1. Introduction 15
1.1 Overview 15
1.2 Purpose of the Environment Plan 15
1.3 Environment Plan summary 15
1.4 Structure of the Environment Plan 16
1.5 Description of the Titleholder 18
1.6 Details of Titleholder and nominated liaison person 18
1.6.1 Titleholder 18
1.6.2 Nominated liaison person 18
1.6.3 Arrangements for notifying change 18
1.7 Woodside Management System 18
1.7.1 Our WMS Purpose 19
1.7.2 Environment and Biodiversity Policy 21
1.8 Description of relevant requirements 21
1.8.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act) 21
1.8.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act) 22
1.8.2.1 Recovery plans and threat abatement plans 22
1.8.2.2 Australian Marine Parks 22
1.8.2.3 World Heritage Properties 23
2. Environment Plan process 24
2.1 Overview 24
2.2 Environmental Plan process 24
2.3 Establish the context 25
2.3.1 Activity description 25
2.3.2 Existing environment description 25
2.3.3 Environmental legislation and other requirements 25
2.3.4 Impact and risk management 25
2.3.4.1 Impact and risk identification and analysis 25
2.3.4.2 Decision support framework 26
2.3.4.3 Decision support framework tools 27
2.3.4.4 Decision calibration 28
2.3.5 Control measures 28
2.3.6 Impact and risk classification 29
2.3.6.1 Impact classification 29
2.3.6.2 Risk classification 30
2.4 Impact and risk evaluation 31
2.4.1 Demonstration of ‘as low as reasonably practicable’ (ALARP) 31
2.4.2 Demonstration of acceptability 32
2.5 Recovery plan and threat abatement plan assessment 32
2.6 Environmental performance objectives/outcomes, standards and measurement criteria 33
2.7 Implement, monitor, review and report 33
2.8 Stakeholder consultation 33
3. Description of the activity 34
3.1 Overview 34

4.9.5.4 Feedback received via consultation to inform Existing Environment Description 103
4.9.6 Summary of cultural features and heritage values 105
4.9.7 Historic sites of significance 110
4.9.8 Historic underwater cultural heritage 110
4.9.9 World, National and Commonwealth heritage listed places 111
4.10 Socio-economic environment 112
4.10.1 Commercial fisheries 112
4.10.2 Traditional and customary fishing 119
4.10.3 Tourism and recreation 119
4.10.4 Commercial shipping 119
4.10.5 Oil and gas facilities, infrastructure and other industries 120
4.10.6 Submarine communication infrastructure 120
4.10.7 Defence 120
5. Stakeholder consultation 125
5.1 Summary 125
5.2 Consultation – general context..... 126
5.3 Identification of relevant persons for consultation 131
5.3.1 Regulations 25(1)(a), (b) and (c) 131
5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c) 131
5.3.3 Regulation 25(1)(d) 131
5.3.4 Identification of relevant persons under Regulation 25(1)(d) 133
5.3.5 Regulation 25(1)(e) 139
5.3.6 Identification of relevant persons under Regulation 25(1)(e) 139
5.3.7 Persons or organisations Woodside chooses to contact 139
5.3.8 Assessment of relevant persons for the proposed activity 139
5.4 Consultation material and timing 139
5.4.1 Sufficient information 140
5.4.2 Reasonable period for consultation 142
5.4.3 Discharge of Regulation 25 143
5.5 Context of consultation approach with Traditional Custodians 144
5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal 144
5.5.2 Consultation method 145
5.5.3 Identification of relevant persons 147
5.5.4 Opportunity to self-identify and identifying other individuals 147
5.5.5 Sufficient information 148
5.5.6 Reasonable period for consultation 149
5.5.7 Discharge of Regulation 25 149
5.6 Providing feedback and assessment of merit of objections or claims 149
5.7 Ongoing consultation..... 150
6. Environmental impact and risk assessment, performance outcomes, standards and measurements criteria 151
6.1 Overview 151
6.2 Impact and risk analysis evaluation 154
6.3 Impacts and risks not deemed credible or outside the scope of this Environment Plan 154
6.3.1 Bunkering 154
6.3.2 Underwater noise emissions from helicopters 154

6.3.3 Underwater noise emissions from remotely operated vehicles 154
6.4 Cumulative impacts 154
6.5 Indirect impacts from activities outside the Operational Area 155
6.6 Environmental performance outcomes, standards and measurement criteria 155
6.7 Presentation 156
6.8 Planned activities (routine and non-routine) 158
6.8.1 Physical presence: interaction with third party vessels 158
6.8.2 Physical presence: disturbance to seabed from geotechnical and geophysical surveys 165
6.8.3 Routine acoustic emissions: Generation of noise from survey vessels and geophysical and geotechnical survey equipment 172
6.8.4 Routine light emissions: external lighting on survey vessels 194
6.8.5 Routine atmospheric and greenhouse gas emissions: fuel combustion 201
6.8.6 Routine and non-routine discharges to the marine environment: survey vessels 205
6.9 Unplanned activities (accidents, incidents, emergency situations) 212
6.9.1 Quantitative spill risk assessment methodology 212
6.9.1.1 Worst-case scenarios 212
6.9.1.2 Environment that may be affected and hydrocarbon contact thresholds 213
6.9.1.3 Operational and scientific monitoring 215
6.9.1.4 Hydrocarbon characteristics 215
6.9.2 Unplanned hydrocarbon release: Vessel collision 219
6.9.3 Physical presence: Interaction with marine fauna 235
6.9.4 Physical presence: Disturbance to seabed from dropped objects and equipment loss 241
6.9.5 Unplanned discharges: Loss of solid hazardous and non-hazardous wastes 246
6.9.6 Unplanned discharges: Deck and subsea spills from geotechnical and geophysical equipment 251
6.9.7 Physical presence: Introduction of invasive marine species 256
6.10 Recovery plan and threat abatement assessment 263
6.11 Cultural features and heritage values assessment 275
7. Implementation strategy 286
7.1 Overview 286
7.2 Systems, practices, and procedures 286
7.2.1 Environmental Consideration during Selection, Assessment and Approval of Chemicals 286
7.2.1.1 Environmental selection criteria 286
7.2.2 Woodside invasive marine species risk assessment process 288
7.2.2.1 Objective and scope 288
7.2.2.2 Risk assessment process 289
7.2.3 Unexpected finds procedure 291
7.2.4 Offshore Seabird Management Plan 292
7.2.5 Pygmy Blue Whale Adaptive Management 292
7.2.5.1 DP operations 293
7.2.5.2 Geophysical survey equipment 296
7.3 Roles and responsibilities 296
7.4 Training and competency 298
7.4.1 Overview 298
7.4.2 Inductions 298
7.4.3 Petroleum Activity-specific environmental awareness 298
7.5 Monitoring, auditing, and managing non-conformance and review 299

7.5.1 Monitoring 299
7.5.2 Auditing 299
7.5.2.1 Survey vessel activities 299
7.5.2.2 Marine assurance 300
7.5.2.3 Risk assessment 300
7.5.3 Management of non-conformance 301
7.5.4 Review 301
7.5.4.1 Management review 301
7.5.4.2 Learning and knowledge sharing 302
7.5.4.3 Review of impacts, risks and controls across the life of the EP 302
7.6 Management of knowledge 302
7.7 Management of newly identified impacts and risks 303
7.8 Management of change and revision 303
7.8.1 Environment Plan management of change 303
7.8.2 Oil Pollution Emergency Plan management of change 303
7.9 Record keeping 303
7.10 Ongoing consultation 304
7.11 Reporting 306
7.11.1 Routine reporting (internal) 306
7.11.1.1 Regular health, safety and environment meetings 306
7.11.1.2 Performance reporting 306
7.11.2 Routine reporting (external) 306
7.11.2.1 Start and end notifications of the Petroleum Activity 306
7.11.2.2 Environmental performance review and reporting 307
7.11.2.3 End of the Environment Plan 307
7.11.3 Incident reporting (internal) 307
7.11.4 Incident reporting (external) – Reportable and recordable 307
7.11.4.1 Reportable incidents 307
7.11.4.2 Recordable incidents 308
7.11.4.3 Other external incident reporting requirements 308
7.12 Emergency preparedness and response 312
7.12.1 Overview 312
7.12.2 Emergency response training 312
7.12.3 Emergency response preparation 313
7.12.4 Oil and other hazardous materials spill 313
7.12.5 Emergency and spill response 314
7.12.6 Emergency and spill response drills and exercises 314
7.12.7 Testing of hydrocarbon spill response arrangements 315
7.12.8 Testing of arrangements schedule 316
7.12.9 Cyclone and dangerous weather preparation 318

1. INTRODUCTION

1.1 Overview

Woodside Energy Limited (Woodside), as Operator of the Browse to North West Shelf (NWS) Project (the 'Project'), plan to undertake a series of geophysical and geotechnical (GPGT) surveys. The Petroleum Activity will consist of a number of individual exploration survey campaigns to acquire appraisal data to inform the assessment and planning of potential future development opportunities. The purpose of these surveys is to gather this data, rather than the recovery of petroleum. The survey will acquire data to characterise seabed and subsurface geological conditions and support a range of engineering, environmental and heritage assessment activities, including optimisation of the pipeline route, identification of suitable MODU anchoring locations, and the development of FEED design and cost estimates for subsea infrastructure. The surveys provide information to support decision making on potential future infrastructure siting, design and development planning and may also provide data on existing infrastructure.

The project covers both State and Commonwealth Waters and has been separated into three Environment Plans (EP).

Woodside, as Titleholder under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023* (Cth) (referred to as the Environment Regulations), proposes to undertake GPGT activities within Permit Area(s) (WA-30-R, WA-28-R, WA-29-R, WA-31-R, WA-32-R). In this document, the GPGT survey activities are referred to as the Petroleum Activity.

This EP details the Petroleum Activity within the Commonwealth Waters of the Torosa, Calliance and Brecknock fields. The Petroleum Activity are considered a Petroleum Activity for the purposes of Regulation 5 of the Environment Regulations. A detailed description of the Petroleum Activity is provided in Section 3. This EP has been prepared as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

1.2 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- The potential environmental impacts and risks (planned [routine and non-routine] and unplanned) that may result from the Petroleum Activity are identified.
- Appropriate management controls are identified and implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable.
- The Petroleum Activity are carried out in a manner consistent with the principles of ecologically sustainable development (ESD) (as defined in Section 3A of the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999* (Cth) [EPBC Act]).

1.3 Environment Plan summary

Table 1-1 summarises the content of this EP, as required by Regulation 35(7).

Table 1-1: EP summary

EP summary material requirement	Relevant section of this EP containing EP summary material
Details of the Titleholder's nominated liaison person for the activity	Section 1.6
A description of the activity	Section 3
The location of the activity	Section 3.3
A description of the receiving environment	Section 4
Consultation already undertaken and plans for ongoing consultation	Section 5

1.4 Structure of the Environment Plan

The EP has been structured to reflect the process and requirements of the Environment Regulations, as outlined in Table 1-2.

Table 1-2: EP process phases, applicable Environment Regulations and relevant section of EP

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 34(a): Is appropriate for the nature and scale of the activity	Regulation 21: • Environmental assessment Regulation 22: • Implementation strategy for the EP Regulation 24: • Other information in the EP	The principle of 'nature and scale' is applicable throughout the EP	Section 2 Section 3 Section 4 Section 5 Section 6 Section 6.11
Regulation 34(b): Demonstrates that the environmental impacts and risks of the activity will be reduced to ALARP Regulation 34(c): Demonstrates that the environmental impacts and risks of the activity will be of an acceptable level	Regulations 21(1)–21(7): • 21(1) Description of the activity • 21(2) and (3) Description of the environment • 21(4) Requirements • 21(5) and (6) Evaluation of environmental impacts and risks • 21(7) Environmental Performance Outcomes and standards • Regulations 24(a)–24(c): • A statement of the Titleholder's corporate environmental policy • A report on all consultations between the Titleholder and any relevant person	Set the context (activity and existing environment) Define 'acceptable' (the requirements, the corporate policy, relevant persons) Detail the impacts and risks Evaluate the nature and scale Detail the control measures – ALARP and acceptable	Section 1 Section 2 Section 3 Section 4 Section 5 Section 6 Section 6.11
Regulation 34(d): Provides for appropriate Environmental Performance Outcomes, environmental performance standards and measurement criteria	Regulation 21(7): • Environmental Performance Outcomes and standards	Environmental Performance Outcomes (EPOs) Environmental performance standards (EPSs) Measurement criteria (MCs)	Section 6
Regulation 34(e): Includes an appropriate implementation strategy and	Regulation 22: • Implementation strategy for the EP	Implementation strategy, including: Environmental Management System (EMS)	Section 6.11

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Complies with the Act and the regulations	• Describe the requirements, including legislative requirements, that apply to activity and are relevant to the environmental management of the activity Regulation 23: • Details of the Titleholder and liaison person Regulation 24(a): • A statement of the Titleholder's corporate environmental policy Regulation 24(c): • Details of all reportable incidents in relation to the proposed activity	*Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act) and the Environment Regulations	Section 6.11

1.5 Description of the Titleholder

Woodside Energy Limited (Woodside) submits the EP as Titleholder for this activity, of the Browse Joint Venture.

1.6 Details of Titleholder and nominated liaison person

In accordance with Regulation 23 of the Environment Regulations, details of the Titleholder, liaison person and arrangements for notifying changes are described below.

1.6.1 Titleholder

Woodside Energy Limited
11 Mount Street
Perth, Western Australia

T: 08 9348 4000

ACN: 63 005 482 986

1.6.2 Nominated liaison person

Nicolas Wirtz
Corporate Affairs Manager
11 Mount Street
Perth, Western Australia

T: 08 9348 4000

Email: feedback@woodside.com

1.6.3 Arrangements for notifying change

If the Titleholder, Titleholder's nominated liaison person, or the contact details for either change, then NOPSEMA will be notified in writing within 2 weeks or as soon as practicable.

1.7 Woodside Management System

The Woodside Management System (Our WMS) defines the core mandatory activities that support safeguarding the business and enabling its people to achieve objectives, manage uncertainty and meet obligations to deliver value for the company and its stakeholders.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

1.7.1 Our WMS Purpose

Our WMS is a series of integrated business processes that contribute to value delivery. A process is defined as the core mandatory activities that are material to converting inputs to outputs for value delivery from the defined business area. A process must reflect relevant corporate drivers and may have associated tools that support its implementation. Our WMS activities are divided into two categories; Deliver Value Chain – for activities directly involved in value delivery and Enable Value Chain – for activities supporting the enterprise and value delivery. The Health, Safety and Environment sub-category is included in the Enable Value Chain category. Given this, there is interdependence between processes across these activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

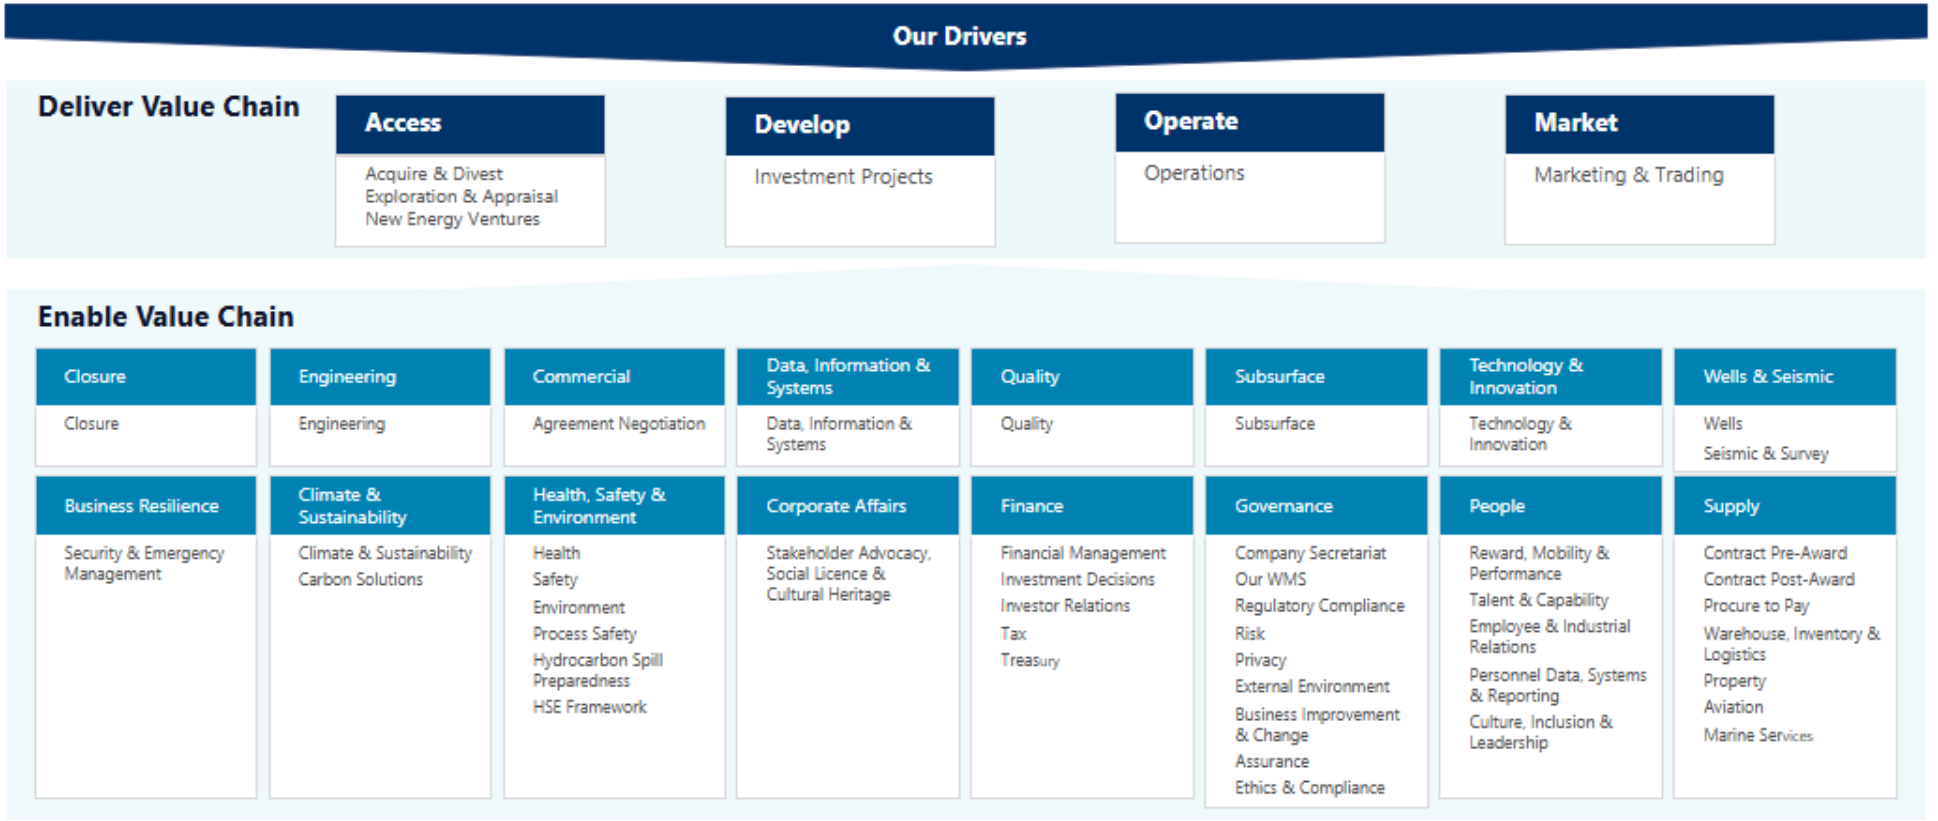

Figure 1-1: The Woodside Management System Structure

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Our WMS content is structured in a hierarchy as illustrated in Figure 1-2. This hierarchy begins with the 'why' through Our Drivers, which are defined by the Board and Executive. It is followed by 'The What' with Our Expectations, which establish mandatory requirements for executing process activities to deliver value in accordance with the relevant Our Drivers. Finally, it includes 'The How' through Tools, which support the implementation, execution, or understanding of Our Expectations. Additionally, there is Non-WMS content that is subordinate to, but sits outside, Our WMS.

Adaptations of Our WMS tools may, as applicable and justified, be created for regional application.

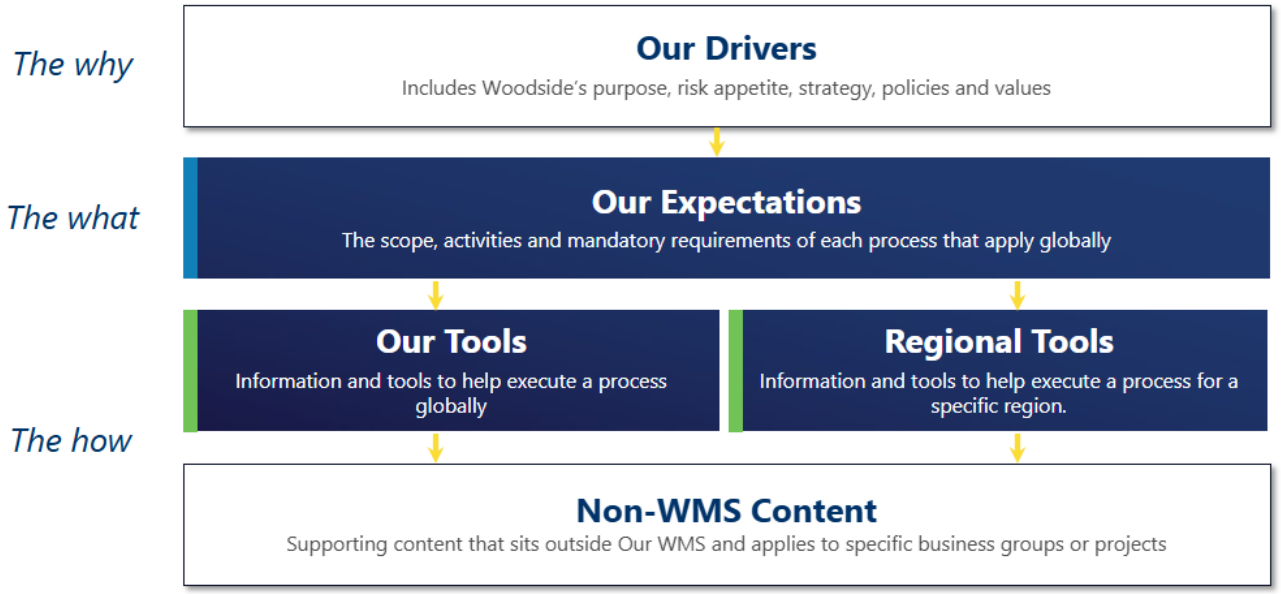

Figure 1-2: Our WMS information structure and document hierarchy

1.7.2 Environment and Biodiversity Policy

In accordance with Regulation 24(a) of the Environment Regulations, Woodside's Environment and Biodiversity Policy is provided in Appendix A of this EP.

Please note that the Environment and Biodiversity Policy is reviewed regularly and is updated as required. The Environment and Biodiversity Policy is made available on our website: https://www.woodside.com/who-we-are/corporate-governance-and-policies. This EP will be implemented in accordance with the current Environment and Biodiversity Policy as shown on our website.

1.8 Description of relevant requirements

In accordance with Regulation 21(4) of the Environment Regulations, a description of the requirements, including legislative requirements, that apply to the Petroleum Activity and relevant to the environmental management of the Petroleum Activity are detailed in Appendix B and summarised in the following paragraphs.

1.8.1 *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (Cth) (OPGGS Act)

The OPGGS Act legislates offshore petroleum activities beyond 3 nautical miles (nm) of the mainland (and islands) to the outer extent of the Australian Exclusive Economic Zone at 200 nm.

Under the OPGGS Act, the Environment Regulations apply to petroleum activities in Commonwealth Waters and are administered by NOPSEMA. The objective of the Environment Regulations is to ensure petroleum activities are performed in a manner:

- consistent with the principles of ESD
- by which the environmental impacts and risks of the activity will be reduced to ALARP
- by which the environmental impacts and risks of the activity will be of an acceptable level.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

This EP has been prepared in accordance with the relevant requirements of the OPGGS Act and the Environment Regulations.

1.8.2 *Environment Protection and Biodiversity Conservation Act 1999* (Cth) (EPBC Act)

The EPBC Act includes the objective to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the EPBC Act as 'matters of national environmental significance' (MNES). The EPBC Act sets a regime which aims to ensure that actions taken are on (or impacting upon) Commonwealth land or waters are consistent with the principles of ESD.

In relation to offshore petroleum activities in Commonwealth waters the requirements of the EPBC Act are administered by NOPSEMA. The Streamlining Offshore Petroleum Environmental Approvals Program Report (NOPSEMA 2014) requires any offshore petroleum activities, authorised by the OPGGS Act, to be conducted in accordance with an accepted EP whereby the definition of 'environment' covers all matters protected under Part 3 of the EPBC Act.

The Petroleum Activity described in this EP is a discrete, pre-development data acquisition activity undertaken to inform potential development and is not part of any current EPBC Act controlled action or approval. An assessment of MNES has been undertaken as part of this EP, taking into account the temporary, localised and low-intensity nature of the survey activities, and has determined that the Petroleum Activity is unlikely to result in a significant impact on MNES.

As outlined by Section 146B of the EPBC Act, separate EPBC approval is not required for this EP.

1.8.2.1 Recovery plans and threat abatement plans

Under Section 139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the Act. Similarly, under Section 268 of the EPBC Act:

> *'A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.'*

In respect to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA. Specifically:

- NOPSEMA will not accept an EP that proposes activities that will result in unacceptable impacts to a listed threatened species or ecological community.
- NOPSEMA will not accept an EP that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community.
- NOPSEMA will have regard to any approved conservation advice in relation to a threatened species or ecological community before accepting an EP.

An assessment of the Petroleum Activity against all relevant recovery plans and threat abatement plans is contained in Section 6.10.

1.8.2.2 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs) are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of National Parks (DNP) is responsible for managing AMPs (supported by Parks Australia) and is required to publish management plans for them. Under Section 362 of the EPBC Act, other parts of the Commonwealth Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans. Therefore, NOPSEMA is required to consider potential impacts from petroleum activities on AMPs

Specific zones within AMPs have been allocated conservation objectives based on the Australian International Union for Conservation of Nature (IUCN) reserve management principles outlined in Schedule 8 of the EPBC Regulations 2025. The principles for each zone determine what activities are acceptable within a protected area under the EPBC Act. Section 4 provides a description of the AMPs that are overlapped by

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

the Operational Area and environment that may be affected (EMBA) and the relevant zones that the Petroleum Activity are likely to interact with.

The Operational Area does not overlap any AMPs. Ashmore Reef Sanctuary Zone and Recreational Zone (classified as an AMP) is overlapped by the EMBA. The survey vessels will not enter the Ashmore Reef Marine Park at any time (unless there is an emergency that requires it).

1.8.2.3 World Heritage Properties

The Operational Area and EMBA do not overlap any World Heritage properties.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2. ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process Woodside follows to prepare the EP once an activity has been defined as a Petroleum Activity. This includes a description of the environmental risk management method that is used to identify, analyse and evaluate risks to meet ALARP and acceptability requirements; and to develop environmental performance outcomes (EPOs) and EPS. This section also describes Woodside's risk management methods applicable to implementation strategies applied during the activity.

2.2 Environmental Plan process

Figure 2-1 illustrates the EP development process. Each element of this process is discussed further in Sections 2.3 to 2.8.

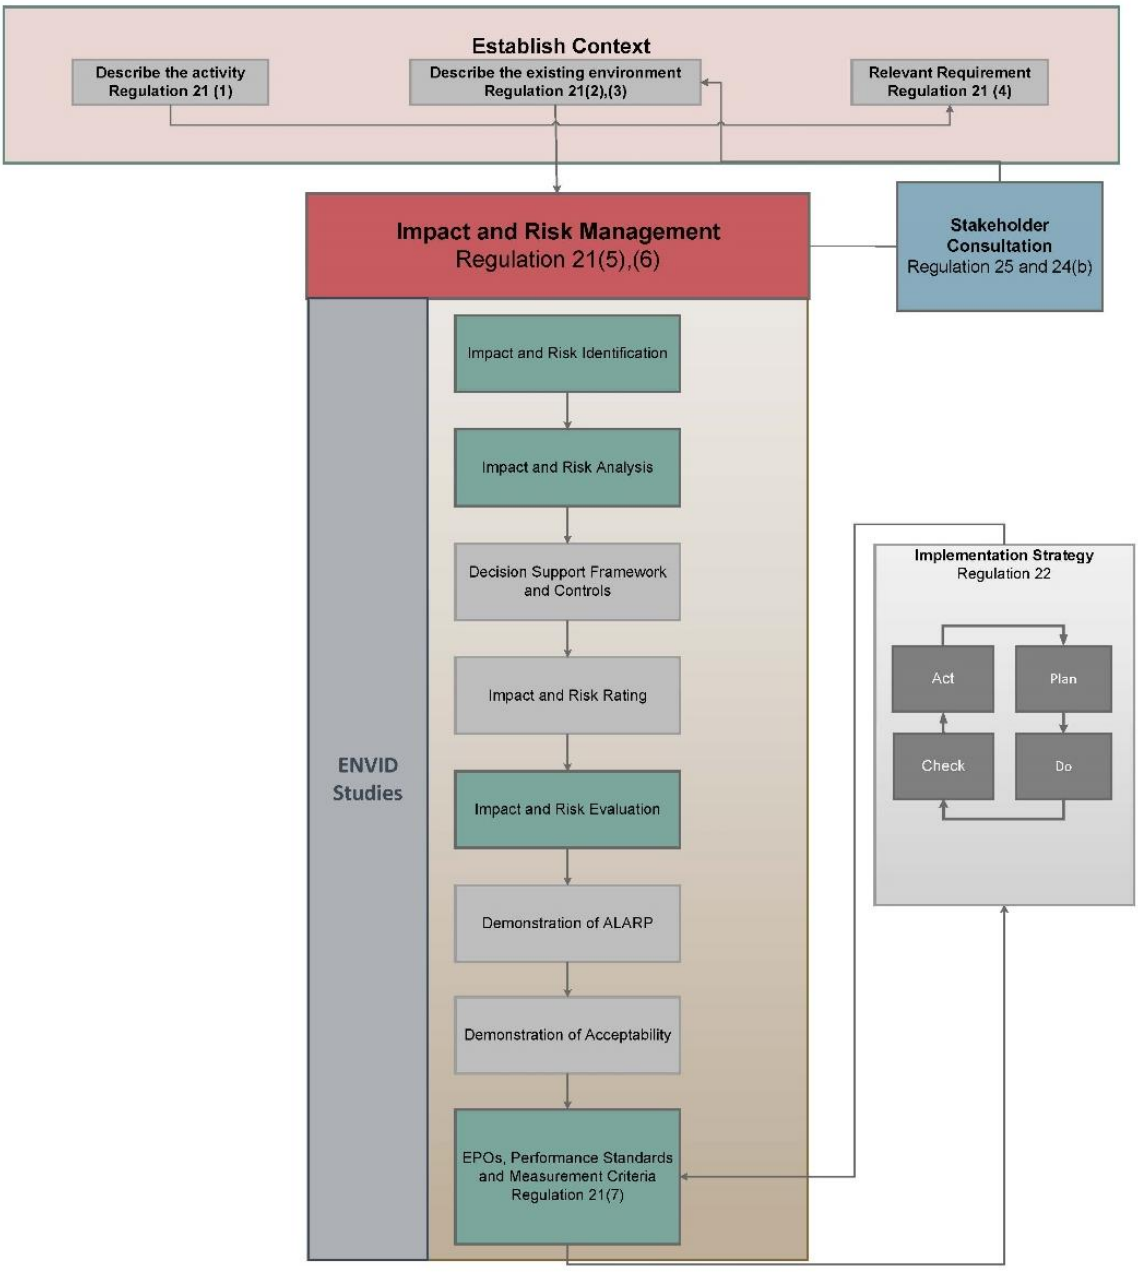

Figure 2-1: EP development process

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.3 Establish the context

Context is established by considering the proposed activities associated with the Petroleum Activity, and the environment in which the activities are planned to take place.

Describing the activity involves the evaluation of whether the activity meets the definition of a 'Petroleum Activity' as defined in the Environment Regulations. The activity is then described in relation to the location, what is to be undertaken and how—this allows for the identification of environmental aspects for each activity.

2.3.1 Activity description

The EP describes the activity, including:

- the location or locations of the activity; general details of the construction and layout of the facility used in undertaking the activity
- an outline of the operational details of the activity and proposed timetables for undertaking the activity
- additional information relevant to consideration of environmental impacts and risks of the activity.

The 'what' and 'how' are described in the context of 'environmental aspects' to inform the risk and impact assessment for planned (routine and non-routine) and unplanned (accidents, incidents, emergency conditions) activities.

This activity is described in Section 3 and is referred to as the Petroleum Activity.

2.3.2 Existing environment description

The values and sensitivities relevant to environment where the Petroleum Activity is proposed to be undertaken have been identified in Section 4.6, to the extent required to inform impact and risk assessment to environmental receptors from the Petroleum Activity.

A full description of the relevant values and sensitivities relevant to the Petroleum Activity is contained within the Master Existing Environment document provided at Appendix C.

2.3.3 Environmental legislation and other requirements

Relevant legislation and other requirements that apply to the Petroleum Activity are presented in Section 1.8 and Appendix B. These requirements have been considered throughout the development of this EP.

2.3.4 Impact and risk management

2.3.4.1 Impact and risk identification and analysis

The first step of impact and risk management is to identify all credible sources of environmental impacts and risks, include those directly and indirectly associated with the Petroleum Activity and potential emergency and accidental events. This may include environment impacts and risk that are a consequence of the proposed activity but are not within Woodside's control. In this EP:

- Planned (routine and non-routine) activities, including contingent activities, have the potential for inherent changes to the environment, are termed environmental 'impacts.'
- Unplanned events, including potential emergency and accidental events which have the potential to result in a change to the environment, are termed environmental 'risks.'

An environmental impacts and risks identification and assessment workshop (ENVID) was undertaken by multidisciplinary teams comprising relevant operational, technical and environmental personnel with sufficient breadth of knowledge, training, and experience to reasonably assure that risks and impacts were identified, and their potential environmental consequences assessed. Impacts and risks were identified, during the workshop, for both planned (routine and non-routine) activities and unplanned (accidents/incidents/emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

During the ENVID, environmental impacts and risks were assessed, and controls were assigned to manage the impact or risk. The ENVID also supported identification of relevant stakeholders to be consulted as part of development of this EP (Section 5). The output of the ENVID, an environmental impacts and risk register, was then used as a basis to develop the risk and impact assessment section of this EP (Section 6).

The environmental impact and risk assessments presented in this EP has been informed by historic as well as more recent hazard and environmental risk identification studies (e.g. HAZID/ENVID) and consequence modelling studies for high consequence, low probability environmental risks. These studies have been reviewed and revalidated, as required, for the development of a new EP. Further, feedback from NOPSEMA to Woodside across Woodside's portfolio of environment plans has been considered and integrated, where relevant.

Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of Woodside's stakeholder engagement process (Section 5). The environment outputs of applicable risk and impact workshops and associated studies are referred to as ENVID in this EP.

Impacts and risks were evaluated and tabulated for each planned activity and unplanned events respectively. Environmental impacts and risks were recorded in an environmental impacts and risk register. The output of the workshop is used to present the risk assessment and form the basis of EPOs, EPSs, and MC. This information is presented in Section 6, following the format presented in Table 2-1.

Table 2-1: Example of layout of identification of risks and impacts in relation to risk sources

Impact evaluation summary													
Source of impact	***Environmental value potentially impacted***						***Evaluation***						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Summary of source of impact/risk													

2.3.4.2 Decision support framework

To support the impact and risk assessment process and Woodside's determination of acceptability, Woodside's health, safety, and environment (HSE) risk management procedures include using a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (Oil and Gas UK 2014). Application of the decision support framework confirms:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the impact or risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to manage risks and impacts based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher-order environmental impacts are subject to further evaluation and assessment).

The framework allows a decision type (A, B, or C) to be selected for each impact and risk, based on several criteria; the decision type is documented in the environmental impacts and risk register. Figure 2-2 summarises the framework, criteria, and resulting level of assessment for decision type A, B and C, which are discussed further below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

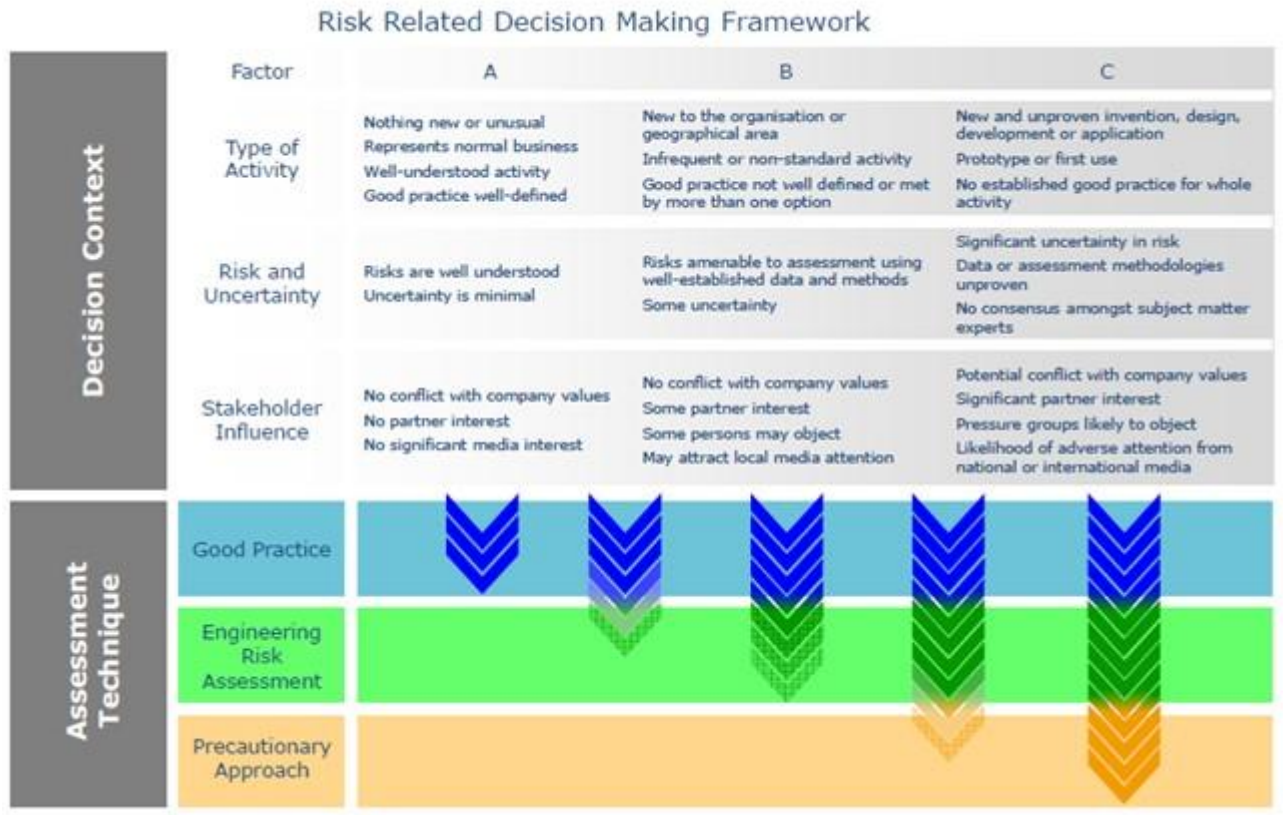

Figure 2-2: Risk-related decision-making framework

Source: (Oil and Gas UK 2014)

2.3.4.2.1 Decision Type A

Decision Type A risks and impacts are well understood and established practice; they are generally recognised as good industry practice and are often embodied in legislation, codes and standards, and use professional judgement.

2.3.4.2.2 Decision Type B

Decision Type B risks and impacts typically involve greater uncertainty and complexity and are considered higher-order impacts and risks. These impacts and risks may deviate from established practice or have some lifecycle implications and therefore require further engineering risk assessment to support the decision and ensure that the risk is ALARP.

2.3.4.2.3 Decision Type C

Decision Type C risks and impacts typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty, therefore requiring the adoption of the precautionary approach. The risks may result in significant environmental impact, significant project risk or exposure, or may elicit negative stakeholder concerns. For these risks or impacts, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external stakeholder consultation as part of the risk assessment process.

2.3.4.3 Decision support framework tools

The below framework tools were applied, as appropriate, when assessing each impact and risk to help identify control measures based on the selected decision type described above.

- Legislation, Codes and Standards (LCS): identifies the requirements of legislation, codes and standards that are to be complied with for the activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Good Industry Practice (GP): identifies further engineering control standards and guidelines that may be applied by Woodside above that required to meet the LCS.
- Professional Judgement (PJ): uses relevant personnel with the knowledge and experience to identify alternative controls. Woodside applies the hierarchy of control as part of the risk assessment to identify any alternative measures to control the risk.
- Risk-based Analysis (RBA): assesses the results of probabilistic analyses such as modelling, quantitative risk assessment and/or cost–benefit analysis to support the selection of control measures identified during the risk assessment process.
- Company Values (CV): identifies values identified in Woodside's code of conduct, policies and Our Values. Views, concerns and perceptions are to be considered from internal Woodside stakeholders directly affected by the planned impact or potential risk.
- Societal Values (SV): identifies the views, concerns and perceptions of relevant stakeholders and addresses relevant stakeholder views, concerns and perceptions.

2.3.4.4 Decision calibration

To determine that the decision type selected and the control measures applied are suitable, the following tools may be used for calibration (i.e. checking) where required:

- LCS/Verification of Predictions: Verification of compliance with applicable LCS and/or good industry practice.
- Peer Review: Independent peer review of PJs, supported by RBA, where appropriate.
- Benchmarking: Where appropriate, benchmarking against a similar facility or activity type or situation that has been deemed to represent acceptable risk.
- Internal Stakeholder Consultation: Consultation undertaken within Woodside to inform the decision and verify company values are met.
- External Stakeholder Consultation: Consultation undertaken to inform the decision and verify societal values are considered.

Where appropriate, additional calibration tools may be selected specific to the decision type and the activity.

2.3.5 Control measures

Once impacts and risks have been identified, the potentially impacted receptors have been identified and understood, and the decision type has been selected, impact and risk reduction measures (i.e. controls) can be applied. Controls are prioritised and categorised in accordance with the hierarchy of controls listed below, where risk reduction measures at the top of the hierarchy take precedence over risk reduction measures further down:

- Elimination of the impact or risk by removing the hazard[1].
- Substitution of a hazard with a less hazardous one.
- Engineering controls including design measures to prevent or reduce the frequency, or detect or control, the impact or risk event (limiting the magnitude, intensity and duration) such as:
  - Prevention: design measures that reduce the likelihood of a hazardous event occurring
  - Detection: design measures that facilitate early detection of a hazardous event
  - Control: design measures that limit the extent/escalation potential of a hazardous event
  - Mitigation: design measures that protect the environment if a hazardous event occurs
  - Response equipment: design measures or safeguards that enable clean-up/response after a hazardous event occurs.

[1] *A hazard has the potential to cause harm to the environment.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Procedures and administration including management systems and work instructions used to prevent or mitigate environmental exposure to hazards.
- Emergency response and contingency planning including methods to enable recovery from the impact of an event (e.g. protection barriers deployed near the sensitive receptor).

2.3.6 Impact and risk classification

Environmental impacts and risks are assessed to determine their potential impact consequence level or risk rating, which can then be evaluated, along with other criteria, against the ALARP and acceptability requirements under the Environment Regulations. The full process for impact and risk classification is described in the subsections below.

2.3.6.1 Impact classification

Using the Woodside Environment Risk and Impact Rating Tool as a guide, environmental impacts are assessed to determine the potential consequence level. The process for determining the consequence levels is described in Section2.3.6.1.1.

2.3.6.1.1 Assign the consequence level

The consequence level (Severe, Major, Moderate, Minor, Localised and Low-Level, and No Lasting Effect) is determined through a classification framework that incorporates:

- significance[2] of the feature of area
- scale of the impact on the feature (e.g. species, population, habitat) or area (size)
- recoverability, defined as the ability of the feature or area to naturally recover from the impact within a nominal period.

2.3.6.1.2 Consequence level descriptions

Table 2-2 describes the possible environment, community and culture consequence levels for each identified impact and risk, assuming all controls (preventative and mitigative) are absent or have failed. Where multiple receptors have the potential to be impacted, the worst-case consequence level is carried into the final impact and risk assessment and evaluation.

[2] *For the purposes of describing the Woodside Environment Risk and Impact Rating Tool, references to significance in impact and risk classification, use significance as defined in the Woodside Environment Risk and Impact Rating Tool.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-2: Woodside impact and impact risk matrix (environment and community and culture) consequence descriptions

Environment	*Social and cultural*		*Consequence level*
Severe impact on a sensitive feature(s) or receiving environment, such as permanent impairment on a highly sensitive area or feature.	Severe, long-term impact to a community, social infrastructure or highly valued areas or items of international cultural and social significance.	***Severe***	***A***
Major impact on environmental feature(s) or area(s), such as impact on feature or area of national importance with limited ability to recover.	Major, long-term impact to a community, social infrastructure or highly valued areas/items of national cultural significance.	***Major***	***B***
Moderate impact on environmental feature(s) or area(s), such as impact on feature or area of heightened sensitivity with limited ability to recover.	Moderate, medium-term impact to a community, social infrastructure of highly valued areas or items of national cultural significance.	***Moderate***	***C***
Minor impact on environmental feature(s) or area(s) such as impact on feature of low significance with some ability to recover.	Minor, short-term impact to a community or areas/items of cultural significance.	***Minor***	***D***
Localised and low-level impact on environmental feature(s) or area(s) of low significance.	Slight, short-term impact to a community or areas/items of cultural significance.	***Localised and Low Level***	***E***
No lasting effect, localised impact not significant to environmental receptors	Temporary localised impact not significant to areas/items of cultural significance.	***No Lasting Effect***	***F***

2.3.6.2 Risk classification

The risk rating process assigns a level of risk to each risk event, measured in terms of consequence (Section 2.3.6.1.2) and likelihood (Section 2.3.6.2.1). The assigned risk rating is determined with controls in place; therefore, the risk rating is determined after identifying the decision type and appropriate control measures. The risk ratings are assigned using the Woodside risk matrix (refer to Table 2-4).

2.3.6.2.1 Assign the likelihood level

Likelihood is determined based on the chance of the selected worst-case consequence occurring, assuming reasonable effectiveness of preventative and mitigative controls (Table 2-3).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 2-3: Woodside risk matrix likelihood levels

	Likelihood description					
	Remote	***Highly unlikely***	***Unlikely***	***Possible***	***Likely***	***Highly likely***
Frequency	1 in 100,000–1,000,000 years	1 in 10,000–100,000 years	1 in 1,000–10,000 years	1 in 100–1,000 years	1 in 10–100 years	>1 in 10 years
Experience	Unheard of in the industry	Has occurred once or twice in the industry	Has occurred many times in the industry but not in the company.	Has occurred once or twice in the company.	Has occurred frequently in the company.	Has occurred frequently the location or activity.
Likelihood level	0	1	2	3	4	5

2.3.6.2.2 Determine the risk rating

The risk rating is derived from the consequence and likelihood levels determined above, in accordance with the Woodside Risk Matrix summarised in Table 2-4.This risk rating is used as an input into the risk evaluation process and ultimately for prioritising further risk reduction measures. Once each risk is treated to ALARP, the risk rating articulates the ALARP baseline risk in the environmental impacts and risk register.

Table 2-4: Woodside risk matrix determination of risk rating

Consequence level	Likelihood level					
	0	***1***	***2***	***3***	***4***	***5***
A	A0	A1	A2	A3	A4	A5
B	B0	B1	B2	B3	B4	B5
C	C0	C1	C2	C3	C4	C5
D	D0	D1	D2	D3	D4	D5
E	E0	E1	E2	E3	E4	E5
F	F0	F1	F2	F3	F4	F5

Risk rating
Severe
Very High
High
Moderate
Low

Note: Very High and Severe risks based on HSE impacts are intolerable – Action Required

2.4 Impact and risk evaluation

In accordance with Environment Regulation 34(a), 34(b), 34(c) and 21(5)(b), Woodside applies the following process to demonstrate ALARP and acceptability for environmental impacts and risks, appropriate to the nature and scale of each impact or risk.

2.4.1 Demonstration of 'as low as reasonably practicable' (ALARP)

The descriptions in Table 2-5 articulate how Woodside demonstrates that each impact and risk identified within this EP are ALARP.

Table 2-5: Summary of Woodside's criteria for 'as low as reasonably practicable' demonstration

Risk	Impact	Decision type
Low and moderate (C, D, E or F level consequence)	***No Lasting Effect, Localised and Low Level, or Minor (D, E or F)***	***A***
Woodside demonstrates these impacts, risks and decision types are reduced to ALARP if: • Identified controls meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines, or		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Risk	Impact	Decision type
• Further effort towards impact/risk reduction (beyond using opportunistic measures) is not reasonably practicable without sacrifices that are grossly disproportionate to the benefit gained.		
High, very high or severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are reduced to ALARP where it can be shown good industry practice and RBA have been employed, if legislative requirements are met, societal concerns are accounted for, and the alternative control measures are grossly disproportionate to the benefit gained.		

2.4.2 Demonstration of acceptability

The descriptions in Table 2-6 articulate how Woodside demonstrates how each impact and risk identified within this EP are acceptable.

Table 2-6: Summary of Woodside's criteria for acceptability

Risk	Impact	Decision type
Low and moderate (C, D, E or F level consequence)	***No Lasting Effect, Localised and Low Level or minor (D, E or F)***	***A***
Woodside demonstrates these lower order impacts, risks and decision types are 'broadly acceptable' if they meet the ALARP requirements for lower order risks and impacts described above (Table 2-5).		
High, very high or severe (A or B level consequence)	***Moderate and above (C, B or A)***	***B and C***
Woodside demonstrates these higher-order risks, impacts and decision types are 'acceptable if ALARP' if it can be demonstrated using good industry practice and RBA, if legislative requirements are met and societal concerns are accounted for and the alternative control measures are grossly disproportionate to the benefit gained. In undertaking this process for moderate and high risks, Woodside evaluates: • the principles of ESD as defined under the EPBC Act • the internal context – the proposed controls and consequence/risk level are consistent with Woodside policies, procedures and standards • the external context – consideration of the environment consequence and stakeholder acceptability are considered • other requirements – the proposed controls and consequence/risk level are consistent with national and international industry standards, laws and policies ad consideration of applicable plans for management and conservation advices, conventions and significant impact guidelines (e.g. MNES). Additionally, very high and severe risks require 'escalated investigation' and mitigation. If after further investigation the risk remains in the very high or severe category, the risk requires appropriate business engagement with increasing involvement of senior management in accordance with Woodside's Risk Management Procedure to accept the risk. This includes due consideration of regulatory requirements.		

2.5 Recovery plan and threat abatement plan assessment

To support the demonstration of acceptability, a separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans, (refer Section 1.8.2.1). This assessment follows the following process:

- Identify relevant listed threatened species and ecological communities (Section 4.5)
- Identify relevant recovery plans and threat abatement plans (Section 6.10)
- list all objectives and (where relevant) the action areas of these plans and assess whether these objectives/action areas apply to government, the Titleholder, and the Petroleum Activity (Section 6.10)
- For those objectives/action areas applicable to the Petroleum Activity, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action. (Section 6.10)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.6 Environmental performance objectives/outcomes, standards and measurement criteria

The Environment Regulations define environmental performance outcomes (EPOs) to mean: 'a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level'. As such, the process of defining an appropriate EPO, has relied on the required levels of performance set either in:

- legislation (such as the OPGGS Act)
- regulator guidance notes such as the Matters of National Environmental Significance– Significant Impact Guidelines (DoE 2013), or
- specific agreements or expectations with other relevant persons (e.g. fishers or other marine users).

For each evaluated impact and risk, controls adopted during the ENVID and through demonstrating ALARP are paired with activity-specific EPOs, performance standards (PS) and measurement criteria (MC). EPOs, PS and MC form the basis for monitoring and auditing and allow Woodside's environmental performance to be measured through the implementation of this EP to ensure impacts and risks will be managed to a level that is ALARP and acceptable. EPOs, PS and MC are defined for each identified credible impact and risk in Section 6.

2.7 Implement, monitor, review and report

An implementation strategy for the Petroleum Activity describes the specific measures and arrangements to be implemented for the duration of the program. The strategy is based on the requirements of the Environment Regulations, and demonstrates:

- control measures are effective in reducing the environmental impacts and risks of the Petroleum Activity to ALARP and acceptable levels
- EPOs and EPSs set out in the EP are met through monitoring, recording, auditing, managing non-conformance, and reviewing
- all environmental impacts and risks of the Petroleum Activity are periodically reviewed in accordance with Woodside's risk management procedures
- roles and responsibilities are clearly defined, and personnel are competent and appropriately trained to implement the requirements set out in this EP, including in emergencies or potential emergencies
- arrangements are in place for oil pollution emergencies, to respond to and monitor impacts
- environmental reporting requirements are met, including 'reportable incidents'
- appropriate consultation is undertaken throughout the activity.

The implementation strategy is presented in Section 6.11.

2.8 Stakeholder consultation

Woodside undertakes consultation in the course of preparing EPs. The consultation, along with the process for ongoing engagement and consultation throughout the activity, is presented in Section 5. A copy of the full text correspondence is provided in Appendix F.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3. DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 21(1) of the Environment Regulations and describes the activities to be undertaken as part of the Petroleum Activity under this EP.

3.2 Project overview

Woodside plans to undertake a series of geophysical and geotechnical (GPGT) surveys within the Operational Area to acquire appraisal data to inform the assessment and planning of potential future development opportunities. The purpose of these surveys is to gather this data, rather than the recovery of petroleum. The survey will acquire data to characterise seabed and subsurface geological conditions and support a range of engineering, environmental and heritage assessment activities, including optimisation of the pipeline route, identification of suitable MODU anchoring locations, and the development of FEED design and cost estimates for subsea infrastructure. The surveys provide information to support decision making on potential future infrastructure siting, design and development planning and may also provide data on existing infrastructure.

Table 3-1: Petroleum Activity overview

Item	Description
Petroleum Licence Area	Operational Area Part A: WA-30-R Operational Area Part B: WA-28-R, WA-29-R, WA-31-R, WA-32-R
Location	Commonwealth waters of Torosa and Calliance Brecknock fields
Water depth	Operational Area Part A : ~400-600m Operational Area Part B : ~350-900m
Vessels	Multi-purpose vessels, uncrewed survey vessels, geotechnical drilling vessels and support vessels.
Key activities	Geophysical surveys within the Operational Area using: • multibeam echosounder (MBES), single beam echo sounder, altimeter • side scan sonar (SSS) including variants such as multi-aperture and synthetic aperture sonar • magnetometer / gradiometer and pipe tracker • sub-bottom profiler (SBP), such as but not limited to boomer, sparker, and CHIRP • water sampler • sound velocity sensor / multi-parameter conductivity-temperature-depth profiler • subsea positioning systems (ultra-short baseline (USBL), Ultra Short Baseline (USBL) Doppler Velocity Log (DVL) Inertial Navigation System (INS) • underwater camera • underwater laser scanner Geotechnical surveys within the Operational Area using: • shallow cores and probes: box corer / grab sampler / piston core / gravity core / vibrocore • boreholes: sampling / coring and in situ testing such as Cone Penetration Test (CPT)

3.3 Location

The planned Petroleum Activity for this EP is to be undertaken within an Operational Area with two separate parts. Operational Area Part A is located ~430 km north -northwest of Broome and Operational Area Part B is located ~370km north-north west of Broome in Commonwealth waters off Western Australia (WA).

Water depths range from ~350-900 m.

The activities will occur within multiple titles, as shown in Figure 3-1 and Table 3-2.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 3-2: Location of Operational Area (GDA 94)

Location	Latitude	Longitude
Operational Area Part A (Torosa): Offshore area in Commonwealth waters Within petroleum title: WA-30-R	13° 49′ 55.00″ S 13° 54′ 54.94″ S 13° 54′ 54.94″ S 14° 04′ 54.94″ S 14° 04′ 54.94″ S	122° 07′ 19.52″ E 122° 07′ 19.52″ E 122° 05′ 04.52″ E 122° 05′ 04.52″ E 122° 01′ 49.75″ E
	Then follow Commonwealth / State boundary to:	
	13° 50′ 35.64″ S 13° 49′ 55.00″ S 13° 49′ 55.00″ S	121° 55′ 04.53″ E 121° 56′ 04.52″ E 122° 07′ 19.52″ E
Operational Area Part B (Calliance Brecknock): Offshore area in Commonwealth waters Within petroleum and Greenhouse Gas (GHG) titles: WA-28-R, WA-29-R, WA-31-R, WA-32-R, G-8-AP	14° 23′ 47.55″ S 14° 37′ 53.02″ S 14° 37′ 53.02″ S 14° 41′ 47.03″ S 14° 41′ 47.03″ S 14° 29′ 55.02″ S 14° 29′ 55.02″ S 14° 23′ 47.55″ S 14° 23′ 47.55″ S	121° 41′ 53.95″ E 121° 41′ 53.95″ E 121° 40′ 04.54″ E 121° 40′ 04.54″ E 121° 25′ 04.55″ E 121° 25′ 04.55″ E 121° 30′ 56.41″ E 121° 30′ 56.41″ E 121° 41′ 53.95″ E

3.4 Operational Area

The Operational Area applicable to the scope of this EP is shown in Figure 3-1 and consists of two separate parts:

- Operational Area Part A
- Operational Area Part B

Part A and Part B are collectively referred to as the Operational Area.

The coordinates of the Operational Area provided in Table 3-2. Operational Area Part A is approximately 340 km^2 while Operational Area Part B is approximately 860 km^2.

As the exact location of the proposed surveys within the Operational Area may vary, a conservative approach has been employed to assess risks and impacts. This approach considered the existing environment of the entirety of the Operational Area (along with the environment potentially impacted by the credible hydrocarbon spill scenarios) to provide context for the risk assessment (Section 6).

The Operational Area include a 500 m safety exclusion zone around the survey vessels to manage vessel movements. The 500 m safety exclusion zone is under the control of the Person in Charge.

Vessels transiting to and from the Operational Area are outside the scope of this EP.

If any activities conducted within the Operational Area are not covered by Woodside's existing titles, Woodside will obtain all necessary authorisations before proceeding with those activities in vacant acreage.

3.5 Timing

The Petroleum Activity is anticipated to commence from ~Q3 2027. Geophysical and geotechnical activities may be completed over several multi-week campaigns (typically 20–60 days in duration) split over the 5-year period of this EP. Survey activities within the Operational Area defined in Section 3.4 are estimated to take up to a maximum of 90 days per year (during any time in a calendar year). The vessels involved will be operating 24 hours a day.

Timing and duration may be subject to change due to survey vessel availability, unforeseen circumstances and weather. To allow for some flexibility for contingency purposes, the EP allows for the activities to occur at any time throughout the year during the 5-year validity from the date of acceptance of the EP. Therefore, this EP has assessed impacts and risks relevant to geophysical and geotechnical survey activities in all seasons to provide operational flexibility on project schedule and survey vessel availability. Where identified impacts and risks are associated with the activity timing, controls specific to the timing have been assessed, as relevant.

3.6 Geophysical surveys

A geophysical survey is the systematic collection of geophysical data. Survey methods used for the geophysical surveys involve primarily acoustic measurements to characterise the seabed features, seabed morphology and the sub-seabed stratigraphy. A variety of geophysical systems described below may be used depending on seabed soil conditions and the required penetration and resolution. Some of the systems act as the transmitter and receiver; others have a separate transmitter and a short hydrophone streamer as a receiver. The industry accepted techniques are outlined in Table 3-3 and described in the following sections. These will be adopted to achieve the objectives of the geophysical survey scope.

The geophysical survey techniques may occur anywhere within the Operational Area. Geophysical sources emit sound at a variety of intensities and frequencies depending on the information required. A summary of estimated source levels and operating frequencies for the proposed geophysical survey techniques is provided in Table 3-3.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 3-3: Acoustic source characteristics of geophysical survey techniques

Geophysical survey technique	Estimated source sound pressure level ($L_{S,P}$) (dB re 1 µPa m/ dB re 1 µPa @ 1 m)	Estimated source peak pressure level ($L_{S,pk}$) (dB re 1µPa m/ dB re 1 µPa @ 1 m)	Estimated sound exposure level ($L_{S,E}$) (dB re 1µPa^2.s @1 m)	Proposed dominant frequency range (kHz)
Multibeam echosounder	210–245 [1,2,3,5]	N/A	173–188 [2]	150–300 kHz
Side scan sonar	200–235 [1,2,5]	N/A	200 [2]	75–900 [1,2]
Sub-bottom profiler – CHIRP	192–210 [2,4,5]	198–218 [2,4]	171–193 [2, 4]	2–30 [1,2,4]
Sub-bottom profiler – Boomer	200–206 [2,4]	210–217 [2,4]	175–180 [2,4]	0.2–16 [2,4]
Sub-bottom profiler – Sparker	200–220 [1]	N/A	N/A	0.05–4 [1]
Ultra-short baseline (USBL) positioning system	184–202[1]	N/A	N/A	19–34 [1]

4. *McPherson and Wood 2017*
5. *Jiménez-Arranz et al. 2020.*

3.6.1 Multibeam echosounder

Multibeam echosounders (MBES), like other sonar systems, transmit sound energy and analyse the return signal (echo) from the seabed or other objects. The sound waves are transmitted from a transducer mounted on the hull of the survey vessel (or ROV/AUV) to produce a fan-shaped coverage of the seabed. The coverage area on the seabed depends on the equipment used, the settings of the equipment and the depth of the water. Typically, coverage is two to four times the water depth (below the transducer). Sound emitted from MBES, including proposed operating frequency and source intensity, is summarised in Table 3-3.

3.6.2 Side scan sonar

Side scan sonar (SSS) is a hydro-acoustic technique. The sensor array comprises a set of transducers which are mounted on either side of a towfish or AUV. The transducers produce a high frequency acoustic signal (pulse) which is formed into the shape of a fan that sweeps the seabed. The return signal (echo) comprises acoustic energy reflected from the seabed and waterborne discontinuities. The strength of the return echo is continuously recorded, creating an ‘image’ of the ocean bottom which can be used to indicate variation in reflectivity (influenced by the texture and composition) of the seabed. Sound emitted from SSS, including proposed operating frequency and source intensity, is summarised in Table 3-3.

A variation to traditional SSS is synthetic aperture sonar, which uses information from a number of overlapping pulses along the track to digitally combine the received signals to create a virtual array significantly longer than the physical sonar, which improves resolution. Frequency and source intensity are the same as described in Table 3-3 for SSS. SSS may also use interferometric processing where the sonar has multiple rows in each transducer and can use the phase differencing between the received signals to produce bathymetry data.

3.6.3 Magnetometer

A magnetometer is used to detect ferrous materials on or buried under the seabed by measuring small variations in the earth's magnetic field. This is used to detect anchors, chains, buried pipelines or cables or identify other magnetic anomalies that may require further investigation. The magnetometer is a passive sensor that does not rely on generating a magnetic field but measures perturbations in the ambient total field

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

strength in the environment. The sensor is typically towed behind the SSS. Multiple magnetometer sensors may also be used simultaneously in a towed array, called a gradiometer.

3.6.4 Sub-bottom profiler

SBPs are devices that convert electrical energy into acoustic energy. They produce an acoustic profile which extends from the seabed down to the limit of subsurface penetration. Geophysical surveys use a variety of profilers which operate at differing energy levels and are characterised by different dominant frequencies. Higher energy sources are needed to transmit the acoustic signals to greater depth, but they have correspondingly lower dominant frequencies which reduce the resolution of the resultant record. Hence, the type of profiler used depends on the nature of the substrate, penetration and resolution required. Typical SBP systems associated with the Petroleum Activity may include the following:

- Chirp/parametric sub-bottom profiler: A chirp system emits an acoustic signal that includes a sweep through a range of frequencies and amplitudes. The chirp system also acts as a receiver for the reflected signal. The chirp SBP may be hull mounted, contained in a towfish or fitted to an AUV. Parametric sub-bottom profilers combine two slightly different high frequencies transmitted simultaneously to create a low frequency pulse from the interference between the high frequency pulses. The low frequency pulse is comparable in frequency and amplitude to a chirp system but is focused in a narrow beam directed below the transducer.
- Boomer sub-bottom profiler: A boomer SBP system consists of two spatially separated units; the boomer plate acoustic source mounted within a catamaran, and a hydrophone receiver. These are both towed on the surface immediately astern of the vessel, usually on opposite sides. The boomer plate is an electro-mechanical transducer comprising an electrical coil adjacent to a metal plate. A shipboard power supply charges a capacitor which is discharged through the electrical coil causing a magnetic field to repel a metal plate. This energetic motion generates a broad band, high amplitude impulsive acoustic signal in the water column that is directed vertically downward. The hydrophone system consists of individual hydrophone elements located within neutrally buoyant synthetic hydrocarbon filled tubing (~5 L). They typically contain 8–12 hydrophone elements evenly spaced in a 2.5–4.5 m long, 25 mm diameter tube.
- Sparker sub-bottom profiler: A sparker system consists of two spatially separated units; the sparker array acoustic source mounted within a catamaran and a hydrophone receiver. These are both towed on the surface immediately astern of the vessel, usually on opposite sides. The sparker is an acoustic source which uses an electrical arc which momentarily vaporises water between positive and negative electrodes, producing an omni-directional acoustic pulse. The hydrophone system consists of individual hydrophone elements located within neutrally buoyant synthetic hydrocarbon filled tubing (~5 L). They typically contain 8–12 hydrophone elements evenly spaced in a 2.5–4.5 m long, 25 mm diameter tube.

3.6.5 Water sampling and profiling

3.6.5.1 Water sampling

Discrete water samples may be taken from desired water depths using for example a Niskin or Van Dorn water sampler. The samplers are deployed to the desired depth by hand or using a winch.

3.6.5.2 Water profiling

Water profiling can be used with a variety of sensors to establish for example: sound velocity, water temperature, conductivity, turbidity, pH and dissolved oxygen level, at differing depth through the water column. The profiler is lowered through the water column by hand or using a winch. After the desired depth is reached the profiler will be recovered to the deck and recorded data downloaded.

3.6.6 Subsea positioning systems

Positioning below the water surface is achieved using ultra short baseline (USBL) systems. This usually involves a vessel transceiver that sends an acoustic signal through the water column to a beacon which replies on a unique code. The position of the beacon relative to the vessel transceiver is calculated by computing the range to the beacon based on the reply time and computing the direction to the beacon by slight changes in the time of the arriving signal at different receive elements in the transceiver.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Subsea vehicles may also be fitted with doppler velocity logs (DVLs) to further aid the positioning. A DVL uses an acoustic signal reflecting off the seabed to determine the speed of the vehicle by measuring the small frequency shift of the returning echo caused by the relative motion of the DVL with respect to the seabed. Inertial Navigation Systems (INS) are frequently used to further aid the subsea positioning. An INS uses accelerometers to measure the accelerations of a vehicle in 3 axis and the rotations around those axis to determine position changes. There are no acoustic emissions from an INS.

3.6.7 Underwater laser scanner

Underwater laser scanners use a laser to scan objects to form a point cloud model of a structure. The results are similar to MBES but with much higher point density. Underwater lasers can only scan over very short distances of a few metres as the water quickly absorbs and scatters the light.

3.6.8 Autonomous underwater vehicles

An AUV is a self-propelled immersible vehicle that tracks a programmed course. An AUV is not tethered to the survey vessel and typically returns to the vessel to change batteries, download data and receive mission planning (new course program). Typically, the vessel USBL system will be used to track the AUV during a dive and to communicate with the vehicle using acoustic telemetry. AUVs have options to include additional payloads such as synthetic aperture sonar, forward looking sonar, turbidity sensors, doppler velocity log and digital cameras.

3.6.9 Remotely operated vehicles

An ROV is a tethered underwater vehicle. ROVs can be fitted with various tools and are fitted with camera systems (still/video). Additional sensors may include, altimeter, doppler velocity log, laser scanners, manipulator use to take sediment or water samples, or pipe trackers to locate buried cables or pipes.

3.6.10 Geophysical equipment deployment

A survey vessel, together with a towfish and/or towed catamaran (Figure 3-5), will be used to deploy geophysical sources and collect data. An ROV or AUV may be deployed with a payload of applicable sensors. Proposed deployment methods are summarised in Table 3-4 and illustrated in Figure 3-2 and Figure 3-3. Depending on the method of deployment, geophysical sources can sit at a variety of locations within the water column (Table 3-5).

Table 3-4: Proposed geophysical survey equipment deployment method

Geophysical survey technique	AUV/ROV	Towfish	Towed catamaran	Hull mounted
MBES	✓			✓
SSS	✓	✓*		
Magnetometer	✓	✓		
USBL	✓**	✓**		✓**
SBP – chirp	✓	✓		✓
SBP – boomer			✓	
SBP – sparker			✓	

** Towfish can also attach several acoustic sources, including side scan sonar or chirp.*

*** USBL has a hull mounted or towed transceiver.*

Table 3-5: Proposed geophysical survey equipment deployment depth

Geophysical survey technique	AUV	Towfish	Towed catamaran	Hull mounted
Deployment depth	5–35 m above seabed (nominal)	10–20 m above seabed	Within 1 m of surface	Dependent on draft of vessel (~10 m)

3.7 Geotechnical surveys

The geotechnical surveys will be performed using standard industry equipment and will consist of in situ testing and the recovery of soil/rock samples at locations within the Operational Area to ground truth existing geophysical data and provide geotechnical data for engineering design.

The geotechnical survey methods that are expected to be used during the Petroleum Activity include but are not limited to:

- penetration testing
- cored borehole
- piston core /gravity core and vibrocore sampling
- box core and grab sampling.

Each of these methods are described in the following sub-sections.

3.7.1 Penetration testing

Penetration testing involves pushing a penetrometer (probe) into the seabed at a constant rate of penetration, and continuously measuring resistance, friction and pore pressure. The piezocone penetration test (PCPT/CPTu) is performed most frequently. In suitable seabed sediments, the cone penetrometer can be replaced with a T-bar penetrometer or ball penetrometer to continuously measure resistance, friction and pore pressure during both the push-in and pull-out phases of the test. Figure 3-4 shows the probes that may be used for the Petroleum Activity.

When the required final penetration depth is reached, all equipment is withdrawn from the seabed. A small hole will remain in the seabed, which will eventually collapse and infill as surface sediments move in the ocean current. The hole remaining in the seabed immediately after test completion will depend on the geometry of the type of penetrometer used:

- piezocone penetrometers: about 25–40 mm (diameter)
- T-bar penetrometers: a slot of about 40 mm × 250 mm
- ball penetrometers: about 56–133 mm (diameter).

PCPT testing will generally be undertaken to depths of between 3 m and 55 m below the mudline. Sub-seabed conditions in Operational Area may include cemented layers that prevent the penetration of the PCPT equipment to the required depth. Depending on the depth and thickness of any cemented layer, it may be necessary to continue the PCPT in order to investigate the conditions below. This would be done by drilling through the cemented layer and the diameter of the drilled hole would depend on the type of equipment used (80–225 mm) The section within a borehole subject to drilling would probably remain open but depending on the layer depth below seabed may eventually infill with the movement of surface sediments in ocean current.

PCPT testing may be undertaken using a remotely operated subsea frame positioned on the seabed and capable of continuously driving the probe to target depth or from a remotely operated subsea drilling rig as described in Section 3.7.2. Alternatively, the testing may be undertaken from the surface on a vessel, as described in Section 3.7.2.

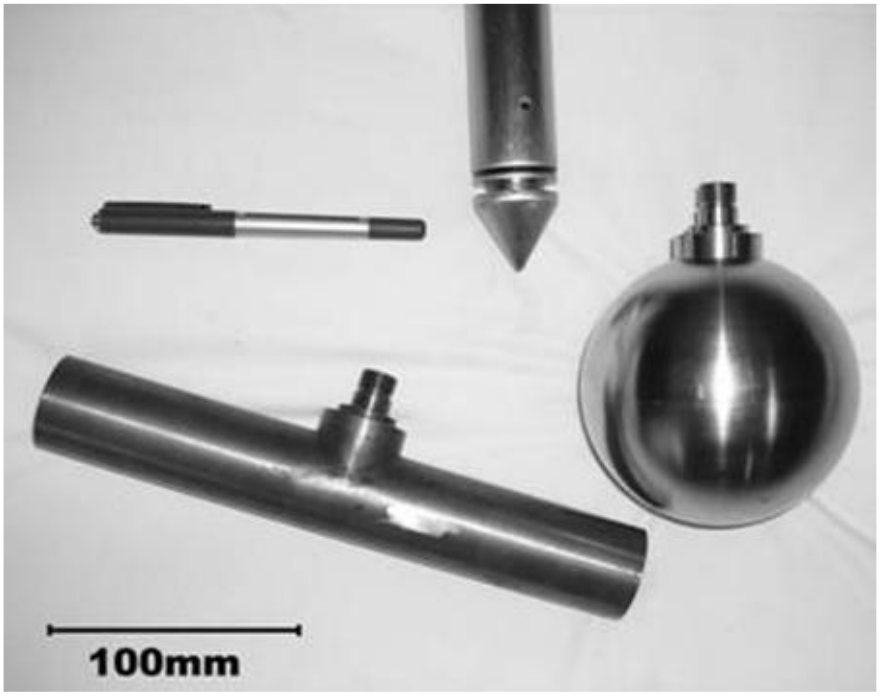

Figure 3-4: Examples of piezocone, T-bar and ball penetrometers

3.7.2 Cored borehole

Some boreholes will be required at the proposed mooring locations and proposed structure foundation sites to recover physical samples at greater depths than can be achieved using piston core sampling (Section 3.7.3). The equipment used to drill each borehole could involve drilling from the sea surface from a vessel (Figure 3-2), where drilling takes place through a riser spanning the water depth and which is slotted into a base frame located on the seabed (Figure 3-5). The drilling vessels generally have a length of <100 m and always have dynamic positioning capability.

The borehole is advanced by a combination of either core drilling or push sampling (thin or thick-walled tubes) at intervals or PCPT testing (Section 3.7.1), each interval. Boreholes will be drilled up to a maximum 50 m below mudline with a diameter up to ~225 mm. Where cemented layers are encountered, coring equipment is used to recover representative samples for those layers. In some cases, depending on the strength of the formation, the borehole may need to be stabilised by running sufficient casing to span the weak formation. Drilling mud is generally used in the process, in order to lubricate the drill bit, keep the borehole stable and hopefully preclude the necessity for casing. Seawater is the primary constituent of geotechnical drilling fluids. In suitable seabed sediments the base fluid (seawater) can be used as the drilling fluid. However, often one or more drilling fluid additives are mixed with the base fluid to produce a drilling fluid with the appropriate properties for the seabed conditions. The geotechnical survey would involve discharge of a small amount of drill cuttings and associated fluids to the marine environment at seabed level. The drill fluid additives will only be known after the contract is awarded and the specific type of seabed coring is confirmed. However, all drilling fluid products proposed by the geotechnical contractor will be assessed by Woodside using the Chemical Selection and Assessment Environment Guideline prior to approval for use.

The second case involves deploying a self-contained drilling unit to the seafloor rather than using a dedicated vessel. In this scenario there is no drill pipe between the vessel and the seafloor and only a combined lifting wire and umbilical runs from the drill unit up to the vessel. Apart from being remote from the vessel this is a similar operation where the drilling unit can provide either core samples or CPT investigations using a combination of drilling and pushing the CPT probe through the drill pipe.

The seafloor units typically use a smaller diameter pipe and do not always need the use of drilling mud.

3.7.3 Piston core and vibrocore sampling

Piston coring is normally used on soft, unconsolidated sediments. A piston corer is lowered by wire rope to the seabed, at ~1 m/s so the duration of lowering and recovery operation is short (minutes at each site). It has a counterweight attached to a trigger device that contacts the seabed to release the corer allowing it to freefall a set distance and the momentum drives the core barrel into the seabed (Figure 3-7 and Figure 3-8). As the barrel enters the sediment, a special internal piston creates a vacuum and helps to draw the core into the barrel. This suction reduces compaction of the sample in the inner sleeve. Core catchers prevent the sediment from coming out of the coring tube. The leading edge of the coring tube is tapered to minimise disturbing the sample and seabed. Sampling itself is of short duration typically approximately 15 minutes at each location.

When the depth of sampler refusal is reached, all equipment is withdrawn from the seabed. A small hole will remain in the seabed, which if does not collapse immediately, will infill with time. Typically, the hole left in the seabed will be proportional to the geometry of the sample tube (i.e. typically 3 m depth by 110 mm diameter).

Piston core samples are typically 70–110 mm in diameter and 1–6 m in length (Figure 3-8).

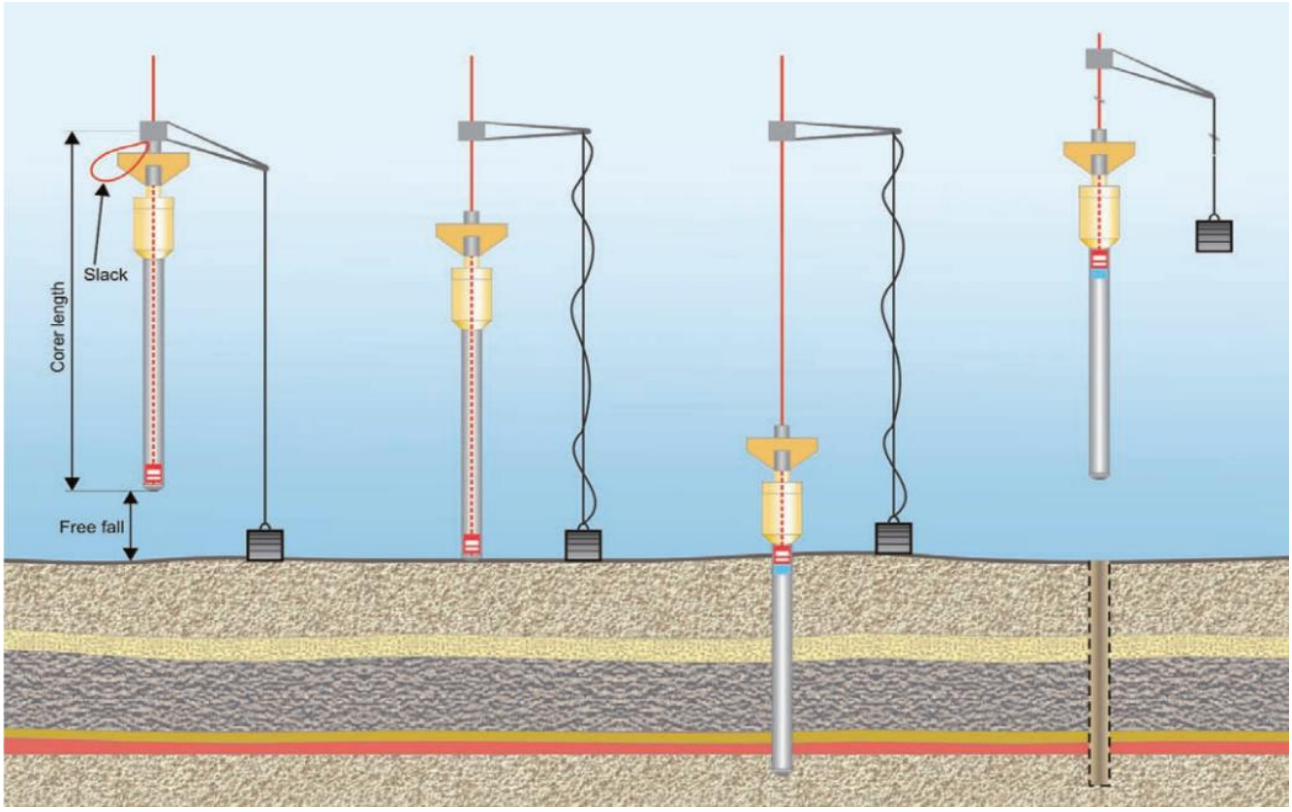

Figure 3-7: Example of a geotechnical piston corer

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Figure 3-8: Examples of geotechnical piston core sample tubes

A vibrocore achieves a similar sample to a piston core but rather than using free fall momentum to drive the core barrel into the seabed, a vibrocore uses a motor above the barrel to vibrate the corer and the weight helps drive the barrel into the sediment. The sample is typically more disturbed, but the method produces better seabed penetration in coarser sediments where a piston corer is of limited use.

3.7.4 Box core and grab sampling

Box core samplers (Figure 3-9) are designed to recover bulk, undisturbed samples of soft surficial material. Box dimensions of 0.5 m × 0.5 m × 0.5 m are typically used for offshore geotechnical surveys. The box corer is mounted on a frame, which is lowered to the seabed. A self-releasing trigger mechanism, initiated once the frame reaches the seabed, allows the box corer to penetrate into the seabed. Penetration is limited by a stopper to 0.5 m depth.

The volume of sample recovery is typically ~0.125 m³.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Figure 3-9: Examples of box core samplers

3.8 Vessels

Three primary types of survey vessels may be used to complete the activities associated with the Petroleum Activity. These include:

- a multi-purpose survey vessel will be used that can conduct geophysical surveys, including ROV and AUV survey operations, and light geotechnical operations;
- a geotechnical drilling vessel for deeper geotechnical investigations; and
- uncrewed surface vessel (USV) which may replace a conventional vessel for numerous survey tasks over the life of the EP.

Unique risks to USVs are considered in the preparation of the EP.

Conservative details for three primary survey vessel types are provided in Table 3-6.

Table 3-6: Typical survey vessel parameters

Vessel type	Length (overall)	Max. persons onboard	Fuel type	Largest tank size
Multi-purpose survey vessel	65 m	40	Marine diesel	120 m³
Geotechnical drilling vessel	100 m	60	Marine diesel	185 m³
USV	24 m	Uncrewed	Marine diesel	75 m^3 (total onboard)

A conservative approach has been employed to select vessel parameters to assess the risks and impacts. It is feasible, although unlikely, that two vessels will perform surveys in the Operational Area at any one time.

Geotechnical drilling vessels are expected to hold station in the Operational Area using dynamic positioning (DP) and geophysical survey vessels and USVs may also require the use of DP although this is uncommon and if required it would only be only for short durations. No anchoring is planned within the Operational Area. A typical geotechnical drilling vessel is shown in Figure 3-10.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

All survey vessels are required to pass a Woodside marine assurance inspection audit (to audit compliance with safety management requirements and marine laws) and operate in accordance with Woodside's HSE policies.

The USVs are controlled from a remote operations centre (ROC) and are staffed 24 hours a day whilst the vessel is in transit or undertaking activities. Remote operators maintain situational awareness through an integrated camera system that provides 360-degree visual coverage around the vessel. Depending on the USV configuration, the camera system may include advanced features such as image stabilisation (motion correction), optical zoom, automatic target recognition and low-light or night-vision capability. These systems assist remote operators to safely navigate the vessel, monitor surrounding conditions, identify other vessels and floating hazards, and detect marine fauna.

Because there are no facilities to support human occupancy on USV's, emissions and discharges are typically limited to cooling water and combustion of marine diesel. The vessel is equipped with bilge monitoring systems to monitor the bilge tanks for hydrocarbons (such as leaks from engine machinery spaces or from marine diesel tanks), and where detected the bilge pumps will auto disable and the vessel will be required to return to port.

Vessels will mobilise and demobilise either from international waters or domestically from within Australia and will comply with the relevant maritime safety requirements and marine order requirements as appropriate for the vessel. Port calls may be required, to change crew or reconfigure the vessel to use different survey equipment (for example between the completion of the geophysical and commencement of the geotechnical surveys). No bunkering at sea will be performed as part of the Petroleum Activity. Any bunkering would be performed during a port call, out of the scope of this EP.

Vessels associated with the Petroleum Activity are to comply with this EP when they are within the Operational Area. When vessels associated with the Petroleum Activity are transiting to or from the Operational Area they are to comply with applicable maritime regulations, laws and other relevant requirements.

Figure 3-10: Typical geotechnical drilling vessel

4. DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulations 21(2) and 21(3) of the Environment Regulations, this section describes the existing EMBA by the activity (planned and unplanned, as described in Section 3, including details of the particular relevant values and sensitivities of the environment, which were used for the risk assessment.

The EMBA is the largest spatial extent where unplanned events could have an environmental and/or socio-cultural consequence on the surrounding environment. For this EP, the EMBA is the potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the event of the worst-case credible spill. The ecological impact thresholds used to delineate the EMBA are defined in Section 6.9.1.2. The EMBA also includes areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations.

Woodside recognises that hydrocarbons may be visible at lower concentrations than the ecological impact thresholds defined in Table 4-1. These visible hydrocarbons have the potential to cause socio-cultural impacts. In respect of this, the EMBA also includes hydrocarbon thresholds where socio-cultural impact could occur. Receptors relevant to the socio-cultural hydrocarbon thresholds include cultural values and heritage, Commonwealth and State marine protected areas (MPAs), National and Commonwealth Heritage Listed places, areas of tourism and recreation, and commercial and traditional fisheries. For this EP, the socio-cultural hydrocarbon thresholds for surface hydrocarbons encompasses a wider area than the EMBA for ecological impacts. The EMBA and socio-economic EMBA are shown in Figure 4-1 and described in Table 4-1.

The EMBA does not represent the predicted coverage of any one hydrocarbon spill nor depict a slick or plume at any particular point in time. Rather, the EMBA represents a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions.

Table 4-1: Hydrocarbon spill thresholds used to define environment that may be affected for surface and in-water hydrocarbons

Hydrocarbon type	Ecological hydrocarbon thresholds[1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for scientific monitoring
Surface	10 g/m^2 This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.	1 g/m^2 This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for scientific monitoring.	
Dissolved	10 ppb The biological effects of hydrocarbons are driven by the fraction of hydrocarbons that are dissolved and therefore bioavailable to aquatic organisms. Toxicity studies show 10 ppb is protective of more than 95% of species for acute exposures, while still capturing the onset of effects in the most sensitive species and life stages (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		10 ppb This low concentration value establishes the planning area for scientific monitoring within which further analysis can be undertaken to inform monitoring priorities. In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold Table 7-9.
Entrained	1000 ppb Entrained hydrocarbons have limited bioavailability as toxic effects are driven by the small soluble fraction		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Hydrocarbon type	Ecological hydrocarbon thresholds[1]	Socio-cultural hydrocarbon thresholds[1]	Planning area for scientific monitoring
	(typically less than 1% of the oil mass) that dissolves into the water column (French-McCay 2026). As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		
Shoreline	100 g/m^2 This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m^2 This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	

1. *Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 6.9.1.2.*

4.2 Regional context

The Operational Area is located in Commonwealth waters within the North-west marine region (NWMR)], as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Department of Sustainability, Environment, Water Population and Communities [DSEWPAC] 2012), in water depths of ~ 350-900 m. Within the NWMR, the Operational Area lies within the Timor Province (Figure 4-2). Woodside's Master Existing Environment document provided in Appendix C summarises the characteristics for the relevant marine bio-regions.

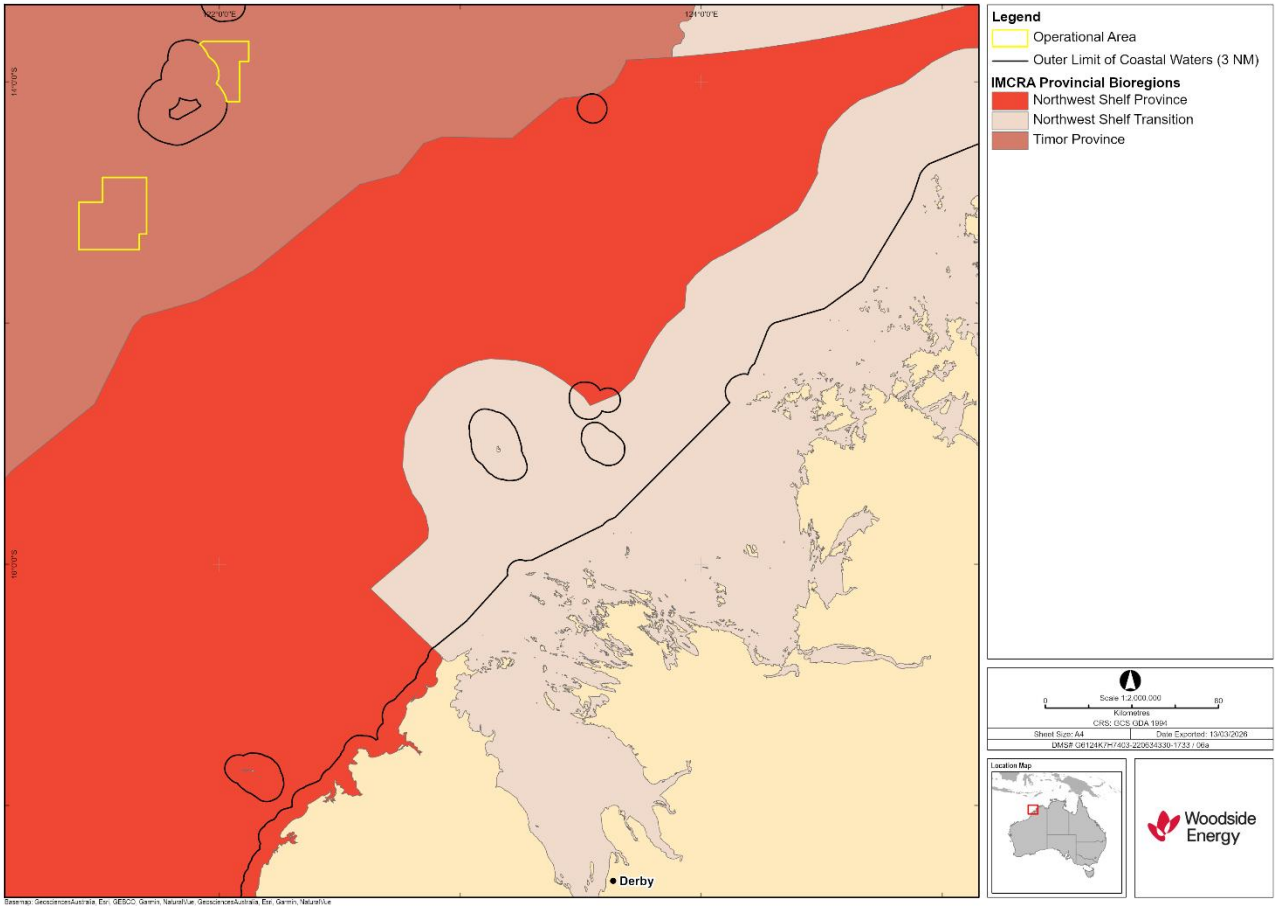

Figure 4-2: Location of the Operational Area and relevant marine bio-regions

4.3 Matters of national environmental significance (EPBC Act)

Table 4-2 summarises the matters of national environmental significance (MNES) overlapping the Operational Area and EMBA, according to Protected Matters Search Tool (PMST) results (Appendix D). It should be noted that the EPBC Act PMST is a general database that identifies areas in which protected species have the potential to occur. The PMST conducts searches to determine the presence/absence of MNES based on a conservative grid-based search function. Marine areas (>30 km) from the coast use 32 km × 32 km grid cells to determine the spatial overlap with listed MNES. Accordingly, the PMST report (Appendix D) can indicate the presence of MNES, that do not actually intersect with the Operational Area or EMBA. To ensure the accurate consideration of any impacts from the Petroleum Activity on MNES, shapefiles (provided by the Commonwealth Department of Climate Change, Energy, Environment and Water [DCCEEW]) have been assessed using Geographic Information System software to determine the actual presence and distance to MNES.

Additional information on these MNES are provided in the subsequent sections of this chapter and described in detail in Appendix D.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-2: Summary of relevant MNES identified by the EPBC Act Protected Matters Search Tool (PMST) as potentially occurring within the Operational Area and EMBA

MNES	Number of MNES in Operational Area		Number of MNES in EMBA
	Area A (Torosa)	Area B (Brecknock Calliance)	
World Heritage Properties	0	0	0
National Heritage Places	0	0	0
Wetlands of International Importance (Ramsar)	0	0	1
Commonwealth Marine Area	1	1	5
Listed Threatened Ecological Communities	0	0	0
Listed Threatened Species	22	20	29
Listed Migratory Species	36	34	57

4.4 Physical environment

The Operational Area lies on the outer continental shelf in water depths within the range from ~ 350-900 m. The Operational Area for the Torosa field is located approximately 23 km from the nearest shoreline (Sandy Islet at Scott Reef).

The bathymetry within the Operational Area (Figure 4-3) is generally flat, which is consistent with the broader North West Shelf (NWS) Province shelf region (Baker et al. 2008). The seabed has a gentle (0.05°) seaward gradient extending to a steep distal slope occurring between 200 and 300 km offshore in water depths of ~200 m (Dix et al. 2005). The continental slope then descends more rapidly from the shelf edge to depths >1,000 m to the north-west (James et al. 2004).

The NWMR is characterised by expanses of continental shelf and slope, with complex areas of bathymetry such as plateaux, terraces and major canyons that facilitate upwelling of nutrients and sediment transport (Commonwealth of Australia (CoA) 2012). The continental shelf in the northern most part of the region (north of Cape Leveque) is described as a ‘rimmed ramp’, as the waters over the outer margins of the shelf are shallower than the middle portions (Commonwealth of Australia 2008). This ‘ramp’ is a unique feature of the Australian continental margin in this region, with the rim at its outer edge being the site of a number of coral reefs including Ashmore, Cartier, Scott and Seringapatam Reefs (CoA 2008).

The greatest water depths in the area occur to the west of Scott Reef. Scott Reef is an annular reef ~17 km long and 16 km wide, comprising two coral atolls (North Scott Reef and South Scott Reef) which is separated by a deep-water channel. The reef rises steeply from surrounding water depths of ~400–500 m (Fugro Survey Pty Ltd 2006; URS Australia Pty Ltd 2007a).

North Scott Reef contains a shallow lagoon ~20 m deep that connects to the surrounding ocean via two narrow channels. In contrast, South Scott Reef contains a larger, more open lagoon ranging from ~20–70 m in depth, supporting different habitat types (Gilmour et al. 2013).

Scott Reef is one of the largest emergent reef systems in the North West Marine Region (NWMR) and overlies part of the Torosa reservoir. At high tide, only a small section of the reef system on the north-western edge of South Scott Reef, known as Sandy Islet, remains exposed. The surrounding seabed reflects the broader deep-water environment of the Project Area, with a gentle gradient of ~0.1° and water depths generally between 400 and 500 m. The Scott Reef Complex lies across both Commonwealth and State waters and includes the Scott Reef Nature Reserve.

Seringapatam Reef is a continental shelf atoll which forms part of a KEF with Scott Reef; Seringapatam Reef and Commonwealth waters in the Scott Reef Complex (Seringapatam Reef is an emergent coral reef, but unlike Scott Reef has no permanent island or islet. The reef is characterised by a combination of physical environmental conditions including clear, warm waters typical of oceanic environments and a large tidal range that provides a high physical energy input to these remote reef marine ecosystems.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The physical characteristics of the environment within the Operational Area and EMBA is described within the Master Existing Environment document in Appendix C.

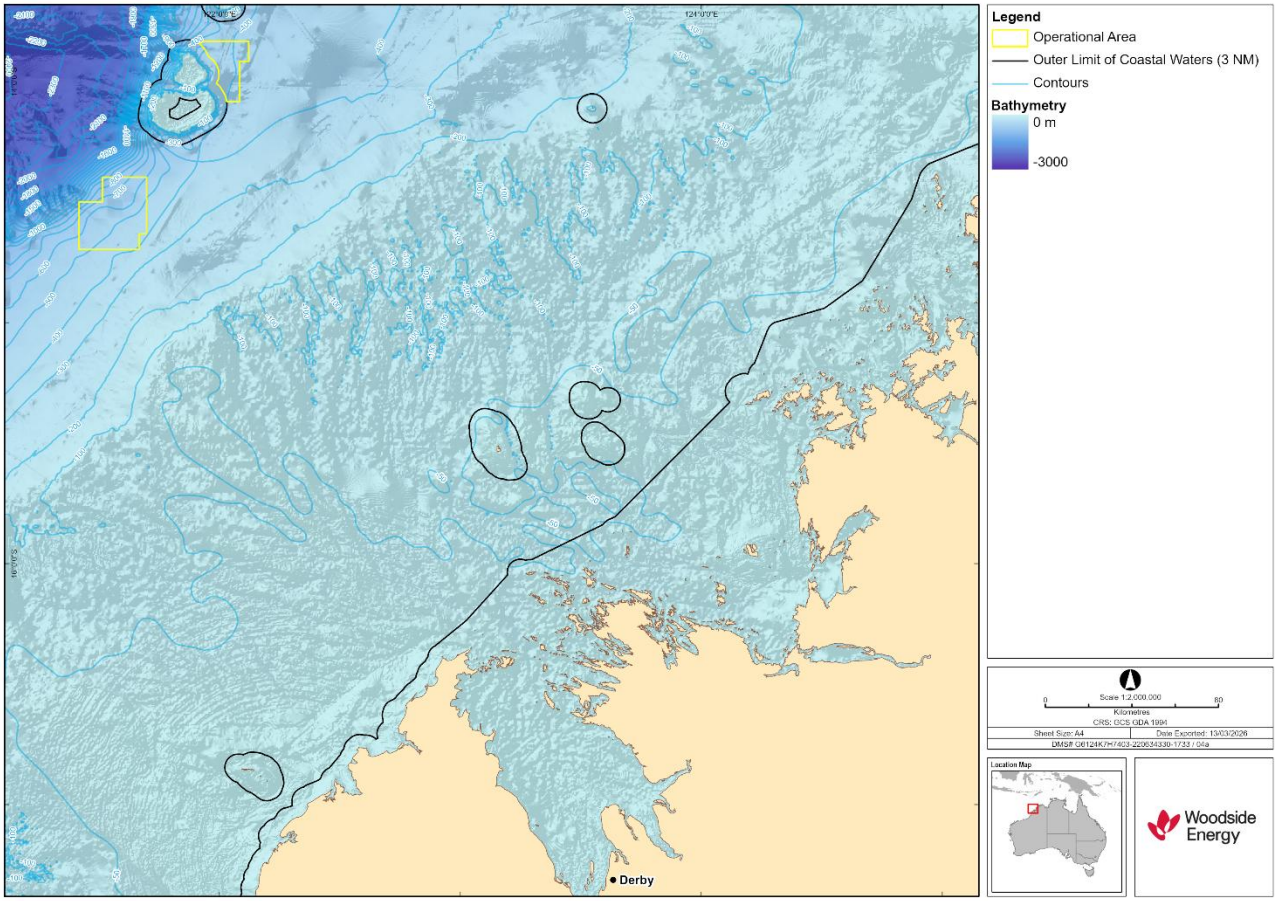

Figure 4-3: Bathymetry of the Operational Area

4.5 Habitats and biological communities

Sediments across the outer North West Shelf (NWS) Province are relatively homogeneous and are typically dominated by sands with minor gravel (Baker et al. 2008). Finer sediments (e.g. muds) become more common closer to the shoreline and shelf break but are less prominent across the intervening continental shelf (Baker et al. 2008). Sediments are predominantly carbonate in composition, consisting of both biogenic and precipitated material on the outer shelf (Dix et al. 2005). Several reef systems occur along the outer shelf and slope of the North West Marine Region, including Ashmore, Cartier, Scott and Seringapatam reefs (Baker et al. 2008).

Surveys conducted in 2007 across 13 sites between Barrow Island and Ashmore Reef (100–1,000 m depth) found that continental slope habitats (around 400 m) were dominated by soft, muddy sediments supporting sparse epifauna (Williams et al. 2010). Sessile fauna included isolated crinoids, anemones, glass sponges and sea pens, while mobile fauna comprised echinoderms (urchins, holothurians and sea stars) and decapod crustaceans such as prawns and crabs. Similar assemblages occurred at depths of 700–1,000 m. Across the broader NWS, benthic habitats generally consist of unconsolidated carbonate sediments supporting sparse deposit- and filter-feeding communities, including glass sponges, bryozoans, gorgonians, hydroids, echinoderms and crustaceans (URS 2010; AIMS 2014). Infaunal communities, particularly polychaetes, are also widespread in soft sediment habitats along the continental shelf and upper slope (Brewer et al. 2007; RPS 2012). The deepwater habitats surrounding the Scott Reef system overlying the Torosa Field generally comprise soft sediment seabed areas with sparse benthic biota.

Seabed sediments were also investigated as part of benthic surveys by Gardline Marine Services Pty Ltd (2009a) in the Browse Development Area (Figure 4-4). Sediment quality data were assessed against the revised ANZECC and ARMCANZ sediment guideline values (Simpson et al. 2013). Although these data

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

were collected 13–15 years ago, they remain representative of current conditions due to the remoteness of the area, minimal anthropogenic inputs and the generally low variability of sediment quality parameters in deep-water environments. Sediments at the Brecknock, Calliance and Torosa reservoirs were predominantly soft silt and clay, with localised areas of sand and stiff, hard or cemented material (Fugro Survey Pty Ltd 2006; Gardline Marine Services Pty Ltd 2009).

No hydrocarbon contamination was detected in seabed sediment samples from the Browse Development Area. Nutrient concentrations were generally within natural ranges, although elevated total nitrogen was recorded near the Brecknock and Calliance reservoirs. Metal concentrations were largely below Australian and New Zealand sediment quality guideline trigger levels, with only minor exceedances for nickel and mercury at a small number of sites.

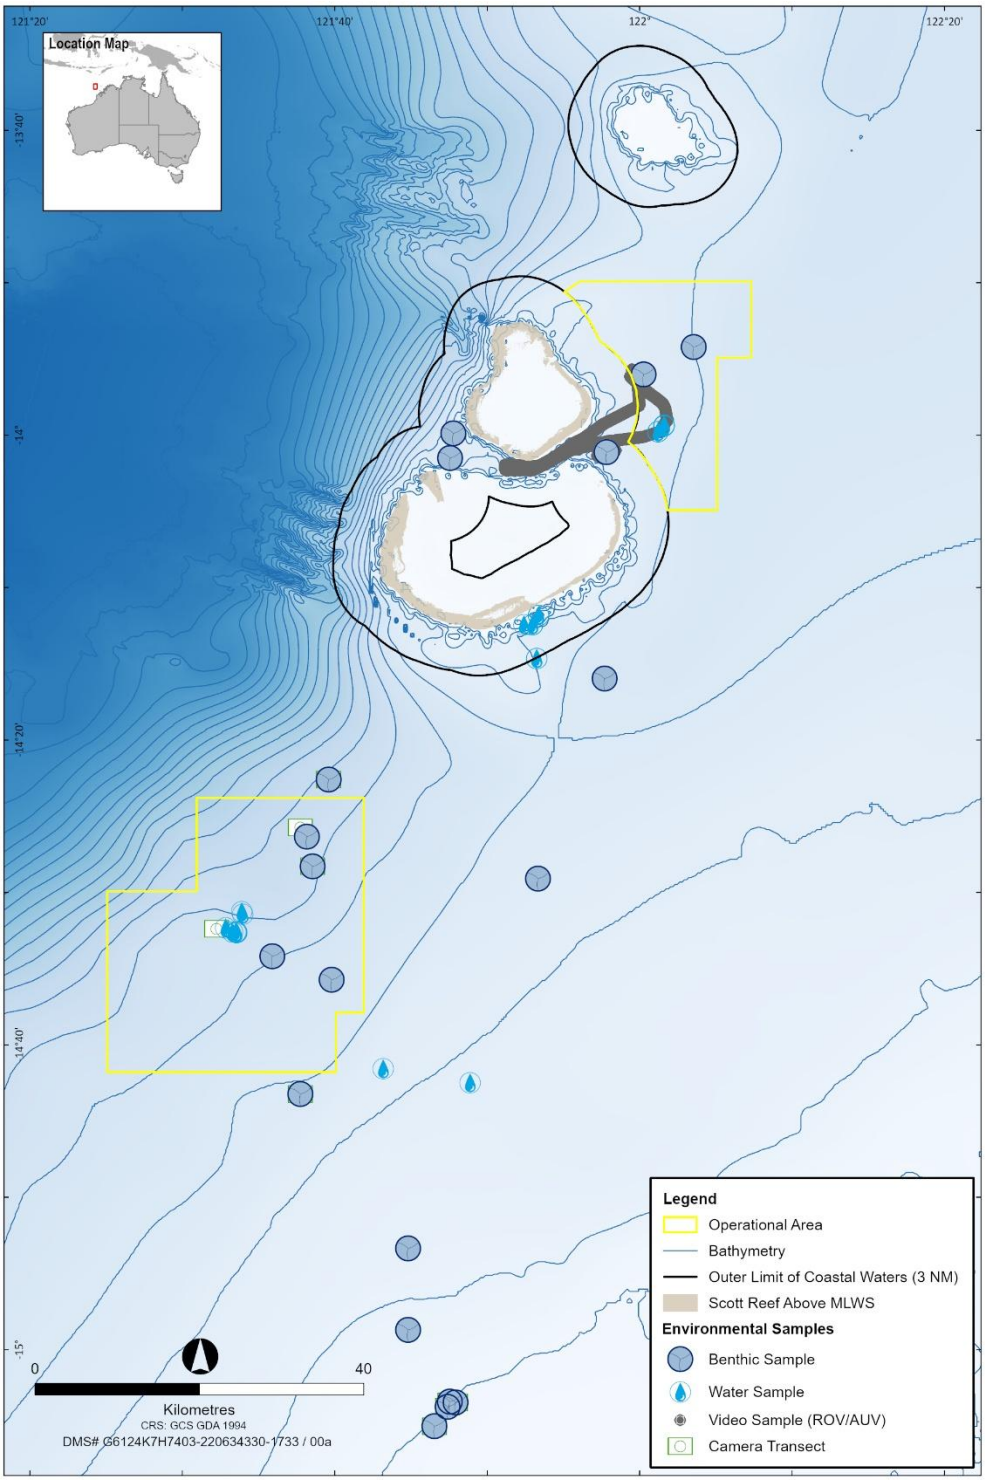

Figure 4-4: Historical environmental sampling locations relevant to Operational Area

Hard substrate may occur within the EMBA within the ancient coastline at 125 m depth contour key ecological feature (KEF) (Section 4.7), which overlaps the EMBA.

Key habitats and ecological communities within the EMBA are briefly described and identified in Table 4-3. A full description of the habitats and ecological communities is contained within the Master Existing Environment document provided in Appendix C.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-3: Habitats and communities within the environment that may be affected (distance calculated from Operational Area)

Habitat/ community	Description	Key locations within the EMBA
Seabed characteristics		
Continental Slope Demersal Fish Communities KEF	The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the North-west Province is high compared to elsewhere along the Australian continental slope (DSEWPAC 2012a). The slope of the Timor Province and the Northwest Transition also contains >500 species of demersal fishes of which 64 are considered endemic (Last et al. 2005), making it the second richest area for demersal fishes throughout the whole continental slope.	• Overlaps Operational Area Part B
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	The NWMR is a tropical carbonate margin that comprises an extensive area of shelf, slope and abyssal plain/deep ocean floor, as well as complex areas of bathymetry such as plateau, terraces and major canyons (Harris et al. 2005). A series of reefs are located on the outer shelf/slope of the NWMR, including Ashmore, Cartier, Scott and Seringapatam reefs (Baker et al. 2008). Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity, and high species richness associated with the reefs themselves. As two of the few offshore reefs in the North-west, they provide an important biophysical environment in the region (DSEWPAC 2012a).	• Overlaps Operational Area Part A
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	Ashmore Reef is the largest of only three emergent oceanic reefs present in the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. Ashmore contains a large reef shelf, two large lagoons, several channelled carbonate sand flats, shifting sand cays, an extensive reef flat, three vegetated islands—East, Middle and West islands—and surrounding waters. Rising from a depth of >100 m, the reef platform is at the edge of the NWS and covers an area of 239 km². Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life; they are areas of enhanced primary productivity in an otherwise low- nutrient environment (DSEWPAC 2012a). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.	• Within EMBA. • ~196 km north-east from Operational Area Part A • ~274 km north-east from Operational Area Part B
Ancient coastline at 125 m depth contour	Several steps and terraces as a result of Holocene sea level changes occur in the region, with the most prominent of these features occurring as an escarpment along the NWMR and Sahul Shelf at a water depth of 125 m. The ancient coastline is not continuous throughout the NWMR and coincides with a well-documented eustatic stillstand at ~130 m depth worldwide (Falkner et al. 2009). Where the ancient coastline provides areas of hard substrate, it may contribute to higher diversity and enhanced species richness relative to soft sediment	• Within EMBA. • ~74 km south-east from Operational Area Part A • ~37 km south-east from Operational Area Part B

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat/ community	Description	Key locations within the EMBA
	habitat (Falkner et al. 2009). Parts of the ancient coastline, represented as rocky escarpment, are considered to provide biologically important habitat in an area predominantly made up of soft sediment. The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient-rich environment. Although the ancient coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner et al. 2009).	
Marine primary producers		
Coral	Coral reef habitats within the NWMR have a high species diversity that includes corals, and associated reef species such as fishes, crustaceans, invertebrates, and algae. Coral reef habitats of the offshore environment of the NWMR include remote oceanic reef systems, large platform reefs, submerged banks and shoals. These reef types include oceanic atolls such as Scott Reef and Seringapatam Reef (located within the EMBA), fringing reefs surrounding offshore islands such as Browse Island and along sections of the Kimberley coastline, and submerged shoals on the North West Shelf (NWS) including Rankin Bank and Glomar Shoal (Veron and Marsh 1988). The scleractinian corals (light dependent), which are found to a maximum depth of 60 m , are the keystone species of the coral communities within the Scott Reef system which are considered to be of high conservation and ecological value. Within the deeper waters of the Operational Area (i.e. seabed habitats excluding Scott Reef), environmental surveys did not record the presence of deepwater soft or hard corals (Gardline Marine Services Pty Ltd 2009a; Hudson and Fletcher 2006).	• Scott Reef (5.5 km west of Operational Area Part A) • Seringapatam Reef (19 km NNE of Operational Area Part A) • Ashmore Reef (197 km north-north-east of Operational Area Part A)
Seagrass beds and macroalgae	Seagrass beds and benthic macroalgae provide important habitat, nursery areas and food sources for marine fauna (Heck et al. 2003; Wilson et al. 2010). In northern Western Australia, these habitats are largely restricted to sheltered shallow waters around reef systems due to high tidal ranges, turbidity, seasonal freshwater runoff and cyclones. Across the North West Marine Region (NWMR), seagrass coverage is generally sparse. Ashmore Reef supports the largest recorded area (~2% cover), although dense seagrass (>10% cover) is limited (Skewes et al. 1999b; Brown and Skewes 2005). Smaller areas occur at Cartier Island and Seringapatam Reef, dominated primarily by *Thalassia hemprichii* and *Halophila ovalis*, while no seagrass has been recorded at Browse Island or Hibernia Reef (Skewes et al. 1999b). Scott Reef supports five seagrass species, with *Thalassia hemprichii* the most abundant. Seagrasses occur mainly in shallow waters, generally <15 m deep, covering ~23 ha (0.22%) at North Scott Reef and 77 ha (0.54%) at South Scott Reef (URS Australia Pty Ltd 2006a; Skewes et al. 1999b). No seagrass was recorded	• Scott Reef (5.5 km west of Operational Area Part A) • Seringapatam Reef (19 km NNE of Operational Area Part A) • Ashmore Reef (197 km north-north-east of Operational Area Part A)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat/ community	Description	Key locations within the EMBA
	at depths >15 m or in deeper lagoon and outer reef habitats (>40 m) (URS 2007a, 2007b). Macroalgal growth within the deep waters of the Project Area is limited by low light availability and soft sediment habitats. Seabed surveys recorded no macroalgal beds within the development area; however, shallow and intertidal areas at Scott Reef support variable algal cover averaging 5–10% (WAM 2009).	
Other communities and habitats		
Plankton	Plankton within the Operational Area and EMBA are expected to be representative of the wider NWMR as detailed in Section 4.3 of the Master Existing Environment document provided in Appendix C. The NWMR has two distinct phytoplankton assemblages; a tropical oceanic community in offshore waters and a tropical shelf community confined to the NWS (Hallegraeff 1995). Further detail regarding productivity at other notable locations within the EMBA is provided in the Master Existing Environment document provided in Appendix C.	Phytoplankton within the EMBA is expected to reflect the distribution and abundance of the NWMR, refer to the Master Existing Environment document in Appendix C.
Pelagic and demersal fish populations	Pelagic and demersal fish populations within the three operational area and EMBA are expected to be representative of the NWMR (described in the Master Existing Environment document, Section 6.2 [Appendix C]). Particular features within the EMBA that are known to support pelagic and demersal fish populations include the Ancient Coastline at 125 m Depth Contour KEF) and the Continental Slope Demersal Fish Communities KEF (which is mapped as overlapping Operational Area Part B). Detail regarding these features is provided in the Master Existing Environment document provided in Appendix C.	Fish populations within the EMBA are expected to reflect the distribution and abundance of the NWMR, refer to the Master Existing Environment document in Appendix C.
Epifauna and infauna	The offshore environment of the NWMR comprises predominately of seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and sparse benthic biota. The benthic communities inhabiting the predominantly soft, fine sediments of the offshore habitats are characterised by infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, cucumbers). The density of benthic fauna is typically lower in deep-sea sediment habitats (>200 m) than in shallower coastal sediment habitats, but the diversity of communities may be similar. Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2008). Filter feeders generally live in areas that have strong currents and hard substratum, often associated with deeper environments of the shoals and banks in the offshore NWMR.	Epifauna and infauna within the EMBA is expected to reflect the distribution and abundance of the NWMR, refer to the Master Existing Environment document in Appendix C.

4.6 Protected species

A total of 66 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which a subset of 42 species were identified as potentially occurring within the Operational Area. The full list of marine species identified from the PMST report(s) is provided in Appendix D. The PMST report is produced from a grid-based search, which can cause species outside of the search area to be detected, such as terrestrial. Species identified in the PMST that are not known to inhabit shorelines, nor rely on the marine environment for their diet, are not included. One conservation dependent species has also been identified with a potential to occur within the Operational Area and EMBA.

Species identified as potentially occurring within the Operational Area and EMBA and biologically important areas (BIAs) or habitat critical to their survival (habitat critical) which overlap the Operational Area and EMBA are listed in Table 4-4 to Table 4-13. Figure 4-5 to Figure 4-12 show the spatial overlap between relevant BIAs and habitat critical areas and the Operational Area and EMBA. Species that have been identified as having ecologically significant interactions in the Operational Area are described in further detail in this section. Key threatened and migratory species and associated biologically important behaviours in the EMBA are further described in the Master Existing Environment document in Appendix C.

4.6.1 Fish, sharks and rays

A total of 12 EPBC Act listed threatened and migratory fish species have been identified to potentially occur within the EMBA, of which 9 occur in the Operational Area (Table 4-4). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

BIAs that overlap the EMBA are presented in Figure 4-5 and in Table 4-4. The Operational Area do not overlap any BIAs for fish, sharks and rays (Figure 4-5, Table 4-4).

Further description of BIAs is provided in the Master Existing Environment document in Appendix C.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-4: Threatened and migratory fish, shark and ray species predicted to occur within the Operational Area and EMBA

Species name	Common name	EPBC Act (as per PMST report Appendix D)		Potential for interaction		
		Threatened status	***Migratory status***	***Operational Area Part A***	***Operational Area Part B***	***EMBA***
Carcharodon carcharias	White Shark, Great White Shark	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area	Species or species habitat may occur within area
Pristis pristis	Largetooth Sawfish. Freshwater Sawfish	Endangered	Migratory	X	X	Species or species habitat may occur within area
Pristis zijsron	Green Sawfish	Vulnerable	Migratory	X	X	Species or species habitat likely to occur within area
Rhincodon typus	Whale Shark	Vulnerable	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area	Foraging, feeding or related behaviour likely to occur within area Species or species habitat may occur within area
Sphyrna lewini	Scalloped Hammerhead	Conservation Dependent	N/A	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area	Species or species habitat likely to occur within area
Anoxypristis cuspidata	Narrow Sawfish, Knifetooth Sawfish	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area	Species or species habitat may occur within area
Carcharhinus longimanus	Oceanic Whitetip Shark	N/A	Migratory	Species or species habitat may occur within area	Species or species habitat may occur within area	Species or species habitat may occur within area
Carcharias taurus	Grey Nurse Shark	N/A	Migratory	X	X	Species or species habitat may occur within area

4.6.2 Marine reptiles

A total of 9 EPBC Act listed threatened and migratory marine reptile species have been identified to potentially occur within the EMBA, of which 7 occur in the Operational Area (Table 4-6). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

BIAs that overlap the EMBA are presented in Figure 4-6 and Table 4-4. Habitat critical overlapping the EMBA is presented in Figure 4-7 and Table 4-8. The Operational Area does not overlap any BIAs for marine reptiles. Operational Area Part A is in close proximity but does not overlap habitat critical for the Green Turtle (Figure 4-6, Table 4-7; Figure 4-7, Table 4-8). Woodside notes that the spatial extent of habitat critical to survival of green turtles around Sandy islet presented in Figure 4-7 differs from the broader area identified as habitat critical to survival in the DCCEEW Protected Matters Search Tool, however it does not align with the definition of internesting habitat under the Recovery Plan for Marine Turtles in Australia, as Scott Reef itself is not a nesting location. The close proximity of this habitat to the Operational Area has been considered in the impact assessment.

The seasonal sensitivities for turtle BIAs that overlap the 20 km light buffer are presented in

Table **4-9**.

Hawksbill turtles have been excluded from the seasonal sensitivities table as although Scott Reef is identified as an area that supports hawksbill turtle nesting in the Recovery Plan, Sandy Islet is not listed as an important nesting area for this stock in the Recovery Plan or a nesting and internesting area identified as habitat critical to the survival of a species. It is also not included in the dataset of nesting sites in Australia and surrounding regions, as presented in the Recovery Plan.

A single hawksbill turtle was tagged (2006) and recaptured (2009) on Sandy Islet by Guinea (2009). During this survey, there were no other reports of hawksbill tracks on Sandy Islet (Guinea, 2009). In subsequent surveys in 2010 and 2011, there was no evidence (tracks, turtles or hatchlings) of hawksbill turtle nesting on Sandy Islet (Guinea, 2010; 2011). There are no other records of hawksbill turtles nesting at Scott Reef. Although there have been observations of some hawksbill turtle nesting at Sandy Islet, is it not considered to be an important nesting area for the Western Australia stock or other stocks in Australia.

Further description of BIAs is provided in the Master Existing Environment document in Appendix C.

4.6.3 Marine mammals

A total of 10 EPBC Act listed threatened and migratory marine mammal species have been identified to potentially occur within the EMBA, of which 9 occur in the Operational Area (Table 4-10). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

BIAs that overlap the EMBA are presented in Table 4-11, Figure 4-8, and Figure 4-9. The Operational Area overlap the foraging, resting and migration BIAs for the Pygmy Blue Whale (PBW) (Table 4-11, Figure 4-8, and Figure 4-9).

Further description of BIAs is provided in the Master Existing Environment document in Appendix C.

4.6.4 Seabirds and migratory shorebirds

A total of 31 EPBC Act listed threatened seabirds and migratory shorebird species have been identified to potentially occur within the EMBA, of which 17 occur in the Operational Area (Table 4-12). A full list of EPBC Act listed species identified in the PMST search is provided in Appendix D.

BIAs that overlap the EMBA are presented in Table 4-12, Figure 4-10, Figure **4-11**, and Figure 4-12. The Operational Area Part A overlaps the resting BIA for the Little Tern (Table 4-12, Figure 4-10).

Detailed descriptions of seabirds and migratory shorebirds in the EMBA are provided in the Master Existing Environment document in Appendix C.

4.6.5 Seasonal sensitivities for protected species

Seasonal sensitivities for protected migratory species identified as potentially occurring within the Operational Area are identified in Table 4-14. Seasonal sensitivities for species in the wider NWMR are described in the Master Existing Environment document in Appendix C.

Table 4-14: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Mammals												
Pygmy Blue Whale (northern migration)[1]												
Pygmy Blue Whale (southern migration)[1]												
Seabirds and shorebirds												
Little Tern (breeding/resting)[2] May be present in NWMR outside breeding season – foraging and resting												
	Species may be present in the Operational Area											
	Peak period. Presence of animals is reliable and predictable each year

4.7 Key ecological features (KEFs)

Two KEFs overlap the Operational Area. KEFs within the Operational Area and EMBA are identified in Table 4-15 and described in the Master Existing Environment document in Appendix C. Figure 4-13 shows the spatial overlap with KEFs and the Operational Area and EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-15: KEFs within the Operational Area and EMBA.

