DGVs) at the approved mixing zone boundary. Measurable levels of organic acids and other non-metallic inorganics and nutrients were detected in the receiving waters. Water column profiles were consistent between sites, and uniform with a slightly lower temperature and conductivity at 50 m depth relative to the rest of the water column. The AUV did not detect a distinct PW plume.

Naturally occurring radioactive materials

PW may include low levels of naturally occurring radioactive materials (NORM) in particular, uranium 238 and thorium 232 decay chains and the longer-lived radionuclides lead 210, polonium 210, radium 226 (Ra-226) and radium 228 (Ra-228) (Coleman and West 2000). These radionuclides can occur in produced water either in solution or as fine mineral suspended solids.

Currently, there are no ANZG (2018) guidelines or international guidance for concentrations of radionuclides in marine water.

Valeur and Petersen (2013) assessed the ecological hazard-related NORMs in PW discharged to the marine environment. They concluded that NORMs have a strong affinity for particulate matter and discharged NORMs would be adsorbed onto fine grained sediments and particulate matter relatively soon after introduction to the marine

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

environment. In high energy environments, NORMs associated particles would settle and resuspend numerous times until they eventually settle in low energy environments in deep parts of the sea that serve as accumulation areas for fine grained sediments. Over time these particles would be buried beneath the benthic mixing layer of the seabed where they will become isolated from the biosphere and are unlikely to exceed background levels.

Given the potential of radionuclides in PW from the GWA facility to adsorb to fine grained sediments, the approved mixing zone is deemed appropriate. Potential toxicity risk would be accounted for during regular WET testing to determine PW toxicity.

Residual process chemicals

Residual process chemicals may be present in the PW stream. Process chemicals are subject to Woodside's chemical selection and approval process. Chemicals will decrease the water quality in the immediate area of the release (i.e., surface waters at the release location); however, the consequence is expected to be temporary and localised due to dilution with the PW stream and the open ocean mixing environment, distance from sensitive receptors and relatively low and or non-routine discharge volumes.

Impact

Potential impacts to water quality are expected to be limited to the immediate vicinity of the discharge location with a slight and low-level impact effect on water quality. Within the approved mixing zone, potential impacts to pelagic fish are expected to be limited to avoidance of the localised area of the plume and short-term decline in planktonic organisms in the immediate vicinity of the discharge plume.

Potential impacts to biological indicators

Most treated PW has low to moderate toxicity (Neff et al. 2011), with actual toxicity of discharge dependant on the chemical constituents of the PW and any added process chemicals, the level of treatment and dilution with PW prior to release, and the dilution of the discharge as it mixes with sea water. Most hydrocarbons in PW are considered non-specific narcotic toxins with additive toxicities; therefore, the toxicity of a PW does, in part, depend on the total concentration and range of bioavailable hydrocarbons (Neff 2002). Potential impacts of PW to biota have been assessed through WET testing and dilution modelling to verify the approved mixing zone is being achieved.

WET testing

WET testing has been undertaken to allow for interactions between toxicants and take into account toxicants which cannot readily be measured or are not known to be present in the sample. A range of mainly tropical Australian marine species were selected based on their ecological relevance, known sensitivity to contaminants, availability of robust test protocols and known reproducibility and sensitivity as test species. Upon completion of WET testing, the results are combined into safe dilution estimates based on 99% SPL.

Routine WET testing has been completed in 2011, 2014, 2017, 2020 and 2023 (Table 6-13). The 2014 results required further investigation as an additional chronic toxicity test was included but concentrations of PW tested were not low enough to enable calculation of a reliable EC10 value. The test was repeated in 2015, and this result is considered as the credible worst-case toxicity and have been used to assess worst case potential impact of PW.

Table 6-13: Calculated 99% and 95% species protection guideline concentrations and corresponding safe dilutions from GWA

Year	99% Guideline Concentration and (Safe Dilutions)	95% Guideline Concentration and (Safe Dilutions)
2011	0.26 (390)	0.43 (230)
2014 / 2015	0.0085 (11,800)	0.11 (910)
2017	0.05 (2,000)	0.27 (370)
2020	0.15 (667)	0.24 (417)
2023	0.072 (1,338)	0.49 (205)

Bioaccumulation

Bioaccumulation refers to the amount of a substance taken up by an organism through all routes of exposure (water, diet, inhalation, epidermal). The Bioaccumulation Factor is the ratio of the steady-state tissue concentration and the steady-state environmental concentration (assuming uptake is from food and water). The test developed to measure the ability of a substance to bioaccumulate, namely, the octanol-water partition (Pow), is based on the preferential partitioning of lipophilic organic compounds into the octanol phase. Partitioning into octanol can be correlated with the attraction for such compounds to the fatty tissue (lipid) of organisms.

The most comprehensive field study assessing bioaccumulation of hydrocarbons and metals from PW discharged into offshore waters is that by Neff et al (2011). At the request of the U.S. Environmental Protection Agency (USEPA), the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Gulf of Mexico Offshore Operators Committee sponsored a study of bioconcentration of selected PW chemicals by marine invertebrates and fish around several offshore production facilities discharging more than 731 m^3 per day of PW to outer continental shelf waters of the western Gulf of Mexico. The target chemicals identified by USEPA included five metals / metalloids (As, Cd, Hg, 226Ra and 228Ra), three volatile Monocyclic Aromatic Hydrocarbons (MAH), benzene, toluene, and ethylbenzene, and four semi-volatile organic chemicals (SVOC), phenol, fluorene, benzo(a)pyrene, and di (2-ethylhexyl) phthalate (DEHP). Additional MAH (m-, p-, and o-xylenes) and a full suite of 40 parent and alkyl-PAH and dibenzothiophenes were also analysed by Neff et al (2011) in PW, ambient water, and tissues at some facilities.

Concentrations of MAH, PAH, and phenol as determined by Neff et al were orders of magnitude higher in PW than in ambient seawater. There was no evidence of MAH or phenol being bioconcentrated. All MAH and phenol were either not detected (> 95% of tissue samples) or were present at trace concentrations in all invertebrate and fish tissue samples. Concentrations of several petrogenic PAHs, including alkyl naphthalene's and alkyl dibenzothiophenes, were slightly, but significantly higher in some bivalve molluscs, but not fish, from discharging than from non-discharging platforms. These PAH could have been derived from PW discharges or from tar balls or small fuel spills. Concentrations of individual and total PAH in mollusc, crab, and fish tissues were well below concentrations that might be harmful to the marine animals or to humans who might collect them for food at offshore platforms (Neff et. al. 2011).

The average concentration of BTEX in PW discharged from the GWA facility is approximately 15 mg/L (BMT 2021). Bioaccumulation of BTEX compounds has been observed to occur in the laboratory but at concentrations far in excess of that discharged from the GWA facility (refer to Berry 1980), hence it is unlikely that BTEX would bioaccumulate at the exposure concentrations that may be experienced by biota around the GWA facility.

In contrast to BTEX compounds, PAH compounds have high Pow values indicative of the potential for bioaccumulation (Vik et al 1996). Neff and Sauer (1996) reviewed the available literature for laboratory and field studies investigating the bioaccumulation of PAHs. The bioaccumulation values for PAHs in marine organisms collected near PW discharges in the Gulf of Mexico reported by Neff and Saur (1996) indicate that the highest bioaccumulation factor were in the tissues of bivalve molluscs and the lowest in the muscle tissue of fish.

Therefore, bioaccumulation is unlikely to result in increased levels of BTEX in biota surrounding the GWA, however, there may be an elevation in PAH levels. The results from Neff et al. (2011) can be used to infer the very low potential for adverse bioaccumulation effects to marine organisms, or to humans, if they were to consume any affected fish, molluscs or crabs found on upper near-surface legs of the facility. The potential environmental impact associated with bioaccumulation of PW constituents in the water column and in the sediments, is considered to be very low, and limited to a potential localised effect on a small number of non-threatened species in waters immediately surrounding the facility, as described below. Potential health risks are unlikely as a result of negligible exposure: the PSZ prohibits fishing from or near the facility as there is very little or no activity within the Operational Area. The findings of the sediment and water quality monitoring completed in 2015 and 2021 at GWA (BMT Oceanica 2015, BMT 2021) validated the conclusion that states, 'the potential environmental impact associated with bioaccumulation of PW constituents in the water column and in the sediments, is considered to be very low and limited to a potential localised effect on a small number of non-threated species in waters immediately surrounding each facility'. Given the nature of the PW discharge from the GWA facility, the potential for bioaccumulation of PW contaminants (in particular BTEX) is considered to be highly localised with no lasting effect.

Potential Impacts to EPBC Listed Species

Water depths in the Operational Area range between ~40-200 m. The fauna present is predominantly pelagic species of fish.

There are 50 EPBC listed species which may occur within the Operational Area, including whales, whale sharks, sharks, rays, dolphins, sea snakes, turtles and seabirds. These fauna species may include those associated with Traditional Custodians values. Key threats identified in species recovery plans and threat abatement assessment are outlined in Section 6.10. Marine fauna may be exposed to the PW plume for short periods while transiting through the Operational Area.

EPBC-listed marine species that have BIAs which overlap the Operational Area with 1,200 m of the GWA platform, include:

- whale shark foraging BIA.

In addition, the wedge-tailed shearwater breeding BIA and the flatback turtle internesting buffer BIA also overlap the Operational Area but not the PW approved mixing zone.

The Ancient Coastline at the 125 Depth Contour KEF overlaps the Operational Area including the location of the GWA platform.

Cetaceans

During PW overboard discharge, transient marine mammals may be exposed to elevated contaminant concentrations primarily through contact with the water column while transiting the Operational Area. Direct exposure may occur through ingestion of water or prey containing contaminants, while indirect effects could arise from temporary changes in prey availability or water quality within the mixing zone.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine Turtles

While sensitive areas for the flatback turtle extend offshore, they primarily encompass foraging and internesting ranges of turtles that use adjacent coastal and island nesting beaches. The deep offshore environment of the Operational Area does not provide suitable nesting or benthic foraging habitat (i.e. no emergent islands, reefs, or shallow shoals), and therefore only low numbers of transient turtles are expected to occur near the facility. The nearest internesting buffer BIA is for the flatback turtle and is approximately 5 km from the GWA platform.

The Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia, 2017) identifies chemical discharges as a potential threat to turtles. However, any exposure of transient individuals to PW discharge would be limited to brief, surface contact within the approved 1,200 m approved mixing zone.

Overall, any interaction between PW discharge and marine turtles is predicted to result in no measurable impact at the individual or population level.

Whale Shark

The GWA platform is located within the known seasonal (July to November) foraging area (BIA) for the whale shark. Whale sharks typically migrate through the region during March to July and tend to travel as single individuals. As filter feeders, whale sharks primarily consume plankton. Therefore, there is a low probability of incidental feeding within highly diluted PW.

Modelling indicates that PW concentrations at the 1,200 m approved mixing zone boundary will meet 99% species protection criteria consistent with ANZG (2018) guidelines. Given the dispersive open-water environment, rapid dilution, and transient nature of whale sharks and other megafauna (including cetaceans, rays, and marine turtles), potential exposure durations are expected to be brief, and no measurable impact to individuals or populations is expected due to short contact times and low contaminant concentrations.

Fish

During PW discharge, fish in the Operational Area may be exposed to elevated contaminant concentrations through both direct and indirect pathways. The mixing zone does not overlap locations where site attached fish are likely (i.e. banks and shoals), therefore impacts would be limited to pelagic species. Direct exposure occurs when fish swim through the discharge mixing zone, resulting in uptake of contaminants across the gills or ingestion during normal feeding, and when benthic or demersal species come into contact with contaminants settling on the seafloor.

Indirect exposure may occur via dietary uptake of contaminated prey (e.g. zooplankton or benthic invertebrates) or through temporary alterations to habitat quality, including changes in water chemistry or prey availability. Predicted contaminant concentrations rapidly dilute beyond the mixing zone and remain below ANZG (2018) guideline values, limiting potential sub-lethal or population-level effects. Exposure is further mitigated through management of the discharge under the OMDAMP.

Seabirds

The GWA platform is located approximately 8 km from the breeding BIA for the Wedge-tailed shearwater, which supports colonies on offshore islands and associated offshore foraging habitat. Consequently, the likelihood of direct exposure through surface contact or ingestion is low. Indirect exposure through consumption of contaminated prey is also unlikely, as contaminant concentrations in the water column and biota are predicted to remain below levels that could cause sub-lethal or population-level effects. Overall, PW discharges is predicted to have negligible impact on individual birds or the breeding population, with discharge quality and environmental performance managed under the OMDAMP consistent with ANZG (2018) guidelines.

Fish communities and other fauna associated with the facility may experience minor, intermittent changes in local water quality as plume vectors shift, but effects are predicted to be localized and non-persistent. Overall, the activity is assessed as having no lasting or ecologically significant impact on whale sharks or other transient marine fauna, with discharges managed under the OMDAMP to ensure compliance with relevant environmental performance standards.

Plankton

A change in water quality as a result of PW and cooling water discharges has the potential to result in the injury or death of planktonic species within the water column through toxicity effects. Early life stages of fish (embryos, larvae) and other plankton would be the most susceptible organisms to exposure from hydrocarbons and chemicals in the discharges, as they have limited mobility and are therefore likely to be exposed to the plume, if present. Impacts are predicted to be limited to within 1,200 m of the discharge location and impacts are expected to be slight and low-level. These types of organisms are known to have high levels of natural mortality and a rapid replacement rate. Plankton is generally abundant in the upper layers of the water column and is the basis of the marine food web, so localised impacts in any one location are unlikely to have long-lasting impacts on plankton populations at a regional level. Reproduction by survivors or migration from unaffected areas is likely to rapidly replenish losses (Volkman et al., 2004).

Impacts to KEFs, Shoals and Banks, and AMPsThe Operational Area overlaps with the Ancient Coastline 125 m Depth Contour KEF, however, as PW forms a buoyant plume which does not reach the KEF depth, no contact and therefore no change in water quality at the KEF is expected from PW discharge.

The nearest sensitive receptors are Rankin Bank and the Montebello Marine Park. Rankin Bank and the Montebello Marine Park are located approximately 33 km 45 km, respectively, from the GWA platform platform. Given the PW mixing zone is 1,200 m from the discharge location, no impacts to Rankin Bank or the Montebello Marine Park are expected (Figure 6-2). There are two other shoals within or close to the Operational Area, however they are not present within the approved mixing zone and hence no impacts are expected.

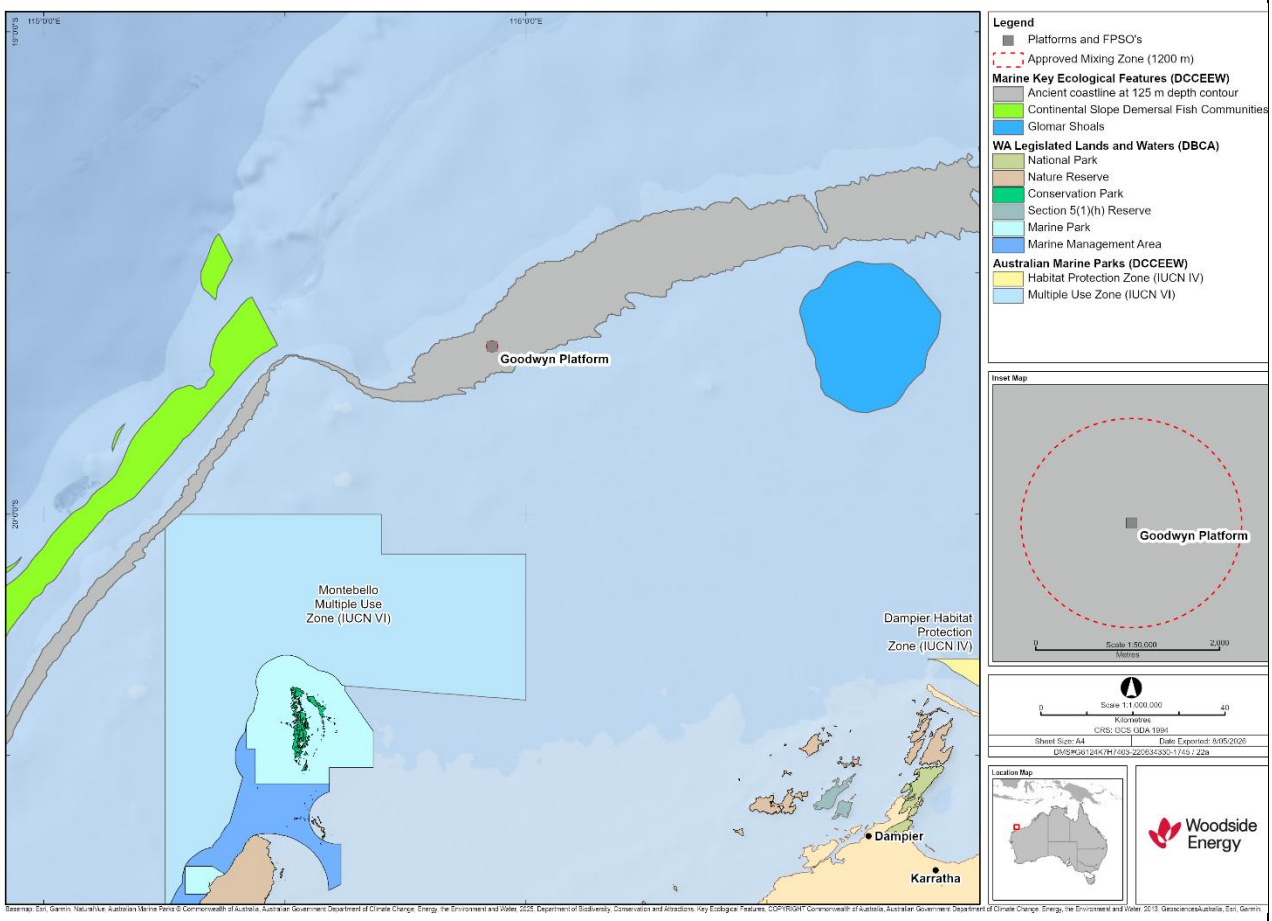

Figure 6-2: Produced water approved mixing zone relative to Australian marine parks and key ecological features

Potential impacts to sediment quality

Potential impacts to sediment quality have been assessed through historic sediment surveys and supported by the results of flocculation/precipitation studies and annual assessments of potential impacts to water quality (chemical characterisation).

Potential contaminants in the PW discharge may be introduced into sediments around the facility through precipitation of soluble contaminants and flocculation and sedimentation of the particles in the PW plume. Accumulation of PW contaminants in sediments depends primarily on the volume and concentration of particulates in PW discharges or constituents that adsorb onto seawater particulates, the area over which those particulates could settle onto the seabed (dominated by current speeds and water depths), and the re-suspension, bioturbation and microbial decay of those particulates in the water column and on the seabed. As described in the water quality section, the potential for PW to impact sediment, based on chemical characterisation of the discharge, is unlikely based to the concentrations observed.

Sediment studies

Studies into potential sediment precipitation, flocculation and accumulation from PW discharge have been undertaken by Woodside, including analysis of samples of PW from GWA (Jacobs 2016; BMT 2021). The Jacobs 2016 study found that the PW at GWA had very small amounts of solid material, with very little potential of settling out due to small particle sizes (100% particles <40 µm), and that it was unlikely to flocculate. The BMT 2021 study found similar results and that 95% of particles were <72 µm.

Based on settling velocities, particles < 5 µm would never permanently settle out of the water column, and that particles from 5 to 40 µm would not permanently settle out of the water column, unless they were in very deep water

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

(>5000 m) or in areas where hydrodynamic conditions were very weak and did not continuously resuspend the particles (SKM 2013).

Historic field sediment surveys

In 2006 and 2014 sediment sampling was conducted at GWA to investigate impacts of historical water based and non-water-based drilling muds on sediment quality (SKM 2006; SKM 2014). Sampling found historical contamination with elevated levels of TPH, lead, zinc and mercury within 200 m of the GWA platform. Beyond 200 m from the GWA platform, TPH and metals concentrations were below ANZECC/ARMCANZ ISQG trigger values.

In 2015 and 2021 sediment sampling was conducted at GWA to verify if impacts to sediment were from PW discharges (BMT Oceanica 2015, BMT 2021). Sediment samples were collected both inside and outside the approved PW mixing zone (1200 m) to a maximum distance of 5 km from the platform. Beyond 400 m from the GWA platform, metals and hydrocarbon concentrations were consistent with background concentrations and well below ANZECC/ARMCANZ ISQG or ANZG 2018 trigger values, indicating no impacts to sediment due to PW discharges.

Impact assessment – non-routine PW discharge

Activities and discharges from production restarts, well commissioning, well cycling and well unloading are not part of the routine operations and routine discharges of produced water at GWA. To account for these non-routine operations an impact assessment was completed to assess for temporary short-term dispensations to the 30 mg/L 24 hour rolling average OIW threshold to allow for safe and successful operation during production restarts and bringing wells online to stabilise them.

During high water cut well unloading in 2019 and 2020, temporary elevated OIW concentrations between 30 mg/L and 100 mg/L (rolling 24 hr average) lasted several days, before stabilising below 30 mg/L during ongoing production. Well shut in periods prior to unloading varied from weeks to years and EPS established for non-routine activities were met.

During well commissioning activities, flowline preservation fluid, which is largely constituted of MEG will be produced back to the platform. MEG is known to have a 'cleaning' effect on the process vessels and equipment through which it travels, incorporating hydrocarbons that adhere to the flowlines and concentrating these in higher volumes, that are then required to be removed through the OIW treatment system. MEG is expected to be produced through GWA topsides within 24-48 hours of commissioning of each well, which may overwhelm the produced water condensate separator and other elements of the OIW treatment system. A temporary OIW polishing skid will be utilised during commissioning to assist with OIW management.

High water cut well unloading/cycling

Modelling was undertaken (RPC 2018) to predict where PEC/PNEC ratios are expected to be achieved during high water cut well unloading/cycling. In the model, OIW was discharged at 100 mg/L for 24 hours at a rate of 7,500 m^3/day. The modelling results demonstrated that the worst-case impact occurs during the transitional period, during which a PEC:PNEC ratio of 1 is achieved in 210 m, well within the approved mixing zone boundary. Refer Table 6-14 below for additional details.

Table 6-14: Modelled distance at which PNEC= 70 µg/L for PW discharged from GWA during well unloading/cycling is achieved (transitional period)

Discharge rate (m^3/day)	Peak OIW conc. at 200 m (ppm)	95%ile at 200 m (ppm)	24 hour average conc. at 200 m (ppm)	Maximum distance at which 70 µg/L PNEC achieved (i.e. PEC:PNEC = 1)
7,500	0.87	0.16	0.048	210 m

A PW sample collected during high water cut well unloading in 2019, while showing an increase in toxicity to previous samples, was considered to be within the range of the safe dilutions measured for the PW (Jacobs 2020), and not significantly different to previous years. The safe dilution estimate (1 in 3,100) for the 99% SPL was within the predicted dilutions (1 in 10,908) at the GWA approved mixing zone boundary (1200 m) for the modelled discharge rate of 7500 m^3/day, indicating impacts from PW discharge during high water cut well unloading remain within the approved mixing zone boundary.

Routine 2020 WET testing was undertaken whilst a high water cut well was producing. Results indicated PW toxicity was lower than previous years, with a safe dilution estimate for the 99% SPL of 1 in 667 (BMT 2021) (Table 6-13) indicating the short-term elevation in PW toxicity observed in the 2019 high water cut well unloading trial PW sample, normalised following the initial unloading period, likely following the return to OIW rates <30 mg/L.

Based on modelling, OIW trends observed during high water cut well unloading, and WET testing results, the non-routine PW discharge associated with high water cut well unloading/cycling is considered to have a short term, temporary and localised impact to water quality, and not predicted to result in impacts beyond the approved mixing zone boundary.

Commissioning of GWF4 and two future tie-in production wells (initial start-up)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Modelling undertaken to predict where PEC/PNEC ratios are expected to be achieved during high water cut well unloading is considered a suitable analogue for predicting potential impacts from PW discharged during commissioning of GWF4 and two future tie-in production wells. The modelling results demonstrated that the worst case impact occurs during the transitional period, during which a PEC:PNEC ratio of 1 is achieved in 210 m (Table 6-14), well within the approved mixing zone boundary.

MEG from flowline preservation is miscible in water and considered PLONOR. Upon discharge via the produced water system, MEG is expected to mix with the receiving environment with no lasting environmental impact. Commissioning of the GWF4 and two future tie-in production wells require discharge of approximately 30-140 m^3 of an MEG/water mixture (85%/15%). Although MEG is classified as PLONOR, it is a solvent and can liberate hydrocarbons as it passes through the process. As a result, artificially elevated OIW levels are expected during well commissioning. Manual OIW sampling will therefore be used during this period, recognising that MEG, despite being PLONOR, can increase OIW.

Based on modelling, and short duration of each well start-up, non-routine discharge associated with commissioning of GWF4 and two future tie-in production wells (initial start-up) is considered to have a short term, temporary and localised impact to water quality, and not predicted to result in impacts beyond the approved mixing zone boundary.

Production restarts

There is the potential for the GWA facility to experience high OIW during production restarts, due to mobilisation of emulsions observed in the PW system after shutdowns. Production restarts after planned shutdown are expected to occur one to three times per year. The emulsions are thought to be caused by calcium carbonate scale and waxy hydrocarbons combining with water during shutdown periods when the topsides process trains have materially cooled down. Elevated OIW in PW discharge during production restarts is expected to be temporary and of short duration (up to three days).

Based on modelling described above, and short duration of elevated OIW, the non-routine discharge during production restarts is considered to have a short term, temporary and localised impact to water quality, and not predicted to result in impacts beyond the approved mixing zone boundary.

Water Standard Operating Procedure.				
Non-routine PW discharge activities will not occur concurrently.	F: Yes CS: Minimal cost due to reducing flexibility to blend reservoir liquids	Management to avoid concurrent non-routine PW discharge activities limits elevations in OIW concentrations within PW and when combined with the 30 mg/L monthly rolling average limit, effectively minimises impacts to the environment.	Avoiding concurrent non-routine activities with potentially high OIW helps to ensure that the OIW limits are met; the benefits outweigh cost/sacrifice.	Yes **C 6.7**
Professional judgement – eliminate				
Reinjection of PW into reservoirs	F: Possible – some technical risk associated with reservoir uncertainty. CS: Significant. The reinjection of PW would require significant modification to the GWA facility, including drilling of injection wells. This would require considerable design and construction costs. Previous studies indicate a cost in excess of AUD$20M CAPEX for PW reinjection, with an estimated OPEX cost of AUD$1M.	The environmental impacts in the approved mixing zone around the facility would be eliminated. Long term biological impacts from Produced Water which are outside of the acceptable limits of change, from contaminant accumulation in sediment and bioaccumulation effects over time, are prevented by the PW Monitoring and Management Framework. Currently, PW does not represent a sediment accumulation or resulting bioaccumulation risk (refer to Potential impacts to Sediment Quality for more detail). Given that a moderate level of environmental protection will be sustained at 500 m, which is the Operational Exclusion Zone of the facility, there is currently no opportunity for other socio-economic marine users to	As part of the 2015 PW study into treatment improvement for GWA, Woodside examined the potential for reinjection of PW. Woodside has not identified a suitable reservoir, and such an option would likely require additional drilling activities to be undertaken. GWA is no longer capable of supporting platform-based drilling. Reinjection is not feasible unless a suitable reservoir is identified. It is not feasible to reinject into a shut-in GWA platform well because the wells continue to have very high reservoir pressure, which would require significant facility modifications to overcome. Drilling and Subsea work activities to establish a reliable PW reinjection well and subsea infrastructure also introduce significant complexity, risk and cost. Retrofitting PW topsides reinjection equipment to GWA introduces significant modifications which pose safety risks on an operational gas facility. Together the significant retrofit risks, associated environmental impact	No

Control considered	***Control feasibility (F) and cost/sacrifice (CS)[33]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
		benefit from a smaller mixing zone. Therefore, there is negligible socio-economic benefit to reinjection.	(drilling and subsea construction, greenhouse gas emissions associated with 7-15 MW based on known requirements for Enfield - Laverda) is considered significantly disproportionate to the potential slight environmental impact improvement. As such, no further engineering design or screening studies reporting is considered reasonably practicable. It is not necessary to conduct a reservoir-by-reservoir analysis to understand these costs. For type B impacts, it is appropriate to consider case specific drivers to ALARP management. The lack of a suitable reservoir contrasts with Woodside's facilities that currently reinject Produced Water. The reinjection of PW would also introduce additional sources of environmental risks and impacts, such as those associated with drilling injection wells (e.g. drill cuttings) and maintaining injection capability (e.g. increased greenhouse gas emissions from power generation for pumps, increased chemical usage etc.). Given the localised, slight non-significant impact of PW discharges, and the considerable costs involved in developing a PW reinjection capability for the GWA facility, implementation risks and environmental impacts (greenhouse gas, chemical use), the costs are grossly disproportionate to the potential environmental benefit gained.	
Professional judgement – substitute

Professional judgement – engineered solution				
Utilise adsorbent hydrocarbon filters to manage OIW upsets.	F: Yes CS: Minimal cost (filter replacement). Standard practice.	Potential minor reduction in OIW concentration. Assist in removal of dispersed oil, depending on cause of high OIW readings.	Benefits outweigh cost/sacrifice, where implemented to manage OIW upsets only. Adsorbent filters are not used constantly during routine operations as they become saturated quickly and require frequent changeout.	Yes **C 6.8**
Upgrade of existing (i.e. permanent) treatment system to increase capacity, whilst maintaining OIW limits: upgrade vessel internals in the T200 PWCS	F: Yes CS: Moderate. Cost of modifying current produced water system vessel internals	Potential minor reduction in OIW concentration. Overall consequence ranking will not be reduced further. Control was assessed to facilitate access to reserves (i.e. by increasing water handling capacity) constrained due to OIW performance.	Following the 2015 PW study into treatment improvement for GWA, the PW treatment system was improved in 2019 by upgrading the existing vessel internals in the T200 PWCS to increase flow whilst maintaining existing OIW limits.	Yes Engineered solution permanently implemented
Upgrade of existing (i.e. permanent) treatment system to increase capacity, whilst maintaining OIW limits: upgrade the OWDS and PW Degasser, install a hydrocyclone.	F: Potentially feasible. CS: Moderate. Cost of upgrading OWDS and PW degasser and installation of a hydrocyclone. Other equipment and software modifications would also be required to accommodate changes to control and safeguarding strategies for the vessels and a new hydrocyclone. Previous studies indicate a cost between of AUD$15-20M CAPEX for upgrades and hydrocyclone installation, with an estimated OPEX cost of AUD$500k p.a.	Potential minor reduction in OIW concentration. Overall consequence ranking will not be reduced further. Control was assessed to facilitate access to reserves (i.e. by increasing water handling capacity) constrained due to OIW performance.	Woodside examined the potential for further developing GWA water handling capacity (beyond PWCS internals upgrade above) by upgrading the OWDS, the PW Degasser as well as the installation of a hydrocyclone. Cost associated with upgrading the OWDS, PW degasser and installation and operation of a hydrocyclone is not currently considered ALARP because the additional costs and risks associated with this option are considered disproportionate to the environmental benefit that is expected to be yielded.	No
Chemical injection of water clarifier to reduce OIW concentration	F: Potentially. Woodside trialled water clarifier injection to reduce OIW	Minor reduction in OIW concentration, however, does not reduce the overall	Woodside's assessment of chemical injection trials did not recommend proceeding with control	No

	concentrations. This test resulted in a reduction in OIW concentration, however resulted in the formation of viscous material within the process equipment. CS: Moderate. Initial cost of modifying production system to include chemical dosing point. Ongoing cost of chemical procurement.	consequence rating. Further, this results in additional chemical load, and lifecycle environmental footprint associated with packaging, logistics, waste management and potential process upsets.	due to the risk of equipment blockages and potential upsets to process chemistry. Mitigating these potential impacts may require modification of the production system, incurring a capital expenditure. The discharge of the clarifying agent with the PW stream may result in additional toxic effects. Ongoing chemical consumption would also incur operational expenditure. Given the nature and scale of impacts forming the current PW discharge, the cost of developing a chemical injection is disproportional to the environmental benefit.	
Adoption of a permanent secondary treatment stage to reduce OIW concentration	F: Potentially feasible. Woodside trialled a produced water compact flotation unit (CFU) to provide secondary treatment of PW. The initial trial was unsuccessful due to low flow experienced to the CFU skid. CS: Moderate. Initial cost of modifying production system to include tie-in point. Ongoing cost of CFU skid rental and maintenance.	Potential minor reduction in OIW concentration. Overall consequence ranking will not be reduced further. Control was assessed to facilitate access to reserves (i.e. by increasing water handling capacity) constrained due to OIW performance.	A continuous improvement PW treatment technology retrial occurred over the period 4th -11th December 2017. The scope was to test a Compact Flotation Unit on GWA. A sidestream of PW going to the closed drains caisson was treated to reduce OIW. CFU effectiveness was measured through a rental oil droplet online analyser during the retrial. The retrial (at a different tie-in point to the initial trial) was completed successfully as sufficient flow was experienced to the skid to gather meaningful data. The CFU did not perform well downstream of the degasser under real process conditions with increased flow through the PW system via one of the high water cut wells, i.e. trial was insufficient to enable bean up of a high water cut well with a 30	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[33]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
			mg/L 24 hr rolling average OIW limit.	
Adoption of a permanent tertiary treatment stage to reduce OIW concentration.	F: Potentially feasible. Large deck space would be needed which is not currently available. CS: Significant cost. Deck reinforcement or cantilevers required, as well as high cost associated with these maintenance intensive technologies. Previous studies indicate a cost between of AUD$5-15M CAPEX for tertiary treatment stage technology, with an estimated OPEX cost of AUD$250k-750k.	Installation of a tertiary treatment stage to support well optimisation and process debottlenecking (to optimise overall reservoir recovery) could be feasible to ensure OIW remains below 30 mg/L. As OIW performance is currently a production constraint, implementation of this option would support being able to lift that constraint, increasing water production and maintaining OIW levels. Negligible OIW reduction is expected. Installation of an MPPE may potentially provide a minor reduction in some toxicants (eg BTEX, PAHs) over the life of the facility. As the 99% species protection level is currently anticipated to be achieved within 1,200 m of the facility during routine operations, the incremental improvement in environmental performance would be so small it would not currently be safely measurable.	Woodside examined the potential for installation of an MPPE. Centrifuges and MPPE are large and heavy, requiring deck reinforcement or cantilevers, significantly increasing CAPEX cost. They are also maintenance intensive. This introduces significant OPEX costs, and additional risk from exposure of personnel. Additionally, these options tend to have high power consumption, introducing an environmental impact from greenhouse gases. The adoption of tertiary treatment is not currently considered ALARP because the additional costs and risks associated with this option are considered disproportionate to the environmental benefit that is expected to be yielded. Installation that would not increase PW treatment capacity and is there purely to reduce hydrocarbon content in current discharges is considered disproportionate from a cost/sacrifice perspective for small localised environmental improvement gains.	No
Mobile treatment technology during high water cut well unloading/cycling or production restart.	F: Yes CS: Equipment hire costs, mobilisation costs, labour, management of change, operational requirements.	Potential improved OIW treatment performance to avoid peaks in short duration OIW discharges. Peaks in OIW discharge are known to be of short duration, with monthly 30 mg/l rolling average maintained, therefore the overall	The equipment hire, ongoing deck space requirements, mobilisation, labour and management of change costs are disproportionate compared to temporary and localised impacts associated with short duration increase in OIW during high water cut well unloading, cycling and	No

Control considered	***Control feasibility (F) and cost/sacrifice (CS)[33]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
		risk reduction is negligible.	restart activities. Data obtained during high water cut well unloading indicate no impact to ecosystem integrity from PW outside of the approved mixing zone boundary. Mobilising temporary treatment technology reduces operational flexibility (e.g. after an ESD restart), which can be provided through other means (e.g. **C 6.2**).	
Temporary OIW polishing skid during well commissioning (initial start-up)	F: Yes CS: Equipment hire costs, mobilisation costs, labour, management of change, operational requirements.	Increased ability to treat higher OIW concentrations, flowline preservation fluids containing MEG, and minor fines from the well start-up activities. Greater operational flexibility and higher likelihood of being able to meet OIW discharge requirements whilst maintaining production during commissioning (initial start-up) activities.	Additional labour and temporary operating procedures associated with initial startup of wells are proportional to manage the risk of high OIW. GWA facility has deck space and suitable tie-in points for an OIW polishing skid, i.e. minimal modifications required to connect temporary skid. There is also proven application of this technology during previous tie-back start-ups; therefore, the benefits of adopting this control outweigh the costs.	Yes **C 6.9**
Professional judgment – procedures and administration				
Routine in-situ monitoring beyond the requirements of Woodside's OMDAMP for an existing asset	F: Yes CS: Increasing in-situ monitoring would result in additional offshore demand on resources, safety hazards and costs associated with monitoring and sampling, such as vessel activities, logistics, manual labour, analytical laboratory and service provider costs.	In-situ monitoring following release is not an effective control to manage the nature of PW discharges and results in limited to no impact reduction. In-situ monitoring beyond the adaptive management approach outlined in the OMDAMP does not follow good application of the hierarchy of controls and results in disproportionate sacrifice with regard	Long term monitoring of water and sediment characteristics at the GWA platform indicate that the PW discharge is not detectable beyond the approved mixing zone. Sediment contamination over time has been stable and is the result of historical drilling activities (i.e. not the result of PW discharge) and limited to within 400 m of the GWA platform. PW separation process design, optimisation, monitoring and surveillance offer the	No

Control considered	***Control feasibility (F) and cost/sacrifice (CS)[33]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
		to execution risks and costs for limited gain.	primary controls, with discharge OIW analysis in place to detect performance variations. Woodside maintains a routine OIW monitoring program for the PW stream (including adaptive management via the OMDAMP, which assesses the need for in-situ monitoring). The work undertaken to date provides Woodside with a sound understanding of the nature and scale of the environmental impacts from PW discharge, which would not be further improved by increasing the frequency of routine in-situ monitoring. Per the OMDAMP, should routine PW monitoring indicate potential impact beyond the approved mixing zone, further investigations are undertaken, including consideration of non-routine in-situ monitoring. The execution risks and cost of implementing this control is grossly disproportionate to the environmental benefit.	
Annual review of routine monitoring results and determine requirement for non-routine sediment quality monitoring as per OMDAMP.	F: Yes. CS: Monitoring and implementation costs. Standard practice.	Review of monitoring results to determine if additional monitoring is required does not reduce environmental impact but provide necessary assurance that impact continues to be appropriately defined.	Additional risk-based monitoring is proportional to the additional cost of implementation and part of the OMDAMP.	Yes **C 6.10**
Risk-based analysis				
Application of Woodside's Risk Management Procedures and implementation of the OMDAMP provide for assessment and ongoing management of impacts from PW discharges. This includes: • ongoing hazard identification, risk assessment and identification of control measures • ongoing monitoring PW discharges to verify performance and detect changes in discharge characteristics.				
Company values				
Woodside's corporate values require personnel to comply with applicable policies, standards, procedures and processes, and to be accountable for their actions in line with the Woodside Compass. As outlined above, the

Petroleum Activity will be undertaken in accordance with these requirements, including the implementation of controls to manage PW discharges.				
Societal values				
Societal values have been considered through engagement with relevant stakeholders, as described in Section 5. Woodside distributed a Consultation Information Sheet outlining the Petroleum Activity to identified relevant stakeholders (Section 5 and Appendix F). No stakeholder concerns specific to PW discharges were identified through this process.				
ALARP statement: On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type B; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the adopted controls appropriate to manage potential impacts of PW discharges associated with GWA facility operations on water quality and environmental receptors. Woodside has undertaken additional PW treatment studies, treatment trials, upgrades to PW system vessel internals, use of a temporary OIW skid for tie-back commissioning, and ongoing monitoring of OIW concentrations and discharge volumes. Risk-based analysis, including PW discharge modelling, has been used to inform the evaluation of environmental impacts. Woodside implements a risk-based, adaptive OMDAMP, which includes annual and triennial end-of-pipe monitoring. The outcomes of modelling studies and long-term monitoring have been considered in determining the ALARP position. In-situ water quality and sediment sampling indicate no impact outside of the approved mixing zone. As no reasonably practicable additional or alternative controls have been identified that would further reduce impacts without disproportionate sacrifice, the impacts are considered ALARP.

Demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The impact assessment has considered the relevant principles of ESD: • conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • inter-generational equity, ensuring the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • integration of long-term and short-term economic, environmental, social and equitable considerations in decision-making. ***Internal context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) • Woodside Environmental Management Standard (including requirements for mixing zones and monitoring). ***External context*** The impact assessment has considered feedback from relevant persons (Section 5). No stakeholder feedback relevant to PW was identified. PW control measures and monitoring frameworks have been designed to be commensurate with the consequence level, location and sensitivity of the receiving environment (including social and amenity values). These measures address broader societal expectations to an acceptable level. ***Other Requirements*** The adopted controls and acceptability assessment has considered regulatory guidance, including the *WA EPA (2016) Technical Guidance: Protecting the Quality of Western Australia's Marine Environment* and the *ANZG (2018) Guidelines*. These guidelines require that environmental values are identified and levels of ecological protection are established. To maintain overall ecosystem health, the cumulative spatial extent of areas assigned lower levels of ecological protection should be small relative to the areas assigned high and maximum levels of protection. The Monitoring and Management Framework aligns with these principles by applying acceptable limits of change consistent with the levels of protection described in WA EPA	The predicted level of impact to ecosystems, species, habitat or physical or biological attributes from discharge of produced water is of an acceptable level (consequence level, E – slight and low level), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements and industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for AMPs, recovery plans and conservation plans/advice • the predicted level of impact has been reduced to ALARP. To manage impacts from discharges of PW to marine sediment, water quality, ecosystems/habitat or species to an acceptable level the following EPO has been applied: **EPO 6:** No impact to the environment outside the Approved Mixing Zone from planned discharges of produced water. The adopted controls are considered appropriate to manage the impacts of the Petroleum Activity and compliance with those controls demonstrates that the EPO have been met.

Demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
(2016) and ANZG (2018). The level of ecological protection afforded to sensitive receptors is also consistent with the *North-west Marine Bioregion Network Management Plan (2018)*. By monitoring and managing produced water (PW) discharges to achieve 99% species protection at a distance of 1200 m, there is a high level of confidence that impacts will be detected and managed through the Offshore Marine Discharges Adaptive Management Plan (OMDAMP). The Minamata Convention on Mercury (2013) (ratified by Australia in 2021) requires measures to control releases containing mercury or mercury compounds. Measures relevant to PW discharges from the platform are outlined below: • *Release limit values:* Guideline values related to mercury are established and applied to control, and where feasible, reduce release. • *Best available techniques and environmental practices:* Monitoring through annual chemical characterisation and implementation of the OMDAMP provides an adaptive management framework to support best environmental practices. • *Multi-pollutant control approach:* The monitoring framework includes comprehensive chemical characterisation and WET testing, enabling assessment of the combined effects of contaminants and potential additive toxicity.

Discharge of deck water, drainage systems and bilge water from the GWA platform and support vessels.		✓												
Discharge brine and cooling water from the GWA platform and support vessels.		✓												

Description of source of impact

Sewage, grey water and putrescible waste

Sewage and grey water generated on the GWA platform are treated (e.g. via maceration) and discharged to the marine environment via the sewage caisson. Putrescible wastes (e.g. food scraps) are macerated to < 25 mm diameter prior to discharge via the sewage caisson.

Support vessels may also discharge sewage, grey water and putrescible wastes. Sewage onboard vessels is routinely treated (e.g. via a sewage treatment plant (STP) or macerator) prior to discharge.

During routine maintenance or repair of treatment systems, short and infrequent direct discharges may occur.

The volume of sewage and grey water generated from the GWA platform is estimated to be approximately 8-9 m^3/day (based on ~75 L/person/day), with actual volumes varying depending on personnel levels. Support vessels typically generate smaller volumes. An ASV which may operate for up to 3 months alongside the GWA platform would have a larger POB (up to 500) and will therefore discharge ~35-40 m^3 per day.

Deck water, drainage systems and bilge water

Operational non-process discharges, maintenance drainage, flushing discharges, washdown water and minor spills are contained and managed through the GWA platform drainage systems. These include:

- non-hazardous open drains - collect drainage from non-hazardous areas and discharges directly to the environment
- hazardous open drains - collect wastewater, hydrocarbons and chemicals from hazardous areas via deck drains, tundishes and drip trays. Collected fluids are treated prior to discharge (Section 3.6.4.1).
- hazardous closed drains– collect liquids from pressurised and hazardous equipment prior to maintenance, and intermittent flows from process equipment. Collected hydrocarbons are treated (Section 3.6.4.3).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Chemicals used onboard the GWA platform may be introduced to the environment via drainage system, including through;

- deck washdown and cleaning activities
- maintenance drainage of treated water systems (e.g. tempered water)
- marine growth treatment of drain caissons.

Support vessels also generate bilge water, which may contain water, oil, detergents, solvents, chemicals and particles. Bilge water is typically treated prior to discharge in accordance with regulatory requirements.

Deck drainage from support vessels may also be discharged overboard and may contain traces of hydrocarbons and chemicals. Sources include rainfall events and deck activities such as cleaning or equipment washdown.

Cooling water and brine

Seawater is used onboard the GWA platform for process and machinery cooling (Section 3.6.5.3) and is discharged via the seawater dump caisson. Cooling water is typically discharged at approximately 32°C with volumes of approximately 4,275 m^3/hr.

To control marine growth, the seawater system is dosed with sodium hypochlorite to a target residual concentration of approximately 0.5 ppm prior to discharge.

The reverse osmosis (RO) plant onboard the GWA platform produces potable water, with brine discharged to the environment. RO brine typically has a salinity of 55-60 ppt, with approximately 75 m^3 of brine produced per day. Small quantities of anti-scaling and cleaning chemicals may also be present.

Support vessels also discharge smaller volumes of cooling water and RO brine.

Impact assessment

Environmental value(s) potentially impacted

The environmental impacts associated with routine and non-routine discharges from utility systems, drains and support vessels include:

- eutrophication, resulting from addition of nutrients (e.g. nitrates and phosphorus) from sewage, grey water and putrescible waste, which may lead to oxygen depletion or phytoplankton blooms. Other potential contaminants include ammonia, faecal indicator bacteria, organic compounds, metals and surfactants.
- temporary and localised increases in turbidity as a result of deck water, drainage systems and bilge water
- changes to ambient water quality as a result of deck water, drainage systems and bilge water, are expected to disperse rapidly following discharge. These discharges may contain low concentrations of hydrocarbons, chemicals, particulates and other contaminants.
- changes in temperature, salinity, pH and chemical composition as a result of cooling water discharges. Elevated temperatures may influence marine organisms through behavioural responses (e.g. avoidance or attraction) or minor physiological stress.
- localised increases in salinity from brine discharge, potentially causing osmotic stress to marine organisms, particularly planktonic and sessile species.

Mobile species are expected to avoid discharge plumes, and no impacts to protected species or benthic habitats are expected.

Water quality

Eutrophication, changes in temperature, salinity, pH and chemical composition can impact water quality.

Water quality monitoring around the GWA platform indicates no detectable decrease in oxygen saturation, nutrient levels or increase in oxygen demand (BMT Oceanica 2015). Monitoring of sewage discharges has demonstrated that a 10 m^3 sewage discharge reducing to approximately 1% of its original concentration within 50 m of the discharge location (Woodside 2008). Further monitoring at distances 50-200 m and across multiple depths confirmed no measurable increases above background levels for key parameters (e.g. total nitrogen, phosphorous and metals) (BMT Oceanica 2015).

Although the NWS Province is characterised as a low nutrient environment (DEWHA 2008), it is also recognised as a productive ecosystem with rapid nutrient recycling (Furnas and Mitchell 1999). Estimated nutrient loading from sewage and putrescible waste (approximately 2.4-3.0 kg/day of TN and 0.38-0.43 kg/day of TP) is small relative to natural nutrient turnover.

Discharged cooling water is typically warmer than ambient seawater (ambient range ~24.3–28.5°C). Due to its buoyancy, the discharge forms a near-surface plume that is rapidly mixed by waves and currents. Monitoring at the GWA platform indicates that water temperatures within the mixing zone are consistent with background levels (BMT Oceanica 2015).

Due to its higher density, brine sinks and disperses through the water column, promoting mixing. Monitoring at the GWA platform indicates salinity within the mixing zone is consistent with background levels (BMT Oceanica 2015), demonstrating rapid dilution.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Sodium hypochlorite used for marine growth control is expected to degrade rapidly following discharge. Monitoring indicates no measurable change in pH within the mixing zone, suggesting rapid dilution and dispersion.

Discharges from vessels are typically dispersed due to vessel movement, enhancing mixing. The exception is the ASV, which may remain connected to the GWA facility, if deployed.

Impacts to marine organisms (such as plankton and fish larvae) may occur in the immediate vicinity of discharge points, depending on contaminant type and concentration. While marine fauna may occur within the Operational Area, the open-ocean environment does not contain known areas of ecological aggregation or increased sensitivity associated with these discharges. Any effects on planktonic organisms would be expected to be highly localised and transient due to the rapid dilution and dispersion of discharges. Given the open-ocean setting, plankton communities would be expected to recover rapidly with no lasting effect.

Utility discharges are routine and occur continuously across offshore petroleum facilities. Given the low discharge volumes, rapid dilution and lack of measurable change above background conditions within the mixing zone, cumulative impacts on water quality are not anticipated.

Accordingly, impacts from utility system discharges are expected to be highly localised to the immediate vicinity of discharge points, short-term in duration and not expected to result in measurable or lasting changes to water quality, marine ecosystems or ecological function.

Cumulative Impacts

Cumulative impacts may arise from repeated discharges at the GWA platform and from multiple discharge sources (platform and vessels). These include sewage, grey water, drainage water, bilge water, cooling water and brine, as well as other discharges such as PW.

However, given the small volumes, rapid dilution, localised extent of discharge plumes (typically within ~100 m), and the well-mixed open ocean environment, cumulative impacts are expected to remain slight and low-level.

Given the spatial separation from other facilities (e.g. NRC), cumulative impacts with external sources are not expected.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[34]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
	possible as there is a risk of the collection tank overfilling, resulting in potential spillage of hydrocarbons. CS: Eliminating the discharge by collecting all contaminated run-off and storing it is not practicable due to the size/weight and the unstaffed philosophy.			
Storing, transporting and treating/disposing onshore of sewage, greywater, putrescible and bilge wastes.	F: No. Would present additional safety and hygiene hazards resulting from the storage, loading and transport of the waste material. CS: Not considered – control not feasible.	Not considered – control not feasible.	Not assessed, control not feasible.	No
Helideck foam systems use water as surrogate	F: High. Water can be used as a substitute for foam during testing of the helideck foam system. CS: Low –procedural updates and spool modifications.	Eliminates discharges of foam to the environment.	Benefit outweighs cost/sacrifice.	Yes **C 7.5**
Professional judgement – Substitute				
Long term transport of potable water from shore to the GWA platform and support vessels.	F: Yes. Potable water can be sourced form onshore water supplies. CS: Significant. The long-term costs and operational complexity associated with potable water bunkering outweigh cost and negligible environmental footprint associated with the RO system and brine discharge.	The potential environmental impact is ranked as having no lasting effect. Eliminating brine discharge would provide negligible environmental gain.	When considering the negligible impact from the discharge of brine reliance on bunkering of potable water and incremental support vessel activities is disproportionate to the environmental impact.	No
Professional judgement – Engineered Solution				
Replace existing sewage treatment with an integrated STP of type certified by MARPOL Annex IV Sewage [MEPC.159(55)].	F: Yes. CS: Significant. Replacement of the existing sewage treatment system onboard the GWA facility would require design, procurement and installation costs, for little to no decrease in nutrient concentrations released to the environment.	No meaningful reduction in nutrient-driven impacts (e.g. eutrophication), as nutrient content would be unchanged. Potential for reduced pathogen loading but given no sensitive receptors (i.e. humans) affected by the discharge, this has no environmental benefit.	Given the considerable costs involved in replacing the existing STP, along with the negligible reduction in environmental impact, the cost is considered to be grossly disproportionate to the environmental benefit.	No
Upgrade existing sewage treatment systems by	F: Yes. However, disinfection of sewage is intended to reduce	Minor reduction in impacts due to	Given the installation of a	No

retrofitting a disinfection system.	pathogenic bacterial loads and hence will have no impact on nutrient concentrations. CS: Significant. Installation of a disinfection system would incur design, procurement, installation and ongoing operational costs. Additional chemicals may also be required, introducing an additional source of environmental risk.	treatment of sewage, given offshore environment and high natural mixing which would occur.	disinfection system does not reduce the environmental impact of sewage discharge, along with the potential for additional chemical use, the cost is considered to be grossly disproportionate to the environmental benefit.	
GWA platform open hazardous drain system integrity maintained to contain potential spilled liquid hydrocarbon in areas as appropriate to safe integrated facility design.	F: Yes. CS: Minimal cost. Standard practice.	The open hazardous drain system is maintained to support appropriate disposal of environmentally hazardous liquids.	Benefits outweigh cost/sacrifice.	Yes **C 7.6**
Maintain level instrumentation to monitor and support hydrocarbon level management in GWA platform open hazardous and closed drain caissons to reduce likelihood of hydrocarbon entrainment/underflow from caisson to the environment.	F: Yes CS: Minimal cost. Standard practice.	Caisson level instrumentation ensures functional operational monitoring, to ensure hydrocarbon level is within expected ranges, and excursion alarms annunciate to alert operations as required.	Benefits outweigh cost/sacrifice.	Yes **C 7.7**
ALARP statement: On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage the impacts of planned routine and non-routine discharges of sewage, putrescible waste, grey water, bilge water, drain water, cooling water and brine from the GWA platform and support vessels. As no reasonably practicable additional or alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of Acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, routine and non-routine discharges of sewage, putrescible waste, grey water, bilge water, drain water, cooling water and brine, and firefighting media from either the GWA facility and support vessels are expected to result in localised and short-term impacts to water quality, sediments and benthic habitats, with no lasting effect on ecosystem function. At the platform, these discharges would mix with PW discharges but would dilute well within the established 300 m mixing zone and cumulative impacts beyond this area are not anticipated.

Demonstration of Acceptability
On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), the adopted controls are considered appropriate to manage impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPO is met.

Description of source of impact

Air emissions associated with GWA facility operations can be classified into two categories:

- Atmospheric emissions (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or the environment. The main emissions responsible for these effects include carbon monoxide (CO), oxides of nitrogen (NOx), sulphur dioxide (SO2), particulate matter less than 10 microns (PM10), non-methane volatile organic compounds (VOCs), BTEX (benzene, toluene, ethylbenzene and xylenes), which are specific VOCs of interest.
- Greenhouse gas (GHG) emissions refer to gases that trap heat within the atmosphere through the absorption of longwave radiation reflected from the earth's surface. The main gases associated with this effect include carbon dioxide (CO2), methane (CH4) and nitrous oxide (N2O). Other greenhouse gases include perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF6). These are considered to be both direct and indirect GHG emissions.

In this section, atmospheric emissions estimates are developed in line with Nationals Pollutant Inventory (NPI) emission estimation techniques (EET). GHG emissions are estimated using the National Greenhouse and Energy Reporting (NGER) Measurement Determination 2008 (Cth).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The following section has been separated into direct GHG emissions (Scope 1) and indirect emissions (Scope 3), aligned with the definitions of the GHG Protocol Corporate Standard (GHG Protocol 2015) and NGER. Scope 2 emissions are not applicable as the GWA facility generates its own power.

The main sources of GHG emissions associated with GWA operations are shown in Table 3-5. In the context of this EP, GHG emissions are classified as direct and indirect emissions. GHG emissions sources that are not part of the Petroleum Activity are included as indirect emissions.

The GHG Protocol 2015 defines indirect GHG emissions as 'emissions that are a consequence of the activities of the reporting entity but occur at sources owned or controlled by another entity.' For the purposes of this EP, the reporting entity is the GWA offshore facility and emissions from facility processes are considered direct emissions sources. Emissions associated with support vessels and helicopter operations are considered indirect emissions sources included as part of the Petroleum Activity, as is onshore processing.

Direct atmospheric and GHG emissions

Direct emissions generated from the GWA facility during the Petroleum Activity include emissions from combustion equipment and generators, flares, fugitives and process vents. Direct emissions and combustion products typically include CO_2, water vapour, NOx, SO_2, methane, refrigerant gases, particulates and VOCs.

A summary of direct GHG emissions reported over the previous four financial years is provided in Table 6-15. Estimates for GHG emissions are informed by NGER data for all relevant direct emissions sources from FY22 onwards. Forecast emissions are expected to vary over the life of the EP in response to changing operational conditions, including facility configuration, production and compression requirements as well as planned and unplanned shutdown activity. Emissions estimates may also change in response to prescribed updates to NGER reporting methodologies and emissions factors.

Table 6-15: Four-year GWA facility GHG (NGER) emissions summary

	FY22	FY23	FY24	FY25
Flared gas

N_2O (tCO_2-e)	6	2	6	9
Total CO2e (t)	2,107	661	2,174	2,996
Fugitives				
Fugitives (tCO_2-e)	3,339	3,204	3,190	3,019
Total				
Total (tCO_2-e)	166,211	156,940	130,674	138,711
Total ($MtCO_2$-e)	0.17	0.16	0.13	0.14

Historical emissions data are presented on a financial year (FY) basis, consistent with NGER obligations. Forecast emissions are presented on a calendar year (CY) basis, consistent with Woodside's operational forecasting,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

emissions planning and performance reporting processes. Although the reporting periods differ, both datasets are presented to provide context on historical performance and the expected future emissions profile of the facility.

Variability in annual emissions for the FY data presented above reflects changes in production rates, compression demand, shutdown activity, flaring performance and diesel consumption. The lower emissions reported in FY24 and FY25 generally reflect reduced production throughput relative to FY22 and FY23, while fluctuations in diesel use are influenced by operational and maintenance activities undertaken during the reporting period. Looking forward, the forecast emissions profile is expected to increase compared with recent historical performance. This is primarily due to declining reservoir pressure, which is expected to increase compression requirements and associated power demand. Future operational requirements are therefore expected to result in higher forecast emissions than those reported in the recent FY historical dataset.

Emissions reduction and energy optimisation opportunities

Woodside continuously evaluates and implements practicable emission reduction and energy optimisation opportunities through the Production Optimisation and Opportunity Management Procedure (POOMP) process (Section 7.2.7.6.1). The POOMP provides a structured framework for identifying, screening, and implementing operational efficiency and emissions reduction initiatives.

Opportunities are assessed for technical feasibility, operational risk, cost and environmental benefit to ensure emissions reduction and energy optimisation measures are implemented where reasonably practicable.

For mature offshore facilities such as GWA, changing reservoir pressure conditions and increasing compression demand may result in increased fuel gas consumption, direct emissions and emissions intensity over time. Accordingly, POOMP initiatives focus on operational efficiency, energy optimisation and reduction of emissions where reasonably practicable, rather than achievement of continuous year-on-year reductions in direct facility emissions.

Emissions reduction and energy optimisation initiatives implemented or progressed through assessment under the POOMP are summarised in Table 6-16. Several opportunities identified through the POOMP process have been incorporated into broader facility optimisation and LLPO-related modification scopes. POOMP opportunities continue to be reviewed against operational requirements, facility configuration, emissions performance and practicability considerations over the life of the EP.

Table 6-16: Emissions reduction activities implemented at GWA since 2016 and currently under assessment

Activity	Estimated emissions benefit (kT CO_2-e/pa)	Status
Turn off T100 stripping gas compressor (until GWF4 RFSU)	8.5	Implemented Q2 2025
Remediate passing BDV / PV to flare	3.3	Implemented Q2 2025
T100 reduced operating pressure	No net reduction, reduces intensity	Implemented Q4 2025
Load shedding system upgrade	Est 2.5	Planned 2028 as part of LLPO
N2 purge prior to flare ignition	Est 10	Assess
Tie in SGC vent to flare	Est 5	Assess, post GWF4 RFSU
Retirement of T100 Glycol Contactor and regeneration	Est 0.8	Assess, target 2031

Several initiatives identified through the POOMP process have been implemented to improve operational efficiency, reduce flare and fuel gas consumption, or reduce emissions intensity during the operational life of the facility. Other initiatives remain under technical, operational or economic assessment, or have been incorporated into broader LLPO and facility optimisation projects. Opportunities continue to be periodically reviewed against operational requirements, facility configuration, emissions performance, operational risk and practicability considerations over the life of the EP.

Fuel gas and diesel combustion

Fuel gas consumption for compression and power generation has been the largest source of combustion emissions from the GWA facility to date making up approximately 70-80% of total emissions. The primary use of fuel gas is for gas export compressors and the GTGs that supply power to the facility. Diesel is used for firewater pumps, emergency generators, cranes and back-up fuel for the turbine generators. Diesel may also be used for start-up or abnormal operating conditions if fuel gas pressure is insufficient.

Fuel gas usage is expected to increase over time as additional compression is required to support production under declining reservoir pressure. Operation of GWF4 and two future tie-in production wells covered by this EP is not expected to result in a material increase in fuel gas consumption relative to the forecast production profile, as the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

developments supplement production from declining reservoirs and do not require a material increase in combustion equipment capacity (e.g. additional GTGs).

Diesel use is expected to vary over the EP period, with higher consumption during common shutdowns and extended shutdowns associated with major project activities such as LLPO installation. In these years, diesel consumption may be up to 1,500 m^3 per annum (excluding support vessels), equivalent to approximately 4,065 tonnes of CO_2-e (Table 6-17). Outside of planned shutdown years, diesel use is expected to be lower, averaging less than 1,000 m^3 per annum. Overall, diesel consumption is expected to remain well below 1,500 m^3 per annum during normal operations.

National Pollutant Inventory Emission Estimation Techniques were applied to determine annual atmospheric emissions (NO_x, SO_x and CO) from fuel combustion on the GWA facility (Table 6-17). Greenhouse gas emissions (CO_2, CH_4, N_2O and CO_2-e) were estimated in accordance with the National Greenhouse and Energy Reporting (Measurement) Determination 2008 (Cth) (as amended), which incorporates factors derived from the National Greenhouse Accounts Factors (NGAF).

Forecast atmospheric and GHG emissions from facility fuel combustion

Forecast emissions are based on representative operating cases for the expected facility configuration over the EP period. The pre-LLPO case reflects current operating conditions. The post-LLPO case reflects operation following implementation of LLPO, including increased compression and associated power generation requirements. Forecasts are developed on a year-by-year basis by applying the relevant operating case to the anticipated activity profile for that year.

The forecast also assumes implementation of LLPO from approximately 2028. Implementation of LLPO is forecast to result in an increase in direct GHG emissions due to increased fuel gas consumption for compression and power generation.

Forecast emissions for the EP period have been developed using representative pre-LLPO and post-LLPO operating cases. These cases incorporate the expected facility configuration, compression demand, GTG loading, diesel use, flaring assumptions and production operating profile for each operating mode. The post-LLPO case reflects the increased compression and power generation required to maintain gas export under declining reservoir pressure conditions.

Table 6-17: Estimated annual atmospheric and GHG emissions from fuel combustion at the facility pre-LLPO (2026-2027) and post-LLPO (from 2028 onwards)

	Pre-LLPO		Post-LLPO[2]

1 Diesel consumption is forecast to be higher during 2027–2029 due to planned shutdown activities, including the LLPO shutdown campaign.

2 Forecast emissions are based on the best available estimates of power demand, EGC throughput and operational requirements for the expected post-LLPO operating configuration. Actual emissions may vary as future production profiles, reservoir conditions and operational requirements evolve over the EP period.

The forecast increase in direct emissions associated with the post-LLPO operating case reflects the substantial increase in compression and associated power generation required to maintain gas export under declining reservoir pressure conditions at a mature offshore facility. While this results in an increase in fuel gas consumption and associated emissions relative to historical operating conditions, the selected LLPO configuration has been developed through engineering and operational assessment considering operational reliability, process safety, facility constraints, energy efficiency and continued use of existing infrastructure. Forecast emissions remain subject to ongoing operational monitoring, optimisation and review over the life of the EP.

Low pressure operations

As reservoir pressure declines over the life of the field, additional compression is required to maintain gas export to the onshore KGP. LLPO will be implemented to enable continued operation under lower pressure conditions.

The increase in emissions associated with LLPO reflects the energy required to maintain production under declining reservoir pressure conditions, rather than an increase in production throughput.

GWF4 and two future tie-in production wells and are expected to utilise available processing capacity as production from existing reservoirs declines. Consistent with the Goodwyn Area Infill Development Offshore Project Proposal, these developments are not expected to result in a net increase in emissions associated with production throughput or flaring.

However, implementation of LLPO will require increased power generation to support compression, resulting in increased fuel use and associated greenhouse gas emissions over time. These emissions are attributable to the broader operational requirement to maintain production under declining reservoir pressure.

LLPO emissions increase reflects declining reservoir pressure and increased compression demand associated with mature field operations, rather than increased hydrocarbon throughput including that which may arise from GWF4 and two future tie-in production wells covered by this EP.

For the GWA facility, emissions are primarily driven by steady-state operations and increasing compression requirements associated with declining reservoir pressure. As such, the forecast assumes continuous operations at representative production levels, which provides a more appropriate and conservative basis for estimating emissions over time.

Flaring

During normal operations, hydrocarbon gas is flared from the GWA facility via the HP and LP flare systems. These systems are maintained to effectively combust hydrocarbons as a critical component for the safe operation of the GWA facility. Combustion efficiency is maintained for low pressure flaring (the major contributor to overall flaring) by the tasks undertaken as part of the P31 Performance Standard. These tasks are undertaken to maintain flare system integrity and flare tip performance, thereby supporting effective combustion of hydrocarbons during flaring operations. The average combustion efficiency of the GWA facility flare is estimated to be approximately 98%.

Gas flaring results in emissions to the atmosphere as part of safe facility operations. Emissions associated with flaring may include CO_2, NOx, SO_2, methane, particulate matter and VOCs. Methane and VOC emissions are primarily associated with incomplete combustion and flare system inefficiencies. Incomplete combustion under certain scenarios may also generate dark smoke. Under normal operating conditions, combustion of hydrocarbon gas during flaring primarily generates water vapour and CO_2.

The release of hydrocarbon gas to the atmosphere from flaring is an essential practice, primarily as a safety requirement and comprises:

- routine flaring associated with flare system purge and pilot, process flows and glycol regeneration
- non-routine flaring that may result from activities such as planned shutdowns and emergency shutdown testing, and unplanned shutdowns and emergency shutdowns, production restarts, equipment outage/failures, subsea flowline depressurisation, and well remediation activities.

Estimated annual flaring emissions for the EP period is presented in Table 6-18. Unlike fuel gas consumption, which is expected to increase over time in response to declining reservoir pressure and increased compression requirements, flaring volumes are primarily influenced by facility operating philosophy, flare system requirements, shutdown activities and operational upsets. Accordingly, flaring volumes are expected to remain relatively stable over the EP period.

Forecast flaring emissions are within the range of recent historical performance and reflect expected operational activities during the EP period, including planned shutdowns and maintenance campaigns. Start-up of new wells covered under this EP is expected to have a relatively small impact on total flaring volumes and is not expected to materially alter forecast flaring trends.

In addition to GHG emissions from flaring, estimated atmospheric emissions are also presented in Table 6-18.

SO_x	trace	trace	trace	trace	trace	trace
CO	119	115	106	110	119	119

1 Forecast flaring emissions are based on the expected operating profile at the time of assessment. Actual flaring may vary due to operational, maintenance and unplanned plant events.

Non-routine venting of process hydrocarbons via the flare system

In the event that flares are extinguished, the hydrocarbon gas discharged via the flare system may initially not be combusted during the period required to purge the flare system and re-establish flare ignition. This may result in the short term (typically less than 24 hours), low-rate release of hydrocarbon gas to the atmosphere. Intermittent venting from the GWA facility represents a minor source of atmospheric emissions and is not considered to lead to additional impacts beyond the routine air emissions described in this section.

Fugitive emissions

Fugitive emissions can occur from pressurised equipment, and are inherent in design. Fugitive emissions may occurdue to infrequent operational activities, or unintentional equipment leaks. Sources can include from valves, flanges, pump seals, compressor seals, relief valves, vents, sampling connections, process drains, open-ended lines, casing, tanks and other potential leakage sources from pressurised equipment.

Discrete relatively small volumes of packed gases and charged systems including refrigerant gases are used across the GWA facility. These have potential for small volume leaks (typically less than 100 kg per isolatable inventory). Refrigerants used on the facility are ozone depleting substance free, synthetic greenhouse gases and managed by licenced refrigeration technicians. The facility is also fitted with a gaseous fire extinguishing system utilising CO2 and FM200. FM200 has zero ozone depleting potential and a low global warming potential. The gaseous fire extinguishing agents are only released as demanded by the applicable safety system or for certification testing.

As the safe operation of the GWA facility relies on effective containment of hydrocarbons, fugitive emissions are expected to remain a minor component of the overall emissions inventory. Fugitive emissions, including those from subsea sources, are inherently difficult to quantify and are estimated by application of methods under the National Greenhouse and Energy Reporting (Measurement) Determination. These emissions are incorporated within the facility-level fugitive emissions estimate and are not reported as discrete emission sources.

Using this technique, the GWA facility reported fugitive emissions to be between 3,019 tCO_2-e and 3,339 tCO_2-e per year in the period FY22-FY25. This range is expected to remain representative for the EP period (next five years) and until EOFL (2040) (Table 6-15). The National Greenhouse and Energy Reporting (Measurement) Determination 2008 (Cth) includes default estimation factors for shallow-water offshore platforms. These factors are one input to the overall facility fugitive emissions estimate and do not represent the total reported fugitive emissions for the GWA facility..

Indirect emissions

Support vessel and helicopter operations

Indirect GHG emissions are generated by facility support vessels as well as helicopters supporting the Petroleum Activity. Vessel emissions include those from internal combustion engines and fugitives as well as incinerators which may be used infrequently onboard vessels to dispose of flammable domestic wastes such as cardboard. Wastes are generally segregated and transported to shore for disposal.

Emissions may vary depending on the nature of activities being undertaken; for example, travelling or “steaming” to a destination at low speed uses less fuel and generates lower GHG and atmospheric emissions than high speed steaming. Emissions generated during safety-related vessel standby activities, holding station using DP during loading and unloading of materials to the facility or undertaking subsea IMMR work also vary. Some vessels may be dual-fuel capable and can use LNG, in which case combustion emissions are expected to be lower.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Expected annual indirect GHG emissions for support vessels and helicopter operations have been estimated based on reported values for previous historic data:

- 2,830tCO_2-e for platform support vessel
- 1,400 tCO_2-e for IMMR vessels, based on diesel consumption
- 730 tCO_2-e for helicopters, based on Jet A1 fuel consumption in 2020

Over the EP period, ASV and HLV may be required to support facility operations and are therefore included within the EP scope. GHG emissions from an ASV, if required, would depend on several factors, including sea state, vessel size and configuration, environmental conditions, crewing levels and activity requirements. Based on these variables, estimated fuel consumption may range from approximately 6-48 tonnes per day for ASV and approximately 15 tonnes per day for an HLV.

For planning purposes, estimated GHG emissions from ASV support are approximately 9,810 tCO_2-e, based on a 90-day campaign. Similarly, an HLV with over a one-month campaign is expected to generate approximately 1,020 tCO_2- e.

Indirect emissions relating to vessels and helicopter operations is a small contribution to the total emissions profile of the Petroleum Activity and are not expected to vary materially for the duration of the EP.

Onshore processing and product end-use

Indirect emissions associated with the Petroleum Activity also arise from hydrocarbon processing (onshore), third party transport of products, regassification, distribution and combustion by end users. This stream of indirect GHG emissions associated with GWA facility operations were estimated based on operational production data, including:

- Total production – indirect emissions are proportional to total production, which varies with shutdown activity, new field tiebacks or gradual reservoir decline.
- Composition of produced gas - onshore emissions are proportional to reservoir CO_2.
- Split of saleable products from KGP – the proportion of hydrocarbons from GWA sold as LNG, condensate, domestic gas and LPG varies. Each product requires differing amounts of energy to process to the point of sale and varies based on reservoir composition, field contribution and commercial reasons.

Forecast direct and indirect GHG emissions are presented in Table 6-19. Indirect emissions from onshore processing, support vessel and helicopter operations as well as product end-use are estimated to be approximately 19.62 MtCO2-e per year, totalling up to 255.06 MtCO_2-e until EOFL (2040). These estimates are gross emissions with net emission being lower due to possible abatement or offsets applied voluntarily or through regulatory mechanisms in Australia and across the value chain and product lifecycle, including internationally. Indirect atmospheric emissions (non-GHG) are discussed in Section 6.7.8.

Table 6-19: Forecast direct and indirect emissions associated with GWA facility offshore production

Source of Impact	Annual estimated emissions (MtCO_2-e)		Total estimated emissions for EP period (MtCO_2-e)	Total estimated emissions until EOFL (MtCO_2-e)
Direct Emissions[2]				
Fuel, flaring and fugitives	Pre-LLPO	Post-LLPO	1.26[4]	3.38
	0.2[3]	0.26[3]		
Indirect Emissions[2]				
Support vessel and helicopter operations	0.005[5]		0.036	0.097
Onshore processing[1]	1.72		8.76	22.78
Third party transport of products, regassification, distribution and end-use	17.86		89.3	232.18

1 Based on 2025 production and KGP emissions intensity apportionment calculation.

2 Source: EcoInvent 3.5 database and National Greenhouse and Energy Reporting (Measurement) Determination 2008. EcoInvent v3.5 represents a large collection of inventory data. It has been recognised as emission factor source for the European Union Renewable Energy Direction GHG methodology and is aligned to the principles of the NGERS methodology.

3 Based on a standard operational year without common shutdown.

4 Based on two common shutdown years along with GWF4 and LLPO specific shutdowns until EOFL in 2040.

5 Stated ASV and HLV emissions are included in the EP period total, rather than in the annual emissions, and are counted three times for the EOFL (2040) estimation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside's current forecast is that the reservoirs produced via the GWA facility will decline toward EOFL. Relatively high initial "plateau" production rates are expected to extend beyond the duration of this EP. This is anticipated to eventually decrease as reservoir/s are depleted towards EOFL, and emissions associated with onshore processing and third-party consumption decline as production volumes reduce over field life. This, however, is subject to reservoir performance, therefore "plateau" production rates have been estimated until EOFL, and impact assessed, to assist in accounting for this uncertainty.

Impact assessment

Air quality

Platform emissions, predominantly from fuel combustion and routine flaring, as well as emissions from support vessel and helicopter operations, have the potential to result in localised, temporary reduction in air quality, generation of dark smoke (if incomplete combustion occurs) and contribution to GHG emissions. Potential impacts of emissions depend on the nature of the emissions, as well as the location and nature of the receiving environment.

Platform design (including the rapidly dispersive characteristics of the gas turbine exhausts, flare and other emissions) and the estimated level of pollutants in emissions, as well as the absence of elevated background ambient levels have been considered in estimating the potential for interaction with human and environmental sensitivities. The Operational Area is in a remote offshore location, with no expected adverse interaction with populated areas or sensitive environmental receptors associated with air emissions.

There is a breeding BIA for the wedge-tailed shearwater overlapping the Operational Area; as such, wedge-tailed shearwaters may occur in the airshed. The nearest potential seabird roosting habitat, the Montebello Islands, are 38 km south of the Operational Area. Given the highly dispersed nature of facility air emissions, no adverse impacts to birds are anticipated due to air emissions.

Air emission impacts are not expected to have direct or cumulative impacts on sensitive environmental receptors, or above National Environmental Protection (Ambient Air Quality) Measures. Additionally, air quality around the GWA platform and on support vessels is maintained to provide a safe working environment for crew.

The offshore location of the Operational Area means the flare and potential black smoke resulting from emissions are not directly visible from the nearest landfall (Montebello Islands, 38 km south of the Operational Area at the closest point). Hence, no impacts to visual amenity for residential communities or to tourism activities are expected.

Management and abatement

Woodside's requirements for GHG emissions in the operate phase is applied to continue the identification and evaluation of emission reduction opportunities. These include application of the Emissions and Energy Management Procedure (Section 7.2.7.6) and the Production Optimisation and Opportunity Management Procedure (POOMP) (Section 7.2.7.6.1) to enable continued reduction of direct GHG emissions to ALARP. This includes a system of continual review and improvement of key emissions sources from the GWA platform and ongoing identification, screening and implementation of opportunities to reduce emissions.

Woodside recognises that forecast GHG emissions from the GWA facility are expected to increase over parts of the EP period as additional compression and associated power generation are required to support production under declining reservoir pressure, including following implementation of the LLPO project. While these changes are expected to increase absolute emissions, Woodside will continue to apply emissions and energy management processes to optimise facility performance, minimise avoidable emissions and identify practicable emissions reduction opportunities throughout the operating life of the facility.

During operate phase, Woodside's Flare Management Framework and Woodside's Methane Management strategy will also be implemented. This includes setting of annual flare and emissions targets for the asset, and annual execution of asset-specific Methane Action Plans, with discrete activities consistent with the principles of OGMP 2.0 and OGCI's Aiming for Zero Methane emissions initiative to reduce emissions to ALARP.

Net-emissions limits under the Federal Safeguard Mechanism (SGM)[35]

The Federal Safeguard Mechanism (SGM) requires Australia's highest greenhouse gas emitting facilities to reduce or limit their emissions in line with Australia's emission reduction targets of 43% below 2005 levels by 2030 and net zero by 2050. Direct and indirect GHG emissions associated with onshore processing of gas from the GWA facility (through its contribution to the North West Shelf Project Facility), as well as indirect emissions associated with the transportation and end use of gas within Australian safeguard facilities are subject to the SGM, and net emissions from these sources must be kept below a specified limit or baseline.

Safeguard facilities that exceed their baseline must manage their excess emissions, such as by surrendering Australian Carbon Credit Units (ACCUs) or Safeguard Mechanism Credits (SMCs), which are representative of one tonne of CO2-e per credit, so that net emissions are brought in line with the baseline. To ensure sufficient credits are available and that there is a means to comply, safeguard facilities that exceed their baseline are able to buy

[35] *Further information about the SGM and SGM Baselines can be found at the Clean Energy Regulator website: https://cer.gov.au/schemes/safeguard-mechanism and https://cer.gov.au/schemes/safeguard-mechanism/safeguard-baselines*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Government-held ACCUs from the Clean Energy Regulator via the Cost Containment Measure implemented as part of recent reforms.

SGM obligations for the North West Shelf Project Facility, which include the GWA facility and onshore processing at KGP, are to be met by emissions abatement via operational controls as first preference. Options to manage residual net emissions in excess of baseline include surrendering ACCUs or SMCs, applying to become a trade-exposed baseline-adjusted facility, applying to borrow baseline from the following year or applying for a multi-year monitoring period. Surrendered carbon credits may be generated from Woodside projects, purchased from the market or purchased from the government through the Cost-Containment Mechanism.

NGERS requires Woodside to report GHG emissions and energy use from activities under its operational control. This includes continued reporting for the North West Shelf Project Facility, including the contribution from the GWA facility, in accordance with its requirements under the NGERS Act.

Carbon Management – Business Context

Woodside's carbon business was established in 2018[36] to develop and manage a portfolio of carbon credits. Woodside's priority is to avoid and reduce emissions. We utilise certified carbon credits to offset equity Scope 1 and 2 greenhouse gas emissions that are above our targets in a given year after avoid and reduce measures have been taken. We prioritise abatement at facilities before we use carbon credits as offsets.

Woodside climate targets

Woodside is targeting a reduction of net equity Scope 1 and 2 GHG emissions of 15% by 2025[37] and 30% by 2030[38], with an aspiration of net zero by 2050 or sooner. Woodside delivered its 2025 net equity Scope 1 and 2 GHG emissions reduction target.[39] Net equity Scope 1 and 2 GHG emissions reduction targets and aspiration are relative to a starting base of 6.27 $MtCO_2$-e which is representative of the gross annual average equity Scope 1 and 2 GHG over 2016–2020 and which may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets, inclusive of those required to meet regulatory obligations.

There is no direct mapping of these corporate level Scope 1 targets to GWA operations. Abatement of these emissions may come from other facilities with more cost-effective or impactful abatement opportunities, or from offsets. Meeting these targets may mean additional net voluntary abatement beyond that required by the SGM described above.

Other regulatory framework for management of indirect GHG emissions from onshore processing

As described above, indirect GHG emissions will be generated by onshore processing of gas from the GWA facility. Onshore processing facilities are also subject to GHG emissions management frameworks and relevant regulatory approvals.

On 15 October 2024, the WA State Government published its updated greenhouse gas emissions policy for major projects (State policy) assessed by the EPA. Recognizing reforms that strengthened the SGM in 2023, the State policy describes that conditions to reduce net greenhouse gas emissions will no longer be applied to major proposals assessed under Part IV of the Environmental Protection Act 1986 where the proposals are subjected to alternative regulatory measures such as the SGM.

In November 2024, the EPA updated its Environmental Factor Guideline: Greenhouse Gas Emissions with consideration of 'rapidly evolving' climate science and policy and the updated State Policy. In its updated guideline, the EPA states that 'emission reductions required under the SGM are now likely to represent an "as far as practicable" reduction of, and in most cases meet its factor expectation for, covered emissions'.

Management and Abatement for Third Party Consumption (inc. Transport, Regasification, Distribution, Combustion) (Indirect)

Woodside continues to pursue a range of management and abatement measures relevant to GHG emissions associated with third party consumption of gas from GWA. These are appropriate and practicable given that Woodside does not have operational control over third party GHG emissions. Examples of initiatives Woodside is currently involved with are provided below.

Reduce

[36] Woodside Energy Carbon (Services) Pty Ltd was established in 2021.

[37] Targets and aspiration are for net equity Scope 1 and 2 greenhouse gas emissions relative to a starting base of 6.32 MtCO2-e which is representative of the gross annual average equity Scope 1 and 2 greenhouse gas emissions over 2016-2020 and which may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets.

[38] The target means that net equity emissions for the 12-month period ending 31 December 2030 are targeted to be 30% lower than starting base.

[39] Achievement of the target reflected a combination of underlying emissions performance at our facilities and the use of carbon credits. These net equity GHG emissions were 15% below the starting base for the 12-month period ending 31 December 2025.

Methane Guiding Principles (MGP): Woodside adopted the MGP in 2018. The MGP focuses on priority areas for action to reduce methane emissions across the natural gas supply chain.

Completed activities under the MGP include:

- led the "Global Midstream Initiative" which encourages MGP members to engage and collaborate with supply chain and share best practises for methane reduction
- sponsored the first technical workshop of the Australian Energy Producers methane taskforce
- presented and participated in panels at the Global Methane Summit and International Gas Union conference

In 2025, the Methane Guiding Principles, having achieved its objectives, was retired as a standalone initiative, with key activities transferred to other organisations such as the International Association of Oil and Gas Producers (IOGP) which Woodside is a member of.

ASEAN Methane Leadership Programme: The ASEAN Methane Leadership Program (MLP) links directly to ASEAN's regional energy and climate goals through fostering collaboration among Southeast Asian countries and energy companies. The MLP aims to build capacity and drive coordinated action across ASEAN members to reduce methane emissions and align with global commitments like the Global Methane Pledge. Woodside has been involved with the ASEAN MLP since 2023.[40]

OGMP 2.0: Woodside joined OGMP 2.0 in 2024. The OGMP 2.0 is the United Nations Environment Programme's flagship oil and gas reporting and mitigation programme.[41] OGMP 2.0 is the only comprehensive, measurement-based reporting framework for the oil and gas industry that improves the accuracy and transparency of methane emissions reporting. This is key to prioritising methane mitigation actions in the sector. In 2025, Woodside submitted its inaugural report to OGMP 2.0. Our Implementation Plan was also recognised as "Gold Standard Pathway" by the UN Environment Program.

Woodside shares examples of emissions reduction initiatives being implemented on its assets with the operator of non-operated assets at governance forums and joint venture technical committee meetings. Examples have included sharing knowledge about methane measurement (such as drone observation surveys), reduction opportunities such as thermal oxidisers at the Wheatstone asset, and approach to workforce engagement on decarbonisation and identification of opportunities.

Woodside also supports customers[42] to avoid or reduce their emissions via the investment in new energy products and lower carbon services, including the progression of corporate Scope 3 targets that apply across Woodside's portfolio including:

- Scope 3 Investment Target[43]: Woodside has a Scope 3 investment target aiming to invest $5 billion in new energy products and lower carbon services by 2030[44]
- Scope 3 Emissions Abatement Target[45]: Woodside has a Scope 3 emissions abatement target, to indicate the potential abatement impact of these products and services upon customer Scope 1 or 2 emissions. This target it to take final investment decisions on new energy products and lower carbon services by 2030, with total abatement capacity of 5 Mtpa CO_2-e[46].