Key ecological feature	Distance / direction from Operational Area to KEF (km)	Description
Continental Slope Demersal Fish Communities	Overlaps Operational Area Part B . Approximately 0.6 km west from Operational Area Part A	The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the North-west Province is high compared to elsewhere along the Australian continental slope (DSEWPAC 2012a). The continental slope between North-west Cape and the Montebello Trough has >500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last et al. 2005). The slope of the Timor Province and the Northwest Transition also contains >500 species of demersal fishes of which 64 are considered endemic (Last et al. 2005), making it the second richest area for demersal fishes throughout the whole continental slope. Demersal fish species occupy two distinct demersal biomes associated with the upper slope (225–500 m water depths) and the mid-slope (750–1,000 m). Although poorly known, it is suggested that the demersal slope communities rely on bacteria and detritus-based systems comprised of infauna and epifauna, which in turn become prey for a range of teleost fishes, molluscs and crustaceans (Brewer et al. 2007). Higher-order consumers may include carnivorous fishes, deepwater sharks, large squid, and toothed whales (Brewer et al. 2007). Pelagic production is phytoplankton-based, with hot spots around oceanic reefs and islands (Brewer et al. 2007).
Seringapatam Reef and Commonwealth waters in the Scott Reef Complex	Overlaps Operational Area Part A Approximately 17 km north-east from Operational Area Part B	Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity, and high species richness associated with the reefs themselves. As two of the few offshore reefs in the North-west, they provide an important biophysical environment in the region (DSEWPAC 2012a).
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	Approximately 196 km north-east from Operational Area Part A . Approximately 274 km north-east from Operational Area Part B	Ashmore Reef is the largest of only three emergent oceanic reefs present in the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. Ashmore contains a large reef shelf, two large lagoons, several channelled carbonate sand flats, shifting sand cays, an extensive reef flat, three vegetated islands—East, Middle and West islands—and surrounding waters. Rising from a depth of >100 m, the reef platform is at the edge of the NWS and covers an area of 239 km². Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life; they are areas of enhanced primary productivity in an otherwise low- nutrient environment (DSEWPAC 2012a). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Key ecological feature	Distance / direction from Operational Area to KEF (km)	Description
Ancient coastline at 125 m depth contour	Approximately 74 km south-east from Operational Area Part A Approximately 37 km south-east from Operational Area Part B	Several steps and terraces as a result of Holocene sea level changes occur in the region, with the most prominent of these features occurring as an escarpment along the NWMR and Sahul Shelf at a water depth of 125 m. The ancient coastline is not continuous throughout the NWMR and coincides with a well-documented eustatic stillstand at ~130 m depth worldwide (Falkner et al. 2009). Where the ancient coastline provides areas of hard substrate, it may contribute to higher diversity and enhanced species richness relative to soft sediment habitat (Falkner et al. 2009). Parts of the ancient coastline, represented as rocky escarpment, are considered to provide biologically important habitat in an area predominantly made up of soft sediment. The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient-rich environment. Although the ancient coastline adds additional habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner et al. 2009).

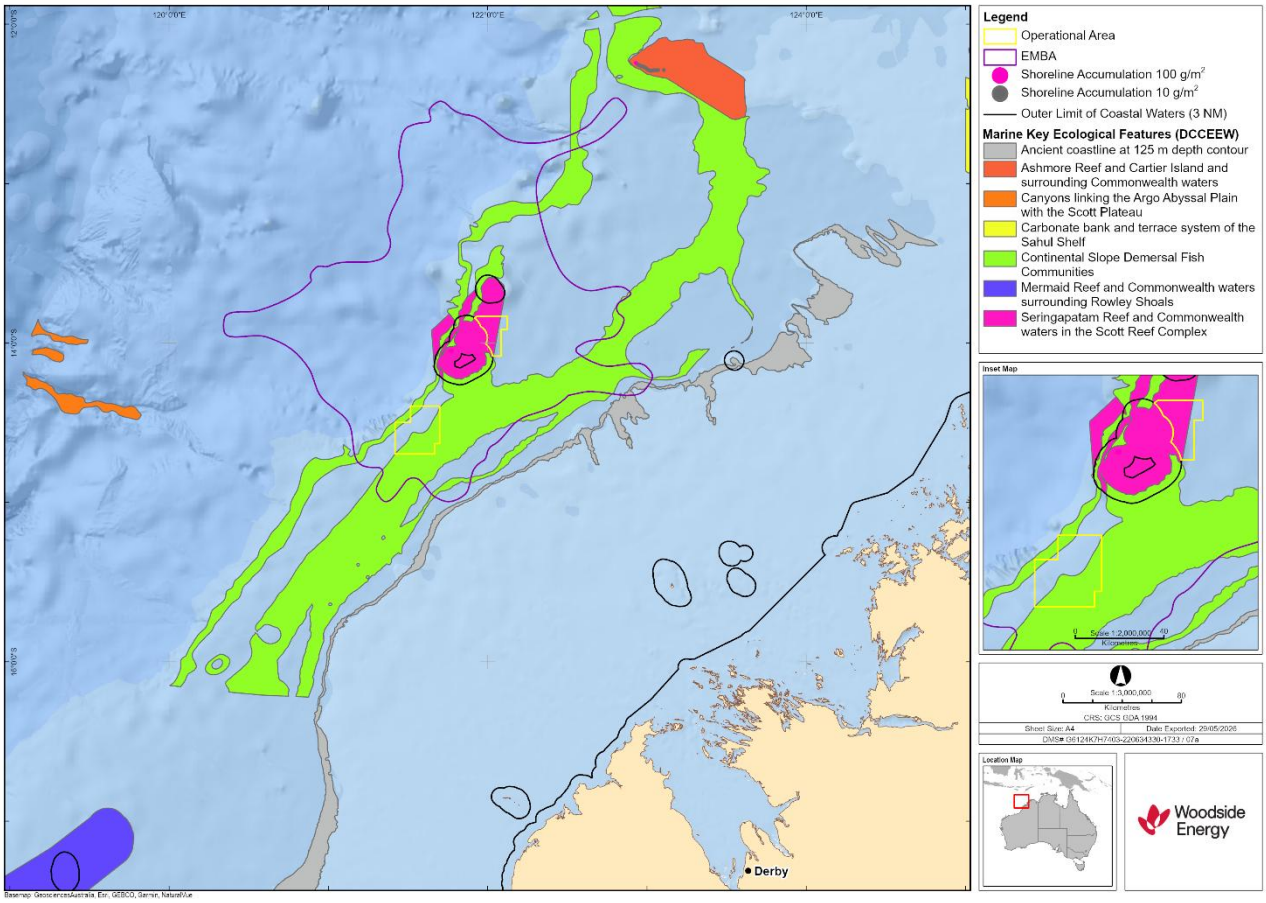

Figure 4-13: KEFs overlapping the Operational Area and EMBA

4.8 Protected places

No protected places overlap the Operational Area. Protected places within the Operational Area and EMBA are identified in Table 4-16 and presented in Figure 4-14. The Master Existing Environment document in Appendix C outlines the values and sensitivities of protected places and other sensitive areas in the Operational Area and EMBA.

Table 4-16: Established protected places and other sensitive areas overlapping the EMBA

	Distance & direction from Operational Area to protected place or sensitive area (km)	IUCN category* or relevant park zone overlapping the EMBA
AMPs		
NWMR		
Ashmore Reef	200 km north-east of Operational Area Part A	Recreational Use Zone (IUCN IV)
	276 km north-east of Operational Area Part B

	Distance & direction from Operational Area to protected place or sensitive area (km)	IUCN category* or relevant park zone overlapping the EMBA
	23 km north-east of Operational Area Part B	

** Conservation objectives for IUCN categories include:*

Ia: Strict Nature Reserve

Ib: Wilderness Area

II: national Park

III: Natural Monument or Feature

IV: Habitat/Species Management Area

V: Protected Landscape

VI: Protected area with sustainable use of natural resources – allow human use but prohibits large scale development.

IUCN categories for the marine park are provided and, in brackets, the IUCN categories for specific zones within each Marine Park as assigned under the North-west Marine Parks Network Management Plan 2018 (Director of National Parks 2018) and South-west Marine Parks Network Management Plan 2018 (Director of National Parks 2018a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9 Cultural values and heritage

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places
- the social, economic and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of these areas are described. Description of cultural values and heritage as they relate to the wider North-west Marine Region (NWMR) are described in the Master Existing Environment document in Appendix C.

4.9.1 Native Title

For the activity in this EP, there are no native title claims or determinations, overlapping the Operational Area and five that are coastally adjacent to the Operational Area. Table 4-17 lists these; however, it does not differentiate between claims and determinations, as it is acknowledged that rights and interest may exist within either of these.

There are no Indigenous Land Use Agreements (ILUAs) overlapping the Operational Area and five that are coastally adjacent to the Operational Area (Table 4-17). Figure 4-15 shows the relevant native title claims or determinations and ILUAs relevant to the Operational Area. Further description of how Woodside considers native tile rights and interest is provided in Appendix F.

4.9.2 Coastally adjacent Indigenous groups

To identify cultural features and heritage values which may exist outside of a native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the Operational Area to be an instructive means of identifying potentially relevant Indigenous groups to be consulted (see Section 5).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.3 Marine parks

Woodside undertakes an assessment of cultural values within Marine Park Management Plans where the Operational Area or EMBA overlaps a Marine Park.

Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified Traditional Custodians or representative bodies referenced to contact regarding potential cultural features and heritage values. For completeness, Woodside considers cultural features and heritage values identified in the management plans, where EP relevant Traditional Custodians or representative bodies are represented. These values are outlined in Table 4-19.

The Operational Area do not overlap a Commonwealth Marine Park. The EMBA does overlap with features of the Ashmore Reef Marine Park managed under the North-West Marine Parks Network Management Plan 2018. The EMBA overlaps a further one State Marine Park. Where these plans specify identifiable representative bodies who may hold knowledge of heritage values or cultural features—including but not limited to Registered Native Title Bodies Corporate—these bodies are consulted (Section 5 and Appendix F) Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. No identifiable representative bodies were specified for the marine parks overlapped by the EMBA (Table 4-18).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

As noted in the North West Marine Park Management Plan, there is limited information about the cultural significance of this marine park (Director of National Parks 2018). There is limited information about the cultural significance of the Scott Reef Nature Reserve.

Management plans for the AMPs note shipwrecks within the AMPs and overlap with World, National and Commonwealth heritage lists. These are addressed in Sections 4.9.8 and 4.9.9.

A number of management plans for the state marine parks also note Indigenous and maritime heritage within the marine parks.

Table 4-18: Summary of the Operational Area and EMBA overlap with Commonwealth and State Marine Park Management Plan areas

Marine Park Management Plan	Operational Area overlap	EMBA overlap	Specified bodies
Commonwealth Marine Park Management Plan			
Ashmore Reef Sanctuary Zone	No	Yes	No identifiable body specified
State Marine Park Management Plan			
Scott Reef Nature Reserve	No	Yes	No identifiable body specified

4.9.4 Indigenous protected areas

Indigenous Protected Areas (IPAs) are areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation through voluntary agreements with the Australian Government.

There are no IPAs that overlap the Operational Area or EMBA.

4.9.5 Sea Country values

Sea country values of marine ecosystems are further described in the Master Existing Environment document in Appendix C. An impact to marine ecosystems has the potential to impact cultural values where the impact is detectable within Sea Country. Potential impacts to these cultural values are assessed in Section 5.

Woodside initiates consultation on cultural values of Sea Country where Traditional Custodians or representative institutions are identified, or self-identify, as relevant persons.

Cultural features or heritage values related to marine species within the Operational Area or EMBA raised by Traditional Custodians in the course of preparing the EP have been outlined in

Table 4-20. Values identified in publicly available literature are summarised in Table 4-19.

4.9.5.1 Desktop assessment of Sea Country values

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the Operational Area. Where cultural features or Sea Country values were identified these are summarised in Table 4-19 according to the Indigenous groups (where identified or inferable) who hold these values.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-19: Cultural features and heritage values identified in publicly available literature

Indigenous group	Features and values	Source	Potential for overlap	
			Operational Area	EMBA
Bardi and Jawi	Feature: Mythologically important places	FCAFC (2010)	Possible (unspecified)	Possible (unspecified)
	Value: Activities of mythological beings in the sea area		Possible (unspecified)	Possible (unspecified)
	Feature: Resources including (1) dugong, (2) turtle and (3) trochus shell		Possible (2,3) No (1)	Possible (2,3) No (1)
	Value: Traditional knowledge of the sea and the features within		Possible (unspecified)	Possible (unspecified)
	Value: Access to the sea around the coast of the mainland of the Dampier Peninsula and among the islands for traveling, hunting and fishing		No	No
	Feature: Pearl shell	FCA (2005)	Possible	Possible
	Value: Fishing		Unlikely	Unlikely
	Feature: Feather		Possible	Possible
	Value: Reefs		No	Yes
	Value: Resource collection at One Arm Point (reef)	Oades and Meister (2013)	No	No
	Value: resources including: ▪ Banyjarr, (clam and abalone) (1) ▪ Noomool (seagrass) (2) ▪ Alngir (trochus), Goowarn (pearl shell) (3) ▪ Bluebone (Goorlan) (4) ▪ Aarli (fish) and fish stocks (5) ▪ Goorlil (turtle) (6) ▪ Odorr (dugong) (7) ▪ Joord (mullet) (8) ▪ Barnamb (stingray) (9)		No (2, 7,10) Possible (all other values)	No (2, 7,10) Possible (all other values)

4.9.5.2 Indigenous archaeological heritage assessment

Indigenous archaeological heritage in relation to the North-west Marine Region (NWMR) is described in the Master Existing Environment document in Appendix C.

The Western Australian Department of Planning, Lands and Heritage (DPLH) Aboriginal Heritage Inquiry system was searched which showed 0 Registered Aboriginal Sites and 0 Lodged Aboriginal Sites for the EMBA (Department of Planning Land, Heritage and Aboriginal Enquiry System Results – Appendix I). The exact location, access, and traditional practices for a number of these sites may not be disclosed and if required, such as in the event of a major oil spill, would involve prioritising further consultation with key contacts within DPLH and relevant local Indigenous communities.

Archaeological material on the Ancient Landscape is a relevant matter for the proposed activity as there is overlap between the Operational Area and the Ancient Landscape, and potential for seabed disturbance from planned activities and therefore potential for impacts to archaeological material. Assessment of the potential for archaeological material to be impacted by the Petroleum Activity is discussed in Sections 6.8 and 6.9.

No sites of significance within the Operational Area were identified by Traditional Custodians during consultation in the course of preparing the EP.

4.9.5.3 Underwater Cultural Heritage

Further information regarding Indigenous archaeological heritage in relation to the Ancient Submerged Landscape in the North-west Marine Region (NWMR) is described in the Master Existing Environment document in Appendix C.

An assessment of the potential impacts on archaeological material by the proposed activity is discussed in Sections 6.8.2 and 6.11

4.9.5.4 Feedback received via consultation to inform Existing Environment Description

Indigenous cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that ‘Aboriginal and Torres Strait Islander heritage is managed... according to community ownership’ (Heritage Chairs of Australia and New Zealand. 2020). Dhawura Ngilan also specifically notes that ‘Aboriginal and Torres Strait Islander...intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community...’ Through consultation with relevant persons, Registered Native Title Bodies Corporate have identified or raised topics relating to environmental values of cultural interest. These include a broad interest in the marine fauna, including whales and turtles (Table 1 in Appendix F)

Feedback received on potential cultural features and heritage values during consultation are described in

Table 4-20.

Woodside has committed to ongoing engagement to further understand these values. Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.8)

Table 4-20: Summary of feedback received via consultation to inform Existing Environment Description

Relevant Indigenous group / individuals	Consultation context	Description of value / feature / interest	Potential for overlap	
			Operational Area	EMBA
Traditional Custodians and Nominated Representative Corporations

4.9.6 Summary of cultural features and heritage values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under regulation 25 of the Environment Regulations.

The cultural features and heritage values identified in Sections 4.9.1 to 4.9.7 confirms whether there is any potential for these to exist within the Operational Area or EMBA. As previously described, topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Sections 6.8 and 6.9.

A summary of cultural features and heritage values identified through both consultation and desktop assessment is provided in Table 4-21.

Where cultural features are physical elements of a place, these can generally be assessed for impacts; where a feature is avoided, impacts from planned activities are not predicted. Heritage values relate less to what is significant and more to why something is significant; potential interactions between heritage values and the Operational Area can only be reliably informed by consultation with Traditional Custodians where they are willing to share the necessary knowledge.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-21: Summary of cultural features and heritage values

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Archaeological heritage and landscapes					
Coastal/ island archaeological sites	Coastal archaeological sites include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources.	✓	✓	No	No
Petroglyphs	Petroglyphs are a form of rock art. Petroglyphs are a prominent feature particularly at Murujuga where it is found on hard, volcanic rock.	x	x	No	No
Fish traps	Stone arrangements constructed in intertidal areas which fill with fish at high tide and trap them at low tide.	x	✓	No	No
Submerged archaeological sites	The Ancient Landscape extends between 125m and 130m below current sea level. Occupation of this area may have left traces through now submerged archaeological sites. Historic wrecks	x	✓	No	Possible
Rivers, waterholes, tidal channels and seeps	Water sources on the Ancient Landscape which may be culturally significant or archeologically prospective.	x	x	No	No
Submerged hills	Hills on the Ancient Landscape which may be culturally significant or archeologically prospective. As sea level rose these hills would have become islands and eventually submerged.	x	x	No	No
Intangible values					
Songlines	Publicly available literature talks to Songlines associated with ancestral beings that travelled Sea Country.	✓	✓	Possible	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Creation/ Dreaming sites, sacred sites and ancestral beings	Publicly available literature talks to creation/dreaming and ancestral beings, including water serpents, connected to or originating from the sea generally.	x	✓	Possible	Possible
Ceremonial sites	Places where ceremony (e.g. thalu ceremonies) are performed. All identified ceremonial sites are located onshore.	x	✓	No	No
Cultural obligations to care for Country	Cultural obligation to care for the environmental values of Sea Country. Exclusion of Traditional Custodians from Sea Country or decision making processes may inhibit ability to care for Country.	x	✓	Possible	Possible
Knowledge of Country/ customary law and transfer of knowledge	The preservation and transmission of knowledge is dependent on the preservation of the environment generally. Exclusion of Traditional Custodians from Sea Country may inhibit the transfer of knowledge.	x	✓	Possible	Possible
Connection to Country	Connection to Country is described in publicly available literature as “important to the Traditional owners’ spirituality and religion”. Connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge	x	✓	Possible	Possible
Access to Country	Limitations on Traditional Custodians accessing or enjoying areas of Sea Country	x	✓	Unlikely	Unlikely
Kinship systems and totemic species	Traditional Custodians have a connection to species through kinship and totemic systems. An individual may have obligation to care for or not consume a species to which they are kin.	x	✓	Possible	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Resource collection	Fishing, hunting, gathering of marine species including marine mammals, marine reptiles, fish and invertebrates.	x	✓	Unlikely	Unlikely
Marine ecosystems and species					
Water quality	Interest only, raised as a natural environment interest	x	✓	Yes	Yes
Marine species	Generally raised in consultation and literature as an interest	x	✓	Yes	Yes
Marine mammals: Whales	Generally raised in consultation and identified in publicly available literature Thalu species of totemic importance Linked to Songlines and Dreaming stories Humpback whales in particular	✓	✓	Possible	Possible
Marine mammals: Dolphins	Cultural ceremonies associated with dolphins Culturally important species	x	✓	Possible	Possible
Marine mammals: Dugongs	Culturally important species Used as a resource	x	✓	No	Possible
Marine reptiles: Marine turtles	Culturally important species and migration Turtles and turtle eggs as a resource	x	✓	Possible	Possible
Fish: Fish, whale sharks, sharks and rays	Culturally important species Used as a resource Law run through the sea, including fish Fish, including bream and sting rays are totemic species Fish, including sharks and rays raised as a natural environment interest	x	✓	Possible	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Identified cultural features and heritage values	Context	EP source		Potential for overlap	
		Consultation feedback	Desktop literature assessment	Operational Area	EMBA
Cephalopods: Squid and Octopus	Thalu species of totemic importance Resource	x	✓	Possible	Possible
Intertidal communities: Bivalves, gastropods, echinoderms (sea urchins), crustaceans	Resource.	x	✓	Possible	Possible
Seabirds	Culturally important species Birds (including shags, seagulls and osprey) and bird eggs as a resource	x	✓	Possible	Possible
Benthic habitats: Macroalgal communities	Interest only, raised as a natural environment interest.	x	✓	Possible	Possible
Shoreline habitats: Mangroves	Critical breeding ground for marine and terrestrial wildlife. Mangroves would have provided shelter, crabbing, digging for shellfish, could be turtle nurseries.	x	✓	No	No
Shoreline habitats: Intertidal sand/ mudflat communities	Interest only, raised as a natural environment interest.	x	✓	No	Possible

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.7 Historic sites of significance

There are no sites of historic cultural heritage significance within the Operational Area and two sites in the EMBA. These are identified in the following sections and described in Appendix F.

4.9.8 Historic underwater cultural heritage

The protection of historic underwater heritage under Commonwealth and State legislation is described in Master Existing Environment document in Appendix C.

The Australasian Underwater Cultural Heritage database records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters. The Australian National Shipwreck Database lists all known shipwrecks in Australian waters. A search of these databases indicated that there are no sites within the Operational Area, however, two sites exist (Yarra and Onogra shipwrecks) within the EMBA (Figure 4-16).

Table 4-22 lists sites identified closest proximity to the Operational Area.

Table 4-22: Underwater heritage sites within closest proximity of the Operational Area

Vessel name	Year wrecked	Wreck location	Latitude (D.MM °S)	Longitude (D.MM °E)	Distance / direction from Operational area (km)
Yarra	1884	Scott Reef	-14^0 2" 25.77"	121^0 46" 12.05"	~20 km W of Operational Area Part A
Onogra	1987	Scott Reef	-14^0 0" 0"	121^0 46" 4.98"	~20 km W of Operational Area Part A

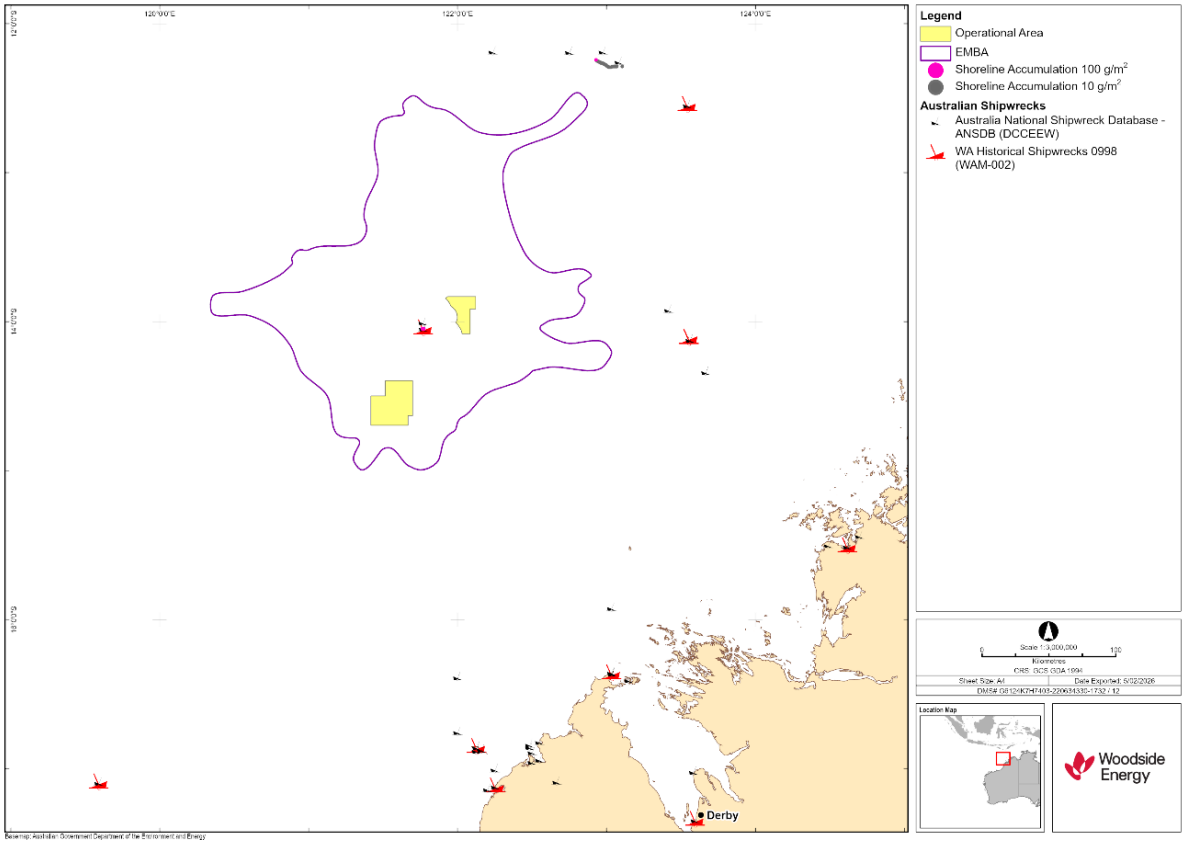

Figure 4-16: Shipwrecks in the EMBA

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.9.9 World, National and Commonwealth heritage listed places

No listed heritage places overlap the Operational Area. World, National and Commonwealth heritage places within the EMBA are identified in Table 4-23. The Master Existing Environment document in Appendix C outlines the values and sensitivities of these places.

Table 4-23: World, National and Commonwealth heritage listed places within the EMBA

Listed Place	Distance / direction from Operational Area to Listed Place (km)
World Heritage Places	
None	
National Heritage Places (NHP)	
None	
Commonwealth Heritage Places (CHP)	
Scott Reef and Surrounds	11.6 km south-west of Operational Area Part A

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

4.10 Socio-economic environment

4.10.1 Commercial fisheries

Several Commonwealth and State fishery management areas are located within the Operational Area and EMBA. Data from the Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES) were used to identify if Commonwealth managed fisheries have fished within the Operational Area and EMBA in the most recently available ten-year period of catch and effort data (2013–2024). FishCube data was also requested from the WA Department of Primary Industries and Regional Development (DPIRD) for the most recently available five-year period of fishery catch and effort data (2020-2025). This data was used to analyse the potential for interaction of fisheries with the Operational Area and EMBA. Data was reviewed from the last five years as a subset of past fishing effort. This was deemed an appropriate period to represent potential future fishing effort over the lifecycle of this EP.

This information was used to determine relevant fisheries for consultation who may be impacted by the proposed petroleum activities. Table 4-24 provides an assessment of the potential interaction and the Master Existing Environment document in Appendix C provides further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5).

One Commonwealth managed fisheries were identified as having a potential interaction with the Petroleum Activity, within the Operational Area and within the EMBA (Figure 4-17). Three State managed fisheries were identified as having a potential interaction with the Petroleum Activity, within the Operational Area and within the EMBA (Figure 4-18).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-24: Commonwealth and State commercial fishery management areas overlapping the Operational Area and EMBA

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
Commonwealth managed fisheries			
North West Slope Trawl Fishery	✓	✓	The North West Slope Trawl Fishery management area overlaps the Operational Area and EMBA. The North West Slope Trawl Fishery extends from 114 °E to 125 °E, from the 200 m isobath to the outer limit of the Australian Fishing Zone (200 nm from the coastline, which is the boundary of the Australian Exclusive Economic Zone [EEZ]). Fishing for scampi occurs over soft, muddy sediments or sandy habitats, using demersal trawl gear on the continental slope (Patterson et al. 2017). The North West Slope Trawl Fishery commenced in 1985 and the number of active vessels peaked at 21 in the 1986–1987 season, decreasing to between 1 and 6 vessels per year since 2005–2006. Three vessels operated in each of the 2022–2023 and 2023–2024 seasons (Keller et al. 2025). Three vessels were active in the 2022–2023 and 2023–2024 season, decline from 4 in the 2021–2022 season, and trawl-hours increased from 4,351 in 2022–2023 to 4,555 in 2023–2024 (Keller et al. 2025). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and the EMBA.
Southern Bluefin Tuna Fishery	✓	✓	This fishery management area overlaps with the Operational Area and EMBA. Most of the Australian fishing effort is by purse-seine vessels in the Great Australian Bight and waters off South Australia during summer months, and by longline off the New South Wales coastline during winter months (Patterson et al. 2025) The fishery has not been active in the Operational Area or EMBA within the last five years (ABARES 2025). Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activity given the current distribution of fishing effort.
Western Skipjack Tuna Fishery	✓	✓	The Skipjack Tuna Fishery overlaps the Operational Area and EMBA, however has not been actively fished since the 2008–2009 fishing season (Patterson and Delewski 2025). Therefore, Woodside considers there is no potential for interaction with this fishery at present.
Western Tuna and Billfish Fishery	✓	✓	While this fishery management area overlaps the Operational Area and EMBA, fishing effort in the last five years has been concentrated in southwest WA (typically as far north as Carnarvon) and occasionally off South Australia. Woodside considers there to be no potential for interaction with this fishery given the current distribution of fishing effort.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
State managed fisheries			
Kimberley Crab Managed Fishery	✓	✓	Kimberley Crab Managed Fishery is one of two small trap-based crab fisheries that exist in the North Coast Bioregion between Cambridge Gulf and Broome (Gaughan and Santoro 2018). In November 2018, the fishery transitioned from developing to fully managed (Johnston et al. 2020).
Mackerel Managed Fishery	✓	✓	The commercial fishery extends from the West Coast Bioregion to the WA/Northern Territory (NT) border. There are three managed fishing areas: Area 1: Kimberley (121° E to the WA/NT border); Area 2: Pilbara (114° E to 121° E) and Area 3: Gascoyne (27° S to 114° E) and West Coast (Cape Leeuwin to 27° S) (Lewis et al. 2020). Most of the catch is taken from waters off the Kimberley and Pilbara coasts (Lewis et al. 2020), reflecting the tropical distribution of mackerel species (Molony et al. 2015). Most fishing activity occurs around the coastal reefs of the Dampier Archipelago and Port Hedland area, with the seasonal appearance of mackerel in shallower coastal waters most likely associated with feeding and gonad development before spawning (Mackie et al. 2003). The Mackerel Managed Fishery overlaps the Operational Area and EMBA. The Operational Area overlap this fishery (specifically, the Kimberley management area – Area 1) but fishing effort has not been reported in the Catch and Effort System (CAES) blocks overlapping the Operational Area in the last five years (not active at 10 nm), and therefore it is considered that there is no interaction with this fishery.
Marine Aquarium Fish	✓	✓	The Marine Aquarium Managed Fishery operates in all State waters between the Northern Territory border and South Australian border and overlaps the Operational Area. The fishery is typically more active in waters south of Broome with higher levels of effort around the Capes region, Perth, Geraldton, Exmouth, Dampier, and Broome. There is also recent effort in the waters from Broome northwards to the NT border (Newman et al.2024). In 2023, the total catch for the Marine Aquarium Fish Managed Fishery was 107,786 fishes (including syngnathids, invertebrates and sponges), 18 t of coral, live rock and living sand, and 272 L of marine plants and live feed (Newman et al. 2024). This fishery is typically active within waters <30 m deep. However, there was fishing effort recorded in the CAES blocks overlapping the Operational Area in the last five years. Therefore, it is considered it is considered that there is potential for interaction with this fishery.
WA North Coastal Shark Fishery	✓	✓	This fishery management area overlaps the Operational Area. However, fishing activity has not been reported by this fishery since the 2008–2009 fishing season (Patterson et al. 2021). Accordingly, Woodside considers there to be no interaction with this fishery.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
Northern Demersal Scalefish Fishery	✓	✓	The Northern Demersal Scalefish Managed Fishery is divided into two fishing areas: an inshore sector (Area 1) and an offshore sector (Area 2) (Newman et al. 2018). Area 1 permits line fishing only, between the high-water mark and the 30 m isobath. Area 2 permits handline, dropline and fish trap fishing methods and is further divided into zones. Zone A is an inshore area, Zone B comprises the area with most historical fishing activity, and Zone C is an offshore deep slope area representing waters deeper than 200 m (Fletcher et al. 2017). Previous years catch based on State of the Fisheries annual reports provided by DPIRD: The Northern Demersal Scalefish Managed Fishery landed 1,450 t in 2023, 1,458 t in 2022, 1,544 t in 2021, 1,419 t in 2020, 1,507 t in 2019, and 1,297 t in 2018. In 2023, the majority of the catch was landed from Zone B, with 1,233 t in 2023. The 2023 catch of jobfish group (Pristipomoides spp.) was 502 t, 91% of which was goldband snapper (Wakefield et al. 2024). Eight vessels fished in the 2023 fishing season.
Pearl Oyster Managed Fishery	✓	✓	The Pearl Oyster Managed Fishery is located in shallow coastal waters, designated by four zones extending from Exmouth to Kununurra and the seaward boundary demarcated by the 200 nm EEZ. Fishing effort is mostly focused in shallow coastal waters (10–15 m depth), with a maximum depth of 35 m (Lulofs et al. 2002).
The South-West Coast Salmon Fishery	✓	✓	The South West Coast Salmon Managed Fishery management area overlaps the Operational Area. As no fishing occurs north of the Perth metropolitan area, no interaction with this fishery is anticipated.
West Coast Deep Sea Crustacean Managed Fishery	✓	✓	The West Coast Deep Sea Crustacean Managed Fishery is permitted to fish in waters deeper than the 150 m isobath overlapping the Operational Area. However, no fishing effort was recorded within the CAES blocks overlapping the Operational Area and as fishing effort is concentrated in water depths of 500–800 m (significantly deeper than the Operational Area). Fishing effort for this fishery has not been recorded within the CAES blocks overlapping the EMBA only in the last five years. Therefore, it is considered that there is no potential for interaction with this fishery within the EMBA either.
Tour Operator	✓	✓	The Operational Area overlap this fishery management area. Fishery effort for this fishery has been recorded within the CAES blocks overlapping the Operational Area and EMBA only in the last five years. Therefore, it is considered that there is potential for interaction with this fishery.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction during activity (x = no spatial overlap; ✓= spatial overlap; blue shading = possibility of interaction)		Description
	Operational Area	EMBA	
West Australian Abalone Fishery	x	✓	While the EMBA is overlapped by this fishery management area, no commercial fishing has occurred north of Moore River since 2011–2012. As there was no fishing effort reported within the CAES blocks overlapping the Operational Area or EMBA in the last five years, no interaction with this fishery is anticipated.
Broome Prawn Managed Fishery	x	✓	The Broome Prawn Managed Fishery operates off Broome and forms part of the North Coast Prawn Fishery. The DPIRD state of State of the Fisheries annual reports indicate that no fishing efforts occurred in 2022 and extremely low fishing effort occurred in 2021, 2020 and 2019 (Wilkin et al. 2023). Two boats undertook trial fishing activities in 2023. Catches were deemed to be too low to undertake further fishing activity (Koefoed et al. 2024). As there was no fishing effort reported within the CAES blocks overlapping the Operational Area or EMBA in the last five years, no interaction with this fishery is anticipated.
Specimen Shell Managed Fishery	x	✓	The Specimen Shell Managed Fishery encompasses the entire WA coastline, but effort is concentrated in areas adjacent to the population centres such as Broome, Exmouth, Shark Bay, Geraldton, Perth, Mandurah, the Capes area, Albany and Esperance (Bruce et al. 2024). Fishing effort for this fishery has not been recorded within the CAES blocks overlapping the EMBA only in the last five years. Therefore, it is considered that there is no potential for interaction with this fishery in the EMBA.

4.10.2 Traditional and customary fishing

Traditional or customary fishing is typically carried out in shallow coastal waters and/or areas with structures such as reef. The Western Australia Recreational Fishing Guide (DPIRD 2024) states that Indigenous people do not need a recreational fishing licence, in any waters, if it is in accordance with continuing tradition, for individual or familial consumption, and not for a commercial purpose.

Dugong, fish and marine turtles that move between coastal and Commonwealth waters are important components of the Indigenous people's culture and diet. Indigenous people continue to actively manage their sea country in coastal waters of WA in order to protect and manage the marine environment, its resources and cultural values.

Woodside consulted with the Department of Foreign Affairs and Trade (DFAT), on the recommendation of AFMA to seek advice on the Traditional Indonesian fishing Memorandum of Understanding Box near Scott Reef. DFAT advised that their Indonesian team had no feedback on the proposed activities and confirmed that other branches of DFAT had received the information (refer to section 4.3.1 of Appendix F).Refer to Section 4.9.2 for coastally adjacent Indigenous groups which may undertake traditional fishing within the EMBA.

Indonesian fishers have traditionally visited reefs in the North-west Marine Region to collect target species such as trepan (sea cucumber), shark fin and other marine species that are economically significant. Indonesian fishers can fish within designated areas under the Australia-Indonesia Memorandum of Understanding (MoU) regarding the Operations of Indonesian Traditional Fishermen in Areas of the Australian Fishing Zone and Continental Shelf – 1974 (MoU 74)). Traditional fishing is allowed within the MoU box, which is overlapped by the Operational Area by 0.8% and the EMBA by 34%.

Traditional fishing was allowed within the 12 mile fishing zones that existed around a number of reefs or islets including Scott Reef, which is currently the principal reef to which Indonesian fishers regularly sail on a seasonal basis to harvest trepang and other reef species.

Traditional fishing methods in the NWMR are further described in the Master Existing Environment document in Appendix C.

4.10.3 Tourism and recreation

Recreation and tourism activities in the Kimberley region occur predominantly in WA State waters (extending offshore 3 nm from the mainland), adjacent to coastal population centres (e.g. Broome), with a peak in activity during the winter months (dry season). These activities include recreational fishing, diving, snorkelling, wildlife watching and boating (Newman et al. 2023).

Primary dive locations in the Kimberley region include the Rowley Shoals, including Mermaid Reef AMP, Scott Reef (5.6 km east of Operational Area Part A), Seringapatam Reef (19 km NNE of Operational Area Part A), Ashmore Reef AMP (195 km NE of Operational Area Part A) and Cartier Island (210 km NE of Operational Area Part A) (Newman et al. 2023).

FishCube data containing tour operator activity was acquired from DPIRD for the period 2018–2023 (inclusive) for five 10 nm CAES blocks that overlap the Operational Area (DPIRD 2023). The data show that fewer than three tour operators have been active within the 10 nm CAES blocks in 2021–2022, suggesting some recent activity in the area.

Tourism and recreation in the context of the wider North-west Marine Region is described in the Master Existing Environment document in Appendix C.

4.10.4 Commercial shipping

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR to reduce the risk of vessel collisions with offshore infrastructure. It is noted that none of these fairways intersect with the Operational Area; the nearest fairway is ~185 km from Operational Area Part B (Figure 4-19). Vessel tracking data suggest shipping is concentrated south west of Operational Area Part B, which is likely associated with Port Hedland port.

4.10.5 Oil and gas facilities, infrastructure and other industries

The Master Existing Environment document in Appendix C describes current oil and gas development within the EMBA, also shown in Figure 4-20.

Table 4-25: Other oil and gas facilities within closest proximity of the Operational Area

Facility or asset	Operator	Distance / direction from Operational Area (km)
Icthys Project offshore facility (Inpex)	WA-50-L	130 km E
Prelude FLNG facility (Shell)	WA-44-L and WA-2-IL	145 km E

4.10.6 Submarine communication infrastructure

The Petroleum Activity is in a region with submarine communications infrastructure. The Vocus submarine fibre optic cable runs between Port Hedland and Darwin and lies within the Operational Area. The submarine communications infrastructure located within proximity to the Operational Area is presented in Figure 4-21

4.10.7 Defence

No defence areas overlap the Operational Area. One defence area overlaps the EMBA and is presented in Figure 4-22.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5. STAKEHOLDER CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 25 of the Environment Regulations. (In this Section, references to 'regulations' are to the Environment Regulations, unless otherwise stated).

The consultation process is designed to identify relevant persons and provide them with sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities. This enables Woodside to assess the merits of objections or claims about the adverse impact of each activity to which the EP relates that are received from relevant persons and for Woodside to adopt appropriate measures (if any) in response to those objections or claims so that the activity is carried out in a manner by which the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable (ALARP) and will be of an acceptable level.

Consultation is informed by both the Environment Regulations and the findings of relevant Courts, including the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa [2022*] FCAFC 193 (Tipakalippa Appeal*)* (see Section 5.2 and 5.5.1) and *Munkara v Santos NA Barossa Pty Ltd (No 3) [2024]* FCA 9 *(Munkara Case*).

For this EP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from activities in the Operational Area (see Section 4).

Woodside's consultation methodology is divided into two parts:

- the first section (Section 5.2 to 5.5) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 25(1) to identify relevant persons
- the second section (Section 5.6 to 5.7) details Woodside's approach to accepting feedback and assessment of the merits of each objection or claim about the adverse impact of each activity to which the EP relates, and engaging in ongoing consultation for this EP.

Woodside's consultation record is in Appendix F and includes a summary of the following:

- assessment and identification of relevant persons
- consultation information provided to relevant persons, feedback received, Woodside's assessment of the merits of objections or claims and Woodside's response to relevant persons and other people or organisations Woodside chose to consult
- engagement with persons or organisations that Woodside chose to contact who are 'not relevant' persons for the purposes of regulation 25(1) (see Section 5.3.4)
- opportunities provided to persons or organisations to participate in consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (elec
consent of Woodside. All rights are reserved.

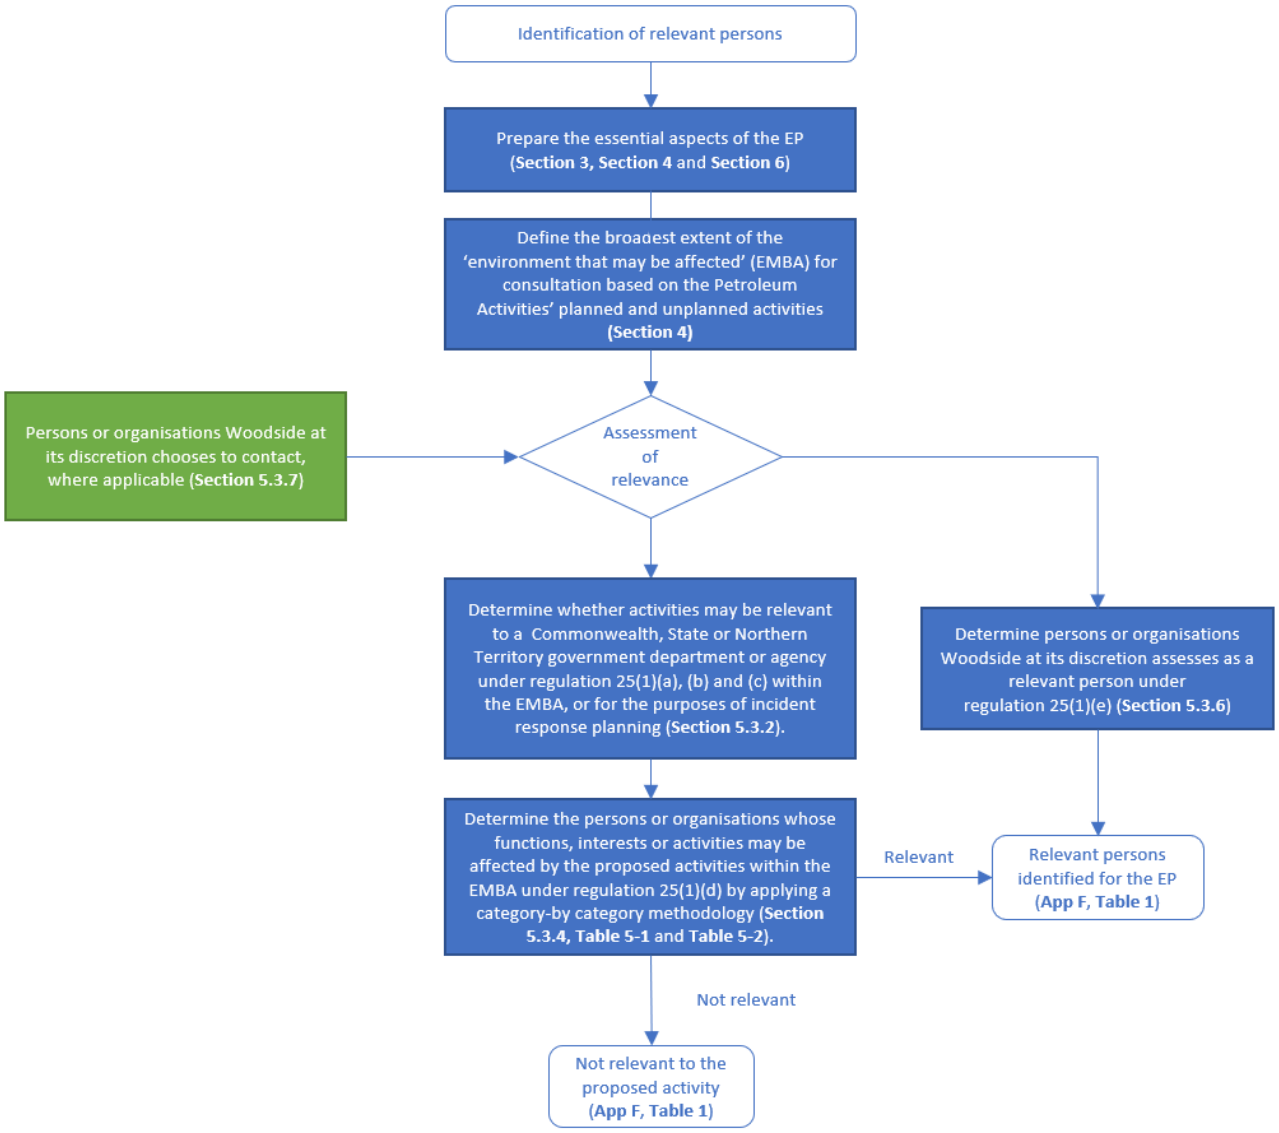

Figure 5-1: Overview of Woodside's methodology to identify relevant persons

5.2 Consultation – general context

Woodside has a portfolio of quality oil and gas assets and more than 40 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations, to better understand the potential risks and impacts associated with our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations, enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult but, rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a Petroleum Activity. The information in the consultation list has been captured from years of experience; it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's GL2086 – *Consultation in the course of preparing an environment plan guideline* (May 2023) as well as judicial guidance in the *Tipakalippa Appeal* on the intent of consultation, as follows:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (elec
consent of Woodside. All rights are reserved.

- At paragraph 54 of the appeal decision: … *provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.*
- At paragraph 89 of the appeal decision: …*its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.*

The *Tipakalippa Appeal* and *Munkara Case* have also been further considered in the context of specific methods for consultation with Indigenous relevant persons (Section 5.5.1).

To undertake consultation, Woodside has developed a methodology for identifying relevant persons in accordance with regulation 25(1) (Section 5.5.3). This methodology is consistent with NOPSEMA's Guideline and demonstrates that, to meet the requirements of regulation 34 (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.4)
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1and assessed in Section 6.9).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 25, which requires a Titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an EP:
  - each Commonwealth, State or Northern Territory agency or authority to which the activities to be carried out under the EP may be relevant
  - if the plan relates to activities in the offshore area of a State – the Department of the responsible State Minister
  - if the plan relates to activities in the Principal Northern Territory offshore area – the Department of the responsible Northern Territory Minister
  - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP
  - any other person or organisation that the Titleholder considers relevant (regulation 25(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 25(2))
- allow a relevant person a reasonable period for the consultation (regulation 25(3))
- tell each relevant person that the Titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 25(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the EPBC Act
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level (regulation 4)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (elec
consent of Woodside. All rights are reserved.

- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts from the petroleum activity
- is collaborative. Woodside respects that, for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside engages with the relevant person with the aim of seeking genuine and meaningful two-way dialogue
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.10).

An overview of Woodside's consultation approach is outlined at Figure 5-2.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (elec
consent of Woodside. All rights are reserved.

5.3 Identification of relevant persons for consultation

5.3.1 Regulations 25(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons under regulations 25(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. The government departments and agencies relevant to the EP are listed in Appendix F, Table 1. In accordance with regulation 25(1)(b), Woodside consults with the Department of the relevant State Minister.

5.3.2 Identification of relevant persons under Regulations 25(1)(a), (b) and (c)

Woodside's methodology for identifying relevant persons under regulations 25(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities to be carried out in the EMBA under the EP may be relevant. This list of relevant departments and agencies is formulated by reference to the responsibilities of the government departments, as set out on their websites, in NOPSEMA's *GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline* (January 2024), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating. This list is revised from time to time, for example, for the purposes of accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.
- Woodside has categorised government department or agency groups as follows:

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies, determining whether those responsibilities overlap with potential risks and impacts specific to the Petroleum Activity in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry; and AHO is responsible for maritime safety and Notices to Mariners. To undertake proposed activities in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release incident response specific to the Operational Area. Feedback received, if any, is assessed in accordance with the intended outcome of consultation.
- The list of government departments and agencies assessed as relevant is set out in Appendix F,Table 1.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation and summarised at Appendix F, Table 2 and Table 3 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the Petroleum Area in the EMBA or would not be involved in incident response planning.

5.3.3 Regulation 25(1)(d)

To identify a relevant person for the purposes of regulation 25(1)(d), the meaning of "*functions, interests or activities*" needs to be understood. In regulation 25(1)(d), the phrase "*functions, interests or activities*" should

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

be construed broadly and consistently with the objects of the Environment Regulations (regulation 4) and the objects of the *EPBC Act* (Section 3A).

In developing its methodology for consultation, Woodside acknowledges the guidance below from NOPSEMA's *GL2086 – Consultation in the course of preparing an environment plan guideline* (May 2023):

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of 'interest' in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of 'activity' in regulation 5 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

Woodside's methodology for determining 'relevant persons' for the purpose of regulation 25(1)(d) includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.

On the topic of consulting outside of Australia's jurisdiction, when assessing potential impacts from planned and unplanned activities for this EP, it was determined there was an extremely low probability of an unplanned hydrocarbon release entering international waters specifically Indonesian waters. Consideration has been given to the functions, interests or activities that may be affected by the activities to be carried out, should a worst-case scenario eventuate, noting that modelling completed to predict the extent of potential impact is based on there being no mitigative controls in place. The more realistic scenario is that appropriate mitigation controls set out in Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans would be in place or will be implemented.

The obligation to consult must be construed in a practical and pragmatic way that makes this process reasonable and workable,4 and capable of being discharged within a reasonable time.5 The obligation to identify relevant persons for the purpose of consultation must be capable of practicable and reasonable discharge. The Regulations require relevant persons, and their interests, to be readily ascertainable to the Titleholder6 .In the case of Indonesia, which comprises extensive coastlines and potentially remote communities, Woodside considers potential relevant persons within these communities are not readily ascertainable, for reasons including that there are limited electronic records and public records which allow for the identification of potential functions, interests or activities e.g. fisheries, tourism licences and permits.

For example, there are no known licencing requirements either in Australia or in Indonesia for traditional Indonesian fishers, therefore, no publicly available information to identify and make contact with persons for consultation purposes. The logistics of access to these fishers, the nature of their activities and distance and remoteness from the Operational Area of this activity of over 1300 kilometres makes international consultation impractical to discharge from a reasonable time and efforts perspective.

Given the extremely low probability of potential impacts, the difficulty of identifying international individuals, and the impracticality of engaging where feedback on unplanned impacts is highly unlikely to inform proposed activities, consultation with international individuals is not required for the activities described in this EP.

Having regard to nature and scale and given the extremely low probability of potential impacts (which are the highly unlikely occurrence of spill traversing international waters), the current processes in place with Department of Foreign Affairs and Trade (DFAT) and the processes and consultation triggers set out in the Woodside's Oil Spill Preparedness and Response Mitigation Assessment and Oil Pollution First Strike Plans

provide a mechanism for consultation in international waters that will be complied with at the appropriate time, if an incident occurs. In such circumstances, consultation with the DFAT discharges the requirement for consultation with international persons.

Woodside will continue to consult the DFAT for proposed activities outside of Australia's jurisdiction including in the event of a hydrocarbon spill that is likely to traverse international waters as described in the Oil Pollution Emergency Plan – Appendix D of this EP. The process for working with DFAT to manage activities and consultation in the highly unlikely event of a hydrocarbon spill that may traverse international waters is described in the Oil Pollution Emergency Plan – Appendix D of this EP.

5.3.4 Identification of relevant persons under Regulation 25(1)(d)

Relevant persons under regulation 25(1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under the EP (described in Section 3)
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within regulation 25(1)(d), Woodside adopts the following methodology, and then undertakes consultation with relevant persons.

As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:

- whether a person or organisation has functions, interests or activities that overlap with the Operational Area and EMBA
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities to be carried out under the EP.

This assessment will include applying judgement, knowledge and considering available, relevant literature.

To assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities to be carried out under the EP. The broad categories are identified in Table Table 5-1 below and identification methodology applied as set out in Section 5.3.

The list of those persons or organisations assessed as relevant persons or organisations Woodside separately chose to contact is set out in Appendix F, Table 1.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation and applying the categories of relevant persons methodology outlined in Table 5-2, as appropriate.

Feedback from relevant persons is summarised at Appendix F, Table 2. Feedback from persons assessed as 'not relevant' but whom Woodside chose to contact, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 3.

Table 5-1 Categories of relevant persons

Category	Explanation
Commercial fisheries (Commonwealth and State) and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the *Commonwealth Fisheries Management Act 1991* (Cth) and the *Western Australian Fish Resources Management Act 1994* (WA), which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Titleholders and Operators	Registered holder of an offshore petroleum title or greenhouse gas (GHG) title under the OPGGS Act and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are Indigenous Australians with cultural rights and interests or cultural functions or who perform cultural activities over particular lands and waters. Where an Indigenous person, group or entity self-identifies and asserts cultural rights, functions, interests or activities they will be considered under the definition of Traditional Custodian for the purpose of this EP (as appropriate).
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the Native Title Act 1993 (Cth) by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the Native Title Act 1993 with prescribed functions, set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Local government and recognised local community reference/liaison groups or organisations	Local government body formed under the Local Government Act 1995 (WA). Recognised local community reference or liaison group or organisation in relation to oil and gas matters.
Other non-government groups, organisations or individuals	Non-government organisation with public website material targeting the proposed activity. Individual who demonstrates the proposed activity could potentially impact their interests, functions or activities.
Research institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-2 Methodology for identifying relevant persons within the EMBA undertaken under Regulation 25(1)(d) – by category

Category	Relevant person identification methodology
Commercial fisheries (Commonwealth and State) and peak representative bodies	Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology: • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Confirming whether the EMBA overlaps with the fisheries management area (i.e., the spatial area the fishery is legally permitted to fish in) (see Section 4.10.1) • Woodside acknowledges WAFIC's consultation guidance[7], that Titleholders develop separate consultation strategies for significant unplanned events (for example an oil spill) where Titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC's guidance is that consultation on unplanned events resulting

[7] Consultation Approach for Unplanned Events - WAFIC

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	in an emergency scenario should only be undertaken if an incident occurs. • For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA, ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.10.1) Assessment of relevance: • State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.1)are assessed as relevant to the proposed activity. However, to avoid over consulting and as requested in WAFIC's guidance, Woodside only consults individual licence holders based on WAFIC's advice. Woodside also utilises WAFIC's consultation service whereby WAFIC: – directly consults fishery licence holders that are assessed as having a potential for interaction in the Operational Area – consults fisheries that are assessed as having a potential for interaction in the EMBA only in the event of an unplanned emergency scenario. • Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.10.1) are assessed as relevant to the proposed activity. Where a relevant fishery is identified, or where Woodside chooses to contact fisheries at its discretion, Woodside consults directly with individual licence holders in that fishery. • A Commonwealth fishery's representative body is assessed as relevant where the EMBA overlaps the fishery's management area, even where the fishery itself has been assessed as not relevant based on potential for interaction. This recognises the representative body's role in representing fishing entitlements and broader fisheries considerations within the management area. Recognised Commonwealth fishery representative bodies are identified by AFMA through information on its website. For State fisheries, representative bodies are assessed as relevant where the fishery they represent is assessed as relevant based on potential for interaction. WAFIC is the only recognised State fishery representative body.
Recreational marine users and peak representative bodies	Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology: • Using Woodside knowledge and operating experience, applying knowledge of recreational marine users in the area. This assessment is both activity and location based. • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years. Assessment of relevance: • Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. • If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers. These representative bodies are identified via Woodside's existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Titleholders and Operators	Woodside assesses relevance for other Titleholders and Operators using the following steps in its methodology: • Using GPInfo to determine overlap with other Titleholders' or Operators' permit areas within the EMBA. • Using Woodside knowledge and operating experience, applying knowledge of other operators in the area. • Woodside produces a map showing the outcome of this assessment. Assessment of relevance: • Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.
Peak industry representative bodies	Woodside assesses relevance for peak industry representative bodies using the following steps in its methodology: • Review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside's proposed activities within the EMBA. • Review of Woodside's existing consultation list. • Website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside's proposed activities within the EMBA. Assessment of relevance: • Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside's proposed activities within the EMBA are assessed as relevant.
Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations	To identify Traditional Custodian groups or individuals, Woodside: • Uses existing systems of recognition to identify Indigenous groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under Native Title or cultural heritage legislation, or marine park management plans, or identification by other Indigenous groups or entities) • Notifies and invites consultation with Indigenous people through their nominated representative corporation (for example Prescribed Bodies Corporate (PBCs)); or, in the case of Native Title and where appropriate, the Native Title Representative Body • Requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders); • Requests advice as to other Indigenous groups or individuals that should be consulted • Advertises widely so as to invite self-identification and consultation by Indigenous groups and individuals. Further detail to Woodside's methodology is as follows. Woodside uses the databases of the National Native Title Tribunal: • To understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA • To understand whether there are any relevant Indigenous Land Use Agreements (ILUAs), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. Where there is a positive determination of Native Title, contacting the PBC or, where their representative is a Native Title Representative Body, contacting the Native Title Representative Body.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	Where appropriate, contacting the relevant Native Title Representative Body to request a list of any Indigenous groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA. Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. In Victoria, using the Victorian Aboriginal Heritage Council data to determine whether there are any Registered Aboriginal Parties (RAP) appointed under the Aboriginal Heritage Act 2006 (Vic), that overlap or are adjacent to the EMBA. Indigenous groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body. Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means. Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self-identify. Individuals that consider their functions, interests or activities may be affected by a proposed activity are provided an opportunity to self-identify for each EP. Woodside does not presume that self-identification for an activity, covered by another EP, automatically means that an individual/s functions, interests and activities may be affected by other activities where EMBAs overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess risks and impacts to their values, and enable individuals to self-identify. Assessment of relevance: • Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.
Native Title Representative Bodies	Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology: • A Representative Aboriginal/Torres Strait Islander Body (RATSIB) is a regional organisation appointed under the Native Title Act 1993 with prescribed functions set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. • Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA. Assessment of relevance: • Where the area for which a Native Title Representative Body is recognised under the Native Title Act 1993, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Local government and recognised local community reference/liaison groups or organisations	Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following steps in its methodology: • Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries 'My Council' database and WA Local Government Association (WALGA) Local Government Directory maps to assess overlap between the local government's defined area of responsibility and the EMBA. • Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. • Woodside reviews the community reference/liaison group's terms of reference to determine its area of responsibility and overlap with the EMBA. For example, the Exmouth Community Liaison Group's area of responsibility in relation to Woodside's operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group's area of responsibility is the Pilbara region (i.e., onshore). Assessment of relevance: • The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant. • The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups, organisations or individuals	Woodside assesses relevance for other non-government groups, organisations or individuals using the following steps in its methodology: • Review of Woodside's existing consultation list. • Website search of registered non-government groups or organisations (i.e., registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website and/or social media material specific to the proposed activity at the time of development of the EP. • Organisation has a publicly available statement (or purpose) that clearly describes their collective functions, interests or activities. • Review of current website and/or social media material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities associated with the EMBA. • Review of an organisation's/individual's feedback to consider whether their functions, interests or activities within the EMBA may be affected by the activities to be carried out under the EP. Considering interests outside the EMBA would be considered too remote and contrary to the purpose of EP consultation. Assessment of relevance: • Registered non-government groups or organisations with current targeted public material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation will be assessed as relevant. • Individual demonstrates their functions, interests or activities may be impacted will be assessed as relevant.
Research institutes and local conservation groups or organisations	Woodside assesses relevance for research institutes and local conservation groups or organisations using the following steps in its methodology: • Review of Woodside's existing consultation list. • Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based. • Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA. Assessment of relevance: • Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	• Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within the EMBA are assessed as relevant. This assessment is both activity and location based.

5.3.5 Regulation 25(1)(e)

In addition to assessing relevance under regulation 25(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 25(1)(e).

5.3.6 Identification of relevant persons under Regulation 25(1)(e)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 25(1)(e).

5.3.7 Persons or organisations Woodside chooses to contact

In addition to undertaking consultation with relevant persons under regulation 25(1), from time to time there are persons or organisations that Woodside chooses to contact in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 25(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with
- that are 'not relevant' pursuant to regulation 25(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is used to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisation's relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.3). The result of Woodside's assessment of relevance during the development of the EP is outlined at Appendix F, Table 1.

5.3.8 Assessment of relevant persons for the proposed activity

The result of Woodside's assessment of relevant persons in accordance with regulation 25(1) is outlined at Appendix F, Table 1 and Appendix F, Table 2.

Persons or organisations that Woodside assessed as 'not relevant' but chose to contact at its discretion in accordance with Section 5.3.4, or self-identified and Woodside assessed as 'not relevant', are summarised at Appendix F, Table 1 and Appendix F, Table 3.

5.4 Consultation material and timing

Regulation 25(2) provides that a Titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 25(3) provides that the Titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons of the proposed activities, respecting that consultation is voluntary, and collaborates on a consultation approach where further engagement is sought by the relevant person. The consultation process aims to be appropriate for the category of relevant persons and not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Operational Area. Woodside acknowledges published guidance for good practice consultation, relevant to different sectors and disciplines. Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.4.1 Sufficient information

Woodside produces a Consultation Information Sheet for each EP. This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes:

- a description of the proposed petroleum activity
- the Operational Area
- where the activity will take place
- the timing and duration of the activity
- a location map of the Operational Area and EMBA
- a description of the EMBA
- relevant exclusion zones
- a summary of relevant risks and mitigation and management control measures relevant to the proposed petroleum activity OR proposed greenhouse gas activity.

It also sets out contact details to provide feedback to Woodside.

The level of information necessary for a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Sufficient information may have been provided to a relevant person even where all documents requested by a relevant person have not been provided. Woodside acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises persons being consulted that they may inform Titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in selected local, state and national newspapers. This typically includes:

- the name of the EP Woodside is seeking feedback on
- an overview of the activity
- the consultation feedback date
- the ways in which a person or organisation can provide feedback.

Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the Native Title Act 1993 for Native Title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.3 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website and shared directly with relevant persons
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs
- emails
- letters
- phone calls
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Let's Talk newsletter – digital and hard copy
- maps outlining a person or organisation's defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area
- community meetings, as appropriate
- attendance at on-the-ground community events or planned regional roadshows
- broader awareness campaigns on the how to be involved in the EP consultation process

Woodside recognises that information may be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that, as part of genuine two-way dialogue, these forms of communication may evolve including, for example due to changes to organisation representation, as relationships are further established, or a preference for an alternative form of communication is expressed by a person or organisation. There might be limitations in how Woodside can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

Category of relevant person	Typically accepted form of communication
Government departments / agencies – marine Government departments / agencies – environment Government departments / agencies – industry	Woodside applies NOPSEMA's guideline for engagement with Commonwealth government departments or agencies (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024) by using email for its consultation unless another form of communication is requested. Other forms of communication, such as phone calls, meetings and/or presentation briefings are used on request.
Commercial fisheries and peak representative bodies Recreational marine users and peak representative bodies	**Commonwealth commercial fisheries**: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **State commercial fisheries and recreational marine users**: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the Fish Resources Management Act 1994 and Aquatic Resources Management Act 2016, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder's discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request. **Peak representative bodies**: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Titleholders and Operators	Email is used as the primary form of communication between Titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Traditional Custodians and nominated representative corporations	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Native Title Representative Bodies	There are many forms of communication that Woodside uses on a case-by-case basis and as appropriate to or requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used on request.
Historical heritage groups or organisations	NOPSEMA's guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024) for engagement with government departments or agencies is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Local government and recognised local community reference/liaison groups or organisations	**Local government:** NOPSEMA's guideline guideline (GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2024 for engagement with local government is used as a reference for Woodside's approach for communicating with historical heritage groups or organisations. **Community reference/liaison groups and chambers of commerce**: Email and presentations are used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Other non-government groups or organisations	Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.
Research Institutes and Local conservation groups or organisations	Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used on request.

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 2.

Appendix F, Table 3 sets out the information which is provided to persons or organisations that are 'not relevant' for the purposes of regulation 25 but which Woodside has chosen to contact.

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 25(4), the relevant person may request that the Titleholder notifies NOPSEMA that particular information the person or organisation provides in the consultation not be published, and that information subject to that request will not be published under the Environment Regulations.

5.4.2 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that genuine two-way engagement may be demonstrated via information on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the EP.

Woodside's methodology allows relevant persons a reasonable period for consultation (regulation 25(3)). A reasonable period for all relevant persons, including Traditional Custodians, to participate in consultation for this EP has been provided.

The consultation period under this EP has satisfied benchmark periods under other relevant legislative processes:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Regulation 30 sets out a public consultation period of 30 days.
- The Department of Mines, Petroleum and Exploration (DMPE) *Guidelines for Consultation with Indigenous People by Mineral Explorers* directs a period of 21-30 days of consultation with traditional owners.

This period of consultation demonstrates that Woodside has provided a "*reasonable period*" for relevant persons to consult in accordance with regulation 25(3). Commentary in the *Tipakalippa Appeal* judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

"*it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time*..."[8]

Woodside seeks feedback in order to support preparation of its EP. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach to providing a reasonable period for consultation is as follows:

- advertising in selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected
- providing consultation materials directly to identified relevant persons as well as persons who are 'not relevant' but Woodside chose to contact and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 2 and Table 3 sets out a history of ongoing consultation and demonstrates that a reasonable period of consultation has been provided.

Woodside considers that consultation for this EP has closed.

As detailed in Section 5.6, if comments and feedback are received after the EP has been submitted, Woodside will consider those comments and update controls as appropriate and at all stages of the life of the EP as per Woodside's ongoing consultation approach described in Section 5.7.

5.4.3 Discharge of Regulation 25

The Full Federal Court made clear in the *Tipakalippa Appeal* that consultation should be approached in a "*reasonable", "pragmatic" and "not so literal"* way, so that consultation obligations were capable of being met by Titleholders (Section 5.5.1).[9] Consultation is a "*real world activity*" and must be capable of reasonable discharge.[10] The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.[11]

When the Titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, then regulation 25 consultation requirements are met.[12] Meeting these obligations requires evaluative judgement to determine reasonable satisfaction of the consultation obligation and, as such, the Regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.[13]

While a Titleholder is required to provide an opportunity to consult, the Titleholder is not required to obtain consent to engage in the activity from a person being consulted, or confirmation from a person being consulted, that consultation is complete. The Federal Court has commented that a "*reasonable opportunity*" for consultation must be afforded to relevant persons.[14] A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed steps required to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible consequences of the activity on their functions, interests or activities; and sufficient time to provide relevant feedback for Woodside to assess relevant persons' objections or claims. Woodside has also provided a reasonable opportunity for there to be genuine two-way dialogue on a person's claims or objections.

Woodside has discharged its duty under regulation 25 and considers that it is complete.

Appendix F sets out the history of consultation under regulation 25. To the extent a relevant person says that they have further information to share or claims that consultation under regulation 25 has not been completed, Appendix F provide reasons why Woodside considers consultation under regulation 25 has been met, in relation to that relevant person.

5.5 Context of consultation approach with Traditional Custodians

To comply with regulation 25, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an EP.

5.5.1 Approach to methodology − Woodside's interpretation of Tipakalippa Appeal

Woodside has implemented a consultation methodology consistent with regulation 25 and guidance provided in the *Tipakalippa Appeal* (Section 5.2). Woodside's consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests or activities may be affected by the activity described in this EP (Section 5.5).

Woodside notes the Full Federal Court discussed several *Native Title Act 1993 (Cth*) cases in response to a submission made in that case that a requirement under regulation 25 to consult *"each and every*" relevant person would be "*unworkable*". The reference to Native Title cases dealt with how decision-making processes under the NTA requiring "*all*" members of a group to be contacted for communal approval are interpreted by courts in a "*reasonable*", "*pragmatic*" and "*not so literal*" way,[15] and how obligations to consult "*each and every*" person under regulation 25 should be interpreted in a similarly pragmatic way, so that consultation is workable. The reference to NTA authorities was made by analogy:

"It can be seen that the terms of [the native title legislation] are somewhat absolute – "all". However, [the native title legislation] has consistently been construed in a way that is not so literal … The cases concerning [the native title legislation] … have reiterated … that [the native title legislation] does not require that "all" of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting." [16]

"We consider the authorities in relation to processes under the NTA to be illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner"[17] (emphasis added).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

"…there is no definition of what constitutes "consultation for the purpose of Reg11A [now regulation 25] ... A titleholder will need to "demonstrate" to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons" [18] (emphasis added).

The Judgment in the Tipakalippa Appeal makes it clear that a Titleholder will have some decisional choice in identifying which person(s) are to be approached, how the information will be given to allow the "*relevant person*" to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken.19 Consultation is not fixed to a rigid process and will be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 25 requirements through its consultation methodology (Section 5.25.5.2).

Consistent with the *Tipakalippa Appeal*, Woodside considers NTA-style "*full group*" meetings are not required for there to be compliance with regulation 25. Nominated representative corporations (such as PBCs established under the NTA) have a designated role of representing the views of their member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. It is not appropriate for Titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside's approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation method

Woodside's Indigenous Affairs team has experience in engaging and working with Traditional Custodian organisations and individuals, including within the Commonwealth Native Title and cultural heritage systems, and state and territory cultural heritage and land rights systems. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with Traditional Custodian groups' established channels of communication and methods of consultation. Woodside's Indigenous Affairs team exercises its professional judgement and is respectful of long-standing relationships (where in place) when considering consultation with Traditional Custodian groups. The Indigenous Affairs team's approach is also informed by the established systems of recognition for Traditional Custodian groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with Traditional Custodian groups in the Northern Territory ('not relevant' for this EP) tends to centre around engagement through Aboriginal land councils (under the *Aboriginal Land Rights (Northern Territory) Act 1976* (*Cth*)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them.

By contrast, recognition for Traditional Custodian groups and their nominated representative corporations in Western Australia falls under the *Native Title Act 1993 (Cth*) because the vast majority of the Western Australian coastline is settled under the Native Title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to, Native Title Representative Bodies and PBCs.

Native Title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA and help Woodside to identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Judgment in the *Tipakalippa Appeal* endorses methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups.[20] Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective Traditional Custodian communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our

activities, to self-identify (Section 5.5.4), and to provide feedback to inform the management of environmental impacts and risks.

Using these processes, Woodside communicates information about EPs by:

- advertising in relevant Indigenous and non-Indigenous newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian.
- creating carefully considered Summary Consultation Information Sheets with content developed by Woodside's Indigenous Affairs Team to remove jargon and present information in a simplified format.
- directing contact through nominated representative corporations.
- using social media (i.e. Facebook/Instagram), texts, phone calls and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and, on that basis, used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. Indigenous Australian woman, Professor Bronwyn Castle, through 10 years of research found *"Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among Indigenous people] than the national average across all geographical locations*" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018)).
- For ongoing consultation post Regulation 25 consultation, Woodside supports ongoing engagement with Traditional Custodians. Woodside is committed to ongoing engagement and support to care for and manage country, including Sea Country.
- basing members of its Indigenous Affairs team in Karratha and Roebourne who serve as on-Country points of contact for Traditional Custodian organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including distributing information and providing notice to the community to support Traditional Custodian attendance and involvement at Woodside's information sessions and Community roadshows.
- ensuring that from the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and who to appropriately consult with (such as elders).
- holding meetings on Country at a place and time agreed with Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate).
- providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

The Indigenous Affairs team approach to consultation is also consistent with the Federal Court's decision in the *Munkara Case*. The *Munkara Case* notes that the word "*culture*" (and hence the word "*cultural*") has a communal aspect to it. To establish cultural features, it is necessary that the beliefs and values are held by the relevant people *as a people*. For values, features or beliefs that are expressed by an individual to be "*cultural*" they cannot simply be an individual's belief - the belief must have a communal aspect too, and demonstrate that the "*individual beliefs are broadly representative of the beliefs of other members of the group*"[21]. The phrase "*cultural features*", when applied to "*people*" as constituent parts of an ecosystem, is not directed to idiosyncratic views or beliefs of an individual[22]. When the Indigenous Affairs team is told that a particular value is cultural by an individual Traditional Owner, that information is taken back to the relevant cultural authority to test its broad acceptance. In the case of gender sensitive information, that information would be restricted to the specific gender within the community.

5.5.3 Identification of relevant persons

To undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 25(1) (Section 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's Indigenous Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation, where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.7). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporation. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate, including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.7 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the *Native Title Act 1993 (Cth*), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with Indigenous peoples, rather than requiring members to be notified via a formal authorisation process which seeks, from members, authorisation of agreements and Native Title/compensation claims under the *Native Title Act 1993* (*Cth*)[23].

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation. Woodside requests nominated representative corporations to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.4 Opportunity to self-identify and identifying other individuals

Woodside requests nominated representative corporations and Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section 5.5.3). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an EP is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Custodians authorised representative entities.
- Recognising the function of nominated representative corporations (such as PBCs) and Native Title Representative Bodies to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside

[23] *Santos NA Barossa Pty Ltd v Tipakalippa [2022] FCAFC 193, at [104]*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

recognises the process is voluntary and Woodside cannot compel them to do so, nor seek to audit the representative entities for compliance with any request.

- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. To date, most nominated representative corporations have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and Elders outside of this process due to requirements imposed in EP consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.5 Sufficient information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and may depend on the degree to which a relevant person is potentially affected.

Woodside produces Consultation Information Sheets for each EP which is provided to relevant persons and organisations for the purpose of seeking feedback on the activity (Section 5.4.1). In response to feedback from Traditional Custodians on information provisions, Woodside has tailored effective consultation methods for its activities. These methods are specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Summary Information Sheet is developed and reviewed by Woodside's Indigenous Affairs Team to ensure that content is appropriate to the intended recipients, which is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face-to-face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians location of choice (where practicable) and with their nominated attendees. Along with members of Woodside's Indigenous Affairs engagement team, key project personnel and environmental experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

During consultation, Woodside provides relevant persons with additional information as appropriate in response to requests. There is no requirement to provide relevant persons with all information or documents requested and a Titleholder will have provided sufficient information even where it has not provided all information or documents requested.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and requesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so, nor would it be appropriate to seek to audit the representative entities for compliance with any request.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.5.6 Reasonable period for consultation

Woodside seeks to consult in order to support preparation of its EP. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.4.2).

5.5.7 Discharge of Regulation 25

Woodside's consideration and approach to discharging regulation 25 for relevant persons is discussed in Section 5.4.3. In addition to this, Woodside has considered the application of regulation 25 specific to Traditional Custodians based on the Tipakalippa Appeal.

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 25 of the Environment Regulations. Woodside considers that consultation under regulation 25 is complete (Section 5.4.3).

5.6 Providing feedback and assessment of merit of objections or claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An EP feedback form is also available on Woodside's website enabling relevant persons to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information* for the community, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the EP and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities. Under regulation 34(g), there is no requirement for a relevant person to agree or confirm that they have been adequately consulted.

During consultation, relevant persons may seek to introduce other issues (such as agreements) that are not specific to EP consultation. While concepts of agreements may be associated with broader consultation processes, consultation for specific EPs can occur in parallel.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.4 and 5.3.7). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 26(8), sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 25, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.7 Ongoing consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside's ongoing consultation approach (refer to Section 7.10), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation.

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that Woodside considers requires implementation or updates to meet the intended outcome of consultation, Woodside will apply its Management of Change and Revision process as appropriate (see Section **7.8**).

6. ENVIRONMENTAL IMPACT AND RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENTS CRITERIA

6.1 Overview

This section presents the impact and risk analysis and evaluation, EPOs, EPSs and MC for the Petroleum Activity, using the methodology described in Section 2 of this EP. Impacts and risks associated with the Petroleum Activity are summarised in Table 6-1 and evaluated throughout this chapter.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-1: Environmental impact analysis summary of planned and unplanned activities

Aspect	EP section	Risk rating				Acceptability of impact/risk
		Impact/ consequence	Potential impact/consequence level	Likelihood	Current risk rating	
Planned activities (routine and non-routine)						
Physical presence: interaction with third-party vessels	6.8.1	F	Social and Cultural – Temporary localised impact not significant to areas/items of cultural significance.	-	-	Broadly acceptable
Physical presence: disturbance to seabed habitat from geotechnical and geophysical surveys	6.8.2	F	Environment – No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly acceptable
Routine acoustic emissions: generation of noise from survey vessels and from geophysical and geotechnical survey equipment	6.8.3	E	Environment – Localised and low-level impact on environmental feature(s) or area(s) of low significance	-	-	Broadly acceptable
Routine light emissions: external lighting on survey vessel	6.8.4	F	Environment – No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly acceptable
Routine atmospheric and greenhouse gas emissions: fuel combustion	6.8.5	F	Environment – No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly acceptable
Routine and non-routine discharges to the marine environment from survey vessels	6.8.6	F	Environment – No lasting effect, localised impact not significant to environmental receptors	-	-	Broadly acceptable
Unplanned activities (accidents, incidents, emergency situations)						
Unplanned hydrocarbon release: vessel collision	6.9.2	B	Environment – Major impact on environmental feature/s or area/s, such as impact on feature/area of national importance with limited ability to recover.	1	M	Acceptable if ALARP
Physical presence: interaction with marine fauna	6.9.3	E	Environment – Slight and low-level impact on environmental feature/s or area/s of low significance.	2	M	Acceptable if ALARP
Physical presence: disturbance to seabed from dropped objects and equipment loss	6.9.4	F	Environment – No lasting effect (less than one month); localised impact not significant to environmental receptors (e.g. benthic habitats).	3	M	Acceptable if ALARP

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Aspect	EP section	Risk rating				Acceptability of impact/risk
		Impact/ consequence	Potential impact/consequence level	Likelihood	Current risk rating	
Unplanned discharges: loss of solid hazardous and non-hazardous wastes	6.9.5	F	Environment – Slight, short-term local impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	3	M	Acceptable if ALARP
Unplanned discharges: deck and subsea spills from geotechnical and geophysical equipment	6.9.6	F	Environment – Slight, short-term local impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	3	M	Acceptable if ALARP
Physical presence: introduction of invasive marine species	6.9.7	B	Reputation - National concern and / or global interest. Serious, medium to long-term impact to reputation and brand, investment attractiveness, or social licence to operate. Venture and / or asset operations restricted	0	M	Acceptable if ALARP

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.2 Impact and risk analysis evaluation

As required by Regulations 21(5) and 21(6) of the Environment Regulations, the following analysis and evaluation demonstrates that the identified impacts and risks associated with the Petroleum Activity are reduced to ALARP and are of an acceptable level, and considers all operations of the activity, including potential emergency conditions.

Impacts and risks identified during the ENVID workshops (including decision type, current risk level, acceptability of impacts and risks, and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

- planned (routine and non-routine) activities
- unplanned events (accidents, incidents or emergency situations).

Within these categories, impact and risk assessment groupings are based on environmental aspect (e.g. emissions, physical presence etc). For all hazardous events considered, the worst-case risk was assumed.

The ENVID identified 7 impacts and 6 risks associated with the Petroleum Activity. Planned activities and unplanned events are summarised in Table 6-1. The assigned risk ratings were determined with controls in place as described in Section 2.3.6.

The analysis and evaluation for the Petroleum Activity indicates that current environmental risks and impacts associated with the activity are reduced to ALARP and are of an acceptable level, as discussed further in Sections 6.8 and 6.9.

The environmental impacts and risks for all aspects are summarised in Table 6-1.

6.3 Impacts and risks not deemed credible or outside the scope of this Environment Plan

During the ENVID several risks and/or impacts were identified as either being outside the scope of this EP, or not relevant to the Petroleum Activity, these are described below:

6.3.1 Bunkering

No bunkering at sea will be performed. Any bunkering will be performed during a port call, out of the scope of this EP. Consequently, risks associated with this activity are not considered applicable to this EP.

6.3.2 Underwater noise emissions from helicopters

No helicopter transfer are planned. These may only occur in emergency situations.

6.3.3 Underwater noise emissions from remotely operated vehicles

It is not credible that noise from ROV operations at the seabed would add to levels of noise emanating from survey vessels just below the sea surface, or noise emissions from equipment. Noise emissions from these sources would not add to cumulative sound fields from survey vessels and equipment to any discernible extent. As such, noise emission from these sources has not been considered further in this EP.

6.4 Cumulative impacts

Woodside has assessed the cumulative impacts of the Petroleum Activity in relation to other relevant petroleum and greenhouse gas activities that could realistically result in overlapping temporal and spatial extents.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.5 Indirect impacts from activities outside the Operational Area

For the Petroleum Activity, the potential 'indirect' environmental impacts and risks evaluated are those associated with mobilisation/demobilisation of the vessels to the Operational Area, which have been considered in the environmental impact assessment in Sections 6.8 and 6.9. Due to the nature and scale of these potential indirect environmental impacts and risks (such as fuel usage, interaction with other marine users and usual vessel discharges), and the regulatory frameworks and applicable maritime regulations in place to manage them, Woodside considers the potential impacts and risks from mobilisation and demobilisation of the survey vessels to be inherently ALARP in their current state. Therefore, Woodside considers that standard vessel operations are appropriate to manage the potential impacts and risks from mobilisation and demobilisation of the vessels to a level that is acceptable.

6.6 Environmental performance outcomes, standards and measurement criteria

This EP includes EPOs, EPSs and MC that address legislative and other controls to manage the environmental risks and impacts of the activity to ALARP and an acceptable level.

The EPOs, EPSs and MC specified in this EP are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the legislation, codes and standards, good industry practice and professional judgement outlined in Section 2.3.5 and Section 2.3.6 as part of the acceptability and ALARP justification process.

The EPOs, EPSs and MC are presented throughout this section and in Appendix G (Oil Spill Preparedness and Response). A breach of these EPOs or standards constitutes a 'Recordable Incident' under the Environment Regulations (refer to Section 7.11.4). For the physical and biological receptors within the EMBA, Woodside has set EPOs that are consistent with the Matters of National Environmental Significance – Significant impact guidelines 1.1 (Department of the Environment, Water, Heritage and the Arts 2013). EPOs are set so that they are consistent with the principles of ESD as defined in section 3A of the EPBC Act and demonstrated through the acceptability process (described in Section 2.4.2), applied to the aspects and receptors in Section 6. The EPOs for planned activities have been set at a level of environmental performance that considers the planned activities and associated level of environmental impact.

For social receptors, including fishing and other commercial activities, the EPOs that have been set in a manner so that the activities undertaken as a part of the Petroleum Activity should not interfere with other marine users, to a greater extent than is necessary for the exercise of right conferred by the titles granted.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.7 Presentation

The environmental impact and risk analysis and evaluation, demonstration of ALARP and acceptability, EPOs, EPSs and MC are presented in tabular form throughout this section, as shown in the example below. Italicised text in this example table denotes the purpose of each part of the table, with reference to the relevant sections of the Regulations and/or this EP.

Context Description of the context for the impact/risk. Regulation 21(1), 21(2) and 21(3)

Impact evaluation summary

Source of impact	***Environmental value potentially impacted***						***Evaluation***						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Presence of vessels (and equipment) excluding or displacing other marine users from the Operational Area						X	A	F	-	-	LCS GP PJ	Broadly Acceptable	EPO 1 EPO 2

Description of source of impact

The geophysical and geotechnical surveys are each expected to take approximately 20-60 days to complete, this may occur as a single campaign or split over a number of campaign but up to a maximum of 90 days per year as defined in Section 3.5.

Vessels do not plan to anchor within the Operational Area during activities and instead maintain positioning using thrusters, where required. The physical presence and movement of survey vessels within the Operational Area has the potential to displace other marine users. All vessels will display navigational lighting and external lighting on a 24-hour basis, as required for safe operations.

It is feasible that two survey vessels may be present in the Operational Area at any one time.

Geophysical survey equipment is towed at a distance of approximately three times the water depth out from the stern. Geotechnical equipment is deployed near vertical and is therefore, in close proximity to the working vessel.

There is the potential for the survey vessels and associated survey equipment to temporarily displace third party vessels i.e. commercial fishing, aquaculture and shipping vessels, including vessels associated with oil and gas activities and recreational fishing vessels, from within the area where the vessel is directly operating.

Impact assessment

Environmental value(s) potentially impacted

Displacement of commercial fishing and aquaculture

A number of Commonwealth and State managed fisheries occur in the region (Section 4.10.1**).**

There are 4 Commonwealth and 12 State managed fisheries with management areas that overlap the Operational Area. One Commonwealth (the North West Slope Trawl Fishery) and three State-managed fisheries (Marine Aquarium Managed Fishery, Northern Demersal Scalefish Fishery and Tour Operator) are considered to have potential for interaction with the Petroleum Activity, based on their catch effort drawn from ABARES (Commonwealth) and FishCube (WA state) data (Table 4-24, Section 4.10.1).

The overlap of the Operational Area with commercial fishing activity may temporarily exclude fishers from the area resulting in a potential displacement and potential loss of gear (particularly in relation to deployed traps). The presence of survey vessels does not present a hazard to bottom trawl fisheries due to the low risk of equipment entanglement and subsequent equipment damage/loss.

The presence of vessels in the Operational Area would likely be of short duration, potentially resulting in a minor interference (i.e. navigational hazard) and localised displacement/avoidance by commercial fishing vessels within the immediate vicinity of the survey vessels. It is also noted that there was no direct response from commercial fisheries during the consultation period, so the potential impacts of survey activities on commercial fisheries is considered minor and temporary.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

No permanent infrastructure is intended to be installed or remain in-situ as part of the Petroleum Activity. Therefore, there is no ongoing entanglement or equipment damage risk to bottom trawl fisheries.

Displacement of recreational fishing and tourism

Tourism and recreation activity in the Operational Area is expected to be infrequent, with recreational and charter fishing from vessels visiting the Scott Reef Nature Reserve the only tourism and recreation activities identified as potentially occurring near the Operational Area. The Operational Area do not overlap AMPs. Recreational and charter fishing from vessels is largely undertaken using line fishing methods. Consultation identified that recreational and charter fishing occurs within and around the Operational Area (Section 5). However, given the temporary and localised nature of the Petroleum Activity, impacts to recreational and charter fishing are expected to be localised and of no lasting effect.

Traditional fishing is permitted within the MoU Box (see Section 4.10.2) surrounding several reefs and islets, including Scott Reef, with fishing effort peaking between July and October due to favourable wind conditions (ERM, 2009). Traditional Indonesian fishing activity is concentrated in shallow reef-associated habitats, including reef flats, lagoons and upper reef slopes, with sea cucumber harvesting occurring from several metres to more than 30 m water depth (Prescott et al., 2016). The temporary presence of survey vessels in the Operational Area may result in minor, localised interference with, or displacement of, traditional fishing activities in the immediate vicinity of the vessels.

Cultural features and heritage values

Refer to Section 6.11 for an assessment of potential impacts to cultural features and heritage values from the Petroleum Activity. Related control measures demonstrate that impacts are reduced to ALARP and are of an acceptable level have been captured in Section 6.11 below.

Displacement to commercial shipping

The presence of survey vessels and towed equipment could potentially cause temporary disruption to commercial shipping. AMSA have introduced a series of shipping fairways within which commercial shipping vessels are advised to navigate. The fairways are not mandatory; however, AMSA strongly recommends commercial shipping vessels remain within the fairway when transiting the region. The use of shipping fairways is considered to be good seafaring practice, with Australian ship reporting (AUSREP) data from AMSA indicating cargo ships and tankers routinely navigate within the established fairways.

No marine fairways intersect with the Operational Area; the nearest fairway is ~185 km from Operational Area Part B.

No concerns from AMSA regarding the activity were raised during the consultation period. The potential impacts to commercial shipping vessels are expected to be limited to a temporary and localised displacement of vessels as they make slight course alterations to avoid the survey vessels (and associated equipment).

Oil and gas

There are no oil and gas platforms within 50 km of the Operational Area. The nearest facility not operated by Woodside, is the Ichthys Project offshore facility (Inpex), which lies ~130 km East of Operational Area Part A. Given the distance between the Operational Area and petroleum activities undertaken by other operators, no impacts to other operators will occur as a result of the physical presence of the vessels.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential impacts/risks associated potential impacts associated with the physical presence of survey vessels on other users such as commercial fisheries, recreational fishing and shipping. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, physical presence of the survey vessels may result in a temporary localised impact to commercial fishing, recreational fishing and shipping. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered good practice/industry best practice and meet the requirements of the *Navigation Act 2012* (Cth) and Australian Marine Orders, and expectations of AMSA and AHO provided in consultation with relevant persons. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Disturbance to seabed habitat as a result of geotechnical surveys	X	X		X			A	F	-	-	GP PJ	Broadly Acceptable	EPO 2 EPO 3 EPO 4

Description of Source of Impact

Geotechnical surveys

The geotechnical surveys will be performed using standard industry equipment (Section 3.7) and will consist of in situ testing and the recovery of soil and rock samples by deploying the geotechnical equipment from the survey vessels to the seabed at locations within the Operational Area to ground truth the geophysical data and provide geotechnical data for engineering design.

The geotechnical investigation may involve the following seabed-disturbing activities:

Penetration testing: The Petroleum Activity includes a number of PCPTs across the Operational Area. Each PCPT will create a hole on the seabed between 3 and 55 m below the mudline with a diameter from 80 mm to 250 mm (depending on the type of equipment used). The number of PCPTs that will be carried out during the Petroleum Activity will depend on conditions during the Petroleum Activity and results of PCPT as they occur. However, for the purpose of this EP the impact assessment assumes ~90 PCPTs per year could occur. Once PCPTs are complete all equipment is removed from the seabed and the resulting hole will infill naturally overtime.

Cored boreholes: Cored boreholes of up to 50 m below the mudline with a diameter up to ~225 mm are planned to be taken across the Operational Area. These will either be drilled from the surface on a vessel or drilling/testing equipment involving a remotely operated self-contained drilling unit lowered to the seabed from the vessel. The borehole is advanced by a combination of either core drilling or push sampling (thin or thick-walled tubes) at intervals or PCPT testing (Section 3.7.1), each interval. The remaining hole in the seabed would infill naturally with sediment over time. The number of boreholes made during the Petroleum Activity may change depending on conditions during the Petroleum Activity. For the purpose of this EP, the impact assessment assumes ~50 boreholes per year.

Piston core sampling: Piston gravity core or vibrocore sampling may occur during the Petroleum Activity creating holes with depths of between 1 m to 6 m below the mudline. When the depth of sample refusal is reached, all equipment is withdrawn from the seabed. A small hole will remain in the seabed, ~70–110 mm in diameter, which will infill naturally with sediment over time. The number of piston cores taken during the Petroleum Activity may change depending on conditions during the Petroleum Activity. For the purpose of this EP, the impact assessment assumes 90 piston cores per year.

Box Core sampling: Box core sampling will occur during the Petroleum Activity across all Operational Area. All box core samples will result in a cube of sediment being removed from the seabed. The possible box core sample equipment is capable of recovering is ~0.125 m³ (0.5 m × 0.5 m × 0.5 m). A self-releasing trigger mechanism, initiated once the frame reaches the seabed, allows the box corer to penetrate into the seabed. Penetration is limited by a

stopper to 0.5 m depth. The number of box cores taken may change depending on conditions during the Petroleum Activity. For the purpose of this EP, the impact assessment assumes ~90 box cores per year will be executed.

Section 3.7 provides further details on the geotechnical equipment associated with the survey and the potential seabed disturbance associated with it.

Drill cuttings

The geotechnical seabed coring may result in the indirect discharge of a small quantity of drill cuttings and fluid at the seafloor. Sampling boreholes drilled to recover soil and rock samples generate minimal drill cuttings as the objective is to recover a continuous sample profile of the depth of the borehole. Any drill cuttings will remain on the seabed immediately adjacent to the borehole site. The cuttings are pieces of material being drilled and likely to be benign calcareous sediment. Some of the discharged cuttings (lighter particles) will be temporarily suspended in the water column (close to seafloor) before settling to the seafloor within the immediate vicinity of the drilling location. The environmental impact associated with the indirect discharge of cuttings from the geotechnical seabed coring activities would be negligible and temporary lasting only minutes after the seabed coring operations are complete. Drilling fluid will consist primarily of seawater, and may have small quantities of additives. These additives are considered to be very low toxicity (as assessed through Woodside's Chemical Selection and Assessment Environment Guideline) and are expected to dilute rapidly upon discharge; as such no toxic effect to biota are expected to occur.

Placement of equipment on the seafloor

Placing the geotechnical equipment on the seafloor will result in minor localised physical disturbance to the seafloor beneath the equipment. These temporary footprints will return to natural state from natural sediment movements.

Discharge of drilling fluids is discussed further in Section 6.8.6.

Impact Assessment

Environmental Value(s) Potentially Impacted

Geotechnical survey activities are likely to result in localised and temporary physical modification and disturbance to a small area of the seabed.

Benthic habitat

The benthic habitat within the Operational Area is predominantly soft sediment with sparsely associated epifauna which is broadly represented throughout the NWS Province and wider NWS (Section 4.5). Benthic habitats of the soft sediment seabed are characterised by burrowing infauna such as polychaetes and worms, with biota such as sessile filter feeders occurring on areas of hard substrate. The infauna communities are likely to be representative of the NWS province which is described as being of low abundance and dominated by polychaetes and crustaceans (RPS 2012).

Subtidal soft sediments support a patchy abundance of various infauna (including polychaete worms, molluscs, and crustaceans) and epifauna (including crabs, sea urchins, snails, sea stars, demersal fish, sponges, sea whips and sea squirts) which are widespread and well represented and in the context of the contiguous extent of habitats across the region. They are considered to be of relatively low environmental sensitivity (Section 4.4).

Impacts from geotechnical survey activities are expected to be confined to sediment burrowing infauna, surface epifauna invertebrates and potentially sessile filter feeders inhabiting the seabed directly around the survey activities (Gates and Jones 2012; Hughes et al. 2010). Placing equipment on the seafloor may relocate small amounts of sediment, with slight and short-term impacts to biota, detailed above, due to elevated turbidity and the clogging of respiratory and feeding parts of filter feeding organisms. However, elevated turbidity would only be expected to be temporary, and is therefore not expected to have a lasting effect on environment receptors.

Key ecological features

Operational Area Part A overlaps the Seringapatam Reef and Commonwealth waters in the Scott Reef Complex. Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity, and high species richness associated with the reefs themselves. As two of the few offshore reefs in the North-west, they provide an important biophysical environment in the region (DSEWPAC 2012a). However, geotechnical activities will occur in water depths greater than 350 m and are therefore unlikely to directly interact with the shallow reef habitats that underpin the ecological values of the Scott Reef Complex and Seringapatam Reef.

Operational Area Part B overlaps with the Continental Slope Demersal Fish Communities KEF. Impacts to benthic marine fauna as a result of geotechnical surveying are expected to be highly localised to surface area of the borehole, drill cuttings and the footprint of the geotechnical equipment, which is a relatively small area compared to the regional extent of this KEF, extending from Broome to Ashmore Reef. As such, this habitat is well represented on a regional scale.

Benthic habitat surveys in the region indicate that benthic habitats within the KEF are characterised by sand interspersed with areas of rubble and outcroppings of limestone pavement (AIMS 2014; RPS 2011). Such habitats are widely distributed in the NWS Province. As noted in Section 4.4 of the Master Existing Environment document (Appendix C), the geomorphic feature the KEF is associated with is represented worldwide and represents the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

coastline during a previous glacial period. Therefore, potential impacts to this regional-scale KEF are expected to be short term and localised.

Impacts to benthic marine fauna that may be present on this feature as a result of geotechnical surveying are expected to be highly localised to surface area of the borehole, drill cuttings and the footprint of the geotechnical equipment, which is a relatively small area.

Cultural features and heritage values

Refer to Section 6.11 for an assessment of potential impacts to cultural features and heritage values from the Petroleum Activity. Control measures related to underwater cultural heritage have been captured in the tables below to demonstrate that impacts are reduced to ALARP and are of an acceptable level.

Cumulative impacts

Given the small area of seabed potentially impacted by the survey activities, the cumulative area potentially disturbed is considered negligible in the context of the wider distribution of the habitats present.

Demonstration of ALARP				
Control Considered	***Control Feasibility (F) and Cost/Sacrifice (CS)[27]***	***Benefit in Impact/Risk Reduction***	***Proportionality***	***Control Adopted***
Legislation, Codes and Standards				
Report any potential UCH finds to relevant stakeholders and authorities in accordance with the Unexpected Finds Procedure, Underwater Cultural Heritage Act 2018 and the ATSIHP Act.	F: Yes. CS: Minimal.	Ensures workforce are suitably aware of legal and process requirements for managing cultural features and heritage values.	Benefits outweigh cost/sacrifice.	Yes C 4.4
Good Practice				
Monitor inventory deployed to the field and track removal of equipment during activity to ensure all deployed equipment is retrieved.	F: Yes. CS: Minimal cost. Standard practice.	Removing equipment from seabed reduces duration of impact.	Benefits outweigh costs/sacrifice.	Yes C 3.1
Review of existing survey data by a suitably qualified maritime archaeologist to inform areas for survey activities and/or installation of equipment that may cause seabed disturbance (in areas not previously disturbed) to avoid or where not possible, minimise physical impacts to cultural heritage areas or prospective areas.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the risk of damage or destruction of culturally significant underwater heritage, including Indigenous heritage values.	Benefits outweigh costs/sacrifice	Yes C 4.1

[27] *Qualitative measure*

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considered the adopted controls appropriate to manage potential impacts/risks associated with seabed disturbance from geophysical and geotechnical survey activities. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, disturbance to the seabed represents a potential result in no lasting effect with localised impact not significant to environmental receptors. Section 6.8.2 demonstrates that the Petroleum Activity is not inconsistent with any recovery plan or threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

Generation of noise from survey vessels					X		A	E	-	-	GP PJ	Broadly Acceptable	EPO 2 EPO 5 EPO 6
Generation of noise from geophysical and geotechnical survey equipment.				X	X		A	E	-	-	GP PJ	Broadly Acceptable	EPO 2 EPO 5 EPO 6

Description of source of impact

Survey vessels will generate continuous non-impulsive noise emitted from engines and thrusters during transit and when using DP, whilst geophysical and geotechnical survey operations will generate both continuous and intermittent non-impulsive and impulsive sound depending on the type of equipment used.

Vessels and operation of dynamic positioning systems

Vessels

Vessels used for the Petroleum Activity are detailed in Section 3.8. The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Vessels produce low frequency sound (i.e. below 1 kHz) from the operation of machinery, hydrodynamic flow sound around the hull and from propeller cavitation, which is typically the dominant source of sound (Ross, 1987, 1993). These noise sources will contribute to and have the potential to exceed ambient noise levels which range from around 90 dB re 1 µPa (root square mean sound pressure level [rms SPL]) under very calm, low wind conditions, to 120 dB re 1µPa (rms SPL) under windy conditions (McCauley, 2005).

Geotechnical drilling vessels are likely to hold station in the Operational Area using DP and multipurpose survey vessels and USVs may also require the use of DP although this is uncommon and if required would likely only be for short durations.

McCauley (1998) measured underwater broadband noise equivalent to about 182 dB re 1 µPa at 1 m (rms SPL) from a support vessel holding station using DP in the Timor Sea; it is expected that similar noise levels will be generated by vessels used for this activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-2 provides indicative source levels for the vessels likely to be operating in the Operational Area. A final vessel selection had not been made; therefor the vessels were selected with parameters considered conservatively representative of a typical vessel that would conduct such works.

Table 6-2 Survey vessel source levels

Vessel	Source level (dB re 1 μPa^2m^2)
Multipurpose survey vessel or USV under transit (e.g. *Skandi Feistein*)	172.6 dB re 1 μPa^2m^2
Multipurpose survey vessel or USV under DP (e.g. *Fugro Etive*)	181.3 dB re 1 μPa^2m^2
Geotechnical drilling vessel under DP (e.g. *Deep Orient*)	185 dB re 1 μPa^2m^2
OSV under DP undertaking resupply of survey vessel (e.g. *Fugro Etive*)	181.3 dB re 1 μPa^2m^2

Geophysical survey activities

Geophysical surveys can generate both impulsive and non-impulsive sounds. Geophysical surveys are used for bathymetric mapping and shallow sub-bottom profiling, penetrating to depths of about 60 m below the seabed. Geophysical surveys use a variety of profilers which operate at differing energy levels and are characterised by different dominant frequencies. Higher energy sources are needed to transmit the acoustic signals to greater depth, but they have correspondingly lower dominant frequencies which reduce the resolution of the resultant record. The type of profiler used depends on the nature of the substrate, penetration and resolution required. The geophysical surveys will use a range of survey techniques detailed in Table 3-3 which are considered non-impulsive sound sources e.g. some types of sub-bottom profilers, MBES, side scan sonars, and impulsive sound sources e.g. the boomer sub-bottom profiler. It is known that impulsive sounds change to non-impulsive as these sounds propagate through the water however, Martin et al. (2020) suggests that this is not relevant for assessing hearing injury because sounds retain impulsive character when SPLs are above the recommended threshold levels.

Most commercial SBPs are small, low-powered, high-resolution and shallow-penetrating systems, producing electrical pulses across a range of frequencies (Salgado Kent et al. 2016; Jiménez-Arranz et al. 2017). The SBP instruments proposed for the survey produce pulses of sound between ~50 Hz and 30 kHz with source levels between ~192 and 220 dB re 1 µPa (SPL) at 1 m.

MBES and SSS are VHF and high-resolution systems, producing short micro-pulses of sound at frequencies in the tens or hundreds of kilohertz. The high-frequency pulses of sound produced by MBES are focused within multiple highly directional and narrow beams, which form a fan shape directed at the seabed (Salgado Kent et al. 2016; Jiménez-Arranz et al. 2017). SSS also produces sound in a focussed swath directed at the seabed. The pulses of sound produced by these instruments are of such high frequency that they rapidly attenuate outside of the beam (Zykov 2013). Indicative source levels produced for MBES range from 210 – 247 dB re 1µPa@1m and for SSS range from 208 – 231 dB re 1µPa@1m (Jiménez-Arranz, et al. 2020). Despite relatively high source levels, the high operating frequencies of most MBES and SSS places the dominant sound frequencies above the principal auditory range of most very low frequency (VLF) and low frequency (LF) hearing cetaceans. However, high-frequency (HF) hearing cetaceans are likely to occur in the Operational Area (e.g. dolphins) that have the capability to hear some of the sound energy (NMFS 2024; Accomando et al. 2025).

A USBL system may also be used during the survey for the purpose of accurate underwater positioning. USBL systems work by emitting short pulses of medium to high frequency sound (19–34 kHz) in short 'chirps'. Source levels are in the order of 184–202 dB re 1 µPa (SPL) at 1 m. The operating frequency range is above the auditory range of VLF and LF hearing cetaceans e.g. Pygmy blue whales and Humpback whales (0.168 – 26.2 and 0.376 - 56 kHz respectively; Accomando et al, 2025), marine turtles and the majority of fish species (<1 kHz; Ladich 2000; Popper et al. 2014). Similar to MBES and SSS, dolphins have the capability to hear the sound produced from USBL.

Geotechnical survey activities

The key sound sources during geotechnical surveys include the penetration tests and sampling boreholes undertaken at the seabed. Sound levels associated with standard penetration testing and small-core drilling have been measured in waters off WA (Erbe and McPherson 2017). The broadband (20 Hz to 24 kHz) source levels for penetration testing were 151–160 dB re 1 uPa^2s sound exposure level (SEL) at 1 m (equivalent to ~160–170 dB re 1 µPa SPL at 1 m), with received levels reducing to ~141–146 dB re 1 µPa SPL within 20 m distance from the source (Erbe and McPherson 2017). The broadband (30 Hz to 2 kHz) drilling source levels were 142–145 dB re 1 µPa SPL at 1 m (Erbe and McPherson 2017).

Underwater sound produced by the geotechnical survey equipment has the potential to affect marine fauna that may pass within close proximity to survey operations. The potential effects to habitats and ecosystems (i.e. benthic invertebrate communities, planktonic communities, KEFs), as well as indirect effects to commercial fisheries associated with the potential disturbance to fishes is also considered.

Species sensitivity and impact thresholds

Marine mammals

Marine mammals, especially cetaceans, rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart 2007; Erbe et al. 2015; Erbe et al. 2018). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold (PTS and TTS), physical damage and stress (National Research Council [NRC] 2003; Erbe 2012; Rolland et al. 2012).

For continuous noise sources thresholds for potential hearing impairment, in terms of TTS or PTS are presented as cumulative sound exposure levels integrated over a 24-hour period (SEL_{24h}) and are frequency weighted according to the auditory weighting categories of different cetacean hearing groups (NMFS 2024, Accomando et al. 2025).

For impulsive sound sources, thresholds for potential hearing impairment are presented as dual metric criteria, comprising the peak pressure (PK) from a single impulse or the SEL accumulated from multiple impulses over a period of 24 hours (SEL_{24h}). The SEL_{24h} thresholds are frequency weighted according to the auditory weighting categories of different types of cetaceans, including VLF cetaceans e.g. pygmy blue whales and LF cetaceans e.g. humpback whales, and HF cetaceans (sperm whales, beaked whales and most dolphins) (Accomando et al.2025). The PK thresholds for a single impulse are not frequency weighted.

A range of behavioural changes can occur in marine fauna in response to sound pressure levels. Onset of behavioural disturbance to cetaceans has been reported to occur in response to sound levels ranging from 120 to >180 dB re 1 µPa SPL (Southall et al. 2007). This may include minor responses, such as a momentary pause in vocalisation or reorientation of an animal to the source of the sound, or stronger avoidance responses (Southall et al. 2007). The US NMFS proposes a threshold of 160 dB re 1 µPa SPL for a potentially significant behavioural response to impulsive sound sources (NMFS 2024). The marine mammal behavioural threshold based on the current US NMFS (2024) criterion for marine mammals of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources is used in this impact assessment.

Table 6-3: Impact thresholds for low and high frequency cetaceans for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)	***TTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)***	***Behavioural response (dB re 1 µPa)***	***PTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)***	***TTS onset thresholds: SEL_{24h} (dB re 1 µPa².s)***	***Behavioural response (dB re 1 µPa)***
VLF cetaceans	183	168	160	197	177	120
LF cetaceans	183	168		197	177	
HF cetaceans	193	178		201	181	

Source: NMFS (2024); Accomando et al. 2025; Southall et al. (2019); NOAA (2019).

Marine Reptiles

There is a paucity of data regarding responses of marine turtles to underwater noise. However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100–700 Hz (Bartol and Musick 2003). Lenhardt (1994) observed marine turtles avoiding LF sound, while McCauley et al. (2000) noted increased swimming activity at received levels of 166 dB re 1 µPa.

McCauley et al. (2000) observed the behavioural response of caged green and loggerhead turtles to an approaching seismic airgun. For received levels above 166 dB re 1 µPa SPL, turtles increased their swimming activity and, above 175 dB re 1 µPa SPL, began to behave erratically, which was interpreted as an agitated state. The 166 dB re 1 µPa SPL threshold has subsequently been adopted by the US NMFS as a behavioural disturbance threshold for marine turtles (NMFS 2011) for impulsive sources and is applied in this assessment.

Historically, few quantitative thresholds have been available for assessing impacts of underwater noise on marine turtles. Popper et al. (2014) assessed thresholds for marine turtles and found qualitative results that TTS was only moderate for near field exposure, and low for both intermediate and far field exposure. The same review found that the risk of behavioural disturbance was high for near-field exposure, moderate for intermediate exposure and low for far-field exposure. No numerical thresholds have been developed for behavioural impacts of continuous noise sources (e.g. vessel noise) on marine turtles.

Updates to the recommended underwater noise effect criteria – temporary threshold shift (TTS), permanent threshold shifts (PTS), and auditory injury (AINJ) thresholds were published by Accomando et al. (2025)[28], and adopted by

[28] *The weighted non-impulsive thresholds by themselves only indicate the TTS/ AINJ threshold at the most susceptible frequency.*

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

NMFS (2025)[29]. This updated criteria provide lower onset thresholds for AINJ and TTS than previously available thresholds and are considered appropriate for assessing impacts from continuous vessel noise associated with the Petroleum Activity however, the behavioural effect threshold for marine turtles remains unchanged. For impulsive sound sources, thresholds for PTS, TTS and auditory injury have been developed by Accomando et al. (2025) and are presented in Table 6-7.

The Recovery Plan for Marine Turtles (CoA 2017) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, given the thresholds outlined in Table 6-7, it is reasonable to expect that marine turtles may demonstrate avoidance or attraction behaviour to the noise generated by the activity.

Table 6-4: Impact thresholds for marine turtles for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: ***SEL24h (dB re 1 µPa².s)***	***TTS onset thresholds:*** ***SEL24h (dB re 1 µPa².s)***	***Behavioural response*** *(dB re 1 µPa)*	***PTS onset thresholds:*** ***SEL24h (dB re 1 µPa².s)***	***TTS onset thresholds:*** *SEL24h (dB re 1 µPa².s)*	***Behavioural response*** *(dB re 1 µPa)*
Marine turtles	184^	169^	166* 175+	198^	178^	(N) High (I) Moderate (F) Low#

*Source: ^ PTS and TTS thresholds (Accomando et al. 2025); * behavioural response threshold (impulsive) (National Science Foundation, 2011), + behavioural disturbance threshold (impulsive) (McCauley et al., 2000); # behavioural response threshold (continuous) (Popper et al., 2014)*

Note: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Fish (including sharks and rays)

Fish perceive sound through the ears and the lateral line, which are sensitive to vibration. Some species of teleost or bony fish (e.g. herring) have a structure linking the gas-filled swim bladder and ear, and these species usually have increased hearing sensitivity. These species are considered to be more sensitive to anthropogenic underwater noise sources than species such as cod (*Gadus* sp.), which do not possess a structure linking the swim bladder and inner ear. Fish species that either do not have a swim bladder (e.g. elasmobranchs (sharks and rays) and scombrid fish (mackerel and tunas)) or have a much-reduced swim bladder (e.g. flat fish) tend to have a relatively low auditory sensitivity.

Fishes are primarily sensitive to the particle motion component of sound at close range to a sound source, while the presence of a swim bladder results in a varying degree of sensitivity to sound pressure (Popper and Hawkins 2018; Popper et al. 2019). Consequently, fishes are broadly categorised into three groups with respect to their hearing capabilities (Popper et al. 2014):

- Fishes with no swim bladder or other gas chamber (e.g. sharks, mackerels) – Sensitive only to particle motion, not sound pressure changes.
- Fishes with swim bladders, but without a direct connection between the swim bladder and the inner ear (e.g. demersal snappers and emperors) – Hearing primarily involves particle motion with some limited ability to indirectly detect changes in sound pressure.
- Fishes with a swim bladder or other gas volume connected directly to the inner ear (e.g. herrings, sardines, pilchards, shads) – These fishes are able to detect both sound pressure as well as particle motion, and are susceptible to barotrauma.

Considering these differences in fish physiology, Popper et al. (2014) developed sound exposure guidelines for fish, sharks and rays. These guidelines include relative risk criteria (high, moderate and low) for behavioural effects, masking, TTS and injury at three distance categories: near (N) (tens of metres from the source), intermediate (I) (hundreds of metres from the source) and far (F) (thousands of metres from the source).

The thresholds presented in Table 6-5 are considered appropriate for assessing the potential impacts of continuous vessel noise and impulsive geophysical and geotechnical sound sources to fish from the Petroleum Activity.

It should be noted that the impulsive sound criteria proposed by Popper et al. (2014) are largely based on studies of exploration seismic surveys and are therefore considered highly conservative when applied to the comparatively low-energy geophysical survey equipment proposed for this activity.

[29] *AINJ was previously referred to as PTS. The new terminology acknowledges that auditory injury may occur without PTS.*

Cartilaginous fish (such as sharks and rays) lack a swim bladder and are considered less sensitive to sound than bony fish. The hearing capabilities of whale sharks have not been studied in detail, although they are considered most likely to respond to low-frequency sounds (Myrberg 2001).

Table 6-5 Impact thresholds for fish, sharks and rays for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL_{24h} ***(dB re 1 µPa².s)***	***TTS onset thresholds:*** SEL_{24h} ***(dB re 1 µPa².s)***	***Behavioural response (dB re 1 µPa)***	***PTS onset thresholds:*** SEL_{24h} ***(dB re 1 µPa².s)***	***TTS onset thresholds:*** SEL_{24h} ***(dB re 1 µPa².s)***	***Behavioural response*** ***(dB re 1 µPa)***
Fish: no swim bladder	216	186	(N) High (I) Moderate (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not involved in hearing	203	186	(N) High (I) Moderate (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder involving hearing	203	186	(N) High (I) High (F) Moderate	170 dB rms SPL for 48-hours	158 dB rms SPL for 12-hours	(N) High (I) Moderate (F) Low

Impulsive noise: All criteria are presented as sound pressure, even for fish without swim bladders, since no data for particle motion exist.

Continuous noise: rms SPL: root mean square of time-series pressure level, useful for quantifying continuous noise sources.

Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I) and far (F). The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al., 2014).

Vessel Noise Modelling

Woodside commissioned JASCO Applied Sciences (JASCO) to undertake a modelling study of underwater sound levels associated with the vessels involved in GTGP surveys planned as part of the proposed Browse to NWS Project.

Vessel activities were modelled in close proximity to the Operational Area Part A in Torosa field ~5 km from Scott Reef, and at the nearby Brecknock field within Operational Area Part B (~50km south of Scott Reef) as shown in Figure 6-1.

A range of vessels and operational circumstances may form part of the works, including separate geotechnical and geophysical survey vessels, which may be uncrewed. A supply vessel may be required to be utilised to deliver equipment and supplies.

Based on the range of vessel activities and locations proposed, four sound-producing scenarios were considered in the study as shown in Table 6-6.

From the underwater acoustic modelling study (Liu et al. 2026), four of the modelled scenarios are discussed in the impact assessment below that demonstrate the worst-case scenarios for underwater noise emitted from a multipurpose survey vessel or USV under transit (scenario A; Figure 6-2), geotechnical drilling vessel under DP (scenario B, Figure 6-3), offshore supply vessel (OSV) resupply of geotechnical drilling vessel under DP (scenario C; Figure 6-4), and a multipurpose survey vessel or USV using DP (scenario D; Figure 6-5).

Whilst Scenarios A, B and C were not modelled at the Torosa site in addition to Brecknock, they are considered conservative scenarios for Operational Area Part A as Brecknock is deeper at 637 m with Torosa site being 396 m depth. Modelling in deeper waters typically shows a wider area that may be ensonified than in shallower waters due to reduced sound absorption by the seafloor substrate. In shallow-water or relatively depth-limited environments, sound propagation is more strongly influenced by interaction with the sea surface and seabed, including reflection, scattering and energy loss to the seabed, whereas deeper-water settings can allow propagation through a larger water column with reduced boundary interaction, depending on the frequency, sound-speed profile and local environmental conditions (Jensen et al., 2011; DOSITS, 2024).

Table 6-6 Description of modelled scenarios applicable to this EP

Scenario	Location	Water Depth	Scenario description
A	Brecknock (Site 2)	637 m	Multipurpose survey vessel or USV at Brecknock for 24 hours (vessel transit and not DP)
B	Brecknock (Site 2)	637 m	Geotechnical drilling vessel under DP for 24 hours, at Brecknock
C	Brecknock (Site 2)	637 m	Offshore supply vessel (OSV) resupply of Geotechnical drilling vessel under DP for 8 hours, at Brecknock
D	Torosa (Site 1)	396 m	Multipurpose survey vessel under DP or USV under DP for 12 hours of operation at Torosa

The purpose of the modelling is to assist in understanding the potential acoustic impact on marine fauna including marine mammals, marine turtles, and fish. The study specifically assessed distances from operations where underwater sound levels reached thresholds corresponding to criteria including behavioural response, impairment (temporary threshold shift (TTS) and permanent threshold shift (PTS). PTS is defined as the permanent, irreversible increase in the threshold of audibility at a specified frequency. Whereas auditory injury (AUD INJ) is defined as damage to the inner ear that can result in destruction of tissue, such as loss of auditory neuropathy. The key distinction is that AUD INJ can still occur which may or may not result in PTS (NMFS 2024). The modelling study (JASCO 2026) combines the terms PTS/AINJ however acknowledge that intense noise exposures can cause auditory injury (represented by AINJ; Accomando et al. 2025) without PTS occurring.

The modelling methodology considered scenario-specific source levels and range-dependent environmental properties. Estimated underwater acoustic levels are presented as sound pressure levels (SPL, L_p), and as accumulated sound exposure levels (SEL, L_E) as relevant to the corresponding noise effect criteria. The assessment period for SEL accumulation is defined as a 24-hour period over which sound energy may be integrated. The level is specified with the abbreviation SEL_{24h}.

SEL24h is a cumulative sound exposure metric that integrates received acoustic energy over a 24 hr period. The corresponding SEL24h modelled ranges are generally based on conservative exposure assumptions and therefore often represent a worst-case assessment scenario. In practice, marine mammals, fish and marine turtles are unlikely to remain at a fixed distance from a sound source for extended periods, and exposure levels will vary as animals and sound sources move. Consequently, the ranges associated with an SEL24h threshold does not indicate that all animals occurring within that distance will experience injury or auditory impairment. Rather, it defines the area within which an animal could accumulate a sound exposure equal to the relevant threshold under the modelled exposure assumptions if present for a sufficient duration.

Two distances relative to the source are reported for each sound level:

- R_{max} – the maximum range to the given sound level over all azimuths
- $R_{95\%}$ – the range to the given sound level after the 5% farthest points were excluded.

For this impact assessment the R_{max} values have been considered, providing a further level of conservatism to the assessment.

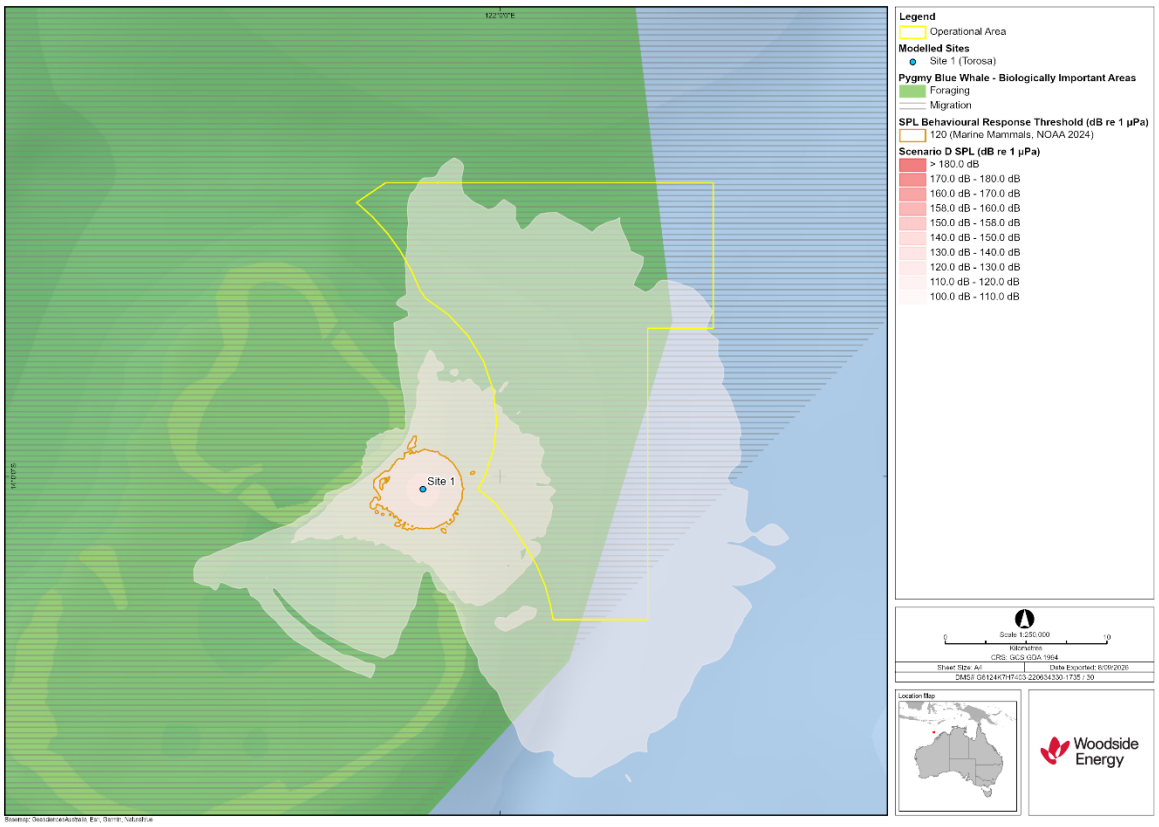

Figure 6-5 Scenario D, Multipurpose survey vessel under DP or USV under DP, at Torosa, SPL: Sound level contour map showing the unweighted maximum-over-depth sound field in 10 dB steps, and the isopleths for behavioural response threshold for marine mammals.

The following thresholds and guidelines for this study were chosen because they represent the best available science:

- Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Accomando et al. (2025) for the onset of TTS and PTS in marine mammals for non-impulsive sound sources. As discussed within Accomando et al (2025), intense noise exposures can cause auditory injury (represented by AINJ) without PTS occurring. In this report, the terms PTS and auditory injury are used however, it is acknowledged that auditory injury may occur without PTS.
- Marine mammal behavioural threshold based on the current US National Oceanic and Atmospheric Administration (NOAA) (NMFS 2024) criterion for marine mammals of 120 dB re 1 µPa (SPL; Lp) for non-impulsive sound sources.
- Sound exposure guidelines for fish, fish eggs, and larvae (Popper et al. 2014, NMFS 2024).
- Frequency-weighted accumulated sound exposure levels (SEL; $L_{E,24h}$) from Accomando et al. (2025) for the onset of TTS and PTS/AINJ in sea turtles.

Table 6-7 presents the maximum (R_{max}) horizontal distances to specific sound pressure levels (SPL) shown in the first column. Table 6-8 presents the maximum (R_{max}) distances to frequency-weighted SEL_{24h} PTS/AINJ and TTS thresholds for marine mammals and sea turtles based on guidelines adopted by Accomando et al. (2025) and NMFS (2024 and 2025).

Impact Assessment

Environmental Value(s) Potentially Impacted

Potential impact of noise

Survey vessels and offshore support vessels will generate continuous non-impulsive noise emitted from engines, thrusters etc during transit and when using DP, whilst geophysical and geotechnical survey operations will generate both continuous and intermittent non-impulsive and (depending on the type of equipment used) impulsive sound e.g. the boomer sub-bottom profiler

Elevated underwater noise has the potential to affect marine fauna, including cetaceans, fish, sharks and rays in three main ways (Richardson et al. 1995; Simmonds et al. 2004):

- by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift (TTS); referred to as auditory fatigue), or permanent threshold shift (PTS; auditory injury)
- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)
- through disturbance leading to behavioural changes or displacement from important areas (e.g. BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

Receptors

The Operational Area are located in water depths between 350 and 900 m. The fauna associated with these areas are predominantly pelagic species of fish, with migratory species such as turtles, whale sharks and cetaceans potentially present in the area seasonally (Section 4.6). Noise interference is a key threat to a number of migratory and threatened cetaceans and marine turtles identified as potentially occurring within the Operational Area. Relevant actions included in recovery plans for these species are outlined in Section 6.10.

There is a pygmy blue whale migration and possible foraging BIA present within the Operational Area. Pygmy blue whales transit the areas during April to August and October to January during their seasonal migrations.

Turtles may occur in Operational Area Part A since the green turtle habitat critical (nesting) zone is in close proximity. The nearest shoreline (and potential nesting beaches) is ~23 km from the Operational Area. Given the water depths are deep and the distance from shore, the Operational Area does not represent suitable foraging or reproduction habitat. Turtles may exhibit behavioural responses when exposed to underwater noise, such as diving. Such disturbances are expected to be localised. Disturbance to individual mating or internesting behaviours may occur, but given the temporary nature of the disturbance, is unlikely to affect individual breeding success or impact marine turtles at the population level.

The Continental Slope Demersal Fish communities KEF and the Seringapatam Reef and Commonwealth waters of the Scott Reef complex KEF overlaps the Operational Area. These KEFs both include some outcrops where demersal fish may be present.

Vessel noise

Survey vessels will contribute noise into the marine environment; however, they will only use DP for short periods when undertaking stationary investigations or undergoing resupply. Survey vessels transiting on main engines will produce lower levels of underwater noise that is below the injury threshold for sensitive marine fauna (e.g. cetaceans), thereby limiting the potential for any impacts.

The results of the activity site specific noise modelling study are detailed in the section above and the results for maximum extents to thresholds for each scenario are summarised as follows:

A multipurpose survey vessel or USV in transit and not on DP (Scenario A) would exceed the marine mammal behavioural threshold out to 210m. This scenario would not exceed the marine mammal injury threshold of PTS for either VLF and LF cetaceans and would exceed the TTS threshold out to a maximum of only 60 m for VLF and LF cetaceans. For marine turtles the TTS threshold was reached within 30 m. No limits were reached for PTS for turtles. The impact threshold for fish was not reached.

A Geotechnical drilling vessel under DP (Scenario B) would exceed the marine mammal behaviour threshold out to a maximum distance of 3.61 km. This scenario would exceed the marine mammal injury threshold of PTS out to a maximum 100m and 70 m for VLF and LF cetaceans respectively, and TTS out to a maximum of 980 m and 680 m for VLF and LF cetaceans respectively. For marine turtles the TTS threshold was reached within a maximum 950m and 90 m for PTS. Potential impacts to fish are limited to within 40m.

A Geotechnical drilling vessel under DP undergoing a resupply by an OSV under DP (Scenario C) would exceed the marine mammal behaviour threshold out to a maximum distance of 7.93 km. This scenario would exceed the marine mammal injury threshold of PTS out to a maximum 120m and 90 m for VLF and LF cetaceans respectively, and TTS out to a maximum of 1.12 km and 800 m for VLF and LF cetaceans respectively. For marine turtles the TTS threshold was reached within a maximum 1.02 km and 110 m for PTS. Potential impacts to fish are limited to within 80m.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

A multipurpose survey vessel or USV under DP (Scenario D) would exceed the marine mammal behaviour threshold out to a maximum distance of 3.14 km. This scenario would exceed the marine mammal injury threshold of PTS out to a maximum 90m and 80 m for VLF and LF cetaceans respectively, and TTS out to a maximum of 670 m and 480 m for VLF and LF cetaceans respectively. For marine turtles the TTS threshold was reached within a maximum 510 m and 90 m for PTS. Potential impacts to fish are limited to within 30m.

Geophysical survey noise

Geophysical surveys can emit impulsive or non-impulsive sounds and depends entirely on the specific technology used in the equipment. Table 3-3 details the proposed survey techniques, and the estimated source sound pressure level, and dominant frequency range (kHz). Impulsive depends entirely on the specific technology used in the equipment (Table 3-3). The sounds of a chirp and boomers sub-bottom profiler have been considered to be non-impulsive sound sources when the sound waves of the different frequency components are not adding coherently as a single rise in pressure, nor is there a sharp negative pressure component to the pulse they sweep (BOEM 2017). However, for this GP survey the boomer sub-bottom profiler generates a broad band, high amplitude impulsive acoustic signal as detailed in Section 3.6.4. Multibeam sonar and vessels are characterised by the US NMFS (2023) as non-impulsive sound sources. The potential underwater noise generated from the survey and OSV vessels has been modelled under various scenarios and discussed above.

Acoustic modelling of sub-bottom profilers by Zykov (2013), MacGillivray et al. (2013) and McPherson and Wood (2017) indicates limited horizontal sound propagation outside of the main directional beams of sound. The modelling studies also indicate that PK and SEL_{24h} thresholds for PTS are not exceeded. The potential for TTS resulting from single-pulse PK pressure exposure is not predicted to occur, while the potential for TTS resulting from SEL_{24h} exposures is limited to a few metres from the moving sound source (Zykov 2013; McPherson and Wood 2017), which is not expected for mobile marine fauna as they are likely to move out of the area relatively quickly. Exceedance of the 160 dB re 1 µPa SPL behavioural response threshold is limited to within a few tens of metres in most instances, or up to a maximum of 150 m depending upon the instrument used, water depth and seabed sediment characteristics (Zykov 2013; McPherson and Wood 2017). McPherson and Wood 2017 modelled different types of SBP equipment with the acoustic threshold for behavioural effects in marine mammals to be exceeded at a maximum of only 2 m for CHIRP systems, and 145 m for boomers. This equipment is representative of the SBP equipment to be used for this Petroleum Activity.

The VHF micro-pulses of sound produced by the MBES and SSS also rapidly attenuate outside of the beam (MacGillivray et al. 2013; Zykov 2013). The high operating frequencies of these instruments place the majority of sound frequencies above the auditory range of most marine fauna species. Dolphins and other mid-frequency cetaceans, which have peak hearing sensitivity up to 110 kHz, with potential for some limited hearing ability up to approximately 160 kHz (NMFS 2018), may be able to detect a small amount of the sound energy from some MBES and SSS instruments operating in the lower frequency ranges (MacGillivray et al. 2013; Zykov 2013). Modelling indicates that sound emissions outside the main beams are below the threshold levels for potential injury, PTS or TTS. Sound levels that may result in behavioural effects are likely limited to within tens of metres, but potentially up to a few hundred metres from the sound source for mid-frequency cetaceans (Zykov 2013; MacGillivray et al. 2013).

USBL positioning equipment also produces high-frequency sound, which may only be audible to dolphins and other mid-frequency cetaceans. The USBL has lower source levels than the other instruments proposed for the geophysical survey and is not expected to result in injury or hearing impairment. Some localised behavioural effects may occur in close proximity to the USBL, but the extent of any effect is expected to be smaller than that of other survey instruments and there are not expected to be any lasting behavioural effects.

Geotechnical survey noise

Sound emitted from geotechnical activities at the seabed (penetration tests and sampling boreholes) may be at levels that result in very localised behavioural effects to animals that happen to be exposed within <10 m; however, such effects will be temporary and the sound levels are well below those that may result in injury or hearing impairment (Erbe and McPherson 2017).

Marine Mammals

Marine mammals that may occur within the Operational Area are summarised in Section 4.6.3.

There is a pygmy blue whale migration and possible foraging BIA present within the Operational Area and migrating pygmy blue whales may be exposed to underwater noise generated by the Petroleum Activity.

The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015b), a recovery plan made under the EPBC Act, defines BIAs for pygmy blue whales, with particular emphasis placed on foraging areas and migration corridors.

Based on the *Guidance on Key Terms within the Blue Whale Conservation Management Plan* (DCCEEW, 2021), underwater noise emissions from the petroleum activities program must not:

- result in TTS or PTS to pygmy blue whales
- displace a pygmy blue whale from a foraging BIA.

Other migratory low frequency cetaceans that may occur seasonally in the Operational Area include fin, sei and humpback whales. These species undertake seasonal migrations and may transit through the Operational Area.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Behavioural thresholds are exceeded for each vessel noise scenario modelled, from between 210m for a multipurpose vessel to 7.93 km for a resupply operation, and there is therefore potential for pygmy blue whales to be exposed to underwater noise levels that may alter their behaviour when they are in the region during seasonal migrations. The Operational Area only makes up a small proportion of the total possible foraging BIA and migration BIA with any potential impact on foraging behaviour or deviation in migratory routes of individuals considered unlikely and insignificant given the whales' extensive migration range and high mobility. In addition the vessel activities, particularly those that involve dynamic positioning are intermittent and of short duration (typically lasting hours to days), further reducing the likelihood of prolonged exposure or significant behavioural disturbance.

The geophysical survey activities are only expected to result in behavioural effects to cetaceans most likely within tens of metres, and possibly up to hundreds of metres, from the survey activities. Such localised effects and potential deviations are not expected to be significant given the transient nature of cetaceans or in the context of long-distance migrations undertaken by pygmy blue whales or other migratory species that might be present.

No injury – as defined by *Guidance on Key Terms within the Conservation Management Plan for the Blue Whale* (DCCEEW 2021) will credibly occur to pygmy blue whales. It is not credible that PTS or TTS effects will occur from vessel noise or geophysical equipment as individual animals are unlikely to remain within range of the activities (i.e. within a maximum 1.2 km for vessel resupply and less for single vessel operations, and a few hundred metres of the SBP geophysical survey equipment) for continuous durations long enough for the relevant sound exposure threshold to be exceeded, being 24 hours.

An animal remaining in the area ensonified above impact thresholds is unrealistic as:

- The highest noise generating activities are shorter (Vessel resupply typically requires < 8 hrs) and vessels are unlikely to remain on DP in one location for more than 24 hours during survey activities.
- Animals experiencing uncomfortable levels of noise are reasonably expected to move away from or avoid the sound source.

Individual fin, sei and humpback whales are also not expected to linger in proximity to vessels. Consequently, PTS and/or TTS will not credibly occur in any LF marine mammals because of the petroleum activity

The Petroleum Activity is a temporary one and mitigation measures are in place to further reduce sound exposure to cetaceans with the proposed mitigation measures for underwater noise in place for this activity including adaptive management detailed in 7.2.5. These measures can be implemented to ensure any blue whale can utilise a BIA without injury and reduce the risk of displacement occurring as per the *Guidance on Key Terms within the Conservation Management Plan for the Blue Whale* (DCCEEW 2021) that details mitigation measures must be implemented to reduce the risk of displacement occurring during operations where modelling indicates that behavioural disturbance within a foraging area may occur.

Overall, the activity is therefore not considered likely to prevent pygmy blue whales from utilising the BIAs, nor cause auditory impairment or present a high risk of behavioural disturbance resulting in displacement to any cetaceans in the region. No injury, mortality, population-level impacts or long-term ecological effects are expected.

Marine Turtles

Marine turtles may occur in the Operational Area (refer Section 4.6.2). There is reproduction BIAs for green and hawksbill turtles within 3 km of the Operational Area. There is also a nesting habitat deemed critical to the survival of green turtle at Scott Reef that is in close proximity to the Operational Area. The green turtle (Scott Reef-Browse Island Stock) peak nesting period is between December to March however, green turtles may be present year-round. Females nest on Sandy Islet before returning to nearshore foraging areas. Emerging green turtle hatchlings swim into the open ocean and are known to remain there for several years before eventually travelling to the feeding grounds as sub-adults, some returning to Sandy Islet as mature adults to lay eggs (Gilmore et al. 2013). Both female turtles and hatchlings may be sensitive to noise disturbance during this period. Marine Turtle Internesting is defined as the rest time taken by female turtles between laying successive clutches. Females typically lay several clutches during each nesting season. The Recovery Plan for Marine Turtles in Australia (2017) identifies anthropogenic threats (including noise) to be minimised to allow the long-term recovery of marine turtle populations.

The Recovery Plan for Marine Turtles (CoA 2017) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). it is reasonable to expect that marine turtles may demonstrate avoidance or attraction behaviour to the noise generated by the activity however the Petroleum Activity is a temporary one. Turtles may exhibit behavioural responses when exposed to underwater noise, such as diving.

Survey vessels will contribute underwater noise to the marine environment; however, dynamic positioning (DP) will only be used for short periods . Any behavioural disturbance associated with vessel noise is therefore expected to be localised and temporary due to the short duration of activities at any one location.

Modelling of sub-bottom profilers (SBP) indicates that sound levels are predicted to fall below the 166 dB re 1 µPa SPL behavioural response threshold within a few metres to tens of metres of the source (Zykov 2013; McPherson and Wood 2017). The marine turtle audiogram suggests hearing sensitivity is concentrated within a relatively narrow band of the broader low-frequency range (Accomando et al. 2024). As such, in the absence of turtle-specific propagation

modelling, the distances at which low-frequency cetacean PTS and TTS thresholds may be exceeded have been used as a conservative proxy to assess the potential spatial extent of impacts to marine turtles.

For low-frequency cetaceans, modelling studies indicate that PK and SEL_{24h} thresholds for PTS are not exceeded and that TTS resulting from single-pulse PK exposure is not predicted to occur (Zykov 2013; McPherson and Wood 2017). Potential TTS resulting from SEL_{24h} exposure is limited to a few metres from the moving source (Zykov 2013; McPherson and Wood 2017). As with cetaceans, this is not considered a credible scenario for marine turtlesas individuals are unlikely to remain within the affected area for sufficient time to accumulate the required exposure.

There is potential for disturbance to interesting behaviours of individual turtles although given the temporary nature of the disturbance unlikely to affect individual breeding success or impact marine turtles at the population level.

Overall, behavioural effects resulting from vessel operations, geophysical survey equipment and geotechnical activities are expected to be localised and temporary, generally within close proximity to the source attenuating quickly. It is unlikely that turtles would remain in the vicinity of the operation and would likely avoid the sound source on commencement of the activity, and after the start of the activity it is anticipated that marine fauna will avoid the sound of the activity. With control measures in place no injury, auditory injury, TTS or PTS is expected, and impacts to marine turtles at the population level are not anticipated.

Sea Snakes

The critically endangered Short-nosed Sea snake and Leaf-scaled Sea Snake may occur in the Operational Area. Conservation advice has indicated that oil and gas exploration activities have caused a decline in these species however, a Recovery Plan is not required as further research is required to fully understand the threats and ecological requirements of the species (DSEWPaC 2011a, 2011b). The Dusky Sea Snake is endangered and may occur in the Operational Area with the remaining dusky sea snake stronghold located at the Scott Reef complex. Conservation advice for the dusky sea snake is to ensure vessels are operating under minimal-noise guidelines in these areas (DCCEEW 2023).

Impacts of acoustic signals on sea snakes have not been researched in great depth. Chapuis, et al. 2019 provided the first experimental evidence of underwater hearing in sea snakes, measuring auditory evoked potentials in *Hydrophis stokesii*. The study demonstrated sensitivity to low frequency sound (40–600 Hz), with peak sensitivity around 60 Hz. However, overall auditory sensitivity was found to be relatively lower than that reported for bony fishes and marine turtles. Since there is limited guidance on hearing thresholds for sea snakes, the extent of potential impacts is conservatively considered however, sea snakes are unlikely to be encountered during the Petroleum activity. Guinea and Whiting (2005) reported that very few short-nosed sea snakes moved as far as 50 m from the reef flat. The nearest coral reef and seagrass habitat is Scott Reef (0.5 km west of Operational Area) and Seringapatam Reef (19 km NNE of Operational Area) and therefore sea snakes are unlikely to be encountered in high numbers in the Operational Area given its proximity to suitable reef habitat is greater than 50m and in water depths of >75m. Vessel noise may result in avoidance behaviour however, these behavioural impacts to sea snakes are likely to be restricted to very low numbers of potential individuals transiting through the area. No injury, mortality, population-level impacts or long-term ecological effects are expected.

Fish, Sharks and Rays

Modelling results indicate potential impacts to fish from vessel noise are limited to within 80m for all scenarios.

The potential for injury or TTS effects to fish resulting from single-impulse peak pressure exposure or accumulated exposures to geophysical survey equipment sound is limited to within approximately 1–2 m beneath or to the side of the sound source (Zykov 2013; McPherson and Wood 2017). Exposure at such close range is considered highly unlikely, particularly given the mobile nature of fish and the moving survey vessel.

As a result, impacts to fishes are expected to be limited primarily to localised and temporary behavioural responses. Demersal and pelagic fish species present within the Operational Area are primarily sensitive to close-range particle motion rather than sound pressure, and any behavioural effects are therefore expected to be limited to within tens of metres of the various geophysical and geotechnical sound sources (Popper et al. 2014; Zykov 2013; McPherson and Wood 2017).

Impacts to protected species of sharks and rays, including whale sharks, are not expected. Sharks do not possess swim bladders and are therefore less sensitive to sound pressure than many teleost fish species. In addition, the whale shark foraging BIA is located approximately 27 km from the Operational Area and does not overlap the survey activities.

Overall, impacts to fish, sharks and rays are expected to be limited to temporary and localised behavioural responses in the immediate vicinity of the activity. No injury, mortality, population-level impacts or long-term ecological effects are expected.

Potential impacts to ecosystems/habitats

Modelling of sound levels beneath SBP, MBES and SSS instruments (Zykov 2013; McPherson and Wood 2017) indicates there would be no impact to benthic invertebrates. Therefore, benthic habitats and communities, including those associated with KEFs, will not be affected by sound produced by the geophysical or geotechnical survey activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impacts to plankton will be limited to within just metres (McPherson and Wood 2017), which is negligible in the context of naturally variability.

Therefore, impacts to marine habitats, primary and secondary production (plankton) and ecosystems are not expected.

Cultural features and heritage values

Refer to Section 6.11 for an assessment of potential impacts to cultural features and heritage values from the Petroleum Activity. Related control measures that demonstrate that impacts are reduced to ALARP and are of an acceptable level have been captured in Section 6.11.

Cumulative underwater sound impacts

Potential impacts are expected to be limited to localised and temporary behavioural responses in the vicinity of vessel operations and geophysical or geotechnical survey activities. While multiple vessels may increase the area over which elevated noise levels occur, the potential cumulative sound has been modelled and discussed above with the extent of potential impacts being limited. No concurrent petroleum activities are expected.

There is no existing subsea infrastructure or vessel traffic within the Operational Area which may contribute to background underwater noise; and any cumulative effects are expected to be minor, localised and temporary.

Overall, given the limited spatial extent and low consequence of predicted behavioural responses, cumulative underwater sound impacts are not expected to result in lasting or population-level effects and do not increase the consequence rating of the impact.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[30]***	***Benefit in impact reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
Implement EPBC Regulations 2025 Part 8 Division 8.1 Interacting with Cetaceans, which includes the following: • Vessels will not travel greater than 6 knots within 300 m of a cetacean (caution zone). • Vessels will not approach closer than 50 m for a dolphin or 100 m for a whale (except animals bow riding). • Vessel will not approach within 300 m of a calf. If a calf appears, vessel will immediately withdraw at a constant speed of less than 6 knots. • If the cetacean shows signs of being disturbed, vessels will immediately withdraw from the caution zone	F: Yes. CS: Minimal cost. Standard practice.	EPBC Regulations 2025 Part 8 Division 8.1 Interacting with Cetaceans includes requirements relating to the speeds vessels can travel within particular distances of cetaceans. Reducing the travel speed of vessels can also reduce the sound levels that are produced, reducing the potential impact on cetaceans from survey vessels.	Controls based on legislative requirements – must be adopted.	Yes C 5.1

Generation of light emissions from vessel operations					X		A	F	-	-	PJ	Broadly Acceptable	EPO 2 EPO 6 EPO 7 EPO 8

Description of Source of Impact

Vessel operations

Routine light emissions include light sources that alter the ambient light conditions in an environment at night. The survey vessels will routinely use external lighting to facilitate navigation and conduct safe operations at night throughout the Petroleum Activity. This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights and is not dissimilar to lighting used for other offshore activities, including fishing and shipping.

Lighting levels will be determined primarily by operational safety and navigational requirements under relevant legislation, specifically the *Navigation Act 2012* (Cth). Survey vessels will be lit to maintain operational safety on a 24-hour basis. External light emissions from the vessels are typically managed to a level that maintains good night vision for crew members. Lighting on the vessels is used to allow safe operations during night hours, and to communicate the vessel's presence and activities to other marine users (i.e. navigation lights). Lighting is required to safely operate the vessels and cannot reasonably be eliminated.

Geophysical and geotechnical activities may be completed over several multi-week campaigns (typically 20–60 days in duration) split over the five-year period of this EP. Survey activities within the Operational Area are estimated to take up to a maximum of 90 days per year (during anytime in a calendar year). The vessels involved will be operating 24 hours a day, seven days a week, while operations are underway.

Due to the transient nature of the survey activity, the source location of the light emissions will vary across the Operational Area throughout the activity.

Lighting from survey vessels may appear as a direct light source from an unshielded lamp with direct line of sight to the observer or through sky glow. Direct lighting falling upon a surface is referred to as light spill. Sky glow is the diffuse glow caused by light that is screened from view, but through reflection and refraction creates a glow in the atmosphere. The distance at which direct light and sky glow may be visible from the source depends on the characteristics of the vessel (namely height above sea level) and environmental conditions (e.g. cloud cover). The external lighting, which is located over the entire vessel, is not expected to be >20 m above sea level. The distance to the horizon at which components of the vessel will be directly visible can be estimated using the formula of:

$$horizon\ distance = 3.57 \times \sqrt{height}$$

where 'horizon distance' is the distance to the horizon at sea level in kilometres and 'height' is the height above sea level of the light source in metres. Using this formula, the approximate distances at which vessel lighting will be visible at sea level is about 16 km from the vessel, based on the typical survey vessels that are proposed to be used for the Petroleum Activity.

While the line of sight may extend to this 16 km distance from the source (vessel), the light density (measured in Lux – which represents the intensity of light that arrives at or leaves a surface, as perceived by the human eye) rapidly

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

decreases as distance increases from the source of the light. Monitoring undertaken as a part of Woodside's 2014 study indicated light density (from navigational lighting) attenuated to below 1.00 Lux and 0.03 Lux at distances of 300 m and 1.4 km, respectively, from the source (a MODU). Light densities of 1.00 Lux and 0.03 Lux are comparable to natural light densities experienced during deep twilight and during a quarter moon. Navigational lighting levels from survey vessels is expected to be appreciably lower than lighting on a MODU, hence light emissions from the survey vessels are expected to be below 1.00 Lux within 300 m from the source.

Impact Assessment

Environmental Value(s) Potentially Impacted

Receptors that have important habitat within a 20 km buffer of the Operational Area were considered for the impact assessment, based on recommendations of the National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds. The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings, demonstrated to occur at 15–18 km, and fledgling seabirds grounded in response to artificial light 15 km away (CoA 2020).

The Operational Area/s are in close proximity to the following relevant BIAs and critical habitat (Section 4.6):

- nesting critical habitat for the survival of the green turtles (Operational Area Part A),
- little tern resting (Operational Area Part A)

Additional species presence including green sawfish, leaf-scaled and short-nosed seasnake were the only ones identified as occurring within the 20 km buffer.

Light emissions have the potential to disrupt ecological processes that rely on natural light for visual cues. Light emissions can affect fauna in two main ways:

- Behaviour: many organisms are adapted to natural levels of lighting and the natural changes associated with the day and night cycle as well as the phase of the moon. Artificial lighting has the potential to create a constant level of light at night that can override these natural levels and cycles.
- Orientation: species such as marine turtles and birds may also use lighting from natural sources to orient themselves in a certain direction at night. In instances where an artificial light source is brighter than a natural source, the artificial light may override natural cues, leading to disorientation.

The impact assessment for above-surface artificial light emissions has focused on seabirds and marine turtles, as these taxa are recognised as being susceptible to behavioural disruption and disorientation from artificial light sources (CoA, 2020).

Migratory birds

Artificial lighting can attract and disorient seabird species resulting in species behavioural changes (e.g. circling light sources or disrupted foraging), injury or mortality near the light source as a result of collision (Longcore and Rich 2004; Gaston et al. 2014). The Operational Area may be visited by migratory and oceanic birds but does not contain emergent land that could be used as roosting or nesting habitat or known critical habitats for seabirds or migratory shorebirds. Although Operational Area Part A overlaps a small peripheral part of the little tern resting BIA associated with Scott Reef and the 20 km buffer around Operational Area Part B, it does not intersect any seabird or migratory shorebird bereding BIAs.

The most vulnerable life stages for seabirds and migratory shorebirds are nesting adults or fledglings. Nesting or fledgling seabirds and migratory shorebirds are vulnerable to artificial lighting within 20 km of the nesting location (CoA 2020). The nearest emergent land is Sandy Islet (~23.2 km east from Operational Area Part A) and Ashmore Reef (~197 km north of Operational Area Part A), outside of the light impact buffer (20 km).

Any behavioural disturbance to birds is expected to be temporary, localised and limited to individuals in the immediate vicinity of survey vessels while operations are underway and not affect nesting birds or fledglings.

The light source from the vessels within the Operational Areas will be temporary and only when operations are occurring. Interactions with seabirds are therefore expected to be unlikely and any impacts are predicted to be at an individual and not a population level. Therefore, any temporary behavioural disturbance of birds will be localised around the light sources and not result in a substantial adverse effect on a population of species or its lifecycle.

Artificial light from the Petroleum Activity is not predicted to disrupt critical breeding behaviours within important nesting habitat or displace seabirds from nesting habitat

Consequently, impacts are expected to be limited to short-term behavioural responses with no lasting effect on seabird populations.

Marine turtles - hatchlings

Turtle hatchlings emerge from the nest and orient towards the sea. After entering the water, hatchlings use a combination of cues (wave direction and currents) to orient and travel into offshore waters. Impacts to the sea-finding behaviour of hatchlings are more common for light sources behind a beach, as lighting offshore will orient emerging hatchlings towards the sea. Sea-finding behaviour of hatchlings is also impacted by light type and intensity, with broader spectrum or 'whiter' light sources (e.g. light-emitting diodes and metal halide lamps) having more of an impact

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

on hatchling sea-finding orientation compared to a narrow spectrum of light, such as low-pressure sodium lighting (Gomez Isaza et al. 2025).

Artificial light at close distances can also impact hatchling dispersal once they are in the water. Light spill may 'entrap' hatchling swimming behaviour, reducing the success of their seaward dispersion and causing them to spend more time in the predator-rich nearshore waters (Thums, et al., 2016; Truscott, et al., 2017; Wilson, et al., 2018).

The nearest turtle nesting locations to the Operational Area are on Sandy Islet at Scott Reef (23.2 km west). The green turtle and hawksbill reproduction BIA is overlapped by the 20km light buffer. Geophysical survey activities are mobile and will not remain in any one location for extended periods, thereby reducing the duration of potential light exposure at a given receptor location. Geotechnical vessels will be stationary whilst undertaking surveys, but typically for short durations before moving onto another location.

As such, the risk of significant numbers of dispersing hatchlings becoming attracted to direct light or sky glow from survey vessels is considered low. This is supported by the findings of a desktop lighting impact assessment for the Scarborough Project, conducted by Pendoley Environmental (2020). At a range of ~20 km, the density of dispersing hatchlings is expected to be low and very few individuals will be at risk of attraction. For any isolated individuals potentially attracted to light spill from survey vessels, following sunrise, any effect of these light sources on hatchlings will be eliminated, allowing dispersal behaviour to resume. Given the closest beach where hatchlings may be present is over 20 km away from the closest point of the Operational area, it is likely that hatchling density will be lower than the nearer shore waters.

Any impacts to hatchling turtles from artificial light will be limited to possible short-term behavioural impacts to isolated individual hatchlings offshore, with no lasting effect to the species.

Marine turtles – adults

Artificial lighting may affect where nesting adult turtles emerge onto the beach, the success of nest construction, whether nesting is abandoned, and the seaward return of adults (Salmon et al. 1995a, 1995b; Salmon and Witherington 1995). Such lighting is typically from residential and industrial development at the coastline, rather than offshore from nesting beaches.

The internesting period is the duration between each successive clutch during that season. The females remain close to rookeries or beaches; therefore, designated and defined buffer zones have been gazetted immediately seaward from nesting beaches. While there are critical habitat overlapping the Operational Area and reproduction BIA within the 20km light buffer, marine turtles do not use light cues to guide these behaviours. Furthermore, there is no evidence, published or anecdotal, to suggest that internesting turtles are impacted by light from offshore vessels. As such, light emissions from the survey vessels are unlikely to result in displacement of, or behavioural changes to individuals in these life stages (Pendoley Environmental 2020).

The nearest nesting beaches are on Sandy Islet (Scott Reef), approximately 23.2 km from Operational Area Part A, outside of the 20 km buffer recommended for light impact assessment, meaning direct light from the survey vessels will not be visible to nesting adult turtles. Furthermore, nesting females are not considered highly vulnerable to disorientation due to artificial light (Pendoley Environmental 2020). Furthermore, the light source would be located offshore in the same general direction as the females' normal return to sea following nesting. As a result, vessel light sources is unlikely to discourage females from nesting, or alter nest site selection, and therefore will not displace females from nesting habitat.

Although individual turtles that may be foraging within or adjacent to the Operational Area may occur, marine turtles do not use light cues to guide these behaviours. As such, light emissions from survey vessels are unlikely to result in more than localised behavioural disturbance to isolated transient individuals, with low-level effect to the species.

Other marine fauna

Zooplankton, including krill, may be impacted by vessel lighting via disruption to diel vertical migration, the daily movement of individuals in the water column in response to natural changes ambient light levels (Berge, et al., 2020). Increased light levels can cause zooplankton to migrate to deeper waters where light levels are lower, with cascading trophic impacts. Such impacts would be highly localised within the vicinity of the vessel (e.g. up to 200 m depth, Berge, et al. (2020)) and low-level given the vessel is continually moving, albeit at a slow speed (unlike in Berge, et al. (2020)). Given the transient nature of the light sources, impacts to zooplankton populations is expected to be localised and low-level and is not expected to result in ecosystem level impacts.

Lighting from the presence of a vessel may result in the localised aggregation of fish below the vessel. These aggregations of fish are considered localised and temporary and any long-term changes to fish species, including whale sharks, composition of abundance is considered highly unlikely. Similarly, any localised impacts to marine fish are not expected to impact on any commercial fishers in the area.

Protected Areas

The Operational Area do not overlap any protected areas. However, the Scott Reef Nature Reserve is located adjacent to the Operational Area, approximately 5.6 km to the west of Operational Area Part A (refer to Figure 4-14). Light emissions from GPGT survey vessels may be visible from within the Nature Reserve. Species within the Nature Reserve have been assessed in the sections above. Given the small scale of impacts and the limited overlap of activities, light emissions from GPGT survey vessels is not expected to impact the values of the Nature Reserve (values are described in the Master Existing Environment document in Appendix C).

Cultural features and heritage values

Refer to Section 6.11 for an assessment of potential impacts to cultural features and heritage values from the Petroleum Activity. Related control measures demonstrate that impacts are reduced to ALARP and are of an acceptable level have been captured in Section 6.11 below.

Cumulative impacts

No significant cumulative impacts over the life of the Petroleum Activity or in relation to other operations and activities in the region (e.g. Ichthys or Prelude) are expected.

Demonstration of ALARP				
Control Considered	***Control Feasibility (F) and Cost/Sacrifice (CS)[31]***	***Benefit in Impact/Risk Reduction***	***Proportionality***	***Control Adopted***
Legislation, Codes and Standards				
No additional controls were identified.				
Good Practice				
Lighting will be limited to the minimum required for navigational and safety requirements, with the exception of emergency events.	F: Yes. Lighting is typically appropriate for navigation and safety. CS: Minor.	Given the potential impacts to turtles during this activity is insignificant, implementation of this control would not result in a reduction in consequence.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 7.1
Implement the Woodside Offshore Seabird Management Plan in accordance with Section 7.2.4	F: Yes. The management plan is an internal Woodside process developed to manage the impacts of artificial light emissions. CS: Minimal cost/sacrifice.	Implementing a Seabird Management Plan will enable standardised data collection to better understand seabird interactions with survey vessels, provide guidance on seabird management to enable the best outcomes for grounded birds and facilitate escalation and adoption of management actions within 24 hours, preferably before next nightfall, should triggers be met.	While the control does not inherently result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 8.1
Professional Judgement – Eliminate				
Substitute external lighting with 'turtle-friendly' light sources (reduced emissions in turtle visible spectrum).	F: Yes. Replacement of external lighting with turtle-friendly lighting is technically feasible, although is not considered to be practicable. CS: Significant cost sacrifice. The retrofitting of all external lighting on the vessels would result in considerable cost and time expenditure. Considerable logistical effort to source	Given the potential impacts to turtles during this activity are insignificant, implementing this control would not reduce the consequence.	Grossly disproportionate. Implementing the control requires considerable cost sacrifice for minimal environmental benefit. The cost/sacrifice outweighs the benefit gained.	No

Demonstration of ALARP				
Control Considered	***Control Feasibility (F) and Cost/Sacrifice (CS)[31]***	***Benefit in Impact/Risk Reduction***	***Proportionality***	***Control Adopted***
	sufficient inventory of the range of light types onboard the vessel.			
Use of curfews to manage light emissions at night.	F: Yes. Variation of Petroleum Activity timing to manage light emissions at night is technically feasible, although it is not considered to be practicable. CS: Significant cost sacrifice. The use of curfews to limit light emissions at night would substantially limit operations to only daylight hours. Additionally, the survey vessels are required to use a baseline level of lighting for navigational safety, meaning the use of curfews to limit project operations to daylight hours would not eliminate light emissions at night. The use of curfews would effectively double the duration of the campaign, resulting in increased environmental impacts and risks and a significant increase in cost.	Given the potential impacts to turtle and seabird species during this activity are insignificant, implementing this control would not reduce the consequence.	Grossly disproportionate. Implementing the control requires considerable cost sacrifice for minimal environmental benefit with respect to light emissions and increased environmental impacts in other aspects. The cost/sacrifice outweighs the benefit gained.	No
Vary the timing of the Petroleum Activity to avoid turtle nesting and hatching peak periods.	F: No. Timing of survey activities is currently undetermined, and due to vessel availability and operational requirements, undertaking activities during migration seasons may not be able to be avoided. CS: Significant cost and schedule impacts due to delays in securing survey vessel for specific timeframes.	Not considered, control not feasible.	Not considered, control not feasible.	No
Complete survey activities in the Operational Area outside of peak turtle hatchling emergence period (Dec to Mar)	F: No. Timing of survey activities is currently undetermined, and due to vessel availability and operational requirements, undertaking activities during peak hatching seasons may not be able to be avoided. CS: Significant cost and schedule impacts due to	Not considered, control not feasible.	Not considered, control not feasible.	No

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considered the adopted controls appropriate to manage potential impacts associated with routine light emissions from the survey vessels. Efforts will be made to minimise unnecessary disturbance from light and has been investigated above.				

Demonstration of acceptability
Acceptability statement: The impact/risk assessment has determined that, given the adopted controls, routine light emissions from the survey vessels may result in no lasting effect with localised impact not significant to environmental receptors such as turtles, fish or seabirds. Section 6.8.4 demonstrates that the Petroleum Activity is not inconsistent with any recovery plan of threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.8.5 Routine atmospheric and greenhouse gas emissions: fuel combustion

Context		
Survey vessels – Section 3.8	Physical Environment – Section 4.4	Consultation – Section 5

Impact evaluation summary

Source of impact	*Environmental value potentially impacted*						*Evaluation*						
	Marine Sediment	Water Quality	Air Quality (inc odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Exhaust emissions associated with internal combustion engines and incinerators on survey vessels			X				A	F	-	-	LC S GP PJ	Broadly Acceptable	EPO 9

Description of source of impact

Atmospheric and GHG emissions associated with internal combustion engines (including all equipment and generators) and incineration activities (including onboard incinerators) will be generated by the survey vessels during the Petroleum Activity. These have been classified into two categories:

- Atmospheric emissions (non-GHG emissions) are gases or particles produced associated with survey vessels within the Operational Area, which are discharged to the atmosphere and pose a recognised level of adverse effect on human health and/or flora and fauna.
- GHG emissions are those gasses within the atmosphere that absorb long-wave radiation, and thus trap heat reflected from the Earth's surface.

The geophysical and geotechnical survey vessels are anticipated to emit up to 7 tonnes of GHG per day. Considering the duration of the Petroleum activities (90 days per year throughout the 5 year life of the EP, refer to section 3.5), 3,150 tonnes of GHG emissions are anticipated (Table 6-9). Helicopter use has not been provided for in this EP however may be used in emergency situations.

Table 6-9: Greenhouse gas emissions and sources

Source	GHG emissions released (tonnes of carbon dioxide equivalent)
Geophysical/geotechnical operations	
Multipurpose/Geotechnical Drilling Vessel (90 days per year)	630
Total GHG emissions over 5 year life of EP	**3,150**

Impact assessment

Environmental value(s) potentially impacted

Air quality (atmospheric pollutants)

Fuel combustion has the potential to result in localised, temporary reduction in air quality. Potential impacts include a localised reduction in air quality and contribution to greenhouse gas emissions. Given the short duration and the offshore location of the Petroleum Activity (~397 km NE of Broome), which will lead to the rapid dispersion of the low volumes of atmospheric emissions, the potential impacts are expected to be localised and of no lasting effect.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Atmospheric emissions can cause direct impacts to fauna, if they are in the presence of significant releases. Birds, for example, have been shown to suffer respiratory distress and illness when subjected to extended duration exposure to air pollutants (Sanderfoot & Holloway, 2017). While a BIA for little tern resting overlaps Operational Area Part A, (refer to Section 4.6.4) species' breeding occurs from June to October (Table 4-13). Given there are no significant releases of atmospheric emissions associated with the Petroleum Activity and the vessels will be moving, facilitating dispersion in an open offshore environment, extended emissions exposure is not expected to occur to any marine fauna species. Injury or mortality to fauna as a result of atmospheric releases are not expected.

Aesthetic value

Atmospheric emissions have the potential to introduce odour and visual amenity issues which can result in changes to the aesthetic value of an area.

Given the distance from shore of the Petroleum Activity (~235 km) and the short duration of the activities, the potential for a change in air quality from atmospheric emissions resulting in a change to aesthetic value for tourism/recreation or settlements is not considered to be credible. Therefore, a change in aesthetic value from atmospheric emissions associated with Petroleum Activity is negligible.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[32]***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
Survey vessels comply with Marine Order 97 (Marine pollution prevention – air pollution), as applicable to vessel class	F: Yes. CS: Minimal cost. Standard practice.	Legislative requirements to be followed may slightly reduce the likelihood of air pollution.	Control based on legislative requirements – must be adopted.	Yes C 9.1
Provide emissions data where relevant to vessel contractor to enable legislative reporting requirements under the *National Greenhouse and Energy Reporting Act 2007* to be met.	F: Yes. CS: Standard practice. Required by Woodside standards.	Tracking and reporting of emissions gives visibility to performance and enables improvement opportunities to be identified. Reporting increases transparency and accountability which can also drive performance improvements.	Control based on legislative requirements – must be adopted.	Yes C 9.2

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential impacts associated with the potential impacts of fuel combustion. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact assessment has determined that, given the adopted controls, fuel combustion is unlikely to result in a potential impact greater than a temporary decrease in local air quality and/or water quality standards, with no lasting effect, localised impact not significant to environmental receptors. Further opportunities to reduce the impacts have been investigated above. The controls adopted are considered good survey practice/industry best practice and meet the legislative requirements within Marine Order 97. Section 6.8.5 demonstrates that the Petroleum Activity is not inconsistent with any recovery plan of threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.8.6 Routine and non-routine discharges to the marine environment: survey vessels

Context		
Survey vessels – Section 3.8	Physical Environment – Section 4.4 Habitats and Biological Communities – Section 4.5	Consultation – Section 5

Impact evaluation summary

Source of impact	*Environmental value potentially impacted*						*Evaluation*						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Routine discharge of sewage, grey water and putrescibles to marine environment from survey vessels		X					A	F			LCS GP PJ	Broadly Acceptable	EPO 10
Routine discharge of deck and bilge water to marine environment from survey vessels		X					A	F			LCS GP PJ	Broadly Acceptable	EPO 10
Routine discharge of cooling water or brine to the marine environment from survey vessels		X					A	F			LCS GP PJ	Broadly Acceptable	EPO 10
Routine discharge of drill cuttings and chemicals during geotechnical drilling to the marine environment from survey vessels		X					A	F			LCS GP PJ	Broadly Acceptable	EPO 10
Non-routine discharge of firefighting media		X					A	F			LCS GP PJ	Broadly Acceptabl	EPO 10

Description of source of impact

The vessels are likely to routinely generate/discharge:

- small volumes of grey water to the marine environment
- relatively small volumes (routinely/periodically) of bilge water, which can contain water, oil, detergents, solvents, chemicals, particles and other liquids, solids or chemicals
- variable water from vessel decks directly overboard or via deck drainage systems; sources could include rainfall events and/or deck activities such as cleaning/wash-down of equipment/decks
- cooling water from machinery engines and brine water produced during the desalination process of reverse osmosis to produce potable water onboard the survey vessels.

Non-routine survey vessel discharges may include firefighting foams, used in the event of an emergency. Survey vessels may be equipped with in-built or portable firefighting foam systems which typically supply 3% aqueous film-forming foam (AFFF) concentrates which may be used in the event of an emergency, such as a vessel fire.

Environmental risks relating to disposal/discharges above regulated levels or incorrect disposal/discharge of waste would be unplanned (non-routine/accidental) and are addressed in Section 6.9.6.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Drill cuttings

The geotechnical seabed coring will result in the indirect discharge of a small quantity of drill cuttings and fluid at the seafloor (refer Section 6.8.2). Drilling fluid will consist primarily of seawater and may have small quantities of additives. These additives are considered to be very low toxicity (as assessed through Woodside's Chemical Selection and Assessment Environment Guideline) as described in Section 6.8.2 and are expected to dilute rapidly upon discharge; as such, no toxic effects to biota are expected to occur.

All drilling fluids used during the drilling process will be discharged from the borehole at the seabed including small amounts of excess fluid which may be produced. Volumes of excess drilling fluid requiring discharge will be limited as fluids are mixed for use on an as needs basis.

Impact assessment

Environmental value(s) potentially impacted

The survey vessels will routinely discharge (daily if necessary) relatively small volumes of grey water and bilge water to the marine environment in compliance with MARPOL requirements. It is noted that sewage and putrescible wastes are not allowed to be discharged within 3 nm of land but may be discharged beyond 3 nm (including outside of the Operational Area) so long as it is discharged in accordance with MARPOL requirements. No significant impacts are anticipated because of the minor quantities involved, localised area of impact, high level of dilution into oceanic waters and high biodegradability/low persistence of the wastes disposed.

Bilge tanks receive fluids from many parts of the vessel. Bilge water can contain water, oil, detergents, solvents, chemicals, particles and other liquids, solids or chemicals. Treatment of bilge water will be conducted using an oily water separator or transported onshore for treatment and disposal. However, if not treated prior to discharge there would be potential for a negligible and localised increase in nutrient concentrations due to the high level of dilution and the natural daily nutrient flux that occurs within the region. The potential impact from routine discharge of treated or untreated sewage, grey water, bilge water and putrescible wastes is expected to be low.

The discharges outlined, which may include other non-organic contaminants (e.g. bilge water, deck drainage and cooling water), will be rapidly diluted when discharged. Variable water discharge from the vessel deck directly overboard or vial deck drainage systems could also occur. Water sources could include rainfall events and/or from deck activities such as cleaning/wash-down of equipment/decks. They are expected to be in very small quantities and concentrations that don’t pose any significant risk to any relevant receptors. As such, no significant impacts from the planned (routine and non-routine) discharges listed above are anticipated, because of the minor quantities involved and the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area.

Drilling fluid discharges are expected to increase turbidity and total suspended solids (TSS) levels above ambient concentrations above the seabed for a short duration during geotechnical drilling. Given the very small volumes discharged short duration and selection of low toxicity (as assessed through Woodside's Chemical Selection and Assessment Environment Guideline), the potential impacts are expected to be negligible.

Aqueous Film Forming Foams are typically comprised of a mix of organic and fluorinated surfactants, however novel and emerging AFFF products may also be comprised of fluorine-free formulations. When discharged in bodies of water, both fluorine containing and fluorine-free AFFF formulations may deplete dissolvable oxygen content. However, when diluted in low concentrations such as in the event of application in a fire, these foams are considered to have relatively low toxicity (Department of Environmental and Heritage Protection 2016). Further, concerns regarding contamination and the toxicity and bioaccumulation potential of AFFF discharges are typically associated with land and waterways near to sites with frequent or prolonged applications. This includes military sites such as defence areas and civilian sites such as airports and industrial areas (Moody et al. 2000; Hu et al. 2016). The non-routine discharge of AFFF in open water environment of the Operational Area in the event of a fire is not consistent with these conditions.

Given the toxicological effects of foam are associated with sites of frequent or prolonged applications and the notion that any non-routine AFFF discharges in the event of an emergency during the activity would be expected to rapidly disperse in the open water environment, it is expected that any impacts would be localised and short-term in nature. Furthermore, potential impacts of AFFF discharge in the event of an emergency are outweighed by the environmental and health and safety benefits that are achieved through suppressing fire and hence, mitigating potential for further adverse impacts.

Cumulative impacts

The survey vessels will be continuously moving in the Operational Area during the majority of the survey with only short stationary periods during the collection of geotechnical survey data. These routine and non-routine discharges are expected to be intermittent in nature for the duration of the Petroleum Activity. Therefore, cumulative impacts to water quality within the Operational Area are expected to be localised and short term, with no lasting effect.

It is possible that marine fauna transiting the localised area may come into contact with these discharges (e.g. marine turtles, cetaceans, fish, Section 4.6); however, given the localised extent of cumulative impacts from vessel discharges within the Operational Area, significant impacts to marine fauna are not expected.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential impacts/risks associated with planned (routine and non-routine) discharges. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact/risk assessment has determined that, given the adopted controls planned discharges (routine and non-routine) are unlikely to result in a potential impact not greater than localised impacts not significant to environmental receptors, and no lasting effect. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered good survey practice/industry best practice and meet legislative requirements under Marine Orders 91, 95 and 96. Section 6.8.6 demonstrates that the Petroleum Activity is not inconsistent with any recovery plan of threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.9 Unplanned activities (accidents, incidents, emergency situations)

6.9.1 Quantitative spill risk assessment methodology

As part of the risk identification process, Woodside identified the range of credible hydrocarbon spill scenarios that may occur during the Petroleum Activity.

Quantitative hydrocarbon spill modelling was undertaken by RPS, on behalf of Woodside, using a three-dimensional (3D) hydrocarbon spill trajectory and weathering model, Spill Impact Mapping and Analysis Program (SIMAP), which is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under the influence of changing meteorological and oceanographic forces

A stochastic modelling scheme was followed in this study, whereby SIMAP was applied to repeatedly simulate the defined credible spill scenarios using different samples of current and wind data. These data samples were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form oil-in-water emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column.

During each simulation, the SIMAP model records the location (by latitude, longitude and depth) of each particle (representing a given mass of hydrocarbons) on or in the water column, at regular time steps. For any particles that contact a shoreline, the model records the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, less any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

The collective records from all simulations are then analysed by dividing the study region into a 3D grid. For surface hydrocarbons (floating oil), the sum of the mass in all hydrocarbon particles located within a grid cell, divided by the area of the cell, provides hydrocarbon concentration estimates in that grid cell at each model output time interval. For entrained and dissolved aromatic hydrocarbon particles, concentrations are calculated at each time step by summing the mass of particles within a grid cell and dividing by the volume of the grid cell. The process is also subject to the application of spreading filters that represent the expected mass distribution of each distinct particle. The concentrations of hydrocarbons calculated for each grid cell, at each time step, are then analysed to determine whether concentration estimates exceed defined threshold concentrations.

Hydrocarbon spill modelling assessments undertaken by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases. This assessment is done by post-processing the sensitivity test results and analysing time-series of median and maximum concentrations in the water and on the surface.

6.9.1.1 Worst-case scenarios

In assessing the potential impacts of an unplanned hydrocarbon release, representative worst-case scenarios (in terms of volume and location) were assessed. A summary of the credible hydrocarbon spill scenarios that could occur during the Petroleum Activity are provided in Table 6-10.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-10: Credible hydrocarbon spill scenarios

Scenario	Hydrocarbon type	Duration (days)	Max. credible volume (m^3)	Locations
Scenario 1 An instantaneous release due to a vessel collision	Marine Gas Oil	Instantaneous	200	Operational Area Part A at location closest to Sandy islet 14° 1'24.07"S 121°54'40.46"E
				Operational Area Part B at location closest Sandy islet 14°23'45.39"S 121°41'48.81"E

6.9.1.2 Environment that may be affected and hydrocarbon contact thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental consequence by delineating which areas of the marine environment could be exposed to hydrocarbon levels that exceed selected hydrocarbon threshold concentrations if a credible hydrocarbon spill scenario occurs. The summary of the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the EMBA.

The EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for various weather and metocean conditions. The EMBA represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. Furthermore, as the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each hydrocarbon fate. Together, these EMBA have defined the spatial extent for the existing environment described in Section 4.

The spill modelling outputs are presented as areas that meet threshold concentrations for surface, entrained and dissolved hydrocarbons for the modelled scenarios. Surface spill concentrations are expressed as grams per square metre (g/m^2), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb).An additional threshold has been included to define the boundary within which socio-cultural impacts may occur, based on visible surface oil (1 g/m^2) impacting on the visual amenity of the marine environment. Each of these hydrocarbon thresholds are presented in Table 6-11 and described in the subsections below.

Table 6-11: Summary of thresholds applied to the quantitative hydrocarbon spill risk modelling results

Hydrocarbon type	Ecological hydrocarbon thresholds				Socio-cultural hydrocarbon thresholds	
	Dissolved hydrocarbon (ppb)	Entrained hydrocarbon (ppb)	Surface hydrocarbon (g/m^2)	Accumulated / shoreline hydrocarbon (g/m^2)	Surface hydrocarbon (g/m^2)	Accumulated hydrocarbon (g/m^2)
Marine Gas Oil	10	1,000	10	100	1	10

6.9.1.2.1 Surface hydrocarbon threshold concentrations

The spill modelling outputs defined the EMBA for surface hydrocarbons resulting from a spill (contact on surface waters) using a threshold of ≥10 g/m^2 (dull metallic colours) based on the relationship between film thickness and appearance (Bonn Agreement 2015) Table 6-12). This threshold concentration is used to define an area within which ecological impacts to the marine environment may occur from surface hydrocarbons. It represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g. to birds and marine mammals) are expected to occur.

Thresholds for registering biological impacts resulting from contact of surface slicks have been estimated by different researchers at about 10–25 g/m^2 (French et al. 1999; Koops et al. 2004; NOAA 1996). Potential impacts of surface slick concentrations in this range for floating hydrocarbons may include harm to seabirds through ingestion from preening of contaminated feathers, or the loss of the thermal protection of their feathers. The 10 g/m^2 threshold is the reported level of oiling to instigate impacts to seabirds and is also

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

applied to other wildlife, though it is recognised that 'unfurred' animals, where hydrocarbon adherence is less, may be less vulnerable. 'Oiling' at this threshold is taken to be of a magnitude that can cause a response from the most vulnerable wildlife such as seabirds. Due to weathering processes, surface hydrocarbons will have a lower toxicity due to change in their composition over time. Potential impacts to shoreline sensitive receptors may be markedly reduced in instances where there is extended duration until shoreline contact.

Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA, at concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible surface oil (1 g/m²) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur. This area is referred to as the socio-cultural EMBA. Potential impacts to socio-cultural values assessed within these EMBAs include:

- protected areas,
- national and Commonwealth Heritage Listed places,
- tourism and recreation, and
- fisheries.

Table 6-12: The Bonn Agreement oil appearance code

Appearance (following Bonn visibility descriptors)	Mass per area (g/m²)	Thickness (µm)	Volume per area (L/km²)
Discontinuous true oil colours	50 to 200	50 to 200	50,000 to 200,000
Dull metallic colours	5 to 50	5 to 50	5000 to 50,000
Rainbow sheen	0.30 to 5.00	0.30 to 5.00	300 to 5000
Silver sheen	0.04 to 0.30	0.04 to 0.30	40 to 300

6.9.1.2.2 Dissolved hydrocarbon thresholds concentrations

Dissolved hydrocarbons present a narcotic effect resulting from uptake into the tissues of marine organisms. This effect is additive, increasing with exposure concentration or with time of exposure (French-McCay 2002; NRC 2005). The dissolved aromatic threshold of 10 ppb has been selected as a threshold to approximate the potential toxic effects, particularly sublethal effects to sensitive species (French-McCay 2026).

Dissolved hydrocarbons represent the bioavailable fraction of oil in the water column and are therefore the most appropriate metric for assessing potential toxic effects to marine organisms. Toxicity studies consistently demonstrate that adverse biological effects are driven by exposure to dissolved oil components, rather than total oil mass or the physical presence of oil droplets, because only dissolved hydrocarbons can cross biological membranes and interact with target tissues. Acute toxicity datasets and species sensitivity distributions show that the majority of marine species experience no acute effects at dissolved hydrocarbon concentrations at or below 10 ppb, indicating that this concentration is protective of more than 95% of species for acute exposures (French-McCay 2026; Negri et al. 2021; Bejarano et al. 2017).

Experimental and modelling studies demonstrate that toxic effects may begin to occur in the most sensitive species and life stages at dissolved concentrations on the order of 10 ppb, including early biological and sub-lethal responses (French-McCay 2026; Bejarano et al. 2014; McGrath et al. 2018). As such, 10 ppb represents a lower-bound, biologically meaningful exposure value, rather than an arbitrary screening threshold. Use of this concentration is therefore appropriate for identifying ecological features that may be affected by dissolved oil and for assessing potential environmental consequences, while avoiding the implication that widespread or severe toxicity is expected. The 10 ppb dissolved hydrocarbon exposure value thus provides a conservative yet scientifically grounded basis for impact assessment of the dissolved-phase hydrocarbon fate.

As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 10 ppb is an instantaneous value while ecological studies are based on an exposure duration of typically 48 to 96 hours and therefore accounts for uncertainty in consequence from hydrocarbons spills on ecological, social, economic and cultural features of the environment.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.9.1.2.3 Entrained hydrocarbon thresholds concentrations

Entrained hydrocarbons in the water column consist of oil droplets containing a mixture of soluble, semi-soluble and insoluble compounds. The toxicologically relevant fraction of entrained oil is limited to the proportion of hydrocarbons that are able to dissolve from droplets into the surrounding water, with multiple experimental and modelling studies demonstrating that toxicity is driven by the dissolved fraction, rather than by droplet mass, and that dissolved hydrocarbons typically represent a small proportion (on the order of ~1%) of fresh oil, with these soluble components lost rapidly as oil weathers (Forth et al. 2017; Redman & Parkerton 2015; French-McCay 2026). Consequently, entrained oil droplets increasingly comprise non-bioavailable material over time, and entrained hydrocarbon concentrations are therefore a poor proxy for toxicity at low concentrations (Forth et al. 2017; Parkerton et al. 2018).

Given this established relationship between oil composition, dissolution processes and weathering, entrained oil concentrations must be substantially higher than dissolved effect thresholds before biologically meaningful exposure is plausible. French-McCay et al. (2018) demonstrate a direct correlation between entrained oil mass and the dissolved fraction derived from it, indicating that entrained concentrations two orders of magnitude greater than dissolved concentrations are required to represent equivalent exposure potential. On this basis, an entrained hydrocarbon exposure value of 1,000 ppb represents a scientifically justified lower-bound threshold for identifying ecological features that may be affected by entrained oil and for assessing potential environmental consequences. This threshold appropriately reflects the limited bioavailability and declining toxicity of entrained oil droplets, while remaining conservative for impact assessment purposes (French-McCay et al. 2018; Negri et al., 2024).

As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors are expected to be associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur. The application of this threshold is conservative as the 1,000 ppb is an instantaneous value whereas laboratory-based ecological studies typically assess toxicity over exposure durations of 48 to 96 hours, such that use of an instantaneous exposure value provides a precautionary margin to account for uncertainty in the assessment of potential ecological, social, economic and cultural consequences of hydrocarbon spills.

6.9.1.2.4 Accumulated hydrocarbon threshold concentrations

Owens et al. (1994) define accumulated hydrocarbon <100 g/m² to have an appearance of a stain on shorelines. French-McCay (2009) defines accumulated hydrocarbons ≥100 g/m² to be the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat. A threshold of ≥100 g/m² has been adopted as the threshold for shoreline accumulation and has been included in the EMBA.

As described above Woodside recognises that hydrocarbons may be present beyond the ecological impact EMBA at low concentrations that may be visible but are not expected to cause ecological impacts. The threshold for visible shoreline accumulation (10 g/m²) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur.

6.9.1.3 Operational and scientific monitoring

A planning area for operational and scientific monitoring is also described in Annex C of the Oil Spill Preparedness and Response Mitigation Assessment (OSPRMA) (Appendix G). This planning area has been set with reference to a low exposure values of 1 g/m^2 for surface hydrocarbons, 10 g/m^2 for accumulated hydrocarbons, and 10 ppb for both entrained and dissolved.

An operational scientific monitoring program may be activated following a release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) and any identified pre-emptive baseline areas for the worst-case credible spill scenario or other identified unplanned hydrocarbon releases associated with the operational activities.

6.9.1.4 Hydrocarbon characteristics

Table 6-13 summarises the characteristics of the hydrocarbons used as the basis for the modelling studies and subsequently used to inform the assessment of credible hydrocarbon spills. Additional detail on the characteristics of these hydrocarbons is also provided in the sections below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-13: Characteristics of the hydrocarbon types used for modelling and ecotoxicological studies

Hydrocarbon Type	Density (g/m3) at 25 °C	Viscosity (cP) at 25 °C	Component	Volatile (%)	Semi-volatile (%)	Low volatility (%)	Residual (%)	Aromatics (%)
			Boiling Point (°C)	<180	180–265	265–380	>380	Of whole oil <380
Marine Gas Oil	0.829	4.00	% of total	6	34.6	54.4	5.0	3.0
			% of aromatics	1.8	1.0	0.2	-	-

6.9.1.4.1 *Marine Gas Oil*

Marine Gas Oil (MGO) is a processed oil that is formulated entirely from the products of distillation (i.e. does not contain residues of distillation that are added to heavier fuel oils. Like all oils, MGO is a complex mixture of multiple hydrocarbon compounds that vary by volatility and solubility. The physical and chemical properties of MGO will determine the way this oil behaves in the marine environment. SIMAP calculations account for the initial density and viscosity of the whole, unweathered, oil mixture as well as the volatility and solubility of component hydrocarbons summarised as pseudo-components. There are multiple grades of MGO that are commercially available, which vary in viscosity and the proportion of longer-chain hydrocarbons (ExxonMobil; online source). The modelling applied specifications from assays of Distillate Marine Fuel Grade A (DMA) MGO (Table 6-13), which is the most common fuel oil used by small to moderate sized vessels in warm water and temperate environments.

MGO is a mixture of both volatile and persistent hydrocarbons. MGO fuels, in general, have relatively low viscosity and density and will consequently spread rapidly as a floating film on calm seas. This spreading will enhance the rate of evaporation of the more volatile components, but evaporation will then slow as the mixture evolves towards higher proportions of the low volatile and non-volatile components.

The residual compounds (BP > 380 °C) will resist evaporation and will require the slower process of degradation (photo and biological) to degrade. The residual mixture will be composed of long chain alkanes, cycloalkanes and other hydrocarbon compounds with complex molecular structures that will be subject to microbial degradation over the longer term (weeks to tens of weeks after release).

The low viscosity of MGO fuels require relatively low wave energy to break up floating slicks and suspend MGO as droplets mixed into the wave-affected layer of the ocean surface. These suspended droplets will be buoyant but will remain in suspension when there is sufficient wave energy. Waves generated by wind speeds as low as 6–7 knots on the open ocean will start to suspend films of floating MGO. Entrainment rates will increase significantly as sea conditions become more energetic. One effect of suspension will be reduction of the evaporation rates of the component hydrocarbons.

In addition to being volatile, the aromatic components, present at a relatively low proportion of the unweathered mixture (~3%) are soluble and may dissolve into the water column from slicks and entrained droplets. Both the solubility and volatility of these compounds vary with the complexity of the hydrocarbon molecules. Around 1.8% of the mixture is contributed by mono-aromatic (MAH) compounds that are both highly volatile and highly soluble and will tend to evaporate rapidly either directly from slicks, or from the water if they first dissolve from the slicks. Semi-volatile (di-aromatic hydrocarbons) and low volatile components (polyaromatic hydrocarbons) contribute around 1.2% of the unweathered mixture will tend to persist in solution if they dissolve.

The mass balance forecast for the constant low-wind case shows rapid initial evaporation, with ~38% lost in the first 12 hours and an additional ~2% in the next 12 hours (Figure 6-6). Evaporation then slows, with ~5% of the remaining mass lost over the following six days. Only a small fraction (~2%) is degraded by microbial and photochemical processes during the first week.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Predicted weathering of MGO, based on typical conditions in the region indicates ~24 hours after the spill, around 74% of the oil mass is forecast to have entrained and a further 26% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The entrained component remained subsurface under the conditions imposed (Figure 6-7). The proportion of the spill volume that entrains will vary with the timing of the release relative to sea conditions. Entrainment would occur more rapidly if the spill occurred when winds exceed more than a moderate breeze (>9–10 m/s), generating breaking waves on the ocean surface.

Given the environmental conditions experienced in the region, MGO is expected to undergo rapid spreading. This, together with evaporative loss, is likely to result in the spill rapidly dissipating. MGO distillates tend not to form emulsions at the temperatures found in the region. The characteristics of the MGO used in the modelling are given in Table 6-13.

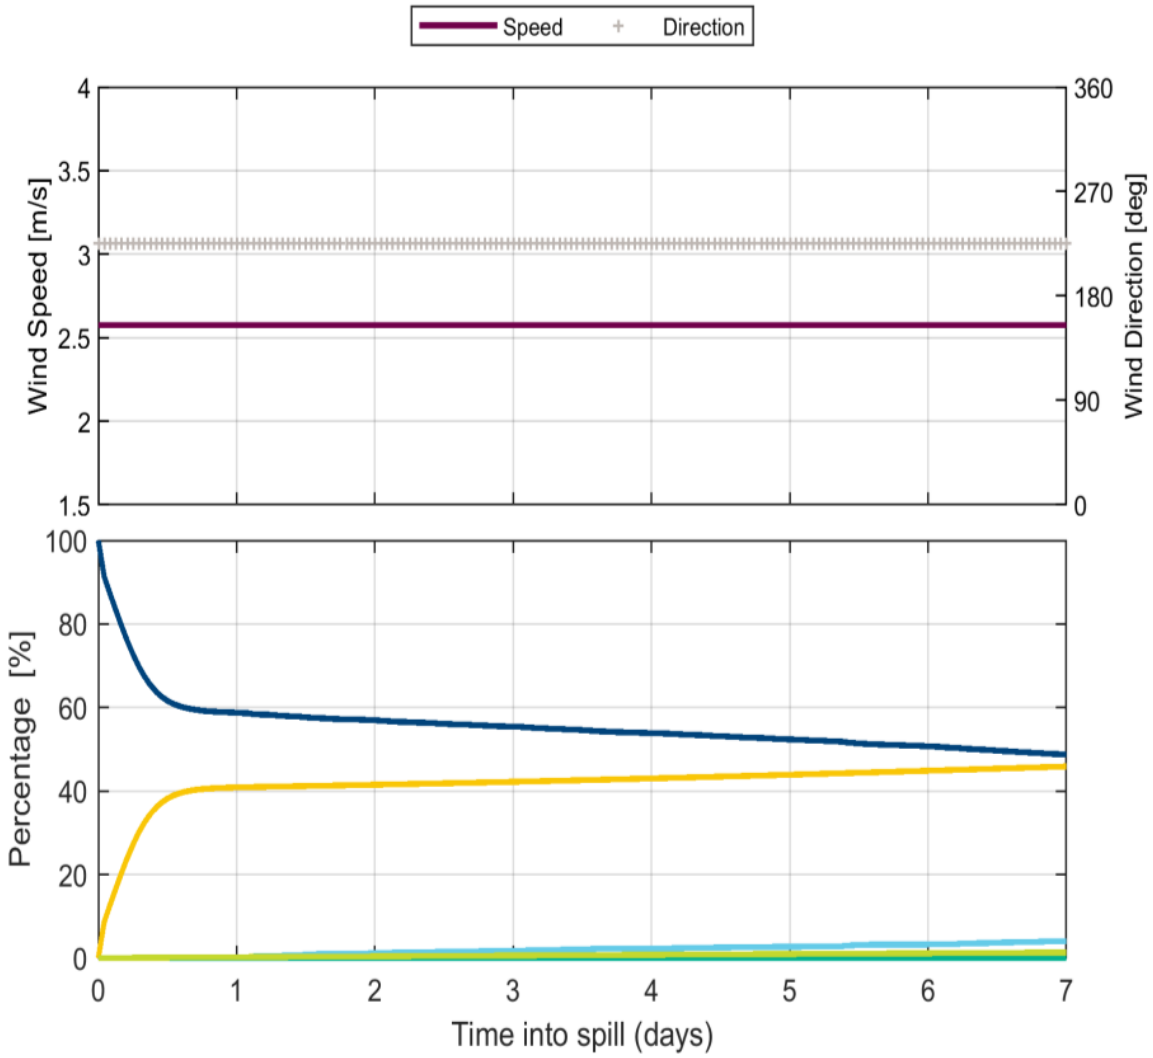

Figure 6-6: Proportional mass balance plot representing weathering of MGO spilled onto the water surface as a one-off instantaneous release of 50 m^3 and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature

Loss of hydrocarbons to marine environment due to a vessel collision	X	X		X	X	X	A	B	1. Highly Unlikely	M	LC S GP PJ	Acceptable if ALARP	EPO 2 EPO 11

Description of source of impact

Background

The Petroleum Activity will involve primarily one survey vessel undertaking each activity, though allowance for two survey vessels in the Operational Area at any one time is provided.

The worst case credible hydrocarbon release would be breach of the survey vessel's largest fuel tank through collision with a third-party vessel.

The specific survey vessels are unknown at this stage of the activity. The typical upper limit for individual tank volume for the different vessel types based on a review of vessels available to complete the work are as follows:

- Geotechnical Drilling Vessel = 185 m^3
- Multipurpose (Geophysical and Light Geotechnical) Vessel = 120 m^3
- Remote (Uncrewed) Vessel = 75 m^3 (total fuel capacity)

A worst-case loss of volume of 200 m^3 of MGO is therefore considered an appropriate conservative worst case for rupture of the single largest fuel tank for any of the survey vessel types

Industry experience

Registered vessels or foreign flag vessels in Australian waters are required to report events to the Australian Transport Safety Bureau, AMSA or Australian Search and Rescue.

From a review of the Australian Transport Safety Bureau marine safety and investigation reports, one vessel collision occurred in 2011–2012 that resulted in a spill of 25–30 L of oil into the marine environment as a result of a collision between a tug and support vessel off Barrow Island. Two other vessel collisions occurred in 2010, one in the port of Dampier, where a support vessel collided with a barge being towed. Minor damage was reported and no significant injury to personnel or pollution occurred. The second 2010 collision involved a vessel under pilot control in a port colliding with a vessel alongside a wharf, causing it to sink. No reported pollution resulted from the sunken vessel.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

These incidents demonstrate the likelihood of only minor volumes of hydrocarbons being released during the event of a vessel collision.

From 2010–2011, the Australian Transport Safety Bureau's annual publication defines the individual safety action factors identified in marine accidents and incidents: 42% related to navigation action (2011). Of those, 15% related to poor communication and 42% related to poor monitoring, checking and documentation. Most of these related to the grounding instances.

Credible scenarios

For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align:

- The identified causes of vessel interaction must result in a collision.
- The collision must have enough force to penetrate the vessel hull.
- The collision must be in the exact location of the fuel tank.
- The fuel tank must be full, or at least have a volume higher than the point of penetration.
- The probability of the chain of events described above aligning, to result in a breach of fuel tanks resulting in a spill that could potentially affect the marine environment, is considered highly unlikely.

The environmental risk analysis identified one credible potential scenario that could result in a loss of vessel structural integrity, resulting in damage to fuel storage tank(s) and a loss of marine diesel to the marine environment (refer to Table 6-14). A collision between the survey vessel and a third party vessel (i.e. commercial shipping, other petroleum related vessels and commercial fishing vessels) was assessed as being credible, but highly unlikely given the standard vessel operations and equipment in place to prevent collision at sea, and the short duration of the activities.

A loss of containment from vessel grounding was not considered credible.

Table 6-14: Details of identified hydrocarbon spill scenarios

Scenario	Likelihood	Credible	Volume (m^3)	Justification
Collision with third-party vessel resulting in breach of the survey vessel's hull	Highly unlikely	Credible	<200	Third-party vessels in the survey vicinity may be commercial shipping vessels which will be notified, by Notices to Mariners through AMSA, of the survey activity in the area. All third-party vessels operating in the vicinity will be tracked on radar and alerted (as required) to the presence of the survey vessel operations and therefore collision resulting in breach of the survey vessel's hull is considered highly unlikely

Quantitative hydrocarbon risk assessment

Woodside has commissioned quantitative hydrocarbon spill modelling of two vessel collision scenarios at two different locations as detailed in Table 6-15. The volumes selected for modelling are based on the potential vessels that may be used and represent an instantaneous release.

Table 6-15: Details of identified marine diesel spill scenarios modelled in vicinity of Operational Area

Location	Coordinates	Volume (m^3)	Justification
Operational Area Part A: Torosa	14° 01′ 24.07″S 121° 54′ 40.46″E	200	Closest point to Sandy Islet in Operational Area Part A
Operational Area Part B: Brecknock Calliance	14°23'45.39"S 121°41'48.81"E	200	Closest point to Sandy Islet in Operational Area Part B

The modelling assessed the extent of a marine diesel spill volume of 200 m^3 for all seasons, using an historic sample of wind and current data for the region. The modelling was conducted by RPS using a three-dimensional hydrocarbon spill trajectory and weathering model (SIMAP, Spill Impact Mapping and Analysis Program) (RPS 2026).

Impact assessment

Environmental value(s) potentially impacted

Environment that may be affected

An EMBA has been drawn that encompasses the EMBA for both spill locations

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The overall EMBA for the Petroleum Activity is based on stochastic modelling, which compiles data from 200 hypothetical worst-case spills under various weather and metocean conditions (as described in Section 6.9.1). Spill modelling was undertaken based on an instantaneous surface release of 200 m³ of marine diesel at different locations.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean transport mechanism, a different EMBA is discussed for each fate. The worst case results for both scenarios are summarised below with results for each receptor presented in Table 6-16; in all cases, the spill from Operational Area Part A results in the worst-case probabilities and concentrations.

Surface hydrocarbons

The highest probability of contact for films ≥1 g/m^2 was calculated at 100% for Scott Reef North, with 4.5%, 7.5% and 26% at Seringapatam Reef, Sandy Islet and Scott Reef South respectively. Probability of contact for films ≥10 g/m^2 was calculated at the highest of 100% for Scott Reef North, while Scott Reef South is calculated at the 16.5% and 1.5% for Sandy Islet, all other locations were no contact. Probability of contact for films ≥50 g/m^2 was calculated at the highest of 100% for Scott Reef North, while Scott Reef North is calculated at the 8%, all other locations were no contact.

The probabilities and concentrations presented above for Operational Area Part A are all higher than those from a spill in Operational Area Part B, therefore these are presented in Table 6-16.

Floating oil at 10 g/m² present in open waters up to 51 km from spill location in Operational Area Part A, but up to 73 km from the spill location in Operational Area Part B.

Entrained hydrocarbons

The furthest extent of entrained oil concentrations ≥10 ppb is calculated to drift up to 569 km from the spill site. The furthest distance calculated for entrained oil ≥100 ppb and 1,000 ppb is 266 km and 50 km, respectively. The highest probability of contact for entrained oil ≥10 ppb is at 50% for Scott Reef North, 45% for Scott Reef South and 33.5% at Sandy Islet. At concentrations >100 ppb, the probabilities drop to 34% for Scott Reef North, 31% for Scott Reef South and 15% at Sandy Islet, and at 1,000 ppb, they drop to 15%, 10.5% and 1.5%. Seringapatam Reef has a low probability of 24.5% at >10 ppb, and 7% at >100 ppb.

The probabilities and concentrations presented above for Operational Area Part A are all higher than those from a spill in Operational Area Part B, therefore these are presented in Table 6-16.

The maximum entrained oil concentration forecast for any receptor is predicted to be 23,377 ppb at Scott Reef North and 23,260 ppb at Scott Reef South.

Dissolved hydrocarbons

The aromatic hydrocarbon concentrations ≥10 ppb and 50 ppb were calculated to potentially occur up to 168 km and 20 km from the spill site, respectively. The highest probability of contact by dissolved hydrocarbon is predicted for Scott Reef North, where concentrations above 10 ppb were predicted with 9% probability. A lower probability 0.5% and 1.5% were calculated for Scott Reef North and Scott Reef South, respectively. At >50 ppb, these probabilities drop to 1.5% for Scott Reef North and <1% for Scott Reef South.

The maximum dissolved aromatic hydrocarbon concentration was predicted at Scott Reef North at 191 ppb.

Accumulated hydrocarbons

For a spill in Operational Area Part A, the potential for accumulation of oil to concentrations ≥10 g/m^2 was calculated at 8% for Sandy Islet, and 1% for Scott Reef North and South. The worst-case accumulated concentration calculated for shoreline location was 3,599 g/m^2, at Sandy Islet, Scott Reef North Reef (NR) and Scott Reef South. These receptors were also calculated to have the worst-case accumulated volume to be 80 m^3. The probabilities and concentrations presented above for Operational Area Part A are all higher than those from a spill in Operational Area Part B, therefore these are presented in Table 6-16.

Summary of potential impacts to protected species, other habitats and communities, water quality and socio-economic values

The potential impacts of spilled hydrocarbons to species (protected and otherwise), marine primary producers, other habitats and communities, water quality, marine sediment quality, air quality, protected areas and socio-economic values are described below. It is noted that the toxic components in marine diesel include alkylated naphthalenes which can be rapidly accumulated by marine biota including invertebrates such as marine oysters, clams, shrimp, as well as a range of vertebrates, such as finfish. Marine diesel also contains additives that contribute to its toxicity.

Given the localised area of the potential EMBA and the rapid dispersion, dilution and weathering of a marine diesel spill, it is expected that any potential impacts will be low magnitude and temporary in nature.

Protected species – marine mammals

Marine mammals that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling or ingestion of hydrocarbons and inhalation of toxic vapours. This may result in the irritation of sensitive membranes such as the eyes, mouth, digestive and respiratory tracts and organs, impairment of the immune system or neurological damage (Helm et al. 2015). If prey (fish and plankton) are contaminated, this can result in the absorption of toxic components of the hydrocarbons (polycyclic aromatic hydrocarbons). In a review of cetacean observations in relation to a number of large-scale hydrocarbon spills, Geraci (1988) found little evidence of mortality associated with hydrocarbon spills; however, behavioural disturbance (i.e. avoiding spilled hydrocarbons) was observed in some instances for several species of cetacean. This suggests that cetaceans have the ability to detect and avoid surface slicks.

Cetaceans that may interact with spilled hydrocarbons are most likely to be subject to physical impacts. Given cetaceans maintain thick skin and blubber, external exposure to hydrocarbons may result in irritation to skin and eyes. Entrained hydrocarbons may also be ingested, particularly by baleen whales which feed by filtering large volumes of water.

As identified in Section 4.6, protected species including migrating blue whales and humpback whales may be encountered near the Operational Area, and therefore could be impacted in close proximity to the marine diesel spill location, where the volatile, water soluble and most toxic components of the diesel may be present. However, the window for exposure to hydrocarbons with the potential for any toxicity effects in these waters would be limited to a few days following the spill. Potential impacts may include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, organ or neurological damage leading to death. Given the absence of critical habitats or aggregation areas, cetaceans in the area are expected to be transient, and impacts are expected to be limited to individuals or small groups of animals. Impacts on the overall population viability of cetaceans are not predicted.

Protected species – marine turtles

Adult sea turtles exhibit no avoidance behaviour when they encounter hydrocarbon spills (NOAA 2010). Contact with entrained (or floating) hydrocarbon can result in hydrocarbon adherence to body surfaces (Gagnon and Rawson 2010) causing irritation of mucous membranes in the nose, throat and eyes leading to inflammation and infection (NOAA 2010). Oiling can also irritate and injure skin which is most evident on pliable areas such as the neck and flippers (Lutcavage et al. 1995). A stress response associated with this exposure pathway includes an increase in the production of white blood cells, and even a short exposure to hydrocarbons may affect the functioning of their salt gland (Lutcavage et al. 1995).

Hydrocarbons in surface waters may impact turtles when they surface to breathe and inhale toxic vapours. Their breathing pattern, involving large ‘tidal’ volumes and rapid inhalation before diving, results in direct exposure to petroleum vapours which are the most toxic component of the hydrocarbon spill (Milton and Lutz 2003). This can lead to lung damage and congestion, interstitial emphysema, inhalant pneumonia and neurological impairment (NOAA 2010). Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces (Gagnon and Rawson 2010) causing irritation of mucous membranes in the nose, throat and eyes leading to inflammation and infection (Gagnon and Rawson 2010). Given the hydrocarbon is expected to weather rapidly when released to the environment, relatively fresh entrained hydrocarbons (which are typically relatively close to the release location) are considered to have the greatest potential for impact.

The EMBA overlaps with habitat critical to the survival of green turtles for nesting and a variety of BIAs identified in Section 4.6.2 including reproduction for both Green and Hawksbill turtles at Scott Reef where shoreline accumulation could occur in the event of a spill. These areas are recognised as habitat critical for the survival of marine turtles under the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017) and support significant breeding and nesting activity throughout the region. The Operational Area is unlikely to represent important habitat for marine turtles, given the absence of potential nesting or foraging habitat (i.e. no emergent islands, reef habitat or shallow shoals) and the water depth (deeper than 350 m).In the event of a worst-case vessel spill of marine diesel oil, there is a potential that surface and entrained hydrocarbons exceeding impact threshold concentrations (10 g/m² and 1,000 ppb respectively) will be present in offshore waters extending up to 73 km and 65 km respectively, with accumulation at Scott Reef and Sandy Islet, from the release site. Toxicity of hydrocarbons will be significantly reduced by weathering at over such distances, with the volatile and water soluble (often the most toxic) components expected to have dissipated beyond the vicinity of the spill site. Dissolved aromatic hydrocarbons at concentrations

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

equal to or greater than the 10 ppb threshold are predicted to extend 168 km from the spill site. Low concentrations are only capable of causing sublethal impacts to the most sensitive marine organisms and no lethal or sub-lethal impacts to marine turtles are expected in the BIAs. The potential for lethal and sub-lethal impacts to marine turtles is limited to small numbers of transient individuals that may be present in offshore waters near the release location.

Sea snakes

Impacts to sea snakes from direct contact with hydrocarbons are likely to result in similar physical effects to those recorded for marine turtles and may include potential damage to the dermis and irritation to mucus membranes of the eyes, nose and throat (ITOPF, 2011). They may also be impacted when they return to the surface to breathe and inhale the toxic vapours associated with the hydrocarbons, resulting in damage to their respiratory system. The dusky sea snake (Aipysurus fuscus) (endangered), short-nosed sea snake (*Aipysurus apraefrontalis)* (critically endangered) and leaf scaled sea snake (*Aipysurus foliosquama*) (critically endangered)*,* have been identified as having the potential to occur in the EMBA.

Stochastic spill modelling indicates that some sea snake habitats may be exposed to surface hydrocarbons (≥10 g/m²) entrained hydrocarbons (≥1000 ppb) and dissolved aromatic hydrocarbons (≥10 ppb).Therefore, a marine diesel spill may have a minor disruption to a portion of the population but there is no threat to overall population viability.

Protected species – birds

Seabirds and migratory birds are particularly vulnerable to contact with floating hydrocarbons, which may mat feathers. This may lead to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons; both impacts may result in mortality (Hassan and Javed 2011). The modelled scenario results in localised floating hydrocarbons below impact thresholds centred around the release location; hence, the potential for seabird exposure to floating hydrocarbons is considered to be low. Migratory shorebirds are unlikely to interact with spilled hydrocarbons; refer to the sections on Islands and Mainland Coast below for a discussion on the potential impacts to migratory shorebirds.

Ashmore Reef is recognised as an important breeding area for foraging seabirds and migratory shorebirds and there are a number of BIAs for seabirds that overlap with a small proportion of the EMBA, as provided in Section 4.6.4. Scott Reef also provides resting habitat BIA for the little tern. Offshore waters are potential foraging grounds for seabirds associated with the coastal roosting and nesting habitat, which includes the numerous islands along the Kimberley coast. Seabirds may also be exposed to marine diesel on the sea surface or upper water column, if resting or foraging in waters near to the spill. Impacts may include mortality due to oiling of feathers or the ingestion of hydrocarbons.

Seabirds generally do not exhibit avoidance behaviour to floating hydrocarbons; exposure may occur through immersion, ingestion or inhalation. Contact with hydrocarbons can result in plumage fouling, hypothermia, reduced buoyancy, impaired flight and feeding ability, and irritation of mucous membranes, with potential for mortality (AMSA, 2013; International Petroleum Industry Conservation Association, 2004). Longer-term impacts may include developmental abnormalities in chicks and reduced reproductive success. The proximity of foraging BIAs suggests individual birds may be exposed during offshore feeding. However, given the localised nature of the spill and the limited spatial extent of surface hydrocarbons, impacts are highly unlikely to result in a potential consequence greater than minor and unlikely to affect population viability at the regional scale.

Protected species – Fish, sharks and rays

Other protected species that may occasionally transit through the area and may potentially be exposed to a marine diesel spill, include shark and ray species such as whale sharks. Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs either through direct contact or via the food chain (consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange). In the offshore environment, it is probable that pelagic shark species are able to detect and avoid surface waters underneath hydrocarbon spills by swimming into deeper water or away from the affected areas. Therefore, any impact on sharks and rays is predicted to be minor and localised.

Hydrocarbon contact may affect whale sharks through ingestion (entrained/dissolved hydrocarbons), particularly if feeding. Whale sharks may transit offshore waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July. While it is possible whale sharks may traverse the vicinity of the Operational Area, their presence would be of a relatively short duration and not in significant numbers, given the main aggregations are recorded in coastal waters, particularly the Ningaloo Reef edge (Department of Parks and Wildlife, 2013; Marine Parks and Reserves Authority, 2005). In addition, tagging studies indicate broad dispersal across the Timor Sea (Meekan & Radford, 2010), suggesting only a portion of the population would be within the area above the adverse exposure threshold at any one time, and any impacts are expected to be minor and limited to individual animals.

Should sharks or fish be present in offshore waters near the Operational Area during the spill, direct impacts may occur if foraging within surface slicks or in the upper 20–30 m of the water column containing entrained hydrocarbons and dissolved aromatics. Contamination of their food supply and the subsequent ingestion of this prey may also result in long term impacts as a result of bioaccumulation. Impacts are again predicted to be limited to a small number of animals given the low numbers of animals that may transit through the area during the short period when spilled hydrocarbons are present.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Rays, including reef manta (*Mobula alfredi*) and giant manta (*M. birostris*), are also listed as migratory and are known to occur within the EMBA. These species may be exposed to hydrocarbons through dermal contact or ingestion during filter feeding. Sawfish species, including narrow sawfish (*Anoxypristis cuspidata*), are listed as vulnerable and migratory, and may occur within the Operational Area and EMBA. While these benthic species may be considered sensitive to sediment contamination, sediment quality is not expected to be significantly affected by a surface marine diesel release. Given the deep-water depths of the Operational Area (>350 m), surface, entrained and dissolved hydrocarbons are confined to the upper layers of the water column and are not predicted to reach or accumulate in benthic sediments. Therefore, impacts to sawfish are expected to be limited to potential water column exposure and are predicted to be minor and temporary. Given the limited number of animals that may be impacted and the rapid dispersion of marine diesel, it is considered that any potential impacts will be minor.

Benthic habitats

Benthic habitats within the Operational Area are primarily Benthic habitats within the Operational Area are primarily composed of unconsolidated soft sediments, including well sorted medium to coarse sands with low total organic carbon content. These sediments are typical of the outer NWMR and support sparse assemblages of filter-feeding and deposit-feeding organisms. The deepwater habitats surrounding the Scott Reef system overlying the Torosa Field generally comprise soft sediment seabed areas with sparse benthic biota. Benthic habitat characteristics are described in Secton 4.5. While these communities may be sensitive to hydrocarbon exposure, spill modelling indicates surface, entrained and dissolved hydrocarbons are confined to the upper layers of the water column and are not predicted to reach the seabed, particularly given the deep water depths (>350m) of the Operational Area.

Planton and fish communities

Within the EMBA for a marine diesel spill resulting from a vessel collision, there is the potential for plankton communities to potentially be impacted where entrained or dissolved hydrocarbon threshold concentrations are exceeded. A range of lethal and sublethal impacts may occur to plankton exposed to entrained or dissolved hydrocarbons within the EMBA. Communities are expected to recover quickly (weeks/months) due to high population turnover (International Tanker Owners Pollution Federation [ITOPF] 2011a). It is therefore considered that any potential impacts would be low magnitude and temporary in nature.

Pelagic fish populations in the open water offshore environment of the EMBA are highly mobile and have the ability to move away from a marine diesel spill. The spill-affected area would be confined to the surface layer and upper 20–30 m of the water column. It is therefore unlikely that fish populations would be exposed to widespread hydrocarbon contamination. Pelagic fish populations are distributed over a wide geographical area so impacts on populations or species level are considered to be negligible. Combined with these factors and the rapid dispersion of marine diesel, it is considered that any potential impacts will be low magnitude and temporary.

Offshore reefs and islands

Offshore reefs and islands within the EMBA, including Scott Reef and Sandy Islet, may be exposed to hydrocarbons above ecological impact thresholds in the event of a worst-case spill scenario (Table 6-16). These locations support sensitive benthic and intertidal communities, including coral reef systems, macroalgae and associated invertebrate fauna.

Potential impacts to reef-associated biota include physical coating of coral and algal surfaces, which may inhibit photosynthesis and gas exchange, leading to reduced growth or mortality. Sessile organisms such as sponges and soft corals may be affected by dissolved and entrained hydrocarbons through dermal absorption or clogging of feeding structures. Protected species inhabiting these reef systems may also be at risk, particularly if hydrocarbons interfere with feeding or reproductive processes. However, given the limited spatial extent and short duration of hydrocarbon exposure predicted by modelling, and the resilience of many reef communities, it is highly unlikely to result in population-level effect.

Key Ecological Features

KEFs potentially impacted by a marine diesel spill from a vessel collision event within the EMBA include:

- Continental Slope Demersal Fish Communities (overlaps Operational Area Part B)
- Seringapatam Reef and Commonwealth waters in the Scott Reef Complex (overlaps Operational Area Part A)
- Ancient coastline at 125 m depth contour
- Ashmore Reef and Cartier Island and surrounding Commonwealth waters

These KEFs are defined by geomorphological features or their ecological significance, including enhanced biological productivity, habitat complexity, and support for demersal fish and benthic communities. Although no interactions with the seabed are likely to occur from a diesel spill, the consequences of a marine diesel spill may include short-term impacts to demersal fish populations and biodiversity associated with some of these KEFs, particularly within surface water layers.

Given the broad spatial extent of most KEFs and the limited duration and footprint of hydrocarbon exposure, it is highly unlikely impacts would result in a potential consequence greater than minor. The greatest potential for ecological effects is predicted to occur closest to the release location, with no long-term or population-level impacts

Water quality

It is likely that water quality will be reduced at the release location of the spill; however, such impacts to water quality would be temporary and localised in nature due to the rapid dispersion and weathering of marine diesel. The potential impact is therefore expected to be low.

Protected areas

Surface and entrained hydrocarbons at or exceeding impact thresholds have a very low probability (2.5 and 3.5% respectively) of contacting the Scott Reef NR (no contact exceeding the impact thresholds for dissolved. Surface and entrained hydrocarbons are mostly only predicted within the deep open waters of these protected areas, with no contact to seabed habitats or to shorelines above the ecological impact threshold values. Potential impacts to water quality and the natural values (e.g. mobile protected species) in these areas would be temporary and localised in nature due to the rapid dispersion and weathering of the marine diesel, as described above.

Commercial Fisheries

Fish exposure to hydrocarbons can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood. Tainting is reversible through the process of depuration, which removes hydrocarbons from tissues by metabolic processes, although it depends upon the magnitude of the hydrocarbon contamination. Fish have a high capacity to metabolise these hydrocarbons while crustaceans (such as prawns) have a reduced ability (Yender, et al., 2002). Seafood safety is a major concern associated with spill incidents. Therefore, actual or potential contamination of seafood can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender, et al., 2002). A spill would result in the establishment of an exclusion zone around the spill affected area. There would be a temporary prohibition on fishing activities for a period and subsequent potential for economic impacts to affected commercial fishing operators. Such measures would likely be in place for less than a week and would not result in widespread or long-term impacts to fishing activities.

A loss of marine diesel spill from a vessel collision is considered unlikely to cause significant direct impacts on the target species fished by Commonwealth and State fisheries (see Section 4.10.1) which overlap with the EMBA. The fisheries that operate within the EMBA predominantly target demersal fish species (demersal finfish and crustaceans) that inhabit waters in the range of >60–200 m depth, or pelagic species which are highly mobile. Therefore, a marine diesel spill is expected to only result in negligible impacts, considering that hydrocarbons are confined to the upper layers of the water column. Visible surface hydrocarbons ≥1 g/m² may also occur up to 243 km from the release site, which may result in fouling of fishing gear and a perception of impacts to fish stocks by fisheries stakeholders and the public. There is the potential that a fishing exclusion zone would be applied in the area of the spill, which would put a temporary ban on fishing activities and therefore potentially lead to subsequent economic impacts on commercial fishing operators if they were planning to fish within the area of the spill. Such measures would likely be in place for less than a week and would not result in widespread or long-term impacts to fishing activities.

Traditional and customary fishing

Traditional fishing was allowed within the 12 mile fishing zones that existed around a number of reefs or islets including Scott Reef, which is currently the principal reef to which Indonesian fishers regularly sail on a seasonal basis to harvest trepang and other reef species. Therefore a spill could result in an exclusion area to traditional fishers on a temporary basis.

Tourism and recreational activities

The Operational Area is considered too far offshore for significant recreational fishing or tourism activities. However, some tourism activities may occur at Scott Reef. These activities are expected to be exclusively nature-based tourism; impacts to the environmental values associated with these islands and reefs may impact upon tourism activities. Refer to 'Offshore reefs and islands' for discussion on the potential impacts to these receptors.

Impacts to tourism activities are expected to be minor based on the likelihood and nature of contact to environmental values that support tourism activities. Impacts to these values may result in displacement of tourism activity, and potentially minor loss of revenue for tourist operators (e.g. charter fishing cancellations due to fishery closures).

Commercial shipping, offshore oil and gas and defence

There are no shipping fairways, offshore oil and gas activities or defence activities in the Operational Area or EMBA. In the event of a spill, avoidance of surface hydrocarbons is a possible response by other vessels that may be transiting through the region. However, such occurrences will likely be limited to proximity to the release site, and other oil and gas activities are unlikely to be impacted.

Cultural features and heritage values

Refer to Section 6.11 for an assessment of potential impacts to cultural features and heritage values from the Petroleum Activity. Related control measures demonstrate that impacts are reduced to ALARP and are of an acceptable level have been captured in Section 6.11 below.

Summary of potential impacts to environmental values

In the event of an unplanned hydrocarbon release to the marine environment due to vessel collision, it is considered that any potential impact would be localised and temporary in nature to water quality (in comparison to background

levels and/or international standards) with localised and temporary impacts to habitats, populations and fishing concerns.

The greatest environmental consequence identified when assessing an unplanned hydrocarbon release to the marine environment due to vessel collision, is defined as B, which equates to 'Major impact on environmental feature(s) or area(s), such as impact on feature or area of national importance with limited ability to recover'.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential impacts/risks associated with an unplanned hydrocarbon release from a vessel collision. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact/risk assessment has determined that, given the adopted controls, an unplanned hydrocarbon release from a vessel collision may result in a major impact on a sensitive feature/s or receiving environment with limited ability to recover. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers

Demonstration of acceptability
the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met. The impact assessment has determined that an unplanned loss of hydrocarbon as a result of a vessel collision represents a low current risk rating that is unlikely to result in potential impact greater than localised, minor and temporary disruption to a small proportion of the population, and no impact on critical habitat or activity. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good survey practice/industry best practice. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers risks to be managed to a level that is broadly acceptable.

Description of source of impact

The survey vessels operating in and around the Operational Area may present a potential hazard to cetaceans and other protected marine fauna such as whale sharks and marine turtles. Vessel movements can result in collisions between the vessel (hull and propellers) and marine fauna, potentially resulting in superficial injury, serious injury that may affect life functions (e.g. movement and reproduction), or mortality.

The factors that contribute to the frequency and severity of impacts due to collisions vary greatly due to vessel type, vessel operation (specific activity, speed), physical environment (e.g. water depth), the type of animal potentially present and their behaviours. Survey vessels are typically moving at low speeds when conducting geophysical and geotechnical survey activities.

Impact assessment

Environmental value(s) potentially impacted

The likelihood of vessel/marine fauna collision being lethal is influenced by vessel speed; the greater the speed at impact, the greater the risk of mortality (Jensen and Silber 2004; Laist et al. 2001). Vanderlaan and Taggart (2007) found that the chance of lethally injuring a large whale due to a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. According to the data of Vanderlaan and Taggart (2007), it is estimated that the risk is <10% at a speed of 4 knots. Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the US NOAA database (Jensen and Silber 2004), there are only two known instances of collisions when the vessel was travelling at less than 6 knots. Both of these were from whale watching vessels that were deliberately placed among whales.

Survey vessels are likely to be travelling <5 knots in the Operational Area; therefore, the chance of a vessel colliding with protected species and resulting in a lethal outcome is reduced.

The nearest recognised BIAs for cetaceans (considered to be at risk due to relatively slow movement and proportion of time spent at or near the sea surface) is the pygmy blue whale foraging and migration BIAs which overlap the Operational Area (refer to Section 4.6.3). Adverse interactions between vessels and pygmy blue whales are considered to be unlikely due to the slow speeds of survey vessels within the Operational Area (mostly <5 knots). However, the likelihood of encountering individuals increases during migration periods (June-November).

Whale sharks are at risk from vessel strikes when feeding at the surface or in shallow waters (where there is limited option to dive). Whale sharks may traverse offshore NWS waters including the Operational Area during their migrations to and from Ningaloo Reef. However, it is expected that whale shark presence within the Operational Area would not comprise of significant numbers given there is no main aggregation area within the vicinity of the Operational Area, and their presence would be transitory and of a short duration. There are no constraints preventing whale sharks moving away from vessels (e.g. shallow water or shorelines).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Turtles may occur in the Operational Area since the green turtle habitat critical (nesting) zone is in close proximity to Operational Area Part A. Given the distance of ~23 km from the Operational Area to the nearest shoreline (and potential nesting beaches), impacts to nesting females are not expected. Disturbance to individual mating or internesting behaviours may occur, but given the temporary nature of the disturbance, is unlikely to affect individual breeding success or impact marine turtles at the population level.

Notably, the typical response from turtles on the surface to the presence of vessels is to dive (a potential 'startle' response), which decreases the risk of collisions (Hazel et al. 2007). As with cetaceans, the risk of collisions between turtles and vessels increases with vessel speed (Hazel et al. 2007). Given the low speeds of vessels undertaking the Petroleum Activity, along with the expected low numbers of turtles within the Operational Area, interactions between vessels and turtles are considered to be highly unlikely.

Marine mammals and fish are at risk of mortality through being caught in thrusters during station keeping operations (DP). The risk of listed marine species getting caught in operating thrusters is unlikely, given the low presence of individuals, combined with the avoidance behaviour commonly displayed during DP operations.

It is unlikely vessel movement associated with the Petroleum Activity will significantly impact marine fauna populations, given the low presence of transiting individuals, expected avoidance behaviour commonly displayed by whales and turtles combined with the low operating speed of the survey vessels (generally <5 knots or stationary, unless operating in an emergency). Activities are considered unlikely to result in a consequence greater than slight short-term disruption to individuals or a small proportion of the population and anticipated to have no impact on critical habitat or activity supported by BIAs.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A/B/C; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential impacts/risks associated with potential vessel collision with protected marine fauna. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact/risk assessment has determined that, given the adopted controls, vessel collision with marine fauna may result in slight, short-term local impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes. Section 6.9.3 demonstrates that the Petroleum Activity is not inconsistent with any recovery plan of threat abatement plan for a listed threatened species of ecological community. Regard has also been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers the adopted controls appropriate to manage the impacts/risks to be managed to a level that is broadly acceptable, and compliance with those controls demonstrates that the EPOs are met.

6.9.4 Physical presence: Disturbance to seabed from dropped objects and equipment loss

Context		
Survey vessels – Section 3.8	Physical Environment – Section 4.4 Habitats and Biological Communities – Section 4.5 Key Ecological Features – Section 4.7	Consultation – Section 5

Impact evaluation summary

Source of impact	*Environmental value potentially impacted*						*Evaluation*						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Dropped objects resulting in the disturbance of seabed habitat	X			X	X	X	A	F	3	M	LCS GP	Acceptable if ALARP	EPO 3
Accidental loss of significant geophysical or geotechnical equipment				X			A	F	1	L	LCS GP	Acceptable if ALARP	EPO 3

Description of source of impact

While undertaking the activity, towed or Immersible equipment may become detached and lost to the seabed, resulting in disturbance or damage to seabed habitat and/or cultural heritage on the seabed.

In addition, there is the potential for objects to be dropped overboard from the survey vessels to the marine environment. Objects that have been dropped during previous offshore projects include small numbers of personnel protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners), hardware fixtures. The spatial extent in which dropped objects can occur is restricted to the Operational Area.

Impact assessment

Environmental value(s) potentially impacted

In the event of loss of equipment or dropped objects to the marine environment, potential environmental effects are anticipated to include localised physical impacts on seabed habitats. As a result of recovering any dropped objects, impacts to seabed habitats will be temporary in nature. However, if the object cannot be recovered due to health and safety, operational constraints or other factors, then the impact may be longer term or permanent. Impacts to heritage features may be temporary or permanent depending on the nature of the associated values. The areas potentially impacted will depend on the scenario, with equipment loss likely to impact a greater area compared to dropped objects.

The temporary or permanent loss of dropped objects into the marine environment is not likely to have a significant environmental impact on seabed habitats, as the seabed habitats associated with the sand/silt habitats comprising most of the Operational Area are of low sensitivity and are broadly represented throughout the broader region (Section 4.4). Although there are areas of higher sensitivity associated with shoals survey activities are not planned over the shoals and therefore dropped objects over them is not credible. Given the types, size and frequency of dropped objects that could occur, it is unlikely that a dropped object would have a significant impact on the marine environment.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential risks associated with seabed disturbance from dropped objects and/or equipment loss. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
The risk assessment has determined that, given the adopted controls dropped objects and/or equipment loss will not result in a potential impact greater than minor and temporary disruption to a small area of the seabed, this would comprise a small proportion of the benthic population, and no impact on critical habitat or activity. Dropped objects within the Ancient Landscape could impact cultural heritage associated with this area, however, this would also comprise a small area. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are considered good survey practice/industry best practice. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers impacts/risks to be managed to a level that is broadly acceptable.

6.9.5 Unplanned discharges: Loss of solid hazardous and non-hazardous wastes

Context		
Survey vessels – Section 3.8	Physical Environment – Section 4.4 Habitats and Biological Communities – Section 4.5 Protected Species – Section 4.6 Key Ecological Features – Section 4.7 Protected Places – Section 4.8	Consultation – Section 5

Impact evaluation summary

Source of impact	*Environmental value potentially impacted*						*Evaluation*						
	Marine Sediment	Water Quality	Air Quality (incl Odour)	Ecosystems/ Habitat	Species	Socio-economic	Decision Type	Consequence/ Impact	Likelihood	Risk Rating	ALARP Tools	Acceptability	Outcome
Accidental loss of hazardous or non-hazardous wastes/ equipment to the marine environment	X	X		X	X		A	F	3	M	LCS GP	Acceptable if ALARP	EPO 12

Description of source of impact

The survey vessels will generate a variety of solid wastes including packaging and domestic wastes such as aluminium cans, bottles, paper and cardboard. Hence, there is the potential for solid wastes to be lost overboard to the marine environment. Woodside has not reported any significant loss of solid wastes to the marine environment during the past 12 months of geophysical and/or geotechnical operations. Equipment that has been recorded as being lost (primarily windblown or dropped overboard) have included the loss of a metal pole and hardhat. These have occurred during periods of adverse weather and incorrect waste storage.

Marine debris has been identified as a threat to humpback whales, marine turtles, whale sharks and sawfish (CoA 2015a, 2015b, Threatened Species Scientific Committee (TSSC) 2015).

Impact assessment

Environmental value(s) potentially impacted

The potential impacts of solid wastes accidentally discharged to the marine environment include direct pollution and contamination of the environment. Secondary impacts relate to potential contact of marine fauna with wastes, resulting in entanglement or ingestion and leading to injury and death of individual animals. The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the types, size and frequency of wastes that could occur and species present.

Accidental release of drilling fluids from borehole activity.	X	X			X	X	A	F	3	M	LCS GP PJ	Acceptable if ALARP	EPO 13

Description of source of impact

Vessels

Survey vessels will need to store small quantities of lubricating oils and hydraulic fluid on the vessel, which have the potential to spill if not appropriately managed. Hydraulic fluid may also potentially be spilled from a leak in hoses or lines on hydraulic equipment such as cranes or winches. Deck spills can result from spills from stored hydrocarbons/chemicals (including those used during geotechnical activities for borehole drilling) or equipment. Due to the short duration of surveys, significant chemical/fluid storage volumes are not anticipated. Storage areas are typically set up with effective primary and secondary bunding to contain any deck spills. Releases from equipment are predominantly from the failure of hydraulic hoses, which can either be located within bunded areas or outside of bunded or deck areas (e.g. over water on cranes).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Woodside's operational experience demonstrates that spills are most likely to originate from hydraulic hoses and have previously been <100 L, with an average volume <10 L.

Geotechnical survey equipment

Survey vessels will place equipment on the seabed which may contain relatively small volumes, ~5–10 L, depending on the system, of hydraulic fluid. The hydraulic fluid enables various mechanical functions to be performed.

Some of the equipment requiring the supply of hydraulic fluid includes sources such as PCPT. PCPT involves pushing a penetrometer (probe) into the seabed at a constant rate of penetration to continuously measure the resistance, friction and water pressure. There is the potential for hoses and seals associated with these systems to fail (i.e. hoses burst or crack) during operation, or leaks as a result of shifts in temperature or pressure can result in small volumes of hydraulic fluid being released to the marine environment. Geotechnical equipment is not designed to intentionally release hydraulic fluid in geotechnical operations. If equipment fails, there is the potential for <10 L to be released from the hydraulic source.

Towed equipment

If a CHIRP, boomer or sparker is used, the receiver will consist of individual hydrophone elements located within neutrally buoyant, synthetic hydrocarbon filled tubing. They typically contain ~8–12 hydrophone elements evenly spaced in ~100 m long, 25 mm diameter tubes. The cable will hold about 5 L of hydrophone fluid. The hydrophone cable has the potential to be punctured, resulting a leakage of fluid for a variety of reasons, including damage during deployment or retrieval.

Impact assessment

Environmental value(s) potentially impacted

Accidental spills of hydrocarbons or chemicals from the vessels and geotechnical and geophysical survey equipment will decrease the water quality in the immediate area of the spill. However, the impacts are expected to be temporary and very localised as only small volumes of hydrocarbons or chemicals are likely to be used which are expected to rapidly disperse and dilute in the marine environment.

Receptors such as marine fauna may be affected if they come in direct contact with a release (i.e. by traversing the immediate spill area). If marine fauna come into contact with a release, they could suffer fouling, ingestion, inhalation of toxic vapours, irritation of sensitive membranes in the eyes, mouth, digestive and respiratory tracts, and organ or neurological damage. Cetaceans may exhibit avoidance behaviour patterns and, given they are smooth skinned, hydrocarbons and other chemicals are not expected to adhere. Given the small area of the potential spill and the dilution and weathering of any spill, the likelihood of ecological impacts to marine fauna (protected species), other communities and habitats is likely to be slight.

No impacts on socio-economic receptors are expected, due to the small volumes of hydrocarbons/chemicals that could be accidentally spilled and the localised and temporary nature of the impacts.

ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage potential risks associated with an unplanned minor discharge or hydrocarbons as a result of minor deck and subsea spills. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts/risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment has determined that, given the adopted controls an unplanned minor discharge of hydrocarbons or chemicals as a result of minor deck and subsea spills represents a low risk rating that is unlikely to result in potential impact greater than localised, with no lasting effect and not significant to environmental receptors. Further opportunities to reduce the impacts and risks have been investigated above. The adopted controls are consistent with the most relevant regulatory guidelines and good survey practice/industry best practice. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2) and Woodside's criteria for demonstrating acceptability (Section 2.4.2), Woodside considers risks to be managed to a level that is broadly acceptable.

Description of source of impact

Vessel operations

During the Petroleum Activity, vessels will be transiting to and from the Operational Area, which may include traffic mobilising from beyond Australian waters.

All vessels are subject to some level of marine fouling. Organisms attach to the vessel hull, particularly in areas where organisms can find a good attachment surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches and sea chests). Commercial vessels typically maintain anti-fouling coatings to reduce the build-up of fouling organisms.

Organisms can also be drawn into ballast tanks during onboarding of ballast water as cargo is loaded or to balance vessels under load.

Immersible equipment

The geophysical and geotechnical survey equipment will also be transported to and used within the Operational Area. As there is the potential for the equipment to be used on other projects before being used on this activity, there is the potential for invasive marine species (IMS) translocation.

During the Petroleum Activity, survey vessels and immersible equipment have the potential to introduce IMS to the Operational Area through biofouling and ballast water exchange (as described above).

Impact assessment

Environmental value(s) potentially impacted

Non-indigenous marine species (NIMS) have been introduced into a region beyond their natural biogeographic range and have the ability to survive, reproduce and establish founder populations. Not all NIMS introduced into an area will thrive or cause demonstrable impacts. Indeed, the majority of NIMS around the world are relatively benign and few have spread widely beyond sheltered ports and harbours. Only a subset of NIMS that become abundant and impact on social/cultural, human health, economic and/or environmental values can be considered IMS.

Potential IMS have historically been introduced and translocated around Australia by various natural and human means including biofouling and ballast water. Potential IMS vary from one region to another depending on various environmental factors such as water temperature, salinity, nutrient levels and habitat type, which dictate their survival and invasive capabilities. IMS typically require hard substrate in the photic zone, therefore requiring shallow waters to become established.

Once introduced, IMS may prey on local species which had previously not been subject to this kind of predation, and therefore not have evolved protective measures against the attack. They may outcompete indigenous species for food, space or light and can also interbreed with local species, creating hybrids so the endemic species is lost. These changes to the local marine environment result in changes to the natural ecosystem.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas once established. If the introduction is detected early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life.

Survey vessels and Immersible equipment have the potential to introduce IMS into the Operational Area. Due to the shallow water depths in some areas, settlement and establishment of IMS is credible, albeit remote, given control measures in place.

Summary of potential impacts to environmental value(s)

In support of Woodside's assessment of the impacts and risks of IMS introduction associated with the Petroleum Activity, risk and impact evaluations of the different aspects of marine pest translocation associated with the activity are undertaken. The results of this assessment are presented in the table below. As a result of this assessment Woodside has presented the highest potential consequence as a B (Major) and likelihood as Remote (0), resulting in an overall Moderate risk following the implementation of identified controls.

Table 6-17: Credibility, consequence and likelihood of introducing invasive marine species

IMS introduction location	Credibility of introduction	Consequence of introduction	Likelihood
Introduced to Operational Area/transfer of IMS from infected vessel to Operational Area and establishment on the seafloor or subsea structures.	**Operational Area Part A** **Credible** There is the potential for IMS to be transferred to the sediment in the operational area, however there are no shallow shoal features within. There is the potential for IMS to be transferred to the shallow shoal areas adjacent (e.g. Scott Reef complex) to Operational Area Part A.	**Environment – Not Credible** The translocation of IMS from a colonised survey vessel to shallower environment via natural dispersion is not considered credible given the vessels are not expected to directly interact with shallow shoals outside of the Operational Area and distances of the Operational Area to shallow nearshore environments is >3 nm (>5 km). There is therefore no credible environmental risk and the assessment is limited to Woodside's reputation. **Reputation – B** If IMS were to establish on a survey vessel this could potentially impact the vessel operationally through the fouling of intakes, result in translocation of an IMS into the Operational Area and, depending on the species, potentially transfer of an IMS to other survey vessels, which would likely result in the quarantine of the vessel until eradication could occur (through cleaning and treatment of infected	**Remote (0)** Spread of marine pests via ballast water or biofouling in these open ocean environments (and given Operational Area is > 350m) is also considered remote. Survey vessels are not planned to directly interact with shoals as they are outside of Operational Area.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		areas), which would be costly to perform. Such introduction would be expected to have slight impact to Woodside's reputation, particularly with Woodside's contractors, and would likely have a reputational impact on future proposals.	
		Environment – Not Credible The translocation of IMS from a colonised survey vessel to shallower environments via natural dispersion is not considered credible given the vessels are not expected to directly interact with shoals and distances of the Operational Area to shallow nearshore environments is >12 nm (~35 km). There is therefore no credible environmental risk and the assessment is limited to Woodside's reputation. **Reputation – B** If IMS were to establish on a survey vessel this could potentially impact the vessel operationally through the fouling of intakes, result in translocation of an IMS into the Operational Area and, depending on the species, potentially transfer of an IMS to other survey vessels, which would likely result in the quarantine of the vessel until eradication could occur (through cleaning and treatment of infected areas), which would be costly to perform. Such introduction would be expected to have slight impact to Woodside's reputation, particularly with Woodside's contractors, and would likely have a reputational impact on future proposals.	
	Operational Area Part B **Not Credible**		
Introduced to Operational Area and establishment on a survey vessel.	**Operational Area Part A** **Credible** There is potential for the transfer of marine pests between survey vessels within Operational Area Part A.		**Remote (0)** Spread of marine pests via ballast water or spawning in these open ocean environments is also considered remote.
	Operational Area Part B **Not Credible**		
Transfer between survey vessels and from vessels	**Not Credible**		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

to other marine environments beyond the Operational Area.	This risk is considered so remote that it is not credible for the purposes of the assessment. The transfer of a marine pest between survey vessels is considered remote, given the offshore open ocean environment (i.e. transfer pathway discussed above). For a marine pest to then establish a mature spawning population on the new survey vessel (which would have been through Woodside's IMS process) and then transfer to another environment is not considered credible. Operational Area where the vessels will operate are located offshore in an oceanic environment, which is uncongenial to the long-term survival of IMS. In the event of a vessel-to-vessel transfer (considered remote), the marine pest would need to become established on a new vessel with good hygiene (i.e. passed Woodside's vessel IMS risk assessment), survive the transport beyond the Operational Area, transfer and become established again elsewhere. This scenario is not considered to be credible.

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[39]***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
Legislation, codes and standards				
Vessels will manage their ballast water using one of the approved ballast water management options, as outlined in the Australian Ballast Water Management Requirements. This applies to all vessels that will enter the Operational Area, including those carrying out activities outside of Australian Territorial Seas (>12nm).	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transferring marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the *Biosecurity Act 2015* (Cth) – must be adopted.	Yes C 14.1
Vessels will manage their biosecurity risk associated with biofouling, as outlined in the Australian Biofouling Management Requirements.	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transferring marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the *Biosecurity Act 2015* (Cth) – must be adopted.	Yes C 14.2
Good practice				
Apply Woodside's IMS risk Assessment Process (Section 7.2.2) to vessels and relevant immersible equipment that enter the Operational Area unless exempt. Based on the outcomes of each IMS	F: Yes. CS: Good Practice implemented across all Woodside operations	The IMS risk assessment process will identify potential risks and additional controls implemented accordingly. In doing so, the likelihood of transfer of IMS between vessels within the Operational Area is reduced. No change in	Benefits outweigh cost/sacrifice	Yes C 14.3

Control considered	***Control feasibility (F) and cost/sacrifice (CS)[39]***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
risk assessment, management measures commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.		consequence would occur.		
Professional judgement – Eliminate				
No discharge of ballast water during the Petroleum Activity.	F: Yes, however ballast water discharges are critical for maintaining vessel stability. Given the nature of the Petroleum Activity, the use of ballast (including the potential discharge of ballast water) is considered a safety critical requirement. CS: Not assessed, due to safety critical element.	Elimination of the potential introduction of IMS, if present within the ballast water.	Legislative requirements (C 14.1) are required to be implemented to manage potential ballast water risk to low. Noting the safety critical element and the adopted control (C 14.1) this is disproportionate to the risk reduction).	No
Eliminate use of vessels.	F: No. Given vessels must be used to complete the Petroleum Activity, there is no feasible means to eliminate the source of risk. CS: Loss of the project.	Not considered- control not feasible.	Not considered - control not feasible.	No
Infield IMS inspection of geotechnical/ geophysical vessel(s) upon arrival into Operational Area	F: Yes, implementation of an infield IMS survey is considered technically feasible, however with significant operational constraints. Any IMS infield survey activities would have to be carried out via ROV as diving is not considered ALARP under Contractor(s) or Company Health and Safety Management systems. The geotechnical/geophysical vessels may not possess DP2 capabilities and is not permitted to deploy an ROV. Therefore, a dedicated additional specialist support vessel equipped with DP2 capability, ROV systems and additional technical crew would be required	No benefit in risk reduction would be achieved because IMS risk has already been managed through implementation of the Woodside's IMS risk assessment process and the Biosecurity Act 2015. An infield inspection would not materially reduce the residual likelihood or consequence of IMS introduction beyond the existing controls.	Disproportionate. Any additional benefit gained through implementation of this control is disproportionate to the cost and effort required to undertake this control infield. The IMS risk has already been managed through controls adopted (and noting already incurred cost through implementation of Woodside's IMS risk assessment process (i.e. inspections and cleaning where risk warrants)).	No

Demonstration of ALARP				
Control considered	***Control feasibility (F) and cost/sacrifice (CS)[39]***	***Benefit in impact/risk reduction***	***Proportionality***	***Control adopted***
	to undertake the IMS survey. CS: Significant cost. The survey would require mobilisation of additional vessel and crew to field, specialist personnel and equipment for the ROV, vessel time, and additional offshore operations. Ability to access some niches may be limited due to type of infield inspection capabilities and safety restrictions i.e. thruster.			
Professional judgement – Substitute				
Inspect all vessels for IMS.	F: Yes. Approach to inspect vessels could be a feasible option. CS: Significant cost and schedule impacts. In addition, Woodside's IMS risk assessment process is seen to be more cost-effective as this control allows Woodside to manage the introduction of marine pests through biofouling, while targeting its efforts and resources to areas of greatest concern.	Inspecting all vessels for IMS would reduce the likelihood of IMS being introduced to the Operational Area. However, this reduction is unlikely to be significant, given the other control measures implemented. No change in consequence would occur.	Disproportionate. The cost/sacrifice outweighs the benefit gained, as other controls to be implemented achieve an ALARP position.	No
Source vessels based in Australia only.	F: Potentially. Limiting activities to only use local survey vessels could pose a significant risk in terms of time and duration of sourcing the vessel, as well as the ability of the local vessels to perform the required tasks. While the Petroleum Activity will attempt to source vessels locally, it is not always possible. Availability cannot always be guaranteed when considered competing oil and gas activities in the region. Sourcing Australian-based vessels will also	Sourcing vessels from within Australia will reduce the likelihood of introducing IMS from outside Australian waters. However, it will not reduce the likelihood of introducing species native to Australia but alien to the Operational Area. It also does not prevent the translocation of IMS that have established elsewhere in Australia. The consequence is unchanged.	Disproportionate. Sourcing survey vessels from Australian waters may reduce the likelihood of introducing IMS to the Operational Area; however, it does not eliminate the risk. Furthermore, the cost to implement this control could be high, given the potential schedule impacts due to restrictions of vessel hire opportunities.	No

ALARP statement: On the basis of the environmental risk assessment outcomes, use of relevant tools appropriate to the decision type (i.e. Decision Type A; Section 2.3.4.2), and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage the impacts and risks of IMS introduction and establishment. As no reasonable additional/alternative controls were identified that would further reduce the impacts and risks without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The risk assessment demonstrates that, with the adopted controls, there is a low residual risk of IMS introduction, establishment and spread to the Operational Area. Consistent with NOPSEMA guidance, the risk assessment identified key risk factors and informed appropriate management measures to minimise the risk of marine pest introduction, establishment and spread (NOPSEMA, 2026). This approach aligns with the MarinePestPlan 2018–2023, which establishes a national objective to minimise the risk of marine pest introduction, establishment and spread (Commonwealth of Australia, 2018b). In this context, "introduction" represents the risk event (translocation of marine pest species), whereas material environmental impact is contingent on subsequent "establishment" (survival, reproduction and persistence). The low residual risk to environmental receptors is acceptable (see risk ratings matrix in Table 2-2), because it represents a level at which the potential risk can be effectively managed by adhering to applicable legislative requirements, industry guidelines, and/or internal Woodside procedures (Section 2.3.3). At this risk level the likelihood of the unplanned event resulting in a minor environmental consequence (D or below) is remote (see likelihood levels in Table 2-3) IMS risks are managed across the full continuum of introduction, establishment and spread, and recognising that ecological impacts arise only where establishment occurs (Commonwealth of Australia, 2013), the adopted controls are designed to minimise both the likelihood of introduction and the potential for establishment of IMS (NOPSEMA, 2026). Further opportunities to reduce risks have been considered above, and the selected controls reflect good industry practice and comply with applicable legislative requirements, including the Biosecurity Act 2015. In line with national guidance (Commonwealth of Australia, 2013; Commonwealth of Australia, 2018b; NOPSEMA, 2026) the EPO for this risk sets a level of performance preventing the introduction of invasive marine species to and within the Operational Area and focuses on prevention through the management of vessel biofouling and ballast water. On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A/B/C; Section 2.3.4.2) Woodside considers the adopted controls appropriate so that IMS risks are reduced to an acceptable level and that the EPO reflects that level. Compliance with the adopted controls will demonstrates that the EPO has been met.

EPO 14 No introduction of invasive marine species into the Operational Area as a result of the Petroleum Activity.	C 14.1 Vessels will manage their ballast water using one of the approved ballast water management options, as outlined in the Australian Ballast Water Management Requirements. This applies to all vessels that will enter the Operational area, including those carrying out activities outside of Australian Territorial Seas (>12nm)	PS 14.1 Prevents the translocation of IMS within the vessel's ballast water from high-risk locations to the Operational area.	MC 14.1 Ballast Water Records System maintained by vessels which verifies compliance against Australian Ballast Water Management Requirements.
	C 14.2 Vessels will manage their biosecurity risk associated with biofouling, as specified in the Australian Biofouling Management Requirements.	PS 14.2 Compliance with Australia Biofouling Management Requirements (as defined under the *Biosecurity Act*) to prevent the introduction of IMS.	MC 14.2 Woodside Invasive Marine Species Vessel and Equipment Questionnaire details ballast water management and internal biofouling treatment systems.
	C 14.3 Apply Woodside's IMS risk assessment process (Section 7.2.2) to vessels and relevant immersible equipment that enter the Operational Area unless exempt. Based on the outcomes, management measures commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.	PS 14.3.1 Before entering the Operational area, vessels and relevant immersible equipment are determined to be low risk [40] of introducing IMS of concern.	MC 14.3.1 Records of IMS risk assessments are maintained for all vessels and relevant immersible equipment entering the Operational area to undertake the Petroleum Activity.
		PS 14.3.2 In accordance with Woodside's IMS risk assessment process, the IMS risk assessments will be undertaken by an authorised Environment Adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector.	MC 14.3.2 Records confirm the IMS risk assessments were undertaken by an Environment Adviser or IMS inspector (as relevant).