Substitute

Promoting and marketing the role of LNG in displacing higher carbon intensity fuels (IEA, 2019): Woodside continues to advocate LNG as a means for customers to reduce their Scope 1 and 2 emissions, in accordance with the customer nations' Nationally Determined Contribution (NDCs) (see section below). The NWS Joint Venture, including continued investment and LNG offtake by Japanese companies, as well as recent portfolio LNG sales contracts with KOGAS (Korea) and China Resources (China) in 2024, demonstrates a long-term recognition of the contribution of GWA gas to meeting global energy demand. Further, evidence of the effectiveness of this strategy across Woodside's

[41] https://www.unep.org/explore-topics/energy/what-we-do/methane/oil-gas-methane-partnership-20-ogmp-20.

[42] *The customers for these products and services may be the same as the customers of our oil and gas business, directly substituting their energy for new products or directly abating the associated emissions. There may also be customers of the new products and services, without also being customers of oil and gas.*

[43] *Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment. Timing refers to financial investment decision, not start-up/operations.*

[44] *Includes pre-RFSU spend on new energy products and lower carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 emissions which are managed separately through asset decarbonisation plans.*

[45] *Same as footnote 32.*

[46] *Includes binding and non-binding opportunities in the portfolio, subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance.*

portfolio is the recent buy into the Scarborough project by Japan LNG (10% – 8 August 2023) and JERA (15.1% – 23 February 2024) with associated potential LNG offtake and collaboration on opportunities in new energy.

Advocate

Advocate for stable policy frameworks that reduce carbon emissions: Woodside aligns its advocacy to support the goals of the Paris Agreement. A list of speeches and submissions to international and domestic audiences which contain climate related content or positions in 2025 is available in the climate section of our website.

Monitor and report

Monitor and report on the global energy outlook: This will be achieved via the release of Woodside's annual disclosures.

Detailed impact assessment

Assessment of potential climate change impacts

Climate change is caused by the net global concentration of GHG in the atmosphere. Human-caused climate change is a consequence of more than a century of net GHG emissions from energy use, land use change, lifestyle patterns of consumption, and production (IPCC 2023). The IPCC has stated that observed increases in GHG concentrations since 1750 leading to climate change are unequivocally caused by human activities and that there's a near linear relationship between cumulative anthropogenic CO2 emissions and the global warming they cause (IPCC 2023). This relationship implies that reaching net zero anthropogenic CO2 emissions is a requirement to stabilize human-induced global temperature increase at any level, but that limiting global temperature increase to a specific level would imply limiting cumulative CO_2 emissions to within a carbon budget (IPCC 2023).

As stated by the IPCC, "it is unequivocal that human influence has warmed the atmosphere, ocean and land. Widespread and rapid changes in the atmosphere, ocean, cryosphere and biosphere have occurred". These impacts are summarised in the below section Climate Change – Global and Australian Context.

The Paris Agreement

The Paris Agreement is an international treaty on climate change, signed in 2016. It includes the goal to hold "the increase in the global average temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C."

Carbon budgets "refer to the total net amount of carbon dioxide that can still be emitted by human activities while limiting global warming to a specified level" (IPCC 2023). A number of factors influence the calculation of remaining carbon budgets, such as the level of global warming chosen, probability, contribution of other greenhouse gases, how much global warming has already occurred due to historical emissions. The remaining carbon budget to limit global warming to 1.5°C and 2°C was 500 $GtCO_2$ and 1350 $GtCO_2$ respectively, as calculated from 2020 (IPCC 2023).

Since 2020, a portion of this global carbon budget has been consumed by ongoing global CO_2 emissions. The Global Carbon Budget, an initiative of the Global Carbon Project of the University of Exeter "tracks the trends in global carbon emissions and sinks and is a key measure of progress towards the goals of the Paris Agreement." It is recognised by being presented at the UNFCC's Conference of Parties (COP) sessions. The last Global Carbon Budget in 2024 estimated that the remaining carbon budget for cumulative global GHG emissions to limit global warming to 1.5°C, and 2°C were 235 GtCO2, and 1,110 GtCO2, respectively, at January 2025 (50% likelihood).

GHG emissions associated with GWA are estimated to be up to 258.44 MtCO2-e until EOFL, of which approximately 22.78 $MtCO_2$-e may originate from extraction and processing in Australia. The peak projected annual extraction and processing of GHG emissions from GWA is estimated to be 1.72 $MTCO_2$-e. Noting in context, Australia's net greenhouse gas emissions from all sectors in 2025 was 458.9 $MtCO_2$-e. (DCCEEW, 2024e).These emissions will not materially or substantially contribute to either Australia's GHG emissions or global GHG emissions and are considered de minimis. Further, net emissions associated with GWA in Australia (through its contribution to the North West Shelf Project Facility) are set to be lower than these totals - with ongoing abatement via implementation of the NGERS Safeguard Mechanism which sets out an abatement trajectory consistent with achieving Australia's emission reduction targets of 43% below 2005 levels by 2030 and net zero by 2050 (DCCEEW, 2023e).

The Australian domestic policy response to its Paris Agreement commitments is contained in multiple pieces of Commonwealth legislation (for example, Australian Registry of Emissions Units Act 2011 (Cth); Carbon Credits (Carbon Farming Initiative) Act 2011 (Cth); Climate Change Act 2022 (Cth); National Greenhouse and Energy Reporting Act 2007 (Cth); National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015 (Cth); Offshore Electricity Infrastructure Act 2011 (Cth); Renewable Energy (Electricity) Act 2000 (Cth)). There are also climate change policies at State level. Policies and mechanisms of this kind will serve as Woodside's primary means of managing GHG emissions.

The Federal SGM described in the Management and Abatement section above is the key piece of legislation that implements the Australian Government's policy for reducing emissions at Australia's largest industrial facilities. The SGM sets legislated limits. known as baselines, on the net greenhouse gas emissions of these facilities. These emissions limits will decline, predictably and gradually. Through these limits, the Australian Government aims to help achieve Australia's emission reduction targets, as committed in Australia's NDC to the Paris Agreement of 43% below 2005 levels by 2030 and net zero by 2050.

Climate related scenarios

The use of fossil fuels for energy currently accounts for around three quarters of anthropogenic GHG emissions (IEA 2021). This means that efforts to meet climate change goals must include changes to the way that the world produces and consumes energy. These changes are referred to as the "energy transition".

The precise shape and pace of the energy transition is uncertain. It is expected to vary in different countries because they have different starting points, development requirements, resources and capabilities. However, the scale of the transition is clearer. It will take many trillions of dollars, invested over decades. The International Renewable Energy Agency estimates it will require $115 trillion of cumulative investment by 2050 (IRENA 2022).

During 2022, the world experienced what the IEA has called the "first truly global energy crisis" (UNFCCC 2022). This crisis has seen higher energy prices and in some cases constraints on access to energy supply, impacting both businesses and households. The energy crisis has led to a renewed focus on energy security and has reconfirmed that the energy transition needs to be carefully managed if it is to be fair, inclusive and ultimately successful.

Gas from GWA is understood to have an ongoing role in supporting customers' plans to secure their energy needs, while they reduce their emissions. Current uses of gas include power generation[47], heating and chemical feedstock.

In 2021, the IEA published its Net Zero by 2050: A Roadmap for the Global Energy Sector report (the NZE Scenario) (IEA 2021). The report is clear that "the route mapped out here is a path, not necessarily the path", and Woodside recognises that this is one scenario out of many. A range of pathways are considered by the IPCC.

Even in the NZE Scenario, investment in oil and gas development does not cease. The IEA estimates the need for an average $365 billion of upstream oil and gas investment every year until 2030, and $171 billion every year thereafter to 2050 is required in the NZE Scenario. The IEA cautions that "The fact that no new oil and natural gas fields are required in the NZE does not mean that limiting investment in new fields will lead to the energy transition outcomes in the NZE. If demand remains at higher levels, reduced investment would result in a shortfall in supply in the years ahead, and this would lead to higher and more volatile prices.

A range of climate pathways that limit global warming to either 1.5°C or 2°C have been published in addition to the NZE Scenario. Figure 6-3 shows the range of potential global gas consumption in these scenarios, along with forecast supply with and without new investment.

[47] *Electricity generation fuelled with natural gas typically releases about half the lifecycle amount of greenhouse gases compared to electricity generation fuelled with coal (IEA 2019). Additionally, natural gas fired electricity generation offers a flexible means of providing support to batteries and help stabilize the power grid during periods of reduced renewable energy production (e.g. at night, and when the wind is calm).*

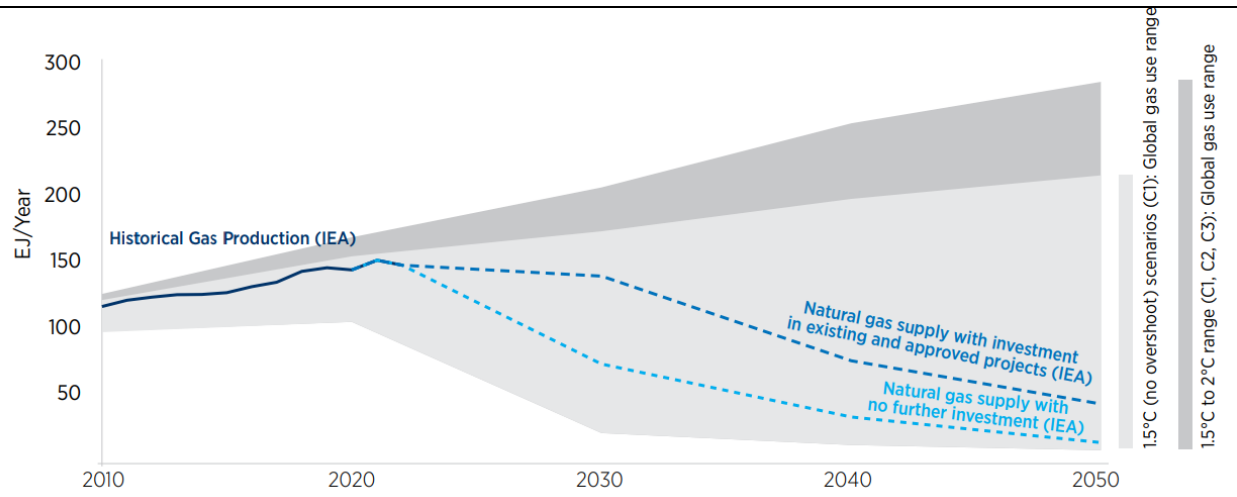

Figure 6-3: Forecast global gas use in climate pathways that limit warming to 1.5°C and 2ºC, with expected supply[48],[49],[50]

Woodside notes that the IEA has published two special reports, Emissions from Oil and Gas Operations in Net Zero Transitions and The Oil and Gas Industry in Net Zero Transitions (IEA 2023). Combined, these reports note that oil and gas operations currently account for around 15% of total energy related emissions globally, identify and advocate for opportunities for oil and gas producers to abate these emissions, and analyse broader implications for the sector through the energy transition which includes the need for increased investment in clean energy. This EP demonstrates that management and abatement measures applied reduce GHG emissions associated with the Petroleum Activity to ALARP and acceptable levels. Through meeting requirements of the SGM, direct GHG emissions and those created by onshore processing at KGP are aligned with Australia's emission reduction targets under the Paris Agreement. Further, Woodside's Scope 3 targets demonstrate how Woodside's products and services can help our customers avoid or reduce their Scope 1 or 2 emissions and therefore reduce life cycle (Scopes 1, 2 and 3) emissions intensity of Woodside's portfolio.

Woodside notes that the IEA makes the following statements in their World Energy Outlook 2024 on LNG demand in their Stated Policies Scenario (STEPS), Announced Pledges Scenario (APS) and Net Zero Emissions by 2050 Scenario (NZE):

- In the STEPS, LNG demand increases by more than 2.5% per year over the 2023-2035 period, which is faster than overall natural gas demand but far less rapid than the average 6% per year LNG growth rate between 2013 and 2022. Around 270 billion cubic metres (bcm) of new LNG supply is currently under construction, and this will lead to a near-doubling of capacity in the United States and Qatar, which are set to dominate supply in 2035, together accounting for around 50% of global LNG trade in the STEPS by this date. This increased supply concentration is likely to put a spotlight on possible security of supply risks that might arise from extreme weather in the Gulf of Mexico and from disruption in the Middle East.
- Due to an upward adjustment to projected natural gas demand growth to 2030, LNG demand growth in the STEPS is higher than in the WEO-2023, reaching more than 700 bcm by 2035. However, this pace of growth does not keep pace with export capacity additions. As a result, a 130 bcm surplus emerges by 2030, bringing prices down in key importing regions like the European Union, China and Japan to a range between USD 6.5- 8.5 per million British thermal units (MBtu). This makes it difficult for some exporters to fully recover their long-run marginal cost of supply during this period.
- This LNG surplus narrows in subsequent years as LNG demand growth continues in the 2030s, and a supply gap emerges in 2040. By 2050, around 175 bcm of additional LNG export capacity is required in the STEPS to cover both demand growth and retiring capacity. This additional supply mainly comes from the Middle East, East Africa and North America. In the APS, projects currently under construction are sufficient to meet LNG demand: this peaks at 650 bcm in 2030, and no supply gap emerges. In the NZE Scenario, In the NZE Scenario, demand can be met in aggregate from projects existing today, without any need for additional LNG from projects currently under construction: this has a profound effect on gas prices in importing regions, which fall to around USD 5/MBtu by 2030.

Japan and Korea have significant energy- and carbon-intensive industry sectors which account for approximately 30% of GDP for each. Most energy used in industry is imported, which creates a priority for energy security during energy transitions. In the APS, energy supplies in Japan and Korea are underpinned by a variety of sources over the next decade as they pivot to increased use of clean energy sources – including renewables, nuclear and low emissions fuels – to reduce emissions and secure supply. Although the share of fossil fuels in power generation decreases through to 2035 and beyond, natural gas continues to provide stable and flexible power for both countries in light of limited domestic supply options or interconnections with neighbouring countries. Natural gas is projected to remain an

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

important energy source, accounting for nearly 12% of the power mix in 2035 in the APS, though gas-fired power drops to just 3% by 2050.

It is acknowledged that information related to climate related scenarios and the energy transition are subject to change, through mechanisms such as ongoing work by the IPCC and other agencies. Woodside will stay abreast of such changes and apply change management processes as described in Section 7.2.8.

Gas's role in energy system

The IEA identifies that there are strong macroeconomic drivers for growth in natural gas consumption in emerging markets and developing economies in Asia over the next decade, at least partially driven by coal to gas switching which "helps countries with net-zero emissions targets accelerate the transition away from coal, even if renewables are the major source of emissions reductions" (IEA 2023).

In the 2019 report The Role of Gas in Today's Energy Transition, the IEA indicates that electricity generation fuelled with natural gas typically releases about half the lifecycle amount of greenhouse gases compared to electricity generation fuelled with coal (IEA 2019). Additionally, natural gas-fired electricity generation offers a flexible means of providing support to batteries and helps stabilise the power grid during periods of decreased renewable energy production (e.g. at night or when the wind is calm).

The same IEA report states that "beating coal on environmental grounds sets a low bar for natural gas, given there are lower emissions and lower cost alternatives to both fuels". However, as shown in Figure 6-3 there is ongoing demand for gas in Paris-aligned scenarios regardless of the presence or trajectory of renewable energy development.

The IPCC has noted carbon intensity (from fossil fuel combustion and industrial processes) decreased, with large regional variations, over the 2010-2019 period "mainly due to fuel switching from coal to gas, reduced expansion of coal capacity, and increased use of renewables" (IPCC 2023).

Global energy demand is expected to increase. Since the availability of gas can support the reduction of more carbon-intensive firming fuel sources such as coal, rather than displacing renewable energy, it cannot be assumed that emissions associated with customer consumption of GWA gas would be entirely additive to global atmospheric emissions.

While the US market is not expected to be customers for GWA gas, it serves as a relevant example. In an article titled Natural gas is now stronger than ever in the United States power sector, the IEA states "the switch from coal to gas and uptake of renewables has lowered emissions in the US power sector… In this period, gas-fired generation more than doubled while coal-fired generation was cut by half" (IEA 2023)

Asia has more than half of the world's people and is growing. Across Asia many countries are still heavily reliant on coal which accounts for approximately 50% of the total energy supply in the Asia Pacific (IEA 2020).

Gas also provides important input to industry, with industrial uses of gas including:

- A feedstock for ammonia and methanol production, which are used for fertiliser and consumer goods manufacturing, among other processes that fuel economic growth and an increasing population
- A source of hydrogen production for the refining and chemical industries
- A source of heat for high-temperature industrial processes, such as producing aluminium, ceramics, cement, glass and steel. Due to its high energy density and controllable combustion characteristics, gas is particularly suitable for generating high temperature heat which may not be achievable through direct electrification (International Gas Union 2023).

Woodside currently expects that natural gas will continue to have a role in the energy transition.

Consideration of likely customer markets and associated energy mixes is important to understand the context of emissions from third party consumption of GWA gas. GWA includes joint venture partnerships and is geographically positioned to provide LNG to Asian markets, which also enables lower shipping emissions. The strong demand for GWA gas, including from customer nations who have publicly stated that they intend to use LNG as part of their

[48] Charts utilise IPCC ranges for oil and gas usage in scenarios that have a 50% or greater probability of limiting warming to 1.5°C with no or limited overshoot (C1), a 50% or greater probability of returning warming to 1.5°C after a high overshoot (C2), a 67% or greater probability of limiting warming to 2°C (C3) from AR6-WG3. IPCC data representing outlooks for Primary Energy Oil and Primary Energy Gas was sourced from AR6 Scenarios Database

[49] Data points sourced from the IPCC includes 2010, 2020, 2030, 2040 and 2050. Historical data from the IEA is provided on an annualised basis. Forward looking data from the IEA includes 2030, 2040, 2050. Woodside has used interpolation of the IEA and IPCC data points in intervening years. This is a work derived by Woodside Energy Ltd from IEA material and Woodside Energy Ltd is solely liable and responsible for this derived work. The derived work is not endorsed by the IEA in any manner. IEA data was converted to exajoules using conversion factors obtained from the IEA report; The Oil and Gas Industry in Net Zero Transitions, IEA 2023. IEA and IPCC scenarios are not predictions or forecasts and are representative of views of the future. Woodside's approach to analysing and assessing future energy market conditions is based on qualitative and quantitative factors and may vary from any one scenario presented by the IEA or IPCC.

approach to meeting their Paris Agreement commitments (see the next section below), some of which already receive LNG from the GWA facility, indicate that it is possible for GWA gas to have a role in reducing global emissions.

The International Energy Agency (IEA) forecasts suggest that most future gas demand in Asia is China, India, Japan, Korea and other developing regions. These regions are existing or likely customer markets for the purpose of evaluating the role of gas from GWA in existing energy mixes. This does not preclude the sale of gas from GWA to other customers.

Customer markets' nationally determined contribution (NDC)

The emissions associated with the consumption of GWA gas along with other feed sources in customer markets will be considered under domestic and international emissions control frameworks. Anticipated and existing customers of gas from GWA are in countries that are parties to the Paris Agreement. Under the Paris Agreement and global GHG accounting conventions, each country is responsible for accounting for, reporting and reducing emissions that physically occur in its jurisdiction. As described in the Management and Abatement section above, Woodside will seek to minimise these emissions as appropriate to our level of control.

The Paris Agreement requires countries to publish NDCs which outline their commitments towards achieving the goals of the Agreement. GHG emissions associated with customer use in countries that have ratified the Paris Agreement are considered under relevant national plans, summarised along with other policies below:

- Japan: "Japan aims to reduce its greenhouse gas emissions by 46 percent in fiscal year 2030 from its fiscal year 2013 levels, setting an ambitions target which is aligned with the long-term goal of achieving net zero by 2050." Japan also published an "Outline of Strategic Energy Plan" in October 2021. This plan assumes that LNG, while reducing from 37% in 2019, still makes up 20% of Japan's electricity generation mix in 2030.
- The People's Republic of China: "China would scale up its NDC by adopting more vigorous policies and measures and aims to have CO2 emissions peak before 2030 and achieve carbon neutrality before 2060." It goes on to state that "energy storage and gas-powered electricity will be stepped up rapidly"
- Republic of Korea: "The Republic of Korea is seeking to dramatically phase down coal-fired power generation while ramping up renewable power. Aged coal power plants will be shut down or shift their fuels from coal to Liquefied Natural Gas (LNG)."

Woodside's analysis of the NDC and key policy documents of key customer nations is that LNG has an important role in supporting their decarbonisation plans under the Paris Agreement. If the introduction or continuation of GWA LNG into the global energy market serves to reduce GHG emissions elsewhere, then in Woodside's view the full volume of GHG emissions associated with the activity are not expected to be additive to global GHG concentrations.

Gas' role in Australia's energy market

Domestic users of GWA gas are expected to be subject to Australia's GHG framework which reflect Australia's NDC, such as the SGM which applies to Australia's largest industrial facilities.

The primary product from GWA is LNG. However, GWA also contributes to the WA domestic gas network through production of pipeline domestic gas.

The emissions intensity of gas-fuelled electricity generation in Western Australia can be compared to other fuels data published by the Clean Energy Regulator (CER 2024). This includes data for designated generation facilities only, which according to the CER are facilities "where the principal activity is electricity production." This data is summarised in Table 6-20.

Table 6-20: Comparative emissions intensity of different energy sources in Western Australia, 2022 2023 financial year

Primary Fuel	Total Generation (million MWh)	Scope 1 and 2 Emissions ($MtCO_2e$)	Emissions Intensity (tCO_2e/MWh)
Natural Gas	13.89	7.95	0.57
Coal	6.23	5.33	0.86
Oil, Diesel	0.10	0.06	0.65
Solar, Wind, Hydro	3.79	0.00	0.00
Other	0.10	0.01	0.08
Total	24.10	13.35	0.55

Table 6-20 shows that the GHG emissions intensity of gas-fuelled electricity generation in WA is approximately 30% lower than coal-fuelled electricity generation, and comparable to that of the total aggregated electricity generation. This may continue to change, for example as the portion of electricity generated from zero-carbon sources increases.

As stated by the Australian Energy market Operator:

[the 2023 data shows] strong growth in electricity demand, driven by electrification, electric vehicle uptake, and new energy-intensive industries including green hydrogen production. Several of these trends lead to reduced gas

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

consumption. However, increases in expected electricity consumption, coupled with the phased closure of state-owned coal power stations has a corresponding impact on modelled use of gas-powered generation to support the transition to a majority-renewables power system

and

Pressures associated with future coal supply and the planned retirements of coal-fired generation, are expected to increase the reliance of the South West Integrated System gas powered generation (GPG) fleet, and GPG is expected to play an important role, along with renewables, storage and supporting transmissions infrastructure, in ensuring the reliability in the SWIS as the energy transition continues. (AEMO 2023)

Continuing operations of NRC and associated KGP will deliver more gas to the WA market, at a time when WA is predicted to face supply shortages. According to 2022 WA Gas Statement of Opportunities report by Australian Energy Market Operator (AEMO) it is forecast there will be insufficient gas supply to meet WA demand. NRC gas will continue to help to address the anticipated forecast supply gap in the WA domestic gas market.

GWA contribution to global GHG concentrations

GWA operations create Scope 1 GHG emissions from the Petroleum Activity and Scope 3 emissions associated with onshore processing at KGP.

The remaining carbon budget to limit global warming to 1.5°C and 2°C was 500 $GtCO_2$ and 1,350 $GtCO_2$, respectively, as calculated from 2020 (IPCC 2023).

Since 2020, a portion of this global carbon budget has been consumed by ongoing global CO2 emissions. The Global Carbon Budget, an initiative of the Global Carbon Project of the University of Exeter "tracks the trends in global carbon emissions and sinks and is a key measure of progress towards the goals of the Paris Agreement." The University of Exeter presented at the UNFCC's Conference of Parties (COP) sessions. The last Global Carbon Budget in 2024 estimated that the remaining carbon budget for cumulative global GHG emissions to limit global warming to 1.5°C, and 2°C were 235 $GtCO_2$, and 1,110 $GtCO_2$, respectively (50% likelihood).

As described above, LNG can have a role in displacing higher carbon intensity fuels and lowering carbon intensity of existing energy mixes, and key customer nations have stated that LNG has an important role in supporting their decarbonisation plans under the Paris Agreement. If the continuation of GWA LNG into the global energy market serves to reduce GHG emissions elsewhere, then the full volume of GHG emissions associated with the activity may not be additive to global GHG concentrations.

To facilitate a comparison against carbon budgets, a hypothetical scenario is considered where GHG emissions associated with GWA are treated as entirely additive. This scenario is not expected to eventuate due to the reasons described above. The estimated GWA GHG emissions over the expected remaining life of the development are compared with remaining carbon budgets expected to achieve the goals of the Paris Agreement below. Additionally, no allowance is given for future abatement of GHG emissions associated with the facility (such as through future abatement opportunities or future policy requirements), or changes to the carbon budgets which are known to be estimates only. As described above, the carbon budgets are developed based on CO_2 only, however. the comparison below conservatively considers all GHG emissions from the facility normalised as CO_2-e, the vast majority of which are CO_2 (Table 6-21).

Table 6-21: Comparison of potential lifecycle GHG emissions associated with the GWA offshore operations to global carbon budgets, assuming they are additive

Source	Estimated GHG Emissions until EOFL[1] ($MtCO_2$-e)	Proportion of remaining global carbon budget – achieving 1.5°C (235 $GtCO_2$)	Proportion of remaining global carbon budget – achieving 2°C (1,110 $GtCO_2$)
Direct emissions Support vessels and helicopter operations	3.38	0.00%	0.00%
Onshore hydrocarbon processing	22.78	0.01%	0.00%
Third party transport of products, regasification, distribution and end use	232.18	0.10%	0.02%
Total	258.44	0.11%	0.02%

1 Based on EOFL in 2040.

Emissions associated with onshore processing of GWA gas is also subject to GHG frameworks which are expected to reduce the estimate from the gross figure used, such as the SGM (through its contribution to the North West Shelf Project Facility).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Assuming the scenario in which all GHG emissions associated with potential remaining GWA field life are additive to global GHG gas concentrations, which they may not be, GWA's contribution to the global carbon budget required to meet the goals of the Paris Agreement is de minimis.

Climate change – global and Australian context

Climate change is caused by the net global concentration of greenhouse gases in the atmosphere. Noting that human-caused climate change is a consequence of more than a century of net GHG emissions from energy use, land use change, lifestyle patterns of consumption, and production (IPCC 2023), the following contextual evaluation of Climate Change impacts is provided.

Climate science is a rapidly evolving field in which new observations continue to deepen understanding of the current and potential impacts of global warming, and the possible pathways for mitigation and adaptation.

The CSIRO State of the Climate 2024 Report (CSIRO, 2024) draws on the latest national and international climate research, encompassing observations, analyses and future projections to describe year-to-year variability and longer-term changes in Australia's climate. Key points from this report on measured warming trends and forecast trajectories include the following:

- Australia's climate has warmed by an average of 1.51 ± 0.23°C since national records began in 1910.
- Sea surface temperatures have increased by an average of 1.08°C since 1900.
- The warming has led to an increase in the frequency of extreme heat events over land and in the oceans.
- Mass coral bleaching is a stress response of corals occurring primarily due to elevated ocean temperature, with five bleaching events associated with marine heatwaves occurring on the Great Barrier Reef over the past 10 years: in 2016, 2017, 2020, 2022 and 2024. In 2016, bleaching was associated with then record high sea surface temperatures, which in turn led to the largest recorded mass bleaching to date on the Great Barrier Reef.
- The 2022 event was the first time that mass bleaching occurred on the Reef during a La Niña year. Accumulated thermal stress during the 2024 event was higher than in 2016, although the full impact in terms of bleaching is still being assessed.
- In 2022 bleaching was also observed on some reefs on Australia's west coast, including Ningaloo Reef. This was due to warm ocean temperatures, driven by the 2021–2022 La Niña. The region's previous severe marine heatwave was driven by the 2010–2011 La Niña, which resulted in bleaching being recorded for the first time on Ningaloo and the closure of several Western Australian fisheries.
- In the south-west of Australia there has been a decrease of around 16% in April to October rainfall since 1970. Across the same region, May to July rainfall has seen the largest reduction, by around 20% since 1970.
- In the south-east of Australia, there has been a decrease of around 9% in April to October rainfall since 1994.
- Heavy short-term rainfall events are becoming more intense.
- There has been a decrease in streamflow at most gauges across Australia since 1970.
- There has been an increase in rainfall and streamflow across parts of northern Australia since the 1970s.
- There has been an increase in extreme fire weather, and a longer fire season, across large parts of the country since the 1950s.
- There has been a decrease in the number of tropical cyclones observed in the Australian region since at least 1982.
- Snow depth, snow cover and number of snow days have decreased in alpine regions since the late 1950s.
- Oceans around Australia are becoming more acidic, with changes happening faster in recent decades.
- Sea levels are rising around Australia, including more frequent extreme high levels that increase the risk of inundation and damage to coastal infrastructure and communities.
- The CSIRO report states that in the coming decades; Australia will experience ongoing changes to its weather and climate which are projected to include:
- Continued increase in air temperatures, with more heat extremes and fewer cold extremes.
- Continued decrease, on average, in cool season rainfall across many regions of southern and eastern Australia, which will likely lead to more time in drought.
- More intense short-duration heavy rainfall events even in regions where the average rainfall decreases or stays the same.
- Continued increase in the number of dangerous fire weather days and a longer fire season for much of southern and eastern Australia.
- Further sea level rise and continued warming and acidification of the oceans around Australia.
- Increased and longer-lasting marine heatwaves that will affect marine environments such as kelp forests and increase the likelihood of more frequent and severe bleaching events in coral reefs around Australia, including the Great Barrier Reef and Ningaloo Reef.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Fewer tropical cyclones, but with higher intensity on average, and greater impacts when they occur through higher rain rates and higher sea level.
- Reduced average snow depth in alpine regions, but with variations from year to year.

The IPCC is the United Nations body for assessing the science related to climate change and finalised the Sixth Assessment Report (AR6) in 2023. This consists of three Working Group contributions and a Synthesis Report. A summary of outcomes of the working group's contributions comprises a range of matters, which amongst others include:

- The AR6 Working Group I (AR6-WG1) report stated that it is unequivocal that there is human-induced warming. It also stated that increased atmospheric carbon dioxide (CO2) levels, generated by human activity, are the largest driver of warming over the longer term, and that there are a range of factors, including emissions of methane, which increase warming in the short-term.
- The AR6 Working Group II (AR6-WG2) report stated that human-induced climate change, including more frequent and intense extreme events, has caused widespread adverse impacts and related losses and damages to nature and people, beyond natural climate variability. It stated that global warming, reaching 1.5°C in the near-term, would cause unavoidable increases in multiple climate hazards and present multiple risks to ecosystems and humans. The report noted that societal choices and actions implemented in the next decade will determine the extent to which medium- and long term pathways will deliver climate resilient development.
- The AR6 Working Group III (AR6-WG3) report provided an updated global assessment of climate change mitigation progress and pledges and examined the sources of global emissions. It explained developments in emissions reduction and mitigation efforts and assessed the impact of national climate pledges in relation to long term emissions goals. More than 2000 quantitative emissions pathways were submitted to the IPCC, of which 1202 scenarios included sufficient information for assessing the associated warming. The report found that there are many pathways in the literature that likely limit global warming to 2°C with no overshoot, or to 1.5°C with limited overshoot. These variations occur because, while climate science is able to calculate a 'carbon budget' of net emissions before any particular temperature outcome is reached, the allocation of this budget between different human activities requires additional judgements about for example technology, economics, consumer preferences and policy choices.
- The AR6 Working Group I (AR6-WGI) report states "[climate change is a global phenomenon, but manifests differently in different regions" (IPCC 2021b). IPCC projections for climate change in Australia from the AR6 Working Group II (AR6-WGII) report include:
    - further climate change is inevitable, with the rate and magnitude largely dependent on the emission pathway (very high confidence)[51]
    - ongoing warming is projected, with more hot days and fewer cold days (very high confidence)
    - further sea level rise, ocean warming, and ocean acidification are projected (very high confidence)
    - less winter and spring rainfall is projected in southern Australia, with more winter rainfall in Tasmania, less autumn rainfall in southwestern Victoria and less summer rainfall in western Tasmania (medium confidence), with uncertain rainfall changes in northern Australia
    - more extreme fire weather is projected in southern and eastern Australia (high confidence)
    - increased drought frequency is projected for southern and eastern Australia (medium confidence)
    - increased heavy rainfall intensity is projected, with fewer tropical cyclones and a greater proportion of severe cyclones (medium confidence) (Lawrence et al., 2022).
    - The AR6-WGII also contains information about projected impacts to health and well-being for the Australasian region including, amongst others:
    - detrimental effects on human health due to heat stress, changing rainfall patterns including floods and drought climate-sensitive air pollution (including that caused by wildfires) (high confidence) and vector-borne diseases (medium confidence)
    - vulnerability to detrimental effects of climate change will vary with socioeconomic conditions (high confidence) (Lawrence et al. 2022).

For further information related to Woodside's approach to climate change, please see Section 5.3 'Managing Physical Risk' and Section 6.3 'A Just Transition' of Woodside's Climate Transition Action Plan and 2023 Progress Report.

The AR6-WGII report identified nine key climate risks for the Australasian region:

- loss and degradation of coral reefs and associated biodiversity and ecosystem service values in Australia due to ocean warming and marine heatwaves (very high confidence)

[51] A level of confidence is expressed using five qualifiers: very low, low, medium, high, and very high. For a given evidence and agreement statement, different confidence levels can be assigned but increasing levels of evidence and degrees of agreement are correlated with increasing confidence (Lawrence et al., 2022).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- loss of alpine biodiversity in Australia due to less snow (high confidence)
- transition or collapse of alpine ash, snow gum woodland, pencil pine and northern jarrah forests in southern Australia due to hotter and drier conditions with more fires (high confidence)
- loss of kelp forests in southern Australia due to ocean warming, marine heatwaves, and overgrazing by climate-driven range extensions of herbivore fish and urchins (high confidence)
- loss of natural and human systems in low-lying coastal areas due to sea level rise (high confidence)
- disruption and decline in agricultural production and increased stress in rural communities in south-western, southern and eastern mainland Australia due to hotter and drier conditions (high confidence)
- increase in heat-related mortality and morbidity for people and wildlife in Australia due to heatwaves (high confidence)
- cascading, compounding and aggregate impacts on cities, settlements, infrastructure, supply-chains and services due to wildfires, floods, droughts, heatwaves, storms and sea level rise (high confidence)
- inability of institutions and governance systems to manage climate risks (high confidence) (Lawrence et al., 2022).

An earlier report by Australia's Biodiversity and Climate Change Advisory Group summarised the potential impacts of climate change to marine and terrestrial species, habitats and ecosystems across Australia (Steffen et al., 2009). The 2009 report identified examples of observed changes in Australia's biota that were considered consistent with the emerging climate change 'signal', as genetic constitution, geographic ranges, lifecycles, populations, ecotonal boundaries, ecosystems, and disturbance regimes (Steffen et al., 2009). The report also stated:

"Biodiversity is one of the most vulnerable sectors to climate change".

"Australia's biodiversity is not distributed evenly over the continent but is clustered in a small number of hotspots with exceptionally rich biodiversity", and that these "include the Great Barrier Reef, south-west Western Australia, the Australian Alps, the Queensland Wet Tropics and the Kakadu wetlands".

Further, it was stated that *"many of the most important impacts of climate change on biodiversity will be the indirect ones at the community and ecosystem levels, together with the interactive effects with existing stressors"* (Steffen et al., 2009). Future climate change (e.g., increased temperature and decreased, but more variable, rainfall) has the potential to have a range of impacts on ecological factors and threaten biodiversity in the Australian Mediterranean ecosystem (CSIRO, 2017).

Extensive modelling and monitoring studies over the last twenty years provide considerable evidence that global climate change is already affecting and will continue to affect species (Hoegh-Guldberg et al., 2018); however, these impacts are likely to be highly species-dependent and spatially variable. The most frequently observed and cited ecological responses to climate change include species distributions shifting towards the poles, upwards in elevation and shifts in phenology (earlier and later autumn life-history events) (M. Dunlop et al., 2012). Climate change may not only change species distribution patterns but also life-history traits such as migration patterns, reproductive seasonality and sex ratios (Steffen et al., 2009).

Impacts of climate change such as altering temperature, rainfall patterns and fire regimes, are likely to lead to changes in vegetation structure across all terrestrial ecosystems within Australia (M. Dunlop et al., 2012; Steffen et al., 2009). Increases in fire regimes will impact Australian ecosystems altering composition structure, habitat heterogeneity and ecosystem processes. Changes in climate variability, as well as averages, could also be important drivers of altered species interactions, both endemic and invasive species (M. Dunlop et al., 2012). Climate change could result in significant ecosystem shifts, as well as alterations to species ranges and abundances within those ecosystems (Hoegh-Guldberg et al., 2018).

The 'loss of climatic habitat caused by anthropogenic emissions of greenhouse gases' has been listed as a key threatening process under the EPBC Act (DCCEEW, 2021). The threatening process consists of reductions in the bioclimatic range within which a given species or ecological community exists due to emissions induced by human activities of greenhouse gases (DCCEEW, 2021). The process is considered to have a continental distribution, including both terrestrial and marine areas. Ecosystems in which the process occurs include: alpine habitats, coral reefs, wetlands and coastal ecosystems, polar communities, tropical forests, temperate forests, and arid and semi-arid environments (DCCEEW, 2021).

Coral reefs were recognised by both IPCC and the Australian Government as being at risk of climate change (Lawrence et al., 2022; DCCEEW, 2021). Protected coral reef areas in Australia include those within World Heritage listed sites, such as Ningaloo Coast, Shark Bay, or the Great Barrier Reef. Climate change has been identified as a threat for each of these World Heritage areas, with potential risks to coral reef as well as other environmental values (such as marine fauna) within these ecosystems (IUCN, 2020b, 2020c, 2020a).

Climate variability and change have been identified as a threat to some EPBC Act protected species, including marine turtles, whales, seabirds and migratory shorebirds:

- The Recovery Plan for Marine Turtles in Australia (CoA 2017) states that "climate change is of particular concern to marine turtles because it is likely to have impacts across their entire range and at all life stages. Climate change is expected to cause changes in dispersal patterns, food webs, species range, primary sex ratios, habitat availability, reproductive success and survivorship".

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- The Conservation Management Plan for the Blue Whale (CoA 2015a) states that "climate change is expected to cause changes in migratory timing and destinations, population range, breeding schedule, reproductive success and survival of baleen whales, including blue whale species and subspecies".
- The Wildlife Conservation Plan for Seabirds (CoA 2022) states that "consequences to seabirds could include negative impacts from an increase in extreme weather events, reduced or changed prey abundance and distribution, and decrease in nesting habitat".
- The Wildlife Conservation Plan for Migratory Shorebirds (CoA 2015) states that "such changes have the potential to affect migratory shorebirds and their habitats by reducing the extent of coastal and inland wetlands or through a poleward shift in the range of many species".
- The Recovery Plan for the Southern Right Whale (DCCEEW, 2024a) states that "modelling the links between krill and whale population dynamics with climate change, including changes in ocean temperature, primary productivity, and sea ice, suggests future ocean conditions are likely to have a negative impact on krill populations and in association the baleen whale species that feed on them".
- The North-west Marine Parks Network Management Plan 2018 (DNP, 2018) identifies climate change as a pressure that may impact marine park values. The management plan states that "the impacts of climate change on the marine environment are complex and may include changes in sea temperature, sea level, ocean acidification, sea currents, increased storm frequency and intensity, species range extensions or local extinctions, all of which have the potential to impact on marine park values".

Within the Marine Bioregional Plan for the NWMR (DSEWPaC, 2012), pressures related to climate change are assessed as 'of potential concern' for species of marine turtle, inshore dolphins, sawfish, sea snakes, whale shark, dugong, and seabird and shorebird, as well as the KEFs and shipwrecks known to occur in the NWMR.

Summary of assessment outcomes

Overall consequence level:

GWA offshore operations (direct and indirect) GHG emissions cause a small reduction of global carbon budgets estimated to meet goals of the Paris Agreement – assigned an impact level of Negligible (F).

Climate change impacts cannot be attributed to any one activity as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution started. They do not take into account the net impact of each project or activity. Even discounting the role gas can play towards customer commitments and plans to decarbonise through the energy transition, emissions associated with GWA production are expected to have a de minimis impact to global carbon budgets estimated to meet goals of the Paris Agreement.

GWA offshore operations and downstream processing facilities (through the North West Shelf Project Facility) will also comply with the Federal SGM Baseline, aligning with Australia's carbon management framework and implementation of the Paris Agreement.

and flare emissions (in accordance with NGERS/NPI) to inform optimisation management practices and minimise environmental impact of direct and indirect GWA and KGP emissions.	CS: Minimal cost. Standard practice.	optimisation. It combines with good operating practice to maximise production, reduce fuel gas use and emissions to manage cost, which improves energy intensity (e.g. cleaner production), optimising emissions from the NWS. Fuel gas and flared hydrocarbons represent both emissions sources and potential product streams. Woodside therefore applies routine short and long term optimisation and opportunity management processes to identify, prioritise and implement operational efficiency and emissions reduction initiatives. This includes optimisation of fuel gas consumption, flare management, energy efficiency and power generation configuration across the integrated NWS system. Annual fuel and flare performance review and routine operational reporting support identification of trends, optimisation opportunities and verification of emissions forecasting assumptions over the life of the EP. Daily production and operational planning processes support optimisation of the integrated NWS production system, including consideration of compression demand, maintenance activities, fuel gas consumption and energy efficiency across connected infrastructure including interaction between upstream compression requirements, downstream processing constraints and overall NWS operational efficiency. Forecast emissions assumptions are reviewed against actual operational performance to support ongoing optimisation and verification of the assessed operating envelope over the life of the EP.		
Implement relevant methane management at GWA	F: Yes CS: Some cost associated with implementation of a new WMS guideline on an	Methane management measures at GWA align with Woodside's corporate approach to methane emissions management as appropriate including current OGMP and Near-Zero	Control is a WMS requirement – must be adopted.	**Yes** **C 8.5**

Control considered	***Control feasibility (F) and cost/sacrifice (CS)[52]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
production as reservoir pressure declines.	However, cessation of production would strand existing infrastructure and hydrocarbon reserves despite continued technically recoverable resources being available. CS: Significant operational and commercial sacrifice associated with early cessation of production and underutilisation of existing infrastructure and facilities.	emissions attributable to LLPO operations.	not considered proportionate given the existing facility infrastructure, continued technically recoverable reserves, operational optimisation measures implemented to reduce emissions where reasonably practicable, and the integrated management of emissions within the broader NWS system and Safeguard Mechanism framework.	
Professional judgement – substitute				
Fuel for energy generation on facility is selected for lowest emissions generation where practicable: • Fuel gas used in preference to diesel for power generation. • Battery energy storage system (BESS) operational	F: Yes, fuel gas is the primary fuel source on GWA. BESS provides back up spinning reserve enabling turning off a gas turbine, with associated fuel gas savings. CS: Cost effective.	Diesel substitution reduces CO_2 emissions for a given unit of power, and reduces spill risk associated with fuel bunkering activities. BESS has successfully delivered substitution of one gas turbine reserve supply and associated fuel, air and GHG emissions. BESS provides additional benefit of back up power in case of loss power supply.	Cost effective. Opportunities minimise fuel bunkering transfer risks.	Yes. Solution permanently implemented.
Professional judgement – engineered solution				
Maintain flare to maximise efficiency of combustion and minimise venting, incomplete combustion waste products and smoke emissions.	F: Yes. CS: Minimal cost, subject to review: e.g. Production Optimisation and Opportunity Management Procedure delivered reduction in GWA flare purge rate in 2020. Standard practice.	Flare tip integrity and ignition system functionality minimises potential for venting, incomplete combustion waste products and smoke emissions.	Control is WMS requirement – must be adopted.	Yes **C 8.6**

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[52]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
Installation of flare gas recovery systems to reduce emissions entering the atmosphere from flaring.	F: Yes. CS: Significant additional cost associated with the design and installation of flare gas recovery systems, including significant retrofitting of multiple stages of compression systems, coupled with associated ancillaries, valving and piping, platform modification and weight considerations. The safe addition of the required rotating equipment also poses significant production sacrifice, and potential domestic gas supply impacts due to the initial design layout and space safety constraints.	Small to negligible environmental benefit from reducing atmospheric emissions from flaring. The environmental benefit gained from the recovery of flaring emissions would be limited to only a portion of flare system flows due to process safety constraints and flare system operation over a wide design envelope (associated with flow variations). Furthermore, required retrofitting of multiple stages of compression (e.g. for LP/HP streams) would offset any environmental benefits through increased power generation emissions. The retrofitting interaction with the safety critical flare system and continued operation of gas compression would also increase platform safety risks.	Given the increased safety risk and the very low, if any, environmental benefit provided when increased power generation emissions are taken into consideration, the installation of flare gas recovery systems is considered grossly disproportionate to the environmental benefit it would provide.	No
Implementation of LLPO compression and associated power generation upgrades to maintain gas export under declining reservoir pressure conditions, including optimisation of compression and power generation configuration.	F: Yes. Additional compression and associated power generation are required to maintain gas export and stable facility operation as reservoir pressure declines. Compression and power system configuration has been developed	Maintains safe and reliable operation of the facility under declining reservoir pressure conditions, supports continued hydrocarbon recovery through use of existing infrastructure, and enables optimisation of compression and power generation efficiency within the operational constraints of a mature offshore facility.	The selected LLPO configuration reflects optimisation of operational reliability, safety, energy efficiency and facility constraints. While implementation results in increased fuel gas use and associated GHG emissions, the selected LLPO configuration	Yes **C 8.8**

	through engineering assessment considering operational reliability, process safety, energy efficiency, facility constraints and integration with existing infrastructure. CS: Significant capital and operational cost associated with compression upgrades, power generation demand, fuel gas consumption and supporting infrastructure modifications.		represents the lowest reasonably practicable emissions outcome capable of maintaining safe and reliable operation of the facility and continued hydrocarbon recovery through existing infrastructure. Alternative configurations considered were either technically infeasible, introduced disproportionate operational or safety risks, or did not provide a material reduction in emissions when assessed against the broader operational requirements of the integrated NWS system.	

ALARP statement – direct and indirect atmospheric emissions (Decision Type A)

On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2), and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage the potential impacts of direct and indirect atmospheric emissions resulting from the Petroleum Activity.

The adopted controls include forward-looking forecasting, routine monitoring of fuel and flare emissions, comparison of actual performance against forecast assumptions, and ongoing optimisation through Woodside's emissions and energy management processes. These measures provide ongoing verification that atmospheric emissions remain understood and managed over the life of the EP.

As no reasonable additional or alternative controls were identified that would further reduce impacts without grossly disproportionate sacrifice, direct and indirect atmospheric emissions associated with GWA operations are considered reduced to ALARP.

ALARP statement - GHG emissions (Decision Type B)

Risk-based analysis

Application of Woodside's Risk Management Procedures, implementation of the Emissions and Energy Management Procedure and Production Optimisation, Opportunity Management Procedure and the Methane Guiding Principles Management Guideline reduces GHG emissions risk to ALARP (Section 7.2.7.6). This includes a system of continual review and improvement of key emissions sources and fugitive methane from NWS assets as an integrated system, including GWA. GWA emissions reduction activities from implementation of existing procedures have resulted in ongoing energy efficiency benefits and net reductions of over 18 kt CO2-e per year (Table 6-16). Further opportunities are implemented at KGP to reduce indirect emissions associated with production of GWA and combined emissions from the NWS assets.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[52]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***

Company values

Woodside's corporate values require personnel to comply with applicable policies, standards, procedures and processes, and to be accountable for their actions in line with the Woodside Compass. As outlined above, the Petroleum Activity will be undertaken in accordance with these requirements, including the implementation of controls to manage GHG emissions.

Societal values

Consultation was undertaken for the Petroleum Activity to identify the views and concerns of relevant stakeholders, as described in Section 5. No specific concerns around air emissions, including atmospheric and GHG emissions, were identified through this process.

ALARP statement

On the basis of the environmental impact assessment outcomes, application of tools appropriate to the decision type (i.e. Decision type B, Section 2.4.4.2), and Woodside's criteria for demonstrating ALARP (Section 2.6.1), the adopted controls are considered appropriate to manage GHG emissions from the Petroleum Activity (including indirect emissions sources) that Woodside can practicably influence, during the five year term of this EP. The adopted controls meet legislative requirements, including:

- Marine Order 97 for support vessels
- NGERS and NPI reporting for direct emissions attributed to the Petroleum Activity
- *National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015*.

Safeguard facilities that exceed their baseline must manage their excess emissions, such as by surrendering acceptable quality offsets suitably classified as Australian Carbon Credit Units (ACCUs) or Safeguard Mechanism Credits (SMCs) which is the other eligible compliance unit. Each are representative of one tonne of CO_2-e per credit, so that net emissions under the scheme are brought in line with the baseline. So that sufficient credits are available and that there is a means to comply, safeguard facilities that exceed their baseline may buy Government-held ACCUs from the Clean Energy Regulator via the Cost Containment Measure implemented as part of recent reforms.

SGM obligations for the North West Shelf Project facility (including from GWA) as defined under SGM will be met by emissions abatement via operational controls as first preference. Options to manage residual net emissions in excess of baseline include surrendering ACCUs or SMCs, applying to become a trade-exposed baseline-adjusted facility, applying to borrow baseline from the following year or applying for a multi-year monitoring period. Surrendered carbon credits may be generated from Woodside projects, purchased from the market or purchased from the Government through the Cost-Containment Mechanism.

Woodside is implementing programs at a corporate level to manage indirect emissions associated with customer use of gas from the GWA facility.

The LLPO operating configuration and associated emissions profile have been developed through engineering and operational assessment considering reservoir conditions, compression requirements, power generation demand, operational reliability, process safety, energy efficiency and existing facility constraints. Forecast emissions assumptions are reviewed against actual operational performance to support ongoing optimisation and verification of the assessed operating envelope over the life of the EP.

As no reasonable additional or alternative controls were identified that would further reduce impacts without grossly disproportionate sacrifice, GHG emissions from the Petroleum Activity that Woodside may practicably influence are considered ALARP.

Demonstration of acceptability	
Acceptability statement – atmospheric emissions: Given the adopted controls, atmospheric emissions represent a negligible impact that is unlikely to result in greater than isolated impacts as the Operational Area is located in an unpopulated area approximately 138 km from the nearest community receptor of Dampier. The adopted controls are considered good offshore industry practice and meet requirements of Australian Marine Orders and National Pollutant Inventory reporting. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of atmospheric emissions to a level that is broadly acceptable.	
Acceptability criteria and assessment	**Statement of acceptability**

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of acceptability	
To assess and determine that impacts from GHG emissions will be of an acceptable level, Woodside considered corporate commitments, principles of Ecologically Sustainable Development, Company Values and Societal Values. The predicted GHG emissions associated with GWA are considered de minimis and as such, below acceptable levels and will not materially or substantially contribute to Australia's net GHG emissions or net global emissions levels. ***Principles of ESD*** Giving consideration to economic development that safeguards the welfare of future generations, the Petroleum Activity is considered to align with the following core objectives of ESD by: <u>Integration Principle</u> • the existing environment (Section 4) has been described consistent with the definition within Regulation 5 of the Environment Regulations (i.e. includes ecological, socioeconomic, and cultural features), and any relevant values and sensitivities have been included within this impact analysis; therefore, the impact assessment process inherently includes economic, environmental and social considerations. • indirect GHG emissions associated with GWA will be managed to ALARP and an acceptable level through the implementation of the controls detailed in this section. • Feedback, objections and claims from Relevant Persons were considered, see Appendix F. <u>Precautionary Principle</u> • there is some scientific uncertainty associated with the projection of climate change trends, the predicted and observed environmental effects of climate change, and the changing regulatory and social requirements and/or expectations. • Woodside has committed to management and mitigation measures for GHG emissions to ensure that GWA continues to manage GHG emissions to an ALARP and acceptable level. <u>Intergenerational Principle</u> • continue to provide LNG as a source of fuel for global markets and pursue the development of new energy products and lower carbon services with reference to the UN Sustainable Development Goal 7, Affordable and Clean Energy. • gas having the potential to contribute to an incremental reduction in global GHG emissions by displacing more carbon intensive power generation (e.g. coal), firming up renewables, or in hard-to-abate sectors. • Woodside considers that this development is aligned with its goals for supporting the energy transition and is compatible with the Paris Agreement goal to hold "the increase in the global average temperature to well below 2°C above pre-industrial levels and to pursue efforts to limit the temperature increase to 1.5°C." <u>Biodiversity Principle</u> • the existing environment (Section 4) identifies and describes relevant MNES, as defined in Regulation 7(3) of the Environment Regulations; any relevant values and sensitivities are included in the contextual evaluation of climate change. • As described above the estimated GHG emissions associated with GWA will have a de minimis contribution the net atmospheric global GHG concentrations and therefore are not expected to affect biodiversity. Woodside looks after the communities and environments where we operate. Risks are inherent in petroleum activities; however, through sound management, systematic application of policies, standards, procedures and processes.	GHG emissions associated with the GWA facility are managed to an acceptable level by meeting (where they exist) legislative requirements, industry codes and standards, applicable company requirements, and industry guidelines, and these have been adopted as key controls. Even discounting the role gas can play towards customer commitments and plans to decarbonise through the energy transition, emissions associated with the Petroleum Activity are negligible in the context of existing and future predicted global GHG emissions. As described above, even in the hypothetical scenario when taken to be wholly additive, the GHG emissions created by and associated with the Petroleum Activity represent a de minimis contribution to the carbon budgets estimated to achieve the goals of the Paris Agreement. Further, through its contribution to the North West Shelf Project Facility, the GWA facility will comply with the relevant Australian carbon management framework, for example the SGM. The impact on national and international emission reduction targets is therefore acceptable. In summary, the predicted level of impact to air quality and socio-economic values is considered to be of an acceptable level (consequence level F – No lasting effect), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Internal Context

The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including:

- Woodside Health, Safety and Environment Policy (Appendix A)
- Woodside Risk Management Policy (Appendix A)
- Woodside Climate Policy (Appendix A)
- Woodside 2023 Climate Transition Action Plan and Progress Report, a 2024 Climate Update, and 2025 Climate and Sustainability Summary
- Woodside being a signatory to the Aiming for Zero Methane Emissions Initiative, the Oil and Gas Methane Partnership 2.0 and the World Bank's Zero Routine Flaring by 2030 Initiative for oil projects, which are voluntary, international multi stakeholder partnerships between industry and non-industry organisations.
- Deployment is applied consistent with OGMP 2.0 principles on a risk-based approach for the most effective deployment of resources and effort to identify and reduce streams which make the most proportional difference - with a methane management strategy for the integrated North West Shelf Project facilities, including offshore at GWA.
- WMS requirements such as the GHG emissions and Energy Management Procedure, Production Optimisation and Opportunity Management Procedure (Section 7.2.7.6.1). This is achieved by implementing tools to identify, evaluate, implement and review emissions reductions projects.

External Context

GHG emissions are a global concern, and as such Woodside has undertaken an impact assessment of GHG associated with the GWA facility and identified key measures to manage GHG emissions to an acceptable level.

According to Wood Mackenzie Energy Research Consultancy, LNG from Woodside operated facilities is amongst the lowest carbon intensity in the world delivered into North Asia[58].

The global consensus on climate change led to the implementation of the Paris Agreement. The aim of the Paris Agreement, as stated in the Article 2.1(a) is to hold the increase in global average temperature to well below 2°C above pre-industrial levels. The Agreement also aims to pursue efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising that this would significantly reduce the risks and impacts of climate change.

Paris Agreement text extract[59]:

"Article 2

1. This Agreement, in enhancing the implementation of the Convention, including its objective, aims to strengthen the global response to the threat of climate change, in the context of sustainable development and efforts to eradicate poverty, including by:

(a) Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognising this would significantly reduce the risks and impacts of climate change;"

This was reaffirmed in December 2023 in the COP28 decision text on the First global stocktake[60]. The text further recognised that the transition away from fossil fuels in energy systems is to be done in a just, orderly and equitable manner accelerating action in this critical decade, so as to achieve net zero by 2050 in keeping with the science[61]. It also recognises transitional fuels can play a role in facilitating the energy transition while ensuring energy security[62].

The Paris Agreement establishes a framework where countries make nationally determined contributions to manage and reduce their own emissions.

Australia has ratified the Paris Agreement and has set a target to reduce emissions by 43% below 2005 levels by 2030 and to reach net-zero emissions by 2050. Australia's emissions projections under a 'with additional measures' scenario is projected to be 42.6% below 2005 levels by 2030, the next waypoint to net zero emissions by 2050 (DCCEEW 2024b).

relevant WHPs, AMPs and recovery plans

- the predicted level of impact has been reduced to ALARP.

To manage impacts to air quality and socio-economic values to an acceptable level the following EPOs have been applied:

EPO 8a: GWA facility GHG emissions shall assist in NWS Project Facility achieving GHG reductions under reformed Safeguard Mechanism (inclusive of legislated net zero emissions by 2050).

EPO 8b: Air quality from direct atmospheric emissions will be limited to planned impacts and activities described as part of the Petroleum Activity.

EPO 8c: Minimise GHG emissions from support vessels through efficient fuel usage and consideration of fuel types utilised[63].

EPO 9: Woodside will support customers to reduce their GHG emissions.

The adopted controls are considered appropriate to manage the impacts of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of acceptability	
GWA offshore (direct GHG) and indirect onshore third party processing facilities (through the North West Shelf Project Facility) are also subject to complying with the SGM to manage net emissions under the scheme in line with Australia's emission reduction targets of 43% below 2005 levels by 2030 and net zero by 2050. Australia's Long-Term Emissions Reduction Plan (DISER, 2021) presents Australia's whole-of-economy plan to achieving net zero emissions by 2050 with priority technologies estimated to achieve 85% reduction and yet-to-be identified emerging technologies abating the remainder. The plan identified LNG as a critical transition fuel and expects growth in the sector with higher use in 2030 than it is today but acknowledging that growth will depend on the preferences of customers and the pace of international action (DISER, 2021). Climate science has drawn a link between cumulative emissions of greenhouse gases and global temperature levels. The link between cumulative emissions and temperature levels allows a carbon budget to be calculated. This is the remaining amount of net emissions (i.e., all global sources of emissions minus all global sinks of emissions) that can occur before today's concentration of greenhouse gases increases to the concentration associated with potential temperature outcomes. Assuming the scenario in which all GHG emissions associated with GWA are additive to global GHG gas concentrations, which they may not be, the activity's contribution to the carbon budget required to meet the goals of the Paris Agreement is de minimis. However, the distribution of this carbon budget across different human activities requires additional judgements about a wider range of social, economic and technological factors and consumer and policy choices. Strategies to achieve emissions reductions include transitioning from fossil fuels without CCS to very low- or zero-carbon energy sources, such as renewables or fossil fuels with CCS, demand side measures and improving efficiency, reducing non-CO_2 emissions, and deploying carbon dioxide removal (CDR) methods to counterbalance residual greenhouse gas emissions. Pathways to limit warming therefore show different combinations of sectoral mitigation strategies consistent with a given warming level. As a result, the demand for oil and gas in climate-related scenarios that could limit global warming to 1.5°C or 2°C is uncertain. For example, in the AR6-WG3 report, the IPCC stated that in pathways that limit warming to 1.5°C (with a greater than 50% probability and with no or limited overshoot) the potential global use of gas in 2050 ranges from 30% above 2019 levels to 85% below them with a median 45% decline. Woodside considers that a stable energy transition will be one in which energy is affordable and reliable, as well as lower carbon. The GWA facility will continue to provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life (between 2036-2040). Woodside considers that this ongoing operation is aligned with goals for supporting the energy transition and is compatible with the Paris Agreement goal to limit global warming to below 2°C. Woodside considers our role in providing energy as core to our contribution to a just energy transition. UNSD Goal 7 is to "ensure access to affordable, reliable,

Demonstration of acceptability

sustainable and modern energy for all". The GWA facility will provide an incremental volume of hydrocarbons to Australian and international markets during its estimated remaining field life. Woodside considers that this development is aligned with the goals for supporting the energy transition and is compatible with the Paris Agreement goal.

Woodside is a signatory to several global initiatives which are complementary to our corporate approach to methane emissions management, which include OGMP (2024), Oil and Gas Climate Initiative Aiming for Zero Methane Emissions (OGCI Near-Zero) and the Methane Guiding Principles (MGP, 2022), which are voluntary, international multi-stakeholder partnerships between industry and non-industry organisations. Woodside will pursue compliance with these commitments in line with the control measures (**C.8.5**) (refer to Internal Context above, and key control measure).

Stakeholder expectations and feedback

All feedback, claims or objections from relevant persons has been appropriately responded to and addressed (see Appendix F), and controls proposed have been assessed in the EP.

Other Requirements

Legislation and other requirements considered relevant for this aspect, and a demonstration of how these requirements are met, are described below.

Requirement	Demonstration
Marine Order 97 Gives effect to Annex VI of MARPOL 73/78	The requirements of Marine Order 97 are incorporated into the key control measures.
National Greenhouse and Energy Reporting (NGER) scheme Annual GHG reporting for facilities	The requirements of NGER reporting scheme are incorporated into the key control measures.
National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015	The requirements of NGER Safeguard Mechanism are incorporated into the key control measures.
National Pollutant Inventory (NPI) Reporting Annual air pollutant reporting	The requirements of annual NPI reporting are incorporated into the key control measures.
Conservation Management Plan for the Blue Whale 2015–2025 Management action A3.1: Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica Conservation Advice *Balaenoptera borealis* Sei Whale Conservation action: Continue to meet Australia's international commitments to reduce greenhouse gas emissions and regulate the krill fishery in Antarctica Conservation Advice *Balaenoptera physalus* Fin Whale	As described above, the predicted atmospheric and GHG emissions from the GWA facility are considered de minimis, with no link to climate change impacts on Australian or International receptors. Therefore, the GWA facility is not considered to be inconsistent with the Conservation Management Plan for the Blue Whale 2015–2025 (CoA, 2015a), Conservation Advice for Sei Whale (TSSC 2015a), Conservation Advice for Fin Whale (TSSC, 2015b), National Recovery Plan for the Southern Right Whale (DCCEEW, 2024b) or the Recovery Plan for Marine Turtles in Australia (CoA, 2017).

Description of source of impact

Atmospheric emissions (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or flora and fauna. The main emissions responsible for these effects include carbon monoxide (CO), oxides of nitrogen (NOx), sulphur dioxide (SO_2), particulate matter less than 10 microns (PM10), non-methane volatile organic compounds (VOCs), BTEX (benzene, toluene, ethylbenzene and xylenes), which are specific VOCs of interest. This section covers indirect atmospheric emissions only (direct atmospheric emissions are covered in Section 6.7.7).

The processing of gas from GWA at the KGP onshore processing facilities will result in the release of atmospheric emissions. These emissions, and their potential indirect effects, have not been raised by stakeholders as a concern, but given the nature and scale of the activity, they are evaluated within this EP.

This section covers indirect atmospheric emissions and provides contextual evaluation of consideration for potential indirect impacts. Consideration of potential indirect impacts include those causing a reduction in ambient air quality impacting human health as well as the potential to contribute to accelerated weathering of rock art on the Burrup Peninsula and within the Dampier Archipelago (i.e. Murujuga). These potential indirect impacts, if realised, would not arise solely from processing of GWA gas, as they would be a result of cumulative airshed conditions generated from multiple sources.

Murujuga Rock Art Strategy

The WA State Government (DWER) has established a Murujuga Rock Art Strategy (MRAS) in partnership with MAC as the Traditional Custodians of Murujuga.

DWER has primary responsibility for the day-to-day implementation of the strategy in partnership with MAC. This includes working with MAC to oversee the development and implementation of a world's best practice monitoring and analysis program that will determine whether the rock art on Murujuga is subject to accelerated change (for further information see Murujuga Rock Art | Western Australian Government (www.wa.gov.au).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The results from studies underway will guide management and protection of Murujuga rock art, with State environmental protection and heritage legislation in place as the applicable regulatory framework.

The MRAS states that:

"The data currently available from previous monitoring projects does not allow for a conclusive answer on whether anthropogenic emissions are impacting Murujuga's rock art. The Murujuga Rock Art Strategy is therefore essential to fill these gaps in knowledge.

Although it is not known whether the rock art is being impacted currently, there are feasible impact pathways by which emissions from industrial activities and other local sources could cause accelerated weathering of the rock art. The strategy is examining these potential pathways and the condition of the rock art to understand whether change is occurring, and whether there is a need to set a future limit on emissions to ensure accelerated weathering does not occur."

"Initial levels of safe air quality have been set for the rock art. In the final years of research, the scientists will refine and determine final safe air quality criteria. These will be monitored to ensure the long-term protection of the rock art."

As a causal link between current industrial air emission levels and anthropogenic-induced change to rock art on Murujuga has not been established, nor sources defined, it is not yet practicable to attribute impact and risk level posed by the Petroleum Activity. The scientific uncertainty that persists is addressed by an adaptive and precautionary management framework in place by way of the MRAS and the associated Murujuga Rock Art Monitoring Program (MRAMP), together with the State Environmental Protection Act 1986 (WA) and associated regulatory framework, approvals and licences.

Onshore processing emission context

Gas from GWA is exported via the IFL from the GWA platform, which join the second trunkline (2TL) near NRC and is processed at the Woodside-operated KGP. Products from GWA are processed into LNG, domestic gas, condensate and LPGs and then sold and delivered to customers via ship or distributed to customers via pipeline for domestic consumption for purposes such as heating, electricity generation or industrial processes such as the production of LNG, ammonia, urea or hydrogen. While the operation of these onshore processing facilities at KGP is outside the scope of this EP, the atmospheric emissions associated with processing GWA gas at these facilities is addressed in this section. It is, further, noted that gas from other facilities, namely NRC, Angel and Okha is also processed at KGP. Potential impacts from atmospheric emissions arising from onshore processing of gas from these facilities is not part of the scope of this EP.

Source of atmospheric emissions from onshore processing

The principal atmospheric emissions from onshore processing in terms of potential for air quality impacts arise from the combustion of gas in fuel turbine generators and compressors as well as acid gas removal vents at onshore facilities. Gas processing and liquefaction can also result in flaring of some gas and incidental venting of un-combusted hydrocarbon gas. The most significant by-products of gas combustion, flaring and venting of gas from GWA will include oxides of nitrogen (NOx), carbon monoxide (CO), methane and non-methane volatile organic compounds (VOCs) including BTEX (benzene, toluene, ethylbenzene and xylenes). Ozone is not typically emitted directly from gas consumption or processing but is formed through anthropogenic sources via chemical reactions between oxides of nitrogen and other emissions such as VOCs and CO in the presence of ultraviolet light. Ventilation readily disperses emissions relative to criteria. There may also be traces of particulate matter (PM), hydrogen sulphide (H_2S) and sulphur dioxide (SO_2) but such emissions are historically minor from the onshore processing of GWA gas, owing to low sulphur in the gas and combustion of natural gas as fuel. Emissions of PM from the consumption of gas from GWA are negligible in comparison to background and other industrial sources.

Sources of emissions within the Murujuga Airshed

Potential indirect impacts from processing of gas from GWA could arise via a contribution to the cumulative effect of all emissions in the airshed. The Murujuga airshed encompasses the entire Burrup Peninsula and includes the population centres of Dampier and Karratha and surrounding areas. Industrial facilities that currently release or have approval to emit into the Murujuga airshed include[70]:

- Woodside Operated North West Shelf Venture's Karratha Gas Plant (KGP)
- Woodside Operated Pluto LNG Facility
- Yara Pilbara Fertilisers Pty Ltd Ammonia Plant
- Yara Pilbara Nitrates Pty Ltd Technical Ammonium Nitrate Production Facility (TANPF)
- Perdaman Urea Project
- Pilbara Iron Yurralyi Maya Power Station
- Santos Devil Creek Power Station

- ATCO Karratha Power Station
- EDL West Kimberley Power Plant (Maitland LNG Plant).

Atmospheric emissions into the Murujuga Airshed from onshore processing of gas from GWA

Atmospheric emissions associated with onshore processing of gas from GWA are emitted and combined with similar emissions from natural sources and other industrial activities in proximity of the Murujuga region. Assessment of potential impacts considers cumulative impacts within the airshed rather than estimating emissions influence associated with processing gas from GWA in isolation. Further, estimating ground level concentrations of atmospheric constituents as related to human health and deposition relies on complex non-linear photochemical modelling, underpinned by biochemical and physical forcing systems such as regional meteorological forcing model.

Therefore, the impact assessment is based on a cumulative airshed modelling inclusive of contribution from onshore processing of GWA gas, and other material sources.

In 2021, DWER commissioned Ramboll Australia Pty Ltd to undertake a Study of the Cumulative Impacts of Air Emissions in the Murujuga Airshed[71] (Ramboll 2022) which considered a "complete emission inventory" including air emissions from existing and proposed future industries, shipping, and aggregated sources in the Pilbara region. The study used the CAMx atmospheric emission model, which includes atmospheric photochemistry to evaluate concentrations of a range of pollutants including NOx, ozone, SOx, CO, VOCs, and particulates across two modelling domains. The detailed 1.33 km grid encompasses the Dampier Archipelago, as far East as Wickham and as far West as 40 Mile Beach. Predicted ground level concentrations were evaluated at Karratha, Dampier, Hearson Cove and Ngajarli (Deep Gorge) and compared with relevant criteria in the National Environment Protection Measure (NEPM) air quality standards. Deposition rates were also predicted.

Emission estimates in the Ramboll (2022) study were based on a range of sources, including publicly available datasets, engineering design estimates (maximum and averages) and facility level monitoring data which match the selected year's meteorological data. The scenarios investigated as part of this study included:

- A baseline scenario reflecting 2014 sources, including all industrial, mobile, domestic and commercial as well as natural sources. This covers onshore gas processing at steady state operational capacity at Pluto Train 1 and KGP Gas Plants. The year 2014 was selected due to typical meteorology (Ramboll 2022). A comparison of modelled data with real-world air quality monitoring data was undertaken, which "indicated reasonable agreement with the measurements at Burrup Road, Dampier, and Karratha"
- A future scenario that considered the above scenario as a basis but included proposed future additional industrial emissions sources in 2030. This scenario included operation of Pluto Train 1, Pluto Train 2, KGP and Perdaman onshore facilities and other future projects producing at capacity.

Assumptions regarding non-industrial emissions considered in these scenarios were based on a range of sources (Ramboll 2022):

Mobile sources:

- Commercial shipping and boating, with data sourced from the maritime automatic identification system (AIS) which also identifies vessel type, enabling application of USEPA default specifications for engines.
- Recreational boating
- Vehicles, which included data from an ABS survey of motor vehicle use scaled down the region, vehicle registration information and traffic and road network data from Main Roads WA
- Aircraft, which applied techniques from NPI to data supplied by airports and public sources such as aircraft operator website and tracking tools.
- Railways, based on public data on fuel consumption per tonne of minerals delivered and mine site production rates. All rail lines in the region are operated by mining companies.

Domestic and commercial sources:

- Estimates of population (with growth for future scenario)
- Other sources such as solvent and aerosol use (per capita data), bitumen road construction (materials usage), service stations (applying population data to service station locations), domestic fuel burning (from previous surveys) and others
- Natural sources such as vegetation, dust, bushfires and oceanic sources which came from other models.

Both the baseline and 2030 scenarios included operation of onshore processing facilities at capacity which covers the portion associated with ongoing processing of GWA gas.

Specific assumptions for individual emission sources were provided by all regional parties in confidence to DWER or were otherwise estimated by Ramboll based on sources such as NPI for operating facilities, and as such are not

[71] Study of the Cumulative Impacts of Air Emissions in the Murujuga Airshed: https://www.wa.gov.au/system/files/2023-03/Study-of-the-cumulative-impacts-of-air-emissions-in-the-Murujuga-airshed.pdf

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

published in the report. Woodside provided inputs to the Ramboll (2022) study in response to DWER's data request, and these are aligned with scenario descriptions and assumptions described in North West Shelf Project Extension Environmental Review Document (ERD) Appendix E Air Quality Impact Assessment[72] (Jacobs 2019), Section 4, Scenarios 3 and 4 with existing, approved and referred facilities operating – which included (amongst others):

- Airshed baseline
- NWS Extension Project with NOx improvement opportunities
- Expansion of Pluto (Train 2 fed by Scarborough gas)
- Perdaman Urea project
- Methanol facility proposal.

Ramboll used tools such as the EPA's Proposal Search Tool and related assessment documentation (such as Environment Document Review or Works Approvals) to provide data on future proposed developments. The model performance was validated at a number of locations using real-world air quality monitoring data provided by DWER and industrial operators in the region.

This indicated that NOx loads to the airshed from NO_2 concentrations predicted by the model were "similar ranges at Karratha, but the model is biased high at Burrup Road and Dampier" which indicates that modelled outcomes at these locations on Murujuga are conservative. It also indicates that assumptions for model inputs are appropriate.

The Jacobs (2019) assumptions were developed with "reasonable and conservative emission estimates" for the purposes of completing a robust risk and impact assessment of industrial sources are, such as inclusive of elevated flare rates (Jacobs 2019). This 2030 projection is the "Future Burrup Strategic Industrial Area state (existing, approved and referred) with proposed emission reductions in place" referred to in Table 6-5 of the NWS Project Extension ERD. The Jacobs (2019) report drew on an earlier aggregated air emissions inventory for the Pilbara region developed by SKM (2003) for sources such as biogenic emissions, vegetation sources and other natural sources, and other previous modelling studies. The Jacobs (2019) model outputs were compared with real-world air quality monitoring results from multiple locations, which indicated that the model was "performing well in terms of being able to accurately predict a variety of statistical results for NO_2. as measured by Woodside at the Burrup, Dampier and Karratha monitoring stations." In addition to validating model performance, this also demonstrates that the assumptions used for existing emissions sources were appropriate.

Ramboll (2022) estimated that NOx loads to the Murujuga airshed (1.33 km grid encompassing Dampier Archipelago, Murujuga, Karratha and Roebourne) from industrial sources were estimated to be 13,937 tonnes per year and were forecast to reduce to 12,052 tonnes per year by 2030. A significant contribution to this cumulative airshed reduction is associated with commitments by the NWSJV to reduce NOx emissions from the Karratha Gas Plant by 40% by 2030. Ramboll (2022) did not predict NOx air concentrations in excess of current air quality standards in any modelled scenario.

The assumptions for Murujuga airshed NOx emissions underpinning Ramboll (2022) are suitably conservative for reviewing relative contribution of KGP for the onshore processing of GWA gas using information provided by the respective facilities as described Table 6-22.

Table 6-22: Baseline, current and future modelled NOx emissions from KGP

Scenario	KGP	
	NOx emission rate annual avg (g/s)	Source/comment
Baseline scenario (2014)	281.1	Jacobs 2019
Current	248.7 (12% below modelled baseline)	Reported NPI data, 2022/23 period (with consistent multi-year history)
Future emissions scenario assumptions (2014)	149.2 g/s (40% reduction commitment)	NWS Extension ERD commitment (Table 6-9, p 106)

The current trajectory of aggregated emissions in the Murujuga airshed indicated that the future emissions scenario assumptions considered by Ramboll (2022) were conservative because:

- Assumptions for Pluto Train 1 and 2 include conservatisms as set out in the Jacobs (2019) report. Assumptions for Train 2 equipment are based on vendor specified performance, which is a conservative basis for emission estimation. This performance will be measured and validated in accordance with Condition 38 of the Pluto Train 2

[72] NWS Extension Environment Review Document Appendices: https://www.woodside.com/docs/default-source/current-consultation-activities/australian-activties/north-west-shelf-project-extension---appendices.pdf

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Works Approval[73], which will include a summary of the environmental performance of equipment against design specifications and the Pluto AQMP (which is consistent with Jacobs 2019). Validation is also covered in section 5 of the Pluto AQMP.

- KGP has commenced the NOx reduction committed in the NWS Extension ERD (see Table 6-9 on pg 106) which has been further strengthened as a condition of Ministerial Statement 1233[74] (MS 1233) to a 60% reduction by 2030. In 2024, LNG Train 2 was taken offline (Woodside 2024).

Emissions estimates for the Perdaman urea project in Jacobs (2019) are 8.93 g/s. It is acknowledged, that the current Perdaman Urea Project Air Quality Management Plan (2021) references an Air Quality Impact Assessment (Jacobs 2020) which estimated 'based on engineering and other data' total NOx emissions for the plant of 11.7 g/s. This increase is 0.7% of the Ramboll future scenario and therefore negligible in context of the broader airshed. It is Woodside's understanding that the proposed methanol plant is no longer proceeding, which for context was expected to contribute 28.05 g/s (Jacobs 2019).

Woodside is not aware of any reason why the future emissions scenario assumptions for contribution to the Murujuga airshed from other sources are not appropriate. Any potential future development not considered in this scenario would be required to undergo its own assessment process under regulatory frameworks (described below). Further, the MRAS/MRAMP is expected to identify any ongoing or future trends in air quality which could potentially impact rock art.

Ramboll (2022) found that "SO_2, NO_2, PM2.5, PM10, CO and NH_3 peak ground level concentrations are centred at industrial facilities near or on the Burrup Peninsula, showing that industrial sources and shipping contribute to emissions in the area, but with total air concentrations for these compounds remaining below current air quality standards except for PM2.5 and PM10." The report also noted that the governing driver for particulate matter concentrations was dust, rather than industrial emissions. As stated in the report "There are no accepted or commonly applied standards for assessing deposition of acidic air pollutants on land surfaces or on sensitive receptors such as the Burrup Peninsula rock art. While this assessment report provides results for acidic deposition, no assessment, or commentary is provided about the potential impacts on areas of sensitivity such as the rock art."

Some recommendations provided in the Ramboll (2022) report related to potential improvements in accuracy regarding terrain datasets, modelling approach for dust and treatment of plumes in the model grid, and uncertainty related to emissions estimates including NPI data. However, "significant effort was made to obtain the most accurate information available with particular focus on sources located near or on the Burrup peninsula" and the comparison of modelled emissions with latest data shown in Table 6-18 indicates that conservatism exists in assumptions. The NWS Project Extension ERD Air Quality Impact Assessment compared measured ground level concentrations of NO_2 from 2009-2015 with NEPM criteria and found no exceedances. The report states that there was "no currently accepted or commonly applied standards for assessing deposition of air pollutants on land surfaces, such as Burrup Peninsula rock art" and the report does not provide any assessment or commentary on potential impacts to rock art.

In FY25, total NO_X emissions reported for KGP under NPI was 4,383 t GWA gas amounted to approximately 43% of North West Shelf offshore feed gas routed to KGP. NO_X emissions associated with processing of GWA gas is therefore estimated to be approximately 1,885 tpa. Total NO_X emissions from KGP are required to reduce to 3,065 tpa by 2030 under MS 1233. Assuming the current relative contribution to KGP, annual NO_X emissions associated with GWA gas will as such also reduce to approximately 1,317 tpa by 2030.

Based on the estimated total regional airshed emissions used in Ramboll (2022) and NO_X contribution to the airshed outlined above, it is estimated that NO_X emissions associated with the processing of GWA gas via the KGP currently accounts for approximately 14%. Assuming similar gas supply, the contribution from GWA gas is anticipated to decline to ~9% of the total estimated 2030 NO_X load in the Murujuga region.

Continued processing of gas from GWA is therefore not anticipated to cause an increase of NOx within the Murujuga airshed beyond historic maximum levels. The reduction in future NOx load within the Murujuga airshed presented in the Ramboll (2022) study is reflective of commitments made by third party proponents that are publicly disclosed either in Ministerial Statements or Air Quality Management Plans.

Existing regulatory framework

Facilities associated with the onshore processing of LNG are not subject to the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Cth). Assessment and management of these emissions is required pursuant to various State and Commonwealth legislative frameworks. Impacts associated with atmospheric emissions are subject to an appropriate level of independent assessment by regulatory agencies and management measures are in place which are sufficient to ensure the environment performance outcome of this Petroleum Activity can be achieved.

A summary of the relevant legislation, approvals and governance measures in place to manage atmospheric emissions from onshore processing facilities such as Pluto LNG facility, NWS Karratha Gas Plant and Perdaman Urea facility are outlined below.

Environmental Protection (EP) Act 1986 (WA)

The EP Act is the principal legislation in WA that provides for "the prevention, control and abatement of pollution and environmental harm" and for "the conservation, preservation, protection, enhancement and management of the environment".

The object of the EP Act is to protect the environment of Western Australia, having regard to a number of principles, including:

- the precautionary principle, which holds that where there are threats of serious or irreversible damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation. In the application of the precautionary principle, decisions are to be guided by:
  - careful evaluation to avoid, where practicable, serious or irreversible damage to the environment
  - an assessment of the risk-weighted consequences of various options
- the principle of intergenerational equity, which holds that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations
- the principle of waste minimisation, which holds that all reasonable and practicable measures should be taken to minimise the generation of waste and its discharge into the environment
- principles relating to improved valuation, pricing and incentive mechanisms, which include the 'polluter pays principle' whereby those who generate pollution and waste should bear the costs of containment, avoidance or abatement.

Assessment of Proposals under Pt IV of the EP Act

In Western Australia, it is the role of the independent Environment Protection Authority (EPA) to assess proposals against the requirements of the EP Act and EPA objectives.

Section 15 of the EP Act establishes the objectives of the EPA (Authority): It is the objective of the Authority to use its best endeavours to protect the environment; and to prevent, control and abate pollution and environmental harm. The object and principles guide the overall application of the powers of the EP Act. The principles are matters to which the EPA is required to have regard as a condition of the valid exercise of its powers to assess and report on proposals and schemes under the EP Act. The EPA only recommends that the Minister approve a proposal if it can be demonstrated the proposal is aligned with the EP Act including any relevant objectives. Under the EPA's Air Quality Environmental Factor Guideline, the EPA has an objective to maintain air quality and minimise emissions so that environmental values are protected[75] (Air Quality Objective).

The Air Quality Environmental Factor Guideline identifies that this objective recognises the fundamental link between good air quality and the environmental values it supports. It also recognises the principle of waste minimisation as set out in the EP Act. In the context of this factor and objective, the EPA recognises that maintaining good air quality and minimising emissions protects human health and amenity, as well as the broader environment. When considering the significance of potential impacts to air quality, the EPA may have regard to the various matters outlined in Section 5 of the Statement of Environmental Principles, Factors and Objectives[76], including the Air Quality Objective. Applicable assessments by the EPA and subsequent decisions by the Minister for Environment under Part IV of the EP Act relevant to KGP includes Ministerial Statement (MS) 757 for the Pluto LNG Facility, and MS 536 for LNG trains 4 and 5 at the Karratha Gas Plant (KGP). MS 1233 (superseding MS 536) was also recently issued for the North West Shelf (NWS) Project Extension, published in December 2024, which allows for continued operation of the NWS Project and processing of third party gas at KGP. Further information regarding conditions of implementation is detailed in sections below.

Environment Protection and Biodiversity Conservation Act 1999 (Cth)

The EPBC Act is the Australian Government's key piece of environmental legislation providing for the protection of the environment and the conservation of biodiversity. The EPBC Act requires approval for activities with a significant impact on a number of matters of national environmental significance, including, for example, National Heritage places and listed threatened species or endangered communities. The NWS Project Extension (a proposal to extend operation of the NWS Project beyond 2030) has been assessed under the EPBC Act by the WA EPA under an accredited process (Refer EPA Report 1727). The controlling provision for the proposed action is 'National heritage places', and the Project is subject to assessment by accredited assessment under Part IV of the EP Act at the level of Public Environment Review. The State environmental approval for the NWS Project Extension has now been finalized through MS 1233, issued on 12 December 2024.

Aboriginal heritage

Aboriginal sites are of cultural heritage importance to both the Aboriginal and wider community. The Aboriginal Heritage Act 1972 (AH Act) is the principal legislation providing for the preservation of Aboriginal sites and objects in WA. All Aboriginal heritage sites or places to which s.5 of the AH Act applies are protected, whether they are registered with the Department of Planning, Lands and Heritage (DPLH). It is an offence under the AH Act to excavate, destroy, damage, conceal or in any way alter any Aboriginal site unless the consent of the Registrar or the Minister for Aboriginal Affairs is first obtained.