6.10 Recovery plan and threat abatement assessment

This section describes the assessment that Woodside has undertaken to demonstrate that the Petroleum Activity is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment, the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017–2027 (CoA 2017)
- Conservation Management Plan for the Blue Whale 2015–2025 (CoA 2015b)

[40] Low risk of introducing IMS of concern is defined as either 'no additional management measures required' or 'management measures have been applied to reduce the risk'.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Recovery Plan for the Grey Nurse Shark (C*archarias taurus*) 2014 (CoA 2014)
- Sawfishes and River Sharks Multispecies Recovery Plan (CoA 2015c)
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (CoA 2018).

Table 6-18 lists the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas apply to government, the Titleholder, and/or the Petroleum Activity. For those objectives/action areas applicable to the Petroleum Activity, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are clearly inconsistent with that action or not. The results of this assessment against relevant actions are presented below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

6.11 Cultural features and heritage values assessment

The identification of cultural features and heritage values of the environment as well as the social, economic and cultural features important to Indigenous people is integral to understanding the environment and any potential impacts and risks to the environment. In line with Woodside's Indigenous Communities Policy (Woodside 2025), Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage). If avoidance is not possible, Woodside will seek to minimise and mitigate any impacts, through consultation with Indigenous communities and Traditional Custodians.

Mitigation of intangible heritage can include any measure or control aimed at ensuring the viability of the cultural heritage and its intergenerational transmission. This can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO, 2003; Australia ICOMOS, 2013).

Values and features of significance identified in Section 4.9 (Table 4-21) as being likely or possible to interact with the Operational Area or EMBA are addressed in the risk assessment below. Management of these risks ensures that Indigenous concerns and interests are adequately acknowledged and protected throughout the duration of the Petroleum Activity.

Any action in Australian waters that will or might interact with the seabed could impact UCH, as such, an adequate process of UCH assessment and management is to be undertaken ahead of, and concurrent with, any proposed actions in the near and offshore environment (DCCEEW 2024). The impact assessment below considers both Indigenous and historical UCH in order to protect its value for future generations.

Context

Detailed impact and risk assessment

The Petroleum Activity have the potential to impact cultural features and heritage values identified in Table 4-21 in the following ways.

Archaeological heritage and landscapes

Places that are identified in Section 4.9 for their value as archaeological sites are assumed to be at risk where there is potential for impact to the tangible or scientific elements of that place. This could include physical damage or disturbance to the archaeological integrity of a place.

Coastal/island archaeological sites (fish traps and middens)

No coastal areas or islands are present within the Operational Area. A review of the DPLH's Aboriginal Heritage Inquiry System identified 0 Registered Heritage Places and 0 Lodged Aboriginal sites within the EMBA.

Submerged cultural heritage (Historic and Indigenous)

The Operational Area does not overlap the submerged landscape, which is defined as the area from the WA coast to the Ancient Coastline at 125 m Depth Contour KEF. The submerged landscape is also considered to comprise potentially culturally significant landscapes and landscape features such as submerged hills, karst depressions/ravines and valleys between submerged ridges and submerged calcarenite ridges/paleo beach barrier systems. This area has been identified as having the potential for Indigenous archaeological heritage material to exist on the seabed. No archaeological sites have been identified beyond terrestrial or intertidal areas, with the exception of two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al. 2020; Benjamin et al 2023), which are outside of the EMBA. Nevertheless, cultural heritage values may exist on the seabed, these include ship and aircraft wrecks.

All actions involving seabed contact, and most actions undertaken in proximity to the seabed, have potential to cause adverse impact to UCH if present (DCCEEW 2024). Planned activities include may result in seabed contact. Woodside therefore engages a qualified consultant to undertake a desktop assessment of the potential for submerged archaeological material in areas that have not been subject to previous disturbance, using available geophysical and bathymetric data. This approach is consistent with Assessing and Managing Impacts to Underwater Cultural Heritage in Australian Waters (DCCEEW 2024). Woodside undertook an UCH assessment of the proposed broader Browse Project area (Wessex Archaeology, 2025). The report confirmed that the Operational area was not connected to the mainland submerged continental shelf of Ancient Australia. The assessment also determined that there was no evidence of historic maritime archaeology in the assessed area.

The report also assessed intangible knowledge associated with the reef. No direct intangible knowledge of values associated with Scott Reef has been documented in literature, nevertheless, environmental values associated with Sea Country such as turtles, that are inherently associated with Scott Reef were acknowledged. These values are assessed in the marine ecosystems and species section below and in relevant assessments in Sections 6.8 and 6.9. Known submerged heritage, including archaeological sites, may be protected subject to declarations under the Aboriginal and Torres Strait Islander Heritage Protection Act 1984, Underwater Cultural Heritage Act 2018 or EPBC Act 1999. Submerged archaeological sites (locations undefined) may exist on the Submerged Landscape within the broader EMBA. However, given the EMBA is driven by an unplanned hydrocarbon release, it is not expected to impact the seabed or archaeological material on or within it. Therefore, there is no anticipated impact pathway to submerged archaeological sites in the broader EMBA from the Petroleum Activity

Woodside understands there is no Indigenous archaeology known to exist within the OAs and no areas subject to declarations or prescriptions under these Acts are located within the OAs. No submerged sites of significance within the OAs were identified by Traditional Custodians during consultation while preparing this EP. There is also no planned dredging or large-scale seabed disturbance. In the event that unidentified cultural heritage is encountered it will be managed in accordance with the Unexpected Finds Procedure detailed Section 7.2.3 and applicable legislative obligations.

Intangible heritage

Intangible values that are identified in Section 4.9 are assumed to be at risk where there is potential for impact to the spiritual connections, features and/or places associated with the value. Impacts to intangible heritage can be individualised; the assessment below does not account for this variability but aims to assess widespread impacts to general intangible values.

Cultural obligations to care for Country/Access to Country

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Potential impact pathways to the rights and obligations of Traditional Custodians to care for Sea Country may be directly associated with environmental impacts, or by excluding Traditional Custodians from Sea Country (e.g. by restricting access) or decision-making processes (e.g. by not conducting ongoing consultation). Restrictions on access may be temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Such impacts are limited to areas that have been traditionally accessed by Traditional Custodians and are expected to be concentrated in shoreline environments therefore not expected to result from the Petroleum Activity. If required, ongoing consultation is intended to facilitate access arrangements where feasibly safe to do so, and to support appropriately informed decision-making processes.

Creation/dreaming sites; ceremonial sites; sacred sites; ancestral beings

Activities that physically alter landscape features may be assumed to potentially impact values of creation/dreaming sites, sacred sites or ancestral beings. Activities that prevent the performance of ceremony at these sites will directly impact its values. This is anticipated to be focused on areas adjacent to the coast. There are no known creation or dreaming sites identified within the Operational Area during consultation or through publicly available literature. With consideration to the limited extent of the proposed activity, impacts to creation/dreaming or ceremonial sites are not expected.

Kinship systems and totemic species

Marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu 2004). It is therefore inferred that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. The impacts and risks associated with the Petroleum Activity are not considered to be ecologically significant at a population level. As such, cultural values associated with kinship systems and totemic species are expected to be maintained.

Resource collection

It is understood that resource collection and use of Sea Country is part of ongoing Indigenous culture in the Kimberley region. For example*, Bardi and Jawi people have always and continue to engage in shore fishing, collecting sea food from the intertidal zone, hunting odorr (dugong) and goorlil (turtle)* (DBCA 2022). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level. However, the impacts and risks associated with the Petroleum Activity are not considered to be ecologically significant at a population level. As such, cultural values associated with resource collection are expected to be maintained.

Songlines

Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. “weaken” a songline) rather than binary or absolute (i.e. destroy a songline).

Knowledge of Country/customary law and transfer of knowledge/ Connection to Country

Where people are displaced or disrupted (e.g., during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald and Phillips, 2021). Direct impact to communities practicing traditional skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in species population. Furthermore, limitations on access to sites or disruption/relocation of Indigenous communities may have implications for the preservation of Indigenous knowledge. Impacts and risks from the Petroleum Activity are not considered to be ecologically significant at a population level and hence are not expected to impact the value of marine species. It is therefore not expected that the Petroleum Activity will displace or disrupt a Traditional Custodians capacity to pass on knowledge related to marine species or knowledge related to traditional culture/ technical skills.

As outlined above, neither the literature reviewed nor the consultation undertaken identified any specific intangible cultural heritage values directly associated with Scott Reef. While no intangible cultural values have been attributed to the reef itself, through these sources it was identified that environmental values linked to Scott Reef including marine species and ecological features are known to hold cultural significance for Indigenous peoples. These values are discussed in detail in the section below, as well as in Sections 6.8 and 6.9, which describe the relevant environmental values, their cultural significance, and the measures adopted to avoid or minimise potential impacts.

Traditional Custodians maintain an ongoing connection to Sea Country through living cultural traditions, including the use of resources and the practice of cultural activities such as ceremonies and Dreaming stories. Woodside invites ongoing engagement with relevant Traditional Custodian groups to understand how this connection can remain uninterrupted during the Petroleum Activity. Further supported by the environmental management controls outlined in Sections 6.8 and 6.9, no adverse impacts to intangible cultural values associated with Sea Country are expected from the Petroleum Activity .

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine Ecosystems and Species

Marine ecosystems may hold both cultural and environmental value, with cultural and environmental values intrinsically linked (DCCEEW 2023; MAC 2022 as cited in Woodside 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country and the seascape which Traditional Custodians view, interact with or hold knowledge of.

Fresh hydrocarbons (i.e. typically in the vicinity of the release location) may have a higher potential to cause toxic effects when ingested, while weathered hydrocarbons are considered to be less likely to result in toxic effects. As such, the risk of hydrocarbon ingestion is low. The migration of culturally significant marine fauna (marine reptiles, fish and mammals) protracts through time and space (i.e. the entire population will not be within the EMBA), and as such, a spill from the loss of well integrity is unlikely to affect an entire population.

A worst-case hydrocarbon spill scenario has the potential to result in major long-term impacts to offshore marine fauna species, with consequence severity dependent on the actual timing, duration and extent of a spill in relation to species' migratory movements and distributions. Such an event has been assessed above as highly unlikely and relevant EPOs and its corresponding controls have been implemented to mitigate such a risk (See Section 6.9).There is potential for temporary or localised effects on cultural features and heritage values associated with affected environmental receptors; however, these impacts are not expected to result in the loss of heritage value, cultural practice, knowledge transmission, or cultural obligations at a broader cultural landscape or population scale.

Benthic habitats (coral, seagrass)

Through consultation and existing literature, Indigenous groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important habitat for dugongs. Additionally, coral and coral reef communities are valued by the Bardi and Jawi people as they provide sustenance and are culturally significant (DBCA 2022). .

As described in Section 6.9, an unplanned hydrocarbon release is unlikely to result in impacts on benthic habitats. As such, cultural values and intangible cultural heritage associated with benthic habitats are expected to be maintained.

Plankton

Through consultation and review of available literature (Section 4.9) Woodside understands that marine fauna such as plankton are culturally important to Traditional Custodians and may be affected by routine and non-routine emissions, light emissions, and unplanned hydrocarbon releases. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to Songlines and Dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

As described in Sections 6.8 and 6.9, potential impacts to marine fauna are predicted to be at an individual level, which are not considered to be ecologically significant at a population level. Impacts are not expected to occur to significant proportions of the populations of the species, nor expected to result in a decrease of the quality of the habitat such that the extent of these species is likely to decline. As such, cultural values and intangible cultural heritage associated with plankton are expected to be maintained.

Fish and crustaceans

Fish and crab and squid have been identified through consultation and existing literature as an important resource, particularly as food sources.. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level.

Through consultation, fish (aarli) were identified as important agents in the management of the broader ecosystem for Indigenous groups within or adjacent to the EMBA. There are Thalu ceremonies associated with increasing fish stocks. It may be assumed that inter-generational transmission of cultural knowledge relating to fish may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). Intangible cultural heritage associated with fish, including inter-generational knowledge regarding fishing techniques and migratory patterns, can be managed by reducing impacts to fish in nearshore marine environments to which this cultural knowledge is intrinsically connected.

The potential impacts from the Petroleum Activity on fish and cephalopods are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with fish and cephalopods are expected to be maintained.

Marine Mammals (Whales, dolphins, esturine crocodiles and dugongs)

There are increase ceremonies/rituals for species of animals and plants important to Indigenous peoples, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites in the reviewed literature were confined to onshore locations, though the values may extend offshore. For example, the Thalu relates to marine species populations. As Thalu ceremonies are performed to maintain and increase populations of marine species, it is inferred that management applies at the species/population level and not to individuals. For example, the Thalu site on Murujuga which "brings in whales to beach" will continue to serve its

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

purpose so long as whales continue to migrate through Mermaid Sound. Reviewed literature (DBCA 2020) also includes information that is marked as information that cannot be copied, reproduced or used without consent. The values described in the literature are environmental in nature, apply to marine mammal behaviours at a population level and are managed through existing environmental controls.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler 2021; Bursill et al. 2007; Cressey 1998). Whales also speak to a broader connection that exists between Indigenous people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to Indigenous people (Fijn 2021). No impacts to communities' ability to perform or transmit stories, music or dance are anticipated from the Petroleum Activity. Where timing or performance is linked to sighting or engaging with these species, impacts may occur where numbers or migration behaviours are impacted at a population level.

Indigenous groups have expressed interest about whale migratory routes and studies. Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

The potential impacts from the Petroleum Activity on marine mammals are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with marine mammals are expected to be maintained.

Marine reptiles (turtles)

Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level.

Through consultation and review of available literature (Section 4.9), Woodside understands that marine fauna such as turtles, are culturally important to Traditional Custodians, and may be affected by light emissions. Traditional Custodians value these species both tangibly as well intangibly as they can be considered a resource or linked to Songlines and Dreaming stories. Traditional Custodians also have connection to many marine species through kinship and totemic systems; an individual may have obligation to care for a species to which they are kin. Traditional Custodians may also have a cultural obligation to care for the environmental values of Sea Country.

Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Cultural knowledge may also be conveyed through stories, such as the turtle being trapped in the sea as a result of its greed for berries as recounted by Capewell (2020). Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Indigenous groups have expressed an interest regarding turtle monitoring programs and migration patterns.

Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al. 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

The potential impacts from the Petroleum Activity on marine reptiles are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with marine reptiles are expected to be maintained.

Seabirds

Seabirds have been identified through literature as a culturally significant species (Malgana Aboriginal Corporation 2021), as well as a resource (seabird eggs; Smyth 2007). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) are likely to be impacted where there is an impact at the species/population level. Intangible cultural heritage may also include the transmission of cultural knowledge about seabirds, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021) Inter-generational transmission of cultural knowledge relating to seabirds may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The potential impacts from the Petroleum Activity on seabirds are not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with seabirds are expected to be maintained.

Shoreline habitats (e.g. mangroves)

Through consultation, Indigenous peoples identified shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified as resources, and a potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (DBCA, nd) There is no overlap between the Operational Area and mangrove habitat, and no planned impacts to mangroves from the Petroleum Activity. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.

Water Quality

Through consultation impacts to water quality potential impacts on water quality and consequent potential impacts on marine fauna such as whales, dugongs, sharks, rays, and seabirds from the risk of unplanned chemical discharges (non-hydrocarbon)

Water quality would be affected in the offshore environment within the EMBA due to hydrocarbon contamination from entrained, dissolved and surface hydrocarbons. Due to the weathering processes of the hydrocarbons, impacts to water quality are anticipated to be minor long term and/or significant short term as a result of hydrocarbon contamination above background levels.

Given likely small volumes of any unplanned solid waste discharge, and the occasional nature of the event, these would result in temporary and highly localised changes to the water quality.

Conclusion

The potential impacts and risks from the Petroleum Activity are not considered to be ecologically significant at the population level. As such, impacts are not expected to result in the loss of heritage value, cultural practice, knowledge transmission, or cultural obligations at a broader cultural landscape or population scale. Refer to the impacts on intangible values assessment above.

The impact and risk assessment for cultural features and heritage values has therefore determined that the planned activities are unlikely to result in an impact greater than slight (E) and unplanned activities are assessed to have a residual risk rating of moderate (or lower). Woodside will continue to consider new heritage information as it becomes available.

Benefits outweigh costs/sacrifice	Yes C 4.3
ALARP statement: On the basis of the assessment outcomes, use of the relevant tools appropriate to the decision type (i.e. Decision Type A Section 2.3.4.2) and Woodside's criteria for demonstrating ALARP (Section 2.4.1), Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonably practicable additional/alternative controls were identified that would further reduce the impacts without disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of acceptability
Acceptability statement: The impact and risk assessment has determined that, given the adopted controls, planned activities are unlikely to result in an impact greater than temporary localised impact not significant to areas or items of cultural significance with slight (E) and unplanned activities are assessed to have a residual risk rating of moderate (or lower). The Petroleum Activity and the EMBA are not expected to have a significant impact (e.g. changes in population levels) on MNES including marine fauna with a cultural connection with, or traditional use in nearshore areas. Woodside facilitates a process of undertaking desktop assessments by qualified professionals, using remote sensing techniques, to identify known or potential underwater cultural heritage where new seabed disturbance occurs and an unexpected finds procedure (refer to Section 7.2.3) will be implemented (C 4.2). Therefore, the activity is not inconsistent with Underwater Cultural Heritage Guidance for Offshore Developments and the Guidelines to assessing and managing impacts to Underwater Cultural Heritage in Australian waters under the UCH Act. As outlined in Section 6.11 and based on the EPOs considered below and the relevant adopted controls, planned activities proposed under the Petroleum Activity are not inconsistent with relevant heritage legislation, management plans and agreements under which these values are protected and conserved. In addition, Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Woodside maintains a long-standing relationship, where established, with relevant Traditional Custodian groups, and undertakes consultation with those whose functions, interests or activities may be affected by activities conducted under this EP. In the event of an unplanned environmental impact, such as a hydrocarbon spill, Woodside will engage with relevant Indigenous groups within or adjacent to the EMBA in line with its First Strike Plan (Appendix H). Woodside will support Traditional Custodians to practice cultural obligations to care for Country by providing timely information on the incident, facilitating safe access to Sea Country where practicable, and incorporating Traditional Custodian knowledge and priorities into response, mitigation and recovery activities. For ongoing consultation post Regulation 25 consultation, Woodside supports ongoing engagement with Traditional Custodians. Woodside is committed to ongoing engagement and support to care for and manage Country, including

Demonstration of acceptability
Sea Country. The 'living heritage' management approach (C 2.1) has been developed to enable Woodside to manage cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians. Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable, if ALARP.

EPOs, EPSs and MC[43]			
EPOs	***C***	***PS***	***MC***
EPO 2a No adverse impact[44] to cultural features and heritage values from the Petroleum Activity. EPO 2b Woodside supports ongoing engagement and consultation with Traditional Custodians for the purpose of assessing and avoiding impacts to cultural features and heritage values.	C 2.1 Apply a 'living heritage' management approach. Woodside engages with Traditional Custodians and seeks to incorporate cultural knowledge, where appropriate across activities. Cultural safety considerations are factored for our workforce and the Indigenous community.	PS 2.1.1 Woodside will continue to invite Traditional Custodians to identify interests, transmit information and express concern through ongoing consultation, as identified in Section 7.10.	MC 2.1.1 Records demonstrate Change Management and Management of Knowledge processes have been followed where new controls or management measures are identified.
	C 2.2 Project inductions to relevant personnel, prior to the individual commencing the activity, will include information on cultural features and heritage values, including tangible and intangible cultural heritage	PS 2.1.2 Woodside will assess and, where deemed practicable, implement appropriate cultural protocols where requested by Traditional Custodians.	MC 2.1.2 Records demonstrate Woodside implemented cultural protocols as requested.
		PS 2.2 Relevant personnel have completed project inductions that include information on cultural values, including tangible and intangible cultural heritage for awareness.	MC 2.2 Records demonstrate relevant personnel have completed inductions that include cultural awareness.
	C 2.3 The environmental impacts and risks of the activity will continue to be managed to as low as reasonably practicable and an acceptable level for cultural features and heritage values.	PS 2.3.1 Consideration of cultural values/new information, through the life of the EP, and the development of avoidance or mitigation strategies in collaboration with Traditional Custodians if impacts to cultural values are identified. Where avoidance is not possible, impact minimisation will be prioritised and	MC 2.3.1 Records demonstrate Change Management and Management of Knowledge processes have been followed where new controls or management measures are identified (Section 7.8)

[43] As marine ecosystems may hold both cultural and environmental value (see Section 4.9), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in Sections 6.8 and 6.9 will reduce impacts to cultural features and heritage values including marine species and habitats.

[44] For the purposes of the Petroleum Activity, an adverse impact to cultural features or heritage values is considered to occur where there is: direct physical disturbance causing observable damage to a site or object of cultural significance; a measurable and significant decline in the population or habitat of a culturally significant species attributable to the surveys; or a substantiated impact on recognised intangible cultural values

7. IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 22 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the Petroleum Activity confirms fit-for-purpose systems, practices and procedures are in place to direct, review and manage the activities so that environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and EPS outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring that the Petroleum Activity is managed in accordance with this Implementation Strategy and the WMS (Section 1.7).

7.2 Systems, practices, and procedures

All operational activities are planned and performed in accordance with relevant legislation and standards, management measures identified in this EP and internal environment standards and procedures (Section 6). The systems, practices and procedures that will be implemented are listed in the EPS adopted in Section 6. Document names and reference numbers may be subject to change during the statutory duration of this EP and is managed through a Change Register and update process.

7.2.1 Environmental Consideration during Selection, Assessment and Approval of Chemicals

All chemicals that may be operationally released or discharged to the marine environment by the Petroleum Activity are evaluated using a defined framework and set of tools to ensure the potential impacts are acceptable, ALARP and meet Woodside's expectation for environmental performance Management Standard, which requires chemicals to be selected with the lowest practicable environmental impacts and risks, subject to technical constraints).

Chemicals proposed to be selected as part for the Petroleum Activity will be managed in accordance with the requirements set out by the Australian Government under the Industrial Chemicals Environmental Standard (IChEMS). The IChEMS is a key component of several National reforms to improve approaches to how industrial chemicals are used, produced, imported and managed. Industrial chemicals will be listed on the IChEMS Register in one of 7 schedules according to their environmental risk.

Chemicals proposed for selection in this activity will be assessed against those listed in the IChEMS register under one of the seven schedules according to their environmental risk. The selection and management of any chemical will adhere to the specific risk management measures, storage, use and handling requirements outlined in the corresponding schedule.

7.2.1.1 Environmental selection criteria

The chemical assessment process follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS), which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands. It applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters, such as biodegradation and bioaccumulation, in accordance with one of two schemes (as shown in Figure 7-1):

- Hazard Quotient (HQ) Colour Band: Gold, Silver, White, Blue, Orange or Purple (listed in order of increasing environmental hazard).
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard). Used for inorganic substances, hydraulic fluids and pipeline chemicals only.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

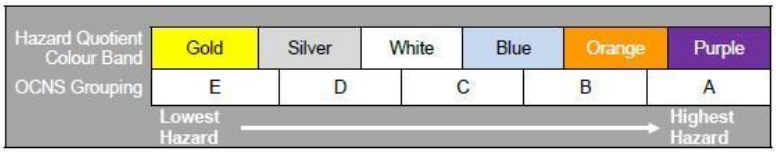

Figure 7-1: OCNS ranking scheme

Chemicals fall into the following assessment types:

- No further assessment: Chemicals with an HQ band of Gold or Silver or an OCNS ranking of E or D with no substitution or product warnings do not require further assessment. Such chemicals do not represent a significant impact on the environment under standard use scenarios and are therefore considered ALARP and acceptable.
- Further assessment/ALARP justification required: The following types of chemicals require further assessment to understand the environmental impacts of discharge into the marine environment:
  - chemicals with no OCNS ranking
  - chemicals with an HQ band of White, Blue, Orange or Purple or an OCNS ranking of A, B or C
  - chemicals with an OCNS product or substitution warning.

This includes assessing the ecotoxicity, biodegradation and bioaccumulation of the chemicals in the marine environment in accordance with the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) Hazard assessment and the Department of Mines, Petroleum and Exploration (DMPE) Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

Ecotoxicity

Chemical ecotoxicity is assessed using the criteria used by CEFAS to group chemicals based on ecotoxicity results (Table 6-1). If a chemical has an aquatic or sediment toxicity within the criteria for the OCNS grouping of D or E, this is considered acceptable in terms of ecotoxicity.

Table 7-1: CEFAS OCNS grouping based on ecotoxicity results

Initial Grouping	A	B	C	D	E
Results of aquatic toxicity data (ppm)	<1	>1–10	>10–100	>100–1,000	>1,000
Results for sediment toxicity data (ppm)	<10	>10–100	>100–1,000	>1,000–10,000	>10,000

Note: Aquatic toxicity refers to the Skeletonema costatum EC50, Acartia tonsa LC50 and Scophthalmus maximus (juvenile turbot) LC50 toxicity tests; sediment toxicity refers to Corophium volutator LC50 test.

Biodegradation

The biodegradation of chemicals is assessed using the CEFAS biodegradation criteria, which align with the categorisation outlined in the DMPE Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

CEFAS categorises biodegradation into the following groups:

- Readily biodegradable: results of >60% biodegradation in 28 days to an OSPAR harmonised offshore chemical notification format (HOCNF) accepted ready biodegradation protocol
- Inherently biodegradable: results >20% and <60% to an OSPAR HOCNF accepted ready biodegradation protocol or result of >20% by OSPAR accepted inherent biodegradation study
- Not biodegradable: results from OSPAR HOCNF accepted biodegradation protocol or inherent biodegradation protocol are <20%, or half-life values derived from aquatic simulation test indicate persistence.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Chemicals with >60% biodegradation in 28 days to an OSPAR HOCNF accepted ready biodegradation protocol are considered acceptable in terms of biodegradation.

Bioaccumulation

The bioaccumulation of chemicals is assessed using the CEFAS bioaccumulation criteria, which align with the categorisation outlined in the DMPE Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

The following guidance is used by CEFAS:

- Non-bioaccumulative: Log Pow <3, or Bioconcentration Factor (BCF) ≤100 and molecular weight is ≥700
- Bioaccumulative: Log Pow ≥3 or BCF >100 and molecular weight is <700.

Chemicals that meet the non-bioaccumulative criteria are considered acceptable. If a product has no specific ecotoxicity, biodegradation or bioaccumulation data available, the following options are considered:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

Alternatives

If no environmental data are available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical will be investigated, with preference for options with an HQ band of Gold or Silver, or OCNS Group E or D with no substitution or product warnings.

Decision

Once the further assessment/ALARP justification has been completed, the relevant environment adviser must concur that the environmental risk as a result of chemical use is ALARP and acceptable.

7.2.2 Woodside invasive marine species risk assessment process

7.2.2.1 Objective and scope

To minimise the risk of introducing invasive marine species (IMS) as a result of the Petroleum Activity, all applicable vessels and relevant immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below), in accordance with Woodside's Invasive Marine Species Management Plan (IMSMP).

The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

The IMS risk assessment process does not apply to:

- vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)[45]
- 'new build' vessels or immersible equipment launched less than 14 days before mobilisation
- locally sourced vessels or immersible equipment from within the Western Locally Sourced Zone (W-LSZ)[46]. Vessels, or immersible equipment are defined as locally sourced when the same supply

[45] The IMSMA is defined as all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 nm from land ('Territorial Seas', and including Australian territorial islands). The IMSMA also includes: (i) all waters which are shallower than the 50-metre depth contour outside of the 12 nm boundary, thereby encompassing submerged reefs and atolls, and (ii) Operational Area defined in environmental approvals. The IMSMA is based on current maritime boundary definitions, legal frameworks and requirements, IMS risk interpretations and existing management arrangements applied by Commonwealth and State/Territory regulatory agencies.

[46] The Western Locally Sourced Zone (W-LSZ) spans an area that includes the entire Western Australian coastline out to the Exclusive Economic Zone (EEZ) limit at 200 nm, but it excludes any government-declared Quarantine Areas (Quarantine Areas are defined below).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of antifouling coating (AFC).

7.2.2.2 Risk assessment process

Woodside's IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships' biofouling to minimise the transfer of invasive aquatic species (International Maritime Organisation 2023).

To effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each vessel, or immersible equipment planning to undertake activities within an IMSMA or Operational Area. The risk assessment process considers a range of factors, as listed in Table 7-2 and Table 7-3.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A quality assurance/quality control (QA/QC) process is implemented for all Woodside conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

Table 7-2: Key factors considered as a part of the risk assessment process for vessels

Factors	Details
Vessel type	The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g. dredges) in comparison to simple vessels (e.g. crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, different risk ratings are applied depending on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past 6 months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel's normal speeds and activity profile (i.e. proportion of time spent stationary or below 3 knots), and its main operational region (i.e. tropical, subtropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.
Internal treatment systems	A risk reduction factor applied if the vessel has an internal biological fouling control system in place at the time of assessment, or evidence of manual dosing.
Vessel origin and proposed area of operation	Differing risk ratings are assigned in relation to the climatic relationship between the vessel's origin and the proposed climatic region of the proposed area of operation. Highest risk rating is applied to similar climatic regions.
Number of stationary/slow speed periods >7 days	A risk factor is calculated based on the number of 7-day periods that the vessel has operated at stationary or at low speed (<3 knots) in port or coastal waters which is any waters <50 m deep outside 12 nm from land or any waters within 12 nm of land. The greater the number of periods, the higher the risk factor applied.
Region of stationary or slow periods	A further multiplier is applied depending on the location of the stationary/slow speed periods. The highest risk rating applied if the stationary or slow speed periods occurred within ports or coastal waters of the same climatic region.
Type of activity – contact with seafloor	The potential for the introduction of IMS varies on the planned vessel activity taking place. Those activities that come in contact with sediments and thus have the potential to accumulate and harbour IMS in areas such as hoppers (dredges) and spud cans (drilling rigs) are considered to have a greater risk of infection.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-3: Key factors considered as a part of the risk assessment process for immersible equipment

Factors	Details
Region of deployment since last thorough clean, particularly coastal locations	Climatic region of use since last overhaul, thorough cleaning or prolonged period out of water (>28 days). Highest risk rating is applied to similar climatic regions. Activities occurring in nearshore areas (<50 m deep and/or within 12 nm from land) are given the highest risk rating.
Duration of deployments	Maximum duration of deployment (maximum time in water) since last overhaul or thorough cleaning. The longer the immersion period, the higher the risk rating applied.
Duration of time out of water since last deployment	A further risk reduction factor can be applied for immersible equipment that has been out of the water for an extended period.
Transport conditions during mobilisation	If the equipment is stored in damp conditions then a high risk factor is applied, while if equipment is stored in dry and well ventilated (low humidity) conditions then a low risk factor is applied.
Post-retrieval maintenance regime	A risk reduction factor is applied if the equipment/item of interest is routinely washed, cleaned, checked and/or dissembled between project sites, while a higher risk rating is applied where no routine cleaning occurs.

Following implementation of the risk assessment process, vessels and/or immersible equipment are classified as one of three risk categories:

- ‘Low’ – Low risk of introducing IMS of concern and hence no additional management required, or management options have been applied to reduce the risk.
- ‘Uncertain’ – Risk of introducing IMS is not apparent and as such the precautionary approach is adopted, and additional management options may be required.
- ‘High’ – High risk of introducing IMS means additional management options are required before this vessel mobilises to the Operational Area.

Following the allocation of a ‘low’ risk rating for a vessel or immersible equipment, the information provided by the vessel operator for the purposes of risk assessment must be confirmed before mobilisation. For vessels or equipment classified as posing an ‘uncertain’ or ‘high’ theoretical risk, a range of management options are presented to reduce this theoretical risk to acceptable levels and achieve a low risk status. These management options have been developed with the intention of reducing IMS risk to levels that are ALARP. It is a flexible approach that allows for a range of management actions to be tailored for a specific vessel movement. These will be assessed on a case-by-case basis and may include:

- having a suitably qualified and experienced IMS inspector inspect (desktop, in-water or dry dock) to verify risk status; where practicable, the inspection shall occur within seven days (but not more than 14 days) before final departure to the Operational Area
- applying in-water or dry dock cleaning of the hull and other niche areas, typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports
- limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries); applicable for Uncertain risk vessels only
- rejecting the vessel.

In some circumstances, such as emergency scenarios or in the presence of serious logistic constraints or other factors outside of Woodside’s control, it may not be possible to effectively apply any of the IMS management measures available and described above. In the absence of regulatory conditions, commitments, or other legislative obligations that prescribe management measures for IMS, a risk-assessed alternative process is available that must be approved by the relevant Business Vice President and HSE Vice President.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Where planned Woodside activities include interactions between a vessel and a Woodside offshore facility (including MODUs and Primary Installation Vessels) that will exceed 14 consecutive days the IMS translocation potential is required to be examined in additional detail. This would likely include additional engagement with a qualified and experienced IMS Inspector, to determine whether any additional management controls should be applied to manage the risk of IMS to Low.

Risk factors that may be further evaluated may include the age of the vessel's antifouling coating, last IMS inspection date, and vessel transit history. Management measures that may be implemented where potential risks have been identified include, but are not limited to, minimising operational time adjacent to the offshore facility, a more specific evaluation of the potential for IMS to be present on the vessel's hull, or an inspection by a qualified IMS Inspector.

Before they enter the Operational area, survey vessels and immersible equipment are required to be a low risk of introducing IMS.

7.2.3 Unexpected finds procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as 'any trace of human existence that has a cultural, historical or archaeological character and is located under water'); the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage, including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside's Principal Heritage Adviser.
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
- No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside's Principal Heritage Adviser.
- Woodside's Principal Heritage Adviser must notify a qualified underwater archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
- If the potential Underwater Cultural Heritage appears to be Aboriginal underwater cultural heritage, Woodside's Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
- If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the *Underwater Cultural Heritage Act 2018* (Cth) (UCH Act), Woodside's Principal Heritage Advisor must notify the Minister responsible for the UCH Act, the Department of Climate Change, Energy, Environment and Water (DCCEEW) underwater archaeology section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.
- If the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
  - the Australian Federal Police (phone: 131 237) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains
  - the Office of the Federal Environment Minister in accordance with Section 20 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (Cth) (ATSIHP Act).
- Work must not recommence in the vicinity of the potential heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.4 Offshore Seabird Management Plan

Vessels will implement Woodside's Offshore Seabird Management Plan (SBMP), which aligns with recommendations in the National Light Pollution Guidelines for Wildlife (CoA 2023) (see C8.1 in Section 6.8.4). When implemented, the Offshore SBMP addresses seabird interaction reporting and management for offshore/inshore activities within the North West Marine Region, specifically where the activity is located within a nocturnal seabird species BIA.

The purpose of the Offshore SBMP is to manage interactions with seabirds offshore to ensure any impacts and risks are reduced to ALARP and an acceptable level. The plan also provides frontline workers with guidance to manage seabird interactions and potential impacts resulting from these interactions identified as occurring as a result of Woodside's activities, as demonstrated in Figure 7-2

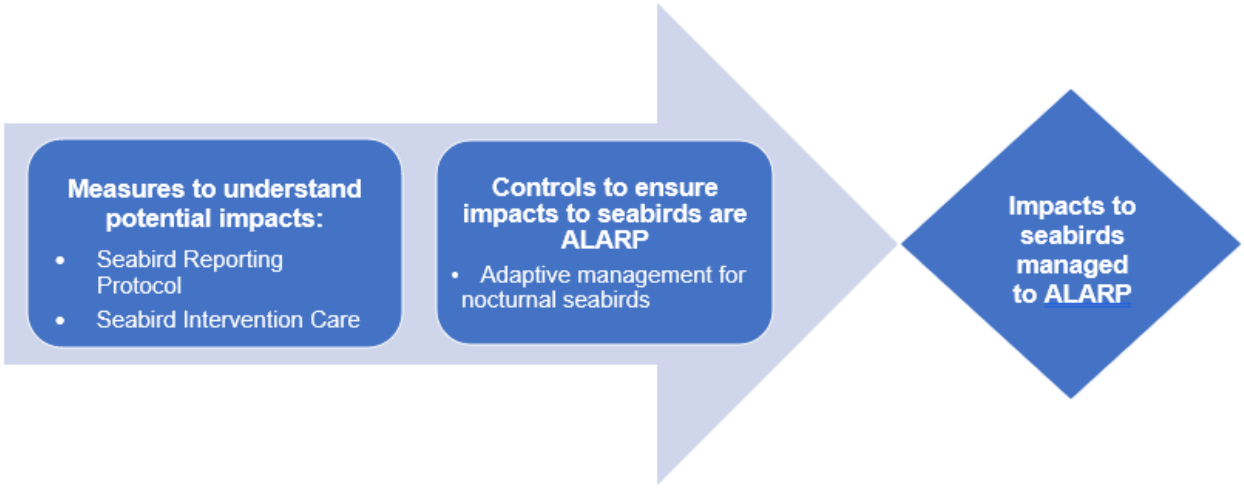

Figure 7-2: Schematic for SBMP to manage seabird impacts to ALARP and acceptable

The Offshore SBMP adaptive management framework has been established to manage the uncertainty of the potential impacts of artificial night at light on nocturnal seabirds and is applied when a Project is within a nocturnal seabird BIA and greater than 20 km from a known rookery. Where interactions with nocturnal seabirds are identified, adaptive management controls under the Offshore SBMP may be triggered in a tiered approach.

This may include an initial assessment of:

- Seabird species important habitat proximity, life cycle seasonality and periods of heightened sensitivity such as fledgling exodus.
- Overlap of seabird interactions and inclement weather (for example, post-cyclonic metocean conditions are known to increase seabird groundings).

And the consideration of controls and mitigation actions, for example:

- Extinguish outdoor/deck lights not necessary for safety and navigation at night.
- Use of block-out-blinds on portholes and windows not necessary for safety and/or navigation.

The Offshore SBMP will be available on board vessels during the petroleum activity. MODU and vessel crew will be made aware of the Offshore SBMP through the campaign environment induction. This induction will include the requirement to report seabird sightings to the offshore HSE advisors on the MODU and the onshore Woodside Environment Advisor. The Offshore SBMP will be implemented by frontline personnel with support from Woodside activity focused Environmental Advisors, the Science team and a dedicated seabird subject matter expert.

7.2.5 Pygmy Blue Whale Adaptive Management

Survey vessels will implement adaptive management measures in the form of pre start observations and shutdown procedures for DP operations and the use of geophysical equipment to achieve the EPO 5 'No injury of, or mortality to, EPBC Act (Cth) and BC Act (WA) listed marine fauna as a result of noise generated

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

by the Petroleum Activity.' and specifically the *Conservation Management Plan for the Blue Whale, Management Action A.2.3: Anthropogenic noise in BIAs will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area*.

Therefore, the objectives of the adaptive management are to:

- prevent TTS, defined as injury, for pygmy blue whales; and
- limit noise disturbance (e.g. manage the introduction of noise emissions in the area) to as low as practicable and acceptable levels to prevent displacement from the possible foraging BIA

The adaptive management procedures will apply to locations within the Operational Area where noise modelling indicates the PBW possible foraging BIA may be ensonified above the cetacean behavioural response threshold.

These measures will be implemented during both daytime and nighttime as required, with infrared goggles utilised for observations during nighttime operations.

A conservative approach has been taken and the adaptive management procedure will apply to all whales as described in the subsequent subsections.

7.2.5.1 DP operations

For DP operations, adaptive management will be implemented through a staged process that manages the introduction of underwater noise and reduces the potential for pygmy blue whale disturbance or injury. The process requires trained crew to confirm whether pre-start observations are required for the relevant vessel/activity scenario, complete the applicable observation period before DP commences, and only proceed where no whales are observed within the relevant observation zone (or to the limits of visibility) for a period of 30 minutes.

Where a shutdown zone applies, trained crew will continue monitoring once DP has commenced and will implement the required response if a whale enters the zone, subject to vessel safety and practicability. The scenario-specific observation zones, shutdown requirements and seasonal controls are set out in Table 7-4.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-4 Scenario-specific observation zones, shutdown requirements and seasonal controls for all vessels

Scenario		Behavioural response 120 SPL 1 Rmax (km)	TTS-SEL24h Rmax (km)	PTS/AINJ-SEL24h Rmax (km)	Pre-start Observation Zones (based on modelled maximum horizontal distance to behavioural response as predicted by modelling)	Shut down zones (based on TTS thresholds for VLF whales as predicted by modelling)	Peak Season Avoidance (constrained by a maximum three-month avoidance period)
A	Multipurpose vessel or USV under transit (not under DP)	0.21	0.06	-	**Not applicable** Behavioural response is localised to 210 m and TTS / PTS unlikely as whale would have to stay within 60 m of the vessel for 24 hours.		N/A due to very localised area of potential disturbance
B	Geotechnical drilling vessel under DP	3.61	0.98	0.10	30 minutes out to a distance of 3.7 km (or to the limit of visibility if conditions prohibit observations to 3.7 km) prior to starting DP operations	**Not applicable** Shut down not feasible due to safety considerations (e.g. DP required for drilling and supply vessel alongside requires DP)	Yes, due to increased area of potential impact and inability to shut down
C	Geotechnical drilling vessel under DP with an OSV resupply	7.93	1.12	0.12	30 minutes out to a distance of 8 km (or to the limit of visibility if conditions prohibit observations to 8 km) prior to second vessel commencing DP operations		
D	Multipurpose vessel or USV under DP	3.14	0.67	0.09	30 minutes out to distance of 3.2 km (or to the limit of visibility if conditions prohibit observations to 3.2 km) prior to starting DP operations	Shut down zone of 700 m Minimum 700 m separation distance to be maintained between vessel and whales; or vessel will reduce thrusters to as low as safely possible	**Not applicable** DP unlikely to be required and will be only for short durations; noting prestart delays and shut down zones will be applied to meet the EPO.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Scenario		Behavioural response 120 SPL 1 Rmax (km)	TTS-SEL24h Rmax (km)	PTS/AINJ-SEL24h Rmax (km)	Pre-start Observation Zones (based on modelled maximum horizontal distance to behavioural response as predicted by modelling)	Shut down zones (based on TTS thresholds for VLF whales as predicted by modelling)	Peak Season Avoidance (constrained by a maximum three-month avoidance period)
E	Multipurpose vessel under DP with an OSV resupply	Not modelled – Scenario C used as a conservative surrogate			30 minutes out to a distance of 8 km (or to the limit of visibility if conditions prohibit observations to 8 km) prior to second vessel commencing DP operations	**Not applicable** Shut down not feasible due to safety considerations during resupply	**Not applicable** Resupply will be of short duration: typically, only 12 hours only for short durations; noting prestart observations will be implemented prior to resupply operations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.5.2 Geophysical survey equipment

Pre start observations will be undertaken during geophysical surveys prior to startup of Boomer and Sparker SBP equipment as follows:

- Monitor for whales 30 minutes prior to commencing startup within an Observation Zone of 150 m from the vessel.
- Proceed with startup only when no whales have been sighted within the Observation Zone over the 30-minute monitoring period.

Shutdown procedures will be implemented during geophysical surveys using Boomer and Sparker SBP equipment as follows:

- Once equipment is started up, monitor for whales within Shutdown Zone (150 m) and if a whale is sighted, power down to lowest possible setting or shut down completely.

Restart can continue if no whales are observed for 30 min within the Shutdown Zone or whales are observed leaving the Shutdown Zone

7.3 Roles and responsibilities

Key roles and responsibilities for Woodside and contractor personnel relating to implementing, managing and reviewing this EP are described in Table 7-5. Roles and responsibilities for oil spill preparation and response are outlined in the Oil Pollution First Strike Plan (Appendix G) and the Woodside Incident Management Handbook.

It is the responsibility of Woodside and contractors to implement the Woodside Corporate Health, Safety and Environment Policy (Appendix A) in their areas of responsibility and to ensure that the personnel are suitably trained and competent in their respective roles.

Table 7-5: Roles and responsibilities

Title (role)	Environmental responsibilities
Office-based personnel	
Woodside Survey Operations Project Manager	Verify relevant Environmental Approvals for the activities exist before commencing activity. Monitor and manage the activity so it is performed as per the relevant standards and commitments in this EP. Notify the Woodside Environment Adviser in a timely manner of any scope changes. Liaise with regulatory authorities as required. Review this EP as necessary and manage change requests. Ensure all project and support vessel crew members complete a Project (Including HSE) induction. Verify that contractors meet environmental related contractual obligations. Liaise with contractors to ensure communication and understanding of environment requirements as outlined in this EP. Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside's HSE Reporting and Investigation Procedure. Monitor and close out corrective actions identified during environmental monitoring or audits. Track compliance with performance outcomes and performance standards as per the requirements of this EP.
Woodside Environmental Adviser	Prepare environmental component of relevant Induction Package. Review compliance with performance outcomes and performance standards as per the requirements of this EP. Ensure relevant Environmental Approvals for the activities exist before commencing activity. Input to environmental component of relevant Induction Package. Assist with the review, investigation and reporting of environmental incidents as required. Assist environmental monitoring and inspections/audits are performed as per the requirements of this EP as required.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	Liaise with relevant regulatory authorities as required. Assist in preparing required external regulatory reports, in line with environmental approval requirements and Woodside incident reporting procedures. Provide advice to relevant Woodside personnel and contractors to help them understand their environment responsibilities. Support the Survey Operations Project Manager in ensuring communications and understanding of environment requirements as outlined in this EP. Provide environmental support for activities through regular engagement with the Woodside Site Representative.
Woodside Corporate Affairs Adviser	Prepare and implement the Consultation Plan for the Petroleum Activity. Report on consultation. Continuously liaise and provide notification as required as outlined in the EP.
Woodside Marine Assurance Superintendent	Source and conduct relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements.
Woodside Corporate Incident Management Team (CIMT) Incident Commander	On receiving notification of an incident: • establish and take control of the Incident Management Team and establish an appropriate command structure for the incident • assess the situation, identify risks and actions to minimise the risk • communicate impact, risk and progress to the Crisis Management Team and stakeholders • develop the Incident Action Plan (IAP) including objectives for action • approve, implement and manage the IAP • communicate within and beyond the incident management structure • manage and review safety of responders • address the broader public safety considerations conclude and review activities.
Vessel-based personnel	
Vessel Master	Ensure the vessel management system and procedures are implemented. Ensure personnel commencing work on the vessel receive an environmental induction that meets the relevant requirements specified in this EP. Ensure personnel are competent to perform the work they have been assigned. Verify SOPEP drills are conducted as per the vessel's schedule. Ensure the vessel Emergency Response Team has been given sufficient training to implement the SOPEP. Ensure any environmental incidents or breaches of relevant EPOs or PSs detailed in this EP, are reported immediately to the Party Chief and Woodside Site Representative. Ensure corrective actions for incidents or breaches are developed, communicated to the Woodside Site Representative, and tracked to closeout in a timely manner. Ensure closeout of actions is communicated to the Woodside Site Representative.
Party Chief/ Manager	Understand and manage environmental aspects of the survey operations per this EP and approval conditions. Provide copies of documents, records, reports and certifications (as requested by Woodside) in a timely manner to assist in compliance reporting. Ensure any environmental incidents or breaches of EPOs or PSs detailed in this EP, are reported immediately to the Woodside Site Representative and Woodside Survey Operations Project Manager.
Woodside Site Representative	Ensure project personnel adhere to the requirements of this EP so the EPOs are met, and the PSs detailed in this EP are implemented during survey operations. Ensure environmental incidents or breaches of outcomes or standards are reported as per the Woodside event notification requirements. Corrective actions for incidents and breaches must be developed, tracked and closed out in a timely manner.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Title (role)	Environmental responsibilities
	Ensure periodic environmental inspections are completed. Monitor and close out corrective actions (Environmental Compliance Action Register) identified during environmental monitoring or audits/inspections. Ensure any environmental incidents or breaches of EPOs or PSs detailed in this EP, are reported immediately to the Woodside Survey Operations Project Manager. Review contractors' procedures, input into Toolbox Talks and JSAs. Provide environmental support for activities through regular engagement with Woodside Environmental Adviser.

7.4 Training and competency

7.4.1 Overview

Woodside as part of its contracting process assesses a proposed contractor's environmental management systems to determine the level of compliance with the standard AS/NZ ISO 14001. This assessment is performed for the Petroleum Activity as part of the pre-mobilisation process. The assessment determines whether there is a clearly defined organisational structure that sets out the roles and responsibilities for key positions. The assessment also assesses whether there is an up-to-date training matrix that defines any corporate and site/activity-specific environmental training and competency requirements.

As a minimum, environmental awareness training is required for all personnel, detailing awareness and compliance with the contractor's environmental policy and EMS.

7.4.2 Inductions

Inductions are provided to all relevant personnel (e.g. contractors and Company representatives) before mobilising to or on arrival at the activity location. The induction covers the HSE requirements and environmental information specific to the activity location. Attendance records will be maintained.

The induction may include, but is not limited to:

- description of the activity
- ecological and socio-economic values of the activity location
- regulations relevant to the activity
- Woodside's Environmental Management System – Health Safety and Environment Policy
- EP importance/structure/implementation/roles and responsibilities
- main environmental aspects/hazards and potential environmental impacts and related EPOs
- oil spill preparedness and response
- monitoring and reporting on EPOs and standards using measurement criteria
- incident reporting.
- MFO training for trained crew performing observation requirements.

7.4.3 Petroleum Activity-specific environmental awareness

Before commencing the survey campaigns associated with the Petroleum Activity, a pre-activity meeting will be held with all relevant personnel. The pre-activity meeting provides an opportunity to reiterate specific environmental sensitivities or commitments associated with the activity. Relevant sections of the pre-activity meeting will also be communicated to the support vessel personnel. Attendance lists are recorded and retained.

During operations, regular HSE meetings will be held. During these meetings, recent environmental incidents are reviewed and awareness material presented.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.5 Monitoring, auditing, and managing non-conformance and review

7.5.1 Monitoring

Regulation 22(5) states that the implementation strategy is to provide for the monitoring, audit, management of non-conformance and review of operator's environmental performance and the implementation strategy itself.

This section of the EP outlines the measures undertaken by Woodside to regularly monitor the management of environmental risks and impacts of the Petroleum Activity against the EPOs, EPSs and MCs, with a view to continuous improvement of environmental performance. The effectiveness of the implementation strategy is also reviewed periodically as part of the monitoring and assurance process.

A key tool that is used throughout the implementation of the EP is Woodside's environmental compliance and action register (ECAR). This is an internal tool that is developed at EP acceptance and is maintained until the EP is closed. The ECAR contains all the commitments, controls, performance standards and measurement criteria from the EP and tracks compliance against each of these items. Before a survey vessel is mobilised, Woodside confirms the compliance systems in place on the vessel and identifies, and records in the ECAR, the specific records that will be provided by the vessel contractor during the offshore campaign. This provides Woodside with the opportunity to confirm the records provided during the activity are sufficient for demonstrating compliance against the EP. It also serves as a central depository for compliance information relevant to each Petroleum Activity.

7.5.2 Auditing

Environmental performance auditing will be performed to:

- identify potential new, or changes to existing environmental impacts and risk, and methods for reducing those to ALARP
- confirm that mitigation measures detailed in this EP are effectively reducing environmental impacts and risk, that mitigation measures proposed are practicable and provide appropriate information to verify compliance
- confirm compliance with the Performance Outcomes, Controls and Standards detailed in this EP.

Internal auditing will be performed to cover each key project activity as summarised below.

7.5.2.1 Survey vessel activities

The following internal auditing will be performed for the Petroleum Activity:

- Pre-mobilisation inspection/audit report will be conducted by a relevant person (before commencing). The scope of the audits are risk-based and specific to the relevant activity, but will generally focus on aspects relating to ensuring appropriate understanding of environmental commitments and the operational readiness of the activity scope, including appropriate environmental controls in place. All primary vessels associated with the Petroleum Activity above scopes will be audited by Woodside.
- At least one operational compliance audit relevant to applicable EP commitments will be conducted by a Woodside Environment Adviser for the campaign. The audit may be conducted offshore or office-based, subject to the duration of the activity and logistics of performing the audit offshore for short duration scopes.
- Vessel-based HSE inspections will be conducted fortnightly by vessel HSE personnel. Each inspection will focus on a specific risk area relevant to the project activity and a formal report will be issued (e.g.chemical and discharge management, cetacean reporting).

The internal audits and reviews, combined with the ongoing monitoring described in this EP, and collection of evidence for MC are used to assess EPOs and standards.

As part of Woodside's Environmental Management System (EMS) and/or assurances processes, activities may also be periodically selected for environmental audits as per Woodside's internal auditing process. Audit, inspection and review findings relevant to continuous improvement of environmental performance are tracked through the ECAR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Non-conformances identified will be reported and/or tracked in accordance with this EP.

7.5.2.2 Marine assurance

Woodside's marine assurance is managed by the Marine Assurance Team of the Logistics Function in accordance with Offshore Vessel Assurance Standard. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

The process is mandatory for all vessels (other than tankers and floating production storage and offloading vessels) hired for Woodside operations, including for short-term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust safety management system.

The process is multi-faceted and encompasses the following marine assurance activities:

- offshore vessel management system assessment (OVMSA)
- dynamic positioning (DP) system verification
- vessel inspections
- offshore vessel inspection database (OVID) or condition and suitability assessment
- project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- Oil Companies International Marine Forum OVID Inspection
- International Marine Contractors Association Common Marine Inspection Document Inspection
- Marine Warranty Survey.

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

If a vessel inspection and/or OVMSA verification review is not available and all reasonable efforts based on time and resource availability have been made to complete this (e.g. short-term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternative means of inspection, known as a risk assessment.

7.5.2.3 Risk assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short-term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Management control factors:
  - Company audit score (i.e. management system)
  - vessel HSE incidents
  - vessel Port State Control deficiencies
  - instances of Port State Control vessel detainment
  - years since previous satisfactory vessel inspection
  - age of vessel
  - contractors' prior experience operating for Woodside.
- Activity risk factors:
  - people health and safety risks (a function of the nature of the work and the area of operation)
  - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
  - value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
  - reputation risk
  - exposure (i.e. exposure to risk based on duration of project)
  - industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

7.5.3 Management of non-conformance

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per HSE Event Reporting and Investigations Work Instruction which includes learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent recurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a consequence matrix for classification of environmental incidents, with the significant categories being A, B and C. Detailed investigations are completed for all categories A, B, C and high potential environmental incidents.

7.5.4 Review

7.5.4.1 Management review

Within the relevant Environment teams, regular reviews of the effectiveness of the EP Implementation Strategy are undertaken at a frequency commensurate with activity duration and risk. This review may consider:

- Geophysical and geotechnical survey key performance indicators (KPIs)
- Effectiveness of tools and systems to monitor environmental performance
- Lessons learned from implementation during previous campaigns or activities
- Reviews of oil spill arrangements and testing performed in accordance with this EP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Within each Asset, Project team or Business Unit, managers review environmental performance regularly, usually though incident and event reporting and monthly HSE reports. The outcome of such reviews will inform whether further action is required to address key or recurring environmental performance matters.

7.5.4.2 Learning and knowledge sharing

Learning and knowledge sharing occurs via several different methods including:

- event investigations
- event bulletins
- formal and informal industry benchmarking
- cross-asset learnings
- engineering and technical authorities discipline communications and sharing.

7.5.4.3 Review of impacts, risks and controls across the life of the EP

In the unlikely case that activities described in this EP do not occur continuously or sequentially, before recommencing activities after a cessation period greater than 12 months, impacts, risks and controls will be reviewed.

The process will identify or review impacts and risks associated with the newly-commencing activity, and will identify or review controls to ensure impacts and risks remain/are reduced to ALARP and acceptable levels. Information learned from previous activities conducted under this EP will be considered. Controls which have previously been excluded on the basis of proportionality will be reconsidered. Any required changes will be managed by the Management of Change (MOC) process outlined below.

7.6 Management of knowledge

Review of knowledge relevant to the existing environment is undertaken to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). New knowledge checks take place both routinely primarily via quarterly and annual knowledge reviews and ad hoc (as information is obtained), and encompasses the following topics:

- Environmental science – update checks conducted via desktop reviews: scientific literature, government publications and Woodside supported publications and studies relating to existing environment topics (including but not limited to species and habitats) as well as EPBC Act Matters of National Environmental Significance (Part 3) and Part 13 statutory instruments.
- Socio-economic environment and stakeholder information – update checks conducted via desktop reviews: scientific literature, government publications and Woodside consultation; and,
- Environmental legislation – monitoring of emerging regulatory changes and the subsequent management of regulatory change (as outlined in the Regulatory Compliance Our Expectations).

A management of knowledge tracker is maintained to record reviews and updates. Communication of relevant new knowledge is addressed at the EP regular cross team environment meetings where changes in knowledge prompt a consideration of MOC, this is actioned and documented appropriately.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of MOC are documented in the WMS EP Guideline.

Any relevant new information on cultural values and heritage will be assessed using the EP Management of Change Process.

Under the Oil Spill Operational and Scientific Monitoring Program, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Biodiversity and Science Team and tracked via the Corporate Environment Baseline Database.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.7 Management of newly identified impacts and risks

New sources of receptor based impacts and risks identified through monitoring and auditing systems and tools and the Woodside Environment Knowledge Management System are assessed using the Change Management Process.

7.8 Management of change and revision

7.8.1 Environment Plan management of change

Management of Changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description described in this EP including: review of advances in technology at stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, EPBC Act listed threatened and migratory species status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current requirements for AMPs; and potential new advice from external stakeholders, will be managed in accordance with Regulation 39 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology detailed in this EP to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 39 of the Environment Regulations.

Minor changes where a review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a formal revision under Regulation 39 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental risks and impacts is not required (e.g. document references, phone numbers, etc.), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

7.8.2 Oil Pollution Emergency Plan management of change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- implementation of improved preparedness measures
- a change in the availability of equipment stockpiles
- a change in the availability of personnel that reduces or improves preparedness and the capacity to respond
- the introduction of a new or improved technology that may be considered in a response for this activity
- to incorporate, where relevant, lessons learned from exercises or events
- if national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulations 38 and 39 to determine if EP, including OPEP, resubmission is required. Changes with potential to influence minor or technical changes to the OPEP are tracked in MOC records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

7.9 Record keeping

Compliance records referenced in the measurement criteria contained within this EP will be maintained. Many of the measurement criteria listed in this EP refers to 'records', in this context Woodside considers 'records' to mean any hard or soft copy of information such as data, observations, certifications or photographs that can show a point in time and can be duplicated such that they can be stored in compliance systems and/or provided to internal and external auditors (i.e. NOPSEMA) on request.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Record keeping will be in accordance with Regulation 22(6) that addresses maintaining records of emissions and discharges.

7.10 Ongoing consultation

Although consultation for the purpose of Regulation 25 is complete, in accordance with Regulation 22(9) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside proposes to undertake the engagements with relevant interested persons throughout the life of the EP. Recent new information identified during ongoing consultation will be assessed as appropriate using the EP Management of Knowledge system and Management of Change Process.

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who are present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations.

Relevant persons and those who are simply interested in the activities, can otherwise remain up-to-date on this activity through subscribing to the Woodside website, or by reading the publicly available version of the EP on NOPSEMA's website, where available.

Should consultation feedback be received following EP acceptance that identifies relevant new information or a measure or control that requires implementation or update to meet the intended outcome of consultation, Woodside will apply its EP Management of Knowledge process and Management of Change Process as appropriate.

Woodside supports ongoing engagement with Traditional Custodians, which complies with Woodside policies, strategies and procedures and is directly informed by feedback from Traditional Custodians.

It provides a mechanism for ongoing dialogue so Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the Petroleum Activity and in relation to caring for and managing Country, including Sea Country. The approach will be tailored to each Traditional Custodian group and may include, as agreed with relevant Traditional Custodians:

- social investment to support Indigenous ranger programs
- support for Indigenous oil spill response capabilities
- support for recording Sea Country values
- support to Traditional Custodian groups to build capabilities and capacity with respect to ability to engage with Woodside and the broader oil and gas industry on activities
- development of ongoing relationships with Traditional Custodian groups
- any other initiatives proposed for protecting Country, including cultural values.

At the time of EP submission, activities as part of ongoing consultation regarding the activity are planned with Traditional Custodians. Where Traditional Custodian relevant persons have requested information or further engagement considered as ongoing consultation, but have not requested a framework agreement, these requests have been captured in Table **7-6**. However, a framework agreement may still be initiated by these groups at any time.

Table 7-6: Ongoing consultation engagements

Report/ information	Recipient	Purpose	Frequency	Content
Notification (Email)	NOPSEMA	Standard practice per regulation	At least 10 days prior to commencement and following completion of activities.	Start and end of activity.

Identification, assessment and consideration of cultural values relevant to the Petroleum Activity.	When engaged or as appropriate.	Relevant new information on cultural values received by Woodside will be assessed using the EP Management of Knowledge (Section 7.6) and Management of Change Process (refer to Section 7.8).

7.11 Reporting

To meet the EPOs and EPSs outlined in this EP, Woodside reports at a number of levels, as outlined in the next sections.

7.11.1 Routine reporting (internal)

7.11.1.1 Regular health, safety and environment meetings

The project support vessel will hold regular HSE meetings which cover all crews. During these meetings, environmental incidents will be reviewed, and awareness material presented. All personnel are required to attend the HSE meetings and attendances sheets are retained by the vessel contractor. Daily meetings held onboard the project support vessel will also serve to reinforce environmental awareness during the Petroleum Activity.

Dedicated HSE meetings will also be held with the offshore and Perth-based management to address targeted HSE incidents and initiatives.

7.11.1.2 Performance reporting

Monthly and quarterly performance reports are developed and reviewed by the Function and Business Unit Leadership Teams. These reports cover several subject matters, including:

- HSE incidents (including high potential incidents and those related to this EP) and recent activities
- corporate KPI targets, which include environmental metrics
- outstanding actions as a result of audits or incident investigations
- technical high and low lights.

7.11.2 Routine reporting (external)

7.11.2.1 Start and end notifications of the Petroleum Activity

In accordance with Regulation 54 of the Environment Regulations, Woodside will notify NOPSEMA of the start of the Petroleum Activity at least 10 days before the activity commences and will notify NOPSEMA within 10 days of completing the activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.11.2.2 Environmental performance review and reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information about environmental performance to the appropriate regulator. Regulatory reporting requirements are summarised in Table 7-7.

Table 7-7: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Reports (Appendix E)	NOPSEMA	Monthly, by the 15th of each month	Details of recordable incidents that have occurred during the Petroleum Activity for previous month (if applicable) (Refer 7.11.4.2)
Environmental Performance Report	NOPSEMA	Annually, with the first report submitted within 12 months of the commencement of the Petroleum Activity covered by this EP (as per the requirements of Regulation 22(7))	• Compliance with EPOs, and EPSs outlined in this EP, in accordance with the Environment Regulations • Decommissioning progress update

7.11.2.3 End of the Environment Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activity has ended and all of the obligations identified in this EP are complete, and NOPSEMA has accepted the notification, in accordance with Regulation 46 of the Environment Regulations.

7.11.3 Incident reporting (internal)

It is the responsibility of the Woodside Project Manager to ensure reporting of environmental incidents meets Woodside and regulatory reporting requirements as detailed in the HSE Event Reporting and Investigations Work Instruction and this section of this EP.

7.11.4 Incident reporting (external) – Reportable and recordable

7.11.4.1 Reportable incidents

Definition

A reportable incident is defined under Regulation 5 of the Environment Regulations as:

- ‘An incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage’.
- A reportable incident for the Petroleum Activity is an incident that:
  - has caused environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table)
  - has the potential to cause environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table).

The environmental risk assessment for the Petroleum Activity identifies those risks with a potential consequence level of Moderate (C) or above for environment. The incidents that have the potential to cause this level of impact include [hydrocarbon loss of containment events to the marine environment resulting from a vessel fuel tank rupture.

Any such incidents represent potential events which would be reportable incidents. Incident reporting is performed with consideration of NOPSEMA (2026) guidance, stating ‘if in doubt, notify NOPSEMA’, and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the Environment Regulations.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 47, 48 and 49 of the Environment Regulations. Woodside will:

- report all reportable incidents to the regulator (orally) as soon as practicable, but within 2 hours of the incident or of its detection by Woodside
- provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator (NOPTA) and the department of the responsible State Minister (DMPE) As soon as practicable after orally reporting the incident
- complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0831 – Reportable Environmental Incident (Appendix E) which must be submitted to NOPSEMA as soon as possible (ASAP), but within 3 days of the incident or of its detection by Woodside
- provide a copy of the written report to the NOPTA and DMPE, within 7 days of the written report being provided to NOPSEMA.

AMSA will be notified of oil spill incidents ASAP after their occurrence, and DCCEEW notified if MNES are to be affected by the oil spill incident.

7.11.4.2 Recordable incidents

Definition

A recordable incident as defined under Regulation 5 of the Environment Regulations is a breach of an EPO or EPS relating to an activity (for which there is an environment plan in force), that is not a reportable incident.

Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 50(2)(b) of the Environment Regulations, no later than 15 days after the end of the calendar month using the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report (Appendix E), detailing:

- all recordable incidents that occurred during the calendar month
- all material facts and circumstances concerning the recordable incidents that the titleholder knows or is able, by reasonable search or enquiry, to find out
- any action taken to avoid or mitigate any adverse environment impacts of the recordable incidents
- the corrective action that has been taken, or is proposed to be taken, to stop, control or remedy the recordable incident
- the action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future.

7.11.4.3 Other external incident reporting requirements

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, Table 7-8 describes the incident reporting requirements that also apply in the Operational Area.

The pollution activities that should also be reported to AMSA via Joint Rescue Coordination Centre (JRCC) Australia by the Vessel Master are:

- any loss of plastic material
- garbage disposed of in the sea within 12 nm of land (garbage includes food, paper, bottles and such)
- any loss of hazardous materials.

Appendix HExternal incident reporting requirements under the OPGGS (Safety) Regulations, including under Sub regulation 2.42, notices and reports of dangerous occurrences will be reported to NOPSEMA under the approved activity safety cases.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

In the unlikely event of a spill, Woodside will notify appropriate cultural authorities, other agencies and organisations as appropriate to the nature and scale of the incident as per procedures and contact lists in the Hydrocarbon Spill Australia Regulatory Framework[47] and the Oil Pollution First Strike Plan (Appendix H).

[47] In accordance with Regulation 56 of the Environmental Regulations, references to the Hydrocarbon Spill Australia Regulatory Framework within this document refer to the version submitted with the accepted North West Shelf Phase 1 Plug and Abandonment and TPA03 Well Intervention Environment Plan, which is available on NOPSEMA's website using the following link: https://docs.nopsema.gov.au/A1282743

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-8: External incident reporting requirements

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact detail
Any marine incidents during Petroleum Activity	Vessel Master	AMSA	Incident Alert Form 18 as soon as reasonably practicable Within 72 hours after becoming aware of the incident, submit Incident Report Form 19	AMSA	reports@amsa.gov.au
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA Joint Rescue Coordination Centre (JRCC)	As per Article 8 and Protocol I of MARPOL within 2 hours via the national emergency 24-hour notification contacts and a written report within 24 hours of the request by AMSA	AMSA JRCC Australia	If the ship is at sea, reports are to be made to: Free call: 1800 641 792 Phone: 08 9430 2100 (Fremantle)
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA	Without delay as per the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* (Cth), part II, section 11(1), AMSA JRCC notified verbally via the national emergency 24-hour notification contact of the hydrocarbon spill; follow up with a written Pollution Report ASAP after verbal notification	JRCC Australia	Phone: 1800 641 792 OR +61 2 6230 6811
Any oil pollution incident which has the potential to enter a National Park or requires oil spill response activities to be conducted within a National Park	Vessel Master	DCCEEW	Reported verbally, ASAP	DNP	Phone: 02 6274 2220
Activity that causes unintentional death of or injury to fauna species listed as Threatened or Migratory under the EPBC Act	Vessel Master	DCCEEW	Within 7 days of becoming aware	Secretary of the DCCEEW	Phone: 1800 803 772 Email: protected.species@environment.gov.au
Within 2 hours of becoming aware of a marine pollution incident	Corporate Incident Management	Department of Transport and Major	Verbally notify DTMI's Maritime Environmental Emergency Response Unit (DTMI MEER) Duty Officer that a spill has	DTMI MEER Duty Officer	Phone: 08 9480 9924

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact detail
(MOP) that occurs in or may impact state waters	Team (CIMT IC) or delegate	Infrastructure (DTMI)	occurred and, if required, request use of equipment stored in Karratha. Follow up with a written pollution reports as soon as practicable following verbal notification. Additionally, DTMI to be notified if spill is likely to extend into WA State waters. Request DTMI to provide Liaison to Woodside Incident Management Team (IMT).		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.12 Emergency preparedness and response

7.12.1 Overview

Under Regulation 22(8), the implementation strategy must contain an oil pollution emergency plan (OPEP) and provide for the updating of the OPEP. Regulation 22(9) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring of oil pollution.

Table 7-9 summarises how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements.

Table 7-9: Oil pollution preparedness and response overview

Content	Environment Regulations reference	Document/section reference
Details (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 21 (5), 21(6), 22 (2)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G)
Describes the oil pollution emergency plan	Regulation 22(8)	Woodside's oil pollution emergency plan has the following components: Hydrocarbon Spill Australia Regulatory Framework[47] Oil Pollution First Strike Plan (Appendix H) Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 22(9)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G). Oil Pollution First Strike Plan (Appendix H).
Details the arrangements for updating and testing the oil pollution response arrangements	Regulation 22(8), 22(12), 22(13), 22(14)	EP: Section 6.9.1 Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Details provisions for monitoring impacts to the environment from oil pollution and response activities	Regulation 22(10)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix G).
Demonstrates that response arrangements in the oil pollution emergency plan are consistent with the national system for oil pollution preparedness and response	Regulation 22(11)	Hydrocarbon Spill Australia Regulatory Framework[47]

7.12.2 Emergency response training

Regulation 22(4) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training. Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response. Following the mapping of training to Woodside identified competencies, training was then mapped to positions based on their required competencies (Table 7-10).

Table 7-10: Emergency response training requirements

IMT position	Minimum competency
Corporate Incident Management Team (CIMT) Incident Commander and Deputy Incident Commander	• IMT Fundamentals Course (internal course) or equivalent • ICS 100/200 • IMO3 or equivalent spill response specialist level with an oil spill response organisation (OSRO)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

IMT position	Minimum competency
	• Participation in L2 activation, exercise or skills maintenance
Operations, Planning, Logistics and Finance Sections, and other rostered members of the CIMT	• IMT Fundamentals Course or equivalent • ICS 100/200 • Oil spill theory • Participation in L2 activation, exercise or skills maintenance
Environment Unit Leader	• IMT Fundamentals Course • ICS 100/200 • IMO2 or equivalent spill response specialist level with an OSRO • Participation in L2 activation, exercise or skills maintenance
Note on competency/equivalency	
In 2023 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Crisis and Emergency Management training and the oil spill response training requirements for IMT roles. The revised IMT Fundamentals training Program was developed in alignment with the performance requirements of the PMAOMIR320 – Manage Incident Response Information and PMAOM0R418 – Coordinate Incident Response. In 2023, Woodside took the decision to align its global incident command arrangements to the Incident Command System (ICS). As such, all rostered members of the Incident Management Team are trained up to ICS 200. In addition to incident management fundamentals training, all rostered members of the CIMT undertake a level of hydrocarbon spill response training. Depending upon the role, this may take the form of IMO training or completion of Woodside's internal oil spill training course (OSREC) and face-to-face training. Woodside Learning Services is responsible for collating and maintaining personnel training records. The Crisis and Emergency Management Dashboard reflects the competencies required for each IMT and operational spill response roles.	

7.12.3 Emergency response preparation

The Emergency Operations Centre (EOC), based in Woodside's head office in Perth, is the onshore coordination point for a Level 2 offshore incident, and the location for the CIMT during an incident. The EOC is staffed by an appropriately skilled team available on call 24 hours a day. This team coordinates incidents that have the potential to impact people, environment, assets, company reputation and livelihood (PEARL), and liaises with external agencies where relevant. Woodside's Incident Command Structure is included in the Oil Pollution First Strike Plan Appendix H and response arrangements are further detailed in the Hydrocarbon Spill Australia Regulatory Framework[47]. Roles and responsibilities for emergency response are detailed in the Woodside Incident Management Handbook.

Woodside will have Emergency Response Plan Bridging Document (ERPBD) in place for project activities which bridges between Woodside's emergency response arrangements and those of the contractor.

In a vessel-based emergency, the Vessel Master will assume overall onsite command and act as the Incident Commander. All persons aboard the vessel will be required to act under the Incident Commander's directions. The vessel will maintain communications with the onshore Project Manager and other emergency services. Emergency response support can be provided by the contractor's emergency centre or via the Woodside Communication Centre, if requested by the Incident Commander. The vessels will have onboard equipment for responding to emergencies, including medical, firefighting and hydrocarbon spill response equipment.

7.12.4 Oil and other hazardous materials spill

A significant hydrocarbon spill during the Petroleum Activity is unlikely, but should such an event occur, it has the potential to cause serious environmental and reputational damage if not managed properly. The Hydrocarbon Spill Australia Regulatory Framework[47], supported by the Petroleum Activity Oil Pollution First Strike Plan (Appendix H) which provides tactical response guidance to the activity/area, cover spill response for the Petroleum Activity.

The Hydrocarbon Spill Preparedness Team manages Woodside's hydrocarbon spill response equipment stockpile. Woodside also maintains a suite of contracts for access to additional specialist response

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

equipment and trained personnel as required via Australian and international spill response organisations and labour supply companies. In the event of a major spill, Woodside will enact first strike response actions, in liaison with the relevant Control Agency, as detailed in the activity-specific Oil Pollution First Strike Plan.

Vessels will have shipboard oil pollution emergency plans (SOPEPs) in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Petroleum Activity Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, EPSs and MCs to be used for hydrocarbon spill response during the Petroleum Activity, as detailed in Appendix G.

7.12.5 Emergency and spill response

Woodside categorises incidents in relation to response requirements:

- **Level 1** incidents are those that can be resolved using existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site- or regionally-based teams using existing resources and functional support services.
- **Level 2** incidents are characterised by a response that requires external operational support to manage the incident. It is triggered if the capabilities of the tactical level response are exceeded. This support is provided to the activity by activating all or part of the responsible CIMT.
- **Level 3** incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, or livelihood. At Woodside, the Crisis Management Team manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation and such). The CIMT may also be activated as required to manage the operational incident response.

7.12.6 Emergency and spill response drills and exercises

Woodside's capability to respond to incidents will be tested periodically, in accordance with the Crisis and Emergency Management Training, Drill and Exercise Standard. The scope, frequency and objective of these tests is described in Table 7-11. Emergency response testing is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards and risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference points for developing and scheduling crisis and emergency management exercises. External participants may be invited to attend exercises, for example, government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements.

The overall objective of exercises is to test procedures, IMT interfaces, skills and the teamwork of the Emergency Response and Command Teams in their ability to respond to major accident and major environment events. After each exercise, the team holds a debriefing session, during which the exercise is reviewed. Any lessons learned or areas for improvement are identified and incorporated into revised procedures, where appropriate.

Table 7-11: Testing of response capability

Response category	Scope	Response testing frequency	Response testing objective
Level 1 Response	Drills are project-/ activity-specific	At least one Level 1 'First Strike' drill must be conducted for each vessel during an activity, where the vessel will be present for greater than two weeks cumulatively. This drill should be undertaken as soon as practicable after commencing activities within the Operational Area. For campaign vessels with an operational duration of greater than one month, the Level 1 drill will occur within the first two weeks of	Drills test elements of the Oil Pollution First Strike Plan (Appendix H)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		commencing the activity and then at least every six-month hire period thereafter. If vessel moves activity/ EP but stays on-hire to or working for Woodside, Level 1 does not need to be repeated if last drill was conducted within 6 months; unless Woodside Environment Adviser stipulates another drill is required, due to change in risk profile between activities).	
Level 2 Response	Exercises are vessel-specific	Level 2 exercises will be carried out in accordance with Crisis and Emergency Management Training Drill and Exercise Standard. The CEM team manages the CIMT's capability and competency requirements, and theme exercises and training based on current and emerging risks per year. These Level 2 exercises may opportunistically involve vessels in the field carrying out the project activity. *Note:* *If the activity poses a unique, new or significant environment risk, the Woodside Environment Adviser should require a Level 2 exercise be conducted and advise CEM Team of such (and schedule/ organise activity).* *Special consideration should be given to conducting a Level 2 exercise for larger installation vessels i.e. not smaller supply vessels or those infield for shorter periods of time.*	Testing both the facility/ vessel IMT response and that of the CIMT following handover of incident control.
Level 3 Response	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Global Workplace.	Test Woodside's ability to respond to and manage a crisis level incident.

7.12.7 Testing of hydrocarbon spill response arrangements

Woodside is required to test hydrocarbon spill response arrangements as per Regulations 22(12), 22(13) and 22(14) in the Environment Regulations. Woodside's arrangements for spill response are common across Australian operating assets and activities to ensure controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities
- test response arrangements and actions to validate response plans
- ensure lessons learned are incorporated into Woodside processes and procedures and improvements made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Table 7-11, up to eight of the response arrangements shown in Figure 8 8 are tested annually. The objective is to verify effective response to a hydrocarbon spill to the marine environment.

7.12.8 Testing of arrangements schedule

Woodside's Testing of Arrangements Schedule (Figure 7-3) aligns with international good practice for spill preparedness and response management; the testing is compatible with the International Petroleum Industry Environmental Conservation Association Good Practice Guide and the Australian Institute for Disaster Resilience Australian Emergency Management Arrangements Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities.

The hydrocarbon spill arrangements shown in the rows of the schedule are tested against Woodside's regulatory commitments. Each arrangement has a support agency/company and an area to be tested e.g. capability, equipment and personnel. For example, an arrangement could be to test Woodside's personnel capability for conducting shoreline assessment, or the ability of Woodside's operational and scientific monitoring third party contractor to provide appropriate personnel and equipment.

The vertical columns relate to how hydrocarbon spill arrangements will be tested over the 3-year rolling schedule. The subheading for the column describes the standard method of testing likely to be undertaken e.g. discussion exercise, desktop exercise, and the green cells indicate the arrangements that could be tested for each method.

Some arrangements may be tested across multiple exercises e.g. critical arrangements, or via other additional assurance methods outside the formal Testing of Arrangements Schedule. These also constitute sufficient evidence of testing of arrangements e.g. audits, no-notice drills, internal exercises, assurance drills.

7.12.9 Cyclone and dangerous weather preparation

Tropical cyclones and other severe weather events are a potential risk to the safety and health of personnel and can potentially cause spills of hazardous materials into the environment from infrastructure and/or damaged vessels.

Facilities and relevant support vessels on hire to Woodside receive regular forecasts from Woodside Meteorologists, who liaise closely with the Bureau of Meteorology (BOM). If a cyclone (or severe weather event) is forecast, the path and its development is plotted and monitored using the BOM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activity the asset Cyclone Contingency Plan and the vessel's Cyclone Contingency Plan will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

9. LIST OF TERMS AND ACRONYMS

Table 9-1: List of terms and definitions

Term	Definition
~	Approximately
<, ≤	Less/fewer than; less/fewer than or equal to
>, ≥	Greater/more than; greater/more than or equal to
°C	Degrees Celsius
ABARES	Australian Bureau of Agricultural and Resource Economics and Sciences
ACN	Australian Company Number
AFC	Antifouling Coating
AFFF	Aqueous film-forming foam
AFMA	Australian Fisheries Management Authority
AHO	Australian Hydrographic Office
AIMS	Australian Institute of Marine Science
AINJ	Auditory injury
ALARP	As Low as Reasonably Practicable
AMP	Australian Marine Park
AMSA	Australian Maritime Safety Authority
ANZECC	Australian and New Zealand Environment and Conservation Council
ARMCANZ	Agriculture and Resource Management Council of Australia and New Zealand
AS	Australian Standard
ASAP	As soon as possible
ATSIHP	Commonwealth *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*
AUSCOAST	Australian Coastal (weather warning)
AUSREP	Australian Ship Reporting System, established under Division 2 of Part 4 of the *Navigation Act 2012*
AUV	Autonomous underwater vehicle
BCF	Bioconcentration Factor
BIA	Biologically important area
BOM	Bureau of Meteorology
BP	Boiling Point
CAES	Catch and Effort System
CEFAS	Centre for Environment, Fisheries and Aquaculture Science
CFA	Commonwealth Fisheries Association
CHP	Commonwealth Heritage Place
CIMT	Corporate Incident Management Team
CMMS	Computerised Maintenance Management System
CPT	Cone penetrometer testing
CPTu	Test with pore pressure measurement

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
CS	Cost/sacrifice
CSIRO	Commonwealth Scientific and Industrial Research Organisation
CV	Company Values
DAFF	Commonwealth Department of Agriculture, Fisheries and Forestry
dB	Decibel
DCCEEW	Commonwealth Department of Climate Change, Energy, Environment and Water
DEWHA	Former Commonwealth Department of the Environment, Water, Heritage and the Arts
D.MM°E	Degrees and decimal minutes (east)
D.MM°S	Degrees and decimal minutes (south)
DMPE	Western Australian Department of Mines, Petroleum and Exploration
DNP	Director of National Parks
DoD	Commonwealth Department of Defence
DP	Dynamic Positioning
DPIRD	Western Australian Department of Primary Industries and Regional Development
DPLH	Western Australian Department of Planning, Lands and Heritage
DSEWPAC	Former Commonwealth Department of Sustainability, Environment, Water Population and Communities
DTMI	Western Australian Department of Transport and Major Infrastructure
ECAR	Environmental Compliance Action Register
ECAR	Environmental compliance and action register
EEZ	Exclusive Economic Zone
EMBA	Environment that May be Affected
EMS	Environmental Management System
ENVID	Environment Identification
EOC	Emergency Operations Centre
EP	Environment Plan
EPBC Act	Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*
EPO	Environmental Performance Outcome
EPS	Environmental Performance Standards
ERP	Emergency Response Plan
ESD	Ecologically Sustainable Development
F	Feasibility
F-Pil	Flatback Turtle Pilbara
GDA	Geocentric Datum of Australia
GHG	Greenhouse Gas
G-NWS	Green Turtle North West Shelf
GP	Good Industry Practice
GPGT	Geophysical and geotechnical
GPS	Global Positioning System

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
ha	Hectare
HAZID	Hazard identification
HF	High-frequency
HFO	Heavy Fuel Oil
HOCNF	Harmonised Offshore Chemical Notification Format
HQ	Hazard Quotient
HSE	Health, Safety and Environment
H-WA	Hawksbill Turtle Western Australia
Hz	Hertz
IAP	Incident Action Plan
IC	Incident Controller
IChEMS	Industrial Chemicals Environmental Standard
ICS	Incident Command System
ID	Identity / identification
ILUA	Indigenous Land Use Agreement
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IMO	International Maritime Organization
IMS	Invasive Marine Species
IMSMA	IMS Management Area
IMSMP	WEL Invasive Marine Species Management Plan
IMT	Incident Management Team
ISO	International Organization for Standardization
IUCN	International Union for Conservation of Nature
JRCC	AMSA's Joint Rescue Coordination Centre
KSCS	Kimberley Sea Country Strategy
KEF	Key ecological feature
kHz	Kilohertz
km	Kilometre
kn	Knot
KPI	Key Performance Indicator
L	Litre
LE	Weighted 24-hour Sound Exposure Level
LCS	Legislation, Codes and Standards
LF	Low frequency
LH-WA	Loggerhead Turtle Western Australia
LNG	Liquefied Natural Gas
Lp	Sound Pressure Level
Lpk	Peak Sound Pressure Level

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
Lux	A standard for measuring light; equal to the amount of visible light per square metre incident on a surface
m	Metre
MAH	Monocyclic aromatic hydrocarbon
MARPOL	The International Convention for the Prevention of Pollution from Ships, 1973 as modified by the Protocol of 1978 (also known as MARPOL 73/78)
MBES	Multibeam echosounder
MC	Measurement Criteria
MEER	Maritime Environmental Emergency Response Unit
MFO	Marine fauna observer
MGO	Marine gas oil
microPascal (µPa)	Unit of underwater sound pressure equal to one-millionth of a Pascal
mm	Millimetre
MNES	Matters of National Environmental Significance
MOC	Management of Change
MODU	Mobile Offshore Drilling Unit
MOP	Marine pollution incident
MoU	Memorandum of Understanding
N/A	Not Applicable
NC	No contact to receptor predicted for specified threshold
NHP	National Heritage Place
NIMS	Non-indigenous marine species
nm	Nautical mile
NMFS	National Marine Fisheries Service (US)
NOAA	National Oceanic and Atmospheric Administration (US)
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NOPTA	National Offshore Petroleum Titles Administrator
NT	Northern Territory
NWMR	North-west marine region
NWS	North West Shelf
NZ	New Zealand
OCNS	Offshore Chemical Notification Scheme
OPEP	Oil Pollution Emergency Plan
OPGGS Act	Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006*
OSPAR	Oslo–Paris Convention for the Protection of the Marine Environment of the North East Atlantic
OSPRMA	Oil Spill Preparedness and Response Mitigation Assessment
OSREC	Oil Spill Response Skills Enhancement Course
OSRO	Oil Spill Response Organisation
OVID	Offshore Vessel Inspection Database

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
OVMSA	Offshore Vessel Management System Assessment
PBC	Prescribed Body Corporate
PBW	Pygmy Blue Whale
PCPT	Piezocone Penetration Test
PFOS	Perfluorooctane sulfonic acid
PJ	Professional Judgement
PK	Peak pressure
PMST	Protected Matters Search Tool
PS	Performance Standard
PTS	Permanent threshold shift
QA/QC	Quality Assurance, Quality Control
RBA	Risk-based Analysis
RCC	Rescue Coordination Centre
RNTBC	Registered Native Title Body Corporate
ROV	Remotely operated vehicle
SBMP	Seabird Management Plan
SBP	Sub-bottom profiler
SEL	Sound exposure level
SIMAP	Spill Impact Mapping and Analysis Program
SIMOPS	Simultaneous operations
SOLAS	(International Convention for the) Safety of Life at Sea
SOPEP	Shipboard Oil Pollution Emergency Plan
SPL	Sound pressure level
SSS	Side scan sonar
SV	Societal Value
t	Tonne
The Regulations	Commonwealth Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023
TSS	Total Suspended Solids
TSSC	Threatened Species Scientific Committee
TTS	Temporary threshold shift
UCH	Underwater Cultural Heritage
UCH Act	Commonwealth *Underwater Cultural Heritage Act 2018*
UK	United Kingdom
US	United States
USBL	Ultra-short baseline
VHF	Very-high-frequency
VP	Vice President
WA	Western Australia

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
WAFIC	Western Australian Fishing Industry Council
WAM	Western Australian Museum
W-LSZ	Western Locally Sourced Zone
WMS	Woodside Management System

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

APPENDIX A WOODSIDE ENVIRONMENT AND BIODIVERSITY, CLIMATE AND RISK MANAGEMENT POLICIES

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision-making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new activities[1] within the boundaries of natural sites on the UNESCO World Heritage List.[2]
- Not undertaking new activities within IUCN Protected Areas[3] unless compatible with management plans in place for the area.
- Achieving net zero deforestation[4] for new activities.
- Developing Biodiversity Management Plans for all new major projects (CAPEX >US$2 billion).
- Supporting positive biodiversity outcomes in regions and areas in which we undertake activities.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Revised by the Woodside Energy Group Ltd Board in December 2024.

[1] Does not include non-industrial and existing activities that are compatible with maintenance of the listed outstanding universal values.

[2] New UNESCO World Heritage Listings that overlap existing activities will be assessed at the time of listing.

[3] New IUCN Protected Areas that overlap existing activities will be assessed at the time of listing.

[4] Definition of Forest: ‘native trees higher than 5 metres and a canopy cover of more than 10 percent on the land to be cleared’.

Climate Policy

BACKGROUND

The Intergovernmental Panel on Climate Change has stated that "it is unequivocal that human influence has warmed the atmosphere, ocean and land". An objective of the Paris Agreement is to hold "the increase in the global average temperature to well below 2ºC above pre-industrial levels" and to pursue "efforts to limit the temperature increase to 1.5ºC". Many countries have set targets to reduce greenhouse gas emissions, including by changing the way they produce and consume energy.

OBJECTIVE

Woodside's objective is to thrive in this energy transition as a low cost, lower carbon energy provider.

PRINCIPLES

Woodside aims to achieve the objective by:

- Setting science-based[1] near, mid, and long-term net emissions reduction targets that are consistent with Paris-aligned[2] scenarios, covering equity scope 1 and 2 emissions, both operated and non-operated.[3]
- Developing and operating oil and gas projects in a manner that is consistent with these targets. This includes the deployment of lower-emission technologies (Design Out), supporting efficient operations (Operate Out) and use of robust offsets (Offset) as methods to reduce and offset greenhouse gas emissions.
- Investing in new energy products and lower carbon services to reduce customers' emissions (part of Woodside's Scope 3 emissions), including but not limited to hydrogen, ammonia and carbon capture, utilisation and storage.
- Publishing transparent climate-related disclosures aligned to the recommendations of the Task Force on Climate-related Financial Disclosures (TCFD) or other recognised global reporting standards.
- Aligning our advocacy to the principles of this Climate Policy.

[1] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "science-based" (published 2021) which states "targets are considered 'science-based' if they are in line with what the most recent climate science sets out is necessary to meet the goals of the Paris Agreement—limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius.". See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[2] Woodside is using the draft Prototype IFRS Sustainability Disclosure Standard definition of "Paris-aligned scenarios" (published 2021) which states "scenarios consistent with limiting global warming to below 2 degrees Celsius above pre-industrial levels and pursuing efforts to limit warming to 1.5 degrees Celsius." See https://www.ifrs.org/content/dam/ifrs/groups/trwg/trwg-climate-related-disclosures- prototype.pdf (Appendix A).

[3] Equity emissions means the share of the total emissions arising from an activity that are attributable to Woodside in proportion to Woodside's ownership interest in the activity, irrespective of whether Woodside operates the activity. Operated emissions are the total emissions arising from an activity that Woodside operates, irrespective of Woodside's ownership interest.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venture participants engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Reviewed by the Woodside Energy Group Ltd Board in December 2024.

Risk Management Policy

OBJECTIVES

Woodside recognises that risk is inherent in our business and the effective management of risk is vital to deliver our strategic objectives, continued growth and success. We are committed to managing risks in a proactive and effective manner as a source of competitive advantage.

Our approach protects us against potential negative impacts, enables us to take risk for reward and improves our resilience against emerging risks. The objective of our risk management framework is to provide a single consolidated view of risks across the company to understand our full risk exposure and prioritise risk management and governance.

The success of our approach lies in the responsibility placed on everyone at all levels to proactively identify, assess and treat risks relating to the objectives they are accountable for delivering.

PRINCIPLES

Woodside achieves these objectives by:

- Applying a structured and comprehensive framework for the identification, assessment and treatment of current risks and response to emerging risks;
- Ensuring line of sight of financial and non-financial risks at appropriate levels of the organisation;
- Demonstrating leadership and commitment to integrating risk management into our business activities and governance practices;
- Recognising the value of stakeholder engagement, best available information and proactive identification of potential changes in external and internal context;
- Embedding risk management into our critical business processes and control framework;
- Understanding our exposure to risk and tolerance for uncertainty to inform our decision making and assure that Woodside is operating with due regard to the risk appetite endorsed by the Board; and
- Evaluating and improving the effectiveness and efficiency our approach.

APPLICABILITY

The Managing Director of Woodside is accountable to the Board of Directors for ensuring this Policy is effectively implemented.

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

APPENDIX B RELEVANT REQUIREMENTS

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth legislation	Summary	Relevance to the activity
Aboriginal and Torres Strait Islander Heritage Protection Act 1984 (ATSIHP Act)	This Act seeks "to preserve and protect places, areas and objects of particular significance" to Aboriginal people. Under the Section 9 and 10 provisions of the Act, the Minister for the Environment may declare significant Aboriginal areas temporarily or permanently protected if they are considered under threat. Similar declarations regarding Aboriginal objects can be made under Section 12. Under Section 22 of the Act, the contravention of any of these declarations is an offence. Additionally, the discovery of any Aboriginal remains must be reported to the Minister under Section 20.	There are no known sites of Aboriginal Heritage Significance within the Operational Area or EMBA.
Australian Maritime Safety Authority Act 1990	This Act establishes a legal framework for AMSA, which represents the Australian Government and international forums in the development, implementation and enforcement of international standards, including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters. AMSA is the lead agency for responding to oil spills in the marine environment and is responsible for the Australian National Plan for Maritime Environmental Emergencies.	The Act applies to maritime safety and vessel activities associated with the Petroleum Activity. It is relevant to promote maritime safety and the protection of the marine environment from vessel pollution. AMSA Response Centre will be notified of activities and movements 24 to 48 hours before the scheduled activity start date and in the event of incidents during the Petroleum Activity (including oil pollution incidents in Commonwealth waters).

Commonwealth legislation	Summary	Relevance to the activity
Biosecurity Act 2015 Australian Ballast Water Management Requirements Australian Biofouling Management Requirements – Version 4 2023	This Act provides the Commonwealth with powers to take quarantine measures, and implement necessary related programs, to prevent introducing any plant, animal, organism or matter that could contain anything that could threaten Australia's native flora and fauna or natural environment. The Commonwealth's powers include entry, seizure, detention and disposal. This Act includes mandatory controls on using seawater as ballast in ships and declaring sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers. The Ballast Water Management Requirements outline the mandatory ballast water management requirements to reduce the risk of introducing harmful aquatic organisms into Australia's marine environment through ballast water from international vessels. These requirements are enforceable under the *Biosecurity Act 2015.* The *Australian biofouling management requirements, Version 2* set out vessel obligations and best practice for the management of biofouling when operating vessels under biosecurity control within Australian territorial seas.	The Act and associated Regulations and Requirements apply to the use of all internationally sourced Petroleum Activity vessels operating in Australian Waters. Controls must be applied to manage the potential for introduction of IMS.
Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act) Environment Protection and Biodiversity Conservation Regulations 2025	This Act includes the objective to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as 'matters of national environmental significance' (MNES). The Act sets a regime that aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ESD (ecologically sustainable development). The Act aims to protect MNES by setting out a regime for environmental assessment and approvals processes for proposed actions, through which the Commonwealth seeks to protect Australian biodiversity and integrates management of important natural and culturally significant places. Where activities have existing approvals under the Act, these will continue to apply.	This Act applies to all aspects of the Petroleum Activity that have the potential to impact MNES. Where there is the potential for MNES to be impacted, an assessment of impacts must be presented in the EP. Authorisation to undertake the Petroleum Activity will be met through NOPSEMA's decision making processes which includes an assessment of the Petroleum Activities compliance with the relevant regulations and plans under the Act, which are presented throughout this EP.

Commonwealth legislation	Summary	Relevance to the activity
Environment Protection (Sea Dumping) Act 1981 Environment Protection (Sea Dumping) Regulations 1983	This Act provides for protecting the environment by regulating dumping of matter into the sea, incineration of waste at sea, and placement of artificial reefs.	The Petroleum Activity does not include sea dumping activities.
Industrial Chemicals Environmental Management (Register) Act 2021 Industrial Chemicals Environmental Management (Register) Instrument 2022	The Act is the legislative framework for the Industrial Chemicals Environmental Management Standard (IChEMS), a scheme to implement a nationally consistent approach to the management of risks to the environment resulting from the use of industrial chemicals, including those by the oil and gas industry, but on its own does not impose enforceable bans on specific chemicals or obligations for proponents. The Instrument supports the Act to create consistent, national, and enforceable standards for environmental risk management of industrial chemicals. Importantly, the Act anticipates that States and Territories (or other Commonwealth laws) must adopt and enforce these standards. Until such additional legislation is passed in relevant jurisdictions, the Instrument's listings (e.g. AFFF bans) have no direct legal effect. Note, Section 4 of the Act states: "Another law of the Commonwealth, or a law of a State, may apply or adopt the [Instrument] (with or without modification) and may make provision for, or in relation to, the implementation and enforcement of the [Instrument], as so applied or adopted."	Whilst no chemical discharges are planned as part of this Petroleum Activity. AFFF may be discharged in the event of an emergency. Woodside's Environment Chemical Selection and Assessment Guideline has regard for the intent of and the proposed requirements set out in the Act, Instrument and IChEMS.
Native Title Act 1993 Native Title (Indigenous Land Use Agreements) Regulations 2024	This Act recognises and protects the traditional rights and interests of First Nation groups in land and waters through native title. Prescribed Bodies Corporate (PBC) manage and protect their native title rights and interests by establishing ways in which future dealings affecting native title may proceed and to set standards for those dealings. Indigenous Land Use Agreements (ILUAs) are voluntary, legally binding agreements established under the Act between native title parties and others regarding land/water use.	Yes – Whilst no planned activities occur within a native title claim or determination, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to consult. There are no native title claims or determinations overlapping the Operational Area or EMBA. There are five that are coastally adjacent to the Operational Area. There are no Indigenous Land Use Agreements (ILUAs) overlapping the Operational Area or EMBA and five that are coastally adjacent to the Operational Area.

Commonwealth legislation	Summary	Relevance to the activity
National Greenhouse and Energy Reporting Act 2007	This Act establishes the legislative framework for the National Greenhouse and Energy Reporting Scheme for reporting GHG emissions and energy consumption and production by corporations in Australia.	The vessel contractor is required to report GHG emissions under this Act.
Navigation Act 2012 *Protection of the Sea (Prevention of Pollution from Ships) Act 1983* Marine Order 12: Construction – subdivision and stability, machinery and electrical installations Marine Order 15: Construction—fire protection, fire detection and fire extinction Marine Order 21: Safety and emergency arrangements Marine Order 27: Safety of navigation and radio equipment Marine Order 30: Prevention of collisions Marine Order 47: Offshore Industry units Marine Order 57: Helicopter operations Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances Marine Order 94: Marine pollution prevention – packaged harmful substances Marine Order 95: Marine pollution prevention – garbage Marine Order 96: Marine pollution prevention – sewage Marine Order 97: Marine pollution prevention – air pollution	This Act regulates navigation and shipping, including SOLAS. This Act is the primary legislation that regulates ship and seafarer safety and shipboard aspects of marine environment protection and pollution prevention. Marine Orders are subordinate rules made pursuant to the Navigation Act 2012 and Protection of the Sea (Prevention of Pollution from Ships) Act 1983 affecting the maritime industry. They are a means of implementing Australia's international maritime obligations by giving effect to international conventions in Australian law. Marine Orders apply to vessel movements, safety, discharges and emissions.	The Act and Marine Orders apply to vessel activities associated with the Petroleum Activity.

Commonwealth legislation	Summary	Relevance to the activity
Offshore Petroleum and Greenhouse Gas Storage Act 2006 (OPGGS Act) Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 Offshore Petroleum and Greenhouse Gas Storage (Resource Management and Administration) Regulations 2025 Offshore Petroleum and Greenhouse Gas Storage (Safety) Regulations 2024	This Act is the principal Act governing offshore petroleum exploration and production in Commonwealth waters. Specific environmental, resource management and safety obligations are set out in the listed Regulations.	The Petroleum Activity must be undertaken in accordance with the requirements of this Act. This EP has been prepared in accordance with the relevant requirements of the OPGGS Act and the Environment Regulations.
Ozone Protection and Synthetic Greenhouse Gas Management Act 1989 Ozone Protection and Synthetic Greenhouse Gas Management Regulations 1995	This Act provides for protecting ozone in the atmosphere by controlling and ultimately reducing the manufacture, import and export of ozone-depleting substances and synthetic GHGs, and replacing them with suitable alternatives. The Act will only apply to Woodside if it manufactures, imports or exports ozone-depleting substances.	This Act applies where ozone-depleting substances is found on vessel refrigeration systems, however, this is a rare occurrence and not anticipated. The Petroleum Activity does not include import, export or manufacture activities of ozone-depleting substances.
Protection of the Sea (Powers of Intervention) Act 1981 Protection of the Sea (Powers of Intervention) Regulations 1983	This Act authorises the Commonwealth to take measures to protect the sea from pollution by oil and other noxious substances discharged from ships. It provides legal immunity for persons acting under an AMSA direction.	The Act may apply in the event of an unplanned hydrocarbon release from a vessel collision.
Protection of the Sea (Prevention of Pollution from Ships) Act 1983 Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994 Marine Order 91: Marine pollution prevention – oil Marine Order 93: Marine pollution prevention – noxious liquid substances Marine Order 94: Marine pollution prevention – packaged harmful substances Marine Order 95: Marine pollution prevention – garbage Marine Order 96: Marine pollution prevention – sewage Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007 International Convention for the Prevention of Pollution from Ships (MARPOL Convention)	This Act relates to protecting the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances. The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 NM off the coast out to the end of the Australian Exclusive Economic Zone (200 NM). It also applies within the 3 NM of the coast where the State/Northern Territory does not have complementary legislation. All the Marine Orders listed, except for Marine Order 95, are enacted under both the *Navigation Act* and the *Protection of the Sea (Prevention of Pollution from Ships) Act*. The *Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007* is an amendment to the *Protection of the Sea (Prevention of Pollution from Ships) Act 1983*. This amended Act provides for protecting the sea from pollution by oil and other harmful substances discharged from ships.	The Act and Marine Orders apply to vessel activities associated with the Petroleum Activity.

Commonwealth legislation	Summary	Relevance to the activity
Protection of the Sea (Harmful Antifouling Systems) Act 2006 Marine Order 98: Marine pollution – anti-fouling systems	This Act relates to Australia's obligations under the international Antifouling System Convention, prohibiting harmful organotin compounds (like TBT) on ship hulls to protect the marine environment. It prohibits the application of such systems on Australian ships and restricts non-complying ships from entering Australian ports.	The Act applies to vessels operating in Australian waters, including for the Petroleum Activity.
Underwater Cultural Heritage Act 2018 (UCH Act) Underwater Cultural Heritage Guidance for Offshore Developments Guidelines on the application of the *Underwater Cultural Heritage Act 2018*	The Act prescribes penalties for damaging protected Underwater Cultural Heritage without a permit under Section 30 or in contravention of a permit under Section 28. Protected Underwater Cultural Heritage is prescribed in Section 16 to automatically include the remains and associated artefacts of any vessel or aircraft that has been in Australian waters for 75 years, whether known or unknown. This protection is also extended to Underwater Cultural Heritage in Commonwealth waters specified by the Environment Minister under Section 17. Without a declaration under this section, Aboriginal Underwater Cultural Heritage is not protected under the *Underwater Cultural Heritage Act*.	Underwater heritage sites within closest proximity to the Operational Areas and EMBA are listed in the EP.

1. INTRODUCTION

1.1 Purpose

This document applies, where indicated in the relevant Environment Plan (EP), to Woodside Energy Ltd. and Woodside Energy Group (Woodside) activities and operations.

1.2 Scope

Woodside is the titleholder of multiple petroleum titles for exploration, development, production and decommissioning activities in the marine waters of north-western Western Australia (WA). This document includes details of the relevant values and sensitivities of the environment as required by the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023 (Commonwealth) (OPGGS (E) Regulations), to inform the impact and risk evaluation of Woodside's activities. Additional information, appropriate to the nature and scale of the impacts and risks of activities that may interact with the environment outside of the scope of this document, will be used to further inform impact and risk assessments and be included in the Description of the Existing Environment of individual EPs.

This Master Existing Environment document identifies and describes the values and sensitivities of the existing environment within the broadly defined Woodside activity areas located in Commonwealth and coastal waters off north-western WA, with a focus on the North-west Marine Region (NWMR), including adjacent coastal waters and shoreline habitats. This document also summarises the regional key values of the South-west Marine Region (SWMR) (extending the WA/South Australia (SA) border) and the North Marine Region (NMR), including adjacent coastal waters and shoreline habitats, as they are relevant to the environment that may be affected (EMBA)[1].

The marine bioregions are described Table 1-1 and shown in Figure 1-1. The NWMR is divided into three large-scale ecological marine systems based on the influence of major ocean currents, seafloor features and eco-physical processes, including Kimberley, Pilbara and Ningaloo-Leeuwin. For the NWMR, Table 1-1 outlines the associated marine systems and relevant Woodside activity areas.

Table 1-1: Description of the marine bioregions, marine systems and associated Woodside activity area and key environmental sensitivities

Marine bioregion*	Marine system	Relevant key environmental sensitivities	Woodside activity area
North-west (Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC) 2012a) The NWMR includes all Commonwealth waters (from three nautical miles (NM) from the Territorial Sea Baseline to the 200 nm Exclusive Economic Zone (EEZ) boundary) extending from the WA/Northern Territory (NT) border to Kalbarri, south of Shark Bay in WA, covering an area of about 1.07 million km², and includes extensive areas of shallower waters on the continental shelf, as well as deep areas of abyssal plain where water is 5,000 m or deeper.	**Kimberley** The northern boundary is the limit of the NWMR; the southern boundary extends west of Broome to the northern edge of the Exmouth Plateau.	• Scott Reef • Rowley Shoals	Browse Basin
	Pilbara The northern boundary extends west of Broome to the northern edge of Exmouth plateau; the southern boundary follows a line west of North West Cape along the southern boundary of Exmouth Plateau.	• Dampier Archipelago • Rankin Bank • Glomar Shoal	North West Shelf (NWS), inclusive of Scarborough gas fields
	Ningaloo-Leeuwin The northern boundary extends from shore at North West Cape directly out along Cape Range escarpment; the southern boundary is the limit of the NWMR.	• Ningaloo • Muiron Islands • Exmouth Gulf	North West Cape

[1] The EMBA encompasses the environmental and social values and sensitivities that might be contacted by surface or subsurface hydrocarbons in the unlikely event of any worst-case spill from Woodside's activities. The values and sensitivities include the physical environments and biological communities present, in addition to protected species and areas, and socioeconomic and cultural values.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine bioregion*	Marine system	Relevant key environmental sensitivities	Woodside activity area
South-west (DSEWPaC 2012b)** The SWMR comprises Commonwealth waters from the eastern end of Kangaroo Island in SA to Shark Bay in WA. The region spans about 1.3 million km² of temperate and subtropical waters and abuts the coastal waters of SA and WA.	Not applicable.	Key environmental values at a regional level considered relevant in the context of the EMBA	No applicable Woodside activity area
North (DSEWPaC 2012c) The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT/WA border). The region covers about 625,689 km² of tropical waters in the Gulf of Carpentaria and Arafura and Timor seas, and abuts the coastal waters of Queensland and the NT.			

**The EMBA for the marine bioregions used in this document has been extended to include adjacent coastal waters and shoreline habitats.*

***The extent of the SWMR for this document has been adjusted to only include marine and coastal waters extending from Shark Bay in WA to the WA/SA border. The boundary of the SWMR as described by DSEWPaC (2012b) extends to the eastern end Kangaroo Island in SA. However, this boundary lies outside the scope of this document.*

1.3 Methodology

This document is informed by resources that include:

- a search of the Department of Climate Change, Energy, the Environment and Water (DCCEEW) Protected Matters Search Tool (PMST) for the marine bioregions (NWMR, SWMR and NMR) and adjacent coastal waters and shoreline habitats (Appendix A)
- State (WA)/Commonwealth marine park management plans
- the *Environment Protection and Biodiversity Conservation* (EPBC) *Act 1999* (Commonwealth) (EPBC Act) Species Profile and Threats Database (SPRAT)
- EPBC Act Part 13 statutory instruments: recovery plans, conservation advice and wildlife conservation plans for listed threatened and migratory species
- peer-reviewed scientific publications, as well as Woodside and joint venture-funded studies and other titleholder-funded study findings available in the public domain.

The PMST uses a conservative, grid-based search methodology rather than precise coordinates to determine the potential presence of matters of national environmental significance (MNES). For marine areas located more than 30 km offshore, this involves using 32 km × 32 km grid cells to identify spatial overlap with listed MNES. As a result, the PMST report (Appendix A) may identify MNES that do not directly intersect with the EMBA, including environmental and socioeconomic receptors that do not overlap with the marine environment or have coastal interface. The Australian Marine Spatial Information System was used to determine the exact location of a feature to determine whether it overlaps or is adjacent to the EMBA. Accordingly, MNES identified in the PMST that are not within the EMBA or associated with marine or coastal environments, and species that do not rely on marine or shoreline habitats (for example, species with no marine foraging or life-cycle processes), have not been assessed within this document.

1.4 Review and revision

The information presented in this document is reviewed and updated least every five years. Key updates are captured in a ‘change register’. Material risk may trigger updates within the five-year review period, as per the OPGGS (E) Regulations. Key updates may include the status of EPBC Act listed species, Part 13 instruments, policies and guidelines, key advice from external stakeholders, and recently published scientific literature.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2. PHYSICAL ENVIRONMENT

2.1 Regional context

Table 2-1 presents the key physical characteristics of the NWMR, SWMR and NMR. The remainder of this section then focuses entirely on the NWMR.

Table 2-1: Key physical characteristics of the NWMR, SWMR and NMR

Bioregion	Key characteristics
NWMR (DSEWPaC 2012a)	The NWMR experiences a tropical monsoonal climate towards the northern extent of the region, transitioning to tropical arid and subtropical arid within the central and southern areas of the region. The NWMR is part of the Indo-Australian Basin, the ocean region between the north-west coast of Australia and the Indonesian islands of Java and Sumatra. Dominant currents in the region include: the South Equatorial Current, the Indonesian Throughflow, the Eastern Gyral Current, and the Leeuwin Current (Department of Environment, Heritage, Water and the Arts (DEWHA) 2007a). The seafloor of the NWMR consists of four general feature types – continental shelf, continental slope, continental rise and abyssal plain – and is distinguished by a range of topographic features, including canyons, plateaus, terraces, ridges, reefs, banks and shoals.
SWMR (DSEWPaC 2012b)	The SWMR contains both subtropical and temperate climates, with overall light climatic cycles. The SWMR experiences complex and unusual oceanographic patterns, driven largely by the Leeuwin Current and its associated currents, which have a significant influence on biodiversity distribution and abundance. The major seafloor features of the SWMR include a narrow continental shelf on the west coast to the waters off south-west WA, and a wide continental shelf dominated by sandy carbonate sediments of marine origin in the Great Australian Bight. The region also contains a steep, muddy continental slope, many canyons and large tracts of abyssal plains.
NMR (DSEWPaC 2012c)	The NMR experiences a tropical monsoonal climate with complex weather cycles, including high temperatures and heavy seasonal yet variable rainfall and cyclones, which can be both destructive (loss of seagrass and mangroves) and constructive (mobilisation of sediment into coastal habitats). The NMR comprises Commonwealth waters from West Cape York Peninsula to the NT/WA border, covering tropical waters in the Gulf of Carpentaria and Arafura and Timor seas. Currents in the NMR are driven largely by strong winds and tides, with only minor influences from oceanographic currents such as the Indonesian Throughflow and the South Equatorial Current. The seafloor of the NMR consists mainly of a wide continental shelf, as well as other geomorphological features such as shoals, banks, terraces, valleys, shallow canyons and limestone pinnacles.

2.2 Marine systems of the North-west Marine Region (NWMR)

The NWMR is divided into three large-scale ecological marine systems – the Kimberley, the Pilbara and Ningaloo-Leeuwin – based on the influence of major ocean currents, seafloor features and eco-physical processes (such as climate, tides, freshwater inflow) upon the region (DSEWPaC 2012a).

The three large-scale marine systems approximate the Woodside activity areas, which include Browse Basin, the NWS/Scarborough, and North West Cape (see Section 1.2 for Woodside activity areas) within the NWMR (Figure 2-1). Table 2-2 outlines the key characteristics of each marine system.

Table 2-2: Key characteristics of the marine systems of the NWMR

Marine system	Key characteristics
Kimberley	• Tropical monsoonal climate • Strong influence from Indonesian Throughflow • Predominantly tropical Indo-Pacific species • Subject to episodic offshore cyclonic activity, rarely crossing the coast • Large tidal regimes • Freshwater input from terrestrial monsoonal runoff • Turbid coastal waters (as in, light-limited systems) • Dominated by shelf environments • Predominantly hard substrates in inner to mid-shelf environments • Includes shelf-edge atolls: Scott Reef, Rowley Shoals
Pilbara	• Tropical arid climate • Transition between Indonesian Throughflow and Leeuwin Current dominated areas • Predominantly tropical species • High cyclone activity with frequent crossing of the coast • Transitional tidal zone • Internal tide activity • Large areas of shelf and slope • Dry coast with ephemeral freshwater inputs
Ningaloo-Leeuwin	• Subtropical arid climate Leeuwin Current consolidates • Transitional tropical/temperate faunal area • Higher water clarity in nearshore and offshore environments • Narrow shelf and slope • Marginal tidal range • Seasonal wind forcing more dominant influence on marine environment

Source: DEWHA (2007a)

2.3 Meteorology and oceanography

This section describes the general meteorological conditions and oceanography for the NWMR and provides further detail for the three Woodside activity areas (Table 2-3). The NWMR is influenced by a complex system of ocean currents that change between seasons and between years, which generally result in its surface waters being warm and nutrient-poor, and of low salinity (DEWHA 2007a). The mix of bathymetric features, complex topography and oceanography across the whole north-west marine environment has created and supports a globally important marine biodiversity hotspot (Wilson 2013). Table 2-3 provides high-level physical characteristics of the marine environment within and across the NWMR. This subsection does not describe warming trends or discuss forecast trajectories for the NWMR.

Table 2-3: NWMR climate and oceanography summary

Receptor	Description
Meteorology	
Seasonal patterns	Seasonal changes in wind direction and rainfall are important factors for driving the ecological processes in the NWMR (DSEWPaC 2012a). The broader NWMR experiences variations of a tropical or monsoon climate, with the northern areas featuring two distinct seasons: the dry season from May to September, and the wet season from October through to April. The wet season is Australia's peak period for tropical cyclones, rainfall and severe thunderstorms (Bureau of Meteorology (BOM) 2026a). The peak of the cyclone season usually occurs between December and March (DSEWPaC 2012a). The Kimberley region features a tropical monsoonal climate, the Pilbara region features a tropical arid climate, and the Ningaloo-Leeuwin region experiences a subtropical arid climate (DEWHA 2007a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Receptor	Description
Air temperature and rainfall	Temperatures and rainfall vary seasonally in the NWMR region. Higher temperatures usually occur during the wet season, with average daily maximum temperatures ranging between 27ºC and 39ºC, and average daily minimum temperatures ranging between 12ºC and 27ºC. Cooler temperatures occur in the dry season; the average daily maximum temperatures range from 21ºC to 36ºC and average daily minimum temperatures range between 9ºC and 21ºC (Figure 2-2 and Figure 2-3 (BOM 2024)). Higher rainfall in the region typically occurs during the northern wet season, with the average rainfall between 100 mm and 2,400 mm, with highest falls observed late in the season. Comparatively, the average rainfall in the dry season is between 100 mm and 300 mm (BOM 2024). These seasonal occurrences are often associated with the passage of tropical low-pressure systems and cyclones (DSEWPaC 2012a).
Wind	Wind patterns in north-west WA are dictated by the seasonal movement of atmospheric pressure systems. During the northern wet season, high-pressure cells produce prevailing winds from the north-west and south-west, which vary between 10 and 13 m/s. During the dry season, high-pressure cells over central Australia produce north-easterly to south-easterly winds with average speeds of between 6 and 8 m/s (BOM 2022b). Refer to Figure 2-4.
Tropical cyclones	Tropical cyclone activity occurs during the wet season, with cyclone activity typically occurring between November and April, although few cyclones tend to occur during November. About five to six tropical cyclones occur in WA during each cyclone season, with about half of these becoming severe (BOM 2026b). See Figure 2-6.
Oceanography	
Ocean temperature	Waters in the NWMR are tropical year-round, with sea surface temperatures in open shelf waters typically reaching about 26°C in summer and dropping to about 22°C in winter. Nearshore temperatures (as recorded for the NWS area) fluctuate more annually, from about less than 23°C in winter to about 31°C in summer (Hallenberger *et al.* 2022), indicative of present-day sea surface temperatures, acquired from the Commonwealth Scientific and Industrial Research Organisation (CSIRO) Oceans and Atmosphere database. Warmer sea surface temperatures are also driven by the decadal variation of Niño/Niña strength in the NWMR. The Atlantic warm sea surface temperature anomalies from the Niño/Niña events drive a series of climate mean-state changes in the Indo-Pacific region, including sea surface temperature warming in the tropical eastern Indian Ocean (Xue *et al.* 2025). See Figure 2-7 and Figure 2-8, for the seasonal variation across and within the NWMR.
Currents	The major surface currents influencing north-west WA flow towards the poles and include the Indonesian Throughflow, the Leeuwin Current, the South Equatorial Current and the Eastern Gyral Current. The Ningaloo Current, the Holloway Current, the Shark Bay Outflow and the Capes Current are seasonal surface currents in the region. Below these surface currents are several subsurface currents, the most important of which are the Leeuwin Undercurrent and the West Australian Current. These subsurface currents flow towards the equator in the opposite direction to surface currents (DEWHA 2007a). The Indonesian Throughflow and Leeuwin Current weaken during the dry season (April to September), and more so during El Niño years (DSEWPaC 2012a). See Figure 2-9. The offshore waters of the NWMR are characterised by surface and subsurface boundary currents that flow along the continental shelf/slope and are enhanced through inflows from the ocean basins. They are an important conduit for the poleward heat and mass transport along the west coast (Wijeratne *et al.* 2018). Local physical oceanography is strongly influenced by the large-scale water movements of the Indonesian Throughflow (Liu *et al.* 2015; Sutton *et al.* 2019). Typically, a warm and well-mixed oligotrophic surface layer, and a cooler and more nutrient-rich deeper water layer (Menezes *et al.* 2013).
Waves	Sea surface waves within the NWMR generally reflect the direction of the synoptic winds and flow predominantly from the south-west in the summer and east in winter (Pearce *et al.* 2003). The NWS within the NWMR is a known area of internal wave generation. Both internal tides and internal waves are thought to be more prevalent during summer months due to the increased stratification of the water column (DEWHA 2007a). Along the continental slope of the NWMR, strong internal waves and interaction between semi-diurnal tidal currents and seabed topographic features facilitate upwelling events and localised productivity events (Holloway 2001).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Receptor	Description
Tides	Tides on the NWS increase as the water moves from deep towards the shallower coast. The highest offshore tides are experienced at the border of the Browse and Canning basins. The smallest tides are experienced at the Exmouth Plateau, near the coast. Tides of the NWS are predominantly semi-diurnal (two highs and two lows each day), but with increasing importance of the diurnal (once per day) inequality at the southern and northern extremities of the NWS. The tide range – represented by the mean spring range – increases northwards along the coast from 1.4 m at North West Cape (Point Murat) to 7.7 m at Broome, before decreasing again (apart from local amplification in King Sound and Collier Bay) to about 5 m off Cape Londonderry. The mean spring range then increases again through Joseph Bonaparte Gulf and on up 5.5 m at Darwin (RPS 2016).

2.3.1 Browse

Table 2-4 summarises the meteorological and oceanographic conditions for the Browse Basin, with supporting metocean data and figures provided in Appendix A.

Table 2-4: Summary meteorology and oceanography for Browse

Receptor	Description
Meteorology	
Seasonal patterns	The Browse area, overlapping the Kimberley marine system, experiences a tropical monsoon climate with moderate offshore cyclone activity (DEWHA 2007a). The region experiences two distinct seasons: the dry season from May to September and the northern wet season from October through to April. The wet season is Australia's peak time for tropical cyclones, rainfall and severe thunderstorms (BOM 2026c).
Air temperature	The mean annual air temperature recorded at Troughton Island between 1991 and 2020 ranged from 22.5ºC in July to 33.4ºC in November (BOM 2026c).
Rainfall	Mean rainfall recorded from Troughton Island in the Browse Basin between 1991 and 2020 ranged from a barely detectable (0.3 mm) mean monthly level in September to 274.8 mm in January (BOM 2026c).
Wind	The dry season experiences high-pressure systems that bring east to south-easterly winds with average wind speeds during the season of around 16.6 km/h and maximum wind gusts of 65 km/h. In contrast, the wet season brings predominantly westerly winds with average wind speeds about 17 km/h and maximum gusts exceeding 100 km/h (generally associated with tropical cyclones (MetOcean Engineers 2005).
Oceanography	
Currents	Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside, 2019). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.

2.3.2 North West Shelf/Scarborough

Table 2-5 summarises the meteorological and oceanographic conditions for the NWS/Scarborough, with supporting metocean data and figures provided in Appendix B.