Approvals under Pt V of the EP Act

DWER regulates certain premises through a works approval and licensing process to prevent, control, abate and mitigate pollution and environmental harm, under Part V of the EP Act. Woodside currently holds the following licences for facilities operated on the Burrup Peninsula: Pluto Liquefied Natural Gas (LNG) Project (L8752/2013/2)[77], Woodside Onshore Gas Treatment Plant (KGP) (L5491/1984/18)[78]. The above-mentioned licences specify air emission limits for individual emission points, NOx concentration in Pluto turbine exhausts is limited to 100 mg/m^3 over a stack test average period not less than 30 minutes; and at KGP 350 mg/m3 for trains 1, 2 and 3 and 100 mg/m^3 for trains 4 and 5. Monitoring of emissions points is required at KGP annually and quarterly, respectively. Woodside is required under these licences to submit an Annual Audit Compliance Report identifying compliance with the conditions of the licences ensuring emissions remain within acceptable levels. Copies of the Annual Audit Compliance Reports are available on the DWER's website.

Other regulatory measures in place for management of atmospheric emissions

National Environmental Protection (Ambient Air Quality) Measure (Cth)

The National Environment Protection Council (NEPC), comprising Commonwealth, State, and Territory Ministers, finalised the NEPM (Ambient Air Quality), on 26 June 1998. The National Environment Protection Council Act 1994 (Cth) allows the National Environment Protection Council to make National Environment Protection Measures (NEPMs). NEPMs are a special set of national objectives designed to assist in protecting or managing particular aspects of the environment. The NEPM [Ambient Air Quality] outlines ambient air quality monitoring protocol that allows for the adequate protection of human health and well-being.

National Environment Protection (National Pollutant Inventory) Measure 1998 (Cth)

The National Pollutant Inventory (NPI) is a public database that provides information on 93 selected air pollutants and their emissions, produced as a result of industry, transport, commercial premise, and household activities, and emitted to air, land, and water in Australia. The NPI is a Commonwealth Government initiative, and each state and territory is responsible for implementing the program. The objective of the NPI is to inform the community about emissions to water, air, and land and acceptable emissions levels. It also provides information for policy and decision making, environmental planning and management, and minimising waste.

The Woodside operated facilities on the Burrup Peninsula have been reporting emission data to the NPI from the NWS Project since the 1998/1999 reporting period and Pluto since the commencement of operations in 2012. Other facilities located on the Burrup Peninsula including Yara Pilbara Fertilisers Pty Ltd have reported since 2005. Emissions data is publicly available on the Australian Government Department of Climate Change, Energy, the Environment and Water (DCCEEW) website: https://www.dcceew.gov.au/environment/protection/npi

Other Relevant Frameworks and Programs

Murujuga Cultural Landscape Strategic Management Framework

As outlined in Appendix C, the Murujuga Cultural Landscape Strategic Management Framework establishes the management structure for the recently inscribed Murujuga Cultural Landscape World Heritage Property. In its support for the MRAMP, Woodside supports the implementation of this framework and its objectives to protect and conserve OUV associated with Murujuga Cultural Landscape.

Murujuga National Park Management Plan

As outlined in Appendix C, Murujuga National Park management plan objectives are achieved through measures which include Conservation Agreements, funding and support, and Cultural Heritage Management Plans. It is under the Conservation Agreement that Woodside continues to support research into, and monitoring of the National Heritage values of the park and conducts its activities in a manner not inconsistent with the Murujuga National Park Management Plan.

Program: Murujuga Rock Art (Western Australian Government)

The Western Australian Government publish on their Aboriginal heritage conservation website a summary of their Murujuga Rock Art Program, the partnership with Murujuga Aboriginal Corporation, and the Murujuga Rock Art Strategy. A summary of the program is outlined in Appendix C, further information relevant to this assessment is

[77] https://www.der.wa.gov.au/component/k2/item/download/4517_d69d5c4f5e6e32e9687a81cd206801d1.

maintained current on the Government of Western Australia online website: https://www.wa.gov.au/government/publications/murujuga-rock-art-strategy

Murujuga Rock Art Management Program

In recognising the high level of stakeholder concern and scientific uncertainty regarding the links between anthropogenic emissions and risks to rock art, the Department of Water and Environmental Regulation (DWER) produced the Murujuga Rock Art Strategy[79] (MRAS) in 2019 (DWER 2019), which builds on the research to date. According to DWER, the MRAS will establish a world's best practice program to monitor, evaluate and report on factors that could affect the condition of Murujuga rock art. This is being undertaken in consultation with the Murujuga Aboriginal Corporation, a team of national and international experts in relevant disciplines and is funded by industry, including Woodside. The MRAS describes a risk-based approach for the management of impacts to the rock art that is consistent with the State Government's responsibilities under the EP Act. A program being executed as part of the MRAS is the Murujuga Rock Art Monitoring Program (MRAMP) which will monitor, evaluate, and report on changes and trends in the integrity of the rock art, specifically to determine whether anthropogenic emissions are accelerating the natural weathering, alteration, or degradation of the rock art. This will enable timely and appropriate management responses by the Western Australian Government, industry and other stakeholders to emerging issues and risks.

In recent EPA assessment reports for industrial facilities on the Burrup Peninsula, the EPA has recommended a condition mandating relevant facilities to comply with air quality standards such as those derived from the MRAMP. In the EPA's North West Shelf Project Extension Assessment Report 1727 (EPA Report 1727), the EPA recommends the 'Air Quality Outcome' for recommended condition 3 be 'to ensure that no air emissions from the proposal have an adverse impact accelerating the weathering of rock art within Murujuga beyond natural rates.' Recommended condition 3-3 states that if the Minister notifies the proponent in writing of one or more air quality standards to be met (including standards derived from the results of the Murujuga Rock Art Monitoring Program) and the proponent complies with all those standards, and any amendments to the standards the proponent is taken to have achieved the Air Quality Outcome.

EPA Report 1727[80] specifies that the proponent is to achieve compliance with any detailed air quality standards to ensure that there are no adverse impacts accelerating the weathering of rock art within Murujuga beyond natural rates. The EPA expects that this will include environmental quality objectives and environmental quality standards derived from the results of the MRAMP. MS 1233 was subsequently issued for the North West Shelf Project Extension, published in December 2024, adopting the above-mentioned EPA-recommended conditions relating to air quality. The Ministerial Statement for the Perdaman Urea Project (MS 1180) includes the same air quality outcome condition that is proposed in EPA Report 1727 and MS 1233.

Statements and commitments made by Woodside within the North West Shelf Air Quality Management Plan commit to manage potential impacts to Aboriginal rock art on the Burrup Peninsula in accordance with the MRAS and as a member of the Murujuga Rock Art Stakeholder Reference Group. Woodside actively supports the implementation of the Murujuga Rock Art Strategy through membership of the Murujuga Rock Art Reference Group and provides funding associated with the Murujuga Rock Art Monitoring Program. Woodside also supports the coordinated approach for an atmospheric deposition monitoring program to be established under the Strategy and currently provides data to the program from the Woodside Atmospheric and Ambient Air Quality Monitoring Programs.

MRAMP interim environmental quality criteria

The MRAMP published interim Environmental Quality Criteria (EQC) which set the initial levels of airborne substances which are considered to not cause harm to rock art (see Curtin University 2025). Woodside complies with the State government's requirements to ensure activities do not result in the region's emissions exceeding MRAMP EQC Standards. Interim Standards published by MRAMP indicated that activities in the region currently remain below this value. Interim EQC Guidelines exist to guide an ongoing management approach under the MRAMP framework for the region.

Onshore facility air emission design mitigations

Under the regulatory Conditions and Part IV Air Quality Management Plans of KGP, Woodside is required to implement a number of controls and risk management practices related to air emissions, including the demonstration of best practice design, and monitoring and abatement programs. The NWS Extension Environment Review Document[81] details how the most recent LNG trains (Trains 4 and 5) constructed at the existing North West Shelf Project are already equipped with lower NOx technology for gas turbines. KGP's Ministerial Statement 536[82] (February 2000), applicable for the construction and operation of Train 4 and Train 5, included the requirement to install low-NOx burners on new gas equipment. MS 1233 issued for the North West Shelf Project Extension, published in December 2024,

requires that no air emissions from the proposal have an adverse impact accelerating the weathering of rock art within Murujuga beyond natural rates. MS 1233 contains a number of conditions related to air quality and NOx emissions, including but not limited to:

- Within 12 months of issue of MS 1233, the Air Quality Management Plan must be revised in consultation with Murujuga Key Stakeholders
- Compliance with all air quality objectives and standards, including, if applicable, those derived from the results of the MRAMP
- At a minimum, reduce NOx emissions to 3,065 tpa by 31 December 2030, corresponding to a 60% reduction
- Include provisions for adoption of continuous or predictive emission monitoring technologies on each stack of LNG processing trains by 30 June 2030
- Identification of best practice design and operational measures and efficient technologies implemented or to be implemented:
    - Specifying when each measure will be implemented
    - Methodology for determination of effectiveness of the measure in minimising air emissions
    - Independent Peer Review Report assessing these measures against international and Australian industry best practice.

Monitoring data and compliance reporting is required to be provided to the WA EPA and made public.

The NWS Extension Environment Review Document[83] details how the most recent LNG trains (Trains 4 and 5) constructed at the existing North West Shelf Project are already equipped with lower NOx technology for gas turbines. KGP's Ministerial Statement 536[84] (February 2000) applicable for the construction and operation of Train 4 and Train 5 included the requirement to install low-NOx burners on new gas equipment.

The existing NWS Air Quality Management Plan includes the following management actions:

- MA4: Adopt practicable and efficient technologies to reduce air emissions. The AQMP states that Woodside has identified and evaluated credible opportunities to achieve a long-term reduction in air emissions and commits to a 40% [updated to 60% in MS 1233 Condition] reduction in NOx emissions from a baseline set between 2013 and 2018. Measures which the NWS has or is considering include implementation of technology such as water injection, dry-low NOx, ultra dry-low NOx, selective catalytic reduction (SCR) systems on turbines, or ceasing operation of older non-DLN equipment with proportionally higher NOx emissions.
- MA5: Implement an adaptive management plan addressing the potential impact to rock art from industrial emissions. This is described in the AQMP, stating that since it is difficult to set appropriate management actions given the current lack of scientific understanding of the impacts of air emissions on petroglyphs, actions will be monitored, reviewed, evaluated and updated considering a range of factors including outcomes from MRAS.

Should credible scientific evidence emerge that industrial emissions are causing accelerated weathering of Murujuga rock art, the impact profile of onshore atmospheric emissions may change. In this eventuality, sufficient provisions exist in the relevant onshore regulatory frameworks as described above to ensure that onshore atmospheric emissions are limited to acceptable levels, which may require review of controls currently in place at onshore processing facilities to manage potential impacts (for example under Section 3 of MS 1233 for NWS). In such a case whereby impact is attributed to the onshore processing of GWA gas, EP change management processes would apply (Section 7.2.5) as required by Regulation 39. It is not feasible to pre-emptively lay out a planned response to such an outcome because there is a broad range of potential findings, severity of change, mechanism timeframes, attribution considerations, and outcomes from stakeholder engagement. However, potential options are available to reduce NOx emissions in this context and to achieve the 60% reduction in NOx emissions at NWS required under MS1233, which may include:

- Retrofitting NOx reduction technology such as DLN (or other technologies as noted above under description of NWS AQMP MA4) on, or ceasing operation of older non-DLN equipment at KGP which emits proportionally higher NOx concentration
- Implementation of further NOx reduction measures or technologies which may no longer be considered disproportionate in context of a proven impact pathway, such as water injection, dry-low NOx, ultra dry-low NOx.

The NWS Karratha Gas Plant is subject to cultural heritage management obligations detailed in MS1233 – further described in Section 6.11.

Impact assessment
Indirect emissions from gas processing onshore – assessment of potential impacts

Contribution to accelerated weathering of Murujuga Rock Art

The Dampier Archipelago, including the Burrup Peninsula and surrounds, traditionally referred to as Murujuga (which means 'Hip Bone Sticking Out' in the Ngarluma-Yaburara language) is located in the Pilbara region of WA. With more than one million images, Murujuga is home to one of the largest, densest and most diverse collections of rock art in the world.[85]

The presence of industry on the Burrup Peninsula has generated concerns from some stakeholders that these emissions may lead to an accelerated weathering of rocks on which rock art is present which may reduce the visibility or destroy the rock art. Research to date on the impacts of emissions on rock art has not been conclusive. Recent publication has included interim environmental quality standards (EQC) set the initial levels of airborne substances which are considered to not cause harm to rock art.

As outlined in Appendix C, industrial emissions on the Burrup Peninsula are subject to extensive scientific studies to understand any potential pathway to impact on rock art, including wet and dry deposition which may alter the pH of rocks as well as the supply of nutrients which may promote microbial activity, the metabolic by-products of which may interact with rock surfaces.

The history of research on this subject, may be broadly divided into four periods. The earliest period, from 2002 to 2009, aligns with the studies conducted by the Burrup Rock Art Monitoring Management Committee (BRAMMC) but also includes work conducted by others, primarily Bednarik who identified potential impact pathways through acid formation and microbial impacts. During this period, MacLeod (2005) also took some comparative pH samples between in-situ rocks and museum samples. None of this parallel work established that industrial emissions were impacting rock art, or the levels of emissions at which impacts may be expected to occur. This period concluded with the 2009 BRAMMC report which stated that "there is no scientific evidence to indicate that there is any measurable impact of emissions on the rate of deterioration of the Aboriginal rock art in the Burrup" (BRAMMC 2009). The report also recommended the establishment of the Burrup Rock Art Technical Working Group (BRATWG) to conduct ongoing monitoring.

The second period of research aligns with BRATWG monitoring from 2010 to 2017. A significant component of this monitoring involved the monitoring of rock art colour. In 2016, Black and Diffey produced an unpublished paper critiquing the statistical methods applied by the CSIRO, which led to a review by Data Analysis Australia (DAA) which raised "substantial doubts about the reliability of the data". A final report from the CSIRO adapted its statistical methods to respond where possible to the conclusions from DAA describing the results as "not fully conclusive". During this period, the BRATWG also commissioned an extreme condition weathering study which found that the dissolution of chemicals began at lower pH levels than previously estimated, however, this work was only preliminary and should not be relied upon in setting thresholds for potential impacts.

The third research period from 2017 until 2023, although overlapping with the conclusion of the BRATWG and initial years of the MRAS and MRAMP, is marked by the absence of any results from a coordinated, well-resourced research program and instead comprises a number of independent studies. As a result, it is difficult to characterise these studies consistently. Some (Black et al. 2017a; Dorn 2020; Smith 2022a) critiqued or re-stated conclusions of previous studies. Black et al. 2017b repurposes historic pH data and concludes that "theoretical evaluation using electrochemical equilibrium principles" indicates impacts to rock art will result from a decreased pH since pre-industrial times; CGB Solutions' 2020 analysis of historic pH and contemporary measurements found that pH was not decreasing and that any correlation between acidity and LNG production sites could not be statistically supported. Both studies suffer from significant issues with the available data.

Other studies (Black et al. 2018; Gleeson et al. 2018) discuss possible impact pathways but do not draw conclusions on whether impacts to rock art are resulting from industrial emissions. Smith et al. (2022b) hypothesise that industrial emissions may be responsible for some reported impacts but acknowledges that the methodologies applied are subject to considerable errors that prevent a definitive conclusion being drawn. A series of studies by MacLeod (2020, 2021, MacLeod and Fish 2021) report on the results of monitoring conducted for Yara Pilbara Nitrates. The outcomes of these reports are inconsistent. Solo reports by MacLeod (2020, 2021) both state that "There is unequivocal evidence that the changes in colour contrast are affected by the changes in the mean and in the minimum pH observed on the rock art sites at the reference positions", though the results include increased acidity correlating in some places with increased contrast and elsewhere with decreased contrast. MacLeod and Fish (2021) then state that "there is presently no adverse impact on the rock engravings from industrial pollution owing to a lower NOx level than when the studies commenced 14 years ago". This conclusion is critiqued by Smith et al. (2022a).

As noted in the MRAMP conceptual model, "while many of these studies form useful datasets to include in subsequent analyses, in general these studies have been inconclusive or failed to show any significant impact of anthropogenic impact on the rock art or chemical/biological species composition and abundance (Commonwealth of Australia 2018).

[85] https://www.wa.gov.au/system/files/2020-07/DWER-Murujuga-rock-art-strategy.pdf.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Nor have they produced any definitive relationships to inform a conceptual impact model, which is instead reliant on fundamental scientific studies in other regions to inform the likely processes occurring at Murujuga (e.g. Dorn 2020).[86]"

In December 2023, the first interim report of MRAMP[87] was published (refer to Section 12.2.1.3 of Appendix C), marking the start of a fourth period of research. The report states that results remain inconclusive with regards to whether industrial air emissions are resulting in anthropogenic change to rock art and recommends that further scientific studies are required. The MRAMP report noted that while some spatial trends in electrochemical parameters (such as pH) and rock surface elemental composition have been found, more work is required to determine causal relationships for these trends (as relationships were not as expected). Spatial trends were also identified as appearing for several measured air pollutants such as NO_2 that are generally consistent with earlier air quality modelling by Ramboll (Ramboll 2022).

The MRAMP monitoring report outlined that similar trends exist for the pH measurements taken in March–April 2022 and the measured NO2 levels generally. This relationship was the reverse of what would be expected to confirm the acid deposition hypothesis in previous literature as MRAMP found pH values in March–April 2022 were highest where NO2 concentrations are highest; whereas with acid deposition, pH is expected to be lower where NO2 is higher, as NO2 is often a precursor to the formation of nitric acid, which has a low pH. Neutral pH is around 7, with low pH indicating potentially acidic conditions. The results in the MRAMP monitoring report have been reinterpreted by Smith (2024) in addition to original research but fails to address this unexpected correlation. Smith (2024) claims that "the damaging impact of acidic emissions on the rock surfaces is not in doubt" but does not provide adequate detail on the original research to allow its reliability to be considered, nor does it provide reason to question the conclusions of the MRAMP report, which stress that the available data is insufficient to draft any meaningful conclusions.

In May 2025, DWER released the secondary technical report of the MRAMP (Curtin University 2024). The results of this report build on the progress reported in the interim (2023) technical report. Over two years of monitoring and research, the program has gathered extensive environmental and geochemical data. The findings in the report included spatial variations in rock porosity, microbiome composition, and pollutant distribution, with elevated porosity linked to historic industrial emissions. Anthropogenic emissions are hypothesized to have accelerated in the 1970s, particularly due to emissions from the former Dampier Power Station. Preliminary conclusions suggest that while the rock surface environment is generally alkaline, pollutants like NO_2 and SO_2 may still play roles in altering surface chemistry and microbiome activity. While the action of NO_2 and SO_2 may contribute to these processes, the historic "acidification" or "acid rain" hypothesis from the literature (Bednarik 2007; Smith et al.,2022a) does not appear to be supported (Curtin University 2024). The study also acknowledged significant trends in air quality data such as 'higher-than-expected' levels of ammonia, ozone, and black carbon, which may pose risks to the rock art and microbiome. These trends are to be investigated as part of the ongoing research to determine the source of potential impacts to rock art.

Throughout this ongoing period of research, new information will continue to be considered and responded to. However, the resourcing, scope and expertise available to MRAMP make it by far the most significant source of research on the cultural impacts of industrial emissions on Murujuga. MRAMP is also co-managed by MAC and emphasises Indigenous decision making and management, aligned with international guidance and standards, including the United Nations Declaration on the Rights of Indigenous Peoples and ICOMOS Charter for the Protection and Management of the Archaeological Heritage. For these reasons, the results of the MRAMP are prioritised in understanding the potential for emission to impact Murujuga's rock art.

The contribution of emissions from processing of GWA gas to the Murujuga airshed is relatively small over the remaining life of GWA offshore operations. Further, there is inconclusive evidence for any causal link between current industrial air emission levels and anthropogenic change to rock art on Murujuga. Given this, and that downstream facilities are subject to separate regulatory assessment outcomes, the risk of processing of GWA gas at KGP adversely impacting rock art on Murujuga is considered to be low, and no impact classification is able to be assigned. Woodside will continue to monitor the outcomes of MRAMP (as per **C 10.1**) and update or change manage the EP accordingly (Section 7.2.8).

Potential Impacts to Human Health

It is recognised that gaseous emissions causing a reduction in ambient air quality have the potential to impact human health as regulated by the NEPM. and the NWS Project Air Quality Management Plan has modelled and assessed the potential impacts of industrial emissions on human health in accordance with the requirements of Western Australian regulatory requirements and international standards (e.g. World Health Organisation). Ambient air quality monitoring programs are in place which demonstrate that current air pollution levels were well below standards set to protect human health and well-being.[88] The magnitude of emissions from processing GWA gas are insufficient to lead to the exceedance of any relevant health criteria on the Burrup Peninsula or surrounding region.

The NWS Project have committed to maintaining an ongoing air quality monitoring program that is in place to monitor the ambient ground-level concentrations of relevant gases on the Burrup Peninsula, with comparisons being made against the NEPM standards and reported to DWER.

Ambient air quality monitoring results from the NWS Project will be summarised in its Annual Environment Report, including any observed exceedances of ambient air quality standards.

As part of the NWS Extension proposal, the EPA assessed the residual impact to human health and amenity from the proposal's nitrogen dioxide (NO2), SO2, NH3, ozone (O3), and particulate (as PM10 and PM2.5) emissions at sensitive

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

receptors both in isolation and in a cumulative context with other existing and future emission sources. Predicted ground level concentrations (GLCs) at Dampier, Karratha, Hearson Cove, and Deep Gorge (Ngajarli) remain below applicable current and future proposed air quality criteria at 'standard operating conditions' and 'worst case' cumulative impact scenarios, with the exception of annual PM10 and PM2.5 GLCs at Hearson Cove and Deep Gorge (Ngajarli), which slightly exceed the applicable criteria due to high levels of natural background dust. Subject to recommended conditions, the impact of the proposal was considered as being consistent with the EPA's objective for air quality in respect of human health.

Noting the absence of any current impacts to human health from industrial activity on Murujuga and presence of a comprehensive regulatory regime including monitoring program, no lasting effect from processing of GWA gas to human health is expected based on slight effect to overall cumulative air quality in context of defined air quality criteria.

Control considered	***Control feasibility (F) and cost/sacrifice (CS)89***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
implementation strategy of this EP.				
NWS Karratha Gas Plant is subject to assessment and compliance under the *Environmental Protection Act 1986* (WA), including: • existence of applicable Ministerial Statement(s) • interim EQC developed as an outcome of MRAS • NO_x concentration limits at emission point sources (via. EP Act Part V Licencing) • implementation of Part IV conditions. • requirement to assess and implement NO_x reduction measures, (e.g. NWS AQMP MA4) This includes implementation of potential Environment Quality Management Framework (EQMF) developed as an outcome of MRAS; and measures such as NO_x concentration limits at emissions point sources under EP Act Part V licences, and implementation of Part IV conditions. The NWS AQMP also requires MA5 development of an adaptive management plan to address the potential impact to rock art from industrial emissions.	F: Yes. CS: Aligned with existing practice.	Implementation of activities and associated controls to ALARP and acceptable levels supports the maintenance of cultural features and heritage values. NWS AQMP MA4 commits to adoption of practicable and efficient technologies to reduce air emissions. MS 1233 requires a reduction of NOx emissions from KGP of 60% by 2030, and identification and implementation of best practice (with peer review). Train 2 has been retired in support of this commitment. Further information on these requirements is described above, under Onshore Facility Air Emission Design Mitigations	Control based on legislative requirements – must be adopted.	Yes. **C 10.2**
Implement the Petroleum Activity in a manner that is not inconsistent with the objectives of the	F: Yes CS: Significant potential cost. Legal requirement.	Legal requirement to carry out activities not inconsistent with the Murujuga National	Control based on legislative requirements – must be adopted.	Yes **C 11.2**

Murujuga National Park Management Plan 78, through execution of the Conservation Agreement and Deep Gorge Joint Statement.		Park Management Plan.		
Implement the Petroleum Activity in a manner that is not inconsistent with UNESCO Operational Guidelines for the Implementation of the World Heritage Convention	F: Yes. CS: Minimal cost.	Implementation of controls for compliance with World Heritage Listing ensures protection and conservation of outstanding universal values,	Benefits outweigh cost/ sacrifice.	Yes. **C 11.3**
Good practice				
Apply a 'living heritage'[90] management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledge across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal cost	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes. **C 11.1**
Forecast, measure, monitor and or estimate facility fuel and flare emissions (in accordance with NGERS and WMS procedures named in Section 7.2.7.6.2) to inform optimisation management practices and minimise environmental impact of emissions.	F: Yes. CS: Minimal cost. Standard practice.	Minimises environmental impact of emissions through planning, ongoing review, governance and optimisation. It combines with good operating practice to maximise production and reduce flaring emissions and fuel emissions at KGP to manage cost, which improves energy intensity (e.g. cleaner production), optimising	Control is WMS requirement – must be adopted.	Yes. **C 10.3**

[90] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

		emissions from the activity. Fuel and flared gas are potential product streams, as such, Woodside applies routine short- and long-term optimisation and opportunity management framework to identify and prioritise enhancement opportunities. Annual flare and fuel target setting and monthly review of performance is completed for KGP.		
Professional judgement – Eliminate				
No additional controls identified				
Professional judgement – Substitute				
No additional controls identified				
Professional judgement – Engineered Solution				
Process all GWA gas exclusively through KGP LNG trains 4 and 5 (T4/T5), equipped with Dry Low NOx (DLN) technology.	F: Not feasible due to operational design and process constraints requiring gas distribution across all active trains; preferential routing to T4/T5 is not possible. CS: Minimal cost as existing infrastructure supports current distribution.	Exclusive processing via DLN trains would maximize NOx reduction from processing of GWA gas, but operational design and processing constraints prevent this. Balanced gas distribution avoids operational failures that could increase emissions and ensures turbines operate within design parameters, maintaining overall emission control.	Not proportionate – Operational design and processing constraints prevent exclusive use of T4/T5 for processing GWA gas. Balanced gas distribution across all available trains is required to sustaining emissions reductions and system reliability.	No
Selective Catalytic Reduction (SCR) at onshore processing facilities.	F: Potentially; subject to sufficient space and technical integration and safety requirements. Installation of SCR on gas turbines to reduce NOx emissions is proven in the power industry. Woodside is not aware of any instances where this	SCR technology converts NOx to other compounds using a catalyst and gaseous reagent, usually ammonia or urea. If feasible, the installation of SCR on existing turbines could deliver a material reduction in NOx	Not proportional based on current impact profile. SCR was not selected for Pluto Train 1 nor recent Train 2, however, the design was subject to peer review and EPA assessment with regard to best practice emission controls.	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)89***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
	has been retrofitted to mechanical drive turbines such as those used in LNG trains. CS: Substantial cost and significant business disruption. The installation of SCR systems introduces material new hazards to facilities, including the need to import significant amounts of ammonia daily, and potentially introduces risks associated with ammonia emissions while operating (which are also being monitored for potential impact to rock art). New gas fired boilers would be required to replace lost ability to extract heat from best-practice exhaust waste-heat recovery systems.	emissions from onshore processing.	Retrofitting on operational processing facilities carries significant cost, safety considerations and complexity. This technology may continue to be assessed under relevant air quality reduction conditions for NWS. However, does not form part of the base case to achieve reduction commitments.	
Risk-based analysis				
Application of Woodside's Risk Management Procedures provide for assessment and ongoing management of impacts from indirect emissions from gas processing. This includes: • ongoing hazard identification, risk assessment and identification of control measures • established programs and frameworks such as MRAS/MRAMP.				
Company values				
Woodside's corporate values require personnel to comply with applicable policies, standards, procedures and processes, and to be accountable for their actions in line with the Woodside Compass. As outlined above, the Petroleum Activity will be undertaken in accordance with these requirements, including the implementation of controls to manage indirect emissions from gas processing.				
Societal values				
Consultation was undertaken for this program to identify the views and concerns of relevant stakeholders. Industrial air emissions on the Burrup Peninsula are being managed by the EPA as part of the EP Act Part IV assessment process and DWER as part of their EP Act Part V process and via the MRAS. Relevant persons consulted in the course of preparing this EP did not raise concerns in relation to atmospheric emissions associated with onshore processing of GWA gas and potential for impact of those emissions on rock art.				
ALARP statement: On the basis of the environmental risk assessment outcomes application of tools appropriate to the decision type B (i.e. Decision Type B; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the adopted controls appropriate to manage the potential impacts of indirect emissions from gas processing onshore on cultural values and heritage. Air emissions from onshore processing at the NWS Project have been assessed and approved in accordance with Ministerial Statement 536 (and others). Air emissions from onshore processing at the NWS Project Extension (i.e. an extension of the life of the NWS Venture beyond 2030) have been assessed by the EPA under Assessment Report

Control considered	***Control feasibility (F) and cost/sacrifice (CS)89***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
1727, and approved by MS 1233. Both facilities are subject to the provisions of Commonwealth and State legislation to ensure unacceptable environmental impacts are avoided. The assessment in the ALARP table reflects the current status of controls related to routine indirect atmospheric emissions, in the context that there is currently no scientific consensus that these emissions are accelerating weathering of Murujuga rock art. These current controls are considered to appropriately implement a risk-weighted precautionary principle. As described above, established programs and frameworks such as MRAS/MRAMP are designed to investigate theorised impact pathways and determine whether impact is occurring. Should credible scientific evidence emerge that anthropogenic emissions associated with processing of GWA gas is causing accelerated weathering of Murujuga rock art as an outcome of MRAMP, the impact profile of onshore atmospheric emissions may change. In this eventuality, sufficient provisions exist in the relevant onshore regulatory frameworks to ensure that onshore atmospheric emissions are limited to acceptable levels, which may require review of controls currently in place at onshore processing facilities to manage potential impacts. As no reasonably practicable additional or alternative controls have been identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.

Demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The impact assessment has considered the relevant principles of ESD: • Conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • Inter-generational equity, enduring the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • Integration of long-term and short-term economic, environmental, social and equitable considerations in decision-making. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) • Woodside Indigenous Communities Policy ***External Context*** The impact assessment has considered feedback from relevant persons (Section 5). No stakeholder feedback relevant to indirect emissions associated with gas processing onshore was identified during consultation for this EP. Controls and monitoring frameworks to manage indirect emissions associated with gas processing onshore have been designed to be commensurate with the consequence level, location and sensitivity of the receiving environment (including social and amenity values). These measures address broader societal expectations to an acceptable level. ***Other Requirements*** Murujuga Cultural Landscape World Heritage Property As outlined above, The Murujuga Cultural Landscape Strategic Management Framework (Government of Western Australia, 2022) establishes the management structure for the inscribed Murujuga Cultural Landscape World Heritage Property. Existing laws and regulations, joint management agreements, management plans and complementary policies, strategies and programs in place for Murujuga will remain active and support the listing of Murujuga Cultural Landscape as a World Heritage Property. The management plans give effect to the duties and obligations of Australia under the World Heritage Convention and help facilitate the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property. Consequently, by demonstrating that it is not	The impact assessment concludes that indirect atmospheric emissions from the onshore processing of GWA gas contribute only a minor portion to the overall industrial emission airshed load on the Burrup Peninsula. Atmospheric emissions within the Murujuga airshed from the NWS Project Extension have undergone independent assessment by the WA and agencies and have been considered acceptable and are subject to management conditions as detailed in Onshore Design Mitigations and adopted through **C 11.3**. As there is no conclusive evidence of a causal link between current industrial air emission levels and potential anthropogenic change to rock art on Murujuga, and that downstream facilities are subject to separate regulatory assessment outcomes, no impact classification is able to be assigned. The predicted level of impact to air quality is considered to be of an acceptable level (consequence level F- No lasting effect), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant world heritage management principles, AMPs, recovery plans • the predicted level of impact has been reduced to ALARP. To manage impacts from indirect atmospheric emissions to cultural heritage and air quality to an acceptable level the following EPOs have been applied: **EPO 10:** Prevent accelerated weathering of Murujuga rock art or impact to human health from air emissions that result from onshore processing of GWA gas.

Demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
inconsistent with the management plans outlined below, the Petroleum Activity is not inconsistent with the Australian World Heritage Schedule 5 Principles (See Table 1-5) and therefore aligns with the World Heritage Convention. Alignment of the Petroleum Activity and indirect emissions associated with onshore gas processing with these management plans, their objectives and regulatory frameworks, where relevant to the Petroleum Activity are addressed in Section 6.10 (Table 6-43).	**EPO 11a:** No adverse impacts to cultural features and heritage values from the Petroleum Activity **EPO 11b:** Woodside will actively support Traditional Custodians' capacity for ongoing engagement and consultation on environment plans for the purpose of avoiding impacts to cultural features and heritage values. The adopted controls are considered appropriate to manage the impacts of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met. On the basis of the assessment outcomes and application of tools appropriate to the decision type (i.e. Decision Type B; Section 2.4.4.2), the adopted controls are appropriate to consider the potential impacts and that this is managed to a level that is broadly acceptable. Compliance with those controls demonstrates that the EPO is met.

Light emissions from the GWA platform, support vessels and IMMR activities.					✓		A	F	-	-	GP, PJ	Broadly Acceptable	EPO 12
Light emissions from flaring.					✓								

Description of source of impact

Lighting is used on the GWA platform and support vessels to support 24-hour operations and to provide navigational marking in accordance with Section 3.6.5.1. As lighting is required for the safe operation it cannot reasonably be eliminated.

The distance to the horizon at which lighting from the GWA platform will be directly visible can be estimated using the following relationship:

$$horizon\ distance = 3.57\ x\ \sqrt{height}$$

where 'horizon distance' is the distance to the horizon at sea level (km), and 'height' is the height above sea level of the light source (m).

Based on this relationship, the approximate maximum distances at which key light sources) may be visible at sea level are:

- approximately 18.75 km from the GWA platform production deck (~25 m above sea level).
- approximately 49.60 km from the flare tower (~175 m above sea level).

Operations

External lighting is installed throughout the GWA platform and on support vessels, with lighting primarily directed towards working areas (i.e. platform and vessel decks).

The platform deck is approximately 25 m above sea level, while the flare tower represents the highest point on the facility at approximately 175 m above sea level. External lighting on support vessels is generally lower in elevation than that of the GWA platform and is typically managed to maintain night vision for bridge crew. A relatively small quantity of gas is continuously flared to maintain purge and pilot systems and to dispose of waste streams not recovered to the process. Intermittent flaring may also occur during process upsets to safely relieve excess pressure via the HP flare system. The flare, located at the top of the flare tower, represents the most prominent light source.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Support vessels, including the ASV, have lighting sources primarily located on accommodation and working decks below the bridge, typically between ~5 and 50 m above sea level. As such, the majority of vessel lighting is at or below the elevation of the primary facility light source (flare tower tip).

IMMR

During IMMR activities, temporary underwater lighting is generated by ROVs and AUVs. Due to the rapid attenuation of light in seawater, these light sources are highly localised and limited to the vicinity of the equipment.

Cumulative light sources

Concurrent activities from platform, support vessels and IMMR activities may temporarily increased localised lighting with the Operational Area.

Light emissions may also arise from nearby offshore facilities, including Okha FPSO, Angel, NRC and Pluto platforms. These sources may contribute to slightly elevated ambient light levels in the region.

Well commissioning

Nitrogen displaced from the Wilcox flowline during GWF4 commissioning of the first Wilcox well is planned to be removed via controlled flaring at the GWA platform for a short-duration period as part of the well clean-up process required to remove nitrogen, fluids and solids from the well and flowline.

The process involves continuous flaring for a minimum of 6 hours and up to 36 hours, or until all nitrogen has been released.

The activity does not introduce a different source of light emissions to that of routine operational flaring, as hydrocarbons will be co-flared with the nitrogen product to maintain stable combustion, resulting in a flare with similar characteristics to normal facility flaring operations as described above.

Impact assessment

Environmental value(s) potentially impacted

Lighting from the GWA platform and support vessels may occur as direct light (light spill) or indirectly as skyglow. The extent and visibility of light emissions are influenced by light source characteristics and environmental conditions.

Subsea lighting associated with IMMR activities (e.g. ROVs and AUVs) is highly localised due to rapid attenuation of light in seawater and is not expected to contribute to surface-visible light emissions or skyglow.

Receptors that have important habitat present within a 20 km buffer of the Operational Area were considered as having potential for interaction, based on recommendations of the National Light Pollution Guidelines for Wildlife (DCCEEW 2023). The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings (15 to 18 km) and fledgling seabirds grounded in response to artificial light 15 km away.

Light emissions can affect fauna in two main ways:

- Behavioural effects: disruption to natural diel cycles or attraction to light sources
- Orientation effects: interference with natural light cues used for navigation or movement

The fauna within the Operational Area are predominantly pelagic fish and zooplankton, with a low abundance of transient species such as seabirds, marine turtles, whale sharks and large whales transiting through the Operational Area and surrounding 20 km light buffer. BIAs and habitats critical for EPBC listed species that overlap the Operational Area are listed in Section 4.6.

Seabirds

Artificial lighting can attract and disorient seabirds, potentially resulting in behavioural disturbance or collision risk (Longcore and Rich 2004; Gaston et al. 2014). However, there are no seabird nesting colonies within the Operational Area, with the nearest at the Montebello Islands (~38 km south of the Operational Area). While a wedge-tailed shearwater breeding BIA overlaps the south-west portion of the Operational Area (approximately 9 km from the GWA platform), individuals are expected to occur at low density and primarily forage during daylight hours.

Support vessel presence is intermittent and of short duration, and lighting is managed where practicable. Accordingly, impacts to seabirds are expected to be limited to localised behavioural disturbance to isolated individuals, with no displacement from important habitat and no lasting effect.

Marine turtles

The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia 2017) identifies artificial light as a potential threat to marine turtles, particularly for nesting adults and hatchlings, where light cues are used for orientation.

Artificial lighting has the potential to affect marine turtles through disorientation or attraction, particularly during hatchling emergence and nearshore dispersal. Hatchlings have been observed responding to artificial light sources over distances of up to approximately 18 km, and may exhibit altered swimming behaviour where light spill is present (Kamrowski et al. 2014).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Internesting BIAs for the flatback turtle overlap the Operational Area, with an internesting buffer BIA located approximately 15 km south, within the 20 km light buffer. In addition, internesting habitat critical to the survival of flatback turtles overlaps the Operational Area, and habitat critical to survival for green and hawksbill turtles occurs within the 20 km light buffer (approximately 18.5 km south of the Operational Area). These areas represent environments important for critical life stages, including internesting and reproductive behaviours.

However, the nearest known nesting beaches are located at the Montebello Islands, approximately 38 km south of the Operational Area and approximately 89 km from the GWA platform. As such, there is no credible pathway for impacts to hatchling emergence or sea-finding behaviour, which are the life stages most sensitive to artificial light.

Marine turtles may occur within the Operational Area at low densities during transit or as part of internesting movements. However, available evidence indicates that marine turtles do not rely on light cues for offshore foraging, migration or internesting behaviours, and offshore artificial light sources are not considered a likely mechanism for significant behavioural disruption in these life stages (PENV 2000; 2020).

Isolated individuals may be temporarily attracted to light spill from the platform and support vessels and to a much lesser extent, highly localised subsea lighting associated IMMR activities. Such effects are expected to be short-term and reversible.

Accordingly, impacts to marine turtles are expected to be localised with no lasting effect on populations or important behaviours.

Fish, sharks and rays

Artificial lighting may attract zooplankton and small fish, potentially resulting in localised aggregation of higher trophic species (Meekan et al. 2001). These aggregations are typically restricted to the immediate vicinity of the light source. Subsea lighting associated with IMMR activities may also result in highly localised attraction of zooplankton and small fish, however, these effects are limited to the immediate vicinity of the equipment.

Fish species are known to respond to artificial light in a similar manner to zooplankton, with increased prey availability potentially attracting predatory fish, sharks and rays. Lighting associated with the GWA platform, support vessels or IMMR activities may therefore result in temporary and localised increases in fish abundance in the vicinity of light sources.

A foraging BIA for the whale shark overlaps the Operational Area. Whale sharks primarily feed on planktonic organisms (e.g. krill and larval stages), which may also exhibit localised attraction to light. However, any increase in prey availability associated with artificial lighting is expected to be small in scale and spatially limited. As such, the presence of lighting is not expected to result in any meaningful change in whale shark distribution or aggregation patterns within the BIA.

Given the transient and localised nature of these effects, no change to overall species composition, abundance or ecological function is expected within the Operational Area. Impacts to fish, sharks and rays are therefore expected to be localised with no lasting effect.

Values and Sensitivities

Ancient Coastline at 125 m Depth Contour

The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF. The Operational Area overlaps approximately 251 km^2 of the 16,242 km^2 KEF (1.5% of the total KEF area). The Operational Area represents a 1,500 m buffer around the GWA subsea infrastructure to facilitate vessel operations.

Given the highly localised extent of light emissions and the absence of benthic or geomorphic sensitivity to light at these depths, potential impacts to the Ancient Coastline at 125 m Depth Contour KEF are expected to be localised with no lasting effect.

Montebello Marine Park

The Operational Area overlaps approximately 3 km^2 of the 3,413 km^2 Montebello Marine Park (0.09% of the total marine park area). The Operational Area represents a 1,500 m buffer around the GWA subsea infrastructure to facilitate vessel operations. While the Operational Area overlaps the Montebello Marine Park, subsea infrastructure does not.

Given the distance to primary light sources and the limited spatial extent of light emissions, impacts to values of the Montebello Marine Park are expected to be localised with no lasting effect.

Cumulative impacts

Cumulative light emissions from nearby facilities (e.g. NRC platforms) may contribute to slightly elevated ambient light levels. However, given the spatial separation of these sources, cumulative impacts are expected to remain localised with no lasting effect.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[92]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
considers the adopted controls appropriate to manage the impacts of routine light emissions from the GWA platform and support vessels. As no reasonable additional or alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of acceptability
The impact assessment has determined that, given the adopted controls, routine light emissions from external lighting on the GWA platform and support vessels represent a localised impact to marine fauna within the Operational Area, with no lasting effect. BIAs for whale shark foraging, flatback turtle internesting and internesting buffer, and wedge-tailed shearwater breeding areas overlap the Operational Area (Section 4.6.1, 4.6.2, 4.6.4, respectively). While these areas represent habitats important for key life stages, the offshore location of the Petroleum Activity, absence of critical nesting habitat, and localised nature of light emissions limit the potential for interaction with these receptors. Relevant conservation advice and the National Light Pollution Guidelines for Wildlife were considered in the impact assessment, and the Petroleum Activity is consistent with these. On the basis of the assessment outcomes, application of tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), Woodside considers the adopted controls appropriate to manage the impacts to a level that is broadly acceptable. Compliance with these controls demonstrates that the EPOs are met.

6.8 Unplanned activities (accidents, incidents, emergency situations) – major environmental events

For Woodside's production facilities, an analysis is undertaken to identify, classify and analyse major environmental events (MEEs), as described in Section 2.5. This extra level of rigour is applied to ensure sufficient controls for operational activities are in place for risks with potential Level B and above consequences as per Woodside's Risk Matrix. MEEs are evaluated against credible worst-case scenarios that may occur when all controls are absent or have failed. The risks considered in this section have therefore been identified as MEEs due to the potential for significant consequence. These sources of risk are subject to additional consideration in accordance with the process described in Section 2.6. Risks associated with the Petroleum Activity that have been classified as MEE's are summarised in Section 6.8.1 and include a range of hydrocarbon spills. The quantitative spill risk assessment methodology used to assess the potential consequence of credible spills is outlined in Section 6.8.2. Credible hydrocarbon spills that have not been classified as MEE's are assessed in Section 6.9. Risks that do not meet the MEE definition, although screened out of the MEE process, are still evaluated for ALARP and risk acceptability using the methodology described in Section 2.6

6.8.1 Major environmental events overview

This section outlines the process for additional analysis and evaluation of MEEs. These are outlined in Table 6-23 and described further in subsequent sections.

Table 6-23: Major environmental events for the Petroleum Activity

No.	Hazard	Top Event
MEE-01	Hydrocarbons in reservoirs, wells, wellheads and xmas trees (XTs)	Well loss of containment
MEE-02	Hydrocarbons in Subsea Equipment (pipelines, manifolds, flowlines and risers)	Subsea pipelines and riser loss of containment
MEE-03	Hydrocarbons in Topsides Equipment	Topsides loss of containment
MEE-04	Hydrocarbons in Subsea and Topsides Equipment and Marine Vessels	Loss of structural integrity
MEE-05	Hydrocarbons in Wells, Subsea and Topsides Equipment and Marine Vessels	Loss of marine vessel separation
MEE-06	Hydrocarbons in Wells, Subsea and Topsides Equipment	Loss of control of suspended load from facility lifting operations

MEEs are described in detail in bowties in Sections 6.8.3 to 6.8.8. These sections also include a summary of the hazard description, hazard management, emergency response, ALARP summary and a list of SCE barriers identified on the bowties. Each group of SCEs is listed under Technical Performance Standards, with consistent naming conventions used across Woodside's process safety management systems (e.g. pipeline integrity SCEs are captured as P09 – Pipeline Systems).

Section 6.8.9 presents the generic bowtie diagrams for SCE failure and human error, illustrating the causes and outcomes, and controls in place to manage potential common cause event (CCE) failure mechanisms. These include SCE equipment failure (CCE-01), and human error (CCE-02). Controls and specific measures are identified for both bowties. Human error is managed via the WMS, and the generic human error bowtie is included in the MEE section for completeness.

ALARP is demonstrated through the identification and selection of controls and barriers based on their independence, with prioritisation in accordance with the hierarchy of controls (where higher-order controls take precedence). Controls are further assessed based on the type of effect they provide. ALARP controls presented for the MEE bowties are classified in accordance with the Type of Effect categories defined in Table 6-24.

Woodside has developed a tailored ALARP position for hydrocarbon spill preparedness and response, including EPOs, EPSs and MCs. These response arrangements act as mitigative controls applicable to all

MEEs where a hydrocarbon release may credibly occur. The hydrocarbon spill response arrangements are described in Appendix G.

Table 6-24: Barrier Hierarchy and Type of Effect

Type of Effect	Legend	Description
Elimination (Technical)		Elimination controls form the 'first line of defence'. They eliminate the underlying hazard and therefore are the most effective category of control measure. If practicable, they should be selected in preference to any other type, as their existence removes the need for any other controls (e.g. a corrosion-resistant metal could replace the original material of construction).
Elimination (Administration)		
Prevention (Technical)		Prevention controls are intended to remove certain causes of incidents or reduce their likelihood. The corresponding hazard remains, but the frequency of incidents involving the hazard is lowered (e.g. introduction of regular maintenance programs can prevent the development of events involving the hazard). Where hazards and causes could not be 'eliminated', controls are required to prevent them from leading to unwanted events and consequences.
Prevention (Administration)		
Detection (Technical)		Detection controls are those that identify a potentially hazardous scenario (e.g. a change in operating parameters), allowing initiation of procedures or systems to prevent the cause occurring. Controls that detect the occurrence of events are often critical to being able to respond with other control measures that reduce the propagation of the events. Detection controls themselves often provide no actual control other than the awareness of the need to respond.
Detection (Administration)		
Reduction / Control (Technical)		Reduction controls are intended to limit the scale and consequence of incidents. They include systems that detect incidents and take some action (e.g. to reduce the rate of leakage of a toxic gas) and also aspects such as inter-unit separation that prevent escalation of fire and explosion incidents. As there is always potential for controls to fail, additional measures are required to limit the scale and severity of any unwanted event or outcome that may arise, by providing the ability to intervene and limit the propagation of the events.
Reduction / Control (Administration)		
Mitigation (Technical)		Mitigation controls take effect in response to an incident. They include controls that lessen the significance or damage caused by an unwanted event. Such controls only take effect after the hazardous event and outcomes occur. Mitigation controls are generally those designed to protect personnel against the consequences of a hazard or to aid in recovering from the effects of the hazard.
Mitigation (Administration)		

6.8.2 Quantitative spill risk assessment methodology

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur during the Petroleum Activity. Scenarios that have been classified as MEEs are assessed in Sections 6.8.3 to 6.8.8. Scenarios that are not classified as MEEs (as explained in Section 6.8.1) are assessed in Section 6.9.

Location-specific, quantitative hydrocarbon spill modelling was undertaken by RPS, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

hydrocarbon types under the influence of changing meteorological and oceanographic forces. The model does this by releasing particles representing hydrocarbons from a specified point within the model and subsequently transported.

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form oil-in-water emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each particle (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

Hydrocarbon spill modelling assessments undertaken by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.8.2.1 Worst-case scenarios

In assessing the potential impacts of an unplanned hydrocarbon release, representative worst-case scenarios (in terms of volume and location) have been considered. A summary of the credible hydrocarbon spill scenarios that may occur during the Petroleum Activity is provided in Table 6-25.

Table 6-25:Credible hydrocarbon spill scenarios

Scenario	Hydrocarbon type	Duration (days)	Maximum credible volume	Modelling locations
Scenario 1 Well blowout: hydrocarbon release caused by well loss of containment MEE-01	Yodel condensate	76	300,985 m^3	Seabed release at YOD05 (part of the GWF4 development)
Scenario 2 Well blowout: hydrocarbon release caused by well loss of containment	GWA03 condensate	68	171,033 m^3	Surface release at GWA-08

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Scenario	Hydrocarbon type	Duration (days)	Maximum credible volume	Modelling locations
MEE-01				
Scenario 3 Subsea Loss of Containment: flowlines (GWF1 / GWF2) subsea release outboard of SSIV MEE-02	GWF4 rich fluid composition (GWF Condensate)	< 6 hours	799.7 m^3	Subsea release from GWF2 flowline inlet
Scenario 4 Subsea Loss of Containment: Subsea release from IFL (including 2TL inventory) downstream of SSIV but within 500 m of the GWA platform MEE-02	GWA condensate	< 6 hours	8,090 m^3	Subsea release from IFL downstream of SSIV but within 500 m of GWA facility
Scenario 5 Subsea Loss of Containment: Surface release from IFL (including 2TL inventory) from rupture of riser at the GWA platform MEE-02	GWA condensate	< 6 hours	7,623 m^3	Surface release from IFL
Scenario 6 Topside loss of containment: Instantaneous release from the GWA facility. MEE-03	Gas and GWA Condensate GWA Condensate Marine Diesel	Instantaneous	Gas and GWA Condensate - 135 m^3 GWA Condensate - 403 m^3 Marine Diesel - 343 m^3.	Topside loss from GWA facility
Scenario 7 Marine fuel loss during hydrocarbon bunkering	Marine diesel	15 days	24 m^3	Surface release within the Operational Areas (not modelled)
Scenario 8 Instantaneous release after a loss of marine vessel separation or vessel collision MEE-05	Marine diesel	Instantaneous	1000 m^3	Surface release near the GDA05 well location

6.8.2.2 Hydrocarbon characteristics

Table 6-26 summarises the characteristics of the hydrocarbons used as the basis for the modelling studies and subsequently used to inform the assessment of credible hydrocarbon spills. Additional detail on the characteristics of these hydrocarbons is also provided in the sections below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-26: Characteristics of the hydrocarbon types used for modelling and ecotoxicological studies

6.8.2.2.1 GWA Condensate

GWA Condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components. In favourable evaporation conditions, about 65.9% of the oil mass should evaporate within the first 12 hours, a further 22.5% should evaporate within the first 24 hours and a further 10.8% should evaporate over several days. About 0.8% of the oil is shown to be persistent (RPS Group 2021).

The whole oil has a low asphaltene content (<0.5%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle.

Soluble, aromatic, hydrocarbons contribute approximately 16.3% by mass of the whole oil. About 9.1% by mass is highly soluble and highly volatile. A further 7.2% by mass has semi-to-low volatility. These compounds dissolve more slowly but tend to persist in soluble form for longer. Discharge onto the water surface will favour the process of evaporation over dissolution under calm sea conditions, but increased entrainment of oil and dissolution of soluble compounds can be expected under breaking wave conditions (RPS Group 2021).

The mass balance forecast for the constant-wind case (see Figure 6-4) for GWA Condensate shows that about 88.4% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes (RPS Group 2021).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

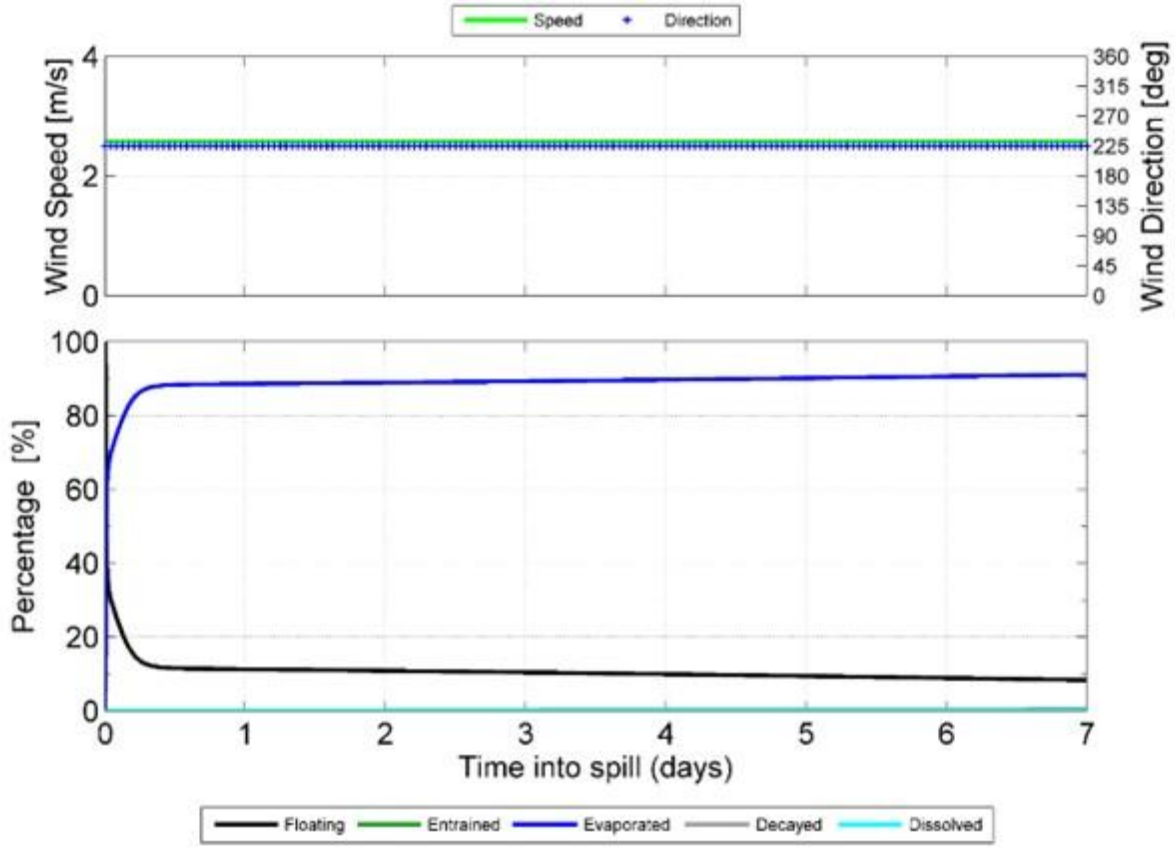

Figure 6-4: Proportional mass balance plot representing the weathering of GWA Condensate spilled onto the water surface as a one-off instantaneous release and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

Under the variable-wind case (see Figure 6-5), where the winds are of greater strength on average, entrainment of GWA Condensate into the water column is predicted to increase. About 24 hours after the spill, around 13.6% of the oil mass is forecast to have entrained and a further 81.1% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

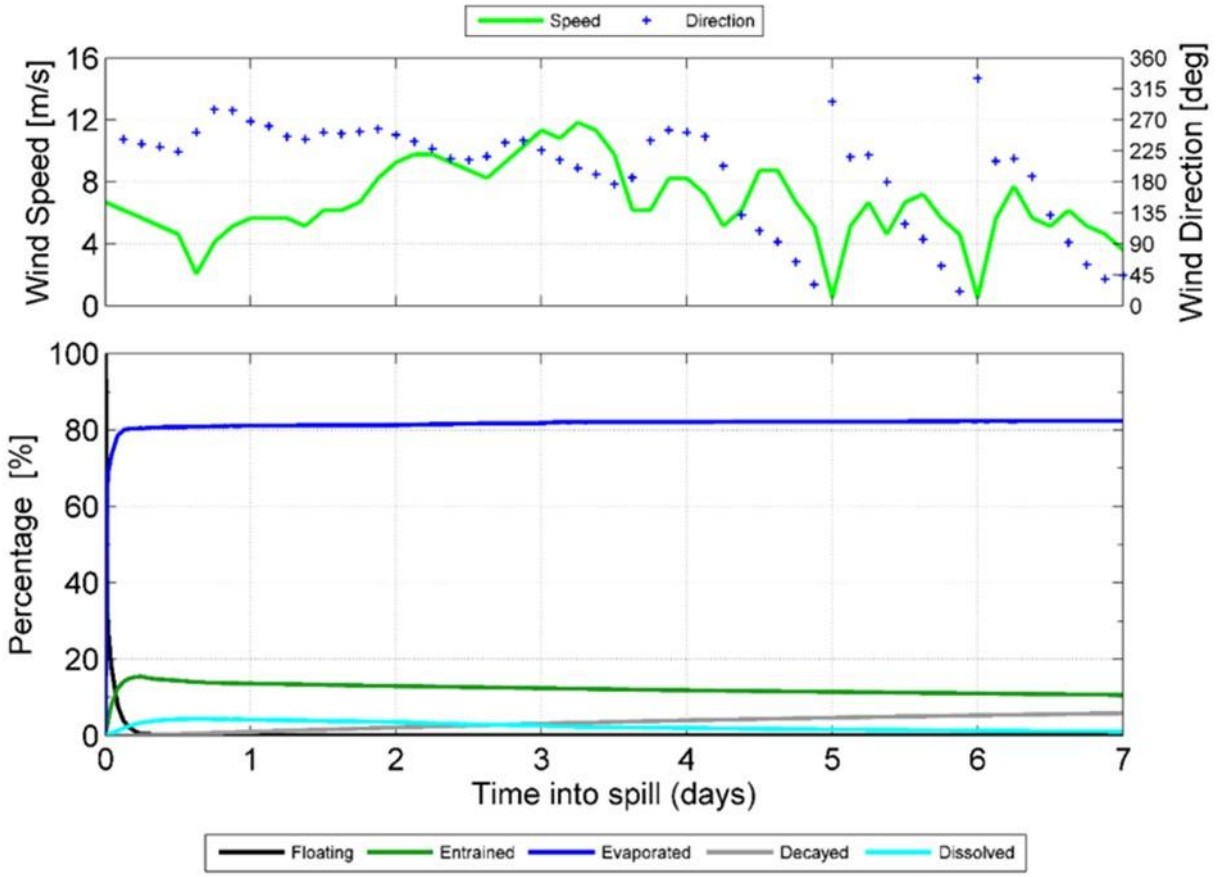

Figure 6-5: Proportional mass balance plot representing the weathering of GWA Condensate spilled onto the water surface as a one-off instantaneous release and subject to variable wind at 27 °C water temperature and 25 °C air temperature

6.8.2.2.2 GWA-03 Condensate

GWA-03 Condensate is a mixture of volatile and persistent hydrocarbons with high proportions of volatile and semi-volatile components. In favourable evaporation conditions, about 71.6% of the oil mass should evaporate within the first 12 hours; a further 19.8% should evaporate within the first 24 hours; and a further 7.0% should evaporate over several days. Only about 1.6% of the oil is shown to be persistent (RPS Group 2021).

The whole oil has a low asphaltene content (< 0.5%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle.

Soluble, aromatic, hydrocarbons contribute approximately 13.2% by mass of the whole oil. Around 9.6% by mass is highly soluble and highly volatile. A further 3.6% by mass has semi-to-low volatility. These compounds dissolve more slowly but tend to persist in soluble form for longer. Discharge onto the water surface will favour the process of evaporation over dissolution under calm sea conditions, but increased entrainment of oil and dissolution of soluble compounds can be expected under breaking wave conditions (RPS Group 2021).

The mass balance forecast for the constant-wind case (see Figure 6-6) for GWA-03 Condensate shows that about 91.4% of the oil is predicted to evaporate within 24 hours. Under calm conditions, the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

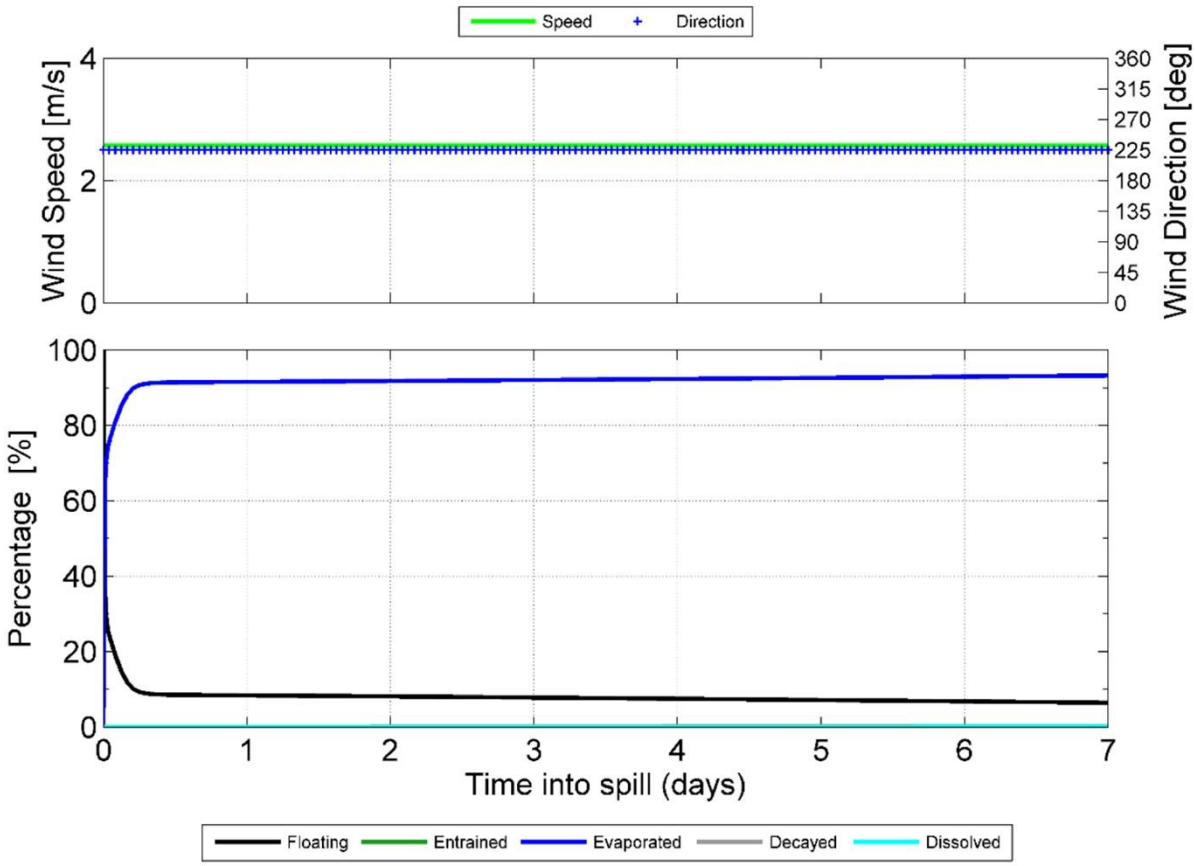

Figure 6-6: Proportional mass balance plot representing the weathering of GWA-03 Condensate spilled onto the water surface as a one-off instantaneous release and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

Under the variable-wind case (see Figure 6-7), where the winds are of greater strength on average, entrainment of GWA-03 Condensate into the water column is predicted to increase. About 24 hours after the spill, around 11.9% of the oil mass is forecast to have entrained and a further 85.4% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

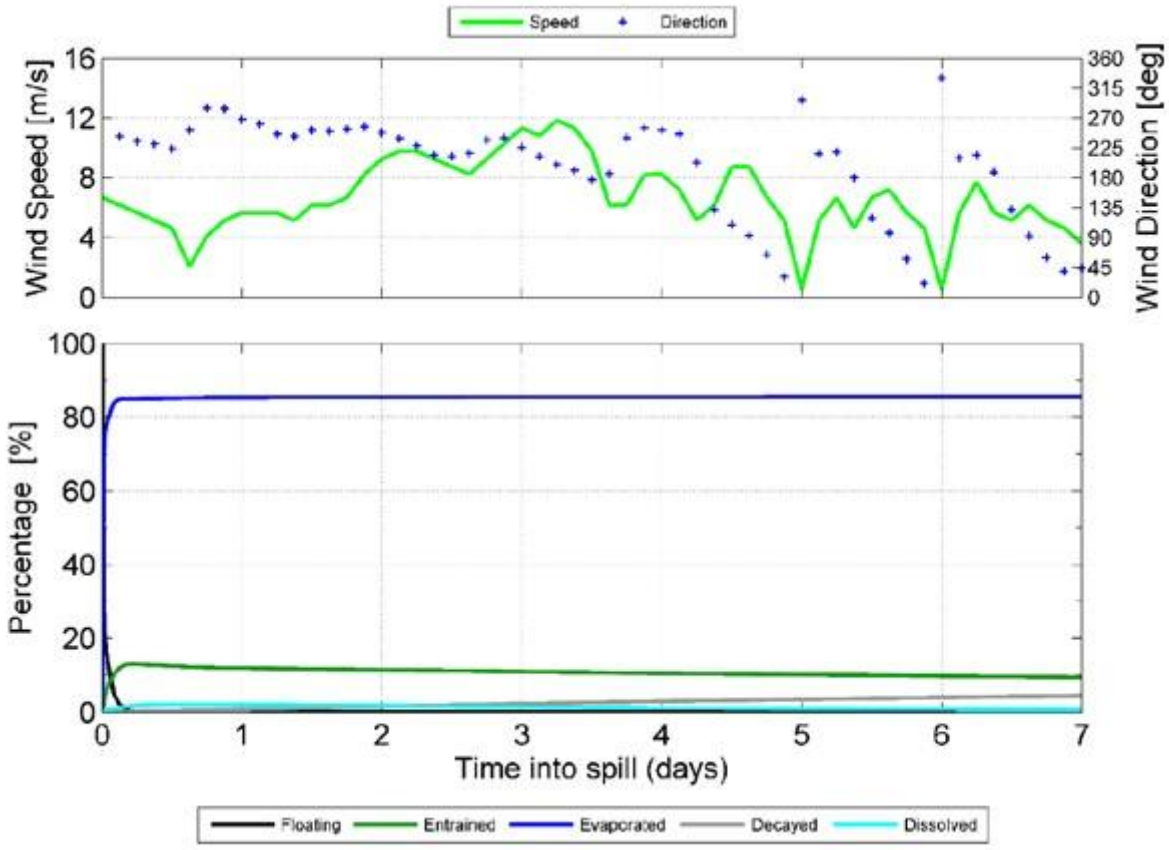

Figure 6-7: Proportional mass balance plot representing the weathering of GWA-03 Condensate spilled onto the water surface as a one-off instantaneous release and subject to variable wind at 27 °C water temperature and 25 °C air temperature

6.8.2.2.3 GWF4 Rich Fluid Composition (GWF Condensate)

The GWF Condensate is made of high proportions of highly volatile hydrocarbons. In general, about 62 % of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 20 % should evaporate within the first 24 hours (180 °C < BP < 265 °C); and a further 10% should evaporate over several days (265 °C < BP < 380 °C). Approximately 8 % of the oil is shown to be persistent. The aromatic content of the oil is approximately 17.1 %.

If released in the marine environment and in contact with the atmosphere (i.e., surface spill), approximately 82 % by mass of this oil is predicted to evaporate over the first couple of days depending upon the prevailing conditions, with further evaporation slowing over time. The heavier (low volatility) components of the oil tend to entrain into the upper water column due to wind-generated waves but can subsequently resurface if wind-waves abate. Therefore, the heavier components of this oil can remain entrained or on the sea surface for an extended period, with associated potential for dissolution of the soluble aromatic fraction. Further, the GWF Condensate contains 8% of heavy hydrocarbons (persistent compounds) that are likely to remain on the sea surface for longer periods.

The mass balance forecast for the constant-wind case (Figure 6-8) for GWF Condensate shows that approximately 82% of the oil is predicted to evaporate within 24 hours. Under these calm conditions, most of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.

Under the variable-wind case (Figure 6-9), where the winds are of greater strength, entrainment of GWF Condensate into the water column is indicated to be greater than the constant wind case. Approximately 24 hours after the spill, around 20% of the oil mass is forecast to have entrained and 73% is forecast to have evaporated. The increased level of entrainment in the variable-wind case will result in a higher percentage of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 1% per day with an accumulated total of ~7% after 7 days, in comparison to a rate of ~0.13% per day and an accumulated total of 0.88% after 7 days in the constant wind case.

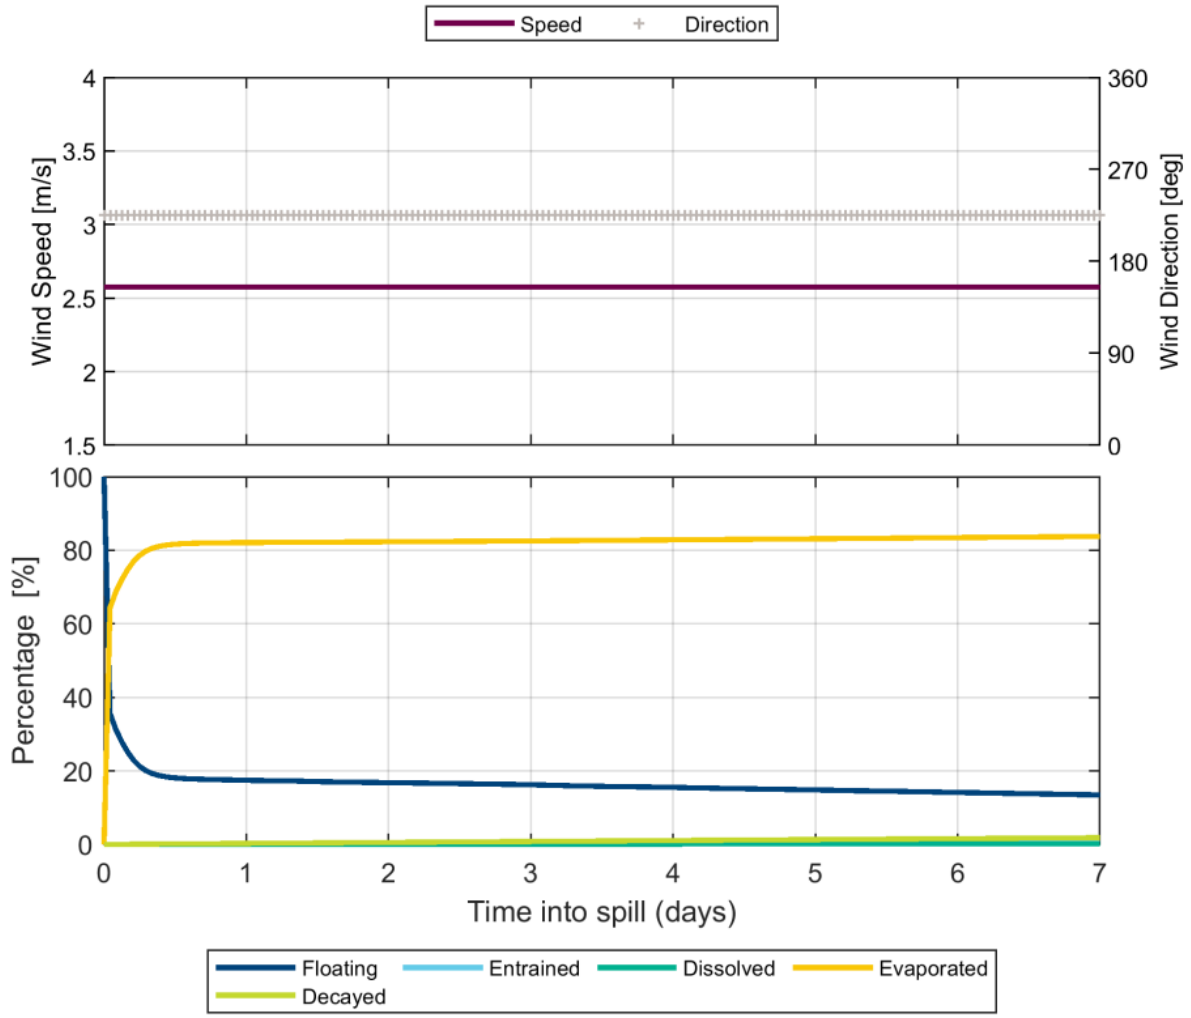

Figure 6-8: Proportional mass balance plot representing the weathering GWF Condensate spilled onto the water surface as a one-off release (50 m3) and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

6.8.2.2.4 Yodel-3 Condensate

Yodel-3 Condensate (API 54.4) contains a low proportion (2.5% by mass) of hydrocarbon compounds that will not evaporate at atmospheric temperatures (residual). These compounds will persist in the marine environment; however, most of the hydrocarbons that comprise this oil (97.5%) will volatilise at ambient temperatures.

The mixture is composed of hydrocarbons that have a wide range of boiling points and volatilities at atmospheric temperatures, and which would begin to evaporate at different rates on exposure to the atmosphere. Evaporation rates will increase with temperature, but in general about 63.1% of the oil mass should evaporate within the first 12 hours (BP < 180 °C); a further 25.3% should evaporate within the first 24 hours (180 °C < BP < 265 °C); and a further 9.1% should evaporate over several days (265 °C < BP < 380 °C).

The unweathered hydrocarbon mixture has low density (0.76 g/cm^3) and very low dynamic viscosity (0.54 cP). The pour point of the whole mixture (< -36 °C) indicates that it will remain in a liquid state over the annual temperature range observed on the North West Shelf.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Selective evaporation of the lower boiling-point components will lead to a shift in the physical properties of the remaining mixture, including an increase in the density, viscosity and pour point. Given the low density, viscosity and pour point of the mixture, it is expected that even after weathering the hydrocarbon mixture will not solidify and will remain less dense than seawater.

The whole oil has low asphaltene content (< 0.1%), indicating a low propensity for the mixture to take up water to form water-in-oil emulsion over the weathering cycle. The whole oil also contains ~ 5% wax, therefore there is potential for residual hydrocarbons to be found as wax in the marine environment if this oil is spilled.

Soluble aromatic hydrocarbons contribute approximately 8.7% by mass of the whole oil, mostly in the C11-C20 range of hydrocarbons. These compounds would evaporate slowly if exposed to the atmosphere, leaving the potential for dissolution of a proportion of them into the water column.

The results for the constant-wind case (Figure 6-10) indicate that Yodel-3 Condensate will have a tendency to evaporate fairly rapidly, with 88% of the spilled volume predicted to evaporate and around 10% remaining on the water surface after the first 24 hours under light winds. Negligible levels of entrainment and dissolution are expected under these light wind conditions.

A slightly reduced evaporation rate is predicted in the first 24 hours for the variable-wind case (Figure 6-11). Increased entrainment and dissolution rates are predicted in this case, with a corresponding decrease in the floating oil proportion to negligible levels. The variable-wind case also indicates that, once entrained, the oil tends to remain in the water column and may not resurface even during calm wind periods.

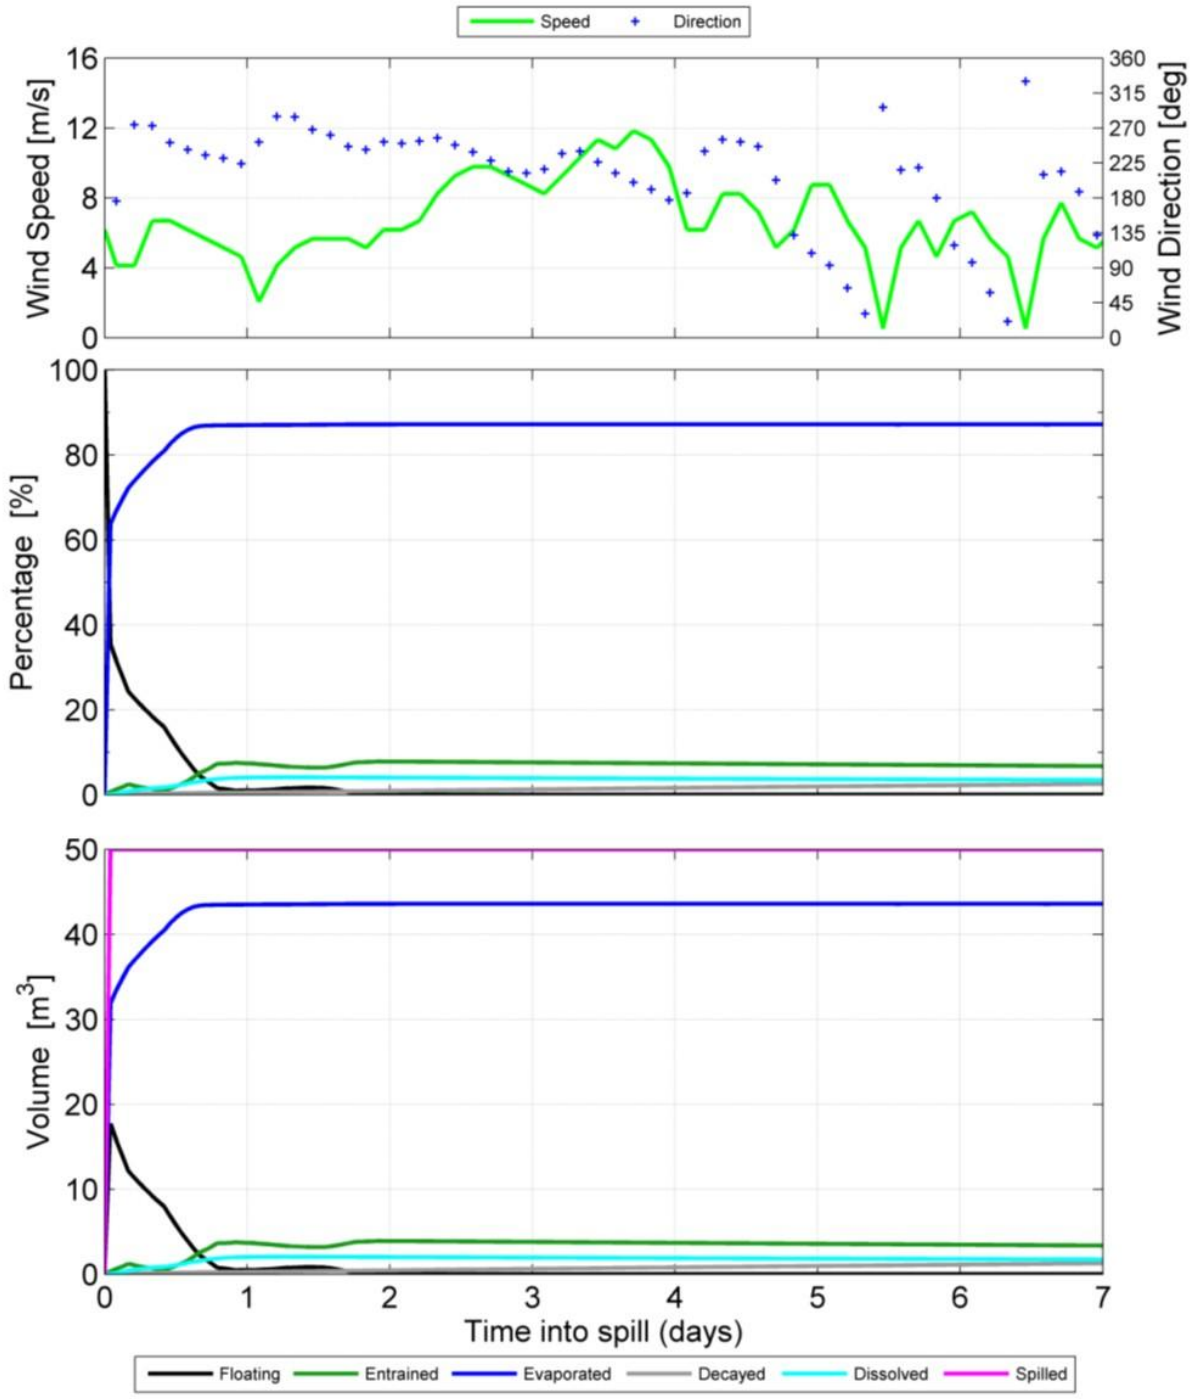

Figure 6-11: Mass balance plot representing, as proportion (middle panel) and volume (bottom panel), the weathering of Yodel-3 Condensate spilled onto the water surface as a one-off release (50 m^3) and subject to variable winds (top panel) at 27 °C water temperature and 25 °C air temperature.

6.8.2.2.5 Marine Diesel

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. In general, about 6% of the oil mass should evaporate within the first 12 hours (boiling point < 180°C); a further 35% should evaporate within the first 24 hours (180°C < boiling point < 265°C); and

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

a further 54% should evaporate over several days (265°C < boiling point < 380°C). About 5% of the oil is shown to be persistent. The aromatic content of the oil is about 3%.

The mass balance forecast for the constant-wind case for marine diesel shows that about 41% of the oil is predicted to evaporate within 24 hours. Under these calm conditions the majority of the remaining oil on the water surface weathers at a slower rate due to comprising the longer-chain compounds with higher boiling points. Evaporation of the residual compounds slows significantly and is then subject to more gradual decay through biological and photochemical processes.

Under the more realistic variable-wind case Figure 6-12, where the winds are of greater strength, entrainment of marine diesel into the water column is indicated to be significant. About 24 hours after the spill, around 72% of the oil mass is forecast to have entrained and a further 24% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds tend to remain entrained beneath the surface under conditions that generate wind waves (about >6 m/s).

The increased level of entrainment in the variable-wind case results in a higher percentage of biological and photochemical degradation, where the decay of the floating slicks and oil droplets in the water column occurs at an approximate rate of 2.4% per day with an accumulated total of ~16% after seven days, in comparison to a rate of ~0.2% per day and an accumulated total of 1.3% after seven days in the constant-wind case. Given the large proportion of entrained oil and the tendency for it to remain mixed in the water column, the remaining hydrocarbons decay and/or evaporate over time scales of several weeks to a few months. This long weathering duration extends the area of potential effect.

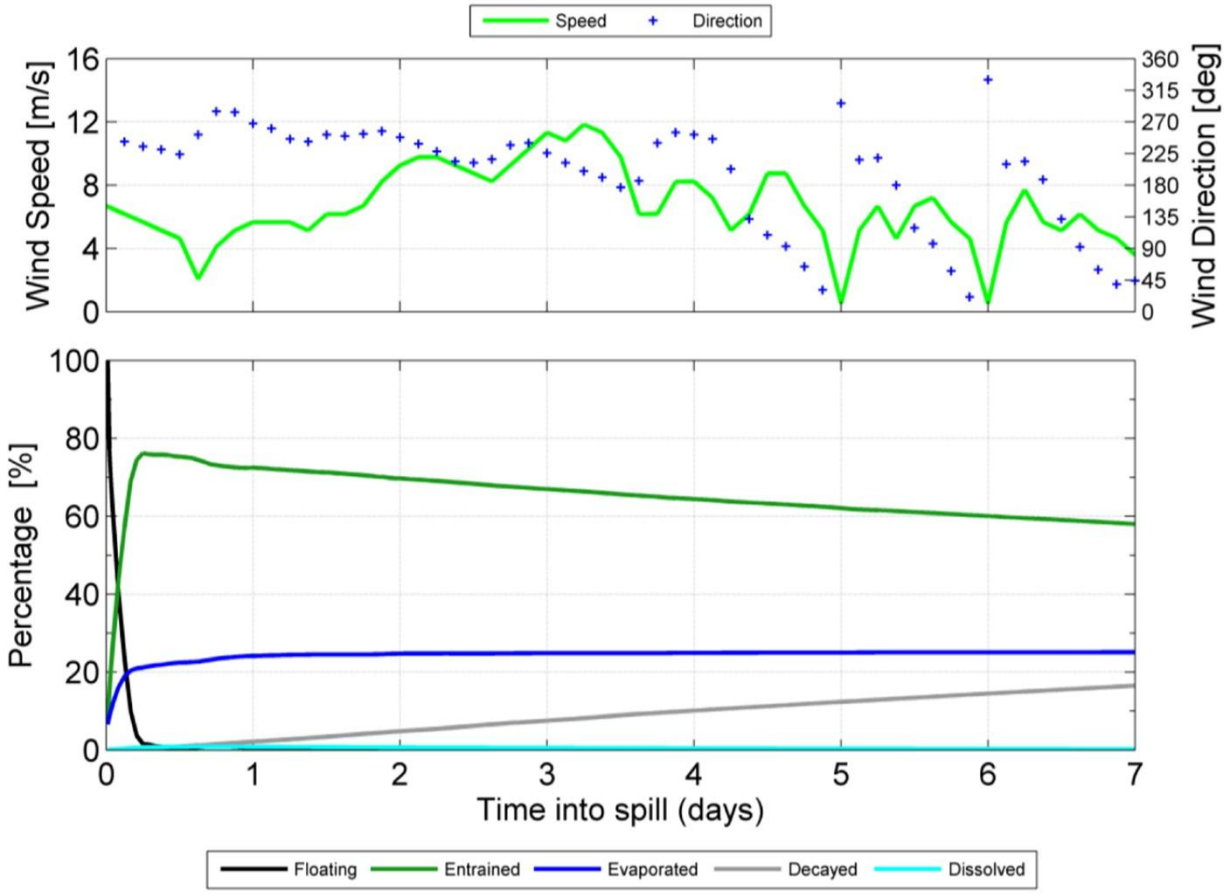

Figure 6-12: Proportional mass balance plot representing the weathering of marine diesel spilled onto the water surface as a one-off release (50 m^3 over one hour) and subject to variable wind at 27°C water temperature and 25°C air temperature.

6.8.2.3 Environment that may be affected and hydrocarbon contact thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels that exceed selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurs. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA.

The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for various weather and metocean conditions. The EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. Furthermore, as the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each hydrocarbon fate. Together, these EMBA have defined the spatial extent for the existing environment described in Section 4.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill concentrations are expressed as grams per square metre (g/m^2), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb). An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m^2) impacting on the visual amenity of the marine environment. Each of these hydrocarbon thresholds are presented in Table 6-27 and described in the subsections below.

Table 6-27: Summary of thresholds applied to the quantitative hydrocarbon spill risk modelling results

Hydrocarbon type	Ecological hydrocarbon thresholds				Socio-cultural hydrocarbon thresholds	
	Surface hydrocarbon (g/m^2)	***Entrained hydrocarbon (ppb)***	***Dissolved aromatic hydrocarbon (ppb)***	***Accumulated hydrocarbons (g/m^2)***	***Surface hydrocarbon (g/m2)***	***Accumulated hydrocarbons (g/m^2)***
Condensate	10	1,000	10	100	1	10
Marine Diesel	10	1,000	10	100	1	10

6.8.2.3.1 Surface hydrocarbon threshold concentration

The spill modelling outputs defined the EMBA for surface hydrocarbons resulting from a spill (contact on surface waters) using a threshold of ≥10 g/m^2 (dull metallic colours) based on the relationship between film thickness and appearance (Bonn Agreement 2015) (Table 6-28). This threshold concentration is used to define an area within which ecological impacts to the marine environment may occur from surface hydrocarbons. It represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.

Thresholds for registering biological impacts resulting from contact of surface slicks have been estimated by different researchers at about 10–25 g/m^2 (French et al. 1999; Koops et al. 2004; NOAA 1996). Potential impacts of surface slick concentrations in this range for floating hydrocarbons may include harm to seabirds through ingestion from preening of contaminated feathers, or the loss of the thermal protection of their feathers. The 10 g/m^2 threshold is the reported level of oiling to instigate impacts to seabirds and is also applied to other wildlife, though it is recognised that 'unfurred' animals, where hydrocarbon adherence is less, may be less vulnerable. 'Oiling' at this threshold is taken to be of a magnitude that can cause a response from the most vulnerable wildlife such as seabirds. Due to weathering processes, surface hydrocarbons will have a lower toxicity due to change in their composition over time. Potential impacts to shoreline sensitive receptors may be markedly reduced in instances where there is extended duration until shoreline contact.

Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA, at concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible surface oil (1 g/m^2) has therefore been used to define an additional boundary within which socio-cultural

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

impacts to the visual amenity of the marine environment may occur. This area is referred to as the socio-cultural EMBA. Potential impacts to socio-cultural values assessed within these EMBAs include:

- protected areas,
- national and Commonwealth Heritage Listed places,
- tourism and recreation, and
- fisheries.

Table 6-28: The Bonn Agreement oil appearance code

Appearance (following Bonn visibility descriptors)	Mass per area (g/m²)	Thickness (µm)	Volume per area (L/km²)
Discontinuous true oil colours	50 to 200	50 to 200	50,000 to 200,000
Dull metallic colours	5 to 50	5 to 50	5000 to 50,000
Rainbow sheen	0.30 to 5.00	0.30 to 5.00	300 to 5000
Silver sheen	0.04 to 0.30	0.04 to 0.30	40 to 300

6.8.2.3.2 Dissolved hydrocarbon thresholds concentrations

Dissolved hydrocarbons present a narcotic effect resulting from uptake into the tissues of marine organisms. This effect is additive, increasing with exposure concentration or with time of exposure (French-McCay 2002; NRC 2005). The dissolved aromatic threshold of 10 ppb has been selected as a threshold to approximate the potential toxic effects, particularly sublethal effects to sensitive species (French-McCay 2026).

Dissolved hydrocarbons represent the bioavailable fraction of oil in the water column and are therefore the most appropriate metric for assessing potential toxic effects to marine organisms. Toxicity studies consistently demonstrate that adverse biological effects are driven by exposure to dissolved oil components, rather than total oil mass or the physical presence of oil droplets, because only dissolved hydrocarbons can cross biological membranes and interact with target tissues. Acute toxicity datasets and species sensitivity distributions show that the majority of marine species experience no acute effects at dissolved hydrocarbon concentrations at or below 10 ppb, indicating that this concentration is protective of more than 95% of species for acute exposures (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017).

Experimental and modelling studies demonstrate that toxic effects may begin to occur in the most sensitive species and life stages at dissolved concentrations on the order of 10 ppb, including early biological and sub-lethal responses (French-McCay 2026; Bejarano et al. 2014; McGrath et al. 2018). As such, 10 ppb represents a lower-bound, biologically meaningful exposure value, rather than an arbitrary screening threshold. Use of this concentration is therefore appropriate for identifying ecological features that may be affected by dissolved oil and for assessing potential environmental consequences, while avoiding the implication that widespread or severe toxicity is expected. The 10 ppb dissolved hydrocarbon exposure value thus provides a conservative yet scientifically grounded basis for impact assessment of the dissolved-phase hydrocarbon fate.

As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts (see Detailed impact and risk assessment). Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 10 ppb is an instantaneous value while ecological studies are based on an exposure duration of typically 48 to 96 hours and therefore accounts for uncertainty in consequence from hydrocarbons spills on ecological, social, economic and cultural features of the environment.

6.8.2.3.3 Entrained hydrocarbon threshold concentrations

Entrained hydrocarbons in the water column consist of oil droplets containing a mixture of soluble, semi-soluble and insoluble compounds. The toxicologically relevant fraction of entrained oil is limited to the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

proportion of hydrocarbons that are able to dissolve from droplets into the surrounding water, with multiple experimental and modelling studies demonstrating that toxicity is driven by the dissolved fraction, rather than by droplet mass, and that dissolved hydrocarbons typically represent a small proportion (on the order of ~1%) of fresh oil, with these soluble components lost rapidly as oil weathers (Forth et al. 2017; Redman & Parkerton 2015; French-McCay 2026). Consequently, entrained oil droplets increasingly comprise non-bioavailable material over time, and entrained hydrocarbon concentrations are therefore a poor proxy for toxicity at low concentrations (Forth et al. 2017; Parkerton et al. 2018).

Given this established relationship between oil composition, dissolution processes and weathering, entrained oil concentrations must be substantially higher than dissolved effect thresholds before biologically meaningful exposure is plausible. French-McCay et al. (2018) demonstrate a direct correlation between entrained oil mass and the dissolved fraction derived from it, indicating that entrained concentrations two orders of magnitude greater than dissolved concentrations are required to represent equivalent exposure potential. On this basis, an entrained hydrocarbon exposure value of 1,000 ppb represents a scientifically justified lower-bound threshold for identifying ecological features that may be affected by entrained oil and for assessing potential environmental consequences. This threshold appropriately reflects the limited bioavailability and declining toxicity of entrained oil droplets, while remaining conservative for impact assessment purposes (French-McCay et al. 2018; Negri et al. 2021).

As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 1,000 ppb is an instantaneous value whereas laboratory-based ecological studies typically assess toxicity over exposure durations of 48 to 96 hours, such that use of an instantaneous exposure value provides a precautionary margin to account for uncertainty in the assessment of potential ecological, social, economic and cultural consequences of hydrocarbon spills.

6.8.2.3.4 Accumulated hydrocarbon threshold concentrations

Owens et al. (1994) define accumulated hydrocarbon <100 g/m² to have an appearance of a stain on shorelines. French-McCay (2009) defines accumulated hydrocarbons ≥100 g/m² to be the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. A threshold of ≥100 g/m² has been adopted as the threshold for shoreline accumulation and has been included in the EMBA.

As described above Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA at low concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible shoreline accumulation (10 g/m²) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur.

6.8.2.3.5 Environment that may be affected

The use of modelling and threshold-based delineation to define the EMBA is inherently conservative, as it results in predicted exposure extents that are broader and more severe than would reasonably be expected during an actual spill event. This conservatism arises from a combination of modelling assumptions and threshold selection, as outlined below:

- Worst-case volumes: the subsea discharge modelling predicts the potential worst-case volumes for loss of well containment scenarios rather than the expected or likely spill volumes. This ensures the upper bound of uncertainty is captured prior to undertaking the stochastic modelling.
- Inclusion of typical and extreme conditions: the stochastic modelling approach involves running hundreds of simulations that incorporates a wide range of metocean conditions, including both representative and extreme combinations of winds, currents and seasonal variability. This captures infrequent but high-consequence trajectories, expanding the spatial envelope beyond typical spill behaviour.
- Assumes no spill response: Modelling used to derive the EMBA generally excludes the effects of spill response measures (e.g. containment, recovery, dispersant application). This assumes hydrocarbons remain unmitigated, resulting in greater persistence and spread than would occur with an effective response.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Application of conservative thresholds: As described above the thresholds used are conservative as they are based on chronic exposure values which require continuous exposure typically over 24 to 96 hours this does not reflect the realistic exposure durations in an offshore environment where hydrocarbons are missed and diluted rapidly in the environment and receptors are moving throughout the water column as well. However, the thresholds applied in the model are based on one instantaneous value being derived in the model resulting in conservative
- Extended simulation periods: Modelling is run over extended durations to capture the full evolution of spill trajectories and delayed transport pathways extending beyond the actual release duration. This allows hydrocarbons to be transported further than may occur within shorter, more realistic exposure windows.
- Constant dispersion rates over distance: Model parameterisation typically applies uniform dispersion and spreading behaviour over time and space. This does not always fully reflect dynamic environmental processes that can enhance dilution or breakup, thereby potentially overestimating persistence and concentration at distance.
- Slower than reality degradation: Conservative assumptions are applied to weathering processes such as evaporation, biodegradation and dispersion as it is based on controlled laboratory studies. The model does not fully account for naturally occurring hydrocarbon-degrading organisms or other environmental factors that can accelerate degradation. This results in hydrocarbons persisting in the modelled environment for longer periods than would be expected under actual conditions.

Collectively, these assumptions ensure that the EMBA represents a precautionary, upper-bound estimate of the spatial extent of potential hydrocarbon exposure, rather than a prediction of the area that would be affected by any single spill event. Consistent with the requirements of Regulation 13(2)(d), the EMBA is intended to identify the full extent of the environment that may be affected by the activity and therefore incorporates conservative modelling assumptions and impact thresholds. The EMBA is derived from the cumulative extent of all modelled scenarios where selected hydrocarbon exposure thresholds are exceeded, across a range of environmental conditions and hydrocarbon fates. As a result, the EMBA is expected to encompass areas where exposure is possible but not necessarily likely, ensuring that all environmental values and sensitivities with a credible pathway for exposure are identified, assessed and considered within the EP.

6.8.2.4 Operational and Scientific Monitoring

A planning area for operational and scientific monitoring is also described in Annex C of the Oil Spill Preparedness and Response Mitigation Assessment (OSPRMA) (Appendix G). This planning area has been set with reference to the low exposure entrained value of 10 ppb detailed in the NOPSEMA (2019) bulletin Oil Spill Modelling (NOPSEMA 2019). The low exposure threshold is based on the potential for exceeding water quality triggers.

An operational and scientific monitoring program may be activated following a release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) and in particular, any identified pre-emptive baseline areas for the worst-case credible spill scenario or other identified unplanned hydrocarbon releases associated with the operational activities.

Release of hydrocarbons resulting from loss of platform (surface) well containment (GWA08)		✓	✓	✓	✓	✓							

Description of source of risk

Background

A loss of well containment can lead to an uncontrolled release of reservoir hydrocarbons or other well fluids to the environment (i.e. a well blowout). Woodside has identified a well blowout as the scenario with the worst-case credible environmental outcome for this event. Due to its potential consequences, a loss of well containment is classified as a MEE (MEE-01). A loss of well containment may occur due to a variety of causes, including:

- internal corrosion
- external corrosion
- erosion
- material, design and other defects
- overpressure of the annuli
- fatigue
- extreme weather (wave loading)
- loss of well integrity during maintenance and interventions

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- premature detonation of explosives during well intervention (perforation)
- anchor drag

A number of common failure causes due to SCE failures and human error are presented in the SCE failure and generic human error bowties in Section 6.8.9.

There are three escalation scenarios from other MEEs that can also lead to loss of well containment on the GWA platform, including:

- loss of structural integrity (MEE-04 – Section 6.8.6)
- loss of marine vessel separation (MEE-05 – Section 6.8.7)
- loss of control of suspended load (MEE-06 – Section 6.8.8).

Loss of Well Containment – Credible Scenarios

The Petroleum Activity includes production from the GWA platform, existing subsea developments and future tie-in production wells (including GWF4) described in Section 3.5. The included future tie-in production wells would be designed, constructed, commissioned and operated in accordance with the same well integrity management framework and barrier philosophy as existing GWA subsea wells. For the purposes of this assessment, the future tie-in production wells are represented by the selected worst-case credible release scenarios, which are based on the highest flowing subsea and platform well configurations anticipated within the Petroleum Activity.

Two credible worst-case loss of well containment scenarios were identified for the Petroleum Activity:

- Scenario 1 - Well blow-out at seabed – highest flow rate GWF4 subsea well (YOD05)
- Scenario 2 - Well blow-out at surface – platform wellhead release (GWA08).

The credible worst-case subsea release, Scenario 1, was based on the maximum credible release volume from the highest flow rate subsea well (YOD05). Scenario 2 represents a credible worst-case surface release from a platform well, with GWA08 selected as a representative wellhead location.

Loss of containment duration has been estimated based on the time required to drill a relief well for each scenario. For Scenario 1, the duration is estimated to be 76 days, and for Scenario 2, 68 days. These durations represent conservative estimates, based on relief well timing under the Mutual Aid Memorandum of Understanding and are consistent with the time required to drill a relief well following the Montara loss of well control in 2009 (refer to Appendix G for further discussion).

The modelling inputs for each of these release scenarios are summarised in Table 6-29. The characteristics of Yodel-3 condensate were used as the basis in the modelling for Scenario 1, while the characteristics of the GWA03 Condensate were used for Scenario 2 (see Table 6-26). Refer to Section 6.8.2 for additional information on modelling methods, environmental impact, thresholds and justification of hydrocarbon characteristics.

Table 6-29: Summary of worst-case loss of well containment hydrocarbon release scenarios

Scenario	Hydrocarbon	Duration (days)	Depth (m)	Latitude	Longitude	Total Condensate Release Volume (m^3)
Scenario 1 – Well blowout at seabed (YOD05)	Yodel-3 condensate	76	132	19° 45' 4.365" S	115° 43' 44.79" E	300,985
Scenario 2 – Well blowout at surface (GWA08)	GWA03 Condensate	68	Surface	19°39’ 12.809’’ S	115°55' 42.567" E	171,033

Decision Type, Risk Analysis and ALARP Tools

Woodside implements industry standard practice in well design and construction. In the company’s recent history, it has not experienced any well integrity events that have resulted in significant releases or significant environmental impacts. Woodside has never experienced a worst-case loss of well containment in its operational history.

Decision Type

A decision type ‘B’ has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk based tools, including the Bowtie Methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability, through peer review, benchmarking and stakeholder consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The release of hydrocarbons as a result of well loss of containment is classified as a Major Environment Event (MEE-01). The hazard associated with this MEE is hydrocarbons in reservoirs, wells, wellheads and xmas trees for GWA platform wells or subsea wells tied-back to the GWA platform.

Quantitative Spill Risk Assessment

Spill modelling of each of the worst-case credible loss of well containment spill scenarios was undertaken by RPS, on behalf of Woodside, over a 76 and 68 day simulation length for Scenario 1 and 2, respectively, to determine the fate of hydrocarbons released based on the assumptions in Section 6.8.2. Modelling was undertaken over all seasons to address year-round operations. This provides a conservative estimate of the EMBA and the potential impacts from the identified worst-case credible release volumes for both loss of well containment scenarios.

Hydrocarbon Characteristics

The hydrocarbon characteristics for Yodel-3 condensate and GWA-03 condensate are summarised in Table 6-26 and described in more detail in Section 6.8.2.2.

Likelihood

Woodside has a strong history of implementing industry standard practice in well design and construction. In the company's 70-year history, it has not experienced any well integrity events that have resulted in significant releases or significant environmental impacts.

The blowout likelihood was evaluated using blowout and well release frequencies based on SINTEF offshore blowout database as analysed in the IOGP 2019 Study Risk Assessment Data Directory Blowout Frequencies – Report 434-02 (September 2019). This uses data from 1980-2014 to determine likelihood for well blowouts and releases. For a gas well, the IOGP study calculated gas blowout frequency during production as 7.20x10-5 per year per well.

- In accordance with the Woodside Risk Matrix, a worst-case loss of well containment has been defined as a 'highly unlikely' event (likelihood Level 1) as it 'has occurred once or twice in the industry' (experience-based likelihood) and aligns with a frequency of a '1 in 10,000 to 1 in 100,000 year' event. Information to support this likelihood determination is outlined below: SINTEF and Lloyds data presented in the IOGP 2019 blowout frequencies study considers production well integrity events between 1980 and 2011, with some additional data from the North Sea between 2011 and 2014. Frequencies are informed by incidents which occurred in Gulf of Mexico prior to standards improvement following the Macondo event. Similarly, improvements in standards have been achieved in the North Sea compared to the pre-Macondo era. External causes are excluded for subsea production wells, as causes discussed appears to only be relevant to dry-tree/platform wells.
- For the international blowout incidents analysed, these are expected to have resulted in varied release outcomes with varied flow and environmental consequence outcomes – not all are aligned with a worst case unconstrained full-bore blowout, from the highest flowing well, nor necessarily required a relief well to remediate (which is the basis for this risk assessment)
- Woodside is aligned to international best practice – the O&G UK (now OEUK) Well Lifecycle Integrity Guidelines (post-Macondo industry improvements). Woodside continues to apply a rigorous well integrity management program (refer WOMP) as required under WMS and Australian regulations, including verification, and testing of key barriers including SSSVs.
- Additionally, when considering likelihood from an 'Experience' perspective, and considering the significant environmental consequence likelihood as the outcome of a blowout event; historical blowouts resulting in major impacts to the environment aligns with "occurred once of twice in the industry" Hence, alignment with Highly Unlikely likelihood classification is deemed appropriate.

The overall risk ranking for this MEE is "Moderate".

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbon were considered during the risk assessment for a worst-case loss of well containment. These considerations were informed primarily by the outputs from the numerical modelling study, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 6.8.2), and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence assessment

Environment that may be affected

The YOD05 scenario (Scenario 1) has been identified as the worst-case loss of well containment based on release volume and spatial extent. Therefore, Table 6-30 lists the key receptor locations and sensitivities potentially contacted above the socio-cultural EMBA and EMBA impact thresholds for Scenario 1. The GWA08 platform release (Scenario 2) is predicted to result in one instance of shoreline accumulation at concentrations equal to or greater than 100 g/m^2 (Muiron Islands and the Muiron Islands MMA) therefore this has been incorporated into Table 6-21.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Surface hydrocarbons (impact threshold -10 g/m^2)

- Scenario 1: The spill modelling results for floating hydrocarbons indicate that concentrations equal to or greater than the 10 g/m^2 thresholds could potentially be found, in the form of slicks, up to 99 km (west) from the release location. The highest probability of contract from films at the 10 g/m^2 thresholds was 80% at Rankin Bank.
- Scenario 2: The spill modelling results for floating hydrocarbons indicate that concentrations equal to or greater than 10 g/m^2 thresholds could potentially be found, in the form of slicks, up to 20 km (west) from the release location. Contact from films at the 10 g/m^2 thresholds was not predicted.

Entrained hydrocarbons (impact threshold – 1,000 ppb)

- Scenario 1: Entrained hydrocarbon concentrations equal to or greater than the 1,000 ppb ecological threshold are predicted to be found up to 166 km (south-west) from the release location. The maximum entrained oil concentration forecast for any receptor is predicted to be 3,135 ppb at Rankin Bank.
- Scenario 2: Entrained hydrocarbon concentrations equal to or greater than the 1,000 ppb ecological threshold are predicted to be found up to 319 km (south-west) from the release location. The maximum entrained oil concentration forecast for any receptor is predicted to be 1,506 ppb at the Muiron Islands MMA.

Dissolved hydrocarbons (impact threshold – 10 ppb)

- Scenario 1: Dissolved hydrocarbon concentrations equal to or greater than the 10 ppb ecological threshold are predicted to be found up to around 860 km (south-west) from the release location. The maximum dissolved hydrocarbon concentration forecast for any receptor is predicted as 7,080 ppb at Rankin Bank.
- Scenario 2: Dissolved aromatic hydrocarbon concentrations equal to or greater than the 10 ppb ecological threshold are predicted to be found up to around 753 km (south-west) from the release location. The maximum dissolved aromatic hydrocarbon concentration forecast for any receptor is predicted as 1,664 ppb at Rankin Bank.

Accumulated hydrocarbons (shoreline oil) (impact threshold -100 g/m^2)

- Scenario 1: No receptors are predicted to be contacted by shoreline hydrocarbons at 100 g/m^2 threshold with above <1% probability.
- Scenario 2: The Muiron Islands and the Muiron Islands MMA receptors are predicted to be contacted by shoreline hydrocarbons at concentrations equal to or greater than 100 g/m^2. The worst-case shoreline hydrocarbon concentration is predicted as 199 g/m^2 at the Muiron Islands and the Muiron Islands MMA receptors.

Summary of environmental value(s) at risk

Figure 4-1 presents the full extent of the EMBA for loss of well containment (within which all other credible hydrocarbon spill EMBAs are contained); i.e. the sensitive receptors and their locations that may be exposed to hydrocarbons (surface, entrained, dissolved and accumulated) at or above the set threshold concentrations in the unlikely event of a loss of well containment during the Petroleum Activity. Loss of containment has the potential to result in a change in water quality which can impact receptors within the EMBA. Details of these receptors are outlined in Section 4. The potential biological and ecological impacts of an unplanned hydrocarbon release as a result of a loss of well containment during the Petroleum Activity are discussed in the following sections.

Environmental value(s) at risk
Open water environment (near spill area)
Air quality A hydrocarbon release during a loss of well containment has the potential to result in localised, temporary reduction in air quality and contribution of greenhouse gases to the global concentration of these gases in the atmosphere. Potential impacts from reduced air quality are expected to be minor, short-term and predominantly localised. There is potential for possible human health effects for workers in the immediate vicinity of atmospheric emissions if there is a hydrocarbon release during a loss of well containment. The ambient concentrations of methane and VOCs released from diffuse sources is difficult to accurately quantify, although the behaviour and fate is predictable in open offshore environments as it is dispersed rapidly by meteorological factors such as wind and temperature. Methane and VOC emissions from a hydrocarbon release in such environments are rapidly degraded in the atmosphere by reaction with photochemically-produced hydroxyl radicals. Due to the unlikely occurrence of a loss of well containment; the temporary nature of any methane or VOC emissions (from either gas surfacing or weathering of liquid hydrocarbons from a loss of well containment); the predicted behaviour and fate of methane and VOCs in open offshore environments; and the significant distance from the Operational Area to the nearest sensitive air shed (town of Dampier, about 130 km away), the potential impacts are expected to be minor and short-term.
Water quality Water quality would be affected in the offshore environment within the EMBA due to hydrocarbon contamination from entrained, dissolved and surface hydrocarbons. Due to the weathering processes of the hydrocarbons, impacts to water quality are anticipated to be minor long term and/or significant short term as a result of hydrocarbon contamination above background levels.
Marine sediment quality In the event of a surface loss of well containment from the platform, spill modelling predicts that a large mass (88.4%) of the oil is predicted to evaporate over the first couple of days depending on the prevailing conditions. The heavier (low volatility) components of the oil will remain entrained into the upper water column due to wind-generated waves and can subsequently resurface if wind-waves abate. It is unlikely that marine sediment quality will be impacted in the event of loss of well containment surface release. In the event of loss of a subsea well containment, studies of hydrocarbon concentrations in deep sea sediments in the vicinity of a major well blowout indicate hydrocarbon from the blowouts can be incorporated into marine sediments (Romero et al. 2015). Proposed mechanisms for hydrocarbon contamination of sediments include sedimentation of hydrocarbons and direct contact between submerged plumes and the seabed (Romero et al. 2015). In the event of a major hydrocarbon release at the seabed, modelling indicates that a pressurised release of condensate would atomise into droplets that would be transported into the water column to the surface. As a result, the extent of potential impacts to the seabed area at and surrounding the release site would be confined to a localised footprint. Marine sediment quality would be reduced as a consequence of hydrocarbon contamination for a small area within the immediate release site for a long to medium term.

Benthic fauna communities

As described above, in the event of a surface loss of well containment from the platform, spill modelling predicts that most of the entrained, dissolved and surface hydrocarbons would be found in the upper water column. It is unlikely that benthic fauna communities would be impacted in the event of loss of well containment surface release.

In the event of a loss of well containment at the seabed, the spill modelling predicted hydrocarbon droplets would be entrained in a gas plume, transporting them through the water column and to the upper water column and sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat within the Operational Area are generally not expected to be exposed to released hydrocarbons. A localised area of impact relating to the hydrocarbon plume at the point of release is however predicted, which would result in a small area of seabed and any associated epifauna and infauna being exposed to hydrocarbons. Impacts to benthic communities within the Operational Area would subsequently be limited to the immediate area around the release site and may include lethal or sub-lethal impacts.

Within the offshore waters of the EMBA, impacts to benthic fauna on the seafloor are not anticipated as hydrocarbons are not expected to gravitate toward the seafloor (as described above).

Benthic fauna at geomorphic features located within the water column such as shoals and banks may be impacted by dissolved and/or entrained hydrocarbons. Spill modelling indicates that Rankin Bank, for example, would be contacted by dissolved hydrocarbons, and Glomar Shoals KEF is located within the EMBA. These features support benthic communities that may be impacted by these hydrocarbons. Notably, given the depths of Rankin Bank and Glomar Shoals KEF, the potential for impacts to benthic communities is considered to be significantly reduced given hydrocarbons will primarily feature in the upper water column.

Pelagic and demersal fish

Demersal and pelagic fish species are associated with the following offshore features within the EMBA (described in Appendix C, Section 6.2):

- Ancient Coastline at the 125 m Depth Contour KEF – overlaps the Operational Area
- Rankin Bank – about 3.7 km west of the Operational Area.
- Continental Slope Demersal Fish Communities KEF – 25 km west-south west of the Operational Area
- Glomar Shoal KEF – about 45.2 km east of the Operational Area
- Glomar Shoal – about 51.5 km east of the Operational Area

There are two other shoals within or close to the Operational Area that are relatively shallow:

- Unnamed Shoal – water depths of between 40 and 50 m, located within the Operational Area
- Wilcox Shoal – water depths of 25 to 80 m, located 2.4 km from the Operational Area.

Unnamed Shoal supports some high relief coral reef but lacks the extent and structural complexity of the coral habitat on Wilcox Shoal (Worley 2025). Similarly, at Wilcox Shoal the habitat transitions from coral-dominated within the reef top into consolidated cobbles (coral rubble) and unconsolidated (soft) sand with sparsely distributed hard corals and other invertebrates including octocorals and porifera (e.g. gorgonians, sea whips, soft corals, sponges, and sea fans) along the shoal slope at ~30 m to 60 m depth (Worley 2025). Deeper water habitats surrounding Unnamed Shoal are very similar to Wilcox Shoal consisting of sparsely distributed gorgonians, sea whips, soft corals, sponges, and sea fans (Worley 2025).

These KEFs and geomorphic features may host relatively diverse or abundant fish assemblages compared to the otherwise relatively featureless continental shelf habitats of the NWMR. Impacts to KEFs are discussed separately below. In summary, impacts to these features are considered to be unlikely. Indirect impacts due to decreased habitat quality at these KEFs to pelagic and demersal fish communities are, therefore, considered unlikely. Impacts to pelagic fish (associated with receptors such as Glomar Shoals and Rankin Bank) from hydrocarbons are described herein.

Fish mortalities are rarely observed to occur as a result of hydrocarbon spills (International Tanker Owners Pollution Federation 2011b). This has generally been attributed to the possibility that pelagic fish are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the spill affected areas. Fish that have been exposed to dissolved aromatic hydrocarbons are capable of eliminating the toxicants once placed in clean water. Hence individuals exposed to a spill are likely to recover (King et al. 1996). Where fish mortalities have been recorded historically, the spills (resulting from the groundings of the tankers Amoco Cadiz in 1978 and the Florida in 1969) have occurred in sheltered bays.

Laboratory studies have shown that adult fish are able to detect hydrocarbons in water at very low concentrations, and large numbers of dead fish have rarely been reported after hydrocarbon spills (Hjermann et al. 2007). This suggests that juvenile and adult fish are capable of avoiding water contaminated with high concentrations of hydrocarbons. However, sub-lethal impacts to adult and juvenile fish may be possible, given long-term exposure (days to weeks) to polyaromatic hydrocarbon (PAH) concentrations (Hjermann et al. 2007). While modelling of the loss of well containment indicates the potential EMBA for dissolved hydrocarbons is relatively extensive, no time-integrated exposure metrics were modelled; given the oceanographic environment within the EMBA, PAH exposures in the order of weeks for pelagic fish are not considered credible.

The effects of exposure to oil on the metabolism of fish appears to vary according to the organs involved, exposure concentrations and route of exposure (waterborne or food intake). Oil reduces the aerobic capacity of fish exposed to aromatics in the water and to a lesser extent affects fish consuming contaminated food (Cohen et al. 2005). The liver, a major detoxification organ, appears to be the organ where anaerobic activity is most impacted, probably increasing anaerobic activity to facilitate the elimination of ingested oil from the fish (Cohen et al. 2005).

Fish are perhaps most susceptible to the effects of spilled oil in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Contact with oil droplets can mechanically damage feeding and breathing apparatus of embryos and larvae (Fodrie and Heck 2011). The toxic hydrocarbons in water can result in genetic damage, physical deformities and altered developmental timing for larvae and eggs exposed to even low concentrations over prolonged timeframes (days to weeks) (Fodrie and Heck 2011). More subtle, chronic effects on the life history of fish as a result of exposure of early life stages to hydrocarbons include disruption to complex behaviours such as predator avoidance, reproductive and social behaviour (Hjermann et al. 2007). Prolonged exposure of eggs and larvae to weathered concentrations of hydrocarbons in water has also been shown to cause immunosuppression and allows expression of viral diseases (Hjermann et al. 2007). PAHs have also been linked to increased mortality and stunted growth rates of early life history (pre-settlement) of reef fishes, as well as behavioural impacts that may increase predation of post-settlement larvae (Johansen et al. 2017). However, the effect of a hydrocarbon spill on a population of fish in an area with fish larvae and/or eggs, and the extent to which any of the adverse impacts may occur, depends greatly on prevailing oceanographic and ecological conditions at the time of the spill and its contact with fish eggs or larvae.

Hydrocarbons above ecological thresholds may subsequently impact populations located near to the release location for the worst-case spill scenario, with lethal impacts not considered likely in this offshore environment. The consequence of a loss of well containment to pelagic and demersal fish and to associated KEFs is moderate, as environmental values are present in an area of heightened sensitivity which may be limited in their ability to recover.

Protected places

Receptors

The AMPs listed in Section 4.8 may be affected by a worst-case spill scenario. The AMPs predicted to potentially be contacted in the event of a loss of well containment by floating hydrocarbons are Montebello Marine Park, and by entrained and dissolved hydrocarbons are Argo-Rowley Terrace, Gascoyne, Montebello and Ningaloo Marine Parks.

The state Marine Parks predicted to potentially be contacted by entrained and dissolved hydrocarbons are Barrow Island MMA, Barrow Island MP (State), Montebello Island MP, Muiron Island MMA, Ningaloo Coast WH and Ningaloo MP (State).

No Ramsar wetlands were predicted to be potentially contacted by accumulated hydrocarbons within socio-cultural thresholds (10 – 100 g/m^2).

Impacts

The Montebello Marine Park which overlaps the Operational Area is predicted to be contacted by hydrocarbons. Impacts to this AMP are discussed below. Impacts to the natural, cultural, heritage and socio-economic values of the other AMPs and MPs predicted to be contacted by hydrocarbons in a worst-case spill scenario are expected to be similar, however, of lower severity and duration due to their distance of at least 100 km further from the Operational Area.

<u>Montebello Marine Park</u>

The Montebello Marine Park comprises an area of about 3,413 km², all of which is zoned as a Multiple Use Zone (IUCN VI). This AMP ranges in depth from less than 15 m up to 150 m.

The Montebello Marine Park is significant as it contains habitats, species and ecological communities, representative of the Northwest Shelf Province. It overlaps the Ancient Coastline at the 125 m Depth Contour KEF (see 'Key Ecological Features' for a discussion of impacts to KEFs). The AMP provides connectivity between the deeper waters of the continental shelf and slope, and the adjacent Barrow Island and Montebello Islands State Marine Parks. A prominent seafloor feature in the AMP is Trial Rocks, which consists of two close coral reefs that are emergent at low tide. There is subsequently potential for impacts to shallow coral reef communities at Trial Rocks, as discussed in the section 'Marine Primary Producers – Coral Reef'. The specific values of the AMP and associated impacts are summarised here.

Natural values – The AMP includes diverse benthic and pelagic fish communities and ancient coastline thought to be an important seafloor feature (KEF) and a migratory pathway for humpback whales (BIA). The AMP supports a range of species, including those listed as threatened, migratory, marine and/or cetacean under the EPBC Act. BIAs within the AMP include breeding habitat for seabirds, internesting, foraging, mating and nesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks. Impacts to the relevant species and BIAs are discussed in the sections below.

Cultural values – There is limited information about the cultural significance of this AMP, however, it is noted that sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their sea country for tens of thousands of years. Potential impacts to cultural values

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

of the AMP will closely tie in with the impacts to the natural values of the Marine Park and range from moderate mid-term potential impacts to major long-term potential impacts.

Heritage values – There are no World, National or Commonwealth heritage listings that apply to the AMP. Two historic shipwrecks are located within the Marine Park. Impacts to shipwrecks are discussed under 'Cultural Heritage'.

Social and economic values – Tourism, commercial fishing, mining and recreation are important activities in the AMP. These activities contribute to the wellbeing of regional communities and the prosperity of the nation. Impacts to tourism and recreation within the AMP are discussed with regard to offshore and nearshore waters in the sections 'Tourism and Recreation'.

A worst-case hydrocarbon spill scenario has the potential to result in impacts to AMPs within the EMBA that range from moderate, medium-term to major, long-term, with the consequence severity dependent on the actual timing, duration and extent of a spill.

Key Ecological Features

The Ancient Coastline at 125 m Depth Contour KEF overlaps the Operational Area. The KEFs located within the EMBA and may be impacted by a worst case hydrocarbon spill are also Glomar Shoal, Continental Slope Demersal Fish Communities, Exmouth Plateau, Canyons Linking the Cuvier Abyssal Plan and the Cape Range Peninsula, Commonwealth Waters Adjacent to Ningaloo Reef, and Western Demersal Slope and Associated Fish Communities Of The Central Western Province. The proximity of the KEFs to the Operational Area are listed in Section 4.7 (described in Appendix C, Section 11).

The Ancient Coastline at the 125 m Depth Contour, Continental Slope Demersal Fish Communities, Exmouth Plateau and Canyons linking the Cuvier Abyssal Plane and the Cape Range Peninsula are KEFs primarily defined by seabed geomorphological features and have been classified as KEFs in recognition of the potential for increased biological productivity and, therefore, ecological significance. Potential impacts to these KEFs include the contamination of marine sediments, direct and indirect impacts to benthic fauna / habitats and associated impacts to demersal fish populations.

Notably, no features indicative of the Ancient Coastline have been identified within the portion of this KEF overlapping the Operational Area (as per Section 1.1). The other KEFs are also quite a significant distance from the Operational Area (approximately 27-693 km) and given the nature of the hydrocarbon, it is likely to be significantly weathered prior to reaching these receptors.

Glomar Shoal features marine primary producer habitat and site attached fishes and provides foraging habitat for a number of species, as discussed under the respective sections above. The Commonwealth waters adjacent to Ningaloo Reef are similarly important habitat for these animal groups. Contamination of marine sediments with hydrocarbons or impacted water quality from entrained and dissolved hydrocarbons may cause flow on effects within these ecosystems.

These KEFs cover extensive areas (as listed in Appendix C, Section 11) and should impacts to receptors within the KEFs (e.g. marine sediment, benthic communities) occur these would be anticipated to be short-lived, with no permanent impacts to the KEF.

Protected species

Cetaceans

A number of cetaceans were predicted to occur with the Operational Area and the EMBA (see Section 4.6.3). In the event of a loss of well containment; surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations may drift across habitat for oceanic cetacean species and the migratory routes and/or BIAs of cetaceans considered to be MNES (e.g. humpback whale and pygmy blue whale north and southbound migrations).

Cetaceans that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling, ingestion of hydrocarbons (including from prey, water and sediments), aspiration of oily water or droplets and inhalation of toxic vapours (Deepwater Horizon Natural Resource Damage Assessment Trustees 2016). This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts and organs, impairment of the immune system, neurological damage (Helm et al. 2015), reproductive failure, adverse health effects (e.g. lung disease, poor body condition) and, potentially, mortality (Deepwater Horizon Natural Resource Damage Assessment Trustees 2016).

Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons is more likely to result in irritation to the more exposed skin and eyes. Entrained hydrocarbons may also be ingested, particularly by baleen whales which feed by filtering large volumes of water. Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects.

Given the non-persistent nature of the hydrocarbons relevant to this EP (see Section 6.8.2.2 – Hydrocarbon Characteristics) and the relatively small floating hydrocarbon EMBA (see Figure 4-1), the area where potential impacts

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

from inhalation and physical contact with surface slicks may occur would be localised around the release location. Impacts would most likely be expected to be limited to individuals that contact the slick, as discussed above.

In a review of the impacts of large-scale hydrocarbon spills on cetaceans, it was found that exposure to oil from the Deepwater Horizon resulted in increased mortality to cetaceans in the Gulf of Mexico (Deepwater Horizon Natural Resource Damage Assessment Trustees 2016), and long-term population level impacts to killer whales were linked to the Exxon Valdez tanker spill (Matkin et al. 2008). Given the nature of the condensate (compared with crude oil from these two spills) and relatively small nature of the surface slick, such exposure impacts to cetaceans may not eventuate.

Geraci (1988) has identified behavioural disturbance (i.e. avoiding spilled hydrocarbons) in some instances for several species of cetacean, suggesting that cetaceans have the ability to detect and avoid surface slicks. However, observations during spills have also recorded larger whales (both mysticetes and odontocetes) and smaller delphinids traveling through and feeding in oil slicks. During the Deepwater Horizon spill cetaceans were routinely seen swimming in surface slicks offshore (and nearshore) (Aichinger Dias et al. 2017).

Suitable habitat for oceanic toothed whales (e.g. sperm whales) and dolphins (e.g. long-snouted spinner dolphin) is broadly distributed throughout the NWMR and, as such, whilst these species may be present within the EMBA, impacts from a spill are unlikely to affect an entire population. Notably, there are no known aggregation areas or BIAs for dolphins or whales within the Operational Area.

Eastern Indian Ocean pygmy blue whales and humpback whales are known to migrate seasonally through the EMBA. Notably, the migration BIAs in the NWMR for both species do not overlap the Operational Area. A major spill event in June through to November would coincide with the humpback whale migration through the waters off the Pilbara, North West Cape and Shark Bay. A major spill in April to July or October to January would coincide with pygmy blue whale migration. Both the pygmy blue and humpback whales are baleen whales and are therefore most likely to be significantly impacted by toxic effects when feeding. However, feeding during migrations is typically low level and opportunistic, with most feeding for both species occurring in the Southern Ocean. Subsequently the risk of ingestion of hydrocarbons through feeding is low.

Migrations of both pygmy blue whales and humpback whales are protracted through time and space (i.e. the whole population will not be within the EMBA at any one time), and as such, a spill from a loss of well containment is not considered likely to affect an entire population.

Dugong

The EMBA overlaps a breeding, calving, foraging and nursing BIA for dugongs in Exmouth Gulf, approximately 222 km from the Operational Area. The dugong is known to inhabit protected shallow coastal areas and feed on seagrass in waters less than 10 m. The presence of the species in the EMBA is expected to be limited to infrequent occurrences of individuals or small groups. Entrained hydrocarbons above threshold concentrations are predicted to reach a number of receptor locations where dugongs may occur, including the following AMPs: Montebello MP (95%), Gascoyne MP (25%), Ningaloo MP (28%), and Argo-Rowley Terrace MP (4%).

Summary

A worst-case hydrocarbon spill scenario has the potential to result in moderate, medium-term impacts to offshore cetacean species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions.

Marine turtles

Five of the six marine turtle species were identified as potentially occurring within the EMBA, with BIAs and Habitat Critical areas identified within the EMBA (see Section 4.6.2).

Adult marine turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (National Oceanic and Atmospheric Administration 2010). Contact with surface slicks, or entrained hydrocarbon can therefore result in hydrocarbon adherence to body surfaces (Gagnon and Rawson 2010) causing irritation of mucous membranes in the nose, throat and eyes leading to inflammation and infection (National Oceanic and Atmospheric Administration 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al. 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells and even a short exposure to hydrocarbons may affect the functioning of their salt glands (Lutcavage et al. 1995).

Hydrocarbons in surface waters may also impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large 'tidal' volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton and Lutz 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (National Oceanic and Atmospheric Administration 2010).

Given the hydrocarbon is expected to weather rapidly when released to the environment, relatively fresh entrained hydrocarbons (which are typically relatively close to the release location) are considered to have the greatest potential

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

for impact. Given the non-persistent nature of the hydrocarbons and the relatively small floating hydrocarbon EMBA, the area where potential impacts from inhalation may occur would be localised around the release location.

Due to the offshore location and water depths within the Operational Area, this area is unlikely to represent important habitat for marine turtles. It is, however, acknowledged that an internesting BIA for the flatback turtle associated with the Montebello Islands overlaps the Operational Area. Individuals may, therefore, be present within the Operational Area during their internesting period.

The EMBA also overlaps a number of BIAs and some habitat critical areas for marine turtles (see Section 4.6.2). Marine turtles are, therefore, likely to be present in the offshore waters of the EMBA, particularly as they are a migratory species which often travel large distances during migration periods. Important areas of aggregation for foraging, nesting and mating are typically associated with nearshore islands along the Pilbara and Gascoyne coastlines, as opposed to offshore waters.

Summary

In the event of a loss of well containment there is potential that surface, entrained and dissolved hydrocarbons exceeding environmental impact threshold concentrations will be present in offshore waters. Therefore, a hydrocarbon spill may disrupt a portion of marine turtle populations for the green, flatback, hawksbill, loggerhead and/or leatherback turtle. However, there is considered to be no threat to overall population viability given the non-persistent nature of predicted hydrocarbons.

Sea snakes

A number of sea snake species which are listed Marine under the EPBC Act were identified by the PMST as potentially occurring within the EMBA, including the critically endangered leaf-scaled sea snake and short-nosed sea snake which are known to occur within the EMBA.

Impacts to sea snakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles and may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (International Tanker Owners Pollution Federation 2011a). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system.

In general, sea snakes frequent the waters of the continental shelf area around offshore islands and potentially submerged shoals (water depths <100 m). It is acknowledged that sea snakes may be present in the Operational Area and within the EMBA. However, their abundance is not expected to be high in the offshore environment.

In summary, a hydrocarbon spill may have a minor disruption to some individuals in the offshore environment. Population level impacts to sea snake species are not, however, considered credible.

Sharks and rays

A number of sharks and ray species were identified as potentially occurring within the Operational Area and/or EMBA (see Section 4.6.1). Two foraging BIAs for the whale shark overlap with the EMBA; foraging (northward from Ningaloo along the 200 m isobath; Operational Area, EMBA) and foraging (high prey density - Ningaloo Marine Park; EMBA). Whale sharks are, therefore, likely to transit the open offshore waters within the EMBA whilst they migrate to and from Ningaloo Reef between July and November.

Other listed Threatened pelagic species identified in the PMST report as potentially occurring within the EMBA include the white shark, grey nurse shark, little gulper shark, dwarf sawfish, largetooth sawfish, green sawfish and scalloped hammerhead. There are no known areas of aggregation for these species in the offshore waters of the EMBA.

Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs either through direct contact or via the food chain (i.e. consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species, such as the whale shark, are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas.

Impacts to whale sharks from a hydrocarbon spill will depend on the timing of the spill, however; whale sharks as a pelagic species are expected to demonstrate avoidance behaviour and population level impacts are not anticipated.

Seabirds

A number of EPBC Act listed threatened and/or migratory seabird and shorebird species were identified by the PMST as potentially occurring within the Operational Area and/or EMBA. The wedge-tailed shearwater foraging (in high numbers) BIA overlaps the Operational Area.

Seabirds and migratory shorebirds are particularly vulnerable to contact with floating hydrocarbons, which may mat their feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed 2011). Notably, the credible loss of well containment scenarios result in a relatively small floating hydrocarbon EMBA which is centred around the release location. Subsequently, the potential for seabird exposure to floating hydrocarbons is considered to be low. Migratory shorebirds are considered unlikely to interact with spilled hydrocarbons as they are not expected to stop over within the offshore waters surrounding the Operational Area during their migrations between mainland/island areas. Many

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

seabirds and migratory shorebirds forage over extensive areas (some hundreds of kilometres out to sea) so individuals may be present. Seabirds roosting or resting on the GWA platform is not common, however those that do may also be impacted, however, these would be individuals and not populations.

Seabirds which plunge dive to feed on prey may also contact entrained or dissolved hydrocarbons, most likely through ingestion of prey which are contaminated. Impacts to prey abundance as a result of hydrocarbons may also indirectly impact individuals.

There are several breeding BIAs for seabirds and migratory shorebirds that overlap with the EMBA, which are associated with breeding and nesting at locations along the Gascoyne and Pilbara coastlines (including near-shore islands). The outer edge of a breeding BIA for the wedge-tailed shearwater overlaps with the Operational Area, and another is less than a kilometre away. It is likely that individual birds may, therefore, transit the Operational Area. Other species' BIAs are at least 47 km away and these species are less likely to occur within the Operational Area.

Given the relatively low area of floating hydrocarbons and the lack of key aggregation areas for migratory shorebirds and seabirds within the Operational Area, impacts at the population level are not anticipated. Individual animals may, however, be impacted with potential fatalities occurring from oiling.

Nearshore waters (mainland and islands)

Marine sediment quality

Entrained and dissolved hydrocarbons (at or above the defined thresholds) are predicted to potentially contact shallow, nearshore waters of identified islands and mainland coastlines (see Table 6-33). Shoreline hydrocarbons may also reach the Muiron Islands and the associated MMA. Such hydrocarbon contact may lead to reduced marine sediment quality by several processes, such as adherence to sediment and deposition shores or seabed habitat.

Protected species

Cetaceans and dugongs

Coastal populations of small cetaceans (e.g. the spotted dolphin) and dugongs are known to reside or frequent nearshore waters along the WA coastline and nearshore islands, including the Ningaloo Coast and at the Muiron Islands, Montebello / Barrow / Group, and the Pilbara Southern Island Groups. These species may be impacted by entrained and dissolved hydrocarbons exceeding threshold concentrations (surface hydrocarbons were not modelled to reach these coastal waters) in the event of a loss of well containment.

The potential impacts of exposure from hydrocarbons are as discussed above. Nearshore populations of cetaceans and dugongs are known to exhibit site fidelity and are often resident populations. The potential impacts of exposure from hydrocarbons for cetaceans and dugongs are as discussed above. More specifically, nearshore populations of cetaceans and dugongs are known to exhibit site fidelity and are often resident populations. Therefore, avoidance behaviour may have greater impacts to population functioning. Notably, Geraci (1988) observed relatively little impacts beyond behavioural disturbance.

Humpback whale

The humpback whale resting area in the Exmouth Gulf lies just within the EMBA (due to modelled contact by entrained hydrocarbons at 100 ppb), however, it is about 218 km south-west of the Operational Area and the EMBA is not representative of any one hydrocarbon spill. The likelihood of impacts occurring within this BIA are, therefore, considered low.

Dugong

Impacts in addition to those noted above include ingestion of hydrocarbons by dugongs that feed on oiled seagrass and indirect impacts to dugongs should seagrass habitats be damaged by a hydrocarbon spill. The dugong calving BIA lies 222 km south-west of the Operational Area. As noted for the humpback whale resting BIA, the EMBA overlaps a small northern portion of the Exmouth Gulf and it is considered a low likelihood that the dugong BIAs (and associated seagrass meadows) located here and along the Ningaloo Coast (BIAs for calving, nursing, breeding and foraging) would be impacted by a hydrocarbon spill. No surface or shoreline hydrocarbons are predicted within the Exmouth Gulf or associated dugong BIAs within the EMBA.

Summary

A hydrocarbon spill may impact coastal cetaceans through site displacement and damage to food source, however, due to the non-persistent nature of the hydrocarbon it is not predicted to result in impacts on overall population viability of either dugongs or coastal cetaceans.

Marine turtles

Marine turtles are known to utilise nearshore waters and shorelines for foraging and breeding activities (including internesting), with significant nesting beaches along the WA mainland coast and nearshore islands in locations that may be impacted by a loss of well containment spill scenario (including the Muiron Islands, Montebello / Barrow Islands group and Pilbara Southern Islands Group).

The nearshore waters of these marine turtle habitat areas may be exposed to surface, entrained or dissolved hydrocarbons exceeding threshold concentrations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The potential impacts of exposure are as previously discussed. In the nearshore environment, turtles can ingest hydrocarbons when feeding and/or can be indirectly affected by loss of food source (e.g. seagrass due to dieback from hydrocarbon exposure) (Gagnon and Rawson 2010). In addition, hydrocarbon exposure can impact on turtles during the breeding season at nesting beaches. Contact with gravid adult females or with hatchlings may occur on nesting beaches (accumulated hydrocarbons) or in nearshore waters (entrained hydrocarbons) where hydrocarbons are predicted to make shoreline contact. Males waiting in nearshore areas to mate with adult females may also be impacted by entrained hydrocarbons.

Marine turtles aggregating near nesting beaches within the EMBA during the mating and nesting seasons are most vulnerable to hydrocarbons, due to greater turtle densities and the possible disruption to important life cycle behaviours. Potential impacts may occur at the population level due to the presence of a high number of breeding individuals and hatchlings (during hatchling dispersal) and may impact on overall population viability of marine turtle species. However, given the volatile nature of the hydrocarbons population level impacts are not anticipated to occur.

Sea snakes

Impacts to sea snakes for the mainland and island nearshore waters from direct contact with hydrocarbons may occur and may include potential damage to the dermis and irritation to mucous membranes of the eyes, nose and throat (ITOPF 2011a). Due to the time to impact in the nearshore environment, the hydrocarbons are considered to be weathered and less likely to result in toxic effects in comparison to fresh hydrocarbons (i.e. typically in the vicinity of the release location).

Therefore, a worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to sea snakes, with consequence severity dependent on the duration and extent of a spill in relation to the distribution of sea snakes.

Sharks and rays

Whale sharks and manta rays (reef manta ray and giant manta ray) are known to frequent Ningaloo Reef (forming feeding aggregations March through July) and the nearshore waters of the Muiron Islands (located 212 km south-south-west of the Operational Area). Whale sharks and manta rays generally transit along the nearshore coastline in these areas and are vulnerable to surface, entrained and dissolved aromatic hydrocarbon spill impacts, with both taxa having similar modes of feeding.

Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson 2004). Whale sharks at Ningaloo Reef have been observed using two different feeding strategies, including passive sub-surface ram-feeding and active surface feeding (Taylor 2007). Passive feeding consists of swimming slowly at the surface with the mouth wide open. During active feeding, sharks swim high in the water with the upper part of the body above the surface with the mouth partially open (Taylor 2007). These feeding methods would result in the potential for individuals that are present in worse affected spill areas to ingest potentially toxic amounts of entrained or dissolved aromatic hydrocarbons into their body. Large amounts of ingested hydrocarbons may affect their endocrine and immune system in the longer term.

The presence of hydrocarbons may also cause displacement of whale sharks from important feeding and resting areas at Ningaloo Reef, potentially disrupt migration and aggregations to these areas in subsequent seasons. Whale sharks may also be affected indirectly by entrained or dissolved aromatic hydrocarbons through the contamination of their prey. The preferred food of whale sharks are planktonic organisms which are abundant in the coastal waters of Ningaloo Reef in late summer/autumn, driving the annual arrival and aggregation of whale sharks in this area. If a worse-case spill event were to occur during the spawning season, this important food supply (in worse spill affected areas of the reef) may be diminished or contaminated. The contamination of their food supply and the subsequent ingestion of this prey by the whale shark may also result in long term impacts as a result of bioaccumulation.

There is the potential for other coastal shark species (e.g. dwarf, narrow and/or green sawfish) to be impacted directly from hydrocarbon contact and/or indirectly through contaminated prey or loss of habitat. Excluding sawfish, which may exhibit high site fidelity, it is most likely that shark species (as mobile animals) will move away from spill affected areas and suffer minimal direct impact.

A spill reaching the Ningaloo coastline during key aggregation periods and impacting important whale shark foraging areas may have severe impacts to the local whale shark population, including possible mortality of individuals and impacts to life cycle habitats such as migration patterns. Most species of shark and ray (including whale sharks) are, however, expected to move away from spill affected areas with minimal impacts.

Seabirds

In the event of a loss of well containment, there is the potential for seabirds, and resident/non-breeding overwintering shorebirds that use the nearshore waters for foraging and resting, to be exposed to entrained and dissolved hydrocarbons. Impacts may include both lethal or sub-lethal effects, as discussed above and in more detail below.

Although breeding oceanic seabird species can travel long distances to forage in offshore waters, most breeding seabirds tend to forage in nearshore waters near to their breeding colony, resulting in intensive feeding by higher seabird densities in these areas during the breeding season and making these areas particularly sensitive in the event of a spill.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Migratory shorebirds may be exposed to stranded hydrocarbon when foraging or resting in intertidal habitats, however, direct oiling is typically restricted to relatively small portion of birds, and such oiling is typically restricted to the birds' feet. Unlike seabirds, shorebird mortality due to hypothermia from matted feathers is relatively uncommon (Henkel et al. 2012). Indirect impacts, such as reduced prey availability, may occur (Henkel et al. 2012).

Notably, the nearest land mass to the Operational Area is the Montebello Islands, which is 38 km south and floating hydrocarbons at impact threshold is not predicted. There are also no known key foraging locations within or surrounding the Operational Area. It is considered unlikely, therefore, that animals nesting or breeding at near-shore islands or along the mainland would be impacted by surface hydrocarbons.

Impacts are more likely to occur through the ingestion of contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs) which have been exposed to entrained or dissolved hydrocarbons within the EMBA. Ingestion of contaminated prey can also lead to internal injury to sensitive membranes and organs (International Petroleum Industry Environmental Conservation Association 2004). Whether the toxicity of ingested hydrocarbons is lethal or sub-lethal will depend on the weathering stage and its inherent toxicity. Exposure to hydrocarbons may have longer term effects, with impacts to population numbers due to decline in reproductive performance and malformed eggs and chicks, affecting survivorship and loss of adult birds. Seabirds also typically nest above the high water mark, meaning nesting areas would not be expected to be directly impacted.

No shoreline contact at or above ecological threshold is predicted.

Submerged shoals and banks

Protected species

Marine turtles

Several submerged shoals and banks are located within the EMBA, including Rankin Bank, Glomar Shoal, Wilcox Shoal and Unnamed Shoal. The unnamed shoal is overlapped by the Operational Area. These shoals and banks may, at times, be foraging habitat for marine turtles, given the coral and filter feeding biota associated with these areas (see Appendix C, Section 7.2.1).

Notably, there are no known key aggregation areas (i.e. BIAs or habitat critical areas) associated with Glomar Shoal or Rankin Bank.

Impacts to marine turtles at submerged shoals and banks are as previously discussed above. Marine turtles would be expected to be foraging, resting and breathing at the surface at these geomorphic features. Ingestion of hydrocarbons whilst foraging through prey is also possible.

Marine turtles may be present at shoals and banks within the EMBA and, therefore, may be impacted by entrained and/or dissolved hydrocarbons present at concentrations greater than the relevant thresholds. Impacts would be expected to be limited to the individuals that may be transiting these areas. Subsequently, impacts at the population level are not anticipated for any of the five marine turtle species that may frequent shoals and banks within the EMBA.

Sea snakes

It is likely that sea snakes will be present at submerged shoals and banks, such as Unnamed Shoal, Wilcox Shoal, Rankin Bank and Glomar Shoal. No key areas of aggregation have been identified for sea snakes within the Operational Area or EMBA. Sea snakes may also be present at near-shore islands and reef areas.

The potential impacts of exposure to hydrocarbons are as discussed above.

Sea snake species in Australia generally show strong habitat preferences (Heatwole and Cogger 1993); species that have preferred habitats associated with submerged shoals and oceanic atolls may be disproportionately affected by a hydrocarbon spill affecting such habitat. However, population level impacts are not anticipated.

Sharks and rays

Pelagic sharks and rays may frequent submerged shoals and banks (such as Rankin Bank and Glomar Shoal) within the EMBA to feed. Some species may also exhibit site fidelity to these geomorphic features. There is the potential for resident shark and ray populations to be impacted directly from hydrocarbon contact or indirectly through contaminated prey or loss of habitat.

Spill modelling results indicated that entrained hydrocarbons may reach Rankin Bank (located 3.7 km from the Operational Area) within 7 hours of a worst-case spill event (i.e. within the first day), therefore there is the potential for sharks and rays at these features to be exposed to fresh unweathered hydrocarbons which may have potential for toxic impacts. Species which are resident to or exhibit site-fidelity to Rankin Bank may subsequently be severely impacted and/or displaced. Indirect impacts through ingestion of prey that has been exposed to hydrocarbons and/or the loss of marine flora habitats may also impact sharks and rays.

Wilcox Shoal and Unnamed Shoal are within or close to the Operational Area. There is a 87% and 94% (respectively) probability of entrained hydrocarbons making contact with these features, with time to exposure 23 hours at Wilcox Shoal and 30 hours at Unnamed Shoal. As with Rankin Bank, shark or ray species which are resident or exhibit site-fidelity to these shoals may be severely impacted and/or displaced.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Glomar Shoal is a greater distance (51.5 km) from the Operational Area, and entrained hydrocarbons are not anticipated to reach this feature until over 600 hours after a spill event. Hydrocarbons will, therefore, be significantly more weathered and impacts to individuals much less severe.

Pelagic sharks and rays are expected to move away from areas affected by spilled hydrocarbons. Impacts to such species are expected to be limited to behavioural responses/displacement. Shark and ray species that have associations with submerged shoals and banks may or may not be displaced/exhibit behavioural avoidance in response to such habitat being contacted by spilled hydrocarbons. Such species may be more susceptible to a reduction in habitat quality resulting from a hydrocarbon spill. It is expected that there will be no impacts at the population level.

All settings

Coral reefs

Receptors

There are no coral reef habitats located within the Operational Area. Within the EMBA, coral reef habitats exist at Rankin Bank, Glomar Shoal, Muiron Islands, the Montebello and Barrow Island groups and numerous receptors associated with Ningaloo Reef, including the reef itself.

As discussed in 'Benthic Fauna', entrained and/or dissolved hydrocarbons are anticipated to reach banks and shoals including Unnamed Shoal, Wilcox Shoal, Rankin Bank and Glomar Shoal. Impacts to coral reef habitat at these features are anticipated to be similar in nature to benthic communities and of similarly low probability due to the water depths they exist at. However, potential biological impacts to sensitive corals could include sub-lethal stress and, in some instances, total or partial mortality of corals.

Hydrocarbons were modelled to reach Barrow Island (entrained); Barrow Island AMP and Marine Management Area (entrained and dissolved); and the Boodie, Double and Middle Islands Nature Reserves (entrained only). Entrained and dissolved hydrocarbons were also modelled to contact the Montebello AMP.

Entrained, dissolved and shoreline accumulation of hydrocarbons were predicted at the Muiron Islands, including the Marine Management Area. Shoreline accumulation was modelled to occur at small discrete locations of the islands. Spill modelling indicated the entrained and dissolved hydrocarbons would also reach the Ningaloo Reef, Commonwealth and State Ningaloo MPs, as well as the Ningaloo Coast World Heritage Area.

Impacts

Exposure to entrained hydrocarbons/dissolved aromatic hydrocarbons (≥100 ppb) has the potential to result in lethal or sub-lethal toxic effects to corals and other sensitive sessile benthos within the upper water column, including upper reef slopes (subtidal corals), reef flat (intertidal corals) and lagoonal (back reef) coral communities (with reference to Ningaloo Coast). Mortality in a number of coral species is possible, and this would result in the reduction of coral cover and change in the composition of coral communities. Sub-lethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates and impaired reproduction (Negri and Heyward 2000).

This could result in impacts to the shallow water fringing coral communities/reefs of the offshore islands (e.g. Muiron Islands, Barrow and Montebello Island groups) and also the mainland coast (e.g. Ningaloo).

With reference to Ningaloo Reef, wave-induced water circulation flushes the lagoon and may promote removal of entrained and dissolved hydrocarbons from this particular reef habitat. Under typical conditions, breaking waves on the reef crest induce a rise in water level in the lagoon creating a pressure gradient that drives water in a strong outward flow through channels.

Shoreline Accumulation

As mentioned, no shoreline contact at ecological thresholds (100 g/m^2) was modelled.

Shallow coral habitats (i.e. nearshore and intertidal waters) are most vulnerable to hydrocarbons through coating by direct contact with surface slicks during periods when corals are tidally-exposed at spring low tides. Water soluble hydrocarbon fractions associated with surface slicks are known to cause high coral mortality (Shigenaka 2001) via direct physical contact of hydrocarbon droplets to sensitive coral species (such as the branching coral species).

There is, therefore, low potential for lethal impacts due to the physical hydrocarbon coating of sessile benthos (including by entrained hydrocarbons), with likely significant mortality of corals (adults, juveniles and established recruits) at the small spill affected areas. These impacts are particularly applicable to branching corals which are reported to be more sensitive than massive corals (Shigenaka 2001).

Recruitment / Spawning

In the unlikely event of a spill occurring at the time of coral spawning at potentially affected coral locations or in the general peak period of biological productivity, there is the potential for a significant reduction in successful fertilization and coral larval survival due to the sensitivity of coral early life stages to hydrocarbons (Negri and Heyward 2000). Such impacts are likely to result in the failure of recruitment and settlement of new population cohorts. In addition, some non-coral species may be affected via direct contact with entrained and dissolved aromatic hydrocarbons, resulting in sub-lethal impacts and in some cases mortality. This is with particular reference to the early life-stages of coral reef animals (reef attached fishes and reef invertebrates), which can be relatively sensitive to hydrocarbon

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

exposure. Coral reef fish are site attached, have small home ranges and as reef residents they are at higher risk from hydrocarbon exposure than non-resident, more wide-ranging fish species. The exact impact on resident coral communities (which may include fringing reefs of the offshore islands and/or the Ningaloo reef system) will be entirely dependent on actual hydrocarbon concentration, duration of exposure and water depth of the affected communities. Coral community live cover, structure and composition may reduce in hydrocarbon impacted areas, manifested by loss of corals and associated sessile biota.

Recovery of impacted reef areas from a range of stressors typically relies on coral larvae from neighbouring coral communities that have either not been affected or only partially impacted. For example, there is evidence that Ningaloo Reef corals and fish are partly self-seeding (Underwood 2009) with the supply of larvae from locations within Ningaloo Reef of critical importance to the healthy maintenance of the coral communities. Recovery at other coral reef areas, may not be aided by a large supply of larvae from other reefs, with levels of recruits after a disturbance event only returning to previous levels after the numbers of reproductive corals had also recovered (Gilmour et al. 2013).

A hydrocarbon spill may result in large-scale impacts to coral reefs within the EMBA, particularly Ningaloo Reef and Muiron Islands, with long-term effects (recovery >10 years) likely.

Productivity

Primary production by plankton (supported by sporadic upwelling events in the offshore waters of the NWS) is an important component of the primary marine food web. Planktonic communities are generally mixed; including phytoplankton (cyanobacteria and other microalgae) and secondary consuming zooplankton, such as crustaceans (e.g. copepods), and the eggs and larvae of fish and invertebrates (meroplankton).

Plankton exposure to hydrocarbons in the water column can result in changes in species composition with declines or increases in one or more species or taxonomic groups (Batten et al. 1998). Phytoplankton may also experience decreased rates of photosynthesis (Tomajka 1985). For zooplankton, direct effects of contamination may include toxicity, suffocation, changes in behaviour, or environmental changes that make them more susceptible to predation.

Impacts on plankton communities are likely to occur in areas where entrained or dissolved aromatic hydrocarbon threshold concentrations are exceeded, but communities are expected to recover relatively quickly (within weeks or months). This is due to high population turnover with copious production within short generation times that also buffers the potential for long-term (i.e. years) population declines (International Tanker Owners Pollution Federation 2011a). Therefore, any impacts to exposed planktonic communities present within the EMBA are anticipated to be short-term.

Filter feeders

Hydrocarbon exposure to filter feeding communities (e.g. Montebello Islands) may occur, depending on the depth of the entrained and dissolved aromatic hydrocarbons. See discussion above on potential impacts.

Nearshore filter feeders that are present in shallower water <20 m may potentially be impacted by entrained hydrocarbon through lethal/sublethal effects (see discussion for Offshore Filter Feeders). However, due to the time to impact in the nearshore environment, the hydrocarbons are considered to be weathered and less likely to result in toxic effects in comparison to fresh hydrocarbons (i.e. typically in the vicinity of the release location). Such impacts may result in localised, long-term effects to community structure and habitat.

Seagrass beds, macroalgae and mangroves

Depending on the trajectory of the entrained and dissolved hydrocarbon plume, macroalgal / seagrass communities including those along the Ningaloo Coast (patchy and low cover associated with the shallow limestone lagoonal platforms), Muiron Islands (associated with limestone pavements), the Barrow and Montebello Island groups, the Pilbara Southern Island Group (documented as low and patchy cover) have the potential to be exposed.

Seagrass in the subtidal and intertidal zones have different degrees of tolerance to exposure of hydrocarbons. Subtidal seagrass is generally considered much less vulnerable to hydrocarbon spills than intertidal seagrass, primarily because freshly spilled hydrocarbons, including crude oil, float under most circumstances. Dean et al. (1998) found that hydrocarbons mainly affect flowering, therefore, species that are able to spread through apical meristem growth are not as affected (e.g. Zostera, Halodule and Halophila species).

Seagrass and macroalgal beds occurring in the intertidal and subtidal zone may be susceptible to impacts from entrained hydrocarbons. Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues (Runcie et al. 2010). The potential for toxicity effects of entrained hydrocarbons may be reduced by weathering processes that should serve to lower the content of soluble aromatic components before contact occurs.

Minimum time to contact for entrained hydrocarbons with the nearest receptor that may host seagrasses is 49 hours (Montebello Marine Park). As such, hydrocarbons released in the event of a loss of well containment are expected to be weathered prior to any credible contact with seagrasses. Exposure to entrained hydrocarbons may result in mortality, depending on actual entrained hydrocarbon concentration received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sub-lethal stress, causing reduced growth rates and a reduction in tolerance to other stress factors (Zieman et al. 1984). Impacts on seagrass and macroalgal communities are likely to occur in areas where hydrocarbon threshold concentrations are exceeded.

As mentioned, mangrove habitat and associated mud flats and salt marsh at Ningaloo Coast and the Montebello Islands have the potential to be exposed to entrained hydrocarbons. Hydrocarbon coating of the prop roots of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

mangroves can occur when entrained hydrocarbons are deposited on the aerial roots. Hydrocarbons deposited on the aerial roots can block the pores used to breathe or interfere with the trees' salt balance, resulting in sub-lethal and potential lethal effects. Mangroves can also be impacted by entrained/dissolved hydrocarbons that may adhere to the sediment particles. In low energy environments, such as in mangroves, deposited sediment-bound hydrocarbons are unlikely to be removed naturally by wave action and may be deposited in layers by successive tides (National Oceanic and Atmospheric Administration 2014). Given the non-persistent nature of the hydrocarbons, however, no significant effects to mangrove habitat are expected to occur.

Entrained/dissolved hydrocarbon impacts may include sub-lethal stress and mortality to certain sensitive biota in these habitats, including infauna and epifauna. Larval and juvenile fish, and invertebrates that depend on these shallow subtidal and intertidal habitats as nursery areas, may be indirectly impacted due to the loss of habitats and/or lethal and sub-lethal in-water toxic effects. This may result in mortality or impairment of growth, survival and reproduction (Heintz et al. 2000). In addition, there is the potential for secondary impacts on shorebirds, fish, sea turtles, rays, and crustaceans that utilise these intertidal habitat areas for breeding, feeding and nursery habitat purposes.

Benthic fauna

In the event of a loss of well containment at the seabed, the spill modelling predicted hydrocarbon droplets would be entrained in a gas plume, transporting them through the water column and to the sea surface. As a result, the low sensitivity benthic communities associated with the unconsolidated, soft sediment habitat within the Operational Area are generally not expected to be exposed to released hydrocarbons. A localised area of impact relating to the hydrocarbon plume at the point of release is however predicted, which would result in a small area of seabed and any associated epifauna and infauna being exposed to hydrocarbons. Impacts to benthic communities within the Operational Area would subsequently be limited to the immediate area around the release site and may include lethal or sub-lethal impacts.

Within the offshore waters of the EMBA, impacts to benthic fauna on the seafloor are not anticipated as hydrocarbons are not expected to gravitate toward the seafloor (as described above). Geomorphic features located within the water column such as shoals and banks, however, may be impacted by dissolved and/or entrained hydrocarbons. Spill modelling indicates that Glomar Shoal, Rankin Bank, Unnamed Shoal and Wilcox Shoal, for example, would be contacted by entrained and/or dissolved hydrocarbons. These features support benthic communities that may be impacted by hydrocarbons. Minimum time to these receptors for entrained hydrocarbons for a subsea release is 23 hours (Wilcox Shoal). Entrained hydrocarbons reaching Wilcox Shoal within the first day may, therefore, present toxic impacts to benthic communities as they will not have had a chance to weather significantly. The worst-case modelling replicate indicated entrained hydrocarbon concentrations of 1,390 ppb at Wilcox Shoal.

Notably, given the depths of Rankin Glomar Shoal, Rankin Bank, Unnamed Shoal and Wilcox Shoal, the potential for impacts to benthic communities is considered to be significantly reduced given hydrocarbons will primarily feature in the upper water column.

Summary of potential consequences to socio-economic values	
Setting	***Receptor group***
All settings	**Cultural heritage** Entrained hydrocarbons above threshold concentrations are predicted to reach the Ningaloo Coast. It is acknowledged that this area contains numerous Indigenous sites such as burial grounds, middens and fish traps that provide a historical account of the early habitation of the area and a tangible part of the culture of local Indigenous groups. No shoreline contact was modelled for the Ningaloo Coast coastline and, therefore, no impacts to these sites is anticipated. The Ningaloo Coast is also designated a National, Commonwealth and World Heritage Feature. Impacts to the Ningaloo Coast have been discussed in the respective receptor sections above. Whilst there are no shipwrecks within or near to the Operational Area, there are a number of shipwrecks within the EMBA. Shipwrecks occurring in the subtidal zone will be exposed to entrained and dissolved hydrocarbons, and the marine life that shelter and take refuge in and around these wrecks may be affected by in-water toxicity of dispersed hydrocarbons. The consequences of such hydrocarbon exposure may include displacement of larger fish species (i.e. avoidance behaviours) and/or resident fish species and sessile benthos (such as hard corals) exhibiting sub-lethal and lethal impacts (which may range from physiological issues to mortality). For a detailed assessment of potential adverse cultural heritage, refer to Section 6.11.
Offshore waters	**Fisheries – commercial** A hydrocarbon release during a loss of well containment event has the potential to result in direct impacts to target species of three Commonwealth and 20 State fisheries active within the defined EMBA (refer Section 4.10.1). Lethal and sublethal effects may impact localised populations of targeted species

	within the EMBA for entrained/dissolved hydrocarbons. However, entrained hydrocarbons are likely to be confined in the upper water column; therefore, demersal species are less likely to be exposed to hydrocarbons than pelagic species. A major loss of hydrocarbons from the Petroleum Activity may also lead to an exclusion of fishing from the spill-affected area for an extended period. Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration which removes hydrocarbons from tissues by metabolic processes, although it is dependent upon the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons while crustaceans (such as prawns) have a comparably reduced ability (Yender et al. 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential contamination of seafood can affect commercial and recreational fishers and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al. 2002). A major hydrocarbon spill would result in the establishment of an exclusion zone around the spill affected area. There would also be a temporary prohibition on fishing activities for a period of time. Subsequently, there is potential for economic impacts to the affected commercial fishing operators. Additionally, hydrocarbon can foul fishing equipment such as traps and trawl nets, requiring cleaning or replacement. The impact to fishers would be dependent on the extent of the spill and resulting exclusion zone and may cause economic impacts as a result of fishing bans, damaged equipment and/or consumer perception of seafood safety. These impacts would not be expected to be long term or affect the viability of the fishery.
	Tourism and recreation Recreational fishers predominantly target tropical species, such as emperor, snapper, grouper, mackerel, trevally and other game fish. Recreational angling activities include shore-based fishing, private boat and charter boat fishing, with the peak in activity between April and October (Smallwood et al. 2011). Limited recreational fishing takes place in the offshore waters of the Operational Area due to the distance from land mass, however; fishing may take place at nearby Rankin Bank and also at Glomar Shoal. Impacts on species that are recreationally fished are described above under 'commercial fisheries' and 'pelagic and demersal fish'. A worst-case spill may lead to the exclusion of marine nature-based tourist activities, resulting in a loss of revenue for tour operators. These impacts would not be expected to be long term.
	Offshore oil and gas infrastructure Surface hydrocarbons from a worst-case spill may affect production from existing offshore petroleum facilities (e.g. platforms and Floating production, storage, and offtake (FPSOs)). For example, facility water intakes for cooling and fire hydrants could be shut off which could in turn lead to the temporary cessation of production activities. Spill exclusion zones established to manage the spill could also prohibit activity support vessel access as well as tankers approaching facilities on the NWS. The impact on ongoing operations of regional production facilities would be determined by the nature and scale of the spill and the metocean conditions at the time. Furthermore, decisions on the operation of production facilities in the event of a spill would be based primarily on health and safety considerations. The closest oil and gas operation is the NRC platform (operated by Woodside). Other nearby facilities include the Chevron-operated Wheatstone platform and the Woodside-operated Pluto platform (Section 4.10.5). Operation of these facilities is likely to be affected in the event of a worst-case loss of well containment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Nearshore island and mainland coastal areas (nearshore waters)	**Fisheries – traditional** No designated traditional fisheries have been identified within the Operational Area or EMBA, it is recognised that Indigenous communities fish in the shallow coastal and nearshore waters including near Ningaloo Reef and therefore may be impacted if a worst-case hydrocarbon spill were to occur. Impacts would be similar to those identified for commercial fishing, in the form of a potential fishing exclusion zone and possible contamination/tainting of fish stocks.
	Tourism and recreation In the unlikely event of a major spill, the nearshore waters of the Ningaloo Coast (including the Ningaloo Coast Marine Park) could be reached by entrained and dissolved hydrocarbons, depending on the prevailing wind and current conditions. This location offers a number of amenities, such as fishing, swimming, snorkelling and other water-based activities, and utilisation of beaches and surrounds have a recreational value for local residents and visitors (regional, national and international). If a major spill resulted in hydrocarbon contact within the Ningaloo coastal area, there could be restricted access to beaches for a period of days to weeks, until natural weathering or tides and currents remove the hydrocarbons. Notably, shoreline contact at > 10 g/m^2 was modelled along the Ningaloo Coastline. In the event of a major spill, tourists and recreational users may also avoid areas due to perceived impacts, including after the hydrocarbon spill has dispersed. There is also the potential for stakeholder perception that this remote environment will be contaminated over a larger area and for the longer term resulting in a prolonged period of tourism decline. Oxford Economics (2010) assessed the duration of hydrocarbon spill related tourism impacts and found that on average, it took 12 to 28 months to return to baseline visitor spending. There is likely to be significant impacts to the tourism industry, wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism. Recovery and return of tourism to pre-spill levels will depend on the size of the spill, effectiveness of the spill clean-up and change in any public misconceptions regarding the spill (Oxford Economics 2010). Other notable areas modelled to receive shoreline accumulation ≥ 10 g/m^2 include the Muiron Islands, Muiron Islands MMA, Southern Pilbara Islands, Exmouth coastline, Airlie Island, Ashburton Island, Barrow Island, Bessieres Island, Boodie Island, Direction Island, Middle Island, Montebello islands, Montebello Islands MP, Sunday Island and Thevenard Island. Impacts to these receptors would be as discussed above, although less significant due to the lower levels of tourism and recreation activities undertaken at these locations compared with the Ningaloo Coast.

MEE-01 well loss of containment – risk analysis
A bowtie risk analysis was undertaken to assess MEE-01. Refer to Figure 6-13, Figure 6-14, Figure 6-15 and Figure 6-16 for bowtie diagrams.

Risk based analysis

For risks identified as MEEs, a more detailed risk-based bowtie analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and considers independence of each barrier and their type of effect in controlling the hazardous event.

Application of Woodside's Risk Management Procedures and implementation of the WOMP ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures
- ongoing integrity management of hardware control measures in accordance with the SCE Technical Performance Standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability
- wells integrity codes and standards.

For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Technical Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.

Bowtie analysis was undertaken to assess MEE-01. Refer to Figure 6-13, Figure 6-14, Figure 6-15 and Figure 6-16 for bowtie diagrams.

A quantitative spill risk assessment was undertaken (refer Section 6.8.2 for details of the method used).

Company values

Corporate values require all personnel at Woodside to comply with appropriate policies, standards, procedures and processes while being accountable for their actions and holding others to account in line with Our Values. As detailed above, the Petroleum Activity will be undertaken in line with these policies, standards and procedures that include suitable controls to prevent loss of well containment, and response should a loss of well containment occur.

Societal values

Due to the proximity to sensitive receptors (e.g. Rankin Bank) and the potential extent of the EMBA, the loss of well containment risk rating presents a Decision Type B in accordance with the decision support framework described in Section 2.4.4. Extensive consultation was undertaken for this program to identify the views and concerns of relevant stakeholders, as described in Section 5.

Woodside has sent a Consultation Information Sheet to all identified relevant stakeholders regarding the Petroleum Activity (Section 5 and Appendix F). Woodside has consulted with WA Department of Transport and Major Infrastructure (DTMI) on spill response strategies.

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood unplanned hydrocarbon release as a result of a loss of well containment.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of well integrity and ensuring the wells are operated within their design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

[93] In accordance with Regulation 56 of the Environmental Regulations, references to the Hydrocarbon Spill Australia Regulatory Framework within this document refer to the version submitted with accepted North West Shelf Phase 1 Plug and Abandonment and TPA03 Well Intervention Environment Plan, which is available on NOPSEMA's website at: https://docs.nopsema.gov.au/A1282743.

MEE-01 loss of well containment – demonstration of ALARP ALARP control measures				
Hierarchy	***Control/barrier***	***SCE/management system reference***	***Type of effect***	***Control adopted***
The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the WOMP, SCE management procedures including performance standards for SCEs, and Management System Performance Standards (MSPSs) for Safety Critical Management System Controls. The application of Woodside Risk Management Procedures and implementation of the WOMP ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes: • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the technical performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability • well integrity codes and standards. Well intervention activities are carried out to address maintenance issues with the wells but offer the potential for Loss of Containment from the wells. These activities are carried out using equipment specific to the task by specialist personnel under the Safe Work Control MSPS. Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of well intervention activities, it is considered that MEE risk associated with wells loss of containment at the GWA platform and at subsea wells are managed to ALARP.				

MEE-01 loss of well containment – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • The principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) ***External Context*** Woodside has considered feedback from relevant persons during the consequence assessment (Section 5). Woodside has consulted with AMSA Marine Pollution and DTMI. A copy of the Oil Pollution First Strike Plan was provided to DTMI.	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a loss of well containment is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been considered, where appropriate • legislative requirements and industry standards have been adopted, as applicable • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans • the predicted level of risk has been reduced to ALARP. ***Environmental performance consideration*** To manage a loss of well containment to ecosystems, species, habitat or physical or biological attributes to an acceptable level the following EPO has been applied: **EPO 13:** No release of hydrocarbons to the marine environment due to well loss of containment. The adopted controls are considered appropriate to manage the risks of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

MEE-01 loss of well containment – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Other relevant persons were consulted (Section 5) and their feedback incorporated into this EP where appropriate. ***Other Requirements*** The EMBA overlaps BIAs for threatened and migratory species, as well as State and Commonwealth marine protected areas. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. As demonstrated in Section 6.10, the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans.

Release of hydrocarbons resulting from loss of export pipeline containment (IFL, including 2TL inventory).	✓	✓	✓	✓	✓	✓		B	1				

Description of source of risk

The GWA platform is connected to the following infrastructure:

- NRC via a 23 km, 30” IFL from the GWA RESDV, through the GWA SSIV, tying into the IFL / 2TL tie-in tee. There is no fail-closed or actuated isolation between the GWA IFL and the 2TL
- PoG wells via the 24.2 km, 16” PoG pipeline with the PoG SSIV located approximately 75 m from the GWA platform and connection to the PoG riser
- GWF1 infrastructure via the 16.3 km, 16” GWF1 pipeline with the GWF1 SSIV located approximately 80 m from the GWA platform and connected to the GWF1 riser
  - GWF3 wells are tied back via the existing GDA manifold and GWF1 pipeline system
  - GWF4 infrastructure is planned to include:
  - TPA04, tied back via the existing GWF1 infrastructure;
  - YOD05 and ESA01, tied back via the KDA manifold and GWF2 pipeline system; and
  - WCA01 and WCA02, tied back via the Wilcox manifold and Wilcox flowline to the GWF2 pipeline system.
  - Two future tie-in production wells may be tied back via the existing GWF1 infrastructure
- GWF2 wells via the ~15 km, 16” GWF2 pipeline, which ties into the GWF1 pipeline at the GWF1 SSIV assembly
- Echo/Yodel (EY) infrastructure connected via the KDA manifold and GWF2 pipeline system. The EY pipeline is currently suspended, filled with treated seawater and isolated from topsides process equipment and suspended

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

wells. Treated seawater does not present a MEE risk and, as such, EY is not considered further in this assessment.

A subsea loss of containment of these components may result in the release of large volumes of hydrocarbon inventory. Due to the potential consequence of a worst-case subsea loss of containment, this risk is considered to be a MEE (MEE-02), with the exception of a loss of containment from PoG pipeline; the consequence of this scenario was not considered to be a MEE.

The pipeline, flowline and riser design include a range of measures that specifically aid in minimising the risk of external damage. These include:

- material selection for strength and corrosion resistant properties
- subsea and surface valves to isolate pipelines from the facility and vice versa
- subsea shutdown system closes on loss of hydraulic pressure
- construction and installation techniques such as stabilisation and self-burial
- design of subsea equipment which takes into consideration snag potential and, where practicable, is snag resistant
- installation of flowline LP alarms (set above minimum operating pressure)
- flowline specifications upgraded in line with changing technologies.