Table 2-5: Summary meteorology and oceanography for the North West Shelf and Scarborough

Receptor	Description
Meteorology	
Seasonal patterns	The NWS and Scarborough activity areas, overlapping the Pilbara marine system, experience a tropical arid climate with high cyclone activity. The monsoonal climate of the wider NWMR has a distinct wet and dry seasonal regime and transition periods between seasons (DEWHA 2007a).
Air temperature	Air temperatures as measured at the North Rankin A platform on the NWS ranged from a maximum average of 39.8°C in summer to a minimum average temperature of 15.2°C in winter (Woodside 2015).
Rainfall	Rainfall patterns annually reveal the wet season with highest rainfalls during the late summer, often associated with the passage of tropical low-pressure systems and cyclones. Rainfall in the dry season is typically extremely low (Pearce *et al.* 2003 and Appendix B).
Wind	Winds are typically from the southwest during the wet season (summer) and tending from the south-east during the dry season (winter). The summer south-westerly winds are driven by high pressure cells that pass from west to east over the Australian continent. During the winter period, the relative position of the high-pressure cells shifts further north, leading to prevailing south-easterly winds from the mainland (Pearce *et al.* 2003 and Appendix B).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Receptor	Description
Oceanography	
Currents	The large-scale ocean currents of the NWMR, primarily the Indonesian Throughflow and Leeuwin Current (and Holloway Current), are the primary influence on the NWS and Scarborough activity areas. The Indonesian Throughflow and Leeuwin Current are strongest during the late summer and winter and flow reversals to the north-east, typically short-lived and weak when there are strong south-westerly winds, can generate localised upwelling on the shelf edge (Holloway and Nye 1985; James *et al.* 2004; Condie *et al.* 2006).

2.3.3 North West Cape

Table 2-6 summarises the meteorological and oceanographic conditions for the North West Cape, with supporting metocean data and figures in Appendix B.

Table 2-6: Summary meteorology and oceanography for the North West Cape

Receptor	Description
Meteorology	
Seasonal patterns	The North West Cape activity area, overlapping the Ningaloo-Leeuwin marine system, experiences a subtropical arid climate featuring a hot summer season and a mild winter season. There are often distinct transition periods between the summer and winter regimes, characterised by periods of relatively low winds, with seasonal winds being the more dominant influence on the marine environment in the region (DEWHA 2007a).
Air temperature	The mean annual air temperature recorded at Learmonth Airport between 1991 and 2020 ranged from a maximum temperature of 38°C in January to a mean minimum temperature of 11.5°C in July (BOM 2026d).
Rainfall	Rainfall typically occurs during the summer, with highest rainfall during later summer and autumn, The mean highest rainfall recorded from Learmonth Airport between 1991 and 2020 was 46.5 mm in June, and the lowest mean rainfall of 0.2 mm in October. These seasonal changes in rainfall are often associated with the passage of tropical low-pressure systems and cyclones (BOM 2026d).
Wind	Winds vary seasonally, generally from the south-west quadrant during summer months and the south-southeast quadrant during the autumn and winter months. The summer south-westerly winds are driven by high-pressure cells that pass from west to east over the Australian continent. Winds typically weaken and are more variable during the transitional period between the summer and winter seasons, generally between April to August.
Oceanography	
Currents	Surface currents exhibit seasonal directionality, with flow to the south-west during March to June and more variable outside this period (Woodside 2022). This is consistent with the stronger Leeuwin Current flow during winter months, with more variable currents driven by local wind stress during periods of weaker Leeuwin Current flow.

2.4 Physical environment of the NWMR

Based on the Integrated Marine and Coastal Regionalisation of Australia Version 4.0, eight provincial bioregions occur within the NWMR, which are based on patterns of demersal fish diversity, benthic habitat and oceanographic data (Commonwealth of Australia 2006a) (Figure 2-10). Of the eight provincial bioregions that occur within the NWMR, these include four offshore (about 65% of total NWMR area) and four shelf (about 35% of total NWMR area) bioregions (Baker *et al.* 2008).

The NWMR is a tropical carbonate margin that comprises an extensive area of shelf, slope and abyssal plain/deep ocean floor, as well as complex areas of bathymetry such as plateau, terraces and major canyons (Harris *et al.* 2005). A series of reefs are on the outer shelf/slope of the NWMR, including Ashmore, Cartier, Scott and Seringapatam reefs (Baker *et al.* 2008). The distribution of seafloor geomorphic features has been systematically mapped over much of the Australian margin and adjacent seafloor. The mapped area can be divided into ten geomorphic regions, of which the NWMR overlays two: the Western Margin and Northern Margin (Harris *et al.* 2005). Most of the region consists of either continental slope (61%) or continental shelf (28%) (DEWHA 2007a), with more than 40% of the NWMR having a water depth less than 200 m. The shallow shelf is contrasted by features such as the Cuvier and Argo abyssal plains, which reach depths of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

more than 5 km. A unique feature of the region is the significant narrowing of the continental shelf around North West Cape (about 7 km wide) from the broad continental shelf in the north of the region (about 400 km wide at Joseph Bonaparte Gulf) (DEWHA 2007a) (Figure 2-11).

The geological history of the region, as well as its geomorphology and oceanography, has influenced the composition and distribution of sediments (DEWHA 2007a). The sedimentology of the NWMR is dominated by marine carbonates, which show a broad zoning and fining with water depth. Main trends of the NWMR sediments include a tropical carbonate shelf that is dominated by sand and gravel, an outer shelf/slope zone that is dominated by mud, and a relatively homogenous rise and abyssal plain/deep ocean floor that is dominated by non-carbonate mud (Baker *et al.* 2008) (Figure 2-12). In the region, mud content generally increases with water depth due to lower depositional energy, while grain-supported coral-rich sediments are more common on platform margins exposed to higher energy conditions (Gischler 2025). The distribution and resuspension of sediments on the inner shelf is strongly influenced by the strength of tides across the continental shelf as well as episodic events such as cyclones. Further offshore, on the mid to outer shelf and on the slope itself, sediment movement is primarily influenced by ocean currents and internal tides (DEWHA 2007a). In carbonate platform environments, similar to those of the NWMR, sediment redistribution can also be strongly affected by spur-and-groove systems, sand aprons and lagoonal circulation patterns, contributing to patchy and heterogeneous sediment facies across depth zones (Gischler 2025). This variation in bathymetry and interactions with oceanographic processes provides diverse habitats for marine fauna and flora within the NWMR.

2.5 Air quality

The ambient air quality of all three marine regions is largely unpolluted due to the extent of the open ocean area, the activities currently carried out in each, and the relative remoteness of each region.

Vessel traffic and existing offshore surface infrastructure are the only likely sources of pollutants in the marine region. Closer to the coast there may be localised and temporary reductions in air quality around areas of high vessel traffic, or due to the occurrence of dust storms and bushfires. International contributors to reduced air quality in the marine region may include ‘slash-and-burn’ agricultural methods and large forest fires in Southeast Asian regions (Vadrevu *et al.* 2014; Kim Oanh *et al.* 2018).

3. MATTERS OF NATIONAL ENVIRONMENTAL SIGNIFICANCE

3.1 Summary of matters of national environmental significance

The EPBC Act refers to living things (including plants and animals), habitats and places that need protecting as 'matters of national environmental significance'. There are nine MNES listed under the EPBC Act:

- World Heritage areas
- National Heritage places
- wetlands of international importance (listed under the Ramsar Convention)
- listed threatened species and listed ecological communities
- listed migratory species (protected under international agreements)
- Commonwealth marine areas
- Great Barrier Reef Marine Park
- nuclear actions (including uranium mines)
- water resources (relating to unconventional gas development and large coal mining development).

The EPBC Act Significant Impact Guidelines 1.1 – Matters of National Environmental Significance 2013 state that "An action is likely to have a significant impact on a threatened species if there is a real chance or possibility that it will: adversely affect habitat critical to the survival of a species." Habitat critical to the survival of a species is defined as areas necessary:

- for activities such as foraging, breeding, roosting or dispersal
- for the long-term maintenance of the species or ecological community, including the maintenance of species essential to the survival of the species or ecological community, such as pollinators
- to maintain genetic diversity and long-term evolutionary development, or
- for reintroducing populations or recovering the species or ecological community.

Habitat critical to the survival of species has been identified for marine turtles and marine mammals, and described in Sections 7.2.1.1 and 8.2.3, respectively.

This section summarises the MNES reported for the three bioregions: NWMR (Table 3-1), SWMR (Table 3-2) and NMR (Table 3-3). The summary is based on the PMST reports (Appendix A) and includes MNES that may occur within each bioregion.

The PMST uses a conservative, grid-based search methodology to determine the potential presence of MNES. For marine areas located more than 30 km offshore, this involves using 32 km × 32 km grid cells to identify spatial overlap with listed MNES. As a result, the PMST report (Appendix A) may identify MNES that do not directly intersect with the EMBA, including protected areas that have no coastal interface and terrestrial species. Accordingly, MNES identified in the PMST that are not associated with coastal environments, and species that do not rely on marine or shoreline habitats (for example, species with no marine foraging or life-cycle processes), have not been assessed further.

Additional information about these MNES for the NWMR, SWMR, and NMR is provided in subsequent sections (referenced in Table 3-1, Table 3-2 and Table 3-3, respectively).

3.2 Part 13 statutory instruments for Environment Protection and Biodiversity Conservation Act listed threatened and migratory species in the NWMR, South-west Marine Region (SWMR) and North Marine Region (NMR)

A screening process was conducted to identify which EPBC Act listed threatened and migratory species, and associated Part 13 statutory instruments, are relevant in the context of assessing impacts and risks associated with petroleum activities in each of the Woodside activity areas. The screening criteria included:

- overlap among the Woodside activity areas with habitat critical for survival (such as marine turtles) and with BIAs (overlapping the marine environment) for any listed threatened or migratory species as reported in the PMST searches
- published literature, unpublished reports and credible anecdotal information (such as feedback from stakeholders) indicating species presence or occurrence within the Woodside activity areas
- temporal overlap between the likely timing of petroleum activities and peak periods for key critical life stage behaviours (for example, breeding, nesting, calving, resting, foraging, migration)
- environmental aspects associated with petroleum activities that have been identified as a key threat to a species in a Part 13 statutory instrument (such as anthropogenic noise, light emissions, marine debris).

Table 3-4 lists relevant EPBC Act threatened and migratory species and their Part 13 statutory instruments. For the full list of EPBC Act listed species for each marine bioregion, refer to the PMST reports (Appendix A).

Table 3-4: Summary of EPBC Act threatened and migratory species to be considered for evaluating impacts or risks for Woodside activities

Species	EPBC Act Part 13 statutory instrument
All vertebrate marine fauna	Threat Abatement Plan for the impacts of marine debris on vertebrate marine life (Commonwealth of Australia 2018)
Fishes, sharks, rays and sawfishes	
All sawfishes (largetooth, green, dwarf, speartooth, narrow)	Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia 2015b)
Grey nurse shark (west coast population)	Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Department of the Environment (DoE) 2014a)
Largetooth sawfish	Conservation Advice for *Pristis pristis* (largetooth sawfish) (DCCEEW 2025a)
Little gulper shark, southern dogfish	Commonwealth Listing Advice on *Centrophorus zeehaani* (southern dogfish) (Threatened Species Scientific Committee 2013a)
Northern river shark	Conservation Advice for *Glyphis garricki* (northern river shark) (DoE 2014b)
Scalloped hammerhead	Listing Advice for *Sphyrna lewini* (scalloped hammerhead) (Threatened Species Scientific Committee 2024)
Speartooth shark	Approved Conservation Advice for *Glyphis glyphis* (speartooth shark) (DoE 2014c)
White shark	Recovery Plan for the White Shark (*Carcharodon carcharias*) 2013 (DSEWPaC 2013b)
Whale shark	Conservation Advice *Rhincodon typus* whale shark (Threatened Species Scientific Committee 2015d)
Marine reptiles	
All marine turtle species (loggerhead, green, leatherback, hawksbill, flatback, olive ridley)	Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia 2017) National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (DCCEEW 2023j)
Dusky sea snake	Conservation Advice for *Aipysurus fuscus* (dusky sea snake) (DCCEEW 2024m)
Leaf-scaled sea snake	Approved Conservation Advice for *Aipysurus foliosquama* (leaf-scaled sea snake) (DSEWPaC 2011b)
Leatherback turtle	Approved Conservation Advice for *Dermochelys coriacea* (*leatherback turtle*) (DEWHA 2009c)

Species	EPBC Act Part 13 statutory instrument
Mertens' water monitor	Conservation Advice for *Varanus mertensi* (Mertens' water monitor) (DCCEEW 2023i)
Mitchell's water monitor	Conservation Advice for *Varanus mitchelli* (Mitchell's water monitor) (DCCEEW 2023c)
Short-nosed sea snake	Approved Conservation Advice for *Aipysurus apraefrontalis* (short-nosed sea snake) (DSEWPaC 2011a)
Marine mammals	
Australian sea lion	Recovery Plan for the Australian Sea Lion (*Neophoca cinerea*) 2013 (DSEWPaC 2013a) Conservation Advice *Neophoca cinerea* Australian Sea Lion (Threatened Species Scientific Committee 2020) (in effect under the EPBC Act from 23 December 2020)
Australian snubfin dolphin	Conservation Advice for *Orcaella heinsohni* (Australian snubfin dolphin) (DCCEEW 2025d)
Blue whale	Conservation Management Plan for the Blue Whale: A Recovery Plan under the *Environment Protection and Biodiversity Conservation Act 1999* 2015–2025 (Commonwealth of Australia 2015a)
Fin whale	Conservation Advice *Balaenoptera physalus* fin whale (Threatened Species Scientific Committee 2015c)
Humpback whale	Listing Advice *Megaptera novaeangliae* Humpback Whale (Department of Agriculture, Water and the Environment (DAWE) 2022)
Indo-Pacific humpback dolphin (Australian humpback dolphin)	Conservation Advice for *Sousa sahulensis* (Australian humpback dolphin) (DCCEEW 2025e)
Sei whale	Conservation Advice *Balaenoptera borealis* sei whale (Threatened Species Scientific Committee 2015a)
Southern right whale	National Recovery Plan for the Southern Right Whale *Eubalaena australis* (DCCEEW 2024a)
Seabirds	
All seabird species	Wildlife Conservation Plan for Seabirds (Commonwealth of Australia 2020) National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (DCCEEW 2023j)
All albatrosses and petrels	National Recovery Plan for albatrosses and petrels (DCCEEW 2022)
Amsterdam albatross	EPBC Act Threat Abatement Plan for the incidental catch (or bycatch) of seabirds during oceanic longline fishing operations (Commonwealth of Australia 2018)
Australian fairy tern	National Recovery Plan for the Australian Fairy Tern *Sternula nereis nereis* (Commonwealth of Australia 2020) EPBC Act Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (Department of Environment and Energy (DoEE) 2018)
Australian lesser noddy	Conservation Advice *Anous tenuirostris melanops* Australian lesser noddy (Threatened Species Scientific Committee 2015e) EPBC Act Threat Abatement Plan to reduce the impacts of exotic rodents on biodiversity on Australian offshore islands of less than 100,000 hectares (ha) (DEWHA 2009a)
Bridled tern	EPBC Act Threat abatement plan for predation by the European red fox (DEWHA 2008b)
Brown booby	EPBC Act Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans (DoEE 2018)
Christmas Island white-tailed tropic bird	Conservation Advice for *Phaethon lepturus fulvus* (golden bosun) (DCCEEW 2026f)

4. BIOLOGICAL COMMUNITIES

4.1 Regional context

The NWMR is characterised by shallow-water tropical marine ecosystems and features high species richness. The southern extent of the NWMR transitions between tropical and temperate waters and includes some species that are found in the SWMR. High diversity is driven by the interaction with seafloor features in addition to the currents in the NWMR, which support unique ecosystems and trophic interactions. The strong seasonality in wind direction and rainfall is another key driver on the ecological processes in the region. The weakening of the Indonesian Throughflow and Leeuwin Current in the dry season, along with the seasonal wind reversal and cyclones, drives biological productivity by mixing deeper, cold nutrient-rich waters with the surface waters (DSEWPaC 2012a).

The SWMR has high biodiversity and a high number of species endemic to the region. Factors that contribute to the high level of biodiversity and endemism in the region include the long stable period of geological oscillation, persistent high energy environment, warm-water intrusion by the Leeuwin Current, and areas in the east of the SWMR where cold nutrient-rich waters rise from the deep ocean to the surface. The low-nutrient environment of the SWMR leads to clear waters and high levels of light penetration, giving rise to a high diversity of seagrass, algal and benthic communities. Biological productivity of the SWMR is low in global standards in comparison to other Australian marine regions due to the low-nutrient tropical waters carried south by the Leeuwin Current, and its effect in supressing the upwelling of deeper nutrient-rich cold waters, in addition to the absence of nutrient runoff from significant rivers. Small seasonal upwellings occur regularly at known locations and, because of the overall absence of nutrients in the region, these productivity locations have a disproportionate effect on the region's ecosystems. These eddies can be either upwelling, which enhances local biological productivity where they form, or downwelling, which concentrates and transports communities away from the coast (DSEWPaC 2012b).

The NMR is known for its high diversity of tropical species but relatively low endemism. The high diversity and low endemism are thought to be due to the vast species-rich biogeographic ocean zone that stretches from the western Pacific to the east coast of Africa, and is thought to have few physical barriers for species dispersal. Most of the NMR endemic species do not have a long-lived pelagic larval stage, which promotes long-distance travel across deeper waters. The NMR is primarily influenced by tidal flows rather than ocean currents. Tidal movement in the region is complex due to the barrier of islands and submerged reefs in the Torres Strait, which hinder tidal energy. The Indonesian Throughflow and surface-driven currents in the region are likely to influence nutrients, pelagic dispersal, and species and biological productivity in the NMR (DSEWPaC 2012c).

4.2 Biological productivity of the NWMR

Primary productivity of the NWMR is generally low and appears to be largely driven by offshore influences (Brewer *et al.* 2007), with periodic upwelling events and cyclonic influences driving coastal productivity with nutrient recycling and advection. Seasonal weather patterns also influence the delivery of nutrients from deep water to shallow water (Brewer *et al.* 2007). Cyclones and north-westerly winds during the north-west wet season (Brewer *et al.* 2007) (around October to April (BOM 2026a)) facilitate the upwelling and mixing of nutrients from deepwater to shallow water environments (Brewer *et al.* 2007).

The Indonesian Throughflow has an important effect on productivity in the northern areas of the region. Generally, its deep, warm and low-nutrient waters suppress upwelling of deeper comparatively nutrient-rich waters, thereby forcing the highest rates of primary productivity to occur at depths associated with the thermocline. When the Indonesian Throughflow is weaker the thermocline lifts, bringing deeper, more nutrient-rich waters into the photic zone and resulting in conditions favourable to increased productivity (DEWHA 2007a). Similarly, the Leeuwin Current has a significant role in determining primary productivity in the southern areas of the NWMR. As with the Indonesian Throughflow, the overlying warm oligotrophic waters of the Leeuwin Current suppress upwelling. A subsurface chlorophyll maximum is therefore formed at a depth in the water column where nutrients and light are sufficient for photosynthesis to proceed. Seasonal changes in the strength of the Leeuwin Current influence primary productivity levels, and seasonal interactions between the Leeuwin and Ningaloo currents in the south of the NWMR are believed to be particularly important (DEWHA 2007a).

Internal tides (defined as internal waves generated by the barotropic tide) are a striking characteristic of many parts of the NWMR and are associated with highly stratified water columns. Internal waves (solitons), which can raise cooler, generally more nutrient-rich water higher in the water column, are generated between

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

water depths of 400 m and 1,000 m where bottom topography results in a significant change in water depth over a relatively short distance. Cyclones are episodic events in the NWMR that contribute to spikes in productivity through enrichment of surface water layers, due to enhanced vertical mixing of the water column. Temporary increases in primary productivity caused by cyclones generally last between one and two weeks, and it is believed the impacts of cyclones are generally limited to waters less than 100 m deep and affect benthic communities more substantially than pelagic systems (DEWHA 2007a).

Water depth also has a significant overriding influence over productivity in the marine environment, due to its influence on light availability. This is reflected by distinct onshore and offshore assemblages of major pelagic groups of phytoplankton, microzooplankton, mesoplankton and ichthyoplankton. Productivity booms are thought to be triggered by seasonal changes to physical drivers or episodic events, as detailed above, which result in rapid increases in primary production over short periods, followed by extended periods of lower primary production. The trophic systems in the NWMR can take advantage of blooms in primary production, enabling nutrients generated to be used by different groups of consumers over long periods (DEWHA 2007a).

Little detailed information is available about the trophic systems in the NWMR. The use of available nutrients is thought to differ between pelagic and benthic environments, influenced by water depth and vertical migration of some species groups in the water column. In the pelagic system, it is thought about half of the nutrients available are used by microzooplankton (such as protozoa), with the remainder going to macro and meso-zooplankton (such as copepods). As primary and secondary consumers, gelatinous zooplankton (such as salps and coelenterates) and jellyfish are thought to play an important role in the food web, contributing a significant proportion of biomass in the marine system during and for periods after booms in primary productivity. Salps are semi-transparent, barrel-shaped marine animals that can reproduce quickly in response to bursts in primary productivity and provide a food source for many pelagic fish species (DEWHA 2007a).

4.3 Planktonic communities in the NWMR

The NWMR has two distinct phytoplankton assemblages – a tropical oceanic community in offshore waters and a tropical shelf community confined to the NWS (Hallegraeff 1995). MODIS (moderate resolution imaging spectrometer) satellite datasets from the NWMR indicates chlorophyll (and thus phytoplankton) levels are low in summer months (December to March) and higher in winter months (Schroeder *et al.* 2009). Low chlorophyll levels during summer months may be a result of lower plankton productivity during the wet season or lower nutrient inputs from warm surface waters dominant during summer. However, it is likely much of the primary production is taking place below the surface, where the MODIS imagery does not penetrate (Schroeder *et al.* 2009). The winter months are relatively cloud free and surface chlorophyll is high throughout most of the region.

Zooplankton may include organisms that complete their life cycle as plankton (such as copepods, euphausiids) and as larval stages of other taxa, such as fishes, corals and molluscs. Peaks in zooplankton, such as mass coral spawning events (typically in March and April) (Rosser and Gilmour 2008) and fish larvae abundance (Department of Conservation and Land Management (CALM) 2005a), can occur throughout the year.

Spatial and temporal patterns in the distribution and abundance of macro-zooplankton on the NWS are influenced by sporadic climatic and oceanographic events, with large inter-annual changes in assemblages (Wilson *et al.* 2003). Amphipods, euphausiids, copepods, mysids and cumaceans are among the most common components of the zooplankton in the region (Wilson *et al.* 2003). Buenafe *et al.* (2025) analysed near-global larval distribution data for 15 taxa of large pelagic fishes and used habitat-suitability models to infer broad-scale spawning patterns, including for key species of management relevance such as skipjack tuna (*Katsuwonus pelamis*), southern bluefin tuna (*Thunnus maccoyii*), other tropical and subtropical tunas (*Thunnus* spp.), and billfishes (such as marlins and swordfish). The study identified consistent seasonal and regional structure in spawning, with modelled spawning habitat for several of these species occurring off northwest Australia, particularly during the wetter months in spring and summer. This overlap suggests the oceanographic conditions in parts of the NWMR are favourable for early life stages and reproduction of large pelagic fishes (Buenafe *et al*. 2025).

4.3.1 Browse

Phytoplankton within the Browse activity area is expected to reflect the conditions of the NWMR. There is a tendency for offshore phytoplankton communities in the NWMR to be characterised by smaller taxa (such as bacteria), whereas shelf waters are dominated by larger taxa such as diatoms (Hanson *et al.* 2007). Communities of phytoplankton in oligotrophic tropical waters, such as those around Scott Reef, are usually dominated by picoplankton. Particularly, the marine cyanobacteria genera Prochlorococcus and Synechococcus (Brinkman *et al.* 2009a). Estimates of the phytoplankton biomass (measured as chlorophyll a) near Scott Reef are about twice that of open waters (sampled more than 50 km south-west of South Scott Reef). The open water location sampled is likely to be representative of the general outer shelf pelagic environment, and so is representative of the oceanic waters of the area. This difference is considered to most likely reflect the enhanced vertical mixing of nutrients into the surface layer around Scott Reef through interactions between the local hydrodynamics and the local topography (Brinkman *et al.* 2009a).

Zooplankton within the activity area may include organisms that complete their life cycle as plankton and as larval stages of other taxa, such as fishes, corals and molluscs. Peaks in zooplankton, such as mass coral spawning events (typically in March and April) (Rosser and Gilmour 2008; Simpson *et al.* 1993) and fish larvae abundance (CALM 2005a), can occur throughout the year.

The influence of the Indonesian Throughflow restricts upwelling across the Kimberley System (roughly equates to the Browse activity area) (Sutton *et al.* 2019). However, small-scale topographically associated current movements, tidal pumping, eddies and upwellings are thought to occur, which transport cooler, nutrient-rich water to specific locations, including reefs and shallow ecosystems, which result in ‘productivity hotspots’ (Sutton *et al.* 2019; Green *et al.* 2019). Similarly, internal waves, generated at the shelf break (for example, west of Browse Island and around submerged cliffs located at the continental shelf edge) play a role in making nutrients available in the photic zone. Productivity within shallow nearshore waters is driven primarily by tidal movement and terrestrial runoff, whereby nutrients are mixed by tidal action and new inputs of organic matter come from the land (Sutton *et al.* 2019).

4.3.2 North West Shelf/Scarborough

Plankton communities within the NWS/Scarborough activity area are expected to reflect conditions of the NWMR.

Internal tides along the NWS and Exmouth Plateau draw deeper cooler waters into the photic zone, stir up nutrients and trigger primary productivity. Broadly, the greatest productivity within this subsystem is found around the 200 m isobath associated with the shelf break (Brewer *et al.* 2007). Overall, productivity across the NWS is maintained through strong nutrient recycling and offshore inputs. Cyanobacteria are an important primary producer in the region, with other primary producers such as diatoms increasing in abundance during nutrient influxes in the area. Along the Pilbara coast and Dampier Archipelago, mean levels of chlorophyll and nutrients are locally elevated, suggesting a high level of primary producer productivity in these areas. Inshore waters of the Pilbara coast and Dampier Archipelago feature high turbidity, strong tidal activity, and detritus inputs that increase primary productivity in the region (Brewer *et al.* 2007).

4.3.3 North West Cape

Waters of the North West Cape experience a relatively high diversity of phytoplankton groups including diatoms, coccolithophorids and dinoflagellates. During the warmer months blooms of *Trichodesmium* occur in the region, these have been observed particularly on the frontal systems around Point Murat (Heyward *et al.* 2000).

Average Leeuwin Current phytoplankton biomass is characteristic of low productivity oceanic waters like the Indian, Pacific and Atlantic Oceans (Hanson *et al.* 2005). However, the Canyons linking the Cuvier Abyssal Plain and Cape Range Peninsula KEF are connected to the Commonwealth waters adjacent to Ningaloo Reef and may also have connections to Exmouth Plateau. The canyons are thought to interact with the Leeuwin Current to produce eddies inside the heads of the canyons, resulting in waters from the Antarctic intermediate water mass being drawn into shallower depths and onto the shelf (Brewer *et al.* 2007). These waters are cooler and richer in nutrients and strong internal tides may also aid upwelling at the canyon heads (Brewer *et al.* 2007). The narrow shelf width (about 10 km) near the canyons facilitates nutrient upwelling and relatively high productivity. This high primary productivity leads to high densities of primary consumers such as micro and macro-zooplankton, such as amphipods, copepods, mysids, cumaceans, euphausiids (Brewer *et al.* 2007).

5. BENTHIC COMMUNITIES AND HABITATS

5.1 Regional context

The NWMR habitats range from nearshore benthic primary producer habitats, such as seagrass beds, coral communities and mangrove forests, to offshore soft sediment seabed habitats and submerged and emergent reef systems. These habitats support biological communities that range from low density sessile and mobile benthos, such as sponges, molluscs and echinoids (with noted areas of sponge hotspot diversity) in offshore soft sediment habitat (DSEWPaC 2012a) to complex, diverse, remote coral reef systems.

Benthic primary producer habitats, such as seagrass beds, coral communities and mangrove forests within the SWMR, are described as a mixture of tropical and temperate species, due to the seasonal influences of the tropical waters carried south by the Leeuwin Current and the temperate waters carried north by the Capes Current (DSEWPaC 2012b).

The NMR shares similar habitat types to the NWMR. The predominant habitat of the region includes soft muddy sediments on relatively flat terrain. Other habitat types include seagrasses, reefs, shoals, and coastal habitats such as mangroves and coastal wetlands (Rochester *et al.* 2007).

Table 5-1, Table 5-2 and Table 5-3 summarise the benthic communities and habitats that are representative of the broader NWMR, SWMR and NMR, respectively. While the next subsections are focused on the primary features of relevance to the activity areas within the NWMR, mainly the offshore habitats of the continental shelf and slope, submerged shoals and banks, and remote oceanic reef systems that are of recognised conservation value.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 5-1: Benthic communities and habitats within the NWMR

Habitat/community	Kimberley	Pilbara	Ningaloo-Leeuwin
Offshore habitats and biological communities			
Soft sediment with infauna	The offshore environment of the NWMR comprises predominantly of seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and sparse benthic biota. The benthic communities inhabiting the predominantly soft, fine sediments of the offshore habitats are characterised by infauna such as polychaetes, and sessile and mobile epifauna such as crustacea (shrimp, crabs and squat lobsters) and echinoderms (starfish, cucumbers). The density of benthic fauna is typically lower in deep-sea sediment habitats (greater than 200 m) than in shallower coastal sediment habitats, but the diversity of communities may be similar.		
Soft sediment with hard substrate outcropping	A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope and escarpments. This habitat is found in offshore areas of the NWMR, often associated with KEFs such as the Ancient Coastline at 125 m Depth Contour KEF.		
	• Ancient coastline at 125 m depth contour KEF • Continental slope demersal fish communities KEF	• Ancient coastline at 125 m depth contour KEF • Continental slope demersal fish communities KEF	• Ancient coastline at 125 m depth contour KEF • Continental slope demersal fish communities KEF
Coral reef	Coral reef habitats within the NWMR have a high species diversity that includes corals, and associated reef species such as fishes, crustaceans, invertebrates and algae. Coral reef habitats of the offshore environment of the NWMR include remote oceanic reef systems, large platform reefs,and submerged banks and shoals.		
	• Browse Island • Scott Reef • Seringapatam Reef • Ashmore Reef • Cartier Island • Hibernia Reef • Rowley Shoals (including Mermaid Reef, Clerke Reef, Imperieuse Reef)	• Glomar Shoal • Rankin Bank • Montebello, Lowendal and Barrow Island groups	N/A
Seagrass and macroalgae communities	Seagrass beds and benthic macroalgae reefs are a main food source for many marine species and provide key habitats and nursery grounds (Heck *et al.* 2003; Wilson *et al.* 2010). In the northern half of WA, these habitats are restricted to sheltered and shallow waters, including around offshore reef systems, due to large tidal movement, high turbidity, cyclones and large seasonal freshwater runoff.

Habitat/community	Kimberley	Pilbara	Ningaloo-Leeuwin
Filter feeders/ heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2008a). Filter feeders generally live in areas that have strong currents and hard substratum, often associated with deeper environments of the shoals and banks in the offshore NWMR.		
	Lower outer reef slopes of the oceanic reef systems such as Scott Reef	• Glomar Shoal • Rankin Bank • Ancient coastline at 125 m depth contour KEF	Cape Range canyon system
Sandy beaches	Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors such as waves and currents. Sandy beaches vary in length, width and gradient, and in sediment type, composition and grain size throughout the NWMR, being found around islands and reefs in the offshore areas of the region.		
	• Browse Island • Scott Reef (Sandy Islet) • Ashmore Reef • Cartier Island	Montebello, Lowendal and Barrow Island groups	N/A
Nearshore/coastal habitats and biological communities			
Coral reef	Coral reef habitats typically found in nearshore regions of the NWMR include the fringing reefs around coastal islands and the mainland shore.		
	• Kimberley • East Holothuria and Long reefs • Bonaparte and Buccaneer Archipelagos • Montgomery Reef • Adele Complex (Beagle, Mavis, Albert, Churchill reefs, Adele Island)	• Dampier Archipelago • Inshore Pilbara Islands (Northern, Middle and Southern)	• Ningaloo Reef • Muiron Islands • Exmouth Gulf • Shark Bay
Seagrass and macroalgae communities	Seagrass beds and benthic macroalgae reefs are a main food source for many marine species and provide key habitats and nursery grounds (Heck Jr. *et al.* 2003; Wilson *et al.* 2010). In the nearshore areas of the NWMR, these habitats are restricted to sheltered and shallow waters due to large tidal movement, high turbidity, cyclones and large seasonal freshwater runoff. These areas include in bays and sounds and around reef and island groups.		
	King Sound	• Roebuck Bay • Dampier Archipelago	• Ningaloo Reef • Exmouth Gulf • Shark Bay

Habitat/community	Kimberley	Pilbara	Ningaloo-Leeuwin
Filter feeders/ heterotrophic	Filter feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2007a). Filter feeders generally live in areas that have strong currents and hard substratum. Conversely, higher diversity infauna is mainly associated with soft unconsolidated sediment, and infauna communities are considered widespread and well represented along the continental shelf and upper slopes of the NWMR. In nearshore areas of the NWMR, these species are generally found around reef systems.		
	• Scott Reef • Rowley Shoals	Deeper habitats of Rankin Bank and Glomar Shoal	Deeper habitats of Ningaloo Reef and the protected sponge zone in the south
Mangroves	Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie *et al.* 2006). Mangrove forests can help stabilise coastal sediments, provide a nursery ground for many species of fish and crustacean, and provide shelter or nesting areas for seabirds (McClatchie *et al.* 2006). In regions like the NWMR, mangroves can frequently occur at their physiological limits due to the high temperatures, hypersaline conditions and low humidity. Their condition can fluctuate with climate, with periods of increased rainfall supporting improved growth and dispersal. Mapping of the Pilbara coastline shows mangroves form a relatively stable component of a broader intertidal environment, occupying about 16% of the intertidal zone over the past two decades, and functioning as an important ecological connector between adjacent saltmarshes, cyanobacterial mats and subtidal habitats (Hickey *et al.* 2025). Mangroves are confined to shoreline habitats, in nearshore areas of the NWMR.		
	Dampier Peninsula (including Carnot Bay, Beagle Bay and Pender Bay)	• Pilbara coastline (including Ashburton River Delta, Coolgra Point, Robe River Delta, Yardie Landing, Yammadery Island and the Mangrove Islands) • Montebello, Lowendal and Barrow Island groups • Roebuck Bay	• Shark Bay • Mangrove Bay, Cape Range Peninsula • Exmouth Gulf
Saltmarshes	Saltmarsh communities are confined to shoreline habitats and are typically dominated by dense stands of halophytic plants such as herbs, grasses and low shrubs. The diversity of saltmarsh plant species increases with increasing latitude (in contrast to mangroves). The vegetation in these environments is essential to the stability of the saltmarsh, as they trap and bind sediments. The sediments are generally sandy silts and clays and can often have high organic material content.

Habitat/community	Kimberley	Pilbara	Ningaloo-Leeuwin
Sandy beaches	Sandy beaches are dynamic environments, naturally fluctuating in response to external forcing factors such as waves and currents. Sandy beaches vary in length, width and gradient, and in sediment type, composition and grain size throughout the NWMR. Sandy beaches are important for both resident and migratory seabirds and shorebirds, and can provide an important habitat for turtle nesting and breeding. They are located along many coastlines of the nearshore environments of the NWMR.

Table 5-2: Benthic communities and habitats within the SWMR

Habitat/community	Location
Offshore	
Soft sediment with infauna	Most of the SWMR seafloor is composed of soft unconsolidated sediments, but due to large variations in bathymetry there are marked differences in sedimentary composition and benthic assemblage structure across the region. Despite the prevalence of these habitats in the SWMR, very little is known about the composition or distribution of the region's sedimentary infauna (DEWHA 2008ba).
Soft sediment with hard substrate outcropping	A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope and escarpments.
	• Perth Canyon Marine Park • Ancient coastline at 90 to 120 m depth contour KEF • Diamantina Fracture Zone • Naturaliste Plateau
Coral reef	To date, studies and understanding of the corals within the SWMR have concentrated on the shallow water areas in State waters. Within the deeper Commonwealth waters of the SWMR, little is known of the distribution of corals.
Filter feeders/ heterotrophic	Filter-feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (Department of the Environment and Water Resources (DEWR) 2007). Filter feeders generally inhabit deeper habitats (below the photic zone) that have strong currents and hard substratum.
	• Ancient coastline at 90 to 120 m depth contour KEF • Diamantina Fracture Zone Naturaliste Plateau • Perth Canyon Marine Park • South-west Corner Marine Park

Habitat/community	Location
Nearshore	
Coral reef	The northern extent of the SWMR coincides loosely with the disappearance of abundant and diverse coral from coastal habitats. To the south of Shark Bay, abundant corals occur predominantly around offshore islands, with corals at inshore sites occurring in very isolated patches of non-reef coral communities, usually of reduced species richness.
	• Houtman Abrolhos Islands • Rottnest Island
Seagrass and macroalgae communities	Within the SWMR, macroalgae and seagrass communities are noted for their extent, species richness and endemism. The clear waters of the region allow light to reach greater depths, with some species found at much greater depths than usual (down to 120 m) (DEWR 2007). Of the known species, there are more than 1,000 species of macro-algae and 22 species of seagrass consisting of tropical and temperate species. Seagrass and macro-algae occur in areas with sheltered bays and in the inter-reef lagoons along exposed sections of the coast. Macrophytes in southwest WA are abundant on shallow-water rock platforms and tidal pools, where these habitats support diverse, high-energy coastal communities (Tremblin *et al.* 2025). These environments, which are characteristic of higher-latitude sections of the region, support a wide variety of algal assemblages that provide structural complexity and microhabitats for numerous marine species. The presence of articulate coralline algae (such as *Amphiroa gracilis*), typically occurring among diverse macrophyte stands, illustrates the rich algal cover characteristic of these shallow, wave-exposed environments (Tremblin *et al.* 2025).
	• Houtman Abrolhos Islands • Jurien Marine Park • Shoalwater Islands Marine Park • Geographe Marine Park • Cockburn Sound • Rottnest Island • Commonwealth marine environment within and adjacent to the west-coast inshore lagoons KEF • Commonwealth marine environment within and adjacent to Geographe Bay KEF • Commonwealth marine environment surrounding the Recherche Archipelago KEF
Filter feeders/ heterotrophic	Filter-feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWR 2007). Filter feeders generally live in areas that have strong currents and hard substratum.
	• Houtman Abrolhos Islands • Recherche Archipelago

Habitat/community	Location
Mangroves	Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie *et al.* 2006). Mangrove forests can help stabilise coastal sediments, provide a nursery ground for many species of fish and crustacean, and provide shelter or nesting areas for seabirds (McClatchie *et al.* 2006). Mangroves are confined to shoreline habitats, in nearshore areas of the SWMR.
	Houtman Abrolhos Islands
Sandy beaches	Sandy beaches within the SWMR are important for both resident and migratory seabirds and shorebirds, and can host breeding populations of the Australian sea lion. They are found along many coastlines of the nearshore environments of the SWMR. In addition, beaches in the SWMR provide a variety of socioeconomic values, including tourism, commercial and recreational fishing, and support other recreational activities.
	• Houtman Abrolhos Islands • Marmion Marine Park • Ngari Capes Marine Park • Walpole and Nornalup Inlets Marine Park

Table 5-3: Benthic communities and habitats within the NMR

Habitat/community	Location
Offshore habitats and biological communities	
Soft sediment with infauna	Most of the offshore environment of the NMR is characterised by relatively flat expanses of soft sediment seabed. The soft sediments of the region are characterised by moderately abundant and diverse communities of infauna and mobile epifauna dominated by polychaetes, crustaceans, molluscs and echinoderms.
Soft sediment with hard substrate outcropping	A unique seafloor feature combining both soft sediment and hard substrates, including outcrops, terraces, continental slope and escarpments. The variability in substrate composition may contribute to the presence of unique ecosystems. Species include sponges, soft corals and other sessile filter feeders associated with hard substrate sediments.
	• Carbonate bank and terrace system of the Van Diemen Rise KEF • Pinnacles of the Bonaparte Basin KEF
Coral reef	Offshore coral reefs within the NMR are generally associated with a series of submerged shoals and banks. The shoals and banks in the region support tropical marine biota consistent with that found on emergent reef systems of the Indo-West Pacific region, such as Ashmore Reef, Cartier Island, Seringapatam Reef and Scott Reef (Heyward *et al.* 1997).
	• Pinnacles of the Bonaparte Basin KEF • Evans Shoal • Tassie Shoal • Blackwood Shoal

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Habitat/community	Location
Filter feeders/ heterotrophic	Filter-feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2007b). Filter feeders generally live in areas that have strong currents and hard substratum, and typically associated with the deeper habitats of the submerged shoals and banks, and canyon features.
	• Carbonate bank and terrace system of the Van Diemen Rise KEF • Pinnacles of the Bonaparte Basin KEF • Tributary Canyons of the Arafura Depression KEF • Evans Shoal • Tassie Shoal • Goodrich Bank
Nearshore	
Coral reef	Within the NMR corals occur both as reefs and in non-reef coral communities. Nearshore reefs include patch reefs and fringing reefs sparsely distributed within the region. Coral reefs within the NMR provide breeding and aggregation areas for many fish species, including mackerel and snapper, and offer refuges for sea snakes and apex predators such as sharks.
	• Submerged coral reefs of the Gulf of Carpentaria KEF • Darwin Harbour
Seagrass and macroalgae communities	Seagrasses provide key habitats in the NMR. They stabilise coastal sediments and trap and recycle nutrients. They provide nursery grounds for commercially harvested fish and prawns and provide feeding grounds for dugongs and green turtles. Seagrass distribution in the region is largely associated with sheltered small bays and inlets, including shallow waters surrounding inshore islands.
	• Field Island • The mainland coastline adjacent to Kakadu National Park
Filter feeders/ heterotrophic	Filter-feeder epifauna such as sponges, ascidians, soft corals and gorgonians are animals that feed by actively filtering suspended matter and food particles from water by passing the water over specialised filtration structures (DEWHA 2007b). Filter feeders generally inhabit areas that have strong currents and hard substratum.
	Cape Helveticus
Mangroves	Mangroves grow in intertidal mud and sand, with specially adapted aerial roots (pneumatophores) that provide for gas exchange during low tide (McClatchie *et al.* 2006). Mangroves provide habitat for waterbirds and support many commercially and recreationally important fish and crustacean species for parts of their life cycles. They buffer the coast from large tidal movements, storm surges and flooding.
	• Tiwi Islands • Darwin Harbour • The mainland coastline adjacent to the Daly River

5.2 Key benthic communities and habitats of the NWMR

The NWMR encompasses offshore and coastal waters, islands and mainland shoreline habitats typified by mangroves, tidal flats, saltmarshes, coral reefs (remote, offshore reef systems to extensive fringing reef systems such as Ningaloo), sandy beaches and smaller areas of rocky shores. Each of these habitat types has the potential to support different flora and fauna assemblages due to the different physical factors (such as waves, tides, light) influencing the habitat.

The NWMR has a large area of continental shelf and continental slope, with a range of bathymetric features such as canyons, plateaus, terraces, ridges, reefs, banks and shoals. The marine environment in this region is typified by tropical to subtropical marine ecosystems with diverse habitats from soft sediments, canyons, remote oceanic coral reef systems and continental shelf limestone pavement seabed habitat. The NWMR encompasses large seabed areas of deepwater seabed habitats dominated by soft sediments (sandy and muddy substrata with occasional patches of coarser sediments) and spare benthic biota.

Comprehensive surveys and documentation of habitats and biota from the shelf to deep waters (100 m to 1,000 m) spanning 13 sites between Barrow Island and Ashmore Reef, running downslope across the continental shelf and slope of NWS, were conducted in 2007 (Williams *et al.* 2010). Sites on the continental slope (about 400 m deep) predominantly comprised soft, muddy sediments, and epifauna were sparsely distributed and limited to isolated individual sessile biota such as crinoids, anemones, glass sponges and sea pens. Occasional non-sessile biota, characteristic of the deeper water benthic communities, were recorded and included echinoderms (urchins, holothurians and sea stars) and decapod crustaceans (prawns and crabs). Similar benthic biota composition was reported for the continental slope seabed habitats at depths of 700 to −1,000 m (Williams *et al.* 2010).

With reference to the NWS, surveys have documented habitats comprising bare unconsolidated carbonate sediments supporting a sparse assemblage of deposit and filter-feeding organisms, including glass sponges, urchins, sea cucumbers, sea stars and crustaceans (URS 2010). Filter-feeding communities documented within the NWS include bryozoans, sponges, gorgonians and hydroids attached to consolidated substrate; these were interspersed with sand, which hosted fewer filter feeders (Australian Institute of Marine Science (AIMS) 2014). Infauna associated with soft, unconsolidated sediment habitat such as polychaetes are widespread and well represented along the continental shelf and upper slopes (Brewer *et al.* 2007; RPS 2012). Table 5-1 summarises the key habitats and biological communities that are representative of the broader NWMR.

There is a marked biodiversity gradient from high ecologically valued coastal (primary producer habitats and associated benthic and mobile biota) to the lower valued deeper offshore habitats comprising soft, unconsolidated sediments and typically sparser biota (epifauna and infauna), except the submerged shoal features, remote oceanic reef systems of the Rowley Shoals, Scott Reef and Ashmore Reef, the submerged shoals of Glomar Shoal and Rankin Bank in the NWS, in addition to the fringing reef habitats of Ningaloo, the Kimberley coastline, the offshore island groups such as Barrow Island, Lowendal and Montebello Islands, and the Dampier Archipelago. The next subsections present a brief overview of the high valued biodiversity reef and mesophotic habitats and associated benthic communities.

Table 11-1 details the 13 KEFs within the NWMR ,as identified by the PMST (Appendix A). Table 12-4 describes protected areas of the NWMR.

5.2.1 Browse

The most diverse habitats and benthic communities in the Kimberley region of north-western Australia are where the oceanic reef systems of Ashmore, Cartier, Scott and Seringapatam reefs, and the Rowley Shoals, sit near the edge of the continental shelf hundreds of kilometres from the mainland and from each other (Gilmour *et al.* 2019; 2023); see Figure 5-1. The long-term monitoring program for Scott Reef and the Rowley Shoals conducted by AIMS since 1994 is now one of the world's longest studies of coral reef ecosystems. It provides unprecedented understanding of the background (baseline) changes at oceanic reefs on Australia's NWS, encompassing the physical drivers and the underlying processes of change (impact and recovery) from acute disturbances (cyclones, heat stress causing coral mass-bleaching).

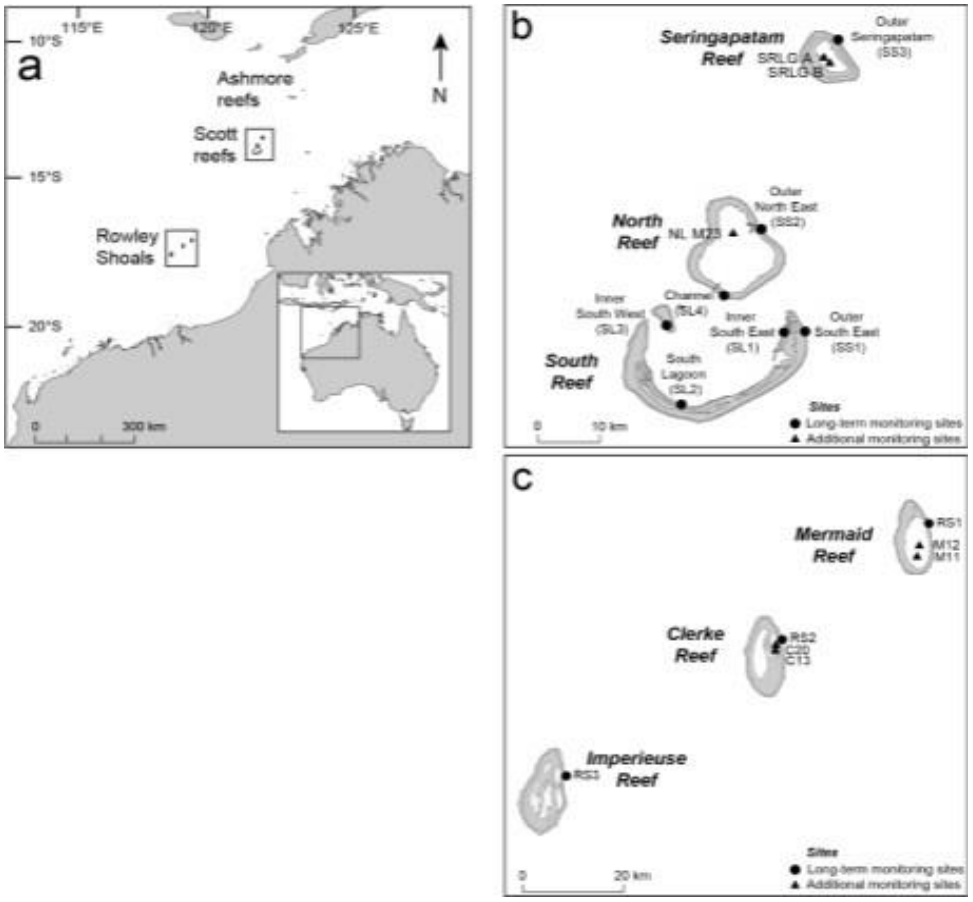

Figure 5-1: The position of Scott Reef, Ashmore Reef and the Rowley Shoals off north-western Australia and location of permanent long-term monitoring sites

Source: Gilmour et al. *(2023)*

5.2.1.1 Scott Reef

Scott Reef is an annular reef about 17 km long and 16 km wide comprising two coral reef atolls rising steeply from depths of around 400 to 500 m. These atolls, referred to as South Scott Reef and North Scott Reef, are separated by a deep channel (Figure 5-1). North Scott Reef features an emergent reef flat, outer slope habitats and a shallow lagoon about 20 m deep, with two small channels linking it to the surrounding ocean. The shallow closed waters of North Scott Reef lagoon contain a range of habitats, from bare sand, sand with coral outcrops, to shallow to deep lagoonal coral dominated habitats (Gilmour *et al.* 2013). This contrasts with the deeper, more open lagoon of South Scott Reef, described as an extensive, unique mesophotic (30 to 70 m depth) coral-dominated habitat comprising hard corals, calcareous algae, soft corals, sponges, bryozoans and other invertebrates (Gilmour *et al.* 2013; Heyward and Radford 2019). It is largely protected from the direct influence of major storms by the surrounding horseshoe-shaped emergent reef rim (Heyward and Radford 2019).

South Scott Reef shallow water habitats also include reef flats (of low coral cover) and extensive outer reef slopes with the highest hard coral diversity of any habitat at Scott Reef (Gilmour *et al.* 2013). Studies at Scott Reef have identified that two short and distinct periods of mass spawning occur during spring and autumn, unlike single mass spawning events at most other reefs around Australia (Gilmour *et al.* 2009a). The dominant coral spawning period at Scott Reef is autumn (March/April), with a secondary, lesser spawning event in spring (October/November). Corals at Scott Reef that are brooders are likely to have multiple gametogenic cycles and spawn several times throughout the year (Gilmour *et al.* 2008; Gilmour *et al.* 2009a).

Over the past 30 years, the coral communities at Scott Reef have been extensively studied and the long-term monitoring program showed that from 1994 to 2021, the mean cover of hard and soft corals on the reef slopes was 36% and ranged between 13% and 59%. Decreases in coral cover were caused by damaging waves, generated by storms and cyclones, and recurrent heat stress causing coral bleaching. The

most severe heat stress and mass coral bleaching occurred in 1998 and 2016 (Gilmour *et al.* 2023). In 1998 a mass-bleaching event caused coral cover at Scott Reef to collapse from about 60% to 6%, representing one of the most severe disturbance events recorded for the system (Birt *et al.* 2025). Recovery took over a decade. By 2010, coral cover had reached pre-bleaching levels (45%). Despite moderate coral bleaching and cyclone disturbances, cover increased to 49% in January 2016, after which the reefs were impacted by a second mass bleaching event that reduced mean coral cover to 15%. Five years after the 2016 mass bleaching event, total cover of hard and soft corals had reached 34%, showing a similar rate of recovery to that after the 1998 mass bleaching (Gilmour *et al.* 2023). Long-term monitoring of reef fish demonstrated the 1998 coral collapse caused strong shifts in fish trophic structure, including marked declines in several species' groups. Although fish assemblages changed substantially after disturbance, they showed resilience and eventual recovery over time. Functional responses were complex, with functional originality at Scott Reef generally increasing as *Acropora* coral cover declined (Birt *et al.* 2025).

Scott Reef supports five species of seagrass: *Thalassia hemprichii, Thalassodendron ciliatum, Cymodocea rotundata, Halophila ovalis* and *H. decipiens* (URS 2006). These species occur widely throughout the Indo-Pacific region. *Thalassia hemprichii* is the most abundant seagrass at Scott Reef (Skewes *et al.* 1999; URS 2006). Skewes *et al.* (1999) reported the dominance of *T. hemprichii*, along with less common *H. ovalis* at South Scott Reef and *T. hemprichii* and *H. ovalis* as co-dominants, with minor *T. ciliatum* at North Scott Reef, all occurring on the reef edge, lagoon edge and shallow lagoon. Seagrasses recorded in less than 15 m depth covered a total of 23 ha out of 10,613 ha (0.22%) at North Scott Reef, and 77 ha out of 14,400 ha (0.54%) at South Scott Reef.

A total of 121 species of algae have been reported from Scott Reef. However, there is likely to be smaller, cryptic species not yet recorded (Western Australian Museum 2009) (SKM 2007). Surveys of macroalgae in 2006 found algal cover to be about 5 to 10% in shallow and intertidal areas, but highly variable, with some areas approaching 100% cover (Western Australian Museum 2009). Higher-energy reef fronts typically supported encrusting coralline *Hydrolithon onkodes* near the reef crest, characteristic of Indo-Pacific reefs. Other reef-front species were associated with dark recesses, including *Peyssonnelia inamoena* and *Corynocystis prostrata*. *Halimeda* species were common across reef flats, outcrops and sandy pools. The turf green algae *Boodlea vanbosseae* and spongy green *Boodlea composita* were commonly present on outcrops, along with red algae *Polysiphonia* spp., *Coelothrix irregularis* and *Gelidiopsis* spp. Dense monospecific stands of algae were observed, most commonly *Ulva* spp. In shallow sandy habitats, as well as *Polysiphonia* spp. at North Scott Reef and *Coelothrix irregularis* at South Scott Reef. An additional survey of deepwater habitats in the Scott Reef lagoons (URS 2007b) identified areas where *Halimeda* occurred in clumps many metres in diameter and was the dominant component of the community. Such densities of *Halimeda* are not considered unique in the region, with similar densities observed at Mermaid, Scott and Seringapatam reefs (Western Australian Museum 2009).

5.2.1.2 Rowley Shoals

The Rowley Shoals comprise three distinct reef continental shelf atolls of similar dimension, shape and orientation, named Mermaid Reef, Clerke Reef and Imperieuse Reef. The reefs are orientated north-south and are about 30 to 40 km apart. Each atoll covers an area about 80 to 90 km² and extends almost vertically from seafloor depths of around 400 m. Each atoll comprises extensive lagoon habitat composed of bare sand, coral-dominated patches and coral outcrops, emergent reef crests and outer reef slopes. At high tide only the sandy cays of Clerke Reef and Imperieuse Reef remain visible.

Across the Rowley Shoals, the reef crest and reef slope were most similar and the lagoon most unique in terms of habitat and benthic communities. Hard corals and coralline algae were the most abundant biota (>40%) and other benthic organisms such as sponges, ascidians and macroalgae are rare (<5%). Soft corals were also rare (<1%) at all reefs and habitats, apart from the reef slope (4%) at Mermaid Reef. Across all surveys (1995 to 2019), the mean cover of hard and soft corals at the reef slope was 46% and ranged between 26% and 58%. Decreases in coral cover were primarily due to frequent storms and cyclones. Between 2005 and 2008, three cyclones and moderate heat stress caused a mean reduction in coral cover (52% to 42%) at the reef slope habitat across the Rowley Shoals. Coral bleaching was low (<10%) in January 2016, except for minor to moderate (11 to 30%) bleaching at two lagoon sites at Mermaid Reef. A prolonged heat stress period (45 days) in May 2020 caused the worst coral bleaching on record (about 20%) across reef habitats, with the highest heat stress and declines in coral cover at the reef slope for Imperieuse Reef (9%) and minor bleaching and small decreases in coral cover at the reef slope (5%) and lagoon (3%) at Clerke Reef (Gilmour *et al.* 2023). Keesing *et al.* (2025) surveyed coral reef communities at Mermaid Reef in July 2022. This survey also compared data from studies in previous and subsequent years and quantified the benthic coverage of coral, invertebrates, algae and sponge. The survey demonstrated densities of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

invertebrates, including sea cucumbers, coral communities and giant clams, remained consistent with previous surveys, with mean hard coral cover being highest (40-50%) on the exposed western outer reef slope and lowest on the reef flat (<10%). *Acropora* was the most abundant coral genus and was significantly greater on the exposed outer western slope. Turf algae on reef surfaces were an important element of the benthic cover (25 to 60%) but lowest in the shallow lagoon. Macroalgae accounted for >1% of benthic cover on the reef flat, while soft corals comprised about 2 to 3% of cover on the back reef outer slope. Sponges were also a minor part of the benthic cover (mostly <0.5%) (Keesing *et al.* 2025).

Sparsely-distributed seagrass communities are also within the Rowley Shoals. *Thalassia hemprichii* has been recorded at both Mermaid and Clerke reefs and *Thalassodendron ciliatum* and *Halophila ovalis* have been recorded at Mermaid Reef (Berry 1986; Walker and Prince 1987), primarily within the lagoon.

The reefs of Seringapatam, Scott Reef, Ashmore Reef and Cartier Island are recognised as KEFs within the NWMR; see Section 11. Protected area status is in Section 12 and includes the AMPs of Ashmore Reef, Cartier Island, Kimberley and Mermaid Reef, and the State marine parks of the North Kimberley, the Rowley Shoals, Lalang-garram horizontal falls and North Lalang-garram.

5.2.2 North West Shelf

The NWS contains numerous benthic habitats and biological communities, both nearshore and offshore, important in supporting biodiversity across the region.

The nearshore NWS environment contains the Dampier Archipelago, a complex coastal ecosystem. Extensive surveys have demonstrated its high biodiversity values comprising of coral, macroalgae, seagrass and benthic communities across the intertidal and subtidal environments.

Offshore, the NWS comprises various submerged shoal features of high biodiversity value, which support hard coral and macro-algae communities on upper reaches of the shoals and mesophotic filter-feeding benthic communities in deeper waters on and near the shoal features, namely Glomar Shoal and Rankin Bank.

5.2.2.1 Dampier Archipelago

The Dampier Archipelago, on the Pilbara coast of WA, comprises a complex of offshore islands, intertidal and subtidal reefs, embayments and coastal waters on the NWS. The region supports a highly diverse marine environment shaped by strong tidal processes, seasonal monsoonal influences, cyclones, and variability associated with El Niño southern oscillation and the Leeuwin Current system.

Coral communities of the Dampier Archipelago predominantly occur as narrow linear features fringing the shorelines of islands and the Burrup Peninsula, typically between 2 m and 10 m mean lower low water (Blakeway and Radford 2005; Jones 2004). The fringing reefs are not true coral reefs; they establish and grow on existing hard substratum (Jones 2004; WorleyParsons 2009). Both zooxanthellate and azooxanthellate corals are found throughout the Dampier Archipelago, including a total of 229 species from 57 hermatypic coral genera (Woodside 2006; Griffith 2004), representing a large proportion of the 318 hermatypic species from 70 genera known to occur in WA (URS 2004). Studies have indicated the coral assemblage distribution in Mermaid Sound is largely driven by turbidity, wave exposure and tidal currents, with inner Mermaid Sound exhibiting more sediment-tolerant species (Blakeway and Radford 2005; CALM 1994). A baseline assessment of the status of coral communities within Mermaid Sound was completed in May 2019 (MScience 2019). Coral cover measured in this survey was very similar to historic cover levels, ranging from 5.7% to 56.7%.

The ecology, particularly reproductive, of corals in the Dampier Archipelago has been extensively studied (Simpson 1985a; Simpson 1985b; Simpson 1988; Heyward *et al.* 2000; Baird *et al.* 2011). Most of the major coral species are broadcast spawners and have their major peak of reproductive activity in autumn between March and April, about seven to ten nights after the full moon, but there is also some participation in a spring spawning (Gilmour *et al.* 2017). Periods of reproduction through these seasons may be more protracted than on the northern reefs, and species common to the Pilbara display distinct cycles of reproduction (Gilmour *et al.* 2017).

Seagrasses in the Dampier Archipelago are generally sparse, occurring in low abundance on shallow sandy sediments in sheltered areas and interspersed with other benthic communities and habitats (CALM 2005b; Jones 2004; MScience 2014). Surveys and studies (McMahon *et al.* 2017; Woodside 2006) of the region have identified nine species; however, *Halophila* is the predominant genus and is typically restricted to the 6 m (chart datum) depth contour (MScience 2014).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The most significant areas of seagrass in the Dampier Archipelago are found between Keast and Legendre islands to the north of the Burrup Peninsula, and between West Intercourse Island and Cape Preston. Recorded occurrences of *Halophila* spp. In the Dampier Archipelago fluctuate, depending on factors such as salinity, success of seed set and colonisation, temperature, and grazing by dugongs (Woodside 2006). Furthermore, this fluctuation may indicate the presence of transitory communities, which are annual meadows that develop from the seed bank, grow flower, set seed and die back each year (McMahon *et al.* 2017). The species composition and temporal patterns of abundance and distribution of seagrasses in northwest Australia are highly dynamic and highly variable, often seasonal, dying off over certain periods of the year then re-establishing (Vanderkliff *et al.* 2017).

Macroalgal assemblages in the Pilbara region display an ephemeral growth pattern and may not be present year-round, despite the presence of suitable habitat. Large algal habitats occur around West Intercourse Island and shallow reef flats on the western and eastern margins of Mermaid Sound. In nearshore areas, macroalgae are mostly found on shallow limestone pavements located on the northern and western portions of West Intercourse, West Lewis and Malus islands. More broadly, large expanses of macroalgae are prevalent along the seaward side of West Intercourse Island, extending south-west along the coast to Cape Preston and beyond. The most abundant group of algae in the region is brown algae; particularly, species from the genera *Sargassum, Dictyopteris* and *Padina* are very common (Woodside 2006). The most common species of green algae in the Dampier Archipelago include *Caulerpa* and calcareous *Halimeda* (CALM 2005b; Jones 2004). Various red algae are also found in the Dampier Archipelago, including corallines, calcified red algae and algal turf (Jones 2004).

The Pilbara region has a very high diversity of marine sponges (Fromont *et al.* 2016). Fromont (2003) recorded 275 sponge species within the Dampier Archipelago. About 20% of these species are known to be limited to WA and are likely to be endemic (Fromont 2003). Surveys conducted by Fromont (2004) found the highest diversity of sponges in the Dampier Archipelago occurred in sponge communities that were either low relief or pavement habitats, often with a sediment layer with strong tidal currents. High-diversity sponge communities have been observed at the eastern end of Flying Foam Passage, at the western end of Mermaid Strait, and between Enderby and West Lewis islands (Fromont 2004; Jones 2004). Generally, the high habitat complexity of the Dampier Archipelago corresponds with high sponge species richness, contributing to the high biodiversity value of the nearshore environment of the Pilbara region (Fromont 2016).

5.2.2.2 Glomar Shoal

Glomar Shoal is a large (215 km²) and complex bathymetrical feature on the outer continental shelf off the Pilbara coast. Glomar Shoal is about 8.5 times wider than Rankin Bank at the 60 m contour. Glomar Shoal rises from 80 m depth on its south-west side and 70 m depth on its north-eastern side to form a single plateau at 40 m depth (Abdul Waheb *et al.* 2018). Together with Rankin Bank, these remote shallow water areas represent regionally unique habitats and are considered likely to play an important role in the productivity of the Pilbara region (AIMS 2014; Abdul Wahab *et al.* 2018) (Figure 5-1).

Baseline biodiversity and habitat mapping surveys of the benthic habitats and communities at Glomar Shoal and Rankin Bank were undertaken in 2013 and 2017 by AIMS (2014), as detailed in Abdul Waheb *et al.* (2018) and Jones *et al.* (2021), respectively. Salinity and temperature were found to be slightly higher in 2017 compared with the 2013 values (Abdul Wahab *et al.* 2018), most likely due to seasonality. Substrates at Glomar Shoal were found to vary with depth, from coarse unconsolidated sediment at depths greater than 60 m and hard substrate (as in, consolidate reef) supporting benthic communities comprising hard and soft corals, sponges and macroalgae at depths <40 m (Abdul Wahab *et al.* 2018). Total cover of benthic taxa (hard coral, soft coral, sponges and other benthic biota) was highest at depths <40 m and decreased with depth (Abdul Wahab *et al.* 2018). At depths of 60 to 80 m, benthic cover was low (about 2%) and at depths greater than 80 m, benthic cover was barely present (Abdul Wahab *et al.* 2018).

A total of 170 fish species were identified at Glomar Shoal and fish abundance and diversity of the demersal fish communities of Glomar Shoal were found to vary with seabed habitat type; sand, hard coral and sponge coverage influenced fish communities, with higher abundance and diversity of fish associated with shallow hard coral habitats (Abdul Wahab *et al.* 2018). In general, the fish abundance and diversity of Glomar Shoal are considered comparable with other reefs and the submerged shoals and banks in the region, although less diverse and abundant than fish assemblages at Rankin Bank (Abdul Wahab *et al.* 2018).

Glomar Shoal is recognised as a KEF within NWMR; see Table 11-1. Protected area status is described in Section 12 and includes the Commonwealth Marine Park of Montebello, the State marine parks of Montebello Islands and Barrow Island, and the Barrow Island marine management area.

5.2.2.3 Rankin Bank

Rankin Bank comprises three main sedimentary banks rising steeply from between 80 and 120 m below sea level, reaching 20 to 40 m below the sea surface and featuring plateaus and troughs (Abdul Wahab *et al.* 2018). Rankin Bank is one of only two large, complex bathymetrical features on the outer western shelf of the West Pilbara (the other being Glomar Shoal, about 125 km west-southwest) (Abdul Waheb *et al.* 2018) (Figure 5-1).

Surveys of Rankin Bank were undertaken by AIMS in 2013 and in 2017 to better understand the habitats and complexity of the submerged shoal ecosystems, and associated fish assemblages (AIMS 2014; Abdul Waheb *et al.* 2018 and 2017; Jones *et al.* 2021). The surveys were undertaken using various methods, including multibeam survey, towed video, stereo baited underwater video survey and beam transmissions (to measure turbidity), at depths between 20 and 115 m (Abdul Waheb *et al.* 2018). Water column data were also collected in January 2017 to examine potential temporal variation in these parameters (Abdul Waheb *et al.* 2018).

Seabed sediments at Rankin Bank were primarily carbonate with a grain size of mostly sand, with finer muds found at the deeper sample sites (AIMS 2014). Sand was also found to increase with depth and unconsolidated reef exceeded 30% at all depths (Abdul Waheb *et al.* 2018). Hydrocarbon and trace metal concentrations in sediments indicated the bank was unaffected by anthropogenic pollution (AIMS 2014). Turbidity was lower at Rankin Bank than Glomar Shoal during the survey, with beam transmissions remaining above 95% at all depths (Abdul Waheb *et al.* 2018). Turbidity was slightly lower in 2017, whereas temperature and salinity were slightly higher at all depths (Abdul Waheb *et al.* 2018).

The proportion of cover by benthic taxa was highest for macroalgae and hard corals, particularly at depths less than 40 m, and decreased with increasing depth. Other benthic taxa included soft corals and sponges, which were present in lower proportions at all depths. Encrusting corals were common, reaching cover of about 12.5% at depths less than 40 m. Solitary corals were also present (about 10% cover) primarily at depths between 40 and 60 m. Foliose and submassive/columnar corals were also present (Abdul Waheb *et al.* 2018).

Fish abundance and diversity at Rankin Bank were found to be comparable with other reefs in north-west Australia, and notably twice as abundant and 1.5 times more diverse than those fishes identified in a comparable survey at Glomar Shoal (Abdul Waheb *et al.* 2018). A total of 205 fish species were recorded at Rankin Bank, 100 of which were common to both Glomar Shoal and Rankin Bank. Depth, location, sand, sponges and hard coral were all found to contribute to the fish communities present. Specifically, fish communities were primarily associated with hard coral and shallow depths at Rankin Bank (Abdul Waheb *et al.* 2018).

5.2.3 North West Cape

The North West Cape contains highly diverse benthic habitats and biological communities, both nearshore and offshore, important in supporting biodiversity across the North West Cape region. The benthic habitats of Exmouth Gulf, Ningaloo Reef and Muiron Islands are ecologically significant, supporting high biodiversity and important habitats for a range of marine species.

The Exmouth Gulf supports diverse benthic habitats, including seagrass meadows, cyanobacterial mats, coral communities and filter-feeding assemblages, which contribute to primary productivity, nutrient cycling and provide habitat for species of ecological and conservation significance. Ningaloo Reef and the Muiron Islands are characterised by extensive coral and algal reef communities that underpin the region's internationally recognised biodiversity values, supporting diverse marine life and important ecological connectivity across the broader North West Cape region. The next subsections describe benthic communities and habitats for the North West Cape.

5.2.3.1 Exmouth Gulf

The Exmouth Gulf supports highly diverse subtidal and intertidal habitats, including cyanobacterial mats, seagrass meadows, mangroves, coral communities and salt flats. Spanning land and sea, within and beyond Exmouth Gulf, the habitats support nutrient flows and species connectivity, while groundwater and seawater interact to regulate the unique karst system and subterranean fauna of Cape Range (Western Australian Marine Science Institution (WAMSI) 2025).

Subtidal benthic habitats within the Exmouth Gulf are dominated by a combination of unvegetated sediments (about 60.5% of benthos), filter-feeding communities (about 24%), seagrass meadows (about 8.1%) and coral reef habitats (about 1.9%) (WAMSI 2025). Cyanobacterial mats are a particularly important benthic component. These mats contribute to primary production and nitrogen fixation within the coastal system, with estimates indicating they contribute up to about 15% of total primary production in the Gulf, supporting higher trophic levels, including fish and elasmobranchs (WAMSI 2025).

Seagrass meadows occur in shallow subtidal waters, particularly along the eastern margins of the Gulf, where they provide essential nursery and foraging habitat for commercially important prawn species, dugongs and marine turtles, while also stabilising sediments and contributing to carbon cycling. Seagrass cover and extent vary seasonally, with the highest densities recorded in summer and the lowest spatial extent recorded in winter. A study conducted in the eastern Gulf between 2013 and 2015 found that seagrass area coverage more than doubled in summer compared to the coverage recorded in winter (WAMSI 2025). This seasonal shift can be attributed to lower turbidity in the Gulf in summer allowing increased sunlight into the water column, which facilitates seagrass expansion before declining in winter due to increased turbidity and cooler water (Evans *et al.* 2025).

Coral reefs of the Gulf occupy a relatively small proportion but support a disproportionately high biodiversity, and are particularly important around the Muiron Islands, Bundegi and offshore islands (WAMSI 2025). Many reefs within Exmouth Gulf are considered marginal or turbid systems, yet they demonstrate complex responses to environmental stressors and contribute to regional connectivity with Ningaloo Reef and the wider Pilbara (WAMSI 2025).

Habitats of the Exmouth Gulf support a high diversity of fauna, including fauna of ecological and conservation importance, such as sawfish, sea snakes, dugongs, marine turtles, humpback whales and migratory birds (WAMSI 2025). Further, the benthic environment of the Gulf supports a diverse and ecologically distinct assemblage of sessile benthic marine invertebrates, particularly within shallow waters (<30 m depth) (Richards *et al.* 2025). A comprehensive review of museum specimens, verified photographic records and biodiversity databases identified at least 295 species of sessile benthic invertebrates from Exmouth Gulf, representing a substantial component of the North West Cape regional biodiversity. Notably, 165 of these species are restricted to Exmouth Gulf and have not been recorded within the neighbouring habitats of Ningaloo Reef or the Muiron Islands. A distinctive community of filter-feeding and habitat-forming invertebrates, including more than 125 sponge species, 27 tunicate species and 18 anemone species, have also been identified in the Gulf and found to be absent from neighbouring areas. All three sea pen species recorded within the broader study area occur exclusively within Exmouth Gulf (Richards *et al.* 2025). The distinctive communities highlight the Gulf as a centre of unique benthic diversity, shaped by turbid, low light and dynamic environmental conditions (Richards *et al.* 2025).

5.2.3.2 Ningaloo Reef and Muiron Islands

Ningaloo Reef is one of Australia's iconic marine areas. The significance of this ecosystem is recognised through the reef's inclusion in State and Commonwealth marine parks and the World Heritage Register. Ningaloo Reef is the only example in the world of an extensive fringing reef on the west coast of a continent. It is one of the longest (about 300 km) and most pristine fringing reefs in the world, with an unusually narrow continental shelf. Deep oceanic waters, the reef and coastline habitats and benthic communities are close, resulting in a huge array of internationally significant marine life coexisting. More than 200 hard coral, 500 fish, 650 mollusc, 600 crustacean, 1,000 marine algae, 155 sponge and 25 echinoderm species have been recorded from the shelf, slope and deepwater habitats[2]. Refer to the CSIRO Ningaloo Outlook program for more information and publications relating to the shallow and deepwater reef systems, and megafauna species (marine turtles and whale sharks)[3].

The extensive reef system has been classified by topography and benthic cover using airborne hyperspectral surveys; much of the area was allocated as shallow, flat lagoons intersected by narrow, deeper channels that facilitate water circulation. Some of the geomorphic/benthic classes of coral-algae mosaics in different topographic settings are presented below (Kobryn *et al.* 2022):

- coral and algal communities – reef flat and very shallow areas
- coral and algal communities – backreef and shallow forereef
- coral and algal communities – deep forereef and other deep areas
- sand or limestone pavement – lagoonal slopes and flat lagoon areas.

Ningaloo Reef, and the Muiron Islands, at the northern tip of the Ningaloo Reef, contain fringing reef habitat that supports benthic communities dominated by algae and consolidated reef in the shallow reef environment. Surveys by AIMS in 2024 documented hard coral cover averaged about 13% across the Ningaloo Marine Park area (Miller *et al.* 2015). A notable pattern in the benthos recorded by Miller *et al.* (2015) was an increase in coral cover with latitude, with the highest coral cover recorded around Coral Bay and the reef areas in southern Ningaloo. Coral cover was the lowest at the East Ningaloo Province (northern Exmouth Gulf) (<6%). Relative to Scott Reef and the Rowley Shoals (Section 5.2.1), the Ningaloo benthic communities are distinct in that they are characterised by high biotic cover overall, but dominated by algal cover and with less than half the cover of key biota including hard corals, soft corals and sponges as recorded on offshore reefs (Miller *et al.* 2015).

Ningaloo Reef is vulnerable to storm damage and marine heat stress events, which have resulted in past localised coral damage and moderate coral bleaching. Coral bleaching occurred in 2022 due to warm ocean temperatures driven by the 2021–22 La Niña. The region's last severe marine heatwave was driven by the 2010–11 La Niña, which resulted in bleaching being recorded for the first time on Ningaloo[4]. Also of note are recurrent deoxygenation events at Bills Bay (Coral Bay) after coral spawning events. Last occurring in March 2022, deoxygenation was triggered by a combination of weather and oceanographic conditions that led to prolonged trapping of coral spawn in Bills Bay, which in turn caused mass coral mortality and a large but localised fish kill. The 2022 deoxygenation event was the seventh such event recorded in documented history (Richards *et al.* 2024).

Commonwealth waters adjacent to Ningaloo Reef are recognised as a KEF within the NWMR (Table 11-1).

5.2.4 Shark Bay

Shark Bay is the most westerly point of Australia and represents a transition zone between temperate and tropical marine fauna, resulting in high species diversity (Miller *et al.* 2015), including fringing coral communities on the leeside of the barrier islands of Dirk Hartog, Bernier and Dorre. The region is renowned for its terrestrial and marine biodiversity, including seagrass cover.

Seagrass in Shark Bay extends over 4,000 km² of the bay and the 1,030 km² Wooramel Seagrass Bank, which is the largest structure of its type in the world. Benthic communities in relatively sheltered areas of outer Shark Bay are characterised by seagrass and turf algae, whereas in more exposed locations, benthos is dominated by macroalgal and turf algal communities (AIMS 2014). Towards the outer Bay area, seagrass is less abundant. Baseline surveys by AIMS in 2014, targeting the outer Shark Bay area and the habitats and

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

benthic communities surrounding the barrier islands of Dirk Hartog, Bernier and Dorre, found sand was a dominant feature of the benthos (>60%), particularly in areas inside the Bay and in deep water.

Corals and sponges made up <1% of the cover in outer Shark Bay, although due to inclement weather during surveys, shallow areas where coral species are more likely to occur could not be assessed (AIMS 2014). Observations of patchy but high coral cover in shallow parts of some towed video transects suggest coral cover across outer Shark Bay may have been underestimated. The highest coral cover was recorded in the channel between Dirk Hartog and Dorre islands, indicating this area may be particularly favourable for coral growth (Miller *et al.* 2015).

Marine heatwaves and other extreme climatic events are causing widespread mortality of habitat-forming species and driving significant ecological change globally, including the loss of seagrass. As marine heatwaves become more frequent and intense, the long-term resilience of these critical habitats becomes increasingly uncertain. In Shark Bay, fragmentation after a 2010–11 heatwave was found to coincide with extensive seagrass loss, indicating the loss was strongly influenced by heat-stress exposure and water depth (Taylor *et al.* 2025).

After the 2011 marine heatwave, a study assessed the changes in seagrass meadows within Monkey Mia and Shark Bay. The study used long-term *in situ* monitoring with satellite-derived habitat classification and revealed a significant loss of seagrass habitat and density (about 1,382 ha) had occurred six years after the 2011 heatwave event. While some was recorded by 2020, the dense seagrass coverage remained lower than levels recorded in 2010. Fragmentation of seagrass had increased dramatically between 2010 and 2013, with seagrass loss most evident on the edges of continuous meadows and near deep channels. Losses were mostly comprised of seagrass *Amphibolis antarctica*. *Posidonia australis* coverage remained stable initially, before a decline was observed in 2016. Despite this, recovery of overall seagrass coverage was observed in 2020, with a higher proportion of sparse meadows indicating recovery (Strydom *et al.* 2026).

Further analysis of marine heatwaves in Shark Bay has highlighted the strong influence bathymetry and geomorphology have on heat stress patterns. Hu *et al.* (2025) observed that the shallow in-bay zones of Shark Bay experience frequent short heatwave events and deeper offshore areas are subject to less frequent, intense heatwaves that are driven by El Niño southern oscillation-modulated warm-water advection. Spatial variability in thermal regimes likely intensified the 2010–11 marine heatwave impacts, as low thermal inertia in shallow seagrass meadows and restricted hydrodynamic exchange amplified thermal stress, contributing to heightened mortality and canopy fragmentation (Hu *et al.* 2025).

6. FISHES, SHARKS AND RAYS

6.1 Regional context

WA waters provide important habitat for listed fishes, sharks and rays, including areas that support key life stages such as breeding and foraging, and migration routes for fish species. Pelagic and demersal fishes occupy a range of habitats throughout each region, from coral reefs to open offshore waters, and are an extremely important component of ecosystems, providing a link between primary production and higher predators, with many species being of conservation value and important for commercial and recreational fishing.

Table 6-1 describes the fish assemblages of each marine bioregion.

Table 6-1: Description of the fish assemblages of the marine bioregions

Marine bioregion	Overview
North-west	The NWMR supports a wide diversity of global fish species. The region is characterised by the highest level of endemism and species diversity compared with other areas of the Australian continental slope. Last *et al.* (2005) recorded 1,431 fish species from the three bioregions encompassing the continental slope, while also acknowledging some information gaps. Of the abut 500 shark species found worldwide, 94 are found in the region (DEWHA 2008a). About 54 species of syngnathids (seahorses, seadragons, pipehorses and pipefishes) and one species of solenostomids (ghostpipefishes) are also known to occur in the NWMR or adjacent State waters (DSEWPaC 2012a). The PMST report (Appendix A) identified a total of 17 EPBC Act listed threatened or migratory shark and ray species within the NWMR (Table 6-2). An additional 53 EPBC Act listed marine fish species, including a variety of pipefish, sea dragons and ghost pipefish (Syngnathidae and Solenostomidae), that do not have a threatened or migratory status were recorded within the NWMR. Appendix A provides a full list of the species identified in the PMST report.
South-west	The fish fauna of the SWMR are highly diverse, with hundreds of species occupying a large variety of habitats, including high biodiversity of tropical and temperate fish species found at Houtman Abrolhos due to the Leeuwin Current, nutrient upwelling events attracting large aggregations of small pelagic fish and predatory fish such as tuna, billfish and sharks, and migratory fish such as herring, garfish, tailor and Australian salmon visiting the west-coast inshore lagoons seasonally. The demersal slope and associated fish communities of the Central Western Province are important habitats for demersal communities with high diversity and endemism. Depths below 400 m are dominated by small benthic species such as grenadiers, dogfish and cucumber fish. Only three species of bony fishes known to occur in the region are listed under the EPBC Act as threatened or marine species, and six listed species of shark (DSEWPaC 2012b). The PMST report (Appendix A) identified a total of nine EPBC Act listed threatened or migratory fish and shark species within the SWMR. An additional 36 EPBC Act listed marine fish species. including a variety of pipefish, sea dragons and ghost pipefish (Syngnathidae and Solenostomidae), that do not have a threatened or migratory status were recorded within the SWMR. Appendix A provides a full list of the species identified in the PMST report.
North	The NMR is considered an important area for sawfish and river shark species, with three species of sawfishes and two species of river sharks listed under the EPBC Act known to occur in the region. Relatively little is known about the distribution and abundance of sawfish and river sharks in the NMR. However, the NMR is crucial for supporting nationally and globally significant populations of sawfish and river shark species found nowhere else in the world. A vast array of seahorse and pipefish species are found in the area, but there is little knowledge about the distribution, relative abundance and habitats of these species in the region. Higher-order fish predators of coral and rock reef habitats include snapper, emperor and grouper. The Gulf of Carpentaria basin supports assemblages of pelagic species, including planktivorous and schooling fish, with top predators such as shark, snapper, tuna and mackerel (DSEWPaC 2012c). The PMST report (Appendix A) identified a total of 15 EPBC Act listed threatened or migratory shark and ray species within the NMR. An additional 45 EPBC Act listed marine fish species, including a variety of pipefish, sea dragons and ghost pipefish (Syngnathidae and Solenostomidae), that do not have a threatened or migratory status were recorded within the NMR. Appendix A provides a full list of the species identified in the PMST report.

6.2 Fish, shark and rays in the NWMR

The NWMR contains a diverse range of fishes of tropical Indo-west Pacific affinity (Allen *et al.* 1988). The region is characterised by the highest level of endemism and species diversity compared with other areas of the Australian continental slope. Last *et al.* (2005) recorded 1,431 species from the three bioregions encompassing the continental slope, while also acknowledging some information gaps.

The NWMR is known for its demersal slope fish assemblages; the continental slope of the Timor Province and the Northwest Transition support more than 418 and 505 species of demersal fishes, respectively, of which 64 are considered to be endemic. This is the second richest area for demersal fish species across the entire Australian continental slope. Conversely, the broad Southern Province, which covers most of southern Australia, supports 463 species, with only 26 possibly being endemic. The continental slope demersal fish assemblages of the NWMR have been identified as a KEF (DEWHA 2008a), as described in Section 11. The Browse, NWS/Scarborough and the North West Cape activity areas overlap the continental slope demersal fish communities KEF. The continental slope between North West Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last *et al.* 2005).

The ancient coastline at 125 m depth contour KEF within the NWMR is thought to support enhanced diversity. Drivers of fish species richness, biodiversity and assemblage composition have been assessed, finding that depth, seafloor complexity and habitat type explain richness and abundance of fish assemblages (Currey-Randall *et al.* 2021). This study also found fish communities along the ancient coastline at 125 m depth contour KEF are similar to other mesophotic areas on the NWS. Most of the surveyed feature was characterised by soft sediment and highly mobile fish species (Currey-Randall *et al.* 2021).

The NWMR also features a diversity of pelagic fishes (those living in the pelagic zone) and bentho-pelagic fishes, including tuna, billfish, bramids, lutjanids, serranids and some sharks (DEWHA 2007a). These species feed on salps and jellyfish, and more often on secondary consumers such as squid and bait fish. Water depth provides an indication of the level of interaction between pelagic and benthic communities within the NWMR; in waters deeper than 1,000 m, for instance, the trophic system is pelagically-driven and benthic communities rely on particulates that fall to the seafloor (DEWHA 2007a).

Pelagic fishes play an important ecological role within the NWMR; small pelagic fishes, such as lantern fish, inhabit a range of marine environments, including inshore and continental shelf waters, and form a vital link in and between many of the region's trophic systems, feeding on pelagic phytoplankton and zooplankton and providing a food source for a wide variety of predators, including large pelagic fishes, sharks, seabirds and marine mammals (Bulman 2006; Mackie *et al.* 2007). Large pelagic fishes, such as tuna, mackerel, swordfish, sailfish and marlin, are found mainly in oceanic waters and occasionally on the continental shelf (Brewer *et al.* 2007). Both juvenile and adult phases of the large pelagic species are highly mobile and have a wide geographic distribution, although the juveniles more frequently inhabit warmer or coastal waters (DEWHA 2008a).

Table 6-2 outlines the threatened and migratory fish species that may occur, are likely to occur or are known to occur within the NWMR, with their conservation status and relevant recovery plans and conservation advice, while the next subsections focus on the fish species (including sharks and rays) listed as threatened or migratory that are known to occur within the NWMR. Section 13.2.1 provides a detailed account of commercial and recreational fisheries that operate in the region.

6.2.1 Fish

The PMST report identified 53 Syngnathidae and Solenostomidae EPBC Act listed marine species within the NWMR. Table 6-3 describes the Syngnathidae and Solenostomidae families.

Table 6-3: Information about the EPBC Act listed threatened fish species that may, likely or are known to occur within the NWMR

Family	Preferred habitat and diet	Habitat location
Syngnathidae and Solenostomidae	The family Syngnathidae is a group of bony fishes that includes seahorses, pipefishes, pipehorses and seadragons. Along with syngnathids, members of the related Solenostomidae family (ghost pipefishes) are also found in the NWMR (DSEWPaC 2012a). Syngnathids live in nearshore and inner shelf habitats, usually in shallow coastal waters, among seagrasses, mangroves, coral reefs, macroalgae-dominated reefs, and sand or rubble habitats (Dawson 1985; Lourie *et al.* 1999; Lourie *et al.* 2004; Vincent 1996). Two listed marine species, the winged seahorse (*Hippocampus alatus*) and western pipehorse (*Solegnathus sp. 2*) have been identified in deeper waters of the NWMR (up to 200 m) (DSEWPaC 2012a). However, these species were not identified by the PMST for the NWMR.	Knowledge about the distribution, abundance and ecology of both syngnathids and solenostomids in the NWMR is limited. No BIAs for syngnathids and solenostomids have been identified in the NWMR.

6.2.2 Sharks and sawfishes

Table 6-4 details the shark, river shark and sawfish species that may, likely or are known to occur within the NWMR.

BIAs are identified within the NWMR for the whale shark, freshwater sawfish, green sawfish and dwarf sawfish. See Table 6-6.

Table 6-4: Information about the EPBC Act listed threatened shark and sawfish species that may, likely or are known to occur within the NWMR

Species	Preferred habitat and diet	Habitat location
Dwarf sawfish	Preferred habitat[1]: Shallow (up to 20 m) silty coastal waters and estuarine habitats, occupying relatively restricted areas and moving only small distances (Stevens *et al.* 2008; Kyne *et al.* 2015). Diet: Shoaling fish such as mullet, molluscs and small crustaceans (Cliff and Wilson 1994).	Northern Australia is considered a stronghold for sawfish (*Pristis* sp.). With observations generally higher in numbers in the western coastal regions of the NT compared to the south-western Gulf of Carpentaria region (Udyawer *et al.* 2025). Literature indicates the most southern range for the dwarf sawfish is Port Hedland (Bateman *et al.* 2024). See Table 6-6 for the BIA summary for the dwarf sawfish.
Green sawfish	Preferred habitat[1]: Inshore coastal environments including estuaries, river mouths, embayments, and along sandy and muddy beaches, as well as offshore marine habitat (Stevens *et al.* 2005; Thorburn *et al.* 2003). They are found at depths of up to 70 m (Kyne *et al.* 2021). Diet: Schools of baitfish and prawns (Poganoski *et al.* 2002), molluscs and small crustaceans (Cliff and Wilson 1994).	Northern Australia is considered a stronghold for sawfish (*Pristis* sp.). With observations generally higher in numbers in the western coastal regions of the NT compared to the south-western Gulf of Carpentaria region (Udyawer *et al.* 2025). An aggregation of green sawfish (*Pristis zijsron*) has been identified in the Garig Gunak Barlu National Park (Cobourg Peninsula, NMR). Davies *et al. (*2022) suggest this may be a nursery area. The Ashburton River Estuary (Onslow region) has been recorded as a nursery site, with juveniles also observed along the Pilbara coast and Exmouth Gulf (Bateman *et al.* 2024). See Table 6-6 for the BIA summary for the green sawfish.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Preferred habitat and diet	Habitat location
Grey nurse shark (west-coast population)	Preferred habitat: Most found in temperate waters on, or near, the bottom of the continental shelf (McAuley 2004; Kyne *et al*. 2021), around coral rocky reefs that span from inshore surf zones to the outer continental reef. They are generally found in depths between 10 and 40 m, with reported maximum depths of 230 m (Krause and Stow 2025). Diet: A variety of teleost and elasmobranch fishes and some cephalopods (Gelsleichter *et al*. 1999; Smale 2005).	Movement patterns of the western subpopulation are unclear (McAuley 2004) and key aggregation sites have not been formally identified within the NWMR (Chidlow *et al*. 2006). The known distribution for the western population extends from the SA border up to Exmouth (Krause and Stow 2025). The NWMR represents the northern limit of the west-coast population. Sighting and bycatch data have indicated grey nurse sharks are present near Exmouth and Shark Bay between May to December (Hoschke *et al*. 2023). Grey nurse sharks have also been recorded around the tropical reefs of Browse Island, and anecdotal sightings from the Arafura Sea. In addition, one individual has been recorded in trawling nets off the north-west coast of the Tiwi Islands, NT (Krause and Stow 2025).
Largetooth (freshwater) sawfish	Preferred habitat: Sandy or muddy bottoms of shallow coastal waters, estuaries, river mouths and freshwater rivers, and isolated water holes. Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson 1994).	Northern Australia is considered a stronghold for the sawfish (*Pristis sp.*), with observations generally higher in numbers in the western coastal regions of the NT compared to the south-western Gulf of Carpentaria region (Udyawer *et al*. 2025). The largetooth sawfish has a wide Northern Australia range (Kyne *et al*. 2021). The Kimberley region, particularly the Fitzroy River, is identified as an important nursery site (Bateman *et al*. 2024). The Exmouth Gulf represents the approximate southern limit for the largetooth (freshwater) sawfish, although there are a few historical records further south (Bateman *et al*. 2024). See Table 6-6 for the BIA summary for the largetooth (freshwater) sawfish.
Little gulper shark	Preferred habitat: the little gulper shark are found in waters on the upper continental slopes and undertake diel migrations across their depth ranges from relatively deep depths during the day to shallower feeding depths at night (Threatened Species Scientific Committee 2013a). Diet: Primarily fish and invertebrates, with lanternfish and squid being the primary prey (Threatened Species Scientific Committee 2013a).	The little gulper shark may occur within the NWMR, however the species is primarily associated with continental slope habitats of southern Australia, including New South Wales, Tasmania, South Australia and south-west Western Australia, typically occurring at depths greater than 400 m (White et al 2008)
Longfin mako	Preferred habitat: A pelagic species with a wide-ranging, patchy, oceanic distribution in tropical and temperate seas (Mollet *et al.* 2000; Kyne *et al.* 2021). They have been recorded at depth ranges of 0 to 1,752 m (Kyne *et al.* 2021). Diet: Primarily teleost fishes and cephalopods (mainly squid) (Last and Stevens 2009).	Records for longfin mako sharks are sporadic and their complete geographic range is not well known (Reardon *et al.* 2006). Given the migratory nature of the species, most likely has a broad distribution within the NWMR. No BIAs identified for the NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Preferred habitat and diet	Habitat location
Mackerel/ porbeagle shark	Preferred habitat: The porbeagle shark primarily inhabits offshore waters around the edge of the continental shelf. They occasionally move into coastal waters, but these movements are temporary (Campana and Joyce 2004; Francis *et al.* 2002). The porbeagle shark is known to dive to depths exceeding 1,300 m (Campana *et al.* 2010; Saunders *et al.* 2011). Depth range records are 0 to 370 m (Kyne *et al.* 2021). Diet: Primarily teleost fish, elasmobranchs and cephalopods (primarily squid) (Joyce *et al.* 2002; Last and Stevens 2009).	In Australia, the species occurs in waters from southern Queensland to south-west Australia (Last and Stevens 2009). Distribution within the NWMR is unknown, but there are several records for this species within the NWS (Atlas of Living Australia, 2020).
Narrow sawfish	Preferred habitat[1]: Shallow coastal, estuarine and riverine habitats, but it may occur in waters up to 40 m deep (D'Anastasi *et al.* 2013). Diet: Shoaling fishes, such as mullet, as well as molluscs and small crustaceans (Cliff and Wilson 1994).	Northern Australia is considered a stronghold for sawfish (*Pristis* sp.), with observations generally higher in numbers in the western coastal regions of the NT compared to the south-western Gulf of Carpentaria region (Udyawer *et al.* 2025). This species has been found in shallow coastal waters of the Pilbara and Kimberly coasts (Last and Stevens 2009).
Northern river shark	Preferred habitat[1]: Rivers, tidal sections of large tropical estuarine systems and macrotidal embayments, as well as inshore and offshore marine habitats (Pillans *et al.* 2009; Thorburn and Morgan 2004). Adults have been recorded only in marine environments. Juveniles and sub-adults have been recorded in freshwater, estuarine and marine environments (Pillans *et al.* 2009). Depth range of up to 23 m (Kyne *et al.* 2021). Diet: A variety of fish and crustaceans (Stevens *et al.* 2005).	Northern Australia is considered a stronghold for river sharks (*Glyphis sp.),* with observations generally higher in numbers in the western coastal regions of the NT compared to the south-western Gulf of Carpentaria region (Udyawer *et al.* 2025). The northern river shark has a relatively restricted northern Australian range (although with an extent of occurrence >20,000 km²) (Kyne *et al.* 2021). Within the NWMR records have come from both the West and East Kimberley, including King Sound, the Ord and King rivers, West Arm of Cambridge Gulf and from Joseph Bonaparte Gulf (Thorburn and Morgan 2004; Stevens *et al.* 2005; Thorburn 2006; Field *et al.* 2008; Pillans *et al.* 2008, Whitty *et al.* 2008; Wynen et al. 2008).
Oceanic whitetip shark	Preferred habitat: The oceanic whitetip shark is globally distributed in warm-temperate and tropical oceans (Andrzejaczek *et al.* 2018). The species may occur in tropical and subtropical offshore and coastal waters around Australia. They primarily occupy pelagic waters in the upper 200 m of the water column; however, they have been observed diving to depths of around 1,000 m, potentially associated with foraging behaviour (Howey-Jordan *et al.* 2013; D'Alberto *et al.* 2017). The species is highly migratory, travelling large distances between shallow reef habitats in coastal waters and oceanic waters (Howey-Jordan *et al.* 2013). The species does exhibit a strong preference for warm and shallow waters above 120 m. Diet: Opportunistic feeders that generally target a variety of finfishes and pelagic squid, depending on habitat. Targets pelagics such as tuna in open ocean, as noted by the large bycatch numbers in the longline fisheries.	Given its migratory nature, this species most likely has a broad distribution within the NWMR. No BIAs identified for NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Preferred habitat and diet	Habitat location
Scalloped hammerhead	Preferred habitat: In northern Australia, juveniles inhabit inshore environments while adults typically occur in deeper waters near the edge of the continental shelf. Pregnant females will move to shallow nursery areas to give birth. The scalloped hammerhead is found in waters ranging from the surface to depths of at least 275 m. The species has also been recorded at a depth of 1,042 m (Threatened Species Scientific Committee 2024).	In WA, the scalloped hammerhead is recorded along the northern coastline to about 34°S (Geographe Bay). It is suggested a high proportion of adult females may migrate from Australia to Indonesia and Papua New Guinea waters, and return to give birth in coastal nursery areas in northern Australia (Threatened Species Scientific Committee 2024).
Shortfin mako	Preferred habitat: The shortfin mako shark is a pelagic species with a circumglobal, wide-ranging oceanic distribution in tropical and temperate seas (Mollet *et al.* 2000). Tagging studies indicate shortfin makos spend most of their time in water less than 50 m deep but with occasional dives up to 880 m (Abascal *et al.* 2011; Stevens et al. 2010). Satellite telemetry suggests shortfin makos have multiple movement phases, displaying both high connectivity between Australian populations and periods of residency (Corrigan *et al.* 2018). Diet: Feeds on a variety of prey, such as teleost fishes, other sharks, marine mammals and marine turtles (Campana *et al.* 2005).	Given its migratory nature, this species most likely has a broad distribution within the NWMR. No BIAs identified for the NWMR.
Speartooth shark	Speartooth sharks are elasmobranchs that can inhabit and move between freshwater and marine environments (DoE 2014c). Juveniles and sub-adults have been observed to inhabit large tropical river systems, while adults are assumed to live outside of rivers in coastal marine areas, due to their physiological and life history similarities with bull sharks (DoE 2014c).	The speartooth shark is a medium sized shark found in tidal rivers and estuaries within the NT, northern WA and Queensland (DoE 2014c). Speartooth sharks have been recorded in tidal rivers and estuaries (Pillans *et al.* 2009). Data on a small number of speartooth sharks indicate this species has tidally influenced movement patterns (Pillans *et al.* 2009). Within Australia, speartooth sharks are known to occur in four distinct locations: Cambridge Gulf in WA; Van Diemen Gulf drainage in the NT, including the Adelaide River, South, East and West Alligator Rivers and Murganella Creek; Port Musgrave in Queensland, including the Wenlock and Ducie Rivers; and the Princess Charlotte Bay area of Eastern Cape York (Field *et al.* 2008, Pillans *et al.* 2009).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Preferred habitat and diet	Habitat location
Whale shark	Preferred habitat: Whale sharks have a widespread distribution in tropical and warm temperate seas, throughout oceanic and coastal Australian waters (Last and Stevens 2009). Diet: Whale sharks are planktivorous and feed on various planktonic species, including krill, jellyfish, and crab larvae (Last and Stevens 2009). At Ningaloo Reef, whale shark habitat use is strongly driven by fine-scale prey availability, with whale sharks concentrating in reef-edge areas where complex bathymetry and local oceanographic processes aggregate zooplankton. While elevated prey density drives horizontal space use, whale sharks' vertical movements are not tightly coupled to prey depth distributions, indicating that prey availability influences foraging locations but does not directly govern diving behaviour (D'Antonio *et al.* 2024).	Ningaloo Reef is the main known aggregation site for whale sharks in Australian waters and has the largest density of whale sharks per kilometre in the world (Martin 2007). A study by D'Antonio *et al.* (2025) investigated the influence of geomorphological features and oil and gas platforms on the broad-scale movement patterns and habitat connectivity of whale sharks across the eastern Indian Ocean and the north-west of Australia. Satellite telemetry from 78 whale sharks tagged between 2005 and 2019 during their seasonal aggregations in coastal waters at Ningaloo Reef and at Shark Bay during the austral autumn and winter were used to identify movement patterns and habitat connectivity. Geomorphological features such as pinnacles, canyons and seamounts promoted habitat connectivity and strongly influenced the habitat use of whale sharks across regional and local spatial scales. Oil and gas platforms were observed to have a similar effect on habitat use as natural feature types and enhanced habitat connectivity. The platforms most visited by whale sharks were situated near the edge of the continental shelf and near natural geomorphological features that likely enhance productivity, and were likely used as migratory stepping stones (D'Antonio *et al.* 2025). Satellite tracking at Ningaloo Reef showed whale shark distribution ranged widely across the eastern Indian Ocean, spending more than 90% of their time in epipelagic waters (≤200 m) while also performing occasional deep dives to bathypelagic depths (about 1,900 m). Geographical and vertical habitat use differed between sexes, with females more likely to occupy offshore areas, use deeper waters, and prefer cooler sea-surface temperatures than males. In contrast, males displayed more consistent space and depth use with warmer (<28 °C), coastal shelf waters (Bignell *et al.* 2025). Acoustically tagged whale sharks have been detected on the NWS in June, July and October to January (Thomson *et al.* 2021). Satellite tagging and sightings of whale sharks off the WA coast indicate that while whale sharks aggregate in higher numbers at Ningaloo Reef seasonally, they may be present year-round (Norman *et al.* 2017). See Table 6-6 for the BIA summary for the whale shark.

Species	Preferred habitat and diet	Habitat location
White shark	Preferred habitat: The species typically occurs in temperate coastal waters between the shore and the 100 m depth contour; however, adults and juveniles have been recorded diving to depths of 1,000 m (Bruce *et al.* 2006; Bruce 2008). Diet: Smaller white sharks (less than 3 m length) feed primarily on teleost and elasmobranch fishes, broadening their diet as larger sharks to include marine mammals (Last and Stevens 2009).	There are no known aggregation sites for white sharks in the NWMR, and this species is most often found south of North West Cape, in low densities (DSEWPaC 2012a). Given its migratory nature, this species most likely has a broad distribution within the NWMR. No BIAs identified for the NWMR.

1. *Preferred habitat as described within the Sawfish and River Sharks Multispecies Recovery Plan (Commonwealth of Australia 2015b).*

6.2.3 Rays

Rays are commonly found in the NWMR. Two listed and migratory species are known to occur within this region: the reef manta ray and giant manta ray.

No BIAs for either the reef or giant manta ray species have been identified in the NWMR.

Table 6-5: Information about migratory ray species within the NWMR

Species	Preferred habitat and diet	Habitat location
Reef manta ray	Preferred habitat: The reef manta ray is commonly sighted within productive nearshore environments, such as island groups, atolls or continental coastlines. However, the species has also been recorded at offshore coral reefs, rocky reefs and seamounts (Marshall *et al.* 2009). Recorded depth range of 0 to 432 m (Kyne *et al.* 2021). Diet: Feeds on planktonic organisms, including krill and crab larvae.	A resident population of reef manta rays has been recorded at Ningaloo Reef. No BIAs identified for the NWMR.
Giant manta ray	Preferred habitat: The species primarily inhabits nearshore environments along productive coastlines with regular upwelling, but they appear to be seasonal visitors to coastal or offshore sites, including offshore island groups, offshore pinnacles and seamounts (Marshall *et al.* 2011). Recorded depth range of up to 1,000 m (Kyne *et al.* 2021). Diet: Feeds on planktonic organisms, including krill and crab larvae.	The Ningaloo coast is an important area for giant manta rays from March to August (Preen *et al.* 1997). No BIAs identified for the NWMR.

6.3 Fish, shark and sawfish biologically important areas in the NWMR

A review of the Australian Marine Spatial Information System (Geoscience Australia, 2026) identified BIAs for four species of fish, shark and sawfish – whale shark, largetooth (freshwater) sawfish, green sawfish and dwarf sawfish – within the NWMR. The BIAs for the whale shark and the sawfish species include foraging, nursing, juvenile and pupping areas. Table 6-6 describes these.

7. MARINE REPTILES

7.1 Regional context

The NWMR and NMR contain important habitat for listed marine reptiles, including areas that support key life stages such as nesting, internesting, migration and foraging for marine turtle species, and habitats supporting resident sea snake, crocodile, and water monitor (NWMR only) populations. Habitats within the SWMR also support marine reptiles; however, these are primarily associated with foraging marine turtle species.

Six of the seven marine turtle species occurring globally are in Australian waters, of which all six – the green, hawksbill, loggerhead, flatback, leatherback and olive ridley turtle – occur in the NWMR and NMR. Four species of marine turtles – the green, loggerhead, flatback and leatherback turtle – have known distribution within the SWMR (see PMST report in Appendix A). However, no known nesting areas exist within the SWMR region (DSEWPaC 2012b).

The PMST report (Appendix A) identified a total of 12 EPBC Act listed threatened or migratory reptile species, including marine turtles, sea snakes, water monitors and crocodiles, within the NWMR. An additional 23 EPBC Act listed marine sea snake species that do not have a threatened or migratory status were recorded within the NWMR. Appendix A contains a full list.

The PMST report identified a total of ten EPBC Act listed threatened or migratory reptile species within the NMR. An additional 28 EPBC Act listed marine sea snake and sea krait species that do not have a threatened or migratory status were recorded within the NMR. Appendix A contains a full list.

The PMST report identified a total of four EPBC Act listed threatened or migratory marine turtle species within the SWMR. Appendix A contains a full list.

7.2 Marine reptiles in the NWMR

The next subsections focus on the listed marine reptile species known to occur within the NWMR.

Table 7-1 outlines the threatened and migratory marine reptile species that may, are likely or are known to occur within the NWMR, with their conservation status and relevant recovery plans and conservation advice.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.1 Marine turtles

The PMST report (Appendix A) identified six species of threatened and migratory (three Vulnerable and three Endangered) EPBC Act listed marine turtles within the NWMR: the green (*Chelonia mydas*), hawksbill (*Eretmochelys imbricata*), flatback (*Natator depressus*), loggerhead (*Caretta caretta*), leatherback (*Dermochelys coriacea*) and olive ridley (*Lepidochelys olivacea*) turtles (see Table 7-1).

The NWMR supports globally significant breeding populations of four marine turtle species: the green, hawksbill, flatback and loggerhead turtles. Olive ridley turtles are known to forage within the NWMR, but there are only occasional records of the species nesting in the region. Leatherback turtles regularly forage over Australian continental shelf waters within the NWMR, but there are also no records of the species nesting in the region (DSEWPaC 2012a).

Marine turtles are highly migratory during non-reproductive life phases and have high site fidelity during breeding and nesting life phases. They spend most of their lives in the ocean, with only adult female marine turtles coming ashore to lay eggs in the sand above the high-water mark on natal beaches (Commonwealth of Australia 2017). Figure 7-1 summarises the generalised life cycle of marine turtles. Species-specific life cycle information is outlined within the Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia 2017).

Discrete genetic stocks have evolved within each marine turtle species. This is the result of marine turtles returning to where they hatched. These genetically distinct stocks are defined by the presence of regional breeding aggregations. Stocks are composed of multiple rookeries in a region and are delineated by where there is little or no migration of individuals between nesting areas. Turtles from different stocks typically overlap at feeding grounds (Commonwealth of Australia 2017). There are 17 genetic stocks across both the NWMR and NMR – nine in the NWMR, six in the NMR, and two overlapping both regions. Of these, 11 are known to occur within Woodside's three activity areas. Table 7-2 describes key information about marine turtles within the NWMR.

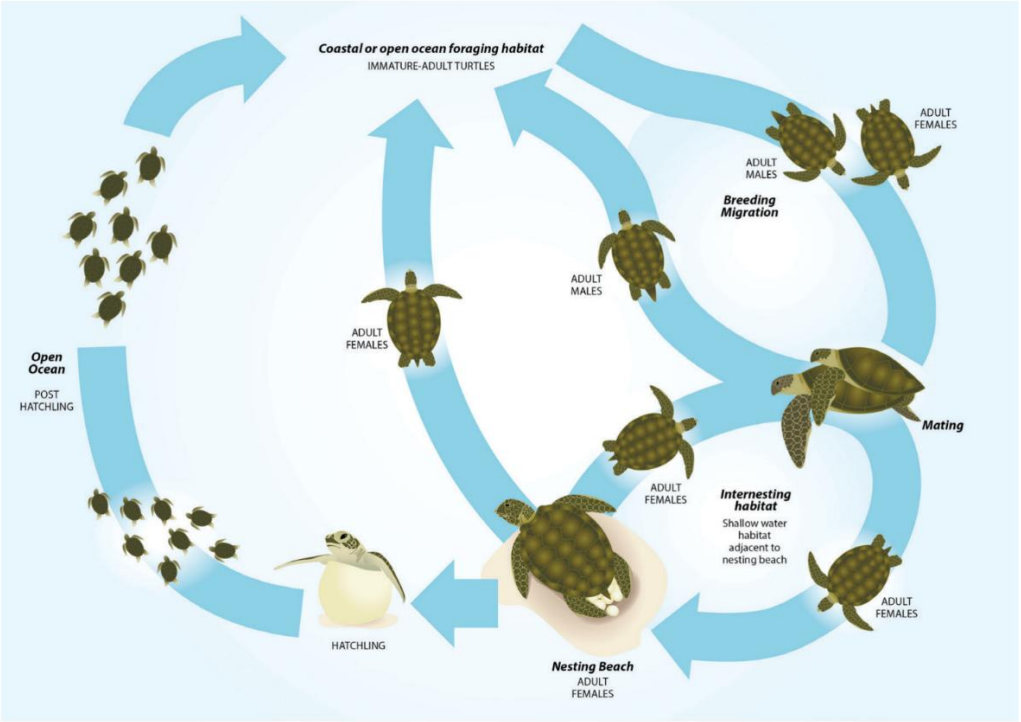

Figure 7-1: Generalised life cycle of marine turtles

Table 7-2: Marine turtle key information within the NWMR

Species/ genetic stock	Woodside activity area			Key information
	Browse	***NWS/ Scarborough***	***North West Cape***	
Flatback turtle				
Distribution: There are five stocks of flatback turtles described in Australian waters. Note, the extent of genetic relatedness of flatback turtles along the WA coast is currently under review. Flatback turtles forage in waters across the Australian continental shelf and into the continental waters off Indonesia and Papua New Guinea. The flatback turtle is found in the tropical waters of northern Australia, Papua New Guinea and Irian Jaya. It is one of the only two species of marine turtle without a global distribution (Limpus 2007). Nesting is known to only occur in Australia for this species. Diet: Juvenile flatback turtles feed on gastropods, molluscs, squid and siphonophores. Limited data indicate cuttlefish, hydroids, soft corals and jellyfish also form part of the juvenile flatback diet. During the adult stage, they are primarily carnivorous, foraging on soft-bodies invertebrates (Commonwealth of Australia 2017).				
Cape Domett stock (F-CD)	✓	-	-	Cape Domett is an important high density nesting area (Tucker *et al.* 2021). Combined with a smaller site at Lacrosse Island, the F-CD stock is one of the largest flatback turtle stocks in Australia. Average nesting abundance at Cape Domett is estimated at 3,250 females per year (Whiting *et al.* 2008). Designated habitat critical for the F-CD stock are the nesting locations of Cape Domett and Lacrosse Island, and an internesting buffer of 60 km radius around these rookeries, year-round with peak internesting activity occurring August to September (Commonwealth of Australia 2017). Extending further than the habitat critical internesting buffer, an internesting buffer BIA of 60 km is at Cape Domett and Lacrosse Island.
Pilbara stock (F-Pil)	-	✓	✓	The major rookeries for the F-Pil stock are on the eastern coast of Barrow Island and at Mundabullangana Station near Cape Thouin on the mainland (greater than 500 km south of Broome) (Limpus 2006) and Delambre Island (Commonwealth of Australia 2017). This stock also nests on many islands in the Pilbara and southern Kimberley, including Thevenard, Varanus, Muiron Islands and Montebello group. The Dampier Archipelago contains several regionally significant flatback turtle rookeries and forms part of the core nesting distribution of the F-Pil stock (Fossette *et al.* 2021b). These areas are designated habitat critical for the F-Pil stock and include an internesting buffer of 60 km radius around these rookeries from October to March. A study using aerial photogrammetry showed nesting beaches were spread across the Pilbara from Y Island (Exmouth Gulf) in the south-west, to Bedout Island in the north and Mulla Mulla Downs Creek in the east (Fossete *et al.* 2021b). Extending further than the habitat critical internesting buffer, a year-round internesting buffer BIA of 60 km is north and north-west of the Montebello Islands. However, use level for this BIA has been defined as very low (Commonwealth of Australia 2017). Satellite tracking data by Whittock *et al.* (2016) found flatback turtles displayed varying internesting movements, with distances travelled ranging between 3.4 and 62.1 km upwards along the coast. Nearshore behaviour was displayed across all Pilbara rookeries, with a consistent occurrence of tagged individuals remaining <10 km of nesting beaches during the internesting period (Whittock *et al.* 2016). Flatbacks exhibit high fidelity to nesting beaches during periods of nesting attempts (Whittock *et al.* 2016; Peel *et al.* 2024).

Species/ genetic stock	Woodside activity area			Key information
	Browse	*NWS/ Scarborough*	*North West Cape*	
				Post-nesting satellite tracking indicates foraging occurs along the WA coast in water shallower than 130 m and within 315 km of shore (Commonwealth of Australia 2017).
South-west Kimberley stock (F-swKim)	✓	✓	-	Eighty Mile Beach and Eco Beach are important nesting areas, with nesting occurring year round but peaking in December to January. These areas are designated habitat critical for the stock and include an internesting buffer of 60 km radius around these rookeries from October to March. Juveniles are likely to remain in waters over the Australian continental shelf after hatching. Flatback turtles are usually found around soft sediment habitat that supports benthic invertebrates. Important foraging habitats are not identified for this species (Commonwealth of Australia 2017).
Green turtle				
Distribution: Green turtles are distributed across nine genetically distinct stocks in Australian waters off WA, the NT and Queensland, with limited numbers in New South Wales, Victoria and SA (Commonwealth of Australia 2017). Diet: During their pelagic juvenile stage, green turtles feed on algae, pelagic crustaceans and molluscs. They are primarily herbivorous during their adult stage, foraging on algae, seagrass and mangroves. However, some green turtles maintain a considerable carnivorous component to their diets (Commonwealth of Australia 2017).				
Ashmore Reef stock (G-AR)	✓	-	-	The G-AR stock nests in the Ashmore Reef and Cartier Island AMP areas. Population estimates are not available for Ashmore Reef, although annual breeding numbers are thought to be in the low hundreds (Whiting 2000). Designated habitat critical for the G-AR stock are the nesting locations of Ashmore Reef and Cartier Reef, and an internesting buffer of 20 km radius around these rookeries, year-round with peak internesting activity occurring December to January (refer Table 6 of the Recovery Plan). Juvenile and adult turtles forage within the tidal/subtidal habitats of offshore islands and coastal waters with coral reef, mangrove, sand, rocky reefs and mudflats where there are algal turfs or seagrass meadows (Commonwealth of Australia 2017).
NWS stock (G-NWS)	-	✓	✓	The G-NWS stock is one of the largest green turtle stocks in the world and the largest in the Indian Ocean. The G-NWS stock is estimated at about 20,000 individuals (DSEWPaC 2012a) and the trend for the stock is reported as stable (Commonwealth of Australia 2017). Major rookeries of the G-NWS stock within the NWS/Scarborough activity area are at Lacepede Islands, Montebello Islands and Barrow Island (Tucker *et al.* 2021), with minor rookeries at Boodie, Middle, Serrurier, Thevenard, Lowendal, Rosemary, Legendre and Delambre islands (Commonwealth of Australia 2017). These areas are designated habitat critical for survival of the stock and include an internesting buffer of 20 km radius around these rookeries from November to March. Major rookeries for the G-NWS stock located within the North West Cape Woodside activity area include the North West Cape and Muiron Islands (Commonwealth of Australia 2017). Located on the mainland coast of

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species/ genetic stock	Woodside activity area			Key information
	Browse	*NWS/ Scarborough*	*North West Cape*	
				the North West Cape, this area is designated habitat critical for the stock and includes an internesting buffer of 20 km radius around the rookery from November to March. A 2018 survey, including on-beach monitoring of the Muiron Islands and Ningaloo Coast from North West Cape to Bungelup (Rob *et al.* 2019), supports the concept that North West Cape and the Muiron Islands are major important nesting areas for green turtles, as identified in the Recovery Plan (Commonwealth of Australia 2017). For the 2024–25 Ningaloo Turtle Program season, green turtles were the most active species in the North West Cape division, accounting for 97.08% of total turtle activity (Department of Biodiversity, Conservation and Attractions (DBCA) 2025). The number of green turtle nests has varied among the years since the program began in 2002 (ranging from 1.06 to 18.13 nests per subsection per day), with a long-term average of about 6.16. The average number of green turtle nests recorded during the 2024–25 peak season was slightly above average at 6.6 nests per subsection per day, ranking as the seventh highest out of 23 seasons that have been monitored (DBCA 2025). Long-term trends indicate several clear peaks in activity since the program began, including 2011–12, 2020–21 and 2023–24, where nesting activity was about 2.5 to 11 times greater than lower-activity seasons (DBCA 2025). All seasons coincided with La Niña weather patterns (DBCA 2021).
Scott Reef-Browse Island stock (G-ScBr)	✓	-	-	The G-ScBr stock is a genetically discrete stock known to nest at only two locations within the north-east Indian Ocean – Sandy Islet and Browse Island. There are currently very limited data available for the G-ScBr stock, so population numbers are not known (Commonwealth of Australia 2017). Designated habitat critical for the G-ScBr stock are the nesting locations of Sandy Islet and Browse Island, and an internesting buffer of 20 km radius around these rookeries, for the period November to March (see Table 6 of the Recovery Plan). Surveys conducted at Scott Reef in 2006, 2008 and 2009 indicate the summer months from late November to February are the preferred breeding season for green turtles at Sandy Islet (Guinea 2009). Satellite tagging studies (Pendoley 2005; Guinea 2011) have provided an indication of the behaviour and migratory routes of adult green turtles leaving Scott Reef. Most animals appear to swim through South Reef lagoon and disperse toward the WA mainland via two distinct post-nesting migration pathways: travelling east and north toward the Bonaparte Archipelago then north along the coast to foraging areas in NT waters, or travelling south to Cape Leveque then south along the coast to the Turtle Islands off the mouth of the De Grey River in the Pilbara region (Ferreira *et al.* 2021).

Species/ genetic stock	Woodside activity area			Key information
	Browse	***NWS/ Scarborough***	***North West Cape***	
Hawksbill turtle				
Distribution: There are three genetic stocks of hawksbill in Australia with distribution occurring across northern and eastern Australia and widely within the NWMR, with most of the H-WA stock in the Pilbara. Hawksbill turtles forage in pelagic environments during the first five to ten years of their life cycle. Upon reaching maturity, they return to their hatching location to settle in tropical tidal and subtidal coral and rocky reef habitats (Commonwealth of Australia 2017). They have also been found within seagrass habitats of coastal waters and deeper habitats, although less frequently. They are distributed throughout the NWS of WA (DoE 2026c). Diet: Hawksbill turtles are omnivorous, foraging on algae, sponges, soft corals and other soft-bodies invertebrates (Commonwealth of Australia 2017).				
WA genetic stock (H-WA)	✓	✓	-	Major rookeries of the H-WA stock occur in the NWS/Scarborough Woodside activity area at islands within the Dampier Archipelago (particularly Rosemary Island), Delambre Island and Montebello Islands, with lower density nesting at the Lowendal Islands and Sholl Island (Limpus 2009b). These areas are designated habitat critical for the stock and include an internesting buffer of 20 km radius around these rookeries from October to February. Peak nesting season occurs from October to January (Commonwealth of Australia 2017). Rosemary Island supports the most significant hawksbill turtle rookery in the WA region and one of the largest in the Indian Ocean; about 500 to 1,000 females nest on the island annually, more than at any other WA rookery (Pendoley 2005; Pendoley *et al.* 2016). In the Browse Woodside activity area, Sandy Islet is recognised as a key nesting BIA for this species, with an internesting BIA in the surrounding waters. In 2006, a single hawksbill turtle was tagged and recaptured in 2009 on Sandy Islet (Guinea 2009). There are no other records of hawksbill turtles nesting at Scott Reef, although the Recovery Plan for Marine Turtles recognises some nesting for this species occurs at Scott Reef and Ashmore Reef (Commonwealth of Australia 2017). The hawksbill turtle is also known to occur within the Rowley Shoals Marine Park. However, the habitats within the marine park are not considered to be significant for the species (Department of Environment and Conservation (DEC) 2007a).
Leatherback turtle				
Distribution: There are potentially three leatherback genetic stocks in the Indo-Pacific. However, genetic linkages are yet to be determined for those found in Australian waters. Leatherback turtles are more commonly found foraging in waters on the east coast of Australia. Leatherbacks foraging in WA may come from nesting areas in the Andaman Sea and Indonesia. Small numbers of leatherback turtles nest along the Cobourg Peninsula in the NT and there have been unconfirmed accounts of leatherbacks nesting in WA (Commonwealth of Australia 2017). Diet: The leatherback is an oceanic species remaining planktivorous throughout its life cycle, feeding on jellyfish and large planktonic ascidians such as sea squirts in the water column (Commonwealth of Australia 2017).				