The potential hazard sources that could instigate a loss of containment from the GWA pipelines and risers are:

- anchor impacts/dragging
- vessel impacts
- pipeline stability and free spans
- pipeline assembly and fittings
- internal or external corrosion
- erosion (for flowlines PoG, GWF1 and GWF2)
- operational activities
- overpressure
- exceedance of design temperature (for IFL)
- equipment fatigue (risers and structural supports)
- design and other defects
- human management/error.

Escalation from other MEEs can cause pipeline and riser loss of containment:

- loss of structural integrity (MEE-04) (Section 6.8.6)
- loss of marine vessel separation (MEE-05) (Section 6.8.7)
- loss of control of suspended load from facility lifting operations (MEE-06) (Section 6.8.8).

Although anchor impact and dragging are potential hazard sources, the risk of pipeline loss of containment as a result of commercial trawling practice is not considered credible to result in pipeline loss of containment, given structural protection frames are in place for key subsea infrastructure (e.g. manifolds) according to design risk based analysis. Notably, the Operational Area is located outside of the North-west Slope Trawl Fishery and the Western Deepwater Trawl Fishery fishery areas (demersal trawl fishing areas within proximity of the NWS). Whilst the Operational Area overlaps the Pilbara Trawl Interim Managed Fishery, this portion of the fishery is closed to trawling.

Maintenance of subsea infrastructure structural protection frames are included in mechanical integrity controls set out for pipeline integrity performance standard P09-Pipeline System.

A number of common failure causes due to human error and Safety Critical Equipment (SCE) failures are presented in the generic Human Error and SCE failure bowties in Section 6.8.9.

Subsea loss of containment – credible scenarios

Three credible worst-case subsea loss of containment scenarios were identified:

- scenario 3 - Flowlines (GWF1 / GWF2 / GWF3 / GWF4) subsea release outboard of SSIV
- scenario 4 - Subsea release from IFL (including 2TL inventory) downstream of SSIV but within 500 m of GWA facility
- scenario 5 - Surface release from IFL (including 2TL inventory) from rupture of riser at GWA facility.

Scenario 3 was recently re-assessed to incorporate the addition of the Wilcox flowline. Three rupture locations have been initially considered: (1) GWF2 flowline inlet (at D/S of LPA manifold), to be consistent with previous GWF1/2/3 LoC Study; (2) Lowest point at Wilcox flowline; (3) Downstream of SSIV. Location (1) was identified to carry the highest volume of condensate released and is therefore used as the worst-case credible scenario for Scenario 3.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The small condensate inventory associated with PoG means it is not considered to present a MEE. Similarly, inventories contained downstream of flowline SSIVs and upstream of the IFL SSIV located on the mudmat are small and as such are unlikely to present MEEs.

Each worst-case scenario assumes the subsea loss of the entire hydrocarbon inventory of the pipework; no additional supply of hydrocarbons to the compromised infrastructure is assumed (i.e. assumed that the Safety Instrumented System has functioned). The release location for Scenario 3 was based on the closest proximity to a sensitive receptor (Rankin Bank); this location is the western end of the GWF2 pipeline (at the LPA PLET). The release location for Scenarios 4 and 5 is the GWA platform. This location was considered to be the most likely for a subsea loss of containment of the IFL (due to loss of suspended load, refer to Section 6.8.8) and the release volume would be larger than a release from GWF3 infrastructure, due to the GWF3 wells tying into an existing GDA manifold.

The subsea loss of containment scenarios parameters are summarised in Table 6-31.

Table 6-31: Summary of worst-case subsea loss of containment hydrocarbon release scenarios

Scenario	Hydrocarbon	Duration (hrs)	Depth (m)	Latitude (D°M'S'' S)	Longitude (D°M'S'' E)	Total release volume (m^3)
Scenario 3 - flowlines (GWF1 / GWF2) subsea release outboard of SSIV	GWF4 rich fluid composition (GWF Condensate)	< 6 hrs	78	19° 49' 42"	115° 39' 30"	799.7
Scenario 4 - subsea release from IFL (including 2TL inventory) downstream of SSIV but within 500 m of the GWA platform	GWA condensate	< 6 hrs	131	19° 39' 8"	115° 55' 46"	8,090
Scenario 5 - surface release from IFL (including 2TL inventory) from rupture of riser at the GWA platform	GWA condensate	< 6 hrs	Surface	19° 39' 8"	115° 55' 46"	7,623

Decision type, risk analysis and ALARP tools

Woodside implements industry standard practice in subsea system design and construction. In the company's recent history, it has not experienced any subsea integrity events that have resulted in significant environmental impacts. The GWA facility has never experienced a worst-case subsea loss of containment event.

Decision type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability, through peer review, benchmarking and stakeholder consultation.

The release of hydrocarbons as a result of subsea loss of containment is considered a Major Environment Event (MEE-02). The hazard associated with this MEE is hydrocarbons in subsea infrastructure (pipelines, flowlines, manifolds etc.) tied to or originating from the GWA platform.

Quantitative spill risk assessment

Spill modelling of each of the subsea loss of containment credible spill scenarios was undertaken by RPS to determine the fate of hydrocarbon released in each scenario based on the assumptions in Table 6-31. Modelling was undertaken over all seasons to address year-round operations. This provides a conservative representation of the EMBA and the environmental risks from the identified worst-case credible release volumes for all subsea loss containment scenarios.

Hydrocarbon characteristics

GWA condensate blend has been used for the modelling of Scenarios 4 and 5 and GWF4 rich fluid composition (GWF Condensate) for Scenario 3, as these hydrocarbons are considered representative of potential hydrocarbons present within each scenario. Refer to Section 6.8.2.2 for a description of the hydrocarbon characteristics.

Subsea plume dynamics

The subsea loss of containment scenarios (Scenarios 3 and 4) would result in a buoyant plume of hydrocarbons, which has been modelled using the OILMAP-Deep numerical model (summarised in Table 6-32).

Table 6-32: Inputs and outputs for OILMAP-Deep model for Scenarios 3 and 4

	Parameter	Scenario 3	Scenario 4
Inputs	Release depth (m below sea level)	78.0	131.0
	Oil density (g/cm^3) (at 15°C)	0.769	0.738
	Oil viscosity (cP) (at 15°C)	1.030	0.529
	Oil temperature (°C)	40	25
	Gas:Oil ratio (m^3/m^3) [scf/barrel]	1,580 [8,873] (first 15 mins)	6,066 [34,055]
	Oil flow rate (m^3/d)	869 [5,466] (first 15 mins)	2,191 [13,781]
	Hole diameter (m) [in]	0.350 [13.763]	0.723 [28.472]
Outputs	Plume diameter (m)	10.1	16.9
	Plume height (m above sea level)	78.0 (Surface)	131.0 (Surface)
	Plume initial rise velocity (m/s)	23.9	19.8
	Plume terminal rise velocity (m/s)	19.5	16.1
Predicted oil droplet size distribution	21.4% droplets of size (µm)	9.88	5.9
	31.1% droplets of size (µm)	14.43	11.9
	24.7% droplets of size (µm)	18.76	17.8
	15.1% droplets of size (µm)	24.38	23.8
	7.7% droplets of size (µm)	35.61	29.7

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance, pipeline marked on marine charts), the likelihood has been determined to be 1 (Highly Unlikely). The likelihood of release due to dropped object impact is also determined as 0 (Remote) because the flowlines outboard of the SSIVs are outside the drop range for lifting activities taking place on the platform.

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbon were considered during the risk assessment for a worst-case subsea or riser loss of containment. These considerations were informed primarily by the outputs from the numerical modelling study, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 6.8.2) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence assessment

Environment that may be affected

Scenario 3 - flowlines (GWF1 / GWF2) subsea release outboard of SSIV

Surface hydrocarbons (impact threshold – 10 g/m^2)

Hydrocarbon spill modelling for floating hydrocarbons indicated that concentrations equal to or greater than the 10 g/m^2 ecological threshold could potentially be found, up to approximately 24 km (north-east) from the release location. The only receptor predicted to be contacted by floating hydrocarbons at ecological thresholds is Rankin Bank (4%) with the minimum time to contact of 2 hours.

Entrained hydrocarbons (impact threshold – 1000 ppb)

Entrained oil concentrations equal to or greater than the 1000 ppb threshold are predicted to be found approximately 75 km south-west from the release location. Receptors with the highest probability of contact above 1000 ppb include Montebello AMP (3.5%). The worst-case entrained oil concentration calculated was 7,116 ppb for Rankin Bank.

Dissolved hydrocarbons (Impact threshold – 10 ppb)

Dissolved aromatic hydrocarbon concentrations equal to or greater than the 10 ppb threshold are predicted to be found up to approximately 443 km south-west from the release location. The worst-case concentration calculated is

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2,544 ppb at Rankin Bank. Cross-section plots calculated from the stochastic modelling indicate that dissolved aromatic hydrocarbon concentrations ≥ 10 ppb would tend to extend over the upper 45 m water depth.

Accumulated hydrocarbons (shoreline oil) (Impact threshold – 100 g/m^2)

No receptors were predicted to receive shoreline hydrocarbons above the 100 g/m^2 threshold.

Scenario 4 - subsea release from IFL (including 2TL inventory) downstream of SSIV but within 500 m of GWA facility

Surface hydrocarbons (Impact threshold – 10 g/m^2)

Hydrocarbon spill modelling for floating hydrocarbons indicated that no floating hydrocarbons at ecological threshold are predicted.

Entrained hydrocarbons (Impact threshold – 1,000 ppb)

Entrained oil concentrations equal to or greater than the 1,000 ppb threshold are predicted to be found approximately 422 km south-east from the release location. Receptors with the highest probability of contact at the ecological threshold (1,000 ppb) include Rankin Bank (12.5%) and Montebello AMP (1.5%).

Dissolved hydrocarbons (Impact threshold – 10 ppb)

Dissolved aromatic hydrocarbon concentrations equal to or greater than the 10 ppb threshold are predicted to be found up to approximately 910 km south-east from the release location. The maximum dissolved aromatic hydrocarbon concentration forecast for any receptor is predicted as 821 ppb at Rankin Bank.

Accumulated hydrocarbons (shoreline oil) (Impact threshold – 100 g/m^2)

No receptors were predicted to receive shoreline hydrocarbons above the 100 g/m^2 threshold.

Scenario 5 - Surface release from IFL (including 2TL inventory) from rupture of riser at GWA facility.

Surface hydrocarbons (Impact threshold – 10 g/m^2)

Hydrocarbon spill modelling for floating hydrocarbons indicated that concentrations equal to or greater than the 10 g/m^2 ecological threshold could potentially be found, up to approximately 29 km (south-east) from the release location. No contact with receptors is predicted.

Entrained hydrocarbons (Impact threshold – 1000 ppb)

Entrained oil concentrations equal to or greater than the 1000 ppb threshold are predicted to be found approximately 111 km south-east from the release location. There was no contact with receptors predicted above a probability of 1%.

Dissolved hydrocarbons (Impact threshold – 10 ppb)

Dissolved aromatic hydrocarbon concentrations equal to or greater than the 10 ppb threshold are predicted to be found up to approximately 693 km south-west from the release location. The maximum dissolved aromatic hydrocarbon concentration forecast for any receptor is predicted as 257 ppb at Rankin Bank.

Accumulated hydrocarbons (shoreline oil) (Impact threshold – 100 g/m^2)

No receptors were predicted to receive shoreline hydrocarbons above the 100 g/m^2 threshold.

Consequence assessment summary

The credible worst-case hydrocarbon spill scenarios that may arise from MEE-02 may present a risk to a range of environmental receptors. Refer to Table 6-33 for a summary of receptors identified by the spill modelling studies. The credible worst-case hydrocarbon volumes that can be released by MEE-02 are significantly smaller than the worst-case loss of well containment volumes considered in MEE-01 and durations are significantly shorter. Risk of a hydrocarbon spill to these receptors are considered in MEE-01 (refer to Section 6.8.3).

Risk based analysis

For risks identified as MEEs, a detailed risk-based bowtie analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and consider independence of each barrier and their type of effect in controlling the hazardous event.

Application of Woodside's Risk Management Procedures and implementation of the NWS Pipelines and GWA Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures
- ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.

Bowtie analysis was undertaken to assess MEE-02; refer to Figure 6-17**,** Figure 6-18**,** Figure 6-19 and Figure 6-20**.**

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood unplanned hydrocarbon release as a result of a subsea equipment loss of containment.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of pipelines and risers, ensuring the export pipeline and risers are operated within their design envelope through operating practices, and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the Safety Cases, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.

The application of Woodside Risk Management Procedures ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures
- ongoing integrity management of hardware control measures in accordance with the technical performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

Given the controls in place to prevent and control loss of containment events and mitigate their consequences, it is considered that MEE risk associated with subsea equipment loss of containment at the GWA facility is managed to ALARP.

MEE-02 subsea equipment loss of containment – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • The principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a subsea equipment loss of containment is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans

6.8.5 Unplanned hydrocarbon release: topsides loss of containment (MEE-03)

Context		
Topsides – Section 3.5.1 Process description – Section 3.6.2 Operational chemical use – Section 3.6.10	Physical environment – Section 4.4 Habitats and biological communities – Section 4.5 Protected species – Section 4.6 Key ecological features – Section 4.7 Protected places – Section 4.8 Socio-economic– Section 4.10	Stakeholder consultation – Section 5

Risk evaluation summary

Source of risk	***Environmental value(s) potentially impacted***						***Evaluation***						
	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems / habitat	Species	Socio-economic	Decision type	Consequence	Likelihood	Risk rating	ALARP tool	Acceptability	Outcome
Hydrocarbon release from topside process equipment to the marine environment and atmosphere.		✓	✓	✓	✓	✓	B	C	1	M	LCS RBA CV SV	Acceptable, if ALARP	EPO 15
Hydrocarbon release from topsides non-process equipment to the marine environment.		✓	✓	✓	✓	✓	B	D	1	M			

Description of source of risk

The hydrocarbon processing equipment on the GWA platform contains a considerable volume of hydrocarbons. The hydrocarbon inventory of this processing equipment may be released, potentially resulting in hydrocarbons being released to the marine environment. Topside process and non-process hydrocarbon inventories are provided in Table 3-4 and Table 3-3.

Due to the potential consequences of a worst-case topsides loss of containment, this risk is considered to be a MEE (MEE-03). The following events could lead to loss of containment from the topsides:

- internal corrosion
- external corrosion
- erosion
- material defect
- welding defect
- piping/equipment repair defect
- vibration fatigue failure
- equipment overpressure
- catastrophic turbine failure
- loss of structural integrity
- loss of marine vessel separation
- loss of control of suspended load
- human/management error
- low temperature
- overstress of topsides equipment

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- equipment fatigue
- rotating equipment failure / uncontrolled transfer (including overflow)
- extreme weather.

A number of common failure causes due to human error and Safety Critical Equipment (SCE) failures are presented in the generic human error and SCE failure bowties in Section 6.8.9.

Escalation from other MEEs can also potentially lead to cause topsides loss of containment:

- loss of structural integrity (MEE-04) (Section 6.8.6)
- loss of marine vessel separation (MEE-05) (Section 6.8.7)
- loss of control of suspended load from facility lifting operations (MEE-06) (Section 6.8.8).

GWA's diesel storage tanks (194 m^3 and 149 m^3) are housed within the East and West crane pedestals and are integral into the structure which supports the crane. As such the tank structures have a low probability of failure. Diesel distribution draws from storage and a stainless steel break tank (0.8 m^3), and feeds the stainless steel diesel fire pump day tank (5.4 m^3), emergency diesel generator (5.9 m^3) incorporated into the base frame manual diesel transfer occurs for day tanks for both cranes situated within the crane structure (1.6 m^3 and 2 m^3 respectively) and small inventories to survival craft storage tanks.

Topsides loss of containment – credible hydrocarbon spill scenario

The following hydrocarbon inventories were considered as the worst-case topsides loss of containment scenario:

- Scenario 6 – instantaneous release from the GWA facility of:
  - gas and GWA Condensate: 135 m^3;
  - GWA condensate: 403 m^3; and
  - marine diesel: 343 m^3.

The locations, hydrocarbon types and volumes for Scenario 6 are provided in Table 6-34.

Table 6-34: Summary of worst-case topsides loss of containment hydrocarbon release scenario

Scenario	Hydrocarbon	Duration (hrs)	Depth (m)	Latitude (D°M'S'' S)	Longitude (D°M'S'' E)	Total release volume (m^3)
Topsides loss of containment	Gas and condensate	Instantaneous	Surface	19° 39' 8"	115° 55' 46"	135
	Condensate					403
	Marine diesel					343

Decision type, risk analysis and ALARP tools

Woodside has a good history of implementing industry standard practice in topsides design and construction. In the company's recent history, it has not experienced any topside integrity events that have resulted in significant releases or significant environmental impacts. The GWA facility has never experienced a worst-case topsides loss of containment in its operational history.

Decision type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk based tools including the Bowtie Methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling (Section 6.8.2). Company and societal values were also considered in the demonstration of ALARP and acceptability.

The release of hydrocarbons as a result of topsides loss of containment is considered a Major Environment Event (MEE-03). The hazard associated with this MEE is hydrocarbon inventory on the GWA platform in process and non-process equipment.

Quantitative spill risk assessment

Credible worst-case hydrocarbon Scenarios 8 (MEE-05) and MEE-04 are considered to apply to the potential topsides loss of containment. Refer to Section 6.8.7 (MEE-05) and Section 6.8.6 (MEE-04) for a discussion of these credible worst-case spill scenarios.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Likelihood

In accordance with the Woodside Risk Matrix, a worst-case topsides loss of containment has been defined as a 'highly unlikely' event as it is 'has occurred once or twice in the industry' (experience based likelihood) and aligns with a frequency of a '1 in 10,000 to 1 in 100,000 year' event.

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbon were considered during the impact assessment for a worst-case topsides loss of containment (presented in the following section). These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 6.8.3) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence assessment

Environment that may be affected

As discussed under description of source of risk section above, the potential risks from hydrocarbon release caused by a topsides loss of containment are comparable to those which would result from:

- loss of structural integrity (MEE-04 Section 6.8.6)
- loss of marine vessel separation (MEE-05 Section 6.8.7).

The potential impacts are therefore discussed in the above mentioned sections.

MEE-03 topsides loss of containment – risk analysis

A bowtie risk analysis was undertaken to assess MEE-03. Refer to Figure 6-21, Figure 6-22**,** Figure 6-23**,** and Figure 6-24 for bowtie diagrams.

Risk based analysis

For risks identified as MEEs, a detailed risk based Bowtie Analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and consider independence of each barrier and their type of effect in controlling the hazardous event.

Application of Woodside's Risk Management Procedures and implementation of the GWA Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures
- ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity.

A quantitative spill risk assessment was undertaken (refer Section 6.8.2 for details of the method used).

Company values

Refer to Company Values in demonstration of ALARP for MEE-01 (Section 6.8.3).

Societal values

Refer to Societal Values in demonstration of ALARP for MEE-01 (Section 6.8.3).

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the risks of a very low likelihood of a topsides loss of containment.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the facility, ensuring the equipment is operated within the design envelope through operating practices, and assurance through maintenance and inspection. If a topsides loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the GWA Safety Case, SCE management procedures including performance standards for SCEs, and MSPSs for Safety Critical Management System Controls.

The application of Woodside Risk Management Procedures and implementation of the GWA Safety Case ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP.

Given the controls in place to prevent and control topsides loss of containment events and mitigate their consequences, alongside procedural control of facility operations, it is considered that MEE risk associated a topsides loss of containment is managed to ALARP.

[94] In accordance with Regulation 56 of the Environmental Regulations, references to the Hydrocarbon Spill Australia Regulatory Framework within this document refer to the version submitted with accepted North West Shelf Phase 1 Plug and Abandonment and TPA03 Well Intervention Environment Plan, which is available on NOPSEMA's website at: https://docs.nopsema.gov.au/A1282743.

MEE-03 topsides loss of containment – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • The principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) ***External Context*** Woodside has considered feedback from relevant persons during the consequence assessment (Section 5). ***Other Requirements*** The EMBA overlaps BIAs for threatened and migratory species, as well as State and Commonwealth marine protected areas, however potential impacts from topside loss of containment are predicted to be concentrated around the GWA platform. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. As demonstrated in Section 6.10, the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans.	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a topsides loss of containment is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans • the predicted level of risk has been reduced to ALARP. ***Environmental performance consideration*** To manage a topsides loss of containment to ecosystems, species, habitat or physical or biological attributes to an acceptable level the following EPO has been applied: **EPO 15:** No release of hydrocarbons to the marine environment due to a topsides loss of containment. The adopted controls are considered appropriate to manage the risks of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

Marine environment footprint and associated hydrocarbon and chemical release associated with structural collapse of GWA.	✓	✓	✓	✓	✓	✓		C	0				

Description of source of risk

Extreme environmental conditions, or other causes which result in an exceedance of the design criteria and a catastrophic failure of the facility and individual equipment (e.g. cranes, flare tower, etc.), has been identified as a potential MEE (MEE-04).

Catastrophic structural failure of the GWA facility could lead to the release of hydrocarbons from platform wells; topsides process and non-process hydrocarbon inventories; and pipeline / IFL inventories.

The following causes of structural failure of GWA were identified:

- excessive environmental loading (e.g. from cyclone, high waves)
- seismic events / seabed instability
- fire and blast / overpressure event
- external corrosion
- internal corrosion (e.g. of caissons)
- fatigue

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- material defect
- marine growth weight and wave loading
- subsea loss of containment
- loss of marine vessel separation (refer to MEE-05, Section 6.8.7).

There is a possibility of platform collapse ('slow' or 'rapid') caused by the extreme loads induced by strong winds and extreme waves. Extreme weather may induce fracture of pipework due to vibration/fatigue and loosen/dislodge objects/projectiles causing impact to equipment/pipework and subsequently result in a loss of containment.

Structural damage to the platform resulting from the causes listed above could be minor or could, in the most extreme situation, result in total loss of the platform. The type of structural failure considered here is restricted to major structural damage (e.g. catastrophic collapse of the jacket or release of hydrocarbons on or adjacent to the platform). Such events are, by definition, beyond the design basis for the platform. Structural damage can affect any area of the platform.

Loss of structural integrity – credible hydrocarbon spill scenario

A loss of structural integrity could result in a significant release of hydrocarbons. Hydrocarbon releases may result in a spill to the marine environment, as described in:

- well loss of containment (MEE-01 Section 6.8.3)
- subsea loss of containment (MEE-02 Section 6.8.4)
- topsides loss of containment (MEE-03 Section 6.8.5)
- loss of marine vessel separation (MEE-05 Section 6.8.7)

Worst case hydrocarbon release scenarios for platform well loss of containment, subsea loss of containment, topsides loss of containment that could result from loss of structural integrity of the GWA platform are discussed in the relevant sections referenced above. Relevant trajectory modelling as applicable to these scenarios is also discussed in the above-mentioned sections.

Decision type, risk analysis and ALARP tools

Woodside implements industry standard practice in structural design and construction. The GWA facility has never experienced a worst-case loss of containment due to structural failure in its operational history.

Decision type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk based tools including the Bowtie Methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability, through peer review, benchmarking and stakeholder consultation.

The loss of structural integrity is considered a Major Environment Event (MEE-04). The hazards associated with this MEE are hydrocarbons in platform wells, pipelines, process and non-process inventories and potentially vessels, wellheads, and the GWA platform itself.

Quantitative Spill Risk Assessment

Credible worst-case hydrocarbon scenarios 2, 3, 4, 5 and 6 are considered to apply to a loss of structural integrity (MEE-04). Refer to the Section 6.8.3 (MEE-01; Scenario 2), Section 6.8.4 (MEE-02; Scenarios 3,4 and 5) and Section 6.8.5 (MEE-03; Scenario 6) for a discussion of these credible spill scenarios.

Likelihood

In accordance with the Woodside Risk Matrix, the following likelihoods have been assigned to the sources of risk:

- hydrocarbon release from platform well to the marine environment and atmosphere / hydrocarbon release from topsides equipment to the marine environment and atmosphere (MEE-01): Highly Unlikely (refer to Section 6.8.3)
- marine environment footprint and associated hydrocarbon and chemical release associated with structural collapse of GWA (MEE-03): Highly Unlikely (Section 6.8.5)

Consequence

The spatial extent and fate (including weathering) of the spilled hydrocarbon and the potential seabed disturbance footprint from the GWA facility were considered during the impact assessment for a worst-case loss of structural integrity. These considerations were informed primarily by the outputs from the numerical modelling studies, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 6.8.2) and relevant literature and studies considering the effects of hydrocarbon exposure.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Consequence assessment
Environment that may be affected As discussed under Description of Source of Risk, the potential impacts from hydrocarbon release caused by a loss of structural integrity are those which would result from: • well loss of containment (MEE-01 Section 6.8.3) • subsea loss of containment (MEE-02 Section 6.8.4) • topsides loss of containment (MEE-03 Section 6.8.5) • loss of marine vessel separation (MEE-05 Section 6.8.7) The potential impacts are therefore discussed in the above mentioned sections. **Seabed disturbance** In the event of loss of structural integrity there is the potential for collapse of the platform leading to an incremental increase of the facility's footprint on the seabed. The potential area that would be affected can conservatively be defined as the existing GWA facility footprint plus 100 m in all directions, that is approximately 300 m by 350 m (0.105 km^2). The benthic habitats surrounding the GWA platform have been subject to historical disturbance (e.g. GWA construction, discharge of drill cuttings) and are considered to be of low ecological value (although it is acknowledged that the GWA platform provides artificial hard substrate, which has formed the basis of relatively high biodiversity communities when compared to the surrounding seabed). The physical disturbance to the seabed resulting from the collapse of the GWA platform would be localised, but result in long-term disturbance to benthic communities. The GWA platform could act as a source of environmental contaminants due to material onboard the platform (e.g. chemical / hydrocarbon inventories, corrosion of structural materials, debris etc.). The potential for contamination would diminish over time as the structure degrades. Depending on the nature of the loss of structural integrity, complete or partial salvage of the GWA platform may not be feasible. Any structures not able to be recovered would be left on the seabed indefinitely. These structures are expected to be colonized by marine organisms, and a reef habitat would develop over time on the structures.

MEE-04 loss of structural integrity – risk analysis
A bowtie risk analysis was undertaken to assess MEE-04. Refer to Figure 6-25**,** Figure 6-26 and Figure 6-27 for bowtie diagrams.

Risk based analysis				
For risks identified as MEEs, a detailed risk based bowtie analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and consider independence of each barrier and their type of effect in controlling the hazardous event. Application of Woodside's Risk Management Procedures and implementation of the NWS Pipelines and GWA Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes: • ongoing hazard identification, risk assessment and the identification of control measures: and • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity. Bowtie analysis was undertaken to assess MEE-04; refer to Figure 6-25, Figure 6-26and Figure 6-27 for bowtie diagrams. A quantitative spill risk assessment was undertaken (refer Section 6.8.2 for details of the method used).				
Company Values				
Refer to company values in demonstration of ALARP for MEE-01 (Section 6.8.3).

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a remote likelihood unplanned hydrocarbon release as a result of a loss of structural integrity.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of pipeline and riser integrity and ensuring the systems are operated within their design envelope through operating practices and assurance through maintenance and inspection. If hydrocarbon loss of containment occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the GWA Safety Case(s), SCE management procedures including technical performance standards for Safety Critical Elements (SCEs) and Management System Performance Standards (MSPS) for Safety Critical Procedures.

The application of Woodside Risk Management Procedures, and implementation of the NWS Pipelines and GWA Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures; and
- ongoing integrity management of hardware control measures in accordance with SCE Technical Performance Standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

Given the controls in place to prevent and control loss of containment events and mitigate their consequences, it is considered that MEE risk associated with Loss of Structural Integrity at GWA is managed to ALARP.

MEE-04 loss of structural integrity – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • the principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A)	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a loss of structural integrity is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans • the predicted level of risk has been reduced to ALARP. ***Environmental performance consideration***

MEE-04 loss of structural integrity – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
External Context Woodside has considered feedback from relevant persons during the consequence assessment (Section 5). ***Other Requirements*** The EMBA overlaps BIAs for threatened and migratory species, as well as State and Commonwealth marine protected areas. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. As demonstrated in Section 6.10, the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans.	To manage a loss of structural integrity to ecosystems, species, habitat or physical or biological attributes to an acceptable level the following EPO has been applied: **EPO 16:** No release of hydrocarbons to the marine environment due to loss of structural integrity. The adopted controls are considered appropriate to manage the risks of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

Description of source of risk

A loss of marine vessel separation between a vessel and the GWA platform may result in a loss of hydrocarbon containment from the GWA platform and / or the release of fuel from the vessel. A vessel collision with the GWA platform has been identified as a potential MEE (MEE-05). Vessel collisions can arise from:

- visiting vessel collisions associated with platform support vessels - ships which are visiting the platform can accidentally collide with the platform during approach to, or manoeuvring alongside, the platform
- errant passing vessel collision - ships which are not visiting the platform (i.e. passing vessels) can, for one reason or another, move off-course and collide with the platform
- vessel operations during adverse weather.

The different collision hazards involve significantly different sized vessels and collision speeds, hence, differing impact energies and consequences, and have been assessed.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Visiting vessels

Visiting vessels are defined as those which are routinely used to service the GWA facility which include platform support vessels, subsea support vessels and accommodation support vessels. Operating procedures will dictate how vessels are operated, loaded and unloaded, but it will generally occur so that the prevailing winds move the vessel away from the facility. The primary causes of visiting vessel collisions are failure to follow safe procedures and communication errors between the marine vessels and platform operations. These errors could be worsened by the following:

- vessel station keeping failures; or
- vessel operations in adverse weather conditions.

A number of common failure causes due to human error and SCE failures are presented in the generic Human Error and SCE failure bowties in Section 6.8.9.

Errant passing vessels

Errant passing vessels are defined as third-party vessels that enter the platform's 500 m PSZ, but do not call at GWA or other installations (i.e. not platform or subsea support vessels). The collision can be powered or drifting. Either has the potential to cause significant damage to the riser platform.

The causes of errant passing vessel collisions include:

- failure of propulsion or steering systems
- adverse weather conditions resulting in poor visibility
- rough seas
- human error.

Woodside implement a range of control measures to mitigate the risk of errant vessel collision. In addition to the potential for large hydrocarbon releases following impact by a vessel with the GWA structure, powered collisions from large passing vessels or tankers could have sufficient impact energy to breach both skins of the vessel to the extent that there is a loss of containment of cargo or fuel oil with the potential for significant loss of inventory and consequent environmental impact.

Errant MODU collision

An errant MODU is a drilling unit that has a broken/failed mooring system and is drifting uncontrolled in the ocean. It may be a MODU contracted to Woodside, drilling in the area proximate to GWA, or a unit contracted to a third party. High energy weather events such as cyclones, while a MODU is on station, can lead to excessive loads on the mooring lines resulting in failure (either anchor(s) dragging or mooring lines parting). A failure of mooring integrity may lead to the mooring lines and anchors attached to the MODU being trailed across the seabed. If mooring failure is sufficient, the MODU may move off station, increasing the likelihood of collision with other assets or infrastructure.

For a moored MODU, personnel from the MODU are typically evacuated during cyclones (and hence response capabilities in the event of a mooring failure may be limited). Woodside, for example, implements a risk-based assessment process to aid in decision making for cyclone evacuations, with the well suspended prior to MODU evacuation. Operational experience indicates cyclone evacuations typically last for seven days.

Note that single and double mooring line failures do not typically result in the loss of station keeping. In the event of partial or complete mooring failures that are sufficient to result in a loss of station keeping, industry experience indicates that MODUs may drift considerable distances from their initial position (Offshore: Risk & Technology Consulting Inc. 2002). Partial mooring failures leading to a loss of station keeping resulted in smaller MODU displacements due to the remaining anchors dragging along the seabed when compared to complete mooring failures; complete mooring failures resulted in a freely drifting MODU (Offshore: Risk & Technology Consulting Inc. 2002). NOPSEMA has recorded four cases of anchor drag due to loss of MODU holding station during cyclone activity between 2004 and 2015 (NOPSEMA 2015).

Vessel Collision

A collision between a subsea support vessel with a third party vessel (i.e. commercial shipping, other petroleum related vessels and commercial fishing vessels) was considered the only credible event that could release a significant quantity of marine diesel to the environment. This was assessed as being credible but highly unlikely, given:

- the PSVs typically operate in the Operational Area
- the presence of subsea vessels in the Operational Area is typically temporary (e.g. while undertaking IMMR activities)
- vessels undertaking the Petroleum Activities typically operate at low speeds or are stationary
- the standard vessel operations and equipment in place to prevent collision at sea
- the construction and placement of storage tanks.

Typically, the MEE register associated with operations sits with the asset and aligns with the asset safety case to ensure appropriate coverage and risk management for the duration of facility operations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The largest individual tank of a vessel within the Operations Area is 1000 m^3 on an installation vessel (HLV). As such, the worst-case credible spill of marine diesel from a vessel is considered to be an instantaneous loss of the content of a 1000 m^3 tank.

Loss of Vessel Separation – Credible Hydrocarbon Spill Scenario

The loss of marine vessel separation is considered a Major Environment Event (MEE-05). The hazards associated with this MEE is hydrocarbons in platform wells, pipelines, process and non-process inventories and potentially vessels, wellheads, and fuel onboard platform support vessels. A loss of marine vessel separation could result in a significant release of hydrocarbons and credible spill scenarios consistent with:

- Well Loss of Containment (MEE-01, Section 6.8.3)
- Subsea Loss of Containment (MEE-02, Section 6.8.4)
- Topsides Loss of Containment (MEE-03, Section 6.8.5)
- Loss of Structural Integrity (MEE-04, Section 6.8.6).

In addition, vessel cargo, including diesel inventory, could be spilled if the cause of the loss of platform integrity was a collision from a support vessel.

Worst case hydrocarbon release scenarios for platform loss of well containment (MEE-01), subsea loss of containment (MEE-02) and topsides loss of containment (MEE-03) that could result from loss of marine vessel separation are discussed in the relevant sections referenced above. Relevant trajectory modelling as applicable to these scenarios is also discussed above.

A loss of vessel separation may lead to the accidental release of marine diesel from the fuel tanks on the vessel(s) involved. For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align as follows:

- vessel interaction must result in a collision
- the collision must have enough force to penetrate the vessel hull
- the collision must be in the exact location of the fuel tank
- the fuel tank must be full, or at least of volume which is higher than the point of penetration.

The probability of the chain of events described above aligning, to result in a breach of fuel tanks resulting in a spill that could potentially affect the marine environment is considered highly unlikely. Although the Operational Area overlaps Unnamed Shoal, vessel grounding associated with the Petroleum Activity is not considered a credible risk given the water depths involved, the charted nature of the feature and the vessel management controls implemented for offshore operations.

Decision type, risk analysis and ALARP tools

Woodside has not experienced any loss of marine vessel separation events that have resulted in significant environmental impacts. The facility has never experienced a worst-case loss of containment due to loss of vessel separation in its operational history.

Decision type

A decision type ‘B’ has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk-based tools including the bowtie methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling. Company and societal values were also considered in the demonstration of ALARP and acceptability, through peer review, benchmarking and stakeholder consultation.

Quantitative spill risk assessment

Modelling was undertaken by RPS Group (2019), on behalf of Woodside, to determine the fate of marine diesel released from a collision at a location within the Operational Area. The modelling assessed the extent of marine diesel spill volume of 1000 m^3 (largest fuel tank on installation vessel) for all seasons, using an historic sample of wind and current data for the region.

Refer to Section 6.8.2 for additional information on modelling methods and environmental impact, thresholds and hydrocarbon characteristics justifications.

Likelihood

In accordance with the Woodside Risk Matrix (Section 2.6), the following likelihoods have been assigned to the sources of risk:

- hydrocarbon release from platform well to the marine environment and atmosphere: highly unlikely
- hydrocarbon release from pipeline and riser to the marine environment and atmosphere: remote
- hydrocarbon release from topsides equipment to the marine environment and atmosphere: highly unlikely
- marine environment footprint and associated hydrocarbon and chemical release associated with structural collapse of GWA: remote

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- loss of marine diesel from a vessel: remote

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbon from the GWA facility and vessels were considered during the impact assessment for a worst-case loss of marine vessel separation. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill (Section 6.8.2) and relevant literature and studies considering the effects of hydrocarbon exposure.

Consequence assessment

Environment that may be affected

The potential impacts from hydrocarbon release caused by a loss of structural integrity are those which would result from:

- well loss of containment, Section 6.8.3 (MEE-01)
- subsea loss of containment, Section 6.8.4 (MEE-02)
- topsides loss of containment, Section 6.8.5 (MEE-03)
- loss of structural integrity, Section 6.8.6 (MEE-04).

The potential impacts are therefore discussed in the above mentioned sections.

Potential impacts for the credible worst-case diesel spill from a vessel (1,000 m^3) is discussed below.

Surface hydrocarbons (impact threshold -10 g/m^2)

The probability contour figures for floating hydrocarbons indicate that concentrations equal to or greater than the 10 g/m^2 thresholds could potentially be found, in the form of slicks, up to 54 km from the spill site. Floating hydrocarbons at concentrations equal to or greater than 10 g/m^2 is not forecast to contact any of the assessed shoreline receptors.

Entrained hydrocarbons (impact threshold - 1000 ppb)

Entrained oil at concentrations equal to or greater than the 1000 ppb threshold are predicted to be found up to around 245 km from the spill site. Contact by entrained hydrocarbons at concentrations equal to or greater than 1000 ppb is predicted at Montebello MP (9%) as well as a few other sensitive receptors with probabilities of equal to or less than 0.5%.

Dissolved hydrocarbons (impact threshold – 10 ppb)

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 10 ppb threshold are predicted to found 433 km from the spill site.

Accumulated hydrocarbons (shoreline oil) (impact threshold -100 g/m^2)

No receptor is predicted to be contacted by shoreline oil at concentrations equal or greater than 100 g/m^2.

Consequence assessment summary

The credible worst-case hydrocarbon spill scenarios that may arise from a 1,000 m^3 may impact upon a range of receptors identified by the stochastic spill modelling studies (RPS Group 2019). Potential impacts of a hydrocarbon spill to these receptors are considered in MEE-01; refer to Section 6.8.3 for a description of potential impacts.

The credible worst-case hydrocarbon volumes that can credibly be released by MEE-05 are significantly smaller than the credible worst-case loss of well containment volumes considered in MEE-01 (Section 6.8.3). Additionally, the credible release durations are significantly shorter.

Summary of potential consequences to environmental value(s)

The modelling conducted for a loss of marine vessel separation provides conservative insight into the consequences of a similar release at GWA. The extent of impacts does not exceed the EMBA defined by the work case release from GWA, which is the well loss of containment (MEE-01). Receptors that may be impacted by the MEE-05 spill scenario are listed within the broader list of receptors for MEE-01, presented in Section 6.8.3. Potential impacts of a hydrocarbon spill to the open water environment and receptors have been assessed within the worst-case spill scenario, MEE-01; refer to Section 6.8.3 for a description of potential impacts.

The marine diesel spill would be highly localised with minor short-term impacts to receptors within the EMBA anticipated. Impacts to water quality and air quality in the immediate location of the spill would be expected to be minor and short-term.

MEE-05 loss of marine vessel separation - risk analysis

Bowtie analysis was undertaken to assess MEE-05; refer to Figure 6-28 and Figure 6-29.

Risk based analysis				
For risks identified as MEEs, a detailed risk based bowtie analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and consider independence of each barrier and their type of effect in controlling the hazardous event. Application of Woodside's Risk Management Procedures and implementation of the GWA and NWS Pipelines Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes: • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity. Bowtie analysis was undertaken to assess MEE-02; refer to Figure 6-28 and Figure 6-29 for bowtie diagrams. A quantitative spill risk assessment was undertaken (refer Section 6.8.2 for details of the method used).				
Company values				
Refer to company values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
Societal values				
Refer to societal values in demonstration of ALARP for MEE-01 (Section 6.8.3).

MEE-05 loss of marine vessel separation – demonstration of ALARP ALARP control measures				
Hierarchy	***Control / barrier***	***SCE / management system reference***	***Type of effect (Refer to Table 6-24)***	***Control adopted***

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood of a loss of marine vessel separation.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the facility, ensuring the equipment is operated within the design envelope through operating practices, and assurance through maintenance and inspection. If a loss of marine vessel separation occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the GWA and NWS Pipelines Safety Cases, SCE management procedures including performance standards for SCEs and MSPSs for Safety Critical Management System Controls.

Application of Woodside's Risk Management Procedures and implementation of the GWA and NWS Pipelines Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- ongoing hazard identification, risk assessment and the identification of control measures
- ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of facility operations, it is considered that MEE risk associated with a loss of marine vessel separation is managed to ALARP.

MEE-05 loss of marine vessel separation – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • the principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) ***External Context*** Woodside has considered feedback from relevant persons during the consequence assessment (Section 5).	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a loss of marine vessel separation is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans • the predicted level of risk has been reduced to ALARP. ***Environmental performance consideration*** To manage a loss of marine vessel separation to ecosystems, species, habitat or physical or biological attributes to an acceptable level the following EPO has been applied:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

MEE-05 loss of marine vessel separation – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
As requested during consultation, controls have been adopted to inform other users of the presence of the support vessels during the Petroleum Activity and reduce the potential for vessel collision, including notifications to AHO and AMSA. ***Other Requirements*** The EMBA overlaps BIAs for threatened and migratory species, as well as State and Commonwealth marine protected areas. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. As demonstrated in Section 6.10, the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans.	**EPO 17**: No release of hydrocarbons to the marine environment due to loss of marine vessel separation. The adopted controls are considered appropriate to manage the risks of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

Description of source of risk

Lifting activities on GWA can take place from one of two platform cranes between supply vessels and laydown areas, or between laydown areas. Lifting operations performed using the platform or visiting vessel cranes could potentially lead to dropped objects impacting assets (topsides equipment, subsea infrastructures) inside the GWA 500 m PSZ, potentially leading to a hydrocarbon loss of containment from topsides and subsea infrastructure. Loss of control of suspended load has been identified as a MEE (MEE-06). A loss of control of suspended load may arise from:

- lifting equipment failure
- facility lifting operations
- adverse weather conditions.

A number of common failure causes due to human error and Safety Critical Equipment (SCE) failures are presented in the generic human error and SCE failure bowties in Section 6.8.9.

Loss of control of suspended load – credible hydrocarbon spill scenario

The potential outcome of a loss of control of a suspended load is a topsides and/or subsea flowlines and riser loss of containment. Refer to Section 6.8.4 (MEE-02 - subsea loss of containment) and 6.8.5 (MEE-03 - topsides loss of containment) for a description of subsea and topsides loss of containments scenarios, respectively.

Decision type, risk analysis and ALARP tools

Woodside has a good history of implementing industry standard practice in subsea system design and construction. In the company's recent history, it has not experienced any loss of suspended load events that have resulted in significant releases or significant environmental impacts.

Decision type

A decision type 'B' has been applied to this risk under the Guidance on Risk Related Decision Making (OEUK 2025). This reflects the complexity of the risk, the higher potential consequence and stakeholder implications should the event be realised. To align with this decision type, a further level of analysis has been applied using risk based tools

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

including the Bowtie methodology (described in Section 2.5.3) and hydrocarbon spill trajectory modelling. Company values were also considered in the demonstration of ALARP and acceptability.

A loss of control of a suspended load is considered a MEE (MEE-06). The hazard associated with this MEE is the hydrocarbon inventory of flowlines and risers, or topsides process and non-process hydrocarbons.

Quantitative spill risk assessment

Credible worst-case hydrocarbon Scenarios 3 (MEE-02) and Scenarios 5 and 6 (MEE-03) are considered to apply to the potential loss of containment that may occur in the event of a loss of a suspended load. Refer to Section 6.8.4 (Scenario 3) and Section 6.8.5 (Scenarios 5 and 6) for a discussion of these credible worst-case spill scenarios.

Likelihood

In accordance with the Woodside Risk Matrix, given prevention and mitigation measures in place (i.e. design, inspection and maintenance), the likelihood assigned to the worst-case risk events are considered 1 (Highly Unlikely).

Consequence

The spatial extent and fate (incl. weathering) of the spilled hydrocarbons were considered during the impact assessment for a loss of control of suspended load. These considerations were informed primarily by the outputs from the numerical modelling studies undertaken by RPS, available information on environmental sensitivities that may credibly be impacted in the event of a worst-case spill, and relevant literature and studies considering the effects of hydrocarbon exposure. Refer to Section 6.8.3 (MEE-01), Section 6.8.4 (MEE-02) and Section 6.8.5 (MEE-03) for a description of the consequence potentially resulting from subsea and topsides loss of containment scenarios, respectively.

MEE-06 loss of control of suspended load from platform – risk analysis
A bowtie risk analysis was undertaken to assess MEE-06; refer to Figure 6-30 and Figure 6-31 for bowtie diagrams.

Risk based analysis				
For risks identified as MEEs, a detailed risk based Bowtie Analysis (as outlined in Section 2.5.3) has been used to identify, analyse and demonstrate that controls in place reduce the risk associated with each MEE to ALARP. Controls have been selected following hierarchy of control principles and consider independence of each barrier and their type of effect in controlling the hazardous event. Application of Woodside Risk Management Procedures, and implementation of the WOMP, GWA and NWS Pipelines Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes: • ongoing hazard identification, risk assessment and the identification of control measures • ongoing integrity management of hardware control measures in accordance with the operational performance standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability. For each SCE, detailed requirements for equipment functionality, availability, reliability and survivability are incorporated into SCE Performance Standards which also include the relevant assurance tasks (e.g. inspection, maintenance, testing and monitoring requirements) to ensure technical integrity. A bowtie analysis was undertaken to assess MEE-06, refer to Figure 6-30 and Figure 6-31 and for bowtie diagrams. A quantitative spill risk assessment was undertaken (refer Section 6.8.2 for details of the method used).				
Company values				
Refer to company values in demonstration of ALARP for MEE-01 (Section 6.8.3).				
Societal values				
Refer to societal values in demonstration of ALARP for MEE-01 (Section 6.8.3).

MEE-06 loss of control of suspended load from platform – demonstration of ALARP ALARP control measures				
Hierarchy	***Control/barrier***	***SCE/management system reference***	***Type of effect (refer to Table 6-24)***	***Control adopted***

ALARP statement:

On the basis of the environmental risk assessment outcomes and use of the relevant tools appropriate to the decision type, Woodside considers the adopted controls appropriate to manage the impacts and risks of a very low likelihood of a loss of control of suspended loads.

The principle of inherent safety and environmental protection is based on the prevention of the MEE through design of the facility, ensuring the equipment is operated within the design envelope through operating practices, and assurance through maintenance and inspection. If a loss of control of suspended load occurs, mitigation measures are in place to minimise the consequence by limiting the inventory which can be released and implementing remediation.

The controls in place for prevention and mitigation of MEEs are specified and assured through implementing the GWA Safety Case(s), SCE management procedures including technical performance standards for Safety Critical Elements (SCEs) and Management System Performance Standards (MSPS) for Safety Critical Procedures.

The application of Woodside Risk Management Procedures, and implementation of the WOMP, NWS Pipelines and GWA Safety Cases ensures the continuous identification of hazards, systematic assessment of risks and ongoing assessment of alternative control measures to reduce risk to ALARP, which includes:

- Ongoing hazard identification, risk assessment and the identification of control measures; and
- Ongoing integrity management of hardware control measures in accordance with the SCE Technical Performance Standards which define requirements to be suitably maintained, such that they retain effectiveness, functionality, availability and survivability.

Given the controls in place to prevent and control loss of containment events and mitigate their consequences, alongside procedural control of facility operations, it is considered that MEE risk associated with a loss of control of suspended load is managed to ALARP.

MEE-06 loss of control of suspended load – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
Principles of ESD The consequence assessment has considered the relevant principles of ESD: • The conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making. • The principle of inter-generational equity – the present generation should ensure the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations. • Decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations. ***Internal Context*** The Petroleum Activity is consistent with Woodside corporate policies, culture, processes, standards, structure and systems as outlined in the Demonstration of ALARP and Environmental Performance Outcomes, including: • Woodside Health, Safety and Environment Policy (Appendix A) • Woodside Risk Management Policy (Appendix A) ***External Context*** Woodside has considered feedback from relevant persons during the consequence assessment (Section 5). ***Other Requirements***	The predicted level of risk to ecosystems, species, habitat or physical or biological attributes from a loss of control of suspended load is considered to be of an acceptable level (consequence level, M - Moderate), given that: • the Petroleum Activity is consistent with the relevant principles of ESD • the proposed controls have considered the environmental consequence and are consistent with Woodside's internal policies, procedures and standards • feedback from stakeholders has been taken into consideration • legislative requirements/industry standards have been adopted • the Petroleum Activity will be managed in a manner that is not inconsistent with management objectives for relevant WHPs, AMPs, recovery plans • the predicted level of risk has been reduced to ALARP. ***Environmental performance consideration*** To manage a loss of control of suspended load to ecosystems, species, habitat or physical or biological attributes to an acceptable level the following EPO has been applied:

MEE-06 loss of control of suspended load – demonstration of acceptability	
Acceptability criteria and assessment	***Statement of acceptability***
The EMBA overlaps BIAs for threatened and migratory species, as well as State and Commonwealth marine protected areas. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. As demonstrated in Section 6.10, the Petroleum Activity is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans.	**EPO 18**: No release of hydrocarbons to the marine environment due to loss of control of suspended load. The adopted controls are considered appropriate to manage the risks of the Petroleum Activity and compliance with those controls is considered to demonstrate that the EPOs have been met.

Hazard Description	Generic Human Errors – Degradation Factors
Hazard Ref ID	N/A
Hazard Description	
Hazard Overview and Scope	
There are a number of causes of human errors which contribute to MEEs, or which can result in failure or degradation of the barriers in place to protect against MEEs. These are presented in the following bowtie pages and include; • task issues, e.g. poor task design; time pressures, task complexity • poor physical interfaces / working environment	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- provision of inappropriate tools for the task
- communication errors, i.e. poor quality information, lack of clarity in instructions
- operator failings, e.g. competence, fitness, impairment or fatigue
- organisational issues, e.g. peer pressure, poor safety culture, inadequate supervision, lack of clarity on roles and expectations.

The Generic Human Errors bowtie illustrates the causes, outcomes and the barriers in place for these failure mechanisms. Human Errors are managed solely via the WMS (no SCEs) and the bowtie is included in this section for completeness. Refer to Section 7 Implementation Strategy for applicable Management System Procedures.

Accidental discharge of marine diesel during bunkering/refuelling or chemicals release during transfer, storage or use.		✓			✓		A	D	2	M	LCS GP PJ	Broadly Acceptable	EPO 20

Description of source of risk

Bunkering of marine diesel between the facility support vessels, the ASV and the GWA facility routinely occurs during the Petroleum Activity, along with bulk transfers of chemicals such as glycol (TEG). Risks associated with these activities are described below.

Marine diesel bunkering/refuelling

Mechanisms are available to capture diesel from process/piping associated with bunkering and fuel transfers, which can be used to drain to a caisson with an oil recovery system. The diesel unloading stations have isolation and vent valves to allow draining of bunkering hoses between uses.

Two credible scenarios for the loss of containment of marine diesel during bunkering operations were identified:

- partial or total failure of a bulk transfer hose or fittings during bunkering, due to operational stress or other integrity issues could spill marine diesel to the deck and/or into the marine environment. This would be in the order of less than 0.2 m^3, based on the likely volume of a bulk transfer hose (assuming a failure of the dry break and complete loss of hose volume)
- partial or total failure of a bulk transfer hose or fittings during bunkering or refuelling, combined with a failure in procedure to shutoff fuel pumps, for a period of up to 15 minutes, resulting in approximately 24 m^3 marine diesel loss to the deck and/or into the marine environment.

Bulk chemical transfer

Bulk transfer of TEG between platform support vessels and the GWA facility occurs typically in smaller quantities than marine diesel. Similar to a spill event during refuelling, the most likely spill volume of TEG is likely to be less than 0.2 m^3 based on the volume of the transfer hose and the immediate shutoff of the pumps by personnel involved in the bulk transfer process. However, the worst-case credible spill scenario could result in up to 8 m^3 of TEG being discharged. This unlikely scenario represents a complete failure of the bulk transfer hose combined with a failure to follow procedures (which require transfer activities to be monitored), coupled with a failure to immediately shut off pumps.

Chemicals use and storage

Chemicals are used during the Petroleum Activity for a variety of purposes (refer to Section 3.6.10 and Section 3.7.5). Spills of chemicals (including non-process hydrocarbons) can originate from stored hydrocarbons/chemicals or equipment on the platform, vessel decks or subsea (refer to Section 6.7.4 for an assessment of the impacts of planned chemical discharges).

Operational process chemicals are typically stored in dedicated vessels which have similar controls of those related to mitigating hydrocarbon releases (e.g. dedicated tanks, permanent piping to the process, isolatable by valves etc.). The chemicals stored in the largest volumes on the GWA facility are MEG and TEG, both operational process chemicals stored in bulk (30 m^3 and 23 m^3 respectively). The MEG and TEG tanks are classified as pressure vessels, as such are covered under relevant performance standards.

The GWA facility and facility support vessels also store other non-process chemicals and hydrocarbons in bulk, in various volumes (up to approximately 6 m^3). Operational non-process chemicals and maintenance chemicals present on the GWA facility and support vessels are generally held in low quantities (usually less than 50 L).

Subsea support vessels undertaking IMMR activities may also store quantities of chemicals for subsea use. Accidental releases of small quantities of subsea chemicals may occur (e.g. deck spills). Operational experience indicates potential volumes of such spills is small (< 20 L). Subsea chemical use is described in Section 3.7.5; subsea operational chemicals are subject to the chemical selection process outlined in Section 7.2.3.

Chemical storage areas are typically set up in cabinets or bunded storage areas to contain any releases to deck from transportable containers (e.g. IBCs, barrels, drums, pails etc.). Releases from equipment are predominantly from the failure of hydraulic hoses or minor leaks from process components, or spills during refuelling of equipment, which can either be located within bunded/drained areas or outside of bunded/drained areas.

Subsea leaks may occur from subsea infrastructure and associated control systems as a result of equipment failure, degradation or damage. Unplanned releases may occur from hydraulic lines, fittings, umbilicals, hose connections, valves or other subsea equipment. Operational experience indicates such releases are generally localised and limited in volume.

ROV operations undertaken during IMMR activities also utilise hydraulic systems and tooling containing relatively small volumes of hydraulic fluid (typically less than 50 L per system). Minor releases may occur during connection and disconnection of subsea tooling, through leakage from hot stab connections, or as a result of hose or fitting failures. In rare cases, tooling failures may result in releases of less than 5 L of hydraulic fluid to the marine environment.

Subsea control fluids and hydraulic fluids used during IMMR activities are subject to the chemical selection and assessment process described in Section 7.2.3.

Quantitative spill risk assessment

Woodside has commissioned RPS to model several marine diesel spills, including surface spill volumes of 8m^3 in the offshore waters of northwest WA.

The results of these models have indicated that exposure to surface hydrocarbons above the 10 g/m^2 threshold is limited to the immediate vicinity of the release site, with little potential to extend beyond 1 km.

Given the volume of potential release, specific modelling for a 24 m^3 marine diesel loss scenario has not been undertaken as it is significantly less than the 1000 m^3 of marine diesel loss assessed under the loss of marine vessel separation scenario in Section 6.8.7. It is considered that exposure to thresholds concentrations from a 24 m^3 surface spill from bunkering activities would be well within the EMBA for the hydrocarbon release scenario detailed in Section 6.8.7.

Hydrocarbon characteristics

Refer to Section 6.8.2.2 for a description of the characteristics of marine diesel, including detail on the predicted fate and weathering of a spill to the marine environment.

As mentioned, note the marine diesel scenario considered in Section 6.8.7 is significantly larger than the volumes considered here.

Consequence assessment

Marine diesel

Given the low viscosity of marine diesel, along with the high portion of volatile components, a spill of up 24 m^3 of marine diesel during transfer, storage or use during operations would spread and weather rapidly. The potential biological and ecological impacts associated with much larger hydrocarbon spills are presented in Section 6.8.7; further detail on impacts specific to a spill of marine diesel from a bunkering loss are provided below.

Environmental receptors at risk would be restricted to those in the immediate vicinity and may include:

- marine fauna, particularly fauna associated with the sea surface (e.g. seabirds, air breathing vertebrates)
- plankton.

Given the relatively small worst-case credible release volume, the non-persistent nature of marine diesel and the low sensitivity of the receiving environment within the Petroleum Activity (i.e. offshore open water environment, refer to

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Section 4), potential impacts are expected to be short term (<1 year) and confined to a localised extent from the release location (<1 km for 24 m^3 release). Such impacts may include:

- localised decrease in water quality
- acute toxic effects to planktonic organisms in the immediate area of the spill.

Impacts to plankton may include acute toxicity resulting in mortality of planktonic organisms. Given the rapid turnover of plankton communities, these impacts would be short-lived (hours to days).

Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by a marine diesel spill. Impacts to larger fauna such as cetaceans and marine turtles are expected to be light fouling, potentially resulting in irritation of sensitive membranes such as the eyes, mouth and digestive system (Helm et al. 2015). Mortality of larger fauna is not expected to occur.

No impacts to ecosystem function are expected.

No impacts are predicted to Ancient Coastline at 125 m Depth Contour KEF. Although, it is overlapped by the Operational Area due to the nature of the spill (i.e. surface spill), water depth and the reduced likelihood of diesel components interacting with the seafloor where the KEF values (i.e. unique hard substrate and associated demersal finfish and benthic fauna) are situated in 125 m water depths, it is unlikely there will be impacts to this KEF.

Minor, short term impacts may occur to other marine users (e.g. commercial fisheries); however, given the small scale of a worst-case marine diesel spill, fishing vessel exclusion within the PSZ, it is unlikely there would be any significant impact to commercial fishers.

Refer to the summary of potential impacts to environmental values(s) within Section 6.8.7 for a description of the impacts of hydrocarbons on the above biota, noting that the extent of the EMBA associated with a marine diesel spill from loss during bunkering is much reduced by comparison (in terms of spatial and temporal scales) and hence the potential for consequences from a loss during bunkering are considered to be minor and short-term.

Chemicals and non-process hydrocarbons

MEG and TEG are miscible in water and are considered PLONOR. A maximum credible spill of MEG or TEG is expected to mix with the receiving environment, resulting in no lasting environmental impact. Corrosion inhibitor is not OCNS rated but is expected to rapidly dilute in the receiving environment.

Accidental releases of chemicals decrease the water quality in the immediate area of the release. The consequence is expected to be slight given the temporary and localised nature of the spill, the water depths, the open ocean mixing environment, Petroleum Activity from sensitive receptors and relatively low credible release volumes. Depending on the chemical released the toxicity and/ or potential to bioaccumulate may potentially result in impacts to sediment quality, pelagic fish or other marine species in the vicinity of the discharge.

Potential impacts to plankton from an accidental chemical spill may include acute toxicity resulting in mortality of planktonic organisms. Given the rapid turnover of plankton communities and nature and scale of the credible releases, these impacts will be short-lived (hours to days). Impacts to fish are expected to be of no lasting effect, as fish species are mobile and expected to avoid the area affected by an accidental chemical spill. Impacts to air-breathing fauna such as cetaceans, birds and marine turtles, are expected to be restricted to irritation of sensitive membranes such as the eyes, mouth, and digestive system.

Slight, short-term impacts may occur to other marine users (e.g. commercial fisheries); however, given the limited fishing activity within the Operational Area (Section 4.10.1), risks to commercial fishers are not significant.

Emergency Response				
Mitigation – hydrocarbon spill response.	Refer to Appendix G for discussion around the ALARP assessment of controls related to hydrocarbon spill response.			
ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the potential impacts/risks associated with unplanned hydrocarbon or chemical release during bunkering, transfer, storage and use to be ALARP. As no reasonably practicable controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered inherently ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls, unplanned hydrocarbon or chemical release during bunkering, transfer, storage and use represent a moderate risk rating that is unlikely to result in a consequence greater than minor short-term impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Description of source of risk

Non-hazardous and hazardous waste

Normal operations on the GWA facility and support vessels results in a variety of hazardous and non-hazardous wastes. These materials could potentially impact the marine environment if incorrectly disposed of, lost overboard, or discharged in significant quantities.

Non-hazardous wastes include domestic and industrial wastes, such as aluminium cans, bottles, paper and cardboard, scrap steel. Hazardous wastes include recovered solvents, excess or spent chemicals, oil contaminated materials (e.g. sorbents, filters and rags), batteries, used lubricating oils and potentially material containing Naturally Occurring Radioactive Material (NORMs)[96]. Sand and sludges may also be periodically generated during well clean-up operations, de-sanding, vessel maintenance and removal of redundant equipment.

Equipment (small hand-held tools) and Personal Protective Equipment (PPE) may be accidentally lost overboard. Equipment that has been recorded as being lost on other similar facilities and vessels has primarily been windblown or dropped overboard and has included things such as hardhats, gloves, safety glasses and small tools or materials. Equipment (small hand-held tools) and PPE are not classified as waste as per the *Woodside Offshore Facilities Waste Management Plan* and are not included any further in this risk assessment. Equipment (small hand-held tools) and PPE lost overboard are recorded, investigated and corrective actions tracked as per requirements in Section 7.7.3 and Section 7.13.3. Loss of hazardous and non-hazardous wastes have occurred during backloading activities, periods of adverse weather and incorrect waste storage.

All waste materials not suitable for discharge to the environment that are generated on GWA, including hazardous wastes (i.e. liquid and solid wastes), are transported to shore for disposal or recycling by Woodside's licensed waste contractor.

[96] *Laboratory analyses results of material produced from the desander (refer to Section 3.6.5.6) are consistent with the Exempt Waste category as per the Australian six-tier radioactive waste classification scheme (i.e. very low levels of radioactivity; thus waste is managed and disposed of similar to the process applied for non-radioactive waste). The results also support the understanding that sand generated from the GWA facility contains little to no NORMs*

Consequence assessment
Environmental value(s) at risk
The potential impacts of hazardous or non-hazardous solid waste/equipment accidentally discharged to the marine environment include contamination of the environment, as well as secondary impacts relating to potential contact of marine fauna with wastes. This could result in entanglement or ingestion and lead to injury and death of individual animals. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the location of the Petroleum Activity, the types, size and frequency of wastes that could occur, and species present. **Water and sediment quality** Hazardous solid wastes such as paint cans, oily rags, etc. can cause localised contamination of the water and sediment through a release of toxins and chemicals. Given likely small volumes of any unplanned solid waste discharge, and the occasional nature of the event, these would result in temporary and highly localised changes to the water quality. **Seabirds and migratory shorebirds, fish, marine reptiles and marine mammals** The unplanned discharge of solid wastes can result in mortality to fauna, either through contamination or physical injury depending on the nature of the waste. Marine fauna, including fish, seabirds and shorebirds, marine mammals and marine reptiles may be impacted through ingestion or entanglement of waste or through exposure to toxic chemicals. Ingestion or entanglement of marine fauna has the potential for physical harm which may limit feeding/foraging behaviours and thus can result in mortalities. Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris was listed as a key threatening process under the EPBC Act in August 2003 (Commonwealth of Australia 2018). The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Commonwealth of Australia 2018) identifies EPBC Act-listed species for which there are scientifically documented adverse impacts resulting from marine debris. Marine turtles and seabirds in particular may be at risk from plastics which may cause entanglement or be mistaken for food (Commonwealth of Australia 2017; Commonwealth of Australia 2018) and ingested causing damage to internal tissues and potentially preventing feeding activities. In the worst instance this could have a lethal effect to an individual. Marine debris has been identified as threat in the Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia 2017). Impacts to species including fish, birds, marine mammals and marine reptiles from the unplanned discharge of solid waste is unlikely given low occurrence of unplanned discharges. Significant impacts are unlikely to occur at an individual level and will not occur at a population level, nor result in the decrease of the quality of the habitat such that the extent of these species is likely to decline. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the nature and scale of activities that may generate wastes, the types, size and frequency of wastes that could occur. **Values and sensitivities** <u>Ancient Coastline at 125 m Depth Contour</u> The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF. No significant escarpments, species of conservation significance, emergent features or areas of high biological productivity characteristically associated with this KEF have been observed in the Operational Area (Section 4.7). Given the limited spatial extent of impacts from loss of waste materials into the marine environment, potential impacts to this regional-scale KEF is expected to be localised with no lasting effect. <u>Montebello Marine Park</u> While the Operational Area overlaps the Montebello Marine Park, GWA subsea infrastructure does not. Given the limited spatial extent of impacts from loss of waste materials into the marine environment, potential impacts to this marine park is expected to be localised with no lasting effect.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the potential impacts/risks associated with hazardous and non-hazardous waste management to be ALARP. As no reasonably practicable controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered inherently ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls, hazardous and non-hazardous waste management represents a low risk rating that is unlikely to result in a consequence greater than no lasting effect and localised impact not significant to individuals or a small proportion of the population, or to physical or biological attribute within the Operational Area On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.6.2), Woodside considers the adopted controls appropriate to manage the risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Physical presence of support vessels resulting in collision with marine fauna.					✓		A	F	1	L	LCS GP PJ	Broadly Acceptable	EPO 22

Description of source of risk

Support vessels operating in and around the Operational Area may present a potential hazard to cetaceans and other protected marine fauna such as whale sharks and marine reptiles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury or serious injury that may affect life functions (e.g. movement and reproduction) and mortality. The frequency and severity of impacts due to collisions vary greatly and is dependent on vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth), and the type of marine fauna potentially present and their behaviours.

Routine vessel activities associated with the Petroleum Activity are concentrated within the PSZ – e.g. activities performed by facility support vessels at the GWA facility, which are typically fortnightly. Subsea support vessels, HLVs and USVs may undertake activities (e.g. IMMR activities, removing redundant equipment) within the Operational Area at any time, including within parts of the Operational Area which are beyond the PSZ. The duration and location of these activities varies depending on the activity being undertaken.

An ASV may be present for up to approximately 3 months during a planned extended maintenance campaign, shutdown maintenance or major project; however, it is connected to the GWA facility and is stationary. An ASV may be used approximately once every 3-6 years.

Consequence assessment

Marine mammals, reptiles and sharks

The likelihood of vessel-whale collision being lethal is influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen and Silber 2004; Laist et al. 2001). Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. According to the data of Vanderlaan and Taggart (2007), it is estimated that the risk is less than 10% at a speed of four knots. Vessel–whale collisions at this speed are uncommon and, based on reported data contained in the US NOAA database (Jensen and Silber 2004), there only two known instances of collisions when the vessel was travelling at less than six knots. Both of these were from whale watching vessels that were deliberately placed among whales.

Vessels undertaking the Petroleum Activity within the Operational Area are likely to be travelling at low speed and much of the time vessels are holding station. Therefore, the risk of a vessel collision with protected species resulting in death is inherently low.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Cetaceans considered to be at risk of vessel-collision due to relatively slow movement and proportion of time spent at or near the sea surface. There are no recognised cetacean BIAs that overlap the Operational Area. The humpback whale migration BIA and pygmy whale migration BIA are approximately 15 km and 29 km from the Operational Area respectively (refer to Section 4.6.3). Adverse interactions between vessels and humpback or pygmy blue whales are considered to be unlikely due to the slow speeds of support vessels within the Operational Area, and the distance of the Operational Area from these known BIAs.

Whale sharks are at risk from vessel strikes when feeding at the surface or in shallow waters (where there is limited option to dive). Whale sharks may traverse offshore NWS waters including the Operational Area during their migrations to and from Ningaloo Reef and a BIA for foraging whale sharks overlaps with the Operational Area. However, it is expected that whale shark presence within the Operational Area would not comprise of significant numbers given the main whale shark aggregation area is located in Ningaloo Marine Park 226 km south-west of the Operational Area, and their presence in the Operational Area would be transitory and of a short duration. There are no constraints preventing whale sharks from moving away from vessels (e.g. shallow water or shorelines).

Most vessel movements will be centred around the GWA facility. Although the Operational Area overlaps Unnamed Shoal, where water depths are ~40–50 m, throughout the rest of the Operational Area water depths are much deeper (between 74-200 m) and are unlikely to represent important habitat for marine turtles. There are no emergent features or reef habitat in close proximity to the GWA facility.

Although the flatback turtle internesting BIA, internesting buffer BIA and internesting habitat critical for the species overlaps the Operational Area, the distance of the nearest turtle nesting and internesting areas (habitat critical to survival to marine turtles) is the Montebello Islands, which is approximately 38 km from the Operational Area at the nearest point and approximately 89 km from the GWA facility.

It is acknowledged, however, that there are significant nesting sites along the WA mainland coast and islands of the region and that turtles may occur within the Operational Area in low numbers. The internesting BIA is a spatially assigned buffer for marine turtles nesting at the Montebello Islands. Therefore, it is unlikely that flatback turtles nesting at the Montebello Islands will be found to aggregate in significant numbers within the Operational Area. Notably, the typical response from turtles on the surface to the presence of vessels is to dive (a potential “startle” response), which decreases the risk of collisions (Hazel et al. 2007). As with cetaceans, the risk of collisions between turtles and vessels increases with vessel speed (Hazel et al. 2007). Given the low speeds of vessels undertaking the Petroleum Activity, along with the expected low numbers of turtles within the Operational Area, interactions between vessels and turtles are considered to be highly unlikely.

It is not deemed credible that vessel movement associated with the Petroleum Activity could have a significant impact on marine fauna populations given:

- the low presence of transiting individuals
- avoidance behaviour commonly displayed by whales, whale sharks and marine turtles
- low operating speed of the activity support vessels, unless operating in an emergency).

Activities are considered unlikely to result in a consequence greater than localised disruption to individuals or a small proportion of the population with no lasting effect and no impact on critical habitat or fauna activity.

Values and Sensitivities

Ancient Coastline at 125 m Depth Contour

The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF. No significant escarpments, species of conservation significance, emergent features or areas of high biological productivity characteristically associated with this KEF have been observed in the Operational Area (Section 4.7). Given the limited spatial extent of impacts from interactions with marine fauna, potential impacts to this regional-scale KEF is expected to be localised with no lasting effect.

Montebello Marine Park

While the Operational Area overlaps the Montebello Marine Park, GWA subsea infrastructure does not. Given the limited spatial extent of impacts from interactions with marine fauna, potential impacts to the Montebello Marine Park are expected to be localised with no lasting effect.

6.9.4 Physical presence: introduction of invasive marine species

Context		
Subsea IMMR activities – Section 3.7 Support vessel operations – Section 3.8	Regional context – Section 4.2 Physical environment – Section 4.4 Habitats and biological communities – Section 4.5 Protected species – Section 4.6 Socio-economic environment– Section 4.10	Stakeholder consultation – Section 5

Risk evaluation summary

Source of risk	*Environmental value(s) potentially impacted*						*Evaluation*						
	Marine sediment	Water quality	Air quality (incl odour)	Ecosystems/ habitat	Species	Socio-economic	Decision type	Consequence/ impact	Likelihood	Risk rating	ALARP Tools	Acceptability	Outcome
Invasive species in vessel ballast tanks or on vessels/ immersible equipment				✓	✓	✓	A	E	1	L	LCS GP PJ	Broadly Acceptable	EPO 23

Description of source of risk

Support vessels will be transiting to and from the Operational Area during the Petroleum Activity. Vessels may mobilise from domestic and international locations.

Support vessels may service routine needs (i.e. facility support vessels, refer to Section 3.8.1) and, less frequently, provide specialist services (subsea support vessels for IMMR refer to Section 3.8.2, and ASV refer to Section 3.8.2.1).

Routine vessel activities associated with the Petroleum Activity are primarily concentrated within the PSZ and include both continuous standby vessel operations (typically in two-week periods) and a PSVs to support routine supply operations (weekly visits with total presence in the Operational Area typically less than 24 hours per visit). The standby and PSV may be present at the platform concurrently during routine operations.

Subsea support vessels and HLVs may undertake activities (e.g. IMMR activities or removal of redundant equipment) throughout the Operational Area, including outside the PSZ. The duration and location of these activities vary depending on operational requirements.

An ASV may be deployed to support extended maintenance campaigns, shutdowns or major projects. During such campaigns, the ASV may operate continuously (24 hours per day) adjacent to the platform. ASV use is expected to be infrequent, with up to one campaign within the EP period (5 years), typically of up to three months' duration.

Vessels may be sourced from the local area (Dampier, Port Hedland, Cape Preston) or from further afield, depending on the type of vessel required and availability. In addition, infrequent import of materials (e.g. spares) from international suppliers may be required. Vessels arriving from international waters typically call into Dampier, where quarantine clearance including ballast log reviews is conducted in accordance with the *Biosecurity Act 2015.*

All vessels are inherently subject to some level of marine fouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a suitable hard surface to settle (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc). Organisms can also be drawn into ballast tanks during on-boarding of ballast water as cargo is unloaded or to balance vessels under load. Biofouling organisms can become established in an area through the release of propagules (e.g. eggs or larvae), or by attaching to substrate after becoming detached from the host vessel.

Non-indigenous marine species (NIMS) are species that have been introduced into a region beyond their natural biogeographic range and have the ability to survive, reproduce and establish founder populations. Not all NIMS

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

introduced into an area thrive or cause demonstrable impacts. Indeed, the majority of NIMS around the world are relatively benign and few have spread widely beyond sheltered ports and harbours. Only a subset of NIMS that become abundant and impact on social/cultural, human health, economic and/or environmental values can be considered invasive marine species (IMS).

During the Petroleum Activity, vessel activities that have the potential to lead to the introduction of IMS are:

- discharge of ballast water from vessels
- vessel interactions with fixed infrastructure (e.g. GWA platform).

Consequence assessment

IMS have historically been introduced and translocated around Australia by a variety of human means including biofouling and ballast water. Species of concern are those that:

- are not native to the region
- are likely to survive and establish in the region
- are able to spread by human mediated or natural means.

Species of concern vary from one region to another, depending on various environmental factors such as water temperature, salinity, nutrient levels and habitat type. These factors dictate their survival and invasive capabilities.

Introducing IMS into the local marine environment may alter the ecosystem, as IMS have characteristics that make them superior (in a survival and/or reproductive sense) to indigenous species. They may prey upon local species (which had previously not been subject to this kind of predation and therefore not have evolved protective measures against the attack), they may outcompete indigenous species for food, space or light and can also interbreed with local species, creating hybrids such that the endemic species is lost.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas, once established. If the introduction is captured early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Despite the potential high consequence of the establishment of a marine pest within a high value environment as a result of introduction, unlike coastal or sheltered nearshore waters, the deep offshore open waters of the Operational Area are deep and are not conducive to the settlement and establishment of IMS (Geiling 2014), due to the lack of light or suitable habitat to sustain growth or survival. The Petroleum Activity will be undertaken in an open ocean, offshore location more than 12 nm from shorelines and/or critical habitat and in waters approximately 74 m to 200 m deep. While Unnamed Shoal is shallower (~40-50 m) and is within the Operational Area, it is approximately 1.9 km north of the nearest flowline.

Table 6-35 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

Epifauna and infauna

Epifauna and infauna are susceptible to impacts from IMS due to the risk of changes to the ecosystem dynamics such as competition for resources and predation.

Discrete areas of hard substrate hosting sessile filter feeding communities that may be vulnerable to impacts of IMS may also be associated within the Ancient Coastline at the 125 m Depth Contour KEF, which overlaps the Operational Area. While the vessels used for the Petroleum Activity have the potential to introduce IMS into the area, the deep offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS (Geiling 2014). The Operational Area is in an offshore continental shelf location more than 12 nm from shorelines and/or critical habitat and in waters approximately 74 m to 200 m deep.

The likelihood of IMS being introduced and establishing viable populations within the Operational Area or immediate surrounds is considered highly unlikely, with the potential settlement on subsea infrastructure not expected. Risks to epifauna and infauna, if realised, may lead to slight and low-level impacts. Table 6-35 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

Values and sensitivities

Ancient Coastline at 125 m Depth Contour

The Operational Area overlaps the Ancient Coastline at 125 m Depth Contour KEF, however no significant escarpments, species of conservation significance, emergent features or areas of high biological productivity characteristically associated with this KEF have been observed in the Operational Area (Section 4.7). As evaluated above, the likelihood of IMS being introduced and establishing viable populations within the Operational Area or immediate surrounds is considered highly unlikely, with the potential settlement on subsea infrastructure not expected. Risks to this regional-scale KEF, if realised may lead to slight and low-level impacts. Table 6-35 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

Montebello Marine Park

While the Operational Area overlaps the Montebello Marine Park, subsea infrastructure associated with the Petroleum Activity does not. As evaluated above, the likelihood of IMS being introduced and establishing viable populations

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

within the Operational Area or immediate surrounds is considered highly unlikely, with the potential settlement on subsea infrastructure not expected. Risks to the marine park, if realised may lead to slight and low-level impacts. Table 6-35 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

Industry, shipping, defence

The establishment of IMS has the potential to cause changes to the functions, interests or activities of other users through indirect impact such as changes to fisheries target species resulting in economic and social implications, or due to compromised reputation to the oil and gas industry.

Given the low likelihood of IMS translocation to, and colonisation of environments within the Operational Area, the Petroleum Activity is highly unlikely to result in establishment of IMS, and as such not adversely affect other marine user activities in the region. Risks to other users, if realised, may lead to slight and low-level impacts. Table 6-35 provides an assessment of the IMS impacts and risks associated with the Petroleum Activity.

As a result of the assessment presented in Table 6-35, potential consequences if the risk of IMS is realised, are assessed as 'E', a slight, short-term impact (<1 year) on species, habitat (but not affecting ecosystem function), physical or biological attribute) and a likelihood as Highly Unlikely (1), resulting in an overall low risk rating following the implementation of identified controls.

Table 6-35: Assessment of the impacts and risks of invasive marine species introduction associated with the Petroleum Activity

IMS Introduction Aspect	Credibility of Introduction	Consequence of Introduction	Likelihood
Transfer of IMS from infected vessel to Operational Area and establishment on the seafloor or subsea infrastructure.	**Not Credible** The deep offshore open waters of the Operational Area, away from shorelines and/or critical habitat, more than 12 nm from a shore and in waters 74 – 200 m deep are not conducive to the settlement and establishment of IMS.	N/A	N/A
Transfer of IMS from infected vessel to and subsequent establishment on the GWA facility.	**Credible** There is potential for the transfer of marine pests to occur.	If IMS were to establish this would potentially result in fouling of intakes (depending on the pest introduced) and would likely result in the quarantine of the GWA facility until eradication could occur (through cleaning and treatment of infected areas), which would be costly to undertake. **Minor (D) – Reputation and Brand** Such introduction would be expected to have Minor (D) impact to Woodside's reputation and brand, and close scrutiny of asset level operations or future proposals. **Slight (E) – Environment** Environmental consequence of introduction of IMS to the GWA facility is considered Slight (E), localised and would relate to habitat	**Highly Unlikely (1)** Interactions between the GWA facility and support vessels will be limited during the Petroleum Activity, with a 500 m safety exclusion zones being adhered too. Spread of marine pests via ballast water or spawning in these open ocean environments is considered Highly Unlikely (1).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		directly on the GWA facility.	
Transfer of IMS from infected vessel to and subsequent establishment on GWA facility, then transfer of IMS to a secondary vessel from the GWA facility.	**Not Credible** Risk is considered so remote that it is not credible for the purposes of the Petroleum Activity. The transfer of a marine pest from an infected vessel to the GWA facility was already considered highly unlikely given the offshore open ocean environment. For marine pests to then establish into a mature spawning population on GWA and then transfer to another support vessel is not considered credible (i.e. beyond the Woodside risk matrix). The GWA facility is located in an offshore, open ocean, deep environment. Support vessels only spend short periods of time alongside GWA (i.e. during backloading or bunkering activities); with the exception of the ASV which may be connected to the GWA platform for up to 3 months, if deployed. There is also no direct contact (i.e. they are not tied up alongside) during these activities. It is also noted that Woodside has been conducting marine vessel movements between the GWA facility and WA ports (such as Dampier), for a long period of time and no IMS has been detected in these ports (DoF 2017).	N/A	N/A

ballast water management options, as outlined in the Australian Ballast Water Management Requirements. This applies to all vessels that will enter the Operational Area, including those carrying out activities outside of Australian Territorial Seas (>12 nm).		within the Operational Area. No change in consequence would occur.	*Act 2015* – must be adopted.	
Vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the *Biosecurity Act 2015* – must be adopted.	Yes **C 23.2**
Good practice				
Woodside's IMS risk assessment process (Section 7.2.4) will be applied to the ASV, vessels and immersible equipment that enter the Operational Area, unless exempt Based on the outcomes of each IMS risk assessment, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.	F: Yes. CS: Good practice implemented across all Woodside operations.	The IMS risk assessment process will identify potential risks and additional controls implemented accordingly. In doing so, the likelihood of transferring marine pests between vessels within the Operational Area is reduced. No change in consequence would occur.	Benefits outweigh cost/sacrifice.	Yes **C 23.3**
Professional judgement – Eliminate				
Not using support vessels.	F: No. No alternative to the use of vessels during the Petroleum Activity was identified, given vessels must be used to undertake the Petroleum Activity. There is no feasible means to eliminate the source of risk. CS: Not assessed, control not feasible.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
No discharge of ballast water during the Petroleum Activity.	F: Yes however ballast water discharges are critical for maintaining	Elimination of the potential introduction of	Legislative requirements (**C 23.1**) are required to be	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)***	***Benefit in risk reduction***	***Proportionality***	***Control adopted***
	vessel stability. Given the nature of the Petroleum Activity, the use of ballast (including the potential discharge of ballast water) is considered to be a safety critical requirement. CS: Not assessed, to safety critical element.	IMS, if present within the ballast water.	implemented to manage potential ballast water risk to low. Noting the safety critical element and the adopted control (**C 23.1**) this is disproportionate to the risk reduction.	
Infield IMS inspection of the GWA platform or the ASV upon arrival into Operational Area.	F: Yes, implementation of a survey is considered feasible for vessels entering the Operational Area. Any IMS survey work would have to be carried out via ROV as diving is not included in the in-force safety case under OPGGS (Safety) Regulations. CS: Significant cost. The survey would require mobilisation of specialist personnel and equipment, vessel time, and additional offshore operations. Ability to access some niches maybe be limited due to in water access and safety restrictions i.e. thrusters on the ASV, caissons on GWA platform and facility simultaneous operations hazards	No benefit in risk reduction would be achieved because IMS risk has already been managed through implementation of the Woodside's IMS risk assessment process and the Biosecurity Act 2015. An infield inspection would not materially reduce the residual likelihood or consequence of IMS introduction beyond the existing controls.	Disproportionate. Any additional benefit gained through implementation of this control is disproportionate to the cost and effort required to undertake this control infield. The IMS risk has already been managed through controls adopted (and noting already incurred cost through implementation of Woodside's IMS risk assessment process (i.e. inspections and cleaning where risk warrants)).	No
Professional judgement – Substitute				
Source vessels based in Australia only.	F: Potentially. Limiting activities to only use local vessels could potentially pose a significant risk in terms of time and duration of sourcing a vessel, as well as the ability of the local vessels to perform the required tasks. While the Petroleum Activity will attempt to source support vessels locally it is not always possible. Availability cannot always be	Sourcing vessels from within Australian will reduce the likelihood of IMS from outside Australian waters, however, it does not reduce the likelihood of introduction of species native to Australia but alien to the Petroleum Activity and NWMR, or of IMS that have established elsewhere in Australia. The consequence is unchanged.	Disproportionate. Sourcing vessels from Australian waters may result in a reduction in the likelihood of IMS introduction to the Petroleum Activity; however, it does not eliminate the risk. Furthermore, the cost to implement this control could be high, given the potential schedule impacts due to restrictions of vessel hire opportunities.	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)***	***Benefit in risk reduction***	***Proportionality***	***Control adopted***
	guaranteed when considered competing oil and gas activities in the region. In addition, sourcing Australian based vessels only will cause increases in cost due to pressures of vessel availability. CS: Significant cost and schedule impacts due to restrictions of vessel hire opportunities.			
Inspecting all vessels for IMS.	F: Yes. Approach to inspect vessels is feasible. CS: Significant cost and schedule impacts. Thorough inspections require vessels to be removed from the sea (e.g. slipped or dry docked) and examined by an IMS expert. This process incurs significant financial and schedule sacrifices. Timely vessel-based support is integral to the safe and efficient operation of the facility and subsea infrastructure. In addition, Woodside's IMS risk assessment process is seen to be more cost-effective as this control allows Woodside to manage the introduction of marine pests through biofouling, while targeting its efforts and resources to areas of greatest concern.	Inspecting all vessels for IMS would reduce the likelihood of IMS being introduced to the Operational Area. However, this reduction is unlikely to be significant, given the other control measures implemented. No change in consequence would occur.	Disproportionate. The cost/sacrifice is grossly disproportionate to the benefit gained.	No
Professional judgement – Engineered Solution				
None identified.				
ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.6.1), Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS introduction. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of acceptability
Acceptability statement: The risk assessment demonstrates that, with the adopted controls, there is a low residual risk of IMS introduction, establishment and spread to the Operational Area. Consistent with NOPSEMA guidance, the risk assessment identified key risk factors and informed appropriate management measures to minimise the risk of marine pest introduction, establishment and spread (NOPSEMA, 2026). This approach aligns with the MarinePestPlan 2018–2023, which establishes a national objective to minimise the risk of marine pest introduction, establishment and spread (Commonwealth of Australia, 2018b). In this context, "introduction" represents the risk event (translocation of marine pest species), whereas material environmental impact is contingent on subsequent "establishment" (survival, reproduction and persistence). The low residual risk to environmental receptors is acceptable (see risk ratings matrix in Table 2-4), because it represents a level at which the potential risk can be effectively managed by adhering to applicable legislative requirements, industry guidelines, and/or internal Woodside procedures (Section 2.6.2). At this risk level the likelihood of the unplanned event resulting in a minor environmental consequence (D or below) is remote (see likelihood levels in Table 2-3). IMS risks are managed across the full continuum of introduction, establishment and spread, and recognising that ecological impacts arise only where establishment occurs (Commonwealth of Australia, 2013), the adopted controls are designed to minimise both the likelihood of introduction and the potential for establishment of IMS (NOPSEMA, 2026). Further opportunities to reduce risks have been considered above, and the selected controls reflect good industry practice and comply with applicable legislative requirements, including the Biosecurity Act 2015. In line with national guidance (Commonwealth of Australia, 2013; Commonwealth of Australia, 2018b; NOPSEMA, 2026) the EPO for this risk sets a level of performance preventing the introduction of invasive marine species to and within the Operational Area and focuses on prevention through the management of vessel biofouling and ballast water. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.4.4.2) Woodside considers the adopted controls appropriate so that IMS risks are reduced to an acceptable level and that the EPO reflects that level. Compliance with the adopted controls will demonstrates that the EPO has been met.

6.10 Recovery plan and threat abatement assessment

This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activity is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia 2017)
- Conservation Management Plan for the Blue Whale 2015–2025 (Commonwealth of Australia 2015a)
- National Recovery Plan for the Southern Right Whale (DCCEEW 2024a)
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Commonwealth of Australia, 2014)
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015b)
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018a).

Table 6-36 lists the objectives and (where relevant) the action areas of these plans and also describes whether these objectives/action areas apply to government, the titleholder, and/or the Petroleum Activity. For those objectives/action areas applicable to the Petroleum Activity, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are clearly inconsistent with that action or not. The results of this assessment against relevant actions are presented in Table 6-37 to Table 6-42.

In addition, this section also lists the relevant requirements and objectives of the management plans and frameworks related to the Murujuga Cultural Landscape World Heritage Area and provides a demonstration that the Petroleum Activity is not inconsistent with these requirements and objectives (Table 6-43).

Southern Right Whale Recovery Plan			
Long-term vision: increase population to a level that the conservation status has improved and the species no longer qualifies for listing as threatened under any of the EPBC Act listing criteria.	Y	Y	Y
Interim Recovery Objectives			
Current levels of Commonwealth and State legislative and management protection for southern right whales are implemented, maintained, or improved, so threats continue to be managed and reduced over the life of the plan	Y		
Anthropogenic threats are managed consistent with ecologically sustainable principles to facilitate recovery of southern right whales	Y	Y	Y
Population dynamics, including demographics, distribution, residency, and coastal movement across the species range are monitored and quantified using robust, standardised, best-practice methodology to assess population recovery	Y		
The population structure in Australian waters is clearly characterised to evaluate the degree to which the western and eastern populations are separate populations and inform the degree of connectivity with other southern right whale populations	Y		
Capability of First Nation Australians, research, citizen science, and general community groups is improved to assist in addressing recovery actions of southern right whales in Australia.	Y		
Action Areas			
Assess and address key threats			
A1: Maintain, implement and improve efficacy of current legislative and management protection for southern right whales.	Y		
A2: Address habitat degradation impacts from coastal and offshore marine infrastructure developments within the species' range.	Y	Y	Y
A3: Understand impacts of climate variability and anthropogenic climate change on the species biology and population recovery.	Y	Y	Y
A4: Manage and mitigate the threat of entanglements from commercial active or discarded fishing gear throughout the species' range in Australian waters.	Y		
A5: Assess, manage, and mitigate impacts from anthropogenic underwater noise.	Y	Y	Y
A6: Manage, minimise and mitigate the threat of vessel strike.	Y	Y	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	***Titleholder***	***Petroleum Activity***
Measure recovery			
B1: Measure and monitor population demographic and recovery	Y		
B2: Characterise population structure	Y		
B3: Determine migratory paths and offshore distribution	Y		
B4: Improve capability of First Nation Australians, research, citizen science, and general community groups to assist management of southern right whales	Y		
Grey Nurse Shark Recovery Plan			
Overarching Objective			
To assist the recovery of the grey nurse shark in the wild, throughout its range in Australian waters, with a view to: improving the population status, leading to future removal of the grey nurse shark from the threatened species list of the EPBC Act ensuring that anthropogenic activities do not hinder the recovery of the grey nurse shark in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objectives			
Develop and apply quantitative monitoring of the population status (distribution and abundance) and potential recovery of the grey nurse shark in Australian waters	Y		
Quantify and reduce the impact of commercial fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Quantify and reduce the impact of recreational fishing on the grey nurse shark through incidental (accidental and/or illegal) take, throughout its range	Y		
Where practicable, minimise the impact of shark control activities on the grey nurse shark	Y		
Investigate and manage the impact of ecotourism on the grey nurse shark	Y		
Manage the impact of aquarium collection on the grey nurse shark	Y		
Improve understanding of the threat of pollution and disease to the grey nurse shark	Y	Y	Y
Continue to identify and protect habitat critical to the survival of the grey nurse shark and reduce the impact of threatening processes within these areas	Y	Y

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	***Titleholder***	***Petroleum Activity***
Continue to develop and implement research programs to support the conservation of the grey nurse shark	Y	Y	
Promote community education and awareness in relation to grey nurse shark conservation and management	Y		
Sawfish and River Sharks Recovery Plan			
Primary Objective			
To assist the recovery of sawfish and river sharks in Australian waters with a view to: improving the population status leading to the removal of the sawfish and river shark species from the threatened species list of the EPBC Act ensuring that anthropogenic activities do not hinder recovery in the near future, or impact on the conservation status of the species in the future	Y	Y	Y
Specific Objectives			
Reduce and, where possible, eliminate adverse impacts of commercial fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of recreational fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of Indigenous fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate the impact of illegal, unregulated and unreported fishing on sawfish and river shark species	Y		
Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	Y	Y	Y
Reduce and, where possible, eliminate any adverse impacts of collection for public aquaria on sawfish and river shark species	Y		
Improve the information base to allow the development of a quantitative framework to assess the recovery of, and inform management options for, sawfish and river shark species	Y		
Develop research programs to assist conservation of sawfish and river shark species	Y	Y	
Improve community understanding and awareness in relation to sawfish and river shark conservation and management	Y

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area A4: Minimise chemical and terrestrial discharge	**Action:** Ensure spill risk strategies and response programs adequately include management for marine turtles and their habitats, particularly in reference to 'slow to recover habitats', e.g. nesting habitat, seagrass meadows or coral reefs Priority actions at stock level: G-NWS – Ensure that spill risk strategies and response programs include management for turtles and their habitats LH-WA & F-Pil – Ensure that spill risk strategies and response programs include management for turtles and their habitats, particularly in reference to slow to recover habitats, e.g. seagrass meadows or corals	Refer Sections 6.7, 6.8 and 6.9. **Not inconsistent assessment:** The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to marine turtles. Spill risk strategies and response program include management measures for turtles and their nesting habitats.	Refer Sections 6.7, 6.8 and 6.9. Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activity are present in Appendix G
	Action Area A8: Minimise light pollution	**Action:** Artificial light within or adjacent to habitat critical to the survival of marine turtles will be managed such that marine turtles are not displaced from these habitats Priority actions at stock level: G-NWS – as above LH-WA – no relevant actions F-Pil – Manage artificial light from onshore and offshore sources to ensure biologically important behaviours of nesting adults and emerging/dispersing hatchlings can continue	Refer Section 6.7.9. **Not inconsistent assessment:** The assessment of light emissions has considered the potential impacts to marine turtles. Internesting, mating, foraging or migrating turtles are not impacted by light from offshore vessels. Based on the frequency and nature of IMMR activities, the impacts to adult turtles moving through the Operational Area from vessel lighting are expected to be localised and temporary with no lasting effect.	**EPO 12** **C 12.2, 12.3** **PS 12.2, 12.3**

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	Action Area B1: Determine trends at index beaches	**Action:** Maintain or establish long-term monitoring programs at index beaches to collect standardised data critical for determining stock trends, including data on hatchling production Priority actions at stock level: G-NWS – Continue long-term monitoring of index beaches LH-WA – Continue long-term monitoring of nesting and foraging populations F-Pil – no relevant actions	**Not inconsistent assessment:** Woodside contributes to Action Area B1 via its support of the Ningaloo Turtle Program.	N/A
	Action Area B3: Address information gaps to better facilitate the recovery of marine turtle stocks	**Action:** Understand the impacts of anthropogenic noise on marine turtle behaviour and biology Priority actions at stock level: G-NWS – Given this is a relatively accessible stock that is likely to be exposed to anthropogenic noise – Investigate the impacts of anthropogenic noise on turtle behaviour and biology and extrapolate findings from the NWS stock to other stocks LH-WA – no relevant actions F-Pil – no relevant actions	Refer Sections 6.7.3. **Not inconsistent assessment:** The assessment of acoustic emissions has considered the potential impacts to marine turtles. IMMR related noise is not expected to result in behavioural response, injury or mortality of individuals, or any other lasting effect.	**EPO 4a and EPO 4b** **C 4.3** **PS 4.3**
Assessment Summary The Marine Turtle Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-38: Assessment against relevant actions of the Blue Whale Conservation Management Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Blue Whale Conservation Management Plan	**Action Area A.2:** Assessing and addressing anthropogenic noise	**Action 2:** Assessing the effect of anthropogenic noise on blue whale behaviour **Action 3:** Anthropogenic noise in BIAs will be managed such that any blue whale continues to use the area without injury[2], and is not displaced from a foraging area	Refer Section 6.9.3 **Not inconsistent assessment:** The assessment of acoustic emissions has considered the potential impacts to pygmy blue whales. Acoustic emissions from support vessels will not cause injury to any pygmy blue whale. There are no known or possible foraging areas for pygmy blue whales within or adjacent to the Operational Area.	**EPO 4a** **C 4.1** **PS 4.1**
	Action Area A.4: Minimising vessel collisions	**Action 3:** Ensure the risk of vessel strikes on blue whales is considered when assessing actions that increase vessel traffic in areas where blue whales occur and, if required, appropriate mitigation measures are implemented	Refer Section 6.9.3. **Not inconsistent assessment:** The assessment of interaction with marine fauna has considered the potential risks to pygmy blue whales. Interactions with pygmy blue whales are highly unlikely to occur, given the low operating speed of support vessels.	**EPO 22** **C 4.1** **PS 4.1**
	Action Area B.3: Describing spatial and temporal distribution and defining biologically important habitat	**Action 2:** Identify migratory pathways between breeding and feeding grounds **Action 3:** Assess timing and residency within BIAs	**Not inconsistent assessment:** Woodside contributes to Action Area B3 via its support of targeted research initiatives (e.g. satellite tracking of pygmy blue whale migratory movements[3]).	N/A
Assessment Summary The Blue Whale Conservation Management Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-39: Assessment against relevant actions of the Southern Right Whale Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
National Recovery Plan for the Southern Right Whale	A2: Address habitat degradation impacts from coastal and offshore marine infrastructure developments within the species' range.	Action 1 Coastal and offshore development actions are assessed according to principles of ecological sustainable development to ensure the risk of injury, auditory impairment and/or disturbance to southern right whales is maintained. Action 3 Current information on species' occurrence, particularly in HCTS, BIAs, and historic high use areas, are used to inform planning, assessment, and decision-making on marine infrastructure development actions.	Refer Section 6.9.3 **Not inconsistent assessment:** This EP assesses the potential impacts of the Petroleum Activity and is not expected to result in the risk of injury, auditory impairment and/or disturbance to southern right whales, particularly within the HCTS and BIAs that are located over 200 km from the Operational Area.	**EPO 22** **C 4.1** **PS 4.1**
	A5: Assess, manage, and mitigate impacts from anthropogenic underwater noise.	Action 2: Actions within and adjacent to southern right whale BIAs and HCTS should demonstrate that it does not prevent any southern right whale from utilising the area or cause auditory impairment. Action 3: Actions within and adjacent to southern right whale BIAs and HCTS should demonstrate that the risk of behavioural disturbance is minimised. Action 4: Ensure environmental assessments associated with underwater noise generating activities include consideration of national policy (e.g. EPBC Act Policy Statement 2.1) and guidelines related to managing anthropogenic underwater noise and implement appropriate mitigation measures to reduce risks to southern right whales to the lowest possible level. Action 5: Quantify risks of anthropogenic underwater noise to southern right whales, including studies aimed to measure physiological effects, behavioural disturbance, and changes to acoustic communication (e.g. masking of vocalisations) to whales.	Refer Section 6.7.3 **Not inconsistent assessment:** The assessment of acoustic emissions has considered the potential impacts to southern right whales. The nearest BIAs and HCTS for the southern right whale being over 200 km from the Operational Areas therefore it is not expected that noise from the Petroleum Activity will impact the southern right whales.	**EPO 4a** **C 4.1** **PS 4.1**
	A6: Manage, minimise and	Action 1: Assess risk of vessel strike to southern right whales in BIAs	Refer Section 6.9.3.	N/A

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
	mitigate the threat of vessel strike.	Action 3: Ensure environmental impact assessments and associated plans consider and quantify the risk of vessel strike and associated potential cumulative risks in BIAs and HCTS/.	**Not inconsistent assessment:** The assessment of interaction with marine fauna has considered the potential risks to southern right whales. The nearest BIAs and HCTS for the southern right whale being over 200 km from the Operational Areas therefore it is not expected that there is a risk of vessel strike.	
Assessment Summary The National Recovery Plan for the Southern Right Whale has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-40: Assessment against relevant actions of the Grey Nurse Shark Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Grey Nurse Shark Recovery Plan	**Objective 7:** Improve understanding of the threat of pollution and disease to the grey nurse shark	**Action 7.1:** Review and assess the potential threat of introduced species, pathogens and pollutants	Refer Section 6.9.2. **Not inconsistent assessment:** This EP includes an assessment of the impacts from accidental release of solid wastes as well as planned discharges of drilling waste on marine species.	**EPO 21** **C 21.1, 21.2, 21.3** **PS 21.1, 21.2, 21.3**
			Refer Sections 6.7, 6.8 and 6.9. **Not inconsistent assessment:** The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to grey nurse sharks. Spill risk strategies and response program include management measures, as identified and required.	Refer Sections 6.7, 6.8 and 6.9. Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activity are present in Appendix G
Assessment Summary The Grey Nurse Shark Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-41: Assessment against relevant actions of the Sawfish and River Shark Recovery Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Sawfish and River Shark Recovery Plan	**Objective 5:** Reduce and, where possible, eliminate adverse impacts of habitat degradation and modification on sawfish and river shark species	**Action 5c:** Identify risks to important sawfish and river shark habitat and measures needed to reduce those risks	Refer Sections 6.7, 6.8 and 6.9. **Not inconsistent assessment:** The assessment of accidental release of chemicals / hydrocarbons has considered the potential risks to sawfish and river shark. Spill risk strategies and response program include management measures, as identified and required.	Refer Sections 6.7, 6.8 and 6.9. Detailed oil spill preparedness and response performance outcomes, standards and measurement criteria for the Petroleum Activity are present in Appendix G
	Objective 6: Reduce and, where possible, eliminate any adverse impacts of marine debris on sawfish and river shark species noting the linkages with the Threat Abatement Plan for the Impact of Marine Debris on Vertebrate Marine Life	**Action 6a:** Assess the impacts of marine debris including ghost nets, fishing gear and plastics on sawfish and river shark species	Refer Section 6.9.2. **Not inconsistent assessment:** The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to sawfish. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activity.	**EPO 21** **C 21.1, 21.2, 21.3** **PS 21.1, 21.2, 21.3**
Assessment Summary The Sawfish and River Shark Recovery Plan has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-42: Assessment against relevant actions of the Marine Debris Threat Abatement Plan

Part 13 Statutory Instrument	Relevant Action Areas/Objectives	Relevant Actions	Evaluation	EPO, Controls and PS
Marine Debris TAP	**Objective 2:** Understand the scale of marine plastic and microplastic impact on key species, ecological communities and locations	**Action 2.04:** Build understanding related to plastic and microplastic pollution	Refer Section 6.9.2. **Not inconsistent assessment:** The assessment of the accidental release of solid hazardous and non-hazardous wastes has considered the potential risks to the marine environment. Controls have been implemented to reduce the likelihood of accidental release of solid wastes for the duration of the Petroleum Activity.	**EPO 21** **C 21.1, 21.2, 21.3** **PS 21.1, 21.2, 21.3**
Assessment Summary The Marine Debris TAP has been considered during the assessment of impacts and risks, and the Petroleum Activity is not considered to be inconsistent with the relevant actions of this plan.				

Table 6-43: Assessment against relevant requirements and objectives of management plans and frameworks related to the Murujuga Cultural Landscape World Heritage Area

Relevant requirement and relevant objective	Demonstration the Petroleum Activity is not inconsistent
The Murujuga Cultural Landscape Strategic Management Framework (2022) Protect, conserve and present the potential Outstanding Universal Value of the property Take appropriate scientific, technical, legal, administrative and financial measures necessary for achieving [these objectives]	There is no overlap between the Operational Area and Murujuga Cultural Landscape World Heritage Area Boundary (See Figure 4-17). **EPO 11a and 11b** and their relevant associated controls support the protection and conservation of the universal values, including the Ngarda- Ngarli peoples ongoing connection to Country. Intangible values associated with Murujuga Cultural Landscape (living cultural traditions) are preserved through the ongoing connection the Traditional Custodians maintain with the landscape. Supported by **C 11.1** of this EP, opportunity for consultation is open for the life of the EP with the cultural authority of the MCL (Ngarda-Ngarli people

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Relevant requirement and relevant objective	Demonstration the Petroleum Activity is not inconsistent
Murujuga Cultural Management Plan (2016) To promote effective, integrated and cooperative management between Murujuga National Park and adjacent land managers	represented by the Murujuga Aboriginal Corporation (MAC)) to inform consideration of these values in the context of the Petroleum Activity. **C 10.1** in this EP, aligns with and supports the objectives of the Murujuga Rock Art Strategy/Murujuga Rock Art Monitoring Program through provision of relevant industry information to inform the assessment of potential anthropogenic emissions impacts on rock art. Woodside monitors the outcomes of the MRAMP and assesses relevance to this Petroleum Activity as part of the implementation strategy of this EP (**C 10.1**). As outlined in **C 10.1**, Woodside is committed to complying with the State government's requirements to ensure that activities do not result in the region's emissions exceeding MRAMP EQC Standards. Interim Standards published by MRAMP indicated that activities in the region currently remain below this value. Interim EQC Guidelines exist to guide an ongoing management approach under the MRAMP framework for the region. NOx emissions to the Murujuga airshed are regulated under the EP Act and Ministerial Conditions. The adopted controls- including compliance with Ministerial Statement 1233 (via **C 10.2**)- manage the indirect air emissions associated with onshore process of GWA gas to '*Prevent accelerated weathering of Murujuga rock art or impact to human health from air emissions that result from onshore processing of GWA gas* (**EPO 10**). *Not inconsistent:* Based on the commitments, controls and relevant information stated above, the Petroleum Activity is not inconsistent with goals and objectives of The Murujuga Cultural Landscape Strategic Management Framework (2022) and Murujuga Cultural Management Plan (2016) which aim to protect and conserve the World Heritage values of Murujuga Cultural Landscape.
Murujuga National Park Management Plan (2013, as amended in 2023) To actively manage the Murujuga Land and Sea Country to keep Country healthy and safe. It was identified that to achieve this Murujuga Land and Sea Unit (Ranger Unit with MAC) will: monitor and protect rock art − have access to all information about the effects of industry on Murujuga Country	**C 11.2** of this EP aligns with Woodsides ongoing support into the research and monitoring of, the National Heritage values of the park so activities are carried out in a manner that is not inconsistent with the *Murujuga National Park Management Plan 78*. An ongoing engagement approach with Traditional Custodians (Section 5) and **EPO 11b**, specifically, **C 11.1**- the 'living heritage' management approach have been developed to enable Woodside to manage cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians. This EP includes an assessment of potential impacts on the World Heritage values of the MCL, with relevant controls (**EPO 10**) implemented to prevent unacceptable impacts on the values of the National Park, including rock art. Requirement for appropriate approval process is met by the submission of this EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Relevant requirement and relevant objective	Demonstration the Petroleum Activity is not inconsistent
To ensure that any developments subject to appropriate assessment and approval processes, and do not unacceptably impact on the park's cultural heritage, including the rock art and natural values, in particular its National Heritage and potential World Heritage values or detract from the visitor experience of Murujuga National Park.	*Not inconsistent:* **EPO 10** and **C 11.2** in this EP aligns Woodsides obligation under the Deep Gorge Joint Statement and supports its action to be not inconsistent with the Murujuga National Park Management Plan (78) that protect and conserve the world heritage values of Murujuga Cultural Landscape.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.11 Cultural features and heritage values assessment

The identification of cultural features and heritage values of the environment as well as the social, economic and cultural features important to Indigenous people is integral to understanding the environment and any potential impacts and risks to the environment. In line with Woodside's Indigenous Communities Policy (Woodside 2025), Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage). If avoidance is not possible, Woodside will seek to minimise and mitigate any impacts, through consultation with Indigenous communities and Traditional Custodians.

Mitigation of intangible heritage can include any measure or control aimed at ensuring the viability of the cultural heritage and its intergenerational transmission. This can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO, 2003; Australia ICOMOS, 2013).

Values and features of significance identified in Section 4.9 (Table 4-21) as being likely or possible to interact with the Operational Area or EMBA are addressed in the risk assessment below. Management of these risks ensures that Indigenous concerns and interests are adequately acknowledged and protected throughout GWA Operations.

Any action in Australian waters that will or might interact with the seabed could impact UCH, as such, an adequate process of UCH assessment and management is to be undertaken ahead of, and concurrent with, any proposed actions in the near and offshore environment (DCCEEW, 2024b). The impact assessment below considers both Indigenous and historical UCH in order to protect its value for future generations.

Description of source impact/risk (key aspects)
Seabed disturbance Seabed disturbance associated with the Petroleum Activity can occur during operations and other activities including physical presence of the GWA facility and subsea infrastructure and subsea IMMR activities. The presence of subsea infrastructure and the interaction with hydrodynamic processes may result in localised scouring to the seabed and localised sedimentation of fine substrates around infrastructure. IMMR activities and ROV operations will be conducted at routine intervals which can result in seabed disturbance. Refer to Section 6.7.2 for more details. **Acoustic emissions** The GWA facility and subsea infrastructure, support vessels, subsea IMMR activities and helicopters generate noise both in the air and underwater, due to the operation of machinery and propeller movement. Support vessels holding station are considered to be the predominant noise source related to the Petroleum Activity Sound levels will fluctuate over the course of the Petroleum Activity and will depend on concurrent vessel activities. Generally, sound associated with operations of the GWA facility and associated subsea infrastructure will be limited. Short-term increases in sound will occur periodically associated with PSV operations in the vicinity of the GWA facility within the PSZ. Support vessels holding station are considered to be the predominant noise source related to the Petroleum Activity The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Large vessels typically produce higher sound levels at lower frequencies than small vessels, although significant variation may be found among vessels within the same group. Sound levels tend to be greatest when engaging the throttle or thrusters, such as use of DP or when vessels are operating under load, compared with slow moving or idling vessels. The greatest sound levels are likely to be associated with vessels using DP thrusters to maintain position on station. Refer to Section 6.7.3 for more details. **Indirect emissions associated with gas processing onshore** Atmospheric emissions (non-greenhouse gas emissions) are gases and particulates from an activity, or piece of machinery, which have a recognised adverse effect on human health and/or flora and fauna. Consideration of potential indirect impacts include those causing a reduction in ambient air quality impacting human health as well as the potential to contribute to accelerated weathering of rock art on the Burrup Peninsula and within the Dampier Archipelago (i.e. Murujuga) are discussed further in Section 6.7.8 **Light emission from GWA facility, vessels and flaring** Lighting is used to ensure a safe working environment to support 24-hour operations and to communicate the presence of the GWA facility and associated vessels to other marine users (i.e. navigational lights). External lighting is located over the entire GWA facility and on vessels, with most external lighting directed towards working areas, such as the production deck of the GWA facility or the back deck of vessels. This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights and is not dissimilar to lighting used for other offshore activities,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Description of source impact/risk (key aspects)
including fishing and shipping. Lighting is required for the safe operation of the facility and support vessels and cannot reasonably be eliminated. Refer to Section 6.7.9 for more details. **Unplanned hydrocarbon release (basis of EMBA)** The EMBA is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the highly unlikely event of the worst-case unplanned release. The EMBA therefore covers a larger area than the area that would be affected during any one single event. Refer to Section 6.8.3 for more details.

Cultural heritage key receptor impact assessment
The potential environmental impact from the Petroleum Activity to receptors that have a cultural feature or heritage value have been summarised in Table 6-44 and Table 6-45 below to provide the context related cumulative impact on the cultural feature or heritage value. The cultural heritage key receptor impact assessment is linked to biological, ecological and cultural values and the relevant aspects associated with the Petroleum Activity. As interactions with other marine users and MEE common cause failure mechanisms: SCE failure CCE-01 and human error CCE-02 do not affect any biological, ecological or cultural values, it has not been assessed for cultural heritage.

Detailed impact and risk assessment
The Petroleum Activity has the potential to impact cultural features and heritage values identified in Table 4-21 in the following ways.
Archaeological heritage and landscapes
Places that are identified in Section 4.9 for their value as archaeological sites are assumed to be at risk where there is potential for impact to the tangible or scientific elements of that place. This could include physical damage or disturbance to the archaeological integrity of a place. **Coastal/island archaeological sites (fish traps and petroglyphs)** No coastal areas or islands are present within the Operational Area. A review of the DPLH's Aboriginal Heritage Inquiry System identified 56 Registered Heritage Places and 58 Lodged Aboriginal sites within the EMBA. These locations do exist within the EMBA boundary. However, given the EMBA is driven by an unplanned hydrocarbon release there is no anticipated impact pathway from this activity to onshore archaeological sites above highest astronomical tide (HAT). Archaeological sites may exist in intertidal landscapes within the EMBA and may be exposed to hydrocarbons from an unplanned release. However, there is no anticipated impact pathway from the presence of hydrocarbons on archaeological values, as this is not expected to impact the fabric or context of sites on an exposed shoreline site. Impacts to the heritage value of fish traps from an unplanned hydrocarbon release may occur indirectly through impacts to fish. However, it is expected that continued use of fish traps beyond their archaeological value will be preserved where fish species and distribution are maintained at a population level. With regard to fish, refer to species specific assessment below for further information, in addition to the impact and risk assessment in Sections 6.7, 6.8, and 6.9 respectively. **Submerged archaeological sites** No archaeological sites have been identified beyond terrestrial or intertidal areas, with the exception of two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al. 2020; Benjamin et al 2023), which are outside of the EMBA. Additionally, volcanic rock which may contain petroglyphs does not occur within the Operational Area. Nevertheless, cultural heritage values may exist on the seabed, these include both unidentified shipwrecks and Indigenous cultural material. The OA overlaps the submerged landscape, which is defined as the area from the WA coast to the Ancient Coastline at 125 m Depth Contour KEF. This area has been identified as having the potential for Indigenous archaeological heritage material to exist on the seabed. All actions involving seabed contact, and most actions undertaken in proximity to the seabed, have potential to cause adverse impact to UCH if present (DCCEEW 2024b). Planned activities may result in seabed contact. Woodside therefore engages a qualified consultant to undertake a desktop assessment of the potential for submerged archaeological material in areas that have not been subject to previous disturbance, using available geophysical and bathymetric data. This approach is consistent with Assessing and Managing Impacts to Underwater Cultural Heritage in Australian Waters (DCCEEW 2024b). Planned assessments will identify any presence of submerged heritage values prior to undertaking activities. Known submerged heritage, including archaeological sites, may be protected subject to declarations under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984, Underwater Cultural Heritage Act 2018 or EPBC Act 1999. Submerged archaeological sites (locations undefined) may exist on the Submerged Landscape within the broader EMBA. However, given the EMBA is driven by an unplanned hydrocarbon release, it is not expected to impact the seabed or archaeological material on or within it. Therefore, there is no anticipated impact pathway to submerged archaeological sites in the broader EMBA from the Petroleum Activity. Woodside understands there is no Indigenous archaeology known to exist within the OA and no areas subject to declarations or prescriptions under these Acts are located within the OA. No submerged sites of significance within the OA were identified by Traditional Custodians during consultation while preparing this EP. In the event that unidentified cultural heritage is encountered it will be managed in accordance with the Unexpected Finds Procedure detailed Section 7.2.5 and applicable legislative obligations. **Murujuga Cultural Landscape** Murujuga (Burrup Peninsula), including the Murujuga National Park and World Heritage Listing is described in Appendix C. The Traditional Owners of Murujuga have a deep cultural and spiritual connection to the rock art of the Burrup Peninsula, which provides a record of Aboriginal lore, dreamtime stories, customs, and local knowledge of the land and its resources (DWER 2019). Safeguarding the Murujuga Cultural Landscape (MCL) and its relevant OUV are considered under a number of relevant management plans (See Appendix C and Section 6.7.8). Cultural features and heritage values associated with Murujuga petroglyphs are outlined in Appendix C and consideration of potential for indirect impact from atmospheric emissions associated with onshore processing of GWA gas presented in Section 6.7.8. Onshore processing of LNG from the Petroleum Activity will occur onshore on Murujuga, which has a high concentration of rock art sites (estimated to exceed a million examples (DBCA & MAC 2024)) with significant local cultural and spiritual values in addition to their inclusion on Australia's National Heritage List and UNESCO World

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Heritage List. Woodside onshore operations at KGP (which receives gas from GWA) are managed via Cultural Heritage Management Plans as implementation conditions required by EPA Act (Pt IV) Ministerial Conditions.

Ministerial Statement 1233 (North West Shelf Project Extension Proposal) Condition section 4 set out Cultural Heritage Outcomes and Objectives to be achieved including (but not limited to):

- allowing Traditional Owner and Custodian access to enable traditional activities and connection to culturally significant heritage areas within the development envelopes
- avoid where possible, and otherwise minimise direct impacts to social, cultural, heritage and archaeological values within the development envelopes

Conditions require implementation of the North West Shelf Project Extension Cultural Heritage Management Plan (CHMP) (2021), including further revision in consultation with Murujuga Key Stakeholders. The plan is required to include elements (not limited to); a framework for ongoing consultation, and operational environmental management activities, monitoring, targets, management actions and reporting relevant to cultural heritage. Related air quality management conditions in MS1233 are outlined in Section 6.7.8.

These conditions support the management and recognition of Murujuga Cultural Landscape OUV related to the NWS Operations. The NWS CHMP (2021) provides management provisions and actions including provide access for Traditional Owners to Aboriginal cultural heritage sites within the Proposal development envelope when requested [MA2], the adoption of technologies to prevent impacts to terrestrial and nearshore vegetation of heritage and conservation value [MA4] and support the implementation of, and participate in, the DWER Murujuga Rock Art Strategy [MA6] (refer to Section 6.7.8).

Intangible values associated with MCL (Living cultural traditions) are preserved through the ongoing connection the Traditional Owners maintain with the landscape. Woodside maintains an ongoing relationship with cultural authority of the MCL to ensure these values are uninterrupted by the Petroleum Activity. Additionally, Woodside actively provides support to the Murujuga Land and Sea Unit to assist in its ongoing management of Country and Sea Country associated with the MCL.

There is no overlap between the Operational Area and the boundary of the MCL World Heritage Area. The Petroleum Activity is not inconsistent with the applicable management plans and legislative requirements associated with the protection and conservation of the MCL (See associated rock art impact assessment in Section 6.7.8); hence no impacts are expected to the MCL and its OUV are expected to be maintained.

Intangible heritage

Intangible values that are identified in Section 4.9 are assumed to be at risk where there is potential for impact to the spiritual connections, features and/or places associated with the value. Impacts to intangible heritage can be individualised; the assessment below does not account for this variability but aims to assess widespread impacts to general intangible values.

Cultural obligations to care for Country/Access to Country

Potential impact pathways to the rights and obligations of Traditional Custodians to care for Sea Country may be directly associated with environmental impacts, or by excluding Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation). Restrictions on access may be temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Such impacts are limited to areas that have been traditionally accessed by Traditional Custodians and are expected to be concentrated in shoreline environments. There is potential for shoreline accumulation of hydrocarbons within the EMBA, therefore additional controls, including engagement of relevant cultural authorities in the event of a spill, have been adopted to mitigate the risk and are not expected to result in the loss of heritage value, cultural practice, knowledge transmission, or cultural obligations at a broader cultural landscape scale. Ongoing consultation is also intended to facilitate access arrangements where feasibly safe to do so, and to support appropriately informed decision-making processes.

Creation/dreaming sites; ceremonial sites; sacred sites; ancestral beings

Activities that physically alter landscape features may be assumed to potentially impact values of creation/dreaming sites, sacred sites or ancestral beings. Activities that prevent the performance of ceremony at these sites will directly impact its values. This is anticipated to be focussed on areas adjacent to the coast. There is no known creation or dreaming sites identified within the Operational Area during consultation or through publicly available literature. With consideration to the limited extent of the proposed activity, impacts to creation/dreaming or ceremonial sites are not expected.

Kinship systems and totemic species

Marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu 2004). It is therefore inferred that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. The impacts and risks associated with the Petroleum Activity are not considered to be ecologically significant at a population level. As such, cultural values associated with kinship systems and totemic species are expected to be maintained.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Resource collection

Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level. However, the impacts and risks associated with the Petroleum Activity are not considered to be ecologically significant at a population level. As such, cultural values associated with kinship systems and totemic species are expected to be maintained.

Songlines

Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. "weaken" a songline) rather than binary or absolute (i.e. destroy a songline).

Knowledge of Country/customary law and transfer of knowledge/ Connection to Country

Where people are displaced or disrupted (e.g., during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald and Phillips, 2021). Direct impact to communities practicing traditional skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in species population. Furthermore, limitations on access to sites or disruption/relocation of Indigenous communities may have implications for the preservation of Indigenous knowledge. Impacts and risks from the Petroleum Activity are not considered to be ecologically significant at a population level and hence are not expected to impact the value of marine species. It is therefore not expected that the Petroleum Activity will displace or disrupt a Traditional Custodians capacity to pass on knowledge related to marine species or knowledge related to traditional culture/ technical skills.

Traditional Custodians maintain an ongoing connection to Sea Country through living cultural traditions, including the use of resources and the practice of cultural activities such as ceremonies and Dreaming stories. Woodside invites ongoing engagement with relevant Traditional Custodian groups to understand how this connection can remain uninterrupted during the Petroleum Activity. Supported further by the environmental management controls outlined in Sections 6.7, 6.8 and 6.9, no adverse impacts to intangible cultural values associated with Sea Country are expected from the Petroleum Activity.

Marine ecosystems and species

Marine ecosystems may hold both cultural and environmental value, with cultural and environmental values intrinsically linked (DCCEEW 2023; MAC 2022 as cited in Woodside 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country and the seascape which Traditional Custodians view, interact with or hold knowledge of.

Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the risk of hydrocarbon ingestion is low. The migration of culturally significant marine fauna (marine reptiles, fish and mammals) protracts through time and space (i.e. the entire population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population.

A worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore marine fauna species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions. Such an event has been assessed above as highly unlikely and relevant EPOs and its corresponding controls have been implemented to mitigate such a risk (See Section 6.8 and Section 6.9). There is also potential for shoreline accumulation of hydrocarbons within the EMBA, therefore additional controls, including engagement of relevant cultural authorities in the event of a spill, have been adopted to mitigate the risk. There is potential for temporary or localised effects on cultural features and heritage values associated with affected environmental receptors; however, these impacts are not expected to result in the loss of heritage value, cultural practice, knowledge transmission, or cultural obligations at a broader cultural landscape or population scale.

Benthic habitats (coral, seagrass)

Through consultation and existing literature, Indigenous groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important habitat for dugongs. Additionally, coral is valued by Murujuga Aboriginal Corporation (MAC) for its aesthetic values.

As described in Section 6.8 and Section 6.9, an unplanned hydrocarbon release may impact benthic habitats. Given hydrocarbon characteristics, rapid weathering, short-term exposure, as well as the response strategies planned to be deployed, an unplanned release is not expected to result in a level of exposure to coral and seagrass that would cause an adverse impact on marine ecosystem functioning or integrity. As such, cultural values and intangible cultural heritage associated with benthic habitats are expected to be maintained.

Plankton

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Through consultation and review of available literature (Section 4.9) Woodside understands that marine fauna such as plankton are culturally important to Traditional Custodians and may be affected by routine and non-routine emissions, light emissions, and unplanned hydrocarbon releases. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to Songlines and Dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have an obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

As described in Sections 6.7, 6.8, and 6.9, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with plankton are expected to be maintained.

Fish and cephalopods

Fish and squid have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level.

Through consultation, fish were identified as important agents in the management of the broader ecosystem for Indigenous groups within or adjacent to the EMBA. There are Thalu ceremonies associated with increasing fish stocks. It may be assumed that inter-generational transmission of cultural knowledge relating to fish may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). Intangible cultural heritage associated with fish, including inter-generational knowledge regarding fishing techniques and migratory patterns, can be managed by reducing impacts to fish in nearshore marine environments to which this cultural knowledge is intrinsically connected.

The octopus is an important totem to Ngarla People and features in the creation story of Solitary Island. There are increase ceremonies/rituals for species of squid and octopus to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites in the reviewed literature were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are preformed to maintain and increase populations of marine species, it is inferred that management applies at the species/population level and not to individuals.

The potential impacts from the Petroleum Activity on fish and cephalopods are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with fish and cephalopods are expected to be maintained.

Whales, dolphins and dugongs

There are increase ceremonies/rituals for species of animals and plants important to Indigenous peoples, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites in the reviewed literature were confined to onshore locations, though the values may extend offshore. For example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is inferred that management applies at the species/population level and not to individuals. For example, the thalu site on Murujuga which "brings in whales to beach" will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Reviewed literature (DBCA 2020) also includes information that is marked as information that cannot be copied, reproduced or used without consent. The values described in the literature are environmental in nature, apply to marine mammal behaviours at a population level and are managed through existing environmental controls.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler 2021; Bursill et al. 2007; Cressey 1998). Whales also speak to a broader connection that exists between Indigenous people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to Indigenous people (Fijn 2021). No impacts to communities' ability to perform or transmit stories, music or dance are anticipated from the Petroleum Activity. Where timing or performance is linked to sighting or engaging with these species, impacts may occur where numbers or migration behaviours are impacted at a population level.

Indigenous groups have expressed interest about whale migratory routes and studies. Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

The potential impacts from the Petroleum Activity on marine mammals are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with marine mammals are expected to be maintained.

Marine reptiles (turtles)

Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level.

Through consultation and review of available literature (Section 4.9), Woodside understands that marine fauna such as turtles, are culturally important to Traditional Custodians, and may be affected by light emissions. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to Songlines and Dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Cultural knowledge may also be conveyed through stories, such as the turtle being trapped in the sea as a result of its greed for berries as recounted by Capewell (2020). Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Indigenous groups have expressed an interest regarding turtle monitoring programs and migration patterns.

Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al. 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

The potential impacts from the Petroleum Activity on marine reptiles are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with marine reptiles are expected to be maintained.

Seabirds

Seabirds have been identified through literature as a culturally significant species (Malgana Aboriginal Corporation 2021), as well as a resource (seabird eggs; Smyth 2007). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level. Intangible cultural heritage may also include the transmission of cultural knowledge about seabirds, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021) Inter-generational transmission of cultural knowledge relating to seabirds may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

The potential impacts from the Petroleum Activity on seabirds are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with seabirds are expected to be maintained.

Shoreline habitats (mangroves)

Through consultation, Indigenous peoples identified shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified as resources, and a potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli (the collective term for the Traditional Custodians who look after Murujuga Country).

There is no overlap between the Operational Area and mangrove habitat, and no planned impacts to mangroves from the Petroleum Activity. In the event of an unplanned hydrocarbon release mangrove habitats may be affected by shoreline accumulation. However, as described in Section 6.8.3, given the non-persistent nature of the hydrocarbons, no significant effects to mangrove habitat are expected to occur. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.

Conclusion

The potential impacts and risks from the Petroleum Activity are not considered to be ecologically significant at the population level. As such, impacts are not expected to result in the loss of heritage value, cultural practice, knowledge

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

transmission, or cultural obligations at a broader cultural landscape or population scale. Refer to the impacts on intangible values assessment above.

No consequence has been assigned regarding indirect emissions impacts as there is no conclusive evidence of a causal link between current industrial air emission levels and potential anthropogenic change to rock art on Murujuga (as described in Section 6.7.8). Woodside will continue to monitor the outcomes of MRAMP (as per **C 10.1**), apply a precautionary approach through implementation of the controls listed in Section 6.7.8, and update or change the management of the EP accordingly.

The impact and risk assessment for cultural features and heritage values has therefore determined that the planned activities are unlikely to result in an impact greater than localised and low level (E) and unplanned activities are assessed to have a residual risk rating of moderate (or lower). Woodside will continue to consider new heritage information as it becomes available.

Demonstration of ALARP

As marine ecosystems may hold both cultural and environmental value with cultural and environmental values intrinsically linked; in addition to the specific controls for cultural features and heritage values, the controls and performance standards outlined will further reduce potential impacts to environmental related values including marine species and habitats.

Control considered	*Feasibility (F) & Cost/Sacrifice (CS)*	*Benefit in Impact/Risk Reduction*	*Proportionality*	*Adopted*
Apply a 'living heritage[104]' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	F: Yes CS: Minimal cost	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer of cultural knowledges and is an effective strategy to manage intangible cultural values.	Benefits outweigh cost/sacrifice.	Yes **C 11.1**
Implement the Petroleum Activity in a manner that is not inconsistent with the objectives of the Murujuga National Park Management Plan 78, through execution of the Conservation Agreement and Deep Gorge Joint Statement.	F: Yes CS: Significant potential cost. Legal requirement.	Legal requirement to carry out activities not inconsistent with the Murujuga National Park Management Plan.	Control based on legislative requirements – must be adopted.	Yes **C 11.2**
Implement the Petroleum Activity in a manner that is not inconsistent with UNESCO Operational Guidelines for the Implementation of the World Heritage Convention	F: Yes. CS: Minimal cost.	Implementation of controls for compliance with World Heritage Listing ensures protection and conservation of outstanding universal values,	Benefits outweigh cost/ sacrifice.	Yes **C 11.3**
The environmental impacts and risks of the activity will	F: Yes	Implementation of activities and associated controls to	Benefits outweigh cost/sacrifice	Yes

[104] Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

Demonstration of ALARP				
outcome of MRAS; and measures such as NO_x concentration limits at emissions point sources under EP Act Part V licenses, and implementation of Part IV conditions		Ensures adaptive management to evolving scientific evidence and that downstream emissions are maintained at a level that is acceptable with regards to the management of cultural heritage values.		
Forecast, measure, monitor and or estimate facility fuel and flare emissions (in accordance with NGERS and WMS procedures named in Section 7.2.7.6.2) to inform optimisation management practices and minimise environmental impact of emissions.	F: Yes. CS: Minimal cost. Standard practice.	Minimises environmental impact of emissions through planning, ongoing review, governance and optimisation. It combines with good operating practice to maximise production and reduce flaring emissions and fuel emissions at KGP to manage cost, which improves energy intensity (e.g. cleaner production), optimising emissions from the activity. Fuel and flared gas are potential product streams, as such, Woodside applies routine short- and long-term optimisation and opportunity management framework to identify and prioritise enhancement opportunities. Annual flare and fuel target setting and monthly review of performance is completed for GWA.	Control is WMS requirement – must be adopted.	Yes. **C 10.3**
Use of cultural heritage monitors on vessels to oversee implementation of controls protecting cultural values	F: No, vessels are POB constrained with no ability to facilitate additional personnel CS: Not feasible	Not considered – control not feasible.	Not considered – control not feasible.	No
Should it be identified that relevant cultural authorities may be affected in the unlikely event of a spill, Woodside will engage with those parties as appropriate and in alignment with the FSP.	F: Yes CS: Minimal	Engaging with relevant cultural authorities that may be impacted by a spill will allow the Traditional Custodians to identify areas of concern.	Benefits outweigh cost/sacrifice	Yes Adopted
ALARP Statement: On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A), Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of acceptability
Acceptability statement: The impact and risk assessment has determined that, given the adopted controls, planned activities are unlikely to result in an impact greater than temporary localised impact not significant to areas or items of cultural significance with no lasting effects (F)[105] and unplanned activities are assessed to have a residual risk rating of moderate (or lower). The Petroleum Activity and the EMBA are not expected to have a significant impact (e.g. changes in population levels) on MNES including marine fauna with a cultural connection with, or traditional use in nearshore areas. While the activity will occur on the Ancient Landscape, Woodside facilitates a process of undertaking desktop assessments by qualified professionals, using remote sensing techniques, to identify known or potential underwater cultural heritage where new seabed disturbance occurs and an unexpected finds procedure (refer to Section 7.2.5) will be implemented. Therefore, the activity is not inconsistent with Underwater Cultural Heritage Guidance for Offshore Developments and the Guidelines to assessing and managing impacts to Underwater Cultural Heritage in Australian waters under the UCH Act. Woodside recognises and supports the ongoing management of heritage values under listings Murujuga Cultural Landscape World Heritage Listing, Murujuga National Park and Dampier Archipelago (Including Burrup Peninsula) National Heritage Place. Legislation and other requirements considered relevant for managing theoretical impacts from indirect emissions associated with onshore processing to the Murujuga Cultural Landscape and how the Petroleum Activity is not inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the Murujuga Cultural Landscape World Heritage Property is described in the Demonstration of Acceptability in Section 6.7.8. As outlined in Section 6.11 and based on the EPOs considered below and the relevant adopted controls, planned activities proposed under the Petroleum Activity are not inconsistent with relevant heritage legislation, management plans and agreements under which these values are protected and conserved. In addition, Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Woodside maintains a long-standing relationship, where established, with relevant Traditional Custodian groups, and undertakes consultation with those whose functions, interests or activities may be affected by activities conducted under this EP. In the event of an unplanned environmental impact, such as a hydrocarbon spill, Woodside will engage with relevant Indigenous groups within or adjacent to the EMBA in line with its First Strike Plan (Appendix H). Woodside will support Traditional Custodians to practice cultural obligations to care for Country by providing timely information on the incident, facilitating safe access to Sea Country where practicable, and incorporating Traditional Custodian knowledge and priorities into response, mitigation and recovery activities. For ongoing consultation post Regulation 25 consultation, Woodside supports ongoing engagement with Traditional Custodians. Woodside is committed to ongoing engagement and support to care for and manage Country, including Sea Country. The 'living heritage' management approach has been developed to enable Woodside to manage cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable, if ALARP.

[105] *Noting that as the receptor sensitivity is high the impact significance level is Slight (E).*

EPOs, EPS and MC related to Cultural Features and Heritage Values[106]			
EPO	***Controls***	***EPS***	***MC***
EPO 11a No adverse impacts[107] to cultural features and heritage values from the Petroleum Activity **EPO 11b** Woodside supports ongoing engagement and consultation with Traditional Custodians or the purpose of assessing and avoiding impacts to cultural features and heritage values.	**C 11.1** Apply a 'living heritage' management approach. Woodside seeks advice and incorporates Traditional Custodian cultural knowledge across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.	**PS 11.1.1** Refer to Section 6.7.8	**MC 11.1.1** Refer to Section 6.7.8
		PS 11.1.2 Woodside will assess and where deemed practicable implement appropriate cultural protocols where requested by Traditional Custodians.	**MC 11.1.2** Records demonstrate Woodside implemented cultural protocols as requested.
	C 11.2 Implement the Petroleum Activity in a manner that is not inconsistent with the objectives of the Murujuga National Park Management Plan 78, through execution of the Conservation Agreement and Deep Gorge Joint Statement.	**PS 11.2.1** Refer to Section 6.7.8	**MC 11.2.1** Refer to Section 6.7.8
		PS 11.2.2 Refer to Section 6.7.8	**MC 11.2.2** Refer to Section 6.7.8
	C 11.3 Implement the Petroleum Activity in a manner that is not inconsistent with UNESCO Operational Guidelines for the Implementation of the Word Heritage Convention.	**PS 11.3** Refer to Section 6.7.8	**MC 11.3.1** Refer to Section 6.7.8
	C 11.4 The environmental impacts and risks of the activity will continue to be managed to as low as reasonably practicable and an acceptable level for cultural features and heritage values.	**PS 11.4** Consideration of cultural values/new information, through the life of the EP, and the development of avoidance or mitigation strategies in collaboration with Traditional Custodians if impacts to cultural values are identified. Where avoidance is not possible, impact minimisation will be prioritised and demonstrated through a written options	**MC 11.4.1** Records demonstrate Change Management and Management of Knowledge processes have been followed where new controls or management measures identified (Section 7.2.8)

[106] As marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in Sections 6.7 and 6.9 will reduce impacts to cultural features and heritage values including marine species and habitats.

[107] For the purposes of the Petroleum Activity, an adverse impact to cultural features or heritage values is considered to occur where there is: direct physical disturbance causing observable damage to a site or object of cultural significance; a measurable and significant decline in the population or habitat of a culturally significant species attributable to the activity; or a substantiated impact on recognised intangible cultural values.

7. IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to include an implementation strategy. The implementation strategy for the Petroleum Activity demonstrates that fit-for-purpose systems, practices and procedures are in place to direct, manage and review the activity so that environmental impacts and risks are reduced to ALARP and are acceptable, and that the EPOs and EPSs defined in this EP are achieved.

Woodside, as operator, is responsible for implementing this strategy and ensuring that the Petroleum Activity is conducted in accordance with this EP and the WMS (Section 1.7).

7.2 Systems, practices, and procedures

All operational activities are planned and executed in accordance with applicable legislation, codes and standards, the management measures identified in this EP and Woodside's environment standards and procedures implemented through the WMS.

The systems, practices and procedures to be implemented are reflected in the EPSs in Section 6. Document titles and reference numbers may change during the life of this EP and are managed through Woodside's change management process (Section 7.2.8).

7.2.1 Woodside Management System operate processes

Under the WMS Operate Activity (see Section 1.7 for an overview of the WMS), there are four overarching processes; those directly relevant to the implementation of this EP and environmental management during the Petroleum Activity are described below (Operate Plant Process and the Maintain Assets Process).

7.2.1.1 Operate plant

The objective of the Operate Plant Process is to ensure production is carried out in a safe, efficient, reliable and economic manner, and that all required process variables are within allowable limits. This ensures the potential for unplanned (accident/incident) events that may impact the environment are minimised.

The Operate Plant Process develops key activities to support ongoing production activities to ensure the facility is operated within the Basis of Design. The process also identifies required production routines, routine execution, recording data gathered and formulating remedial activities. The Operate Plant Process includes the Integrated Safe System of Work (ISSoW) system (described below).

In addition, the Operating Practice Management System Performance Standard (MSPS) (M02) is in place to assure operating practices are in place, such that:

- integrity critical operating procedures are available, accurate, up-to-date, understood and used
- safe operating and technical integrity limits are defined, understood and the process is managed within these limits.

7.2.1.1.1 Integrated safe system of work

The ISSoW Procedure outlines the key activities required to achieve effective management of permit-controlled work on the facility. The ISSoW process is a management system for all work and is a key element in ensuring personnel safety, protecting the environment, and protecting the technical integrity of the facility.

Work within the 500 m PSZ and in the vicinity of connected subsea infrastructure is managed in accordance with ISSoW.

The ISSoW system takes a risk-based approach to activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control. The ISSoW system also allows for low risk routine tasks to be carried out with adequate but minimal administration. The prime objective of ISSoW is to ensure work other than normal operations is properly planned, risk assessed, controlled, coordinated, and safely executed. It provides a methodical approach to identifying hazards, assessing risks, and creating and supporting permits to work and associated certificates.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

In keeping with ALARP principles, this system is critical to ensuring the appropriate level of hazard identification and risk assessment is carried out for activities performed on the facility.

In addition, the Safe Work Control MSPS (M04) is in place to assure effective safe work control, permit to work and task risk management arrangements are implemented and followed to control the risks arising from work activities.

7.2.1.2 Maintain assets

The Maintain Assets Process aims to improve the reliability and availability of plant and equipment (which includes that required for safe operation) through well managed and planned execution of maintenance that promotes a proactive maintenance culture.

Maintenance, inspection and testing systems and procedures are in place to safeguard the integrity of the facility. The maintenance strategy for the facility is based on optimising safety, minimising environmental impact and maximising production. Maintenance practices used to establish well managed maintenances strategies, planned execution and improvement are described in the Maintenance of Assets Procedure.

A risk-based approach is used as the basis for establishing and prioritising inspection, maintenance and testing requirements at the facility. Equipment is assessed to establish equipment criticality with respect to the consequences and likelihood of equipment failure. This informs determination of appropriate maintenance and inspection activities. Maintenance activities are allocated risk rankings according to the criticality of equipment, to ensure high risk maintenance work orders are completed as a priority.

A computerised maintenance management system (CMMS) provides a database called SAP-PM that contains facility registers, equipment details, spare parts data and associated planned maintenance tasks. This system is used to plan, monitor and record maintenance activities. The system provides various reports that enable monitoring and assessment of maintenance activities.

SCE Technical Performance Standards identify SCEs and associated assurance activities. These activities are identified in the CMMS and given the appropriate priority (Technical Integrity status). Refer to Sections 2.5.5 and 7.2.9 for more detail on SCE Technical Performance Standards and how they differ from EPSs required by the Environment Regulations. SCE Technical Performance Standards form a key component in the processes and systems implemented by Woodside to maintain safety and environment critical plant and equipment.

In addition, the Maintenance and Inspection MSPS (M03) is in place to assure that the necessary inspection and maintenance requirements are identified and carried out to maintain the integrity of SCEs.

7.2.2 Process safety management

To ensure the safety, security and health of its employees, contractors, and the protection of the environment and assets, Woodside has adopted the Energy Institute's Process Safety Management (PSM) framework within its PSM Procedure which sets out a disciplined framework for managing the integrity of systems and processes that handle hazardous substances over the production (and exploration) lifecycle. It deals with the prevention and control of events that have potential to release hazardous materials and energy.

PSM comprises 4 main focus areas, each of which contains several PSM requirements that define key aspects required to ensure that PSM is integrated through the organisation. There are 20 PSM requirements. The focus areas and requirements are shown in Figure 7-1.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

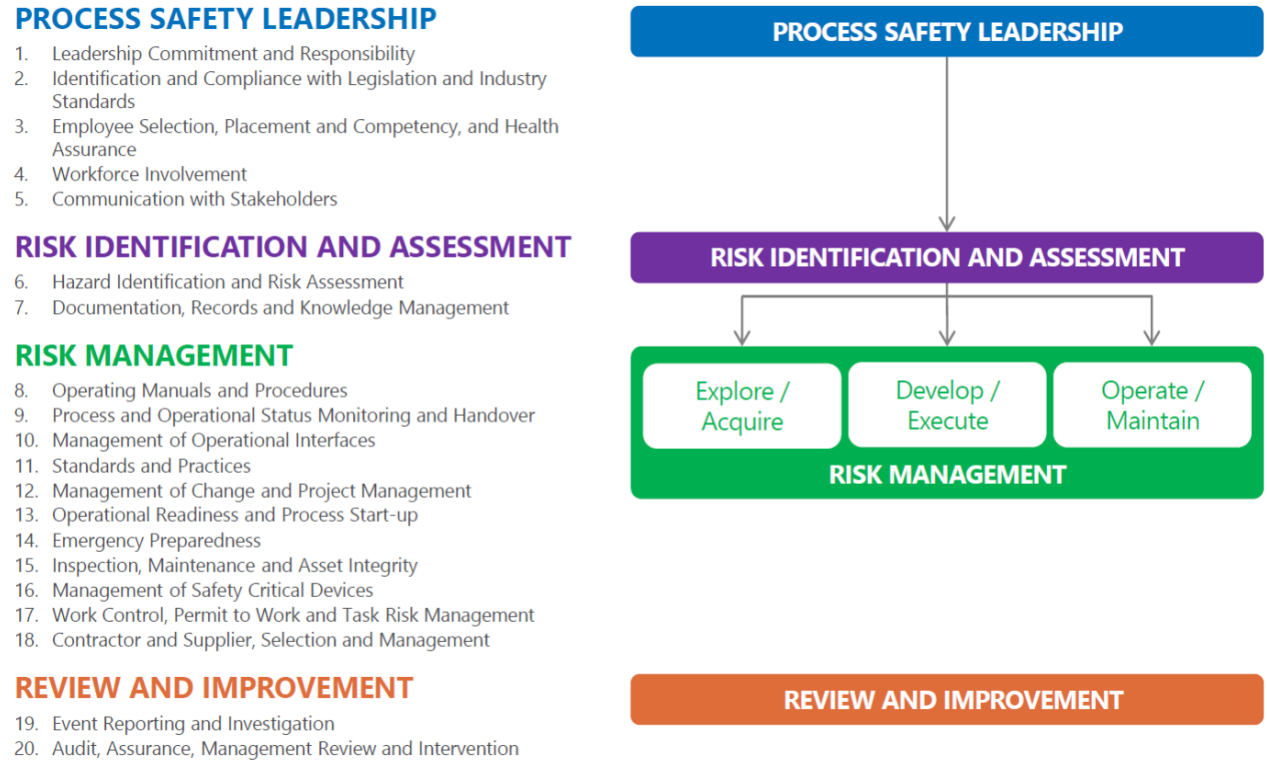

Figure 7-1: Process safety management focus areas and requirements

7.2.2.1 Woodside safety culture framework

Woodside's 'Our Safety Culture' framework (shown in Figure 7-2) promotes a strong HSE culture and is a key enabler for effective process safety management. This framework outlines the expected behaviours for everyone including supervisors and managers/executives, and is openly discussed as part of inductions, training and development.

Theme	Everyone	Supervisors	Managers/Executives
Standards	Follow rules	Ensure compliance	Set high standards
Communication	Speak up	Encourage the team	Communicate openly
Risk management	Be mindful	Promote risk awareness	Confront risk
Involvement	Get involved	Involve the team	Involve the workforce

Figure 7-2: Woodside 'Our Safety Culture' framework

7.2.3 Selection, assessment and approval of chemicals

Operational chemicals required for the Petroleum Activity are selected, assessed and approved in accordance with the Chemical Selection and Assessment Environment Guideline. This procedure is used to demonstrate that the potential impacts of the chemicals selected are acceptable and ALARP, in line with the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside Environmental Management Standard. Chemicals are required to be selected with the lowest practicable environmental impacts and risks, subject to technical constraints, and managed to achieve outcomes that are ALARP and acceptable.

Chemical selection and environmental assessment of discharged and operational chemicals is undertaken in accordance with the Chemical Selection and Assessment Environment Guideline. This process applies a risk-based framework to assess environmental hazards, including ecotoxicity, biodegradation and bioaccumulation, and to confirm that chemicals with the lowest practicable environmental risk are selected.

Chemicals proposed to be selected as part for the Petroleum Activity will be managed in accordance with the requirements set out by the Australian Government under the Industrial Chemicals Environmental Standard (IChEMS). The IChEMS is a key component of several national reforms to improve approaches to how industrial chemicals are used, produced, imported and managed. Industrial chemicals will be listed on the IChEMS Register in one of 7 schedules according to their environmental risk.

Chemicals proposed for selection will be assessed against those listed in the IChEMS register under one of the seven schedules according to their environmental risk. The selection and management of any chemical will adhere to the specific risk management measures, storage, use and handling requirements outlined in the corresponding schedule.

7.2.3.1 Selection criteria

The chemical assessment process follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS), which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands and applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). OCNS is widely accepted as good industry practice for offshore chemical assessment.

All chemical substances on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters, such as biodegradation and bioaccumulation, in accordance with one of two schemes (as shown in Figure 7-3):

- **Hazard Quotient (HQ) Colour Band**: Gold, Silver, White, Blue, Orange or Purple (listed in order of increasing environmental hazard).
- **OCNS Grouping**: E, D, C, B or A (listed in order of increasing environmental hazard). Used for inorganic substances, hydraulic fluids and pipeline chemicals only.

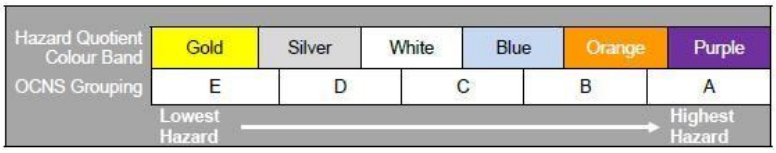

Figure 7-3: OCNS ranking scheme

Where operational chemicals with an OCNS rating of Gold/Silver/E/D and no OCNS substitution or product warning are selected, or a substance is considered to pose little or no risk to the environment (PLONOR), no further control is required. Such chemicals do not represent a significant impact on the environment under standard use scenarios and therefore, are considered ALARP and acceptable.

If other OCNS rated or non-OCNS rated operational chemicals are selected, the chemical is assessed as follows:

- If there is **no planned discharge** of the operational chemical to the marine environment, written technical verification of the 'no discharge' fate is provided and no further assessment is required.
- If there is **planned discharge** of the operational chemical to the marine environment, a further assessment/ALARP justification is conducted.

The ALARP assessment includes consideration of chemical toxicity, biodegradation and bioaccumulation potential, using industry standard classification criteria (CEFAS scheme criteria).

If a product has no specific ecotoxicity, biodegradation or bioaccumulation data available the following options are considered:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical; or
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

If no environmental data is available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical are investigated, with preference for options with an HQ band of Gold or Silver or are OCNS Group E or D with no substitution or product warnings.

If no more environmentally suitable alternatives are available, further risk reduction measures (e.g. controls related to use and discharge) are considered for the specific context and implemented where relevant to ensure the risk is ALARP and acceptable.

Once the further assessment/ALARP justification has been completed, concurrence from the relevant manager that the environmental risk as result of chemical use is ALARP and acceptable is obtained.

7.2.4 Invasive marine species risk assessment

7.2.4.1 Objective and scope

To minimise the risk of introducing invasive marine species (IMS) as a result of the Petroleum Activity, all applicable vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below in accordance with Woodside's Invasive Marine Species Management Plan).

The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

The IMS risk assessment process does not apply to:

- vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)[111]
- 'new build' vessels or immersible equipment launched less than14 days before mobilisation
- locally sourced vessels or immersible equipment from within the Western Locally Sourced Zone (W-LSZ)[112]. Vessels, or immersible equipment are defined as locally sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of antifouling coating (AFC).

7.2.4.2 Risk assessment process

Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species International Maritime Organisation, 2023).

To effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each support vessel, or immersible equipment planning to undertake activities within an IMSMA or Operational Area. The risk assessment process considers a range of factors, as listed in Table 7-1 and Table 7-2.

[111] The IMSMA is defined as all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 nm from land ('Territorial Seas', and including Australian territorial islands). The IMSMA also includes: (i) all waters which are shallower than the 50-metre depth contour outside of the 12 nm boundary, thereby encompassing submerged reefs and atolls, and (ii) Operational Areas defined in environmental approvals. The IMSMA is based on current maritime boundary definitions, legal frameworks and requirements, IMS risk interpretations and existing management arrangements applied by Commonwealth and State/Territory regulatory agencies.

[112] The Western Locally Sourced Zone (W-LSZ) spans an area that includes the entire Western Australian coastline out to the Exclusive Economic Zone (EEZ) limit at 200 nm, but it excludes any government-declared Quarantine Areas.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A QA/QC process is implemented for all Woodside conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

Table 7-1: Key factors considered as a part of the risk assessment process for vessels

Factors	Details
Vessel type	The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g. dredges) in comparison to simple vessels (e.g. crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, different risk ratings are applied depending on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past 6 months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e. proportion of time spent stationary or below 3 knots), and its main operational region (i.e. tropical, subtropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.
Internal treatment systems	A risk reduction factor applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.
Vessel origin and proposed area of operation	Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the proposed climatic region of the proposed area of operation. Highest risk rating is applied to similar climatic regions.
Number of stationary/slow speed periods >7 days	A risk factor is calculated based on the number of 7-day periods that the vessel has operated at stationary or at low speed (<3 knots) in port or coastal waters which is any waters <50 m deep outside 12 nm from land or any waters within 12 nm of land. The greater the number of periods, the higher the risk factor applied.
Region of stationary or slow periods	A further multiplier is applied depending on the location of the stationary/slow speed periods. The highest risk rating applied if the stationary or slow speed periods occurred within ports or coastal waters of the same climatic region.
Type of activity – contact with seafloor	The potential for the introduction of IMS varies on the planned vessel activity taking place. Those activities that come in contact with sediments and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs) are considered to have a greater risk of infection.

Table 7-2: Key factors considered as a part of the risk assessment process for immersible equipment

Factors	Details
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep and/or within 12 nm from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.
Duration of time out of water since last deployment	A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Factors	Details
Transport conditions during mobilisation	If the equipment is stored in damp conditions then a high risk factor is applied, while if equipment is stored in dry and well ventilated (low humidity) conditions then a low risk factor is applied.
Post-retrieval maintenance regime	A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and/or dissembled between activities , while a higher risk rating is applied where no routine cleaning occurs.
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep and/or within 12 nm from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.

Following implementation of the risk assessment process, vessels and/or immersible equipment are classified as one of three risk categories:

- ‘Low’ – Low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk.
- ‘Uncertain’ – Risk of introducing IMS is not apparent and as such the precautionary approach is adopted, and additional management options may be required.
- ‘High’ – High risk of introducing IMS means additional management options are required before this vessel mobilises to the Operational Area.

Following the allocation of a ‘low’ risk rating for a vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed before mobilisation. For vessels or equipment classified as posing an ‘uncertain’ or ‘high’ theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a low risk status. These management options have been developed with the intention of reducing IMS risk to levels that are ALARP. It is a flexible approach that allows for a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include:

- having a suitably qualified and experienced IMS inspector inspect (desktop, in-water or dry dock) to verify risk status; where practicable, the inspection shall occur within seven days (but not more than 14 days) before final departure to the Operational Area
- applying in-water or dry dock cleaning of the hull and other niche areas, typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports
- limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries); applicable for Uncertain risk vessels only
- rejecting the vessel.
- In some circumstances, such as emergency scenarios or in the presence of serious logistic constraints or other factors outside of the control of WEL, it may not be possible to effectively apply any of the IMS management measures available and described above. In the absence of regulatory conditions, commitments, or other legislative obligations that prescribe management measures for IMS, a risk assessed alternative process is available which must be approved by the relevant Business Vice President (VP), and HSE Vice President.

Where planned Woodside activities include interactions[113] between a vessel and a Woodside offshore facility that will exceed 14 consecutive days[114] the IMS translocation potential is required to be examined in

[113] *I Interaction is defined where the vessel, rig or relevant immersible equipment are at a distance of <500 m from the offshore facility..*

[114] *This is defined as when a vessel is within 500 m of the asset for a consecutive period of more than 14 days.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

additional detail. This would likely include additional engagement with a qualified and experienced IMS Inspector, to determine whether any additional management controls should be applied to manage the risk of IMS to Low[103].

Risk factors that may be further evaluated may include the age of the vessel's antifouling coating, last IMS inspection date, and vessel transit history. Management measures that may be implemented where potential risks have been identified include, but are not limited to, minimising operational time adjacent to the offshore facility, a more specific evaluation of the potential for IMS to be present on the vessel's hull, or an inspection by a qualified IMS Inspector.

Before they enter the Operational Area, support vessels and immersible equipment are required to be a low risk of introducing IMS.

7.2.5 Unexpected finds procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as 'any trace of human existence that has a cultural, historical or archaeological character and is located under water'); the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside's Principal Heritage Adviser.
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
- No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside's Principal Heritage Adviser.
- Woodside's Principal Heritage Adviser must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
- If the potential Underwater Cultural Heritage appears to be Aboriginal underwater cultural heritage, Woodside's Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
- If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the *Underwater Cultural Heritage Act 2018* (Cth) (UCH Act), Woodside's Principal Heritage Advisor must notify the Minister responsible for the UCH Act, the Department of Climate Change, Energy, Environment and Water (DCCEEW) underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.
- If the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
  - the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
  - the Office of the Federal Environment Minister in accordance with Section 20 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (Cth).
- Work must not recommence in the vicinity of the potential heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

7.2.6 Offshore marine discharge adaptive management plan

7.2.6.1 Overview

The Offshore Marine Discharges Adaptive Management Plan (OMDAMP) has been developed to manage routine discharges to the marine environment from applicable offshore production facilities.

The objectives of the OMDAMP are to:

- Manage marine discharges in a way that reduces the environmental risks and potential environmental impacts to ALARP and to an acceptable level.
- Define monitoring measures to determine whether routine marine discharges comply with regulatory requirements and the Woodside Environmental Management Standard.
- Detail verification assessment and non-routine monitoring to be undertaken when routine monitoring identifies a change in discharge characteristics which have the potential to alter existing compliance with the Woodside Environmental Management Standard or relevant facility Operations Environment Plans (EPs).

The OMDAMP defines a process and rationale for management of routine marine discharges such as produced water (PW), cooling water, and brine. The OMDAMP considers applicable technical guidance (including the Commonwealth ANZG for fresh and marine water quality, National Water Quality Management Strategy and Technical Guidance: Protecting the quality of Western Australia's marine environment (EPA 2016) as well as relevant internal procedures and asset specific EP commitments. In addition, the OMDAMP is based on Woodside's experience managing PW at multiple North West Shelf offshore facilities and considers monitoring data collected over 20-30 years allowing the application of appropriate controls and any lessons learnt to ensure impacts are acceptable and reduced to ALARP.

7.2.6.2 Routine monitoring and management

Monitoring changes in water quality as well as investigating potential toxicity via whole effluent toxicity (WET) testing and implementing management to maintain acceptable levels of changes is standard industry practice in Commonwealth and State waters. By limiting the changes to water quality and therefore pathway to impact sediment quality and biota there is high confidence no environmental impact has occurred outside the approved mixing zone boundary.

The OMDAMP details trigger values, routine monitoring assessment against trigger values, analytical methods and actions when a trigger value is exceeded. The trigger values are applied through a risk-based approach that is intended to capture uncertainty around the level of impact by staging monitoring and management responses according to the degree of risk of environmental impact. This approach provides a level of confidence that management responses are not triggered too early (i.e. when there is no actual impact) or too late after significant or irreversible damage to the surrounding ecosystem (EPA 2016). Changes in discharge contaminants and PW toxicity can be detected early and can indicate the potential for an impact prior to an impact occurring allowing for timely management. WET testing confirms if there is a potential for impact.

PW samples should be representative of normal operations, hence timing of sampling coincides with a period of normal operating circumstances for a facility, as well as also considering when wells have begun to cut water, which formation water producing wells are online and chemicals that may be present in the discharge stream. Ensuring samples are representative of normal operations may require deferring sampling within the calendar year if required. Samples are analysed by a NATA accredited laboratory (where applicable) for key physio-chemical parameters and chemical analytes.

WET tests are undertaken on a broad range of taxa of ecological relevance for which accepted standard test protocols are well established. WET tests mainly focus on the early life stages of test organisms, when organisms are typically most sensitive to contaminants; the tests are designed to represent local trophic level receptors. For WET testing, a range of tropical and temperate Australian marine species were selected based on their ecological relevance, known sensitivity to contaminants, availability of robust test protocols, and known reproducibility and sensitivity as test species. The dilutions required to protect 99% and 95% of species are calculated using the Warne et al. (2018) methodology. If a trigger value is not met, it indicates uncertainty around whether the environmental value is being protected and further investigation is required (Figure 7-4).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

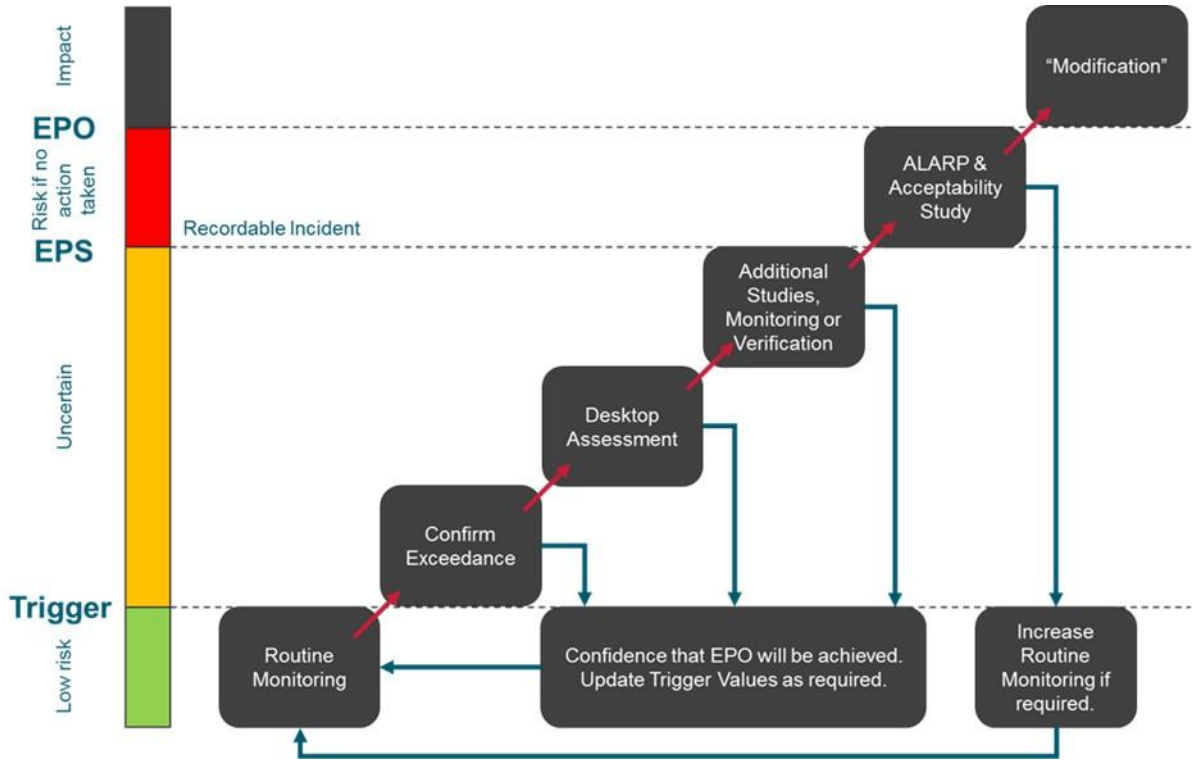

Figure 7-4 Routine monitoring and adaptive management framework for produced water

7.2.6.3 Further investigations

Detectable exceedances in trigger values may occur without impacting the environment. To provide confidence that environmental impact has not occurred outside the approved mixing zone boundary, further investigation would be required (Figure 7-4) in the form of a desktop study to initially assess the exceedance in context of available data and confirm if there is potential for impact to the environment. A desktop assessment is necessary before undertaking additional in-field monitoring. This ensures monitoring programs are designed and implemented to provide robust findings based on good survey design.

A range of methods can be used to detect trigger value exceedances (e.g. relative percentage difference, control charts, multivariate analysis, etc.) depending on the dataset available. An appropriate method is selected as described in the OMDAMP due to the variable nature of environmental data. If critical data are not available, the desktop study identifies potential data gaps and may recommend additional non-routine studies and/or monitoring to ensure the assessment is appropriately undertaken. The purpose of the 'further investigations' step is to provide certainty that the EPO has been achieved, if a trigger value has been exceeded. The key investigation steps are described below:

- **Confirm the trigger value has been exceeded** – Review quality assurance and quality control, methodology and possible sources of contamination to determine if the results are reliable, or if any factors have occurred that may compromise the integrity of the monitoring or data. If necessary repeat monitoring.
- **Desktop assessment to understand whether the EPO is at risk** – If a trigger value is confirmed to be exceeded, multiple lines of evidence are considered including historical and current data from routine and non-routine monitoring and studies. This assessment shall consider whether there is adequate evidence to demonstrate that acceptability criteria have been met and (EPO not breached). If the desktop assessment determines that the existing body of evidence is insufficient, it shall outline what additional monitoring or studies are required. Potential additional monitoring/studies may include but is not limited to:
  - single species test (collected annually in parallel with routine chemical characterisation should further investigation be required)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- dilution modelling and or studies
- flocculation, sedimentation, settling velocity and/or dispersion analysis
- metal bioavailability
- scanning electron microscopy and particle size distribution analyses
- in-situ monitoring (water quality and/or sediments).

Routine monitoring activities may be required ahead of schedule and additional monitoring not listed may be undertaken as appropriate. Field monitoring is undertaken in accordance with a plan that details timing, locations and objectives of monitoring.

- Conduct additional studies to confirm the EPO is not at risk – Monitoring results provide additional lines of evidence to determine whether there is a risk of environmental impact at the mixing zone boundary due to unacceptable changes in water quality resulting in changes to sediment, or biological indicators. Given the significant health, safety and technical risks, logistics and planning required, monitoring of the receiving environment is typically only considered when all other sources of evidence are insufficient to demonstrate that the EPO is not at risk. The OMDAMP provides detailed guidance on the steps and actions required to be undertaken if a trigger value is exceeded and this may include additional non-routine monitoring to verify that environmental impacts have not occurred outside the boundary of the mixing zone.

If triggers are being exceed but no impact to the environment is predicted to occur the desktop assessment may consider development of site-specific trigger values in line with ANZG. For example, if chemical characterisation identified copper as exceeding trigger - ANZG 99% DGV but further investigations concluded levels observed were consistent with baseline and naturally occurring in the region. If potential impacts to the environment are identified, an ALARP/Acceptability Study is required to determine what additional controls can be implemented to ensure the impacts are not realised.

7.2.6.4 ALARP/Acceptability Study

An ALARP/Acceptability study is conducted once it has been determined, as a result of further investigations, that there is potential for an impact that exceeds the acceptable limits of change. The ALARP/Acceptability study shall be conducted in accordance with the ALARP Demonstration Procedure, to determine additional controls that may be necessary to reduce the potential impacts. Additional management measures (controls) may include technology, process upgrades or reservoir management. Woodside will implement the additional controls identified in the ALARP/Acceptability study that are required to give confidence that the acceptable limits of impact can be achieved.

In the event sampling of MEG salts indicates that there is a potentially significant pathway for mercury to enter the marine environment, the study would need to consider as a minimum volumes, duration, source, speciation and potential for settlement. The ALARP study may implement measures such as:

- well management,
- in-boarding,
- collection of MEG salts for onshore disposal,
- increased non routine monitoring,
- in-situ monitoring,
- remediation,
- technology or process upgrades.

In the event WET testing identifies a higher-than-expected effluent toxicity the study would need to consider discharge volumes, duration, well line up, potential drivers of toxicity. The ALARP study may recommend the following:

- non routine WET testing,
- operational discharge limits,
- change out of process chemicals if appropriate or reduce dosing rates, implement

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- well management,
- in-boarding,
- in-situ monitoring,
- technology or process upgrades.

In the event in-situ plume measurement and analysis of plume dilution indicates that the EPO may not be met the study would need to consider discharge volumes, discharge toxicity, well line up, process chemicals and baseline data. The ALARP study may recommend:

- implement discharge limits,
- well management
- in-situ monitoring,
- technology or process upgrades,
- in-boarding,
- change out of process chemicals if appropriate or reduce dosing rates

7.2.6.5 Review and revision

This OMDAMP is typically reviewed annually to incorporate the following:

- Completion of the annual OMDAMP compliance review – incorporating any recommendations for further assessment and/or updates to the monitoring framework
- Recently accepted EPs - incorporating any new/amended monitoring commitments/triggers
- Regulatory inspections - incorporating any relevant findings or recommendations
- Updates to key guidelines, guideline values or changes to recommended sampling/ methodologies.

7.2.7 Risk management

Risk management processes and practices are applied on an ongoing basis to manage risks to personnel, assets and the environment.

Potential environmental consequences and impacts from the Petroleum Activity are risk assessed and controlled in accordance with the Woodside risk management processes described in Section 2 of this EP.

In addition, other risk sub-processes and practices are also applied within Woodside on an ongoing basis to manage different types of risk. A summary of those relevant to the Petroleum Activity is provided below. Woodside's risk management processes, along with the supporting risk sub-processes and practices discussed in this section, ensure the environmental impacts and risks of the activity continue to be identified and reduced to a level that is ALARP.

7.2.7.1 Management of risks – contracting and procurement

Suppliers and contractors play a significant role in meeting the resource needs of Woodside's operations, including the facility operations. Effective management of environmental risks in contracts is achieved by setting clear expectations and managing environmental risks throughout the duration of the contract. Environmental risks in contracts are managed under the Contracting and Procurement Procedure supported by the Health, Safety and Environment in Contracting Guideline. The guideline provides a risk-based approach to contractor selection and management and is aligned with 'HSE Management – Guidelines for Working Together in a Contract Environment' (International Association of Oil and Gas Producers, Report No. 423).

The Engineering Standard: Quality Requirements for Supply of Products and Services defines specific quality requirements for engineering contracts and purchase orders. The specified quality control requirements in the Standard are required to be complied with as applicable to the scope of supply.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.7.2 Management of risks – subsea activities

Subsea activities are managed in line with the Subsea and Pipelines Integrity Management Procedure which defines the practices and technical requirements that must be applied to deliver and safeguard integrity of the subsea equipment and pipelines during the facility lifecycle. It provides the relationship between the PSM Framework (including management of change [MOC]) and Subsea and Pipelines Group services processes.

Inspection, monitoring, maintenance and repair (IMMR) activities are managed under the Manage IMMR Work Procedure. Risk assessments are conducted as required under this procedure.

These requirements are supported by implementing the Subsea Construction and Inspection, Maintenance and Repair Environment Screening Questionnaire tool. The screening questionnaire is used to understand the scope of the activity, potential environmental impact and if additional regulatory approvals are required. To achieve this, the questionnaire captures key activity information such as seabed disturbance, chemical use and waste. This information is used by an environment focal point to determine if further assessment is required. For activities that have the potential for environmental impact, an assessment is undertaken against this EP and other Woodside environmental requirements. If determined by the Subsea and Pipeline Environment Screening Questionnaire process, an EP Management of Change (MoC) review undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP.

Key environmental requirements and regulatory commitments are communicated to subsea teams and incorporated into key documentation where applicable and required (i.e. not addressed via existing Woodside practices).

7.2.7.3 Management of risks – major projects

Major projects are required to follow the Appraise and Develop Management Procedure and the Investment Management Framework. This procedure defines the requirements to deliver a commercially valuable production facility or modification to an existing facility. The process workflow requires integrating work from various functions using their people and processes, including Environment (e.g. HSE philosophy and regulatory approval requirements).

These requirements are supported by implementing the Brownfields Environment Screening Questionnaire tool. The screening tool is used to determine if a project has the potential for environmental impact or requires additional regulatory approvals. For projects that have the potential for environmental impact, an environmental focal point is assigned and the risks and impacts assessed against the facility EP and other Woodside environmental requirements.

Key environmental requirements and regulatory commitments are communicated to project teams and incorporated into key project documentation where applicable and required (i.e. not addressed via existing Woodside practices).Where it is identified that the project scope has the potential to result in modification or change to the facility description provided in the EP, or where potential new environmental risks or impacts or increases in an existing environmental risk or impact are identified, an EP MoC review is undertaken to confirm if the level of environmental risk warrants revision and resubmission of an EP.