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species/ genetic stock	Woodside activity area			Key information
	Browse	***NWS/ Scarborough***	***North West Cape***	
Nesting in Australia	✓	-	-	The leatherback turtle is the largest of all marine turtles. They are pelagic feeders and spend most of their lives in the open ocean in tropical, subtropical and temperate waters throughout the world (Limpus 2009a). Leatherback turtles have been recorded feeding in the coastal waters of all Australian states and territories. It is thought they migrate from Australian waters to breed at larger rookeries in neighbouring countries such as Indonesia, Papua New Guinea and Solomon Islands. There are no known foraging sites for this species within WA and no records of leatherback turtles nesting in WA (Commonwealth of Australia 2017).
Loggerhead turtle				
Distribution: There are two genetically distinct stocks of loggerheads in Australia, one in Queensland and one in WA. Foraging occurs in coastal areas in WA and the NT, ranging from nearshore benthic habitats to depths of 55 m (Commonwealth of Australia 2017). Diet: In the post-hatchling stage, the loggerhead feeds on algae, pelagic crustaceans and molluscs. During the adult stage, they are carnivorous, feeding primarily on benthic invertebrates (Commonwealth of Australia 2017).			
WA (LH-WA)	-	-	✓	Loggerhead turtles have a global distribution and occur throughout eastern, northern and western Australia (Limpus 2008). Major rookeries of the LH-WA stock are at Dirk Hartog Island, Muiron Islands, North West Cape and Gnaraloo Bay. These areas are designated habitat critical for the stock and include an internesting buffer of 20 km radius around these rookeries from November to May (Commonwealth of Australia 2017). Loggerhead turtles migrate over 2,600 km between foraging and nesting areas (Limpus 2008). There has been one reported loggerhead nesting at Ashmore Reef (DoE 2026a). The LH-WA stock is one of the largest in the world (Limpus 2009c). The trend for the stock is reported as stable (Commonwealth of Australia 2017). A 2018 survey, including on-beach monitoring of the Muiron Islands and Ningaloo Coast from North West Cape to Bungelup (Rob *et al.* 2019), supports the concept that North West Cape and the Muiron Islands are major important nesting areas for loggerhead turtles, as identified in the Recovery Plan (Commonwealth of Australia 2017). The standardised level of loggerhead turtle nesting along the North West Cape was above the long-term average (0.36) for the 2022–23 season and the third highest since the Ningaloo Turtle Program began (2002), with 0.46 nests per subsection per day (DBCA 2021). Dirk Hartog Island in the Shark Bay Marine Park, with an average of 122 nests per day over 2.1 km (Reinhold and Whiting 2014), is recognised as the most important loggerhead turtle rookery in WA (Commonwealth of Australia 2016; as cited in Rob *et al.* 2019).
Olive ridley turtle				
Distribution: There are two genetic stocks in Australia, one in the NT and the other that nests on western Cape York. Low-density nesting occurs in the Kimberley and genetic relatedness is unknown. There is limited data about olive ridley individuals, but satellite tracking indicates they appear to remain on the Australian continental shelf and into waters off Indonesia. Foraging occurs in depths ranging between 15 and 200 m (Commonwealth of Australia 2017). Diet: The olive ridley turtle is primarily carnivorous, feeding on soft-bodied invertebrates including sea pens, soft corals, beche-der-mer (sea cucumbers) and jellyfish (Commonwealth of Australia 2017).			

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species/ genetic stock	Woodside activity area			Key information
	Browse	***NWS/ Scarborough***	***North West Cape***	
Unknown genetic stock, Kimberley	✓	-	-	The olive ridley turtle is the smallest of all marine turtles. It has a global tropical and subtropical distribution and is known to forage primarily in soft-bottom habitats ranging from 6 to 35 m in nearshore locations (DSEWPaC 2012a), and offshore in depths of up to 200 m (Whiting *et al.* 2018). Olive ridley nesting is recorded as incidental and sparse in the Kimberley region (Whiting *et al.* 2018). It has been recorded nesting in WA only twice, both times in the Kimberley region (RPS Environment and Planning Pty Ltd, 2010), with most nesting occurring in the NT (Commonwealth of Australia 2017). Key nesting locations in the NT include Cape Leveque, Darcy Island, Prior Point, Llanggi and Vulcan Island (Commonwealth of Australia 2017).

7.2.1.1 Habitat critical to survival for marine turtles

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia 2017) identifies habitat critical to the survival of a species for marine turtle stocks under the EPBC Act. Habitat critical to survival is defined by the EPBC Act Significant Impact Guidelines 1.1 – Matters of National Environmental Significance as areas necessary:

- for activities such as foraging, breeding or dispersal
- for the long-term maintenance of the species, including species essential to their survival
- to maintain genetic diversity and long-term evolutionary development
- for the reintroduction of populations or recovery of the species.

The Recovery Plan for Marine Turtles of Australia (Commonwealth of Australia 2017) has identified nesting locations and associated internesting areas as habitat critical to survival for five marine turtle species within the NWMR. These are identified, described and mapped in Table 7-3 and Figure 7-2 to Figure 7-6. No habitat critical to survival of leatherback turtles has been identified within the NWMR.

Table 7-3 outlines the relevant genetic stock, habitat critical to survival and key life cycle stage seasonality of the four species of marine turtles within the NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.2.1.2 Marine turtle biologically important areas

A review of the Australian Marine Spatial Information System (Geoscience Australia 2026), the Marine Bioregional Plan for the North-west Marine Region (DSEWPaC 2012a) and the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia 2017) identified BIAs for five of the marine turtle species that occur within the NWMR. Table 7-4 describes these.

Table 7-4: Marine turtle BIAs within the NWMR

Species	Woodside activity area			BIAs				
	Browse	***NWS/ Scarborough***	***North West Cape***	***Mating***	***Nesting***	***Internesting***	***Foraging***	***Migration[9]***
Green turtle	✓	✓	✓	• Barrow Island • Montebello Islands (including Hermite Island, North West Island, Trimouille Island) • Dampier Archipelago (islands to the west of the Burrup Peninsula) • Ashmore Reef	• Barrow Island • Montebello Islands (including Hermite Island, North West Island, Trimouille Island) • Middle Island • Dampier Archipelago (islands west of the Burrup Peninsula) • North and South Muiron Islands • North West Cape • Delambre Island • Legendre Island and Huay Island • Lacepede Islands • Scott Reef – Sandy Island • Ashmore Reef • Cartier Island	Locations of 20 km internesting buffer BIAs for green turtles are described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPaC 2012a). Year-round and seasonal 20 km internesting buffer BIAs are around nesting sites. Habitat critical to survival internesting buffer (Table 7-3) is the legally recognised area of protection under the EPBC Act.	• Inshore areas of Barrow Island • Montgomery Reef • Montebello Islands • Dixon Island • Ashmore Reef • Seringapatam Reef and Scott Reef • De Grey River area to Bedout Island • Around the islands between Cape Preston and Onslow and inshore of Barrow Island • Dampier Archipelago (islands west of the Burrup Peninsula) • Legendre Island and Huay Island • Delambre Island	Migration corridor at Dampier Archipelago (islands west of the Burrup Peninsula). Green turtles can migrate more than 2,600 km between their feeding and nesting grounds. Individual turtles foraging in the same area do not necessarily take the same migration route (Limpus *et al.* 1992). Ferreira *et al.* (2021) broadly identified two migratory corridors, one used by the NWS Pilbara Stock and another used by the NWS Kimberley Stock and the G-ScBr stock, with some overlap at the northern and southern extents respectively. This study showed the foraging

[9] Migration BIA included in Australian Marine Spatial Information System (Geoscience Australia 2026). General information for migratory behaviours also provided.

					• Cassini Island		• Joseph Bonaparte Gulf • In waters adjacent to James Price Point	distribution of green turtles from two stocks in WA expands throughout north-west and northern Australian coastal waters, including the NT and Queensland.
Hawksbill turtle	✓	✓	✓	• Montebello Islands Barrow Island • Lowendal Island Group • Dampier Archipelago (to the west of the Burrup Peninsula)	• Lowendal Island Group • Montebello Islands (including Ah Chong and South East islands) • Rosemary Island • Delambre Island • Barrow Island • Varanus Island and Thevenard Island • Dampier Archipelago (west of the Burrup Peninsula) • Ningaloo Coast and Jurabi Coast • Sandy Islet at Scott Reef	Locations of 20 km internesting buffer BIAs for hawksbill turtles are described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPaC 2012a) and Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia 2017). Year-round and seasonal 20 km internesting buffer BIAs are around nesting sites. Habitat critical to survival internesting buffer (Table 7-3) is the legally recognised area of protection under the EPBC Act.	Recent data shows foraging ranges from north of Exmouth Gulf to offshore Broome (Fossette *et al.* 2021a). Known foraging BIAs in the NWMR include: • Lowendal Island group • Delambre Island • around Dixon Island • in the De Grey River area to Bedout Island • around the islands between Cape Preston and Onslow and inshore of Barrow Island • around the islands of the Dampier Archipelago (west of the Burrup Peninsula)	Migration corridor at Dampier Archipelago (islands west of the Burrup Peninsula). Individuals may migrate up to 2,400 km between their nesting and foraging grounds (DSEWPaC 2012a), although reproductive migration distances over 1,000 km appear less common in hawksbill turtles than other species (Fossette *et al.* 2021a). Recent satellite tracking data show turtles migrating from WA rookeries remained on the continental shelf, with most following the coastline and dispersing in a north-easterly direction, with some turtles from the Montebello Archipelago and

							• Ashmore Reef	Lowendal Islands moving in a south-westerly direction and some stopping around Barrow Island. A migratory corridor was observed from Cape Preston to De Grey River (Fossette *et al.* 2021a).
Flatback turtle	✓	✓	-	• Lacepede Islands • Montebello Islands • Dampier Archipelago (islands to the West of the Burrup Peninsula) • Mating at Barrow Island	Flatback turtles nest exclusively in the northern regions of Australia, between latitudes of 22°S in the west and 25°S in the east. There are seven genetically distinct stocks, identified across 17 rookeries, with Delambre Island representing a key nesting site in the NWS genetic stock (Whiting *et al.* 2025). Known nesting BIA locations in the NWMR include: • Thevenard Island – South Coast (summer) high use on beaches with high dune height	Locations of 60 km internesting buffer BIAs for flatback turtles are described in the Recovery Plan for Marine Turtles in Australia 2017–2027 (Commonwealth of Australia 2017). Year-round and seasonal internesting buffer BIAs of 60 km are around nesting sites, extending 20 km further than the habitat critical to survival. Habitat critical to survival internesting buffer (60 km, Table 7-3) is the legally recognised area of protection under the EPBC Act. Flatback turtles preferentially use shallow continental	• Islands between Cape Preston and Onslow and inshore of Barrow Island. • Montebello Islands • Dampier Archipelago (islands west of the Burrup Peninsula) • Legendre Island and Huay Island • Delambre Island • Joseph Bonaparte Depression • In waters adjacent to James Price Point Bathymetry and distance from the coast are key environmental features that influence the suitability of flatback	Migration corridor at Dampier Archipelago (islands west of the Burrup Peninsula). The flatback turtle is a resident to Australian waters and spends 99% of its time within the Australian EEZ. A migratory corridor connects the coastlines between the Kimberley and Pilbara (Peel *et al.* 2024). There is evidence some flatback turtles migrate long distances between breeding and feeding grounds (Limpus *et al.* 1983). However, flatback turtles generally do not have a pelagic phase to their life cycle. Instead, hatchlings grow to maturity in

					• Barrow Island • Montebello Islands (including Hermite Island, North West Island, Trimouille Island) • Dampier Archipelago (islands west of the Burrup Peninsula) • Delambre Island • Legendre Island and Huay Island • Dixon Island • Intercourse Island • West of Cape Lambert • Various locations along the Pilbara coast between Karratha and Broome, including Cape Thouin, Mundabullangana, Cowrie Beach, Port Hedland (Cemetery Beach, Paradise Beach) and Eighty Mile Beach • Lacepede Islands	shelf waters near nesting beaches during the internesting period, with habitat suitability strongly influenced by bathymetry, proximity to the coastline and sea surface temperature. Tracking data from multiple rookeries show internesting individuals remain in relatively shallow waters near the shore in depths of generally <44 m, while typically averaging under 10 m. Internesting flatbacks rarely exceed 28 km from the coastline and usually remain within about 6 km. Habitat suitability modelling by *Whittock et al*. (2016) indicates internesting areas are spatially constrained, nearshore and associated with relatively warm shelf waters (about 27 to 30°C), rather than being widely dispersed offshore.	turtle foraging and behaviours in the NWMR (Hounslow *et al.* 2025). Suitable habitats for flatback foraging include soft-sediment habitats containing a plethora of invertebrates, sea pens and sea cucumbers, which are their typical diet. These habitats are usually in intertidal and nearshore areas about 5 to 10 km from the coast in areas characterised by shallow bathymetry (<15 m depth). The probability of suitable foraging habitats for flatbacks declines in depths >15 m and >10 km from the coastline (Hounslow *et al.* 2025).	shallow coastal waters thought to be near their natal beaches (DSEWPaC 2012a). A study predicting the dispersal of flatback turtle hatchlings found core areas were predominantly on the continental shelf (<200 m depth contour) during all dispersal phases, indicating flatback turtles remain in neritic areas (Wilson *et al.* 2023). Flatback turtles tagged at Roebuck Bay showed high residency, using the area year round as a foraging site, with movement patterns strongly influenced by tides rather than long-distance displacement (Hounslow *et al.* 2025). Flatback turtles are endemic to northern Australia and have a largely cryptic life history, from entering the ocean immediately after hatching until the turtles return to nest as adults. Therefore, there

7.2.2 Sea snakes

Sea snakes are widely distributed in the NWMR and NMR, but less common in the SWMR. They occupy three broad habitat types: shallow water coral reef and seagrass habitats, deepwater soft bottom habitats away from reefs, and surface water pelagic habitats (Guinea 2007a).

The PMST report identified a total of three EPBC Act listed threatened sea snakes (Table 7-1) and a further 23 EPBC Act listed marine sea snake species within the NWMR (Appendix A). Of these species, Guinea (2007a) and Udyawer *et al.* (2016) have described four of these species as being endemic to reef habitats in the remote parts of the NWMR. These species include the:

- dusky sea snake (*Aipysurus fuscus*)
- large headed sea snake (*Hydrophis pacificus*)
- short-nosed sea snake (*Aipysurus apraefrontalis*)
- leaf-scaled sea snake (*Aipysurus foliosquama*).

The short-nosed sea snake, the leaf-scaled sea snake and the dusky sea snake are listed threatened species (Critically Endangered or Endangered) under the EPBC Act (see Table 7-1). Table 7-5 presents further information about their preferred habitat, diet and habitat location.

The Kimberley coast has the world's highest diversity of sea snakes, supporting over one third of all known species (Somaweera and Saunders 2015). There is currently limited knowledge about the ranges and distribution patterns of sea snake species in the NWMR, in addition to a lack of understanding about population status and threats. Recent findings of *A. apraefrontalis* and *A. foliosquama* in locations outside of their previously defined ranges have highlighted the lack of information about species distributions in the NWMR (Udyawer *et al.* 2016). Udyawer *et al.* (2020) used a correlative modelling approach to understand habitat associations and identify suitable habitats for five sea snake species (*A. apraefrontalis*, *A. foliosquama*, *A. fuscus*, *A. l. pooleorum* and *A. tenuis*). Species-specific habitat suitability was modelled across 804,244 km² of coastal waters along the NWS, and the resulting habitat suitability maps enabled the identification of key locations of suitable habitat for these five species (see Table 7-5).

No habitat critical to survival or BIAs for sea snake species have been identified in the NWMR. While the Ashmore Reef and Cartier Island AMPs have been recognised for their high diversity and density of sea snakes (DSEWPaC 2012a), surveys have revealed a steep decline in sea snake numbers at Ashmore Reef (Guinea 2007b; Lukoschek *et al.* 2013). Leaf-scaled and short-nosed sea snakes have been absent from surveys at Ashmore Reef since 2001, despite an increase in survey intensity (Guinea, 2006, 2007b; Guinea and Whiting 2005; Lukoschek *et al.* 2013). The reason for the decline is unknown.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-5: Information about threatened sea snake species within the NWMR

Species	Preferred habitat and diet	Habitat location
Short-nosed sea snake	Preferred habitat: Primarily on reef flats or in shallow waters of outer reef edges to depths of 10 m (Minton *et al.* 1975). Typically, movement is restricted to within 50 m of reef flat habitat (Guinea and Whiting 2005). Diet: Primarily fishes and eels.	The short-nosed sea snake has been recorded from Exmouth Gulf to the reefs of the Sahul Shelf, although most records come from Ashmore and Hibernia reefs (Guinea and Whiting 2005). Key locations of suitable habitat: Ashmore Reef, Exmouth Gulf and coral habitat fringing the Muiron Islands and the Montebello Islands (Udyawer *et al.* 2020).
Leaf-scaled sea snake	Preferred habitat: The leaf-scaled sea snake occurs in shallow protected areas of reef flats, typically in water depth less than 10 m. Diet: Primarily shallow water coral-associated wrasse, gudgeons, clinids and eels (McCosker 1975; Voris 1972; Voris and Voris 1983).	The leaf-scaled sea snake has only been recorded at Ashmore and Hibernia reefs (Guinea and Whiting 2005), indicating it has a very limited distribution. Key locations of suitable habitat: Ashmore Reef, Shark Bay, Exmouth Gulf, Barrow Island and Montebello Islands (Udyawer *et al.* 2020).
Dusky sea snake	Preferred habitat: The dusky sea snake is a reef specialist that is only known to occur on complex hard coral reefs and shoals, both emergent and subsurface. It has only been recorded at depths of 0 to 20 m but may occur in deeper areas with less survey effort (DCCEEW 2024m). Diet: Stomach content analyses have identified benthic gobies, wrasses and occasionally fish eggs (DCCEEW 2024m).	The dusky sea snake has been recorded sparsely and patchily from reefs and shoals at the outer margin and mid-shelf of the Australian continental shelf, specifically at the Scott Reef complex (Scott Reef, North Scott Reef and Sandy Islet) and nearby Seringapatam Reef, Heywood Shoal, and at Ashmore Reef, Cartier Island and Hibernia Reef. The dusky sea snake has not been detected at Ashmore Reef, Cartier Island or Hibernia Reef since the early 2000s. The species may occur undetected at mid-shelf shoals, which comprise the shallowest of sea mounts and banks that occur along a north-easterly crescent from south of Heywood Shoal, past Cartier Island, to Ashmore Reef (DCCEEW 2024m).

7.2.3 Crocodiles

The PMST report identified the salt-water crocodile (*Crocodylus porosus*) is listed as a migratory species under the EPBC Act within the NWMR (Table 7-1). This species is usually found in Australian coastal waters, including estuaries, lakes, inland swamps and marshes, and have been recorded persisting in freshwater bodies hundreds of kilometres inland. In the NWMR, the species is found in most major river systems of the Kimberley, including the Ord, Patrick, Forrest, Durack, King, Pentecost, Prince Regent, Lawley, Mitchell, Hunter, Roe and Glenelg rivers. The largest populations occur in the rivers draining into the Cambridge Gulf and the Prince Regent River and Roe River systems. There have also been isolated records in rivers of the Pilbara region, around Derby near Broome and as far south as Carnarvon on the mid-west coast (DoE 2026b).

The preferred nesting habitat of the salt-water crocodile includes elevated and isolated freshwater swamps with no tidal movements, with vegetation and floating rafts of vegetation for nesting. Nesting usually occurs between November and May, with a peak between January and February (DoE 2026b). No BIAs for salt-water crocodile have been identified in the NWMR.

7.2.4 Water monitors

The PMST report identified a total of two EPBC Act listed threatened water monitors within the NWMR (Table 7-1) that inhabit coastal areas. Table 7-6 describes these.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-6: Water monitors identified within the NWMR

Species	Key information
Mertens' water monitor	Mertens' water monitor (*Varanus mertensi*) is listed as endangered under the EPBC Act. This species occurs sparsely across the tropical areas of the Kimberley extending to the NT, inhabiting coastal areas and near coastal islands. Extensive surveys in the Kimberley found the Mertens' water monitor on 11 of the islands off the coast of the Kimberley and NT. These islands represent <1% of the modelled distribution of this species (DCCEEW 2023i). This species is highly aquatic and seldom ventures more than 5 to 10 m from the water's edge, except when travelling between core aquatic sites. It inhabits swamps, creeks, floodplains, lagoons, swamps and perennial and semi-perennial pools, and is known to bask on structures in and surrounding water bodies (DCCEEW 2023i). Habitat critical to the survival of the species has not been mapped but includes all areas where the species persists after cane toads have established and areas within known distribution where habitat occurs or can be restored (terrestrial) (DCCEEW 2023i). No BIAs for Mertens' water monitor have been identified in the NWMR.
Mitchell's water monitor	Mitchell's water monitor (*Varanus mitchelli*) is listed as critically endangered under the EPBC Act. The species is known to occur in wetlands and coastal floodplains in the northern extent of the NWMR, with distribution from Yampi Sound Training Area, across the Kimberley and into the Top End of the NT and far northwest Queensland (DCCEEW 2023c). The species inhabits freshwater and saline wetlands that range from seasonal gorges in upper catchments to large rivers and coastal floodplains. It has been recorded in rivers, creeks, riffle zones, gorges, springs, lagoons, swamps, mangroves and foreshores (DCCEEW 2023c). Habitat critical to the survival of the species has not been mapped but includes all areas where the species persists after cane toads have established and areas within known distribution where habitat occurs or can be restored (terrestrial) (DCCEEW 2023c). No BIAs for Mitchell's water monitor have been identified in the NWMR.

8. MARINE MAMMALS

8.1 Regional context

The offshore waters of WA provide important habitat for marine mammals, including areas that support key life stages such as breeding, calving, foraging and migration. As described in the Marine Bioregional Plan for the North-west Marine Region (DSEWPaC 2012a), of the 45 species of cetacean occurring in Australian waters, 21 occur regularly in the waters of the NWMR and a further 12 may occur infrequently. In the waters of the NMR, nine of the 45 cetacean species occur regularly and a further 15 may occur infrequently (DSEWPaC 2012c). In the SWMR, 33 species of cetaceans occur frequently, with a further ten that may occur infrequently in the region (DSEWPaC 2012b).

The NWMR is an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters of the NWMR for several cetacean species (DSEWPaC 2012a). Numerous large mysticetes (baleen whale) species, particularly the humpback whale, are known to use the region for migration and calving, and the pygmy blue whale is known to use the region for foraging and as a migration pathway between southern feeding and northern breeding and feeding areas north of the equator. The waters of the NWMR and the NMR also support globally significant dugong populations (DSEWPaC 2012a; 2012c).

The SWMR is an important area for numerous marine mammal species, including pinniped species, large, migratory whale species and resident coastal whale and dolphin species (DSEWPaC 2012b).

The NMR and adjacent areas are important for several species of cetaceans, particularly inshore dolphin species. These species, and other marine mammals, rely on the waters of the NMR and adjacent coastal areas for breeding and foraging (DSEWPaC 2012c).

The PMST report (Appendix A) identified a total of 15 EPBC Act listed threatened or migratory marine mammal species, including cetaceans, one dugong and one pinniped, within the NWMR (Table 8-1). An additional 22 EPBC Act listed cetacean species that do not have a threatened or migratory status were recorded within the NWMR. Appendix A provides a full list.

The PMST report identified a total of 12 EPBC Act listed threatened or migratory marine mammal species, including cetaceans and one dugong, within the NMR. An additional 15 EPBC Act listed cetacean species that do not have a threatened or migratory status were recorded within the NMR. Appendix A provides a full list.

The PMST report identified a total of 12 EPBC Act listed threatened or migratory cetaceans and one pinniped species within the SWMR. An additional 29 EPBC Act listed cetacean species, and one pinniped species, that do not have a threatened or migratory status were recorded within the SWMR. Appendix A provides a full list.

8.2 Marine mammals in the NWMR

Table 8-1 outlines the threatened and migratory marine mammal species identified by the PMST that may, are likely or are known to occur within the NWMR, with their conservation status and relevant recovery plans and conservation advice.

8.2.1 Cetaceans

Cetaceans are generally widely distributed and highly mobile. In general, distribution patterns reflect seasonal feeding and breeding areas, characterised by high productivity, and migration routes associated with reproductive patterns. The NWMR is an important migratory pathway between feeding grounds in the Southern Ocean and breeding grounds in tropical waters for several cetacean species (DSEWPaC 2012a).

The PMST report identified 35 EPBC Act listed cetacean species as potentially occurring or having habitat within the NWMR (Appendix A). Of those, 13 cetacean species are listed as threatened or migratory (Table 8-1), including baleen whales, toothed whales and dolphins that occur within the NWMR.

Table 8-2: Information about the threatened/migratory cetacean species within the NWMR

Species	Key information
Baleen whales (Mysticeti) – low frequency hearing	
Humpback whale	In Australian waters, two genetically distinct populations of humpback whales migrate annually along the west (Group IV/D) and east (Group V) coasts between May and November (Jenner *et al.* 2001), The population of humpback whales (*Megaptera novaeangliae*) known as Group IV/D migrate annually from Antarctic feeding grounds, passing along the coast of WA to warm tropical waters, including the Kimberley, North West Cape and Exmouth Gulf, for breeding and calving (Russell *et al.* 2024). The biannual migration of humpback whales through the NWMR occurs in winter (June to August) for northbound migrating whales and southbound in early spring (September to November). Population data for the WA subpopulation is considerably variable (DAWE 2022). The population has been increasing in size at a rate of about 10% per annum since whaling ceased in WA waters by 1963 (Thums *et al.* 2018) and population numbers have increased from about 2,000 to 3,000 individuals in 1991 to between 19,200 and 33,850 individuals in 2008 (Bannister and Hedley 2001; Bejder *et al.* 2019; Hedley *et al.* 2011). Aerial surveys off the WA coast between 2000 and 2008 produced a population estimate for Group IV of 26,100 individuals (Salgado Kent *et al.* 2012) and the predicted increasing trend in abundance predicted by modelling (Thums *et al.* 2018). The International Whaling Commission (IWC) estimated that in 2012 the WA subpopulation had recovered to 90% (74 to 98% probability interval) of its pre-whaling levels and projected that by 2020 it would have reached 98% (88 to 100% probability interval) (IWC 2015, cited in DAWE 2022). Due to the unprecedented population recovery, the humpback whale was removed from the EPBC Act threatened species list as it was deemed no longer eligible for inclusion (*DAWE 20*22) after a previous listing as vulnerable for many decades. The Group IV population migrates northward from their Antarctic feeding grounds around May each year, reaching the NWMR around early June. The southward migration subsequently starts in mid-September, after time for breeding and calving (typically within August and September) (Threatened Species Scientific Committee 2015b). Within the NWMR are key calving areas between Broome and the northern end of Camden Sound, and resting areas in the southern Kimberley region, Exmouth Gulf and Shark Bay. High numbers of humpback whales are observed in Camden Sound and Pender Bay from June to September each year (Threatened Species Scientific Committee 2015b) and as far south as Gourdon Bay in the Kimberley (Thums *et al*. 2018). There are reports of neonates present further south, suggesting the calving areas may be poorly defined, expanding or returning to pre-whaling patterns as the population recovers. Aerial photogrammetric surveys in 2013 and 2015 recorded large numbers of humpback whale calves along the North West Cape, with estimated minimum relative calf abundance of 463 to 603 in 2013 and 557 to 725 in 2015 (Irvine *et al.* 2018). Most calves sighted in both years (85% in 2013; 94% in 2015) were neonates, and these observations indicate a minimum of about 20% of the expected number of calves of this population are born near or south of North West Cape. Thus, the calving grounds for the Group IV population extend south from Camden Sound to at least North West Cape, 1,000 km south-west of the currently recognised calving area (Irvine *et al.* 2017) and further south, as reported for Geographe Bay and Flinders Bay (in July and August) in south-west WA (Jolliffe *et al.* 2024). Table 10-1 presents the seasonal presence of humpback whales. Migration, breeding and calving BIAs for the humpback whale within the NWMR are presented in Table 8-3 and Figure 8-2.
Blue whale	There are two recognised subspecies of blue whale in the southern hemisphere, both of which are recorded in Australian waters. These are the southern (or 'true') blue whale (*Balaenoptera musculus*) and the 'pygmy' blue whale (*Balaenoptera musculus brevicauda*) (Commonwealth of Australia 2015a). In general, southern blue whales occur in waters south of 60°S and pygmy blue whales occur in waters north of 55°S (as in, not in Antarctic waters). On this basis, it is reasonably assumed all blue whales sighted in the NWMR are likely to be pygmy blue whales.

Species	Key information
	The migratory population, known as the East Indian Ocean pygmy blue whale population, migrates biannually through the NWMR. This population is seasonally distributed from Indonesia (a potential breeding ground) to south-west of Australia and east across the Great Australian Bight and Bonney Upwelling to beyond the Bass Strait (Blue Planet Marine 2020; McCauley *et al.* 2018). Migration seems to be variable, with some individuals appearing as resident to areas of high productivity and others migrating across long distances (Commonwealth of Australia 2015a). McCauley *et al.* (2018) describe three migratory stages around Australia for the East Indian Ocean pygmy blue whale population, based on collated passive acoustic data: a 'southbound migratory stage' where whales travel southwards from Indonesian waters offshore from the WA coastline, mostly from October to December but possibly into January of the next year; a protracted 'southern Australian stage' (January to June) where animals spread across southern waters of the Indian Ocean and south of Australia (with movement as far south as the Southern Subtropical Convergence Zone); and a 'northbound migratory stage' (April to August) where animals travel north back to Indonesia again. Extensive passive acoustic monitoring throughout the NWMR indicates migratory timing and distribution of pygmy blue whales (noting this survey method detects vocalising whales): • Acoustic monitoring by McCauley and Jenner (2010) in the Exmouth and northern Montebello Islands region identified a peak period in the northern migration of pygmy blue whales from April to August, and from November through to late December during the southern migration. • McCauley (2011b) recorded northbound migration between mid-April and early August and southbound migration between October and December and possibly into January for the Scott Reef area from 2006 to 2009, noting the absence of any southbound detection in 2007. • Noise loggers deployed in 2019 for a full year detected pygmy blue whales on their northern and southern migration. The noise loggers were at various locations about 40 to 50 km west of the activity area, and in about 1,300 m water depth. Many pygmy blue whales detected on their northern migration occurred from mid-April to the end of July, then again on their southern migration in November through to early December (Chevron Australia 2019). • Gavrilov *et al.* (2018) analysed acoustic data from an array of ocean bottom seismographs (recorded in December 2014) to detect pygmy blue whales, and showed the southbound migration was over an extended offshore corridor traversing an area up to 400 km northwest of North West Cape. • A targeted passive acoustic monitoring program to detect southbound migratory pygmy blue whales ran from late October 2021 to March 2022 with a deepwater acoustic long-term observatory lander (900 m depth) west of the Montebello Trough and C-lander (190 m depth) at the outer edge of the NWS (Warren *et al.* 2023). Despite vessel noise dominating low frequencies throughout the recording periods at both locations, pygmy blue whale song vocalisations and D-calls were detected from the start of the recording period through November and early December 2021. • An offshore trial of distributed acoustic sensing using fibre optic cables (submarine telecommunications cable) to detect low-frequency whales recorded vocalising pygmy blue whales within 12 km detection range within a 50 km long area on the outer edge of NWS (Debens *et al.* 2024). Pygmy blue whale detections were made from mid-November (start of the trial) through to mid-December 2023 and a couple of detections in early January 2024. The first satellite tracks of pygmy blue whales for this population documented northbound migration between WA and Indonesia (Double *et al.* 2014) and identified areas where whales had highest occupancy, such as Perth Canyon, Naturalist Plateau, North West Cape region and the Banda Sea. Pygmy blue whales tagged in the Bonney Upwelling region of SA in 2015 showed most of the tagged whales remained in SA waters during the tracking period, but one documented the migration to Indonesia via WA waters and a return journey (albeit via intermittent data) of the southbound migration to the southern coast of WA (Möller *et al.* 2020). Thums *et al*. (2022) used passive acoustic monitoring and satellite telemetry data (a combination of existing data and tag tracking data collected for WA between 2019 and 2022) to assess the spatial extent of the distribution, migration and foraging areas for pygmy blue whales in the south-east Indian Ocean associated with the northbound migration. The tag tracking results highlighted extensive use of slope habitat off WA and minimal use of shelf habitat by pygmy blue whales. Additionally, pygmy blue whales off WA were mostly engaged in migration, with short periods of foraging. Whale density was highest in the southern part of the north-west Australian coast and whales were there between April and June and November and December. This study also compared foraging and migration areas to described areas of importance (BIAs); some aligned such as migratory BIA for northbound pygmy blue whales while some had less than 10% overlap (Thums *et al.* 2022). The timing, distribution and behaviour of southbound pygmy blue whales is less well documented with reference to satellite tagging. Limited tagged whale data from Double *et al.* (2014), Möller *et al.* (2020) and Thums *et al.* (2022) indicated connectivity of migrating pygmy blue whales

Species	Key information
	from SA through WA to and back from Indonesia. Mustika *et al.* (2024) satellite tag tracking data for two southbound pygmy blue whales (tagged in Indonesia) suggest varying migratory pathways from the Savu Sea to subantarctic waters, as well as extended time in the Southern Subtropical Convergence Zone. One tagged whale traversed a migratory path through offshore waters of WA towards Heard and McDonalds islands, covering almost 6,000 km and travelling at 100 km per day. In contrast, a second tagged whale took a migratory journey similar to the documented northbound route to the North West Cape before heading out into offshore waters and spending time in the Subantarctic Front before looping back up through the Perth Canyon, North West Cape and towards Savu Sea (Mustika *et al.* 2024). More recent tagging data from Thums *et al.* (2025) observed one whale travelling southwards rather than northwards to forage off the shelf edge in Bremer Bay in an area where another pygmy blue whales were observed to be foraging. This highlights that not all pygmy blue whales migrate northward each year. More recent combined satellite tracking and dive behaviour data provide evidence about the timing and location of pygmy blue whales foraging along their migration pathway (Thums *et al.* 2025). This study showed pygmy blue whales forage intermittently during migration, with foraging and lunge feeding occurring every one to ten days (Thums *et al.* 2025). Foraging behaviour was confirmed in several areas along WA, including Perth Canyon to offshore Jurien Bay, the shelf edge near Geraldton and the Abrolhos region, offshore Ningaloo to the Montebello Islands, and in smaller areas near Shark Bay, offshore Bremer Bay and in the Savu Sea (Indonesian waters). Opportunistic foraging also occurred in offshore waters between these areas during long-distance migration (Thums *et al.* 2025). In southern WA, foraging and lunge feeding dives were typically in deeper waters (>300 m), associated with slower horizontal movement and predominantly foraged during daylight hours. In contrast, whales foraging off Ningaloo, the Kimberley and in Indonesian waters exhibited shallower dives (about 100 m), faster travel rates, and weaker or absent diel patterns, consistent with more opportunistic feeding (Thums *et al.* 2025). There is currently insufficient data to accurately estimate population numbers of the pygmy blue whale in Australian waters (Blue Planet Marine 2020; Commonwealth of Australia 2015a). There are, however, two estimates of population size of the East Indian Ocean pygmy blue whale for WA. McCauley and Jenner (2010) calculated the population to be between 662 and 1,559 individuals in 2004 based on passive acoustics (whale vocalisations), and Jenner *et al.* (2008) (based on photographic mark and recapture) calculated between 712 and 1,754 individuals. Neither estimates accounted for animals travelling further west into the Indian Ocean (McCauley *et al.* 2018). More recent passive acoustic data estimate a 4.3% growth rate that applies to the proportion of East Indian Ocean pygmy blue whales seasonally present in offshore water off south-eastern Australia and may not reflect the full population but does imply an increase (McCauley *et al.* 2018). Thums *et al.* (2022) identified the most important foraging (and resting or breeding) areas from south to north as: (1) the Perth Canyon and vicinity; (2) the shelf edge off Geraldton; (3) the shelf edge from Ningaloo Reef to the Rowley Shoals (not continuous) and including a couple of small areas near the shelf edge off about 25ºS; and (4) the Banda Sea. The foraging BIA off the south-west of WA encompassed 83% of the most important areas in that region (Thums *et al.* 2022). Thums *et al.* (2025) validated these areas using direct dive data and further showed that additional, smaller and more opportunistic foraging areas can occur outside designated BIAs, particularly during migration. The pygmy blue whale is typically in the Perth Canyon from November to June, with an observed peak between March and May (Commonwealth of Australia 2015a; Blue Planet Marine 2020). The pygmy blue whale feeds in the Perth Canyon at depths of 200 to 300 m, which overlaps the typical distribution of krill (200 to 500 m water depth (day) to surface (night)) (McCauley *et al.* 2004; Commonwealth of Australia 2015a). Other possible feeding grounds off the WA coast include the wider area around the Perth Canyon, and possible foraging areas off the Ningaloo Coast and at Scott Reef (Commonwealth of Australia 2015a). Table 10-1 presents the seasonal presence of pygmy blue whales. Table 8-3 and Figure 8-4 present the location and type of BIAs for blue whales in the NWMR. There is a migratory BIA for the pygmy blue whale within WA waters, which extends for most of the length of the NWMR within offshore waters.

Species	Key information
Bryde's whale	The Bryde's whale is the least migratory of its genus and is restricted geographically from the equator to about 40°N and S, or the 20° isotherm (Bannister *et al.* 1996). The species is known to exhibit inshore and offshore forms, varying in morphology and migratory behaviours in other international locations (Bannister *et al.* 1996). This appears to also be the case within Australian waters. Bryde's whales have been identified as occurring in oceanic and inshore waters, with the only key localities recognised in WA being in the Houtman Abrolhos Islands and north of Shark Bay (Bannister *et al.* 1996). Data suggest offshore whales migrate seasonally, heading towards warmer tropical waters during the winter, but information about migration within the NWMR is not well known (McCauley and Duncan 2011). McCauley (2011b) detected Bryde's whales using acoustic loggers deployed in and around Scott Reef from 2006 to 2009. Other acoustic logger data of Bryde's whale vocalisations recorded between Ningaloo and north of Darwin showed no apparent trends or seasonality (McCauley 2011a). There are no identified BIAs for this species in the NWMR.
Southern right whale	The southern right whale occurs primarily in waters between about 20°S and 60°S and moves from high-latitude feeding grounds in summer to warmer, low-latitude coastal locations in winter (Bannister *et al.* 1996). Two populations of southern right whale occur in Australian waters: the western and eastern (DCCEEW 2024a). Southern right whales in Australian waters predominantly occur in aggregations in coastal water reproductive areas where they calve and nurse their young from May to October, primarily occupying shallow waters (<10 m depth) within 1 km of the coastline (Charlton *et al.* 2019; Smith *et al.* 2022a, cited in DCCEEW 2024a). Peak period of abundance is late July to August, with seasonal variability. Females accompanied by a calf generally occupy the calving ground for two to three months between June and September (DCCEEW 2024a). Recent long-term monitoring data indicated more than 95% of southern right whales using key calving areas were also found to occur within 1 km of the shore, typically in shallow sheltered environments, such as Head Bight, Fowlers Bay and Encounter Bay in SA (O'Shannessy *et al.* 2025). For the western population, breeding occurs in Exmouth Gulf and in calving areas along the south coast of WA outside of the NWMR (DCCEEW 2024a). A stranding record exists for the far north Kimberley coast (Atlas of Living Australia 2006). Known females have rarely been observed on the Australian coastline in the year before calving, suggesting mating and conception may predominantly occur away from calving grounds, potentially on feeding grounds (Watson *et al*. 2021, cited in DCCEEW 2024a). There is a significant energetic cost to the mother in the late stages of gestation (last trimester) and calf growth rate has been found to depend on the maternal body size and condition of the mother (Christiansen *et al.* 2018 and Christiansen *et al.* 2022, cited in DCCEEW 2024a). Foraging ecology of southern right whales is poorly understood and observations of foraging whales are rare (DCCEEW 2024a). There is evidence of an increase in the western population, whereas there is greater uncertainty of the population status and trends of the eastern population (DCCEEW 2024a). Southern right whale abundance in Australian waters is still far below estimated historic abundance (>20%) (DCCEEW 2024a). Long-term monitoring data from SA indicate population growth has slowed since around 2016, with average annual increases estimated at 3.34% for all individuals and 3.93% for cow–calf pairs. These rates are lower than those recorded in earlier decades (O'Shannessy *et al.* 2025). Abundance and reproductive success in southern right whales are primarily tied to foraging success and body condition, with southern right whales relying on stored energy reserves for reproductive success. A recent study identified declining reproductive performance in the WA southern right whale population, with calving intervals increasing from 3.4 to 4.1 years since, with sustained longer breeding intervals evident since 2015 (*Charlton et al*. 2026). This reproductive decline is associated with climate-driven trophic changes in key southern right whale offshore foraging areas. Since 2013, reduced Antarctic sea ice in high-latitude habitats has altered ecosystem structure and krill-based food webs, while mid-latitude regions have experienced warming, declining chlorophyll-a, and reduced prey availability since 2010 (Charlton *et al.* 2026). Calving intervals began increasing around 2010, with significant population-level shifts evident by 2015. This trend corresponds with a decline in the western population's growth rate from about 2016 onward (Charlton *et al.* 2026). There are a reproduction BIA and habitat critical to survival for the southern right whale within Exmouth Gulf (DCCEEW 2024a). A migration BIA extends 3 nm out from the coastline from Ningaloo and spans down the WA coastline and across the south and south-east coast of Australia (DCCEEW 2024a). Nursing and calving behaviours are known to occur within reproductive BIAs. Habitat critical to survival for the southern right whale has been identified as all reproductive BIAs across the species range (DCCEEW 2024a). See Figure 8-1 and Section 8.2.3 for habitat critical to survival for southern right whales in the NWMR. See Table 8-3 and Figure 8-5 for BIAs for southern right whales in the NWMR

Species	Key information
Antarctic minke whale	The Antarctic minke whale has a circumpolar distribution south of 60°S during summer (Risch *et al.* 2019) and has been recorded off all Australian states (apart from the NT) in winter (see the DCCEEW SPRAT profile). Their seasonal distribution and migration patterns are poorly understood (Risch *et al.* 2019). The species is highly associated with sea ice and feeds in cold Antarctic waters over the summer. It is thought the Antarctic minke whale migrates through offshore waters of WA to about 20°S to feed and possibly breed (Bannister *et al.* 1996). Information about timing and distribution, behaviour (migration and breeding) within the NWMR, however, is presently not known. In the high latitudinal winter breeding grounds in other regions, the species appears to be distributed off the continental shelf edge. No population estimates are available for Antarctic minke whales in Australian waters. Acoustic detection has been recorded for the Perth Canyon and Exmouth Plateau (McCauley 2011b), and more recently acoustic detection indicated presence in offshore waters of NWS in late October and all of November and was absent (based on no vocalisation and detection) in December 2021 to March 2022 (over a monitoring period from October 2021 to March 2022) (Warren *et al.* 2023). There are no identified BIAs for this species in the NWMR.
Sei whale	The sei whale is a baleen whale with a worldwide oceanic distribution, expected to seasonally migrate between low latitude wintering areas and high latitude summer feeding grounds (Bannister *et al.* 1996; Prieto *et al.* 2012). There are no known mating or calving areas in Australian waters. The species prefers deep waters, typically occurs in oceanic basins and continental slopes (Prieto *et al.* 2012), and exhibits a migration pathway influenced by seasonal feeding and breeding patterns. Sei whales have been infrequently recorded in Australian waters (Bannister *et al.* 1996). Reliable estimates of the sei whale population size in Australian waters are currently not possible due to a lack of dedicated surveys and their elusive characteristics. Similarly, the extent of occurrence and area of occupancy of sei whales in Australian waters cannot be calculated due to the rarity of sighting records. They will typically travel in small pods of three to five individuals, with some segregation by age, sex and reproductive status. Calving grounds are presumed to exist in low latitudes with mating and calving potentially occurring during winter months (Threatened Species Scientific Committee 2015a). There are no known mating or calving areas in Australian waters, and no identified BIAs for this species in the NWMR.
Fin whale	The fin whale is a large baleen whale distributed worldwide. Fin whales migrate annually between high latitude summer feeding grounds and lower latitude overwintering areas (Bannister *et al.* 1996) and follow oceanic migration paths. The species is uncommonly encountered in coastal or continental shelf waters. Australian Antarctic waters are important feeding grounds for fin whales but there are no known mating or calving areas in Australian waters (Morrice *et al.* 2004). The species has been observed in groups of six to ten individuals, as well as in pairs and alone (Threatened Species Scientific Committee 2015c). Accurate distribution patterns are not known within Australian waters and most data are from stranding events. Fin whales have been recorded vocalising off the Perth Canyon, WA, between January and April 2000 (McCauley *et al.* 2000). It is currently not possible to accurately estimate the population size of fin whales in Australian waters predominantly due to the species' behaviour and local ecology, as the proportion of time they spend at the surface varies greatly depending on these factors. In addition, natural fluctuations of fin whales in Australian waters are unknown, but long-range movements do appear to be prey related (Aulich *et al.* 2022). A recent study by Aulich *et al.* (2022) used passive acoustic monitoring as a tool to identify the migratory movements of fin whales in Australian waters. On the west coast, the earliest arrival of these animals from Antarctica occurred at Cape Leeuwin in April, and between May and October they migrated along the WA coastline to the Perth Canyon, which likely acts as a feeding zone for migratory whales (Aulich *et al.* 2022). Some whales were found to continue migrating northwards along the WA coastline, with vocalisation presence recorded as far north as Dampier between August and late October (Aulich *et al.* 2022). There are no identified BIAs for this species in the NWMR.
Omura's whale	Omura's whale is a species of baleen whale that was first described in 2003. Previously specimens of Omura's whale were identified as pygmy/dwarf Bryde's whales, but morphological and molecular evidence identified Omura's whale as a distinct species not closely related to Bryde's whale in 2003 (Ottewell *et al.* 2016). It was believed the range of Omura's whale was restricted to the eastern Indo-Pacific, but recent discoveries suggest the species may have a more widespread distribution (Ottewell *et al.* 2016; Cerchio *et al.* 2019). In Australia, presence of this species was confirmed in 2015 when, what was later determined to be an Omura's whale, was stranded on the northwest coast of Australia, near Exmouth (Ottewell *et al.* 2016). An in-depth review by Cerchio *et al.* (2019) concluded Omura's whale can primarily be found in tropical and warm-temperate waters and is currently known from all

Species	Key information
	ocean basins, excluding the central and eastern Pacific. Further, a strong tendency toward a coastal and neritic water distribution was found, although there were several pelagic water records, most of which were on the continental shelf and within shallow seas throughout the documented range (Cerchio *et al.* 2019). Passive acoustic monitoring indicates Omura's whales are present across multiple regions of northern Australian waters, with vocal detections extending from northwest Australia (Timor Sea, Kimberley, Pilbara and Gascoyne) to the Great Barrier Reef. Vocalisations were recorded repeatedly over extended periods (hours), indicating extended vocal activity and consistent species presence within the monitoring locations (Browne *et al.* 2025). While detections occurred across all surveyed regions, differences in call occurrence were observed (Browne *et al*. 2025). The Warren *et al.* (2023) targeted passive acoustic monitoring program to detect southbound migratory pygmy blue whales ran from late October 2021 to March 2022, with a deepwater acoustic long-term observatory lander (900 m depth) to the west of the Montebello Trough and C-lander (190 m depth) at the outer edge of the NWS. Calls of the Omura's whales were detected at both locations throughout the recording period. Detections were, however, more common at the deeper water location, in terms of both number of detection days and number of detection hours per day (Warren *et al.* 2023). The shelf edge location showed Omura's whale present primarily in December, but this lander malfunctioned and stopped recording in mid-January 2022. An offshore trial of distributed acoustic sensing using fibre optic cables (submarine telecommunications cable) to detect low-frequency whales recorded vocalising Omura's whales within a 12 km detection range along a 50 km long area on the outer edge of the NWS (Debens *et al.* 2024). Omura's whale detections were made from the beginning of December 2023 through to mid-January 2024 (and the end of the trial). Currently little is known about the ecology and life history characteristics of Omura's whale, resulting in an IUCN listing of Data Deficient. There are no identified BIAs for this species in the NWMR.
Toothed whales (Odontoceti) – high frequency hearing	
Sperm whale	Sperm whales are the largest of the toothed whales and are distributed worldwide in deep waters (greater than 200 m) off continental shelves and sometimes near shelf edges (Bannister *et al.* 1996). The species tends to inhabit offshore areas at depths of 600 m or more and is uncommon in waters less than 300 m deep (Ceccarelli *et al.* 2011). There is limited information about sperm whale distribution in Australian waters, but they are usually found in deep offshore waters, with more dense populations near continental shelves and canyons. In the open ocean, there is a generalised movement of sperm whales southwards in summer, and corresponding movement northwards in winter, particularly for males. Detailed information about the distribution and migration patterns of sperm whales off the WA coast is not available. Females with young may reside within the NWMR all year, males may migrate through the region, and the species may be associated with canyon habitats (Ceccarelli *et al.* 2011).Sperm whales have been recorded in deep waters off North West Cape and appear to occasionally venture into shallower waters in other areas. Twenty-three sightings of sperm whales (variable pod sizes, ranging from one to six animals) were recorded by marine mammal observers during the North West Cape multi-client 3D marine seismic survey (December 2016 to April 2017) (Woodside 2020). These animals were observed in deep, continental slope waters of the Montebello Saddle (maximum distance of about 90 km from North West Cape), and the waters overlying the canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF. The deep waters above the gully/saddle on the inner edge of the plateau (the Montebello Saddle) are thought to be important for sperm whales that may feed in the region (based on 19th century whaling records; Townsend 1935). Recent studies such as acoustic detection indicated sperm whale presence in deep, offshore waters but not at the edge of the NWS (over a monitoring period of October 2021 to March 2022, for the deepwater location). However, while sperm whales were detected every month, occurring in bouts, there was no evidence for lasting use of the area around this recording location (Warren *et al.* 2023), Ferriera *et al.* (2024) reported sperm whale sightings off North West Cape in May 2023. A total of 26 individual sperm whales were sighted about 30 km offshore in groups up to ten individuals. The sperm whales were observed displaying surface logging behaviour, with frequent and numerous blows before flukes-up dives (indicative of deep feeding behaviour). Such aggregations appear to be an annual occurrence and at the same time as migratory pygmy blue whale feed and move through the same area, to the west and offshore of Ningaloo and North West Cape. Sperm whales produce foraging sounds during deep dives, but their echolocation clicks have much lower peak frequencies (about 15 kHz) than the detection bandwidth that high-frequency acoustic monitoring systems use on the NWS. As a result, sperm whales are unlikely to be detected by recorders, despite being one of several deep-diving toothed whale species that regularly forages in the region (Madhusudhana *et al.* 2026).

Species	Key information
	There are no identified BIAs for this species in the NWMR.
Orca (killer whale)	The preferred habitat of killer whales (*Orcinus orca*) includes oceanic, pelagic and neritic (relatively shallow waters over the continental shelf) regions, in both warm and cold waters. Killer whales appear to be more common in cold, deep waters, but have been observed along the continental slope and shelf, particularly near seal colonies, and in shallow coastal areas of WA (Bannister *et al.* 1996; Thiele and Gill 1999). The total number of killer whales in Australian waters is unknown, but the total number of mature animals within waters around the continent may be less than 10,000. Killer whales are known to make seasonal movements, and probably follow regular migratory routes, but no information is available for the species in Australian waters. There is thought to be at least three distinct groups of killer whales in Australian waters, with key groups in the South-east Marine Region, the SWMR and NWMR. These groups appear to vary depending on broader tropical and temperate environmental conditions that influence prey choices, habitat preferences and phenotypic traits (Hutchings *et al.* 2025). Recent species distribution modelling of killer whales in Australian waters has provided a large-scale assessment of potential habitat suitability of these regional populations. The modelling identified areas of higher habitat suitability in WA, including nearshore and reef-associated waters of the Ningaloo Reef region during the astral winter, and in the SWMR during February and March, consistent with sighting records. Suitable habitat in the NWMR was concentrated in nearshore and reef environments, particularly along Ningaloo Reef, extending north to offshore reefs and islands in the Kimberley, and southwards along the coast to Carnarvon and Geraldton. These areas are characterised by oceanographic conditions and enhanced productivity that support prey aggregations, including migratory baleen whales, which killer whales are known to target in the region. Environmental predictors demonstrated clear ecological differentiation between killer whale groups, with the northwest population showing a preference for warm tropical waters in contrast to temperate-associated groups in southern regions (Hutchings *et al.* 2025). Killer whales are top-level carnivores. There are reports from around Australia of attacks on dolphins, juvenile humpback whales, blue whales, sperm whales, dugongs and Australian sea lions (Bannister *et al.* 1996). Killer whales target humpback whales, particularly calves, off Ningaloo Reef during the humpback southern migration season (Pitman *et al.* 2015). Overall, observations suggest humpback calves are a predictable, plentiful and readily taken prey source for killer whales off Ningaloo Reef for at least five months of the year. There are also records of killer whales attacking dugongs in Shark Bay (Anderson and Prince 1985). However, attacks appear opportunistic as there are no recognised key localities or important habitats for killer whales within the NWMR (DSEWPaC 2012a). There are no identified BIAs for this species in the NWMR.
Australian snubfin dolphin	Stranding and museum specimen records indicate Australian snubfin dolphins occur only in waters off northern Australia, from around Broome on the west coast to the Brisbane River on the east coast (Parra *et al.* 2002). Aerial and boat-based surveys indicate Australian snubfin dolphins occur mostly in protected shallow waters near the coast, and near river and creek mouths (Parra 2006; Parra *et al.* 2006; Parra *et al.* 2002). Within the NWMR, this species has been found in the shallow coastal waters and estuaries along the Kimberley coast. Beagle and Pender bays on the Dampier Peninsula, and tidal creeks around Yampi Sound and between Kuri Bay and Cape Londonderry, are important areas for Australian snubfin dolphins (DEWHA 2008a). Roebuck Bay has generally been considered the south-western limit of snubfin dolphin distribution across northern Australia, but the species has been recorded in Port Hedland harbour, Dampier Archipelago, Montebello Islands, Exmouth Gulf and off North West Cape (Allen *et al.* 2012). Roebuck Bay supports one of the largest known populations of Australian snubfin dolphins (D'Cruz *et al.* 2022). A first comprehensive catalogue of snubfin dolphin sightings has been compiled for the Kimberley, north-west WA (Bouchet *et al.* 2021) and documented that snubfin dolphins are consistently encountered in shallow water (<21 m depth) near (<15 km) freshwater inputs, with high detection rates in known hotspots such as Roebuck Bay and Cygnet Bay and suitable coastal habitat in the wider Kimberley region. Table 8-3 and Figure 8-6 present the location and type of BIAs for Australian snubfin dolphins in the NWMR.

Species	Key information
Indo-Pacific humpback dolphin (Australian humpback dolphin)	Previously included with *Sousa chinensis*, the Australian humpback dolphin (*S. sahulensis*) was elevated to a species in 2014. *S. chinensis* is now applied for humpback dolphins in the eastern Indian and western Pacific oceans and *S. sahulensis* for humpback dolphins in the waters of the Sahul Shelf from northern Australia to southern New Guinea (Jefferson and Rosenbaum 2014). The Australian humpback dolphin is listed as *S. chinensis* under the EPBC Act. The Australian humpback dolphin (referred to as 'humpback dolphin' hereafter) inhabits the tropical/subtropical waters of the Sahul Shelf across northern Australia and southern Papua New Guinea (Jefferson and Rosenbaum 2014). Based on historical stranding data, museum specimens and opportunistic sightings collected during aerial and boat-based surveys for other fauna, it has been inferred that humpback dolphins occur from the WA/NT border to the south-west to Shark Bay (Hanf *et al.* 2016). Allen *et al.* (2012) suggested humpback dolphins use a range of inshore habitats, including clear and turbid coastal waters across northern WA. The waters surrounding North West Cape are an important area for the species. Boat-based surveys up to 5 km from the coast (Brown *et al.* 2012) recorded humpback dolphins from 0.3 to 4.5 km away from shore and in depths ranging from 1.2 to 20 m, with a mean of about 8 m. Other studies around North West Cape, surveying waters up to 5 km from the coast, recorded humpback dolphins in water depths of up to 40 m (Hanf *et al.* 2016). Based on density, site fidelity and residence patterns, the North West Cape has been identified as an important habitat at the southwestern limit of this species' range (Hunt *et al.* 2017). Additionally, Brown *et al.* (2014) reported evidence of hybridisation between the Australian snubfin and humpback dolphin populations in north-western Australia. Aerial line-transect surveys across the Pilbara between 2015 and 2017 produced modelled abundance estimates for Australian humpback dolphins of 1,546 (2016) and 2,690 (2017) (Raudino *et al.* 2023). Densities were highest in nearshore waters, with hotspots in Exmouth Gulf, Dampier Archipelago and the Great Sandy Islands. However, aerial surveys targeting other marine species over the western Pilbara have recorded humpback dolphins more than 50 km from the mainland in shallow shelf waters (<30 m deep) near Barrow Island and the western Lowendal Islands (Hanf 2015). The species has also been recorded in fringing coral reef and shallow, sheltered sandy lagoons at the Montebello Islands (Raudino *et al.* 2018). Humpback dolphins do not appear to undergo large-scale seasonal migrations, although seasonal shifts in abundance have been observed (Parra and Cagnazzi 2016, cited in DCCEEW 2023a). Table 8-3 and Figure 8-7 provide the location and type of BIAs for Australian humpback dolphins in the NWMR.
Indo-Pacific bottlenose dolphin (spotted bottlenose dolphin)	There are four known subpopulations of spotted bottlenose dolphins, of which the Arafura/Timor Sea populations were identified as potentially occurring within the NWMR. The species is restricted to inshore areas such as bays and estuaries, nearshore waters, open coast environments, and shallow offshore waters, including coastal areas around oceanic islands, from Shark Bay to the western edge of the Gulf of Carpentaria. The species forages in a range of habitats but is generally restricted to water depths of less than 200 m (DSEWPaC 2012a). Important foraging and breeding areas include the shallow coastal waters and estuaries along the Kimberley coast and Roebuck Bay. A study at North West Cape found spotted bottlenose dolphins were more likely to occur in coastal lagoons west of North West Cape during winter months than other seasons. In spring, the probability of occurrence was higher outside of the Ningaloo Marine Park, although summer data was not included in this study (Haughey *et al.* 2021). Aerial transect surveys in the Kimberley region showed the abundance for bottlenose dolphins has been declining, with estimated abundance of 3,713 individuals in 2015, 2,638 in 2016 and 1,635 in 2017. Spotted bottlenose dolphins off North West Cape exhibit a highly fluid spatial and temporal structure, characterised by loose, non-random associations with low temporal stability and frequent turnover of individuals. The absence of distinct social clusters indicates an open, fission–fusion population, with space use and associations varying over short timeframes rather than reflecting stable, long-term groupings (Edwards *et al.* 2025). Spatial data collected in Ningaloo Marine Park between 2013 and 2019 showed the distribution of foraging groups was related to distance from the nearest boat ramp and seabed slope, with the foraging dolphins more likely to occur 3,000 to 5,000 m from the nearest boat ramp and in areas of moderate seabed slope. Resting dolphins were localised and most likely to occur in shallow waters (5 to 10 m deep) within designated Sanctuary Zones of the Ningaloo Marine Park. Dolphins travelling were more likely to occur 1,000 to 2,000 m from the coast and in water depths of 7 to 12 m, but were observed to reach depths of 20 m (Haughey *et al.* 2025). Table 8-3 and Figure 8-8 provide the location and type of BIAs for spotted bottlenose dolphins in the NWMR.

8.2.2 Dugongs

The dugong is listed as migratory under the EPBC Act (DSEWPaC 2012a).

Seagrass meadows in coastal waters, estuarine creeks and streams within and adjacent to the NWMR support significant populations of dugongs, including Shark Bay, Exmouth Gulf, Ningaloo Reef, Broome and the Kimberley coast, as well as offshore seagrass meadows at Ashmore Reef (DSEWPaC 2012a). Dugongs are distributed along the WA coast throughout the Gascoyne, Pilbara and Kimberley regions. Specific areas supporting dugong populations include Shark Bay, Ningaloo Reef, Exmouth Gulf, the Pilbara coast (Exmouth Gulf to De Grey River [Marsh *et al.* 2002]), Eighty Mile Beach, and the Kimberley coast, including Roebuck Bay (Bayliss and Hutton 2017). Dugong distribution is correlated with the seagrass habitats upon which it feeds, although water temperature has also been correlated with dugong movements and distribution (Preen *et al.* 1997; Preen 2004). Even areas with sparse seagrass coverage (e.g. 2 to 10% in the Pilbara) can serve as a key driver of dugong presence and abundance (Said *et al.* 2025).

Dugongs are highly migratory and have been observed moving large distances (DSEWPaC 2012a). Although the patterns of dugong movement in WA are not well understood, it is suggested dugong movements are influenced by water temperatures (Holley *et al.* 2006; Marsh *et al.* 2011) and the availability of seagrass foraging habitats (Marsh *et al.* 1994; Preen *et al.* 1997; Said *et al.* 2025). Dugongs are typically associated with shallow waters (<100 m), which support the growth of subtropical and tropical seagrass meadows (Marsh *et al.* 2025). Dugongs are known to migrate between seagrass habitats (hundreds of kilometres) (Sheppard *et al.* 2006), and in Shark Bay they exhibit seasonal movements as a behavioural thermoregulatory response to winter water temperatures (Holley *et al.* 2006; Marsh *et al.* 2011).

Cleguer and Marsh (2023) present the most contemporary data for dugongs and population estimates via an inventory of dugong aerial surveys of Australia, including north-west Australia (Shark Bay, Ningaloo, Exmouth Gulf and Pilbara, the Kimberley region). The first standardised dugong aerial abundance surveys in Australia were conducted in the early 1980s. In regions including Shark Bay and the Ningaloo-Exmouth area, repeated surveys over several decades provide long-term datasets that suggest dugong populations are relatively stable or fluctuate over time, rather than showing clear long-term declines. In contrast, the Kimberley region has only been comprehensively surveyed in 2015 and 2017, meaning only baseline information is currently available for that region, and long-term population trends cannot yet be assessed (Cleguer and Marsh 2023).

There are BIAs for dugongs within and adjacent to waters of the NWMR (refer Section 7.2.3). Table 8-3 and Figure 8-9 provide the location and type of BIAs for dugongs in the NWMR.

8.2.3 Pinnipeds

The Australian sea lion is listed as a species that may occur or may have habitat within the NWMR (Appendix A).

The Australian sea lion's breeding range is only in SA and WA waters in the SWMR, extending from the Houtman Abrolhos Islands in WA to The Pages Islands, east of Kangaroo Island, in SA (DSEWPaC 2013a). The Australian sea lion is the only pinniped endemic to Australia (Strahan 1983) and has also been recorded within the southern extent of the NWMR in Shark Bay, WA (Kirkwood *et al.* 1992). All known breeding colonies occurring in WA and SA are considered as habitat critical to the survival of the species under the Recovery Plan for the Australian Sea Lion (DSEWPaC 2013a), noting subsequent work by Goldsworthy *et al.* (2021) has identified additional breeding sites, reflecting updated knowledge since 2013. Of these breeding sites, four are in the SWMR along the west coast of WA, including the Houtman Abrolhos Islands (Easter Group), Beagle Island, North Fisherman Island and Buller Island. There are also foraging BIAs for males and females along the west coast, extending from the Abrolhos Islands south to Rockingham. The Australian sea lion is unique among pinnipeds in being the only species that has a non-annual breeding cycle that is also temporally asynchronous across its range (DSEWPaC 2013a; Threatened Species Scientific Committee 2020). This means breeding periods (copulation and birthing) differ between colonies and can occur at various times of the year. The birth interval in Australian sea lions is about 17 to 18 months, and breeding seasons are protracted, lasting between four and nine months (Threatened Species Scientific Committee 2020).

The Australian sea lion is a specialised benthic forager, feeding primarily on the sea floor. Studies have shown the species will eat a range of prey, including fish, cephalopods (squid, cuttlefish and octopus), sharks, rays, rock lobsters and penguins (DSEWPaC 2013a; Threatened Species Scientific Committee 2020). The Australian sea lion forages predominantly on the continental shelf, with most dives occurring in

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

depths of 20 to 100 m. Individuals typically travel up to about 60 km from their colony on each foraging trip, with a maximum distance of around 190 km from their colony over shelf waters.

The Australian sea lion is a member of the Otariidae (eared seals) family. It was listed as endangered in 2020 (Threatened Species Scientific Committee 2020). An assessment of the status and trends in abundance of this endemic, coastal pinniped species (Goldsworthy *et al.* 2021) documented an overall reduction in pup abundance over three generations, providing strong evidence the species meets IUCN endangered criteria.

There is no designated habitat critical to survival or identified BIAs for the Australian sea lion in the NWMR.

8.2.4 Habitat critical to survival for marine mammals

The southern right whale is the only marine mammal that has habitat critical to survival of a species defined.

The National Recovery Plan for the Southern Right Whale (DCCEEW 2024a) identifies habitat critical to survival under the EPBC Act.

Habitat critical to survival for the southern right whale has been identified as all reproductive BIAs across the southern right whale range (Figure 8-1). The identification of habitat critical to survival reflects that southern right whales display strong site fidelity to calving areas in Australian coastal waters, within and between years, over decades (Bannister 2001; Charlton *et al.* 2021; Watson *et al.* 2021, cited in DCCEEW 2024a). Reproductive areas have been identified as habitat critical to survival for the species because:

- they meet the species' essential life cycle requirements for reproduction, such as mating, calving and nursing, and reproduction is known to occur at that location
- there is a level of occupancy by individual breeding females at these locations of multiple days in any given year, and across multiple years, for long-term maintenance of the species
- they are critical for recovery of the southern right whale in terms of expanding habitat occupancy and contributing to the maintenance of genetic diversity as site fidelity may lead to small-scale genetic differences.

No 'Critical Habitat' as defined under section 207A of the EPBC Act has been identified for the southern right whale. 'Critical Habitat' is different from habitat critical to survival and only applies to Commonwealth land and sea. There are also no important cetacean habitat areas identified in the Australian Whale Sanctuary as defined under section 228A of the EPBC Act for southern right whales (DCCEEW 2024a).

8.2.5 Marine mammal biologically important areas

A review of the Australian Marine Spatial Information System (Geoscience Australia 2026) identified BIAs representing important life cycle stages and behaviours for six species of marine mammals in the NWMR, presented in Table 8-3:

- Australian snubfin dolphin
- Indo-Pacific humpback dolphin (Australian humpback dolphin)
- Indo-Pacific/Indian Ocean spotted bottlenose dolphin
- dugong
- humpback whale
- pygmy blue whale, blue whale
- southern right whale.

9. SEABIRDS AND MIGRATORY SHOREBIRDS OF THE NWMR

9.1 Regional context

The NWMR supports high numbers and species diversity of seabirds and migratory shorebirds, including many that are EPBC Act listed as threatened and migratory. The NWMR Marine Bioregional Plan reported 34 seabird species (listed as threatened, migratory or marine) that are known to occur, and 30 of 37 species of migratory shorebird species that regularly occur in Australia, are recorded at Ashmore Reef in the NWMR (DSEWPaC 2012d). The NWMR Marine Bioregional Plan also noted that Roebuck Bay and Eighty Mile Beach are internationally significant and recognised migratory shorebird locations.

A 'Seabird and Shorebird Existing Knowledge and Threats' report was prepared (2022) and updated in 2024 (Worley 2024) to identify key bird species (categorised: pelagic seabirds, nearshore seabirds, shorebirds and others) and their threats in the NWMR (Worley 2024). The high and moderate occurrence species for the NWMR were informed from this report and PMST results. The report identified 92 species.

Each species was assigned to one of three 'frequency of occurrence' levels:

- high – breeding and foraging aggregations known to occur
- moderate – known or likely presence
- low – may occur, or at limits of species range.

Table 9-1 includes those considered key species, with high or moderate occurrence (Worley 2024), and listed threatened or migratory under the EPBC Act, with a total of 63 key species identified within the NWMR, comprising 27 seabirds, 34 shorebirds and two other marine birds.

The PMST report identified a total of nine EPBC Act listed threatened or migratory bird species within the NMR. An additional 15 EPBC Act listed marine bird species that do not have a threatened or migratory status were recorded within the NMR. Appendix A provides a full list.

The PMST report identified a total of 46 EPBC Act listed threatened or migratory bird species within the SWMR. Appendix A provides a full list.

Many migratory seabirds and shorebirds are protected through bilateral agreements between Australia and Japan, China and the Republic of Korea, recognising the migratory route and important stopover and resting habitats of the East Asian–Australasian Flyway (EAAF). Important migratory bird habitats are also recognised as part of protected wetlands of international significance under the Ramsar Convention. Important bird areas for the NWMR, which are also recognised as global key biodiversity areas (KBAs) (BirdLife Australia[13]), include:

- Roebuck Bay KBA (and Ramsar site): internationally significant migratory shorebird species
- Mandora Marsh and Anna Plains KBA (adjacent to Eighty Mile Beach, Ramsar site) – internationally significant migratory shorebird species
- Dampier Saltworks KBA – internationally significant migratory shorebird species
- Montebello Islands KBA – shorebird and seabird species
- Barrow Island KBA – shorebird and seabird species
- Exmouth Gulf Mangroves KBA – internationally significant migratory shorebird species.

Table 9-1 lists the high and moderate occurrence threatened and migratory seabird and shorebird species (as per subject matter expert review (Worley 2024)) that occur within the NWMR, with their conservation/protected status, relevant recovery plans and conservation advice.

9.2 Seabirds in the NWMR

Seabirds are birds that are adapted to life within the marine environment (oceanic and coastal). They are generally long-lived, have delayed breeding and have fewer young than other bird species (Commonwealth of Australia 2020a).

At least 27 key seabird species (high and moderate occurrence as per Worley (2024), or listed as threatened or migratory under the EPBC Act as identified in the PMST reports in Appendix A) are known to occur in the NWMR. These include various species of terns, noddies, petrels, shearwaters, frigatebirds and boobies.

Seabird species can be grouped into pelagic and nearshore seabirds, based on life cycle behaviour, distributions and key habitats (Worley 2024). Pelagic species spend most of their life at sea, ranging over large distances to forage. These pelagic species only come onshore to breed and raise chicks at natal or high-fidelity breeding colonies. These colonies are often on remote, offshore island locations in and adjacent to the NWMR. Many species are ecologically significant to the NWMR as they are endemic to the region, can be present in large numbers in breeding seasons and non-breeding seasons, and many exhibit extensive annual migrations that include marine areas outside the Australian EEZ (DSEWPaC 2012d). Nearshore seabirds are confined to nearshore areas (unless migrating), have shorter foraging trips during breeding, and may rest on land or shoreline habitats outside of breeding periods (Worley 2024).

The presence of seabirds within the NWMR is influenced by seabird species that migrate and forage in the area during the non-breeding season, including many seabird species that breed on the Houtman Abrolhos Islands in the SWMR. Pelagic seabirds have been documented foraging at current boundaries and seasonal upwellings within the NWMR (Sutton *et al*. 2019). The Houtman Abrolhos Islands National Park in the SWMR is one of the most significant seabird breeding locations in the eastern Indian Ocean. Sixteen species of seabirds breed there; 80% of common (brown) noddies, 40% of sooty terns and all the lesser noddies found in Australia nest at the Houtman Abrolhos (Surman 2019). Important seabird areas in the NWMR are as identified by the KBAs (see Section 9.1), EPBC Act Bioregional BIAs and subject matter expert review, as presented in Worley (2024).

9.2.1 High-occurrence key seabird species

Species descriptions for high occurrence key seabird species are provided in the next subsections. High occurrence seabird species were defined as those with breeding and foraging aggregations known to occur within the NWMR (Worley 2024).

9.2.1.1 Australian fairy tern (nearshore seabird)

The Australian fairy tern (*Sternula nereis nereis*) is listed as vulnerable under the EPBC Act. The WA breeding population (about 5,000 to 6,000 mature individuals) is dispersed over about 2,500 km of coastline (Greenwell 2021). Within WA, the subspecies comprises a sedentary Pilbara population and a partially migratory population extending from Exmouth to Point Malcolm. Individuals of the partially migratory population may occasionally migrate into the southern region of the NWMR during winter months.

Within the NWMR breeding occurs in small colonies between June and September on offshore islands, including Simpson Island, Barrow Island, the Montebello Islands, the Lowendal Islands, Thevenard Island, Serrurier Island, the islands in the Dampier Archipelago, Maryanne Shoals and Egret Island (Dunlop 2018; Johnstone *et al*. 2013; Surman pers obs.). Colonies tend to occupy areas rather than fixed sites, and nest sites can be abandoned after one or more years, even if they have been successful (Saunders and de Rebeira 1985).

While information regarding foraging ecology of this species within the NWMR is lacking, the Australian fairy tern has been studied in SA. Here, the species typically forages in inshore waters and has been reported to rarely travel beyond 2 km during the breeding season in SA (Paton and Rogers 2009).

Australian fairy terns are diurnal plunge diving seabirds, feeding exclusively on small (<60 mm) surface-schooling bait fishes throughout their range. Prey includes species of sprats, hardy heads and larval prey of some demersal fish species. Unlike many other terns, fairy terns do not depend on large pelagic fishes to drive their prey to the surface.

Breeding BIAs are identified for the fairy tern in the NWMR, as presented in Figure 9-1.

9.2.1.2 Australian lesser noddy (pelagic seabird)

The Australian lesser noddy (*Anous tenuirostris melanops*), which is endemic to Australia, is listed as vulnerable under the EBPC Act and endangered under the BC Act. The largest breeding colonies are found on the Houtman Abrolhos Islands, with fewer records of breeding on Ashmore Reef (Clark *et al.* 2011; Cannell and Surman 2021). Possible colonisation of Cocos (Keeling) Island is reported, but it is unconfirmed if this is the Australian subspecies (Stokes and Hinchey 1990).

At the Houtman Abrolhos Islands, the breeding population has been estimated at about 50,000 breeding pairs (Surman *et al.* 2016). At this location, studies indicate breeding is not highly synchronised; the single egg clutches were laid over a 102-day period from late August to early December, peaking in September (Surman and Wooller 1995). The incubation period averaged 34 days and the fledging period 40 days (Surman and Wooller 1995).

Studies of foraging ecology of breeding Australian lesser noddies at the Houtman Abrolhos Islands found they are largely diurnal, foraging between 4 am and 8:40 pm and returning to their colony at night (Surman *et al.* 2017). From this study, the global positioning system tracks of 17 adults during incubation or chick provisioning revealed most foraging trips lasted between two and four hours with a total trip distance of less than 40 km. However, some trips lasted up to 16 hours covering distances of up to 112 km (Surman *et al.* 2017). During non-breeding, birds appear to remain near the breeding islands year-round (Higgins and Davies 1996).

Due to differences in climate and seasonality experienced at the Houtman Abrolhos Islands and Ashmore Reef, timing of breeding differs. The Ashmore Reef population has been recorded breeding in the Austral autumn/winter (Clarke and Herrod 2016), while the Houtman Abrolhos Islands population breeds during the Austral spring/summer (Surman and Wooller 1995).

No BIAs for the Australian lesser noddy overlap the NWMR and tracking data suggest individuals breeding at the Houtman Abrolhos Islands foraged predominantly in a south-westerly direction, remaining within waters of the SWMR (Surman *et al.* 2017). Several individuals were observed roosting with common noddies on Bernier Island, near Carnarvon in 2022 (Nicholson pers obs.). However, it is unlikely waters of the NWMR provide significant habitat for individuals breeding at the Houtman Abrolhos Islands. The small population of this subspecies breeding on Ashmore Reef may show similar foraging ecology during breeding and remain in the vicinity of the islands, using habitats of the NWMR.

9.2.1.3 Bridled tern (pelagic seabird)

The bridled tern (*Onychiprion anaethetus*, listed as *Sterna anaethetus*) is listed as migratory under the EPBC Act and BC Act. It is a common summer breeding visitor to the NWMR between September and April, especially around Dampier Archipelago and the Montebello Islands (Johnstone *et al.* 2013). Breeding has also been reported on the Lowendal Islands (Nicholson 2002), Passage Islands and islands off Onslow from November to March (Johnstone *et al.* 2013). Small breeding populations have also been recorded on East Island at Ashmore Reef between April and November and the Lacapede Islands (Clarke and Herrod 2016; Johnstone and Storr 1998).

The migration and local movements of breeding birds within the NWMR are poorly defined; two individuals were tracked departing the Houtman Abrolhos islands in April/May, transiting along the continental shelf waters before departing Australian waters and migrating towards the Western Celebes Sea, east of Borneo (Surman *et al.* 2018). These individuals departed the Western Celebes Sea in August/September, returning to the Houtman Abrolhos islands around 14 days later (Surman *et al.* 2018). This species has been regularly recorded on the continental shelf up to 70 km away from breeding locations during oceanic surveys (Surman and Nicholson 2011; Dunlop *et al.* 2001).

Bridled terns feed diurnally on a range of species of fish, crustaceans, cephalopods and insects. In Australia, they feed almost entirely on fish, though they also take crustaceans and aquatic insects. They often feed on schools of fish forced to the surface by other predators (Dunlop 1997). Bridled terns forage mainly by contact dipping, with birds hovering or gliding near the surface of the sea and swooping down and immersing only the head and breast when attacking prey, which are usually taken from the top few centimetres of the sea surface (<20 cm) (Dunlop 1997).

During breeding at Penguin Island, WA, individuals foraged most commonly between 20 km and 40 km from the nearest breeding colony, though some were observed at distances up to 80 km (Dunlop 1997). This species has also been recorded within 70 km of its breeding colonies within the NWMR, on outer continental shelf waters (Nicholson 2002; Dunlop *et al.* 2001).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Although foraging may be concentrated around breeding colonies during the breeding season, no BIAs in the NWMR have been identified for this species.

9.2.1.4 Brown booby (pelagic seabird)

The brown booby (*Sula leucogaster*) is listed as migratory under the EPBC Act and BC Act. It is a cosmopolitan species with a pan-tropical distribution. Within the NWMR, large colonies occur at offshore islands, including the Lacepede Islands (17,000 pairs, Mustoe and Edmunds 2008), Ashmore Reef (5,000 pairs at Middle Island and 3,000 pairs at East Island in 2007, Swann 2005a; Swann 2005b; Swann 2005c; Milton 2005; Clarke 2010), Bedout Island (1,000 pairs) and Adele Island (7,500 pairs, Burbidge *et al*. 1987). Small colonies of up to ten pairs have been recorded at Overhanging Rock, within the Lowendal Islands (Nicholson pers obs.). The total breeding population in the Australian region in 1996–97 was estimated at 59,940 to 73,900 pairs (WBM Oceanics and Claridge 1997).

Brown boobies do not migrate far from their breeding islands, rarely dispersing more than 240 km from their natal colony (Dunlop *et al.* 2001). Brown boobies forage within 50 km of their colony where they plunge dive, reaching up to 15 m depth and pursuing their prey when ascending after the dive (Austin *et al.* 2021). Brown booby diet is principally medium to large surface schooling prey (northern pilchard, Indian anchovy, flying fish and cephalopods), often associated with feeding tunas and mackerels (Cannell *et al.* 2022; Austin *et al.* 2021).

Brown boobies are not prone to waterlogging and will roost on the sea surface, and are known to form large aggregations on oil and gas platforms throughout the NWMR (Surman pers obs.), including Woodside facilities, indicating wider distribution of non-breeding individuals across the NWMR.

Breeding BIAs for the brown booby in the NWMR are associated with breeding colonies on Ashmore Reef, Adele Island, White Island, Lacepede Islands and Bedout Island (Figure 9-2). Breeding is reported as occurring between January and March, but this becomes protracted through to October at Ashmore Reef (Clarke *et al.* 2016). Brown boobies are resident in the NWMR throughout the year, although they may forage long distances over the open ocean (Surman and Nicholson 2011).

9.2.1.5 Caspian tern (nearshore seabird)

The Caspian tern (*Hydroprogne caspia*) is listed as migratory under the EPBC Act and BC Act. It is moderately common across coastlines of the NWMR and offshore islands (Johnstone *et al.* 2013).

Breeding occurs as solitary nests or in colonies of up to 52 breeding pairs, mainly on islands, including North Turtle Island, Dampier Archipelago including Enderby Island, and Frazer Island, and occasionally on mainland coasts, such as Cape Preston and North West Cape, from late March to early November (Johnstone *et al.* 2013).

During breeding, adults can forage up to 60 km from the colony to catch fish and meet their elevated energetic requirements at this time (Burger *et al.* 1996; Balance *et al.* 2008). The Caspian tern is a diurnal forager, with the length and frequency of foraging trips, as well as relative time spent foraging or attending chicks, changing with food resource availability (Dunlop and McNeill 2017).

Caspian terns usually forage in shallow, sheltered waters by plunge-diving for various prey species (Serventy *et al.* 1971).

Although foraging BIAs occur in the SWMR, no BIAs for this species have been identified in the NWMR.

9.2.1.6 Common noddy (pelagic seabird)

The common (or brown) noddy (*Anous stolidus*) is listed as migratory under the EPBC Act and BC Act. The species is widespread in tropical and subtropical areas within and beyond Australia. This seabird species is gregarious and normally occurs in flocks, up to hundreds of individuals, when feeding or roosting.

The Houtman Abrolhos is the primary breeding habitat for the common noddy in the eastern Indian Ocean, although breeding occurs across offshore islands of the NWMR, albeit in fewer numbers, including Bedout Island, Montebello Islands and Frazer Island (Johnstone *et al.* 2013), and Ashmore Reef (Clark and Herrod 2016). Breeding at Ashmore Reef has been recorded as occurring between April and November (Clark and Herrod 2016).

During breeding, individuals nesting on Lancelin Island in the SWMR were found to forage diurnally (Shephard *et al.* 2018). Tracked individuals travelled an average of 97 km from the colony, with an average

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

round-trip distance of 141 km, with significantly longer trips during chick rearing compared to incubation (Shephard *et al.* 2018).

The species is highly pelagic outside breeding (March to August), with breeding individuals of the Houtman Abrolhos Islands travelling about 950 km north to the NWMR (Surman *et al.* 2017). The species is often reported roosting on uncrewed oil and gas platforms within the NWS and Timor Sea (Surman pers obs. 2021).

Although widespread across the NWMR during breeding and non-breeding, no BIAs for this species are in the NWMR.

9.2.1.7 Frigate birds (pelagic seabirds)

The lesser (*Fregata ariel*) and great frigatebirds (*Fregata minor*) are both listed as migratory under the EBPC Act and BC Act. They are the most widely distributed of the frigatebirds, with a pan-tropical distribution.

In the NWMR the great frigatebird nests at Ashmore Reef and Adele Island. At Ashmore Reef they are found to breed year-round (Clark and Herrod 2016). In addition to Ashmore Reef and Adele Island, the lesser frigatebird also nests at Cartier Island, the Lacepede Islands and Bedout Island, which is thought to support more than 1% of the world's breeding population (BirdLife International 2021). On Ashmore Reef the species breeds in the Austral winter (Clark and Herrod 2016).

Great frigatebirds breeding in the South China Sea on average foraged 75 km (maximum 150 km) from their breeding colony and lesser frigatebirds 123 km (maximum 300 km) (Mott *et al.* 2017).

Outside of breeding, frigatebirds may disperse significant distances from their breeding colonies (Mott *et al.* 2017). Great frigatebirds are wide ranging, being recorded between 900 and 1,400 km from their natal colonies (Dunlop *et al.* 2001). Tracking studies of non-breeding lesser and great frigatebirds roosting on Ashmore Reef and Adele Island demonstrated that individuals have large distributions, including Australian coastal waters and the South China, Java and Sulu Seas and the Gulf of Thailand (Mott *et al.* 2021). During the wet season particularly, Australian waters provided optimal habitat for non-breeding individuals of both species (Mott *et al.* 2021).

Both frigatebirds forage by snatching prey from the surface waters, or when prey break the surface. They also rely heavily upon kleptoparasitism, harrying other seabirds returning to their colonies with food until it is regurgitated. Frigatebirds are susceptible to waterlogging, so do not plunge or splash dive for prey nor do they roost on the seas surface. Across the NWMR they forage on flying fish, cephalopods, anchovies, northern pilchards and other medium sized prey (8 to 30 cm, Surman pers obs.).

Breeding BIAs for the great frigatebird in the NWMR are associated with breeding colonies on Ashmore Reef and Adele Island (Figure 9-3). For the lesser frigatebird, breeding BIAs are associated with breeding colonies on Ashmore Reef, Adele Island, White Island, Lacepede Islands and Bedout Island (Figure 9-4).

9.2.1.8 Greater crested tern (nearshore seabird)

The greater crested tern (*Thalasseus bergii*) is listed as migratory under the EPBC Act and BC Act. The species is widespread along coastlines of the NWMR and offshore islands (Johnstone *et al.* 2013).

Many populations remain sedentary in their breeding areas or disperse locally (del Hoyo *et al*. 1996), although some are more migratory (Urban *et al*. 1986). The species breeds in large, dense colonies, or in small groups of fewer than ten pairs amid colonies of other species, such as silver gull (del Hoyo *et al.* 1996). Colonies are on islands, including those as far offshore as Bedout, Legendre and the Montebello and Lowendal islands (Johnstone *et al.* 2013). Adult breeders have shown both high site fidelity and flexibility in their breeding localities, depending upon the spatial and temporal reliability of food resources (Crawford *et al.* 2002).

Breeding occurs from late March to May (Johnstone *et al.* 2013). During breeding, greater crested terns conduct short, diurnal foraging trips near (<40 km) the colony (Surman and Wooller 2003; Rock *et al.* 2007; McLeay *et al.* 2010), with most foraging behaviour displayed by individuals at distances >5 km (McLeay *et al.* 2010). Further, crested terns require limited nesting material, thus forage near breeding sites for such materials (Surman *et al.* 2025).

The chicks are predominantly fed pelagic fish, a diet that varies among colonies and years (Chiaradia *et al.* 2002; McLeay *et al.* 2009). Adults may forage more widely on inshore reef fish (Surman and Wooller 2003), crustaceans and cephalopods using a plunge diving method (Commonwealth of Australia 2020a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Although there is known habitat use in the NWMR, there are no designated BIAs for the greater crested tern in the NWMR.

9.2.1.9 Lesser crested tern (nearshore seabird)

The lesser crested tern (*Thalasseus bengalensis*) is listed as marine under the EPBC Act and is known to breed on islands in the NWMR. This species inhabits sandy and coral coasts and estuaries and breeds on low-lying offshore islands. It forages for small pelagic fish and shrimps in the surf and offshore waters Commonwealth of Australia 2020.

This species has been recorded nesting regularly at the Lowendal Islands, with up to 200 pairs recorded among larger colonies of crested terns. The lesser crested tern has also been recorded nesting on Stena Island in the Kimberley region, Bedout Island in the Pilbara region, and may nest at the Montebello Islands. There are also breeding records for Ashmore Reef and Low Rocks and Adele Islands in the Kimberley (DSEWPaC 2012d).

Breeding BIAs across the NWMR are associated with known breeding colonies on islands (Figure 9-5).

9.2.1.10 Little shearwater (pelagic seabird)

The little shearwater (*Puffinus assimilis*) is listed as marine under the EPBC Act. This bird is typically sedentary and recluse and prefers feeding further offshore than similar birds. Breeding occurs in islands off southern WA, between Recherche Archipelago and the Houtman Abrolhos group. During the Australian summer, the little shearwater nests on grassy slopes and forests in self-excavated burrows or rock crevices among boulders (Kirwan *et al.* 2020).

A foraging BIA for this species is in the southern extent of the NWMR (Figure 9-6).

9.2.1.11 Little tern (nearshore seabird)

The little tern (*Sternula albifrons*) is listed as migratory under the EPBC Act and BC Act. There are three subpopulations of little tern in Australia and two of these are in the NWMR – the northern Australian breeding subpopulation occurring around Broome and extending across the NWMR to Cape York, and an east Asian breeding subpopulation, with the terns present from Shark Bay to south-eastern Queensland during the Austral summer.

Recent surveys have found little terns breed across the NWMR in small colonies (Surman pers obs.). However, identification between subpopulations is difficult, and population estimates have high error due to the overlapping range and remote breeding sites of the northern populations. A southwards movement of breeding distribution has been noted at three key locations: Lowendal Islands (Surman pers comm.), Burrup Peninsula (Nicholson pers comm.) and North West Cape (Greenwell and Dunlop 2021). Little terns usually forage near their breeding colonies, typically within 5 km (Bertolero *et al.* 2005) mainly on small fish (<10 cm in length), but they also eat crustaceans, insects, annelids and molluscs.

Little is known about the breeding and foraging ecology of little terns, but BIAs for foraging and resting have been identified across the NWMR (Figure 9-7), with a peak in breeding activity between June and October.

9.2.1.12 Masked booby (pelagic seabird)

The masked booby (*Sula dactylatra*) is listed as migratory under the EBPC Act. Within the NWMR, the subspecies *Sula dactylatra bedouti* ranges from the Dampier Archipelago, along the entire coast into the NMR and across to Queensland (Merchant and Higgins 1990). Individuals have also been recorded at Barrow Island.

Within the NWMR, Bedout and Adele islands represent the main breeding locations, with 400 and 320 breeding pairs estimated at each, respectively (Marchant and Higgins 1990; Swann *et al.* 2002). Breeding is also reported at the Ashmore Reef group, with up to 30 breeding pairs recorded on Middle Island and 15 pairs on East Island (Burbidge and Fuller 1996; Hassell *et al.* 2003; Swann 2005a; Swann, 2005b; Swann 2005c; Milton, 2005; Clarke 2010; Clarke *et al.* 2016). Up to two pairs have also been recorded breeding in the Lacepede group (Hassell *et al.* 2003).

A recent study of individuals from Bedout Island indicated low genetic exchanges (mitochondrial genes) with other masked booby colonies currently studied, suggesting a dependence on local recruitment for population persistence (Kingsley *et al.* 2019). Further, the low exchange of mitochondrial genes may reflect high breeding site fidelity and limited foraging distances during the breeding season. Due to the concentration in a

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

relatively small number of areas to breed, any catastrophe at these sites (such as oil spills, or disturbance and vandalism of nests) could have a substantial impact on the population (Birds Australia 2005).

Studies of foraging behaviour of individuals breeding within the NWMR are lacking, but studies at other locations indicate foraging is diurnal and ranges vary between 100 and 200 km of the breeding colony (Weimerskirch *et al.* 2008).

There are no BIAs for this species in the NWMR.

9.2.1.13 Red-footed booby (pelagic seabird)

The red-footed booby (*Sula sula*) is listed as migratory under the EPBC Act and BC Act. Compared to brown boobies, the red-footed booby occurs in fewer numbers across the NWMR. Within the NWMR they breed at Ashmore Reef (up to 100 pairs, Clarke and Herrod 2016) and Adele Island (14 pairs, Botle et al. 2004). At Ashmore Reef they have been recorded breeding year round (Clarke and Herrod 2016).

The red-footed booby is one of the most widely distributed of the boobies across oceanic waters in the tropical Indian Ocean; during non-breeding, individuals have been observed up to 800 km from their natal colony (Dunlop *et al.* 2001). However, individuals are limited to a range of 150 km from the breeding colony when breeding (Wiemerskirsch et al. 2005). In the Ashmore area, adults have been detected up to 125 km from the nearest breeding islands during October (unpubl. data, referenced in Clarke and Herrod 2016).

Red-footed boobies are diurnal foragers, plunge diving for flying fishes (predominantly) across their range (Commonwealth of Australia 2020a). Breeding BIAs for the red-footed booby are associated with breeding colonies at Ashmore Reef and Adele Island (Figure 9-8).

9.2.1.14 Red-tailed tropicbird (pelagic seabird)

The red-tailed tropic bird is listed as endangered (since December 2023) under the EPBC Act and 'Priority 4' under the BC Act.

Across the NWMR, the largest population breeds on Christmas Island (1,400 to 2,000 pairs, references within Sommerfeld *et al.* 2015) with additional key breeding locations on Cocos (Keeling) group and islands of Ashmore Reef Marine Park (17 to 24 breeding pairs, Clarke *et al.* 2011; Clarke and Herrod 2016). At Ashmore Reef, breeding pairs were observed year-round, with no discernible peak in breeding activity (Clarke *et al.* 2011). The species nests on islands, stacks, atolls, cays or coastal cliffs (DCCEEW 2023h).

The red-tailed tropicbird is a shallow diving species typically foraging diurnally within the first 4 m of the water column (LeCorre 1997). There is limited information about foraging range when breeding in Australia, but observations at sea in the Ashmore Reef region demonstrate they can forage considerable distances from land (unpubl. data, Clarke 2010). This corroborates data from elsewhere in their global range, which reported foraging distances of 240 km during incubation, 109 km during chick rearing and maximum distances of 380 km (Fayat *et al.* 2023). This species has been observed during boat surveys of the outer shelf of the NWMR year round (Surman and Nicholson 2011).

There are no BIAs for this species within the NWMR.

9.2.1.15 Roseate tern (nearshore seabird)

The roseate tern (*Sterna dougallii*) is listed as migratory under the EPBC Act and BC Act. This species is generally subtropical in distribution and there are many breeding populations in the NWMR, including Ashmore Reef, Bonaparte Archipelago, Lacepede Islands, Dampier Archipelago and the Lowendal Islands.

The largest roseate tern breeding colony in WA is in the Houtman Abrolhos Islands (Surman and Nicholson 2009), with roseate terns requiring limited nesting material, thus foraging near breeding sites for nesting materials (Surman *et al.* 2025). Large colonies breed within the Lowendal Islands and Montebello Islands region where there is a stronghold for this species (Higgins and Davies 1996). A large breeding colony has also been recorded on Goodwyn Island on the Dampier Archipelago (Higgins and Davies 1996). Peak breeding times across the NWMR are between May and August.

Birds are known to usually move away from breeding colonies after breeding, but their non-breeding range is not well defined (Higgins and Davies 1996). Many non-breeding roseate terns have been observed at several remote locations in the Kimberley, high numbers are also recorded at the Eighty Mile Beach Ramsar site (Surman pers obs.).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Roseate terns will forage diurnally, up to 60 km from their colonies and always over deeper shelf waters rather than shallow coastal areas (Surman and Wooller 2003). Roseate terns will also readily raft (roost in flocks on the sea surface) after foraging episodes (Commonwealth of Australia 2020).

Roseate terns predominantly eat small pelagic fish taken by plunge diving or surface dipping, typically foraging in dense flocks overflying predatory fishes that push their prey to the surface. Roseate terns may plunge to 20 cm depth.

Breeding BIAs across the NWMR are associated with known breeding colonies on islands, while a resting BIA encompasses Eighty Mile Beach (Figure 9-9).

9.2.1.16 Sooty tern (nearshore seabird)

The sooty tern (*Onychoprion fuscatus*) inhabits tropical and subtropical oceans around the world and nests on remote islands that have limited human interaction. This species lives on the wing and remains airborne for years at a time between fledging and its first breeding, never returning to land during the nonbreeding seasons nor observed resting on the water. Sooty tern breeding colonies are dense, with pairs generally nesting on the ground in sandy substrate or sparse vegetation. In contrast to most terns who feed by plunge diving, the sooty tern forages by 'dipping' or merely brushing the surface of the water or by snatching small fish in midair as they escape from predators (Schreiber *et al.* 2020).

The sooty tern has a foraging BIA overlapping the southern extent of the NWMR (Figure 9-10).

9.2.1.17 Wedge-tailed shearwater (pelagic seabird)

The wedge-tailed shearwater (*Ardenna pacifica*) is listed as migratory under the EPBC Act and BC Act. It is a pelagic, marine seabird known from tropical and subtropical waters. Its distribution is widespread across the Indian and Pacific oceans, with a global population of 2.6 million pairs. Of this, about one million pairs breed in Australia, most of which do so on islands in WA between Rottnest Island in the south to Ashmore Reef in the north. The largest breeding populations are at the Houtman Abrolhos (600,000 pairs – Surman and Nicholson 2009), and throughout the NWS region of the NWMR, where large populations exist on Muiron Islands (300,000 pairs) and Serrurier Island (60,000 pairs) (Surman and Nicholson 2009; 2015).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean overwintering grounds from late-June onwards to re-excavate their burrows. This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period. They lay their single egg during early-November, which is then incubated until the chick hatches (after 53 days) in early-January. Once hatched, adults leave the burrows to forage locally during the day, returning at night to feed chicks until they are ready to fledge (Nicholson 2002). Due to the high synchronicity in egg laying, fledging is restricted to the first two weeks of April (Nicholson 2002).

Breeding behaviours are nocturnal in wedge-tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead-up to fledging, chicks also leave their burrows to exercise their wings. Adults may not return to feed chicks each night; wedge-tailed shearwaters breeding on Muiron Island (north) undertook extensive foraging trips during the incubation period (1,200 to 1,400 km) and shorter trips during chick rearing (<300 km, Cannell *et al.* 2019). Longer foraging trips took individuals in a north-west direction offshore towards oceanic seamounts. Conversely, the shorter trips tended to include waters to the west and north-west of the Muiron Islands (Cannell *et al.* 2019). In addition to the Muiron Islands, this dual foraging strategy, whereby parents alternate or mix short and long trips, have been recorded in wedge-tailed shearwaters breeding at Heron Island in Queensland, Lord Howe Island in Tasmania (Peck and Congdon 2005), and New Caledonia (Weimerskirch *et al.* 2020). However, divergent foraging strategies have been detected between colonies, which is linked to the proximity of colonies to high-productivity waters (Peck and Congdon 2005; Weimerskirch *et al.* 2020).

While the presence of squid and lanternfish in their diet (Surman and Nicholson 2009) suggests nocturnal foraging occurs in this species, global positioning system tracking studies found foraging activities at sea were more frequent during the day compared with at night (Weimerskirch *et al.* 2020; Catry *et al.* 2009). During the day, resting periods on the sea surface were short whereas at night individuals spent a large proportion of their time resting at the surface (Weimerskirch *et al.* 2020). Other prey species include schooling bait fishes and cephalopods, often feeding in association with other pelagic seabird species such as sooty terns and common noddies, and pelagic fishes such as tunas and mackerels. Diet composition is likely to vary between colonies, depending upon the prey available, and thus determining both the foraging strategy, as described above, and the division of nocturnal and diurnal foraging. Wedge-tailed shearwaters

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

dive between 3 and 66 m, actively pursuing prey by feeding at the surface or by actively swimming below bait schools.

Post-breeding, wedge-tailed shearwaters breeding on the Houtman Abrolhos Islands and Varanus Island migrated 4,500 km north-west to equatorial waters of the Indian Ocean around 90°E (Surman *et al.* 2018), traversing the NWMR, and those from the Great Barrier Reef migrated to the northern hemisphere, about 6,000 km northwards to Micronesia (McDuie and Congdon 2016).

Wedge-tailed shearwaters are observed during breeding across all shelf waters and are the most frequently encountered seabird at sea. Large numbers of wedge-tailed shearwaters have been observed foraging off the NWS between May and August (Surman pers obs.).

Breeding BIAs are located for the wedge-tailed shearwater across the NWMR (Figure 9-11). It is noted both breeding and foraging BIAs represent foraging habitat used by adult (chick-rearing) wedge-tailed shearwaters during the breeding season.

9.2.1.18 White-tailed tropicbird (pelagic seabird)

The white-tailed tropicbird (*Phaethon lepturus*) is listed as migratory under the EPBC Act and BC Act. The species breeds across many sites, but in low numbers (Commonwealth of Australia 2020). In Australia, between 6,000 and 12,000 pairs nest on Christmas Island, with smaller fragmented populations at North Keeling Island (40 pairs). These individuals are expected to be members of the Christmas Island white-tailed tropicbird subspecies *Phaethon lepturus fulvus*. While individuals of this subspecies can forage at great distances from colonies (see below), the numbers occurring in the NWMR are expected to be low.

In the NWMR, the white-tailed tropicbird is known to nest on Ashmore Reef and the Rowley Shoals (ten breeding pairs and up to three nesting pairs; Clark 2010; Burbidge *et al.* 1996, respectively). Breeding can occur year round (Clarke and Herrod 2016).

Pennycuick *et al.* (1990) demonstrated that the white-tailed tropicbirds breeding in Puerto Rico foraged up to 89 km from the nest site when breeding and moved considerably larger distances when not breeding. Dunlop *et al.* (2001) observed birds from Christmas Island foraging singly between 1,400 and 1,600 km south-east of Christmas Island.

This species regularly roosts on the sea surface between bouts of foraging. It is a solitary forager, rarely feeding in association with other seabird species and always in waters favourable for its principal prey, flying fish (Santos *et al.* 2018). The species is a surface forager that occasionally undertakes shallow dives (Marchant and Higgins 1990).

There are breeding BIAs associated with nesting occurring at the Rowley Shoals and Ashmore Reef within the NWMR (Figure 9-12).

9.2.2 Moderate-occurrence key seabird species

Table 9-2 summarises descriptions for moderate occurrence key pelagic and nearshore seabird species.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 9-2: Species summary for moderate occurrence pelagic and nearshore seabird species within the NWMR

Species	NWMR presence	Predominant feeding behaviour	Diet
Amsterdam albatross	Year-round low-density presence associated with foraging breeding and non-breeding individuals	Diurnal and nocturnal Dipping, surface-seizing, diving to depths ≥2 m	Squid, fish and crustaceans
Flesh-footed shearwater	Non-breeding, migration: Jun to Aug	Diurnal and nocturnal Pursuit-plunging, surface-seizing	Fish, cephalopods
Soft-plumaged petrel	Non-breeding, migration: Jan to Jun	Diurnal and nocturnal Dipping, surface-seizing	Crustaceans, fish
Streaked shearwater	Non-breeding: Dec to Apr	Diurnal and nocturnal Surface-seizing	Fish, squid, crustacean
Wilson's storm petrel	Non-breeding: Jun to Dec	Diurnal and nocturnal Dipping, surface-seizing	Crustaceans, fish
Common tern	Non-breeding: Aug to Mar	Diurnal Surface-plunging, dipping	Fish
Christmas Island white-tailed tropicbird	Year-round low-density presence associated with foraging breeding and non-breeding individuals	Diurnal Surface-plunging, dipping; aerial foraging over open ocean	Fish, squid, crustaceans

9.2.3 Biologically important areas for seabirds

A review of the Australian Marine Spatial Information System (Geoscience Australia 2026) identified BIAs representing important life cycle stages and behaviours for nine species of seabird in the NWMR. These are presented in Table 9-3.

The NWMR is important for multiple oceangoing and nearshore seabird species, as described in the preceding sections. DCCEEW is actively updating BIAs, with revisions to the datasets occurring in June 2024, January 2025 and December 2025 (DCCEEW 2025b) for a range of these seabird species. These BIA revisions have removed all foraging BIAs for seabirds throughout the NWMR. It is noted many of the listed seabird species do forage in the region. Refer to the detailed species descriptions, particularly with note to the pelagic (oceangoing) wedge-tailed shearwater (Section 9.2.1.1) and nearshore, residential tern species that have foraging BIAs listed in the SWMR (Section 9.2.1.1).

9.3 Shorebirds in the NWMR

Shorebirds (migratory and resident species) are generally associated with wetland or coastal environmentsI the NWMR hosts many, particularly in the Austral summer (see Appendix A for the EPBC Act PMST reports on listed species of shorebirds). Shorebirds may use coastal environments for feeding, nesting or migratory stopovers. In coastal environments, shorebirds generally feed during low tide on exposed intertidal mud and sand flats, and roost in suitable habitat above the high water mark.

At least 34 key shorebird species (high and moderate occurrence as per Worley (2024), or listed as threatened or migratory under the EPBC Act) are known to occur in the NWMR. The NWMR is situated within the EAAF, a geographic region supporting populations of migratory shorebirds throughout their annual cycle (Bamford *et al.* 2008). Australia supports >67% of the entire flyway population for 11 migratory shorebird species (such as the far eastern curlew, great knot, oriental pratincole, little curlew and red-necked stint) (Driessen *et al*. 2026). The EAAF extends from breeding grounds in the Russian tundra, Mongolia and Alaska southwards through east and southeast Asia, to non-breeding areas of Indonesia, Papua New Guinea, Australia and New Zealand (Weller and Lee 2017). All shorebird species identified undertake annual migrations from breeding sites in the northern hemisphere to more southern non-breeding sites within the EAAF (Bamford *et al.* 2008).

The EAAF encompasses a large proportion of the NWMR. Migratory shorebirds are known to migrate through the offshore areas of the NWMR between overwintering grounds in Australia and breeding sites in the northern hemisphere (Bamford *et al.* 2008). Peak migration occurs between March and May (northern migration) and August and November (southern migration) (Bamford *et al.* 2008). Several key EAAF sites in the NWMR, such as Eighty Mile Beach, Roebuck Bay and the Gulf of Carpentaria, receive large influxes of birds during the southward and northward migrations (Driessen *et al.* 2026). The 220 km stretch of sand, mudflats and mangroves of Eighty Mile Beach receives the largest numbers of shorebirds out of all the sites in Australia (Williams *et al.* 2026). During the southward migration, large influxes of birds begin arriving at key EAAF sites in the NWMR by late August before dispersing across Australia, with many reaching the southeastern states by October (Driessen *et al.* 2025). Immature migratory shorebirds have a slower southwards migration and tend to arrive in Australia from September to late November (Rogers *et al.* 2025). Toward the end of the non-breeding season, birds return to major sites within the NWMR by March, where they feed intensely to prepare for a northward migration in March and April (Driessen *et al.* 2025). Migration routes of some migratory shorebird species have been characterised using band recoveries (Minton *et al.* 2006), but the migration pathways taken between sightings are poorly understood.

Migratory shorebird species are in Australia during the non-breeding period (December to February), in coastal and inland habitats where adult birds feed and rest, accumulating the energy reserves necessary to support northward migration and subsequent breeding (Commonwealth of Australia 2015c). During this time, individuals must maintain an energy intake greater than their energy expenditure to recover from the southward migration, to allow moulting, and to build fat reserves in preparation for the northward migration The high energy demands of migration mean both foraging and resting during the non-breeding period are vital for individual fitness and survival (Commonwealth of Australia 2015c). Some young shorebirds may choose to delay migration based on achieving body composition and fuel stores to support migration, or due to the delayed timing of flight-feather and pre-breeding moults (Rogers *et al.* 2025). Coastal shorebird species tend to delay maturity more than species that spend their non-breeding season in non-tidal inland wetlands.

Long-term monitoring of 15 migratory shorebird taxa over 28 years shows varied population trajectories; four species have declined by more than 50%, three by more than 30%, five by less than 30%, and two species have increased. Notably, five species that declined by more than 30% exhibited higher mean annual growth rates in 2012 to 2021 compared to 1993 to 2012, indicating a potential slowing of decline (Rogers *et al.* 2025).

Due to differences in coastal or wetland habitat requirements between roosting and foraging behaviours, areas used most by migratory shorebirds usually comprise networks of coastal or wetland foraging and roosting habitats (Commonwealth of Australia 2015c). Coastal habitats such as mudflats, saltmarsh and mangroves, which are rich in benthic macroinvertebrates, are important foraging habitats for migratory shorebirds (Williams *et al.* 2026). Other foraging habitats can also include inland ephemeral wetlands, which have been recorded to intermittently support high numbers of migratory shorebirds after major rainfall events (Driessen *et al.* 2026).Shorebirds move between areas of this network, depending on the time of day, availability of resources, levels of disturbance and environmental conditions Displacement from one habitat or the other may result in use of sub-optimal habitat or increase in energetic demands via increased distance

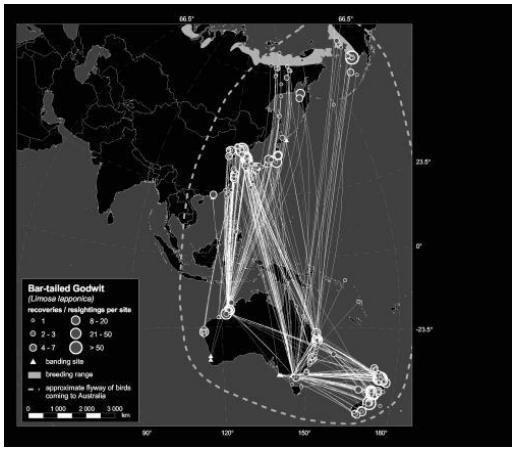
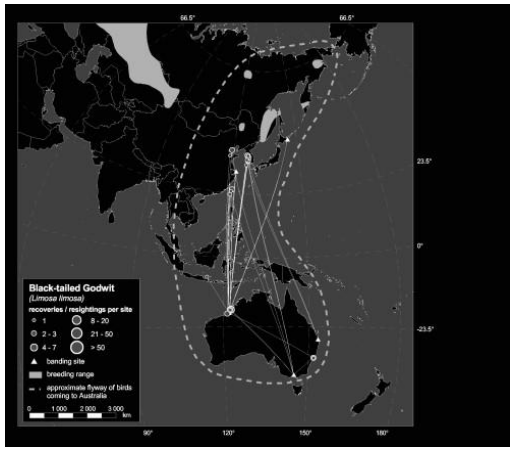
between habitats (Commonwealth of Australia 2015c). Foraging habitat preference is linked to the availability of prey as many shorebirds have narrow foraging and dietary niches, which vary between species (Williams *et al.* 2026).





Within the EAAF, “a wetland should be considered internationally important if it regularly supports 1% of the individuals in a population of one species or subspecies of waterbird” (Ramsar Convention Bureau 2000). All shorebirds identified as high occurrence key species occur in shoreline habitats within the NWMR for at least part of their non-breeding season in Australia.

Ashmore Reef is documented as a BIA for migratory shorebirds in the NWMR (DSEWPaC 2012a).

Table 9-4 and Table 9-5 provide descriptions for key high and moderate occurrence shorebird species, including information about migration routes where available. It should be noted that Minton *et al.* (2006) did not report on the Pilbara region or Exmouth Gulf, so the migratory pathways may be incompletely depicted.

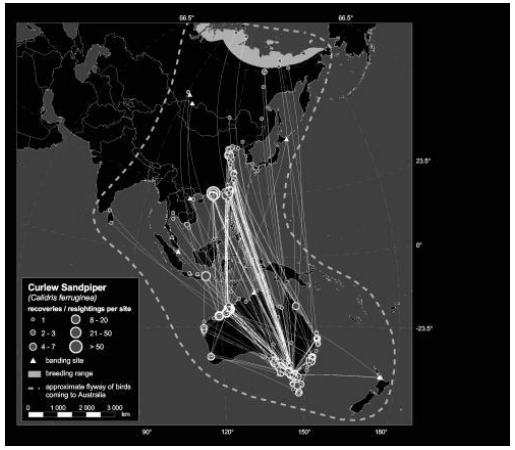
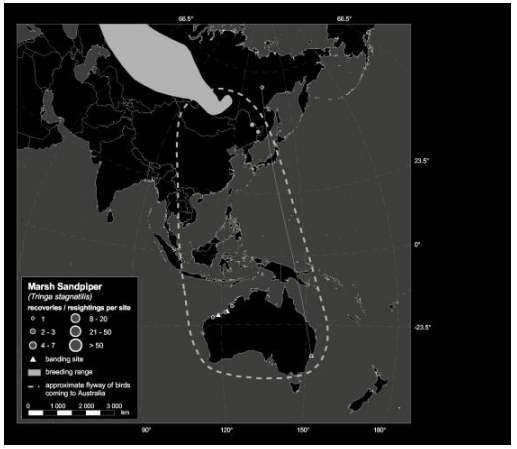
Table 9-4: Species summary for high and selected moderate occurrence key shorebird species





Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Bar-tailed godwit[16]	Widespread around the coast as far east as Derby, with a few scattered records elsewhere in the Kimberley *Internationally important sites:* • Roebuck Bay • Eighty Mile Beach	Sandy beaches, sandbars, spits and in near-coastal saltmarsh	Tidal estuaries and harbours	Worms, molluscs, crustaceans, insects and some plant material	
Black-tailed godwit	Found in coastal regions of all states and territories of Australia *Internationally important site:* • Roebuck Bay	Claypan	Intertidal mudflats or sandflats	Annelids, crustaceans, arachnids, fish eggs and spawn and tadpoles	

[16] Nominate species Limosa lapponica. Subspecies which may occur includes L. l menzbieri, which is listed Critically Endangered under the EPBC Act. Specific information on L. l menzbieri is lacking, but information regarding habitat use and diet for the nominate species is considered applicable.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
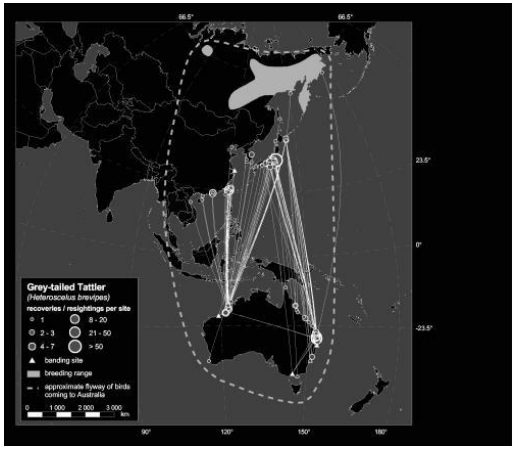
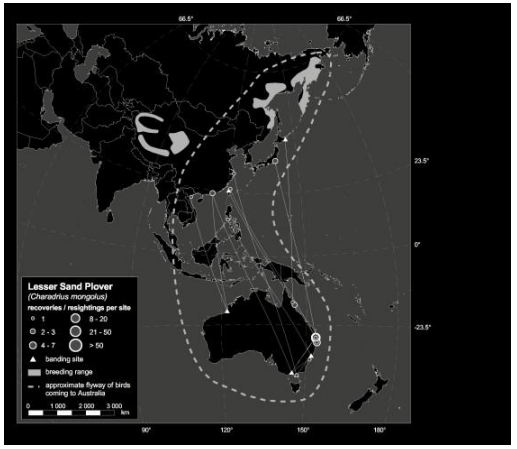
Curlew sandpiper	Widespread around coastal and subcoastal plains Non-breeding one year old birds may remain in Australia rather than migrating north *Internationally important sites:* • Dampier Saltworks • Port Hedland Saltworks • Eighty Mile Beach • Roebuck Bay	Bare dry shingle, shell or sand beaches, sandspits and islets in or around coastal or near-coastal lagoons and other wetlands	Mudflats and nearby shallow water	Worms, molluscs, crustaceans, insects and seeds	
Marsh sandpiper	Widespread; notable areas include Eighty Mile Beach, Port Hedland Saltworks	Tidal mudflats	Mudflats, marshy vegetation	Molluscs, crustaceans and insects	



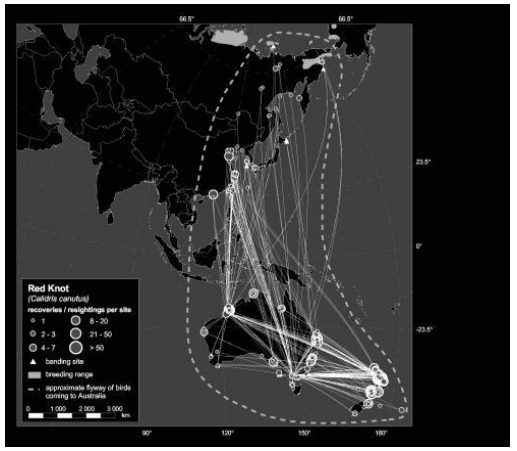


This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Eastern curlew	Continuous distribution from Barrow Island and Dampier Archipelago through the Kimberley region *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Sandy spits, sandbars and islets, beaches near the high water mark, and coastal vegetation, including low saltmarsh or mangroves	Soft sheltered intertidal sandflats or mudflats, salt flats and saltmarsh, near mangroves, among rubble on coral reefs, and beaches near the tideline	Crustaceans, insects and small molluscs	
Great knot	Common on the coasts of the Pilbara and Kimberley, from the Dampier Archipelago to the NT border *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Roosts in large groups in open areas, often at the water's edge or in shallow water near feeding grounds	Sheltered coastal habitats with large intertidal mudflats or sandflats	Bivalves, gastropods, crustaceans and other invertebrates	

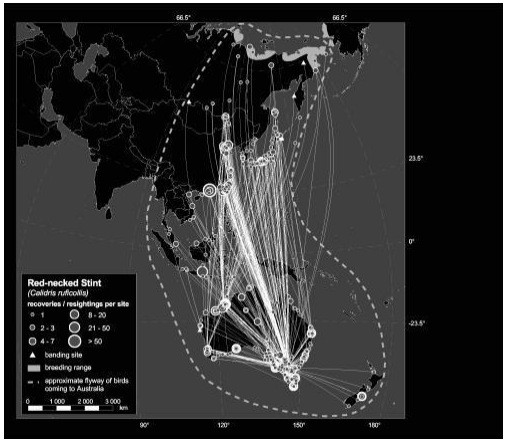
This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

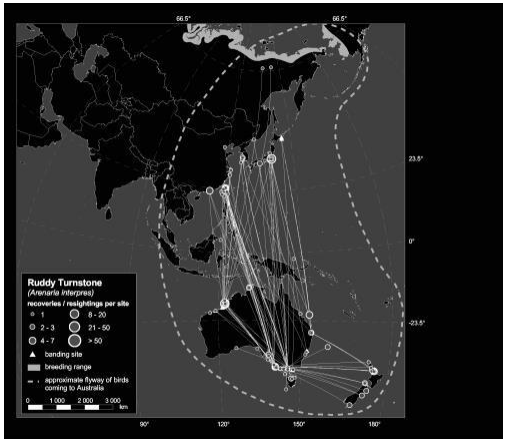
Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Greater sand plover	Widespread between North West Cape and Roebuck Bay *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Sand spits and banks on beaches or in tidal lagoons	Surface of wet sand or mud on open intertidal flats of sheltered embayments, lagoons or estuaries	Molluscs, worms, crustaceans and insects	
Grey plover	Widespread in coastal areas across Australia *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Sandy habitats, including unvegetated sandbanks or sand spits, sheltered beaches, estuaries or lagoons	Large areas of exposed mudflats and beaches of sheltered coastal shores	Molluscs, insects and their larvae, crustaceans and polychaete worms	



This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

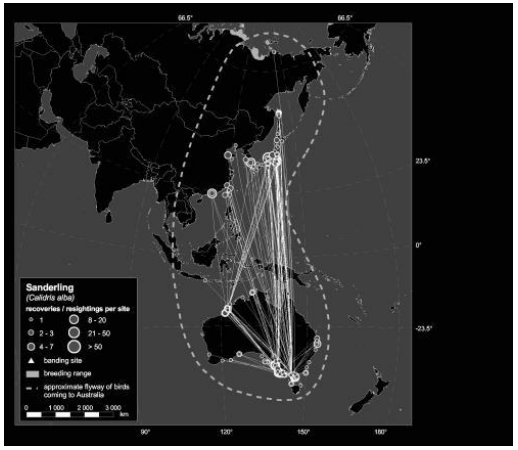
Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Grey-tailed tattler	Widespread from Houtman Abrolhos and the mainland adjacent to the Kimberley *Internationally important sites:* • Barrow Island • Roebuck Bay • Eighty Mile Beach • Lacepede Islands	Branches of mangroves, snags or driftwood	Shallow water on hard intertidal substrates, such as reefs and rock platforms, in rock pools and among rocks and coral rubble	Polychaetes, molluscs, crustaceans, insects and, occasionally, fish	
Lesser sand plover	*Widespread, internationally important sites:* • Eighty Mile Beach • Roebuck Bay • Broome • Port Hedland Saltworks	Beaches, banks, spits of sand or shell, occasionally rocky spits, islets and reefs	Exposed intertidal sandflats and mudflats of beaches or estuaries, occasionally shallow water in saltworks	Molluscs, worms, crustaceans and insects	

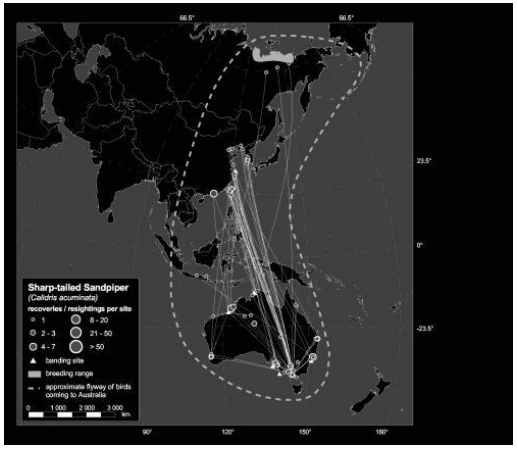




This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

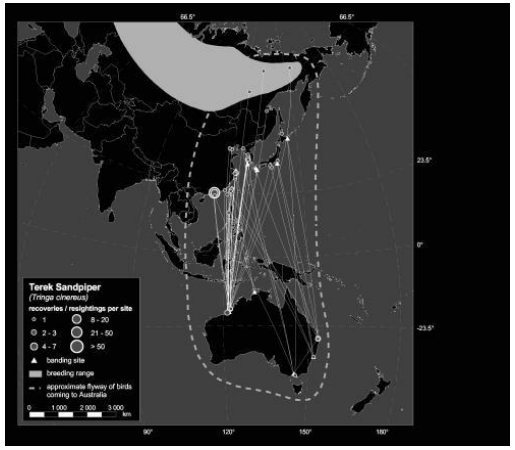
Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Oriental plover	Most records are along the north-western coast between Exmouth Gulf and Derby in WA *Internationally important sites:* • Dampier Saltworks • Port Hedland Saltworks • Eighty Mile Beach • Roebuck Bay	Soft wet mud or in shallow water of beaches and tidal mudflats	Short grass, hard stony bare ground, mudflats or among beach-cast seaweed on beaches	Insects, including termites, beetles, grasshoppers and crickets	Not available
Oriental pratincole	Widespread along the coasts of the Pilbara and Kimberley *Internationally important sites:* • Eighty Mile Beach • Roebuck Plains	Bare areas such as claypans or areas with low vegetation, such as saltmarsh	Open plains, floodplains or short grassland, artificial wetlands (saltworks), beaches, mudflats and islands, or around coastal lagoons Usually feeds aerially, at heights varying from just above the ground up to 300 m	Insects, including dragonflies, cicadas, beetles, moths, ants, termites, locusts, grasshoppers, flies, bees and wasps	Not available

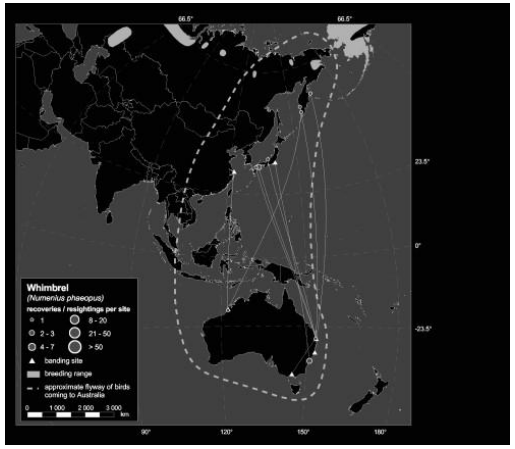




This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Pacific golden plover	Widespread along the coasts of the Pilbara and Kimberley *Nationally important site:* • Eighty Mile Beach	Sandy beaches and spits, rocky points, islets, exposed reef, occasionally mangrove and saltmarsh vegetation, beach-cast seaweed, levee banks and saltwork evaporation ponds	Sandy, muddy and rocky shores, sheltered estuaries and lagoons, occasionally saltmarsh, mangrove or pasture	Molluscs, polychaete worms, insects, insect larvae, spiders, crustaceans, occasionally seeds, leaves, lizards, bird eggs and fish	
Red knot	Large numbers regularly recorded in north-west Australia *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Sandy beaches, spits and islets, and mudflats near feeding grounds	Soft substrate near the water edge, including intertidal mudflats and sandflats exposed by low tide	Worms, bivalves, gastropods, crustaceans and echinoderms	





This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Red-necked stint	Widespread in coastal areas across Australia *Internationally important sites:* • Barrow Island • Port Hedland Saltworks • Eighty Mile Beach • Roebuck Bay	Sheltered beaches, spits, banks or islets of sand, mud, coral or shingle, occasionally in saltmarsh or other vegetation	Feed in dense flocks on bare wet mud such as intertidal mudflats or sandflats, or in very shallow water	Marine worms, molluscs, snails and slugs, shrimps, spiders, beetles, flies and ants	
Ruddy turnstone	Found in most coastal regions across Australia *Internationally important sites:* • Barrow Island • Eighty Mile Beach • Roebuck Bay • Lacepede Islands	Beaches above the tideline, among rocks, shells, beach-cast seaweed or other debris	Between lower supralittoral and lower littoral zones of foreshores. Often forage among banks of stranded seaweed or other tide-wrack Occasionally forage on exposed rocky platforms, coral reefs and mudflats	Insects, worms, crustaceans, molluscs and spiders Occasionally been known to eat fish, birds' eggs and carrion, and human food scraps	
Ruff	Periodically recorded in Port Hedland, Kununurra and the Argyle Diamond Mine	Wetlands with exposed mudflats and short, dense vegetation	Exposed mudflats with shallow water and dry mud	Moss, plant fibre, seeds, annelid worms, molluscs, crustaceans, spiders, insects, fish and amphibians	Not available

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Sanderling	Occur across most of the NWMR coast as far east as Derby *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Bare sand high on the beach clumps of washed-up kelp, coastal dunes, rocky reefs and ledge	Open sandy beaches exposed to open sea swell, exposed sandbars and spits and shingle banks, where they forage in the wave-wash zone and among rotting seaweed	Plants, seeds, worms, crustaceans, spiders, insects Occasionally on medusae, fish, larger molluscs and crustaceans taken as carrion	
Sharp-tailed sandpiper	Widespread from Cape Arid to Carnarvon, around coastal and subcoastal plains of the Pilbara to Kimberley *Internationally important site:* • Port Hedlands Saltworks • Eighty Mile Beach	Edges of wetlands, on wet open mud or sand, in shallow water, or in short, sparse vegetation, such as grass or saltmarsh	Edge of the water of wetlands or intertidal mudflats, either on bare wet mud or sand, or in shallow water Also forage among inundated vegetation of saltmarsh, grass or sedges	Seeds, worms, molluscs, crustaceans and insects	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	Presence in NWMR	Roosting habitat	Foraging habitat	Diet	Migration From Minton *et al.* (2006)
Terek sandpiper	The species is widespread in the Pilbara and Kimberley, from Dampier to Wyndham, with occasional records around Shark Bay *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	In or among mangroves, may perch in branches or roots up to 2 m from the ground, or in shade beneath	Soft wet intertidal mudflats or in sheltered estuaries, embayments, harbours or lagoons	Crustaceans, insects, seeds, molluscs and arachnids	
Whimbrel	Widespread from Carnarvon to the north-east Kimberley Primarily coastal distribution; there are also scattered inland records of whimbrels in all regions *Internationally important site:* • Roebuck Bay	Regularly roost in mangroves and other structures flooded at high tide May also roost on ground of muddy, sandy or rocky beaches, rocky islets and coral cays	Intertidal mudflats, muddy banks of estuaries and in coastal lagoons, open unvegetated areas or among mangroves Occasionally on sandy beaches or among rocks	Annelids, crustaceans and, rarely, vertebrates (such as small fish, little tern chicks)	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 9-5: Species summary for moderate occurrence key shorebird species

Species	NWMR presence	Roosting habitat	Foraging habitat	Diet
Asian dowitcher	Regular visitor to the north-west between Port Hedland and Broome *Internationally important sites:* • Roebuck Bay • Port Hedland saltworks	Coastal lagoons, estuaries and tidal creeks	Intertidal mud flats	Polychaete worms and larvae, also insect larvae and molluscs
Australian painted snipe	Widespread in low numbers	Shallow freshwater wetlands with bare mud and dense canopy cover	Dense vegetation cover, occasionally mudflats and grassland	Vegetation, seeds, insects, worms, molluscs and crustaceans
Little curlew	Widespread with distribution concentrated along the northern coast from Port Hedland during the non-breeding season *Internationally important sites:* • Roebuck Plains • Roebuck Bay • Anna Plains • Derby Sewage Ponds • Parry Floodplain	Short, dry grassland, and occasionally dry saltmarshes, coastal swamps, mudflats or sandflats in estuaries, or on the beaches of sheltered coasts	Short, dry grassland and sedgeland with shallow freshwater pools or seasonal inundation	Insects, seeds and berries
Common greenshank	Occurs in all types of wetlands and has the widest distribution of any shorebird in Australia *Internationally important sites:* • Eighty Mile Beach • Roebuck Bay	Wetlands, shallow pools and puddles, or slightly elevated on rocks, sandbanks or small muddy islets	Edges of wetlands, in soft mud on mudflats, in channels, among pneumatophores of mangroves or other sparse, emergent or fringing vegetation, such as sedges or saltmarsh	Molluscs, crustaceans, insects, and occasionally fish and frogs
Common sandpiper	Widespread in low numbers	Rocks or in roots or branches of vegetation, especially mangroves	Bare soft mud at the edges of wetlands	Molluscs, crustaceans and insects
Pectoral sandpiper	Low numbers recorded across the Gascoyne, Pilbara and Kimberley regions	Coastal lagoons, estuaries, bays, swamps, lakes, inundated grasslands, saltmarshes, river pools, creeks, floodplains and artificial wetlands	Bare soft mud at the edges of wetlands	Algae, seeds, crustaceans, arachnids and insects

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	NWMR presence	Roosting habitat	Foraging habitat	Diet
Wood sandpiper	NWMR supports largest numbers in Australia; notable areas include Parry floodplain, Shark Bay	Low trees, grassy hillocks	Bare, soft mud at the edges of wetlands	Insects and molluscs
Long-toed stint	Widespread along the coasts of the Pilbara and Kimberley	Shallow inland wetlands	Wetland or islets with wet mud or shallow water and short vegetation	Seeds, molluscs, crustaceans, insects, occasionally algae
Pin-tailed snipe	Recorded in the Pilbara, Port Hedland, Myaree Pool, Maitland River and near Karratha	Wide variety of wetland habitats, including flooded paddy fields, wet grasslands, seepage swamps and marshland	Muddy shorelines of swamps and along streams	Molluscs, adult and larval insects, earthworms and occasionally crustaceans, seeds and other plant matter
Swinhoe's snipe	Recorded in the Pilbara, Kimberley, Mount Goldsworth, Mount Blaize and near the Mitchell Plateau	Grasses and rushes around the edge of fresh and brackish marshes	Grasses and rushes near the water edge, in addition to hummocks or on mudflats around seepage areas	Earthworms, adult and larval insects

9.4 Other marine birds in the NWMR

Table 9-6 summarises species descriptions for high occurrence key other marine bird species.