7.2.7.4 Management of risks – well integrity

Wells are managed throughout their lifecycle in line with the Woodside's Manage Well Delivery Standard and Well Integrity Management Standard, which define the requirements for design, construction, operation and maintenance of wells to ensure containment of hydrocarbon and well fluids.

All wells associated with the Petroleum Activity are required to have a regulator-accepted Well Operations Management Plan (WOMP), which demonstrates that well integrity risks are understood and managed to ALARP and acceptable levels.

7.2.7.5 Management of risks – marine services

Woodside's Marine Services Function provides a platform for the conduct of safe and efficient marine operations across Woodside through Marine Services Management. A set of procedures that support vessel assurance and management (including HSE and quality management) are in place to ensure marine operations are conducted in a safe and efficient manner, and in accordance with regulatory requirements.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.7.6 Management of risks – emissions and energy management

Emissions generation and energy use is managed in line with the Greenhouse Gas (GHG) Emissions and Energy Management Procedure which defines the minimum mandatory requirements to manage and deliver continuous improvement in energy efficiency and reduction in GHG emissions. The procedure supports the implementation of the Climate Policy and aligns with the requirements of the Environmental Management Standard, applicable to assets in Operate phase. It supports the 'operate out' component of limiting net emissions, as shown in the Woodside Climate Change Policy.

Implementing the GHG Emissions and Energy Management Procedure assists in meeting external expectations, such as Woodside's net equity Scope 1 and 2 GHG emissions reduction targets of 15% by 2025[115] and 30% by 2030, and our aspiration for Net Zero by 2050 or sooner[116]. Woodside delivered its 2025 net equity Scope 1 and 2 GHG emissions reduction target.[117] [118] [119]These targets apply across Woodside's portfolio and progress against targets are reported in annual corporate disclosures. Meeting these corporate reduction targets may mean additional net voluntary abatement beyond that required by the SGM.

The GHG Emissions and Energy Management Procedure is consistent with other initiatives, such as the Zero Routine Flaring Initiative for oil assets, the OGMP 2.0, OGCI Near-Zero, and Methane Guiding Principles. Section 3 of the WMS Climate Management Standard aims for assets that emit material amounts of methane to continually reduce methane through leak detection and repair, annual routine monitoring, accountability and governance, improving methane emissions data and increasing transparency through reporting and for emissions that cannot be mitigated, implement appropriate controls consistent with the principles of the OGCI Near-Zero. The Woodside Flare Framework is a WMS tool that seeks to improve awareness of flaring-related issues and influence for reduced flaring.

The GHG Emissions and Energy Management Procedure links to the annual review of opportunities to improve energy performance through identification and evaluation as described in the Production Optimisation and Opportunity Management Procedure. It also requires measurement, analysis and communication of energy performance across the Operations Division and consideration of actual or potential impacts to energy efficiency in company decision-making, such as MOC, operational decisions, issue resolution options analysis and facility optimisation plans.

Identification considers a wide range of opportunities, including those that require formal allocation of budget and resources (longer term), as well as opportunities that can be executed as part of day-to-day operations. Opportunities identified are to be evaluated and implemented in a manner consistent with the Production Optimisation and Opportunity Management Procedure. The Environmental Performance Procedure requires that assets measure, monitor or estimate direct air and GHG emissions, and that such emissions and energy intensities are minimised to ALARP in design. The requirement to set, measure and track flare and emissions targets for assets, help to manage the emissions to meet the requirements of the EPS.

7.2.7.6.1 Production optimisation and opportunity management

The Production and Opportunity Management Procedure outlines the process for identification, prioritisation and management of production opportunities that maximise production revenue or reduce emissions intensity across Woodside operated assets. Opportunities are identified throughout the year in various meetings, forums and teams. In addition, formal opportunity identification takes place through annual

[115] Targets and aspiration are for net equity Scope 1 and 2 greenhouse gas emissions relative to a starting base of 6.32 Mt CO2 -e which is representative of the gross annual average equity Scope 1 and 2 greenhouse gas emissions over 2016-2020 and which may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets.

[116] Net equity Scope 1 and 2 GHG emissions reduction targets and aspiration are relative to a starting base of 6.27 Mt CO2-e which is representative of the gross annual average equity Scope 1 and 2 GHG over 2016–2020 and which may be adjusted (up or down) for potential equity changes in producing or sanctioned assets with a final investment decision prior to 2021. Net equity emissions include the utilisation of carbon credits as offsets, inclusive of those required to meet regulatory obligations.

[117] *Ibid.*

[118] Achievement of the target reflected a combination of underlying emissions performance at our facilities and the use of carbon credits. These net equity GHG emissions were 15% below the starting base for the 12-month period ending 31 December 2025.

[119] In relation to our 2025 equity Scope 1 and 2 GHG emissions, 1283 kt CO2-e carbon credits were retired in order to meet our target of 5334 kt CO2-e net equity Scope 1 and 2 GHG emissions. This includes retirement of carbon credits subsequent to the period, after full year 2025 gross equity Scope 1 and 2 GHG emissions were calculated and externally assured

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

workshops, which complement the identification of improvement opportunities. These opportunities are prioritised and managed according to the workflow shown in Figure 7-5.

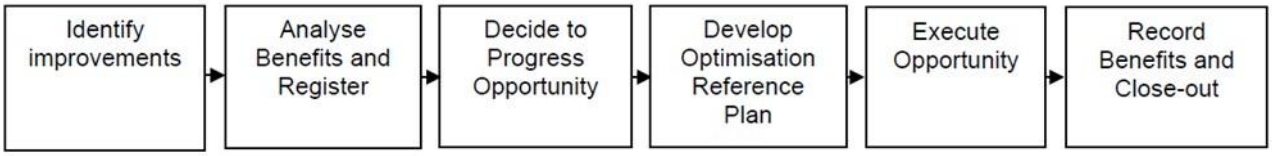

Figure 7-5: Opportunity management workflow

Production opportunities are evaluated and progressed, based on value and confidence of return, within the constraints of technical feasibility, cost and other factors. Implemented opportunities are validated and recorded before close out.

7.2.7.6.2 Fuel and flare target setting

In demonstrating the impacts and risks relating to fuel and flaring have been reduced to ALARP, fuel and flare targets for the facility are set annually in accordance with Woodside's Greenhouse Gas, Energy and Flare Target Setting Guideline. Targets are estimated based on operating experience and forecast activities; e.g. shutdowns. Consideration is also given to the flaring estimates contained within this EP.

The fuel and flare target is tracked against fuel and flare performance throughout the year. Where achieving a flare target is in question, an internal flare target deviation is developed, which requires an ALARP justification. A flare target deviation considers EP flare estimates. If estimate is likely to be exceeded, an EP MoC assessment (see Section 7.10.1) is undertaken to determine if a revision and resubmission is required.

7.2.7.7 Management of risks – Indirect emissions management

As stated in the Climate Policy, Woodside's objective is to thrive in this energy transition as a low cost, lower-carbon[120] energy provider. Woodside aims to achieve this objective by:

- setting science-based[121] near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned[122] scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated[123].
- developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- investing in new energy products and lower-carbon[69] services to reduce customers' emissions (part of Woodside's Scope 3 GHG emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.

---

[120] Woodside uses this term to describe the characteristic of having lower levels of associated potential GHG emissions when compared to historical and/or current conventions or analogues, for example relating to an otherwise similar resource, process, production facility, product or service, or activity.

[121] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "science-based" (published 2021) which states "targets are considered 'science-based' if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.". See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related disclosures-prototype.pdf (Appendix A).

[122] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "Paris-aligned scenarios" (published 2021) which states "scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related disclosures- prototype.pdf (Appendix A).

[123] Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside's ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside's ownership interest.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- aligning our advocacy to the principles of this Climate Policy.

Woodside's Scope 3 GHG emissions approach includes the introduction of new energy products and lower-carbon[69] services into our portfolio, like hydrogen and CCS which can help our customers avoid or reduce their Scope 1 and 2 GHG emissions.[124]

We have set two related Scope 3 targets. The first, to invest US$5 billion in new energy products and lower-carbon services by year end 2030 (investment target). The second, to take FID on new energy products and lower-carbon services by year end 2030, with total abatement capacity of 5 Mtpa CO_2-e (emissions abatement target). [125,126,127] The investment target tracks our work to develop these projects and bring them to market. The emissions abatement target will track their potential impact on customer emissions.

Investing in products and services for the energy transition is also supported by three levers: assessing investments for their resilience to the energy transition; diversifying our products and services; and supporting our customers and suppliers to reduce their emissions.

These levers are further supported by our work to promote global measurement and reporting – including our own publication of transparent disclosures.

Progress against these targets is reported annually in Woodsides annual disclosures. Targets are not set for individual facilities, including GWA, but are assessed corporately.

7.2.7.7.1 Annual Review

An annual review of the implementation and outcomes associated with Woodside working with the natural gas value chain to reduce emissions in third party systems via corporate activities will be undertaken. Additionally, progress against corporate Scope 3 investment and abatement targets will be reported annually in relevant Woodside annual disclosures. If they are deemed to be effective at a corporate implementation level, then it will also be deemed that specific impacts and risks at an asset contribution level (i.e. proportion attributable to GWA production) are also being managed appropriately.

If the annual review deems the controls are not effective, an EP management of change assessment (see Section 7.10.1) is undertaken to determine if a revision and resubmission is required.

7.2.7.8 Management of human factor related risks

The term 'human factors' is used to describe the consideration of people as part of complex systems. Woodside defines 'human factors' as follows: 'human factors uses what we know about people, organisation and work design to influence performance'.

Human factors can contribute to MEEs, or result in failure or degradation of the controls in place to protect against MEEs. The WMS includes several procedures designed to manage human factors related risks and prevent incident causation.

7.2.8 Change management

The Change Management Procedure describes requirements for change management at Woodside owned or controlled operations/sites.

Change management is used where there is no existing approved business baseline, such as a process, procedure or accepted practice, or where conformance with an approved baseline is not possible or

---

[124] For information on the Scope 3 methodology utilised to prepare our Scope 3 targets, please see our 2023 Climate Transition Action Plan available on our website. https://www.woodside.com/docs/default-source/investor-documents/major-reports-(static-pdfs)/ctap2023/climate-transition-action-plan-and-2023-progress-report.pdf

[125] Scope 3 targets are subject to commercial arrangements, commercial feasibility, regulatory and Joint Venture approvals, and third party activities (which may or may not proceed). Individual investment decisions are subject to Woodside's investment targets. Not guidance. Potentially includes both organic and inorganic investment.

[126] Scope 3 investment target includes pre-RFSU spend on new energy products and lower-carbon services that can help our customers decarbonise by using these products and services. It is not used to fund reductions of Woodside's net equity Scope 1 and 2 greenhouse gas emissions which are managed separately through asset decarbonisation plans.

[127] For information on the Scope 3 methodology utilised to prepare our Scope 3 targets, please see our 2023 Climate Transition Action Plan available on our website. https://www.woodside.com/docs/default-source/investor-documents/major-reports-(static-pdfs)/ctap2023/climate-transition-action-plan-and-2023-progress-report.pdf

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

intended; for example, due to equipment fault or failure or a recently discovered issue which will take time to rectify. Change management is also used when the baseline is changed (e.g. the process is modified). It applies to management of temporary, permanent, planned or unplanned change encompassing one or more of:

- plant (equipment, plant, technology, facilities, operations or materials)
- projects (budget, schedule)
- people (organisation structure, performance, roles)
- process (WMS content, processes, procedures, standards, legislation, information).

Woodside's change management process hierarchy is depicted in Figure 7-6. The hierarchy has been developed with sub-processes to address the different types of change performed at Woodside.

Figure 7-6: Change management hierarchy

To help manage the day-to-day operation of the facility, Woodside has developed a Golden Safety Rules Booklet, which summarises mandatory requirements for safety in the workplace and includes guidance for managing changes that have a Health, Safety, Integrity and/or Environment impact.

7.2.8.1 Technical change management

Technical changes within the Operations Division are managed using the Management of Change – Assets Procedure. The objective of the procedure is to ensure HSE risks associated with both realised and potential changes, including any failure to meet the facility SCE Technical Performance Standards, are identified, assessed and reduced to ALARP (Section 7.2.9 provides further information on management of SCE Technical Performance Standards).

Assessed changes must be recommended, agreed and decided upon based on the assessed current level of risk, as defined by Woodside's Technical Decision Authority matrices.

The management of change requirements contained in the Process Safety Management Procedure and Management System Performance Standard M05 Management of Change are considered when conducting any changes with the potential to impact process safety.

The Engineering Management Procedure specifies key requirements of engineering related changes, and requires that engineering Technical Decisions are agreed, recommended and decided at the appropriate engineering authority level according to the risk. Change management and risk assessment include consideration of applicable legislation/regulation.

Change is also managed under management system requirements set out as part of major projects (Brownfields), wells integrity, subsea and pipelines integrity management and marine management system. Change management includes consideration of regulatory requirements, managed in accordance with the Regulatory Compliance Management Procedure.

In addition, the Management of Change MSPS (M05) is in place to assure process safety risks arising from change (temporary and permanent) are systematically identified, assessed and managed.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.9 Management of safety and environment critical element technical performance standards and management system performance standards

7.2.9.1 Management system performance standards

Woodside ensures safety-critical management processes function as required by applying MSPS. MSPS are developed and owned at non facility-specific level (i.e. pan-Woodside) and include assurance checks for the key requirements of the applicable management system.

Individual facilities demonstrate conformance against the MSPS through the conduct of reviews. Non-conformances against an MSPS are internally managed in accordance with the WMS.

7.2.9.2 Safety and environment critical element technical performance standards

An SCE is defined by Woodside as a hardware barrier, the failure of which could cause or contribute substantially to, or the purpose of which is to prevent or limit the effect of a MAE/MEE, or Process Safety Event.

Woodside identifies/develops, implements, monitors/assures and verifies/optimises SCEs by applying SCE Technical Performance Standards as described in the Safety and Environment Critical Element Management Procedure. Key elements of the procedure are summarised in Table 7-3.

Table 7-3: Safety and environment critical element management procedure summary

Identify/Develop	**Safety and Environment Critical Element Management Procedure** Identify SCE – SCEs must be identified from the facilities process safety risk assessments (PSRAs) (Section 2.2.2). The identification of SCEs for which Performance Standards are required are part of the formal safety and environmental risk assessment processes. Woodside's Global Performance Standards (based on industry and Woodside Standards) should be used for preliminary selection of SCEs. Complete Engineering Design Studies – Engineering design studies must be completed to demonstrate that SCE Performance Criteria specified in the global Performance Standard and/or determined by PSRA will be met by the facility design, allowing for normal SCE degradation in operation. The studies must establish the testing and inspection tasks required to assess performance against the criteria. The scope and frequency of SCE Assurance Tasks are guided by the Global Performance Standard and may require designated Engineering Design Studies. Studies should include Reliability Centred Maintenance, Risk Based Inspection and Safety Instrumented Function studies to determine the Assurance Task scope and frequencies, risk-based inspection plans, and classification and implementation requirements for instrumented safeguarding. Develop Performance Standards – Facilities must develop Performance Standards for all SCEs by: • selecting the applicable Global Performance Standard (including Assurance Tasks) • considering facility-specific requirements and applicable regulatory requirements • adding the specific data from the facility Engineering Design Studies and PSRA to compile scope and frequency of SCE assurance activities.
Implement	**Management of Hardware Controls in the Operate Phase Procedure** Identify SCE in Asset Register – SCEs must be uniquely identified on the asset register and assigned Performance Standard flags. Develop Testing, Inspection and Maintenance Programs – SCE assurance tasks are developed into maintenance procedures. Implement Testing, Inspection and Maintenance Programs – SCE testing, inspection and maintenance requirements must be implemented in the CMMS (Section 7.2.1.2).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Maintain/Assure	**Management of Hardware Controls in the Operate Phase Procedure** Execute Testing, Inspection and Maintenance Programs – On completing SCE assurance tasks, results must be recorded with all relevant detail, assessed for conformance with the Performance Criteria and any follow on correction work identified. Conduct Fitness for Service Assessment – In some instances, an engineering fitness for service assessment may be required to determine whether equipment has failed its performance standard requirements; e.g. assessment of corrosion defects following inspection of piping. Detailed results of fitness for service assessment may be recorded out of CMMS. Manage and Analyse Results – The results from assurance tasks must be accurately recorded to support data analysis. Analysis will enable appropriate action to be taken to minimise future failure recurrences, and enable assessment of overall system performance and reliability to verify SCE effectiveness in revealing failures and to allow predictive maintenance.
Respond	**Control of Operational Risk Procedure** Respond to SCE Failure – SCE failure (Technical Performance Standard non-conformance) is a failure to achieve the given Performance Criteria. SCE failures must be managed in accordance with a structured review process. This process may require the application of the facility MOPO which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE or managed in accordance with the Control of Operational Risk Procedure. **Management of Hardware Controls in the Operate Phase Procedure** Report Internally – SCE failures that cause failure to meet the facility Performance Standard must be reported in accordance with the Health Safety and Environment Event Reporting and Investigation Procedure (Section 7.13.3). Report Externally – Failure to meet the facility Performance Standard may require external regulatory reporting. External communications must be in accordance with the Regulator Event Reporting – Western Australia – Guideline and the Regulator Event Reporting – Commonwealth of Australia – Guideline.
Verify/Optimise	Review SCE Performance – SCE performance reviews must be conducted to ensure requirements for maintaining SCE performance are being met. Manage Change – Any change to the Performance Standards must be conducted in accordance with the Change Management Procedure (Section 7.10.1).

SCE Technical Performance Standards are a statement of the performance required of an SCE (e.g. functionality, availability, reliability, survivability), which is used as the basis for establishing agreed assurance tasks and managing the hazard. An assurance task is an activity carried out by the operator to confirm that the SCE meets, or will meet, its SCE Technical Performance Standard. Examples of assurance tasks include inspection routines, maintenance activities, test routines, instrumentation calibration and reliability monitoring.

These assurance tasks are identified in the CMMS, flagged against their associated technical Performance Standard, and given the appropriate priority (defined as Technical Integrity). Management systems are in place to manage the completion of maintenance including that required for Technical Integrity assurance.

Events where the SCC/SCE have not met their specified performance criteria must be managed in accordance with a structured review process. This process may require the application of the facility MOPO which provides prescriptive guidelines to be followed in the event of a reduction in the performance of an SCE in specific defined circumstances; or, if the MOPO does not cover the event, according to procedures for the assessment and management of operational risk.

Internal notification of SCC failures must be made in accordance with maintenance management workflows. Failures to meet a Facility Performance Standard occur where SCC events lead to the functional objectives (goal and/or key requirement statements) of the facility Performance Standard for the SCE not being met (i.e. lost or unavailable), taking into account any redundancy inherent within the SCE. These events are reported in the Event Reporting Database as potential SCE Failure to Meet Facility Performance Standard Events.

These are internally reported as Hazard Events. Where ‘Failure to meet a Facility Performance Standard’ leads to a loss of hydrocarbon containment, or a release of energy, it is internally reported (and externally where relevant) as a Loss of Primary Containment or Environmental Spill event, depending on the nature of the release.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Additionally, confirmed ‘Failure to meet a Facility Performance Standard’’ events for the SCEs identified in the MEE bowties may equate to a breach of EPOs and/or EPSs. The review to identify such events for external reporting considers whether the hazard event is relevant to environmental SCE functional objectives (goal and/or key requirements) of the SCE Facility Performance Standard and whether the event poses a risk to achieving EPOs and EPSs. The WMS Regulator Event Reporting Guideline (Australia) provides additional information regarding external SCE related reporting obligations.

There may also be planned changes/deviations from SCE Technical Performance Standards, these are managed via procedures for the assessment and management of operational risk and endorsed in accordance with the engineering management procedures (described further within Section 7.2.9). This management process ensures risks (including environment) are managed so that the planned change/deviation does not result in unacceptable impact or risk, remains ALARP and regulatory requirements are met.

An additional class of SCE exists to capture environment critical emissions monitoring and control equipment and is also managed under this process. The P31 Technical Performance Standard – Environmental Emissions Monitoring and Controls’ includes equipment required to comply with environmental legislation, Regulations, approval conditions or requirements which apply to the facility although not specifically required under the MEE bowtie analysis and SCE groupings.

The scope of P31 includes equipment such as that to maintain and monitor flare ignition, flow metering, and discharge quality of PW. P31 sets out key performance requirements for applicable equipment to meet regulatory requirements as appropriate to the reporting methods (e.g. NGERs Determination and NPI) and meet the functional intent of the system that the equipment supports (e.g. ensuring flare systems can be ignited, with monitoring in place to ensure the flare/pilots are lit). P31 also defines maintenance/assurance tasks for associated equipment (SCC), and is used to support change management, prioritisation and governance.

7.3 Woodside decommissioning framework

Decommissioning is a planned activity for the offshore oil and gas industry. Current best practice is for decommissioning to include:

- designing for decommissioning during the development phase of facilities
- removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging wells associated with a Petroleum Activity
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production
- selecting, developing and planning the selected decommissioning option
- executing decommissioning plans
- restoring the marine environment.

This is aligned with Section 572(3) of the OPGGS Act, which requires titleholders to remove property from the title area when it is neither used, nor to be used, in connection with the operations.

Under section 270(3) of the OPGGS Act, before title surrender, all property brought into the surrender area by any person engaged or concerned in the operations authorised by the permit, lease or licence must be removed or cause to be removed from the surrender area to the satisfaction of NOPSEMA, or arrangements that are satisfactory to NOPSEMA must be made in relation to the property. Sections 572(7) and 270(3) of the OPGGS Act provide scope for in-situ decommissioning and other arrangements to be made where it can be demonstrated that the risks and impacts are ALARP and acceptable as well as comply with all other Acts and relevant legislation.

7.3.1 Decommissioning in operations

Woodside's approach to closure and decommissioning is governed by the Closure Planning Standard within Woodside's Management System. The Standard requires that closure planning is considered throughout the asset lifecycle and that Closure Management Plans (CMPs) are prepared and maintained for all operated assets.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

For planning purposes, CoP for the GWA facility is currently estimated to be approximately 2036. This timing is indicative and subject to change based on reservoir performance and production forecasting.

Decommissioning planning for the GWA field is documented within the NWS Gas Offshore CMP and prepared in accordance with Woodside's Closure Planning Standard. The CMP documents the decommissioning strategy, asset inventory and indicative schedule, and is reviewed periodically to reflect current planning, regulatory expectations and decommissioning progress. Decommissioning end-state decisions and execution methodologies will be defined through the Select/Define phase and confirmed at EOFL.

Prior to decommissioning activities commencing post cessation of production (CoP), Woodside will submit decommissioning EP(s) to NOPSEMA that demonstrate environmental impacts and risks associated with decommissioning activities are reduced to ALARP and acceptable levels. Decommissioning EPs will be developed to meet the requirements of the OPGGS Act and OPGGS Environment Regulations, as well as any other relevant legislation in force at the time.

7.3.2 Facility decommissioning planning

Decommissioning planning generally commences two (2) to 10 years before ceasing production (**Figure 7-7**). The timeframe selected for decommissioning planning depends on the complexity of the facility and infrastructure requiring decommissioning.

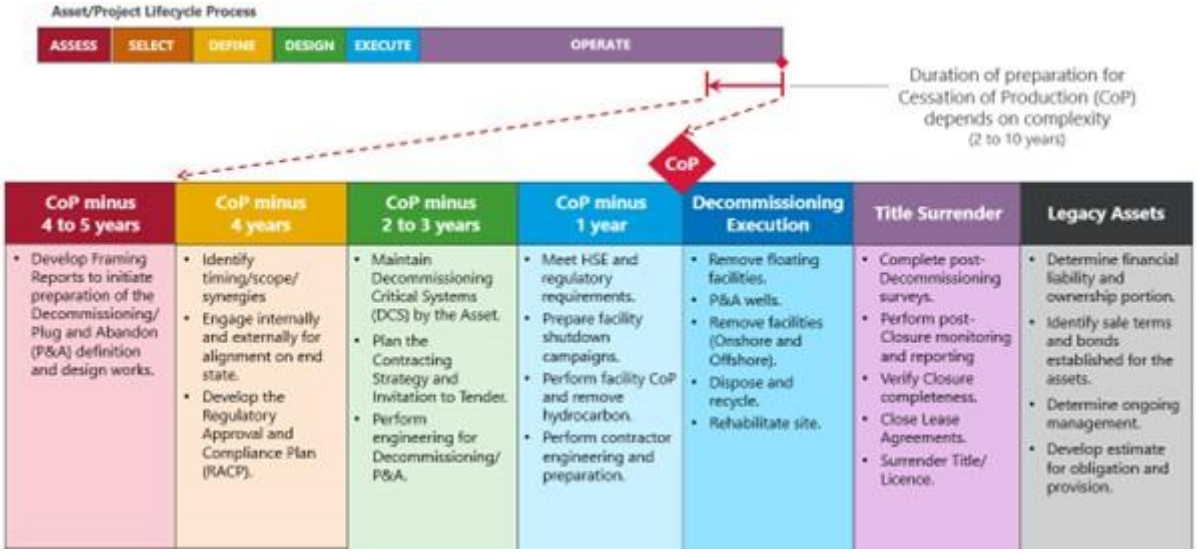

Figure 7-7: Woodside's process for decommissioning planning

7.3.2.1 Decommissioning critical systems

Woodside maintains all infrastructure and property bought onto the title area to allow safe, reliable and efficient decommissioning, in accordance with Section 572(2) of the OPGGS Act. As part of this approach, Woodside identifies and manages decommissioning critical systems, which are systems that need to remain functional to safely and efficiently deliver decommissioning activities.

Early identification of these systems and maintenance strategies that evolve through the operational phase, support readiness for safe and efficient decommissioning. Decommissioning critical systems are identified with consideration of safety, regulatory compliance, and functionality required to execute decommissioning activities. Maintenance plans are adapted through the Operate phase to reflect the evolving criticality of systems as the asset transitions toward CoP.

7.3.2.2 Management of redundant infrastructure

Where infrastructure is identified as potentially redundant, an assessment is undertaken to evaluate the risks associated with removal during operations compared with retaining the infrastructure in situ until end of field life (EOFL). This assessment considers safety, environmental and operational risks, and identifies appropriate control measures to ensure risks are reduced to as low as reasonably practicable (ALARP).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The timing of decommissioning activities is informed by risk, operational constraints and efficiency considerations. Removal during operations is generally not assessed as ALARP where redundant infrastructure is integrated with live systems, located within or beneath active production infrastructure, or within the petroleum safety zone, due to the additional operational complexity and HSE risk associated with early removal.

Where redundant infrastructure is retained, appropriate preservation and maintenance measures are implemented to maintain integrity and ensure the infrastructure remains safe and suitable for future decommissioning. These measures may include inspection, monitoring, isolation and environmental protection measures.

Redundant infrastructure is tracked within the asset inventory. Decisions regarding retention in situ until EOFL are subject to periodic review and reflected in the CMP. This process does not apply to wells, which are managed under Woodside's well integrity management processes and the approved WOMP.

7.3.3 Inventory of property within the Petroleum Activity

The title areas relevant to this EP are WA-1-L, WA-5-L, WA-6-L, WA-23-L, WA-24-L, WA-57-L, and associated pipeline licences WA-2-PL, WA-9-PL, WA-13-PL, WA-24-PL and WA-27-PL.

The inventory of property associated with the GWA facility within these title areas, and within the scope of this EP are provided in Table 7-4, Table 7-5 and Table 7-6. The inventory includes both active and redundant infrastructure and is current at the time of EP submission.

Additional infrastructure installed during the life of this EP, including future developments such as GWF-4, will be incorporated into the inventory once installed. The decommissioning strategy for the infrastructure listed in Table 7-4 to Table 7-6 is described in Section 7.3.4.

Table 7-4: Inventory and status of surface infrastructure, production wells, redundant production wells and subsea infrastructure on the title areas relevant to this EP

Infrastructure	Status[1]	Number	Title(s)	Note
Facilities				
Goodwyn A platform and jacket	Active	1	WA-5-L	
Production wells[2]				
Perseus subsea wells (PER-01, PER-03)	Active	2	WA-1-L	
GWF-1 subsea wells (TPA01, TPA02, TPA03, GDA01, GDA02)	Active	5	WA-5-L	
GWF-2 subsea wells (SRA01, SRA02, KDA01, KDA02, LPA01, LPA02, LPA03, DOA01)	Active	8	WA-5-L, WA-6-L, WA-24-L, WA-57-L	
GWF-3 subsea wells (GDA03, GDA04, GDA05)	Active	3	WA-5-L	
GWA platform wells (GWA-01, GWA-03, GWA-05, GWA-08, GWA-10, GWA-13, GWA-16, GWA-17, GWA-18, GWA-19)	Active	10	WA-5-L	
Redundant production wells[3]				
Perseus subsea wells (PER-02, PER-04)[4]	Redundant	2	WA-1-L	Maintained for decommissioning (see Section 7.3.4.2)
GWA dry tree platform wells[5] (GWA-02, GWA-04, GWA-06, GWA-07, GWA-09, GWA-11, GWA-12, GWA-14, GWA-15)	Redundant	9	WA-5-L	Maintained for decommissioning (see Section 7.3.4.3)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Infrastructure	Status[1]	Number	Title(s)	Note
Subsea structures				
Production manifold (GDA, TPA, DOA, KDA, LPA, SRA, PoG)	Active	7	WA-5-L, WA-6-L, WA-24-L, WA-57-L, WA-1-L	
PoG Pipeline End Manifold (PLEM)	Active	1	WA-1-L	
Pipeline End Terminations (PLETs)	Active	2	WA-5-L, WA-57-L	
Mid-Connection Structures (MCS)	Active	1	WA-5-L	
Spool Connection Assemblies (SCAs)	Active	4	WA-5-L, WA-6-L, WA-24-L, WA-57-L	
Tie-in Skids and Assemblies	Active	6	WA-1-L, WA-5-L, WA-6-L, WA-24-L, WA-57-L	
Subsea Isolation Valves (SSIVs) and Valve Skids	Active	3	WA-5-L	
	Redundant	1	WA-5-L	Relating to Echo Yodel. Maintained for decommissioning (see Section 7.3.4.1)
Subsea and Electrical Distribution Units	Active	7	WA-1-L, WA-5-L	
	Redundant	3	WA-1-L	Relating to PER02, PER04 wells. Maintained for decommissioning (See Section 7.3.4.2)
Umbilical Termination Assemblies (UTAs)	Active	23	WA-5-L, WA-6-L, WA-24-L, WA-57-L	
Splitter Boxes	Active	2	WA-5-L	
	Redundant	1	WA-5-L	Relating to Echo Yodel. Maintained for decommissioning (see Section 7.3.4.1)
Stabilisation and Anchors (Anchor piles, walking anchors and buckle initiators)	Active	45	WA-5-L	

1. Status at the time of EP submission.

2. Includes well infrastructure including wellhead and subsea tree (XT).

3. Plug and abandonment planned under the accepted NWS Phase 1 Plug and Abandonment and TPA03 Well Intervention EP (NOPSEMA Doc ID A1282745). Associated subsea infrastructure maintained with removal planned at EOFL. See Section 7.3.4.2 for further detail.

4. Wells are temporarily suspended and monitored and maintained under the approved GWA WOMP. Additional wells may become redundant during the life of this EP. See Section 7.3.4.3.

5. Associated with the Echo Yodel development. Will be retained and managed under this EP following completion of EY pipeline decommissioning. See Section 7.3.4.1 for further detail.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-5 Inventory and status of pipelines, flowlines, risers and spools on the title areas relevant to this EP

Infrastructure	Status[1]	Number	Total length (m)	Title(s)
GWA Interfield Line (IFL) (30")	Active	1	23,287	WA-2-PL
PoG Pipeline (16")	Active	1	24,162	WA-13-PL
GWF-1 Pipeline (16")	Active	1	14,350	WA-24-PL
GWF-2 Pipeline (16")	Active	1	35,362	WA-27-PL
Rigid spools	Active	39	3,214	WA-1-L, WA-5-L, WA-6-L, WA-24-L, WA-57-L
	Redundant[2]	4	252	WA-9-PL
Flexible flowlines	Active	4	7,702	WA-5-L
	Redundant[3]	1	1,381	WA-1-L

1 Status at the time of EP submission.

2. Associated with the Echo Yodel development. Will be retained and managed under this EP following completion of EY pipeline decommissioning. See Section 7.3.4.1 for further detail.

[3] Redundant infrastructure associated with the PER02 and PER04 wells (WA-1-L) are integrated with live production infrastructure and will be maintained under this EP with removal is planned at EOFL (Section 7.3.4.2).

Table 7-6 Inventory and status of umbilicals and jumpers on the title areas relevant to this EP

Infrastructure	Status[1]	Number	Total length (m)	Title(s)
Umbilicals	Active	18	79,687	WA-1-L, WA-5-L, WA-6-L, WA-24-L, WA-57-L
	Redundant[2]	2	8,427	WA-1-L
Jumpers and flying leads[3]	Active	~ 128	~ 7,000 – 8,500	WA-5-L, WA-6-L, WA-24-L, WA-57-L, WA-1-L
	Redundant[2]	~ 13	~ 380 – 520	WA-1-L, WA-5-L

1. Status at the time of EP submission.

2. Redundant infrastructure associated with the PER02 and PER04 wells (WA-1-L) are integrated with live production infrastructure and will be maintained under this EP with removal planned at EOFL (Section 7.3.4.5). Three redundant EFL's associated with GWF 1 and GWF 2 are integrated within existing subsea infrastructure. These will be retained and maintained under this EP, with removal planned at EOFL, consistent with Section 7.3.2.2.

3. Jumper quantities and lengths are approximate as the inventory is subject to change through routine IMMR activities. The current detailed inventory is maintained in the GWA subsea inventory database.

7.3.3.1 Other infrastructure within the title areas

Other infrastructure located within the same title areas within the same title areas are outside the scope of this EP and are managed under separate accepted EPs. This includes infrastructure previously associated with GWA that has since transitioned to other accepted EPs. A summary of this infrastructure is provided in Table 7-7. The environmental impacts and risks associated with this infrastructure are assessed and managed under the respective accepted EPs and are not addressed within this EP.

Table 7-7 Other infrastructure in the title areas outside the scope of this EP

Infrastructure[1]	Title(s)	Relevant accepted EP
Echo Yodel subsea pipeline and associated ancillary infrastructure	WA-9-PL	Echo Yodel Subsea Decommissioning Environment Plan (A830461)
North Rankin complex facilities and associated infrastructure	WA-1-L, WA-2-PL	North Rankin Complex Facility Operations Environment Plan (A1294930)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Infrastructure[1]	Title(s)	Relevant accepted EP
Redundant PoG production wells undergoing permanent plug and abandonment (PER-02 and PER-04)	WA-1-L	North West Shelf Phase 1 Plug and Abandonment and TPA03 Well Intervention Environment Plan (A1282745)
Exploration Temporarily Abandoned (ETA) wells: • Goodwyn-3 • Goodwyn-6 • Rankin-1 • North-Rankin-2 • North Rankin-3 • North Rankin-6	WA-1-L, WA-5-L, WA-24-L	NWS and Julimar Exploration Wellhead Decommissioning Environment Plan[2] (A1080491)
Abandoned wells with wellheads (AW) • Dockerell-1 • Goodwyn-1 • Goodwyn-5 • North Rankin-1 • North Rankin-5 • Tidepole-1 • North Rankin-4 • Goodwyn-4 • Haycock-1	WA-1-L, WA-5-L, WA-24-L, WA-57-L	NWS and Julimar Exploration Wellhead Decommissioning Environment Plan[2] (A1080491)

[1] Status at the time of EP submission.

[2] Yodel-3 (WA-23-L), Yodel-4 (WA-23-L), Goodwyn-2 (WA-5-L), Lady Nora-2 (WA-57-L) and Lowendal-1 (WA-57-L) wellheads have already been removed under this EP.

7.3.4 GWA decommissioning strategy

Subsequent sections provide an overview of decommissioning activities relating to redundant wells and infrastructure associated with the GWA title areas that are currently being planned or underway.

7.3.4.1 Echo Yodel subsea infrastructure decommissioning planning

The Echo Yodel subsea wells (EY3, EY4) have been accepted by NOPSEMA as permanently plugged and abandoned under the *Echo Yodel and Capella Permanent Plugging for Abandonment EP* (NOPSEMA Doc ID A772288). Associated wellheads, Xmas trees and flying leads were recovered between 2021 and 2025, and the Echo Yodel umbilical was removed in 2025 under the *Echo Yodel Subsea Decommissioning EP* (NOPSEMA Doc ID A830461).

The remaining Echo Yodel pipeline and ancillary subsea infrastructure are scheduled for removal under the *Echo Yodel Subsea Decommissioning EP* (NOPSEMA Doc ID A830461), with activities expected to commence late 2026 to early 2027.

Following pipeline removal, minor residual infrastructure within WA-5-L and WA-9-PL will remain in situ in close proximity to the GWA platform, including:

- production tie-in spool and riser between the SSIV structure and topsides;
- topsides riser piping;
- SSIV structure;
- control jumper from the splitter box; and
- electrohydraulic unit from the splitter box to topsides.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

This infrastructure is integrated with GWA platform systems and cannot reasonably be removed independently of the platform. It will be retained and maintained under this EP until EOFL decommissioning.

7.3.4.2 Perseus over Goodwyn wells plug and abandonment

Two of the PoG production wells (PER02 and PER04) are redundant and Woodside will be conducting plug and abandonment activities for these wells under the accepted North West Shelf Phase 1 Plug and Abandonment EP (NOPSEMA Doc ID A1282745). The project is currently in the Execution phase with planned P&A activities expected to be completed in 2026, subject to operational constraints. Monitoring of the two shut-in PER wells continues as per the approved WOMP and well integrity management procedure (Section 3.9).

The PoG pipeline connecting the PoG wells with the GWA platform remains in use transporting well fluids from production wells (PER01 and PER03). The PoG pipeline and producing wells (PER01 and PER03) will continue to be managed under this EP.

Due to the subsea architecture at PoG and the ongoing production from the remaining two wells in the field (PER01 and PER03), flushing of the PER02 and PER04 flowlines prior to well P&A is not considered viable. Instead, these flowlines may be partially depressured and valve isolations implemented to isolate the well from the production system. Flushing and disconnection of the flowlines will then be conducted as part of a future decommissioning scope at end of field life subject to a separate decommissioning EP.

The well infrastructure associated with PER02 and PER04 (XTs, wellheads and flowbases) will remain in situ until EOFL as these are required for future system flushing operations. There is potential that the subsea XTs may need to be removed during the P&A activity to enable access to the wellbore. In this instance, removal activities are covered under the accepted North West Shelf Phase 1 Plug and Abandonment EP. Well infrastructure relating to PER02 and PER04 that will remain in field following well P&A will be maintained under this EP to ensure infrastructure remains safe and suitable for future decommissioning at facility EOFL.

Subsea infrastructure associated with the PER02 and PER04 wells including the SDUs/CHTU, infield umbilicals, rigid spools and control jumpers will continue to be maintained after well plug and abandonment, with removal planned at EOFL. Removal during the operational phase is not considered to be ALARP, as the infrastructure is integrated with live production systems. Early removal would introduce additional operational complexity and increased HSE risks that can be avoided by deferring to coordinated EOFL decommissioning activities.

The impacts and risks of leaving the infrastructure in-situ until EOFL are covered in Section 6.

7.3.4.3 GWA dry tree platform wells decommissioning planning

Planning for P&A of redundant GWA dry tree platform wells is being progressed through Woodside's IMF process and has completed the Select phase, with Define-phase activities commencing in January 2027. The redundant wells are managed under the approved Goodwyn Operate WOMP and Woodside's well integrity management processes (Section 3.10). Additional wells may become redundant during the life of this EP as reservoir depletion progresses and these will be managed through the same planning process.

Work completed to date has established well-specific abandonment concepts and a preferred phased execution approach, informed by well integrity history, barrier condition and subsurface context. Current Define-phase activities are focused on maturing the technical, environmental and execution definition required to support future P&A execution and associated regulatory submissions.

Planning is also addressing execution strategy development, including identification of appropriate intervention methodologies, logistics considerations, and integration with ongoing operations to minimise risk and production impacts. The Define phase will confirm the preferred execution methodology and refine scope definition to support subsequent EP development.

7.3.4.4 Exploration wells decommissioning planning

Exploration Temporarily Abandoned (ETA) and Abandoned Wellhead (AW) wells with wellheads are located within the GWA title areas (refer Table 7-4). These wells are managed under the accepted *NWS and Julimar Exploration Wellhead Decommissioning Environment Plan* (NOPSEMA Doc ID A1080491).

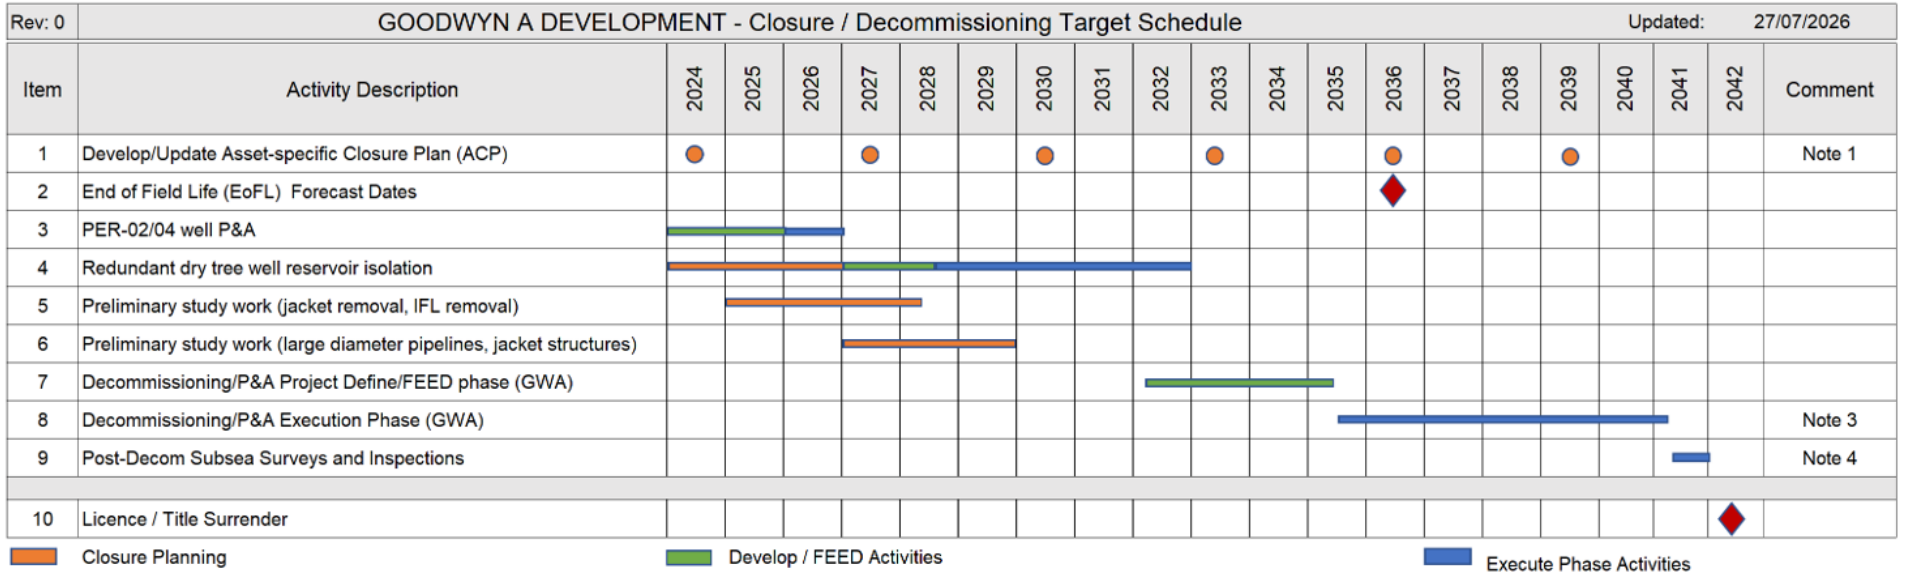
This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

AW wells (refer Table 7-4) have previously been accepted as permanently abandoned and severance of AW wellheads are being progressed through Integrated Wellhead Removal campaigns.

The six ETA wells in the GWA title areas (Goodwyn-3, Goodwyn-6, Rankin-1, North Rankin-2, North Rankin-3 and North Rankin-6) have not yet been accepted as permanently abandoned. Detailed technical assessments have concluded that further well intervention is required to complete P&A and meet the criteria for acceptance as permanently abandoned. Until P&A is completed and accepted, the ETA wells continue to be managed under the Woodside's Suspended Exploration Wells - Well Operations Management Plan (WOMP) (G2000GD1401763008).

Planning for this scope is being progressed through Woodside's IMF framework, with Define phase activities underway. Define phase is focused on establishing sufficient abandonment design, execution and approvals definition to support transition to Design, including completion of key technical assessments, site surveys and execution strategy development.

Permanent abandonment of the ETA wells, and subsequent wellhead removal activities will be covered under a separate future decommissioning EP.



7.3.4.5 GWA facility and subsea infrastructure decommissioning planning

The GWA facility and broader subsea production system are anticipated to remain in service until EOFL and will be decommissioned as a coordinated EOFL activity. During the decommissioning planning phase, all infrastructure within scope will continue to be managed and maintained under this EP, with decommissioning planning predominantly comprising desktop studies and engineering design, supplemented by data from inspections and IMMR scopes delivered under the Petroleum Activity.

Flushing and preservation of subsea flowlines and associated infrastructure will be required prior to or following CoP. It is anticipated that flushing will be conducted from the GWA topsides to the reservoir, with flowlines temporarily preserved with treated seawater consisting of seawater treated with an oxygen scavenger and a biocide.

Consistent with Woodside's process (Figure 7-8) decommissioning planning for GWA will commence prior to CoP. Detailed planning entails technical engineering studies, contracting activities, approvals planning, consultation with stakeholders, and assessment of decommissioning options, timing and risk management. Decommissioning activities will be subject to separate decommissioning EPs.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Notes:

1) The Asset Closure Plan (ACP) is updated regularly every three years , or more frequently if major changes to the Asset occur.
2) For clarity, ETA/AW wells and Echo Yodel are not shown. They are covered under separate EPs.
3) Risk based approach to scheduling, informed by NOPSEMA Compliance Strategy (2024-2029) for P&A within 3 years of EoFL and other property (as required) within 5 years of CoP
4) Post closure monitoring plan assumes that final survey and title surrender is completed within 5 years post completion of all decommissioning activities.

Figure 7-8: GWA decommissioning planning lifecycle and schedule

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.4 Organisation Structure

The following Woodside organisational structure provides leadership and direction for operation of the facility and environmental performance:

- The Executive Vice President (EVP) and Chief Operations Officer (COO) Australia reports to the Chief Executive Officer (CEO).
- The VP North West Shelf reports to the EVP & COO Australia.
- The Asset Manager reports to the VP North West Shelf.
- The Reliability & Integrity Manager reports to the VP North West Shelf.
- The functional support teams report to the corresponding Business Unit.

All Production facilities are supported by a team of environmental professionals who report to the Production Environment Manager.

All facilities are supported by other Woodside functional teams, including:

- HSE – provides specific guidance and access to specialist HSE resources including assistance for governance and training, as well as guidance on Woodside HSE standards
- Subsea – responsible for the installation and IMMR activities on subsea infrastructure including facility structures, flowlines, manifolds and subsea isolation valves to ensure integrity
- Global Wells and Seismic – ensures the safe planning and execution of drilling, completion and work over operations
- Projects – responsible for the engineering, construction and execution of projects on operational facilities to ensure ongoing integrity and safe operation
- Marine Group – responsible for chartering vessels to support Woodside's offshore production facilities including vessels to aid emergency response
- Aviation Group – provides personnel transport, material transport, emergency evacuation and search and rescue capabilities.

7.5 Roles and responsibilities

Key roles and responsibilities for Woodside and contractor personnel relating to implementing, managing and reviewing this EP are described in Table 7-8. Roles and responsibilities for oil spill preparation and response are outlined in the Oil Pollution First Strike Plan (Appendix H) and the Woodside Incident Management Handbook.

It is the responsibility of Woodside and contractors to implement the Woodside Corporate Health, Safety and Environment Policy (Appendix A) in their areas of responsibility and to ensure that the personnel are suitably trained and competent in their respective roles.

Table 7-8: Roles and responsibilities

Title (role)	Environmental responsibilities
All personnel	
All facility-based personnel and onshore support personnel	• understand the Woodside standards and procedures that apply to their area of work • understand the environmental risks and control measures that apply to their area of work • carry out assigned activities in accordance with approved procedures and the EP • follow instructions from relevant supervisor with respect to environmental protection • cease operations which are deemed to present an unacceptable risk to the environment • participate in environmental assurance activities and inspections as required • prompt reporting of environmental hazards/incidents to their supervisor and assist in event investigation. • attend HSE meetings, training and drills when required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
Office-based personnel	
Asset Manager	• accountable for ensuring all necessary regulatory approvals are in place to operate • approves (decides on) the content to be contained in the EP • accountable for managing the asset throughout its operations in accordance with legislative/regulatory requirements (including this EP) and WMS requirements. • approves written notification to regulatory authorities (for example notifications to NOPSEMA under this EP) • agrees facility key performance indicators (KPIs), including environment KPIs and is accountable for their achievement • accountable for incident notification, reporting and investigation in line with regulatory requirements, the WMS and EP requirements • decides on technical decisions where required based on assessed current level of risk • responsible for continuous improvement of operations of the facility, including environmental performance
Asset Superintendent	• responsible for the operation of the facility in accordance with legislative/regulatory requirements (including this EP) and the WMS. • accountable for aspects of integrity management. • accountable for conformance to production Operations processes including ISSoW. • decide on technical decisions where required based on assessed current level of risk. • communicate changes relevant to the EP to the Production Environment team.
Reliability and Integrity Manager	• steward of Reliability and Integrity for the business unit. • lead a team that expertly ensures that strategies for equipment maintenance and operation are set to meet Reliability, Performance and Integrity goals. • ensuring that the Safety Case, Performance Standard, Regulatory and Reliability driven maintenance tasks for all equipment are known and implemented in the most efficient maintenance strategy possible. • ensuring that Very High and Severe risks are assessed and controlled when they appear, and that the right technical expertise, including technical authorities, is engaged to understand, communicate and manage the risk, as part of the 'Agree' role in the Engineering Management Procedure. • ensuring that refresh of facility baseline risk assessments is completed upon trigger of re-assessment. • assuring that reliability and integrity delivery processes in the assets is being done to correct standard and engaging with relevant process owners.
Technical Support Lead	• responsible for safeguarding process safety with respect to the asset. • ensure technical integrity risks are identified, managed and reduced to ALARP. • recommend technical decisions where required based on assessed current level of risk.
Integrity Authorities (Technical Integrity Custodians, Technical Authorities and Engineering Authorities)	• agree technical integrity decision based on assessed current level of risk when discipline owner • undertake process safety responsibilities as defined under the Woodside process safety framework.
Environment Manager Australian Operations	• facilitate operations environmental approval documentation and timely submission in accordance with regulatory requirements. • facilitate review of the EP, including five-yearly revision and in relation to any technical decisions or proposed changes to operations. • ensure Asset and supporting personnel understand and adhere to legislative and regulatory environment requirements, EP requirements and the environmental requirements of the WMS.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	• monitor and communicate to internal stakeholders relevant changes to legislation, policies, regulator organisation that may impact the EP or business. • develop and maintain appropriate Production environmental processes and procedures.
Environment Adviser Australian Operations	• manage change relevant to the EP in accordance with the regulations and the EP. • ensure environmental monitoring, offshore inspections, and reporting is undertaken as per the requirements of this EP. • coordinate and monitor closeout of corrective actions. • ensure environmental inspections/audits are undertaken as per the requirements of the EP. • ensure environmental incident reporting meets regulatory requirements (as described within the EP) and WMS.
Subsea and Pipelines (IMMR) Activity Manager	• ensure IMMR process undertaken in line with EP commitments • manage IMMR change requests for the activity and notify the Environment Adviser of any scope changes in a timely manner • provide sufficient resources to implement the EP requirements • monitor and close out corrective actions raised from IMMR environmental inspections/audits or incidents • responsible for governance of IMMR related activities for subsea support vessels.
Corporate Affairs Adviser	• prepare and implement the consultation plan for the petroleum activity • reporting on consultation • perform ongoing stakeholder liaison as required.
Woodside Marine Services Function	• conduct relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements to meet safety, navigation and emergency response requirements
Woodside CIMT Deputy Incident Commander	On receiving notification of an incident, the Woodside CIMT deputy incident commander (IC) shall: • establish and take control of the Incident Management Team and establish an appropriate command structure for the incident • assess the situation, identify risks and actions to minimise the risk • communicate impact, risk and progress to the Crisis Management Team and stakeholders • develop the incident action plan (IAP), including objectives for action • approve, implement and manage the IAP • communicate within and beyond the incident management structure • manage and review safety of responders • address the broader public safety considerations • conclude and review activities.
Contractor Sponsors	• ensure implementation of EP for the contractor's scope of work • ensure contractors have adequate environmental capability in order to execute their respective scopes of work • review contractor environmental performance as required.
Offshore-based personnel	
GWA Offshore Installation Manager (OIM)	• in charge of the GWA facility and the field • accountable for implementation of the EP at the facility • ensures offshore personnel comply with regulatory/legislative requirements (including the EP) and the WMS • responsible for Area Operations compliance with Technical Integrity requirements including MoC process, Permit to Work process and MOPO and process safety requirements

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	• single point responsible person for the coordination of simultaneous activities • accountable for the performance and development of direct reports, ensuring operator capability and competency across all shifts and ensuring the skill requirements of the Production division are being met. • implement relevant offshore environment initiatives and review environmental performance to drive continuous improvement. • ensure effective communication with workforce on environmental performance • ensure incidents are reported and investigated in line with WMS and EP requirements, with appropriate actions initiated and closed out • lead response efforts (as Incident Controller) in managing emergency or crisis scenarios • ensure exercises and drills are conducted in a manner to assure the facility's ability to respond effectively to an emergency • decide on technical decisions where required based on assessed current level of risk • communicates changes relevant to the EP to the Production Environment team.
Frontline and Executive Superintendents, Operations and Maintenance Supervisors	• accountable for the day-to-day operations of the facility including effective shift handover; completion and logging of operator routine • responsible for operations shift compliance to all legislative and regulatory requirements as defined in the EP • responsible for permitting and isolation for all frontline work activities • responsible for following emergency response protocols in accordance with the emergency response procedure and fulfilling allocated emergency response roles • responsible for leading and coordinating a multi-disciplined team performing specific duties required to support the facility, including helicopter operations, vessel movements and consumable controls.
Operations and Maintenance Technicians	• responsible for all daily operations on the facility within their operational control. • undertake daily operational and maintenance tasks in accordance with approved standards and procedures to ensure compliance with the EP. • manage day-to-day environmental risks through use of ISSoW and other risk management tools. • identify opportunities for continuous improvement and communicate these to their Supervisor. • complete training requirements to maintain competence and knowledge in operating and maintaining equipment, and manage environmental risks and impacts. • participate in environmental assurance activities and inspections as required. • report all environmental hazards and incidents and assist in investigations.
Health, Safety and Environment Coordinator (HSEC)	• liaise with managers/supervisors on day to day management of environmental risks and issues • assist in the ongoing promotion of environmental performance at the facilities and day-to-day management HSE risks and issues • support operational personnel to understand the EP requirements applicable to their role • identify opportunities for continuous improvement and communicate these to the OIM and Environment Team • implement environmental improvement plans • communicate environmental performance information and training material to offshore personnel and maintain associated records.
Vessel-based personnel	
Vessel Master of Support Vessel (Platform and Subsea Support Vessels)	• understand and manage HSE aspects of the vessel, including environmental requirements • communicate with OIM as required regarding potential environmental risks applicable to vessel activities • ensure vessel meets quarantine requirements

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	• notify AMSA and other authorities of any incidents as per maritime requirements • provide, as requested by Woodside, copies of documents, records, reports and certifications (i.e. fuel use, ballast exchanges, waste logs, etc.) in a timely manner to assist in compliance reporting • ensure the vessel's Emergency Response Team have sufficient training to implement the vessel's SOPEP • ensure all emergency and SOPEP drills are conducted • ensure that vessel procedures are followed in the event of an emergency or spill • immediately notify the Woodside Representative of any environmental incidents.
Subsea and Pipelines Site Woodside Representative	• ensure relevant management measures in this EP are implemented on the Subsea Support Vessel • ensure periodic environmental inspections are completed • ensure environmental incidents or breaches of EPOs, EPSs or MCs are reported in accordance with Woodside and regulatory requirements • ensure Subsea Support Vessel induction attendance is recorded.

7.6 Training and competency

Woodside as part of its contracting process assesses a proposed contractor's environmental management system (EMS) to determine the level of compliance with the standard AS/NZ ISO 14001. This assessment is performed for the Petroleum Activity as part of the pre-mobilisation process. The assessment determines whether there is a clearly defined organisational structure that sets out the roles and responsibilities for key positions. The assessment also assesses whether there is an up-to-date training matrix that defines any corporate and site/activity-specific environmental training and competency requirements.

As a minimum, environmental awareness training is required for all personnel, detailing awareness and compliance with the contractor's environmental policy and EMS.

7.6.1 Inductions and training

Inductions are provided to all relevant personnel (e.g. contractors and Company representatives) before mobilising to or on arrival at the activity location. The induction covers the HSE requirements and environmental information specific to the activity location. Attendance records will be maintained.

The induction may include, but is not limited to:

- description of the activity
- ecological and socio-economic values of the activity location
- regulations relevant to the activity
- Woodside's Environmental Management System – Health Safety and Environment Policy
- EP importance/structure/implementation/roles and responsibilities
- main environmental aspects/hazards and potential environmental impacts and related EPOs
- oil spill preparedness and response
- monitoring and reporting on EPOs and standards using measurement criteria
- incident reporting
- inductions for offshore facility workers and visitors;
- operations competency framework training;
- permit to work training (ISSoW);
- production environmental leadership training and environment awareness training;
- emergency and hydrocarbon spill response training;

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- inductions for subsea IMMR (vessel based) personnel; and
- Unexpected Finds Procedure and reporting requirements (Section 6.7.2).

Records for Woodside operations personnel, in relation to the above-listed training, are maintained in Woodside's Learning Management System. Contractor training records are maintained in the Contractor Verification platform.

Competence of operations personnel can be reviewed via online dashboards.

7.6.2 Specific environmental awareness

Before the Petroleum Activity begins, a pre-activity meeting will be held onboard the facility and support vessels with all relevant personnel. The pre-activity meeting provides an opportunity to reiterate specific environmental sensitivities or commitments associated with the activity. Relevant sections of the pre-activity meeting will also be communicated to the support vessel personnel. Attendance lists are recorded and retained.

During operations, regular HSE meetings will be held on the facility and support vessels which cover all crew. During these meetings, recent environmental incidents are reviewed and awareness material presented.

7.6.3 Inductions for offshore facility workers and visitors

A comprehensive induction process is in place for personnel working on or visiting Woodside's offshore production facilities. The induction process is designed to equip personnel with the HSE awareness and skills necessary for them to manage their own safety and environmental performance and contribute to others working around them. The induction process includes:

- **Common Production Induction** – All employees and contractors who have not accessed a production facility within 12 months are required to undertake this induction prior to mobilisation. It includes Woodside's values, HSEQ and Process Safety, continuous improvement and risk management.
- **ISSoW** - All members of the workforce that are required to work with ISSoW receive training commensurate with the level of authority and responsibility they hold in ISSoW.
- **Facility Specific Induction** – All employees and contractors that have not accessed the production facility within twelve months are required to undertake this induction before or upon arrival at the facility. This induction covers the HSE and emergency response issues specific to each facility.
- **Production Offshore Environmental Leadership Training** – Key operations leadership roles (as specified within the Operations Competency Framework) are required to complete this competency on commencement of the new role and three yearly thereafter. The training covers Woodside's policies and standards, environmental legislative requirements, the EP, key environmental risk and impacts, environmental reporting, environmental management tools (e.g., improvement planning, compliance reviews and audits), hydrocarbon spill response and environmental accountabilities.
- **Production Offshore Environmental Awareness Training** – All new offshore operational personnel are required to undertake this online training on commencement of the new role and two yearly thereafter. This training covers environmental legislative requirements, the facility EP, key environmental hazards and control measures (including waste management, spill prevention, chemical storage, wildlife interactions as well as other relevant environmental aspects), environmental management tools, hazard and incident reporting, spill response, and environmental responsibilities.

7.6.4 Operations competency framework training

The Operations Competency Guideline outlines the requirements for competency and proficiency within the Australian Operations Division and informs individuals of their roles and responsibilities to ensure safe, reliable, and efficient operations. By doing this, the potential for unplanned (accident/incident) type events that could result in environmental impact is minimised.

Operational Area Licence to Operate (LTO) roles are those roles related to oil and gas processing, equipment maintenance, marine regulations, emergency response and any other roles involved with safeguarding the facility integrity, including all roles where high-risk work licences are required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The requisite competency and training for each LTO role has been defined. Competencies for these LTO roles are stipulated by the governance group for each respective position and are based on the relevant Australian or International standards which apply. In cases where no Australian or International standards are available or applicable, training is based on the relevant Woodside Standard as determined by the respective governance group.

Contractors working on Woodside facilities are required to verify the competency of their personnel through the contractor's own verification systems. Additionally, contractor personnel working on Woodside facilities are required to be registered in Woodside's Contractor Verification Service (CVS) beforehand. Personnel registered in CVS have had their skills and qualifications independently verified on behalf of Woodside thereby confirming that contractor personnel hold the required competencies before mobilisation to the facility.

The Woodside Competency Reporting Dashboard provides the conformance status of the facility against the LTO roles requirements.

7.6.5 Permit to work system training

The ISSoW permit to work (i.e., participation in crisis or emergency management exercises). Roles based training is further described in Section 7.14.

An overview of Woodside's hydrocarbon spill response training and competency requirements are provided in dashboards for key responder roles. The roles are consistent with Woodside's crisis and emergency management incident control structure system (see Section 7.2.1) is a key element in ensuring that all necessary steps are taken to ensure the safety of personnel, protection of the environment and technical integrity of the facility. The ISSoW system takes a risk-based approach to all activities, thus tasks with higher levels of risk are subjected to greater scrutiny and control.

All members of the workforce that are required to work with ISSoW (Section 7.2.1) receive training commensurate with the level of authority and responsibility they hold in ISSoW.

7.6.6 Emergency and hydrocarbon spill response training

All operations personnel involved in crisis and emergency management are required to commit to ongoing training, process improvement and participation in emergency and crisis response (both real and simulated), including emergency drills specific to potential incidents at the facility. Training includes task specific training and role-based training and 'on the job' experience.

Woodside Hydrocarbon Spill Preparedness Advisor(s) are responsible for maintaining hydrocarbon spill preparedness competency. This includes the identification and development of approved competency and non-competency-based courses, identification of relevant personnel required to undertake training and ensuring training records are maintained. Minimum Woodside capabilities will continue to be identified and documented.

7.6.7 Subsea inspection, monitoring, maintenance and repair activity environmental awareness

At the beginning of, and during a new subsea IMMR activity, the subsea support vessel crew including contractor crew, Woodside representatives and other relevant personnel are required to undertake a vessel induction before commencing work. This induction covers HSE requirements for the vessel and IMMR activities, and as required environmental information specific to the activity location. The induction may cover the following environmental information:

- adherence to standards and procedures, and the use of job safety analysis and permit to work hazard identification and management process;
- spill management including prevention, response and clean-up, location of spill kits and reporting requirements;
- waste management requirements and location of bins;
- reporting of marine fauna, location of forms and charts;
- chemical management requirements; and

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Unexpected Finds Procedure and reporting requirements (Section 6.7.2).

All personnel who undertake the induction are required to sign an attendance sheet which is retained.

Regular HSE meetings are held on subsea support vessels with crew. During these meetings, any environmental incidents are reviewed, and environmental awareness material presented.

7.6.8 Management of training requirements

All personnel on the facility and support vessels are required to be competent to perform their assigned positions. This may be in the form of external or 'on the job' training. The vessel Safety Training Coordinator (or equivalent) is responsible for identifying training needs, keeping records of training performed and identifying minimum training requirements.

7.7 Monitoring, auditing, and managing non-conformance and review

Regulation 22(5) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental impacts and risks of the Petroleum Activity against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

A key tool that is used throughout the implementation of the EP is Woodside's environmental compliance and action register (ECAR). This is an internal tool that is developed at EP acceptance and is maintained until the EP is closed. The ECAR contains all the commitments, controls, EPSs and MCs from the EP and tracks compliance against each of these items.

7.7.1 Monitoring

Woodside and its contractors will perform a program of periodic monitoring throughout the Petroleum Activity, from mobilisation of each activity through to activity completion. A summary of emissions and discharges monitoring is presented in Table 7-9. Monitoring will be undertaken using the systems and tools described below, which have been developed to demonstrate implementation of the EPOs, controls, EPSs and MCs described in this EP. These systems will collect, as a minimum, the evidence specified in the MCs presented in Section 6 and Appendix D. This information form part of Woodside's permanent compliance record and provide the basis for demonstrating that the EPOs and EPSs have been achieved, with outcomes summarised in routine reporting documents.

7.7.1.1 Source-based impacts and risks

The systems and tools to monitor environmental performance, where relevant, will include:

- daily reports which include leading indicator compliance
- periodic review of waste management and recycling records
- use of contractor's risk identification program that requires recording and submitting safety and environment risk observation cards routinely (frequency varies with contractor)
- collection of evidence of compliance with the controls detailed in the EP relevant to offshore activities by the Woodside Offshore HSE Adviser (other compliance evidence is collected onshore)
- environmental discharge reports that record volumes of planned and unplanned discharges downhole (in the well), to ocean and atmosphere
- monitoring of progress against the Global Wells and Seismic function and Operations Division scorecards for KPIs
- internal auditing and assurance program as described in Section 7.7.2.

Throughout this activity, Woodside will continue to identify and assess new source-based impacts and risks through monitoring and auditing systems and tools described above and in Section 7.7.2.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Other examples of assurance tasks implemented through the EP include (as an example):

- start of shift operator walk arounds;
- permit to work hazard, risk management check list, area sign-on, and permit audits (ISSoW – Section 7.6.5);
- technical integrity SCE performance reviews (daily, weekly, monthly) (Section 2.5.5);
- ongoing maintenance performance assurance (e.g. conformance dashboard);
- management system performance audits reviews (e.g. MSPSs) (Section 7.7.2); and
- data gathering and governance dashboard presentations (e.g. Woodside Integrated Risk and Compliance System).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-9 Summary of emissions and discharges monitoring for the Petroleum Activity

Category	Parameter to be Monitored/Reported	Monitoring Frequency	Monitoring Equipment/Methodology	EP Reference
Planned Emissions				
Atmospheric emissions	Greenhouse, energy and criteria pollutants	Normally continuous process metering/annual reporting	NGERS and NPO reporting estimation methods (e.g. fuel/flare flow meters, throughput meters, process estimation)	Section 6.7.7
	Fuel gas and flare intensity	Normally continuous process metering/monthly reviews	Fuel and flare flowmeters inform intensity profiles – tracked against optimisation targets	Section 6.7.7
Planned Discharges				
Discharge of subsea control fluids during valve actuations	Subsea control fluid consumption	Normally continuous process indication/monthly review	Subsea control fluid consumption surveillance. Process indication for gross leaks/ruptures	Section 6.7.4
Discharge of hydrocarbons and chemicals during subsea IMMR activities	Volumes of hydrocarbons and chemicals released subsea	As required, during IMMR activities (activity specific)	Estimates based on known volumes pumped and ROV observation	Section 6.7.4
Discharge of produced water	Volume discharged overboard	Normally continuous process indication/monthly review	PW flow meter(s), process estimation	Section 6.7.5
	OIW concentration of discharged PW	Normally continuous process indication/monthly review	Normally continuous process metering/monthly review	
	Chemical characterisation	Annually	Characterisation of end-of-pipe sample	
	WET testing	Three yearly	PW ecotoxicity testing	
Waste recycling and disposal	Quantities of solid and liquid wastes disposed of onshore	Ongoing	Facility waste manifest	Section 6.9.2
Unplanned Emissions and Discharges				
Unplanned emissions and discharges	Nature of release	As required	HSEQ Event Reporting System (First Priority)	Section 6.8 and 6.9

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7.2 Auditing

Environmental performance auditing will be performed to:

- identify potential new, or changes to existing environmental impacts and risks, and methods for reducing those to ALARP
- confirm that mitigation measures detailed in this EP are effectively reducing environmental impacts and risks, are practicable and provide appropriate information to verify compliance
- confirm compliance with the EPOs, EPSs and MCs detailed in this EP.

Internal auditing will be performed to cover key activities as summarised below.

7.7.2.1 Support vessel activities

The following internal assurance will be performed for vessel-based activities:

- A pre-mobilisation inspection/audit will be conducted by relevant personnel. The scope of the audits are risk-based and specific to the relevant activity, but will generally focus on aspects relating to ensuring appropriate understanding of environmental commitments and the operational readiness of the activity scope, including appropriate environmental controls in place. All vessels associated with identified scopes will be audited by Woodside.
- At least one operational compliance audit relevant to applicable EP commitments will be conducted by a Woodside Environment Adviser for subsea support vessels. The audit may be conducted offshore or be office-based, subject to the duration of the activity and logistics of performing the audit offshore for short duration scopes.
- Contractor-specific HSE audits will also be conducted of all support vessels. The audits will consider the implementation of HSE management, risk management, as well as pre-mobilisation and offshore readiness.
- Vessel-based HSE inspections will be conducted fortnightly by vessel HSE personnel. Each inspection will focus on a specific risk area relevant to the activity and a formal report will be issued (for example, bunkering controls, chemical and discharge management, cetacean reporting, etc).
- Annual inspection of Woodside's long-term hire support vessels are undertaken to ensure compliance with both the EP and the approved Contractor Management system.

The internal audits and reviews, combined with the ongoing monitoring described in Section 7.7.1, and collection of data referenced in the MC are used to assess EPOs and EPSs.

As part of Woodside's EMS and/or assurances processes, activities may also be periodically selected for environmental audits as per Woodside's internal auditing process. Audit, inspection and review findings relevant to continuous improvement of environmental performance are tracked through the ECAR.

This Environmental Commitments and Actions Register is used to track support vessel and subsea activity compliance with EP commitments, including any findings and corrective actions.

Non-conformances identified will be reported and/or tracked in accordance with Section 7.7.3.

7.7.2.2 Operations assurance

The Provide Assurance Procedure and the Provide Assurance Guideline ensure that risks are managed while business activities are being performed. The Guideline aims to explain how the Operations Division Assurance Team implements WMS Assurance requirements, while concurrently satisfying the Operations Division's specific objectives.

Operations Assurance Assignments are contained within the Operations Division Integrated Assurance Assignment Plan.

Environmental assurance activities are conducted on a regular basis to help:

- Verify environmental risks and potential impacts are being managed in accordance with the EPOs and EPSs;

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Monitor, review and evaluate the effectiveness of the EPOs and EPSs;
- Verify effectiveness of the implementation strategy; and
- Identify potential non-conformances.

The outputs of the assurance process are corrective actions that drives continuous improvement.

7.7.2.3 Annual offshore inspection / desktop review

An inspection or review of the GWA facility is undertaken every calendar year by the Production Environment Team. Selected risk areas and/or activities are inspected against relevant EPOs and EPSs. The outcomes verify that control measures are effective in reducing the environmental impacts and risks to ALARP and an acceptable level.

The inspection or review also assesses conformance with selected aspects of the implementation strategy. All risk sources and activities applicable to the GWA facility are reviewed over a rolling three-year period. Records of findings, together with the close-out of any corrective or improvement actions, are maintained, with action close-out tracked in Woodside's action tracking system.

7.7.2.4 Marine assurance

Woodside's marine assurance is managed by the Marine Assurance team in accordance with the Offshore Vessel Assurance Standard. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

The process is mandatory for all vessels (other than tankers and floating production storage and offloading vessels) hired for Woodside operations, including for short-term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel are fit for duty, meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the following marine assurance activities:

- offshore vessel management system assessment (OVMSA)
- dynamic positioning (DP) assessment
- vessel inspections
- offshore vessel inspection database (OVID) or condition and suitability assessment
- support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the operator's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. A Woodside marine assurance specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- Oil Companies International Marine Forum OVID Inspection
- International Marine Contractors Association Common Marine Inspection Document Inspection
- Marine Warranty Survey.

Upon completion of the assurance process, a statement of approval is issued by the Woodside Marine Assurance team confirming that identified concerns have been addressed appropriately and that the imposed conditions are being management.

If a vessel inspection and/or OVMSA verification review is not available and all reasonable efforts based on time and resource availability have been made to complete this (e.g. short-term vessel hire), the marine assurance specialist offshore may approve the use of an alternative means of inspection, known as a risk assessment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Environmental requirements specific to PSV contractors are communicated via Woodside marine charterers instructions. This document provides the Master of a vessel on hire to Woodside with a clearly defined set of requirements and procedures for operating the vessel in the vicinity of the Woodside's operating facilities. This includes the management of environmental risks and impacts from the facility. The document includes information on:

- applicable legislation and guidelines;
- roles and responsibilities;
- marine fauna interaction guidance; and
- incident reporting requirements.

Environmental requirements specific to subsea support vessels are communicated via the Subsea Environmental Compliance Package. This document outlines mandatory environmental management requirements for subsea support vessels and associated contractors.

7.7.2.5 Risk assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short-term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

- Management control factors:
  - Company audit score (i.e. management system)
  - vessel HSE incidents
  - vessel Port State Control deficiencies
  - instances of Port State Control vessel detainment
  - years since previous satisfactory vessel inspection
  - age of vessel
  - contractors' prior experience operating for Woodside.
- Activity risk factors:
  - people health and safety risks (a function of the nature of the work and the area of operation)
  - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
  - value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
  - reputation risk
  - exposure (i.e. exposure to risk based on duration of activity)
  - industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7.3 Management of non-conformance

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per HSE Event Reporting and Investigations Work Instruction which includes learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent recurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a consequence matrix for classification of environmental incidents, with the significant categories being A, B and C. Detailed investigations are completed for all categories A, B, C and high potential environmental incidents.

7.7.4 Review

7.7.4.1 Management review

Within the relevant Environment teams, regular reviews of the effectiveness of the implementation strategy are undertaken at a frequency commensurate with the impact and risk profile of the Petroleum Activity. This review may consider:

- Operations Division key performance indicators (KPIs)
- effectiveness of tools and systems to monitor environmental performance
- lessons learned from implementation during previous campaigns or activities
- reviews of oil spill arrangements and testing performed in accordance with this EP.

Within each Asset team or Business Unit, managers review environmental performance regularly, usually though incident and event reporting and monthly HSE reports. The outcome of such reviews will inform whether further action is required to address key or recurring environmental performance matters.

7.7.4.2 Learning and knowledge sharing

Learning and knowledge sharing occurs via several different methods including:

- event investigations
- event bulletins
- formal and informal industry benchmarking
- cross-asset learnings
- engineering and technical authorities discipline communications and sharing.
- review of impacts, risks and controls across the life of the EP.

7.7.4.3 Continuous improvement

Continuous improvement (CI) projects that involve refurbishment, modification or major maintenance on the facility are typically managed by Offshore Development and Delivery Engineering Teams and are required to follow Appraise and Develop management procedures. Currently, the procedures require that all projects be managed in accordance with the Investment Management Framework which supports the progressive maturation of an opportunity through value creation in the Assess and Select Phases and the maintenance of value in the Develop and Execute phases.

To support the accountable executive to make a decision on whether a CI Project should proceed to the next phase in the Investment Management Framework, it is sometimes necessary to conduct a trial of the modification to determine the outcomes that can be expected if the modification is implemented. Due to prioritisation of resources, the phased progress of opportunities, competition between different solutions and long-term strategic and financial considerations, it is not possible to set quantitative success criteria to

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

determine whether a modification will be implemented based on the results of trials. Instead, the results of a trial are used to inform a decision on whether to progress the CI Project to the next phase in the Investment Management Framework. Decisions are typically made with two key considerations; whether the business is ready to proceed which has a technical/functional focus and whether there is a business case for progressing to the next phase. The business case may consider the ALARP position for the CI Project, if relevant.

7.8 Management of knowledge

Relevant knowledge of the existing environment, socio-economic context and regulatory framework is periodically reviewed to identify changes that may influence the environmental impact and risk assessments for this EPs.

Knowledge reviews are undertaken on both routine and ad hoc basis, including quarterly and annual reviews and as information becomes available. These reviews encompass:

- environmental science: updates from scientific literature, government publications and Woodside-supported studies, including information relating to species, habitats and Matters of National Environmental Significance under the EPBC Act.
- socio-economic environment and stakeholder information: updates from published sources and consultation activities
- environmental legislation: monitoring of regulatory changes and alignment with applicable requirements.

A management of knowledge tracker is maintained to record reviews and updates. Relevant new information is communicated through regular cross-functional environmental forums, where it is assessed to determine whether changes to impacts, risks or controls are required.

The documentation of reviews, communication of relevant new knowledge, and consideration of MOC, are documented in the WMS EP Delivery Guideline. Table 7-10 outlines the formal quarterly management of knowledge review frequency and the due dates for finalisation of the associated report.

Table 7-10: Management of knowledge review frequency

Management of knowledge review	Quarterly final report due date
1st Quarter Review (1st Jan - 31st Mar)	31st March
2nd Quarter Review (1st April -30th Jun)	30th June
3rd Quarter Review (1st Jul - 30th Sep)	30th September
4th Quarter Review (1st Oct - 31st Dec)	31st December

Where new information may affect the environmental risk profile or control framework, it is assessed and managed through Woodside's Management of Change (MoC) process (Section 7.10). Under the AEP Joint Industry Operational and Scientific Monitoring (OSM) arrangements, environmental baseline information is reviewed annually and updated as required. This includes maintenance of the environmental baseline database and identification of data gaps. Any additional studies required by Woodside are coordinated by the Biodiversity and Science Team.

7.9 Management of newly identified impacts and risks

New sources of impacts and risks identified through monitoring and auditing systems and tools, and the Woodside Environment Knowledge Management System are assessed using the Change Management Process.

7.10 Management of change and revision

7.10.1 Environment Plan management of change

Management of changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description described in this EP including: review of advances in technology at

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, EPBC Act listed threatened and migratory species status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current requirements for AMPs; and potential new advice from external stakeholders, will be managed in accordance with Regulation 39 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology detailed in this EP to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 39 of the Environment Regulations.

Minor changes where a review of the activity and the environmental impacts and risks of the Petroleum Activity do not trigger a requirement for a formal revision under Regulation 39 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental impacts and risks is not required (e.g. document references, phone numbers, etc.), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative impact and risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

7.10.2 Oil Pollution Emergency Plan management of change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes to the Oil Pollution Emergency Plan (OPEP) are identified through the reviews described above, they will be assessed against Regulations 38 and 39 of the Environment Regulations to determine whether resubmission of the EP (including the OPEP) is required.

Changes that do not trigger EP resubmission are managed through Woodside's Management of Change (MoC) process and documented in relevant records. These changes are incorporated into the OPEP through internal updates or at the five-yearly EP revision, as appropriate.

7.11 Record keeping

Regulation 22(6) of the Environment Regulations requires records of emissions and discharges to be maintained.

Compliance records referenced in MCs contained within this EP will be maintained. Many of the MCs listed in this EP refer to 'records'. Woodside considers 'records' to mean any hard or soft copy of information such as data, observations, certifications or photographs that can show a point in time and can be duplicated such that they can be stored in compliance systems and/or provided to internal and external auditors (i.e. NOPSEMA) on request.

7.12 Ongoing consultation

Although consultation for the purpose of Regulation 25 is complete, in accordance with Regulation 22(15) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside engages in ongoing consultation with relevant persons throughout the life of the EP, including undertaking the engagements listed in Table 7-11. New information identified during ongoing consultation will be assessed as appropriate using the EP Management of Knowledge system and Management of Change Process.

Woodside hosts community forums on a regular basis at which members are provided updates on Woodside activities (for example community liaison group meetings). Representatives who are present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), local government, Indigenous groups, industry representative bodies, community and industry organisations.

Relevant persons and others who are interested in Woodside activities, can otherwise remain up-to-date through subscribing to receive Consultation Information Sheets and other information via the Woodside website, or by accessing the publicly available EP on NOPSEMA's website.

Woodside supports ongoing engagement with Traditional Custodians, which complies with Woodside policies, strategies and procedures and is directly informed by feedback from Traditional Custodians

It provides a mechanism for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the activity and in relation to caring for and managing country, including Sea Country. The approach will be tailored to each Traditional Custodian group and may include, as agreed with relevant Traditional Custodians:

- social investment to support Indigenous ranger programs
- support for Indigenous oil spill response capabilities
- support for recording Sea Country values
- support to Traditional Custodian groups to build capabilities and capacity with respect to ability to engage with Woodside and the broader oil and gas industry on activities
- development of ongoing relationships with Traditional Custodian groups
- any other initiatives proposed for protecting Country, including cultural values.

At the time of EP submission, a number of specific activities as part of ongoing consultation regarding the Petroleum Activity are planned with Traditional Custodians. Where Traditional Custodian relevant persons have requested information or further engagement considered as ongoing consultation, , these requests have been captured in Table 7-11.

Table 7-11: Ongoing consultation engagements

Report/ information	***Recipient***	***Purpose***	***Frequency***	***Content***
Notification (email)	AHO	As requested by AMSA and AHO during consultation	Notify AHO no less than 4 weeks prior to commencement of activities where vessels will be in the Operational Area, but outside of the Petroleum Safety Zone >3 weeks.	PS 1.6 (Section 6.7.1) Date of activity start.
Notification (email)	AMSA JRCC	Standard practice	Notify JRCC prior to commencement of activities where vessels will be in the Operational Area, but outside of the Petroleum Safety Zone >3 weeks.	PS 1.7 (Section 6.7.1) Date of activity start.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Report/ information	Recipient	Purpose	Frequency	Content
		Standard practice	Notify JRCC prior to activities where vessels will be undertaking activities in, or within 1 km of, shipping lanes and the vessel will be connected to the seabed.	PS 1.8 (Section 6.7.1) Date of activity start.
Notification (email)	WAFIC, Recfishwest, AFMA, DPIRD, DAFF – Fisheries, CFA	Standard Practice	At least 10 days prior to commencement and following completion of activities where vessels will be in the Operational Area, but outside of the Petroleum Safety Zone >3 weeks.	PS 1.9 (Section 6.7.1) Date of activity start and end.
Notification (email)	Director of National Parks	Standard Practice as required by Class Approval.	Notify DNP at least 10 days prior to all activities occurring within the Montebello AMP – Multiple Use Zone (excluding transiting) and at the conclusion of that activity.	PS 1.10 (Section 6.7.1) Date of activity start and end.
		As requested during consultation	Notify DNP upon acceptance of this EP.	PS 1.10 (Section 6.7.1)
Notification of significant change (email)	All relevant persons	Standard practice (when notification of significant change is needed)	As needed.	Notification of significant change.
Emails/ Meetings	Persons or organisations who provide feedback to Woodside post EP submission	Identification, assessment and consideration of feedback, claims and/or objections	As appropriate.	Assessment of claims and/ or objections. Relevant new information will be assessed using the EP Management of Knowledge (Section 7.8) and Management of Change Process (refer to Section 7.10).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Report/ information	Recipient	Purpose	Frequency	Content
Notification (email)	Australasian Underwater Cultural Heritage Database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.2.5).	Report any unexpected finds of potential Underwater Cultural Heritage	If triggered by Unexpected Finds Procedure (Section 7.2.5).	Refer to Unexpected Finds Procedure (Section 7.2.5 and PS 3.2).
Various forms of engagement including but not limited to emails, phone calls and meetings.	Relevant cultural authorities who provide information to Woodside following submission.	Identification, assessment and consideration of cultural values relevant to the Petroleum Activity.	When engaged or as appropriate.	Relevant new information on cultural values received by Woodside will be assessed using the EP Management of Knowledge (Section 7.8) and Management of Change Process (Section 7.10). 7.87.10

7.13 Reporting

To meet the EPOs and EPSs outlined in this EP, Woodside reports at a number of levels, as outlined in the next sections.

7.13.1 Routine reporting (internal)

7.13.1.1 Daily progress reports and meetings

The following daily reports containing environmental performance information are issued:

- pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events; and Pan-Woodside Daily Production Report – The report includes facility performance information on production and a log of any HSE events; and
- subsea support vessel Daily Progress Report(s) – During subsea IMMR activities, daily reports are issued by the Woodside Site Representative. Subsea support vessel Daily Progress Report(s) – During subsea IMMR activities, daily reports are issued by the Woodside Site Representative. The reports provide performance information on HSE events, diesel use, together with equipment information, current and planned work activities.

Meetings between key personnel are used to transfer information, discuss incidents, agree plans for future activities and develop plans and accountabilities for resolving issues.

7.13.1.2 Regular health, safety and environment meetings

Dedicated HSE meetings are held with offshore and Perth-based management and advisers to address targeted HSE incidents and initiatives. Minutes of these meetings are produced and distributed as appropriate.

7.13.1.3 Performance reporting

Monthly and quarterly performance reports are developed and reviewed by the Australian Operations HSE Function and Business Unit Leadership Teams. These reports cover several subject matters, including:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- HSE incidents (including high potential incidents and those related to this EP) and recent activities
- corporate KPI targets, which include environmental metrics
- outstanding actions as a result of audits or incident investigations
- technical high and low lights

7.13.2 Routine reporting (external)

7.13.2.1 Start and end notifications of the Petroleum Activity

In accordance with Regulation 54, Woodside will notify NOPSEMA within ten days of the completion of the Petroleum Activity.

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activity has ended, all of the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 46 of the Environment Regulations. The Petroleum Activity is not expected to end within the five-year life of this EP.

7.13.2.2 Cetacean and whale shark sighting reporting

Woodside will keep a record of any cetacean and whale shark sightings for the life of this EP. A sightings report will be submitted to the Australian Antarctic Division annually with the reporting period being by calendar year.

7.13.2.3 Environmental performance review and reporting

In accordance with applicable environmental legislation, Woodside is required to report information about environmental performance to the appropriate regulator. Regulatory reporting requirements are summarised in Table 7-12.

Table 7-12: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Reports (Appendix E)	NOPSEMA	Monthly, by the 15th of each month	Details of recordable incidents that have occurred during the Petroleum Activity for previous month (if applicable)
Annual Environment Plan Performance Report	NOPSEMA	Annually, by the 30th April of the year following reporting period	• Compliance with EPOs, controls and EPSs outlined in this EP, in accordance with the Environment Regulations • Decommissioning progress update
National Pollutant Inventory (NPI) Report	DCCEEW	Annual, by the 30th September each year	• Summary of the emissions to land, air and water including those from the facility. Reporting period 1 July to 30 June each year.
National Greenhouse and Energy Reporting (NGERS)	Clean Energy Regulator	Annual, by the 31st October each year	• Summary of energy use and greenhouse gas emissions including those from the facility. Reporting period is 1 July to 30 June each year.
Cetacean and Whale Shark Sightings Report	Australian Antarctic Division	Annually, by 31 January each year	• Summary of any sightings of cetaceans or whale sharks. Reporting period is 1 Jan to 31 December.

7.13.3 Incident reporting (internal)

The process for reporting environmental incidents is described in Section 7.7.3. All Woodside employees and contractors are required to report environmental incidents and non-conformances with this EP. Incidents are reported using an Event Report Form which includes details of the event, immediate action taken to control the situation, and corrective actions to prevent reoccurrence.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.13.4 Incident reporting (external) – Reportable and recordable

7.13.4.1 Reportable incidents

A reportable incident is defined under Regulation 5 of the Environment Regulations as:

- ‘an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage’.

A reportable incident for the Petroleum Activity is:

- an incident that has caused environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table)
- an incident that has the potential to cause environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table).

The environmental risk assessment for the Petroleum Activity identifies those risks with a potential consequence level of C+ for environment. The incidents that have the potential to cause this level of impact include hydrocarbon loss of containment events to the environment resulting from:

- well loss of containment (MEE-01)
- subsea equipment loss of containment (MEE-02)
- topsides loss of containment (MEE-03)
- loss of structural integrity (MEE-04)
- loss of marine vessel separation (MEE-05)
- loss of control of suspended load (MEE-06)

Any such incidents represent potential events which would be reportable incidents. Incident reporting is performed with consideration of NOPSEMA (2025) guidance, stating ‘if in doubt, notify NOPSEMA’, and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the Environment Regulations.

7.13.4.1.1 Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47, 48 and 49 of the Environment Regulations. Woodside will:

- report all reportable incidents to the regulator (orally) as soon as practicable, but within 2 hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator and the department of the responsible State Minister (DMPE) As soon as practicable after orally reporting the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0831 – Reportable Environmental Incident (Appendix E) which must be submitted to NOPSEMA as soon as possible (ASAP), but within 3 days of the incident or of its detection by Woodside
- provide a copy of the written report to the National Offshore Petroleum Titles Administrator (NOPTA) and DMPE, within 7 days of the written report being provided to NOPSEMA.

AMSA will be notified of oil spill incidents ASAP after their occurrence, and DCCEEW notified if MNES are to be affected by the oil spill incident.

In the unlikely event of a spill, Woodside must notify appropriate cultural authorities that may be affected; with the purpose of mitigating potential risks to cultural heritage values in accordance with the Oil Pollution First Strike Plan (See Appendix H).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.13.4.2 Recordable incidents

A recordable incident as defined under Regulation 5 of the Environment Regulations is an incident arising from the activity that 'breaches an EPO or EPS, in the EP that applies to the activity, that is not a reportable incident'.

Any breach of the EPOs or EPSs (as presented within Section 6) will be raised as a recordable incident and managed as per the notification and reporting requirements outlined below and internal requirements outlined in Section 7.13.

7.13.4.2.1 Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50(4), no later than 15 days after the end of the calendar month using the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report (Appendix E), detailing:

- all recordable incidents that occurred during the calendar month
- all material facts and circumstances concerning the recordable incidents that the operator knows or is able, by reasonable search or enquiry, to find out
- any action taken to avoid or mitigate any adverse environment impacts of the recordable incidents
- the corrective action that has been taken, or is proposed to be taken, to prevent similar recordable incidents
- the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring.

7.13.4.3 Other external incident reporting requirements

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, Table 7-13 describes the incident reporting requirements that also apply to the Petroleum Activity if a spill original from a vessel.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-13: External incident reporting requirements

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact detail
Any marine incidents during the Petroleum Activity	Vessel Master	AMSA	Incident Alert Form 18 as soon as reasonably practicable Within 72 hours after becoming aware of the incident, submit Incident Report Form 19	AMSA	reports@amsa.gov.au
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA JRCC	As per Article 8 and Protocol I of MARPOL within 2 hours via the national emergency 24-hour notification contacts and a written report within 24 hours of the request by AMSA	AMSA JRCC	If the ship is at sea, reports are to be made to: Free call: 1800 641 792 Phone: 08 9430 2100 (Fremantle)
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA	Without delay as per the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* (Cth), part II, section 11(1), AMSA JRCC notified verbally via the national emergency 24-hour notification contact of the hydrocarbon spill; follow up with a written Pollution Report ASAP after verbal notification	AMSA JRCC	Phone: 1800 641 792 OR +61 2 6230 6811
Any oil pollution incident which has the potential to enter a National Park or requires oil spill response activities to be conducted within a National Park	Vessel Master	DCCEEW	Reported verbally, ASAP	DNP	Phone: +61 419 293 465
Activity that causes unintentional death of or injury to fauna species listed as Threatened or Migratory under the EPBC Act	Vessel Master	DCCEEW	Within 7 days of becoming aware	Secretary of the DCCEEW	Phone: 1800 803 772 Email: protected.species@environment.gov.au
Within 2 hours of becoming aware of a marine oil pollution	Corporate Incident Management	Department of Transport and Major	Verbally notify DTMI's Maritime Environmental Emergency Response Unit (DTMI MEER) Duty Officer that a spill has	DTMI MEER Duty Officer	Phone: 08 9480 9924

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact detail
incident (MOP) that occurs in or may impact state waters	Team (CIMT IC) or delegate	Infrastructure (DTMI)	occurred and, if required, request use of equipment stored in Karratha. Follow up with a written pollution reports as soon as practicable following verbal notification. Additionally, DTMI to be notified if spill is likely to extend into WA State waters. Request DTMI to provide Liaison to Woodside Incident Management Team (IMT).		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.14 Emergency preparedness and response

7.14.1 Overview

Under Regulation 22(8), the implementation strategy must contain an oil pollution emergency plan (OPEP) and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

Table 7-14 summarises how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements.

Table 7-14: Oil pollution preparedness and response overview

Content	Environment Regulations reference	Document/section reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21 (5), 21(6), 22 (2)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G)
Describes the oil pollution emergency plan	Regulation 22(8)	Woodside's oil pollution emergency plan has the following components: Hydrocarbon Spill Australia Regulatory Framework[93] Oil Pollution First Strike Plan (Appendix H) Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22(9)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G). Oil Pollution First Strike Plan (Appendix H).
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22(8), 22(12), 22(13), 22(14)	EP: Section 7.14.8 Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Demonstrates that response arrangements in the oil pollution emergency plan are consistent with the national system for oil pollution preparedness and response	Regulation 22(11)	Hydrocarbon Spill Australia Regulatory Framework

7.14.2 Emergency response training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response.

Following the mapping of training to Woodside identified competencies, training was then mapped to positions based on their required competencies (Table 7-15).

Table 7-15: Emergency response training requirements

IMT position	Minimum competency
Corporate Incident Management Team (CIMT) Incident Commander and Deputy Incident Commander	• IMT Fundamentals Course (internal course) or equivalent • ICS 100/200

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

IMT position	Minimum competency
	• IMO3 or equivalent spill response specialist level with an oil spill response organisation (OSRO) • Participation in L2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	• IMT Fundamentals Course or equivalent • ICS 100/200 • Oil spill theory • Participation in L2 activation, exercise or skills maintenance
Environment Unit Leader	• IMT Fundamentals Course • ICS 100/200 • IMO2 or equivalent spill response specialist level with an OSRO • Participation in L2 activation, exercise or skills maintenance
Note on competency/equivalency	
In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for IMT roles. The revised IMT Fundamentals training Program aligns with the performance requirements of the PMAOMIR320 – Manage Incident Response Information and PMAOM0R418 - Coordinate Incident Response. In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such, all rostered members of the Incident Management Team are trained up to ICS 200. In addition to baseline incident management training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) which involves the completion of two online AMSA Modules (Introduction to National Plan and Incident Management; and Introduction to Oil Spills) and face-to-face training. Woodside Learning Services is responsible for collating and maintaining personnel training records. The HSP Dashboard reflects the competencies required for each oil spill role (IMT/operational).	

7.14.3 Emergency response preparation

The Emergency Operations Centre, based in Woodside's head office, is the onshore coordination point for an offshore emergency, and the location for the Corporate Incident Management Team (CIMT) during an incident. The CIMT is staffed by an appropriately skilled team available on call 24 hours a day. This team coordinates rescues, minimises damage to the environment and facilities, and liaises with external agencies. Woodside's Incident Command Structure is included in the Goodwyn Alpha (GWA) Facility Operations – Oil Pollution First Strike Plan (Appendix H) and response arrangements are further detailed in the Hydrocarbon Spill Australia Regulatory Framework[93]. Roles and responsibilities for emergency response are detailed in the Woodside Incident Management Handbook.

Woodside will have an Emergency Response Plan (ERP) in place relevant to the Petroleum Activity. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident. The ERP will contain instructions for vessel emergency, medical emergency, search and rescue, reportable incidents, incident notification, contact information and activation of the contractor's emergency centre and Woodside Communication Centre.

In addition, the Emergency Preparedness MSPS (M06) is in place to assure thatin the event of an incident, the organisation is appropriately prepared for all necessary actions which may be required for the protection of People, Environment, Asset, Reputation and Livelihood.

7.14.4 Initial response to a facility incident

The facility is equipped with emergency shutdown (ESD) systems designed to protect personnel, the facility and the environment from unsafe operating conditions and catastrophic situations.

ESD systems are provided as a means of isolation in response to process upsets and facility conditions (including associated flowlines and risers) that could result in loss of hydrocarbon inventories, or to reduce the potential impact from a hydrocarbon loss of containment event on the facility. Provision has been made

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

for process and facility alarm systems to provide early indication of any process upset conditions and potential hazardous events, including fire and gas alarms.

The key ERP relevant to the facility and subsea infrastructure is the Goodwyn Alpha ERP. This plan covers health, safety, asset and environmental risks (including fire, structural integrity, sabotage, etc) to ensure the range of occupational, asset and environmental risk exposures from incidents have been considered and plans are in place for their management. The plan provides specific details on the initial response required during events with potential significant environmental consequences such as a hydrocarbon spill, subsea hydrocarbon leak or potential collision.

7.14.5 Oil and other hazardous materials spill

A significant hydrocarbon spill during the Petroleum Activity is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Hydrocarbon Spill Australia Regulatory Framework[93] document, supported by the Goodwyn Alpha (GWA) Facility Operations – Oil Pollution First Strike Plan which provides tactical response guidance to the activity/area (Appendix H), cover spill response for this Petroleum Activity.

The Hydrocarbon Spill Preparedness Team manages Woodside's hydrocarbon spill response equipment stockpile. Woodside also maintains a suite of contracts for access to additional specialist response equipment and trained personnel as required via Australian and international spill response organisations and labour supply companies. In the event of a major spill, Woodside will enact first strike response actions, in liaison with the relevant Control Agency, as detailed in the GWA Facility Operations – Oil Pollution First Strike Plan (Appendix H). This Plan provides immediate actions required to begin a response.

Support vessels will have shipboard oil pollution emergency plans (SOPEPs) in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Petroleum Activity's Oil Pollution First Strike Plan (Appendix H) is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activity, as detailed in Appendix G.

7.14.6 Emergency and spill response

Woodside categorises incidents in relation to response requirements:

- **Level 1** incidents are those that can be resolved using existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site- or regionally based teams using existing resources and functional support services.
- **Level 2** incidents are characterised by a response that requires external operational support to manage the incident. It is triggered if the capabilities of the tactical level response are exceeded. This support is provided to the activity by activating all or part of the responsible CIMT.
- **Level 3** incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, or livelihood. At Woodside, the Crisis Management Team manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation and such). The CIMT may also be activated as required to manage the operational incident response.

7.14.7 Emergency and spill response drills and exercises

Woodside's capability to respond to incidents will be tested periodically, in accordance with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in Table 7-16. Emergency response testing is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards and risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference points for developing and scheduling emergency and crisis management exercises. External participants may be invited to attend exercises (for example, government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The overall objective of exercises is to test procedures, skills and the teamwork of the Emergency Response and Command Teams in their ability to respond to major accident and major environment events. After each exercise, the team holds a debriefing session, during which the exercise is reviewed. Any lessons learned or areas for improvement are identified and incorporated into revised procedures, where appropriate.

Table 7-16: Testing of response capability

Response category	Scope	Response testing frequency	Response testing objective
Level 1 Response	Exercises are project-/ activity-specific	Two Level 1 'First Strike' drills conducted per year, per asset. Additional Level 1 emergency drills routinely conducted (approximately one per fortnight).	Drills test elements of the Oil Pollution First Strike Plan (Appendix H) Emergency drills are scheduled to test other aspects of the Emergency Response Plan.
Level 2 Response	Exercises are facility-specific	A minimum of one Emergency Management exercise is conducted biennially.	Testing both the facility IMT response and/or that of the CIMT following handover of incident control.
Level 3 Response	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management.	Test Woodside's ability to respond to and manage a crisis level incident.

7.14.8 Testing of hydrocarbon spill response arrangements

Woodside is required to test hydrocarbon spill response arrangements as per Regulations 22(12), 22(13) and 22(14) in the Environment Regulations. Woodside's arrangements for spill response are common across Australian operating assets and activities to ensure controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside processes and procedures and improvements made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Table 7-16, up to eight formal exercises are planned annually, pan-Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.14.9 Testing of arrangements schedule

Woodside's Testing of Arrangements Schedule (Figure 7-9-) aligns with international good practice for spill preparedness and response management; the testing is compatible with the International Petroleum Industry Environmental Conservation Association (IPIECA) Good Practice Guide and the Australian Institute for Disaster Resilience Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested (e.g. capability, equipment and personnel). For example, an arrangement could be to test Woodside's personnel capability for conducting operational monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the 3-year rolling schedule. The subheading for the column describes the standard method of testing likely to be undertaken (e.g. discussion exercise, desktop exercise), and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises (e.g. critical arrangements) or via other 'additional assurance' methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g. audits, no-notice drills, internal exercises, assurance drills).

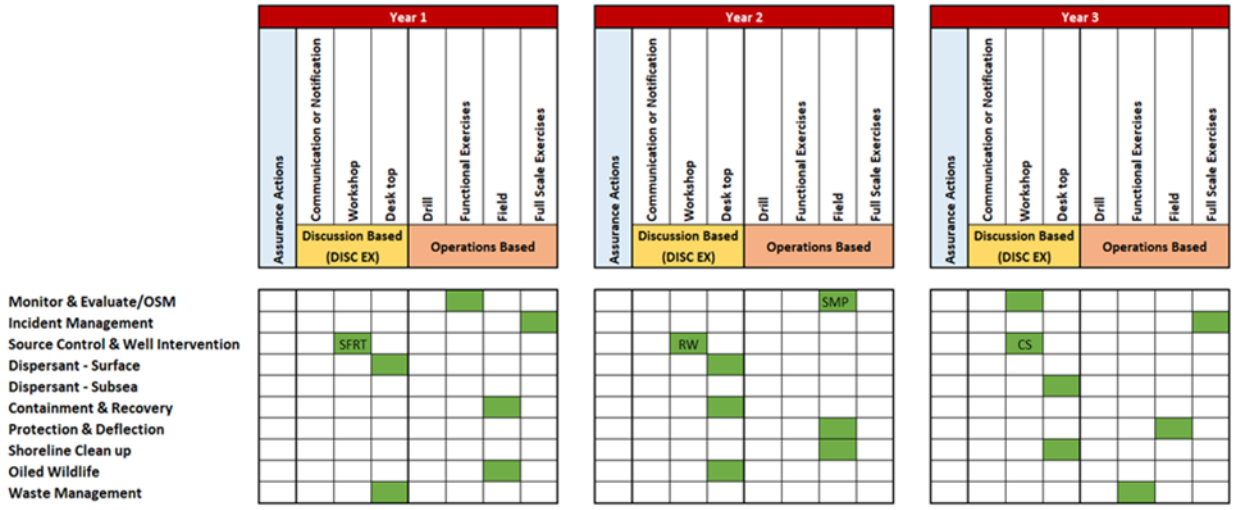


Figure 7-9-: Indicative 3-yearly testing of arrangements schedule

Note: Schedule is subject to change, additional detail is included in live document

7.14.10 Cyclone and dangerous weather preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Facilities and relevant support vessels on hire to Woodside receive regular forecasts from Woodside Meteorologists, who liaise closely with the Bureau of Meteorology (BOM). If a cyclone (or severe weather event) is forecast, the path and its development is plotted and monitored using the BOM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activity the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

9. LIST OF TERMS AND ACRONYMS

Table 9-1: List of terms and definitions

Term	Definition
2TL	Second Trunkline
ABARES	Australian Bureau of Agricultural and Resource Economics and Sciences
ABN	Australian Business Number
ABS	Australian Bureau of Statistics
ACN	Australian Company Number
AEMO	Australian Energy Market Operator
AEP	Australian Energy Producers
AER	Auxiliary Equipment Room
AFC	Antifouling Coating
AFMA	Australian Fisheries Management Authority
AFZ	Australian Fishing Zone
AH	Aboriginal Heritage
AHO	Australian Hydrographic Office
AHT	Anchor Handling Tug
AIMS	Australian Institute of Marine Science
AIS	Automatic Identification System
ALARP	As Low as Reasonably Practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZG	Australia and New Zealand Guideline
APS	Announced Pledges Scenario
AQMP	Air Quality Management Plan
ARPANSA	Australian Radiation Protection and Nuclear Safety Agency
AS	Australian Standard
ASAP	As soon as possible
ASV	Accommodation Support Vessel
ATSIHP	Aboriginal and Torres Strait Islander Heritage Protection
AUV	Autonomous Underwater Vehicle
AW	Abandoned Wells
BCF	Bioconcentration Factor
BDV	Blow-Down Valve
BESS	Battery Energy Storage System
BIA	Biologically Important Area
BOM	Bureau of Meteorology
BOP	Blow-Out Preventer
BRAMMC	Burrup Rock Art Monitoring Management Committee
BRATWG	Burrup Rock Art Technical Working Group

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
BTAC	Buurabalayji Thalanyji Aboriginal Corporation
BTEX	Benzene, Toluene, Ethylbenzene and Xylene
BWCMP	Conservation Management Plan for the Blue Whale
CAES	Catch and Effort System
CAMBA	Agreement Between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and their Environment
CAPEX	Capital Expenditure
CATAMI	Collaborative and Automated Tools for the Analysis of Marine Imagery
CCE	Common Cause Event
CCR	Central Control Room
CCS	Carbon Capture and Storage
CDOM	Coloured Dissolved Organic Matter
CEFAS	Centre for Environment, Fisheries and Aquaculture Science
CFA	Commonwealth Fisheries Association
CFU	Compact Flotation Unit
CHMP	Cultural Heritage Management Plan
CHP	Commonwealth Heritage Places
CIMT	Corporate Incident Management Team
CIP	Clean-in-Place
CMMS	Computerised Maintenance Management System
CMP	Closure Management Plans
CMT	Crisis Management Team
CO	Carbon Monoxide
COD	Chemical Oxygen Demand
COLREGS	Convention on the International Regulations for Preventing Collisions at Sea 1972
COP	Conference of Parties
CS	Cost/Sacrifice
CSIRO	Commonwealth Scientific and Industrial Research Organisation
CTD	Conductivity, Temperature and Depth
CV	Company Values
CVS	Contractor Verification Service
CY	Calendar Year
DAA	Data Analysis Australia
DAFF	Department of Agriculture, Fisheries and Forestry
DCCEEW	Commonwealth Department of Climate Change, Energy, Environment and Water
DCS	Distributed Control System
DEHP	Di (2-ethylhexyl) phthalate
DGV	Default Guideline Value
DLN	Dry Low NOx

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
DMPE	Western Australian Department of Mines, Petroleum and Exploration
DNP	Director of National Parks
DO	Dissolved Oxygen
DOC	Dissolved Organic Carbon
DP	Dynamic Positioning
DPIRD	Department of Primary Industries and Regional Development
DPLH	Department of Planning, Lands and Heritage
DTMI	Western Australian Department of Transport and Major Infrastructure
DWER	Department of Water and Environmental Regulation
DWT	Dead Weight Tonnage
ECAR	Environmental Compliance Action Register
EDU	Electrical Distribution Unit
EET	Emission Estimation Techniques
EEZ	Exclusive Economic Zone
EFL	Electrical Flying Lead
EHU	Electro-Hydraulic Umbilical
EMBA	Environment that May be Affected
EMS	Environmental Management System
ENVID	Environment Identification
EOC	Emergency Operations Centre
EOFL	End of Field Life
EP	Environment Plan
EPA	Environmental Protection Authority
EPBC	Environment Protection and Biodiversity Conservation Act 1999
EPO	Environmental Performance Outcome
EPS	Environmental Performance Standards
EQC	Environmental Quality Criteria
EQMF	Environment Quality Management Framework
EQS	Environmental Quality Criteria
ER	Emergency Response
ERD	Environmental Review Document
ERM	Environmental Resource Management
ERP	Emergency Response Plan
ESD	Emergency Shutdown
ESD	Ecologically Sustainable Development
ETA	Exploration Temporarily Abandoned
EY	Echo Yodel
F	Feasibility
FCAFC	Federal Circuit and Family Court of Australia.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
FDOM	Fluorescent Dissolved Organic Matter
FID	Final investment decision
FLNG	Floating Liquefied Natural Gas
FPSO	Floating Production, Storage and Offloading
FSP	First Strike Plan
FY	Financial Year
GDP	Gross Domestic Profit
GHG	Greenhouse Gas
GIS	Geographic Information System
GL	Gigaliter
GP	Good Industry Practice
GPG	Gas Powered Generation
GTG	Gas Turbine-Driven Generator
GWA	Goodwyn Alpha
GWF	Greater Western Flank
H2S	Hydrogen Sulphide
HAT	Highest Astronomical Tide
HAZID	Hazard Identification
HCTS	Habitat Critical to the Survival
HF	High Frequency
HFL	Hydraulic Flying Lead
HLV	Heavy Lift Vessel / Installation Vessel
HMS	His / Her Majesty's Ship
HOCNF	Harmonised Offshore Chemical Notification Format
HP	High Pressure
HQ	Hazard Quotient
HSE	Health, Safety and Environment
HSEC	Health, Safety, Environmental and Community
HSEQ	Health, Safety, Environment and Quality
HVAC	Heating Ventilation and Air Conditioning System
HWU	Hydraulic Workover Unit
IA	Indo-Australian
IAP	Incident Action Plan
IC	Incident Commander
ICLDP	Incident and Crisis Leadership Development Program
ICOMOS	International Council on Monuments and Sites
ICS	Incident Command System
ID	Identity / identification
IEA	International Energy Agency

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
IFL	Interfield Line
ILUA	Indigenous Land Use Agreements
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IMMR	Inspection, Maintenance, Monitoring and Repair
IMO	International Maritime Organisation
IMS	Invasive Marine Species
IMSMA	Invasive Marine Species Management Area
IMSMP	Invasive Marine Species Management Plan
IMT	Incident Management Team
IOGP	International association of Oil and Gas Producers
IPCC	Intergovernmental Panel on Climate Change
IPIECA	International Petroleum Industry Environmental Conservation Association
ISO	International Organization for Standardization
ISQG	Interim Sediment Quality Guideline
ITOPF	International Tank Owners Pollution Federation
IUCN	International Union for Conservation of Nature
JAMBA	Japan-Australia Migratory Bird Agreement
JASCO	Jasco Applied Sciences
JRCC	Joint Rescue Coordination Centre
KEF	Key Ecological Feature
KGP	Karratha Gas Plant
KO	Knock Out
KPI	Key Performance Indicator
LAT	Lowest Astronomical Tide
LBL	Long baseline
LCS	Legislation, Codes and Standards
LF	Low Frequency
LLPC	Low-Low-Pressure Compressor
LLPO	Low-Low-Pressure Operations
LNG	Liquefied Natural Gas
LOA	Length Overall
LOR	Limit of Reporting
LOT	Leak-off Testing
LP	Low Pressure
LPG	Liquefied Petroleum Gas
LSS	Load Shedding System
LTO	Licence to Operate
MAC	Murujuga Aboriginal Corporation
MAE	Major Accident Events

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
MAH	Monocyclic Aromatic Hydrocarbons
MARPOL	The International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978 (also known as MARPOL 73/78)
MASTREP	Modernised Australian Ship Tracking and Reporting System
MBES	Multibeam Sonar
MC	Measurement Criteria
MCL	Murujuga Cultural Landscape
MCS	Master Control Station
MEE	Major Environmental Events
MEER	Maritime Environmental Emergency Response Unit
MEG	Monoethylene Glycol
METL	Maintenance Engineering Team Leader
MFO	Marine Fauna Observer
MGP	Methane Guiding Principles
MLP	ASEAN Methane Leadership Program
MMA	Marine Management Area
MNES	Matters of National Environmental Significance
MOC	Management of Change
MODU	Mobile Offshore Drilling Unit
MOP	Marine Oil Pollution
MOPO	Manual of Permitted Operations
MP	Monopile
MRAMP	Murujuga Rock Art Monitoring Program
MRAS	Murujuga Rock Art Strategy
MS	Management System
MSPS	Management System Performance Standard
MW	Megawatts
N/A	Not Applicable
N2	Nitrogen
N2O	Nitrous Oxide
NAC	Nanda Aboriginal Corporation
NAH	Monocyclic Aromatic Hydrocarbon
NATA	National Association of Testing Authorities
NDC	Nationally Determined Contributions
NEPC	National Environment Protection Council
NEPM	National Environment Protection Measure
NGAF	National Greenhouse Accounts Factors
NGER	National Greenhouse and Energy Reporting
NGERS	National Greenhouse and Energy Reporting Scheme

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
NIMS	Non-indigenous Marine Species
NM	Nautical Miles
NMFS	National Marine Fisheries Service
NOAA	National Oceanic and Atmospheric Administration
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NOPTA	National Offshore Petroleum Titles Administrator
NORM	Naturally Occurring Radioactive Material
NOX	Nitrous Oxides
NPI	National Pollution Inventory
NRC	North Rankin Complex
NT	Northern Territory
NTD	Native Title Determination
NW	North-West
NWS	North West Shelf
NWSTF	North West Slope Trawl Fishery
NZ	New Zealand
NZE	Net Zero Emissions
O3	Ozone
OA	Operational Area
OCNS	Offshore Chemical Notification Scheme
OCS	Offshore Constitutional Settlement
ODS	Ozone-Depleting Substances
OEUK	UK Offshore Energies
OGCI	Oil and Gas Climate Initiative
OGUK	Oil and Gas UK (O&G UK)
OIM	Offshore Installation Manager
OIW	Oil-In-Water
OMDAMP	Offshore Marine Discharge Adaptive Management Plan
OPAM	Operator Proactive Monitoring
OPEP	Oil Pollution Emergency Plan
OPEX	Operating Expense
OPGGS Act	Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006*
OPP	Offshore Project Proposal
OPRC	Oil Pollution Preparedness, Response and Cooperation
OSM	Operational and Scientific Monitoring
OSPAR	Oslo/Paris convention (for the Protection of the Marine Environment of the North-East Atlantic)
OSPRMA	Oil Spill Preparedness and Response Mitigation Assessment
OSREC	Oil Spill Response Skills Enhancement Course

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
OSRO	Oil Spill Response Organisation
OSV	Offshore Support Vessel
OUV	Outstanding Universal Values
OVID	Offshore Vessel Inspection Database
OVMSA	Offshore Vessel Management System Assessment
OWDS	Oily Water Drains Separator
P&A	Plug and Abandon
PAH	Polycyclic Aromatic Hydrocarbons
PBC	Prescribed Body Corporate
PDSF	Pilbara Demersal Scalefish Fishery
PEC	Predicted Effect Concentration
PFTIMF	Pilbara Fish Trawl (Interim) Managed Fishery
PHD	Process Historian Database
PJ	Professional Judgement
PK	Peak Pressure
PLET	Pipeline End Termination
PLF	Pilbara Line Fishery
PLONOR	Pose Little or No-risk
PM	Particulate Matter
PMST	Protected Matters Search Tool
PNEC	Predicted No-effect Concentration
PoB	Personnel Onboard
POOMP	Production Optimisation and Opportunity Management Procedure
PPE	Personal Protective Equipment
PRT	Proportioning Rate Test
PS	Performance Standard
PSD	Production Shutdown
PSM	Process Safety Management
PSRA	Process Safety Risk Assessment
PSV	Pressure Safety Valves
PSZ	Petroleum Safety Zone
PTMF	Pilbara Trap Managed Fishery
PTS	Permanent Threshold Shift
PW	Produced Water
QA/QC	Quality Assurance, Quality Control
RAP	Reconciliation Action Plan
RATSIB	Representative Aboriginal/Torres Strait Islander Body
RBA	Risk-Based Analysis
RBI	Risk-Based Inspection

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
RCC	Regional Coordination Centre
RESDV	Riser Emergency Shutdown Valve
RFSU	Ready for Start-Up
RO	Reverse Osmosis
ROC	Remote Operation Centre
ROV	Remotely Operated Vehicle
SAP-PM	Woodside's CMMS
SBP	Sub Bottom Profiling
SBTF	Southern Bluefin Tuna Fishery
SCE	Safety and Environment Critical Element
SCM	Subsea Control Modules
SCQ	Safety and Environment Critical Equipment
SCR	Selective Catalytic Reduction
SCV	Subsea Construction Vessel
SDU	Subsea Distribution Units
SEL_{24}	Sound Exposure Level (24 hour)
SEZ	Safety Exclusion Zone
SGM	Safeguard Mechanism
SIMAP	Spill Impact Mapping Analysis Program
SMPEP	Shipboard Marine Pollution Emergency Plan
SOLAS	Safety of Life at Sea
SOPEP	Shipboard Oil Pollution Emergency Plan
SPL	Sound Pressure Level
SSIV	Sub-sea Isolation Valve
SSS	Side Scan Sonar
SSSV	Sub Surface Safety Valve
STEPS	Stated Policies Scenario
STP	Sewage Treatment Plant
SV	Societal Value
SVOC	Semi-volatile Organic Chemical
SW	Southwest
SWIS	Southwest Integrated System
SWMR	South West Marine Region
TANPF	Technical Ammonium Nitrate Production Facility
TAP	Threat Abatement Plan
TCFD	Task Force on Climate-related Financial Disclosure
TDS	Total Dissolved Solids
TEG	Triethylene Glycol

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
The Regulations	Commonwealth Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023
TOC	Total Organic Carbon
TPH	Total Petroleum Hydrocarbon
TRH	Total Recoverable Hydrocarbons
TSS	Total Suspended Solid
TSSC	Threatened Species Scientific Committee
TTS	Temporary Threshold Shift
UCH	Underwater Cultural Heritage
UK	United Kingdom
UN	United Nations
UNCLOS	United Nations Convention on the Law of the Sea 1982
UNESCO	United Nations Educational, Scientific, and Cultural Organization
UNFCC	United Nations Framework Convention on Climate Change
UPS	Uninterruptable Power Supply
USBL	Ultra-short Baseline
USEPA	U.S. Environmental Protection Agency
USV	Uncrewed Surface Vessels
UTA	Umbilical Termination Assemblies
UTB	Umbilical Termination Baskets
VHF	Very High Frequency
VOC	Volatile Organic Compounds
WA	Western Australia
WAFIC	Western Australian fishing industry council
WALGA	WA Local Government Association
WDTF	Western Deepwater Trawl Fishery
WEL	Woodside Energy Limited
WET	Whole Effluent Testing
WGR	Water-Gas Ratio
WHP	Wellhead Platform
WLS	Woodside Learning System
WMS	Woodside Management System
WOMP	Well Operations Management Plan
WSF	Western Skipjack Fishery
WTBF	Western Tuna and Billfish Fishery
XT	Christmas Tree Wellhead

APPENDIX A WOODSIDE ENVIRONMENT AND BIODIVERSITY, CLIMATE AND RISK MANAGEMENT POLICIES

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision-making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new activities[1] within the boundaries of natural sites on the UNESCO World Heritage List.[2]
- Not undertaking new activities within IUCN Protected Areas[3] unless compatible with management plans in place for the area.
- Achieving net zero deforestation[4] for new activities.
- Developing Biodiversity Management Plans for all new major projects (CAPEX >US$2 billion).
- Supporting positive biodiversity outcomes in regions and areas in which we undertake activities.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2025.

[1] Does not include non-industrial and existing activities that are compatible with maintenance of the listed outstanding universal values.

[2] New UNESCO World Heritage Listings that overlap existing activities will be assessed at the time of listing.

[3] New IUCN Protected Areas that overlap existing activities will be assessed at the time of listing.

[4] Definition of Forest: 'native trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared'.

Climate Policy

BACKGROUND

The Intergovernmental Panel on Climate Change has stated that “it is unequivocal that human influence has warmed the atmosphere, ocean and land”. An objective of the Paris Agreement is to hold “the increase in the global average temperature to well below 2ºC above pre-industrial levels” and to pursue “efforts to limit the temperature increase to 1.5ºC”. Many countries have set targets to reduce greenhouse gas emissions, including by changing the way they produce and consume energy.

OBJECTIVE

Woodside’s objective is to thrive in this energy transition as a low cost, lower carbon energy provider.

PRINCIPLES

Woodside aims to achieve the objective by:

- Setting science-based[1] near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned[2] scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.[3]
- Developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- Investing in new energy products and lower carbon services to reduce customers’ emissions (part of Woodside’s Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Aligning our advocacy to the principles of this Climate Policy.

[1] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of “science-based” (published 2021) which states “targets are considered ‘science-based’ if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.”. See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[2] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of “Paris-aligned scenarios” (published 2021) which states “scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.” See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[3] Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside’s ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside’s ownership interest.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venture participants engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2025.

Risk Management Policy

OBJECTIVES

Woodside recognises that risk is inherent in our business and that effective risk management supports delivery of our strategic objectives. We are committed to managing risks proactively and effectively to protect and create value.

Our risk management framework outlines how we prioritise risk management and governance. We maintain oversight of our enterprise risk exposure, seek to protect ourselves from potential negative impacts and improve our resilience against emerging risks.

Our approach enables a risk-aware culture where everyone at Woodside is responsible for proactively identifying, assessing and treating risks that relate to the objectives they are accountable for delivering.

PRINCIPLES

Woodside achieves these objectives by:

- Demonstrating leadership and commitment to aligning and integrating the risk management framework with our values, strategy, culture, behaviours, business activities and governance practices.
- Understanding the type and amount of risk we take and accept to inform our decision making and acting with due regard to the risk appetite endorsed by the Board.
- Allocating competent resources to own and assure risk and controls.
- Applying a structured and comprehensive approach to identifying, assessing and treating current risks and responding to strategic and emerging risks.
- Maintaining a robust and proportionate level of internal control.
- Analysing insights from trends and developments in the external environment and stakeholder engagement.
- Evaluating and improving the effectiveness and efficiency of our approach.

APPLICABILITY

The Managing Director of Woodside is accountable to the Board of Directors for ensuring this Policy is effectively implemented.

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2025.

APPENDIX B RELEVANT REQUIREMENTS

The below table refers to Commonwealth legislation related to the Petroleum Activity.

Commonwealth legislation	Summary	Relevant to the activity	EP Section
Aboriginal and Torres Strait Islander Heritage Protection Act 1984	This Act seeks "to preserve and protect places, areas and objects of particular significance" to Aboriginal people. Under the Section 9 and 10 provisions of the Act, the Minister for the Environment may declare significant Aboriginal areas temporarily or permanently protected if they are considered under threat. Similar declarations regarding Aboriginal objects can be made under Section 12. Under Section 22 of the Act, the contravention of any of these declarations is an offence. Additionally, the discovery of any Aboriginal remains must be reported to the Minister under Section 20.	Yes – There are known areas, features and values within the Operational Area relevant to Indigenous heritage as described throughout Section 4.9.	Section 6.11 (Indigenous cultural features and heritage values assessment)
Air Navigation Act 1920 Air Navigation Regulations 2026 Air Navigation (Aircraft Engine Emissions) Regulations 1995 Air Navigation (Aircraft Noise) Regulations 2018	This Act relates to managing air navigation and safety.	Yes – The Act and associated Regulations apply to helicopter movements that may be required during the Petroleum Activity.	Section 6.7.1 (Physical presence: interaction with other marine users)
Australian Heritage Council Act 2003	This Act establishes the Australian Heritage Council and supports the administration of Australia's national heritage system, including advice relating to the National Heritage List and Commonwealth Heritage List.	Yes – National and Commonwealth heritage listed places have been identified in the EMBA (see Table 4-23).	Section 4.9.9 (World, National and Commonwealth heritage listed places) Section 6.11 (Indigenous cultural features and heritage values assessment)
Australian Maritime Safety Authority Act 1990	This Act establishes a legal framework for AMSA, which represents the Australian Government and international forums in the development, implementation and enforcement of international standards, including those governing ship safety	Yes – The Act applies to maritime safety and vessel activities associated with the Petroleum Activity. It is relevant to promote maritime	Section 6.7.1 (Physical presence: interaction with other marine users)

Commonwealth legislation	Summary	Relevant to the activity	EP Section
	and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters. AMSA is the lead agency for responding to oil spills in the marine environment and is responsible for the Australian National Plan for Maritime Environmental Emergencies.	safety and the protection of the marine environment from vessel pollution. AMSA Response Centre will be notified of activities and movements 24 to 48 hours before the scheduled activity start date and in the event of incidents during the Petroleum Activity (including oil pollution incidents in Commonwealth waters).	Section 6.7.6 (Routine and non-routine discharges: utility systems, drains and support vessels) Section 6.8.7 (Unplanned hydrocarbon release: loss of marine vessel separation) Table 7-13 (External incident reporting requirements)
Australian Radiation Protection and Nuclear Safety Act 1998 *Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) Radiation Protection Series (RPS)*	This Act aims to protect the health and safety of people and the environment from the harmful effects of radiation.	Yes – NORMs may be present in PW.	Section 6.7.5 (Routine and non-routine discharges: produced water) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management)
Biosecurity Act 2015 Biosecurity Regulations 2016 Australian Ballast Water Management Requirements	This Act provides the Commonwealth with powers to take quarantine measures, and implement necessary related programs, to prevent introducing any plant, animal, organism or matter that could contain anything that could threaten Australia's native flora and fauna or natural environment. The Commonwealth's powers include entry, seizure, detention and disposal. This Act includes mandatory controls on using seawater as ballast in ships and declaring sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers. The Regulations requires ships to report information about biofouling management and the voyage history of the ship in the past 12 months through a pre arrival report.	Yes – The Act and associated Regulations and Requirements apply to the use of all internationally sourced Petroleum Activity vessels operating in Australian Waters. Controls must be applied to manage the potential for introduction of IMS.	Section 6.9.4 (Physical presence: introduction of invasive marine species)
Climate Change Act 2022	This Act sets out Australia's greenhouse gas emissions reduction targets in a manner consistent with the Paris	Yes - The emissions targets established by this Act are inclusive of offshore petroleum activities.	Sections 6.7.7 and 6.7.8 (Routine and non-routine

	Agreement and Australia's Nationally Determined Contribution (NDC). As the Nationally Determined Contribution (NDC) are at the heart of the Paris Agreement, NDCs embody efforts by each country to reduce national emissions and adapt to the impacts of climate change.		atmospheric and greenhouse gas emissions)
Environment Protection and Biodiversity Conservation Act 1999 Environment Protection and Biodiversity Conservation Regulations 2025	This Act includes the objective to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as 'matters of national environmental significance' (MNES). The Act sets a regime that aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ESD. The Act streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places. Where activities have existing approvals under the Act, these will continue to apply.	Yes – This Act applies to all aspects of the Petroleum Activity that have the potential to impact MNES. Where there is the potential for MNES to be impacted, an assessment of impacts must be presented in the EP. Authorisation to undertake the Petroleum Activity will be met through NOPSEMA's decision making processes which includes an assessment of the Petroleum Activities compliance with the relevant regulations and plans under the Act, which are presented throughout this EP.	Section 1.8.2 (Environment Protection and Biodiversity Conservation Act 1999) Section 6.7.2 (Physical presence: disturbance to the seabed) Section 6.7.3 (Routine acoustic emissions) Section 6.7.4, and 6.7.5, 6.7.6 (Routine and non-routine discharges) Section 6.7.9 (Routine light emissions) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7, and 6.8.8 (Unplanned hydrocarbon releases) Section 6.9.1 (Unplanned hydrocarbon or chemical release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management) Section 6.9.3 (Physical presence: interactions with marine fauna)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary	Relevant to the activity	EP Section
			Section 6.9.4 (Physical presence: introduction of invasive marine species) Section 6.10 (Recovery plan and threat abatement assessment)
Environment Protection (Sea Dumping) Act 1981 Environment Protection (Sea Dumping) Regulations 1983	This Act provides for protecting the environment by regulating dumping of matter into the sea, incineration of waste at sea, and placement of artificial reefs.	No – No dumping, abandonment or placement of infrastructure at sea for the sole purpose of disposal is proposed within the five year scope of the EP. Any future decommissioning activities will be managed under separate EPs and assessed against applicable legislation at the time.	N/A
Fisheries Management Act 1991 Fisheries Management Regulations 2019	This Act provides the legislative framework for the sustainable management and conservation of Commonwealth fisheries within the Australian Fishing Zone. It establishes systems for regulating fishing activities, including licensing and quotas, and confers powers on the Australian Fisheries Management Authority (AFMA) to develop management plans, enforce compliance, and protect fishery resources.	Yes – the Petroleum Activity may interact with Commonwealth-managed fisheries (Section 4.10.1).	Section 6.7.1 (Physical presence: interaction with other marine users) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7, and 6.8.8 (Unplanned hydrocarbon releases)
Hazardous Waste (Regulation of Exports and Imports) Act 1989	This Act establishes a national framework to regulate the export, import and transit of hazardous waste, with the primary objective of ensuring such waste is managed in an environmentally sound manner to protect human health and the environment both within Australia and internationally. The Act also gives effect to Australia's obligations under the Basel Convention, which governs the transboundary movement of hazardous waste.	No – The activity does not involve transboundary movement of hazardous wastes. Any future decommissioning activities involving the transboundary movement of hazardous waste will be assessed under separate EPs and against the legislation in force at that time.	N/A
Industrial Chemicals Environmental Management (Register) Act 2021 Industrial Chemicals Environmental Management (Register) Instrument 2022	The Act is the legislative framework for the Industrial Chemicals Environmental Management Standard (IChEMS), a scheme to implement a nationally consistent approach to the management of risks to the environment resulting from the use of industrial chemicals, including those by the oil and gas industry.	Yes – Hydrocarbons and chemicals may be discharged during routine and non-routine operations and activities. Woodside's Environment Chemical Selection and Assessment Guideline includes the requirements set out by the Australian	Sections 6.7.4, 6.7.5 and 6.7.6 (Routine and non-routine discharges) Sections 6.9.1 and 6.9.2 (Unplanned discharges)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary	Relevant to the activity	EP Section
	The Instrument supports the Act to create consistent, national, and enforceable standards for environmental risk management of industrial chemicals.	Government under IChEMS (refer to Section 7.2.3).	Section 7.2.3 (Selection, assessment and approval of chemicals)
National Environment Protection Measures (Implementation) Act 1998 National Environment Protection Measures (Implementation) Regulations 1999 National Environment Protection (National Pollutant Inventory) Measure 1998	This Act and Regulations provide for implementing National Environment Protection Measures to protect, restore and enhance the quality of the environment in Australia and ensure the community has access to relevant and meaningful information about pollution. The National Environment Protection Council has made National Environment Protection (National Pollutant Inventory) Measures relating to ambient air quality, movement of controlled waste between states and territories, the National Pollutant Inventory, and used packaging materials. The Measure enforces the National Pollutant Inventory (NPI), which collects and publishes data on emissions and transfers of toxic substances.	Yes – Woodside reports atmospheric emissions and waste transfers for its Australian operations, including the North West Shelf facilities in Western Australia to the NPI.	Section 6.7.7 and 6.7.8 (Routine and non-routine atmospheric emissions and greenhouse gas emissions)
National Greenhouse and Energy Reporting Act 2007 National Greenhouse and Energy Reporting (Safeguard Mechanism) Rule 2015	This Act and associated Rule establishes the legislative framework for the National Greenhouse and Energy Reporting Scheme for reporting GHG emissions and energy consumption and production by corporations in Australia.	Yes – Woodside are required to report GHG emissions for its Australian operations, including the North West Shelf facilities. Vessel contractors are also required to report GHG emissions under this Act.	Section 6.7.7 and 6.7.8 (Routine and non-routine atmospheric emissions and greenhouse gas emissions)
Native Title Act 1993 *Native Title (Indigenous Land Use Agreements) Regulations 2024*	This Act recognises and protects the traditional rights and interests of First Nation groups in land and waters through native title. Prescribed Bodies Corporate (PBC) manage and protect their native title rights and interests by establishing ways in which future dealings affecting native title may proceed and to set standards for those dealings. Indigenous Land Use Agreements (ILUAs) are voluntary, legally binding agreements established under the Act between native title parties and others regarding land/water use.	Yes – There are six native title claims or determinations overlapping the EMBA and a further nine that are coastally adjacent to the EMBA (see Table 4-17). There are also seven Indigenous Land Use Agreements (ILUAs) overlapping the EMBA and a further 24 that are coastally adjacent to the EMBA (see Table 4-17). Woodside considers native title claims, determinations and ILUAs to be an instructive means of identifying potentially relevant Indigenous groups to consult (see Section 5.3).	Section 4.9.1 (Native Title) Section 5.3 (Identification of relevant persons for consultation) Section 6.11 (Indigenous cultural features and heritage assessment)

Commonwealth legislation	Summary	Relevant to the activity	EP Section
Navigation Act 2012 *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* Marine Order 12: Construction – subdivision and stability, machinery and electrical installations Marine Order 15: Construction – fire protection, fire detection and fire extinction Marine Order 30: Prevention of collisions Marine Order 47: Offshore Industry units Marine Order 57: Helicopter operations Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances Marine Order 94: Marine pollution prevention – packaged harmful substances Marine Order 96: Marine pollution prevention – sewage Marine Order 97: Marine pollution prevention – air pollution	This Act regulates navigation and shipping, including SOLAS. This Act is the primary legislation that regulates ship and seafarer safety and shipboard aspects of marine environment protection and pollution prevention. Marine Orders are subordinate rules made pursuant to the *Navigation Act 2012* and *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* affecting the maritime industry. They are a means of implementing Australia's international maritime obligations by giving effect to international conventions in Australian law. Marine Orders apply to vessel movements, safety, discharges and emissions.	Yes - The Act and Marine Orders apply to vessel activities associated with the Petroleum Activity.	Section 6.7.1 (Physical presence: interaction with other marine users) Section 6.7.6 (Routine discharges) Section 6.7.9 (Routine light emissions) Sections 6.8.5, 6.8.6, 6.8.7 and 6.8.8 (Unplanned hydrocarbon release) Section 6.9.1 (Unplanned hydrocarbon or chemical release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management)
Offshore Petroleum and Greenhouse Gas Storage Act 2006	This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the listed Regulations.	Yes – The Petroleum Activity must be undertaken in accordance with the requirements of this Act. This EP has been prepared in accordance with the relevant	Table 1-2 (presents the EP structure against the requirements of the Environment Regulations

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary	Relevant to the activity	EP Section
Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2025 Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2024		requirements of the OPGGS Act and the Environment Regulations.	Section 1.5 (Structure of the Environment Plan) Section 1.8.1 (Offshore Petroleum and Greenhouse Gas Storage Act 2006)
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989 Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995	This Act provides for protecting ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone-depleting substances and synthetic GHGs, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone depleting substances.	Yes – This Act applies where ozone-depleting substances is found on vessel refrigeration systems, however, this is a rare occurrence and not anticipated (Section 3.6.5.2).	Section 6.7.7 (Routine and non-routine atmospheric emissions) Section 6.11 (Indigenous cultural features and heritage values assessment)
Protection of the Sea (Powers of Intervention) Act 1981 Protection of the Sea (Powers of Intervention) Regulations 1983	This Act authorises the Commonwealth to take measures to protect the sea from pollution by oil and other noxious substances discharged from ships. It provides legal immunity for persons acting under an AMSA direction.	Yes – The Act may apply in the event of an unplanned hydrocarbon release.	Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8 (Unplanned hydrocarbon release)
Protection of the Sea (Prevention of Pollution from Ships) Act 1983 Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994 Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances	This Act relates to protecting the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances. The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 NM off the coast out to the end of the Australian Exclusive Economic Zone (200 NM). It also applies within the 3 NM of the coast where the State / Northern Territory does not have complementary legislation.	Yes - The Act and Marine Orders apply to vessel activities associated with the Petroleum Activity.	Sections 6.7.4, 6.7.5 and 6.7.6 (Routine and non-routine discharges) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7, 6.8.8 and 6.9.1 (Unplanned hydrocarbon release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary	Relevant to the activity	EP Section
Marine Order 94: Marine pollution prevention – packaged harmful substances Marine Order 95: Marine pollution prevention – garbage Marine Order 96: Marine pollution prevention – sewage Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007 International Convention for the Prevention of Pollution from Ships (MARPOL Convention)	All the Marine Orders listed, except for Marine Order 95, are enacted under both the *Navigation Act 2012* and the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983.* The Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007 is an amendment to the Protection of the Sea (Prevention of Pollution from Ships) Act 1983. This amended Act provides for protecting the sea from pollution by oil and other harmful substances discharged from ships.		
Protection of the Sea (Harmful Antifouling Systems) Act 2006 Marine Order 98: Marine pollution – anti-fouling systems	This Act relates to Australia's obligations under the international Antifouling System Convention, prohibiting harmful organotin compounds (e.g. TBT) on ship hulls to protect the marine environment. It prohibits the application of such systems on Australian ships and restricts non-complying ships from entering Australian ports.	Yes – The Act applies to vessels operating in Australian waters, including for the Petroleum Activity.	Section 6.9.4 (Physical presence: introduction of invasive marine species)
Seas and Submerged Lands Act 1973	This Act establishes the legal framework for Australia's sovereignty and sovereign rights over its offshore marine areas, including the territorial sea, exclusive economic zone and continental shelf. It implements international law (particularly UNCLOS) into Australian domestic law, defining maritime boundaries and confirming the Commonwealth's authority over offshore waters, seabed and subsoil resources for purposes such as exploration, resource management and environmental protection.	Yes – the Petroleum Activity is located within Australia's EEZ.	Section 3.2 (Location)
Underwater Cultural Heritage Act 2018 *Guidelines on the application of the Underwater Cultural Heritage Act 2018*	The Act prescribes penalties for damaging protected Underwater Cultural Heritage without a permit under Section 30 or in contravention of a permit under Section 28. Protected Underwater Cultural Heritage is prescribed in Section 16 to automatically include the remains and associated artefacts of any vessel or aircraft that has been in Australian waters for 75 years, whether known or unknown.	Yes – Table 4-22 lists underwater heritage sites identified within the Operational Area and EMBA.	Section 4.9.8 (Historic underwater heritage) Section 6.7.2 (Physical presence: disturbance to the seabed) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8

Commonwealth legislation	Summary	Relevant to the activity	EP Section
	This protection is also extended to Underwater Cultural Heritage in Commonwealth waters specified by the Environment Minister under Section 17. Without a declaration under this section, Aboriginal Underwater Cultural Heritage is not protected under the Underwater Cultural Heritage Act.		(Unplanned hydrocarbon release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management) Section 6.11 (Indigenous cultural features and heritage values assessment)

The below table refers to WA State legislation related to the Petroleum Activity.

State legislation	Summary	Relevant to the activity	EP Section
The Aboriginal Heritage Act 1972 (WA) Aboriginal Heritage Regulations 1974	This Act is the principal Western Australian legislation for the protection and preservation of Aboriginal Cultural Heritage, including all sites and objects of significance to Aboriginal people, whether or not they are formally recorded. Under the Act, it is an offence to damage or disturb Aboriginal heritage without prior approval from the appropriate authority, and it provides procedures for seeking consent where impacts cannot be avoided.	Yes - Cultural features and heritage values have been identified to potentially overlap the Operational Area and / or EMBA (Table 4-19)	Section 4.9.5 (Sea Country values) Section 6.11 (Indigenous cultural features and heritage assessment)
Biodiversity Conservation Act 2016 (WA) *Biodiversity Conservation Regulations 2018*	This Act first came into effect on 3 December 2016 and replaced the *Wildlife Conservation Act 1950*. Relating to potential impacts to listed species: this Act provides for the conservation and protection of Western Australian wildlife.	Yes – Planned and unplanned activities associated with the Petroleum Activity may impact listed species.	Section 4.6 (Protected species) Section 6.7 (Planned activities) Sections 6.8 and 6.9 (Unplanned activities)
The Heritage Act 2018 (WA) *Heritage Regulations 2019*	This Act is the primary legislation for the protection of historic heritage in Western Australia. It supports the identification, documentation, and management of places of cultural heritage significance. The Act mandates approval or referral for any work that may affect registered heritage places and establishes offences and	Yes – While there are no known Historic Heritage Sites within the Operational Area, there are sites within the EMBA (refer to Sections 4.9.7, 4.9.8 and 4.9.9).	Sections 4.9.7, 4.9.8 and 4.9.9 (Cultural values and heritage) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8

State legislation	Summary	Relevant to the activity	EP Section
	regulations to prevent unauthorised damage or modifications of heritage-listed sites.		(Unplanned hydrocarbon release)
Western Australian Fish Resources Management Act 1994 (WA) Fish Resources Management Regulations 1995 (WA)	This Act aims to manage fisheries and aquaculture in a sustainable way to ensure the long-term health of fish stocks and aquatic. Under the Act, the Department has emergency powers to deal with incursions of IMS, which include directing a person to perform necessary activities to prevent or control the spread of IMS, or to eradicate them in WA waters. Under section 105 of the Act, it is an offence to bring noxious fish into WA. Under the Regulation 176, it is an offence to translocate live non-endemic fish to WA without permission. Under Regulation 70 and Schedule 5 of the Regulations it is an offence to bring noxious fish into WA.	No - The Petroleum Activity is located in Commonwealth waters. Transit to and from the Operational Area by support vessels, and port activities associated with these vessels, are not within the scope of this EP.	N/A

The below table refers to International Agreements and Conventions related to the Petroleum Activity.

International Agreements and/or Conventions	Summary	Relevant to the activity	EP Section
Agreement Between the Government of Australia and the Government of Japan for the Protection of Migratory Birds in Danger of Extinction and Their Environment 1974 (commonly referred to as the Japan Australia Migratory Bird Agreement or JAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and Japan. Implemented in EPBC Act 1999.	Yes – Planned and unplanned activities associated with the Petroleum Activity may impact migratory birds relevant to this Agreement.	Section 4.6.4 (Seabirds and migratory shorebirds) Section 6.7.9 (Routine light emissions) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8 (Unplanned hydrocarbon release) Section 6.9.1 (Unplanned hydrocarbon or chemical release) Section 6.9.2 (Unplanned discharges: hazardous
Agreement Between the Government of Australia and the Government of the People's Republic of China for the Protection of Migratory Birds and Their Environment 1986 (commonly referred to as the China Australia Migratory Bird Agreement or CAMBA)	This agreement recognises the special international concern for the protection of migratory birds and birds in danger of extinction that migrate between Australia and China. Implemented in EPBC Act 1999.

			and non-hazardous waste management)
Convention for the Control of Transboundary Movements of Hazardous Wastes and Their Disposal 1989 (Basel Convention)	This convention deals with the transboundary movement of hazardous wastes, particularly by sea. Implemented in *Hazardous Waste (Regulation of Exports and Imports) Act 1989*.	No – The activity does not involve transboundary movement of hazardous wastes. Any future decommissioning activities involving the transboundary movement of hazardous waste will be assessed under separate EPs and against the legislation in force at that time.	N/A
Convention on the Conservation of Migratory Species of Wild Animals 1979 (Bonn Convention)	The Bonn Convention aims to improve the status of all threatened migratory species through national action and international agreements between range states of particular groups of species.	Yes - Planned and unplanned activities associated with the Petroleum Activity may impact threatened migratory species relevant to this Agreement.	Section 4.6 (Protected species) Section 6.7.3 (Routine acoustic emissions) Section 6.7.5 (Routine and non-routine discharges: produced water) Section 6.7.9 (Routine light emissions) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8 (Unplanned hydrocarbon release) Section 6.9.1 (Unplanned hydrocarbon or chemical release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management) Section 6.9.3 (Physical presence: interaction with marine fauna)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

International Agreements and/or Conventions	Summary	Relevant to the activity	EP Section
Convention on the International Regulations for Preventing Collisions at Sea, 1972 (COLREGS)	The COLREGS are a set of rules that apply to prevent the collision of vessels at sea and apply to vessels navigating waters outside of the COLREGS demarcation lines. Activity vessels will comply with the COLREGS, including in particular, through the use of appropriate lights and shapes to reflect the nature of operations. The convention is given effect in Australia through Marine Order 30 (see Commonwealth legislation table above).	Yes – The convention applies to vessel movements associated with the Petroleum Activity.	Section 6.8.7 (Unplanned hydrocarbon release: loss of marine vessel separation)
Convention on Oil Pollution Preparedness, Response and Co-operation 1990 (OPRC 90)	This convention comprises national arrangements for responding to oil pollution incidents from ships, offshore oil facilities, sea ports and oil handling. The Convention was adopted under the International Maritime Organization (IMO) in 1990. Parties to the convention are required to establish measures for dealing with pollution incidents, either nationally or in co-operation with other countries. Ships are required to carry a shipboard oil pollution emergency plan (SOPEP / SMPEP). Operators of offshore units are also required to have oil pollution emergency plans or similar arrangements which must be co-ordinated with national systems for responding promptly and effectively to oil pollution incidents.	Yes – The convention applies to vessels associated with the Petroleum Activity, which are required to carry a shipboard oil pollution emergency plan (SOPEP / SMPEP). The OSPRMA (Appendix G) and First Strike Pan (Appendix H) include arrangements for managing oil spills from the Petroleum Activity. The OSPRMA includes Jurisdictional Authority for managing spills and the relationship between the OSPRMA and Commonwealth and State response plans.	Section 6.8.7 (Unplanned hydrocarbon release: loss of marine vessel separation) Section 6.9.1 (Unplanned hydrocarbon or chemical release) OSPRMA (Appendix G) First Strike Pan (Appendix H)
International Convention for the Control and Management of Ships' Ballast Water and Sediments (Ballast Water Convention) 2004	The convention is an international treaty adopted by the International Maritime Organization (IMO) to prevent the spread of invasive aquatic species and pathogens. The convention establishes standards for the management and control of ships' ballast water and sediments. Must either use an IMO-recognized authority approved ballast water management system or use another IMO-compliant method of managing ballast water.	Yes - The convention is adopted through the *Biosecurity Act 2015* and its associated regulations, which contain several requirements for managing ballast water with which the Petroleum Activity vessels will be required to comply (see Commonwealth legislation table above).	Section 6.9.4 (Physical presence: introduction of invasive marine species)
International Convention for the Prevention of Pollution from Ships 1973/1978 (MARPOL 73/78)	MARPOL 73/78 is the primary international convention aimed at preventing marine pollution by ships from operational or accidental causes. The convention is structured around six technical Annexes that set regulations for different types of marine pollution. The	Yes – This convention is adopted through the *Navigation Act 2012* and relevant Marine Orders which apply to vessel activities associated with the Petroleum Activity (see Commonwealth legislation table above).	Section 6.7.1 (Physical presence: interaction with other marine users)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

International Agreements and/or Conventions	Summary	Relevant to the activity	EP Section
	2021 and is implemented in Commonwealth law, effective from 2022.		discharges: produced water)
Ramsar Convention on Wetlands 1971	This Convention provides an international framework for the conservation and wise use of wetlands, recognising their ecological importance and their role in supporting biodiversity, including migratory species.	No – Neither the Operational Area or EMBA overlap with Wetlands of International Importance (Ramsar) (Table 4-2).	N/A
United Nations Convention on Biological Diversity 1992	This Convention was established at the 1992 Rio Earth Summit to provide a global framework for protecting the Earth's biodiversity. Its core purpose is to address the ongoing loss of ecosystems, species, and genetic diversity through coordinated international action.	Yes – Planned and unplanned activities associated with the Petroleum Activity may interact with MNES (threatened and migratory species) protected under the EPBC Act.	Section 4.6 (Protected species) Section 6.7.3 (Routine acoustic emissions) Section 6.7.5 (Routine and non-routine discharges: produced water) Section 6.7.9 (Routine light emissions) Sections 6.8.3, 6.8.4, 6.8.5, 6.8.6, 6.8.7 and 6.8.8 (Unplanned hydrocarbon release) Section 6.9.1 (Unplanned hydrocarbon or chemical release) Section 6.9.2 (Unplanned discharges: hazardous and non-hazardous waste management) Section 6.9.3 (Physical presence: interaction with marine fauna)
United Nations Convention on the Law of the Sea (UNCLOS) 1982	The United Nations Convention on the Law of the Sea (UNCLOS) is an international treaty established in 1982 to provide a comprehensive legal framework governing the	Yes – UNCLOS underpins Commonwealth jurisdiction over petroleum activities within Australia's Exclusive Economic Zone and	Section 3.2 (Location)

International Agreements and/or Conventions	Summary	Relevant to the activity	EP Section
	world's oceans and seas. Its core purpose is to create a stable, rules-based system for how countries use, manage, and protect marine environments and resources. The UNCLOS to which Australia is a party, entered into force on 16 November 1994.	continental shelf. It also imposes obligations to prevent, reduce and control marine pollution and protect the marine environment from offshore and maritime activities. In Australia, UNCLOS is implemented via multiple Acts which give effect to marine environmental obligations, such as MARPOL, operationalising UNCLOS principles.	Section 4.3 (Matters of national environmental significance) Section 6.7 (Planned activities) Sections 6.8 and 6.9 (Unplanned activities)
United Nations Framework Convention on Climate Change (UNFCC) 1992 Paris Agreement 2015	The objective of the convention is to stabilise greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous interference with the climate system. Australia ratified the UNFCC in December 1992, and it came into force on 21 December 1993 and ratified the Paris Agreement on 10 November 2016.	Yes – Direct and indirect atmospheric and Greenhouse gas emissions are assessed as part of the Petroleum Activity as a result of vessel use and onshore gas processing.	Sections 6.7.7 and 6.7.8 (Routine and non-routine atmospheric and greenhouse gas emissions)

1. INTRODUCTION

1.1 Purpose

This document applies, where indicated in the relevant Environment Plan (EP), to Woodside Energy Ltd. and Woodside Energy Group (Woodside) activities and operations.

1.2 Scope

Woodside is the titleholder of multiple petroleum titles for exploration, development, production and decommissioning activities in the marine waters of north-western Western Australia (WA). This document includes details of the relevant values and sensitivities of the environment as required by the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Commonwealth) (OPGGS (E) Regulations), to inform the impact and risk evaluation of Woodside's activities. Additional information, appropriate to the nature and scale of the impacts and risks of activities that may interact with the environment outside of the scope of this document, will be used to further inform impact and risk assessments and be included in the Description of the Existing Environment of individual EPs.

This Master Existing Environment document identifies and describes the values and sensitivities of the existing environment within the broadly defined Woodside activity areas located in Commonwealth and coastal waters off north-western WA, with a focus on the North-west Marine Region (NWMR), including adjacent coastal waters and shoreline habitats. This document also summarises the regional key values of the South-west Marine Region (SWMR) (extending the WA/South Australia (SA) border) and the North Marine Region (NMR), including adjacent coastal waters and shoreline habitats, as they are relevant to the environment that may be affected (EMBA)[1].

The marine bioregions are described Table 1-1 and shown in Figure 1-1. The NWMR is divided into three large-scale ecological marine systems based on the influence of major ocean currents, seafloor features and eco-physical processes, including Kimberley, Pilbara and Ningaloo-Leeuwin. For the NWMR, Table 1-1 outlines the associated marine systems and relevant Woodside activity areas.

Table 1-1: Description of the marine bioregions, marine systems and associated Woodside activity area and key environmental sensitivities

Marine bioregion*	Marine system	Relevant key environmental sensitivities	Woodside activity area
North-west (Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC) 2012a) The NWMR includes all Commonwealth waters (from three nautical miles (NM) from the Territorial Sea Baseline to the 200 nm Exclusive Economic Zone (EEZ) boundary) extending from the WA/Northern Territory (NT) border to Kalbarri, south of Shark Bay in WA, covering an area of about 1.07 million km², and includes extensive areas of shallower waters on the continental shelf, as well as deep areas of abyssal plain where water is 5,000 m or deeper.	**Kimberley** The northern boundary is the limit of the NWMR; the southern boundary extends west of Broome to the northern edge of the Exmouth Plateau.	• Scott Reef • Rowley Shoals	Browse Basin
	Pilbara The northern boundary extends west of Broome to the northern edge of Exmouth plateau; the southern boundary follows a line west of North West Cape along the southern boundary of Exmouth Plateau.	• Dampier Archipelago • Rankin Bank • Glomar Shoal	North West Shelf (NWS), inclusive of Scarborough gas fields
	Ningaloo-Leeuwin The northern boundary extends from shore at North West Cape directly out along Cape Range escarpment; the southern boundary is the limit of the NWMR.	• Ningaloo • Muiron Islands • Exmouth Gulf	North West Cape

[1] The EMBA encompasses the environmental and social values and sensitivities that might be contacted by surface or subsurface hydrocarbons in the unlikely event of any worst-case spill from Woodside's activities. The values and sensitivities include the physical environments and biological communities present, in addition to protected species and areas, and socioeconomic and cultural values.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine bioregion*	Marine system	Relevant key environmental sensitivities	Woodside activity area
South-west (DSEWPaC 2012b)** The SWMR comprises Commonwealth waters from the eastern end of Kangaroo Island in SA to Shark Bay in WA. The region spans about 1.3 million km² of temperate and subtropical waters and abuts the coastal waters of SA and WA.	Not applicable.	Key environmental values at a regional level considered relevant in the context of the EMBA	No applicable Woodside activity area
North (DSEWPaC 2012c) The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT/WA border). The region covers about 625,689 km² of tropical waters in the Gulf of Carpentaria and Arafura and Timor seas, and abuts the coastal waters of Queensland and the NT.			

**The EMBA for the marine bioregions used in this document has been extended to include adjacent coastal waters and shoreline habitats.*

***The extent of the SWMR for this document has been adjusted to only include marine and coastal waters extending from Shark Bay in WA to the WA/SA border. The boundary of the SWMR as described by DSEWPaC (2012b) extends to the eastern end Kangaroo Island in SA. However, this boundary lies outside the scope of this document.*

1.3 Methodology

This document is informed by resources that include:

- a search of the Department of Climate Change, Energy, the Environment and Water (DCCEEW) Protected Matters Search Tool (PMST) for the marine bioregions (NWMR, SWMR and NMR) and adjacent coastal waters and shoreline habitats (Appendix A)
- State (WA)/Commonwealth marine park management plans
- the *Environment Protection and Biodiversity Conservation* (EPBC) *Act 1999* (Commonwealth) (EPBC Act) Species Profile and Threats Database (SPRAT)
- EPBC Act Part 13 statutory instruments: recovery plans, conservation advice and wildlife conservation plans for listed threatened and migratory species
- peer-reviewed scientific publications, as well as Woodside and joint venture-funded studies and other titleholder-funded study findings available in the public domain.

The PMST uses a conservative, grid-based search methodology rather than precise coordinates to determine the potential presence of matters of national environmental significance (MNES). For marine areas located more than 30 km offshore, this involves using 32 km × 32 km grid cells to identify spatial overlap with listed MNES. As a result, the PMST report (Appendix A) may identify MNES that do not directly intersect with the EMBA, including environmental and socioeconomic receptors that do not overlap with the marine environment or have coastal interface. The Australian Marine Spatial Information System was used to determine the exact location of a feature to determine whether it overlaps or is adjacent to the EMBA. Accordingly, MNES identified in the PMST that are not within the EMBA or associated with marine or coastal environments, and species that do not rely on marine or shoreline habitats (for example, species with no marine foraging or life-cycle processes), have not been assessed within this document.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.4 Review and revision

The information presented in this document is reviewed and updated least every five years. Key updates are captured in a ‘change register’. Material risk may trigger updates within the five-year review period, as per the OPGGS (E) Regulations. Key updates may include the status of EPBC Act listed species, Part 13 instruments, policies and guidelines, key advice from external stakeholders, and recently published scientific literature.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2. PHYSICAL ENVIRONMENT

2.1 Regional context

Table 2-1 presents the key physical characteristics of the NWMR, SWMR and NMR. The remainder of this section then focuses entirely on the NWMR.

Table 2-1: Key physical characteristics of the NWMR, SWMR and NMR

Bioregion	Key characteristics
NWMR (DSEWPaC 2012a)	The NWMR experiences a tropical monsoonal climate towards the northern extent of the region, transitioning to tropical arid and subtropical arid within the central and southern areas of the region. The NWMR is part of the Indo-Australian Basin, the ocean region between the north-west coast of Australia and the Indonesian islands of Java and Sumatra. Dominant currents in the region include: the South Equatorial Current, the Indonesian Throughflow, the Eastern Gyral Current, and the Leeuwin Current (Department of Environment, Heritage, Water and the Arts (DEWHA) 2007a). The seafloor of the NWMR consists of four general feature types – continental shelf, continental slope, continental rise and abyssal plain – and is distinguished by a range of topographic features, including canyons, plateaus, terraces, ridges, reefs, banks and shoals.
SWMR (DSEWPaC 2012b)	The SWMR contains both subtropical and temperate climates, with overall light climatic cycles. The SWMR experiences complex and unusual oceanographic patterns, driven largely by the Leeuwin Current and its associated currents, which have a significant influence on biodiversity distribution and abundance. The major seafloor features of the SWMR include a narrow continental shelf on the west coast to the waters off south-west WA, and a wide continental shelf dominated by sandy carbonate sediments of marine origin in the Great Australian Bight. The region also contains a steep, muddy continental slope, many canyons and large tracts of abyssal plains.
NMR (DSEWPaC 2012c)	The NMR experiences a tropical monsoonal climate with complex weather cycles, including high temperatures and heavy seasonal yet variable rainfall and cyclones, which can be both destructive (loss of seagrass and mangroves) and constructive (mobilisation of sediment into coastal habitats). The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT/WA border, covering tropical waters in the Gulf of Carpentaria and Arafura and Timor seas. Currents in the NMR are driven largely by strong winds and tides, with only minor influences from oceanographic currents such as the Indonesian Throughflow and the South Equatorial Current. The seafloor of the NMR consists mainly of a wide continental shelf, as well as other geomorphological features such as shoals, banks, terraces, valleys, shallow canyons and limestone pinnacles.

2.2 Marine systems of the North-west Marine Region (NWMR)

The NWMR is divided into three large-scale ecological marine systems – the Kimberley, the Pilbara and Ningaloo-Leeuwin – based on the influence of major ocean currents, seafloor features and eco-physical processes (such as climate, tides, freshwater inflow) upon the region (DSEWPaC 2012a).

The three large-scale marine systems approximate the Woodside activity areas, which include Browse Basin, the NWS/Scarborough, and North West Cape (see Section 1.2 for Woodside activity areas) within the NWMR (Figure 2-1). Table 2-2 outlines the key characteristics of each marine system.

Table 2-2: Key characteristics of the marine systems of the NWMR

Marine system	Key characteristics
Kimberley	• Tropical monsoonal climate • Strong influence from Indonesian Throughflow • Predominantly tropical Indo-Pacific species • Subject to episodic offshore cyclonic activity, rarely crossing the coast • Large tidal regimes • Freshwater input from terrestrial monsoonal runoff • Turbid coastal waters (as in, light-limited systems) • Dominated by shelf environments • Predominantly hard substrates in inner to mid-shelf environments • Includes shelf-edge atolls: Scott Reef, Rowley Shoals
Pilbara	• Tropical arid climate • Transition between Indonesian Throughflow and Leeuwin Current dominated areas • Predominantly tropical species • High cyclone activity with frequent crossing of the coast • Transitional tidal zone • Internal tide activity • Large areas of shelf and slope • Dry coast with ephemeral freshwater inputs
Ningaloo-Leeuwin	• Subtropical arid climate Leeuwin Current consolidates • Transitional tropical/temperate faunal area • Higher water clarity in nearshore and offshore environments • Narrow shelf and slope • Marginal tidal range • Seasonal wind forcing more dominant influence on marine environment

2.3 Meteorology and oceanography

This section describes the general meteorological conditions and oceanography for the NWMR and provides further detail for the three Woodside activity areas (Table 2-3). The NWMR is influenced by a complex system of ocean currents that change between seasons and between years, which generally result in its surface waters being warm and nutrient-poor, and of low salinity (DEWHA 2007a). The mix of bathymetric features, complex topography and oceanography across the whole north-west marine environment has created and supports a globally important marine biodiversity hotspot (Wilson 2013). Table 2-3 provides high-level physical characteristics of the marine environment within and across the NWMR. This subsection does not describe warming trends or discuss forecast trajectories for the NWMR.

Table 2-3: NWMR climate and oceanography summary

Receptor	Description
Meteorology	
Seasonal patterns	Seasonal changes in wind direction and rainfall are important factors for driving the ecological processes in the NWMR (DSEWPaC 2012a). The broader NWMR experiences variations of a tropical or monsoon climate, with the northern areas featuring two distinct seasons: the dry season from May to September, and the wet season from October through to April. The wet season is Australia's peak period for tropical cyclones, rainfall and severe thunderstorms (Bureau of Meteorology (BOM) 2026a). The peak of the cyclone season usually occurs between December and March (DSEWPaC 2012a). The Kimberley region features a tropical monsoonal climate, the Pilbara region features a tropical arid climate, and the Ningaloo-Leeuwin region experiences a subtropical arid climate (DEWHA 2007a).

Receptor	Description
Air temperature and rainfall	Temperatures and rainfall vary seasonally in the NWMR region. Higher temperatures usually occur during the wet season, with average daily maximum temperatures ranging between 27ºC and 39ºC, and average daily minimum temperatures ranging between 12ºC and 27ºC. Cooler temperatures occur in the dry season; the average daily maximum temperatures range from 21ºC to 36ºC and average daily minimum temperatures range between 9ºC and 21ºC (Figure 2-2 and Figure 2-3 (BOM 2024)). Higher rainfall in the region typically occurs during the northern wet season, with the average rainfall between 100 mm and 2,400 mm, with highest falls observed late in the season. Comparatively, the average rainfall in the dry season is between 100 mm and 300 mm (BOM 2024). These seasonal occurrences are often associated with the passage of tropical low-pressure systems and cyclones (DSEWPaC 2012a).
Wind	Wind patterns in north-west WA are dictated by the seasonal movement of atmospheric pressure systems. During the northern wet season, high-pressure cells produce prevailing winds from the north-west and south-west, which vary between 10 and 13 m/s. During the dry season, high-pressure cells over central Australia produce north-easterly to south-easterly winds with average speeds of between 6 and 8 m/s (BOM 2022b). Refer to Figure 2-4.
Tropical cyclones	Tropical cyclone activity occurs during the wet season, with cyclone activity typically occurring between November and April, although few cyclones tend to occur during November. About five to six tropical cyclones occur in WA during each cyclone season, with about half of these becoming severe (BOM 2026b). See Figure 2-6.
Oceanography	
Ocean temperature	Waters in the NWMR are tropical year-round, with sea surface temperatures in open shelf waters typically reaching about 26°C in summer and dropping to about 22°C in winter. Nearshore temperatures (as recorded for the NWS area) fluctuate more annually, from about less than 23°C in winter to about 31°C in summer (Hallenberger *et al.* 2022), indicative of present-day sea surface temperatures, acquired from the Commonwealth Scientific and Industrial Research Organisation (CSIRO) Oceans and Atmosphere database. Warmer sea surface temperatures are also driven by the decadal variation of Niño/Niña strength in the NWMR. The Atlantic warm sea surface temperature anomalies from the Niño/Niña events drive a series of climate mean-state changes in the Indo-Pacific region, including sea surface temperature warming in the tropical eastern Indian Ocean (Xue *et al.* 2025). See Figure 2-7 and Figure 2-8, for the seasonal variation across and within the NWMR.
Currents	The major surface currents influencing north-west WA flow towards the poles and include the Indonesian Throughflow, the Leeuwin Current, the South Equatorial Current and the Eastern Gyral Current. The Ningaloo Current, the Holloway Current, the Shark Bay Outflow and the Capes Current are seasonal surface currents in the region. Below these surface currents are several subsurface currents, the most important of which are the Leeuwin Undercurrent and the West Australian Current. These subsurface currents flow towards the equator in the opposite direction to surface currents (DEWHA 2007a). The Indonesian Throughflow and Leeuwin Current weaken during the dry season (April to September), and more so during El Niño years (DSEWPaC 2012a). See Figure 2-9. The offshore waters of the NWMR are characterised by surface and subsurface boundary currents that flow along the continental shelf/slope and are enhanced through inflows from the ocean basins. They are an important conduit for the poleward heat and mass transport along the west coast (Wijeratne *et al.* 2018). Local physical oceanography is strongly influenced by the large-scale water movements of the Indonesian Throughflow (Liu *et al.* 2015; Sutton *et al.* 2019). Typically, a warm and well-mixed oligotrophic surface layer, and a cooler and more nutrient-rich deeper water layer (Menezes *et al.* 2013).
Waves	Sea surface waves within the NWMR generally reflect the direction of the synoptic winds and flow predominantly from the south-west in the summer and east in winter (Pearce *et al.* 2003). The NWS within the NWMR is a known area of internal wave generation. Both internal tides and internal waves are thought to be more prevalent during summer months due to the increased stratification of the water column (DEWHA 2007a). Along the continental slope of the NWMR, strong internal waves and interaction between semi-diurnal tidal currents and seabed topographic features facilitate upwelling events and localised productivity events (Holloway 2001).

Receptor	Description
Tides	Tides on the NWS increase as the water moves from deep towards the shallower coast. The highest offshore tides are experienced at the border of the Browse and Canning basins. The smallest tides are experienced at the Exmouth Plateau, near the coast. Tides of the NWS are predominantly semi-diurnal (two highs and two lows each day), but with increasing importance of the diurnal (once per day) inequality at the southern and northern extremities of the NWS. The tide range – represented by the mean spring range – increases northwards along the coast from 1.4 m at North West Cape (Point Murat) to 7.7 m at Broome, before decreasing again (apart from local amplification in King Sound and Collier Bay) to about 5 m off Cape Londonderry. The mean spring range then increases again through Joseph Bonaparte Gulf and on up 5.5 m at Darwin (RPS 2016).

2.3.1 Browse

Table 2-4 summarises the meteorological and oceanographic conditions for the Browse Basin, with supporting metocean data and figures provided in Appendix A.

Table 2-4: Summary meteorology and oceanography for Browse

Receptor	Description
Meteorology	
Seasonal patterns	The Browse area, overlapping the Kimberley marine system, experiences a tropical monsoon climate with moderate offshore cyclone activity (DEWHA 2007a). The region experiences two distinct seasons: the dry season from May to September and the northern wet season from October through to April. The wet season is Australia's peak time for tropical cyclones, rainfall and severe thunderstorms (BOM 2026c).
Air temperature	The mean annual air temperature recorded at Troughton Island between 1991 and 2020 ranged from 22.5ºC in July to 33.4ºC in November (BOM 2026c).
Rainfall	Mean rainfall recorded from Troughton Island in the Browse Basin between 1991 and 2020 ranged from a barely detectable (0.3 mm) mean monthly level in September to 274.8 mm in January (BOM 2026c).
Wind	The dry season experiences high-pressure systems that bring east to south-easterly winds with average wind speeds during the season of around 16.6 km/h and maximum wind gusts of 65 km/h. In contrast, the wet season brings predominantly westerly winds with average wind speeds about 17 km/h and maximum gusts exceeding 100 km/h (generally associated with tropical cyclones (MetOcean Engineers 2005).
Oceanography	
Currents	Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside, 2019). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.

2.3.2 North West Shelf/Scarborough

Table 2-5 summarises the meteorological and oceanographic conditions for the NWS/Scarborough, with supporting metocean data and figures provided in Appendix B.

Table 2-5: Summary meteorology and oceanography for the North West Shelf and Scarborough

Receptor	Description
Meteorology	
Seasonal patterns	The NWS and Scarborough activity areas, overlapping the Pilbara marine system, experience a tropical arid climate with high cyclone activity. The monsoonal climate of the wider NWMR has a distinct wet and dry seasonal regime and transition periods between seasons (DEWHA 2007a).
Air temperature	Air temperatures as measured at the North Rankin A platform on the NWS ranged from a maximum average of 39.8°C in summer to a minimum average temperature of 15.2°C in winter (Woodside 2015).
Rainfall	Rainfall patterns annually reveal the wet season with highest rainfalls during the late summer, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall in the dry season is typically extremely low (Pearce *et al.* 2003 and Appendix B).
Wind	Winds are typically from the southwest during the wet season (summer) and tending from the south-east during the dry season (winter). The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. During the winter period, the relative position of the high-pressure cells shifts further north, leading to prevailing south-easterly winds from the mainland (Pearce *et al.* 2003 and Appendix B).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Receptor	Description
Oceanography	
Currents	The large-scale ocean currents of the NWMR, primarily the Indonesian Throughflow and Leeuwin Current (and Holloway Current), are the primary influence on the NWS and Scarborough activity areas. The Indonesian Throughflow and Leeuwin Current are strongest during the late summer and winter and flow reversals to the north-east, typically short-lived and weak when there are strong south-westerly winds, can generate localised upwelling on the shelf edge (Holloway and Nye 1985; James *et al.* 2004; Condie *et al.* 2006).

2.3.3 North West Cape

Table 2-6 summarises the meteorological and oceanographic conditions for the North West Cape, with supporting metocean data and figures in Appendix B.

Table 2-6: Summary meteorology and oceanography for the North West Cape

Receptor	Description
Meteorology	
Seasonal patterns	The North West Cape activity area, overlapping the Ningaloo-Leeuwin marine system, experiences a subtropical arid climate featuring a hot summer season and a mild winter season. There are often distinct transition periods between the summer and winter regimes, characterised by periods of relatively low winds, with seasonal winds being the more dominant influence on the marine environment in the region (DEWHA 2007a).