Table 9-6: Species summary for high occurrence key other marine bird species

Species	NWMR presence	Predominant feeding behaviour	Diet
Fork-tailed swift	Non-breeding: Oct to Apr Widespread in coastal areas as far north as Carnarvon, including some on nearshore and offshore islands Scattered along the Pilbara coast to the east Kimberley region	Aerial forager, flying anywhere from 1 m to 300 m above the ground to forage Typically feed in flocks ranging from 10 to 1,000 birds	Insectivorous
Osprey	Breeding: April to February, though depends on latitude; NWMR individuals breeding early in the season compared to the SWMR Non-breeding: Remain in breeding territories Continuous distribution of the species around the coast except for a possible gap at Eighty Mile Beach	Hover momentarily then dive down, sometimes in stages, before snatching prey from near the surface with the feet or by plunging into the water feet first	Fish, especially mullet where available Rarely take molluscs, crustaceans, insects, reptiles, birds and mammals

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

10. THREATENED AND MIGRATORY SPECIES' SEASONAL PRESENCE

Seasonal sensitivity for key threatened and migratory species in the NWMR and applicable to Woodside activities are presented in Table 10-1. The timing presented is displayed as a broad representation for the NWMR, with location specific seasonality presented within Environment Plans (EPs).

Table 10-1: Seasonal sensitivity of key threatened and migratory species in the NWMR

Species	January	February	March	April	May	June	July	August	September	October	November	December
Fishes, sharks and rays												
Whale shark – foraging (northward from Ningaloo) Whale shark foraging northward from Ningaloo in Spring[1] Migration along the north coast of WA also known to occur between July and November[2] Potential presence of whale sharks year-round at Ningaloo[3]												
Whale shark – foraging (high density prey, Ningaloo Reef) Whale shark foraging (high density prey) Ningaloo April to June, Autumn[1] March to July[2] Potential presence of whale sharks year-round at Ningaloo[3]												
Dwarf sawfish – reproduction[1] Potential to occur all seasons												
Dwarf sawfish – foraging[1] Potential to occur all seasons												
Largetooth (freshwater) sawfish – reproduction (pupping)[1] Pupping occurs from January to May												
Largetooth (freshwater) sawfish – foraging[1]												
Green sawfish (reproduction)[1]												
Green sawfish (foraging)[1]

Species	January	February	March	April	May	June	July	August	September	October	November	December
Marine reptiles – marine turtle nesting [note, hatchling emergence is generally six to eight weeks after nesting activity]												
Green turtle												
Ashmore Reef stock (G-AR)[1, 4] Mating occurs September to November Nesting occurs year round (peak December to January) Hatching September to May												
Scott Reef-Browse Island stock (G-ScBr)[1, 4] Mating: October Nesting: November to March (peak January to February) Hatching: Peak March to April												
NWS stock (G-NWS)[1, 4] Mating: September to December Nesting: November to March (peak December to February) Hatching: January to May (peak February to March)												
Hawksbill turtle												
WA stock (H-WA)[1, 4] Mating: Unknown Nesting: November to March (peak January) Hatching: January to May												
Flatback turtle												
Cape Domett stock (F-CD)[1, 4] Mating: year round Nesting: all year (peak August to September) Hatching: all year												
South-west Kimberley stock (F-swKim)[1, 4] Mating: year round Nesting: all year (peak December to January) Hatching: all year												

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	January	February	March	April	May	June	July	August	September	October	November	December
Pilbara stock (F-Pil)[1, 4] Mating: September to January Nesting: October to March (peak November to January) Hatching: February to March												
Unknown genetic stock, Kimberley, WA[1, 4] May to July												
Loggerhead turtle												
WA stock (LH-WA)[1, 4] Mating: Unknown Nesting: November to March (peak January) Hatching: January to May												
Olive ridley turtle												
Unknown genetic stock, Kimberley, WA[1, 4] May to July												
Cetaceans												
Fin whale[5] Fin whale presence NWMR May to October Migrating north from Cape Leeuwin (SWMR) May to October Present offshore Dampier August to October												
Humpback whale – northern migration[6] Range June to September[1, 6, 14] Peak July to August[7]												
Humpback whale – southern migration[7] Range July to November. Peak August to October[6, 7, 8, 14]												
Humpback whale – reproduction (nursing, Kimberley coast)[8] Reproduction (nursing, Kimberley coast) Winter (June to August)[1] Breeding August to September[6, 14] Calves present off Kimberley in October[9]

Species	January	February	March	April	May	June	July	August	September	October	November	December
Omura's whale Limited data but sightings reported year round[9]												
Pygmy blue whale – northern migration[10] Pygmy blue whale northern migration April to August[1, 6, 11, 12] Peak April to July[13] From the Perth Canyon (April/May) to the NWS (June/July) [13]												
Pygmy blue whale – southern migration[11] Migration October to December, possibly into January[1, 6] Peak November to December[13]												
Southern right whale (calving/presence in NWMR)[12] Calving and migratory presence in Exmouth Gulf (NWMR) June to September[1] Peak: July and August[1]												
Seabirds (high occurrence seabirds with designated BIAs[15]												
Wedge-tailed shearwater – breeding/foraging *fledgling emergence (first two weeks of April)				*								
Australian lesser noddy NWMR presence in non-breeding period *breeding – Ashmore Reef and Abrolhos, may forage in NWMR								*	*	*	*	*
Common noddy – breeding												
Bridled tern – breeding and foraging												
Great frigatebird – breeding/foraging *possibly present in NWMR in non-breeding and foraging in breeding season	*	*	*	*	*	*	*	*	*			
Lesser frigatebird – breeding/foraging *possibly present in NWMR in non-breeding and foraging in breeding season	*	*	*	*	*	*	*	*	*			
Brown booby – presence in NWMR (breeding/foraging) Present NWMR year-round (breeding at Ashmore Reef, Adele Island, Lacepedes between January and March (protracted through to October at Ashmore Reef)												

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	January	February	March	April	May	June	July	August	September	October	November	December
Red-footed booby – presence in NWMR (breeding/foraging) Breed at Ashmore Reef and Adele Island, recorded breeding year-round at Ashmore Reef												
Little tern – breeding/foraging maybe present in NWMR outside breeding season – foraging and resting												
Roseate tern – breeding												
Caspian tern – breeding Dampier Archipelago and North West Cape												
Greater crested tern												
White-tailed and red-tailed tropicbird – breeding largest breeding populations on Christmas Island												
Key												
	Peak period (reliable/predictable)											
	Species present/undertaking biologically important behaviour in the NWMR											
	Species not likely to be present or undertaking biologically important behaviour in the NWMR

11. KEY ECOLOGICAL FEATURES

KEFs are elements of the Commonwealth marine environment that are considered important for a marine region's biodiversity or ecosystem function and integrity. The Australian Government has identified KEFs based on advice from scientists about the ecological processes and characteristics of the area.

KEFs meet one or more of the criteria of:

- a species, group of species, or a community with a regionally important ecological role; for example, a predator, or prey that affects a large biomass or number of other marine species
- a species, group of species or a community that is nationally or regionally important for biodiversity
- an area or habitat that is nationally or regionally important for:
  - enhanced or high productivity, such as predictable upwellings – an upwelling occurs when cold nutrient-rich waters from the bottom of the ocean rise to the surface
  - aggregations of marine life, such as feeding, resting, breeding or nursery areas, or
  - biodiversity and endemism (species that only occur in a specific area)
- a unique seafloor feature, with known or presumed ecological properties of regional significance.

Thirteen KEFs are designated within the NWMR, detailed in Table 11-1. Twelve KEFs are designated within the SWMR and eight within the NMR, detailed in (Appendix A).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 11-1 details the 13 KEFs within the NWMR as identified by the PMST (Appendix A) and are displayed in Figure 11-1.

Table 11-1: Key ecological features within the NWMR

KEF name	Woodside activity area			Values[1]	Description
	Browse	*NWS/ Scarborough*	*North West Cape*		
Ancient coastline at 125 m depth contour	✓	✓	✓	Unique seafloor feature with ecological properties of regional significance. Provides areas of hard substrate and may provide sites for higher diversity and enhanced species richness relative to surrounding areas of predominantly soft sediment.	Several steps and terraces as a result of Holocene sea level changes occur in the region, with the most prominent of these features occurring as an escarpment along the NWMR and Sahul Shelf at a water depth of 125 m. The ancient coastline is not continuous throughout the NWMR and coincides with a well-documented eustatic stillstand at about 130 m depth worldwide (Falkner *et al.* 2009). Where the ancient coastline provides areas of hard substrate, it may contribute to higher diversity and enhanced species richness relative to soft sediment habitat (Falkner *et al.* 2009). Parts of the ancient coastline, represented as rocky escarpment, are considered to provide biologically important habitat in an area predominantly made up of soft sediment. The escarpment type features may also potentially facilitate mixing within the water column due to upwelling, providing a nutrient-rich environment. Although the ancient coastline adds more habitat types to a representative system, the habitat types are not unique to the coastline as they are widespread on the upper shelf (Falkner *et al.* 2009).
Ashmore Reef and Cartier Island and surrounding Commonwealth waters	✓	-	-	High productivity, biodiversity and aggregation of marine life that apply to both the benthic and pelagic habitats within the feature.	Ashmore Reef is the largest of only three emergent oceanic reefs in the north-eastern Indian Ocean and is the only oceanic reef in the region with vegetated islands. Ashmore contains a large reef shelf, two large lagoons, several channelled carbonate sand flats, shifting sand cays, an extensive reef flat, three vegetated islands – East, Middle and West islands – and surrounding waters. Rising from a depth of more than 100 m, the reef platform is at the edge of the NWS and covers an area of 239 km². Ashmore Reef and Cartier Island and the surrounding Commonwealth waters are regionally important for feeding and breeding aggregations of birds and other marine life; they are areas of enhanced primary productivity in an otherwise low- nutrient environment (DSEWPaC 2012a). Ashmore Reef supports the highest number of coral species of any reef off the WA coast.

KEF name	Woodside activity area			Values[1]	Description
	Browse	*NWS/ Scarborough*	*North West Cape*		
Carbonate bank and terrace system of the Sahul Shelf	✓	-	-	Unique seafloor feature with ecological properties of regional significance. Regionally important because of their role in enhancing biodiversity and local productivity relative to their surrounds. The carbonate banks and terraces provide areas of hard substrate in an otherwise soft sediment environment, and are important for sessile species.	The carbonate banks and terrace system of the Sahul Shelf are in the western Joseph Bonaparte Gulf and north of Cape Bougainville and Cape Londonderry. The carbonate banks and terraces are part of a larger complex of banks and terraces that occurs on the Van Diemen Rise in the adjacent NMR. The bank and terrace system of the Van Diemen Rise covers about 31,278 km² and forms part of the larger system associated with the Sahul Banks to the north and Londonderry Rise to the east. The feature is characterised by terrace, banks, channels and valleys (DSEWPaC 2012c). The banks, ridges and terraces of the Van Diemen Rise are raised geomorphic features with relatively high proportions of hard substrate that support sponge and octocoral gardens. These, in turn, provide habitat to other epifauna, by providing structure in an otherwise flat environment (Przeslawski *et al.* 2011). Plains and valleys are characterised by scattered epifauna and infauna that include polychaetes and ascidians. These epibenthic communities support higher order species such as olive ridley turtles, sea snakes and sharks (DSEWPaC 2012c).
Canyons linking the Argo Abyssal Plain and Scott Plateau	-	✓	-	Facilitates nutrient upwelling, creating enhanced productivity and encouraging diverse aggregations of marine life. Likely to be important due to their historical association with sperm whale aggregations.	Interactions with the Leeuwin Current and strong internal tides are thought to result in upwelling at the canyon heads, thus creating conditions for enhanced productivity in the region (Brewer *et al.* 2007). As a result, aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, predatory fishes and seabirds are known to occur in the area due to its enhanced productivity (Sleeman *et al.* 2007).
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	-	-	✓	Unique seafloor feature with ecological properties of regional significance. The feature creates an enhanced productivity environment, attracting aggregations of fish and higher-order consumers such as large predatory fish, sharks, toothed whales and dolphins.	The canyons are associated with upwelling as they channel deep water from the Cuvier Abyssal Plain up onto the slope, Exmouth Plateau and Ningaloo Reef. This nutrient-rich water interacts with the Leeuwin Current at the canyon heads (DSEWPaC 2012a). Aggregations of whale sharks, manta rays, sea snakes, sharks, seabirds and large predatory fish are known to occur in this area.

	Browse	*NWS/ Scarborough*	*North West Cape*		
Commonwealth waters adjacent to Ningaloo Reef	-	-	✓	High productivity and diverse aggregations of marine life. The Commonwealth waters adjacent to Ningaloo Reef and associated canyons and plateaus are interconnected and support the high productivity and species richness of Ningaloo Reef. Ningaloo Reef is globally significant as it is the only extensive coral reef in the world that fringes the west coast of a continent.	The Leeuwin and Ningaloo currents interact, leading to areas of enhanced productivity in the Commonwealth waters adjacent to Ningaloo Reef. Aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, seabirds and large predatory fish are known to occur in this area (DSEWPaC 2012a). The spatial boundary of this KEF, as defined in the Australian Marine Spatial Information System, is defined as the waters contained in the existing Ningaloo AMP provided in Section 12.5.
Continental slope demersal fish communities	✓	✓	✓	High biodiversity of demersal fish assemblages, including high levels of endemism.	The diversity of demersal fish assemblages on the continental slope in the Timor Province, the Northwest Transition and the Northwest Province is high compared to elsewhere along the Australian continental slope (DSEWPaC 2012a). The continental slope between North West Cape and the Montebello Trough has more than 500 fish species, 76 of which are endemic, which makes it the most diverse slope bioregion in Australia (Last *et al.* 2005). The slope of the Timor Province and the Northwest Transition also contains more than 500 species of demersal fishes, of which 64 are considered endemic (Last *et al.* 2005), making it the second richest area for demersal fishes throughout the whole continental slope. Demersal fish species occupy two distinct demersal biomes associated with the upper slope (225 to 500 m water depths) and the mid-slope (750 to 1,000 m). Although poorly known, it is suggested the demersal slope communities rely on bacteria and detritus-based systems comprised of infauna and epifauna, which in turn become prey for a range of teleost fishes, molluscs and crustaceans (Brewer *et al.* 2007). Higher-order consumers may include carnivorous fishes, deepwater sharks, toothed whales and large squid (Brewer *et al.* 2007). Pelagic production is phytoplankton-based, with hotspots around oceanic reefs and islands (Brewer *et al.* 2007)

	Browse	***NWS/ Scarborough***	***North West Cape***		
Exmouth Plateau	-	✓	✓	Unique seafloor feature with ecological properties of regional significance, which apply to both benthic and pelagic habitats. Likely to be an important area of biodiversity as it provides an extended area offshore for communities adapted to depths of about 1,000 m.	The Exmouth Plateau is a large, mid-slope, continental margin plateau that lies off the north-west coast of Australia. It ranges in depth from about 500 to more than 5,000 m and is a major structural element of the Carnarvon Basin (Miyazaki and Stagg 2013). The large size of the Exmouth Plateau and its expansive surface may modify deepwater flow and be associated with generating internal tides, both of which may subsequently contribute to the upwelling of deeper, nutrient-rich waters nearer the surface (Brewer *et al.* 2007). Satellite observations suggest productivity is enhanced along the northern and southern boundaries of the plateau (Brewer *et al.* 2007). Sediments on the plateau suggest biological communities include scavengers, benthic filter feeders and epifauna (DSEWPaC 2012a). Fauna in the pelagic waters above the plateau are likely to include small pelagic species and nekton attracted to seasonal upwellings, as well as larger predators such as billfishes, sharks and dolphins (Brewer *et al.* 2007). Protected and migratory species are also known to pass through the region, including whale sharks and cetaceans.
Glomar Shoal	-	✓	-	An area of high productivity and aggregations of marine life, including commercial and recreational fish species.	Glomar Shoal is a submerged littoral feature about 150 km north of Dampier on the Rowley shelf at depths of 33 to 77 m (Falkner *et al.* 2009). Studies by Abdul Wahab *et al.* (2018) found hard coral and sponge species in water depths less than 40 m. One hundred and seventy different species of fishes were detected, with greatest species richness and abundance in shallow habitats (Abdul Wahab *et al.* 2018). Fish species present include commercial and recreational species such as rankin cod, brown striped snapper, red emperor, crimson snapper, bream and yellow-spotted triggerfish (Falkner *et al.* 2009; Fletcher and Santoro 2009). These species have recorded high catch rates associated with Glomar Shoal, indicating the shoal is likely to be an area of high productivity.

KEF name	Woodside activity area			Values[1]	Description
	Browse	*NWS/ Scarborough*	*North West Cape*		
Mermaid Reef and Commonwealth waters surrounding Rowley Shoals	-	✓	-	Regionally important in supporting high species richness, higher productivity and aggregations of marine life.	The Mermaid Reef and Commonwealth waters surrounding the KEF is adjacent to the 3 nm State waters limit surrounding Clerke Reef and Imperieuse Reef, and include the Mermaid Reef Marine Park as described in Section 12. The reefs provide a distinctive biophysical environment in the region. They have steep and distinct reef slopes and associated fish communities. In evolutionary terms, the reefs may play a role in supplying coral and fish larvae to reefs further south via the southward-flowing Indonesian Throughflow. Both coral communities and fish assemblages differ from similar habitats in eastern Australia (Done *et al*. 1994).
Pinnacles of the Bonaparte Basin	✓	-	-	Unique seafloor feature with ecological properties of regional significance. Provide areas of hard substrate in an otherwise soft sediment environment and so are important for sessile species. Recognised as a biodiversity hotspot for sponges. The KEF is within both the NWMR and NMR.	The Pinnacles of the Bonaparte Basin provide areas of hard substrate in an otherwise relatively featureless environment, the pinnacles are likely to support a high number of species, although a better understanding of the species richness and diversity associated with these structures is required (DSEWPaC 2012a; 2012c). Covering >520 km² within the Bonaparte Basin, this feature contains the largest concentration of pinnacles along the Australian margin. The pinnacles of the Bonaparte Basin are thought to be the eroded remnants of underlying strata; it is likely the vertical walls generate local upwelling of nutrient-rich water, leading to phytoplankton productivity that attracts aggregations of planktivorous and predatory fish, seabirds and foraging turtles (DSEWPaC 2012a; 2012c).
Seringapatam Reef and the Commonwealth waters in the Scott Reef complex	✓	-	-	Support diverse aggregations of marine life, have high primary productivity relative to other parts of the region, are relatively pristine and have high species richness, which apply to both the benthic and pelagic habitats within the feature.	Seringapatam Reef and the Commonwealth waters in the Scott Reef complex are regionally important in supporting the diverse aggregations of marine life, high primary productivity and high species richness associated with the reefs themselves. As two of the few offshore reefs in the north-west, they provide an important biophysical environment in the region (DSEWPaC 2012a).

KEF name	Woodside activity area			Values[1]	Description
	Browse	***NWS/ Scarborough***	***North West Cape***		
Wallaby Saddle	-	-	✓	High productivity and aggregations of marine life, representing almost the entire area of this type of geomorphic feature in the NWMR. It is a unique habitat that neither occurs anywhere else nearby (within hundreds of kilometres) nor with as large an area (Falkner *et al.* 2009).	The Wallaby Saddle may be an area of enhanced productivity. Historical whaling records provide evidence of sperm whale aggregations in the area of the Wallaby Saddle, possibly due to the enhanced productivity of the area and aggregations of baitfish (DSEWPaC 2012a).

12. PROTECTED AREAS

12.1 Regional context

Protected areas include World Heritage properties, National Heritage places, wetlands of international importance, AMPs, State marine parks and reserves, threatened ecological communities and the Australian Whale Sanctuary. The PMST Reports (Appendix A) show 30 protected areas in the NWMR, 19 in the SWMR and nine in the NMR.

12.2 World Heritage properties

World Heritage listings are sites of outstanding universal value and meet at least ten selection criteria, compiled of cultural and natural basis criteria. World Heritage listings classed as meeting outstanding natural criteria are discussed in this section and World Heritage sites classed as meeting outstanding cultural criteria are discussed in Section 13.

The list of Australia's World Heritage Properties and the PMST reports (Appendix A) show two World Heritage properties classed as natural within the NWMR (Table 12-4), and one World Heritage property classed as cultural, the Murujuga Cultural Landscape (MCL), which is described in Section 12.2.1. One World Heritage property is within the SWMR and one in the NMR (Appendix A).

Table 12-4 describes the World Heritage properties within the NWMR.

12.2.1 Murujuga Cultural Landscape World Heritage property

The MCL, within the NWMR (Figure 12-2), is globally significant and is recognised on Australia's National Heritage list and United Nations Educational, Scientific and Cultural Organization's (UNESCO) World Heritage list. The landscape encompasses one of the largest, densest and most diverse collections of rock art in the world. The area is estimated to contain over a million engravings (petroglyphs) demonstrating a broad range of styles and subjects. The landscape also boasts various archaeological sites, including quarries, middens, fish traps, rock shelters, ceremonial sites, artefact scatters, grinding patches and stone arrangements that evidence tens of thousands of years of human occupation. These significant places are linked through the stories, knowledge and customs maintained by Traditional Custodians of Murujuga.

12.2.1.1 UNESCO World Heritage listing

UNESCO "seeks to encourage the identification, protection and preservation of cultural and natural heritage around the world considered to be of outstanding value to humanity" via the World Heritage List, established under the World Heritage Convention 1972 (UNESCO 2024).

The MCL was nominated by the Federal Department of the Environment and Energy in 2020 and was inscribed on the UNESCO World Heritage List on 11 July 2025. This property is comprised of 99,881 ha, includes 8,356 ha of the Burrup Peninsula, 42 islands of the Dampier Archipelago and adjacent marine areas.

The outstanding universal values of the MCL World Heritage property include the following:

- Petroglyphs demonstrate artistic achievement assembled over 50,000 years. They are visually outstanding, demonstrate technical skill, and represent multiple phases in the development of regional and local styles.
- The Murujuga Cultural Landscape bears testimony to the living cultural traditions of Ngarda-Ngarli and the spiritual relationship between people and landscape that is at least 50,000 years old.
- The Murujuga Cultural Landscape is an outstanding example of human interaction with the environment over at least 50,000 years. The landscape is patterned by this long-term presence persisting through irreversible environmental and climatic changes.

The MCL is inscribed under Cultural Criterion i, iii and v, which reflect the outstanding universal values.

More information about the MCL can be found on the publicly available UNESCO World Heritage Listing[17].

[17] https://whc.unesco.org/en/list/1709

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The WA DBCA states “World Heritage listing also brings a commitment at local, state and national levels to protect and manage the property for present and future generations.” This affirms that with appropriate management, the World Heritage listing and industry could occur in parallel, as long as there are no significant impacts on World Heritage values (DBCA 2019).

12.2.1.2 Condition of Murujuga Cultural Landscape

The identified condition of the MCL has been assessed from publicly available sources:

The following is an excerpt from the World Heritage Submission for MCL (Murujuga Aboriginal Corporation (MAC), DBCA, DoEE 2020) which noted, with regards to the Statements of Integrity and/or Authenticity:

> “Aboriginal cultural landscapes are living landscapes that change as time progresses, where oral tradition is the canon of proof and where changing practices of embodied experience with landscapes grow from generation to generation (Andrews and Buggey 2008).
>
> “In the context of Aboriginal cultural landscapes, any test of authenticity must recognise, expect, and endorse changes (Andrews and Buggey 2008). The archaeological and anthropological evidence for Murujuga is well preserved, with a high degree of authenticity. The exceptionally well-preserved cultural values of Murujuga can be found across an area of more than 37,000 ha, comprising the majority of the Burrup Peninsula, as well as the surrounding islands of the Dampier Archipelago.
>
> “The petroglyphs of Murujuga have been made on the exceptionally hard, dark volcanic rock using stone tool technology. Methods of production included pecking, abrasion, incision and bas-relief. When first produced the very pale grey petroglyphs would have contrasted starkly with the dark red-brown cortex of the rock. With subsequent patination and weathering, this contrast gradually reduces…
>
> “Murujuga has a high level of integrity and received enhanced protection and management following its National Heritage listing in 2007. A detailed land-use impact study of Murujuga documented that all 40 islands included in the Dampier Archipelago (including Burrup Peninsula) National Heritage place and approximately 85 per cent of the Burrup Peninsula, retain extremely high integrity (McDonald and Veth 2006), and contain all the attributes that constitute the potential outstanding universal value of the place…
>
> “Within the National Heritage listed area, the petroglyphs are whole and intact (Jo McDonald Cultural Heritage Management 2009; 2011). Although the entirety of Murujuga has not been surveyed and recorded, there are thousands of known sites which demonstrate the potential outstanding universal value of the Murujuga Cultural Landscape…
>
> “While industrial development visually compromises some areas of the southern section of the Burrup Peninsula, the topography, with its deeply dissected gorges, valleys and scree slopes, means that a large portion of Murujuga, including the vast majority of its islands retain high visual integrity (Jo McDonald Cultural Heritage Management 2011; Australian Heritage Council 2012). In summary, the Murujuga Cultural Landscape is an intact and representative example of one of the most significant concentrations of human artistic creativity in the world, which survives through the continuity of Ngurra-ra Ngarli cultural and social practices and active management.”

A report titled The Potential Outstanding Universal Value of the Dampier Archipelago Site and Threats to that Site – A report by the Australian Heritage Council to the Minister for Sustainability, Environment, Water, Population and Communities (Australian Heritage Council 2012), found that:

> “It is clear that the undisturbed area within the boundaries of the National Heritage listed place is complete and whole, notwithstanding the proximity of industry.”

The Australian Heritage Database listing for the Nationally Heritage Listed Dampier Archipelago (including Burrup Peninsula) states:

> “Condition: Parts of the area, particularly the Burrup Peninsula, East Intercourse Island and Mid East Intercourse Island, have been subject to industrial development and other impacts such as the construction of towns and work camps. A land use impact assessment, undertaken using aerial photographs from August 2004, estimates that high levels of impact have occurred on 1,643 ha (or 16.4 square kilometres) on the Burrup Peninsula (McDonald and Veth 2006). A high level of impact in these areas on the Burrup Peninsula has resulted in the destruction of archaeological material and in some cases the relocation of engravings and other stone features. Despite this, the natural and cultural heritage in Dampier Archipelago and its surrounding waters is in good condition” (DCCEEW 2007).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

12.2.1.3 Murujuga rock art monitoring

In 2019, the WA Department of Water and Environmental Regulation (DWER) released the Murujuga Rock Art Strategy (MRAS), a "monitoring, analysis and decision-making framework to protect Aboriginal rock art located on Murujuga (the Dampier Archipelago and Burrup Peninsula)" (DWER 2019). The MRAS notes "This strategy builds on the previous work on Murujuga to deliver a scientifically rigorous approach to monitoring, analysis and management that will provide an appropriate level of protection to the rock art. It describes a risk-based approach for the management of impacts to the rock art that is consistent with the State Government's responsibilities under the *Environmental Protection Act 1986* (EP Act) and provides the monitoring and analysis to determine whether accelerated change is occurring to the petroglyphs" (DWER 2019).

The results from these studies will guide management and protection of the rock art" (Government of Western Australia 2023). The MRAS states that "The successful implementation of the management framework to protect the rock art from anthropogenic emissions will require…a monitoring program that is appropriately designed and implemented to take the necessary measurements, to analyse the data and to report on the integrity or condition of the rock art and change in that condition" (DWER 2019). As described in the MRAS, "The Western Australian Government in partnership with MAC and in consultation with international and national experts in relevant disciplines and the Murujuga Rock Art Stakeholder Reference Group, will develop and implement a revised long-term Murujuga Rock Art Monitoring Program" (DWER 2019).

The Murujuga Rock Art Monitoring Program (MRAMP) is a five-year program run by MAC and DWER, is described as a "best practice monitoring and analysis program" by the Government of Western Australia, which "will provide reliable information about changes and trends in the condition of the rock art and whether the rock art is showing signs of accelerated change. In 2025, MRAMP published interim environmental quality criteria that set the initial levels of airborne substances that are considered to not cause harm to rock art (Curtin University 2025). Interim standards published by MRAMP indicated that activities in the region currently remain below this value. Interim Environmental Quality Criteria Guidelines exist to guide an ongoing management approach under the MRAMP framework for the region.

More information about the MRAS and MRAMP can be found on the Government of Western Australia publicly available website.[18]

12.2.1.4 *Aboriginal and Torres Strait Islander Heritage Protection Act* section 10 (Murujuga) declaration

The (Murujuga) Declaration 2025 was issued on 12 September 2025 under section 10 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (Commonwealth) to provide additional Commonwealth protection for areas of the MCL, specifically on the Burrup Peninsula and Dampier Archipelago (DCCEEW 2025f). The declaration comes into force 12 months after its issue (12 September 2026).

The declaration allows the Minister for Environment and Water (the Minister) to intervene when an area of Aboriginal significance is considered under threat of injury or desecration. The Minister determined that Murujuga is a *significant Aboriginal area* and is subject to a range of threats, including those arising from existing and proposed industrial development, access arrangements, and indirect impacts on heritage values. The original application included a broader area for protection; a partial declaration was issued covering certain defined *declared areas.* These declared areas include Woodside-operated onshore leases. The prohibitions in the declaration do not apply where a person has prior written agreement from MAC to undertake certain activities (DCCEEW 2025f).

The statement about making the section 10 (Murujuga) Declaration is available on DCCEEW's webpage.[19]

12.3 National and Commonwealth Heritage places

The National Heritage List (DCCEEW 2026a) is Australia's list of natural, historic and Indigenous places of outstanding significance to the nation. The National Heritage List Spatial Database (DCCEEW 2026e) describes the place name, class (Indigenous, natural, historic) and status of the heritage places.

[18] Murujuga rock art strategy

[19] Statement about the making of a partial declaration under section 10 of the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984* (Commonwealth) in relation to parts of Murujuga, Western Australia

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Commonwealth Heritage places are a collection of sites recognised for their Indigenous, historical or natural values and are owned or controlled by the Australian Government.

A search of the National Heritage List Spatial Database and the PMST reports (Appendix A) identified six National Heritage places in the NWMR (Table 12-4), four in the SWMR and two in the NMR (Appendix A). A search of the Commonwealth Heritage List identified seven Commonwealth Heritage places within the NWMR (Table 12-4) and six within the SWMR (Appendix A). Four Commonwealth Heritage places are listed within the NMR (Appendix A).

Table 12-4 describes National and Commonwealth Heritage places within the NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

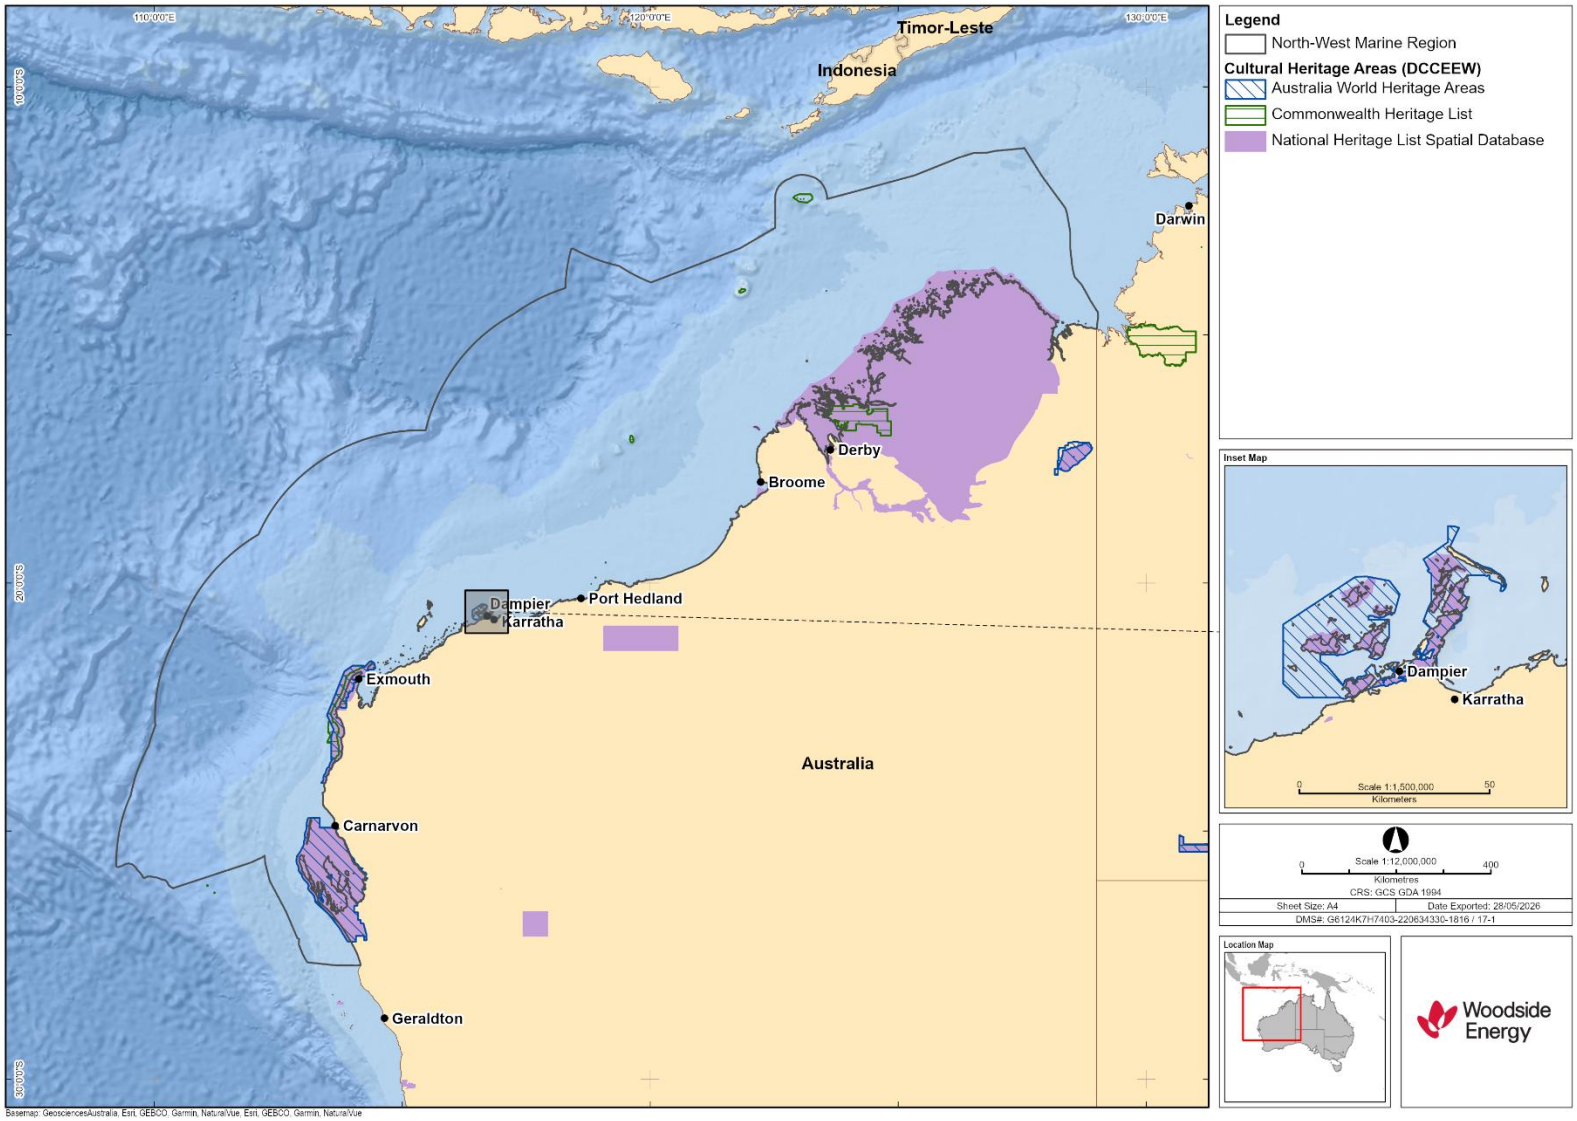

Figure 12-1: World Heritage properties and National and Commonwealth Heritage listed places in the NWMR

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

12.4 Wetlands of international importance (listed under the Ramsar Convention)

Australia has 65 Ramsar wetlands that cover >8.3 million hectares. Ramsar wetlands are those that are representative, rare or unique wetlands, or that are important for conserving biological diversity.

The List of Wetlands of International Importance held under the Ramsar Convention and the PMST reports (Appendix A) identified four Ramsar sites with coastal features within the NWMR (Table 12-4). There are five Ramsar sites within the SWMR (Appendix A) and two within the NMR in the PMST report (Appendix A).

Table 12-4 describes Ramsar wetlands within the NWMR.

12.5 Australian Marine Parks

AMPs, proclaimed under the EPBC Act in 2007 and 2013, are in Commonwealth waters from the outer edge of State and Territory waters (3 nm) to the outer boundary of Australia's EEZ 200 nm from the shore.

PMST reports (Appendix A) identified 16 AMPs within the NWMR, ten within the SWMR and eight within the NMR.

There are also two AMPs in the Indian Ocean territories. These are the Cocos (Keeling) Islands Marine Park and the Christmas Island Marine Park (Table 12-2) (Commonwealth of Australia 2021). Section 12.5.2 describes these further.

Table 12-1 describes the values of all marine parks identified in the North-west Marine Network management plans.

12.5.1 North-west Marine Parks Network

Table 12-1 describes AMPs within the North-west Marine Park Network, according to the North-west Marine Parks Network Management Plan 2018 (Director of National Parks (DNP) 2018a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 12-1: Summary of Australian Marine Parks in the North-west Marine Park Network

North-west Marine Park Network	IUCN zones	Description and values
Argo-Rowley Terrace Marine Park	National Park (II) Multiple Use (VI) Special Purpose Zone (Trawl) (VI)	**Description** The Argo–Rowley Terrace Marine Park is about 270 km north-west of Broome, WA, and extends to the limit of Australia's EEZ. This AMP covers an area of 146,003 km² and water depths between 220 m and 6,000 m, protecting ecological communities in the deep offshore region. The AMP provides connectivity between the Mermaid Reef Marine Park and WA Rowley Shoals Marine Park. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Argo-Rowley Terrace Marine Park on 9 October 2017.
		Natural values The marine park includes ecosystems representative of: • Northwest Transition – an area of shelf break, continental slope and most of the Argo Abyssal Plain; key topographic features include Mermaid, Clerke and Imperieuse reefs • Timor Province – an area dominated by warm, nutrient-poor waters; canyons are an important feature in this area of the marine park and are generally associated with high productivity and aggregations of marine life. KEFs are: • canyons linking the Argo Abyssal Plain with the Scott Plateau • Mermaid Reef and Commonwealth waters surrounding Rowley Shoals. The marine park includes a range of seafloor features such as canyons on the slope between the Argo Abyssal Plain, Rowley Terrace and Scott Plateau. These are believed to be up to 50 million years old and are associated with small, periodic upwellings that results in localised higher levels of biological productivity. The marine park includes species listed under the EPBC Act. BIAs within the marine park include resting and breeding habitat for seabirds and a migratory pathway for the pygmy blue whale.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, limited information regarding the cultural significance of this marine park is currently available (DNP 2018a).
		Heritage values There are no International, Commonwealth or National Heritage listings relevant to the Argo-Rowley Terrace Marine Park. The marine park contains two known shipwrecks listed under the *Historic Shipwrecks Act 1976*: Alfred (wrecked in 1908) and Pelsart (wrecked in 1908).
		Social and economic values Socioeconomic values of this marine park include commercial fishing and mining.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
Ashmore Reef Marine Park	Sanctuary (Ia) Recreational Use (IV)	**Description** The Ashmore Reef Marine Park is about 630 km north of Broome and 110 km south of the Indonesian island of Roti. The marine park is in Australia's External Territory of Ashmore and Cartier islands. It is within an area subject to a Memorandum of Understanding (MoU) between Indonesia and Australia, known as the MoU Box. The marine park covers an area of 583 km² and water depths from less than 15 m to 500 m. The marine park was originally proclaimed under the *National Parks and Wildlife Conservation Act 1975* on 16 August 1983 as the Ashmore Reef National Nature Reserve, and proclaimed under the EPBC Act on 14 December 2013 and renamed Ashmore Reef Marine Park on 9 October 2017.
		Natural values The Ashmore Reef Marine Park includes ecosystems representative of the Timor Province – a bioregion with a depth range from about 200 m near the shelf break to 5,920 m over the Argo Abyssal Plain. Ashmore Reef is an important feature of the bioregion. There are two distinct demersal fish communities: one on the upper slope, the other mid slope. The marine environment includes two extensive lagoons, sand flats, shifting sand cays, extensive reef flat and large areas of seagrass. The reef ecosystems are comprised of hard and soft corals, gorgonians, sponges and a range of encrusting organisms, with the highest number of coral species of any reef off the WA coast. This marine park supports a range of species listed under the EPBC Act. BIAs within the marine park include breeding, foraging and resting habitat for seabirds, resting and foraging habitat for migratory shorebirds, foraging, mating, nesting and internesting habitat for marine turtles, foraging habitat for dugongs, and a migratory pathway for pygmy blue whales. The Ashmore Reef Ramsar site includes the largest of the atolls in the region. West Island, Middle Island and East Island represent the only vegetated islands in the region. The site supports internationally significant populations of seabirds and shorebirds, is important for turtles (green, hawksbill and loggerhead) and dugongs, and has the highest diversity of hermatypic (reef-building) corals on the WA coast. It is known for its abundance and diversity of sea snakes, although populations at Ashmore Reef have been in decline since 1998. KEFs are: • Ashmore Reef and Cartier Island and surrounding Commonwealth waters • continental slope demersal fish communities – an area of high-diversity demersal fish assemblages.
		Cultural values Sea Country is valued for Indigenous Australians' cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP 2018a). This marine park is valued in Indonesian culture as it contains Indonesian artefacts and grave sites. Ashmore Lagoon is still accessed as a rest or staging area for traditional Indonesian fishers travelling to and from fishing grounds within the MoU Box.
		Heritage values Ashmore Reef is a Commonwealth Heritage listed site, meeting criteria A, B and C.

North-west Marine Park Network	IUCN zones	Description and values
		Social and economic values Tourism, recreation and scientific research are important activities in this marine park.
Carnarvon Canyon Marine Park	Habitat Protection (IV)	**Description** The Carnarvon Canyon Marine Park is about 300 km north-west of Carnarvon. It covers an area of 6,177 km² and a water depth range of 1,500 to 6,000 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Carnarvon Canyon Marine Park on 9 October 2017.
		Natural values This marine park includes ecosystems representative of the Central Western Transition – a bioregion characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities. It includes the Carnarvon Canyon, a single-channel canyon covering the entire depth range of this marine park. Ecosystems of this marine park are influenced by tropical and temperate currents, deepwater environments and proximity to the continental slope and shelf. The soft-bottom environment at the base of the Carnarvon Canyon is likely to support deep seafloor species, such as holothurians, polychaetes and sea-pens. This marine park supports a range of species listed under the EPBC Act.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years.
		Heritage values No International, Commonwealth or National Heritage listings apply to the marine park.
		Social and economic values Commercial fishing is an important activity in the marine park.
Cartier Island Marine Park	Sanctuary (Ia)	**Description** The Cartier Island Marine Park is about 45 km south-east of Ashmore Reef Marine Park and 610 km north of Broome, WA. Both marine parks are in Australia's External Territory of Ashmore and Cartier islands and within an area subject to an MoU between Indonesia and Australia, known as the MoU Box. The Cartier Island Marine Park covers an area of 172 km² and water depths from less than 15 m to 500 m. The marine park was originally proclaimed under the *National Parks and Wildlife Conservation Act* on 21 June 2000 as the Cartier Island Marine Reserve. It was then proclaimed under the EPBC Act on 14 December 2013 and renamed Cartier Island Marine Park on 9 October 2017.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Natural values This marine park includes ecosystems representative of the Timor Province – a bioregion with depths ranging from about 200 m near the shelf break to 5,920 m over the Argo Abyssal Plain. The reefs and islands of this bioregion are regarded as biodiversity hotspots. KEFs are: • Ashmore Reef and Cartier Island and surrounding Commonwealth waters • continental slope demersal fish communities. There are two distinct demersal fish communities of the continental slope: one on the upper slope, the other mid slope. This marine park includes an unvegetated sand island (Cartier Island), mature reef flat, a small, submerged pinnacle (Wave Governor Bank), and two shallow pools north-east of the island. It is also an area of high diversity and abundance of hard and soft corals, gorgonians (sea fans), sponges and a range of encrusting organisms. The reef crests are generally algal dominated, while the reef flats feature ridges of coral rubble and large areas of seagrass. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding and foraging habitat for seabirds, internesting, nesting and foraging habitat for marine turtles, and foraging habitat for whale sharks. This marine park is internationally significant for its abundance and diversity of sea snakes.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP 2018a).
		Heritage values This marine park contains one known shipwreck listed under the *Historic Shipwrecks Act:* the Ann Millicent (wrecked in 1888). No International or National Heritage listings apply to this marine park.
		Social and economic values Scientific research is an important activity in this marine park.
Dampier Marine Park	National Park (II) Habitat Protection (IV)	**Description** The Dampier Marine Park is about 10 km north-east of Cape Lambert and 40 km from Dampier, extending from the WA State water boundary. This marine park covers an area of 1,252 km² and a water depth range between less than 15 m and 70 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Dampier Marine Park on 9 October 2017.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
	Multiple Use (VI)	**Natural values** This marine park includes ecosystems representative of the Northwest Shelf Province – a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding and foraging habitat for seabirds, internesting habitat for marine turtles, and a migratory pathway for humpback whales.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Ngarluma, Yindjibarndi, Yaburara and Mardudhunera people have responsibilities for Sea Country in this marine park. The native title holders for these peoples are represented by the Ngarluma Aboriginal Corporation and Yindjibarndi Aboriginal Corporation. These Prescribed Bodies Corporate represent Traditional Owners with native title over coastal areas adjacent to this marine park. The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara and Yamatji regions.
		Heritage values No International, Commonwealth or National Heritage listings apply to this marine park, but the marine park is about 10 km north of the Dampier Archipelago (including Burrup Peninsula) National Heritage listing, which has significant Indigenous heritage values. including rock art sites.
		Social and economic values Port activities, commercial fishing and recreation, including fishing, are important activities in this marine park.
Eighty Mile Beach Marine Park	Multiple Use (VI)	**Description** The Eighty Mile Beach Marine Park is about 74 km north-east of Port Hedland, adjacent to the WA Eighty Mile Beach Marine Park. This marine park covers an area of 10,785 km² and water depth ranges between less than 15 m and 70 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Eighty Mile Beach Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of the Northwest Shelf Province – a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding, foraging and resting habitat for seabirds, internesting and nesting habitat for marine turtles, foraging, nursing and pupping habitat for sawfish, and a migratory pathway for humpback whales.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Sea Country of the Nyangumarta, Karajarri and Ngarla people extends into the Eighty Mile Beach Marine Park. Sea Country is culturally significant and important to their identity. They have an unbroken, deep spiritual connection to their Sea Country, with traditional practices continuing today. Staple foods of living cultural value for the Nyangumarta, Karajarri and Ngarla people include saltwater fish, turtles, dugongs, crabs and oysters. Access to Sea Country by families is important for cultural traditions, livelihoods and future socioeconomic development opportunities. The native title holders for the Nyangumarta, Karajarri and Ngarla people are represented by the Karajarri Aboriginal Corporation, Nyangumarta Karajarri Aboriginal Corporation, Nyangumarta Warrarn Aboriginal Corporation and Wanparta Aboriginal Corporation. These Prescribed Body Corporates represent Traditional Owners with native title over coastal area adjacent to the marine park. They are the points of contact for their respective areas of responsibility for Sea Country in the marine park. The Kimberley Land Council and the Yamatji Marlpa Aboriginal Corporation are the Native Title Representative Bodies for the Kimberley and Pilbara regions.
		Heritage values This marine park contains three known shipwrecks listed under the *Historic Shipwrecks Act:* Lorna Doone (wrecked in 1923), Nellie (wrecked in 1908) and Tifera (wrecked in 1923). No International, Commonwealth or National Heritage listings apply to the marine park.
		Social and economic values Tourism, commercial fishing, pearling and recreation are important activities in this marine park.
Gascoyne Marine Park	National Park (II) Habitat Protection (IV) Multiple Use (VI)	**Description** The Gascoyne Marine Park is about 20 km off the west coast of the Cape Range Peninsula, adjacent to the Ningaloo Reef Marine Park and the WA Ningaloo Marine Park, and extends to the limit of Australia's EEZ. This marine park covers an area of 81,766 km² and water depth varies between 15 m and 6,000 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Gascoyne Marine Park on 9 October 2017.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Natural values This marine park includes ecosystems representative of: • Central Western Shelf Transition – continental shelf with water depths up to 100 m, and a significant transition zone between tropical and temperate species • Central Western Transition – characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species • Northwest Province – an area of continental slope comprising diverse and endemic fish communities. KEFs are: • canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula • Commonwealth waters adjacent to Ningaloo Reef • continental slope demersal fish communities • Exmouth Plateau. Ecosystems represented in this marine park are influenced by the interaction of the Leeuwin Current, Leeuwin Undercurrent and the Ningaloo Current. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding habitat for seabirds, internesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat and migratory pathway for pygmy blue whales.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Gnulli people have responsibilities for Sea Country in this marine park. The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Heritage values *World Heritage* The Ningaloo Coast was listed as an area of outstanding universal value under the World Heritage Convention in 2011, meeting World Heritage listing criteria vii and x. The Ningaloo Coast World Heritage property is adjacent to the marine park. *Commonwealth Heritage* The Ningaloo Marine Area (Commonwealth waters) meets the Commonwealth Heritage listing criteria A, B and C. The Ningaloo Marine Area is adjacent to the marine park. *National Heritage* The Ningaloo Coast meets the National Heritage listing criteria A, B, C, D, and F and is adjacent to the marine park. *Historic shipwrecks* The marine park contains more than five known shipwrecks listed under the *Historic Shipwrecks Act*.
		Social and economic values Commercial fishing, mining and recreation are important activities in this marine park.
Joseph Bonaparte Gulf Marine Park	Multiple Use Zone (VI) Special Purpose Zone (VI) (NMR only)	**Description** The Joseph Bonaparte Gulf Marine Park is about 15 km west of Wadeye, NT, and about 90 km north of Wyndham, WA, in the Joseph Bonaparte Gulf. It is adjacent to the WA North Kimberley Marine Park. This marine park covers an area of 8,597 km² and water depth ranges between less than 15 m and 100 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Joseph Bonaparte Gulf Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of the Northwest Shelf Transition – a dynamic environment influenced by strong tidal currents, monsoonal winds, cyclones and wind-generated waves. The large tidal ranges and wide intertidal zones near this marine park create a physically dynamic and turbid marine environment. The KEF in this marine park is the carbonate bank and terrace system of the Sahul Shelf – characterised by terraces, banks, channels and valleys supporting sponges, soft corals, sessile filter feeders, polychaetes and ascidians. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include foraging habitat for marine turtles and the Australian snubfin dolphin.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Miriuwung, Gajerrong, Doolboong, Wardenybeng and Gija and Balangarra people have responsibilities for Sea Country in this marine park. They are represented by the following Prescribed Bodies Corporate: Miriuwung and Gajerrong Aboriginal Corporation and Balanggarra Aboriginal Corporation. These corporations are the points of contact for their respective areas of Sea Country in this marine park. The Northern Land Council and the Kimberley Land Council are the Native Title Representative Bodies for the NT's northern region and the Kimberley region, respectively.
		Heritage values No International, Commonwealth or National Heritage listings apply to this marine park, but this marine park is adjacent to the West Kimberley National Heritage place.
		Social and economic values Tourism, commercial fishing, mining and recreation, including fishing, are important activities in this marine park.
Kimberley Marine Park	Habitat Protection (IV) National Park (II) Multiple Use (VI)	**Description** The Kimberley Marine Park is about 100 km north of Broome, extending from the WA State water boundary north from the Lacepede Islands to the Holothuria Banks offshore from Cape Bougainville. This marine park is adjacent to the WA Lalang-garram/Camden Sound Marine Park and the North Kimberley Marine Park. This marine park covers an area of 74,469 km² and water depths from less than 15 m to 800 m. **The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Kimberley Marine Park on 9 October 2017.**
		Natural values This marine park includes ecosystems representative of: • Northwest Shelf Province – a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and an ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. • Northwest Shelf Transition – straddles the NWMR and NMR and in the north-west includes shelf break, continental slope and most of the Argo Abyssal Plain, and is subject to a high incidence of cyclones. Benthic biological communities in the deeper parts of the bioregion have not been extensively studied, although high levels of species diversity and endemism occur among demersal fish communities on the continental slope. • Timor Province – water depths (of the bioregion) range from about 200 m near the shelf break to 5,920 m over the Argo Abyssal Plain. The reefs and islands of the bioregion are regarded as biodiversity hotspots. Endemism in demersal fish communities of the continental slope is high; two distinct communities have been identified on the upper and mid slopes. KEFs are: • ancient coastline at the 125 m depth contour

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		• continental slope demersal fish communities. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding and foraging habitat for seabirds, internesting and nesting habitat for marine turtles, breeding, calving and foraging habitat for inshore dolphins, calving, migratory pathway and nursing habitat for humpback whales, migratory pathway for pygmy blue whales, foraging habitat for dugongs, and foraging habitat for whale sharks.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Wunambal Gaambera, Dambimangari, Mayala, Bardi Jawi and the Nyul Nyul people's Sea Country extends into the Kimberley Marine Park. The Wunambal Gaambera people's country includes daagu (deep waters), with about 3,400 km² of their Sea Country in this marine park. The Wunambal Gaambera, Dambimangari, Mayala, Bardi Jawi and the Nyul Nyul people have an unbroken connection to their Sea Country, having deep spiritual connection through wunggurr (creator snakes) that still live in the sea. Staple foods of living cultural value include saltwater fish, turtles, dugongs, crabs and oysters. Access to Sea Country by families is important for cultural traditions, livelihoods and future socioeconomic development opportunities. The National Heritage listing for the West Kimberley recognises the following key cultural heritage values: • Wanjina Wunggurr cultural tradition, which incorporates many Sea Country cultural sites • log-raft maritime tradition, which involved using tides and currents to access warrurru (reefs) far offshore to fish • interactions with Makassan traders around sea foods over hundreds of years • important pearl resources that were used in traditional trade through the wunan and in contemporary commercial agreements. The Wunambal Gaambera, Dambimangari and Bardi Jawi people consider that these values extend into the Kimberley Marine Park. The Wanjina Wunggurr is law of the Wunambal Gaambera and Dambimangari people and it is recognised all the Sea Country, land, plants and animals were put there by Wanjina Wunggurr. Under Wanjina Wunggurr law, the Wunambal Gaambera and Dambimangari people have a responsibility to manage Country, to maintain the health of the Country and all living things. The Wunambal Gaambera, Bardi Jawi, Mayala and the Nyul Nyul people have had native title determined over parts of their Sea Country included in this marine park. The native title holders for these people are represented by the Wunambal Gaambera Aboriginal Corporation, Bardi and Jawi Niimidiman Aboriginal Corporation and the Kimberley Land Council. These representative bodies are the points of contact for their respective areas of Sea Country for this marine park. The Kimberley Land Council is the Native Title Representative Body for the Kimberley region.
		Heritage values This marine park contains more than 40 known shipwrecks listed under the *Historic Shipwrecks Act*. No International, Commonwealth or National Heritage listings apply to the marine park, but the marine park is adjacent to the National Heritage place of the West Kimberley.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Social and economic values Tourism, commercial fishing, mining, recreation, including fishing, and traditional use are important activities in this marine park.
Mermaid Reef Marine Park	National Park (II)	**Description** The Mermaid Reef Marine Park is about 280 km north-west of Broome, adjacent to the Argo-Rowley Terrace Marine Park and about 13 km from the WA Rowley Shoals Marine Park. This marine park covers an area of 540 km² and water depths from less than 15 m to 500 m. Mermaid Reef is one of three reefs forming the Rowley Shoals. The reefs of the Rowley Shoals are significant as they are considered ecological stepping stones for reef species originating in Indonesian/Western Pacific waters, are one of a few offshore reef systems on the NWS, and may provide an upstream source for recruitment to reefs further south. The marine park was originally proclaimed under the *National Parks and Wildlife Conservation Act* on 10 April 1991 as the Mermaid Reef Marine National Nature Reserve and proclaimed under the EPBC Act on 14 December 2013 and renamed Mermaid Reef Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of the Northwest Transition – an area of shelf break, continental slope, and most of the Argo Abyssal Plain. Together with Clerke Reef and Imperieuse Reef, Mermaid Reef is a biodiversity hotspot and key topographic feature of the Argo Abyssal Plain. A KEF of this marine park is the Mermaid Reef and Commonwealth waters surrounding the Rowley Shoals. Ecosystems of this marine park are associated with emergent reef flat, deep reef flat, lagoon, and submerged sand habitats. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding habitat for seabirds and a migratory pathway for the pygmy blue whale.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP 2018a).
		Heritage values No International or National Heritage listings apply to this marine park. Mermaid Reef-Rowley Shoals was established on the Commonwealth Heritage List in 2004, meeting Commonwealth Heritage listing criteria A, B, C and D. This marine park contains one known shipwreck listed under the *Historic Shipwrecks Act*: Lively (wrecked in 1810).
		Social and economic values Tourism, recreation and scientific research are important activities in this marine park.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
Montebello Marine Park	Multiple Use (VI)	**Description** The Montebello Marine Park is offshore of Barrow Island and 80 km west of Dampier, extending from the WA State waters boundary, and is adjacent to the WA Barrow Island and Montebello Islands marine parks. This marine park covers an area of 3,413 km² and water depths from less than 15 m to 150 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Montebello Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of the Northwest Shelf Province – a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities. A KEF of this marine park is the ancient coastline at 125 m depth contour. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding habitat for seabirds, internesting, foraging, mating and nesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat for whale sharks. The marine park contains important breeding grounds for four turtle species: flatback, green, hawksbill and loggerhead turtles.
		Cultural values The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Pilbara region. Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. As noted in the North-west Marine Park Management Plan, there is limited information about the cultural significance of this marine park (DNP 2018a).
		Heritage values No International, Commonwealth or National listings apply to this marine park, but this marine park is adjacent to the WA Barrow Island and the Montebello–Barrow Island Marine Conservation Reserves, which have been nominated for National Heritage listing. This marine park contains two known shipwrecks listed under the *Historic Shipwrecks Act*: Trial (wrecked in 1622), the earliest known shipwreck in Australian waters, and Tanami (unknown date).
		Social and economic values Tourism, commercial fishing, mining and recreation are important activities in this marine park.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
Ningaloo Marine Park	National Park (II) Recreational Use (IV)	**Description** The Ningaloo Marine Park stretches about 300 km along the west coast of the Cape Range Peninsula, and is adjacent to the WA Ningaloo Marine Park and Gascoyne Marine Park. This marine park covers an area of 2,435 km² and a water depth range of 30 m to more than 500 m. This marine park provides connectivity between deeper offshore waters of the shelf break and coastal waters of the adjacent WA Ningaloo Marine Park. It includes some of the most diverse continental slope habitats in Australia, including the continental slope area between North West Cape and the Montebello Trough. Canyons in this marine park are important for sustaining the nutrient conditions that support the high diversity of Ningaloo Reef. The marine park was originally proclaimed under the *National Parks and Wildlife Conservation Act* on 20 May 1987 as the Ningaloo Marine Park (Commonwealth waters) and proclaimed under the EPBC Act on 14 December 2013 and renamed Ningaloo Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of: • Central Western Shelf Transition – continental shelf of water depths up to 100 m, and a significant transition zone between tropical and temperate species • Central Western Transition – characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species • Northwest Province – an area of continental slope comprising diverse and endemic fish communities • Northwest Shelf Province – a dynamic environment, influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. KEFs are: • canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula • Commonwealth waters adjacent to Ningaloo Reef • continental slope demersal fish communities. Ecosystems represented in this marine park are influenced by interaction of the Leeuwin Current, Leeuwin Undercurrent and the Ningaloo Current. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding and foraging habitat for seabirds, internesting habitat for marine turtles, a migratory pathway for humpback whales, foraging habitat and migratory pathway for pygmy blue whales, breeding, calving, foraging and nursing habitat for dugongs, and foraging habitat for whale sharks.

North-west Marine Park Network	IUCN zones	Description and values
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Gnulli people have responsibilities for Sea Country in this marine park. The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.
		Heritage values *World Heritage* This marine park is within the Ningaloo Coast World Heritage property, meeting World Heritage listing criteria vii and x. The area is valued for high terrestrial species endemism, marine species diversity and abundance, and the interconnectedness of large-scale marine, coastal and terrestrial environments. The area connects the limestone karst system and fossil reefs of the ancient Cape Range to the nearshore reef system of Ningaloo Reef, to the continental slope and shelf in Commonwealth waters. *National Heritage* The Ningaloo Coast overlaps this marine park, meeting the national heritage listing criteria A, B, C, D, and F. *Commonwealth Heritage* The Ningaloo Marine Area (Commonwealth waters) meets Commonwealth Heritage listing criteria A, B and C. The Ningaloo Marine Area overlaps this marine park. *Historic shipwrecks* This marine park contains more than 15 known shipwrecks listed under the *Historic Shipwrecks Act*.
		Social and economic values Tourism and recreation, including fishing, are important activities in this marine park.
Roebuck Marine Park	Multiple Use (VI)	**Description** The Roebuck Marine Park is about 12 km offshore of Broome and is adjacent to the WA Yawuru Nagulagun/Roebuck Bay Marine Park. This marine park covers an area of 304 km² and a water depth range of less than 15 m to 70 m. This marine park is adjacent to the Roebuck Bay Ramsar site, recognised as one of the most important areas for migratory shorebirds in Australia; and the WA Yawuru Nagulagun/Roebuck Bay Marine Park, providing connectivity between offshore and inshore coastal waters of Roebuck Bay. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Roebuck Marine Park on 9 October 2017.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
		Natural values This marine park includes examples of ecosystems representative of the Northwest Shelf Province – a dynamic environment influenced by strong tides, cyclonic storms, long-period swells and internal tides. The bioregion includes diverse benthic and pelagic fish communities, and ancient coastline thought to be an important seafloor feature and migratory pathway for humpback whales. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding and resting habitat for seabirds, foraging and internesting habitat for marine turtles, a migratory pathway for humpback whales, and foraging habitat for dugongs.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. Yawuru people have always recognised the waters of Roebuck Bay as nagula (Yawuru Sea Country), and have customary responsibilities to care for it. They have a deep spiritual connection to offshore landscapes from bugarrigarra (creator beings), and believe snake-like metaphysical beings inhabit the sea. Cultural sites in Sea Country are also a source of law. The Yawuru people harvest marine resources according to the six Yawuru seasons. They have harvested pearl shell for food and cultural purposes. Fish are a staple food source, and fishing a form of cultural expression, connecting people to their Country, modelled on tradition and based in traditional law. Access to Sea Country by families is important to cultural traditions, livelihoods and future socioeconomic development opportunities. The Yawuru Native Title Holders Aboriginal Corporation is the Prescribed Body Corporate representing Traditional Owners with native title over coastal areas adjacent to this marine park, and is the point of contact for Sea Country in this marine park. The Kimberley Land Council is the Native Title Representative Body for the Kimberley region.
		Heritage values No international, Commonwealth or national listings apply to the marine park, but it is adjacent to the West Kimberley National Heritage place.
		Social and economic values Tourism, commercial fishing, pearling and recreation, including fishing, are important activities that occur in the marine park.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

North-west Marine Park Network	IUCN zones	Description and values
Shark Bay Marine Park	Multiple Use (VI)	**Description** The Shark Bay Marine Park is about 60 km offshore of Carnarvon, adjacent to the Shark Bay World Heritage property and National Heritage place. This marine park covers an area of 7,443 km², extending from the WA State water boundary, and a water depth range between 15 m and 220 m. The marine park was proclaimed under the EPBC Act on 14 December 2013 and renamed Shark Bay Marine Park on 9 October 2017.
		Natural values This marine park includes examples of ecosystems representative of: • Central Western Shelf – a predominantly flat, sandy and low-nutrient area, in water depths 50 to 100 m; the bioregion is a transitional zone between tropical and temperate species • Central Western Transition – characterised by large areas of continental slope, a range of topographic features such as terraces, rises and canyons, seasonal and sporadic upwelling, and benthic slope communities comprising tropical and temperate species. Ecosystems represented in this marine park are influenced by the Leeuwin, Ningaloo and Capes currents. This marine park supports a range of species listed under the EPBC Act. BIAs within this marine park include breeding habitat for seabirds, internesting habitat for marine turtles, and a migratory pathway for humpback whales. This marine park and adjacent coastal areas are also important for shallow-water snapper.
		Cultural values Sea Country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been sustainably using and managing their Sea Country for tens of thousands of years. The Gnulli and Malgana people have responsibilities for Sea Country in this marine park. The Yamatji Marlpa Aboriginal Corporation is the Native Title Representative Body for the Yamatji region.
		Heritage values no international, commonwealth or national heritage listings apply to this marine park, but this marine park is adjacent to the Shark Bay World Heritage property and Shark Bay National Heritage place. The marine park contains about 20 known shipwrecks listed under the *Historic Shipwrecks Act*.
		Social and economic values Tourism, commercial fishing, mining and recreation, including fishing, are important activities in the marine park.

12.5.2 Commonwealth Marine Parks within Indian Ocean territory

Table 12-2 describes the values of the Indian Ocean territory AMPs according to the Christmas Island Marine Park Management Plan (DNP 2025a) and the Cocos (Keeling) Islands Marine Park Management Plan (DNP 2025b).

Table 12-2: Summary of Australian Marine Parks within Indian Ocean territories

Indian Ocean territory marine park	IUCN zones	Values
Christmas Island Marine Park (DNP 2025a)	National Park (II) Habitat Protection (IV)	**Description** Christmas Island Marine Park covers an area of 277,016 km² and extends from the island's shoreline to the limit of Australia's Exclusive Economic Zone, about 200 nm from shore (except to the north of Christmas Island). This marine park adjoins the marine boundary of Christmas Island National Park, which extends 50 m seaward from the island. Almost all the island's port is excluded from this marine park, except for a very small and narrow part of the port's western boundary.
		Natural values The tropical waters and fringing coral reefs that surround Christmas Island contain a mix of coral reef species from both the Indian and Pacific oceans; over 680 species of fish have been recorded in the region. The overlap of these waters gives rise to varieties of hybrid marine fish and some endemic species. Christmas Island also has the world's greatest diversity and abundance of land crabs. The island's waters are essential for the crabs, as they migrate to the coast to breed and release their eggs into the ocean. This marine park contains a range of unique seafloor features, habitats and species, particularly seamounts and deep-sea plains. BIAs include foraging areas for the endemic Abbott's booby, Christmas Island frigatebird and golden bosun and other seabirds that nest on Christmas Island, as well as whale shark feeding areas and southern bluefin tuna breeding habitat. Christmas Island includes rainforests, surrounding clear azure waters, and marine and terrestrial habitats and species of international conservation significance.
		Cultural values The ocean is a centrepiece of life for many community members of Christmas Island, including those of Malay and Chinese heritage who maintain strong cultural traditions and connections to the surrounding marine environment. History of the land has been passed down through generations through historical and cultural stories.
		Heritage values Not listed.
		Social and economic values This marine park is valued for fishing (commercial, recreational and subsistence), diving, snorkelling and tourism. There is potential for scientific study and educational activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Indian Ocean territory marine park	IUCN zones	Values
Cocos (Keeling) Islands Marine Park (DNP 2025b)	National Park (II) Habitat Protection (IV)	**Description** Cocos (Keeling) Islands are located around 2,750 km north-west of Perth. The Cocos (Keeling) Islands Marine Park covers a 467,054 km² area, extending from most of the islands' shoreline to the limit of the Australian EEZ, about 100 nm from shore. The Cocos (Keeling) Islands are a group of 27 tropical low-lying coral islands. The Cocos (Keeling) Islands Marine Park was established on the 20 March 2022 by the Australian Government under the EPBC Act and managed by the Commonwealth DNP.
		Natural values The central lagoon system and outer reefs are two of the islands' important habitats. The lagoon encompasses a variety of unique and distinct habitats. This includes seagrass, which is essential for the resident green turtle population (which is a genetically distinct stock that is unique to the islands) and for sustaining fish populations. The outer reef habitats are dominated by hard and soft corals and have a high abundance and diversity of reef fish and other species. The offshore waters contain a range of unique seafloor features, habitats and species, particularly seamounts, deep-sea plains and a significant deep-sea ridgeline. This marine park also protects the foraging habitat of nesting seabirds on North Keeling Island (Pulu Keeling National Park), and species such as dolphins, deep-sea fish and sharks that are or may be threatened elsewhere in the region.
		Cultural values Most of the islands' community members are Cocos Malay, who maintain vibrant and unique cultural traditions, including strong cultural connections to the surrounding marine environment, which is evident through traditional fishing practices, and environmental knowledge of the marine environment, which has been sustained over generations. The lagoon and ocean are an important part of life for all community members living on the remote atoll.
		Heritage values Not listed.
		Social and economic values This marine park is valued for recreational and subsistence activities (fishing, boating, diving, snorkelling, kite surfing, and kayaking), tourism, scientific research and educational activities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

12.6 Threatened ecological communities

No threatened ecological communities (TECs) as listed under the EPBC Act are known to occur within the marine waters of the NWMR or NMR, as indicated by the PMST reports (Appendix A). However, the monsoon vine thickets on the coastal sand dunes of Dampier Peninsula TEC occurs on the coastal dunes of Dampier Peninsula in the NWMR. The subtropical and temperate coastal saltmarsh (which is a TEC) occurs within the marine water of the SWMR. No TECs occur in the NMR. Table 12-3 describes TECs in the NWMR.

Table 12-3: Summary of threatened ecological communities within the NWMR

TEC	Description	Conservation values
Monsoon vine thickets on the coastal sand dunes of Dampier Peninsula	The ecological community represents certain occurrences of monsoon vine thickets in the southwest Kimberley region of WA, predominantly restricted to the coastlines of the Dampier Peninsula from Broome in the south to One Arm Point in the north and on the north-eastern coast of the Peninsula from One Arm Point to Goodenough Bay (DSEWPaC 2013d). The TEC occurs as discontinuous patches of dense vegetation and contains about 23% of vascular plant species that occur on the Dampier Peninsula. The ecological community contains deciduous, semi-deciduous and evergreen perennial flora species (DSEWPaC 2013d).	The ecological community is listed as endangered (DSEWPaC 2013d). The extent of the ecological community corresponds to Country (the traditional lands) of the Bardi Jawi, Djabera Djabera, Goolarabaloo, Jabirr Jabirr, Nyul Nyul and Yawuru Indigenous people. The ecological community is of cultural significance (DSEWPaC 2013d). Patches of the TEC operate as an ecological network, with birds, mammals and frugivore species providing connectivity. The vegetation provides refuge for animals (DSEWPaC 2013d).

12.7 Australian Whale Sanctuary

The Australian Whale Sanctuary (DCCEEW 2023g) has been established to protect all whales and dolphins found in Australian waters. Under the EPBC Act, all cetaceans (whales, dolphins and porpoises) are protected in Australian waters.

The Australian Whale Sanctuary includes all Commonwealth waters from the 3 nm State/Territory waters limit out to the boundary of the EEZ (i.e. out to 200 nm and further in some places). Within the Australian Whale Sanctuary, it is an offence to kill, injure or interfere with a cetacean. Severe penalties apply to anyone convicted of such offences. It is the responsibility of the state and territory governments to protect whales and dolphins within State and Territory waters (3 nm from the coastline).

12.8 State marine parks and reserves

State marine parks and reserves, proclaimed under the *Conservation and Land Management Act 1984* (WA), are in State waters and vested in the WA Conservation and Parks Commission. Marine-interfacing state marine parks and reserves of WA have been considered, with 12 occurring in the NWMR (Table 12-4), six in the NMR and 14 in the SWMR.

The Exmouth Gulf Taskforce delivered its final report, including advice and recommendations to the Minister for the Environment in 2025, to inform the Exmouth Gulf Marine Park and outline its values and recommended management approach (Government of Western Australia 2025).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

12.9 Summary of protected areas within the NWMR

Table 12-4 describes the protected areas classed as natural within the NWMR. Protected places classed as Indigenous and historic within the NWMR are described in Table 13-2.

Table 12-4: Protected areas within the NWMR

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
World Heritage properties					
Shark Bay World Heritage property	-	-	✓	Natural	**Description** The Shark Bay World Heritage property is adjacent to the Shark Bay AMP and was included on the World Heritage List in 1991 (UNESCO 1991).
					Conservation values Universal values of the Shark Bay World Heritage property include large and diverse seagrass beds, stromatolites and populations of dugongs and threatened species. Inscribed under natural criteria vii, viii, ix and x (UNESCO 1991).
The Ningaloo Coast World Heritage property	-	-	✓	Natural	**Description** The Ningaloo Coast World Heritage property is about 710,000 ha and lies within the Ningaloo AMP and was included on the World Heritage List in 2011 (UNESCO 2011).
					Conservation values Universal values of the Ningaloo Coast World Heritage property include high marine species diversity and abundance; particularly, Ningaloo Reef supports both tropical and temperate marine reptiles and mammals inscribed under natural criteria vii and x (UNESCO 2011).
Murujuga Cultural Landscape	-	✓	-	Indigenous	See Section 12.2.1 for the description and values of this World Heritage property.
National Heritage places					
Shark Bay	-	-	✓	Natural	**Description** The Shark Bay National Heritage Place consists of the same area included in the Shark Bay World Heritage property (refer above) and was established on the National Heritage List in 2007 (DEC 2008).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
					Conservation values This National Heritage place has multiple exceptional natural features, including one of the largest and most diverse seagrass beds in the world, colonies of stromatolites and rich marine life, including a large population of dugongs, and provides a refuge for other globally threatened species. Shark Bay meets the National Heritage listing criteria a, b, c, d, e, f, g, h and i (DEC 2008).
The Ningaloo Coast	-	-	✓	Natural	**Description** The Ningaloo Coast National Heritage Place consists of the same area included in the Ningaloo Coast World Heritage property (refer above) and was established on the National Heritage List in 2010 (Commonwealth of Australia 2010).
					Natural values The Ningaloo Coast contains one of the best developed nearshore reefs in the world, being home to rugged limestone peninsulas, spectacular coral and sponge gardens, and the whale shark. The Ningaloo Coast meets National Heritage listing criteria a, b, c, d and f (Commonwealth of Australia 2010).
The West Kimberley	✓	✓	-	Natural	**Description** The West Kimberley National Heritage place covers an area of around 192,000 km² in the north-west of Australia from Broome to Wyndham, and was established on the National Heritage List in 2011 (Commonwealth of Australia 2011a).
					Conservation values The Kimberley plateau, north-western coastline and northern rivers of the West Kimberley provide a vital refuge for many native plants and animals that are found nowhere else or which have disappeared from much of the rest of Australia. In addition, Roebuck Bay is internationally recognised as one of Australia's most significant sites for migratory wading birds. This National Heritage place also contains a remarkable history of Indigenous occupation, with many places of Indigenous sacred value. The West Kimberley meets the National Heritage listing criteria a, b, c, d, e, f, g, h and i (Commonwealth of Australia 2011a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
Dampier Archipelago	-	✓	-	Historic	**Description** The Dampier Archipelago National Heritage place, about 1550 km north of Perth in WA, covers around 400 km² of islands, reefs and the Burrup Peninsula, and was added to the National Heritage List on 3 July 2007 for its extensive and significant Indigenous rock art and natural values (Commonwealth of Australia 2007). **Conservation values** The Dampier Archipelago National Heritage place is recognised for its outstanding cultural heritage values, particularly its extensive and diverse rock engravings that record Aboriginal responses to environmental change over thousands of years. The area is notable for the rarity and density of its engravings and stone features, its high potential to yield information about Australia's cultural history, and its representation of major Pilbara rock art styles. It also demonstrates a high degree of creative and technical achievement through detailed and complex depictions of human activity and fauna. The Dampier Archipelago meets National Heritage criteria a, b, c, d and f (Commonwealth of Australia 2007).
Dirk Hartog Landing Site/Cape Inscription	-	-	✓	Indigenous	**Description** Cape Inscription, located on Dirk Hartog Island in WA, was inscribed on the National Heritage List in 2006 and marks the site of the earliest recorded European landings on Australia's west coast in 1616, with subsequent visits over 250 years contributing to the mapping of the continent and its inclusion on world maps (Commonwealth of Australia 2006b). **Conservation values** The Cape Inscription/Dirk Hartog Landing National Heritage place is recognised for its outstanding cultural heritage values as the site of the earliest recorded European landing on Australia's west coast and for its strong associations with a sequence of prominent explorers and surveyors over a 250-year period. The area is notable for the rarity of its surviving physical evidence of early exploration, including inscription sites and landing locations, and its role in the development of European scientific knowledge, particularly early botanical collection and classification. It also demonstrates the processes of exploration, survey and mapping that led to the first accurate delineation of the Australian coastline and major changes in world cartography. The Cape Inscription/Dirk Hartog Landing meets National Heritage criteria a, b, d and h (Commonwealth of Australia 2006b).

HMAS Sydney II and HSK Kormoran Shipwreck Sites	-	-	✓	Historic	**Description** The HMAS Sydney II and HSK Kormoran shipwrecks are about 290 km west-south-west of Carnarvon, WA, in waters around 2,500 m deep, and were added to the National Heritage List in 2011 after their significance as the site of a major World War II naval battle on 19 November 1941.
					Conservation values The HMAS Sydney II and HSK Kormoran Shipwreck Sites are recognised for their outstanding cultural heritage values as the remains of a defining naval engagement in Australia's World War II history and for their enduring significance as places of loss and commemoration. The sites are notable for the rarity and integrity of their surviving underwater fabric, which provides important archaeological evidence of the 1941 battle and has contributed to resolving longstanding historical uncertainties. They also demonstrate aspects of wartime technological innovation and Australia's evolving wartime experience, alongside strong social value as the final resting places of those who perished. The HMAS Sydney II and HSK Kormoran Shipwreck Sites meet Commonwealth Heritage criteria a, c, f, g and h (Commonwealth of Australia 2011b).
Commonwealth Heritage places					
Ashmore Reef National Nature Reserve	✓	-	-	Natural	**Description** The Ashmore Reef Commonwealth Heritage place is within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed as a Commonwealth Heritage place in 2004 (DCCEEW n.d.-d).
					Conservation values Ashmore Reef has major significance as a staging point for wading birds migrating between Australia and the northern hemisphere and supports high concentrations of breeding seabirds, many of which are nomadic and typically breed on small, isolated islands. Ashmore Reef is an important scientific reference area for migratory seabirds, sea snakes and marine invertebrates. The Ashmore Reef Commonwealth Heritage place is significant for its history of human occupation and use. The island is believed to have been visited by Indonesian fishers since the early eighteenth century. The islands were used both for fishing and as a staging point for voyages to the southern reefs off Australia's coast (DCCEEW n.d.-d).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
Learmonth Air Weapons Range Facility	-	-	✓	Natural	**Description** Located along the Ningaloo coastline, the Learmonth Air Weapons Range Facility was one of Australia's most active bombing ranges until 1990. It is of considerable importance in documenting sea level and landform changes since the late Cenozoic period (DCCEEW n.d.-b). **Conservation values** The area includes an ancient reef complex and cave fauna that is of exceptional importance. The ages of the reef terraces are key to understanding the timing of uplift events. The Learmonth Air Weapons Range Facility meets the Commonwealth Heritage listing criteria a, b and c (DCCEEW n.d.-b).
Mermaid Reef–Rowley Shoals	-	✓	-	Natural	**Description** The Mermaid Reef–Rowley Shoals Commonwealth Heritage place is within the boundary of the Mermaid Reef Marine National Nature Reserve. The site was listed as a Commonwealth Heritage place in 2004 (DCCEEW n.d.-a). **Conservation values** The Mermaid Reef–Rowley Shoals Commonwealth Heritage place is regionally important for the diversity of its fauna and, together with Clerke and Imperieuse reefs, has biogeographical significance due to the presence of species that are at or near the limits of their geographic ranges, including fishes known previously only from Indonesian waters. Rowley Shoals is important for benchmark studies as one of the few places off the north-west coast of WA that have been the site of major biological collection trips by the Western Australian Museum (DCCEEW n.d.-a).
Ningaloo Marine Area – Commonwealth Waters	-	-	✓	Natural	**Description** The Ningaloo Marine Area Commonwealth Heritage place is within the Commonwealth waters of the Ningaloo Marine Park (refer AMPs below). The site was listed as a Commonwealth Heritage place in 2004 (DCCEEW n.d.-f).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
					Conservation values The Ningaloo Marine Area Commonwealth Heritage place provides a migratory pathway for humpback whales and foraging habitat for whale shark. The place is an important breeding area for billfish and manta ray. The Ningaloo Marine Area provides opportunities for scientific research relating to aspects of the area's unique features, including tourism, marine ecology (whales, turtles, whale shark, fish) and oceanography (DCCEEW n.d.-f).
Scott Reef and Surrounds – Commonwealth Area	✓	-	-	Natural	**Description** Scott Reef and Surrounds Commonwealth Heritage place is within the WA coastal waters surrounding North and South Scott Reef. The site was listed as a Commonwealth Heritage place in 2004 (DCCEEW n.d.-e).
					Conservation values The Scott Reef and Surrounds Commonwealth Heritage place is regionally important for the diversity of its fauna and has biogeographical significance due to the presence of species that are at or near the limits of their geographic ranges, including fish known previously only from Indonesian waters. Scott Reef is recognised as important for scientific research and benchmark studies due to its age, the extensive documentation of its geophysical and physical environmental characteristics, and its use as a site of major biological collection trips and surveys by the Western Australian Museum and AIMS (DCCEEW n.d.-e).
Yampi Defence Area	✓	-	-	Natural	**Description** Located 35 km south of Koolan Island, the Yampi Defence Area displays a unique mosaic of geographical landforms that is unique to the region. The occurrence of such diverse landscapes within a small area is unusual (DCCEEW n.d.-c).
					Conservation values The Yampi Defence Area occurs at the confluence of three biogeographic regions in the north-west of Australia. It exhibits diverse landforms, soils and vegetation representative of the sandstone plateaux of the wetter areas of the north-west Kimberley to the broad plains and pindin scrub of the drier areas in the south-west Kimberley. The Yampi Peninsula contains one of the richest amphibian records in the Kimberley. The Yampi Defence Area meets Commonwealth Heritage Listing criteria a, b and c (DCCEEW n.d.-c).

HMAS Sydney II and HSK Kormoran Shipwreck Sites	-	-	✓	Historic	Refer to National Heritage properties for a description and the conservation values of the HMAS Sydney II and HSK Kormoran Shipwreck Sites.
Wetlands of international importance (Ramsar)					
Ashmore Reef National Nature Reserve	✓	-	-	Ramsar	**Description** The Ashmore Reef Ramsar site is within the boundary of the Ashmore Reef Marine Park (refer AMPs below). The site was listed under the Ramsar Convention in 2002 (Commonwealth of Australia 2002b). **Conservation values** The Ashmore Reef Ramsar site supports internationally significant populations of seabirds and shorebirds, is important for turtles (green, hawksbill and loggerhead) and dugongs, and has the highest diversity of hermatypic (reef-building) corals on the WA coast. It is known for its abundance and diversity of sea snakes. However, populations of sea snakes at Ashmore Reef since 1998 have been in decline (Commonwealth of Australia 2002b). **Cultural values** Indonesian fishers have regularly visited Ashmore Reef since the early eighteenth century to fish within the area and use the islands for staging points before travelling to other reefs in the region. Indonesian artefacts have been found on Cartier Island and West, Middle and East Islands (Commonwealth of Australia 2002b).
Eighty Mile Beach	-	✓	-	Ramsar	**Description** The Eighty Mile Beach Ramsar site covers an area of 1,250 km², located along a long section of the WA coastline adjacent to the Eighty Mile Beach AMP (refer below) (CALM 2003a). **Conservation values** The Eighty Mile Beach Ramsar site includes saltmarsh and a raised peat bog more than 7,000 years old. The site contains the most important wetland for waders in north-western Australia, supporting up to 336,000 birds, and is especially important as a landfall for waders migrating south for the austral summer (CALM 2003a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Ord River Floodplain	✓	-	-	Ramsar	**Description** The Ord River Floodplain Ramsar site is in the East Kimberley region and encompasses an extensive system of river, seasonal creek, tidal mudflat and floodplain wetlands. The site is a nursery, feeding or breeding ground for migratory birds, waterbirds, fish, crabs, prawns and crocodiles. The site supports vulnerable species under the EPBC Act, including freshwater sawfish (*Pristis microdon*), green sawfish (*Pristis zijsron*) and the Australian painted snipe (*Rostratula australis*). The site is also one of the only two known habitats in WA of the nationally endangered northern river shark (*Glyphis garricki*) (DCCEEW 2019a).
					Conservation values The site represents the best example of wetlands associated with the floodplain and estuary of a tropical river system in the Tanami–Timor Sea Coast bioregion in the Kimberley. In addition, the False Mouths of the Ord are the most extensive mudflat and tidal waterway complex in WA (DCCEEW 2019a).
Roebuck Bay	-	✓	-	Ramsar	**Description** The Roebuck Bay Ramsar site covers an area of 550 km², south of Broome and adjacent to the Roebuck AMP (refer below) (CALM 2003b).
					Conservation values The Roebuck Bay Ramsar site is recognised as one of the most important areas for migratory shorebirds in Australia. The site regularly supports over 100,000 waterbirds, with numbers being highest in the Austral spring when migrant species breeding in the Palearctic stop to feed during migration. Roebuck Bay supports one of the largest known populations of Australian snubfin dolphins (*Orcaella heinsohni*) – a species with a limited distribution, vulnerable conservation status and high cultural value (CALM 2003a; D'Cruz *et al*. 2022).
State marine parks and reserves					
Bardi Jawi Gaarra Marine Park	✓	-	-	Sanctuary, Recreation, Special Purpose Zones (biocultural	**Description** The Bardi Jawi Gaara Marine Park is in the West Kimberley region surrounding the northern part of the Dampier Peninsula and the western islands of the Buccaneer Archipelago, covering areas of about 2,040 km².

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
				conservation and cultural protection), and General use	**Conservation values** The Bardi Jawi Gaara Marine Park has a tidal range of 11 m, which is the highest in Australia. The mangrove-lined creeks, intertidal and fringing reef areas that encompass the coastline and islands are ecologically important and host a vast number of plants and animals that have adapted to the unique area. Migratory marine mammals. including humpback whales, migrate to the areas between June and November each year to birth their young. Dugongs visit the area in the cooler months from May to July (DBCA 2022a).
					Social and Economic Values Commercial fishing, pearling and aquaculture are important economic activities that occur within this region. The area is a popular tourism destination and hosts a number or recreational activities and water sports (DBCA 2022a).
					Cultural values The Bardi and Jawi people have a significant connection to the animals, sites and places within this region, which are connected by stories and songlines. The Sea Country is used for hunting, fishing, cultural activities and business (DBCA 2022a).
Barrow Island Marine Park and Barrow Island Marine Management Area, and Montebello Islands Marine Park (jointly managed)	-	✓	-	Sanctuary, Recreation, General Use and Special Purpose Zones	**Description** The Barrow Island Marine Park and Barrow Island Marine Management Area and Montebello Islands Marine Park are located off the north-west coast of WA, about 1,600 km north of Perth, and cover areas of about 583 km², 42 km² and 1,147 km², respectively (DEC 2007b).
					Conservation values The Montebello/Barrow Islands marine conservation reserves have very complex seabed and island topography, resulting in a myriad of different habitats, subtidal coral reefs, macroalgal and seagrass communities, subtidal soft-bottom communities, rocky shores and intertidal reef platforms, which support a rich diversity of invertebrates and finfish. The reserves are important breeding areas for several species of marine turtles and seabirds, which use the undisturbed sandy beaches for nesting. Humpback whales migrate through the reserves and dugongs occur in the shallow warm waters (DEC 2007b).
					Social and economic values Major commercial fishing and pearling occur within the area and provide employment and economic value to surrounding communities. Nature-based tourism, water sports and recreational fishing are popular recreational activities in the area (DEC 2007b).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

					Cultural values There are no recorded seabed Aboriginal sites within this park. However, it is possible there are Aboriginal archaeological sites on the seabed that were created before the most recent sea level rise (DEC 2007b).
Eighty Mile Beach Marine Park	-	✓	-	Sanctuary, Recreation, Special Purpose and General Use Zones	**Description** Eighty Mile Beach Marine Park covers about 2,000 km² stretching across 220 km of coastline between Port Hedland and Broome (Department of the Parks and Wildlife (DPAW) 2014a).
					Conservation values Eighty Mile Beach Marine Park is one of the world's most important feeding grounds for small wading birds that migrate to the area each summer, travelling from countries thousands of kilometres away. The marine park is a major nesting area for flatback turtles that are found only in northern Australia. Sawfishes, dugongs, dolphins and millions of invertebrates inhabit the sand and mud flats, seagrass meadows, coral reefs and mangroves (DPAW 2014a).
					Social and economic values Social values of the marine park include tourism, nature-based recreational activities and commercial fishing (DPAW 2014a).
					Cultural values The Karajarri, Nyangumarta and Ngarla people have a powerful connection to the land and sea of this region. Traditional hunting and fishing are important cultural activities for the Traditional Owners of this marine park (DPAW 2014a).
Lalang-gaddam Marine Park	✓	-	-	Sanctuary, Recreation, General Use and Special Purpose Zones	**Description** The Lalang-gaddam Marine Park is managed under the amended joint management plan for the Lalang-gaddam/Camden Sound, Lalang-gaddam/Horizontal Falls and North Lalang-gaddam marine parks, and the indicative joint management plan for the proposed Maiyalam Marine Park (DBCA 2022b). . The Lalang-gaddam Marine Park is in the Kimberley region of WA and adjacent to Derby and the Shire of Wyndham. The Class A marine park covers about 13,085 km² (DBCA 2022b).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
					Conservation values The Lalang-gaddam/Camden Sound Marine Park is the most important humpback whale nursery in the southern hemisphere. It also features the spectacular coastal Montgomery Reef. The marine park is home to six species of threatened marine turtle, Australian snubfin and Indo-Pacific humpback dolphins, saltwater crocodiles, manta rays, several species of protected sawfish, and the world's large population of dugongs (about 12,000). The Lalang-gaddam Marine Park's most celebrated attraction, The Horizontal Falls, is created by massive tides of up to 10 m and narrow gaps in two parallel tongues of land, meaning the tide falls faster than the water can escape, producing 'horizontal falls'. There are also islands with fringing coral reefs and mangrove-lined creeks and bays. This marine park has islands fringed with coral reef. It has been identified as an ecological hotspot and supports more than 1% of the world's population of brown boobies, with up to 2,000 breeding pairs. About 500 pairs of crested terns also nest on the island (DBCA 2022b).
					Social and economic values This marine park has spectacular scenery that attracts tourists and generates about $563 million annually. Recreational fishing and recreational maritime activities are popular within this marine park. Commercial fisheries can operate within the waters of this marine park, but many do not regularly fish within this area. Pearling and aquaculture occur within this marine park and provide economic value for the region (DBCA 2022b).
					Cultural values The area is of cultural significance to the Dambeemangarddee people who have lived on the land and cared for land and Sea Country for tens of thousands of years. Some animals such as the barramundi and rock cod have particular cultural significance and are sacred animals to the Dambeemangarddee people. Numerous coastal and marine plants continue to be an important food source for the Traditional Owners of this marine park (DBCA 2022b).

Mayala Marine Park	✓	-	-	Sanctuary, Recreation, General Use and Special Purpose Zones	**Description** The Mayala Marine Park is a Class A reserve in the West Kimberley region and covers about 3,150 km² (DBCA 2022c).
					Conservation values The Mayala Marine Park has a tidal range of 11 m, the highest in Australia. The mangrove-lined creeks, intertidal and fringing reef areas that encompass the coastline and islands are ecologically important and host a vast number of plants and animals that have adapted to the unique area. The seagrass communities provide habitat and food for many species, including turtles and dugongs. Migratory marine mammals, including humpback whales, migrate to the areas between June and November each year to birth their young. Dugongs visit the area in the cooler months from May to July (DBCA 2022c).
					Social and economic values Due to the extraordinary natural values of the area, the number of visitors to the area has continued to grow over the years. Popular activities within the park include fishing, boating and wildlife watching. The waters of this area provide optimal conditions for commercial fishing, pearling and aquaculture (DBCA 2022c).
					Cultural values The area is of exceptional cultural significance to the Malaya people who are true saltwater people and use both land and sea resources and have a strong connection to the land, animals and plants of the region. This marine park has many sacred sites that occur on land and sea, which include artefacts, fish traps and human-made structures. This marine park is culturally significant to the Malaya people who care for Country and use this marine park for fishing, hunting and camping (DBCA 2022c).
Ningaloo Marine Park and Muiron Islands Marine Management	-	-	✓	Sanctuary, Recreation, General Use and	**Description** The Ningaloo Marine Park and Muiron Islands Marine Management Area are off the North West Cape, about 1,200 km north of Perth, and cover areas of about 2,633 km² and 286 km², respectively (CALM 2005a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

	Browse	*NWS/ Scarborough*	*North West Cape*		
Area (jointly managed)				Special Purpose Zones	**Ecological Values** Ningaloo Reef is the largest fringing coral reef in Australia. Temperate and tropical currents converge in the Ningaloo region, resulting in highly diverse marine life, including spectacular coral reefs, abundant fishes and species with special conservation significance such as turtles, whale sharks, dugongs, whales and dolphins. The region has diverse marine communities, including mangroves, algae and filter-feeding communities, and has high water quality. These values contribute to the Ningaloo Marine Park being regarded as the state's premier marine conservation icon. The area features large aggregations of marine mammals, fish and whale sharks, which coincide with the Ningaloo mass coral spawning and seasonal nutrient upwelling events. The key values include karst environments, interglacial fossil reefs, rocks shores and sandy beaches. The area supports populations of threatened turtle nesting areas, seabird and shorebird roosting and breeding areas, and priority flora and vegetation that is a habitat for endemic reptiles and invertebrates (DBCA 2022d). The Muiron Islands Marine Management Area is also important, containing a very diverse marine environment, with coral reefs, filter-feeding communities and macroalgal beds. In addition, the islands are important seabird and green turtle nesting areas (CALM 2005a).
					Social and economic values The Ningaloo region has a high number of visitors enjoying the area who come to appreciate nature-based tourism, which brings important economic value to the communities of the area (CALM 2005a). The aesthetic values of the seascape are noted as a cultural value and that panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
					Cultural values The Ningaloo Reef has a long history of occupancy by Aboriginal communities and Aboriginal heritage sites. The Jinigudira and Baiyungu people have lived in this region for thousands of years and use coastal areas for fishing, camping and hunting of turtles and dugongs (CALM 2005a). Nyinggulu (Ningaloo) coast is highly valued by the Traditional Owners of the area, with many culturally significant values in the area, including cultural heritage sites and places of ceremonial and mythological significance. There are also culturally significant animals and plants in the areas, some of which are sacred totems that relate to Creation stories, ceremonies or are used as medicine or food. There are also significant thalu sites along the coast, which are used for ceremonies and rituals to increase the numbers of particular species. Undertaking customary activities on Country is central to maintaining the cultural heritage of the land. Such activities are an important part of Traditional Owner and wider Aboriginal culture, enabling maintenance of traditional relationships with the land and water, sharing of knowledge, engagement in traditional practices, and accessing and looking after significant places (DBCA 2022d).
North Kimberley Marine Park	✓	-	-	Sanctuary, Special Purpose and General Use Zones	**Description** The North Kimberley Marine Park covers 18,450 km², with its south-western boundary located about 270 km north-east of Derby (DPAW 2016a).
					Conservation values The marine park covers about 1,845,000 ha. The coral reefs of the North Kimberley have the greatest diversity in WA and are some of the most pristine and remarkable reefs in the world. The park surrounds more than 1,000 islands and is home to listed species such as dugongs, marine turtles and sawfishes (DPAW 2016a).
					Social and economic values The park features diverse wildlife, remarkable scenery and cultural heritage, which provide excellent opportunities for tourism experiences, recreational and nature-based activities such as fishing and hunting (DPAW 2016a).
					Cultural values The Wunambal Gaambera, Balanggarra, Ngarinyin and Miriuwung Gajerrong people have strong and ongoing cultural connections to the North Kimberley saltwater Country and rely on coastal and marine environments and resources for their cultural identity, livelihoods and economy (DPAW 2016a).

Pilbara Island Nature Reserve (Great Sandy Island, Rocky Island, Thevenard Island)	-	✓	-	Nature Reserve	**Description** Located between the Ningaloo Coast World Heritage area and the Dampier Archipelago, the Pilbara Islands Nature Reserve includes 174 small islands with a combined area of over 130 km² and a total coastline of over 500 km. Islands within this management area are characterised by foredunes surrounding a central depression and less than 12 m in elevation (DBCA 2020a).
					Conservation values The islands provide a refuge for threatened and migratory species, including the critically endangered eastern curlew, great knot and curlew sandpiper. The islands provide nesting beaches for green, flatback, hawksbill and loggerhead turtles. Mangrove thickets are found on some of the islands, which provide essential habitat for coastal species and shorebirds (DBCA 2020a).
					Social and economic values Visitation to the islands is low and only by private boat. Commercial accommodation is only available at Thevenard Island. Recreational fishing is undertaken around the islands. Thevenard Island previously was used as a base for an oil and gas facility but is being decommissioned (DBCA 2020a).
					Cultural values The Nganhurra Thanadri Garrbu Aboriginal Corporation and the Wirrawandi Aboriginal Corporation have native title determinations over parts of the planning area. The area holds significant cultural value to Indigenous people. Culturally significant sites, places and species are found within the area. Customary activities including hunting, ceremonies and sharing of traditional knowledge is practiced in the region. Thevenard Island contains one registered site under the *Aboriginal Heritage Act 1972*, which includes a midden scatter with three baler shell containers. Aboriginal artefacts have been found on some of the islands, including a burial site, stone and glass flakes, brunt shell and bone and baler shells. Some of the islands were possibly occupied by Indigenous people of the region (DBCA 2020a).
Rowley Shoals Marine Park	-	✓	-	Sanctuary, Recreation and General Use Zones	**Description** The Rowley Shoals comprise three reef systems: Mermaid Reef, Clerke Reef and Imperieuse Reef; all are 30 to 40 km apart. These reef systems are about 300 km west-north-west of Broome (DEC 2007a).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Protected area	Woodside activity area			IUCN protected area category* or relevant park zone	Description and values
	Browse	*NWS/ Scarborough*	*North West Cape*		
					Conservation values The three coral atolls of the Rowley Shoals Marine Park comprise of shallow lagoons inhabited by diverse corals and abundant marine life, each covering around 80 km² at the edge of Australia's continental shelf (DEC 2007a). Further offshore, the seafloor slopes away to the abyssal plain, some 6,000 m below. Undersea canyons slice the slope. These features are commonly associated with diverse communities of deepwater corals and sponges and create localised upwellings that aggregate pelagic species like tunas and billfish (DEC 2007a).
					Social and economic values Due to its remote location, the Rowley Shoals has low numbers of visitors, with most arriving aboard licenced charter boats. Popular activities in the area include scuba diving, recreational fishing and boating (DEC 2007a).
Scott Reef	✓	-	-	Nature Reserve	The values of Scott Reef Nature Reserve are described in the Scott Reef and Surrounds – Commonwealth Area above.
Shark Bay Marine Park and Hamelin Pool Marine Nature Reserve (jointly managed)	-	-	✓	Sanctuary, Recreation, General Use and Special Purpose Zones	**Description** The Shark Bay Marine Park and Hamelin Pool Marine Nature Reserves are 400 km north of Geraldton, covering areas of about 7,487 km² and 1,270 km², respectively (CALM 1996).
					Conservation values Seagrass covers over 4,000 km² of the Shark Bay Marine Park, with 12 different species making it one of the most diverse seagrass assemblages in the world. Dugongs regularly use this habitat, with the bay containing one of the largest populations in the world. Humpback whales also use the bay as a staging post in their migration along the coast. Green and loggerhead turtles occur in the bay, with Dirk Hartog Island providing the most important nesting site for loggerheads in WA. Hamelin Pool contains the most diverse and abundant examples of stromatolites found in the world. These are living representatives of stromatolites that existed some 3,500 million years ago (CALM 1996).
					Social and economic values Commercial fishing and tourism are important economic values of the region. Popular recreational activities include nature-based tourism, recreational fishing and water sports (DEC 2008).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

					Cultural values The Malgana people occupy the land and waters in the vicinity of Shark Bay and have strong cultural connection to the region. The area is important for cultural practices and for fishing, hunting and camping for the Malgana people (DEC 2008).
Yawuru Nagulagun/ Roebuck Bay Marine Park	-	✓	-	Special Purpose Zone	**Description** Yawuru Nagulagun/Roebuck Bay Marine Park is a series of intertidal flats lying on the coast to the south-east of Broome.
					Conservation values Roebuck Bay is an internationally significant wetland and one of the most important feeding grounds for migratory shorebirds in Australia. Australian snubfin and Australian humpback dolphins frequent the waters and humpback whales pass through on their annual migration. Flatback turtles nest on the shores and are found in the bay's waters with other sea turtle species. Seagrass and macroalgae communities provide food for protected species such as the dugongs and flatback turtles (DPAW 2016b).
					Social and economic values The marine park is adjacent to Broome, supports tourism activities and provides an active outdoor lifestyle for the residents of the region (DPAW 2016b).
					Cultural values The Yawuru people have lived along the shores of Roebuck Bay for thousands of years and have a dynamic and enduring relationship with the Yawuru Country. The coastline is important for cultural activities and is a place for hunting, fishing, gathering and camping for the Yawuru people (DPAW 2016b).

13. SOCIOECONOMIC AND CULTURAL ENVIRONMENT

This section summarises the information relating to the socioeconomic and cultural environment of the regions offshore of WA, with a focus on the NWMR.

13.1 Cultural values and heritage

Woodside's approach to cultural values and heritage management reflects our publicly available Indigenous Communities Policy (Woodside 2025). This policy is underpinned by core principles that ensure our management of cultural heritage is thorough, transparent and supported by consultation and continued engagement with Indigenous communities. Our approach to identifying, managing and protecting cultural heritage is consistent with the United Nations Declaration on the Rights of Indigenous Peoples, engaging with Indigenous communities in ways that reflect the principles of seeking free, prior and informed consent. Where heritage is concerned, Woodside seeks to avoid impact or, if avoidance is not possible, to minimise and mitigate impact through consultation with relevant Indigenous communities. We seek to ensure Traditional Owners and Custodians are central to heritage management so cultural values are understood and remain protected.

Australia ICOMOS (International Council on Monuments and Sites) is a non-government peak body for cultural heritage professionals formed as a national committee for ICOMOS (international). Australia ICOMOS' mission is to lead cultural heritage conservation in Australia by issuing standards and practice notes. Woodside understands heritage value to mean the cultural significance of a place to an individual or group in line with the Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (Australia ICOMOS 2013) (Burra Charter), and associated practice notes. A cultural feature is therefore comparable to the Burra Charter term "fabric" and refers to a place's elements, fixtures, contents and objects which have cultural values. Although these features are necessarily physical, the place they inhabit or comprise may have tangible or intangible dimensions (Australia ICOMOS 2013).

13.1.1 Native title

Woodside uses established systems, such as native title, to identify Indigenous groups that have functions, interests or activities that may be affected. While acknowledging cultural features and heritage values may exist outside of the native title framework, native title claims, determinations and Indigenous Land Use Agreements (ILUAs) are defined under the *Native Title Act 1993* (Commonwealth). Woodside considers this to be the broadest extent over which Indigenous groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the *Native Title Act* for a determination or decision about native title in a particular area. A claim is made by a native title claim group that asserts it holds native title rights and interests in an area of land or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so its rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area (Native Title Tribunal).

A requirement to establishing a positive determination of native title in court is proving there is an organised society that occupied the land or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of Mabo v Queensland (No 2)) [1992] HCA 23; (1992) 175 CLR 1 ('Mabo'). Justice Toohey had the following to say (at 187):

> "…it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilised in a way determined by that society. There must, of course, be a society sufficiently organised to create and sustain rights and duties…"

Therefore, Woodside understands native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which Indigenous groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist, they will be held by a Registered Native Title Body Corporate (RNTBC) (section 57, *Native Title Act*) in trust or as agent for native title holders.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area, or
- a native title claim has been made, or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders (Native Title Tribunal).

The *Native Title Act* provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the *Native Title Act* within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details ABOUT the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

13.1.2 Coastal Indigenous groups

Indigenous groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth 2007). To identify cultural features and heritage values that may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to areas of operation to be an instructive means of identifying potentially relevant Indigenous groups to consult.

Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for groups and individuals. This may also, over time, build expectations in the broader community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge.

Woodside acknowledges an Indigenous group's relative proximity to any operational areas is not necessarily a meaningful indicator of the connection to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

13.1.3 Sea Country

“Sea Country is valued for Indigenous cultural identity, health and wellbeing” (DNP, 2018a; 2018b).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. This is one aspect of the broader concept of ‘Sea Country’, which can be defined as the area of sea over which an Indigenous group has interests, cultural value, connection and use. It has been noted that “the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as ‘Saltwater Country’ or ‘Sea Country’.

‘Country’ refers to more than just a geographical area; it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area (Smyth 2007), and encompasses the lands, waterways and seas to which Indigenous people are connected (Australian Institute of Aboriginal and Torres Strait Islander Studies 2026).

An impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within Sea Country – the seascape that Traditional Custodians view, interact with or hold knowledge of. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas Program. The Indigenous Protected Areas Program provides for “areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation…IPAs [Indigenous Protected Areas] deliver environmental benefits…Managing IPAs also helps Indigenous communities protect the cultural values of their Country for future generations…” (DCCEEW 2025c).

McNiven (2004) suggests that “For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20 to 30 km out to sea, out to the horizon and the limit of human visibility. However, in some coastal places, clouds that can be seen well over 100 km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s north-west, the recorded evidence is limited to travel across inland rivers (such as Barber and Jackson 2011) or travel between coastal islands (Paterson *et al*. 2019).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple Indigenous language groups. Some species may travel as far as 5,000 km from Antarctica to the Kimberley region of WA (Double *et al.* 2010; 2012), passing Indigenous language groups along the entire west coast of Australia.

Table 13-1: Commonly identified Sea Country species and habitats

Value	Details
Marine mammals	Whales, particularly humpbacks, and dugongs are commonly identified through consultation with Indigenous people as culturally important species, with totemic importance. Common interests include maintaining their populations, biodiversity, and migration patterns.
Marine reptiles	Turtles and sea snakes are commonly identified through consultation with Indigenous people as culturally important species and a favoured resource. Indigenous people that identify marine reptiles as species of totemic importance or integral to songlines may place high cultural value on their protection. Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to Indigenous people (Fijn 2021:47; Delisle *et al.* 2018).
Fish and cephalopods	Fishes, stingrays and squids are commonly identified through consultation with Indigenous people as a culturally important species, with fish generally being identified as a resource. Indigenous people may identify cultural values associated with fish species as important to maintaining both tangible (physical sites) and intangible (knowledge) cultural heritage. Tangible cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. There are increase ceremonies for species of squid and octopus to enhance or maintain populations. Thalu are places where these increase ceremonies are performed.
Seabirds	Seabirds, particularly shags, are commonly identified through literature as a culturally significant species (Malgana Land and Sea Management *et al.* 2021) and a resource (seabird eggs; Smyth 2007).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Value	Details
Benthic habitats	Indigenous peoples identify benthic habitats as valuable for both their ecological and aesthetic values. Corals attract fish and seagrass provide shelter for fauna, as well as an important resource for dugongs.
Shoreline habitats	Indigenous peoples identify shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature notes mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that Ngarda-Ngarli use mangrove seeds as a resource.

13.1.4 Marine parks

Woodside acknowledges Commonwealth and State marine park management plans have sought to recognise cultural values and responsibilities of Indigenous groups. AMPs describe this framework in the following way: “when making decisions about what can occur in marine parks and what action we will take to protect AMPs, we take values into account”. AMPs summarise these values as natural, cultural, heritage and socioeconomic values (see Section 12.5).

13.1.5 Indigenous Protected Areas

IPAs are areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation through voluntary agreements with the Australian Government. IPAs are an essential component of Australia’s National Reserve System, which is the network of formally recognised parks, reserves and protected areas across Australia (DCCEEW 2026b).

IPAs play a critical role in conserving Australia’s marine environments by enabling Aboriginal and Torres Strait Islander peoples to continue their long-standing stewardship of Sea Country. These Indigenous-led governance systems strengthen environmental management, uphold cultural responsibilities, and provide effective, place-based frameworks for caring for coastal and marine ecosystems. IPAs also support greater recognition of Indigenous rights and knowledge in marine management and offer pathways for improving co-management across Australia’s protected areas (Isaac *et al.* 2024).

As of March 2026, there are 95 dedicated IPAs spanning over 108.5 million hectares, with 6.8 million hectares of sea covered by IPAs. These account for more than 54% of the National Reserve System (DCCEEW 2026b). As of the 1 April 2026, DCCEEW will administer the IPA program.

There are 11 IPAs identified within the NWMR; ten overlap the Browse activity area and two overlap the NWS/Scarborough activity area, with the Yawuru IPA overlapping both the Browse and NWS/Scarborough activity areas, as listed in Table 13-2 and shown in Figure 13-4. IPAs in the NWMR are described in the next subsections.

13.1.5.1 Balanggarra

The Balanggarra IPA was dedicated on 7 August 2013. It spans over one million hectares of land and Sea Country in the Kimberley region and has been home to the Balanggarra people for thousands of years. The five big rivers of the north Kimberley intersect on Balanggarra Country. These are the King River, Forest River, Pentecost River, Durack River and Ord River. The region also borders the Cambridge Gulf and Timor Sea. Three species of vulnerable sawfish are found in the waters of this region (Kimberley Land Council n.d.).

Nine targets identified in the Balanggarra Healthy Country Plan 2012–2022 are:

- Balanggarra law and culture
- our *Gra* (Country, including land, sea, rivers and islands)
- cultural sites (rock art sites, burial sites, heritage places)
- native animals
- accessible bush tucker and medicine plants
- right-way fire
- freshwater (places and freshwater fish)
- saltwater fish and seafood
- migratory saltwater species (turtle, dugong, whales, dolphins).

The Balanggarra Rangers manage 1,000 km of river and sea frontage on their Country to manage, protect and enhance its unique biodiversity values (Balanggarra Aboriginal Corporation 2011).

13.1.5.2 Bardi Jawi

Bardi Jawi IPA is 160 km north of Broome and covers 1,269.9 km² of land and Sea Country (National Indigenous Australians Agency (NIAA), n.d.-c). The main communities on Bardi Country are Djarindjin, Lombadina and Ardyaloon (One Arm Point). Bardi people live on the mainland of the Dampier Peninsula and islands immediately offshore from Ardyaloon. Jawi people call the islands further east, including Iwany (Sunday Island), their Country. Today people live in outstations spread along the mainland Peninsula coastline (Kimberley Land Council/Bardi Jawi Niimidiman Aboriginal Corporation RNTBC 2013).

During the IPA consultation process, the Bardi Jawi Rangers guided meetings with individual family groups to identify what they considered important to look after. An IPA steering committee was formed, who contributed cultural knowledge to the Bardi Jawi Indigenous Protected Area Management Plan (2013–2023). They were assisted by The Nature Conservancy in conservation action planning. This plan highlights targets to be protected on Country:

- marnany (fringing reefs)
- aarli (fish)
- odorr (dugong) and goorlil (turtle)
- significant sites, language, law and culture
- traditional oola (water) places
- Indigenous plant resources (Kimberley Land Council/Bardi Jawi Niimidiman Aboriginal Corporation RNTBC 2013).

Jardagarr (coastal Country) is classed under IUCN Category 4, and Niimidiman (inland Country) is classed under Category 6. Niimidiman harbours many plant and animal species of high cultural value. For example, irrgil trees are used for making boomerangs and marrga, joolgirr and bilimangard trees are used for making shields. Some Niimidiman areas feature traditional oola (water) places and the stories attached to these places are culturally important. Ecological values of the Jardagarr (coastal) Country include many species of native garrabal (birds), including eastern curlews and fork-tailed swifts (Kimberley Land Council/Bardi Jawi Niimidiman Aboriginal Corporation RNTBC 2013).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

13.1.5.3 Dambimangari

Dambimangari IPA is between Broome and Darwin, stretching east to the Prince Regent area. It covers 6,422.94 km² of landscape, including open grasslands, eucalyptus woodlands, intertidal flats and rocky reefs and shoals (NIAA, n.d.-d). Dambimangari is the traditional home of the Worrarra people. Dambimangari peoples' identity is interwoven with the sea and its reefs and islands. Reefs are important hunting grounds for jaya (saltwater fish) and warliny (dugongs).

The targets for protection are identified in the Dambimangari Healthy Country Plan 2012–2022 as:

- cultural sites
- reefs, beaches and islands
- saltwater fish
- turtles and dugongs
- whales and dolphins
- rivers, waterholes, waterfalls and wetlands (freshwater systems)
- culturally important native animals
- bush fruits and medicine plants
- right-way fire (Dambimangari Aboriginal Corporation 2012).

Jurluwarra (saltwater turtles) and warliny (dugongs) are culturally important to Dambimangari people as a food source. Cultural sites include rock art sites, stone arrangements, burial sites and important camping beaches that were used for resting when travelling through saltwater Country (Dambimangari Aboriginal Corporation 2012).

13.1.5.4 Karajarri

Karajarri IPA was dedicated in 2014 to manage, protect and enhance Karajarri Country. The IPA covers nearly 25,000 km² of land in the southern Kimberley, including 130 km of coastline stretching from Gordon Bay to Cape Missiessy. It comprises extensive coastlines, tidal creeks and wetlands as well as arid Country that stretches into the Great Sandy Desert (NIAA n.d.-a).

Karajarri people want to ensure areas of cultural and natural significance are looked after correctly according to their own protocols, and they view their environmental responsibilities as Palanapayana Tukjana Ngurra, meaning "everybody looking after Country properly" (Karajarri Traditional Lands Association (KTLA) 2014a).

The IPA includes two zoning categories to help manage Country: IUCN Category 2 (national park) and Category 6 (protected area with sustainable use of resources). The Category 2 zoning allows for the area to become part of an integrated system of protected areas, with Eighty Mile Beach to the south and Roebuck Bay to the north of the IPA (KTLA 2014a).

To assist in planning and developing the IPA, KTLA developed a Healthy Country Plan, which provides direction for addressing threats and for working on priorities for land and cultural site management (KTLA 2014b).

The Tukujana pa Karajarri Kura Jurrar IPA has been announced under the Sea Country IPA program, extending from the existing Karajarri IPA into the sea off the south-west Kimberley coast (DCCEEW 2023b). The area includes a network of coastal habitats, such as intertidal and subtidal reefs, mangrove systems, lagoons and tidal creeks, and connects the Ramsar sites of Roebuck Bay and Eighty Mile Beach (DCCEEW 2023b).

13.1.5.5 Karajarri Jurarr Ngurra – Sea Country

On 3 March 2026, the Karajarri Jurarr Ngurra Sea Country IPA was declared near Bidyadanga, Kimberley, WA. The Sea Country IPA spans over 237,489 ha and sits next to the Karajarrii native title area and the already declared Karajarri IPA. It includes Eighty Mile Beach State and Commonwealth marine parks and links land and marine protected areas across the south-west Kimberley region (DCCEEW 2026b).

The Karajarri Jurarr Ngurra Sea Country IPA holds a range of cultural and ecological values, including important species, habitats, places, and unique cultural knowledge and practices. Threatened and culturally

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

important species include turtles, dugongs, sawfish, dolphins and migratory shorebirds. The IPA contains important habitats that support high biodiversity that store large amounts of blue carbon, and include beaches, dunes, tidal creeks, estuaries, kunturunkarra/mangroves, mudflats, reefs, seagrass beds and rocky headlands. There are also culturally significant areas that provide food, wild oyster farming, and riji (carved pearl shell) traditions, which are recognised in the National Heritage listing of the West Kimberley (DCCEEW 2026b).

13.1.5.6 Mayala

The Mayala IPA spans most of Mayala Country, with over 375,848 ha that overlaps the Mayala Marine Park and part of the Kimberley Marine Park. The Country features extensive networks of hundreds of islands, reefs, submerged lands, sandbars, seabeds and saltwater in the Buccaneer Archipelago and King Sound of the West Kimberly region. The area contains culturally significant places for ceremony, sites for stone tools, middens, ochres and clays used for ceremonial purposes, engravings, stone arrangements and fish traps. The large tidal ranges in the region create unique marine environments that contain unique high biodiversity values. Sea Country values include large coral reefs, sea turtles, humpback whales, sharks, sailfish and whale sharks. There are large estuaries and mangrove communities that are important nursery grounds for marine life. The IPA also contains habitat and breeding grounds for migratory and threatened ocean species, including sea turtles, dugongs and sawfish (Mayala Inninalang Aboriginal Corporation RNTBC 2024).

13.1.5.7 Nyangumarta Warrarn

The Nyangumarta Warrarn IPA comprises four areas totalling about 28,675 km², including parts of the Great Sandy Desert, Walyarta Conservation Reserve, Kujungurru Warrarn Conservation Reserve Area and the Eighty Mile Beach Marine Park Intertidal Area. The Traditional Owners of the designated IPA self-identify as and are identified by other Pilbara Indigenous people as Nyangumarta people. Nyangumarta people are the native title holders of the land and waters.

Ecological values in the IPA include a complex wetland system associated with Mandora Marsh, known to Nyangumarta people as Nyamaring. Walyarta (or Salt Creek). The Mandora Marsh area holds the most inland distribution of mangroves in Australia and the mound springs associated with Mandora Marsh area, such as Yalayala (Eil Eil), are recognised as important bird nesting sites (Nyangumarta Warrarn Aboriginal Corporation & Yamatji Marlpa Aboriginal Corporation, 2015).

13.1.5.8 Nyul Nyul

The Nyul Nyul IPA was officially dedicated in May 2025, spanning 144,493 ha of land that is rich in cultural and ecological value. The IPA protects important freshwater springs, monsoon vine thickets, and threatened species such as the greater bilby and short-nosed sea snake. The IPA provides important cultural connection and wellbeing to the Indigenous people of the Nyul Nyul Country (Australian Public Service Commission 2025).

13.1.5.9 Uunguu

Stage one of the Uunguu IPA was declared on 23 May 2011, coinciding with the native title determination and release of the Healthy Country Plan. The IPA covers 7,598.06 km². It has been home to the Wunambal Gaambera people for many thousands of years and is part of the Wanjina Wunggurr culture. Wunambal Gaambera people call their Country Uunguu – “our living home”. Two of the reserves extend to the low water mark at Bougainville Peninsula, Vansittart Bay, Anjo Peninsula, Napier Broome Bay and islands in Rothsay Water (Wunambal Gaambera Aboriginal Corporation (WGAC) 2017). A Saltwater IPA Plan of Management was created in 2017 as a sub-plan to the Wunambal Gaambera Healthy Country Plan (WGAC 2017).[20]

Ten targets identified in the Wunambal Gaambera Healthy Country Plan are:

- Wanjina Wunggurr law – our culture
- right-way fire
- aamba (kangaroos and wallabies) and other meat foods
- wulo (rainforest)

[20] Marine areas were proposed to be added to the Uunguu IPA as an IUCN Category VI (Managed Resource) Protected Area, early in 2018.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- yawal (waterholes)
- bush plants
- rock art
- cultural places on islands
- fish and other seafoods
- mangguru (marine turtles) and balguja (dugongs) (WGAC 2010).

The Uunguu Rangers look after land and Sea Country through pest control, visitor management, cultural heritage conservation, flora and fauna monitoring and fire management (NIAA n.d.-d).

13.1.5.10 Wilinggin

The Wilinggin IPA spans over 2.4 million hectares of remote Country in the central north Kimberley region and was declared in 2013. It includes basalt ranges and sandstone cliffs that rise 250 m high. The area has wooded grasslands, pockets of rainforest, extensive mangrove systems, tidal mudflats, rivers, creeks and billabongs. The Ngarinyin people are the Traditional Owners of this area and have lived on Wilinggin Country for thousands of years (NIAA n.d.-e). Wilinggin Country is mostly landlocked, apart from two small saltwater areas: Walcott Inlet and Prince Frederick Harbour.

Seven targets identified in the Wilinggin Healthy Country Plan 2023–2032 are:

- becoming strong on Country
- food and medicine plants
- bushfire
- law and culture sites
- law and culture
- freshwater places
- wildlife and bush meats.

The Wunggurr Rangers are caretakers of the unique natural and cultural values of Wilinggin Country (Wilinggin Aboriginal Corporation 2022).

13.1.5.11 Yawuru

The Yawuru IPA was dedicated by Yawuru people in 2017, covering 2,109 km² of Yawuru coastal and inland Country (Yawuru RNTBC 2014). The Yawuru people are the native title holders of their land and sea – their ancestors have lived along the foreshores of Roebuck Bay, across the Pindan Plains and inland along the fringes of the Great Sandy Desert for thousands of years (NIAA n.d.-b).

The Yawuru IPA is managed under the Walyjalajala nagulagabu birrangun buru Plan of Management for 2017–2026 (Yaruwu RNTBC 2014). The plan includes eight targets for management:

- Yawuru cultural knowledge and practice
- Yawuru significant areas
- Yawuru rights and responsibilities
- niyamarri – sand dunes
- bilarra – wetlands
- birra – bush and pindan Country
- nagulagun – saltwater Country (deep water and intertidal)
- seasonal resources and biodiversity.

Cultural values include Yawuru named sites, tracks and areas, historical sites associated with pearling and pastoral industries, archaeological sites and traditional bush/sea resources. Ecological values include reefs

and seagrass beds that provide habitat for dugongs (*Dugong dugon*) and EPBC Act listed threatened sea turtle species, including hawksbill turtles (*Eretmochelys imbricata*), loggerhead turtles (*Caretta caretta*), green turtles (*Chelonia mydas*) and flatback turtles (*Nataden depressus*). Roebuck Bay is a Ramsar site and has a known population of snubfin dolphins (*Orcaella heinsohni*) (Figure 8-6). Other ecological values include pearl shell beds for pearl oysters and habitat for a range of EPBC Act listed threatened species (Yaruwu RNTBC 2014).

13.1.6 Indigenous cultural heritage

On 15 November 2023, the *Aboriginal Heritage Act* (WA) was restored as the legislation that manages Aboriginal heritage in WA (DPLH 2024). Under section 17 of that Act it is an offence to excavate, destroy, damage, conceal or alter any Aboriginal site without authorisation. Where there is a risk of injury or desecration to a significant Aboriginal area, even where permitted under the Act, any Aboriginal person may apply to the federal Environment Minister for a declaration under sections 9 or 10 of the *Aboriginal and Torres Strait Islander Heritage Protection Act* (Commonwealth) to protect and preserve that area.

Woodside understands communal cultural connection exists between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that Indigenous people have occupied the Australian continent for at least 65,000 years (Clarkson *et al.* 2017) and in many places maintain a strong continuing connection that is said to extend back in Indigenous cosmology to the beginning of time.

Archaeological sites identified onshore that have the potential to be preserved in intertidal or submerged locations include petroglyphs, fish traps and artefact scatters or burials contained within sand dunes. As archaeological sites, these features have archaeological value that relate to preserving their fabric (as in, the tangible features) and their context (as in, their location and relationship to other archaeological and natural features). Archaeological sites may also have intangible dimensions (ICOMOS 2013), cultural values that exist in addition to their archaeological or scientific value.

Intangible values are a living expression of cultural heritage that is prevalent across generations. These values can be traditional. They can also be new and living at the same time. An understanding of the intangible cultural heritage of different Indigenous communities helps with intercultural dialogue and encourages mutual respect (UNESCO 2011). Intangible cultural heritage is safeguarded through practicing and passing on knowledge or expressions by the people to whom it belongs (UNESCO 2003). Table 13-3 provides context to common intangible themes that exist in Indigenous communities.

Table 13-3: Intangible heritage values associated with Sea Country

Value	Details
Songlines	Indigenous people often describe oral songlines as the law of the land and make up part of the Dreaming (Neale and Kelly 2020:30). Songlines are viewed in western academia as a framework for relating people to land. They consist of a series of invisible, interconnected routes across the landscape that mark significant sites for Indigenous people (Higgins 2021:723). Songlines demonstrate Indigenous peoples' strong connections to land by revealing sacred knowledge that is place specific (Roberts 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through and interacted with the physical landscape, leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include rocks, mountains, rivers, caves and hills (Higgins 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). It is important to protect physical sites identified as comprising a component of a songline, to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of Indigenous communities across the land (Neale and Kelly 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country mention mythical events around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country. For example, connections to nearby islands they once inhabited in their songlines (Smyth and Isherwood 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly 2020:83-84).

Value	Details
Creation/Dreaming sites, sacred sites and ancestral beings	The only published sources Woodside found with detailed descriptions of the location of ancestral beings or Creation/Dreaming or sacred sites place these on land, or within inland water sources such as rivers and pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some Creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in Indigenous cosmology.
Cultural obligations to care for Country	Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature Woodside reviewed, caring for Country was noted to include maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions, such as caring for ancestral beings or ensuring cultural safety. Thalu are places where what are known as 'increase ceremonies' are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where, for example, a thalu relates to marine species populations.
Knowledge of Country/customary law and transfer of knowledge	Knowledge of and familiarity with the features of Sea Country are itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess, even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption or relocation of Indigenous communities may have implications for preserving Indigenous knowledge. Further, connection to Country may be damaged where people are displaced or disrupted (such as during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips 2021). Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).
Connection to Country	This describes the multi-faceted relationship between Indigenous people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many Indigenous people. In the case of Sea Country, this can mean identifying as a Saltwater person, where "essence of being a 'Saltwater' person is ontological… it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people" (McDonald and Phillips 2021).
Access to Country, including Sea Country	Access is necessary for continuing other values, including caring for Country, carrying out cultural practices and transferring traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.
Kinship systems and totemic species	Individuals may have kinship to specific species (Smyth 2008; Juluwarlu 2004) and a responsibility to care for species (Muller 2008). Kinship arises from totemic associations within Indigenous 'skin group' systems. It is forbidden for an individual to kill or eat a species who is from the same 'skin group' (Juluwarlu 2004). They may also have certain obligations linked to the discussion of caring for Country above. It is assumed marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood these relationships do not prohibit people outside of that 'skin group' from hunting or eating that same species (Juluwarlu 2004).
Resource collection	Multiple marine species are identified through consultation and literature as important resources, particularly as food sources (see Section 13.1.4). In addition to their immediate value as sustenance, gathering and preparing these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

13.1.6.1 Underwater cultural heritage

It is understood the sea level has risen significantly during the 65,000 years of Indigenous occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth *et al.* 2019; University of Western Australia (UWA) 2021). Sea levels began to rise about 18,000 years ago, which flooded the coastal plain and forced further inland those who dwelled on the coast (Smyth 2007). At its lowest level during Indigenous occupation, the sea was between 125 m (O'Leary *et al.* 2020; Veth *et al.* 2019; Williams *et al.* 2018) and 130 m below current levels (Benjamin *et al.* 2020; Benjamin *et al.* 2023; UWA 2021). Oral traditions in Australia have mapped maritime activity and changes in coastal environments back to the Holocene period, with many Indigenous stories along the northern Australia coast highlighting seafaring,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

voyages, and the coastal environments that were encountered and created in the area. These oral traditions form the intangible cultural heritage of Sea Country, which also holds knowledge of the sea level rise and change in marine environments (Farr 2025).

Archaeological material preserved on the Ancient Landscape has the potential to provide more information about the earliest periods of human occupation (Veth *et al.* 2019; UWA 2021).

Recent archaeological discoveries demonstrate the now submerged landscape was occupied and inhabited and may retain archaeological material from this time (Benjamin *et al.* 2020; Benjamin *et al.* 2023; see Ward *et al.* 2022 for an opposing view).

Certain landscapes have been identified as archaeologically prospective on the submerged Ancient Landscape, including:

- submerged water sources (rivers, waterholes, tidal channels and seeps) that have an increased likelihood of use or habitation as past generations used the associated resources (UWA 2021)
- submerged calcarenite ridges younger than human occupation of the continent, which may have formed over and protected artefacts *in situ* (Veth 2019)
- prominent landscape features (such as hills, particularly of igneous rock formations) that may have been focus areas for cultural activity (UWA 2021)
- karst depressions and other ‘catch points’ where artefacts may accumulate after disturbances caused by inundation (UWA 2021; Nutley 2022; Nutley 2023a)
- Madeleine Shoals, specifically identified by MAC as an archaeologically prospective feature due to its igneous rock formations, which have the potential to contain petroglyphs.

The sites considered most likely to survive inundation, based on the review of existing literature, were logically the more robust forms, including:

- midden and artefacts within cemented dunes, relict water holes, and beach rock deposits
- quarry outcrops, extraction pits, and associated reduction debris in fine-grained volcanic outcrops
- curvilinear stone structures and standing stones sitting on volcanic pavements and jammed into volcanic rock piles
- lag deposits of artefacts and possibly midden on hardpan in suitable landscape contexts with good preservation conditions; for example, shallow declination shorelines in sheltered passages of the inner archipelago or on the leeward side of hard-rock/fringing reef causeways adjacent to the outer islands
- small overhangs and shelters with preserved deposits, facing away from the dominant wave and wind action (Veth *et al.* 2019).

Recognising this, Woodside considers the Ancient Landscape between the mainland and the ancient coastline at 125 m depth contour KEF (Figure 13-5) as an area where potential Indigenous archaeological material may exist on the seabed, as this covers the full extent of this possible occupation. Known places, including archaeological sites, may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act*, *Underwater Cultural Heritage Act 2018* or EPBC Act. However, these Acts only extend protection to Indigenous heritage places specified by declaration or otherwise included on a statutory list. Woodside understands there is currently no Indigenous archaeology known to exist within Commonwealth waters and no areas subject to declarations or prescriptions under these Acts.

13.1.6.2 Indigenous sites of significance

Murujuga (the Burrup Peninsula) has a very high density of significant Indigenous heritage sites and places with tangible and intangible heritage values. These places are linked to Indigenous cosmology, Dreaming stories and songs through the stories, knowledge and customs that are still held by Traditional Custodians.

The MCL is a UNESCO World Heritage inscribed property. The Dampier Archipelago (including the Burrup Peninsula) was included on the National Heritage List in 2007 due to outstanding heritage values relating to Australia's cultural history contained in the large number, density, diversity, distribution and fine execution of rock art. The values of MCL and the Dampier Archipelago National Heritage place are described in Section 12.2.1 and Section 12.9.

DPLH maintains an Aboriginal Cultural Heritage Register of registered sites and heritage places on the Aboriginal Cultural Heritage Inquiry System. There are over 1,600 registered sites on Murujuga and the Dampier Archipelago, with around 1,100 other heritage places. This register is not comprehensive and will be complemented by heritage surveys where necessary. Protection of National and World Heritage values is also legislated through various provisions of the EPBC Act. Murujuga National Park is managed under the *Conservation and Land Management Act* (WA).

13.1.7 Historic sites of significance

Places of historic cultural significance are protected under Commonwealth, State and local regimes. Places inscribed on the National or World Heritage List are protected through various provisions of the EPBC Act. Historic places may also be protected under the *Heritage Act 2018* (WA); under section 129 of this Act, the prohibited alteration, demolition, damage, despoilment or removal of objects from a registered place may result in a fine of A$1 million. Protection of heritage by local government typically emanates from local planning schemes produced under Part 5 of the *Planning and Development Act 2005* (WA).

Historical sites of significance and heritage value are found along adjacent foreshores of the NWMR, SWMR and NMR.

13.1.8 Historic underwater heritage

The remains of vessels and aircraft in Commonwealth waters, along with any associated article, are automatically protected under the *Underwater Cultural Heritage Act* (Commonwealth) after 75 years. This is applicable whether the existence or location of the article is known or unknown, as per section 16 of the Act. Other articles of underwater cultural heritage may be declared for protection as outlined in section 17 of the Act. Remains and relics of any ship lost, wrecked or abandoned in WA waters before the year 1900 are protected by the *Maritime Archaeology Act 1973* (WA).

There are no known National Heritage listed shipwrecks in the NWMR or NMR (Figure 13-6). The only known National Heritage listed shipwrecks are within the SWMR and include:

- the HMAS Sydney II
- the HSK Kormoran
- the Batavia.

Known historical shipwreck sites in WA waters are listed in the WA Maritime Museum Shipwreck Database (Western Australian Museum 2026). Known historical shipwreck sites in Commonwealth waters are listed in Australasian Underwater Cultural Heritage Database (DCCEEW 2026d). These databases only cover known historical sites. Figure 13-6 shows known shipwrecks for the NWMR as listed in these databases.

13.2 Socioeconomic values

Socioeconomic values include commercial and traditional fishing, tourism, recreation, shipping, oil and gas activities and defence activities.

13.2.1 Commercial fisheries – Commonwealth and State

The Australian Fisheries Management Authority (AFMA) manages fisheries on behalf of the Commonwealth Government and is bound by objectives under the *Fisheries Management Act 1991* (Commonwealth).

WA State commercial fisheries are managed by the WA Department of Primary Industries and Regional Development (WA DPIRD) under the *Fish Resources Management Act 1994* (WA), Fisheries Resources Management Regulations 1995 (WA), relevant gazetted notices and licence conditions, and applicable fishery management plans.

Commonwealth and State managed fisheries that are licenced to operate within the NWMR are summarised in Table 13-4 and Table 13-5, respectively. Commercial fisheries with activity in the NRMW are shown in Figure 13-7 to Figure 13-11.

Western Australia demersal fishing reforms

From January 2026, the Government of Western Australia has introduced demersal fishing reforms to manage and protect at-risk demersal fish species, to help stocks recover for future generations within the boundaries of the fishing bioregions, as defined by DPIRD (2025a). These demersal fishing reforms may affect the commercial and recreational fisheries interacting with Woodside activity areas, as described below.

North Coast bioregion

The DPIRD North Coast fishing bioregion includes the Pilbara and Kimberley regions and runs from Ashburton River south of Onslow to the border of WA and the NT (DPIRD 2026c).

Kimberley region

- Recreational and charter fishing will remain open.
- A 50% catch reduction for commercial fisheries applies from 1 January 2026 (DPIRD 2025a).

Pilbara region

- Recreational and charter fishing will remain open.
- A 50% catch reduction for commercial fisheries applies from 1 January 2026.
- Permanent closure of commercial trawl fishing for demersal scalefish applies from 1 January 2026 (DPIRD 2025a).

Gascoyne Coast bioregion

The DPIRD Gascoyne Coast fishing bioregion runs from the Zuytdorp Cliffs north of Kalbarri to the Ashburton River south of Onslow (DPIRD 2026c).

- Recreational, charter and commercial fishing will remain open (DPIRD 2025a).

West Coast bioregion

The DPIRD West Coast fishing bioregion runs from Black Point east of Augusta to the Zuytdorp Cliffs north of Kalbarri. This area includes the Houtman Abrolhos Islands (DPIRD 2026c).

- Recreational boat-based fishing for demersals did not reopen on 16 December 2025 and is scheduled to reopen in spring 2027 as an exclusively recreational fishing zone.
- Charter fishing for demersals in the metropolitan area closed from 16 December 2025, but charter fishing for demersals under the tag system will continue in the remainder of the West Coast bioregion under a reduced annual catch limit of 25 tonnes.
- Commercial fishing for demersals closed from 1 January 2026. This includes a permanent closure of gillnet fisheries and commercial line fishing south of Kalbarri, supported by a compulsory buyback of commercial fishing licences (DPIRD 2025a).

<tr><td rowspan="5">Southern Bluefin Tuna Fishery</td><td rowspan="5">✓</td><td rowspan="5">✓</td><td rowspan="5">✓</td><td>Management area</td><td colspan="3">The Southern Bluefin Tuna Fishery covers the entire EEZ around Australia, out to 200 nm from the coast. They do not fish in the Woodside activity areas.</td></tr>
<tr><td colspan="2">Species targeted</td><td>Fishing methods</td><td>Fishing depth</td></tr>
<tr><td colspan="2">Southern bluefin tuna (Thunnus maccoyii).</td><td>Longline, purse seine fishing, and minor line (troll and poling).</td><td>Southern bluefin tuna is a pelagic species that can be found to depths of 500 m (AFMA 2021a).</td></tr>
<tr><td>Fishing effort</td><td colspan="3">Most of the Australian fishing effort is by purse-seine vessels in the Great Australian Bight and waters off SA during summer months, and by longline off the New South Wales coastline during winter months (Patterson et al. 2025a).
The Southern Bluefin Tuna Fishery is shared among countries. Australia currently has a 35% share of the total global allowable catch. While wild capture fishing in Australia to sell directly to market can occur anywhere throughout the fishery’s range, currently most of that quota is value-added through ranching (on-growing the wild captured fish for an extra five to six months). Ranching requires significant infrastructure, a resident labour force, plus proximity to a fishery able to supply a large quantity of natural feed or sardines (40,000+ tonnes). North-west WA is critically important, regardless of how the quota is fished, because of the proximity to the single spawning ground of this global roaming species. Young fish (one to four years of age) move from the spawning ground in the north-east Indian Ocean into the Australian EEZ and southwards along the WA coast (Patterson et al. 2025a).
The stock is classified as not overfished (Patterson et al. 2025a).
A total of 6,325 t bluefin tuna catch was recorded for the 2023–24 fishing season, an increase from 6,034 t in the 2022–23 period (Patterson et al. 2025a). Of the total catch, 4,525 t were collected using purse seine and 1,799 t from pelagic longline.</td></tr>
<tr><td>Active licences/ vessels</td><td colspan="3">Five purse seine vessels and 27 longline vessels in the 2023–24 period, a decrease from six purse seine vessels and an increase from the 24 longline vessels in the 2022–23 period (Patterson et al. 2025a).</td></tr>

<tr><td rowspan="5">Western Deepwater Trawl Fishery</td><td rowspan="5"></td><td rowspan="5"></td><td rowspan="5">✓</td><td>Management area</td><td colspan="3">The Western Deepwater Trawl Fishery is in deep water off WA, from the line approximating the 200 m isobath to the edge of the AFZ (Blake et al. 2021).</td></tr>
<tr><td colspan="2">Species targeted</td><td>Fishing methods</td><td>Fishing depth</td></tr>
<tr><td colspan="2">More than 50 species, historically dominated by six commercial finfish species or species groups:
• orange roughy (Hoplostethus atlanticus)
• oreos (Oreosomatidae)
• boarfish (Pentacerotidae)
• eteline snapper (Lutjanidae: Etelinae)
• apsiline snapper (Lutjanidae: Apsilinae)
• sea bream (Lethrinidae).</td><td>Demersal trawl.</td><td>Water deeper than 200 m (Blake et al. 2021).</td></tr>
<tr><td>Fishing effort</td><td colspan="3">The number of vessels active in the fishery and total hours trawled have fluctuated from year to year. Notably, total hours trawled were relatively high for a brief period during the early 2000s when fishers targeted ruby snapper and deepwater bugs (Patterson et al. 2020).
Total trawl hours have been variable but relatively low since 2005–06. In 2023–24, 15 trawl-hours were recorded in the fishery, up from 2022–23 when no effort was recorded, but down from the 76 trawl-hours recorded in 2021–22 (Keller et al. 2025a).
A total of 3.39 t of catch was landed in the Western Deepwater Trawl Fishery in 2023–24, comprising various finfish species including amberjack (29%), rubyfish – mixed (Plagiogeneion spp.; 24%) and rosy snapper (13%). No catch was recorded in 2022–23 and no deepwater bugs have been landed since 2019–20 (Keller et al. 2025a).
Ruby snapper and deepwater bugs stock are considered not subject to overfishing but the biomass status of deepwater bugs is classified as uncertain (Keller et al. 2025a).</td></tr>
<tr><td>Active licences/ vessels</td><td colspan="3">Since 2004–05, one to three vessels have been active in the fishery, with one active vessel in 2023–24 (Keller et al. 2025a).</td></tr>

Fishery	Woodside activity area			Description	
	Browse	*NWS/ Scarborough*	*North West Cape*		
				Active licences/ vessels	Four pelagic longline and three minor line vessels were active during the 2023–24 season (Patterson *et al.* 2025b).

Table 13-5: State managed fisheries

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
Abrolhos Islands and Mid-West Trawl Fishery			✓	***Management area***	The Abrolhos Islands and Mid-West Trawl Fishery operates around the Abrolhos Islands within the SWMR.		
				Species targeted	***Fishing methods***	***Fishing depth***	
				Saucer scallops (*Ylistrum balloti*, formerly *Amusium balloti*).	Otter trawl.	Saucer scallops occur in inshore waters around 40 m depth at the Abrolhos Islands (Wilkin *et al.* 2024).	
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total landings in the 2023 season was 467 t meat weight (2,333 t whole weight) (Wilkin *et al.* 2024). The Abrolhos Islands and Mid-West Trawl Fishery did not fish in 2022 due to the stock being environmentally limited (Wilkin *et al.* 2023a). The fishery landed 123.1 t meat weight (615.1 t whole weight) in 2021.		
				Active licences/ vessels	The number of vessels is unreported. There were ten licences in 2021 (Kangas *et al.* 2023b).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
Broome Prawn Managed Fishery	✓			***Management area***	The Broome Prawn Managed Fishery operates off Broome and forms part of the North Coast Prawn Fishery.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Western king prawn (*Penaeus latisulcatus*), brown tiger prawns (*Penaeus esculentus*) and blue endeavour prawns (*Metapenaeus endeavouri*).		Low opening, otter prawn trawl systems.	Trawling is generally in waters between 30 and 60 m deep, but can occur down to 100 m (Department of Environment and Heritage 2004).
				Fishing effort	The total landings of the Broome Prawn Managed Fishery in the 2023 season were negligible (Koefoed *et al.* 2024a). The DPIRD State of the Fisheries annual reports indicate that no fishing efforts occurred in 2022 and extremely low fishing effort occurred in 2021, 2020 and 2019 (Wilkin *et al.* 2023b). The stock status of western king prawns is considered sustainable – adequate (Koefoed *et al.* 2024a).		
				Active licences/ vessels	Two boats undertook trial fishing activities in 2023 (Koefoed *et al.* 2024a).		
Exmouth Gulf Prawn Managed Fishery			✓	***Management area***	The Exmouth Gulf Prawn Managed Fishery operates within the sheltered waters of Exmouth Gulf. The fishery occupies a total area of 4,000 km², with only half of this area being trawled (Fletcher and Santoro 2015).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Western king prawn (*Penaeus latisulcatus*), brown tiger prawn (*Penaeus esculentus*), blue endeavour prawn (*Metapenaeus endeavouri*) and banana prawn (*Penaeus merguinensis*).		The fishery uses low opening, otter prawn trawl systems (Koefoed *et al.* 2024b).	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The Exmouth Gulf Prawn Managed Fishery landed 653 t in 2023, 898 t in 2022, 777 t in 2021, 673 t in 2020, 821 t in 2019, 880 t in 2018, 713 t in 2017 and 822 t in 2016 (Koefoed *et al.* 2024b). The total catch comprised 306 t of brown tiger prawns, 200 t of western king prawns, and 147 t of blue endeavour prawns (Koefoed *et al.* 2024b). Stock status of landed species is considered sustainable – adequate (Koefoed *et al.* 2024b).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
Kimberley Crab Managed Fishery (formerly Kimberley Developing Mud Crab Fishery)	✓			***Management area***	The Kimberley Crab Managed Fishery is one of two small trap-based crab fisheries that exist in the North Coast bioregion between Cambridge Gulf and Broome (Gaughan and Santoro 2018). In November 2018, the fishery transitioned from developing to fully managed (Johnston *et al.* 2020b).		
					Species targeted	***Fishing methods***	***Fishing depth***
					Brown mud crab (*Scylla olivacea*) and green mud crab (*Scylla serrata*).	Trap. Exemption holders use crab traps and drop nets in waters adjacent to native title lands (Johnston *et al.* 2023).	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total crab landed was 0.45 t in 2023, 13.6 t in 2022, 9.7 t in 2021, 1.5 t in 2020, 3.2 t in 2018 and 7.4 t in 2019. In 2023, Kimberley Crab Managed Fishery landed a total catch of 0.45 t of brown mud crab, which represented the entire reported commercial mud crab catch (Harris *et al.* 2024). Mud crab species in the managed fishery is considered sustainable – adequate (Harris *et al.* 2024).		
				Active licences/ vessels	There is an allocation of 1,200 units (equivalent to 600 traps) to licence holders (Johnston *et al.* 2023). An equivalent allocation of 600 traps for commercial purposes was provided to Traditional Owner groups through the granting of non-transferable Instruments of Exemption under the *Fish Resources Management Act*.		
Mackerel Managed Fishery	✓	✓	✓	***Management area***	The commercial fishery extends from the West Coast bioregion to the WA/NT border. There are three managed fishing areas: Area 1: Kimberley (121ºE to the WA/NT border); Area 2: Pilbara (114ºE to 121ºE) and Area 3: Gascoyne (27ºS to 114ºE) and West Coast (Cape Leeuwin to 27ºS) (Lewis *et al.* 2020).		
					Species targeted	***Fishing methods***	***Fishing depth***
					Spanish mackerel (*Scomberomorus commerson*), grey mackerel (*S. semifasciatus*) and other species from the genus *Scomberomorus*.	Trolling, baits or lures cast, jigging (Lewis *et al.* 2020).	Information not available.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Most of the catch is taken from waters off the Kimberley and Pilbara coasts (Lewis *et al.* 2020), reflecting the tropical distribution of mackerel species (Molony *et al.* 2015). Most fishing activity occurs around the coastal reefs of the Dampier Archipelago and Port Hedland area, with the seasonal appearance of mackerel in shallower coastal waters most likely associated with feeding and gonad development before spawning (Mackie *et al.* 2003). Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: 242 t in 2023, 213 t in 2022, 310 t in 2021, 290 t in 2020, 291 t in 2019, 214 t in 2018, 283 t in 2017, 276 t in 2016, 302 t in 2015 and 322 t in 2014 (Lewis and Rynvis 2024). The landed catch in 2023 was 225 t for Spanish mackerel and 16 t for grey mackerel (Lewis and Rynvis 2024). The commercial landings for other large pelagic species, such as the amberjack and cobia, were 19.7 t and 18.2 t, and other species contributed to the remaining <10 t of the total catch (Lewis and Rynvis 2024). All species stocks are sustainable – adequate (Lewis and Rynvis 2024).		
				Active licences/ vessels	There were 15 vessels in 2023, primarily from May to November (Lewis and Rynvis 2024).		
Marine Aquarium Fish Managed Fishery	✓	✓	✓	***Management area***	The Marine Aquarium Fish Managed Fishery can operate throughout WA State waters. The fishery is typically more active in waters south of Broome and higher levels of effort around the Capes region, Perth, Geraldton, Exmouth, Dampier and Broome (Newman *et al.* 2021b). There has been recent effort in the waters from Broome northwards to the NT border (Newman *et al.* 2024b).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Finfish, hard coral, soft coral, tridacnid clams, syngnathids (seahorses and pipefish), other invertebrates (including molluscs, crustaceans, echinoderms), algae, seagrasses and 'live rock'. The resource potentially includes over 1,500 species of marine aquarium fishes (Newman *et al.* 2024b).	The fishery is diver-based, which typically restricts effort to safe diving depths (less than 30 m).	Information not available.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Total catch for the Marine Aquarium Fish Managed Fishery in 2023 was 107,786 fishes and invertebrates, 18 t of coral, live rock and living sand, and 272 L of marine plants and live feed (Newman *et al.* 2024b). In 2022, the total catch for the Marine Aquarium Fish Managed Fishery was 98,694 fishes and invertebrates, 17.83 t of coral, live rock and living sand, and 39 L of marine plants and live feed (Newman *et al.* 2024b). Dominant fish species caught in 2022 include spotted blenny (*Istiblennius meleagris*), scribbled angelfish (*Chaetodontoplus duboulayi*), black-axil chromis (*Chromis atripectoralis*), stripey (*Microcanthus strigatus*), Vachell's glassfish (*Ambassis vachellii*), margined coralfish (*Chelmon marginalis*), black-axil chromis (*Chromis atripectoralis*), and blue and yellow wrasse (*Anampses lennardi*) (Newman *et al.* 2024b). The breeding stocks of landed species are classified as sustainable – adequate (Newman *et al.* 2024b).		
				Active licences/ vessels	Twelve licences were active in 2023 across the Marine Aquarium Fish Managed Fishery and the Hermit Crab Fishery (Newman *et al.* 2024b).		
Nickol Bay Prawn Managed Fishery		✓		***Management area***	The Nickol Bay Prawn Managed Fishery operates in nearshore and offshore waters of the Pilbara region along the NWS. Trawling has been reported to occur at several locations along the Pilbara coast to the east of the Burrup Peninsula, including within the waters of Nickol Bay (Fletcher and Santoro 2015).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Banana prawn (*Penaeus merguiensis*), western king prawn (*Penaeus latisulcatus*), brown tiger prawn (*Penaeus esculentus*) and blue endeavour prawn (*Metapenaeus endeavouri*).		Low opening, otter prawn trawl systems.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The Nickol Bay Prawn Managed Fishery landed 89 t in 2023, 51 t in 2022, 123.4 t in 2021, 202.4 t in 2020, 254 t in 2019 and 81 t in 2018 (Koefoed *et al.* 2024a). Of the total landings in 2023, landings were dominated by 68 t banana, 15 t brown tiger, 4 t western king and 1 t blue endeavour prawns (Koefoed *et al.* 2024a). The banana prawn stock status within the Nickol Bay Prawn Managed Fishery is considered sustainable – adequate (Koefoed *et al.* 2024a).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Active licences/ vessels	There were five participating vessels in 2023 (Koefoed *et al.* 2024a).		
Northern Demersal Scalefish Managed Fishery	✓			***Management area***	The Northern Demersal Scalefish Managed Fishery is divided into two fishing areas: an inshore sector (Area 1) and an offshore sector (Area 2) (Newman *et al.* 2018). Area 1 permits line fishing only, between the high water mark and the 30 m isobath. Area 2 permits handline, dropline and fish trap fishing methods and is further divided into zones. Zone A is an inshore area, Zone B comprises the area with most historical fishing activity, and Zone C is an offshore deep slope area representing waters deeper than 200 m (Fletcher *et al.* 2017; Smith, *et al.* 2025).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Goldband snapper (*Pristipomoides multidens*), blue-spotted emperor (*Lethrinus punctulantus*), red emperor (*Lutjanus sebae*) and rankin cod (*Epinephelus multinotatus*).		Handline, dropline and fish trap.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The Northern Demersal Scalefish Managed Fishery landed 1,450 t in 2023, 1,458 t in 2022, 1,544 t in 2021, 1,419 t in 2020, 1,507 t in 2019, and 1,297 t in 2018 (Wakefield *et al.* 2024). In 2023, most of the catch was landed from Zone B, with 1,233 t in 2023. The 2023 catch of jobfish group (*Pristipomoides spp*.) was 503 t, 91% of which was goldband snapper (Wakefield *et al.* 2024). The stock status of landed species in the managed fishery is classified as sustainable – adequate (Wakefield *et al.* 2024).		
				Active licences/ vessels	Eight active vessels in 2023 (Wakefield *et al.* 2024).		
Octopus Interim Managed Fishery	-	-	-	***Management area***	The Octopus Interim Managed Fishery operates from Kalbarri Cliffs in the north to Esperance in the south.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Octopus djinda, which is closely related to *Octopus tetricus*.		Primary method is baited octopus trap (combination of active trapping via trigger mechanisms, and passive trapping – shelter traps) (Strain *et al.* 2024d).	Catches typically occur in nearshore waters of less than 20 m depths, but traps may be deployed in depths of up to 50 m (Desfosses *et al.* 2024.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: Commercial catch for the Octopus Interim Managed Fishery was 777 t in 2023, 744 t in 2022, 487 t in 2021, 254 t in 2020, 453 t in 2019, 314 t in 2018, 257 t in 2017 and 252 t in 2016 (Strain *et al.* 2024d). In 2023, the total catch of octopus of 777 t live weight was a 4.4% increase from 2022 with a total catch of 744 t, due to one new vessel and increased use of trap allocations (Strain *et al.* 2024d). Octopus stock status in 2023 is considered sustainable – adequate (Strain *et al.* 2024d).		
				Active licences/ vessels	Twenty-eight active vessels in 2023 (Strain *et al.* 2024d).		
Onslow Prawn Managed Fishery		✓		***Management area***	The Onslow Prawn Managed Fishery encompasses a portion of the continental shelf off the Pilbara.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Western king prawns (*Penaeus esculentus*), brown tiger prawns (*Penaeus esculentus*), blue endeavour prawns (*Metapenaeus endeavouri.*		Low opening, otter prawn trawl systems.	Fishery and or fishing activity overlaps the Beadon Creek dredging scope (Sporer *et al.* 2015).
				Fishing effort	The total landings for the Onslow Prawn Managed Fishery for the 2023 and 2022 seasons are not available due to data confidentiality (Koefoed *et al.* 2024a). In 2021, the total catch was less than the target catch range of 60 t (Kangas *et al.* 2023a). Thirty-seven days of fishing took place in 2021, compared to 13 days in 2020 (Kangas *et al.* 2023a). The breeding stocks of banana, brown tiger and western king prawns are considered sustainable – adequate (Koefoed *et al.* 2024a).		
				Active licences/ vessels	One vessel was active in 2023 (Koefoed *et al.* 2024a).		

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
Pearl Oyster Managed Fishery	✓	✓	✓	***Management area***	The Pearl Oyster Managed Fishery is in shallow coastal waters, designated by four zones extending from Exmouth to Kununurra and the seaward boundary demarcated by the 200 nm EEZ. The fishery is currently managed under the *Pearling Act 1990* (Koefoed *et al.* 2024a).		
					Species targeted	***Fishing methods***	***Fishing depth***
					Silver lipped pearl oysters (*Pinctada maxima*).	Drift diving.	Fishing effort is mostly focused in shallow coastal waters (10 to 15 m depth), with a maximum depth of 35 m (Lulofs *et al.* 2002).
				Fishing effort	In 2023, catch was taken from Zones 2 and 3 only with no fishing in Zone 1, which has not been fished from 2017 to 2023 (Koefoed *et al.* 2024a). In 2023, the number of wild-caught pearl oysters was 798,217 (Koefoed *et al.* 2024a). Total dive hours increased in 2023 from 10,641 hours in 2022 to 10,906 hours due to a 28% increase in harvest (Hart *et al.* 2023b). Zones 1 to 3 are all considered to be sustainable – adequate (Koefoed *et al.* 2024a).		
				Active licences/ vessels	Five active vessels in 2023 (Koefoed *et al.* 2024a).		
Pilbara Crab Managed Fishery		✓	✓	***Management area***	The Pilbara Crab Managed Fishery covers inshore waters from Onslow to Port Hedland (between longitudes 115° 5’ 60”E and 120°E), with most activity around Nickol Bay (Newman *et al.* 2024a). Areas of the fishery north and east of Exmouth and nearshore are currently closed as per Schedule 2 of the Draft Management Plan for the Pilbara Crab Managed Fishery (DPIRD 2018).		
					Species targeted	***Fishing methods***	***Fishing depth***
					Blue swimmer crab (*Portunus armatus)* (Johnston *et al.* 2021).	Hourglass traps (Johnston *et al.* 2021).	Up to 50 m deep (Harris *et al.* 2024).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: Catch for the Pilbara Crab Managed Fishery was 23.8 t in 2023, 11.2 t in 2022, 9.7 t in 2021, 0.6 t in 2020 and 19.3 t in 2019 (Harris *et al.* 2024). The total catch in 2023 was a substantial increase from the 2.1 t caught in 2020, which was the lowest landed catch in 20 years (Harris *et al.* 2024). In 2023 the blue swimmer crab catch accounted for about 5% of the State commercial catch, all taken by this fishery (Harris *et al.* 2024). The blue swimmer crab stock status is considered sustainable – adequate (Harris *et al.* 2024).		
				Active licences/ vessels	No information currently available.		
Pilbara Trawl (Interim) Managed Fishery		✓		***Management area***	The Pilbara Trawl (Interim) Managed Fishery is a high-intensity fishery divided into two zones and an area governed by Schedule 5 (prohibited to trawling). In addition to the Prohibited Trawl Fishing area, no fish trawl units are allocated for use in Zone 1 or Areas 3 and 6 of Zone 2 (which comprises six management areas) (Newman *et al.* 2024; Smith, *et al.* 2025).		
				Species targeted		***Fishing methods***	***Fishing depth***
				The fishery targets more than 50 scalefish species. The main demersal scalefish species landed by the fisheries in the Pilbara region are bluespotted emperor, red emperor and rankin cod (Newman *et al.* 2021a). The key species caught by the Pilbara Trawl (Interim) Managed Fishery include crimson snapper, bluespotted emperor trevally and threadfin bream (Trinnie *et al.* 2025).	Demersal trawl. The fishery operates with standard stern trawling gear (single net with extension sweeps) (Wakefield *et al.* 2024).	The fishery operates in waters between 50 and 200 m depth (Allen *et al.* 2014; Newman *et al.* 2015).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Based on State of the Fisheries annual reports provided by DPIRD, catch trends were seen to be increasing over the past reporting years, until the past two seasons. The Pilbara Trawl (Interim) Managed Fishery catch was 1,907 t in 2023, 1,784 t in 2022,1,928 t in 2021, 2,087 t in 2020, 2,142 t in 2019, 1,996 t in 2018, 1,780 t in 2017, 1,529 t in 2016, 1,172 t in 2015 and 1,105 t in 2014 (Wakefield *et al.* 2024). The fishery landed 74% of total commercial catches of the demersal scale fish in the Pilbara in 2023. Increasing catch rates and fishing mortality spawning biomass estimates indicate imposed effort reductions since 2008 have resulted in increased fish abundance and stock rebuilding in the fishery (Wakefield *et al.* 2024). In 2023, the total catch of the indicator species red emperor in the Pilbara Demersal Scalefish Fishery (includes the Pilbara trawl, trap and line fisheries) was 150 t, which is within the acceptable catch range (Wakefield *et al.* 2024). The biological stocks for the Pilbara Demersal Scalefish Fishery are classified as unsustainable – inadequate (Wakefield *et al.* 2024).		
				Active licences/ vessels	Four active vessels in the trawl sector in 2023 (Wakefield *et al.* 2024).		
Pilbara Line Managed Fishery		✓	✓	***Management area***	The Pilbara Line Managed Fishery boat licences are permitted to operate anywhere within 'Pilbara water', bounded by a line starting at the intersection of 21° 56'S latitude and the high water mark on the western side of the North West Cape on the mainland of WA, west along the parallel to the intersection of 21° 56'S latitude and the boundary of the AFZ, and north to longitude 120°E (Wakefield *et al.* 2024; Smith *et al.* 2025).		
				Species targeted		***Fishing method***	***Fishing depths***
				The Pilbara Line Managed Fishery catch is made up around 45 to 50 fish species. The fishery targets similar demersal species to the Pilbara Trap and Trawl fisheries, as well as some deeper offshore species such as ruby snapper and eightbar grouper (Trinnie *et al.* 2025).		Demersal long line.	Information not available.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Based on State of the Fisheries annual reports provided by DPIRD: The Pilbara Line Managed Fishery caught 114 t in 2023, 104 t in 2022, 124 t in 2021, 167 t in 2020, 148 t in 2019, 93 t in 2018, 143 t in 2017, 126 t in 2016, 97 t in 2015 and 40 t in 2014 (Wakefield *et al.* 2024). The total catch of 104 t in 2023 made up 4% of the total catch by the Pilbara Demersal Scalefish Fishery and was within the acceptable catch range (Wakefield *et al.* 2024).		
				Active licences/ vessels	Six active vessels in 2023 (Wakefield *et al.* 2024).		
Pilbara Trap Managed Fishery		✓	✓	***Management area***	The Pilbara Trap Managed Fishery covers the area from Exmouth northwards and eastwards to the 120° line of longitude, and offshore as far as the 200 m isobath. Like the trawl fishery, the trap fishery is also managed using input controls in the form of individual transferable effort allocations, monitored with a satellite-based vessel management system. The fishery includes six licences allocated to three vessels, operating principally from Onslow (Wakefield *et al.* 2024; Smith *et al.* 2025).		
				Species targeted		***Fishing methods***	***Fishing depths***
				The catch is made up of around 45 to 50 fish species. The fishery generally targets long-lived, high-value demersal scalefish such as red emperor and rankin cod, but also lands significant catches of shorter-lived species such as blue spotted emperor (Trinnie *et al.* 2025).		Demersal fish traps.	About 30 m isobath to 200 m isobath (DPIRD n.d.).
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The Pilbara Trap Managed Fishery caught 573 t in 2023, 597 t in 2022, 662 t in 2021, 584 t in 2020, 680 t in 2019, 563 t in 2018, 573 t in 2017, 495 t in 2016, 510 t in 2015 and 268 t in 2014 (Wakefield *et al.* 2024). The total catch of 573 t in 2023 made up 22% of the total catch by the Pilbara Demersal Scalefish Fishery and exceeded the acceptable catch range for the total catch (Wakefield *et al.* 2024).		
				Active licences/ vessels	Three active vessels in the trap sector in 2023 (Wakefield *et al.* 2024).

	Browse	*NWS/ Scarborough*	*North West Cape*				
Shark Bay Beach Seine and Mesh Net Managed Fishery	-	-	-	***Management area***	The Shark Bay Beach Seine and Mesh Net Managed Fishery operates from Denham.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Whiting (yellowfin *Sillago schomburgkii*), sea mullet (*Mugil cephalus*), tailor (*Pomatomus saltatrix*) and western yellowfin bream (*Acanthopagrus australis*).		Beach seine and mesh net.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: Total catch was 131 t in 2023, 131 t in 2022,135 t in 2021, 171 t in 2020, 175 t in 2019 and 176 t in 2018 (Jackson and Nolan 2024). Of the total catch in 2023, 80 t consisted of whiting, 25 t of sea mullet, 13 t of western yellowfin bream, 8 t of tailor, and 0.5 t of pink snapper (Jackson and Nolan 2024). The stock status of targeted species is sustainable – adequate (Jackson and Nolan 2024).		
				Active licences/ vessels	Four vessels were active in 2022 (Jackson and Nolan 2024).		
Shark Bay Crab Managed Fishery	-	-	-	***Management area***	The Shark Bay Crab Managed Fishery operates within the NWMR. It is based primarily in Carnarvon but operates throughout the waters of Shark Bay.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Blue swimmer crab (*Portunus armatus*).		Trap and trawl.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The fishery landed 369 t in 2023, 401 t in 2022, 549 t in 2020–21, 638 t in 2019–20, 529 t in 2018–19 and 518 t in 2017–18 (Chandrapavan *et al.* 2024). The fishery closed for 18 months in 2012 and 2013 to promote stock recovery after a series of adverse environmental conditions between 2010 and 2011 (Chandrapavan *et al.* 2024). Limited commercial fishing resumed under a national quota management system between 2013 and 2017 (Chandrapavan *et al.* 2024). The current stock status is sustainable – adequate (Chandrapavan *et al.* 2024).		
				Active licences/ vessels	In the trawl sector in 2023 there were three trap vessels and 21 trawl vessels (Chandrapavan *et al.* 2023a).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
South West Coast Salmon Managed Fishery	✓	✓	✓	***Management area***	The South West Coast Salmon Managed Fishery operates on various beaches south of the metropolitan area and includes all WA waters north of Cape Beaufort except Geographe Bay.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Western Australian salmon (*Arripis truttaceus*).		Beach seine nets.	Information not available.
				Fishing effort	No fishing occurs north of the Perth metropolitan area, despite the managed fishery boundary extending to Cape Beaufort (WA/NT border), as advised by Western Australian Fishing Industry Council. The commercial catch for the entire West Coast Nearshore and Estuarine Finfish resource was 267.5 t in 2023. The total catch of WA salmon was 28.4 t in 2023, a decrease from 82.9 t in 2022. The WA salmon stock status is considered sustainable – adequate (Yeoh *et al.* 2024).		
				Active licences/ vessels	The number of active vessels or licences in 2023 is unknown, but there were about 12 commercial fishers employed in 2018 (Yeoh *et al.* 2024).		
South-west Trawl Managed Fishery	-	-	-	***Management area***	The South-west Trawl Managed Fishery is a multi-species fishery and includes two of WA's smaller scallop fishing grounds at Fremantle and north of Geographe Bay (Fairclough and Walters 2018).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Scallops (*Ylistrum balloti,* formerly *Amusium balloti*) and associated byproducts. In years of low scallop catches, licensees may use trawl gear to target finfish species.		Trawl.	Information not available.
				Fishing effort	Catch levels are unavailable for recent years. The fishery was not active in 2015 or 2016 (Fairclough and Walters 2018). Effort in the fishery is highly variable and typically fluctuates in response to recruitment variability in saucer scallops and prawns. In 2023, the South-west Trawl Managed Fishery reported 62 t (Fisher *et al.* 2024). The stock status of scallops is considered sustainable – adequate (Wilkin *et al.* 2023a).		
				Active licences/ vessels	Five vessels fished in 2023 (Fisher *et al.* 2024).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
The South Coast Salmon Managed Fishery	-	-	-	***Management area***	The South Coast Salmon Managed Fishery is one of two fisheries operating in the South Coast bioregion that target nearshore and estuarine finfish.		
				Species targeted		***Fishing methods***	***Fishing depth***
				WA salmon (*Arripis truttaceus*), southern school whiting (*Sillago bassensis*), Australian herring (*Arripis georgianus*), King George whiting (*Sillaginodes punctatus*), sea mullet (*Mugil cephalus*), estuary cobbler (*Cnidoglanis macrocephalus*) and black bream (*Acanthopagrus butcheri*).		Beach seines, haul nets and gill nets.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: Total catch for the South Coast Estuarine and Nearshore Scalefish and Invertebrates resource was 238.6 t in 2023, 267.6 t for 2022, 275.1 t in 2021 and 334 t in 2020. Of this, the South Coast Salmon Managed Fishery landed 6.7 t of WA salmon in 2023, 54.5 t in 2022, 48.5 t in 2021, 76 t in 2020 and 56.5 t in 2019. The stock status of target species is sustainable – adequate (Yeoh *et al.* 2024).		
				Active licences/ vessels	Catch was recorded against eight licences in 2023 (Yeoh *et al.* 2024).		
Western Australian Abalone Managed Fishery	✓	✓	✓	***Management area***	The Western Australian Abalone Managed Fishery includes all coastal waters from the WA/SA border to the WA/NT border. The fishery is concentrated on the south coast and the west coast. It is divided into eight management areas. The fishery for greenlip and brownlip abalone operates in areas 1 to 4 and the Roe's abalone fishery operates in areas 1, 2, 5, 6, 7 and 8 (Strain *et al.* 2024c).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Greenlip abalone (*Haliotis laevigata*), brownlip abalone (*Haliotis conicopora*) and Roe's abalone (*Haliotis roei*).		Divers.	Distribution to 5 m depth for Roe's abalone and 40 m depth for greenlip/brownlip abalone (Strain *et al.* 2024c).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total catch for greenlip and brownlip abalone in 2023 was 41.4 t whole weight (27.3 t greenlip and 14.4 t brownlip), (Strain *et al.* 2024b), a decrease from 2022 which was 54.5 t whole weight (37.2 greenlip t and 17.3 t brownlip) (Strain *et al.* 2024b). The total catch in 2021 was the lowest catch recorded for greenlip/brownlip in 53 years (Strain *et al.* 2023). The Roe's abalone resource catch for 2023 was 25.9 t, a 10.4% decrease from the previous season (Strain *et al.* 2024c). In 2022 was 28.9 t whole weight, an increase from 25.6 t whole weight in 2021 (Strain *et al.* 2024c). The stock status of greenlip abalone is considered inadequate and brownlip abalone is adequate (Strain *et al.* 2024b). The stock status of the Roe's abalone is considered adequate (Strain *et al.* 2024c).		
				Active licences/ vessels	There were 15 registered vessels in 2023 for greenlip and brownlip abalone (Strain *et al.* 2024b) and 21 for Roe's abalone, but only a small proportion was active (Strain *et al.* 2024c).		
West Coast Beach (Beach Bait Fish Net) Managed Fishery	-	-	-	***Management area***	Primarily active in the Bunbury areas in the SWMR, operates between 26° and 33°S.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Whitebait.		Beach-based haul nets.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total catch of whitebait in 2023 was 18 t, a decrease from 23.3 t in 2022 (Yeoh *et al.* 2024). The fishery continues to be environmentally limited, with stocks still recovering from the 2010–11 marine heat wave (Yeoh *et al.* 2024). The stock status is inadequate – environmentally limited (Yeoh *et al.* 2024).		
				Active licences/ vessel:	The number of active vessels in 2023 is unknown, but five licensees reported landings of whitebait in 2011 (Yeoh *et al.* 2024).

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
West Coast Purse Seine Managed Fishery	-	-	-	***Management area***	Most of the catch in the West Coast Purse Seine Managed fishery is taken from between Cape Leeuwin and Geraldton. This region is separated into three zones: Northern Development, Perth Metropolitan, and Southern Development zones (Norriss and Moses 2024b).		
				Species targeted		***Fishing methods***	***Fishing depth***
				Small pelagic finfish such as: • scaly mackerel (*Sardinella lemuru*) • pilchards (*Sardinops sagax*) • Australian anchovy (*Engraulis australis*) • yellowtail scad (*Trachurus novaezelandiae*) • maray (*Etrumeus teres*).	Purse seine.	Information not available.
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total combined catch taken by the West Coast Purse Seine Managed Fishery and developmental licences was 214 t in 2023, 259 t in 2022, 504 t in 2021, 493 t in 2020, 527 t in 2019 and 340 t in 2018. In 2023, the total catch consisted of 66% scaley mackerel and 31% Australian sardine (Norriss and Moses 2024b). Both the scaley mackerel and Australian sardine have a stock status classified as sustainable – adequate (Norriss and Moses 2024b).		
				Active licences/ vessels	Three active vessels in 2022 (Norriss and Blazeski 2023d).		
West Coast Rock Lobster Managed Fishery			✓	***Management area***	The West Coast Rock Lobster Managed Fishery operates from Shark Bay south to Cape Leeuwin. The fishery is managed using zones, seasons and total allowable catch. The recreational fishery targets the western rock lobsters using baited pots and by diving between North West Cape and Augusta.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Western rock lobster (*Panulirus cygnus).*		Baited pots.	Information not available.

Fishery	Woodside activity area			Description	Fishery		
	Browse	*NWS/ Scarborough*	*North West Cape*				
				Fishing effort	Previous years' catch based on State of the Fisheries annual reports provided by DPIRD: The total catch for the West Coast Rock Lobster Managed Fishery was 4,361 t in 2023 (de Lestang and Walsh 2024). Due to COVID-19 related logistics and marketing issues, the 2020–21 season was extended from 12 to 18 months. Since the current extended season is still in progress, data has been reported on a 12-month period (15 Jan 2021 to 14 Jan 2022) (How and Wiberg 2023a). Landings for the 12-month (2021–22) season was 6,334 t and the 18-month 2020–21 season was 9,132 t. Commercial landings over the traditional 12-month season (15 Jan 2020 to 14 Jan 2021) were 5,696 t. The fishery landed 6,397 t in 2019 and 6,400 t in 2018 and 2017. The stock status for the western rock lobster is classified as sustainable – adequate (de Lestang and Walsh 2024).		
				Active licences/ vessel:	Two hundred and eighteen vessels were active in the 2023 season (de Lestang and Walsh 2024).		
Western Australia Joint Authority Northern Shark Fishery	✓			***Management area***	The Western Australia Joint Authority Northern Shark Fishery extends from longitude 12'° 45'E to the NT border.		
				Species targeted		***Fishing methods***	***Fishing depth***
				Blacktip shark (*Carcharhinus tilstoni*) and spot-tail shark (*Carcharhinus sorrah*).		Gillnets and longlines.	Information not available.
				Fishing effort	Since 2005, 60% of the waters have been closed to finishing and limited on the number of fishing days. No catch has been reported since 2008–09 (Braccini and Watt 2023; Newman *et al.* 2024a).		
				Active licences/ vessels	Information not available.

13.2.2 Fish habitat protection areas

Fish habitat protection areas (FHPAs) are areas of special protection and management in WA waters. There are six FHPAs established in areas identified as having a particular value for protecting fish and their habitats, as well as providing areas for education or aquaculture, and which are considered to require a higher level of protection than other parts of the marine environment (DPIRD 2026a). They are set under section 115 of the *Fish Resources Management Act* (WA) for:

- the conservation and protection of fish, fish breeding areas, fish fossils or the aquatic ecosystem
- the culture and propagation of fish and experimental purposes related to that culture and propagation, or
- the management of fish and activities relating to the appreciation or observation of fish.

Under the Act, fish can include a range of organisms, including finfish, crustaceans, molluscs, corals, seagrass and algae at all stages of their life cycles. FHPAs and a marine reserve declared under the *Conservation and Land Management Act* (WA) cannot exist in the same area (DPIRD 2026a).

Management of an FHPA is designed and carried out to achieve the purposes outlined in a Plan of Management. FHPAs may restrict non-fishing-related activities, such as the use of anchors, if they are considered inconsistent with the purpose of the FHPA; for example, if there is a risk of damage to fragile marine formations such as coral reefs. Protection may also involve managing human activities, such as dredging, draining wetlands, and fishing or diving near sensitive marine habitats (DPIRD 2026a).

FHPAs within the NWMR include:

- Miaboolya Beach
- Point Quobba.

FHPAs within the SWMR include:

- Cottesloe Reef
- Houtman Abrolhos Islands
- Kalbarri Blue Holes
- Lancelin Island Lagoon.

There are no FHPAs within the NMR.

13.2.2.1 Fish habitat protection areas within the NWMR

FHPAs within the NWMR are described here.

Miaboolya Beach

Miaboolya Beach is an area of the Gascoyne River delta near Carnarvon. The FHPA covers the nearshore waters and extends north to South Bejaling and south to the northern side of the Gascoyne River mouth. It also includes the adjoining mangrove system, associated seasonal creeks and salt marshes (DPIRD 2025c).

The Miaboolya system has regional importance as a fish nursery and general fish habitat. Native fauna include juvenile finfish species such as tailor (*Pomatomus saltatrix*), mulloway (*Argyrosomus spp.*) and sand whiting (*Sillago ciliata*), and various crab species including mud crabs, blue swimmer and green mud crabs (family Portunidae). The fish and crab stocks use this environment for breeding, growth and development. Resident and migratory populations of birds, marine turtles and dolphins also exist within the area and contribute to its environmental value (DPIRD 2025c).

The Miaboolya area is of important cultural and historical value to the Gnulli native title group. The area is a place for collecting traditional food and gathering for social occasions (DPIRD 2025c).

Recreational fishing is permitted but there are restrictions in place by DPIRD (Alymore and Anderson 2003).

Point Quobba

The Point Quobba FHPA adjoins the well-known ‘Blowholes’ tourist attraction at Quobba Station, 75 km north-west of Carnarvon WA, at the northernmost point of Shark Bay (DPIRD 2004).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The marine life and habitats of the area are of considerable scientific and recreational interest and are highly valued in the local community. However, the area is at risk from a high level of use and conflict between users, due to the area's proximity to popular tourism sites, the boat ramp, camping and settlement areas (DPIRD 2004).

The marine habitat at Point Quobba is in a transition zone between tropical and temperate climatic zones and is therefore highly diverse. It contains a mix of endemic temperate south-west Australian species and tropical and temperate Indo-Pacific species. The FHPA provides relatively sheltered breeding and feeding habitat for more than 100 species of fish (DPIRD 2025d)

Point Quobba lies within the traditional area of the Baiyungu people, who are members of the Gnulli Group. The Baiyungu people use the area regularly, sometimes to collect trochus for consumption at Point Quobba and Black Rock (DPIRD 2004).

There is a designated 'restricted area' within the FHPA to protect vulnerable habitats and fish species from human activity. Within this area commercial and recreational fishing and jet-skiing are prohibited. Restrictions on fishing in the rest of the FHPA are defined by the Department of Fisheries (DPIRD 2025d).

13.2.3 Aquaculture

Aquaculture operations in the north-west are typically restricted to inland and shallow coastal waters. The aquaculture bioregions within the NWMR include the Gascoyne Coast bioregion, the North Coast bioregion and the West Coast bioregion. These fishing bioregion boundaries are defined by DPIRD as the government body responsible for managing primary industries in WA.

Aquaculture operations within the NWMR are described below.

13.2.3.1 Gascoyne Coast bioregion

The Gascoyne Coast recreational fishing bioregion runs from the Zuytdorp Cliffs north of Kalbarri to the Ashburton River south of Onslow (DPIRD 2026c).

In the Gascoyne Coast bioregion, aquaculture activities are focused on the blacklip oyster (*Pinctada margaritifera*). Other aquaculture developments in the Gascoyne Coast bioregion include emerging producers of coral and live rock species for aquariums. There is some recent interest in the development of rock oysters in the Exmouth Gulf (Newman *et al.* 2024a).

13.2.3.2 North Coast bioregion

The North Coast recreational fishing bioregion includes the Pilbara and Kimberley regions and runs from Ashburton River south of Onslow to the WA/NT border (DPIRD 2026c).

Aquaculture activities in the North Coast bioregion are dominated by the production of pearls (from the *Pinctada maxima* oyster). Many pearl oysters for seeding are obtained from wild stocks and supplemented by hatchery-produced oysters, with major hatcheries operating at Broome and around the Dampier Peninsula (Newman *et al.* 2024a). Primary spawning of the pearl oyster occurs from mid-October to December. A smaller secondary spawning occurs in February and March (Newman *et al.* 2024a).

Finfish aquaculture in the Kimberley region is dominated by barramundi farming in the Kimberley Aquaculture Development Zone, which lies around 200 km north-east of Broome. Rock oyster trials are nearing completion near Karratha in the Pilbara region, but there is no commercial production of the species in this region at this stage (Newman *et al.* 2024a).

There is one Indigenous project at One Arm Point that operates a marine hatchery that focuses on a variety of ornamental and edible marine species (Newman *et al.* 2024a).

13.2.3.3 West Coast Bioregion

The West Coast recreational fishing bioregion runs from Black Point east of Augusta to the Zuytdorp Cliffs north of Kalbarri. This area includes the Houtman Abrolhos Islands (DPIRD 2026c).

Aquaculture activities in the West Coast bioregion, defined by DPIRD are focused on finfish, edible oysters (mainly in Cockburn Sound) and marine algae for production of beta-carotene, used as a food additive and as a nutritional supplement.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

There is also an emerging black pearl industry (from the *Pinctada margaritifera* oyster) in the Abrolhos Islands, as well as expansion in the production of Akoya pearls (small white pearls from *Pinctada fucata martensi*), *Pinctada albina* (small, yellow pearls) and *Pteria penguin*, which are often used to produce half (Mabe) pearls in pink and bluish shades.

Aquaculture licences for producing coral and live rock (pieces of old coral reefs colonised by marine life, such as beneficial bacteria, for aquariums) at the Abrolhos Islands have also been issued and other applications are being assessed (Newman *et al.* 2024a).

13.3 Fisheries – traditional

Traditional or customary fisheries are typically restricted to shallow coastal waters and areas with structures such as reef. The Western Australia Recreational Fishing Guide (DPIRD 2025b) states that Indigenous people do not need a recreational fishing licence in any waters if it is in accordance with continuing tradition and for individual or familial consumption, not for a commercial purpose.

Dugongs, fish and marine turtles that move between coastal and Commonwealth waters are important components of the Indigenous people's culture and diet. Indigenous people continue to actively manage their Sea Country in coastal waters of WA to protect and manage the marine environment, its resources and cultural values.

Indonesian fishers can fish within designated areas under the Australia–Indonesia regarding the Operations of Indonesian Traditional Fishermen in Areas of the Australian Fishing Zone and Continental Shelf – 1974 (MoU Box). Traditional fishing is allowed within the MoU Box (Figure 13-12), which encompasses Ashmore Reef (Pulau Pasir), Cartier Island (Pulau Baru), Seringapatam Reef (Afringan), Scott Reef (Pulau Dato) and Browse Island (Berselan). Restrictions have since been introduced around Ashmore Reef and Cartier Island after their designation as nature reserves under the Commonwealth *National Parks and Wildlife Conservation Act* in 1983 and 2000, respectively.

The MoU allows Indonesian fishers to fish in designated areas using traditional methods only. These methods include reef gleaning, free-diving, hand lining and other non-mechanised methods. Scott Reef is currently the principal reef in the MoU Box and Indonesian fishers use it seasonally to harvest trepang, trochus shells and other reef species. The peak season is July to October due to more favourable wind conditions, and to allow fishers to sun dry their catch on their boat decks (Environmental Resources Management 2009). Browse Island is also frequently visited by shark fishers who mostly fish along the eastern margin of the MoU Box.

The Agreement between the Government of Australia and the Government of the Republic of Indonesia Relating to Cooperation in Fisheries (1992 Fisheries Cooperation Agreement) provides the framework for fisheries and marine cooperation between Australia and Indonesia. Cooperation under the Agreement today takes place under the auspices of the Working Group on Marine Affairs and Fisheries. Research reports on reef-top species in the MoU Box indicate that stocks in the area are severely depleted. In 2009 the Working Group on Marine Affairs and Fisheries agreed to a Roadmap for MoU Box Cooperative Management (DAWE 2020).

Figure 13-12 shows the operations of Indonesian traditional fishers in the MoU Box in the NWMR.

13.4 Tourism and recreation

WA's tourism sector is important to industry and the economy. In 2023–24, tourism accounted for 7.2% of WA's total jobs and generated a gross total value added of $138 billion (Tourism Western Australia 2025).

The Kimberley, Pilbara and Ningaloo-Leeuwin regions are popular destinations for Australian and international tourists. Tourism is concentrated in the vicinity of population centres. Including Broome, Dampier, Exmouth, Coral Bay and Shark Bay. Recreational and tourism activities include charter fishing, recreational fishing, diving, snorkelling, marine fauna watching and yachting (Tourism Western Australia 2024).

In 2025, visitation in the regions generated a spend of $758 million in Australia's Coral Coast and $1.4 million in the North West (Tourism Western Australia 2026).

13.4.1 Kimberley region

Tourism is one of the main industries in the Kimberley region, alongside resources, energy construction, aquaculture, agriculture and the services sector. The Kimberley Development Commission is focusing on maximising these sectors and the growing visitor economy by enhancing Aboriginal cultural experiences, adventure tourism, and eco and food tourism in the Kimberley region (Kimberley Development Commission 2025).

The Dampier Peninsula Activation Project progressed in the 2024–25 period, with upgrades to day-use facilities, communication systems and cultural heritage protection and signage, and upgrades to accommodation and resorts in the area to meet the needs of the community and tourism (Kimberley Development Commission 2025).

Recreation and tourism activities in the Kimberley region occur predominantly in WA State waters (extending offshore 3 nm from the mainland), adjacent to coastal population centres such as Broome, with a peak in activity during the winter months (dry season). These activities include recreational fishing, diving, snorkelling, wildlife watching and boating (Newman *et al.* 2023b).

Primary dive locations in the Kimberley region include the Rowley Shoals, including Mermaid Reef AMP, Scott Reef, Seringapatam Reef, Ashmore Reef AMP and Cartier Island (Newman *et al.* 2023b).

13.4.2 Pilbara region

Recreation and tourism activities within the Pilbara are of high social value. Tourism is a key economic driver for the Pilbara, with more than one million visitors to the region every year. There were over 590,000 Karijini National Park visitors recorded in the 2024–25 season (Pilbara Development Commission (PDC) 2025). Multi-year tourism infrastructure development funding has been provided for the Niminjarra Highway to provide easier access to the Karlamilyi National Park and enhance cultural tourism opportunities, and to the Whim Creek Hotel to re-establish a tourism destination between Karratha and Hedland (PDC 2024).In 2024, Mackerel Islands Pty received a grant in funding from the State Government to progress with the development of a tourism resort featuring eco-cabins, a restaurant and eco-tents on Thevenard Island. The initiative will also offer the 'Outback Ranges to Reef' tourism packages, combing visitation eco-tourism and exclusive accommodation on Thevenard and Direction islands, Onslow Beach Resort and Karijini Eco Retreat (PDC 2025).

Pilbara Dive Tours based in Karratha has grown significantly over the past 16 years, offering unique dive trips, snorkelling tours and certifications for divers in the Pilbara and Dampier Archpelago. The company also began collaborating with Flinders University in 2023 to train MAC Rangers to become dive certified, which will allow them to assist with submerged archaeological surveys on Murujuga Country (PDC 2025).

Recreational fishing within the Pilbara region tends to be concentrated in State waters adjacent to population centres. Recreational fishing is known to occur around the Dampier Archipelago, with boats launched from boat ramps around Dampier and Karratha. Once at sea, charter vessels may also frequent the waters surrounding the Montebello Islands (Williamson *et al.* 2006).

13.4.3 Ningaloo-Leeuwin region

Tourism is a major economic driver across the connected Gascoyne, Ningaloo and Shark Bay regions. Tourism has the fourth largest economic output of all the major industries of the Gascoyne region (Gascoyne Development Commission (GDC) 2023). It contributes significantly to the local economy in terms of both

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

income and employment. In the 2024–25 period, the Gascoyne region had more than 267,000 overnight visitors. The total visitor spend, including daytrips in the region, equated to $385 million, with tourism accounting for 21% of employment in the region (GDC 2025).

The main attraction of the coastline for tourists is the quality of marine life. The region supports extensive scuba diving, snorkelling and fishing; specialised eco-tourism activities include whale shark and manta ray observation at Ningaloo, and dolphin and dugong viewing in Shark Bay (Newman *et al.* 2023b). In 2018–19, the Ningaloo region – Ningaloo Reef and the surrounding coastal region of Exmouth Gulf, communities of Exmouth and Coral Bay, and adjacent proposed southern coastal reserves and pastoral leases – contributed an estimated $110 million in value to the WA economy (DBCA 2020). Ningaloo's economic contribution to WA is attributed to four key types of economic activity: tourism expenditure by international, interstate and WA visitors to the Ningaloo region, commercial fishing in the Exmouth Gulf, recreation activity involving the reef by residents of the Ningaloo region, and management and research relating to the reef (DBCA 2020). More than 90% of this value added is attributed to the domestic and international tourists who visit Ningaloo each year (DBCA 2020). Dark-sky tourism flourished in 2023 with an influx of visitors coming together in Exmouth to witness a rare hybrid solar eclipse (GDC 2023). The natural phenomena brought thousands of visitors both interstate and international to the region in April 2023.

The first Cultural Tour experience was launched in 2022 on the Ningaloo Coast. Departing from Coral Bay, the Cultural Tour provides visitors the opportunity to experience a unique perspective on the coastline's rich cultural heritage and unique environment. The main marine nature-based tourist activities are concentrated around and within the Ningaloo World Heritage Area (GDC 2022). The Aboriginal AstroTourism Project was launched where Indigenous people were consulted on night-sky constellations and trained in dark-sky tourism. Through this program, star gazing experiences were successfully delivered to about 665 visitors over ten nights during the Ningaloo Eclipse (GDC 2023).

Demersal-focused recreational fishing contributes to the Gascoyne region's marine-based tourism, with about 8,500 recreational licenced fishers recorded to participate in the Gascoyne Coast demersal fishery per year (Ryan *et al.* 2025). These fishers are typically regional residents and a broad mix of age groups. Participation levels in Gascoyne fisheries have shown sensitivity to external factors, such as COVID-19 travel restrictions, which caused a marked temporary decline in 2020 before rebounding again in 2021 (Ryan *et al.* 2025).

13.5 Shipping

Commercial shipping traffic is high within the NWMR, with vessel activities including commercial fisheries, tourism such as cruises, international shipping, and oil and gas operations. There are 12 ports adjacent to the NWMR, including the major ports of Dampier, Port Hedland and Broome, which are operated by their port authorities. These ports handle large tonnages of iron ore and petroleum exports in addition to salt, manganese, feldspar, chromite and copper (DEWHA 2008a).

Heavy vessel traffic exists within the Pilbara Ports Authority management area, which recorded 3,638 vessel visits in the Port of Dampier, 3,363 vessel movements in the Port of Port Hedland, 1,214 vessel movements in the Port of Ashburton, and 265 at the Port of Varanus Island in the 2024–25 reporting period (Pilbara Ports Authority 2025). Twenty-six designated anchorages for bulk carriers, petroleum and gas tankers, drilling rigs, offshore platforms and pipelay vessels are located offshore of Rosemary Island.

In 2012, Australian Maritime Safety Authority established a network of shipping fairways off the north-west coast of Australia. The shipping fairways, while not mandatory, aim to reduce the risk of collision between transiting vessels and offshore infrastructure. The fairways are intended to direct large vessels, such as bulk carriers and liquified natural gas (LNG) ships, trading to the major ports into pre-defined routes to keep them clear of existing and planned offshore infrastructure (Australian Maritime Safety Authority 2013).

13.6 Petroleum basins

The NWMR supports multiple industries, including petroleum exploration and production.

Within the NWMR there are seven sedimentary petroleum basins: Northern and Southern Carnarvon basins, Perth, Browse, Roebuck, Offshore Canning and Bonaparte basins (Geoscience Australia 2026). Of these, the Northern Carnarvon, Browse and Bonaparte basins hold large quantities and comprise most of Australia's reserves of natural gas (DEWHA 2008a), which is reflected by the level of development in the area. In addition to existing facilities, there are proposed developments in the region. This includes proposals to develop gas and condensate from fields within the NWMR.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

In addition to the oil and gas industry, other land-based industries depend upon the marine environment in the nearshore area. These include ports, salt mines such as Karratha and Onslow, LNG onshore processing facilities such as Burrup Hub, Thevenard Island, Barrow Island, Varanus Island, and small-scale desalination plants at Barrow Island, Burrup, Cape Preston and Onslow.

Figure 13-13 shows the basins of WA and Woodside's hydrocarbon fields.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

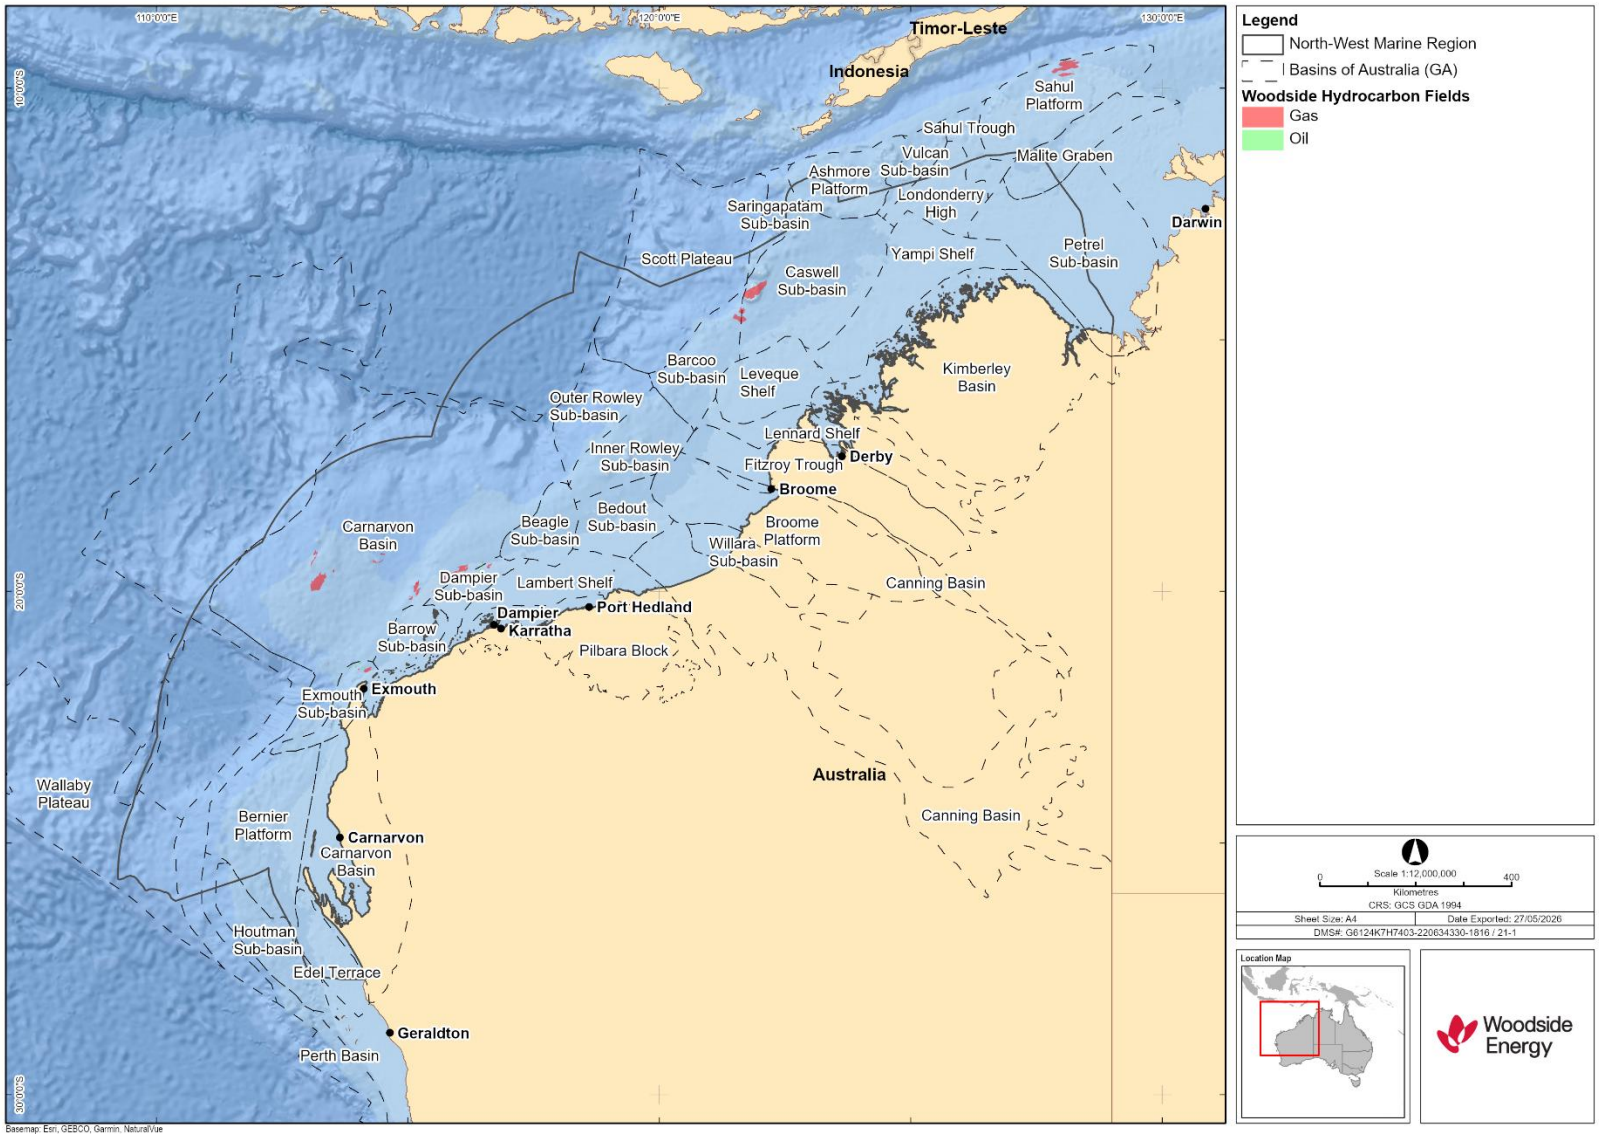

Figure 13-13: Petroleum basins within the NWMR

13.7 Defence

Key Australian Department of Defence operational areas and facilities in the NWMR for training and operational activities include the following:

- An operating logistics base has been established in Dampier to support vessels patrolling the waters around offshore oil and gas facilities. A dedicated Navy administrative support facility is also being constructed at the nearby township of Karratha (DEWHA 2008a).
- The Taylor Barracks are the headquarters of the Pilbara regiment, one of three Regional Force Surveillance Units conducting surveillance and reconnaissance of remote areas of northern Australia. This base is in Karratha (Department of Defence n.d.).
- The Royal Australian Air Force currently maintains two 'bare bases' in remote areas of WA that are used for military exercises. One of these is the Royal Australian Air Force Base in Learmonth. The Royal Australian Air Force maintains the Commonwealth Heritage listed Learmonth Air Weapons Range Facility, which is between Ningaloo Station and the Cape Range National Park. The air training area associated with the Learmonth base extends over the offshore region.
- The Royal Australian Air Force Base Curtin is located on the north coast of WA, south-east of Derby and 170 km east of Broome. It supports land, air and sea operations aimed at supporting Australia's northern approaches.
- The Naval Communications Station Harold E. Holt is about 6 km north of Exmouth. The main role of the station is to communicate at very low frequencies (19.8 kHz) with Australian and United States submarines and ships in the eastern Indian Ocean and the western Pacific Ocean (DEWHA 2008a).
- Areas may be subject to unexploded ordnance because of military activities. These are offshore sites where ammunition and explosives have been dumped, or have been used as live bombing or firing ranges. Department of Defence maintains a record of sites confirmed as, or reasonably suspected of, being affected by unexploded ordnance. There are several suspected unexploded ordnance sites in the NWMR (Australian Government Defence n.d.).
- Three plutonium-based nuclear tests were completed at the Montebello Islands in 1952 and 1956. Sediments in the Montebello Islands Marine Park still show radionuclide levels up to 4,500 times higher than the wider WA coast, with the highest concentrations near the original blast sites. A recent study identified a radioactive site in the southern Lowendal Islands. Elevated plutonium and americium suggest potential remobilisation or transport of historic defence materials beyond known boundaries (Williams-Hoffman *et al.* 2025).

15. LIST OF TERMS AND ACRONYMS

Table 15-1: List of terms and acronyms

Term	Definition
°C	Degrees Celsius
3D	three-dimensional
AFMA	Australian Fisheries Management Authority
AFZ	Australian Fishing Zone
AIMS	Australian Institute of Marine Science
AMP	Australian Marine Park
BC Act	*Biodiversity Conservation Act 2016* (WA)
BIA	biologically important area
BOM	Bureau of Meteorology
Burra Charter	Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance
CALM	Department of Conservation and Land Management
cm	centimetres
CSIRO	Commonwealth Scientific and Industrial Research Organisation
Commonwealth	Commonwealth
DAWE	Department of Agriculture, Water and the Environment
DBCA	Department of Biodiversity, Conservation and Attractions
DCCEEW	Department of Climate Change, Energy, the Environment and Wate
DEC	Department of Environment and Conservation
DEWHA	Department of Environment, Heritage, Water and the Arts
DEWR	Department of the Environment and Water Resources
DNP	Director of National Parks
DoE	Department of the Environment
DoEE	Department of Environment and Energy
DPAW	Department of the Parks and Wildlife
DPIRD	Department of Primary Industries and Regional Development
DPLH	Department of Planning, Lands and Heritage
DSEWPaC	Department of Sustainability, Environment, Water, Population and Communities
DWER	Department of Water and Environmental Regulation
EAAF	East Asian–Australasian Flyway
EEZ	Exclusive Economic Zone
EMBA	environment that may be affected
EP	Environment Plan
EPBC	environment protection and biodiversity conservation
F-CD	flatback turtle, Cape Domett stock
F-Pil	flatback turtle, Pilbara stock
F-swKim	flatback turtle, south-west Kimberley stock
FHPA	fish habitat protection area

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
G-AR	green turtle, Ashmore Reef stock
G-NWS	green turtle, NWS stock
G-ScBr	green turtle, Scott Reef-Browse Island stock
GDC	Gascoyne Development Commission
H-WA	hawksbill turtle, Western Australia genetic stock
ha	hectares
HMAS	His Majesty's Australian Ship
HSK	Handelstörkreuzer
ICOMOS	International Council on Monuments and Sites
ILUA	Indigenous Land Use Agreement
IPA	Indigenous Protected Area
IUCN	International Union for Conservation of Nature
IWC	International Whaling Commission
KBA	key biodiversity area
KEF	key ecological feature
kHz	kilohertz
km	kilometres
km/h	kilometres per hour
km²	cubic kilometres
KTLA	Karajarri Traditional Lands Association
L	litres
LH-WA	loggerhead turtle, Western Australia stock
LNG	liquified natural gas
m	metres
m²	square metres
m/s	metres per second
MAC	Murujuga Aboriginal Corporation
MCL	Murujuga Cultural Landscape
mm	millimetres
MNES	matters of national environmental significance
MODIS	moderate resolution imaging spectroradiometer
MoU	Memorandum of Understanding
MRAMP	Murujuga Rock Art Monitoring Program
MRAS	Murujuga Rock Art Strategy
NIAA	National Indigenous Australians Agency
nm	nautical miles
NMR	North Marine Region
NWMR	North-west Marine Region
NT	Northern Territory
NWS	North West Shelf

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Definition
OPGGS (E) Regulations	Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2023
PDC	Pilbara Development Commission
PMST	EPBC Act Protected Matters Search Tool
RNTBC	Registered Native Title Body Corporate
SA	South Australia
SPRAT	species profile and threats database
SWMR	South-west Marine Region
t	tonnes
TEC	threatened ecological community
UNESCO	United Nations Educational, Scientific and Cultural Organization
UWA	University of Western Australia
WA	Western Australia
WAMSI	Western Australian Marine Science Institution
WGAC	Wunambal Gaambera Aboriginal Corporation
Woodside	Woodside Energy Ltd. or Woodside Energy Group

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

APPENDIX A PROTECTED MATTERS SEARCH REPORTS FOR THE NWMR, SWMR AND NMR

The PMST tool conducts searches on a grid-based function. Accordingly, the PMST results can indicate features or species that do not actually intersect or have a presence in the area. To validate search results, comprehensive literature and scientific expertise is used. As such, only species considered relevant to the scope of this document have been described.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	62
Listed Migratory Species:	64

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	5
Commonwealth Heritage Places:	1
Listed Marine Species:	104
Whales and Other Cetaceans:	16
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	5
Habitat Critical to the Survival of Marine Turtles:	2

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	1
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	51
Key Ecological Features (Marine):	4
Biologically Important Areas:	7
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Arenaria interpres		
Ruddy Turnstone [872]	Vulnerable	Species or species habitat likely to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris canutus		
Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris tenuirostris		
Great Knot [862]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat likely to occur within area
Chloebia gouldiae listed as Erythrura gouldiae Gouldian Finch [90091]	Endangered	Species or species habitat likely to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii smithii Partridge Pigeon (eastern) [64441]	Vulnerable	Species or species habitat likely to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat may occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Pezoporus occidentalis](#)		
Night Parrot [59350]	Critically Endangered	Species or species habitat may occur within area
[Phaethon rubricauda westralis](#)		
Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Species or species habitat likely to occur within area
[Pluvialis squatarola](#)		
Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area
[Rostratula australis](#)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
[Sternula albifrons](#)		
Little Tern [82849]	Vulnerable	Breeding likely to occur within area
[Tringa nebularia](#)		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
[Tyto novaehollandiae kimberli](#)		
Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
FROG		
[Uperoleia daviesae](#)		
Howard River Toadlet, Davies's Toadlet [85375]	Vulnerable	Species or species habitat may occur within area
MAMMAL		
[Antechinus bellus](#)		
Fawn Antechinus [344]	Vulnerable	Species or species habitat likely to occur within area
[Balaenoptera borealis](#)		
Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
[Balaenoptera musculus](#)		
Blue Whale [36]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat may occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Mesembriomys gouldii gouldii Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat likely to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat likely to occur within area
Petrogale concinna canescens Nabarlek (Top End) [87606]	Endangered	Species or species habitat likely to occur within area
Petrogale concinna concinna Nabarlek (Victoria River District) [87605]	Critically Endangered	Species or species habitat likely to occur within area
Phascogale pirata Northern Brush-tailed Phascogale [82954]	Vulnerable	Species or species habitat likely to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat likely to occur within area
PLANT		
Typhonium praetermissum [65859]	Endangered	Species or species habitat likely to occur within area
Typhonium sp. Cox Peninsula (S.Nicholas 15/12/1999) [93623]	Endangered	Species or species habitat likely to occur within area
REPTILE		
Acanthophis hawkei Plains Death Adder [83821]	Vulnerable	Species or species habitat likely to occur within area
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Carettochelys insculpta Pig-nosed Turtle, Pitted Shell Turtle [1762]	Vulnerable	Species or species habitat may occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Natator depressus		
Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area
Tiliqua scincoides intermedia		
Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat likely to occur within area
Varanus mertensi		
Mertens' Water Monitor [1568]	Endangered	Species or species habitat likely to occur within area
Varanus mitchelli		
Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat likely to occur within area
Glyphis glyphis		
Speartooth Shark [82453]	Critically Endangered	Species or species habitat likely to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis		
Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini		
Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
null		
Balaenoptera omurai		
Omura's Whale [87136]		Species or species habitat likely to occur within area
Migratory Marine Birds		
Anous stolidus		
Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus		
Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas		
Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat likely to occur within area
Phaethon lepturus		
White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda		
Red-tailed Tropicbird [994]		Species or species habitat likely to occur within area
Sternula albifrons		
Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Migratory Marine Species		
Anoxypristis cuspidata		
Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Species or species habitat likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat may occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat may occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis		
Oriental Reed-Warbler [59570]		Species or species habitat may occur within area
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Species or species habitat likely to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris alba Sanderling [875]		Species or species habitat likely to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Species or species habitat likely to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat likely to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Numenius phaeopus Whimbrel [849]		Species or species habitat likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Scientific Name	Threatened Category	Presence Text
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat likely to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Numenius phaeopus Whimbrel [849]		Species or species habitat likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Rostratula australis as Rostratula benghalensis (sensu lato)		
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area
Sternula albifrons as Sterna albifrons		
Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
Fish		
Bhanotia fasciolata		
Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus		
Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma		
Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus		
Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus		
Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus		
Yellow-banded Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus		
Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis		
Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Festucalex cinctus Girdled Pipefish [66214]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Haliichthys taeniophora as Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Pipefish, Ribboned Seadragon [94706]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys parvicarinatus Short-keel Pipefish, Short-keeled Pipefish [66230]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Species or species habitat likely to occur within area
Reptile		
Aipysurus apraefrontalis Short-nosed Sea Snake, Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat likely to occur within area
Aipysurus duboisii Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Crocodylus johnstoni](#) Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Sahul Shelf	North-west
Carbonate bank and terrace system of the Van Diemen Rise	North
Pinnacles of the Bonaparte Basin	North-west
Pinnacles of the Bonaparte Basin	North

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Sousa sahulensis Australian Humpback Dolphin [87942]	Reproduction	Likely to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Foraging	Known to occur
Lepidochelys olivacea Olive Ridley Turtle [1767]	Reproduction	Likely to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Reproduction	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar	1
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	73
Listed Migratory Species:	79

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	30
Commonwealth Heritage Places:	7
Listed Marine Species:	119
Whales and Other Cetaceans:	26
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	4
Habitat Critical to the Survival of Marine Turtles:	3

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	5
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	75
Key Ecological Features (Marine):	3
Biologically Important Areas:	7
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

Wetlands of International Importance (Ramsar Wetlands)	[Resource Information]
Ramsar Site Name	Proximity
Cobourg peninsula	Within 10km of Ramsar site

Commonwealth Marine Area	[Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species	[Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Arenaria interpres		
Ruddy Turnstone [872]	Vulnerable	Roosting likely to occur within area
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris canutus		
Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area
Calidris ferruginea		
Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris tenuirostris

Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting likely to occur within area
Chloebia gouldiae listed as Erythrura gouldiae Gouldian Finch [90091]	Endangered	Species or species habitat likely to occur within area
Epthianura crocea tunneyi Alligator Rivers Yellow Chat, Yellow Chat (Alligator Rivers) [67089]	Endangered	Species or species habitat likely to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii smithii Partridge Pigeon (eastern) [64441]	Vulnerable	Species or species habitat likely to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat may occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting likely to occur within area
Melanodryas cucullata melvillensis Tiwi Islands Hooded Robin, Hooded Robin (Tiwi Islands) [67092]	Critically Endangered	Species or species habitat likely to occur within area
Mirafra javanica melvillensis Horsfield's Bushlark (Tiwi Islands) [81011]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius madagascariensis		
Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Phaethon rubricauda westralis		
Red-tailed Tropicbird (Indian Ocean), Indian Ocean Red-tailed Tropicbird [91824]	Endangered	Species or species habitat may occur within area
Pluvialis squatarola		
Grey Plover [865]	Vulnerable	Roosting likely to occur within area
Rostratula australis		
Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
Sternula albifrons		
Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Tringa nebularia		
Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
Tyto novaehollandiae kimberli		
Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
Tyto novaehollandiae melvillensis		
Tiwi Masked Owl, Tiwi Islands Masked Owl [26049]	Endangered	Species or species habitat likely to occur within area
Xenus cinereus		
Terek Sandpiper [59300]	Vulnerable	Roosting likely to occur within area
FROG		
Uperoleia daviesae		
Howard River Toadlet, Davies's Toadlet [85375]	Vulnerable	Species or species habitat likely to occur within area
MAMMAL		
Antechinus bellus		
Fawn Antechinus [344]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Mesembriomys gouldii gouldii Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat likely to occur within area
Mesembriomys gouldii melvillensis Black-footed Tree-rat (Melville Island) [87619]	Vulnerable	Species or species habitat likely to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Breeding likely to occur within area
Petrogale concinna canescens Nabarlek (Top End) [87606]	Endangered	Species or species habitat likely to occur within area
Phascogale pirata Northern Brush-tailed Phascogale [82954]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Sminthopsis butleri Butler's Dunnart [302]	Vulnerable	Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat likely to occur within area
PLANT		
Burmannia championii listed as Burmannia sp. Bathurst Island (R.Fensham 1021) [93461]	Endangered (listed as Burmannia sp. Bathurst Island	Species or species habitat likely to occur within area
Elaeocarpus miegei [65147]	Endangered	Species or species habitat likely to occur within area
Hoya australis subsp. oramicola a vine [55436]	Vulnerable	Species or species habitat likely to occur within area
Mitrella tiwiensis a vine [82029]	Vulnerable	Species or species habitat likely to occur within area
Stylidium ensatum a triggerplant [86366]	Endangered	Species or species habitat likely to occur within area
Tarennoidea wallichii [65173]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Typhonium jonesii a herb [62412]	Endangered	Species or species habitat likely to occur within area
Typhonium mirabile a herb [79227]	Endangered	Species or species habitat likely to occur within area
Typhonium praetermissum [65859]	Endangered	Species or species habitat likely to occur within area
Typhonium sp. Cox Peninsula (S.Nicholas 15/12/1999) [93623]	Endangered	Species or species habitat likely to occur within area
Xylopia monosperma a shrub [82030]	Endangered	Species or species habitat likely to occur within area
REPTILE		
Acanthophis hawkei Plains Death Adder [83821]	Vulnerable	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Tiliqua scincoides intermedia Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat likely to occur within area
Varanus mertensi Mertens' Water Monitor [1568]	Endangered	Species or species habitat likely to occur within area
Varanus mitchelli Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat likely to occur within area
Glyphis glyphis Speartooth Shark [82453]	Critically Endangered	Species or species habitat likely to occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sphyrna lewini Scalloped Hammerhead [85267]	Conservation Dependent	Species or species habitat likely to occur within area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text
null		

Scientific Name	Threatened Category	Presence Text
Balaenoptera omurai Omura's Whale [87136]		Species or species habitat likely to occur within area
Migratory Marine Birds		
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat likely to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat may occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Migratory Marine Species		
Anoxypristis cuspidata Narrow Sawfish, Knifetooth Sawfish [68448]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Carcharhinus longimanus Oceanic Whitetip Shark [84108]		Species or species habitat may occur within area
Carcharias taurus Grey Nurse Shark [64469]		Species or species habitat may occur within area
Carcharodon carcharias White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Dugong dugon Dugong [28]		Species or species habitat likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Isurus oxyrinchus Shortfin Mako, Mako Shark [79073]		Species or species habitat likely to occur within area
Isurus paucus Longfin Mako [82947]		Species or species habitat likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat likely to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat likely to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Breeding likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat likely to occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat likely to occur within area
Motacilla cinerea		
Grey Wagtail [642]		Species or species habitat likely to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis		
Oriental Reed-Warbler [59570]		Species or species habitat may occur within area
Actitis hypoleucos		
Common Sandpiper [59309]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting likely to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris alba Sanderling [875]		Roosting likely to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area
Calidris falcinellus as Limicola falcinellus Broad-billed Sandpiper [91731]		Roosting likely to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area
Calidris ruficollis Red-necked Stint [860]		Roosting likely to occur within area
Calidris subminuta Long-toed Stint [861]		Roosting likely to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting likely to occur within area
Charadrius dubius Little Ringed Plover [896]		Roosting likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting likely to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Roosting likely to occur within area
Gallinago megala Swinhoe's Snipe [864]		Roosting likely to occur within area
Gallinago stenura Pin-tailed Snipe [841]		Roosting likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Roosting likely to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat likely to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat likely to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area
Numenius phaeopus Whimbrel [849]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting likely to occur within area

Scientific Name	Threatened Category	Presence Text
Thalasseus bergii Greater Crested Tern [83000]		Breeding likely to occur within area
Tringa brevipes Grey-tailed Tattler [851]		Roosting likely to occur within area
Tringa glareola Wood Sandpiper [829]		Roosting likely to occur within area
Tringa incana Wandering Tattler [831]		Roosting likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Roosting likely to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Roosting likely to occur within area

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Listed Marine Species

[Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat may occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat likely to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Arenaria interpres Ruddy Turnstone [872]	Vulnerable	Roosting likely to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris alba Sanderling [875]		Roosting likely to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Calidris falcinellus as Limicola falcinellus Broad-billed Sandpiper [91731]		Roosting likely to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat likely to occur within area overfly marine area
Calidris ruficollis Red-necked Stint [860]		Roosting likely to occur within area overfly marine area
Calidris subminuta Long-toed Stint [861]		Roosting likely to occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Roosting likely to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Chalcites osculans as Chrysococcyx osculans		
Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius dubius		
Little Ringed Plover [896]		Roosting likely to occur within area overfly marine area
Charadrius leschenaultii		
Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius mongolus		
Lesser Sand Plover, Mongolian Plover [879]	Endangered	Roosting likely to occur within area
Charadrius ruficapillus		
Red-capped Plover [881]		Roosting likely to occur within area overfly marine area
Charadrius veredus		
Oriental Plover, Oriental Dotterel [882]		Roosting likely to occur within area overfly marine area
Fregata ariel		
Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area
Fregata minor		
Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat likely to occur within area
Gallinago megala		
Swinhoe's Snipe [864]		Roosting likely to occur within area overfly marine area
Gallinago stenura		
Pin-tailed Snipe [841]		Roosting likely to occur within area overfly marine area
Glareola maldivarum		
Oriental Pratincole [840]		Roosting likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat likely to occur within area
Himantopus himantopus Pied Stilt, Black-winged Stilt [870]		Roosting likely to occur within area overfly marine area
Hirundo rustica Barn Swallow [662]		Species or species habitat likely to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat likely to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Roosting likely to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat likely to occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat likely to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius minutus Little Curlew, Little Whimbrel [848]		Roosting likely to occur within area overfly marine area
Numenius phaeopus Whimbrel [849]		Roosting likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat may occur within area
Pluvialis fulva Pacific Golden Plover [25545]		Roosting likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Roosting likely to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat likely to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area
Sternula albifrons as Sterna albifrons Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Stiltia isabella Australian Pratincole [818]		Roosting likely to occur within area overfly marine area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
[Tringa brevipes as Heteroscelus brevipes](#) Grey-tailed Tattler [851]		Roosting likely to occur within area
[Tringa glareola](#) Wood Sandpiper [829]		Roosting likely to occur within area overfly marine area
[Tringa incana as Heteroscelus incanus](#) Wandering Tattler [831]		Roosting likely to occur within area
[Tringa nebularia](#) Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area
[Tringa stagnatilis](#) Marsh Sandpiper, Little Greenshank [833]		Roosting likely to occur within area overfly marine area
[Xenus cinereus](#) Terek Sandpiper [59300]	Vulnerable	Roosting likely to occur within area overfly marine area
Fish		
[Bhanotia fasciolata](#) Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
[Campichthys tricarinatus](#) Three-keel Pipefish [66192]		Species or species habitat may occur within area
[Choeroichthys brachysoma](#) Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
[Choeroichthys suillus](#) Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
[Corythoichthys amplexus](#) Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Corythoichthys flavofasciatus Yellow-banded Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Festucalex cinctus Girdled Pipefish [66214]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophora as Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Pipefish, Ribboned Seadragon [94706]		Species or species habitat may occur within area
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys parvicarinatus Short-keel Pipefish, Short-keeled Pipefish [66230]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Species or species habitat likely to occur within area
Reptile		
Aipysurus duboisii Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
Aipysurus laevis Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
Aipysurus mosaicus as Aipysurus eydouxii Mosaic Sea Snake [87261]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding likely to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Crocodylus johnstoni Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
Crocodylus porosus Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Breeding likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Sea Snake, Banded Sea Snake [1101]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake, Black-headed Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis inornatus Plain Sea Snake [1107]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis pacificus Pacific Sea Snake, Large-headed Sea Snake [1112]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Hydrophis zweifeli as Enhydrina schistosa Australian Beaked Sea Snake [93514]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area
Parahydrophis mertoni Arafura Smooth Sea Snake, Northern Mangrove Sea Snake [1090]		Species or species habitat may occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat likely to occur within area
Balaenoptera omurai Omura's Whale [87136]		Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
[Megaptera novaeangliae](#) Humpback Whale [38]		Species or species habitat likely to occur within area

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Carbonate bank and terrace system of the Van Diemen Rise	North
Pinnacles of the Bonaparte Basin	North
Shelf break and slope of the Arafura Shelf	North

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni		
Australian Snubfin Dolphin [81322]	Reproduction	Known to occur
Sousa sahulensis		
Australian Humpback Dolphin [87942]	Reproduction	Likely to occur
Tursiops aduncus		
Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Reproduction	Known to occur
Marine Turtles		
Chelonia mydas		
Green Turtle [1765]	Reproduction	Likely to occur
Lepidochelys olivacea		
Olive Ridley Turtle [1767]	Reproduction	Likely to occur
Natator depressus		
Flatback Turtle [59257]	Reproduction	Known to occur
Seabirds		
Thalasseus bergii		
Crested Tern [83000]	Reproduction	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data is available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance on the contents of this report.

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using point locations and environmental data layers.

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions when time permits.

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded breeding sites; and
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Report created: 26-Jun-2026

[Summary](#)

[Details](#)

- [Matters of NES](#)
- [Other Matters Protected by the EPBC Act](#)
- [Extra Information](#)

[Caveat](#)

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	1
National Heritage Places:	1
Wetlands of International Importance (Ramsar	2
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	3
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	58
Listed Migratory Species:	64

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at https://www.dcceew.gov.au/parks-heritage/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	4
Commonwealth Heritage Places:	None
Listed Marine Species:	103
Whales and Other Cetaceans:	26
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	1
Australian Marine Parks:	5
Habitat Critical to the Survival of Marine Turtles:	5

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	3
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	10
Key Ecological Features (Marine):	1
Biologically Important Areas:	12
Bioregional Assessments:	None
Geological and Bioregional Assessments:	None

Details

Matters of National Environmental Significance

World Heritage Properties [Resource Information]

Name	State	Legal Status
Kakadu National Park	NT	Declared property

National Heritage Places [Resource Information]

Name	State	Legal Status
Natural		
Kakadu National Park	NT	Listed place

Wetlands of International Importance (Ramsar Wetlands) [Resource Information]

Ramsar Site Name	Proximity
Cobourg peninsula	Within Ramsar site
Kakadu national park	Within Ramsar site

Commonwealth Marine Area [Resource Information]

Approval is required for a proposed activity that is located within the Commonwealth Marine Area which has, will have, or is likely to have a significant impact on the environment. Approval may be required for a proposed action taken outside a Commonwealth Marine Area but which has, may have or is likely to have a significant impact on the environment in the Commonwealth Marine Area.

Feature Name
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)
Commonwealth Marine Areas (EPBC Act)

Listed Threatened Species [Resource Information]

Status of Conservation Dependent and Extinct are not MNES under the EPBC Act.
Number is the current name ID.

Scientific Name	Threatened Category	Presence Text
BIRD		
Calidris acuminata		
Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris canutus		
Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Chloebia gouldiae listed as Erythrura gouldiae Gouldian Finch [90091]	Endangered	Species or species habitat likely to occur within area
Epthianura crocea tunneyi Alligator Rivers Yellow Chat, Yellow Chat (Alligator Rivers) [67089]	Endangered	Species or species habitat likely to occur within area
Erythrotriorchis radiatus Red Goshawk [942]	Endangered	Species or species habitat likely to occur within area
Falco hypoleucos Grey Falcon [929]	Vulnerable	Species or species habitat likely to occur within area
Falcunculus frontatus whitei Crested Shrike-tit (northern), Northern Shrike-tit [26013]	Vulnerable	Species or species habitat likely to occur within area
Geophaps smithii smithii Partridge Pigeon (eastern) [64441]	Vulnerable	Species or species habitat likely to occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat may occur within area
Limosa lapponica baueri Nunivak Bar-tailed Godwit, Western Alaskan Bar-tailed Godwit [86380]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area
Rostratula australis Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area
Sternula albifrons Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
Tyto novaehollandiae kimberli Masked Owl (northern) [26048]	Vulnerable	Species or species habitat likely to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Species or species habitat likely to occur within area
MAMMAL		
Antechinus bellus Fawn Antechinus [344]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Conilurus penicillatus Brush-tailed Rabbit-rat, Brush-tailed Tree-rat, Pakooma [132]	Vulnerable	Species or species habitat likely to occur within area
Dasyurus hallucatus Northern Quoll, Digul [Gogo-Yimidir], Wijingadda [Dambimangari], Wiminji [Martu] [331]	Endangered	Species or species habitat likely to occur within area
Macroderma gigas Ghost Bat [174]	Vulnerable	Species or species habitat likely to occur within area
Mesembriomys gouldii gouldii Black-footed Tree-rat (Kimberley and mainland Northern Territory), Djintamoonga, Manbul [87618]	Endangered	Species or species habitat likely to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Breeding likely to occur within area
Petrogale concinna canescens Nabarlek (Top End) [87606]	Endangered	Species or species habitat likely to occur within area
Phascogale pirata Northern Brush-tailed Phascogale [82954]	Vulnerable	Species or species habitat likely to occur within area
Saccolaimus saccolaimus nudicluniatus Bare-rumped Sheath-tailed Bat, Bare-rumped Sheathtail Bat [66889]	Vulnerable	Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Trichosurus vulpecula arnhemensis Northern Brushtail Possum [83091]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Xeromys myoides Water Mouse, False Water Rat, Yirrkoo [66]	Vulnerable	Species or species habitat likely to occur within area
REPTILE		
Acanthophis hawkei Plains Death Adder [83821]	Vulnerable	Species or species habitat likely to occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Carettochelys insculpta Pig-nosed Turtle, Pitted Shell Turtle [1762]	Vulnerable	Species or species habitat may occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
Cryptoblepharus gurrmul Arafura Snake-eyed Skink [83106]	Endangered	Species or species habitat likely to occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Lucasium occultum Yellow-snouted Gecko, Yellow-snouted Ground Gecko [82993]	Endangered	Species or species habitat likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area

Scientific Name	Threatened Category	Presence Text
Nyctophilopython oenpelliensis		
Nawaran, Oenpelli Python, Oenpelli Rock Python [92941]	Vulnerable	Species or species habitat may occur within area
Tiliqua scincoides intermedia		
Northern Blue-tongued Skink [89838]	Critically Endangered	Species or species habitat likely to occur within area
Varanus mertensi		
Mertens' Water Monitor [1568]	Endangered	Species or species habitat likely to occur within area
Varanus mitchelli		
Mitchell's Water Monitor [1569]	Critically Endangered	Species or species habitat likely to occur within area
SHARK		
Carcharodon carcharias		
White Shark, Great White Shark [64470]	Vulnerable	Species or species habitat may occur within area
Glyphis garricki		
Northern River Shark, New Guinea River Shark [82454]	Endangered	Species or species habitat likely to occur within area
Glyphis glyphis		
Speartooth Shark [82453]	Critically Endangered	Species or species habitat likely to occur within area
Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis		
Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area

Pristis clavata		
Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Breeding likely to occur within area
Pristis pristis		
Largetooth Sawfish, Freshwater Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Endangered	Species or species habitat likely to occur within area
Pristis zijsron		
Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Breeding likely to occur within area
Rhincodon typus		
Whale Shark [66680]	Vulnerable	Species or species habitat may occur within area
Sousa sahulensis as Sousa chinensis		
Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations)		
Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area
Migratory Terrestrial Species		
Cecropis daurica		
Red-rumped Swallow [80610]		Species or species habitat may occur within area
Cuculus optatus		
Oriental Cuckoo, Horsfield's Cuckoo [86651]		Species or species habitat likely to occur within area
Hirundo rustica		
Barn Swallow [662]		Species or species habitat likely to occur within area
Motacilla flava		
Yellow Wagtail [644]		Species or species habitat likely to occur within area
Migratory Wetlands Species		
Acrocephalus orientalis		
Oriental Reed-Warbler [59570]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat likely to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat likely to occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat may occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat likely to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area
Numenius phaeopus Whimbrel [849]		Species or species habitat likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Species or species habitat likely to occur within area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Species or species habitat likely to occur within area

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State

Listed Marine Species [Resource Information]

Scientific Name	Threatened Category	Presence Text
Bird		
Acrocephalus orientalis Oriental Reed-Warbler [59570]		Species or species habitat may occur within area overfly marine area
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat likely to occur within area
Anous stolidus Common Noddy [825]		Species or species habitat likely to occur within area
Anseranas semipalmata Magpie Goose [978]		Species or species habitat may occur within area overfly marine area
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area overfly marine area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]	Vulnerable	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris canutus Red Knot, Knot [855]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Calidris tenuirostris Great Knot [862]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Cecropis daurica as Hirundo daurica Red-rumped Swallow [80610]		Species or species habitat may occur within area overfly marine area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat likely to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat likely to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat likely to occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat likely to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat likely to occur within area overfly marine area
Limnodromus semipalmatus Asian Dowitcher [843]	Vulnerable	Species or species habitat may occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat likely to occur within area
Limosa limosa Black-tailed Godwit [845]	Endangered	Species or species habitat likely to occur within area overfly marine area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat likely to occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Numenius phaeopus Whimbrel [849]		Species or species habitat likely to occur within area
Pandion haliaetus Osprey [952]		Species or species habitat likely to occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat may occur within area
Phaethon rubricauda Red-tailed Tropicbird [994]		Species or species habitat may occur within area
Pluvialis squatarola Grey Plover [865]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Rhipidura rufifrons Rufous Fantail [592]		Species or species habitat likely to occur within area overfly marine area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat may occur within area overfly marine area
Sterna dougallii Roseate Tern [817]		Breeding likely to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]	Vulnerable	Breeding likely to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding likely to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]	Endangered	Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Tringa stagnatilis Marsh Sandpiper, Little Greenshank [833]		Species or species habitat likely to occur within area overfly marine area
Xenus cinereus Terek Sandpiper [59300]	Vulnerable	Species or species habitat likely to occur within area overfly marine area
Fish		
Bhanotia fasciolata Corrugated Pipefish, Barbed Pipefish [66188]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys amplexus Fijian Banded Pipefish, Brown-banded Pipefish [66199]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Yellow-banded Pipefish [66200]		Species or species habitat may occur within area
Corythoichthys haematopterus Reef-top Pipefish [66201]		Species or species habitat may occur within area
Corythoichthys intestinalis Australian Messmate Pipefish, Banded Pipefish [66202]		Species or species habitat may occur within area
Corythoichthys schultzi Schultz's Pipefish [66205]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Festucalex cinctus Girdled Pipefish [66214]		Species or species habitat may occur within area
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus dunckeri Red-hair Pipefish, Duncker's Pipefish [66220]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus spinirostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophora as Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Pipefish, Ribboned Seadragon [94706]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippichthys cyanospilos Blue-speckled Pipefish, Blue-spotted Pipefish [66228]		Species or species habitat may occur within area
Hippichthys parvicarinatus Short-keel Pipefish, Short-keeled Pipefish [66230]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
[Syngnathoides biaculeatus](#) Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area
[Trachyrhamphus bicoarctatus](#) Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
[Trachyrhamphus longirostris](#) Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
[Dugong dugon](#) Dugong [28]		Species or species habitat likely to occur within area
Reptile		
[Aipysurus duboisii](#) Dubois' Sea Snake, Dubois' Seasnake, Reef Shallows Sea Snake [1116]		Species or species habitat may occur within area
[Aipysurus laevis](#) Olive Sea Snake, Olive-brown Sea Snake [1120]		Species or species habitat may occur within area
[Aipysurus mosaicus as Aipysurus eydouxii](#) Mosaic Sea Snake [87261]		Species or species habitat may occur within area
[Caretta caretta](#) Loggerhead Turtle [1763]	Endangered	Foraging, feeding or related behaviour likely to occur within area
[Chelonia mydas](#) Green Turtle [1765]	Vulnerable	Breeding likely to occur within area
[Crocodylus johnstoni](#) Freshwater Crocodile, Johnston's Crocodile, Johnstone's Crocodile [1773]		Species or species habitat may occur within area
[Crocodylus porosus](#) Salt-water Crocodile, Estuarine Crocodile [1774]		Species or species habitat likely to occur within area

Scientific Name	Threatened Category	Presence Text
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour likely to occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding likely to occur within area
Hydrelaps darwiniensis Port Darwin Sea Snake, Black-ringed Mangrove Sea Snake [1100]		Species or species habitat may occur within area
Hydrophis atriceps Black-headed Sea Snake, Banded Sea Snake [1101]		Species or species habitat may occur within area
Hydrophis coggeri Cogger's Sea Snake, Black-headed Sea Snake [25925]		Species or species habitat may occur within area
Hydrophis czeblukovi Fine-spined Sea Snake [59233]		Species or species habitat may occur within area
Hydrophis elegans Elegant Sea Snake, Bar-bellied Sea Snake [1104]		Species or species habitat may occur within area
Hydrophis hardwickii as Lapemis hardwickii Spine-bellied Sea Snake [93516]		Species or species habitat may occur within area
Hydrophis inornatus Plain Sea Snake [1107]		Species or species habitat may occur within area
Hydrophis kingii as Disteira kingii Spectacled Sea Snake [93511]		Species or species habitat may occur within area
Hydrophis macdowelli as Hydrophis mcdowelli MacDowell's Sea Snake, Small-headed Sea Snake, [75601]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis major as Disteira major Olive-headed Sea Snake [93512]		Species or species habitat may occur within area
Hydrophis ornatus Spotted Sea Snake, Ornate Reef Sea Snake [1111]		Species or species habitat may occur within area
Hydrophis pacificus Pacific Sea Snake, Large-headed Sea Snake [1112]		Species or species habitat may occur within area
Hydrophis peronii as Acalyptophis peronii Horned Sea Snake [93509]		Species or species habitat may occur within area
Hydrophis platura as Pelamis platurus Yellow-bellied Sea Snake [93746]		Species or species habitat may occur within area
Hydrophis stokesii as Astrotia stokesii Stokes' Sea Snake [93510]		Species or species habitat may occur within area
Hydrophis zweifeli as Enhydrina schistosa Australian Beaked Sea Snake [93514]		Species or species habitat may occur within area
Lepidochelys olivacea Olive Ridley Turtle, Pacific Ridley Turtle [1767]	Endangered	Breeding likely to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding likely to occur within area
Parahydrophis mertoni Arafura Smooth Sea Snake, Northern Mangrove Sea Snake [1090]		Species or species habitat may occur within area

Whales and Other Cetaceans		[Resource Information]
Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera borealis Sei Whale [34]	Vulnerable	Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat may occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Species or species habitat may occur within area
Balaenoptera omurai Omura's Whale [87136]		Species or species habitat likely to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Species or species habitat likely to occur within area
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Vulnerable	Breeding likely to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahulensis Australian Humpback Dolphin [87942]	Vulnerable	Breeding likely to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat likely to occur within area

Current Scientific Name	Status	Type of Presence
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Commonwealth Reserves Terrestrial [Resource Information]

Key Ecological Features [Resource Information]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Tributary Canyons of the Arafura Depression	North

Biologically Important Areas [Resource Information]

Scientific Name	Behaviour	Presence
Dolphins		
Orcaella heinsohni Australian Snubfin Dolphin [81322]	Reproduction	Known to occur
Sousa sahulensis Australian Humpback Dolphin [87942]	Reproduction	Likely to occur
Tursiops aduncus Indo-Pacific/Spotted Bottlenose Dolphin [68418]	Reproduction	Known to occur
Marine Turtles		
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Reproduction	Likely to occur
Dermochelys coriacea Leatherback Turtle [1768]	Reproduction	Likely to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Reproduction	Known to occur

Scientific Name	Behaviour	Presence
Lepidochelys olivacea Olive Ridley Turtle [1767]	Reproduction	Likely to occur
Natator depressus Flatback Turtle [59257]	Reproduction	Known to occur
Seabirds		
Onychoprion anaethetus Bridled Tern [82845]	Reproduction	Known to occur
Sterna dougallii Roseate Tern [817]	Reproduction	Known to occur
Thalasseus bergii Crested Tern [83000]	Reproduction	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
